OFFICE OF THE REGISTRAR-GENERAL FOR ONTARIO,

TORONTO, December 1st, 1898.

To Sir OLIVER MOWAT, K.O.M.G.,

Lieutenant-Governor of the Province of Ontario.

MAY IT PLEASE YOUR HONOUR:

In compliance with the Statute in that behalf, the undersigned respectfully presents to Your Honour the Annual Report of Births, Marriages and Deaths for the year ending 31st December, 1897.

Respectfully submitted,

E. J. DAVIS,

Registrar-General.

REPORT

RELATING TO THE REGISTRATION OF

BIRTHS, MARRIAGES AND DEATHS

IN THE PROVINCE OF ONTARIO, FOR THE YEAR
ENDING DECEMBER 31st, 1897.

TORONTO, December 1st, 1898.

TO THE HON. ELIHU JAMES DAVIS.

Registrar-General of the Province of Ontario.

SIR,—I have the honor herewith to lay before you for consideration, the twenty-eighth annual report regarding births, marriages and deaths in the Province of Ontario, being for the year 1897.

Population.

The population utilized as the basis of calculation for the several tables of the report, is estimated from the difference between the number of births and of deaths recorded for the year, by the 777 Division-Registrars.

The total births returned is, 47,323, and the total deaths 27,633, the difference giving an actual increase over 1896 of 19,690. This increase added to the assumed population of 2,263,492 in 1896, gives a population of 2,283,182, or an increase practically of one per cent. of population during the year. No attempt has been made to estimate the variation in the population due to immigration and emigration. Owing to the transportation of persons through Ontario, en route from Europe to the United States, by Canadian railways, and their passage tickets in Europe having often been sold to Canadian ports, the immigration returns give results which are little to be depended upon in calculating the increase of population from this source. Similarly the emigration from Ontario to Manitoba is liable to error owing to many young men going there to work in the spring, returning often in the autumn. The following returns relating to both immigration and emigration are given :

According to the report of the Minister of the Interior for 1897, the total immigrants arriving by ocean steamers in Canada, was 27,209. Of these, 19,304 had Canada as their destination, 9,709 of them settling in Manitoba, the North-West Territories and

British Columbia, leaving 9,595 for distribution to the other provinces. Making allowance for the emigration to the North-West of 455 settlers and assuming half of the 9,140 immigrants to have come to Ontario, there was an increase of 4,570.

From the imperfect data obtained from the Board of Trade returns in England, the Registrar-General there has assumed that, for practical purposes, it is preferable to calculate population from the difference between the births and deaths in any year, not attempting to estimate either the immigrants or emigrants. While manifestly this method cannot be adopted for such provinces as Manitoba, where there is a notable influx of settlers, yet in an old agricultural community as Ontario, it is probably true that the increase in the new mining and lumber districts is offset by emigration from the oldest counties where machinery and cattle-raising have lessened the need for agricultural laborers.

The total Municipal Registration Divisions in 1898 were.....	777
" Division Registrars in organized municipalities "	750
" Division Registrars in unorganized areas "	27
" Division Registrars making returns "	777

By the power placed upon the Registrar-General under the Act to appoint Division Registrars in unorganized territory, he has endeavored to have a Division Registrar appointed in every new group of settlements for convenience of registration, and so far as known, there is no single area in Ontario where local registration facilities are absent.

For the reasons given, it is apparent, that there will be an increase yearly of the areas of registration, and inasmuch as there is no municipal assessment in unorganized territory, its population reported upon, being based on the last census, cannot in any accurate manner be estimated. The only method possible has been to take populations from the municipal assessment, and by assuming the vital statistics for any neighboring unorganized territory to have the same relation to population, we may calculate from the returns the probable average population.

Completeness of Returns.

Practically the whole population of the Province being within some registration division, the accuracy of the statistics, assuming that the estimated population is correct for the whole Province, will depend upon the completeness of the returns made by each registrar. The year 1897 is the first complete year for which returns have been made under the Act, as revised and consolidated in 1896. The various provisions made under the Act, with a view to improving the returns, have been referred to in the last two Annual Reports.

The operation of the Act is seen by a comparison of returns for the several years, 1892-1897.

Year.	Births.	Marriages.	Deaths.	Total.
1892.....	42,176	14,482	23,120	79,778
1893.....	42,894	14,475	22,933	80,292
1894.....	42,051	14,341	22,538	78,930
1895.....	41,628	13,987	22,461	78,076
1896.....	46,908	14,904	24,857	86,669
1897.....	47,323	15,293	27,633	90,249

While it must be remembered that the number of registration divisions has been increased since 1892, yet many of these had been already added in 1895, when the total returns were slightly less than in 1892. The notable increase in the total returns

in 1897 may, therefore, be fairly attributed to the better provisions of the new Act for obtaining returns. As compared with 1895, it will be seen from the previous tables, that the several increases are :—

Births	5,695	13.7 per cent., or a total rate of 20.6 per 1,000.
Marriages.....	1,306	9.2 " " 6.7 "
Deaths.....	5,172	23.0 " " 12.2 "
Total.....	12,173	or 15.3 per cent.

These results of the first complete year under the operation of the revised Act must be considered remarkable, as illustrating what is possible, when a practical scheme is put in operation, wherein, with exactness of detail in the definite legal requirements of the Act, every possible facility has been given, whereby the provisions of the Act may be carried out with no inconvenience or irksomeness to a single member of the community. The principal provisions of the revised Act whereby these results have been effected may be recalled.

1st. That whereby physicians, as well as householders, are required to report births.

2nd. That requiring clergymen to make a half-yearly return of all marriages celebrated by them during the previous half-year, as well as the monthly return of each marriage.

3rd. The clause in the Marriage Act, requiring issuers to forward to the Registrar-General, the particulars of every license issued by them.

4th. The prohibition of all funerals until a burial permit has been issued by the Division-Registrar, which can only be done after registration of the death.

5th. The privilege of sending all blank forms free through the mails, and the supplying of post-card blanks of every kind, with envelopes for free transmission by the local registrars to clergymen, physicians and householders.

6th. The increase of the fee to Division-Registrars for each registration return.

7th. That whereby a Burial permit may be issued, in the case of townships, by the nearest Division-Registrar, the original return being sent to the proper Division for registration.

8th. That whereby a clause requires Division Registrars to make monthly returns of all deaths from contagious disease occurring during the previous month.

That the working of the Act has proved, in a large measure, satisfactory, may be gathered not only from the increased returns, but also from the comparatively few enquiries made during the year regarding the meaning of clauses of the Act, and the absence of complaints as to their irksomeness.

Not only, however, are the returns larger, as already seen, but they are also more complete than ever as regards the particulars asked for. Indeed, it is now the exception to find an incomplete return, and the omission is generally in some unimportant item, not readily obtainable by the Division-Registrar.

