Gold has been up to 115 since our last. It closed weak, however, at 11314 on the 17th of October... The awfully destructive fire at Chicago was the chief topic in business circles the latter part of the month under review. The main consideration of our merchants was, not how much they had lost by the fire, but what were the sufferings of the people of the hapless city, and how far and in what way relief could be promptly afforded to the sufferers.....

In the produce line the reports of the fire and of the amounts of produce destroyed by it, tended to stiffen prices in our market. Holders offered supplies less freely, and seemed confident of the establishment of an important advance. Buyers, however, did not respond with freedom, purchasing only as they urgently needed stock. at the higher figures. At the close se ers of Breadstuffs were generally more accommodating, and the market were generally more accommonating, and the market-seemed weak and yielding..... Of Provisions the avail-able supplies were gaining on the demand, and prices were depressed..... Wool has been moderately sought after and held with firmness.... Hay, Seeds, and Tobacco have been quiet at our revised quotations..... Hops bave been in more request and quoted dearer .... Broom Corn bas been in active demand and decidedly higher in price, under the reports of the large amounts destroyed by the Chicago fire.

Beef Cattle .- With a little increase in numbers, the market has been variable during the past five weeks, the close showing a decline of about 1c. One week ago, with unfavorable weather, the markets were extremely depressed, and prices fell off nearly 1½c. P D., but with a lighter run just now, ½c. is restored. The great fire at Chicago has had the effect to derange the trade here, as the bulk of stock coming to this market was originally sent to Chicago and there hought by parties operating on Eastern account. Texans are coming forward quite freely, and are in fair condition. The experiment of sending them direct from Texas was unsatisfactory and has been abandoned. We are now receiving droves which were kept for some time in the States.

Below we give the range of prices, average price, and figures at which large lots were sold:

Sept. 18th, ranged 7½@19½c. Large sales 10 @11½c. Av. 11½ Sept. 25th, do. 6½@12½c. do. do. 10 @11½c. do. 11 Oct. 2d, do. 7 @13 c. do. do. 10 @11½c. do. 11 Oct. 9th, do. 6 @13 c. do. do. 10 @11½c. do. 9th do. 6 @13 c. do. do. 9 @10½c. do. 9th do. 10 @11½c. do. 0. 10 % do. 4 @10½c. 
Milch Cows .- As is usually the case at this season of the year, the offerings have been larger, to meet the increased demand. Good milkers, known to be fresh. are in fair demand, but common cows sell slowly. Prices vary from \$40@\$50 each, for poor; \$60@\$70 for medium to good, with a few choice at \$80.... Calves.—As cool weather sets in, calves are sent here dressed rather than alive, as they can be shipped from longer distances and the transportation is less. Some still come alive, and sell for more money. Good to prime milk-fed are firm at 9½c. @ 1ic. \$ tb.; common to fair sell at 7½c. @ 9c.; mixed lots, half grassers and balf milk-fed to slaughterers at 51/2c. @ 7c.; and common to best grassers to feeders at \$6@ \$9 per head. Hog-dressed are worth 13c. @ 1514c. for milk-fed, and 7c. @ 10c. for grassers..... Sheep and Lambs.—The arrivals have not been so large as is usual at this season of the year. And still the trade has been slow, with low rates up to the present week, when %c. @ 1/2c. were added to the prices, leaving sheep about as they closed last month, but lambs have declined. They are gradually approaching the price of fat sheep. Canada continues to give us the greatest number lambs, while the largest run of sheep is from Ohio. Poor to medium sheep are selling at 41/4c. @ 51/4c. 19 1b.; fair to good at 51/2c. @ 6c.; and prime to best selections at Lambs range from 6c. @ 7c. P D., a few choice reaching 7½c...... Swine.—Here we have a large increase in numbers, and the market first declined, but has since rallied, closing firm. Live are worth 54c. @ 51/2c., and city dressed Western 61/2c. @71/4c., the latter price for light pigs.

How shall he Manure a Hill which is too steep to get a team up with a load, is the question with "B. W." He should get clover to grow by using a bushel of plaster, and perhaps a bushel per acre, spread on the crop early in May. If once a good crop of clover can be got, and that be plowed under, the land may be kept in fair yielding condition by renewing the clover once in four years.

## **EVERYBODY**

IS RICHER THAN

## ANYBODY!!!

As drops of rain unite to make the houndless flood, so the mites that "Everybody" contributes make the monuments of the world.

IT IS THE MASSES WHO ARE RICH—rich men are comparatively few and far between.

A Five-Cent Savings Bank accumulates money faster than a "National" bank. Cabbages pay better than cauliflowers, for "everybody" eats cabbages, and only rich people cat cauliflowers.

If you want a project to succeed, get "everybody" interested in it, and it is sure, however wild it may seem.

Webster's Spelling-Book is the most profitable book ever published, because "everybody" uses it.

Crossus himself could not pay for the sugar that "everybody" uses in his tea.

If the American Agriculturist were sold for ten dollars a year, its publishers would starve. There are not rich agricultural readers enough in the country to pay for its engravings alone. It is only when the publishers adopt the great principle that

"EVERYBODY IS RICHER THAN ANYBODY,"

and the price is cut right down to the capacity of "everybody," that it succeeds.

"EVERYBODY" TAKES IT AT \$1.50, and so the publishers are able to spend the really princely sum it costs to keep the staff of writers and engravers—and to keep them for the exclusive use of its own readers.

When we say "everybody," we mean the great industrial class to whom "everybody" belongs—the great mass of the people.

The circulation is incomparably greater than that of any other similar paper in the world, and some of its readers, at least, think it gives ten times as much genuine information for the money as any other paper does. At the same time,

ITS PUBLISHERS ARE NOT SATISFIED.

THEY WANT TO MAKE IT TWICE AS GOOD.

To this end it only needs still more subscribers. It "everybody" who now takes the paper would urge it upon "everybody" they know who ought to subscribe for it, it would soon double its subscription list, and then the American Agriculturist would be incomparably better and cheaper than even it now is. Present subscribers would get much more for their money, and

EVERYBODY WOULD BE MUCH BETTER OFF.

Remember that

## EVERYBODY

is made up of

## ANYBODIES,

and that it is for the self-interest of "anyhody" who may see this article to set at once at work to help the publishers to carry out their plans.

## Noteworthy Facts.

1st.—The circulation of American Agriculturist and Hearth and Home is greater than the combined circulation of half of ALL other similar journals published between the Atlantic and Pacific Oceans.

2d.—The Publishers have to provide but one set of business offices, clerks, printing-rooms, mailing-rooms, etc., instead of fifteen or twenty, and only two corps of editors, information gatherers, etc. Therefore,

**A.**—They can expend much more in gathering reliable information, valuable engravings, etc., and give vastly more for the same money. "A word to the wise," etc.

**B.**—Their advertising space is far more valuable, and from this revenue they can give the most valuable premiums to those sending clubs of subscribers.

## A Special Request.

The reader is requested to carefully look through pages 433, 434, 435, 436, in this paper. We can not afford space to repeat all the contents of those pages again. We believe the offers made on those pages are really worthy of general attention. Great pains have been taken to get together a large assortment of the best articles, those that are useful as well as pleasing, and no better opportunity can ever be offered to our readers to seenre for themselves one or more of these valuable articles. Please read through the descriptions and see what they are. Every word that is said about them can be confidently believed. Over Thirteen Thousand persons have made up clabs of subscribers, and in return have received one or more of the preminm articles free. The great smount of valuable information and interesting reading-matter given during a year in the American Agriculturist and Hearth and Home, at the low subscription rates-rates so low as to little more than cover the cost of the printing paper-can but be useful to every reader. It only needs a little showing of the papers, and a little explanation of their character, value, and cheapness, to induce most persons to take them for a year. A very trifling economy in some direction will furnish the few cents per week needed to pay for both joarnals. The premiams given will pay any person well for the little time and troubte required to show and explain the papers. There are persons enough in the vicinity of every Post-office to make up one or more premium clubs; and, except at places where nearly every one now takes both papers, every one of our present readers may easily collect a premium club, large or small, and obtain a fine article without expense. We therefore again ask every reader to tarn to pages 433-436, see what is offered, and put forth a little effort to secure a premium. Now is just the time to do it. All new subscribers, now coming in, for 1872, are at once entered upon our books and receive the remaining numbers of the American Agriculturist for this year without extra expense.

TAKE NOTICE that American Agriculturist (monthly) and Hearth and Home (weekly) are two entirely different journals, in reading matter, engravings, etc., as much so as if published a thousand miles apart. The fact that they are issued from the same office merely adds to the value of each, by affording extra facilities and a saving of expense, so that each can bave a greater amount expended upon the paper itself. The reader, of course, knows what the Américan Agriculturist is. Hearth and Home is a very large 20-page weekly, full of useful information and inferesting reading for every Hearth aud Home. It gives an immense amount of splendid Engravings of a high character, and it supplies to the reader the News of the world for each week, brought up to the hour of going to press. This is given in a clear style, and in so carefully prepared and condensed a manner as to meet the wants of basy men and women who desire to keep up with the world, to be intelligent, but who have not time to wade through acres of printed matter. Both journals will be found useful in every household. Hearth and Home is the cheapest journal in the world, considering its character, engravings, and careful preparation. It costs but \$3 a year, though fully equal to others published at \$4 and \$5 a year; still further, it is supplied in connection with the American Agriculturist for \$4 a year (for the two).

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Cheeks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Ordera can not be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Lettera thus sent to us are at our risk.

Life Insurance—"Mutual Benefit? Companies.—In reply to many inquiries, we answer that we can not commend the plan of these companies to general adoption. For example, it is proposed that 1,000 persons between the ages of 51 and 60 unite, and first pay in \$18 each (\$18,000), and \$9 a year for annual dues (\$0,000), which \$27,000, and the annual \$9,000 besides, goes for offices and other expenses. Then, on the

death of any one of the number, all the rest pay \$5 each. If only 13 die each year, the assessments upon the survivors will be \$65 each, in thirteen separate instalments. The company has to make 13,000 separate assessments and collections during each year from 1,000 persons scattered all over the country, and each member must pay \$74 a year. But 13 deaths a year is far too low an esti-It would give an average length of life, to each, of 132 years, for it would take nearly 77 years for 1,000 persons to die, at the rate of 13 a year, and 77 added to the original 55 years equals 132 for each. work if a class of 1,000 persons all resided near together, so that the numerous assessments could be readily and quickly made. Everything considered, we believe the plan in general use, that of paying a fixed sum per annum for a given amount of insurance in a responsible company, is far preferable. We have not, in this item, discussed the personal responsibility and reliability of the parties managing these "mutual benefit" companies
—a matter of no little importance to those who fall in with the theories put forth by them.

SUNDRY HUMBUGS .- The skill and ingenuity of the swindling gentry is often surprising, and we scarcely wonder that many persons of fair intelligence are entrapped by their plausible schemes. If this talent were turned to honest account it would be very useful to the country. We have before us, recently received circulars-written, printed, and lithographed-of no less than thirty-two schemes for getting money from people without returning any adequate equivalent; several of them pocket all the money received, sending absolutely nothing in return ...... "C. O. D."-One of the common methods of seenring confidence is the offer to send articles "C. O. D." (collect on delivery), under the pretense that parties can examine them and decide upon their merits before paying for them. This is all very honest in appearance, but really a sham. In all cases, a part of the money must be paid in advance. Every one should understand that these "C. O. D." parcels can not be taken from the express offices or be examined until the accompanying bills and charges are paid. If suspicion be aroused, and a parcel be refused, or returned after examination, the operator retains the percentage of money previously paid to him. Never have anything to do with ordering or receiving C. O. D. parcels, unless for things known to be good, and ordered from well-known, reliable parties..... Watches, Jeweiry.—Hundreds of thousands of dollars are annually wasted in ordering low-priced (not cheap) watches. Oroide watches, watches eased in some wonderful new metal or metallic compound, cheap watches from auction, from failed dealers or mannfacturers, watches by tickets, by lot, by gift enterprises, etc., etc., are continually offered by advertisement and by private circulars. And the same of jewelry. The truth is, that good watches, like coin, like wheat, and like cotton cloth, are always worth and will bring a standard price, no matter how many dealers or manufacturers fail. You might just as well think of buying, at a great discount, the genuine gold dollars of a failing firm as of getting genuine, good watches or jewelry at half-When you go after plated cases, or any other muetal cases than those made of coin-silver or gold, you are sure of "paying too much for the whistle" of get-ting unreliable articles at enormous prices, as compared with their actual value or lack of any real value-no matter what the puffing circulars may assert. A poor time-piece is worse than none; it leads to errors and wrong calculations just when one most relies upon it. low-priced good watch is an impossibility. We would not take as a gift a watch of which the works-the "running gear"-did not cost at least \$10 to manufacture, aside from the case. A silver case should weigh at least 21/2 onnces of coin silver, worth \$3 to \$4 for the silver, and \$3 to \$5 more for making up plain. The pinch-beck or other low-priced cases cost nearly as much to manufacture. It is therefore always cheaper to buy the real silver. Good, reliable works (not reckoning case) cost all the way up from \$20 to \$50, or more. The above will show the nnreliable character of a dozen cheap watch circulars now before us. One is only safe when he gives them all the go-by, and deals only with reliable, well-known parties, who can be found if wanted. More than half of all the circulars offering these cheap watches are from despicable swindlers, who operate only at distant points, and pocket all money sent them. circulars indicate immense establishments; their base of operations are small attic rooms, always closed to actual callers. The pretense of wishing to send you a good watch as a sample, and to secure you as an agent, is always a trap..... "Sun-light Oil" is an unmitigated humbug, as we have often shown, and no one should invest a dime in any recipes or "family rights" to make it.....Electrical appliances for the hair, etc., are nonsensical, when not sheer humbugs. ...The "Span-1sh Policy" scheme, an unmitigated cheat, is run by a thief, who changes his name and address every few

days. His latest assumed name received is J. W. Parker, 16 South Fifth Avenue, N. Y ..... "Howard Association." - Several new readers are referred to our past denunciations of these so-called benevolent associations. run by advertising individuals. Put no confidence io a one of pretended doctors of "sexual" and private diseases, who make great and benevolent pretensions by circular and letter. Your money is what they are after, and if they get the slightest hold upon you, by a letter even, we would not give much for any money you have left when they let go their hold. Their highest skill is in writing plansible letters.....The "Marriage writing plausible letters.....The 66 Marriage Guide, 21 now advertised by the Jersey City Picture Company, is such an absurdity, that we wonder where, even among the most ignorant and simple people, there can be found foolish buyers enough to pay for printing the advertising circulars, to say nothing of postage.... Derby's Aikin Scheme .- We are glad to see that J. C. Derby announces a positive close of his Aikin S. C. Land Distribution, alias Sale, alias Lottery, for there will then be one less of these lottery enterprises, and if the lists are filled, the 616 lucky ones, drawing prizes of \$5 and upwards, will know what they get, and the 18,384 who get no prizes for their \$5 tickets will know that also ... The Louisville (Ky.) Library Lottery is carpeting Broadway, near the Astor House, with its documents. The boys carry off the pictures pretty freely. Wonder how much will remain for the library after expenses are paid? Ditto of the Omaha Scheme. Ditto of the S. C. Land and Immigration Association. Ditto the Cosmopolitan Benevolent Society of Nevada, alias School Lot-Ditto the Diamond Gift Distribution for French War Victims in Washington and New York. If anybody has \$5 to invest in these enterprises, we are sure he will find it an every way better investment to send it to the Chicago sufferers-one almost as sure to get a present return, and sure to yield a perpetual return in inward satisfaction, infinitely greater than can be reasonably hoped for from any investment in these various lotteries, dubbed Library Aids, etc ..... Medical .- A Dr. Dixon, of Ohio (not of New York City), sends his circulars to postmasters asking them to distribute them, and offering in return to doctor themselves or families or intimate friends free of charge! This reminds us of the coffin-maker who wanted an editor to advertise for him and take pay from his shop ! ..... A New York man is offering to send lots of medicines, circulars, etc., to those who simply pay expressage, and take his pay when the medicines are sold. In this way a flood of vile stuff is being pushed upon poor, suffering mortals all over the What a pity the thousands of tons of deleterious trash, alias patent and secret medicines, were not all concentrated in Chicago about October 9th! The loss of other property would have been in part compensated, and a hundred lives would have been saved elsewhere for every one lost in the fire ..... 66 Queer . "-A correspondent in Dakota writes us that that region and the whole North-west is still being flooded with the pretended counterfeit money circulars. To what has been already said by us, we need only add that every dollar sent to these swindlers has been pocketed, and no counterfeit money ever returned. The result is, the loss of much money by those who are dishonest enough to want to swindle others; and, fortunately, no counterfeits have been put into circulation to bother good people. Among the new names assumed by operators in this line we find: Alex. Stephens, 56 John st.; Jason Phelps, 688 Broadway; S. T. V. Ludlow, 189 Broadway, alias Job Spencer, 190 Broadway; Dr. J. Homan, 340 Canal st.; J. Town-send Palmer, 33 Park Row; Day & Wallace, 143 Fulton st., who are at it again, etc.

Trenching a Garden.-"E. O. A.," Monmonth Co., N. J., wants to know how to trench a garden, and how deep it should be dng. Trenching is an expensive process, and should be thoroughly done if at all. Two feet is the least depth advisable. Remove the surface soil of a space a yard wide and two yards long, lay this on one side; then dig out one yard square of the subsoil to the proper depth, and lay that also on one In its place put the square yard of subsoil maining, breaking it up finely. Then dig up another square yard of surface soil and place it on top of the subsoil last removed. Thus one square yard is finished. Then continue in this manner with this strip, and when it is finished work backwards on another to the place where the commencement was made. Thus work back-ward and forward until the garden has been gone over, and the earth first removed must be used to replace the last piece dug ont. Manure should be mixed with the soil and subsoil as the work proceeds.

"Love Powders" very Danger-ous.-Ia our Humbug column we have often cantioned our readers against the advertisers of various "lovepowders," lotions, medicines for private diseases, etc., and characterized them as dangerous. Here is one actual illustration among thousands we could give: A young man (whose residence shall be nameless, for the sake of his friends) desired to scenre the affections of a worthy young lady, and to help him he sent \$1 to Reeves & Co. (shown up in these columns some time since), and procured a so-called love-powder, warranted to secure the love of the person to whom it was given. He put part of it into some figs, and handed them to the young lady. For some reason she suspected him, and so informed him. He at once ate the figs in her presence, to show his innocence. The result was, the powder removed the skin from his month, laid him up under the doctor's care for two months, nearly costing his life. An examination of the remsinder of the powder showed it to be mainly Cantharides (blistering fly). The young man was obliged to confess, and the thing getting out, he now, in addition to being severely injured, has to bear in the community the sobrigust of "Shop-Fly." There are multitudes of cases of suffering from such like medicines and powders, where the friends of the victim are ignorant of the cause.

A New Work on Architecture.—
Atwood's Country and Surburban Houses. By Daniel T.
Atwood, Architect. Illustrated. Orange Judd & Co.
Most of the works upon architecture are too expensive,
not only in the books themselves, but in the plans which
they present, for persons of moderate means. In the
present volume the author aims to give designs for
houses which will meet the wants of a large share of
country and suburban dwellers. Besides giving plans he
discusses the general principles of building, and matters
which demand attention before commencing to build.
Price, by mail, \$1.50.

The Value of Wood-Ashes for Wheat.—A "Subscriber" send us the following as his experience in using wood-ashes, viz., that in quantities of only eight bushels per acre they have a marked effect; that they push the wheat forward several days, thus getting it ahead of that critical period when it is so apt to be attacked hy rnst; that they strengthen the stem and increase its solidity. All of which, and much more, we can readily indorse. In fact, ashes are an excellent application for all crops, and especially for an orchard.

Advice to Seedsmen.—A correspondent in Danville, Ky., asks us to publish the following: "Persons having Lucern seed for sale will please advertise in the Agriculturist."—We comply with our friend's request, for the purpose of saying that all first-class seedsmen keep all kinds of seeds. If a dealer in a large city, like New York, Philadelphia, St. Lonis, etc., receives an order for a seed that he has not in stock, he will send about among other seedsmen and flud it. If he will not do this, he is no sort of a seedsman and had better go into some other business. A seedsman can not catalogue his whole stock in an advertisement. Send to several for catalogues, and you will no doubt find Lucern and every other desirable seed.

Preserving Eggs in Winter.—"E. A. B.," Herkimer Co., N. Y., asks how to preserve eggs for winter use. We have kept eggs perfectly good from Octoher to March in the following manner: A piece of lime, as large as a quart-dipper, is put into five gallons of water, and salt added until an egg will float. This is strained and put into a clean keg, into which a loose head is made to fit easily; a knob is fitted to the head for a handle. The eggs are put, as they are gathered, into the liquid, and the loose head placed on them to keep them below the surface. The keg should be kept in a cool place in the cellar. The liquor will not freeze except at a tower tempersture than freezing point. Eggs thus preserved will sell readily as "limed eggs" until fresh eggs come, and are almost as good as fresh ones.

Young Farmer, a youth of 17, at Mt. Vernon, Ind., complains that we do not give sufficiently specific directions for performing the various farm operations, and especially that we do not tell him what plows and other implements to use. When "Young Farmer" gets older, he will learn that each section of the country has its favorite farm implements, and were he to visit his neighbors and the county fairs he would see an abundance of excellent varieties. Our advice is to use those farming utensils made nearest home, provided they will accomplish the purpose. We can not publish a full treatise upon agriculture in every issue of the Agriculturist: We are obliged to assume that certain fundamental principles are understood by our readers. "Young Farmer's" letter is a very neatly put and sensible one, and the best we can say to him is that when he puts us a

question upon any particular point, we will try to answer it to the best of our ability: We like such young farmers.

Surfeit.—"J. II. S.," Union City, Pa., has a horse that has the surfeit; he asks what can be done for bim. The animal is out of condition or has been allowed to become heated and suddenly cooled. Give bran mashes and keep the bowels loose. Feed moist feed with crushed oats and a little liuseed meal, but no corn. Keep the stable well ventilated and administer some tonic medicine.

Peat or Turf as Manure.—A. Spreeher, Black Hawk, Wis., asks whether he can use turf or peat as manure, without preparation, and what would be the best crop to raise the first year after it applied. Peat, when dried, is very indestructible, and in this state is a poor manure. If piled when dug it will on exposure to the frost become fine and fit for application to grass land, for which it is best fitted. For any other crop it is not of much value without some preparation. Lime (four bushels to the cord of peat) is the best material to reduce it to a state fit for use.

Seed Wheat.—"J. B. M.," Hamilton Co., Ohio, asks which is the best seed wheat, and if we could send him a sample and prices; also, if we could supply him with some. For our own use we would choose the Diehl or the Treadwell. The first is a white wheat, the latter an amber wheat. Both yield well and are favorite wheats among millers. The Diehlis perhaps the hardiest. Any seed dealer whose advertisements appear in onr columns, would supply these or other wheats at market prices. We do not deal in seeds, nor do we know the price of these wheats. Something above the price of ordinary wheat is charged by the seedsmen for seed, but this depends on the scarcity of the seed and its purity.

Weeds Plowed under.—A Subscriber, Ora Oak, Wis., asks if a crop of weeds plowed under benefits the soil. We do not think any benefit is derived from permitting weeds to grow and then plowing them down. If weeds have grown unavoidably, of course we would plow them in, but would rather make a clean fallow. Great mischief is often done by permitting weeds to grow, in the hope of getting some benefit from them as manure. Seeds will mature and propagate at a very early stage of the plant, and when it is supposed to be in blossom they are often ready to seed the ground for many future crops.

Wheat and Clover.—R. Garcia, Powhatan C. H., asks how to make forty acres of poor land grow good wheat and clover. If we could answer this satisfactorily, we should have no anxiety as to the source of our bread and butter for all time to come. In fact, we should possess something equal to the philosopher's stone. This must be a work of time and some expense. Probably a dressing of lime to commence with, and grass gradually brought in, would be a proper course. 'Ample information on this subject can be gathered from the back numbers of the American Agriculturist.

How to Kill Sassafras Bushes.—
R. Garcia. Sheep will soon destroy them by browsing the leaves and twigs, or they may be plowed up and gathered and burnt, but many years will be required to effect their entire removal. This must be followed up by clean culture every year after the first plowing, and cutting the spronts persistently.....C. Hoffman. We do not know of any way of killing sprouts by "chemicals," that is practicable. Catting while in full vigor is the only available method.

Wire Fences.—S. F. Brayman, Kane Co., Ill., says a wire fence, really serviceable, is more expensive than a board fence, with lumber at \$20 per thousand. He builds a fence with seven wires at equal distances apart, posts of white oak or cedar, six feet apart, and set alternately on either side of the wires, when fastened with staples. Staples, however, are objectionable, and he recommends the posts to be bored with a balf-inch bit and the wires passed through them. This prevents cattle or horses from breaking the staples when pressing against the wires. The extra cost of this feece be thinks Is repald in its impenetrability by nurnly cattle, who will readily break through an ordinary wire fence.

Ashes—the best time to apply them.

H. M. Wilson, Portage Co., Ohio.—The best time is, as soon as they can be procured; they can be spread at once from the wagon in which they are hauled as easily as at any time, and one time is as good to apply them as another.

Lice our Poultry. - "Tormented," Metuchin, N. J., is played with hen-lice. They are in his chicken house, in his horse stable, and in his dwelling

house. He bought a book, entitled "What I Know by a well-known author, and then about Farming," bought a farm to carry out the ideas therein set forth. But an undesirable stock has taken possession of his premises, and his author knowing nothing about them, he seeks further light .- Remove the horse, wash him thoroughly with carbolic coapsuds daily, or twice a day, until he is free from them, or they will eventually kill Tear out of the stable and the chicken-house all the fixtures, and give it and them a coat of hot whitewash, with an onnce of carbolic acid dissolved in a pailful of it. Anoint the fowls beneath the wings with a mixture of lard and kerosene oil-two parls lard to one of The lice will not live on the human person, but if among the clothes they may be got rid of hy washing with soap and hot water. If they are destroyed ont of doors they will disappear from the house. Burn the nestboxes, and make new ones, and paint them with crude petroleum. Also study the back numbers of this paper.

Glanders.—A "Subscriber" asks if glanders causes a running at one nostril only, or if both are affected. In its first stages it is almost impossible to distinguish glanders from nasal gleet. Glanders is shown by the nature of the discharge, which is gluey and sticky, and often adheres to the nostril, and is also glossy in appearance. The lining of the nostril is also ulcerated, and there is a peculiar expression of the nose, caused by the raising of the nostrils, which we have never seen in any other disease. In gleet the nostrils are of a dull, leaden color, without any spots, and the discharge runs or parts freely and is not adherent.

Curry-Combs and Cards.—G. Pauls, St. Lonis Co., Mo., uses a curry-comb which he says is a great improvement on the old-fashioned square ones. It is rounded on the corners, and is more convenient to use on this account. He wants a good card to scratch stock. In this item of cards an improvement is much needed. The old-fashioned one is of the weakest description, and soon becomes clogged with hair, dust, and dirt. What is wanted is a metal frame shaped like a gridiron, on the hars of which the teeth are fixed. This will give room for the dirt to pass through, and it can be easily cleared from all such matter. Then, with good steel-wire teeth, and a card will do good service.

Pears Cracking.—"J. G.," Redding, Ct. We can not tell you why your pears crack, and we should like to see some one who could.

The Peerless Potato.—Harry Cropsey, having seen a statement in the N. Y. Evening Post that the Peerless was a failure, writes that he planted half a bushel on April 24th, and on August 19th dug nine and a half bushels of the finest potatoes he ever saw.

Horses Slobbering or Running at the Month.-J. C. Adams, Kalamszoo, Mich., wants to know why his horses are thus affected after pasturing on young clover. "Is it the clover, or, if not, what is "-We can not tell; it has been a subject of investigation with the writer for some time, but it has not yet been traced to a satisfactory source. It has been said to be caused by St. John's wort in the pasture; but our fields, or at least the one specially concerned, was quite free from this weed. Others attribute it to the webs of spiders, thickly woven over the fields, which are taken up with the clover into the horses' mouths. Can it be any acrid principle in the young clover which affects the salivary glands? We suggest the following experiment: Feed the grass cut from the field which produces this effect, in the stable, carefully examining it, and observing that it be free from any weeds, and also from spiders' webbs. If the effect still continues, it may be attributed with certainty to the clover. The slobbering may be stopped by feeding a quart of bran at a meal.

Lime for Fruit-Trees and for Land.—J. A. Stont, Adams Co., Ohio, asks how he should apply lime to his soil, which is a light "poplar and sngar-tree" land, produces well, but does not last. Also if lime is good for young fruit-trees.—Lime must be used cantionsly and with judgment, as it is, exhaustive if not backed up with a good deal of vegetable matter. It should never be mixed in a compost heap when stable manner is the main ingredients. When sods, weeds, ditch-bottoms, swamp-muck, leaves, etc., are used, then lime may he mixed in. It will hasten the decomposition. In general, when barn-yard manner is used, that should be first plowed in; after that the lime should he spread, according to the amount of inert vegetable matter in the soil, at the rate of from 10 to 50 hushels per acre. Then harrow in the seed with the lime. Land in which lime stone exists is improved by lime equally with that free from it; because limestone is practically without effect on vegetation. Lime is very beneficial to young trees,

but, as with other crops, frult-trees will not grow on lime and ashes alone.

Grass in Wheat.—E. S. Mudgett, Belknap Co., N. H. The plant sent is Chess, or Cheat.

Braft of a Roller.—"L. D. I.," Beaufort, Mo., wants to know whether the tongae of a roller should be opposite to its center, level with the axis, or framed above the roller, to secure the lightest draft. It will make no difference, theoretically; the draft in both cases must be from the axis of the roller, and therefore the least cumbrous and simplest mode of connecting the tongue will be direct from the iron rod which passes through the center. Every inch, however, that the frame is raised above this point will raise the line of draft from a perpendicular to the plane of the horses' shoulders, and so a proportionate amount of the horses' labor will be expended uselessly.

Fall Wheat for Name.—A "Subscriber," Manhattan, Kansas, sends us a sample of wheat yielding thirty-five bushels per acre; weight per bushel, sixty-five pounds. It is a very fine white wheat and looks like White Mediterranean, but we have found so much dissimilarity between Eastern wheats and those grown west of the Mississippi, that it is difficult to name it with certainty.

Brick-Clay.—An "Old Subscriber," Fall River, Mass., has some awamp land underlaid with a bed of blue clay. How can he try experiments in brick-making without burning an entire kiln? First ascertain if the deposit is sufficiently extensive to be available for brick-making, and induce a brick-maker to examine it. He will say at once if the clay is suitable.

What is the Matter with the Sheep ?-" J. R. R.," Clarksville, Tenn., has lost some sheep in the following manner, viz., they leave the flock and refrain from feeding. Before they die they swell up, and a frothy foam escapes from their nose. These are similar symptoms to what we have seen follow poisoning with laurel (Kalmia angustifolia). If this plant is found on J. R. R.'s farm, we think this is the cause of the trouble, and it should be thoroughly eradicated, as sheep will occasionally feed on it if it is within their reach. If not past remedy when discovered, sweetened milk given freely will lead to a recovery. These are also symptoms of rot, but this disease is not very frequent in this country, except in very wet pastures. If on parting the wool the skin is seen to be of a yellow color on the brisket, and the eye has lost its bright color and appears pale and muddy at the corners where it ought to be bright red then the disease may be the rot. The animal should be destroyed, lest it communicate the complaint to the flock.

Ventilation of Ice-Houses.—I. M. Grabam, Pinewood, Tenn., sends a sketch of his ice-house, which does not keep ice very well. The air is warmer in the house in August than outside. Should there be ventilation? If so, where and how much? The principle involved in this question is, that where there is evaporation occurs is reduced. Also, there can be no continued evaporation unless the air is in motion. Therefore, when a current of air is admitted into the upper part of an ice-house, the moisture is carried off, renewed evaporation occurs, and the temperature is lowered. So that rain and sunshine are excluded and the covering is abundant, the ventilation may be as free as possible, but only at the top. See illustration of ice-house in this number.

The Prairie Farmer.—In the great calamity which befell Chicago, the daily papers were all suspended. We are glad to learn from Mr. Thomas, one of the proprietors, that it fared better with the Prairie Farmer. They were able to save their subscription books, files, and much other valuable material, and the regularity of their issues was not interrupted. Of course the destruction of their building is a great inconvenience to the proprietors and all concerned, but they, with true Western energy, will soon be at work again as if nothing had happened.

**Drain-tile Machine.**—"D. H.," Page Co., Va., wants a good drain-tile machine. There are several of these machines manufactured, and it would seem to be to the interest of the manufacturers to advertise them.

How to Get the Seed ont of Clover.—"R. G." There are machines called clover-hullers, for this purpose; but nearly all of the seed may be got out by placing a board in front of the common thrashing machine and leaving only a small place for

the clover to come out, when the space around the cylinder will become choked, and a rabbing motion will occur which will loosen the seed and separate it from the pods. It may then be cleaned in the fan-mill. Or the chaff may be sown after it is thrashed from the stalks with the common fiail. This will answer equally well as sowing cleaned seed. Clover seed does not separate well, except in dry, frosty weather, or unless it has been exposed to rain in the field, and dried.

Sawdust.—B. Nelson has four horses and fifteen head of cattle. He wishes to know how he can best make use of sawdust which he can get from a sawmill a fourth of a mile off, and if it will be cheaper than sawdust is of hard wood it is better than that from pine. But in either case he had hetter use it liberally as bedding for his cattle and horses. When piled it will rot rapidly and make excellent manure. Swamp-muck may be more beneficially used as manure alone, or mixed with salt or lime, than sawdust. Try and use both.

rid of "mallows." or "pot-cheese," a weed that he finds troublesome in his garden. This weed delights in a moist, rich soil, and in such a position is difficult to eradicate by half measures. In spading the garden, all the roots should be picked out and destroyed. This is the most satisfactory method, and never fails if persevered in and if backed up by care to prevent stray plants from seeding. "One year's seeding makes nine years' weeding "should be thought of daily by every farmer and gardener, and acted upon as often.

To Restore Worn-out Lands. — A Subscriber, Greenwood, Del., has some white-oak flats covered with sedge that will not bring five bushels of cora without manure, and manure can not be had. How shall he improve them? There is certainly no hope for these flats but in green crops. If they will produce cora at all, they ought to produce some clover. We would apply ten bushels of lime per acre, or more, if means will admit of it, plow the sedge and weeds under, and sow clover seed in the spring. When the clover is started, sow a bushel of plaster per acre. Ia May or June, next year, when the clover is in blossom, plow it under, and a crop of early corn may be taken and clover seed sown when the corn is laid by. Thus, alternating clover and corn, plowing the corn-stalks under, the land ought to improve, It is up-hill work improving land without manure.

Civil Engineering.—"J. C. G.," Monmouth Co., N. J., asks if a young man with a commouschool education and considerable attainments in mathematics, can hope to attain proficiency in civil engineering without pursuing a general course of study.—A general knowledge of the cognate sciences is of very great assistance to a civil engineer; but mathematical knowledge is essential. An engineer might be able to lay out a road, with its gradients and curves, with no other knowledge than that of mathematics and the use of his instruments; but he could not test the accuracy of his work understandingly without knowing something of astronomy and physical geography. In fact, the intimate connection of the physical sciences is such, that to be proficient in one a student must be able to travel with more or less certainly over the whole ground. The University of Ann Arbor would be an excellent institution for such a course of study.

Oxeye Daisy.—A. D. Burns, Alleghany Co., Pn., has his farm infested with the oxeye daisy, and wants to exterminate it.—There are hundreds of farmers in A. D. B.'s position; in fact, this is the most common weed to be seen in the Eastern and Middle States. And yet it can be easily destroyed. If plowed under before the seeds become ripe, or if pastured with sheep, it can be got rid of. Mowing before maturity will also prevent its re-appearance. It is often introduced by purchasing timothy seed grown on land infested with it. Care should be taken to avoid this.

Lucern.—T., Prince George Co., Va., asks: What is the time for seeding, quantity of seed per acre, and the quality of land required for growing lucern; also the price of the accd.—Lucern should be sown in the spring, at the rate of 10 hs. of seed per acre, if in drills, or 15 hs. if broadcast. It should, if possible, be sown in drills fifteen inches apart. We, however, have got a good stand, in clean ground, by sowing broadcast. The land must be fine, mellow, deeply plowed, and rich. Weeds are very injurious, and crowd out the young plants, which are slow in starting. For this reason sowing in drills is to be recommended, as the cultivator can then be used. When fully established It will yield heavy crops of green fodder, and may be cut, if on rich soil, once a month. All kinds of stock will eat it engerly.

Pigs seem especially fond of it. It is a long-rooted plant, and a perennial. For plowing under it is possibly equal to red clover. The seed costs about 40 cents per pound.

Cider and Cider-Presses. — August Diedrich, Duhuque, Iowa, wants to get a cider-press. The old-fashioned wooden cider-press is in our opinion the best. Those which have iron about them convey an unpleasant flavor to the cider and darken the color. The old press, being wholly of wood, has no ill effect on the cider, and besides is of far greater capacity. The barrels to hold the cider should be perfectly clean. Brandy casks are the best, if they can be procured. Whisky or alcohol barrels come next, but should be well washed before using. No barrel in which vinegar has been kept, should be used for cider. Where a common, old-fashioned mill is not available, the Buckeye Mill is as good as any that we know of as a substitute.

Plowing under Buckwheat, or Applying Lime.—"J. H. S.," Honston, Texas Co., Mo., has a field of forty acres, worn-out land, which yielded last year two and a half hushels of wheat per acre. It is now in buckwheat, which promises to yield at least 800 bushels. He had intended to plow this under, but now wishes to know whether it would be better to save the crop and sell it at 50 cents per bushel, and buy lime at 20 cents per bushel, and apply that instead. The land is intended for red clover next spring.—We would advise the latter course. The fact that such a fair crop of buckwheat is possible to be raised shows that the land has some heart left in it yet. If the straw and chaff of the present crop can be used as litter and turned into manure, and put on the field, it will help somewhat, in addition to the lime; as it will furnish some vegetable matter to the soil. From the facts given, we judge that this field needs lime as much as anything.

Those Little Pigs again. - What sympathy we have discovered towards little pigs deprived of their maternal parent! A correspondent from "Wichita" gives us his experience. He has raised three different litters without loss, on milk from a fresh cow in one instance, from a nine-moaths milking cow in another instance, and in a third instance on cream. He gets up the first three or four nights and feeds them three or four times. They soon learned to eat, and wanted more. To sum up the matter, milk and water, milk cold or warm, milk and mush, and cream are all available sources of nutriment, to be given often and in small quantities. We would add this advice: Don't pamper the sow before littering; keep her down in flesh somewhat, and give her no rich feed for two weeks before her time; give roots or clover that will have a gentic laxative effect, and prevent heating of the blood and fever. If a sow costs a hundred dollars, she ought to be fed without pampering equally with one costing five dollars. There will then be less risk of losing her on these occasions.

Stock Running at Large.-The practice of allowing stock-cows, hogs, and sheep-to wander about the public roads is a troublesome and very wasteful one. A great portion of the value of the feed of an animal properly fed and kept in yards is returned in the shape of manure; but if stock is allowed to roam at large, all the manure dropped by them becomes the perquisite of some long-headed farmer who keeps the road-drains and gutters open on to his farm, so that he receives all the wash after every rain. A very noticeable cause of the poverty of the stock met with in districts where this custom is observed, is the promiscuous mixing up occasioned by allowing animals of both genders to run uncheeked. In such localities a farmer can not tell when he can expect a calf or a litter of pigs, and often they come at most unseasonable times and of very undesirable parentage. Thus, without order or system in this particular, and from want of care generally, the stock becomes next to worthless, and is hardly worth the feed it consumes. Besides, it is very unfair to others who keep better stock and keep them in pastures. dering stock is generally nornly, and will occasionally get into other fields than their owners' at times when their presence can do mischief which their owners can not repair. It would be better for all concerned that no stock of any kind should be allowed to run at large. In well-ordered and prosperous communities this practice is considered the reverse of proper or profitable.

Composting Muck, Ashes, and Cotton Seed.—J. M. Clair, Johnson Co., N. C., wants a work on the above subject. We do not know of any. The process of composting such simple materiala is easily performed. They need to be brought into contact in such a manner that the more active fermentation of the cotton seed ahall induce a similar action in the more inert muck, which, at the same time, shall be incorporated in each quantities as to absorb all the fertilizing gases—

as ammonia-given off either during the fermentation or by the chemical action of the potash on the decomposing cotton seed. To bring about these results, the muck should be in layers of not less than six inches, and should be moderately damp (except on the top, which should be dry, so as to absorb the moisture given off by the lower layers). The cotton seed should be in layers of two or three inches. The ashes should be mixed evenly among the muck. When a good heat has started, fresh, dry muck should be heaped on the top if any strong smell is apparent, or plaster might be spread over the heap, ben the active fermentation has ceased and the heat has disappeared, the heap should be turned over, when it will heat once more, and should receive the same cantions attention. It will then be thoroughly rotted, and is ready for use. A shovelful applied in the hill would be about right. Had we a quantity of cetten seed, we should as soon think of using it in this manner as we should of using an equal quantity of flaxseed. As an article of feed, rich in oil and mineilage, it is equal to flaxseed. For the meal, Northern farmers have to pay prices equal to flaxseed-meal, and find it profitable to do so. Unless obliged by circumstances, we should not use

Crops and Prices .- From a careful revision of all that we have seen, read, and heard, we gather that the crops throughout the United States and Cauada have been in the main satisfactory, not to say abundant. The wheat crop has suffered somewhat from the drouth early in the season, and from the chinch-bug in certain localities, and it is doubtful if the large estimates of the yield will be realized. Oats have been an abundant crop generally, and corn, although injured in some places by a dry summer, will be greatly above the average. In European countries, with the exception of France, where the crop is seriously deficient, and England, where the wheat crop is undoubtedly below the average, a good yield has been secured. We may therefore expect that the foreign demand, though It will probably be good, will not be excessive, and that present prices may be maintained for wheat and flour. As European populations can not be induced to use corn as an article of food, it would be unwise to look to them as a means for disposing of the certain abundance of this crop. But we find throughout the Western States that hogs are abundant. These will furnish a means of consuming a large proportion of the excess, and as pork is very low, a large demand will probably arise which will ease the market of the surplus. The great fire in Chicago has consumed a considerable amount of the large stock on hand there. Pork and corn, reacting in the market very much on each other, necessarily rise and fall together. Any rise in pork, then, will favorably affect corn. Throughout Southern Illiuois and Missouri, the drouth has seriously shortened the hay crop and late pasturage, and generally throughout the country hay is scarce. In the East, the deficiency is partly made np among the more thoughtful and forehanded farmers by means of other fodder crops, and though possibly others may have to get rid of a portion of their stock, yet we do not look for any necessary sacrifice of values on that account. Kansas is full of cheap cattle from Texas, and drovers are afraid of touching stock.

## Bee Notes for November. -By M. Quinby.

If, as is often the case this month, the apinrian does not feel quite satisfied that all is right with his bees for winter, he can look them over again on any cool day. He may see things that escaped his observation in warmer weather when the bees were less compact. Any weak stock should be united with some other; or, if that is not convenient, kill the hees rather than let them freeze or starve. Unfilled boxes, or such as contain so little honey as not to be worth removing for the table, may be aved for another year. Dry comb should also be saved for the same purposs. Hives containing bees may be painted now without injury to them, and new hives ought also be painted, that they may thoroughly dry before another year. Use different colors, that each bee may know its own hive at a glance.

Protect hives standing out of doors by wire clothe placed over the entrance, leaving a passage for heea only. Ventilation should be secured by hole a two or three inches square at the bottom. A good plan for accomplishing this is to have a hox, two or three inches deep, of the same size as the bottom of the hive, set under it, with a hole in one of its sides covered with wire cloth. Let it be where the wind will not drive directly through it.

Large Pay for Little Work.
For All.-See Page 433.

The Great Fire in Chicago has stirred the heart of the whole Christian world more than any single event of this century. The particulars have been so thoroughly discussed already, that we need add nothing here, except to say that, in this city at least, there has not only been sympathy in every heart, but action in every hand, from the poor, ragged newsboy on the street, who gave his few pennies, to the contributor of tens of thousands. We were pleased at the impromptu action of those employed in this office. Though many had suffering relations at Chicago, to be relieved by themselves, and almost all gave liberally to other Chicago Relief Funds, the following snms were quickly gathered in this office-viz.: From 22 printers, \$69.25; artists and engravers, \$102; from 23 employés in publishing department, \$54; from 37 employés in the press-rooms, \$61; from 18 women and girls in the folding department, \$3.25; from 25 electrotypers (Lovejoy, Sen & Co.), \$50. To this the publishers added about as much more, and seat the following telegram:

New York, October 17th, 1871. To Hon. R. B. Mason,

Mayor of Chicago, Illinois;
Six hundred and fifty dollars (\$650)—for relief of Chicago sufferers, contributed by Employes of American Agriculturist and Hearth and Home, and by the Proprietars-subject to your order, whenever needed.

ORANGE JODD & COMPANY,

245 Broadway, New York.

To which the following response came: CHICAGO, October 18th, 1871.

To Messes Oranoe Judd & Co.:

Hearen bless the generous Employès. The "Chicago Re-lief and Aid Society" will draw.

R. B. MASON, Mayor.

The Fires in Michigan and Wisconsin.—The heart sickens as we read the accounts of these extensive fires. No long recital could be more eloquent than the statement that hundreds have perished by fire, and that thousands have lost their all, and are houseless, homeless, and helpless. God comfort these sufferers, and so teach the hearts of the prosperous that they may send them much-needed aid! It was well to help Chicago. It will be better to help these poor, scattered, and needy people.

Sending Grapes and other Frnit. -We received a box of grapes and the following letter from Cornwall (no State): "I send you a small package of grapes, of a new kind, which please examine, test, and name. Be kind enough to state in the next Agriculturist your opinion of same, and oblige an 'Old Sub-scriber.' "—We give this as a specimen of the many in-definite things which come to us. If "Old Subscriber" had given us his name, we should have written to ask in what way his grapes were "new." They seem to us, and to other very good indges of grapes, very much like one of Rogers's hybrids, and probably No. 4, or Wilder. It is, in our "opinion," a very fair grape, and it is our "opinion" that no one should write to an editor apon any subject whatever without giving his full name and address.

Ayrshire Herd-Book .- The American and Canadian Ayrshire Herd-Book is the title of a volume just received. It contains the third volume of the Ayrshire Herd-Book, edited by J. N. Bagg, Esq., West Springfield, Mass., which indeed makes up the bulk of the volume, but this is prefixed by two previous records, and as a whole possesses the greatest value to the breeder of Ayrshires. The work contains the pedigrees of 530 bulls and 1,132 cows, belonging to the herds of the most noted breeders of Ayrshires in the United States and Canada. The names and addresses of 333 Ayrshire breeders are given; twenty-seven of these live in the British Provinces, and the others are scattered through twenty-one of the States of the Union. The book is embellished by photographs and engravings of noted

Plants Named .- O. H. Leavitt, No. Turner, Mc. Corydalis glauca, or Pale Corydalis, a band-some plant in cultivation; has yellow and red flowers, and is quite common upon rocky hillsides . . . . "J. A. M.," Eastmanville, Mich. Adlumia sirrhosa, Alleghany Vioe, or Climbing Famitery; cultivated as an ornamental vine; it is figured and described in March Agriculturist, 1865. .....J. E. Darby, Dexter, Iowa. No. 1 is Setaria viridis, sometimes called Green Foxtail, or Bottle Grass; No. 2 is Setaria glauca, or Foxtail. Both species are annual grasses, and can be destroyed by mowing often enough to prevent their seeding, and sowing good varietics. Neither are valuable for hay....." J. B.," Dalton Station, Ill. Erigeron Canadense, or Canada Flea-hane, or Horse-weed; a very common weed throughout the United States, and varying in hight from 5 inches to 5 feet....
"J. B.," Venango Co., Pa. Gypsophila paniculata; its

delicate white flowers are valuable for dressing bouquets. .. L. Woodworth, Niagara Co., N. Y. No. 1, Chrysopsis Mariana, or Golden Aster. No. 2, a species of Aster, which can not be determined from the small and incomplete specimen sent...... "Mrs. S. J. II.," Elyria, Ohio, No. 3, Centradenia rosea, a low, bushy plant from Mexico, bearing very numerous white and rose-tinged flowers; not very common, but sometimes found in choice conservatories. No. 4, Alstræmeria psittacina; belongs to the Amaryllis family, and is a native of South America; a very pretty and free-blooming greenhouse plant. No. 6, a species of Croton. No. 7. Epiphyllum; belongs to the Cactas family. The other specimens are too poor to name. Those who wish plants named should prepare complete specimens, consisting of the flowers, fruit, or seed, and a portion of the stem with the leaves on..... "Old Subscriber," La Porte, Iud. Staphylea trifolia, the Bladdernnt. An interesting shrub or small tree.....Mrs. D. D., Clarence, Mo. The White Dny-Lily, Funkia subcordata......J. A. Liueback, Salem, N. C. No. 1, Variegated Funkia. No. 2, Aucuba Japonica, a charming climber. ... Ella Corbett, Perry, Ga. A Coral-root (Corallorhiza) of some kind, but too much crushed and decayed to make out the species. Plants should be dried before

Having Things Handy .-- The writer lately had occasion to hire a passage in Southern Illinois on a light road-wagon, and the horse, being fractions, broke one of the shafts. The driver had nothing to re-pair the damage with, and was "stnck." Fortunately there was close by a neat-looking farm-house, which seemed so well appointed in every respect, having gates well hung, etc., that we were led to go there for assistance. The farmer kindly came to our help with brace and bit, a couple of small carriage-bolts, and a piece of wire. The broken shaft was repaired in a few minutes, and we were under way again, thankfully remembering that farmer who had "things so handy." During the few minutes we were in his company, we discovered that he was one of a club that subscribed to the Agriculturist. He will therefore see that his kindness is not forgotten.

Native Grapes .- "C. Horst," Washington Co., Wis., wishes to improve a let of wild grapes, and neks how to do it. Also, he is nnable to distinguish the various cultivated grapes, and asks us to give descriptions of them. The best way to "improve wild grapes" dig them up and put out others. Any other mode will be would take the whole paper. Buy Fuller's or Husmann's book, or send to Isidore Bush & Son, Bushburgh, Mo., for their illustrated catalogue.

Thorough-bred Negretti Sheep. We have just seen ten of these animals-four rams and six to be Merino. They are very fine in wool, which covers their whole body, limbs, and faces, excepting a very small portion of the tip of the nose. They are in the hands of Godeffrny, Brancker & Co., 5 South street, who have their full pedigrees.

Traveler's Guide to New York City. New York: J. S. Redfield, Price 25 cents. This is a well-prepared little work, which points out the principal objects of interest and tells how to reach them. It gives to strangers, visiting the city for the first time, advice which, if fellowed, would prevent much swindling by sharpers. A good map accompanies the work.

The Chicago Papers .- The agricultural papers published in Chicago are the Prairie Farmer, the Western Rural, and one upon an agricultural specialty, the National Live-Stock Journal. In another item we have alluded to the energy which the Prairie Farmer displayed in keeping up its issues. Its half-sheet has just come to hand, dated October 14th. It gives a full account of the fire, and the first map of the burnt district that was published. Among its acknowledgments of aid and sympathy we find the following:

"Offers of aid in a trying time like this always strike npnn the hearts of the recipients with peculiar impres-The Prairie Farmer Company acknowle many of them in various ways, but it must particularly mention the contents of a dispatch received on Thursday from Orange Judd & Co., of New York. It read as

"What can we do for you? Command us. If send copy, will issue your next number at our expension." "Having our paper in this modest form nearly ready for the press, we could not avail ourselves of the offer, but our thanks are none the less hearty for the kindness."

We supposed that the Western Rural was still printed in Detroit, or we should have extended our sympathy to it. This paper comes out with a "Fire Extra," In which it states that it lost all, save its account books and

lists of subscribers. It promises to go ahead as lively as ever within a month. We wish it much success, as we have few more welcome exchanges than this. The Stock Journal saved its books and will go on without interruption. Its October number was destroyed, but will be re-

Gas-Lime.-" V. S. D.," New York, asks what is the real value of this article, how should it be used, and should it be mixed with stable-manure? Gaslime is most valuable applied to cearse-grass lands, or on a fallow. It contains chlorine, sulphur, and ammonia, and after some exposure to the atmosphere the sulphur in combination with it (which renders it injurious to vegetation in Its fresh state) is changed to sulphate of lime. It is thus about equal in value to ordinary lime that has been thus exposed. It should not be brought into contact with stable-manare, unless at the moment of application to the soil.

Power of a Suction-Pump.-M. H. Polliemns, Somerset Co., N. J., has a spring, 145 feet distant from the house and 20 feet below the level of the ground on which it is built. He asks if a common suctionpump will raise the water through this length of pipe. The theoretical hight to which a section-pamp will raise water is 34 feet, but friction and the imperfect vacuum obtained reduce this to 28 feet in practice. Against the excess of 8 feet in this case must be offset the friction occasioned by the water passing through 145 feet of pipe. Here it is obvious that the kind of pipe used will affect the result. A smooth, tin-lined lead-pipe would probably enable the water to pass with so little friction that the pump would raise it successfully. Cucumber-wood pipe (which is the best wooden pipe) of 1% inch bore might succeed, but the margin is so close that the pump must be most perfectly made or it would fail. All curves should be avoided, and a straight stream obtained.

Cabbages and Onious.-Edw'd Skinner, Orange Co., N. Y., states that one of his friends has very fine cabbages in an onion-field while the cabbages in his garden are infested by worms, and asks if we think the strong oder of the onion kept them away. We do not. There is very little oder about a growing onion, unless it is bruised.

"Some Pumpkins."-"W. J. P." writes as about a "volunteer" pumpkin-vine which produced 60 pumpkins, averaging 12 lbs. each. Good for one vine.

