WOOD, TABER & MORSE, EATON, MADISON CO., NEW YORK.

## HEARTH & HOME, Issued Weekly;

A Large, Beautiful, Highly Illustrated and very Valuable Journal, of 20 Pages -full of Reliable, Instructive, and Interesting Reading Matter, News, and Miscellany: just suited to the Wants and Wishes of every Family - every Man, Woman, and Child in Americawhether living in City or Country.

### TERMS:

One Copy, One Year, - - \$3.00. Four Copies, One Year, - \$2.75 each. Ten or more Copies, - - \$2.50 each. Single Numbers, - - 8 cents each.

One copy each of Hearth and Home and American Agriculturist will be sent one year for \$4.

ORANGE JUDD & CO., Publishers,

· 245 Broadway, New York.

### NEW LOAN

### United States.

The subscriptions to the New Five Per Cent Stock of the United States now amount to about \$60,000,000. They are confidently expected to reach \$200,000,000 by the time the New Bonds are ready for delivery in May. proposals of the Secretary of the Treasury will then be changed to the following programme:

First-Bonds to the amount of three hundred millions of dollars, payable in coin, at the pleasure of the United States, after ten years from the date of their issue, and bearing interest payable quarterly in coin, at the rate of

five per cent per annum.

Second-Bends to the amount of three hundred millions of dollars, payable in coin, at the pleasure of the United States, after fifteen years from the date of their issne, and bearing interest, payable quarterly in coin, at the rate of four and a half per cent per annua.

Third—Bends to the amount of seven hundred millions

of dollars, payable in coin, at the pleasure of the United States, after thirty years from the date of their issue, and bearing interest, payable quarterly in coin, at the rate of four per cent per annum.

Subscriptions to the loan will have preference, after the above-mentioned two hundred millions are taken up, in the following order, namely:

First-Subscriptions for equal amounts of each class

Second-Subscriptions for equal amounts of bonds bearing interest at the rate of four and a half per cent, and of bonds bearing interest at the rate of five per cent.

Third—Subscriptions for any five per cent bonds that may not be subscribed for in the preceding classes.

Subscriptions to the remainder of the \$200,000,000 of five per cents, which are nuconditional, are now going on, and the honds will soon be issued to the subscribers, who can receive a scrip certificate, in advance, if they desire to pay their gold or exchange U. S. 5-20s at once, in the Registered or Coupon form. Registered bonds will be issued of the denominations of \$50, \$100, \$500, \$1,000, \$5,000, and \$10,000; and coupon bonds of each denomination except the last two. The interest will be payable in the United States, at the office of the Treasurer, any Assistant Treasurer, or Designated Depositary of the Government, quarterly, on the first days of February, May, August, and November, in each year.

The honds of the several classes aforesaid, and the

interest thereon, are exempt from the payment of all taxes or dues of the United States, as well as from taxation in any form by or under State, municipal, or local

After maturity, the bonds last issued will be first redeemed by classes and numbers, as may be designated by the Sccretary of the Treasury.

The reduction of the public debt since the close of the war of the Rebellion, and the relief, at the same time, to the anonal burden of interest, are as follows:

Paid under Johnson ..... 265,595,371 Principal, March 4, 1869..... \$2,491,399,904 Paid under Grant. Interest charge, 1865..... 151,832,051 Reduced in four years by payment and funding... Interest charge, 1869...... \$126,389,550 Reduced in two years by payment. .....

Present interest charge ...... The proposed further reduction of the annual interest charge upon the public debt by refunding, are as

By exchange of \$500,000,000 U. S. 6 per cents for new five per cents of 1881..... By exchange of \$300,000,000 U. S. 6 per

cents for 4 per cents of 1901 ..... 14,000,000

Total saving per annum by refunding.... The whole proceeds of the New Loans will be applied to the payment or redemption and cancelation of the 5-20 years 6 per cent bonds, and in addition to these proceeds, the 5-20s are now being reduced by purchase at the rate of \$10,000,000 per month.

HEAD OF JERSEY BULL "WACHUSETT."-DRAWN FROM LIFE BY EDWIN FORBES .- Engraved for the American Agriculturist.

This picture is a portrait of a very fine Jersey bull; in fact, one at least of the finest ever bred in this country. His color is French gray and black, shaded on the back into reddish brown, with all the black points so much sought after and admired by high-fanciers of this breed of cattle. Wachusett was bred by J. P. Swain, Esq., of Bronxville, N. Y., one of the oldest and most careful and observant

breeders in the country. He has imported a large number of very fine animals from the Channel Islands, both Jersey and Guernsey, and has a thorough understanding of their characteristics and good qualities; and in his opinion Wachusett will compare favorably with any Jersey bull that can be shown here or elsewhere. At two years old he was a terror not only to evil-doers, but to all strangers, but now

at four years old he is much more quict, and his keeper fondles him like a kitten. The good qualities of the Jerseys and Guernseys consist of richness of milk, which in the proportion of cream excels that of all other breeds, averaging in a small herd, which we have tested with the lactometer 22 per cent. Wachusett was purchased for an American Agriculturist premium in 1867, and is now owned by L. A. Chase

A Triangular Harrow.—A correspondent sends us a drawing and description of a triangular harrow which he has constructed. It does not differ essentially from the well-known Geddes harrow. For a heavy harrow, and for working among stumps, the triangular form has manifest advantages.