In one point only is it believed that the returns are otherwise than practically complete, and this is the return of births. While the provision requiring physicians to report births has been a most important means of improving the returns, yet there is no doubt from a close examination and comparison of returns, that births in some municipalities are yet by no means complete. By examining returns of Division Registrars who are known to take advantage of every known means to obtain complete returns, it is found that births stand to deaths, practically as two to one. Again, it will have been noticed that since a burial can legally take place only on a burial permit, and as a death is a matter of general knowledge, and not readily overlooked, the percentage of increase in deaths, with no general increase of sickness, but rather the opposite, has amounted to 23 per cent., whereas births have increased but 13 per cent.

Moreover, in a certain proportion of cases where, amongst the poor, and in outlying settlements, no physician has been in attendance at a birth, there will be in such cases, doubtless, a frequent neglect on the part of householders to register births. It is readily possible, however, to determine where such omissions are habitual, and it is found to be principally in those municipalities where the Division-Registrar is not allowed the legal fee for each registration; the council having commuted his fees, he agreeing, doubtless under protest, to perform all the duties of clerk for a fixed sum.

The following instances illustrate this point:—

Toronto	Total births 4,078	Total returns by physicians 856 or 21.0 per cent.
Hamilton	" 969	" about 20 "
Ottawa	" 1,273	" 314 or 24.7 "
London	" 352	" 27 or 5.0 "
Kingston	" 356	" 120 or 34.1 "
Brantford.....	" 408	" 6 or 1.0 "
St. Thomas	" 221	" 2 or 1.0 "
Guelph	" 259	" 10 or 3.8 "
St. Catharines....	" 200	" 44 or 22.0 "
Belleville	" 151	" 22 or 4.0 "
Stratford	" 134	" 21 or 10.6 "
Windsor	" 237	" 20 or 8.5 "
Chatham	" 199	" 22 or 11.0 "

To the great credit, however, of the municipal clerks, it would seem that many, in spite of the fact that they are deprived of what the Legislature has specially stated they are entitled to, faithfully perform their duties as Division-Registrars. It is hoped that the difficulty may in some manner be overcome by legislation. If then, the percentage of increase, actually obtained in the returns of deaths, be applied to births, and it is probable it should be more rather than less, there would be some 4,000 births added to the returns, or a total of 51,500 would have been recorded. If, however, the investigation, which has been already referred to, in the larger centres as in several cities shows an extended neglect, it is quite probable that even this increase should be further added to, in order that the true birth-rate of the Province may be arrived at. It may further be stated that from 307 replies sent in answer to a circular to Division Registrars thirty, or ten per cent. state their fees are commuted; and in many others are practically so, since the salary as the clerk is reduced.

Movement of population in Ontario.

Remembering that the settlement of Ontario has taken place almost wholly within the past 100 years, it is manifest that conditions of settlement have made it impossible to make comparative studies in any close degree comparable to those which can be made between districts in old countries, as England or France, which have been settled for hundreds of years. Not less interesting, however, is the study of the statistics which are available, such as the census returns, since new influences are seen operative, in some ways different from those in the older countries of Europe. Especially are such seen where settlements rapidly spring up, as now may be seen in the new mining camps of British Columbia, and as formerly occurred in Ontario, where the lumbering industry in the new agricultural communities, at first formed a large portion of the business of many counties.

Not only did such industries greatly influence the movement of population in what was then Upper Canada, but they were repeated decade after decade in successive counties as such were opened up for settlement.

Owing to the fact of the frequent redistribution of population into electoral districts with different boundaries, it has been difficult to make accurate comparisons of all the counties as they now exist, but the following table for three periods taken from the census returns for 1851 and 1881 along with the population used as the basis of this report, show in an interesting manner the movement of population in Ontario.

Table of Population for Counties from Census of 1851, 1881 and for 1897 based on 1891 Census.

Counties.	1851.	1881.	1897.
Algoma	not settled.	26,104	46,734
Brant (cities included)	25,426	33,869	38,722
Bruce	2,837	64,403	60,642
Carleton	23,367	58,876	82,474
Dufferin	(then included in Wellington & Simcoe	22,093	23,632
Elgin	25,418	42,361	46,087
Essex	16,817	48,049	50,017
Frontenac	19,150	40,384	49,948
Grey	10,413	70,539	75,667
Haldimand	18,788	24,980	24,903
Halton	18,322	21,919	23,357
Hastings	31,977	45,545	62,880
Haliburton	not settled.	5,911	6,742
Huron	19,188	76,526	70,955
Kent	17,469	54,310	62,368
Lambton	10,815	52,034	58,358
Lanark	27,317	33,975	40,082
Leeds and Grenville	50,987	61,175	64,693
Lennox and Addington	23,120	26,484	26,295
Lincoln	23,868	31,573	31,959
Middlesex	32,863	93,111	108,334
Muskoka and Parry Sound	not settled.	27,204	17,606
Norfolk	21,281	33,527	32,927
Northumberland and Durham	61,961	77,388	74,867
Ontario	30,576	48,812	48,190
Oxford	32,638	50,159	52,964
Peel	24,816	26,175	26,423
Perth	15,545	45,454	54,949
Peterborough	15,237	30,472	37,514
Prescott and Russell	13,357	35,937	45,115
Prince Edward (cities included)	18,887	21,044	20,065
Renfrew	9,415	38,166	48,882
Simcoe	27,165	74,803	76,212
Stormont, Dundas and Glengarry	46,050	66,017	74,096
Victoria	11,656	33,655	35,051
Waterloo	26,537	42,740	53,633
Welland	20,141	31,771	32,544
Wellington	26,796	64,632	63,151
Wentworth	28,507	66,952	83,780
York	48,944	153,113	298,268

Excepting Wellington and Waterloo, which were first opened for settlement about 1825, the other of the following counties had, excepting Kent, made great progress in settlement, by the census year 1851. Especially had settlement been rapid between 1840 and 1850, as may be seen from the following figures of population in Upper Canada in different years :

Population of Ontario in different Years.

1840.....	427,441	1861.....	1,396,091
1841.....	465,357	1871.....	1,620,851
1842.....	486,055	1881.....	1,923,228
1848.....	723,322	1891.....	2,114,321
1851.....	952,004	1897.....	2,283,182

It will be seen that as between 1840-51, the population increased over 100 per cent., and that some of the counties—as Brant, Lincoln, Prince Edward—were completely settled in 1851, as an increase since then has been wholly in the county towns ; the rural population being actually less than in 1851. This loss was apparently in Brant, 5,284 in 1891 ; and in Prince Edward, 3,434 in 1891. Such illustrations serve to illustrate what an unstable thing population in a new country has been. From the enormous increase of

population in the decade 1840-50, it is manifest that the influences affecting the population were external to the Province. Economic causes, as the depression of agriculture in Britain and the Irish famine, played an important part in the settlement of Upper Canada at that time, and such influence was doubtless greatest in those counties already partially settled. That during the past three decades, there should have been in such counties a successive decline of the population, is a phenomenon, the causes of which it is here not necessary to discuss at length; but it is important, as indicating a condition, which in succeeding decades, has likewise been operative in other counties, where a general settlement followed at a period later than in these oldest counties.