Mulching Raspberries .- J. Van Loon, Wis.—It will no doubt be of great benefit to mulch with five or six inches of straw, as you propose. Clear off what weeds there may he, and put on the mulch when freezing weather sets in.

A Large Egg. - W. E. Horwill, New Utrecht, L. I., sends an egg weighing 4 oz., 28 inches in circumference, from a Brahma fowl, but it is not stated whether light or dark.

Great Nettle .- "E. H.," Hickok, Pa .- We know of no nettle bearing the name of Urtica major, nor can we find such in a pretty full botanical library. nettle sometimes used in Europe as a substitute for flax is Urtica dioica. We do not know where the seed may

A Southern Cabbage Pest.-S. Scrvice, Fairfax Co., Va.-The insect which is committing ravages upon the cabbages in your vicinity is, as you suspect, the *Phytocoris lincolaris* of Harris's Insects, and suspect, the Projector's amounts of Parris's Precess, and the Capsus oblineatus of Say. A very good account of it will be found in Riley's 2d Report of the Insects of Missonri, where it is given the name of Tarnished Plant Bug. We hope to say more about it another menth.

House-Fly .- "E. G. H."-The common fly breeds mostly in mannre heaps. Some individuals pass the winter hidden in crevices, and come ent in spring in sufficient numbers to supply the demand.

Apple and Pear Orchard.-"H.," Brooklyn, N. Y .- We have frequently stated that we must decline giving advice to any one as to where he had better locate. It is a responsibility that we do not care to assume.

Old Postage Stamps,-"J. A, L," N. Carolina. The Government does not buy ca stamps. They are of no value save as paper stock. The Government does not buy canceled

Seeds of the Hard Maple.-A. G. Weed. -Mix them with dry sand, and keep in a cool place where the temperature will be uniform. They should not get too dry, nor should they heat by lying in a mass.

## Ogden Farm Papers.-No. 22.

I have received the following: "Thinking of trying your plan of farming, I think a few details would be of benefit to me as well as to many others.

"1st. How many hands would you recommend keeping to do general farm work and to till the following crops (and take care of four horses, five cows, calves, pigs, etc., all soiling), six acres drilled and hill corn, three acres potatoes, one acre sweet corn, two and a half acres of the following, cabbages, tomatoes, Lima beans, beets, onions, egg plants, etc., three acres wheat to harvest, twelve aeres oats to put in and harvest, and other work pertaining to a run-down farm of fifty aeres? In addition to the above, two acres of beets, mangolds, etc., and drawing all the above seven miles to market. If not asking too much of you, how many hands do you employ on your farm? Now, you must not think me too inquisitive, since I have not asked a balance-sheet, but only such questions as will be of benefit to many beginners as a guard to not doing too much with little help.

"2d. Would you advise keeping cows for butter when bran is worth \$22 to \$35 per ton, hay \$16 to \$25, corn 85 cents and upward per bushel, and butter bringing 20 cents to 50 cents per pound, not averaging more than 35 cents the year round? Is 15 pounds of hay, 6 quarts of bran, 6 quarts of meal, too much feed for a cow per day, in a raw state?"

I do not exactly know what my friend's idea of inquisitiveness may be. In the sense of asking questions, he certainly has that quality. In the sense of asking improper questions, he is entirely blameless. Nor do I mean by this to imply that the request for my balance-sheet, to which he refers, was in any respect improper, though, having spent'a good share of my time, first and last, gossiping with brother farmers in stores and grist-mills, I am not at all blind to the fact that even simpler questions thau these lead to my being hauled over the coals and chaffed about in a sufficiently uncomplimentary way to satisfy any modest man's highest ambition. But, unless one has a particularly tender hide, the skiving that he gets in a few years' experience of the twaddle of country neighborhoods will turn his cuticle to leather, and, unless his wits are unusually dull, will teach him the art of chaffing back again sufficiently for his own protection. I generally know, when I write, just about what sort of comments I shall elicit from a class of numbskulls that collects at the Four Corners store on a rainy afternoon for the discussion of book-farmers such as I; and I am sufficiently used to the process not to be deterred by it from writing whatever I think more intelligent men may be glad to read. Therefore, no one need apologize for asking whatever questions he pleases. If they are answered at all, it will be simply from a desire to give, not to him alone, but to many, information that may be of practical value to them.

In the case at hand, I fear that the desire must remain in a great measure unfulfilled; for it is not only beyond the scope of a newspaper article—it is beyond the ability of man to give a satisfactory reply to the all-embracing questions that are propounded. There are so many circumstances that affect the requirement for manual labor on such a farm as is described, and so much depends on the executive ability of the farmer himself, that no rule can be laid down which would be applicable to any two places or to any two meu. To answer the per-

sonal question first: I employ, all the year round, about an average of four men and two boys. But we have a hard, old farm to renovate, not far from one hundred head of horses and horned cattle, beside the smaller animals, to take care of, and much soiling and steaming to do. Yet, with all this help, though we do make some progress in the general effect, we are much more often behindhand in our work than in advance of it, and it would be difficult to find a farm where the conveniences for the care of stockin winter and in summer are better adapted for economical working.

In the case before us there is the equivalent of about twenty head of stock. To feed these, and to take proper care of them (soiling), I should consider to be about half-duty for a man. The hauling seven miles to market and back will spoil the time of another man, so far as the farm work is concerned. A third, with the unoecupied time of the stock tender, might be sufficient. The market-garden item is still more difficult to calculate for. Peter Henderson says that fully one man to the acre throughout the year will be required for such gardening as is done near New York City. I find that in my market-garden, of about ten acres, I need five men in summer and three in winter. If it were not for my greenhouses I could get on with two men in winter. My work is perhaps a little more complete than that my correspondent contemplates, and he may be able to get on with one gardener employed by the year, and another to help him out in April, May, and June. If the land is fertile, clean, and easily worked, he may be able to accomplish everything he describes with considerably less help than I have named, but, as I said before, it is only guess-work at the best, and I might almost as well undertake to tell him whether he had better, in going to market, drive around by the north road or go straight over the hill. That is to say, I have not the knowledge of his location and circumstances necessary to give value to my opinion, except in a very general way. I will venture, however, to say, as a fixed fact from which there is no escape, that if he attempts all he proposes with an insufficient working force, he will wish that he were something else than a high farmer and market-gardener.

In the manufacture of butter at the prices named for fodder and for the product, the most that can be said in favor of it is that it affords a fair home market for home products, and gives a fair return for money spent in buying food. For the profit of the operation we must look to the value of the manure. But if this is duly appreciated the profit will not be considered insignificant, especially so if it is used in the gardening operations, at least so far as the farming lands can be made to do tolerably well without it. Fifteen pounds of hay is not too much for the daily rations of an average sized cow, but in my judgment 6 quarts of meal and 6 quarts of bran would be about right for two such cows. I should prefer to give 10 quarts of bran and no meal, unless my object were to force fresh cows to their utmost product, and have them dry off in condition for the butcher. In that case, all the corn-meal they can be made to eat, with a little bran for "condition's" sake, will not be too much—the more the better. If I were to advise you in the matter, I would suggest that as you are near to a very good market for butter (Philadelphia), it will pay you to devote yourself to the manufacture of an extra quality of butter, such as you can readily sell for considerably more than the price you name. You may be helped in this by the introduction of some Jersey blood into your herd, and still more by adopting the best processes for butter-making, and giving all their details your personal attention.

It is rarely advisable to use the personal letters of a friend in public communications, but the following so completely takes away the glory I was hoping to achieve, that it would be hardly fair to withhold it:

"I was made aware two years ago by Dr. Potter, the inventor of a milk-cooler, that if milk be immediately deprived of its animal heat, the eream will rise through any hight; 'ten feet,' he said, 'if you choose to set it so deep.' His theory was that if the heat was allowed to remain long, it favored a lactic fermentation, or other chemical change, which prevented the free separation of the cream from the milk. Still, I did not profit by the hint. But recently I read an account of some Holland dairies in which deep crocks were used. So I got to thinking, and it occurred to me that people, in setting in shallow pans, were merely, in ignorance, accomplishing the early cooling, though they imagined the necessity was shallowness. So I went to the Ironclad Can Co., and said I wanted a slender, tall can.

"'You want an Orange County Creamery cooler,' they said. 'They use in the factories  $8 \times 10$  inches.'

"Make me one—and a conical skimmer." "We set it with 15 or 16 inches of milk in a deep spring reservoir, where it floated upright, the heavy ironclad bottom ballasting it. At the end of 36 hours skimmed it, and set the skimmed milk. We got no more cream from it. We next set it 48 hours, and the milk still continued perfectly sweet. I then ordered a full set,  $8\times25$ , and we are skimming at 24 hours. I intend to try 12 hours, and if satisfied that we get all the cream, that little pool (holding 5 cans) will be more than ample.

"Near the stone house I have another reservoir,  $4'2'' \times 4'6''$ , which will hold 30 cans, and a live spring boiling up in the bottom.

"Just as I got my set going, I saw the last Journal of the R. A. Society, containing a lecture by X. A. Willard, delivered in Maine, and found it all described, and the cooler and skimmer figured; and I now find in Ogden Farm Papers in August that you have been at it too. I believe it will be generally adopted."

So it seems again that there is "nothing new under the sun," and I shall not be surprised to hear that one of the sorest sorrows of old Johnimself—that patient herdsman—was the discovery that Jacob had used deep milk-cans before him.

However, although I was so late to discover the merits of this deep setting of milk, I am none the less anxious to spread the knowledge of its advantages. Every day brings evidence that, in avoiding some almost insuperable difficulties in summer butter-making, it is even more effective than I had at first conceived it to be.

In general farm matters there is nothing of especial interest to report. We jog along very much as usual, well satisfied of the benefits of soiling, and not especially dissatisfied with our results in any respect, save that, in spite of thorough cultivation and heavy manuring, we still feel the ill effect of the deep plowing of about ten acres of the farm in the autumn of 1863. For ordinary crops it does very well, probably much better, because of the deep

plowing, but about two acres of carrots planted upon it will bring a very insignificant result, because of the injurious effect of the upturned clay on the delicate and slow-growing seedlings.

## Riding on Horseback.-No. 7.

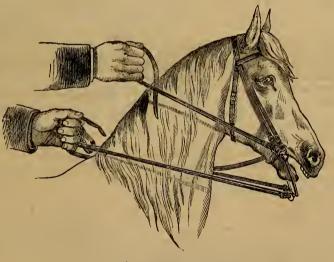

Although you may have taught the horse to stand perfectly at his ease while standing still, and to be "light in hand and light on his legs," you will find that the moment you attempt to move him forward at a walk, he will throw out his nose at the first step, and be as ungainly as ever. Take hold of his mouth immediately and endeavor to supple his neck. If he continue the resistance, halt him at once, bring his head into position, and let him rest a moment before advancing again. He will soon learn to walk with his mouth light. If he seem to step too short, as though too much restrained by the curved position, press him lightly with the heels to send him forward. You will soon learn when the free movement of the horse indicates a just balance (or equilibrium) between the forehand and the hind quarters. It is this that you must always study to preserve-drawing back the head when there is too much forward tendency, and applying the legs when the horse goes, as horsemen say, "behind the bit," that is, with

an uncertain, short step. The next step is not to trot, but to move backward at a walk. This you can attempt only when the use of the curb causes the horse to bring in his head before it shortens his step. Get him well collected at a halt; apply the legs until you feel a forward tendency of the weight, showing that the hind legs are free to step; then draw backward on the curb to such a degree that the horse, to preserve his balance, will step backward, that is, the horse's weight being in perfect balance between your legs and hand, so

that you can send it in either direction-throw it backward by the use of the hand, causing the horse instinctively to step in that direction, to prevent falling, just as when you force his weight forward he advances his feet to receive it. This is the secret of Baucher's treatment, and its perfect mastery, accompanied with practiced skill, is perfect horsemanship. As soon as the horse has taken a single step backward, loosen the rein and withdraw the legs from his sides, and pet him and praise him, to show that he has done what is desired-which knowledge is dearer than oats to a kindly-tempered horse. After a little he will take two or three steps backward, and in time will move backward as gracefully as forward.

Having taught all you can teach of movements in a direct line at a walk, repeat the lessons at a trot. You will have the same difficulty as in the former case, and you will probably be longer in overcoming it. The faster the motion, the greater the tendency of the horse to throw his weight forward and to hear on the bit. Don't try to draw him back by an extra pressure on the curb, but hold your hand firm and toneh him gently with the spurs; this will drive his hind legs under him and take the weight from

the forehand. He will in time learn that he can go more easily and more safely with his weight on his haunches than on his shoulders, and his gait will then become easy instead of hard. When he trots perfectly, teach him, which will be easier, to gallop with the same collected motion. In doing this, pursue the same routine that has been laid down for the walk and the trot; that is, do not allow the borse for a moment to carry his head too low or too far out, to bore on the bit, as though he would drive his fore feet into the ground, neither let him commit the opposite fault of throwing his whole weight on his haunches as if to rear, and so make every step a miniature jump. The habit of "boring" is inveterate with some horses, and can not easily be contended against by ordinary means. Baucher had a device (which he withheld from publication) that is very effective. Both curb-reins and the left snaffle-rein being held in the left hand (in its proper position), the right snafflerein only is taken in the right hand and drawn upward, so as to press the snaffle against the corner of the mouth on one side, as shown in the engraving. This has an effect that an upward pressure on both snaffle-reins entirely fails to produce, and its knowledge has given to the personal pupils of Baucher a great

BAUCHER'S TREATMENT OF BORING.

advantage over those who have learned his system from his books alone.

The gallop will never be perfectly easy and perfectly safe until it is what is called perfectly "eadenced"—the fore feet and the hind ones striking the ground with equal force and both neck and tail being perfectly supple. A horse traveling in this way may trip over a rolling stone at every tenth step without danger of falling, and he will perform a journey of twenty miles with much more ease to himself and his rider than he would make even five miles with (as is usual) most of the force of every leap falling on the fore feet.

In accomplishing all this as much depends on the perfect balance of the rider's temper as on the balance of his weight. Above all must nothing provoke or startle him to a rough handling of the bit, which is his chief means of communication with the horse; a mistake will be interpreted precisely as an intention would be, and a very few mistakes will suffice to confuse all previous teachings. "Firm as a grasp of steel, yet soft as the touch of love," this describes the perfect hand, and while it should yield to the horse's proper movements and restrain his improper ones, as it can do only when guided

by instinctive intelligence, it should be as independent of the movement of the rider's body and of his efforts to keep a proper seat as though it were an iron hand attached to the pommel of the saddle. The legs, too, should be ever ready to perform their office—the thighs, to preserve the rider's seat, and the lower limbs ever on the alert to restrain any interruption of the equilibrium by reason of a faulty position of the horse's hind legs.

## An Egg Farm.

BY H. H. STODDARD .- Seventh Article.

The proper management of the breeding stock is a very important part of the scheme, for there must annually be raised a large supply of pullets of the right quality. The profits of the establishment depend largely on the excellence of the fowls, and as they can be multiplied very fast from a chosen few, no pains should be spared to secure the very best as a source from which to stock the whole farm. There is but one way to do this, and that is to keep individual birds in experimental yards in order to test their merits, recording the degree of excellence and the pedigree of the best with as much care as would be given to breeding cows or horses.

We will suppose it is designed to produce a strain of Leghorns that shall excel in prolificness, laying at an early age, and in other requisites. Procure a pullet from A and a cockerel from B, and put them in yard No. 1; purchase of C and D one bird from each, for yard No. 2, and so on, always taking care that no specimens are obtained from any locality where disease has prevailed. The smaller breeding yards are used as experimental yards, and to allow each cock a proper number of mates, two or more half-blood Brahma pullets (whose eggs can be distinguished by their color) are added. Give each Leghorn a name or number, and enter in a book all details necessary for testing progress in improving the breed, such as weight, the age at which laying commenced, and the yield of eggs during the first year, at the expiration of which banish all but the best hens. The second year set the eggs of the reserved extra fowls, and keep the chickens produced by each pair separate from all others. At the age of five or six months, cull out the most promising pullets and cockerels, and pair them for testing and recording pedigree and prolificness as before. By mating the produce of the original birds from A and B with the produce of those from C and D, finally the four stocks will become blended in one. Proceed in this manner a number of years, and when in the course of time a very extra prolific and vigorous hen has been found, which reached full size and commenced laying early, and whose ancestry have excelled in the same respects for several generations, as shown by the book, then from her eggs cocks are raised from which to breed to replenish the main stock of layers at the itinerant stations. These cocks are put in the larger breeding yards, each with a flock of ten hens, and no further accounts are kept of the prolificness of individuals.

After new stock is introduced to the experimental yards, as must be done yearly, care is taken for a series of years to avoid breeding akin, and as purchases will be made from fanciers, who to fix the conventional points have most likely bred close and impaired strength, crossing will immediately give a decided increase of vigor. Towards the last, however,

when sufficient stamina has been gained, and the stations are to be stocked, close breeding is resorted to. This is to increase the yield of eggs, the philosophy of the matter being as follows: Just as a fruit tree girdled or severely root-pruned will give a profuse yield and then die, and as various domestic animals will for a

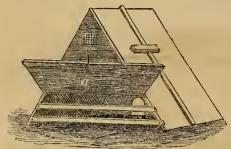

Fig. 1.-cnicken coop.

short time be more prolific after removal to unaccustomed climates, so the violent attack on vitality which occurs when there is in-and-in breeding, is met by an energetic attempt of the organism to propagate in unusual numbers and thus maintain its kind. There has been much confusion on this point, for while scientific naturalists have insisted that no animal can thrive under continued close breeding, practical

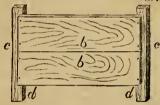

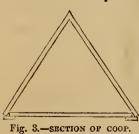

Fig. 2.—FLOOR OF COOP.

poultry keepers have pointed to the prolifieness of in-and-in bred fowls as a proof that there was no deterioration. The fact is, individual perfection and rapid increase are to a certain degree incompatible. Under our plan of aiming chiefly to seeme great quantities of eggs, we purposely give the constitution of the birds a shock in order to increase fecundity, having first, however, carefully built up, for some years, by careful selection and good sanitary conditions, sufficient strength to withstand the assault. This course may appear inconsistent, but experiments have shown us that it is correct.

The Brahmas are bred in the experimental yards with a different basis of selection. The best sitters, and those with the shortest legs and the least black upon the plumage, are preferred. Brahmas can be bred very light-colored in a short time. The white barn-yard fowls are selected also with reference to persistence in sitting, and particularly for

The experiments need not be carried out to such an extent with these last - mentioned breeds as in case of the Leghorns, which fill such an important part.

their ample wings.

In the breeding and experimental yards, the fowls must be fed and managed in every respect with the greatest care. Over-fattening is to be deprecated above all other things, and may be avoided by burying all the grain to make the birds exercise by scratching. The supply of grain should be moderate; meat should be given very often in very small quantities, and the allowance of fresh vegetables should be ample.

Free range would be very desirable for all the breeders, but as it is impracticable, scrupulous care must be taken to furnish artificially natural conditions. Though the birds of the laying class in the experimental yards are rated according to their prolificness, yet the test is merely a relative one, for they are not forced to profuse laying by stimulating feed.

The construction of the coops for young chickens remains to be described. A chicken coop must be adapted to warm weather and cold and especially to rains, be easily cleaned, and made rat-proof nights. The old-fashioned

triangular pattern (fig. 1) secures all this, and also gives small chickens a chance to escape under the caves from the feet of the hens. Two hens are put together with their broods, for reasons which will be given in another place. The size proper to accommodate a double brood is  $2\frac{1}{2} \times 3\frac{1}{2}$  feet upon the ground, with roof 3 feet from caves to peak. A bit of scantling is fastened to each roof for a handle. The door, a, is hinged to open upwards. There is a small door at the rear that will

allow chickens to pass, but not grown fowls. An opening for ventilation is made near the peak, and covered with wire cloth. Take inch boards, b b (fig. 2), and nail strongly, planed side up, to the cleats, c c, and clinch. Let both ends of each cleat project three inches, and the outside edge of each two

inches. This is the movable floor, and must be of such size that the coop shall rest entirely upon the projecting ends and edges of the cleats, then when the doors are closed all rain will be shed outside the floor. In fig. 3, a section of the coop shows the floor in its place. When the doors are closed at night, leave the large one, a, ajar  $\frac{1}{2}$  inch or 1 inch, according

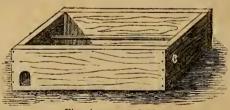

Fig. 4.—FEEDING BOX.

to the weather, for air, and fasten it with wooden pegs stuck in holes through the cleats, at dd, which will make the coop perfectly ratproof. Once a week, after opening the door a, to enable the chickens to escape through the slats out of the way, slide the coop slowly lengthwise of the cleats away from the floor, which must be scraped thoroughly; then give it a shovelful of dry earth and replace. You will always have a dry, inodorous apartment, and will not shut up chickens in close, foul air.

All the chickens destined for the itinerant stations, must, as mentioned in the first article, be fed indirectly. For two days only are they and the hens fed upon the floor of the coop. Then for a week they are fed in the box given in fig. 4. It has no bottom, and the top, not shown in the figure, is temporary, and com-

posed of loose boards. Place it so that its door shall meet the small door in the coop, having first dropped in the feed at the corner e, and covered the box with the boards in such a manner as to admit a little light. After a week, the chickens, being strong enough to venture some distance, are fed from a box of tin, 6 × 16 inches

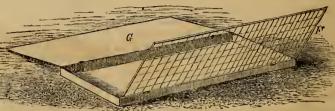

Fig. 5.-FEED-BOX WITH GRATING.

and  $^3/_4$  inch deep (fig. 5). A wire grating, F, with meshes 1 inch square, protects the feed from the feet of the chickens but admits their bills. The grating is covered at pleasure by a lid, G, both being hinged to opposite sides of the box. When such boxes are placed in a row (fig. 6), each filled with feed, one for each coop, with the lids down, a snap-hook is attached to a ring which is fastened to each lid, and a wire connects with all the hooks. One pull opens all the lids and the chickens are at dinner.

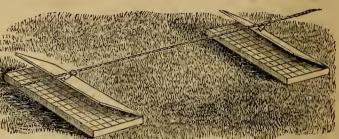

Fig. 6.—ARRANGEMENT FOR OPENING FEED BOXES.

These feed-boxes are carried to the granary to be filled, using a wheelbarrow in which many may be packed at a time. The coops are 20 feet apart, in a single row, and the wheelbarrow is rolled along the line, and the boxes, with lids closed, are put on the side of the coops near the small doors, which are shut, in order that the hens may not worry when the chickens are feeding. The hens are fed and watered in cups, fastened to the inside of the coops as high as they can reach. The cups are filled once each twenty-four hours, after dark in the evening, so as not to attract the attention of either hens or chickens. When the chickens are a month old, a part of their feed should be buried near the coop early in the morning, before they are let out, so that they may scratch during the day. Whenever it is rainy, the box used the first week for feeding (fig. 4) is resorted to again for that purpose,

The additional time required to feed chickens indirectly is slight, if operations are systematized. All the chickens of the experimental stock, and of the Brahma, and white Barn-yard, and Half-blood classes also, are reared at a separate part of the farm, and fed directly.

When the hens are removed from the chickens, the latter huddle together nights upon the floor for some weeks, but when old enough to perch, the box (fig. 4) is placed upon the movable coop-floor, and the coop is placed upon the top of the whole, the box being of such size that the caves and sides of the coop overlap sufficiently to shed rain. The box has two perches permanently fastened to it, one of which is seen in fig. 4. This roost is rat-proof, and a bushel or so of dry earth keeps it clean.

## A Colorado Immigrant.

Many persons are looking wistfully to the far West, and debating the question whether they can better their condition by removal. They have a great longing for exact information in

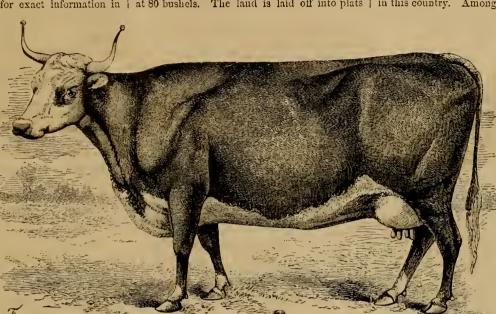

regard to the state of things in these new regions. We can not better meet this want than by giving a bit of personal history which we learned from George Ratcliff, of Bear Canyon, Douglass Co., Colorado Territory. Mr. Ratcliff's farm is situated unon both sides of West Plum Creek, about twelve from its miles mouth, falls into the South Platte. It is just at the foot of the mountains, and timber, mostly the hard pine, is easily procured. He came out here eleven years ago, in the

time of the mining excitement, with little more than his hands. He and his wife are English. They have enjoyed uninterrupted health, and have had four children born to them in the last five years, good specimens of the Angla-Saxon race. They have prospered in this new country, and have laid the foundation of a handsome fortune. We drove up to the house about noon, for the purpose of watering the horses, but found so hospitable a reception that we stayed several hours to look at the crops and stock. Mr. Ratcliff owns two hundred acres of land, for which he has been offered \$2,000, but thinks

it worth \$3,000 now that the narrowgauge railroad runs so near it. He has 200 head of cattle, which are increasing rapidly in numbers and value. A good cow in milk is worth about \$65, yearlings \$25, and calves \$15. Butter, marketed at Denver, is worth forty cents a pound. The winters are mild and pleasant, and cattle graze the year round. There is a large range for stock unoccupied, and he can raise as many cattle as he likes. He has opened a ditch on the west side of the creek, which brings the

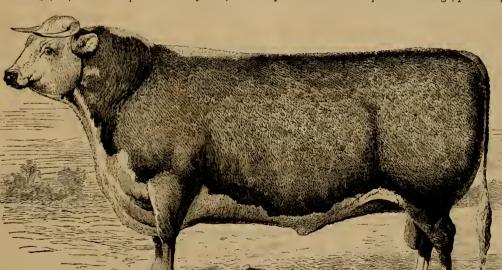

water from above in sufficient quantity to irrigate 50 acfes. This only cost him twelve days' labor. He has this year about 16 acres in crops, of which 13 acres of oats and wheat have been irrigated twice. Generally it requires but one irrigation, but this season has been much drier than usual.

He takes three, and sometimes five, wheat crops in succession from the same land. Both wheat and oats were very heavy in grain, though the straw was not of large growth. He estimated the wheat at 35 bushels the acre, and the oats at 80 bushels. The land is laid off into plats

HEREFORD COW "VERBENA."

ten or twelve paces wide, bordered by shallow watercourses. The water is turned into these courses and diverted by the use of a shovel to either side, until the whole land is completely saturated. It took eight days only to irrigate thirteen acres twice, and secure these heavy crops. Mr. Ratcliff is cultivating other crops, which look as well as anything we ever saw in a rainy climate. He has the Early Rose potato, which yields 300 bushels to the acre, and brings from eight to four cents a pound, according to the time they are marketed. Onions are worth five cents a pound, and the yield is marvelous.

HEREFORD BULL "COMPTON LAD."

Cabbages, tomatoes, encumbers, and melons do well. Mr. Rateliff has been back to England on a visit, but returned to Colorado perfectly satisfied. He has a house, a large log-barn, and other out-buildings. There is still plenty of land, at Government prices, in Colorado.

## A Pair of Herefords.

It is somewhat remarkable that a breed of cattle so popular in England as are the Herefords should have obtained so slight a foothold in this country. Among the earliest importa-

tions of this breed, if not the earliest one, was that made by Henry Clay, about the year 1816. They were bred for a while at Ashland. Ky., but soon disappeared in favor of the Shorthorns. A large importation was made in 1840. and a portion of this herd, then on the farm of Erastus Corning, near Albany, N. Y., was described in this journal in 1843. This fine herd. which was afterwards removed from one point to another, is said by Mr. L. F. Allen, in his recent work on American Cattle, to

have "run out." The same may be said of some other importations. Mr. F. W. Stone, of Guelph, Canada, has one of the largest herds of Herefords on this continent, and is still, we believe, a successful breeder. It is probable that the great popularity of the Shorthorns has diverted the attention of breeders from the Herefords, and this, combined with the generally inferior dairy qualities of the breed, has made their career in this country so uncertain and unsuccessful. It is as working oxen and beef cattle that the Herefords are most prized. The oxen are large, powerful, intelligent, and quick

under the yoke, and it is claimed by those who have them used Hereford grade oxen approach perfection as working animals. As beef cattle, the Herefords maintain a high rank in England, on account of their early maturity and the excellence of their flesh. Writers upon breeds differ as to the original color of the Herefords. Now the color is usually some shade of red, "with white faces, throats, bellies, and sometimes backs, and occasionally a roan of red and white mixed, and,

more rarely, an almost clear white, with red ears, is found among them." We give portraits of a cow, "Verbena," and bull, "Compton Lad," exhibited by H. C. Burleigh, Esq., of Fairfield, Me., at the last New England Fair, and which took the first premiums in their class.

## Walks and Talks on the Farm-No. 95.

Mr. J. W. Varney, of Ohio, says: "If you will tell me how to kill Ground Ivy, I will tell you how to kill Red-root or Pigeon-grass. I had a field that was badly invested with Red-root. I cut and thrashed the wheat on the field; then spread the straw evenly over the field, making sure to cover the parts well where the Red-root had nearly taken full possession; then burnt the whole. This was done four or five years ago, and I have not seen a stock of the pest on that field since. Burning the straw and stubble on the ground made a clean sweep of the seed. If you find any better plan, please let us know."

I am too short of straw to adopt this plan. In my case, it would be far better to prepare the land for winter wheat, and then not sow it. The Red-root would grow just as well as if wheat was sown. Then, in the spring, plow under the red-root, and sow spring wheat, barley, or oats. This would be just as effectual as the burning. The only difference in the two methods is that one kills the plants before they go to seed; the other lets the plants go to seed, and then burns up the seed. When it is an object to get rid of straw, the plan is a good one. But I do not think I am obliged to give a recipe for killing Ground Ivy, as the Red-root recipe is of no use to me. Those readers of the Agriculturist who can use this remedy for Red-root should, in justice to Mr. V., send us their methods of killing Ground Ivy.

John S. Bowles, of Hamilton County, Ohio, writes me a very interesting private letter, giving the details and results of his farming operations. There is nothing I like better than to read such letters. If farmers would talk less, and read, write, and think more, agriculture would make greater progress. Mr. B. says: "I still stick to hogs, in spite of low prices. I have now exactly 165 head. I endeavor to have a lot of about 30 ready for market every three months all the year round. Horse-power thrashing machines are out of date in this neighborhood. Steamers have effectually driven them away. I should never have run a thrashing machine, but I wanted an engine to shell and grind and cook my corn, and I thought it might as well earn something at thrashing as not. In shelling corn, fuel costs me nothing, as the cobs alone run the engine. I am inclined to think that cooking food for young hogs has another advantage besides the mere saving of grain and saving of time in fattening them. I think they are less liable to disease. At any rate, I know that I have fewer hogs die, in proportion to the number kept, than any other farmer in this vicinity; and I have fewer die now than before I commenced to cook, four or five years ago, although I keep three or four times as many." . This is quite in accordance with what I should expect. Most of the swine diseases arise from indigestion. Clean and well-ventilated quarters, with regularity in feeding, giving no more than they will eat up clean, and then letting them have a comfortable bed, where they can lie down quietly and digest their food, and turn it into pork -these are the essential conditions in feeding pigs profitably. And anything that will facilitate digestion will have a tendency to keep them healthy, and, provided they are of the right sort and have all the food they can digest, they will grow with great rapidity. I suppose cooked grain is more easily digested than uncooked, and I regard this as the one great reason why it pays to cook grain for pigs. It is no use wasting money in cooking food for ill-bred, slow-growing hogs, that can digest food as fast or faster than they can assimilate it—or, in other words, faster than they can convertitinto pork.

Mr. B. proposes to fatten some sheep this winter and sell them in the spring. He says: "I can buy good, thrifty sheep, such as the hutchers kill, weighing about 100 lbs. each, for \$3.50 per head. Next spring they will sell for \$6 and probably \$6.50 per 100 lbs., gross weight. I think I can calculate with certainty on \$6.50, as wool is rising all the time, and farmers next spring will hate to part with their sheep. Clover hay is, or will be, worth \$18 per ton, and corn 50 cents per bushel. What I want to find out is, how much hay a sheep will eat between December 1st and March 10th, or say 100 days?"

I think we may estimate that for sheep weighing about 100 lbs, it takes about 2 lbs, of hay per day, or its equivalent, to keep the sheep alive and healthy, without gaining anything in weight. Give them 1 lb. of corn per day in addition, and a good sheep ought to gain 2 lbs. per week in live weight. The account with 100 sheep would stand as follows:

| Dec. 1st, 1871—                      |     |
|--------------------------------------|-----|
| 100 sheep, 100 lbs. each, @ \$3.50\$ | 350 |
| 10 tons of clover hay, @ \$18        | 180 |
| 180 bushels corn, @ 50c              | 90  |
| 35. 1. 5011. 5010.                   | 620 |

March 10th, 1872—

100 sheep, 128 lbs, each, @ \$6.50.......\$832.00

Manure from 10 tons clover hay, @ \$9.64.....96.40

" " 5 tons corn, @ \$6.65.......33.25

This shows a very fair profit. On farms where there is plenty of good wheat straw, the sheep can be wintered at less cost. The profit does not come from the increase of weight of the sheep so much as from the increase in price, and provided the sheep are fat enough in the spring to bring the highest price, a few pounds less tallow on each sheep will make little difference in the result-certainly nothing like as much difference as that between the cost of hay and straw. So far as the amount of nutriment is concerned, corn at 50 cents per bushel is-far cheaper than hay at \$18 per ton. The most prevailing folly is in wintering sheep on straw alone. A little corn, in addition to the straw, will keep the sheep in good health and vigor, and pay better than most agricultural operations with which I am acquainted.

"Cattle are very low," continues Mr. B., "and I shall feed a few that I raised myself, instead of selling them now. Beef cattle bring only \$3.25 to \$3.50 per 100 lbs. I propose to try a little cooked food for them, as I have a steamengine and a power cutting box. I shall cut up corn-fodder and straw, and mix with corn-meal and hulled cotton-seed, and wet and steam the whole together. Hulled cotton-seed (not the cake, but the kernels containing all the oil) is worth in Cincinnati \$30 per ton. Corn-meal, allowing 1/8 for grinding, is worth \$20 per ton.' With labor so high and food so cheap, I do not see how it can pay to cook food for cattle that are worth only 3½ cents per pound. Low prices and high farming are not profitable concomitants.

I have just got back from Chicago. Things are done there on a grand scale. I expected to find them disheartened at the low price of beef and pork. Not a bit of it—or at least they are as en-

thusiastic as ever. They believe in themselves -and in each other-and they have reason to. Standing in Dexter Park during the swine show, I heard a Chicago man talking to "Fighting Joe Hooker" and Gen. Logan. "This," said be, "just where you sit, is the center of the county. Twenty years ago not a railroad came into Chicago; and now see!" And truly it is marvelous. Close by was the great Union Cattle Yard, with long trains of cattle, hogs, and sheep coming in and going out every hour. The day I was there nearly 3,000 head of cattle were received, over 9,000 hogs, and not quite 1,000 sheep; and so it is every day in the year. There was to me a peculiar fascination in watching the discharge of these cattle from the cars, speculating as to where they came from and what they had seen in their short but eventful lives.

"But," says the Deacon, in rather an impatient tone, "I came over to hear something about the Great Swine Show."

I hardly know yet what to say about it. I think I was more interested in the cattle and hogs in the yards than in the prize pigs. The latter merely showed what could be done by men who raise pigs to sell at high prices. The former showed what was being done by the farmers of the West in raising cattle and hogs for the butcher. And I was perfectly astonished at the general excellence of the hogs in market. It seems to me that a marvelous improvement has taken place during the last few years. Western farmers need say no more about the necessity of a breed of pigs that can get their own living and stand rough treatment. It is evident to me that thousands of these hogs had received better care and better food than we at the East usually give our swine. We, if anybody, want a hog that will pick up his own living. We can not afford to stuff our pigs with grain at all times. We have to keep them on the slops of the house and dairy, and on clover and other cheap food, giving them only a little grain until they are shut up to fatten. If any one needs a large, slow-maturing breed, that will live on cheap food, it is the farmers of the Eastern and Middle States, and not the farmers of the West, where corn is cheap. These hogs in the Chicago market have had all the corn they could eat. But they are not fat. On the average, they would not dress over 200 lbs., while they are capable of being made to dress 400 lbs. and upwards.

"I see what you are driving at," remarks the Deacon, "and I want to hear about the show."

Well, it was the grandest exhibition of well-bred pigs, probably, that the world has ever seen. There were some five thousand pigs in the show-yard. What interested me most, and what in fact I went on purpose to see, was the Magie or Poland-China breed. They were there by the thousand. Judging from the few I had previously seen, I thought them a great, coarse, overgrown, flop-eared, rough-haired, bigboned kind of common heg, without style or comeliness, that, with an unlimited amount of food, would at two or three years old attain a great weight.

There were a few of this breed at Chicago that nearly answer the above description—hogs that would weigh 1,000 lbs., with legs as thick as those of a well-bred ox, and with great, thick ears that almost reached to the ground. But, on the whole, the breed is far superior to what I suspected. Many of the specimens shown are nearly as refined as the Berkshires. In fact, a

casual observer might suppose they were Berkshires.

"Are they as black as the Berkshires?" asks the Deacon, who has a decided prejudice against color.

Some that were shown were almost white, but the greater portion were black hogs with white spots. There seemed to be no uniformity in this respect. From what I could learn from the breeders, I judge that they are aiming to get them blacker and blacker. Several told me that the blacker they got them the finer they became, and the easier they fattened.

The Magies and Berkshires were the two leading breeds at Chicago. I think there must have been nearly or quite two thousand of each breed on exhibition. It was too much of a good thing. The judges must have had a hard time, and got little thanks for their labors.

Chester Whites, in comparison with the Magies and Berkshires, were "nowhere." I should judge that this breed is hardly holding its own. And the same will apply to the Cheshires. Black seems to be the winning color at the West.

The "Suffolk, Essex, small Yorkshire, and other small breeds," were all huddled together, black and white, in one class. There was a good pen or two of imported "Lancastershire" pigs shown in this class. I suppose they are essentially Yorkshires. There were also two or three pens of capital Suffolks from Canada, some of them recently imported from England. There was a very fair show of Essex, and the most interesting fact in regard to them, was that the home-bred pigs were far superior, at least in my judgment, to some just imported from England by a leading Canadian breeder. And why should we not raise just as good pigs here as they can in England? We ought to be able to raise better, and I believe we shall soon do it. To me, the word "imported" adds no value to any animal. I heard the man in charge of Mr. Wood's Essex tell some one that a particularly fine sow was "imported from Mr. Thorne"!

The show of "crosses" was not as interesting as I expected. The largest exhibition in this class showed pigs from a Magie sow, sired by a bear that was "part Berkshire and part Magie," and I imagine part Essex also! This is crossing with a vengeance. If he had taken a part Magie sow, and put her to a thorough-bred Berkshire or Essex, he would probably have had pigs worth looking at. If there is one principle in breeding well established, it is that we should use none but thorough-bred males. And I doubt the policy of the Swine Breeders' Association offering prizes for cross-bred boars. A show of cross-bred pigs raised solely for the butcher would be very useful, but to offer prizes for them as a breeding stock is a mistake.

Finaucially, the show was not a success. There is probably not a town or county fair in the United States where the attendance is not larger than it was at this grand National Swine Show. The Association should hold its exhibitions in connection with the State Fair.

The grand prize of one thousand dollars for the best show of swine, not less than ten nor more than twenty, was awarded to the Berkshires of Mr. Clay, of Kentucky. There was an imported Berkshire boar on exhibition that was said to have cost "one thousand guineas in England." Our English friend Sotham remarked that he did not believe it. "No Englishman," he said, "would have the conscience to ask such a price."

## Lucern in California.

Mr. Joseph Enscoe, of Antelope Ranche, Loyalton, California, writes: "In the July number of the American Agriculturist Walks and Talks says the Doctor has been to California. and that there is a weed there which is called clover. I suppose him to refer to Alfalfa, or Chili clover, and if so, I think an article in your valuable paper, giving an account of its merits and demerits, mode of culture, etc., would be highly appreciated by your California readers. I understand that a man below me has 400 acres of this weed. But little is known in regard to its cultivation. It is said to seek water even at the depth of forty feet. I have tried to obtain some published treatise on the culture of Alfalfa, or Chili clover, but have been unable to succeed. The seed is scarce. It is worth 25 cents per pound, down to 15 cents, according to quality."

Alfalfa, or Chili clover, is simply Lucern (Medicago sativa), a well-known plant cultivated in Europe, and to some extent in this country, for soiling purposes as well as for hay. You will find an article in regard to its value, cultivation, etc., in the American Agricultural Annual for 1871. But it is not at all probable that this is the plant to which the Doctor referred as a "weed." Prof. Brewer, of New Haven, to whom we sent Mr. Enscoe's letter, says they have a species of Lucern in California (Medicago denticulata) that is called "Burr clover." He is not aware that it is cultivated, but it is protected and cherished as a valuable forage, and has spread over much of the State. We think this is the plant to which the Doctor referred.

Prof. Brewer, like all others who have had any experience in regard to it, speaks in the highest terms of Lucern as a forage plant, "For several years," he says, "I have made diligent inquiries as to the best forage plant in the dry climates of Southern Europe, and the answer was uniformly, Lucern (Medicago sativa). In California the Chilian variety appears to do better than the European variety. But I want to see the experiment fairly tried between it and seed from the drier parts of southern Europe. Its cultivation is extending in California as rapidly, perhaps, as is possible in a State where the great cry is for some never-failing forage plant, that will stand the drouth, too close feeding, a too wet winter, and do all this without either care or cultivation. Unfortunately Alfalfa requires care in getting it started, and takes some years to come into its best value, and then needs a fence around it to prevent too close feeding in times of searcity. The land needs to be deeply plowed and prepared with care, and during the first year the crop should not be fed very closely. When well rooted, it is exceedingly tenacious of life, the tap-root running very deep-I know not how deep, but I have seen roots twelve feet long, and I doubt not they sometimes run much deeper; and when well set it is very long-lived. European authorities speak of roots known to live 40 and even 60 years. The herbage is coarse but very nutritious, and the amount produced very large, cither as hay or pasture."

There can be no doubt of the great value of Lucern as a cultivated crop for soiling purposes. On rich land, kept free from weeds, it will yield four or five crops a year, and it is very nutritious, and all animals eat it readily. It will stand drouth better, probably, than any other forage plant. But it will not stand weeds. The point which is of most interest to our readers in California, Colorado, and other sections liable

to long-continued drouths, is, whether Lucern (Medicago sativa) or the Burr clover (Medicago denticulata) can be grown as we grow clover and grass, and whether this Burr clover is as nutritious as Lucern. We should like to hear from our California readers on these points.

## Winter Grazing.

This term will strike the Eastern reader unpleasantly, for it is associated in his mind with bare fields, stack-yards, frozen earth, and shivering cattle. In the trans-Missouri country, we have a vast region where winter grazing is a fixed fact, without any of the disagreeable accompaniments of the rainy and snowy climates east of the Mississippi. The eastern limit of this climate is about the 98th degree of longitude west from Greenwich, which crosses the Union Pacific R.R. near Grand Island. Nearly all the country west of this line, extending from Texas far into the British Possessions, is one vast natural pasture the year round. The climate is not well understood by many of our Eastern people. It is entirely unlike that of the Atlantic and the Mississippi Valley States. Judged by our standards at the East, four fifths of this region would be uninhabitable on account of its elevation above the sea level. On this coast, seven thousand feet would be about the snow line. In the Rocky Mountains it is nearly twice that hight. They have good summer weather in its season at ten thousand feet above the sea level, and it is only the cool nights that make the raising of Indian corn impracticable. The terminal line of vegetation on the White Mountains is about 5,000 feet, on the Alleghanies 5,500 feet. The grasses grow luxuriantly on the Rocky Mountains up to ten thousand feet, and we have seen a heavy growth of timber on Pike's Peak, and on other summits, as far up as 12,000 feet, and a smaller growth of evergreens 15,000 feet high. In the North, South, and Middle Parks, eight to ten thousand feet above the sea level, the winters are less severe than in the Atlantic States. The rainfall over the greater part of this region is about twenty inches annually, and the larger part falls in the month of May. This gives the grasses a vigorous start, and in June they are fully matured. By the 1st of September these grasses have become a perfectly cured hay, as nutritious as any the Eastern farmer puts into his stacks or barns. The proof of its excellence is the fact that thousands of sheep and cattle feed upon it all winter, and come out in the spring ripe for the butcher. There is none of that pining which is inseparable from all out-door feeding in winter in the Eastern States. There are not only the "hunch" and "gramma" grasses, but the species are numerous, and every valley has its complement of them. This fact of abundant fodder for all graminivorous animals is as well established as any fact in our agriculture. It is this which makes this vast region so attractive to the stock-grower.

## Water-Rams.

The frequent inquiries received about elevating water by means of the water-ram induce us to describe the machine and illustrate its mode of working. In figure 1 we give a sectional view, showing the valves. It will be seen that the supply pipe, which should be somewhat more than twice the diameter of the discharge pipe, brings the water from a spring, which must be elevated at least four feet above the ram, and

distant forty or fifty feet from it. The mode of working is as follows: The current of water

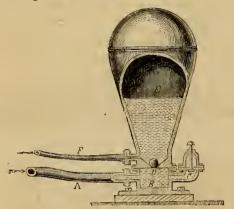

Fig. 1 .- SECTION OF WATER-RAM.

flowing down the supply pipe A (fig. 1), acquires a sufficient velocity to raise the valve C and close the orifice. The current thus suddenly stopped, causes a great pressure on the water in the chamber B, which is equal to the velocity and weight of the amount contained in the supply pipe (less friction). This pressure forces up the valve D, and permits the access of a quantity of water into the large chamber E, which relieves the pressure, and the water in the supply pipe comes to a rest, and the valve C, being relieved from

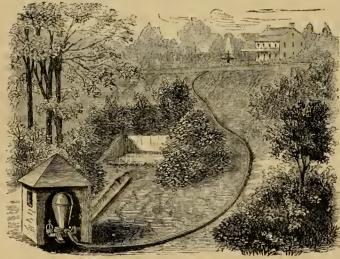

Fig. 2.-RAM IN OPERATION.

pressure, falls down and opens the orifice. But there being a fall of four feet, the current again commences, and the water passes off by the orifice over the valve C, until the velocity has increased so much as to shut this valve again, when the same round of effects ensues. Thus the ram seems to throb and pulsate like a living thing, each pulsation forcing a quantity of water into the reservoir. But this reservoir contains some air, which, being elastic, acts as a spring, and not only reduces the violence of the pulsations, but forces the water out of the chamber into the discharge pipe in a steady stream. It can be easily seen that it only needs to proportion the sizes of the pipes to raise the water any desired hight. If the hight is increased, the quantity is diminished. With perfect work-manship the ram is a very permanent machine, and without care and attention throbs away day and night, for year after year. As a matter of course, it must in winter be safely protected from frost. The cost of the ram is from \$10 to \$50, and a spring may be utilized that will furnish from three quarts of water per minute up to 75 gallons. For instance, a No. 5 ram, costing \$18, would, with a fall of three or four feet, use seven gallons of water per minute, elevating about half that quantity to a hight of fifty or one hundred feet. The cost of the pipe would be additional to the cost of the ram. Figure 2 shows the arrangement of the whole thing when complete. When the cost of the ram and pipe is considered, we could not hesitate on the score of economy to recommend any farmer who has a suitable spring, to bring the water to the house and barn. Considering the constant and wearving labors of the women in a farm-house, the saving to them by having a constant stream of pure spring-water running at the house, would alone pay the interest on the cost twice over, or more, while the benefit accruing to the stock by reason of a bountiful supply of water of a fitting temperature for them to drink will equal the principal in a single season. What investment can then pay better?

## Paving Barn-Yards.

"A Subscriber," Madison Co., Ohio, wishes to pave his barn-yard in the cheapest manner. The paving of barn-yards is a matter of great economy to a farmer, and it is a wonder that so great a proportion is permitted to remain unpaved. The whole of the work can be done by the farm help, and therefore no money need be laid out. The best material is cobble-stones,

chosen of a regular size and shape, the best shape being one longer than it is broad, or somewhat the shape of an egg, blunt at the largest end. The yard should be evenly graded with the plow, and carefully leveled, so that the lowest spot is just where the drainage is wanted, either in the center or at one corner. Then, with the tool represented at figure 1, scoop out of the loose earth a hole large enough to receive the end of the stone, place the stone in the hole, and proceed with the next-ramming the stone down partly with the end of the handle where is seen the iron ferule. Care must be

taken to make the holes deep enough to permit the tops of the stones to maintain a regular level. When a few stones are placed, the operator should stand on them, and then the loose earth scooped up will fall between them, filling up the hollows and making all solid.

When the yard is laid all over, the rammer

Fig. 1.—PAVER'S TOOL.

(fig. 2), which is a round piece of wood as heavy as can be conveniently handled, and shod with an iron ring, should be used to drive the stones

down solidly and firm, keeping a level surface.

When the yard is finished, a barrel of waterlime may be procured, and a thin coating of cement brushed all over, which will make it water-tight. All liquid manure may then be saved, and this item alone will soon pay the expense incurred. With a yard thus paved, and well littered in the center, everything can be kept clean and comfortable. There will be no mud in winter, no danger of cows slipping and injuring themselves, for the surface is rough, and gives a good hold for the feet. Hogs can not root it up when turned out in the yard, and a general improvement will be experienced in every-

Fig. 2.—POUNDER.

thing appertaining to the barn and barn-yard.

## A Piece of Copper Wire.

Something to mend with—that is the great need of us all, especially of those who live in the country, and whose traps are sometimes "rattle-traps," and have a way of breaking

Fig. 1.—coll of copper wire.

at inconvenient times. An old officer of the Coast Survey, who had spent thirty years in field service, once told us that he never went from camp in the morning without having a spool of copper wire in his wagon, and that, as a consequence, he never had a breakdown that he could not repair on the road, or in the woods, or wherever he might be. Harness, wagons, tools, everything almost that is subject to breakage, may be stoutly mended with copper wire, which is flexible and tough.

The best size for such use as we are now considering is the size of a rather large knitting-needle, of which a piece two yards long may be coiled up to about the size of a watch (fig. 1), so as to be carried in the pocket—the end being wound around the coil, to keep it in place. This will, then, always be at hand ready to mend a broken tool.

A longer piece of the same wire, tightly wound on a spool or on a stick, may be always kept in the wagon to repair any damage to it or to the harness. Such a spool as carpenters use for a chalk-line will carry enough for any purpose. If the tongue of a buckle breaks, its place may be supplied as shown in fig. 2. We recently broke the spring of a carriage when far from home, and soon mended it, so that it

was used safely until there was an opportunity to have it repaired, more than a week later. I remove all kinks, and leave the wire smooth

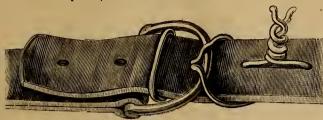

Fig. 2.-MENDING A BUCKLE.

The break in the spring is shown in fig. 3, and the repairing in fig. 4.

We have sometimes while plowing mended a broken trace-chain in two minutes' time, saving a two hours' trip to the blacksmith to have an S-hook put in; and a broken whiffletree has been so bound as to be made strong enough for a season's work without leaving the field. In short, there is hardly anything that can be mended with a string or a rope that can not be much better done with copper wire; and no farmer who has once learned its utility would willingly be without it.

If the supply is kept on a stick or a spool, it should be wound on so evenly and tightly that it will lie perfectly solid, and allow a good strain to be given as it is wound around a broken spade-handle, or anything else that is to be make the wire slip tightly around it (fig. 5), will

and straight. By the same process, a wire that has been once used can be again made smooth, to be wound on the spool for future use.

PRESERVING ROOTS. - As roots are a very bulky crop, and require much room to store them in cellars, in fact much more than many barns

have capacity for, it is often more convenient to store most of them in the field. We are of

opinion that they keep better thus stored-coming out much juicier and sweeter at the end of the winter. A very convenient and rapid mode of pitting them is to take the plow and open out a row of hollows through the field, twenty feet long and six feet wide, leaving spaces of six feet between the ends of each, finishing them with the shovel until the pits are a foot deep. Draw the turnips, and pile them up as high as they

will stay without roll-

ing down. Then, with the plow, turn furrows on to the heaps, and keep plowing earth towards them until there is sufficient to cover them a foot and a half in depth. As the pits are in a row, this is rapidly and easily done by passing down one side and up the other. The roots are then in heaps of

storing roots in this manner, they will be sometimes found touched with frost at the north end of the pits, unless some coarse litter is thrown over them there as a protection. This should be done if possible, but otherwise no protection is necessary. If this plan is followed in storing roots, no great

essarily incurred in providing cellar room. A cellar that will hold one pit at a time conveniently is all that is necessary, as that amount can be drawn in at any time without trouble. Carts are much handier than wagons for such work as hauling roots-the unloading is the work of but a moment.

