In 1837 he issued a pamphlet (*Post-Office Reform*) citing facts and figures to support his claim that while the postal revenue for the previous twenty years had shown an actual diminution, it ought to have shown a positive increase in order to have kept pace with the growth of the population and the amount derived from the duties imposed upon stage coaches. According to the estimates made by Hill, and predicated upon data obtained from reliable sources of information, he argued that the expense incurred in the receipt, transit, and delivery of a letter between post-towns should be made uniform, and the charge precisely the same for every

packet of moderate weight, without reference to the number of its inclosures. At this time the rate of postage imposed varied from 8 to 40 cents for a single letter, which meant a single piece of paper not exceeding an ounce in weight, a second piece of paper, however small, constituted a double letter, and if a single sheet of paper weighed over an ounce it was charged with four-fold postage. He proposed to enact that the charge for primary distribution should be at the uniform rate of one penny for each half ounce, heavier packets to any convenient limit being charged an additional penny for each additional half ounce. He also proposed the sale of stamped envelopes to the public, and the removal of other embargoes upon the service. His plans were received with favor by the trading public, but denounced as ruinous and ridiculed as visionary by the postoffice functionaries. In 1838 a committee of the House of Commons reported in favor of the plan.

The measure was carried in the House of Commons by a majority of 100, and became law on August 17, 1839, and was a success from the start; the system of cheap postal service having been universally adopted.

The money-order branch of the postoffice was for forty years the private enterprise of three postoffice clerks known as "Stow and Company." It was commenced in 1792, with the special object of facilitating the safe conveyance of small sums to soldiers and sailors, but was soon extended to all classes of small remitters. The postmaster-general sanctioned the scheme without interposing in the management. On December 6, 1838, the office was converted into an official department under the postmaster-general, where it has since remained, with annually increased results advantageous to the public and the service.

The establishment of postoffice savings banks was practically suggested in the year 1860 by Mr. Charles William Sykes of Huddersfield, whose suggestion was cordially received by Mr. Gladstone, then chancellor of the exchequer, to whose conspicuous exertions in parliament the effectual working out of the measure and also many and great improvements in its details are substantially and unquestionably due.

In May, 1861, the latter introduced a bill providing for the establishment of postal banks for the deposit of small savings, upon which interest was to be paid, and the payment thereof secured by the government. The bill became a law in September following. The act was extended to Scotland and Ireland in 1862, and at present all the money order offices of the United Kingdom are savings banks. The benefits derived are reciprocal, the laboring classes being thus afforded a reliable depository for their earnings, and the government the use of an immense sum upon which only a nominal interest is paid. The deposits at present have reached more than £60,000,000 (\$300,000,000).

To the chamber of commerce of Edinburgh belongs the honor of effectually originating that public demand for the transfer of the telegraphic service of the United Kingdom from commercial companies to the state which led to the passing of the Acts of Parliament of 1868 and 1869.

The Electric Telegraph Act of 1868 (31 and 32 Vict. c. 110) authorized the postmaster-general, with consent of the treasury, to purchase for the purposes of the act the whole, or such parts as he should think fit, of any telegraphic company.

The Act of 1869 (32 and 33 Vict. c. 73), entitled "An Act to alter and amend the Telegraphic act, 1869," gives to the postoffice the exclusive privilege of transmission—withheld in the previous act—empowers the purchase of telegraphic undertakings other than those included in that act, and enables certain companies to

require the postmaster-general to make such purchase. It also directs the raising by the treasury of a sum of \$35,000,000 for the purposes of the acts. The Act 33 and 34 Vict. c. 88 (1870) extended the postoffice telegraphic system to the Channel Islands and to the Isle of Man; and that of the 34 and 35 Vict. c. 75 (1871) authorized the raising of an additional million. These sums collectively proved to be quite insufficient, and eventually the capital sum so raised exceeded \$50,000,000. From the beginning the work of improving the service has been pursued continually and indefatigably. The number of miles of road and railway wires have been increased, as also have the number of offices, while the superintendence and management have contributed substantially to its present superior condition. During 1889 the system produced \$10,649,800 and cost \$10,211,970 in addition to about \$1,632,085 interest on the original cost.

In conclusion it may be said that the postoffice is the most satisfactory of all the money-producing items in the kingdom. The result of the year's work, ending January 1, 1890, showed a gross income of \$45,500,000. The number of letters delivered in the United Kingdom aggregated 1,558,100,000 in addition to 151,900,000 newspapers, 412,000,000 book packets, 201,400,000 postal cards, and 39,590,000 parcels.

Benjamin Franklin was removed by the home department from his office of postmaster-general in America in 1774. On July 26, 1775, the American Congress assumed direction of the postoffices, reappointing Franklin to his former post. Shortly afterward, when Franklin was sent as ambassador to France, his son-in-law, Richard Bache, was made postmaster-general in November, 1775.

In 1789 the number of postoffices was 75, in 1800, 903, in 1825, 5,677, in 1875, 35,734, in 1884, 50,017, and in 1899, 58,999. In 1789 the gross revenues of the postal service were \$30,000, in 1800 \$280,804. In 1860 the gross revenues had increased to \$8,518,067, and in 1875 to \$26,671,218. In 1884 they amounted to \$43,338,127.08, in 1889 to \$56,175,611. In 1860 there was a deficit in the postal income of \$10,652,542.59, occasioned through lavish expenditure and then existing abuses. Annual deficiencies had occurred for nine years previous to 1860, and continued for twenty-one years thereafter. In 1882 a surplus of \$1,394,388.92 was shown, and in 1883 a profit of \$1,001,281.83. Since the latter date annual deficiencies have again occurred, that of 1889 being over \$5,000,000.

Until 1863 the rates of postage were based upon the distances over which the mails were conveyed. In 1846 these rates were—not exceeding 300 miles, 3 cents; exceeding 300 miles, 10 cents. In 1851 the rates were reduced to 3 cents for distances not exceeding 3,000 miles and 10 cents for distances exceeding 3,000 miles. The use of adhesive postage stamps was first authorized by Act of Congress, approved March 3, 1847, and on June 1, 1856 prepayment by stamps was made compulsory. In 1863 a uniform rate of postage without regard to distance was fixed at 3 cents; and on October 1, 1883, excepting, however, lottery matter, coins, jewelry, merchandise, etc., the rate was further reduced to 2 cents, the equivalent of the British penny postage.

The franking privilege, which had grown to be an intolerable abuse, was finally abolished in 1873, and the postoffice now carries free under official "penalty" labels or envelopes nothing but matter which is of a strictly official character, with the single exception of newspapers circulated within the county of publication. As late as 1860 the mails conveyed nothing but written and printed matter. They now admit nearly every known substance which does not exceed four pounds in

weight, and which from its nature is not liable to injure the mails or the persons of postal employes.

The railway mail service, including the "fast mail," was inaugurated in 1864 after a successful experiment upon a few of the large railroad lines with important termini. The service was reorganized in 1874 with eight territorial divisions, each in charge of a superintendent subordinate to a general superintendent at the seat of government. This service was one of the earliest exponents of a classified civil service in the more recent acceptance of that term in the United States, appointment of railway postal clerks having always been made for a probationary period, permanent appointment conditioned upon satisfactory conduct and service, and removal based upon good cause only. The service has been steadily increased from year to year, now consisting of eleven divisions, employing thousands of persons, and operated on nearly every railroad in the country. The penny post existed in a number of cities of the Union in 1862, the carriers remunerating themselves by the collection of a voluntary fee of from one to two cents on each piece of mail delivered. A uniform free delivery system was first authorized by law on March 3, 1863, and was established on the succeeding 1st of July in forty-nine cities. June 30, 1888, the total number of free delivery offices was 358, the number of carriers 6,346, and number of pieces for the year ending on that date 2,630,861,758.

The registry system, in which great improvements have been made within the last few years, did not attain any degree of excellence until after 1860; and the money-order system was first established in 1864. The aggregate number of money orders, domestic and foreign, issued during the fiscal year 1888 was 13,677,169. Postal notes for small sums, payable to bearer, and resembling the British postal orders except in that they are not drawn for fixed amounts, were first issued to the public in September, 1883, and the money orders are exchanged, in pursuance of postal conventions for the purpose, with most of the important countries of the world which have money-order systems of their own. The total staff of the post office in 1888 numbered 94,790, of whom 54,774 were postmasters.

Very many improvements of the postal service have been perfected within the past ten years besides those mentioned, and many equally important, not to say indispensable, are in contemplation. Among these are the organization of telegraph and postal savings departments, the reduction of expenses now incurred in several branches of the service, the extension of the civil service to every department, the extension of the free delivery system, adoption of the pneumatic tube system, for the special delivery of letters in large cities, together with other reforms that other nations have adopted and successfully conducted.

The regulation of international postal intercourse is reached through the Universal Postal Union, an association proposed by the United States in August, 1862, and organized at Paris in May, 1863. In September, 1874, another convention assembled at Berne, Switzerland, when the defects of the agreement entered into at Paris were remedied, and provision made for the continuance of the same for a period of not less than three years. Conventions have since been held, at Paris in May, 1878, and at Lisbon in February, 1885, and the fourth will be convened at Vienna during the current year (1890). At present the union is composed of the Argentine Republic, Austria-Hungary, Belgium, Bolivia, Brazil, British-India, Bulgaria, Canada, Chili, Colombia, the Independent State of Congo, Costa-Rica, Denmark and Danish colonies, Dominican Republic, Ecuador, Egypt, France and French colonies, Germany, Great Britain

and the British colonies (except the Australian and Oceanian colonies), Greece, Guatemala, Hayti, Hawaiian Islands, Honduras, Italy, Japan, Liberia, Luxembourg, Mexico, Montenegro, Netherlands and Netherland colonies, Nicaragua, Norway, Paraguay, Persia, Peru, Portugal and Portuguese colonies, Roumania, Russia, Salvador, Servia, Siam, Southwest Africa, Spain and Spanish colonies, Sweden, Switzerland, Tunis, Turkey, Uruguay and Venezuela.

For the postal service in other European countries, find same under appropriate headings.

**POTASSIUM METALS.** Under this heading we treat of potassium, rubidium, and caesium; **SODIUM** and **LITHIUM**, being less closely allied to potassium, have special articles devoted to them.

The three metals under consideration are all very widely diffused throughout nature; but only potassium is at all abundant, and therefore we begin with it. The richest natural store is in the ocean, which, according to Boguslawski's calculation (in his *Oceanographie*) of its total volume and the present writer's analysis of sea water, contains potassium equal to 1,141 times  $10^{12}$  tons of sulphate,  $K_2SO_4$ . This inexhaustible store, however, is not much drawn upon at present; the "salt-gardens" on the coast of France have lost their industrial importance as potash-producers, if not otherwise, since the rich deposits at Stassfurt in Germany have come to be so largely worked. The potassium minerals named are not confined to Stassfurt; far larger quantities of sylvine and kainite are met with in the salt-mines of Kalusz in the eastern Carpathian Mountains, but they have not yet come to be worked so extensively. The Stassfurt potassiferous minerals owe their industrial importance to their solubility in water and consequent ready amenability to chemical operations.

Carbonate of Potash ( $K_2CO_3$ ) in former times used to be made exclusively from wood-ashes, and even now the industry survives in Canada, Russia, Hungary, and other countries, where wood is used as the general fuel. In some places—for instance, in certain districts of Hungary—wood is burned expressly for the purpose; as a rule, however, the ashes produced in households form the raw material. The ashes are lixiviated with water, which dissolves all the carbonate of potash along with more or less of chloride, sulphate, and a little silicate, while the earthy phosphates and carbonates and other insoluble matters remain as a residue. The clarified solution is evaporated to dryness in iron basins and the residue calcined to burn away particles of charcoal and half-burned organic matter. In former times this calcination used to be effected in iron pots, whence the name "potashes" was given to the product; at present it is generally conducted in reverberatory furnaces on soles of cast-iron. The calcined product goes into commerce as crude potashes which is used for the manufacture of glass, and after being causticized for the making of soft soap. For many other purposes it is too impure and must be refined, which is done by treating the crude product with the minimum of cold water required to dissolve the carbonate, removing the undissolved part (which consists chiefly of sulphate), and evaporating the clear liquor to dryness in an iron pan. The purified carbonate (which still contains most of the chloride of the raw material and other impurities) is known as "pearl ashes."

Bicarbonate of Potash ( $K_2OCO_2 + H_2OCO_2 = 2KHCO_3$ ) is obtained when carbonic acid is passed through a cold solution of the ordinary carbonate as long as it is absorbed. If silicate is present, it likewise is converted into bicarbonate with elimination of silica, which must be filtered off. The filtrate is evaporated at a temperature not exceeding  $60^\circ$  or at most  $70^\circ$  C.:

after sufficient concentration it deposits on cooling anhydrous crystals of the salt, while the chloride of potassium, which may be present as an impurity, remains mostly in the mother-liquor. Bicarbonate of potash forms large monoclinic prisms, permanent in the air.

Caustic Potash (Hydrate of Potassium),  $KHO$ . It has been known for a long time that a solution of carbonate of potash becomes more intensely alkaline, acts more strongly on the epidermis; and dissolves fats more promptly after it has been treated with slaked lime. It used to be supposed that the latent fire in the quick-lime went into the "mild" alkali and made it "caustic," until Black, about the middle of last century, showed that the chemical difference between the two preparations is that the mild is a compound of carbonic acid and the caustic one of water with the same base (potash)—the causticizing action of the lime consisting in this, that it withdraws the carbonic acid from the alkali and substitutes its own water. A good concentration is twelve parts of water for one of carbonate of potash; the lime is best employed in the shape of a semi-fluid paste, made by slaking quick-lime with three parts of water poured on at a time. The alkali solution is heated to boiling in a cast-iron vessel and the lime paste added in installments until a sample of the filtered mixture no longer effervesces on addition of an excess of acid. The mixture is then allowed to settle in the iron vessel, access of air being prevented, and the clear liquor drawn off by means of a syphon. The remaining mud of carbonate and hydrate of lime is washed, by decantation, with small installments of hot water to recover at least part of the alkali diffused throughout it, but this process must not be continued too long or else some of the lime passes into solution. The united liquors are boiled down in an iron vessel until the desired degree of concentration is reached.

Frozen caustic potash forms an opaque, white, stone-like mass of dense granular fracture, and is perceptibly volatile at a red heat. It is extremely soluble in even cold water, and in any proportion of water on boiling. All commercial caustic potash is contaminated with excess of water and with carbonate and chloride of potassium; sulphate, as a rule, is absent. Absolutely pure potash has perhaps never been seen; a preparation sufficing for most purposes of the analyst is obtained by digesting the commercial article in strong *pure* alcohol.

Pure potassium is a bluish-white metal; but on exposure to ordinary air it at once draws a film of oxide, and on prolonged exposure deliquesces into a solution of hydrate and carbonate. At temperatures below  $0^\circ$  C. it is pretty hard and brittle; at the ordinary temperature it is so soft that it can be kneaded between the fingers and cut with a blunt knife. Most remarkable, and characteristic for the group it represents, is its action on water. A pellet of potassium when thrown on water at once bursts out into a violent flame, and the burning metal fizzes about on the surface, its extremely high temperature precluding absolute contact with the liquid, except at the very end, when the last remnant, through loss of temperature, is wetted by the water and bursts with explosive violence.

The salt has been recommended as a substitute for chlorate in pyrotechnic mixtures, because it contains more oxygen, and yet, on account of its greater stability, is a less dangerous ingredient.

**Bromide**,  $KBr$ .—This salt is formed when bromine is dissolved in caustic potash-lye. It is used in photography.

**Iodide**,  $KI$ .—Of the very numerous methods which have been recommended for the preparation of this important salt the simplest (and probably the best) is to dissolve in a caustic-potash lye (which is dilute enough

to hold the rather difficultly soluble iodate  $KIO_3$  in solution) enough iodine to produce a permanent yellow color (the iodine passes at once into  $5KI + KIO_3$ ; the hypo body  $KIO$  has no existence practically) and to deoxidize the iodate, which is done most conveniently by adding a sufficiency of powdered charcoal to the solution, evaporating to dryness in an iron vessel, and heating the residue.

*Sulphate* ( $K_2SO_4$ ) used to be extracted from kainite, but the process is now given up because the salt can be produced cheaply enough from the muriate by decomposing it with its exact equivalent of oil of vitriol and calcining the residue.

*Bisulphate* ( $KHSO_4$ ) is readily produced by fusing thirteen parts of the powdered normal salt with eight parts of oil of vitriol. It dissolves in three parts of water of  $0^\circ C$ .

*Rubidium and Cæsium.*—When Bunsen and Kirchhoff in 1860 applied their method of spectrum analysis to the alkali salts which they had extracted analytically from Dürkheim mineral water, they obtained a spectrum which, in addition to the lines characteristic for sodium, potassium, and lithium, exhibited two blue lines which were foreign to any other spectrum they had ever seen. They accordingly concluded that these lines must be owing to the presence of a new alkali metal, which they called "cæsium." Bunsen at once resumed the preparation of the mixed alkaline salt with 44,000 litres of Dürkheim water, with the view of isolating the cæsium in the form of a pure salt; and he was more than successful—for the new alkali salt, after elimination of all the ordinary alkali metals, proved to be a mixture of the salts of two new alkali metals, which he succeeded in separating from each other. For one he retained the name already chosen; the other he called "rubidium," on account of the presence in his spectrum of certain characteristic red lines. Since Bunsen's time these two metals have been discovered in a great many native potassiferous materials—minerals, mineral waters, plant ashes, etc.—but in all cases they form only a small fraction of the alkali, the cæsium in general amounting to only a fraction of even the rubidium.

**POTATO.** The potato (*Solanum tuberosum*) is too well known to need detailed description. It owes its value to the peculiar habit of developing underground slender leafless shoots or branches which differ in character and office from the true roots, and which gradually swell at the free end and thus produce the tubers with which we are so familiar. The nature of these tubers is further rendered evident by the presence of "eyes" or leaf-buds, which in due time lengthen into shoots and form the haulm or stems of the plant. Such buds are not, under ordinary circumstances, formed on roots. What the determining cause of the formation of the tubers may be is not known; the object evidently is to secure a method of propagation independently of the seed. Starch and other matters are stored up in the tubers, as in the perisperm of a seed, and in due season are rendered available for the nutrition of the young shoots when they begin to grow. When grown under natural circumstances tubers are relatively small and close to the surface of the soil, or even lie upon it. In the latter case they become green and have an acrid taste, which would probably render them objectionable to predatory animals or insects. They consist mainly of a mass of cells filled with starch and encircled by a thin corky rind. A few vessels and woody fibers traverse the tubers. The chief value of the potato as an article of diet consists in the starch it contains, and to a less extent in the potash and other salts. The quantity of nitrogen in its composition is small, and hence it should not be relied on to constitute

the staple article of diet, unless in admixture with milk or some other substance containing nitrogen. Where, as in some parts of northern Germany, the potato is grown for the purpose of manufacturing spirit great attention is necessarily paid to the quantitative analysis of the starchy and saccharine matters, which are found to vary much in particular varieties, irrespective of the conditions under which they are grown.

The origin and history of the potato are better known than in the case of many long-cultivated plants. At the discovery of America, we are told by Humboldt, the plant was cultivated in all the temperate parts of the continent from Chili to New Granada, but not in Mexico. Nearly a hundred years afterward, in 1585, or 1586, potato tubers were brought from North Carolina and Virginia to Ireland on the return of the colonists sent out by Sir Walter Raleigh, and were first cultivated on Sir Walter's estate near Cork. The tubers introduced under the auspices of Raleigh were thus imported a few years later than those mentioned by Clusius in 1588, which must have been in cultivation in Italy and Spain for some years prior to that time. Be this as it may, the earliest representation of the plant is to be found in Gerard's *Herbal*, published in 1597.

There are few agricultural subjects of greater importance than the culture of the potato and the losses entailed by potato disease. The disease of potatoes is caused by the growth of a fungus named *Peronospora infestans*, Mont., within the tissues of the host plant, and this fungus has a peculiar property of piercing and breaking up the cellular tissues, and setting up putrescence in the course of its growth.

In England the disease is generally first seen during the last ten days of July; its extension is greatly favored by the warm and showery weather peculiar to that period of the year, and according as the warm and humid weather of autumn is late or early the murrain varies a little in its time of appearance. To the unaided eye the disease is seen as purplish brown or blackish blotches of various sizes, at first on the tips and edges of the leaves, and ultimately upon the leaf-stalks and the larger stems. On gathering the foliage for examination, especially in humid weather, these dark blotches are seen to be putrid, and when the disease takes a bad form the dying leaves give out a highly offensive odor.

**POTATO, SWEET.** This plant (the *Convolvulus batatas*, or *Ipomoea batatas* of some authors) is generally cultivated in the West Indies and most tropical countries for the sake of its tuberous root, which is an article of diet greatly in request. It is a climbing perennial with cordate, entire, or palmately-lobed leaves borne on slender twining stems. The flowers are borne on long stalks in loose clusters or cymes, and have a white or rosy funnel-shaped corolla like that of the common bindweed of English hedges. The edible portion is the root, which dilates into large club-shaped masses filled with starch. The plant is not known in a truly wild state, nor has its origin been ascertained. A. de Candolle concludes that it is in all probability of American origin, though dispersed in Japan, China, the South Sea Islands, Australia, etc. It is grown largely in the southern part of the United States where it forms a staple article of diet.

**POTATO BEETLE or COLORADO BEETLE.** See COLEOPTERA (*Doryphora decemlineata*).

**POTEMKIN, GREGORY ALEXANDROVICH,** Russian soldier and statesman, was born in 1739 in the village of Domnovo, in the government of Smolensk. His father was a poor nobleman of Polish extraction, but the family had been settled for some time in Russia. Owing to the slender means of his parents, Potemkin's

first plan seems to have been to devote himself to the church; but he did not show much inclination for this profession, and eventually embraced the calling of a soldier. His fortunes rose from the time when he assisted the empress Catharine in her conspiracy against her husband on July 10, 1762.

In March, 1791, Potemkin made his triumphal entry into St. Petersburg. The description of the banquet which he gave in honor of the empress at his Taurian palace rivals any scene of Oriental magnificence. But his constitution was now breaking; his body at a comparatively early age was worn out by his labors and excesses. He died October 15, 1791.

POTENZA, a city of Italy, the chief town of Potenza (Basilicata), lies in the heart of the country, on an isolated hill in the valley of the Basento or Busento (Casuentus or Masuentum), sixty-nine miles by rail east of Salerno and fifty-one west-northwest of Metapontum, where the Basento reaches the Gulf of Taranto and the railway joins the line between Taranto and Reggio. The buildings of chief note are the cathedral, the seminary, and the hospital of San Carlo (1869). The population was 18,295 in 1871, 16,968 in 1881, and estimated at about 18,500 in 1889.

POTI, a seaport town of Trans-Caucasia in the government of Kutais (Mingrelia), lies at the mouth of the Rhion (Phasis) on the coast of the Black Sea, 193 miles west-northwest of Tiflis, with which it is connected by a railway opened in 1872. The population of the town is given as 3,112 in the Russian *Calendar* for 1882.

POTOMAC, a river of the United States, which joins Chesapeake Bay by a considerable estuary after a course of about 400 miles. The northern branch of the upper river rises in the Alleghanies, West Virginia, the southern in the Shenandoah Mountains. Affluents are received from Pennsylvania, Maryland, Virginia, and West Virginia—the most important of all being the Shenandoah, which joins it at Harper's Ferry, below which the united stream breaks through the line of the Blue Ridge. Ships ascend for a short distance above Washington (the capital of the United States), or a total distance from the sea of 125 miles.

POTOSI (not to be confounded with San Luis Potosi, the state and state capital in Mexico) is a town of Bolivia, at the head of the department of Potosi. Situated at the height of about 13,280 feet above the sea, it is one of the highest inhabited places in the world. The city is still the seat of the national mint. It consists of nine streets about thirty feet broad, running north and south and crossed at right angles by others of varying breadth. In 1611 its inhabitants are said to have numbered 160,000; at present they are probably not more than 11,000.

POTSDAM, the seat of government for the Prussian province of Brandenburg, and the summer residence of the emperor of Germany, lies sixteen miles to the southwest of Berlin, on the river Havel, which here expands into a series of small lakes. The town is handsomely built, though with a monotonous regularity that betrays its artificial origin, and is situated amid the prettiest scenery of the Mark of Brandenburg, consisting of an oasis of wood and hill and lake in the center of a sandy and unattractive plain. In spite of its somewhat sleepy appearance, Potsdam is the seat of varied if not very extensive industry, of which sugar, cotton and woolen goods, chocolate, and tobacco are the chief products. Market-gardening affords occupation to many of the inhabitants, and the cultivation of winter violets is important enough to be mentioned as a specialty. The Havel is well stocked with fish. In 1880 Potsdam contained 48,447 inhabitants, mainly Prot-

estant. The population is now estimated at upward of 50,000. The garrison consists of about 7,000 men.

POTTER, JOHN, archbishop of Canterbury, was the son of a linen-draper at Wakefield, Yorkshire, and was born about 1674. At the age of fourteen he entered University College, Oxford, and in January, 1737, was unexpectedly appointed to succeed Wake in the see of Canterbury. He died on October 10, 1747. His *Theological Works*, consisting of sermons, charges, divinity lectures, and the *Discourse on Church Government*, were published in three vols., 8vo, in 1753.

POTTER, PAUL, animal painter, was born at Enkhuizen, Holland, in 1625. He died in 1654 at the early age of twenty-nine.

POTTERY AND PORCELAIN. The word "pottery" (Fr. *poterie*) in its widest sense includes all objects made of clay, molded into form while in a moist plastic state, and then hardened by fire. Clay, the most widely spread and abundant of all mineral substances, consists essentially of a hydrated silicate of alumina, admixed, however, in almost all cases with various impurities. Thus it usually contains a considerable proportion of free silica, lime, and oxides of iron, its color chiefly depending on the last ingredient. The white kaolin clays (see KAOLIN) used in the manufacture of porcelain are the purest; they consist of silicate of alumina, with 5 to 7 per cent. of potash, and only traces of lime, iron, and magnesia. The making of pottery depends on the chemical change that takes place when clay is heated in the fire. In preparing clay for the potter it is above all things necessary that it should be worked and beaten, with sufficient water to make it plastic, into a perfectly homogeneous mass.

During the process of firing all clays shrink in volume, partly through the loss of water and partly on account of increase of density. What are called "fat" clays—those, that is to say, which are very plastic and unctuous—shrink very much, losing from one-third to one-fourth of their bulk; they are also very liable to crack or twist during the firing. "Lean" clays—those that have a large percentage of free silica—shrink but little, and keep their form unaltered under the heat of the kiln; they are not, however, so easy to mold into the required shape, and thus a certain compromise is frequently required. Lean and fat clays are mixed together, or silica (sand or ground and calcined flints) is added to a fat clay in sufficient quantity to enable it to stand the firing.

Porcelain differs from pottery in being whiter, harder, less fusible, and (most essential difference) in being slightly translucent. The paste of which it is formed is a purer silicate of alumina than the clay of which the pottery is made.

The art of making pottery is one of the most extreme antiquity; with the exception of the cave-dwellers of the Drift or Paleolithic period it was practiced by all known prehistoric races from the Neolithic age downward. The sepulchral barrows of Britain and other European countries have supplied vast stores of this earliest kind of pottery. It is mostly formed of coarse clay, generally brown in color, though sometimes gray or reddish; some few specimens are fine in texture and have a slightly glossy surface. The clay, while moist, has been kneaded with some care, and is often mixed with a proportion of gravel, coarse sand, quartz crystals, or pounded pottery. The more carefully made specimens, chiefly those of the bronze and iron ages, are frequently covered with a smooth slip, made of the same clay as the body, but finely pounded and thoroughly mixed. All are alike "hand-made," some of the smaller ones are scooped out of a solid ball of clay, while in some cases

great skill has been shown in the building up, by the unaided hand, of the thin walls of larger vessels, some of which are so round and neatly formed as to appear at first sight to be wheel-made. This, however, is never the case with the pottery of the three great prehistoric periods. But few examples remain which date from the time of the earlier dynasties of Egypt, though from the XVIIIth Dynasty downward a great quantity of specimens exist.