Thus Perth, Huron, Bruce, Grey, Simcoe, etc., are counties where settlement became general only at a time when the oldest counties were practically filled up.

The following figures illustrate the fact:

	1851.	1861.	1871.	1881.	1891.
Perth	15,545	38,083	46,536	54,985	46,307
Huron	19,198	51,954	66,165	76,970	58,173
Bruce	2,837	27,499	48,515	64,774	64,603
Grey	10,413	37,750	59,395	74,129	76,238
Simcoe	27,165	44,720	57,389	76,129	84,828

Again, a later movement of population went on, when the *free grant* lands of Muskoka, Parry Sound, Haliburton, Victoria, Hastings and Renfrew, were opened up, after Confederation, and settlement began about 1870; and finally there has been a widening of this movement during the last fifteen years, since the Canadian Pacific Railway opened up the country from Pembroke to Rat Portage.

From the statistical standpoint, these successive movements of population are of extreme importance, in enabling us to study intelligently, those vital conditions which affect very markedly, the rates of births, deaths and marriages.

As an illustration of what is meant, Dr. John Tatham, in the supplement to the 55th annual report of the Registrar-General of England, in a special study of the deaths for 1881-90, says, "It is therefore futile to compare the crude death rates of different districts, unless their populations are known to be alike with respect to age and sex constitution," and illustrates the fact by taking the populations of Norfolk and Lancashire from the census of 1891, and points out the difference in the age distribution. Thus:—

	Per 1,000 population.	
	In Norfolk.	In Lancashire.
Under 15 years of age.....	353	352
15 and under 45 years.....	410	479
45 and upwards.....	237	169

Owing to the different distribution of these two populations, as regards rural and urban residence, and the difference in occupation, it will be seen that the number of persons in Norfolk, over 45 years of age, is 68 more than in Lancashire. As the average death-rate in persons over 45 was over four times as great as under that age it is plain that no close comparison of the total mortality, or crude death rates, in such cases can be made.

Yet still another illustration of this movement of population and its different distribution according to age periods may be taken from the Report on Vital Statistics of Ireland for 1897. In 1897, the returns for Ireland, give births 106,664, and deaths 83,839, or a natural increase of 22,825. As there were 32,535 emigrants recorded, there was, unless made up by an immigration, of which no record has been kept, a loss of population of nearly 10,000. While the greatest average marriage rate was 5.03 per 1,000 in 1897, that in the province of Connaught, including the counties of Galway, Leitrim, Mayo, Roscommon and Sligo, average only 3.3 per 1,000, and the average birth rate but 20 per 1,000.

Or to take another return depending upon conditions, comparable to that in at least several of our old counties, from the report of the Registrar-General of Scotland, 1897, it is found that while in the group of districts known as the Insular Rural, the census of 1881 gave a population of 130,388; this was decreased to 123,163 in 1896. Not only is this decline very remarkable, amounting, in spite of the natural increase of births over deaths, to 7,225 between 1881-1896, but the excess of females over males, which was in 1881, 8,030 in the 130,388, had increased 601 in 1896. As would be supposed, the birth rate shows an intimate connection with these figures. Thus, while the birth rate for all Scotland in 1896, was 30.9 per 1,000, and that in the principal town districts, was 32.5 per 1,000—that in the Insular Rural district was but 22.7 in 1896—with an illegitimate rate of 6.65 per cent. of all births, rising in one county to 14.61 per cent. of all births.

Table of Age (percentage), Distribution of Population in 1,000,000 Persons in England and Wales, 1881-1890; in United States in 1890 Census, and in Ontario, 1891 Census.

All ages.	England.		United States.		Ontario.	
	Reduced to rate per 1,000,000	Per cent.	Population in 1890, 62,622,190.	Per cent.	Population in 1891, 2,114,321.	Per cent.
0-4.....	128,679	12.8	7,634,693	12.19	239,847	11.34
5-9.....	119,006	11.9	7,573,998	12.09	246,610	11.65
10-14.....	109,571	10.00	7,033,509	11.23	243,277	11.50
15-19.....	100,007	9.00	6,557,583	10.47	232,073	10.97
20-24.....	90,006	14.8	6,196,676	9.90	219,983	10.40
25-34.....	148,630	11.4	9,806,407	15.66	325,520	15.39
35-44.....	114,039	8.4	7,051,679	11.26	226,064	10.69
45-54.....	84,950	5.8	5,057,802	8.07	164,952	7.80
55 and over.	101,598	10.4	5,709,823	9.13	216,052	10.83

This comparative table illustrates the fact above alluded to, that with but little immigration in a population like that in a rural district in England, Ireland and Scotland, the births are proportionately lower, and hence the percentage of persons living in the age period 0-4 is 1.5 per cent. lower in Ontario than in England, and 0.8 than in the United States.

Births.

In a previous paragraph some of the causes which have been operative in producing not only variations in the comparative birth rate of different counties in Ontario have been pointed out, but by comparative illustrations it has been shown that in every country, where similar influences have been operative, there are districts in which the birth rate is abnormally low. In view, however, of public attention having been called to the low recorded birth rate of Ontario, taken as a whole, not only in previous reports of the Registrar-General, but also owing to the matter having during the past year been referred to in a

resolution adopted by the Montreal Synod of the Church of England, deplored the fact; and inasmuch as strongly worded articles on the subject have appeared in the daily press, it seems proper that the Registrar-General should present as many statistical facts bearing on the matter as are available in order that any inferences as to the causes for this low birth rate may be based upon extended data.

The following grouping of Ontario counties, classified as far as practicable on the basis of the periods of their settlement presents facts of interest regarding the birth rate, it always being remembered that the returns are to some extent defective. It will be remembered that early settlement was naturally along the great rivers and lakes. The inland counties and townships of older counties belong largely to the later railroad building period. The several large cities are included in their counties, and thus make several old settled counties, as York, Wentworth and Middlesex show large increases in their later periods.

Table from Census of 1851, giving Birth rate per 1,000 population.

<i>St. Lawrence and Lake Ontario Counties.</i>		<i>Lake Huron Counties</i>

We have, however, yet another table which is instructive as bearing upon the completeness with which births have been reported, and it is based upon the proportion of instances where the physician is reported as being present at a birth. Those instances where no physician is reported in attendance form in the newer counties a notable percentage of all returns.

Table of Births in 1897, giving number returned without Physicians in attendance, or where Midwives were in attendance.