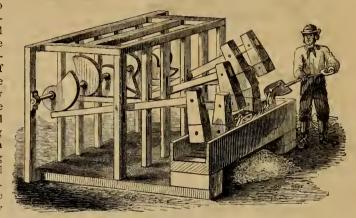

expense is nec-

Increased attention is being given to the use of bones for manure. It is quite imperative on farmers to restore them to the soil whence they have been taken if they would keep up the fer-

tility of their farms. The great difficulty in the way is the high price of the bone when reduced to a proper state for manure. Bones can be got

in quantities for \$20 a ton, but ground bone is worth something like twice that sum. We are often asked if there is a machine for crushing bones that can be got at a reasonable price, and can be relied upon as efficient. Several bone mills are advertised, but we have not seen them in operation, and can not say how well they work. We give a drawing of a stamping machine, which we think might be put up for the purpose of crushing bones for their customers by some of the country millers who stamp and grind plaster. The bones might be afterwards ground in a pair of burr-stones used for plaster or feed. This mill might be put together for a comparatively small sum by any mill-

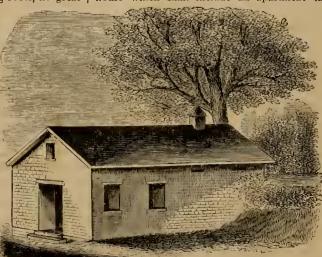

STAMPING-MILL FOR BONES.

wright, as it is wholly of wood excepting the stamp-heads and stamping block, which are east iron. Mills of this kind can be run by five horse-power. Such a business as this, interesting as it does a whole community, could be well undertaken by a co-operative company of farmers, or an agricultural society, who could doubtless rent the power of almost any country miller who has water-power. There is no patent on the stamp-mill. It has been in use for many years for breaking stone and the hardest kind of ore, both of iron and copper, and has done its work well. We do not see, therefore, why it should not crush bones of the toughest kind perfectly.

## An Ice-House with a Cool-Room.

We are requested to give plans of an icehouse which shall include an apartment in

ELEVATION OF ICE-DOUSE.

which meat or milk may be kept cool. One very important item in putting up such a building is the location. This should be dry, and if

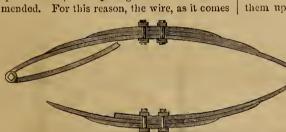

Fig. 3.—THE BROKEN SPRING.

from the store, should be fastened by an end to a about 200 bushels each, which can be taken nail in the fence, or otherwise, so that it can be successively as they are wanted for feeding. In

Fig. 4.—THE SPRING MENDED.

drawn taut. One turn of the wire near the fence should then be taken around a hammer

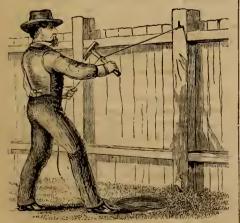

Fig. 5.—STRAIGHTENING THE WIRE.

handle, or other smooth piece of hard wood, which being drawn back in such a way as to possible on the side of a hill, into which a part of the house may be built. This will enable the unloading of the ice to be much more easily accomplished, as the door may be made in the back of the building, and the sled or wagon drawn close up to it. The blocks of ice will not then need to be lifted in piling them up. A drain should be made to carry off all water

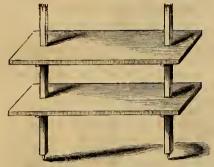

Fig. 2 - SHELVES IN MILK-ROOM.

from the melted ice. A piece of lead pipe, bent in the shape represented at a, fig. 3, should be made to carry off the water; any current of air would thus be prevented from entering at the bottom, which would be fatal to the preservation of the ice. The size of the ice-room should not be less than ten feet inside. The walls are double. They may be of common boards, battened over the cracks, and a space of ten inches should be left between them. This space may be filled with any light, dry, porous material. Sawdust, tan-bark, swampmoss, chaff, or charcoal-dust would either of them be excellent material for this purpose. The filling should be carried up to the eaves. The roof need not be double, but it should be tight, and ventilators should be made just below the eaves and out of the roof, to allow a free current of air through the top of the honse. The doorway leading to the milk-room needs no door, but short boards put across as the ice is built up, which may be taken away again as

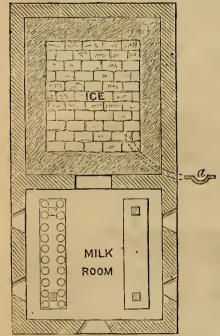

Fig. 3.—PLAN OF ICE-HOUSE AND MILK-ROOM.

the pile is decreased by use. The ice should be cut in blocks nearly of a size, and packed away as closely as possible, filling up all crevices with small pieces. Choose cold weather for this business, and open the house so that it may be thoroughly reduced in temperature. Pack

around the ice a foot of sawdust or tan-bark, well trodden down, and put two feet in depth on the top of it. The dotted space in fig. 3 shows the sawdust. The milk or meat room is seen at the front of the plan, with ranges of shelves on each side, and windows at each side for ventilation. They may be closed with wiregauze double windows, to exclude the heat in summer, and shutters. The shelves are built on central posts which pass through them, and on which cross-pieces are fixed (resting in slots cut in the post) to sustain the shelves. The posts rest on small iron pins, which fit into a hole in a flat stone or brick in the floor, and are fastened to the ceiling above. The shelves should be placed so far from the walls that mice can not leap on to them, and as they can not climb up from the posts, the milk, meat, etc., on the shelves are preserved from them. Fig. 2 shows the construction of these shelves, and fig. 1 the whole building, which is all the better for being shaded by a few trees. A coat of whitewash over the whole, including roof, would keep the interior much cooler, as the heat would be reflected and not absorbed.

## Shelter for Stock.

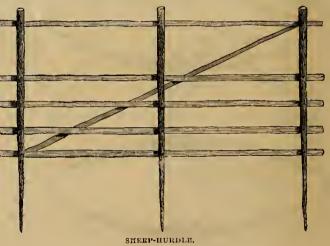

We should provide comfortable shelter for stock, not only from motives of humanity, but also because it affects in a large measure the profits of keeping and feeding them. Every inch of snow melted on the back of a cow or an ox will tell on the profits of that animal next

season. There will be so much the less butter and so much less beef for the owner to sell. So much more risk, too, of losing his animals altogether, when, having passed through the snows and sleets of a hundred wintry nights, they come weakened and worn-out to gasp under the first hot suns of the spring. Thus it is we hear of this farmer having a cow "lifting," or that one having an ox that requires the help of three or four neighbors to get him on his legs. And what showing would the cost of feed of these animals make on

the account-book, if such a farmer keeps one! He would find that a large portion of his feed had become dissipated in the frozen air of the north winds; that a good portion of hay or corn had gone to melt ice and snow and evaporate cold rain-water, and that what was left after these things had been done, had barely sufficed to keep life in his beasts. For in this case philosophy, or science, or bookknowledge, call it what you will, is thoroughly corroborated by practice. If two beasts are fed alike, except that one is kept well stabled and the other out of doors exposed to the cold, the one thus exposed will consume just double the amount that the other will, and will be in worse condition besides. Every man who keeps a cow knows this to some extent, though he may not know the exact figures. Here we give themthey are the result of a careful experiment made by a trustworthy feeder, viz.: Two lots of sheep (of five each) were selected, of equal weights and conditions. One lot was kept out of doors and unsheltered, the other kept in a close pen. The lot unsheltered atc 1,912 pounds of turnips against 886 pounds eaten by the other lot. The gain in weight was 23 pounds per head in the first lot and 28 pounds per head in the second. The profit can be figured out by any man who knows what turnips and mutton are worth. Had not the feeding been abundant, some of the exposed sheep would have died. And yet sheep will stand more exposure than calves or heifers, or even full-grown cattle. Notwithstanding all this, every winter's day one may see young calves humped up and stiffened with cold, shaking in the keen breeze, and their owners knowing at the same time that a year's growth is thus frozen out of them. This comes of not figuring up profit and loss.

## Sheep-Hurdles.

Light, cheap, easily made, and easily erected hurdles are a necessity where sheep are kept. The hurdle figured on this page is made of small round poles from two to three inches thick; the cross-bars are of smaller poles, split, and may be either nailed on to the upright posts, or the ends trimmed and inserted into holes bored in the posts to receive them. They should be nailed to the middle post, and the ends should be secured by nails. A wooden mallet is used to drive them into the ground, when they are required to pen sheep feeding on turnips, or where the ground is soft or mellow enough. Where the soil is too hard to drive them, a light iron bar is used to make the holes, into which the sharpened points are driven with the

mallet. The winter is the proper season in which to procure the materials for such things as these, and put them together, ready for use when needed. Fifty hurdles, ten feet long, will inclose a quarter of an acre; sixty will inclose half an acre, if placed correctly.

## Oats with Wheat.

We occasionally see the practice of sowing oats with fall wheat recommended. It is claimed by those who practice and defend this plan that the oats shield the young wheat plants and protect them from the effects of frosts; that, dying down after the first heavy frost, they form a sort of mulch, which not only affords protection to the wheat during the winter, but nutriment afterwards, when they rot in the spring. We do not consider this reasoning sound, and the custom we think one not to be commended. If a mulch is required—and nothing can be more desirable under certain circumstances—let a mulch be given that will not rob the wheat

plants of greatly needed nourishment. Every blade of oats growing in a crop of fall wheat is a weed which exhausts the soil and smothers out the crop. The apparent gain (if any) is only secured by a fatal weakening of the wheat. A weak stand will inevitably suffer by winterkilling, when a vigorous one would survive perfeetly. Thus the practice brings about the very conditions it is intended to prevent. We strive to clean our soil, and enrich it in preparation for a crop, and then undo our work or destroy its effect by crowding that crop with rankgrowing weeds. For oats grow much ranker than wheat, and the crowding and smothering effect is in fact a greater injury than the abstraction of nutriment from the soil. A few tons of straw or swamp hay scattered over the field would be a mulch without doubt. But we do not care to mulch our wheat. We would prepare the ground well, sow early in drills, let the drills run across the line of prevalent severe winds, which will prevent exposure by drifting of soil from the roots, and let the crop have the advantage of all the light and air possible without covering it with any mulch. If a mulch is used, let it be when danger is apprehended from severe weather on bare ground in the winter, and when the wheat is dormant. But not when it needs all the strength it can gather from manure, air, and light to prepare its forces to resist the severity of winter.

## Fall Plowing of Corn-Stubble.

There are more good reasons than one, why a corn-stubble should be turned over before winter. Having been in grass the previous year, there was a sod turned down in the spring. That sod is very unevenly mixed in the soil. If it was a good heavy clover sod, with strong roots, there will be a large amount of vegetable matter still left in the soil that was unappropriated by the corn crop. This should now be thoroughly mixed up by a fall plowing, that whatever soluble matter remains may be absorbed with more facility by the soil; besides, the intimate mixture will render the soil more open and amenable to the influences of frost, air, and moisture. Then the refuse of the corn crop, the large amount of stalks and roots turned under now, while they still contain some portion of sap, that will cause them to rot when buried in the moist soil, will add considerably to the store of nutriment for the following crop of either oats or barley. Left standing exposed during a whole winter, corn-stubs become dried up and difficult to rot, and are found, after a plowing and harrowing, scattered over the surface in an uncomfortable manner. This may be prevented by fall plowing, and a benefit snatched from what would be otherwise a nuisance. Then one more but chief advantage is the forwarding of the spring work, enabling the spring sowing to be done in good season, that the corn-ground may be attacked in time. It is not your forehanded farmer who gets bad crops because of bad seasons, late springs, and late plantings, but he who is always driven by his work, and has always two things waiting to be done, and he knows not which to do first. Such a farmer is always in a quandary, works hardest, and has most trouble, most anxiety, most losses, and, alas! smallest crops and least profit.

TOPPING AND TAILING TURNIPS. — With proper care, a large amount of extra feed can be gathered in the process of taking up turnips

or mangels. As soon as the time has arrived for taking up the roots, a man provided with a sharp, heavy hoe walks along the rows and strikes off the tops. These are gathered up, and carried either to the barn or feeding sheds, or to the fields, where they will supply sheep or horned stock with a large amount of additional feed. A plow is then run along the rows by a steady hand, which removes the soil from one side of the roots. They can now be gathered and thrown into heaps with a pronged hoe. The hoe should be struck into the earth just beneath or on one side of the root, and a sharp jerk will throw it to the heap. If it is desired to tail the turnips, the sharp hoe should be used to cut them from the tap and fibrous roots; and, at the same stroke, as the hoe is withdrawn, the turnip is thrown out and jerked on to the heap. This process, however, leaves in the ground a large amount of feeding material, and though the turnips require less room to store them when neatly trimmed, we do not think the gain adequate to the price paid for it. As they may be stored in the field, room is not so much an object as amount of feed secured.

## Making a Fish-Pond.

F. I. N. writes that "he has good facilities for making fish-ponds, with abundant springs and swamp or waste land, and that many farmers in his vicinity are in like condition."

There is no difficulty whatever in his having fish-ponds, well stocked, in a few years, if he will make the ponds and put in the fish. It is not expensive to make a pond, wherever there is a permanent brook flowing through a hollow or swamp. Of course, the size of the pond will depend somewhat upon the lay of the land and the quantity of water in the stream. Sometimes fifty dollars spent on a dam will flow fifty acres or more. Often the ponds are already made for reservoirs or milling purposes, and are just as good for raising fish as if they were constructed expressly for that purpose. If a brook is already stocked with trout, they will multiply much faster with the aid of a pond. Nothing need be done but to stop fishing in the brook, and let the trout multiply for three or four years. They will increase faster if you supplement natural by artificial breeding. Ten thousand young fry put into the brook every spring, will help the stock very much. You can raise the fry yourself, or buy them, as suits your means and convenience. It is merely a question of dollars and cents. In brooks and ponds, stocked with other fish than trout, we have no hesitation in recommending the Black Bass (Grystes nigricans) for all northern waters. This fish has been thoroughly tested, in many experiments, for over twenty years, and is admitted by all sportsmen to be unsurpassed as a game-fish. It is many times more prolific than the trout, and will make fine fishing in less than half the time. It grows much more rapidly, and in three years from the egg you get one and two pound fish. In old ponds, where feed is abundant, they are frequently taken weighing from four to six pounds. They will hold their own amid the most destructive fresh-water fishes. Many claim that the flesh is quite as good as that of the trout and salmon. All we claim for it is, that it is an excellent table fish, good enough for anybody. In any well-stocked water it requires no feeding. The owner has only to put in his adult Black Bass, and they will take care of themselves, and make money for him while he sleeps. Scores of ponds

in the Northern and Eastern States have been stocked with this fish, and we have yet to hear of any dissatisfaction. We know of one forty-acre pond, stocked two years ago, that is now valued at \$10,000, and it will probably pay the interest on that sum as long as fish run.

## Couch or Quack Grass, and a Properly Managed Summer-Fallow.

A correspondent desires us to give our views on the best methods of destroying Couch grass, and also on what a properly managed summerfallow should be. First, as to the Couch grass. We know of no way of destroying this but plowing, harrowing, and bringing the roots to the surface, and gathering them up and burning them. They are then effectually disposed of. Let this be done persistently and thoroughly. and the pest will be got rid of. If a common harrow does not bring the roots to the surface, make some teeth slightly curved forwards at the bottom, and use them in the harrow, and all the roots will be torn up in time. Second, our ideas of a properly managed fallow are that it should consist of plowing, harrowing, rolling (if necessary), picking up and destroying weeds that can not be killed by any other means, and by the use of all the devices known to agriculture to reduce the soil to a proper tilth and destroy all weeds. If these two things are done by any means-and whatever they may be we do not care, so that the ends are accomplished-we should then say that we had a properly managed summer-fallow. But a fallow that presents a green surface is not properly managed, nor is one in which roots that are tenacious of life are permitted to lie on the surface in the vain hope that the heat of the sun will kill them, but which revive and sprout with the first shower. Work on a summer-fallow must be constant and judicious to be effectual. On page 341, vol. 24, American Agriculturist, is a drawing of a couch-grass rake, well adapted to tear up the roots, bring them to the surface, and gather them in rows.

## Making Cut Shingles.

Producing shingles by hand is a now nearly unused method, for the shingle-machine has been found to shape them much better, and more cheaply. In some parts of the country, far from steam-mills and pine timber, cut shingles are still manufactured.

The work from which these sketches were taken was being carried on at Guyandotte, a town in West Virginia, at the confluence of the Guyandotte River with the Ohio, where some primitive ways of doing things are still in vogue.

To commence at the beginning, we should go up the river to where the gigantic Tulip-Poplars grow, see them cut down and trimmed, divested of their bark, and hauled to some low-lying, convenient spot near the river, where the raftsmen can take advantage of the spring floods to float them on that beautiful, hurrying stream down towards its mouth, near which point our shingle-makers happen to be located for a season. But few of the many noble trunks, rafted every year from their mountain fastnesses, are detained by the shingle-makers. Only the shorter ones, unfit for other uses, are doomed to become roofing material in their hands, they have first to be hauled up the steep bank by an ordinary horsewindlass, and so wound up to the level, as we

see in fig. 1, when it is rolled off the little car to make room for another load. The logs are next sawed into lengths, as seen in fig. 2, a horse being the motive power again. These lengths are about twenty inches, and have to be split the soaking trough (fig. 4), which is filled with water, kept as hot as possible by a fire underneath, and are thus fitted for the cutting operation. This is performed by a machine somewhat on the principle of the guillotine, inasremainder of the block under the knife, now raised again, and the motion is repeated until it is entirely cut up. Two men, accustomed to the work, go on very rapidly, and are able to keep a couple of boys busy in bunching, or

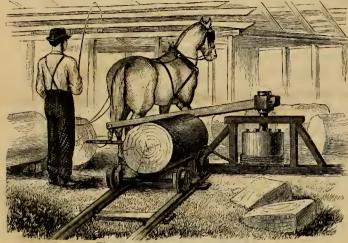

Fig. 1.—HAULING UP SHINGLE-LOGS.

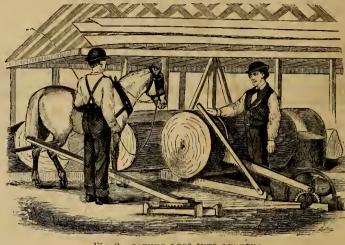

Fig. 2.—SAWING LOGS INTO LENGTHS.

into sections before they can be steamed or boiled, as they must be, in order to prevent their splitting under the knife while being finally cut in shingle shape, thin at one end. Instead of

much as it has a descending knife, under which the block is thrust, as far as the guides will allow. The knife does not fall by a weight, however, but is drawn. down by lever power packing in bundles (fig. 6), such as the ordinary sawn shingles are put up in. Each bundle is intended to contain two hundred and fifty, fastened together by cross-bars with a stick running.

Fig. 3.—SPLITTING THE LOGS.

Fig. 4.—STEAMING THE BLOCKS.

the ordinary iron wedges used by rail-makers, two ax-heads (see fig. 3), driven in with a heavy wooden maul, are preferred, because, the blades being wider, they are less liable to split

(fig. 5), one man being required to hold the wood to the knife, and another to bear down on the lever when it is in position. The cut is instantaneous, and as the shingle is severed from

through them, and prevented from slipping out by pins through the ends.

These poplar hand-made or cut shingles are not so large or so even as sawed pine shingles,

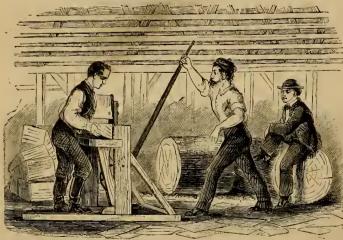

Fig. 5.—cutting the shingles.

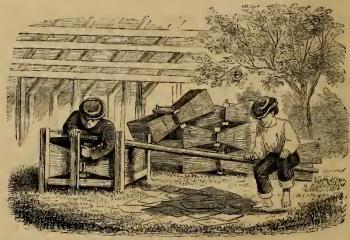

Fig. 6.—PACKING THE SHINGLES.

the wood out of line and waste the material. When a number of logs have thus been reduced to chunks of an average width of ten inches at the broadest point, they are put into

the block, the workman lifts it from the frame with his right hand and tosses it on the heap at his right or left, as it proves sound and of the full size or not, when he instantly replaces the

nor do they command so good a price, and although they serve every purpose for which they are intended, are not likely to remain in usemuch longer, even in the South.

## The Virginian Agave.

Almost every one has either seen or read of the famous Century-plant, or Agave Americana of tropical America. This grows to a gigantic

we do many others, by experience, and next spring we shall know all about it. The engraving gives a portion of the flower spike, about half the natural size, and a very much reduced drawing of the whole plant, to show its habit.

## Plants for a Small Greenhouse. BY JAMES HOGG.

[The articles in August and September upon building and heating a small greenhouse have

# The Partridge Pea.

size, and is remarkable for the length of time it ! requires in cultivation at the North to accumulate sufficient energy to make its first and only bloom. The majority of those who have seen or read about this floral wonder are probably not aware that we have within our own temperate limits a representative—an humble one, it is true-of this giant Agave. In Virginia and Southern Illinois we have the Virginian Agave, Agave Virginica, which grows far southward into Florida and Texas. A friend sent us a specimen, which bloomed this year, and enabled us to present a drawing of it. It makes a low tuft of thick and fleshy leaves, a foot or so across. The leaves are often furnished with spiny teeth on the margins. The flower-stalk grows with great rapidity, and reaches the hight of five or six feet. Unlike the Century-plant, it does not branch, but the flowers are arranged in a simple spike around the summit of the stem, and keep on developing for some weeks. The flowers (about an inch long) are purplish without, yellow within, and somewhat fragrant. Altogether, it is a plant more interesting than showy, being a representative in our cold elimates of a genus that furnishes some of the most striking features of tropical scenery. Those who have described this plant fail to state if, like the Century-plant, it exhausts itself with the effort of flowering. The root looks sound, and we shall have to learn this point, as

Sometimes we give representations of plants that are neither useful nor ornamental, but of such common occurrence, that many friends send them to be named. By publishing an engraving we are able to answer a large number of inquiries at once. The Partridge Pea is very common in sandy soil. It is an annual, with a spreading stem about a foot high, and bearing pinnate leaves of from ten to fifteen pairs of small leaflets. The foliage is very delicate in appearance, and is somewhat sensitive, the leaves closing gradually when the plant is disturbed or plucked. The flowers are in small clusters, bright yellow, and showy. The petals have often a purple spot at the base. The flowers are succeeded by flat pods about two inches long. The botanical name of the plant is Cassia Chamacrista. It belongs to the Pea Family (Leguminosa), although the flowers have not the peculiar shape that characterizes the members of the family that we are the most familiar with. The genus Cassia is a large one, and many of the tropical species are grown in greenhouses. The drug known as Senna is the leaves of several Eastern species, and the leaves of a tall-growing native species, Cassia Marilandica, the Wild Senua, are used for a similar purpose by some physicians, but they are very much less active than the imported article. met the wants of a number of readers, who now ask for a selection of plants with which to stock the house after it is built. We referred the matter to Mr. Hogg, who has given such a collection as he should procure himself. In looking over the list we find things that some may consider old-fashioned, but they are not the less meritorious on that account. The list allows a considerable range in selection.-ED.1

In making a selection of plants for a greenhouse which will be mainly in charge of its owner, and not under the care of a professional gardener, it is desirable to select hard-wooded plants chiefly, as they are the easiest cared for, and do not require as high a temperature to grow them well as do soft-wooded plants: yet some of these latter, such as Pelargoniums, Cinerarias, and winter-blooming bulbs, and succulent plants, as Aloes and Cactuses, are almost indispensable in any collection.

It is a common fault with inexperienced amateur cultivators to purchase any plant in the nursery collections that may strike their fancy, without any inquiry as to their facilities for or any reference to their experience or skill in cultivation. This leads to much disappointment, and at times to disgust, with plant culture. In making such purchases, strict inquiry should be made as to the mode of cultivation, and whether the necessary attention can be given to the plant, and if one is satisfied that the proper cul-

PARTRIDGE PEA. - (Cassia Chamacrista.)

ture can not be given, the plant should not be purchased, no matter how beautiful it may appear in the hands of a skillful gardener. In addition to this, none but strictly winter-blooming plants should be grown in the small greenhouse of an amateur, as the object in having such a luxury is not to make the greenhouse a storehouse for summer-blooming plants, but to have a continual bloom during the dreary winter.

Our selections, therefore, will have especial reference to this desideratum, and we shall divide them into separate classes. We can only briefly name the most suitable genera and species, for our space will not admit of an extended notice or description of each.

## HARD-WOODED PLANTS.

Abutilon. This is a well-known genus of easily grown plants. They grow rapidly, but take up much room in the greenhouse, and on this account should be severely pruned. They require plenty of light. In our opinion, they often displace plants of greater beauty.

Acacias are all beautiful, but some species grow to a great size. A. decurrens and A. cultriformis are two of the best.

Ardisia crenulata, desirable on account of its bright, glossy foliage and brilliant red berries. Azaleas. All the varieties of Chinese Azaleas are elegant, but owing to their being so numerous, and new ones being brought forward every year, it is difficult to say which are the best. We have grown the following varieties with much satisfaction: Admiration, pure white, striped, and flamed with salmon; Baron de Vriere, pale rose, spotted and shaded with crimson, and edged with white; Beauté de l'Europe, white, spotted, and striped with rose; Criterion, salmon rose, edged with white; Empress Eugenie, bright rose, with black spots on the upper petals; Fielder's, white, pure white; Eulalie Von Geest, rose color, shading to white on the edges of the petals, with carmine spots; Iveryana, white, striped, and shaded with rose; Magniflora de Spae, white, washed with salmon, bordered with white, and with dark spots : Narcissiflora, double white : Vittata rosea and Vittata Fortunei; these last two being early winter-blooming varieties.

Burchellia capensis—Beaufortia decussata— Bouvardia leiantha, and its varieties.

Camellias. No collection is complete that does not include several varieties of this superb plant. Of the numerous varieties in the catalogues we recommend the following as being perfect in form and free bloomers, opening their flowers easily, which many varieties do not. The Double White; Candidissima, white, blooming late in the season; Fimbriata, white, with the edges of the petals fringed; Bonomiana, white, striped, and spotted with deep red; Lady Hume's Blush, blush white; Imbricata, deep rose, with large splashes of white; Bealii, deep, rich crimson; Myrtifolia, carmine, shading to pale rose; Saccoi nova, varying in color from pale rose to carmine, and sometimes spotted with white; Teutonia, produces flowers all red or all white, or sometimes half white and half red on the same plant; Commensa, or Reine des Fleurs, vermilion red, sometimes splashed with white; Donklaarii, is a single-flowcred variety, with very large vase-shaped flowers of a deep crimson color, spotted with white.

Chorizema varium—Coronilla glauca—Correa pulchella—C. speciosa, and their hybrids.

Citrus, or Orange. The best varieties for ordinary greenhouse culture are the Myrtle-leaved, the Bergamot, and the Seville, or Bitter Orange. This has very large flowers. The Otaheite is a very pretty, dwarf-growing spe-

cies. Lemons, Limes, Citrons, and Shaddocks are only suitable for large conservatories, as they take up a great deal of room. The three varieties we have named above, are moderate growers and free bloomers.

Daphne odora—D. Indica rubra—D. Fioniana and D. Cheorum—Dracana ferrea and D. indivisa—Diosma ericoides and D. ciliaris—Eranthemum pulchellum—Erica Mediterranea—E. arborea and E. persotuta—Eutaxia myrtifolia.

Fuchsia—F. serratifolia—F. corymbiflora and F. speciosa are free winter-blooming varieties; the ordinary varieties do not bloom until April and May—Genista ramosus and G. rhodaphne—Habrothamnus elegans and H. corymbosus—Heliotropium Peruvianum, and its varieties—Hoya carnosa—Jasminum revolutum—J. grandiflorum and its double-flowered variety—Justicia carnea—J. speciosa and J. nervosa—Kennedya Marryatta—K. coccinea—K. rubicunda, and K. bimaculata—Linum trigynum—Libonia floribunda.

Myrsiphyllum asparagoides and Mandevillea suaveolens, both fine climbers.

Melaleuca elegans and M. speciosa—Metrosideros floribunda and M. semperflorens—Pittosporum Tobira, and the variety with variegated leaves—Polygala myrtifolia and P. Dalmaisiana—Pimelia decussata,

Rhododendron arboreum, and its various hybrids. Many of these latter, as R. Russellianum, are of much dwarfer habit than the original species. A number of new species from the Himalayan Mountains have been introduced of late years; many of these are remarkable for their large foliage and flowers; they require a cool, moist atmosphere. R. Falconeri, R. Gibsoni, R. niveum, and R. ciliatum are very fine.

Rondeletia speciosa—Rhyncospermum jasminoides, a beautiful climber—Thea viridis, the Tea plant—Viburnum Tinus, the Laurustinus, and Monthly Roses.

## SOFT-WOODED PLANTS.

Begonia fuchsioides and B. Ingramii.

Culceolarias. These are generally raised from seeds, obtainable in fine variety at any of our leading seed stores—and the same remark applies to Cinerarias.

Pelargoniums of nearly all the species. Of these the varieties are so numerous, and new ones are so rapidly being brought out, that it is better to make the selections from the catalogues from time to time. P. Comptoniana is a true winter-blooming species.

Pentas carnea and P. rosea—Cuphea eminens and C. platycentra.

Prinula Sinensis. Of this species there are now a great number of varieties, both single and double, white, and of various shades of red. All the double-flowered varieties are desirable, and of the single varieties what are known as the fringe-flowered and the fern-leaved are the finest.

Ruellia formosa—Strelitzia regina and Tetratheca verticillata—Calla Æthiopica and the variegated-leaved variety— and winter-blooming Carnations and Pinks.

## SUCCULENT PLANTS.

Aloe margaritifera—A. retusa and A. variegata—Rochea coccinea—Crassula versicolor and their varieties—Sempervivum arachnoideum and S. tabulaformie—Cereus grandiflorus—C. Maynardii and C. speciosissimus—Epiphyllum crenatum—E. speciosum—E. Jenkinsonii—E. May-Fly—E. truncatum, with its varieties, violaceum and Russchlianum—Echinocactus Eyresii, and E. Ottonis.

## BULBOUS PLANTS.

Hyacinths—Narcissuses—Early Tulips—Crocuses—Amaryllis Johnsoni—A. vittata and their hybrids, and A. undulata.

Lachenalia tricolor and L. quadricolor—Ivia crocata—I. viridiflora and I. speciosa—Ovalis flabelliformis—O. versicolor—O. rosacca and O. speciosa—Ornithogalum arabicum—O. aureum, and O. thyrsoides alba—Sparaxis tricolor—Tropæolum tricolorum—T. Jarrattii and T. pentaphyllum. These three are delicate climbers.—Cyclamen persicum, and its varieties.

## TERRESTRIAL ORCHIDS.

Bletia hyacinthina — Cypripedium insigne— Calanthe veratrifolia — Cymbidium aloifolium, and C. sinense.

## FERNS.

Davallia Canariense—Platycerium alcicorne—Adiantum Capillus Veneris, and A. cuneatum—Blechnum corcovadense-Pteris cretica albo-lineata—P. serrulata, and P. serrulata-variegata—Onychium Japonicum—Cyrtomium falcatum—Lastræa Sieboldii, and Didymochlæna pulcherrima.

## Fruit-Growing about Leavenworth.

The fame of Kansas as a fruit-growing State, honestly won by competition with all the States in fairs held at the East, where the largest and choicest displays take place, had awakened an eager desire to visit Leavenworth, one of the largest and longest-settled towns in the State. It may be that Dr. Stayman, whose heresies about pruning and planting had been troubling the wise men of the East, had something to do with our curiosity. There is generally quite as good occasion for heresy in the garden as in the pulpit, and we always like to meet a man who fights against dogmatism, even if he is a little dogmatic himself. We were hardly prepared for the display of fruits at the Planter's House, on the occasion of the reception of our party. Though prepared under many disadvantages, and drawn mainly from the immediate vicinity, it would have done bonor to any State exhibition. A friend took us out to Dr. Stayman's house in the suburbs of the city, where we found a fine display of fruit. But we there learned that the Doctor had met with so many discouragements on the bottom land of the Missouri, that he had given up fruit-growing in the valley and gone on to the bluffs, some two miles out of the city. Others, less fastidious, keep planting in their city yards, and though they have some blight among the pears, and some varieties of apples fail, they are in the main successful, and raise a great abundance of apples, peaches, pears, plums, and grapes, besides the smaller fruits. Grapes seem to be entirely at home in this valley, all the way from St. Louis up, and we presume much farther north. We found Dr. Staymau where we always like to meet a fruit grower, under his own vine and apple-tree. He has selected the south-east spur of a bluff that extends for miles along the west bank of the Missouri. It is a limestone soil, and the rock crops out in some places. The land was in a rough state, and covered with brush, when he took it in hand a few years ago. The only preparation of the soil was the removal of the brush and deep plowing. The bluff is 160 feet above the Missouri River. The reason for selecting this spot was the more even temperature which he found to exist here. The thermometer shows that the air is five degrees warmer at morning, and five cooler at noon, than in the adjacent valley. This difference in temperature is found to be very favorable for grapes. And this difference probably exists between the high bluffs and the valleys all through the State It is a fact of very great importance to all the settlers, who are just beginning to plant orchards and vineyards, in this region. The high binffs yield the most perfect fruit in the greatest abundance. The soil is a fine loam, naturally underdrained, and was plowed eight or ten inches deep. The varieties of grape planted are principally the Concord and Ives' Seedling. The vines are planted in rows, eight feet apart each way. The supports consist of five poles, four feet long, driven in the line of the rows, for each vine. One foot of the poles is driven into the ground. The system of pruning and tying is very simple. Each vine is allowed to make four canes. These are spread out upon the poles, two upon each side, and tied at each pole. Thus each cane is four feet long.

While the old canes are bearing fruit four new ones are matured, and the old canes are cut away each year. The pruning for fruit is principally done with the thumb and finger, at three different times. Just before the blossom unfolds the shoot is pinched back close to the last bunch left for maturing. They are pinched back a second time, as soon as the leaves are out enough, leaving one leaf beyond the bunch. The third time the same rule is followed, which makes three leaves to each bunch of grapes. All the poor, imperfect bunches are pinched off, leaving about twenty-five pounds to each vine. The new canes are allowed to grow without any check. Following this system, one man will take care of four acres of vineyard. The vines are in perfect health, and the fruit as fine as anything we ever saw of these varieties. He gets about ten cents a pound for his grapes.

The Doctor grows peaches in great perfection. The varieties that succeed best are Early York, Early and Late Crawford, Early Tillotson, and a Seedling that matures by the Fourth of July. The ground devoted to peaches is kept under the plow, and the soil is stirred three times in the season to keep down the weeds.

The Doctor's heresy comes out in his appletrees, and, what is better, the fruit comes with it, in unparalleled abundance. He plants fifteen feet apart, upon a system that provides for the removal of a part of the early-bearing, short-lived trees. He does not prune, and aims to keep the ground shaded, and the trunks of the trees shaded. This he thinks essential under the hot suns of Kansas. The Cooper's Early White is only twelve feet apart. Young trees, that had been out only four years, were judged to yield four bushels of apples on the average. The apples were of very uniform size, and exceedingly fair. The Pennock is a very large, handsome apple, and though not first-rate in quality, brings good prices in market. The Doctor was getting a dollar and a half a bushel for his apples, at Leavenworth.

EVERGREENS FROM SEED .- We continue to have inquiries in regard to raising evergreens from seed. The whole story may be briefly stated. Success depends, in the first place, upon good seed, and in the second place upon the care of the seedlings the first year. They must be shaded or the sun will burn them up, and they must not be too wet or they will rot. Young evergreens require more care than an ordinary farmer, in the press of other work, is likely to give, and if he wishes trees for his own planting, it will be much cheaper for him to purchase young trees of those who make a business of raising them. It is not likely that one farmer in fifty who attempts to raise evergreens from seed will be successful. Young plants a year or two old can be bought at very low rates and can be successfully sent by mail, and it will be much better for those who wish only a few hundreds or thousands, to send to a nurseryman.

# Autumn Colors of Foliage.

We have before suggested that we should, in selecting trees for planting, keep in mind the character of their autumnal foliage. It is so pleasant to have bits of bright color here and there, and they will be all the brighter if brought ont against a background of evergreens. We made a good hit in this way by accident, having planted a Sorrel-tree (Oxydendrum arboreum) in full view from our study-window. We admire the tree for its abundant long strings of Lily-of-the-Valley-like flowers, and placed it near the house. This autumn its foliage has ripened up to a rich crimson, against which the white seedvessels, which look almost like the flowers which preceded them, show in fine contrast.

There is scarcely anything so brilliant at this season as the Virginia Creeper. We daily pass a hemlock directly upon a river bank, and upon its trunk is a dense patch of the foliage of the creeper that in previous years had been a wonder of color. This year it turned a dull brown, and remained so for several days. The other evening we found the brown changed to a blaze of searlet. The color had come in a single day, more brilliant than words can describe. This happened on a warm day, when there had been no frost for weeks. Indeed, it is now well established that frost has little or no agency in producing the autumnal tints of our forests, the most brilliant effects being produced in warm seasons, when the leaves have an opportunity to ripen completely.

Mr. Quinn sent us this spring some cions of a Japanese pear which he said was worth growing for the beauty of its foliage. The leaves are of enormous size, about as large as one's hand, and of a fine, glossy green, which in autumn turns to a brilliant scarlet. We have not seen the fruit and do not know what species of pear it is, but it is highly ornamental, either in its green dress or in its flaming colors.

#### Sending Plants and Seeds by Mail.

No part of our mail service is more valuable than that which carries a pound of vegetable life to any part of our country for eight cents. A package, weighing not over four pounds, can be sent from shore to shore at this rate. It not only brings the seed store to every man's door, but it bridges the long distance between the emigrant and his old home, and performs one of the most acceptable offices of friendship and love. It enables parents to follow their children to their new homes in the trans-Missouri country with constant remembrances of the most valuable kind, at the time when they are most needed. Nothing can be more desolate than a young man in his first season, who has gone out from an Eastern home to pre-empt or homestead upon a Western prairie. His first shelter is a dug-out or log-cabin, with a roof of poles and dirt. There is no fence, no garden, no vegetables, no fruits-nothing to which he has been accustomed. However much he may feel the want of these things, there is no nursery or seed-store close by, where he can supply his need. Every want is pressing, and everything calls for immediate attention. Field crops must be attended to, for he must have the money to pay up or meet the annual interest, or he loses

his claim. Under this pressure, the garden is sometimes uncared for for years. What a boon it would be to the young man if his friends at the East would send him a few of the seeds that are going to waste in their gardens, a few of the plants or roots that would never be missed from their abundance! A thoughtful friend at the old home can in a few hours completely stock a settler's garden, and make him happier all the coming year. Strawberries, raspberries, blackberries, gooseberries, grapes, pie-plant, asparagus, and the seeds of all vegetables, fruits, and flowers, are easily gathered and sent by mail. A cigar-box, 4 × 4, and ten inches long, will easily hold 200 strawberry plants, and by proper trimming the weight will not be over three pounds. The plants can be packed with a little damp moss in a very short time, and sent to the post-office. In less than a week they will be in the hands of your distant friend-a pleasant remembrance at the start, and the material for love-feasts in the coming years. Let our readers remember the pioneers as they gather their seeds, and make provision for another year.

# How to Become a Florist. BY PETER HENDERSON.

R. L. G., of Desmoines, Iowa, asks a question that has been proposed to me certainly a score of times during the past year, a question which, no doubt, concerns others of your readers, and to whom this reply may have some interest. He wishes to know whether, in order to become a florist, it would be best to enter some large establishment for a few years, or whether it is possible for him to learn from reading only. I reply, if he can afford it, it will be to his advantage, by all means, to serve at least two years in some well-conducted establishmentone that has been long enough established to have made the business a success, for the best index of ability in any business is success. I have said, if he can afford it, as for the first two years, unless he prove himself unusually smart, he will not likely be paid more than enough to pay his board, for he is simply an apprentice under instructions, who has come with the design of leaving when he has acquired a knowledge of the trade, and just at the time that he begins to be of use to his employer.

But to those to whom it would be inconvenient to place themselves thus under instructions, a knowledge of the business could be unquestionably obtained from books, particularly if actual practice were followed conjointly with the reading. There are upward of a hundred of my patrons (about one tenth of whom are ladies), located in nearly every State of the Union, who have worked themselves into the florists' business, exclusively by reading and their own practice, having had no opportunity for other instruction. In not a few cases some of these have got ahead of what is known as professional gardeners, those who have had no other experience than that received in private gardens in Europe, which by no means fits them for the American style of commercial floriculture. The increase of taste for flowers for the past twenty years has been truly wonderful. A gentleman who has a turn for statistics in this particular line, informed me that he had begun to procure information from all parts of the country, of the numbers engaged in the trade, together with the capital employed. He said that his investigations for this locality, taken in the rough, extending in a radius of ten miles

from the center of New York Island, proved that the number of florists' establishments was about five hundred, and the capital used in stock and structures upwards of \$6,000,000. If the number of establishments is nearly correct-and there is no reason to doubt it-I am certain that the value is not overestimated, as we have at least half a dozen establishments where the capital used in stock and buildings must be nearly \$100,000 each. And this, too, in New York and its suburbs, where the taste is lower than it is in either Boston or Philadelphia. In

The pure white color, and the singular spiral arrangement of the flowers upon the stem, are sure to attract attention, and besides these it has a very sweet odor, more like that of a spring flower than of one of late antuun. The name Spiranthes means spiral flower, and is applied to a genus of which we have six species. Three of them have the flowers in one row, and the other three, like the one we figure, have them crowded in three rows. The one under considcration, the largest as well as the most abundant species, is the Nodding Ladies' Tresses,

Spiranthes cernua. genus belongs to the large and interesting Orchis family, which contains so many members noted for the singular structure and great brilliancy and beauty of their flowers.

A great number of the plants of this family are epiphytes, or "air plants," as in the moist atmosphere of their tropical homes they live attached to the branches of trees and without any connection with the soil. All of our Northern Orchids - and we have some very beautiful ones-are terrestrial, and, like the Ladies' Tresses, are rooted in the earth. The species we have figured varies much in size and foliage, it growing from 6 to 20 inches high, and specimens have been found which nearly reached the hight of three feet. The long and narrow leaves, which spring from the root, have frequently decayed by flowering time, leaving only those which clothe the stem. We have never tried to cultivate this species, but think it could be grown without difficulty as it is frequently found in rather dry ground.

A single Snow - drop does not amount much-a generous clump of them is bright and cheery. Some talk about their blooming in February, before the snow is off, but those who write thus in this country must have copied from English

works. With a very favorable climate we never have succeeded in getting them in bloom before the end of March or the first of April. Those who love delicate little flowers will admire the Snow-drop. Our engraving shows it of its natural size. It makes no show, but it is welcome for its modesty. An eccentric literary man in England who was very fond of confectionery, used to hide little parcels of sugarplums in all sorts of out-of-the-way places, in order to enjoy the pleasure of coming upon them unexpectedly. That is the way in which we like to grow Snow-drops-put a dozen or two bulbs here and there, and then forget all about them. In spring, when one is looking about to see how things are waking up, it is a real pleasure to come upon the delicate white flowers.

Snow-drops, like other bulbs, should have been planted earlier, but if the ground is still in good condition they may yet be put in and do well.

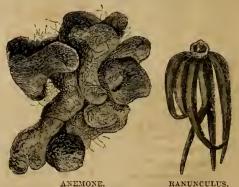

#### Anemones and Ranunculuses.

The bulb catalogues include the Anemones and Ranunculuses, though they are not bulbs in any sense of the word. They are merely dried and

dormant roots or root-stocks. As may be seen by the engraving, the Anemone root looks like a piece of ginger that had been trodden upon, and the Ranunculus root is not unlike a manypronged tooth. Nothing can show less appearance of life than Snow-drop Buth. do these, and it may be on ac-

count of their unpromising looks that American cultivators so seldom try them. We have succeeded fairly in an ordinary horder without any special preparation, only covering the soil with a good coating of litter. To get the best results the soil should be light and rich, well-rotted cow manure being the best fertilizer, and this should be given in abundance. When the plant-

ing is done, cover with litter, or, what is better, put down a frame of boards and fill it with leaves. The colors of Anemones are white, red, and blue, while those of Ranunculuses vary from white and yellow to blackish purple, and frequently diversified with spots and stripes.

those places, no doubt, their excellent horticultural societies have done much to refine the tastes of the people, and it is to be regretted that neither New York nor its adjacent cities, with probably over two millions of people, have a single horticultural or floricultural society.

# Ladies' Tresses-Spiranthes.

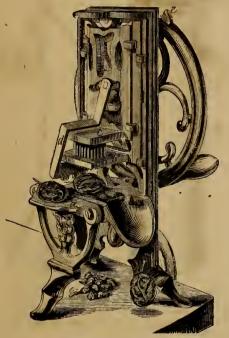

Those who in October search for the Gentians and the few late flowers, must have met the very striking one represented in our engraving.

# THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

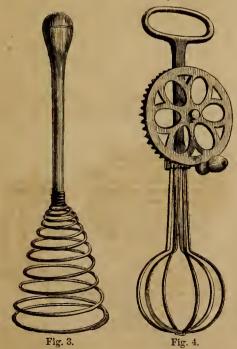

#### A Raisin-Seeder.

A few days ago we saw in a store a little machine which looked like a bit of European workmanship. It had a crank, and when that crank was turned

RAISIN-SEEDER.

there were all sorts of motions, evidently intended to accomplish something; but what that something was we could not guess, and, giving up in despair, had to ask. Here was a pretty position for an editor of a household department—not to know at sight what a household implement was intended for. But we had our compensation. We took possession of the little machine, and submitted it to one after another, and no one could guess what it was for. At last came Mr. Judd, who has the

quickest eye for "crinkums" and the sharpest mechanical talent of any one within our knowledge. He turned the machire, and looked at it in all ways, and then—gave it up. This ingenious machine is for removing the seeds from raisius, and we have had it figured as an illustration of the wonderful

mechanical ingenuity that is at work to facilitate the simple operations of the household. Every housekeeper knows that raisins are all the better for being stoned, and she also knows how tedious is the operation when performed in the ordinary manner. With this machine, the stoning is performed with comparative rapidity. It has so many parts and so many movements, that it is not easy to represent it in a drawing. The machine being fastened to the table by a clamp, the raisins are pushed one by one upon the grating, a. The crank being turned, the plate b comes down and holds it in place; then the plate c, which contains numerous blunt needles which pass through holes in plate b, is pressed down. These needles punch out the seeds of the raisins through the grating a, and to make sure that they will be removed, there works underneath this grating a blunt knife, moved by the notch d upon the moving wheel. As the driving wheel revolves, the arm e comes over, and pushes the seeded raisin away to make room for another. We are aware that this may seem to be complicated when shown in an engraving, but if one sees the machine in operation it appears simple enough.

# ${\bf Egg\text{-}Beaters.}$

It is an old saying that "there is science in sucking eggs." Be this as it may, there is no little

philosophy involved in beating eggs.
light, snowy light, snowy froth which is yielded when the whites of eggs are properly bealen is well known to all good housekeepers. No amount of rubbing of the whites of eggs will produce it—they must be beaten. Now, the result of the beating, by whatever mechanical means it is brought about, is to mix air in minute bubbles with the white of the egg; the finer the bubbles, and the more of them, the lighter and stiffer will be the froth. The simplest and the primitive way is to beat the eggs with a fork. This requires a good deal of time and labor, but when properly done produces good results. A few days ago we requested our neighbor Baldwin, who keeps a furnishing store in Murray street, to show us all the different kinds of egg-beaters he had in his store. The number was appalling, and it was wonderful to see the various ingenious methods that had been

devised for accomplishing so simple a thing as the beating of an egg. We have figured a few of the leading forms. Starting with the idea of a fork, we have several wire beaters, which are only forks in a modified form. Figure 1 shows one of these. There are a half-dozen more, differing only in detail. Next, in fig. 2, we have the wires of the beater contrived so as to form a pear-shaped body; this makes a very large beater, and can only be useful to confectioners and in hotels. It is a refluement on the old bundle of twigs so long used by confectioners and bakers. We next have, in fig. 3, a very efficient egg beater in the form of a spiral wire. The base of the spiral rests upon the bottom of the plate or other dish containing the egg, and the handle being moved up and down causes a very

Fig. 1.

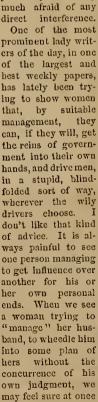

satisfactory frothing of the egg. This is only moving the wires in a different manner from that provided for in figs. 1 and 2. Then we have a whole series of revolving heaters, some of which are to be serewed to the table, and others are held in the hand while the crank is turned. Some have revolving wire frames, and others have flat strips, to which a rapid rotary motion is imparted by a system of cog-wheels; one of these is shown in fig. 4. There are other devices for obtaining a rotary motion. Figure 5 gives an egg-beater to which the motion is imparted by rolling it between the hands. A very ingenious implement is shown in fig. 6, in which the hollow handle has a spiral groove within it, and when this is pushed up and down, the beater is made to revolve with great rapidity. Quite different from the egg-beaters we have already mentioned is the one shown in fig. 7, which acts somewhat upon the principle of a churn. The cylinder into which the eggs are put has a conical bottom, and the dasher is a cone of tin perforated with small holes. It is claimed that by moving this dasher smartly up and down the egg is speedily brought to a froth. We might fill several pages with figures of the different egg-beaters, but we have already given a sufficient number to show the leading features of their construction, and the principles upon which they operate.

# On the Treatment of Husbands.

BY FAITH ROCHESTER.

Adam set the rest of mankind a bad example in more respects than one. "The woman thou gavest to be with me, she tempted me, and I did eat," whined he, when called to an account for his disobedience. Ever since that day, women have been blamed for

most of the mischief
done by men. It
seems to be a common sentiment
among men that
women can make of
them pretty much
what they choose,
yet they are very
much afraid of any

that there is some-

thing wrong about their marriage. The wife does injustice to herself, and to her husband also.

I am thankful myself for any influence that enlightens my understanding or corrects my will-for

anything that makes me more reasonable and ripe as a Christian woman. But no finite creature has any right deliberately to hoodwink my proper faculties,

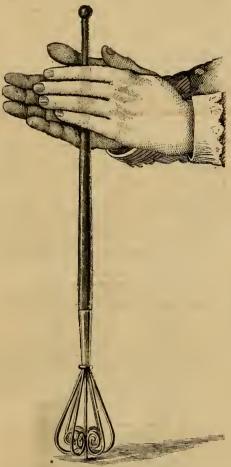

Fig. 5.—BEATER REVOLVED BY HAND.

and lead me about by my weaknesses. The "golden rule," then, forbids my treating others in this way.

It is a part of the ideal of a perfect marriage that there should be capacity for entire frankness between the husband and the wife. They should be able to reason together when they differ in opinion—as the best people sometimes will. Neither ought to desire to conquer the other, but they should seek together to find the right way, and if they are patient, and keep their hearts turned the true way (listening for the Divine Providence), they will come to a speedy agreement, and neither will have juclination to rejoice over the other's mistake.

Among the men of the generation that is gradually passing away, one sees many specimens of arbitrary manners in the family. These elderly men often seem to consider everything about the honse and home as part of their own personal possessions. Not only is it "my farm" and "my barn," but "my furniture," "my household arrangements," and "my children." These men always believe that "home is woman's sphere," but even there their wives have no "right," except to do everything in the way of their husband's preference.

There are young husbands who are setting out in the same unlovely way of life. Can not their wives save them by timely fraukness? "Sweet little wives" will dislike to attempt this. It will pain them to resist the tide or to seem to criticise. But if they have the intelligence to see what these early sprouts of masculine tyranny and impudence will pretty surely grow to if left unchecked, they will find a way to be frank without harshness, and, in most cases, their very dislike of wounding, or of asserting any superiority of judgment, will make itself felt, and win love in return.

I wonder if I make my meaning plain? I wished to say that I believe in a standing of frank friend-liness between husband and wife—in a relation where each respects the tastes, habits, and conscience of the other, where each is willing to hear to reason, and to "speak the truth in love." And

I do not believe in trying to buy love or favors of any kind, by presents of jewelry and trinkets, or by good dinners and fascinating costumes. Wives should try to please their husbands because they love them and wish to do them good. For the sake of the manliness of men, a footing of equal rights between husband and wife is necessary in the family.

It is not "love according to wisdom" that keeps a wife in literal subjection to her husband. It is not kindness to him. It cultivates the domineering, animal nature, instead of true spiritual graces, in the husband. Of course there would be no gain in reversing this, and putting the husband in subjection to the wife. It is contrary to the nature of the true woman to wish to rule others. I think it is also contrary to the best ideal of man. weak, the ignorant, the vicious, we must lead and enlighten and control, for their own good, and for the good of the society of which they are members; and those who are strong, and wise, and good, must bear a certain rule over the immature members; but if society will bend its energies chiefly in the direction of the prevention of weakness, ignorance, and crime, we shall become, more and more, a truly self-governing people. -

# Letter from a Housekeeper.

CHICKEN PIE.—My Euglish friend, who is, by the by, an excellent cook, criticised the chicken pie at the pienic. I thought it very nice indeed the meat tender and well seasoned. But she thought there was not gravy enough.

"In our country, this meat would be entirely surrounded with a little of the chicken jelly."

"And you don't put a cup in the center?"

"Never in a meat pic. You see, the gravy runs up into the cup, and when cold forms a jelly there, whereas you want the jelly around the chicken or yeal, or whatever it is."

"Tell us your way, if you please. How do you make a chicken pie?"

"If the chickens are young, I joint them and seasou with white pepper and salt, sprinkling a little over each piece. I do not stew them, but arrange the parts in a deep earthern pie-dish. After the meat is all in, I place a few bits of butter on top, and pour in enough cold water to nearly cover the meat. A little pounded mace is an excellent addition. I now put on the pastry cover, pare the edge, and ornament as I think best. It must be baked in a moderate oven for an hour and a half to two hours. When the pastry is done, the oven-door may be left open, or a brown paper laid on the top of the pie. I never put in the breast-bone or the back and neck. If these are boiled down with a bit of bacon or a ham bone, the gravy will be nice to put in the pie after taking it from the oven, to supply the waste made by cooking." I think there is hardly anything nicer than an old-fashioued

Pumpkin Pie, and my English friend, for a wonder, thinks they are good, and has asked me to tell her how I make them. I cut the pumpkin into thin slices, and boil it very tender in as little water as possible. When nearly done, he careful it does not burn, as it is apt to do so. When done, drain off the water, and let the pumpkin steam or dry on

the back of the stove for ten or fifteen minutes. Now mash and rub through a sieve. The more milk you put to it the more eggs you will require, and the less milk the less number of eggs. A quart of rich milk to a quart of pumpkin, and three or four eggs, is a good rule. Ginger and nutmeg are

Fig. 6.

my favorite spices, though many like cinnamon and cloves. Sugar or molasses may be used for sweetening. I use sugar in proportion of twoheaping tablespoonfuls to a pie. You must have a

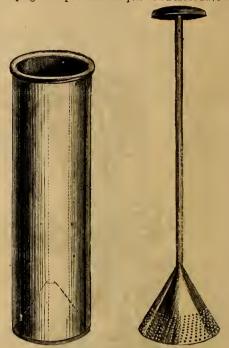

Fig. 7 .- CYLINDER AND DASHER.

very hot oven for these pies, as it is difficult to brown them without. It is a good plan to heat the batter sealding hot before putting it in the pie.