### AMERICAN AGRICULTURIST.

NEW YORK, JUNE, 1871.

~~~

We have had a remarkably favorable and early spring for getting in wheat, barley, oats, and peas, and it is probable that an unusually large breadth of wheat and oats bave been sown. For a year or two past oats have proved a more profitable erop than barley, and many farmers who usually sow barley have this year sown oats instead. In the great spring wheat sections of Wisconsin, Illinois, and Minnesota, the erop was sown unusually early and in good condition, and the prospects, so far, are highly favorable for a large yield. As a rule, also, winter wheat looks well.

The early spring has given farmers an unusnally loug season for plowing; and the presumption is that they have availed themselves of it, and that a large area has been, or will be, planted to corn and potatoes. It is true that high wages have induced a good many farmers to leave their operations. But on the whole we can hardly doubt that a large breadth has been planted, and that the cultivation and harvesting will require as much labor as hitherto, and consequently high wages must still be paid. The country will prosper, though those who work for farmers will do better than the farmers themselves. And there is no remedy for this unsatisfactory condition of affairs except in better farming-that is, in raising as much grain on half a million acres as we now do on a million.

#### Hints about Work.

Corn.—Small early varieties may still be planted. Soak the seed in soft water for 24 hours, and if the ground is warm, moist, and mellow, the plants will be up in a few days. The great husiness of the corn-grower this month is to cultivate, cultivate, cultivate. Something may still be done by applying plaster, or plaster, ashes, and hen-dung, mixed, on the young plants in the hill; but the main reliance now is on the cultivator. There was much sod land plowed early this spring for corn, and not a little of it was planted while the soil was cold and sodden underneath. In such cases a good crop can only be expected by deep and thorough cultivation. And the implement should he of the best kind—one that will not slip over the hard spots. Many

are not sufficiently careful on this latter point. The loose soil that needs the least cultivation gets the most, while the clay spots that need the most get the least. It cannot be too often repeated that there is an immense advantage in starting the cultivator the moment the rows can be distinguished. If necessary, set the cultivator very narrow, and go only once in a row, and as deep as it can be run without tearing up the sod too much. In a few days run closer to the plants; and if the rows are not absolutely straight, it may be necessary, in order to get closer to the plants, to go twice in a row. Less hoeing and more cultivating should be the motto of the corn-grower. Clean and thorough cultivation will often add one-third to the yield of the corn, and the land will be in far better condition for the following crops of grain and grass.

Potatoes.—We believe in early planting, especially for Peachblows and other late-growing varieties. But we have had good crops of Flnkes and other early kinds planted as late as the first week in June. Where potatoes were planted early and deep, a harrow run over the land just as the potatoes are breaking the crust, will destroy millions of small weeds without pulling up one potato in a thousand. The cultivator should be used as early, as deep, and as frequently as possible, and continued until there is danger of disturbing the roots or tubers.

Plaster or Gypsum may still be sown with advantage on clover, corn, peas, etc. Where the sowing costs more than the plaster, put on two or three bushels per acre; but when plaster is dear, we should not sow more than a bushel per acre.

Beans.—Drill in the beans on good, clean land, or on clover sod,  $2\frac{1}{2}$  feet apart, and 10 inches apart in the rows, and say 4 beans in a hill; or drill in the heans 2 or 3 inches apart in the rows. The latter plan sometimes gives the largest yield, but it is more work to hoe and pull the crop. Beans may be sown as late as the middle of the mooth, but the earlier in the mooth the better.

Root Crops.-If not already sown, heets, mangels, parsnips, and carrots should be put in at once. It is a waste of labor and expense to sow any of these erops, except the land is rich, clean, and mellow. Mangels will produce an immense quantity of valuable food per acre, bat they require the richest of land. A good plan is to mark off the rows 27 inches apart (or the width of the wagon wheels), and ridge up the land, and then put 25 or 30 loads of well-rotted manure per acre in the rows, spreading it evenly and breaking up the lumps; then split the rows and cover up the manure; then roll down the ridges and drill in the seed, at the rate of 5 lbs. per aere. As soon as the plants can be seen, ruu the cultivator between the rows, and thin ont the plants a foot apart. Many of the English growers prefer to dibble in the seed 15 inches apart, putting two or three seeds in each hill. This is done to save labor in hoeing. And it has another advantage-you can soak the seed for 24 or 36 hours before planting, thus gaining several days the start of the weeds.

Ruto-bagas need not be sown before the middle or end of the mouth. Same preparation as for mangels. Never sow them broadcast. Let the land be clean, mellow, and rich, and drill in the seed at the rate of 2 lbs. per acre, on the fresh-stirred, moist soil. Thin out to 10 inches or a foot apart. There is no remedy for the fly. Thick seeding, and pushing the plants rapidly forward by the use of superphosphate, will greatly lessen the chances of injury. On a small scale, something may be done by dusting slaked lime or plaster on and under the plants when the dew is on. Plaster is good for the crop, and lime will not burt it.

Corn for soiling.—Select land near the barn-yard, and make it as rich as possible. It cannot be too rich. Never sow this crop broadcast. Prepare the land, and mark it one way as for other corn; then drill in the seed, at the rate of 4 bushels per aere; or if you have no drill, plow out a shallow furrow, and sow the seed in the furrow—say a pint to fifteen or twenty yards. Keep the land clean and mellow by the frequent use of the cultivator.

Peas.—In sections where the "bug" affects the peas, it is sometimes customary to sow this exop the first or second week in June. The bug seldom attacks crops sown so late. But the yield is usually small.

Summer-fallows for Wheat.—On clover sod, not over three years old, a summer-fallow on clay ground is the best of all preparations for wheat. Break up the soil early in June. Harrow thoroughly, and continue to harrow or cultivate sufficiently to kill weeds; then cross-plow in July, and harrow, cultivate, and roll. Plow again the last of August, and drill in the wheat. Some farmers break up the land in June, and do not plow again, depending on the frequent use of the cultivator and harrows to keep down the weeds. On light, loamy soil, such treatment does very well; but heavy soil should be plowed twice or three times. An old, tough sod, broken up in June, does not make a good fallow for wheat. Better fallow it for oats, or break it up early in the fall, and plant corn in the spring.

Weeds.—If not already done, pull out red-root from winter wheat. Spud the thistles; pull docks after a soaking rain, while the ground is loose. Attend to the weeds in the fence corners and along the ditches, and around stone heaps, and suffer none to go to seed. The oftener thistles and other weeds can be mown in pastures, the better. The weeds generally rob us of half our profits, and often take the whole. Declare a war of extermination. Give up the silly notion that weeds cannot be killed and go at the business with energy and promptness, and success will attend him who perseveres. Recollect that it is the last blow that kills. If you stop short of this, your labor is thrown away.

Horses.—Feed liberally and regularly, and groom thoroughly. Do not work them too many hours. From 7 A. M. until 11:30 A. M., and from 1:30 P. M. to 6 P. M., if kept steadily at work, is long enough. Let them rest in the stable and not in the field. Give ent feed and allow them plenty of time to digest it. Nearly all our horse complaints come from indigestion—and this arises very frequently from working too hard and too soon after eating.

Working Oxen differ essentially from horses in their digestive organs. The horse has but one stomach and that a very small one, while the ox has four, and one of these is capable of carrying a large quantity of food that the ox can bring up and eat at his leisure. Oxen may be worked for this reason far more hours than a horse without injury; neither do they require such rich food. If they are allowed too much grain or meal, much of it is voided undigested. Feed them all they will digest, but it is a waste to give more. It is well to work them earlier and later than horses, and let them rest in the shade during the extreme heat of the day. They should be well cleaned every day with currycomb and brush.

The Dairy .- Let everything about the dairy be done with unvarying regularity and with scrupnlous cleanliness. Tolerate no noise, harsh words or rough treatment. Never hurry or run the cows, or excite them in any way. Milk with a steady, unceasing flow, and leave not a drop in the udder. Next to liberal feed, pure water and clean milking, we place in importance, petting the cows. A dairy farmer must be a gentleman. And the cows like to see a kind-hearted, sensible woman in the yard or stable at milking time! Let every dairy utensil be scalled every day. Mere washing in warm water will not answer. The water must be boiling hot. Nearly all the trouble of the butter not coming, bad flavor, etc., arises from ignorance of or inattention to the necessity of having the water boiling hot. A dirty vessel dipped in boiling hot water for a minute or two is far better than one that has been washed perfectly clean in merely warm water, but not scalded. The hot water penetrates into every pore or crack, and destroys the germs of the fungus that produces the mischief.

Sheep.—Tag all that need it, and wash the sheep as soon as the water is warm, but not earlier. Attend to the washing yourself and recollect that it will

be better (at least for the sheep) to allow the washers more warm coffee than whiskey. A little grain for a week or ten days before and after washing, will do much to prevent the sheep from taking cold-and it will start the oil sooper after washing, and they can be sheared earlier. If a shearer is rough with the sheep, kick him out of the barnfiguratively, of conrse. Fat, long wooled sheep should be fasted a few hours before shearing. Look out for foot-rot. On the first symptom of lameness, separate the lame sheep, and dress the feet of the whole flock with a strong solution of carbolic acid. There is nothing better than earbolicacid to eure the foot-rot, and nothing so good as a preventive. Lambs troubled with ticks should be dipped in a weak solution of earbolic acid-say a gallon of the crude acid to twenty gallons of water.

Swine.-Spring pigs intended for the butcher next winter should be favored in the distribution of the milk, and should have nearly as much corn or cornmeal as they will eat, with a few hours' run every day, if possible, in a good clover pasture. If intended to be kept until eighteen months old, it will not be necessary to give so much grain. If of a good breed they will thrive well on clover, and a pint of corn each, per day, increasing the quantity as they get older. Fall pigs should have the same treatment, with the exception of being allowed more corn. In our experience there is no way of making cheaper or better pork than allowing wellbred, early fall pigs that have been well wintered, to have the run of a good clover pasture and a liberal allowance of corn during the summer and autumn. See that all the pigs have abundance of fresh water. If any are taken sick separate them from the rest of the herd. Some farmers say if they feed corn to pigs in summer they eat but little clover. This is because the cora is not fed regularly, and the pigs are constantly expecting the corn. Feed regularly night and morning, and none at any other time, and you will have no trouble.

Haying.—Clover will be ready to cut towards the last of the month. See that everything is ready.

Implements and Machines.—We probably shall not need sleighs before next winter! And it would be well to stow them away under cover for the summer. And so with all other tools and machines that will not be needed until winter. Wagons, cultivators, barrows, plows, and other implements in constant use, should be kept housed as much as possible—or failing in this, wash or paint them with crude petroleum. Never use an implement or machine without first seeing that all the bolts are tight. Do not run a wagon with a loose tire.

A Grindstone with a treadle, or better still, one which can be run by horse-power, is iudispensable to good farm management. A dull seythe, a blunt spade, and above all, a dull, rusty hoe, absorb many hours of hard labor. Better griad a hoe all away in a season than use it dull for two days.

### Work in the Horticultural Departments.

The abundant work which the month of June brings is amply rewarded by the many beautiful flowers which the warm days bring forth, and the harvest is also a great attraction, the beginning of which will appear in the shape of the strawberries, soon followed by the other small fruits. Seeds, if sown now in the well warmed soil, will germinate very rapidly, and a good crop of most varieties of vegetables may still be obtained this season.

### Orchard and Nursery.

Trees set this spring will need constant care in rubbing off all bnds that start from the trunk, and are not wanted for limbs: if trees become bent by strong winds they must be tied up to stakes or else reset. Young trees may be snecessfully transplanted a short distance, even when in full leaf, if the roots are not dried by the snu.

Pruning.—This mouth is preferred by many for pruning bearing orehards. Cover the wounds with shellae varnish.

Thinning, though seldom practised on large trees

is of great benefit, as the tree will continue in bearing longer, and the fruit is much finer.

Cultivation.—All young orehards do better if the ground is kept cultivated, and if any crop is raised between the rows, supply a plenty of manure.

Seed-beds of evergreens and other forest trees will need attention; they ought to be kept free from weeds and furnished with a skuding of laths to protect them from the sun.

Insects.—Look out for insects of all kinds. When the tent caterpillars appear, destroy their nests.

Curculio.—The best remedy for the curculio is to place a sheet under the trees and shake the insects into it, when they can be collected and destroyed.

Slugs, upon pear and other trees, may be killed by dusting the leaves with lime, ashes or dry earth.

#### Fruit Garden.

Strawberries ought to be mulched now, if not already doue, to prevent the growth of weeds as well as to keep the fruit free from dirt. If the hay or straw used in mulching can be run through a hay entter, it forms a better material than when uncut. Plants set this spring ought not to be allowed to bear until the next season.

Grape-vines set this season should be allowed to grow but one shoot. Rub off all other buds and keep the single shoot tied up to a stake. Young bearing vines should not ripen more than two bunches to a shoot, as the quality of the fruit will then be much better. Wherever mildew makes its appearance use sulphur, applied by a bellows.

Currants ought to be heavily mulched, as it saves a time in hoeing during the busy season.

Raspherries.—Allow only three or four canes to grow to each stool, unless it is desired to propagate the variety.

Blackberries.—Canes must not be allowed to grow more than four or five feet; the pinehing induces the growth of side shoots, and these should be stopped when eighteen inches in length.

### Kitchen Garden.

Weeds will require the constant use of the hoe and rake, and if attended small it requires much less time to destroy them than when they are older. Where the rows are wide enough to admit the cultivator, the horse can be used with good effect.

Seeds.—Many seeds require to be sown this month for a succession, as well as for late planting.

Asparagus may be cut until green peas are ready for the table; stop cutting, and spade in a dressing of manure between the rows.

Beans.—Bush varieties may still be planted for late crops, and the Limas started in the hot-bed may be set out. Put poles to all running varieties.

Beets must be thinned out as soon as they are two or three inches high; the thinnings may be used for greens; many prefer them to Spinach.

Cubbages from cold-frame plants will be ready for market this month. Set out plants from the seedbeds. Seed of late varieties for winter use may be sown. The Savoy or Curled varieties are much superior to the other sorts for home use.

Currots need great care in weeding, and those sown early need to be thinned ont. Seed may still be sown early this month and make a good crop.

Cauliflowers.—Set out plants in fine, rich soil, and keep well hoed.

Celery may be planted on ground from which early cabbages were taken. The plants in the seed beds ought not to become drawn, but set out when two or three inches high in another bed, or where they are to grow.

Corn.—Plank early varieties for use late in the full, and keep that already up free from weeds. Plant a few rows of the pop-eorn.

Cucumbers.—Set ont plants started in the hot-bed, and keep free from insects by the use of ashes or dust sprinkled upon the plants when covered with dew.

Egg-Plants need a rich, warm soil; they amply

repay a liberal supply of manure, and a watering of liquid manure ouce a week is of great advantage.

Lettuce.—Transplant from the seed-beds; seed may be sown in a cool and partially shady spot.

Melons need the same care as cucumbers.

Onions need a great deal of attention in weeding. A push-hoe is a very useful implement to loosen the soil and destroy the weeds. Give the bed a dressing of salt or ashes.

Pursnips must be kept clear of weeds until the tops cover the ground. Seeds planted early this month will give a fair crop in most localities.

Peas may yet be planted for late use, though they are usually affected by mildew. Ground from which the early sorts have been removed can be planted with cabbages or celery.

Radishes can be sown now for late use, though they are usually tough and stringy put in so late.

Rhubarb should not be cut severely after the small fruits begin to ripen, but allowed to rest; give a supply of manure; keep all flower-stalks cut.

Ruta-bagas.—Sow this month, and when the plants are well up, dust with ashes to keep off insects.

Salsify, if sown now, will produce fair roots, but not so large as that sown earlier; the treatment is the same as for carrots.

Spinach.—Spade up the ground where the early crop has been taken off, and if the soil is not too dry, sow a bed for late use; the later sown crop is very liable to rnn to seed. New Zealand spinach is the best for late.

Sweet Potatoes should be plauted on ridges as recommended last mouth. Keep the ground clear of weeds.

Tomatoes.—Set out plants and keep them well cultivated and clear of worms.

#### Flower-Garden and Lawn,

The cultivator is supplied with pleaty of flowers from the garden, but weeds also make their appearance in great numbers, requiring constant care to keep them down. The laws needs to be cut at least once a week, and if weeds make their appearance, destroy as soon as seen.

Bulbs which have finished flowering ought to be taken up and put away in a dry place, and the ground occupied by bedding plants or annuals.

Annuals.—Those sown in the seed-beds must be transplanted into fine, rich soil.

Herbaccous Perennials may be set out early this mouth, if not already done; divide and reset those that have done blooming.

Tie up all plants which need support, and supply neat labels to all requiring them.

### Greenhouse and Window Plants.

Plants which are to remain in the greenhouse during the summer require shading, and this is best furnished by whitewashing the glass.

Azaleas and Camellias ought to be put out in a shady place, and if they can be plunged in the soil, it will save a great deal of time in watering during hot weather.

Insects must be destroyed whenever they attack plants in the greenhouse,

Soil.—Now is the time to prepare a stock of soil for use next winter and spring. Pile up sods, and if possible, empty house slops upon the heap turning it over once in two or three weeks.

#### Commercial Matters-Market Prices.

Gold has been quoted firmer, since our last, on a more active inquiry, chiefly for Custom House and export purposes. The quotation, May 15, was 111%.... The Breadstuff movement has been up to a fair average, though checked by the break in the Eric Canal, near Rochester, which delayed the arrival of fresh supplies from the Lakes. The receipts by rail have been quite liberal of Wheat and Corn, though moderate of other articles. The home trade demand has been good, though mostly in a

jobbing way. The export call has been mainly for Wheat, Corn, and low grades of Flour. Prices have been variable, but close steadily, as a rule. The advance in ocean freights has been against the export movement. ... Cotton has been more active, closing strong and buoyant in price... There has been a moderate business reported in Provisions, generally at lower rates... Wool has been offered sparingly and has been in fair request at firmer prices.... Hay has heen in better supply and quoted cheaper, on a moderate trade. Straw has been scarce and in demand at an advance... Hops and Seeds have been quiet... Tobacco has been rather more sought after at our quoted rates.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending May 15, 1871, and for the corresponding month last year.

Beef Cattle.—With an average of 742 more cattle per week than were received the previous month, and 881 above the average for the corresponding period of 1870, the market rules weak, and prices have a downward tendency. The fine eorn crop of last year at the West, now shows itself upon the stock coming forward. There are abundance of ripe cattle without waiting for the grass to fatten them. In fact, it is a common remark among butchers that cattle never did so well at this season of the year. There is one great drawback to the butcher, however, and that is the low price of rough fat, so that the more a bullock has, the more are the other portions reduced in value. High prices are not looked for this spring. Taken as a whole, the market does not differ materially from what it was five weeks ago, only we are not getting so poor cattle as were then sent in. Even the Texans are fat, and the scallawag, State, dry cows, old oxen and stags, are kept at home, as it does not pay to send them here.

Below we give the range of prices, average price, and figures at which large lots were sold:

Apr. 17th, ranged 11 @15½c. Large sales 12½@14 c. Av. 12½ do. 24th, do. 10½@5½c. do. dc. 18 @14 c. do. 13½ May 1st, do. 11 @15 c. do. do. 12½@15½c. do. 13½ do. 8th, do. 11½@15 c. do. do. 13 @14 c. do. 13½ do. 15th, do. 11 @15 c. do. do. do. 33 @13½c. do. 13½

Milch Cows .- The offerings of fresh cows and springers have been light, the demand not calling for Trade has ruled very dull until within the past week, when it has picked up a little. If only good cows were sent here, they would sell, but the stock runs very The presumption is that good cows are wanted at home for the opening of the butter and cheese season, while nearly worthless stock is sent here for sale. Common cows are quoted at \$50@\$60 each; medium to good, \$70@\$80, with a few prime at \$90@\$1.00..... Calves .-Here we have a great increase in numbers, the present heigg the season of their greatest abundance. The arrivals would be still larger but for the low rates which induce farmers to hold them back. Those known as "buttermilk calves" will only sell at 4@6c. per lb., live weight, while fair to good calves from Central N. Y., bring 7@Sc., and those from near the city. S@Sc. A pen of 92 State calves, 127 lbs., just sold at 7½c... Sheep and Lambs .- Spring lambs are now coming forward in considerable quantities; and have declined from 18 to 20c. per lb., to 12@15c., some poor ones selling still low-There is not much difference in the price of sheep, from what they were quoted last month. Nearly all the stock is now shorn. Wool skins help materially to sell a lot of sheep, the pelts being in good demand. Ordinary to fair sheared sheep sell at 5@64e. per lb., live weight, good to prime at 61/2@7c., with a few extras at 714c. Lambs are quoted at 11@15c.—the latter price for 55@60 lb. Jersey stock....Swine.—Receipts have been unusually large for the spring months, and trade has dragged heavily at constantly declining rates. Most of the hogs are first killed and then sold, but live hogs are worth 5%@5%c., with city slanghtered at 7@7%c., being a falling off of 1c. per lb. during the mouth.

The Dollar Steam-Engine-Give it to the Boys!—In a former paper, we described and illustrated this useful toy, and strongly commended it, after a trial of a few weeks. After a much longer experience, we can still more strongly commend it, not only for small boys, but for grown up ones, too. confess to baving played with it not a little ourselves, and to have helped our boys to add sundry little mechanical contrivances. It is a perfect little engine that will not only go itself, but has power enough to drive other toys. It gives pleasure to the operator, while it conveys instruction and develops mechanical skill. As previously announced, we have seenred a supply for pre-minus, one being given for three subscribers to American Agriculturist, at \$1.50 each a year, or for two subscribers to Hearth and Home, at \$3 each a year. And to make it more convenient, we will, for a month or two, give one of the engines for one subscriber to each of the papers, at \$4.50 a year for the two. It will be mailed anywhere in the United States and Territories if 36 cents be sent for purpose of postage. Any subscriber, however, can have one for \$1.00 at the Office, or have one mailed, postpaid, to his address for \$1.36. Nothing is needed to set the engine in motion after it arrives but to put water in the boiler, and a little alcohol for the lamp under it.

### AMERICAN AGRICULTURIST.

ANNUAL Sunsceiption Terms (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upward, \$1 each. Papers are addressed to each name.

HEARTH AND HOME: \$3 a year for less than four copies: Four to nine copies, \$2.75 each: Ten to nineteen copies, \$2.50 each; and twenty or more copies, \$2.25 each. Both Papers sent to one address for \$4.00 a year.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

## LAST CALL.

Close Up the Ranks.

26 TWENTY-SIX DAYS. 26

N. B .- The General Premium List will be withdrawn at the end of June, which leaves twentysix more working days to fill up Premium Clubs under way, and to open and complete new lists.

N. B .- A few days grace will be allowed for those living at a distance, so as to place all canvassers on a par.

N. B.-In hundreds of cases a few more names will fill out a list partly made up already, and secure a valuable premium. This mouth is the time to do it.

N. B.-We are anxious to have all who have worked for Premiums, receive some rewardand though we can not vary from our general offers, we hope all who have uncompleted lists will fill them this month, even though it be a boss for us to have them do so.

N. B.—Our Premium Secretary has a record of every name sent by any person for a premium list, and can tell at a glance just how each canvasser's list stands.

N. B.-N. B.-Last June many new premium clubs were formed, and the premiums secured. It can be readily done this year. In several cases, such large premiums as the Cyclopedia, etc., have been obtained in four to six days of canvassing.

N. B.-N. B.-N. B.--About one subscriber a day (or evening) for June, will secure any one

of several large, valuable premiums. See numbers 1-2-16-18-19-35-43-48 51-53-58-72-73-81-83, and 89...A few more names will secure Nos. 33-42-51-76-81-85-90.

N. B.-N. B.-N. B.-About half a subscriber a day (or evening), that is one once in two days, for June, will secure Nos. 5-15-17-22-23-24-26-27-28-31-57-68, or 69..... few extra names will secure Nos. 14-18-19-36-47-50-55-56-62-65-70-71, etc.

N. B.-N. B.-N. B.-About two subscribers a week will secure Nos. 6-7 -10-20-21-49-59 and 102....About one subscriber a week will secure one of several good articles, such as Nos. 8-9-11-29-63-64 and 101.

N. B. - IMPORTANT. -About half the above number of subscribers for Hearth and Home. will secure the same result-or part for one paper and part for the other.

N. B.-CONCLUSION. - Read last few paragraphs, and try your hand at it this month. The premiums are firstrate-they are ready for you-and you can get them with a little effort, this month!...TRY IT.

### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But ... (b) Tell us with each name or list of names sent, that it is for a premium . . . (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have all of this month (June), to fill up your list ... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts ... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit money in Checks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk,

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50.]

N. B .- In all Premium Chubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39.

Table of Premiums and Terms. American | Hearth For American Agriculturist, Agriculturist. and for Hearth and Home, Number of Sub-scribers required for the Year 1871. Open to all-No Competition. at at \$1.50 \$1.

11 9—Proket Knife (do. do.). \$2 in Portect Hart's best Silver-plated. \$5 in Portect Hart's best Silver-plated. \$5 in Portect Hart's best Silver-plated. \$5 in Portect Plate (do. do.). \$3 in Portect Plate (do. do.). \$3 in Portect Plate (do. do.). \$4 in Portect Plate (do.). \$4 in Por 31 17

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums; Nos. 8 to 11, 21 to 24, 27, 28, 29, 47, 48, 63, 64, and 66 to 100 inclusive, will each be de-liverest FREE of all charges, by mail or express (at the Post-affice or express office nearest recipient), to, any place in the United States or Ter--The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified. (Steam-Engine mailed for 36 cents extra.)

Full Descriptions of Se Premiums sent free to ALL Applicants.

containing a great variety of Hems, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:-Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Morrey Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly sais, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

**Bone Mills.**—"D. P. M." Bones require a great deal of power to grind them. We know of no satisfactory horse-power mill.

Bone Spavin.—A. M. Smith, Washington, Conn. If your horse is not lame with the spavin, leave him alone. If lame, apply a good blister and turn him out for about a month. If this fail, the actual cautery is to be applied.

Warts on Horses.—E. H. Hallis, Newton Co., Ind., has a young horse which has upon his breast what he takes to be a wart, as large as a silver dollar. If the trouble described is really a wart, the application of nitric acid repeated for two or three days, will remove it. But if it is not a wart, he had better call a Veterinary Surgeon, as otherwise that application may produce much trouble.

Which Breed of Cattle is Best?—We are asked which of the four breeds of cattle is the best.—Jersey, Devon, Ayrshire, or Shorthorn,—which combines the most good qualities for a common farmer? This depends entirely on what kind of a common farmer it is. If a butter-maker, the Jorsey is the best, by all odds; if a breeder of working cattle, the Devon; if a producer of milk for sale, the Ayrshire; and if a beefmaker, the Shorthorn. Each is best for its particular use. If a combinative cow is wanted, one whose male calves will make fair oxen or beef, and whose milk will be abandant, yet good for butter, the Ayrshire will generally be the best, but more money will be made if that breed is selected which is best adapted to one particular industry—and that industry well followed.

Milk Fever.—A Wisconsin correspondent writes of a cow belonging to a neighbor that was attacked with milk-fever one day after calving. She was found just at night unable to rise—tongue protruding, eyes glassy, and it was not thought that she could live until morning. They gave her a dose of physic consisting of one-half pint of soft soap, and one-half pint of vinegar,—mixed at the mouth, well shaken, and poured down. To their great astonishment they found the \_w up and eating the next morning. They call this 'the nearest a miracle they have ever seen." It is certainly a remarkable cnre, and we know by experience that even a violent dose of physic is usually ineffectual in milk-fever. An onnce of prevention is worth a pound of soap and vinegar.

Corn Fodder.—Mr. F. T. Baldwin, of Patterson, N. Y. (referring to the remarks about curing corn fodder in Ogden Farm Papers, No. 16), says: "I have raised some every year for about 20 years, and have never had any trouble in curing. I sow from May 10th to June 10th, and commence feeding the dast days of August. I find at that time the stalks have their full growth. After I have fed as much green as I wish, I go into the field and with both arms reach around and bind tight at the top, letting the commencement of the stout stand fast upon the hills or drills—then cut and stout around until I have as much as I can bind at the top. I have never

lost a stalk by being moldy or damaged in any way. The stalks on the inside will remain green, and retain all the sweetness as when first cut. My theory in regard to putting up in this way is this: the stalks that are bound without cutting keep the balance of the stout spread out, and the air has free circulation upward through the stout which prevents mold or damage. On moving the stalks to the barn, unbind the stout and tie up in sheaves. We usually make three sheaves from one stout."-This is a very intelligible description, and we (O. F.) shall give the recommendation a fair trial. We infer that it will not do to commence making the stouts (stocks) before the middle of October, when the stalks will have become somewhat dry, and this will entail some loss in quality. Still, if it will secure good keeping, the loss will be more thau made up.

SUNDRY HUMBUGS.—We are right glad to find the new contributors to this department less numerous than at any time before, for a long time. Only twenty new schemes, or names, require special notice this month. Very many who have written us, or sent contributions of circulars within the past four weeks, will find them already referred to in our previous numbers.

.... A Scranton (Pa.) subscriber sends a circular of a

\$5 Sewing Machine from Nassau-st., N. Y., and says a neighbor sent the money and received one weighing 1% lbs., io a box 8 inches square, and 5 inches deep; that it will sew a little, but on trial it does not prove to be worth 50 cents (he might have said not worth 5 cents!) .... We have circulars offering 52,000 tickets at \$5.00 each, in a "Grand Gift Concert and Distribution, for the benefit of the Foundling Asylum of the Sisters of Charity, in the City of New York, and the Soldiers and Sailors' Orphans' Home, of Washington, D.C., to be held in Washington City, June 7th, 1871." While all such affairs, even when genuine and as fairly conducted as can be, are wrong in principle, and bad in their influence upon all concerned, this one has several special objections. To make up the pretended \$260,000 of prizes offered, the large block of Eric R. R. stock put in must be reckoned at par, while it is selling in open market at about one-fourth of this snm! As a "vacant lot " is usually 25x100 feet, we should not like to take shares in the \$17,500 of vacant lots in Govanstown, Md., at \$2,500 each; nor in the \$80,000 to \$100,000 of other " probably similar valuation. We should like to know what part of the proceeds go to the Washington "Home," and what part to the N. Y. Asylum. Further, would we have any chance, if the whole number of 51,999 other foolish people should not be found to take tickets at \$5 each. Five dollar bills must somewhere be plenty-fools ditto—to afford any chance for such an enterprize!.....
The N. Y. "Agent" of the above advertises himselfalso
as "Agent" of the "Cosmopolitan Benevolent Society of California," which proclaims 100,000 theatre tickets at \$2.50 each, each ticket having one chance in fifty at some gold prizes. This differs no whit from the old lotteries suppressed by law, except in giving less chance for success to the ticket buyers....The "\$765,000 in Cash Gifts" of C. B. Taylor & Co., 78 Broadway, can not need any attention from us, among our readers. If distant Editors publish the "direct advertisement," we notify them not to ask as to help collect their bills-nor will Geo. P. Rowell & Co. help, as they give Taylor & Co. no permission to refer to them. N. S. (nuff said)......
Golloday's "Drawings" at Danville, Ky., is another of the schemes to blind and catch greenhorus.....Edgerton & Co., 703 Second ave., N. Y., is writing letters about Havana Lotteries," and as a blind, offers to go in on shares in the purchase of tickets. His share will of course be all the money that comes to him from his dupes .... A so-called "American Engraving Company," at a small town in Connecticut, has the impudence to send an advertisement to our weekly journal, HEARTH AND HOME-offering engravings at \$1, and with each a ticket giving a chance at \$200,000 of gifts to be distributed in July. We refer said "Company" to humbug columns in this and previous numbers. charge nothing for advertising such enterprises. How could we have the heart to do it, when they are of such inestimable benefit to the dear people!...

The "Foot of the Rocky Mountains" must be a won-

The "Foot of the Rocky Monntains" must be a wonderful place, if anybody can find it. At least, so thinks a New York "nedicine man" who, now under one name, then under another, and then another, professes to have been a Missionary there, and to have discovered a wonderful plant whose juices cure almost every disease that flesh (especially lung-flesh) is heir to. An old woman with a wonderful his-story, and a changing face and name, graces the frontispiece of this doctor's wooderful—wonder-telling-pamphlets. We can but feel sad to know that there are poor dupes enough to send money sufficient to keep this man at his swindling trade.... "Married" or "Unmarried," we advise you to burn all circulars coming from John H. Stevenson, of Nassan-street, N. Y. Neither he nor any other man living can do what he pro-

poses. So keep your \$10 for some good purpose....Put no faith in any "Potato Bug Bestroyer," advertised in Michigan or elsewhere. If any man believes he has a sure thing of this kind, let him go into the culture of the tuber and make the money himself. We can't afford a "stamp" for any such tract, though earnestly invited to do so by a lot of circulars on hand.....

Post-masters and others should be careful about furnishing any lists of names to parties in N. Y., and elsewhere—no matter what the pretense, or what the compensation offered (though never paid). These names are almost invariably used for improper or hambug purposes. We have a dozen or more of different circulars of this kind sent out through the country, every one of which is a swindling dodge.... The "Arabian Secret to restore Verility!" We suppose the ignorant swindler who advertises this from Philadelphia, at \$5, means "Virility." He better take a dose himself, and then go to Arabia and sell his medicines. Our people don't want any such verility or virility as abounds in that country.....

The pretended counterfeit money operators are at workbut not so briskly. Some of them have taken to sending written instead of lithographed letters. The most annoyng rascal in this line is one who pretends to be Day & Wallace, 143 Fulton-st., N. Y. He, by theft, or by reprinting, or by other means, has secured a lot of letter envelopes of Orange Judd & Co., and sends them to distant parts of the country enclosing his swindling circulars. We could expect nothing else. Those who will lie and cheat will not stop at theft. "Milton & Brother," Those who will new No. 307 Bleecker-st., N. Y., is one of those chaps who plead with young men to take more of the stnff, or "come and get it at the Factory, No. 10 Fake street, where you will see over the door, Harris & Brother, You ring three times, and when you Fancy Goods. come in, introduce yourself. You need not be afraid, for I pay the Police to inform me of all coming trouble."-As there is no Fake-st., of course this is all a ruse to get you to send money. Among the new names in this line, we find Chas. A. Roberts and Jos. G. Perry, both at 688 Broadway; J. B. Page & Bro., 200 Broadway; John Bsker, 5 Catherine-st., etc.

Sage's Vinegar Recipe.-Vinegar is ordinarily produced by allowing cider, alcoholic fruit juices, as wine, sugar containing fluids, as molasses, sweet-wood saps, and the like, to stand for a long time exposed to the air. The process is greatly hastened by various methods securing greater exposure, the more common one being to allow the liquids to trickle down through barrels filled with shavings, to which free access of air is given. Sometime since F. I. Sage proposed arranging a series of gently inclined shelves, to have the fluids drip from one to another, spreading over the surface of each, so as to give large exposure. With a great number of these shelves, the same end would be seenred as in the use of the shavings. The plan was submitted to Prof. Johnston, of the Wesleyan University, and Prof. Silliman, of Yale College, and they gave their approval of the idea without specially examining any apparatus, as we understand. Wherenpon, Mr. Sage advertised his process largely by newspaper and circular, offering the secret for \$5, first taking a pledge of secrecy from the purchasers. His circulars gave such wonderful claims for the great value of the process, the immense profits to be made, etc., that multitudes of persons were led to invest \$5 each. They probably did so, largely on their faith in the recommendation of the worthy Pro-We have yet to hear of the first one of all these purchasers who has put the process to practical, profitable use-though a few may have done so. One great objection to Mr. Sage's circulars is the claims he puts forth as to the profits to be surely derived, and the simple, cheap, and easy adoption of the process by any and every person. Last October, we stated in a P.S., that we had received (too late for insertion then) a withdrawal of the recommendation of the above-named college Professors, and that they had so notified Mr. Sageadding, that "of course he would not send out any further cliculars with their names as endorsers, supposed that that would end the matter. But it would seem that this is not the case, as we learn that the Professors are still greatly annoyed by letters concerning Mr. Sage, and we are requested to publish the following, which speaks for itself:

A CARD.

"The undersigned hereby give notice, that their certificate to Mr. F. I. Sage, of Cromwell, Ct., concerning his vinegar process, was withdrawn many months ago, and he forbidden longer to use our names, because of his very objectionable practices connected with it that came to our knowledge. We are driven to this course, as we learn that he is still distributing his circulars through the mails with our names attached. Beware of them.'

John Johnston, Prof. Nat. Science, Middletown, Ct. B. Silliman, Prof. Chemistry, etc., New Haven, Ct.

May 3d, 1871.

Messrs. B. Fox & Co.-Our remarks concerning this firm last mouth were based upon the information then obtained, and justified by it. A member of the firm has called upon us with several references, given us their actual place of business (369 Canal-st.), says they intend to do a straightforward business, and challenges proof that any dollar intrnsted to their firm has not been appropriated to the purposes directed by the sender. He disclaims any intention or willingness to deal in the articles to which we objected, says he was not aware of their being in the catalogue, and he promises that they shall be stricken out and not supplied. have no desire to interfere with any legitimate husiness, and will not; and so long as Messrs. B. Fox and Co., (which is the real name of the firm) or any other firm or individual, do, as they assure us they will do, we shall find no fault. But we shall always stand ready to expose and call to account any one sending, or offering to send, the "French" or other appliance that professes to diminish population, or to render the practice of immorality safe, or any books, cards, or pictures that the chaste should not purchase, or marked playing and fancy cards, and the like.

Watering Tomatoes.—An amateur, who proposes to compete for Col. Waring's hundred dollar premium for the largest tomato grown this year from his seed, asks if it is advisable to water the plants with manure water during fruiting. If any manure is used at this time, it should be exceedingly dilute, and we would prefer to use it only during the early growth; but the most abundant watering should be continued throughout the whole period of fruitiog. Nothing does so much to make the fruit large and smooth as plenty of water—applied after the sun goes off in the evening.

That Mexican Saddle.-We have received many letters complaining because the Mexican and McClellan Saddles, pictured in our April number, have iron instead of wood and leather stirrups. Our Horseback Editor replies that in directing our artist to go for his models to the best wholesale saddlers in New York, he did not apprehend that such a mistake would be made. But evidently people who sell saddles in New York are different from the people who ride in them on the plains. Ose correspondent, writing from Nevada, objects to our preference for the English saddle, saying, "I profess to be a first-class rider, but I could not be hired to get on a had horse with an English saddle." The writer of our article-hy no means professing to he a first-class rider, has had some twenty-five years' experience in the saddle, including nearly four years of steady cavalry service in the Southwest, and he has been obliged at times to become accustomed to all sorts of saddles. He has not yet seen a horse he would not willingly mount, and could not stay mounted on, with a English saddle. He would not willingly mount a back-leaper or a runaway with any other. Possibly if our correspondent had had twenty years' practice in English pig-skin, he would change his opinion.

Bloody Milk .- Mr. Job Osborne, of Farmers' Institute, Indiana, has a cow, a large milker, that gives bloody milk out of the two front tents. He asks for a remedy.—We have had no personal experience with this difficulty. Allen says, in his American Cattle, "Bloody milk generally comes from an injury to the udder or teat by inflammation, a bruise, or wound, and sometimes from disorder in the interior part of the nd-der. \* \* \* The effected teat and udder should be bathed with some soft emollient, as in garget or puerperal fever. An ounce or two of sultpetre, dissolved in water, may be given as a dose. \* \* \* Such difficulties, however, seldom occur, and are usually overcome without difficulty in a few days by careful usage. Should the udder persist in yielding such disordered milk for any considerable length of time, and through a majority of the teats, it must be a question of profit to the diaryman whether to dry her off for the shumbles or still retain her in the dairy, or for breeding in hopes of n better prospect in another year."

Double Head of Rye.—J. H. Shook, Long, Ill., sends a double head of rye. We have seen similar specimens several times before. We shall he glad to know if the seed from it produces any double heads.

High Priced Seeds.—"A Subscriber" nt Three Rivers, Canada, complains that he paid 50 cents for a packet of choice Pansy seeds, and received a parcel containing very few seeds, and he looks npon the transaction in the light of a humbug. Those who purchase novelties must expect to pay high for them. Many foreign seeds sent out by our seedsmoo are in the original little packets put up ahrond. The dealers generally charge in proportion to the cost. Some seeds cost many times more than their weight in gold.

Hoop Poles.—F. W. Hall, New Haven, Conn., says: The kinds principally used are walnut, all kinds of oak, and occasionally a few white birch. Trim them ont close, and cut them off twelve and fourteen feet long, then split them, and hew or shave them down smooth, and put twenty-five in each bunch. Bind them with rope-yarn, and they are ready for market.

Large Eggs .- Referring to a notice of some large hen's eggs, given in the May Basket, F. T. Simpson, Wilkes Co., Ga., writes: "More than two months ago Mrs. S. took from a hen's nest an egg weighing 6 oz., and about three weeks after found another that weighed 5 oz., and since then has brought in four or five, which were not weighed, but much larger than the average size of hen's eggs. The first two were boiled nntil The larger, npon opening, had two coatings of white or albumen, one enveloping the other, and two distinct volks, joined together by a ligament of an inch long by 14 of an inch wide. Had this egg been hatched, the product would have been twin chickens, joined together after the manner of the Siamese twins. The smaller had two whites and two yolks, which were not united, but entirely surrounded by the whites."-We have found all the very large eggs that we have examined to be either double volked, or, as sometimes happens, a completely developed egg, with its shell, within another shell, and surrounded by albumen.

Fattening Cattle and Hogs in Illinois.—A correspondent writes: "As there is considerable talk in regard to prepared food for cattle and hogs, I will give my plan for getting the most out of a bushed of corn. In the first place I feed the corn to cuttle, and have hogs to follow, and the feed they get is second only to cooked corn; then, after the cattle go on grass, I put the hogs on clover with corn, and the green food appears to help digest the corn, so that the hogs get the same amount of nourishment out of it that they would if steamed."—The plan of giving hogs a good clover pasture is excellent; and the reason assigned is the true one, "The green food appears to help digest the corn." And would it not be well to give the cattle some corn with their grass for the same reason!

Colorado Agricultural Society.—
The Deuver Tribune of April 22, gives the following as a list of officers: President—II. B. Bearce; Secretary—
Fred. A. Clifton; Treasurer—Frank Palmer. The next Aonual Fair is fixed for the 12th September, extending to the 16th, inclusive, but the place of holding it is not mentioned.

Chicken Cholera.—M. M. Sheets, Holden, Mo., finds this disease taking off his laying bens and young chickens. It is malady respecting which little is known, though as used in such cases all sorts of nostrums are prescribed, the paramy being formidable in proportion to the ignorance of the would-be doctors. We have gathered all the information respecting this disorder we could procure, since it prevailed a few years since at the West. There is a very malignant type that is almost always fatal. A milder form appears in some districts that does not destroy more than half or one-third of the birds attacked. Alum water made pretty strong, given for drink and mixed with their soft feed, has seemed to be the hest medicine in many cases that has been reported.

Potato Bug.—M. D. Settler, Dayton, O. The insect sent is the Colorado Potato Beetle. The best known remedy is the virulent poison, Paris green. Mix with eight or ten times its bulk of floor, and dust the vines. Use carefully to avoid accidents.

Spurious Eggs for Hatching.—A correspondent asks if eggs hought for dark Brahmas, of a dealer who advertised in the Agriculturist, were genuine. He says they produced chicks of various colors, and some had no feathers on their legs.—If the color is not a dark brown at first, with two stripes on the back running from neck to tail, and with legs and first and second toes well feathered, then the eggs were not dark Brahmas. At four or five weeks old the color should incline a little toward grayish, and the stripes become chocolate. It is charitable to suppose that the advertiser meant to act fairly. You should write to him to correct a mistake if he has made one. If he is a cheat, we shall upon evidence exclude his advertisement. The Agriculturist always fights humbogs of whatever sort, and endeavors to insert only trustworthy advertisements.

**Double-furrow Plow.**—Z. Acher, Chester Co., Pa. We know of no plows of this kind in this country. The article was given to call attention to an implement now popular in England.

Corn Husking Machines. — M. C. Carr, of N. H., wants to know more about the corn husking machines alluded to in our report of the Trial of Implements at the last N. Y. State Fair. We gave all the essential facts. We do not regard them as a complete success at present. All that can be said is that they "promise well." We hope and believe that they will be improved, and that in a few years we shall no more think of husking corn by hand than of thrashing wheat with a flail. We will keep our readers informed of all improvements that may be made in the huskers.

Discased Fowls.—E. W. Irish, Amherst (State not given), has lost half his grown fowls by a disease with the following symptoms: the legs become weak, then the head drops to one side, and comb turns pale.—Put the fowls in a dry place. Feed potatoes, hoiled, mashed and mixed with an equal quantity of scalded meal, adding a pinch of cayenne to each fowl. Put scraps of rusty iron in their drinking water. If too sick to eat or drink, give them soft hay to rest on, and let them alone.

Dark Brahma Fowls.—J. M. Williamson, Butler Co., Pn., aska: "Are the dark Brahma fowls a good breed to raise for market, and good layers?"—They are large, casily fattened, and good winter layers, but will not produce so many eggs in a year as some of the non-sitting breeds. For the table they are rather coarse-fleshed, but still of passable flavor. They have the merit of being very hardy when chickens, and easy to rear in great numbers.

Peas on Sod Land.—"G. N. L." Instead of plowing under the peas, we should prefer to sow them on the farrows as left by the plow, and harrow in. The variety we usually sow is the common Canada Creeper. Should be glad to know if there is a better variety.

Will Clover, Peas, and Beans, produce milk containing more cheese than grass and corn? Such is said to be the case, from the fact that the former contain about double the quantity of nitrogenous or "cheese-forming" material than the latter; but we know of no satisfactory proof, and we should, for reasons we have not now time to give, expect more cream from cows fed on the peas, etc., than from those fed on corn, etc.

Will Bells on Sheep Frighten away the Dogs?—R. H. Martin writes: "Our sheep have a range of 50 acres, one-half of it pine finber. They never stay at the house nights, but go to the pines. They have a bell on them, and though several sheep have been killed in the neighborhood by dogs, my sheep have not yet been disturbed. Is a hell a reliable safeguard?" It is unquestionably a great help, but cannot always hedepended on. Put a hell on the sheep and some lead in the dogs, and use all your influence to get a law enacted taxing the dogs, and see that it is enforced.

Work.—Mr. Snith, of Wisconsin, asks us how he shall feed bis horses, and remarks: "I feed them according to their work, and they are in splendid condition. I am a great hand to pet horses, and like to have them in good condition for their work."—That is right. Nothing is more aggravatiog in a busy time than an inefficient team. It is economical to have good horses (or cattle), and take good care of them. Feed regularly, groom thoroughly, and work steadily; these are the only rules we can give. "Feeding according to their work" must not be carried to extremes. When a horse is overworked, overfeeding will not help him; and it is almost certain to bring on indigestion, and this leads to colic, and, if persisted in, will probably end in death. Many a good horse is lost in this way. We know farmers who do not give their horses any grain on Sonday because they are not doing any thing; whereas the horses shoold, if any thing, have more grain, because they have time and strength to digest it.

Tree-Planting in Illinois.—A bill is before the Illinois Legislature offering a bounty for plantations of forest-trees. As the bill has not yet become a law, we do not give the conditions it proposes. It is believed that this bill, or some acceptable substitute for it, will be passed.

Purity of Plaster.—"D. P.," of N. H., asks, "Is there any way for farmers to test the purity of gypsum that is not expensive?"—We know of none that does not require considerable chemical knowledge and skill. The manafacturers should have it analyzed by a good chemist. It is their interest to satisfy farmers that the article is good.

Half-a-Year, Now!—This number closes the first half of Volume 30. When desired, subscribers will be taken for the remaining half of the year at half the regular rates, single or clubs. In Premium lists, two half-year subscribers may, during this month, count the same as one full subscriber. Our friends may now invite in their friends for a half year's trial.

Boes Farming Pay ?-We often hear it said, there is no longer any money in farming. In the course of our experience we have heard similar statements concerning other occupations. A printer, adhering in these days to the old-fashioned hand-press, might make the same complaint, and with as much justice as the present farmer, who carries on operations in the old atyle, or a carpenter who makes his moldings by hand and planes boards. The improvements in machinery of all kinds have so quickened the demand for labor in every branch of industry, that the farmer as well as the mechanic must abandon hand labor and use machinery, or his profits must be eaten up in expenses. Hay may be made and put in the barn by machinery now at the rate of one dollar per acre. By hand the cost would be four dollars. The old style of crop is half a ton per acre; now three times that is a fair crop. The difference is just that between eight dollars per ton and sixty-six cents. The wide-awake farmer has this difference for his profit, eight dollars being about the market price for hay in many places. The same is true of most other crops, grain and roots especially. In feeding stock and making and using manure, equally large differences result. So of breeding stock; the old style rooter, and the modern Berkshire, are not more unlike than are their several values when made into pork. The same of the ill-fed, rough-coated native heifer or steer, and the sleek, well-fed grade Jersey or Ayrshire. The same is true of many farming communities in respect to roads, fences, and schools. All these must be fitted up with modern improvements, or farming as a business must suffer. know whereof we speak, when we emphatically dony that farming is an unprofitable business. The capital invested will, if rightly used, return in this branch of industry as good an interest as in any other, besides having the invaluable merit of indestructibility. A workshop or factory may burn up, but land remains not only intact, but from uncontrollable circumstances is ever advancing in value. So the labor of the farmer is sure of some remuneration if properly directed. Poor farms and poor farmers are the ones whose crops fail through drouth or excessive wet. On a properly conducted farm these may damage the crop, but will never destroy it. The divine promise of seed-time and harvest is for the especial benefit of the farmer; but it rests with himself in a great measure whether the fulfilment comes to him individually, or whether his more enterprising neighbor secures it.

Exhibition at Jersey.—Not New Jersey, but one of the Channel Islands, so celebrated as the home of the Jersey cattle. We have received a prospectus of a show to open on the 28th of the present month, which offers liberal prizes for bulls, heifers, and cows of both Jersey and Guernsey cattle, as well as for butter from both of these breeds. Prizes are also offered for horses, pigs, poultry, and dogs, for cage-birds, for plants and entiowers, agricultural and horticultural machinery and implements, and for various works of art and industry.

Improved Stock .- The present high price of thorough-bred stock, while it limits the business of breeding to men of capital, does not necessarily prevent the ordinary farmer from procuring male animals wherewith to improve his native stock. A stock of grade cows for the dairy may be gradually gathered up by the expen-diture of from fifty to two hundred dollars. Many breeders of Jersey cattle will dispose of a young bull calf for a very small sum, because its color does not suit their taste, while in respect to its pedigree or other useful qualities, it may be faultless. Such an animal purchased young and well cared for, will become useful for raising calves, at a year old. A yearling heifer of his get will, by the use of another such animal, become profitable at two years old, and its calf will be three-quarters bred, and it is quite likely to become as valuable for the dairy as a pure bred animal that could not be purchased for less than \$300 or \$400. The produce of this cow would be seven-eighths bred, and if care is taken in selecting the parents, would show little difference from entirely pure animals. Co-operation among a few neighbors who would each procure and keep a young bull whose services they might exchange with each other to prevent close breeding, would soon change the appearance as well as the productive qualities of the stock of quite a

large district. The main point to be guarded against is not to breed from any but pure stock. All male grade animals should be emasculated or go to the butcher, while young. The use of a grade bull ought not to be permitted. Here is where many a mistake is made. In the course of four or five years, quite a herd of threequarter or seven-eighth-bred animals would accumulate, and the profit would begin to come in. Ayrshire and Jersey cattle should be the breeds aimed ut, as these are excellently fitted for the dairy, and are profitably fed for the butcher ou ordinary farms. They are exceedingly tractable, quiet and orderly, are large milkers, and yield much butter of good color and flavor. The Devon and Durham are better fitted for the grazier, and would be more suitable where beef is the object aimed at. But whatever the breed chosen, care should be taken to avoid neglect, or loss will inevitably ensue. We have known cases where money has been invested in thorough-bred stock which has been treated as though its blood alone would be sufficient to protect it from neglect, exposure, and starvation. The natural consequence of such a mistake was made a ground of complaint against the breeder, and led to dissatisfaction and disgust. The old sdage, blood will tell." true as it may be, is no talisman against such an error. The refined nature of an animal carefully bred through many generations, will often enable it to sustain much ill treatment, but it will not thrive under it. When possessed of a specimen of such stock, give it fair treatment—pampering is unnecessary, as it is unwise-but care and proper feed and attention will make the investment a greatly profitable one.

Fruit Trees in Gardens are often seriously damaged by cutting their roots with the spade. The roots thus severed throw up sprouts which are difficult to get rid of. We know of but one cure, which is, to remove the earth around the sprouts carefully, and cut them off with a sharp knife, leaving the cut with clean edges. If the sprouts are from the detached parts of the

rout, each piece of root must be taken out. Prevention is the best cure. Don't use a spade in a fruit garden. Make use of a digging fork or a tool shaped as above. The work will be slower, but with such a tool the roots cannot be injured. The handle can be made and fitted at home; a blacksmith will forge the iron out of old tire.

Brushing Peas.—To prevent the wind blowing down the peas, drive stout stakes about six feet spart in the row to support the hrush.

The Current Worm may be kept in check by vigorously destroying the young larve. In the early morning they may be discovered just coming into active life on the under side of the leaf. They are then about a quarter of an inch in length. By removing the leaf with the worms adhering, they may be killed in large numbers. By close attention for a short time daily, the bushes may be saved; no surface application can prevent their appearance. Unceasing warfare is the price we must pay for our currants and gooseberries.

Buckwheat should be sown as early as possible in July. If the ground is not perfectly mellow, give one more plowing; this crop will suffer on imperfectly It may be true that a comparatively prepared ground. fair yield may be gained under poor culture, but the aim should be to grasp all that Nature will yield. A farmer is a good business man, only when he geta the largest return from his land by means of his labor of hand and head. These are his capital, and he can only succeed by a wise use of them. Buckwhest is generally hurried into the ground as a catch crop, but it can be made sufficiently profitable to pay well for all the care and attention that may be given to it. The first requisite is mellow ground. Plow and harrow until the lumps are reduced. Plow once more, and sow and harrow in. A bushel of seed is sufficient for an acre. We have succeeded better with this liberal seeding than with two or three pecks. Grass seed and clover will often take well with this crop, especially if the soil is in fair condition. The dense shade afforded will shield it until the vigorous heats of summer are past, when the fall rains will push it ahead sufficiently to withstand the frosts of winter. Great caution must be observed in harvesting this crop. The quality of the flour depends mainly in getting the grain in perfectly dry. Never on any account stack it or put it into the barn. Cut when the dew is off, and put up in small shocks without tying; watch the weather closely, and as soon as a dry, breezy day necurs, haul in and thrash Clean up immediately after thrashing, and spread the grain on the harn floor, turning over a few times, and allowing the drying winds free access to it.

The yield of flour will be greatly increased by such treatment. Twenty-five pounds of fine flour may be taken from a bushel of grain after the miller's toll is deducted, and new flour brings a high price. The middlings should be separated from the bran, which will be found an excellent addition to the hot-bed in the spring, and is worth preserving for that purpose. The middlings are excellent food for young stock-pigs, horses, or poultry, but we would not advise them to be fed to cows. The butter resulting from such feed will be white and tasteless. Treated thus, Buckwheat is safe to yield at the rate of a dollar, or even considerably more, for each bushel of grain, besides the feed yielded by the middlings. But let it be borne in mind that the early market must be secured, or the profit will be considerably reduced.

"Hybrid" between a Rabbit and Cat.—A story comes to us by the way of Sank Co., Wis., about some hybrids between the cat and rabbit born in Connecticut. These remarkable animals feed on clover and catch mice! It is not stated whether they give midnight serenades or not. Our correspondent wishes we would say something about the matter; so we say—we don't believe it.

Management of Colts.-Colts are very apt to be left to shift for themselves after weaning. This is wrong. A year's gain in the nsefulness of a horse may easily be made by care and attention during the first few months of its life. The mare, while nursing its foal, should not be overworked, and good pasture or green feed in the stable will keep her in fair condition, and furnish sufficient nourishment for the foal. When weaved, and pasture becomes short, neglect is hnrtful; then care should be exercised to keep it growing. During the fall months some of the best early cut hav should be given to it; and when the horses are stabled, let it have a loose box, or stall adjoining them, where it can see and become used to the discipline of the stable. Everything around it should be well secured, lest in rubbing itself it might get something loose. A habit of breaking things and getting loose is casily and invariably formed at this time, and should be guarded sgainst. During winter, feed your colts as you feed your horses. Give them a share of what is served out, oats, corn, or ground feed as it may. They cannot grow or fare well otherwise. "Stinginess" dou't pay in rearing young animals. An additiou of twenty-five or forty dollars to its value may result in the winter's feeding and care of one colt. Generosity here (of course exercised with judgment) is only wise foresight, and will pay good interest on the investment. Colts are better kept up than allowed to run around. They will become more docile and tractable, and will learn fewer tricks. Take them out only for exercise, except when at pasture, and then be sure to have a secure fence, or they will inevitably learn to rub it down or jump over it. Train your colt to walk, and keep it walking. Farmers don't want fast-trotting horses—as yet—we have need so far of fast-walking borses, great need, we may say, for they are far too Therefore, train colts to walk at the rate of four scarce miles an hour at least. The time will come when a horse that can walk his mile in twelve minutes will take a prize at an agricultural fair, equal in value to the best trotter. A team of such horses could plow an aere of ground, with a furrow six inchea wide, in five hours, allowing time for turnings round. This is above the quantity plowed on the average now, in a day of ten hours. Horses of such capacity would be worth a large price, and it abould be our endeavor to produce them. We have a breed that can transmit trotting capacity to its descendants, why could we not raise up a breed of walking horses? Some one might make a name and fortune in this.

Bark-louse.—"A. B.," West Brom. The specimen of apple-tree is infested with Harris' Bark-louse (Aspidiotus Harrisi). Scrubbing the limbs with lye or very strong soft soap will help. If but one tree is infested, cut and burn the limbs npon which they are.

Composts.—"L. W. G.," Lancaster Co., Pa. Sud obtained from the banks of streams is valuable, if composted with lime, when the soil is deficient in organic matter, though it would be better to mix it with animal manures. Sheep-manure should never be mixed with ashes. Apply the ashes separately, and mix the sheep-manure with soil.

Feeding: Milch Cows.—Last month we published a translated article upon "Swedish Dairy Farming," in which the singular practice of feeding horse manure to milch cows was described, but not commended, "Tommy," Ripley Co., Ind., writes: "My cows that I have at home are allowed to run in the yard, into which the horse manure is thrown, and can cat all they choose (which they are sure to do). They have been cating the manure for about three months, with no good

result. The cows became poor, though they were given all of the very hest of hay they would eat, with plenty of corn fodder, and two buckets of slop each day; while others that I have on another farm, one-half mile distant, and do not get any horse manure, and were fed nothing but hay, all the time were in twice as good condition. The nilk has a very offensive smell, and some of it is hardly fit for use. In straining it you may strain through the finest cloth, and after it has stood twenty-four hours, there will be found to every gallon milk from one to two table spoonfuls, a black sediment. The butter is worse than the milk, for it smells stronger, tastes bitter, and frequently is of no use for the table. I think that horse manner fed to cows has a worse effect on the milk than onions, and I am sure that it is bad enough. I would recommend all the farmers who keep cows never to feed horse manure, as it makes the cow poor, the butter not fit for use, and the milk taste very strong."

Strawberry Show at Elizabeth, N. J.—The N. J. State Agricultural Society will hold un exhibition of strawberries at Arcade Hall, Elizabeth, N. J., on June 14th and 15th. If the efforts of the committee are properly responded to by the New Jersey fruit-growers, the exhibition will be a fair one.

The Milk Escuteheon in Cows .-Puchnewala, Ridgeway, Iowa, asks: "1. What is meant by the milk escutcheon in cows? 2. Is it to be relied on as a mark of a good future milker?"—The milk escutcheon is that part of the hind-quarters of the cow on and about the udder, on which the hair grows upward. Its boundaries are defined by a quirl, where the up-growing hair meets the down-growing. Sometimes it occupies only a little more than the udder itself, while in other cases it reaches well out on to the thighs, sud raus up several inches wide, quite to the setting-on of the tail. Sometimes it lies only on one side of the vulva, and again on both sides. Occasionally it is cut square across half way up, and again is rounded at the top. form can usually be seen at a glauce. Its future extent and shape can generally be clearly determined on close examination in even very young calves. The escutcheon is quite generally regarded as a valuable indication of the quantity of the milk and of the duration of the flow; while the softness of the up-growing hair, the yellowness of the skin, and the amount of dandruff produced are taken as indications of the richness of the milk. Guenon, a French herdsman, who first called attention to the scutcheon, made a study of it, and established a system almost as intricate as that of the phrenologist; and there is ample evidence that he read with remarkable accuracy the characters of large numbers of cattle submitted to his examination, by the committee appointed to investigate his system. Most modern dairy-men attach much importance to the escutcheon as a general indication; and although the minute details of Gueoon's system are little regarded, its general principles are quite commonly accepted as valuable. See "Gneuon on Milch Cows," sent post-paid by Orange Judd & Co. on receipt of 75 cts.

Root Crops for Western Dairies .-A correspondent in Illinois asks: "What is the best root erop for dairy cows in winter, and when is the right time to sow the seed, and bow much to the acre? We at the West feed corn, corn, corn, but I know from experience that roots are cheaper and better if we knew how to grow them. About thirty years ago I raised a fine crop of ruta-bagas, but have failed several times since from poor seed, or bugs, or dry weather. If I try it again, I shall have to procure seed from the East, for they have not grown here for many years. I should like to hear from some one who has been more successful."— The best crops hereabouts are ruta-baga and mangel warzel. We presume they would both do well in Illinois, especially the mangel. The seed of either crop may be sown early in Jane. The effect of drouth is much mitigated by planting not less than one inch deep and rolling the ground firmly. The seed should not be soaked, unless you can be sure of moist land. The amount of seed required for an acre, if planted in drills thirty inches apart, is one pound of ruta-baga, or five pounds of mangel. This is necessary to safety, but will produce fifty times us many plants as are to remain, as, with either crop, they should be thinned to from twelve to fifteen inches apart in the rows. We like the transplanting system better than the direct growing from seeds. If the seed is planted in the rows in the field, and thinned to single plants an inch apart at the first boeing, they can be left until as large as a hickory unt, and then finally thinned, the rejected plants being set ont in other rows. The best way to protect the ruta-baga from the skipping beetle, is to dust the leaves with salphur, or lime, or soot; or in default of these, with any dust applied while the plants are wet with dew. It is a good precaution to plant a double allowance of seed, giving enough plants for the bug and the crop too.

the plants are growing thickly in a small seed-bed, it will be much easier to dust them than if scattered over a broad field. The method of transplanting is described in the Ogden Farm papers for this month.

## Early Cabbages, Cauliflowers, and Lettuce.

BY PETER HENDERSON.

I have received letters from many sections of the country complaining that the cabbages and eauliflowers sown last September, and wintered over in cotd-frames, are now (May 5th) doing badly. Many of the cabbages are running to seed, and the cauliflowers "buttoning," or showing abortive "flowers." The reason of this will be found in my artiele, under the head of "Don't Sow too Early," on page 222; but the remedy is the great point. A safe plan-one that need not fail-and one that can be better done by any one having greenhouses than by the cold-frame method, is the following: sow the seeds for early cauliflowers, cabbages, or lettuce, about February 1st, in well-prepared soil say one-third each of leaf-mold, saud, and loam; spread three or four inches deep on the benches of the greenhouse, or in boxes of about that depth. Keep a temperature of from 55° to 60°, and in three weeks they will be ready to replant-this time in boxes-at about 21/4 inches apart each way for the eabbages, and 11/2 inches for the lettuce. By the middle of March they will, if the temperature has averaged 55°, be strong plants, superior in every respect to those wintered over in cold-frames. By this date (the middle of March) the weather is such that they may be set out in cold-frames, and eovered at night either with wooden shutters or sashes for five or six days, when they will be sufficiently hardened off to be planted in the open field. We have treated a few in this manner for the past few seasons, and believe they can be so raised cheaper than in the cold-frames, and without doubt much better, without the danger of one plant in a thousand running to seed. The conversion of sash that has been used on cold-frames into greenhouses is a very simple matter: two sashes, of 6 feet in length, give, when placed at the proper angle, a width to the greenhouse of 11 feet; 2 feet of this space is used as a walk, the remainder, 9 feet, for bench room, on which to grow the plants. The outer walls may be formed of wood, in the manner described, in my article on "Roses for Winter Flowering," in April last. If heated by a fine, the tength of the house should not exceed 50 feet, and, if more than one is wanted, they should be formed in threes, the ends running north and south, on the ridge and furrow plan, as detailed in "Gardening for Profit." As written directions to a novice are always more or less obsence, any of your readers interested in this matter, when in New York, may reach us in less than an hour from the office of the Agriculturist; and to all such we will be happy to show our buildings, and give such information as is in our power.

#### Cultivate the Corn.

Constant cultivation cannot be too strongly urged for the corn crop. As soon as the blade appears above ground, pass through the rows with a harrow made for the purpose, or with the cultivator. Constant stirring of the soil will destroy the young weeds and push the corn ahead. A week thus gained may save the crop from an injurious frost when near ripening. An excellent implement for this purpose is Shares' horse-hoe; with it a careful hand may cut out the weeds to within an inch of the growing corn. By going twice in a row the crop may be effectually hoed, and much handweeding saved. The soil does not need stirring deeply; one inch is sufficient; deeper would injure the corn roots, which love to spread near the surface. For this reason all deep cultivation should be avoided. The surface should be

kept level; the crop will thrive better than by burying the roots under a ridge of soil; therefore, keep the plow out of the cornfield. This crop requires heat and moisture, and a level, mellow, porous surface will secure these. A soil packed with rain and baked by the hot sun, cannot be endured; therefore, if a heavy rain should occur, followed by dry weather, turn in at once to the exclusion of all else, and break up this crust. This may be done safely even after the corn is in tassel. With level and shallow cultivation no check will be given, and good results will follow. The roots will be uninjured. It is the disturbance of the roots, when the plant is in blossom, that checks the growth and injures the corn. Corn need not be laid by until the rows become so close that the horse can no longer pass through without breaking down the stalks. Permit only three stalks to a hill. If planted three feet apart each way, with one fair ear to each stalk, seventy bushels of shelled corn per acre may be counted on. Better cultivate five acres well, than to work and grow weary over twenty acres, and get but fifteen bushels per acre for your pay.

#### An Egg Farm.

BY H. H. STODDARD .- Second Article,

A location near a city secures the best advantages. An article produced daily the year through, and which is prized for being fresh, should be raised as close to a market as possible. Thus the highest rates may be obtained, the special aim being to supply the demand for better eggs than any can be that are packed and sent great distances. Under the system which now supplies to a great extent eastern cities, there is the time spent in collecting eggs from various sources, to which must be added the time for transportation, and the time they are in the dealer's hands after arrival. Then the jarring is more or less injurious, and after it, eggs will keep but a little while. They pass through so many hands, that no one in particular is responsible for the character of the article. Under our plan eggs are delivered directly to consumers, families being visited regularly once a week. The egg-route has this advantage over a milk-route, that it need not be traversed so often, only a sixth of the whole being traveled daily; thus the expense of delivery is not great. As a team must be sent to town every day to collect waste bits from the meat markets, eggs can be sent, when only a day or two laid, with no extra trouble. If disposed of at stores, au arrangement should be made with the dealer whereby they may be kept in a separate lot, and sold under the name of the producer. Consumers readily appreciate eggs, butter, or other produce that comes from a regular responsible source. When a lot is mixed with lots from other farms, its individuality is lost; if good, it may only be helping to sell the poor article of somebody else, and the producer does not reap the benefits of his pains in increased custom. No produce can be supplied to city dwellers to better mutual advantage to seller and buyer, than new-laid eggs delivered direct, the dubious ones now in the market causing much loss and vexation. Poultry farms may be established at the West, and have the benefits of cheap land and grain; or at the South, where the season is earlier, and water transportation available. But the value of manure at the East is so great, that it is more economical to bring grain here from the West than eggs; the latter being so trouble-

some to send by rail. Butcher's waste, procured fresh, being almost absolutely necessary, is an important consideration in favor of proximity to a city. When it is seen that high prices for eggs depends on their being produced near by and delivered fresh, and that the labor is no greater to raise them close by the market, than at a distance at lower rates, with an additional deduction for transportation and breakage, we believe it must be admitted that the best place is, on the whole, near an eastern The site should not be far from a railroad freight depot or wharf. The amount of Western grain needed is large. Hauling this many miles by team is too costly. Enriching ground at the east by feeding out grain from the prairies, is an indirect way of importing their rich mold. Therefore, we take care that this importation is judiciously contrived. A mill near, for grinding, is desirable. A tract of arable land may be found (though rarely), surrounded on all sides by either woods, swamps, or rocky pastures, so that there need be no danger of the fowls straying into tilled fields of adjoining proprietors. In case such a farm could be procured, the great expense of a fowlproof fence all around it would be saved. If the tract is unfortunately bounded by cultivated lands, then it must be so large and of such cheap quality, that a border, 20 or 30 rods wide, may be afforded to be kept in permanent pasture. The land should be upon a slope, for there must be a quick surface drainage after heavy rains; but the pitch should not be so steep as to prevent easy wagoning. A southward inclination gives a proper sunny exposure; and if there is a belt of woods on the north to break the winds, so much the better. If near swamps, sea-marshes, or damp river valleys, the site should be so elevated as to be out of the reach of the worst raw chilling fogs. We have enumerated all the above qualifications as necessary to a site for an egg farm. Their combination with certain essentials of soil which we are about to state, make the matter of selection one of considerable difficulty. Many more important points are to be attended to than in choosing a place for ordinary farming or gardening.

The soil should be adapted to cultivation. Those who advocate a waste tract make a great mistake, in our opinion. . Every rood should be capable of cultivation, and rocky or bushy land avoided. Shade to be artificially provided at a small cost in a manner to be hereafter described. It is necessary to raise crops in order to get the full advantage of the manure. It exceeds in value that made by any other domestic animal, because from rich food more thoroughly digested than is the case with quadrupeds. The scrapings from the roosts might be carried to another farm, it is true, but the nearer they are applied the less labor; and the droppings where fowls range, and at every coop of small chickens, etc., are too valuable to be lost, and cannot be gathered up save by the roots of plants on the spot. In order to distract attention from the main business as little as possible, crops of the simplest management should be mostly grown, and only those that can be consumed by the establishment; grass, cabbages, lettuce, onions, potatoes, beets, and other roots, large quantities of oat or rye straw, and the balance, grains of various sorts, corn especially being always in order. The principle of division of labor, carried out to full extent, would forbid our raising crops at all, were we able to gather all the manure and sell it for what it is really worth. But, as we have seen, much would be

wasted unless there is tillage, and there is no price established for such manure; and if there were, it is under our system all immediately mixed with earth, so that the amount could only be guessed at. The quality of the soil may be poor, or worn out at the start, thus securing cheapness; but it should be of a sort that it would pay to apply valuable manure to. For the sake of the health of the birds, choose a warm, dry soil. Land, quickly dry after rains, is the kind; and another test is, whether it is ready for the plow early in spring. If it will produce peas or watermelons earlier than common, we are not far wrong. It should not be clayey or gravelly, but a sandy loam. Gravel for a subsoil, low enough down to never be reached by the plow, would be excellent, making a natural underdrainage; but gravel at the surface troubles the fowls in their rolling and dusting. A supply of white gravel for the use of the birds should be screened to a proper size at some other place, and hauled to the spot, and put in boxes for the use of the birds. The soil should answer for dry earth for the roosts and for dust-baths, the loam being of a sort easily reduced to an impalpable powder. This is important, because we depend upon pulverized dry earth all through the business, to secure the cleanliness and health of the birds with the least possible labor. A great deal is said in poultry books and papers about the importance of cleaning the roosts frequently. We do not clean ours oftener than once in three or four months. The labor of going the rounds daily in a large establishment, thoroughly scraping floors, and removing manure, would be enormous. We set all our fowl-houses on a ridge of earth thrown up, by plowing several times toward the center, and surround with a shallow ditch for surface drainage after heavy rains. Thus we secure dryness, wet being the foe that must be kept from the fowls at every stage. Then in winter a bed of dry earth, six inches deep, is put inside the houses instead of a floor, and a couple of inches added monthly if needed. The birds may be depended upon to cover their own droppings, not only daily but hourly, when not at roost, a thick cloud of dust being raised every little while. The houses will always be freer from taint than if floors were used without dry earth, and scrubbed with soap and sand three times a day.

As it is impossible to raise any crop on vines, stalks, or trees above ground or below it, that hens will not damage, crops are put on onehalf of the ground each year, and the fowls on the other half. Movable fowl-houses are used exclusively, with the exception of some large ones for hatching-rooms. By building small, light, and low, with strong sills made on purpose for runners, the houses may be moved every spring by an ordinary team, to the section tilled the previous summer. The distance traveled in transferring 100 fowl-houses, from one 60-acre lot to another, is one-third of a mile for each building, and back with no load. The amount of labor is much less than would be involved in hauling the manure, mixed with dry earth, from the buildings. The moving is accomplished systematically; the fowls belonging to a building being all moved in one flock in a large box made on purpose, in which they are quietly entrapped when attempting to leave their house in the morning by placing it adjoining, after which the box is darkened and drawn upon runners, on which it stands, to the new station. On arriving they are immediately allowed to escape into a spare house, shaped and colored like the one they left, placed before-

hand, when they are ready to commence their day as usual, the whole operation of removal occupying only a few minutes. Besides this yearly moving each building is moved every few days during spring, summer, and fall, its length only. Thus a fresh spot is secured, and to prevent all taint and uncleanliness, as well as to keep the manure safe for next year's crops, an implement like a harrow, with teeth like a horse-hoe, is drawn over the spot where it stood. The buildings are all moved in regular order in the same direction, so as to keep the same distances apart; then back again over another strip of ground, so as to fertilize the whole lot in the course of the season. The frequent turning of the soil not only keeps it sweet, but provides what fowls are so fond ofa place to scratch for insects, and roll and dust themselves in dry weather. The crop of weeds that will constantly appear in summer must be as constantly turned under; and whatever advantage there may be in green crops for manure will be secured; thus the enriching and pulverizing of the ground will fit it for large crops. It need not lie altogether fallow either, for a few small spots may be sown thickly with lettuce, cabbages, or other plants that fowls will eat, and protected until partly grown, by movable lath-fences or wire-netting, after which they may be allowed to help themselves. Oats may be sown in strips also; and whether the fowls. scratch up and eat the seed in spring, or forage upon the ripened grain, no matter. It is only necessary to compare the amount of labor spent in spading the ground in vards, to keep it fresh, with this way of using team and plow, to see the superiority of the latter method.

#### Ogden Farm Papers,-No. 18.

Up to this time (April 25th), we have had such weather as I have never known before; the winter ended, virtually, on the 22nd of February; the frost was all out of the ground on the 15th of March: and from that time to this there has been little interruption to out-door work. My small grain and grass are all in (20 acres), potatoes are planted, and the land is plowed for root crops and for corn. In fact, the work has gone ou so smoothly, that I fairly forgot the reason for it, until a few days ago, as I walked across a neighbor's field (a part of the same slope). Then the "squash" of the sod brought back the old times when we first took hold, and before the land was drained, and when it was sure to be the middle of June before we could depend with any certainty on getting the land in fit condition for corn planting. Half a day's rain would soak us full, and it would take four or five days of drying weather to make the ground fit for teams. By that time probably another rain would set us back again. This year we commenced plowing the first week in April, and could have commenced the last week in March; and although we have had several heavy rains since then, which set the drains flowing to their full capacity, the land would get in good condition within twentyfour hours after the rain stopped, and I am satisfied that we have been able to work four times as many hours as we could have done were the land not drained. The value of being able to work twenty days in April instead of five days, no farmer who knows the importance of taking his "stitch in time," need be told. We shall feel the benefit of the early start throughout the whole season. With ordinary weather from now until the end of June, we shall get at

least twice as much work out of our men and teams, as our predecessor could have done, to say nothing of the great advantage to crops of the absence of superabundant moisture.

We have this spring seeded down one section of the farm (91/2 acres) as permanent mowing land, partly because it will always be well to have the grass, and partly because that section is the most conspicuous one; and we believe in having our best foot forward with the boot well polished. Three acres are seeded with a mixture of vetches, peas, and oats, and six with oats alone for soiling, to be followed with late fodder corn sowed in drills. About thirteen acres more will be used for the main crop of fodder corn put in early, and four acres are well advanced with winter rye, which will be fit for the scythe by the 10th of May, and again early in June, when fodder corn will probably be sown on that as well.

We are now preparing about five acres for carrots and mangels. The land is that which was plowed so deeply year before last, that we practically lost the erop of two seasons; but it is now turning up in heautiful condition, the ugly blue clay having been oxidized to a yellow cast, and the whole being as mellow as an ash heap. If, as I believe, a good top-dressing of manure will hasten the germination of the seed and strengthen the early growth, the roots will get down to the top soil-that was buried a foot deep two years ago-and will carry us safely through any drouth we are likely to have, proving that brother Greeley is right in his theory of deep plowing, if we only give him time; perhaps though it will be safer to wait until the crop is made, before forming a final opinion.

In growing my carrots and mangels, I shall pursue a course different from that generally adopted, but one which ample experience has shown to be best. The land is now plowed, and will soon be harrowed. It had a good coating of stable manure last year, and will receive more this year. As soon as weeds begin to show, it will be harrowed again; and as often as they appear, the operation will be repeated until planting time. The carrots (these do not bear transplanting well) will not be planted until the first week in June, when, under the influence of the warm weather, they will come up in a few days, instead of lying from two weeks to a month as they do when planted early in May, and they will have a fair chance in competition with the few weeds that will remain after the repeated harrowing. Iuimediately before the sowing of the seed, a heavy dressing of some artificial fertilizer will be harrowed in. The subsequent cultivation of this crop will be according to the usual custom.

The mangel seeds will be sown in a seed-bed early in May, and will be transplanted somewhere about the 20th of June; the field being kept clean by repeated harrowing to the very last, and artificial manure being applied at the last harrowing. As I have before stated, this is not only the best, but it is much the cheapest way to grow this crop; and these directions are not untimely, for the seed may be sown early in June, and the transplanting post-poned until the middle of July, and a good-crop still be taken, if the land is rich and the season not unusually dry. The idea of transplanting several acres of beets is a formidable one only to those who know nothing about it.

It is a comparatively easy job to hand-weed the plants in a small seed-bed; they will need no thinning; and it is not half the work to set out a row of mangels at intervals of fifteeu inches, that it would be to go over the same length of row, and weed and thin it by hand, if the seed were planted in place. Then, again, the seed must be planted at a time when weeds grow profusely, and there must be a good month's fight with them before the mangels gain the mastery. Under the transplanting system, the harrow does all the early work of weeding; and the plants that are set out, being already from half an inch to an inch in diamcter, grow vigorously from the start, and before weeds can grow a quarter of an inch in hight, they will bear horse-hoeing or hand-hoeing as well as corn or potatoes. The ease of transplanting depends very much on how you set about it.

If a man takes a lot of plants in a basket, digs

a hole with a trowel, sets down his basket and picks out a plant at every step, he will soon get sick of his undertaking. Our method is the following: all hands pull plants from the seedbed until enough are taken for the day's work. As they pull them, they cut off the tap roots and shorten the leaves to about four inches, laying them in small heaps with the tops all in one direction. These heaps are gathered by the double handful, packed in regular order in larger heaps, and covered with a horse-blanket. A puddle of cow manure, superphosphate or bone-dust, clay and water, is prepared in a tub near the heap. When plants enough are made ready, a force of three men and two boys is divided as follows; one man dips the roots in the puddle and puts the plants into baskets, which he carries to convenient parts of the field. The two boys station themselves near the center of the field, and the two men, one at each end of it, with a long line stretched between them. Each has a marking-stick, 27 inches long, to mark the distance of the rows. The line is stretched at one side of the field in the position of the first row, and is made fast to stakes. The boys then start from the middle of the line and the men from the ends, and walk on the line until they meet (each making one-fourth of the whole distance): they then run (not walk) back to their starting points. The men now measure off 27 inches, and stretch the line for the next row; and so on. The line, of course, is perfectly straight, and the impression is sufficient to be easily seen. When five or six lines are marked, the planting is commenced. Each boy takes a basket of plants and walks backward ahead of his man, and drops the plants with the tops toward the planter's left hand at regular intervals of about 15 inches. The man has in his right hand a "dihber" (shown in the engraving, fig. 1); with this he makes a hole where the plant is to stand; then taking the plant in his left hand, he sets it in its place and gives a sidelong thrust with the dibber, so as to press the earth firmly about the lower part of the plant (not the crown): strikes his dibber into the next spot, and so on. When the five or six rows are planted, and the backs are a little tired with stooping, it is a relief to stop and mark off a few more rows; but the regular order of the operations is kept up without stopping, except for dinner, until the day's work on the field is finished. Of course the rapidity with which the planting is done depends on the experience and dexterity of the planter. It takes from 13,000 to 15,000 plants for an acre; and I have one man who, with a good boy to

drop, can easily set an acte in two days. The same man and boy, however skilful they might be, would not thoroughly finger-weed, and thin out an acre of mangels, grown in the ordinary way, in twice the time. In pulling the plants, enough are left in the seed-bed to grow for acrop; but it is noticeable that these never grow nearly so large (although the land is usually richer) as do those that are transplanted.

As some of our land is now in sufficiently good condition for the trial, I am going to make the effort to raise a few acres of potatoes and cabbages for sale, using the money to buy cheaper cattle food. This is a safe thing to do, for we always have an anchor to windward, inasmuch as potatoes and cabbages can always be fed out if there is no market, while now and then, a good profit could be taken. For instance, if I had raised 10 acres of cabbages last yeara fair average crop-I could have sold them for enough to pay the original cost of the land, and the cost of draining and other improvements that have been put upon it. So long as cabbages can be raised at a cost that their feeding value will warrant, I propose always to be in a position to take advantage of such a market as that of last winter—and I think others may safely do the same. To a certain extent the same thing is true with regard to turnips and other roots. They pay to raise, as cattle feed alone, and at times they may be sold for five times their feeding value; then let them go and turn the money (or a part of it) into brau and meal.

#### Riding on Horseback,-No. 4.

Even more important than the Saddle-so far as the management of the horse is concernedis the apparatus by which his movements are to be regulated and restrained: that is, the "Bit." The various forms of bit sold by saddlers, even in the largest cities, are almost invariably faulty. They are made without much consideration of the use to which they are to be put, and often fail to produce much effect, except as a means of torturing the horse into a kind of sullen obedience. It is one of the offices of the bit to produce pain; but only when the horse resists its action, and then only so much as may be necessary to secure submission to the rider's will. As he will instinctively yield to a pressure that would cause pain if he did not yield, and as, if the pain is produced from both directions, he will try so to move as to escape from that which is the more intense; it is of the greatest importance that the bit he constructed in such a manner, and so placed in the mouth, as to impel his head in the right direction-that is, toward the rider's hand.

The bit rests against the "bars" of the lower jaw (those parts of the jaw where there are no teeth). It has two levers, one at each side; one end of each of these levers projects upward, carrying the chain that passes under the chiu, and the other ends project downward to receive the reins, by which the force is to be applied. The object is to have the chin serve as a fulcrum, so that when a strain is applied to the lower ends of the levers, the pressure on the bars will be sufficiently suggestive of pain to cause the horse to draw in his head. If, from bad construction or improper adjustment, the chain becomes more painful than the bit, the horse will withstand the lesser pain in his mouth to escape the greater pain behind it, and will thrust out his head in obedience to the real impulsion. In this case the bit is virtually the

fulcrum, and the stronger impression is produced by the chain. It is in the principle herein suggested that we are to seek the solution of the greatest difficulties connected with proper bitting; and its close observance is necessary to complete success. In nine cases out of ten the arrangement of the bit is so faulty, that it is impossible for it to act as it should, and instead of inducing obedience, we arouse opposition. The reason for the prejudice against curb-bits-among those who consider them instruments of torture-is, that as they are generally used, they are instruments of torture. It is impossible to ride really well on an average horse without a curb-bit; but it is impossible to ride well on any horse, unless the curb-bit is properly made and properly adjusted. Its importance is sufficient to justify a careful explanation, for which purpose the following illustration, figure 1, is taken from Major Dwyer's book.

The point, d, shows the position of the bit in the mouth; e, is what is known as the "chingroove," which is easily seen on any horse. The head-stall should in all cases be of such a length as to allow the bit, d, to lie exactly opposite the chin-groove. This is the only place where it will not do more harm than good, unless the horse is remarkably well broken; f, is the point where the rein is attached, at the end of the lower arm of the lever; a, b, c, represent the ends of the upper arms of the lever, showing what would be their action if they were of different lengths. These are the points where the curb chain is attached to the bit. The rule which has been established by experience is, that this upper arm of the lever should be exactly as long as the perpendicular distance from d to e. This allows the chain, b, e, to lie easily and naturally in the chin-groove without

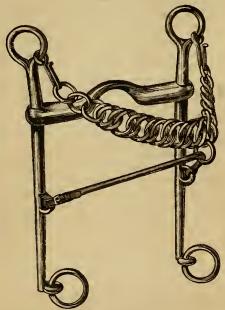

Fig. 2.—"BAUCHER" DIT.

pinching, when the rein is held lightly, yet to exercise a strong leverage when the reins are drawn. For instance, when the point, f, is drawn back to the point, h, it will not be able to move much farther, and a strong pressure will be brought to bear on the mouth. If the upper arm of the lever were twice as long as the distance from d to e (reaching to a), the chain, a e, if hanging in the chin-groove, would have very little effect, except to pinch and torture the horse, producing the most pain upon the jawbone, just above the chin-groove, caus-

ing the horse to throw up his head to escape it. If, on the other hand, the upper arm of the lever were made only half as long as the distance from d to e (reaching to e), the chain would have very little effect, unless it were drawn so tight as to be uncomfortable even with a loose rein—so tight, indeed, that it would soon chafe the chin-groove and make that so painful, that

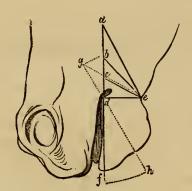

Fig. 1.—CURB BITTING.

at the least touch of the rein the principal effect would be produced there rather than in the mouth, and the horse would again be caused to throw up his head.

If the upper arm of the lever is of the proper length, reaching to b, when the lower end of the lever is drawn back to h, the upper end will be advanced to g, and the chain will draw on the line g to e, drawing, almost exactly, at right angles to the jawbone at the chin-groove, bringing the chain flat against it, creating the least possible amount of pain there, and affording a firm fulcrum, from which force may be directly applied to the bars at the mouth.

The length of the lower levers need not be made so exactly according to rule. The longer they are, the more effect will be produced with a given amount of force applied to the reins. Perhaps a safe rule would be to make them twice as long as the upper arms of the levers. This is enough for the control of the worst cases, and more than this (as is usual), increases the difficulty of light handling. The construction of that part of the bit which lies in the horse's mouth, connecting the two side levers, is important. Its length should be just such as to allow the levers (which should be turned out a little at the top to make room for the leathers) to play freely over the sides of the face without chafing. The bit should not be too long, nor should the upper ends of the levers be too much turned out lest the chain be straightened out, and caused to rest only against the bones of the jaw; whereas it ought to follow closely around, touching the skin for at least three inches of its course. Curb-chains are made flat, so that when twisted into shape, they lie almost as smooth as a band of leather against the chin. The larger they are, and the larger the wire of which they are made, the easier and better they will be. They are attached by spring hooks to the eyes of the upper ends of the levers. The mouthpiece of the bit should also be of generous size in those parts that lie against the bars, being much less painful than if small. That part of the bit lying between the bars should be made of thinner iron and a little elevated, forming what is called the port or tongue-groove, preventing the horse from taking the pressure on his tongue (as he might do if the bit were straight), and thus becoming heavy or dull in the hand.

The lower ends of the levers or "branches" may be either straight or curved. If straight,

they should have eyes a little above the points where the reins are attached, to carry what is called the lip-strap—a small leather that passes through a loose ring in the curb-chain, and is buckled to the lever on each side. The object of this strap is to prevent the horse from taking the branch of the bit in his teeth and destroying the effect of the curb—a trick that most horses soon learn, and which they know how to take advantage of. Fig. 2 represents what is called the "Baucher" bit, and is copied from one that the writer has had in use for many years.

To avoid the complication and cost of the lipstrap, the curbed branch (or lower lever) is adopted for army use; and there is no reason why it is not equally suitable for the use of civilians. It brings the iron in such a position that the horse cannot possibly get hold of it. This bit is shown in fig. 3, the "McClellan" bit.

The foregoing details will seem to those who are not familiar with the niceties of riding, to be needlessly minute and particular. Many a man will say that any bit is good enough for him-just give him a good strong pair of reins to hang on by (!) The proper reply to this is, that this article is not written so much for him (though he needs its information more than any one else, if he only knew it), but for those who really care to become good horsemen. No one can ride with pleasure on a horse that has a bee incessantly trying to sting him under the chin. His fear of the bee introduces a disturbing element that counteracts all our efforts to make him attend steadily to his duty; and an ill-fitting, badly placed bit causes hardly less disturbance.

There are many points to be attended to in the proper equipment of a saddle horse—nearly all of them points of minor detail—yet they are important details, too; for unless the rider's

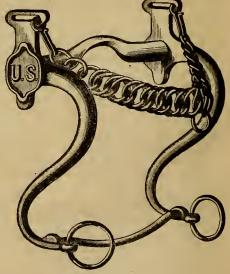

Fig. 3.—" M'CLELLAN" DIT.

weight is properly placed, and unless he has the proper means for controlling and guiding his horse, there can be no comfort, or gracefulness, or pleasure for the man. There must also be a loss of endurance and smoothness of working for the animal; and as it costs no more, save in attention, to have things right than to have them wrong, there need be no excuse for failure in essential points.

Note.—Our illustrations of the "McClellan" and the Mexican saddles in the April number were taken from articles in the saddler shops in New York. This must account for iron stirrups having been substituted for the wooden ones covered with leather that belong to those saddles.

#### Fat-tailed and Fat-rumped Sheep.

Sheen are so readily modified by breeding, as well as by the peculiarities of climate or the nature of their food, that naturalists are much

puzzled as to the number of natural species. Sheep removed from a cool climate to a hot one lose their wool, and becoming covered with coarse hair, appear more like goats than like sheep. Some varieties with remarkable local deposits of fat are found in different countries. An Angola variety has curious masses of fat on the back of the head and beneath the jaws, which give the animal the appearance of wearing a large collar or ruff. Several countries possess breeds of sheep which have the tail

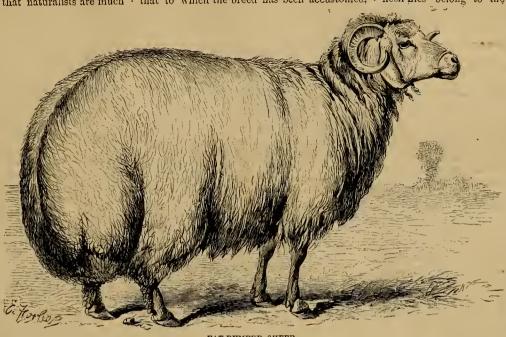

enormously enlarged by a deposit of fat. One of these, an Asiatic one, has a tail containing twenty vertebræ, and so loaded with fat, that in order to preserve it from injury, it being considered a great delicacy, it is sometimes supported by a truck, which is dragged about by the animal.

The broad-tailed sheep of different and widely separated countries have generally pendulous ears, which are considered by Darwin to be a mark of long domestication. Some of them have four and even six horns, while others are hornless. The wool on these sheep is generally coarse and long, and hanging in thick patches. The Astrachan sheep belongs to this broad-tailed group. The coat of the young animal, killed before birth, is fine and frizzled, and is used as an ornamental fur.

In some countries there are breeds in which there is a great deposit of fat upon the hind-quarters near the tail, but the tail is most usually undeveloped, and in some of the fat-rumped varieties is entirely wanting. There are some breeds of this kind in Africa, where they are valued not only as furnish. ing a much-prized article of food, but for supplying tallow for domestic purposes. One of these Afri-

can fat-rumped sheep is in the collection at Central Park, and we give an engraving of it from life. The fat-tailed sheep of Tartary and the Crimea, when taken to Russia, are said to lose their peculiar fatty development in a few generations.

Were there a number of these fat-rumped sheep at the Park, it would be interesting to see if they retained their distinctive character in a climate, and with food so different from that to which the breed has been accustomed,

FAT-RUMPED SHEEP.

#### Meat-flies and Fly-blows.

A number of flies belonging to different genera pass their larva state as maggots in meat. Many times their presence is annoying and a cause of loss; but the damage they do us

METAMORPHOSES OF THE FLESH-FLY.

is probably offset by their rapid and beneficial work as scavengers, as they hasten the removal of animal matters, which might in their slow decay prove noxious. Some of these flesh-flies produce their young alive-an unusual thing with insects-and the maggots are ready to go to work at once without waiting the few hours required for the hatching of the eggs of some other species. Our viviparous flesh-flies belong to the genus Sarcophaga-

flesh-eaters. It is stated upon the authority of Reaumur that a single female of the European Flesh-fly will produce as many as twenty thousand maggets. Our largest Flesh-fly is the Sarcophaga Georgina, it being about half an inch long. It is distinguished by its silvery white face and copper-colored eyes, between which there is an oblong square black spot. Its thorax or chest is gray, with seven black stripes. The Blue-bottle fly, Musca Casar, and the Meat-fly, Musca vomitoria, are better

known; the one being of a blue-black, and the other of a brilliant blue-green color. These do not produce their young alive, but lay eggs, which are deposited upon meat and decaying animal substances, and are well-known as flyblows. The eggs hatch in three or four hours,

and the resulting maggets feed most ravenously, and grow with great rapidity. They attain their growth in three or four days, when they hide themselves in some crevice, or burrow in the earth and pass into the pupa state, from which they come out in a few days as perfect flies, and go on with the work of The enreproduction. graving illustrates the metamorphoses of flies of this kind, giving the maggot, the pupa, and the perfect insect. The meat-flies deposit their eggs not only in dead animal substances, but in the wounds of the living ones. During the late war the soldiers were subject to great suffering on this account, as it was frequently the ease, that those who were left for some time before they could receive surgical attention, were found with their wounds filled with the devouring larvæ of the Meat-fly. Under the name of "gentles," the maggots of meat-flies are used as bait by fishermen, and the

breeders of trout find them a most valuable food for the young fry. The maggets are obtained from the bone-boilers in large quantities; and we know of one fish-breeder who orders several barrels at a time for the purpose of feeding young trout. The salt and smoke of hams and bacon do not seem to be distasteful to the maggots of the meat-flies, and such articles should be kept where flies cannot enter, or be so thoroughly enwrapped in paper that there will be no chance for them to deposit their eggs.

#### Walks and Talks on the Farm-No. 90.

Our venerable friend, John Johnston, writes: "I will tell you how to eradicate docks, and no humbug, and charge nothing. Cut them off close to the ground when the tops are fully out, but the seed not fully formed, and they are done for. The stalk dies in the ground; but you must cut them so close to the ground that you leave no leaves on the stalk, else they will not die. About the end of June I found generally the best time to cut them; but it depends on the season. In pasture-fields, they are soon cut with a scythe. In wheat and meadows they have to be cut with a knife. Never mind trampling down a little wheat or timothy. You will save it all in getting rid of dock. I kill burdock by cutting off when the burs are formed, and putting a handful of salt on the top of the stalk." Mr. J. adds: "I found out how to kill docks by cutting clover early." This is encouraging, and is an additional reason for endeavoring to grow large crops of clover that must be cut early. Docks do not seed till the second year. If cut off the first year, the root will throw up several seed-stalks the next season, and the process seems to do more harm than good; but if the cutting is delayed till the second year, when the seed is partially formed and the plant nearly exhausted, I have no doubt Mr. J. is right in saying that it will die. We may assume that the only way to kill docks the first year is to pull them up by the roots, or else cut them below the crown; but the second year, cutting them after the seed is partially formed, is better than pulling.; for if pulled, there is so much vegetable matter stored up in the root, that the seed will ripen after the plant is pulled up. It is a capital thing for a farmer to get the idea fully established in his head that weeds can be killed. Many people seem to suppose that weeds spring spontaneously from the soil. And yet the soil can no more create a weed than it can create a man or a monkey. Kill all the roots in a soil and cause all the seeds to grow, and then kill the young plants, and you have land free from weeds. I do not suppose that this can be absolutely attained in practice, but a thorough conviction of its truth will stimulate our efforts. Our seasons are exceedingly favorable for the destruction of weeds. and yet one of the most marked characteristics of our agriculture is its weediness. The weeds carry off half our profits.

A gentleman in Tennessee, who has been engaged in other business, but who now wishes to turn farmer, writes me that he can get 5 acres of poor sandy land at a moderate rent for 10 years. With a little stable manure in the hill, he thinks the land would produce 75 or 100 hushels of peachblow potatoes per acre. But he has no manure, and he wants to know what is the cheapest fertilizer for him to buy: superphosphate at \$60 per ton, Chicago blood at \$55, bone-dust at \$45, plaster at \$20, cotton-seed at \$15, or lime at 12 cents per bushel. He proposes to sow winter oats, and, when harvested, plant the land to potatoes, and thus grow two crops in a season. I am always

sorry for such men. They are so enthusiastic and hopeful that it is far from pleasant to say any thing discouraging. "In all labor there is profit," but, strictly speaking, there is no profit in the mere possession of land. It gives one an opportunity to work. And the profit will be in proportion to the amount, skill, judgment, and efficiency of the labor, and not in proportion to the land. Now, a man cannot spend labor enough on five acres of ordinary oats to enable him to earn a living. He must raise something that requires more labor. The land is near a city where there is probably a demand for vegetables, small fruits, etc. There must be stable manure to be sold in the city, and this at anything less than \$1.50 per ton, would be far cheaper than any of the fertilizers named. Cotton-seed would be the next cheapest. I would mix 20 tons of manure and 1 ton of cotton-seed together in a heap, keep it moist, cover it with soil or sods, and let it rot, turning it occasionally, to accelerate fermentation and to make it fine. Put this amount on an acre, and then plant something that requires rich land and much labor and attention, and as much money can be made from five acres as from fifty.

"Deacon," I said, last night, "listen to this letter from a farmer in New Jersey: 'I have a farm on which there are thousands of cords of muck (not peat); I wish to know how to use it to the best advantage; when and how to get it out; and what chemicals have proved the best to remove the sourness and make it good manure? I have Dana's "Muck Manual," but want the latest information; and I inclose the small sum of ten dollars, which you can use, if you please, to accomplish this end."

"There, now, Deacon, is a man who appreciates an agricultural editor. If a short article is worth \$10 to one reader of the Agriculturist, what is the information contained in a whole volume worth to its half million readers? The ten dollars have been returned; but I for one feel grateful for this appreciation of the labors of an agricultural editor. We get double the abuse, and not half the credit we deserve."

"Don't know about that," said the Deacon, dryly, "but what are you going to tell him? I 've been thinking of getting out some muck; but somehow I can never find time to do it."

"It is just so with me. I have thousands of loads of splendid muck in the swamp, and have hitherto excused myself for not using it because the land was so wet. But as soon as we get the ditch through it, I mean to go at the work in earnest. An average sample of airdried peat contains more than twice as much nitrogen as stable manure; and there can be no doubt of its value. The trouble is, that the plantfood it contains is in a comparatively insoluble condition. It is 'sour,' but merely neutralizing the acids is not enough. The aim should be to decompose it by fermentation. Anything that will accomplish this will render the plant-food available. The first thing is to get rid of the water. Throw up the muck in June or July. and turn it during the hot weather, in July or August. I would then put about a bushel of lime to 20 or 25 bushels of muck; and, in turning it over to mix the lime with it, would aim to make the heap as compact as possible: and before the fall rains set in, I would cover it with something to throw off the water. In the winter, draw this prepared muck to the yard, and mix it with the manure-say one load of muck to one load of manure. In my case, I should use some of the earliest-made manure and muck for root crops in May or June; and to get it in good condition, the heap should be turned, if possible, during the winter, and again in the spring; and if bone-dust, or blood, or woollen waste, or any thing that would favor rapid decomposition, could be obtained, I would mix it with the heap a month or six weeks before using—the earlier the better."

"But," remarks the Deacon, "I thought lime would set free the ammonia. I know lime and ashes are good to mix with the muck when about to apply it directly to the land, but I never heard of mixing lime with muck, that was to be afterwards mixed with stable-manure."

Exactly. That is precisely where my plan differs from that generally recommended. I have no fear of the ammonia escaping from the heap. The more ammonia we can set free in the heap the better, provided it does not escape; and if muck enough is used, there is no sort of danger.

In my case, the bulk of the manure would be kept in the heap during the summer, and be drawn out on to the grass-land in the fall, to be plowed under for corn or potatoes the next spring. A much larger proportion of muck could be used with the manure in this case. It is true that I have had comparatively little experience in the use of muck; and I wish some of the readers of the Agriculturist would give the Deacon and me some hiuts as to the most economical manner of handling and using it.

The Deacon never gets excited about any thing; at any rate, he never shows it. But he is quite enthusiastic in his praise of my grade Cotswold lambs. "I always told you," says, "that cross-bred animals are more profitable than thorough-breds." The truth is, I told the Deacon so; and it is so far complimentary to find that he has adopted my views. in part, even though he claims them for his own. I say "in part," because he does not clearly understand the point I insist upon in crossing. I want a thorough-bred ram to cross with common, hardy, vigorous ewes; whereas the Deacon can hardly get rid of the idea that a cross-bred ram, provided he is as large and well-formed as the thorough-bred is just as good, whereas I know that such is not the case. We have got, up to this time, 67 lambs from 60 common Merino ewes from a thorough-bred Cotswold. They are the healthiest and hardiest lambs I ever saw. We have had not the slightest trouble in any way, and have lost but oue lamb in the whole lot. One of them weighed, when dropped, 121 |2 lbs., and we had many nearly, or quite, as large, and the shepherd says some that were larger. This afternoon, April 22d, we weighed five of these grade lambs that are from eight to nine weeks old. They weighed respectively 50, 461/2, 521/2, 471/2, and 461/2 lbs., or an average of 49 lbs. each. Is not that pretty good for ewes that at 4 years old only weighed 80 lbs., and that I bought for 3 cents per lb. The ewes have had nothing but dry feed, and as soon as they get some grass, I expect the lambs to do even better still. We allow the lambs all the corn, meal, and brau they will eat, in small troughs separate from the ewes; but they do not eat half as much as I wish they would-not to exceed 10 lbs. a day among the whole lot. This is the only fault I have to find with them. I think lambs from Canada ewes would eat more meal, and consequently fat better; but some of my neighbors who have Canada ewes, have no better lambs than these of mine from Merino ewes. Liberal feeding, and a thorough-bred ram, is the secret in raising good lambs for the butcher.

I think that picture of Shropshire-Down sheep in the April number of the Agriculturist is the best I ever saw; and I am glad these magnificent sheep are to be in Central Park. I suppose the design is to keep specimens of all the leading breeds of sheep. Until 1857, the Shropshire-Downs were comparatively unknown. The Royal Agricultural Society that year offered a special price for the best shortwooled sheep, not South-Down. This brought out the Shropshire-Down sheep, and the late George Adney, of Harley, was the most successful exhibitor, winning the first prize, if I mistake not, with "Old Patentee," one of the ancestors of the Central Park sheep. I once spent several days on Mr. Adney's farm. He was a good specimen, though rather a rough one, of the plain, practical English farmer. He had then a splendid flock of sheep, but I question if the thought ever occurred to him that he and his slicep would ever become celebrated. He worked for years on his quiet farm, improving his flock, without dreaming of fame or fortune. The success of the Shropshire sheep at the "Royal" took England by surprise, but I question if any one was more surprised than Adney himself. Previous to the fair, these sheep could have been bought for the price of mutton; afterwards they were worth whatever the breeders chose to ask. "George," as he was familiarly called, was a "character," and many stories are told of him. He would not sell his ewes to any of his neighbors. Lord Wenlock had an estate in the neighborhood, but was personally unknown to Mr. Adney. One day a gentleman called to look at Mr. Adney's sheep, and said he would like to buy some. Not knowing him, "George" thought he was a stranger, and told him he would sell him some; "but," said he, "I shall want the money down." The stranger, who proved to be a capital judge, selected out a lot of good ewes, and the price was agreed upon, and he stepped into the house to pay for them. He wrote out a check, signed "Wenlock," and handed it to Mr. Adney. "You don't call this money," said George. "Wenlock is the name of a town; anybody can sign a check Wenlock." "But that is my name," replied the stranger. "I am Lord Wenlock." "You ben, ben you?" said George; "then you can't have noue of my sheep." At one of the fairs where Mr. Adney exhibited his sheep, the late Prince Albert visited the show grounds before the general public was admitted. Coming with a number of other distinguished persons to Mr. Adney's pen, he stopped to examine the sheep, and called particular attention to their peculiar merits. George was greatly excited, and as the Prince dwelt first on the importance of this "point," and then on that, he could hardly control himself. At length the Prince alluded in high praise to one of the best features of the sheep, when George could hold in no longer, but gave the Prince a hearty slap on the back, exclaiming, "You ben a judge of sheep, you ben."

The Shropshire-Downs are of a mixed origin, and it is doubtful whether they are entitled to be regarded as a thoroughly established breed. They have many excellent points—will fat more easily than the South-Downs, and their mutton is of better quality than the Leicesters, though not equal in this respect to the South-Downs, while their wool is now not as valuable as that of the Leicesters, Lincolns and Cotswolds. There have been several importations of Shropshire-Downs into the United States and Canada during the last dozen years, but I do not know how they have succeeded.

The Deacon has always condemned my steel plows; and I do not know of anything that surprised or pleased me more than to find that this spring the Deacon was plowing with a steel plow. He still contends that for plowing hard, dry land, the cast-iron plow is the best; "but," said he, "I must say I never had a handler plow for putting in spring crops." I shall next expect to see the Deacon bringing home a load of two-inch pipe tiles, and commence ditching. He has very decided opinions of his own, but, like other sensible men, the Deacon will adopt a new thing when he is convinced of its value.

My English friend is satisfied that no ammonia is escaping from the manure heap, and yet it is not covered with soil or any other absorbent. We pump up the water that soaks into the tank back on to the heap, and I never saw manure ferment better. There can be no loss either from leaching or evaporation, and it will be in capital condition for root crops or for top-dressing meadow land after hay harvest.

The high wages and low price of produce are having their legitimate effect. Farmers are employing much less labor than formerly, and putting in fewer crops. And I never knew so many farms being let out to "work on shares." In the present condition of affairs, this is perhaps the better plan, but rented farms invariably deteriorate. As long as labor is so high, we must lessen the quantity of plowed land, and especially of hoed crops, and increase the area in grass and clover. This will make the land richer, and in the end we shall grow as much grain on far less land, and consequently with far less labor. I think this will be the solution of the difficulty.

#### Manure in Illinois.

A correspondent of the American Agriculturist at Decatur, Ill., writes: "I presume you do not often have Illinois farmers write you concerning manure. I have for three years hauled all the manure I make upon my meadows, and find that the amount of grass is nearly doubled; and not only this, but during our dry, hot time in summer, the grass on land manured looks greener, and the ground seems to retain moisture better. From this experience I am led to think that our land, which in grass (clover and timothy), usually requires three acres to the bullock, can be improved so that two acres will carry a bullock, and do it finely; and I would ask you if, in the event I continued manuring my apparently rich, black prairie soil, there is a likelihood of one acre carrying a steer? On corn ground the manure appears to show its effect more the second year than the first, and, as we corn our land constantly, is there not a great chance for all of it to need manure? How much some of your Eastern farmers would like to be situated as we are. A number of men here buy and feed many thousand bushels corn, and feed it on their farm with what they raise, and the manure from all could be applied to the grass and corn ground; but few make any use of it."

Remarks.—We should be glad to hear from our Western readers in answer to these questions. Top dressing is unquestionably a grand means of enriching grass land; and the advantage is not merely the absolutely greater quantity produced during the season, but in the improved quality of the grass, and in giving a more steady growth throughout the season. We have observed the same effects as our corres-

pondent. Top-dressed grass will keep green, and afford a fair bite during periods of drouth, when the grass on ordinary pastures is dried up. We do not think that the grass on the rich, black prairie soils is likely to be as fattening as that grown on the rich, clay, permanent pastures, known as "builook land." But where corn is as cheap as it usually is in Illinois, this defect may be advantageously obviated by feeding the steers a little corn every day while grazing. We believe the time is coming if not already come, when the farmers of the West will find it highly justifiable to save and apply all the manure they can make.—ED.

#### Large Turkeys and Turkey Breeding.

A passion for extra size is one of the weaknesses of the American mind. Fat men's clubs show the national drift. In what other nation would it be possible to associate men simply on their avoirdupois merit? Where else should a man be most highly considered, because he could show the most adipose matter laid upon his bones? In the decisions given at our fairs, weight is not only an important item, but the one thing needful. In a scale of one hundred points, weight would be the equivalent of fifty, in the minds of most judges. It is the big swine, the big pumpkin, and the largest fat ox that takes the premium. Economy of fattening, or the process of production, is seldom inquired after. The same bad taste is likely to affect the decisions in our poultry shows, unless the managers insist upon a more wholesome standard. A large, well-developed bird, of maximum size, is desirable. A monster is not, for any conceivable purpose, except to excite wonder and draw the crowd. We raise poultry chiefly for the table. What the producer wants in his stock is good quality of flesh, early maturity, and capacity to make the most flesh out of a given amount of food. A turkey, weighing fifteen pounds, is just as good for the table as one weighing thirty; and most housekeepers would prefer them under twelve pounds. In most markets the lighter weights would bring the higher price. It is only in the region of large hotels and boarding-houses that the very large birds bring an extra price. For what object, then, do we want large breeding birds. and how large do we want them? It takes about three years for a turkey to attain his largest weight. If at twelve months a gobbler reach thirty pounds live weight, at two years he would reach thirty-five, and at three years forty, or a little more. But it is rare to get a male bird above forty pounds, and then it is generally by some process of stuffing that destroys his stamina and oftentimes his life. This weight is excelled sometimes; but about the time one thinks he is almost sure of a forty-five pounder, the prodigy sickens and dies. It may be assumed, then, that forty pounds is about the limit to which a vigorous turkey-cock may be safely carried, and from half to two-thirds of that weight is the last safe limit for the hens. With breeders of this size, and a little under, we will get large, strong chicks, that will economize food, and mature earlier than the offspring of common-sized birds. No bird vields more quickly to treatment than the turkey. The influence of a large-sized gobbler in a flock is immediately visible in the increased size of the chicks. The introduction of wild blood increases the hardiness of the young. A larger proportion of the eggs will hatch, and a much larger number of young will be likely to grow

up. With a little painstaking it is quite easy to breed to any desired shade of plumage.

#### Mr. Crozier's Pig-pens-

Mr. Wm. Crozier, of Beacou Stock-Farm, Northport, L. I., has a range of pig-pens seventy

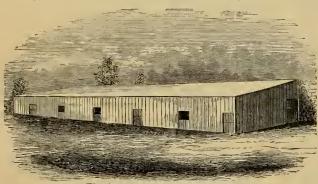

Fig. 1.—ELEVATION OF PIGGERY.

feet long, and he is so well pleased with the plan that he proposes to enlarge it to two hundred feet. The elevation (fig. 1), the ground plan (fig. 2), and a view of the interior of the building (fig. 3), show the simple arrangement. The building is placed against a bank, which has a brick retaining wall that answers as the rear wall of the building, and is 9 feet high. The tneky "Blue-grass," assumes so dark a hue, that it has been named Blue-grass. The soil of Kentucky is so well adapted to its culture, that it has been supposed to be a species peculiar to that State, where I have seen it from two to three feet high in the seed-stalks, with long parallel, sided blades two-thirds as tall. I

sent a specimen to a competent botanist, but he pronounced it the same as that bearing all the above names. It is very widely diffused over the northern parts of the world. I have seen it at St. Paul, in Minnesota, in Cleveland, Ohio, in England, all Northern Europe, and as far as St. Petersburg, Russia, sixty degrees north latitude. In Tennessee and Arkansas, and further south, it grows poorly, and is soon killed out by grasses better suited to the soil and climate.

It is highly nutritious and adapted to grazing and ornament; but it is hard to cut, and difficult to cure as hay. It is said to pass uninjured in its seeds through the stomachs of cattle; and thus it has gone, it is said, west with civilization. In Virginia, Kentucky, and parts of Missouri, upon limestone, clay, and loam, it is self-propagating, and masters all other plants and grasses.

I have in Kentucky frequently wintered stock upon it without other feed. But where it is designed for winter use, it should be allowed to grow undisturbed from midsummer until cold weather. As its

tween the palms of the hands, appear of a long oval shape, wax color, and hard. The seeds are easily injured by heating in bulk; and it is surest to buy those in the cut-up seed-stalks, which are thus better aired. Good seed, when thrown

upon live coals, makes a sharp, crackling noise.

Sowing .- In woodlands, after the fallen leaves are burned or removed, the seed may be sown broadcast upon the snow any time after February, or sooner; the freezing of the ground and its thawing in early spring will sufficiently imbed the seed. The brushwood and weeds should be kept down until the seed is ripe, in the second year, when the lands may be safely grazed.

Lawns.—In making lawns, the ground, if clayey, should be well underdrained, deeply plowed, or spaded, all large stones, stumps, etc., removed,

and the surface made level and clear of clods by the harrow or other means. The Blue-grass seed, mixed with timothy, clover, or other grasses, in small quantities to shade the tender shoots, should then be sowed broadcast with the hand; and then the ground should be smoothed with a heavy roller. In the Middle States the fall is the best time to sow, on account of the hot spring-time; but in New York, and further north, perhaps, early spring is better. I say nothing about the quantity of seed, as it is marketed in a clean state, in the chaff, beaten from dew-rotted stalks, and cut-up stalks and all, in a feed-box, and also stripped by machinery or the hand from the standing grass. Other things equal, the more seed the better; but as this grass spreads readily from the roots, it will soon fill the whole surface of the ground.

Culture.—In sandy soils, there should be a heavy top-dressing of lime, clay, and vegetable manure, before plowing; stable and other hot manures should not be put on until the grass is well sodded; and then only in the late fall, winter, or early spring. The grasses sowed with the Blue, should be cut off with the scythe; but the lawn should not be grazed until after the Blue-grass seed are ripe, the second year, when it may be cut or grazed. After this, the sward may be kept down smoothly with a scythe or mowing machine; but I would recommend the suspension of that operation during a drouth and the late fall, so that the blades may better protect the roots during the summer heat, and give the sod an earlier start in the spring. White clover being a low plant and of similar habits with this grass, may be sown with it-but to me no green-sward is so beautiful as the unmixed Blue-grass. C. M. C.

APPARATUS FOR COOLING CREAM.-Much of the ease of butter-making depends upon having the cream at the proper temperature. If the

CROZIER'S MILK-COOLER.

cream is shown by the thermometer to be warmer than 62° or 63°, it should be cooled to that point. The cooling is usually accomplished by setting the vessel containing the cream in cold spring-water or ice-water. A very rapid and effective method of cooling a large quantity of cream, is to use a vessel like that shown in the engraving. It is a tin can, about 31/2 inches in diameter and 20 inches long. This, being filled with broken ice, is moved about in the cream until the temperature is sufficiently reduced. As the cooling medium is moved through the cream, not only does the cooling take place rapidly, but the agitation causes the cream to be of a uniform temperature throughout the whole. It is not a slight advantage that this cooler is merely a plain cylinder, and as its exterior surface only requires cleaning, it is likely to he kept

sweet. In cold weather, when it is necessary to warm the cream, the same implement is used, but in this case, hot water takes the place of ice.

A BOTTLE FOR DOSING ANIMALS.-The engraving represents a tin bottle with a curved

DOSINO BOTTLE.

neck, made for the purpose of administering a dose of medicine to a horse. glass bottle is commonly employed for this purpose; but one made of tin is altogether

safer, being not liable to be broken, and more convenient, and, being kept for this purpose alone, it is always at hand, when required for use.

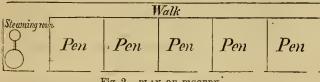

Fig. 2.—PLAN OF PIGGERY.

building is 16 feet wide, with the front side 61/2

feet high. The pens (see fig. 2) are  $12 \times 10$  feet, and 3 feet high, with a 4-foot walk at the rear of them. The doors, of which each pen has one opening into the yard, are in halves. The upper half may be left open to admit light and air, while the lower one is kept closed, if it be desired, to prevent egress. At one end of the

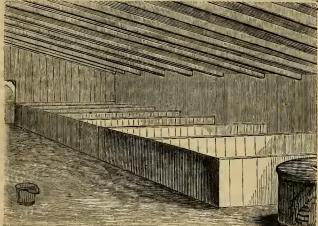

Fig. 3.—INTERIOR OF PIGGERY

building is a room furnished with apparatus for steaming food. The feeding is done from the walk, the food being placed in small portable troughs, which can be readily cleaned.

#### Blue-grass.—(Poa pratensis).

I have been so often asked about this grass, that I say a word about its history and propagation. In the latitude of Virginia, say from thirty-five to thirty-eight degrees north, the Poa Pratensis, English "Green-sward," or Ken-

#### A Hay-rack for a Farm-wagon.

In a recent visit to Beacon Stock-Farm, at Northport, L. I., to inspect Mr. Crozier's pigs and piggeries, we saw several farm appliances which may be new to many of our readers. We

Fig. 1.—HAY-RACK SEEN FROM ABOVE,

present illustrations of a hay-rack, a tin bottle for administering medicine to animals, and a simple contrivance for regulating the temperature of cream. The hay-rack is intended to be used with a common farm-wagon. Figure 1

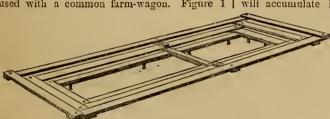

Fig. 2.—HAY-RACK IN PERSPECTIVE.

is a perspective view, and figure 2 shows the same thing looked upon from above. Four joists, to correspond with the length and width of the wagon-box, are taken as the foundation. The shorter or end-pieces are laid upon the longer or side-pieces, and firmly pinned to them. The end-pieces project far enough beyond the side-pieces to receive two boards, which run parallel with the side-pieces; these boards are long enough to allow two end-hoards to be secured to them, and these end boards in turn support two more long boards, and the whole is finished by the addition of two boards for end-pieces. It will be seen by the figures that there are three tiers, one of joist and two of boards, laid up cobhouse fashion, each tier being larger than the one beneath it by the width of a board. A piece across the joists in the middle, and two short pieces at the center of the planks, give the requisite stiffness. The rack is held in its place upon the wagon-box by means of wooden pins, driven into the joists at such distances as the size of the box requires.

### The Art of Making Good Butter. BY MRS. GEO. WOOD, OF WILLIAMSPORT, O.

Milk.—First, you must have good, healthy young cows. They require good food and uniform feeding. They should be salted twice a week, and have fresh running water daily. Second, the cow must be milked as thoroughly and as rapidly as strength will permit; then, after standing 5 to 10 minutes, she must be stripped, so that she will be left dry; for a pint of strippings will make far more butter than a gallon of the first drawn milk. The milk should be strained immediately. My experience is, that a large two-gallon stone crock is best for setting, and should remain standing for 48 hours in moderate temperature (about 60°) before skimming.

Cream.—Churn every other morning in cool

weather, but, when warm, churning should be done every morning, and the cream kept in as cool a place as possible; also, put a large lump of ice in the cream over night, which will have no effect on the butter; but if the ice were put in the butter, it would spoil it. The milk should

be skimmed every 24 or 36 hours. I place the crock of milk in water from 8 to 10 inches deep, when the cream rises in the above-stated time (24 to 36 hours), and the milk seldom gets sour.

Washing and Cleansing the Utensils.—The only method I know of, that will thoroughly cleanse milking-vessels, is, to add to 10 gallons of water a half gallon of clean, strong woodashes, and let it come to a boil; wash the stone crocks in warm

water, then run them around in the boiling lye, and wash in warm water. This process will do for the buckets, ladles, the churn, etc. No other mode will purify the rancidness that will accumulate in a dairy. After washing

and rinsing the crocks, expose them to the air and sun; they will be as sweet as when first brought from the store. Once a month will be sufficient for this cleansing. All good dairywomen know that the utensils should be washed in boiling water after using.

Churning.—My plan is to never let the cream stand over 48 hours after it is skimmed, and I find no difficulty in churning. In midwinter, proceed as follows: Stand the cream near the fire, where it will become quite warm; then let

it cool rapidly; add more cream the next skimming, and so on until the fourth skimming. Let it stand all night, and in the morning scald out the churn before using. In case the cream is too cold. add a little boiling water. When the churning is finished, the butter should be drained and well worked; and on no account should the butter be wash-

ed, for this reason: if you wash butter, it will get strong in half the time it would by extracting the milk without washing; it must be worked out, or the butter will soon become rancid.

Salting. — To 12 pounds of butter use a pound and a half of salt, well worked in, and put in a cool place until the next morning; then work again, working out the brine which will accumulate, which is almost equivalent to the amount of salt put in. If the butter is made for packing

purposes, work it the third morning, and make into rolls of convenient size.

Keeping.—The best mode I ever discovered is to make each roll separate, wrapping a clean thick cloth around it tightly, then place in a tub as tight and close together as you can; cover with a brine, which is made as follows: To 5 gallons of spring-water, add 5 lbs. of coarse salt, 2 oz. of saltpetre, 8 to 10 oz. of the best loaf-sngar, all well dissolved. This should cover 100 lbs. of butter, and preserve the same for six months or more.

Coloring.—I have never found it necessary to use anything to color butter, but by observing the preceding rules, in summer and winter, have always had good golden butter. This is the experience of the past 18 years of farm life.

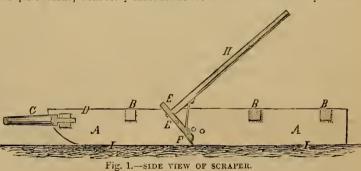

Butter for market should be made into rolls of convenient size—say 2<sup>1</sup>|<sub>2</sub> lbs. in a roll, and confined in a thin muslin cloth, rinsed in saltwater, then placed in a tub, around which should be a woolen matting.

When the above process is used, you can send butter one hundred miles in midsummer, and it will keep better than if packed in ice. I would say, for the benefit of the farmers, that they cannot take 12 or 15 head of cattle (and give them all the feed they can possibly eat), and make half the money off the feed that they could with that number of cows. Then, butter-making is the most healthy exercise a person can take while the warm air that arises from a bucket of fresh milk is worth more than all the beverages ever produced. It would be well for young ladies to profit by this.

### A Scraper, or Ground Leveler.

BY SAMUEL T. VARIAN, PLAINFIELD, N. J.

A beautiful lawn or meadow is one of the most attractive features of the country.

A, A, Runners, two-inch plank, twelve feet long, twelve inches wide; B, B, Braces between runners; C, Pole for horses; E, Scraper, two-inch plank, fifteen inches wide, with tenon on each end to enter angur-holes, in runners forming axis, upon which the scraper works; F, Iron or steel plate let in finsh with scraper; G, Iron plates or battens to prevent splitting; H, Handles to operate scraper; I, Iron shoes; I, Platforms on which driver and operator stand.

The expensiveness of a nicely graded surface, produced by ordinary means, prevents many persons from doing what would afford to themselves and others a vast amount of pleasure.

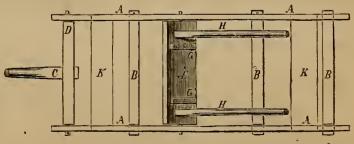

Fig. 2.—Plan of scraper.—the lettering the same as on fig. 1.

Farmers would be amply repaid for a little extra work in smoothing off their land, when in

a friable condition, by the increased facility of gathering crops from an even surface.

The lack of knowledge as to how this object can be easily and cheaply accomplished, prompts me to offer a simple and very effective device for this purpose. I have used it several years, and with suck satisfactory results, that I deem it an almost indispensable implement.