Counties.	No physician.	Midwives.	Total births.	Counties.	No physician.	Midwives.	Total births.
Algoma	476	91	906	Northumberland and Durham.....	91	21	1,264
Brant	24	10	771	Ontario	73	24	903
Bruce	304	91	1,467	Oxford	48	1	1,037
Carleton	410	2,088	Parry Sound	369	21	731
Dufferin.....	118	1	450	Peel	36	1	394

These two tables are new and are of unusual interest, from the standpoint of social evolution, as giving an accurate idea of the appreciation in which the practice of medicine is held in the province, of the advance of settlement and of the availability of medical men in the different new districts and the financial ability of the people to employ their services. For practical purposes it may be assumed, since the Division Registrars are required to make their returns as complete as practicable, that no physician was employed in those instances where no physician's name is entered in the returns. Thus, in York with 5,549 births returned, there was but 3.5% where no physician was present. On the other hand, in Renfrew, there were 50% of cases where no physician was returned, and practically the same percentage in Algoma. In the whole province there were 16.4% of cases not attended by a physician. What a great assistance the physicians may be in securing complete returns is amply illustrated by these returns; and how much neglected this duty has been in some places is seen by the results of investigation in the cities already referred to.

Another point of interest as bearing most directly on the birth-rate is obtained from the following table, giving the population of some towns and villages in successive periods. In the column for 1897, the population is that taken from the assessment returns for 1896. The birth-rate in such as are stationary or decreasing in population

is illustrated. The low rate in such simply indicates that those persons of a marriageable age, notably the young men, have migrated, as may be proven by reference to the low marriage-rate in such municipalities, or to imperfect returns.

Populations of some towns and villages where population has increased slowly, with the birth rate in 1897.

From these several tables the following facts may be summarized :

1st. That the older the settlement of any county, or the earlier the period at which an agricultural district was filled up with population the less the present relative number of settlers, in those periods of life during which children are born, in comparison with the number of population, and if this population be not increased, the lower, proportionately, will be the birth rate, and the greater the number of deaths relatively of persons in the later periods of life. To illustrate the point the following table gives the number of deaths at different age periods in two counties and two towns. Renfrew has increased rapidly, while Prince Edward has rather decreased ; Belleville city has remained stationary, while Owen Sound has notably increased.

Percentage of deaths by age periods in certain counties and towns.

	Under 1 yr.	1 year.	2 years.	3 years.	4 years.	5-9.	10-14.	15-19.	20-24.	25-29.	30-34.	35-39.	40-44.	45-49.	50-59.	60-69.	70-79.	80 and over.	Not given.	
Renfrew County.....	24	5	3	2	3	3	2	3	6	5	2	3	2	2	2	5	8	8	9	1
Prince Edward County.....	16	4	2	1	2	3	2	2	1	3	3	2	3	2	5	12	23	16	..	
Belleville	20	5	1	0.5	..	2	2	3	3	9	3	6	2	2	4	11	17	9	.	
Owen Sound	21	3	2	3	1	2	2	3	5	3	3	5	5	3	9	9	7	8	.	

2nd. That as seen in Table I in the more newly settled counties, as Bruce, Simcoe, Muskoka, and Parry Sound, the birth rate is decidedly higher.

3rd. That in the most recently settled districts of Algoma, Nipissing and Rainy River the birth rate, even though necessarily incomplete, is high.

4th. That in certain cities the birth rate is lower than in others, and it is seen to be always lower in those where population has become more or less stationary, and where the age at marriage both of males and females is proportionately higher than where population is increasing rapidly by immigration, as is well seen in the subsequent paragraph relating to marriages.

Such are some of the principal conclusions which, as have been stated, are fully borne out by the data supplied in the tables.

We have, however, to deal with other facts which are obtained from the returns, and from such data as are obtainable from the assessment returns. There are in Ontario a number of cities which during the last nine years have shown a large increase in population, such as Toronto, Ottawa, Hamilton, London, Brantford, Berlin and St. Thomas. Their birth rates are low, absolutely and relatively, in comparison with those of any other country, as may be seen by reference to Table 2. Further, the marriage rate is an average one, as may be seen from the table in a succeeding paragraph dealing with marriages.

The marriage rates are, however, higher than they should be, inasmuch as it is the custom in a certain number of instances for persons residing in surrounding districts to go to neighboring towns to be married. Thus, as will be seen in tables under the paragraph relating to marriages, Toronto, with a marriage rate of 7.6 per 1000, had but 63% of grooms and 85% of brides resident in the city. Hence the true marriage rate would be 5.7. Age at marriage has a direct bearing on the number of children born, and as will be seen from a further table in the same paragraph, there is an upward tendency in the ages of those marrying. Thus the mean age at marriage in the thirteen cities of Ontario in 1897 is, for husbands 29.35, and for wives 25.30. That the rate is, in the instance of wives, as favorable to a normal birth rate as in England, is seen in the fact that for 1896 the rate there was, husbands, 28.43, and for wives, 26.21 years. As has before been stated, the birth rate there in 1896 was 29.7 per 1000, or nearly one-third higher than in Ontario, for the births recorded. On the basis of the English marriage rate, 7.5 per 1000 in 1896, the birth rate in Ontario cities as based on the marriage rate, even though it be taken as 25% less than the recorded rate of 9.8 per 1000, should be nearly that of England, or 29 per 1000. Manifestly, therefore, there is in Ontario cities a birth rate not more than two-thirds of the English average, and even if 10% be added on for incomplete returns, it still approaches that of France.

Assuming, however, after allowing for imperfect registrations, that the basis established between marriages and births is a fair one, it would seem impossible not to conclude that certain other influences, which may be termed of a social or moral character, must be operative to produce such a low birth rate.

In the report of the Registrar-General for 1894, some of these influences were referred to. According to the standpoint from which the subject is viewed by different persons, the duty of the Registrar-General is simply to point out the simple tabulated results of these returns, and leave to economists and moralists to draw lessons from them; or, on the other hand, inasmuch as the population of a state has long been looked upon as the real basis of wealth, it would seem proper to briefly refer to these other causes which seem to influence the birthrate.

Assuming then that it is proper to draw such inferences as may fairly be made from these statistics, it must be acknowledged with regret that, after making every allowance for defects in the returns of births in Ontario, the conclusion seems inevitable that the birth rate of Ontario is lower than under normal conditions, such as with the increase of population generally, it should be. The following table would seem to illustrate this.

Birth Rates and Death Rates in different countries and states per 1,000 population.