What is to be done with all these

GREEN TOMATOES? But they make a very fine pickle, and if you think best some of them may be preserved. I find that they give very great satisfaction when made into what we call

FRENCH PICKLE.—Gut up in slices one peek of green tomatoes and one dozen small onions. You need not peel the tomatoes. Put them in layers, and sprinkle salt over each layer, and let them stand over night. Now take a quart of vinegar and water, and let the onions and tomatoes boil in it for twenty minutes. Pour off the liquor, and bring them again to a boil in another quart or more of vinegar, to which has been added two teaspoons of mace, two of ginger, two of cloves, two of allspice, one red pepper without the seeds, two teaspoons of cinnamon, and a little more than a halfpound of brown sugar. Let them boil well together for a few minutes, when they may be put away for winter use.

Our Tomato Preserve is made as follows: To every pound of tomato allow a small lemon. Grate the yellow part only of the lemon, and squeeze out the juice. Add a root of ginger, and cover with water. Boil together for nearly an hour. Then take out the tomatoes, and if the liquor is not clear strain it. To every pound of tomatoes, before boiling, add a pound and a half of white sugar to the liquor. Return the tomatoes, and let them boil gently until the syrup enters and they look transparent. Set them aside for a few days, when the liquor may be scalded again and poured over the tomatoes; when they may be put away for use. Carrot Pies.—If carrots are seraped, boiled

CARROT Pies.—If carrots are scraped, boiled tender, and sifted, and afterwards prepared in the same way as pnmpkin, with perhaps a little more milk and eggs, they will make an excellent pie.

Now is the time to gather, dry, and store away for winter use any herbs the garden affords.

Parsley Dried is, I think, as nice as when freshly picked. It is certainly more convenient. I put mine in a scanty layer on a paper in the oven, leaving the doors open. It will very soon dry in this way, and will not lose any of its beautiful green color. It will, however, he crisp. I now crunch it to pawder, and cork it np in a bottle, from which a tablespoonful can be taken at a moment's notice at any time. It will not do to dry other herbs in this way, as many will discolor.

# BOYS & GURLS' COLUMNS.

#### Street Shows in London.

BY ULIVE THORNE.

Wouldn't you think it fanny to see a baby of three years old, walking on stilts three or four times as long as she was herself? And not only walking with perfect ease, but dancing several fancy dances, playing the tambourine, and going through various other exercises, at the top of those fearful stilts?

Well, you would not only see that-if you went to London-but you would see a good many other street per-formances that would seem very odd to you.

You must know that there are so many people to do the work of London, that wages are very low, and the father of a family can not always earn enough to support them. Often, every one of the family, down to the baby, has some way of earning a few pennies, to help buy bread.

But though there are hundreds of trades at which people work, that you never heard of, and many ways of earning a living that you would think horrible, still there is not work enough for all; so many people earn their

bread by some show, or street performance.
You've heard of "Punch and Judy," and probably know that it's a sort of play theater, where the actors are wooden dolls, whose owners move them, and talk for them. 1 don't know how many dozens of these there are But I will tell you about a different kind of street show:

There were two little girls, not very long ago, the daughters of a woman famous for walking on stilts, who were trained, almost before they could staud, to walk on stilts themselves. At three years old they had learned well enough to go into the streets to earn a living.

Think of a baby of three earning its own living! The mother could really do marvelons things. She could stand on one stilt, take off the other, and go through a gan exercise, using the stilt as a gun, and all the time, you must remember, standing on one stilt.

They are not made like our etilts. They are fastened

tightly just below the knee, and the arms are left free.

It was a funny sight, I can tell you, to see the mother and the two little girls, dressed in gay, spangled dresses, walking the streets, on a level with the second-story windows. When they saw people interested, and thought they could carn something, they would stop, and go through their exercises. Of course they always drew a crowd; and when they finished, and handed around a

tambourine, most everybody would give a few pennies.

Besides the stilts, these babies learned to walk and dance on a rope, before they were six years old.

Now I want to tell you young folks a eccret. These babies were no smarter than other babies. They learned their wonderful tricks by simply-practising. At all hours of the day-when just out of hed, or just going to bed, before breakfast, and after dinner, they always had their practicing tools by them, and every few minutes they would try, either to walk on the broomstick their father put between the rounds of two chairs, or to take some new step on the stilts.

Don't ever let me hear any child say "I can't," when

babies can learn to walk a rope.

Another street-showman of London is called a "Posturer," and he does such things as circus performers do, such as tarning wonderful summersets, balancing poles on the chin, keeping a dozen balls in the air, etc.

Some of them imitate the conjurers, swallow knives, eat fire, and such pleasant little things. Of course they always draw crowds.

Then there's a "Street Reciter." He goes to hotels and saloons, everywhere that he finds men idle and ready to be amused. He repeats poems and other pieces, and often he is a very good speaker. When he gets through, ot course he don't forget to pass around his hat.

Telescopes pointed to the heavens from the street corners are common here as well as in London.

One of the most comical street shows is a set of mechanical figures—that is, figures that move by machinery inside of them. The showman has a sort of platform, and the little dolls walk around, and do various funny things to amuse people.

Besides all these, and many that I can't remember, they have not only plenty of hand-organs, but performers on nearly every kind of instrument small enough to carry. It is sad, when there's so much useful and necessary

work to be done in the world, to see grown men obliged to sing ballads or speak pieces in the streets, to put bread in their mouths.

#### Aunt Sue's Puzzle-Box.

That fish story in the September number has proved a terrible poser. However, I suppose the puzzlers are studying their Natural Histories, and that I shall have more to say about it in December. I will give you a nice, easy lot this month.

DECAPITATIONS.

1. Behead an article of furniture, and leave an animal growth.

2. Behead a fruit, and leave an organ.

3. Behead certain water, and leave what you would not wish to be. E. L. CLARK.

CROSS-WORD ENIGMA.

4. My first is in great but not in small. My next is in stable but not in stall. My third is in red but not in pink. My fourth is in water but not in drink. My fifth is in nice but not in good. My sixth is in pine but not in wood. My seventh is in quick, but not in slow. My eighth is in make but not in sew. My whole is a flower, you know it well; So now, dear friends, its name pray tell.

FANNIE BROOKS. GEOGRAPHICAL ANAGRAMS.

- 5. Chewer's test.
- S. Nose trap.
- 6. Beat in school.
- 9. A strap.
- 10. Red dens. T. Nine oil maps.

ADOLPH M. NAGEL

PUZZLE. 11. Search Holy Writ, and you will see A noted warrior fought with me. Behead, on mountain tops I'm seen, Or in the briny deep have been; Behead again, transpose, beware ! Or I may prove a fatal snare. If you again my head should sever, No matter how informed or clever, Tis all in vain, give up the route, For you can never find me out.

F. H. C.

I am composed of 13 letters: My 1, 8, 3, 11, is a command. My 4, 8, 10, is a girl's nickname. My 7, 2, 11 is an article of clothing. My 6, 5, 12, is a quadruped. My 9, 7, 2, 1, is not real. My 13, 5, 3, 7, is something worn by young ladies. My whole may be found on the map of the United MARIA L. BROOKS.

CHARADE.

13. My first a pronoun is I ween, My next a political name is seen. My whole doth tell of time that's past, And shows how long good men did last.

(Fill the following blanks with words pronounced alike but spelled differently.)

- 14. A --- stood near the cage of the -
- 15. A --- person led the ---.
- 16. The was a man of 17. The played upon a —
- 18. A large grew near the -
- 19. The --- fell upon a --- man.

THE ITALIAN BOY.

20. My whole, when suitably prepared, is an article of food; beheaded I am something used in cooking it; behead again and show what you often do with behead again, and leave a preposition; again, and REEN Ross. leave a beverage.

Puzzle Picture.-This young lady has evidently met with a sad eatastrophe, which is the reason she covers her face. See if you can make out the puzzle.

21. A thelih herat kasem a hlomogin gavise.

ANSWERS TO PUZZLES IN THE SEPTEMBER NUMBER.

THE FISH STORY .- 1. Maid. 2. Plaice. 3. Cod. 4. The Fish Storny.—I. Maid. 2. Plaice. 3. Cod. 4. Alewife. 5. Weak. 6. Hodmandod (hudman Dodd). 7. Tum Cod. S. Cat. 9. Dog. 10. Old Wife. 11. John Doree. 12. Poor Jehn. 13. Whale. 14. Pilot. 15. Trumpet. 16. Weak. 17. Ruffe. 18. Bleak. 19. Perch. 20. Rock. 21. Fish. 22. Pole. 23. Shad. 24. Hake. 25. Pike. 26. Wiffes. 27. Pipe. 28. Bib. 29. Anagnams.-1. Elaborate. 2. Solicitude. 3. Personation. 4. Literature. 5. Comforting. 6. Centipede.

Renus.-415. Every man and woman in North America should subscribe for the Hearth and Home and American Agriculturist.

I'll go to tell Him all I've done, 416. And fall before his face; Unworthy to be called a son. I'll seck a servant's place.

AUNT SUE'S address is Box 111, P. O., Brooklyn, N. Y., and Nor 245 Broadway, New York.

AUNT SUE'S NOTICES TO CORNESPONDENTS.

CHARLIE W. T.—Nothing gives me greater pleasure than to hear that "pa and ma helped."

In auswering the "Opposites," Nos. 4, 5, and 6 seem to

in answering the "Opposites," Nos. 4, 5, and 6 seem to have furnished the greatest wariety of answers. To "English nose," Salem answers "Tarkey," Helty "Franchise," and Toursead W. "Duchy;" to No. 5 ("invisible"), they give "incited" and "insight;" to No. 6 ("penniless"), "senseless" and "scentless." Let us have some more "Opposites."

Glad to hear from Mrs. H. J. N., Mrs. M. H., and F. W. Hall, E. M. R., V. Y., O. A. G., and Mary A. S. Thanks for puzzles, etc., to F. W. Hall, R. T. Ishester,

and G. T.

M. E. L.—Numerical enigmas are not particularly "acceptable," especially those constructed upon my own name; nevertheless I thank you for the trouble you took, and for the kind thought involved.

MINNIE.—This isn't just the place to discuss love mat-ters, although love is admitted to be quite a puzzle. If you are really serious, and "have no mother to consult," send your address to your "Auntie," and she will advise you to the best of her abilities.

M. M. P .- 1 will make inquiry about the matter, and tell you the result.

Glad to hear from Freddie W. B., S. D. M., Mary A. C., Mamie W., S. M. Shaw, Bennie, and J. H. G. Thanks for puzzles, etc., to H. Du B., J. T. G., Sallie,

M. D. T., and Alpha.

11. G. T.—Your pleasure adds to mine; thanks.

#### The Doctor Talks about Bears.

The hoys had been to see the animals at Central Park, and came back delighted with their half-holiday. The hears seemed especially to interest them, and for several days they talked about bears, and made sketches from memory of those they had seen in the Park menageric, "Now, uncle," said Walter, "please tell us something about bears; you have been so much in the wilderness

that you must know all about them."....."It is not probable that any one knows 'all' about them, but I will probable that any one knows 'all' about them, but I will tell you about a few that I have seen—provided you will, in the first place, tell me what is a bear.".....'A great, shaggy animal," said Arthur. "And sits up on his haunches, and has claws," added Walter....." That will not do; dogs are great and shaggy, and can be taught to sit upon their haunches, and cats and tigers have We must find some peculiarities that distinguish bears from dogs, tigers, and all other animals." Finding that the boys had not, in their watching the habits of the animals, naticed their peculiar make, I referred Walter to a small compendium of natural history for a description. He turned to the word Bear, which referred him to Ursina, where he read "plantigrade carnivorous animals, cartilage of nose elongated and movable, carnivorous tooth blantly tubercular."—"Whew! nncle, that is just the way with your books; one is none the wiser for them! Oh! yes; a bear is a planti-something, and a carni-something, and now we know all about it.' "As you spent some hours among the hears, and did not notice that they were carnivorous or plantigrades, perhaps you will condescend to learn what these terms

GRIZZLY BEAR.

SUN-BEAR, OF ASIA.

BLACK BEAR.

CINNAMON BEAR.

#### BEARS AT CENTRAL PARK .- Drawn and Engraved for the American Agriculturist,

mean." This brought him back to a teachable mood. He was then told that carnivorous animals are those which eat flesh, and differ from those which live upon vegeta-bles by the form of their teeth, which are of such a shape as to cut or grind their food, as may be required. animals that live entirely upon flesh have teeth that cut like shears. A naturalist can tell by looking at the teeth of an animal what kind of food he lives upon. Bears live upon a mixed diet, and their teeth are less savage than those of wolves and tigers. That hard-looking word plantigrade means walking upon the sole of the foot, which serves to distinguish the bears and raccoons from other carnivorous animals, as all the others walk monother toes and fingers only, the heel of the foot not touching the ground. There are four if not five different kinds of bears found on this continent. The Black Bear is the best known, and is found in a wider range of country than any other. The Cinnamon Bear, from the Rocky Mountains, is so named on account of its color. Some think it is only the Black Bear with a brown coat on, but others think there are differences besides that of color. Then there is the Grizzly of the Plains and California, the largest, most powerful, and most ferocious of all our bears. There are specimens of these three at the Park. The Polar Bear is only found within the Arctic

regions, and is also a formidable animal.
"The Black Bear is the most common, and is the most frequently seen in captivity. It is found in most parts of the country that are well wooded and not very thickly settled. They seldom or never attack any one, unless they receive the first assault, when they sit up on their haunchcs, and fight with their fore-legs. If you should ever meet with a she-hear with her young, you had better give

her a wide berth, as the mother bears are apt to be very cross and savage."...." What does the bear feed upon?"
"Both animal and vegetable food. It will eat any small animals, and to settlers in new countries it is often troublesome, by carrying off their calves and pigs. A bear will carry off in his arms a pig nearly as large as himself. Acorns and other nuts furnish a considerable share of the bear's food, and he is very fond of huckleberries, raspberries, and other wild fruits. He often makes forays upon cultivated fields, and shows a great fondness for roasting ears of corn and sweet apples. Bears, like boys, have what is called a "sweet-tooth," and are particularly fond of honey. They will rob hives whenever they can get a chance, and are great bee-hunters. When they find a bee-tree—which you know is a tree in which bees have found a hollow and there made a home-they climb the tree, and gnaw at the bole until they get at the honey. Of course the bees defend their stores, but the bear is so fond of honey that he is willing to endure their stings, so he gnaws away and growls. might be some consolation to the bees, if they only knew it, that the constant growling kept up by the bear, on account of their stings, often attracts the attention of the hunter and guides him to the spot."

Do bears live in winter by sucking their paws?"

"It is, or used to be, a popular notion that bears passed the winter in sucking their paws. Nothing could be nore absurd. Like many other animals, the bear hibernates—that is, passes the winter in a quiet and dormant state. The bear finds a hollow tree, or a den among rocks, or, failing these, it scoops out a hole in the earth, During the autuma nuts of all kinds are abundant, and at this season the bear gets very fat. When cold weather comes on, he retires to his dea, where he remains perfectly quiet, and to shield his nose from the frost puts his paws over it, which has given rise to the notion that he sucks his paws. He is supported by the fat stored up in the fall, but he does not get it through the paws."
"How do they catch hears, uncle?"

"They are sometimes shot, but as the skin, which is of considerable value, is likely to be injured in this way, they are usually taken in a trap of some kind. What is called a dead-fall is built of logs, and so arranged that when the bear disturbs the bait a mass of heavy logs falls npon and crushes him. The regular trappers, however, use a steel trap, made like those used to catch rats, only many times larger. Bears, if taken young, are readily domesticated, and are easily taught to do muusing tricks. I once saw one at a public garden near New York that was very fond of soda-water; he would open a bottle, and drink it with the greatest relish. It made a good sale for soda-water, as a large number would purchase bottles for the sake of seeing the bear open them."

"But, nucle, tell us something of the wild hears you must have met with in your wanderings."

"I can not; for in truth, though I was three years in a famous hear country, I never saw but one hear. I gave chase to him, but he was going down a rocky bill, and could travel much faster than my horse. I have lived upon bear's meat by the week, and have happened along just as several recently killed grizzly and other bears were being skinned, but it so befell that I never saw a live wild grizzly, though I bave belped eat more than a dozen.'

# Chesapeake and Ohios-Five-Twentics—Central Pacifics.

BANKING OFFICE OF FISH & HATCH, NO. 5 NASSAU ST., NEW YORK, Oct. 9, 1871. )
Of the Fifteen Millions Chesapeake and Ohio Six

PER CENT LOAN, less than one third remains unsold, and this remainder is rapidly being taken up. have thirty years to rno, are especially desirable for investment, can now be bought

17 per cent less than TEN-FORTIES,

20 per cent less than Five-Twenties,

25 per cent less than Sixes of 1881,

and are equally sure to be paid, principal and interest, in gold coin. Price (at present) 93 and accrued interest,

that is, with coupon attached, due Nov. 1st. \$1,000 Chesapcake and Ohio Bond costs to-day \$956.47. \$500 Chesapcake and Ohio Bond costs to-day \$478.23. \$100 Chesapeake and Ohio Bond costs to-day \$95.65.

We have but a limited supply left of the smaller denominations. Bonds are in coupon or registered form, same as Five-Twenties.

When the Railroad is completed in 1872, and the Bunds are dealt in at the Stock Exchanges of the world, we have no doubt they will be equally popular with the Central Pacifics, which now command a premium, and are a favorite security here and in Europe, both roads being prominent lines and under substantially the same fiscal management. Principal and interest of the Central Pacific and Chesapeake and Ohio Bonds are specifically payable in gold coin in New York; the interest on the former being paid January and July, and of the latter, May and November, corresponding with the two classes of Five-Twenties.

We recommend either of them to our friends and castomers with the same confidence that we did the Five-Twenty Bonds, when we were selling millions of them for the United States Government.

We boy and sell Five-Twenties, Ten-Forties, Eighty-Ones, and Central or Western Pacifics, or receive them io payment for CHESAPEAKE AND OHIO Bonns at their current market price. Orders for Chesa-peake and Ohio Bonds, accompanied with Drafts or Checks, may be forwarded to us by mail, and the honds will be sent by express, charges paid.

### FISK & HATCH.

P.S .- Accounts of Banks, Bankers, and others received,

on which we allow Four per Cent interest.

Certificates of deposit issued and collections made in all parts of the Union.

HARVEY FISK. A. S. HATCH.

Facts for Housekeepers.-No one doubts the value of a patent Universal Clothes-Wringer, and no one after one trial will find less reason for doubting the value of a Doty Washing Machine. If one is complete and labor-saving, so is the other. - Cleveland (Ohio) Farmer.

# WATCHES!

The Famous Railroad Time-Keepers.

NEW YORK CENTRAL RAILEGAD, GENERAL SUPERINTENDENT'S OFFICE, ALGANY, March 26, 1870.

T. M. AVERY, Esq.,

T. M. Avery, Esq.,
Pres't National Watch Co., Chicago:

Dear Sir: --In answer to your inquiries as to the Watch I
have of your manufacture, I would say that I have carried some four months, and find it a good, reliable time-keeper it some four months, and find it a good, reliable time-keeper. The movements seem perfect; it runs regular, and I see no difference in its register of thne whether I carry it about with me in the office or when traveling by trains. I do not he state to recommend them as reliable Watches, with perfect works running with great accuracy, and well adapted for use of railroad men or others that wish good Watches. Besides, they are the production of our own country's mechanics, and that, together with their merit as time-registers, should certainly give them preference over imported Watches, however good the reputation of foreign makers may be.

Yours truly,

J. TILLINGHAST.

Similar testimoutals to the above have been received from the General Sun'ts of the Union Pacific, the Chicago, Alton. and St. L., the C. and R. I., the C. and N. W., the Eric, the Hudson River, the Pean, Central, the Mich. Central, and the Mich. Southern Railroads. The Penn. Central R.R. are furnishing the Elgin Watches to their engineers. Nearly 200 are now in use upon that line owned by the Company. Not the least among the causes why this leading and splendidly managed road has never met with a serious accident in the running of its trains, is the reliability of these time-keepers.

From the above testimony, it is claimed for them that they are the standard Railroad Watches of the Country.

FOR SALE BY ALL JEWELERS.

The Eigin Illustrated Almanac, or the Illustrated Article on "Ancient and Modern Time-Keepers," by A. D. Richardson, sent free upon application to National (Elgin) Watch Company, 127 and 129 Lake Street, Chicago, or No. 1 Maiden Lane, New York.

# WHAT SHALL WE SLEEP

The attention of every reader who values "Life, Health, and Happiness" is called to the ANSWER to this important question, as found in the wonderful and beautiful

#### WOVEN WIRE MATTRESS

Patented June 16, 1868; Nov. 23 and 30, 1869; Nov. 22, 1870; April 11, 1871.

MANUFACTURED BY THE

# Woven Wire Mattress Company, of Hartford, Ct, SOLE PATENTEES AND MANUFACTURERS.

For Perfect Cleanliness, Perfect Comfort, and Perfect Durability,

The Company claim that this Perfect Spring Bed without Spring; has no rival.

The Mattress consists of 8,000 feet of 18% whre made into perfect cults, and at the same time interlocked by an ingenious process of Double Weaving, by which a fabric half an inch thick is formed, which, when it is stretched on its frame by machinery, forms a bed of remarkable elasticity and strength.

The Wire Mattress is a complete revolution of old ideas as to beds, being a Perfect Sleepling Arrangement in itself, with the addition of a blanket in warm weather. For ordinary use, however, a thin hair mattress is destrable; but this is the only covering necessary, and on this account the bed is the CHEAPEST ARTICLE IN MARKET.

All the vexing repairs usually necessary in almost every other hed are avoided, and they are gnaraateed

# NEVER TO LOSE THEIR SHAPE OR NEED A REPAIR.

This wire fabric is as Noiscless as India-Rubber Cloth, which is a strong recommendation to all nervous, restless slocpers. It is destined to be THE POPULAR BED of the country.

These beds can be found at nearly all the best Furniture Dealers' in the country. When they are not, the Company will send direct, free of freight charges. Address, for Circular and Price-List,

GEO. C. PERKINS, Secretary, Hartford, Ct.

G. B. HAWLEY, President.

AMOR HILLBORN & CO., 44 North Tenth St., Philadelphia. A. S. HERENDEN & CO., Cleveland, O. W. B. MOSES, Washington, D. C. EMMONS & CAMPFIELD, 215 North Sixth St., St. Louis,

And the Trade in all the large towns and cities in the Union.

Also by all first-class dealers in BOSTON.

Ask for the WONDERFUL WOVEN WIRE MATTRESS, and take no other bed.

# CASTERS FOR SEWING MACHINES.

Combination of Patents.

All ladies using Sewing Machines, have experienced great annoyance and much hard work in moying their machines from one part of the room to another for the purpose of getting better light, sweeping, etc., etc., and have wondered why somebody would not get up a Sewing Machine Caster. Every one has wanted them and waited for them, and now here they are.

With a set of these Casters the machine is allowed to stand firmly on its feet (not on the Casters) while sewing; but by an ingenious, simple, and self-operating device, it is allowed to rest upon the Casters for moving about.

Manufactured by SARCENT & CO., 70 Beekman St., New York.

# Sold by Sewing Machine Agents Generally.

(27) On receipt of \$2, we will forward a set of these casters, express paid, to the nearest express station, to any address the United States north of North Carolina and Tennessee and east of the Missouri River.

Beyond this houndary, a special arrangement as to expressage will be necessary.

When ordering, be sure to mention the name and particular style of machine for which Casters are wanted.

# LARGE PAY For Spare Hours, **ForEveningWork** For Rainy Days, and

for those Seeking Employment.

GOOD FOR

Farmers, Gardeners, Nurserymen, Mechanics, Physicians, Ministers, Teachers, Ladies, Children,

Postmasters. Merchants, Lawyers, Students, Clerks, Conductors, For ALL.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in announcing a new general Premium List for 1872 superior to anything before offered. The best premiums of last year are retained, and many new and valuable articles are introduced.

The design of this Premium List is fully explained on page 368 of Amer. Agriculturist, Oct., 1871, which please sec.

These premiums have engaged the attention of all classes in past years, and over 13,000 persous have found pleasure and profit in them.

They are all new, first-class, valuable, reliable articles, just as good as money. The assortment is so large that every one will find something needed. See table and descriptions.

Any person who chooses may collect a small or large list of subscribers and receive the premium. It is only necessary to show a copy of the paper, explain its value, and collect and forward names.

It has been done largely at stores, shops, post-offices, etc., and by private individuals. By Co-operation, Ministers, Teachers, Churches, Sunday and week-day Scholars, have obtained Melodeons, Libraries, Cyclopedias, Dictionaries, etc., also Sewing Machines, and the like, for poor widows and others. Many professional men have opened and made up good premium lists at their offices. Clerks in stores and post-offices have materially increased their salaries thus, while infor themselves or for presents to others, all without the use of working hours, and at no money cost.

As a constant Business Employment, some persons canvass all the time, receive the premium articles, and sell them for eash, and thus seeure large salaries. One lady has averaged over \$3,000 a year for years past, and others are getting large pay for their time, often \$5 to \$20 a day. Some who did poorly at first have, by perseverance, acquired the art of canvassing, and become very successful. The work is houorable. The Journals are useful in every family in City, Village, and Country.

The American Agriculturist is everywhere known and approved. HEARTH AND HOME is now without a superior in the world as a splendidly illustrated Weekly Newspaper, for real value, cheapness, and adaptability to every home in America. The papers are entirely different. Taken together, they supply over \$30,000 worth of fine engravings, and more good reading than can be found in fifty books costing one Dollar each.

Premium Clubs can be made up of subscribers to either paper, or partly of both, as noted over the Table. We call especial attention to the last column of figures, showing the small number of names required where both papers are taken, at the reduced price of \$4 a year.

You, Reader, can get a Premium. TRY IT.

# Explanatory Notes.

Read and carefully Note the following Items:

(a) All subscribers sent by one person count, though from one or a different Post-offices. But....(b) Tell ns with each name or list of names sent, that it is for a premium ... (c) Send the names as fast as obtained that the subscribers may begin to re-ceive the paper at once. You can have any time, from one to six months, to fill up your list...(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premiam clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers.... (f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$3.50; also at the rates of \$4 a year for both papers together.]

N. R.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way I remium Clubs can be made up from the 2nd and 4th columns, or from the 3d and 5th, or wholly from the 6th column. 6th column, (1) (2) 0r (3) (4) 0r (5) 0r (6) Both

| l | Table of Premiums and Terms,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           | meri           |                                  |            | r (5)<br>Irtii             | Bot                  |

### Descriptions of Premiums.

(For number of Subscribers required, see Tuble, page 433.)

Nos. 1, 2, 3, 4, 5, 6.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign goods. Messrs. Patterson Bros., 27 Park Row, who supply us with these articles, are also importers of English goods. They recommend these Knives, mannfactured by the Merlden Cutlery Co., as equal to any Cutlery in the market, and their recommendation is a guarantee, wherever they are known. We offer four kinds of Knives, and three sizes of each kind. No. I have Rubber Handles, which are netually boiling-water proof, so that, if they were accidentally to remain in it for several minntes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$14....For 23 subscribers at \$1.50, or 78 at \$1, we will give either the median size or the table size, sold at \$15.50. No. 2 have Ivory Handles, are selected with great care, have Steel Elades, and are beautiful goods. Dessert size, with Forks, sold at \$18.50....For 31 subscribers, at \$1.50, or 100 at \$1, we will send the neclium size, sold at \$20.50....For 34 at \$1.50, or 112 at \$1, we will send the Table size, sold at \$25.50....For 37 subscribers at \$1.50, or 112 at \$1, we will send the Table size, sold at \$25.50....For 37 subscribers at \$1.50, or 118 at \$1, we will give the medium size, sold at \$25.50....For 39 at \$1.50, or 120 at \$1, we will send the Table size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.00....For 30 at \$1, we will give the medium size, sold at \$25.0

No. 7.—French Cook's Knife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Pat. Rubber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by the Meriden Cuttery Co.

Nos. 8, 9, 10, 11—Pocket Knives.

—Ilere's for the Boys and Girls!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are made by Hesses. Smith & Clark, Bronxville, N. Y., whose work is equal to any done in this country or Europe. No. 8 is a neat, substantial Knife, with three blades and buck-horn handle. No. 9 is a still finer article, with four blades and buck-horn handle. No. 10 is an elegant Knife, with four blades and shell handle.

No. 11 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 12.—Multum in Parvo Pocket Knife.—This is a most attractive as well as useful Premium. It comprises, in one knife-handle, a large and a small blade, a screw-driver, a saw, a strong hook, a nutcracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim panch, and, in addition to this, it can be used for various other purposes which will at once suggest themselyes to any smart boy or man. The knives will be sent anywhere in our country, post-paid.

No. 13. — Cake Basket.—A new pattern, oval-shaped, nicely chased—a very taking, useful, and beautiful table ornament. This, with other articles that follow, is made by the Luclus Hart Mannfacturing Co., of Nos. 4 and 6 Burling Slip, New York City, and is warranted by them to be of the best triple plate. Mr. Hart, "the veteran Sunday-school man," was engaged in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and have taken pleasure in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrily of the manufacturer. We could give nearly as good-looking plated ware for less than half the money.

No. 14.—Casters and Fruit or Cake Basket Combined.—This is a new pattern, both novel and beautiful. It can be used as large, showy Casters, with six cut-glass buttles, or be instaatly changed into complete Casters, with Call-Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers and of equally good quality as the preceding.

No. 15.—Revolving Butter Cooler.—This is a really good and useful article. It is so arranged that a very little ice in the holder under, the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same house as No. 13.

No. 16.—Card Receiver. — This is a beautiful ornament, as well as a useful article. It is finely chused and gilt-lined, and, like the three preceding, is from the Lucius Hart Manufacturing Co.

No. 17.—Nut Picks and Crackers.

Here are twelve nut-picks, elegantly chased, of medallion pattern, with two handsome nut-crackers, in a morocco-covered case. From the same house as No. 13.

No. 18. Half-Dozen Napkin Rings.—These rings are beantifully chased, and in a morocco-covered case. From the same house as No. 13.

No. 19.—One Dozen Teaspoons.—
No. 20.—One Dozen Table-Spoons.—
These are "figured tips," Olive-leaf Pattern, all of the
same metal, plating, etc., and from the same makers as
No. 13. They are far cheaper than anything we have
found at half the price, and well worth working for.

No. 21.—One Dozen Table-Forks.

—The same description and remarks apply to these as to No. 20. We select as preminms only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 22.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the ontside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life keepsake.

Nos. 23, 24, 25.—Gold Pens: with everpointed Pencils, in extension, coin-silver cases.—Premium
No. 23 contains the best No. 4 Gold Pen; and No. 24 the
best No. 6 Gold Pen, which is the same style, but larger.
No. 25 contains No. 7 Gold Pen, in Gold-tipped Ebouy
Holder. Each pen will be sent in a neat leather case by
mail, post-paid. These pens are made by Geo. F.
Hawkes, No. 64 Nassan St., and have obtained
an excellent reputation. We have known the maker
and his goods for many years, and can recommend them.

No. 26.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same makers as above.

Nos. 27, 28.—Ludden's Patent Magle Revolving Penell.—This is a beautiful Pocket Peneil, which is extended or closed by pulling or pressing the head. They are made with great care, and every Peneil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3.50. They are made by Ludden's Gold P. and P. C. Co., Wm. A. Ludden, Agent, 195 Broadway, who has been in the business thirty years.

No. 29.—Amusette.—We believe in home entertainment for both young and old people. Our observation is, that the increase of entertaining home games is already doing much to keep not only the buys but their fathers away from drinking and gambling rooms, and other places of evening resort not conducive to good morals. This premlum the "Amusette," as it is called, will afford interest to the older as well as the younger members of the family, male and female. It only needs a smooth table of any kind covered with a cloth. The play with the balls will develop much of ingenuity and skill, and give a capital study of the laws of motion, force, etc. The price has been reduced from \$10 to \$6, and our premium will place it in the power of very many to secure this additional source of home amusements. The Amusette is supplied by E. I. Horsman, 100 William Street, N. Y., who will send any desired circulars giving information. It packs in small space and can be safely sent anywhere by express at small cost.

No. 30.—Baby's Chair.—This beautiful Fremium will delight mothers and babies everywhere. It is a chair, in combination with a limited spring, suspended from a hook in the ceiling of a ruom. It gives a young child such a variety of amusement, such varied and healthful exercise, allowing free motion and action

for limb and musele, that it becomes almost an indispensable article to the nursery. It is made of black walnut, nicely finished, upholstered in green, blue, or red, with cords to match, and sold, with the hook, for \$4. L. O. Colvin, 94 Waverley Place, Newark, N. J.

No. 31.— Parlor Kalcidoscope.—
A most pleasing article—one which can not fail to delight all who receive it. The Kalcidoscope is landsomely inshed, with brass object-box, monuted on a neat black-walnut stand. The changes and combinations of colors which may be seen are exquisitely beautiful, and almost numberless. The younger members of the family, especially, will find great entertainment in this elegant premium, which a little effort will secure for them.

No. 32.—Moore's Floral Set.—This is a beautiful Preminm—a complete set of Ladies' or Children's Garden Tools for the cultivation of flowers, consisting of a Floral Hoe, Spade, Fork, and Rake. They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly floished, and each set inclused in a box. They will be found very convenient in the garden and greenhouse, and are pleasing toys for the little folks. Made by the Moore Manufacturing Company, Kensington, Ct.

No. 33.—Steam-Engine. — This is a veritable steam-engine; one that will 60; and a capital, intensely interesting, and instructive article for boys, and grown-up people too. Our eleven-year-old boy ran his engine an average of an hour or more a day-for six months; he has exhibited if in motion to many of his playmates; has hitched on various toy machinery, and it appears to go just as well as when first started.

No. 34.— Garden Seeds.—A valuable selection of 40 varieties of the best seeds, for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next two are put up for us by Messrs. B. K. Bliss & Sons, Seed & Horticultural Warchonse, 23 Park Place and 20 Murray St., whose seed establishment is well known us one of the best in the country. This premium will be of great value and convenience to many, as we send the seeds post-paid.

No. 35.—Flower Seeds.—Like No. 34 this is a valuable premium. It consists of 100 different kinds of heautiful flower seeds, all in separate papers, and includes the finer common varieties, and many of the newer and rarer kinds that are costly. Delivered free.

No. 36.—Very Choice Garden Seeds and Plower Bulbs.—We have taken special pains to have prepared by Messrs. B. K. Bliss & Sons at list of seeds and bulbs of the very choicest kinds, and the most useful varieties. Though some are rare (and costly), all have been tested and found excellent. Here is an opportunity to obtain a valuable assortment of seeds, as this premium allows you to select from the list below any that may be desired, to the amount of two dollars. If more is wanted, it of course is only needful to secure two or more of the premiums, and select seeds accordingly. All delivered free: 1 Pkt. Early Wyman Cabbage, 25c.; Diosecorea Batatas, or Chinese Potato, per doz. bulblets, 25c.; Moore's Early Concord Corn, pkt., 25c.; Laxton's Alpha Peas, pkt., 23c.; Trophy Tomato, ½ oz. pkt., 50c.; ½ oz. Improved American Savoy, do., 25c.; ½ oz. Improved American Savoy, do., 25c.; ½ oz. Improved American Savoy, do., 25c.; ½ oz. Improved Red Dutch, do., for pickling, 25c.; ½ bl. Bliss' Improved 'Long Orange Carrot, 50c.; 1 pkt. Perpetnal Spinach Beet, 25c.; 1 pkt. Boston Market Celery, 25c.; 2 oz. Dewing's Improved Early Turnip Beet, 25c.; 1 pint McLem's Little Gem Peas, 30c.; 1 pkt. New Black Pekia Egg-Plant, 25c.; 1 pint Carter's First Crop Peas, 30c.; 1 pint Crosby's Extra Early Sugar Corn, 25c.; 1 oz. Boston Market Tomato, 50c.; 1 pkt. Bayard Taylor's Watermelon, 25c.; 1 pkt. Conover's Colossal Asparagus, 25c.; 1 pkt. (ten seeds) General Grant Cucumber, 25c.; 1 oz. Boston Market Tomato, 50c.; 1 pkt. Early White Erntri Cauliflower, 25c.; 1 pkt. Early Simpson Lettuce, 25c.; 1 pkt. Perpethon, 25c.; 1 pkt. Early Simpson Lettuce, 25c.; 1 pkt. Perpethon, 25c.; 1 pkt. Early Simpson Lettuce, 25c.; 1 pkt. Perpethon, 25c.; 1 pkt. Early Rose Potato Seed (from balls), 25c.; 2 oz. Conn. Seed Leaf Tohacco, 50c.; 1 pkt. Early Paris Cauliflower, 25c.; 1 pkt. Early Rose Potato Seed (from balls), 25c.; 2 oz. Genuine Hubbard Squash, 50c.; 2 oz. Trne Boston Marrow, do., 50c.; 2 oz. Turban, do., 50c.; 1 lilium lancifolium rubrum, J

No. 37.—Set of Field Croquet.—The game of Croquet is so pleasing, and has become so pop-

nlar, that we believe many will be glad to avail themselves of the opportunity of obtaining this new and beautifu Premium upon terms as easy as we propose.

Nos. 38, 39, 40 .- Sewing Machines. -"A good Sewing Machine lightens the labor and promotes the health and happiness of those at home." We offer a choice of three of the best of the leading machines, all of which have been thoroughly tested in our own families, and give entire satisfaction. While all are valuable, each has some excellence peculiar to itself. The Grover & Baker Machine is remarkable for the elasticity of its stitch, which is at the same time very firm and durable. The structure of the seam is such that, though it be cut or broken at intervals of only a few stitches, it will neither open, run, nor ravel. It sews directly from two spools, without rewinding.... The Florence Machine makes different stitches, stitches, each being alike on both sides of One of its special advantages is that it has the fabric. One of its special advantages is that it has the reversible feed motion, which could be operator, by simply turning a thumb-serew, to have the work run either to the right or left, to stay any part of the seam, or fasten the ends of seams without throing the fabric. The Willoox & Glibbs Machine excels in the exceeding simplicity of its construction. Very little instruction and ingenuity are required to understand the few parts of which it is composed, and their use; and there is no excuse for getting it out of order, until the parts are fairly One of its strongest recommendations is the ease with which it is worked, taxing the strength of the operator less than other machines. All these machines have constantly increasing sales, showing the public ceti-mate of their value. Either of them will prove a great trensure in any household-worth more than \$500. \$500, at 7 per cent interest, would yield, less taxes, about \$32. Most families require at least four months of steady hand-sewing a year, costing, if all hired, not less than \$21 a month, board included, or \$96 a year. With a Sewing Machine, a woman can sew more in one month than in four mouths by hand. Here is a clear-saving of \$72. But far above this—the everlasting "Stitch, stitch, stitch," the bending over the work, and the loss of sleep, have brought tens of thousands to early graves. We say to every man, get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre or two of land—get the Sewing Machine any way. If you can get one through our premium-list—well; but get the machine. -No charge for hoxing the machines. They go safely as freight. Send for circulars, giving full Instructions, to Grover & Baker Mf'g Co., 405 Broadway, N. Y. Florence Sewing M'ne Co., 505 Broadway, N. Y. Willcox & Glbbs Mf'g Co., 508 Broadway, N. Y.

No. 41.—Bickford Family Knit-tlng Machine.—This is a practical and efficient machine, simple in construction, works very easily, makes scarcely any noise, occupies but little space, can be attached to any common table, and be removed instantly by simply turning a thumb-screw. It can be worked by any person of ordinary intelligence, after a careful perusal of the accompanying book of instructions and a little patient practice, A great variety of articles have been made with this machine, and it is capable of producing many more and different kinds. A complete stocking, heel, toe, and all, can be knit in ten minutes by a skillful operator, and socks, sacks, hoods, skirts, nittens, undergariments; etc., in remarkably duick time. Send for circular to Dana Hickford, General Agent, 689 Broadway, New York. For 52 subscribers at \$1.50, or 162 at \$1.00, we will send the machine with black walnut table, price \$33.

No. 42.—Doty's Improved Clothes Washer, with the Metropolitan Balance Weight. Over sixty thousand families in: the United States are now using the Doty Washing Machine, and we believe the improved machine has no superior. The "help!", use it and like it. Send for descriptive circulars to B. G. Browning, 32 Cortlandt St., New York, or to Metropolitan Washing Machine Co., Middlefield, Ct. It goes cheaply by freight or Ex.

No. 43.—Universal Clothes Wring-er.—A very useful, time-saving, strength-saving, clothessaving implement, that should be in every family. The wringing of clothes by hand is hard upon the bands, arms, and chest, and the twisting stretches and breaks the fibers with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which pross the water out better than hand wringing, and as fast as one can pick up the articles. We have given thousands of these premiums, with almost universal satisfaction. They are made by the Metropolitan Washing Machine Co., Middlefield, Ct.

No. 44.—Blanchard. Churn.—, The mannfacturers of this churn have been engaged (father and sons) in the making of churns for over fifty years! They have devoted much time to the scientific investigation of the chemical process of butter-making, and developing the best means for aiding it. They believe they have succeeded, and now offer "The Manchard Churn" as in every

respect the best one ever made. It is not n new thing, as over thirty thousand are now in actual and successful operation. It has no cog-wheels or gearing of any kind. It brings the butter as quickly as it ought to come. It works the butter free from butter-milk in the churn, without any change of dasher, quicker and better than it can be done by hand. It works in the salt in the same way. These churns are manufactured by Porter Blanchard's Sons, and are supplied to us by R. II. Allen & Co., 189 Water st., New York. The churn in the list is No. 5, for about 8 galls, of cream. For 13 subs. at \$1.50, or 45 at \$1, we will give No. 3, for 2 galls, cream, price \$6; and for 18 subs. at \$1.50, or 58 at \$1, we will give No. 7, for 18 galls, cream, price \$10.

Nos. 45, 46.— Melodeons.— These are excellent and desirable instruments, for the Home Circle, for small Churches, for Sunday-schools, for Day Schools, Academies, etc. Instrumental and Vocal Music in a school has a beneficial influence upon the pupils. We have seen the whole fone and character of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer the Melodeons made by Messes. Geo. A. Prince & Co., Buffalo, N. Y., for we know them to be good. A large one in our own Sunday-school room has been in use for twelve years, and is to-day just as good as when first purchased, though used from time to time by a large number of persons.—Several elergymen have obtained this premium for themselves, their Churches, or sunday-school rooms. The clubs of subscribers were quickly raised among the members of their parishes.—Many others can get a Melodeon for their home use. Send a postage-stamp to the makers and get their illustrated descriptive circular. These Melodeons will be shipped direct from the manufactory at Buffalo. They can go safely as freight or by express. If an Organ should be wanted instead of a Melodeon, we can supply it for an increased number of subscribers in proportion to the value.

Vo. 47 .- Steinway Piano .- Seven Oc-TAVE ROSEWOOD CASE, SOLID ROSEWOOD DESK, LARGE FRONT, ROUND CORNERS; OVERSTRUNG BASE, FULL IRON FRAME, PATENT AGRAFFE TREBLE, CARVED LEGS, AND Canved Lyne.—This is one of the most elegant Premiums ever offered; regular and only price \$62.5. That this magnificent instrument comes from the celebrated establishment of Messrs. Stelnway & Sons, Nos. 109 & 111 East 14th St., is enough to say; but it due to these enterprising manufacturers to state that, while their pianos have repeatedly received the Frest PREMIUMS, by the award of the most competent indges the world can produce, at the Universal Exposition, in Paris, they received the Finst Grand Gold Medal for American Pinoos in all three styles exhibited, viz.: Grand, Square, and Upright. The following official certificate was signed by the President and the five members of the International Jury: "Paris, July 20th, 1867. I certify that the First Gold Medal for American Pianos bas been unanimonsly awarded to Messrs. Steinway by the Jury of the International Exhibition. First on the The Society of Fine Arts in Paris List in Class X." The Society of Fine Arts in Paris unanimously awarded Steinway & Sons their only annual Testimonial Medal for 1867. The President of the Musical Department of that Society reports: "The pianos of Messrs, Steinway appear to me, as well as to all the artists who have tried them, superior to all that have been made to this day in the entire world." The best judges in America say the same. We also speak from paragonal knowledge, as anche of corn partyers has overest. personal knowledge, as each of our partners has one at home and desires no better. This splendid premium may be secured by many persons. Only 520 subscribers are required to do it. Several have obtained this pre-mind during the last year. It will pay for even a year's labor. Classes of young ladies at school might unite in canvassing, and obtain a present for a Teacher, or a Pinno for their school-room. We shall be glad to give this premium to a large number. Send to Messrs. Steln-way & Sous for a free circular describing it.

No. 48.—A Good Watch.—The Watches made by the American Watch Co., Waltham, Mass., have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor, with machinery perfect and ample, enable them to offer watches at lower rates than any other manufacturers... Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of over 400,000 Waltham Watches in the poeckets of the people, is the best proof of the public approval. We offer a Silver watch,

jeweled, with chronometer balance, warranted by this Companyus made of the best materials in the best manner, and in pure coin-silver "hunting" case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "American Adriculturist. Made by the American Watch Co., Waltham, Mass."

No. 49.—Ladies' Fine Gold Watch.

This clegant Premium will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 40 above) includes these heautiful gold watches. They are full-jeweled, in 18-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time-Keeper. Upon the movement of each Premium Watch will be engraved "AM. AGRICULTURIST. MADE BY THE AM. WATCH CO., WALTHAM, MASS."

No. 50.—Erecch-loading Pocket Rifle.—This remarkable little fire-arm weighs only eleven onnees, yet shoots with great accuracy and power from 30 to 100 yards, or more, and can be loaded and fired five times a miunte. It can be carried in a side pocket, and is accompanied by an extension breech, so that it may be used either as a pistol or rifle. It is put up in a neat mabogany case, with 250 rounds of ammunition. The manufacturers are Messrs. J. Stevens & Co., Chicopee Falls, Mass., and the rifles are sold at retail by Messrs. Coopen, Harris & Hodgkins, No. 177 Broadway. Without the mahogany case, we will give the weapon, all complete, with 100 cartiridges, packed in a pasteboard box, on receipt of 18 subscribers, at \$1.50 each. For a full description see American Agriculturist for Jan. 1869, page 32.

No. 51.—Double-Barrel Gun; or Fowline Prece.—These guns are the genuine London "Twist" barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their caliber and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this Premium by Messrs. Cooper, Harris & Hodgkins, 177 Broadway, well known as one of the most reliable and best honses in their line of business, and they highly recommend this particular gan, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This Premium ioclodes Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 52.—Chest of Good Tools.—We continue through the special favor of Messys. Patterson Brothers, of 27 Park Row, the offer of chests of the very first quality of tools, of kinds and prices named below. Similar tools could be purchased for half the money, but these are all A No. 1, for practical use, and worth a dozen common articles. For this we have the gnarantee of Messys. Patterson, which is amply sufficient, for us, and for all who know them. Any of these tools may be ordered of them. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and but few additions would be required for a Journeyman Carpenter. The assortment we offer is as follows: 1 Tool Chest, \$8; 1 Jack Plane, \$1.75; 1 Smooth Plane, \$1.50; 1 Fore Plane, \$2.25; 1 Handsaw, 22 in., \$1.75; 1 Compass Saw, 10 in., 50c.; Compass, 6 in., 37c.; 1 Adz-eye Hammer, No. 4, \$1.25; 1 Hatchet, No. 2, 90c.; 1 Draw Knife, 5 in., \$1.13; 1 Try Square, 6 in., 70c.; 1 Bevel, 8 in., 75c.; 1 Chalk Line and Spool, 30c.; 1 Mallet, 30c.; 1 Pair of Pliers (steel), 5 in., 60c.; 1 Pair of Calipers, 4 in., 30c.; 2 in., 45c.; 1in., 60c.; 1 Center bit, ea. ½ in., 30c.; 1 m., 25c.; 1in., 50c.; 1 In., 50c.

No. 53.—Charles Fratt's Astral Oil supplies a great Public Want for a Safe, Reliable, Illuminating Oil. Itis manufactured by him and packed only in the Guarantee Patent Cans, expressly for Family Use. It has more body, and an equal quantity will burn longer and give more light than other oils. The constant recurrence of explosions, firea, devastation, and death resulting from the use of what is called Kerosone Oil—but really a mixture of Benzine, Naphtha, and other highly inflammable substances, the use or sale of which is an infriogement of United States Law—has induced us to place this article on our premium—list as a humanitarian as well as a useful act. The Board of Health of the city of New

York have examined scores of samples of Oil obtained from as many different dealers in this city, and nearly all have been found far below the Government standard and entirely unfit for use. This "Astral Oil" is from the House of Chas. Pratt, 103 Fulton St. Mr. P., a merchant of high reputation, will keep up the article to its present standard. It has been tested, and fully indorsed by the highest scientific authorities in the land. The Guaranty Cans are made of tin, and sealed so that none of the oil can be removed without breaking the seal, thus securing safety in transportation. The can is inclosed in a strong wooden case, and may be returned for refilling. For 19 subscribers at \$1.50, or 65 at \$1.00, we will send a case containing 12 one-gallon Guaranty Cans of Oil, which may be distributed among a club.

Nos. 54, 55.—Mercurial Barometers.—Woodnuff's Patent, made by Chas. Wilder, Peterboro, N. H. These are the most convenient and portable Mercurial Barometers made. (Send to Mr. Wilder for a circular.) The peculiar form of Mercury cup invented by Mr. Woodraff renders these Barometers so portable that Mr. Wilder guarantees their safe delivery, if not to be sent beyond the Rocky Mountains. The instruments are about 3 feet long, differing mainly in the style of case, both being supplied with Thermometer and Vernier. A Barometer is to farmers, or others on land, what it is to sailors at sea—an indicator of the weather to be looked for—and of special value and interest now with the Government Weather Reports.

No. 56.—Buckeye Harvester Mower.—The Buckeye Mower is so widely and favorably known that we need not describe it particularly. In 1870 this machine received the premium at twenty-eight field trials, and several gold medals. Messrs. Adriance, Platt & Co., 165 Greeuwich St., N. Y. City, will send any one a circular, giving full description, engravings, etc. Many a farmer can secure this premium by a very few days' or odd honrs' and evenings' canvassing for subscribers. A few can unite their efforts, each getting a part of the subscribers, and own the machine in common.—Ten subscribers a day for 15 days would seenre it (\$125).—Many can easily raise the necessary club at Town Meetings, Fairs, Elections, and other gatherings, or during evenings. The Buckeye Self-Rake Reaper has been proved to be a very valuable machine and is at least equal to any Reaper and Raker in the market. Those who secure this Mower, can afterward secure the Reaper, which can be attached. We can give, as Premiums, any of the Buckeye machines.

No. 57.—Patent Cylinder Plow.—We hear very good reports from those who have herefore received this premium. It is an Ohio invention, but is manufactured by the well-known firm of R. H. Allen & Co., 189 & 191 Water St., New York, to whom application may be made for descriptive circulars, etc. The kind we offer for premiums is the "Two-horse size, cutting a furrow 12 to 14 in. wide, and 5 to 8 in. deep." It is provided with a wheel and with a "skim plow," like the double "Michigan plow."... For 29 subscribers at \$1.50, or 97 at \$1.00, we will give the Heavy Two-horse, 14 to 16 in. wide, and 6 to 9 in. deep, \$19.00.. For 32 at \$1.50 or 100 at \$1.00, the Two to Three horse, 16 to 18 in. wide, 8 to 11 in. deep, \$21.00... For 22 subscribers at \$1.50 or 75 at \$1.00, the One-horae, 10 to 12 in. wide and 4 to 7 inches deep, \$15.00.

No. 58.—Collins & Co.'s Cast-Steel Plows.—These excellent plows are made by a patented process, of cast-steel recast (not rolled), tempered and polished like a good ax. They will seour in the softest soils, and are great favorites on the prairies. The canvasser has his choice of eight plows named in the manufacturers' circular at the same price (\$25), of which we particularly recommend "C, No. 3" for general use; "B, No. 12" for stubble only; and "E, No. 12" for turf only. Send for circular, giving full particulars, to Collins & Co., 212 Water St., New York.

No. 59.—Comstock's New Hortical-tural Implements Combland.—The Hand Cultivator and Onion Weeder will do the work of six men with hoes. It pulls the weeds and thoroughly pulverizes the soil. It is as much superior to the hoe for all small drill culture, as the mowers and reapers are to the scythe and cradle. The Seed Sover is the most perfect small-seed drill we have seen. It sows Beet, Parsnip, and other difficult seeds, with the greatect regularity, and it is specially adapted to sowing Onion seed at the rate of 4, 5, or 6 pounds to the acre. It is readly attached to the Cultivator. The Strawberry Cutter takes off the runners and at the same time cultivates between the rows. After another year's trial of these implements ou our own grounds, and the entire satisfaction they have given to all who ordered them of us as premiums, we offer them again and recommend them as being all the inventor claims—
"the best in the world." For 19 subscribers at \$1.50, or 65 at \$1.90, we will give the Cultivator and Weeder and Strawberry Cutter, price \$12.00....For 22 at \$1.50, or 75

at \$1.00, we will send the Cultivator and Weeder and Seed Sower, price \$15.00.... For 27 nt \$1.50, or 90 at \$1.00, we will send all these implements complete, price \$18.00. Mannfactured by Comstock Brothers, East Hartford, Ct., who furnish descriptive circulars to all applicants. See cnts in American Agriculturist, page 127, 1869, and page 118, 1870.