Egypt is rich in materials for pottery, both glazed and enameled. The finest of clays is washed down and deposited by the Nile; the sandy deserts supply pure silica; and a great part of the soil is saturated with the alkali necessary for the composition of vitreous enamels and glazes. In spite, however, of this abundance of materials the Egyptians never learned to apply either their enamels or their glazes, both of great beauty, to their larger works in pottery made of the fine Nile clay. The term "Egyptian porcelain" has sometimes been given to the small mummy-figures in brilliant blues and greens. This is a misnomer.

During the XVIIIth and XIXth Dynasties and later pottery was used in many ways for wall-decoration. A number of brilliant wall-tiles covered with deep blue glaze, and painted in black outline with figures and hieroglyphs, have been found in many places in Lower Egypt; the painting is very simple and decorative in effect, drawn with much skill and precision of touch. The Canopic vases are an important class and great quantities have been found in Egyptian tombs. They are generally made of plain brown-red clay, and have a lid in the shape of a human head.

But little remains to us of the pottery of the primitive Accadian races of Babylonia and Assyria. It was all extremely simple and undecorated, partly hand-made and partly wheel-made, mostly graceful and natural in form, owing its beauty chiefly to the simple elegance of its shape and the fine material of which it was made—the close-grained light yellow and brown clays in which the country between the Tigris and the Euphrates is so rich.

The ruined palaces of Babylon and Nineveh have supplied great quantities of bricks painted in various colors, some as early as the twelfth century B.C. The finest examples of pictured bricks were found in the great palace at Nimrúd; they appear, judging from the imperfect fragments that remain, to illustrate a victorious expedition by the Assyrians against a foreign nation.

In addition to figure subjects and ornaments, large wall surfaces were covered with cuneiform inscriptions, having letters about an inch and a half high painted in white and yellow on blue or green grounds; these are executed on large slabs of coarse brown clay, to which a smooth surface, fit for painting, has been given by a thin coating or slip of fine-ground yellowish clay. Large slabs with pendants for ceilings, painted in the same way with very graceful patterns, have been found, all in simple earth colors.

The most remarkable application of pottery in Assyria and Babylonia was its use for literary records. Tablets, cylinders, and polygonal prisms were impressed with cuneiform characters in the moist clay, and then baked, thus forming the most imperishable of all kinds of MSS. (cp. BABYLONIA).

The discoveries of recent years have opened out a new field in the history of the origin and growth of Hellenic art, especially as relating to pottery. Excavations in Cyprus, Rhodes, Thera (Santorin), the plains of Troy, Mycenæ, Attica, and the coasts of southern Italy, have revealed the existence of an abundant class of pottery of great antiquity, a large part of which, in

its forms and decoration, appears to have been due, directly or indirectly, to the Phœnicians.

The islands of Thera, Rhodes, and Cyprus, which were colonized by the Phœnicians at a very early period (see PHŒNICIA), have supplied large quantities of archaic pottery, ornamented with characteristically Phœnician patterns and figures. The equally rich finds of pottery from Mycenæ and the Troad, though not free from Phœnician influence, have mostly a more native style of decoration.

Among the earlier pottery from Mycenæ and the Troad are several very strange vases in coarse clay rudely modeled to indicate a human form. Some have the upper part formed like a head, very like the Egyptian Canopic vases. A great number of "pithi" (*πίθοι*), enormous vases shaped something like amphoræ, have been discovered in Rhodes, the Troad, and other places, some as much as seven feet high. Such vessels are often decorated with patterns in relief, chiefly combinations of spirals and the like, some closely resembling the designs on the sculptured architrave from the "Treasury of Atreus" at Mycenæ.

The manner in which the styles of ornament on early pottery merge almost insensibly one into another makes it difficult to arrange it in distinct classes, and it is not easy to say at what precise stage the term "Hellenic" can be given to the archaic vessels. The presence of Greek inscriptions makes, however, a convenient starting-point.

Probably the earliest known Greek ceramic inscription occurs on the Rhodian pinax. The painting on this, though rudely executed in brown and red ochers on a pale yellow slip-covered clay, the same in method as the earlier non-Hellenic paintings, shows a marked artistic advance by the fact that it represents a definite historical scene taken from the *Iliad*. No incised lines are used except for the feathers of the heraldic eagle on Hector's shield. A large number of other pinaces were found at Camirus, of the same date, but without inscriptions, and with purely decorative paintings, such as geometrical lotus patterns, and spirited figures of bulls, sheep, and other animals, or sphinxes and gorgons' heads. Some large clay coffins, also found at Camirus, and others at Clazomenæ, belong to this class of pottery. The "Burgon Amphora," so called from its finder, now in the British Museum, and the "François Crater," now in the Etruscan Museum, at Florence, are specimens of this class.

*Places Where Greek Vases Have Been Found.*—Till within the last twenty years most were discovered in the tombs of Magna Græcia, Sicily, and Etruria. Capua, Nola, and Vulci supplied a very large quantity of vases of the finest sort with the most rich and brilliant enamel. Special characteristics of style and technique can be traced in the production of special localities, but these differences are not very important. Of late years Attica, the isthmus of Corinth, and other places on Hellenic soil, have yielded a great many fine vases; the islands of the Ægean Sea and the western shores of Asia Minor are rich in sepulchral stores of these and all branches of Greek art. Athens possesses a fine and rapidly-increasing collection, chiefly from Attica. The British Museum collection is on the whole the finest for Greek vases of all periods, though it is very poor in Etruscan pottery. The other chief collections of Europe are in the Louvre, at Naples, in the Vatican, at Florence, and Turin; Munich, Vienna, Berlin, and St. Petersburg also have very fine collections; and there is a small one in the Bibliothèque, Paris.

Very many of the numerous vases discovered in the tombs of ETRURIA (*q.v.*) are imports either from Greece and its islands or from the neighboring country

of Magna Græcia. Nevertheless, there is a large class of pottery which is distinctly native, extending over a very long period from quite prehistoric ages down to the time when the Roman rule extended throughout the peninsula.

Some specimens of very peculiar glazed pottery have been found at Cyrene, Cyme, Pergamum, Smyrna, Tarsus, and other Roman colonies in Asia Minor. It is very delicate and often graceful in shape, with very thin handles, fashioned more like glass than pottery. It is remarkable for being covered with a thick vitreous glaze, usually colored either green, orange, or purple-brown, with oxide of copper, antimoniate of lead, or manganese, quite unlike the thin, almost imperceptible, glaze of Greek vases. The Louvre and the British Museum have the best specimens of this rare ware, which probably dates from the first century B.C. downwards.

In the numerous varieties of Persian and Moslem pottery, with the exception of that included under the head "Hispano-Moorish," there is a great similarity in character of design and in methods of execution, both of which appear to a great extent to have been originated and brought to highest perfection under the Persians, who seem to have inherited, through the Sasanians, much of the skill in manipulating clay and manufacturing enamels and glazes which was possessed by the people of ancient Assyria. The Persians of the tenth to the seventeenth century, perfect masters of all the decorative arts to a degree possessed probably by no other race or age, excelled in pottery as in other handicrafts.

The following were the chief varieties of Persian pottery: Lustered ware, Sgraffiato ware, Damascus and Rhodian wares.

The South Kensington Museum and the Hôtel Cluny in Paris have the finest collections of Rhodian wares, the most magnificent class of Oriental pottery; some very choice specimens are in the British Museum and the Louvre.

To the earlier or Arab period of oriental rule in southwest Europe no existing specimens of pottery can be attributed. The Teutonic, Saxon, and Gaulish types that have been discovered show traces of Roman influence, and mediæval pottery made in England and France from the eleventh to the fifteenth century was coarse and without artistic beauty. The opposite was the rule in Italy, but Spanish pottery was for the most part a coarse imitation of Italian majolica, chiefly made at Valencia, Triana, and Talavera. In Portugal there was no enameled pottery of Portuguese workmanship known to exist prior to the seventeenth century, but in France during the previous century two different though equally remarkable sorts of pottery, one the invention of Bernard Palissy, (see PALISSY), and the other of François Cherpentier, and known as Oiron pottery, were made. At the latter end of the century Dutch potters started in London the making of stoneware, and radical improvements were made in all the departments of the ceramic art during the succeeding century. John Dwight spent many years to improve the manufacture of pottery, also to discover the secret of true transparent porcelain, and to promote these objects set up kilns at Fulham. The Lambeth potteries began to produce ware superior to the lead-glazed varieties and imitated successfully Pallissy ware.

Toward the end of the eighteenth century many imitations were made of the Wedgwood cameo ware by different English manufacturers, and even at Sèvres it was copied in porcelain, though with original French designs. None, however, are equal to Wedgwood's work, either in beauty of design or in delicacy of execution.

Until quite recently little or no pottery of any artistic

merit has been produced in England during the present century, partly owing to the absurd notion that pottery is a sort of inferior porcelain, and should be made to resemble it as much as possible, and also very largely on account of the invention in the eighteenth century of a process for *printing* patterns under the glaze, so as to avoid the labor of painting them by hand. Other modern so-called improvements of manufacture have done much to destroy all true art in English pottery; such are the too finely ground and artificial mixtures of different materials, the great use of the mold in preference to the potter's wheel, and, most fatal of all, the fact that, when the pottery is thrown on the wheel, it is afterward handed over to a workman who turns it on a lathe and rubs it down with glass-paper, as if it were a block of wood, thus removing all the surface put on the vessel by the touch of the thrower's hand.

The pottery of ancient Mexico and Peru, certainly older than the Spanish conquests in America, and possibly dating from a much more remote age, has many points of interest. Large quantities in good preservation have been discovered in the tombs of chiefs and other important persons of those once powerful and (in a somewhat barbaric way) artistic races. Much of their pottery is grotesque and even hideous in shape, modeled in the forms of semi-human monsters; it is often made of a hard black clay, well burned, something like the early black wares of Etruria. Another kind is graceful and natural in shape, formed with great taste and skill on the potter's wheel. The clay is fine in texture and has a slight surface-gloss, apparently the result of mechanical polishing.

In the methods of treatment employed in China and Japan the usual distinctions between pottery (earthenware) and porcelain (kaolinic ware) are not always observed. In many cases these two different materials are treated in exactly the same way and decorated after the same fashion. The chronological arrangement of Chinese wares is a matter of great difficulty. Many of the professedly historical records of the Chinese themselves are quite untrustworthy; as with all other arts, they have claimed for the manufacture of porcelain an antiquity far beyond the actual facts of the case. This exaggerated estimate of the antiquity of Chinese porcelain was for a long time supported by the supposed discovery in Egypt of certain small bottles made of real porcelain, and inscribed with Chinese characters, which were said to have been found in tombs at Thebes dating as early as 1800 B.C. According to a history of the art compiled from earlier records, the manufacture of pottery is said to have commenced in 2697 B.C., and that of porcelain during the Han dynasty, 206 B.C. to 25 A.D. The Tsin dynasty (265-419 A.D.) was remarkable for its blue porcelain, and the Suy dynasty (581-618 A.D.) for its fine green ware. One of the most celebrated kinds of porcelain was that made about 954 A.D., deep sky-blue in color, very glossy in texture, extremely thin, and sounding musically when struck. Even small fragments of it are treasured up by the Chinese, and set like jewels. Most dynasties seem to have been famed for a special variety of porcelain. The earlier sorts appear not to have been decorated with painting, but were all of one rich color. Decorative painting did not apparently come into general use before the Yuen dynasty of Mongols (1260-1368), and was brought to great perfection under the Mings (1368-1644). The porcelain of the last-named dynasty is classified in periods, four of which (from 1426 to 1567) were greatly esteemed. Probably few specimens of Chinese porcelain known in Europe are earlier in date than the time of Kang-he, the second emperor of the Tsing dynasty (1661-1722). Porcelain is made from two substances, "pe-tun-tse" and

"kao-ling;" the latter is a white pasty substance derived from the decomposition of feldspathic rocks such as granite. The precise nature of pe-tun-tse is not exactly known, but it appears to resemble kaolin, with the addition of a considerable proportion of free silica. The white pastes of which the porcelain is made are very carefully washed, finely ground, and mixed in due proportion. The paste is "thrown" on the potter's wheel in the usual way and set to dry; its colored decoration is then applied, and over that the transparent glaze is laid. The porcelain is next packed in clay boxes or "saggers," piled one above another in the kiln, in order to protect it from discoloration from the smoke. After the kiln has been heated for a considerable time to a very high temperature, the fire is withdrawn; and the porcelain is allowed to cool slowly in the clay saggers before the kiln is opened and its contents removed. Additional decoration is frequently added *over* the glaze, generally in enamel colors, applied thickly so as to stand out in perceptible relief; gilding is also added over the glaze. The porcelain is afterward fired a second time in a more open kiln, and at a lower temperature.

The methods of decorations on Chinese porcelain are extremely varied, and are applied with the most skillful hand and wonderful fertility of design; but they are always dainty and feebly pretty rather than artistic, except when there is a Persian element present. The general forms of the porcelain are mostly feeble, and often of extreme ugliness, while the skill in drawing is mostly confined to representations of flowers, some of which, especially the chrysanthemum and the peony, are painted with great truth and enjoyment. With the beauties of the human form the Chinaman has no acquaintance or sympathy, and he never possessed the wonderful skill of the Japanese in the delineation of animals and birds.

In the main the technical methods used in Japan and the styles of painted ornament were introduced from China, and also to a less extent from the adjacent peninsula of Corea. Glazed pottery was first made at Seto about 1230 A. D. by a potter who had visited China. Porcelain manufacture was introduced in a similar way into the province of Hizen about 1513. On the whole, the Japanese are more remarkable for their skill and almost endless methods in the production of pottery than of porcelain. No people ever approached them for marvelous fertility of invention and skill in the manipulation of all sorts of clay, pastes, enamels and pigments.

A great deal of Japanese ceramic ware is simply copied from Chinese porcelain, and often has forged Chinese marks. It is very difficult to find out what notions the Japanese themselves really have as to what is admirable in pottery. A purely archæological interest in old sorts of ware appears to affect them strongly, and they often put the highest value on what appears a very ordinary and rudely-made kind of pottery. Within the present century a new and elaborate method of decorating porcelain has been practiced in Japan, the chief object of which seems to be to make a porcelain vessel look like a metal one. Brass cloisonné enamel is applied to the outer surface of porcelain vases or bowls; the strips of brass set on edge which form the outline of the design, instead of being soldered to a metal plate, are fixed in some almost incomprehensible fashion to the surface of the porcelain, and then the compartments are filled in with colored enamels and fired in the usual way—a marvel of technical skill and wasted ingenuity. In various places in Europe, especially in Italy and France, attempts to produce translucent porcelain like that produced by the Chinese were almost continually being made from the end of the fifteenth century down to the

beginning of the eighteenth. From the thirteenth to the fifteenth century Chinese porcelain was very sparingly brought into Europe, and generally occurs among royal possessions or gifts as an object of great value. The name "china," from the country where porcelain was made, was given to it not later than the sixteenth century, and perhaps earlier, having been used by the Arabs long before; "china dishes" are mentioned by Shakespeare (*Measure for Measure*, act ii., scene i.) as being things of value. The main reason of the very slight success gained for so many years in the attempts to make porcelain in Europe, was the fact that it was regarded as a highly artificial substance, something between pottery and glass; the many beds of kaolinic clays which exist in Europe were never thought of as being the true material of which to make it, or, if used at all, were only employed partially and in an accidental way. The earliest attempts at the production of translucent porcelain which had any practical success took place at Venice about 1470. An alchemist named Antonio succeeded in making and firing in a kiln at San Simone, near Venice, "porcelane trasparente e vaghissime," described, in a document dated 1470, as being as beautiful in glaze and color as "the porcelain from barbarous countries."

After the Medici ware ceased to be made there is a blank of nearly a century in the history of European porcelain. In 1664 a patent was granted to Claude Reverend, a citizen of Paris, which gave him the privilege of making "imitation porcelain, as fine as that from the East Indies." In 1673 another patent was conceded to Louis Poterat, who certainly did produce artificial porcelain at Rouen. Saint Cloud was the next place in France where porcelain was produced, and from 1700 to 1745 at Lille, Chantilly and Mennecey-Villeroy.

The increasing success and popularity of the porcelain produced in Germany and England induced Louis XV. to establish a private royal manufactory of porcelain, which was first started at Vincennes, with a privilege granted to Charles Adam and others in 1745. In 1753 the king himself became a partner in the works, with a third share in the property. The seat of the manufactory was then transferred to Sèvres, and the official title was assumed of "manufacture royale de porcelaine de France." Before 1753 the royal porcelain was simply marked with two crossed L's for Louis, but from that year a date-letter was made compulsory—A for 1753, B for 1754, and so on till 1777, after which a new doubled alphabet was started AA, BB, etc.; this lasted down to RR (1793), and then a less regular series of marks came into use. Till 1792 the date-letter was put between the crossed L's, but in that year the republic substituted the letter R. Later various royal monograms and marks were used. Till about 1770 all French porcelain was artificial or "soft" (*pâte tendre*); the discovery of kaolinic clays in France then brought about the manufacture of natural hard porcelain (*pâte dure*) like that made in China and Japan. This gradually superseded the soft kind, which ceased to be made at the end of the eighteenth century. Its manufacture has recently been revived at Sèvres to some slight extent. M. Brongniart, the director of the Sèvres porcelain works from 1800 to 1847, in his *Traité des Arts Céramiques* (1854), gives a full account of the materials and methods used at Sèvres during all periods.

The porcelain of Germany was, from the first, composed of a hard natural paste, a true kaolinic clay. Its successful production was the result of a single, almost accidental, act of discovery, and not, like that of the French, of a long series of experiments with different materials, ending in the invention of a highly artificial imitation of true porcelain. In the year 1700

young chemist, or rather alchemist, of great ability, called Frederick Böttger (1682-1719), a native of Saxony, fled to Dresden under the accusation of practicing magical arts and searching for the "philosopher's stone." He was there taken under the protection of Augustus II., elector of Saxony, who employed him to make experiments, at first connected with medical chemistry, and afterward with the composition of pastes and clays for ceramic ware; but in 1710 he seems to have been in some way set on the track of the secret of porcelain manufacture. His first attempts were unsuccessful: the paste is gray and defective, and there is little or no glaze. So far no real progress had been made toward the discovery of true porcelain. But in 1710 a lucky accident, combined with the young chemist's ready powers of observation, revealed the true nature of the required paste. Having noticed the unusual weight of some new hair-powder with which his wig was dressed, he inquired what it was made of, and finding that it was a finely-powdered white clay from Aue, near Schneeberg in Saxony, he procured some of the clay. He made vessels of it and fired them, and found that he had discovered the material of true hard porcelain, like that from China and Japan. When Augustus II. learned the importance of the discovery he established the porcelain manufactory at Meissen with Böttger as its director. The earliest productions of the Meissen (Dresden) porcelain-works are copies from the Chinese and Japanese.

After about 1725 the Eastern style of design was superseded by elaborate miniature paintings of flowers and insects, or copies from Dutch and Flemish painters. All notion of true ceramic decoration was gone, and the porcelain was only regarded as a ground on which to paint an imitation of an oil-painting.

The manufacture of pottery, stoneware, and china has been established in the United States for many years, and is now conducted on the most extensive scale both at the East and in some portions of the West—notably at a pottery in Cincinnati, Ohio, where a very superior quality of ornamental china is included in the output. The principal depots for the manufacture of this commodity are at Trenton, N. J., and at East Liverpool, Ohio, where, it is said, fully nine-tenths of the capital employed in the production of pottery in the United States are invested. There are potteries also at East Boston, Mass.; Geddes, N. Y.; Green Point, L. I.; Peoria, Ill., and at various points in West Virginia, their lines of production grading from the ordinary descriptions of pottery to the best qualities of vitrified china. The trade catered to is domestic, and for some portions of Canada, South America, and Mexico.

**POTTSTOWN**, a borough of Montgomery county, Penn., is picturesquely situated on the Schuylkill river, in a plain surrounded by hills. It is eighteen miles east-southeast of Reading and forty miles west-northwest of Philadelphia, at the junction of the Philadelphia and Reading (main line) and the Colebrookdale Railroads, and has communication also by the Schuylkill Valley branch of the Pennsylvania Railroad. There are in and near Pottstown six rolling-mills, two blast-furnaces, three iron and brass foundries, two nail-factories, and large bridge works, besides minor industries. The population of Pottstown was 4,125 in 1870, and 13,285 in 1890.

**POTTSVILLE**, a city of the United States, capital of Schuylkill county, Penn., lies thirty-five miles northwest of Reading, on the north side of the Schuylkill river, in the gap by which it breaks through Sharp Mountain. It is the terminus of the main line of the Philadelphia and Reading Railroad, and the great emporium of the Schuylkill coal region, which extends

north and east and west, and has an annual yield of about 6,000,000 tons. Furnaces, rolling-mills, machine-shops, planing-mills, a spike-mill, a pottery, etc., are among the industrial establishments; and the public institutions include a court-house, a jail, a town-hall, a union hall, an opera-house, a children's home, a lyceum, and a free reading-room. The German and Welsh elements in the population are strong enough to be represented each by several churches. Pottsville as a city dates from 1825. In 1850 it had 7,515 inhabitants, 12,384 in 1870, 13,253 in 1880, and 14,117 in 1890.

**POUGHKEEPSIE**, a city of the United States, capital of Dutchess county, N. Y., lies on the east bank of the Hudson river, seventy-three miles north of New York. It is on the New York Central and Hudson River Railroad, and communicates with the New York, West Shore and Buffalo Railway by ferry from Highland, and with the Hartford and Connecticut Western Railroad by the Poughkeepsie, Hartford and Boston Railroad (thirty-seven miles). The site consists for the most part of a tableland which rises from 150 to 200 feet above the river, and is backed toward the east by College Hill, 300 feet in height. Well laid out, with regular and shaded streets and abundantly supplied with water (pumped from the river to a reservoir on College Hill), Poughkeepsie is a pleasant place of residence, and it enjoys a special reputation for its educational institutions. Vassar College (two miles east of the city), the earliest and one of the greatest women's colleges in the world, was founded and endowed in 1865 by Matthew Vassar, a wealthy Poughkeepsie brewer. It has a full corps of teachers and a library of 20,000 volumes, together with collections of water-colors and of American birds, both of great value, an astronomical observatory, and a chemical laboratory. Two miles north of the city, on an eminence above the Hudson, stands the Hudson River State Hospital for the Insane, an immense building erected between 1867 and 1871, with 300 acres of ground attached, and costing \$750,000. Within the city are an opera-house, a free public library, a Young Men's Christian Association building with a free reading-room, St. Barnabas and Vassar Brothers Hospital, and homes for aged men and women. It also contains iron-furnaces, breweries, and manufactories of shoes, glass, mowing machines, pottery, hardware, and various minor industries. The population was 14,726 in 1860, 20,080 in 1870, 20,207 in 1880, and 22,206 in 1890.

Poughkeepsie (forty-two different spellings of the name are said to be found in old records) was settled by the Dutch about 1698-1700. Two sessions of the State legislature were held in the place in 1777 and 1778; the former gave assent to the articles of confederation, and the latter ratified the national constitution. The city charter dates from 1854.

**POULPE**, or **OCTOPUS**. See **CUTTLE-FISH**.

**POULTRY**. The term "poultry" (Fr. *oiseaux de basse cour*) is usually regarded as including the whole of the domesticated birds reclaimed by man for the sake of their flesh and their eggs. The most important are the common fowl, which is remarkable as having no distinctive English name, the Turkey, and the Guinea-fowl, all members of the family of birds known as *Phasianidæ*. The pheasants themselves, belonging to the restricted genus *Phasianus*, are not capable of being domesticated, and the peacock is to be regarded rather as an ornamental than as a poultry bird. The aquatic birds which are strictly entitled to be considered domesticated poultry are the duck and the goose, two species of the latter having been perfectly reclaimed.

The origin of the domesticated breeds is ascribed by

Darwin, Blyth, and other naturalists to the Bankiva fowl, and the number of distinctive breeds of the domesticated fowl has very greatly increased of late years, owing to the emulation excited by poultry shows. Darwin, in his *Variations of Animals, Etc., Under Domestication*, enumerated thirteen principal breeds with numerous sub-varieties, but several very distinctive races have come into notice during the last ten years, varieties having been formed by careful selection that may be relied on for reproducing their own distinctive peculiarities in the descendants, and hence constituting what are regarded by fanciers as pure breeds. The classification of the known varieties is not an easy task; each is capable of interbreeding with every other, and so great an intermixture of local races has taken place that the arrangement of the breeds is as difficult in poultry as in dogs. Game fowls differ less from the wild Bankiva than any other variety; they are, however, considerably larger, and carry the tail more erect than the wild birds. The comb is single, the beak massive, the spurs strong and very sharp. There is a tendency toward the assumption of the female plumage by the males, and distinct breeds of "henney" Game are known. Economically considered, Game are highly esteemed for the table on account of their plumpness, the amount of the breast-meat, owing to the size of the pectoral muscles, being very great, from which cause, combined with their hardihood, they are most valuable for crossing with other breeds, as the Dorking. The Malayan type has been long recognized as of Eastern origin. The birds are of large size, close and scant in plumage, with very long legs and necks.

The Cochin type must be regarded as including not only the birds generally so called but also the Brahmas and Langshans; it is of very large size, some of the males reaching the great weight of sixteen or seventeen pounds. They are distinguished by a profusion of downy plumage, with small wings and tails; they are incapable of long flight, and the pectoral muscles are consequently but feebly developed. The Langshans are a more recent importation; since their introduction they have been bred by careful selection for eating, and have fuller breasts and less abundant plumage than the older known Cochins and Brahmas. Recently a sub-variety of Cochin has been raised in America by crossing with a cuckoo-colored breed long known as Dominiques. These have become fashionable under the name of Plymouth Rocks.

The Spanish or Mediterranean birds are of moderate size, with large single erect combs and white ear lobes.

The Hamburgs, erroneously so called from a name given them in the classification adopted at the early Birmingham shows, are chiefly breeds of English origin. They have double combs and small white ear lobes, and are non-sitters and lay a remarkably large number of eggs.

The crested breeds have long been cultivated on the continent and are admirably delineated in the pictures by Hondekoeter and other early Dutch artists. In Great Britain they are erroneously termed Polish. The best-known breeds in England are the spangled, with a dark mark at the end of each feather. The Crève-cœur is a crested breed of uniform black color; it is of large size and of great value for the table and for egg-production. The Houdan is a black and white breed of very similar character. In some breeds there is an absence of the feathered crest, the crescent-shaped comb becoming more largely developed; such are those known as Guelders, Bredas, and La Flèche, the latter being the best French fowl for eating. A small white-crested variety, profusely feathered on the legs is known as Sultan. The crested breeds are all non-incubating.

In breeding the domestic fowl for useful purposes it is desirable to follow to a greater extent than is usual the natural habits and instincts of the bird. The wild fowl is a resident in forests, coming out to feed in the open; in addition to green vegetables and fruit it lives on grain, seeds, worms, grubs, and insects, which it obtains by scratching in the soil; it roosts in the higher branches of trees, and the hen deposits her eggs on the ground, usually in a concealed situation, laying one egg every other day until the number is completed, when she sits for twenty-one days. On the chickens being hatched they do not leave the nest for twenty-four or thirty hours, being nourished by the absorption of the yolk into the intestinal canal. When they are sufficiently strong to run after the hen she takes them in search of food, which she obtains by scratching in the ground or among decaying vegetable matter.

Poultry-rearing is an industry adapted to the small holder, to the rearer for home consumption, or as an adjunct to the work of a large farm, but as an industry of its own it is never likely to be worked to advantage.

Artificial Incubation, or the process of hatching by artificial heat, was known to the Egyptians, by whom it was carried on, employing the concentrated rays of the sun for that purpose. Within the past twenty years artificial incubation has been extensively engaged in, especially in the United States, England and in portions of Continental Europe. Briefly, the process is as follows: The eggs are placed on wire shelves, arranged in a close box, into which the hot air is introduced through coiled pipe. The temperature within the box is maintained at from 92° to 96°, rendered moist by the presence there of hot water, and at the expiration of from eighteen to twenty-one days the shells break, the chicks are delivered, and the process is completed. The chickens are then fed with worms, larvæ, etc., and are soon able to take care of themselves.

The origin of the domesticated turkey is probably of a composite character; by Mr. Gould and other naturalists this bird is generally regarded as having been derived from the Mexican species *Meleagris mexicana*; but this has recently been crossed with the North American *M. gallo-pavo*, with great advantage as to size and hardihood. The varieties of the turkey differ chiefly as to color. The principal English breeds are the bronze or Cambridgeshire, the black or Norfolk, the fawn, and the white. Of these the first, especially when crossed with the American, is the largest and most desirable.