Countries.	Births.	Deaths.	Natural increase.
United Kingdom	1896 . . .	29.2	17.1
England and Wales	" . . .	29.7	17.1
Scotland	" . . .	30.8	16.9
Ireland	" . . .	23.6	16.6

Quebec	1896 . . .	38.57	1.852
United States.			
Maine	1896 . . .	22.23	.616
Connecticut	1897 . . .	24.9	.74
New Hampshire	" . . .	22.4	.486
Massachusetts	1896 . . .	27.0	.80
Vermont	" . . .	21.2	.47
Rhode Island	" . . .	25.7	.61

Remembering the remarkably low death rate, which we have reason to believe is nearly correct, it appears that, compared with the New England States, the increase is satisfactory, and indeed most satisfactory, when it is remembered that all of these have within recent years received great accessions to the factory population of French Canadians, whose fecundity is illustrated by the statistics of the Province of Quebec. It is apparent, however, that the rate of increase is notably less than in almost all European countries. If comparison be made of the marriage rates it is apparent, further, that the Ontario rate is an average one.

Thus, in 1896, the marriage rate per 1,000 was :

England.....	7.9
Scotland.....	7.2
Ireland	5.06
New Hampshire	10.7 (Divorces 1 for 10 marriages.)
Connecticut	8.1
Ontario (1897).	6.7

That our population is increasing with average rapidity must, from the economic standpoint, afford a measure of satisfaction. When, however, the practical completeness of the death returns is remembered, it must be apparent that the increase is principally due to the remarkably low death rate. Indeed, were the death rate that of France, the Ontario population would be practically stationary. If we further examine the marriage rate, it appears that no intimate relationship is seen between the low birth rates and counties with low marriage rates. See Table I.

What does seem to be apparent, however, is that counties located in certain sections of the country, and settled at more or less distinctly separate periods, show some generally operative influences affecting the birth rate, and this in counties where the marriage rate is practically up to the average. What seems apparent is that where the populations are largely from European countries and from Quebec, where as yet they may be said to hold to, in some measure, the simpler habits of life of their ancestors—where, indeed, as we may say, life is ruder and more rural—the birth rate is, on the whole, definitely higher, even though the marriage rate may be, as it is in many instances, actually lower. On the other hand, where cities, towns and villages are older and more numerous, where urbanizing influences are greater, where so called modern ideas prevail, and where the life of the people has become more artificial, there may be seen a very general tendency to a lowered birth-rate.

This subject of the tendency to a lowered birth rate, amongst the more advanced peoples of Europe and America has occupied the attention of many statisticians and writers on questions of economic and social reform, and those who are leaders of moral and religious thought during especially the last twenty-five years. To cite the writings of such would require a small treatise; but it may be said that since the time when political economists and philanthropists began, early in the century, to study the problem of over population, as during the years between 1840-50, when the first enormous emigration from the British Isles began, due to depression in agriculture and famine, the question of the limitation of the birth rate by prudential marriages, as urged by Malthus, has never ceased to be a subject of discussion. In still more recent years, however, the question of artificial checks to procreation, has become, as it were, an advance on the teachings of Malthus, and indeed a school of pamphleteers and *soi-disant* philanthropists, in the guise of writers of novels, have brought the teachings of the Neo-Malthusians before the attention of the public, giving their sophistries those alluring and pleasing qualities by which the minds of many men and women are only too readily influenced. It is natural that amongst such writers many should be women; some moved thereto, at times, doubtless, from womanly sympathy for their sisters amongst the poor, borne down with the cares of children; others have been urged to speak from the standpoint of the emancipated woman, whose ambition it is to enter the arena of public affairs and dispute the field with men, and a yet still larger number have adopted this new philosophy from the standpoint of personal selfishness, and declare that they will recognize no duty

which will deprive them of the right to enjoy to the fullest whatever society may bring them of pleasure, and utterly refuse to undergo, if it can be avoided, the pains and inconveniences of maternity, while accepting the social protection, privileges and joys which marriage can bring them.

It would be idle to expect or deny that as the outcome of such theories, methods should follow and be adopted for putting them into practice; and it would be sheer hypocrisy not to acknowledge that the state to day in Canada, by allowing the newspaper press to distribute daily by thousands advertisements teaching the arts of prevention, and by permitting pamphlets of every form and of a still more reprehensible character to be sent broadcast through the mails, is giving its tacit sanction to practices which it makes criminal laws to punish. What is still more remarkable is that the state licenses a business, and allows the druggist to carry on a traffic without let or hindrance in every form of nostrum and mechanical appliance, having for their end such prevention. Physicians too are approached, and it is feared may at times accede to the petitions of their clients, to undo what nature has asserted is a logical outcome of her laws.

This is not the place for teaching public morals, but rather to indicate wherein the state has duties in the interests of public health and economic progress. History gives attestation to the fact that a degeneracy of manners and morals, which in any degree affects the sanctity of marriage and degrades nature's functions, bears its legitimate fruits in national decay and in the destruction of family life. In 1896, French statistics showed that fifty-five Departments out of eighty-seven had decreased in population collectively 399,001 persons from what they had been in 1886. Indeed, in the year 1865 there were but 2.9 per cent. of foreigners in France, while out of the total increase of population during the succeeding twenty-five years, 26.4 per cent. of it was foreign, and largely of Italians. Her debt is the largest in the world, taxation is unbearable, divorces have in recent years notably increased, and prostitution is enormously prevalent. The number of children is less than two to a family, while a general law exists that when the birth rate falls below four in one family, population becomes stationary or declines. That the evils of Neo-Malthusianism are, however, almost as prevalent in certain parts of the North American continent as in France, may readily be concluded from the birth rate in the eastern United States, if that of the foreign-born population be excluded. The sanctity of the marriage tie is disappearing at a rate as never before elsewhere, divorces being as high as one in every eight marriages in Maine, almost as high in New Hampshire, and but little less in neighboring States.

It is manifest, therefore, that if the Anglo Saxon race is to fulfil its destiny on the American continent, and play the dominant part over inferior races in the march of progress, the exponents of its assumed superiority will have to preach a gospel of patriotism of which to-day they seem singularly blind. Social degeneracy has always meant national decay, and it is the simple and moral citizens of to-day who will hold the supremacy to-morrow. The matter is one which ought to be of the highest interest and importance to the teachers and exponents of public morals; although there may be seen in some directions a curious anomaly, whereby those who sanctify marriage and hold its responsibilities inviolable, should at times fail to comprehend that the duty of protecting human life *post natal*, is at least as incumbent upon us as when *pre natal*. The figures, however, of the Report have so many points of interest bearing upon this question, that it will have been deemed sufficient if it has indicated some of the salient conclusions to which they point.

Births in Cities. It will be noticed in Table II., that notable variations exist in the birth rate of different cities, that of Ottawa being highest. This is probably due, in part, to its rapid increase in population during the last two years, thereby making the divisor too low, and partly owing to the fact that a large maternity home registered 137 births as having occurred therein.

The very high rate in Brantford is, likewise, due in part to the population adopted for estimation being too small, but it is, undoubtedly, on the other hand, due to the completeness of the returns. The very low birth rate in Stratford is due to very defective

returns, and applying the correction made in 1898, due to an investigation by the Inspector, the true rate would approximate 23 per 1,000. Belleville returns are likewise defective, as from a statement made by the Division Registrar, are also those of London.