For lawns, meadows, ball-grounds, or race-courses, when carefully managed, it has no superior: the only requirements being mellow ground, free from stones or other obstructions. A sod, well turned under, does not interfere with its operation. The advantage of the adjustment of the scraper between two runners, or straight edges must be obvious. The removal of scraper leaves a good sled for the winter use. For rural improvements it is no less valable than is the jack-plane to the carpenter.

#### Butter from Devonshire Cream.

There is a custom of sealding cream prevailing in Devonshire, England, which is worthy of a wider extension. The product, "clouted" cream, also called "Devenshire" cream, is exceedingly rich, thick, and palatable, and is accounted a luxury wherever obtainable. The process is the following: the milk is allowed to stand in the dairy, which must be too cool to allow it to sour, from twelve to twenty-four hours-that is, the milk of one day is attended to on the following morning. It is set in tin pans about seven inches deep; these have a good handle at each side as a help to eareful moving. Most of the cream will have risen at the time of the preparation, which consists in sealding simply, eare being taken not to allow the milk to reach the boiling point. The best way would be to set the pan in gently boiling water. The heat must be kept up until the milk becomes very hot, and the cream thoroughly "crinkled" or clotted; the pan should then be removed carefully to a cool place, and allowed to stand undisturbed for twenty-four hours. The cream may then be removed, and, either fresh or salted, it is an excellent substitute for, many think a great improvement upon, butter. It is especially important that there should be no smoke in the apartment where the scalding is done.

This is Devonshire cream, a delicious article for home consumption, but one for which there exists no market demand in this country. The chief value of the process, for American farmers, lies in the fact that it is an excellent preparatory step in the making of butter. It secures all the cream, gives it such a consistency, that skimming is much easier and much cleaner-that is, there is less milk taken, which enables it to give up its butter with remarkable case. Indeed, it is only necessary to rub the cream with the hand for a few minutes in a smooth wooden bowl to separate the butter entirely, ready for washing. For each pound of butter there remains not to exceed a half-pint of buttermilk. This does away, almost entirely, with the labor of churning, and with the handling of an immense bulk of buttermilk, and its difficult removal from the butter by washing or otherwise. When properly made, the quality of the butter is excellent; and there is the advantage, that the skimmed milk remains sweet and fit for use, or for the manufacture of "lean" cheese.

We do not pretend that the foregoing is a complete description of this mode of making butter; and we warn all readers not to blame as if they fail to get good results from their

first experiments. We have merely sketched out a process that is in successful use in many parts of England and Scotland, and that promises advantages for us, and we must leave the details of manipulation to be learned by experience. It is an exceedingly simple system, but it needs practice to teach the exact point to which the milk should be scalded, and to settle the question of temperature, frequency of churning, etc.

Since the above was written, we have had a talk with an English lady who has had experience in the matter. She says the two great things to be guarded against are (1), agitation of the milk in handling the pans; and (2), too rapid heating, or heating for too long a time. The pan should be set over a slow fire, or over, or in, boiling water, and watched until the cream begins to contract so as to leave the sides of the pan; then the center of the cream should be punetured by a sharpened stick (wood is better than metal for this purpose); if the hole made becomes larger, showing a contraction of the cream in the center as well as at the sides, then it is time to remove the pan from the fire. She also says the knack of the thing is easily learned by a careful person, but that it should not be left to ordinary hired help.

## Mineral Fertilizers — Why they are Needed—Analysis of Wheat.

BY W. S. WARD.

So much has been written in defense of a regular and judicious system of fertilizing, that it is not the intention of the writer to attempt any further support of claims, which are doubtless recognized as sound and just by all intelligent farmers; and yet careful personal observations have but strengthened the conviction, that the recognition of these claims would be more general and hearty did there exist a better understanding between the agricultural chemist and the practical farmer. It is with a view to promote this mutual respect and confidence that we ask you to join us in our laboratory-the chemist's workshop-that we may pursue together a few of the investigations on the results of which the chemist founds his theory of mineral fertilizers, while we on our part stand ready to accept any suggestions which your experience as practical farmers may render worthy of consideration.

We have, for instance, propounded to us the question, "What mineral substances are most needed to increase the yield of wheat on any given soil?" Were a farmer to be shown a well-fattened and finely-developed steer, his first inquiry might naturally be respecting the kind of food upon which the animal had been fed. Let us, then, take in hand a few full and well-rounded wheat-grains.

And since he upon whose lands they were grown can give little information beyond that which relates to the season in which the seed was planted, the general character of the soil, etc., we must therefore propound any questions respecting the quality and quantity of the food they consume to the grains themselves, and how clear and satisfactory will be the reply, let the chemist's crucible and balance determine.

Since it is not our intention to discuss in full the nature or authority for the present system of chemical analysis, our readers must take for granted that certain results are sure to follow when we comply with all the conditions named.

As the head of wheat is formed at the top of

a long, slender stalk, each kernel inclosed in a leafy shield, which afterward becomes the chaff, and as previous investigations have taught us that the leaves of plants, like the lungs of animals, have the power of drawing from the air

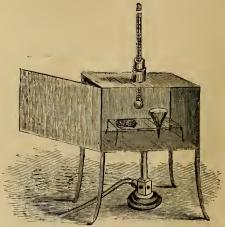

Fig. 1.-DRYING APPARATUS.

such food as their growth requires, when that food exists in a gaseous state, it is therefore proper that we first determine what proportion of the grain is capable of assuming this gaseous form, which is done by burning it in a low, open platinum dish, called a capsule. Having, therefore, weighed our dish carefully on a balance so delicate that it will easily weigh the finest hair, we will fill it with the well-cleaned grains and weigh again; the difference will represent the weight of the grains to be analyzed.

In order to remove the moisture from any animal or vegetable substance, it is only needful to heat it for some time at a temperature of 212° Fahrenheit, since at that point water, as we know, becomes steam, and passes off. This heating is done in a sheet-iron box, and lest we burn the grains before the time, a thermometer is inserted into the top; the lamp used is that known as a Bunsen burner, in which common air is combined with gas in such a way as to

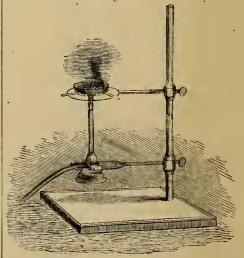

Fig. 2.—BURNING IN PLATINUM CAPSULE.

produce intense heat. The form of this "drying apparatus" is shown by fig. 1.

After heating for about six hours, we remove the capsule and weigh again; the loss in weight will not vary far from 12 per cent of the whole. Let us now place the capsule on a platinum triangle, supported upon a movable ring, as shown in fig. 2, and heat by means of the same lamp, applying the heat slowly at first.

To enumerate all the changes which take place when animal or vegetable matter is burned, would introduce us into the department of organic chemistry, in which the methods of analysis, though certain and beautiful, are too complex to be clearly demonstrated here; it is enough to say, that during the first stages of the combustion, and while the heat is compara-

Fig. 3.—BEAKER. Fig. 4.—EVAPORATING DISH.

tively low, the nitrogen is driven off; nitric acid and ammonia being formed, both of which remain suspended in the moisture of the atmosphere, from whence it is returned to growing plants through the roots or leafy lungs. Before increasing the heat, let us examine our grains. They have become black, and resemble small lumps of charcoal, which is one of the forms of pure carbon, and as carbon is the principal constituent of all animal or vegetable substances so far examined, we have a right to believe that it is also present in the wheat-grains; but there must be no guessing in so important an investigation; hence we will settle the question by actual experiment. It has been previously determined that when pure charcoal is heated in the open air, it will slowly disappear; the earbon uniting with the oxygen of the air, forming carbonic acid gas, which plays the same part in the vegetable economy that oxygen does in the animal. Now there are certain tests by which the chemist can determine whether a gas be carbonic acid or not; we apply one of these tests to some of the gas collected from above the burning grains, and it answers the reaction, as it is termed; hence we know that the substance which remained after the first burning was chiefly carbon. We say chiefly, because we will discover, after burning all the carbon off, that there remains behind a grayish white powder, which is not reduced in quantity or changed in color by continued heating. After removing the lamp and allowing the capsule to cool, we weigh it again; the amount not consumed will be found to be about 3 per cent of the whole, and we call it inorganic or mineral matter.

Since the question which engages our attention relates particularly to those mineral substances most needed in a general fertilizer, we will proceed at once to analyze this grayish powder, which contains all the involatile constituents of the wheat-grain. It is evident that in order to conduct an analysis of this character, it is desirable that the substance under examination be reduced to a fluid state—that is, that it be dissolved in some suitable solvent. Now, as it is probable that this powder contains some substances which it may be difficult to dissolve directly in pure water, we will remove it from the capsule to a glass vessel, called a beaker, and having poured over it some strong muriatic acid, place it upon a thin iron plate containing sand, over the flame, and supported upon a stand, as shown in fig. 3.

When the last traces have disappeared, which may require several hours of continued heating,

we will transfer the acid liquid, which contains the powder in solution, to a saucer-shaped porcelain evaporating dish (fig. 4). The cason for this second operation will be apparent when we state, that among the most frequently present of all mineral substances is silica, which appears in its pure state in the quartz crystal, forming also the chief constituent of sand, and therefore existing to a greater or less extent in all soils. It is this which gives to wheat-straw its gritty feeling, while the surface of those peculiar reeds, once used for scouring, is, as it were, paved with it. Since of so general occurrence in the soil, and as it is also found in the animal system, it is natural that we apply a test to answer if any has found its way into the wheat-grain, and, if so, we will remove and weigh it. In order to determine this, it is necessary to evaporate our solution to dryness in the manner indicated in figure 4. When all the free acid has been driven off, the solid substances, including the silica, will remain in the dish as a white powder; we now add more of the acid and water, when, if there be silica present, it will not dissolve a second time, but remain so mixed with the liquid as to require another process for its removal. This is effected by pouring the liquor upon a filter of unsized paper, carefully fitted into a glass funnel. To effect this transfer

Fig. 5.-FILTERS AND FILTERING.

safely, a glass rod is used in the manner shown in fig. 5, which also shows the form of the paper filter, and manner of folding.

When the liquor has all passed through the filter into the beaker beneath, pure water is added by means of a chemist's wash-bottle, in order to wash out from the paper any of the remaining fluid, and leave the silica on the filter pure and clean. The funnel is then carefully covered, and placed in the drying-box (fig. 1), and when the filter is dry, the silica is carefully removed by means of a feather to an ordinary watch crystal, and weighed, when it will be found to represent about 3 per cent of the whole weight of the ash. We now return to the liquor contained in the beaker, and add to it enough liquid ammonia to neutralize the acid, and then a small amount of oxalic acid in the form of oxalate of ammonia. After boiling and allowing to stand over night, a white powder will be discovered at the bottom, which is oxalate of lime. We remove this by means of the filter, as we did the silica; its weight will indicate about 3 per cent of lime. By the same general method we might remove the phosphoric acid, potash, magnesia, etc., and our final report would be very similar to the following

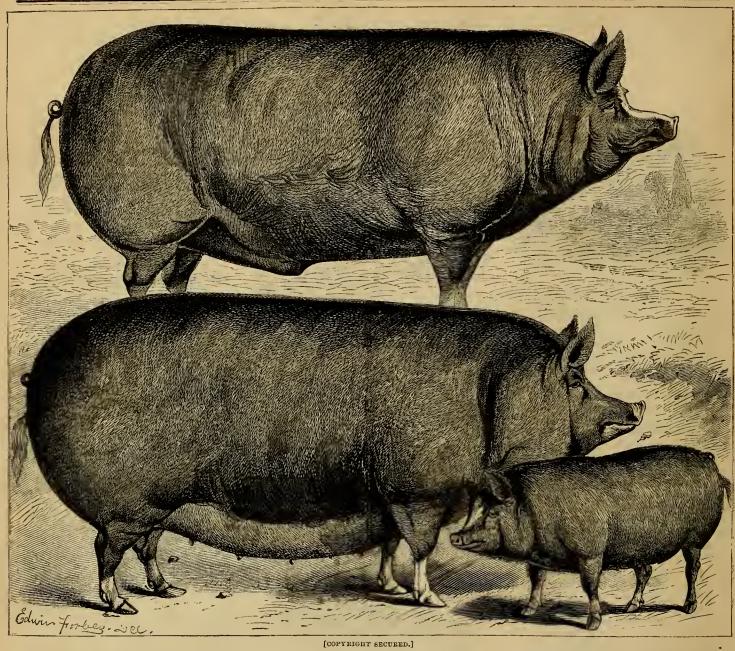

Having once decided the question as to what mineral substances are represented in the wheat-grain, and knowing the relation they bear to those which are found in the body, the conclusion naturally follows that what the body gets from the grain, the grain must obtain from the soil; and as frequently this soil contains but a limited amount of the desired substances, it is evident that in order to secure a healthy and vigorous growth, due attention must be paid to this demand. It is with these facts in mind that the intelligent farmer resorts to the application of "mineral fertilizers,"

#### The Management of Clover Hay,

Clover should be moved as soon as it is well in blossom. There is no necessity to wait for a brown head; there will be plenty to be seen before the crop is well down. Cut when the dew is off, and allow to dry until afternoon, when it should be shaken up and turned before the dew falls. If a tedder is employed, its constant use will fit the clover to be put in cocks the same day. If turned by hand, it may lie until the noon of next day, when it may be put in cocks, made as high and narrow as possible; they will shed rain better in this shape, and, if caps are used, a yard square will be sufficiently large to cover them. Caps are to be strongly recommended, and the above size is sufficient, as the top only needs protection. Put up, and, thus protected, the hay may stay in the field until it is all made, when it may be hauled together. If any cock should be damp inside, spread for a few minutes; it will dry rapidly. Clover cured in the cock is much more valuable than that dried in the sun, and wastes less in handling. Put away the first cut hay by itself, in a place convenient for use in the spring. Cows coming in early in the spring will thrive on this hay; the milk will be largely increased in quantity, and be richer in quality, while the butter will come easily, be free from white curdy speeks, and in color will not be far behind that from June grass.

#### Sowing and Curing Corn Fodder.

Corn, planted after the first week in June, is likely to be caught by an early frost and injured. Rather than plant later than this period. it would be much better to sow it for fodder. One acre sown with three bushels of corn, in drills three feet apart, and kept well cultivated, will yield as much feed on land of equal quality as three acres of clover or grass. We have heard of nine tons of cured fodder being taken from a single acre. Of course this must have been on exceedingly rich land; but why could not any farmer make one or two acres rich enough to do this for himself? We have cut at the rate of four tons per acre, and the crop did not look well enough to satisfy us. If the seed is dropped at the rate of twelve grains to the foot, and twelve cured stalks weigh a pound, which they should do if five or six feet high, and as thick as one's little finger, the crop would yield nearly seven tons per acre. A little care, and plenty of manure, would secure this result. As soon as the blossom appears,

BERKSHIRE PIGS, BELONGING TO WM. CROZIER, ESQ., BEACON STOCK FARM, NORTHPORT, L. I.—Drawn and Engraved for the American Agriculturist.

the stalks should be cut up or cradled, and permitted to lie for a couple of days to wilt; they may then be gathered into small bundles, tied up, and shocked, well spread, and opened at the buts for the admission of the air. This is an important point. Corn-stalks, thus grown, will contain much sugar, and need to be perfectly well cured, or fermentation will set in and sourness and mold occur. When sufficiently cured, the stalks may be stacked or put away in the barn. They will need a ventilator in the shape of three rails, with short pieces of boards a foot long nailed to them, to keep them apart and make a sort of pipe. This must be set up in the center of the stack, and the stalks placed round it, buts outward. If they should be put away in a mow, two such ventilators must be provided. The top must be kept open, or only lightly covered, as much damp air will escape. Such fodder will be found equal to ordinary hay; in fact, better than most hay. Cut up with a stalk-cutter, wetted, and sprink.cd with a handful of meal-or corn and oats ground together-for each head of cows and calves, and a bushel basket of the mixture given at each feed, it will carry such stock through the winter in excellent condition.

Milking cows will improve by changing to such feed. Working horses may be kept in good condition on three quarts of meal and a bushel of fodder at a feed, equally well as on hay and grain. A still greater economy might be secured by steaming; but with a small stock, and on average farms, this process is impracticable.

#### Berkshire Pigs.

The Berkshire and the Essex are both black breeds, each of which has its advocates and admirers, who claim that the Berkshire or the Essex, as the case may be, is superior to any other breed. The chief use of these thoroughbred animals is to cross with and improve our common stock; and for this purpose, if the boars be thorough-bred, it makes but little practical difference which breed is chosen. In England, where the breeds originated, the Berkshire is preferred for furnishing hams and bacon, while the Essex is considered the best for fresh pork. Crosses of either breed, with good common sows, produce pigs much "refined" in form, and able to fatten rapidly, while at slaughtering they yield a minimum amount

of offal. We present an engraving of two of Mr. Crozier's imported Berkshires, with a small pig born in this country from imported parents. The Berkshires are covered with long, silky hair, and in the best examples, have four whitefeet, a white spot upon the forehead, and white on the end of the tail: all the rest being black, save a very small amount of white behind each shoulder. The Berkshires-and the same may be said of other pure breeds-have only within a comparatively few years been appreciated in this country. They were introduced here some thirty or forty years ago, at which time there was a great excitement over the breed, and specimens sold at enormous prices. Our farmers had not learned, that these animals. had reached their then state of perfection, through the greatest care in breeding and keeping; and when these high-bred animals were subjected to the treatment given ordinary swine, they disappointed their owners, and the breed fell into disrepute. Doubtless, since the first introduction of Berkshires, the English breeders have much improved the breed; and the specimens now in the hands of our own stock fanciers, are much superior to those about which so much was said thirty years ago.

#### Field Culture of Lima Beans.

The cultivation of the Lima, the most delicious of all beans, is principally confined to the home and market garden. The price always ranges high, from eight to fifteen dollars a

in devoting a large breadth to Limas. The mature part of the beans will bring a large price for seed; and the immature, if properly dried, will bring nearly as much for table use in winter. The family grocers in our large cities always find it difficult to meet the demand for

have been much pleased this spring with the variegated Crown Imperials—the Golden and Silver-striped, as they are called. The variegation is well marked, and appears very lively in contrast with the dark-green foliage of the ordinary form. The plants with variegated foliage.

VARIEGATED CROWN IMPERIAL.

bushel wholesale, according to the character of the season. It is a little uncertain of ripening its seed, north of 42°, though it will mature fine pods for succotash much further north. The green beans, dried at any time before the frost strikes them, are even better for table use than those fully matured. The demand for Limas from the market-gardener is so brisk, that he usually sells his whole crop green in the pod, not always reserving enough for his own seed. The good housekeeper welcomes the first show of Limas upon her poles, and the pods are plucked as fast as they are old enough for succotash, and she is greatly astonished that there is not a brown pod for seed when the frost closes the season. Between the improvidence of cultivators in the region where the crop will fully ripen, and the inability of others in the narrow belt where nothing but green Limas can be grown, there is always a lively demand for good sound seed in the spring. In cool seasons the seed is scarce, and rules very high. In hot, dry seasons, like the last, more of it is matured, and the price is lower, but still about three times that of the best kidney beans. This peculiarity of the crop that we have noticed makes it a desirable one for farmers remote from market towns. If they are within the belt where the seed will ripen from onehalf to the whole crop, they are perfectly safe

this vegetable. We devoted a quarter of an acre to this crop last season by way of experi-ment. The land selected was a gravelly loam, in nothing more than fair condition; probably capable of growing thirty five bushels of shelled corn to the aere. It was manured with about two cords of barnyard manure and compost, planted the last of May, and treated very much as the corn crop through the season. The beans grew well, and gave four bushels and six quarts of seed, besides some sent green to market. The market wholesale price for the article this spring was eight dollars a bushel, or \$134.00 per acre for the crop. This is about three times what the corn crop would have been worth upon the same land with the same

of poling the beans, and of harvesting them, was judged to be an expense of ten dollars an acre above that of a corn crop. Connecticut.

manure. The cost

#### Variegated Crown Imperials.

The Crown Imperial is the monarch of spring bulbs. It lifts its stately head far above the Tulips, Narcissuses, and other humbler plants, and wears its floral crown with a royal air. Kings are but mortals, and Crown Imperials are not all perfect. The large bulb which we plant in autumn is about as repulsive in odor as a Skunk-cabbage with the cabbage omitted. The bulbs of the Crown Imperial should not be left too long out of the ground, as they dry up and become weakened, and probably this strong odor is a hint that they should be promptly earthed. In spring this bulb throws up a robust stem, clothed part of the way with luxuriant leaves; then a bare space of stem, above this a large whori or crown of pendent tulip-like red or yellow flowers; and, above all, a tuft of smaller leaves. These flowers do not show all their beauty until we examine them closely. Turn one of them up, and there, at the base, are six pearls-at least they look like pearls; but they are only drops of honey-like liquid, in a round cavity at the base of each petal. We

THE RHODORA.

age do not flower so freely as the others, sometimes failing to bloom altogether, and often producing flowers much reduced in size. Yet their foliage is so bright that they are worth growing, even if they do not flower at all. The engraving represents the markings as well as can be done upon such a reduced scale.

#### The Rhodora.

In the latter part of April, or early in May, the wet meadows of many parts of New England show fine patches of color, which are due to the flowers of a low shrub—the Rhodora Canadensis. The plant grows from one to three feet high, has very crect branches, each of which produces a cluster of showy rose-purple flowers. The leaves at flowering time are just appearing from their scaly buds; when fully developed they are narrow, oblong, pale-green above and whitish and downy upon the underside. The Rhodora usually occurs in clumps, with the stems growing at about the same hight, and thus in the mass makes a fine show. Viewed separately, the flowers remind one of the Azalea, to which the plant is nearly related. Though growing naturally in very swampy places, the Rhodora does well in the garden. The specimen from which the engraving is taken has been for some years in the poorest

and sandiest part of our grounds, yet it flourishes finely. It is usually recommended to grow this in "Rhododendron soil," which means soil with a considerable amount of peat mixed with it. It would probably grow better in such a soil, but we hope that the lack of it, will not deter any one from trying the Rhodora in any good garden soil. The name Rhodora is from the Greek word for rose, on account of the color of the flowers. Plants may be obtained from the native localities, and they are kept by some of the nurserymen.

#### Training and Pruning the Tomato.

The French method of pruning the tomato to a single stem, and keeping this tied to a stake five or six feet long, though not to be commended for general culture, has its particular uses. In localities where the season is too short to allow the fruit to ripen without extra care, this manner of training may be profitably adopted. In gardens in more favored climates, a few plants grown in this way will give fruit carlier than the general crop, and the specimens, as a general thing, will be finer. The

PRUNING THE TOMATO VINE.

objections to the method are, that it takes too much time, and the plant does not yield all the fruit it would if not so restricted; while with large varieties the clusters are apt to break away by their own weight, unless great care is taken to support them. To those who have leisure, the training will afford abundant employment, and the sight of a well-managed plant, loaded with clusters from the bottom to the top, is worth working for. As the tomato differs in its manner of growth from most plants, we give a diagram showing the manner of pruning. The majority of plants produce flowers either upon the end of the stem, or from the axils of the leaves. In the tomato, the flower clusters appear, not in the axils of the leaves, but considerably above them-about midway between two leaves. In pruning for this style of training, as soon as the first cluster of flowers a, or rather of flower-buds, shows itself, the vine is cut off above the next leaf, as shown by the line b in the diagram. The bud in the axil of this leaf below will soon push out a shoot c, which is cut off in the same manner, as soon as it is sufficiently developed to show the cluster, and in this way the cutting is continued until the desired hight is reached. Shoots will start from the axil of every leaf, but these must be kept cut off, which will be found no little task, and the stem must be kept carefully tied to

the stake with ties that will not cut it. The tomato is such a rampant grower that it will need daily care, if this method of training is strictly followed; and unless it is carried out, it had better not be undertaken.

#### Don't Sow too Early.

BY PETER HENDERSON.

A decision was rendered recently in one of the Philadelphia courts against the claim for damages made by Jacob Kessler, a marketgardener, who brought suit against Mr. Dreer, the well-known seedsman of Philadelphia, for having sold him Early York cabbage seed that "run to seed." The seedsmen of the whole country are indebted to Mr. Dreer, and no doubt will tender him their hearty thanks, for the grit he showed in standing a suit rather than to compromise, as the chances were more than even against him, the sympathies of the jury being most likely to be with the complainant in such a case. The ventilation of such a matter is exceedingly instructive to those engaged in gardening operations, as was shown by the facts elicited on the trial, the gist of which was,

that Mr. Kessler had sown the cabbage seed on the 5th of September instead of the 15th, and that error, combined with an unusually mild and growing fall, practically lengthened the season, so that the cabbage plants became "annuals" - running to seed within the year of sowing-rather than forming heads and acting as "biennials," as was expected of them. Now, just here an excellent lesson comes in with another vegetable. Most of our so-called scientific gardeners are English, Scotch, Irish, or Germans; they come here, most of them, with a thorough contempt for our rougher style of doing things (a practical style born of our necessities in the higher cost of labor); and it is next to impossible to convince one in a dozen of them, that

there is anything in horticultural matters here, that he needs to be informed of. Accordingly, if he wishes to raise celery, he starts his seed in a hot-bed in February, just as he would have done in England, and is astonished to find in July that, instead of forming a thick and solid stalk, as it would have done there, it spindles and runs to seed. If his knowledge of the art had been based on common sense, instead of the blind routine practice attained in a colder climate, he would have known our season-from April 1st to July 1st-would sum up nearly the same mean of temperature here as it would there, from February 1st to July 1st; and hence it was not only unnecessary here, but dangerous to the welfare of the crop, to sow such biennial plants as celery in any other place but in the open ground, and that not before April. It was just such an error that the market-gardener made who sued Mr. Dreer. He had been following likely in the English or German method, and paid the penalty not only of losing his crop, but losing his lawsuit, by not adapting his practice to our conditions of temperature. As the matter of sowing the seeds of cabbage, cauliflower, and lettuce to make plants to winter over in cold-frames, is one in which there is a widespread interest, I may here state that the

time of sowing in fall, in a country having such an area and difference of latitude as ours, is somewhat difficult to gauge; but taking the latitude of New York as a basis, the safest time we have found to sow is from the 10th to the 15th of September. Of late years we have inclined rather more to the latter date, and have even sown as late as the 30th September, with excellent success, in warm, well-sheltered positions, in a rich, well-prepared soil. In connection with this subject, I would refer to the evils arising from the too common practice of many of our agricultural and horticultural journals, of selecting from English papers articles that often seriously mislead. For example, a Boston magazine not long ago copied a long article from the English Journal of Horticulture, telling us, in a very patronizing way, how to propagate the golden tricolor-leaved geraniums. The writer laid great stress on having a sharp knife, and cutting the slip in a particular manner, then to insert it in silver sand, and a lot of other nonsense, that any boy of six months' practice here would have known was absurd; but, above all, the operation was to be performed in July! He might have got the sharpest knife that was ever made, and the purest silver sand that ever lay on the seashore, but he would have utterly failed in our climate, if he attempted the work in July. This is only one of scores of such absurd selections as we see yearly in some of our horticultural journals. If the conductors of such have not original matter to fill up with, better far that they leave their pages blank than to show their utter ignorance of what is suitable to our climate.

#### Gardening in Iowa.

BY A WESTERN MAN.

I was quite interested in an article on gardening by the author of "Walks and Talks," but we farmers in the West will but few of us take the trouble to prepare the ground as there directed. I will give you my plan, and, as it is not patented, any one may follow it who wishes: first, have two gardens, or a fence dividing the garden into two compartments, and have them well fenced. Now, to start with I have a few rules which, if they are not mathematical axioms, yet are important-1st, whatever is worth doing, is worth doing well; 2d, in order to have a good garden, the ground must be prepared the year beforehand; 3d, that in Western gardening, as in Western farming (or for that matter wherever land is cheap), the object is to raise as much as possible from a given amount of work instead of a given quantity of land. Now, for the preparation; we premise that every farmer keeps stock, and, as labor is scarce and high, we wish to bring it to our assistance, and have it help us to make our garden. We used sheep, as they are the best. As soon in the spring as the ground is dry, plow the land, and harrow down smooth, then yard the sheep; and if the yard can be adjoining the pasture, induce the sheep to take their "nooning" in the garden that is to be. No danger of its getting too rich, even on our black prairie soil. After it has lain about a month, plow and ridge up the ground, as is commonly done for sweetpotatoes, plowing as deep as possible with two horses; plow again, and make the ridges where the furrows were. It is better to plow thus as often as once a month, but it is quite important that it should be plowed in ridges as high as possible, just before it freezes up. Keep the sheep on eyen through the winter, provided

they are not fed on the ground with hay or fodder, that will make long unrotted manure. Do not allow stock to tramp the ground after it thaws in the spring. You now have the ground in a condition to make a splendid garden. The other garden or compartment is to be prepared in a like manner for the next year's use, thus using one of the gardens each alternate year. Of course perennials of all kinds will have to be allotted a separate place. I will not try to tell you of the crops that we raised on our sheep-yard, for we neither measured nor weighed but one of the crops, but ourselves and all that saw, were astonished. The one we did measure was "set onions," as we call them; or, as they are called by some, "top onions." This was a bed 8 feet wide and 30 feet long. From this we gathered 13 gallons of the top onions; 11 gallons we sold at 80 cents per gallon, and 3 bushels of the root onions, which were put away to raise another crop. I have not written this for publication, but that you might urge upon Western farmers a better preparation of their garden ground.

#### The Cabbage Pest. - (Pieris rapæ.)

BY W. V. ANDREWS.

The butterfly Pieris rapa, has become so common in certain localities, and is such a pest to farmers and gardeners, that it becomes a duty to offer a few words of warning to those not yet visited by it. Much may be done by persistent work at the caterpillars. From a patch of cabbage plants, about four yards square, I picked off over two hundred caterpillars, but, being unable to attend to the work continuously, left enough behind to devour the whole of the cabbage plants. But had everybody done as much as I did, what a difference in the number of P. rapæ would there now have been. so far as this locality is concerned! But, as I said before, the work must be persistently continued. It is one of the earliest of our butterflies, and brood after brood appears, up to September. And be it remembered that, although it prefers a nice little cabbage to almost anything, it does not consider itself bound to confine its ravages to that plant. Early radishes receive its attention, and in default of other food it does not refuse a little mignonette, of which fact our flower-beds bear ample evidence.

For those who have not seen it, I will give a brief description of the caterpillar. Full-grown, it is about one inch and a half in length, of a fine dark green. Sometimes a brassy line is visible down the back, and on the sides. Those on the sides, however, are generally broken up into spots, and none of them are ordinarily visible without close inspection. The pupa is green, with the usual protuberances, and is generally fastened to a fence, or other convenient place, by a silk thread thrown over the back. It remains about fourteen days in the pupa state, and then emerges to carry on its appointed task of reproducing its species.

In the butterfly state, as well as in the caterpillar state, it is one of the most assiduous of insects. By 7 o'clock in the morning it is well on the wing, and it continues its flight from flower to flower until late in the afternoon. It is useless to indulge in the hope that it may, in its butterfly state, be starved to death for want of food; for nothing comes amiss to it—it lives on Catnip, Boneset, everything in fact. But a patch of thistles is its paradise; and here, in Jersey, our farmers deal gently with the thistles. I have seen a patch of thistles, in flower, so

thickly covered by *P. rapæ*, that, at a distance, the flowers looked to be strongly variegated with white. A near approach does not frighten them in the least; so if the farmer should choose to try his skill in the art of throwing a butterfly net, I know of no opportunity that will afford him a better chance of capturing his game.

And it should be remembered, that this is after all the most effectual way of going to work; for capturing one female butterfly is equivalent to the destruction of a great many caterpillars. It may be well to look out for the first appearance of this butterfly in localities not yet visited by it. It is a small white butlerfly, about an inch and a half, or two inches, in the spread of the wing. The male has one black spot on the upper surface of the secondaries; the female has two. This is the most obvious difference. Both sexes have the top of the primaries of a brownish-black on the upper side, and a corresponding yellow spot on the under side. The under part of the secondaries is of a greenish-yellow. This description is sufficient for any ordinary observer; but it may not be unnecessary to say that there are varieties in which the whole of the ordinarily white portion is of a cream color.

It is almost useless to look for the egg of this insect, as it is difficult to detect, except by a great expenditure of time, but in the caterpillar, the pupa, and perfect state, it is easy to capture; and farmers and gardeners should assiduously endeavour to extirpate it, whenever and wherever found. It should be sought for in the caterpillar state when quite young, especially the second brood, which hatches out about the time the early cabbage is forming the heart; and it takes but a short time to enable the little sapper and miner to bury itself therein, and the plant is then unfit for market.

[In addition to the description of Mr. Andrews, we would refer the reader to the engravings of the insect in all its stages, given in the Agriculturist in Nov. 1870, page 422.—Ed.]

#### The Robin-What to do with Him.

-----

The robin is here with his mate, and a whole nest full of hungry young ones, just ready to fly. You heard his notes all through April and May, saluting the earliest dawn, bidding farewell to the twilight. True, it was not much of a song, but it was the best he had, and always at your service. You saw his house-building in the old apple-tree, or in the corner of the fence, most industriously carried on from the day that he wedded his mate. There was nothing very charming in the architecture, not much evidence in it of progress toward a higher type of bird life, as we compare it with the robin nests of two hundred and fifty years ago, but it was good, honest work, the best he knew, and it sheltered his young. Each one of those fledglings in the nest has eaten many times his weight of insects in the few brief weeks of his growth. If you have watched the operations of that household, you have seen the unwearied industry of the parent birds in procuring food for their young. It is nearly all animal food that they have consumed, taken from your blossoming fruit-trees and vines, just at a time when they were being most injured. They have had their fill of worms and bugs, and when they get out of the nest they will change their diet a little, and help themselves to your currants, cherries, raspherries, and grapes. All the small fruits will suffer, and some of the vegetables. And as the robin is a

connoiseur, he will take the best of your fruits. You cannot blame him for the refinement and delicacy of his taste. It will do no good to cultivate foxgrapes for him: he will not touch one of them until the best grapes are all gone. If you get any fruit in perfect order, you must put netting over it, or in some way make it a physical impossibility for the robin to touch it. We have tried the theory of raising fruit enough for yourself and the robins too. It is all theory and moonshine. There is no one to divide the spoil, and the birds, by virtue of their early rising, are always masters of the situation. It is very nice and humane to spare the birds for the sake of the insects they devour, and the possibilities of fruit they promise you. But what is the use of raising fruit if the birds take it all? So far as the reward of our labor is concerned, we are not profited at all by the slaughter of the insects. We have been studying Mr. Bergh, and think there is about as much cruelty to brutes in killing insects, as in killing birds. Only think of the hopes crushed in worm households by cockrobin and his mate in catering for their young Will there not be a sort of poetic justice when he and his brood are thrust into a pot-pie, for the benefit of the lord of creation? We want to keep Nature in healthful balance. We err when we spare all the birds, and pay for our fault in the loss of all our fruit. We may safely kill so many birds as beasts and birds of prey would take, if they were not sheltered by our care.

MULCHING.-After the spring rains are over and the hot days have come, the newly-planted fruit and ornamental trees, as well as flowering shrubs and small fruits, feel the effects of heat and drouth. Though they may have made a good start in the spring, the growth flags in these hot June days, and while the well-established plants do not mind it so much, those set this season are evidently suffering. Only those who have tried it know the benefits of mulching. After cultivating or otherwise stirring the soil, put around the trees or shrubs a good covering of straw, bog, or salt hay, or any similar material. Not a handful, but a good generous covering, to extend as far or farther than the roots of the tree or shrub are likely to spread. This will prevent evaporation, keep the soil mellow, and smother the weeds. Currants and gooseberries are, in particular, benefited by this treatment, and there is scarcely any plant that will not flourish all the better for it.

#### Sweet-Potatoes.

The first week in June is quite early enough to set out sweet-potatoes in northern localities. Where but few are grown, it is much cheaper and easier to buy the plants than it is to start them. They earry readily by express. In preparing the soil, put upon the level surface a strip of fine manure a foot wide, and turn two furrows over it to form a ridge. Dress up the ridge with the spade, and set the plants about 15 inches apart. Unless the soil is moist, water the holes before setting the plants, which should be set well down, so that the stalk of the first leaf is covered. Press the soil firmly around the plants: much of the success will depend upon this. Should the tops wilt and dry up, a new shoot will spring up if the plant has been set deep enough. The sides of the ridges should be kept free of weeds by the proper use of the rake. The vines will soon get so large as to smother most of the weeds.

#### Essential Implements.

There are two implements that we regard as essential to the successful and satisfactory cultivation of the family garden, whether it contain vegetables or flowers. These are a sharp steel-

rake, and a lance-headed, or bayonet-hoe. If the rake be used in time, and sufficiently often, other weed-killing implements will seldom be called into use. The most serious and obstinate of weeds, even the Canada thistle, if taken in its infancy, can be killed as easily as any other plant. Let a few days pass, and it must be hoed up, and at the end of a few weeks it can with difficulty be up-rooted by the spade. Use the rake frequently. The lancehead, or bayonet-hoe, are much alike in shape, but we prefer the first-named, which is a triangular plate of steel attached to a suitable shank and handle. For weeding, loosening the soil around plants, opening drills to sow

seed, and many other purposes, it is an implement that we find to be in constant requisition.

#### Canada Snakeroot, or Wild Ginger.

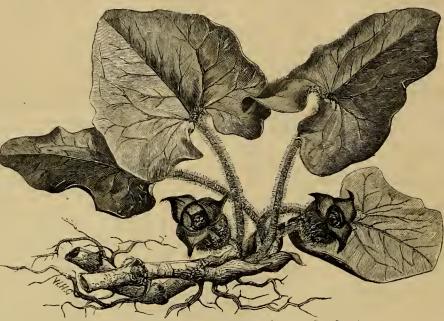

(Asarum Canadense.)

In the rich woods of the northern hill-sides there will often be seen, in spring, patches of broad, kidney-shaped leaves, which are soft with down, and have a pleasing tender green. The careless observer would not notice that the

plant had a flower, so completely is it concealed by its position close to the earth and the protecting leaves. If we pull up the plant, it is found to have a creeping root-stock or underground stem, which bears the leaves in pairs, and between each pair of leaves, upon a short stalk, a flower of such odd appearance that one is at first in doubt whether it is a flower or not. The flower has no petals, but the bell-shaped calyx has three spreading, pointed lobes, which, on the inside, are of a peeuliar purplish-brown

color. The engraving represents the plant of about the size it is at the time of flowering, but later in the season, the leaves increase much in size and become more robust. The root-stock, or root, is very aromatic and pungent to the taste, and is sometimes, as one of its common names indicates, used as a substitute for ginger.

It is somewhat employed medicinally, having the general properties of aromatic stimulants. The species here noticed is Asarum Canadense; there are two others, found in Virginia and southward, which differ in the shape of the leaves and some other characters, but possess

CANADA SNAKEROOT, OR WILD GINGER .- (Asarum Canadense.)

the same aromatic properties. Asarum is an ancient name for a similar plant. The Asarum belongs to the Birthwort Family (Aristolochiaeca), the flowers of which are generally of a striking appearance. The Dutchman's Pipe—Aristolochia Siplio, is a common example of this family, and some exotic species of Aristolochia are among the curiosities, if not the ornaments, of choice green-house collections. Not only are the flowers of some of these grotesque in form and odd in their coloring, but some of them are among the largest known

CLUSTERED LEUCOTHOË.—(Leucothoë racemosa.)

flowers. Humboldt mentions one which he met with in South America, the blossoms of which measured four feet in circumference, and which "the Indian children drew sportively upon their heads as caps." The term Snakeroot is applied to several plants of this family, they having a reputation as cures for snake bites.

#### The Clustered Leucothoe.

A number of our native shrubs, which we used to know under the generic name of Andromeda, have for good botanical reasons been placed in other genera, and bear other names.

The pretty shrub, which in our early botanizing days was Andromeda racemosa, is now Leucothoë racemosa. Leucothoë is a good enough name for a mythological female, but we must admit that we should prefer some other for the beautiful shrubs, which are now called Leucothoë. There are in the United States five species of Leucothoë, one of which is found north of Virginia -the L. racemosa. This species is found from Massachusetts southward, and though not classed among the rare plants, we do not recollect to have ever seen it abundant. It is a shrub from four to six feet high, and, when out of flower, has much the aspect of a huckleberry bush. Its flowers, which appear in

May and June, are borne in racemes three or four inches long, which are situated at the ends of the branches. The flowers are pure white, cylindrical and contracted at the mouth; they are arranged with great regularity, are all turned downward, and have been likened in appearance to rows of teeth. The shruh, when in bloom, presents an attractive appearance, and the flowers are pleasantly fragrant—qualities that give it a stronger claim to a place in the garden than many exotics present. Its cultivation is easy, and, like many other plants

that naturally grow in moist localitics, it will flourish in common garden soil. The engraving gives a flower cluster or raceme, and the leaves of the natural size.

"HARDY" PEAR
STOCKS.—"Rustie,"
an Iowa correspondent, writes that
the peddlers in his
state do not sell
dwarf pear - trees
grafted on quince
stocks, as they have
proved too tender
for the climate, but
they cau furnish
them upon Sycamore, Maple, or
White Elm-stocks.
He asks, "Are such
trees raised for sale,

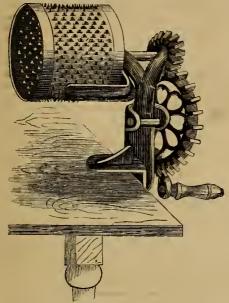

and if so, are they good for anything?"—We do not know what a tree peddler might do, save tell the truth, but no one else, so far as our knowledge goes, ever saw a pear growing upon either of the above named stocks. The humbug is an old one. Grafting succeeds only with nearly related resuscitated plants.

#### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### A Revolving Grater.

We have seen the pickle-venders in the market prepare horse-radish by means of a large revolving grater, moved by a treadle, and have wondered why no one had invented a small revolving grater for family use. Some one has done it. We were a few days ago looking through the house-furnishing stock of our neighbor, J. H. Baldwin, in Murraystreet, in search of new household appliances, and there stood the very thing we had been long looking for—a revolving grater. The grater itself is of

REVOLVING GRATER.

tin, with the teeth made of a triangular form, and well adapted for cutting. It is fixed upon a stand, which may be readily screwed to the kitchen table, and is moved by multiplying eog-wheels. This grater will be found handy not only for horse-radish, but for grating cheese, carrots, crackers, or any similar thing that it is desired to reduce to the form of coarse powder.

#### Home Topics.

BY FAITH NOCHESTER.

THE BABY'S "SECOND SUMMER."—The little one is teething; and unless it has a strong constitution, and proper food, clothing, and attention, it is often very peevish, and shows symptoms of illness that call for careful nursing.

Its bowels will probably be "loose," and that is all right, provided this looseness does not become downright diarrhea, or take on a dyseuteric appearance. Constipation is more dangerous than simple looseness-more likely to be accompanied by convulsions or diseases of the head. To check a diarrhea suddenly, may throw the disturbance to the head, and cause a malady more dangerous and difficult to reach. I have invariably found that an injection of cool (not shockingly cold) water, immediately following every passage of the bowels that had a slimy appearance, mitigated this symptom of dysentery. It simply washes and cools the lining of the intestine which the slime shows to be morbidly irritated. If farther treatment seems necessary to prevent dysentery, wrap a bandage of double coarse linen (a folded towel will do,) wrung ont of cool water, around the little one's abdomen, and over this seeure a doubled dry towel. Wet this compress again before it becomes dry, unless the child is sleeping. If you would prevent bowel diseases in children, be careful to keep their lower limbs warm. Of course nothing is more important than the diet, which should be plain and nutritious, and given as regularly as possible. Nature calls

for bone-making material, and the nursing mother's food or the food of the weaned baby should not be lacking in this element. Any food that requires much chewing is clearly improper for it.

If mothers are healthy, and are surrounded by intelligent friends who will guard them from overwork and excitement, it seems most safe for teething babies to depend mainly upon their mother's milk for nourishment; but many a case of cholera infantum has resulted from some severe physical strain or mental agitation of the mother; and because of this intimate connection between mother and child, it is, perhaps, best, that a teething child should not be too dependent upon the breast. A watchful mother can refuse to nurse her babe for several hours after any unavoidable excitement, drawing off the milk by artificial means and giving her child more wholesome food. My heart aches as I write this, because our race is still in such ignorance and wickedness as to make it almost impossible for mothers to give their babes a fair start in life, in respect to health and happy temperament.

It is not uncommon for teething children to suffer great distress just before a passage of urine, and mothers are sometimes in entire ignorance of the cause of their crics. If the writhing and crying ceases after this discharge, there is little doubt in respect to the seat of pain. For this I know nothing better (and in all this matter I speak from experience as well as inquiry) than warm sitz-baths. If the child is accustomed to wake in the night with this distress, try the warm bath before putting it to bed. Simply to immerse the fect in warm water and hold them there a few minutes, afterward drying them and gnarding them from cold, is often sufficient to prevent this trouble returning. Water that feels only warm to your hand may be very hot for teuder little feet. As children go, in these degenerate days, the mother of a teething child has almost constant work and anxiety night and day, iu the simple care of her child, and should be relieved from other labors, and encouraged to take needed rest and out-door exercise. If people were wise just here-in the case of young children and the mothers of young children-statistics would show a much smaller proportiou of deaths of infants under three years of age. At present not half the human race lives beyond the age of five.

Two Books for Parents and Teachers.—I thought when I read the essay at the back of Miss Youmans' "First Book of Botany," that I should like to put it into the hands of every thinking parent and teacher of children. Her views of the education of children seem sound and sensible. She justly remarks in speaking of the importance of cultivating the observing faculties, "To postpone this, is to defeat it." For after the intellect once gets started in the way of "learning by rote" and accepting the "say so" of the books or teacher, its free development becomes almostimpossible.

My own late experience makes me strong in the belief that Botany is one of the hest things possible for cultivating the awakening faculties of a child, if taught very gradually and always as a pleasure to the child, never as a task, or when its heart is set on something else. But I think it has already been too long postponed—this early cultivation-if delayed until a child is old enough to make schedules such as Miss Youmans advises. This seems an excellent method for children who are old enough to read and write, but I wish Miss Youmans' book might be in every family as a guide for the older members in their chats with the threeyear-old members. There is no hint in this excellent essay that its author was acquainted with the Kindergarten at the time of writing, but evidently her own observation and reflection had led her to many of the same conclusions that influenced Froebel, the inventor of the Kindergarten system.

Mrs. Horaee Mann's "Moral Culture of Infancy"
—a series of letters written to a friend more than
twenty years ago, and published in the same volume with Miss Peabody's "Kindergarten Guide,"
shows how her experience as a teacher led her to
the same conclusions. She speaks of it as a groping attempt on her part after the Kindergarten.
As a mother, I could not afford to be without this

book, and I think we should have more careful and conscientious teachers, if it was circulated among them. Miss Peabody's "Kindergarten Guide" will give any one curious upon the subject, the best information of any work I know of (Weibe's "Paradise of Childhood" excepted) in respect to the Kindergarten. Her "Guide" eosts a dollar. Weibe's book costs three dollars.

WHAT WILL THE KINDERGARTEN DO FOR US? -It is a "garden" for little children, between three and seven years old, to grow in. Iustead of a teacher or instructor to repress the natural activities of childhood while endeavoring to pour knowledge into the youthful mind, the little ones have a "Gartner" (gardener) to keep the soil of this world's influences loose and genial about them, to see that all have a fair chance to be happy in the sunshine of love and congenial employment, to sprinkle and nourish with words fitly spoken the tender germs of the intellect and affection. The great principle of the Kindergarten is "to educate by directing the natural activities." Ignorant and heedless persons cannot do this, and carefully trained "Gärtners" are absolutely necessary to conduct Kindergarteu.

I would describe here the different occupations of the Kindergarten, if sure that I had not already done so in the previous article. The paper which will contain it (editors and publishers permitting) has not yet come to hand. At present I will only try to answer briefly the question proposed above. The Kindergarten is the only safe and reasonable substitute for constant wise parental care, that we can see at prescut. No mother can give her child constant care if she has more than one child, or any other duties beyond its care. Even then the Kindergarten is better for the child, during the three hours of its daily session, than a mother's continual presence. Children over three years of age absolutely need, for their most healthy development, companions of their own age. But we can-not turn them loose into the street. The ordinary primary school will not do for children so young, and no book-lessons cau take the place of Kindergarten culture. In the Kindergarten no books are used, except for the pictures. All the employments are actual "plays" to the child, but so well ordered, that they afford just the gradual and genial discipline best adapted for the early culture of the

physical, mental, and moral powers.

The children "play" with blocks, or weave slats together, or cut paper into various forms, but iustead of an aimless play, and useless, except in the way of diversion, they are gently led to build and cut and mark and mold with method and exactness. Unconsciously they learn to use correct terms and good language. Their eyes grow observant and their fingers skillful. When once we get free Kindergartens well started, we shall begin to see how we are to be supplied with good and faithful workers in every department of labor and art.

More than this will the Kindergarten do for us, but we cannot say more ou the subject at present.

#### Portable Clothes-Drying Posts.

A correspondent of the American Agriculturist in this city, who has a small place in the country,

is annoyed at seeing posts, for tying the clothes-lines to, standing permanently on the lawn. He asks if there is any invention of a movable character that will obviate the difficulty?—There are several patented contrivances of this kind manufactured. We have had one in use for some years that answers a good purpose, but do not recollect the name of the manufacturer. The difficulty, however, can he easily overcome by having movable posts, that can be placed in posi-

Fig. 1.

tion for a few hours, when needed, and theu taken down and laid away till next washing day. We give a description of such a plan that has been used for some years, and found to answer the purpose. First make a box (fig. 1) of 1½ or 2-inch plank, 18 inches loug, 7 inches square at the top, and 6 at

Fig. 2.—PLANK TO HOLD FIG. 1.

the bottom; next get a plank about 3 feet long, 2 or 3 inches thick, and 12 or 14 inches wide (fig. 2), in which cut a square hole which shall tightly fit

the box at the dotted line, aa; next make a wooden stopper (fig. 3) to fit the top of the box (fig. 1); nail the box firmly into the plank (fig. 2), and plant them firmly in the ground, so that the

top of the box is just level with the surface, ramming the whole well down. Make the end of your clothes-post to fit the socket (fig. 1), and,

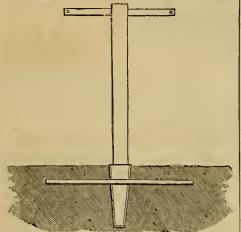

Fig. 4.—CLOTHES DRYING POST IN PLACE.

when you remove it, be careful to cover the hole with the stopper. Fig. 4 shows a section of the whole when fixed for use.

#### Hints on Canning Fruit.

BY ESTELLE EDGERTON.

The season when fruit will be plenty is fast approaching, and those kousekeepers who have seen how much their canned fruit was enjoyed the last winter, will be making calculations to put up a large supply the present summer. There is nothing healthier, and really, hardly anything cheaper, than canned fruit.

It may seem unnecessary to those who are already adepts at the art to write anything on this subject; but I can assure such, that there are hundreds of bushels of fruit spoiled every year in this town alone.

A lady not long since was telling me that last fall she put up three baskets of as handsome peaches as were ever gathered, and every bottle was spoiled. I coustantly hear the ladies talking about their spoiled fruit. There is another remark I often hear, and which seems absurd to me. It is this: "My fruit always white-molds, and I think it improves it." There is a thick leathery white mold, which often forms on the top of the fruit, and which can be removed whole without affeeting, apparently, the flavor of the fruit; but it is not desirable to have even this sort of mold. It would be out of the question to send such bottles to a long distance, as the mold would be spread all over the fruit, if it did not impart any unpleasant flavor. There is such a thing as having bottled fruit without any mold whatever. I think the reason white mold forms, is, that the lid of the can is not applied soon enough, and many ladies consider this as part of the process. Only yesterday a frieud told me that she always waited three or four minutes after the fruit was in the bottle before putting on the hid. "It lets out the air," she said. I looked surprised. "You know there are always bubbles of air that have to come up." "Oh, yes!" I said, "I know; but always run a knife quickly down the inside, and that brings them up." The quicker the lid is applied, the better, and it should not be disturbed until you want to use the fruit.

In regard to the air-bubbles, which often form while the bottle is filling, a little care will obviate the difficulty. In putting the fruit into the bottle, do not pour in such a way as to close the whole mouth of the bottle, because that prevents the escape of the air; but rather let the fruit slide gently down the side of the bottle. It can be done just as quickly this way as the other.

The secret of having bottled fruit keep, is to have a perfectly air-tight cover, and to be sure that the fruit perfectly boils all throughout, before putting it into the bottles, and then to be quick about putting on the cover, and letting the cover alone, until you want to use the contents of the bottle.

It is not necessary to let out the steam or air, after the cover is on. Do not place a string under the rubber for this purpose. Do not insert a penknife under the rubber (according to some directions) to let out air (I know a lady that learned this lesson after her peaches had all fermented). It is not necessary to bury the bottles in the earth, or to have a dark vault made in the cellar for the purpose. Mine keep perfectly, without mold, on a shelf in a rather light cellar. If you bottle your fruit in the right way, it will keep almost anywhere, but by the stove; if you don't do it right, and let in the air with a knife, or some other way, it won't keep, no matter where you put it. Of course, if you have not done it right, it will keep longer in a dark, cold place, but it will succumb to the atmosphere in the end. Bottled fruit put up in a proper manner will keep for years, if desired. I had some splendid peaches at a friend's the other evening, and she said she did not know whether they were two or three years old. But she knew they were not last year's, for she did not put up any, as she had used up all her empty bottles for cherries, plums, raspberries, etc.; and as she had several bottles of peaches on hand, she did not think it necessary to buy more bottles for a fresh supply.

Green Currants—To Bottle.—These are nice for pies, and many housekeepers put up a large quantity. Strip them from the stems. Allow six ounces of sugar to the pound of fruit, or about one pound of sugar to three pounds of currants. Put a layer of sugar and enrants in the kettle until two-thirds full; set on back of stove, or in the oven, until the sugar melts and the juice starts. Now let them come to a boil, stew them awhile, if you wish, or bottle as quickly as possible; they must be boiling when bottled. Common, smallmouthed bottles will do. The corks should be ent off smooth and even with the glass, and waxed neatly.

GREEN GOOSEBERRIES—To BOTTLE.—Remove the stems and blows, and allow about a half pound of sugar to a pound of berries. If you wish them whole, you will need a little water. Put a layer of sugar and gooseberries, and so on, and then water nearly to cover them, but not quite. Put the fruit into the bottles by the teacupful. Take them from the kettle solid in the cup, but allow some of the boiling juice, or they will chill. Have the bottle full of the berries, and then cover with whatever quantity of the boiling juice is necessary. If you want them made into jam, let them stew until a pulp is formed, and use no water. Ripe gooseberries are better made into a jam; a little less sugar than for the green ones is required.

RIUBARB, OR PIE-PLANT—TO BOTTLE. — Skin young and tender stems, and cut them into proper lengths. Allow a half pound of sugar (brown will do) to the pound of fruit. Stew it for some time, if you wish, or simply bring it to a boil, and bottle, sealing as quickly as possible.

To Bottle Cherries.—I always stone the red sour pie-cherries; the large white look and taste better with the stone left in. Some persons cousider the black Tartarian an unsuitable fruit to bottle. I put up a quantity the past year: they kept well and were delicious. I did some with stones, and some without. You may put them up with or without sugar. My way is this: To one pound of sweet cherries allow one-quarter pound

of white sugar, and a little water. Bring to a perfect boil, and bottle.

PIE-CHERRIES—To BOTTLE.—Stoue them, allowing the juice to drop with the cherries. To a pound of fruit add nearly or quite a half pound of brown sugar. Let them stew until the sugar is reduced to a syrup, or until they look a little glazed. Now bring to a lively boil, and they are ready to bottle. Remember the invariable rule for all bottled fruit: seal quickly, while boiling hot.

STRAWBERRIES—TO BOTTLE.—Let them be as fresh as possible. Pick over, and reject every one at all decayed. Wash thoroughly before taking off the stems. To every pound of berries allow three ounces of white sugar; use a porcelain or brass kettle. Put layers of sugar and fruit; no water, until you have sufficient in the kettle. Put them on a slow fire, and stir them constantly until reduced to a jam. Let them stew until the jam looks glazed, then boil up and bottle. If you wish them whole, take the juice drained from the berries, and the sugar, no water, and boil well together. Then add the berries, and as soon as the fruit boils, bottle. Strawberries, done whole, change color badly, besides the husks from the seeds show unpleasantly in the syrup. I prefer to make a jam of them.

RED RASPHERRIES — TO BOTTLE. — One short quarter pound to a good pound of fruit; put in layers in the kettle, and reduced to a jam; stewed awhile, brought to a boil, and bottled. Excellent.

BLACK RASPIERRIES.—The same as red. They make delicious pies.

RED RASPHERRY VINEGAR.—Put a quart of good vinegar over two quarts of berries. Let them stand over night, strain, and pour the juice over two more quarts of berries; stand over night, then strain again. To every pint of juice allow a pound of white sugar. Let it come gently to a boil, and bottle for use in small-necked bottles. One tablespoonful to a glass of ice-water makes a refreshing summer beverage, and is also excellent for invalids.

Washing Dishes .- Mrs. E. Ward, Knox Co., Ill., 1871, writes: "In your March number, Mrs. W. Y. gives her process of washing dishes, which I approve of, except the pouring of hot water upon the soap. I like to put it in after I cool the water. Young people are apt to waste it in hot water. I wish to say to Mrs. W. Y., that I have a process for washing dishes which I always follow, and teach it wherever I can. After removing the bits from the dishes with a knife, I have about two quarts of hot water in a small pan; I then take my wisp of broom-corn, which I always have near my dish-paus, holding the dish with the left hand, not putting it in the water, but cleansing it with the wisp from all bits and grease, which are very objectionable to me, even in my large pan of soapy water. I must add here, that these wisps (which are made of broom-corn, tied into bundles as large as a broom-stick, or larger, by two strong cords near the coarse ends, which form a handle) are indispensable in cleaning kettles and fryingpans. I never allow myself to be without two or three, handy. I find them good in cleaning window-sash. In fact, if a housekeeper would use them one month, she would wonder how she ever lived so long without such a convenience.

Corn Bread.—2 teacups of sweet milk, 1 egg, 1½ teacups wheat flour, 2 teacups Indian meal, 2 tablespoonfuls of sugar, a little salt, 4 teaspoonfuls of Cream Tartar put on with flour, 2 teaspoonfuls of soda dissolved in warm water; add this the lest thing. Bake in gem pans in a quick oven.

Carrie's Pudding. By "W."—Cut any nice stale cake into squares or thick slices, and pour over it a soft boiled custard, flavored with lemou or vanilla. Serve when cold.

A Refreshing Summer Drink.—A friend states that the most thirst-quenching drink that he found during the unusually hot summer was strong cold black tea, to which lemon juice and sugar were added in quantities to suit the taste. We have often used cold or iced tea, and found it an exceedingly grateful summer beverage.

#### BOYS & GIRLS' COLUMNS.

#### Fishing.

BY "CARLETON,"

I need not ask the hoys if they ever have been asfishing; of course they have. If there is a lad anywhere in the United States who never dropped a hook and line into the water, and felt a nibble, and pulled up a perch or horned pont, he don't know what fan is. vivid remembrance of the first time I tried my hand; it was not with a hook and line, however, but with a spear. It was in the spring of the year, when the birds singing, the frogs peeping, and the suckers were beginning to make their appearance in the meadow brook, and my elder brothers were getting their billets of pitch wood in shape for a grand spearing excursion on the first calm night. They talked about it so much that I canght the fever, and sallied out one sunny afternoon in May, with a one-tined spear, which I had made myself. by driving a nail into a breom handle and filing the nail to a sharp point. I hastened down to the brook side, but saw no suckers nor perch nor pont. There were frogs by the score, swelling out their throats and winking at me with their great goggle eyes. "You won't wink at me in that way much longer," I said, as I let my spear drive at a great pot-bellied fellow, who leaped into the water ker-chug, and I followed him ker-splash! bank was slippery, and I had not calculated the distance carefully, and unexpectedly found myself up to my arms in mad and water. I crawled up the bank and went home, thinking that there wasn't much fun in spearing.

I can remember the time when I caught my first fish as plainly as if it were only yesterday. I see the pond, although it is far away; the water is still: there is not a ripple upon the calm surface; the boat lies motionless. I have a little alder fishing pole, and there is a squirming mud worm on my hook. Ha! there is a nibble. An electric thrill runs through me, from the ends of my

fingers to the soles of my feet. There is a heavier pull.

"O——o, wasn't that a big one?" The O is several seconds long. Another pull, and the little alder pole bends with the weight. "I've got him!" and the echoes come back from the wooded shore-" got

-o. ain't he a lunker?" You need not look " O into the dictionary to see whether or not that is a choice word; but whether in the dictionary or not, the people of my native place used it when they wanted to describe a big thing. Are you impatient to know how large the "lunker" was? Well, it was a shiner, folly foar inches

I think that I hear a haw-haw-haw from all the boys from Maine to Nebraska. Laugh away my lads, for I love to hear a good, jolly laugh from a wide-awake hoy, even if it is at my expense. It is sweeter than anything else I know of, except the laoghter of the girls. I like that a little better.

I have caught many fish since then that weighed more than that shiner, but I never have caught a fish so higone that seemed so big, I mean. I caught that day a half-dozen perch and a pout, but I shall never again experience a thrill of pleasure like that which flashed through me when I pulled up that shiner. I have seen whales in the Atlantic and in the Pacific Oceans since then that were puffing, blowing, and sponting-one that was forty feet long, but he did not seem to he near so large as that first shiner. How proudly I walked home from the pond, carrying my string of fish, running ahead to let the folks know what I had done. "See there! -o, ain't they hig ones ?" I do not believe that Wellington at Waterloo, or General Grant at Appomation, felt prouder than I on that eventfol day, when I caught one shiner, three flat sides, six perch, and a It was like capturing the "horse, foot, and dragoons" that we read about in the war books.

I have fished many times since then, and have caught pickerel, ponts, cels, cod-fish, and mackerel, and once I caught a great turtle in a funny way—by the tail with my hands. I was in Mionesota, on a heautiful lake, in a row-boat, with a long line trailing from the stero, trolling for pickerel, and was palling them in one after another-great fellows with wide mouths, and voracions jaws, that made the water fly when they took the hook. A young Norwegian was rowing the hoat, and we were gliding gaily over the lake, when suddenly I saw something black floating on the water, and as we came nearer, discovered that it was a great turtle, taking a morning nap. He was lying on his back, but waked up suddealy, flopped over with his face downward, and made a dive for the hottom; then, as if only half awake, and not knowing what he was about, he rose slowly to the surface. I could see him rising. He was a monster-an old settler-so old that his back was all covered with green moss like the shingles on an old building that has braved the storms of a hondred years.

"We'll have him yet," I whispered to the boatman, who worked the oars noiselessly, and sent the hoat stern foremost toward the spot. I looked down into the water and saw the old fellow slowly rising. Up-up-up-he came.

One more stroke," I said, and the boat shoots ahead to the very spot. He is at the surface: I grab him by the tail, and lift with all my might. The boat goes over, but a quick backward spring saves it from turning bottom-side up. Another lift, and he is mine. He is in the boat, flopping and floundering. The boat is half filled with water, and the turtle is making at me with his jaws wide open, hissing, snapping, snarling, digging his great scaly claws into the side of the hoat. The frightened Norwegian is dancing about at the other end, ready to leap overboard. It is an exciting moment. Let the turtle but once get his jaws hold of my flesh, and it would take an iron har to open them again.

He is making at me. I seize an oar, for defence. I must whirl him upon his back, and then I can master him. He bites the wood into splinters, in a twinkling. But at last I have him on his back, the oar upon him, the boat-chain around his legs, and so with our prisoner snapping and hissing me, work our way to the shore, and find, when we weigh him, that he is a forty-eight-pounder -one of the largest fresh-water turtles probably that ever were caught. That was fun worth having, and the eating in our camp at night was worth having also. And here let me give you a hit of advice in regard to turtlecatching-always grab them by the tail!

#### Aunt Sue's Puzzle-Box.

Instead of giving one prize for the longest list of correct answers, I shall give four sets of anagram-letters, to be drawn by lot, for the solution of all the anagrams. I receive a great many letters containing answers only to the auagrams. I should like to reward each one, but that would be a little too much of an undertaking. So I shall draw four names for this month's anagrams, and give to each one drawn, a prize. Answers to these must reach me before the first of July. Those received later will not be credited.

Address Aunt Sue. Box 111, P. O., Brooklyn, N. Y.

#### ANAGRAMS.

6. C. torn side. 1. Sure bond. Comet is dated.
 A fed horse. 7. I can apples.8. Never no wit.

9. O! go finger. 4. Is soda, gin? 5. O! bail a ring. 10. Featherer,

#### WORDS ENIGMATICALLY EXPRESSED.

TEMPY. 11. What vessel?

12. A warm letter.

13. Greasy pronoun.

14. Observe an instrument with teeth.

A foolish weight. HOPPER.

#### MULTUM IN PARVO.

16. Out of what one pronoun can you get nine pronouns inclusive?

#### DIAMOND CROSS PUZZLE.

1. The capitol of Norway. 2. A fish. 3. A culter. 4. A city. 5. A color. 6. Great anger. 7. The tail of a bird. The center letters, perpendicular, will name a great city, and the center letters, horizontal, will give the name of the State it is in.

ADOLPH M. NAGLE.
To the nickname of a great statesman add a common French word, and a wild beast, and make a plant valued by some for its medicinal properties.

M. RICHARDSON.

Opeh, rafe, capee dan trisef Kame pu hist gedlant bew fo file.

Lay down 24 matches, forming 9 squares, as in the accompanying diagram. Now, take away 8 of the matches, without displacing the rest, and leave two perfect squares.

#### ALPHABETICAL ARITHMETIC.

The following is a simple sum in division; letters are substituted for figures:

ENP) DIEOA (GEP NTG oDo OME GGA ENP CHARADE.

22. My first is a vehicle, my second the nationality of its driver, my whole the casing of the room he lives in. TEMPY.

RIDDLE.

There are two nicknames, both well known, One of sister, one of brother Place a vowel before each one (Each vowel, mind, unlike the other), And lo! a wundrous organ,-human; Can our puzzlers gaess the true one? TEMPY.

Mustrated Rebus .- A saying which many unfortunately find true.

PUZZLE.

Find the word out of which the following sentence was made :

24. A modern Matron bad on a Roman garment, and tore the hem on a thorn.

ANSWERS TO PUZZLES IN THE APRIL NUMBER

Anagrams.—1. Innumerable. 2. Turmoil. 3. Imagined. 4. Universal. 5. Wearied. 6. Builders (this was often answered with "Rebuilds," which I credited as good). 7. Ransacked. 8. Retrospect (several young ones answered this—"Protecters," and then informed me that it should have been "—ors"). 9. Blemishes. 10. Entangle, 11. Black, white; brew, lash, alibi, currant, kayle. 12. Barbarous. 13. Taintless (J. A. B., and others send "nevertheless," which is equally correct and more elegant). 14. Microscope. 15. Intwine, 16. Farthing. Figure. 18. (There was an error in this puzzle, so I shall republish it, amended.) 19. Share, hare. 20. Bear, ear. 21. Heel, eel. 22. Bass, ass. 23. Goat, oat. 24. Rice, icc. 25. Spike, pike, Ike. 26. Sea-lion. 27. Promise little and do much.—406. One ought to manage, arrange, and superintend all his own business .- 407. Fort Wayne (four twain). (This Rebus has met with universal approval).

Correct answers to more or less of the puzzles have been sent by Willie Webster, M. St. Juhn, Susic H., M. C. S., M. Soule, J. L. W., J. Corhett, F. W. II., N. Y.

411. Illustrated Rebus .- Words used by the weatherwise or otherwise.

H., J. E. S. D., A. A. M., C. A. S., S. L. D., W. Taylor, W. H. R., Laura E., M. T., O. A. G., M. C., W. H. & S. G. K., J. H. B., Gipsy Jane, M. B. C., C. H. K., R. B. E., J. W. L., Emma D., H. E. P., M. St. J., J. P., W. W. Y., H. P., E. M. H., L. E. M., L. S., G., M. M. M., Ainslee Bros., U. H. W., B. W. P., and J. B.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

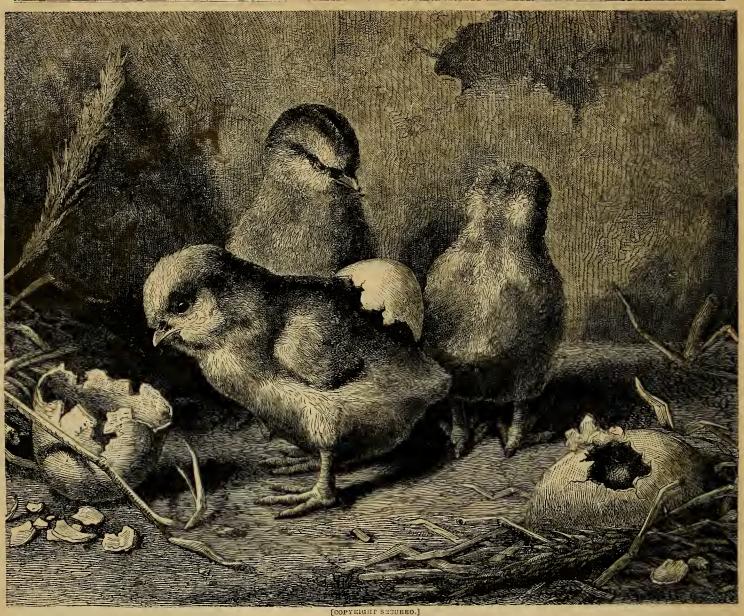

J. A. B. Some of those "proverbial" words, I think,

might be considered obsolete.

II. H. CLARKE. Thanks for your puzzles, which are very good. It is quite a relief to not find any numerical enigmas nor cross-word enigmas among them. I should prefer giving the puzzlers your first item to square,

rather than describe each word, if yo have no objection.

NEVVY. "Rich" and "pretty." Bless me! it must
be some other party. But proceed to "cultivate," I'm willing. Give my love to your "mother" for the "sister's" sake.

JUST HATCHED .- Drawn and Engraved for the American Agriculturist,

MAGGIE C. The idea of addressing your Auntie as "Dear Sir!"

Mocking Bird and Jennie Foster. The way to find out "how to solve" any puzzle is to study the answer and the puzzle together.

BLUE BIRD thinks that HAUTBOY must subsist ou "stews and soups;" perhaps that is what makes him such a "broth of a boy." I believe that is complimentary; if not, I take it all back.

Andrew M. C. How you must enjoy baving earned your paper, when many boys, who are not "cripples," don't earn their salt.

LILLIE S. GOTWALT. Can you tell me why young gen tlemen who answer puzzles, like to sign young ladies' names?

B. W. P. The "prize" has been a gold pen, to genbut you will see a change in the prize programme with this number.

JOHN C. WATSON. Do you know how fortunate you are to have a mother who is willing and who has the time to enter into your amusements?

Toccoa Cozart. (Have we an Indian among us! Whence came such a name?) You are welcome to our "charmed circle." I cannot tell you "the age of my oldest correspondent," but I am proud to say that some of them are grandmothers and grandfathers. Some are so young that they print their little letters; and some younger yet get their sisters or other relative to write for them. One little chap, in his dictation, said: "Tell Aunt Sue I falled in the water." I like to have the little ones make a household word of "Aunt Sue."

WILLIE S. On. What is the matter, dear, with "Betrothal?" Suppose you look in your big dictionary and make your mind easy.

HAROLD FROTHINGHAM sends 258 words made from the word "valentines." Can any one make more words out of that one, or out of any other word of ten letters? I fancy they can. (He does not use the plurals except when they have a different signification.)

H. W. Otis. Thanks for your puzzles and rebuses, so good, and so modestly presented.

Horace Millen. Did you receive your anagram

MAGGIE D. C. Yes, dcar, your answers were quite right as far as they went.

Mr. Vernon. (No signature.) You must remember that the Agriculturist is issued long before its date.

Thanks for Puzzles, etc., to B. W. P., S. L. D., E. L. C., Aunt Molly, G. M. B., G. B. C., and W. W. Y.

#### THE PRIZE.

I have been very much exercised this month upon the question of who deserved the prize. First came S. Dimon, who answered all but Nos. 17 and 407; then Blue Bird, who misses 16 and 407; then Star and Crescent, who misses 27 and 406. Now come Lillie Streeper and John A. Boston, who both fail on 407; and now we have three who answer the whole list (leaving ont No. 18, of course, as it-was faulty). Nevvy, W. F. Curtiss, and O. B. Joyful. O. B. J. gives the original answer to No. 13, and I suppose I might decide that he wins the prize; but Nevvy and W. F. C. give "knotless," which is certainly unexceptionable. So I have concluded to give each one a gold pen, instead of drawing lots.

THE ANAGRAM PRIZE was drawn, from among fifty-two names, by Clara R. Taylor, Oakfield, Genesee Co., I hope the pleasure that the other fifty-one took in solving the anagrams will compensate them for their trouble in writing the answers,

#### Just Hatched.

The above picture was made for you, Boys and Girls; but I wonder if any of you will be as much amused with it as I was when I first saw it. You may think it strange that one old enough to be your grandfather can find amusement in a picture for children. You must not sup-pose, that we old fellows are going to let you young ones bave all the fun. Now, is not there something right funny in the expression of the little chick that is looking at the broken egg-shell. His countenance says as plainly as can be, "Did I come out of that?" "How did I ever get into "such a little brittle cell?" Poor chicky, he is only puzzling himself about that which has proved too much for much larger bipeds without bill and feathers. We daily hear and read of wonderful discoveries and mysterious things, but after all there is nothing more wonderful than the egg we eat at breakfast. If we examine it ever so closely, we find in it nothing like a chicken, and not the least sign of life. Yet twenty-one days under the hen brings out of the shapeless mass of white and yolk, bones, flesh, down, bill, and claws, and all these belonging to a living and moving thing! What are the most wonderful feats of magicians compared to this? The chick standing behind the first one has an air of wisdom. It was probably hatched some hours be-fore the other, has seen something of the world, and looks with a feeling of contempt upon the later comer. It seems to me that I have seen something of this feeling shown by individuals who were not chickens. Then there is the little fellow that has picked his shell and has not come out. I wonder what it is thinking about. It evidently is not in a hurry to try the new world, the light of which has just come into its narrow dwelling. I think this not only a very pretty, but a suggestive picture, and I hope you will agree with-THE DOCTOR.

THE FIRST PREMIUM for the best TIN-LINED LEAD PIPE was awarded by the American Institute Fair to the Colwell's Shaw & Willard M. F. G. Co., No. 213 Centre street, New York, Manufacturers of Tin-Lined Lead Pipe, Block-Tin Pipe, LEAD PIPE, SHEET LEAD, SOLDER, etc. Orders solicited. Tin-Lined Lead Pipe is 15 cents a pound, for all sizes. Warranted to be stronger than Lead Pipe of the same weight and size, and free from Lead or Zine Poison or Iron Rust. Circular and sample of Pipe sent by mail, free. Address as above.

FACTS FOR HOUSEKEEPERS.—We advise every woman who washes, to get a Doty Washer and a Universal Wringer. Get them if you have to live on one meal a day. You have no idea of their ex-cellence. They will save money, strength, and even your life. - Philadelphia (Pa.), Christian Recorder.

AMERICAN FRUIT-PRESERVING POWDER .- The cheapest and bast method for preserving all kinds of Fruits, Vegetables, etc., without air-tighting the jars, and with or without Sugar; it is particularly desirable for Straw-herrics, Raspherries, and Cherries, to retain their color. Sold by Merchants and Agents everywhere,—L. P. Wor-RALL & Co., Proprietors, 153 Chambers-st., N. Y.

West. Terms, \$2.0) per year; three months, on trial, for 50 cents. Specimen copy free. Liberal terms to Club Agents. Send for our new Premium List, now ready. Address,

PRAIRIE FARMER COMPANY, Chicago, Ill.

ATTENTION IS CALLED TO OUR LARGE STOCK OF

### WALTHAM WATCHES.

And we submit the following reasons why they should be preferred to any other American Watches:

In the first place, the Waltham Company is the oldest, and has had fourfold the experience of any others engaged in the business in the United States.

In the second place, the machinery in use by the Waltham Company is far more perfect and varied, and as a result, the Watches are of far higher grade and of greater variety, and are placed in the market at much lower prices than any others, quality and style fully considered.

In the third place, the Waltham Watch is now a staple article, its reputation fully established, and, as a consequence, is sold at less profit than any others in the market.

#### WARING'S

### BOOKS FOR FARMERS.

### DRAINING FOR PROFIT

#### DRAINING FOR HEALTH.

By GEO. E. WARING, Jn.,

Engineer of the Drainage of Central Park, New York. CONTENTS.

LAND TO BE DRAINED; How DRAINS ACT; How TO MAKE DEALNS; HOW TO TAKE CARE OF DRAINS; WHAT DRAINING COSTS; WILL IT PAY? HOW TO MAKE TILES; RECLAIMING SALT MARSHES; HOUSE AND TOWN DRAINAGE.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining apon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health. [Portland (Me.) Press.

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, lost to this state from want of proper surface dramage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it.

[Chicago (III.) Republican.

A Book that ought to be in the hands of every Farmer. SENT POST-PAID, - - - PRICE, \$1.50.

#### ELEMENTS OF AGRICULTURE. A BOOK FOR YOUNG FARMERS.

By GEO, E. WARING, JR.,

Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS

THE PLANT; THE SOIL; MANURES; MECHANICAL CUL-TIVATION; ANALYSIS.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful practical farmer, and

The book is winten by a successing practical partner, and is full of information, good advice, and sound doctrine.

HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the hook; its 254 far, open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son caustudy it thoughtfully without being a better and more successful cultivator than before."

SENT POST-PAID, - - - PRICE, \$1.00. Address

#### FRANK MILLER'S

### Mowing Machine

Grain and Clover Threshing and Separating Machines.

The Glen & Hall Manufacturing Co., ROCHESTER, N. Y., or DETROIT, MICH. Catalogues sent free to all applicants.

#### CARHART'S PATENT TWO-HORSE CULTIVATOR.

Was awarded the First Premium at the N. Y. State Fair, 1870.

It is superior to the best Wheel Cultivator. The depth is regulated pertectly without the use of wheels. The draft is reduced nearly one-half. It may be drawn close to a tree or plant without injuring it. It levels and fits the earth for the Mowing Machine better than any cultivator in use. It is not disturbed by small elevations or depressions in the earth, as is the case with the Wheel cultivator.

Price, Sco.

Manufactured by

C. C. BRADLEY & SON, Syracuse, N. Y.

## **1,500,000 ACRES** THE RICHEST FARMING LANDS IN THE WORLD. FOR SALE TO ACTUAL SETTLERS. NEOSHO VALLET, KANSAS. Missonri, Kansas and Texas Railway Co.

The Lands now offered by this Company are mainly within 20 miles of each side of the road, extending 170 miles along the NEOSHO VALLEY, the richest, finest, and most inviting valley for settlement in the West.

One-third of the labor required at the East in the culture of farms will insure here double the amount of crops.

PIHCE OF LAND.—\$2 to \$8 per acre; credit of ten years'

#### FOR SALE OR EXCHANGE,

Two fine Farms in Lunenburg Co., Va., 69 miles from Bichmond, two miles from depot; 600 and 800 acres respectively; good land, well wooded and watered, part in fine clover; comfortable dwellings in good repair; climate very healthy; many Northern families in the eighborhood; good grist and saw-mill on the 800 acre Farm For full particulars apply to LANGAN, GOSTENHOFER & CO., No. 111 Water St., New York.

near ANNAPOLIS, the CAPITAL OF MARYLAND.—The undersigned offers for sale his Farm, known as "Primrose," containing 43½ acres; not over a half-mile by water, and a mile and a half by the county road from the City. All of the farm buildings, which are ample for all the wants of such property, are either new or in excellent repair, except the dwelling honse, which is a double, two-story, brick house and wing, and for a small sum can be made a first-class residence.

class residence.

The location is healthful and beautiful, commanding as extensive view of the waters of the Bay, and the crounds are planted with shade-trees, shrubbery, and flowers. The cultivated land of about 300 acres has all been heavily limed and is in a high state of enlityation, adapted to the growth of all the crops raised in this region, but especially adapted to the cultivation of melons, herries, vegetables, and all trefrunts, with which the estate is abundantly supplied, and for which its vicinity to Annapolis and access to Baltimore by rall, and daily and nightly by steamer, furnish ready sales. There are about 4,000 hearing peach-trees; 500 pears, dwarf and standard; and 50 apple-trees now bearing, or all rapidly becoming so, on this property. The location of the Navab Academy, and the cultivated society of the City, furnish superior attractions to those who desire recreation. St. John's College, and excellent Schools, Inrushs the growth of the City is rapidly enhancing the value of all property in the neighborhood.

As an investment for future advantages, or for profit from

As an investment for future advantages, or for profit from cultivation, few estates in the country present greater advantages than the purchase of the property now offered, or than the terms for which it can be purchased.

Price, \$25,000, of which \$10,000 to be paid in cash, residue on easy terms of credit.

THE PRACTICAL

### POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE

#### MANAGEMENT OF POULTRY,

FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrated.

By L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poalterer who must make the business pay, and the chicken fancier whose taste is for gay plumage, and strange, bright birds. The most valuable portion is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed bis aim. The middle parts of Mr. Wright's Manual are taken np with minute directions for making show fowls for Fairs, a nice discussion of the good and had points of the different breeds, and a brief sketch of such fancy stock as peafowl, phessants, and water-fowl. Then follows section on artificial hatching, and another, worth special attention, on large poultry yards....A study of Mr. Wright's book will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutmegs merely, but the family supplies of sugar, shoes, and cloth. New York Tribune.

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fowls.

Farmers' Cabinet.

This is a reprint, with numerous wood engravings, of an English hook, the object of which is to convey in plain language a great deal of practical information about the breeding and management of poultry, whether for domestic use, the markets, or exhibition....The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry.

Philadelphia Press.

It is a handsome volume, brought out in the best style, and enriched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business.

\*\*United Presbyterian\*\*.

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is embellished with numerous illustrative engravings.

New York Observer.

The anthor has called to his aid all who were experienced in the subject whereof he writes, and the consequence is a volume of more than ordinary thoroughness and exhaustiveness.

\*\*Rochester Democrat.\*\*

The book is a complete and standard guide to the management of poultry for domestic use, the market, and for exhibition.

Watchman and Reflector.

PRICE, POST-PAID, \$2.00.

ORANGE JUDD & CO., 245 Broadway, New York.

#### GARDENING FOR THE SOUTH:

OR, HOW TO GROW

#### VEGETABLES AND FRUITS.

BY THE LATE

WILLIAM N. WHITE,

OF ATHENS, GA.

WITH ADDITIONS BY MR. J. VAN BUREN, AND

REVISED AND NEWLY STEREOTYPED.

#### ILLUSTRATED.

Though entitled "Gardening for the South," the work is one the utility of which is not restricted to the South. It is an admirable treatise on gardening in general, and will rank among the most useful horticultural works of the present day. Horticultural operations are clearly explained, and more in detail than is usual in works of this kind. To those living in the warmer portions of the Union, the work will be especially valuable, as it gives the varieties of vegetables and fruits adapted to the climate and the modes of culture which it is necessary to follow.

#### CONTENTS.

CHAPTER I.—Formation and Management of Gardens in General.

CHAPTER II.-Soils-Their Characteristics.

CHAPTER III .- The Improvement of the Soil.

## HARRIS ON THE PIG.

Breeding, Rearing, Management,

ANI

Improvement.

With Numerous Illustrations.

By JOSEPH HARRIS,

OF MORETON FARM, ROCHESTER, N. Y.

This is the only American treatise upon the breeding, rearing, and management of swine, and is by one thoroughly familiar with the whole subject. The points of the various English and American breeds are thoroughly discussed, and the great advantage of using thoroughbred males clearly shown. The work is equally valuable to the farmer who keeps but a few pigs, and to the breeder on an extensive scale.

#### CONTENTS:

CHAPTER I.-Introductory.

CHAPTER II.—Breeds of Pigs.

CHAPTER III.—The Form of a Good Pig.

CHAPTER IV.-Desirable Qualities in a Pig.

CHAPTER V.-Large vs. Small Ereeds and Crosses.

CHAPTER VI,--Value of a Thorough-bred Pig.

CHAPTER VII.—Good Pigs Need Good Care.

CHAPTER VIII,—The Origin and Improvement of our Domestic Pigs.

CHAPTER IX.—Improvement of English Breeds of Pigs.

CHAPTER X.—The Modern Breeds of English Pigs. CHAPTER XI.—Breeds of Pigs in the United States.

CHAPTER XII.—Experiments in Pig Feeding.

CHAPTER XIII.—Lawes and Gilbert's Experiments in Pig Feeding.

CHAPTER XIV.-Sugar as Food for Pigs.

CHAPTER XV.-The Value of Pig Manure,

CHAPTER XVI.—Piggeries and Pig Pens.

CHAPTER XVII.-Swill Barrels, Fig Troughs, ect.

CHAPTER XVIII.—Management of Pigs.

CHAPTER XIX.—English Experience in Pig Feeding.

CHAPTER XX. Live and Dead Weight of Pigs.

CHAPTER XXI.—Breeding and Rearing Pigs.

CHAPTER XXII.—Management of Thorough-bred Pigs.

CHAPTER XXIII.—Profit of Raising Thorough-bred Pigs.

CHAPTER XXIV .- Cooking Food for Pigs,

CHAPTER XXV.-Summary.

CHAPTER XXVI .- Appendix.

Price, Post-paid, \$1.50.

### PURITY AND HEALTH.

#### CARBOLIC SOAPS

#### Compounds Saponaceous

#### Carbolic and Cresylic Acids. Disinfectant, Insect Destroyer, Preventive of Fungus, etc.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable henefit to the community. By tests made under our own supervision, and the reports of careful observers, we helieve it to be established that these Cresylic Compounds are

Ist. Complete Disinfectants .- They not only remove all noxisus odors from sinks, privies, stahles, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Feyer, Cholera, and other diseases, may be effectually pre-vented. They are used in the New York and other Hospitals for these parposes.

2d. Insect Destroyers.—An animal washed with Carbolic Soap will be cotirely freed from all vermin. It will destroy ticks on sheep, fleas on dogs, lice on eattle or poultry, roaches, anti, bed-bugs, etc., in rooms. It repels flies from animals, and thus is especially useful in case of wounds or sores from any canse.

3d. Preventive of Fungus Growth.-On this oint we ask for further experiment. We feel confident this point we ask for further experiment. We feel confident this soap, properly applied, will prevent smut in wheat, mildew on vines, and similar parastic growth, and trust that experimenters will furnish the result of their trials.

4th. Cleaning Sores, etc .- For washing pleers and other fool sores, and preventing gangrene in wounds, etc., Carholic Soap is, we believe, unequaled. We know also that it has been successful wherever used, for footrot in sheep, and mange, itch, ring-worm, and other skin disesses.

Desiring that our readers should be benefited by the exbeginning the determinant we believe to be so valuable, we have established a general agency for the sale of these compounds keeping them constantly on hand, and are prepared to fill orders at wholesale or retail, at the following prices.

Sheep Dip, for Curing Scub and Destroying Insects

| จั  | D  | Capisters\$1.25 |
|-----|----|-----------------|
| 10  | ** | 2.25            |
| 50  | 44 | Kegs10,00       |
| 200 | 66 | Bbls            |

Proportions are 1 D Dip to 5 gallons water for 5 to 10 Sheep, if they are very large and heavily fleeced. For ordinary sized animals, or those recently shorn, 1 D Dip will take 8 to 10 gallons water. The solution must be graded according to the age and condition of the animal.

Cresylic Cintment, for Cure of Footrot, etc. solution for killing Insects, etc., on stock. In 1 D Capisters, at 50 cts.; in 3 D Capisters, \$1; in 5 D Capisters, \$1.25.

Carbolic Disinfecting Soap.-In tablets for convenient use in washing Horses, Dogs, Pigs, etc., destroying Insects of all kinds, protecting from Files, carative of Sores, Scratches, and Chafes of all kinds. In hoxes, 3 doz. tablets, \$3.60; in boxes of 1 D bars, 10 each, \$4.00.

Carbolic Plant Protector.—To be used as a wash for Plauts, Trees, etc.; to destroy and prevent the harbor-ing of Insects. In 1 m. Canisters, at 50 cts.; in 5 m. Canisters, at \$1.25; in 10 lb. Canisters, at \$2.25.

Granulated Carbolic Disinfecting Powder .-It removes noxions odors from Stables, Pontry-houses, Cellars, Sewers, Water-closets, etc., and prevents, in a great degree, infection from contagious diseases. It is specially well adapted for household use, to purify the air and preserve health. In 1 b. boxes, 25 cts.; in 5 b. boxes, \$1; in 10 b. boxes, \$1.50.

Carbolic Laundry Soap, for the Laundry, etc.; 60 p boxes, 14 cts. per B. 24 b boxes, and in 10 paper boxes con-taining 6 bs. each, packed in a case, 15 cts. per B.

Carbolic Tollet Soap, perfumed, two sizes, \$2 and \$4 per dozen, in hoxes of 3 dozen each.

Carbolic Bath Soap, \$1.50 per dozen. In boxes of 3 dozen each.

#### A BEAUTIFUL GIFT.

A Picture for the Home Circle.

## "DANDELION TIME."

BY MRS. LILLY M. SPENCER.

The Publishers of the American Agriculturist have purchased of the artist this beautiful painting, and bave issued it as a Chromo, designing thus to enable very many to secure it, as an ornament and source of pleasure in their homes. Mrs. Lilly M. Spencer has already won an honorable name in art. Though of a poetic imagination, and the author of muny paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. Her works of this class have been reproduced in colored lithographs and other forms, and through these, ber name has become a familiar one throughout the country. Finding that pictures of a domestic character, with something of the humorous in them, were more popular than those to which ber natural tastes inclined her, Mrs. S. for some years painted such subjects almost exclusively. Her "Shake Hands," "Jolly Washerwoman," "The Gossips." and others, are known to all lovers of pictures. They are full of life and meaning, and at the same time finished with an accuracy and detail that few artists attempt. Among her latest productions are "War Times at Home," "The Home of the Red, White, and Blue," "The Starry Flag," "Beauty to the Brave," etc. In the beautifid picture now offered, called

#### "DANDELION TIME,"

three children, of whom the youngest is a plump, rosy babe, and a huge Newfoundland dog which they have decked with a dandelion wreath, are represented out at play upon the green grass. This Chromo is done in the best style, by Hermann Bencke, whose work equals any thing of the kind done in this country. The scene is full of happy life and cannot full to delight both old and young.

The picture would prove an ornament in any home. and be a most beautiful and acceptable present to make to a friend. It is 13×18 inches in size, mounted on linen, and will be sent by mail, in a tube, with all materials and directions for stretching.

#### PRICE, POST-PAID, \$6.00.

If preferred, the picture will be sent by express, mounted on artists' board, all ready for framing, on receipt of the price, \$6.00, the purchaser to pay express charges. If ordered in a frame, it will be sent by express, carefully hoxed, on receipt of prices, as follows:

In a neat Black-Walnut Frame, gilt ban 1 ..... \$ 9.00. " wider .it hand .. 10.00. " carved edged .. 11.00. " beautiful gilt " 1 est quality..... 15.00.

If taken with a frame at the store, 245 Broadway, the charge for boxing, which is 75 cents, will be deducted from these prices. In all cases where sent by express, the purchaser will pay express charges.

A LIBERAL DISCOUNT MADE TO THE TRADE.

ORANGE JUDD AND COMPANY, 245 BROADWAY, NEW YORK.

#### **Practical** Floriculture;

A GUIDE TO THE

Successful Propagation and Cultivation

#### FLORISTS' PLANTS.

BY

PETER HENDERSON, AUTHOR OF "GARDENING FOR PROFIT."

BERGEN CITY, N. J.

Mr. Henderson is known as the largest Commercial Florist in the country. In the present work he gives a full account of his modes of propagation and cultivation. It is adapted to the wants of the amateur, as well as the professional grower.

#### NOTICES BY FLORISTS AND OTHERS.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone. H. A. Dreen,
Seedsman and Florist, Philadelphia, Pa.

Truly "practical," and ought to be in the bands of every one engaged in the culture of Flowers. T. C. MAXWELL & BROS., Geneva, N. Y.

It might be entitled "Floriculture Mude Easy." I do not see why any one with ordinary common sense should

not succeed, with this book in his hands. L. C. LISHY, Florist, Nashville, Tenn.

No work ever before published in this country was practically valuable to those in want of direct informa-tion (upon this subject). WM. SAUNDERS, Sup't Dep't of Agriculture, Washington, D. C.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its

simple teachings are followed. GALVIN & GERAGHTY, Florists, Newport, R. I.

What is wouderful, the most of our Professional Florists here frankly admit their indebtedness to the work for information and suggestions. I am only an amateur in flowers, but feel gratefully indebted to its author for the pleasure its perusal has given.

George W. Sanders, Baltimore, Md.

Without exception the most practical work on Floriculture in the English language. All the prosy fossils of ——— &c., I consign to the lumber room. I shall order a dozen from the publishers to give to my friends.

JAMES FLEMING, Nurseryman and Florist, Toronto, Canada.

Complete in all its departments, a thoroughly commonsense book, valuable to all interested in Plants and Flowers. GEO. W. CAMPBELL, Nurseryman, Delaware, O.

We have been asked hundreds of times by our customers for a work on flowers; now we get something creditable to recommend. Elliott Bros. & Burgess, Florists, Pittsburgh, Pa.

Apart from its great working value, the book is de-ghtful reading.

MISS ANNA WARNEN,
"The Island," West Point, N. Y. lightful reading.

Thoroughly practical, yet readable as a novel. NEW YORK SUN.

A worthy contribation to every votary of Flora; style comprehensive, sharp and decisive, just what was to be expected from its well-known author.

F. K. PHENIX, Bloomington, III.

Full to overflowing with valuable information. FRANCIS RICHARDSON, Toronto, Canada:

#### ILLUSTRATED.

SENT POST-PAID. - - PRICE, \$1.50.

NEW

#### American Farm Book.

ORIGINALLY BY

R. L. ALLEN.

Author of "Diseases of Domestic Animals," and formerly editor of the "American Agriculturist."

REVISED AND ENLARGED BY

LEWIS F. ALLEN,

Author of "American Cattle," editor of the "American Shorthorn Herd Book," etc.

NOTICES BY THE PRESS.

Everything connected with the business of farming finds a place in it; soils, manures of every kind, irrigation and draining, grasses, grain and root crops, fruits, cotton, hemp, fences, farm buildings, domestic cattle, sheep, poultry, and the like. The work has been written with great care by men qualified to discuss the subject, and it is really valuable. The chapter on soils should be read carefully by every farmer who desires to make the most of the land he cultivates. The chapter on fruits constitutes an important feature of the work; and there is nothing in it which is not well considered and nseful.

Worcester Daily Spy.

Comprehensive and careful, telling, and telling specifically, just what the tillers of the soil need to know; it will prove of great advantage to all who faithfully follow its counsels in the spirit in which they are given.

Congregationalist & Recorder.

It intelligently and quite fully discusses the various operations of farm life, and is invaluable to all engaged in agriculture. Farmer's Cabinet.

For the young man of rural tastes, but without a training at the plow-handles, who asks for a general guide and instructor that shall be to agriculture what the map of the world is to geography, it is the best manual in print. For the working farmer, who, in summer noonings and by the winter fireside, would refresh his convictions and reassure his knowledge by old definitions and well-considered summaries, it is the most convenient hand-book. From its double authorship one might expect some show patch-work, the original statement of the author of 1846, annotated and qualified by the writer of this year. But this has been wisely avoided. The book is a unit, and shows no disparity of style nor contradiction in statement. Practically it is altogether a recent and time ly volume. Only so much of the original Book of the Farm, by R. L. Allen, as time could not change, has been New York Tribune. adopted by the reviser.

It is a volume of over five hundred pages, and in its present shape comprises all that can well be condensed into an available volume of its kind.

Hartford Daily Times.

It is almost as comprehensive as a cyclopædia. We can safely recommend it as a valuable and standard work.

It has a very wide range of subjects, taking up nearly all matters that are most important to farmers. Comprising the combined wisdom and experience of two eminent agriculturists, it must prove of great value to the class for whom it is prepared. New York Observer.

It is crammed full of just the information that is wanted, which it is a pleasure to recommend. We know of no better encyclopædia of farming.

New York Independent.

In its present revised and enlarged form, it is a work that every practical farmer may consult with advantage, and none can well afford to do without.

Christian Intelligencer.

It is something in favor of this work, that it has been before the public for many years. The original work was prepared with extraordinary care, and contained a vast amount of general truth that is as applicable now as it was then; it has therefore been made the basis of the present work, which, to all intents and purposes, is new, since it is adapted to the present improved state of agrioultural knowledge. Every department is prepared with conscientious care, and with a view of making the work a reliable source of agricultural information.

Chicago Republican.

SENT POST-PAID......PRICE \$2.50.

ORANGE JUDD & CO. 245 Broadway, New York.

#### AMERICAN CATTE:

THEIR

HISTORY, BREEDING.

AND

#### MANAGEMENT.

BY LEWIS F. ALLEN,

Late President New York State Agricultural Society, editor "American Shorthorn Herd Book," author "Rural Architecture," etc., etc.

NOTICES BY THE PRESS.

We consider this the most valuable work that has recently been issued from the American press. It embraces all branches of the important subject, and fills a vacancy in our agricultural literature for which work the author by his many years' experience and observation was eminently fitted.....It ought to be in the hauds of every owner of cattle; and the country, as well as individuals, would soon be much richer for its teachings.

Journal of Agriculture (St. Louis).

The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims, as a standard authority on the subject. An excellent feature of this volume is its orderly, methodical arrangement; condeusing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves.

N. Y. Tribune.

This will rank among the standard works of the country, and will be considered indispensable by every breed-Practical Farmer (Phila). er of live-stock.

We think it is the most complete work upon neatstock that we have seen; embodying as it does a vast amount of research and careful study and observation. Wisconsin Farmer.

His history of cattle in general and of the individual breeds in particular, which occupies the first 180 pages of the volume, is written with much of the grace and charm of an Allison or a Macauley. His description of the leading breeds is illustrated by cuts of a bull, a cow, and a fat ox, of each race. The next one hundred pages are devoted to the subject of Breeding. This is followed by chapters on Beef Cattle, Working Oxen, Milch Cows, Cattle Food, Diseases, etc. The arrangement, illustra-tions, analytical index, etc., of the work are in the best style of modern book-making.

New England Farmer,

The work is one that has long been needed, as it takes the place of the foreign books of like nature to which our farmers have been obliged to refer, and furnishes in a compact and well-arranged volume all they desire upon Maine Farme this important subject.

Whatever works the stock farmer may already have, he cannot afford to do without this. Ohio Farmer.

It is one of the best treatises within our knowledge, and contains information sound and sensible, on every page.

The People, (Concord, N. H.)

The object of the work, as stated by the author in his preface, "is not only to give a historical account of the Bovine race, to suggest to our farmers and cattle breeders the best methods of their production and management, but to exalt and ennoble its pursuit to the dignity to which it is entitled, in the various departments of American agriculture." From the little examination we have been From the little examination we have been able to give it, we can not recommend it too highly.

Conado Farmer.

Considering that there are some ten millions milch cows in the United States, and nearly a thousand millions of dollars invested in cattle, the magnitude of this interest demands that the best skilled talent be devoted to the improvement of the various breeds, and the investigation of the best method of so caring for the animala, as to gain the greatest profit from them. This volume will give the the greatest profit from them.

farmer just the instruction which he wants.

N. Y. Independent.

PRICE, POST-PAID, \$2.50.

ORANGE JUDD & COMPANY, 245 Broadway, New York. FARM IMPLEMENTS

#### FARM MACHINERY.

Principles of their Construction and Use:

SIMPLE AND PRACTICAL EXPLANATIONS

OF THE

#### LAWS OF MOTION AND FORCE

AS APPLIED

ON THE FARM.

With 287 Illustrations.

DY

JOHN J. THOMAS.

The basis of this admirable work was an essay published in 1850, in the Transactions of the N. Y. State Agricultural Society, which was enlarged, and in 1854 published by the Harpers. It has been, and remains, the only work in which the principles of Natural Philosophy, namely, the mechanical powers, and the powers of water, wind, and heat, are systematically discussed as applied to the operations of the farm.

The work has now been most carefully revised by the author. It is much enlarged, and a great part has been re-written, while the illustrations, before abundant, now number two hundred and eighty-seven. A large number of new implements are described, with the heavier farm machinery; and the use of steam, both in cooking and as power on the farm, is clearly discussed

NOTICES BY THE PRESS.

The great value of this work is the application of natural philoaophy to farm labor, in the use of power, and it will supply one of the hest text-books in our agricultural schools. Every farmer's son should carefully study this book, and he will be saved much hard lahor, accomplish more work, and have less wear and breakage in the implements he uses. The chapter on plowing is of great value to all plowmen, whether old or young, and is worth more than the cost of the book. Chicago Tribune.

We welcome this new and re-written edition of an old and very valuable work. The six pages on road-making are worth more than the price of the book to every highway surveyor in Vermont. Farmers need to study the mechanics of Agriculture....This volume is admirably calculated to aid the farmer in determining what he needs and how to supply that want. Burlington Free Press.

The volume is one of great value, and should be in every Farmer's Library, for it is full of practical suggestions and useful information.

Salem Observer.

Mr. Thomas' illustrations are largely drawn from objects with which the farmer is familiar, and any one of ordinary intelligence can readily grasp the whole, following the author step by step, from the inertia of the load-ed wagon which snaps the harness traces on a sndden start, to the laws which govern the shape of the working parts of the plow, and the construction of the steam engine, or the radiation of heat causing the phenomena of dew and frost. Cultivator and Country Gentleman.

Those who are acquainted with Mr. Thomas' previous works need not to be told that it is written in a clear, concise, practical style, and though eminently scientific, the language is so free from all nnecessary technicalities, and so pleasingly familiar, and at the same time so well illustrated and enlivened by appropriate incident, anecdotes, experiments, etc., as to excite and repay the continued attention of the reader. Galesburg Free Press.

The whole work is of a thoroughly practical character, and the application of the principles taught to the farmer's daily work makes its instructions of very great value. There is not an agricultural writer that could be named more respected than Mr. Thomas, or one whose judgment and freedom from personal bias in discussing new implements could be more implicitly Hartford Daily Times .. relied upon.

PREMIUM Chester White and Berkshire Pigs, Southdown Sheep, improved breeds of Cattle, and Fancy Fowls, hred and shipped to order. Send for Circular on Breeding and Care of Swine. THOS. WOOD, Doe Run, Chester Co., Pa.

#### Houdan, Gray Dorking and Dark Brahmas.

The Subscriber will fill orders for Eggs from the above varieties, which he has made a specialty, having a well-sected stock of the best imported and premium Fowls. Houdan and D. Brahmas, \$5.00 per doz.; Gray Dorking, \$3.00

per doz. Address, C. D. VALENTINE, Fordham, Westchester Co., N. Y.

EGGS FOR HATCHING.—Houdan, Dark Brahma, Buff Cochin, Lemon Cochin, \$4 doz.; Light Brahma, Silver Gray Docking, Silver-spangled Hamburg, Golden Sebright Baoi am, White Leghorn, \$2 doz. Most kinds imported from Cooper. Houdans and Light Brahmas are best layers known. We are breeding from a Light Brahma Cock, weighing 13% lbs. 4 doz. Houdan eggs, \$10; 4 doz. Light Brahma, \$5. Send for Descriptive Catalogue.

W. S. CARPENTER & SON, Rye, Westchester Co., N. Y.

LIGHT BRAHMA EGGS for Hatching of Ives' Su-perfor Stock, carefully packed and delivered to Express at \$1.50 per doz. S. A. SPALDING, Lockport, N. Y.

#### CELERY, CABBAGE and CAULIFLOWER PLANTS.

CAULIFLOWER PLANTS.

Boston Market Celery, a favorite variety; remarkable for its tender, crisp and succeient stems, and delicate flavor. It is grown almost exclusively by the Boston Market Gardeners, who consider it superior to all others for its excellent qualities. Price \$1.00 per hundred; \$4.00 for five hundred; \$6.00 per thousand, \$25.00 for five thousand. By mail, \$25, per hundred, extra.

Dwarf Incomparable.—A well known variety, of dwarf labits, extensively grown by the New York Market Gardeners; solid, crisp, and of fine flavor. 75c. per hundred; \$6.00 for five hundred; \$5.00 per thousand; \$20 for five thousand. By mail, \$2c. per hundred extra. Explicit directions for culture will be set with each package.

Cauliflower.—Early Paris, Nonparell, Large White Explant, \$1.00 per bundred; \$4.00 for five hundred; \$6.00 per thousand.

Cabbage Plants.—Premium Flat Dutch, Large Drumhead, Fotter's Brinswick, Improved American Savoy and Red Dutch for pickling. 35c. per hundred; \$3.00 for five hundred; \$5.00 per thousand.

On account of the tender nature of the leaves of the Cabbage and Cauliflower, they can only be sent by express.

Seed and Horticalitural Warehouse.

Nos. 23 Park Place and 20 Murrayst., New York, Our celebrated Seed Cautologue and Guide to the Flouer and Kitchen Garden, will be mailed to all applicants upour receipt of two three-cent stamps for return postage.

#### Herron's Patent, No. 4,884. HAY SLED, FOR GRAIN OR HAY.

APVANTAGES.—One man may load as much hay as two men can on a wagon, and as there is no builder required, there are two akillul hands saved in harvest. One horse is equal to two in a wagon—the greater rapidity of movement. A hand can pitch from the sled as much more in the same time as from a wagon; if in cocks, from four to six can be loaded without breaking. Three men can stack or house hay as well as a double set of hands with two wagons, from its simplicity and cheapness, any firmer can make one in a fee hours without cost, save for bolts and nails.

TESTIMONY OF THOSE WHO HAVE USED IT.—We do not hesitate to state that one man, with the use of Herron's Sled, on suitable ground with one horse, and a boy to drive, is fully equal to three men with two horses in a wagon; and when a hand-fork is used in unloading, a man will remove men't two tons while he would pitch one from a wagon. We would not be without it for ten times its cost.

John Walten,

JOHN WALTER, CHARLES H. OBSBORN, ROBERT McDONALD, GEORGE ALLISON, Jr.

Persons wishing to use this improvement can do so by in-closing me five dollars, for which I will send Descriptive Circular, and convey the right to the applicant to manufac-ture for the nse of his own farm.

Farmers or others desiring to introduce it into a township or county, can send for Circular, which I will forward with turns.

I have said township.

I have sold forty-five rights in my own immediate neighborhood. Address

JAMES A. HERRON, Tally Cavey, Alleghany Co., Pa.

#### BULLARD'S IMPROVED

### HAY TEDDER

Is mounted on wheels 4 ft. high; spreads 2 ft. wider than any other Tedder, and is easy draft for one horse. Does not run over the grass after it is spread, and never clogs.

Is the only Hay Tedder that will THOROUGHLY SPREAD ALL KINDS OF BAY, ON BOUGH AND SMOOTH OBOUND, "taking it up from the bottom, and leaving it id a light, FLEECY CONDITION FOR DRYING."

A large farmer says: "ITS use in a single season will more than pay its cost. The enterprising farmer will NOT, CANNOT do WITHOUT IT; the longer he puts off buying, the poorer he will be.

#### A TREATISE

ON THE

### Chemical Composition, Structure, and Life of the Plant,

FOR ALL STUDENTS OF AGRICULTURE.

WITH NUMEROUS ILLUSTRATIONS AND TABLES OF ANALYSES,

#### SAMUEL W. JOHNSON, M. A.

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEM-ISTRY IN YALE COLLEGE; CHEMIST TO THE CONN. STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

This is a volume of nearly 400 pages, in which Agricultural Plants, or "Crops," are considered from three distinct, yet closely related, stand-points, as indicated by the descriptive title.

#### The Chemical Composition of the Plant

Is discussed in three Chapters.

1st .- The Volatile Part.

- 2d .- The Ash-its Ingredients, their Distribution, Variation and Quantities. The Composition of the Ash of various Farm Crops, with full Tables; and the Functions of the Ash.
- 3d .- Composition of the Plant in various Stages of Growth, and the Relations subsisting among the Ingredients.

#### The Structure of the Plant and the Offices of its Organs

Is the subject of the Second Division, in which are discussed

The Primary Elements of Organic Structure.

The Vegetative Organs-Root, Stem, and Leaf, and their Functions; and

The Reproductive Organs, viz., Flowers and Fruit, and the Vitality of Seeds with their Influence on the Plants they produce.

#### The Life of the Plant

Porms the Third Division, under which are discussed the Phenomena of

Germination, and the conditions most favorable and unfavorable to it.

The Food of the Plant when independent of the Seed. Sap and its Motions, etc., etc.

THE APPENDIX, which consists of 12 Tables exhibiting the Composition of a great number of Plants viewed from many different stand-points, will be found of inestimable value to practical agriculturists, students, and

### HOW CROPS GROW. HOW CROPS FEED.

A TREATISE ON THE

#### ATMOSPHERE AND THE SOIL

AS RELATED TO THE

#### NUTRITION OF AGRICULTURAL PLANTS.

WITH ILLUSTRATIONS.

#### SAMUEL W. JOHNSON, M. A.,

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEM-ISTRY IN THE SUEFFIELD SCIENTIFIC SCHOOL OF YALE COLLEGE; CHEMIST TO THE CONNECTICUT STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES

The work entitled "How Crops Grow" has been received with very great favor, not only in America, but in Europe. It has been republished in England under the joint Editorship of Professors Church and Dyer, of the Royal Agricultural College, at Circneester, and a translation into German is soon to appear, at the instigation of Professor von Liebig. The Anthor, therefore, puts forth this volume-the companion and complement to the former—with the hope that it also will be welcomed by those who appreciate the scientific aspects of Agriculture, and are persuaded that a true Theory is the surest guide to a successful Practice.

#### CONTENTS.

DIVISION I.

#### The Atmosphere as Related to Vegetation.

CHAPTER I.-Atmospheric Air as Food of Plants.

Chemical Composition of the Atmosphere. Relations of Oxygen Gas, Nitrogen Gas, Atmospheric Water, Carbonic Acid Gas, and Atmospheric Ammonia to Vegetable Nutrition. Ozone. Compounds of Nitrogen and Oxygen in the Atmosphere. Other Ingredients of the Atmosphere, Recapitulation of the Atmospheric Supplies of Food to Crops. Assimilation of Atmospheric Food. Tabular View of the Relations of the Atmospheric Ingredients to the Life of Plants.

CHAPTER II .- THE ATMOSPHERE AS PHYSICALLY RE-LATED TO VEGETATION.

Manner of Absorption of Gaseous Food by Plants.

#### The Soil as Related to Vegetable Production.

CHAPTER I.-INTRODUCTORY.

CHAPTER II.-ORIGIN AND FORMATION OF SOILS.

Chemical and Mineralogical Elements of Rocks. Kinds and Characters of Rocks. Conversion of Rocks into Soil. Incorporation of Organic Matter with the Soil.

CHAPTER III.—KINDS OF SOILS, THEIR DEFINITION AND

CLASSIFICATION.

Distinctions of Soils based upon the Mode of their Formation or Deposition; and upon Obvious or External Characters.

CHAPTER IV .- PRIVSICAL CHARACTERS OF THE SOIL.

Weight of Soils. State of Division. Absorption of Va-por of Wuter. Condensation of Gases. Power of Re-moving of Soild Matters from Solution. Permeability to Liquid Water. Imbibition. Capillary Power. Changes of Bulk by Drying and Frost. Relations to Heat.

CHAPTER V.—The Soil as a Source of Food to Crops: Ingredients whose Elements are of Atmospheric Origin.

The Free Water of the Soil in its Relatious to Vegetable Nutrition. The Air of the Soil. Non-nitrogenous Organic Matters. Hamus. The Ammonia of the Soil. Nitric Acid (Nitrates) of the Soil. Nitrogenous Organic Matters of the soil. Available Nitrogen Decay of Organic Matters. Nitrogenous Principles of Urine. Nutritive Value of Ammonia Salts and Nitrates.

CHAPTER VI.—The Soil as a Sounce of Food to Crops: Ingredients whose Elements are De-RIVED FROM ROCKS.

General View of the Constitution of the Soil as Related to Vegetable Natrition. Aquenus Solution of the Soil. Solution of the Soil in Strong Acids. Portion of Soil Insoluble in Acids. Reactions by which the Solubility of the Elements of the Soil is altered. Solvent Effects of Various Substances. Absorptive and Fixing Power of Soils. Review and Conclusion.

PRICE, POST-PAID, \$2.00.

ORANGE JUDD AND COMPANY. 245 BROADWAY, NEW YORK.

A NEW BOOK FOR ALL STUDENTS OF AGRICULTURE

### AGRICULTURAL

### Qualitative and Quantitative CHEMICAL ANALYSIS.

EDITED BY

G. C. CALDWELL,

Professor of Agricultural Chemistry in the Cornell University.

Teachers of Agricultural Chemistry have long felt the need of a text book which should serve as a guide to the analysis of soils, manures, and the products of the farm The present work is very thorough, beginning with the preparation of reagents and giving the most approved methods of manipulation. Professor Caldwell modestly calls himself the editor, but his book shows that he has not contented himself with editing the works of others, but has given much of his own experience.

#### CONTENTS.

CHAPTER I .- THE REAGENTS.

List of the reagents needed, with directions for preparing them, when not more readily obtained otherwise, and for testing their purity.

CHAPTER II.-ANALYTICAL MANIPULATION.

Determination of specific gravity, solution, evaporation, precipitation, filtration (including Bunsen's new method), weighing of residues and precipitates, measuring and dividing solutions, and calculation of results.

CHAPTER III.—REACTIONS AND METHODS OF QUANTI-TATIVE ESTIMATION.

Potassiom, sodium, ammonium, barium, calcium, magnesium, aluminium, iron, manganese, zinc, lead, copper, and arsenic; silicic, sulphuric, carhonic, phosphoric, nitric, hydrochloric, hydrocyanic, hydroferrocyanic, hydrosulphuric, hydrodic, hydrofluoric, oxalic, acetic, tartaric, citric, malic, lactic, uric, hip puric, and tannic acide; cellulose, starch, gum, the sugars, albuminoids, urea, fat, and alcohol.

CHAPTER IV .- Special Methods of Analysis.

Conrse of Qualitative analysis, estimation of water, of organic matter, of sulphur and chlorine in organic compounds, special methods of separation of base and acids, schemes of analysis,

CHAPTER V .- ANALYSIS OF SOILS AND ROCKS.

Mechanical and chemical analysis, and examination of physical properties of soils, and examination of marl, limestone, and clay

CHAPTER VI.-FERTILIZERS.

Farm-yard manure, urine, solid excrementa, bone-meal, bone-black, bone-ash, phosphorite, gnano, super-phosphate, gypsam, salt, potash compounds, and Chili saltpetre.

CHAPTER VII.-ASHES.

Ashes of plants, of animal substances, and of fuel.

CHAPTER VIII .- FODDER AND FOOD.

Fodder plants, beets, turnips, potatoes, seeds, meal flour, milk, butter, cheese, and vioegar.

CHAPTER IX .- WOOL AND BARK

Examination of wool and tanners' bark.

CHAPTER X .- BEVERAGES.

Water and wine.

#### CHAPTER XL-TABLES.

Metric system of weights and measures, atomic weights of elements, factors for calculating analyses, estimation of tannin in bark, etc

PRICE, POST-PAID, \$2.00.

## DOWNING'S PEACH CULTURE.

## FRUITS

## FRUIT TREES.

A. J. DOWNING.

#### Newly Revised and Greatly Enlarged

BY

#### CHARLES DOWNING.

Octavo, 1122 Pages.

The original work of the late A. J. Downing appeared in 1845. Some years after it was revised and much en larged by his brother, Charles Downing, who has again completed the work of a second revision. Charles Downing is upon all hands acknowledged as one of our highest pomological authorities. He writes but seldom, but whatever bears his name is accepted as the judgment of one who is entirely disinterested, as far as the commercial aspects of pomology are concerned. The present edition contains the results of many years' labor and experience which have been devoted to testing the value of fruits and acquiring a knowledge of them that should benefit others.

RECOMMENDATION FROM HON. MARSHALL P. WILDER, President of the American Pomological Society.

Boston, Oct. 4, 1869.

I have received a copy from Mr. Charles Downing of the second revised edition of the "FRUITS AND FRUIT TREES OF AMERICA." It is the most comprehensive of any aimilar work, in fact a complete Encyclopenia or AMERICAN POMOLOGY brought down to the present time.

The original edition by his brother, the late Andrew Jackson Downing, popular as it ever has been, is made doubly interesting and useful by this revision, comprising as it does the results of a long life of critical obser

As a work of reference it has no equal in this country and deserves a place in the library of every Pomolo MARSHALL P. WILDER. gist in America

This elegant and valuable work will be an indispensable requisite to every library, and to all interested in Fruits or Fruit Culture.

PRICE, PREPAID, \$4.00.

ORANGE JUDD & CO., 245 Broadway, New York.

#### JAMES ALEXANDER FULTON,

DOVER, DELAWARE,

#### ILLUSTRATED.

NOTICES BY THE PRESS.

This book abounds with good, practical directions for all the departments of sneeessful oreharding, which will he found nowhere else, and are worthy of careful examination by every one interested in this branch of fruit culture .- Cultivator and Country Gentleman.

It ought to be in the hands of every peach-grower who desires to understand thoroughly this great and important interest .- Middletown (Del.) Transcript.

Every farmer in the State should have a copy of this work.-Smyrna (Del.) Herald.

This is an interesting and important treatise. It is a complete hand-book of nseful knowledge to those who have any interest in the cultivation of the peach.

[Philadelphia Age.

It is a full and thorough treatise on the raising and training of this luseions fruit, with illustrations for explanation where needed .- Congregationalist and Recorder.

Those who raise peaches for profit, nursery-men, and also those who are interested in scientific culture of the fruit, will find it an exhaustive work on the propagation and culture of the fruit, with suggestions as to putting up and marketing .- Chicago Republican.

The growing importance of the erop, especially at the West, has long called for just such a work as this.

[Chicago Tribune,

The book is compact, plain in its directions, and all that can be desired .- Watchman and Reflector.

#### CONTENTS:

INTRODUCTION.

CHAPTER I .- Site of Nursery.

CHAPTER II .- Seed.

CHAPTER III.—Seed-bed.

## CRANBERRY CULTURE.

BY

#### JOSEPH J. WHITE.

A PRACTICAL GROWER

ILLUSTRATED.

#### NOTICES BY THE PRESS.

The book is profusely illustrated, contains minute directions for preparing the ground, setting and cultivating the plants, flowing the plantations, and picking and marketing the fruit,-Springfield Republican.

As the business of eranberry culture is largely and rapidly increasing, such a book as this will prove to many an efficient and profitable guide.

[Detroit Advertiser and Tribune.

This is decidedly the best work out on the cranberry. [Practical Farmer (Phils.).

It is a practical, compact treatise, full of all necessary details, fully illustrated, and must satisfy all wishing a complete and thorough guide to cranberry growing.

[Maine Farmer.

The man who is growing eranberries, if he have enterprise, and a good conscience, and eats his own cranberries, or expects other people to cat them, ought to get this little book .- Chicago Tribune.

We judge this to be the best book on cramberry culture vet published .- Prairie Farmer.

The work is very comprehensive in its details, and will he invaluable to those who have an interest in the subject.—Pittsburgh Dispatch.

A thoroughly practical manual, and one apparently prepared to answer any and every question which any one may be moved to ask on the subject discussed.

[Congregationalist and Recorder.

It seems to be a complete manual on a branch of horticulture which is of growing importance.

[Lowell Dany Courier.

We consider it invaluable to the fruit grower.

[The Courier (N. J.).

The directions in regard to forming beds or plantations are so plain that any person could follow them. The various illustrations and diagrams aid much in conveying correct ideas in regard to the different subjects.

The State Republican (Mich.)

THE WOODCOCK'S FEEDING GROUND, -Drawn and Engraved for the American Agriculturist.

Of all American birds the Woodcock is the most prized by sportsmen. Not only does its excellent quality upon the table commend it to their attention, but the skill required in finding its haunts, and the difficulty experienced in flushing it, are such that the true sportsman thinks more of bringing home a brace or two of woodcock, than he does of a bag-full of other birds. So seeluded is the bird in its habits, that many ridiculous stories have been told about its manner of feeding. It is a popular notion that it feeds by "suction",—if any one knows

what that means. The fact is that the Woodcock is mainly a nocturnal bird, only flying at dusk, unless startled from its covert by the approach of danger. Its principal feeding-time is also at night, unless in some densely shaded spot, where the daylight is obscured by an abundance of undergrowth. The favorite retreats of the bird are moist lands, where there is a heavy covering of ferns, briers, and similar wild growth. Its long bill is well adapted to probing the soft ground, and its senses are so acute, that it detects a hidden worm or grub

with the greatest accuracy. It is sometimes found in woods, turning over the dead leaves in search of any larvæ that may be concealed beneath them. The Woodcock is an enormous feeder, and is said to devour in a single night a quantity of worms equal to its own weight. Its digestion is very rapid, as it is rare to find, upon opening the bird, any undigested food. In captivity the birds have been taught to take vegetable food by mixing soaked bread with worms. In searching after the worms the birds become accustomed to the vegetable food.

#### AMERICAN AGRICULTURIST.

NEW YORK, JULY, 1871.

The American Agriculturist was one of the earliest advocates of the plau for communicating by telegraph the state of the weather at different points of the continent. We were fully satisfied of its importance to the farmers of the country. And we cannot but rejoice that the Government is now furnishing daily reports to the papers. Probably a still more efficient system will, in time, be inaugurated by the use of signal guns. But even now, those farmers who take a morning paper can receive timely warning of the approach of a storm. We believe, however, that it would be well to tell us what the "probabilities" are for two or three days in advance. Farmers have not time to study out this matter every day for themselves, and we believe they would cheerfully excuse a good many mistakes if the meteorologist would give us his opinion of what the weather is likely to be for two or three days in advance. We do not expect certainties, but would like to know the probabilities. And it is nearly as important for us to know that the indications are favorable for settled weather, as to know that a storm is approaching. No sensible farmer will leave his hay out any longer than he can help. If it is ready, he will draw it in whether a storm is approaching or not. What he most needs to know is whether he had better cut his grass to-day or wait until to-morrow. After it is cut, the meteorologist can help him but little.

We are very differently situated in this respect from the English farmer. He does not ask when he shall cut his grass, but when he shall stir it. He often cuts in a rain, thinking that by the time he is through cutting, the rain may be over, and he shall have fair weather to make the hay. As long as the weather is damp or rainy, the fresh cut grass will not be injured in the swath, but after it is stirred and partly cured, then rain or dew is very injurious. But with us, grass cures so rapidly that we cannot allow it to lie in the swath or spread out on the ground. When it is cut we must attend to it-dry it as rapidly as possible and get it into cock. After it is in cock, it is sometimes a question with us, as it is in England, whether we had better open the cocks or let them remain as they

are. It is at this point that we want to know what the weather is going to be for a few hours in advance. If by opening the cocks we can get the hay dry, and there is time to draw it in, it is best to open them; but if the weather is uncertain and the hay is well cocked, it is better not to disturb it.

#### Hints about Work.

Haying and Harvesting are supposed to be the most important work for July. There is a sense, of course, in which this is true. But if those of our readers who keep a daily record of their farm operations will turn to them, they will find that gathering the crops constitutes, notwithstanding its traditional and real importance, a very small part of the actual work of the month. With mowers, reapers (we wish we could add binders), tedders, rakes, and unloading forks, all run by horses, harvesting calls for the exercise of very different faculties than it did when the farmer, notwithstanding his many cares, found it necessary to lead the mowers and cradles in the hay and wheat field.

The most important work of this month is doing those things which we are constantly tempted to neglect. Among these may be mentioned:

The cellar, draios, sinks, privy, etc., must be kept clean. Dry earth is the best and cheapest disinfectant. For sinks and drains, use copperas or chloride of lime. The uights and mornings are frequently chilly. Make a little fire on the hearth, or in the stove. Go to bed early and get a plenty of sleep.

The health of our Animals.—The sickness and death of stock constitutes one of the greatest losses and discouragements of the farmer. The immediate cause of their death may be beyond our control, but in nine cases out of ten, the disease, if we search back far enough, might be traced to dyspepsia, derangement of the bowels, and general debility. Improper and irregular feeding, overwork in a hot sun, going too long without water, and then giving too much, are among the causes of bad digestion and general ill-health. And these are under our control.

Killing weeds is one of the most important labors on the farm, at this season. None should be suffered to go to seed, if it can be avoided without too great expense. At any rate, not a weed should be suffered in corn, potatocs, and other hoed crops.

Summer-fallows for Wheat are apt to be neglected this month. A good plowing or cultivating during this dry, hot weather, will kill every weed that has germinated. Heavy, cloddy land, that can be reduced and pulverized when completely dry, will not forget it for years.

Cultivating corn we regard as the most important labor of the month. There can no longer be any doubt that thorough and repeated cultivation will frequently add one-third to the yield, while the future condition of the land is greatly improved.

Hoeing corn is becoming less and less necessary, owing to the improvements in our horse-hoes and cultivatora. We sometimes wish that the phrase 'hoeing corn," or "hoeing potatoes," was banished from our agricultural vocabulary. We try to impress it on our own men that we do not want them to "hoe the corn." We want them merely to hoe the weeds. They would get over twice as much land in a day, if this simple idea could be got ioto their heads. We want every weed destroyed that the cultivator cannot reach-and that is all or uearly all that is required. Many men waste half their time faddling about the hills of corn, forgetting that we have cultivators that will do the work of hilling nearly as well as it can be done with the hoe, and for one-third the cost.

Hilling corn, notwithstanding so much has been said against the practice, still has many advocates among intelligent farmers. In our own case, we throw up a little soil to the plants early in July, in hopes of smothering some of the small weeds in the hill. About the first of August we go over the field, and hoe out such weeds as have escaped, and the soil that has been thrown up can be heed away without jujury.

Cultivating and Hoeing Fotatoes.—There are few crops which suffer more from weeds than potatoes. They require more moisture than corn, and every weed robs the ground of moisture. The weeds are constantly absorbing, from the soil, water through their roots, and evaporating it through their leaves into the atmosphere. The weeds in many a field of potatoes, evaporate during our hot July weather, 500 gallons of water per day, per acre! And yet the farmer is complaining of drouth and sighing for raiu! If possible, stop the weeds from growing at all, but if they have got possession of the land, destroy them at all hazards, even if it is necessary to disturb the roots and tubers.

Mangel Wurzel and other root crops, require abundance of moisture, and must be kept entirely free from weeds. And recollect that a mangel plant that is not needed is just as much a weed as a thistle, and will evaporate nearly as much moisture. Single out the plants early. In our own case, we leave only one plant every twelve or fifteen inches. If the work is done during rainy weather, vacancies may be filled out, as the mangels transplant as easily as cabbage.

Ruta-bagas should be enlitivated, hoed, and singled out as soon as they are in the rough leaf. Single them out to a foot apart in the rows. Ruta-bagas may be sown as late as the middle of the month. After this, it would be better to sow white turnips instead. Dusting the plants, while the dew is on, with ashes, plaster, or lime, will cheek the ravages of the turnip beetle. After the plants get into the rough leaf, the danger is over, and all that need be done is to single out the plants and keep the land clean by the use of the cultivator and hoe.

Corn for soiling may still be sown. See directious for last mouth.

Timothy seed has been and still is very scaree and high. A crop of timothy that could not be cut early enough for hay, had better be left for seed. Cut it with a reaper and bind it into sheaves.

Barley was got in early and in good condition, but has been seriously injured by the drouth. It will probably be wanted at higher figures than for a year or two past. The best way to harvest it is to cut it with a reaper and bind into sheaves. But much of it will be too short for this, and will have to be eradled or cut with a mowing machine and raked up with a steel rake.

Peas can sometimes be cut with a mowing machine, or they may be pulled up with a wooden revolving rake. But it is a slovenly practice, and renders the haulm unfit for fodder. The better plan, with a good crop, is to mow it with seythes, and pull it into small cocks. Turn the cocks as often as needed. A well-cured crop of peas affords straw almost as valuable for fodder as clover lay.

Wheat should not be ent before all trace of "milk" has disappeared from the kernel when crushed between the thumb and finger; neither should it be left to get dead ripe. Much wheat is lost every year from carcless binding and shocking. The farmer himself or one of his best men should attend to the shocking, and see that the sheaves are made into compact shocks that will shed the rain and not easily blow down.

Thrashing, where barn room is scarce, is best done as the grain is drawn from the field. Steam engines are yearly becoming more common, and will thrash the grain as rapidly as three or four wagons can draw it from the fields. If the grain is dry enough, so that it will not heat after thrashing, we can confidently recommend this plan. It saves all the expense and risk of stacking.

Turning over the grain after it is thrashed, should never be neglected. No matter how dry it may appear, it will sweat if not turned oceasionally. If it gets heated, turn it at onee, and then run it through a fanning-mill

Straw will be valuable this year. Much of jt is usually wasted through careless stacking. If possible, put all the straw in one stack. The larger and higher it is, the less chance there is of its being damaged by the rain. Keep the middle full and well trodden down, and make the roof as high as

possible. Better find that it is impossible to get all the straw on to the stack than not have enough to make a good, steep roof. In our own ease, we thrash the wheat and barley as drawn in from the field. The oats are thrashed two or three weeks later, and by this time the straw stack is so settled that by spreading out the roof a little all the oat straw can be put on the top and make a good roof.

Recreation.—After the harvest is all seenred, go a fishing for a few days and take a little rest! A farmer needs it if any one does.

#### Work in the Horticultural Departments.

Weeds will grow in spite of the heat and dryness, and a constant warfare must be waged against them. When weeds are hoed up and allowed to wilt under the scorching July sun, there is very little danger of their growing again, unless there is plenty of yellow docks. Never allow a weed to run to seed if it can be helped, as the garden can be kept free of weeds, to a certain extent, if they are carefully pulled up when small,

#### Orchard and Nursery.

Trees newly set last spring ought to be heavily mulched, as stated in article on page 262.

Insects will appear upon many of the trees in the orchard and nursery. It will require a constant watchfulness to prevent their ravages, both on the foliage and fruit.

Seeds.—As fast as fruits ripen, save the seeds, if it is desired to propagate. Seeds of many ornamental trees in the nursery require to be sown as soon as ripe.

Seedlings of evergreen and other forest trees require to be shaded from the hot sun by means of brush, or, what is better, a lattice-work of laths. A mulch of hey or straw between the rows of larger plants will prevent the growth of many weeds, and thus saye much time and labor in weeding.

Grafts set in the spring will require looking after now, as the stock often sends out new shoots, which rob the cion of nourishment.

Layers may be made of vines and shrubs as soon as the new growth becomes firm. See page 263.

Suckers should be rubbed off wherever they appear upon budded or grafted stocks.

Cherries.—Care must be used in picking not to injure the bark or break any limbs.

Thinning of fruit should be continued this month, if not already finished in June.

#### Fruit Garden.

Where one has an abundance of small fruits, it will pay to preserve a good supply for winter use, by drying and eanning.

Blackberries for home use should be allowed to become perfectly ripe before picking, as they are then much sweeter, and of a higher flavor; it is necessary to pick earlier where they are sent to market. Never allow the new caues to grow higher than five or six feet, and when the side branches reach a length of eighteen inches, pinch off the ends.

Ruspherries.—The canes which bore fruit this season, should be cut as soon as the crop is off, and all but three or four suckers cut out, unless it is desired to propagate the variety. A good dressing of well-rotted manure spaded in between the rows is a great help to the growth of the plants.

Currants.—Where the currant worm makes its appearance, dust the bushes with white hellebore. Give the ground between the rows a thick mulch; it will save a great deal of time during the season in keeping weeds under.

Strawberries.—The season of these will be over by the first of this month, and the plants ought not to be neglected. Give a good compost to the beds, and where the plants are in hills, keep the runners cut off.

Dwarf Trees ought to have their fruit thinned. Pinch the growing shoots so as to give the tree a compact and symmetrical form.

Grape-vines.—If these have been properly trained and pruned when small, they will need nothing but a little pinching during the summer. Where the fruit shows any signs of deeay, it ought to be cut out; and if a part in any case is taken out, the remainder of the fruit will be much finer. Young vines just planted must be kept tied up to stakes. Keep the ground free from weeds, and the soil well stirred. If mildew makes its appearance, use sulphur freely, applying it by means of a bellows. Some good work upon grape culture is very necessary to one who grows many vines.

#### Kitchen Garden.

A fall crop of garden vegetables will reward the cultivator this month for the time and care used in their cultivation; and it is the fault of the gardener if he does not have fresh vegetables upon his table every day until cold weather. Where the surplus products of the garden are marketed, they ought to be gathered late in the afternoon, and kept cool, and then taken to market early the next morning. If a farmer has land within a short distauce of a good market, he will find that it will pay him to devote his attention to the growing of early vegetables.