The Common Guinea-fowl (*Numida meleagris*) is a native of eastern Africa, whence it has been carried to many parts of the world, in some of which, as the West India Islands, it has become wild. It has also been reared in a half-wild state in many English preserves. The birds are useful as furnishing a supply of poultry for the table in the interval that ensues between the time when game is out of season and that before chickens arrive at maturity.

All the varieties of the domesticated duck are descended from the Common Mallard or Wild Duck, *Anas boschas*, a species which, though timid in its wild state, is easily domesticated, and suffers changes of form and color in a few generations. The most important breeds are—the Rouen, which, retaining the color of the original species, grows to a large size; the Aylesbury, a large white breed with an expanded lemon-colored bill; the Pekin, a white breed with a pale yellowish tint in the plumage, and a very bright orange bill; two breeds which are entirely black. For table and market purposes no breed surpasses the Aylesbury; its large size, great fecundity, early maturity, and white skin and plumage cause it to be reared in immense numbers for

the London markets. Duck-rearing is a very profitable industry, very high prices being paid for ducklings in the early months of the year. The so-called Muscovy duck is a Brazilian species *Cairina moschata*, which is not reared for the market, although the young birds are edible.

The domestic goose of Europe is undoubtedly the descendant of the migratory gray lag Goose, *Anser cinereus*, from which it differs chiefly in its increased size. Although domesticated since the time of the Romans, it has not been subject to much variation. The most important breeds are the large gray variety known as the Toulouse, the white breed known as the Embden, and the common variety. There has also been introduced from the Crimea since the Russian war a variety of this breed which is termed the Sebastopol. In some countries a second species is domesticated; it is usually termed the Chinese, knob-fronted, or swan goose, *Anser cygnoides*. Geese are readily fattened, and the young, when brought rapidly forward for the markets, afford a very good profit.

All the different breeds of pigeons which are known to the fancier, have descended from the wild blue rock-dove *Columba livia*, and return to the coloration and form of the wild original if allowed to interbreed without interference. When reared as articles of food with due care and proper management six or seven couples of young can be raised from each old pair during the year, and a continuous supply of young birds for the table can be depended on.

POUND, an inclosure in which cattle or other animals found straying are retained until they are redeemed by the owners, or when taken in distraint until replevined, such retention being in the nature of a pledge or security to compel the performance of satisfaction for debt or damage done. A pound belongs to the township or village, and should be kept in repair by the county. The pound-keeper is obliged to receive everything offered to his custody, and is not answerable if the thing offered be illegally impounded.

POUSHKIN, ALEXANDER, the most celebrated of Russian poets, was born at Moscow, June 7, 1799. In 1837 the poet, who had been long growing in literary reputation, fell mortally wounded in a duel with Baron George Heckeren d'Anthès, the adopted son of the Dutch minister then resident at the court of St. Petersburg. Poushkin remains as yet the greatest poet whom Russia has produced.

POUSSIN, NICOLAS, French painter, was born at Les Andelys (Eure) in June, 1594, and died in 1665.

POUT, also WHITING-POUT or BIB (*Gadus luscus*), a small species of cod-fish locally abundant on the coasts of northern and western Europe, but less so in the Mediterranean. It is distinguished from other species of the genus *Gadus* by having a deep short body; a short and obtuse snout, not longer than the eye; the upper jaw the longer; and a long barbel at the chin.

POWAN, or POWEN (*Coregonus clupeioides*), a species of the Salmonoid genus *Coregonus*, which seems to be peculiar to Loch Lomond in Scotland, the great lakes of Cumberland, where it is called "schelly," and Lake Bala in Wales, the Welsh name of the fish being "gwyniad."

POWERS, HIRAM, American sculptor, was the son of a farmer, and was born at Woodstock, Vt., on June 29, 1807. In 1826 he began to frequent the studio of Mr. Eckstein, and at once conceived a strong passion for the art of sculpture. After studying thoroughly the art of modeling and casting, he in the end of 1834 went to Washington, and a friend having secured for him as sitters the president and some of the leading statesmen his remarkable gifts soon awakened

general attention. In 1837 he settled in Florence, where he remained till his death. While from pecuniary considerations he found it necessary to devote the greater part of his time to busts, his best efforts were bestowed on ideal work. In 1838 his statue of Eve excited the warm admiration of Thorwaldsen, and in 1839 he produced his celebrated Greek Slave, which at once gave him a place among the greatest sculptors of his time. Among the best known of his other ideal statues are the *Fisher Boy*, *Il Penseroso*, *Proserpine*, *California*, *America* (modeled for the Crystal Palace, Sydenham), and the *Last of his Tribe*. He died on June 27, 1873.

POZZO DI BORGO, CARLO ANDREA, Russian diplomatist, was descended from an old Corsican family, and was born at Alata near Ajaccio on March 8, 1764. He died in 1842.

POZZUOLI, the ancient PUTEOLI, a city of Italy, on the northern shore of the Bay of Pozzuoli (Sinus Puteolanus or Cumanus)—the western portion of the Gulf of Naples, separated from the larger eastern portion by the promontory of Posillipo and from the open sea on the west by the peninsula which terminates in Cape Miseno. Population (1890), 12,000.

PRADIER, JAMES, French sculptor, was born at Geneva in 1790 and died in Paris on June 5, 1852.

PRAED, WINTHROP MACKWORTH, one of the most illustrious English writers of *vers de société*, was born at 35 John Street, Bedford Row, London, July 26, 1802. He died at Chester Square, London, on July 15, 1839, and was buried at Kensal Green on July 23d.

PRÆFECT (*præfectus*) was the title of various Roman officials, both civil and military. A præfect was not one of the magistrates proper; he was, strictly speaking, only the deputy or lieutenant of a superior magistrate or commander.

1. The city præfect (*præfectus urbi*) acted at Rome as the deputy of the chief magistrate or magistrates during his or their absence from the city.

Under the empire there was introduced a city præfecture which differed essentially from the above. Augustus occasionally appointed a city præfect to represent him in his absence from Italy, although the prætors or even one of the consuls remained in the capital.

2. Under the republic judicial præfects (*præfecti juri dicundo*) were sent annually from Rome as deputies of the prætors to administer justice in certain towns of the Italian allies.

3. Under the empire the prætorians or imperial guards were commanded by one, two, or even three præfects (*præfecti prætorio*), who were chosen by the emperor from among the knights and held office at his pleasure.

PRÆMONSTRATIENSIS. See ABBEY, and MONACHISM.

PRÆMUNIRE, the name given to a writ originating in the fourteenth century in the attempt to put restraint on the action of the papal authority in regard to the disposal of ecclesiastical benefices in England before the same became vacant, and subsequently, to the prejudice of the rightful patron, and also in the encouragement of resort to the Roman curia rather than to the courts of the country, in disregard of the authority of the crown, leading thereby to the creation of an *imperium in imperio* and the paying of that obedience to papal process which constitutionally belonged to the king alone. The word "præmunire" is applied also to the offense for which the writ is granted, and furthermore to the penalty it incurs.

PRÆNESTE (now PALESTRINA), a very ancient city of Latium, lies twenty-two miles east of Rome, on a spur of the Apennines facing the Alban Hills. The modern

town of Palestrina, a collection of narrow and filthy alleys, stands on the terrace once occupied by the temple of Fortune.

PRÆTOR (*præ-itor*, "he who goes before," "a leader"), originally a military title, was in classical times the designation of the highest magistrates in the Latin towns. The Roman consuls were at first called "prætors"; in the early code of the Twelve Tables (450 B.C.) they appear to have had no other title. By the Licinian law of 367 B.C., which abolished the military tribunes with consular power and enacted that the supreme executive should henceforward be in the hands of the two consuls, a new magistrate was at the same time created who was to be a colleague of the consuls, though with lower rank and lesser powers. This new magistrate was intrusted with the exclusive jurisdiction in civil cases; in other respects his powers resembled those of the consuls. His distinctive title was the "city prætor" (*prætor urbanus*), and in after time, when the number of prætors was increased, the city prætor always ranked first. The prætors were elected, like the consuls, by the people assembled in the *comitia centuriata* and with the same formalities. (See CONSUL.)

PRÆTORIANS (*prætoriani*) was the name borne by the body-guards of the Roman emperors. The name was derived from the prætorian cohort, a picked body of troops who in the time of the republic formed the guard of a general in command of an army, the old Latin name for a general being *prætor* and his quarters in the camp being known as the *prætorium*. As the emperor was commander-in-chief the headquarters (*prætorium*) were established at Rome, and one of the earliest measures of Augustus was the new organization of the guard. The command of the prætorians rested legally with the emperor, but after 2 B.C. it was practically exercised by one or more colonels chosen by the emperor with the title of "prætorian præfects" (*præfecti prætorio*, see PRÆFECT).

PRÆTORIUS, MICHAEL, German musical historian, theorist, and composer, was born at Kreuzberg in Thuringia, February 15, 1571. He died in 1621.

PRAGMATIC SANCTION, the technical name given to some decrees which have been issued as fundamental laws. There is a famous document known as the Pragmatic Sanction of St. Louis, which contains six articles directed against the assumptions of the papacy; but there are reasons for doubting its genuineness. In 1438 Charles VII. of France issued at Bourges a pragmatic sanction which embodied the most important decisions of the council of Basel. The most famous of all pragmatic sanctions was that of the emperor Charles VI. In 1713 it was issued as a family statute, but, as the emperor proposed that it should become a fundamental law of the state, it was afterward submitted to the diets of the lands ruled by the house of Austria by hereditary right. Having been accepted by the estates of Lower Austria and Bohemia in 1720, by the Hungarian diet in 1722, and by the remaining diets between 1720 and 1724, it was proclaimed as a fundamental law on December 6th, 1724. By this edict it was decreed that the Austrian lands should always be united; that they should be ruled by Charles VI.'s male descendants; that, if he had no male descendants, his territories should pass to his female descendants; and that, if his female descendants died without issue, the right of succession should belong to the daughters of his brother Joseph and to their male and female offspring in accordance with the law of primogeniture. In the interest of his daughter Maria Theresa the emperor spared no pains to secure from the empire and from the other powers guarantees for the execution of this law; and, when his nieces, who as the daughters of his elder

brother might prove to be dangerous rivals of Maria Theresa, were married, one to the electoral prince of Saxony, the other to the electoral prince of Bavaria, he caused them to declare on oath that they abandoned their claims. Nevertheless after his death the pragmatic sanction led to the War of the Austrian Succession. In 1759 a pragmatic sanction was issued by Charles III. of Spain granting the throne of the Two Sicilies to his third son and his descendants.

PRAGUE (German, *Prag*; Bohemian, *Praha*), the capital of Bohemia, the seat of an archbishop, and the third largest town of the Austrian-Hungarian monarchy, lies on both banks of the Moldau in 50° 5' N. latitude and 14° 25' E. longitude, 150 miles to the northwest of Vienna and 75 miles to the south-southwest of Dresden. Population (1890), (with suburbs) 304,000.

The foundation of Prague is ascribed to the princess Libussa, who appears at the beginning of the eighth century of our era as ruling the Bohemians from her stronghold of Wyscherad on the right bank of the Moldau. It is at least certain that the town made rapid progress under the fostering care of the early Bohemian sovereigns, and in the thirteenth century it was able to bid defiance to the Tartar hordes that then overran the country. Its chief period of prosperity was the reign of Charles IV. (1346-1378), who by founding the university, establishing fairs, and investing the town with valuable privileges attracted to it numerous strangers. At this time Prague was perhaps the most important town in Germany, and could even boast of an independent school of art. Afterward, however, Prague became the center of the agitation that culminated in the Hussite wars, and thus brought upon itself a long train of misfortunes. The Hussites took possession of the city soon after defeating the emperor Sigismund, and allowed their religious zeal to carry them so far as to destroy many of the most interesting old churches in the city—a fact that accounts for the want of venerable ecclesiastical edifices in Prague. The town was, however, afterward rebuilt by the imperialists upon an improved scale. Under Rudolf II. (1576-1612) a second season of prosperity was enjoyed; Copernicus, Tycho Brahe, and other men eminent in science, art, or letters flocked to the court of this enlightened monarch and contributed to the importance of his capital. Prague suffered its full share of the evils of the Thirty Years' War, which may be said to have begun here with the precipitation of the councilors from the window of the Hradschin (1618), and to have ended here with the occupation of the Kleinseite by the Swedes in 1648. The town was occupied by the imperialists after the defeat of the Protestants at the White Hill in 1620, and its Protestant sympathies caused it to find scant grace in the eyes of the victors. It was taken by Swedes in 1631, by Wallenstein in 1632, by the French and Bavarians in 1741, and by Frederick the Great in 1744. In 1757 it narrowly escaped a second capture by Frederick, who held it closely invested after defeating the Austrians at the battle of Prague, but was compelled to raise the siege by the disaster of Kolin. This was the last time Prague underwent a siege, though it was occupied by the Prussians in 1866. During the present century its material advance has been unbroken, but its harmonious social development has been hampered by the disunion between the Czechish and German elements of its population. The revolutionary ideas of 1848 found a warm response in the nationalist party of Bohemia, and a Pan-Slavonic congress was opened at Prague in May of that year. Unfortunately, however, a collision took place between the military and the populace, and Prince Windischgrätz forcibly dissolved the congress and

bombarded the town for two days. In 1862 a new impetus was given to the Slavonic agitation by the formation of a Bohemian diet, and since then the fissure between the warring races has grown wider rather than diminished. The Slavs seem to be steadily gaining ground at the expense of the Germans in both numbers and influence. Among the celebrated natives of Prague the most eminent in public interest are John Huss (1369-1415) and Jerome of Prague (c. 1365-1416). A fragment of the house of the former is still shown in the Altstadt.

PRAHRAN, a city of Victoria, Australia, is situated about three and a half miles southeast of Melbourne, with which it is connected by the Melbourne and Brighton Railway, and by road over a fine iron girder bridge which crosses the Yarra. The area of the city is 2,320 acres, with a population in 1881 of 21,169.

PRAIRIE DOG. See MARMOT.

PRAKRIT (*prākṛta*, "common," as contrasted with *sanskṛta*, "perfect") is the term applied to the vernacular languages of India derived from Sanskrit. (See SANSKRIT.)

PRAM, CHRISTEN HENRIKSEN, Scandinavian poet, was born in Gudbrandsdal, Norway, in 1756, and died in the West Indies in 1821.

PRATINCOLE, a word apparently invented by Latham, being the English rendering of *Pratincola*, applied in 1756 by Kramer to a bird which had hitherto received no definite name, though it had long before been described and even recognizably figured by Aldrovandus under the vague designation of "*hirundo marina*." It is the *Glareola pratincola* of modern ornithologists, forming the type of a genus *Glareola*, founded by Brisson in 1760, and unquestionably belonging (as is now generally admitted) to the group *Limicola*, being either placed in the family *Charadriidae* or regarded as constituting a separate family *Glareolidae*. The pratincoles, of which some eight or nine species have been described, are all small birds, slenderly built and most delicately colored, with a short stout bill, a wide gape, long pointed wings, and a tail more or less forked.

PRATO, a city and bishop's see of Italy, in the province of Florence, on the north edge of the alluvial plain which extends between Florence and Pistoia. By rail it is distant from the former city eleven and one-fourth miles, and from the latter nine and three-fourths.

PRATT, CHARLES. See CAMDEN, EARL.

PRAXITELES, a Greek sculptor, son and apparently also pupil of the Athenian Cephisodotus. There has been found at Olympia, where it still remains, a marble statue from his hand, *Hermes carrying the infant Dionysus*.

PRECEDENCE. This word in the sense in which it is here employed means priority of place, or superiority of rank, in the conventional system of arrangement under which the more eminent and dignified orders of the community are classified on occasions of public ceremony and in the intercourse of private life. In the United States in the very nature of things there can be no precedence save that allowed by common consent to persons of distinguished merit. An exception to this remark is, of course, found in the officers of the army and navy.

PREDESTINATION is a theological term, sometimes used with greater latitude to denote the decree or purpose of God by which He has from eternity immutably determined whatever comes to pass; sometimes more strictly to denote the decree by which men are destined to everlasting happiness or misery; and sometimes with excessive strictness to denote only predestination to life or election.

The question to which the theory of predestination supplies an answer, although it has a special interest to Christian thought, yet arises in all minds which are occupied with the problems of human existence. That question is, To what cause can we refer the diversities in human character, fortunes, and destiny? The Greek tragedians made it their business to exhibit the helplessness of man in his strife against fate. Sometimes, indeed, they explicitly distinguish fate from a mere pitiless and non-moral sovereignty and identify it with the Nemesis which pursues hereditary or individual guilt; and sometimes—as in the case of *Œdipus*—they follow the history of the sufferer for the sake of showing how the predestined and inevitable transgression and punishment educate the character. But the idea which fascinates and pursues them is that man cannot escape his destiny; that his life is woven with a "shuttle of adamant," and that when God means to destroy a man He makes evil seem good to him. The Greek philosophy tended in the same direction; and the Stoic doctrine of necessity or providence, though based on a broad and thoroughly philosophical view of nature and of man's place in it, was entangled in the very difficulties which attach to Calvinism.

The doctrine of predestination was first formulated in the church by Augustine. The Pelagian idea that man is competent to determine his own character, conduct, and destiny was repugnant to him, and he strove to show that the initial and determining element in the salvation of the individual is not the human, but the divine, will. He based his position upon the doctrine of original sin and the consequent depravity of the will. This doctrine represents the whole human race as involved in moral ruin, guilty and sinful, incapable of self-regeneration or of willing what is good. By God alone, therefore, can regeneration and deliverance be accomplished. The salvation designed by God must not be allowed to depend for its efficacy on the depraved and incapable will of man; it must be an absolute act of power on God's part. Provision must be made not only for the offer but for the acceptance of grace. In a word, grace must be effectual or irresistible.

At the Reformation the discussion was drawn back from the endeavor initiated by the schoolmen to find for the doctrine of predestination a scientific basis in the nature of God and His connection with the world. The more circumscribed method of Augustine was reverted to, and it was deemed sufficient to show that predestination was indispensable to the ideas of grace which found a response in the devout Christian consciousness, and that it was in harmony with Scripture. Not only Calvin, but much more unguardedly Luther, and even Melancthon in the earliest (1521) edition of his *Loci Communes*, taught the most rigid Augustinian doctrine. In the later editions (1535, 1543) Melancthon greatly modified his opinions and inclined more to the synergistic view, though even in this he was not thoroughgoing. But the attempt to terminate the synergistic controversy saddled the Lutherans with a symbol—the *formula concordie*—which, awkwardly enough, rejected both the Semipelagian theory of coöperation and the Augustinian doctrine of predestination. The consequence has been that later Lutheran theologians, in their efforts to purge their church of this inconsistency, have devised the theory that man, unable as he is to will any good thing, can yet use the means of grace, and that these means of grace, carrying in themselves a divine power, produce a saving effect on all who do not voluntarily oppose their influence. Baptism, *e.g.*, confers grace which, if not resisted, is saving. And God, foreseeing who will and who will not resist the

grace offered, predestinates to life all who are foreseen as believers.

PREÈMPTION. See SALE.

PRELATE. See ABBOT and BISHOP.

PRELLER, FRIEDRICH, German landscape-painter, was born at Eisenach April 24, 1804. He was also a successful etcher, and died at Wiemar April 23, 1878.

PRELLER, LUDWIG, author of well-known works on Greek and Roman mythology, was born at Hamburg, September 15, 1809, and died in 1861.

PRENZLAU, or PRENZLOW, a town of Prussia, in the province of Brandenburg, lies on the lower Ucker See, sixty miles north-by-east of Berlin and thirty miles west-by-south of Stettin. In 1880 Prenzlau contained 16,933 inhabitants, nearly all Protestants and many of French descent. The garrison consists of about 800 men.

PRERAU (Slav. *Prerov*), one of the oldest towns in Moravia, lies on the Bečwa, thirteen miles to the southeast of Olmütz. The population in 1880 was 10,985.

PREROGATIVE, in law, is an exclusive privilege of the crown. The word, originally an adjective, is derived from the *centuria prerogativa*, or century which voted first on a proposed law (*rogatio*) in the Roman *comitia centuriata*. In English law, Blackstone says, "by the word prerogative we are to understand the character and power which the sovereign hath over and above all other persons, in right of his regal dignity; and which, though part of the common law of the country, is out of its ordinary course."

PRESBYTER. Toward the end of the second century the organization of the Christian congregations throughout the Roman empire, at least of all the greater ones, was identical. At the head of each was the bishop, whose function it was to conduct public worship, control the church funds, and keep watch over the manners of his flock. The free prophets and teachers having almost everywhere died out, the duty of religious instruction and edification also fell on him. In conducting the worship and in ministering to the wants of the poor he was assisted by the deacons as his subordinates. The presbyters formed a college, whose business was that of advising the bishop. Of this college he was the president, and as such he was himself a presbyter, and conversely the presbytery, inclusive of the bishop, formed the governing body of the community. Outside of the presbytery the individual presbyter as such had no definite official duties. If he baptized, celebrated the eucharist, preached, or the like, this was only as commissioned and deputed by the bishop. Such deputation was frequently necessary, and therefore the presbyter behaved as far as possible to be qualified to teach. As member of the college, which before everything had to do with jurisdiction and discipline, it was required of him that he should be of blameless life, that he should administer just judgment without respect of persons, and that in private life also he should as occasion offered exhort and admonish the faithful and set before them the law of God. The presbyters, who as a rule were expected to be men of advanced years, were, like the bishop and the deacons, chosen by the congregation.

The office of presbyter was not during the oldest period (90-140) a *spiritual* one. The apostle, the prophet, the teacher, in a certain sense also even the old bishop and deacon, had a spiritual character, for they possessed a charisma. It was not so with the presbyters; they had no charisma, and the respect in which they were held arose out of the *natural* position which they took within the congregations.

PRESBYTERIANISM. The Presbyterian form

of church government began at the Reformation, and attained development only in the churches commonly called "Reformed."

In 1526 John Brenz drew up at Halle (Swabia) a scheme including elders, ministers chosen from the elders, and councils, by which the elders were chosen by the government, who also had the final decision in all questions of importance. Franz Lambert, at the same time, provided for the church at Hesse provincial synods, representative of the churches, and a general or land synod, under the control of the government. Within the limits of a congregation the scheme was purely congregational. At Ziegenhain, in 1539, a decided advance was made toward autonomy, as only half the elders, who had extended powers, were there chosen by the government. Zwingli theoretically gave the power to the congregation, practically to the civil power, as being the representative of the church. In Basel, in 1529, the clergy alone had the power of church discipline. In 1530, however, Ecolampadius, fearing a spiritual tyranny, wished to join a body of elders with the clergy, to be chosen by the council, partly from its own body and partly from the congregation, four from each, who with the clergy would form the "censurum consensus." But the council, fearing the *imperium in imperio*, preferred four colleges, one for each parish, each college being formed by two members of the council, one of the congregation, and the minister; and the council also retained the final decision regarding excommunication. At Strasburg (1531) the council created an assembly of the ministers of the seven churches, with three life elders from each, nominated by the council. In 1534 this system was modified: ordinary matters were settled each fortnight by the minister and three of the twenty-one elders. Difficult questions were carried to the twenty-one, and discipline, short of excommunication, to them with the seven ministers. Capito's system at Frankfort differed from this in that only three out of nine elders were elected by the council, and that the office was for three years only.

These all remained mere theories, limited, fragmentary, and abortive. Calvin set himself to create a majestic and comprehensive system and to give to it the double authority of argumentative statement and practical realization. He saw that the impulses and the aspirations of the Reformation were, for want of discipline, robbed of a large part of their dynamic force. He threw these forces and aspirations into the mold of his own genius, developed order out of tumult, and created a definite, yet elastic code, which should match the discipline of Rome and at the same time frustrate the anarchical tendencies of extreme Protestantism. The contrast with Luther is complete: Luther created, Calvin fashioned; "the watchword of the one was war, of the other order." Calvin, surrounded by Catholic powers, felt more strongly than Luther that a definite protest as to church government was necessary. His leading principles are that—(1) a separate ministry is an ordinance of God; (2) ministers duly called and ordained may alone preach and administer sacraments; (3) a legitimate ministry is one where suitable persons are appointed with the consent and approbation of the people, but that other pastors should preside over the election to guard against inconstancy, intrigue, or confusion, the final act of ordination, the laying on of hands, being confined to the pastors; (4) to cooperate with the pastors there should be "governors," whom he "apprehends" to be persons of advanced years, selected from the people to join with the pastors in admonishing and in exercising discipline; (5) discipline, the ordering of men's lives, is all-important and is the special business of the governors aforesaid.

With regard to the relations between the church and the state, Calvin was utterly opposed to the Zwinglian theory, whereby all ecclesiastical power was handed over to the state. The political administration, he says, is as necessary to human weakness as are food and light and air; but it has not the right to legislate for religion or divine worship, though it must take care that the gospel religion is not insulted or injured. "The church of God stands in need of a certain spiritual polity, which, however, is entirely distinct from civil polity, and is so far from obstructing or weakening it, that on the contrary it highly conduces to its assistance and advancement."

The course of events in Geneva had developed a theocratic feeling; and the essence of a theocracy seemed gained when the citizens were summoned by tens in 1536 to swear to the confession contained in Calvin's first *Catechism* (really an analysis of the *Institutes*). They swore as citizens, and those who refused lost their citizenship. As soon, however, as Calvin attempted to make this a reality trouble followed. His ruling idea was discipline, and this was exercised against both the moral and the spiritual libertines—against those who objected to the discipline of manners and those who disliked submission to the confession. As the reins were drawn tighter these two bodies gained influence in the council, and inveighed against the new popedom. At length, in 1538, when Calvin, Farel, and Conrad refused to give the communion in a city which, as represented by the council, would not submit to church discipline, the storm broke out. The three preachers were banished, and Calvin retired to Strasburg. This refusal of the sacrament is important as a matter of ecclesiastical history, because it is the essence of that whole system which Calvin subsequently introduced, and which rests on the principles that the church has the right to exclude those who, according to her judgment, appear unworthy, and that she is in no way subject to the state in matters of religion. For the present the state had refused to admit the claims of the church. Calvin laid down as the conditions of his return the recognition of the church's independence, the division of the town into parishes, and the appointment by the council of elders in each parish for excommunication. The feeling, however, was for three years too strong; the banishment was confirmed on the specific ground that the insistence on excommunication was an attempt at despotic power. Calvin's absence left the town a prey to anarchy; one party threatened to return to Romanism, another to give up their independence to Bern. It was felt to be a *political* necessity to recall Calvin, and in 1541 he returned on his own terms. Meanwhile he had been maturing and carrying out his system in the French and Walloon churches in Strasburg.

In 1549 Lasky, who had established a flourishing church at Emden, was driven to London. There in 1550 he became superintendent of the foreign congregation, which was independent of the state church, but which was intended by the king to serve as a model to be followed when England should be ripe for reform. This church was in two congregations, French and German. The French kept the Genevan system, the German a modification of it. In this latter the ministers, elders, and deacons were chosen by the written votes of the congregation, with revision and final decision by the officers already existing, though any objection on the part of the congregation must be duly considered. The strictest discipline was carried out.

*Scotland.*—The initial conditions of Scottish Presbyterianism are seen in the historical facts—(1) that the Reformation was the form taken by the triumph of a violent and grasping aristocracy over the encroachments

of the sovereign and an alien church; and (2) that John Knox was its spiritual leader. Under his advice the Protestant nobles in December, 1557, formed themselves into a covenanted body called "The Lords of the Congregation;" in 1559 Perth declared itself Protestant, and Knox's sermon there on May 11th was the manifesto of revolt. In 1560, being hard pressed, the lords concluded with England the Pacification of Berwick, and a few months later the treaty of Edinburgh, whereby the whole government was placed in their hands.