The following corrected table, in which the population by assessment for 1897 is taken, shows the variations due to an incorrect population having been taken:—

Table with corrected Populations in Cities, 1896, 1897.

Cities.	Assessment population.	Registrar-General's estimated population.	Variation.	Cities.	Assessment population.	Registrar-General's estimated population.	Variation.
	1896.	1897.	Increase or Decrease.		1896.	1897.	Increase or Decrease.

Guelph	10,741	11,192	I. 451				

Marriages.

As seen in Table I. the average number of marriages is 6.8 for 1897. There is an increase in marriages in Ontario in 22 counties, and a decrease in 16, amounting to 346, for those counties in which a comparison with 1896 is made in Table I. This is, however, due to more complete returns, as has already been pointed out. In cities, however, while an increase is seen in seven out of thirteen cities, the fact is observed that in Toronto, Hamilton and London, there was a decrease respectively of 100, 19 and 117, which, in view of the notable increase in population, is remarkable. Even in Ottawa, the rate is a decreasing one if the increase in population be allowed for.

The average age at marriage in the several cities is set forth in the following table:

The following Table gives the Marriages by Ages in the 13 Cities in Ontario in 1897.

Cities.	Number of marriages.	Average age, males.	Average age, females.	Cities.	Number of Marriages.	Average age, males.	Average age, females.
Toronto	1,501	28.45	24.99	St. Catharines .	88	30.77	26.06

After deducting the marriages of non-residents, the rate for these cities gives the following average rate per 1,000 in Toronto and Windsor, taken as illustrations. The percentage given is that of groom and bride residing in city and elsewhere.

Marriages by Residents.

Toronto.				Windsor.			
	Groom.	Bride.		Groom.	Bride.		
In City	1,095	63%	1,277	85%	47	8%	61 10%
" Ontario	309	20%	190	11%	(Not separated from Canada)		
" Canada	24	15%	12	0.8%	44	7.9%	51 8.3%
" Foreign	7	4%	22	1.5%	524	85%	81 81%

The extent of the marriage of non-residents in different counties is further illustrated by the fact that of the licenses returned by counties, 2,479, or only 13 per cent. are for marriages solemnized elsewhere. It thus appears that with a marriage rate of 9.8 per 1,000 the annual birth rate of these cities is only 20.6. Assuming that the birth

Table shewing percentage of Married Persons in each Five-Year Period by Counties.

rate approaches roughly 2 to 1 of deaths in Ontario, or that an average marriage rate of 7.9, is associated with a birth rate in England of 29.7, the birth rate in Ontario should be 25.5 per 1,000.

Taken in conjunction with the following table of percentage of marriages in the several life periods by counties, this table affords evidence similar to that in other countries that there is a distinct tendency to delay marriage, which means necessarily that the proportion of marriageable persons in any community decreases with each semi-decade, and bears a close relationship to the question of a decreasing birth rate.

Thus, as was pointed out in the report for 1894, in a specially prepared table of persons married in Toronto and to whom children born were registered within the succeeding eighteen months, the proportion of children born in each semi-decade was as follows :

Table from Report of 1894.—Number of Marriages and Births by Age Periods in Toronto in 1892.
Marriages (1,140 total).

Age periods	15-20	Per cent. of whole.	20-25	Per cent. of whole.	25-30	Per cent. of whole.	30-35	Per cent. of whole.	35-40	Per cent. of whole.	40-45	Per cent. of whole.
Totals	145	12.7	571	50	571	24.6	86	75	87	29	20	1.7

BIRTHS.

Age periods	15-20	Per cent. of whole.	20-25	Per cent. of whole.	25-30	Per cent. of whole.	30-35	Per cent. of whole.	35-40	Per cent. of whole.	40-45	Per cent. of whole.
Totals	49	13.5	193	53.4	93	25.7	17	4.7	6	1.6

These figures show that 87.3 per cent. of all marriages took place within the first 30 years or under of life, leaving but 12.1 per cent.; also that 92.67 per cent. of these births occurred with mothers of 30 or under, leaving but 6.3 per cent. They also show that the first three periods have a greater percentage of births relatively to marriages by 0.8 per cent., 3.4 per cent. and 1.17 per cent. respectively. It may further be remarked that English statisticians have laid it down as a law that had no woman borne children before 30 years the normal birth rate would be reduced by one-third.

DEATHS.

The total recorded deaths in Ontario during the year 1897 as seen in Table 1, are 27,633. Taking the average for the 38 counties whose population has been estimated, the returns show an average rate per 1,000 of 11.8. This rate is 0.9 greater than in 1896, when 24,857 deaths were recorded. As stated in the report for 1896, the present Act was in operation for five months of that year, and gave an increase over the preceding year of 2,396 deaths for the year. This year adds 2,776, or a total increase over 1895 of 5,172 or exactly 23 per cent. As there have been no notable outbreaks of contagious diseases during the year, it is evident that the increase is due to more complete returns. From the very effective operation of that clause of the Act providing that no burial can take place until registration of the death has been made, this remarkable increase gives the best grounds for the belief that the record of deaths is

practically complete. That the death-rate of Ontario is remarkably low has always been assumed from the records of those cities, whose cemetery regulations have made a burial permit prior to interment necessary, and even this notable per centage of increase in 1897 does not seriously effect the low record. It is a notable evidence of improv'd conditions of life, and of the advance of scientific medicine that the death-records of all civilized countries show a downward movement. Thus:

	Death rates per 1,000.
England and Wales, 1896	17.1, or 1.7 less than for preceding 10 years.
Rutlandshire	12.8
Berkshire	13.1
Surrey	13.3
Scotland, 1896	16.9
Insular Rural Districts	13.6
Ireland, 1897	18.4, slightly greater than for preceding 10 years.
Maine, 1896	16.07
New Hampshire, 1896	18.04
Connecticut, 1896	17.05
Quebec, 1896	21.21

How low the annual death rate is, especially in certain inland counties, situated on the highlands of the province is seen in the following instances, viz.: Bruce 9.7, Dufferin 8.4, Grey 9.5, Halton 9.2, Perth 9.5, Wellington 9.9. These counties while having many small towns and villages, are distinctive in the fact that for the most part they lie on the the tableland with an average height approaching 1,000 feet above the sea, and with a soil composed largely of post glacial, deposits of gravel and sandy loams, and have the drainage flowing rapidly towards the Great Lakes. As will be seen in a later reference table to the death rate from tuberculosis, this elevated area shows its healthfulness in a relative immunity from this disease, the rate of the six counties with a total population of 300,398 being but 0.9 in 1,000. A fact of importance in this connection is that in the counties of Lincoln and Welland, where much of the land is heavy clay, the death rates are the highest of all counties except Prescott, which is largely rural, Lincoln being 14.4 and Welland 14.4, with a death rate from tuberculosis of 1.8, or just double that of the central counties.