Asparagus.—No cuttings ought to be made from the asparagus bed at this season, but encourage the vigorous growth of tops by a good covering of manure. Where seed is wanted for making new beds, select a sufficient number of strong plants; gather the seeds as soon as ripe, and sow early next spring. Weeds ought not to be allowed to grow in the bed, but kept down by the constant use of the hoe or rake. If the asparagus beetle appears, cut off all the tops infested by them, and buru.

Beans.—Bush beans may still be planted for pickling, or for late use as string-beans. Those now growing should be hoed frequently; do not hoe until the dew is off. Limas must be kept pinched after they have reached the hight of the poles; five or six feet is high enough.

Beets.—A late erop may be had if sown early this month. Keep those already growing free from weeds, and pull the young plants where they are too thick, and use for greens. The ground ought to be loosened frequently between the rows, so that the plants may be kept in a growing condition.

Cabbages and Cauliflowers.—Set out late sorts in well-manured soil. Hoe those already planted, and give a little top-dressing of guano, or a watering of liquid manure to encourage a rapid growth.

Celery.—Set out in freshly-stirred soil, wetting the plants before setting, and pressing the earth firmly around the roots. Put the plants six inches and the rows three feet apart.

Carrots.—Allow no weeds to grow, but keep the ground well stirred until the tops are large enough to cover the ground.

Corn.—Some of the early varieties may be planted now for late use. Keep the cultivator in frequent use among that already growing. Plant enough to have a quantity to dry for winter use.

Cucumbers.—Keep the plants already up free from weeds, and sow for pickling early this month.

Egg-Plants should be forwarded as fast as possible, by hoeing and giving a good watering of liquid manure at least once a week.

Endive may be sown for a late crop of salad.

Herbs ought to be cut when they flower, tied in small bundles, and allowed to dry in the shade.

Lettuce for late use may be sown in a shady place. Silesian is a good summer sort.

Manure.—No garden ought to be without a good eask for liquid manure; the house slops can also be very beneficially applied to growing plants. If there is no liquid-manure cask, the slops should be applied to the compost-heap.

Melons.—The weeds ought to be destroyed as soon as they appear between the hills, and the ground loosened with a hoe or fork.

Onions require to be well hood and weeded, and where too thick thinned out.

Peas. - Sow for succession; they should be plant-

ed deep, and only the early varieties should be sown.

Potatoes.-The early varieties may be-harvested this month, and the space filled with late cabbages, lettuce, or turnips.

Rhubarb.-Do not exhaust the plants by allowing them to throw up flower stalks. Give the beds a thick dressing of stable manure.

Squashes.-Keep the plants free from weeds, and pinch the ends of the shoots that run too far.

Sweet-Potatoes. - Do not allow the vines to root, but move them often, and keep down all weeds.

Seeds.-It is usually better to procure seeds from some reliable seedsman than to attempt to raise them. Where one grows his own seed, preserve only the best plants or roots.

Tomatoes must be kept hoed until the vines are too large. Place brush or a mulch of hay around the plants to keep the fruit from the ground. Destroy the green worm which is so destructive.

Turnips.-Sow for winter use. Keep the early sown varieties free from weeds, and thin.

Weeds should be killed as soon as they appear above the surface; au iron rake is very effective, as is also a push hoe.

#### Flower-Garden and Lawn.

Everything in this department requires constant attention to cusure neatness. All tall growing plants must be tied to stakes or trellises, and dead flowers, weeds, etc., carefully removed. The lawn will need to be kept moved so as to give it a soft, velvety appearance.

Annuals sown last month may be transplanted from the seed-bed to the flower garden, arranging the taller growing ones at the back side, and the low ones in front.

Carnations should be tied up to neat stakes; make layers and cuttings.

Duhlius growing in pots may be put out; set the stake at the same time, and keep carefully tied up during the summer.

Gladiolus should be tied to stakes to prevent being broken by high winds.

Gravel walks.-Keep clear of all weeds, and where the gravel has become thin apply a new coating. The edges of the paths must be cut with an edgingiron to prevent grass from growing into the walk.

Propagation .- Many of the ornamental shrubs may be propagated from cuttings of the new growth, set in a light soil in a shady place.

Rhododendrons may be preserved from injury by the drouth by supplying them with a good mulch.

Perennials.—Sow the seed of these as fast as they ripen in a light, rich soil.

Potted Plants. - Do not allow plants in pots to suffer from dryness; the best way is to plunge the pots in the soil.

Roses.-Keep the climbing varieties tied to trellises. Layers may be made from the new growth this month. Use sulphur for mildew.

Verbenas and other low growing bedding plants ought to be pegged down so as to give a better show of flowers, as well as for the sake of neatness.

Weeds.-A constant fight must be kept up with the weeds; never allow a weed to grow among the flowers.

#### Greenhouse and Window Plants.

All plants left in the greenhouse or house ought to be carefully watered, and during the middle of the day shaded. The shading in the greenhouse is best effected by means of whitewashing the glass. Give plenty of air during warm days.

Budding may be performed whenever the bark of the shrubs will lift.

Callas.-Re-pot after flowering, and give only a small quanity of water.

Earth.—Get a stock of potting earth ready for winter use, and store in a cellar or damp place to prevent drying.

Potting .- All cuttings which are rooted must be

potted before they become drawu; shade for a few days until established

Propagation. - Cuttings of plants wanted for winter blooming ought to be started in time to get well established before fall.

#### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending June 15, 1871, and for the corresponding month last year.

and the price has been advanced to 113, closing June 15, at 112%, as against 111% on May 15... The supplies of Breadstuffs have been more liberal, and though the demand has been good, particularly for Wheat and Corn for export, prices have been variable, closing, as a rule, in favor of buyers. The foreign advices, which had been of an encouraging tenor, were rather against the export movement toward the end of the month under review. The decline in ocean freights, however, served to check the depressing influence of the later Liverpool reports. The grain coming to market by Canal is arriving in nnusually good order, and the hulk of it is in merchantable condition . . . The Cotton market has been active, excited, and higher, under speculative operations, based mainly on the assumption that the next crop would be a short one. The final dealings indicated less confidence in this theory, and less bnoyancy in values....The Provision markets have been less active, and prices have been quoted lower and unsettled, particularly for hog products. .. There has been a good inquiry for Wool at firmer rates, on a limited offering of desirable samples .. bacco, Itops, Hay, and Naval Stores, have attracted more attention.

Beef Cattle. - The supply of cattle is large, and reports show that there is a heavy stock still pressing for-Trade was somewhat unsettled during the month just ended, prices falling off 1c. per lb. one week, with a heavy run, and recovering a like amount the next week, closing a little lower than it opened four weeks ago. Texas has not given us many grass cattle, but they are liable to come forward any moment. One or two lots of cattle came through in stock Palace cars, but they did not show enough better to warrant the extra expense. There is probably some experimenting yet to be done before these cars will be looked upon with favor. As yet there are no indications of a general reduction of cattle freights, but a few of the leading shippers doubtless obtain drawbacks.

Below we give the range of prices, average price, and

figures at which large lots were sold:

May 2°d, ranged 11 @14c. Large sales
do. 29th, do. 10 @14c. do. do. 12@13 c. do. 12%
June 5th, do. 9½@13e. do. do. 11@12 c. do. 11%
do. 12th, do. 10 @14e. do. do. 12@13 c. do. 12%

Milch Cows.—These have been offered more freely,

and after a dull month, there is a little improvement at the close, helped by an advance in beef, which enables the milkmen to sell their fat, dry cows to advantage. Some miserably poor cows are being sent to market, and sold at \$40@\$45 each, with ordinary to fair milkers at \$55@\$65, and good to extras at \$75@\$90..... Calves,-The offerings are still quite free, but not so large as in May. They dragged heavily for a week or two, after last report, fat yeals selling at 71/2008c. Now they are doing better. Butter-milk and grass calves are worth 51/2@6c., thin milk veals, 61/2@71/2c., good to choice, 8@ 91/2c. A lot of 33 State calves, 142 lhs., just sold at Sc., with a pen of 204 lbs, at 9c... Sheep and Lambs.ts are larger, the greatest increase being in These have declined 2@3c. per lb., poor Southern Receipts and Western selling at 9@11c., fair to prime State and Jersey, 111/2@121/2c., with a few extras at 13c. Sheep have been running down quite gradually, but close firm at 433@51/2c. for poor to medium, and 6@61/2c. for good to prime, some choice lots selling at 63 c. Most of the sheep are now coming from Ohio, and Ill., with lambs from N. J., and this State, an occasional lot being received from Ky., Va., and Ohio ... Swine .- Free as were the receipts of the previous month, they are still larger now, and live hogs have declined about 3/c. per lb. They went to 41/05c., a fortnight ago, but close somewhat firm at 5c@5\%c., a recent advance in lard helping them. City dressed vary from 6c. to 6\%c., according as heavy hogs or light ones.

Stock Breeding .- Charles R. Hoffman, Kansas. In breeding stock of all kinds, it is a rule never to breed the progeny to its sire. This rule is often de-parted from among breeders; but exceptions should only he made for some good reason. The male progeny of a thorough-bred heifer might be used on a half-bred heifer from a native cow, although the sire of both was the same, as this would not be considered close But judicious selections should be made. A change of blood would be well every four or five years.

containing a great variety of Hems, including n any good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Theeles on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

A Necessary Item. — To correct a mistaken idea that has got abroad in some quarters, we wish it distinctly understood, that The

AMERICAN AGRICULTURIST (Monthly),

and HEARTH and HOME (Weekly),

are two totally different, Independent Journals-as much so as if published a thousand miles apart. Their engravings and their reading matter are entirely unlike, and neither Journal takes or supplies the place of the other. HEARTH and HOME is an Illustrated Weekly Family Newspaper, of a high order, designed especially for the HOME CIR-CLE-containing a variety of home reading, and general information, with full and choice departments for the Housekeeper and the Young People, and a NEWS department, giving the news of the World for each week, in that complete but condensed form desired and needed by busy men and women who wish to keep up with the times, but have not leisure to wade through the acres of printed matter of the general newspapers. Our readers know the character of the AMER-ICAN AGRICULTURIST. The issuing of the two journals under one business management, is a saving of expense to each, which enables the Proprietors to do more for both journals than if each had to separately bear the entire expense of offices, clerks, printing machinery, etc.

The Agriculturist as Premiums.—
A member of the Lehigh Co. (Pa.) Agricultural Society, writes that the American Agriculturist is offered by that Society as a premium at their fair, and commends the example of that society to other similar associations. This has long been done by many societies, and the plan might be profitably adopted by a great many more. Aside from its intrinsic value, it will, as our correspondent suggests, be of great use in remluding the recipient each month of his relations to the County Society. The money could not be more wisely expended.

The Apperican Pomological Society.—The circular of the President comes to us just as we are making up the paper. The meeting will be held at Richmond, Va., on September 6th, 7th and 8th, in Assembly Itali, Eighth street. All Horticultural, Pomological and kindred societies are requested to send delegates, and all persons interested in the cultivation of fruits are invited to take seats in the convention. The Virginia Pomological and Horticultural Society will hold an exhibition in conjunction with the meeting, and bevides the premiums offered by that society, there are

premiums from \$50 to \$5, offered by individuals for the best collections of apples, pears, grapes, peaches, figs, etc. The Pomological Society has never held a meeting so far south as Richmond, and it is hoped that there will be a large attendance from all parts of the country.

Peter Henderson & Co.—The firm of Henderson & Fleming having dissolved, Mr. Henderson, his son Alfred, and Mr. Wm. Carson, have formed a copartnership under the above name. The new firm will be located at 35 Cortlandt street, and will soon present a general stock of seeds, plants and other articles usually found in a first-class horticultural establishment.

A New Early Peach.—Mr. S. G. Bilyeu, of Littleton, Halifax Co., N. C., exhibited to us on June 19th, specimens of a new early peach called Beatrice. This is a seedling by the celebrated Thomas Rivers, of Sawbridgeworth, Eng. Upon the grounds of Mr. B. the Beatrice is at least 20 days earlier than Hale's Early. Like all early peaches, it is small, but it has a very high color, is very fragrant and of good quality for a very early variety. The specimens presented to us had been picked for five days, and were in perfectly good condition, and would seem to warrant Mr. Bilyeu's claim that they possess superior shipping qualities.

Prevailing Diseuseamong Horses. —Dr. Liantard, of the N. Y. College of Veterinary Surgeons, writes to the American Agriculturist; "In relation to the disease which is now raging amongst the horses of this City, I would say that it is not a new disease, but the Cerebral Spinal Meningitis, or Spotted Fever-that the disease has shown itself this year in a peculiar form, and has been of a much milder character than I have seen it before, that the curative treatment which consists principally of counter-irritants, catharties, nervous arterial sedatives, is, in many cases, unsuccessful and that I am satisfied that in that disease, more than in any other, prevention is the true way to treat it. In several instances where I have seen horses dying from it, by putting the remainder of the stock under prophylactic treatment, I always stopped the disease, and feel satisfied that the same result could have been obtained in this fearful outbreak."

Pure Water.—Chickens that are kept confined should always have at least the luxury of pure, cool water, and they will not flourish without it. Many contrivances are in use for this purpose, none probably better than the Flowing Spring Poultry Fountain.

Will Thromps and Cabbages Mix?

"R. W. W.," Union Lakes. We never knew of a case in which cabbages and turnips crossed with one another, but they are so closely related, that we should not be surprised to learn that such admixture had taken place.

"Amateur" asks how to make one. Such a thing would be so much bother, that it would be poor economy to use muslin instead of glass. The plants would not get sufficient light, and snow and rain would get it out of order.

Potato Bugs. — Joseph Bowland, Winneshick Co., Pa., wishes to know if the Colorado potato beetle has left Colorado. Who can tell?

Sweet-Potato Insect.—G. J. Read, Adair Co., Ky. The insect that looks "like a terrapin" when magnified, is one of several tortoise beetles that infest the sweet-potato. Yours is the Mottled Tortoise-beetle, Cassida guttata. The larve of the half dozen species all have the singular habit of making a screen or shelter of their own excrement. As the beetles are upon the under sides of the leaves, it is difficult to reach them with Paris green, which it is said will destroy them. Examining the young plants, and picking off the first comers before they increase, is the best remedy.

The Grain Moth or Elittle Wolf.

— Quinton Dick, Marshall, Ohio, has his granary infested with small worms of a dirty white color, which spin a web connecting several grains of wheat together. They eat out the heart of the grain, and now (May) are in the chrysalis state and appear as brown pupe three-eighths of an inch in length. They are the larve and pupe of the Grain Moth or little Wolf, at the present time, and until August they exist as moths which may be found on the walls and ceilings of granaries by day, and flying about by night. They may be destroyed by burning a candle in the granary. The worms and chrysalides will be destroyed by scrubbing the floor and walls of the granary with hot soft-soap sads and limewashing the ceiling. All cracks should be carefully cleaned out and then filled up. Once got rid of, they may be kept out by using fine gauze screens to the windows.

Sundry Humburs. - In reference to one of the "Gift Enterprises" referred to last month, that for the "Home" at Washington and the "Asylum" in N. Y., we have heard from several parties interested. Appleman, of Hagerstown, Md., says, he believed it to be a well conducted enterprise, everything on the square, and he put in some property with the distinct understanding, that all profits from it should be given to the Soldiers' and Sailors' Home at Washington. Mr. Devlin says, he took the New York agency of the tickets, just as he would of any other business, which he believed honorably conducted, but he took extra pains to have a part of the profits go to the N. Y. Roman Catholic Asylum, in which he was interested. Probably every one connected with the enterprise would show similar good intentions, unless it be that some first originator who started it to get a ready market for real estate, that had come to be an "elephant" on his hands. We believe no one denies that, as a whole, the property offered in this scheme is priced far above what it would sell for. Indeed, we are told that it was estimated that the managers should receive \$10,000 each, and that there would still be a good surplus for the institutions, after paying all expenses, advertising, commissions, etc. It amounts to just about this: People are invited to pay in their money, partly because a small percentage of it will go to benevolent institutions, which is "touching them in a tender " and they are further stimulated with the hope that there is a possibility (a very remote one) that they may draw a big prize. The best result which can happen to any but the managers, who get \$10,000 cach, and those who have put in property, will be that: 1,003 persons will get something worth on the average half of what it is priced at in the scheme, and 50,997 persons will get nothing, except the consolation that a few cents on the dollar have gone to good objects. The whole scheme, like every other one of the kind, is bad in its results; it differs nothing in principle from the old lotteries, and no amount of good intentions, and good faith in carrying it ont, can whitewash it into credit. Lotteries of any kind, in and for churches, asylums, or otherwise, from the grab-bag up to Pike's Opera House and the San Francisco Library, are worthy of the severest condemnation. They appeal to and cultivate a morbid hope of "luck," that stifles self-reliance, painstaking effort, and manly energy, which lie at the foundation of all true success in life.... An Illinois Loan Agency, proposing to receive and invest funds at 10 per cent, appears very plausible, and something on this plan, under the control and management of thoroughly known, responsible, and experienced business men would be useful. The one before us, may be all right, and we think the originator means well, though we always look with suspicion upon any business circular, we aways rook with suspicion upon any onseness circular, addressed specially to elergymen, beginning with the patronizing "Dear Brother." ... A swindler, calling himself J. T. Stewart & Co., advertised a paper, "The Press," at 10 cents a year, and offered a \$50 Greenback in every hundredth paper as a prize to secure a large circulation. A multitude of such ignorant people as are always expecting somebody to give them \$20 for \$1, sent in their subscriptions. Every subscriber received an intimation that he was the lucky one, and received a pieture of a greenback, informing him, that on remitting \$10 for expenses, he would receive a \$175 Watch. And thus it is, that these rascals go on stealing from their ignorant dapes ..... 190,000 foolish people (no others can be expected to participate) are invited to send \$6 each for a remote chance of drawing \$60,000 in breastpins and ear-rings, etc. to be positively distributed at Washington, July 5th, and they are expected to take the tickets promptly, because the "victims of the French war" will get some benefit. Anybody who wishes to sport a \$60,000 breastpin, and believes such a thing will be distributed, and is positively sure that, among 190,000 people he will be the lucky one, will send on \$6 for a ticket instanter. All others better think it over until July 4th, 1872, and in the meantime send their whole contribution at once to the proper relief-committees. . . . Will the self-dubbed "Dr. Audrews," of Albany, never die, but forever keep on distributing those numberless disgusting circulars, etc.? In one before us he tells the post-masters they have been his constant friends, and helped him for over 40 years! He ought to be known well enough by this time to be every where avoided - but his latest circulars come to us from way down in Texas. And now one of the "Spanish Policy" swindlers calls himself "C. P. Barkis, 1210 Broadway, N.Y." He is "willing" to take and keep your money-for there is no "Spanish Policy." Next month he will assume other names One signing himself S. C. Thompson & Co., 41 Maiden Lane, N. Y., sent out lists of cheap goods, and filled small orders quite satisfa forily. The bait took, and many others united in cla's and forwarded considerable sums of money. After maiting and waiting, week after week, the only answer they could get was, that past of the goods ordered were 'out," but would soon be on band and be immediately forwarded. We find no such person

or firm at No. 41 Maiden Lane. This is another illustration of the risk, concerning which we have so often cautioned our readers, of sending money to any unknown parties advertising by circulars .... GAIUS W. HUBBARD, Jr., AGAIN. This scoundrel who has his headquarters at 208 Broadway, is full of ingenious swindling schemes. The pretended counterfeit money or sawdust game he has worked under a great variety of names, and in this as in other cases, he usually manages to operate upon other disbonest people in such a way that they can not appear as witnesses against him without criminating themselves. Here is one of his latest swindles: The following is a copy of many similar documents returned to us by honest people. Hubbard had a large lot of them written out and forwarded to different parties all over the West. They are all ahke except in the name of the person ad-(The Bill Head is neatly prioted in the usual form; the rest is written.)

"New York, May 15th, 1871.

"New York, May 15th, 1871.

Mr. W. P. Gillenvoaltus, Rogersville, Tenn.

To Durvin, Elliott & Co.,

Importers and Manufacturers of

Watches, Lewelry and Silverware,

Wholeaale Department up stairs.

No. 198 Broadway.

For repairs on Hunting, Stem-Winding, Gold Chronometer, made by Jugerson, No. 15,021, viz.:

1 Balance Wheel and Hair Spring, \$7.50

1 Mair Spring and Cleaning, - - 1.25

1 Fine Lever, regulating, etc., - - 5.00

1 Gold Cap, Eng'd, - - - 6.50—\$20.25

Please remit by Express.

DEAR Siz:—The above watch received from you 21st

Please remit by Express.

DEAR SIR:—The above watch received from you 21st Feb'y, is now ready for delivery. You were correct when you stated it could not be repaired outside of this City.—We have had great difficulty with it, but is now in thorough order, and we warrant it to keep correct time for five years.—You wrote that the watch was found and desired to know its worth. It is a very valuable time-piece, and must have cost at least \$500 in gold. It is now worth \$500, and for any one desiring a correct time-piece, is really chean at its first cost.—Please remit the amount of above bill by express, and the watch will be immediately forwarded.—Oblige by responding at once, as every day it remains with us entails additional trouble and expense. Respectfully, Durvin, Elliott & Co., 198 Broadway, N. T."

After mailing sundry thousands of the above. Hubbard

After mailing sundry thousands of the above, Hubbard got out a regular power of Attorney, signed by Durvin, Elliott & Co. (probably the real names of some of his employees), directing the Express Companies to deliver their parcels to himself. The result was that many dishonest people said to themselves, "well, there such person hereabouts, and if there was, the watch was 'found,' and did not belong to him, and so I'll privately forward the \$20.25 and get the watch and keep it.' course, Hubbard pocketed the funds and let the dupes whistle for their money. They dare not expose them-selves by complaining, and if they did, they would find no Durvin, Elliott & Co., at 198 Broadway, for the building is nnoccupied-such buildings are often selected as their advertised headquarters by various swindlers. Of course no thoroughly honest person would forward money for a watch not belonging to him, but be would promptly do as Mr. Gillenwaltus and others have done, forward the documents to this office, or elsewhere, for investigation. --- We have given considerable space to the description of this particular swindle to illustrate how ingenious are the dodges resorted to, and to show that great care should be exercised in responding to cirenlars, etc., from unknown parties. We confess also, to a little satisfaction in showing those who bave had a hand in sending the thousands of dollars in response to this operation, how completely they have been "done for" in their dishonest attempts to get watches not belonging to them.

We have the usual assortment of "queer," alias "Sawdust," alias pretended counterfeit money, circulars and letters, but this subject has been so well ventilated that it is needless to say much. The swindled, willingto-swindle, people throughout the country must have mostly received their dose of "sawdust" and had their eyes scoured open with it by this time. They have con-tributed enough to enable Hubbard and others to own Fifth Avenue Houses, splendid turn-outs, large bank accounts, and abundant solid investments, besides liberal expenditures for gambling, wines, etc. Geo. L. Decker (so-called), 688 Broadway, sends out boxes of old medicine bottles as a blind, with \$15 to \$50 C. O. D. bills, and writes to the victims very plausible letters.-Henry Parker & Co., 48 Liberty St., pretends to have city police men paid to protect him and his customers. Among new names of "queer" operators we find Sami, J. Hale, 31 Park Row; Thos. Bailey & Co., 42 Liberty St.; I. F. Burroughs & Co., 1 Beekman St., and 11 Ann St.; Christopher Yates, 129 Nassau St.; Daniel Elliott & Co., 190 Broadway; Francis Ogden, 131 Fulton St. (old name and new circular); Howard L. Jones & Son, 194 Broadway, paper, or otherwise, is to be let alone severely, no matter how grand his show of profits to be made, etc.

MEDICAL HUMBUGS .- Despite all we have written, we still receive (from new subscribers generally) large numbers of inquiries in regard to this and that doctor, medicines, etc. As a general answer to all, we say: Every

one of the doctors, remedies, etc., inquired about in the numerous recent letters before us, is a humbug—no exception—whether referring to "eyes," "ears," "lungs," "consumption," "early indiscretions," "premature decay," "impotence," "seminal weakness," "diseases of women," "urinary diseases," advertised "medical colleges," "medical institutes," and "medical universities," no matter how high the pretented State Authority Endorsements. — Frequency circular or bill seet through the mails in a form sent through the mails, in reference to any medicine, or doctor, or medical institute, that we have seen, and we have seen many thousands, has been a swindle. We do not speak ignorantly, or at random. If you don't believe this, reader, but choose to risk your health and your money, we can't help it. If you let one of these fellows have a line from you, they will worm plausible letters, and they will stick to you as long as you have a dollar left, or can borrow one. They will send you stimulants or touics to make you "feel better" for the time, and then lead you on to further investments; or by some other ingenious dodge get your money.

Tansy for Current Worms.—E. Bonney, Jr., Syracuse, N. Y., makes a strong decoction of tansy and sprinkles it upon the bushes from a watering pot. He applies it when the dew is on, three mornings in succession, and then waits until the worms reappear. The remedy is cheap, simple, and easily applied, and in the hands of Mr. B. has proved successful.

Cocoa or Nut Grass .- "N. H. K.," Fulton, Miss. This is a troublesome species of sedge, growing in the Sonthern States, which can only be killed by constant and thorough cultivation. Plow the land once a week during the season, and harrow it at least twice a week; or, if this plan is too expensive, plow in the spring and sow wheat or some other grain, applying a good dressing of manure, and sow ten or twelve pounds of clover seed to the acre.

"The Southern Farmer."-We learn that this paper, published in Memphis, Tenn., is now entirely owned by its former editor, Dr. M. W. Phillips. Dr. P. is a veteran in the service, and has always made a most excellent paper. We hope he will be equally successful as a publisher.

Washing Trees .- "Subscriber." best wash for fruit-trees is a strong solution of soft-soap, applied with a brush. The best time to perform this operation is early in the spring.

Cucumber Bugs .- "A. J. M." destroys them with boiling hot soap-suds, sprinkled on the vines. He also washes the stems of young apple-trees with the same, and thereby kills all lice and makes the bark sbine. We think the soap-suds might be beneficial, especially if made with carbolic soap, which we have tried on the bugs with success; but we fear the boiling heat might be too much for the vines; we should advise caution in using it at such a temperature.

Fairbank's Patent for railroad scales has been extended by the Commissioner of Patents for 17 years. The proof shows that these scales have been put in use to the amount of \$789,000, and that they have revolutionized the railroad freighting business. The Patent is justly extended; it is benefiting the people by many millions annually.

American Raisins .- In the May Agriculturist we made the statement that raisins could not be made from any American grape. This must be qualified so far as the Walter grape is concerned, as Messrs. L. M. Ferris & Son, of Poughkeepsie, N. Y., send us some dried berries of the Walter, which, though small, are really raisins. The specimens sent were from inferior fruit, dried without any especial care, and give encouragement to try what can be done with selected fruit cured in the best manner.

Plaster on Potatoes. - "Virginia." Plaster is not generally considered beneficial to potatoes. All applications of lime affect the quality of this crop injuriously. The potatoes boil hard, and have a disagreeable flavor. We have heard this maintained, and have also experienced it. As soils differ widely in character, it would be wise to try a few hills, or a single row.

Locust for Posts .- "C. M.," Delphi, Ind. That which you refer to as Black Locust is probably the Robinia Pseudacacia, known in the East as Yellow Locust, from the color of its wood. It is one of the most valuable and durable sorts of timber for posts and other uses. Large quantities are used in all ship-yards for tree-nails. If you should fail to want them for your own use, they

will surely come to a good market. The great drawback to their cultivation in the West has been the borer, which honeycombs the collar, and soon destroys the tree. Seald the seed before it is sown. For full directions for sowing and cultivation see back numbers. We bave no experience with the Honey Locust for post timber.

Traveling Shows .- We well know by experience, the anxiety that parents undergo in reference to proper amusement for their children-and especially is this the case, when the great half-acre, high-colored, show-bills appear, announcing some traveling show, circus, menagerie, or other exhibition. The little ones are all excitement, and if there is not a prompt decision that they are to go, or a positive negative, the amount of solicitation, teasing, and ingenious argument one hears, is amusing-often painful. An ordinary circus is not refining, and its accompaniments are such that its influence upon young or old people, or upon a community, is deleterious. A well conducted menagerie is instructive, and when kept clear of low characters and performers, can be safely visited by families with profit. As a rule, parents should always go with their children to all such or keep them at home. We have frequent inquiries from all parts of the country, as to whether a Christian man can visit with his family the Traveling Exhibition of Mr. Phineas T. Barnum. We have not personally seen it, but some intelligent friends have, and from their report, and from what we know of Mr. Barnum personally, we judge that he carefully excludes all immoral features, and that he has a collection of animals, curiosities, etc., more worthy of visiting than usual, and on the whole more entertaining, and less objectionable than one will ordinarily be likely to meet with.

A Prolific Graft.-"H. H.," Riverside, Me., set some apple grafts in 1870. One of them made a growth of seven feet, and at the time of writing this spring it had twenty-four clusters of blossoms upon it. He asks what he shall do with it.—A graft should be treated as if it was a young tree; its growth may be controlled, if need be, by pinching, and it should not be allowed to overbear.

Smut in Wheat .- "J. T.," Nokesville, Va. Smut is not a disease, properly speaking, but it is the cause of an injury which may be regarded as a dis-It is a minute fungus, living in and upon the grain, and is propagated by spores, which answer the purpose of These spores are so very small that they may adhere to the seed grain unnoticed, and from them the smut will be developed more or less abundantly, as the season is favorable or otherwise to its growth. usual preventives are soaking the seed wheat, just before sowing, in very strong brine or in a strong solution of Blue Vitriol (Sulphate of Copper), in either case drying the grain by the use of quick-lime.

Pinching the Grape-vine. - "Subscriber" should have pinched his vine shoots as soon as the leaves could be distinctly seen. It is now too late, but had he done as every person should who writes to an editor or any one else-given his name and address, he would have had a timely answer by mail.

Potato Bugs ouce More,-"I. B. D.," Lockport, (State not given), writes that he has used a decoction of May-weed or Dog-fennel (Maruta Cotula), to which soft-soap had been added. When the decoction is cool, the plants are sprinkled with it from a wateringpot. Our correspondent speaks of using it for the Potato bug. As there are many Potato bugs, we have no means of knowing if it is the dreaded Colorado beetle, or some other insect, that is killed by the above mixture.

The First Book of Botany, by Eliza A. Youmans.-When the first edition of Miss Youmans' book appeared, we commended it to the notice of teachers. We now have a revised edition, enlarged by extending the subject upon the same plan. The work is admirably calculated to "cultivate the observing powers of children," and to teach botany in the only way in which it can be successfully taught—from the plant itself. We are glad to learn that the work has met with a favorable reception by teachers, and though intended for quite young children, older persons can, by its aid, lay a good foundation for the study of more advanced works.

Sumach. - G. W. Walker, Lowell, Mass. We know of no attempts to cultivate our native Sumach, and cannot tell you what the yield per acre would be. It is cut from the middle of July until frosts. Crude, dry leaves were worth at the mills in Virginia, last year, \$1.75 per 100 lbs. The European Sumach is Rhus Coriaria, but it is not white-berried. Our native white-berried sumachs are puisonous. We do not find the European in the catalogues of our nurserymen, but it is in the French ones. Guano.—"R. R.," Newark, wants to know how and when to use guano. This being a very soluble and concentrated manure, should be applied early in the season. For corn or potatoes, mix in the proportion of one part of guano with three of fine, dry earth, and apply a handful in the hill at planting. For vegetables, harrow or rake in the guano at the rate of 500 pounds per acre just before sowing. For strawberries or the lawo, apply about half the above quantity just as the growth commences in the spring. It is apt to burn a crop if the season be dry.

Maunring Cheap Land .- C. D. Koch, Pearlington, Miss., lives in the piney woods where land is worth ten cents to \$1 per acre, and is therefore supposed to be unable to repay the expense of proper ma-nuring and cultivation. He wants to know if manare is roughly spread on in big lumps and plowed under, whether he cannot subsequently get the full benefit of it by plowing and cultivating.-Most certainly not. Manure in hig lumps cannot be properly decomposed, and is not in a condition to yield to the soil its fall amount of fertility. To get the full benefit of manure it must be well rotted, and in a fine state of division. It must be evenly distributed in the soil, so that each plant may get an equal share, or the crop will be very naeven-some parts getting too much, and others none at all. In this way neither portion will be benefited. The fact that land is worth but \$1 per acre does not necessarily make it unable to yield to an improved system of cultivation. Where land is cheap and labor dear, the effort should be to make the crops as large as possible, and return most for the labor expended. The first step towards this is to use manure most efficiently.

Plaster on Wheat.—Luke Townsend, Black Water, Del., asks about plaster on wheat in stiff clay soil, that brings eight bushels of wheat per acre. This land certainly needs "doctoring," but plaster is not the thing needed. We would recommend lime at the rate of twenty-five or thirty bushels per acre.

Lime on Corn-Stubble.—J. H. Mussen, Center Co., Mo. To lime a corn-stubble most profitably where manure is scarce, the ground should be plowed and sown with buckwheat early in July. When the crop is in full blossom, but before any seed has matured, it should be plowed under, and carefully harrowed. After a lapse of two or three weeks, spread evenly what manure there is, and cross-plow the field thoroughly. Twenty-five bushels of slacked lime per acre should now be spread, harrowed in, and the seed (tye if the ground is poor, wheat if it is in better condition) may be drilled in. Such a field should be sown with clover (one peck per acre) in the spring, and that clover to be left on the ground the first year, and the second year turned under.

Superphosphate on Meadow Lands.—J. M. Cowles, Norfolk, Com. Gnano, which would cost a little more than superphosphate, will be preferable for meadows. It would not be wise to apply either to very dry land, especially in a dry season, they would both burn the grass. On moist land, guano might be applied successfully in any season.

Peas for Green Manure.— J. M. Graham, Pine Wood, Tenn. Peas make a heavy crop of stems and leaves, and are considered specially beneficial to land by reason of the dense shade afforded. To sow them for green manure, the land should be plowed, and if a drill is used, harrow; if not, the peas may be sown on the plowed ground and covered by drawing the harrow across the furrows on its back. When the peas are in blossom, turn them under, and don't cross-plow until they are rotted. In the South the cow pea is used; further North the common field pea, or the black-eye marrowfat. The time of sowing will depend on the time you want to use the land. Two months will be required for the peas to come into blossom.

Red Corn.—"A. W. M.," Ind. We do not know of any special virtue in red corn that would, when fed to the mare, cure scours in a colt—Probably a change from green to dry feed would have this effect. Colored corn is said by millers to make stronger feed than white corn. The greater proportion of oil contained in it is supposed to be the reason of this.

Salt-fish as Manne. — A subscriber Alexandria, Va., asks what he shall do with 250 barrels of salt herrings. Take the herrings near to where you want to use the manure, throw up a bank of earth a foot high, and spread on that a layer of herrings 6 inches thick, then put a layer of earth — the surface soil of the field—then fish, and so on until your stock is exhausted.

Cover the sides, ends, and top of the heap with soil to prevent the escape of the ammonia which will soon be abundantly produced. Leave the top dishing, to receive the rains. When decomposition has somewhat reduced the mass, turn over, and when well decomposed, spread on grass or plow it in for corn. If you have an old pasture or waste ground, whence you can get sods, use them or any similar waste matter in the compost.

Improvement of Marsh Lands.—
R J. Wood, Portage Lake, Mich., wants to know how to bring into cultivation a marsh, which has a layer of twenty inches of black muck, resting on an impervious white sand. First, drain. The manner of properly doing this may be learned from Waring's "Draining for Pr. fit." When drained, plow thoroughly in the fall; in the spring, spread fifty hushels of freshly slacked lime per acre, and harrow until the lumps are well broken up. Sow to oats, and seed to timothy. On such a piece of land, this grass will take though sown in the spring.

Clover. — A Subscriber, Beaufort, Mo. Where frosts are not severe or injurious, clover seed may be sown in the fall, say August or September. A dry season would prevent a good catch anywhere. Early sowing in the spring generally takes the best.

Potatoes Growing to Tops.—Wm. H. Erwin, Mifflin Co., Pa., has a very rich lot that he plants in potatoes, and they grow to tops only. He wants to know if cutting the tops would do any good, and if so, at what time. This lot is probably in need of a rotation. If very rich, a crop of cabbages taken off would bring it into condition for potatoes. The yield has sometimes been improved by preventing the tops from maturing seed-balls. Cutting off the blossoms would effect this.

Wire Fencing.—J. P. Smith, Hinds, Co., Miss., asks will it turn cattle or hogs, also about its relative cheapness. A good two-wire fence will turn cattle if properly put up. Its first cost will be more than with boards at \$20 per thousand. A wire fence that would turn hogs would be worth several times as much as the hogs. The cheapest way would be to fence in (not out) the hogs with a tight board fence, and make them earn their living by working up coarse manure.

Rotatoes in new Ground. — John P. Kast, Mechanicsburgh, Pa., has raised a crop of potatoes, partly io new and partly in old ground, and finds those from the new ground had a brown streak through them, and that the Harisons thus raised were "sad" when boiled and smelt disagreeably. There is nothing surprising in the fact, that the Harisons were sad when boiled. They are not only very generally sad themselves, but the cause of much sadness to those who unwittingly cat them. The brown streak and bad odor is probably owing to the abundance of undecomposed vegetable matter in the soil. Among Pennsylvania farmers it is considered best to take a crop of grain, generally buckwheat, off new ground before planting to potatoes.

Curing Hay.—R. L. Cooper. You will find in the June number of the Agriculturist, page 219, directions for curing hay. The green color can only be preserved in the hay by drying quickly and in the shade. The least heating or fermentation will destroy it. As a slight heating is considered an improvement to clover hay, the green color cannot be preserved when it is cured in cocks. Timothy hay may be cured so as to retain its green color by constantly turning, and putting in the barn the afternoon of the day it is cut. It does not require so much curing as clover, being less full of sap.

Timothy May.—F. Kraft finds his hay to be so dusty that it chokes his horses when thrown to them, and wants a remedy. If timothy hay is not dry when put into the haro, some mold will gather on it, which makes a dust very burtful to horses. On lined soils hay will be dusty, and the dust acrid and productive of coughs. If wetted before feeding, the dust would be prevented in a measure, but if cut and wetted, the dust would be effectually prevented from injuring the horses. Salt, spread on the hay when put into the bara, a few handfuls at a time, will prevent mold and keep down dust, as the hay will be always a little moist.

Carring Clover May. — George Muth, Carrolton, Ind., cuts his clover from the 6th to the 15th of June, or when about one-fourth to one-third of the heads are browning; cuts, according to quantity and labor force, from two to six acres at a time; commences about four o'clock in the afternoon, cuts next morning until nine or ten, sees that all the clover cut is evenly spread; at noon he commences raking (where first cut) in light windrows, at the same time starts the team to

load and hanl into the barn. His hav-mow is 14x50 feet. 12 feet high, with a jointed floor; on this he commences spreading evenly at one end, about the thickness of a middle-sized forkful; he thus goes over the whole mow, then sprinkles a little salt over all the hay, in quantity about as much as he would give his stock if the hay was not salted, rather less, than too much. Next he goes through the same process until the mow is filled up. He is careful to tramp and pack the clover as little as possible, to let it settle of its own accord. Further, be places in the mow every eight feet a ventilator, to permit evaporation, and prevent the hay from molding. ventilators are made each from two planks six inches and two planks eight inches wide, and fourteen feet long, to reach to the top of the hay; the planks are bored full of holes with a two-inch anger, and form an inside space of six inches square; they are set on the floor, and propped until the hay supports them. He learned this evaporator plan many years ago from the Agriculturist. Where the clover crop is light, this plan would do; but with a crop of two tons per acre the clover would heat in the barn and probably take fire or become worthless. He does not give time for a heavy crop to become cured.

Grass Seeding in the Fall .- E. A. Goodell, Minnesota, has a piece of land sown to barley, and wants to seed to grass this fall and cut a crop of hay next season. He has also two or three high knolls, soil, sand and gravel, which he would plant with trees, and asks what kinds he should plant. If the land is in good heart, it may be successfully seeded to timothy this fall by thoroughly harrowing, spreading some fine manure, and sowing and brushing in eight quarts of seed per acre. If clover is desired to be sown in the spring, put on only six quarts of timothy, and early in spring quarts of clover. Those knolls might be planted either to fruit or timber trees; but if planted, the young trees should be kept well cultivated until established. On just such soils, sainfoin succeeds, and it is a question whether it might not be profitable to introduce that, plowing in a crop after a few years to enrich the soil. It is not wise to plant poor spots with fruit or any other trees.

Gang Plows.—"M.," Chowchilla Creek, Cal., says that in the San Joaquin Valley three or four gang plows are in more common use than any other; further north, "in the sand," four to seven plows are used in a gang. For a four gang, ten-inch plow, a team of eight good males are used, and work from daylight to dark, and keep in good condition, fed morning and evening oo all they can eat of wheat and wheat straw. It would have been an interesting item to know what amount of land can thus be plowed in a day of ten hours. "M." does not inform us on this very material point.

Colic in Horses. - A. M. Alexander, Miss. —In this disease, prevention is better than cure. Colic may be prevented by care in feeding. When succelent green fodder is used, such as the blades and tops of the green corn, colic is common. It is caused by the production of gas in the stomach and intestines from the fermentation of the food, or by permitting the horse to drink too freely of cold water when tired and exhansted by work. Feed sparingly of succulent food until the animal has become accustomed to its use. Water often and give little at a time and never either immediately before or after a feed. If the horse has been permitted to become very thirsty, give no more than half a pailful at a time; letting fifteen minutes elapse between the drinks, until he is satisfied. If notwithstanding all care, he is troubled still with colic, give him 2 oz. sweet spirits of nitre and 1 oz. tiucture of opinm in half a pint of water. If necessary repeat in half an hour, adding 1 oz. tincture of aloes. Any spirituous medicine should be carefully administered. If no inflammation be present a pint of rum with half an ounce of pure ginger might afford relief.

Fast-Walking Horses.—Geo. S. Myers, Lewiston, Pa., says he has a colt four years old that can walk a mile inside of ten minutes. If our correspondent can procure another animal of equal walking capacity, he would have a valuable team.

Broken-winded Horse,—"H. C. M." asks if "anything can be given to a broken-winded horse to stop his blowing while he is working?"—We know of nothing. Feed him on moist, cut-feed, say 8 lbs. of chopped timothy hay, 8 lbs. of bran, and 12 ''ss. of ground oats, peas, barley, or corn, per day. The main object should be to let him have sufficient nat.innent without overloading his stomach. And he should never be worked for an hour or two after cating. Let aim have all the food and water he wants in the evening, but comparatively little before he goes to work in the morning. When he is brought to the stable at noon, give him half a pailful of water, with a pint of meal stirred into it. Then

give him, say 3 quarts of the cut-feed, and before he goes to work, another half pailful of water. When he comes home in the evening, after the harness is removed, and he has been rubbed down, give him a pailful of water with a pint of meal in it. Then give him 3 quarts of cut-feed, and in an hour or so let him have all the water he will drink, and also all the cut-feed he will cat.

Bloody Milk.—Chas. A. Morse, Leominster, Mass., writes that during the past ten years he has cured frequent cases in which cows gave bloody milk, by the use of the root of Garget—also, called Poke-weed and Pigeon-berry—Phytolaca decandra. A piece of the root half the size of a hen's egg, is given, inserted in a potato or carrot. Repeat the dose if necessary, in twelve hours. A widely different plant, the Veratrum viride, is called Poke in some localities, the use of which would be attended with serious consequences.

Tanning Cat Skins.—F. Fuller, We suppose that the process for tanning rabbit skins will answer as well for those of the cat. The Besh side being first cleansed of any adhering fat or flesh, is sprinkled with a mixture of two parts each of alum and salt and one part of saltpetre, all pulverized. Enough is put upon the skin to make it look white, the edges are folded in and the skin rolled up. After remaining three or four days the skin is first washed in clear water and then in soap and water. While drying, it must be pulled in all directions, in order to make it pliable. If any one has a better process we should be glad to know of it.

Four Calves at a Birth.—A. H. Lord, Somerset Co., Md., informs us that a cow in his County gave birth to three heifers and one bull calf. The last named lived only about a day.

"Where to Locate."—A basket item with the above heading appeared in our columns in May last. The case of a gentleman in St. Lonis was taken as an illustration of the difficulty of giving advice in such matters. It was a specimen of many unanswered and unanswerable applications, and the letter was destroyed. A large number of persoos have taken the notice as a request for proposals, and have forwarded us letters by dozens. As we have now no recollection of the name of the gentleman in St. Louis, we reluctantly consign these descriptions of desirable places to the waste basket.

Chester County Mammoth Corn.— Beroa College, Ky. The sample and statement sent show that you have been humbugged. But how can we show up the parties unless you sign your full name? No one has a right to ask us to expose a humbug who is not willing to be called in evidence in case it is necessary. Meanwhile, let this "Mammoth Corn" alone and plant your old sort.

Artificial Hatching .- An inquiry reaches us from Olympia, Wash. Ter., for a good incubator. Experiments are being made by many poultry raisers, with the various incubators in the market, but the evidence is not in yet to show which is the best. It is certain, however, that some that are advertised and puffed extensively, are worthless. We have never tried one onrselves that was as satisfactory as the natural method. It can hardly be expected, we think, that any greater per cent of eggs will be hatched by the most perfect artificial apparatus that will ever be invented, than by natural incubation. Also, whether there can be less cost in money and trouble in the artificial method, is very doubtful. An artificial apparatus that would work well would have this great advantage, however: eggs might be hatched when desired, without waiting for hens to become broody, and on this account we shall gladly report progress in inventions of this sort as soon as able.

New Poultry Paper.—The "Poultry Standard," is the title of a new monthly paper published by W. H. Lockwood & Co., Hartford, Ct., devoted exclusively to poultry. It is evident that there is a growing interest in this branch, when a sheet so well illustrated and printed can find support.

Testing Medicines for Live-Stock.

-We cannot be expected to report upon the value of "specifies" sont us for diseases in animals, because op portunity may not occur for their trial, besides it is not safe to pronounce on the effects of a prescription administered to one, or a few animals only, but a great number of cases should be tabulated to make the test value.

Light Brahma Fowls.— From Lockport, N. Y., we received the following: "After a careful experience of four years with the Light Brahma fowls, I am satisfied they are the most profitable breed now

known. I have for thirty years had various breeds, embracing White Leghorn, Black Spanish, and the common mixed breeds, and believe the country would be vastly encfited by discarding these and raising only the fullblooded Light Brahma. They are quiet and kep, within a 41/2 ft. fence, the best winter layers known, and not surpassed as layers by any other breed. Very hardy and easily raised, weigh from ten to twelve pounds at maturity, and exceedingly fine flavored. Always fat and ready to kill, if properly fed."—While our correspondent is zealous in praising his favorites, other persons are as positive in favor of other breeds. For ourselves, we conour in his testimony respecting the hardiness, winter-laying qualities, and quiet manners of the Light Brahma fowls. As regards the number of eggs per head yearly, there seems to be a great difference in different strains of this breed, and though in some instances where count has been kept, the average yearly yield has been high, yet in many other cases it has been only moderate, owing to a great propensity of the birds to sit during warm weather, which results in scanty laying at a time when other breeds are laying profusely.

What can be done with a wet Bleadow?—"H. C. M.," of Rockland Co., N. Y., writes: "I have a wet meadow, the grass on which is about run out. Should I plow up the meadow or sow good grass seed on it after the hay is taken off, without plowing?"-Plow the land. Roll it, and then harrow lengthwise of the furrows, and continue to harrow sufficiently often to keep down the weeds. A Shares' or Nishwitz harrow, so-called, is the best implement that can be used, as it cuts the land three or four inches deep without disturbing the tough sod underneath. Make the land as clean, mellow and fine as possible, and the latter part of August or first of September, sow on the grass seeds, and if the land is rich and not too wet, you will probably get a good crop of hay the next season. But if possible, the land should be drained. And it is rare, indeed, to find land so low that sufficient fall cannot be obtained to drain it, with more or less efficiency.

The Farmer's Workshop is a necessary department on every farm. Not only necessary, but it affords an agreeable variation to the boys, and in rainy days will furnish them profitable and pleasant occupation. Give them a tool chest and a supply of tools, and let them make all such things as rakes, harrows, handsleds, hen-coops, mend harness, cut threads on holts or burrs, or anything else they desire. Let them experiment there as much as they wish, and by and by you will see them bring out something useful, save many trips to the blacksmith's or wagon maker's, and many hard-carned quarters. If "variety is the spice of life," needed on the farm where hard and constant labor is the rule, and recreation is the exception. If you give them a supply of oil and paints, you will probably some fine day find the plows and harrows, or may be the old wagon looking like new, in a new coat, and the garden gate smiling to the passer-by, in a new clean dress. By all means, to induce them, both by practice and precept, to keep the work-hench neat, and the shop orderly, habits thus formed will influence them through life, and may lay the foundation for future success. If you cannot teach them yourself, furnish them with a book; there are many such published at such a price as will be repaid many times within a year, hesides leaving a lasting investment of good effects for a lifetime.

# About Editorial Advertisements.—A Grievous Wrong.

When the conductor of a newspaper finds a good thing—one which he believes, after full examination, to be highly useful to his readers—he ought to tell them of it editorially. Usually this should be done without charge, for when a man sits down to write a puff simply because he is paid for it, he becomes an advocate rather than a disinterested Judge of merit. The description of any unpatented article—one free to the public use—ought not to be paid for. When any person holds an exclusive right, or royalty, in any article, however good, he should, in justice, remunerate the publisher who supports the journal that gives notoricty and salable value to the article, but, as above stated, it is dangerous for any editor to "puff" any article simply because he is paid for doing so by advertising patronage or by money direct.

There is a kind of editorial advertising, however, which merits the strongest condemnation, and though largely practised by several leading religious and non-religious journals, it is really a fraud upon trusting readers. We refer to the practice of allowing an advertisement to appear in such a type and position among reading or editorial matter, that it is easily mistaken by the reader for the actual language and endorsement of the

editors, when this is not the case. Large prices are paid for such advertisements, because it is known they will decive the readers. The editor of one of our otherwise most excellent religious journals, was recently called to account by a reader for puffing an imposter. The editor replied in effect, that the complainant was a "greenhora," not to know that the item was in a "business" column. Yet, in this case, as in thousands of other similar ones, nine out of ten of the great mass of readers, unskilled in type and "make up," could not distinguish between the item in question and the real editorials on the same page and in the same type,

the same page and in the same type.

We go so far as to say that any editor or publisher who knowingly admits into his paper at all, an advertisement of any kind which he does not believe to be worthy of the attention of his readers, or which at least can harm any one of them in pocket or morals, is accessory to any wrong or loss that may result to them. He takes the quack doctor, the vender of useless or hurtful medicines, the swindler or the cheat, by the hand and introduces him to the homes of the readers of his paper. But even if we admitted the plea that the publisher merely puts up a bulletin for anybody to cover with posters who will pay him well for its erection, and that the readers know or ought to know that the advertisers are there simply because they pay for space, we should still claim that any editor who hires out his own clothes this peculiar type and place in a paper) to a swindler, or even to an unreliable, or an unendorsed advertiser, is a direct particeps criminis, and by no subterfuge or casuistry can he escape the verdict of "sold himself for lucre."

#### Bee Notes for July.—By M. Quinby.

As moths increase, treat them to a drink of molasses, vinegar and water, set in saucers near the hive at night. Their appetite for it proves their ruin. Let the chickens have the moths, and use the liquid again, renewing if necessary. Italians defend themselves from the moth better than black bees, and are less liable to foul brood. Foul brood, where it exists, should be attended to now, or in three weeks after the first swarm, as all healthy brood, except a few drones, has matured. Cells containing dead larvæ remain sealed. Make examinations in the middle of the day. If you are timid, put on some protection, but the bees will not be likely to sting if directions are followed. With the box hive you will first blow a few puffs of smoke under it. Then turn it bottom up, drive the bees away with a little more smoke, spread the combs apart, and if among the brood comb you discover any scaled cells, open a few of them with the point of a kuife. If they are black and putrid, while yet in the larva state, drive out the bees at once. Set an empty hive on the old stand, to catch returning bees, put another on the inverted hive, and with a hammer or stick, gently and rapidly strike the lower hive. In fifteen minutes the bees will mostly be in the upper one. Set this on the old stand, and all will soon gather there to begin With movable comb hives it is only necessary to lift out the combs and shake the bees off at the entrance of the empty hive-which should, of course, be on the old stand-taking care to have a wide board or sheet to facilitate their creeping directly in. All movements should be made very gently. It is not necessary that one should be a smoker in order to manage bees. Decayed wood, that which will just hold together, will burn a long time without blazing, and answers a very good purpose. If any choose to use tobacco, take a bit of cotton cloth a foot square, cover it with tobacco a quarter of an inch thick, roll it up, fasten with a few stitches, and set fire to one end. This auswers every purpose of a pipe. It subdnes Italians quickly, but the next time you meet them, you will be likely to find them more irritable. Early swarms will often fill the hive and store a quantity of surplus. If such is the prospect, it is just as well to put on boxes soon after bees are hived. This becomes necessary when two swarms are hived together. Keep a supply of boxes on hand, and change as fast as filled. No need of waiting until every cell is full. When taken from the hive, keep them the same side up if practicable, and raise them a little from the ground to let the bees creep out. Always avoid turning over, further than on one side, and keep the sheets vertical, else the honey will leak and look badly. Keep them out of the sun. In movable comb hives, weak colonies are easily strengthened by giving them a comb or more filled with brood from some strong one, shaking off all bees, of course. Replace these with In a time of a great yield of honey there is danger of too little room for breeding, and consequently weak colonies. In such case remove the outside frames, that will be well filled with honey, put some of the inside ones in their places, and empty ones in the center. The full combs can be used for feeding, or otherwise, as may be desired. If moth-worms appear among them, smoke with brimstone, in a close box or barrel.

#### Raising Pigs for Fresh Pork.

The author of "Walks and Talks" writes: "The most profitable branch of pig raising and feeding is to get the pigs fat at from three to four months old, and sell them for fresh pork. If of the right breed, and well fatted, they are as tender, juicy, and delicious as a turkey. The most provoking thing about it is, that the few consumers who know what choice eating such a pig really is, cannot get it; and the few farmers who produce it cannot get half what it is worth. It is a fact almost unknown in the American markets. Till it is known, those of us who raise the article in perfection must content ourselves with such prices as we can get, in hopes that when it becomes known we shall get what it is actually worth. But even now, at the present low price such pork brings, it will pay as well as any other branch of farming-which, it must be confessed, is not very much. Take such a pig as my young Essex sow, that at a little over four months old weighs 110 lbs. She will certainly dress over 80 lbs. Such a pig would sell for at least \$7.00, and ought to bring \$10 or \$12. A sow should average 8 pigs at a litter twice a year-say 16 pigs, at \$7 or \$112. A good sow, weighing say 400 lbs, kept, as she should be, in extra store condition, would eat food equivalent to two tons of clover hay per year. But much of it is food that she picks up, slop from the house, etc.: and we will estimate it at \$25 per year, which is certainly liberal. If it is not, how much profit do those farmers realize who keep a pig two years to make him dress 400 lbs., and then sell him for 7 cents per lb.?

Now, what will it cost to feed the little pigs? Till they are three weeks old, they will get all their food from the sow, and a good proportion of it till they are from two months to ten weeks old. Taking our data from Dr. Miles' experiments, and bearing in mind that we must, if possible, induce our pigs to eat more food than his did, we will estimate that the pigs the first month eat little or nothing more than they get from the sow, and the second month that they eat half a lb. each of corn per day, and the third month 11/2 lb. each per day, and the fourth month 3 lbs. per day, the litter of 8 pigs would eat 20 bushels of corn; or the two litter would eat 40 bushels, which we will estimate worth \$40.

And besides this, we have the manure, and have disposed of our corn at one dollar per bushel.

The figures would have a more pleasing aspect if we got 15 cents a lb. for the pork. In stead of getting \$47 for our trouble, we should then get \$127; and that, when the article becomes known, such pork will average 15 cents by the careass I have no sort of doubt. In London, "large pork" is quoted at 11 cents per lb., and "small pork" 16 cents per lb. in gold, by the carcass. And New York, Boston, Philadelphia, and other large American cities are better markets for really choice meat and butter than London. We can no more glut the market with choice meat than we can with choice fruit. The greater the supply of such an article of fresh pork as I have described, the greater will be the demand; for the simple reason, that it is intrinsically worth much more than we ask for it. Let us study the interests of the consumers, as well as our own. They do not want bone or rind a quarter of an inch thick, but sweet, tender, delicate, juicy meat; and it costs no more to produce it than rind and bristles.

### Country Roads and Bridges. BY W. J. CHAMBERLAIN, HUDSON, O.

Travelers over the wagon roads of our Western States will agree with me that the way the road tax is usually expended, discloses a great lack of judgment on the part of the supervisors thereof.

I wish to show how, with due regard to economy, to keep the road hard and smooth, the hedges firm and durable, and give the whole highway a neat and tasteful appearance. To this end these rules should be borne in mind:

- 1. Let the water have its own way,
- 2. Don't let the water have its own way.
- 3. Drain the road perfectly, keep the surface smooth, the crown high, and sloping well away to the ditch on either side.
- 4. Never leave a piece of new turnpike unfinished, but once begun carry out rule 3d before you leave it.

Within a mile of my house a small stream crosses the road diagonally no less than four times in a length of ten rods. In all these places the bridge is at the wrong place. In one case shown in figure 1, the bridge has always been at the point b. So at every freshet the brook, impatient of the abrupt curve just below a, figure 1, washes away its banks in the direction of the semicircular curves d, until it rushes triumphantly across the road and makes itself a new channel indicated by the dotted lines e. For fifty years the brook has been emphatically showing where the bridge ought to be, and for fifty years the supervisors with commendable pluck have insisted that it should flow, like a law-abiding brook, in the course laid down for it by their forefathers. Every spring at least this occurs, and then the district turns out with plows and scrapers, and turnpikes the road again, ready for the next freshet.

Last year it came my turn to be supervisor (this burden is borne by turns) and it so happened that a new bridge was required. I asked advice of the neighbors as to its location. A. said, "Guess you better put it in the old spot; the brook has kind o' got used to going that way." It seemed to me that was just what it hadn't "kind o' got used to," but I didn't venture the remark. B's and C's advice agreed with that of A. But D. bluntly remarked, "Bet-

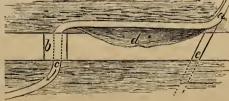

Fig. 1.

ter let the brook have its own way. It's been a fightin' fifty year' an' more to have the bridge put jest so the water could shoot right across the road when it got its dander up, and we 've been such a set o' fools we couldn't see what it wanted. The last big freshet I had the hull idee kind o' popped into my thick old head. Look here, neighbor," he continued, walking to the point b, figure 2, "you jest put the bridge here, and you make it big enough, and you build it slantin' across the road jest as the brook slants, and you bolt it from foundation to top-rider, and turnpike the road right, the hull length of the holler, and I'll keep up bridge and turnpike fifteen year' for what it cost the deestrick to do

it last year alone. Once get the water across the road and it aint a-goin back agin to wash away the turnpike."

Well the job was done as he suggested, and as represented in figure 2; and he will be safe in taking the contract on the terms he named. In fig. 2, d is the old bridge, b the new one; c, c, are stones to preserve the bank. The only wonder is that the "hull idee" hadn't "kind o' popped" into some one's head before. But since that time I have seen many cases as bad as the one I have described.

The bridge then should always be opposite the inlet not the outlet of the stream, and where practicable, should point in the same direction as the current, that the water may flow clear through, forming no eddies, which have a fatal tendency to undermine and wash away banks and abutments. Once more, the bridge should be constructed with its floor on a level with the

Fig. 2.

road each side, thereby avoiding the strain put upon a bridge whenever a heavy load is driven on it from a road at a greater elevation. Another important point is to afford sufficient "waterway" even during the heaviest floods, which in hilly districts will often swell a stream to ten or fifteen times its usual bulk. Finally, the bed of the brook for some distance from the road downwards should be made and kept large enough to discharge the water as fast as the bridge. Otherwise the water will set back in extreme cases, even flooding the road. This then is an illustration of what I mean by the first rule. "Let the water have its own way." The remaining rules, with the structure of small bridges and the general maintenance of the highways may be treated of hereafter.

#### Agricultural Societies and Fairs.

No agricultural community should be without its Agricultural Society. An organization having for its object mutual assistance and instruction should be of interest everywhere. To assist in the formation of such coöperative societies, we give a few hints as to the mode of bringing them into existence, and some of the advantages which may be derived from them.

As nothing can be done without money, the first business will be to interes ...d associate together a sufficient number of men to contribute the necessary funds. Laws exist in all the States for the encouragement of these enterprises and it is only necessary to follow them, in the mode of organization and incorporation set forth in each instance. These societies should have for their objects, in addition to the usual exhibitions, the introduction of improved stock, farm machinery, seeds and agricultural literature. Each one should aim to possess one or more thorough-bred male animals, together with mowing, reaping and thrashing machines, and a well-selected library for the use of those of its members who cannot afford to purchase for themselves. An annual exhibition should be held at some convenient period, to which the public should be invited to bring their stock, seeds and specimens of fruit and crops for competition. The funds necessary to furnish the

prizes offered should be raised by means of a small admission fee, and to make these secure, they should be guaranteed by the members of the association or some of the wealthier of them. Once put in operation, experience will soon show what is wanting and suggest the remedy. If an exhibition is all that can be accomplished at first, a good commencement will have been made. Above all things, get plenty of exhibitors, and if the stock does not show better than the seven lean kine dreamed of by Pharaoli, well and good, there is something to start from. Each year will improve on the preceeding one, and having an ideal in view, every farmer in the county will endeavor to attain it. We remember the first exhibition in a county in a Western State, at which there was no blooded stock of any kind, but such was the impetus given to improvement by the spirit of competition engendered, that in five years from that time there were exhibited three kinds of purebred horned stock, five of pure-bred sheep, and two of hogs; while the grades had already become respectable in numbers and appearance. Besides this, a mutual insurance company had been started among the members, and nearly every house and barn in that district was insured against fire.

As interchange of ideas is a great help to improvement, it would be well to enlist in these annual gatherings some well informed farmer from a distance who should deliver an address upon some interesting topic. This probably might be found more instructive than a horserace. We wish this doubtful agricultural feature, could be stricken out of the programme on these occasions.

#### Bots in Horses.

There are probably more mistakes made in the treatment of horses supposed to be suffering from Bots, than from any other complaint whatever. While we admit the existence of Bots, we don't believe in the many stories of their injurious effects on horses' stomachs. We have owned at different times many horses, and have had them occasionally afflicted with what was called Bots, but have never lost a horse by death from this cause. The reason of this exemption from loss, has arisen, we firmly believe, from the fact that we have never permitted them to be dosed with the poisonous mixtures so much in favor with drivers and hostlers. The writer with ten horses in his stable at one time for a period of three years, had no case of sickness, not even an attack of Bots, from the moment he cleared the hostlers apartment of all the powders and villainous drugs he had there stored up in fearful array. Previously the horses had the Bots all the year round, and many were the remedies administered. Turpentine, milk and molasses, whiskey, and raw potatoes were common medicines. Now if the Bots were actively engaged in boring holes through the coats of the beast's stomach and laying bare the sensitive membranes, we fancy turpentine or whiskey would not be a soothing application thereto. A fatal inflammation would more likely be the result, and the remedy would prove as bad as the disease. In passing through the interior of the horse the Bot is undergoing its natural development; and when the proper time comes, it passes out with the excrement. To bore a passage through the carcass of the horse is not its natural mode of exit. We may always safely trust to the laws of nature, and the instincts of living things, to guide us in our operations.

These all point to the fact that Bots are not necessarily injurious to the stomach of a living animal. We may then safely search elsewhere for the cause of those complaints generally attributed to the grubs of the Bot-fly. When we think of the carelessness with which horses are generally treated in the matters of overdriving, feeding, and watering, we cannot be astonished at the numerous forms of ailments of the stomach and intestines to which they are subject. In the majority of these cases the horse, if left to himself for a few hours, will be relieved naturally, but in a serious and prolonged indisposition, it would be wiser to seek the help of a practised veterinarian than that of the ordinary ignorant village horse or cow doctor, who will probably in nine cases out of ten, do more harm than good, for while he is endeavoring to kill the supposed Bots, he is more likely to succeed in destroying the horse. Generally it may be taken for granted when a horse rolls in his stable, gets up and lies down again often, turus his nose to his flank, and repeatedly makes ineffectual attempts to state, that he is suffering from indigestion or from inflammation of the stomach or bladder, resulting from errors in feeding or watering, after excessive labor-in such a case, nature will almost always find a means of relief in a few hours without any assistance other than rest, and care to prevent the horse from bruising himself.

## Sheep on a Poor Farm.

Some farmers of our acquaintance feel an antipathy to sheep, for the reason that they "bite close." We consider this their chief recommendation. They can only bite close where the pasture is short, and the pasture is short only on a poor farm. A poor farm will necessarily be encumbered with briers, weeds, and brush, in the fence corners. Under such conditions, we would say to a farmer who has twenty dollars or upwards in eash (or credit for it, and then let him borrow the amount if he has to pay one per cent a month for the use of it), invest it in as many ewes, not older than three years, as you can get for that money. Put them this summer in such a field as we have described, and give them, in addition to what they can pick up, a pint of wheat bran and oatmeal daily, with free access to water and salt. They will first "go for" the briers and clean them out; every portion of that field will be trodden over and over again, and the weeds will have no chance. Fold them on that field during winter, and carry to them feed sufficient to keep them thriving. Get the use of a good buck in season-South-Down would be preferable-and in the spring, if you have luck (that means if you give them proper attention and feed regularly), you will raise more lambs than you have ewes. The money will be more than doubled, and the wool and manure will pay for their feed and interest. In the spring you may put that field in corn, with the certainty of getting fifty per cent increase of crop.

#### The Color of Bulls.

It is a little difficult to seriously and patiently discuss the bearings of the question of color in our domestic animals—a question that is raised almost exclusively with reference to the Jerseys—for nothing is better known than that nothing at all is known about it. If Mr. A. tells us that he wishes his Jerseys all to have

black tongues and black hair on the ends of their tails, and a uniform color of body and limb, because he thinks they are so much more "stylish"-looking, we may smile at his taste, and even think that he attaches importance to a very unimportant characteristic; but we can find no serious fault with him for gratifying his own taste in his own way. If Mr. B. tells us that he wants his cattle to be of all colors, and some to have broad patches of white for the sake of contrast, we may or may not think that he, too, is working for a trivial object. But if either of these gentlemen tell us seriously that the color of an animal, or of any of its members, has a known physiological significance, he must excuse us if we give him credit for more cuthusiasm than discretion. (We except, of course, those well-known indications of a tendency to the high coloring of butter, which is indicated by a corresponding deposition of color in the udder, in the horns, under the white hair, and in the ears.) We have been gravely told, more than once, that a bull with a black tongue is more likely to perpetuate his own characteristics than one with a lightcolored tongue. After some investigation and much inquiry, we are confident that there is no ground for this theory, which, so far as we know, finds its adherents only among men of limited experience. What peculiar virtues attach to black tails, we do not know. That they are handsomer, we cannot think; but this, again, is a matter of taste, and is not to be discussed.

A new idea is now being sprung upon the public. It comes, as its predecessors did, in the modest form of a suggestion; but one after another will probably take it up, and in a few years it is not unlikely that it may become a cardinal article of faith with the proselytes. It is no less than the following: That the fawn, or blonde color, represents a more delicate constitution, and that when animals of this color are bred together they deteriorate; and it is also suggested that, as in the human family, the introduction of dark blood tends to reinvigorate the race. Not to go far for our illustration, we refer to the cattle of the Island of Guernsey, whose characteristics are well known to Jersey breeders. They are the blondes of the blondes. Not only are their colors very light, but they even lack the dark evelids, muzzles, and horntips so common (but not universal) with Jerseys; yet they are as hearty and vigorous and persistent a race as is known, and a single cross of their blood will be evident for many generations. The shorthorns are blondes almost without exception, and no race is more vigorous. If we were to meet the question by reference to the human race, we would modestly suggest, being Anglo-Saxon ourselves, that these blne-eyed, flaxen-haired men of the North have held their own tolerably well in the world, and that their fair-haired cousins show a constitution for which the dark blood of France has no terrors. If the objection is raised that the triumphs of these races are due to intellectual rather than to physical causes, we have only to cite the Russians, who are almost uniformly fair, who have superabundant animal health and vigor, and who show by their close personal resemblance to each other, observable especially among the common people, that they are a thorough-bred race of long standing, without the intermixture of dark blood.

The mulattoes of our own country are not quite so clear a case in point, because in their case the infusion of dark blood is from the mother's side; but their weakness of constitu-

tion, as compared with either whites or blacks, is well known; and if we are to carry the teachings of human reproduction into our stables, it seems to us that we find here a hint in favor of avoiding the admixture of dark and light Jerseys-which is probably an absurd conclusion—showing only that we ought in our breeding operations to be guided, not by our fancies as to the influence of color-for this influence is as yet a scaled book to us all -but by the well-known experience of successful breeders. If we put a dark bull to a light cow, or a light bull to a dark cow, we may or may not be able to guess at the color of the progeny. Farther than this, surely no man can yet go; and we advise all breeders, whether of Jerseys or any other pure race, to stick to the good old plan of having a good cow served by a bull that had a good mother. An adherence to this practice would have a better effect on the future value of the breed than all the vagaries of all the theorists who ever owned a black-tailed bull.

### The Foot and Mouth Disease, BY JAMES P. SWAIN, BRONXVILLE, N. Y.

GENTS:-In compliance with your request, Isend you a history of foot and mouth disease as it occurred in my herd. Early in March last, I purchased at Bull's Head, an ox apparently in good health and condition. He was put in my yard on Tuesday, and worked well until Friday evening, when he refused to cat. I examined him on Saturday morning, when he seemed to be in great pain, nervously shaking his chops, drooling from the mouth, and shaking his feet as if endeavoring to throw something off. He was immediately removed from the other cattle and kept under a shed half a mile away from them. The next day a cow showed the same symptoms, and the day after, Monday, several others did the same. I then reported the case to the State Cattle Commissioner, Dr. Moreau Morris, who treated me with all the consideration that could be expected, gave me all the advice he could, and sent a Veterinary Surgeon to examine the animals. Several other Physicians and Veterinary Surgeons saw them, and all agreed as to the character of the disease, and the mode of treatment, but I had previously commenced an entirely different and exactly opposite treatment, and carried it out. I do not recommend this treatment to others, but I should myself try it again in preference to any and all others. I purchased five gallons of crude carbolic acid at the suggestion of Dr. Morris, and should have used it for disinfecting my yards, for I think very well of it, but I chose to use more simple things that I more fully understood. My first operation was to cart fresh earth into my yards, and two or three times a day the diseased animals were driven into the mud and water where it was two feet deep, and were let stand there for an hour or more; after the first one or two trials they would go of their own accord, and stay longer than we wished them to. I let them drink freely of riley water, which they preferred to the pure water of the Bronx river. My cows averaged about one week, after showing the first symptoms, before they got to the worst. The blisters in the mouth and about the feet showed themselves in three to four days, and began to break in six to seven days. Either from the effects of the disease or from the difficulty and pain of masticating the food, or from both causes, the entire alimentary canal is irritated, some are costive, and others scour, discharging undigested food, and in bad cases,

bloody mucous. This was in all cases corrected at once, by giving gruel made of Linseed oil-cake meal—cotton-seed is not so good for this purpose. In some cases I had common salt rubbed in the mouth, just as the blisters began to break, and apparently with good effect. Some of my animals that stood on board floors were much worse than others; in several instances the animal would seek the soft, moist earth, and lie down and try to bury its feet in the earth; in such cases I threw on earth enough to cover them, and they would lie still for hours with it on their feet and legs.

The last phase of the disease, which is in the third week, is a mucous sweat which mats the hair, and the last appearance is scabs or scurf about the nose, and sometimes around the lips, and occasionally spots on the body. It is a painful and troublesome disease, but I do not think it dangerous; it leaves the animals in good heart, with improved appetites, and mine are in decidedly better condition than before they had it. I have twenty-four animals at home, all of which had the 'disease, and I had twenty-seven at another barn, half a mile off, attended by the same men, without any extra precaution, and none of them have taken the disease. I have now mingled these animals for over two weeks, and have had no new cases, and it has not extended to any of my neighbors' cattle. I have been as singular in my mode of disinfecting my yards as in the treatment of the disease, but it is too soon to publish it, as it may not prove effectual, and I would not willingly lead any one astray by my peculiarities. I presume there is nothing peculiar or different in my case than in others, except it may be that of one of my imported cows that was affected differently from the others, and my theory is that she had the disease in Europe, and was only relatively affected, much as a man has varioloid after small-pox, or kine-pox, or as he has the kine-pox the second time. If you wish my mode of disinfeeting yards, you shall have it.

#### Ogden Farm Papers .- No. 19.

For once we are fairly up with our work; every thing, that it was planned to have done by this time (June 10th), has been done. The carrots were put in sharp upon time this afternoon, and a rain that is brewing, ought to make such a reaction in the 2,000 lbs. of Manhattan Co's Dried Blood with which the 2 acres have been manured, that under such heat as we have a right now to expect, the carrots will be up nearly as early as the weeds remaining after the repeated harrowing of the land; and if the weather continues favorable for their growth, it will be a far simpler matter to nurse them until they are ready to "lay by," than if they had been planted, as is the custom, a month earlier. In fact it has been amply proven by experience, that carrots sown at this time are more easily cared for and make quite as good a crop as those planted early in May. I shall have however, from this field, no large crop to report as the variety grown is the Early Horn raised more for its color than its substance. Quantity can be more cheaply made up with Mangel and Ruta-baga.

After all sorts of experiments in the coloring of butter, I have come to the conclusion that the old-fashioned way is the best, that is, to color the cow. A peek of carrots a day with other root feed, fed to Jersey cows, will keep up a sufficient color for the

highest demand of the market. This will take 40 bushels carrots, for a cow in full milk, all winter. With ordinary success they should be raised at a cost of 15 cents, per bushel; 25 ets. would surely leave a safe margin, and at this price the cost would be \$10 for a cow. The carrots are worth nearly if not quite this amount as food. With a good dairy, having a high-priced market, they would certainly make a difference, of 10 ets. per lb. in the price of the butter, and this would amount fully to the extra outlay, showing a fair arithmetical profit and ensuring what is of the utmost of importance to the permanence of high prices, a uniform color and quality, especially during the spring.

We got on very well this spring until the carrots we had laid by for coloring began to grow. Their renewed vegetation turned their sugary juices into gall and wormwood and spoiled two makings of butter and more than two profitable customers. We had already commenced green feeding, but before the grass color can affect the butter, it has first to affect the whole cow, and it takes a couple of weeks of grass to bring the color to the right standard.

There was another defect in our arrange, ments this spring that would not perhaps have manifested itself but for the prolonged drouth. We had too little soiling rye, only three acres, and we were afraid to commence cutting as early as we should have done, lest we should run out. As result, the drouth and heat of the latter weeks of May threw the bulk of the crop into head and blossom, making it too hard and too bitter for the cows. As a consequence they have had to go to grass, where they will remain until the middle of next week when the oats will be fit for cutting. I am now adopting brother Harris's recommendation to the extent of summer-fallowing a full section of the farm (91/2 acres), to be laid down with rye this fall. We can safely commence cutting this in the spring when eight or ten inches high, and by keeping it cut short, will have a good supply, virtually of grass, until the middle of June.

In seeding down over nine acres of meadow this spring, I had intended to sow grass seed by itself, but yielded to the entreaties of our good German foreman, and let him sow something less than a bushel to the acre of outs for a shelter to the grass. As it has turned out, the venture has been an excellent one. Under the continued drouth, the grass came up but slowly. While we were for weeks without rain, we had frequent heavy fogs which made the oats dripping wet and so gave the soil an amount of moisture, without which the seed would hardly have germinated at all. Now the grass has taken well, and owing to the good condition of the land, we have a good deal more than half a crop of well-stooled oats for soiling now ready for the mowing machine. With this, and the crops that are to follow, we are morally certain of a superabundant amount of forage for the whole season; - a condition which it was not predicted by my neighbors would arrive so soon as the year eighteen hundred and seventy-one.

Contrary to our established rule, we are experimenting a little in butter-making. A lot of cans have been procured about 18 inches deep and 12 inches in diameter; a supernumerary horse-trough has been serubbed out and put into the summer milk-room (under ground). Into this there runs a stream of water from the

windm ll, the water having a temperature of about 58°. The milk as it is drawn is poured into these cans until they are nearly full and they are then stood in the cold water. Whether we shall get to using ice-water remains to be seen. In fact the result of the whole experiment remains to be determined. I can only say now that it has been going on for two churnings and both quantity and quality of cream and butter are at least as good as under the much more laborious system of using innumerable shallow pans. A month hence, I shall probably be able to speak more definitely.

#### Riding on Horseback.-No. 5.

We have now given our learner a preliminary shaking into a smooth and secure seat by mounting him on a horse whose management is intrusted to a friend, have taught him the use of the stirrups, and have shown him what sort of saddle and bridle he needs for his outfit. He is now ready to begin to learn to be a horseman, and he may next he taught to mount properly.

He should first learn (if young enough for such efforts) to vault into the saddle. We now and then hear of Princes, and the like, who lay one hand on the pommel and "gracefully vault into the saddle," but we do not see the feat performed except by skilful acrobats, and it is not very gracefully performed even by them. The following method, however, demands but little skill or strength, and, while always a good way to mount, is sometimes the only way it is practicable to mount a restive horse.

1. Stand facing the horse's left shoulder; 2, adjust the reins in the left hand, and take a lock of the mane in it; 3, lay the right hand on the ponunel of the saddle, with the fingers inside and the thumb outside of it; 4, spring upward and throw the whole weight on the hands, with the crotch at the hight of the saddle, fig. 1; 5, raise the right leg slowly, well over the horse's eroup (without bending the knee), and drop lightly into the saddle,—during this movement most of the weight is horne by the right arm; 6, withdraw the hands from the neck and pom-

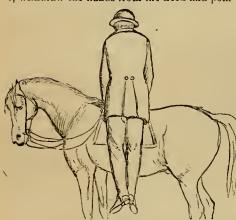

Fig. 1.—LEARNING TO MOUNT.

mel, and put the feet into the stirrups. These movements should be practised until it becomes easy to make them moderately; it looks very awkward to see a man "scramble" into his seat by hooking his right leg over the saddle and tugging himself over by his hands. As soon as your horse is accustomed to the manœuvre, and will stand quietly, practise the two movements (4 and 5) separately;—first learn to spring from the ground to the position described, and to drop easily down again without effort (and without kicking), and learn to handle the weight, when up, by raising the body until the

knees are on a level with the hands, and settling back again. This movement depends very much on the ability to handle the weight of the person with the arms, and will need a little practice, which may as well be taken on a wooden horse or a bar, fastened five feet from the ground—a little higher after this has become easy. In short, make it easy to get into this elevated position and to feel unrestrained, while in it; next, learn to get the control of your right leg, so that it becomes natural and

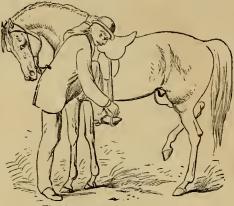

Fig. 2.-OLD MILITARY MOUNT.

easy to throw it over the horse's croup with a bold swing-not poking it over knee foremostand to carry it so high that there is no danger of touching his hips with the toe, nor of scraping his flank with the spur, as the foot descends. Keep up the alternate motions of throwing the leg over the saddle, and of returning again to the erect position, until you can arrest the movement at any point, and have such perfect command of the weight that you can be sure of getting lightly into the saddle under all eircumstances. This knack once acquired will never be lost, and you may be sure of mounting any horse, except a bad rearer, on whose neck and saddle you can once lay your hands,-that much accomplished, you are sure of him,-and you can safely dismount by reversing the movements, in spite of his efforts to give you a fall.

While this vaulting is a very valuable knack to possess, the ordinary steady, soher citizen whom we are addressing, will usually wish to mount with the stirrup. It is curious to see what different ways different people adopt to do so simple a thing. Some practise the old military system :-standing at the side of the horse's neck (face to the rear), with the left hand holding the reins and a lock of the mane, they hold the stirrup with the right hand, fig. 2, put the left toe into it, give two hops which slews them around until they face the horse and catch the cantle (back part) of the saddle with the right hand, then rise and get their seat. The first position of this manner of mounting exposes the rear of the rider to a bite from the horse, which-the hand being engaged in the manehe is powerless to prevent. A beginner usually takes hold of both ends of the saddle, finally manages to get his toe into the dangling stirrup, and then struggles with more or less difficulty into the saddle, where, for a moment he has no control of the horse, who, if he is at all spirited, commences the exercises by a very confusing start.

The correct manner of mounting with the aid of the stirrup, is, in our opinion, the following:—1. Stand opposite the cantle of the saddle (face to the front), with the right hand (holding the rein short enough to feel the horse's mouth) far over on the right side of the cantle; 2, take the lower part of the stirrup leather in

the left hand, and steady it while introducing the left foot, fig. 3; 3, give a spring, upward and forward, throwing the weight as evenly as possible on the left foot and on the right hand. so as not to turn the saddle, grasping the lower part of the mane with the left hand in rising, and standing erect in the stirrup, with the feet touching each other, fig. 4; 4, throw the right leg (without bending the knec) well over the horse's croup, and (raising the right hand at the same time) drop lightly into the saddle; 5, as the right hand is raised from the eartle, let go of the mane and receive the reins between the fingers of the left hand, letting go with the right as soon as they are properly adjusted. In dismounting, exactly reverse all of these movements,-especially bringing the feet together while standing in the stirrup. Practise these exercises until it becomes easy to mount a tall horse without disturbing an ungirthed saddle.

There is a method of training, invented by a French rider, Baucher, and named after him, which is the most effective means for making both horse and rider perfect in their work. Its details are too minute for repetition here, but they are well set forth in Herhert's Hints to Horsekeepers, and will well reward the attention of those who have the time and the enthusiasm to follow them out. By their aid an unbroken horse, if a good subject, can be made a very nearly perfect saddle beast in two months' time—having a lesson of thirty minutes or less, morning and night.

While it is not practicable to give here even an outline of this system, we shall adhere to its general principles, which are: to teach the horse but one thing at a time; to teach that thoroughly before proceeding with the next step; to make the lessons so short as not to disgust the pupil; to reward obedience more especially than to punish disobedience (or rather non-obedience); to make the horse thoroughly supple in every muscle of his body, and to teach him to move all his members as easily—under the rider's weight, and under the restraint of his hand and legs,—as he would do if playing in a pasture; and to practise him in handling

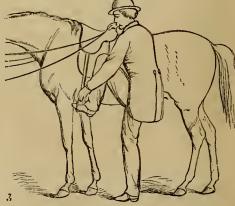

Fig. 3.—PROPER WAY TO MOUNT WITH STIRRUP.

the rider's weight, and in obeying the rider's impulses and restrictions, so that all his movements shall be made in accordance with the rider's will rather than his own—so that he shall, in fact, make no account at all of his own will, but execute that of the man instead.

We are aware that this sounds like an impossibility, but any one who will faithfully study and practise Baucher's system, will soon see that any horse of tolerable form and strength, and of average courage and temper, may be brought to this state of discipline without difficulty.

#### The Great and Razor-billed Auks.

The family of Auks includes marine aquatic birds, with large webbed feet, from which the hind toe is absent. The wings are frequently so small as to be useless for flight, and the short, strong legs are placed so far back, that when the birds are at rest upon the rocks, they appear to be standing in an upright position. The penguins, with which most persons are familiar through pictures, belong to this family. There are two Auks, the Great Auk (Alca impennis) and the Razor-billed Auk (Alca torda), both of which are found in the Arctic regions of North America. As far as the Great Auk is concerned, it perhaps would be safer to say it was found, as the bird is now believed to be extinct. The new museum of Natural History at Central Park is fortunate in possessing a specimen of this rare bird, there being but two others known to exist in the country. The bird was once obtained in Iceland, but it is some twenty years since a pair was captured, though English naturalists have since visited its former haunts for the purpose of obtaining specimens. The egg has sold in Europe for as much as £30 a single specimen. The Great Auk stands nearly three feet high. The bill is long, curved, and flattened sidewise, the upper mandible being marked by six to ten curved transverse grooves. The head and upper parts of the body are brownish-hlack, the under parts

front of each eye. The wings are mere rudiments, and the bird is unable to fly, though it

GREAT AUK AND SEA DOVE.

white, and there is an oval spot of white in | merly the skins of this bird were much used by the Esquimaux as a material for garments. THE RAZOR-BILLED AUK is not considered a

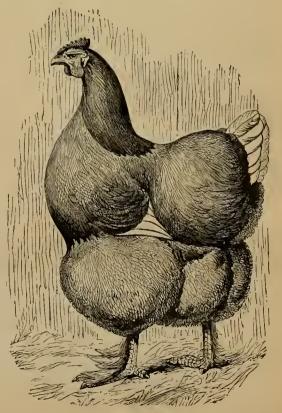

rare bird. It comes down from the Arctic regions in winter, and is occasionally found as far south as the coast of New Jersey. Having the same general form as the Great Auk, this species is only about half its size. It is, moreover, able to fly. The bill is flattened, black, with a single transverse line of white, and with three to five transverse grooves. The head and entire upper part of the body are brownishblack, with a clearer brown on the neck in front. The under parts white. A line of white, extending from the base of the bill to the eye, is one of the distinguishing marks of this species. This Auk is also found in the northern regions of the Old World, and is hunted wherever found for the sake of its warm and elastic breast feathers. It lays but a single egg, which is as large as a turkey's egg, and curiously poised upou end by means of a viscid substance, which accompanies the egg when it is deposited. The eggs are considered a great delicacy. The small bird by the side of the Great Auk, in the engraving, is the Sea Dove, which is not

from the Auks proper, in many particulars, especially in the structure of the bill. Our engraving is from specimens at the Museum at Central Park.

#### A New Variety of Buff Cochins.

The engravings here given, show the portraits, taken from life, of a pair of Cochin fowls raised by Mr. Andrew Gorsline, of Bloomfield, N. J. The birds are of a light buff color, with beautiful and uniform plumage. The legs are feathered of a lighter color to the tips of the toes. The combs are single. These birds are strikingly unlike ordinary Cochins in the markings of their plumage, the flight feathers of the wings and the tail feathers being pure white. The hackle is also marked with white. These peculiar markings give the birds a very stylish appearance. The hens weigh eight pounds each, and the cock twelve pounds. These fowls are said to be good layers, summer and winter, and their flesh is of fine quality. The owner of these birds, who is quite a poultry fancier, regards them as the choicest of his stock, as they combine three very desirable qualities, namely: the rapid production of flesh, prolific laying of eggs, and the possessiou of the most beautiful plumage. Mr. Gorsline does not at present state the manner in which this cross was produced, but it is evident that it was accidently or intentionally done through the agency of some breed with white

plumage. At all events, the markings seem to be quite well fixed, as several broods of chickens from the eggs of these fowls uniformly

#### Walks and Talks on the Farm-No. 91.

There seems to be an unusual amount of redroot in the wheat and clover this season. There are acres in some fields where it has actually choked out the wheat and taken full possession of the soil. The Deacon has a little of it in his wheat and has been pulling it out by hand and throwing it into the road. My own wheat, especially that I "fall-fallowed," two years ago for barley, is tolerably clean; but I have one fifteenacre field of two-year-old clover that is one thick mass of red-root. I never saw anything like it. If the clover was mown for hay, there would be red-root enough in it to seed the whole farm for years to come. But we are pasturing the field, and the question is what I had better do to get rid of this terrible pest. I had intended plowing up the field and sowing it to wheat this fall. The seeds of the red-root will, of course, be on the surface of the land, and if the sod was turned over six or seven inches deep, with a skim coulter, or what we used to call a Michigan double plow, the seed would probably lie at the bottom of the furrow and not germinate this fall, and consequently the wheat would not be troubled with it. It is, however, only postponing the evil day. The seed is there, and sooner or later it will produce a great crop of red-root. If we sow the field to wheat this fall, and seed it down again with clover, the greater portion of the seed of the red-root would probably lie at the bottom of the sod till the field was again plowed. If it was then broke up in June and fallowed for fall-wheat, we should have reason to expect a great crop of red-root. Being in the wheat, there would be no opportunity of killing it. It would go to seed, and the evil would be increased rather than lessened. If, instead of fallowing the clover soil for wheat, it was broken up in the spring and planted to corn, followed with barley or oats, and then sown to wheat, we should adopt the very best course to cause the red-root to germinate in the wheat. It is said to be a fact that red-root seed will not germinate except in September or October; and that the only way to get rid of it is to prepare the land for fall-wheat, and then not sow it to wheat. The red-root will then ger-minate, and the plants will be plowed under in the spring and destroyed.

"I wish you would tell us, through the American Agriculturist," writes a distinguished New York gentleman, who has a farm of barren sand, "whether it is best to let clover ripen and rot on the surface, or plow it under when in blossom? I have heard that it gave more nitrogen to the land to let it ripen and rot on it, but as I am no chemist I do not know."-If, instead of plowing under the clover-say the last of June, it was left to grow a month longer, it is quite possible that the clover roots and seed would contain more nitrogen than they did a month earlier. It was formerly thought that there was a loss of nitrogen during the ripening process, but the evidence is not altogether conclusive on the point. Still, if I had a piece of sandy land that I wished to enrich by clover, I do not think I should plow it under in June on the one hand, or let it grow until maturity and rot down on the other. I should rather

prefer to mow the crop just as it commenced to blossom, and let the clover lie, spread out on the land, as left by the machine. There would, I think, be no loss of fertilizing elements by evaporation, while the clover hay would act as a mulch, and the second growth of clover would be encouraged by it. Mow this second crop again about the first week in August. Then, unless it was desirable to continue the process another year, the land might be plowed up in two or three weeks, turning under the two previous crops of clover that are on the surface, together with the green clover still growing. I believe this would be better than to let the clover exhaust itself by running to seed.

I am aware that this is contrary to the deductions drawn from Dr. Voelcker's celebrated experiments on clover. But in truth it must be admitted that this able and usually cautious chemist has for once been hasty in his conclusions; and several of our ablest American agricultural writers seem to have accepted his opinions without giving them due consideration. The facts are simply these:

A field of 11 acres was sown to winter wheat, and seeded down in the spring with 12 lbs. per acre of clover. The wheat yielded 40 bushels per acre. The next year, on the 25th of June, the clover was mown for hay. We are told that "the best part of the field yielded 3 tons (6,720 lbs.) of clover hay per acre; the whole field averaging  $2^{1}$  tons (5,600 lbs.) per acre."

We are not informed how much land there was of the "best part," but assuming that it was half the field, the poorer part must have yielded only 4,480 lbs. of hay per acre, or only two-thirds as much as the other. This shows that there was considerable difference in the quality or condition of the land.

After the field was mown for hay, it was divided into two parts: one part was mown again for hay August 21st, and yielded about 30 cwt. (3,360 lbs.) of hay per acre; the other half was allowed to grow six or seven weeks longer, and was then (October 8th) cut for seed. The yield was a little over 5½ bushels of seed per acre. Whether the clover allowed to grow for seed was on the richer or the poorer half of the field, we are not informed.

Dr. Voelcker then analyzed the soil. That from the part of the field mown twice for hay, contained per acre:

| COHOMING Por no. |                 |                |                |                              |
|------------------|-----------------|----------------|----------------|------------------------------|
|                  | 1st six inches. | 2d six inches. | 3d six inches. | Total, 18<br>inches<br>deep. |
| Phosphoric acid  | 4,950           | 2,725          | 3,575          | 11,250                       |
| Nitrogen         | 3,350           | 1,875          | 1,325          | 6,550                        |

The soil from the part mown once for hay, and then for seed, contained per acre:

|                 | 1st six inches. |       |       | Total, 18<br>inches<br>deep. |
|-----------------|-----------------|-------|-------|------------------------------|
| Phosphoric acid | 3,975           | 4,150 | 3,500 | 11,625                       |
| Nitrogen        | 4,725           | 3,350 | 2,225 | 10,300                       |

Dr. Voeleker also ascertained the amount and composition of the clover roots growing in the soil on the two parts of the field. On the part mown twice for hay, the roots contained per acre  $24^{1}|_{2}$  lbs, of nitrogen.

On the part moion once for hay, and then for seed, the roots contained  $51^{1}|_{2}$  lbs. of nitrogen per acre.

These are the facts. Now, what are the deductions? If I was shelling the corn from a comple of corn cribs, and should find that one crib contained 100 bushels of corn and the other only 50 bushels, and should find furthermore a large rat in the former and a small one in the latter, and should send the rats to a chemist for

analysis, and he should report that the big rat contained twice as much nitrogen as the small one, I should be somewhat surprised to find that the learned chemist had written an elaborate essay on the matter, giving the composition of the two samples of corn and of the two rats, closing with the following "summary:"

1st. A good rat removes from corn a considerable amount of potash, phosphoric acid, nitrogen, and other matters which enter into the composition of our cultivated plants.

2d. Notwithstanding the large amount of nitrogen and other constituents of food removed from the corn in the body of the well-grown rat, there was found, nevertheless, a larger amount of nitrogen in the corn from the crib in which the aforesaid rat was grown than in that where the small rat was found.

3d. During the growth of the rat a large amount of corn accumulates in the corn cribs.

4th. The larger the rat the greater is the accumulation of corn in the crib.

Dr. Voelcker draws similar deductions from his experiments on clover. He says "an immense amount of nitrogenous food accumulates in the soil during the growth of clover." "This accumulation of nitrogenous plant-food is, as shown in the preceding experiments, much greater when clover is grown for seed than when it is made into hay." "An enormous quantity of nitrogenous organic matter, as we have seen, is left in the soil after the removal of the clover crop." This is all very true. And so there was a large amount of corn in the corn crib when the small rat was found; and a still larger amount when the large rat was discovered. But there is no evidence to show that the clover had anything more to do in producing this nitrogenous matter in the soil than the rat had in producing the corn in the crib. We do not know how much corn there was in the crib before the rat got into it; neither do we know how much nitrogen there was in the soil before the clover was sown!

There was 3,350 lbs. of nitrogen per acre in the first six inches of soil, when the clover was mown twice for hay, and 4,725 lbs. when it was allowed to grow six or seven weeks longer and go to seed, or 1,375 lbs. more in the one case than the other. Dr. Voelcker says, and says truly, that "more leaves fall on the ground when clover is grown for seed than when it is mown for hay; in consequence, more nitrogen is left after clover seed than after hay, which accounts for wheat yielding a better crop after clover seed than after hay." In other words, there was 50 bushels more corn in the crib where the big rat was found-and it would be just as reasonable to attribute this increase to the rat as it is to attribute the increased amount of nitrogen in the soil, to the fact that the clover was allowed to go to seed. To produce the extra 1,375 lbs. of nitrogen found in the six inches of surface soil, would require over one hundred tons of clover leaves.

The truth of the matter seems to be, that the part of the field on which the clover was allowed to go to seed was naturally much richer than the other part, and consequently produced more clover and more clover roots. And if Dr. Voelcker's analyses prove anything they prove this—and nothing more.

In 1864, I plowed up a field of clover and planted corn. In 1865, planted corn again, and used the cultivator very freely both years to kill the weeds. In 1866, sowed barley, followed by wheat, and seeded down into clover in the

spring. In 1867, mowed the clover for hay, and the second crop for seed. In 1868, mowed it again for hay. After the hay was off we plowed half the field, and allowed the other half to produce a second crop of clover. It was a wet season, and the second crop of clover grew splendidly. I think it would have made a ton of hay per acre. This clover we plowed under

The next spring (1870) the whole field was cultivated, but not plowed, and sown with barley. I could see no difference in the growth of barley on the part plowed immediately after hay harvest, and that when the clover was allowed to grow and then plowed under. After the barley, the field was plowed and sown to winter wheat. So far, I can see no difference in the color or growth of the wheat.

There was no more labor expended on the one part of the field than on the other. The only difference was, that one was plowed before the clover commenced to grow, and the other after the clover had attained its growth. The presumption is, that notwithstanding the fact that a large growth of clover was plowed under, there was no more nitrogen or other plant-food in the soil on one part of the field than on the other. The plant-food organized in the clover was simply taken out of the soil, and was merely returned when plowed under, Had the part of the field plowed immediately after harvest been harrowed, cultivated, and then plowed again in the fall, and otherwise exposed to the decomposing influences of the atmosphere, I believe more plant-food would have been developed from the soil than on the part where the clover was allowed growth, This probably would not be the case in poor, sandy land; but I have no doubt that clay loams, which abounded in latent plant-food, would become richer from being worked and exposed to the atmosphere than from the mere growth of clover. If there is any evidence to the contrary, I would like to have it produced.

I believe in clover. No one has written more in its favor as a renovating crop. We cannot grow too much of it. But it should all be consumed on the farm, and in addition, the clay-land farmer should "fall-fallow" as much land as he can. I am satisfied, though I admit the evidence is not conclusive, that fall-fallowing is more in accordance with the facts of scientific farming than the practice of plowing under clover.

A young man in Wisconsin has a farm of 150 acres, 45 acres cleared, and the rest what was called oak openings, but the young trees have grown up thickly. He asks a number of questions, which I will give in the Agriculturist in hopes of drawing out the opinions of those who have had more experience on the points than I have. 1st. "What kind of grass would do to sow under fruit-trees, so as to make pasture?"-There is no grass which will afford much nutriment when grown in the shade. I should try Kentucky blue grass. 2d. "What is the best treatment for blind staggers in pigs?" -Let the pigs have cool pens, clean troughs, fresh water, the run of a good clover pasture, and a moderate allowance of cooked meal, either of oats, barley, or corn. A gallon or two of water, sprinkled over each pig every day in hot weather, is also excellent. In case of a violent attack, give a tablespoonful of castoroil for a 100 lb. pig, and if there is much prostratiou, give from two to three table-

spoonfuls to half a pint of whiskey, according to the size of the pig and the urgency of the case.

2d. "What books on the horse, cow, sheep, pig, poultry, would you recommend for general uses; also on manures, crops, etc.?"—The best general work for a young farmer is the new edition of "Allen's American Farm Book." Youatt's books on the horse, cattle, and sheep, are all good [as is "Harris on the Pig."—Ed.]. On sheep, especially fine wools, "Randall's Practical Shepherd" is the best work in the English language. I do not know much about the poultry books. But I suppose "Wright's Practical Poultry Keeper" is as good as any. We have no book on manures. "Boussingault's Rural Economy" treats the subject with great ability, and is otherwise worthy the study of every intelligent farmer.

4th. "Are Norway oats and Alsike clover, humbugs? or are they worth trying?"—Better first try to get your farm clean and in good condition, and then if you have time, energy, and money to try new things, do so.

5th. "What shall I do with my woodland, so that I can keep it as woodland, and yet get grass on it?"—Thin it out to let in the sun. Sow on some timothy and blue grass seed. Let the cattle brouse the young under-brush. I imagine the result will be inferior grass and inferior timber. But I have no experience.

6th. "Will farm machinery pay at first?"—I should buy as little machinery as possible. In my experience, with a few exceptions, it costs as much, with ordinary hired help, to do work by machinery as by hand. I asked a farmer who has had considerable experience with machines, if they paid? "If bought with good judgment," he replied, "and used with great care, I think they do." A farmer can lose more by using a broken, one-tined fork, a dull, rnsty hoe, a worn-out ax, and a battered-up spade than he can save by using a machine to saw wood or a reaper to cut his grain. A small farmer had better hire the work done with a machine than to buy the machine himself.

Our correspondent in Missouri is not satisfied with our answer to his question about curry-combs. He says: "I encourage the rolling of my horses and mules, and as soon as the harness is off, they always take a good roll in the stable-lot. But they sometimes select places to roll where I do not wish them. In my pasture there are some clay banks, and whenever they can, they prefer to roll there; and when the ground is wet, they get a coat of clay on them which all the straw in the country cannot rub off, and which, when it gets dry on their backs, will be so hard as almost to pull the hair out if you try to curry it off. I generally wash them clean, but am always afraid of their catching cold."-I do not see how I can help him. I think I should scrape as much of the mud off as possible before it got dry, and then remove the remainder after it was dry with a curry-comb. It seems to me, however, that if the horses were well curried and cleaned every day, they would not be so much inclined to roll on the wet clay. A Welchman, who went into Shropshire to work during harvest, was much surprised at finding that an Englishman combed his hair every morning. "Why," said he, "I only comb mine once a week, on Sunday, and it is an awful job. I don't see how you can find time to do it every day."

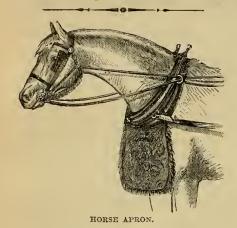

The Chester White breeder in Iowa, who thought I was "grinding my ax" in recommending Berkshire pigs, has written another

letter in reply to our remarks, which exhibits more candor and courtesy. He claims that "the Chester White, or Magie pigs, will produce more pork, and as good pork, at six months or a year old, according to the amount of food consumed, than either the Berkshire or Suffolk pig."-Possibly this is true, though I should hardly expect it. But this is not the point I make. We have some thirty million pigs in the United States. They are kept for the production of pork and lard. Confessedly, there is great room for improvement. Of these thirty million pigs, 29,975,000 are what may be called "common pigs." They are of no distinct breed. Now, we have to select from them this fall-say 5,000,000 sows to breed from. I do not know how it is elsewhere, but in this neighborhood, if I wanted to get a score of sows to raise pigs to fatten, I should have no difficulty in finding just what I wanted-vigorous, healthy sows of fair size, that would probably prove good breeders and good milkers. Now, having got my sows, what breed shall I cross them with? My object, mark you, is simply to raise pigs for the pork barrel. Shall I use a Chester White, a Magie, or other large, coarse breed? or shall I use a small, highly refined, thoroughbred boar? I advocate the latter course. It is in accordance with well-established principles of breeding, and confirmed by general experience and observation. "But why do you make this point," asks our Iowa correspondent, " when you admit that the thorough-bred is preferable to half-breeds or grades?" I never have admitted anything of the kind, when pigs are raised solely for the butcher. For producing pork, I should never dream of keeping thorough-breds. A thorough-bred boar is of great value for improving our common stock, and that is all.

This Chester White breeder seems to think that I am "prejudiced" against this breed of pigs. It is not so. I wish they were far more common than they are. If I was obliged to raise my own sows from which to raise pigs for the butcher, I think I should get a Chester White boar and a Magie sow; and the sows from this cross I would put to a thorough-bred Yorkshire or Berkshire boar. If the offspring was not fine enough, I should select some of the best sows and mate them with a thoroughbred Essex boar. I think this last cross would give me the perfection of pigs for the butcher. And after that I should merely have to repeat the process. Such pigs I should expect to fatten more rapidly (because they would eat more), and to be in every way more profitable for the mere purpose of raising pork than any thorough bred Essex, Berkshire, or Yorksbire.

Horses in Summer .- Farm work during the hot summer months, requires only the lightest harness. Wooden collars are now used with great comfort to the horse. In the city of New York the harness worn by the street railroad horses is as scant as is consistent with the work they have to perform. No breeching is used, and hip-straps are dispensed with. Teams may often be seen plowing in the hot days of July and August, in the same harness they were during the winter. This is unnecessary, nay sometimes it amounts to positive cruelty. Remove every superfluous strap, take away the backstrap and crupper-band and let the air circulate freely around the body. At night when work is over, wash the sweat and dust from the legs and thighs of the horse; a dash of water on his flanks would be grateful to him. Let his stable be airy and clean, with a bed of clean straw.

Kindness to these serviceable animals is the truest economy. Besides, we feel better when our horses are made comfortable; the sensation is akin to that derived from the doing of a benevolent action. A sensitive man cannot see a horse sweating under and galled by a heavy harness during the intense heat of a summer's day, without sympathy and pity, nor can he retire to rest with an easy conscience, knowing that his faithful servants in the stable are improperly cared for and suffering. righteous man regardeth the life of his beast."

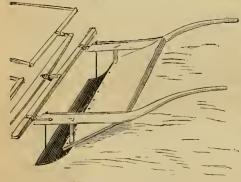

Aprons for Horses.

Though rarely seen in the country, aprons are a much needed addition to the harness. They may be made of cloth, a piece of carpet, or tanned sheepskin. Suspend them from the lower part of the collar and allow them to reach the knees. A cloth fastened under the jaws suspended from the throat-latch to the curb strap by short strings, is also highly necessary as a protection from the pertinacious attacks of the Bot-fly. With this and the apron, the wearisome and irritating attentions of this abominable pest will be greatly mitigated. The plowman will also be much relieved by the absence of the frantic efforts of the suffering horse to rid himself of his relentless enemy.

#### An Implement for Cutting Tussocks.

In reclaiming bog meadows, the first thing after draining and removing the water is to get rid of the unsightly tussocks. This is a slow and wearisome process, when undertaken by handlabor. We have used with great satisfaction a hoe, suitable for a pair of horses, made something like a horse-shovel or seraper, as represented in the engraving. The cutting part was

CUTTER FOR TUSSOCKS.

made of a used-up mill-saw, ground sharp; the frame and attachments were all home-made. If good, white oak timber is used, it can be made light enough to be quite easily handled. When cut, the best way to get rid of these tussocks is to pile them up, let them dry, set fire to them, and heap damp muck on them so that they may burn slowly. The ashes of slowly burnt materials are much richer in fertilizing elements than those resulting from a hot, quick combustion, and the ashes of these otherwise almost imperishable things, thus burnt, would be valuable. The surface once well dried and leveled, reclamation becomes a simple process.

#### A Deep, Loose Soil.

A deep, loose soil can only be had by subsoiling or trench-plowing. Trench-plowing is fitted only for very deep and rich soil, in which the subsoil is equally fertile with the surface. Where there is but a shallow depth of fertile soil, the work of subsoiling must be performed before it can be improved in depth. This is generally done by means of a subsoil plow following in the furrow, and necessitates the use of an extra team. This is an obstacle which is insurmountable on the great majority of farms. To provide a means of accomplishing the important work of loosening the soil below the bottom of the furrow, we have bit upon the expedient here described. The attachment here figured may be affixed to almost any plow. Three bolts fasten it to the landside of the plow ou the inside; the arrangement of the boltholes should permit the teeth only, to project beneath the sole-a small block of wood will be necessary to be laid between it and the landside, to correspond with the flange generally found at the bottom of plows on the inside. The draft is not materially increased, and the

plow holds the ground more steadily. The teeth, two in number, and about four inches apart, should be of steel, and should be kept sharp in front; the rest is of wrought iron. A blacksmith can make the

affair at a cost of something over one dollar.

The constant use of this addition to the plow will loosen the subsoil, and allow it to be turned over and intermixed at the rate of two or three inches deeper each year. It will dry the soil by thus loosening it, in a degree gaining some of the benefits of underdraining, without any of its cost. But its great advantage is, that it will gradually break up the hard stratum of soil which has been formed at the bottom of the furrow by continued plowing and trampling, and permit the penetration of roots into the subsoil, without unnecessarily bringing it to the surface.

#### Seed Wheats.

By the time this number of the Agriculturist is in the hands of the farmers all over the United

States, they will be casting about where to get their seed wheat. We would suggest that it would be advisable to experiment a little with fresh seed. It has been found that seed procured from a distance-either greater or less-has been used with profit, and generally it has been found that seeds brought from a northern

locality have been more profitable than those from a southern one. Doubtless the continued use of the same seed on the same ground leads surely, though gradually, to deterioration in the crops. Farmers have changed seed with neighbors only a few miles distant, with advantage.

As to varieties there is abundant room for choice. The white or amber varieties furnish a

valuable grain for the first quality of flour, and millers are glad to see such wheats coming to them; but they require good soil and good preparation, as well as early sowing, or drilling in, all of which will prevent heaving by frost in ordinary winters. We have found the Treadwell a very profitable wheat, stooling thickly, and proof against the midge, but very subject to heaving on undrained ground. It has yielded with us over twenty-five bushels per aere on what was two years previously a badly used up field. This wheat has the peculiarity of producing smooth and bearded heads from the same stool, and a field of it would look to the uninitiated as if it were badly mixed. grain is small and therefore heavy, weighing 60 lbs. to the struck bushel. The Diehl is also a favorite wheat with us; it, too, requires good farming to seeure a good crop. In fact, we cannot mention a wheat that does not require good culture, though some varieties seem to stand neglect better than others. The old Lancaster Red is a favorite in some districts, and

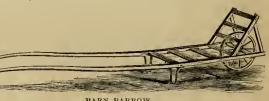

GRINDSTONE FRAME.

we have seen fair crops on what we should call poor farms. Aim to get a trial piece well prepared this fall, and sow it with some new, well recommended wheat. In every neighborhood there is usually some go-ahead farmer who has been experimenting, and has some seed to offer. Encourage bim by trying his seed if of promising quality, he will then make other trials.

#### A Grindstone Frame and Trough.

The sides of the frame are made of stout plank, the bottom is of galvanized sheet-iron, nailed on close enough to be water-tight, and brought up in front sufficiently high to protect the person using it from being spattered with the dirty water. The blocks on the sides are screwed on, and, as the stone wears down, one or both may be removed. The ordinary friction-roller hangings are used. A peg in the lowest part of the side lets out the water when necessary, which should be when done with.

BARN BARROW.

#### A Barn Barrow for Fodder, etc.

The engraving which is here given is of a barrow, that we have found very useful. Its structure will be understood without any extended description. The handles being longfour feet, the whole barrow being eight feet-a large load can be wheeled by one man. If used

for carrying grass, a light rack may be set up on it. It will be found useful in the feeding alley, or in the field where only a few animals are kept. If made of stout stuff, it will be found capable of bearing several bags of grain at a load.

Fig. 1.—TREE WITH CROOKED TRUNK.

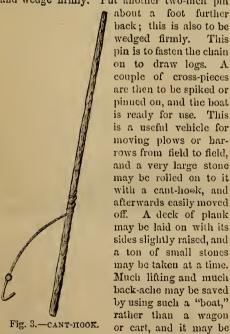

#### Implements for Moving Stone.

A very easily constructed and handy boat for moving large stones may be made as follows: Select a couple of small trees, six inches in diameter—oak or hard maple is best—with crook-

Fig. 2.—STONE BOAT.

ed stems, like that in figure 1. Hew the sides, if desired—it will make it lighter. At the crook, bevel the insides for a few inches so as to allow sufficient spread to the hinder ends (fig. 2). Pin with a two-inch pin at the "nose," and wedge firmly. Put another two-inch pin

made in an hour or two without laying out a cent for materials. A cant-hook (fig. 3) may be made with a long handspike to which is attached a grab-hook, by means of a short, stout rope or piece of chain; once get hold of a stone with this and it must come or something will break.

An Egg Farm.

ву н. н. stoddard.—Third Article.

The distance once around to each station amounts to several miles, and the rounds must be made four or five times at least every day. The distance would be too great for the attendant to walk over, even if empty-handed, and

transporting grain and water without a team would be out of the question. A supply of water through pipes, connecting with each station, would be too costly, especially as they would be idle when the land was cultivated. A running stream conducted in an open ditch to

each building would freeze in winter, make the ground near its banks too damp, and be in the way of plowing, moving buildings and other operations; besides, few lots suitable in other respects can be found where the slope of ground with water supply at top admit of the construction of such an aqueduct. Each flock of fowls needs a pailful of water daily, taking account of the evaporation in hot weather, and the necessity of emptying the drinking vessels at night in winter to prevent freezing. Such an amount of water could not well be carried by hand.

The most convenient wagon for our use is that sometimes kept for moving stone at quarries, and called a stone-cutter's dray, shown in figure 1. In Maine, such are used very commonly to carry timber about saw-mills, and on short routes where no stumps or stones are to be passed over, thus saving much lifting.

It is desirable that the driver should ride the ten-rod stages between the fowl-houses to lighten his labor, and that the team should trot to save time. But to climb in and out of an ordinary wagon to ride ten rods, would involve more exertion than walking. Besides, the labor of lifting grain in and out will be much less in a low wagon; the water-cask may be filled and drawn from readily, and it is especially convenient in gathering dry earth. The vehicle should be built just heavy enough to support a barrel of water, five or six bushels of grain, and the driver; or when rigged for earth, the amount designed to be carried is about equal to an ordinary horse-cart load. It is not intended to be used off the premises at all, and as there are no stones, lummocks, or

the like, and no deep ruts, the body is set so as to clear the ground by only 8 inches (10 inches are allowed in the Maine wagons). The body is 12 feet long, and 4 feet 2 inches wide behind, and 3 feet wide in front, the tapering shape being necessary to give a chance to turn the wagon without cramping; and the turning is

also facilitated by making the axle-trees so long that the wheels track 5 feet 7 inches, or about 4 inches wider than a common horse-cart. The side-boards are but 6 inches wide—the aim being to keep as near the ground as possible—and of two-inch plank, serving as part of the body frame. Four cross-pieces underneath, fastened to the side-boards by stout clamp bolts,

complete the frame; and the whole is so constructed that no part of the body projects from under the side-boards, the compactness of shape serving a useful purpose when we come to load dry earth. The rear axle-tree is made in one piece of wrought iron 2 inches square. The king-bolt should be made stout, and allowed to turn freely in the forward axle-tree. To carry

Fig. 1 .- STONE CUTTER'S DRAY.

eggs without breakage, a movable stand for the egg-basket, furnished with springs, can be set in the wagon. A low sled may take the place of the wagon when the season requires it.

The road may be constructed quite narrow, as there will be no occasion to pass other teams; and an easy way to raise a path sufficiently to avoid wet is, to plow a strip of ground a number of times over, always throwing the furrows

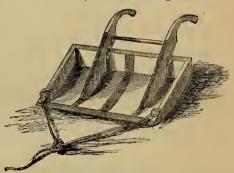

Fig. 2.—SHOVEL.

towards the center, and the rounded ridges thus made with ditches on each side is to remain in the field permanently, and may be cropped with the rest of the land if desired. The wheels of the wagon are made with very wide tires, as shown in the illustration, and must not be driven in the same track twice in succession, but used as rollers to smooth down the whole ridge, for there must be no deep ruts to cause the wagon-body to graze the ground.

To gather and store dry earth, the following plan is submitted as available not only for the

Fig. 3.—LOADING DRY EARTH.

poultry business, and that invaluable invention the earth-closet, but for preparing absorbents and litter for stables and pig-pens. The best farmers are fast learning to use dry earth for all their animals, not only for the cleanliness and health of the stock, but to lighten the labor of attendance, substitute a cheap litter for straw, and save every particle of manure.

The spot of ground set apart for the dryearth harvest should be kept free from weeds and turf, and harrowed as shallow as possible, using a harrow with numerous very short teeth. The ground should not have been plowed for a year, the object being to pulverize it only at the surface, for in this way the top soil can be better kept from absorbing moisture from below, reversing the usual maxims of tillage. There is seldom a summer without several weeks when the soil for a couple of inches is almost dry. This is the time to proceed with the work. The implements used are a wide scraper (fig. 4) 5 feet × 10 inches, and 1a shovel (fig. 3) 2 feet 3 inches × 2 feet. They are made lighter than

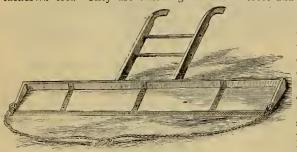

Fig. 4.—scraper for dry earth.

similar ones designed to work among stones and gravel, and both are intended to be always used in a nearly perpendicular position, and therefore the backs need not be shod for wear, as is usual with team shovels and scrapers.

They are both built of wood, edged and bound with iron. The shovel is made somewhat concave, being designed to move a pretty full load for a short distance; the scraper which only skims the surface is made straight. A rope is substituted for the iron bail for draft attachment in the shovel to make it lighter, and for

Fig. 5.—PLATFORM FOR DRYING EARTH.

the same reason the iron edge and bands are thin. The mass moved being very dry, light, and mellow, admits of a rather slight construction of the implement; and as this is to be used by backing the team at every shovelful, and pulling the shovel back by hand, as little weight as possible is desirable. The wooden rod connecting the two crooked handles of the shovel is essential, serving as a convenient handle in backing. Now, during a time of dry weather, by harrowing your ground with the short-toothed harrow half a dozen times on a hot day, the soil will become sufficiently pulverized, and also advanced one stage in dryness. The next day—watching the weather as

closely as a hay maker—hitch your horse to the scraper, and try to scrape one inch

Fig. 6.—BOTTOM OF DRAY. deep, no more, and gather the earth into small winrows, extending regularly across the field, the operation being like raking hay. Next make the team follow the winrows, and cock the dirt into heaps of a cart-load each. Now, you have piles of earth nearly dry, but they will not grow any drier until placed, so that moisture cannot be absorbed from below. Platforms of boards(fig. 5), 8 feet square, and built wedge-shaped, and 14 inches high at the highest part, are now drawn

by the team upon the joists which form the sides and serve as runners, and located one by each heap with the thin edge towards it.

Attach the team to the shovel by a rope about 12 feet long, and transfer the earth to the platforms, heaping the first shovelful upon the edge next the pile to cover it, so that it may not obstruct the shovel. The platforms should be on the north side of the heaps at the commencement, so as to slope toward the south, and afford direct exposure to the snn. In two or three days of fine weather the piles will be nearly as free from moisture as if kiln-dried, if the earth has been well pulverized, for it is so loose and porous that the moisture from the

bottom finds its way to the snrface as fast as the latter dries. If the weather becomes threatening, house the earth without waiting for further drying, or cover with hay-caps, according to circumstances. When ready for housing, draw the wagon close to the north side of the platform, and connect the two with a skid 5 feet×14 inches, with teeth projecting over the body to hold up the shovel, and let the earth drop through. The same length of rope

between the horse and shovel will be needed as when piling earth upon the platforms. Fig. 3 shows the manner of loading.

The flooring of the wagon, when used for carrying feed and water, consists of movable boards, which are taken out with the hind board when preparing to hanl earth, and 1<sup>1</sup>|2-inch planks, 5 inches wide, with planed edges fitting accurately, are substituted. One end of each plank projects a few inches behind the body (fig. 6), and is so narrowed that a handspike may be inserted between the planks. By prying them

up one at a time, the wagon is readily unloaded. There will not be any appreciable leakage between the planks in hanling 40 or 50 rods, and, to save travel, the earth plat should not be more than that distance from the store-room

at farthest. An underground basement in the granary of the establishment is the proper store-room, and, by driving in above, the load may be discharged through a trap-door in the floor into a capacious hopper-shaped bin. Underneath the bin should be space to drive in winter the wagon or sled, and, by pulling a slide, let the earth fall until a load is obtained to be carried to the stations. In this way the earth is pulverized, heaped upon the drying platforms, loaded upon the wagon, transferred to the bin, and re-loaded, without touching a hand-shovel to it at all. The wagon may be loaded with the aid of the team shovel in less than three minutes. The farmer may make an earth-bin, of the kind described, in his barn cellar under a trap in the barn floor. The earth, upon a tract of such mellow loam as is suitable for poultry, will become, by pulverizing and drying, reduced completely to dust. The loading and unloading by team power not only saves labor, but overcomes the difficulties inse arable from shoveling such a light powder, that flies at the least wind. Of course only slight pulverization will be best in preparing dirt for the earth-closet and stable, but for pourry the finer the better. In the fall, when dry weather gives opportunity, labor may be still further saved by scraping heaps of dry eartl: directly upon the winter sites of the fowlhouses, and drawing as many of the latter as are rendered tenantless by the sale of the old stock upon the heaps, where the earth can remain sheltered awaiting the new flocks of pullets, and no wagon is needed at all for the earth in that case.

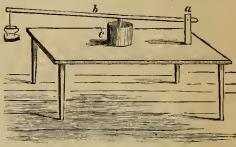

After the dry earth has been used in the houses through the winter, the final disposition of it must be made in the spring, as much with an eye to labor-saving as in collecting it. The fowl-houses are to be pried up to loosen their sills from the dust-heap in which they are embedded, and drawn off to summer quarters. Then the earth, mixed with the manure, is to be first moved with the shovel, and scattered about the immediate vicinity, one shovelful in a place. The scraper is next in requisition to spread these heaps, and the harrow comes last, reversing the order of gathering.

#### Cheese-Press.

A small family cheese may be made on any farm, where two or more cows are kept. The night's milking may be kept over, and added to that of the morning, about fifty to sixty quarts being sufficient. Bring the milk to blood heat, that is, so as to feel warm to the hand. A piece of well-saved rennet, two inches square, is to be soaked over night, in a pint of warm water, and the liquid from it added to the warm milk, which may be left for half an hour to set.

A small tub, or a common wash-boiler well secured, may be used for this purpose. When well set, the curd should be cut across both ways, into small squares, of two or three inches, with a long bladed knife, to facilitate the separation of the whey. Lift the curd out carefully with a strainer, and place it in the hoop.

This may be of tin, eight inches in diameter. A six-quart pail, which has become useless for other purposes, will serve. Punch the bottom full of holes for the whey to drain off. Set the hoop on a stand for pressing. A handy press may be made as in the engraving. A piece of 1½-inch board, will make the bench; four legs are put beneath, fitted into holes bored to receive them. An upright, a, is put through a hole in the end of the bench, and a pin passed through underneath to prevent it from being drawn out. A lever b, is fitted on a so as to work up and down, as may be neces-

HOME-MADE CHEESE PRESS.

sary. The hoop e, is set on the bench, a wooden follower fitting loosely; is laid on the curd, and a sad-iron is hung on the end of the lever. The weight can be increased as desired by shifting the cheese nearer to the post a. A few grooves are necessary to carry off the whey which drains from the curd, and drops into a pan underneath. As soon as the cheese is sufficiently pressed to handle, take it out, wrap a bandage of fine muslin round it, and sew the edges.

Butter the cheese all over, and put it away in a cool, dry place to cure. The next week make another, and repeat the process as often as desired. A very palatable cheese may be made with three parts skim-milk and one of new. A few experiments will make a green hand quite an adept at this branch of housekeeping.

The model of the above cheese-press was designed and made by a boy of fourteen, and it answered its purpose admirably.

Root Crops.—The great objection among farmers to raising root crops is the great danger of the destruction of the young plants by weeds. There is no remedy, that we can see, but in greater care to clean the ground by thorough fallowing and thoroughly rotting the manure, which must be well incorporated in the soil by at least three plawings and harrowings. This will permit the weeds to start, and be plawed under and torn up and rooted out by the teeth of the harrow. In the fine, rich soil thus produced, the seed will germinate quickly, and get ahead of the weeds that remain. A well-grown root crop is the most valuable, and will carry the most stock per acre.

#### How to get Thorough-bred Stock,

LETTER FROM A YOUNG KANSAS FARMER.

C. F. T., a young Kansas farmer, writes to one of the editors of the Agriculturist asking the price of pure-bred Essex pigs, and adds: "I cannot afford to pay fancy prices. I am a young farmer, trying to make my two-year-old farm support me. Stock-raising is money; but to do it well you must have a large herd, and a herder, and this requires a large outlay of money, and hence I am turning my attention to hogs. I have two sows of Silver's 'Ohio Improved Chester's,' long, coarse, well-made hogs, though hardly enough shoulder, and I can trade around and piek up fair grade sows at \$8 and \$10 each. Now, if I can cross a pure Essex with these common hogs, and also with my Chesters, would I not be able to turn out thirty or forty hogs a season. At the same time, by raising some pure Essex, I could show intelligent farmers what I was doing, and dispose of them at good prices for stock pigs. Now will you give me some good, substantial advice. I have read Harris on the Pig, and also the Agriculturist regularly, and I would like to be a good farmer, but it is almost discouraging. I now own four good cows and 11 two-year-old heifers, and for common stock they are good. My neighbor proposed for us to buy a Shorthorn bull together, and I wrote to five different breeders and received elegant catalogues, fine engravings, etc., with prices \$400 and \$500 for 14 months old, and \$250 for an October calf. Is not this enough to get one vexed? I would be willing to pay from \$100 to \$200 for a good yearling, but these prices put it out of our reach."