To the parliament which now assembled a petition was addressed praying (1) that a "true kirk of God" and the sound doctrines of the Reformation might be established, (2) that the true discipline of the ancient church might be restored, and (3) that the ecclesiastical revenues might be applied to the support of the ministry, schools, and the poor. Meanwhile the Reformers garrisoned, as it were, the country. Under Knox's agency Edinburgh, St. Andrews, Aberdeen, Jedburgh, Perth, Dunfermline, and Leith had fixed ministers appointed, while wider districts were placed under superintendents or traveling ministers. To meet the first prayer of the petition Knox and five other ministers drew up a scheme of doctrine and discipline. The *Confession of Faith*, produced within four days and ratified by the three estates on July 17, 1560, was naturally aggressive and uncompromising. It expresses abhorrence especially of the blasphemy of them "that affirme that men who live according to equity and justice shall be saved, what religion soever they have professed," and of all the doctrines of the Anabaptist. The civil magistrate is appointed for the "suppressing of idolatrie and superstition whatsoever." Above all, no mercy was to be shown to Catholicism; the celebration of mass was to be punished by death. To accomplish the second prayer of the petition the Reformed ministers and the leading Protestant nobles met at Edinburgh on December 20, 1560. This was a purely church meeting; parliament had in it no part whatsoever. Even in its birth the Scottish Church announced its independence. It will, however, be observed that there were in the forty-six members comprising it but six ministers. At this assembly was drawn up the *First Buik of Discipline*, which, though not accepted by the privy council, was on January 27, 1561 signed by the great majority of the members, and by the chiefs of the great Protestant families, on the noteworthy condition that the deposed prelates were allowed to enjoy their benefices during life. This book, which was a grand effort to reconstruct society, and for which its authors asserted, "they took not their example from any kirk in the world—no, not from Geneva," was nevertheless on the Genevan principle.

Care was taken to preserve the rights of the congregation: "It apperteaneth to the Pepill, and to everie several congregation, to elect their minister. \* \* \* Altogether this is to be avoided that any man be violently intruded or thrust in upon any congregation." But, once elected, he is irremovable, except for heinous crimes or by the majority of the whole kirk. Of course he is strictly "examined" as regards both "lyiff and maneris" and "doctryne and knowlege," and especially as to his grasp of the chief points of controversy with Papists, Anabaptists, etc. No special method of nomination of elders is laid down, but from those nominated the whole congregation is to choose, special care being taken "that every man may gyf his vote freelie." The liberty of the churches is preserved by making the elections of elders and deacons annual. The affairs of each congregation were managed by the kirk session (French "consistoire"), which met at least once a week. In every considerable town another weekly meeting was held, called

the "exercise of prophesying," which in course of time became the presbytery or classical assembly (colloque). It was formally erected in 1579, and generally introduced in 1581. Then, again, the superintendent, with the ministers and delegated elders of his district, formed what developed into the provincial assembly. To this any one aggrieved by the kirk session might appeal, and, if necessary, the appeal went to the general assembly. This right of appeal was given in 1563. The general assembly, composed of delegated ministers and elders, into the constitution of which a change similar to that in France in 1565 was introduced in 1568, met as occasion served.

During the troublous years 1566-7 the kirk, stable in a time of confusion, consolidated her strength, and within her own bounds established the strictest discipline. In 1567 parliament made the monarchy Protestant, ratified the rights of the church to collation, and established the important principle, resisted from time to time, that the "thirds" of benefices should be henceforth collected by persons nominated *by herself*, and that she should pay the surplus into the exchequer after satisfying the ministers' stipends. Her progress may be gathered from the fact that, while in 1560 the general assembly contained only six ministers and thirty-four laymen, in 1567 it contained 252 ministers and 467 readers. Her power is seen in the censure passed upon the countess of Argyll, the earl being the most powerful of the nobility, for assisting at the baptism of Mary's son with Catholic rites.

In 1574 Andrew Melville appeared on the scene, and, by steady persistence gave fresh life to the church. The *Second Book of Discipline*, sanctioned by the general assembly in April, 1578, and ordered in 1581 to be registered in the acts of the church, represents her determination to repel the aggressions of the nobility. It was decreed that no more bishops should be appointed, that the existing ones should be called by their own names, not by their titles, and that they should submit to the general assembly for disposal.

The *First Book of Discipline* occupied itself chiefly with the congregation, the *Second Book* with the dependence of the congregation upon higher courts. It did away with superintendents and established complete parity among ministers, transferring discipline and authority from individuals to bodies of men.

The contest which was waged during 1582-84 between the kirk and the crown was chiefly concerned with the denial by Melville of the primary jurisdiction of the privy council over ministers summoned for offenses committed in their ministerial capacity. He demanded in his own case to be tried, in the first instance, by the ecclesiastical courts. A more important case of the same claim, because connected with less important persons, occurred in 1591, and the demand of the church was allowed so far that the offender was tried in both courts concurrently. In May, 1584, the parliament met secretly and, having been thoroughly corrupted by the court, passed the "Black Acts." Act 2 declared Melville's claim to be treason; act 4 forbade presbyteries, synods, and assemblies, as being not allowed by parliament; act 20 reestablished episcopacy and made it treason to speak against any of the three estates (*e.g.*, bishops). The king was made supreme in all cases and over all persons, while none were to presume "to meddle with the affairs of his Highness and estate." The course of events from 1584 to 1592, the fear of Catholic Spain, the league with England, and especially the ability of Robert Bruce led to a settlement, by which in May, 1592, Presbyterianism was restored and ratified by parliament. It was of course a compromise, as is shown in the provision that, if a presby-

tery refuse to admit a qualified minister, the patron may retain the income.

The quarrel, however, was not to be settled. For rejecting the bill of attainder against the popish lords the synod of Fife excommunicated James and convened a meeting from the whole kingdom to complain of his conduct. A little later Andrew Melville, when sent on a deputation, called James "God's silly vassal," and told him that there were two kings and two kingdoms in Scotland; King James the head of the commonwealth and Christ Jesus the head of the church, whose subject he was. James, however, was strong enough to remain inflexible and to secure a victory on the question of the church courts, which, in the case of David Black, one of the ministers of St. Andrews, who had in a sermon reflected upon the queen and Church of England, had arisen in its most acute form.

Two alternative steps were now suggested for preventing future strife, the establishment of episcopacy or the admission into parliament of representatives of the church without any title or jurisdiction derived from the crown. In a general assembly opened at Perth on February 29, 1597, and packed with ministers from the remote northern presbyteries, where the democratic spirit of the High Presbyterians of the south was unknown, James obtained leave to suggest in a future assembly alterations in the existing government of the church, a disapproval of the discussion of state questions and of the denunciation of individuals from the pulpit, and the forbidding of extraordinary conventions. Ministers were also to confine their discourses strictly to their own congregations, and summary excommunication was abolished. He had previously with a high hand put down the opposition of the Edinburgh ministers, Bruce and others seeking safety in flight.

In April, at Dundee, an assembly similar to that of Perth consented that commissioners should be appointed to advise the king on church affairs, which step in a great degree freed him from the general assembly. These commissioners were easily induced to petition that the church might be represented in parliament. Parliament thereupon passed an act allowing those to sit there who might be appointed *by the king*, as bishop, abbot, or other prelate, the duties of their offices to be determined in conference with the assembly. At the second assembly of Dundee, however, which met on March 7, 1598, and at which Andrew Melville was refused admittance by James on frivolous though legal grounds, it was resolved that fifty-one representatives of the church, chosen partly by the king and partly by the church, should vote in parliament.

Almost the first act of Charles I. was to proclaim the strict observance of the articles of Perth. In November 1625 he revoked all the acts of his father prejudicial to the crown, as a first step toward the resumption of the church lands. This, of course, met with the vehement opposition of the nobility, and the scheme in the end had to be given up. In 1630 Maxwell, in Laud's confidence, was sent to Scotland to try to force upon the people the English liturgy. It is significant of the change in feeling that a paper of grievances sent in by ministers was supported by several of the nobility. Their hatred was always directed to the nearest enemy, against the crown before the Reformation and during its early stages, against the Reformed Church of late years, now against the crown again. In 1633 Charles came to Edinburgh and forced through the convention the "Act anent his Majesty's Prerogative and Apparel of Churchmen," a combination of two acts passed in 1606 and 1609 respectively. All protests were disregarded and the whole nation was thrown into a state of anger and disappointment. The attack on Balmerino still

further alienated the lords. In 1635 diocesan courts were erected with the most vexatious powers, and the *Book of Canons*, subversive of Presbyterianism and insulting in language, was distributed; and in 1636 the people were ordered to adopt Laud's book of public worship; while in July, 1637, the prelates obtained an order of outlawry against ministers who should be backward in receiving the liturgy. As Baillie said, they were like to go "to Rome for religion, to Constantinople for policy." On July 23d, however, the outburst of St. Giles' took place. The history of the great rising cannot be traced here. The National Covenant, which was its outcome, drawn up by Alexander Henderson and Johnston of Warriston, consisted of the *Second Book of Discipline*, a recapitulation of the acts of Parliament condemning Popery and ratifying the acts of the general assembly, and the application of the whole to present times.

After some months of trickery and evasion, frustrated with firmness and ability by the Covenanters, the general assembly met on Wednesday, November 21 1638. When they determined to sit in judgment on the prelates, Hamilton, the king's commissioner, dissolved the assembly. It, however, continued its sitting, refused to acknowledge the assemblies which had introduced prelacy, condemned the acts of Perth and all the late innovations, and abjured all episcopacy different from that of a pastor over a particular flock. Baillie alone made a stand for not rejecting episcopacy as represented by the superintendents of Knox's time. Eight prelates were excommunicated, four deposed only, two reduced to the simple pastorate. All church assemblies were restored, and the principle that the consent of the congregation was necessary to a minister's appointment was reënacted. Schools and schoolmasters were at once to be provided. In August, 1639, an act was passed, called the Barrier Act, that no change should be made in the laws of the church until the proposal had been submitted to all provincial synods and presbyteries. The church was now secure. She had gained the day as against the crown, and had taken her affairs into her own hands.

Passing over the events of the next six years, as coming more conveniently under the head of England, we notice that the moment external danger was removed the natural and abiding antipathy between a licentious and entirely selfish aristocracy and a masterful, censorious, and democratic church broke out. Two parties showed themselves—that of the ministers, who insisted that no arrangement should be come to with Charles unless he would take the covenant (compare the French "consistoriaux"), the other headed by Hamilton, Lanark, Lauderdale, and others, who "engaged" to raise an army for him on condition, ostensibly, that he would confirm Presbyterian church government for three years. The real conditions, as long believed but only just discovered, contain not a word about the church, but are entirely concerned with the privileges of the Scottish nobility. A vehement disruption of the church at once took place and did not cease until the defeat of Hamilton. Then the ministers were once more masters. Parliament repealed the Act of Engagement and passed the Act of Classes, whereby all those to whom the church deemed it inexpedient to give political power were registered in four classes according to their faults. It was by this parliament that lay patronage was abolished, and that the rights of the congregation as to election of ministers were settled for the time. After the battle of Dunbar, when troops were being hastily raised, the Act of Classes stood much in the way. In spite of the remonstrances of Patrick Gillespie and the western Covenanters, the commission of the

assembly (which sat *en permanence* during the recess of the assembly itself) resolved to allow all persons to serve who were not professed enemies to the Covenant or excommunicated. The parliament went further and rescinded the Act of Classes altogether. Against this union of the church with the "malignants" Gillespie's faction protested, and henceforward the rivalry and bitterness between Resolutioners and Protesters, the latter being favored by Cromwell, deprived the church of much of its power of resistance. Both parties, absorbed in their quarrel, looked on while Monk, after the battle of Worcester (1651), took the matter into his own hands by refusing to allow any general assembly whatever to meet, though he permitted the continuance of the other assemblies.

Within two years of the Restoration the Presbyterian Church ceased to exist. Weariness, internal dissension, the indifference or positive hatred of the nobles, and the extremity of treachery in James Sharp brought about the downfall. Finally, on August 14, 1661, episcopacy was restored by proclamation; Sharp, Fairfoul, Hamilton, and Leighton were consecrated in London; and on January 2, 1662, all Presbyterian assemblies of every sort, unless authorized by the prelates, were forbidden.

Revolt soon followed; it was crushed at Pentland and ruthlessly punished. But the nobles speedily became jealous of the growing power of the prelates. Lauderdale in especial saw his influence threatened. He reported to Charles that prelacy was becoming as great a danger to the crown as Presbyterianism had been, "so unwilling are churchmen, by whatever name they are distinguished, to part with power." Sharp was easily threatened and cajoled, and Burnet, after a struggle of three years, was forced to resign. It was not, however, until after the fall of Clarendon in 1667 that indulgence was seriously tried there as in England. In July, 1669, ten ministers, of whom Hutcheson was the chief, who were willing to admit the ecclesiastical supremacy of the king, and to accept the bishops' collation, were allowed to return to their livings, and were henceforth known as the "bishops' curates." This subservience caused a renewal of the breach in the church; from that time on the feud between the "Indulged" and the "non-Indulged" took the place of that between Resolutioners and Protesters. Forty-two ministers accepted the indulgence. A second indulgence followed in 1672. From Lauderdale's marriage with Lady Dysart until 1687 there ensued a policy of extermination, borne with marvelous fortitude. To Covenanters had succeeded Protesters, to Protesters Conventiclers, to Conventiclers now succeeded Hamiltonians, to Hamiltonians Cameronians or Society People.

On November 5, 1688, William landed at Torbay; the bishops' curates were ejected without violence; no retribution was taken, but Presbyterianism quietly reasserted itself as the form of church government natural to the Scottish mind. Presbyterianism, however, was not now what it had been in the days of Andrew Melville or in 1638. The last twenty-six years had thoroughly cowed a great part of the nation, and a new generation had come to manhood who could not even remember the time when Scotland was not Episcopal. The nobles had no interest to serve in reëstablishing the old form; the very ministers were those who had conformed or had accepted indulgence. Out of the 400 ejected in 1663 only sixty now survived. Moreover, Scotland had not escaped the wave of latitudinarianism that had come over all forms of Protestant religion. Most of all, the character of William III. and his confidential adviser Carstares affected the nature of the settlement. William was above all a statesman, and a tolerant statesman, and he wished for union of the mod-

erate parties in both kingdoms; on taking the coronation oath he refused to swear the clause binding him to root out heretics and enemies of the true worship of God. The claim of right, too, avoids any assertion of the *jus divinum* of Presbyterianism. But on July 22, 1689, its declaration that prelacy had been an insupportable grievance was made into an act by the convention of estates, and all acts in favor of episcopacy were rescinded. In April, 1690, the Act of Supremacy was also rescinded; ministers ejected since 1661 were replaced, and the Presbyterian government of 1592 (thus avoiding all mention of the covenants) restored; lay patronage was abolished, but pecuniary compensation was granted. On October 16, 1690, the first general assembly since 1653 met, when the preliminary act was to receive into the national church the remaining three ministers of the Cameronians (Thomas Lining, Alexander Shields and William Boyd). Their followers, however, regarded this as a compromise with Satan, and kept themselves aloof. Episcopalian ministers who subscribed the confession and obeyed the Presbyterian government retained their livings, and all sentences of Resolutions and Protesters against one another were rescinded. Mr. Hetherington well says, "Without a clear conception of this point it is impossible to understand the subsequent history of the Church of Scotland. In consequence of the introduction of the prelatic party the church thenceforward contained within its pale two systems, that of the old and true Presbyterian subsequently known as the 'evangelical,' and that of the new and semi-prelatical, subsequently known as the 'moderate.' Thenceforward the history of the Church of Scotland is the history of the protracted struggle between these two systems, which were necessarily irreconcilable."

In the first case of friction with the crown, which occurred in 1691, a compromise was effected—the church successfully asserting its autonomy by granting only part of the privileges which William desired for the Episcopal clergy. The critical dispute occurred when parliament imposed a new oath of allegiance, the taking of which was made a necessary qualification for sitting in the assembly. The church denied the right of the crown to impose a civil oath as a condition of spiritual office; and a serious breach would have occurred but for the efforts of Carstairs, who induced the king to give way at the last moment. Having thus asserted her independence, the church conceded to William nearly all he had asked for on behalf of the Episcopalians. In 1696 the parish schools were established. In 1698, to vindicate the church from the charges of backsliding, the general assembly published the *Seasonable Admonition*, which claimed in emphatic language the dependence of the church on Christ alone, and repudiated the doctrine that the inclination of the people was the foundation of Presbyterianism. In 1701 the first condemnation of heresy took place.

The spirit of watchfulness on the part of the church increased during Anne's reign. In naming commissioners for the Union the parliament forbade them to mention the church. The extreme section indeed regarded the Union itself as a violation of the Solemn League and Covenant. The Act of Security provided that the *Confession of Faith* and the Presbyterian government should "continue without any alteration to the people of this land in all succeeding ages," and the first oath taken by the queen at her accession was to preserve it. The Union, however, tended to Anglicise the upper classes, and thus to increase the latitudinarianism which was finding its way within the church. Politically speaking, the settlement of the Scottish Church was of great importance to the government during the Jacobite

intrigues, for its attitude was one of vigilance against all that was favorable to prelacy, and its influence consolidated opinion against the Stuarts.

The High-Church revival of 1710, however, had its effect upon the church. In 1711 an Episcopalian named Greenshields used the English liturgy in Edinburgh. He was condemned by the Court of Session; but the House of Lords reversed the decision, and imposed heavy damages on the magistrates who had closed his chapel. In 1712 a Bill of Toleration, which allowed Episcopalian dissenters to use the English liturgy, was hurried through both houses, in spite of the urgent remonstrances of the Scottish commissioners, and on April 22d lay patronage was restored. This latter act, as violating the Act of Security, has never been regarded as valid by the severer Presbyterians. That no further resistance was made than by protests and petitions, shows how far the "moderatizing" spirit had spread. The remnant of the Cameronians, who were outside of and discouraged by the church, alone met and renewed the Covenant after solemnly acknowledging the sins of the nation.

The progress toward Arminianism, due to the influence of Baxter's writings and to the training of the young ministers in Holland, may be seen in the treatment of Professor Simson and in the Auchterarder case. It was now that Neonomianism, or the doctrine that the gospel is a new law, promising salvation upon the condition of the abandonment of sin, began. Its first victory was when the general assembly condemned the doctrines of the *Marrow of Modern Divinity*, and rebuked the twelve ministers who had sent in a representation against the decision. The Patronage Act was rapidly being accepted and was showing its effects chiefly in the neglect shown to the wishes of the congregations. In 1731 the right was given to the heritors and elders to "elect and call" instead of to "name and propose the person to the whole congregation to be approved or disapproved," and was made law without having first been submitted to the presbyteries according to the Barrier Act of 1639. This led to the first great schism. Ebenezer Erskine denounced the action of the assembly in two sermons. Being rebuked by the synod of Perth and Stirling, he appealed to the assembly, who approved the rebuke. With three other ministers he protested. The four were temporarily deposed by the assembly, and on December 6, 1733, they formed the "Associate Presbytery." In 1737 their number was largely increased, and they published their manifesto, the "Declaration and Testimony." Their final deposition, and the first schism, occurred on May 15, 1740.

For several years the wishes of congregations were ignored; wherever the presbytery refused to appoint at the will of the assembly, a "riding committee," often assisted by military force, carried out the decision. The civil courts were bound to obey the Act of Patronage, and therefore never upheld the congregation against a legal appointment. At length in 1752 the leader of the "moderate" party, Principal Robertson, seeing in this refusal of presbyteries the elements of endless confusion, and that temporary substitutes, *e.g.*, riding committees, were unconstitutional and bad in principle, determined that the presbyteries themselves should be compelled to carry out the decisions of the assembly. From the deposition of Thomas GILLESPIE (*q.v.*), a member of the presbytery of Dunfermline, who refused to act in accordance with the assembly's decision, is dated the second or "Relief" schism. Principal Tulloch says upon this: "The policy was so far successful; but the success was of that nature which is almost worse than defeat. It introduced order within the church. It crushed the revolt of presbv-

teries. It silenced in many cases popular clamor. But it quietly and gradually alienated masses of the people from the establishment." So rapidly did dissent spread that from a report presented to the general assembly in 1765 it appears that "there are now 120 meeting-houses erected, to which more than 100,000 persons resort, who were formerly of our communion, but have separated themselves from the Church of Scotland. This secession," the report adds, "is most extensive in the greatest and most populous towns." For the subsequent history of Presbyterianism in Scotland, see FREE CHURCH, UNITED PRESBYTERIAN CHURCH, and SCOTLAND (CHURCH OF).

Presbyterianism existed in England a few years after the Reformation, and although it was always in a subordinate position, still its struggles with both the Episcopacy and the Roundhead congregationalists are not devoid of interest to the student of church history. In Ireland Presbyterianism has existed since the Ulster colony was first founded. Here, too, the church underwent great trouble from both internal and external sources, several schisms having taken place in its economy. It has of late years been quite prosperous. In France, the organization of the church was completed about 1555. The church has been the victim of persecution at various times but at present is in a flourishing condition.

#### UNITED STATES.

Presbyterianism in the United States is a reproduction and further development of Presbyterianism in Europe. It differs from the latter in that the various types produced in Great Britain and on the continent of Europe combined to produce a new American type.

1. *The Colonial Period.*—The earliest Presbyterian emigration consisted of French Huguenots under the auspices of Admiral Coligny, led by Ribault in 1562 to the Carolinas and in 1565 to Florida. But the former enterprise was soon abandoned, and the colonists of the latter were massacred by the Spaniards. The Huguenots also settled in Nova Scotia in 1604 under De Monts. The later Huguenot colonists mingled with the Dutch in New York and with the British Presbyterians and Episcopalians in New England and the Carolinas.

English Puritanism emigrated under the auspices of the Virginia Company to the Bermudas in 1612. In 1617 a Presbyterian church, governed by ministers and four elders, was established by Lewis Hughes, and the liturgy of the isles of Guernsey and Jersey was used. From 1620 onward English Puritanism colonized New England. This was of the two types which developed from the discussions of the Westminster Assembly (1643-48) into Presbyterianism and Congregationalism. They coöperated in New England as they did in Old England in the county associations. The Plymouth colony was more of the Congregational type, the Massachusetts Bay colony more of the Presbyterian type. A mixed system was produced which has been happily called by Henry M. Dexter "a Congregationalized Presbyterianism or a Presbyterianized Congregationalism \* \* \* which was essentially Genevan within the local congregation and essentially other outside of it." Presbyterianism was stronger in Connecticut than in Massachusetts. Thence it crossed the borders into the Dutch settlements on the Hudson and the Delaware, and mingled with other elements in Virginia, Maryland, and the Carolinas.

Dutch Presbyterianism was planted in New Amsterdam, N. Y., in 1628, when the first Reformed Dutch church was organized by Jonas Michaelius with two elders and fifty communicants. This had a strong

Huguenot and Walloon representation. Services were held in the Dutch and the French languages and subsequently in the English language also. The Dutch churches spread along the valleys of the Hudson, the Mohawk, the Raritan, and the Passaic, and also on the Delaware. They continued in subordination to the classis of Amsterdam, Holland, until 1747.

Irish Presbyterianism was carried to America by an unknown Irish minister in 1668, by William Traill in 1683, and especially by Francis Makemie in the same year, an ordained missionary of the presbytery of Laggan, who was invited to minister to the Maryland and Virginia Presbyterians. He was a merchant and a man of executive ability, and was the chief instrument in establishing the presbytery of Philadelphia, and interesting the Presbyterians of London, Dublin, and Glasgow in the feeble state of their church in America. In 1704 he obtained aid from the London ministers and returned to America with two ordained missionaries, John Hampton (Irish) and George Macnish (Scotch).

Meanwhile the New England ministers had sent several missionaries to the banks of the Delaware; Benjamin Woodbridge and Jedidiah Andrews went to Philadelphia in 1698-1700; John Wilson became pastor of a Presbyterian church at Newcastle, Del., in 1098; Samuel Davis and Nathaniel Taylor supplied other churches in the vicinity. Seven of these ministers organized the presbytery of Philadelphia in 1706. Friction was caused by a contest between Gilbert Tennent and his friends, who favored Whitefield and his revival measures, and Robert Cross and his friends, who opposed them. Passions were deeply stirred when the synod met in 1741. The moderate men remained away. The Cross party brought in a protestation to the effect that the Tennent party were no longer members of the synod; and thus the synod suddenly broke in two. The New York presbytery declined at first to unite with either party, and endeavored to bring about a union, but in vain. The Tennent party were found at length to be more reasonable, and the New York presbytery combined with them in establishing the synod of New York, which was called the New Side in contradistinction to the synod of Philadelphia, which was called the Old Side.

The synod of New York and Philadelphia embraced only a portion of the Presbyterian ministers of the middle colonies. In the Carolinas Presbyterianism had an independent development. There was a considerable Scottish emigration between 1684 and 1687. William Dunlop ministered to them until 1688, when he returned to become principal of the university of Glasgow. A mixed congregation of English Puritans and Scottish Presbyterians was organized at Charleston in 1690. In 1710 there were five churches, which combined to form the presbytery of James Island in 1722-23. This presbytery went through the same struggle with reference to subscription as the synod of Philadelphia, and the parties separated in 1731 into subscribers and non-subscribers.

2. *From the Revolution to the Civil War.*—During the war of the Revolution the Presbyterian churches suffered severely. The ministers and people, with scarcely an exception, entered upon the struggle for constitutional liberty with all their souls. The Presbyterian Church was the church of constitutional government and orderly liberty. The Presbyterians exerted great influence in the construction of the constitution of the United States, and the government of the church was assimilated in no slight degree to the civil government of the country.

In 1785 the synod of New York and Philadelphia took steps for the organization of a general assembly and also with a view to the union of all the Presbyte-

rian bodies into one. In 1789 the synod resolved itself into a general assembly of four synods, which, after revising the chapters relating to church and state, adopted the Westminster symbols as their constitution, "as containing the system of doctrine taught in the Holy Scriptures," and they made them unalterable without the consent of two-thirds of the presbyteries and the general assembly. In 1798 another effort was made for union with the Reformed Dutch and the Associate Reformed, which failed. Three years afterward a plan of union with the general association of Connecticut was agreed upon by the general assembly, and the work of home missions in the western section of the country was prosecuted jointly. The result was mixed churches in western New York and the new States west of the Alleghany Mountains, which grew into presbyteries and synods having peculiar features midway between Presbyterianism and Congregationalism.

The revivals in Kentucky brought about differences which resulted in the high-handed exclusion of the revivalists. These formed themselves into the presbytery of Cumberland, February 4, 1810, which grew in three years into a synod of three presbyteries. In 1813 they revised the Westminster confession and excluded, as they claimed, fatalism and infant damnation.

A great and widespread revival marked the opening years of the century, resulting in marvelous increase of zeal and numbers in the churches. New measures were adopted, doctrines were adapted to the times and occasions, and ancient disputes were revived between the conservative and progressive forces. Theological seminaries had been organized at Princeton in 1812, at Auburn in 1820, at Hampton Sydney in 1824, Alleghany in 1827, Columbia in 1828, Cincinnati in 1829, and Union Seminary, New York, in 1836. Differences in doctrine as well as polity and discipline became more and more prominent.

The agitation with reference to African slavery threw the bulk of the Southern Presbyterians on the Old Side, which was further strengthened by the accession of the Associate Reformed. In 1834 a convention of the Old Side was held in Philadelphia, and the "Act and Testimony" was adopted, charging doctrinal unsoundness and neglect of discipline upon the New Side, and urging that these should be excluded from the church. The moderate men on both sides opposed this action, and strove for peace or an amicable separation, but in vain. In 1837 the Old Side obtained the majority in the general assembly for the second time only in seven years. They seized their opportunity and abrogated the "Plan of Union," cut off the synod of Western Reserve, and then the synods of Utica, Geneva, and Genesee, four entire synods, without a trial, and dissolved the third presbytery of Philadelphia without providing for the standing of its ministers. This revolutionary proceeding brought about the second great rupture in the Presbyterian Church. The New Side men met in convention at Auburn, in August, 1837, and adopted measures for resisting the wrong. In the general assembly of 1838 the moderator refused to recognize the commissioners of the four excised synods. An appeal was made to the assembly and the moderator's decision reversed. A new moderator was chosen, while the assembly adjourned to another place of meeting. The Old Side remained after the adjournment, and organized themselves, claiming the historic succession. Having the moderator and clerks from the assembly of 1837, they retained the books and papers. Thus two general assemblies were organized, the Old and the New School. An appeal was made to the civil courts, which decided in favor of the New School; but this decision was overruled on a technical point of law by the court in bank,

and a new trial ordered. It was deemed best, however, to cease litigation and to leave matters as they were.

Several years of confusion followed. In 1840 we have the first safe basis for comparison of strength.