No. 60.—Cahoon's Broadcast Seed-Sower.—This is an article that the majority of farmers would be glad to own. The Premium offered is the Hand Seed-Sower. It sows from four to eight acres per hour, at a common walking gait, throwing wheat and rye about 33 feet wide; barley. 30 feet; hemp, 28 feet; oats, 23 feet; clover, millet, and Hungarian seed, 22 feet; and timothy 18 feet. The bag and hopper will hold about 22 quarts—as much as a man can well carry at once. The manufacturers warrant this machine to sow 50 acres of wheat, or 35 acres of oats, or 30 acres of grass seed in ten hours. Made by D. H. Goodell & Co., and sold by R. H. Allen & Co., 189 and 191 Water St., New York, who are the General Agents, and will send circulars if desired.

No. 61.—The American Submerged Pump,—Every family needs a reliable pump, capable of raising water easily and rapidly from the bottom of the well, be it deep or shallow—one that is durable, that will not get out of order, or be liable to injury from frost or gravel. When we add to these the qualities of a powerful force-pump, ability to throw water 60 or 70 feet from a hose-plpc, and a construction which renders freezing an impossibility, though it stand out of doors, we think we have a family and farm pump which we can conscientiously recommend. No. 1 will raise 20 gallons of water a minute, This is the pump offered in the list. No. 2, 30 to 35 gallons. No. 3 will raise two bbls. per minute from an ordinary well; and there are larger sizes. Either of these pumps will be furnished for the same number of subscribers required for other premiums of the same price. The pump is set in the well, and nothing but the perpendicular brake and spout appear above the platform. Send for Circulars, to the Bridgeport Manufacturing Co., Bridgeport, Ct., or 55 Chambers St., New York.

No. 62.—Page's Patent Pump and Sprinkler.—A Hand Watering-Pot, a Greenhouse Syringe, a light Force-Pump and Garden-Engine. It is very simple in construction, light to carry, easy to operate, and adapted to many uses—convenient for washing windows or blinds, carriages, horses; watering plants, etc. Throws a small stream about 40 feet. It is so arranged that the stream can be instantly changed to drops, spray, or mist. For circulars, etc., address the potentee and manufacturer, N. Page, Jr., Danvers, Mass.

No. 63.—Family Scales.—These scales, combining the advantages of counter and platform scales, are peculiarly adapted to honsehold purposes. They weigh from ½ once to 240 lbs. They have a scoop, or pan, for weighing flour, sngar, or other house stores, and a platform for heavier articles, and are just auch an apparatus as is needed for in-door or out-door use, occupying less than 2 feet square. These scales are manufactured by the well-known Fairbanks & Co., No. 252 Broadway, New York, whose weighing apparatua has long ranked as the standard in all parts of the country. Send to them for circulars, if desired.

No. 64. — Crandall's Improved Bullding Blocks furnish a most attractive amusement for children. Churches, Dwellinga, Barns, Mills, Fences, Furniture, etc., in almost endless variely, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequaled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc. This is one of the most successful toys ever inveuted.

No. 65.—Pocket Lauterns.—A very ingenious and valuable Yankee invention—a complete Lautern, yet it can be folded into a parcel 3 by 4 inches long, and 34 of an inch in thickness; it contains 3 little sperm candles, matches, etc., always ready for use, Made by the Merriam Mant's Company (Julius Ives & Co., Agents, No. 37 Barclay St., New York).

No. 66. — New American Cyclopædia.—We can not commend this great work too highly. We wish it could be placed in every family in the country. Scholars at our Academies and Seminaries, and members of Library Associations, can easily unite their efforts and secure it. Young men should devote evenings and spare hours to canvassing for this magnificent and useful premium for their own use. Published by D. Appleton & Co., 90 Grand St., New York. The Cyclopædia is a whole library of itself, consisting

of sixteen very large octavo volumes, well bound, averaging 800 large, two-column pages in each book. They treat upon over 25,000 different subjects. It is hardly possible to name any subject, any country, any person of note in past or recent time, concerning which pretty full information may not be found in the Cyclopedia, alphabetically. It is worth a year's effort in raising subscribers.

No. 67.—The Great Dictionary.—Worcesten's Large Pictorial Unabridged Edition, containing 1854 three-column pages, with a multifude of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopedia. The Dictionary can be called for at our office, or be sent by express or otherwise to any part of the country. It should be in every family. It is published by Brewer and Tileston, Boston.

Nos. 68 to 76.—Volumes of the American Agriculturist (Unbound). — These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Honsehold, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes la \$1.50 cach, at the Office, or \$1.75 if sent by msil, as they must be post-paid. — They are profusely Illustrated, the engravings used in them having nlone cost at least \$100,000. Those obtaining premiums for less than fourteen volumes can select any volumes desired, from XVI. to XXX. inclusive. For ordinary use, the sets of numbers unbound will answer.

Nos. 77 to 86.—Bound Volumes of the Agriculturist.—These are the same as Nos. 68 to 77 above, but are neatly bound in uniform style, and cost us more for binding and postage. Sent post-paid.

No. S7.—Farmer's Boy's Library.—A few dollars' worth of books pertaining to the farm will give the boya new ideas, act them to thinking and observing, and thus enable them to make their heads help their hands. One such book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. Any amart boy cau easily secure this Premium, and he will have two sterling works by a well-known, practical farmer. They are Allen's New American Farm Book, and Allen's American Cattle.

No. 88.—Farmer's Boy's Library.— Both the books in No. 87, and also Herbert's Hints to Horsekeepers, and Henderson's Gardening for Profit.

No. 89.—Farmer's Boy's Library.— The four books in No. 88, with the addition of American Agricultural Annual for 1871, American Horticultural Annual for 1871, and Harris on the Pig.

No. 90.—Farmer's Boy's Library.— The seven books in No. 89, with the addition of Thomae's Farm Implements, Tim Bunker Papers, and Waring's Draining for Profit.

No. 91.—Farmer's Boy's Library.— The ten books in No. 90, with the addition of Fuller's Grape Culturist, Breck's New Book of Flowers, and Hunter and Trapper—in all 13 fine volumes.

Nos. 92, 93.—Bound Volumes of Hearth and Home.—These volumes are neatly and uniformly hound in cloth, with title in gilt on back and side. With their beautiful engravings, and abundance of useful and entertaining reading for all the members of a family, they will prove valuable additions to any library.

Nos. 94 to 105.—Good Libraries.—In these premiums, we offer a choice of Books for the Farm, Garden, and Honselvold. The person entitled to any one of the premiums 94 to 105 may select any books desired from the list of our books published monthly in the American Agriculturist, to the amount of the premiums, and the books will be forwarded, Post or Express paid. The the farmers of a neighborhood unite their efforts, and through these premiums get an agricultural library for general use.

No. 106.—General Book Premium.

Any one sending 25 or more names, may select books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1.20; or clubs of 25 or more. The books will be sent by mail or express, prepaid through, by us.

# GET THE BEST.

# Webster's Unabridged Dictionary.

10,000 Words and Meanings not in other Dictionaries.

3,000 Engravings. 1840 Pages Quarto. Price \$12.

A necessity to every intelligent family, student, teacher, and professional man. What Library is complete without the best English Dictionary?

"GET THE BEST."

"All young persons should have a standard

#### DICTIONARY

st their elbows. And while you are about it, get the best; that Dictionary is

# NOAH WEBSTER'S,

the great work unabridged. If you are too poor, save the smount from off your back, to put it into your liead."—
Phrenological Journal.

Webster's Quarto Dictionary.—Everybody knows about Webster's Dictionary, and every man, woman, and child ought to bave access to it.

It will tell you everything in regard to your mother tongue which you want to know. It shows you the words in all their aspects—giving you a sort of history of each individual that is lo any way worthy of attention—developing their powers and delineating their features and general appearance so precisely, that the unlearned will remember them, sfier the first sight, and know who they are, and what they are, whenever he meets them. A MAN WHO WOULD KNOW, MUST OWN WEBSTER'S LARGE DICTION.
ARY. It is a great light, and he that will not avail himself of it must walk in darkness. Every young honsekeeper should lay it in, to occupy the place which was formerly filled with decanters and wine-glasses.

Every farmer should give his sons two or three square rods of ground, well prepared, with the avails of which they may buy it. Every nechanic should put a receiving box in some conspletions place in the house, to catch the stray penniles, for the like purpose.

Lay it upon your table by the side of the Bible—it is a better expounder than many which claim to be expounders.

It is a great labor-saver—it has saved us time enough in one year's use to pay for itself; and that must be deemed good property which will clear itself once a year. If you lave any doubt about the precise meaning of the word clear, in the last sentence, look at Webster's nine definitions of the v.t.—Massachusetts Life-Boat.

NEW

# American Farm

ORIGINALLY BY

R. L. ALLEN,

Author of "Diseases of Domestic Animals," and formerly editor of the "American Agriculturist."

REVISED AND ENLARGED BY

LEWIS F. ALLEN,

Author of "American Cattle," editor of the "American .. Shorthorn Herd Book," etc.

. NOTICES BY THE PRESS.

Everything connected with the business of farming finds a place in it; soils, manures of every kind, irrigation and draining, grasses, grain and root crops, fruits. eotton, hemp, fences, farm buildings, domestic eattle, sheep, poultry, and the like. The work has been written with great care by men qualified to discuss the subject, and it is really valuable. The chapter on soils should be read carefully by every farmer who desires to make the most of the land he cultivates. The chapter on fruits constitutes an important feature of the work; and there is nothing in it which is not well considered and useful. Worcester Daily Spy.

Comprehensive and careful, telling, and telling specifically, just what the tillers of the soil need to know: it will prove of great advantage to all who faithfully follow its counsels in the spirit in which they are given.

Congregationalist & Recorder.

It intelligently and quite fully discusses the various operations of farm life, and is invaluable to all engaged in agriculture. Farmer's Cabinet.

For the young man of rural tastes, but without a training at the plow-handles, who asks for a general guide and instructor that shall be to agriculture what the map of the world is to geography, it is the best manual in print. For the working farmer, who, in summer noonings and by the winter fireside, would refresh his convictions and reassure his knowledge by old definitions and well-considered summaries, it is the most convenient hand-book. From its double authorship one might expect some show of patch-work, the original statement of the author of 1846, annotated and qualified by the writer of this year. But this has been wisely avoided. The book is a unit, and shows no disparity of style nor contradiction in statement. Practically it is altogether a recent and timely volume. Only so much of the original Book of the Farm, hy R. F. Allen, as time could not change, has been New York Tribune. adopted by the reviser.

It is a volume of over five hundred pages, and in its present shape comprises all that can well be condensed into an available volume of its kind.

Hartford Daily Times.

It is almost as comprehensive as a cyclopædia. We can safely recommend it as a valuable and standard work. Salem Gazette.

It has a very wide range of subjects, taking up nearly all matters that are most important to farmers. Comprising the combined wisdom and experience of two eminent agriculturists, it must prove of great value to the class for whom it is prepared. New York Observer.

It is erammed full of just the information that is wanted, which it is a pleasure to recommend. We know of no better encyclopædia of farming.

New York Independent.

In its present revised and enlarged form, it is a work that every practical farmer may consult with advantage, and none can well afford to do without.

Christian Intelligencer.

It is something in favor of this work, that it has been before the public for many years. The original work was prepared with extraordinary care, and contained a vast amount of general truth that is as applicable now us it was then; it has therefore been made the basis of the present work, which, to all intents and purposes, is new, since it is adapted to the present improved state of agri-cultural knowledge. Every department is prepared with conscientious care, and with a view of making the work a reliable sonree of agricultural information.

Chicago Republican.

SENT POST-PAID......PRICE \$2.50.

ORANGE JUDD & CO. 245 Broadway, New York.

# AMERICAN CATTLE:

THEIR

# HISTORY, BREEDING,

AND

#### MANAGEMENT.

By Lewis F. Allen,

Late President New York State Agricultural Society, editor
"American Shorthorn Herd Book," author "Rural
Architecture," etc., etc.

NOTICES BY THE PRESS.

We consider this the most valuable work that has recently been issued from the American press. It embraces all branches of the important subject, and fills a vacancy in our agricultural literature for which work the author by his many years' experience and observation was eminently fitted....It ought to be in the hands of every owner of cattle; and the country, as well as individuals, would soon be much richer for its teachings.

Journal of Agriculture (St. Louis).

The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims, as a standard authority on the subject. An excellent feature of this volume is its orderly, methodical arrangement; condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves.

N. Y. Tribune.

This will rank among the standard works of the country, and will be considered indispensable by every breeder of live-stock.

Practical Farmer (Phila).

We think it is the most complete work upon neatstock that we have seen; embodying as it does a vast amount of research and careful study and observation. Wisconsin Farmer.

His history of cattle in general and of the individual breeds in particular, which occupies the first 180 pages of the volume, is written with much of the grace and charm of an Allison or a Macaulay. His description of the leading breeds is illustrated by cuts of a bull, a cow, and a fatox, of each race. The next one hundred pages are devoted to the subject of Breeding. This is followed by chapters on Beef Cattle, Working Oxen, Milch Cows, Cattle Food, Diseases, etc. The arrangement, illustrations, analytical index, etc., of the work are in the best style of modern book-making.

New England Farmer.

The work is one that has long been needed, as it takes the place of the foreign books of like nature to which our farmers have been obliged to refer, and furnishes in a compact and well-arranged volume all they desire upon this important subject.

Maine Farmer.

Whatever works the stock farmer may already have, he cannot afford to do without this, Ohio Farmer.

It is one of the best treatises within our knowledge, and contains information sound and scusible, on every page.

The People, (Concord, N. H.)

The object of the work, as stated by the author in his preface, "is not only to give a historical account of the Bovine race, to suggest to our farmers and cattle breeders the hest methods of their production and management, but to exalt and ennoble its pursuit to the dignity to which it is entitled, in the various departments of American agriculture." From the little examination we have been able to give it, we can not recommend it too highly.

Canada Farmer.

Considering that there are some ten millions milch cows in the United States, and nearly a thousand millions of dollars invested in cattle, the magnitude of this interest demands that the best skilled talent he devoted to the improvement of the various breeds, and the Investigation of the best method of so caring for the animals, as to gain the greatest profit from them. This volume will give the farmer just the instruction which he wants.

### GETTING UP CLUBS.

Let each person wishing to join in a club, say how much Tea or Coffee he wants, and select the kind and price from our Price-List, as published. Write the names, kinds, and amonots plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upen them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more.

each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New Tork, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, and the goods by Express, to "collect on delivery."

Consumers can save 5 to 8 profits by purchasing of

# THE BEST BOOK ON GARDENING.

# Gardening for Profit

In the Market and Family Garden.

By Peter Henderson.

ILLUSTRATED.

NOTICES BY THE PRESS.

All the vegetables that thrive in the open air in our latitude are described, together with the best methods for growing them. The anthor also imparts practical instructions on the subjects of drainage, and the formation and management of hot-beds. Numerous well-executed wood cuts tend to make clearer the instructions of the author .- Philadelphia Inquirer.

The author of this treatise is one of the best known and most successful of those gardeners who supply New York with green vegetables; and as he writes from long and dear-bought experience, the positive, dogmatic tone he often assumes is by no means unbecoming. The book itself is intended to be a guide for beginners embarking in the author's business, and gives full and explicit directions about all the operations connected with marketgardening, lists of varieties of the most profitable vegetables, and much sound advice ou kindred topics. Though designed for a special class, it cannot fail to be valuable to the amateur and private gardener, and nulucky experience has taught us that the information contained single chapter would have been worth to us the price of the book.-Daily Mercury (New Bedford).

It is unquestionably the most thorough and the best work of its kind we have yet had from the pen of an American author. It is written in a clear, concise style, and thus made more compreheusive than works which smack more of the office than the farm or garden.

• [Daily Evening Times (Bangor, Mc.).

Mr. Henderson writes from knowledge, and is not one of those amatear cultivators whose potatoes cost them ten dollars a bushel, and whose eggs ought to be as valuable as those of that other member of their familythe goose of golden-egg-laying memory—for they are all but priceless. No; he is a practical man, and he has the art of imparting the knowledge he possesses in a very agreeable manner; and he has brought together an ex-traordinary amount of useful matter in a small volume, which those who would "garden for profit" ought to study carefully .- Evening Traveller (Boston).

There are marvels of transformation and rapid reproduction recorded therein, which might well shame the dull fancy of the author of Aladdin or of Kaloolah. There is no theory about it; a man who has made bimself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and with-out wandering to California or Montana for it either.

[Horace Greeley in the N. Y. Tribune.

We have devoted more space to this little work than we usually do to tomes much more pretentions. We have done so because of the rare merits of the book in its fund of information, useful to the farmer and marketgardener, and because of the dearth of that kind of mowledge. We carnestly advise that fraternity, for whom this work was written, to buy it and study it. If any among them have never yet read a book, let this be their primer, and we will vouch for the excellence and endurance of the priming. The work is profusely illustrated with wood cuts.—Louisville Daily Journal.

TRIAL OF WORKING OXEN .- Drawn and Engraved for the American Agriculturist.

The fast horse has so generally monopolized attention at our agricultural shows, that at the New England Fair, held last September, it was gratifying to notice the interest manifested by the spectators in the trial of working oxen. A pair of well-trained oxen are, in their way, as well worthy of an admiring crowd as a fleet horse, and we are glad to see respectable prizes offered for them. The proper training of oxen requires much patience on the part of the drivers and manifests great intelligence on the part of the animals. A man can not train oxen properly until he has first trained himself in

the ways of patience, perseverance, and quietness. Unlike the horse that is guided by rein and bit, the ox moves only by word and motion. There is something very imposing about a well-kept, well-developed pair of oxen of a good breed. Every muscle indicates strength, and the beasts move with a deliberation and dignity that convey the idea of immense power. Then, when they bend their necks to the yoke of the trial load, their expression seems to say, "This is nothing to what we could do if we tried." We have never seen oxen so thoroughly and intelligently use their strength

as in "stumping" and "logging" upon a Western clearing. They seem to know quite as much about this work as their drivers, and to lay out their full power just at the right moment. For work of this kind they are incomparably superior to horses. For general farm uses horses will usually be preferred, but for certain heavy labor the ox will always be the favorite, and he has the great advantage, that, when the time of his utility is past, he can be converted into beef. The above engraving is from a sketch taken by one of our artists, at the trial of working oxen at the New England Fair.

#### AMERICAN AGRICULTURIST.

NEW YORK, DECEMBER, 1871.

This month closes the thirtieth volume of the American Agriculturist. During these thirty years it has labored earnestly, and in a good degree, we trust, effectively, for the advancement of American agriculture and the improvement and interest of American farmers. We can not complain of a want of appreciation. No agricultural paper ever before attained half the circulation of that enjoyed by the American Agriculturist for 1871. We have reason to expect a still greater number of subscribers for 1872. No editors ever had more liberal publishers, no publishers ever had more willing editors. What we have done in the past is nothing in comparison with our hopes and intentions for the future. We believe in ourselves and in our readers. We have faith in good farming; and we are endeavoring to show our faith by our works. The agricultural editors of the Agriculturist are practical farmers. We live on the farm, and our monthly "Hints about Work" are the result of our own experience and observation. The year now drawing to a close has been, in many respects, a discouraging one to farmers. Butter, cheese, pork, and beef are low. Wool has done a little better and the prospects are encouraging. Those farmers who sold their sheep and bought cows, will probably now sell their cows for half what they cost, and buy sheep at double what they got for them. We urged our readers not to sell their sheep, and cautioned them against rushing into the dairy business. We would say now: If you have sheep, keep them; if you have cows, do not sell them. It is a good time for any one to buy cows who proposes to establish a permanent dairy. Select the best, get a good bull, and aim to improve the herd. There is still money in the dairy business. Pork-packers lost heavily last winter. They will try to get back their money the present season, and the probabilities are that we shall be obliged to sell our pork below the cost of production. In a year or two it will be our turn. The low price of pork will increase consumption at home and abroad. American hams, bacon, and barreled pork will be introduced into new markets and to thousands of new consumers in different parts of the world. We lose money by the transaction, but we shall get it back in the end. Those farmers will make a mistake who sacrifice good breeding stock.

It is never so dark as just before dawn; and dark as have been our prospects the past season, we mistake the signs of the times if a bright day is not rapidly approaching. We shall get better prices for all our products.

But good prices alone do not make good times. We need good crops, good stock, and a less cost of production. Now is a good time to think and talk about these matters and lay plans for the future. "We need more capital." Certainly we do—and

"We need more capital." Certainly we do—and the same is true of all occupations, in trade, commerce, or manufactures. But what is capital? It is simply labor, or the means of procuring labor. We have heard farmers bemoan their lack of capital while they spent several hours a day, in winter, smoking and talking around the stove at a village grocery. Many farmers need enterprise and pluck much more than they need capital.

### Hints about Work.

Make the House Comfortable. - We have no patience with a man who allows the windows to rattle in the casements, while with a hammer, a few nails, a lath or two, and a little putty, he could, in an hour or two, make the house snug and comfortable. We believe in thorough ventilation, but it should be under our control. There are thousands of homes where the inmates spend a wretched winter simply for want of a little attention to such matters. See that the outside doors fit snug. A storm house inclosing the door most exposed, or where the family are going in and out frequently, is a great comfort. A damper in the stove-pipe prevents the heat from going up the chimney, and saves fuel. See that the wood-house is well supplied with drywood ready for the stove, and that there is some kindling always prepared ready for use. Where coal is used, and in the absence of charcoal, havea barrel of dry corn-cobs ready for starting fires.

Let the family room be well lighted, and make home attractive to the young people. Let there be no lack of good books and useful papers. Pleasant winter evenings at home constitute one of the great charms of country life. It is here that character is formed, and the future usefulness of our children in a good degree determined.

A comfortable family room, warm beds, nutritious food, and plenty of sleep, will enable a farmer and his family to spend the winter pleasantly and profitably. There is plenty of work to be done, and the cold, instead of benumbing the faculties, will stimulate exertion. Do not spend your winter days by the stove, or in complaining of hard times.

Attend to the Animals.-Next to the family the most important duty is to make our domestic animals comfortable. There is great profit in it. Warmth is, to a certain extent, equivalent to food. And, what is of far greater importance, it saves digestion. It is sometimes said, when speaking on this subject, that corn or hay is a costly fuel, but this does not tell half the story. When an animal is exposed to storms and loses an excessive amount of heat, this heat has to be supplied from the blood or from flesh and fat. And good meat, fat, or butter is certainly a very expensive fuel to burn in the animal stove. Many farmers who think it a great waste to burn "body maple" in the house, allow their cows to burn butter in the barn-yard. This is precisely what thousands and tens of thousands of farmers do every winter. We implore every reader of the Agriculturist to provide some shelter for his animals-if it is nothing more than a shed of evergreen branches or corn-stalks.

Give the Animals Enough to Eat.—Next to exposure, one of the most serious drawbacks to profitable stock feeding is the waut of a liberal and regular supply of untritious food. Many farmers can not be made to understand that an animal cats a large amount of food merely to keep it alive, and that all the profit the owner derives from keeping the animal, comes from the food caten in excess of this amount. If straw will keep an animal alive, all the profit of keeping the animal is derived from hay or grain fed in addition to the straw.

Feeding Cattle and Sheep on the bare ground may be

necessary in certain circumstances, but, as a rule, it is a most wasteful practice. Do not say you are short of "capital," and that you can not afford to buy racks or lumber to make them. What you want is industry and pluck. If you can not do anything better, make a rack out of a few rails or poles, placed alongside the barn, or shed, or fence.

Cooking Food for Stock will doubtless pay where everything is convenient, and where well-bred stock is kept and liberal feeding is required. But not one farmer in a thousand is ready for the work. His farming, his stock, and his system of feeding are not up to it. There are many other things of far greater importance for him to attend to. To plow under clover in the summer and steam corn-stalks in the winter shows great ignorance of the fundamental principles of good agriculture. It will seldom, if ever, pay to cook in order to save food; but it will frequently pay to cook in order to save digestion. It will not pay to cook food for store cows; but it might pay well to cook for milch cows that are capable of turning more food into milk than they can digest. It will not pay to cook food for breeding sows that can cat and digest more food than they require; but it will pay well to cook for a lot of well-hred young pigs that are capable of converting into flesh more corn-meal than they can digest in the raw state.

Milch Cows, if fed liberally, may be milked until within six weeks of calving. In ordinary cases, however, it is better to let them go dry for two months or ten weeks. The cow and the ealf will both be stronger; and any fat or flesh stored up during this period will, in the case of a good cow, find its way to the milk-pail next summer. For this reason we advocate liberal feeding, even when the cows are dry. Some of our associates think and practice differently, but the writer's own experience is in favor of drying off the cows as here indicated. Because a good milker is always thin before the end of the season, many farmers advocate keeping cows thin in order to make them good milkers. They mistake cause for effect. The cow is thin because she is a good milker, not a good milker because she is thin. There is a great prejudice against corn-meal for milch cows. without judgment it may be injurious, but in our own experience we have never known two quarts of corn-meal a day, cooked or uncooked (but far better cooked), have any other than the most beneficial effect. Do not forget to card the cows, or to give salt regularly and an abundant supply of fresh (not ice-cold) water.

Horses that have worked hard during the autumn had better rest a little this month, rather than towards spring. But much depends, of course, on what there is to be done. If horses are well fed steady work does not hurt them. And it costs so much to keep a horse that we can not afford to let him lie idle unnecessarily. Horses that have been pampered in the city are rejuvenated by a winter's run at a straw stack, but farm horses are seldom benefited to a like extent by such treatment. The only advantage in turning them out is that it saves the labor of taking care of them. They ought to have a warm shed to run into in stormy weather.

Sheep .- Sheep may be allowed to run out on the pasture as long as they can find anything to graze; but they should have other food in addition. On grain farms the most economical way of wintering Merino sheep is on straw, with half a pound of corn or oats per day. Long-wooled sheep and fattening sheep should have a little better feed-say one pound of bran, half a pound grain, and all the straw or corn-stalks they will eat. Fattening sheep should be allowed more grain as they become accustomed to it. Pea and bean straw, if well cured, is excellent for sheep. Clover hay should be reserved for feeding towards spring.

Swine.-Except where corn is very low, it will not pay to keep fattening pigs after cold weather sets in. Better dispose of them early and reserve the feed for the young pigs. The latter will probably pay for all the extra grain they receive. Certainly, if kept at all, pigs should be kept well. Fall

pigs should have all the food they can eat and digest the first winter.

Ditching-Ou low, mucky land, where there is sufficient fall to allow the water to pass away freely from the ditches, the frost will seldom be so severe as to prevent ditching this month, and the work can be done to great advantage.

#### Work in the Horticultural Departments.

The amount of work that can be done now will be limited, but still every day something may be accomplished which will make the labor of the coming spring easier. The long evenings will give one ample time for study and reading, and thus enable the gardener to profit by the experience of others, and to obtain better results from a given amount of labor. Every year new books are being published upon different branches of horticulture, many of which are very valuable even to a person well versed in practical horticulture; and no thinking gardener can afford to be without them, especially if he wishes to keep pace with the new improvements which are constantly being made. Outdoor work will have to be suspended in many northern localities, but many things can be done under cover, such as mending tools, painting, preparing labels, etc.

#### Orchard and Nursery.

Cions.-Cut eions when the trees are not frozen. Choose only those which have made a vigorous and healthy growth. Store in sawdust or sand in the cellar, taking care to label each variety. Copper wire is best for tying up the bunches, as twine is liable to rot when buried in damp earth.

Fruit.-The secret of keeping fruit during the winter is to place it in a cellar where the temperature is as low as 36°, and where it varies as little as possible from this,

Manure may be earted upon the orchard during the winter; or it may be carted to some convenient place, and the coarser portions allowed to rot.

Mice and Rabbits.-Tread the snow firmly around the trunks of the trees, to prevent mice from injuring the bark; rabbits may be kept off by smearing the lower part of the trunk with fresh blood.

Pruning.-If the weather is mild, orehards may be pruned at any time, and the large wounds coated over with gum shellac, varnish, or common paint, to prevent decay.

Root-Grafting can be done when the weather is too cool to work outdoors. Take care to preserve the different varieties distinct. After the grafts are set, place them in boxes of earth in the cellar.

Seeds.—If any seeds of stone fruits still remain out of the ground, bury them before the ground freezes too hard, first mixing the seeds with earth.

Water .- See that surface drains are made, to take offall standing water from the orchard and nursery.

#### Fruit Garden.

Many of the directions given under the Orchard and Nursery will apply equally well here.

Protection must be given to the tender plants. The tender varieties of raspberries are to be laid down and covered with earth, and in extreme northern latitudes grapes do better if so treated.

Strawberries.—Cover the ground between the rows with a good mulch of hay, taking care not to cover the plants themselves too thickly.

Grape-Vines .- Finish trimming, and save wood of choice varieties, to propagate from. Cut the wood into lengths of two or three eyes, tie in bundles, and cover with earth in a well-drained spot.

#### Kitchen Garden.

Whenever the weather is mild, and the ground open enough, use the spade or plow. The soil is much better if exposed to the action of the frost during the winter, and besides it can be sooner worked in the spring. See that the fences are tight, so that stray cattle can not get into the garden and trample over the beds and paths.

Roots.-If the roots are not all stored away for the winter, it should be attended to immediately, before the cold becomes severe. If one has not a root cellar, the best way is to store the roots in pits in the open ground. These should be 21/2 to 3 feet deep, 6 feet wide, and as long as necessary; stack up the roots in sections reaching across the pit. two feet long and as high as the surface of the ground. The sections are to be six inches apart. and the space between filled with earth. The pit. when filled, will present alternate sections of roots and earth. Finish the pit by placing a layer of straw on the top, and then covering with a foot or more of carth. The top should be slanted like the roof of a house, to allow the water to run off.

Parsnips, Salsify, and Horse Radish are hardy, and may be left in the ground without protection. Enough of these must be taken up for winter use.

Spinach and Leeks give a little covering of hay.

Cabbages .-- Store in trenches, with the heads inverted; cover with six inches of earth, and finish off smoothly, to shed rain.

Manure.-Do not neglect to take advantage of everything that can be had for making manure. See that plenty of dry earth and leaves are stored for bedding and composting.

Seeds.-Thrash and winnow all seeds that are to be saved for planting; store away from mice.

#### Flower-Garden and Lawn.

Clear up all leaves, old vines, and everything which will detract from the neat appearance of the immediate surroundings of the house.

Trellises and Stakes .- See that these are not left exposed during the winter. With proper shelter they may be made to last for several years.

Protection .- Give the tender roses and deciduous shrubs proper protection. The former may be laid down and covered with sods, and the latter tied up with a covering of straw. Tender evergreens must not have the straw tied too closely around them, as they are often smothered in this way. The best method is to drive stakes around them in a slanting direction, like an inverted cone, and then cover with straw, or evergreen boughs.

Bulbs.—It is not too late to plant now in many places, where the ground is open, but it must be done soon. Give the beds a covering of straw.

Herbaceous Perennials .- Cover the less hardy sorts with leaves. The hardy varieties will also do better if treated in the same way, or if they have earth drawn up to them.

Wistarias.-In very cold latitudes these do best if taken down and covered with a little earth.

Cold-Frames .- Whenever the weather is mild. remove the sashes from the cold-frames containing the half-bardy things. See that no mice are harbored to destroy the plants.

Lawns can be manufred with well-rotted compost.

#### Greenhouse and Window Plants.

Heat .- During the day the temperature in houses where plants are to bloom, must not be less than 65°, and it ought not to fall to less than 45° at night. In the Camellia-house, for example, where it is desirable to prevent the plants from flowering as long as possible, the heat need only be a few degrees above the freezing point at night.

Bulbs,-Bring the bulbs which were placed in the cellar to form roots, to a warm house, where they will soon flower. If only a few pots are brought out at a time, flowers may be had until quite late.

Air must be admitted whenever it is safe, only taking eare that the ventilators are opened upon the side opposite to which the wind blows.

Water .- Apply water with care, and do not give enough to make the earth soggy. The plants should have an occasional sprinkling overhead, to wash off dust. If this is allowed to accumulate, it soon fills up the breathing pores of the leaves and renders the plant nnhealthy. This is more necessary with house plants than with those of the greenhouse.

Insects, such as green fly, thrip, scale, etc., will infest plants in spite of all precautions, and the only way is to keep up a constant warfare against them. The green fly is easily destroyed by tohaeco smoke; the other two must be treated with a thorough washing of whale-oil scap, applied with a cloth to the bark of shrubs, and with a spouge to the foliage. The red spider can usually be killed by frequent sprinklings of water, as it particularly dislikes moisture.

Sods.—A good quantity of sods ought to be piled up and allowed to decay, as they make the best soil for potting that can be had. If it is desirable to hurry the growth of any plant, a little well-rotted stable manure may be mixed with the soil.

#### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Nov. 17, 1871, and for the corresponding month last year.

1. TRANSACTIONS AT THE NEW YORK MAREETS.

Recripts. Flour. Wheat. Corn. Rue. Rarley. Oats. 27 d's this m'th.337,000 4,816,000 1,207,000 217,000 1,335,000 1,719,000 28 d's last m'th.339,000 4,816,000 1,904,000 231,000 541,000 2,116,000 SALES. Gold has been down to 111, closing November 16th at 111%, against 1131, on the 17th of October... The receipts of produce, since our last, have been quite liberal... Receivers of Breadstuffs have met the demand from sbippers

as well as home buyers with considerable promptuess, and at prices which show a pretty general reduction, though toward the close, with an easier freight market and rather more favorable reports from Liverpool, a fair degree of activity prevailed, particularly in Flour, Wheat, and Corn, with more steadiness in values ..... There has been an unusually free movement in Barley, which has been purchased quite extensively on speculative account, closing much stronger as to price....Provisions have been moderately sought after, at fairly supported prices. The chief inquiry for Butter has been from the home trade, and for the finer makes of State, and nice, fresh lots of Western. Fresh roll Butter has been in better request, but the re-made old stock, offered as roll butter, has been neglected and nominal in price, as neither dealers, packers, nor grocers were deceived by the offerings ia this form. The export trade in both Butter and Cheese has been comparatively light, the foreign advices not having been sufficiently encouraging to justify free purchases for shipment....Wool has been offered sparingly, and at prices which buyers have been unwilling to pay; hence business has been dull......Cotton, Hops, and Tobacco have been moderately sought after, closing about steady at our quotations.....In the line of Grass Seed the only show of activity has been in Clover Seed, which has been in brisk request, mostly for shipment, at firmer prices.

Beef Cattle.—In comparison with the previous month—that greatest month for moving live stock—there has been a falling off of 1,000 cattle per week, and the market closes stronger. Prices declined at first, but have recovered during the past week, the final sales being about %c. higher than they were at the opening. Poultry is now plenty and cheap, and goes a long way towards supplying the place of beef. Other meats are also plenty, pork being much lower than usual at this season of the year, so it is only a matter of surprise that cattle sell as well as they do. The average quality of the cattle has been good, Texas sending in lightly. Dealers in that kind of stock have become convinced that it is useless to run in cattle direct from their native prairies, as such droves are too poor to bring remunerative prices. When kept a year or more in Kansas, Illinois, or some other good grazing State, they make passable beef, worth at the present writing Sc. © 9c. ? D., net weight.

Below we give the range of prices, average price, and figures at which large lots were sold:

Milch Cows .- The change from green to dry feed causes a shrinkage of milk, and more cows are required to keep up the amount contracted for by the producers. This has caused a good demand for fresh cows, and prices have advanced about \$5 per head, helped by the higher price of beef. They vary from \$45 to \$55 each for poor, to \$55. for medium to good, with a few choice at \$50 to \$55......Calves.—Live calves continue to fall off in numbers, while more are sent in dressed. It is cheaper to send them in dead, and they can be sent from greater distances, and will keep in cool weather if not sold at once. And still prices are lower, the demand running npon other meats. Good to prime milk-fed calves are worth 9c. @ 1014c. 9 B.; common to fair sell at 7c. @ 81/4c.; mixed lots, half grassers and half milk-fed, of large size. 4c. @ 61/2c.; and common grassers at \$6 @ \$9 per bead. Hog-dressed are worth 12c. @ 1416c. for milk-fed, and 5c. @ 9c. for grassers..... Sheep and Lambs. These are coming forward more freely, and lambs sell for more money, choice lots reaching Sc. Sales were made during the month at 81/4c., for some extra State lambs of 80 lbs. Sheep are in fair request, most sales being at 5 1/4 c. @ 5%c. Scarcely anything exceeds 61;c., and it takes fine 110 @ 120 fb. Canadas to reach those figures. Poor to medium sheep are selling at 414c. @ 514c. @ D.; fair to good at 5½c.@5½c.; and prime to best selections at 6c. @ 6½c. Lambs range from 6c.@7½c. P D., a few choice reaching Sc ..... Swine. - The arrivals of hogs have been the largest ever known, and prices rule lower than at any time since the war, having declined about 14c. since the low rates one month ago. Heavy losses have been sustained in the trade, many a car-load selling here at very little more than they cost in Chicago. dressed are arriving freely from this State and Jersey. Live are worth 4% c. @ 5% c.; city-dressed Western 6c. @ 7c.; State and Jersey, 6% c. @ 7% c., the latter price only

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd & Co.....Post-Office Money Orders, for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Fostage: On American Agriculturist, 3 cents a quarter, in advance; on Hearth and Home, 5 cents per quarter. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage must be sent to this office for prepayment here.

Bound Copies of this Volume will be ready this mooth. Price, \$2, at our office; or \$2.50 each, if seet by mail. Any of the last fifteen volumes (16 to 30) will also be forwarded at same price. Sets of numbers sent to our office will be neatly hound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Save the Index Sheet, which is put loosely to this number, so that it can be bound or stitched at the beginning of the volume without cutting the thread.

Many Items are left over, including, answers to correspondents—also Farm Notes—because the Annual Index takes out rages of this number. To, add these pages extra would increase the weight beyond & pound, and double the postage to all subscribers.

SPECIAL PREMIUM.-Thomas' Smoothing Harrow and Broadcast Weeder.-We consider this so good an implement that we have made arrangements with the manufacturers to offer itas a premium. Mr. J. J. Thomas has so wide and so good a reputation, both as a writer on agricultural subjects, and as author of "Farm Implements and Farm Machinery," that his name alone would be a safe guarantee for the goodness of a farm tool or machine. harrow has, however, been tested by other good indges. who agree that it is a really valuable article. a thorough pulverizer of the soil and good cultivator of growing crops. It is of easy draft, takes a sweep of nine feet, can barrow twenty acres a day, and it leaves the ground as fine and smooth as a garden-bed. For 28 subscribers to American Agriculturist, at \$1.50, or 120 do. at \$1, or for 19 subscribers to Hearth and Home. at \$3, or 60 do., at \$2.50, or for 21 subscribers to both papers, at \$4 for the two, we will send the harrow, worth \$25. Send for descriptive list to J. J. Thomas & Co., Proprietors.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, or a small club may be increased to a larger one: thus: a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$8: making a club of 20 at \$1 each; and so of the other club rates.

Products of Washington Territory.—Messrs, Jay Cooke & Co. exhibited at their office in New York specimens from Olympia and other places near the terminus of the Northern Pacific Railroad. There were apples and pears of wondrons size and fairness, vegetables of gigantic proportions, and—what is most important—grain of varions kinds of a plumpness and weight that will make it necessary for California and Oregon to look to their lanrels. All these from a place known only a few years ago by the general name of the North-west Coast.

HEARTH AND HOME and American Agriculturist are entirely different, there is a very manifest advantage in combining their publication under one business management. Besides the saving in office rent, in business employes, in the purchase of paper, materials, etc., the two papers make practicable the maintenance of a large and complete engraving and artists' establishment, which secures a regular supply of superior illustrations at less cost, all of which indices to the benefit of the readers.

.

The Chesapeake and Ohio Railroad, which is being rapidly pushed out from the seaboard to the Ohio, will open up not only many splendid farraing regions, but will also bring into market vast treasures of coal that have been stored up for untold centuries ready for our day and age. We do not see how the bonds of this road can fail to be as safe an investment as can he found. Messrs. Fisk & Hatch, the agents, give the particulars in our advertising columns.

A New Lift and Force Pump.—Geo. E. Waring, Jr., of Ogden Farm, writes: "The pump advertised in the September number by the American Pump Company, is the best pump of its kind that I have ever seen. It is as good for the kitchen-sink as a common pitcher-pump—and it costs but little more—and is as good to force water to the top of the house or (in a jet from a hose nozzle) over the roof, or to water a greenbouse with, as an elaborate affair costing from five to ten times as much. We have long needed a good force-pump, that could be used for all sorts of work about a house or barn, and now we have got one. I consider mine worth much more than it cost me, simply to wash carriage-wheels with, and to shower horses' legs when they are inclined to get out of order."

Hydrantic Rams.—A "Subscriber," Waterville, Me., points ont an error, or rather an umission, which was perceived by us when too late to remedy, in the article on water rams in the Agriculturist for November. It is stated that a No. 5 ram, etc., using 7 gallons of water per minute, would elevate half that quantity to a hight of fifty or a bundred feet. There should have been added the words "every fifteen to thirty minutes."

Supplement to Bicknell's Village Builder: Containing Eighteen Modern Designs for Country and Suburban Homes of Moderate Cost, with Elevations, Plans. Sections, and a Variety of Details, all Drawn to Scale, also a Full Set of Specifications, with Approved Form of Contract and Estimates of Cost. New York: A. J. Bicknell.—The foregoing title is so descriptive of the contents of the work that but little need be added, save that several architects in New Jersey and Massachusetts have contributed the designs, and that they are in what is now the popular style of suburban dwellings. The designs are neatly executed, and the part relating to specifications and contracts can not fail to be useful. Price \$5.

The Hundred-Dollar Trophy-Tomato Premium.—As our readers are aware, Col. Waring offered last spring a premium of \$100, to be awarded in the judgment of the editors of this paper for the largest specimen that should be sent to this office, of a Trophy Tomato, grown from seed purchased directly from him. A large amonat of fruit was sent in for competition, which was duly examined and weighed. The season was unfavorable for the growth of this fruit, at least in this section of the country. The largest specimen submitted weighed 2 fbs., but it was not of "perfect" form, although its shape was not at all objectionable for ordinary purposes. This was raised by a Mr. Heath, of Bristol, Ct. A specimen submitted by S. Hemmenway, Jr., Potsdam, N. Y., walld have received the prize, if size had not been an important condition. This tomato was large enough for any use, and the most perfect in form, ripeness, and solidity, that we have ever seen. Its weight, however, was only 12 oz. The premium of \$100 was awarded to Mr. Thomas J. Hand, of Sing Sing, N. Y. His largest specimen weighed 21% oz. and was unexceptionable in all respects, though not quite so fine as Mr. Hemmenway's. We learn that Col. Waring has secured Mr. Hand's entire crop of seed, and that he will renew his offer of a \$100 premium for the coming year. The Trophy Tomato has been a complete success, and we are glad to have been instrumental in making it known.

Ecoarth and filome—Fiction.—"M. F. W.," New Share, lowe, would like to subscribe for Heath and Home, but he bas leard that it publishes stories, and "would like to know whether this is the case or not, as I do not wish to bring fictitions reading into my family." Heath and Home does publish fictitions stories, but they are not so good as some we could refer "M. F. W." to. Let him refer to Lake xv, and he will find a most tonching story, heginning, "A certain man had two sons." Certainly, if the Saviour chose the parable, which is one form of fiction, to impart some of his best-remembered teachings, there is nothing in fiction itself that should prevent others from using it. Fiction may be prostituted and rendered mischlevons, as may any other form of literature, but "M. F. W." will not find anything in Hearth and Home that he can not safely take into his family.

Fowls for Examilation.—As the season for the annual poultry shows is at hand, we ofter a few rules for preparing birds for exhibition that may be of service to the novice. They should be entered by trios, each fowl of which must match with the others in color of feathers, legs, and eyes, as well as age, size, and general appearance. It is necessary that the trio be made up and confined in a small space for some days before the show, in order that they may become thoroughly acquainted. Otherwise they may fight and spoil their appearance. But care should be taken that they do not become dirty, or impaired in health, or get their plumage worn, by being caged too long. A good way is to put them for a few days, alternately, in a roomy yard and then in a coop of show-room size. They should be coaxed and petted, when young, so as to not show wildness. For ten days before the show, feed one part linseed meal to three parts corn-meal, daily, and an occasional handful of hemp-seed. This will increase the inster of the plumage. Add a little boiled meat, and plenty of raw cabbage. The feathers of white or light-colored birds should be washed, if at all stained, in warm water to which a little soda has been added. Wipe with a soft cloth and place in a covered basket before a fire to dry.

# To Every Subscriber.

A SPECIAL and SEASONABLE REQUEST.

This number closes Volume 30. Will the Reader please favor us by renewing his subscription, for 1872, the first week in December, so that our experienced clerks can get the new mail-books for Vol. 31 all carefully arranged and the wrappers written, ready to mail the next number promptly? It will greatly aid our office work, and we ask this early renewal as a special favor.

For the Next Volume of American Agriculturist, the Publishers can promise increased attractions. The present able Editorial force will remain at work, with the benefit of increased experience, and new aid will help make the pages still more valuable. Our Engraving Rooms and Artist force are now well established in our new, enlarged quarters, and our readers will receive a splendid assortment of very fine, pleasing, and interesting pictures, that will alone give information and delight of infinitely greater value than the small subscription price, which is put so low as to little more than cover the cost of printing paper.

We hope our friends will also take pleasure in inviting their friends and neighbors to join the American Agriculturist Family for the coming year. We say family, for thus we like to esteem ALL our readers, and our aim is to consult their pleasure and profit in all that is provided for these pages.

We also invite attention to our splendid Weekly, Hearth and Home. It oecupies a different field from the American Agriculturist, and is entirely different in matter and engravings. The two go well together in any family. Hearth and Home is essentially a family or HOME JOURNAL—combining the complete Newspaper, with elegant and refined Illustrations in large amount and great variety. Each number contains first-class editorial articles, from the best pens, on topics of the times; a Household Department that ean but be of great value to every housekeeper; a Children and Youth's Department, edited by Mrs. Mary E. Dodge, that shall not be surpassed in variety and interest or usefulness by any journal published in the world. A Story Department of the highest characternot trashy, sensational novels, but the most pleasing and instructive literature, by such minds as Jean Ingelow, Miss Alcott (author of "Little Women"), Miss Phelps, Rose Terry, Rebecca Harding Davis, Miss Oakey, Edward Everett Hale, Edward Eggleston, and others.

Science, Literature, Amusement, and a great variety of interesting and useful intelligence fill up its ample pages. The NEWS DEPARTMENT, containing a clear, condensed account of current events throughout the world, brought up to the moment of going to press, is of great value to every business man, woman, and child, who has not the time to wade through the great mass of undigested items printed in the ordinary newspaper.

We invite our readers to try both the papers for a single year, confident that they will find them of great value and interest, as well as remarkably cheap. The two are supplied together to regular subscribers for §4 a year (only 8 cents a week). The two papers will give more than §30,000 worth of new and valuable engravings during the year. Subscribers for a year are entered as soon as received now, and get the papers to the close of 1872.

Walnable Premiums are offered on page 469 to those who send in clubs of subscribers.

IT WHELL I'A To supply yourself, your sons, and your workmen with good papers and books. \$5 to \$20, or more, expended in this way, will come back every year. Your sons will be kept from idleness and mischievons company; they will understand and respect their work more; they will gain new ideas and learn to think and reason better; they will learn to make their heads help their hands; they will labor more intelligently and be happier because their minds will be developed, and they will have something to think about while at Better sell an acre of land than not to have these mind-cultivators. Any intelligent man will make more off from 9 acres than the unintelligent one will from 10 acres. Think of this in planning and providing for your sons in the future. Store their growing minds with useful ideas, or the devil will fill the vacancies with very undesirable tenants (ideas). (The premium list on page 469 will afford to many an opportunity to get some books free of expense; and plenty of good books, to be delivered by mail or otherwise, will be found in the advertising pages.)

Please Speak of our German Edition.—This has all the principal articles and engravings of the English edition, besides a Special German Department, by Hon. Frederick Mänch, a practical cultivator in Missouri. This paper is useful to the great number of German-speaking cultivators of the country, and especially so to the scores of thousands of new-comers from Faderland. Terms the same as for the English edition. Clubs may consist of either edition, or partly of both.

SUNDERY INVESTIGES.—A long chapter of humbag exposures, in type, is unfortunately crowded over to our next paper, by the Iadex, which takes off four pages of space this month. Among the schemes and names in the article are: Bank of England Notes; Sawdust and "Queer;" B. F. Grayson; Robert M. Jameson; Wm. and Jno. Wood; Wm. Potter; Itudson Wood & Co.; Dr. Lorand; Dr. J. Hermans; G. M. Washburn; B. H. Longstreet; Spanish Policy; G. W. Jackson; Wm. T. Neal; Lonisville, Ky., Library; A West Virginia Sister of Charity Gift Enterprise; Luther & Son; a Minn. N. W. Book Co.; Turkish Lozenges (dangerous); Consumption Cure, by returned missionaries and other ministers; and all advertised cures; professed Cancer Cures; University Medicines; R. H. Foster; Sarah B. Lambort; Books of Recipes; Prophylactical Star; Good Samaritan; Newspapers advertising Quack Medicines, Patent Medicines, Swindlers, etc., etc. We shall continue a faithful showing up of the various swindlers so long as they continue operations. This department of the paper will alone save to individuals, and the people at large, ten times its entire cost to the country.

Crops and Prices.—Now that the reports of the crops all over the world are in, it is found that the anticipated large yield will not be realized, and yet there will be abundance to supply all wants. With the present facilities for procuring rapid information, the effects of good or bad yields of crops are immediately discounted, and markets are influenced accordingly. Whether the prices of grain will maintain themselves throughout the season, depends greatly on circumstances quite foreign to the amount to be marketed. The state of the money market will probably influence them more than anything else. Farmers, therefore, who hold on to take the risk of profits or losses as such.

Forest 'Frees: A New Work,—
"Forest Trees for Shelter, Ornament, and Profit," is the
title of a recent work by Arthur Bryant, Sr. Mr. Bryant
has long been known as one of the most eminent horticulturists of the West, and is at present the President of
the Illinois Horticultural Society, and anything from his
pen is sure to be founded upon intelligent experience.
Mr. Bryant has long made the propagation and cultivation
of forest trees a specialty, and we know of no one better
qualified to give instructions to others. The advance
sheets of the work show that the author has taken a large
view of the subject, as he discusses not only the methods
of raising trees, but their meteorological and economical
relations. The illustrations are well done, and the work
presents a pleasing mechanical appearance. Sent from
this office by mail for \$1.50.

Ancuba—Akebia.—In the item "Plants Named," on page 409, last mouth, the types made us say that Ancuba Japonica is a charming climber. We of course intended to write Akebia Japonica.

One of Many.—We very frequently receive letters like the following, in regard to the esteem in which the Agricultarist is held. This comes from Ohio: "Have been a subscriber for several years; should not like to do without it, although I am not a farmer, having

only one aere of ground in town or city of A.—. I have about 200 grape-vines—principally Concord and Creveling, with some twelve or more other varieties. I also grow several varieties of raspberries and blackberries. Acrapenter by trade, but do not work at it at present, as I have been in the mail service for two years and a half, as route agent."

remedy is to kill the dogs. If the owners of the dogs can prove damages, pay them. But at any rate kill any dog that is discovered prowling about the premises. Or if he is a respectable dog that is worth training, put a charge of peas in a shot-gun, and when the dog is about 50 yards distant, let him have a taste of them. He will not like it; and one or two doses will convince him that home is the pleasantest place for a well-behaved dog to spend his evenings. He will also he likely to tell his friends that there is something about a sheep-farm that renders it an unbealthy place for dogs to visit.

Rolling Spring Grain.—"J. A. C.," of Wisconsin, asks "if it is a good plan to roll spring wheat, barley, and oats after they have come up, and if so, how high should the grain be, and should the roller be heavy or light?"—We usually roll sur barley with an ordinary two-horse roller, a few days after it comes up. It can be rolled with safety until it is three or four inches high. We roll not so much for the beactif of the crop, as to have the land smooth for the convenience of harvesting. We should be glad to hear from the readers of the Arriculturist on the subject. We apprehend that much depends on the character of the soil. The rolling sometimes, in our experience, caused the land to bake worse, apparently, than if it had been left unrolled. Still, on the whole, we think the practice beneficial.

Sows that have Lost their Appretite.—A correspondent in Minnesota has some sows that "will not eat corn, rough or hoiled, corn-meal, or barley-meal, or oat-meal, made into slops. They will drink milk, but that is not to be had." Try them with sealded bran or fine middlings, mixed with sufficient water to look like milk. Let them have all the bran they will eat or drink, and give no corn or other grain. If not diseased, they will recover their appetite on this dict. Let them have clean, dry, warm but well-ventilated pens, and plenty of opportunity for exercise out of doors. Give them all the sait, ashes, and charcoal they like to eat, and if possible let them root in the fresh earth. A few roots or potatoos might help them.

Taste in Mutton.—Mr. Collins, of Michigan, writes that he has a way of dressing mutton which makes it sweet and palatable, and entirely destitute of woolly taste. "As soon as possible after the sheep is dead, skin the legs and hang up. Then make an opening in front, as high up as possible, and turn in with a cup or dipper as much cold water as the careass will hold—usually from one to one and a half pailfuls. Then go on and skin and dress as usual." We do not see the philosophy of the plan, but it is simple and easy, and is worth trying. The method we try to adopt is, to make the sheep quite fat before killing. We have never known it fail. There are sheep which it is almost impossible to fatten. On such we would try the water-enre.