This is a very sensible letter. Our young friend has got hold of the right ideas, and we prophesy that he will be heard from by and by. Our advice is: do not be in a hurry. Improve the farm, and at the same time improve the stock, gradually. Do not pay "fancy prices." See what y tean do nearer home. There has been some g and stock taken into Kansas. The writer has sent as good Essex pigs there as he ever raised. And there are superior herds of Shorthorns in the State. Patronize the home breeders. Visit them and tell them what you want, and you will very likely find a pure-bred animal that is just as good for your purpose as one from abroad costing three times as much. If a man with abundant capital likes to pay \$10,000 for a Shorthorn bull, no one has any right to complain. It is a good thing for the man who raised the animal. He gets well paid for his skill, judgment, and experience, and the fact should encourage other practical breeders to persevere in their efforts to improve their stock. But it is folly for an ordinary breeder to pay such prices. We must not lose sight of the fact that the ultimate object in keeping Essex pigs and Shorthorn cattle is to raise animals for the butcher. And while it is certain that nothing will pay our correspondent better than to give \$25 or \$50 for an Essex boar, or \$100 to \$200 for a Shorthorn bull, it is doubtful if he will get any corresponding henefit by paying fancy prices for fancy animals.

#### Thrash the Grain Early.

It is always economical to thrash early. We would advise every farmer, who can possibly do it, to thrash his wheat, rye, or oats, as the crop is drawn from the field. There are many considerations in favor of doing this. 1st. By reason of the state of dryness in which it is hauled off the field, the grain is in better condition for the thrashing machine (or certainly as good). than at any other time. 2d. Only one handling is necessary, and thus labor is saved. 3d. At harvest-time grain is almost always in better demand by millers, and in the general market often brings a higher price than at other times, Taking one year with another, it will be found that this is the most advantageous time to market grain. If the farmer holds his grain for speculation, very well: he has a right to become a speculator if any one has; but we hold as a general rule, that so soon as a farmer has his produce ready for market, then is his best time to sell. The earliest markets are almost invariably the best. We were once enabled to sell the whole of our crop of wheat at a high price, for seed, because we had thrashed in time and none of our neighbors had. Lastly and most worthy of consideration is the fact that, by thus early thrashing and marketing, the destruction by vermin-mice, rats, weevil, etc.-is prevented. We believe that ten per cent at least of the grain put into barns is put there,-unintentionally of course, but not the less surely,-for the benefit of rats and mice. A granary may be made rat-proof, but a barn cannot, and if it could, would soon be stocked by the animals carried in from the field among the sheaves.

If four horses are kept on the farm, one pair may be hauling while the other is at the machine. If only a single team is kept, they can be unhitched from the wagon, put into the machine, and as soon as the load is thrashed, taken to the field again for another load. While loading, two extra hands may be profitably engaged putting away the straw or cleaning up and bagging grain, or storing it in the granary.

If it is impracticable to thrash the grain as it is drawn, we would stack it close to the barn, make the top secure for a few days, and as soon as possible, thrash it out. Even this mode would tend to save labor as well as grain, and on a small or new farm where machines are not yet introduced, any plan whereby labor can be saved is worthy of consideration and adoption.

SAVING CLOVER SEED.—It is not an uncommon occurrence for a field supposed to have been sown with clover seed to prove to have been sown with many other seeds not mentioned in the catalogues. While the seed purchased from responsible seedmen is generally free from admixture with seeds of weeds, in consequence of the care with which they select it, many a farmer has permitted impure seed

bought at country stores to be put into the ground, and has in consequence, reaped a plentiful harvest of mulleins, ragweeds, and other abominations. This might have been avoided had he raised his own seed. For clover seed, select a small piece which was well summerfallowed, and freed from weeds and laid down with carefully selected seed in the first place; cut early and save the second growth for seed. This would be a profitable experiment on any farm. Any surplus seed so grown would meet with ready sale at a high price, by reason of its purity. Clean seed will often bring a dollar a bushel above the market price, while impure seed will be begging a sale unsuccessfully at any price. Clover for seed may be conveniently cut and gathered by attaching a light frame behind the cutter-bar of the mowing machine and covering it with a piece of cotton cloth. The heads will fall on this cloth and may be raked together by a boy following; when a sufficient quantity has been gathered, one sweep of the rake will leave them on the ground in a heap. Being at this season almost free from sap and moisture, seed clover is very easily cured. A wetting with rain and subsequent drying will make it thrash more easily.

#### Substitutes for Hay.

A dry May makes a short hay crop. We have experienced the former, and shall suffer from the latter in all probability. Farmers who bestir themselves in time may secure abundant crops of hay, or substitutes for the general hay crops thus cut short. That which will first suggest itself to most persons is

Fodder Corn. — This requires soil in a fair state of fertility, a fresh sod or manure. It may be sowed at any time before the 10th of July. There are three kinds of corn commonly used for seed, viz., any large sweet corn like the Evergreen or R. I. Asylum, the southern White Dent or Yellow Western Dent; besides, any tall-growing variety will do. It is sown in drills, 24 or 30 inches apart, or broadcast. Drill-culture requires less seed; a better and evener stand is usually secured; cultivation with horse-hoe is possible, and usually remunerative, and, where green fodder in small quantities is required, the rows may be easily thinned.

In planting, the ground should be laid off with a marker, farrows opened, manure dropped in them, and the corn scattered by hand, or by a sowing machine, at the rate of about eighteen to twenty kernels to the foot. This requires three to five bushels to the acre, according to the size of the kernels, and the distance the rows are apart. In furrowing, if a common one-horse plow be used, the furrows should be alternate, turned together in pairs, the plowing being done back and forth across the field in the most natural way. Then, if one has a Shares' cultivator, the teeth being removed, and the wings opened, two drills may be covered by once passing through, which will greatly expedite matters. Corn sowed broadcast, if the ground be rich enough, and the stand be thick enough, gives an excellent return of fine, tender fodder. It is hardly possible, however, to get so heavy a yield, and it requires fully one-third more seed, which, when seed-corn is worth two dollars per bushel, is an item worth considering.

MILLET is another summer crop, which affords an excellent substitute for hay. This will grow well on light, rather dry soils, bears drouth well, and produces on ordinary land some two to two-and-a-half tons of excellent hay to the

[COPYRIGHT SECURED.]

THE RUBBING POST.—DRAWN BY W. H. CARY.—Engraved for the American Agriculturist.

acre, if cut before it is fully ripe; indeed, while the ripest of the grain is still in the milk. There are several kinds of millet, of which

HUNGARIAN GRASS, since its introduction some fifteen years ago, has grown in favor, and in many sections is cultivated to the entire neglect of other varieties of millet. It is really only a delicate variety of the Italian millet, having a closer, shorter head, and more abundant foliage. It is usually sown after the hay-crop is known to have been cut short, rarely before the middle of June, and very good crops may be obtained, if sowed as late as July 10th to 15th, as it needs only about sixty days to mature. Of course, it needs moist weather to promote the germination of the seed, but after it has a good start, it will bear dry, hot weather well. A rich, sandy loam is best for it, but it will make a crop on any tolerably clean land, with a top-dressing of some good fertilizer. It should be cut before the seed approaches ripeness, as the hard shell, which incloses the ripe seeds, is so indigestible, that injury sometimes comes from feeding the unthrashed straw of the ripe millet. Horses, and indeed all our domestic animals, are very fond of hay from Hungarian grass, and, if cut early, it may be fed with impunity.

#### The Rubbing Post.

White's Natural History of Selbourne, gives an account of the animals and other natural objects, of a very small district in England. It was written something like a hundred years ago, yet it remains a standard work to the present day. This remarkable popularity is due to the fact that the author gives the habits of the animals he describes-whether quadrupeds, birds, or insects-and it is full of interesting observations as to their modes of life. . While we have most accurate descriptions of our native quadrupeds, birds, etc., and their structure is so closely described that there is but little difficulty in identifying them, our literature is very barren in respect to the habits of the animals. But few, since Audubon, have thought it worth while to record the very facts that most interest the general reader. By listening to the talk of a group of Adiroudack guides gathered around a camp fire, one can learn more about the habits of Deer than he can find in any book, and the western hunter is full of curious ancedotes concerning the ways of the Buffalo. Mr. Cary, who passed some time in the buffalo range,

illustrates in the above engraving a habit of the buffalo that we have not before seen noticed. The vast plains over which the herds of buffalo range are treeless, and it is only along the infrequent water courses that trees are found at all, and at those streams to which the buffaloes resort for water, they are even there of rare occurrence. The buffaloes, besides trampling down the young growth, destroy the trees of any considerable size, by using them as rubbing posts. One after another of these rub their shaggy sides against the tree until it is completely barked and killed. Once in a while, a tree will, after a fashion, survive this rough treatment, and here and there there will be a gnarled, seraggy, mutilated willow or cotton-wood, which maintains a struggling extence in spite of the buffaloes, and these are known to the hunters as "rubbing posts." One of these trees is represented in the engraving. A bear, that is enjoying the luxury of a good scratching, has his pleasant occupation broken in upon by the approach of the herd to water. The leading bull, finding the rubbing post occupied, charges upon the intruder, who, as soon as the remainder of the herd come up, will find himself in the minority and be glad to retreat.

#### The Buffalo Grass,

Our largest quadruped subsists mainly upon one of the smallest of our grasses. Viewed as a single specimen, the Buffalo-grass appears a most insignificant plant. Yet upon it the im-

acute Doct. Engelmann, of St. Louis, Mo., in examining a collection of plants, made upon an exploring expedition by his brother, found the clue to the whole puzzle. He determined to the surprise of all botanists, that the grass was diecious. The pistillate plant is so unlike the

staminate in its general appearance, that no one would suspect their relationship. Indeed, so dissimilar are they that the pistillate plant had long ago been described by an European botanist as a species of another and widely separated genus. Doct. Engelmann was so fortunate as to discover an abnormal specimen in which staminate and pistillate flowers hanpened to be growing upon the same plant, and thus the matter was established beyond a doubt. Numerous collectors had brought in the staminate and the pistillate plants, without suspecting that they were in any way related, much less that they were man and wife, but Mr. Engelmann was the first one fortunate enough, or shrewd enough to collect them together. The en-

graving shows a pistillate plant, and a detatched flowering stem of a staminate one. It is not necessary to go into a botanical description. It will be seen at a glance that the two kinds of flowers are as unlike as are the tassel of Indian corn and its ripened ear. The pistillate flowers of the Buffalo-grass are surrounded by a leafy covering, or involucre, which, as the seed ripens, becomes very hard, even bony and shining. The engraving, modified from Doct. Engelmann's figure, shows the abundant provision for the spread of this plant by means of "ruuners." The turf formed by the Buffalo-grass is so very compact, and endures drouth so well, that were it not for its unpleasant, grayish color, it would be worth while to experiment as to its availability as a lawn grass. There was, a few years ago, a small bed of it at Shaw's garden at St. Louis, which seemed to be well established.

The Pasque-flower, or Pasque Anemone—socalled because it blooms about Easter—is common in England and other parts of Europe. With us it is rarely seen in cultivation; yet there is no plant in our very large border whose early bloom we greet with more pleasure than we do that of this very old-fashioned flower. It has a very long and thick woody roct, from which arises a tuft of finely-cut leaves; these, when young, are very downy. The large purple flowers are borne singly upon stems three to eight inches high; they consist of six petal-like sepals, which are violet-purple within, and very silky outside. The stem-leaves

PASQUE FLOWER.—(Anemone Pulsatilla.)

Notes from the Pines.

A SILVER-GRAY EDGING.—Last year Artemisia Stelleriana (not A. stellaris, as some catalogues have it), was sent out as a new "foliage plant." I had enough to encircle a bed of Coleus, and the effect was quite satisfactory. The plant bears cutting admirably, and while its leaves have not the delicacy of Centaurea gymnocarpa, they are sufficiently small not to appear coarse. In the fall clearing up, this hed escaped, and, much to my surprise, the Artemisia very early this spring, began to push buds from the old stems. It proved perfectly hardy, and with the proper trimming, the edging is

BUFFALO GRASS. - (Buchloë dactyloides.) meuse herds of buffalo depend for sustenance, and so, indirectly, do numerous tribes of Indians, The Buffalo-grass extends from the British Possessions, through a broad range of country, southward to Texas, covering immense tracts with a turf composed of its strong interlaced roots, and its very narrow leaves, which, except in the growing season, are curled and twisted into a closely matted mass. Mr. T. L. Rankin, of Osage Co., Kas., the gentleman who, last winter, introduced buffalo-beef into the markets of the Eastern cities, recently brought us a specimen of the turf, and we thought that some account of the grass itself might be of interest. We give an engraving of the plant of its natural size. It is not very nearly related to any grass with which our readers are likely to be familiar, and it gives us an instance of what is very rare, a diacious grass, that is, one in which the staminate and pistillate flowers are borne by separate plants. Buffalo-grass was described some fifty years ago by Nuttall, who called it a Sesleria, but was doubtful about its being properly determined, as he had never seen the seeds. For many years our botanists were on the lookout for specimens of the Buffalo-grass with ripe seeds, but none came. It was supposed that a plant which multiplied itself so rapidly by runners, had no need to be at the trouble to propagate itself by seed, and consequently the flowers were abortive. Only a few years ago, the

are three, placed in a whorl just below the flowers. The Pasque-flower remains in bloom for many days, keeping wholly or partly closed in dull weather, and only fully opening in the sunshine. The plant has a very sturdy, vigorous look, and appears quite unlike its near relative, the delicate Wind-flower of our woods—Anemone nemorosa. We have, however, in Illinois and westward an Anemone that very much resembles the European Pasque-flower, and is called the Wild Pasque-flower. It is the Anemone patens, var. Nuttalliana. It differs from the European species in cutting of its leaves, which appear later than the flower.

better than it was last year. I put just within it a circle of the dark red Achyranthes Lindenii, and filled up the center with one of the Coleuses.

Garland-flower — Dapune Cneorum.— What a charming thing this is where it does well. It succeeds finely in my light soil, and is, as a neighbor says, "too pretty for anything." I thought my clumps were fine, but Olm Brothers sent down a plant in full bloom, which shows that Springfield can beat "The Pines" on Daphne.

The Golden Yew.—A group of this has been a daily pleasure. It is a variety of the English yew, and, as sometimes happens, the variety is hardier than the regular form. My plants are small, but there are some fine, large ones at Parsons' nursery, at Flushing, which quite bear out the enthusiastic Scotchman, who likened it to "a golden candlestick ornamented with glow-worms." For a door-yard, or for a place on the lawn near the house, nothing can be better in the way of an evergreen than this yew, which is never green.

DICENTRA SPECTABILISALBA.—A great flourish was made over this when it was first introduced. Too much cannot be said in praise of the original Dicentra Spectabilis, or Bleeding. Heart—but this white variety is miserable rubbish. It looks like what it is, a poor, sickly albino; a poor grower, a sparse flowerer, and of a very dirty white.

Names and Numbers.—When Rogers' hybrid grapes were known by numbers only, I did not take half the interest in them that I do now that the best of them bear names. Who could recollect the difference between 13 and 33; they seemed to have but little individuality. Now, as I pinch "Barry" and train "Wilder," and tie up "Lindley," I, as a matter of course, think of those whose names they bear, and they are the pets of my little vineyard.

THE WHITE WIEGELA.—Let no lover of shrubs omit from his collection. The White Wiegela—Wiegela nivea, I think the catalogues call it. Its flowers are pure white, and it keeps in bloom much longer than the other varieties. Last year it bloomed nearly all summer.

How a Monarch Dies.—Last summer I stated that my tallest Pine, a grand old specimen, probably the growth of a hundred years or more, was struck by lightning. A slight crack in the bark was the only visible injury, and the tree retained its usual appearance through the remainder of the summer, and all through the winter. Early this spring some of the lower limbs looked of a less fresh green than the rest. As the season advanced, one after another of the lower limbs gradually browned, the upper portion still remaining green. As it would be a difficult matter to fell it without injury to other trees, I sent for a man known for his skill in wood-craft. He examined the tree and said "that 'are ain't dead only in the lower limbs," and proposed to cut them away. In these last hot days the monarch that has clung so tenaciously to life has yielded, and now its very top is as if scorched with fire.

CARNATIONS FOR WINTER BLOOMING.—Many persons think that a plant, which has flowered all summer should, when taken up in the fall and removed to the house, flower all the

winter. A few plants will keep up this continuous blooming, but the carnation is not one of them. If carnations are wanted for winter-blooming, either in the greenhouse or dwelling, they must be prepared beforehand. Plants raised from cuttings this spring and set in the open ground, should not be allowed to flower. The flower-buds must be cut off as soou as they appear. By this treatment the plants become strong and stocky and when potted in the fall are ready to furnish a good supply of flowers.

### Strawberries for Next Spring.

The amateur or the retired merchant who, for the first time finds himself in the possession of a garden, presents an amusing embodiment of impatience. These enthusiasts cannot see why a plant should not flower all summer; they expect the pear tree they put out this spring to be loaded with fruit next fall, and the strawberries they set in April to yield a crop in June. The itinerant and irregular dealers find their readiest customers among this class, who are ready to believe any impossible story about plants, if it accord with their wishes. As far as strawberries are concerned, we would say to these impatient people, that the only way they can get a satisfactory crop of strawberries next spring-assuming, of course, that they have yet to plant their bed-is to begin now. Layers, rooted in pots, may be planted even in the hot days of July and August; the plants will grow right on, and become sufficiently large to give a good crop next spring. Plants rooted in pots are not generally for sale by nurserymen, but there will be no difficulty in getting them done to order. Small pots, those known in the trade as verbena pots, are filled with good compost, and suuk in the soil of the bed. The runner is placed upon the soil of the pot, and a clod of earth or a small stone placed upon it to keep the wind from disturbing it until it is rooted. The plants should not remain so long in the pots as to become at all root-bound, but as soon as they are well rooted they should be turned out and planted in the new bed. The plant should be set in freshly stirred soil, and if the operation is properly managed, it will show no signs of having been disturbed.

#### Collecting Flower Seeds.

----

It is desirable to save one's own flower seeds, not only as a matter of economy, but as a means of improving the variety. In a collection of annual plants, all from the same stock of seed. there will be considerable variety presented. Some may vary from the general stock in the size or color of the flower, and others in the babit of the plant. These peculiarities are not certain to be reproduced, but the probabilities are, that some of the seeds from such plants will show them, and by following up a course of selection, one can in a few years so establish a variety, that it will come constantly true from seed. It may be here remarked, that florists have found in practice that, though a peculiarity may not show itself very strongly the first year, yet it will manifest itself the next year, if the grower perseveres. It is well to mark those plants, the seeds of which it is desired to save by themselves, while in full bloom, and not trust to memory. In a bed of plants, from which seeds are to be saved promiscuously, and when it is desirable to have all of one color, the "rogues" must be pulled out as soon as they show themselves. For instance, if we wish to use Drummond's Phlox for bedding purposes, it is important that each lot of seed produce flowers all of a similar color. If we have a patch of dark rose, from which seeds are to be saved, pull up every light-colored one before it goes to seed.

To be successful in seed-gathering, one must study the habits of the plants. Nature provides for the scattering, not the saving of seeds, and we must study her methods and anticipate her a little. Some seed-pods open with a jerk as soon as ripe, and scatter the contents to a distance; some open by a hole or crack, and as the plant is swayed by the wind, the seeds are gradually sifted out; again each seed has a downy tuft, that will allow it to sail away upon the breeze. In other cases there is no provision for scattering the seeds, but the fruit or seedvessel must decay, before they can be liberated. It is not necessary to wait until seeds are dead ripe before collecting them; a little experience will teach one to know the point at which it is safe to gather them. Those seedvessels, which in breaking scatter the seeds, should be gathered just before they open, and be allowed to pop under a sieve or convenient cover. Pansies and other Violets, Phloxes, Ricinuses, and others, need care in this respect. As soon as seeds are gathered, put a label with them, and as soou as they are thoroughly dry, clean them, and store them away. The manner of cleaning the seeds is varied according to circumstances; sifting, gentle winnowing, rubbing between the hands, and hand-picking being resorted to, according to the kind of seeds. A series of small sieves, of different size of mesh. will accomplish most of the work.

#### The Red Spider.

Whether the Red Spider, that attacks trees and plants in the open air, is the same as the pest of the greenhouse we are unable to say. As far as the gardener is concerned they are practically the same. The insect is so small, that it is not usually discovered, until considerable mischief has been done. It attacks fruit and ornamental trees and evergreens as well as the soft-wooded plants of the flower-garden. A general browning of the foliage is usually the first intimation of its presence.

A few years ago we saw a fine pear-orchard nearly ruined before the owner found out what the trouble was. It was during a dry, hot summer, and he supposed the leaves to be sunburned. One familiar with the work of the Red Spider will detect it at once. When browned leaves are observed, examine their under surfaces. If the insect be present, a very delicate filmy web will be found, and minute red or blackish specks may be seen in motion, which a magnifier will show to be the dreaded enemy. Frequent syringings with clear water will perhaps answer as well as whale-oil soap or any other insect-destroying application. Moisture is their greatest enemy, and water applied often will check their operations. Some of the small garden pumps or engines will be found convenient for the purpose.

#### Young Trees in Hot Weather.

July and August are usually trying months for young trees. Those that were set this spring, and have appeared to be doing well thus far, may succumb to the long continued heat and drouth of midsummer. It is safest to mulch all young trees, but where this has not been

done, all those that show signs of suffering should be attended to at once. A timely mulching may save the tree. It makes but little difference, what material is used so that the soil around the tree is prevented from losing its moisture by evaporation. Stones, if most convenient, will answer as well as anything. If the tree has an exposed trunk, it should be protected from the intense heat. A couple of boards tacked together like a trough, and set up against the trunk will furnish the required shade, or the trunk may be bound with a hay rope or be loosely strawed up as for winter protection.

#### Where to Look for a Cranberry Bog.

The large profits realized from the sale of

cranberries for the last ten years, has led many to inquire for suitable lands for a plantation. It is by no means necessary to go to New Jersey, or to Cape Cod for this purpose. There is undoubtedly a larger amount of peat bogs and sand banks in these sections than can be found in most places, but there, also, the value of the raw material is best appreciated, and the prices are correspondingly high. So far as climate is conceroed, a peat bog in any of the shore towns from Maine to New Jersey is just as good as Cape Cod or Ocean county. The frosts are kept off by the sea air, and the land. if properly handled would be quite as productive. Peat bogs in these localities which the cranberry fever has not visited are still cheap, say from ten to twenty dollars an acre, while on Cape Cod, they would be worth at least ten times that sum. To make a plantation a successful commercial enterprise, several things are to be considered. We must have the three essential things-peat, sand or gravel, and capacity for flowage, or there is no assurance of success. A bog that does not have these requisites is not cheap at any price. Then, a bog, with every thing promising well, may be bought at such figures as to leave a small margin for profit. If the raw material costs three hundred dollars an acre, and the skinning, sanding, and planting cost five hundred more, the capital is eight hundred per acre, and one will have to wait three vears, before he can expect to make much re-The conditions are changed for the better when we can get equally good land for twenty dollars an acre, and the cost of preparation is only two hundred. Such lands can be found in many of these shore towns, and the owners are willing to sell them because they are unproductive, and they have no faith iu cranberries, or no capital to invest in such improvements. Still further back from the shore for fifty miles or more, there are lands just as good, if the stream running through them is large enough to admit of sudden flowage to guard against the frosts of September. Sometimes this can be secured by a reservoir, even where the stream that supplies it is small. But this reserve of water can only be had at an extra expense, and must be taken into account in making the investment. The cranberry interest is constantly increasing in the localities referred to, and large sums are annually expended in grubbing old maple and cedar swamps, carting sand or gravel, and planting the vines. James A. Bill, of Lyme, Ct., is just finishing the sanding of thirty acres, at a cost of about twenty thousand dollars, when the plants are all in. Mr. Spencer, of Saybrook, near the Shore Line road, has about twenty acres, nearly covered with gravel, and the plants will be set this season. Dennis Tuttle, at Madison, has

been at work upon a plantation several years, and his vines put out last year are coming on as finely as could be desired. The small plantation put out by Mr. Small a dozen years ago, though not so thoroughy prepared as the later ones, still bears abundantly, and annually makes converts to the cranberry faith. A single acre of this plantation, one year, produced one hundred and sixty barrels of fruit, worth not far from \$1,600. This successful enterprise has led many to drain their peat bogs, and make plantations in all the neighboring towns. There is still much land of this sort to be possessed, and the chief thing wanted is capital to develop it. The business is now pretty well understood by the gentlemen who have undertaken these improvements. Skilled labor can be found to sand the land, and to set out the plants. There is no more risk in the investment than in ordinary farming, and capital judiciously expended brings a large reward. Men who wish to make investments in this kind of fruit culture, can hardly do better than to visit these plantations along the Connecticut shore. Connecticut.

#### Seed Sowing in Dry Weather.

BY PETER HENDERSON.

I do not remember to have heard so many complaints of seeds coming up badly as have been made this year, in consequence of the continued dry weather. Even those kinds of seeds that germinate most freely, such as cabbages, turnips, and beets, have been complained of, and celery plants particularly, will be scarce, in consequence of the unusually dry May. Such, in many cases, bave been the results when seeds have been treated in the ordinary way, and continued drouth ensued; but it is necessary that the gardener should always apply common sense to his work, and not simply follow routine, for what will suit for one condition of soil or atmosphere, would be unnecessary or even wrong for another. I will give a case to illustrate. About the fifth of May of this year, I sowed a large patch in the open ground with celery seed, and another with cabbage seed. The soil was in fine order, and the beds after sowing, were raked; the celery with a fine steel rake, the cabbage with a large wooden rake, which covered the seed of each to the regular depth. The weather was dry, with indications of its continuing so, and after sowing I had both the cabbage and celery beds rolled heavily, leaving, however, a strip of each unrolled, so that I could clearly show to some of my young men what the result of this omission would be if dry weather continued. Had a heavy rain fallen within a day or two after sowing, it would have compacted the soil, excluding the air from the seed-in fact, producing the effect of rolling it. But we had no rain for three or four weeks, and a burning-hot atmosphere, passing through the shallow, loose covering of the seeds, shrivelled and dried them up so that it was impossible they could ever germinate. This little experiment resulted exactly as any one having experience in seed-sowing knew it must; our crop of celery and cabbage plants were as fine as need be on the rolled bed, while not one seed in a thousand of the celery, and not one in a hundred of the cabbage started in the strips left loose. The season for sowing turnip seed is at hand, and the same care is more likely to be necessary now than in May, for July and August are always hot and often dry months, and it is imperative that seeds be closely covered so that the dry, hot air is as far as practicable kept from

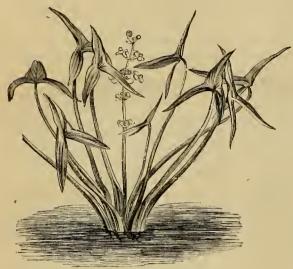

them. In the sowing of cauliflower, cabbage, or lettuce in September, the same precaution had better be used. But in small beds, such as are usually taken for these, if a roller is not at hand, after raking the beds, the soil should be firmly patted with the back of a spade; this not only produces quicker and more certain germination, but it leaves the surface of the beds smooth, so that the plants come up straighter than if the beds were left rough. We consider the practice of soaking seeds before sowing worse than uscless.

#### Summer Layering.

To the amateur who has not the facilities for propagating plants in any other manner, layering is the simplest method of multiplying his shrubs and vines. It is not sufficiently expeditious for the nurseryman, and it is too wasteful of material, as he could make a dozen plants from cuttings of the material required to make one layer. In private gardens, we wish to increase the stock moderately, either to obtain a few plants for our own use, or to present to friends, and to do this, layering answers admirably. Even the nurseryman is obliged to resort to this method with plants that cannot be propagated in any other way. The operation is of the simplest. We have only to bend down a shoot and bury a portion in the earth, and in most cases it will be found well rooted by autumn, and it may be severed from the parent plant, and removed at that time, or be left until the following spring. There are a few points necessary to be observed. The wood of the shoot should be partially ripened or hardened. before it is layered. In most cases the rooting is much facilitated by cutting a tongue in the portion to be layered. This tongue should be made upon the upper side of the stem. It is simply a cut from below upwards, an inch or two long, and extending about half way through the stem. In bending the shoot down, care must be taken not to break it at the cut point. The soil should be mellow and rich, and a little trench being opened, the shoot, including the cut portion, laid in it, and fastened down with a hooked peg. The earth is then replaced and pressed down firmly, and the upper end of the shoot, which projects above ground, is to be tied up to a stake; this will give a better shape to the new plant than if it were allowed to take a reclined position. Want of success in summer layering is due to the ground around the layer becoming too dry to allow the formation of roots. This may be remedied by placing a mulch of moss or other material, over the surface. A flat stone laid upon the soil over the layer answers an admirable purpose.

THE NEW REMEDY FOR THE PEACH-BORER. -Mr. M. B. Bateham, of Painesville, O., writes as follows: "Since the publication of my article in the April number of the American Agriculturist. I have received several letters asking for more particulars respecting the use of carbolic soap as a remedy for the peach-borer. A correspondent in Southern Tennessee wishes to know the capacity of a "barrel," or how many gallons of water I use for five pounds of soap. My answer is, about thirty gallons-a little more or less is not material. But for small or young trees, the strength of the liquid should not be so great, as it might flow down and injure small roots. I would say eight or ten gallons of water to a pound of the soap. For bearing trees, 5 or 6 years planted, I have dis-

covered no injury to the roots from using a pound of soap to six gallons of water. It may be necessary to apply this remedy earlier in the season at the South-say the middle of Junethen again in August, if the fly continues to deposit eggs until that time. I am confident

ARROW-HEAD.

that this remedy will prove completely effectual

both for the peach and apple borers, and hence be of immense benefit to orchardists and cultivators generally throughout the country."

#### The Arrow-head.

Along the margins of ponds and in wet places, there is an aquatic plant which is noticeable for the arrow shape of its leaves, and its white flowers, which are produced all summer. We refer to the Arrow-head, or Sagittaria, one species of

which is very common in swamps and along streams. The botanical name, Sagittaria, is suggested by the prevailing shape of the leaves, and our most common species is properly called variabilis, as the foliage varies greatly. In some specimens the points of the arrow facing the lobes of the leaf are very broad and blunt, and in others, as shown in the engraving, they will be long, narrow, and acute. Indeed, the foliage presents every possible gradation, from leaves with almost linear lobes to those in which the arrow form is quite lost. A plant with such a tendency to vary is puzzling to young botanists. The staminate and fertile flowers are sometimes upon the same plant, and often on different plants. The three white pet-

als are quite conspicuous, and the plant is a desirable one to those who have a situation in which they can grow aquatics. Plants with double flowers have occasionally been found growing wild, showing that the great tendency to vary is not confined to the leaves alone.

The Wild Pink .- (Silene Pennsylvanica.)

The Pink Family produces many very unattractive plants, and a share of our troublesome weeds, such as Chick-weed, Cockle, Carpet-weed, Bladder Campion, Soap-

wort, etc., but it also furnishes a large number of ornamental plants. Besides the Pink proper (Dianthus), in its many species and innumerable varicties, including the Carnations, we have in cultivation various species of Silene, Lychnis, Gypsophila, Cerastium, etc., many of which are favorites in the flower garden. We have wondered why one of our native species of Silene never became better known, as it is as showy as many of those now popular in cultivation. We refer to the Silene Pennsylvanica, commonly known as Wild Pink, and in some localities called Mountain Pink. It is not a rare plant, and is frequently found in great abundance in gravelly and

rocky places, from New England south-The plant is a dwarf perennial, not more than 6 or 8 inches high, and forms dense patches. The shape of the leaves as well as the general habit of the plant, are shown in the engraving. The flowers are produced in clusters of six or eight, each about an inch across. The calyx is hairy and sticky, and the five notched petals are rose-purple, of a very lively tint, varying in intensity, and sometimes so pale as to be almost white. When the plant grows, as we have often seen it, in large masses,

desirable ornament to rock-work. A closely re-

lated species is the Fire Pink (Silene Virginica),

with fewer, and deep crimson flowers, found in

Illinois and southward, and another is the Roy-

TWO-LEAVED SOLOMON'S SEAL.

al Catch-fly (Silene regia), which has very handsome deep scarlet flowers, and is found on the prairies of the West and South-west,

#### The Two-leaved Solomon's Seal.

In May, in moist woods, especially in the Northern States, there is found an abundance of a little plant which somewhat resembles the

Lily of the Valley-the Two-leaved Solomon's Seal. It is only from three to five inches high, and each stem bears two, and often three, heart-shaped leaves. The minute white flowers are in erect spikes, an inch or more long. When the plant grows, as it frequently does in dense tufts or clumps, it makes an exceedingly neat and pretty appearance. The root-stock is slender and creeping. The plant is easily cultivated, and though it does better in a partially shaded place, it will flourish when fully exposed. Care must be taken to keep the weeds from encroaching upon it. In its season we frequently see the flowers of this Smilacina used in bouquets by the city florists, its delicate spikes projecting above the coarser flowers, producing a

graceful effect. There is a Three-leaved Solomon's Seal, Smilacina trifolia, which is a little taller and more robust, and with longer leaves; it is less common than the one engraved. These plants belong to the Lily Family, and are closely related to the Lily of the Valley.

WILD PINK.—(Silene Pennsylvanica.)

the effect is very pleasing-almost brilliant. The Wild Pink grows readily from seeds and cuttings, and there is no difficulty attending its cultivation.. While our gardeners have quite neglected this plant, it has been recently introduced into England, where it is found to be a

### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### An Unpatented Trap.

A friend, who has a great fancy for making traps, says that the one here figured is very effective in taking rats and mice. He uses a bucket fitted with a circular board or false cover, which is so nicely suspended, that a slight weight upon either side of the center will cause it to tilt. The bait is suspended by a wire in such a manner, that it can

A MOUSE OR RAT-TRAP.

only be reached from this treacherous platform. The bucket contains water for the reception of the rat or mouse. Where rats are shy, as they will be where traps have been frequently set, it is well to fix the platform so that it cannot move, and allow them to take away the bait for a few times. When they have become accustomed to the affair, they may then be easily trapped.

#### An Ironing-Board.

Maggie Martin, Sussex Co., Del., after reading "Ironing Made Easy" in the May Agriculturist, sends us an account of her ironing-board. This simple contrivance, though much used, may not be known to all our readers, and we give it with the suggestion that those who have never made use of a similar help in ironing should try it at once. Our

correspondent says: "My method is to take a board five or six feet long, one foot wide and an inch and a half thick. The board is covered with two or three folds of woolen material, and over this is put a piece of linen or flannel, which is lightly tacked on, in order that it may be taken off and washed when necessary. In use, the ends of the board rest upon the backs of two chairs, or they may be supported at the proper hight in any

other convenient manner. I consider a board of this kind almost indispensable in ironing dresses or skirts, as no part gets rumpled while the rest is being ironed—a thing which always happens when the ironing is done upon a table. The hoard is to be put into the skirt in the manner shown in the engraving. Shirts can be ironed by the aid of this board, and it will be found to greatly reduce the trouble of ironing the bosoms. Every man that has any taste for dress (and the most of them have), especially prides himself upon a perfectly smooth shirt-bosom. I think if a board of this kind were in general use, there would be less frowning over badly ironed shirt-bosoms than there is at present."

#### Home Topics.

BY FAITH ROCHESTER.

CITY GUESTS IN THE COUNTRY.-It is folly for country people of moderate means to attempt to give their city guests the style to which they have been accustomed at home. The effort to do so only makes all parties ill at ease, and can never be quite successful. The luxuries of city life are by no means to be despised-soft couches, bath-rooms, gas-light, early fruits in the markets, attendance of servants, etc. But city people are often glad to turn their backs upon all their bome luxuries as warm weather approaches, and go in search of simple comfort. Let country people who take such truants into their families for a season remember that comfort is the essential thing to give their city guests.

Comfort means so much to some of the pampered children of wealth, that it is no easy matter to satisfy them; but when you are sure that you have done all that it is reasonable for you to do, be as deaf and blind as possible to any nnreasonable discontent on the part of your guests. They ought to know, before they take up their quarters with you, whether your rooms, and beds, and table furnishings are such as they can put up with, and of course you will take all reasonable pains to accommodate their habits and tastes. They should consider beforehand how much attendance they will require, so that they may not call for more assistance from the families where they board than can be conveniently and willingly rendered. If they do not know that silver forks and napkins will be furnished them, they should take such small things, necessary to their comfort, with them. To some excellent people the preference for silver forks still seems a mere whim, dependent upon fashion's changes. People who must have luxurious carpets and curtains, and several courses at dinner, should go to the fashionable summer resorts where these things are to be had and roundly paid for.

On the other hand, country families who "cannot afford" to keep clean rooms and clean grounds, who are not willing to swerve in the least from their habitual manners to accommodate people of different tastes, who have no charity for the ignorance of city children in respect to farm life, ought never to attempt to take city boarders.

What is that comfort which sensible city people are in search of? Pure air, coolness, natural scenery, good milk for the little ones, quiet. They should have rooms which can be well ventilated by

AN IRONING-BOARD.

fresh breezes from out-doors, protected by netting in the windows from danger of filling them with mosquitoes and moths. There should be low, wide, easy benches of some sort, under shade trees in the yard, in the orehard, down by the brook, and wherever there is a shady spot to sit and see the changing landscape, or listen to the running water. In the house there should be as many com-

fortable lounges and easy chairs as the hosts can afford. I say "benches" and "lounges," because these can be made so as to be comfortable, easily and cheaply; while sofas and pretty "rustie" seats cost more, either in time or money. No sensible person reckons fineness of fabric and beauty of form of no account, but coarse lounge-covers and table-cloths, kept clean by frequent changing and washing, give more real comfort than soiled ones of finer texture.

City people who go into the country for comfort should have the good sense to wear plain, strong clothing, loosely made. No climate in the world can give a woman, fashionably dressed, all the pure air she needs. Especially should the children be dressed in simple clothes, that they may-little girls as well as little boys-climb the hill-sides, wade in the brooks, visit the cow-yard and stables, and have a genuine good time in the country.

The hearty food that suits working farmers will soldom satisfy the daintier palates of city boarders. The latter are not likely to be contented without a variety, and a plenty of fresh vegetables and fresh With these, and with light, sweet bread, fresh dairy butter, sweet cream and rich milk, they ought not to complain if porter-house steaks are not on the bill of fare.

City people who put on airs of superiority when among country people, show their own in-feriority, and persons of good sense can only pity them. But sometimes the daily intercourse between country bosts and city guests is very pleasant, and socially profitable to both parties.

Washing Dishes .- I know their tricks and manners-those little girls who "hate to wash dishes!" I know how they find some long errand out of doors while they leave the table standing uncleared of the soiled dishes; how they dawdle about the table, handling the cups and saucers daintily, as though afraid of contact with them; how they discover at the last minute that they have not heated any dish-water, and must wait for it; how they leave everything they dare to "asoak" until the next dish-washing, and feel that the most disagreeable drudgery of their household is washing

Little girls, how do you suppose I found this out? Must I confess that I learned it by my own childish experience? But I have learned by observation that the state of things described above is very common to girlhood. My little sisters, let me talk with you about it, though we are not in the "children's column" at present. Indeed, I had rather have my say on this subject in this department, hoping that some older girls may possibly get a helping hint from my remarks.

You sometimes hear grown-up persons say that they like to wash dishes, but you doubt their sincerity. I think that every one of you may learn to like it too, if you set about it in the right way. In the first place, look at the matter reasonably, and you will see that a great deal of work, which is not very agreeable in itself, must be done in every family. Comparatively few families can, even if they prefer, have all this labor performed by paid servants. Shall we not each bear a part-each according to our ability? You would prefer to do a part of the cooking, perhaps, but that requires a degree of judgment which your experience has not been long enough to develop; and you can help mother best by doing such work as demands least of her oversight. By being faithful in the least things, you will prove yourselves worthy of trust in more responsible situations. You will never like to wash dishes until you learn to do the work well.

A large tin dish-pan is a great convenience. You can work more rapidly with such a pan than with one that is small and shallow, spattering your clothing and slopping your sink or table with its contents. Have a large dish-apron, with a bib, or a "high apron," and roll up your sleeves, or wear oil-silk over-sleeves. In clearing the table, scrape off the crumbs, and especially the grease, from your dishes, gently, so as not to injure the glazing, and pile them neatly on one side of your pan. Gather the spoons and forks (if silver) by themselves. Contact with the knives is liable to mar them.

If you are obliged to wash dishes in hard water, it is best to use no soap, but with soft water use soap enough to make a bright suds. Now, you always want a clean dish-cloth and clean wiping towels. You can keep them clean by washing and scalding them every day, if you have not towels enough for frequent changes. Always wash out your dish-cloth the last thing, and leave it clean. It is best to have at least two-one for the coarser dishes and kettles. If you have much glass and silver ware to wash, there should be a third soft dish-eloth for that purpose. Wash the glass first, the silver next, then the knives, then the cups, sancers, plates, etc. You should have plenty of dish-water, and keep that in the pan clean and hot enough to cleanse the dishes as they go through it. Wipe the glass and silver from the hot suds, rubbing them with a soft towel until they shine. The knives, lay aside to be scoured after you have finished washing. Rinse the crockery well with hot water. If you can have a rack to place across the top of the sink, made of wooden slats half or three-quarters of an inch apart, the open places being wide enough to slip in the edges of the plates and sancers, it will facilitate the drying, and save the towels some wetting.

My young haters of the dish-pan, let me tell you frankly that if you are going to make useful women, treasures and blessings to others wherever you go, you must learn to do faithfully the work your hands find to do, whether it be agreeable or not. Let your consciences guide you in this matter, and you will find that the surest road to happiness is the way of usefulness.

PLAYTHINGS FOR CHILDREN.—How to employ and amuse the little ones, is a question that puzzles all mothers more or less. The children over three years old, who have no playmates of their own age, puzzle one the most. They grow so desperately naughty, they are so full of push and pull, and have such a fund of unapplied activity ruuning to waste, I see no reasonable cure for this but the kindergarten; but those who need it just now eame a little too soon to share its full blessing.

Mrs. Horace Mann, who taught a primary school in Boston for years, before the kindergarten was launched, says that mothers have often told her that the little ones who had been full of irrepressible rudeness and tyranny in the nursery, alone or among younger children, grew more manly and gentle in their manners from the time their little world was enlarged by their entrance to her school. But this was no ordinary school. It was a most extraordinary one, for those days at least. Any mother whose love is "according to wisdom," would gladly loosen her arms from about her child and send him half across the continent, if needful, if sure of placing him under care as conscientious, wise, and loving.

But such teachers are very rare, and we cannot risk the mental and moral injury which our more tender little ones might sustain if sent to ordinary primary schools under six, or at least five years of age. We cannot buy them the best of playthings—living playmates; or if we did, how could we be sure that the association, if left without oversight, might not do more harm than good?

Of playthings, the best are those in the form of miniature tools—little hoes, brooms, carts, wheel-barrows, dishes, etc. By most little girls, dolls and play-houses are more prized than auything else; and little boys, too, will often find some comfort in them if grown-up people are not so thoughtless as to ridicale them.

Children have so much imagination, and enjoy its use so much, that they really seem to like the play-houses patched together from all sorts of odds and ends better than expensive doll-houses. A plain rag-baby, with changes of clothing to take off and put on, gives better satisfaction than a fine "bonghten" dolly, with filmsy finery sewed on.

Every child should have its slate with a pencil tied to it. A pair of round-pointed seissors is an excellent plaything, if plenty of paper be furnished, and a little care be taken to teach the little one to cut some *simple* but pleasing forms. Coarse perforated card-board, with strong colored worsted

(silk is still better), will give much pleasure and employment, if you do not expect too fine results from the little worker. All children love to string buttons (or button-molds) and beads. Colored glass beads can be bought by the ounce for children old enough to use them—over three years, perhaps. Younger children like to fill a large-headed pin with button-molds and empty it into a dish beside them. Of course they love to play in sand, and it pays to provide a box of clean sand, with a little tunnel and a few little tins or bottles to pour it back and forth. Hammer and tacks have great faseination. Very little ones love to drive the tacks into a bar of soap, sitting by the table in a high chair.

After all, there is nothing that wears better for children of all ages than blocks. Only yesterday I heard a little boy begging his younger sister to "keep still a minute," and when I asked the reason, it was whispered to me that he "wanted to pray to God for more blocks." Afterwards I was privately informed by him that he told the Lord he had "not blocks enough to build a large house." I smiled and said nothing, but thought within myself, "The Lord works by means, and now I will send for the box of Crandall's building blocks, for which I have long been importuned."

To be sure we have all of the kindergarten blocks, but they are so small and so useful for future kindergarten lessons in the family, that I cannot have them used very freely without my oversight now that the doors are wide open.

#### Salads and Salad Dressing.

A subscriber in Illinois thus writes on the subject of salads: "My partner for life, who attends to the culinary business of our firm, says she wishes to know how to make such salads as are to be had at the tables of first-class hotels. My partner says she cannot imitate these by following any of the recipes of the 'Cook Books.' Can you tell through the Agriculturist how it is done, and oblige a subscriber who thinks people in the country ought to have as good eating as city folks. The trouble is with the dressing."—We quite believe with our correspondent, that country people should have all the luxuries that any one has. A celebrated cook says that he can never make a salad twice alike; he is governed by the "inspiration of the moment." All the recipes and even the French cook's "inspiration" are of no avail, if the materials used are not of the very best quality. The foundation of salad dressing is olive oil, and here is the very thing that those who live in the country will find it most difficult to procure. Unless the oil is absolutely without unpleasant odor or taste, and if it have not a pure, nutty flavor, don't use it. Sweet, not over-salted butter, is much better in salad dressings than most of the oil that is sold. The butter should be slowly melted by a very gentle heat, without the least approach to frying. Let the melted butter stand a short time, then pour it off from the salt that will have settled, and use it instead of oil. The vinegar should be of the best, and so should the mustard. We give Mr. Harrison's recipe for dressing: Mix a heaping teaspoonful of mustard, the yolk of a fresh egg, and a tablespoonful of vinegar, rubbing them into a smooth paste with a silver fork. Mix one tablespoonful each of vinegar and lemon juice, and measure out twelve tablespoonfuls of oil. Add to the egg mixture, very slowly, and stirring constantly, two tablespoonfuls of the oil. When the mixture becomes thick, add a teaspoonful of the mixed vinegar and lemon juice, stir this well, and then add more oil, and thus continue alternately adding oil and vinegar, until the quantity measured is used up, and a smooth, creamy paste is obtained. The stirring must be thorough, and a fresh quantity of oil should not be put in until that previously added is thoroughly incorporated in the mixture. Properly made, and with good materials, this dressing can hardly fail to suit either city or eountry folks. It may be used for chicken or lobster or meat salad, and as a dressing for celery, eabbage, or lettuce. Salads may be made of chicken, lobster, mutton or beef, mixed with celery, lettuce, cut cabbage, etc. Boiled beets, olives, capers, and slices of hard-boiled eggs, are often added to meat and chicken salads.

#### Economy in Ice.

Refrigerators are made upon one general principle-that is, to keep the ice from melting, except by means of the heat it abstracts from the articles that we wish to cool. The walls of refrigerators are made double, and the space between them is filled with sawdust, charcoal, or other substance that will serve as a non-conductor of heat. There must be a metallic liuing to prevent the filling material from becoming wet. There must also be a pipe to convey off the water resulting from the melting of the ice. The simplest refrigerator is the common groeer's box, which is a plain ehest of convenient size lined and filled as above indicated. A lump of ice is placed in the box, and the articles to be cooled are set around it. Where ice is plenty, a box of this kind will answer a good purpose, and it can be mainly made at home, the aid of a tinsmith being required for the zine lining. Then there are refrigerators of numerous patents, each claiming to be superior to all others. We are unable to see a great deal of difference in principle among the most popular of these, though they differ in details, and some are more convenient than others. It is desirable to have two compartments, in order that butter and milk may not absorb odors from meats and vegetables. The later styles of refrigerators have the receptacle for the ice at the top, which is according to correct principles. There are also various devices for ventilating, and other contrivances, which, the inventors claim, add to the efficiency of their particular patents. Where there is no refrigerator, ice may be kept tolerably well by wrapping it in a thick woolen blanket, and keeping it in a covered box. In removing portions for cooling water or other purposes, ehip it from one side, and do not break the lump in several parts.

#### Recipes.

The following seasonable recipes are from "Common Sense in the Household:" a work by the well-known authoress, Marion Harland, and one which has received high praise from competent judges.

Green Pea Soup.—4 lbs. beef, cut into small pieces, ½ peck of green peas, 1 gallon of water. Boil the empty pods of the peas in the water one hour before putting in the beef. Strain them out, add the beef and boil slowly for an hour and a half longer. Half an hour before serving add the shelled peas; and twenty minutes later, half a cup of rice flour, with salt and pepper. After adding the rice flour, stir frequently to prevent seorehing. Strain into a hot tureen.

Tomato Soup.—2½ lbs. of veal or lamb, 1 gallon of water, 2 quarts fresh tomatoes, peeled and cut up fine. Boil the meat to shreds, and the water down to two quarts. Strain the liquor, put in the tomatoes, stirring them very hard, that they may dissolve thoroughly; boil half an hour. Season with parsley, or any other herb you may prefer, pepper and salt. Strain again and stir in a table-spoonful of butter, with a teaspoonful of white sugar, before putting into the turcen.

Scalloped Tomatoes.—Peel and cut in slices quarter of an inch thick. Pack in a pudding-dish in alternate layers, with a force-meat made of bread crumbs, butter, salt, pepper, and a little white sugar. Spread thickly upon each stratum of tomatoes, and when the dish is nearly full, put tomatoes uppermost, a good bit of butter upon each slice. Dust with pepper and a little sugar. Strew with dry bread crumbs and hake covered, half an hour; remove the lid and bake brown.

Fried Cucumbers.—Pare and lay in icewater half an hour. Cut lengthwise and lay in icewater ten minutes longer. Wipe each piece dry with a soft cloth, sprinkle with pepper and salt, and dredge with flour. Fry to a delicate brown, in sweet, clarified drippings, nice lard or butter.

#### BOYS & GIRLS' COLUMNS.

#### Setting Traps.

BY "CARLETON "

I dare say, my young friends, that you will think it strange when I inform you that I was once a great hunter; but it is a fact, nevertheless. I commenced very early, when I was a little white-haired boy.

"I'll give you a cent for every mouse, and two cents for every rat you will eatch," said my father, and I went My traps were figure fours, and they were to work. made with three thin splinters of wood, with notches ent in them, and a board with a heavy rock on top of it. When the trap was set, the three sticks resembled the figure 4, under a board. I tied a hit of toasted cheese to the trencher, and wound it round with a thread, so that the nice would have to nibble a long while to get it off; and the chances were that if they touched it, they would be squeezed flatter than a pancake in a twinkling. I set traps in the garret, in the cellar, and in the granary.

You may be sure that I was up early the next morning. I dreamed of catching rats and mice all night. I rushed up to the garret, but the traps were not sprung. I hastened down into the cellar, two steps at a jump; no mice there. My cuthusiasm was cooling; but I went to the corn-bin, and there was my first prize, a little mouse flattened out almost as thin as a wafer, and spread over an astonishing amount of surface. How proudly I walked into the honse carrying the trophy by its tail, which for all the world looked like a shoe-string! How glorioosly that first cent I ever earned slipped into my There was only one drawback to my pleasure, I wanted another cent to chink with it. I showed it to all the boys at school; looked at it during school hours, when I ought to have been reading about the dog that met a bad boy and bit him-in the spelling-book. I rubbed it on the seat to make it bright and shining, and let it fall, and saw it roll across the floor on its edge toward the master, a thin-faced fellow, with eyes like a pig, who picked it np and put it in his pocket, and that

was the last of my first fortune.

When I told the story of my loss at home, my older sister, who was always saying queer things, and quoting poetry, said it was another illustration of the truth of the saying that "Blessings brighten when they take their flight;" and all the grown-up folks laoghed, though I could not see anything particular to laugh at. My father said that it showed that riches take to themselves wings and fly away—that money is slippery stuff. I am sure that it is; so far from that time to the present, it has slipped away from me in an unaccountable manner. But though I lost my first fortune, those figure fours were

the snow, and put some coro noderneath. When the jay put his head through the hole to get at the corn, he could not get it back again, for some slips of basket stuff held him fast. The silly creatures plunged their heads in without once stopping to think whether they could ever get them out again. But, then, I have seen boys and men quite as silly in some of their habits, especially when they take to drinking whiskey.

I am afraid that I was a mischievous fellow in my boyhood, especially in trapping the heus. But it was such fun to hend a pole, with a slip-noose lying coiled on the ground, with a kernel of corn on the trencher, to see a biddy pick it up, and the next moment be daugling, squawking and fluttering in the air!

There was a bad boy who lived near by who need to

tie two kernels of corn together by a string. He would manage to have one hen swallow one, and another the other. Then there was pulling and hauling, squawking and flattering-now one hen losing her breakfast, and now the other,—the bad boy rubbing his hands and screaming with delight to see the strife. But his father saw what was going on one day, and dusted his jacket with a withe, and served him right, for if there is anything mean and low and deserving of punishment, it is the wantou giving of pain to a dumb creature.

If I had space I could tell you some nice stories about

trapping rabbits and foxes-how I set my first fox-trap, and how I hastened out the next morning and found I had caught a skunk! how an old fox knew all about the trap and used to spring it by striking it suddenly with one of his fore feet, and then quietly ate up all the bait, and undoubtedly had a hearty laugh all to himself to think how he had outwitted me, and how the sly fellow was caught at last, by setting two traps. But 1 must was caught at fast, by setting two traps. But I must make my stories very short, and I can only tell you about a man who started for the woods one day with a great trap, large enough to hold a bear. "What are you going to catch?" asked one of his neighbors. "O, I don't know but the devil or one of his imps, like enough," said the man with the trap, who didn't read his Bible much, and who nsed bad language now and then. A bear had been seen in the neighborhood and had killed a sheep, and the trapper set his trap to catch him. He fixed the bait upon the trencher and tied some more to a stake driven into the ground, and was going away when, not noticing where he was stepping, put his own foot in the trap. The great iron jaws came together with a grip that held him fast. He screamed and yelled for help, and the people ran to see what was the matter, and found him in the trap.

"We didn't think you would catch the devil or one of his imps, so soon," said his neighbors when they helped him out, and they laughed at him so much that he hung his head, and what was better, it so shamed him that he left off using profane words and became a better man.

come and be caught. There are many curious stories told of the devices rats will resort to to obtain food. A gentleman at Chicago, Ill., sends a drawing to illustrate something that happened in his neighborhood, and we have had it engraved. A lady threw ont at her back door some griddle-cakes for the chickens, and soon after, upon looking out of the window, she saw a large rat smelling around them. He ran off and soon returned with a companion. He then rulled up one of the cakes with his nose, and, turning upon his back, held the rolled cake by his legs, while his companion took him by the tail and dragged him to their hidingplace. We have often heard of eggs being carried in this manner by rats, and that is a performance that seems sensible, as an egg is a load that cannot well be divided; but why the rats should take this method to carry off a thing that could be so readily gnawed into pieces, seems rather singular. Still the story comes well authenticated.

profitable concerns as long as the game lasted, and I soon had a dozen cents to chink in my pocket. I remember that one Sunday I astonished the whole congregation when one of the deacons came round with his black beaver hat to take up a collection for the Tuscarora Indians, by letting them all drop one at a time into the hat. It was by far the largest contribution made that day, judging by the sound!

I had great fun in trapping the blue-jays that came in flocks during the wioter and helped themselves at the corn-crib. I bored holes in shingles and buried them in

#### The Ingenuity of Rats.

If rats were not such mischievous animals, we should admire their cunning much more than we do. Their sagacity is all employed in ways that are injurious, and in avoiding punishment for their misdeeds. An old rat is a shrewd animal, and if we wish to catch him, we must exercise a great amount of strategy. He has a suspicious turn of mind, and a sharp eye for any thing in the shape of a trap, and unless the trap is thoroughly concealed, the most tempting bait will not tempt him to

[COPYRIGHT SECURED.]

#### WAITING FOR A B I T E .- Drawn and Engraved for the American Agriculturist.

Hudson river, Detroit, Noah, A. 409. Put none but Americans on gnard.

11. There stands a castle by the sea,
With an ancient keep and turrets three.

And in it dwells a lady rare,

Rich and lovely, with golden hair,

By the wild waves plashing wearily.
12. Volley, lovely, 13. Usnrper, pursuer, 14. Master, stream, 15. Retina, retain, 16. Wells, swell, 17. Selma, Salem.

#### THE PRIZE.

Nevvy and J. B. Howes sent complete lists of answers, but Nevvy answers No. 1 with "Brass, grass," and No. 17 with Nevia, Niven. I have a very complete gazetteer, but I can find no such place as Niveu, Mr. Nevvy, so we must count you out. J. B. H. wins the prize, as he fails only on No. 5, which he answers with Commend, condemn.

### AUNT SUE'S NOTICES TO CORRESPONDENTS.

AGNES LEE.—You wish I would "please write" to you. Bless your little heart! I should like to write to you all, personally and individually; but just think! how could I?

Mrs. H. A. D.-I nm "that Aunt Sue," and your loviag remembrance does me a world of good,
"Mother."—You may give the "little ones" all the

"help" you can. Your answer to No. 16, "the Iser hegan to rise with the rain," was very clever.

H. E. O .- What do you now think about the spelling of "peck?" You were not the only one who put the cart before the horse

R. A .- Yes, to both your questions.

II. W. Otis.—I am very glad you liked your "beautiful

QUESITOR .- It is not worth while "explaining about the prizes" when I do not mean to offer any more. flud they give more dissatisfaction than the reverse, so I shall discontinue them. Those who answer puzzles in future will do so con amore, and not with the bope of gaining a prize.

Thanks for puzzles, etc., to J. P. W., H. E. D., and

Correct answers, more or less, were sent by W. H. and E. G. Kerr, Anna K., C. G. T., Wm. Taylor, J. P. P., H.
E. P., E. L. D., J. C. W., O. A. G., F. S., H. E. P.,
Aiuslee Bros., H. E. O., M. T., R. A., and L. N.

SPECIAL NOTICE TO PUZZLERS.

It is impossible for me, dear children, to tell you "how" to find out the different kinds of pnzzles. If you do not understand them at first, wait until the answers to them appear, and then you will know all about it.

Whenever you write to any one, asking information for your own especial benefit, it is only polite to enclose a postage stamp. -We want none hat original puzzles.

#### Waiting for a Bite.

Of all the children in the pleasing group in the picture. we best like the boy in the center, who is quietly and pa-tiently waiting for a bite. We suppose that all the boys, and most of the girls too, read what Carleton had to say last month, about fishing. Carleton has so much "go" in him as a man, that he must have been tremendous as a boy, and the fish that came anywhere near his book would have been jerked to land in short order. One so

active as Carleton, naturally presents the lively side of fishing, or any other subject he writes about. We quieter old fellows look at fishing from a different side, like to go out with book and line, and have plenty of fishing, whether we get any fish or not. The pleasant breeze, the singing of the birds, the hum of the bees, the flowers, the ripple of the brook, the insects that play upon the surface of the water, or just above it, all these and many more things, come into our idea of fishing, as well as do the fish. A true fisherman can enjoy himself if he does not catch a fish. We look upon fishing as a school in which many good lessons are taught. Patience is one of the virtnes that the fisherman must learn. The boy in the center of the picture is evidently exercising patience, while he, at the same time, looks ready to take advantage of the first nibble. Then the good fisherman must have perseverance. If one part of the stream uffords him no sport, he will go to another and another, until he succeeds. Then, where there is a party of fishermen, there always will be some bungler who will give one an opportunity to exercise self-control. If you can go n fishing with several other boys and have some careless fellow entangle his line with yours, just as you are feeling a good bite, and not get angry, you have a better control of your temper than most boys have. When a trouble of this kind occurs, take it quietly—scolding will not untie knots half as well as patient fingers. Don't ent your companion's line, as I have seen boys do, but quietly go to work and disentangle the snarl without an angry word. You will feel all the better afterwards for having acted like a gentleman. Don't understand from what has been written that we do not like to catch fish: we only wish to say that fish are not all that there is about fishing.

How to Punchase a Clothes Whinger .- In purchasing a clothes wringer we prefer one with eog-wheels, as they greatly relieve the rubber rolls from strain that would otherwise occur, and add much to the durability of the machine. The next point is to see that the cogwheels are so arranged as not to fly apart when a large erticle is passed between the rollers. It matters not whether the cog-wheels are on one end or both ends of the shaft; if large articles disconnect them, they are entirely useless. This is very important, for as the larger the article the greater the strain; therefore, if the cog-wheels separate so as to disconnect, they are of no service when most needed. We have taken some pains to examine the various wringers, and much prefer the "Universal," as lately improved, because it has long and strong gears (Rowell's Patent Double Gear), and is the only wringer with "patent stop" for preventing the cog-wheels from separating so far as to lose their power. -[New England Farmer.

Having used for many months the kind of wringer named above, we fully endorse all that is said of it by our New England cotemporary, -Editors of Scientific American.

THE BEST WATER-PIPE, also the cheapest when strength and durability are considered, is the TIN-LINED LEAD PIPE, manufactured by the Colwells, SHAW & WILLARD MF'G Co., No. 213 Centre-st., New York. Price 15 cents a pound for all sizes. Send for a circular.

#### DENSLOW & BUSIL'S "SAFETY" OIL

Gharanteed to stand a fire stover 150 degrees Fahrenheit, being the highest fire test, consequently the safest oil in the U.S. It is over 40 degrees higher fire test than oil in common use, and is sabsolutely safe, brilliant and odorless, and for family use more economical than common oil. It is urgently recommended by the Fire Underwriters and Fire Insurance Cos, of N. T., and endorsed by thousands of families. ### SOMETHING NEW FROM WALTHAM. BOY'S WATCH

This Watch, which is of smaller size than the other Waltham Watches, has just been introduced, and, although called the Boy's Watch, on account of its size, is destined to have a wide and universal sale. It is finely finished, or substantial construction, and contains all the recent improvements. Its low price and neat appearance will commend it to a large class of persons who have been deterred from purchaslay waithand Watches heretofore, on account of their largesize. Our Illustrated Price list describes this, and all other Waltham Watches, in detail, gives weight and quality of the cases, with prices of each, and explains our plan of sending watches to all parts of the country, without risk to the purchaser.

Send for the Price-list, and sales that the

All Prices reduced since February 1st.

ATTENTION IS CALLED TO OUR

LARGE STOCK OF

### WALTHAM WATCHES,

And we submit the following reasons why they should be preferred to any other American Watches:

In the first place, the Waltham Company is the oldest, and has had fourfold the experience of any others engaged in the business in the United States.

In the second place, the machinery in use by the Waltham Company is far more perfect and varied, and as a result, the Watches are of far higher grade and of greater variety, and are placed in the market at omeh lower prices than any others, quality and style fully considered.

In the third place, the Waltham Watch is now a staple article, its reputation fully established, and, as a consequence, is sold at less profit than any others in the market.

### BALL, BLACK & CO.,

#### CABBACE AND PLANT PROTECTOR AND FERTILIZER.

Adapted to the protection of Cabbages from attacks by the Cabbage Worm (Pieris rape) and Turnips, and other plants trom destruction by iosects injurious to vegetation, In addition to protecting the plants by driving off the worms, bugs, etc., this compound sets as a powerful fertilizer. Mr. P. T. Quim, of Newark, N. J., Horticultural Editor of the New York Weekly Tribune, who used this mixture last year with great success on upwards of 40,000 Cabbages, writes in the Weekly Tribune, May Ir, 1871:

"It serves as a fertilizer, bosides as an effective remedy against this voracious pest of the Cabbage plant; at least, this was my experience last year."

Prices, packed in bags, 10 lbs., \$1.50; 25 lbs., \$2.25; 50 lbs., \$1.00; 100 lbs., \$7.50. A bag of 10 lbs. will be sufficient for 1,000 Cabbage plants. Sold Wholesale and Retail by

B. K. BLISS & SONS, Seed and Horticultural Warebouse, 2.3 Park Place and 2.0 Myrray St., New York, Liberal Discount to the Trade.

#### THE BRINKERHOFF CORN-SHELLER. It Shells! It Separates! It Cleans!

The U.S. Commissioner of Agriculture says, in his report to Congress: "It is the very best Hund-Sheller that is made in the United States." The American Institute Farmers' Club say: "It is the best Sheller we have ever met with." The officers of the National Implement Trial say: "It is the best Corn-Sheller we ever saw." The Rural New-Yorker, The Western Rural, and all competent judges, concede that it is the very best Corn-Sheller in use.

We have greatly improved the working of the Sheller, by enlarging the gear and otherwise perfecting it so that it can be run with about one-half the power formerly required. Great care is also taken to make them strong and durable, and it is now fully conceded by all competent judges that it is incomparably better than any other Corn-Shelter ever made.

First Previums awarded this Sheller at every State Fair

made.

First Premiums awarded this Sheller at every State Fair at which it has been exhibited, including Ohio, Illinois, Michigan, Delaware, Louisiana, Georgia, and New York State Fairs; also at a large number of County Fairs in this and other States.

ORANGE JUDD & CO., 245 Broadway New York.

HARVARD UNIVERSITY, CAMBRIDGE, MASS.

### BUSSEY INSTITUTION.

### School of Agriculture and Horticulture.

A School of Agriculture and Horticulture.

This School is to be opened September 23, 1871. It will teach Practical Agriculture and Horticulture, and the sciences and arts subservient thereto. The regular course of study will fill three years. Any person 18 years of age, not being a candidate for a degree, may take such part of the regular course as he pleases. The year extends from Sept. 28, 1871, to June 27, 1872. The tuition fee for regular students will be \$150 a year; this fee will be freely remitted to poor, meritorious students. The teachings of the school will be amply illustrated by the rich scientific collections of the University, and by a botante garden, a large and profit-ble farm, greenhouses, propagating houses, and field experiments. For particulars, address

JAMES W. HARRITS, Secretary, Cambridge, Mass.

### Eureka Butter Worker.

Working position.

Draining.

Detached.

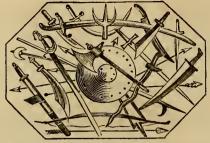

norwing position. Draining. Detached.

Common bowls are used, and of all sizes. A large ladle is nttached to a Leven, enabling a person to wash, salt, press, cut, turn and work hard butter easily and perfectly in every part of the bowl, in any manner desired. Exactly the hand-ladle principle. Three times faster and easier than with a hand-ladle, and not as liable to injure the butter. It is light; convenient to earry; nothing liable to get out of order; very shaple, and as handly washed as any burd and ladle. The bowl is securely held against a solid rest, is easily revolved, and thopad to drain by the strength of one finger; also removed as readily as from a table. Retail prices, \$7, \$7.59, \$3. Three sizes. Liberal discount to the trade.

29 Beckman St., New York.

#### GREAT NATIONAL LOAN.

\$133,000,000 NEW 5 PER CENTS.

PRINCIPAL AND INTEREST PAYABLE IN COIN.

Interest quarterly, February, May, August, and November

BONDS FREE OF ALL TAXES, LOCAL OR NATIONAL.

The Treasury Department having already received sub-The Treasury Department having already received subscriptions to the amount of \$80,000,000 to the first two hundred millions of the New Loans anthorized by the Act of Congress, of July 14, 1870, for refunding the Public Debt, bearing five percent per annum interest, now offers to popular subscription the remaining \$133,000,000 of this particular Loan, and is prepared to promptly deliver the Coupon Bonds or Equistred Cortificates in explange deliver for delilar Loan, and is prepared to promptly deliver the Coupon Bonds or Registered Certificates in exchange dollar for dollar for any of the United States six per cent Bonds or Registered Stocks, known as Fire-Theenties, or for Gold Coin at the par value of the New Loan, and accrued Interest from the first of May. When this amount, to which preference is given, is taken up, the remainder of the Five per Cents, \$300,000,000, embraced in the Act, will be offered in connection with \$200,000,000. Four and capability or Cents and services are the services of the service of the services of the s tion with \$300,000,000 Four and one-half per Cents, and any part of \$700,000,000 of Four per Cents, the one running fifteen ears and the other thirty years.
Registered Bonds will be issued of the denominations of

\$50, \$100, \$500, \$1,000, \$5,000, \$10,000, and coupon bonds of each denomination except the last two. The interest will

each denomination except the last two. The interest will be payable in the United States, at the office of the Treasurer, any Assistant Treasurer, or designated depository of the Government, quarterly, on the first days of February, May, Angust, and November, in each year.

The interest on the Registered Stock of this Loan, it is determined by the Treasury Department, will be paid under the following convenient regulations, thus bringing a Gold Check for the Quarterly Interest, to the Post-office of every holder, free of trouble or expense, dispensing with attendance, in person or by proxy, at the Treasury, for the purpose of receipting for and drawing such Interest.

The whole proceeds of the New Loan will be applied to the payment or redemption and cancellation of the 5-20 years six per cent bonds, and in addition to those proceeds,

years six per cent bonds, and in addition to these proceeds, the 5-20s are being reduced by purchases, averaging, for two

the payment or redemption and cancellation of the 5-20 years six per cent bonds, and in addition to these proceeds, the 5-20s are being reduced by purchases, averaging, for two years past, about \$10,000,000 per month.

The entire effect, therefore, of the New Loan, in connection with the existing Sinking Fund process of the Treasury, is to reduce both Principal and Interest of the Public Debt of the United States. The Loan creates no additional suppling of Government Stocks, while the application of the Surplus revenue is constantly lessening the Funded Stocks bearing six per cent Gold Interest.

The policy of the Government since the close of the War in 1855, which left a debt upon the country of \$2,755,000,000, and an annual taxation of \$311,000,000, has been to reduce steadily both Debt and Taxes; to reduce the Principal of the Debt hy actual payments, and to lessen the annual burden of Interest, and thereby the burden of Taxation, not only through such payments, but hy funding the debt at the cheapest rates of interest practicable from time to time, until it is now felt that the very cheapest rates are due to the high Credit, unblemished Public Faith, and vest and growing resources of the country. From \$2,755,000,000, the Principal of the Debt has been reduced to \$2,200,000,000—both sams exclusive of accrued interest—and from the heavy burden of \$151,820,000 per annum; while the annual taxation, under the Internal Revenue system, which the necessities of the War and the Debt thereby created rendered necessary for at lenst a short series of years, has been reduced to \$12,750,000 per annum; while the annual taxation, under the Internal Revenue system, which the necessities of the War and the Debt thereby created rendered necessary for at lenst a short series of years, has been reduced from \$31,000,000 in 1853-66 to about \$15,1600,000 per year in 180-71, estimating for the Public Debt of which the Act of July, 180, so as to give only \$15,000,000 for the year, or about two-fifts the marking of the Public Debt o

NOTICES BY THE PRESS.

All the vegetables that thrive in the open air in onr latitude are described, together with the best methods for growing them. The author also imparts practical instructions on the subjects of drainage, and the formation and management of hot-beds. Numerous well-exccuted wood cuts tend to make clearer the instructions of the author.—Philadelphia Inquirer.

The author of this treatise is one of the best known and most successful of those gardeners who supply New York with green vegetables; and as he writes from long and dear-bought experience, the positive, dogmatic tone he often assumes is by no means nubecoming. The book itself is intended to be a guide for beginners embarking in the author's business, and gives full and explicit directions about all the operations connected with marketgardening, lists of varieties of the most profitable vege-tables, and much sound advice on kindred topics. Though designed for a special class, it cannot fail to be valuable to the amateur and private gardener, and unlucky experience has taught us that the information contained in a single chapter would have been worth to us the price of the book .- Daily Mercury (New Bedford).

It is unquestionably the most thorough and the best work of its kind we have yet had from the pen of an American author. It is written in a clear, concise style, and thus made more comprehensive than works which smack more of the office than the farm or garden.

[Daily Evening Times (Bangor, Mc.).

Mr. Henderson writes from knowledge, and is not one of those amateur cultivators whose potatoes cost them ten dollars a bushel, and whose eggs ought to be as valuable as those of that other member of their family the goose of golden-egg-laying memory-for they are all but priceless. No; he is a practical man, and he has the art of imparting the knowledge he possesses in a very agreeable manner; and he has brought together an extraordinary amount of useful matter in a small volume, which those who would "garden for profit" ought to study carefully.—Evening Traveller (Boston).

There are marvels of transformation and rapid reproduction recorded therein, which might well shame the dull fancy of the author of Aladdin or of Kaloolah, There is no theory about it; a man who has made him-self rich by market-gardening plainly tells our young men bow they can get rich as easily as he did, and without wandering to California or Montana for it either.

[Horace Greeley in the N. Y. Tribune.

We have devoted more space to this little work than we usually do to tomes much more pretentions. We have done so because of the rare merits of the book in its fund of information, useful to the farmer and marketgardener, and because of the dearth of that kind of knowledge. We earnestly advise that fraternity, for whom this work was written, to buy it and study it. any among them have never yet read a book, let this be their primer, and we will vouch for the excellence and endurance of the priming. The work is profusely illustrated with wood cuts.—Louisville Daily Journal.

Sent post-paid, Price, \$1.50.

THE AMERICAN

# AGRICULTURAL ANNUAL HORTICULTURAL ANNUAL

FOR 1871.

A YEAR-BOOK

#### WANTED BY RVERYBODY.

This valuable Year-Book has now reached its fifth number. In its general features it follows the plan of the four numbers that have preceded it.

It contains hesides the review of the year, a record of Inventions affecting Agriculture; Progress in Dairy Matters, by Gandner B. Weeks: Progress in Agricultural Education; Veterinary Matters, by Dr. John Busteed; Leguminous Forage-Plants; Mutton-Sheep in America; Progress in Fish Culture, by WILLIAM CLIFT; The Pneumatic Sewage System, by Dr. F. Coan; Poultry Raised for Flesh; Agricultural Books for the Year; Farmers' Directory, giving names of manufacturers of agricultural implements, dealers in seeds, stock, etc.

#### Beautifully Illustrated.

SENT POST-PAID. PRICE, FANCY PAPER COVERS, 50 CENTS; CLOTH, 75 CENTS.

—:o:—

Either of these Annuals for the four preceding years may be had at the same prices.

ORANGE JUDD AND COMPANY.

### 245 BROADWAY, NEW YORK.

### To Help Every Man to be his own Cattle-Doctor. A work by Geo. H. Dadd, M. D., Veterinary Practitioner; giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable information on Farm and Dairy Management. 12mo, 359 pp.

Dadd's American Cattle-Doctor. . \$1.50.

#### Hop Culture......40

PRACTICAL DETAILS fally given, from the Selection and Preparation of the Soll, Settino and Cultivation of the Plants, to Pickino, Dryino, Pressing and Marketing the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by Prof. George Thurber, Editor of the American Agriculturist. Svo , paper.

#### Flaz Culture..... 50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. Svo, paper.

Either of the above books sent post-paid on receipt of

ORANGE JUDD & CO., 245 Broadway, New York.

THE AMERICAN

FOR 1871.

A YEAR-BOOK

### FOR EVERY HOME.

The fifth number of this beautiful serial is now ready. It presents reports upon the various departments of horticulture. Dr. J. A. WANDER writes upon Apples; P. BARRY gives an account of New Pears; CHARLES Downing and F. R. Elliott treat of New Peaches; A. S. FULLER gives a full account of Small Fruits; C. L. ALLEN has an article on New Bulbs: Peter Henderson tells of the New Bedding and Other Plants. Besides these, there are valuable treatises, among which are those on Orange Culture in Florida, by SAMUEL B. PARSONS: Raising Nursery-Trees from Seed, by Thomas Meenan; Dwarf Evergreens, by Josian Hoopes; various tables, summaries, and other useful matter by the Editor, including a list of the principal seedsmen, nurserymen, and florists in the United States.

#### Itlustrated with Elegant Engravings.

SENT POST-PAID. PRICE FANCY PAPER COVERS 50 CENTS; CLOTH, 75 CENTS.

> ORANGE JUDD AND COMPANY, 245 BROADWAY, NEW YORK.

#### Tobacco Culture: Full Practical Details.25

This is by far the most useful and valuable work ever issued on this subject. It contains full details of every process from the Selection and Preparation of the Seed and Soil, to the Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by Fourteen Experienced To-bacco Grovers, residing in different parts of the coun-try. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 48 pp., in neat paper covers.

#### Boussingault's Rural Economy .... \$1.60

Rural Economy in its relations with Chemistry, Physics, and Meteorology; or Chemistry Applied to Agriculture in the Principles of Farm Management, the Preservation and Use of Manures, the Natrition and Food of Animals, and the General Economy of Agriculture. By J. B. Boussingault, Member of Institute of France, etc. Translated, with Introduction and Notes, by George Law, Agriculturist. Cloth, 12mo, 507 pp.

Either of the above books sent post-paid on receipt of

ORANGE JUDD AND COMPANY, 245 BROADWAY, NEW YORK.

### PURITY AND HEALTH.

### CARBOLIC SOAPS

AND

### Saponaceous Compounds

OF

# Carbolic and Cresylic Acids. Disinfectant, Insect Destroyer, Preventive of Fungus, etc.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable benefit to the community. By tests made under our own supervision, and the reports of careful observers, we believe it to be established that these Cresylic Compounds are

1st. Complete Disinfectants.—They not only remove all aoxions odors from sinks, privies, stables, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Fever, Cholera, and other diseases, may be effectually prevented. They are used in the New York and other Hospitals for these purposes.

2d. Insect Destroyers.—An animal washed with Carbolic Soap will be entirely freed from all vermin. It will destroy tieks on sheep, fleas on dogs, lice on eattle or poultry, roaches, ants, bed-bugs, etc., in rooms. It repels fles from animals, and thus is especially useful in case of wonads or sores from any cause.

3d. Preventive of Fungus Growth.—On this point we ask for further experiment. We feel confident this soap, properly applied, will prevent smut in wheat, mildew on vines, and similar parasitic growth, and trust that experimenters will furnish the result of their trials.

4th. Cleaning Sores, etc.—For washing pleers and other foul sores, and preventing gangrene in wounds, etc., Carbolie Soap is, we believe, unequaled. We know also that it has been successful wherever used, for footrot in sheep, and mange, itch, ring-worm, and other skin diseases.

Desiring that our readers should be benefited by the extended introduction of what we believe to be so valuable, we have established a general agency for the sale of these compounds, keeping them constantly on hand, and are prepared to fill orders at wholesale or retail, at the following prices.

Sheep Dip, for Curing Scab and Destroying Insects

| 5   | D   | Canisters  |  |
|-----|-----|------------|--|
| 10  | 16  | 2.25       |  |
| 50  | +4  | Kegs       |  |
| 200 | 3.6 | Bbis 95.00 |  |

Proportions are 1 D Dip to 5 gallons water for 5 to 10 Sheep, if they are very large and heavily fleeced. For ordinary sized animals, or those recently shorn, 1 D Dip will take 8 to 10 gallons water. The solution must be graded according to the age and condition of the animal.

Cresylic Ointment, for Chre of Footrot, etc. In solution for killing Insects, etc., on stock. In 1 th Canisters, at 50 cts.; in 3 th Canisters, \$1; in 5 th Canisters, \$1.25.

Carbolic Disinfecting Soap.—In tablets for convenient use in washing Horses, Dogs, Pigs, etc., destroying Insects of all kinds, protecting from Flies, curative of Sores, Scratches, and Chafes of all kinds. In boxes, 3 doz. tablets, \$3.60; in boxes of 1 \( \tilde{D} \) bars, 10 each, \$4.00.

Carbolic Plant Protector.—To be used as a wash for Plants, Trees, etc.; to destroy and prevent the harborlag of Iosects. In 1 th. Canisters, at 50 cts.; in 5 th. Canisters, at \$1.25; in 10 lb. Canisters, at \$1.25.

Granulated Carbotic Disinfecting Powder.— It removes noxious odors from Stables, Poultry-bouses, Cellars, Sewers, Water-closets, etc., and prevents, in a great degree, infection from contagious diseases. It is specially well adapted for household use, to purify the air and preserve health. In 1 D. boxes, 25 cts.; in 5 D. boxes, \$1; in 10 D. hoxes, \$1,50.

Carbolic Laundry Soap, for the Laundry, etc.; 60 b boxes, 14 cts. per b. 24 b boxes, and in 10 paper boxes containing 6 bs. each, packed in a case, 15 cts. per b.

Carbolic Tollet Soap, perfumed, two sizes, \$2 and \$4 per dozen, in hoxes of 3 dozen each.

Carbolic Bath Soap, \$1.50 per dozen. In boxes of 3 dozen each.

Address orders to

ORANGE JUDD & CO., 245 Broadway, New York.

# THE TRAPPER'S GUIDE;

### A Manual of Instructions

For capturing all kinds of fur-bearing animals, and curing their skins; with observations on the fur trade, hints on life in the woods, and narratives of trapping and hunting excursions.

By S. NEWHOUSE,

And other Trappers and Sportsmen.

### A BOOK FOR HUNTERS.

THE

## HUNTER AND TRAPPER

въ

#### HALSEY THRASHER,

AN EXPEDIENCED HUNTER.

#### ILLUSTRATED.

This little book will be read with interest by all who would find instruction and entertainment in the narrative of an old hunter's experience. The following, from the author's Preface, will give an idea of the character and design of the work:

"I am a blacksmith by trade, but when I was a boy I became fond of a gun and a trap, and my first success in my shop was to make a steel trap. It was my aim to become an expert trapper, and I tried my hand at catching foxes.

"Many a dollar have I paid to cunning old men to learn the art, and I have succeeded pretty well, too; but why has not some man of experience written a book explaining the art of successfully trapping the different kinds of fur animals? I propose to tell the boys how to do it.

"I have studied the nature and habits of animals of different species, and a plan that was good to capture the otter, the mink, and the heaver, forty years ago, is just as good now as then. The nature of animals doesn't change like the nature of men; we have grown wiser, while they have remained the same. The mode of capturing them when I was a boy, and the way used now, may be put together, and succeed better than either one alone.

"Men are traveling through the country selling recipes at n high price to teach how to dress skins. I propose in this work to teach all these things, so that a man may have them in a neat little volume for reference at any time. I shall also treat upon angling for the tront, the bass, and the pickerel, which I think I understand. I hope to make it all so plain that even the inexperienced will, in some measure, succeed,"

#### CONTENTS.

CHAPTER I.-Deer Hunting.

CHAPTER II.-How to Catch the Fox.

CHAPTER III.-How to Hunt and Catch the Beaver.

CHAPTER IV.—How to Catch the Otter,

CHAPTER V.-How to Catch the Mink.

CHAPTER VI .-- How to Hunt and Catch the Muskrat.

CHAPTER VII.—How to Catch the Marten,

CHAPTER VIII.-How to Catch the Fisher.

CHAPTER IX.—How to Catch the Raccoon.

CHAPTER X-How to Hunt and Trap the Bear.

CHAPTER XI.-How to Hunt and Trap the Wolf.

CHAPTER XII.-How to Trap the Pocket Gopher.

CHAPTER XIII.-Fishing for Tront, Pickerel, and Bass.

CHAPTER XIV.—How to Hunt the Honey Bee.

CHAPTER XIV.—How to Hant the Honey Bee.

CHAPTER XV .- Hints About Shot-Guns and Rifles.

CHAPTER XVI,—Traps.

CHAPTER XVII.—Dressing and Tanning Skins and Furs.

#### Floriculture: Practical

A GUIDE TO THE

Successful Propagation and Cultivation oF

#### FLORISTS' PLANTS.

PETER HENDERSON,

AUTHOR OF "GARDENING FOR PROFIT."

BERGEN CITY, N. J.

Mr. Henderson is known as the largest Commercial Florist in the country. In the present work he gives a full account of his modes of propagation and cultivation. It is adapted to the wants of the amateur, as well as the professional grower.

#### NOTICES BY FLORISTS AND OTHERS.

Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone. H. A. Dreen, Seedsman and Florist, Philadelphia, Pa.

Truly "practical," and ought to be in the hands of every one engaged in the culture of Flowers.

T. C. MAXWELL & Bnos., Geneva, N. Y.

It might be entitled "Floriculture Made Easy." I do not see why any one with ordinary common sense should not succeed, with this book in bis hands.
L. C. Lishy, Florist, Nashville, Tenu.

No work ever before published in this country was practically valuable to those in want of direct informa-tion (npon this subject). WM. SAUNDERS, Sup't Dep't of Agriculture, Washington, D. C.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.

GALVIN & GERAGUTY, Florists, Newport, R. I.

What is wonderful, the most of our Professional Florists here frankly admit their indebtedness to the work for information and suggestions. I am only an amateur in flowers, but feel gratefully indebted to its author for the pleasure its perusal has given.

George W. Sanders, Baltimore, Md.

Without exception the most practical work on Floriculture in the English language. All the prosy fossils of - &c., I consign to the lumber room. I shall order a dozen from the publishers to give to my friends.

JAMES FLEMINO, Nurserymau and Florist,

Toronto, Canada,

Complete in all its departments, a thoroughly commonsense book, valuable to all interested in Plants and Flowers. Geo. W. Campbell, Nurseryman, Delaware, O.

We have been asked hundreds of times by our customers for a work on flowers; now we get something creditable to recommend. Elliott Bros. & Bungess, Florists, Pittshurgh, Pa.

Apart from its great working value, the book is deglitful reading.

MISS ANNA WARNER,

"The Island," West Point, N. Y. lightful reading.

Thoroughly practical, yet readable as a novel. NEW YORK SUN.

A worthy contribution to every votary of Flora; style comprehensive, sharp and decisive, just what was to be expected from its well-known anthor.

F. K. PHENIX, Bloomington, 111.

Full to overflowing with valuable information. FRANCIS RICHARDSON, Toronto, Canada.

### LIGHTNING PEACH PARER.

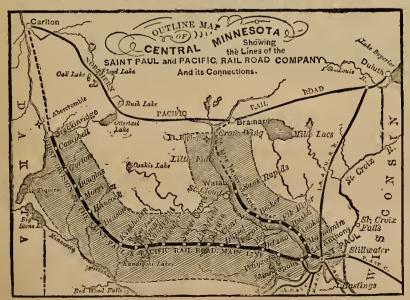

A continuous and urgent inquiry for a machine for Paring Peaches, has been ringing to our ears from all Peachgrowing sections, for the past five years, and in response to this universal appeal, the manufacturers of the Lightning and Turn-Table Apple Parers have at last succeeded in obtaining and securing a device for Holding and Paring Peaches, which is as practical and economical as the Apple Parer, and cannot fail to come into immediate and general use. They pare Apples also, as well as any Apple Parer.

They were exhibited in the Fall of 1869, at the New York, Ohio, Infiana, Illinois, Wisconsin, Minnesota, and ST. LOUIS FAIRS, and in every instance the judges were delighted with the rapidity and perfection of their work, and awarded them the highest Premium. A limited quantity of them has been made for distribution this year, in anticipation of the immense sale that must speedily follow. On receipt of \$1.50 we will send a sample machine by Express.

> SARGENT & CO., Sole Agents, 70 Beekman Street, New York.

P. S .- We are also Sole Agents for the Lightning and Turn-Table Apple Parers.

# A BEAUTIFUL GIFT.

# A PICTURE FOR THE HOME CIRCLE.

# con a repair to a second

### BY MRS, LILLY M. SPENCER.

Entered according to Act of Congress, in 1869, by Orange Judo & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New York

The Publishers of the American Agriculturist have purchased of the artist this beautiful painting, and now issue it as a Chromo, believing that it will be gladly secured by thousands as an ornament and source of pleasure in their homes. Mrs. Lilly M. Spencer has already won an honorable name in art. Though of a poetic imagination, and the

author of many paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. Her works of this class have been reproduced in colored lithographs and other forms, and through these her name has become a familiar one throughout the country. Finding that pictures of a domestic character with something of the humorons in them were more popular than those to which her natural tastes

inclined her, Mrs. S. for some years painted such subjects almost exclusively. Her "Shake Hands," "Jolly Washerwoman," "The Gossips," and others, are known to all lovers of pictures. They are full of life and meaning, and at the same time finished with an accuracy and detail that few artists attempt. Among her latest productions are "War Times at Home," "The Home of the Red. White and Blue," "The Starry Flag," etc.

This Chromo is done in the best style, by Hermann Bencke, whose work equals anything of the kind done in this country. The scene is full of happy life and cannot fail to delight both old and young. The above wood engraving is a miniature representation of it. The picture would prove an ornament in any home, and be a most beautiful and acceptable present to make to a friend. It is 13×18 inches in size, and, mounted on linen, will be sent by mail, in a tube, with all materials and directions for stretching.

### PRICE, POST-PAID, \$6.00.

If preferred, the picture will be sent by express, mounted on artists' board, all ready for framing, on receipt of the price, \$6.00, the purchaser to pay express charges. If ordered in a frame, it will be sent by express, carefully boxed, on receipt of prices, as follows:

| In a | neat  | Black-walnut | Frame, | gilt band       | - | - | - | - | - | \$ 9.00. |
|------|-------|--------------|--------|-----------------|---|---|---|---|---|----------|
| 66   | 66    | 66           | "      | wider gilt band |   | - | - | - | - | 10.00.   |
| 66   | carve | ed edged "   | 66     | "               | - | - | - | - | - | 11.00.   |
| 66   | beaut | iful gilt    | "      | best quality    | - | - | • | - | - | 15.60.   |

If taken with a frame at the store, 245 Broadway, the charge for boxing, which is 75 cents, will be deducted from these prices. In all cases where sent by express, the purchaser will pay express charges.

A LIBERAL DISCOUNT TO THE TRADE.

# HARRIS ON THE PIG.

Breeding, Rearing, Management,

Improvement.

With Numerous Illustrations.

By JOSEPH HARRIS.

CF MORETON FARM, ROCHESTER, N. Y.

NOTICES BY THE PRESS.

say that this work on the pig is by Joseph Harris, genial philosopher-farmer of Rochester, N. Y., who tes the "Walks and Talks upon the Farm" in the Aricalturist, is to insure for his book at once a large circle of delighted readers. He is just the man to lay down the gospel for the raising of pigs or any other domestic animal. If all breeders and farmers would follow Mr. Harris's directions, pork would be a very different article of food from what it is now, and could be eaten without any fears of the trichina.

[Springfield Republican.

The author discusses the pig-for he takes exception to the word hog as applied to the domesticated animalwith a view of showing how the most pork and lard can be produced from the smallest amount of feed. He gives claborate descriptions of the different breeds of swine, showing the peculiarities of each, and the relative advantages to the producer .- [Prairie Farmer (Chicago).

The pig is doubtless one of the most valuable animals that a farmer can raise, and it is the laudable purpose of Mr. Harris to tell farmers how to treat their pigs so as to get the most profit from them, and what kind of pigs are best.—[Daily Evening Traveller (Boston).

It treats of breeding, rearing, managing, and improving swine; and what Mr. Harris don't know on these topics, is hardly worth knowing at all. The book is fully illustrated, and is very valuable to all who are interested in this branch of stock-raising.

[Lowell (Mass.) Daily Courier.

The author is a practical farmer, and has gathered the results of many experiments besides his own. The book is amply illustrated.

[Republican Statesman (Concord, N. H.).

Almost everything a farmer wants to know about the breeding, keeping, and fattening of pigs, is here put down in plain, common sense, and is mainly the result of the writer's own management.-[Maine Farmer.

This is an interesting, valuable, and a much-needed Treatise on an important department of rural economy. It contains about 56 illustrations of pigs, piggeries, troughs, etc. We are heartly glad our old friend Harris was persuaded to prepare this useful Manual on the Pigbreeds, breeding, feeding, etc., comprising what farmers need know respecting this department of husbandry.

[Boston Cultivator.

This little book is profusely illustrated, and contains information in abundance, which every farmer ought to possess.—[Weekly Mail (St. Lonis).

Here is a book written by a practical farmer, who has brought to the aid of his own large experience and ohservation the most extensive acquaintance with the science of breeding, and, as might reasonably be expected, we have from his pen the best book on the Pig ever written .- [ Western Stock Journal.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Cows Leaking their Milk.—C. E. Rogers, Orleans Co., Vt., wants a remedy for cows leaking milk. Milk such cows three times a day. On page 203, vol. 28, American Agriculturist, the following preventive was given, viz., apply collodion (gan cotton dissolved in ethery to the end of the teat, covering the orifice. This will form a thin skin over the end of the teat which must be picked off before milking. It will also tend, by its contraction, to press the teat together, and close the aperture whence the milk escapes. If there are cracks or sore spots on the teats, wash them clean with water before applying the collodion; it is a very healing application, though slightly painful at first.

### Calendar for August.

 ### AMERICAN AGRICULTURIST.

NEW YORK, AUGUST, 1871.

We have had an unusually hurrying time on the farm the past month. The hay crop was late, and the wheat crop early. We have also had heavy and frequent rains, which, though much needed, and of great value to pastures, corn, potatoes, oats, and roots, have not only retarded the hay-making operations, but caused a great growth of weeds in the corn and potato fields, and rendered necessary an extra amount of hocing and cultivating. Seldom has work been more pressing, and he is a fortunate farmer who has been able to secure his hay and grain in good condition, and at the same time keep his growing crops clean.

To those who have been able to do this, August is a month of comparative leisure. Or, rather, it is a month of freedom from pressing work. We have time to breathe. We can stop to think. But the battle is not over. A farmer's work is never done. Next year the same things must be done again, and now is the time to prepare for them. If we have had good crops, this should encourage us to renewed exertions; if we have had poor ones, it should spur us up to more vigorous efforts to remove the cause. As a rule, we know what the cause is. And many of us know also how to remove it. What we need is promptness, energy, and forethought. The weak point in the management of not a few farmers, is the neglect of little things. Tools, implements, and machines are out of order. Gates eag, the hinges are off, the lower board is broken, and the fastening is gone. Fences are out of repair. Boards and shingles are loose upon the barn. The apple-trees are full of suckers. fence corners are a mass of weeds, rubbish, stones, and brush. Every year the owner of such a farm has made up his mind to improve, but he does not know when and where to commence. We can tell him: There can not be a better time than the month of August, 1871, and the first thing to do is to reform himself. Agriculture is, or ought to be, a grand educator. It should teach promptness, order, system, energy, self-reliance, patience, a sense of responsibility, faith in Providence, and a joyous hopefulness. As a rule, a farmer has no one to blame but himself. He may complain of the weather, but it is no worse for him than for others, no worse this year than it was in years past, or will be in years to come. He may complain of "want of time," but he will soon learn that he has all the time there is. No one robs him of it. It is a good thing for a man to feel his responsibility. We all want to blame some one other than ourselves.

It is no use quarreling with circumstances, or the "constitution of things." We must meet our difficulties like men; and patience, perseverance, and intelligent industry will enable us to triumph over them.

### Hints about Work.

Thatching Hay Stacks .- We are no advocates of the English system of stacking and thatching hay. It is far better and cheaper to put it in a barn. But where this can not be done, the stacks should be thatched with more or less care, according to circumstances and the value of the hay. With a carefully made roof much may be done to enable it to shed the rain by raking the hay downward on the roof, so as to make it lie smooth and straight. It is better to do this during or immediately after a rain. It is better, however, to regularly thatch the stack, directions for which were given in the Agriculturist for October, 1870, page 374. Long grass, very useful for thatching hay stacks, may frequently be cut on low land. It should be put on while green, and laid straight, and carefully raked. If straw is used, the great point is to have it thoroughly wet, so that it can be made to lie straight on the roof of the stack. If thatching is considered too much trouble, at any rate do not neglect to tie some poles together with hay-bands, and place them astraddle the roof to prevent the wind from tearing up the hav.

Thrashing Grain .-- A farmer had better hire an extra man than to work at any steady job connected with thrashing. He can save more by seeing that every thing is done properly, than by doing, as is frequently the case, the hardest part of the labor himself. A thrashing machine is a "regular horse killer." The thrashers are inclined to save their own horses at the expense of those of the farmer. The ontside horse has to walk much faster than the inside one, and should have a correspondingly longer part of the evener. Bore a hole in the evener of the inside horse, for the clevis, from two to three inches nearer the center than that of the outside horse. See that the track is firm, even, and free from stones. If possible, let it be on level land, as a free horse is inclined to pull harder when going up hill. When stopping for lunch, let the horses have some water, and if a pint of meal is stirred up in a pail of water for each horse, it will enable them to do extra work without feeling it. The granary, of course, will be put in order before the thrashers arrive. If there is a cellar underneath the granary or the thrashing floor, it is better to be on the safe side and put an extra prop or two underneath to support the floor. Fodder will be scarce the coming winter, and all the straw and chaff should be carefully saved. It is a common mistake to make the straw stack too wide, and not high enough. This gives too flat a roof, and much of the straw is damaged by the rain. Better make the bottom of the stack too small than too large. The great point in stacking straw is to keep the middle full and tread it down solid. For the first ten or twelve feet the better plan is to put a horse or an ox on the stack, and drive him about to tread down the straw. With a horse that is used to it, there is no trouble in getting him off the stack, especially if a part of one side is made a little slanting, and a few forkfuls of straw are placed at the bottom for him to alight on. When the middle is kept full and well trodden, the outsides will settle more than the middle, and thus make a better roof. The hole where the man stands to take the straw from the earrier, should, after the stack is completed, be carefully filled with a few bundles of straw, so placed and held in by thatch-pegs that they will keep out water.

Weeds in Corn and Potatoes must be destroyed. Better knock down a few hills of corn in cultivating, than suffer the land to be covered with weeds. A shallow-running cultivator with broad shares will not injure the corn by cutting off the roots. Go through the corn after the cultivator and pull or hoe all the weeds from the hills of corn. It is hardly safe to use a cultivator on potatoes so late in the season. Pull the weeds out by hand.

Weeds in Pustures and Fence Corners should not on any account be suffered to go to seed. Let them be moved at once.

Stubble Land, especially after barley, is often full of weeds; a mowing machine may be used with advantage to cut them. Also, in pastures where thistles and other weeds or rough grass and rushes are abundant, a mowing machine affords an easy method of checking or destroying them.

Mich Coves are apt to fall off rapidly in their milk this month, and that dairyman is fortunate, or, more correctly speaking, prudent and enterprising, who has a good supply of corn fodder. There is little profit in keeping cows, unless they have all the food they can eat and digest. The trouble with corn fodder is that it is too bulky. The cows are capable of digesting more of it than their stomachs will hold. They need, if the grass is of poor quality, a little corn-meal in addition to the fodder.

Horses suffer greatly from flies this month, and should be provided with nets or light cotton covers. Washing them with water containing a little crude carbolic acid is a temporary relief.

Sheep frequently suffer greatly this month for want of water. If there is no water in their pasture lot, let them be put at night in a lot where there is water, or else be driven to water night and morning; allow them plenty of time to drink. If the weather is wet, and the grass long and succulent, it is a good plan to mow a portion of it occasionally. The sheep will eat and thrive on the dried grass. It is a true saying that "sheep like roast meat better than boiled." Lambs, if not done already, should now be weaned. Let them have the best of pasture after weaning, and place the ewes on poor pasture until dry. Examine the bags for a few days, and, if necessary, draw out the milk. When dry, and if early lambs are desired next spring, the ewes, towards the latter end of the month, should begin to have abundance of good food. Strong, healthy lambs can only be expected from ewes in good condition. Sheep intended to be fattened next winter, should now be purchased and placed in good pasture. In the case of Merinoes, select strong, thrifty wethers, three or four years old. There is no money to be made in fattening poor sheep in winter. Most of the fat must be put on between now and November.

Swine.—Low prices are causing farmers to neglect their pigs. It is poor policy. If kept at all, they should be kept well. Our own plan is to feed the pigs at night, but not in the morning. They are then hungry enough to search for their food, to run on the stubbles, to pick up wormy fruit in the orchard, and to eat weeds and grass. At night they have a feed of soaked corn, and go to sleep contentedly with a full stomach. They should have constant access to fresh water, and an external application will be gratefully received.

Winter Wheat .- Where wheat is sown after barley or oats, the land should be plowed as early after harvest as possible. If this can not be done at once, harrow the land, to break down the stubble and destroy weeds, and cause the seeds to germinate. The rubbish will act as a mulch and keep the ground moist, and it will plow easier than if left unprotected to bake in the scorehing sun. The fallows must not be neglected. Get every thing ready, but do not be in too great a hurry to sow. If the land is in good condition, from the 5th to the 25th of September is the best time in our latitude. To prevent smut, the old-fashioned plan of moistening the seed with fermented chamber-lye, and then drying it with quicklime, is safe, and, if thoroughly done, e& fective. The liquid from the stables, if fermented so as to develop the ammonia, is equally good. The main point is to turn over the heap until every seed and every part of each seed is moistened with the liquid, and the same is true in regard to the lime. A simpler and entirely effective plan is to dissolve,

for each bushel of seed wheat, 3 ounces of blue vitriol in one quart of water. When cool, sprinkle it over the wheat, and turn carefully until every seed is completely moistened. Old wheat will require three pints of water to each bushel. No lime is required to dry the wheat, and, in fact, would probably do more harm than good, as it would decompose the vitriol. The seed wheat, after being treated with the vitriol, may be kept for days or weeks without injury, which is not the case in the old plan above described. Wheat is sometimes treated with brine to prevent smul, but we have always thought it rather risky.

Renewing old Pastures, by harrowing them and sowing timothy, can be done any time this month, or the beginning of the next.

Manure may be drawn out and spread on the pastures or meadows, or on grass or clover land intended for corn next spring. Many farmers are afraid that the hot sun will evaporate all the ammonia. It would do so if there was any free ammonia in the manure, but such is rarely the case. Spread the manure at once, and be careful to break up all the lumps. Thomas' smoothing harrow is a capital implement for this purpose.

Root Crops must be hoed and thinued out. Most people are inclined to leave the plants too thick. White turnips may be sown any time during the month, and even ruta-bagas sometimes afford a fair erop on good land, sown early this month.

### Work in the Horticultural Departments.

At this season there is, as usual, a great deal of work to be done in the garden and orehard, but the labor of planting is very light compared to that of two months since; all that now needs to be done is to keep the horse and cultivator busy, stirring the soil as often as possible. Many things can be done now to good advantage about a place, such as cutting brush and weeds along fencerows and making it look as neat as possible.

#### Orchard and Nursery.

The newly-set trees ought not to be neglected during the hot, dry weather of August, when a little timely attention and care would save many which would otherwise perish at this trying season. A heavy mulch applied now will save a great deal of time in hoeing, besides keeping the ground moist.

Marketing.—In marketing early apples and pears, care must be used in packing, to prevent the fruit from becoming brnised during transportation. All fruit should be picked by hand, after it is fully developed, but before it softens. Establish a good name for fair dealing, and have each package of uniform quality throughout. In picking take care not to break or injure the limbs.

Insects.—Pick up all unripe fruit which falls to the ground and feed to the pigs, or allow the pigs to run in the orchard, where they can devour the fruit as fast as it falls. Remove all late caterpillars' nests as soon as they make their appearance.

Budding should be done whenever the bark is loose enough to run easily, and well-ripexed buds can be had.

Borers.—If borers are found, probe with a wire. Seeds and Seedlings.—Young seedlings require shade from the scorching sun; this may be given by using laths, as already mentioned, or evergreen branches. Collect tree seeds as soon as ripe, and either sow now or preserve in sand until spring.

Weeds must be kept ont of nursery rows, either by the use of the horse or by hand. Where old trees have been neglected, and the ground near the body of the tree is occupied by weeds and snekers, a heavy breaking-up hoe can be used.

#### Kitchen Garden.

During this month most of the vegetables will be fit for the table, and a well-stocked garden will furnish a family with a supply of healthy food during the summer, as well as a good part of the winter. The soil between the rows of plants must be kept light and free from weeds by the use of the cultivator, or with some hand implement.

Asparagus.—Never allow the bed to become filled with weeds, but keep the soil between the rows hoed often. This is a good time to apply a dressing of manure, in order to give the plants a good start in the spring. If new beds are wanted, gather a supply of seeds.

Beans.—Plant Refugee or other early sorts for late use and for salting. If Limas are inclined to run higher than the poles, pinch them. Never hoe beans until the dew has dried up, as it will cause the vines to rust.

Beets.—Where the plants are too thick, thin out and use as greens. Keep the rows free from weeds, and in dry weather apply liquid manure.

Cabbages and Cauliflowers.—Plants, if set out now, will produce a crop in most localities. Where exterpillars are troublesome, destroy by hand-picking or by the use of salt or other application

Carrots.—Keep heed and thinned, and if young earrots are preferred, sow for a late supply.

Celery plants for the late erop may now be set in well-enriched ground.

Corn will need constant care in hocing and weeding; where seed is to be saved, select the earliest and best cars.

Cucumbers.—Cultivate the soil around the hills until the vines cover the ground. Gather for pickling as soon as they reach a suitable size.

Ejg-Rants.—Draw the earth around the stem, and give thorough cultivation. A little straw placed around each plant will preserve the fruit from becoming soiled by touching the ground.

Endive.—Tie up the leaves of the early-planted crop when dry, to blanch them for use. Set out plants a foot apart for a late crop.

Herbs should be cut on a dry day, just as they commence to flower, tied up in small bundles, and dried in a shady place.

Lettuce.—It is of no use to sow lettuce now, unless one has a shady place, for it soon runs to seed.

Melons.—All fruit not likely to perfect itself ought to be ent off; this makes the remainder much finer. When the fruit approaches maturity, it will be benefited by turning occasionally, and by having a little straw placed under it.

Onions.—Harvest as soon as the majority of the tops fall over, and after being thoroughly dried store them in a cool, dry place. Store onion sets in an airy loft, with their tops on, taking care not to have them so thick that they will decay.

Peas.—Late-sown peas are liable to mildew, and produce a very searty erop; if desired, some of the earlier varieties may be sown now.

Potatoes.—The early crop may be dug and sold, or if used in the family, dig only as wanted. The tops may be buried in the rows, or else placed on the compost heap.

Radishes.—The best winter sort is the Chinese Rose-colored; sow late this month or early next; if sown earlier, it will become overgrown.

Seeds should be gathered from the earliest and best specimens as fast as they mature, if one is anxious to improve his stock. The best way, in small gardens, is to buy most seeds from reliable seedsmen, as they cost less than home-grown ones.

Squashes,—Examine the vines to find and destroy all the injurious insects which infest them.

Sweet Potatoes.-Vines must not be allowed to root, and the soil kept clear of weeds, and light.

Tomatoes.—Destroy the large green worm which eats the foliage. Pinch the rampant shoots, and keep tied to some sort of trellis; or allow the vines to rest upon brush placed around the plant.

Turnips.—Ground from which early crops have been taken may be sown with turnips. Thin ruta-bagas, and keep the rows free from weeds.

### Fruit Garden.

The main work here is the eare of the fruit as it ripens; remove all superfluons growth, and keep the soil free from weeds. Where there is more

fruit than can be used, it should be preserved by eanning, bottling, or drying. Directions have often been given in the Household Department.

Blackberries.—Do not allow the new canes to grow over four or five feet high, and pinch the laterals when a foot or eighteen inches long. Fruit for home use should be thoroughly ripe before it is picked, while that for the market must be gathered before it becomes soft enough to bruise in handling.

Dwarf Trees.—Thin out all poor fruit, and if the crop is too large, remove a part of it. Control the shape of the tree by pinching.

Grapes.—If mildew appear, give a thorough dusting of sulphur. Keep the vines tied to stakes or trellises, and do not allow them to become entangled with each other. Cut off all bunches which are affected with rot.

Rasphernes.—Remove all of the old fruiting canes, and keep the new growth tied to stakes, to prevent its being blown down; three or four strong canes are enough for one plant to carry. The soil between the rows must be kept loose and clean.

Strawberries.—New beds, if set out with young plants, will produce moderately next spring. Old beds should be cleared of weeds, and thoroughly enriched with a good dressing of manure.

Weeds will grow in the fruit garden as well as elsewhere, if not kept down by constant cultivation. A thick mulch between the rows will save much time and trouble in cultivation.

#### Flower-Garden and Lawn.

The severe heat of this month often prevents the growth of plants, and it is not until the late rains have watered them that they produce their finest effect. Weeds will, however, grow, and they will require constant attention.

Box ought to be clipped this month, to preserve the edging in good shape.

Bulbs.—If any spring flowering bulbs are still in the ground, take them up.

Climbers.—The annual climbers ought to have strong supports, to prevent the wind from blowing them down. Keep the woody climbers tied up, and cut off all superfluous branches.

Dahlias ought to be fied to strong stakes, which should be firmly set in the ground. Remove all imperfect buds and flowers.

Grass.—Lawns and edgings need constant care to preserve their good appearance. They ought to be mowed once a week at least, and, if possible, twice. Where a lawn has been recently seeded down and weeds are abundant, many of the larger ones can be removed by the use of a spud; this is a thinedged chisel, about two inches wide, having a socket for a handle, which may be of any convenient length; the root of the weed can be cut off below the surface without disturbing the grass.

Gladiolus,—Tie flower-stalks to stakes to prevent breaking by the wind, for if once bent it is very hard to bring them into an erect position.

Hedges .- Give their summer elipping this month.

Potted Plants.—Do not neglect them at this season, but keep supplied with water.

Perennials.—Seeds of these, as well as of biennials, are better if sown now, as they will generally produce plants large enough to flower next season.

### Greenhouse and Window Plants.

The thorough renovation of the greenhouse should be finished before, the pressure of fall work comes. See that all insects are destroyed by a thorough washing, and afterwards paint or whitewash the inside woodwork. If the heating apparatus is out of order, repair before cold weather. See that there is a good stock of potting material on hand for winter use, and also provide boxes and pots for the large plants which have been planted out during the summer.

Worn-out Stock.—There is no profit in feeding old stock. When cows and sheep are past their prime, they can not be made to pay for feeding. There-

fore we would not advise sheep to be kept over five years, or cows over eight or nine. Occasionally a ewe or a cow will be profitable to keep for breeding purposes for three or four years after these ages, but no expectation of fattening them profitably need he entertained; and it is a question whether the gain io one way is not lost altogether in the other. After the system begins to run down, the teeth become worn, and food is no longer perfectly digested. Waste occurs, and though it is true the manure pile is enriched when aged stock is kept, the advantage does not compensate for the waste. During the latter part of summer, selections should be made for feeding for market next spring. No time should be lost then in preparing those of full age, intended for this purpose, as much care and attention must be given them and early feeding he commenced, or they can not be successfully brought into condition for market.

#### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending July 17, 1871, and for the corresponding month last year.

Gold has been up to 113% and down to 112 since our last, closing, July 15, at 112%.....Breadstuffs have been offered with more freedom, and have been generally

quoted lower, with a fairly active business reported in the leading kinds, for home use, shipment, and, to a limited extent, on speculative account. The arrivals of Wheat have been quite generally in poor order, while those of Corn have been well up, on the average, to the standard of merchantable. Several lots of new-crop Wheat, chiefly Southern and Sonth-western amber, have been received and marketed within the month at equal to full current rates. The quality, in most instannees, was superior to that of the earlier offeriogs of new-crop last year.....Provisions have been depressed and lower, yet not active. At the close, more steadiness was apparent......Cotton has been less freely dealt in, at variable prices, though closing with a fair show of firmness, on a less liberal offering of stock...... Wool has been in good demand, at advancing prices......Tobacco, Hops, Hay, and Naval Stores are in request.

Beef Cattle.—With an average increase of 1,300 bullocks per week, during the past month, the markets have ruled dull and decidedly against the drover. There has been a steady decline from beginning to end, amounting to about to per to, the closing rates being 3½c, below what they were one year ago. Texans begin to come forward somewhat freely—much faster than they can be sold. Operators in this kind of stock are likely to have a hard time of it. When people are starved to it, they take to the dry Texan beef, but in a glut of good stock, as at present, when fair Illinois cattle can be bought at 10½c.@11c., these wild breeds go begging at 8c.@8½c. They are frequently sold at about what they cost in Illinois. Altogether, the trade is very discouraging for Western shippers and Eastern speculators. Low freights alone save them from heavy losses, but do not always keep them from going behind.

Below we give the range of prices, average price, and figures at which large lots were sold:

Crops in Virginia. — Gilbert Child, Stannton, Va., sends us specimens of wheat, rye, and timothy, grown in his neighborhood, where he says the best yield of wheat is 44 bushels per acre, though some claim to have made much more than that. Average yield of the county, 10 bushels. Land is worth sixty deliars per acre; labor is plentiful at one dollar per day and board in barvest, and eight to twelve dollars per month by the year. The specimens sent would indicate what we should call a fair crop, and would equal the average of a good crop in New York State. We rarely see a crop that will yield over 25 bushels of wheat, or 30 of rye, though we often hear of them. The writer never succeeded in

getting more than 25 bushels of wheat or rye, as the average of a crop, fairly measured; but out of such a crop much better specimens could be picked, than those sent.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:-Cheeks on New-York Banks or Bankers are best for large sums ; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Special Notice.—Communications giving or asking for information are always acceptable, should always he accompanied by the name of the writer. The name will not be published whenever there is indicated a desire that it be withheld. Writers may choose any signature they please, but we kinst be furnished with the real name. We are under no obligation to return rejected mannscripts. Where stamps are sent for their return, we, as a matter of courtesy, try to send them back. Writers should retain copies of articles which they consider valuable, as, with the best intentions in the world, we may not be able to return them if called for after the lapse of considerable time.

New York Agricultural Editorial Excursion " is announced as having started for the Mammoth Cave, Kansas, Colorado, and the Parks of the Rocky Mountains. Upon looking over the list of excursionists which start out under this flaming banner we do not find the name of a single editor of an agricultural paper. There are several male and fe-male attaches of agricultural and daily papers who have thus boldly pushed off upon the railroad, and are ready to brave its dangers. For fear that these lambs (and-we don't know the feminine for lambs) should lose themselves in the agricultural intricacies of the Mammoth Cave, or get astray among the attractions of Denver, we have induced Tim Bunker to go with the party. thing transpires worth knowing that the sharp eye of the 'Squire does not see, we shall-for the first timebe mistaken in our man.

Odd Fellows will be specially interested in an announcement in the business columns. The publishing business association has been thoroughly reorganized on an efficient basis, and the Magazine will doubtless have a splendid success.

Wheat and Chess.-O. Gillette, Saybrook, O., sends us some newspaper accounts which shake his belief on the question of the degeneracy of wheat into chess. One of these statements is by Lewis Austin, of Austinburg, O., who some thirty years ago "a perfect head of wheat out of which grew a perfect head of chess, each of which was well filled with its respective kind of grain." This is what we have been trying to get a sight of these many years, and have offered a reward for it. People have written us that they had such heads, and we have sent immediate requests to be allowed to see the specimens, but never have been able to inspect one. It is a matter upon which we shall accept the testimony of no one else, as the sources of error are so many that one not used to examining plants may be readily (and honestly) deceived. Until we can see and examine a specimen showing distinctly wheat and chess growing from the same root, or a grain intermediate in character between the two, we shall insist that the fre-

quent claim that wheat degenerates into chess is not proven. Send on your specimens.

Farmers' Clubs.—A young farmer asks how to organize a farmers' club. These associations generally result from the action of some one go-ahead individual, who invites a few of his neighbors to a social meeting, where they converse without formality on the subjects most interesting to them, compare notes generally, and make arrangements for continuance. the ice is broken and an interest in the thing is felt, there do not seem to be any difficulties in the way of getting along. The main point is to choose a chairman whose principal duty will be to prevent two men speaking at one time, and in other ways to see that the meetings are conducted in order.

Poppy Culture .- O. B. McCurdy, Muskingum Co., O. We gave considerable space to this matter last year, and in April, May, and June, 1870, you will find full directions. As your questions show that you have not looked into the matter at all, we refer you to those articles. It is too late to begin this year.

Building a Greenhouse.—The article on pages 301 and 302, upon building a cheap greenhouse, is, by one of those accidents that will sometimes occur in a printing-office, rather abruptly terminated. As we have in hand for September an article upon heating such a house, we can then give the description of the internal arrangement, which is now unfortunately omitted.

Criticisms .- "M. E. W.," Bowling Green, Ohio, is informed that letters which the writer does not consider of sufficient importance for him to attach his name to them, are not of sufficient importance to require a reply.

A Stock-Growers' Association. Somebody at Cheyenne (whose name is entirely illegible) sends us a very plainly-written letter asking where he can obtain information as to the preparation of the constitution and articles of association for a "Territorial Stock-Growers' Association." We have no definite information on the subject, but, doubtless, many of our readers may have, and if our correspondent will be good enough to send us his address, we will try to put him in communication with the officers of some organization.

Corn should not be allowed to stand until a frost has injured it. As soon as the ears are glazed it may be cut un. Much corn is ready to cut by the middle of August which Is left from day to day, until at last a frost occurs, and the value of the fodder is deteriorated, possibly one fourth. The great value of corn fodder is hecoming recognized, and more care is exercised in harvesting it than heretofore. Cutting it at the right time is one of the first requisites in preserving it, and if this is neglected, no after-care can repair the damage.

Wash Grom Roads,-"I. A. V.," Kanawha, Va., asks if the wash from roads should be allowed to run into the fields .-- By all means. Keep the ditches open, and turn all the road wash into your fields in such a manner as to have it spread over as much ground as possible. It contains much fertilizing matter.

Breaking in Young Steers. -"Subscriber," Carbon Cliff, Ill., asks how to break a pair of young steers to the yoke. First train them to lead by a rope attached to the horns. Then procure a light yoke and bows, and teach them to stand with them on for a few days until they get used to them. Then take them ont and exercise them gently, and with great patience, teaching them the meaning of the terms used in going to the right or left and backing. If they get restive, quiet them with a little salt and some coaxing. Never unyoke them while they are excited; cool them down first. Let the lessons gradually increase in length until they understand their business; then attach a chain, and soon after a small log or other weight may be given them to draw. Working in this manner, they may soon be broken in to do light harrowing or other work not too heavy for them. It would be well if oxen were broken in to the use of a line, attached to the horn, and the shouting commonly made use of were abandoned.

To Prevent Cows Holding up their Milk. J. A. Wilson, of Eric Co., N. Y., says the best remedy he has found for preventing cows holding up their milk, is to "take a log-chain, double it, then lay it gently over the cow's back—on the 'small of the back' so that the ends of the chain will clear the floor. The cow loses the power of holding up her milk, and after a few trials will forget the habit."—That cows do hold up their milk, every one who has had uny experience knows to his sorrow. But still it is, to say the least,

doubtful whether cows have the power of holding up or letting down the milk voluntarily. It is more likely that the muscles refuse to relax, from nervous excitement, rather than from a mere act of the will. And if so, any thing that will soothe the cow, such as kind words, or a mess of palatable food, would be the proper remedy.

Hide-Bound Calf.-Jas, Wilson, Fond du Lac, Wis., has some calves that are hide-bound, and wants a remedy. There is no better remedy than oilmeal, which will act as a gentle laxative on the howels and remove the causes of the disease.

Horse that will not Lead. - Wm. Johnson, Benton, Tenn., asks how to make a horse lead. If the horse drags on the halter, or stops and pulls back, take him by the head close to the jaws, and stand back against the shoulder. If he objects to go then, touch him behind with a light switch. With patience you will persuade him to start, and with a little practice he will keep up with his leader.

SUNDRY HUMBUGS. - To many of our readers, the following will not be new, as multitudes have received this or a similar document. To others, it will be a curiosity, as it is a fair sample of a great variety of letters used by the "Queer" swindlers:

will be a curiosity, as it is a lair sample of a great variety of letters used by the "Queer" swindlers:

New York, June 9th, 1371.

Dean Stri:—Your favor rec'd. I have concluded to take you into my confidence, and I here beg of you for God's sake not to hetray me. I have at last got hold of the right thing, and all wanks a fortune in 6 nonths. And guarantee we can each make a fortune in 6 nonths. And guarantee we can each make a fortune in 6 nonths. And guarantee we can each make a fortune in 6 nonths. And guarantee we can each make a fortune in 6 nonths. I wan it is not to the many plates for different having, and all wants. I was employed by the Government on the Treasmy Notes. My last work was the overnment of the Treasmy Notes. My last work was the Government of the plates of the late of late of the late of late of the late of late o NEW YORK, June 9th, 1871.

C. EMERSON.
This time, as a blind, be sore to address

\*\*\* Miss Belle Vernon, 1210 Broadway, and I will certainly get the letter.
P. S.—Send money by express, if possible.

By sending out a great number of such letters, now and then one of them reaches a person green enough and dis-honest enough to respond. If money is sent, of course it is never heard from. If a C. O. D. box is sent, the recipient finds, after paying the bill, and going to a secret place to open the parcel, that he has only old paper, saw-dust, etc. If he calls, he is taken to a private room, stripped of all his money, usually by the aid of a bogus policeman, or he is shown a box of real money, and given another bogus one. In any case, he dare not complain, as he has bimself tried to deal in counterfeits. ilar letters to the above are signed Wm. Webb, alias D. A. Mason, 1210 Broadway. Letters like these are sent to those who answer the following advertisement, which we are sorry to see in newspapers that claim to be respectable and reliable:

### A MILLION DOLLARS.

Shrewd but quiet men can make a fortune by revealing the secret of the business to no oue.

Address

C. EMERSON,
ma 20 4w
1210 Broadway, New York.

Conrad Long, hailing from the same place (and doubtless the same operator), sends neatly printed gilt certificates stating that so and so have drawn "solid gold watches, valued at \$200," in a Spanish Policy, which will be forwarded on receipt of the usual 5 per cent—but said Long is just leaving for Spain, and the money must be sent by mail to Mr. Edward Miller, his appointed agent for the United States. What surprises us most is that many people

have faith enough in this humbug to ask us to receive the prizes and forward them, for which trouble they will pay as a commission. The "Spanish policy," advertised at many places, is a pure swindle.....We have always supposed that the good people of St. Lawrence Co., N. Y., were too intelligent to harbor a "gift enterprise" like that approunded by "O. J. Stickles, Manager," Cauton, N. Y. If he does all and just as he promises, the scheme is not a whit more nor less than a lottery, and will be let alone severely by all respectable people. We have a lot of tickets, sent us by generous subscribers, which, according to the promises made, ought to draw lots of farms, sewing machines, casters, center-tables, etc., etc. We haven't room to store so many things, Mr. Stickles!.... 100,000 people are invited to invest \$10 each in a "Grand Gift Concert," at Lonisville, Ky. If so many wrong-headed people can be found, 16 are to have prizes of \$1,000 and upward; 243 of \$200 to \$900; 446 of \$100, and 99,279 contributors are to get nothing at all, except the assurance that if any thing is left "after paying the expenses of the enterprise, and making the distribution of the gifts," "the balance will be appropriated to the es-tablishment of a Free Library in Louisville." Had not these 99,279 persons, in which class the reader will most likely be found, better keep their money, and let the 721, among whom the reader will most likely not be found, pnt up the \$1,000,000 required to give them a chance to draw \$550,000? This affair-a pure lottery-is an outcrop of the San Francisco enterprise, managed by the same party, who, of course, finds it to pay him....E. F. Rogers, 131 Nassau St., alias II. J. Worth, 4 Broadway, quondam 31 Park Row, is sending letters all over the country, offering to each person addressed, a ticket in the Roya! Havana Lottery, which draws every Saturday, that will surely draw \$1,000 for each \$1 said persons invest-which letters show the said so-called Rogers, alias Worth, to be a swindler, intending to pocket all money received, or a fool to sell thousands of people the certainty of getting \$1,000 for \$1, instead of taking these chances himself, or a liar to pretending to know what tickets will surely draw prizes. Our generous friend Young, editor of the Saratoga Sentinel, claims to be too poor to raise the dollar or two, and kindly offers to go halves with us in the prize offered, if we will advance the said dollar or two, and receive the \$1,000 or \$2,000. Thanks, friend Y., but we are too poor also, to spare \$1, even, for such Can't you divide the cost with us, and an investment. send along a 50c. stamp? Please bring it down, and when we get the prize we'll go out on a bender and order one ice-cream and two spoons, regardless of expense. A Michigan swindler, with more names and hailing places than we can print, sends out circulars and advertisements with great promises of wages, profits, etc., to those who will send him from \$1 to \$10, for rights, recipes, etc., including "Safety Oil," etc. He, of course, pockets the money, and if any victim takes the trouble to follow him, he has changed his name and place. We have frequently exposed him, his humbur oil, etc. W. D. Miller & Co., Philadelphia, pretends to offer 100,000 gold watches, etc., worth \$100 each and less, for \$1.25 each, which is all bosh. He will give you nothing for \$1.25 which does not pay him a round profit at that price. If there were not many foolish people, he could not pay bis printer ..... We are in continual receipt of the circulars and flaming sheets of perambulating Doctors, of immense pretensions, who advertise a place of business at some central point, usually at the West, and announce visits at specified places on particular days. Some of them give hundreds of names as references, and reports of scores of cases of remarkable cures. These are too numerous to describe in actail. We say positively, that one and all of these Doctors are ontrageous quacks. names given are usually fictitious; those of well-known persons are used without permission, and the few certificates that are gennine, when any are, are from weak, nervous people who have been cared of some imaginary disease by their faith in the pretentions claims of the quacks. Any man advertising to cure "Cancers," is a er. See our remarks on this subject last month, We are asked our opinion of California Wine Bitp. 240. We are asked our opinion of California Wine Bitters, Vinegar Iridin, and a hundred other nostrums. Ans.: If you have a mean, sheep-killing dog, which you are too tender-hearted to get rid of by cutting his tail off close behind his ears, make believs he is sick, and dose him with any one of these advertised medicines. Keep the bottles, boxes, or packages in a safe place where no human being can, by any possible mistake, swallow any of the stuff. N. B.—This includes each and every advertised medicine, lotion, bitters, soothing sirup, nerve autidote, electrical sure-cure, etc., etc., etc., etc., etc., etc., etc., etc., etc.-no matter how flucly put ap in glass or gilt parcels. You have our opinion, founded on much study and observation, and we have looked into medical science as much as half the doctors, and all the quacks in the country..... There is no photographic apparatas for \$1, or for \$5, that will take pictures worth a penny. West Virginians, and many other people elsewhere, will