	Ministers.	Churches.	Communicants.
Old Side.....	1,308	1,898	126,583
New Side .....	1,234	1,375	102,000

The churches remained separate throughout the remainder of this period. The North was especially agitated by the slavery question, and the anti-slavery element became so strong that the Southern synods of the New School assembly felt constrained to withdraw in 1858. They organized the United Synod of 4 synods, 15 presbyteries, 113 ministers, 197 churches, 10,205 communicants. Just before the outbreak of the Civil War in 1861 these churches numbered:—

	Synods.	Presbyteries.	Ministers.	Churches.	Communicants.
Old Side .....	33	171	2,656	3,531	292,927 (1860)
New Side .....	22	104	1,523	1,482	134,933 (1860)
United Synod ..	4	15	113	197	10,205 (1858)
Cumberland Presbyterian	23	96	890	1,189	82,008 (1859)

The Civil War in separating the people of the North from the people of the South also brought about a separation of churches. Some of the breaches have been healed, others remain until now.

In 1861 the Southern section of the Presbyterian Church withdrew from the Northern and organized the general assembly of the Presbyterian Church in the Confederate States of America, with 11 synods, 47 presbyteries, about 700 ministers, 1,000 churches, and 75,000 communicants. In 1865 this body united with the United Synod of the South, and increased its strength by 120 ministers, 190 churches, and 12,000 communicants. After the close of the war the name of the denomination was changed to "the Presbyterian Church in the United States." In 1867 this church was joined by the presbytery of Patapsco, in 1869 by the synod of Kentucky, and in 1874 by the synod of Missouri, all of which had separated from the Northern church.

The war also united the Northern churches more closely together, and there was an increasing desire for organic union. An effort was made to combine all the Presbyterian bodies of the North in 1867, but in vain. In 1869, however, the Old and New School churches of the North combined on the basis of the common standards.

The American Presbyterian churches have always been marked by a zeal for missions.

The tendency of Presbyterianism in the United States is to adapt itself to the circumstances of the country.

PRESCOT, a market-town of Lancashire, is situated on rising ground on the Liverpool and Wigan branch of the London and Northwestern Railway, eight miles east of Liverpool and twenty-eight west of Manchester. Population, 8,000.

PRESCOTT, WILLIAM HICKLING, historian, born in Salem, Mass., May 4, 1796. After graduating honorably in 1814, he entered his father's office as a student of law. On May 4, 1820, he was married to Miss Susan Amory. Prior to his marriage he had made a few experiments in composition which had obtained no further publicity than that of his own circle of friends, but he now finally decided to devote his life to literature. Of the direction and quality of his

thought at this time he has left indications in his papers on *Essay-Writing* (1822) and on *French and English Tragedy* (1823).

In the meantime his aims had been gradually concentrating. History had always been a favorite study with him, and Mably's *Observations sur l'Histoire* appears to have had considerable influence in determining him to the choice of some special period for historic research. He was happy in the possession of both ample means and admirable friends to supply so far as might be the necessary materials, and of a wide leisure in which to give them literary shape and polish; and he sketched with no undue restriction or hesitancy the plan of the *History of the Reign of Ferdinand and Isabella*—his first great work. On October 6, 1829, he began the actual work of composition, which was continued without more serious interruptions than those occasioned by the essays on *Asylums for the Blind* (1830), *Poetry and Romance of the Italians* (1831), and *English Literature of the Nineteenth Century* (1832), until June 25, 1836, when the concluding note was written. Another year, during which his essay on *Cervantes* appeared, was spent in the final revision of the *History* for the press, in which the author was ably assisted by two friends, of whom Gardiner, the son of his schoolmaster, criticised the style and Folsom verified the facts. Its success upon its publication in Boston was immediate, the five years' contract being discharged in a few months. After coquetting for a short time with the project of a life of Molière he decided to follow in the track of his first work with a *History of the Conquest of Mexico*. Washington Irving, who had already made preparations to occupy the same field, generously withdrew in his favor; and in May, 1838, Prescott began his first reading in the subject. The work was completed in August, 1843, the five years' labor having been broken by the composition of reviews of Lockhart's *Life of Scott* (1838), Kenyon's *Poems* (1839), *Chateaubriand* (1839), Bancroft's *United States* (1841), Mariotti's *Italy* (1842), and Madame Calderon's *Life in Mexico* (1843), and by the preparation of an abridgment of his *Ferdinand and Isabella* in anticipation of its threatened abridgment by another hand. On December 6, 1843, the *Conquest of Mexico* was published with a success proportionate to the wide reputation won by his previous work.

In February, 1845, he received the announcement of his election as corresponding member of the French Institute in place of the Spanish historian Navarrete, and also of the Royal Society of Berlin. The winter found him arranging for the publication in England of the selection from his articles and reviews which appeared in 1845, under the title of *Critical and Historical Essays*, and which was issued almost contemporaneously at New York under the title of *Biographical and Critical Miscellanies*. After some minor interruptions—his removal from the old mansion-house in Bedford street to the house in Beacon street, visits to friends, and a renewed failure of sight—the *Conquest of Peru* was completed in November, 1846, and published in March following. His misgivings as to its reception were at once set at rest, and it was speedily issued in translations into French, Spanish, German, and Dutch, in addition to the English editions of New York, London, and Paris. He had been for many years collecting materials for a history of Philip II., but he hesitated for some time to attempt a work of such magnitude. The idea of writing memoirs was dismissed in favor of the more elaborate form, and in November, 1855, the first two volumes of his uncompleted *History of Philip II.* were issued from the press, their sale eclipsing that of any of his earlier books. This was his last great undertaking; but as Robertson's *Charles V.* in the

light of new sources of information, was inadequate to take its place as a link in the series, he republished it in an improved and extended form in December, 1856. A slight attack of apoplexy on February 4, 1858, foretold the end, though he persevered with the preparation of the third volume of *Philip II.* for the press, and with the emendation and annotation of his *Conquest of Mexico*. On the morning of January 27, 1859, a second attack occurred, and he died in the afternoon of the same day in his sixty-third year.

PRESCRIPTION in the broadest sense of the word denotes the acquisition or extinction of rights by lapse of time. The term is derived from the *præscriptio* of Roman law, originally a matter of procedure, a clause inserted before the *formula* on behalf of either the plaintiff or, in early times, the defendant, limiting the question at issue. (See PLEADING.) It was so called from its preceding the *formula*. One of the defendant's *præscriptiones* was *longi temporis* or *longæ possessionis præscriptio* (afterward superseded by the *exceptio*), limiting the question to the fact of possession without interruption by the defendant for a certain time (See POSSESSION). It seems to have been introduced by the prætor to meet cases affecting aliens or lands out of Italy where the *usucapio* of the civil law (the original means of curing a defect of title by lapse of time) could not apply. The time of acquisition by *usucapio* was fixed by the Twelve Tables at one year for movables and two years for immovables. *Præscriptio* thus constituted a kind of prætorian *usucapio*. In the time of Justinian *usucapio* and *præscriptio* (called also *longi temporis possessio*), as far as they affected the acquisition of ownership, differed only in name, *usucapio* being looked at from the point of view of pleading. By the legislation of Justinian movables were acquired by three years' possession, immovables by ten years' possession where the parties had their domicile in the same province (*inter presentes*), twenty years' possession where they were domiciled in different provinces (*inter absentes*). Servitudes could not be acquired by *usucapio* proper, but were said to be acquired by *quasi usucapio*, probably in the same time as sufficed to give a title to immovables. There was also a *longissimi temporis possessio* of thirty years, applicable to both movables and immovables, and requiring nothing but *bona fides* on the part of the possessor. Where the right sought to be established was claimed against the church, a still longer period of forty years (at one time a hundred) was necessary. Immemorial prescription was required in a few cases of a public character, such as roads. *Præscriptio* was also the term applied to lapse of time as barring actions upon contracts or torts under various provisions corresponding to the English Statutes of Limitation. The prescription of Roman land (and of modern systems based upon it) is thus both acquisitive and extinctive. It looks either to the length of time during which the defendant has been in possession, or to the length of time during which the plaintiff has been out of possession. In English law the latter kind of prescription is called LIMITATION, (*q.v.*) The tendency of law is to substitute a definite for an indefinite period of prescription.

*United States.*—The law of the United States (except in Louisiana) is based upon that of England, but the period of enjoyment necessary to found a title by prescription varies in the different States.

*International law* uses the term "prescription" in its wider or Roman sense.

PRESERVED FOOD. The perfect preservation of any substance for use as food implies the retention of its full nutritive power, sapidity, and digestibility, with its natural odor and color unimpaired, for such length

of time as may be required. The process employed must be sufficiently cheap to allow of the preserved food being placed in the market at a price which will insure a demand for it. The operations connected with the preparation of many food-substances are partly directed to the production of food in a new and more convenient form from that in which it is yielded by nature, and partly with the view of preserving the alimentary body. Cheese is an example of such a food-preparation, and to a smaller extent so also are butter and other edible fats and oils, as well as fruit and vegetable jellies and conserves. Concentrated foods and extracts, such as Liebig's extract of beef, belong to the same category, consisting of certain essential principles of animal food easily preserved, and prepared partly on that account.

Many of the most important food-staples require nothing more than favorable natural conditions for their preservation, till they are ordinarily required for consumption. Such is the case with the cereal grains, which are sufficiently ripened and dried in the harvest field, and with all hard farinaceous and oleaginous seeds, nuts, and fruits. Most soft succulent fruits and vegetables, on the other hand, and all varieties of animal food require artificial preservation, and it is to these that the various processes in use are applied. These processes resolve themselves into four groups—(1) drying, (2) use of antiseptics, (3) exclusion of air, and (4) refrigeration. Several hundreds of patents have been obtained in the United Kingdom alone for preservative processes coming under one or more of these heads; but in reality the methods of preservation in practical operation are not many.

1. *Drying* is the most ancient and primitive of all processes for preserving food, and, although it answers but imperfectly for most animal substances, yet in dry hot countries it is very extensively practiced.

Succulent fruits and vegetables are satisfactorily preserved by simple drying. The principal dried saccharine fruits of commerce are raisins, currants, figs, dates, and prunes. These differ in their nutritive properties considerably from the natural fruits they represent, as do also the farinaceous fruits and vegetables preserved by drying, such as the banana, bread-fruit, mandioc, etc.

2. *Use of Antiseptics.*—The variety of antiseptic substances which have been experimented with for the curing of food is numberless. Bodies solid, liquid, and gaseous have been proposed, and these have been variously recommended for superficial application, for injection, and for forming an artificial atmosphere around the substance to be preserved; and further, it has been suggested that the creature whose flesh is to be preserved should, before killing, be impregnated with the antiseptic by inhalation or otherwise. In practice the antiseptics used are very few in number, since many of them have a physiological effect on the digestive and other internal organs into which they are introduced with the food, and so must injure the health. Besides, many proposed antiseptics are either in themselves unpleasant in smell or taste, or alter the appearance, color, taste, or consistency of the food preserved. The least objectionable are substances which enter into human food themselves, such as certain salts, sugar, vinegar, and alcohol.

3. *Exclusion of Air.*—The principal method of food preservation dependent on the exclusion of air is the invention of François Appert and dates from 1809. It consists essentially in securing cooked food in hermetically sealed vessels from which the atmospheric air is as far as possible driven off before sealing, and in killing by heat or otherwise such germs or ferments as may re-

main within the vessel either before or after it is sealed up. At present the innumerable varieties of tinned foods, both animal and vegetable, are entirely the result of the application of Appert's principle. In practice there are several processes of "tinning" food, but the general method adopted is everywhere uniform in principle.

The tins used are manufactured with the greatest care, and most ingenious machinery has been devised for their thorough and expeditious preparation. The proper quantity of meat, generally, though not necessarily, free from bone, tendon, and undue proportion of fat, is weighed out and placed raw in the tin, over which the cover is soldered. In the cover a small "pin-hole" is left, and the tins are placed in a bath or boiler of solution of chloride of calcium, which boils at a temperature of from 260° to 270° Fahr. Each tin is immersed to within an inch or two of the top, and as the heat is gradually raised steam issues from the pin-hole, carrying off the atmospheric air from within the tin. When all the air has been expelled the pin-hole is promptly closed with a drop of solder, and the tin, hermetically sealed, is entirely immersed for some time in the superheated solution. When withdrawn and cooled, the tins are placed in a heated testing-house, in which after a few days those that have been imperfectly treated manifest their defects by bulging of the sides, due to the generation of gases from the putrefying mass they contain. Those which have been successfully preserved generally show both ends collapsed or depressed by the pressure of the air outside; and usually on a well-preserved tin being pierced the air is audibly sucked in. This method is the one which is employed in the extensive canneries and packing houses of America, and has been found eminently satisfactory.

About the year 1875 ice began to be used on a large scale for the preservation of fresh meat during its transit from America to the European markets. This, the first practically successful method of preserving fresh meat for such a period as enabled it to be sold in remote markets, consisted in cooling a large meat chamber hung full of carcasses by continually blowing into it air which had previously been cooled to near the freezing point by being made to pass through reservoirs of ice. The process was not all that could be desired, but it successfully solved a question which had previously been attempted many times and ways. It continued to be the method by which large quantities of fresh meat were brought in good condition to the European market, till in 1879 Mr. J. J. Coleman inaugurated a new era by the introduction, in conjunction with Mr. H. Bell and Mr. J. Bell, of his Bell-Coleman dry-air refrigerator.

PRESSBURG (Hung., *Pozsony*; Lat., *Posonium*), capital of the county of the same name and in former times also of the country, is a royal free town in Hungary, situated on the left bank of the Danube, in 48° 8' N. latitude and 17° 6' E. longitude. Pressburg is the see of an evangelical bishop, and the headquarters of one of the fifteen army-corps of the Austro-Hungarian army and of a honved district; its civil departments include finance, posts, land surveying, state forestry, public instruction, river regulation, and government buildings; it has also a district court of justice, a superior law court, and a chamber of trade and commerce.

PRESS LAWS. The liberty of the press has always been regarded by modern political writers as a matter of supreme importance. "Give me liberty to know, to utter, and to argue freely according to conscience, above all other liberties," says Milton in the *Areopagitica*. At the present day the liberty of the press in English-speaking countries is (with perhaps the single

exception of Ireland) a matter of merely historical importance. The liberty was a plant of slow growth.

The constitutions of Pennsylvania, Delaware, Maryland, and North Carolina, all enacted in 1776, are interesting as containing the earliest declarations of any legislative authority in favor of the liberty of the press. The same principle was afterward adopted in the constitution of the United States. By art. i. of the amended constitution, "Congress shall make no law \* \* \* abridging the freedom of speech or of the press." Art. iv. secures against warrants for the seizure of papers, except on probable cause supported by oath or affirmation and particularly describing the thing to be seized. The constitution of Louisiana is that in which the right of liberty of the press is declared with the greatest minuteness. By art. vi. s. 21 of the constitution of that State, "Printing presses shall be free to every person who undertakes to examine the proceedings of the legislature or any branch of the government, and no law shall ever be made to restrain the right thereof. The free communication of thoughts and opinions is one of the invaluable rights of man, and every citizen may freely speak, write, and print on any subject, being responsible for the abuse of that liberty." The acts of Congress dealing with the press are not numerous, as each State has for the most part its own legislation on the subject, dealing generally with, among other matters, the registration of newspapers, the monopoly of the State printer, and the right of giving the truth in evidence in defense to proceedings for libel. The act of August 18, 1856, forbids diplomatic or consular officers of the United States to correspond with any foreign newspaper in regard to the affairs of a foreign state. The act of March 3, 1873, prohibits the printing and circulation of obscene literature. By the act of June 23, 1860, the congressional printer has, except where otherwise provided by law, the monopoly of printing for the Senate or House of Representatives and the executive and judicial departments. State prosecutions for seditious libel were not infrequent in the early years of the republic; examples will be found in Wharton's *State Trials*.

*India*.—During the governor-generalship of Lord Lytton was passed the "Act for the better control of publications in Oriental languages," act ix. of 1878. (1) By this act copies of newspapers published out of British India are liable to forfeiture and seizure by warrant throughout the whole of British India if the papers "contain any words, signs, or visible representations likely to excite disaffection to the government established by law in British India, or antipathy between any persons of different races, castes, religions, or sects in British India." The governor-general may, by notification in the *Gazette of India*, exclude newspapers, books, etc., from British India.

Liberty of the press is the rule in most European states. This liberty is in almost every case secured by a constitution or organic law, the earliest being those of Sweden and Spain in 1812. In some states there is a tax upon newspapers and advertisements; in others, as in Sweden and Norway, there is none. In most states there is a government official newspaper, and a government printer, enjoying peculiar privileges.

*Mexico*.—A board or "junta" of censors existed during the Spanish dominion. The fundamental law of Mexico is now the constitution of 1857, as amended by subsequent additions. By art. vi. the expression of ideas cannot be the object of any judicial or administrative inquiry, unless in case of attacks on morality, public order, etc. By art. vii. the liberty of writing and publishing writings on any subject is inviolable. Censorship is abolished, and press offenses are to be

tried by one jury which testifies the act and another which applies the law and defines the penalty.

**PRESTER JOHN**. The history of Prester John is that of a phantom, taking many forms. It no doubt originally was based on some nucleus of fact or connected itself with some such nucleus, though what that nucleus was has been much controverted and is extremely difficult to determine. But the name and the figure which it suggested occupied so prominent a place in the mind of Europe for two or three centuries that a real history could hardly have a stronger claim to exposition here than this history of a will-o'-the-wisp.

The first mention of Prester John occurs in the chronicle of Otho or Otto, bishop of Freisingen. This writer states that when at the papal court in 1145 he met with the bishop of Gabala (Jibal in Syria), who related how "not many years before one John, king and priest (*rex et sacerdos*), who dwelt in the extreme Orient beyond Persia and Armenia, and was, with his people, a Christian but a Nestorian, had made war against the brother kings of the Persians and Medes, who were called Samiards (or Sanjards), and captured Egbatana their capital. The battle with those princes endured three days, but at last *Presbyter John*—for so he was wont to be styled—routed the Persians with immense slaughter. After this victory the aforesaid John was advancing to fight in aid of the church at Jerusalem; but, when he arrived at the Tigris, and found no possible means of transport for his army, he turned northward, as he had heard that the river in that quarter was frozen over in winter-time. After halting on its banks for some years (*per aliquot annos*) in expectation of a frost he was obliged to return to his own land. This personage was said to be of the ancient race of the Magi mentioned in the gospel, to rule the same nations that they ruled, and to have such a plenitude of wealth and glory that he used none but a scepter of solid emerald. It was as if by the example of his ancestors (they said) that he was proposing to go to Jerusalem when thus obstructed." We cannot say how far the report of the bishop of Gabala, or other rumors of the events on which this was founded, made an impression on Europe at that time. But there can be no doubt about the impression that was made some twenty years later (*c.* 1165) by the wide circulation of a letter which purported to have been addressed by the potentate in question to the Greek emperor Manuel. This letter, professing to come from "Presbyter Joannes, by the power and virtue of God and of the Lord Jesus Christ, Lord of Lords," is filled with the most extravagant details of the greatness and splendor of the writer. He claims to be the greatest monarch under heaven as well as a devout Christian and protector of Christians.

**PRESTON**, a market-town and municipal and parliamentary borough of Lancashire, is situated on the north bank of the Ribble, on the Lancaster Canal, and at the junction of several railway lines, twenty-eight miles northeast of Liverpool and thirty-one northwest of Manchester. Population (1891), 111,696.

**PRESTWICH**, a township of Lancashire, is situated on a branch of the Lancashire and Yorkshire Railway, four miles northwest of Manchester and five south of Bury. The population of the urban sanitary district (area, 1,917 acres) in 1871 was 6,820, and in 1891 it was 7,689.

**PRESUMPTION**. See **EVIDENCE**.

**PREVESA**, the chief town of a sandjak in the Turkish vilayet of Janina, commanding the entrance to the Gulf of Arta. Prevesa, which represents the ancient **NICOPOLIS** (*q.v.*), has a population of about 7,000.

**PRÉVOST, PIERRE**, was born in Geneva, March 3, 1751. He died at Geneva on April 8, 1839. **Prévost**

published much on philology, philosophy, and political economy; but he will be remembered mainly on two accounts—(1) his having published, with additions of his own, the posthumous memoirs of the ingenious Le Sage (see ATOM and ATTRACTION); and (2) his having first enunciated the theory of exchanges (see RADIATION), on which has been based one of the grandest experimental methods of modern times.

PRÉVOST D'EXILLES, ANTOINE FRANÇOIS, more commonly called the abbé Prévost, one of the most important French novelists of the eighteenth century, was born at Hesdin in Artois on April 1, 1697. He died in 1763.

PRÉVOST-PARADOL, LUCIEN ANATOLE, a writer whose career, except in its unhappy end, was typical of the importance of journalism in France, was born at Paris on August 8, 1829. He committed suicide at Washington, whither he had been sent as envoy to the United States, on July 20, 1870.

PRIAM. See TROY.

PRIAPUS, the Greek god of teeming flock and fruitful field. He was unknown to the earliest Greek poets Homer and Hesiod, but in later times his worship prevailed on the fertile coast of Asia Minor. Lampsacus on the Hellespont, nestling in its vineyards, claimed to be his birthplace.

PRIBRAM or PRZIBRAM, a prosperous mining town of Bohemia, is situated about thirty-two miles southwest of Prague. The population of Pribram in 1880 was 11,171, or, including the adjacent Birkenberg, where the largest mines are situated, 14,881.

PRICE, RICHARD, philosopher, son of a Dissenting minister, was born on February 23, 1723, at Tynton, in the parish of Llangeinor, Glamorganshire, Wales. He died in 1791.

PRICHARD, JAMES COWLES, the founder of ethnology or anthropology in England, was born on February 11, 1786, at Ross in Herefordshire, England, and died in 1848.

PRIDE, THOMAS, Parliamentary officer, was of humble origin, and is stated to have been brought up by the parish of St. Bride's, London. At the beginning of the Civil War he served as ensign under the earl of Essex, and gradually obtained promotion to the rank of colonel. He distinguished himself at the battle of Preston, August 17, 1648, and in Cromwell's Scottish campaign he held command of a brigade. He was noted for his resolute character and extreme anti-Royalist sentiments. After the Commons had voted that the king's concessions at Newport were a basis for a settlement, he was chosen by the army chiefs to effect their purpose of "purging" the Commons. Taking his stand at the entrance of the House of Commons with a written list in his hand, he caused the arrest of the Royalist members who were pointed out to him, and placed them in custody. After about a hundred members had been dealt with by this ordinance, subsequently known as "Pride's Purge," the mutilated House of Commons proceeded to bring the king to trial. Pride was one of the judges of the king, and signed his death-warrant. Under Cromwell he received the honor of knighthood, and was also chosen a member of the new House of Lords. He died at Nonsuch on October 23, 1658, and after the Restoration his body was dug up and suspended on the gallows at Tyburn along with that of Cromwell.

PRIDEAUX, HUMPHREY, dean of Norwich, was born at Place, England, on May 3, 1648. He died at Norwich on November 1, 1724, and was buried in the cathedral on November 4th.

PRIESSNITZ, VINCENZ. See HYDROPATHY.

PRIEST (Ger. *Priester*, Fr. *prêtre*) is a contracted

form of "presbyter" (*πρεσβύτερος* "elder;" see PRESBYTER), a name of office in the early Christian church, already mentioned in the New Testament. But in the English Bible the presbyters of the New Testament are called "elders," not "priests;" the latter name is reserved for ministers of pre-Christian religions, the Semitic (*kōhānīm*, sing. *kōhēn*) and (*kemārīm*). The theologians of the Greek and Latin Churches expressly found the conception of a Christian priesthood on the hierarchy of the Jewish temple, while the names by which the sacerdotal character is expressed—*sacerdos*—originally designated the ministers of sacred things in Greek and Roman heathenism, and then came to be used as translations into Greek and Latin of the Hebrew *kōhēn*. *Kōhēn*, *sacerdos*, are in fact fair translations of one another; they each denote a minister whose stated business was to perform, on behalf of the community, certain public ritual acts, particularly sacrifices, directed godward. Such ministers or priests existed in all the great religions of ancient civilization, and indeed a priesthood in the sense now defined is generally found, in all parts of the world, among races which have a tribal or national religion of definite character, and not merely an unorganized mass of superstitious ideas, fears, and hopes issuing in practices of sorcery. The term "priest" is sometimes taken to include "sorcerer," just as religion is often taken to include the belief in mysterious or superhuman powers which can be constrained by spells, but this is an abuse of language. Religion begins when the relation of the divine powers to man is conceived—on the analogy of the relations of formed human society—as having a certain stable personal character on which the worshipers can calculate and act.

The influence of the Hebrew priesthood on the thought and organization of Christendom was the influence not of a living institution, for it hardly began till after the fall of the temple, but of the theory embodied in the later parts of the Pentateuch. Two points in this theory were laid hold of—the doctrine of priestly mediation and the system of priestly hierarchy. The first forms the text of the principal argument in the Epistle to the Hebrews, in which the author easily demonstrates the inadequacy of the mediations and atoning rites of the Old Testament, and builds upon this demonstration the doctrine of the effectual high-priesthood of Christ, who, in His sacrifice of Himself, truly "led His people to God," not leaving them outside as He entered the heavenly sanctuary, but taking them with Him into spiritual nearness to the throne of grace. This argument leaves no room for a special priesthood in the Christian church, and in fact nothing of the kind is found in the oldest organization of the new communities of faith. The idea that presbyters and bishops are priests and the successors of the Old Testament priesthood first appears in full force in the writings of Cyprian, and here it is not the notion of priestly mediation but that of priestly power which is insisted on. Church office is a copy of the old hierarchy.

There is probably no nature religion among races above mere savagery which has not had a priesthood; but an examination of other examples would scarcely bring out any important feature that has not been already illustrated. Among higher religions orthodox Islam has never had real priests, doing religious acts on behalf of others, though it has, like Protestant churches, leaders of public devotion (imáms) and an important class of privileged religious teachers ('ulemá). But a distinction of grades of holiness gained by ascetic life has never been entirely foreign to the Eastern mind, and in the popular faith of Mohammedan peoples something

very like priesthood has crept in by this channel. For where holiness is associated with ascetic practices the masses can never attain to a perfect life, and naturally tend to lean on the professors of special sanctity as the mediators of their religious welfare. The best example, however, of a full-blown priestly system with a monastic hierarchy grafted in this way on a religion originally not priestly is found in Tibetan Buddhism (see LAMAISM), and similar causes undoubtedly had their share in the development of sacerdotalism in the Christian church. The idea of priestly asceticism expressed in the celibacy of the clergy belongs also to certain types of heathen and especially Semitic priesthood, to those above all in which the priestly service is held to have a magical or theurgic quality.

PRIESTLEY, JOSEPH, was born on March 13, 1733, at Fieldhead near Birstal, in the West Riding of Yorkshire.

The works of Doctor Priestley fill twenty-five octavo volumes one of which, however, consists of memoirs and correspondence. The date of this collected edition is 1832. It contains upward of 130 separate works, varying in size from brief pamphlets to treatises in four volumes, and his labors range over almost all possible subjects of human knowledge or speculation. Mathematics, chemistry, physiology, grammar, logic, mental and moral philosophy, history, theology, interpretation of prophecy, politics, and sociology, all alike furnished themes for Priestley's untiring pen, and if he did not write on any of them with striking originality he treated all with freedom and intelligence. In 1761 he issued his first published works, a treatise on the *Scripture Doctrine of Remission* and *The Rudiments of English Grammar*. From that date till 1767 he was content with publishing something every alternate year. But from 1767 to 1804 he allowed only two years to go by unmarked by one or more publications, many of them remarkable as monuments of conscientious and laborious industry. His first scientific work, *The History and Present State of Electricity, with Original Experiments*, was published in 1767. The rapid advance of science has left to this and similar works of his little more than an antiquarian interest. But the treatise illustrates his prophetic spirit, inasmuch as it shows how far he was in advance of his contemporaries in appreciation of the prospects of physical research. In 1774 he issued his first volume of *Experiments and Observations on Different Branches of Air, etc.* In this volume he announced his discovery of "dephlogisticated air," now known as oxygen. The then prevalent theory of *phlogiston*, or the combustible principle in matter, betrayed him into great confusion, evident enough in the very name he gave to his new "branch of air." Nevertheless it is said of him in Roscoe and Schorlemmer's *Chemistry*, that "no one obtained more important results or threw more light upon the chemical existence of a number of different gases than Joseph Priestley." These *Experiments and Observations* were continued through five volumes, of which the last appeared in 1780. Perhaps the limit of Priestley's power of growth is illustrated by the persistency with which he clung to *phlogiston* notwithstanding the discoveries of Black, Lavoisier, and Cavendish. In 1800 he issued a treatise called *The Doctrine of Phlogiston established, and that of the Composition of Water refuted*. Doctor Priestley clearly failed to appreciate the progress of the science he had done so much to promote. But the attempt made by Lavoisier to claim for himself a concurrent discovery of oxygen at the same time as Priestley's was certainly unjustifiable. This achievement, together with the first preparation of nitric oxide, nitrous oxide, hydrochloric acid, and other

important gases, constitutes the true ground of his fame as a scientific pioneer.