The now well-known effects of drainage in lessening the prevalence of tuberculosis in those counties in England situated on clay soils, point to a very obvious need in these counties. Carleton, Prescott and Russell, with a large French population, and high birth rate, show also a high death rate, Carleton being 20.3, and Prescott and Russell 16.9. The city of Ottawa however, is included in Carleton, and has a death rate high owing to a large lying-in hospital, as well as three other large general hospitals, much utilized by the new country to the north. The salubrity of the northern wooded districts of the Laurentian area whose death rates have not been calculated separately in this report has been frequently noted, the death rates from tuberculosis being, estimating the population as probably 100,000, less than 0.8 in the 1,000.

Death Rate in Cities—The death rate in cities is estimated at 18.4 on a population of 436,996. The rate is disproportionately high to that of the counties, but if the correction for population, based on the assessment returns, be applied the rate would be somewhat lower than is given in the tables. The cities of Guelph, Stratford and London on the central plateau already referred to maintain the same preminence for healthfulness as do the counties. The city of Ottawa, for reasons already given, has an abnormal death rate, as compared with other cities.

Diseases by classes.—In this year's report, a rearrangement of diseases by classes has been made in keeping with a proposition being generally accepted for a common system of classification approved of by the American Public Health Association, which includes the

United States, Canada and Mexico, that adopted being the Bertillon of the municipality of Paris, France. This decision has been arrived at after a careful consideration of the question, the object being first to establish uniformity for purposes of comparison and further to adopt a classification simpler and more modern than that of the Royal College of Physicians of England, as respects the most recent scientific views on causation of disease. The classification is a short form, in which the several diseases referred to in Table 13 are included in some one class. The Tables 10, 11 and 12 summarize by counties, cities and towns the extended tables as found in the appendix. It is to be regretted that 2.6 per cent. of all deaths are found in the class of ill-defined causes, while by far the largest number of any class has yet to be included under Class XI., where the major part are returned as due to debility, atrophy, immaturity in infants and to old age. In other respects the returns may be deemed fairly accurate. In Tables 13 and 14, however, the analysis of the classes is given by county and city totals for each disease, of which ninety-two are set forth in the table.

Special Diseases.

Typhoid fever.—This disease shows a mortality of 355. Remembering the general increase this is a remarkably low rate, the total deaths being for the five years, 1893-96 previous, 1,642.

The death rate is 0.15 per 1,000 population. The incidence of this disease largely depends upon the amount and distribution of the rainfall during the summer months, and shows its effects chiefly in rural places, towns and villages without a public water supply, and in those cities where well water is still partially used.

What may be termed typhoid years are indicated in the following table of death rates in the cities and principal towns. Thus the years 1895 and 1896 show a prevalence above the average.

Deaths from Typhoid Fever in Ontario.

Smallpox and Scarlatina. No deaths from smallpox occurred in Ontario in 1897, and scarlatina shows a small mortality, viz.: 169 deaths.

Diphtheria and Croup. This disease ranks first in the causes of deaths amongst the acute communicable diseases, it causing 976. The following list gives the deaths for 4 years. Remembering the more perfect registration, the rate for 1897 shows a slight decline.

Thus in 1894 the total deaths were	1075
" 1895 " "	942
" 1896 " "	925
" 1897 " "	976

The deaths in the thirteen Ontario cities in the same four years were :

Deaths from Diphtheria in cities—1893 to 1897.

Tuberculosis. For the first time the total recorded deaths in Ontario for this disease have reached 3,000, the total number being 3,154. If, however, the percentage of total increase of recorded deaths be applied to the rate for 1895, there would have been 3,040, so that the rate has not increased, being exactly 11.7 of the total recorded deaths as it was in 1895 and 1896.

This rate includes tuberculous diseases of every kind and gives a rate of 1.4 per 1,000. High as the rate is, it is low compared with most countries in temperate climates.

Thus England has a rate of 1.30 per 1,000, being but 7 per cent. of all deaths.

" Scotland	"	2.33	" 1,000, or 13.81	"	"
" Ireland	:	2.9	" 1,000, or 15.5	"	"

The rate of England is a phenomenon very remarkable, since while the death rate in the decennium 1861-70 was 2.46 per 1,000, it had decreased to 1.3 in 1896, or nearly a half less and slightly lower than the rate in Ontario. This is all the more remarkable when it is seen that Scotland and Ireland stand almost at the same rate as England did thirty years ago. With climates similar this must be conceded as being the highest possible test of the progress of that system of public sanitation which has made the English general death rate with its enormous urban population fall as low as that of most rural populations.

Comparing these rates from tuberculosis with neighboring States and Provinces we find the death rate in :

Tuberculosis in Quebec	in 1896 to be 1.8 per 1,000
" New Hampshire 1897	" 1.75 " "
" Maine 1896	" 2.05 "

Tuberculosis in cities.—Remembering that tuberculosis tends to become especially prevalent where population is densest the following rates in Ontario cities are given.

Death from Tuberculosis in Ontario Cities in 1897 and 1898.

Cities.	1897.		1898.	
	Total deaths.	Ratio per 1,000 of population.	Total deaths.	Ratio per 1,000 of population.
Toronto	464	2.3	468	2.39
Hamilton	83	1.6	73	1.4
Ottawa	134	2.8	121	2.6
London	52	1.6	39	1.2
Kingston	54	2.6	33	1.6
Brantford	25	1.8	16	1.2
St. Thomas	17	1.5	9	.8
Guelph	14	1.2	14	1.2
St. Catharines	15	1.5	11	1.1
Bellevoile	20	1.8	12	1.1
Stratford	13	1.3	10	.9
Windsor	17	1.5	11	1.0
Chatham	12	1.2	12	1.2

Further interest attaches to the returns for consumption in Ontario for almost fifty years taken from the census returns, which may be assumed not to include other tuberculous diseases.

Deaths from Consumption in Ontario in Census Years.

—	Population.	Deaths from all causes.	Deaths from consumption
1851.....	952,004	7,775	763
1861.....	1,396,091	10,160	1,509
1871.....	1,620,851	18,063	2,183
1881.....	1,923,228	22,727	2,395
1891.....	2,114,221	24,211	2,485
1897.....	2,257,378	27,633	3,154

Some idea, however, of the probable incompleteness of early census returns of deaths may be gathered from the following table of deaths of some old counties.

	Deaths per 1,000.	
	1851.	1861.
Brant	8.6	7.0
Dundas	18.0	5.6
Elgin	7.4	7.7
Halton	7.3	9.0
Kent	12.0	13.2
Prince Edward	6.9	6.0
Waterloo.....	8.9	8.5

In Tables 15 and 16 is given a statement of deaths due to tuberculosis in the cities of Toronto and Ottawa by ages and occupations. These are most interesting as illustrating not only how this most fatal disease prevails during the wage-earning periods of life, but also how its incidence is especially upon the wage-earning classes.