do well to heed this and save their money. The name of the sellers of such things is legion..... The "Arabian Secret" seller, recently exposed in these columns, has gone over to New Jersey, and taken a new name and P. O The "New York Cash Prize Company" is still catching greenhorns, but will not take in many editors, unless eash goes with orders for advertisements "direct," and then only those who sell space to all paying comers. ... Here comes another "Academy of Music," in Charleston, S. C., to be given some one of the 150,000 people, who are asked to contribute \$5 each to the "South Carolina Land and Emigration Association." One person in seventy is offered a prize of from ten dollars to an Academy of Music. Every good singer, who wants such a building, and knows he will draw it, better walk up and put down five dollars. Of course, 147,596 other persons, who don't want any prize, and can't get any, will help him hay the building by giving \$5 each.....If not satisfied with the above, and you know how to keep a hotel, there is a "Caroline County Land Association," in Wilmington, Del., offering you the Leprerre Hutel in Denton, Md., "worth" \$25, 000, that only asks you to give \$2, to have one chance in fifty thousand to draw said hotel....Or, for \$2, Omaha, Neb., offers you one chance in nineteen thousand, to get a cash prize of \$20,000, all for the benefit of a public library!.....Or, for the same money, you can have one chance in fifly thousand, at a Frnit Farm, in Iowa City, "valued at \$30,000.".....Or, for \$3, you can have one chance in two hundred and thirty-four thousand at the Pattison Market, Elmira, N. Y., valued at \$100,000!.....Or, for \$5, you can have one chance in a million, more or less, to become the proprietor of the "New Memphis Theater."....Or, for \$5, you can have a similar chance in a "Monument to the Confederate Dead of Georgia," in nine hundred acres of land in Lincoln County, Ga., and in a prize of \$10,000 U. S. greenbacks. Query: Will the deceased, or their friends, like this commingling of Federate and Confederate affairs? If you don't like any of the above "Splendid Chances," our Humbug Drawer can supply any quantity of others, in any one of which you will be a trifle more likely to draw a prize than you will be to be buried in the moon, with a greencheese monument a mile high. But chance is a great thing; so hand over the money. The operators will be profiled, i-f y-o-n a-r-e n-o-t.....A late swindle, becoming quite common, is that of writing to a distant man (or woman), and telling him (or her) that some relative or person of the same name has recently died, leaving considerable property, and that the operator has strong reason to believe that the person addressed is cutilted to quite a slice of the estate, and that \$5, or \$10, or \$20 will pay the said operator, who claims to be an "Attorney at Law," for looking up the matter. Several thousands of such letters are being scattered over the country. They catch a good many dollars. These swindlers are located all over the country, and only address persons living at a distance. This is a shrewd dodge, and many quite sensible people are caught by it.

Scolymns.—"T. B. H.," Hillsboro, N. C., sowed some Scolymus this spring, and it is now running to seed. He asks if the root will be good after the seed has formed.—With us it does not flower the first seasen. We should think that, like parsnip and carrot, the root would be worthless after it had produced seed. Still, as in its native country the Scolymus is perennial, it may, after seeding, form a supply of new roots. This is a matter in which we have had no experience, and we hope T. B. H. will tell us what the result is in his case.

Cutting Cious.—"A. J. W.," Port Gibson, Miss. One great object in cutting cions in early winter, is to be able to graft at any convenient season. If the cions be dormant, we can extend the season of grafting over several weeks, but if we delay cutting them until the time for grafting arrives, the business must be hurried up. If vegetation has started in the cion, the check it receives in removal from the tree is likely to prove fatal to it. Cions may be ent at any time during the period in which the plant is perfectly at rest. The growth of the previous season should be taken. The question "How dry should the cions be?" we suppose refers to the keeping of them. The object should be to preserve the natural moisture; they must not be allowed to shrivel, nor should they be wet and water-soaked.

Hard-Milking Cow.—Y. C. Smith, Carbondale, Pa., asks bow a hard-milking cow can be made to milk easy. If the difficulty is natural to the cow and there is no stricture in the orifice of the teat resulting from disease, we do not think there is any remedy. We should feed the cow for the butcher. If the trouble has been caused by garget or inflammation of the udder that has resulted in stricture, or partial closing of the milk passage, it may be removed by entting. The operation,

however, is a delicate one, and we would rather not perform it unless the cow is a valuable one.

Four Eambs at a Birth.—William Woodzell, of Bath Co., Va., writes that he has two sheep that had four lambs each this spring. The year before they had three each. Seven of this spring's lambs are still alive and doing well. We have known frequent instances of common long-wooled sheep having four lambs at a birth. But it is not a habit that it is desirable to perpetuate in breeding ewes. We like good, strong ewes to have twins, but not triplets or quartets.

Relative Nutritive Value of Skimmed Milk and Corn-Meal.—"A. S." We can not answer this question any more than we can tell can many pretend to do), how much bread is as nutritions as a pound of beef. One thing we do know, skimmed milk and corn-meal together are better for bogs than either alone. If you can get 10 cents per gallon for the skimmed milk on the farm, it will pay better to sell it than to feed it to logs.

A Neglected Orchard. - "Lowery," Jasper Co., Tenn., has an orchard of some twelve acres, which, having been used as a camping ground by both armies during the war, and neglected since, is in a bad condition. He rightly concludes that the orchard needs both manuring and pruning, and asks advice. Pruning may be done at almost any time, except in early spring, when vegetation is vigorous, and in winter, when the limbs are frozen. The wounds should be covered with melted grafting wax. The amount of pruning will depend upon the condition of each individual tree. move limbs that cross and crowd each other, and leave the top open to light and air. Manure may be applied in antumn and winter: good, well-rotted stable mannre is best. Lime and ashes applied before the mannre, and forked in around the trees, will be found useful. If the ground has run up to briers and coarse weeds, a flock of sheep will do good service in reducing them, and their droppings will help fertilize the soil. not be kept in the orchard during winter, as in the absence of green food they may gnaw the bark of the trees.

Fleas.—"H. E. C." says his "whole neighborhood" (but doesn't mention where) is infested with fleas. Pennyroyal and Tansy have been recommended. We should try Persian Insect Powder. Will any one help H. E. C. ?

Strawberry Questions.—A subscriber (Athens, Tenu.) asks: 1. What strawberries are known to succeed best on red clay, in the South? 2. In strawberry culture, fruit is the main object. It is well understood that different substances, taken as food, go to form the bones, flesh, and muscles of animal bodies. Is this true of plants? Do certain kinds of food produce vines and leaves, while other kinds produce fruit? 3. What kinds of manure are found, from experience, best calculated to produce fruit? 4. Is it well authenticated that potash, at the rate of a pound to a barrel of water, applied twice a week, will cause plants to throw out large quantities of runners and produce a luxuriant growth of vines? And that ammonia-sulphate or carbonate-at the same rate, and applied in the same way, will produce large quantities of fruit, but cause the fruit to ripen late? 5. Cau these substances be purchased at such a price as that their use on a small scale will be profitable? 6. The new plants of some varieties seem disinclined to take What treatment will be likely to help the matter? —Answer.—1. The Wilson succeeds almost everywhere. Upon a clay soil we should try Jucanda and Triomphe de Gand and Napoleon 1H. 2. Practically, the parallel between plants and animals does not hold. can not have fruit without an abundance of healthy foliage. 3. Well-rotted stable manure, especially that from cattle, is best. 4. Potash is excellent for the strawberry. A vigorous plant will produce an abundance of runners. Ammoniacal manures are also useful. 5. Potash is most readily obtained in the form of ashes, and Pernyian readily obtained in the form of amnonia. 6. Probably the surface is too dry. Put on a mulch. If our friend will use plenty of good manure, he need not trouble himself about fertilizing, for fruit especially.

Tomato Wine.—"J. C. B.," Rulpsville, Pa. We do not know how to make "a good wine" ont of tomatoes, and do not believe that it can be done. We have seen a miserable, sweet, alcoholic liquid made from tomatoes, and we thought it an insult to a respectable vegetable to put it to such a use.

Scab in Sheep.—H. S. Burris, Clinton, Mo. When this disease affects a flock, the closest attention is required, or it will spread; flies will "blow" the affected parts, maggots will breed, and the sheep perish

most miserably. To cure and prevent, use common mercuvial ointment mixed with four times its bulk of lard, rub it on the skin in a line from the poil to the tail, and on lines four inches apart on the sides of the animal. A mixture of lard, sulphur, and carbolic acid, in the proportions of one bundred parts of lard, twenty-five of sulphur, and one of pure acid, roay be rubbed on the sores, and the flies will be kept off. Common creosote may be used in place of the acid, doubling the quantity.

Glycerine.—"M. L.," Jersey Shore. We do not know "how" glycerine can be used in 'sealiog canned fruits." Can any body tell her?

Plaster. — W. P. Tate, Clearfield, Pa, wants to know how to use plaster. Plaster for corn should not be used in the hill; it should be scattered over the corn when a foot high, a handful to three or four hills; it acts best in moist weather, and when the leaves are damp with dew or rain. It is now thought best to plaster clover early in the spring, and again when it covers the ground, using fifty lbs. per acre each time.

Alfalfa.—J. R. R. Moore, Worcester Co., Md., asks about alfalfa or Chili clover, and where the seed can be procured. It is Lucern, and nothing more. It wing been cultivated for ages by the Spaniards as a forage plant, it was doubtless introduced by them into their American colonies, north and south. The seed can be procured at any seed store for about fifty cents per pound. Twenty pounds broadcast, or nine pounds in drills, nine inches apart, is the quantity per acre.

Nottoway Co., Vu., asks how much ashes (unleached) would be equal to a bushel of lime. This is like asking how much cheese a pound of butter is equal to. A bushel of ashes contains, in eighty pounds of weight, from thirty to sixty pounds of lime, but it is not in the condition in which it is used in agriculture, viz., quicklime; and the things are therefore not comparable. Ashes are valuable for the potask and phosphoric acid they contain; lime for its solvent action on all vegetable and many mineral substances. The commercial value of ashes is double that of lime under ordinary circumstances.

Docking Lambs.—Isaac S. Batchtel, Stark Co., Ohio, docks his lambs as follows: He takes them between his legs with the rump hefore him, holds the tail between the thumb and two fingers, pressing up the skin as much as possible; then, with a stout pair of shears, cuts off the tail about two inches from the root. He continues the pressure until the blood "clots," when the bleeding will stop. We would suggest the application of blue vitriol (sulphate of copper), powdered, which not only canterizes the wound, but keeps off the flies. The additional pain is only momentary. The earlier docking is performed, the better.

Harvesting Peanuts. — J. H. Yarnall. Peanuts are usually harvested immediately after the first frost, but where it is desirable to get the crop to market early, they are sometimes pulled earlier. The later the crop can grow, the greater the yield of nuts, while on the other hand, the vines are more valuable as forage if pulled and cured before they are touched by frost.

Oxford, Pa., Fair.—"T. F. W." We do not publish articles of the kind you sent unless the name of the writer is attached. It would seem to be as easy to write a full name as to append initials.

Currant Worms.—W. G. Barton, Salem, Mass., writes that he finds air-slaked lime a "sure cure" for the worms that attack the foliage of the currant and gooseberry....C. A. Morse, Leominster, Mass., uses with equal success a solution of one onnee of copperas (sulphate of iron) in a gallon of water. By "surface application" in the article referred to, the surface of the soil was intended.

A Lactometer.—A. M. Walker, Randolph, Wis., made use of the tubular portion of the chimney of a German student's lamp, and closed one end by filling the cover of a tin box with wetted plaster of Paris, and setting the tube in it. He attached a strip of paper graduated to 100 parts, as a scale, and had a serviceable milk tester. The hint may be of use to those who live far away from druggists and glass-dealers.

How Long will Seeds Keep?—"R. G. L." asks to what age do certain seeds arrive "before they become valueless?"—Much depends upon how they are kept. The practical point, and probably what our correspondent wishes to know, is the age to which they may be kept and still be sown with the probability of their germinating. Various tables of this kind have

been published, the English and French anthors differing widely. Of those mentioned by our correspondent, onion and parsnip are only safe for one year; carrot and sage for two years; cabbage and turnip for four years; beet, squash, and cucumber, from five to ten years.

Green Sand Marl.—Chas. L. Smith, Rahway. Marl may be applied to grass lands with henefit in quantities of from one to five tons, or even more, per acre. One too or thereabouts is generally applied annually for three or four years in saccession, when its effects become less apparent, a dressing of lime is found to restore the fertility. It is hest to baul the marl during winter and deposit it in heaps, and let it be exposed to the atmosphere until spring, when it is spread. We lately saw a field that had been dressed with one ton of marl per acre three years ago; the good effects were abundantly visible in a heavy growth of clover, while on undressed lacd, adjoining, the clover was decidedly poor. A shovelfai put into the hill in planting potatoes is found to be very beneficial.

**Pollen.**—"J. P. S.," Springfield, Mo. The package of yellow dust sent is the pollen from the flowers of some pine; showers of this pollen often fall, and to the ignorant and superstitions they are the cause of much fear, many imagining that it is sulpbur, and that it is the forerunner of some terrible calamity.

Fortl in the Foot.—A Subscriber, Clifford, Pa., wants a cure for foul in the feet of cows. This disease is most often caused by uncleanliness. In successe, cleanliness will produce a cure, assisted by an astringent lotion or ointment. Wash perfectly clean with carbolic soap and water, and especially between the claws of the hoof. Apply an ointment of lard four parts, sulphate of iron and sulphur, finely ground, one part each; smear the raw or suppurating parts with it, and keep the cows in a clean, dry stable. If the cows are out of bealth, give half a pound of Glanber salts and one ounce of sulphur afterwards, daily for a week. The sulphur may be administered with some salt.

Lime on Oat Stubble.—I. G. Barger, Clearfield Co., Pa., would like to know how to apply lime to oat stubble which is to be plowed for wheat, and the proper quantity. Lime must be kept near the surface, therefore it must not be plowed in. When the last plowing is finished, spread the lime on the plowed ground and harrow it in. Fifty bushels per acre is the usual quantity. It must be properly slaked, so that it is in a fine state of division, or its full value will not be secured. To slake it, put it in small heaps in the field where it is to be used, and two showers of rain will do the husiness.

To Kill Milk-Weed. — W. G. Mathes, Okaman, Minn., asks how to destroy milk-weed. This is a difficult weed to kill in some places, in others it does not seem to be troublesome. The main trouble lies in the roots, which are long and penetrate deeply. It can not be eradicated without labor and patience. If it is in large patches, we would mow it often through the summer, and plow the ground in the fall, carefully picking up the pieces of root brought up by the plow or harrow. If in small patches, we would dig out the roots with the spade. If prevented from seeding it will not spread, but if the seeds are allowed to ripen, they will scatter widely.

How to get Land into Grass.—
"B. D. C.," Baltimore Co., Md., has five acres of land which he wants to seed to grass, part for a lawn, and the remainder for feed and hay for a borse and cow. The land should be plowed and harrowed fine, with plenty of manure well incorporated; the part reserved for a lawn should be leveled, made smooth, and sown with a mixture of grass seeds—for instance, one bushel of red-top, four quarts of blue-grass, with a little white clover, say two or three pounds per acre. For mowing land nothing is better than six quarts of timothy and a peck of clover. If the land is inclined to be wet, replace three quarts of the timothy with a peck of red-top.

Thrashing Buckwheat.—Harvesting buckwheat is subject to so many accidents, and must necessarily be done at so short a notice, that it is value ble to know any plan by which it may be readily and quickly performed. Where it must be thrashed by hand, a floor may be prepared in the field by scraping and sweeping a piece of ground, or laying down sheets. Lay over this a bed of rails an inch or two apart, raised from the ground sufficiently to make room for the grain when it is thrashed. On these rails throw the straw as it is brought from the stocks, and thrash out the grain, which falls through the openings between the rails. The straw can thus be removed and separated from the grain very quickly. When all is thrashed, immore the rails, and the grain may be cleaned on the ground it desired, without mov

ing it to the barn. It is absolutely necessary to clean buckwheat as soon as thrashed, or the chaff, being damp, will beat and spoil the grain in a few hours.

Carrots and Onions on Sandy Land.—George Cassels, Saratoga Co., N. Y., has four acres of poor, sandy loam, but he has plenty of green manure. He asks how to manage so as to put enions and carrots in next year. The green manner must be rotted, by piling and turning several times, intil it is reduced to a fine state. Early in spring the land should be plowed deeply, the manure spread as abundantly as possible—25 two-horse loads per acre would not overdo it—and the land cross-plowed and harrowed. Another plowing would be a benefit, when the ground may be harrowed, the seed sowed, and a rolling given, which will compact the soil and seeme germination.

Corn-Husking Machine.—J. T. Robertson, McLaughlin's Store, Pa., asks if there has been a machine invected that will lusk corn and do it right.—A husking machine is advertised in the *Agriculturist* of this month, which we have seen in operation; if under the test of actual work in the field it acts as well as we have seen it in the manufacturer's hands, we should say it is a valuable machine.

Thomas' Smoothing Harrow.—I.

A. Rogers asks what we know of Thomas' smoothing harrow, and how it will harrow corn.—It is doubtless a valuable implement for finishing the surface of land laid down to grass—when free from stone. It does not work well on stony land. We have successfully used it to harrow wheat in the spring, but our corn was badly injured by it. Others have used it satisfactorily.

Farm Gates.—A. C. Drury, Copper Creek, Ill., asks if there is a patent on the common sliding-gate. There is a patent on the rollers on which it works. The form of gate and the sliding movement having been in common use for many years back, we should say, without knowing positively, would not be patentable. It would be safer, however, to be certain of this before using it, by writing to the Patent Office, Washington.

Feeding Fodder Corn.-Chas. Strange, Grass Valley, Pa., asks how fodder corn should be fed, whether green or wilted. He says his grandfather, when he wanted to dry up a cow, used to put her in a lot and feed her all the green stalks she would cat, and did not milk ber; in a few days she would be dry. If this is correct, it shows that we nowadays have improved on old-fashioned modes, for we feed green corn fodder and get more milk. There is a difference in opinion among dairy men as to the relative value of wilted and fresh fodder, but so far as the experience of the writer goes in feeding, and in our conversations with dairy men, we have learned that it is best to feed it when wilted by some hours' exposure to the snn. What is cut in the morning is fed at night, and the morning's feed is cat in the evening. The cows cat it with more relish, probably for the reason that fermentation of the jnices has occarred to some extent.

Raising Little Pigs by Hand.—
"W. H. B.," Fremont, O., writes: "I wish to inquire of you, or some of the many readers of the American Agriculturist, how to raise little pigs taken from the sow, when only a few hours old. I have a fine sow that has bad luck raising her pigs, and I have tried to do it for ker by feeding the pigs cow's milk, from one to two tablespoonfuls every hour, using for one lot the milk of a fresh cow; for another lot that of a cow not fresh. But I failed in both cases." We should be glad to bear from our readers. Except in the case of valuable thoroughbreds, it will not pay to raise pigs by hand.

Green Fly on the Quince,—"H. B. H." Use strong tobacco water, either by syringing er beading down the shoots and dipping them.

Butter Making.—Mrs. N. J. Fisk, of Minnesota, sends the following short statement of her process of butter making: "I first rinse the pans with cold water, then pour boiling water in them and let them seald about five minutes, then pour out the water and turn up the pans to dry. Let the milk staad 24 hours, and then skim and set the cream in a cool place. Churn every other day, and keep the churn sweet and clean. Nover let sour milk stand in a wooden churn. Rose the butter well, salt it, and stand it away until the next day; then work it well, until no more brine can be got from it. Work fast, and you need not be afraid of its being oily." The directions are good for such short ones, but we would add: Alvays use your brins. Good butter can not be made in a variable climate by any fixed rule. Sometimes.

milk should stand only 12 hours, and sometimes it will take 36 hours for the cream all to rise. If the salt is well worked in, four or five hours is as good as all night for the collection of the brine. In working the hutter over the second time, you may be fast or slow, according to the temperature. In cool weather speed is of no advantage. "Wiping" or "sopping" the butter with a damp cloth is a good way to get the moisture out. Never let sour milk stand (unnecessarily) in any dairy vessel, and never let any thing stand in a wooden charm—except sunshine and fresh air.

Sandy Uplands in N.W. Indiana .-Can they be farmed profitably? asks E. Y. T., Richmond, Indiana. - We have no doubt of it. Within sixty miles of Chicago, on direct railroad, the proprietors of such lands, who live by hunting and fishing, do it from choice, not from necessity. Such lands will, when cleared, grow excellent clover, and that is the key to all other crops. Around Chicago there is a great amount of such land, and occasionally one sees a good farm with flourishing snrroundings in the midst of it. The adage, "There is will apply more in the man than there is in the land," here with force. If that land, unpromising as it now looks to the traveler passing through it, is managed well, its favorable locality will help it amazingly. Sweet potatoes, round potatoes, rye, clover, corn, and the dairy should be specialties. And we do not doubt that lime could be procured there cheap enough to give a dressing once in five years. Such lands in other localities flourish abundantly, but not without proper management and

Putty and Paint .- However much these two articles may be used to hide deficiencies and cover up faults by dishonest tradesmen, in the farmer's hands they may be made to do excellent service. Possibly the wagon, plows, and harrows that have been in active emplayment during the sammer, have had their seams or cracks opened by the sun's heat. Now is the time to stop those cracks or seams with putty and a touch of paint, before the fall rains soak in and commence to rot the wood. Repeated swelling and shrinking do serious injury to all wooden implements, and now, while they are well shrunk, is the time to look after them and prevent the swelling which will occur if damp or wet is allowed to penetrate. Forks, shovels, axes, and all tools with wooden handles, should be rubbed with linseed oil while dry .. They will have their elasticity preserved, and their durability and appearance improved thereby.

Care of Marness .- During the busy season harness is often neglected, and for want of cleaning becomes coated with dust, which causes it to dry and become cracked. It is then on the road to min. it, it should be taken apart, every buckle should be nnloosed, and it should be thoroughly cleansed with warm water and soap. If a thorough sponging does not free it from the glutinous coating derived from former greasings with improper materials, a weak lye of wood-ashes, or a solution of borax or soda, may be used, until the old grease is all removed. Then wipe the surface, and while the harness is still damp, coat it with sweet-oil until no more is absorbed. The oil will displace the water, thoroughly penetrating the substance of the leather. thus be kept pliable. Harness should not be oiled when it is dusty or unclean; always wash it previously, as above directed. For fine harness an excellent dressing is made with 8 oz. beeswax melted, into which is stirred 2 oz. ivory black, 1 oz. Prassian blue, ground in oil, 1 oz. oil of turpentine, and 14 oz. of copal varnish. This is made into balls. It should be applied with a stiff brush and the harness polished with a soft cloth. No hair or dirt will stick to this, and if expense is no object, working harness may be made to look well with a coat of it,

Garget and Bitter Cream .- "L. T. W.," Minu., has some cows which give stringy milk from one teat, which she calls dry garget. Also has occasionally a pan of milk in which the cream is bitter, and asks for remedies. Cows often suffer from inflamed udder when they come in, and if the calf-is not allowed to suck or it is not reduced by other means, it results in "caked bag," or garget. Tumors often occur in consequence, which remain for a considerable period, and from time to time discharge their contents with the milk in the shape of a thick, glutinous matter. The remedy is to cause the substance of the tamor to be absorbed by the use of iodine applied to the udder, assisted by friction. The common iodine ointment of the druggist may be used, rubbed in around the diseased teat with gentle pressure. In such cases the milk from that teat should not be used. The bitter cream may arise from weeds eaten by the cow. or an abnormal state of the liver resulting in an excess of bile; or, what is most probable, the pan may not have been perfectly cleaned from sour milk, and the milk and cream may have soured prematurely; without knowing more than the bare fact communicated, it is impossible to give either a definite cause or remedy.

Curing Corn Fodder .- Mr. A. Bayley, Derby, Vt., says: "We fally agree with Mr. Foster (Agriculturist for May) about the value of foddercorn, especially as a milk-producing feed, either in a green or dry state, notwithstanding Dr. George B. Loring pronounces it to be the 'meanest feed that can be given a cow.' We would, however, for winter use, cut and cure it before it has attained its full growth; when in blossom is probably the best time. Green-cut corn-fodder is as much superior to that which is ripe as early cut hay is to that which has matured its seed. Our practice has been to sow in drills, and of late years not more than ten or twelve kernels to the foot. I find from experience that cattle will eat fodder grown from this rate of seeding with better relish than the small and unnatural growth obtained from heavy seeding. I do not think that corn grown at the rate of thirty or forty plants to the foot contains so large amount of sweet and nutritions juices, in proportion to its weight, as that grown from thin seeding. The principal difficulty lies in the curing; a corn-stalk as green as I cut it is so limber it is next to impossible to make a stock stand that is small enough to cure well-it will tumble down when there does not seem to be the slightest occasion for it. Last year we tried several expedients, and at last hit upon a plan that worked with complete success: two crotched stakes were driven into the ground at a convenient distance apart; a pole was laid crosswise three feet from the ground; small bundles were placed on each side of this support, and bound together two and two, one on each side of the pole. There was some work in this, but it was the best of some half-dozen different arrangements. This was nicely cured, and made excellent winter feed, cattle eating it as readily as the best of hay. If we had let the corn stand until ripe we should not have had so much difficulty about making the stocks stand."

South Carolina Phosphate.—I. II. Satierthwait, of Aiken, S. C., writes: "You know of the extensive deposits of petrified bones of animals in the neighborhood of Charleston, S. C. These bones, when ground and made soluble, are excellent manure for our lands, but the price is so high when manipulated, that we farmers can not afford to buy it. Neither can we afford to farm these poor lands without manure. Consequently, we should know how to manipulate for ourselves, and I appeal to you for the desired information, hoping I am not asking too much. We can purchase the ground bone at the factory for from \$12 to \$15 per ton. When made soluble with an equal weight of sulphuric acid, they charge \$40 per ton. Can we not add the acid ourselves! and will it pay?"-We have no doubt you could buy the ground bone and the sulphuric acid and make the soluble manure on your farm somewhat more cheaply than you could buy it, but the saving would not, probably, be great as you imagine, though it would be worth while if the quantity needed were enough to cover the outlay for the necessary fixtures. The profit will depend on the cost of the materials and the labor required. If a ton of ground bone costs \$15, and a ton of acid costs (including the use of carboys, freight, and handling) \$50, the two tons would cost (for material) \$65, leaving a margin of \$7.50 per ton, to cover the cost of manipulation. What the material actually would cost. we do not know. It would be worth something to know you have the genuine article, but we do not hear that the manufacturers of South Carolina superphosphates are making undue profits by their business, and we would recommend farmers to figure carefully before they commence making their own superphosphate. be more true than our correspondent's remark that it will not pay to farm any poor lands without manure.

#### Plantation Cows.

We have received the following letter from an esteemed correspondent in South Carolina:

"I would like to get some information about stabling cows, which I do not find in the agricultural books within my reach, and would be glad of instruction on the following points:

ing points:

"1. When fastened with halter, how many feet of front is allowed each animal? 2. How much of a partition is there between the different cows? I can not recollect whether those I have seen fastened were secured with a collar around the neck, or whether the chain was around the horns. 3. In either case, how long should the halterchain be? 4. Are common trace-chains used, or chains made especially for the purpose? The halter-chain I believe works with a ring upon an iron rod, giving the cow's head more play up and down. 5. How high from the ground should this rod be? The most puzzling ques.

tion to my mind is how a common herd of plantation cattle are to be taught to walk up and be haltered of an afternoon. As the sole object in stabling them is to save the mannre under shelter, I should much prefer dispensing with the halters, if there was any way to prevent their hooking one another under a reasonable-sized shelter. Dairymen, I suppose, have constantly to train new cows to 'come up to the rack,' and possibly I may get a hint from their experience. I can't agree with your esteemed contributor, 'Walks and Talks,' about making manure in an uncovered lot, and want to improve on our common plan of penning cattle; but as mild as our winters are and common as the cattle are, more for the sake of the manure than of the cattle."

1. For cows of ordinary size, 3 feet is a sufficient width to allow to each. 2. It is quite as well to have no partitions at all, only the posts to which the animals are ened; these will separate them sufficiently. 3. In fastening to posts the chain has only length enough to go around the cow's ncck-loosely-carrying a large ring that plays up and down on the post. 4. The chains are made for the purpose. They are not expensive. 5. If an iron rod is used in the place of the post, it should come to within about a foot of the ground. As the cow stands up to the rack, in a natural position, the post (say 3 inches in diameter, and of strong wood) should be close to the left side of her neck—a little back of the head. Each post carries its chain by a large ring or clamp that plays easily up and down upon it. The chain has several rings at one end (to regulate the length) and a crossat the other. The tying is a very simple matter, especially if a nail be driven, a little ont of the cow's reach, on which to hang the ring end of the chain so that it can be reached without stooping.

Cattle will soon learn to come to their stalls for any

Cattle will soon learn to come to their stalls for any regular reward—either meal, bran, salt, or hay—and they should be fed at once on coming in. The only way to get on without tying would be to put the cattle in stanchious, which for the case in question would answer very well.

### Bee Notes for August.-By M. Quinby.

The moth will continue or increase its depredations, and the price of exemption, for weak colonies, is perpetual vigilance. Continue to place sweetened water and vinegar about the bives at night. Any diseased stocks that have been neglected, may be driven out now. What they do will be good for another year, if not avail-Where backwheat is abundant, strong colonies, in good seasons, will store a plenty of surplus, and boxes should be given them with reference to it. Boxes of clover-honey should be removed early this month, even if not quite fall, as a little of that from buckwheat on the ontside materially affects the price. Weak stocks will sometimes fill a box half full, more or less, and if honey fails somewhat, they will remove every particle of it to the combs below, while strong swarms may be gradually filling boxes. Watch such closely, and take off the boxes if necessary. As the honey in such hoxes is free from bee-bread, it is nice for the table even if unscaled, and the supply of honey being limited at this time, it might not be safe to risk putting the boxes on another hive for filling. Swarms which come this month are worth but little, and the bees are needed in the old stocks. Should any swarm now issue, and should there be a queenless colony in the apiary, divide the swarm, give half the bees with the queen to the queenless one, and return the rest to the hive whence they issued. needed in this way, take away the quoen and put the bees back in the old hive. They will not be likely to come out again so late in the season. Should a streak of white, powder-like substance he seen on the surface of the combs of box-honey that has been kent through the hot weather it is a sign that a web will soon appear, and that a worm is there, though he does not appear. Put the honey-hox in a close hox, and smoke with brimstone, but not so strong as to discolor the combs. In rearing Italians, where they are surrounded by natives, it is difficult to keep them pure, as the queen will sometimes meet the drone three miles away. To obviate this, it is well to keep drones as late as October, at which time natives are To do this, select now a colony of the best. Take away the queen, and eight days afterwards destroy all the queen cells. In such a case drones are not destroyed, unless destitute of stores. You may increase the number by introducing two or three drone-combs containing scaled brood. The same hive can be used to taining scaled brood. The same hive can he need to winter a colony if it has plenty of honey. The hees from some light colony may be introduced in November or December. Allow me to repeat here, that persons wishing to make the most of their bees must discard the box-hive, and educate themselves to use movable combs in some form. Study the subject. And I would strongly advise the use of the mel-ex-tractor. It is proved that two or three pounds of ex-tracted honey can be got where one can be obtained in a

box. Italians are disposed to fill their combs too full of honey in August, leaving too little room for brood. By using the mel-extractor room is given them, and consequently there will be plenty of young bees for winter.

### Wool-Bearing Animals.

At the International Exhibition now open in London, there is a collection of wool-bearing animals brought to-gether for the purpose of showing the origin of the material from which the fabrics exhibited are made. We give an engraving representing these animals upon the first page of this paper. With the exception of the Al-paeas, which helong to Lady Coutts, the animals are from the Gardens of the London Zoological Society. The animals placed highest in the picture are Monfilons, from the mountains of Greece, Corsica, etc. Those shown here are females, the males having much larger horns. The Moufflon is a very strong and agile animal, and is interesting as being, in the opinion of some naturalists, the original of our common sheep.

Next, below the Moufflons, is a fine specimen of the Cashmere goat, which furnishes the raw material for the most costly shawls. At the left of the Moufflons are two Merino Rams, which do not call for especial com-ment, and at the left of these again, a Huanaco, or Guanaco, as it is sometimes written, and lower down are the nearly related Llama and Alpacas. These three varieties or species of animals, aside from their furnishing wool, are interesting as having long been under a rudo domestication. When South America was discovered by the Spaniards, the Llamas and Alpacas were found in use by the natives as beasts of burden, and it is stated that in the time of the Incas, it was the custom to have large bunts and drive in the wild herds, when the animals were shorn, and the old and imperfect ones were killed, in order to improve the race. The Llama and Alpaca are not known in the wild state, and those who have investigated the matter consider the Llama the descendant of the Huanaco, and the Alpaca as resulting from the Vicugna, an exceedingly wild animal found in the elevated mountains of Bolivia and Chili. The animal in the lower left-hand corner is the Fat-tuiled sheep, which was fully described in June last, on page 213.

### Pasturing Meadows, or Young Clover.

Thr want of sufficient pasture, cattle and horses are o. :: turned into the mown meadows, or stubbles that have seen seeded with clover. This is, to say the least, injudicious. Generally dry weather occurs after harvest, during which the clover and grass have a struggle to maintain their existence, the young clover plants especially suffering from the heat and drouth. Possibly for some weeks the principal dependence of the meadows for moisture is the nightly dews. If the leaves are allowed to be eaten off, this mode of supply is arrested, by depriving the roots of the shade which they would have afforded. Only a weak growth can then be made, many plants will be totally destroyed, and when the fall rains occur, followed by nightly frosts, the unsheltered roots are thrown out by thousands. A promising piece of young clover may thus be completely ruined and the next year's supply of hay be seriously curtailed. The small quantity of feed thus gained is dearly purchased. The life of the meadows is consumed and their existence threatened. We are aware of the great temptation there is to turn stock on to the aftermath and stubbles, but, unless in the very rare cases where the soil is rich and the growth is too heavy to be eaten nearly bare, it would be a great saving of money in the end, to hire pasture, bay feed, or sell the surplus stock which can not otherwise be fed at home Ou many farms, had this course been adopted for one season, the resources for feeding in after years would have been doubled; but by carrying too much stock on the fields during the fall months, they were eaten off too closely to stand the winter, and were too seriously in-jured to fully recover. It is becoming more apparent each year, that more stock must be fed on Eastern farms, nay, on many Western farms too, or their fertility can not be maintained; but it is bad policy to keep too many at the commencement, before the means of feeding have become equal to the demand. It is something like a man living upon his capital, instead of upon the interest of it each year; in the one case, he becomes poorer by mere ill-judged use of his means, which, by proper husbanding, in the other case would keep him by its income, and itself remain intact.

It is a question worth consideration, whether it would not be wise to largely reduce pasturing stock; whether money could not be made by selling off in the spring the bulk of the stock usually pastured, and mowing, or otherwise using the land to produce feed for keeping stock during the winter, which should be purchased in the fall, by which means more manure would be made, the difference in the values of stock at these different

seasons saved, and all temptation to pasture mowing lands, or young grass or clover fields, removed.

### Tim Bunker on Paying Crops.

"Ye see, Squire, taters don't pay, blamed if they du. Ye see, I've been raisin' 'em nigh on to forty years, and I don't git ahead a bit. When taters are high, ye see, I ha'n't got any; and when I've got 'em, which seldom happens, they don't bring any thing, if ye sell 'em. I'm gettin' sick of raisin' things that don't pay."

"How do you know they don't pay?" says
I. "Do you keep any account of expenses?
Do you know what it costs to plow, to manure,
to plant, to hoe, to dig, and to store? Do you
know what the crop has cost when you have
put it down where you get your money for it?"

"Well, no, I don't keep an 'count in ritin', but kind o' keep the run on't in my head, and what a feller knows, he knows jest as well as if it was ritten. Ef I raise taters forty years and don't git ahead, it is pretty sartin 'taint a payin' business. No amount of ritin' would make it any plainer that they cost more than they come to."

"Well, neighbor Frink, has any thing paid on your farm? You haven't got ahead much."

"You see, Squire, I'm here, gettin' pretty well along in life; the farm is pretty much paid for, and the stock, and the clothes I stan' in. Ef suthin' hadn't paid, I shouldn't av been here, for I hadn't a red cent to begin with."

Thousands of people are just in Jake Frink's state of mind. They don't know what pays on the farm, and what brings them into debt. They keep no debt and credit with particular fields, or particular crops, or kinds of stock. They have a very indefinite notion that some things pay better than others, but they can not hole the fox, big or little, that cats up the grapes and destroys their profits. They keep on raising a great variety of things, some at a profit and some at a loss, on the whole getting a living, and that is about all. Now, I know just about what Jake's potatoes cost him, and I will figure up a little for his benefit and the public's: Plowing 1 acre, two dollars; 10 bushels seed at eighty cents, eight dollars; planting, three dollars; cultivating twice, six dollars; digging and storing, six dollars; 8 cords of manure, twenty-four dollars-forty-nine dollars. The crop is 50 bushels of potatoes, of which 10 are small; 40 bushels, at eighty cents, are thirty-two dollars, and the small potatoes are worth five dollars, total thirty-seven dollars; which, taken from forty-nine dollars, leaves twelve dollars as the loss on the operation. But if we take off one half from the cost of the manure as left in the land, the account stands even and Jake has his potatoes for his labor. They are all eaten in the family, and they cost in labor eighty cents a bushel. This kind of potato-raising does not pay much, as any one can see, and if the question is between raising this crop in this way and abandoning it, we had better abandon it at once; the farmer makes nothing, and the land is not improved. As most Eastern farmers raise corn, it pays no better; the crop costs more than the price of Western corn brought a thousand miles, and put down at their doors.

"Lost twelve dollars, did ye say, Squire?" asked Jake, when I showed him the figures. "I guess it's true as preachin'. Ye see, every tater in that swale rotted. I've been gwine to drain it ever sense you knocked the bottom out of that hoss-pond lot, but somehow I didn't git up to it. Ef them had been sound, I should have had 100 bushels strong. But that's jest my luck. When taters are high I ha'n't none to sell."

I got into the way of ciphering on my crops quite early, and I do believe the tallow candles and the slate and pencils that I have spent in this business, have been about as good a crop as I ever raised in Hookertown. It don't take a great while for a common-sense farmer to tell whether a crop pays or not. I raised last year a crop of rye, on a little less than three acres of land. The cost was: Plowing, six dollars; seed, three dollars; harrowing, two dollars; harvesting, three dollars; threshing, four dollars and fifty cents; total, eighteen dollars and fifty cents. Sales, forty-five bushels of rye, forty-five dollars; straw, forty-eight dollars and fifty cents; total, ninetythree dollars and fifty cents. Deduct eighteen dollars and fifty cents, cost of crop, and we have seventy five dollars as the profit. This is about twenty-five dollars an acre profit. Now, if I can get 15 bushels of rye to the acre without manure, and can add ten bushels to the yield by putting on five dollars' worth of bone-dust, or fish guano, to the acre; I can afford to buy the manure. The hone-dust will not only help the present crop, but will add to the yield of grass for several years to come. It is a safe business operation for me to enlarge the rye erop on the old pasture. I can kill the briers, sweet-fern, bay-berries, and other brush, and increase the grass crop and get paid for the job. If I take up twenty acres, and get only twenty bushels to the acre, I shall have 400 bushels of rye, worth as many dollars to sell, or to consume upon the farm; and the straw will be worth as much as the grain, at the present market prices. It can be done with the present working force of the farm, and eight hundred dollars is an item worth looking at in the year's receipts of any small farm. Rye pays in Hookertown; it might not pay where the grain was worth only fi 'y cents a bushel, and the straw was considered worthless.

Then there is another little crop that I have found out pays better than rye. In some districts there is a great outcry against slicep, and the farmers sell them for a song. Last February I bought ten ewes of a mongrel sort, having some South-Down blood in them. They brought ten lambs, and the sheep sheared thirty pounds of wool. My principal object in getting them was to help keep down the brush and briers in an old pasture. They ate before they went to pasture about half a ton of good hay. Their pasturing I do not count, for it has not interfered with the other stock, and almost any pasture improves where well-fed sheep graze. The cost of the sheep was forty dollars; feed, ten dollars and fifty cents. The lambs average six dollars each, sixty dollars, and the wool sold for fifteen dollars-seventy-five dollars; and the ten sheep are in better condition than when they were purchased. Here, then, is a return of seventyfive dollars from an investment of fifty dollars. The labor of taking care of them I think was fully paid for in the manure they dropped. The grubbing they do among the briers will be clear gain. One of the lambs weighed 31 lbs., and sold for twenty cents a pound dressed, and the pelt sold for fifty cents. A business that pays as well as this ought to be extended. Now, suppose I go a little out of Hookertown, where the people think sheep a drug, and buy in the fall a hundred ewes at, say, two dollars apiece-two hundred dollars; add two hundred dollars more for cost of wintering-four hundred dollars. If I put a Cotswold ram with them in November I secure lambs that will weigh 40 lbs, each and average eight dollars a piece by next July. I shall then have with good care, which is the

secret of good luck, 100 lambs sold for eight hundred dollars; and 300 lbs. of wool for one hundred and fifty dollars, or nine hundred and fifty dollars as the gross return for my investment of four hundred dollars. There cau't be much discount on this ciphering, for the calculation is based on the actual results attained this year. You see it makes a great deal of difference whether you sell a sheep as lamb or as mutton. If the animal is worth six dollars at four months old, and only four at eighteen months old, why should I keep it? In the one case, I make fifty per cent profit; in the other I am in Jake Frink's quandary about the thing's paying at ail. It is a clear case that keeping sheep pays in Hookertown. I want the old pasture grubbed at cheap rates. I have a good market for lambs right at my door. My neighbors like lamb with their green peas, and are ready to take all I can raise. If the butcher's price don't suit me, I can slaughter the animals myself, undersell him in market, and make money by it. He knows that, and has his choice, just as I have mine. The competition, if it comes to that, is rather a benefit to the public, as it tends to chearen food. There is a good market for wool and for pelts. I have plenty of old pasture not worth over twenty dollars an acre. It might not pay if the land were worth two hundred dollars an acre, if lamb was not in demand, and if nobody wanted the wool, and if the Whiteoakers did not keep sheep that they were willing to sell, after shearing, at two dollars a head. We must cipher more if we want to get out of Jake Frink's quandary, and find out what crops pay. Hookertown, Conn., July 15, 1871. Yours to command, TIMOTHY BUNKER, Esq.

### Ogden Farm Papers. -No. 20.

I intimated in my last, that I should have something to say in the future about the newly recommended method of setting milk for cream in very deep vessels. The result is so manifest. that it does not seem worth while to wait longer, before stating it. Taking it all in all, I regard it as the most important improvement in butter-making, that has come up in my time. I have just completed the plans and specifications for building an elaborate milk-house for a client in Massachusetts, with water-piping for shelves, having a flow of warm water through them in winter, and cold water in summer; and I have advised that the plan be abandoned, and that a much cheaper one be adopted, suitable for the new, or "Swedish," system. To begin at the beginning, I will refer the reader to an article on "Swedish Dairy Farming," on pages 178 and 179 (May No., 1871). This was the first intimation I had that such a system was practicable. I was brought up on the shallowpan system, and rarely set my milk more than an inch deep. Having confidence in the source from which I obtained the information given in the above-named article, I had a half-dozen cans made of three sheets of 12-inch by 171/2-inch tin, measuring, when finished, about 17 inches deep, and 111/2 inches in diameter. I then moved into my summer milk-room (underground) an unused horse-trough, about 18 inches deep, and large enough to hold five of the cans. Three cans hold most of the milk of each milking, but we are obliged to set some of the milk in shallow pans yet, and this affords an opportunity for comparison. In the morning we set three of the eans, filled to within an inch of the top, in the trough. At evening, only two cans can be put in, the third being put on the floor outside of the trough. My self-

regulating windmill, which works in the lightest winds and is rarely still, keeps an almost constant flow of water, from a deep well, nearly a quarter of a mile away, pouring into the trough, and flowing out at its other end. This keeps the temperature at about 58° or 59°. I have not icc enough to keep it as cold as Mr. Swartz does his, and I doubt whether that is necessary. Neither do I skim until the milk has stood nearly 24 hours (just before the second milking), and I have not even tried to see whether it would do as well to skim at the end of 12 hours. At five o'clock on the second morning, the three cans of the previous morning are skimmed; the two of the evening before are moved up to the head of the trough, and the third, which has stood outside, is put in the water. Then two of the morning cans are put in, and the third is set outside. Thus, at each milking, two cans are put at once in the water, and one is left outside for 12 hours, and is then taken inside. The following are the results:

- 1. In ordinary weather, the milk that is set in the old-fashioned pans yields all its cream, but turns a little sour within the 24 hours.
- 2. The two cans that are put at once in the water, remain entirely sweet, and they yield, as nearly as I can judge without accurate measurement, at least as much cream as we would get from the same amount of milk in shallow pans—possibly a little more.
- 3. The milk in the can that passes its first 12 hours out of the water—probably because it cools off much more slowly—gets more sour than the milk in the shallow pans, turning quite thick. I think it thickens before it gives up all its cream, as we seem to get rather less cream from this can than from the other two.
- 4. We make quite as much butter from a given quantity of milk as we did when using pans.
- 5. The skimming is done with a dipper, and is done much more expeditiously than under the old system, occupying the same time for one can that it did for one pan.
- 6. We use 6 cans in place of from 90 to 110 pans.
- 7. The cream is of a uniform consistency, and much more liquid than when so much of its surface is exposed to the air. The cream on a pan of Jersey milk that has stood 24 hours is so tough as to seem almost leathery, and can be taken off in a mass-almost rolled off. The cream on one of my cans-two inches thickis liquid, and can not be taken up with a punctured strainer. I am thus far disposed to attribute to this the fact that the "marbling" of the color of the butter, which we scarcely ever avoided before, has entirely disappeared under the new method; the "O.F." butter being now a pure, solid gold color throughout. It is not unlikely that the exposure of so much of the cream to the air affected the color of parts of the butter. Then, again, the cream now mixes thoroughly, and at once, in the cream-pail, while that which was taken from the old pans was always more or less clotted. One of the oldfashioned preventives of "marbling" was to stir the cream thoroughly together whenever a new skimming was added. Hitherto, however thoroughly this was done, the cream was always quite lumpy when it was turned into the churn; it now pours like a smooth syrup.

8. This can not be called a *result*; it is, as yet, only a suggestion, and one that it will be difficult to prove. My butter, from the same cows and the same food, has never been so good as it now is. May not the present improved

quality be due in part to the fact that so little of the cream is exposed to the air? Does not such exposure allow an oxidation or evaporation, or other action that destroys or wastes the aroma?

A month is not long to study the operation of any improvement, but I have studied this one closely, and I am satisfied that my conclusion, as described under the foregoing heads, is a sound one, and I shall do away with all of my old utensils, have a permanent trough made large enough to hold the necessary cans for all my milk, and follow the example of Mr. Swartz, until I find some better way.

I advise all who are so situated that they can keep up a supply of cold water, either with ice or by the aid of naturally or artificially running spring water, and who care for the least work and best results, to do likewise.

Concerning the farm in general, there is not much to say. June is a month of full promise and little result. Every thing looks well, better than I had hoped; and if it will only stop raining long enough to let me put in my turnips by the end of the month, I shall have nothing to complain of. The young stock comes on well; of my eighteen thorough-bred calves thus far dropped, nine are beifers (good ones), and the bull-calves are selling much more readily now than they did a few years ago. In fact, the value of the Jersey blood to cross with the common cows of any butter-making farm, is becoming better understood every year, and where we used to have to sell our bull-calves to the butcher, we now get from twenty-five to fifty dollars each for them for cross-breeding, keeping the best to sell as yearlings to the breeders of herd-book animals, at higher prices.

"Dallas" is slowly making his way to 1 03perity. When I brought him here three years ago, it was the fashion to laugh at me for charging twenty-five dollars for the services of a stallion, when from three to five dollars was the price asked for those already here. It was of no use to say that "Dallas" was a thorough-bred horse, and had the best blood of the English Stud-book in his veins; that his colts from good mares ought to be worth twice as much as those of any cold-blooded stallion. "So-and-so has got a pretty likely looking horse, I guess he is good enough for me;" and with a very knowing, smart-looking sneer, Mr. Neighbor would betake himself to the cheaper shop. The next year I had two colts by him, the next four, and this year two, and more to come. "By their fruits shall ye know them." It is now confessed that Dallas's colts are "extra good," and the older they are, the more they show their superiority. Aud, naturally, the more they show their superiority, the more people send their mares to their sire, until he is now an object of respect. As I shall drive a pair of his three-year-olds next year, I think he is bound to become popular in his old age (he is eighteen years old now, and seems good for ten years to come). One thing is certain: There will be more good, sound, well-bred horses on this island for the next twenty years for Dallas's having come here; and some day I shall be thanked, as well as paid, for having brought him here.

Will you, Mr. Editor, excuse me if I kick out of the traces a little, and protest mildly against the tone of your article in the July number, entitled "How to get Thorough-bred Stock"? What I object to is rather your omission than your direct expression. Your correspondent

complains that when he wrote to known breeders for the price of a bull, he was charged a higher price than he could afford to pay (\$400 to \$500). I do not think you do full justice to the breeders in your reply. Those who are known to be first-rate breeders of Shorthorns are few. They have paid thousands for their foundation stock, where they ask bundreds for the choicest progeny; they have taken enormous risks, and they have but a limited market. The price that common farmers, with limited capital, think they can afford to pay, would not remunerate them, and no one has a right to get vexed that they should ask all they think their stock will command. I never knew a breeder of thorough-bred stock to make a large fortune, and this fact alone shows that what you call "fancy" prices are none too high, in view of the capital invested and the hazard incurred. Then, again, what do we mean by "fancy prices"? If the \$400 to which your correspondent objects, is fancy, why is not the \$200 that you suggest? It is more than the value of an equal weight of common stock, and if the surplus is fancy in one case it must be in another. Where shall we draw the line? There is one safe rule for us all to follow; that is, for each party to a negotiation to fix his own standard of value. If Mr. Smith objects to paying \$500 for a calf, Mr. Jones has no right to compel him to pay it, or to get angry because he won't. On the other hand, if Mr. Jones will not sell his calf for less than \$500, Mr. Smith has no right to grumble thereanent. Each is a free agent; the one has a right to ask, and the other to pay just what he pleases; if they don't agree, they needn't trade-that is the whole story. For my part, I do not believe at all in the idea of "fancy prices." I stand ready to pay for just such a Jersey bull as I want (if he exists-which is doubtful), several times \$500; but I should not be, in any sense, paying a fancy price. Fancy would have nothing to do with it. It would be a purely business transaction, and I should be actuated solely by a desire to add to the value (not for sale only, but for the purposes of my buttery) of every calf that will henceforth be born on the farm. There is no end to the influence of a good bull; every calf he gets carries the impress of his quality in its own person, and transmits it through countless generations. Suppose I were to pay \$5,000 for a bull, and should use him for four years on all my thirty cows and heifers, and on all their female progeny.

With only ordinary luck, I would have in all about 150 calves by him, each one of which would cost about \$30 more than if from a \$500 bull. And this is only the beginning; I should have laid a foundation for future improvement that by judicious selection I could keep up indefinitely, and if I had succeeded in adding ou the average five per cent to the dairy value of every calf that would ever be born to any descendant of my present herd, I should have attained a result of priceless value. Of course, I would be a fool to pay \$5,000 for a bull no better than I could get for \$500, but if I really had a chance to buy the very best bull in existence, I would be a fool not to buy him at any price I could possibly afford to pay, providing I could not get him for less.

The bull is the key-note of the whole tune. If you intend to breed thorough-breds, go the full length of your tether, if you must, to get the the very best. If you only mean to raise butcher's meat, get a thorough-bred of good quality, and at a price you can afford to pay. The better he is, the better for you, but don't growl be-

cause you can't buy the best at half-price. I am a breeder of the kind of stock you would call "fancy," but I never bought an animal with any other motive than a desire to make money by it, and though I have both paid and received high prices for my animals, I think their actual value as progenitors of future herds, if rightly estimated by butter-making capacity alone, would in every case exceed the price. There is no "fancy" in 225 lbs. of good butter in a year from a small cow.

### An Egg Farm.

BY H. H. STODDARD.—Fourth Article.

When it is attempted to raise a few eggs and chickens for home use, the form, proportions, and fixtures of the fowl-house are of small consequence, so long as the proprietor has invented something a little different from what has ever been made before, and is satisfied. But business upon a large scale demands buildings that shall conduce in the highest degree to the thrift of their inmates, and to the convenience of the attendant, while the outlay in both material and construction should be the lowest possible. The buildings generally put up cost \$2 or \$3 for each fowl provided for, while amateurs sometimes expend \$5 or more per head for the housing of their poultry. There are three classes of adult fowls necessary under our plan, which we designate breeders, sitters, and layers; and the latter, which are most numerous, are housed at a cost of materials not exceeding 40c. for each bird; estimates being based on hemlock lumber at \$23 per thousand. The accommodations for the breeding and sitting stock are necessarily more expensive, and there is, in addition, the cost of coops and fixtures for raising chickens enough to replace two thirds of the adults yearly.

In a practical and economical fowl-house, we expect nothing ornamental nor complicated. There are no ingenious ventilators cheap at \$3 each, or patent nests to beguile hens into laying more or bigger eggs, or rat-proof feeding hoppers opening by clock-work, but the utmost simplicity is sought throughout.

The illustration shows upon the right the house used at the stations, for the layers. It is not too large to be moved with convenience, and nothing smaller would accommodate a flock of fifty, the number to be kept at each station, with perches, nests, and sufficient ground room in stormy weather, and at the same time afford hight enough to give a circulation of air over the perches, and a proper pitch of roof. It is 15 ft. long, 81/2 ft. wide, and 41/2 ft. high at the peak. Let it be noted that any attempt to huild so that the attendant may enter, either makes a stooping, slow job of every operation, from year's end to year's end, or if the house is carried high enough to allow standing upright, the weight interferes with moving, and the lumber costs too much. It is as easy to reach into a building designed for the keeper to stand outside, as to reach into a handy cupboard. To give sufficient air, the room is as lofty in proportion to the size of the birds or their breathing capacity, as a stable twenty feet high would be for cattle. It is just about as necessary for the poulterer to have a roof over his head for protection in all weathers while at work, as in the plan the National Poultry Co. carried out at Bromley, Kent, in England, as it is for a farmer to make a shed over his land to defend his complexion from the sun while having, and the rain while transplanting cabbages. The part

of the roof on the south side at A, A, A, and nearly all on the north, consists of hinged doors opening to the right or left, and overlapping when closed, to shed rain. When it is desired to whitewash, throw open all the doors, thus turning the house iuside out, take out the perches and nests, all built movable, and there will be no nook or cranny of the woodwork that the brush can not be made to reach with ease, and no lack of clbow-room. This arrangement of doors makes it convenient also to catch fowls upon the perches by night. The doors should shut as snugly as may be in coarse joiner work, and the cracks unavoidably left around them will afford all the ventilation needed in winter, while in summer they may be opened more or less widely, according to the weather. When it is warm, yet wet, they may be partly opened and propped up, and a board put across their edges to shed rain. It is very desirable, under any plan for henneries, to build so that while moderately tight in winter, they may be thrown open on every side in hot weather; for fowls are warmly clad, and suffer much from the heat when in buildings made, as is too frequently the case, only with reference to the cold. The doors which form the north roof project 6 inches at the ridge to keep ont rain, as there is no ridge-cap. The two windows in the south roof are glazed greenhouse fashion, that is, with overlapping panes, that snow may slide from them readily as soon as loosened by the warmth inside. They are 2 ft. high and 3 ft. wide, and set 18 inches from the peak of the roof. A strip of tin is fastened over the upper part of the sash, and the sides and bottom of the sash overlap the roof, to be rain-proof. The shutters, B, B, used to darken the building on certain necessary occasions, elsewhere referred to, are hinged to the lower part of the sash, and when opened, as in the illustration, rest upon the roof below the windows. The side sills project at both ends of the building, are beveled runner fashion, and strengthened with iron where holes are bored to attach chains; thus it may be drawn by either end. The sills, which receive the principal strain during moving, should be so well braced as to keep the whole building in shape. The end sills, of 2-iuch plank, should be spiked upon the top of the others, flatwise, so as not to touch the ground while moving, and the side-sills, 4 inches square, should be of chestnut or oak, to be as durable as possible, for they rest on the ground during a good part of the year. The sprnce rafters, 2 × 3 inches, which answer for studs and rafters both, should be set at such distances apart as will correspond with the width of the doors and windows which are fastened to them. A stout ridge-pole, sawn of a triangular shape, runs the length of the building underneath the rafters, and two sticks are fastened to this ridge-pole, one 5 ft. from each end, and braced upon the center of the end sills to give firmness, for the covering, consisting chiefly of doors, does not strengthen the building, as in ordinary cases, where the covering is nailed to the frame. CC are doors, each 3 ft. ×1 ft., opening outwards and downwards, to give the keeper access to the nests, which are 1 ft. square, and the same in depth, and so contrived that the hens enter them at one side from a passage 6 inches wide and 1 ft. high, boarded at side and top, running the length of the row of nests, and are thus indulged in their liking for privacy while laying. The nests are tight upon the top, the outside door should fit closely, and the opening admitting the fowls to the passage he made so small that the nests will be rather dark. It is found that when nests are

open to view from the main apartment, hens will, in stormy weather, for lack of other employment, sometimes enter them to scratch for food, and thus by chance break eggs and learn to eat them, and acquire the habit of peeking at and devouring eggs as fast as laid. But a darkened nest will deter them from entering, except to lay, for which purpose they prefer a dark, low corner. There is a row of six nests running across the building at each end, making twelve, which will be sufficient, as it will not happen that more than that number out of a flock will need them at once. The passages are made so that they may be taken out with the nests for whitewashing. The end sills, of plank 18 inches wide, serve as a tight floor for the nests and passage. The perches, two in number, are 18 inches apart, and each is 18 inches from the roof, and 2 ft. higher than the sills. Perches should be of 21/2×31/2-inch sawed stuff, the widest part up, with the upper corners rounded off a very little. When fowls not fully grown roost upon narrow perches, their breast-bones sometimes become deformed. From four to five average-sized fowls will occupy 2 feet of perch. The perches, being each 12 ft. long, will accommodate a flock of fifty, and are to be placed so as not to extend over the part occupied by the nests. The drinking vessel stands upon one of the platforms formed by the nests, and upon these platforms are also shallow boxes containing gravel, pounded charcoal, and a mixture of loam, sand, and oyster-shell lime, made into an easily crumbled mortar. The boxes are 10 inches wide, and, being placed next the end wall, leave a space 8 inches wide upon the platform, for the fowls to stand upon. The drinking pail and gravel boxes are protected by their elevation from the dirt that would otherwise be thrown into them by the fowls when seratching and dusting, and are fronted by slats with openings  $6 \times 2^3/4$  inches between them. An opening is made in the end wall over the pail that is just large enough to admit the spout of a large watering-pot without the sprinkler, to afford the most convenient arrangement for watering. The door, D, 1 ft. wide, opening downwards, is for removing the pail and gravel boxes when desired, and when fastened ajar will be found more convenient for ventilation than the roof doors, when the weather is only moderately warm. Both ends of the building alike are furnished with doors.

During the severest weather, generally about three or three and a half months of the year, this building does not stand with sills upon the

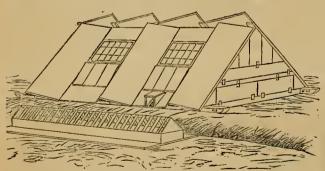

Fig. 2.—HOUSE FOR LAYERS—SUMMER ARRANGEMENT.

ground, but for winter it rests, as in the figure, upon the edges of a box or bin of dimensions corresponding with the center of the sills of the building, made of planks 9 inches wide and 2 thick, like a mortar-bed with no bottom, filled with dry earth. This should be set upon ridges thrown up by the plow, as previously described, and it will be found that, by starting with the carch

dry in the fall, it will not absorb moisture from the ground beneath during winter, any faster than it dries away from the surface where the fowls keep it in motion. There need be no eleaning of the house while thus arranged for winter, but about once a month an inch or two of dry earth may be added. There will be no accumulations under the perches if the birds are kept not too profusely supplied with gravel at that season, as they should be to induce them to thoroughly pulverize every portion of the manure and mix it with the dry earth, in search of the gravel which is very frequently voided. There can be no objection to saving labor by inducing the birds to perform the work of seavengers, which will give them salutary exercise, for it is not intended that they shall be deprived of as much gravel as they need, but only forced to use the same many times over. The bin, as it may be called, should be strengthened with braces across the corners, and kept from spreading by the pressure of its contents by strips nailed from side to side. After the building has been moved in spring to a new station, the bin is to be pried up until the earth drops through, it having no bottom, and when empty it may be

tains a trough made by nailing boards 3 inches wide to each edge of a board 5 inches wide. A door, F, in one end of the feed-room, large enough to admit a fowl, communicates with a similar door, G, in the south side of the main building, by a movable covered passage,  $5^1/2$  ft. long,  $1^1/4$ high, and I wide, it being like a box with a lid, and but one end, and with an opening on one side. This passage is not shown in the illustra-Every night in winter, after the fowls are at roost, the door G should be closed, and the window-shutters of the main building likewise. In the morning a mixture of vegetables boiled and mashed, scalded meal, and a little meat boiled and chopped fine, is placed in the feedtrough, and the daily rations of hard grain buried underneath straw which covers the ground of the feeding apartment to the depth of 8 or 10 inches. The fowls are prevented by the shutters from looking on. Next open the passage and in a minute the fowls will all be at the feed-box. After finishing the soft feed, the grain, consisting in part of buck wheat or cracked corn or wheat screenings, so as to make as much work as possible to find it, will be scratched for at intervals all day long. A little practice will

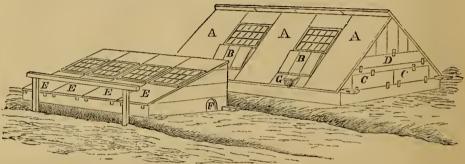

Fig 1.—HOUSE FOR LAYERS—WINTER ARRANGEMENT.

readily hauled by team, like a sled, to the place where it is to be used, as will be explained, in connection with chicken raising. The building is bauled on and off this bin yearly by taking the wedge-shaped platform for drying earth, previously figured, for a skid, and attaching the team to a rope 20 ft. or more long, and using small rollers. It is a quick and not overtroublesome operation, for it must be recollected that the house is not large nor heavy.

During the winter, a low structure, 6 ft. wide and 12 long, and  $1^{1}/_{2}$  high on one side, and  $3^{1}/_{2}$  on the other, seen at the left in the illustration, serves the purpose of a feeding room, and the rest of the year is used as a shel-

ter for chickens. Its winter location is about 4 ft. from the larger building. E, E, E, E, E, represent doors which overlap each other to shed rain, and when closed rest upon the highest or north wall, and open upwards and to the south, resting upon a rail attached to posts set in the ground. In each door is a window 3 ft. square, glazed, as are all the windows in the various fowlhouses, greenhouse style. This feed-house is movable, being

furnished with planks set edgewise, with runner-shaped ends for side sills. Inside, a feedbox, slatted on both sides, rests on cleats attached to the end walls, 20 inches from the north wall, and near the top of the room, so that dirt can not be scratched into it. It has a shelf 7 inches wide on both sides in front of the slats, on which the birds stand while feeding, and con-

enable the attendant to give just enough, and have none left over night.

During a few of the coldest spells, such as usually occur three or four times in the winter, and last three to seven days, and during storms, fowls prefer to remain in doors all day, but they should never, except in the morning, before feeding, be prevented from going out if they choose. Altogether there are not usually twenty days in a year during which fowls will voluntarily keep inside all day. Snow should be cleared from a plat of ground at each station, with the aid of the team, and the scraper and shovel previously described. If the winter is open and mild, have a pile of straw out of doors with grain buried under it. As soon as the buildings are moved to the new stations in spring, and the feeding-rooms are also drawn off to be used in housing young chickens, the feed-boxes are taken out, they merely resting on cleats, without being fastened, and carried to the stations, where they stand on the ground out of doors during summer, for use each morning, feed being placed in them, out of sight of the birds, as before.

In the illustration of the summer arrangement the feed-box is seen in the foreground, and the doors in both roofs of the house are propped up a little, as in cases of extremely hot weather. It will be found that the birds will seek the protection of a building thus arranged, for shade, when the heat is severe, in preference to any other place. In summer the grain is buried under a profuse allowance of straw, by the use of a horse-rake and hay tedder, or under the soil, by means of the fine and short-toothed harrow used in pulverizing earth for gathering, as mentioned in a former paper.

### The Alewife.

The Alewife (Alosa tyrannus) belongs to the great family of herrings (Clupeidæ), so numerous, and furnishing so large an amount of wholesome food as to be almost indispensable to man. It bears the name of Gaspereau in Canada, Buckie and Alewife in New England, and Herring in the Middle and Southern States.

It generally keeps company with the shad, and by reason of its habit of breeding in brackish water, it is found in the estuaries of many small streams from which the shad long since disappeared. The same causes which have destroyed the salmon and shad are operating to diminish the numbers of wives, and in many

streams once swarming with them, they are seldom or never seen. They are much more abundant along the coast of the Southern and Middle States, because there are fewer dams at the mouths of the streams. In New England, almost every small stream, large enough to carry a mill of any kind, is dammed near its mouth, and very early these fish were cut off from their breeding-ground. They are still taken, however, in nearly all the streams where shad are found, and in some brackish ponds where the shad were never known. In the Sonth they are still so abundant that no thought of scarcity has ever been entertained. Farmers from the back country come down to the fishing-houses and carry away immense numbers every

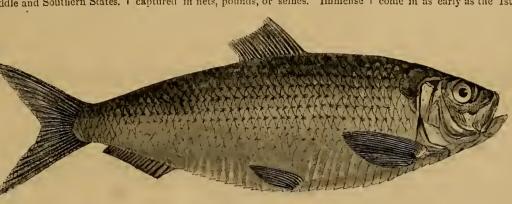

season. In the East they have disappeared from a very large number of streams, and are only taken 00casionally in seines drawn for other fish. They are so prolifie, and a few still remain in so many of the streams, that they might be restored with much more facility than either shad or salmon; and they have probably such a connection with the food supply of the young fry of these better kinds of fish, that they may be regarded as their forerunners.

There are several runs of the alewives, the earlier being the larger fish. They are from

six inches to a foot in length, depending somewhat upon their age, and the streams that they frequent. The average weight is about six ounces. They come on to the coast early in the spring, and only visit fresh water for the purpose of spawning. The most of them disap-

pear in June. The fry remain in the waters where they are hatched until November, or later, and then go to sea. At this time they are three or four inches long. If from any cause their exit is shut off and they are detained in fresh water, they do not grow much after this period.

THE MODE OF CAPTURE.—Although the alewife will take a bait, they are almost always captured in nets, pounds, or seines. Immense

ALEWIFE. - (Alosa tyrannus.)

numbers are taken in the pounds set for larger fish near the moutbs of large rivers, and in small streams and ponds the seine is used. Where there is a fish-way around a dam they are easily taken in scoop nets, at the foot of the rapid. Near Cross's Mills, in Charlestown, R. I., there is a valuable alewife fishery that has not been much affected by the causes which have destroyed them in other places. The Charlestown ponds communicate with the sea only by a narrow passage, which is frequently closed by the action of the waves, and has to be artificially opened. There are no large streams running into them, and the fish come in to shoot their spawn in the brackish water made by springs near the shore. The menhaden as well as the

is 1<sup>1</sup>|<sub>3</sub> inches in the bunt or middle part. They are also taken in other parts of the pond, as the shoals make their appearance upon the surface of the water. About 100,000 fish are taken at all the fisheries, and the numbers are said not to be materially diminished. Owing to the better implements of capture more are probably taken than in the early days. They begin to come in as early as the 1st of March, but the

main run is from the middle of April to the middle of Mav.

CURING OF THE Fish. — In some places they are pickled. simply packed in barrels, and sent to market. At the Charlestown ponds they are salted,smoked, and, to a considerable extent, sent to merchants in the villages of Rhode Island and Connecticut. Tm-

mediately after capture they are taken from the boats, washed clean, and salted whole in casks. The rule in salting is two quarts of Turk's Island salt to one hundred fish. They remain in the pickle from three to five days, and are then removed to the smoke-house. To prepare them for smoking, a wand two feet long is thrust through the eyes of ten fish. These wands are suspended upon the ends on poles arranged for the purpose in the smoke-house. The smoke-house is purposely made small, say 8 or 10 feet square, and is built over a walled pit about 4 feet deep. It is about 8 feet between the joints, and accommodates six or seven tiers of fish, which are arranged upon the poles about as close as they can hang. About ten thousand can be smoked

at a time in one of these houses. The smoking continues two days. The fish are then ready for market, and are sent off as fast as they can be sold. Green wood of oak or hickory is preferred for making the smoke, and the fire must be very gentle, so as not to the fish.

ECONOMICAL RE-SULTS. - The first fish sent to market are of the best quality, and bring about three dollars a hundred. They are full of spawn, and quite fat, and are considered of better flavor than the late fish, which are sometimes taken after spawning and are very poor. The price

falls off until it reaches about a dollar a hundred, wholesale. They are retailed from one to three cents a piece by the village dealers. The fresh fish are retailed to the farmers, and to all who come for them, at fifty cents a hundred. Rarely, they are so abundant that

BRITTANY COW. - (See page 209.)

alewives come into these ponds to spawn, and if the ponds are closed in winter, as sometimes happens, the menhaden are all killed while the other fish survive. A seme is used near the breach for the capture of the alewives. It is about one hundred fathous long, and the mesh

they are caught and sold for manure. The cured fish are much used by the laboring classes in the cities and large manufacturing towns. It is one of the cheapest forms of animal food, costing the consumer only about three cents a pound. To those who live in the vicinity of a fishery and cure their own fish, the cost is much less. In some places the fishery is owned by the town, and is sold annually to the highest bidder. The Agawam, at East Warcham, Mass., is rented thus at \$600 to \$900 a year. The yield is about 1,500 barrels of alewives.

THE RESTOCKING OF STREAMS with this fish is very easily accomplished. In many streams where there are few still left about the estuary, nothing more would be needed than to put up a fish-way over two or three of the dams. In others, fish would have to be brought from other quarters. In either case the cost is so small, and the results are so promising, that the work ought not to be delayed. This work is going on at many places on the New England coast. The Poquonoc Fish Company have had a large run of fish this season, as a consequence of the spawning of a few alewives in the first pond above tide-water, two years ago. The fish-way costs less than \$40, and may answer for shad and salmon as well as alewives.

### Walks and Talks on the Farm-No. 92.

A few days ago, I had a letter from our friend John Johnston. "I want to show you my apple-orchard," he wrote, "planted eight years ago, last May. The trees had an immense quantity of fruit on last year, and I had a great many picked off when quite small, thinking they would break down the branches. All who see them say they are the finest trees they ever saw. They were only two years old when planted. If you will come, I will tell you what I did for them, that makes them look so splendid. Come and see, and then you will believe." It is hardly complimentary to suppose that I would not believe without seeing. Almost any man will believe a thing when he sees it. But it requires a certain amount of training to enable one to beheve without seeing. It is a very low order of intellect that will not yield implicit assent to a statement that rests on satisfactory evidence. Many farmers rather pride themselves on this mental characteristic. "You gan't fool me!" is one of their over-recurring phrases; while it is a matter of observation that, of all men, these incredulous people are most easily duped. I should despair of ever amounting to anything, it I could not believe without seeing.

But I am very glad I went to Geneva. Mr. Johnston's trees are, by far, the handsomest and healthiest I have ever seen; and I came back with a determination to at once carry out his recommendation. I have gained this much, at any rate, by seeing the trees. The plan is simply to make a lye, just as you would for soap, and wash the trunk and larger branches of the trees with it. "If the lye was very strong," Mr. J. said, "and made from hickory ashes, it might, perhaps, need to be diluted with a little water; but the lye from ordinary ashes is not too strong." He applies it with a swab tied to a stick. A man went over an orchard of a hundred trees in an afternoon. He has done this once every two years. There is not a particle of moss, lichen, or fungus, on any of the trees. The stumps are as smooth as the standard of a mahogany table. And I do not wonder that Mr. Johnston feels proud of them.

Still, I do not think that this splendid result is due merely to this biennial washing with lye. The land is thoroughly underdrained. It is a rich, clay loam. The trees were only two years old when set out-and a well-grown two-yearold apple-tree is better than a poor-grown one four years old. Then, great pains were taken to prepare the land, and to set out the trees. Wide holes were dug, two feet deep; and some decomposed swamp-muck put in the holes, and covered with good soil. The trees were then set out and staked, and the land has been kept in hoed crops ever since, and I presume has been liberally manured. And you must recollect that Mr. Johnston's manure is manure-not rotted straw. And the coal-ashes from the house have been put round the trunks of the trees. In short, it is quite evident that Mr. J. has petted his trees almost as much as, during his long life, he has been in the habit of petting his cows and his sheep. He is constitutionally incapable of neglecting any thing he undertakes. Thoroughness is an essential characteristic of the man, and accounts for much of his great success.

I was telling Mr. Johnston about the red-root, or "pigeon weed," as he calls it, that came up in such immense quantities in my two-year-old clover-field, this spring. "It is a terrible pest," he said, "and cost me a great deal of trouble to get rid of it. I thought, at one time, it would ruin me." He studied the habits of the plant, and thus ascertained how best to attack it. He sowed some red-root seed in flower-pots each month, commencing in February, and kept them well watered. The seed sown in February, March, April, May, and June, did not germinate any earlier than that sown in July. That sown in August germinated more freely, while that sown in September came up at once, and in great numbers. Here he got an explanation of the fact that red-root rarely proves of any damage to any crop except winter wheat. It shows, too, that a summer-fallow for wheat will not kill it. The seed mainly lies dormant in the ground during the whole summer; and the thorough cultivation causes it to start up the more freely in the wheat. But if you fallow the land, and then do not sow it to wheat, the red-root will spring up and can be easily killed.

The red-root seed gets into the manure from clover-hay and wheat-straw; and when the manure is applied to wheat, it springs up, and there is no chance of killing the plants except by weeding and hand-hoeing. It was for this reason that Mr. Johnston adopted the plan of spreading his manure on grass land in September. The red-root seed then germinates, and when the land is plowed over next spring, the plants are turned under and killed.

He advises me to treat my clover-field, where so much red-root has gone to seed this summer, as follows: Pasture it with sheep, and eat it down close. Then, during the latter part of August, or early in September, harrow the ground and tear up as much of the soil as possible. Then draw out all the manure that can be found on the premises, and spread it evenly over the land, and take great pains to break up all the lumps. 'Thomas' smoothing harrow is just the implement for this purpose. In this way, he thinks, I shall cause all the red-root seed that has fallen on the surface of the land this summer, to germinate; as well as that contained in the manure. Plow up the land in the spring and plant corn. I propose to carry out this plan, except that I think I shall sow peas instead of corn; and then, after the peas are off.sow winter wheat and seed down with clover.

A correspondent of the American Agriculturist, at Alton, Illinois, incloses a letter he has recently received from his brother, "containing," he says, "a fair and just criticism, mainly of what he has read in the Agriculturist," and which he would like to see published. Here it is: "I gather from the Agriculturist a great many items of interest to me as a farmer; first among which is 'Walks and Talks.' The writer lives in a part of the country that I never saw, and has Essex pigs and South-Down sheep, manuring and draining, smartly on the brain; still, I find, beyond controversy, that thorough cultivation, manure, and draining, are the main springs of successful farming. I mean such manure as a poor man can make, or save; and drainage by open ditches. Tiles are too expensive for the mass of farmers. Most farmers in the Middle and Western States are poor; or, more correctly, they commenced poor and on a small scale. \* \* They cannot live on prospective profits. They can not wait. The profit must come yearly, from one crop or another, and no dodging. " \* My notion is, that thorough cultivation is the poor man's way to high farming; as in it he gets much of his manure from the air and rain, and his drainage from deep and frequent stirring of the soil."

I do not object to such "criticism." I have felt all the difficulties he alludes to, and have spoken of them time and again. No one realizes more fully than I have done, the fact that a poor man must have something to live on. I have, for this very reason, frequently sown a crop, when I knew that if I could only afford to wait I should have made more money in the end by summer-fallowing the land. The principles I have endeavored to teach, are believed to be correct. But a farmer must judge for himself how far he can adopt them.

"Thorough cultivation is the poor man's way to high farming"—and the rich man's too, on the great portion of land in the United States. And this is precisely the doctrine I have always taught. And I am more and more convinced of its truth, as I see its effect on my own farm. Stirring the land hastens the decomposition of the organic matter in the soil, and otherwise readers the latent plant-food available. To some extent, too, it enables the soil to absorb ammonia from the atmosphere.

"That is all very well," says the Deacon, "but what have you to say about having 'Essex Digs and South-Down sheep on the brain'?" Simply that no matter how impartially a man may write, he is very apt to be suspected of interested motives. I have been accused of having Berkshires and Yorkshires on the brain, and yet I have not a single pig of either of these breeds; and so with sheep. I like South-Down and Leicester sheep because of their intrinsic merits. But I have not a sheep of either breed. I have written a good deal in favor of Shorthorn and Ayrshire cattle. But I do not breed them. This is what I have "on the brain:" that farmers should use thorough-bred male animals to cross with their common stock. If, among cattle, they prefer Shorthorns, or Devons, or Herefords, or, for milk, Ayrshire or Jerseys, I have no objection; if they like Cotswolds or Leicesters or Lincolns, for long-wool and mutton sheep, or if they prefer the South-Down, I say go ahead and prosper; if they prefer Yorkshire or Berkshire or Essex pigs, I still say all right. You can hardly go wrong. It will make comparatively little difference which breed of pigs is selected, provided the animal is thorough-bred and is a good specimen of the breed. This is

what I have "on the brain," and I could wish that all the good farmers in the United States were affected with the same disease. I say good farmers, because a poor, careless feeder and manager can never have good stock, no matter what breed he selects. Of course there is a great difference in the different breeds of animals, some are adapted for one purpose and some for another; and it is here that the farmer should call to his aid all the information he can obtain. No breed is best everywhere and in all circumstances, and he is a "quack" who claims any thing of the sort.

"Again," the same writer continues, "Walks and Talks sometimes nauseates me a little in his rotation system. He generally commences with turning down a clover sod. Now this is all right, if said farmer lives where clover does well, and does not freeze out, as clover and winter wheat frequently do, in a large portion of the country, and if all farming could commence on old land, fenced off in five or six fields ready to his hand; but such is not the case. When a farmer commences with breaking prairie sod or clearing timber land, making his own rails to fence, you see such rotation is absurd, and seems in many cases to create a distaste for agricultural information from such writers."

This is rather severe, and I hope unjust. I should be exceedingly glad to adopt the suggestion of the gentleman, and commence my rotation with a prairie sod, were it not for the fact that there is not a bit of prairie sod within hundreds of miles of me. This may be my misfortune, but can hardly be considered my fault. I have to begin my rotation with what I happen to have. I have talked and written a good deal about rotation, simply because it is an exceedingly important matter, and one which necessarily largely occupies my thoughts, especially with reference to the question of killing weeds. I bought a wet, weedy, run-down (but not exhausted) farm, and I am trying to drain it, to clear it, and to make it productive. If it was in Illinois, I should have adopted different methods from what I thought best here.

When I lived in the city I had a garden; I wrote a number of articles called "Walks and Talks in the Garden," and when I sold the garden and bought a farm, I commenced to write "Walks and Talks on the Farm." I little thought that they would attract half the attention they seem to have done, or I most certainly never should have written them. I have told what I have done and suffered, what I have hoped and feared. I have given a faithful record of my farm life; its pleasures and drawbacks, its successes and failures. I have received complimentary letters from hundreds of farmers whom I have never seen, in all parts of the country. They have been a source of much encouragement and pleasure, and, on the whole, I am not sorry that I have written them. But it should be understood that these "Walks and Talks" are not editorial articles, designed to give directions for the management of farms in all parts of the country where the American Agriculturist circulates. They are merely a record of what I am doing on my own farm, with such reflections as may seem pertinent. I never supposed that a cotton-planter in South Carolina, or a sugar-planter in Louisiana, or a corn-grower on the rich bottoms of the Southwest, would adopt the same rotation that I find hest on the wheat-growing land of Western New York. The truth is, practical agriculture can never be taught by book and papers, or by agricultural colleges. They can only teach general principles. The application must be left to the good sense of the individual farmer. If he has got good sense, a good agricultural paper will be a great help to him; if he has not, he had better turn his attention to something else than farming. A farmer, of all men, must learn to think for himself, and that book or paper is best that furnishes food for thought, and stimulates him to persevering efforts in improving himself and his land.

The principles of agriculture are the same in Illinois as in New York; but the mode of applying them differs with the soil and climate. For my part, I read the Prairie Farmer and the Western Rural with as much interest as I do the New England Farmer and the Albany Cultivator. They furnish me as much useful information as the excellent agricultural journal And yet the published in my own county. mode of farming practiced in these different sections of the country is very different from that adopted here. If a man will honestly tell what he is doing on his farm, and what the result is, I do not care where he resides. I should read his statement with interest.

What I have on the brain is weeds. Some people think that with modern agricultural implements, and the vast extent of fertile land in the United States, we shall produce so much more grain, and meat, and wool, than can possibly be consumed by our population, that prices will fall so low that there will be no profit in farming. Were it not for weeds and insects, such probably would be the case. My own farm and the Deacon's are overrun with weeds. We are fighting them to the extent of our ability, and are meeting with gratifying success. Our farms are becoming cleaner and cleaner every year, but even yet the weeds cost us more than all other taxes-town, county, State, and national-direct and indirect, combined. I do not mean that the labor of destroying them costs so much, but the weeds that escape, damage our crops to such an extent, that we lose half our profits. You must recollect that the actual profits of farming, after deducting the interest on capital, the cost of labor (our own or others'), the wear and tear of implements, etc., are exceedingly small. I know of comparatively few farms where, after making these deductions, the actual profits are more than five dollars per acre. On the other hand, I know of scores of farms where, at least on some fields, the weeds damage the crops ten dollars per acre. And, depend upon it, no farmer can be really successful until he makes an earnest, persevering effort to clean his land. It is fortunate for us, that the means used to accomplish this object will do much towards enriching the soil.

I was in Genesee the other day, looking at Mr.Wadsworth's fine herd of Shorthorns. The pastures on these celebrated Genesee flats are overrun with weeds, and I saw in one field six men with seythes, cutting thistles. The soil is very rich, and, although it is flooded nearly every spring, there is abundant opportunity for draining. I saw one field of six acres, that yielded over 80 bushels of shelled corn per acre last year. And yet the pastures adjoining do not carry more than one steer to three acres. The more experienced feeders say that the great point is to stock so light that the steers have abundance of feed throughout the season.

They go to Buffalo in the spring, and buy in the market three and four year old steers, weighing about 800 lbs., at, say, 54<sub>2</sub> cents per lb. They are turned on to these rich pastures, and kept until the grass fails in the fall. The average gain on a fair lot is about 350 lbs. If they get a cent a lb. more for them when fat than they paid for them, they think they are doing well. They make about \$30 per head, or say \$10 per acre. Canada steers are preferred. They do not care how thin they are, provided they are thrifty. As one of the graziers expressed it, they like to "buy bones to put flesh on." I was a little disappointed in these meadows and pastures. There are too many weeds, and much of the grass is coarse. A little draining, and judicious management, would render them capable of carrying much more stock.

It would seem as though this splendid section would become the head-quarters of the State for Shorthorn cattle. The time will surely come, when it will be more profitable to raise and fatten good cattle that mature early, than to depend on buying "bags of bones," for the purpose of putting a little flesh on them during the summer, and selling them in the fall, at a time when beef brings a comparatively low price. The English farmers find it highly profitable to feed their cattle and sheep some grain or oilcake while at pasture. This improves the land almost as much as it improves the stock. But it is necessary to have well-bred animals, that grow rapidly and mature early. Shorthorns are being gradually introduced among the enterprising young farmers up the valley, and the general stock of the district shows a marked improvement over that in this neighborhood. I found, however, that the opinion was not uncommon, among even good, sensible, successful farmers, that there was more money to be made from the so-called native stock than from Shorthorns and their grades. And I have no doubt they are right, unless a system of higher feeding is adopted.

A good many long-wooled Canada sheep are kept, and seem to be gradually displacing the Merinoes. Some of the farmers, however, seem to give these sheep no more attention than they have been in the habit of bestowing on their Merinoes. They let them have plenty of food when they have it to spare, and when they are short the sheep have to pick up a living as best they may. "There is no profit in sheep," they say; and they are right, when the sheep are halfstarved, and compelled to eke out their subsistence from their own accumulated flesh and fat. But I am inclined to think that a properly managed flock of slicep will pay better in this section, to-day, than any other farm slock. This is John Johnston's opinion, and I know of no farmer who has had greater experience, or whose judgment is more to be depended upon.

"If you ever have footrot break out among your sheep" said Mr. Johnston, "let me know, and, if I am well enough, I will come and show you how to cure it. You can do it yourself; but I have told a good many people how to do it, but I scarcely ever knew one of them who succeeded. They don't follow the directions."

"I thought at one time," he continued, "it would ruin me. I had over a thousand sheep, and the footrot broke out among them. We could cure the sheep affected, but it kept breaking out among the others. I went to bed one night greatly distressed about it. I kept thinking and thinking the matter all over. Finally I exclaimed, 'I have it!' 'Have what!' asked my wife. 'I have found out how to cure the footrot.' 'I am afraid you'll never do that, John,' she replied. 'Yes, I can, I am sure ot it.' In the morning I told the man to get up the sheep, and we went at it. We dressed every!

sheep, and those that were affected we drew out, and put in a field by themselves. These we dressed again the next day, and the others in two or three days. We cured every sheep, and banished footrot from the flock."

"What did you dress them with?" I asked. " though I suppose that is not the essential point." "No," he replied, "the point is to dress the whole flock, whether they have the footrot or not, and another essential point is to pare off the hoof, so as to lay bare all the affected parts. Nothing can cure the footrot without this being done. I used blue vitriol ground into powder, and made into a salve with tallow; and if the weather is very hot, use beeswax instead of tallow. Rub this salve between the claws with your finger, and all over the foot, being careful that no part escapes. Those affected are treated in the same way, only that more pains are necessary to get the salve in direct contact with all the diseased parts. Two, or at most three, dressings will effect a cure."

### How to Replace a Horse's Shoe.

Much time is often lost at inconvenient seasons because a shoe needs replacing, and every thing must stop while a journey is made to the blacksmith's. If one of the boys could nail on a shoe, without endangering the safety of the horse's foot, this loss of time might be avoided.

To replace or fasten a shoe that has just been east, or is about to be, the following tools are required: A light hammer, a piece of iron on which to trim the nails, or clinch them (an old hammer-head of two or three pounds' weight is

good), a pair of pincers, a thin, long punch, and some horseshoe nails. These nails should be kept ready prepared; the preparation consists in beating out the point sharp enough to penetrate easily, and giving it a little bend; also trimming the head. Figure 1 shows the common nail, and fig. 2 the same made ready for use. The hammer must be only a little heavier than a tack hammer, or it will bend, and not drive the nail, and it must be used with light, sharp blows.

Let us commence now to put on a shoe. The old one is to be removed, if not already off, and the old nails drawn out; if any fragments remain, drive them out with the punch. This is important; a piece left in might work through the crust into the foot, and lame the horse, and he would then have the founder, or a sprain, or be lamed in the stifle, and it might be recommended to blister bim, or to fire him, or to

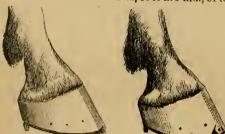

Fig. 3.—RIGHT.

Fig. 4.-wrone.

torture him in many ways; all of which may be avoided, if care he taken not to leave pieces of nails in his hoof. Then take the horse's foot between the knees; place the shoe, and set a nail so that the turned point will pass outwardly, an inch and a half at least, above the edge of the shoe; hold the fingers on the hoof, where the nail should come through, and if it does not come out just right, draw it and try again; don't drive it too far before stopping. There is no danger of hurting the horse, if you stop in time; and after one or two trials, you will hit the exact spot; practice will soon teach.

Avoid driving any nail too low down; they should all come out evenly. If one is driven too low, a piece of the hoof will either split off at conce, or it will break off soon. Figure 3 shows how the nails ought to be placed, while figure 4 shows them badly placed,

but as they may very often be seen. As the nails are driven through, turn them down until all are in; then, with the pincers, nip them off an eighth of an inch from the hoof. Put the iron block under the head of a nail (first turning round and taking the horse's foot in the lap over one thigh), turn the point downwards, and clinch it into the hoof; proceed thus all around, and the job is finished. The horse may now go to work, and that shoe will last until there is an opportunity for the blacksmith.

### A Fruit Ladder.

In previous numbers we have given designs for ladders which are self-supporting, and allow

ORCHARD-LADDER.

one to gather the fruit without resting at all upon the tree. We now illustrate a very simple ladder, which may be used upon old trees, and is much to be preferred to the ordinary form, as it may be set among the limbs without injuring the branches, or knocking off the fruit spurs. It is light and portable, and so simple, that the engraving does not need any explanation. All choice fruit should be handpicked, and it is best to use a deep fruit basket, with a hook attached to the handle, to allow it to be suspended from a limb, in a convenient position. A deep basket is not liable to be upset by being unequally balauced.

### A Fumigator for Plants and Poultry.

Mr. A. M. Halstead brings us a drawing of an implement, which he finds very convenient where tobacco funigation is to be applied locally: A is a cylinder, made of tin,  $7^1/2$  inches long, by  $1^1/2$  in diameter; a a, is another cylinder, 2 inches diameter, 8 inches long, placed

outside the first, and the space p p between the two filled with plaster. B is a cap, or cover, fitting over the open end of the cylinder, likewise having  $^{1}/_{2}$  inch thickness of plaster, kept in place by an inner disk of tin. Through this passes a tube (O), connecting with I, which

is an India-rubber bulb, such as is used for syringes. D is a spout, extending 4 inches beyond the outside of the cylinder, the outer orifice being about  $^{1}/_{8}$  inch in diameter. H is the handle.

The inner cylinder, A, is filled, or partially so, with tobacco; a coal of fire dropped in, and the cap put on. This cap must fit tight. The bulb I is then worked with the hand, and forces the smoke from the spout in a dense jet. In smoking house-plants I take a large-sized paper bag, inflate it, and place it over one or more plants; fill the bag with smoke, and let it remain so for a few minutes. Insect life is by this treatment speedily and thoroughly extinguished.

For poultry, visit the hen-house, after the fowls have gone to roost, and, inserting the nose, or spout, of the fumigator under the feathers, in all parts of the body, puff the smoke through them, only being careful not to let the fowl inhale it, as it may produce insensibility. For sitting hens—inject the smoke into the feathers, and also into the straw or hay, and the cracks of the nests. I have cleansed nests by this mode, that were fairly alive with lice, either killing them, or driving them away.

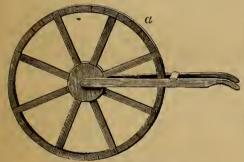

### Salt-Marsh Mud as a Fertilizer.

The application of salt-marsh mud as a topdressing for grass land, undertaken by J. D. Fish, of Stonington, Connecticut, has proved so satisfactory, that it is to be renewed again the present season. A steam-digger was used in the fall of 1869, and a large quantity was removed from the bottom of a salt-marsh pond to the adjoining meadows. It was dumped directly from the bucket of the digger into the cart, and drawn off by teams, and dropped in heaps where it was to be spread. It cost about 60 cents a load of a ton and a half. Beneficial results soon appeared upon the grass where it was spread. The first crop, it was estimated, was increased a third, or more, by the application. This May the effect was still more marked, and the contrast between this meadow. and the adjoining lands not treated with this fertilizer, is very striking. The line where the dressing stopped, is very distinct. All over the meadow the grasses are well set; the white and red clover have come in abundantly, and the herd's-grass is well rooted. A few acres of better land and grass were treated the same season with a dressing of rock-weed, which is considered one of the best fertilizers drawn from the sea. About the same value in money per acre was put in the rock-weed as in the salt-marsh mud. The yield of the land dressed with the weed was much less the first season, and this spring there is four times the grass upon the land dressed with the mud. It is estimated that a heavy dressing of stable manure, costing twice as much, would not have put the land in so good condition as it now is. If the season is

favorable, the yield will not be less than two tons of hay to the acre. There can be no doubt, that these salt-water ditches and ponds, full of decayed sea-weed and marine deposits, are one of the cheapest sources of manure to the shore farmer. It is by no means necessary to have a steam-digger to procure it. In many places the teams can be driven to the edge of the ditches and loaded. Even where planks and wheelbarrows are necessary at low tide, it will pay well to get it. It is much richer in ammonia than common yard manure, and will help all farm crops. The shore farmer has no occasion to invest in guano or superphosphate, if he will liberally use this neglected fertilizer. If the mud is to be carted a half-mile or more, the extra expense of removing it from the ditch with the wheelbarrow will be compensated in part by the lighter cartage, as it will lose half its weight in the water that drains from it. This fertilizer is accessible at all seasons of the year, at every low tide, and the experiments upon Mr. Fish's farm show that it pays better than sea-weed. CONNECTICUT.

### An Odometer, or Measuring-Wheel

Wm. H. Barnes, Oakwood, Kansas, sends a drawing of a wheel, for measuring the boundaries of fields. It is exactly one rod (16<sup>1</sup>/<sub>2</sub> feet) in circumference, and at one point a pin is

ODOMETER, OR MEASURING-WHEEL.

placed, which every time it comes round indicates that one rod of ground has been passed over. This instrument can be made useful in laying out fields, and we would suggest the advantage of arranging farms into such divisions, that the size can be easily calculated and remembered. For instance, a field 40 rods square contains 10 acres; 80 rods square contains 40 acres. Where the original division of the land has been made in squares, as in the Western States, this is easily done; but even in the Eastern States, where boundaries are often very irregular, fields may be made to approach the square form more commonly than they now are. To ascertain the contents of a square field, multiply the length of one side, in rods, by that of the next side to it, and divide by 160; this will give the number of acres.

#### How to Build a Boat.

Rivers and lakes being so plentifully interspersed over our territory, boats become articles of great convenience, or absolute necessity, and the ability to construct one, however rude it may be, is a useful accomplishment.

We aim in this article to give directions for constructing a boat, capacious enough to carry two good-sized men and a fat buck, if they should ever be so lucky as to be compelled to carry one home, and at the same time sufficiently light to enable it to be carried about eas-

ily, when required to be removed from one piece of water to another, overland.

The boat is flat-bottomed, and the keel or bot-

Fig. 1.—THE BOAT IN USE.

tom is of board three quarters of an inch in thickness, of white pine, or other light wood that will not readily split. The length of the boat represented is nine feet, width two to three feet, depth eighteen inches. These proportions may be varied to suit circumstances.

To shape the bottom or keel, take two boards of the character before mentioned, and twelve inches wide, join them together by a tongue-and-groove joint, make the joint water-tight by means of pitch, and fasten a cleat

across with clinch-nails or screws, to prevent its spreading. Mark out with a pencil the shape represented in figure 2. Cut this out very accurately, and plane very smoothly to line, with a slight bevel upwards. The more carefully this is done, the closer the joint and the dryer the boat will be.

The stem is made, preferably, of a tamarack "knee;" if this can not be readily procured, cut out of soft maple a "knee" one inch thick, as a substitute. This should represent an angle of something over 90 degrees, so as to give a forward rake, as in figure 3. The front of the upright portion should be beveled to a fine edge, the bottom dressed square, and fitted to the keel in its place with screws, or wrought nails riveted over burrs. The stern (figure 4) is of similar stuff to the keel, cut 6 inches wider at the top

Fig. 4.—BOAT TURNED TO SHOW BOTTOM AND STERN.

than at the bottom. The side boards should be of quarter-inch spruce stuff, well seasoned, and dressed, at least on the outside, to present the least resistance to the water. To give the boat the proper shape, cut out patterns representing the cross section of it at those parts crossed by

the dotted lines. The sides should spread a little, that is, should be wider at the gunwale than at the keel, say 6 to 12 inches. The patterns should be cut accordingly, and be tacked lightly to the keel-board, to hold them

in their place until done with. The dotted lines which cross the boat are drawn at equal distances, and show the width at those places which is greatest a little back of the center (figure 2). It is a great point in hunting to have

a boat that will make no ripple, and this gradual decrease of width towards the stern avoids all noise as the boat passes along. A boat of this

pattern will do this perfectly, and will be found easier to row or paddle. When the molds are properly placed, take the boards-which should have been previously soaked at the ends in water-and fit them to their places, holding them with a clamp, until securely nailed to the stem and stern; all nails which pass through the boards where they lap, should be clinched on the inside; boat nails should be used. When the first board, which is the bottom one, is put on, fit the next, allowing three quarters of an inch to lap. Between the boards, at the lap, place a piece of thick

cotton cloth, dipped in tar, which will make the joint water-tight, or nearly so, and calking will be unnecessary; then fit on the top board, taking care the upper edge has a proper sweep; when the boards are fastened, put in two ribs, which should be of white oak, half an inch

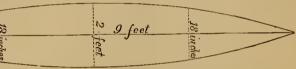

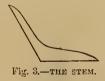

Fig. 2.—The bottom of the boat.

thick, and one and a half wide; soak them thoroughly, until they are pliable enough to bend into their places, and secure them by nails clinched on the inside. These should be placed midway between the molds, and not only

strengthen the frame, but give a bearing for the feet of the rower. A piece of tin should be bent over the stem, and nailed from bottom to top, for a cutwater. Before putting this

piece of tin on, fill in well with pitch and tallow.

The molds may now be removed; a strip two inches wide and one half thick should then be nailed all around on the inside; cleats are to be nailed on, for the thwarts (or seats)

which should be placed six inches below the gunwale or edge; the hinder seat may be made of the lid of a locker or box, in which tools, nails, lines, a supply of putty, tallow, pieces of tarred canvas and tin, should be stowed away, as re-

sources in case of damage or leaking. The bow of the boat should have a similar place made, to hold a supply of eatables when necessary. A baling dipper should be stowed away in one of these lockers. The bottoms of these lockers must be elevated two or three inches above the

Fig. 5.—BOAT, SHOWING RIBS, LOCKERS, AND SEAT.

keel, to keep the contents dry. Fig. 5 shows the arrangement of the lockers and seat.

A ring-bolt and cord, sufficiently long, should be attached to the bow, for the purpose of tying up. To finish up the job, the seams must be gone over carefully, and putty and white lead be applied to every crack; then two coats of paint ought to be laid on, the name painted on the stern, and she is ready for the launch.

A pair of oars may be made of ash, or, what is

preferable, a pair of paddles, like the one shown in figure 6. When properly made and used, paddles are much more convenient and efficient than oars. In using a paddle, one has his face to the front, and can see all ahead of him; in rowing, it is necessarily the opposite to this. If oars are used, rowlocks must be fitted on to the sides. To make a paddle, take a piece of inch board (cedar is the lightest and hest, but an oak paddle is very durable), six inches wide; dress out the blade quarter of an inch thick at the edges, half inch at the center, gradually increasing the thickness towards the handle. The handle may be whittled down until it fits the hand comfortably, then dress it with sand-paper perfectly smooth, and rnb with oil; a smooth handle will not blister the hands. A boat thus made will look very nicely, but if means and time are wanting to finish it as here described, a rough

Fig. 6. one may be put together very quickly and cheaply by using the same or lighter materials in a rougher fashion. In place of three side boards, one wide board (12 inches) may be used, and the seats laid across flush with the top.

### Brooms for the Stable and Barn-yard.

A cleanly horse or cow stable is very desirable, and will be appreciated, especially by

the women folks, who often are troubled to find a clean spot whereon to place their milkingstool, to say nothing of their spreading robes. If cleanliness is next to godliness, in the house or person, very surely it is equally so in the stable or barn-yard; many highly improper feelings and expressions arise through contact with dirt or filth, in places where it ought not to be. The want of Fig. 1.—STABLE BROOM. brooms, or scrapers, is

made an excuse for dirt lying about where it is not wanted, and this excuse is valid to a great extent, as a stable-broom, fit to use, is rarely seen. The broom represented in figure 1, is made of twigs; birch being the best, as it is long and straight. Any stiff brush, however, will answer. Cut the twigs of a proper length -30 inches will make a good broom-lay them in a box, made

Fig. 2.—BOX FOR MAKING BROOMS.

like that shown in figure 2, draw them tightly together with the binders (fig. 3), which are stout sticks placed through eyes at the end of a short rope, wound once around the bundle; when pressed apart, they draw the twigs together with great force. Tie two pieces of cord (which should have been already laid across the box in the slots) around the broom; when it may be taken out and well bound with several rounds of strong tarred twine. For a handle take a stick long and stout enough, sharpen the point, and drive it into the center of the broom, until it has a good hold. The broom is then ready for use. It is hardly necessary to

Fig. 3.—BINDER FOR BROOMS.

say that this is not a lady's broom; and yet we have seen a lady handle one with vigor, rather than not have a clean place to milk in.

### Will it Pay to Cook Corn for Hogs?

Mr. J. M. Martin, of Louisiana, writes to the American Agriculturist as follows: "In the Agricultural Report of Missouri for 1870, Mr. A. E. Trabue asserts, after making very careful experiments, that Indian corn in the crude state is better for fattening hogs than when boiled or steamed. His report is so positive, that, having had no experience myself, I am in doubt whether I shall make certain preparations for cooking the grain. I am desirous to make my own pork, and had concluded to place several sugar-kettles in a convenient position for boiling and steaming food, but desisted after reading this report. I would be pleased to hear from you on this subject."

REMARKS.—There are breeds or sorts of hogs that grow so slowly, that they can eat and digest more food than they can assimilate or turn into flesh and fat. For such hogs cooking the food would do no good, and probably by deranging the digestive organs and bowels would do positive injury.

On the other hand, we have breeds of pigs that are capable of assimilating more food than they can digest. They have little offal, are exceedingly quiet, have been bred for generation after generation to simply eat, sleep, and grow fat. With such pigs, the main object of the feeder is to get them to eat and digest as much food as they are capable of assimilating or turning into flesh and fat. Grinding and cooking the corn, unquestionably renders it much more easily masticated and digested, and there can not be a doubt that such well-bred pigs as we have alluded to, will gain much faster on cooked grain than on uncooked. They will eat more food, or at any rate digest more, and will grow faster in proportion to the food consumed, than those pigs which eat and digest less. We have frequently shown why this result must follow, and can at this time only say that our correspondent will find the whole subject thoroughly discussed in "Harris on the Pig."

Whether to cook or not to cook, then, depends a good deal on the kind of hogs, their age, breed, and condition. If we were going to fatten a lot of common hogs that had been picking up their own living for eighteen months or two years, and their ancestors for generations had been accustomed to this kind of treatment: in other words, if they were slow-growing hogs, with a voracious appetite, and a stomach that could digest shoe-leather, we can see no use in cooking the corn for them. But if we intended to produce choice pork from pigs that mature early and fatten rapidly, we should, if going into the business on an extensive scale, certainly cook their food.-EDS.

### Harrowing for Different Effects.

The operation of harrowing is next in importance to that of plowing. The ends to be attained are threefold, viz.: to reduce the soil to a fine, mellow condition, to kill weeds, and to cover seeds. Now these three operations are widely different, and yet the same implement is in many cases used to effect them all. To reduce the soil, a heavy harrow, driven with a rapid motion, is required; if sod ground is to be reduced, a different style of tooth from the ordinary straight one is necessary; to kill weeds, a light, wide-spreading harrow, with sharp, straight teeth is wanted, that will tear up, and leave on the surface, every root and sprout. The teeth of such a harrow should be long, sharp, and run closely. To cover seeds, a harrow that will draw the soil along the surface without penetrating deeply is needed, and for economy of time and labor it should cover a wide space.

In making or procuring a harrow, the purposes to be served should be considered, and that one chosen which is best fitted to perform the work desired. The variety of harrows offered to farmers is so great, that one is almost bewildered in making a choice. For pulverizing the soil, the Nishwitz harrow is, probably, not excelled; for dressing sod-ground, the Shares coulter-harrow is very effective; for destroying weeds on ordinary fallows, the common, straighttooth harrow (with sharp teeth) has not yet been superseded; while for finishing a surface, and covering grass or clover seeds, or harrowing grain in spring, the Thomas Smoothing-harrow is the best that we have used.

### Don't Sell the Best Calves.

A really choice cow will readily bring eighty to one hundred dollars. A cow that will make one pound of butter per day during six months, and half a pound per day during two or three months more, is cheaper at one hundred dolars, than a cow that will do half as much, would be at fifty dollars. Poor cows are more plentiful than good ones; and where little or no attention is given to improving the stock, good cows are fast becoming scarcer. If one wants to find good cows, he has to follow the track of a drover, who is constantly raking over the country places to supply the demand of the large towns and great cities. Thus the farming localities are being constantly depleted. But this would be of no damage, if the supply was kept up, and this constant draft replaced with young stock. Here lies the trouble. Not only are cows in demand, but calves are equally sought after. The farmer is constantly tempted by drovers and butchers, from far and near, to dispose of his calves. The majority of them can not withstand the flutter of a greenback ornamented with a large X. The choicest calves are, of course, selected, and these are generally from the best cows. Ten dollars is thought to be a good price for a calf four weeks old, and pays better than fifteen for a year-old animal. So would five dollars a bushel be a high price for potato sets; but few farmers would be tempted to tear them out of newly planted hills for that money. But does he not

sell the seed of a valuable crop, when he parts with his best calves? Many men say it costs more to raise a cow than to buy one. This is palpably wrong, as will be seen if they sit down and figure it out. But if it were true now, it could not long remain so; for cows must be raised; and those who raise them must be paid profitably, or they will not do it. We confess that there is some ground for the idea that it does not pay to raise cows, wrong as it may be, and it lies just here: The poorest calves are selected for rearing; and as it costs as much, and sometimes more, to feed a poor calf from a poor cow, until maturity, when it probably is worth twenty-five to thirty dollars only, as it does to feed a good calf, that would make a cow worth double that money at two years old. There is actually a loss in the operation, and the farmer is out of pocket, not only indirectly, but directly, in having spent more than he can get back again. A merchant doing business thus, would soon find work for an assignee or the bankrupt court; but such are the advantages of the farmer's occupation, that he is able to live, and often do well, in spite of his unbusinesslike methods. Let him make farming a business; let him calculate and figure out results, as other men are obliged to do; and it will be found that there is no operation on the farm, but pays fair interest over and above a good remuneration for labor and attention, if such labor and attention are only well directed; and most surely will be find that there is more money in a good heiferealf, than any butcher could afford to give him, if he will only give the animal time to show it. So with a bull-calf; if one is to be raised, select the best. It is by a course of selection, that the present races of blooded stock have been built up; as it is by a contrary course, that the native stock has been run down. Our "native" stock has sprung from good sources, and if the best calves are retained on the farm, there will soon be a better supply of good cows.

A HUSKING PIN, which will be found very durable and worth preserving from one season to another, may be made out of a twenty-penny nail, ground sharp at the point and fitted with

a piece of leather, through which the second and third fingers are passed. Very neat and handsome ones may be cut out of bone.

### The Pig Question again.

The author of "Walks and Talks" says: "C. D. E.," of Muncy, Pa., writes us a letter on the breeds of pigs. He says: "I have just read 'Walks and Talks,' and the article on 'Berkshire vs. Chester Whites,' in the American Agriculturist for May, and have come to the conclusion that the hog breeders of this country must submit to the inevitable decree of fushion, and for the future go in for small instead of large porkers! "Well, let us reject the Chester hogs. They grow too large and 'coarse,' and are too heavy to handle. Let us try the Berkshire and the Essex, and if the fashion shall still tend downward, why not fall back upon the guinea-pig? What pot-pies they would make! Will our

friend 'Walks and Talks' consider this proposition seriously, and if he fails to indorse it, give us a reason for his refusal?"-I cannot indorse this proposed cross, for the simple reason that the guinea-pig is not a pig at all! And another objection is, even if he were a pig, he is too long in coming to maturity, in proportion to his size. What I want in a thorough-bred pig, designed for crossing with common sows, is smallness of bone, little offal, rapid growth, fine quality of meat, and carly maturity. I have no objection to size; but, so far as the efforts of breeders have yet gone, early maturity is always accompanied with a reduction of ultimate growth. If I were going to raise pigs to work in tread-powers, I should go in for large size and slow growth. But where pigs are required simply for converting corn into pork, I want such as will do this, and nothing else. The less corn is expended in producing bristles, bones, ears, legs, snout, and other offal, the more will there be left to produce good hams, pork, and lard. I do not want any more corn used to produce heat, motion, and the various functions of animal life than is necessary for health. I want the pig to eat all it can digest and assimilate, and the less of this digested food is used for any purpose, except the production of meat and fat, the more profit will there be in the business. Now, all this means rapid growth and early maturity; and early maturity is necessarily accompanied by a reduction in size.

Where cattle are kept solely for beef, breeders aim at early maturity; and such is also the ease when sheep are bred for mutton. On highpriced land, a farmer can not afford to raise an ox for beef, that does not mature till he is six years old. He must keep one that will mature in two or three years. Such an animal will not be quite as large as the slow-growing one, but the beef will be produced at far less cost. The only objection to the system is, that richer and more costly food has to be used; and furthermore, it is desirable to get an ox that attains a pretty good weight before he matures, for the reason that it costs considerable to produce the calf. It is a slow process. We get but one calf a year. But in the case of pigs, we not unfrequently get twenty in a year. They can be multiplied with immense rapidity, and at small cost, and there is far less necessity for aiming at large size. The cost of this pork-producing machine is so small, that if twenty of them will produce more and better pork, at less cost for food, than one big machine, I prefer the twenty little ones-and so will the consumers.

I am well aware that a good deal can be said on the other side. In my own case, I want my pigs to live on clover during the summer; and if we pushed early maturity and small size to its utmost limits, the pigs would not thrive on clover. They would need much more concentrated food. But at present we are in no danger of getting our breeds of pigs too small.

### The Brittany Cow Bessie.

Upon page 293 we give an engraving of a very interesting Brittany Cow, which is now the property of R. H.Allen, Esq., Summit, N. J., and, if we mistake not, was imported by him. Bessie is of a very dark, silver-gray color, with some white. When fresh she yields, upon ordinary good feed, from twelve to fourteen quarts of milk, and keeps up the supply well. Her hight at the fore-shoulders is three feet and four inches. She has a broad, heavy body, very small bones, a fine head and horns, and delicate limbs. This cow

is as gentle and familiar as a pet lamb. This breed is quite rare in this country, dark colors being the favorites. Since the dispersion of Mr. Maitland's herd, we know of no one engaged in breeding these useful animals.

### Drainage in Scotland.

There was published last year, under the auspices of the Highland and Agricultural Society of Scotland, an essay on Agricultural Drainage, for which the society's gold medal had been awarded to Mr. Hozier, its author. It has been said of another book, "What is good in it is not new, and what is new in it is not good." This would not be exactly a fair criticism of Mr. Hozier's essay, yet, at the same time, it would be more uncourteous than unfair to make it.

Land-drainage is not one of the exact sciences, it is true; still a good deal is known about it, and it is not to be expected that any new essay upon it should avoid repeating the fundamental principles that have been determined by long experience; consequently, we must expect to find in every new book much that is to be found in all of the old ones, and we may be well satisfied if, in addition to this, we find new and valuable principles set forth, or new and improved processes described. Mr. Hozier, while he proceeds systematically and well in giving directions for the laying out and execution of drainage works, advances some ideas which would be important if true, but which experience has led us to judge not to be true.

For instance, he insists on a fall of 1 foot in 200 feet, as the very least that can be allowed. Now, it is quite true that it is highly desirable to get this much fall when it is practicable, or even more; but there is an enormous amount of nearly level land that could not be drained at all, without the extensive use of open ditches, if this rule must be adhered to. It often happens that a main drain must be made 1,000 feet in length. If the fall of 1 in 200 is insisted upon, then the drain must be five feet higher at the head than at the outlet. If the land has this fall, well and good; but suppose it is a dead level on which we are to work, and that five feet is the utmost depth we can get at the outlet, then, if we follow the rule, the drain will run quite to the surface at its upper end. Now, it is possible to lay a drain so accurately that a fall of 1 in 1,000 (1/10 foot in 100 feet) will give a free and perfect current. There is a long main drain under the upper meadow in the Central Park that has only this fall. It was laid in 1860, and has always worked perfectly from that time until now. It is much easier to make a good drain on a fall of 1 in 600, and this would leave the upper end of the 1,000-foot drain in question, nearly 31/2 feet below the surface. We are strong advocates for all the fall it is practicable to get, but we also advocate the underdraining of land, in which the least practicable fall is all it is possible to get. If the work is properly done, very little fall will answer, but in such cases the grading of the bottom must be very carefully done, so that no fall shall be lost in one place by giving too much in another.

Mr. Hozier recommends that in heavy clay soils, drains should not be less than 2 feet 9 inches, nor more than 3 ft. 3 in. deep, and that the intervals between the drains be not more than 15 feet. This advice will not hold in many sections of America; for we rarely have such obdurate clays as he has in mind. Indeed, with a varied experience in drainage works in America, the writer has not found a soil that was not completely drained at 4 ft. depth, and

#### WATERING THE

H E R D .- DRAWN BY WILLIAM M. CARY.-Engraved for the American Agriculturist.

35 to 40 ft. intervals. These measurements have, however, often been found insufficient in England.

The point on which our author's ideas are most at variance with our own, is the size of tiles that it is best to use. He insists on the use of large tiles; nothing less than 21/2 inches diameter for lateral drains, and from 3-inch to 6-inch tiles for mains, 6-inch for the outlet of 12 acres. Our experience goes to show that 11/4-inch tiles for laterals answer not only as good, but a much better purpose than the large ones, while their cost, both for manufacture and for transportation, is less than half that of the 21/2-inch; we would use 4-inch tiles for the outlet of 12 acres.

Mr. Hozier thinks a drain should never be filled full by the hardest rain; we think it an advantage to have them flushed several times during the season, insuring their thorough cleansing. Considerable experience in the practice of both systems seems very clearly to sustain our idea, and the experiments instituted for the purpose by the sewerage engineers of cities show ample reason for its soundness.

Any reader who will use due caution about accepting what seems to us to be the heresics of this essay, will find it replete with practical suggestions, and with sound arguments in favor of underdraining, and will be well repaid for all the time and care he may give it. There is given in it an instance of the complete stoppage of a stone culvert, not less than 15 inches square in the water way, by the roots of a tree, "and, though the drain was opened and cleared at considerable trouble and expense, hardly a year clapsed before the mass juside was as impenetrable as ever."

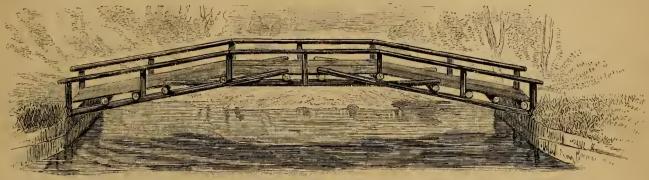

### Watering the Herd.

A scarcity of water is something with which the majority of our readers are fortunately not familiar. We do not refer to the failure of streams and wells, which occurs in all sections in an unusually dry season, but a perennial searcity of water, where miles and miles must be crossed before one can supply his own wants and those of his animals. Some excellent grazing regions in the far West and South-west, where the most nutritious grasses abound, are often discouragingly dry, and the droves and herds must be driven a long distance from their feeding-grounds to water. To the traveler across these plains the occurrence of water is a matter of the greatest interest. The other two requisites of a camping-ground, grass and fuel, he generally feels sure of finding by searching for them, but water occurs only in certain localities. The day's travel, whether of a few persons or a large train, is governed by the distance between watering-places. The writer has, upon several occasions, found these from filty to seventy-five miles apart-distances somewhat appalling to one having charge of a slowmoving train. After the forced abstinence from water that attends a long march, the animals become almost frantic when they reach camp, and rush for the pool or stream in the wildest mauner. In traveling in a country where Indians are troublesome, and the camp, as is frequently the case, is at some distance from the water, it requires no little circumspection on the part of those in charge of the animals to prevent a surprise on the part of the enemy. Many an emigrant train has been left without means of transportation by allowing the animals to be driven to water without a guard sufficiently strong to repel an attack.

### Rustic Bridges.

Where there is a stream of water in public or private grounds, an opportunity is offered for introducing a pleasing ornamental feature The bridge we have figured was exhibited at the International Exposition of Horticulture, that was held at St. Petersburgh, Russia, in 1869, and attracted much attention; it was first engraved in L'Illustration Horticole.

we proceed to give, will enable any carpenter of ordinary intelligence to construct it. Many of them will no doubt object to the dimensions of the rafters, thickness of the sushes, etc., as it is a besetting fault with these men

RUSTIC BRIDGE, SHOWN AT THE INTERNATIONAL HORTICULTURAL EXHIBITION AT ST. PETERSBURG

in the shape of a bridge. A structure of this kind may be very simple and cheap, or highly claborate and expensive, according to the tastes and means of the proprietor. It is only in places which are highly embellished that an expensive structure will be in keeping with its

Fig. 3.—a, Locust Post; b, Plate; c, Rafter; d, Sash; e, Weatherboarding.

surroundings, while in most all situations a rustic bridge is in good taste. A rustic bridge may be made very claborate in its workmanship, or it may be exceedingly simple. Some examples of costly structures of this kind may be seen at Central Park. We present an engraving of a very simple one, which is not only pleasing in its appearance, but its construction is such as to render it substantial and perma-

nent. The engraving shows the structure so plainly that no description is needed. It will be seen that it is self-supporting. In bridges of all kinds every care should be taken to make the abutments secure and the approaches laid in a substantial manner. The railing in the

### How to Build a Cheap Greenhouse.

BY JAMES HOGG.

The plans which we give are intended for a small greenhouse suitable for an ordinary coun-

try residence where no regular gardener is kept, and where the care of such an appendage to the house would devolve upon the family. Such a greenhouse can be built separate from the dwelling, and a shed at tached to the northerly end for the purposes of a potting shed, the storage of tools, etc., but as drawn it is intended to be attached to the dwelling, and entered therefrom by means of a door from one of the rooms. This we consider preferable to having it detached, as it is accessible and enjoyable in all weathers, and if the en-

trance door from the house is glazed it renders the room to which it adjoins remarkably cheerful and elegant. We prefer a double-pitched roof for such a greenhouse, to a lean-to, or single pitch, as it gets the benefit of the early morning

and latest evening sun, an item of much importance in growing plants, and escapes the intenser heat of the noon-day sun (which in March and April is very great), as the end is perpendicular, the side of the roof being at an angle of forty-five degrees. Besides these benefits, plants grow better in such houses, because they have more light on every side, and consequently are not liable to become so drawn and onesided as they are in a lean-to.

The proper exposure is southerly, that is, with the end facing any of the south-erly points of the compass, from W.S.W. to S.E.; if any preference can be given in

locating it, it should be given to the easterly points, as it enables it to receive more of the early sun during the shortest days of winter. Our drawings, with the descriptions which

generally to make the rafters and other woodwork of such structures entirely too heavy. A plant structure cannot be made too light, provided due strength is maintained. It will be noticed that we do away entirely with all plates

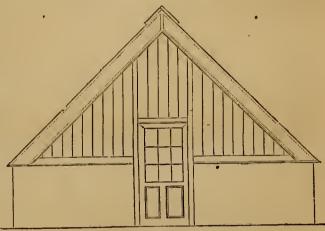

Fig. 1.-END VIEW OF GREENHOUSE.

and sills, and also tenoned and mortised joints, as these are only so many places for the admission of water and subsequent decay, and also involve much outlay for material and labor.

The sashes measure 6 feet 3 inches long, by 3 feet one inch wide, and one and a half inch thick, made of the best quality of white pine.

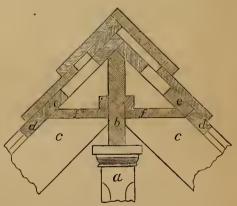

Fig. 4.-DETAILS OF ROOF. a, Pillar; b, Ridge-pole; c, Rafters; d, Sash;  $\epsilon$ , Stoppiece; f, Ceiling.

The side rails should be 21/2 inches wide, the top rail 3 inches, and the bottom rail 4 inches wide. The sash bars should be one inch and an eighth wide, rabbeted out five eighths of an inch deep, and blis of an inch wide, leaving the parting strip half an inch wide; this should over-

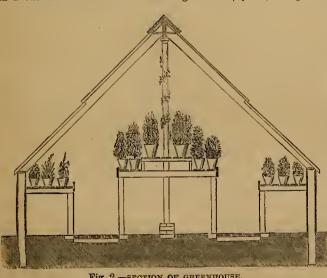

Fig. 2.—section of greenhouse.

bridge here given is exceedingly plain. It can be made much more ornamental by the introduction of rustic panels, and some vines trained along it would add greatly to the rustic effect.

lap the bottom rail 21/2 inches. The top rail should not be grooved out to receive the upper edge of the upper pane of glass, as in case of breakage it is almost impossible to clean it out; it should, therefore, be rabbeted to correspond with the sash-bars. A cross-bar of iron one quarter of an inch thick by half an inch wide, should be

Fig. 5,-GROUND PLAN OF GREENHOUSE.

a. a. Front Platform for Plants; b, b, Center Platform; c, c, Side of Dwellings stage, and the outer end is sup-

put across the middle of each sash, only lapping one inch on each side rail, or a cross-bar of ash or some similar wood may be used: it should be about five eighths of an inch thick and three quarters of an inch wide, and notched out half its depth to receive the sash bars; these last should not be notched out on any account, as it weakens the sash very materially. The screws used in putting on these cross-bars should be dipped in boiled linseed oil, to prevent them rusting in the sash bars, which would weaken them. The joints should all be put together with strong glue and not with white or red lead and oil; the glue makes a much stronger joint, and when the sash is kept well painted, will hold as long as the wood lasts, as it does not evaporate or dry out, as the oil does.

The glass should be  $6\times8$  French seconds, each pane to overlap the other about three eighths of an inch; the lower panes should overlap the bottom rail at least half an inch. They should not be bedded in putty when put in, as they cannot be so evenly laid when that is done; after being puttied on the face, they should be back-puttied, that is, the angular spaces formed by the overlaps should be filled up with putty; this makes a much neater job than any other way. Each pane should be fastened down at the overlap with a half-inch copper or zinc sparable on each side.

The outside measure of the house is 18 feet 9 inches wide (from east to west), and 19 feet long, from north to south; over all, from the ground level to the top of the ridge-pole, is 14 feet. In constructing it, locust posts 7 or 8 feet long, squared on two sides to 4 inches thick, are set in the ground 3 feet 1 inch apart from center to center, leaving 4 feet above the ground level. These are weather-boarded inside and out-

side; on the top of these posts, after being sawed off level and square, a strip of white pine 2 inches thick and 6 inches wide is nailed down, which answers the purpose of a plate. It is beveled on the front to the angle of the rafters (45 degrees), and from where the upper edge of the lower rail of the sash touches it, it is bevel-

ed back to the thickness of an inch, the object of this being to prevent the water-drip lying on it and rotting it. The space between the weather-boarding is left vacant, as the still, inclosed air is a better non-conductor of cold than any filling would be. The rafters are 6 inches deep by 3 inches wide, an inch and a half of thickness being cut away for the lower sash, so that for the lower half of their length they are only 41 2 inches deep. They may be made of uniform depth through their whole length, and a thickness strip planted on under the upper sash. The toe of the lower end of each rafter rests upon the plate strip, and is nailed through it to the head of the post immediately beneath it. A ridgepole, 2 inches by 12 inches, is carried the whole length of the house; the end next the dwelling is supported by a bracket; two intermediate posts to carry it are placed one at each end of the center plantported by a small strip carried