Priestley's chief theological works were the *Institutes of Natural and Revealed Religion*, *A History of the Corruptions of Christianity*, and *A General History of the Christian Church to the Fall of the Western Empire*. Bishop Horsley's criticisms on the second of these works produced letters in reply, "with additional evidence that the primitive church was Unitarian." His principal metaphysical writings were *Disquisitions relating to Matter and Spirit* and various essays and letters on necessitarianism. He died in 1804.

PRIM, JUAN, MARQUIS DE LOS CASTILLEJOS, COUNT DE REUS, Spanish soldier and statesman, was the son of Lieutenant-Colonel Pablo Prim, and was born at Reus in Catalonia on December 12, 1814. On November 16, 1870, Amadeo, duke of Aosta, was elected king of Spain, but Prim was not destined to receive the new monarch, for on leaving the chamber of the cortes on December 28th, he was shot by unknown assassins and died two days later.

PRIMATE (*primas i.e., primus*), a title more than once bestowed in the *Codex Theodosianus* on various civil functionaries, came about the beginning of the fourth century to be used also, especially in Africa, as a designation of the "primæ sedis episcopus." In the canon law the word "primate" is regarded as essentially the Western equivalent of the Eastern "patriarch." See ARCHBISHOP and PATRIARCH.

PRIMOGENITURE. The term "primogeniture" is used to signify the preference in inheritance which is given by law, custom, or usage to the eldest son and his issue, or in exceptional cases to the line of the eldest daughter. The practice prevailed under the feudal codes throughout all the Western countries. It is now almost entirely confined to the United Kingdom, having been abolished (except in the succession to the crown) by the various civil codes which have superseded feudalism on the Continent, and having been universally rejected in the United States as being contrary to the spirit of their institutions. The system has of late years been persistently attacked in Great Britain, chiefly on the ground of hardship in cases of intestacy where the property is small; but the rule was found to operate so successfully in former times toward keeping large properties together that it seems likely to be still maintained by law; and even if abolished as a rule of law it would most probably be maintained in full vigor as a habit or rule of practice.

PRIMROSE. The genus *Primula* contains numerous species distributed throughout the cooler parts of Europe and Asia, and found also on the mountains of Abyssinia and Java. They are all herbaceous perennials, possessing a permanent stock, from which are emitted tufts of leaves and flower-stems which die down in winter; the new growths formed in autumn remain in a bud-like condition ready to develop themselves in spring. They form the typical genus of *Primulaceæ*, the floral conformation of which is very interesting on several accounts independently of the beauty of the flowers.

PRINCE. "Prince" and "princess" are names or descriptions implying either political authority or social rank in the persons to whom they relate or are accorded. We have in "prince" the English and French form of the Latin *princeps*, which with more or less modification has been adopted into nearly every language of modern Europe, and of which the original and common use was to indicate priority or preëminence of any sort. In an honorary sense it was, to begin with, applied by the Romans to the first or most distinguished members of the senate and the equestrian order respectively, and

their appellations of *princeps senatus* and *princeps juventutis* were afterward appropriated to the emperors themselves and to their adopted heirs and successors in the empire. Hence the attribute *princeps* became definitely associated with the notions of sovereignty and dominion, and its derivatives have been always and everywhere employed as titles of dignity and expressions of awe and respect.

In English the word "prince" may be used in certain connections in the original wide sense of the Latin word. More definitely it is applicable to supreme rulers of both sexes and almost all kinds. Thus the emperor of Russia, the queen of England, and the king of the Belgians are equally princes or monarchs, and the consorts of emperors and kings are princesses. But the presidents of republics are neither princes nor monarchs. Prince, however, unlike monarch, applies to rulers who are subordinate as well as to rulers who are supreme, to such minor potentates as the electors of the old German empire or the federal peers of France once were, and the reigning grand dukes or dukes of Germany now are. Again, all the children, and many of the descendants and other relations of monarchs, and princes of every class and grade are themselves princes or princesses, although it often happens that they have also some special name or personal dignity by which they are ordinarily known. But, when they are not dukes, or princes with a territorial title, as the prince of Wales or the princes of Naples in Italy, and Orange in Holland, they are described as "prince" with additions of "imperial," "crown," "royal," or "hereditary," as the case may be, and the name of the dominions to which they are the heirs-apparent. The eldest sons of reigning grand dukes, or dukes, however, are called "hereditary grand-dukes" or "hereditary dukes," their younger brothers and sisters being all the same, princes and princesses.

PRINCE EDWARD ISLAND, formerly called Isle St. Jean, a province of Canada, in British North America, lies between  $45^{\circ} 58'$  and  $47^{\circ} 7'$  N. latitude and  $62^{\circ}$  and  $64^{\circ} 27'$  W. longitude, on the south side of the Gulf of St. Lawrence. It is separated from Nova Scotia on the south and from New Brunswick on the south and west by Northumberland Strait, which varies from nine to thirty miles in width. Its greatest length is nearly 150 miles, its general breadth 34 miles, and the area 2,133 square miles (1,365,120 acres).

*Physical Features.*—Prince Edward Island resembles a crescent in its northern outline, the two horns being North and East Capes, and it is altogether irregular in form. Its surface is slightly rolling, the elevations of land, however, rising nowhere higher than 500 feet. The coast-line is indented with numerous bays and projecting headlands.

The climate of Prince Edward Island is much milder than that of the adjacent provinces, and, though the winter is severe and cold, the air is invigorating and salubrious. The coldest month is January, when the thermometer registers a daily average of  $15.9^{\circ}$ . Fogs seldom occur. In summer the heat is less extreme than in Quebec, the mean being  $62.3^{\circ}$ , and the pleasant autumn months attract visitors from all parts of the American continent. Vegetation develops rapidly, and agriculture is extensively prosecuted. Wheat, barley, oats, peas and beans, potatoes, turnips, and other crops ripen to perfection.

Prince Edward Island does not grow much fruit, but the apple crop is usually good, though not large, and grapes, plums, and currants are grown in small quantities. The land which is not cultivable consists of soft spongy turf, which may be used for fuel.

The forests of the island used to be very extensive,

but lumbering operations, destructive fires, and the needs of the husbandmen have reduced them, though many trees still remain, the principal being beech, birch, pine, maple, poplar, spruce, fir, hemlock, larch, cedar, etc.

*Industries.*—Shipbuilding in former years was a very active industry. It is still carried on, but to a considerably smaller extent—the number of vessels built in 1883 having been only seventeen, with a tonnage of 5,343.

The fisheries are exceedingly valuable, particularly those on the north coast, the catch being chiefly mackerel, haddock, cod, hake, and herrings, though other kinds are taken. Of late years increased impetus has been given to this industry, and many men and boats are employed in conducting it. Enormous quantities of lobsters and oysters are annually shipped to all parts of the American continent as well as elsewhere. The value of the fisheries in 1883 was nearly half a million dollars.

Wild ducks, teal, brant, wild geese, woodcocks, partridges, pigeons, and snipe occur in great abundance. Birds number 260 species. Of wild animals the principal are bears (found occasionally only), lynxes, foxes, muskrats, hares, squirrels, etc. In the summer and autumn seals in large numbers frequent the shores.

Good wagon roads are to be found wherever there is a settlement. The Prince Edward Island Railway, 200 miles long, runs from one end of the island to the other, and branches off to every town or point of importance. The main line extends from Souris and Georgetown on the east to Tignish on the northwestern extremity, connecting with Summerside and Charlottetown, the capital.

The province is divided into three counties, viz., King's, Queen's, and Prince, which are subdivided into sixty-seven townships and three royalties. The population is of mixed origin, a large proportion being emigrants from Great Britain, and the remainder natives of the country, descendants of the French Acadians, Scottish, English, and Irish settlers, and the loyalists who went to the island after the American revolution. The Indians number 281. In 1881 the population was 108,891 (54,729 males and 54,162 females). The Roman Catholic diocese is situated at Charlottetown, and authority over the spiritual affairs of the Episcopalians is exercised by the bishop of Nova Scotia.

The chief towns are Charlottetown (11,485), the capital of the island, and the county town of Queen's, Summerside (2,853), capital of Prince county, and Georgetown (1,118), capital of King's county.

*Administration, Finance, etc.*—The affairs of the province are administered by a lieutenant-governor and an executive council consisting of nine members, three with portfolios and six without, assisted by a legislative council of thirteen members and a legislative assembly of thirty members, both elective. The lieutenant-governor is appointed by the governor-general of Canada in council. A system of responsible government has existed in the island since 1851. Prince Edward Island returns six members to the Canadian House of Commons, and four senators are appointed to the Canadian Senate by the crown. All males owning freehold or leasehold property to the value of \$400, or partly freehold and partly leasehold amounting together to \$400, and in possession of the same for at least twelve months previous to election, have the right to vote for a member of the Legislative Council. The franchise for the House of Assembly is practically residential manhood suffrage.

The chief source of revenue is the yearly subsidy granted by the Dominion Government under the terms of the British North America Act.

The free-school system has obtained in the island since 1852. Previous to that date the schools were mainly supported by voluntary subscription and such local assistance as could be obtained. In 1877 the Public Schools Act—an ample and liberal measure—was passed, and a department of education was instituted.

Sebastian Cabot is said to have discovered this island in 1497, but the authority on which this statement rests is at least doubtful. Certain it is that Jacques Cartier had the credit of naming it Isle St. Jean when he discovered it on June 24, 1534, during one of his voyages up the St. Lawrence. That name clung to it for 265 years. Champlain, early in the next century, took possession of it for France, and in 1663 a grant was made of it to Captain Doublet, an officer in the army, who, however, failing to make settlements in the colony, soon afterward lost his grant. Little attention was paid to the island until after the peace of Utrecht, when the French, allured by its fertility, made efforts to colonize it. In 1719 it was granted, *en seigneurie*, to the count of St. Pierre, who tried to establish fisheries and a trading company. He lavished considerable means on his enterprise, but the scheme proved unsuccessful and his grant was revoked. In 1755 the island was captured by the British, but after the treaty of Aix-la-Chapelle it was restored to France, from which it was again wrested in 1758. It was afterward placed under the administration of Nova Scotia, and some years later it was erected into a separate government. The first parliament was called together in 1773, and a constitution was given to the colony. In November, 1798, the legislature passed an act changing the name of the province to Prince Edward Island, out of compliment to the duke of Kent, who was at that time commander of the forces in British North America. In February, 1799, the act was confirmed by the king in council.

Prince Edward Island declined to accept the Act of Confederation in 1867, but in July, 1873, it entered the union of American colonies which constituted the Dominion of CANADA, (*q.v.*)

PRINCE OF WALES ISLAND, the official name of the island popularly known as PENANG or PULO-PENANG (*i.e.*, Areca Nut Island), which lies eight or nine miles off the west coast of the Malay peninsula in 5° 20' N. latitude and 100° 20' E. longitude. The island is about fifteen miles long by five broad, and has an area of 107 square miles or 69,000 acres, considerably less than the Isle of Wight. Population, 10,000.

PRINCE OF WALES LAND, a large insular tract in the northern Arctic region opposite Boothia Felix, from which it is separated by Franklin Strait.

PRINCES ISLANDS, the Demonesi or Demonesi of the ancients, a beautiful cluster in the Sea of Marmora opposite that part of the Asiatic coast which trends southeast from Scutari to the entrance of the Gulf of Ismid (Nicomedia). They are nine in number—Prinkipo or Principo (with an Italian *c*), Kyzyl-Ada or Red Island of the Turks, the largest of the group, is a broad green hill of red quartz rising with soft and verdant outlines into two peaks, the higher of which (500 feet) is crowned by the ex-monastery of St. George, embosomed amid its oaks. On the height above the town of Prinkipo is the monastery of the Transfiguration and on the coast opposite Antirobido that of St. Nicholas.

PRINCETON, a borough and township of the United States, in Mercer county, N. J., on the Delaware and Raritan Canal, three miles north by rail from Princeton Junction, which is forty-eight miles southwest of New York and forty-two northeast of Philadelphia on the Pennsylvania Railway. Standing on high ground, it commands a fine prospect toward the east

and south. The town is the seat of Princeton or New Jersey College, founded in 1746 by members of the presbytery of New York, chartered in the same year, and opened at Elizabethtown (now Elizabeth) in 1747, removed to Newark in the same year and rechartered in 1748, and finally transferred in 1756 to Princeton, where Nassau Hall, so called in honor of William III. of England, had been erected. Nassau Hall has been twice burned down, in 1802 and 1855, but was restored in 1856 in the old style. Almost all the buildings are the gifts of generous benefactors, the most munificent of whom was Mr. John C. Green, by whom and the trustees of his estate not less than \$1,500,000 has been given in buildings and endowments. In 1884 the college, which is steadily growing, had 39 professors and 519 students, and the library contained 77,000 volumes. The endowments amount to \$1,392,000. The governor of the State of New Jersey is *ex officio* president of the board of trustees, who are 25 in number besides the president of the college. The trustees appoint the members of the faculty, and have entire control over the funds and property of the college. They fill all vacancies in their own body. Besides the Halstead observatory, there is another well-equipped observatory at the School of Science, and the laboratories and museum are well furnished for scientific study. In the cemetery, which lies to the north of the college, are the tombs of Jonathan Edwards, Aaron Burr, etc. Princeton is also the seat of the oldest theological seminary of the Presbyterian church in the United States (founded in 1812), with 7 professors, 1 instructor, about 150 students, and an endowment of about \$1,000,000. Population (1890), 4,200.

At Princeton, on January 3, 1777, Washington defeated the British forces; the Continental Congress met in the town (Nassau Hall) from June 26 to November 4, 1783.

PRINCETON, the county seat of Bureau county, Ill., is situated on the Chicago, Burlington & Quincy railroad, twenty-two miles west-southwest of Mendota and 105 miles west-southwest of Chicago. It has three banks, three newspaper offices, manufactories of flour and farming implements and some coal mines. Population, 5,000.

PRINCETON, the county seat of Gibson county, Ind., is a town of 5,000 people, situated twenty-seven miles north of Evansville. It has good railroad and banking facilities and is of some importance as a shipping point for local produce. Princeton has good schools and some fine residences.

PRINGLE, SIR JOHN, a distinguished physician, was the younger son of Sir John Pringle, of Stichel, Roxburghshire, and was born on April 10, 1707, and died in 1782.

PRINTING, TYPOGRAPHIC. See TYPOGRAPHY.

PRINTING PRESS. In no branch of industry has there been a greater development of appliances than has been apparent in the printing press. From the old-fashioned wedge press the stride to the hand lever press was thought to be a great one. But the gulf between the hand press and the latest achievements of the modern builders is greater yet. In the execution of "press work" the following operations are essential. 1. The types, carefully set, fixed with precision in forms, rendered level all over, so that ail parts may be pressed alike, and the whole properly cleaned by a wash of potash lye. Much printing has latterly been done from plates, which necessitates overlaying and underlaying and calls for great skill on the part of the pressman. 2. A uniform inking of the surface, to give uniformity of color. 3. The paper dampened equably, neither too much nor too little, so as to take an impression easily and

evenly. In using paper with a glazed surface the dampening is omitted, in fact except in newspaper or in very careful book work damping the sheets is rarely practiced. 4. An equable, firm, and smart pressure, and with that degree of steadiness in the mechanism that the sheet shall touch and leave the types without shaking and blurring. 5. Care in adjusting the pointers (or gauge), so that perfect register may be secured in printing the second side. 6. Such frequency in changing fly or under-sheets on the tympan, that the first side shall not get dirtied by off-setting when printing the second side. 7. The laying of small patches on the tympan, where, from any inequality, it seems necessary to bring up the pressing-surface to a thorough equality. A regard to all these circumstances constitutes the duty of a pressman. Bad printing is usually a result of old and worn types, want of proper cleaning, or an inferior kind of ink. Early in this century important improvements were made on the old system. The presses then brought out have been still further improved, until we now have as the outgrowth of the original hand press, the great Cottrell, the Potter, the Bullock, the Hoe, and other steam-power presses, capable of delivering 10,000 to 20,000 impressions an hour. Hand presses of an improved kind continue to be used, however, in the case of limited impressions, or where extra care and elegance in typography are required; also where machinery is unattainable. The web perfecting press prints from a continuous roll of paper, which is dampened as it goes into the machine, and impressions are printed on both sides, alternately, from curved stereotype plates fitted to the large cylinders. The same machine cuts off the sheet of the required length, folds and pastes it, cuts the edges, and delivers on the fly-board a complete 4, 8, 12, or 16 page newspaper, so rapidly that complete editions of the great dailies are now run off in a few hours.

PRIOR, MATTHEW, the most distinguished of English society poets, was born in 1664, and died in 1721.

PRISCIAN (PRISCIANUS CÆSARIENSIS), the most celebrated Latin grammarian, lived about 500 A.D., *i.e.*, somewhat before Justinian. This is shown by the facts that he addressed to Anastasius, emperor of the East 491-518, a laudatory poem, and that the MSS. of his *Institutiones Grammaticæ* contain a subscription to the effect that the work was copied (526, 527) by Flav. Theodorus, a clerk in the imperial secretariat ("memorialis sacri scrinii epistolarum"). Three minor treatises are dedicated to Symmachus (the father-in-law of Boetius). Cassiodorus, writing in the ninety-third year of his age (560? 573?), heads some extracts from Priscian with the statement that he taught at Constantinople in his (Cassiodorus's) time. His title *Cæsariensis* points, according to Niebuhr and others, to Cæsarea in Mauretania.

PRISCILLIANISTS, an heretical sect which rose to some prominence in Spain toward the end of the fourth century and continued to subsist, in varying numbers, there and in Gaul, until after the middle of the sixth. Its founder was Priscillian, a wealthy and influential layman of considerable reading and ability who had devoted his life to a self-denying study of the occult sciences and the deeper problems of philosophy. In the course of his speculations he came under the influence of two teachers, Elpidius and Agape, who professed to have derived their views from a certain Marcus, a native of Egypt who had settled in Spain. The creed which Priscillian now formulated appears to have combined various features of Gnosticism and Manichæism: he seems, for example, to have held the theory of emanations—high in rank among these being the heavenly powers whom he called by the name of the

twelve patriarchs, and brought also into close relation with the signs of the zodiac—the doctrine of the demiurge, the preëxistence of souls, the eternity of the devil, the essential sinfulness of the flesh, the unlawfulness of procreation, and the like. He and his followers retained their connection with the Catholic Church, insisting, however, on fasting on Sundays, and refusing the bread in the sacrament; but they also held separate meetings in private at which they were accused by their adversaries (with what truth is not known) of practicing magic and indulging in licentious orgies. Many women joined the sect, and among the more prominent of its converts were two bishops, named Instantius and Salvianus.

PRISHTINA, or PRISTINA, a town of European Turkey, since 1877 at the head of a liwa in the vilayet of Kossovo, lies on an affluent of the Sitnitza, a tributary of the Morava, and gives its name to one of the stations on the Salonica-Uskub-Mitrovica Railway, which runs at a distance of six or seven miles to the west of the town. Population, 11,000.

PRISON DISCIPLINE. Authority in every age and in every country has claimed to impose penalties on all who offend against it. Either coercion or protection has been the moving principle: the master extorted submission, or society, through its rulers, defended itself against evil doers. The most common punishments in early times were naturally those most easily inflicted. Offenders paid in their persons: they were put to death with every variety of the capital sentence, were branded, mutilated, or sold as slaves. They were fined also, were degraded, or forfeited civil rights, or yet again were simply banished from their homes. Enforced detention, incarceration within four walls, was another method of coercion which grew and gained favor under the feudal system. The lord temporal or spiritual or corporate body could thus hold the vassal safe until he yielded fealty or submitted to extortion. A dungeon told no tales, and served conveniently to bury the victims of mediæval oppression. The unrestrained and unjustifiable exercise of the power to imprison lingered long in lands where personal liberty was unknown; nor did arbitrary imprisonment terminate with the destruction of the Bastille.

In the olden time the prisoner was the unreserved property of his captor or jailor, and the most frightful excesses and barbarities were practiced on the victim, who was by reason of his imprisonment unable to defend himself, or make his condition known to his friends. John Howard was the first to inaugurate a movement looking toward reform in this direction; but for many years there was but little progress made in European governments in regard to this important matter. Indeed, America may be said to have furnished, in the earlier years of the present century, the first specimen of genuine prison-reform and wholesome discipline.

The true object of penal treatment had begun to be understood, and keen controversy had arisen as to the best methods for securing it. This object, broadly stated, was to compass the reformation of the convicted offender and at the same time deter others from crime. The chief experiments in this direction had been made in the United States, where two remarkable systems of penal discipline had for some time been in operation. Each had its warm supporters and friends. One had originated with the Quakers of Pennsylvania, who, as far back as 1786, had abolished capital punishment and all other purely personal penalties, and had subjected all offenders instead to solitary confinement without occupation for mind or body. This, as developed in the years following, became the purely solitary system, and was the first of the two methods mentioned above. The

idea, although not absolutely new, having been already accepted in the United Kingdom both in the Gloucester penitentiary and the Glasgow bridewell, was hailed with enthusiasm as a solution of all difficulties of prison treatment. Many other States in the Union followed the lead of Pennsylvania. That of New York built the great Auburn penitentiary in 1816 to carry out the new principles. There every prisoner was kept continuously in complete isolation. He saw no one, spoke to no one, and did no work. But within a short period very deplorable results began to show themselves at Auburn. Many prisoners became insane; health was impaired, and life greatly endangered. Some relaxation of the disastrous severity seemed desirable, and out of this grew the second great system, which was presently introduced at Auburn, and afterward at the no less renowned prison of Sing Sing. It was called the silent system. While the prisoners were still separated at night or meals, they were suffered to labor in association, but under a rule of silence ruthlessly and rigorously maintained. The latter, intrusted to irresponsible subordinates, degenerated into a despotism which brought the system into great discredit. All discipline officers were permitted to wield the whip summarily and without the slightest check. Under such a system the most frightful excesses were possible, and many cases of brutal cruelty were laid bare.

The only other system ever tried in the United States is the contract system, happily now almost extinct. This consisted in hiring the convicts to contractors who had absolute charge of them—in fact, it was a horrible system of slavery, far worse than absolute slavery, for the reason that the contractors failed to have the interest in the welfare of their charges which ownership would have given. The most brutal cruelties were inflicted, and public sentiment has long demanded the extinction of the system, which at present only exists in one or two of the southern States.

The following sketch will give the career of the English criminal and best illustrate the system of discipline in vogue in that country. After a short detention in a police cell, an offender, unless disposed of summarily, passes into one of her majesty's local prisons, there to await his trial at sessions or assizes. The period thus spent in the provinces will never exceed three months; in London, with the frequent sittings at Clerkenwell and of the Central Criminal Court, it is seldom more than one month. While awaiting trial the prisoner may wear his own clothes, provide his own food, see and communicate with his friends and legal adviser, so as to prepare fully for his defense. His fate after conviction depends on his sentence. If this be imprisonment, so called to distinguish it from penal servitude, although both mean deprivation of liberty and are closely akin, it is undergone in one of the "local" prisons—the prisons till 1878 under local jurisdiction, but now entirely controlled by the state through the home secretary and the commissioners of prisons. The régime undergone is cellular; able-bodied prisoners are kept in strict separation for at least one month, and during that time subjected to first-class hard labor, which is purely penal in character; and nowadays, under the uniform system introduced by the commissioners, consists of the treadwheel, in which each individual ascends 8,640 feet in a day's work, or six hours' work on cranks or hard labor machines is exacted where there are no treadwheels; and the labor, whether of treadwheel or crank, is generally utilized as the motive power for grinding corn or pumping water for prison use. Beating oakum with a heavy beater and mat-making with heavy implements are also considered

first-class hard labor. Throughout the sentence the prisoner has the advantage of religious and moral instruction; he attends divine service regularly and according to his creed, is visited by the chaplain, and receives educational assistance according to his needs. His physical welfare is watched over by competent medical men; close attention is paid to the sanitary condition of prisons; strict rules govern the size of the cells, with their lighting, warming, and ventilation. Dietaries are everywhere the same, they are calculated with great nicety according to the terms of duration, and afford variety and ample nutrition without running into excess. In a word, as regards discipline, labor, treatment, exactly the same system obtains throughout the United Kingdom from Bodmin to the far north, from Cork to Belfast.

Where the sentence passes beyond two years it ceases to be styled imprisonment and becomes penal servitude, which may be inflicted for any period from five years to life. The prisoner becomes a convict, and undergoes his penalty in one or more of the convict prisons. These are entirely under state management. A sentence of penal servitude, as now administered, consists of three distinct periods or stages:—(1) that of probation endured in separate confinement at a so-called "close" prison; (2) a period of labor in association at a public works prison; and (3) conditional release for the unexpired portion of the sentence upon license or ticket-of-leave.

Most civilized nations have considered the question of prison discipline from time to time, and have endeavored, but with varying degrees of earnestness, to conform to accepted modern ideas as to the proper method of dealing with criminals. The subject has also been dealt with at two international congresses, one of which assembled in London in 1873, and the other at Stockholm in 1878, when views were exchanged, and matters of much interest discussed.

The prison system of Canada is advanced and enlightened. The numbers incarcerated are not great, and crime is not very prevalent. Six establishments suffice for the Dominion—Kingston, St. Vincent de Paul (for the province of Quebec), Halifax, Manitoba, British Columbia, and Dorchester.

In Mexico the rule of constant separation for all prisoners has been accepted, but not yet carried out entirely. The old prisons were on the associated system; but new cellular prisons have recently been built, or are in process of construction at Jalisco, Durango, Puebla, and Mexico. These will receive trial prisoners and those sentenced. There is an "hospicio de pobres" for young children; also a special reformatory establishment for children between nine and eighteen. Political offenders are kept apart from ordinary offenders. All convicted prisoners may earn conditional release on completion of half their whole sentence. This form of release is called preparatory liberty, and for a short time preceding it they are allowed to leave the jail to run errands or seek work. The labor in Mexican prisons is industrial, not penal, and in theory at least the advantages of learning a trade in prison are fully understood. Contracts for prison labor are forbidden.

In Russia deportation to Siberia began in 1591. It was used for political prisoners, insurgents, religious dissenters, and conspirators. There are several hundred prisons in Siberia. They are of three kinds:—(1) the *etape*, which afford temporary lodgings for prisoners on the line of march; (2) the *prisylnic*, where the detention is often for several months during the winter or until the ice is broken up; and (3) the *ostrog*, the generic Russian name for a prison, which is the place of duration for all exiles not on their own resources. Few of the large prisons in Siberia were built for the

purpose. They are converted buildings—old factories, distilleries, and so forth. They are all upon the associate principle, containing a number of large rooms to accommodate any number from twenty-five to a hundred. The great central prison near Irkutsk, called the Alexandreffsky, one of the most important in Siberia, generally holds from 1,600 to 2,000 prisoners all under sentence of hard labor, and awaiting transfer to the mines. Prison offenses are punished by relegation to a solitary cell, a certain number of which exist at all the prisons. Diminutions of diet are also inflicted, and an obligation to wear irons if they are not already worn. All exiles wear leg-irons for a certain time. These are riveted onto the ankles, and caught by a chain which is carried suspended to a belt round the waist. The irons are worn for various periods from eighteen months to four and even eight years. Very heinous offenders or those who have escaped frequently are chained to a wheelbarrow, which they are obliged to pull about with them wherever they go. A more severe punishment when confinement and irons fail is birching with a rod, for the knout is now abolished. The rod consists of switches so small that three may be passed together into the muzzle of a musket.