One Hundred Founds of Fork from 7 or 8 Bushels of Corn.—"I. II. S.," East New York, is feeding seven pigs with one and a half bushels of ears of corn per day, but ean not make pork at the above rate. How can he mend his practice? By shelling and grinding his corn, and either soaking it in boiling water or cooking it and feeding the mush cold, there will be a large saving. Feeding corn in the ear is expensive.

"S. O.," Middletown, Ct., asks when to banl and spread lime. There is no better time than the present. Unload it from the wagon into small heaps; a bushel every two rods each way, would make forty bushels per acre. It will soon slake by exposure to the weather. Spread as soon as it becomes fine.

Spilles in Hogs.—E. P. McClure, Grant Co., Ind., asks how this disease operates and the remedy. We are not acquainted with any complaint thus named, but suppose it is what is known as "cold," which affects the head and snont. Harris, in his work on "The Pig," recommends a table-spoonful of Glauber salts with a little ginger, and a dry, comfortable bed.

Violets.—R. L. Schrock, Laclede, Mo., has had two pots of Violets for 18 months, and they do not bloom. The plants are too old. They should have been

turned out last spring and new offsets taken this fall for winter blooming.

Heat.—"F. W. de R.," Rockingham Co., N. H., sends a specimen of peat, dag out of a salt marsh, where it lies beneath two feet of clay, and wants to know if it is valuable as manure. It contains much undecomposed vegetable matter, and would need to be dug in the fall and suffered to freeze during the winter, when it would make a valuable addition to the manure pile. It would also make a good fuel, if properly prepared. It approaches more nearly to the character of the Irish peat, which is extensively used in Ireland for fuel, than any other we have met with.

A Good Pig.—G. W. Fourge, Fulton Co., New York, sends the following account of a pig he lately dressed, viz.: a pig, six months and twenty-six days old, and dressed 341% pounds. He asks who will beat it.

What is the Best Stock for an Ordinary Farmer to Keep?—This depends on the purpose for which the stock is kept. If a milk or cheese dairy, Ayrshire blood should be infused into the best native stock that can be picked up. If butter is wanted, the Jersey stock would be preferable. If beef as well as butter is desired, and the pastures are light, Devons should be chosen. If the pastures are light, Devons should be chosen. If the pasture is rich and feed abundant, 'Hereford or Durham grades would be the best. Whatever stock is chosen, should be introduced by mean of a thorough-bred young bull; the use of which on fair native stock would soon result in a great improvement.

John G. Carlkins, Knoxville, Tenn., had three little pigs left, when four weeks old, to root-for themselves. They were fed milk five times a day, and soon some wheat bran was added; after three months were fed new shelled corn, soaked in milk, four times a day. Killed at four months, they weighed 91, 89, 92 pounds. How could they have been made into more pork in the same time? As this is the season for pork stories, we shall be glad to hear from some of our readers an answer to this question. We do not doubt but many will improve on these weights. We have done it ourselves, by feeding corn-meal and milk, also boiled mush, cold.

Osage Orange.—E. F. Johnsou, Niagara Co., N. Y.—You are rather far north for the Osage Orange to be a sure thing. One-year-old plants are set in the spring. Unless you have some local knowledge of the success of the Osage, you had better use Honey Locust.

Cedars.—"T. B. P.," St. Lawrence, N. C.— The best time to set cedars is just as they are starting into growth. If the roots once get dry they will not succeed at any time. If you have to carry the plants any great distance, the roots must be surrounded by damp moss, or some other means taken to keep them moist.

**Pouble Geraniums.**—"R. L. S." William Pfitzer, scarlet, and Madame Lemoine, pink, are good sorts.

To Full Stumps.—Geo. E. Lee, Hulton, sends a plan to pull up small stumps. He takes a young white-oak or hickory tree, 30 or 40 feet long, and thick enough not to spring much, fastens a short chain with a hook to the end of it, takes a turn round the stump to be extracted (the hook is attached to a root, to get a good hold), and by means of a team hitched to the other end, the stump is twisted out of the ground.

Bricks and Leather.—"N. W.," Wies Bluff, Texas, wishes to engage in brick-making and tanning leather, with a capital of \$3,000, and wants all the formation about the best mades and best machines for these businesses. Unfortunately our space is too limited, or we would gladly accede to N. W.'s request. We will say, however, that \$3,000 may start a brick-yard, but would go a very short way towards establishing a tannery. It would be a small tannery that would not have over that amount constantly invested in bark alone.

Grease from Edones.—"P. S." asks if the grease which rises on the surface of the acid in which bones are dissolving, is useful as a maunre, or as a soap grease. It is of more value to make soft-soap.

Number of Feet in an Acre.—Chas. Sims, St. Louis Co., Mo., ask the number of square feet in an acre, and parts of an acre. One acre contains 43,560 square feet, half an acre 21,780 feet, a quarter of an acre 10,890 feet. A square of 20834 feet makes an acre. 20834 feet in length, and 101 feet 4 inches in width, is half an acre, and a square of 104 feet 4 inches is equal to a quarter of an acre. A city lot 100 feet long by 25 feet wide is less than a sixteenth part of an acre.

The Northern Parific Railrond is a national enterprise, and as such is interesting to every citizen of our country. As we have before remarked, it will open to settlement a rich agricultural region capable of supporting and employing the entire people of three or four of the smaller nations of Europe. We are glad to learn that the route is proving more favorable even than was anticipated by the projectors. The bonds of the road, paying 7-30 interest (2 cents a day on each \$100), are convenient, pay a good interest, and are a desirable investment. They are in the good hands of Messrs. Jay Cooke & Co., whose announcement is given on the cover page.

"W. E. H." of Clay Co., Mo., has a ten-acre clover-field, that has been down five years, and during this time has received several liberal dressings of stable manure. He intends breaking it up for coru, and asks our opinion as to whether it would be best to plow it in the fall and again in the spring, or not to break it up till spring? The soil is deep, dark upland. Much would depend on circumstances, but in our own case, unless the sod was very tough and we could break it up very early in the fall, so that it would not before winter set in, we should prefer not to break it till just before planting in the spring. "Should it he broken deep or shallow? We can not tell. As it has received such liberal top-dressings of manure, shallow plowing, say six or seven inches, would probably give the best corn the first year.

Good Returns from a Small Flock of Sheep.—W. II. Rathbone, of Ct., writes: "We have only 15 sheep, about half of which are grade Cotswold, the remainder grade South Downs; only twelve of the ewes brought lambs, remaining three were yearlings. The twelve ewes brought 17 lambs, which were all sold by the middle of July at 10c. per D.: total weight 1,247½ Ds., a fraction over 73 Ds. each. One of the sheep was killed by dogs, before shearing. From 14 sheared we had 55½ Ds. wool, sold at 55c. per D., \$30.52. Total from 15 sheep, \$155.27, or \$19.35 from each sheep. The lambs all came in March, with the exception of two, which came the last week in February. The sheep are all good mutton. So yon see that the capital is not impaired, as the sheep are all young."

Farming on the West Coast of Mexico.—"Constant Reader." Our personal knowledge of the agriculture of the western coast of Mexico is confined to the northern portion, Sonora and Sinoloa. There cultivation without irrigation is impossible; with it all the cereals yield good crops, and sngar-cane and many of the tropical fruits may be grown. You could probably get statistics of the several States from the Mexican Minister.

Curing Cats.—"C. W.," Alleghany, Pa., asks how to cure a cat that nearly chokes with worms. We never knew of a case of this kind, and can not advise from experience. If the cat was ours, we should experiment a little. Take a piece of stout cord and a "sizable" stone. The one end of the cord securely to the stone, and the other end around the cat's neck. Then throw the stone into the Alleghany River.

Transplanting Hickory Trees.—
J. Williamson, Adams Co., Jowa. Hickory trees have such strong tap-roots and so few fibrous ones, that it is very difficult to transplant them. The chances of success would be greater, if you were to dig down and cut off the taproot with a sharp spade, and let the trees remain another year before attempting their removal.

Rolling Land for Corn and Potatoes.—"E. W.," of Kansas, wishes to know "if there would be any benefit in rolling potato or corn ground, either before or after planting, provided it was free from lumps." Many farmers think the roller, by pressing the particles of surface soil more closely together, checks evaporation and keeps the soil moist. Where the ground is lumpy this is undoubtedly the case, but where it is entirely free from lumps, we think, as a rule, there is little to be gained by rolling. A thorough harrowing will consolidate such soil deeper and better than a roller.

When to Apply Askes, Lime, and Guano.—"I. I.," Pontiac, Mich., asks when to spread askes, lime, and guano. Lime and askes may be spread in the fall, but guano is best spread early in the spring.

How Much Oil-Meal?—Jas. Smith, Woodsville, O., wants to know how much oil-meal may be fed to fattening beeves, without waste. It is best to commence gradually, as this feed is often too laxative at first. One quart at a feed, mixed with wheat-shorts, with a handful of salt, would be a good way of commencing;

and the quantity may be increased gradually to four quarts. But coarse feed, as straw, with plenty of hay, should be fed in abundance, even if roots are supplied. Cattle fed on oil-cake meal should be well littered.

#### What Agricultural Books to Read.

—A young farmer in Wisconsin says he intends to devote his evenings this winter to reading agricultural books, and asks what he shall select. The best works on agricultural chemistry are Professor S. W. Johnson's How Crops Grow, and How Crops Feed. They are perhaps too scientific for ordinary readers, but for the student there is nothing equal to them. Boussingault's Bural Economy, though somewhat out of date, is a work that every one interested in the application of chemistry to the cultivation of the soil and the management of farm stock should read and study carefully. Allen's New Americao Farm Book is the best work on general farming, while Harris on the Pig is well worth reading, even by those not specially interested in the subject. It discusses principles of great importance to every one engaged in raising farm stock. There are many other valuable agricultural books, but these will do to commence on.

Mortar.—"I. D. S.," Sacramento, Cal., asks in what proportion lime and sand should be mixed for building mortar. The proper proportions are 3½ parts sand to 1 lime. This depends somewhat on the "fatness" or quality of the lime, and unless the lime is rich, 3 parts of sand in measure would be sufficient. In mixing up a cubic yard of sand with 9 bushels of lime a cubic yard of mortar only will be the result, the mortar being less bulky than the materials separately. One third the bulk of water is sufficient, and too much is injurious.

Artesian Wells.—II. B. Gay, Springfield, Mass, asks the cost of sinking an artesian well in Massachusetts. We do not know that there should be any greater cost in sinking these wells in that State than in Wisconsin or elsewhere. Near Fond du Lac, in Wis., there are a great number of them, and the cost of sinking through ordinary limestone rock is, for depths less than 100 feet, about one dollar per foot. Where the rock is shelly and "caves," or where tobing is necessary, the cost is much greater. We have known of oil-wells that cost from 4 to 10 dollars per foot. So much depends on circumstances, that no estimate can be made with certainty.

Sprain of the Back Sinews.—"A. G. B.," Barry Co., Mich., has a colt that is not right in his hind foot. He has difficulty in raising it and acts as though he had a springhalt. Without knowing more about it, we should say the colt has a sprain. This may be proved by passing the fingers with pressure down the sinew, and where the pressure causes the colt to ffinch, will be the seat of the sprain. Absolute rest, with a bandage round the part, kept wet with cold water, will be the best treatment; patience will also be required.

How much Land is Necessary to Keep a Cow?—Wm. Johnson, Allentown, Pa., wishes to keep a cow on half an acre of ground; can he do it?——Yes, if the ground is sufficiently rich and properly managed. Half the ground should he in clover, which will be ready to cut in June and will last three months; one fourth should be put in corn for fodder, in drills two feet apart, planted quite thickly in the row (12 grains to a foot), and well hoed and weeded; this may be used occasionally to help out the clover, if necessary. The remainder of the ground should be put in turnips, or sugarbeets, or partly both, and may yield 200 bushels, which, with the stalks left over, will feed the cow through the winter and until the clover is ready again. Remember, the tops of the beets and turnips will last quite a time, if used economically. Keep them in a cellar in a heap, well pressed down and covered with boards.

### Bee Notes for December.—By M. Quinby.

Let the becs have a chance to fly out some of the latest warm days, and then as soon as the weather is cold they may be housed. It is well understood that strong stocks should be selected for wintering. They should be in a perfectly dark room, and the temperature kept at all times above the freezing point. It takes about fifty stocks to generate sufficient heat to make it warm enough, in a room fifteen or twenty feet square. Like other animals they consume less food when kept confortably warm, than when exposed to inclement weather. There is an advantage in housing bees in large numbers, as it takes less honey to keep up the proper warmth, smaller colonies being warmed by their proximity to large ones. To get rid of moisture, box hives may and should be turned bottom up. In movable combs the honey-board may be raised a little for the same purpose. Smaller

numbers may be kept in a dry cellar. Very strong stocks will winter on the stand out doors, but much better in straw than in wood. Straw hives may be entirely closed, except a small opening at bottom, as the moisture will pass out, while the warmth is retained. Wooden hives will need opening at top to let out moisture, and however well protected by straw, heat will pass from these openings.

These remarks, of course, do not refer to some modern bives, in which the space allotted for boxes in summer is used in winter for straw or some other such material to keep the bees warm; such I think the intelligent beekeeper will adupt as soon as he comprehends his true interests. In any case there should be proper ventilation and mice be excluded. Now is a good time to study bees and their culture. Much that is deeply interesting may be found in their habits and physiology.

### Ogden Farm Papers.-No. 23.

The other day I had an auction. A neighbor had been selling off his stock, and I arranged to bring over the auctioneer, and such of his sparse company as would come, to try their hands on a few native and grade eows that I am obliged to get rid of in order to make room for my thorough-breds. I put up the choice of a half-dozen three-year-old natives. The one sclected was a very good Devon-like animal that had cost me, a year ago, \$39. She had come in in July, was again in ealf, and was then giving about nine quarts. She commenced at \$10, and struggled her way slowly up to \$22.50, at which price she was sold. I adjourned the auction, having bought as much "food for reflectiou' as I could afford at the price.

My first reflection was that if I had depended on "the good old kind"-or native cattle-in my operations, I should have found myself, now, in a position to have an auction that it would not have been in my power to adjourn. That discretion would have lain with a gentleman of our community who, by virtue of his office, wears a stove-pipe hat with a cockade on it-for the sheriff is a "high" sheriff with us. My next reflection was that farmers are the most panieky lot we have. Hay is worth about twenty per cent more than it was a year ago, and some one has said that the crop is short at the East, and that the price is going up. So, with hay enough in their stacks to winter more stock than they have, Eastern farmers want to sell out everything they have that can cat hay, and to sell them at any price. With butcher's meat retailing at twenty-five cents a pound, we are all rushing to sell out for the value of hide and tallow-just as Ohio shepherds sold their sheep a few years ago for the price of their pelts. I don't profess to be better than the rest, especially as I still have to buy hay, and my "natives" must be thrown into the pool at the best price I can get for them. I also reflected that such sacrifiees had better be left, as much as possible, to people who do not take the American Agriculturist, and that I should advise all readers of these papers to buy thorough-bred stock that can be sold in the face of such a market, as I sold Thrift the other day, for a dozen times the price of my Devonish heifer. This reflection was an extremely short-lived one. The only reason why thorough-bred stock is salable at high prices is because it is scarce; and if every one had it, it would cease to be searce, and would be sold for a song whenever such a scare as the present one occurred.

So the more I reflected the more I became convinced that I was dealing with problems that were beyond my reach, and that the law of supply and demand must work out its results in its own harsh way, until we know more about it than we now do. It must, however, be safe to say that the "ups and downs" in

farming are absurd, and ought to be avoided by a simple exercise of common sense on the part of farmers themselves. If we will make a resolution not to change the system of our business with each change of the market (and, having made it, will stick to it), we may be sure of a good average result. Those who are constantly changing lose in a paule more than they make in a rise. It is the steady goers that win in the end. It is all very well to say that you can't afford to winter eattle that you could only sell in the fall for half their value. Unless you are obliged to sell, you need pay no attention to the price, but quietly wait until they will sell for their real value. Cattle will not go out of fashion in our day, nor will they ever, for many months, together, sell for less than they have cost to raise; so, when they get down to lowwater mark, as they now are, it is the wisest plan to take good care of them and have them in condition to sell when the reaction comes and they will fetch more than they are worth.

The spasms that attend the business of cattlegrowing are still more marked in the case of These are slaughtered so unmercifully, and their breeding is so much suspended when they get below a certain price, that they are quite sure, within a year or two, to rise far beyond their real value; then the extraordinary price stimulates an excessive over-production, and this in its turn brings on a depression. Of course, we can not do much to counteract this tendency, but if we are shrewd we can do something toward profiting by the rise, without losing too much by the fall. My plan would be to keep always on hand a certain number of breeding sows, and to keep them breeding as steadily as possible. After each period of high prices, when it began to be evident that the change was coming, I would sell the pigs as "roasters" at six weeks old, and sell them for what they would fetch. If no one wanted them, I would kill them as fast as the sow's health would allow, and in either case would let her take the boar again as soon as she would. After a few months of such prices as are now prevailing, when everybody is "going out of pork," and when it is selling for less than the cost of production, I would commence to save all my litters and to raise every thrifty pig I had, even if I had to buy feed for them. In this way I should feel quite sure of meeting a reaction that would enable me to sell my whole product at much more than an average price. Especially would it be well to have a good stock of young breeding sows for sale, as the demand for these is always very active after the price gets well up again.

I have been annoyed more than once, when I have spoken of the price at which I have sold my butter, by the remark that I received such a price only because I happened to live in Newport, where there are rich and extravagant people who do not care what prices they pay, but that my experience is no criterion for farmers who are not so situated. Now, in the first place, the richest and most extravagant men I have known are far from being the most careless of the price they pay for butter. Their purse-strings fly utterly loose in the matter of wine and cigars, and all manner of luxuries, but a difference of ten cents a day in the cost of their butter is a serious matter with them. The fact is, our American training has been "thrifty." and its effect still shows itself. We have been brought up to keep a close watch of the spigot, and even when, in the days of our prosperity, we knock the bung entirely loose, force of habit makes us still hold fast at the smaller vent. Hence it is natural for us, all our lives, to consider it a sort of personal triumph to save as much on our month's butter as we spend on our day's cigars.

In the next place, it is by no means a limited class that is willing to pay a high price for good butter. Indeed, the people to pay such prices are much more abundant than the butter to supply them. This is a theory I have always held, and I am glad to be able to bring practical proof of its soundness, by stating that I have just closed a contract for my entire supply with one of the largest butter and cheese dealers in Boston, a man who is handling tons of "best" butter at 30c. to 35c. per lb. He pays me, to begin with, 75c., and promises an advance when winter sets in. After I had made this engagement I was offered 85c. by another customer. My man not only pays me this price-he makes an advertisement in the Boston papers of "Ogden Farm Butter," and behaves generally as though he considered it a good thing to have got hold of it.

Now, why is it that my butter commands at wholesale more than twice the retail price of "best" butter? Simply because it is of extragood quality; hard, firm, high-colored, well flavored, and well worked. It is put up in neatly ornamented half-pound cakes; each of these is wrapped in a square of damp muslin, and they are packed on shelves in an ice-box, so that they are packed the market in the most attractive form. No pains are spared to make everything as appetizing as possible, and the butter really costs as much as two cents a pound more than it would if put up in the ordinary way.

Notwithstanding all this, I could not possibly make such butter as I do from any other than Jersey cows, nor could I be sure of having it always good if I did not set my milk in deep cans, immersed in cold spring water.

For the majority of my readers the foregoing account of my butter business will be only so much chat to be taken in at one car and let out at the other; but there are a few who will try to take a hint from it, and these few do not need to have its lessons pointed out for them. They will see that a Jersey bull, a set of deep milkeans, and the utmost thoroughness in all the little details of making and marketing, will enable them to sell their butter at twice their present prices. There need be no fear of overstocking the market with really "gilt-edged" butter. It will always be scarce and high. For instance: Mr. Sargent, of Brookline-at whose feet I sit in dairy matters-sells his whole product to Hovey (my customer) for \$1.15 per pound, and Hovey sells it for \$1.25. I hope, in time, to equal him.

### An Egg Farm.

BY H. H. STODDARD .- Eighth Article.

Vigor and thrift in chickens depend, in the first place, upon the quality of the eggs set. Those obtained from breeding stock managed as described in the preceding article, will hatch strong and healthy chickens; observing one precaution. Care should be taken never to set eggs laid near the close of the season, when the hens have been very prolifie, for such will produce chickens deficient in vigor. The produce to edges in great numbers is, in the best laying breeds, abnormal. The wild jungle fowl, in common with all birds in a state of nature, lays no more than she can cover, and this is true of domestic hens of sitting breeds, that steal their nests. It is the daily removal of the eggs

by the keeper, and the supply of an abundance of nutritious food, that causes great prolificness. There are some species of wild birds that will produce from three to ten times their usual number of eggs, during a season when their food is abundant, if their nests are continually robbed. But when hens lay twenty or more per month, for several months, the eggs are impaired. This is one reason why chickens hatched in summer are sometimes so deficient in vigor, compared with those produced in early spring. For the sake of economy it is important to have as few non-impregnated eggs as possible. Over ninety per cent will be impregnated if the breeding cocks are strong and sprightly, and no more than ten hens are allowed in a flock. It is a good plan to keep two cocks for each group of breeding hens, and shut them up, alternately, one day at a time, in a small but comfortable coop, entirely out of sight of the hens. The eggs should not be kept more than a week or a fortnight before being set. Those laid the same day should be given to one hen, so that the whole brood may hatch simultaneously, for new-laid eggs hatch several hours sooner than those that have been laid a considerable time before being set.

Artificial hatching and rearing are not economical. Even if incubators should become so perfected as to be capable of hatching as great a proportion of eggs as hens, there is no way of rearing the chickens artificially, and securing ventilation, warmth, cleanliness, and room for exercise, without greater outlay in labor and building materials than is necessary when hens are employed. Young chickens can not be kept warm enough, during cool nights, under an artificial mother, by their own heat, unless they are in a small apartment, kept so close as to produce very foul air. If good ventilation is attempted, there must be artificial heat supplied. and this needs an apparatus very nicely regulated, or the chickens will suffer from extremes of temperature. The cost of fixtures for heating, and of fuel, and of separate inclosures large enough for each brood to exercise in, would be great, and, what is of more consequence, the amount of attendance involved would make the plan entirely impracticable, except in case of high prices for early chickens or blooded fowls.

The nests of sitters should be made at bottom of damp earth, packed to a concave shape. It is not necessary to place them upon the ground, or to sprinkle the eggs with water, if this rule is followed. It is proper that the eggs should be in some way exposed to moderate dampness during incubation, as otherwise too much of the water in their composition evaporates. An elevated box furnished with nothing but dry litter is not suitable. Cover the earth with straw, bruised until pliable and broken short. Long straw is apt to become entangled with the feet of the hen, causing breakage of eggs. It should not, however, be cut by a machine, because the sharp ends of the pieces will come in contact with the skin of the hen, or that of the delicate chickens. In very cold weather line the nest with feathers. We have successfully hatched eggs by preparing a nest thus, in a room where during part of the time of incubation the temperature was below zero. Set hens in large numbers at a time, having kept some of them upon artificial eggs till all are ready. Of course, an entry must be made in a book of the family or strain, and other particulars of each clutch.

There are various methods of managing fowls while sitting, of which one of those securing a separate room for each will answer for a small establishment, but keeping them with the rest of the flock in a house such as was described:

in the fifth article, takes the least time of any, when great numbers are to be set, allowing an attendant to exercise oversight systematically and punctually. If it is attempted to keep each sitter in a large separate room, much outlay is necessary, while again, if small rooms are used, the hens are not easily made to take exercise, without which they will not thrive, especially if they sit a double term. Another objection to separate rooms is, that if feed is placed so that the hen can leave her nest to eat at pleasure, rats are baited to the spot, or if each room is made rat-proof, it will be too expensive. To feed and water individual birds in separate apartments takes much time, and if several are placed in one room, they must be looked to, or two will take to the same nest. But if surveillance is attempted, it will be handier to carry it out by placing many in a large room.

Fig. 1.-PLAN OF HOUSE FOR SITTERS.

[Note.—By mistake alighting-boards were shown on only one side, in the illustration of the interior of the house for sitters, but there should be three on each side.]

The nests are guarded against the depredations of rats by the fine wire netting described on page 332. The use of the coarse netting that alternates with the fine, is as follows: Half the labor of managing chickens is saved, by confining in the same coop two hens with their broods. They will agree perfectly, if well acqueinted beforehand. We take a hint from nature here; such wild birds as live chiefly on the ground, sometimes incubate and lead their broods in company. While sitting, adjoining hens form a particular acquaintance through the coarse meshes of the netting, and at the same time they can not interfere with each other, or roll the eggs from one nest to another.

Without a special system of management, a considerable number of sitting hens can not incubate and feed in the same apartment without confusion, but by the following plan each is made to know her own nest and return to it after feeding. In the first place, the laying bens, before offering to sit, are induced to choose nests scattered evenly through the whole building, by properly distributing nest eggs and keeping half of the nests closed. The nests on both sides of the house are divided vertically into three sections, one at each end of the room, and one at the center, by painting each division a special color -the center black, and the ends respectively red and blue. The contrast assists the fowls very much in determining their places. No more than three pairs of sitters should be allowed to each division, or eighteen clutches on each side of the building. The six birds belonging in the middle division remember their places very readily, because they are so far from either end. To prevent those at the ends from making mistakes, as soon as the laying season commences, one end wall of the room is covered with straw, or evergreen boughs, and the other left bare. All birds, wild or domesticated, possess a keen sense of locality, and a few neighboring objects enable them to recognize their nests. The nests that are used for hatching are num-

bered by affixing movable labels, and every sitter is distinguished by having a feather or two painted, the color showing her division, and the position of the mark, upon her head, or body, or tail, signifying a number corresponding to that of her nest. This enables the attendant to correct mistakes by the birds (which will, however, be rare) before fastening them in daily. The colors show distinctly upon the white ground of the feathers. This plan appears somewhat whimsical, but it is simple and convenient. Figure 1 shows the numbers on a side of the room, arranged as if for eighteen clutches, the nests not numbered being for the use of laying fowls in the mean time. The shading represents the three different colors of the divisions. The sitters are assigned places two by two as above stated, and each of a pair of nests and each of the occupants receives the same num-

ber. Only three numerals are necessary to designate three dozen nests in all, in one house. The incubating hens should be fed early in the morning, before any of the others are ready to lay. Those not sitting are shut into the yard; the large doors of coarse wire-work that prevent

hens from roosting on the alighting boards at night, are raised (at one side of the room only) and the pieces of wire-cloth before the separate entrances to the nests of the sitting hens are removed and placed in front of the nests frequented by the layers. Next, grain is thrown upon the ground in view of all the sitters on that side of the room, when a call to which they are accustomed will cause them to leave their nests, after which the large doors are lowered and the hens are left from 1 to 2 of an hour, according to the weather, while the poulterer is repeating the operation at the other buildings. When the hens are off, inspect every nest to detect broken eggs or anything else amiss. The sitters upon one side are all admitted to their nests at once, by raising the large

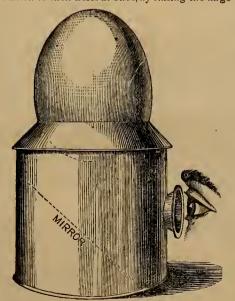

Fig. 2.-EOG TESTER.

wire doors, and then shut in safe from rats or the intrusions of laying hens, by the separate pieces of wire-cloth. Repeat the operation at the nests on the opposite side of the house.

Examine the eggs after the hen has been upon them ten days by the well-known method of

placing them between the hands and attempting to look through them at a strong light; or a better way is to use an "egg-tester." The tester represented in figure 1 is a very simple one, which we have used with satisfaction. It has been previously figured in the National Live Stock Journal, and its use is becoming common among poultry raisers. It consists of a tin cup. 3 inches high and 2} inches in diameter, narrowed at the top, leaving a round opening large enough to partly admit an egg endwise. An oval mirror is fastened in a slanting position across the cup, by projections of tin or solder. The eye is placed opposite an opening, 4 inch in diameter, and I inch from the bottom of the cup, the opening being furnished with an eyepiece. Enough light will be transmitted through the egg to form a distinct image of the yolk upon the mirror. Return to the hen only those eggs that appear opaque or clouded, and use those which show clear, orange-colored yolks as feed for chickens.

When hatching is progressing, remove gently once or twice the empty shells that might otherwise overcap the unhatched eggs, but further than this do not interfere, as a chicken worth hatching will contrive to get itself hatched. Let the chicks remain in the nest 48 hours without being fed, allowing the hen meanwhile water, and a handful of dry grain, placed in dishes by the nest. When removed to the coops, put in each double brood thirty chickens—less if it is cold weather.

### Country Roads and Bridges.

BY W. J. CHAMBERLAIN, HUDSON, O .- Concluding Article.

TURNPIKING.—Figure 1 represents a crosssection of an ordinary country tumpike. Our highways are about sixty feet wide. Fifteen feet may well be spared on each side for grass and for shade trees, leaving thirty for the turnpike and its ditches. The bottom of the latter should be about sixteen inches lower than the middle of the turnpike, and the ascent should be a curved slope, as given in the figure. The Implements Required are—first, a

THE IMPLEMENTS REQUIRED ARE—first, a strong, good, wheel-plow; second, a team-scraper or two; third, a thirty-toothed harrow—the square-hinge harrow and Geddes' (not patent) "double A" are both good; fourth, a heavy roller; fifth, farm tools, such as shovels, hoes, mattocks, steel rakes, etc. The old-fashioned scraper needs no description. That with a cast-iron edge, running back a foot, the rest of wood, is best if of the right shape.

Figure 2 represents a simple scraper that will move dirt much faster in ordinary turnpiking. It consists of a light two-inch plank, about 14 inches wide and 8 feet long, with tongue and handles, and a sharp, steel edge, often made of an old saw-mill saw, as given in the figure. The edge slants forward. The tongue is rigid. Figures 3 and 4 represent an improvement on figure 2. It is shorter and wider. The tongue is hung by pivots or hinges, at each end of the scraper-board, close to the cutting-edge. It loads better, is held far more easily, cleans the bottom angle of the ditch, as figure 2 can not, and dumps and spreads admirably.

THE WORK OF TURNPIKING.—The plow, with a steady, strong team, should turn a straight furrow on each side toward the middle of the road. It should be 3 inches deep, and 9 feet from the middle of the highway, and the plow should be tipped so that the outside of the furrow shall be an inch lower than its inside. This makes an inclined plane and facilitates

scraping. The wheel of the plow should now be raised an inch, and a furrow four inches deep plowed, inclined as before, then others in the same way to the number of six. The last will be 8 inches deep and 15 feet from the middle of the road. This plowing should be done

six furrows were plowed, but with the old-fashioned scraper and hand-leveling it would have taken three times as long. The common scraper, too, leaves the dirt in hillocks, and unless these are leveled with the greatest care, there will be a billowy road. New turnpikes are commonly wretched roads the

Fig. 1.-section of Turnpike.

as soon as the ground is settled in the spring, so as to run the furrows, when necessary, straight through the beaten wagon-track, which often crooks. Later in the season this is beaten so hard that it can not be plowed. Then, too, there is no grass to "bother" in April. The supervisor should himself do this work, and see that the furrows are straight, parallel with the fences, and at the right distance from them. The furrows, as soon as plowed, should be well harrowed and left to rot until May or June. This work should be done in the fall, that the sod might fully rot, but the supervisor is not elected until spring.

If the scraper, figure 2, is used, three of the six furrows should be replowed as at first. The scraping is done thus: Two men set the edge of the scraper, just behind the three furrows, and the team draws an eight-foot section of them to the middle of the road. The distance is only twelve feet. Then the team backs diagonally for another load, the meu carrying the scraper by the handles (a, a) at the end of the plank. When the three furrows are finished, three more are plowed as at the first plowing, and

Second, it is hard work for the horses. They must back up each time and then draw two men besides the load of earth. The scraper, figure 3, has not these faults nor those of the old one. It is far easier for man and beast than either. It loads without any one riding, and with perfect

more for every load.

ease for the holder, carries its load with no work to him, dumps without heavy lifting, levels its own earth, and keeps its handles out of the dirt and mud, and where the holder can reach them easily (see figures 3 and 4). The tongue helps

the holder manage the scraper, and keeps the traces from under the horses' feet. The sharp, steel cutting edge, the purchase the chain gives the operator, with the draft so near the cutting edge, and the fact that the scraper can be set

at any required angle, make it possible to drive it into the hardest ground. It can even be used for leveling knolls and hummocks in meadows without first plowing. Only one man is ever needed to manage team and scraper, while the old one needs a driver and

holder, and figure 2 really needs a driver and two holders. Figure 2 is certainly an improvement on the old scraper, but figure 3 is a still greater one on figure 2. Figure 2 is, however,

home-made, and costs perhaps not more than \$5, besides the steel edge. Figure 3 is patented, is made only in Chicago, and costs \$12, besides freight. A good old - style scraper costs \$10.50. I shall sell mine as soon as I can, and use only figure 3. If a road district can not

afford the \$12 for figure 3, it ought to have both other kinds. Both figures 2 and 3 are admirable for smoothing rough roads in the spring, and for leveling new turnpikes.

After a rain a new turnpike is apt to rat, and

should be re-leveled with scraper fig. 2 or 3, and with the hoe. If it is so leveled, after two or three rains the surface gets packed and there is no more trouble. Otherwise the ruts and holes grow deeper and deeper after each rain. New turnpikes, as I have said, are notoriously bad roads. It is simply because they are not properly leveled at first, especially where the old scraper is used, and are not kept in repair. A supervisor should reserve a part of his funds for this purpose. What would be thought of a railroad company that should not repair its road for a full year after a new track was made? A word in regard to

THE GENERAL APPEARANCE OF HIGHWAYS. -Some farmers, sometimes whole neighborhoods, get into the habit of leaving their wagons, sleds, lumber-piles, stones from meadows, apple-tree brush, etc., in the highway. "It is so handy." But how a road looks full of such truck! The wagons, etc., should be in the barn or tool-house, the stones under fence corners or in walls or pits, and the brush in fire-wood or

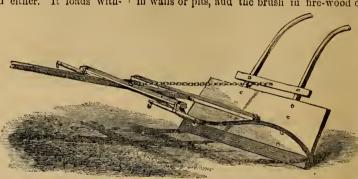

Fig. 3.—FLEXIBLE PLANK SCRAPER, LOADING.

ashes. A nice turf should cover the vacant space each side. The grass can be moved with profit, where animals are kept from the streets, as they should be. Many farmers own several acres of road. They hought it with their land, and pay yearly taxes on it. The public have a right to use it for a road, but not for a cow and hog pasture.

A certain town in Massachusetts has a society whose sole object is to beautify the highways, and it is a luxury to drive through the streets of that town. No unsightly objects meet the eye. No plows show their rusty mold-boards to the traveler. No wagons slowly rot beside the lazy farmer's barn. No mud-holes are kept in repair by a dozen nasty hogs. No nice turf is rooted into an unsightly mass of dirt by ahominable snouts. Would that there were more of such towns! Public sentiment can at least drive rubbish and hogs from the streets. If it rises high enough to plant and keep in thrifty growth a double row of elms, future generations will see Temple streets and Hillhouse

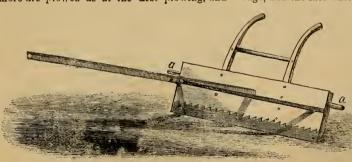

Fig. 2.-RIOID PLANK SCRAPER.

scraped as before. These furrows are deeper, and will require two scrapings in each place to make a clean job. If the ditch needs to be deeper, three, or even six more furrows may be plowed. But the first six, done as described, will make the middle of the turnpike sixteen inches higher than the bottom of the gutter.

When the six furrows have been scraped as described, there will be six ridges of dirt (side by side, their bases touching) the whole length of the job. The harrow, driven several times over them, will level them nearly enough; the scraper, figure 2 or 3, will improve the surface; the lice, rake, or potato-hook must dispose of sods and stones, and the roller finish the work.

The scraper, figure 2, is a simple, home-made thing, but puts dirt en the turnpike much faster than the ordinary team-shovel. This spring I saw two men and a team, plow, scrape, and finish thirty-five rods of turnpike in ten hours, and it was a smooth, handsome job, too. True, It was on a narrow by-road, and four instead of

avenues elsewhere than in New Haven. If property owners were aware that well-kept and properly shaded roads added greatly to the value of their farms, they would be more ready to scenre them than they are at present.

#### The Cow-Bunting.

BY ERNEST INGERSOLL, OBERLIN, O.

The striking peculiarity which gives to the Cow-Bunting bird a distinct character, is its strange yet undeniable habit of depositing its

eggs in the nests of other birds, and leaving them entirely to the mercy of strangers. Unaccountable as this practice may seem, it yet has its parallel. The ancients, even, were well aware that the Cuckoo, of Europe, never constructed for herself a nest, but dropped her eggs into the nests of other birds; but among the thousands of species spread over the globe, no other instance of the same uniform habit has been found to exist, until discovered in the Cow-Bunting.

The nests usually selected by the Cow-Bird are those of birds smaller than herself; though here in the West—a fact which seems not to

have been observed by some Eastern ornithologists—birds as large as the robin, wood-thrush, and song sparrow are among her chosen nurses.

About the middle of May, when the small birds are beginning to lay, the females leave the flock and skulk through the hedge-rows and brier-patches with a stealthy, restless air, which plainly betokens that some anxiety of no small account agitates the mind of the dusky lady. Moving in short, spasmodic flights, she at last pauses above an old, brier-hidden stump, glances hurriedly right and left, and dives into the briers. She remains but a moment, then

springs out, not as before, stealthy and suspicious, but with a careless, joyous air, straight up to the top of the nearest tree, pouring out with all her power the "liquid, glassy" notes which constitute her best song. But see, as if summoned by the exultant 'cry of the Bunting, approaches on swift, sure wings, a Maryland Yellow-throat, and darts into the bushes like a flash of sunlight. There, she has come out again and perched on that smilax! No, it is not the same bird! Yes, it is, but how different! She went

in blithe, and bright, and merry—she comes out restless, drooping, seeming almost stricken dumb with some mysterions terror. Let us go and discover the cause of her strange conduct. Ah! yes, now it is plain. There, at the foot of the mossy stump, sunk among the

fallen leaves, and arched over by sprays of moss, is the Yellow-throat's nest—dry leaves and grass, lined with hair. There are three white, browndotted eggs, and one larger, porcelain white, peppered all over with brown and layender dots, which become confluent near the large

HOODWINKING THE CROWS .- (See page 453.)

end. It is that large egg that caused the Yellow-throat's consternation. The Cow-Bunting has been here. But what will the Yellow-throat do? Nothing. She will lay another egg to complete her complement of four; then one of her eggs must be thrown out, because there is not room enough in the nest for five. She will sit upon them all, and hatch out the Cow-Bird's only; for that matures a considerable time before the Yellow-throat's. After the Cow-Bird has broken the shell she will remove from the nest her own three remaining eggs, and devote herself to the nourishing of the foundling, until

return. We prefer that one life rather than four should be sacrificed.

"It is a singular freak of nature, this instinct which prompts one bird to lay its eggs in the nests of others, and thus shirk the responsibility of rearing its own young. The Cow-Buntings always resort to

this cunning trick; and when one reflects upon their numbers, it is evident that these little tragedies are quite frequent. The Cow-Bunting seems to have no conscience about the matter. Its egg is usually the first to hatch; its young overreaches all the rest when food is brought; it grows with great rapidity, spreads and fills the nest, and the starved and crowded occupants soon perish, when the parent bird removes their bodies, giving its whole energy and care to the foster child."

Occasionally, however, the intruder fails in her thievish purpose. If she happen to visit a

nest which has not yet been occupied, the rightful owner seems invariably to abandon it in disgust. Some birds, as the Goldfinch, build a new nest over the stranger egg, even though their own must also be buried. Only one egg seems ever to be laid in the same nest; but the Buntings are not scrupulous about leaving a card where some of their congeners have also been visitors; so that frequently I have found three of these parasitic eggs in the same nest.

The Cow-Bunting is well known throughout the eastern half of the Union, and, as with every common bird, has received a variety of

titles, suggestive of haunts and habits. Arriving from the South early in the spring, with their cousins the redwings, they do not, like them, separate into pairs, but into small flocks in which the females predominate in numbers. Thus they remain all summer in a sort of indiscriminate concubinage-a practice seemingly consistent with their anomalous nidification. In the fall the young forsake their foster parents and collect together in small parties with their older congeners and the

it is large enough to take care of itself, and a hard enough task it will be, too. That is what the Yellow-throat will do if nothing happens. Something does happen, for we take the large egg out of its snug place among the small ones, and throw it so far that it is certain never to redwings, committing common depredation on the Indian corn. By the last of October they have all moved off to the South, taking advantage of favorable winds to carry them on, and by short flights soon reach their winter quarters among the rice-fields of the Gulf States,

# Walks and Talks on the Farm-No. 96.

"No. 96." And is it so that I have written these "Walks and Talks" for ninety-six consecutive months? I am told that they have done good. Many persons, strangers to me personally, have written to thank me for them; only two, so far as I know, have written to the publishers of the Agriculturist asking that they be discontinued. Mr. Judd, who is certainly a good judge, tells me I ought to write them as long as I live. Be that as it may, I feel profoundly grateful for the kindness manifested towards me in the past, and the interest which so many seem to take in my farm work. The Deacon and I are plain, unpretending people. We lead rather a quiet, uneventful sort of life. There are thousands of better farmers than either of us. But the Deacon is a close observer, and has had great experience, and if I have had sense enough to "draw Imm out," and then tell the readers of the Agriculturist what he says, who shall say me nay?

The best farmer between me and the city is a German, who a few years ago worked by the month on the farm he now owns. He saved a little money; then rented a farm "on shares;" then he bought it; then sold and bought a larger one; and now he has one of the best farms in the neighborhood, worth \$20,000. He is very industrious; never seems in a hurry, but is always ahead with his work. You always see him at church Sundays, and on his farm week days. He raises a good many calves, and when I was only half through husking he had his corn in the crib and the stalks in the barn, and fifteen head of young cattle on the stubble picking up the leaves and scattered ears. He has enlarged and reshingled the old barn, given it a coat of paint, put on gutters, and conducts the water into a large cistern. His fences are in perfect order. The whole farm, garden, and orchard is a pattern of neatness and thrift. No water stands on his low land, no weeds go to seed on his pastures. His back lot, adjoining the woods, was covered with partially decayed stumps, brambles, and weeds. He set fire to the stumps, cleared the land, summer-fallowed it, and sowed it to Diehl wheat, and got (this year) forty bushels per acre. And it is now in wheat again, and is probably good for over thirty bushels next harvest. Everything he does prospers. He is a "lucky" man-that is, he has good sense, and has health, strength, energy, and industry to use it.

It is curious how some men succeed, and others, with equal or better opportunities, fail. "It is not in man that runneth to direct his steps." But, at the same time, it is equally true that the causes which lead to success or failure are pretty generally under our own control. I have sometimes thought that the great difference in men was the ability or inability to "see a point," as a friend of mine expresses it. It is eminently so in the legal profession. A mere talker sometimes wins temporary reputation as a "jury lawyer;" but no lawyer who can not "see a point" ever attains real eminence in the profession. It is so in all professions. An editor who can not see the real point of any subject he is discussing had better quit the business. People are too busy to read column after column of words with no point to them. How often do men put a heavy building on a weak foundation, or make a machine very strong at some unimportant point, while the parts where the strain comes are made of the poorest and lightest material! They can not "see a point." I have an old crowbar on my farm that is thicker and heavier at the upper than at the lower end. I once heard a gentleman, who is regarded as an authority on such subjects, say that "timothy, weight for weight, is the most nutritious of all the grasses," and at the same time declare that a mixture of different grasses, weight for weight, is far more nutritious than timothy alone. He can not "see a point."

A farmer, more than most men, needs to cultivate this faculty. Every day questions arise as to what had best be done, and when and how to do it. The man who can think clearly, and will patiently look at the matter in all its bearings, taking everything into consideration, will decide wisely and act promptly. His stock will be well attended to; implements and machines in repair and in their proper place; work will be done systematically and cheaply; there will be no loss of time; nothing of real importance will be neglected, and it will be done in the best manner and at the best time. On the other hand, we need not go far to find a specimen. A farmer may have his head full of miscellaneous knowledge, may be a "great reader," a fluent talker, and a ready writer, but if he can not think, if he lack common sense, if he can not "see a point," his brain, his farm, and all his affairs will be in confusion. He will always be in a hurry; never has time to attend to necessary duties, but spends hours and days in doing something of no consequence to himself or any one else. He has a dozen jobs on hand unfinished. He feeds extravagantly for a few weeks, then gets tired and lets his stock pick up a living as best they can. He can tell you the leading characteristics of the different breeds of cattle, sheep, and pigs. He has tried many of them. But he can not see the main point in regard to their successful breeding and management.

It took me three years to convince our pathmaster that it was just as well to lower the water two feet below the road as it was to raise the road two feet above the water—and a good deal cheaper. He finally let me work out my tax by digging a ditch on the side of the road. I am not sure that he sees the point, but the road is now dry, firm, and good. I lowered the water two feet below the road for half the money it would have cost to raise the road six inches.

Mr. Glover, of Illinois, writes: "I should be glad if you would show how the manure from a ton of bran is worth more than the bran at \$14." I am glad to have this question asked, although it is not an easy matter to answer it. Some things must be taken on trust. Mr. Lawes' celebrated table showing the composition of thirty-one different articles of food, and the value of the manure made by animals consuming them, is the result of years of careful investigation and experiments in the field, the feeding sheds, and the laboratory. I can not give all the details, and few farmers would read them if I did. Suffice it to say that the evidence comes as near demonstration as the nature of the subject will admit. It should be understood, however, as stated in "Harris on the page 139, that the estimate of value is "relative," not absolute. The value of the manure made from a ton of wheat straw is placed at \$2.68; that from a ton of clover hay at \$9.64; and that from a ton of bran at \$14.59. But I do not claim that the manure from a ton of wheat straw is always, on all soils and for all crops, worth \$2.68; but where such is the case, the manure from a ton of clover hay is certainly worth \$9.64, and that from a ton of bran \$14.59. If the manure from the ton of straw is only worth \$1.34, that from a ton of clover would only be worth \$4.82. If in Illinois, on Mr. Glover's farm, the manure from a ton of straw, drawn out and spread, is only worth 67 cents, that from a ton of clover would be worth \$2.46, and that from a ton of bran \$3.65.

To determine the actual value of a manure is not an easy matter. In Illinois, for ordinary farm crops, it is not worth as much as it is in Western New York, not merely because the land is richer, but because produce is lower. On my farm, if I have a field properly prepared for wheat, I should probably get, without manure, 20 bushels per acre. Now, judging from Mr. Lawes' long-continued and accurate experiments, I should have reason to expect that the manure from a ton of bran, the liquid and solid excrements being all carefully saved and thoroughly decomposed without loss, so that the ammonia would be immediately available, if applied to an acre of this wheat would give 30 bushels per acre. In other words, the manure would give me 10 bushels of wheat. Good Diell wheat is now worth \$1.70 per bushel. And the ten extra bushels, after deducting the extra cost of harvesting, thrashing, and marketing, would net me at least \$15. So that the estimate of \$14.59, as the value of the manure from a ton of bran, is not far out of the way. And if this is correct, then the other figures in the table are correct also.

This estimate of the effect of the manure on the first crop is based on the supposition that the ammonia is nearly all available the first year; but there would be an excess of other plant-food left for the following crop of clover. The land, too, where the heavy wheat crop has grown would probably be cleaner, and it would produce a greater growth of clover, and this in turn would make the land (or the farm) richer, and so the effect of the manure would be felt for many years.

Where wheat only brings half the above price, the manure would not be worth more than half the estimate. And it must not be forgotten that the manure is supposed to be drawn out and spread on the land. It would cost as much to draw out the manure in the one case as in the other, while the increased produce obtained from its application is worth only half as much. This would make a serious deduction from the estimated value of the branfor manure, but it would make a still greater deduction from the estimated value of straw. On the whole, therefore, I believe that the table of values is relatively correct. It is worthy the careful study of every farmer. In the whole range of agricultural literature, I know of nothing that has done and is still doing so much good, and I think I have a right to feel proud of the fact that I was the first to call attention to its real, practical value, and to publish it two years in advance of its appearance in the Journal of the Royal Agricultural Society of England. The more the table is studied, and the better it is understood, the more will its value and importance be appreciated.

So far, I am delighted with my white-mustard experiment. We had an oat stubble on which the clover and grass seed had failed. The field is back of the Deacon's farm, and for want of a good outlet through his land I am unable to drain it properly. Until this is done, it is throwing time and money away to try to raise grain

crops. How to get it into grass was the problem I had to solve this spring. My English friend, Mr. Medcalf, suggested mustard. It was a new idea to me. We plowed the field three timesin other words, summer-fallowed it. Then, in July, we sowed it to white mustard, and at the same time seeded it down with clover and timotby. The clover is a good catch, and if it stands the winter the experiment will be a decided success. The mustard proves a far more valuable crop than I expected. It has given me more food than I know what to do with. I am feeding it out ad libitum to all my stock except horses. The Merino sheep at first did not seem to like it, but after a few days ate it with avidity. The Cotswolds seemed to know what it was, and fully appreciated their privileges. The pigs literally devour it. Even the little, growing ones, that I feed as high as I know how, eat considerable of it, and it seems to enable them to digest their other food more perfectly. I have not seen any voided grain since we commenced to feed the green mustard. My breeding sows get little else than mustard, and thrive well on it. Of course, it would not fatten a pig alone, but it is unquestionably a useful auxiliary food. I have over ninety pigs, little and big, and find the mustard a great saving to the corn crib. We have been feeding the mustard (Oct. 21st) to the cows for a few days, and so far it has not affected the taste of the milk. The cows eat it greedily, and if it does not affect the milk I shall certainly try mustard as a soiling crop next year.

You can sow the mustard at any time in the spring after all danger of frost is past, and in two months it will be ready to feed off or mow for soiling. The land may then be sown again, and a second crop obtained in September, October, and as late into November as severe frosts keep off.

It seems to me that in sections where wheat is not grown, and where land has to be seeded with oats, mustard might be grown with great advantage. Two crops might be grown in a season. The first crop might be plowed under for manure, or fed off on the land, as thought best. The second crop should be seeded down with timothy and clover. I am assured that the few English farmers who have tried it find it one of the very best crops to seed with, say in July-getting a large crop of hay the next season. A little artificial manure, such as superphosphate, or even plaster, has a wonderful effect on mustard, and in such a case it is just the crop for poor land that is in good mechanical condition.

We have just killed one of our grade Cotswold-Merino lambs, not seven months old. He weighed alive 96 lbs. The blood weighed 21/2 lbs.; offal, 21 lbs.; skin and feet, 18 lbs.; waste, <sup>1</sup>/<sub>2</sub> lb.; carcass, 54 lbs. Is not that a pretty good lamb from a common Merino ewe that cost only \$2.40? I raised 74 such lambs from 60 ewes, and was foolish enough to sell 70 of them to the butcher in July, most of them better lambs than this one. Unless a farmer raises very early lambs, and has good opportunities for disposing of them to the best advantage, it will pay better to keep them-if they are kept well and are of the right kind. I think I never saw better-wooled sheep in my life than these grade Cotswold-Merinos. They are covered with wool from the nose to the toes. I am inclined to think that in our climate, and for ordinary farm management, these grade slicep will prove more profitable than the pure longwooled sheep. The latter require better treatment than ordinary farmers are willing to bestow. If they were prepared to give the requisite food and care, no sheep, where money is in demand, would pay so well. But they certainly will not bear neglect as well as Merinos. And this is true of all good stock. It is a truth which farmers need to know and feel and act upon.

These grade Cotswold-Merino sheep require better treatment than Merinos, but nothing that any farmer can not readily bestow without changing his rotation or management. They get along very well without roots; require morely good pacture, good clover-hay, and a little bran, and a few oats or peas in winter would not hurt them nor do the manure heap any harm.

Nearly all our farmers now burn more or less coal. Many who have still plenty of wood, say it costs more to prepare it for the stove than to buy coal, the use of which saves a great deal of work in the house.

What shall we find for our farm men to do in the winter? is a question well deserving thought.

My experience in underdraining two winters ago was, on the whole, so satisfactory, that I propose to do still more at it the coming winter. The main point is to get everything ready before winter sets in. The open ditch into which the main drain is to discharge should be cleaned out, and made so wide and deep that there will be no danger of the water setting back. The next thing is to determine where the underdrains are to be cut, and stake them out. Then take a plow, and turn two or three furrows away from each side of the line of stakes, being careful to go as straight as possible. With the right kind of plow, and three or four horses abreast, you can make a dead-furrow fifteen or eighteen inches deep. And it is also a good plan to run the plow once or twice along the dead furrow to break up the subsoil as much as possible. The more loose soil there is in the furrow, the less danger will there be of its freezing solid. In my case, the first snow we had was blown into these deep dead-furrows, and although the winter was a severe one we had no trouble from the frost. A slight frozen crust was sometimes formed on the loose earth, but rarely if ever so hard that the pick had to be used.

There is no difficulty at all in digging the drains. The point where skill and experience are required is in laying the tiles. The drains must be cut to the required depth and the tiles laid and covered up at once. In my case, in some instances, I did not lay the tiles until we had finished cutting the drain the whole length, but it is somewhat risky. Better lay the tiles as you go along. There will usually be water enough in the drains to show you the proper level. Your own judgment will tell you better how to do the work than any description. You must be careful to get every tile deep enough, and at the same time not too deep. It is necessary also to put a little something at the end of the last tile to prevent the water carrying loose earth into the drain.

On low, mucky land, where there is a good outlet, this kind of soil is seldom so frozen beneath the snow that open ditches can not be dug at any time during the winter. But the work ought to be laid out and the land staked before winter sets in, and when you can see where the ditches are required.