The total deaths from other special causes are given in Tables 13 and 14 for the whole Province by counties, as well as the deaths in cities and towns. The Tables will prove of much value for comparative purposes.

The report for the year 1897 being that for the first complete year under the operation of the amended Registration Act of 1896, which has resulted in so notable an increase in the completeness of death returns, with the adoption of the Bertillon System of classification, and the addition of several special tables, will serve to mark the vital statistics of Ontario as now occupying a position for accuracy and completeness of detail in large degree comparable to those of the long-established returns of European countries. That they indicate the prevalence of certain preventable diseases will readily be admitted, but that they also indicate a marked effect of the operation of sanitary laws is abundantly illustrated. That the total mortality of Ontario compares most favorably with that of all other countries is so apparent that we have good reason for asserting that in few, if any countries, is a higher degree of general health maintained, or are greater climatic advantages afforded, whereby the individual may exert his fullest energies with less danger of injury to his physical powers and general well-being.

I have the honor to be, sir,

Your obedient servant,

PETER H. BRYCE,

Deputy Registrar-General.

Report of the Inspector.

TORONTO, January 2nd, 1899.

To THE HON. E. J. DAVIS,

Registrar General of Ontario :

SIR,—I have the honor to report, that during the past year I visited, for purposes of inspection, the Division Registrars of seventy municipalities within the counties of Brant, Carleton, Dufferin, Frontenac, Halton, Hastings, Lincoln, Lennox and Addington, Middlesex, Northumberland and Durham, Ontario, Peel, Perth, Peterborough, Simcoe, Waterloo, Welland, Wentworth, and York. I find that, as a general rule, these officials are very painstaking in their work, and are honestly endeavoring to secure as complete returns as possible of births, marriages and deaths, but frequently their labors do not seem to be properly appreciated by the members of the council, or the residents of their respective localities. The people do not yet fully comprehend the value of these statistics, and many look upon the outlay connected therewith as an actual waste of money; consequently the Division Registrars do not receive that active assistance and sympathy from the ratepayers to which they are fully entitled. But the greatest drawback of all is the fact that the physicians throughout the Province, with a few notable exceptions, make scarcely any pretence of reporting the birth cases which they attend—the section of the Act requiring their attention to this matter being practically a dead letter. A few instances will suffice to show the extreme laxity displayed by the doctors in this respect:—In Toronto, with birth returns amounting to 4,078, we find that only 856 were made by medical practitioners; St. Catharines shows 200 returns, and only 44 from doctors; in Hamilton, less than one-third of the returns are made by physicians, while at London, out of 352 returns, not more than 27 were credited to the medical fraternity. The Division Registrar of St. Thomas writes as follows. “The medical men make but few returns, with one or two exceptions.” In fact, from enquiries made in all sections of the Province, the same information is obtained, and that is to the effect that the Division Registrars receive but little assistance from the physicians in the collection of their birth returns. This, to a considerable extent, accounts for the apparently extremely low birth rate in Ontario. In regard to death returns, I have good reason to think they are much nearer complete as the section in the Act prohibiting the burial of any dead body until a burial certificate has been secured is a rather difficult one to get over, and I must give the doctors and undertakers credit for pretty strict compliance with the Act in this respect. Of course in some places even this imperative section is occasionally ignored, but any Division Registrar who is at all anxious to have his returns anyways near complete can easily find out the particulars of practically all the deaths that occur in his municipality. Marriages are pretty thoroughly reported, the clergymen, with very few exceptions, giving every assistance in this respect, although some of them are occasionally a little slow in making their returns.

In a former report I made the following recommendations, viz: “The amount due each Division Registrar, as shown by certificate from the Registrar General, should be a lien upon said municipality until paid, and no mutual agreement for commutation should be considered legally binding upon the Division Registrar.” I would again make this recommendation, and in addition would suggest that the Act be changed so that the Department would have the power to appoint a Division Registrar in the place of the

Municipal Clerk in municipalities where the work is not being well done, or where the Councils do not allow the Clerks sufficient salary to enable them to do the work properly.

In regard to the clerical work and the general completeness of the returns received, I have much pleasure in stating that a most marked improvement has taken place since the amendments to the Act came into force. Very few schedules have now to be sent back for correction and as a rule the returns are received promptly in time at this office. The registers at the offices of the various Division Registrars are with few exceptions very creditably kept and the almost unanimous opinion expressed on all sides is that the adoption of these books, combined with the increase in the fee of registration, has done much towards making the collection of vital statistics seem a much more important matter than it formerly appeared to be.

Great strides have been made within the last few years towards the goal of reliable and complete returns, but much yet remains to be done. We must enlist the active sympathy of all classes of the people of the Province in the work, but more especially so of the medical practitioners. Newspapers can and, in many instances do, give valuable aid, as when they choose they can place the value of vital statistics so clearly before their readers that the most skeptical must be convinced ; but after all, the physicians are the ones we must place our greatest reliance upon. They can insure practically full birth and death returns if they only put a little more energy in the work and with very little inconvenience to themselves. A strong effort should be made to bring them into line. It is now nearly three years since the amended Act came into force, and by this time all the officials and others whose duties are clearly defined in its several sections should be well posted in these duties, and there is now no reasonable excuse why they should not comply with them. Under these circumstances I would therefore strongly urge that during the coming year prosecutions be instituted in every case where it is evident that through indifference or negligence the provisions of the Act are not being complied with. Such action by the Department would seem to be the only way to stir up a keen interest in vital statistics and I have no doubt but that a few prosecutions in different sections of the Province would awaken our people to the fact that the registration of births, marriages and deaths was a real "live issue" which must be attended to in accordance with the provisions of the Act.. I have the honor to be, sir,

Your obedient servant,

R. B. HAMILTON,

Inspector.

Summary of Deaths by Classes of Occupations.

Males—	Per cent.	Females—	Per cent.
Labourers.....	14.7	Housewives	22.1
Artisans (33 trades).....	28.8	Servants	3.6
Business men (clerks and travellers).....	12.4	Widows	2.8
Farmers.....	2.9	Milliners and seamstresses	2.1
Students and school children.....	2.7	Stenographers, telegraph and telephone employees	1.5
Professional men (inc. male teachers)	2.6	Female teachers	1.4
Gentlemen.....	1.4	Nuns	1.4
Public officials.....	0.8	Farmers' wives	0.3
Sailors.....	0.6	—	—
Soldiers.....	0.3	These percentages are calculated for the 1,053 persons whose occupations are named. It may be assumed that the same proportions would be main- tained in the 500 additional deaths over 15 years.	—
Convicts.....	0.2	Thus 83 per cent. of all occupations given belong to those earning a daily wage.	—
Pedlars.....	0.1	—	—