In the United States, while there are but few agencies for the assistance of discharged prisoners, considerable care is devoted to the treatment and checking of juvenile crime. Reformatories have existed since 1825, when the first was established on Randall's Island within the limits of the city of New York. Others followed; but these did not form part of the penal system of the States till 1847, when the State reform school at Westborough was established by law. They soon increased and multiplied, and now between sixteen and twenty are to be found within the principal States. There are also a number of semi-public schools. The average reformatory population is about 15,000. The results are said to be very satisfactory. The percentage of youths reformed and trained into good citizens has been placed as high as 60, 75, even 80 per cent. Parents may in some States contribute to the support of their children in reformatories, but as a rule the inmates are orphans or abandoned children or those whose parents are very poor. The best system for training and caring for juvenile offenders probably is that which obtains in Massachusetts.

PRISREND, PRISDREN, PRISDRA, PISDRA, PISREN, or PISRA, in Roumelia, the chief town of a sandjak and the seat of a Greek and a Roman Catholic archbishop, in the Turkish vilayet of Kossovo (formerly Monastir), stretches for two or three miles along the northwestern base of the Scardus or Shar-dagh, and is traversed by the rapid waters of the Resna Mitritza, which, issuing from a deep gorge a little above the town, joins the Drin (White or Albanian Drin) a few miles below.

PRIVATEER is an armed vessel belonging to a private owner, the subject of a belligerent power, commissioned by the sovereign of that power. The commission is either a commission of war or of marque and reprisals in time of peace. Privateers stand in a position between that of a public ship of war and a merchant vessel. They are not entitled to the full rights which the comity of nations extends to public ships of war; *e.g.*, by the municipal regulations of most nations they may not carry the flag of a public ship of war.

PRIVET (*Ligustrum*), the vernacular name of a genus of *Oleaceæ*. There are several species, all of them shrubs or low trees with evergreen or nearly evergreen opposite entire leaves, and dense cymes of small white tubular four-parted flowers, inclosing two stamens and succeeded by small, globular, usually black berries, each with a single pendulous seed.

PRIVILEGE, in law, is an immunity or exemption conferred by special grant in derogation of common right. The term is derived from *privilegium*, a law specially passed in favor of or against a particular person. In Roman law the latter sense was the more common; in modern law the word bears only the former sense. Privilege in English law is either *personal* or *real*—that is to say, it is granted to a person, as a peer, or to a place, as a university.

In the United States the term privilege is of considerable political importance. By Art. IV. § 2 of the constitution, "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." By Art. XIV. § 1 of the amendments to the constitution (enacted July 28, 1868), "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." It will be noticed that Art. IV. applies to citizens of the States, Art. XIV. to the citizens of the United States. "The intention of this clause (Art. IV.) was to confer on the citizens of each State, if one may so say, a general citizenship, and to communicate all the privileges and immunities which the citizens of the same State would have been entitled to under the like circumstances" (Story, *Constitution of the United States*, § 1806). The clauses have several times been the subject of judicial decision in the supreme court. Their practical effect may be thus illustrated. With regard to Art. IV., it was held that a State license tax discriminating against commodities of production of other States was void as abridging the privileges and immunities of such other States (*Ward v. State of Maryland*, 12 Wallace's Reports, 418). With regard to Art. XIV. § 1, it was held that its main purpose was to protect from the hostile legislation of the States the privileges and immunities of citizens of the United States, looking more especially to the then recent admission of negroes to political rights. Accordingly it was held that a grant of exclusive right or privilege of maintaining slaughter-houses for twenty-one years, imposing at the same time the duty of providing ample conveniences was not unconstitutional, as it was only a police regulation for the health of the people (*The Slaughter-House Cases*, 16 Wallace, 36). The same has been held of a refusal by a State to grant a woman a license to practice law (*Bradwell v. The State*, 16 Wallace, 130), of a State law confining the right of suffrage to males (*Minor v. Happersett*, 21 Wallace, 162), and a State law regulating the sale of intoxicating liquors (*Bartemeyer v. Iowa*, 18 Wallace, 129). Suits to redress the deprivations of privilege secured by the constitution of the United States must be brought in a United States court. It is a crime to conspire to prevent the free exercise and enjoyment of any privilege, or to conspire to deprive any person of equal privileges and immunities, or under color of law subject any inhabitant of a State or Territory to the deprivation of any privileges or immunities (*Revised Statutes of the United States*, §§ 5507, 5510, 5519).

PRIVY COUNCIL. In England the king, almost of necessity, has been at all times guided by a council. The council, as it existed in the Norman period under the name of *curia regis* (a branch of the larger *commune concilium regni*), exercised judicial, legislative, and administrative functions. It contained the germs of the courts of law and equity, the House of Parliament, and the privy council. The Courts of King's Bench and Common Pleas were gradually separated from it, and became only courts of first instance, subject to appeal to the king's council. From the time of Edward I. the *concilium ordinarium*, the ordinary or standing council of the king, superseded the *curia regis*

It exercised high judicial functions as the ultimate court of appeal, as the adviser of suitors on petition what court to choose for redress, and as the resort of those who failed to obtain justice in the ordinary course. It was also the supreme administrative body, and as such issued ordinances on matters of a local or temporary nature, with not infrequent usurpations at a later period of jurisdiction belonging more properly to the common law courts or to parliament. The council "consisted of the chief ministers, the chancellor, treasurer, lord steward, lord admiral, lord marshal, the keeper of the privy seal, the chamberlain, treasurer, and comptroller of the household, the chancellor of the exchequer, the master of the wardrobe; and of the judges, king's serjeant, and attorney-general, the master of the rolls, and justices in eyre, who at that time were not the same as the judges at Westminster."

**PRIZE**, or **PRIZE OF WAR**, denotes the ship or goods of an enemy, or *in transitu* to an enemy, captured at sea. Goods captured on land are not prize, but booty of war. To be good prize the capture must be on the high seas or in the territorial waters of one of the belligerents, and must be by an armed vessel duly commissioned by the sovereign of the captor. A capture made in neutral waters is a violation of neutrality, and may be restored at the discretion of the neutral power. Most nations have municipal regulations upon the subject. Thus prizes captured in breach of the neutrality of Great Britain may be restored by the High Court of Justice (Admiralty Division) under the powers of the Foreign Enlistment Act, 1870. Capture may be actual or constructive. Constructive or joint captors are those who have assisted the actual captors by conveying encouragement to them or intimidation to the enemy. All public ships of war within signaling distance are usually held entitled to share in the proceeds of the capture. This rule is incorporated in the United States code of prize law, the Act of Congress of June 30, 1864. It is not all enemy's property that is good prize. The conflicting interests of neutrals have led to modifications of the general belligerent right of seizing enemy's property wherever found, a right which had become established as part of the general maritime law as early as the *Consolato del Mare*.

By the Naval Discipline Act, 1866, a commanding officer making an unlawful agreement for ransom is liable to be dismissed from the service. The United States has never prohibited ransom bills. The rights of the sovereign to prize may be waived, as was formerly done by the crown of Great Britain in the case of privateers (see **PRIVATEER**).

*Prize Court.*—This is a court sitting by the commission of the sovereign of the captor for the determination of prize causes. A capture does not become good prize until condemnation by a prize court. The United States prize courts have by the act of 1854 jurisdiction over property captured in an insurrection.

*Prize Money.*—The term prize money is used in a wider sense than the term prize. It extends to any reward granted by the state for the capture of enemy's property whether by land or sea. By an act of Congress of March 3, 1819, a bounty of \$25 is given for each slave captured, and the proceeds of condemned slave ships are divided between the United States and the captors, half to each.

**PROBABILITY.** The mathematical theory of probability is a science which aims at reducing to calculation, where possible, the amount of credence due to propositions or statements, or to the occurrence of events, future or past, more especially as contingent or dependent upon other propositions or events the probability of which is known.

Any statement or (supposed) fact commands a certain amount of credence, varying from zero, which means conviction of its falsity, to absolute certainty, denoted by unity. An even chance, or the probability of an event which is as likely as not to happen, is represented by the fraction  $\frac{1}{2}$ . It is to be observed that  $\frac{1}{2}$  will be the probability of an event about which we have no knowledge whatever, because if we can see that it is more likely to happen than not, or less likely than not, we must be in possession of some information respecting it. It has been proposed to form a sort of thermometrical scale, to which to refer the strength of the conviction we have in any given case. Thus if the twenty-six letters of the alphabet have been shaken together in a bag, and one letter be drawn, we feel a very feeble expectation that A has been the one taken. If two letters be drawn, we have still very little confidence that A is one of them; if three be drawn, it is somewhat stronger; and so on, till at last, if twenty-six be drawn, we are certain of the event, that is, of A having been taken.

Probability, which necessarily implies uncertainty, is a consequence of our ignorance. To an omniscient Being there can be none. Why, for instance, if we throw up a shilling, are we uncertain whether it will turn up head or tail? Because the shilling passes, in the interval, through a series of states which our knowledge is unable to predict or to follow. If we knew the exact position and state of motion of the coin as it leaves our hand, the exact value of the final impulse it receives, the laws of its motion as affected by the resistance of the air and gravity, and finally the nature of the ground at the exact spot where it falls, and the laws regulating the collision between the two substances, we could predict as certainly the result of the toss as we can which letter of the alphabet will be drawn after twenty-five have been taken and examined.

The probability, or amount of conviction accorded to any fact or statement, is thus essentially subjective, and varies with the degree of knowledge of the mind to which the fact is presented (it is often indeed also influenced by passion and prejudice, which act powerfully in warping the judgment)—so that, as Laplace observes, it is affected partly by our ignorance partly by our knowledge. Thus, if the question were put, Is lead heavier than silver? some persons would think it is, but would not be surprised if they were wrong; others would say it is lighter; while to a worker in metals probability would be superseded by certainty. Again, to take Laplace's illustration, there are three urns, A, B, C, one of which contains black balls, the other two white balls; a ball is drawn from the urn C, and we want to know the probability that it shall be black. If we do not know which of the urns contains the black balls, there is only one favorable chance out of three, and the probability is said to be one-third. But if a person knows that the urn A contains white balls, to him the uncertainty is confined to the urns B and C, and therefore the probability of the same event is one-half. Finally to one who had found that A and B both contained white balls, the probability is converted into certainty.

In common language, an event is usually said to be likely or probable if it is more likely to happen than not, or when, in mathematical language, its probability exceeds one-half; and it is said to be improbable or unlikely when its probability is less than one-half. Not that this sense is always adhered to; for, in such a phrase as "It is likely to thunder to-day," we do not mean that it is more likely than not, but that in our opinion the chance of thunder is greater than usual; again, "Such a horse is likely to win the Derby," simply means that he has the best chance, though according to the betting that chance may be only one-sixth. Such unsteady and ellip-

cical employment of words has of course to be abandoned and replaced by strict definition, at least mentally, when they are made the subjects of mathematical analysis.

PROBATE. See WILL.

PROBUS, MARCUS AURELIUS, Roman emperor from 276 to 282 A.D., was a native of Sirmium on the Save, and son of a military officer of moderate fortune. One of his principles was never to allow the soldiers to be idle, and to employ them in time of peace on useful works, such as the planting of vineyards in Gaul, Pannonia, and other districts where a selfish policy had previously forbidden this form of husbandry. This increase of duties was naturally unpopular with the troops, and while the emperor was urging on the drainage of the marshes of his native place he was attacked and slain by a sudden mutiny. Scarcely any emperor has left behind him so good a reputation.

PROCESS, in law, denotes in the widest sense of the word any means by which a court of justice gives effect to its authority. In the old practice of the English common law courts process was either original or judicial. Original process was a means of compelling a defendant to compliance with an original writ (see WRIT). Judicial process was any compulsory proceeding rendered necessary after the appearance of the defendant. Process was also divided in civil matters into original, mesne, and final. Original process in this sense was any means taken to compel the appearance of the defendant.

In the United States process is governed by numerous statutes, both of Congress and of the State legislatures. The law is founded upon the English common law.

PROCIDA, an island less than two miles off the west coast of southern Italy between Capo Miseno (or rather Monte Procida) on the mainland and the island of Ischia, forming part of the circondario of Pozzuoli and the province of Naples.

PROCLUS. See NEOPLATONISM.

PROCONSUL. See CONSUL and PROVINCE.

PROCOPIUS, the most eminent historian of the Eastern Roman empire, was born at Cæsarea in Palestine, then one of the chief cities of the Roman East, toward the end of the fifth century, probably between 485 and 495 A.D. Of his family and earlier life nothing is known, but it has been plausibly conjectured from the aristocratic sympathies he manifests that he belonged to one of the better families of his city, and from the place of his birth that he was educated at the great law school of Berytus (Beirut).

As an historian, Procopius would have deserved honor in any age, and is of quite unusual merit when one considers the generally low literary level of the age which produced him. From the fourth to the fifteenth century the Eastern empire has no lay writer of gifts approaching his. He is industrious in collecting facts, careful and impartial in stating them; his judgment is sound, his reflections generally acute, his conceptions of the general march and movement of things not unworthy of the great events he has recorded. His descriptions, particularly of military operations, are clear, and his especial fondness for this part of the subject seldom leads him into unnecessary minuteness.

The *Anecdota*, or Secret History, in length almost equal to the *De Aedificiis*, and somewhat shorter than the average length of a book of the *Histories*, purports to be a supplement to these, containing explanations and additions which the author could not place in the *Histories* for fear of Justinian and Theodora.

PROCOPIUS. Two leaders of this name are mentioned in connection with the wars of the HUSSITES, (*q. v.*)

I. ANDREAS PROCOPIUS, surnamed "the Great" or "the Bald," was a native of Bohemia, born about 1380. He perished in the decisive battle fought near Böhmischtrod on May 30, 1434.

II. Of PROCOPIUS surnamed "the Little," nothing is known save that he coöperated with Procopius "the Great" from 1427 onward, and that he shared his fate.

PROCTER, BRYAN WALLER, poet and miscellaneous writer, was born on 21st Nov., 1787. He was sent to a small boarding school near London, and thence in his thirteenth year to Harrow, where he had for contemporaries Lord Byron and Sir Robert Peel. On leaving school he was placed in the office of a solicitor at Calne, Wiltshire, remaining there until about 1807, when he returned to pursue his legal studies in London. By the death of his father in 1816 he became possessed of a small property, and soon entered into partnership with a solicitor; but in 1820 the partnership was dissolved, and during the temporary difficulties thus occasioned he supported himself in part by literary work under the pseudonym of Barry Cornwall. After his marriage in 1824 he returned to his professional work as conveyancer, and was called to the bar in 1831. In the following year he was appointed metropolitan commissioner of lunacy, an appointment annually renewed until his election to the permanent commission constituted by the act of 1842. He resigned office in 1861. During the last years of his life a failure of speech led him to withdraw from society, and his death took place on October 4, 1874.

PROCTOR, the English form of the Latin *procurator*, denotes a person who acts for another, and so approaches very nearly in meaning to AGENT, (*q. v.*) The word is used in three senses: (1) A particular kind of university official; (2) a representative of the clergy in convocation. A proctor represents either the chapter of a cathedral or the beneficed clergy of a diocese.

PRODICUS of Ceos, whose birth is conjecturally assigned to 465-460 B.C., was a humanist of the first period of the Sophistical movement. He was still living in 399 B.C.

PROHIBITION is defined by Blackstone as "a writ directed to the judge and parties of a suit in any inferior court, commanding them to cease from the prosecution thereof, upon a surmise either that the cause originally or some collateral matter arising therein does not belong to that jurisdiction, but to the cognizance of some other court." A writ of prohibition is a prerogative writ—that is to say, it does not issue as of course, but is granted only on proper grounds being shown.

PROHIBITION PARTY (See LIQUOR LAWS). The prohibition party is a political organization that during recent years has occupied a position of no inconsiderable importance among the political parties of the United States, and wielded an influence extending to a considerable degree beyond local circles. It grew out of the conviction among those who have been identified with the cause of temperance for years that the manufacture and sale of intoxicating liquors could only be suppressed by legislative enactment, and the purpose of its organization was a "stronger and more formal bond of union between those who favor the legal prohibition of the liquor traffic." The principles of the party first found expression in Maine during 1851, when the State adopted a law prohibitory in its character that yet remains on the statute book. Through succeeding years the question thus specifically addressed to "the intelligence of mankind" was made the subject of agitation in many of the States, on the hustings, through the columns of the daily press, in the pulpit, and by lect-

urers employed for such purpose. Societies and associations of a semi-political character were also formed, and efforts were made to concentrate an army of reformers, so to speak, to the end that the contest in behalf of the cause of prohibition might be solidified and strengthened. On various occasions since 1867 conventions have been held, and since 1869 those convening have nominated candidates for the presidency of the United States, as also for state and county offices. During the year 1889, the party encountered many obstacles to its progress and prosperity. At the convention held at Chicago, in the summer of that year, dissensions arose in that body growing out of the political complexion sought to be given the organization. After some earnest discussion, the Iowa delegation withdrew and has since formed the nucleus of a new party. In 1890 the Supreme Court of the United States in a case on appeal from Iowa, decided that the transportation of liquor through, and the sale of liquor in original packages could not be prohibited in any of the States or Territories of the United States, and that the statute of Iowa prohibiting the sale of liquors in the State was in violation of the constitution of the United States. The policy of re-submitting the entire matter to the popular vote in some of the States interested was seriously mooted for a time, but the leaders of the party incline to an opinion that the only possible method of attaining their object is through national legislation, and an effort will likely be made, in the near future, to secure a constitutional amendment embodying their views on the question of prohibition.

**PROJECTILES.** See **MECHANICS** and **GUNNERY**.

**PROJECTION.** If from a fixed point *S* in space lines or rays be drawn to different points *A, B, C, \* \* \** in space, and if these rays are cut by a plane in points *A', B', C', \* \* \** the latter are called the projections of the given points on the plane. Instead of the plane another surface may be taken, and then the points are projected to that surface instead of to a plane. In this manner any figure, plane or in space of three dimensions, may be projected to any surface from any point which is called the center of projection. If the figure projected is in three dimensions then this projection is the same as that used in what is generally known as *perspective*.

In modern mathematics the word *projection* is often taken with a slightly different meaning, supposing that plane figures are projected into plane figures, but three-dimensional ones into three-dimensional figures. Projection in this sense, when treated by coördinate geometry, leads in its algebraical aspect to the theory of linear substitution and hence to the theory of invariants and co-variants.

If all points in a figure be projected from a fixed center to a plane, each point on the projection will be the projection of all points on the projecting ray. A complete representation by a single projection is therefore possible only when there is but one point to be projected on each ray. This is the case by projecting from one plane to another, but it is also the case if we project the *visible* parts of objects in nature; for every ray of light meeting the eye starts from that point in which the ray, if we follow its course from the eye backward, meets for the first time any object. Thus, if we project from a fixed center the *visible* part of objects to a plane or other surface, then the outlines of the projection would give the same impression to the eye as the outlines of the things projected, provided that one eye only be used and that this be at the center of projection. If at the same time the light emanating from the different points in the picture could be made to be of the same

kind—that is, of the same color and intensity and of the same kind of polarization—as that coming from the objects themselves, then the projection would give sensibly the same impression as the objects themselves. The art of obtaining this result constitutes a chief part of the technique of a painter, who includes the rules which guide him under the name of perspective, distinguishing between *linear* and *aerial* perspective—the former relating to the projection, to the *drawing* of the outlines, the latter to the coloring and the shading off of the colors in order to give the appearance of distance.

**PROJECTION OF THE SPHERE.** See **GEOGRAPHY**.

**PROME**, a district in Pegu division, British Burmah, India, between  $18^{\circ} 30'$  and  $19^{\circ} 15'$  N. latitude, and  $94^{\circ} 40'$  and  $96^{\circ}$  E. longitude, containing an area of 2,887 square miles. In 1881 the population was 322,342 (161,433 males and 160,909 females).

The early history of the once flourishing kingdom of Prome, like that of the other states which now form portions of the province of British Burmah, is veiled in obscurity. Fact and fable are so interwoven that it is impossible to disentangle the true from the false. After the conquest of Pegu in 1758 by Aloung-bhúra, the founder of the third and present dynasty of Ava kings, Prome remained a province of the Burman kingdom till the close of the second Burmese war in 1853, when the province of Pegu was annexed to British territory.

**PROME**, chief town of the above district, on the left bank of the Irawadi, had a population in 1881 of 28,813 (males 14,982, females 13,831).

**PROMETHEUS**, son of the Titan Iapetus by the sea nymph Clymene, is the chief "culture hero," and, in some accounts, the Demiurge of Greek mythical legend. The pedigree and early exploits of Prometheus are given by Hesiod. On a certain occasion gods and men met at Mecone. The business of the assembly was to decide what portions of slain animals the gods should receive in sacrifice. On one side Prometheus arranged the best parts of the ox covered with offal, on the other the bones covered with fat. Zeus was invited to make his choice, chose the fat and found only bones beneath. A similar fable of an original choice, in which the chooser is beguiled by appearances, recurs in Africa and North America. The native tribes adapt it to explain the different modes of life among themselves and white men. In wrath at this trick, according to Hesiod, or in other versions for the purpose of exterminating the remnants of people who escaped the deluge of Deucalion, Zeus never bestowed, or later withdrew, the gift of fire. In his "philanthropic fashion," Prometheus stole fire, concealed in a hollow fennel stalk, and a fennel stalk is still used in the Greek islands as a means of carrying a light. According to some legends he gained the fire by holding a rod close to the sun. Probably the hollow fennel stalk in which fire was carried got its place in myth from the very fact of its common use.

**PRONGBUCK.** See **ANTELOPE**.

**PRONY**, GASPARD CLAIR FRANÇOIS MARIE RICHELIEU, a celebrated French engineer, was born at Chamelet, in the department of the Rhone, July 22, 1755, and died at Lyons July 31, 1839.

**PROPAGANDA**, or Sacred Congregation *de Propaganda Fide*, is the name given to a commission of cardinals appointed for the direction of the missions of the Roman Church. The idea of forming such an institution was conceived by Pope Gregory XIII. and other pontiffs, but it was Gregory XV. (1621-1623) who, after having sought counsel from cardinals and information concerning the state of religion in various countries from apostolic nuncios and superiors of religious orders,

published, July 22, 1622, the bull *Inscrutabile*, by which he founded the Congregation of Propaganda and provided means for its continuance.

The primary purpose of the Propaganda being to secure laborious and pious missionaries, colleges for their education and training were established. Chief among these is the Propaganda or Urban College in Rome, so named from Urban VIII. It is a general missionary seminary for the whole world. Here students are received from all foreign nations, and there are special foundations for Georgian, Persian, Chaldaean, Syrian, Coptic, Brahman, Abyssinian, Armenian, Greek, and Chinese students, as well as for students from England, Ireland, America, and Australia, although these last have special colleges in Rome. After the age of fourteen each student takes an oath to serve the missions during his whole life in the ecclesiastical province or vicariate assigned to him by the Congregation, to which he must send annually an account of himself and of his work. He is maintained and clothed free of expense. His studies embrace the full course of Greek, Latin, and Italian letters, some of the chief Oriental languages, as Hebrew, Syriac, Arabic, Armenian, and, when necessary, Chinese. There are also schools for the teaching of rational and natural philosophy, a complete course of theology, and the institutions of canon law. Besides this principal seminary, the Propaganda has colleges dependent on it both in Rome and in other countries, under the direction of regular and secular priests. From its beginning it had at its disposition national colleges—such as the English, founded by Gregory XIII.; the Irish, by Cardinal Ludovisi in 1628; the Scotch, by Clement VIII. in 1600; the German and Hungarian; the American, of the United States, opened by Pius IX. in 1859; the Greek, founded by Gregory XIII.; the Armenian, recently established by Leo XIII.; and the Bohemian, opened November 4, 1884. The jurisdiction of the Propaganda extends over the English colleges of Lisbon and Valladolid, the Irish college of Paris, and the American of Louvain. Until recently it had the Chinese college of Naples, transformed by the Italian Government, and the Illyrian college of Loreto, suppressed by the same government; and it still has the Albanian pontifical college of Scutari. Besides these, other colleges serve for the education of missionaries for the Propaganda, as the college of SS. Peter and Paul in Rome, founded by Pius IX., in Milan; the seminary of St. Calocero for all foreign missions, and at Genoa the College Brignole Sale for Italian emigrants to America. The institutions at Verona for central Africa are the support of the missions in the Soudan. Chief of all the seminaries is that of Paris which, for two centuries, has supplied missionaries for India and China.

PROPERTIUS, SEXTUS, the greatest elegiac poet of Rome, was born of a good Umbrian family. The year of his birth is uncertain, and it has been variously placed between 57 and 44 B.C. The poems of Propertius, as they have come down to us, consist of four books containing 4,046 lines of elegiac verse. The author died sometime subsequent to 16 B.C.

PROPHET (*προφήτης*) is a word taken from the vocabulary of ancient Greek religion, which passed into the language of Christianity, and so into the modern tongues of Europe, because it was adopted by the Hellenistic Jews as the rendering of the Hebrew נָבִי (*nābî*, pl. *nebíim*). The word therefore as we use it is meant to convey an idea which belongs to Hebrew and not to Hellenic belief; but when it first underwent this change of application the age of the *nebíim* was long past, and the Jews themselves had a very imperfect conception of what they had been and done. Hence in actual usage

the idea conveyed by the word prophet has never quite corresponded with its historical prototype; the prophets of early Christendom, for example, are not by any means exact counterparts of the Old-Testament prophets, and in general very various ideas have prevailed as to what a prophet is or should be, because up to quite a recent date the work of the Hebrew prophets has been habitually approached not in a purely historical spirit but under the influence of preconceived ideas.

*The Prophets of the Old Testament.*—The author of 1 Sam. ix. 9, tells us that “beforetime in Israel, when a man went to inquire of God, thus he spake, Come and let us go to the seer; for he that is now called a prophet (*nābî*) was beforetime called a seer.” This remark is introduced to explain how his contemporaries spoke of Samuel. He was a “seer,” or, as he is also called, a “man of God,” that is one who stood in closer relations to God than ordinary men; “all that he said was sure to come to pass,” so that he could be consulted with advantage even in private matters like the loss of the asses of Kish. The narrative of 1 Sam. ix. is so vivid and exact that not many generations of oral tradition can have separated the author from the events he records; it shows us therefore, at least broadly, what the word prophet meant in the early times of the Hebrew kingdom, and it shows us that it had acquired that meaning after the age of Philistine oppression in which Samuel lived, and to which his younger contemporaries Saul and David put an end. That this is the sense of the author, and that we must not suppose that the word prophet had merely become more common in his time and supplemented an older synonym, appears beyond question a few verses further down, where we see that there were already in Samuel’s time people known as *nebíim*, but that they were not seers. The seer, with his exceptional insight, is a man of prominent individuality and held in great respect: when Saul asks for the seer every one knows that there is only one person in the town whom he can mean. With the prophets it is quite otherwise; they appear not individually but in bands; their prophesying is a united exercise, accompanied by music, and seemingly dance-music; it is marked by strong excitement, which sometimes acts contagiously, and may be so powerful that he who is seized by it is unable to stand, and though this condition is regarded as produced by a divine afflatus, it is matter of ironical comment when a prominent man like Saul is found to be thus affected. Samuel in his later days appears presiding over a group of *nebíim* at Ramah, where they seem to have had a sort of cœnobium (Naioth), but he was not himself a *nābî*—that name is never applied to him except in 1 Sam. iii. 21, where it is plainly used in the later sense for the idea which in Samuel’s own time was expressed by “seer.”