up from the door-head. We sometimes see houses constructed without a ridge-pole, but the roof in such cases is always very weak and continually spreading, sometimes causing them to fall in. The upper end of the rafters is nailed to this ridge-pole. No parting strip is necessary between the sashes, nor is it necessary to have the rafter grooved out under each sash, as is sometimes done, to carry off the water. Such channels soon become choked up by dust and dirt, and are the favorite resort of all sorts of insects; they are, indeed, worse than useless.

A stop piece 1 ½ by 4 inches, is nailed along the rafters at the head of the upper sashes, and a similar strip is carried along the peak of the rafters; these two strips carry the weather-boarding of the eap; this weather-boarding should cover the upper rail of the sash about 2 inches. Inside, a narrow ceiling is carried across; this gives a neater appearance to the inside than if the peak above the sashes is left open.

### The Egyptian Beet.

BY PETER HENDERSON.

I send you six specimens of early Beets; the larger is the "Egyptian," the other the "Shorttop Round." You will observe that the Egyptian is more than double the size of the other, the average circumference being 17 inches, while that of the Short-top Round is only 8 inches. Both these varieties were sown under exactly similar conditions of soil and manuring, on April 15th. The Egyptian was first marketed on June 5th, and brought ten dollars per 100 bunches—about two cents each; the other was first sent in on June 17th, and sold for four dollars per 100 bunches, or less than one cent each. And even

at this date, July 1st, when the market is flooded, the superior size of the Egyptian gives it a freer sale, at 25 per cent higher rates, than the old variety. From the smallness of the tops of the Egyptian, at least one fourth greater number can be grown on the same space than we have been in the habit of raising, so that it must take the place of all other varieties, either for market or private gardens. Last year I tried the new beet, very carelessly indeed, but even in that way saw that in earliness it was in advance of the other; but this season, when grown by the aere, side by side with our old varieties, the difference is greater than I have ever yet seen in any other vegetable. It is fully twelve days ahead of the other round varieties in earliness, and that means that the profit per acre will at least be doubled, when grown in competition with the old sorts. In other words, if the old Short-top Round, or Bassano, gave us a profit of three hundred dollars per acre, the Egyptian is certain to give six hundred dollars. This advantage, of course, will only be temporary, for just as soon as its cultivation becomes general, the profits will come down to the old level. Those growing the Egyptian for the next year or two, will most likely reap the benefit; for we all know, that no matter what merit any article may have, it takes years before all the people find it out.

[From our experiments this year with several kinds of early beets, we are confident that Mr. Henderson does not overstate the superiority of the Egyptian. With usit was far ahead of any of some half-dozen varieties. If other results are obtained, we shall be inclined to attribute them to false seed, as one of our dealers, in ordering the Egyptian from an English house, received some seed with the word that they were out of the Egyptian, but had sent some "just as good," and which they were selling for Egyptian.—Ed.]

#### Notes from the Pines.

Grapes.—The moral influence of gardening in general has formed the theme of more than one essayist. The subject might be treated with special reference to grape culture, though I don't propose to do it any further than to say that a small vineyard affords an abundant field for the exercise of patience and many other virtues. Last year I planted a little vineyard of some fifty vines, in about half that number of varieties. The vines were partly one year old, others two and three, and included old and well-known as well as new and untested sorts. The vines all made a fair first year's growth; in fall, were cut back to near the ground, and left during the winter without any protection. Their behavior this year, now that they are well established, allows me to form a fair opinion as to which

VARIETIES are adapted to my soil. There are some which, like the Concord, succeed almost anywhere, and others, like the Iona, that succeed almost nowhere. What a magnificent fruit the Iona is when it will grow as it does in some localities in Ohio and elsewhere! Here a young vine will make a fair growth the first year, a smaller one the second, and by the third it will have dwindled away to a stick with a few curled and half-developed leaves upon it, and only fit to be cast out. The South Carolina Hybrids of Dr. Wylie, from which much was expected, may be considered as failures here. I have had them for three and five years, and do not care to bother with them any longer. The Rogers' grapes and the Martha seem to

flourish with great vigor, and if one wishes fruit without looking for high quality, it can be had from these and the Concord. The Eumelan makes an excellent growth and is a precocious bearer. Salem, though one of the Rogers set, does miserably, while the new varieties, Croton and Senasqua, are thus far the pets of my collection. But it is hardly worth while to go through the list. Suffice it to say that, as a general thing, the higher qualities of grapes will not do well on light soils.

MILDEW appeared remarkably early this year; so much sooner than usual, that it had niade some headway before I noticed it. The fungus of the mildew is very freaky in its selection of subjects. Some of Rogers' grapes, such as Agawam, with leaves so large and leathery that they would seem able to defy any thing, are badly scorched, while the comparatively delicate foliage of the Croton—which is, moreover, largely foreign—is entirely untouched. Eumelan has mildewed badly this year. Mildew is easily kept in subjection if sulphur be used in time, and it is only through inattention that any serious damage need occur.

INSECTS.—Some one has said that horticulture is merely "a fight with weeds and insects." That man must have had a vineyard, for the fight must be kept up, with insects at least, from before the opening of the buds until the ripe clusters are gathered. The unopened buds are bored by a Flea-beetle; the leaves of the infant shoot, before it is an inch long, are the home of the larva of a Plume. At flowering come the Rose-bugs, which feed away upon the embryo clusters, and between whiles doing a little amateur "piuching" wherever they can find a shoot that you are particularly desirous should be prolonged. Along with the Rosebugs come other beetles, from as small as they up to the Spotted Pelidnota, which is larger than a May-bug. Some of these beetles attack the leaf just where its ribs join the leaf-stalkthe very place of all where the most injury can be done-and in a few days your broad and vigorous leaf flaps in the wind like a tattered banner. Then the caterpillars, from the beautiful-great fellows that travel singly, to the diminutive Procris, that passes in military order over the surface of the leaf like a well-drilled platoon-keeping "a light touch of the elbows," so close are they. Then the little gall-flies, seldom seen, save by their work, puncture the leaves, and the resulting excrescences make the vine look as if it had some unpleasant cutaneous disease, while other gall insects attack the young shoots, giving them a dissipated, gouty look. The pulp of the berry is infested by the larva of a curculio, and a troublesome brother of his makes its home in the very grape-seed itself. I have not mentioned the root-borers and stem-borers, as these have not troubled me. Indeed, a work upon the insects injurious to the grape-vine would make a handsome volume. The trouble with insects is so serious, and the desire of the grower to avoid it is so great, that quackery has a fine chance for the sale of its nostrums. I place no reliance upon any thing except actual slaughter, Hand-picking, and shaking off and killing, will do much to keep insects in check, while natural foes, in the shape of parasitic insects, sooner or later come to our aid.

Training.—A visitor called while I was at work among my trellises, and asked what "system" I followed in training. "None at all, sir!" I can not imagine any thing more monotonous than to go over a vineyard and try to make

cach vine look like the next, and all like a picture in a book. When a doctor talks about treating the sick according to some "system," I set him down as a quack. A physician treats his patient according to his individual peculiarities and needs, and this is what a vine-dresser should do with his vines. His object should be to procure the greatest amount of fruit, with proper regard to the future well-being of the vines. If he understands enough about the vine to do this, he need not bother himself about anybody's system.

Tendrils.—I have noticed in both my specimens of Rogers' 39, a strong tendency to produce leaves upon the tendrils. I have observed this now and then in other varieties, but never saw more than a single instance or so on a vine. I would like to know if this is a constant peculiarity of this variety?

EVERGREENS.—It is the general custom to plant evergreens later than we do deciduous trees, it being thought that they succeed better if moved just as the new growth is starting. My experience with planting at this time is not such as to induce me to commend it to others, and another year I shall try putting them out earlier. The success of the evergreens set out last fall in City Hall Park is strong evidence in favor of fall planting. A large number of trees, of unusual size, were put out, and we have not noticed a single failure. The autumn last year was very mild, and the trees had time to become well established before cold weather came on.

Pruning Evergreens is best done after the season's growth is made, and when the new wood is hardening. A badly-shaped tree may be made comely by the proper use of the knife. By all means, preserve the lower branches, as the great beauty of an evergreen is in its being well furnished to the ground. If upper branches overhang the lower tiers, these last will die out for want of light and air. A little judicious pruning will prevent this.

Peas.-Among a half-dozen of early varieties tried this spring, Carter's First Crop were decidedly the earliest-a full week ahead of the popular Dan O'Rourke. I think peas are the most unsatisfactory crop in the garden. In our climate they come forward too rapidly, and one gets but two pickings at most from the early sorts before they have become too hard for the table. What we need for the family garden is a pea that will mature gradually and prolong the season. Until we can get a variety of this kind, perhaps the best way is to plant a succession of dwarf sorts. The Little Gem is the best dwarf sort, but the trouble is that the seed, for some reason, is very uncertain. I have grown it for three years, and have never succeeded in getting an even stand.

Spiræa Callosa is one of the best of the late-blooming spiræas, and I find this and its white variety valuable for blooming at mid-summer, when we have so few shrubs in bloom. I find that the white variety, like the White Wiegela, keeps in bloom much longer than the regular rose-colored sort.

Hardy Cactuses.—I have now four species of the eactus family that I know to be hardy, and have a half-dozen or more from the mountains of Utah, on trial. If we can get a set of these grotesque plants that will endure our winters, it will allow us to introduce an interesting feature into our gardens. A small bed

of these, and another of succulents, prove a great attraction to visitors, as their forms are so different from the plants commonly met with.

### A New Tuberose.

Some years ago one of our most observing florists noticed among his tuberoses one that produced much larger flowers than the rest, and at the same time was of low growth. This particular bulb was saved and quietly propagated from, until quite a stock was accumulated, which he sold at a round price to two of our florists. We are not informed when this novelty will be offered for sale, but florists and amateurs will be glad to know that there is in store for them a tuberose which grows only about eighteen inches high, and produces flowers of double the size of the ordinary kind. This variety will be a favorite with those who force tuberoses for cut-flowers, as the long stems of the common kinds are always troublesome.

### The Yellow Asphodel.

The Asphodel is mentioned by the early Greek and Latin poets as a plant which was placed in tombs, or planted around them, that its roots might furnish food for the dead. There is some doubt if the plant we now know as Asphodel, is the one alluded to by the ancient writers. At all events, the Asphodel (Asphodelus luteus) is one of the oldest of garden-plants, it having been introduced into England from the south of Europe nearly three hundred years ago. It is one of those old-fashioned things rarely to be met with, and we have long cherished a clump of it mainly on account of its antiquity. It is not without claims as an ornamental plant, and if it were brought out as a new discovery, it would have glowing descriptions in the catalogues. The Asphodel is perfectly hardy; early in spring it throws up from its fleshy roots a tuft of narrow leaves of a pale green, and later a flower-stalk clothed with similar leaves, and about three feet high. The flower-spike is some eight inches long, and as the flowers open gradually from below upwards, it remains for some time in bloom. The engraving on the next page is much reduced in size. The flowers are bright yellow, and are followed by a nearly globular seed-pod about the size of a cherry. The plant forms an abundant supply of offsets which allow of its ready multiplication. Having a rather stately appearance, and being perfectly able to take care of itself when once established, the Yellow Asphodel is a plant well adapted to the "wild garden." There is a double variety which we have not seen, and several other species are known in cultivation.

### The Cabbage Maggot and Caterpillar. BY PETER HENDERSON.

Quite a number of the readers of the Agriculturist have applied to me for a remedy to destroy the maggot that attacks the roots of cabbage and cauliflower, and also for the caterpillar that attacks the leaves. I regret to say I know of no certain remedy. Nothing is more difficult and unsatisfactory than the attempt to defeat the ravages of insects in the open field and I have yet to know of any being entirely successful. In the long-cultivated gardens of New Jersey and Long Island we do not suffer much from the ravages of either of the above pests. The soil is so repeatedly turned over and disturbed that I presume the maggot is not

left long enough at rest to develop itself in sufficient numbers to produce any great injury; and the luxurious growth resulting from the continued and heavy manuring seems to be less inviting to the butterfly to deposit her eggs than the feebler growth of less fertile soils. Or it may

be that the increase of English sparrows is help-

YELLOW ASPHODEL.

ing us in both these cases, by destroying the fly that produces the maggot, or the small white butterfly that produces the caterpillar, or it may be that they feed on the caterpillar itself, as I know they do with the rose-slug. At all events, the farmer will gain by encouraging and caring for the sparrows. A few years ago the street trees of New York, Brooklyn, and Jersey City were festooned by myriads of the "measuring worm;" now, since the advent of the sparrows, they are scarcely ever seen. The sparrows will live in any section of the country if properly housed and fed in winter, and if such care was general, we would hear fewer complaints of iusect ravages. True, they might exact wages for their services in requiring a little grain, but of the two evils, better submit to that done by the birds than to the insects.

I will relate an experiment to destroy the cabbage caterpillar, which occurred during this month, in my immediate neighborhood. One of my neighbors, no less a man than the noted John Reilly, found that the pest was attacking his cabbages; he came to me, and asked what I thought of his using slaked lime to dust over them. I told him I had but little faith in it. But he was resolved to try it, and put it on at the rate of four or five barrels to the acre, carefully dusting it on each plant. This was about the 1st of June; on the 17th he came to me in

triumph, saying that the remedy had been effectual, and that there was hardly a caterpillar to be seen. But, unfortunately for the experiment, but fortunately for truth, Patrick Smith's cabbage patch, that had been also attacked when Reilly's was, but had received no lime, was also entirely clear of the caterpillar! The cure was

traceable to another cause: we had had a deluging rain, that swept off the caterpillars and started the cabbages into luxuriant growth at the same time. Had the insect come in the legions it comes in some places, had there been no rain, and had the dry, hot weather continued, the lime dust would have failed.

Last summer I had with great care nursed along in my greenhouses for many weeks a collection of rare varieties of German Stock Gillyflowers, a plant belonging to the same natural order (Crucifera) as the cabbage. Upwards of two thousand plants were set out in June, ou rather poor soil; by the middle of July they had made splendid plants, one foot in diameter, and just as they were bursting into bloom we observed the little white butterfly moving amongst them, and knew what might be expected to follow. Lime dust, solutions of carbolic soap, whale-oil soap, and sundry other things were used, all to no effect, and by middle of August the plants were literally eaten up by the caterpillar. There is nothing more unpleasant than to tell any one suffering under a calamity that there is no tangible remedy; but it is infinitely better to do so

than to delude them with a false one. I have been a worker of the soil since my boyhood, and every year's experience convinces me of the helplessness of remedies against insects or other blighting plagues that attack vegetation in the open field. It is true that the amateur gardener may save his dozen or two of cabbages or roses by daily picking off or destroying; but when it comes to broad acres, I much doubt if ever any remedy will be found to be practicable. We have one consolation in knowing that these pests are only periodical, and never continne so as to permanently destroy.

[The views of an experienced cultivator, like Mr. Henderson, are always worthy of consideration. While his attempts to destroy insects may not have proved successful, we think effort in that direction should not be discouraged .- ED.]

### The Fraxinella, -(Dictamnus Fraxinella.)

A well-known horticulturist and a great lover of herbaceous plants once said to us that if he could have but one herbaceous plant it would be the Fraxinella. While we can not place so high an estimate as this upon it, we regard it as a valuable occupant of our border. It has been for a long time in cultivation, and in antiquity it is worthy to stand by the side of the Asphodel.

In good soil the Fraxinella grows to the hight of two or three feet. The leaves are pinnate, and from their resemblance to those of the Ash (Fraxinus), the plant has received its common name. The flowers are produced in a terminal raceme, and have five petals, four of which are erect, while one is bent downward, giving the

FRAXINELLA. - (Dictamnus Fraxinella.)

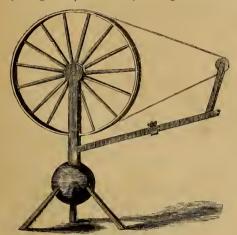

flower an irregular appearance. The stamens, which are long and conspicuous, are bent downwards and curved. The flowers are white, and there is a variety with the petals pale purple, marked with darker veius. All parts of the plant are highly aromatic; the stem, leaves, and the flower-stalks, particularly, are furnished with glands which secrete a volatile oil, having an odor something like lemons, or rather between that of oil of lemon and turpentine. This aroma is very agreeable to some persous, while to others it is offensive. At flowering time this secretion is produced in such abundance and is so freely diffused in the air around the plant, that it will burn with a flash when light is applied. We have never thought to try this experiment when our plants were in flower, but it is stated by so many reliable persons that we have no doubt of its truth. It is said to be most successful upon a mild, warm evening, when the air is perfectly still. The Fraxinella does not produce seed very abundantly, and the plants are several years in coming into flower. It is generally multiplied by division of the roots, which are very large and tough, and require care in dividing them in order to secure a bud to each piece of root. Formerly the roots of the Fraxinella were used in medicine, but like many other things of the kind, they have been dropped from the list of Materia Medica.

### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

### An Improved Spinning-Wheel.

One of the effects of the late war was to revive the almost forgotten accomplishment of spinning. It is to be hoped that spinning may not become one of the "lost arts," though we trust it will not require an occasional war to prevent it from passing out of knowledge. W. II. Swearingen, West Plains, Mo., sends us a sketch of a frame for a spinning-wheel, invented by a neighbor of his.

AN IMPROVED SPINNING-WHEEL

The improvement consists in the arrangement of the projecting arm, which is furnished with a joint that enables it to be folded when not in use; also, in the foundation for the post, which is a large ball, instead of a bench. The improvement seems to be a substantial one, providing for economy of space, which, in the majority of Western houses, is exceedingly limited.

### Home Topics.

BY FAITH ROCHESTER.

Practical Studies for a Young Woman at School.—Educational matters may surely have some place in the Household Department. I hope I shall not push them too far. But this letter from Annette K—— appeared to me as expressing one of the strongest wants of my own girlhood, and possibly of other young women. I do not feel competent to turn adviser, but I make public Annette's letter, and reply through the Agriculturist.

DEAR MADAM: I want to ask advice of some one, and my mother suggests that perhaps you will let me come to you. I am sixteen years old, but have never been to any school except our public school, and only during the winter sessions for a few years past, because mother has needed my help at home. Father has just promised me that I may - Academy next fall, and stay a year. I cannot tell you how glad I am, but I do not know what I had better study, and there is no one to tell There is a regular course of study at the Academy, but I probably could not stay long enough to complete it, and father is very anxious that I should study only practical things. He does not tell me what he means, and I suppose he really thinks I know enough now for a woman, if I am not going to be a teacher, and I suppose I am not. I have as good a knowledge of the common English branches as I can get at our public school, but I feel very ignorant. I want to understand things better, and I want to be as useful as I can wherever I go. I feel as though there is a great deal that I could learn at school if I had the chance, that it would make me happier and more useful to know. I cannot say what I shall do after I leave school. Mother is very glad to have me go, but I know she ean hardly spare me, for there are seven children younger than I am.

If I am not intruding, please give me your idea

of "practical" studies for a girl in my situation. With great respect, ANNETTE K---.

The desire to be a good and useful woman, whatever one's lot in life may be, is far nobler than the aim, primarily, to be "successful" as a merchant, milliner, doctor, or dressmaker. It is degrading to dwarf the man or woman to the limits of any calling or profession; for one's business vocation is an outside matter pertaining to the material interests that must be left behind at the close of our earthly life. The proper education of the immortal part, the mind, is an everlasting advantage. And if the mind be properly educated, it is also daily advantage in all the labors of this life. Every study is really practical that strengthens the mind or helps to build up the character.

Annette wants "to understand things," I like that. She wants to be able to do her own thinking. She wants to get her mental faculties sharpened, and ready for use all the way through life. To accomplish this, it does not matter so much what she studies as how she studies. Many students fail to get any real education from their lessons at school, because the aim before them is simply success in the recitation class, or at the examination. They soon forget the lessons memorized simply to repeat, and as the memory was the only faculty particularly exercised, no especial benefit remains. If Annette will apply her own judgment to every lesson, bringing all her experience and observation to bear upon the facts she finds in her books, trying to understand the reason for every step she takes, she will get mental discipline rapidly.

But it is of considerable importance what studies one's time is devoted to. The natural sciences seem to me first in importance—none more so than physiology, especially for women who may be housekeepers or mothers. We ought to do our best to understand the mechanism of our bodies, and how they may be kept in good running order. Chemistry is a science of constant daily application in all our cooking and cleansing affairs. knowledge of it is necessary to a clear understanding of physiology, botany, or geology. Good teachers of this science are rarely found, but some study of it alone, without teacher or apparatus, is better than none. Botany, geology, astronomy, natural philosophy, United States history, and rhetoric ought all to come in, and Annette will find them all "practical" in making her a more intelligent woman, a better helper for her younger brothers and sisters, and a more reasonable companion for educated men and women. If she ever has her bread to carn, she will find that intelligence and culture pay in dollars and cents.

In mathematics, I should let the taste decide, beyond a good, practical knowledge of arithmetic. For those to whom such studies are positively distasteful, I do not think them very useful; but as discipline of the reasoning powers, and as delight to the mind willingly exercised with them, they can hardly be too highly praised.

Annette evidently loves to learn, and I am almost afraid of wronging her if I do not recommend some study of "the languages." But she cannot afford to let them crowd out the natural sciences. I am glad of all that I have learned in that line, at school, or since. Scarcely a day passes in which I am not conscious of some obligation to my little knowledge of Latin and Greek, in helping me to a better understanding of my own language, and it is very pleasant to have even a slight idea of the meaning of the French words and phrases with which our own literature is so profusely sprinkled. But here I only give my personal testimony without venturing to advise. I realize more and more how helpful and precious would be to me a thorough collegiate education, even in these busy days when I am confined almost entirely to the society of my little children. One year of schooling is not long, but a great deal may be done, and there is no reason why Annette should drop her studies at the end of that time.

MISTAKEN ECONOMY.—One mistake is, to make sheets short and narrow. They should never be less than two and a half yards in length, and three yards is hardly too long. Short sheets either pull

up from the bottom of the bed, leaving the mattress and blankets to get soiled by the uncomfortable feet of tall persons, or they do not turn over at the top enough to preserve the bed-clothes from soiling by the breath and perspiration of sleepers.

It does not pay to make comfortables of old dresses worn so much as to be tender in the threads. Strong materials should be used for the covering of thick comfortables.

I have learned better than to put much work upon garments made over from other garments partially worn out.

Children's Shoulder-straps, etc.—I remember perfectly how uncomfortable were the narrow straps that slipped off from my sloping shoulders and let the weight of my skirts fall upon my arms. I often see little children tormented in like manner in these days. It is barbarous. A waist with the strapseut on, and so cut as to go over the shoulders securely, is much better. Such comfortable straps may interfere with very low-necked dresses, and little girls' shoulders are very pretty—but so are their whole bodies lovely! No style of dress is really beautiful that is decidedly uncomfortable or unhealthful. Let us mothers rejoice together that the fashions for children's dresses are more sensible than they used to be.

The garters that eneirele the leg are uncomfortable, if close enough to keep the stockings smooth, and they are unhealthy to the degree that they interfere with the circulation of the blood by their tightness. It is a better way to have a strong clastic strap with a button at one end and a buttonhole at the other. The button should connect with a firmly made button-hole in the stocking top (on the outside of the leg), and the button-hole at the other end may fasten over a strong button on the waist of the drawers. With close drawers buttoned to a good waist, no chemise is needed by a small child in very warm weather.

FROEDEL'S GIFTS FOR THE KINDERGANTEN.—
1. Six rubber balls—the primary colors, red, blue, and yellow, and the secondary colors, purple, green, and orange.

- 2. A box containing a wooden sphere, cube, and cylinder, with wire loops for fastening strings.
- 3. A cube made up of eight small cubes.
- 4. A cube consisting of eight oblong parts.
- 5. A large cube made of small cubes, half-cubes, and quarter-cubes—an extension of the third gift.6. A large cube made of oblong blocks, which are
- variously divided—an extension of the fourth gift.
  7. Bright-colored square and triangular tablets for laying figures.
- 8. Slender staffs for laying figures.
- 9. Whole and half rings for laying figures.
- 10. Material for drawing—paper ruled in small cheeks.
- 11. Material for perforating—checked paper, with a needle fixed in a handle.
- 12. Material for embroidery—the paper of the eleventh gift already perforated, with colored silk in addition.
- 13. Paper for cutting into various beautiful forms, with blunt-pointed seissors.
- 14. Material for braiding or weaving—strips of paper of bright colors, with a braiding-needle.
  - aper of bright colors, wit 15. Slats for interlacing.
  - 16. The slat with many links.
  - 17. Material for intertwining.
  - 18. Material for paper-folding.
  - 19. Material for peas-work.
- 20. Material for modeling-wax or elay, with a modeling knife.

It is impossible to describe all these gifts and the occupations to be conducted with them, so that one can get a clear idea, without many illustrations. The first and second gifts belong to the nursery even more than to the kindergarten. The blocks are for building purposes, and you would be surprised to see how many forms of life or use can be made from them. Weibe's Guide gives forty models that can be made with the eight cubes of the third gift alone, and a bright child will invent others. All these designs are made with exactness on a table ruled in squares of an inch, and most chil-

dren soon learn the value and beauty of precision in their work.

It is the same with the tablets and staffs and rings. These flat designs, following the solid forms, lead the way to drawing, which, in the kindergarten, is very elementary, but excellent training for young eyes and little fingers. The training of the kindergarten meets the common wants of children, or is adapted to the harmonious development of all children.

At the same time it affords an opportunity for genius of any kind to show itself and get the first steps of training. Besides the exercises with the gifts mentioned above, there are class exercises and games set to music, and it was the design of Froebel that each child should have a little garden bed to cultivate, for the sake of its religious education among other things—more agreeable to some children than the catechism! It is claimed that kindergarten training has the most happy effect upon a child's disposition. I am sure it must be so.

A mother who is relieved from the cares of the kitchen and of fashion, may be able to give her children a good deal of the kindergarten culture at home, but where there are no two pupils of the same age, there will probably be some friction, and no untrained teacher can half do justice to the work. One child alone does not make a "garten," but it needs culture nevertheless.

### Canning, Pickling, and Using Fruit.

BY ESTELLE EDGERTON.

PICKLED PLUMS .- Last summer plums were very plentiful in our neighborhood, and of course a large quantity were bottled and pickled. A lady from Geneva, N. Y., gave me a recipe for pickling blue plums, which she thought a good one. I tried it, and we all pronounced it excellent. To 7 pounds of plums allow 3 pounds of brown sugar, and a quart of good vinegar. Boil the sugar and vinegar together with an ounce of cloves and nearly as much cinuamon, and pour it boiling hot over the fruit, which, of course, has been picked over and all stems and partly decayed fruit removed. Cover the jar and let it stard 24 hours, or over night. Pour off the mice, boil up again, and pour it boiling hot over them. Do this again on the next day, and close for winter use. They ought to keep perfectly, but if they do not, the juice should be drained from them, boiled up again, and poured hot over the plums.

PLUMS, TO BOTTLE .- Weigh the fruit, and allow a half pound of sugar to a pound of plums; less than this quantity for very ripe and sweet Green Gage varieties. Put the sugar in the kettle and moisten it welt with water. Let it come to a sirup, boiling and skimming if brown sugar (which is the kind I use); now add the right proportion of plums. Let them come to a boil, and then bottle. I like them whole, with the juice clear, and to insure this, I let them stand on the back of the stove until they are heated through, and the juice running before I bring them to a boil. I think it is a shame to make a strong jam of good, handsome blue plums; whole, they are of a delightful purple color—the jam is brown and ugly. I have seen a method in your paper where the plums are put in jars, covered closely, and allowed to remain over night in a warm oven. It is a very good way.

PLUM PIE.—An English recipe. Take a deep, earthen dish. Invert a cup in the center. Place plums all around the cup until the dish is heaping full, adding what sugar you think best. Make a rather plain pastry. Moisten the edge of the dish with a little water. Cut a strip of pastry half an inch wide, and as thin or thick as you like. Place all around the rim. Moisten this pastry with your finger dipped in water, or, better, with white of egg. Now cover the whole with the remaining pastry, trim around, and bake. This pie is delicious, eaten cold, with white sugar and cream. In helping guests, do not forget to give a generous portion of the juice.

Peacues.—I used to consider the work half done when the peaches were pealed, but that is the sim-

plest part of the process now. I believe that under proper management a bushel of peaches might be skinned in five minutes or less, and I have no doubt that it is done in well-regulated canning factories. A few years since you gave a recipe for skinning peaches with ashes and water. It was excellent, but I have discovered that it is not necessary to have the ashes themselves (as said the recipe) in the kettle-a strong lye is all that is required. Sal-soda and water will do the business, but I do not know the exact proportion, or if it needs to be exact. Make a strong lye of fresh wood ashes, ponr off the clear lye into a kettle, bring to a boil. Put in as many peaches as desired, stir them round gently, and when you see any bare places take them out and throw them into a pail of cold water; remove the skin, and pass them into another vessel of cold water, and from thence to the kettle on the stove. They should not remain in the boiling lye more than twelve or fifteen seconds. I think white peaches are the nicest kinds to bottle; they are more delicate in color and flavor, but of course I always put up a large quantity of yellow varieties. A quarter of a pound of good white engar is sufficient to a pound of the fruit; you may use less if you like, or even more; but the sugar penetrates the fruit while in the bottle, and very much improves the flavor. A few of the pits improves the flavor; where bottle room is not an object, the stones may be left in. It will take ten ordinary-sized peaches to fill a quart bottle, if whole. The same bottle would have held fourteen if halved and the stones removed. You will need to use a little water. The sugar and water should be brought to a sirup, when the peaches may be put in, and as soon as they boil well they should be bottled and scaled imprediately,

PEACH PIE.—I think a peach pie is much better made without an under crust, the peaches whole. Eaten cold, with sugar and cream, it is delicious.

PEACHES FOR TEA are much nicer and look better when cut up just before going to table.

PEACU PICKLE.—Take any quantity of fine peaches just before they ripen; stick into each one four or five cloves; make a sirup of three pints of vinegar and three pounds of brown sugar to every seven pounds of peaches; add cinnamon if you like, I like them better without. Bring the sirup to a boil, and pour hot over them; repeat the process for three days or until they are shrunk on the pit. After the last scald, they should be well covered and put away in a very cool cellar until cold weather sets in. They will be ready to use, however, in a few days after they are pickled. Pears pickled in the same way as the blue plums, are excellent, to my thinking.

LAYING DOWN CUCUMBERS.—The best way to lay down cucumbers is to sprinkle salt over and let them form their own brine. A board and stone should be laid over them, in order to keep them under the brine. If in three days there is not enough brine formed to cover the cucumbers, there is not salt enough on them and more should be added. They should never be allowed to protrude above the brine, as a white mold will form and they will soon soften. In cutting the encumbers from the vine, leave a small stem on the pickles. They keep better and appear better on the table.

### Eating Green Corn.

Last autumn persons who wished to observe "the propricties," inquired of us whether it was according to good usage to gnaw the corn from the cob, or if it should be ent into the plate. Generally, though not always, matters of table etiquette are founded in common sense. A bird can only be properly enjoyed by picking it, hence good usage sanctions the use of the fingers in removing the flesh from the bones of a bird, while one who should take the bone of a beefsteak, or a muttonehop, in his fingers, would be looked upon as illbred. The only way to get the full satisfaction on of green eorn is to gnaw it from the cob, and though the operation, especially to a foreigner who knows not corn, is not an elegant one to witness,

it is performed at the best-ordered tables. So generally is it conceded that corn should be eaten from the cob, that silversmiths now make silver greencorn handles; these are thrust into the large end of the cob, and allow it to be held without soiling the fingers. It is rather an awkward matter to ent the corn from the ear at table, especially if the knives are not sharp. If it is to be eaten in this way, it should be prepared before it is sent to the table. The operation of eating from the cob is much facilitated by drawing a sharp knife lengthwise of each row, in such a manner that the hull of each kernel will be split. When this is done, the digestible, nutritions contents of the kernels will slip out, and the often tough hull be left upon the cob. Those whose teeth are sensitive or defective will find this a great help.

### Questions about Canning.

Canning or bottling fruit is an operation of so much importance in the household, that, although we have an article upon the subject from a correspondent, we answer here a letter which will allow us to make some explanations that may be of interest to many. H. T. Sweeney, Springfield (no State), writes as follows:

"In the June number of the Agriculturist is an article on the canning of berries, etc. The writer says: 'Put the fruitin hot, and seal at once.' I have been informed that canning-houses let the steam and hot air escape before sealing. (1) Wilt you inform me if there is any work giving the particulars concerning the canning of meats, fruits, and vegetables, as practiced by canning establishments? (2) Will tomatoes put up in glass jars keep as well as in tin cans? My impression is that the action of light through the glass impairs the tomatoes." (3)

Reply. (1) This question arises from confounding the two terms canning and bottling. We have used these terms as meaning the same thing, but, properly, canning should be applied only to the process of putting up fruit in tin cans. Our people first became acquainted with fruit preserved at the factories in cans, and afterwards, when in domestic operations glass vessels were used for fruits, they were still called canned fruits, though put up in bottles. When a word gets into common use, it is very difficult to change it, though its application, as in this ease, may not be precisely accurate. In factories the fruit is put into the cans, which have the covers scaled on; these are then heated in a vat of water, or by steam, and the fruit cooked in the eans. A small hole is then punched in the tinnot so much to let out the steam as to let out the air; this hole is theu closed by a drop of solder. When bottles are used, the case is entirely different; the fruit is first cooked, and put hot into the bottles with its sirup. If the fruit is filled in carefally, and the sirup fills all the spaces among the fruit, and if the bottle is well filled, there is no chance for air and no steam to be let off.

(2) We know of no treatise on the subject, except an old French one, now useless. Factory experience would be of but little use in the family, and if one wishes to go into canning as a business, he could easily obtain a competent foreman by advertising. We know of no information upon preserving fruits of full as is contained in the back volumes of the Agriculturist.

(3) We have never seen tomatoes put up in glass that kept as well as those in tin. We attribute this not to the action of light, for the bottles can be kept in a dark place, but to the fact that the fermenting principle is destroyed by the long boiling, with the exclusion of air, that is possible in tin vessels.

Meading off Mosquitoes.—"J. A. W." writes: Not having the convenience of a cistern, I catch rainwater in barrels. To avoid breeding my own mosquitoes, I clevate my barrels so I can draw the water from the bottom, then pour upon the surface of the water a little thin oil, which soon is diffused over the water; and if it has "wigglers"—undeveloped mosquitoes—in it, they will die, and no more will accumulate while the oil is on the water.

#### & CHRUS' COLUMNS. BOYS

#### Insects as Musicians.

We frequently hear people speak of the singing of crickets and grasshoppers. These insects are very noisy, it is true, but they are not vocalists; they are instrumental performers. Each one is furnished with a sort of violin npon which it plays without any instruction. crickets, a portion or rib of each wing is furnished with teeth, which serves as the bow, and a hard, smooth rib answers for the strings of the fiddle. The insect rubs one wing over the other, and then reverses the movement, and by the scraping of these two parts together the sound is produced. The grasshoppers manage some-what differently. The long hind legs are the fiddle-hows. The inner surface of the broad upper part of these legs is farnished with over eighty small lancet-shaped elastic teeth, and these the insect scrapes against the sharp ribs npon the wing cover-or outer wing-first one and then the other. The loudest instrumental performer among one insects is the Katydid. In a still night the constantly repeated "katydid-she-did" may be heard for the distance of a quarter of a mile. The katydid produces its note by means of its wings, which are peculiarly fitted for the purpose. In each wing-cover there is a little tambourine formed of a thin transparent membrane or skin, stretched in a strong, ha'f-oval frame. As the wingcovers are opened and shut these little tambourines rub against one another, and produce the sounds which give the insect its name. These notes are supposed to be useful to the insects in enabling them to find their mates. From the constancy with which some of them keep up the sounds, we think that they must be pleased with their own music. Boys just learning to whistle make a noise that, whatever it may be to others, seems very pleasing to themselves, and they keep it up for their own gratification. It may be that insects do the same.

#### Farmer or Doctor-Which?

Sammie B. Wells, Jr., writes us the following: "I take the American Agriculturist, and as I see that you advise hoys, please give me a little advice. Had I better be a doctor or a farmer? My father wishes me to be a farmer, and my oldest brother, who is a doctor, wishes me to be a doctor. Which is the best business? I think I prefer farming. Please answer me in the next Agri--Answer you-why, you have answered yourself. Your own preferences are in accordance with your father's wishes, and what can be better? The only point to be answered is—which is the best business, that of the doctor or farmer? There is no doubt that a successful physician may accumulate money more rapidly than most farmers are able to, but his is a hard life, and, as far as comfort goes, that of the farmer is much to be pre-ferred. But a small share of those who are educated as physicians are successful. Their reward, when it comes, one should become a physician unless he feels a strong inclination towards the profession. It should not be taken up as a mere business. With all respect to the "oldest brother," we say, if your inclinations are to be a farmer, follow them. It is a calling in which you can invest all the talent you may possess, and be at least sure of a good living, without the inconveniences that attend the physician's life. Of course, these remarks are made on general principles, and without knowing any thing of the persons. There are too many poor doctors, and not near enough good farmers, and we always look upon it as a fortunate thing when a furmer's son himself desires to be a farmer.

ROBBIE. When you make a labyrinth you should have an entrance into every path.

NEALIE C. I am glad you made a beginning if you "never tried before." THOS, C. COOPER (Santa Cruz, Cal.) is much interested in natural history, and would like a correspondent of similar tastes, with a view to mutual improvement.

HATTIE E. PECK .- I have put that little geranium leaf with my treasures.

LILLIE STREEFER. Dld you receive your package safely? I directed it to "Newtown Square, Delaware Co., Pa.

[COPYRIOHT SECUREO.]

### TEMPTING GOOD NATURE, -Drawn and Engraved for the American Agriculturist.

Boys and dogs are much alike in some respects. There are some boys whom you know you will like without ever having spoken to them, or knowing any thing about them. When a new boy comes into the neighborhood, he very soon gets his measure taken by the other boys. You at once say, "That is a good fellow; I am glad he has come;" or, "I don't like the looks of that chap, and I shouldn't be surprised if he would turn out a sneak." These boys carry their characters in their faces and whole general bearing. We think we could pick out a brave, generous, and trusty boy from his photograph. Among the dumb animals, we think that dogs show their characters in their looks more distinctly than any others, and it is about as easy to distinguish between a noble and a mean dog, as it is between a noble and a mean boy. Some dogs, by their look and manner, invite confidence, and others you know at sight to be suspicious and untrustworthy. How admirably the artist has shown dog character in the above picture! With what a quiet dignity the larger dog rests, and how cowardly the one looks that is stealing up to get the coveted hone! He looks as if he were conscious of being engaged in doing something mean and sneaking, and we feel that he deserves the pat of the heavy paw that he will get when he has imposed too far upon good nature. It may be, after all, that dogs have their dispositions much influenced by those of their owners. It would not be at all surprising that the dog belonging to a passionate boy, who beat him without cause, and was unreasonable in all his demands, should be quite different from an animal brought up by a gentle and affectionate boy. We can make dogs, by careful training, learn a great many tricks. It may be that we teach them unconsciously, and that our example is not without its effect upon even our brute companions.

### Boys' and Girls' Letters.

It is an excellent thing for boys and girls to begin to write letters while they are quite young. The mere writing of the words and sentences is easily learned; but there are several other things about letter-writing than this, and are quite as important to be learned early in life. There are three or four letters from young folks now before us, and in many respects they are much like the letters of older people. Perhaps some hints may be gathered from these letters that will be of use to those who are just practicing writing. The first letter that we take up has the town, but no State. This is a very commen mistake in our business letters from grown-up people, and often makes much trouble. Next, here is a boy who asks twelve questions, one right after another, making all sorts of inquiries about the prices of various things in New York. To answer this we should be obliged to employ a person for perhaps a whole day to go around and find out about the things, and then it would probably be of no other use than to gratify a boy's curiosity. When older people write such letters, we do not answer them. The boy will be served the same. Here is a boy who lives in Columbus, Ohio, who sends a letter without any name signed to it. Must we infer that the poor fellow has no name? Never write any thing that you are ashamed to sign. It is one of the rudest things any one, old or young, can do, to send another a letter without a name. Anonymous (nameless) letters are so much used by cowardly people as a means of saying that to a person which they would not dare say to his face, that the custom is associated with too much that is disreputable to allow any boy who expects to co only the fair thing to practice it. Of course, well-meaning people

Sometimes thoughtlessly do it; but they would not if they considered how impolite it is. Begin your letter-writing with the determination never to write any thing that you will regret to see again, and sign your name openly and above board. One boy wishes us to write out "what every thing costs on a farm of 100 acres." If he will tell us how many gray squirrels there are in his State, and what would be the length of their tails placed end to end, we will think of his question. "Answer this right off" appears at the bottom of one of these letters. That is not a polite way of making a uscless request, as there was nothing in the letter requiring an answer.

You must not judge from this that we are not glad to get letters from boys and girls, for we sometimes receive much pleasure from them. We only wish to point out some things to be avoided. 1st. Do not write unless you have something to tell or something to ask. 2d. We like to have you tell us of what you see that is curious, strange, or interesting. 3d. We like to have you ask questions that can not be readily answered in your own family, or by your neighbors. Don't ask questions merely for the sake of asking. We are always glad if we can instruct, but have no thme to give to finding out prices, and such things. 4th. When you have determined to write, and decided what you will write, put down Town (or Postoffice), County, and Slate, before you write a word of the letter proper. 5th. Say what you have to say as plainly as you can, and when you have done so—stop! Do not say "I must stop now, for it is getting late," or make any other excuse for stopping, but stop simply because you have got through. 6th, and most important. Sign your name. 7th. If your letter is one requiring an answer by mail, it is always polite to send a stamp, whether to a private person or an editor, to pay for the return letter.

THE FIRST PREMIUM for the best TIN-LINED LEAD PIPE was awarded by the American Institute Fair to the Colwell's Shaw & Willard M'F'G Co., No. 213 Centre street, New York, Manufacturers of Tin-Lined Lead Pipe, Block-Tin Pipe, LEAD PIPE, SHEET LEAD, SOLDER, etc. Orders solicited. #### "Universal" Wringer,

So long offered as a Premium by the American Agriculturist, the Rural New-Yorker, and other leading Periodicals, still stands narivaled for Strength and Durability. Its sale constantly increases, as those who are induced to buy other kinds, which sooner wear out, are sure to get the Universal as their second purchase. It is the only Wringer which has

### Rowell's Patent Cogs,

with long and strong alternate teeth, which can separate widely, or crowd closely together, without binding or losing their power.

These are protected by the PATENT STOP, or screw, above the cogs, which prevents them from entirely sepa-

### UNIVERSAL WRINCER NEVER PLAYS OUT OF GEAR,

yet the teeth of the Rowell Cogs are so long, the rolls can separate far enough to pass the largest article easily.

#### Always try a Wringer before Purchasing, and buy none which will play out of gear in passing a sheet, blanket, or bedquilt.

The Universal is sold as low as any other licensed wringer, and kept by dealers generally.

The celebrated Doty Washing Machine sold also

Metropolitan Washing Machine Co., R. C. BROWNING, President. 32 Cortlandt Street, New York.

### THE BICKFORD

Family Knitting Machine.

The Original and only Practical and Efficient Knitting Machine yet Introduced, Sets up its own Work, and Knits 20,000

Stitches, or 22 inches of Perfect Work per Minute.

### PRICES FROM \$25 TO \$40.

Any one who possesses a Blekford Knittlag Machine can cara from \$3 to \$3 per day; for she may knit any thing or every thing that the most ingenious lady can knit or erochet, more nicely and easily, in one hundredth part of the time. Wool-growers and Farmers only realize 40 to 50 cents per pound for wool; but, by having it converted into yarn and knit into socks or other goods, a much larger profit may be obtained, as this brings the producer in direct contact with the consumer. Let Farmers' wives and daughters throughout the country, who long for more "pin money," think of this. No more useful and entertaining present can be made to a lady than one of these Machines. She will find it a never-failing source of pleasure and profit. Every Machine is warranted to be in perfect order, and to do just what is represented.

We now have every thing in the most complete condition Any one who possesses a Bickford Knitting Machine can

We now have every thing in the most complete condition to manufacture this Machine, and have fitted an elegant store at 689 Broadway for head-quarters, where we are ready to furnish Machines at retail, or make the most liberal arrangements for their introduction, for which we want agents in every section of the country.

### Butterwood Fruit Farm and Nursery, LITTLETON, N. C.

S. C. BILYEU, Proprietor.

S. C. BILYEU, Proprietor.

A New Early Peach.—The Early Beatrice, a seedling by Mr. Thomas livers, of Sawbridgeworth, England, 20 days earlier than Hule's Early; medium size: high, bright color; of good quality; flowers large; a profuse bearer; and possesses superior shipping qualities. I secured them from Mr. Rivers, Jan., 1867, having made a voyage to England for the purpose of securing some new and reliable varieties. The Early Beatrice fruited in my orchards last year. It also fruited abundantly this season on 2-year-old trees. The fruit ripened the 8th of June; was picked the 10th, and exhibited in Del, and Md. on the 13th and 15th. The last picking was shipped June 14th, and exhibited in New York the 17th and 19th. I respectfully refer to the following gentlemen who saw the fruit: Col. E. Wilkins, Chestertown, Kent Co., Md.; Mr. H. N. Wiltets, Middletown, Del.; Selset & Brother, Commission Merchants, No. 30 North Wharves, Philadelphia; Romain & Fowell, 141 West-st., New York, 60,000 trees of the Early Beatrice ready for safe for the autumn of 18th, those who purchase now will fruit them profitably before they come in general cultivation. They will not be sold in small lots this season, not less than 1,000. The Proprietor, formerly of New Jersey, desires to call the special attention of his patroos to his catalogues of this season, in which will be set forth the advantages of his new location and superior stock of trees. A full and well-selected variety of the staple kinds of Peach, Apple, and Pear trees, Grapevines, and every thing in the fruit hime. 300 acres in orchards for marketing; also, large and extensive experimental orchards. My orchards will be yearly enlarged, hence every variety I skall propagate will be fruited and well known in market.

Price of trees, Early Beatrice. \$500 per M. Other varieties as low as at any other first-class Mursery.

ket. rice of trees, Early Beatrice, \$500 per M. Other vari-s as low as at any other first-class Nursery. ddress S. G. BILYEU, Littleton, N. C.

# FELLOWS.

THE ONLY AUTHORIZED OFFICIAL ORGAN OF THE ORDER IS

#### AMERICAN FELLOW. The

ESTABLISHED 1862.

It is not only the oldest, but acknowledged everywhere to be the best Odd Fellows' publication extant. Each monthly issue contains Eighty large Octavo pages, giving more information relative to the teachings, principles, operations, and condition of this great Fraternity throughout the globe, than all other periodicals combined. Having regular and able correspondents in England and other parts of Europe, Australia, New Zealand, Ontario, British Lower Provinces, and in every State and Territory in the Union, this popular magazine enjoys unequaled facilities for gaining intelligence as to the doings and progress of the Organization everywhere.

### Important to the Daughters of Rebekah.

In each number of the American Odd Fellow appears a separate Department for the Ladies of the Rebekah Degree, containing a complete record of the proceedings of the numerous Lodges and Associations of the Sisters, far and near. This is a very attractive specialty, and will be found of great interest to every Odd Fellow's wife.

Besides serving the best interests of the order as its Official Organ, the AMERICAN ODD FELLOW is no less

### A First-class Family Magazine,

beautifully illustrated, and embracing in each number Original Stories written expressly for this work; Sketches of Travel in both hemispheres; popular papers on Science and Art; dissertations on Domestic and Social Life; special department devoted to Agriculture, Horticulture, and Gardening; entertaining Miscellany; choice Poetry, and humorous paragraphs, etc., for the FAMILY CIRCLE; all of

which will be found highly interesting to those who have a taste for instructive and unexceptionable literature.

Each succeeding number will contain a

### Monthly Record of Current Events,

carefully compiled and condensed, enabling the reader to review, in brief, all the news of the previous month, and affording a continuous history in the preserved volumes, which feature alone is worth the entire price of the work.

The magazine is published by the American Odd Fellow Association, under an efficient business management. The Officers of the Association are: ORANGE JUDD, Esq., President; JOHN W. ORR, P. G. M., Vice-President, and principal editor; and S. A. LAW POST, Secretary, Treasurer, and Business Manager.

Office of the American Odd Fellow No. 96 Nassau St., New York City.

Two large volumes in a year, comprise 960 pages of reading matter. Terms: \$2.50 per year, or \$1.25 per volume, payable in advance. The cheapest magazine of its size and character in the world.

Agents, Male and Female, wanted everywhere. to canvass for the work-to whom special inducements are offered. Many are already making from \$20 to \$50 per week. Inclose 20 cents for specimen number. All remittances should be made by Draft on New York, or Post-Office Order, or Registered Letter, and all communieations be addressed to

A. O. F. ASSOCIATION, Box 4217, New York City.

### Ballard's Champion Shoe.

The most practical Working Shoe

Yet invented for Out-Door Wear.

Easy to put on, comfortable to the foot. Wears as long as tree pairs of common shoes. No gores, no seaus to rip or nt the feet. No Lacings.

Get a Pair for the Harvest Field.

Get a Pair for the Harvest Flam.

They keep ont chaff, straw, stubble, and dirt. Ask your merchants for them. See large cut and full particulars, page 133, April No. Am. Agriculturist. Over 25,000 pairs sold to Farmers.

A. BALLARD & SON.

32 and 34 Vesey-street,

Mem.—Attention is called to Government lands on the west end of the Main Line, which can be taken under the Homestead Law.

# PARSONS ON THE ROSE.

A TREATISE ON THE PROPAGATION, CULTURE, AND HISTORY OF THE ROSE.

By SAMUEL B. PARSONS.

### NEW AND REVISED EDITION. ILLUSTRATED.

The Rose is the only flower that can be said to have a history. It is popular now and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curious legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has been adopted, and the leading varieties under each class enumerated and briefly described. The chapters on multiplication, cultivation, and training, are very full, and the work is altogether the most complete of any before the public.

The following is from the author's Preface:-"In offering a new edition of this work, the preparation of which gave us pleasure more than twenty years ago, we have not only carefully revised the garden classification, but have stricken out much of the poetry, which to the cultivator may have seemed irrelevant, if not worthless. For the interest of the classical scholar we have retained much of the early history of the Rose, and its connection with the manners and custnms of the twn great nations of a former age.

"The amateur will, we think, find the labor of selection much diminished by the increased simplicity of the mode we have adopted, while the commercial gardener will in nowise be injured by the change.

"In directions for culture, we give the results of our own experience, and have not besitated to avail ourselves of any satisfactory results in the experience of others, which might enhance the utility of the work."

# MY VINEYARD AT LAKEVIEW.

BY A WESTERN GRAPE GROWER.

"Twelve years have passed," writes the anthor, in the first chapter of this work, "since I planted my first vine. I commenced under difficulties, and have met with some discouragements. But my labor and perseverance have been well rewarded in the success which I have attained. To be sure, I might have reached the same results in half the time had I commenced with a better knowledge of my subject. Many errors into which I have fallen might have been avoided, and needless expenditures of time and money saved. In looking back upon my experience, I can now see where better methods might have been pursued. I can see wherein a little knowledge might have saved many losses, and much discouragement. The information which would have enabled me to avoid these losses, I believe I can now im-

part to others. Nothing, it is true, can in any business take the place of experience; but we can frequently, when commencing a new enterprise, so far avail ourselves of the experience of others as to materially affect the success which we may attain. In making this record of my experience, I disclaim all efforts at fine writing. My only aim will be to give the facts in the case, in the simplest and plainest language I can command."

### DOWNING'S PEACH CULTURE.

# FRUITS

### FRUIT TREES.

A. J. DOWNING.

#### Newly Revised and Greatly Enlarged

#### CHARLES DOWNING.

Octavo, 1122 Pages.

The original work of the late A. J. Downing appeared In 1845. Some years after it was revised and much en larged by his brother, Charles Downing, who has again completed the work of a second revision. Charles Downing is upon all hands acknowledged as one of our highest pomological authorities. He writes but seldom, but whatever bears his name is accepted as the judgment of one who is entirely disinterested, as far as the commercial aspects of pomology are concerned. The present edition contains the results of many years' labor and ex perience which have been devoted to testing the value of fruits and acquiring a knowledge of them that should benefit others.

RECOMMENDATION FROM HON. MARSHALL P. WILDER, President of the American Pomological Society.

BOSTON, Oct. 4, 1869.

#### GENTLEMEN:

I have received a copy from Mr. Charles Downing of the second revised edition of the "FRUITS AND FRUIT TREES OF AMERICA." It is the most comprehensive of any similar work, in fact a complete Encycloredia or AMERICAN POMOLOGY brought down to the present time.

The original edition by his brother, the late Andrew Jackson Downing, popular as it ever has been, is made doubly interesting and useful by this revision, comprising as it does the results of a long life of critical obser

As a work of reference It has no equal in this country and deserves a place in the library of every Pomolo. gist in America. MARSHALL P. WILDER.

This elegant and valuable work will be an indispensable requisite to every library, and to all interested in Fruits or Fruit Culture.

PRICE, PREPAID, \$4.00.

ORANGE JUDD & CO., 245 Broadway, New York.

BY

JAMES ALEXANDER FULTON,

DOVER, DELAWARE.

#### ILLUSTRATED.

NOTICES BY THE PRESS.

This book abounds with good, practical directions for all the departments of successful orcharding, which will be found nowhere else, and are worthy of careful examioation by every one interested in this branch of fruit culture .- Cultivator and Country Gentleman.

It ought to be in the hands of every peach-grower who desires to understand thoroughly this great and important interest .- Middletown (Del.) Transcript.

Every farmer in the State should have a copy of this work.—Smyrna (Del.) Herald.

This is an interesting and important treatise. It is a complete hand-book of useful knowledge to those who have any interest in the cultivation of the peach.

[Philadelphia Age.

It is a full and thorough treatise on the raising and training of this luacious fruit, with illustrations for explanation where needed .- Congregationalist and Recorder.

Those who raise peaches for profit, nursery-men, and also those who are interested in scientific culture of the fruit, will find it an exhaustive work on the propagation and culture of the fruit, with suggestions as to putting up and marketing .- Chicago Republican.

The growing importance of the crop, especially at the West, has long called for just such a work as this.

[Chicago Tribune.

The book is compact, plain in its directions, and all that can be desired .- Watchman and Reflector.

#### CONTENTS:

INTRODUCTION.

CHAPTER I .- Site of Nursery.

CHAPTER II.-Seed.

CHAPTER III.—Seed-bed.

CHAPTER IV .- Preparation of Ground for Nursery.

CHAPTER V .-- Planting the Seed.

CHAPTER VI.-Nursery Cultivation.

# CRANBERRY CULTURE.

BY

#### JOSEPH J. WHITE.

A PRACTICAL GROWER.

ILLUSTRATED.

NOTICES BY THE PRESS.

The book is profusely illustrated, contains minute directions for preparing the ground, setting and cultivating the plants, flowing the plantations, and picking and marketing the fruit .- Springfield Republican.

As the business of cranberry culture is largely and rapidly increasing, such a book as this will prove to many an efficient and profitable guide.

[Detroit Advertiser and Tribune.

This is decidedly the best work out on the cranberry. [Practical Farmer (Phila.).

It is a practical, compact treatise, full of all necessary details, fully illustrated, and must satisfy all wishing a complete and thorough guide to cranberry growing.

[Maine Farmer.

The man who is growing eranberries, if he have enterprise, and a good conscience, and eats his own cranberries, or expects other people to ent them, enght to get this little book .- Chicago Tribune.

We judge this to be the best book on cranberry culture yet published .- Prairie Farmer.

The work is very comprehensive in its details, and will be invaluable to those who have an interest in the subject .- Pittsburgh Dispatch.

A thoroughly practical manual, and one apparently prepared to answer any and every question which any one may be moved to ask on the subject discussed.

[Congregationalist and Recorder.

It seems to be a complete manual on a branch of horticulture which is of growing importance.

[Lowell Daily Courier.

We cousider it invaluable to the fruit grower,

[The Courier (N. J.).

The directions in regard to forming beds or plantations are so plain that any person could follow them. The various illustrations and diagrams aid much in conveyiog correct ideas in regard to the different subjects.

The State Republican (Mich.)

#### THE L. CREEN PLOW.

Superior to all others in these respects:

Superior to all others in these respects:

It has a quick entry, adheres well to the ground, and runs perfectly flat and level, even in rough and stony land. It turns the furrow with unparalleled neatness, even up any ordinary sidehill. It pulverizes the soil in such a manner and to such an extent that it stands the drouth better. It works well in all kinds of soil. The slare will wear longer and remain sharper than any other. It requires less power than any other. This saving of power is the most characteristic feature of these plows, and is due to the peculiar lines of the landside, moldboard, and share, by which the greatest possible avoidance of friction is effected. These, we are well aware, are large claims, but we believe them within the truth, and invite the most thorough examination. Send for a Circular. AGENTS WANTED.

#### DARWIN'S GREAT WORK.

# THE VARIATION OF ANIMALS AND PLANTS UNDER DOMESTICATION.

BY CHARLES DARWIN, M. A., F. R. S., Erc.

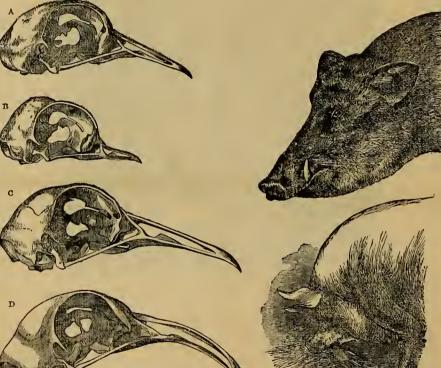

WITH A PREFACE TO THE AMERICAN EDITION BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY, OF HARVARD UNIVERSITY.

It is one of the most remarkable books of the day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: Pies. CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS : FOWLS, DUCKS, GEESE, PEACOCK, TURKEYS, GUINEA FOWLS, CANARY-EIRDS, GOLD-FISH ; HIVE-BEER; SILK-MOTHS. CULTIVATED PLANTS: CEREAL AND CULINARYPLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS. BUD VARIATION. INHERITANCE, Revension on Atavism, Cross-ING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING, SELECTION, CAUSES of Variability, Laws of Va. Skulls of I. Rock Pigeon. Skulls of Figeons viewed laterally, of natural size. RIATION, ETC., ETC. D.—Bagadotten Carrier.

Head of Wild Boar, and of a pig of the into the same space Yorkshire Large Breed, named "Golden Days," tained nothing else, the latter from a photograph. New York Even

#### Notices by the Press.

Mr. Darwin la not an ordinary writer, and has not been content to expand his earlier and more general statements. His recital of curious facts is enlivened and illustrated throughout by thought: his principles and arguments everywhere rest solidly upon observed fact.

The reader is frequently led up in thought, within sight and hearing, as it were, of the very workshop of Nature. Glimpses are given of wonderful prospects; passing suggestions of thoughts almost too hold for expression, or profound analogies are embodied in illustrations which might be expanded into theories. Every chapter is full of facts. They are the substance of the whole work. No room is lost by the theories. They serve as a system for arranging the facts, of which the book seems to contain more than could possibly be compressed into the same space, if it cou-

New York Evening Post.

The book presents the most remarkable collection of facts, methodically arranged concerning our domestic animals and plants, yet brought together, and for this alone, it is of the highest value. (St. Louis) Journal of Agriculture.

geons viewed laterally of natural size. A.—Wild B.—Short-faced Tumbler. C.—English Carrier.

It is a work which will command universal attention, and will be of particular value to agriculturists, whether engaged in stock-raising only, or in the cultivation of the soil in general. Forney's (Philadelphia) Weekly Press.

Whether the reader agrees or not with the peculiar views of the author upon the great problems involved, there can be no two opinions of the value of these volumes as a storehouse of the results of observations concerning our domestic animals and plants, far more elaborate and complete than can elsewhere be found. We can testify also that the work is a fascinating one for perusal. Congregationalist and Recorder, (Boston).

The work is alike adapted to the wants of the practical agriculturist and the student of natural history. The immense collection of facts which it presents in illustration of the scientific views of the writer are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form. the original expounder. Mr. Darwin's modesty is no less remarkable than his candor. He is an example of the humility which belongs to genuine science, and is the condition of high intellectual attainments. The execution of his work is in harmony with the characteristics of his mind. Written in a style of eminent simplicity, artlessness, and sincerity, free from abtruse reasonings or pedantic refinements, it must prove singularly attractive to the lovers of nature no less than to the scientific student. New York Tribune.

### PURITY AND HEALTH.

### CARBOLIC SOAPS

#### Compounds Saponaceous

#### Carbolic and Cresylic Acids. Disinfectant, Insect Destroyer, Preventive of Fungus, etc.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable becefit to the commu-nity. By tests made under our own supervision, and the reports of careful observers, we believe it to be established that these Cresylic Compounds are

Ist. Complete Disinfectants.—They not only remove all noxions odors from sinks, privies, stables, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Fever, Cholera, and other diseases, may be effectually prevented. They are used in the New York and other Hospitals for these ways excess. for these purposes.

2d. Insect Desiroyers.—An animal washed with Carbolic Soap will be entirely freed from all vermin. It will destroy ticks on sheep, fleas on dogs, lice on cattle or poultry, roaches, ants, bed-bugs, etc., io rooms. It repels flies from animals, and thus is especially useful in case of wounds or sorce from any cause.

3d. Preventive of Fungus Growth.—On this point we ask for further experiment. We feel confident this soap, properly applied; will prevent smut to wheat, mildew oo vines, and similar parasitic growth, and trust that experimenters will furnish the result of their trials.

41h. Clenning Sores, etc.—For washing ulcers and other foul sores, and preventing gangrene in wounds, etc., Carbolic Soap is, we believe, unequaled. We know also that it has been successful wherever used, for footret in sheep, and mange, itch, ring-worm, and other skin diseases.

Desiring that our readers should be benefited by the extended introduction of what we believe to be so valuable, we have established a general agency for the sale of these compounds, keeping them constantly on hand, and are prepared to fill orders at wholesale or retail, at the following

Sheep Dip, for Curing Scab and Destroying Insects on Sheep,

| up. |    |                 |
|-----|----|-----------------|
| - 5 | Th | Canisters\$1.25 |
| 10  | 44 |                 |
|     |    |                 |

THE THOROUGH-BRED STALLION LEXINGTON .- FROM A PAINTING BY TROYE .- Drawn and Engraved for the American Agriculturist.

Whatever may be thought of horse-racing, there is no doubt of the great utility of the race-horse. By race-horse, we do not refer to the modern trotter, but to the thorough-bred animal whose pedigree can be traced back in an unbroken line to its British ancestry and to the Arabian horse. The thorough-bred stallion is of the greatest value in breeding, whether we raise roadsters, coach -horses, or farm horses, as it possesses in a wonderful degree strength, endurance, activity, and intelligence, all of which qualities it imparts to its offspring. When farmers learn that it costs as much to raise a

poor colt as a good one, and that the good animal will sell for several times more than the inferior one, thorough-bred stallions will be more in request. As a typical specimen, we present a portrait of Lexington, considered by judges as the best race-horse and sire this country has ever produced. Lexington was foaled in 1850; was by Boston, dam Alice Corneal by Sarpedon. See the *Turf Register*. The performances of his sire, Boston, were unparalleled in the annals of the turf, and his numerous offspring were all notables, though their fame was eclipsed by that of Lexington.

Lexington is a blood bay, fifteen hands three inches high, with fore and hind feet and pasterns white. In all points, his body is considered absolute perfection, and in action he is unsurpassed. The remarkable performances of Lexington upon the turf are matters of record, the most noteworthy of these being his race against time, over the Metairic course at New Orleaus, in June, 1854, when he ran four miles in 7 minutes 194 seconds, which is believed to be the fastest ever made. Lexington was sold in 1856 to the late R. A. Alexander, for \$15,000, and is now owned by A. J. Alexander, Spring St'n, Ky.

# Ashes Leached and Unleached.— "R. G. L."—The relative value of ashes will depend upon the thoroughness of the leaching as well as the character of the wood from which they are obtained.

#### Calendar for September.

| Day of Month.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Boston, NEngland, N. #### AMERICAN AGRICULTURIST.

NEW YORK, SEPTEMBER, 1871.

September should be a comparatively leisure month on the farm. Wheat, barley, and, this year, oats are all harvested, and corn is not yet ready to cut. The principal steady work of the month for the teams is to put in the winter wheat. With us, October and November are the two busiest months of the year, and during September it should be our aim not only to get every thing ready, but to anticipate the work as much as possible. Of all the summer and autumn months, the farmer is inexeusable who does not drive his work. Next month it will drive him. We doubt the economy of a farmer taking a team and going to plow all day. A hired man, or a good boy, with a little instruction and occasional assistance, will do this kind of work, while there are a score of important things to be done that no one can do as well as the farmer himself. Much of the success of a farmer depends on the good judgment exercised on this point. It is where two farmers out of three fail. They would rather work than think-rather plow all day than keep things in order, and attend to the details as well as the general direction of the farm. They do things that they like to do, and leave undone those things which they do not like to do-or, what is about the same thing, they leave them to the hired men. No man can succeed who habitually adopts this course, for the simple reason that, no matter how industrious he may think himself to be, or appear to others, he does not in fact work. Work is doing something that his judgment or his conscience tells him he ought to do. If a farmer has a particular fondness for feeding a thrushing machine, and does not like to attend to the details of thrashing, such as seeing that no grain is left in the straw, or goes over in the chaff; that the horses are properly fed and watered, and that the outside horse, which has to travel farther than the inside one, is allowed a longer half of the evener; that the straw stack is properly built; that the boys are not put to do the hardest part of the work, and required to do all the running about and wait on the men besides; the farmer, in short, who shuns all thought, care, and responsibility, and devotes his time to feeding the machine simply because he likes to do so, while he knows, or might know, that he ought to be attending to other things, is merely wasting his time and strength. He is playing, not working. In agriculture, as in religion, feeling is no rule of duty. Happy he who, against his inclinations, does what he knows ought to be done; happier still he who feels like doing it.

#### Hints about Work.

Clover Seed will be a light crop this year. The spring of 1870 was so dry, that thousands of acres seeded down with clover failed entirely, and thousands more would not have been worth resowing for meadow or pasture had it not been for the timothy sown on the land the fall previous. We can not expect a heavy crop of clover seed from such land. Those who have any clover that will yield even a bushel of seed per aere would do well to gather it. With a mowing machine and a reaper platform, entting clover seed is expeditiously and cheaply performed. Those who have only a mowing machine, can cut and gather a light crop of clover seed by making a sheet-iron platform, and attaching it to the cutter-bar of the mower, and letting it drag on the ground. A man walks behind the machine with a rake, and keeps the clover on the platform until he has got all it will carry, when he pulls it off into windrows. On a wood mower, the sheet-iron can be attached in a few minutes. When there is a large growth of elover, and comparatively little seed in it, it should be cured in such a way as to preserve as much nutriment in the clover as possible. We shall then get seed and hay. In this case, the clover seed should he cured in the same way we cure clover hay. But when the fodder is of no value, clover seed may be allowed to lie exposed to the sun and rain for days or weeks without injury. In fact, it will thrash all the easier for such repeated wettings and dryings. When drawn in, however, it should be quite dry, and if there is no barn room it is better to thrash it out at once, as it is almost impossible to make a stack of clove seed that will shed the rain. If put in a stack, it must be thatched.

Sowing Winter Wheat .- Some hints were given on this subject in the last Agriculturist. On a good summer fallow that is mellow and moist, it will make comparatively little difference whether the seed is sown broadcast or put in with a drill. after spring crops, on dry, cloddy land, a drill frequently makes the difference between a good erop and a poor one. If sown broadcast, the seed lies among the dry clods, and much of it will not germinate until we have rain; while a drill can be set deep enough to deposit the seed in the moist earth beneath the clods. And if the drill is followed by a roller to break the clods, the moisture beneath will be retained, and the seed will germinate and grow, even should no rain fall for weeks. Latesown wheat requires more seed than when sown early-say 11/4 bushels per acre if sown the first week in September, and two bushels the last week. Much, however, depends on the condition of the On good, rich land, in fine order, the wheat tillers so much that less seed is required. A change of seed is always desirable. As a rule, it is believed to be better to get it from a somewhat more southern latitude, and from poorer soil.

Top-Draining the Wheat Fields where needed is of great importance, and it is better to do it as soon as the wheat is sown than to wait until the rains come. There are fields where it is necessary to plow out every dead furrow, but ordinarily all that need be done is to make furrows from the lower parts of the field where water accumulates. Secure a good outlet from these, and the upper portions, unless there are hellows, will not need furrowing.

Artificial Manure for Wheat will not pay unless we get \$1.50 to \$1.75 per bushel for the wheat. Nitrate of soda at four cents per pound is the cheapest source of nitrogen in the market at the present time, and with wheat at \$1.75 it might be used with fair profit. Sow 100 pounds per acre when the wheat is sown, and another 100 pounds if need be in the spring. On poor, sandy land, it would be better to sow 100 pounds of guano and 100 pounds nitrate of soda per acre in the fall.

Timothy Seed catches better when sown with the wheat in the fall, than when sown in the spring. A peck of seed per acre is none too much, unless clover is to be sown in the spring; in this case, we prefer to sow four quarts of timothy in the fall, and six quarts of clover in the spring.

Manure may be drawn out on grass land when other work is not pressing. Spread it evenly as fast as it is drawn, and harrow to break lumps.

Thrashing.—See hints for last month. When grain is safe in the barn, and the space is not wanted for clover seed, the straw and the grain-will he all the better if not thrashed until they are wanted. There is little prospect of a decline in prices, and many reasons for anticipating an advance. The straw is generally of good quality, and as the hay crop is short, it will be nuusually valuable for fodder. See that it is earefully preserved. An extra man in topping off the stack will be good economy.

Peas, when affected with the "bug," should be fed out early. When fed in September and October, the bugs cause little or no loss of nutriment. The pigs will cat bugs and peas together, and enjoy it.

Sheep .- With good feed, sheep will grow rapidly this mouth and the next, and lay up a store of fat and strength for the winter. We are sorry to say, however, that too many farmers leave their sheep to pick up a living as best they may. Instead of allowing all the food they can eat and assimilate, they are content if they find enough to keep them alive. They thus lose all that the sheep ate, while a little additional food would enable the sheep to produce considerable wool, mutton, and fat. Better, if need be, give a little hay, than let the sheep go without all the food they need. Lambs especially should be well fed. If they seour, there is nothing better than a pint each of milk porridge, made from fresh skim-milk and wheat flour. In severe cases, ten or fifteen drops of laudanum may be given, and repeated every five hours until the diarrhœa is arrested. Ewes intended for raising early lambs for the butcher must have extra good feed, and the ram put with them. There can no longer be any doubt that good, strong, common Merino ewes, crossed with a Cotswold or Leicester ram, will produce excellent lambs for the butcher. But it is equally certain that both ewes and lambs must be well fed. That is to say, the ewes should have good pasture in the fall, and good hay in the winter; or if straw is fed, which is the more profitable plan on wheat-growing farms, a little grain must be given in addition. The ram should have a pint of grain every day. A long-wooled lamb ram should not be allowed to serve more than forty ewes. A yearling or two-year-old will serve from sixty to one hundred, according to the length of time, food, and condition.

Milch Cows should have good pasture, and, if need be, a little extra food to prevent them falling off too rapidly in their milk. Contrary to general opinion, we find in our own experience that two quarts of coru-meal per day, instead of drying up the eow, will greatly increase the quantity of the milk and the richness of the cream.

Swine.—Pork is low, and it is a good time to pay extra attention to raising good pigs, as thousands of farmers will neglect their stock or abandon the business. Fall pigs need extra food to get them strong for the winter. Fattening pigs should be pushed forward rapidly this month. If there is not much profit in fattening pork at present prices, there will be still less if we feed the pigs little more than enough to keep them alive. That farmer will make the most money, or, at any rate, lose the least, who feeds the most liberally.

Do not be Discouraged.—If farmers are not making as much money as they have a right to expect—and, as a rule, such is the case—it may be well to recollect that we all anticipated "hard times" after the war. We have certainly suffered far less than we feared. Let us be thankful, and take heart for the future. The farmers are the mainstay of the nation. If the farmers prosper, the nation prospers. If farmers suffer, all classes suffer also.

We must Farm Better .- We must aim to make

our land cleaner every year. Weeds are the most oppressive tax we have. We can not get rid of them at once. Keep fighting, and especially should it be recollected that we must make thorough work as far as we go. If not entirely dead, they will grow again, and we lose what work we have performed.

Killing Weeds Enriches the Soil.—This is the keynote to good farming. Most of our soils abound in latent plant-food. Stirring the soil, and exposing it to the atmosphere, favors decomposition, and renders the plant-food available—in other words, makes the land rich. The fall of the year is the best time to do much of this work. And the earlier we can get at it, the better.

Harrowing Grass Land causes a good many weed seeds to germinate, and when the laud is plowed next spring the plants will be destroyed. In some cases, especially on light land, this is a better plan than fall plowing.

Keep the Teams at Work.—This is our own rule. We must aim to distribute the work so as not to be erowded too much at any one time. It is not always best to do work at what may be absolutely the best time, but to do it when you can best afford the time—provided always that it is never done too late. Any thing that we have time to do now that will lessen work in the spring should be done, even though we gain nothing except being so much ahead, with our work.

A Dry September affords an excellent opportunity for digging ditches in low land, and for cleaning out and deepening those already cut. It is also a capital time to throw up muck, and get it ready for hauling in the winter. Any of our readers who have some land they think too low to drain, if they will commence at the stream, and dig a ditch through their land, making the water follow them, they will probably be astonished at the result.

#### Work in the Horticultural Departments.

September is a month for planting, as well as a month for harvesting. Many seeds can now be sown to advantage for early crops next spring. The horticulturist should always be on the track of progress. In order to do this, he needs to visit the exhibitions of fruits, flowers, etc., nearest to him, and as many more as practicable. One evening a week can be improved in visiting the farmers' club, if there is one in the neighborhood, and profiting by the experience of others. Standard works upon different branches of hortienlture are valuable for study or reference, even if one is pretty well versed in the practical operations of the garden.

#### Orchard and Nursery.

In marketing fruit of all kinds, it will pay to take eare not to injure it by careless handling, for the price paid for a good quality of fruit is much above that given for a poorly assorted and bruised article. If fruit is to be sent to a distant market, it must be picked while it is firm, but still fully developed.

Dried Fruit.—Commence to dry fruit as soon as it is fully matured. It will be of use when the season for fresh fruit is over, and when it is difficult to procure a variety of food.

Trees set last spring without any mulch around them, will often show signs of failing during the warm weather of autumn. If the soil around them is removed to the depth of three or four inches, and then watered thoroughly, and a heavy mulch applied, it will often save them.

Seed-Beds are to be shaded as directed last month, and kept free from weeds.

Evergreens may be removed now as well as in spring, if eare is only used in taking up plenty of earth with the roots. Be sure that the roots are not exposed to the sun or to drying winds, and select, if possible, a damp, cloudy day. Large stones placed around the trees are better than stakes to prevent them from being disturbed by heavy winds.

Likels.—Provide new labels for fruit trees, where the old ones have become useless from long exposure to the weather. Have a plan of the orebard and nursery, so that in ease the labels are lost, the different varieties may be readily known.

Seeds.—Save peach and plum pits from healthy trees, and bary them for planting next spring.

Rowing.—If new orchards are to be set this fall, the land ought to be plowed and manured, in order to provide the young trees with a good soil, in which they can make a rapid and healthy growth.

#### Kitchen Garden.

It is a good time now to make preparations for underdraining the garden. In a well-drained and deeply-worked soil, the crops rarely suffer from drouth, and the ground can always be worked much earlier in the spring. Harvest all crops as soon as they are in perfection, and clear the ground of all weeds and rubbish.

Asparagus.—If the beds did not receive a dressing of manuare last month, apply it as soon as possible.

Beans.—Shell Limas, and dry for use next winter; and string-beans, prepared as for cooking, may be packed in jars with alternate layers of salt.

Cabbages and Cauliflowers.—In order to have these carly next spring, sow the seeds in the open ground about the middle of this mouth, and, when large enough, prick out into cold-frames. Keep the late crop well hoed, and dust with lime if the slug makes its appearance.

Corn.—As soon as the ears have been taken from the early sorts, cut the stalks and feed them to the cattle; they make excellent food, and serve as a change of diet. Dry a supply of corn for winter use. Saye a few ears of the earliest and best for seed.

Cucumbers.—Go over the vines every day, and pick all fruit of the proper size for pickling. Sweet pickles may be made of those which are too large for salting down.

Colory.—As soon as the nights begin to be cool, commence to earth up. Select a time when the plant is dry, for if the leaves are wet the stalks will be likely to rust. Use care in earthing up, not to allow any particles of soil to enter the ceuter or heart of the plant.

Endive.—When the plants are a foot across, tie the leaves together at the top, or cover the plant with a flower-pot or a mat, to blanch it so as to destroy the bitter taste which it otherwise has.

Kale.—Sow the variety known as the German Green, which will stand our winters.

Manure.—Every thing in and around the garden that can be converted into manure must be saved and composted with stable manure. Where there is peat uear by, dig out for the compost heap. Land for early spring crops is better if manured in the fall.

Melons.—Turn the fruit so as to ripen both sides; when ripe, the stem parts readily. Place the fruit on ice a few hours before eating.

Onions.—Harvest as soon as the tops fall down, dry thoroughly, and spread them in a dry, cool place.

Radish. - Sow the Chinese Rose-colored this month; it will keep all winter.

Spinach.—Sow in 15 inch drills; thin and weed as soon as the plants are large enough.

Sweet Potatoes.—Move the vines occasionally, to prevent their rooting. The larger tubers may be carefully removed, and the others allowed to grow.

Squashes.—Destroy all insects as fast as they appear. Remove the old vines of the early summer sorts. Allow the vines of the winter varieties to root freely at the joints.

Tomatoes.—Keep the superfluous growth ent away, and give the vines a support of some kind, if nothing more than a heap of brush. Destroy the large green "worm" which is found upon the vines abundantly this month.

Turnips.—Hhe the Ruta-bagas often. Sow the round early sorts early this month.

#### Fruit Garden.

Blackberries.—After the fruit has been picked, remove the old caues, and cut out all but two or three of the new ones. Never allow the new caues

to grow more than six feet high, and keep the side branches cut back to eighteen inches.

Currents.-Remove all suckers, and keep the rows free from weeds.

Grapes.-The prospects of the grape crop this year are, in most localities, very good, and plenty of boxes and baskets must be provided for marketing the fruit. Five-pound hoxes are preferable.

Pears .- Gather the early varieties as soon as they are matured, and, if intended for home use, allow them to ripen upon shelves in the fruit-room; this greatly increases their flavor and juiciness.

Raspberries .- Tie up the new canes to stakes, after entting out all but three or four, and shorten the laterals. Give the plants a dressing of stable manure, spaded under.

Strawberries.-Plants started in pots may be set out at any time during this month, but it is better to wait until spring for general planting. Keep all runners cut where the plants are grown in hills, and give the plants a good mulch of hay, after a dressing of manure has been applied.

#### Flower-Garden and Lawn.

If a good collection of annuals were planted, they will be making a good show now. Asters, Balsams, Donble Zinnias, etc., are very fine autumn bloomers. All weeds must be destroyed as soon as they appear.

Bulbs. - Set the spring and early summer flowering bulbs late this month or early next month. If new varieties are to be purchased, order early, as it often happens that a dealer's stock runs low later in the season.

Chrysanthenums .- Pot a few plants for flowering in the house; place in the shade for a few days; thin out the weaker shoots, and stimulate with a little manure water.

Dahlias.-If not kept tied to stakes, the stalks are easily broken by winds. Remove all flowers as soon as they have passed their prime, and all imperfect buds.

Gladioluses .- Keep tied to stakes, and when they have done flowering, cut away the flower-stalks.

Lawns.-Remove all weeds, as recommended last month, and mow occasionally. Where there are bare places, sow grass-seed in time to receive the benefit of the autumn rains.

Perennials and Biennials,-Sow seeds this month in well-prepared beds, and keep free from weeds.

Potted Plants. - As soon as the nights begin to be eold, remove to the house, after washing the pots and pulling out all weeds.

Seeds.-Continue to gather seeds as fast as they ripen, and before the wind has scattered them.

#### Greenhouse and Window Plants.

All alterations and additions should be finished by this time, as a sudden frost is liable to injure many of the plants which have been set out in the flower-garden and ornamental grounds. See that there is a good supply of coal, potting earth, and other articles needed during the winter. Remove all tender plants to the greenhouse as soon as the nights become eool.

Annuals.—Sow seeds in boxes or pans for winter flowering.

Bulbs .- Pot all tender greenhouse bulbs like the Cyclamen, Oxalis, etc., the latter part of the month.

Callas.-Re-pot Callas after dividing them, and give them a rich, turfy soil, which is particularly adapted to their growth.

Potting .- Commence potting the tender plants which were bedded out during the summer, and plants which are to be used for propagating from.

Cuttings .- Prepare a quantity of enttings for a supply of early plants in the spring.

A Remedy for a Hard-milking Cow.-Ed. Skinner, Middletown, Orange Co., N. Y gives a remedy for a hard-milking cow, as follows: He

makes four wooden nees about an inch and a quarter long. of a proper shape and thickness to enter the orifice of the teat and distend it somewhat. These are greased, and when the cow has been milked, the pegs are inserted carefully, and allowed to remain. The constant distension of the teat enlarges the orifice gradually, and the cow will be more easily milked. When the teat is so obstructed that the milk spatters about, a small quill is inserted in that teat at milking time, and the milk is drawn in a regular stream.—These suggestions seem practicable, and we should be glad to hear if on trial they are found to accomplish the results aimed at.

#### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Ang. 16, 1871, and for the corresponding month last year.

CURRENT WHOLESALE PRICES.

July 17. Aug. 16. \$\frac{11.9\frac{9}{6}}{4.90} \times \frac{6}{6} \times \frac{25}{6} \times \frac{1}{6} \times \frac{6}{6} \times \frac{25}{6} \times \frac{1}{6} 
Gold has been moderately active since our last, with 1111/2@112% as the extreme quotations, closing, August

15, at 11234 .... The arrivals of Breadstuffs have been very liberal during the month, and as receivers have been free sellers, prices have generally declined, influenced, to some extent, by higher rates on ocean freight. Toward the close, Flour, Corn, and Rye showed more firmness, with a livelier inquiry reported. Wheat left off heavily; Oats unusually depressed and unsettled, influenced by the large offerings of new, which are not cooring to market in very desirable order. Rye closed strong, on a good export call for new-crop Western, of which considerable sales have been made for forward delivery. Barley has been altogether nominal .... Provisions have been quoted lower, on a more extensive offering of stock and a comparatively moderate demand ... Cotton has been less active and quoted cheaper. moderate inquiry has been noted for Domestic Fluece Mood, mostly for the lower grades, at previous quota-tions. Domestic Pulled has been scarce and wanted at decidedly firmer rates. Texas and California Wool has been selling moderately at former figures. Foreign Wool, especially Cape, has attracted much more attention. chiefly from buyers for manufacturing purposes, at strong and buoyant prices. Holders of most kinds of stock have been very confident in their views....Hops have been in better request and quoted decidedly higher, influenced, in part, by the less favorable English, as well as home, crop reports.... Tobacco has attracted less attention within our previous range of prices.

Beef Cattle .- The supply has been quite large during the past five weeks, though less than for the previous month. With many people ont of town during midsummer, and peaches and other fruits abundant, less beef is consumed. Texan eattle have not come forward as freely as anticipated, the first shipments losing money. They are now increasing in quantity. The average quality of the receipts is fair, and trade has been somewhat uniform, the close being marked with some firmness, though the average decline for the month is nearly 1/2c. P D. As a general thing, the business of late has unsatisfactory to shippers.

Below we give the range of prices, average price, and figures at which large lots were sold:

July 17th, ranged 6 @12½c. Large sales 10½@11½c. Ay. 11½
July 24th, do. 8 @18 c. do. do. 11 @12 c. do. 11½
July 31st, do. 6½@18 c. do. do. 10 @11 c. do. 10½
August 7th, do. 8 @12½c. do. do. 10½@11½c. do. 11
Aug. 14th, do. 8½@12½c. do. do. 11 @12 c. do. 11½

Milch Cows .- With a fair supply of cows coming forward to keep up the flow of milk at a time when it is in most request, the market has raled heavy, and low rates have generally obtained. Some miserably poor cows have been sent in for sale. They only brought \$30 @ \$35 each, what are generally termed common selling at \$40 @ \$55, fair to good at \$60 @ \$70, and prime to extras at \$75 @ \$80.... Calves.—Receips continue quite liberal; but many of these now sent in are known as "grass calves," generally sold by the head, at \$8 @ \$9 each, or 41/2c. @ 51/2c. P D. Prices have latterly adeach, or 41/2c. (6) 51/2c. W w. Frices have latterly advanced about 1c. P b., and the demand is good. Ordinary milk veals are quoted at 61/2c. (673/2c; fair to prime, Sc.@9c.; and only extras reach 91/2c. @ 10c ..... Sheep and Lambs.—Arrivals are increasing, as is usual at this season of the year. The greatest increase is in lambs. Fat sheep are scarce and wanted. Butchers are accustomed to use a portion of the loose fat of old sheep in setting off thin lambs upon the hooks. This make the former in special request, and 6c, is readily obtained for those weighing 85@90 lbs. Some of 100 lbs, and upwards are selling at 614c.@61/c. Thin sheep and poor lambs go slowly. The bulk of the sheep are now coming from Ohio, with many lambs from Canada. Poor sheep sell at 4½c.@5½c.; fair to good, 5½c.@6c., and prime to extras, 61/4e.@61/4e. Lambs sell at 6c.@71/4c.; few choice, 8c.... Swine.—There has been a little falling off in receipts, and some flactuation in prices-first a decline, then an advanta .... a now an easier feeling again. Live hogs are quoted at 54.00.05% c.; dressed, at 614c.@74c. The market closes heavy.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territorics, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:-Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Special Notice.—Communications giving or asking for information are always acceptable. These should always he accompanied by the name of the writer. The name will not be published whenever there is indicated a desire that it be withheld. Writers may choose any signature they please, but we must be furnished with the real name. We are under no obligation to return rejected manuscripts. Where stamps are sent for their return, we, as a matter of courtesy, try to send them back. Writers should retain copies of articles which they consider valuable, as, with the best intentions in the warld, we may not be able to return them if called for after the lapse of considerable time.

"Will Gas Lime Drive away Insects?"—We fear not. But it is worth trying. An Illinois farmer writes us: "A person near Chicago has been experimenting with different substances on potatobugs, and claims to have found in gas lime a specific that will not only banish the potato-bug, but all other ioseets. I propose to try it next year on my spring wheat as a preventive to chinch-bugs." We would spread it on the land this fall, and either plow and harrow it in; or, if necessary, let it lie exposed to the atmosphere all winter. In this way, if not applied in excessive quantity, there will be no danger of its injuring the wheat.

Manure a Remedy for the Chinch-Bug in Wheat .- Mr. John T. Lawrence, of Lee Co., Ill., writes that he hears many complaints of the damage done by chinch-bugs this season to the spring wheat. " My own wheat," he says, "has escaped, and is a better crop in quality than I have raised for many years, which I attribute to a liberal application of manure plowed in last fall. Seed sown March 11th. The land is a sandy bluff, sloping to Rock River, the ridge being crowned by a row of Indian mounds, from which we have taken bones, arrow-heads, pottery, etc. Such soil, being dry and light, is just suited to the chinch-bug. Some years ago I sowed a piece in wheat which had been heavily manured for corn, and it was the only wheat in the neighborhood which escaped. A small portion not mannred destroyed by them, the line of their rayages being distinctly marked." This is an interesting experiment, and well worthy the consderation of our Western readers. When the midge made such havoc with the wheat crop of Western New York fifteen years ago, similar effects of an application of manure on dry land were frequently observed. It may be that the insects do as much damage on the manured crop as on that unmanured; but if we had a piece of land rich enough to produce 35 bushels of wheat per acre, and another piece adjoining only rich enough to produce 10 hushels, and the insects destroyed 5 bushels per acre from both crops, we should get 30 bushels per acre from one piece, and only 5 bushels from the other. Practically, the insects might be said to have nearly destroyed one crop, and to have done little damage to the other, while, in point of fact, they destroyed just as much wheat on the rich land as on the poor land.

Common Sense in the Monsehold is the title of a work by Marion Harland, which is publish by Charles Scribner & Co., N. Y. Price \$2. Mrs. Harland is widely known as a writer of fiction, and one might expect to find her quite out of her sphere as the author of a work upon such a matter-of-fact subject as domestic economy. Whoever prejudges the work in this way will make a great mistake, for a more practical, "commonsease" household book than this we do not remember to have seen. The recipes, so far as we have had occasion to test them, are excellent; and the whole work bears the evidence of having been written by one who has "been there." The chapters about "Servants," "Company," "The Sick-Room," and others, are full of sound sense, capitally put. It is not often that we meet with a work that we can commend so heartily.

Drilling Seed.—A new subscriber, Clarkston, U. T., is a novice at farming, and wants information about drills and drilling seed.—Drills are of great variety, but yet nearly all are constructed on the same principle. They can be drawn by a two-horse team, and will sow about ten acres of grain in a day, depositing the seed at a depth of three inches beneath the surface, more or less, as desired. Economy of seed and a better stand of grain are among the advantages gained by the use of drills. Our advertising columns contain the names of makers of drills who would gladly send a descriptive circular to our correspondent on being asked for one.

Wire Fences.—W. H. Barnes, Anderson Co., Mansas, says a two-wire fence would be of doubtful value. He makes a three-wire fence, the lowest wire 18 to 20 in. ses from the ground, the others placed at intervals of 12 o 14 inches. Thus the fence will be four feet high or something less, but sufficient to turn stock of any kind. Posts need to be one rod apart, and between the posts stakes to prevent the wires from spreading.

Management of Timber Lands in Illinois.—A subscriber (Iroquois Co., Ill.) has 150 acres of timber land which he wants to make the most of, and asks how he must manage it. All brush and undergrowth must be kept down. If the trees are small, they may be permitted to stand six feet apart until they begin to get too tall, then one half may be cut out and disposed of and the rest will increase in size. In a few years another thinning will be necessary, to be continued until each tree accupies a square rod of space. In twenty-five years each of these trees will probably contain half a cord of wood, or from six to eight posts, so that their value will be considerable. During these years the ground may be sown with orchard grass and some white clover, and pastured.

Clover with Corn.—A. G. Kirk, Dickinson Co., Kansas, says he saw in Columbus County, Obio, last April, a fine stand of clover in a corn stubble, and on inquiry found the owner of the land was in the habit of sowing clover seed when he worked the corn the last time, for the purpose of supplying manure for the crop of nats, or barley, or wheat, which was to follow. This farmer evidently was one of the progressive sort, who believes in putting all he can on the land. We have done the same, pasturing the clover with sheep, and had a good crop of wheat after it.

Grass for Mountain Land in New Jersey.—A subscriber asks which is the best grass for mountain land in the north-west part of New Jersey. We have seen in Sussex and Warren Counties (which comprise the district referred to) us five timothy and clover us we have seen anywhere, and we do not think these could be changed with any benefit. Where timothy and clover will thrive, we do not know of any more valuable substitute, though we might propose to add some bluegrass, which also thrives in that locality, as n help to the pasture.

The Extensive Roofing Works of H. W. Johns, which were burned July 26th, are being rebuilt of iron, on a larger scale than before, and will be completed by the time this paper goes to press. His business of manufacturing Asbestos Roofing has increased very rapidly, the demand this season having exceeded the manufacturing facilities. The enlargement of his factory will enable him to meet the requirements of his customers.

Farm Gate.—As a Hartshorn, Ashtabula Co., O., sends us a model of a farm gate very neatly gotten up, but unfortunately the patent-right men have a claim on that gate. There is a patent on it for the right to manufacture and use, for which parties have been to our knowledge charged two dollars. It is hardly safe to make or use any gate that operates by means of rollers, as they are all subject to one or more patents.

Stopping a Hen from Sitting.—
J. E. Smith, Durhao, N. H., writes: "I was quite amused some days since by an old sitting hen. Having tried all the usual ways to induce her to leave her nest, I concluded to use 'moral suasion.' I placed two lumps of ice in the nest after taking her off. The 'old critter,' as usual in such cases, soon returned and took a seat, which seemed to disagree with her, and after a few hours Mrs. Hen concluded to associate with her fellows."

A Model Letter.—Wm. Johnston, Brookside, Mich., sends us a rare specimen of brevity and pertinence, which we print in full, as an example to others. "Hill, forty feet high: pitch of hill, 45°: spring at bottom, house at the top; what is the cheapest fixture you know of to raise water to the house?"—One thing is lacking, the fall of the spring from source to outlet, and this is important, as on it depends whether a ram can be used or not. If a fall of three feet can be got in a length of farty feet, a ram would work, and would elevate water through a half-inch pipe to the hight required. The pipe supplying the ram should be 1½ inches in diameter. If there is not sufficient fall, a windmill is the best thing.

Soft Britter.—H. S. Dutch, Johnson Co., lowa, has his butter come soft. His cellar is a "Western" one, not walled, well ventilated. Cows have good pasture, water, shade, and salt twice a week. What is the matter?—August probably is the matter. There is a good deal of soft butter comes in July and August. "Western" cellars are generally rather warm in the hottest part of summer, and ventilation does not mend it much. We have get good hard butter by putting a muslin hag filled with pounded ice in the churn just before the butter came. But generally, if the cellar is sufficiently cool, the butter will harden by the time it is ready to work over. Butter-making in summer is attended with many difficulties, unless all the accessories are well arranged, and even then the cows themselves will sometimes fail of coming up to the mark.

Norway Onts.—W. D. Krohu, of Bergen, Norway, sends us, by steamer, a sample of his oats. He states the native Norway oats had been cultivated for some years with great care, but without improvement; he therefore procured seed from Scotland, and now has a really good oat. The men consume all the crop; the animals get but little of it. The climate of Norway is damp, and the oats, having a heavy straw, are apt to lodge. We think, as has been generally the case, these oats would deteriorate in our hot, dry climate, though the appearance of the sample hefore us is very different from the Norway oats sent out by Ramsdell & Co.; they are plump, heavy oats, and would weigh 40 pounds to the bushel.

Bone Manure.—N. C. Boutelle asks if ground bone is profitable to use at \$45 a ton, where barnyard manure is worth \$10 a cord, delivered on land. We think it is, if got pure. A dressing of 250 pounds per acre on grass land, especially if it is occasionally pastured, would andoubtedly pay. It must be remembered that the principal mineral substance carried off from grass land, in the shape of fed cattle, is the bone, and if this is returned to the land exhaustion is prevented, more especially when occasional dressings of barn-yard manure are applied. As a dressing for grape-vines, pear-trees, and for general garden use, it may be used at the rate of 300 to 500 pounds per acre profitably.

Making Cheese-Saving Rennet.

Julius F. Bingham, Greensville Co., cheese in a region where nobody saves the rennet, and can not procure it. Can it he purchased in New York? Is also a novice in making cheese, and has made some errors, and wants advice. One cheese leaked badly, and is now dry and hard; some are hard and tough. Sometimes the curd comes in thirty minutes, and sometimes in an hour .-- Rennet should be saved by all cheesemakers. It is very easily prepared, nothing more being required than to take the stomach of an unweaned calf and empty it of its contents without rinsing it; ruh it with salt until it is perfectly cured; then the loose salt may be turned out, and a hoop of light twig be inserted, to keep it distended, when it may be dried and hung up for use. We have purchased remet, when commencing to make cheese, at a seed store in Philadelphia. seen them in New York. The failures spoken of are undoubtedly due to irregularities in the making of the curd, which practice will enable our correspondent to over-The temperature of the milk when the rennet is added should be always equal. 95 degrees is the proper heat. If this is exceeded, it will make a hard, tough cheese. The curd should not stand too long, or the same . effect will be produced.

Clipping Sheep into Shape. - The proverh says that there are tricks in all trades. This is probably true, for we regret to say that farmers, who are by the very nature of their employment removed beyond the temptation to practice "ways that are dark," do sometimes allow themselves to fall into temptation. And here we relate a case in point. At an agricultural exhibition we were examining some long-wooled sheep, and it was whispered in our ear that the exhibitor of a prize ram had at the previous shearing made up the fleece by leaving the wool on the shoulders and breast and the rump, so as to give a squareness to the hody of the animal which was fictitions. As our informant who thus let us into the secret of making up sheep for exhibition, was the son of the owner, and had a hand in it, and represented it as commonly done, and that the best hand at it was sure to have the best-looking sheep, we had faith in the truth of it and accept it as a fact. We find further that this same trick is practiced at English exhibitions, and has led to some sheep thas "gotten up" being set aside and not allowed to compete for the prizes. We doubt not that this practice is already in vogue in the United States, for we are apt to learn, and invent, and it is said sheep thus clipped were exhibited at the last New York State Fair (the instance we refer to occurred in Canada), and judges at fairs should take notice of it, and not allow any sheep to get ahead of its proper position by the practice of such an easily discovered trick.

that the issuing of the Weekly Hearth and Home will lead the Publishers to any less attention to the American Agriculturist, it is proper to say, that this is not the case in any way. The two papers are entirely distinct from each other in matter, engraving, etc., as much so as if published a thousand miles apart. But the enlarged field and the increased facilities brought in by the Weekly, add to the resources and facilities forkeeping up the old American Agriculturist to all its former excellence, and increasing its value.

Grass in Summer Fallows.—An inquirer has a summer fallow now bad with Quack and June grass, and asks about sowing timothy on it. This fallow can not have been properly managed, or there would be no grass in it. The purpose of a summer fallow is to destroy all vegetation by plowing it down or harrowing it out as soon as it appears, and thus keeping the ground quite clean. We would not put seed on such foul ground; we would rather sow oats or buckwheat next season, and seed down then. We have seeded timothy and clover successfully with a crop of buckwheat sown on the 12th of July; also with oats sown thin (2 bushels per acre) in April.

Sowing Timothy on Stubble.—I. McC. asks if timothy could be sown on wheat stubble without harrowing, this fall. It would be a risky experiment, unless the soil is in good heart, or it can be top-dressed with a little fine manure, or the fall rains should be copious enough to give the seeds some covering of soil. The seed should be sown liberally, say 10 quarts per acre, as much of it would fail to eatch from want of covering,

Musty Cellar.—Fred. K. Gates, Cazenovia, N. Y., has a musty cellar which spoils the milk and other things in a few hours, and he wants a cure. This cellar wants ventilation. If ordinary ventilation by a window is not sufficient, open a communication with the chimney if possible, or put a wooden spout, eight or ten feet high, against the back or side of the house, and make the bettom of it open into the top of the cellar. Fix another tube from the outside, near the ground, which shall open at the bottom of the cellar. Thus a circulation of air will take place from the bottom to the top. Wash the cellar walls and ceiling with lime whitewash in which a little carbolic scid has been mixed; this will destroy the mold on the walls, and the ventilation will prevent its fature formation.

Sawdust, Bone-Meal, and Ashes .-A. E. Phillips, Spottsylvania Court-House, Va., asks about the value of sawdust as a manure; also as to the propriety of mixing bone-meal, ashes and lime.-Sawdust is not of itself considered valuable, but we do not indorse much that is said of its worthlessness. once saw very promising potatoes growing on a patch of old sawdust, mostly pine, but it was well rotted. It will soon rot if In a heap, and wet; but we would not advise it to be plowed in fresh. Better to use it for bedding for horses or cattle and allow it to ferment, which it will readily do, and then makes excellent manure, especially if of hard wood. Bone-meal should not be mixed with lime and water. They would act free the ammonia, which is one special virtue of bone-meal. Ashes may be mixed with bone-meal without loss, used dry, and immediately; any ammonia set free would be appropriated by the soil. Lime should not be mixed with manure.

Fattening Hogs.-Hogs that are intended for pork this year should now commence fattening. They should be put by themselves in a grain or clover stubble, where they will have exercise sufficient to keep them healthy and in good appetite, and be fed so as to keep them gaining rapidly. They will make a healthy growth during August and September, and, put up in November, will be ready for the butcher on one half the feed they would require if delayed one month later. In cold weather, a great portion of the feed is used up to maintain the animal heat, all of which is saved by commencing so as to forestall the cold, stormy weather of December. Plenty of fresh drinking water, and a trough in which to roll and bathe, will be needed and should be supplied. Pork, at the best, is not the most wholesome food, and the filthy manner in which some is fatted, is far from making it less disagreeable. A proper attention to cleanliness, to which a hog naturally is not disinclined, will not only improve the quality of the pork, but will prevent absolutely poisonous conditions of the meat.

To Prevent Sows Eating their Young.—"S. L. P." has tried the following plan and found it effective: "Take an old, coarse boot, and cut off the top above the instep; then cut a slit in the back, commencing at the top of the boot leg, so as to leave the bottom one or two inches below her snout. Thrust in the snout, and then take a rope and ran through the finger straps and tie it back of the ears. This will prevent her from biting her pigs, while allowing her an opportunity to drink her food."

Value of Apple Pomace for Manue.—"W. II. C." We think it is worth a l'.ile more per ton than ordinary bare-yard manne. Liow it to thoroughly ferment and decompose before applying it. It would be better to compost it with manure.

Shade as a Fertilizer .- A gentleman in Maryland, who has recently become a farmer, asks our opinion of an experiment he proposes to make. He has a field of limestone land, naturally good, but "run down." He has great faith in "shade" as a fertilizer. The field is now in oats—sown more for the benefit of shading the land than for any other object. As soon as the crop is off he proposes "to cover the field over with straw, and then sow a bushel of plaster per acre on the same, for the parpose of holding what little animonia may be in this poor soil, and also to hasten the early decay of the straw." We have no personal experience on this point, but think that where a farmer has more straw than he knows what to do with, the plan proposed is well worth trying. Shade, or, more properly, mulching the ground, checks evaporation and keeps the land moist, and thus during hot weather favora the fermentation or decomposition of the organic matter in the soil, and probably leads to the formation of nitrates, which have great fertilizing value. A growing crop, though it shades the land, does not have the same effect, as the growing plants pump up moisture and make the soil drier than it would be if kept clean and free from vegetation by summer-fallowing.

Will it Pay to Use Lime for Manure at 25 cents per Bushel?—C. A. Baker, of Chantanqua Co., N. Y., writes us that he has a farm of 230 acres, 100 of which is bottom land, subject to overflow. The balance is upland, originally timbered with pine and oak, with some hemlock knolls near the bottom land. The latter he has drained to some extent with hemlock boards. "And now," he writes, "the question is whether it will pay to use lime upon the upland at 25 I have 40 acres that I want to break cents per bushel. up and summer-fallow next year for wheat, as there are some white daisies on it. It is a pasture now, and will be used for that purpose as soon as seeded down again. Will it pay to dress it with lime? I keep 50 cows and make batter, also some young stock, and seven horses, and have 22 acres in Diell wheat."—This is a sensible letter, as it gives us all the facts. We think Mr. B. is adopting the right course. Drain the rich bottom land and summer-fallow the upland. We should expect lime to have a good influence on such land, not merely for the wheat but also on the grass for many years. If lime could be had for 15 or 20 cents per bushel, we think few things would pay better than an application of one hundred bushels per acre, and lime for manure ought to be afforded at this price.

What is the Best Variety of White Winter Wheat?—We know of no better variety for good, rich, dry land, than the Diehl. It has short, stiff straw, and plamp, well-filled ears. It is an agreeably deceptive variety, as, on good land, it turns out better on thrashing than it looks at harvest-time. The great trouble about it is that it varies a good deal in quality even when pure; and farthermore, it is almost impossible to find seed unmixed with other varieties.

Cultivating Corn.—II. I. Rosenberger, Clover Dale Farm, Va. The two articles in the June Agriculturist on cultivating corn are not contradictory, as our correspondent seems to think; they are in "Hints about Work." The deep cultivation there recommended will be seen to apply only to the exceptional case of sod land plowed early, which was not in good condition, being full of hard spots, needing deep cultivation to break them up. Further, this deep culture was recommended to be confined to the middle of the rows where there would be, at that early season, no roots to disturb.

To Kill Dew-Berry Bushes,—"I. G. B.," Woodland, Pa. The best plan you can adopt will be to plow the field infested with these bushes, twice in this menth, harrow thoroughly after each plewing, and pick up and burn the roots.

To Prevent Butchers' and other Blocks from Splitting,—Geo. W. Walker, Lowell, Mass., has discovered that the round blocks used by butchers, glove and shoc cutters, and other tradesmen, can be prevented from splitting by boring a two-inch augur-hole in one side, and nearly through the block, half way between top and bottom. The hole is kept filled with water; a pine plug is driven in when the hole is filled, and taken out and replaced as may be necessary.

Potatoes on Sod .- "W. C. W.." Canaseraga, N. Y., has a piece of gravelly loam that has been five years in pasture, which he wishes to plant with potatoes next spring; and wants to know the best method of preparing the ground and manaring it. Sod ground is excellent for potatoes, and gravelly loam is a congenial soil. We would plow it this fall early enough to have the sod rotted before the ground freezes up. What manure is to be applied we would prepare during the winter by piling it as it comes from the stables, letting it heat, and turning it over twice or thrice; giving it occasionally a dose of plaster, say a bushel or two, spread over it when it steams. Worked in this way it will be pretty well rotted by the time the snow is disappearing. Then, while there is sufficient sledding, draw it out and spread at once from the sled. When the ground is sufficiently dry, we would turn the manure under and harrow it well inst before planting.

who gives and Elders.—A correspondent who gives no name or address, asks how to kill docks, elders, and plantains (also, other questions which we can not answer for want of name and address). Docks and elders must be grubbed out by the roots. Plow the fence rows where they grow, during this mouth, and gather the roots and burn them, and use the ashes in the orchard or garden. Plantains may be dug up with a stont knife; if they are in a lawn or grass-plat, manure it and encourage the growth of grass, which will smother them out in time.

A Kansas Farm that seems to be Worn out.—"Cocklebur," of Leavenworth Co., Kan., has a farm that has been in enlitivation 12 years, growing corn and wheat, soil a sandy loam, and it now seems to be worn out. This is the text that has been preached over and over again, and now one might say, "We tald you so," and the ald eroak would not be devoid of truth. But "Cocklebur" is not past redemption—he has 2,000! large loads of mannre in his feeding pens. Then let him forthwith get it out of his pens and put it where it ought to have been years ago, on his land. It will give 30 loads to the acre on his 70 acres of hardly used land, which will fit it to bear a crop of wheat and take to grass and clover; this plowed in, after two or three years will bring a crop of oorn, which ought to be fed to some of those Texan steers he writes about, and a quantity of manure made and saved which will put the land through another course; and so proceed.

A. Fly-proof Smoke-House.—E. B. Steers, Bull Creek, W. Va., wants a plan of a smokehouse that will keep meat clear of flies. It is necessary, house that will keep meat clear of flies. It is necessary, to scenre this, to build the house of brick, or of hoards battened tightly together and lathed and plastered inside. The roof should be of tin, and the cornice should be tightly fitted together. The door should not be more than five feet high, and just above it a screen of fine wire gauze fitted on a frame hung on hinges and fitting closely to the sides of the house, so as to divide the upper part of the house, where the meat is hung, from the lower part, where the fire is made. This screen should not be removed or opened while the outer door is open, and flies should be carefully excluded during this time. A window Atted with a fine wire screen may be set in the house, both for light and ventilation, when required. For greater convenience in opening, the cross screen may be made in two parts, but care must be taken that no spaces he lest where a fly or insect could arawl through.

We call attention to the liberal offer of the publishers on page 328, noder the head of "Money Saved " There are thousands who could be greatly benefited, if led to read more of the useful; and if the extra offers made stimulate such persons to read and think more, they will doubtless be benefited, and the Publishers' end will be gained.

Cost of those Boats .- H. Moses, Exeter, N. H., wants to know the cost of one of the boats described in the American Agriculturist of August. The materials will cost about ten dollars, including two coats of paint and wrought boat nails. If common nails are used and only a coat of pitch ontside, which will answer for hunting purposes, \$4 or \$5 will cover the cost.

List of Fairs .- On pagea 353 and 354 will be found a very full list of fairs to be held in September and October, to which attention is directed.

Corn-Husks .- The husks of corn are very well worth the trouble of saving. When dried and torn into strips they make excellent mattresses, clean and sweet, and very soft and elastic. Plaited into a rope and wound round a central point, they make serviceable doormats, the manufacture of which will furnish pleasing and nseful fireside employment for many a stormy day when ontside work is impossible, or for the long evenings of winter. They are worth saving for these purposes alone.

Salt and Muck .- J. E. Larmer, North Haven, Ct., ask how much salt is sufficient for an acre of sod ground to be plowed this fall, or whether he may expect a good crop from well-pulverized muck, without other manure. We would not advise salt to be applied in the Top-dressings of all soluble manures are more efficient when applied in the spring, more especially of those so very soluble as salt. If the sod ground is to be sown with wheat, we would apply two bushels per acre next April. As regards the muck, if it is rotted it will be of benefit, but if salt or lime is applied along with it, the benefit will be considerably increased. We would advise the mack to be composted with four bashels of lime and one peck of salt to the cord of muck, and after lying through the winter spread it eafly in spring.

More about the Little Pigs.-John Miller, Slackwater, Pa., recommends that the little orphan pigs be fed with milk and lakewarm water, with a teaspoon, taking them on the knees wrapped in a cloth. In the course of one or two days they will learn to drink the milk and water out of a pan. The water should be gradually decreased until pure milk is given. Another correspondent, who forgets to append his name to his letter, says the pigs will thrive better on sonr milk (but not thick), fed a little and often.

Cure for Rot in Sheep .- J. Miller says that inrpentine is a preventive of rot in sheep. To administer it, for every twelve head mix a tablespoonful with two quarts of wheat bran and one quart of salt; give

Harvesting Peas .- Wm. Koeing & Co., St. Lonis, Mo., ask how to harvest peas on ground too noeven for the mower. A horse rake may be used, which will gather them into rows, from which they may be forked up, when cured, into the wagon. Peas, when ripe, leave the ground very easily; in small quantities they may be "hooked" np with a scythe, but when the field is large the rake may be made available.

Horse Potato-Digger.-I. C. M., East Toledo, O., asks which is the best horse potato-digger. R. H. Allen & Co., 189 Water street, New York, have very good potato-digger. We can not tell the price of it. They claim that it will dig the potatoes and separate them from the earth, leaving them in the row on the surface of the ground. Any mode of successfully digging potatoes by horse-power must necessarily be a great improvement on the old-fashioned hoe or fork.

Sweet Pork .- It is beyond a doubt that cleanliness has much to do with the flavor of pork. The filthy state in which many fattening hoga are kept has a tendency not only to give a rank taste to the meat, but to render it positively unwholesome. A very common mode of penning hogs at this season is in a rail pen, without protection from the weather. The consequence is that such pens are not fit to keep a living animal in; wet and filthy, cold and nocomfortable as they are, hogs will not take on fat, and a great proportion of the food is wasted while they are kept in them, while the filth, a considerable amount of which the hogs will consume, must be detrimental to their bealth and to the health of those who

eat their flesh. It is not only safer but more economical to give fattening animals good shelter and dry beds and litter, and keep them quite clean. The labor will be well repaid.

How to getrid of Sorrel .- L. Horning, Montgomery Co., Pa., asks if some of our numerous readers can give him a plan to get rid of red sorrel-will lime do it?—Lime, of itself, will not destroy sorrel; we have seen it flourishing on the very verge of a lime-kiln. Cultivation will destroy it, and lime will encourage the growth of clover and grass, which will tend to smother it ont. Direct applications of ashes or lime seem to enconrage its growth, and we know of no plan but to plow it under before its seed is ripe. The seeds ripen very early in summer. Then keep the soil in good condition, producing good crops, and sorrel will be of no trouble.

Cleansing Milk Pans. -S. Owens, Malaga, N. J., asks how she can get her milk pans perfectly Wash with hot soapsnds, and rinse well in sweet clean cold water, and if still sour, rinse with water in which soda or lime has been dissolved. Either lime or soda water will destroy any acid or sour smell which the pans may have, and will render them perfectly sweet,

Wire and Board Fence.—I. T. Smith, Cedar Rapids, Iowa, sends us estimates of the cost of wire and hoard fences as follows:

| 9 lbs. wire, @ 7½c.<br>1 post, @ 30c.<br>7 stays, @ 1c.<br>1 lb. staples. | 20c.<br>7c. |
|---------------------------------------------------------------------------|-------------|
| Per rod                                                                   | 70          |
| 5 bnards, 8 ft. each, @ 2c. per foot<br>2 posts, @ 20c.<br>1 D. nails.    | 40c.        |
| Per rod                                                                   | 28          |

Thus, he considers a board fence to be the more expensive of the two. As the fence question is one of the most important ones a farmer can study, we shall be glad to hear from our correspondent, as he intimates.

Temperature of a Spring-House for keeping MHk .- I. Wilson, Monroe Co., Iowa, has some springs which run from a bank, the temperature of which is 62'. He asks if they could be made available for a milk-house. These springs must receive warmth from the upper soil before they escape, as this is a very high temperature for spring-water and would not be sufficiently cool to keep milk well. There is no donht that cooler water could be found by digging into the bank and forming a cave; if a apring could thus be found of a temperature of 50° or less, a very good milk-house might be made. The floor should be paved with stone and a chan-nel dag out all round the inside, through which the water should be made to flow. In this stream the milk-paos should be set

Bee Notes for September.—By M. Quinby.

Any old hive, weak or otherwise, should be examined Unless in sections where backwheat is in blossom, weak hives will in all probability he plandered, unless they are protected. Contract the entrance or remove them at once. Refuse honey may be carefully fed to light hives, but leave none near the apiary. Diseased stocks should be removed now, that they may not be robbed, to the detriment of the robber. Such bees can be given to queenless stocks ; but to guard against infection, confine them for forty-eight hours in an empty box or hive. honey, such as is not fit for table, can be scalded, skimmed, and used for feeding. Other parts of the comb, mixed with brood, should be buried in ground, to prevent the possibility of contagion. With Italians, there is usually but little disease. There need be no particular hurry about removing condemned healthy hives, that are strong enough to defend themselves, as it is well to allow the young bees to mature and leave the combs clean for another year. It is quite common to find in the apiary a hive with plenty of stores, few bees, and no queen; this occurs especially with box hives. If such hives are not infested with worms, they may be saved by sapplying a queen and bees from one or more other hives. They will unite more readily if removed a mile or so from the old stand. A swarm that has filled up without a queen will have so much drone comb that it will not be worth while to try to winter it. Few bees and no scaled brood indicate a queenless hive. It is sometimes desired to winter light stocks, which is doubtful economy. In such a case the bees must be fed freely to induce them to build comb and rear brood. Now is the time to do this, if it is done at all. If it is necessary to feed a strong hive, October is

the best time. Remove all surplus boxes. Honey that is now noscaled will be removed into the hive. It is reported that the prairie flowers of the Western States furnish abundant honey in September, and that colonies often get enough to corry theor through the winter, and that they frequently gather a surplus. But we of England and the central States need not expect any thing of this kind. It is presumed that most of the readers of the Agriculturist are sufficiently advanced to use movable combs in some form, and with them comes the necessity for a closer intimacy with our bees; of studying their na-ture, and learning what they will bear, etc. It will be found that their mood or temper varies with the weather, and that they may be trained to allow all our manipulations without resentment.

Sundry Humbugs .- Several subscribers, while writing very landatory of these humbug exposures, say they come too late in many cases. That can not be The ingenious swindlers usually send their helped. documents only to distant points. Some of them watch this office, and, after getting a new scheme all ready, time their mailing so as to operate just after a number of the American Agriculturist has gone to press, so as to have a month to work in. Most of them pretend to limit the time in which their specions proposals can be responded to, so as to hurry up their victims before they are themselves checked by exposure. The only preventive is to give the cold shoulder to all these grand schemes for enriching you, and to promptly mail to us any new circulars received which have not already been men-tioned in these columns. While gratified to know that few of the vast multitude of our readers are now liable to be caught by the swindling fraternity, we are sorry to learn that some were taken in by "S.C. Thompson & Co.," who obtained confidence by filling small ordera very satisfactorily, and then failed to fill a great many large cash orders, and pocketed the cash sext. cern has vanished out of sight or finding; the successful operators are probably now engaged in some new scheme under other names, and the sufferers have only dearbought experience in return for their good cash. The only treatment for all these splendid circular or letter schemes offering large returns for little money is that recommended by Cuffee to Pompey in "cholera times," viz.; "De safust way is to est notting 't all, and den you no 'spose yousef." One who lost \$60 hy S. C. T. & Co. writes that he sent the money because he saw the advertisement in such papers as the New York Tribune, Toledo Blade, Western Home, and others like them-papers which ought to reject all advertisements of uoreliable or nuknown character.....The following letter, received by one of our subscribers, who is a dealer in groceries and also postmaster, exhibits one of the sbrewd schemes of 688 Broadway swindlers to get men into the meshes of their nets. Mr. A., being an honest man, sends the letter to us to hang in our roguea' gallery. Others who have bitten at the tempting bait, and involved themselves in aiding and ahetting (as they suppose) a swindling scheme, will be glad to get ont by paying a heavy blackmail assessment! This letter has a prioted heading, with the 241 partly crossed by a pen-mark;

> [COPY.] THOMAS B. THAYER, DEALER IN GROCERIES, LIQUORS, TOBACCO, ETC. No. 241 SIXTH AVENUE.

NEW YORK, July 8th, 1871.

JOHN AQUE, ESQ.—

DEAR SHE: I have been in the Grocery business since 1869. About three months since, I was coopelled to fail. I succeeded in saving between six and seven thousand dollars worth of Sugars, Coffees, Teas, Tobaccos, and Segars. My creditors got all the balance. They suspected me of taking these goods, but were unable to prove it; so I have the goods safe. Now, Si, I have a confidential proposition to make to you in reference to the disposal of these goods. In the first place, your name was given to me by a young man that was engaged to a house you bought goods from, although the does not know of this matter, or me writing to you. If you will sell these goods for me, I will give you one (%) third of what they bring, with the noderstanding that you send me every two weeks my two (%) thirds of the money. The goods are assorted just right for a Retail Store, and suitable fer your market.

I am anxious to have these goods turned into Cash as soon as possible, so I can have the money to go into some other business.

If you accent the proposition, let me know how to ship the goods, and I will do so at once.

business.

If you accent the proposition, let me know how to ship the goods, and I will do so at once.

Respectfully,

THOMAS B. THAYER,

688 Broadway.

N. B.—This matter must be confidential, whether you accept the proposition or not. If my creditors find out about these goods, they would have them seized, and perhaps cause considerable trouble.

Address me at 6-8 Broadway.

.....C. E. Weldon, to be addressed "Miss Jenny Everett, 688 Broadway," for a "blind," sends a letter very similar to C. Emerson's, printed last month, and is from the same party. Mr. Gayler will have to give special attention to ladies' letters hereafter, as the swindlers are quite generally donning the crinoline [ad]dress for a "blind."..... One of the "Queer" operators, who mails circulars, apparently from Newport, Ky., professes to dip his counterfeits in an acid that causes them to rot and fall into powder in 25 to 30 days, so that they can not be used as evidence against any one detected in passing them, if he gets his trial put off for that time. He, of course, wants \$5 in advance, which he pockets, which \$5 is all there is in this affair ..... About as "cheeky" a circular as we ever saw, is that of a Yankee, who offers advice and information on every conceivable topic in medicine and law, in patent-rights and religion, in science and art, etc., etc., etc., and after enumerating about every thing and every man ou earth, and some things under the earth, offers "information on any other subject that can be thought of." He offers an unlimited number of receipts [recipes, we suppose, he means] "for any thing you wish" for 25 cents to \$1. No letters answered, unless accompanied with a stamped envelope, and 25 cents required in advance as a first fee. The circular may be considered as next door to blaspheny, simply because no being short of Omnipotence could know and do all he professes Our curiosity is a leetle excited to know what Col. G. I. F. A. means..... Omaha, Neh., has the credit of a lottery, dubbed a "Legal Enterprise," in which 90,000 persons are asked to give \$2 each, or \$180,000, for which a chance at \$100,000 is offered—\$80,000 of their money not going into the pool. Of said 90,000 ticket-buyers, 2,000 can draw prizes of \$5 to \$10 each; 200 prizes of \$25 to \$30; 70 of \$50 to \$100; 30 of \$100 to \$250; 15 of \$500; 10 of \$1,000; and 1 each of \$2,000, \$3,000, \$5,000, \$10,000, \$15,000, and \$20,000, and 87,690 persons out of 90,000 can't get any thing-all this, if every thing is done just as represented. We don't know what is to be done if all the tickets are not sold-and we don't see where 90,000 persons can be found to invest in such an enterprise, even though all the projectors be highly indorsed, and though something is said about aiding a Public Library..... Louisville, Ky., has another just such an enterprise, calling for a million dollars, of which a trifle over half is promised in "gifts." Is there no law to squelch these lotteries?—for they are nothing else..... Curing disease by smoking in medicines with tobacco!! Whew! Puff!! Puff!!! A nice thing to ease the consciences of the smokers! Said to be a French discovery, etc., etc. Well, what next? (See notes on medicines last month and in July number.)..... An active agent of the Evil Ooc, we should say of his meanest imp, has located at Hanover, Pa., or at least that P. O. address, under the name of Mrs. H. Metzger, lock-hox No. —. The real operator is doubtless of the masculine gender—we can not imagine a woman so desperately wicked for lucre's sake alone. The cir-cular sent is entitled: "Fifteen Minutes' Private Con-versation with Married Ladies." The 1st, 2d, 3d, and 5th paragraphs of this vile sheet, or any one of them, is sufficient to show the Satanic character of the swindler, We warn all who receive this circular, or others like it, to heed not a moment its lying promises, as they value their lives, health, or souls, to say nothing of the money which it is attempted to filch from them. Even granting it possible for any person, even in the most desperate case, to need one of the articles, we warn them that, should they get any return for their money sent, the articles will not do what is promised for them, and, if at all effective, can not be used without the most imminent risk of life, and the *certainty* of destroying health. Those who receive the circulars, as many are doing, will understand us; others will need no explanations. This being stand us; others will need no explanations. This being one of the most ingenious and plausible of this class of dangerone circulars, we deemed it best to give space for a reference to it, in as delicate language as the case will The good people of Hanover should drive out, or better lock up, the vile being, by legal means, if possible, but do it at any rate, and speedily....It seems almost impossible that in this country, noted for its intelligence, there should be ignorant and gullible people enough to furnish a profitable patronage to such non-sense and trash as is sent out by J. W. Stephens, Newark, N. J. (His numerous circulars don't tell us where he is to be found in that large city.) For example, he offers the "Oriental Charm," which, among a hundred other things, will make a woman love you, whether she will or no, and "make any one act just as you desire." Whoever has it will be healthy, successful, and prosperous, and "there is no power on earth that can prevent it "-all for \$3!! His "Marriage Guide" he promises will teach how to cure all diseases, to manufacture diamonds, superphosphate of lime equal to guano, at one quarter the usual price, genuine Turkish Love Powders, lightning, fire, and water-proof paint, and to do a thousand other things absurd and otherwise. Said Stephens will also send (for \$1) a secret that will surely make you rich. Why don't he keep and use the secret, and not bother himself and other people with nonsensical things that bring in only a dollar or two each? A glauce at what he promises is enough to enlighten the greenest man or woman, yet he returns "thanks to our 10.000 customers and hosts of agents.... for their liberal patronage.'

# MONEY SAVED!

A "Penny saved is two pence earned," ruus the old adage, and it is a true one. Can you tell why? Below you will see how to save 25 per cent—equal to earning 50 per cent.

### T-W-O F-A-C-T-S.

FACT the FIRST: There is not a MAN, or WOMAN-hardly a CHILD-that can really afford to do without the American Agriculturist .-If it can be done now, the Publishers mean to render this impossible in the future, by putting so much real PRACTICAL INFORMATION into its columns, that its readers will so far excel all others in useful intelligence, and in knowing how to live well, comfortably, happily, and successfully, that they will be compelled to get the paper for self-protection. This will happen largely within the coming year. With 30 years' past experience, with enlarged facilities, with an increase of publishing and editorial talent to aid them, the Publishers mean to surpass all their own past efforts, and to surpass all others......So much will be given in useful, reliable information, fine engravings, etc., for less than 1/2 cent a day, that everybody can take the paper-should take it-MUST take it, or suffer great loss, and fall far behind their neighbors who do read it.

#### IMPORTANT NOW IS

FACT the SECOND: The Publishers offer a special premium to all New Subscribers for the 31st Annual Volume (i. e., for all of 1872), who subscribe during this month of September—which offer will save 25 per cent. It is as follows:

### 

Every New Subscriber for Volume 31 (that, is for all of 1872) whose Subscription is received during this month of September, will receive the paper from that time to the end of 1872. ... That is, he will get the paper Fifteen Months for one year's subscription! or he will get the Three Months Free.

### 

Take Notice, First, that the above offer applies to all new subscribers received this month, that is, to single subscribers, at \$1.50; or clubs of four to nine, at \$1.25 cach; or clubs of ten to twenty, at \$1.20 each; or to clubs of twenty and upward, at \$1 each.

N.B.—Subscribers tan distant to respond to this before Oct. 1, will be allowed extra time to send in their names.

Please tell all your Neighbors of the above offer, and get them to send at once, and get the extra numbers free. It will be to them

MONEY SAVED.

#### High Prices for Shorthorns.

The great demand for beef in the cities and large towns in this country, keeps up the prices of Shorthorns beyond all other breeds of cattle. Though they have been very extensively cultivated both at the East and in the luxuriant pastures of the West, pricea are still rising. We have probably quite as good Shorthorns as can be found in the world. Breeders from Great Britain are now found among the purchasers at our annual sales. At a sale of Shorthorns in Woodford Co., Kentucky, June 27th, eight bulls brought an average price of \$190.621/2, and twentyfive cows brought an average of \$305. The highest bull was \$440, and the highest cow \$1,025. At a sale at Paris, Kentucky, June 29th, the bulls averaged \$181.50, and the cows \$230. At a public sale in Clark Co., Ky., June 30th, the bulls averaged \$400, and the cows \$277. These are great prices to pay for cattle, but they are cheaper to the purchasers who make a business of breeding than inferior animals at any price. The services of good bulls are a source of revenue. A. J. Alexander, of Woodhurn Farm, Ky., charges \$200 for service by 10th Duke of Thorndale, and, in England, Mr. McIntosh charges 50 guineas for service by 3d Duke of Geneva. Mr. King, the distinguished breeder of Minnesota, has recently offered Mr. Sheldon \$36,000 for three heifers, and did not get them. On the same day Mr. Sheldon was offered \$63,000 for five of his heifers. These offers for first-class stock, by men who best know the market, indicate good times ahead for Shorthorn breeders. This breed is likely to take the lead of all others in the new States west of the Mississippi, where beef-making is to be a leading business for many years to come. No investment will pay better than a Shorthorn bull to run with a herd of Texas or common cows.

### The Register of the American Jersey Cattle Club.

This long-looked for volume has at length made its appearance, after many vexations delays. It does great credit to the indefatigable Secretary, upon whom the principal labor of compiling has fallen. This labor had been much less, if correct pedigrees had always been furnished to his hands. But these have often been defective in dates, or minor points, where there was no doubt as to sire and dam, and the desire to make the work as perfect as possible has made the delay necessary. It will save much labor in the future to breeders who own registered The contents of the volume are: constitution and list of members of the club; an elaborate essay on Jersey cattle, by the Secretary; the scale of points as adopted by the Royal Jersey Society; notes and rules as to the preparation of pedigrees; the Herd Register itself, comprising the names of 539 bulls and 1,427 cows and heifers, and 21 photographs of good specimens of the breed. The names of 93 members are enrolled, embracing a large portion of the breeders of Jersey cattle in this country. The appearance of this volume indicates an increasing interest in this breed of cattle, and will lead to a wider distribution of the stock. It can not fail to secure more careful breeding, and the improvement of the Jersey stock. It has already raised the price of registered animals, as it has depreciated those which can not trace their pedigree to importation. The volume will he almost a necessity for all Jersey breeders in this conn-It can be had of the Treasurer, Thomas J. Hand, Box 802, New York City.

Stump Puller.—J. B. Sydner & Co., of Lynchburg, ask which is the best machine for pulling stumps. In this number of American Agriculturist we give a drawing and description of a machine that can be made for a few dollars. It will take out stumps 24 inches in diameter. If any heavier machine with greater power is required, the same principle can be applied, but the strength of the parts must be proportionately increased.

To Destroy Ants.—A. J. Miller, Alleghany City, mixes a teaspoonful of "cobalt" in three tablespoonfuls of warm water, and sweetens it. This he places in their hannts, and in a short time none are left to say how much they liked it. What is sold in the storee as "cohalt" is metallic arsenic, and none should use it without being fully aware of its deadly qualities.

Draining for Gardens.—J. M. Graham, Pine Wood, Tenn., has a piece of land that has a heavy clay subsoil which he is obliged to use as a garden. He finds it dificult to work, and asks if sand would improve it. Sauding would be found too expensive. The most satisfactory remedy would be to cut drains four feet deep, four rods apart, put in either tile, plank, or stone, and then trench the ground with the spade eighteen inches or two feet deep. With sufficient manner there would be no further trouble about that garden.

#### A Pleasant Announcement.

All our readers will be gratified to learn that EDWARD EGGLESTON has joined our editorial corps, and that hereafter his entire time and talent will be exclusively devoted to the publications issued by ORANGE JUDD & Co. His attention will be given mainly to Hearth and Home, for the editorial work of which he has peculiar natural qualifications, and the benefit of much previous experience, as editor of the Little Corporal, the National Sunday-School Teacher, etc., and also for some time past as Superintending Editor of the New York Independent. The multitudes who have enjoyed his pleasant, instructive, and widely popular contributions to Scribner's Monthly, and other magazines and periodicals, will be glad to know that he has found a congenial home, where he can concentrate all his energies, and they will gladly follow him to this his new field of labor.

We are glad to announce further, that Joseph H. Richards, long known to the newspaper world as publisher—for several years last past as Business Manager of the New York Evening Post—has joined the publishing force of Orange Judd & Co., where his aid will doubtless be especially valuable.

#### A Working Capital of \$200 per Acre.

The suggestion made on another page that \$200 per acre might be used with profit, will bear explanation. It is susceptible of demonstration that even this large sum may, on a small farm, if not on a large one, be used to advantage.

Let us take, as an example, a fair farm of fifty acres, in the condition in which hundreds of small places now exist-good, but not remarkable, with tolerable buildings, a good but rather wet soil in fair condition, fences good, and live-stock neither good nor bad (just middling, as the live-stock on such a farm usually The farm is worth, with its improvements, \$6,000; stock and implements, including six cows, one yoke of oxen, and a pair of horses, not less than than \$1,500. Here is a capital of \$7,500, on which taxes, interest, insurance, repairs, and renewals can not be covered by less than \$600 a year. Add to this, for the farmer's own services, \$600 more. Here is an outlay of \$1,200. The income of the place may be set down as follows, which is an average case: 

|                                                | <br>. 100        |
|------------------------------------------------|------------------|
| Ponltry and eggs                               | <br>. 100        |
| Supplies for family (from the farm)            | <br>. 300        |
| House rent                                     | <br>. 140        |
|                                                |                  |
| Total income                                   | <br>\$2,400      |
| Deduct: interest and services as above \$1,200 | ,                |
| Hired man (wages and board) 500                |                  |
| Seeds, store bills, blacksmith, harness-       |                  |
| maker, etc., etc                               | 2,000            |
|                                                | ~.000            |
| Profit                                         | \$100            |
| A 10/110;                                      | <br><b>40460</b> |

This is a very fair showing of much of the "good farming" on Eastern farms. Now, let us see what might be done on the same land, with a cash capital of \$10,000 (\$200 per acre).

In the first place, the land that needs draining may be drained for (say forty acres at \$70 per acre) \$2,800. The buildings may be enlarged and made convenient for work for \$1,500. The six ordinary cows can be sold off for \$300, and twelve first-class ones can be bought for \$1,200—making a difference of \$900.

Five hundred pounds of good superphosphate per acre, or its equivalent in other manure, can be applied to the whole of the available land (say forty-five acres) for \$600. New implements, including a steam-engine, cutting machine, etc., will cost \$1,500. Placing fences so as to make the fields more convenient, the removal of old headlands, etc., may cost \$400; and it will pay to spend \$300 in subsoil plowing, etc.

We have now made a permanent investment of \$8,000 of our capital, where its value will depend very largely on the manner in which it is used; and for its successful management we must be very careful in the handling of the \$2,000 remaining. Of this sum, \$1,000 had better be put in the bank against a time of need.

With this outfit, and a good business man to manage it, let us see what we may accomplish. The income of the place may be thus stated:

| Milk from twelve extra good cows, 30,000 quarts                                                                                                                     | 1 24 000  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Ø 5½e Potatoes and other vegetables sold                                                                                                                            | 1.500     |
| Grain sold                                                                                                                                                          | 500       |
| Pork                                                                                                                                                                | . 500     |
| Poultry and eggs                                                                                                                                                    | . 200     |
| Supplies for family from farm                                                                                                                                       | . 300     |
| House rent                                                                                                                                                          |           |
| Interest on casa for fice.                                                                                                                                          |           |
|                                                                                                                                                                     |           |
| Total income                                                                                                                                                        | . \$5.200 |
| Deduct: Interest and services as above . \$1,200                                                                                                                    | . \$5.200 |

Nor is this the whole story. It is hardly the half of it. In the first instauce, what with the sale of hay and the keeping of a small stock of cattle and swine, the farm is sure to run down, so that in a few years its balance

will show on the wrong side of the account, and its owner will emigrate or go into trade. In the latter instance, where we have understated the early possibilities, the future improvement of the farm may be set down as absolutely secure. Every year the number of cows may be increased, and

the product of the laud will grow larger every year. It is not too much to say that at the end of ten years the borrowed capital may all be paid off, and the yearly profit per acre may be doubled

With \$100 per acre, more than one half as much may be accomplished as with \$200, and perhaps more in proportion with \$50; but, whatever the amount, and whatever the farm, let it be distinctly understood that the man himself is the true measure of his success. An idler, a dolt, or a novice attempting to carry out our suggestions, would run through his capital and swamp his whole farm—"as sure as eggs is eggs."

#### Country Roads and Bridges.

BY W. J. CHAMBERLAIN, HUDSON, O.

In an article published in July, there were given the location and the proper angle for bridges and sluices. I now propose to give some of the best methods of constructing them.

Where white oak or other durable timber is plenty and sandstone is not, the cheapest and best bridge is made as represented in figure 1. Suppose we want a bridge 2 by 10 feet inside measure. Such a bridge will discharge 56,000 barrels per hour, or over a million in a day.

The oak logs, b b, figure 1, 14 feet by 30 inch-

es, have their ends resting on oak plank, a a. each about 15 feet long by 15 inches wide. The ends of the logs are hewn down so as to rest firmly on the planks. The stringers, c, c, etc.. four in number, rest on the logs in the ordinary manuer, then the planks, and then the wheelguards, e, e. Then holes are bored, and long /e-inch bolts, f, f, are passed from wheel-guard to foundation plank, through the hearts of the logs, about six inches from their ends, and short bolts, g, g, are put through stringers, planks, and wheel-guards. Still shorter ones, not seen in the figure, bolt the middle stringers to the planks. The long bolts have a nut on each end, for convenience, instead of a nut on one and a head on the other. If there were a head on the lower end, the holt must be driven up from beneath in building the bridge, which would be very difficult. If there were one at the top, the bolts would have to be drawn out to renew the planks, which would be almost impossible after they had rusted in for ten years.

A bridge so built will last twenty years by renewing the planks once. The abutments can never be pressed in, for the long holts hold-them in place. No freshet can wash away the bridge, unless it sweeps away the whole thing at once. If sandstone can be obtained within five unles, at a dollar a perch, it will not cost much more on the spot than oak logs, and make more durable abutments; but in this case the whole bottom of the bridge should be covered with plank running lengthwise of the road and extending under the stone-work; and the bridge should be bolted as when built with logs.

A bridge built of the size and in the manner described, with log abutments, will cost from

Fig. 1.—CHEAP AND SUBSTANTIAL BRIDGE.

\$25 to \$30; built with stone abutments and full plank bottom, from \$35 to \$45.

The best small sluice is made by spiking firmly together four 2-inch planks, as represented in figure 2. The sides should be 4 inches narrower than the top and bottom, and the latter should be spiked on to the former. Then we have a box, square inside. It can not cave in, and never will choke up, and will last as long as oak fence-posts, and is really cheaper than the old-fashioned sluice made with two logs and a plank. Sewer-pipes are expensive, and are apt

Fig. 2.—SMALL SLUICE.

to tip and heave, and then clog; or to become exposed and broken by heavy wagons.

The July article spoke at some length of Rule 1st. The present article must speak more briefly of the remaining ones.

Rule 2d.—Don't let the water have its own way.

Not many miles from my house is a hill half a mile long, and some 200 feet high. Last spring the water from one gutter near the top worked its way into the middle of the road, and followed a rut to the bottom of the hill. In six

weeks there was a huge gully there, and dirt enough at the bottom of the hill to cost \$50 to replace it. One dollar spent at first, in using plow and hoe, would have prevented all this waste. The supervisor of that district fairly owed the traveling public or the county treasury \$49. "A stitch in time saves nine." It is his business to take the stitch.

Rule 3d. - Dig out all stones that stick up in the track. Of course throw out all loose ones. "It's surprisin'." said my shrewd old neighbor before mentioned, "how much enssin' a few small stuns in the track will cause. Th' use t'be an ugly one stickin' up front of my house, and it spoilt my front porch for noonin's. You see. I found the swearin' done over that stun was corruptin' my morals, say nothin' of spoilin' my noonin' naps. So I dug the thing up, and since then the teamsters have been more pious in front of my house. I b'lieve I stopped more swearin' than the parson could by preachin' on the hull ten commandments." Nothing tries the temper of a driver and the stuff of his wagon worse than stones in the wheel-track, and loose stones often seriously lame a horse. A supervisor can not do a better deed than to clear them all out of the road.

Rule 4th.—Clean and fill all mud-holes, as a dentist would a tooth, so they will stay filled.

It does no good to pile in dirt while they are full of mud and water. That merely enlarges the hole and makes it muddier. A few such "fillings" will spread it clear across the road. The water should be drained or dipped off, and the hole filled and rounded up so the dirt can not settle there again. If it is deep, small stones picked out of the track may be filled in at the bottom, if they are then well covered with gravel or dirt.

When a supervisor has observed these four rules and acted on them, his roads will be in a passable condition, and not liable to be rendered impassable by the first heavy rain. He can then use the rest of his funds in turnpiking and in improving the appearance of the highways.

### How They Make Roads in Quiddletown,

MR. EDITOR: I don't want you to flatter yourself that you are doing such a mighty sight of good by your paper. It is all very well for you to tell folks how to do all sorts of things, and then, for fear they won't know what you mean, to rub it in with pictures. Your newfangled notions may be good enough, and your pictures are awful taking; but you don't know every thing, or if you do, you can't teach it to the Q diddletown folks—you can't teach them any thing, they learned it all from their fathers.

To say nothing about high farming, and saving manure, and soiling, and all that, just take the matter of making roads for an example. Now, you think you know something about making country roads, don't you? Well, may be you do, but if you do the Quiddletown folks don't, and what they don't know a'n't worth knowing—as any one of them will tell you. I don't know much about such things myself, but I am going to tell you how they do it, and if you get my "illustrations" up in good style, I'll bet that a dozen people will follow this plan to one that will follow yours.

In the first place, Quiddletown is an old town, and they don't make any new roads; they only make the old ones over, and this is how they do it. Figure 1 is what you call a cross-section of a road, as it looks after corn-planting time.

The black part is top soil and sods; the light part is blue clay, and the lumps are stones.

Figure 2 is the way the road looks after they have "made" it. In a little while, as the season is dry, it gets to look like fig. 3, where the spotted part shows the dust. It keeps this way

I suppose they know best—they say they do. Another funny thing is the way they manage when two road districts join. They say every district must take care of its own water; so instead of turning the gutter down alongside of the road where they branch, they make the

Fig. 1.—THE WAY THE ROAD IS AFTER CORN-PLANTING.

most of the summer; except for a rain now and then, but in the fall it gets pretty bad, as in fig. 4. Then the committee gets mad and puts on some stone, like fig. 5, with sods on top of them, so as to make the road hard in the middle any other people keep the stream in their own district, and every man of them has to drive through the mud or over the ice every time he goes to town. The other people don't care—they don't go that way.

Fig. 2.—THE ROAD "MADE"—ALL THE SURFACE SOIL OF THE GUTTERS BEING PILED ON IT.

how. It makes it so hard that folks drive at the sides all winter, when the road looks as in fig. 6. It is only in the spring, when the frost is coming out, that they go on the stones, because they can't help themselves, and this is just enough to make it look like fig. 1, again.

#### Swamp Muck.

No farmer who has a supply of this valuable material, should permit the opportunities presented during this month, to pass away without digging out a supply, to be hauled during the

Fig. 3.-DUSTY TIMES, ALONG IN JUNY.

Then they appoint a new committee, and they go over the same course again, only they pick off some of the stones to make the road smooth for summer. They have to put them back again in the fall though.

winter. After this month has passed away, the fall rains may be expected, which will flood all the low grounds, and prevent digging, or make it so uncomfortable that any excuse will be found to avoid it. No more valuable addition

Fig. 4.-MUD AND SLUSH-ALL AFLOAT.

Now this is most pictures enough for one letter, but I would like to show you how they manage a springy place in the spring of the year. They don't make a draiu and tap the spring, the way you tell them to; they just put

to the manurcheap can be procured, and a supply that will last all winter, to absorb all liquid waste from stables, cow-houses, kitchen, and hogpens, and keep hen-roosts well provided, should be procured without fail. Next spring no money

Fig. 5.—THE MUD CURED BY A RIDGE OF STONE AND SOD IN THE MIDDLE.

on some loads of stones, and smooth them off with earth on top. It looks first-rate when it is new, and they do say it is the best plan, but I wish you could see what a mess it is when the ground a'n't got no bottom to it. It is just

can in many cases procure the supply of manure that may thus be made with only the expenditure of some days' labor now. Whenever we hear or read of the successful bringing up of a run-down farm, we invariably come across

Fig. 6.—WINTER WEATHER ROADS.

like driving over a rotten corduroy in a swamp, and if it wasn't for these spots they could carry twice the load they do. Seems to me if water makes the trouble, they had ought to put in a drain and keep the water out of the way; but

this fact, viz.: "He hauled some swamp muck." Now, whatever chemists may say about the composition of this or that material, we farmers know that we must have a certain amount of bulk in our manure. The soil needs the mechan-

ical effect of the addition of a large amount of decomposing vegetable matter, and in swamp muck we have it, finely divided, and capable of absorbing much concentrated matter. Therefore, as a basis of compost heaps, it is most excellent. It should be taken out during the present month, and put in heaps to drain. The heaps should be made high and narrow, in which shape the rain falling on them will be shed, and the muck kept dry, at least sufficiently so as to absorb large quantities of the liquids of the barn-yard. Two or three hundred loads of swamp muck would make a handsome pile of compost, when mixed with the manure of a pair of horses, four or five cows, a few hogs, slicep, etc.; and, spread on ten acres of grass land during winter and plowed in in spring, would bring a handsome crop of corn to commence with. That field might be considered out of leading strings, and able to stand alone until corn-time came around again, when it would be thankful for just such another supply.

#### More Labor and Manure, and Less Land.

It is a first-rate rule for farmers to take the world as they find it. There has been, for long years past, a disposition on the part of farmers at the East not "to bear the ills they have," but to "fly to others that they know not of."

How large a proportion of those who have gone to people the far West have succeeded there, it is hardly worth while to inquire, for we can not know how many of the successful ones would have been successful here. They have certainly accomplished great good for the country by their emigration. It is time now for those who are left behind to consider very carefully what course their best interests indicate. It is fair to assume that no man moves West from motives of philanthropy. Whatever may be the effect of each one's going, his own motive is self-advancement-the sort of advancement that is represented by the accumulation of money, or money's worth. They find land is dear and poor at the East, and that under the old system of farming it is difficult to make a living, and almost impossible to accumulate wealth. Disregarding the fact that they can get abundant labor, abundant manure, and cheap implements, and that they have a good market at their doors, they are apt to stop short at the fact that, farming it as they do, their only chance lies in their getting more and richer land, no matter where it may be. In our opinion, the time is past when an average, old-fashioned farmer, with his two or three sons, can make a satisfactory business of the cultivation of a large farm in New England, in the old-fashioned way. His own opinion, too, is apt to be the same, and he sends his sons to farm at the West, or to some other occupation than farming, nearer home. Instead of taking the world as he finds it, and making the best of it, he tries to find a new world, hoping it may prove a better one.

The writer of this article has had a long experience in farming, and he has seen a great deal of the West as well as the East. He believes that the radical fault of Eastern agriculture is that we try to do a great deal too much, and so fail to do any thing well. And if, with his present conviction, he had to commence a life-long career, or to lay one out for his son, he would take a farm, chosen more with reference to its nearness to a good market and to manure than for its soil, and only so large that after putting the buildings and permanent improvements in order, he would have an available working capi-

tal, in ready money, of \$200 for every acre. Having this money, he would use it all in his business. Not one cent of it should be invested in stocks, or on bond and mortgage. There might, under this plan, be only enough to work 5 acres, or 10, or 20. No matter; what acres he has should be well stocked, well manured, and well cultivated, and it would certainly pay. It is demonstrated by the experience of hundreds of our farmers that it is only the good farming that pays. There is a point (varying according to the quality of the land and local circumstances) where the production pays less than the interest on the value of the land and the cost of labor, manure, and superintendence. The secret of successful farming lies in turning this point on every field of the farm. Every acre the produce of which falls below it, is a tax on every acre the produce of which exceeds it, and, too often, farmers who raise splendid and most profitable crops on a part of their land, find their profits eaten up

by the interest and expenses of the rest. Now, there is no land anywhere that may not, by the expenditure of money, be made fer-tile. There is little land that any practical man would think of cultivating at all, that might not profitably be made fertile by judicious expenditure; and probably the wise use of \$200 per acre on a farm where the buildings, etc., are in good condition, even in rocky Connecticut, would make it a profitable one to cultivate. Consequently, if one has a well appointed farm of 100 acres with good buildings, but no

money, he would do well to sell 65 acres for \$6,500, and use all the money in working the 35 acres that he retained. No two cases would be exactly alike, but it may be stated as a general proposition, that while he is now struggling to make both ends meet, and wasting interest money, labor, and maunre on his whole poorly-worked farm, he might get rich from the thorough cultivation of the well-worked part of it

Every place has some advantages, and the true plan is to appreciate and to make the most of these. The advantages of those who live at the East lie not in the land, but in the facilities for working it; consequently, their chance for profit lies not in the land, but in the facilities. They need only so much land as will enable them to turn these to the best account. If one acre will bring the largest net profit from all the facilities for cultivation and sale that they can command, then one acre is enough for them—better than two acres.

This idea might be indefinitely enlarged upon, but it is sufficient to indicate it, and to allow each man to apply it to his own condition. If we are sure of any thing connected with farming, it is that we are absolutely right in our opinions as above expressed, and that whoever adopts them and follows them judiciously, will make money.

An Egg Farm.
BY H. H. STODDARD.—Fifth Article.

The stock used for hatching purposes is managed differently from the layers, and needs different accommodations. The houses for sitters,

fig. 1, are near the center of the farm where the granary and cook-room are located. They accommodate 100 fowls each, are not movable, and are set upon a stone or brick underpinning, 10 inches high. They are 10 feet 4 inches from the ground to the peak, and 20 feet long by way of the ridge, and 16 feet wide. The roofs are shingled, and the ends of the buildings covered with boards nailed upright and battened. The form of these houses, like that of all in the establishment with caves near the ground, is adapted to afford as much ground room as possible in proportion to the lumber used. The roof of each house is crossed outside by a picket fence running at right angles with the ridge. This fence forms one side of the yard with which each house is furnished, and though it extends only 18 inches above the ridge of the building, the sitters, not being of a high-flying breed, will not get over it. By this arrangement exit is afforded to the fowls and to their keeper at

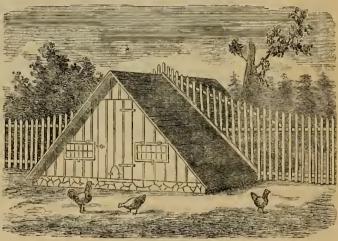

Fig. 1.—HOUSE FOR SITTERS.

either end of the building, into a yard which is located at either end on alternate years. The two ends of the house, one fronting east and the other west, are both provided exactly alike with doors and windows. The large doors are 61/2 × 3 feet, opening outwards, and the smaller ones attached to them are 7×9 inches. The windows are 2 × 3 feet, and are hinged, opening upwards for ventilation. In hot weather the windows and doors in both ends of the building are opened wide, and to prevent the fowls escaping at the end where there is no yard, wire netting is fastened across the window casings inside, and there is an inside door of the same material hung to the stud to which the outside door is hinged. Fig. 2 gives an interior view of the house. There are four perches, each 15 feet long, and of the width and thickness of those for layers. They are placed 18 inches higher than the top of the underpinning, those nearest the nests being 31/2 feet, and those nearest the caves 51/4 feet from the center of the building. A space 21/2 feet wide at each end of the room is left unoccupied by the perches. Three tiers of nests occupy the center of the room, each tier consisting of two rows placed back to back, and running in the same direction as the perches. There are 12 nests in each row, or 72 in all, and as each nest is 1 foot square and 1 foot high, they occupy 12 feet in length. This allows a space of 4 feet at each end of the building between the nests and the doors, and as the latter are planned of a sufficient width to admit a wheelbarrow, and the perches are made so as to be easily moved, opportunity is afforded to wheel in or out the dry earth which fills the bottom of the room nearly

up to the top of the underpinning. There are nests enough so that forty or fifty hens may be set at once, and leave room for fowls that are

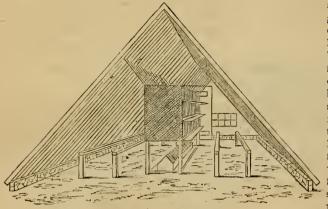

Fig. 2.—HOUSE FOR SITTERS—INTERIOR.

laying. The nests are placed so that the bottom of the lower ones is 6 inches higher than the perches, this hight enabling the attendant to avoid stooping, as there is much work to be done about the nests of sitting hens; while they are not so high as to prevent the fowls reaching them by flying upon the nearest perch, or as to render a ladder necessary. The nests are made so that the hens enter them at the front, where a 2-inch strip set edgewise prevents the eggs from tumbling out. An alighting-board projects 21/2 inches in front of each row of nests. The partitions at the backs of the nests are made of wire-cloth of a mesh fine enough to keep out rats, those at the sides of the same and of a coarse wire netting, alternately, for

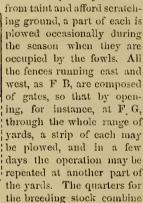

folding together, so that there may be room for them overhead, when raised. A piece of rat-proof wire-cloth is placed in front of

a nest occupied by a hen engaged in hatching, and fastened by buttons, to keep out laying fowls by day and rats by night. To keep the fowls from using the upper part of the room as a roosting place, lath-work, a part of which is shown in the figure, extends from the top of the upper nests to the roof. Underneath the lower tier of nests is placed a feed-box, made like those with which the houses for layers are furnished, and others of the same construction should be placed on the ground at the ends of the perches, and at

right angles with the latter. Five houses for sitters, each with its yard, will be required for an establishment of the size we are describing.

The arrangement of the yards is shown by fig. 3. The fence, A B, is made like the buildings C, non-movable. The fences on the remaining three sides of the yards are moved yearly. Suppose that last year the yards were located at E; then this year they are at D, and E is

devoted to crops. A strip of ground is left untilled near the doors of the buildings for a wagon path. To keep the yards free

houses very much like those for layers, and yards like those for sitters, only both are smaller. The houses for layers are movable, with no yards; the houses for sitters are stationary, with movable yards; and the houses and yards for breeders are both movable. The breeders are kept in fives and tens, no flock ever to exceed the latter number. The buildings are of two sizes, one  $3^{1}/_{2}$  feet wide, 4 long, and  $2^{1}/_{2}$  high, and the other of the

same width and hight, and 7½, feet long. There are no runners, and the doors are few in number, though comprising the whole roof; each house is furnished with but one window, and but two or three nests are necessary, and one perch. Otherwise the houses are like those for layers on a reduced

scale. They are designed to be moved by two persons, adjustable handles being attached at either end for this purpose. In this way, being without floors, they are shifted to different parts of the yards, and set on ridges of earth raised

by the plow. In winter each stands upon the edges of a dust-bin of 2×8-inch plank. The arrangement of gates to admit the team for plowing, the stationary fence at one side of the yards, and the shifting of the latter to allow tillage, are the same as for sitters, with the exception that the stationary fence is entirely detached from the houses. The movable fences for the yards of both sitters and breeders are made as follows: Pickets 2 inches wide, 1/2 inch thick, and 6 feet long, are nailed to two rails 3 inches square, and 12 feet long. At both ends of every rail, U-shaped pieces of stout, hogshead hoop-iron are fastened by screws so as to form staples through which round posts, 71/2 feet long, and 21/2 inches in diameter, pointed at both ends, are thrust, and set in the ground. The rails in the alternate sections are at such distances apart that the tops of the pickets shall be in live, and the staples not interfere with those of the adjoining sections. Each post is supported so as to resist the winds to which the fences expose so much surface, by a brace upon the outside of the yard (fig. 5). This brace is

Fig. 5.—YARDS AND HOUSES FOR BREEDERS.

Fig. 3.—Plan of yards for sitters.

purposes described in another place. In this way the circulation of air is allowed for the health of the sitters. Sufficient attention is not generally given to this point. Fowls in a state of nature being accustomed to scratch holes in the ground under bushes, to form their nests and incubate where there is plenty of air, pant and show distress in hot weather when forced to occupy close boxes. Large doors of wire netting, with coarse meshes, not shown in the

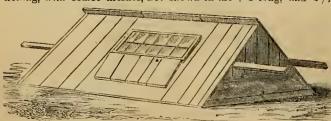

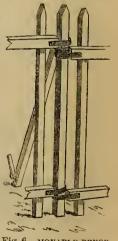

Fig. 4.—HOUSE FOR BREEDERS.

illustration, prevent the fowls roosting at the entrance to the nests at night. These doors are closed after gathering the eggs towards evening, and opened again the first thing in the morning, and are made in two parts,

made by sawing a rail stick in two, and furnishing each end with a staple like those upon the rails. The staples are fastened upon the braces in an obtuse angle, and the ends of the braces are beveled, the better to fit the posts. One of these staples passes around the post between the two staples of the upper rails, and through the lower one, which reaches to the ground, a short stable is driven into

short stake is driven into the earth, with its top inclining away from the fence (fig. 6). The gates which compose the entire sides of the yards where the team passes in plowing, are hinged to stout posts, which are braced in a similar The stationary way. fence represented in fig. 1, and the corresponding one which forms a part of the breeding yards, are made substantially with posts of good size, deeply set in the ground, so as to stand without braces.

The Fig. 6.-MOVABLE FENCE.

gates occupy a space of 12 feet each, the same as a section of the movable fence. The smaller breeding yards for five birds are 12 feet square (fig. 4); the larger ones for ten birds are 24 feet square, and the yards for sitters are 48 feet, or in each case a fraction over these figures, to allow for the room occupied by the posts; the design being to use one, two, or four gates, or movable sections, to make one side of a yard. The openings between the pickets are 21/2 inches wide for breeders; for sitters which are of larger breed, 3 inches are allowed. The pickets are nailed on the yard side of the rails, to prevent fowls alighting on the latter. The gates which divide the breeding-yards are boarded for 2 feet at the bottom, to keep neighboring cocks from fighting.

#### Gathering Sea-Weed for Manure.

Those who live inland can hardly appreciate the value a shore farmer attaches to a sea-weed privilege. Many of the shore farms are naturally sterile, and were not their owners able to

draw fertilizing material of various kinds from the sea, their cultivation would, in many cases, be abandoned. Their fertilizers are fish, shell-fish of various kinds, saltmarsh mud, and the sea-weeds proper, all of which furnish valuable plant-food. Fish guano and cancerine, made from king-crabs, are now articles of commerce, and are used at great distances from the coast; but sea-weed is of so hulky a nature that it is only available to those farms that are within hauling distance of the shore. Two very

distinct things are popularly known as sea-weed. First, the sea-weeds proper, or algæ, those flowerless plants which, having no true root, draw their sustenance from the water which surrounds them. These are usually found on rocky coasts, and are thrown up by the sea, or are torn from the rocks to which they are attached. Kelp and Rock-weed are familiar examples of these. Secondly, a flowering plant, Sea-wrack, or Eel-grass, which roots in the muddy bottoms along the creeks and bays of the coast. This seaweed is largely used upon the East End of Long Island, and in other localities, and an account of the manner of collecting and using it is sent us

by Mr. S. T. Ferry, of Southold, from which we extract as follows: The seaweed principally used on the East End, known as Eelgrass, is distinguished into "Bay seaweed" and "Creek sea-weed," or, as it is generally call-"Creek-mud."

BAY SEA-WEED grows in shallow water, upon a sandy bottom, and is torn up by the roots, or, more properly, broken off just above the roots by violent winds, and cast upon the shore in large quantities. It is generally hauled to the barnyard and hog-

pen, where it absorbs the waste and makes a valuable manure. It is also dried, and used for littering stables to some extent. Few, comparatively, enjoy the benefits of the use of bay sea-weed, as only those who control the

shores or beaches have the privilege of taking it away. It is true all may remove it from the bed where it grows, but that is a slow and laborious operation, and pays but poorly.

CREEK SEA-WEED grows usually on very muddy bottoms, and ripens about the first of

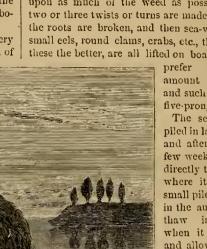

Fig. 1 .- GATHERING SEA-WEED-USING THE TONGS.

August, when the harvest generally commences, although in creeks where landing-places can be secured, the anxious ones commence harvesting early in . July, thereby "killing the goose that lays the golden egg," for the material taken in such an immature state not only shrinks hadly, thereby causing loss, but the roots are weakened, and the crop inevitably grows smaller each year, or, as the farmers say, "it grows thinner." This would seem to be a subject worthy the attention of our State Legislature. Creek seaweed is taken by persons in boats, or, more generally, on flats, as the labor of baling is thereby saved. The implements used are a pair of tongs thrust into the water wide open, and closed upon as much of the weed as possible, when two or three twists or turns are made, by which the roots are broken, and then sea-weed, mud, small eels, round clams, crabs, etc., the more of these the better, are all lifted on board. Some

> a amount of mud, and such use heavy, five-pronged rakes.

The sea-weed is piled in large heaps, and after heating a few weeks is hauled directly to the field, where it is left in small piles until late in the autumn or a thaw in winter, when it is spread and allowed to remain upon the surface until spring, and is then plowed under for corn. It is almost invariably used upon sod ground, and if not applied too frequently it will com monly produce on our shore farms as good a crop of corn

(for which crop it appears to be the best adapted) as an equal quantity of barn-yard manure.

A moderate estimate of the number of loads of Creek sea-weed used annually, in the town of Southold, can not certainly be less than ten thousand two-horse wagon loads. It sells green, that is, before it is seasoned or dries up, at fifty cents per load, and is worth when upon the field, \$1.25 to \$1.50 a load, according to the distance hauled. From twelve to sixteen loads is the quantity that generally applied to the acre, although a larger quantity may be safely used.

CLOVER FOR PLOWING UNDER .- "An ac-

quaintance of mine," writes a correspondent in Connecticut, "who has greatly improved his farm by plowing in clover, says he would not give any thing for the common small variety of red clover for a fertilizer-that only the large Northern variety that grows but once in a season, is of any value for that purpose. Is he correct?"-We think not. In fact, we are sure he is not. A given quantity of the ordinary early red clover is worth as much to plow under for manure as the late variety, and probably

Fig. 2.—GATHERING SEA-WEED-UNLOADING IN SHALLOW WATER.

made of two pieces of tough wood, from six to eight feet in length, according to the depth of water or the size of the person who uses them, and riveted at about one third of the distance from the ends held in the hand. The tongs are a little more, as it has more leaves and less woody stalk. The late variety grows longer and larger, and where clover is grown merely for the purpose of plowing under for manure, it may he better to sow it than the ordinary so-called "medium clover." This is the opinion of many experienced farmers in Western New York, while others who have tried both, prefer the ordinary variety. But the truth is that the old practice of sowing clover merely for the purpose of plowing under, is almost entirely abandoned in that section. The land is kept in clover two and sometimes three years, and then as much of it plowed under as can be spared. Nine farmers out of ten prefer the medium variety.

#### Walks and Talks on the Farm-No. 93.

The sharp advance in the price of wool will be of great benefit to our agriculture. It will save the sheep interest. I have done all I could, during the depression, to persuade farmers not to sacrifice their sheep, but rather to weed out the poor ones and retain their best ewes, take good care of them, and breed to the best rams they could find. Those who have done so will now get their reward for their perseverance and common sense. There is nothing more certain than that a great leading product like wool, or wheat, corn, oats, pork, or beef, can not long remain below the cost of production. And a farmer can not make a greater mistake than to abandon wool-growing, or wheat-growing, or beef or pork growing, during a period of temporary depression, and of engaging in something that for the moment happens to be paying unusually well. Every body will now rush into wool-growing. Pork and beef are low, and thousands of farmers who have been endeavoring to improve their stock of hogs or cattle, will now neglect or sacrifice them; whereas the wise farmer will hold on to his stock and continue to improve it, and by the time the tide turns, as turn it must, he will be ready to avail himself of the increased demand for his products. A year ago this spring I bought potatoes to feed pigs at ten cents a bushel. This spring they were worth \$1.50, and vet we had a better yield last year than the year before. The price was so low in the spring of 1870 that farmers planted far less than usual.

Take one year with another, that farmer makes the most money who pursues the even tenor of his way uninfluenced by the fluctuations in the price of his products. It may be said that this is plodding work, calling for little intelligence and no enterprise. But this is a mistake. There are abundant opportunities for the exercise of skill, intelligence, patience, perseverance, industry, enterprise, and every thing that makes a man. A farmer had far better occupy his thoughts and his energies in determining the best method of enriching and preparing his land for potatoes, and how to plant, cultivate, dig, and market them, rather than in worrying, unsatisfactory, and uncertain speculations as to whether "be crop will or will not be largely grown and command a low or a high price. Like other men, a farmer has only a certain amount of energy, and his success depends very much on its judicious and economical employment. The less of it there is wasted in useless anxiety and worry, the more will there be left to manage the farm. And let me tell you, it requires more brains, more energy, more thoughtful discrimination and good judgment, greater activity, tempered with prudence and common sense, to manage a farm properly at the present day, with American machinery and old-country help, than it does to manage a church choir or run the Union Pacific Railroad. You have to work yourself and keep others at work, to lay plans and change them half a

dozen times to suit the weather; to keep all your tools, implements, and machines in work ing order and in their proper place, ready for use at any moment. You must be diligent to know the state of the flocks and look well to the herds, to see that they are in good health and are fed regularly, to give them an occasional change of pasture and a constant supply of water, and (to give a bit of my own experience) to see that the fences are in repair, and that the cows do not get into the Deacon's corn.

I think the Deacon will beat me this year in corn. He drew out his manure from the yard this spring, and plowed it under for corn. He put on only a very light dressing, and it was rather coarse and strawy, but it seems to have done considerable good. At any rate, his corn looks better than mine. The Deacon thinks that long, coarse manure is of great benefit to corn from its mechanical effect in lightening the soil and making it warm and porous. He did not put enough on, and it was not sufficiently decomposed to do much in furnishing plantfood to so vigorous and rapid-growing a crop as Indian corn. I think the Deacon, too, for once cultivated his corn better than I did, and I am inclined to believe that this is the main reason why his crop is better than mine. We both planted in hills this year, so that the manner of planting could not make the difference.

If I had the time I would try to raise a superior variety of Diehl wheat. All things considered, it is, for this section and on dry, rich, clean land, the best kind of white wheat yet tried. But it varies greatly in character. In the first place it is almost impossible to get it pure, and even the pure Diehl wheat itself, and, in fact, the different kernels in the same head, vary greatly in quality. The plan to adopt is to take a number of the finest heads of Diehl wheat that can be found, and from these select the best kernels-such kernels as an experienced miller wants, to make the choicest flour. Sow these kernels, and next year repeat the process, selecting out the best, and continuing the practice until the desired quality is fully established. I would myself give five dollars a bushel this year for absolutely pure Diehl wheat, but my plan contemplates far more than this. I want it not only pure, but the best specimens of the breed. Halleck's pedigree wheat has proved a failure, but this was due to the fact that he aimed at quantity rather than quality. What we want is not so much a wheat that is capable of producing a large yield per acre. We already have varieties that are capable of producing more wheat per acre than the available plant-food in the soil will support. In other words, so far as quantity is concerned, our varieties are better than our soil. It is no use getting a variety capable of yielding 50 bushels per acre, and sowing it on land not rich enough to grow twenty-five bushels. Our climate is better than our farming. The person, therefore, who proposes to improve a variety of wheat had better aim at superior quality rather than at great productiveness. If he can secure the former, the latter will depend principally on the condition of the soil.

One of my neighbors had a field of low land that has been little better than a swamp ever since it was cleared. He cut an open ditch on one side of it, and then laid a few stone drains across the field, which discharge into the open ditch. It was not by any means thorough drainage; so far from it, indeed, that it was deemed desirable to plow the field into lands only about four yards wide, and leave very deep,

dead furrows to carry off the water. Last fall he sowed the field with Diehl wheat, and he had the heaviest crop of wheat I have seen this year. The straw was about five feet high, and stood up stiff and straight, and was as bright as could be desired; and, notwithstanding the mucky character of the land, the clover had taken finely. I have rarely seen so great an improvement at so small an expense. But the truth is, these low, swampy lands, abounding in organic matter, are of such a porous nature that an underdrain will dry the soil to a far greater distance than it will on ordinary upland. If a good outlet can be secured, one or two open ditches, three or four feet deep, with a few underdrains, would render many of these swampy fields the best land ou our farms.

Mr. John S. Bowles, of Ohio, writes me as follows: "I see that you advocate a peculiar system of raising swine, which entirely meets my approval, only that I do not see how it is possible for a farmer to follow it for more than one year. You say, get good, coarse brood sows, Chester White or Magie, put them to an Essex boar, and the pigs will be splendid, even superior to thorough-bred Essex. So far, all right; but what am I to do next?" Do thesame thing over again, or, better still, select a few of the largest, healthiest, and most vigorous sow pigs, obtained from the first cross, and put them to a thorough-bred Essex. You will, judging from my own experience and observation, get as good pigs for common purposes as a man can hope to see. If sows from this second cross are bred to an Essex boar, the pigs would make splendid "jointers" at four months old, or might be profitably kept nine or ten months and fattened for pork. For the latter purpose I do not think I should want a larger infusion of Essex blood. But for what the London butchers call "jointers," that is, pigs three or four months old that dress from 60 to 70 lbs., another cross or two of Essex blood might be desirable.

I do not happen to know of any really thorough-bred animals of any kind, cattle, sheep, or swine, that I should consider as profitable to raise solely for the butcher as animals having a dash of common blood in them. And the reason is that the perfection of an animal that is kept solely for the purpose of putting on flesh and fat in the shortest possible time is not the perfection of a breeding animal. Early maturity is obtained at the expense of ultimate size and longevity. Bakewell's Leicester sheep, which, so far as early maturity, lightness of offal, and fattening qualities are concerned, have never been excelled, and which have done so much for English sheep and English farmers, have themselves become extinct. They did their work and did it well, and then disappeared as a distinct breed. It will be so with Essex swine. They will, if pure-bred, refine every breed they are crossed with, and in time they will cease to be needed. For my part I am willing to avail myself of them so long as they will improve our common race of hogs, without speculating as to their fate in the future. There are over thirty million pigs in the United States, and it will take some years to bring them to perfection. There is room enough, and work enough, and occasion enough for all good breeds of cattle, sheep, and swine in this country. They are all needed. There is no breed that is absolutely best everywhere. There is plenty of room for the so-called China, Poland, or Magie hogs, as well as for the Chester Whites, Yorkshire, Berkshire, or Essex. I have never said that I thought the Essex were the best breed. All I have ever claimed for them is that, when pure-bred, they will at once greatly improve our common stock. What the result will be of continuing to breed from these crosses does not particularly trouble me. One thing is certain, however, it will not do to breed cross-bred animals together. We must always use thorough-bred males. I think Mr. Bowles and all other experienced breeders will agree on this point.

Mr. Bowles says the wheat crop in his section is poor, and will average only 8 bushels per acre. "Fall barley pretty good; spring barley, none at all. Oats, a little. Hay very poor on poor land, but pretty good on good land. I think I raised," he says, " two tons per acre all round. One little patch of clover of an acre and a half had six good two-horse loads on it; I presume equal to 31/2 tons per acre. You seem to think," he adds, "that clover can not add to the fertility of a soil by being mown and hauled away. I say it does add to the fertility. I account for it in this manner: The atmosphere always contains a vast amount of fertilizing matter. Clover is a plant that draws a great deal of its support from the atmosphere." This is precisely the point that is not proved. "Clover," he continues, "is a vehicle for conveying fertilizing elements from the atmosphere to the soil. The greater the growth of clover the greater the size of the vehicle, and the greater its work. So convinced am I of the truth of this theory that I apply all my manure as a top-dressing to grain on which clover is sown. The manure makes a large growth of clover, and the clover roots make still more manure. What clover hay I feed (which is all I grow) goes on the land again, or if I pasture it with hogs it then returns to the land. The point that I wish to impress upon you, however, is that after a crop of clover hay is hauled away, even then the ground is richer than before the clover was sown."

I should be glad to be impressed with the truth of such a pleasant doctrine, but, unfortunately, it has no sound basis of facts to rest on. Mr. Bowles' practice is much better than his theory, for he seems to be careful not to sell any of his clover, but to consume the whole on the farm, and also applies manure in order to make the clover grow more luxuriantly. This treatment will make his land richer year after year; but if he should sell the clover, the probabilities are that the land would sooner or later become too poor to grow profitable crops of clover at But even then it might still be rich enough, with the aid of a summer fallow, to produce a fair crop of wheat. The truth is that clover, turnips, and other renovating crops require a richer soil than wheat. If a soil is rich enough to produce a heavy crop of clover, it is rich enough, even after the clover is grown and removed from the land, to produce a fair crop of wheat. But continue the practice of raising and selling clover, and the yield of clover will gradually and perhaps rapidly diminish, followed by a decreased yield of wheat.

We can not raise too much clover, but it must either be plowed under or fed out on the farm, and the manure carefully saved and returned to the land. Any other doctrine is unsound in theory and detrimental in practice.

American farmers can not be too often reminded that what we should aim at is, fewer crops, cleaner culture, and a larger yield per

acre. We are a great beef-eating people, and are taking kindly to good mutton when it can be found. Already a large proportion of the beef consumed in the Atlantic cities is raised west of the Mississippi. The price for the moment happens to be low, but it will not remain so long. The farmer who raises good beef or mutton in New England, New York, Pennsylvania, Ohio, Indiana, Illinois, Iowa, or any of the older settled States, need not fear that the half-wild cattle of Texas or elsewhere are going to drive him to the wall. There is no sort of danger. Unaided, nature can not compete with agriculture any better than the Indian can compete with the Anglo-Saxon. Our population is rapidly increasing, and the demand for meat will continue to increase from year to year. The causes which lead to an over-supply for a few months are only temporary. The demand is unceasing, and he is a wise farmer who looks ahead and quietly and perseveringly improves his farm and his stock. He is certain of his reward. Wool, mutton, beef, pork, cheese, butter, milk, poultry, and all other animal products will be wanted more and more as the condition of the world improves. There are millions of people, even in Europe, who seldom taste fresh meat. An Irishman eats double the meat and does double the work here that he did at home. Even the Chinese in this country cat meat as soon as they can earn money enough to buy it.

The point I want to get at is this: We have a large country. Land is comparatively cheap, and labor comparatively high. Crops are great in extent but small in yield, and many of our farms are getting more weedy and less productive. Now, what we must aim at is to make them cleaner and richer. We must devote less land to the production of wheat and other grain that is sold, and more to the production of such crops as are fed out to animals on the farm. We all know that it is far better to raise 300 bushels of wheat from ten acres than to plow, seed, and reap twenty or thirty acres to get the same amount. We obtain no more money for the crop in the one case than the other, but the profits are quadrupled. The market is not glutted with grain, and there will be more meat and wool to sell, and more manure to use. To bring this about, we must summer-fallow when necessary; sow clover more frequently, and not sell a pound; let our land lie longer in grass; and when it is broken up and planted to corn, cultivate it very thoroughly, and not overcrop it before it is seeded down again. In some cases it will pay to summer-fallow, and then seed the land down to grass without a grain crop. We must aim to save labor, enrich our land, reduce the area under tillage, and, when it is plowed, cultivate thoroughly to kill weeds and develop the latent plant-food in the soil.

Plant-food is the farmer's capital. It is present in large quantities in most of our soils, but a great proportion of it lies idle. Our profits will be in proportion to the amount of this plant-food that we can render available and keep in active circulation without allowing it to diminish faster than fresh quantities are developed from the soil by the decomposing and disintegrating action of the atmosphere.

How Much Seed, and How should it be Sown?—A bushel of wheat contains 660,000 grains. If this quantity should be spread equally over an acre of ground, it would give nearly 10 square inches of space for each plant; each plant would be a little more than 3 inches from the next, and there would be 15 plants to

each square foot. If the seed were sown in drills 9 inches apart, there would be a plant to each inch in the drill. It is well known that in broadcast sowing much of the seed is covered too deeply, and some not sufficiently, and thus possibly a half of the seed sown is wasted. In drill-sowing a much greater proportion of the seed produces returns, because of its even covering and more regular germination. If each seed should produce but one perfect ear, the yield would be over 30 fold, but it is safe to say that every healthy wheat-plant will produce at least three stalks, so that, should the whole of the seed sown mature, a crop of 90 bushels would be the result. There is no doubt but drill-sowing will produce a better yield than broadcast sowing, as much more of the seed will successfully germinate, and the expense of drill-sowing being less than handsowing and harrowing afterwards, we would advise all those who can bny or hire a drill, to abandon broadcast sowing.

#### Lime and Lime-Kilns.

The use of lime in agriculture dates back many centuries in the Eastern world. From the commencement of the Christian era the farmers of the most civilized parts of Europe were in the habit of spreading it upon their fields, and at the present day the custom is so thoroughly established that no rotation, whatever course it may consist of, is complete without a liming. In Lurope, farmers have been for hundreds of years working to increase the fertility of their farms, while during the short time our lands have been under cultivation, they have been subjected to a process of exhaustion. This operation is now at an end, the process can go no further, and it is absolutely necessary that every possible effort be exerted to restore our land without delay, or impoverishment must be the result. Large tracts of land, more especially in the Southern States, are abandoned so far as agriculture is concerned, and it needs no prophetic eye to see in advance many Western lands in the same predicament. No fertilizer exists in such abundance, or can be produced in condition fit for use so inexpensively, as lime. Protruding almost everywhere above the earth's surface, it can be procured in almost every locality without great expense of carriage; in fact, we doubt whether there are so many as one fourth of the farmers of the United States or Canada that can not procure limestone within half a dozen miles of them.

The mode of preparing lime is so simple, that farmers who live in those districts where it is regular employed, commonly prepare it for themselves. The eastern part of Pennsylvania, and the adjoining parts of New Jersey and New York, comprise within their limits a large majority of the kilns in which lime is burnt for agricultural purposes. Almost every farm has a lime-kiln as part of its establishment, and lime-burning takes place regularly each year. The kilns are structures of stone, for convenience erected in a bank, so that limestone and fuel can readily be brought to the top. They are built about 16 to 20 feet square and 12 feet high (fig. 1). The inside is built up round, gradually widening until half up; then it is drawn in again, so as to make it something of the shape of an egg. Smooth stone, that will stand fire, needs to be used for the inside. An arch is made in the front, from which the lime is drawn when ready. The kiln is charged by alternate layers of limestone and fuel until filled;

the archway is then built up so as to regulate the draft, and fire is set. A regular, steady heat is kept up until the stone is well ignited, when regularly with limestone and coal at the top,

shows a draw-kiln, or one that is always burning and yields lime twice a day. It is charged

> and every twelve hours the lime is drawn out at the bottom. These are used where lime is burnt to supply a large demand, and in some localities in Pennsylvania the demand is so great as to keep large numbers of these kilns continually working. Some companies employ a capital of two to three hundred thousand dollars, and ship their lime by schooners to Delaware, Maryland, and Virginia. These establishments are on the Schuylkill river, and hundreds of vessels load there each year to supply the farms

of those States, a great many of which can be reached by the waters of the bays and large rivers. Lime is now produced at these kilns for eight cents per bushel.

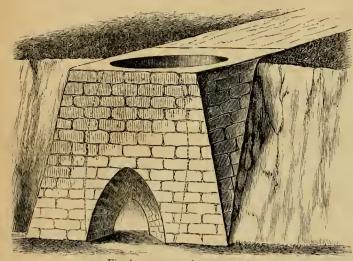

Fig. 1.—A FARMER'S LIME-KILN.

the drafts may be closed and the fire moderated. Ten days will suffice to calcine the lime, and it may then be drawn off for use. Many farmers, however, who find it difficult to build a kiln,

avoid the expense by putting up pits. These are piles of stone and fuel, properly arranged, around which are loose blocks of stone laid up with earth or clay to close the interstices; a few rough boards are then put up around, and held by stakes, and clay rammed down between them and the pit; to confine the heat. As the fuel and stone burn down and the upper part falls in, fresh wood and stone are put in, and the heap kept covered. The top needs a covering of sods, damp grass, and clay, to retain the heat. This

needs constant attention, but where lime and wood can be procured, no money outlay is necessary. Where labor and material are plentiful, these are all that is required. Three cords of wood will burn a pit of five to seven hun-

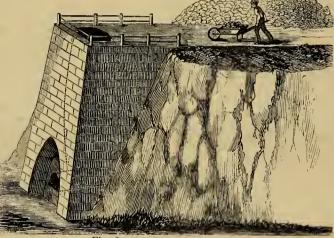

Fig. 2.—PERPETUAL LIME-KILN.

MUTTON SHEEP.—Rhode Island is famous for its fine mutton, the South-Down of the islands of Narragansett Bay rivaling that of England. On Conanicut, Mr. Tucker makes it pay reasonably well, and has the satisfaction of serving the

public with a prime article of meat and wool. He had 160 sheep last fall, raised from them 192 lambs, which he sold for \$5 each, and sheared from the sheep 31/2 pounds of wool each, worth fifty cents a pound. The sales from his flock, then, are 192 lambs, \$5=\$960; 480 lbs. of wool, at 50 ets. = \$280; whole amount, \$1,240, or \$7.75 for each sheep. A Pennsylvania farmer hought last fall eleven sheep for \$20.90, and sold wool this spring for \$12.90, and lambs for \$36=\$48.90, or \$4.44 for each sheep. They do these things a little better in Connecticut. A farmer there bought ten sheep in Feb-

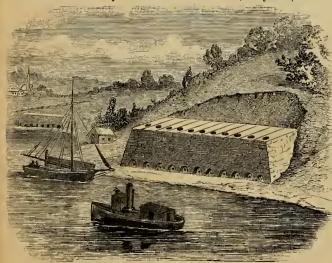

Fig. 3.-LIME-KILNS ON THE SCHUYLKILL.

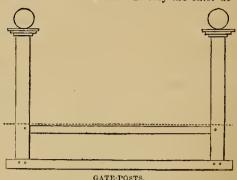

the fire not allowed to blaze out. Figure 2 | \$7 each=\$70, and wool \$15=\$85 for the whole,

dred bushels of lime, if used economically, and | ruary, for \$40. Sold from them ten lambs at

or \$8.50 for each sheep, realized in six months from purchase. The capital is still unimpaired. and good for another year. CONNECTICHT.

#### Gate-Posts.

Notwithstanding all the improvements in gates, the old-fashioned swing-gate still remains master of the situation. If only the chief de-

feet inherent in it-that of sagging-could he prevented, we prefer it to any of the newfangled ones. We have, for several years past, arranged our gate-posts in such a manner that sagging and heaving by the frost are both impossible. The posts are framed in a stout sill; about two feet above this a girt is framed in; this acts as a brace in such a mauner that the posts are rigidly kept in place. A trench three fect deep is dug, the frame and posts are set up therein, and the earth is well tamped and compacted around the sill. The upper girt need not be sunk more than a few inches beneath the surface, but the earth should be well tamped and forced under it, that it may not suffer from loaded wagons being driven over it. These posts may be guaranteed to stay where they are placed until inevitable decay overtakes them. This may be put off by using seasoned timber well soaked in crude petroleum.

#### Harvesting Corn.

Corn should not be left until the frost has injured the fodder, before it is cut. The value of

corn fodder is becoming. better appreciated every year, and more care is . taken in curing and preserving it. The first care, then, should be in cutting it before it is damaged by frost or over-ripening. As soon as the corn is glazed, it may be cut. This is a tedious operation, but a division of labor will lighten it. The usual plan is to cut a few hills and set the stalks around a hill not cut off, which helps hold them up; then twist the top of one of the stalks round the bundle to hold it together, and make this the foundation for a shock, which is built up by bringing several armfuls and placing them around the foun-

dation, already set up, until the shock is sufficiently large, or a certain number of hills are cut up. Then the workman lays down

his knife, and ties the shock, selecting a pliable stalk for this purpose, and passes on to make another. Instead of this, let the men pass along the rows, each man taking three rows, and, pushing the hills from him, cut off each hill with a single blow, laying the stalks down with the tops towards the next row, the next man laying his stalks with the tops towards those cut by the first one. Thus the stalks will lie in double rows, the tops towards each other. When a few rows have been cut, one can turn in, and set up and bind. When the shock is set up, it may be readily tied by using the binder figured on the preceding page. It consists simply of a stout wooden pin, with a crank on the end of it; a small pin is passed through it, to which is fastened a cord with a loop on the end. The pin is thrust through the loose stalks, the cord is passed around it, and the loop passed over the small pin. The crank is turned until the shock is drawn sufficiently together, when it can be easily bound with a stalk, without danger of

With the labor divided in this manner, one cutting and one setting up and binding, much

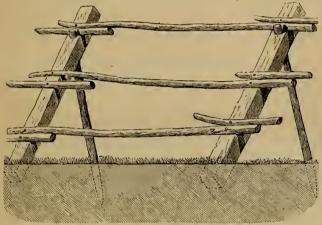

Fig. 1.—PORTABLE FENCE.

more corn can be cut in a day, than on the old plan, by which much time is lost.

#### Portable Fences.

A subscriber from Kansas sends us drawings of some fences, which we here illustrate. That shown in figure 2 is similar to one in common use; the chief difference, which seems to be an improvement, is that a pin is inserted in one stake to support the lower rails, instead of a separate stake, or a

Fig. 2.-FENCE.

stone, or a block, as is generally used. The stakes are driven into the ground, as shown by the dotted lines. Figure 1 represents a fence which has been found sufficient to turn Texan cattle, which are largely pastured in Kansas, and which are supposed to have little respect for fences. The principal post is placed in a leaning position, and is supported by a stake,

which is driven into the ground. In removing this fence, it is necessary to remove the rails of each alternate panel only; the other panels then can be moved whole.

WEIGHING STOCK.—It would be a profitable investment for almost every farmer to have in his barn a platform-scale capable of weighing at least 600 lbs. As it is, most farmers are at the mercy of every one they trade with-millers, butchers, and merchants. It is a good business fashion for a man to know exactly how many pounds of grain or pork he has in his wagon when he starts out to deliver it, and he will then know beforehand just how much cash he should bring back home. A farmer, as a rule, can not estimate as accurately as he should, the live weights of stock; it is the consequence of not using the scales sufficiently often. He should know the weight of his shoats monthly, and the weight of each log when put up to fatten, and its dressed weight when made into pork. Then, if he weighs his feed as used, he can tell what profit he makes. In the mean time he will learn to judge of the value of a live hog, and if an occasion occur, as it often does, when he has a chance to buy a few head, he will be able to tell pretty nearly what he can afford to give for them. The fact is, the scales are one of the most valuable implements a

farmer can possess, and he should not, if he can help it, be without them.

#### Working Oxen.

The patient endurance of neglect, and the heavy work performed by oxen, make them valuable on many rough or partially cleared or broken-up farms. On smooth land in fair condition, that has been well tilled or where machinery is in use, their gait is too slow to be profitable. Their drivers seem to become inoculated with the same deliberateness of motion, and on farms

where vigor or promptitude of labor is required, their use becomes intolerable. Where there is a diversity of labor to be undertaken, however, they have advantages over horses. Where a furrow, on account of stumps, rocks, or fast stones, can not be plowed through without often stopping, where logs are to be hauled, where ditching has to be done, or where work is unsteady and many intervals of idleness come in between working spells, there

they will be found more useful than horses. There is no harness to be broken by sudden jerks; when a heavy pull is needed, they will throw all their weight in with steadiness, and try and try again, without floundering around, or secsawing, as many horse teams will do in the hands of injudicious drivers. They will work anywhere with safety, and if hopelessly stuck in a soft place, will remain with patience until extricated; and when labor is over for a time, they can be turned out anywhere to graze or browse around in the woods, to be brought home

when wanted, and hitched up for work again in a few minutes. They will exist under treatment that would ruin any horse; never have heaves, colics, or bots, or ringbones, or

splints, or the numerous ailments that render horses unsound; and if by any accident they become disabled, if they have been kept in good condition, the butcher is always ready to take their carcass. These, to many men, are valuable considerations, and yet, though our advice

Fig. 1.—CANADIAN MODE OF SHOEING OXEN.

has often been sought on the subject of using oxen in proference to horses in certain conditions, we have been very cautious about recommending their employment to some men, mainly for the reason that few have the tact and patience necessary to use them satisfactorily. Great gentleness and patience are necessary, and a hasty-tempered person would never get out of a yoke of oxen half the work they would be capable of performing. Oxen should in all cases be kept shod, more especially on the front feet, which often become so tender as to almost cause lameness, before it is suspected. There is no difficulty in shoeing oxen if a proper frame is provided. As they will not permit their feet to be handled like horses, it becomes necessary to sling them up, so that the feet can not touch the ground; they will then remain tractable. The want of such a frame is often a source of . expense to the owner of a pair of oxen, who is sometimes compelled to send them many miles to be shod, occupying a whole day on the journey. A few such trips would pay for a frame, when the shoes might be nailed on at home. We give in fig. 1 a sketch of the necessary frame, which speaks for itself, so far as its general construction is concerned. The ropes are arranged over the rollers so that the turning

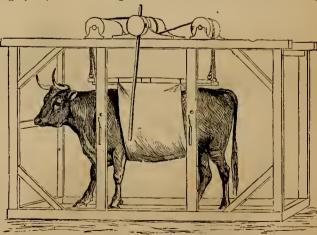

Fig. 2.—FRAME FOR SHOEING OXEN.

of the center one draws up the ropes over each of the others, and so lift equally. The hoisting part needs to be made sufficiently strong to bear the ox. Fig. 2 shows a rough-and-ready

plan of shoeing oxen which we have seen among the lumberers of Canada. The ox is thrown and held down while the shoes are fixed, the feet being kept drawn up tightly together. The animals seem to understand it and keep comparatively quiet. Ox shoes (fig. 3) need to be made much lighter than horse shoes and are differently shaped. Most blacksmiths know

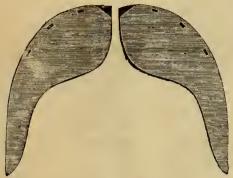

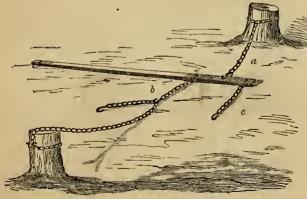

Fig. 3.—oxsnoes.

how to make them, yet we have found some that did not; we therefore give a representation of the shape of the shoe, two of which are required for each foot, a left and a right one. Any one that can not long a horse shoe can fix an ox shoe. The Deson cattle make by far the best working oxen. They are active, strong, and tractable, easily kept and fattened, and make first-class beef when slaughtered.

Pickling Seed Wheat.—The results of experiments have fully substantiated the benefit, as a preventive of smut, of pickling the seed preparatory to sowing it. The pickle may be either common salt dissolved in water, strong enough to bear up an egg, or sulphate of copper, at the rate of one pound dissolved in eight gallons of water. The pickle should be placed in a tub, the seed poured slowly into it, so that the light grains will float; these are to be removed, as they should not be sown. The seed may soak for a few minutes, then take it out and put it in a heap on the barn-floor to drain; after draining, mix it with some fresh-slaked lime, until it is dry, then sow it immediately.

#### A Simple Stump Puller.

W. S. Ramsey, Butler Co., Pa., wants a stump puller. In reply we give an illustration of a simple but yet very efficient one, which has done as some good service. It is worked by a lever,

A STUMP PULLER.

moved preferably by a stout yoke of oxen. The end of the lever is supplied with a strong clevis, sufficiently long to pass around so as to be used on either side. The fulcrum of the lever consists of a chain which is to be fastened to the

largest stump near (a); on each side of this is a clevis with a short chain and hook attached. To work the machine, fix a chain to the stump to be pulled, hook on to one of the short chains of the machine (b), draw up the oxen until that chain is tight; hook on the other chain (c), turn the team, and draw up as far as they can go; hook the chain (b), turn and draw again, and so repeat until the stump is drawn out. Then fasten on to another, and repeat the process until all the stumps are out within reach of the one the machine is anchored to. The machine will then have to be moved to another anchoring place, and so on until the field is cleared. The last stump left must be grubbed out. It will be necessary to remember that the power of this lever is very great, and stump pulling requires stout implements and chains. A breakage may not only cause delay, but a blow from a snapping chain may very easily be fatal; it is therefore absolutely necessary for safety that the chains be made of the best iron, with the best workmanship, and strong enough to hold against all the resistance they may meet. The lever should be strengthened with iron plates in those parts where the holes are bored for the clevis bolts.

#### The Mother's Milk for Calves.

I visited one of my neighbors yesterday, who has a reputation for raising good stock. He showed me a Jersey heifer, as he called her, one year old. The sire was Joe Hooker, No. 465, Am. J. C. C. Register, a fawn-and-white bull of high reputation. The dam was a large fawnand-white cow, represented as purely bred, but without recorded pedigree. She looks enough like Sharpless Duchess, 101, Am. J. C. C. R., to be her sister. She had been bought by a former owner for \$450, on account of her great excellence as a milker. This yearling heifer looked so much like the Guernsey stock, that good judges would call her a thorough-bred Guernsey. She was quite as large as common two-year-old Jerseys. But it was not good blood alone that had made this well-developed heifer. She had run with the mother all last season and was now in flush pasture. This told the story. A full year has been gained by good feeding, and she will be a well-grown cow with a calf at two years old. I have been trying this experiment on my farm the past two years, and am perfectly satisfied there is no substitute for the mother's milk in raising good milking stock. Milk is the natural food of

calves, and on the plains of Texas and Kansas, where grass and milk are plenty, they suck the cows until they dry up. Milk is costly on Northern farms, especially Jersey milk, which is nearly half cream. It seems almost too good to give to a calf, however handsome. But the Jersey heifer, if a Herd-Book animal, and well raised, is also a very costly animal. With the mother's milk invested in the calf, she is likely to be graceful, and to gain some of the fancy points which command high prices. It is better to

raise heifers worth \$300 at two years old on the mother's milk than to raise them worth \$100 on hay-tea and skim-milk. No more slops and pot-bellied yearlings for me.

CONNECTICUT.

#### Grain-Bins and Corn-Cribs.

Much inconvenience in handling grain is occasioned by a faulty construction of the bins in the granaries. Generally the grain has to be shoveled out over the top of the bin into a bag,

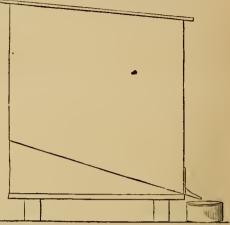

Fig. 1.-section of grain-bin.

requiring two persons to perform the work. We recommend an improvement illustrated in figure 1. The bin is raised on short posts a few inches from the floor. This prevents the tapping of the grain by rats and mice. These often cause great loss by gnawing holes through the corner of the bin, through which much grain escapes. A false bottom, with sufficient elevation to cause the grain to flow towards the front, is arranged, and a slide-door at the bottom permits it to run into a half-bushel standing on the floor; from whence it may be transferred to a bag, if desired. One man can now perform the job alone. If the door be placed at the center of the bin, the bottom may be arranged so that every grain will run out as it is wanted. To effect this, the bottom must slope every way towards the outlet. Many country millers who handle a good deal of grain might profitably have their bins made in this manner.

Corn-cribs might be improved in a double way

Fig. 2.—IMPROVED CORN-CRIB.

by a somewhat similar arrangement of the floor. Generally, if any mold occurs in a crib, it is on the floor, as here is found the first corn put in, which is generally dampest, and here the least ventilation takes place. A floor raised "roof-shaped" (fig. 2), and holes bored in it for ventilation, would effectually prevent dampness or mold in that part of the crib; and if slide-doors are put here and there at the bottom, at con-

venient places, the crib may be emptied, or nearly so, without taking a shovel or scoop into it. We have found that rats may be excluded from the crib by a peculiar form of post, turned smoothly in the lathe. The shape is somewhat like a mushroom, the stalk smallest at the bottom. The blocks (sunk in the ground) are of wood, with holes made to receive the posts, which enter four or five inches and fit tightly. This causes the crib to stand firmly. When the posts are made smooth with saud-paper, no rats or mice will mount them.

LARGE VS. SMALL PIGS .- Mr. Hinman, of Connecticut, writes: "Pigs with us this year sell at about six dollars each at weaning time. Last year my neighbor, who keeps a large breed, had pigs which weighed at nine months old, 424, 431, and 450 lbs., respectively, while mine at the same age weighed only about half as much, and were very nice pork indeed. I think I fattened two pigs as cheaply as my neighbor fattened one, but is it your opinion that I did so enough cheaper to make the difference in the first cost, my two pigs being worth twelve dollars, and his one only six dollars?"-If the two pigs ate as much as the one, and sell for no more per lb., evidently the man who bought the small pigs loses three dollars per head. In other words, he pays three dollars per head too much for them. In such circumstances the feeder had better buy the large breed. But how is it, with the man who raises the pigs to sell? If the large breed, as our correspondent asserts, eat twice as much as the small breed, it is evident that two sows of the latter could be kept as cheaply as one of the former, and consequently the little pigs could be sold at half-price. If they bring as much as the others when ready to wean, the small breed is the most profitable to the farmer who raises them for this purpose. If he both raises and fattens them, there would be, according to the statement of our correspondent, no difference. One breed would be as profitable as the other.

#### Pumps for Liquid Manure.

A reader of the American Agriculturist in Kossuth, Ind., asks information about square or box pumps for liquid manure-one that he can construct for himself. We give an engraving of a pump (fig. 1) that has worked well in our hands, and one that can be readily made with such tools as a saw, hammer, and nails. The size may be made to suit any circumstances. The box must be fitted tightly together, so that it does not leak. The valves (fig. 2) are of wood, covered with sole-leather, which projects a quarter of an inch over the edge, so as to insure a tight fit. They are hinged with a pair of common

butt hinges to the pump rod, so that they will open the full width, to permit any solid matter that may be in the mauure to pass up without chok-

Fig. 1. sing. The pump Fig. 2. rod is a strip three or four inches wide; at the bottom of it is fastened a hemispherical piece of wood, which supports the valves, when working.

We also reproduce an engraving (fig. 3) of another kind of valve, which was figured in these

columns several years ago. A valve of this kind may be used in any commou box pump. It will work where much coarse malter is mixed in the liquid manure, as the sides of the valve are capable of being pressed closely together, affording room for the solid matter to pass beyond them, when, on being drawn up, they open again, and every thing is lifted and discharged. When it is necessary to use a long pump, as where the manure cistern is deep, and a pump of 12 feet or more is needed, we would put a stationary valve at a convenient distance, say four or five feet from the bot-

tom. The pump rod need not then be so long, and the pump will work more easily. A discharge spout should be made in the pump, which renders the work more cleanly than when the manure is permitted to flow over the top, as is sometimes done, causing splashing that might be avoided.

#### Early Lambs for Market.

Where it is possible to get lambs to market early in the spring, a very profitable business may be made of raising them. Common native ewes put to a South-Down buck iu August, will bring a lamb in the month of January that will fatten more readily (though it may not gain so great a size) than the Cotswold cross. A lamb dropped during the middle of winter sometimes requires attention during the first few hours of its existence to prevent its becoming chilled, after which it will need no extra care, and will thrive apace, if the ewe is properly fed. As the sale of fat lambs in May at 25 cents per pound is a profitable operation, it is worth while to give attention to producing them. Allow no old ewes to be coupled, as they can not raise a lamb so well as a young and hearty one. Select the best of the young ewes, and commence feeding them something extra from the day the buck is turned in with them. A little wheat bran is good, changed occasionally for a handful of rye, oats, or buckwheat. See that these ewes don't want water, and a trough containing a quart of salt with the fourth of a pint of sulphur mixed iu, should be placed where they cau get to it at any time. With good care most of the ewes will produce twin lambs. A good, full bite of aftermath, if it can be had, should be given; if not, rather than injure the meadows, turnips may be pulled, or a few green corn-stalks cut for them; and when these fail, clover hay should be supplied freely. Excellent care from the earliest periods of gestation will make the lamb, more than any after care could do, with neglect now. The sheep will also keep in good condition, and when the lamb is taken away in May or June, will fatten quickly, if desired, on the early grass, and can be turned off profitably as mutton. A small but well-selected flock of sheep may thus be made the most profitable investment of the farm, but it is undoubtedly true that the flock should be no larger than can be properly handled and cared for.

#### Putting in Wheat.

A crop of wheat is often only half as large as it should be, from the faulty preparation of the ground. Manure and lime are supplied as abundantly as may be, but the laud is plowed iu such a manner that the surface water is always about the roots of the wheat, and the first frost heaves out the plants. It is too commonly the ease that fields are plowed from the outside to the center, leaving, as the consequence of a few years' plowing, a high bank around the fence, and a hollow in the center of the field. with four diagonal hollows meeting there. This gives no chance for the water lo get away; it lies and saturates the surface. Now let the field be plowed in lands, say 11 paces or 22 feet wide; there will be a dead-furrow, causing drainage at least 6 inches deep at each of these spaces, which will bring the surface-water at least below the level of the roots of the wheat. Besides, there will be a number of watercourses which will carry off the surplus water, and by means of a connecting furrow it may be generally conducted away from the field altogether. However much it may be advantageous to underdrain land, in many cases, from want of the necessary capital, it can not be undertaken. Then the best possible substitute must be found. Surface-draining by means of ridges and open furrows is the best substitute, and if this style of plowing is properly performed, where the subsoil is not remarkably retentive, the ground may be kept dry enough to prevent throwing out during winter. Above all things, the fashion of plowing around fields should be abandoned when wheat is to be sown. It may answer for spring crops, but a better and neater plan of plowing, and one leaving the ground in a better condition, could be easily substituted. Generally, it may be concluded that the ridge and furrow system of plowing is in all cases better on undrained land than the flat system. Where the land is underdrained, a swivel plow makes handsome work, and entirely avoids the bad effects of plowing around the field.

#### Dry Earth in Veterinary Surgery

BY GEORGE E. WARING, JR., OGDEN FARM.

Perhaps I should say "Cow-Doctoring," for such a thing as Veterinary Surgery is uuknown on this island of Rhode Island. I found, one afternoon late in May, that two of my men had been called to attend a sick cow belonging to a neighbor who was then absent. The animal had recently calved; had been allowed to stand on a sand floor in which her hind feet had worn a deep depression; and in "cleansing," the effort at expulsion, added to the low position of the hind-quarters, had forced out the entire uterus, and in frequent lying down and rising she had bruised and soiled the parls so that the whole was covered with sand, manure, and blood. When I arrived on the ground the parts had been only imperfectly washed, and had been returned by main force-so far as I could learn, with more clotted blood and filth than would have been left on them by a more skillful practitioner. The cow was in an extreme state of exhaustion, and we none of us thought it possible that she could live. The usual remedies were resorted to, and every thing that the very limited knowledge of the neighborhood could suggest, was done to make the animal more comfortable-all to no purpose. She grew worse from day to day, and finally her

#### INDIANS GATHERING COTTON - WOOD BARK .- DRAWN BY W. M. CARY .- Engraved for the American Agriculturist.

owner told me, "That cow is going to die-the most offensive mortification has set in, and I see no way on earth to help her. It's a pity; she is a very good animal"-and he evidently felt (in dollars and cents) the full weight of his misfortune. I told him, if he considered her already a lost eow, I would suggest another remedy that might succeed, but it was one which, as it was only an experiment, I would not advise in any but a desperate case. He said the cow was worth her hide, and no more, and he was ready to try any thing. I knew my prescription would lessen the poor animal's pain, and would remove the offensiveness of her mortifying wound, and so I gave it. "Take some of the finest earth of your garden (clay loam); make it airdry; sift it finely, so as to get out all small stones, and fibres of roots; and fill the womb with it. When some of this is expelled, put in a fresh supply, so as to keep as much dry earthor pure earth-in constant contact with the wounded parts, as you can. Ahandon every other form of treatment, and give the earth a fair chance." He promised to follow the directions, and drove on. From that time until the middle of July, when I met him again on the

road, I thought nothing of his cow, and probably should never have thought of her again. He accosted me with: "Well, that cow got well after all. I did exactly what you told me to, and it stopped the mortification right off. She is as well as ever now."

This is the whole story; but it is a story full of suggestiveness for all owners of live-stock. Fortunately such eases as this are of rare occurrence, but there are all manner of wounds and abseesses and ulcers-which give infinite trouble, and which, under ordinary treatment, give much pain to the animal-that may be successfully treated with dressings of dry, clayey earth, and with immediate relief from pain. This is a remedy which all who can procure suitable earth can readily use. The only caution necessary is to avoid making the application to any sore that it is best to keep open.

#### Gathering Cotton-wood Bark for Forage.

The inner bark of some trees is very rich in mucilaginous matter, sometimes in sufficient quantities to be available as an article of food. This is notably the case in our Slippery Elm, the inner bark of which readily yields to water a rich mucilage, and the flour made from it is used as a nutriment for invalids. The barks of some poplars and willows are nutritious, and in times of searcity are used by the people of Northern Europe either as a substitute for grain, or to mix with their scanty supply of flour. Deer, rabbits, and other animals, both wild and domestic, in the absence of other food, frequently sustain themselves by eating the bark of trees, often to the annoyance of the cultivator. Some of the Indian tribes of the West rely upon the bark of the Cotton-wood (Populus monilifera and other species) as a forage for their hardy ponics, and gather stores of it for use in winter when other food is not to be obtained. The engraving is from a drawing by Mr. Cary, and represents a party of Indians laying in their winter stock of cotton-wood bark, and shews their rude means of transportation. The writer has, on more than one occasion, found the cottonwood the only available forage for his animals. On reaching camp, trees were felled, and the animals allowed to browse upon the small branches and twigs, which were eaten with great avidity by the half-starved horses and mules.

#### The Southern Bush-Honeysuckle.

In the rocky woods at the North, there grows a small Bush-Honeysuckle, a small and not very showy species, with honey-yellow flowers, the Diervilla trifida. This species was called Diervilla lutea by some of the older botanists, and

SOUTHERN BUSH HONEYSUCKLE.

seeing that name on a catalogue we ordered the plant. When the shrub came in flower, we found to our gratification that instead of the plant of the Northern States we had one peculiar to the Southern Alleghanies, the Diervilla sessilifolia, which, besides being rare, is a much finer plant than the other. We give an engraving of a flower cluster of the natural size. Though this Southern Bush-Honeysuckle can not rank as a very showy shrub, it is an exceedingly neat one, and the modest color of its abundant flowers makes it an acceptable addition to a collection. The showy and very popular Wiegelas are now placed in the genus Diervilla, but they differ from our species in the size, shape, and color of the flowers.

#### The Common or Scotch Broom.

The engraving shows plainly enough that the Broom belongs to the Pea or Pulse family. It is a shrub usually growing from three to six feet or more in hight, and is found throughout Europe. In the south of Europe it becomes a small tree, 20 or 30 feet high. Its tough and slender green branches are angled, and bear small leaves, the lower ones of three, and the upper ones of a single leaflet. The flowers are borne in the axils of the leaves, are of a goldenyellow color, showy and fragrant. When the flower first opens, the style and stamens are

confined in the keel, but when touched or disturbed by an insect, they suddenly spring upward. As an ornamental shrub the Broom is not without beauty; the leaves are quite incon-

spicuous, but the long stems are of a dark green, and produce a pleasing variety when mingled with

shrubbery. other The name indicates one of its most common uses, that of making brooms for sweeping, and it appears to have been used for that purpose in ancient times as well as in modern ones. In the domestic economy of some parts of Europe, the Broom is used for thatching, filling in hurdles for sheep and cattle shelters, and for fuel. Sheep are said to eat it readily at all seasons, and there have been times in Scotthe land, when ground was long covered with snow, that it has furnished the only available food for the flocks. The branches, when rotted and beaten, afford a fiber from which a good coarse cloth may be made, and in those countries where it attains a large size, the wood is valued for ornamental work.

Formerly the plant was in repute as a diuretic and purgative. It is most readily propagated by seeds which are produced abundantly. The botanical name is Cytisus scoparius, though some botanists put it in a separate genus, Sarothamnus.

#### How to Build a Cheap Greenhouse.

BY JAMES HOGG.

[In the article upon building a greenhouse, given last month, the portion descriptive of the internal arrangement was by accident omitted, and is given here.—ED.]

INTERIOR OF House.-Inside, the front platform for the plants is carried along the two sides and the end. It is 3 feet wide and 12 inches below the upper and inner edge of the plate strip. The walks are 3 feet wide, although they may be reduced to 2 feet 9 inches, and the extra 3 inches added to the center platform; the lower half of this platform is of the same hight as the front platform, and 18 inches wide; the center shelf is raised 10 inches, and is 3 feet wide.

All the lower sashes are screwed fast to the rafters, as is also every alternate upper sash, the intermediate ones sliding down to afford ventilation. A cap 3 inches wide is fastened to each side rail of the upper sashes that are fastened down; these cap pieces cover the side rails of the sliding sashes 11/2 inches, and prevent the

wind from lifting them and blowing them off. For the purposes of ventilation it is not well to have the lower sashes loose, as the cold air admitted directly over the plants very frequently

does injury to them, especially if there is the least neglect in watering them. All the ventilation required in a house of this size can he had by lowering the upper sashes and opening the door at the end of the house.

The sliding sashes should be hung with greenhouse sash pulleys, which are made in such a way that the cord can not slip off the sheave and jam between it and the jaws of the pulley. They can be had at any of the larger city hardware stores. The lower end of the sash-cord is fastened to belaying pins, or some similar contrivance, attached to the rafter over the front platform. The joints of the rafters should all be put together with thick white lead and oil, and care should be had that the joints are mitered true and square.

HEATING .- A really cheap method of heating greenhouses, that is, one relatively as cheap as the structure itself can be made, has not yet been devised, although it has occupied the minds of garden architects for many years. The objects to be attained are: first, cheap materials; secondly, quick diffusion of the heat throughout the house; and thirdly, the retention of heat in the apparatus, to be given out in the latter part of the night, when it is not convenient for one to attend to the firing. The cheapest materials are brick, built into the form of a flue; for giving out heat quickly, sheetiron pipe, like ordinary stove-pipe, is the best; and for retaining heat nothing yet devised is

better than a good hot-water apparatus. The objection ordinarily urged against the brick flues, is the escape of the gases evolved by the combustion of the fuel through the pores of the bricks, and more especially through the joints, these gases being very detrimental to the health of the plants. With care in the construction of the flue, the escape through the joints can be almost altogether obviated, and if the draft is as it should be, no difficulty need be experienced from the escape of gases through the porcs of the bricks. When any sort of cast-iron stoves is used, the objection generally made is the dryness of the atmosphere, superinduced by the hot iron, but this objection is founded upon a popular error. The dryness of the atmosphere is incidental to the winter season, as the moisture is all precipitated by congelation, and what moisture is artificially produced in the greenhouse is precipitated on the glass roof in the form of rime or hoar-frost, and this dryness will exist, if not counteracted artificially, under any mode of heating that may be adopted. Where the fire-pot of the stove is simply cast iron, injurious effects may result if it is allowed to become red-hot, but this is owing to the action of great heat upon the metal which appears to cause it to give out deleterious gases. What these gases are, has eluded the observation of investigators, as air passed over red-hot iron plates fails to show the presence of any specially deleterious gases, but yet is sufficiently deadly in its character to kill a cat in a few minutes, when inclosed in a receiver of such an atmosphere. This can be obviated by having the fire-pot lined with fire-brick or soapstone. Another objection to stoves is that they are

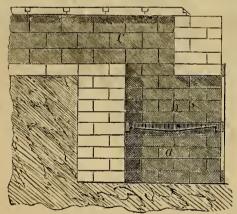

Fig. 1.-VERTICAL SECTION OF FURNACE AND FLUE.

either too hot or too cold, not giving out the heat regularly; but the invention of base-burning stoves has done away with this, as they are so constructed as to keep up an equable temperature when due attention is paid to the regulation and adjustment of the dampers.

The pipes, however, rapidly rust away, unless they are made of galvanized iron, especially those carried under the shelving of the front platform. The use of sheet-iron pipes has one great advantage in the rapidity with which they respond to the action of the fire and heat the house quickly; a matter of great importance in our climate, as it frequently happens that after a warm rainy day and evening in winter, when scarcely any fire is needed, the weather will suddenly clear up with high, cold winds from the westward, and before the fire can be got properly under way the temperature of the house will be so greatly reduced as to almost baffle all attempts to get it up to the proper point again before sunrise.

It is often urged in favor of the use of hot-

water pipes that they give out a moist heat. A moment's consideration will show the fallacy of this notion. The boilers are air and water tight, as are also the iron pipes themselves, and no vapor or moisture can escape from them except from the receiver, an iron column of perhaps six, eight, or ten inches in diameter, the evaporation from which would not exceed two inches in twenty-four hours. The great advantages in

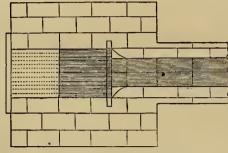

Fig. 2.—norizontal section of furnace and flue.

the use of a hot-water heating apparatus are the equable distribution of the heat throughout the house, making the temperature almost the same at one end as at the other, and the slowness with which the water gives out the heat it has taken up from the fire, thus insuring an evenness of temperature during the whole night Its disadvautages are its cost in the first instance, and the slowness with which it responds to the action of the fire. The latter can be obviated by adding to it sheet-iron pipes or flues for the carrying off the gases of combustion from the fire, an arrangement which in our climate should never be neglected, as a great saving of fuel results from it. This, however, is seldom done, as the arrangement and setting up of such apparatus is almost always intrusted to architects or mechanics who generally know little about the cultivation of plants.

In heating by brick flues the main point to be attended to is the construction of the furnace, which, for a greenhouse such as is described in our last number, should be 12 inches wide, 12 inches high, and two feet deep. These dimensions are somewhat larger than those usually employed, but we prefer, from long experience, to have plenty of room in the furnace, as the combustion of the fuel is more perfect, and when required is more rapid, as it gives an opportunity to use a thin, quick fire when necessity calls for it. The ash-pit should be of the same hight, if practicable, but it may be reduced to eight or nine inches in hight, if necessary. Both the ash-pit and furnace should be provided with east-iron doors, both hung on one cast-iron frame, if they can be had made in this way; otherwise each door may have its own separate frame. The frame should be anchored into the The furnace bars should be 24 brick-work. inches long, one inch thick, and one inch wide at each end, three eighths of an inch thick in the body, and two inches deep in the center. They rest at each end on a east-irou bearer, 15 inches long, and an inch square.

The furnace should be lined with fire brick laid flat, and backed up on the two sides and back and on top with eight or twelve inches of common brick. The top of the furnace should be laid with a three-inch fire tile, 12 × 15 inches. The flue starts from the top of the furnace; it is laid under the front shelf, on a foundation of brick, one brick thick, on the flat, and 14 or 15 inches wide; the sides are built up of three bricks on edge, the clear space between them being 7 inches, making the area 7×12,

if tiles are used for the covering; but, if bricks are used for covering, the width must be reduced one or two inches. It is commou to make the tiles with a rabbet on each end and to lay them with the rabbets overlapping each other, but as it is almost impossible to make them smoke-tight when thus laid, we always turn each alternate tile on its back and butt the edges of the rabbets together, which thus makes a groove or gutter half au inch deep and an inch wide, to be filled with mortar, and it is then perfectly tight.

In laying the tiles or bricks as covering, we do not generally lay them so as to cover the full width of the sides, but regulate the width of the flue in such a way as to have the covering (either bricks or tiles) short of the outside width of the flue, two or three inches, and lay the mortar on the edges in such a way as to make the flue appear as though its upper edges were chamfered. If the flue has to be carried under a doorway, it will be necessary to sink the furnace so far as to keep the bottom of the flue at its lowest part level with the top of the furnace; if it is carried lower than this, it will not draw. The bricks both for the furnace and flue should be damp when laid, and the mortar rather thin. Great care must be taken to lay all solid; every joint should be filled when laid, and so as not to require any "pointing up' afterwards, neither should the flue be "parged" or plastered on the inside, as it soon drops off

Fig. 3.—GRATE-BAR—SIDE VIEW.

and chokes the passage. If the flue is not carried into one of the chimneys of the house, it should be taken through the side of the green-

house and a separate chimney made for it. If there should be any danger of a bad draft when the chimney is carried up near the dwelling, the flue may be returned alongside of itself to a properly safe point, and then carried out.

If the greenhouse is to be heated by a base-burning stove, the stove-pipes should be five or six inches in diameter and made of galvanized iron. They may be suspended under the front shelves; but neither they nor the brick flue should come within 8 or 9 inches of any woodwork, for fear of fire.

A hot-water apparatus can only be set up by mechanics who are fully acquainted with the

Fig. 5.—SECTION OF FLUE.

principles upon which it operates, and who have the mechanical skill necessary to put it together. There are several kinds of boilers in use, and if any of our readers should desire to heat their greenhouse by this method, we advise them to apply to some

one of those who make it a specialty; their advertisements are to be found in almost any horticultural journal. For an ordinary greenhouse, especially if of small size, a brick flue or base-burning stove will answer every purpose, at less than one half what a hot-water apparatus would cost. Under any arrangement that may be adopted the fire end of the mode employed should be at the coldest side of the house when it can conveniently be placed there.

### The Wakefield Cabbage — How to Select for Seed.

BY PETER HENDERSON.

After we had been growing the Early Wakefield cabbage in Jersey for a few years after its introduction from England, we found that it broke into over a dozen sub-varieties, of varying size of leaf and shape of head, and, worse than all, of varying earliness. No matter how carefully we selected the heads that we used for seed, the same difficulty occurred. A few miles inland, somewhere near the Orange Mountain, we found that an old German was always ahead of us in having the first Wakefields in New York, and these too of a uniformity in shape that none of us nearer the city could produce. All inducements to get him to sell seed were disregarded, and year after year he kept the lead. Several plans were laid to circumvent him, such as ordering a hundred of his cabbages with roots on. But old Carl was not to be caught so; he filled the order to the letter, making the buyer pay roundly for the roots, but took the liberty of first dipping them in boiling water! But one day he invited a friend and countryman to see his wonderful cabbages as they grew. This was a fatal day for Carl's monopoly, for his friend had his eyes about him, and observed that several of the stumps from which the earliest heads had been cut were marked with a stake, as were a few of the choicest shape, as yet nucut. The secret was out. Carl's success had been gained by persistently year after year selecting the earliest and finest heads; taking up the stumps from which they where cut, he planted them carefully, and taking the young shoots produced from the stumps, he treated them exactly as we treat cuttings of a flower, that is, by planting the slip in the soil, watering it freely, and shading it until it rooted. After these cuttings or shoots of the cabbage were rooted, they were planted in the usual cabbage-frame, covered with glass in winter, set out in spring, and next July ripened seed. This process is too expensive and slow to follow for raising cabbage seed in quantity, but it is now used by careful growers to produce pure and improved stock from which to raise seed.

#### Notes from the Pines.

SWEET CORN.-Much talk was made last spring about "Moore's Extra Early Concord." It came from Massachusetts, and that was in its favor, for Massachusetts is next door to Rhode Island, where sweet corn was invented. I can recollect when Rhode Island people used to send baskets of sweet corn, by stage-that was before railroads-to their friends in Boston who, in those days, knew not sweet corn. In adjoining rows, and upon the same day, I planted Crosby's Early, Moore's Concord, and a variety grown extensively about here known as Tom Thumb, Van Riper's, Cadmus', and by other local names. The varieties had the same care, and the last-named was fit for the table full two weeks before the others, Moore's leading Crosby's by a few days. But what stuff this Moore's proved! I never saw such a mixed lot, and in size and color there was the greatest lack of uniformity. Some stalks were three feet high and others ten. Then as to smut-I never saw any thing to equal it. In a row 150 feet in length I did not get three dozen ears, and of these not more than a dozen were of decent size, the rest being nubbins two and three inches long. I know that this variety does finely around Boston, but upon my light soil it has been the most provoking of failures. Still I shall try it again, as the unusually wet season may have had something to do with the untoward results. It is only by recording failures as well as successes that we can arrive at the value of varieties.

Subtropical.—I made an odd bed, which thus far is very pleasing. The bed is a long oval in the lawn, and I put out two plants of Ricinus (Castor Oil) and set around them a margin of Colocasia (Coladium) esculenta. The luxuriance of the foliage of these produces a striking effect. Another thing that has given me much satisfaction is a clump of

Arundo Donax.—This is a native of our Southern States, but is quite hardy here. My plant of it is now in its second year, and its stems form an immense clump ten or twelve feet higb, of a bluish-green color. The leaves have a graceful curve, and are moved by every breeze. It is the "reed shaken in the wind" of Scripture, and if it were better known it would be very popular. It is not as graceful as the Pampas grass or Erianthus Ravennæ, but it requires no petting nor protection, and has a sturdy elegance of its own that is pleasing to look upon. Its variegated form is a poor grower in comparison, but it is a showy plant, and worth the trouble of protecting it in winter.

The Sorrel Tree. — This was formerly called Andromeda, but is now Oxydendrum arboreum. The leaves are sour to the taste, hence the common name. It grows in its intive localities, the Southern and Middle States, to the hight of 40 or 50 feet. My specimen is about 15 feet high, and has been clothed for some weeks from "top to toe" with its long, one sided clusters of white flowers, which in shape remind one of the Lily of the Valley. If you wish to plant a good thing and something out of the usual run of trees, try the Sorrel Tree. Near it is a specimen of another valuable tree,

The Kœlreuteria pariculata, than which nothing can be neater in its dark-green cut foliage. Its clusters of yellow blossoms are showy, and its bladdery pods still more so. The tree is remarkably clean, not liable to be troubled by insects, a good grower, and in all respects desirable. Yet nurserymen tell me that there is no sale for this and many other choice species. People confine their orders to maples, elms, and a half-dözen other well-known things, while really choice varieties remain as dead stock upon their hands.

#### Fall Planting of Hardy Plants.

BY PETER HENDERSON.

All hardy plants, that start early in spring, should be set out in autumn. The best time in this latitude is from October 15th to November 15th; if later than this, they should be covered with hay, straw, or some such material, to keep them from being severely frozen. The reason why such plants as Rhubarb and Asparagus do better by being planted in fall, rather than in spring, will be apparent when we consider their nature. Young or old plants of either Asparagus or Rhubarb, just as soon as the frost is out of the ground in spring, begin to develop the buds which form the stalks. Simultaneously with this starting of the buds, there is a development of rootlets. Now, when we lift these plants to transplant in spring, these minute fibers are destroyed-not only by break-

ing off, when dug up, but by exposure to the air. This does not seem materially to injure these roots, for either will grow and do well if the transplanting is delayed even late into the spring mouths. But what we contend for is, that they will do better, if planted so early in the fall-say during October-that these rootlets may be emitted, and be ready, if thus left undisturbed, to impart vigor to the plant in spring. I am convinced that, particularly in light, dry soils, Rhubarb or Asparagus roots planted in October will give (conditions of soil and manure being equal) a much better growth than when set in spring. Last fall I put out in October, for my own use, a dozen roots of Rhubarb. Not having enough plants then to complete the row, I delayed getting additional roots until April. The result was, that we were pulling the stalks from those planted in October before those set out in April were showing signs of starting. This fall planting is equally advantageous with hardy bulbs. Our stock of Lilies is usually planted in October, and if by any chance some are left over until spring, the growth is never so vigorous, and the later the operation of planting is delayed, the weaker the growth. This many of your lady readers, no doubt, have experienced with their Hyacinths and Tulips. When planted early in fall, they form roots before cold weather sets in, and are ready to start early in the spring; but if the planting has been delayed until December, it is then too cold for roots to form, and the consequence is, a feeble flower in spring; or, worse yet, if Hyacinths, Tulips, or Crocuses are not planted until spring, the top starts before the roots, and the result is complete disappointment, and if the bulbs flower at all, they are weak and feeble. This may be still further illustrated by plants of an entirely different nature, in any section of the country where the thermometer does not fall lower than 15 or 20 degrees below the freezing point. Cabbages or lettuce plants set out in October, will come to maturity 10 or 12 days quieker than if planted in February or March. In many parts of the Southern States this fall planting of cabbages, or sowing or planting of onious, for market purposes, may be followed very profitably. No doubt it is done in some places, but I do not believe it is generally practiced. In such localities the advantage of planting Rhubarb or Asparagus in fall would be even greater than in colder districts, for if delayed until spring, hot weather rapidly sets in, and, as in the case of Hyacinths or Tulips, above referred to, the tops start before the roots, and the growth for some time is feeble.

#### Our Native Loosestrifes.

There are many native plants which, while they possess neither a striking appearance nor any marked qualities, are yet of such frequent occurrence that most persons desire to know what they are and something about them. Our native Loosestrifes, though not of any great beauty, are of such frequent occurrence that specimens are often sent to us for a name, and we give engravings of two of our common species. The well-known Moneywort of the gardens, the long, trailing stems of which make it such a favorite plant for hanging baskets, is a European species of Loosestrife, which has become naturalized in some places. Loosestrifes belong to the genus Lysimachia, the name supposed to be from Greek words meaning a release from strife; the common name in this instance being nearly a translation

of the botanical one. Pliny states that in his time it was a popular notion that if the plant be laid upon a yoke of oxen when they are quarreling, it will quiet them. It is not necessary to say any more about the botanical relations of

tions to the statement, but we may say as a general thing that wild plants improve when transferred to the garden. The chief reason of this is that the plant has undisputed possession of a sufficient amount of soil, to allow it to de-

velop to its fullest extent, and is not, as in its wild locality, obliged to struggle with a host of aggressive neighbors. Each new work published abroad contains an increased number of our native . plants, and we find in English catalogues very many more American plants than we find in those of our own florists and nurserymen. Among the beautiful native plants that are eminently worthy of a place in our borders, are the Trilliums, or Wake-Robins, We have eight species, all of which are interesting, and some of them very showy. They have a tuber-like roofstock, from which arises a stem bearing at its summit a whorl of three ample leaves, and a single terminal flower with its parts in threes.

In the large White Wake-Robin (Trillium grandiflorum) the flow-

er is from three to five inches across; white when it first opens, and when older changing to rose color. This is our showiest species, and a bed of it is truly beautiful. The Purple Wake-Robin, sometimes called Birthroot (Trillium erectum), is the species we have figured, and gives an idea of the general aspect of the others. The petals in this are dark purple or maroon color. These and other species are to be found in rich damp woods in the North and West. When transferred to the garden they require a year or two to become established, and then they will each spring give an abundance of bloom, and are almost unrivaled in beauty by any flowers of the season.

LETTUCE FOR NEXT SPRING .- Those who have not frames for wintering their lettuce can get an early start by sowing about the middle of this month the seed of some hardy variety. The Brown Dutch and the Green Winter are among the hardiest sorts. Sow where water will not stand, and when cold weather comes give a covering of leaves and brush. Around New York the plants winter perfectly well, and as soon as a well-enriched spot of ground can be got ready in spring the lettuce may be transplanted and give a very early crop.

thing to take up and pot, about the time frost

comes, those Verbenas, Geraniums, Heliotropes, and other plants that have been in the borders all summer. As a general thing this is labor lost. The plants have grown quite out of shape, and they are very long in recovering from the

THE PURPLE WAKE-ROBIN, OR TRILLIUM.

shock caused by removal, if they do so at all. It is as a general thing much better to strike cuttings and get a stock of young plants, and the matter can not be attended to too soon. Verbenas, Geraniums, and the like root readily if they are put in sandy soil in a shady place, or they may be artificially shaded. Heliotropes succeed better if potted than do most others, but they should be lifted early, in order that they may be well established before cold weather. Cut back their straggling growth severely.

CURRANT AND GOOSEBERRY TREES.-The Gardeners' Magazine (Eng.) describes and figures some remarkable current and gooseberry trees growing in the garden of Col. Fox, at Kensington. He has an avenue of gooseberries trained as pyramids and thirteen feet high, and standard current-trees which are five feet from the ground to the commencement of the head. Our gardeners would find it difficult to afford the time to produce such specimens did not the destructive attacks of the borer render it quite impossible. Some years ago our horticultural books and journals advocated growing the currant and gooseberry in the form of a small tree, or upon a "single leg," as it was then called. Such specimens make handsome objects in the garden, but as a general thing, after they have grown to a good size, the borer finds its way into the stem and that is the end of it. Our cultivators have found, to their cost, that it is safer to have several stems than a single one.

UPRIGHT AND FOUR-LEAVED LOOSESTRIFE.

these plants, than that they belong to the large Primrose family (Primulacea), and have the general characters of that order. leafy-stemmed, with opposite or whorled leaves, and our species all have yellow flowers. The specimen at the right hand in the engraving is the Four-leaved Loosestrife, Lysimachia quadrifolia, and is noticeable for its symmetrical arrangement, the leaves being in whorls of four (sometimes more or less), with the flowers upon long and very slender stalks from the axils of the leaves. The other species is the Upright Loosestrife, L. stricta, and has its flowers arranged in a long pyramidal raceme. This is the showiest of our species, of which there are five others, to be found in damp thickets.

#### The Trilliums, or Wake-Robins.

In looking through the volumes of the past six or eight years, we find that we have figured a large number of native shrubs and herbaceous plants, and that together they make a collection not to be rivaled by any exotics. We have endeavored to point out such natives as were worthy of cultivation, and to show lovers of flowers whose means were limited that they might surround themselves with beautiful objects without other expense than the trouble of removing the plants from their native localities to the garden border. There are some excep-

PLANTS FOR WINTER.—It is a very common

### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### Drying Fruit, Corn, etc.

J. N. Nind, Du Page Co., Ill., reminds us of a drying-box, which we think we have already published, but it is well to call attention to it at this scason, as it is a very convenient arrangement. It is a box like a hot-bed frame, covered with one or more sashes. Window-sashes, or those made especially for hot-beds, will answer equally well. The box should be higher at one side than at the other, to give a slope to earry off water, and the better to eateh the sun's rays. It should be in all respects like a kot-bed, except that it must have a bottom, and be set up upon pieces of joist, or some other material, to keep it from contact with the earth. Several holes are to be bored in each side of the hox, for ventilation; these are to be covered with gauze, to keep out insects. Fruit, etc., will dry rapidly in such a box, and he kept clean; besides, it need not be brought in at night or during a rain.

### Home Topics.

ACCOMPLISUMENTS.—Kate G., who knows what I wrote for Annette's benefit last month, wants me to say something on the general subject of accomplishments for women. She wants to know what I would advise about studying music, painting, dancing, etc.

From the busy lives of most persons, some things, very desirable in themselves, must get erowded out. "Every thing depends upon what gets crowded out," dear Miss Craydock says, in Leslie Goldthwaite's "Summer." The accomplishments named above are not essential to the existence, or to the absolute comfort of any hody. But bare existence is, by no means, living; and physical comfort is only essential as the necessary foundation for the healthful development of the higher faculties. The uceds of the body are imperative, however, and you can not slight them without wronging the soul that inhabits the body. So it seems to me that every woman should be skilled in the preparation of wholesome food and comfortable clothing, whether she knows how to play the piano or not; but let her also learn to make music.

The best of all music is that of the human voice, well cultivated. It seems to me much better to learn to sing sweetly, than to learn to play on any musical instrument. Many voices, naturally good, are strained and spoiled very early by the effort to sing too loud. Some of the best professional singers were allowed to sing very little during childhood, or only with moderate power. "Louder! louder!" the leader of singlog at the Sabbathschool exclaims, and the young voices of the poor little victims stretch to their utmost capacity to satisfy the unreasonable demand. Some leaders of children's singing seem to suppose that to keep time and sing loud are the chief requisites of good singing. Quality is sacrificed to quantity, and many a child suffers life-long injury from this cause. The ability to sing, even moderately well, is of great value to a mother. Most married women are obliged to give up their piano-practice while they have the care of young children, but there is a chance for some vocal music every day. not sing the little lullabys too sweetly. Every day I am thankful for my own poor little gift, which rarely comes into service anywhere except in the nursery. While one baby is lulled to happy rest by the singing of little rhymes from "Songs for the Little Ones at. Home," a larger one sits near, or lies upon the floor, resting, too, and laying by hard questions to ask me at the first opportunity, about the meaning of what I sing.

Among accomplishments to be desired I would rank the ability to read aloud with clearness and proper expression. It is a very rare accomplishment, but one that may be made to add greatly to domestic happiness.

A great deal of time and money is fooled away in

lessons on the piano, where there is little natural gift in that line, and where the motive is merely a desire to make a display. A young girl who wishes to study instrumental music had better satisfy herself first that nothing more important is likely to be crowded out by her music lessons, and that a real love and talent for music animates her, more than the wish to shine in society. The desire to dazzle others, or to be admired, is an unworthy motive; not so with the honest wish to contribute in every way we can to the rational pleasure and entertainment of society about us.

I think drawing-mechanical drawing, and sketching from nature-should be taught to every child, not merely as an accomplishment, but as a useful art, and as legitimate training for both eye and hand. I don't think much of learning to paint merely for the sake of getting a few "pretty" pictures for your walls. However, there is pleasure and some degree of culture even in that. But there is more real culture in the patient copying, with pencil, or charcoal, of a burdock plant, studying all its outlines, and lights, and shades, just as you see it growing in your back-yard-or in your neighbor's yard, for, of course, you don't allow burdocks to grow on your premises! Any other plant will do. Half a day's faithful study of nature, in the attempt to copy her beautiful shapes and shadows, will make all nature vastly more beautiful and wouderful to you ever afterward. There is no danger of carrying this study too far, if you keep it from monopolizing time that should be given to other duties. And when you come to use colors, the pleasure is increased.

Kate mentions dancing. There is no harm in knowing how, and there is no harm in dancing. It may be made good physical culture and healthful exercise. Usually, this is not the case, and there are so many evils associated with dancing that I don't feel ready to recommend dancing lessons very cordially. I wish we were all ready to take hold and free dancing from its evil associations, and conscerate it to good. It is a heavy task until the leavening influence of simple Christianity has spread farther and deeper through society, but we can at least try to speak frankly, and without prejudice, about it. Did you read what H. W. Beccher wrote lately about his memory of the single time when his sainted mother dauced before her little flock of ehildren and their father?

In my opinion, it is for the good of man, and, therefore, for the glory of God, to cultivate the love of the beautiful, and the ability to express it as perfectly as possible to all the senses—not for the sake of the senses, but for the sake of the soul, to which the senses may all be made to minister, by judicious cultivation and exercise.

SUNDAY HEADACHES. — They are a reality—a dreadful reality—as many weakly persons know to their sorrow. Why should they come just once a week, and on Sunday, too? I used to wonder ahout it when I was a little girl, and had to lie abed, or in my cldest sister's arms, enduring the misery of a sick or a nervons headache on a Sunday afternoon. The headaches used to begin to come on, or to suggest themselves somewhat, before I started for church; and when I begged to stay at home on the plea of sickness, after a whole week of exemption from such suffering, I do not wonder that the request was deemed absurd by stronger persons, and that I was sometimes obliged to choose between going to meeting or taking a dose if I stayed at home.

I can see now that the Sunday habits of many families are directly conducive to headache, stomach-ache, and other physical discomforts, with accompanying mental stupidity. When Sunday comes, overworked people are glad to sleep a little later than usual, and perhaps it is best that they should do so. But for people who are not overworked, such late rising is a bad beginning of a good day, and sets the stomach out of order at the outset, by breaking in upon the usual habit of breakfasting. Some feeble persons can not lounge in bed after the time of waking, without rising with a headache. The stomach is already out of tune before the late breakfast is ready, and the chil-

dren are apt to be hungry and cross. In many families it is any thing but a pleasant and leisurely task to get all the members ready for church or Sunday-school; and it is not strange that the body calls for rest, when once scated in the church pew, more carnestly than the mind for instruction. Drowsiness is a natural result of the whole week's work and the whole morning's proceedings. Add to this the poor ventilation of the church, the crowd of changing colors and shifting scenes, and the misery of many of the fashions of women's head-gear, and it is not strange that many a mother, work when she goes home from church to a late and perhaps a heavy dinner.

It would be more healthful, and so more religious in one sense, to have the hours for rising and eating vary as little as possible from those observed on other days. Extra Sunday naps ought not to be made necessary by the irreligious conduct of the whole week. Earlier hours for bed every night would give a more reasonable and comfortable day of rest on Sunday.

BY EXPRESS OR BY POST .- A friend lately sent me a present of a package of books and picturecards of wild animals, birds, and foreign people, for the children. She sent by express, paying the charges herself. So I need not hesitate to say that she might better have sent the parcel by mail, as printed matter. Large parcels, on which you must pay letter postage, cost heavily; but in this case the expense would not have been more than half what it cost to send the same so far by express. Had the distance been shorter, her way would have been the better one; but in sending by express, the expense constantly increases with the distance, as the parcel changes from one line to another. You can send a printed parcel by mail from Boston to Oregon as cheaply as from Bostou to Springfield. But be careful not to send any thing as printed matter which does not properly come under that head. It is easy to find out the law on the subject, and silly, to say the least, to attempt to evade it. A friend onec sent me a bouquet (much faded, of course, when I received it) in a newspaper, and I had to pay twenty-five cents for it when I took it from the office. A few words, thoughtlessly written on the margin of a newspaper by me when a school-girl, cost the friend so addressed twenty-eight cents, besides some shame on account of my folly.

TREATMENT FOR "CROSS CHILDREN." - Mrs. Mann commends the good sense of a mother of her acquaintance who used to give her children medical treatment to cure their cvil tempers. She acted under the advice of a good physician, and the children, as well as their mother, learned to observe the moral effects of an emetic! It seems quite reasonable. In such a case, as in all others, vention is better than cure." A simple, wholesome diet, free from rich and spicy and greasy combinations, plenty of quiet sleep and exercise in pure air, and a clean skin-these are the preventive measures, if we would escape peevishness and quarrelsome tempers in children. Even with the greatest care for their physical condition, we need not expect perfect dispositions, for the little ereatures will inherit more or less of "the old Adam."

When young children ery much, the trouble is apt to be in the stomach. If we have reason to suspect that some undigested matter there causes the irritability, a warm-water emetic (sickishly warm) will sometimes bring speedy relief. Pieces of unripe fruit will sometimes be thrown up, and so cease to torment the little sufferer. I have seldom resorted to this; but a cool, wet compress, bound over the stomach and bowels, will often cause a marked change for the better in the temper of a child. When I find my child incapable of heing pacified by playthings or fun, I sometimes think to ask, "Don't you want a compress on?" and often the suggestion is welcomed by the little one. Then I am glad enough that I did not punish for naughtiness, instead of trying to cure siekness. Sometimes hunger or cold makes a child pecvish when we little suspect it.

OATMEAL GRUEL.-This is a favorite dish with

us, and with many of our friends. I was glad to see that William Eullen Bryant knows its virtues, and mentions it in his letter describing his method of living at such a good old age. He uses it as a breakfast oksh. We more frequently take it for our supper.

Oatmeal is very nutritious. It has an odd taste, that is not always agreeable just at first, but it is generally much relished after a little trial. Some like the gruel thinner than others do. We use about two level table-spoonfuls to a quartol water. Make a batter of the meal and a little water, and stir it into boiling water. Let it boil gently from fifteen to thirty miuntes, stirring it most of the time. Of course most people will salt the water. I do myself, though not sure that it is necessary or best. Cream is all the seasoning we care for after it comes to the table, though some use sugar also. Stirred thicker, it makes an excellent pudding.

Knee-Breeches.—Mrs. B——, Holley, N. Y. The little "knee-breeches" are to be made, as you suppose, in two separate pieces, and fastened each to a button, or through a button-hole in the skirt, one on each side of the child's body. Make them a little longer than the pattern given in the Agriculturist shows. You will find no difficulty in arranging the diaper under it—bringing the corners through under the straps of the little breeches. In spring or fall weather I-sometimes put these on over the cotton drawers of my two-year-old baby.

#### Hints on Making Pickles.

BY ESTELLE EDGERTON.

Care should be taken to procure unadulterated vinegar. It is very unsatisfactory to make pickles unless you are sure your vinegar is perfectly pure. It is better to go some distance from home to proeure reliable vinegar than to use that which is not warranted free from foreign acid. The quantity of salt water used in scalding the vegetables will indieate the quantity of vinegar required. About a pound and a half of salt to a gallon of water is the usual allowance for this operation. All vegetables, excepting onions, make better pickles, if young and tender. I know a lady who pickled a peck of yellow butter-beans, full-grown, and bought at the grocery at a fancy price. They were highly and expensively spiced, but when brought to table were so tough and stringy that it was found impossible to eat them. Beans are not fit to pickle after the seed bas commenced to absorb the juices of the pod. The smaller and greener bean-pods are, the nieer the pickle. When the conditions are right, they make as delicious a pickle as can be made.

Very early and green melons make a fine pickle. If they will not snap off, rind and all, without effort, they are unfit for use.

Most bousekeepers differ in their methods of making pickles; but if good vinegar is used, the spices the same, and the vegetables tender, the results will be very nearly the same. It is only a question of time. What I mean is this: In the long run it does not matter so much what the salting process has been, whether they have been in salt three days, twenty-four hours, or only a few minutes. Very excellent pickles can be made without putting the vegetable in salt at all, but it will take a longer time for the vinegar to penetrate it. The object of putting vegetables designed for present vinegar-pickling in salt and water is to extract or reduce the natural juices of the fruit in order to make room for the vinegar to enter readily. A very little alum dissolved in the vinegar restores the erispness lost through the action of the salt. All young tender and green vegetables are adapted to acid pickling, to which sugar would be inappropriate; but ripe vegetables, which have lost their snap, such as yellow eucumbers, are better when the acid used receives a due proportion of sugar. Pickled fruits are better when the sugar predominates over the acid of the vinegar. Cloves, ciunamou, and eassia-buds are, in my opinion, only adapted to those pickles in which sugar is used. Mace, mustard-seed, eapsieums or red peppers, green peppers, garlic, black peppercorns, ginger-root, and bay-leaves are best adapted to a purely acid pickle. INDIA PICKLE.—After peeling and slieing a root of horseradish, chop it fine, also a half-dozen medium-sized onions, three or four green peppers, removing the seeds, and a cabbage. Pour over the whole, after mixing, a weak brine, and allow it to stand over night. Spice some vinegar with all-spice and mace, adding cloves and cinnamon, if you like. Heat the vinegar and spice to boiling, with a small quantity of alum, and turn it over the pickle. It will be fit to eat in three weeks.

Young Beans.—Gather them when quite small and tender. Pour over them a brine made in the proportion of an ounce of salt to a quart of water. It should be scalded. Let them stand over night. Drain off the brine, and pour over hot spiced vinegar with a trifle of alum.

NASTURTIUMS.—Let them stand in salt and water a few days, when they should be well drained and scalding-hot vinegar poured over them. No spice. Put into a narrow-mouthed bottle and cork well.

PEPPERS, GREEN.—Take out the seeds. Soak them for a few days in salt and water. Then pour over them hot vinegar. They are good when opened earefully on the side, stuffed with cabbage, and then put into vinegar.

Mangoes are made of young and tender melons gathered late in the season. Cut out a small slice and remove the seedy portion. Stuff with small cucumhers, radish-pods, nasturtiums, young onious, and cauliflower, or any thing you like, using mustard-seed as a spice, about a teaspoouful put inside of each melon; replace the piece and tie it on. The melous and stuffing ingredients should be soaked in brine for two days before fixing them for the vinegar. Pour the vinegar over them scalding hot, with a piece of alum as large as a hickory nut to a gallon.

Peaches, sealded in salt and water, thoroughly wiped, and hot spiced vinegar poured over them, make a good pickle.

PURPLE OR RED CABBAGE.—Take off all the tough outside leaves, slice them thinly and evenly, put them in layers, and sprinkle salt freely over each layer, and let them remain twenty-four hours. Drain the cabbage well. Boil up some vinegar and add alum, and spice to your taste, and pour hot over it. Repeat this process for three or four days.

GHERKINS.—Scald in salt and water. Drain and pour hot spieed vinegar over them.

CUCUMBERS.—There are many different methods for putting up this fine pickle; almost all are good. From two to four inches long, and as thick as the finger, is the best size. The quicker grown, the better. One way is to give them a good scald-up in brine, wipe, and pour over spiced hot vinegar. Another is to soak them in het salt and water twenty-four hours, and then pickle them. may put them in salt and water as you pick them, and finish them when they are all collected from the vines. Sealding several times will make them green and brittle. Peppers and onions improve the flavor. Horseradish and green grapes are excellent, added to eucumbers, and, in fact, improve pickles generally.

ARTICHOKES, JERUSALEM.—Soak in salt and water for a few days, or until the skin ean be removed. Rub off the skin, and pour boiling spiced vinegar over them. Let them stand in the vinegar four or five days, seald up again, and repeat this until the artichokes are thoroughly pickled.

Onions.—The best time to pickle onions is in October. Small button onions are the best. Cut off the end smoothly with a sharp kuife. Pour a strong, hot lye over them. Let them stand until the skin is loose. Pour off the lye, and wash them in clear water before putting in the hands. The skin may now be readily removed. When skinned pour over them a good brine, and let them stand a week, or until they are transparent. Drain and pour boiling vinegar over them. They need very little, if any spice. If not convenient to use lye, the roots and tops may be cut off smoothly, and the salt and water put over them before the skin is taken off. In that case they will not affect the eyes in the usual unpleasant manner.

CAULIFLOWERS should be parboiled, cut into small pieces, and allowed to stand in a brine a few days. They may then be drained, and spiced vinegar poured over. They may be colored with beetroot vinegar, or, if added to the red cabbage, they will turn of the same color as the cabbage.

PEACH MANGOES.—Cut off a slice from the stalkend large enough to allow the stone to be removed. They may then be filled with a few eschalots, a little horseradish, or chillies, adding spice. Replace the piece, and pour over sealding-hot vinegar.

Salad Dressing .- "B. L. J.," Burlington. N. J., sends what he considers an improvement on the Salad Dressing given in July: "First are the necessary tools. There is now made and sold at most furnishing and country stores, a wire muddler (egg-beater), which is worked by a spring iu the handle, and which makes what was formerly a task in mixing salad dressing, a mere pastime. With this take a large-sized tumbler, or a bowl, and put in the yolk of a fresh raw egg. Drop on it ten drops of vinegar; then pour in a steady stream of pure oil, about one eighth of an inch in diameter (keeping the muddler rapidly going by pressing the handle down, and allowing it to spring back), until a gill of oil is added to the egg. It will rapidly thicken, until the whole mass adheres to the muddler, and can be lifted by it from the glass. Now, in a cup, mix two mustard-spoonfuls of mustard, one full salt-spoon of salt, half that quantity (or less, according to taste) of cayenne paper (cayenne being more wholesome than black), and one teaspoonful of pure cider-vinegar. Mix well, and then add gradually to the oil and egg, stirring rapidly and well, until it is brought again to the original consistency.

"Sandwiches are excellent when the above dressing, minus the vinegar and plus more mustard, is used to spread over the bread instead of butter. No good salad dressing can be made unless the oil is not only pure, but also kept in a cool place, and it is improved by placing the oil bottle, for a short time before making, in ice-water. I presume you have heard the saying that 'it takes four men to make a good salad—a spendthrift for oil, a miser for vinegar, a judge for salt, and a madman to stir."

#### Recipes.

Sweet-Breads.—To cook, put a piece of butter into the pan you nse; let it get rather hot Now put in the sweet-breads. Do not blanch or seald, or wash them, if you want them prime. Do not season them now. Let them cook thoroughly. When a fine brown, sprinkle salt all over them. Put no pepper—pepper is too strong for them. Put no pepper—pepper is too strong for them. Pour a very little water into the pan. Boil it up and pour on the dish. A little pork or ham or bacou fried, should be served with them. Butter improves them very much, and you may be generous in its use, when cooking for the table. For invalids, as little as possible should be used; and if butter is not allowed the patient, a trifle of bacon liquor or lard must be used instead.

Springfield, Ill., says: To avoid the necessity of using a fly-brush at the table during meals, when flies are troublesome, I pour a thin stream of molasses upon the rim of a plate, and set it on the side of the table, where the flies will get the least disturbance; and so many of them will gather on the plate, that those not thus gathered will cause little annoyance. When the plate is first set, it is well to wave the hand to drive them towards it. I call it my patent fly-brush.

Green Corn.—The following is going the rounds of the papers, and is sent us by a lady who says that she has tried it with success. We have not tried it. Dissolve 1½ ez. Tartaric Acid in ½ pint of water. Cut the corn from the cob and cook it. Add two tablespoonfuls of the acid solution to each quart of corn and can immediately. When used stir half a teaspoonful of soda in each two quarts of corn. Allow to stand 3 or 4 hours before cooking. Then cookas fresh corn. Here is a chance to experiment, but we have no great faith in it.

#### Red River Trains.

BY "CABLETON."

I am writing to you this month, my young friends, from the Red River country. You say that the Red River is in Arkansas, and empties into the Mississippi. So it does, but there is another Red River away up in the North, which runs through a wonderful valley, where you can see some things that you can not see anywhere else in the world, and which soon will not he seen even there—I mean, the Red River trains and carts.

I have seen a great many of the rivers of the world, and many fertile fields, but I do not know of another valley like this one of the North. You will see by looking on the atlas that the river runs north into Lake Winnipeg, and from thence its waters go out into Hudson's Bay.
The ground is very level. How would you like to plow
a furrow fifty miles long? You can do it here. You might start your team in the morning on its eastern border and drive west all day until sunset, and you would have to whip up the oxen well to get to the center of the valley by sunset. Then, crossing the river, you might start the next morning and drive all day, still toward the west, and you would be leg-weary and tired out long before you reached the western border. And all the while you would be turning up rich black loam, and the oxen would be trampling through luxuriant grass. This would be plowing a furrow across the valley. Now let us turn one lengthwise this field. We will travel northward from its southern border. We shall have here and there to cross a small stream, but were it not for these, we could plow a furrow straight as a line the entire length of the valley without turning the plow from the sod. would be a long furrow—fully three hundred miles in length! Think of plowing from New York to Washington; or, from Boston to Philadelphia; or, from Chicago to St. Louis; or, from Albany to Buffalo ! Fifteen miles a day is a good distance for an ox team to make. We should be 20 days then in plowing a single furrow, or six weeks in making one bout! We should have to carry our camp-kettle and stew-pan with us, and lay over two or three times to wash our clothes! We should want a telegraph constructed so that we could communicate once in a while with the folks at home. Three hundred miles! and not a stone, a hillock, or knoll to prevent us from