On my farm, I have no difficulty in finding plenty of work that can be profitably done in winter. If stones are placed in large heaps where they can be got at, they are cheaply drawn on sleighs or stone-boats to where they

are required to make stone wall or for building purposes. One winter I drew the stones in this way to make over one hundred rods of fence. I could not have found time for the work at any other season.

We must make up our minds to pay men as much for working on the farm as they can earn in other pursuits. If they can get \$1.25 per day the year round in a factory or on a railroad, we must furnish a similar compensation in one form or other on the farm. If we only want men for six or eight months, and that during the busiest season, we must be prepared to pay higher wages than those who give constant employment. We shall never have reliable labor until we make it worth a good man's while to stay with us year after year. And we can do a great deal to induce such men to settle in the country by building and renting small houses, or by selling an acre or two of land to some steady married man who wants to own a home of his own. There are many such men who would rather work on a farm than at any other employment, who are absolutely compelled to leave the country and go into the cities or villages because they can not get a house to live in. And, as a result, we frequently have to paymen from 20 to 30 per cent more per day than they get in the immediate neighborhood of a city. Farmers have this matter entirely in their own hands. They must either build houses, or sell land to those willing to build. Every good, honest, industrious married man who settles in the country increases the value of farm property. The greater the population, if of the right kind, the greater the value of land. We can not too often remember that it is labor and not land that produces wealth. It is a loss to the community to have a man lie idle all winter. And in this country there is certainly no lack of employment for any man who will work at reasonable wages.

# Hoodwinking the Crows.

One of our artists gives a sketch of a device to which he resorted in order to rid himself of the crows that made too free with his newlyplanted corn. He made several cones of stiff paper, and upon the inside of the larger end of these he spread a ring of old and gummy linseed oil-a mixture of oil and rosin just so thick as not to run would answer the same purpose. The cones were lightly and carefully inserted in holes made in the soil, and a few grains of corn dropped into the point of each. picious crows, after careful inspection, would put their heads in to reach the corn-what happened then is sufficiently shown in the engraving, given on page 451. Our friend did not do the birds any serious bodily injury, but he remarked that they were "very much disgusted."

#### Sheep Pens and Racks.

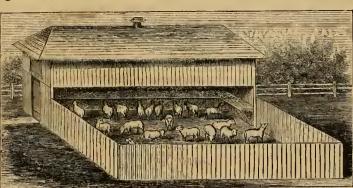

Sheep that are not being prepared for market do not thrive well during winter, unless they have exercise and a well-ventilated pen. We have used a pen similar to the one here figured, which we found very convenient in many respects. The building may be of any hight, but the upper floor is only six feet from the ground, which gives a large amount of storage room above for hay. The floor should be of matched boards, or the cracks should be otherwise closed up to prevent hay-seed or chaff from dropping on to the wool. The front of

the shed is boarded to within four feet of the ground, leaving that space open, that the sheep may go in or out when they please. The feeding-rack is placed round three sides of the shed,

of it, where the hair may be scraped off. When the scraping is done a hoisting apparatus on the floor above elevates the careass while it undergoes the operations of dressing and clean-

ing. This hoist consists of an axle with cranks by which one man may raise a hog of four hundred pounds. The frame is set on common casters, by means of which it is pushed backward - the rope passing along a slit in the floor-to where some S hooks are suspended, to one of which the carcass is transferred, and the

transferred, and the apparatus is ready for another hog. With a sufficient number of hands to help, the job of slaughtering is soon finished.

SHED, PEN, AND RACK FOR SHEEP.

and slopes forward so that the sheep can consume the last mouthful of hay contained in it. It is made so high that the sheep can not reach over the front of it and pull the hay out over each other's wool. Three feet and a half is the right hight for large sheep. The slats are placed three inches apart, which prevents the sheep from pushing their heads through and wearing the wool from their necks. Everything about a sheep-pen should be smooth, leaving no rough splinters to catch and tear the wool. The pen and yard should be kept well littered. This shed is arranged especially to keep the wool clean and free from hay seed, clover heads, and dust, and that the sheep may be outdoors or indoors as they wish, and according to the weather, without needing very much attention.

#### Slaughtering Hogs.

A necessary work, but generally a most disagreeable one, is that of slaughtering hogs. It is made more unpleasant by the reason that it comes in the cold and stormy season, and from the absence of a sheltered place in which to do the work. Any out-house or shed may be fitted up with little trouble, so as to render this duty, if not pleasant, at any rate not so sloppy, cold, and uncomfortable as it usually is. A tight,

### Home-Made Sleds.

A pair of bob-sleds ordinarily cost fifty dollars, and are generally much heavier than necessary. Besides they are very often made on a wrong principle. The joints are made very tight and the frame rigid. When, therefore, they are taken off a smooth road and brought into the woods with perhaps a heavy log or other load on them, there is no play or "give"

to the joints, and they either break or become badly racked. We figure here a pair of sleds which have neither mortises, tenons, nor iron about them, necessarily, except the shoes, king-

bolt, and the coupling clevises. They can be made without any other tools than an ax and an auger. They sit low to the ground and are easily loaded and difficult to upset, and the cost to a man who can use an ax is about four days' work. The runners are hewed from small oaks, or sugar maples, which have a natural

crook at the root. They should be two and a half or three inches thick, and as deep as desired. Blocks are pinned on to each runner to receive the beams. The hind beam should be eight inches thick, the front beam about half that thickness, the bolster being the same, or an inch or so heavier. The beams and blocks are bolted to the runners with inch - and - a - quarter oak or hickory pins, well wedged at both

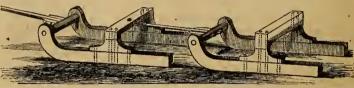

bolster being the same, or an inch or so heavier. The beams and blocks are bolted to the runners with inch-and-a-quarter oak or hickory pins, well wedged at both ends. The tongues are fitted in with wooden wedges, which come well up from the roller, and two halfinch pins should be put through both the

are fitted in with wooden wedges, which come well up from the roller, and two half-inch pins should be put through both the wedges and tongue to keep them from working loose. This will make the tongue sufficiently rigid without braces, unless some careless teamster drives around too short sometimes, when the tongue is just as apt to break as to be

wrenched from its place if well wedged. In case the sleds are wanted shod we would recommend cast-steel shoes, one eighth of an inch thick, to be put on with three-inch wood screws, the holes being countersunk so that the screw-heads may be quite flush with the shoe. A steel shoe is light and will not "stick" in frosty weather, as a cast shoe will. The writer has built such sleds and shod them with common band iron, one eighth thick, which comes cheaper than the steel, and for ordinary use is nearly as good. But for heavy work, such as drawing logs, timber, or lumber steadily every day, the steel shoes are the cheapest in the end. These sleds are very durable if taken care of during the summer, and a coat of crude petroleum put on will increase their durability. If made of well-selected stuff a pair of these sleds are good for five years, when probably they will need new pins or some repairs. There is no necessity to use seasoned lumber for making the sleds, as green timber just out of the woods will answer, as there are no joints to work loose.

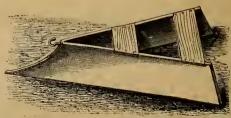

#### A Snow-Plow.

A properly constructed snow-plow is worth several times its cost. After every storm which covers up the roads, if a good snow-plow is drawn around and the roads and paths opened, the snow is packed down and becomes consolidated. It does not then melt away rapidly, and sleds will not cut down to the ground. To make such a plow as is figured here, take two

HOME-MADE WOOD OR LUMBER SLEDS.

planks eight or ten feet long, bevel the end of each plank, and bring it to a point so that when put together they will form something like a double-mold-board plow. Let the planks slope outwards from the upper part, so that the sled shall be wider by a few inches at the bottom than at the top. It will not then ride on the snow, but will push it sideways and throw it off. A floor may be laid on the plow on which the boys, who will always be on hand to assist, may ride, and this necessary job of clearing away snow will become one of the regular win-

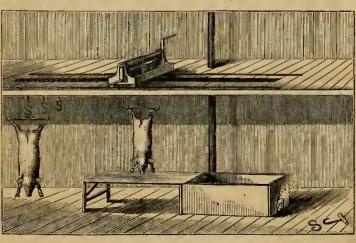

A SNOW-PLOW.

ter sports. The hook by which the plow is drawn, must be fixed at the top of the nose, or it will be lifted up when in motion.

### A Movable Feed-Rack.

A very simple rack for cows, calves, or sheep is shown in the engraving. It is intended for the yard, and the illustration sufficiently explains the construction of the rack itself. It is mounted on a post, and a strong iron pin set in the top of the post passes through a piece of

ARRANGEMENT FOR DRESSING HOOS.

wooden scalding-trough may be made, with a sheet-iron bottom, under which may be set a simple arch of stone or brick, to hold a few brands, which will keep the water hot enough to do the scalding, and obviate the necessity of keeping the kitchen stove occupied.

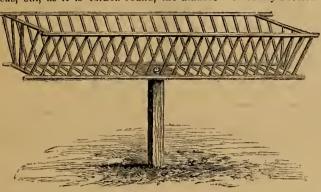

A sloping end to this trough enables the hog to be easily drawn out on to a bench at the end

plank in the floor of the rack and enables it to be turned around when desired. In the barnyard this is a convenience, as the manure will not be then left in piles in the front of the feedracks, but, as it is turned round, the manure parison of the two yokes figured on this page will show this difference at a glance.

The hollows of the yoke, where they rest on the oxen's necks, should also be well and smoothly beyeled or rounded off, so as to en-

large the bearing surface. This prevents galled and swollen or bruised necks. With a badly made voke an ox can not draw, if willing; with a well-fitting and easy one, an ox will draw until his power is exhausted. If an ox ever refuses to pull, it is, as a rule, the yoke that is to blame. Oxen will not balk without good reason; in fact, we doubt if a really balky ox has ever existed. When the yoke is properly shaped it should be made

smooth; after all irregularities are removed by rasping, it should be sandpapered until quite smooth. The best timber for yokes is basswood or soft maple, and for bows hickory or second-growth white-oak is to be preferred.

A REVOLVING FEED-RACK.

will be more equally spread. If several posts are placed in different parts of the yard, the rack may be moved from one to another.

#### 0x-Yokes.

There is nothing which a farmer uses that is more dependent for ease and convenience in use upon true scientific principles of construction than an ox-yoke. We very seldom come across a yoke and bows to which some objection may not be made. They either choke the oxen or gall their necks, or the yoke will break under a sudden jerk. These difficulties are all owing to faulty construction. In the first place more timber is generally used than necessary, and the consequence is that more cutting is needed to shape it. This makes the yoke weak where it ought to be strongest. Sometimes the stick is sawed  $7 \times 10$  inches; but really  $4 \times 6$  is amply sufficient. This is little more than one third the other size, and a saving is consequently made. The principle on which the yoke should be shaped is this: the point to which the draft-chain is fastened should be on a line with the center of the force applied, or that part of the yoke surrounding the neck of

Fig. 1,-OX-YOKE-INCORRECT FORM.

the ox. Then there is no effort made to twist the yoke and crowd the lower part of the bows against the animal's throat and so interfere with its breathing. This pressure is the reason why

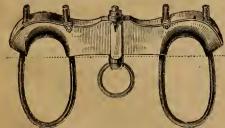

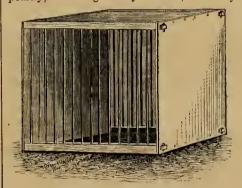

Fig. 2.-ox-yoke-correct form.

oxen will sometimes go on their knees under a heavy pull, sagaciously discovering the trouble which their drivers could not see. A com-

# A Folding Chicken-Coop.

At the Ohio State Fair we saw a collection of poultry, consisting of fifty varieties, owned by

FOLDING EXHIBITION-COOP.

one exhibitor, all contained in handsome coops made to one pattern. These coops were the simplest and most easily constructed we have anywhere seen, and there is not a nail in them. They can be taken apart and piled up when not needed, taking up very small space. The front

and back are alike, and consist of two strips (an upper and lower one) held together by wooden rods, placed a proper distance apart. At each end of these strips is a tenon which passes through a mortise in the side boards and is secured by a key which holds the sides in their places. The floor and top are kept in their places by small, round pins, similar to dowelpins, which pass through holes made to correspond in the side boards.

The coops are held together by the keys in the tenons of the front and back pieces. When these keys are knocked out the coops fall apart and may be packed away. There is no patent on these coops, which is not the least of their merits. They are easily transported, and allow the fowls to be seen to the best advantage.

#### Smoke-House and Oven.

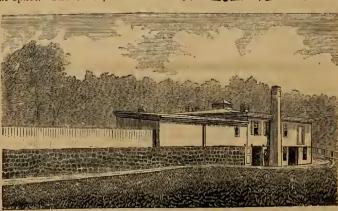

We are requested to give a plan for a bakeoven and smoke-house in one building. These

COMBINED SMOKE-HOUSE AND OVEN.

are common adjuncts to the farm-house in Eastern Pennsylvania, and are generally built of stone or brick. The oven occupies the front and that part of the interior which is represented by the dotted lines. The smoke-house occupies the rear and extends over the oven. The advantage of this mode of building is the perfect dryness secured, which is of great importance in preserving the meat, as also the economy of expense gained in building the two together, and the smoke that escapes from the oven may be turned into the smoke-house.

GREASE FOR GALLS ON HORSES.-"I. G. Irwin" asks whether grease (i. e., meat fryings, bacon grease, and lard) is considered the wrong thing to apply to galled places and bruises. We do not know that there is any objection to the use of such refuse grease. We often use lard and gunpowder, as a mixture, to prevent white hair from growing on a saddle gall; and we use salt water for bathing scratches and bruises. As grease and salt used separately are not injurious, we see no reason why they should be when used in conjunction. At the same time we are fast gaining faith in the use of simple hot or cold water and dry and finely sifted earth for all minor treatment, and we are gradually dropping all our old remedies.

ELEVATION OF MR. SARGENT'S BARN.

# Mr. Charles S. Sargent's Barn.

We have had occasion heretofore to refer to the barn recently built by Mr. Chas. S. Sargent, of Brookline, Mass. We give above an elevation showing its general appearance, and plans of its arrangement on the next page.

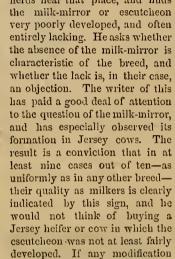

Fig. 1 shows the cast side of the barn (the down-hill side), with the cart entrances to the manure cellar and wagon shed. The hight of this story is about eight feet in the clear. Fig. 2 shows the arrangement of the cellar, which, aside from the usual appliances of a farm barn, has a steam-boiler for cooking hay, etc. Fig. 3 is the main floor, containing six box-stalls, and stabling for ten cows. The cow-room, which is ceiled on the walls and overhead with varnished pine, and has its windows protected by green blinds, is-without being extravagant or

main cut. When the other fore leg has been completed, commence at the heel of the hind leg, go down over the cap of the hock joint, and down the back of the buttock to the first split. When the hide is loose and spread out, it will be seen that there are no such irregularities in its contour as if the cuts had been made down the inside of the legs, as is often done.

# The Milk-Mirror in Jersey Cows.

A correspondent at Hannibal, Mo., writes that

he has been studying some Jersey herds near that place, and finds the milk-mirror or escutcheon very poorly developed, and often the absence of the milk-mirror is characteristic of the breed, and whether the lack is, in their case, an objection. The writer of this has paid a good deal of attention to the question of the milk-mirror, and has especially observed its formation in Jersey cows. The result is a conviction that in at least nine cases out of ten-as uniformly as in any other breedtheir quality as milkers is clearly indicated by this sign, and he would not think of buying a Jersey heifer or cow in which the escutcheon was not at least fairly

of Guenon's system were to be made in applying it to the Jersey breed, it would be, perhaps, in attaching less importance to the upper part of the escutcheon, and more to that which runs out over the thighs-but even this we are not sure of. As a rule to live by, we believe in buying a Jersey with a good, full Guenon escutcheon, and no other. That

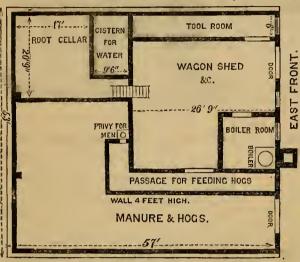

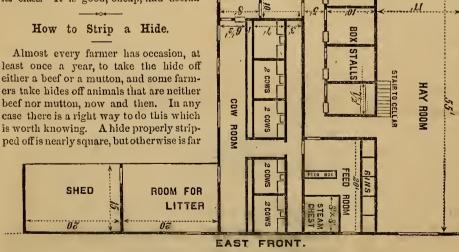

Fig. 2.—BASEMENT OF MR. SARGENT'S BARN.

"fancy"-very neatly and perfectly adapted to its uses. The mangers are of "Cottam's Patent," much used in England, consisting of two iron feed-tubs, with an iron water-trough between them for each pair of cows. A low partition separates each double stall from its neighbor. The box-stalls are fitted with rocking mangers, which move back and forth through the parti-

tion, so that feed can be supplied from the passage way. This barn is a capital model for any amateur, small, or "fancy" farmer to follow, as it has all the conveniences needed, and none of the ornament that we too often see on barns of its class. It is good, cheap, and useful.

Almost every farmer has occasion, at least once a year, to take the hide off either a beef or a mutton, and some farmers take hides off animals that are neither beef nor mutton, now and then. In any case there is a right way to do this which is worth knowing. A hide properly strip-

from that shape. To proceed properly, lay the carcass on the back, run a sharp knife from the chin down along the belly in a straight line to the root of the tail. The knife should have a sharp point and be inserted edge upwards beneath the skin, when it should be run steadily along. Then commence at the split of the hoof on the fore foot and run the knife down over the knee in a straight line to the brisket where it meets the there should exist anywhere a whole herd of Jerseys with defective escutcheons is an indication of the injurious effect of "breeding for color." Essential qualities, like large milkveins, well-shaped udders, and full escutcheons, are overlooked, and breeding animals are seleeted which have nothing to recommend them but "solid color and full black points." Of course, the men who are accomplishing this

unfortunate result are innocent of any intention to do harm, but unless something is done to check their folly the Jerseys, as a breed, will lose their reputation as large butter-makers.

We could show our correspondent more than one herd of Jerseys, and large herds too, in which a defective escutcheon is a rare exception, and we will pit them against any breeds in the country for the quantity of butter made.

# Drying Up Cows.

The common idea that it is necessary to dry off a cow two or three months before calving, is really not only an erroneous but a very unprofitable one. A cow in the dairy is not an animal in a state of nature. She is as artificial a production as the improved carrot or turnip which she cats, or the oil-cake which is fed to her. And if this is so, and her milking capacity has been artificially built up far beyond that originally consistent with her natural condition, why should we stop in our work at a certain point and not continue it as far as possible? We have known more than one occasion when a cow was milked up to the period of calving, and no injury occurred either to her or the calf. It is true that the changed condition of the cow needs some change of treatment. There is a greatly enhanced demand on her physical resources, but this change comes on so gradually that we can not tell the exact moment her milking powers should be suspended. Certainly not necessarily two months any more than three or four months previous to her coming in again. The gradually changing condition of the cow must be gradually met and all will be well. We lately saw a fine Ayrshire cow which had just dropped a calf when at the Illinois State Fair, and she was in very high condition, so much so that an ordinary farmer, having a cow in similar condition, would fear for her safety. We also saw a fine Jersey cow, on another occasion, which the owner assured us was milked the evening previous to her calving, and the calf seemed to have suffered nothing in consequence. In fact it is doubtful if a cow is not in a much safer position when thus constantly milked. It is within our experience that garget has occurred before calving, and that cows often need to have the milk drawn from them, sometimes for some days previous to this event.

Then, if all this is true (and we think most experienced men will coincide with us), why should not the cow be utilized as much as possible; why should she not be permitted to produce milk as long as she will, and why should we be at so much pains to dry up our cows? It is certain that injury is sometimes done to cows by improperly drying them off, and when we sometimes read of farmers being advised to take such and such precautions in this matter, we are led to think that they are not only making gratuitous trouble for themselves, but are throwing away a source of profit. That there is a change occurring in the common idea in this respect, is proved abundantly by the fact that a cow which will milk continuously, is looked on as something above the common. And why, while we are improving our stock in this direction, should farmers be advised to adhere to a practice which produces a contrary effect?

How Much does a Quart of Milk Weigh? -It has now become almost universal with dairy men who handle large quantities of milk. to estimate it by weight rather than by measure. The reduction to quarts is made by divid-

ing the pounds by 2. This is not exactly correct, for a quart of milk weighs somewhat over 2 lbs. The standard gallon in the United States is the old English wine gallon, which contains 231 cubic inches. This quantity of distilled water, at its maximum density (barometer at 30'') weighs 8<sup>3009</sup>/10000 lbs. Cream has a specific gravity (or a weight as compared with water) of 116/1000; skimmed milk, of 137/1000; and "good" milk of 131/1000. Even cream is a trifle heavier than water, but the difference between cream and skimmed milk is enough to make the weight of whole milk vary considerably in proportion to the amount of cream it contains. If no water has been added to the milk, then the lighter it is, the better its quality as to cream. Taking the normal weight of new milk at 131/1000, as compared with water, and the weight of a gallon of water at 83880/10000 lbs., we have 85974/10000 lbs. as the weight of a gallon of milk, and 21403/10000 lbs. as the weight of a quart-say 215/100 lbs.

# Winter Care of Sheep.

Sheep are looking up. The tide has turned. But unless slieep are to be taken up as a permanent part of the farm stock and proper care and attention given to them, it would be better for the farmer to let them alone. Sheen properly cared for, are the most profitable and least troublesome farm stock; but if neglected and improperly managed, none so soon become out of condition and become diseased and die. Winter is the most trying time for them. "Coddling" is the most hurtful thing. With good feed a flock of sheep would do better to lie out of doors in the snow the whole winter, than to be kept in a close, warm stable. Running at the nose and lung disease will surely follow too close penning up. Unless the weather is stormy, or the ewes with lamb are near their time, they should be turned into a field every day. They should have fresh water (access to a spring is best) at least once every day. It is a mistake to suppose that sheep will thrive with snow for drink, and yet many flocks are permitted thus to quench their thirst every day through the winter. Clover hay is the best standard feed, with half a pint of oats, rye, or buckwheat daily. Sheep do better with a little change in their feed occasionally. Salt, in which a fourth part of sulphur is mingled, should be placed where they can always have access to it. Corn-stalks may do as a coarse feed to pick amongst, but as a standard feed it does not seem palatable enough for them. They will live on it but do not thrive. Separate the flock into at least two portions. The lambs, and in-lamb ewes which may be weakly, should, at all events, be taken from the strong, hearty ewes, wethers, and bucks, and extra care given to them. It is still better to keep the wethers and bucks by themselves, and thus make three divisions. Guard against dogs, which, at this season, are more than ever mischievous. If a dog is kept on the farm, let him be well acquainted with the flock and they with him. Above all things, he patient, quiet, attentive, and exactly regular in feeding and watering, not overfeeding nor stinting the flesh, but, having found the right way, persevere therein, and do not swerve one way or the other from it. One can not neglect his sheep one day and make up by extra care the next.

Onling Anles,—Much is lost for want of attention to wagon axles. They should be examined at least once a week, if in constant use,

and properly oiled. Lard is not suitable, for it penetrates through the hub and loosens the spokes. We know of nothing better than castor oil, and a rancid article, which can be had at cheap rates at the apothecary's, is just as good for this purpose as the best. A small quantity, applied upon the bearings of the axle, is just as good as to oil the whole surface. If the oiling is neglected, there is much friction, which has to be overcome by the increased exertion of the team. The boxes and axles both wear away more rapidly, and there is soon need of a new wheel and axle. A good wheel-jack will greatly facilitate the oiling process. With this implement one man can oil the wheels of an ox-wagon as rapidly as two without it.

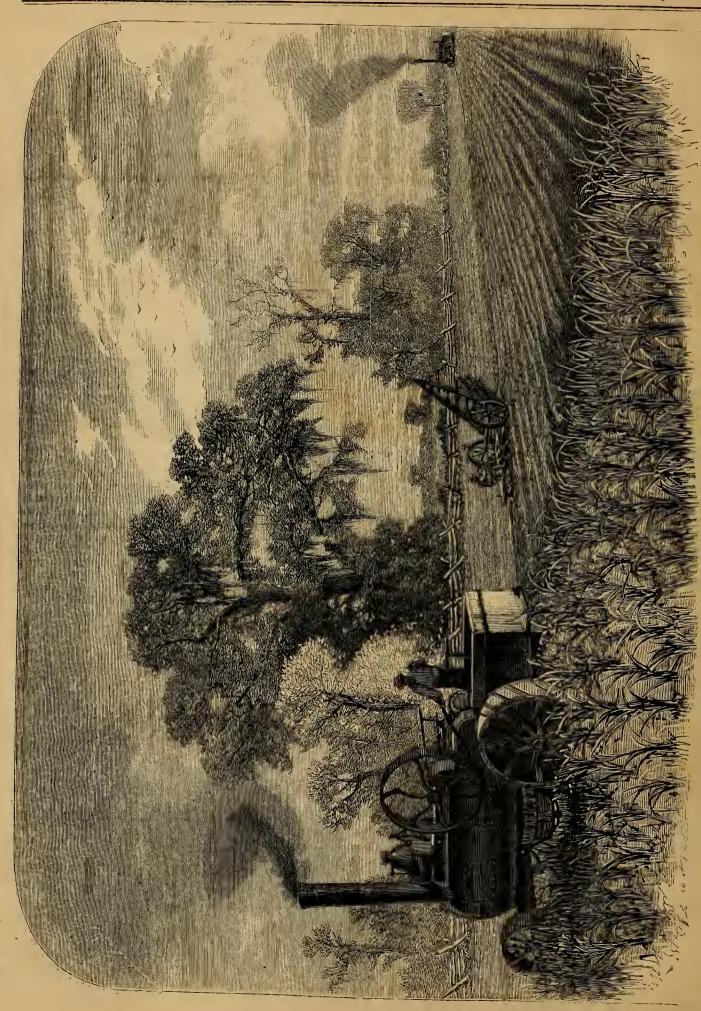

# Method of Utilizing Bones.

The utility of raw bones is much circumscribed by the difficulty of bringing them into a fit state for use. A rough method of cracking them, or reducing them to large fragments by means of a heavy pounder or sledge, may be employed where they are intended for use in an orchard or vineyard, where they may be buried at the roots of a permanently established fruittree. But to become useful to annual crops they must be brought to a more practicable shape. When coarsely broken they may be reduced by caustic lye more slowly but with much less inconvenience than by sulphurie acid. To accomplish this, a rough but tight box, not over eighteen inches deep, is needed. Procure sound, unleached wood-ashes, mix a peck of slaked lime and a peck of sal-soda to every barrel of dry ashes. Pack the ashes, etc., with the bones in layers (ashes first) until the box is filled. Saturate the mass with water, and add from time to time more water to preserve a constant state of moisture. In four or six weeks the bones will have become so much softened that they will crumble to powder with a slight blow. The mass may then be mixed up and beaten fine with a shovel, and an equal quantity of fine soil added and thoroughly intermingled. This compost is too strong for direct application to the seed, and in using it for corn some earth needs to be mixed with it previously. If the quantity of ashes is increased the process is proportionately hastened.

CARE OF IMPLEMENTS .- There is probably no text on which more preaching is done by the agricultural press than that which heads this article. And yet farmers are either forgetful of the lesson, or are too careless of their own interests to act upon it. We were especially reminded of this by seeing, in the course of a ride of ninety miles through an average agricultural district, the following tools lying out exposed to the weather-viz.: Forty-four plows, twentythree harrows, seven mowers, one reaper with beater and platform as last used, wagons too numerous to count, and, in one instance, a set of harness hanging on a fence. The plows were mostly sticking in the furrow where they had been last used. Now, it is natural to suppose that the owners of all these tools and implements never see an agricultural paper, or they could not resist the reiterated advice to take better care of their property of such a perishable nature. It is safe to say that these tools, kept under cover when not in use, will last more than twice as long as they will when exposed to rain and sun. The loss is thus a serious one, and we regret when we think that we can not reach such farmers by a word of advice.

# Plowing and Cultivating by Steam.

The day will probably come, when a large share of the cultivation of the land will be done by steam-power. The steam-plow has for some years been in successful use in England, but in this country, where we have so much land especially favorable for its operation, the attempts at steam cultivation have been so few as to amount to little in demonstrating its value as compared with ordinary methods. The English machines are ponderous, combersome, and expensive, and it is this, coupled with the fact that the steam-plow implies a more thorough system of agriculture than we have yet adopted, that has retarded their introduction. In the most successful English implements the plows are drawn backwards and forwards across the field by means of two engines, one stationed at each end of the furrows. There have been several inventions made in this country, in which the engine is a locomotive which traverses the field and drags the plows after it. Some of these machines have made more or less successful trials, but there are still many obstacles to overcome before such a locomotive engine for plowing can be made a complete success. To illustrate the appearance of the English plows and their manner of working, we give on the next page an engraving, taken by our artist while upon a trip through the Gulf States. There are several of these plows at work upon sugar plantations in Louisiana. The cane crop is a very exhausting one, and deep plowing is necessary. One of the most enterprising planters, finding it impracticable to obtain the required depth of soil by ordinary plowing, imported a set of steam machinery. The results attained by this were so satisfactory, that the first importation was followed by others, and in Louisiana at least, steam-plowing may be considered an established fact. Aside from the thorough working of the soil, one great point in favor of the steam-plow upon plantations is that the most favorable season for plowing is autumn, and this is just the time when the teams and hands are busy in cutting cane and carrying it to the mill. The steam-plows usually require only two or three hands to work them, though in cane fields, where there is much "trash," more help is required, to keep the plows from being clogged. The plows are carried upon a frame, and are from two to five in number. The frame carries two sets of plows, and is so arranged that it can be tilted when it reaches the end of the field, and the direction is to be reversed, thus lifting one set of plows out of the soil and bringing the other set into proper position for work. The plows are moved by means of a wire rope, which is wound upon a drum below the engine, as shown in the engraving. When the plows have reached one side of the field and are placed in proper position, the man at the opposite engine is signaled and the plows drawn back, and they thus go back and forth as fast as a man can walk, plowing from two to five furrows, two feet deep, at the rate of six to twelve acres a day, according to the nature of the land. The cultivation between the rows of cane is also done by these engines, cultivators being substituted for plows. Mr. Lawrence, who imported the first plows, estimates that, by reason of the deep tillage be can give, two feet instead of six inches, the production of sugar per acre has been considerably more than doubled. Upon the bottom lands of the Connecticut and other rivers, and upon the Western prairies, the steam plow will yet be found the cheapest means of tilling the soil.

THE

#### The Chinese Quince.

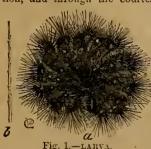

We do not know how so many Chinese Quince-trees became distributed about the country without the owners of them having their names. For several autumns, including the one just past, we have received a number

of fruits from different points in the vicinity of New York to be named. This year one of them remained on exhibition at our office for several days, where it attracted much attention from its novel shape. We have had the fruit and leaves engraved at about half the average natural size. The tree grows in a spreading form, and reaches the hight of about 20 feet. The leaves are quite unlike in appearance to those of the common quince, being of a dark green, with a shining surface. The flowers are rose-colored, with a violet odor, becoming darker with age, and make the tree quite ornamental in spring. The fruit is irregularly egg-shaped, green, and very hard and dry. We do not know that any use can be made of the fruit, but it is quite con-spicuous and ornamental

when upon the tree. The botanical name is *Cydonia Sinensis*. We do not find the plant in any of the catalogues of our leading nurserymen, and can not say where it may be procured.

### The Great White Leopard-Moth. (Ecpantheria scribonia, Stoll.)

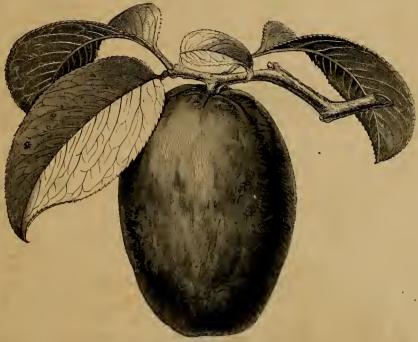

There is a large family of moths, known as Arctians (Arctiadæ) or Tiger-moths, which is rendered conspicuous by the beauty of design and boldness of contrast in color which its members generally present. The largest and perhaps the most beautiful of them all in North America is the above-named species. The larva has recently been sent to us for determination, and through the courtesy of Mr. C. V.

Riley, the State Entomologist of Missouri, we are able to give a brief account of its history. This larva (fig. 1) may be called the Large Black Bear, as the hairy worms of our different

Arctians are popularly called bears, and the family name was derived from the Greek word for "bear. It is often observed in the fall of the year, though few persons have ever seen the moth which it produces. This larva is black, and so thickly covered with jet black spines as almost to hide a series of roughened warts on each joint, from which the spines spring. When disturbed, it curls itself up, and then the sutures of the joints are seen to be reddish brown, in strong contrast with the black of the rest of the body. If carefully observed, the spines will be seen to be barbed, as represented at b, fig. 1.

This worm feeds upon the wild Sun-flower (Helianthus decapetalus), the different species of Plantain (Plantago), and upon Willows. It comes to its growth in the fall, and, like many others of its family, curls up and passes the winter in any shelter that it can find, being especially fond of getting under the bark of old

CHINESE QUINCE.

trees. In the spring, it feeds for a few days on almost any green thing that presents itself, and then forms a loose cocoou, interwoven with its own black spines, and becomes a chrysalis. Shortly afterwards the moth escapes.

The accompanying illustration (fig. 2) represents the female moth at a, and the male at b. The upper portion of the abdomen is steel-blue, or blue-black, marked longitudinally along the middle and sides with yellow or orange. With this exception, the whole insect is white marked and patterned with dark brown, as in the fig-

ures. The male differs from the female principally in his smaller size and more acuminate wings, and by the narrower abdomen, which is also generally duller in color, with the pale markings less distinct. The markings on the wings, which may be likened to scribblings, vary in a striking manner in different individuals, the oval or elliptical rings sometimes filling up so as to form black spots. This insect is considered rare in New England, but is much more common in the Mississippi Valley.

Don't Cover too Early.— Many mistake the use of a winter mulch. It is not to prevent the ground from freezing, but to protect the plants from the injury that re-

sults from frequent freezing and thawing. Hence we do not cover our strawberry beds and other things until cold weather has apparently set in and the ground has begun to freeze. So with covering half-hardy shrubs with straw or mats, we do it quite as much to protect them from the winter's sun as to ward off the frost.

The Crimson and White Mignonettes.

In these days of gigantic frauds that have so astounded the people of the great metropolis, the lesser ones that crop out in the every-day things of life are apt to be overlooked or for-

gotten. Yet the fifty cents paid for a package of worthless flower-seeds is to many thousands of the lovers of nature in the humbler walks of life as much felt as are the thousands fraudulently extracted from the pockets of our wealthy taxpayers by dishonest rulers. The principle is the same in either case, and the crime is "theft" in both. If I knowingly advertise a mignonette that I am sure is green and brown as "crimson" or as "white," and thereby induce a person to pay me fifty cents for what to him is worthless, I am as guilty of stealing as the man was that received \$500 apiece for the City Hall chairs. Dozeus of seedsmen unwittingly did so last season, and retailed the English descriptions of "crimson" and "white" mignonettes with wonderful unanimity, and a con-

fidence in the veracity of our English contemporaries which past experience hardly warranted. The "White" Mignonette was issued under the indorsement of the Loudon Horticultural Society, and we naturally thought that such a body would not have lent themselves to fraud. Yet the fact is, that in no case that we have seen or heard of in this country has the "White" Mignonette proved much different from or whiter than that which our grandmothers grew. The same may be said of the "Grimson." The tinge on the tips of flow-

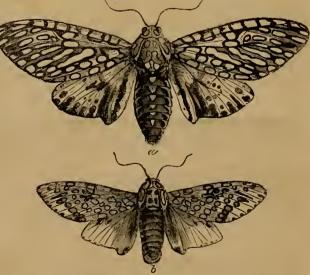

Fig. 2.-male and female leopard-moth.

ers may be a little darker brown, but no stretch of imagination could honestly call it crimson.

I trust this lesson will not be lost on us, and that for our own sakes we will not soon use a foreign description of a "novelty," either of flowers, fruits, or vegetables, without being careful to give the original describer credit for what

he says of it, so that the responsibility will rest where it belongs. It is perhaps not too much to say that probably \$5,000 worth of these mignonettes were last season sold to ten or fifteen thousand persons, not one in a thousand of whom but believes himself to have been swindled. The effect of this is damaging in the extreme, not only to us as seedsmen, but to the spread of horticultural taste, and it is to the interest of every one engaged in the business to frown down every such fraud. Last July, a special circular received from one of the leading London florists' establishments described a new dwarf White Ageratum. Without much confidence in the white part of the story, I sent for a dozen plants, and received them in fine order by mail. They are now in full bloom, but the color is blue-no more white than the sky is at noon. Had I not had an opportunity of proving the fraud, and copied my correspondent's description without qualification, some of your readers next season would have had good cause to complain of being cheated. The great desire for something new, and the avidity with which "novelties" are bought at high prices, is a great incentive to this horticultural swindling. Every season we import an average of two dozen new varieties of flower and perhaps half as many of vegetable seeds, and if we get one good thing of each we think ourselves fortunate; so that our amateur friends will understand that they are not alone the sufferers, and should not complain of our seedsmen if they do not indorse the foreign descriptions.

#### Experience with the Egg-Plant.

BY HENRI W. YOUNG.

I was interested in an article by Peter Henderson, in the October Agriculturist, upon the Egg-plant, and as I have succeeded in raising an abundance of this delicious vegetable during the past season in a rather less expensive way than he deems essential, I will, for the information of your readers who have never raised it, narrate my experience. I grew the two varieties, Black Pekin and Improved New York Purple, of which I made my first sowing in boxes in the house late in March, but keeping them in a room in which there was no fire, it was over a month before they germinated. My second sowing was made in my hot-bed on April 1st, and they came up in eight days. This was 20 days too early, according to Mr. Henderson's view; and had I kept up a heat of 70° until it was safe to transplant them, they must certainly have outgrown the bed, which, by the way, had muslin covers instead of glass sashes; but the heating material being solely fresh horse-manure, the heat was soon exhausted, and their growth for a long time very slow. I also made a third sowing in a cold-frame, similarly covered, on April 10th, where they came up in 18 days.

May 17th, I transplanted several of the Purple plants from the hot-bed into the field, but their vitality was impaired by the cold, and they soon succumbed to the attacks of a small black flea, that first appeared about that date. I do not recall the name of this flea, but it was an old acquaintance, that had destroyed my plants on a former attempt to raise them. It attacks all the plants of the Solanum Family, so far as I know, except peppers. They destroyed all my tomatoes sown in the open ground, and made sad havoe in my beds, damaging tomatoes there, and threatening the entire destruction of petunias and egg-plants, even going so far as to riddle the leaves of the wild

Bittersweet (Solanum Dulcamara), while I have seen potato-vines covered with them. To check them, I tried dusting with lime and sprinkling with solutions of tobacco, guano, etc., which were at best but partially successful, as every one of the egg-plants in the cold-frame perished, and a part in the hot-bed, the remainder suffering severely. As they did not attack my plants in the house, I am of the opinion that a box in a warm room would be the safest and perhaps the best place for us to start them.

June 12th, I transplanted about twenty of each variety from the hot-bed into the field, and although they seemed very impatient of removal they all survived. The Black Pekins commenced to bloom July 21st, several days before the others, and were far ahead in fruiting, but not as prolific. We have had an abundant supply of both through September and October thus far, and would have had a large stock on hand now had not I been so hasty as to cut them up and house my fruit on September 22d, in anticipation of the frost which occurred on the next succeeding night, but did not kill, only scotched the vines I left. There has not been a sign of frost since, and I might just as well have had the benefit of a whole month's growth, and double the quantity of sound fruit on the vines at this date, as to have a pile of them nearly all decayed in an out-house. Thus have I learned how "haste makes waste."

Those sown in boxes in the house and kept spindling in the shade in a cold room, I transplanted into the old hot-bed June 12th, and from thence into the open ground on July 25th, yet they had eggs as large as the largest apples by September 20th. Had these plants been kept in a warm room instead of a cold one, it would have made nearly a month's difference in their growth, and they might have been as early as any; their exemption from the attacks of the flea giving them one great advantage over even those grown in the hot-bed.

From these facts, I conclude that a uniform temperature of 70°, although desirable, is not absolutely required, or even the most important requisite for the egg-plant.

ROANOKE, L. I., October 17th, 1871.

#### The "Early Shipping" Tomato.

BY PETER HENDERSON.

This is a new and valuable variety, raised by Mr. Turner, of Norwich, Ct., and is a hybrid between "Keyes' Prolific" and "Crimson Cluster." It has qualities that will render it extremely valuable for Bermuda or our own Southern latitudes, as it is as early as the earliest, and enormously productive-having from twenty to thirty medium-sized fruits in a cluster. Above all, its solid, seedless character enables it to carry in shipping much better than the larger sorts. All who have had experience in shipping tomatoes from points where they require to be over a week in transit, know the loss often experienced in fruit if too ripe when picked, and if not sufficiently ripe there is a corresponding loss in price. But this comparatively small variety, with its thick skin, may be picked nearly ripe in New Orleans, Charleston, or Savannah in June, and if carefully packed be in as good condition on arrival in New York or Philadelphia as if grown near those cities.

THE EUROPEAN LARCH.—Some of our Western friends are very enthusiastic about the European Larch, and claim that it is preferable to all other trees for profitable planting. Of the

excellence of the timber there is no doubt. It is unequaled for durability. The tree seems to be a sufficiently rapid grower. Last year the writer put out a small one in rather poor soil, poorer probably than any one would ever select for a plantation. Noticing that it had made a remarkable growth, it was measured, and we found that during the past season the leader had grown four feet, and the branches had a new growth of one to two feet. A tree like this will make timber rapidly.

#### Notes from the Pines.

Telling One's Experience.—The only way in which we can arrive at a proper estimate of the value of new things is for each one to say how they have done with him. If one reports favorably upon a variety he is at once a very good fellow; but if his report is adverse, those having an interest in the plant, seed, or whatever it may be in question, don't find him to be such a very good fellow after all. It takes several years to ascertain the precise value of a new thing, whether it be fruit, flower, or vegetable. For instance, the

SHELDON PEAR was for some years thought to be one of the very best, but it has begun to crack in widely separated localities, and in many places is quite as worthless as the old Virgalieu. When I gave my experience with

Moone's Concord Conn I was aware that I should displease some persons. The seed was from the best source, the corn had good culture, but it was a thorough failure. I recorded that experience with the view of calling out that which had been favorable, but while those interested in the corn growl at me, they do not take the trouble to tell how it succeeded with them. I am quite sure that mine is an exceptional case. Such things will sometimes occur, as we have an instance in Mr. Quinn's experience with the

PEERLESS POTATO. Mr. Quinn, whose accuracy of observation and disinterestedness of judgment no one will question, in an article in the Weekly Tribune, puts the Peerless down as of poor quality. Now, with me, it is of as good a quality as any potato can be. It yields wonderfully, and has fewer small tubers than any potato I ever grew.

THE "LATE ROSES."—I do not refer to "the last rose of summer" kind, but to the potatoes of this name. It seems that in more than one instance exceptional specimens of the Early Rose have shown a tendency to be late, and these have been propagated and are offered as new varieties. Thorburn & Co. sent us specimens of their "Late Rose," fine large potatoes, having the general appearance of the Early Rose, and it is stated that they are more productive and better keepers. A few days later I received specimens, from B. K. Bliss & Son, of another "Late Rose," similar in appearance. Soon after this I obtained through a friend a specimen of a seedling raised by Mr. Geo. W. Campbell, of Delaware, Ohio, which he also calls the Late Rose. So here we have three lots, all claiming to be of different origin, and bearing the same name. In appearance they are as alike as three peas, and all excellent potatoes. Whatever differences there may be in growth and productiveness can of course only be told upon trial. But what a misfortune in nomenclature, and what a confused "war of the roses" it will lead to if some distinguishing prefix is not given to them! "That which we

call a rose by any other name "-may or may not bring a dollar a pound.

LIGHTNING AS A LANDSCAPE GARDENER .-I told you about the great pine-tree that was struck by lightning a year ago last summer. It died at last, and was cut down. It was my pet pine, and no reasonable sum of money would have bought it. I indulged in a great deal of unnecessary mourning at its loss, as now no moderate sum would induce me to have it back again. Such a magnificent view as is opened by its fall! From my "den," I can now see a distant bend of the river, the steeples of the village peering above the trees, and in the far distance the mountains, which present a different hue with every atmospheric change. It is not often that such a calamity as the loss of the grand old pine appeared to be brings with it such ample compensation. I of course knew that the view was there, but it could only be enjoyed from the house by sacrificing the noblest pine. I feel much like the colored citizen who, after an unsuccessful search for his dog, said: "Now I can't find 'um, I'se mighty glad I loss 'um."

THE CHRISTMAS ROSE.—The other day (Nov. 1st) I was quite astonished to find the Christmas Rose (Helleborus niger) in flower. In this country it does not usually appear until spring. It is a charming, old-fashioned herbaceous plant, and were it not such a slow grower it would be much more popular than it is. I have had my plant for eight years, and it is now so small that it can be readily covered with one's hat,

THE WINTER STATE OF PLANTS .- Did you ever notice how plants prepare themselves for winter? The last growth of the season becomes dwarf and stunted, and the whole aspect of the plant is so different from what it is when flourishing, that the commonest ones are with difficulty recognized. I find much interest in examining our commonest weeds after they have gone into winter quarters, and often find myself puzzled to identify them.

WINTER PEARS.-How seldom do we see a good late pear! They are generally poor, shriveled things, and altogether unsatisfactory. The reason is, people take too much pains with them, and ripen them up before their time. Have just been picking my Vicars. It is the fashion to turn up the pomological nose at the Vicar, and say patronizingly, "Excellent for cooking! So it is, there is no pear equal to it for cooking; but, properly managed, it is excellent without cooking. I assort the pears, put them in boxes, and place them in the cellar among the potatoes. They will need looking at now and then, and when they show signs of ripening up, which is usually in December, they are taken up-stairs and allowed to finish off in a warm room. If the Vicar has been well grown and properly ripened, it is most acceptable to those who like very brisk and vinous fruit, but will not suit those who are fond of sweet fruits only.

KEEPING GERANIUMS .- I never have any trouble in keeping such Gerauiums as are worth keeping. They are taken up and cut back pretty severely, removing all the succulent and unripe wood. They are then stacked in a box with some dryish earth about the roots, and put in the cellar for the winter. The trouble is in putting them away too moist. The earth should be almost dust-dry. I have a fine old Gloire de Nancy, which goes into the cellar for the fifth time. I have nevertried the method of hanging them up by the heels. The plants are cut back, tied together by the roots, and hung up in the cellar, heads downwards. Those who have tried this, report that it is successful.

PARSNIPS.—Such a yield of large fine parsnips as we dug a few days ago! The success was due to deep plowing, heavy manuring, and early sowing, including, of course, clean working. I believe that farmers can get more nutriment, at the same expense, from parsnips than from any other root. They are less trouble in cultivation than carrots, and pound for pound worth considerably more.

JUDSON'S BRANCHING CORN.—" Branching" pop, field, and sweet corn were offered a year ago. We grew the "branching" pop last year and the other two this year, a long row of each. In neither case was there the least sign of branching, and it was seldom that either the sweet or "Golden Drop" had two ears to the stalk. This "branching" corn must be set down as a failure, if not a humbug.

#### How I Made a Hedge.

Osage-hedge makers differ pretty widely as to the best distance to put the plants in the row, and a novice in hedge-making is perfectly bewildered when he reads the advice of divers men. He does not know what is really best to do, and so he makes a leap in the dark and hones for the best.

I intended two years ago to make a hedge around my orchard, aiming to erect a barrier against thieves and a wind-break at the same time. I had no experience whatever, had never seen a hedge, and desiring to proceed aright, I ordered "Warder on Hedges," which I carefully studied, but for the life of me I could not tell from that work whether it was best to put the plants in a single row, four inches apart, or in a double row, two feet apart, or in a single row, six, eight, ten, fifteen, or twenty inches apart. Each plan was highly recommended, and each said to be the best. I finally settled on a single row, eight inches apart. I believe Mr. Warder himself prefers two feet apart, but a hedge made on this plan would not in twenty years turn a two-hundred-pound hog. The distance now recommended by the experienced hedgegrowers of the West-chief among whom is Prof. J. B. Turner, of Jacksonville, Ill.—is six inches, and even four inches is better than eight inches or any greater distance. In spite of all that the most careful and vigilant can do, many of the plants will die out or become so feeble that they do not keep up with their adjoining neighbors, and a "break" or "gap" in the hedge is the consequence, as not one replant in a dozen will grow and thrive sufficiently to fill up the missing place, no matter how carefully it may have been replanted and tended. For this reason it may be safe to infer (and act accordingly) that close setting-say four to six inches—is the best of all plans; and then, the following fall after planting, if the plants are found to be too thick, it is far easier, and more satisfactory, to remove every other one than to depend upon replanting the following spring.

Now for my new plan. Being tired with the labor of setting every plant just eight inches from the next, and holding it there perfectly straight while setting, I commenced on a back line to put them in a trench which had been made perfectly straight, regardless of exact distances, putting them in carelessly all the way from two to four inches, and not minding whether the tops were straight or crooked.

thinned them to about four inches. Now this back line is the best of all my entire hedge, and I firmly believe it the best plan after all.

STANFORD, KY. WOODMAN.

#### Selling Fruit and Vegetables by Weight.

While in Denver last summer we found almost all farm produce except eggs sold by weight. Even the delicate fruits brought from California -pears, grapes, and plums-had their value tested by the scales. The fruit peddlers that circulate in the Rocky Mountains carry the balances with them, and the purchaser knows how much he gets in avoirdupois. This is the prevailing usage upon the Pacific coast, and is worthy of universal adoption. With us, almost all fruits and garden truck are sold by no definite measurement. The basket, barrel, or box has no standard of measurement. Some barrels contain 104 quarts, the standard of the Cape Cod Cranberry Association, and others will not hold 80. The old-style peachbasket held nearly a bushel. They grow smaller every year, and now contain a scant half-bushel. The berry baskets and boxes are of all sizes, and the grape boxes run from three to ten pounds. While this mode of sale continues, there is a constant temptation to depreciate the measure and cheat the consumer. The producer gets the same price for his box or basket of fruit this year that he received last, although it contains but nine tenths as much. This is virtually a fraud, although no express compact has been made or violated. The loss to the individual purchaser is very small. The gain to the producer is ten per cent, for which he gives no equivalent. Purchasers have it in their power to correct this abuse, and now that the spirit of reform is abroad and the accounts of rulers are overhauled, these small robberies should be looked after. Bring every kind of produce to the test of the scales, and we have a remedy against cheating. Purchasers then see five pounds of grapes for the five-pound box that they buy, and are satisfied.

CACTUSES IN WINTER.—The reason why so many fail to bloom their cactuses satisfactorily is, because they do not treat them properly during winter. By their structure the cactuses are especially adapted to a long season of drouth, and in a dry time they take their rest, the same as our plants do during the winter. Iu our treatment of them we must imitate their natural conditious, and during winter keep them dry, not so dry that they will shrivel, but they will rarely need any water. Of conrse, they must be kept in a warm place, and where they will not get near the freezing point. In spring, when they start to grow and bloom, they should be freely watered. The exceptions to this treatment are the Epiphyllums, Crab's Claw Cactuses, and the Rat-tail Cactus, Cereus flagelliformis.

#### A Useful Hand-Cultivator.

In August .ast we received by express an implement which at first sight did not promise to he of any great value. At any rate, it was taken home for trial, with the thought that we were to add another to our collection of curiosities in the way of horticultural implements. It was received too late to be tried upon anything but turnips and late spinach, and the way it walked through them was altogether gratify-They grew just as well as any, and in the fall I | ing. Our gardener took to it at once, as it gives

the weeds no chance. We give an engraving, which shows its construction sufficiently well. It will be seen to consist of a wide blade, which

HAND CULTIVATOR AND WEEDER.

serves as a hoe, and a revolving rake or cultivator. We do not know who makes the machine, but the parties will doubtless make themselves known. The one we have was forwarded by Louis Perrot, Outagamie Co., Wisconsin, who states that he is one of the inventors.

#### ---A Japan Pear.

This spring Mr. Quinn, of Pear celebrity, sent us some cions of what he called a Japan Pear, with the recommendation that it was valuable

as an ornamental tree. Having an old, worthless pear-tree upon the edge of the lawn, we grafted it with these cions. The growth they made was something wonderful, and the leaves! some of them were nearly as large as one's hand, and in autumn they held on long after most other pears had cast their leaves, and became as finely colored as those of the maple. As the tree possessed such interesting characters, we were desirous to see the fruit, and at our request Mr. Quinn brought us specimens, but evidently of two distinct varieties -one bright green, with a few russet splashes, and the other of a fine golden russet with conspicuous white dots, the one we have figured. It will be seen that the fruit is in shape so like an apple, that we do not wonder that several pomologists who saw it upon our table each took it for an apple. The history of this remarkable fruit is a little obscure, and can not be traced beyond the person from whom Mr. Quinn obtained it. We suppose it to be a seedling of the Chinese Sand Pear, Pyrus Sinensis, which has been for a long time in cultivation as an ornamental tree, and that the name of "Japan Pear," under which Mr. Quinn received it, is a misnomer. At all events, the thing is a puzzle. The tree has the wood, leaves, and habit of growth of a pear; the fruit has the shape of an apple and the odor of a quiuce, while the seeds have a little of the

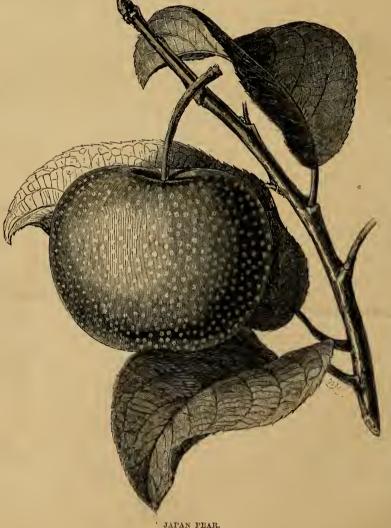

mucilaginous character of those of the quince. |

work upon genera, unite the quince (Cydonia) with the apple and pear (Pyrus), and this fruit would show that the characters which botanical-

> ly separate the apple and the pear are not well defined. The tree is altogether a most interesting one, and while it is highly ornamental, we learn from Mr. Quinn that it hears most abundantly of fruit, which makes the most delicious preserves, with a positive quince flavor .-Since the above was in type, we learn from Mr. Thomas Hogg that both forms of this fruit above referred to are common in He considers it Japan. speifically the same with

the Sand Pear, which has long been cultivated.

SORREL.—This vegetable is but little known in American gardens, but in France it is as common as spinach. It is not the weed known by this name, but a much larger plant with a general resemblance to a dock. It is a perennial easily raised from seed, and will furnish leaves for use the first season. It is cooked the same as spinach, and boils up into a very tender mucilaginous mass. It has a brisk, pleasing acid taste, and forms alone or cooked with spinach a very acceptable accompaniment to meat. We

Beutham and Hooker, in their recent great | much pleased with the result of the experiment. | mordica comes from the Latin mordeo, to bite.

#### Balsam Apples and Pears.

One need not be a centenarian in order to have noticed that many plants that were common enough in his youth have so nearly disappeared from culture, that they only turn up now and then as curiosities. It was the custom of our good grand-mothers to look after the gardens, and especially that portion containing those herbs so useful "in case of sickness." Among the plants thought in those days to be valuable were the Balsam Apple and the Balsam Pear. These are both species of Momordica, and belong to the same family with the cucumber, melon, etc. Though formerly so common, they are now but rarely met with; even the name

seems to have been for-

BALSAM PEAR.

gotten, as almost every season we have a specimen or two brought to us to be named. The vines are rather pretty climbers,

with their lobed leaves and yellowish flowers, which if not showy are pleasing. The fruit is, however, the most ornamental portion, and it is for this that the plant is cultivated. That of the Balsam Apple (Momordica Balsamina) is egg-shaped, and pointed at each end; that of the Balsam Pear (M. Charantia) is larger and oblong. The fruit of both species is covered with warts, as shown in the engraving. When ripe, the fruits break open with some force and scatter the seeds, which are covered with a brilliant scarlet envelop. Both the seeds and the fleshy wall of the fruit are quite mucilaginous, and in olden times were supposed to possess valuable healing properties. The fruit and seeds were formerly put into spirits, and the liquid used upon fresh wounds. As these generally healed in spite of the application, the Balsam received much credit. The engraving shows the general appearance of these fruits, and is taken from a specimen sent for a name. We suppose it to be Momordica Charantia, though it is more regular than we recollect to have seen the fruit of that species. One species, M. mixta, is said to bear a fruit as large as a child's head. Both the Balsam Apple and Balsam Pear are natives of the East Indies, and perfeet their fruit wherever the melon will. They are interesting plants for a low trellis, and in Europe are sometimes used for

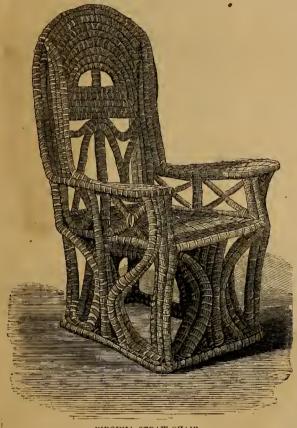

cultivated it this year for the first time, and are | the decoration of greenhouses. The name Mo-

### THIE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### Some Novel Chairs.

The straw chair (fig. 1) we do not introduce so much as a thing to be copied as a household curiosity. Being in Richmond some months ago, we came across and purchased the chair here figured.

VIRGINIA STRAW-CHAIR.

It is made entirely of straw, bound together by hickory withes. The skill displayed in the arrangement of stays and braces is remarkable. This chair is a very easy one to sit in, and is said to be very durable. Our purchase excited the admiration of our associates, and orders were sent to Richmond for others. The gentleman who procured the chairs writes: "The chairs are made by an old negro who belonged to John Randolph of Roanoke (the man who fought the duel with Henry Clay). He is one hundred years of age, and it takes him and two boys, his sons, a week to make one chair." The "boys" are one sixty-five and the other seventy years of age.

The other chair is one we saw at the St. Louis Fair. It is made entirely of hoop-poles. The arrangement of the frame is sufficiently shown in the engraving. It forms an excellent garden chair, much more comfortable than the ordinary rastic one, and can be easily made by any one who can command a supply of smooth hickory saplings. The saplings where they cross one another arc fastened by nails. The seat is made of small sticks of the same material, the larger portions of the saplings being used for the legs. Winter is the best time for making work of this kind, and a chair made in this style costs nothing for materials, and will prove an acceptable present for a friend.

#### Home Topics. BY FAITH ROCHESTER.

HIGH-CHAIRS AND THEIR PERILS. - Our first child had a present of a pretty willow high-chair. The lady who gave it afterwards expressed a fear that it would tip over easily, the legs were so per-

pendicular, or made so small a base. I meant to be very watchful, but one day, a few months afterward, I set the baby in a very dangerous position without realizing it. He was tied into the chair, and I placed this before a window, from which he could see three girls pulling turnips in a field. I was very busy with household labor; in fact, I was mopping the kitchen floor. [This fact I take pleasure in stating. It would have been such criminal neglect had I been engaged in literary labor, or had I left the little one in another's eare while I

stepped out to vote! No; the worst accidents that have happened to my children have taken place while their mother has been in the approved "womanly sphere" of household labor.] Well, there was a crash and a scream, and there lay the baby on the wet floor, with the high-chair upon him, and with a bleeding gash in his lower lip. This was cut by his own sharp little teeth as his lip struck against the window-sill in falling.

The child was dreadfully frightened, but searcely more so than his mamma. He cried very hard for some time, while I soothed him in my arms, and bathed the wound with cool water, using a soft linen cloth. I sent for our physician, who came in about an hour and found the baby sleeping. All that the doctor did was to stick a bit of court-plaster over the wound. Even that was not necessary, the doctor told me, but it might serve as a protection from dust. So I might have saved myself a doctor's bill had I known as much as any mother may who reads this page. I thought the baby would suffer greatly in taking food for several days, fon I had not then learned that nature generally takes away a child's appetite while carrying on her active healing operations. The wound was made at about three o'clock in the afternoon, and baby went to sleep about half an hour afterward, and slept until six o'clock. When he awoke he cried some, but refused food, and soon went to sleep in my arms: slept well all

night, ate comfortably next morning, and never had any further apparent discomfort from the wound, which was quite healed within a week from the fall.

I was washing dishes and planning the day's dinner, one morning a few years later, when another haby gave her occiput a terrible blow, by pushing herself away from the table where she sat and falling over backwards. These blows upon the head always cause me anxiety, lest the brain may have received injury. I bathed it well with tepid water, and the little one soon went to sleep in my arms. Once this would have alarmed me, for I used to hear it said that a child must not be allowed to go to sleep after a blow upon the head; if it did, some degree of idiocy would be likely to follow. Medical men say this is absurd, and it is quite reasonable to suppose that rest is the very best thing for a brain that has received such a shock. So I was glad to have this baby take a long, quiet nap, and glad to see her appear as well as ever when she awoke. But look out for the high-chairs. They are very useful, but should be safely constructed. The legs should spread well apart.

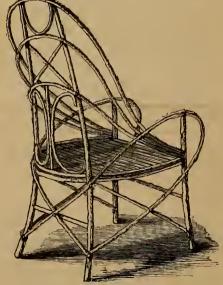

HINTS FOR SANTA CLAUS .- Do you know what a capital plaything for a child is a small box of water-colors? Very small ones, with six or eight cheap colors, may be bought for ten or fifteen Small hair-brushes are a penny a piece. These will do for the wee ones who are not old and steady enough to color pictures. I knew one little boy, aged three and a half years, who had the best of water-colors to use, but only a few cakes. He had a mother who was able to make her child's eare and culture her daily business. She taught him to mix the few colors he had so as to make all the other colors with their shades and tints-green from blue and yellow, purple from blue and red, orange from red and yellow, etc. He was away from home with his mother for a few weeks, and employed many happy half-hours in coloring the pictures of a new Primary Reader to carry home as a present to his papa.

Another child of my acquaintance finds great delight in coloring the pictures of her Sunday-school papers. The little boy mentioned above had a fine toy, which was a source of ever new and fascinating interest to him. It was a mosaic of diamondshaped blocks, of several different colors, which could be arranged in countless beautiful forms. The tablets of the seventh gift of Froebel's Kindergarten series make a beautiful present for a child. So of several other gifts of the series, especially the one that consists of strips of fancy-colored paper for weaving. The paper for perforating and embroidering is another gift that will give much delightful employment to little children.

I know a little boy who wishes to measure things so much of late, that I mean to give him a pocket foot-rule for his next plaything.

The poorest Christmas presents, I think, are those that are soon eaten up. How eruel it is for us to make our children sick with sweetmeats on this holiday! A little something in that line, as an addition to their other presents, is admissible generally. Garments that will soon be worn out are poor Christmas presents, though if they are needed it is well enough to give them, along with other presents, on this oceasion. A genuine Christmas present should seem to come of no necessity for supplying deficiencies in our children's comfort, but should show that the parent "so loved" the child that it delighted to make it happy with something over and above its actual necessities. It is the time for toys and picture-books and wholesome feasts and sleigh-rides and games—a time for "peace on earth and good-will toward men."

CHILDREN'S BOOKS .- Can not we teach publishers that we do not want for our children those silly books with coarse daubs for pictures, which are so abundant in the market? Or, do we want them? I, at least, do not. They pervert the taste of children, while they really give them little gratifica-I confess I do not want many of the fairy stories either. The bound volumes of "The Nursery" contain a pleasing variety of wholesome reading, and the pictures are usually very good. For children beyond the nursery range, some of Abbott's books are excellent, especially "Rollo's Tour in Europe;" "The Heroes," by Charles Kingsley; "Tanglewood Tales," by Hawthorne; "Tales of a Grandfather," by Walter Scott;

MISSOURI HOOP-POLE CHAIR.

"Child's History of England," by Dickens. But this will not do; I did not mean to make out a list. Yet there are many books written by the best authors for children, which are at the same time interesting and instructive. I don't object to the stories that are not historical or scientific, but are simple, wholesome pictures of life. But there are so many of them! Unless a child has a taste for something else-something positively instructiveit is in danger of keeping its mental digestion weak by too easy intellectual diet.

FEMININE UNDERWEAR FOR WINTER.-Judging by what I have myself observed. I should suppose that it is very common for women to dress during winter weather almost the same as in summer. They "dress up" in merino and warm-looking clothes, but the appearance is deceptive. Many young women wear the same thin cotton stockings and drawers all the year round, and a single calico covering on their arms while about their work. Over their shoulders they have not more than two thicknesses of thin material, three over the lungs, and around the lower part of the waist considerable more warmth in the thick corset. The covering of the body is very unequally distributed. There should be warm undergarments of flannel, merino, or cotton-flannel, covering the whole body. The merino yests and drawers furnished for ladies used to be quite senseless a few years ago-shortsleeved and short-tegged, only reaching just below the elbows and knees. Some women purchase the smaller sizes of men's ribbed drawers and shirts for their own use. Some prefer a long-sleeved, high-necked waist of cotton-flannel, with a full (gathered) piece set in across the bust, leaving the front with a voke and broad belt. The drawers, of the same material, are sewed to this across the front, and button to it across the back. In that ease the waist opens behind. When it opens before, the drawers button on all around. The drawers are made at the bottom like men's drawersreaching to the heel under the stockings. The usual muslin drawers are generally worn over Some grown-up women choose flannel drawers, like the red ones worn by children, instead of a flaunet underskirt.

I think the day is fast approaching when women will be clothed, instead of draped as hitherto; when comfort and convenience will insure to woman's attire a reasonable and permanent beauty. While we wait for that day to come, we can be more reasonable about our undergarments than has been our habit, if we consider the matter and are wise.

The girls who are only half-dressed say they are warm enough, but they do not know what a price they pay for such degree of comfort as they are able to maintain. It uses up the vital force which is needed to earry on the various functions of the body; and though the girls may not seem to "take by such habitual exposure, they are undermining their constitutional vigor, and are preparing themselves to be added to the list of nervous, broken-down women.

#### Letter from a Housekeeper.

SAUCES AND GARNISHES .- We had broiled chickens a few days ago for an eight-o'clock supper, at which our friend Mrs. S. was a guest. We all said "How delicious!" but I was almost tempted to feel annoyed at Mrs. S. because she helped herself to tomato eatsup, and I knew she did not enjoy the delicate flavor of the chicken as we did. When will people learn that delicacies like broiled chicken do not require the aid of strong sauces and pickles to make them palatable? Casters are now generally banished from the upper table. When mustard, pepper, oil, and catsup are required, they are placed upon the table in convenient places, and in jars and bottles adapted for the purpose. When a joint of cold meat is put upon the table, pickles, catsups, and sauces should accompany it. Years ago, pickle, checse, spiced meats, and even pic, were introduced at tea or supper, but now we do · not do so. A plate of biscuit, one kind of cake, a dish of delicate preserves, and perhaps a few slices of meat, are all that is required. But of course judgment must be exercised in this as in everything. If a friend or friends from a distance are of the party, the gracious hostess will provide something substantial and appetizing for their refreshment. Nothing more displays the good-breeding

of a lady than consideration for the actual wants of her guests. We used to laugh at a cousin of mine because he insisted upon eating mustard with mutton and vinegar with sardines, and I know a gentleman who eats mint-sauce with beef. Many persons eat sardines with vinegar, but in my opinion it destroys the delicate flavor of the fish. Handsome jellies are an acceptable addition to a table. Of course you would not use jelly on fish, but it is good with beef, mutton, or lamb, and especially appropriate for turkey, poultry, and game.

Fish of most kinds are rather insipid without sauce or catsup. A few years since a friend (who was constitutionally deficient in all matters pertaining to the apportio) invited me to dinner. She had carrots brought to table with the fish. It seemed very odd to me, though the other guests probably thought nothing of it.

A few hints in regard to garnishes for meat: Horseradish scraped into shavings for roast beef. Put a pinch as large as an egg lightly on the joint, and an equal quantity in even spaces around the dish. Leaves or tender sprigs of spear-mint around mutton or lamb. Parsfey for chicken, yeaf, and fish; to the latter two, slices of lemon may be added. Red beet-root, boiled and stieed, and boiled carrot sliced, make a very pretty garnish for boiled heef. Fried sausages or balls of forcemeat around turkey and roast chickens. Parsley around boiled chickens. Game may be garnished with jelly.

A CHRISTMAS GOOSE.-We always have a goose for dinner on Christmas, and do not attempt so claborate an affair as on Thanksgiving. We used to think a goose must be boiled before it is roasted or it would not be good, but have since learned better. It should of course be tender. Take the body of the goose with one hand, and with the other grasp the leg. Bend the knee-joint from the body. If it eracks and snaps you may know it is young. If the skin will break under the wing close to the body it is also young. Unless a goose is very fat it will not be good. Not that any of the fat is required for the table, but it indicates good feeding and condition. Every part of the leaf fat should be removed from the inside before preparing it for the oven. The neck and apron incisions should be securely sewed up after the forcemeat has been put in, and then the fat from the surface of the body will roll off as it melts without affecting the lean meat. Every particle of this fat should be removed from the pan before the gravy is made. Many persons do not think of this, and they make sad work of the gravy. A neighbor of mine once came into possession of four young ducks. She kept them until they became very fat, when she gave one away, and as she had a large family the other three were kitled for her table. A few days after one of the sons called, and having nothing else to say, I asked how they enjoyed the eating of the ducks. "Well, not much," he said. "They were so rich we could hardly eat them, and mother has two turcenfuls of gravy left. She don't know what to do with it." "Did you see your mother make the gravy?" I said, suspecting where the trouble was. "Yes." "And did she pour off the fat?" "No, not any of it, and she thickened it with flour. It is a horrid mess. I never want any more duck to eat." I should fancy not. Just think of the quantity of grease that would flow from three fat ducks, and then thicken this with flour, and expect her family to eat and enjoy such a dish! I suspect that if we could go into the kitchens of some families and see the stupid way in which the cooking is done we should be astonished. We shalf have with our roast goose apple-sauce nicely made in a covered jar in the oven, to which sugar is added, making it rather sweet; then onion sauce, the onions so thoroughly boiled that their intact relations would not know them.

MAKING SHIRTS .- It is very essential that the eloth from which shirts are to be made should be well shrunk before the garments are cut out. once made a dozen shirts for my brother, which fitted him perfectly before they were washed, but afterwards each one shrank nearly two inches around the neck, and the wristbands one inch. Of course, new bands had to be put on, but the shoulder pieces had also shrunk, and it was impossible to make them fit well. I was mortified about it at the time, as they were made just before he was married, and the mistake not being discovered until afterwards, his new wife had to alter them, and I fancied she thought I did not know much about shirts. It is a great deal better to shrink the cloth first than to allow for shrinkage, as many do. because there is a difference in cloth in this respect.

BUTTONS .- Of course, button rings or slides would be better, but I happen to be without any, and I can't go out after them, so you see I do the next best thing. A piece of string or a narrow strip from the selvedge of cambric, which I prefer to string, run in through the eye of each button, on the wrong side of the garment, serves to hold them very firmly, if the needle and thread are also passed through a few times. In making button-holes, the end passing around the eye of the button should be made oval in shape. Where this is not done, the garment is apt to look drawn between the buttons after it is fastened together.

How to Cook Sturgeon. - "Max" writes: In the May number you give your readers a very interesting and instructive article upon the sturgeon, wherein the writer states that he "tried it several years ago (upon the table) and has since had no desire to repeat the experiment. Now, I had the good fortune to be born in the staid old city of Albany, which our friend represents as head-quarters for the consumption of the North River Sturgeon erop, and many a savory dish of the aforesaid "Albany beef" has my good mother served up for us in years goue by. Others who never tasted it elsewhere have partaken of it on these occasions, and I believe their testimony has always been in its favor, unless when an unfounded prejudice has stood in the way. I call it delicions, and for the fair fame of the calumniated Acipenser, and the information of whom it may concern, I append the recipe for its preparation: Take off all the fat and the brown meat. Cut in slices about 1 by 2 inches. Rinse off, and put over the fire in cold water, for half an hour or more, until tender, but not enough to break apart. Add flour and butter, salt and pepper, and bring again to the boil. Remove from the fire, and stir in one or more eggs, according to quantity. Serve on toast, with plenty of dressing. It is in fact, prepared the same as chicken fricassee, except the toast and eggs.

Dried Apple-Parings .- Wherever apples are scarce, it is good economy to dry the nice parings, especially of fine fall apples, as thus dried they will make good apple-jelly in winter. I have tried it myself, and I can fancy that the richty elaborated juices so close to the sunshine under the erimson and golden surface are more suitable for jellies than other parts of the apple, as we know it to be so in the quince. The parings dry nicely laid in plates under the cooking stove for the first day, then in the sunshine. Keep in paper bags. The parings of russets are generally bitter.

Scalloped Oysters.-This makes an excellent dish to accompany the turkey or goose at a Christmas dinner, to serve at a supper party, or to help out an otherwise meager dinner. Small oysters, which cost less than large ones, and are just as well flavored, will answer as well as large. Butter a pudding-dish and put on a thin layer of bread crumbs or rolled cracker; put on a layer of oysters, another layer of erumbs, and so on until the dish is filled or all the oysters have been used. The top layer should be of crumbs. In filling the dish, put bits of butter and a little pepper with each layer of oysters. A very little mace makes an exectlent seasoning for this dish; a few small bits with each layer-avoid using too much. The oysters in cooking usually give up enough fiquor to moisten the crumbs. Bake for an hour. The dish should be handsomely browned upon top, and should be moist all through, without any running liquor

#### BOYS & GURLS' COLUMNS.

#### The Doctor makes a Proposition.

How many boys and girls, if they wished to give a stranger a map of the road from their house to the schoolhouse, or to the house of a distant neighbor, could do it correctly? Such a map should show all the turns of the

Fig. 1,-MONEY-BOX COMPLETE

road, and point out all the prominent landmarks, so that one who took it for a guide should feel sure that he was right. Being able to draw objects correctly is a pleasing and often a very nseful accomplishment, but it is of more importance to know how to draw a map or a plan cor-

Fig. 2.—ONE PIECE OF MONEY-BOX.

rectly. How many of you can draw a plan of your own place properly, giving the relative size of the lots, the building, and all that is upon the farm? Now, let us

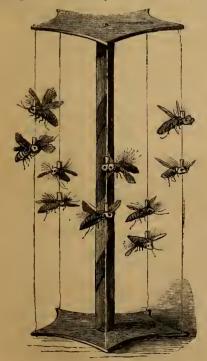

Fig. 3. - SINGING CRICKETS.

have a little trial of this, and see how much we know about it, and I propose to have a little competition, into which girls as well as boys can enter. The steam-engine

that I offered for a premium last winter was for boys only. The girls did not like that arrangement, and I do not blame them that they found fault at being shut out from competition.

Now, what I propose is to offer premiums, which will be named below, for the best map or plan of the farm or place that the boy or girl lives upon. Not a pieture, you understand, but a map. It must show the fields and other inclosures in their proper proportions, the positions of house, barns, and other buildings, the roads and paths, and if there is a pond, brook, hill, or unusually big tree or rock, the places of these should be marked down. A piece of strong twine, with a white thread sewed through it for every foot, will answer for most of the measurements, and the relative sizes of the fields can be found by counting the fence sections. Of course proper reforence should be had to the points of the compass. The scale upon which the map is made must be determined on, but about this your father or some older person will give you advice. It is well to draw the plan first in pencil, and after all the necessary corrections are made, carefully ink over the lines.

I have spoken about a map of the farm, but this should not exclude those who live on smaller places. Those who have only village lots, can make maps of those, only they should be more minute than those of larger places, and show all the paths, flower-beds, principal trees, shrubs, and the like. What I wish, is to encourage a habit of accurate observation and the ability to represent things upon paper in their proper position. The neatness in the drawing and apparent accuracy will be considered in awarding the prize, and each boy or girl will sign the map or plan as an assurance that it is his or her own work. These must reach me by February 1st, 1872, and be directed "The Doctor," 245 Broadway. The best plan will be published, if I see proper, but this I do not promise.

For the best map or plan, Five Dollars .........\$5.00 For the 2d best, *Hearth and Home* one year, equal to \$3.00 For the third best, *American Agriculturist* for one

year, equal to.....\$1.50

### About Christmas Presents.

December 25th will soon he here, and every boy and girl knows that to be the date of Christmas. And probably almost all of them have their minds fixed upon Christmas presents. Some are thinking what they shall get, but we hope that more are considering what they will give. It is very easy for those who have a plenty of money to purchase gifts, but we think that those presents which are made by the giver's own hands are most acceptable. It is not the thing given that is valued so much the love and kindness that prompted the giving at all. While you are contriving some little gifts for your young friends, don't forget the older ones. Parents, grandparents, and good old uncles and aunts like to feel that they are remembered in these holiday times; no matter how small the gift, it shows that their happiness has been thought of. Girls at these times have a great advantage over boys, as there are so many pretty and useful things that they can make with the needle, or crochet, or knit, while boys, with every desire to make holiday gifts, are much puzzled what to do. In former volumes we have given patterns for hrackets and little picture-frames, which may be readily cut from thin wood, by the skillful use of the jackknife. A neat bracket or small frame for a photograph is an acceptable present for almost any one, especially to an older person. Boys that are handy with tools, can make small boxes of black walnut, red cedar, or any other pretty wood. Here (fig. 1) is a drawing of a money-box, which would be a elever present for a boy or girl. It is made of six pieces, all of the same size, and like that shown in figure 2. At a short distance from the end of each piece a groove is cut, as wide as the thickness of the material, and half-way through the wood. This can be cut by the aid of a knife and a small chisel. The box, when put together, is like figure 1. There are no nails or other fastenings to hold the sides of the box in place-they hind one another. Should there be a difficulty in getting the last piece into its place, widen the grooves a trifle. It should go together with some difficulty. Figure 3 shows "singing crickets," a toy that is very amusing to small children. A central, upright stick has a piece at each end cut to form five points. Between the lower and upper points are stretched pieces of very fine wire, such as is known as "binding wire." The insects' bodies are made of clay, mixed up with gum-water, rolled into a cylinder about an inch long; a small hole to receive the wire is made by means of a pin near one end, and a bit of feather is stuck in each side, to serve for wings. When these are dry they may be painted some gay colors and strung upon the wires, two or three upon each wire; a little section of a small quill is put upon the wire between each two crickets, to keep them apart. When the stand is turned over, the things slide down the wire, but the hole through which the wire passes, being near one end of the body, they do not fall readily, but drop down with a series of jerks, which give them a curious

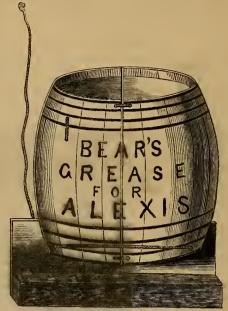

Fig. 4.—THE CURIOUS BARREL

fluttering motion, and at the same time the vibration of the wires makes a sort of musical sound.

An ingentous friend of ours got up an annising toy for a fair, which we figure here, as it may please some. The toy (fig. 4) appears like a barrel, which should bave some marks upon it to attract attention. While a person

Fig. 5.—WHAT WAS IN THE BARREL

is looking at it, it suddenly changes into a hear (fig. 5). How this is done will be seen by consulting the lines in fig. 5. One half of the barrel folds over upon the other half and discloses the body of the bear. This is, of course, done by one in the secret, who pulls a thread that moves the parts. The head is upon a separate piece and hinged

421. Geographical Puzzle.—A celebrated Southern locality.

upon the back of the toy, and turned down so as to be out of sight. It is raised in place by means of the same thread that moves the half of the harrel. To make this requires some skill in drawing, though for a small toy

the parts may be traced from our engravings. The parts should be appropriately painted with water-colors. The toy should be made of moderately stiff card-board, and at the bottom he attached to a small block of wood, to serve as a stand.

#### The Doctor Talks about Indians.

My nephews, like most other nephews, have a great fondness for reading about Indians. There is much in their wild life to interest a wide-awake youth, and the books about them, which would seem to be mainly written by people who never saw much of Indians, possessa great attraction for all young people. As I have been

much among the savages, the boys frequent-ly ask me to tell them a story about Indians, but being a very mat-ter-of-fact uncle, and never having seen an Indian that was not a miserable, lazy, lying, thieving specimen, my stories are altogether unlike those found in the books. I know that there are some excellent, civilvery ized Indians, but those are not the ones that are met with on "the Plaios." The last story that I told the boys was one that illustrated the ingenuity an Indian will display in horsestealing. The Apaches steal anything, but their chief delight is to rob horses and mules. These animals are not only a necessity of their wild, roving life, to carry them about, but also to serve as food. "What, eat

horses and mules? Yes, and very good eating they are said to be. In many parts of Europe horse-meat is regularly sold, and in Paris, during the siege, it was considered a great luxury. A military post was established at Doña Ana, in New I don't know that you will find the miserable little place upon your maps, but it is upon the Rio Grande, some fifty miles above El Paso. At a military post there are usually many horses and mules, and here there was quite a large herd to be taken care of. After much trouble and labor the quartermaster had built a large corral, which is a Mexicau name for an inclosure where animals are kept. This was a large yard, surrounded by a thick wall of adobe, some ten feet high. Adobes are bricks made of clay mixed with cut straw, formed in a mold about a foot square, and dried in the sun. These are laid up with mud instead of mortar, and are used to build houses, walls, etc.; they answer a good purpose in a country where there is very little rain. Well, the corral was built of these adobes, and an enormous, heavy gate put at the entrance. The animals were driven into the inclosure every night, the gate bolted and barred, and, that no one might enter, a sentinel was kept pacing in front of the gate all night long. One bright morning, when the herders came to take the ani-mals out to graze, the gate was opened, but, instead of the usual noisy rush of the animals towards water and grass, there was perfect silence. Not a horse nor a mule was to be found! The gate was all right and the sentinel had heard nothing. An examination showed that Indians had been at work, and very cleverly they did it. One Indian had climbed over the wall, and the end of a bair lariat (a rope made of twisted horse-hair) was passed to bim. The Indian within the inclosure and one without pulled the lariat back and forth, and thus quietly sawed through the soft adobe. The bricks, as they were loosened, were sliently removed, and thus in a short time a passage was made in the walls, sufficiently large for the animals to pass through. By the time the loss was discovered the animals were far away. Most of the people at the post were much amused at the ingenuity of the Apaches, but I know that there was one very cross man at Doña Ana that morning, and that was the quartermaster.

#### A Trick of the Gulls.

Who opened the first oyster? We do not know, but suppose that it was done by some one who took a lesson from a bird. The gulls are well known for their ingenuity in obtaining food from mussels, clams, and other shell-We suppose that all the boys and girls know the

gulls. They are more abundant upon the sea-coast than elsewhere, but they are also found plentifully around the larger lakes and rivers, and they are noticeable for their very long wings, which give them great powers of flight. They are great gluttons, feeding npon whatever floating offal they can find, and catching fish with dexterity. When the tide is low, they are ready for anything eatable that may be picked up along shore. Even those creatures that are protected by shells, such as sea-urchins, clams, mussels, and the like, fall a prey to the gulls. This kind of food, however, can not be got at without first breaking the shells, and the bird, being unable to do this by means of its beak, resorts to a trick which, were it not related by very reliable witnesses, would be difficult to believe.

GULLS DROPPING CLAMS UPON THE ROCKS.

The gull takes the shell-fish in its beak, rises high in the air, and then lets it fall so that it will strike upon a rock and the shell be shattered. As soon as the bird lets the shell-fish fall, it at once darts down to secure its prey, for it well knows that there are a number of its fellows on the watch to avail themselves of the labors of their industrious companion. It seems astonishing that an animal so stupid as a sea fowl should know that a cause will follow au effect; that dropping from a hight will break the shell, and allow the food to be reached. dubon tells of an instance in which he saw a gull let a mussel fall for three successive times before it succeeded in breaking it. There are some people who maintain that animals do not reason, but the conduct of these birds looks very much as if they were able to reason. The engraving shows the White-winged Silvery Gull in the act of dropping a clam,

#### GEOGRAPHICAL PUZZLE.

(Fill the blanks with names of countries, rivers, towns, etc., so as to make sense of the story.)

18. Once upon a time, while traveling in Eogland, I stopped at an 1—— (one of the tributaries of the Danube), and calling the landlord asked him what he could give me for supper. He said I could have some cold 2--- (a country in Europe), and leaving me alone for a few moments, soon returned with that, and two bottles, one of 3— (a bay on the coast of AC , and the other 4— (an island

in the Indian Ocean). As I sat down to the 5on the coast of Africa), he prepared to draw the 6city in Ireland), but I told him that I was a disciple of temperance and would take only water.

The 7— (a country in Africa) being quite 8— (a country in South America), I called a 9— (a cape on the coast of Guinea) waiter, told him to prepare me a 10 (a city in England), and I would retire. Early in the morning I was awakened by the loud crowing of a large --- (a sea in Europe) 12 — (a city in Asia) rooster. With a boot-jack, a footstool, and several other missile-a-neous articles of domestic furniture dexterously directed, I persuaded him to leave the immediate neighbrhood, and returning to my couch was just tumbling into a delicious

dose, when a (a group of islands in the Atlantic Ocean) in the next room set up a most melodious racket, and effectually banished slumber from my eyelids. I arose, dressed myself, and going down to the breakfast-room. I found the landlord sitting on his porch, 14— (a city of England). I usked him if he could let me have a conveyance to take me to the next town. He assured me that he could, and calling to a 16——
(an island in the Irish Sea), ordered him to go and harness the 18— (mountains in Africa) horse to the 17sea in Asia) wagon and bring him around to the door. After paying my bill, which was just one 18 (a country in Africa), I bade my kind host 19—— (a cape on the coast of New Zealand), and pursued my journey. W. McC.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

VIRGINIA Y. says "i think you are quite a smart old lady or you could not make so many hard puzzles." Why, Virginia, it is my nicces and nephews who are "smart;" not I.

MINNIE E. S. Why didn't you tell me more about the

picture your teacher gave you?

W. McC. Thanks for your geographical puzzle, which is very "acceptable," but I shall have to take the liberty of condensing it somewhat.

If I have failed here to notice any of my correspondents who expected a little word from me, the reason is, doubtless, because they gave me no clue as to whether they were writing for the Puzzle-Box or the Sphinx. So, my darlings, if I have neglected any of you, I forgive

Glad to hear from Lillie S., G. R. W., M. E. L., Minnie M., Hessa M. W., and Emmett S. K.

Those sending puzzles to Aunt Sue, Box 111 P. O., Brooklyn, N. Y., will please specify whether their contributions are for the Agriculturist, or for Hearth and

#### Office of FISK & HATCH,

Bankers and Financial Agents of the Chesapeake and Ohio Railroad Company,

No. 5 Nassau Street, New York.

We are now selling the last of the Chesapeake and Ohio FIFTEEN Mullion Gold Loan, secured by mort-gage on the whole railroad property. These bends combine perfect safety with a fair income, and a prospective advantage in their future market value. Holders of Fivetwenties, or other Government scenrities, can exchange for these bonds, and realize a handsome increase in the amount of their invested principal and their annual income, without impairing the scenrity of their investment. They are issued in \$100, \$500, \$1,000, either coupon or registered; interest six per cent, gold, payable May and November. Price, for the present, 94 and accraed interest from Nov 1st. We recommend them to our friends and customers with the same confidence with which we have always recommended the United States Government and the CENTRAL PACIFIC BONDS.

We continue to buy and sell CENTRAL PACIFIC BONDS, and fully expect they will, in time, reach the price of Five-twenty Bonds. They are dealt in at all the principal money centers of the world. The Company have none left, and can issue no more on their main line, as the amount was fixed by act of Congress at \$25,885,000. The property pledged to secure the bondholders is worth fully one hundred million dollars; the net receipts of the road for the year will be nearly three times the interest payments thereon.

We buy and sell Five-twenties, Ten-forties, Eighty-ones, and Central or Western Pacifics, or receive them in payment for CHESAPEAKE AND OHIO BONDS at their current market price.

Deposit accounts of banks, bankers, and others received on which we allow four per cent interest. Checks payable on presentation, without notice, the same as at a national FISK & HATCH.

HARVEY FISK, A. S. HATCH.

#### HEREDITARY GENIUS:

Its Laws and Consequences.

This great book separately would cost \$2.00, and is the most wonderful book of the time. Its influence on the future of the race will be very great. Every married or unmarried person should read it. Also

#### KITTY HOWARD'S JOURNAL, Part 2,

or the Sequel to Kitty Howard's Journal, which so delighted all mothers in 1869-by Mrs. E. Oakes Smith. This story be full of wisdom and hints for better living.

The January number will contain an article ou

#### THE CARE OF CHILDREN, By Dr. Clemence S. Lozier, M.D.,

which alone is worth the subscription price.

During the year we shall print an able article on

#### THE RULES FOR GETTING RICH.

Every number will be filled with sensible articles. A health magazine should be found in every household as much as a farm or political paper. Its hints on how to live will save ten times its cost in doctor bills every year, enable thousands of invalids to regain their health witbont medicine, and show parents how they may rear strong, healthy children. Its articles on rearing children are the best ever

The Scientific American says this Journal contains more sensible articles than any monthly that comes to its sanctum. Send in your names at once.

#### FOREST TREES. FOR SHELTER, ORNA-HENT, AND PROFIT.—BY ARTHUR BRYANT, SEN,

#### CASTERS FOR SEWING MACHINES.

Combination of Patents.

All ladies using Sewing Machines, have experienced great annoyance and much hard work in moving their machines from one part of the room to another for the purpose of getting better light, sweeping, etc., etc., and have wondered why somebody would not get up a Sewing Machine Caster. Every one has wanted them and waited for them, and now here they are.

With a set of these Casters the machine is allowed to stand firmly on its feet (not on the Casters) while sewing; but by an iugenious, simple, and self-operating device, it is allowed to rest upon the Casters for moving about,

Manufactured by SARCENT & CO., 70 Beekman St., New York.

#### Sold by Sewing Machine Agents Generally. On receipt of \$2, we will forward a set of these casters, express paid, to the nearest express station, to any address

in the United States north of North Carolina and Tennessee and east of the Missouri River. Beyond this boundary, a special arrangement as to expressage will be necessary.

When ordering, be sure to mention the name and particular style of machine for which Casters are wanted.

YOU CAN GET A

(YOUR OWN CHOICE OF 100)

#### WITHOUT MONEY.

### **Very Little Trouble**

# MONTH

December, 1871.

### HOLIDAY PRESENT

For YOURSELF,
For YOUR WIFE, For YOUR CHILD, For YOUR FRIEND, For A LOVED PASTOR, For A LOVED TEACHER.

Read over the list of good articles in the Table. They are all new, first-class, volumble, reliable articles, just as good as money. The assortment is so large that every one will find something needed. Over 1,500 persons have already obtained them with pleasure and profit.

Any person who chooses may collect a small or large list of subscribers and receive the premium. It is only necessary to show copies of the papers, explain their value, and collect and forward

It has been done largely at stores, shops, post-offices, etc., and by private individuals. By Co-operation, Ministers, Teachers, Churches, Sunday and week-day Scholars, have obtained Melodeons, Libraries, Cyclopedias, Dictionaries, etc., also Sewing Machines, and the like, for poor widows and others. Many professional men have opened and made up good premium lists at their offices. Clerks in stores and Post-offices have materially increased their salaries thus, while in-

for themselves or for presents to others, all without the use of working hours, and at no money cost.

As a constant Business Employment, some persons eanvass all the time, receive the premium articles, and sell them for eash, and thus secure large salaries. One lady has averaged over \$3,000 a year for years past, and others are getting large pay for their time, often \$5 to \$20 a day. Some who did poorly at first have, by perseverance, acquired the art of canvassing, and become very successful. The work is honorable. The Journals are useful in every family in City, Village, and Country.

The American Agriculturist is everywhere known and approved. HEARTH AND HOME is now without a superior in the world as a splendidly illustrated Weekly Newspaper, for real value, cheapness, and adaptability to every home in America. The papers are entirely different. Taken together, they supply over \$30,000 worth of fine engravings, and more good reading than can be found in fifty books costing one Dollar cach.

Preminm Clubs can be made up of subscribers to either paper, or partly of both, as noted over the Table. We call especial attention to the last column of figures, showing the small number of names required where both papers are taken, at the reduced price of \$4 a year.

Yon, Reader, can get a Premium. TRY IT.

#### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But ... (b) Tell ns with each name or list of names sent, that it is for a premium. (c) Send the names as fast as obtained that the subscribers may begin to receive the paper at once. You can have any time, from one to six months, to fill up your list....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts...(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers.... (f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly...(g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainstamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways dividuals in all classes have secured good things is at our risk; otherwise it is not. conveyance desired.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together.]

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2nd and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

able, Register Money Letters, affixing charge is made for packing or boxing any article in our Premium List. tremiums, Nos. 8 to 12, 23 to 28, 34, 35, 36, 68 to 91, and 94 to 106 inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express affice nearest recipient), to any place in the United States or Territories.—(No. 33 mailed for 30 cents extra.) The other articles States or Territories.—(No. 33 mailed for 30 cents extra.) The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. See Descriptions of Premiums on Next Page.

#### Full Descriptions

of all the Premiums are given in our October number, which will be mailed *free* to all applicants. Read over the descriptions, and you will find many desirable articles—indeed, all are desirable. We have room in this paper only for the following DESCRIPTIVE NOTES:

Nos. 1, 2, 3, 4, 5, 6.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign goods. Messrs. Pattersou Bros., 27 Park How, who supply us with these articles, are also importers of English goods. They recommend these Knives, manufactured by the Meriden Cutlery Co., as equal to any Cutlery in the market, and their recommendation is a gnarantee, wherever they are known. We offer four kinds of Knives, and three sizes of each kind. No. 1 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$14... For 23 subscribors at \$1.50, or 78 at \$1, we will give either the medium size or the table size, sold at \$15.50. No. 2 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$18.50... For 31 subscribers, at \$1.50, or 100 at \$1, we will send the medium size, sold at \$20.50... For 34 at \$1.50, or 112 at \$1, we will send the Table size, sold at \$22.50. No. 3 are made of Solid Steel and are triple-plated all over with pure silver, which will wear for a long time, while the Knife is actually indestructible by ordinary use. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25.0... For 42 subscribers at \$1.50, or 123 at \$1, we will give the medium size, sold at \$25.0... For 45 subscribers at \$1.50, or 143 at \$1, we will give the Table size, sold at \$25.0... For 42 subscribers at \$1.50, or 123 at \$1, we will give the Table size, sold at \$25.0... For 42 subscribers at \$1.50, or 123 at

No. 7.—French Cook's Knife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Pat. Rubber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by the Meriden Cutlery Co.

Nos. S. 9. 10, 11—Pocket Knives.—Ilbne's for the Boys and Girls!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are made by Messes. Smith & Clark, Bronxville, N. Y., whose work is equal to any done in this country or Europe. No. S is a neat, substantial Knife, with three blades and buck-horn handle. No. 9 is a still finer article, with four blades and bnck-horn handle. No. 10 is a nelegant Knife, with four blades and shell handle, No. 11 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 12.—Multum in Parvo Pocket Maite.—This is a most attractive as well as useful Previum. It comprises, in one knife-handle, a large and a mall blade, a screw-driver, a saw, a strong hook, a nutcracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim punch, and, in addition to this, it can be used for various other purposes which will at once suggest themselves to any smart boy or man. The knives will be sent anywhere in our country, post-paid.

No. 13. — Cake Basket.—A new pattern, oval-shaped, nicely chased—a very taking, useful, and beautiful table ornament. This, with other articles that follow, ismade by the Lucius Hart Manufacturing Co., of Nos. 1 and 6 Burling Slip, New York City, and is warranted by them to be of the best triple plate. Mr. Hart, "the veteran Sunday-school man," was engaged in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and have taken pleasure in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrity

of the manufacturer. We could give nearly as good-look-ing plated ware for less than half the money.

No. 14.—Casters and Fruit or Cake Basket Combined.—This is a new pattern, both novel and beautiful. It can be used as large, showy Casters, with six cut-glass bottles, or be instantly changed into complete Casters, with Call-Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers and of equally good quality as the preceding.

No. 15.—Revolving Butter Cooler.—This is a really good and useful article. It is so arranged that a very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate-for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same house as No. 13.

No. 16.—Card Receiver. — This is a beautiful ornament, as well as a useful article. It is finely chased and gilt-lined, and, like the three preceding, is from the Lucius Hart Manufacturing Co.

No. 17.—Nut Picks and Crackers.

—Here are twelve nut-picks, elegantly chased, of medalion pattern, with two handsome nut-crackers, in a morrocco-covered case. From the same house as No. 13.

No. 18. — Half-Dozen Napkin Rings.—These rings are beautifully chased, and in a morocco-covered case. From the same honse as No. 13.

No. 19.—One Bozen Teaspoons.— No. 20.—One Bozen Table-Spoons.— These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 13. They are far cheaper than anything we have found at half the price, and well worth working for.

No. 21.—One Dozen Table-Forks.

—The same description and remarks apply to these as to No. 20. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manafacturing Co.

No. 22.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the outside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life keepsake.

Nos. 23, 24, 25.—Gold Pens: with everpointed Pencils, in extension, coin-siber cases.—Premium
No. 23 contains the best No. 4 Gold Pen; and No. 24 the
best No. 6 Gold Pen, which is the same style, but larger.
No. 25 contains No. 7 Gold Pen, in Gold-tipped Ebony
Holder. Each pen will be sent in a neat leather case by
mail, post-paid. These pens are made by Geo. P.
Havkes, No. 64 Nassan St., and have obtained
au excellent reputation. We have known the maker
and his goods for many years, and can recommend them.

No. 26.—Ladies' Fine Gold Fen, in Rubher Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same makers as above.

Nos. 27, 28.—Ludden's Patent Magie Revolving Peneil.—This is a beautiful Pocket Peneil, which is extended or closed by pulling or pressing the bead. They are made with great care, and every Peneil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3.50. They are made by Ludden's Gold P. and P. C. Co., Win. A. Ludden, Agent, 195 Broadway, who has been in the business thirty years.

No. 29.—Annesette.—We believe in home entertainment for both young and old people. Our observation is, that the increase of entertaining home games is already doing much to keep not only the boys but their fathers away from drinking and gambling rooms, and other places of evening resort not conducive to good morals. This premium, the "Amusette," as it is called, will afford interest to the older as well as the younger members of the family, male and female. It only needs a smooth table of any kind covered with a cloth. The play with the balls will develop much of ingenuity and skill, and give a capital study of the laws of motion, force, etc. The price has been reduced from \$10 to \$6, and our premium will place it in the power of very many to secure this additional source of home amusements. The Amusette is supplied by E. I. HOTSMAN, 160 William Street, N. V., who will send any desired circulars giving information. It packs in small space and can be safely sent anywhere by express at small cost.

THE

# HOOSIER . SCHOOL-MASTER.

By EDWARD EGGLESTON.

Finely Illustrated, with 12 Full-Page
Engravings on Tinted Paper,
and Numerous Other
Cuts.

This intensely interesting story, which has appeared as a serial in the columns of Hearth and Home, and will be concluded this moath, is now issued in elegant book form, printed on fine paper, with engravings on tinted paper, and bound in extra cloth. It is a truly American Story, and will be read with delight by all.

#### NOTICES BY THE PRESS.

Mr. Eggleston's powerful novel, "The Hoosier School-Master," increases in interest as it goes on, and contains some characters truly original.—Springfield Republican.

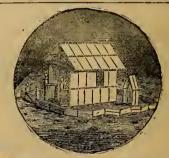

Some passages in it, for lifelike delineation and the simple, artless beauty which constitute the highest perfection of story-writing, are equal to some of the very best passages in Dickens.—*Heligious Telescope*.

Edward Eggleston's genins for story-telling is now flowering out in "The Hoosier School-Master," an illustrated story, which promises to be of rare interest.—Sunday-School Times.

Edward Eggleston's story, "The Hoosier School-Master," affords one of the most graphic and picturesque portraitnres of the early frontier life of the West which has ever been written. Some of his character sketches are inimitable, and all have an individuality and freshness which stamp him as a genuine artist.—N. Y. Evening Mail.

PRICE, POST-PAID. ....\$1.25.

#### A BOOK FOR THE MILLION.

THE

#### YOUNG

### HOUSEKEEPER'S FRIEND.

By MRS. CORNELIUS.

REVISED AND ENLARGED.

The aim of the writer of this work has been to furnish to young housekeepers the best aid that a book can give in the departments of which it treats. No printed guide can perfectly supply the place of that experience which is gained by early and habitual attention to domestic concerns. But the directions here given are so minute and practical, that the observance of them will prevent very many of the per-plexities which most young people suffer during their first

plexities which most young people suner during their missi-years of married life.

The recipes, with very few exceptions, are furnished from the author's own experience, or that of her immediate frieads. An ample variety is given for furnishing the table of any American family; but especial reference has been had to those who have neither poverty nor riches; and such discussions have been given as will enable a housekeeper to directions have been given as will enable a housekeeper to provide a good and healthful table, or, if desired, a hand-

some one, at a moderate expense. How well the author has succeeded is manifest from the How well the author has succeeded is manifest from the very great favor with which past editions, through a period of twenty-favo years, have been received. And now, in this new edition, she has rendered the book more than ever worthy of patronage, by a thorough revision, the omission of a few recipes of least value, the addition of full directions for Camming Fruits, and more than One Hundred and Fifty New Recipes which have been tested by experienced housekeepers. While the lessons of economy taught by the late war have not been forgotten, the author has well net the demands of the present customs of society for a greater variety of dishes than used to be thought requisite for the ample supply of the family table.

PRICE, POST-PAID......\$1.50.

#### ORANGE JUDD & CO., 245 Broadway, New York.

NEW AMERICAN FARM BOOK.

NEW AMERICAN FARM BOOK.

Originally by Richard L. Allen. Revised and grently enlarged by Lewis F. Allen. Price \$2.50.

Allen's American Farm Book has been one of the standard farmers' hand-looks for twenty years; is is still a valuable book, but not up to the times; and as its author, Mr.H.L.Allen, could not give time to its revision, this was undertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Eric county, editor of the American Shorthorn Herd-Book. The work is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser, and is called the New American Farm Book.

#### ORANGE JUDD & CO., 245 Broadway, New York.

#### FARM IMPLEMENTS AND MACHINERY.

The principles of their construction and use; with simple and practical explanations of the laws of motion and force as applied on the farm. By John J. Thomas. With 287 illustrations.

Price \$1.50.

With 287 illustrations.

Price \$1.50.

The basis of this admirable work was an essay published in 1850, in the Transactions of the N. Y. State Agricultural Society, which was enlarged, and in 1854 published by the Harpers. It has been, and remains, the only work in which the principles of Natural Philosophy, namely, the mechanical powers, and the powers of water, wind, and heat, are systematically discussed as applied to the operations of the farm. This work has now been most carefully revised by the author. It is much enlarged, and a great part has been re-written, while the illustrations, before abundant, now number two hundred and eighty-seven. There is not an agricultural writer that could be named more respected than enitural writer that could be named more respected than John J. Thomas, or one whose judgment and freedom from personal bias in discussing new implements could be more

#### HARRIS ON THE PIG.

Breeding, Rearing, Management, and Improvement. With

Breeding, Rearing, Management, and Improvement. With numerous Illustrations, Dy Joseph Harris, Price, \$1.50.

This is the only American treatise upon the breeding, rearing, and management of swine, and is by one thorough; familiar with the whole sniplet. The points of the various English and American breeds are thoroughly discussed, and the great advantage of using thorough-bred males clearly shown. The work is equally valuable to the farmer who keeps but few pigs, and to the breeder on an extensive scale.

Either of the above books sent post-paid on receipt of price by

ORANGE JUDD AND COMPANY,

L. A. CHASE, 245 Broadway, New York.

# Fottler's Improved Brunswick Cabbage.

This fine Cabbage, originally introduced by one Mr. Schlegel, and perfected in size and form by Mr. Fottler, father of the junior member of our firm, still maintains its superiority for general culture over all other cabbages at present known.

The accompanying cut was drawn and engraved from a fair average specimen of our seed stock crop of 1871, and is a faithful representation of the variety as sold by us. It is a rapid grower, and uniformly productive of large, landsome, solid heads, on short stems, with but few ontside leaves. Early planted, it is ready for use in July and August. Later planted, it is in use throughout the winter. We offer seed of this fine variety, and a general assortment of other seeds, in quantities suited to the requirements of purchasers.

The specialty of our business is furnishing seeds of extra quality suited to the requirements of the requirements of Market-Gardeners and others. Our seeds are grown from the choicest stocks and in the most careful manner, and we knowingly deal in no other.

Catalogues of varieties and prices sent free to all who apply for them.

#### GETTING UP CLUBS.

Let each person wishing to join in a club, say how much Tea or Coffee he wants, and select the kind and price from our Price-List, as published. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Consumers can save 5 to 8 prafts by purchasing of

# Harper's Periodicals FOR 1872.

### Harper's Magazine.

The great design of Harper's is to give correct information and rational anusement to the great masses of the correct and the state of the great masses of the great masses are accumulated. Harper's is edited. There is not a Magazine are accumulated. Harper's is edited. There is not a Magazine that is printed which shows more intelligent paths expended on its nuttless and mechanical execution. There is not a cheaper Magazine published. There is not confessedly, a more popular Magazine in the world.—New England Homestead.

At once the most popular, and, in its scheme, the most original of our Magazines. \* \* All the periodicals which the Harpers publish are almost ideally well edited.—Nation.

# Harper's Weekly.

The best publication of its class in America, and so far ahead of all other weekly journals as not to permit of any comparison between it and any of their number. Its columns contain the finest collections of reading matter that are printed. \*\* 'Its illustrations are numerous and beautiful, being furnished by the chief artists of the country.—

Harper's Weekly is the best and most interesting illustrated newspaper. Nor does its value depend on its illustrations alone. Its reading matter is of a high order of literary merit-warded, instructive, entertaining, and unexceptionable.—N. Y. Sun.

### Harper's Bazar.

Free from all political and sectarian discussion, devoted to fashion, pleasure, and instruction, it is just the agreeable, companionable, and interesting domestic paper which every nother and wife and sweetheart will require every son, hushand, and lover to bring home with him every Saturday evening.—Philadelphia Ledger.

By all means buy \*Harper's Bazar\*. Not for yourself, but for your wife or daughter or sister or sweetheart. There never was any paper published that so delighted the heart of woman. Never mind if it does cost you a new bonnet; it will save you ten times the price in the household economy it teaches,—Providence Journal.

### GREAT VALUE OF PATENTS.

ROBABLY no investment of a small sum of money brings a greater return than the expense incurred in obtaining a patent, even when the invention is but a small one. Larger inventions are found to pay correspondingly well. The mames of Bianchard, Morse, Bigelow, Colt, Ericsson, Howe, McCormick, Hoe, and others, who have a massed immense fortunes from their inventions, are well known. And there are thousands of others who have realized large sums from their patents. The first time requisite for an inventor is to know if his invention is patentable. To obtain this information, prepare a sketch and description of the inventor, or send a modelto Mexa. 40, and ask advice.

HOW TO

OBTAIN

More than First Thousaxon inventors have availed themselves of the services 
e claiorate opinion for a fee of \$5.00.

Recifications and drawings for Patents, Caveats, Resissues, Designs, Trade Marks, Copyrights, Assignnces, obtain Extensions, and solicit Patents in all foreign countries. Every patent taken by Munn & Co.