*Prophets in the Christian Church.*—The appearance of prophets in the first Christian communities is one proof of the strength of faith and hope by which these bodies were animated. An old prophecy (Joel iii. 1) had foretold that in the Messianic age the Spirit of God would be poured out on every member of the religious community, and, in point of fact, it was the universal conviction of those who believed in Christ that they all possessed the Spirit of God. This Spirit, manifesting His presence in a variety of ways and through a variety of gifts, was to be the only ruling authority in the church. He raised up for Himself particular individuals, into whose mouths He put the word of God, and these were at first regarded as the true leaders of the congregations. We find accordingly that there were prophets in the oldest church, that of Jerusalem, and again that there were “prophets and teachers” in the church at Antioch. These were not office-bearers

chosen by the congregation, but preachers raised up by the Spirit and conferred as gifts on the church. When Paul says: "God has set some in the church, first as apostles, second as prophets, third as teachers," he points to a state of things which in his time prevailed in all the churches both of Jewish and of heathen origin. We here learn from Paul that the prophets occupied the second position in point of dignity; and we see from another passage (1 Cor. xiv.) that they were distinguished from the teachers by their speaking under the influence of inspiration—not, however, like the "speakers in tongues," in unintelligible ejaculations and disconnected words, but in articulate, rational, edifying speech. Until recently it was impossible to form any distinct idea of the Christian prophets in the post-apostolic age, not so much from want of materials as because what evidence existed was not sufficiently clear and connected. It was understood, indeed, that they had maintained their place in the churches till the end of the second century, and that the great conflict with what is known as Montanism had first proved fatal to them; but a clear conception of their position and influence in the churches was not to be had. But the discovery, by Bryennios, of the ancient Christian work *Διδαχὴ τῶν δωδεκά ἀποστόλων* (The Teachings of the Twelve Apostles), has immensely extended the range of our knowledge, and has at the same time thrown a clear light on many notices in other sources which for want of proper interpretation had been previously neglected or incorrectly understood.

PROSELYTE (*προσήλυτος*) is the term most frequently adopted by the Septuagint, especially in legal passages, to represent the Hebrew גֵר. The *gēr*, or more fully *gēr w'tōshāb*, is not any "stranger," but a stranger dwelling in a Hebrew community, and enjoying a certain measure of protection. In old time at least the position of such a stranger was no doubt very insecure, for he had no strong kinsmen to take his part, and so, like the widow and orphan, with whom many passages of the Old Testament associate him, he was liable to oppression. The law as well as the prophets commend him to the humane regard of his neighbors, but it would have been quite foreign to antique ideas to grant him equal rights.

The condition of admission to the full privileges of an Israelite, in particular to the passover, is, according to the Priestly Code (Exod. xii. 48; Numb. ix. 14), circumcision—to which the later Jewish usage adds lustration by immersion in water (baptism, *t'bilā*) and the presentation of a sacrifice (*korbān*). The immersion, about which there has been a good deal of controversy, some maintaining that it came into use later than Christian baptism, was really a necessary act for one who had been previously unclean, and may be held to be involved in the general Pentateuchal law of ceremonial washings. The later technical name for a heathen who thus joined the theocracy was גֵר הַצְדִק, "proselyte of righteousness."

PROSERPINE (*Proserpina*) is the Latin form of PERSEPHONE, a Greek goddess, daughter of Zeus and the earth-goddess Demeter. As she was gathering flowers with her playmates in a meadow, the earth opened and Pluto, god of the dead, appeared and carried her off to be his queen in the world below. Torch in hand, her sorrowing mother sought her through the wide world, and finding her not she forbade the earth to put forth its increase. So all that year not a blade of corn grew on the earth, and men would have died of hunger if Zeus had not persuaded Pluto to let Proserpine go. But before he let her go Pluto made her eat the seed of a pomegranate, and thus she could not stay away from him forever. So it was arranged that she should spend two-thirds (according to later authors,

one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Pluto beneath the earth.

PROSKUROFF, a district town of the government of Podolia, Russia, situated on the railway from Odessa to Lemberg, sixty-two miles to the northwest of Schmerinka junction, and on the highway from Zhitomir to Kieff. Of the population (11,750 in 1880), more than one-half are Jews.

PROSPER OF AQUITAINE (AQUITANUS, or AQUITANICUS), a Christian prose and verse writer of the first half of the fifth century. Of his personal history almost nothing is known; his surname seems to imply that he was a native of Aquitania, and there are various indications that he was educated as a "rhetorician."

PROSSNITZ (Slavonic, *Prostejov*), the chief place in the fertile district of the Hanna, in Moravia, Austria, is situated on the small river Rumza, eleven miles southwest of Olmütz. Population in 1880, 16,751.

PROTAGORAS of Abdera, the first of the so-called Sophists—who, about the middle of the fifth century B. C., asserted throughout Greece the claims of education or culture in opposition on the one hand to technical instruction and on the other to physical research—was an older contemporary of Socrates. At the age of seventy, having been accused and convicted of atheism, Protagoras fled from Athens, and on his way to Sicily was lost at sea. His birth has been plausibly assigned to 481 and his death to 411 B. C. Forty years of his life were spent in the exercise of his popular and lucrative profession in the principal cities of Greece and Sicily.

PROTECTION. See FREE TRADE and POLITICAL ECONOMY.

PROTESTANTENVEREIN is the name of a society in Germany the general object of which is to promote the union and the progress of the various established Protestant churches of the country in harmony with the advance of culture and on the basis of Christianity. It was founded at Frankfort-on-the-Main in 1863 by a number of distinguished clergymen and laymen of liberal tendencies, representing the freer parties of the Lutheran and reformed churches of the various German states, among whom were the statesmen Bluntschli and Von Bennigsen and the professors Rothe, Ewald, Schenkel, Hilginfeld, and Hitzig.

PROTESTANTS is the generic term for members of the churches which owe their origin directly or indirectly to the REFORMATION, (*q. v.*) The name is derived from the Protest of Spires in 1529 (see LUTHER). Certain small communities of Christians older than the Reformation, but agreeing with it in rejecting the authority of Rome, are generally and quite logically grouped as Protestants; and popularly the name is considered to include all Christians who do not belong to the Greek and Roman Catholic communions, though members of the Anglican Church, for example, frequently protest against such a classification as historically false and personally obnoxious. Protestantism has flourished best among the Teutonic peoples of Northern Europe, and has always found it difficult to make its way among the Latin peoples of the South.

The following table shows approximately the number of Protestants in the world:—

#### I. EUROPE—

Great Britain and Ireland (Anglicans, 18,800,000; Presbyterians, 3,900,000; Methodists, 3,500,000; Independents, 1,200,000; Baptists, 1,000,000) . . . . .	28,400,000 (estimate)
German Empire (Lutherans, Reformed, and United, 28,318,280; Mennonites and other Baptists, 38,744) . . . . .	28,357,024 (1880)

Norway and Sweden (Norway, 1,805,076; Sweden, 4,561,759, mostly Lutheran).....	6,366,835 (1875 and 1880)
Denmark and Iceland (Denmark, 1,960,844; Iceland, 72,000, mostly Lutheran).....	2,032,844 (1880)
Holland (Reformed, 2,346,568— including Remonstrants, 9,678; Lutherans, 73,696; Mennonites, 50,705).....	2,472,680 (1879)
Switzerland (mainly Reformed) (Making a total in countries of the Teutonic race of 69,296,492.)	1,667,109 (1880)
France (Reformed or Calvinists, 467,631; Lutherans, 80,117; others, 33,109).....	580,757 (1872)
Belgium, Spain, and Portugal, Luxemburg and Monaco (respectively 15,000, 10,500, 963, and 626).....	27,089 (various)
Italy (Waldensians, Free Church of Italy, Methodists, Baptists, etc.).....	62,000 (estimate)
Roumania (Total in countries of Latin race, 683,646.)	13,800 (estimate)
Austria (Lutherans, 289,005; Reformed, 110,525; Unitarians, 169, etc.).....	401,479 (1880)
Hungary (Lutherans, 1,130,150; Reformed, 2,043,280; Unitarians, 56,190).....	3,220,620 (1880)
Russia in Europe (Lutherans in Finland, 2,019,727).....	4,504,000 (partly estimate)
Turkey, Greece, Servia (respectively 10,200, 20,000, and 500). (Total in countries of Slavonic, non-Aryan, and mixed race, 8,165,799.)	30,700 (estimate)
<b>II. AMERICA—</b>	78,145,937
United States (Methodists, 3,686,114 church members; Baptists, 2,424,878; Lutherans, 950,868; Disciples of Christ, 591,821; Congregationalists, 381,697; Episcopalians, 347,781).....	30,000,000 *
Canada.....	2,422,285 (1881)
West Indies.....	160,500 (estimate)
Central and South America....	180,000 (partly estimate)
	32,762,785
<b>III. ASIA and AUSTRALASIA—</b>	
India, (Anglicans, etc., 373,848; Baptists, Presbyterians, etc., 128,694; Lutherans, 29,577)...	532,219 (1881)
Dutch Possessions.....	170,000 (partly estimate)
China and Corea (73,000), Japan (13,000), and Siam (2,000) ...	88,000 (estimate)
Turkey in Asia (100,000) and Persia (5,000).....	105,000 (estimate)
New South Wales (516,512), Victoria (618,392), Queensland (139,380).....	1,274,284 (1881)
South Australia (216,626) and West Australia (20,613).....	237,239 (1881)
New Zealand.....	393,971 (1881)
Polynesia, Micronesia, and Melanesia (260,000, 8,000, and 16,000).....	284,600 (estimate)
	3,084,713
<b>IV. AFRICA—</b>	
Egypt and North Africa (10,000) and West Africa (110,000)....	120,000 (estimate)
Cape Colony, etc.....	400,000 (estimate)
East and Central Africa (2,000) and Madagascar (300,000)....	302,000 (estimate)
	822,000
Total number of Protestants thus ascertained...	114,815,435

This total of 115,000,000 is for obvious reasons considerably within the truth. Making allowance for increase of population since some of the census returns, it will probably be not beyond the mark to state the Protestants of Europe at 81,000,000, of America at 34,000,000, of Asia and Australasia at 3,300,000, and of Africa at 850,000, and the total in round numbers at 120,000,000.

\* This estimate of the Protestant population is based on the details of church membership (partly given above) obtained at the census of 1880.

PROTEUS, a Greek sea-god, spoken of by Homer as the Old Man of the Sea. In the *Odyssey* he dwells in the sea near Pharos, an island said to be a day's sail from the mouth of the Nile; in Virgil his home is the Carpathian Sea between Crete and Rhodes. He knew all things past, present, and future, but was very loth to tell what he knew. Those who would consult him had first to surprise and bind him during his noon-day slumber in a cave by the sea, where he was wont to pass the heat of the day surrounded by his seals. Even when caught he would try to escape by assuming all sorts of shapes; now he was a lion, now a serpent, a leopard, a boar, a tree, fire, water. But if his captor held him fast, the god at last returned to his proper shape, gave the wished-for answer, and then plunged into the sea.

PROTEUS ANGUINUS, a blind, newt-like perennibranchiate Amphibian, about a foot long, found in the Adelsberg, Maddalena, and other limestone caverns of Carinthia and Carniola.

PROTOGENES, a Greek painter, born in Caunus on the coast of Caria, but resident in Rhodes during the latter half of the fourth century B.C., was celebrated for the minute and laborious finish which he bestowed on his pictures, both in drawing and in color.

PROTOPLASM. In most of the biological articles of the present day special reference is made to protoplasm as the living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred. Fundamentally important then as this substance is, whether we occupy the standpoint of morphology, physiology, or ætiology, an attempt must be made to outline the way in which our knowledge of it has been reached, to bring together by the aid of a short summary the statements of such preceding articles, and to supply means of extending the general idea thus obtained by reference to the original literature of the subject.

*Appearance and Properties of Protoplasm.*—To obtain a notion of the appearance and physical properties of protoplasm, it is expedient as it were to repeat the process of discovery, and acquire concrete ideas by actual observation as far as possible, or at least from good figures. The *Amæba* (see PROTOZOA) and the FORAMINIFERA (*q.v.*) thus afford convenient and classical examples of the protoplasm of the lowest animal forms; the colorless corpuscles of blood should also be examined, and the structure of the higher tissues (see ANATOMY and HISTOLOGY) inquired into, and the segmentation of an ovum (see REPRODUCTION) observed—most conveniently perhaps in frog spawn.

*Manifestations of Life (Functions).*—The vital properties or "functions" exhibited by undifferentiated living protoplasm (*e.g.*, *Amæba*) are usually enumerated as contractility, irritability and automatism, reception and assimilation of food, metabolism with secretion and excretion, respiration, and reproduction.

*Chemical Composition and Processes.*—This aspect of protoplasm is of constantly increasing importance, since for the chemist all functions alike can only be viewed in terms of those specific anabolic or katabolic changes which to the physiologist, on the other hand, seem mere accompaniments of them (see PHYSIOLOGY, NUTRITION, REPRODUCTION). The determination of the chemical nature of protoplasm is thus the supreme problem of physiological chemistry; and, while, thanks to the labors of Reinke, E. Schultze, and others, there has been a rapidly increasing knowledge of its anastates, but more especially of its katabates, and of many cases of the unity of metabolic processes throughout nature, several daring general hypotheses are already in the field. Of these that of Schützenberger, who views proteid bodies as complex ureides, and that of Loew

and Bokorny, who regard them as a complex mixture of aldehyde groups, are examples.

PROTOZOA is the name applied to the lowest grade of the animal kingdom, and originated as a translation of the German term "Urthiere." While at first used some forty years ago in a vague sense, without any strict definition, so as to include on the one hand some simple organisms which are now regarded as plants, and on the other some animals which are now assigned a higher place in the animal series, the term has within the last twenty years acquired a very clear signification.

The protozoa are sharply and definitely distinguished from all the rest of the animal kingdom, which are known by the names "Metazoa" or "Enterozoa." They are those animals which are structurally single "cells" or single corpuscles of protoplasm, whereas the Enterozoa consist of many such units arranged definitely (in the first instance) in two layers—an endoderm or enteric cell-layer and an ectoderm or deric cell-layer—around a central cavity, the enteron or common digestive cavity, which is in open communication with the exterior by a mouth.

The protozoa are then essentially unicellular animals. The individual or person in this grade of the animal kingdom is a single cell; and, although we find protozoa which consist of aggregates of such cells, and are entitled to be called "multicellular," and yet an examination of the details of structure of these cell-aggregates and of their life-history establishes the fact that the cohesion of the cells in these instances is not an essential feature of the life of such multicellular protozoa, but a secondary and non-essential arrangement. Like the budded "persons" forming, when coherent to one another, undifferentiated "colonies" among the polyps and corals, the coherent cells of a compound protozoon can be separated from one another and live independently; their cohesion has no economic significance. Each cell is precisely the counterpart of its neighbor; there is no common life, no distribution of function among special groups of the associated cells, and no corresponding differentiation of structure. As a contrast to this we find even in the simplest enterozoa that the cells are functionally and structurally distinguishable into two groups—those which line the enteron or digestive cavity and those which form the outer body wall. The cells of these two layers are not interchangeable; they are fundamentally different in properties and structure from one another. The individual enterozoon is not a single cell; it is an aggregate of a higher order consisting essentially of a digestive cavity around which two layers of cells are disposed. The individual protozoon is a single cell; a number of these individuals may, as the result of the process of fission (cell-division), remain in contact with one another, but the compound individual which they thus originate has not a strong character. The constituent cells are still the more important individualities; they never become differentiated and grouped in distinct layers differing from one another in properties and structure; they never become subordinated to the individuality of the aggregate produced by their cohesion; hence we are justified in calling even these exceptional aggregated protozoa unicellular.

By far the larger number of protozoa are absolutely single isolated cells, which, whenever they duplicate themselves by that process of division common to these units of structure (whether existing as isolated organisms or as constituents of the tissues of plants or of animals), separate at once into two distinct individuals which move away from one another and are thenceforward strangers.

The feeding of plants upon carbonic acid is invariably accompanied by the presence of a peculiar green-coloring matter—chlorophyl. In virtue of some direct or indirect action of this chlorophyl the protoplasm of the plant is enabled to seize the carbon of the mineral world—the carbon which has sunk to the lowest resting stage of combination—and to raise it into combination with hydrogen and oxygen and ultimately with nitrogen. There are plants which have no chlorophyl, and are thus unable to feed upon carbonic acid. They are none the less plants since they agree closely with particular chlorophyl-bearing plants in details of form and structure, mode of growth and reproduction. A large series of these are termed fungi. Though unable to feed on carbonic acid, they do not feed as do animals. They can take their carbon from acetates and tartrates, which animals cannot do, and their nitrogen from ammonia. Even when it is admitted that some of these colorless plants, such as the bacteria (Schizomycetes), can act upon albumens so as to digest them and thus nourish themselves, it is not reasonable to place the bacteria among animals, any more than it would be reasonable so to place nepenthes, sarracenia, and drosera (insectivorous phanerogams); for the structure and mode of growth of the bacteria is like that of well-known chlorophylligerous minute algæ from which they undoubtedly differ only in having secondarily acquired this peculiar mode of nutrition, distinct from that which has dominated and determined the typical structure of plants.

So we find in a less striking series of instances among animals that here and there the nutritional arrangements which we have no hesitation in affirming to be the leading characteristic of animals, and to have directly and perhaps solely determined the great structural features of the animal line of descent, are largely modified or even altogether revolutionized. The green hydra, the freshwater sponge, and some planarian worms produce chlorophyl corpuscles in the protoplasm of their tissues just as green plants do, and are able in consequence to do what animals usually cannot do—namely, feed upon carbonic acid. The possibilities of the protoplasm of the plant and of the animal are, we are thus reminded, the same. The fact that characteristically and typically plant protoplasm exhibits one mode of activity and animal protoplasm another does not prevent the protoplasm of even a highly developed plant from asserting itself in the animal direction, or of a thoroughly characterized animal, such as the green hydra, from putting forth its chlorophylligenous powers as though it belonged to a plant.

Hence it is not surprising that we find among the protozoa, notwithstanding that they are characterized by the animal method of nutrition and their forms determined by the exigencies of that method, occasional instances of partial vegetable nutrition such as is implied by the development of chlorophyl in the protoplasm of a few members of the group. It would not be inconsistent with what is observed in other groups should we find that there are some unicellular organisms which must, on account of their structural resemblances to other organisms, be considered as Protozoa and yet have absolutely given up altogether the animal mode of nutrition (by the ingestion of solid albumens) and have acquired the vegetable mode of absorbing ammonia, nitrates, and carbonic acid. Experiment in this matter is extremely difficult, but such "vegetable" or "holophytic nutrition" appears to obtain in the case of many of the green flagellata, of the dinoflagellata, and possibly of other protozoa.

On the other hand there is no doubt that we may fall into an error in including in the animal line of descent all unicellular organisms which nourish themselves by

the inception of solid nutriment. It is conceivable that some of these are exceptional creophagous protophytes parallel at a lower level of structure to the insectivorous phanerogams. In all cases we have to balance the whole of the evidence and to consider probabilities as indicated by a widely-reaching consideration of numerous facts.

The mere automatic motility of unicellular organisms was at one time considered sufficient indication that such organisms were animals rather than plants. We now know that not only are the male reproductive cells of ferns and similar plants propelled by vibratile protoplasm, but such locomotive particles are recognized as common products ("swarm-spores" and "zoospores") of the lowest plants.

The danger of dogmatizing erroneously in distinguishing protozoa from protophyta, and the insuperable difficulty in really accomplishing the feat satisfactorily, has led at various times to the suggestion that the effort should be abandoned and a group constituted confessedly containing both unicellular plants and unicellular animals, and those organisms which may be one or the other. Haeckel has proposed to call this group the Protista. On the whole, it is more satisfactory to make the attempt to discriminate those unicellular forms which belong to the animal line of descent from those belonging to the vegetable line. It is, after all, not a matter of much consequence if the botanist should mistakenly claim a few protozoa as plants and the zoölogist a few protophyta as animals. The evil which we have to avoid is that some small group of unattractive character should be rejected by both botanist and zoölogist, and thus our knowledge of it should unduly lag. Bearing this in mind, the zoölogist should accord recognition as protozoa to as wide a range of unicellular organisms as he can without doing violence to his conceptions of probability.

A very interesting and very difficult subject of speculation forces itself on our attention when we attempt to draw the line between the lowest plants and the lowest animals, and even comes again before us when we pass in review the different forms of protozoa.

That subject is the nature of the first protoplasm which was evolved from not-living matter on the earth's surface. Was that first protoplasm more like animal or more like vegetable protoplasm as we know it to-day? By what steps was it brought into existence?

Briefly stated the present writer's view is that the earliest protoplasm did not possess chlorophyl and therefore did *not* possess the power of feeding on carbonic acid. A conceivable state of things is that a vast amount of albuminoids and other such compounds had been brought into existence by those processes which culminated in the development of the first protoplasm, and it seems therefore likely enough that the first protoplasm fed upon these antecedent steps in its own evolution just as animals feed on organic compounds at the present day, more especially as the large creeping plasmodia of some mycetozoa feed on vegetable refuse. It indeed seems not at all improbable that, apart from their elaborate fructification, the mycetozoa represent more closely than any other living forms the original ancestors of the whole organic world. At subsequent stages in the history of this archaic living matter chlorophyl was evolved and the power of taking carbon from carbonic acid. The "green" plants were rendered possible by the evolution of chlorophyl, but through what ancestral forms they took origin or whether more than once, *i.e.*, by more than one branch, it is difficult even to guess. The green flagellate protozoa (Volvocineæ) certainly furnish a connecting point by which it is possible to link on the pedigree of green plants to the primitive protoplasm; it is noteworthy that

they cannot be considered as very primitive and are indeed highly specialized forms as compared with the naked protoplasm of the mycetozoon's plasmodium.

Thus then we are led to entertain the paradox that though the animal is dependent on the plant for its food yet the animal preceded the plant in evolution, and we look among the lower protozoa and not among the lower protophyta for the nearest representatives of that first protoplasm which was the result of a long and gradual evolution of chemical structure and the starting point of the development of organic form.

PROUDHON, PIERRE JOSEPH, a well-known revolutionary writer, was born in 1809 at Besançon, France. In 1840 he published his first work *Qu'est-ce que la Propriété?* In 1846 he published his greatest work, the *Système des Contradictions économiques ou Philosophie de la Misère*. The violence of his utterances led to an imprisonment at Paris for three years, during which he married a young working woman. As Proudhon aimed at economic rather than political innovation, he had no special quarrel with the second empire, and he lived in comparative quiet under it till the publication of his work, *De la Justice dans la Révolution et dans l'Église* (1858), in which he attacked the church and other existing institutions with unusual fury. This time he fled to Brussels to escape imprisonment. On his return to France his health broke down, though he continued to write. He died at Passy in 1865.

PROUT, SAMUEL, water-color painter, was born at Plymouth, England, on September 17, 1783. At the time of his death, February 10, 1852, there was scarcely a nook in France, Germany, Italy, and the Netherlands where his quiet, benevolent, observant face had not been seen searching for antique gables and sculptured pieces of stone. In Venice especially there was hardly a pillar which his eye had not lovingly studied and his pencil had not dexterously copied.

PROVENÇAL LANGUAGE AND LITERATURE. Provençal is a name used to comprehend all the varieties of Romanic speech formerly spoken and written, and still generally used by country people, in the south of France. The geographical limits of this infinitely varied idiom cannot be defined with precision, because it is conterminous on the north, south, and east with idioms of the same family, with which at almost every point it blends by insensible gradations. Roughly speaking, it may be said to be contained between the Atlantic on the west, the Pyrenees and Mediterranean on the south, and the Alps on the east, and to be bounded on the north by a line proceeding from the Gironde to the Alps, and passing through the departments of Gironde, Dordogne, Haute Vienne, Creuse, Allier, Loire, Rhone, Isère, and Savoie. These limits are to some extent conventional. True, they are fixed in accordance with the mean of linguistic characters; but it is self-evident that according to the importance attached to one character or another they may be determined differently.

The name Provençal as applied to language is hardly met with in the Middle Ages, except in the restricted sense of the language of Provence proper, *i.e.*, of the region lying south of Dauphiné on the eastern side of the Rhone.

The Provençal language cannot be said to have general characteristics really peculiar to it. Such of its characteristics as are found in all varieties of the language are met with also in neighboring idioms; such as are not found elsewhere are not general characteristics, that is, are manifested only in certain varieties of Provençal. In reality "Provençal language" does not designate, properly speaking, a linguistic unity; it is merely a geographical expression.

Provençal literature is much more easily defined than the language in which it is expressed. Starting in the eleventh and twelfth centuries in several centers, it thence gradually spread out, first over the greater portion, though not the whole, of southern France, and then into the north of Italy and Spain. It nowhere merged in the neighboring literatures. At the time of the highest development (twelfth century) the art of composing in the vulgar tongue did not exist, or was only beginning to exist, to the south of the Alps and the Pyrenees. In the north, in the country of French speech, vernacular poetry was in full bloom; but between the districts in which it had developed—Champagne, Île de France, Picardy, and Normandy—and the region in which Provençal literature had sprung up, there seems to have been an intermediate zone formed by Burgundy, Bourbonnais, Berry, Touraine, and Anjou, which, far on into the Middle Ages, appears to have remained barren of vernacular literature. In its rise Provençal literature stands completely by itself, and in its development it long continued to be absolutely original. It presents at several points genuine analogies with the sister literature of northern France; but these analogies are due principally to certain primary elements common to both and only in a slight degree to mutual reaction.

PROVENCE (*Provincia*), a province of France lying to the extreme southeast on the shores of the Mediterranean, bounded on the west by Languedoc, on the north by Venaissin and Dauphiné and on the east by Italy. It now forms the departments of Bouches-du-Rhône, Var, and Basses-Alpes, with portions of Vaucluse and Alpes Maritimes. It was divided into Upper Provence, containing the four seneschalates of Forcalquier, Castellane, Sisteron Digne, and the valley of Barcelonnette; and Lower Provence, containing the eight seneschalates of Aix, Arles, Brignoles, Grasse, Marseilles, Draguignan, Hyères, and Toulon. In ancient as in modern times the most important city was Marseilles (Massilia), a chief seat of trade for the Greek merchants of the Mediterranean, who extended their power along the coast and founded Agde, Antibes, Grasse, and Nice. They afterward called in the aid of the Romans (125 B.C.) against the Ligurian inhabitants of the surrounding country, and the new-comers soon made themselves masters of the territory which later formed the provinces of Languedoc, Dauphiné, and Provence. The new province, of which the capital was Aquæ Sextiæ (Aix), was called Provincia Gallica until the total conquest of Gaul, when the name of the district was changed to Gallia Narbonensis. In the fourth century of the Christian era, when the greater part of Languedoc, or Narbonensis Prima, had become subject to the Visigoths; and the Burgundians had spread to the Viennois, Provincia came to be applied only to the country lying between the Rhone, the Durance, and the Alps which was still held by the Romans.

On the reconvoation of the estates in 1787 the two upper houses refused to bear their share of taxation, and in 1789, in the states-general of the kingdom, Mirabeau with his colleagues renounced the freedom and independence of the province. The division of Provence into departments in 1790 finally obliterated all traces of the ancient constitution, but the people still preserve in the soft tones of their *langue d'oc* an undying reminder of their former independence.

PROVERBS, BOOK OF. The title of the book of Proverbs is *The Proverbs of Solomon*. In early times the book was frequently referred to both among Jews and Christians under the name of *Wisdom* or *The Wisdom that comprises all Virtues*. The name, however, was employed somewhat indiscriminately, for not

only Proverbs but also Ecclesiastes and the apocryphal books Ecclesiasticus and Wisdom were also designated by it, and sometimes apparently the whole third division of the canon.

PROVIDENCE, a city of the United States, one of the capitals of the State of Rhode Island (the other being Newport), and the seat of justice of Providence county, is situated in 41° 49' 22" N. latitude, and 71° 24' 48" W. longitude, at the head of Narragansett Bay, on both banks of Providence River, and with Seekonk River on its eastern boundary. A nearly circular sheet of water known as the Cove lies in the heart of the city at the junction of river and estuaries. The total area of Providence is 14.76 square miles. On the east side the ground rises to a height of 204 feet. On the extreme southern boundary lies Roger Williams Park (102 acres), bequeathed to the city in 1871. The buildings of the Brown University occupy a commanding position on the East Side. This institution, the seventh college organized in the country, was originally founded at Warren, R. I., in 1764, as "Rhode Island College." It was removed to Providence in 1770, and took its present name (that of its principal benefactor) in 1804. University Hall was erected in 1770, and of the eight other buildings three have been built since 1877. Of its governing board five-eighths must, by its charter, be Baptists, but the faculty and the students have always represented a wide variety of religious beliefs. It possesses a library of 62,000 volumes, preserved in a fire-proof structure, costing about \$120,000. Among other educational institutions are the Friends' school (1819), the academy of the Sacred Heart (Roman Catholic) (1873), the university grammar school, the Berkeley school, and the English and classical school. The city system of public schools comprises high and other schools of various grades. The Rhode Island Historical Society was founded in 1822 and occupied its present building in 1844, and the Providence Franklin Society (scientific) dates from 1823. The Providence Athenæum founded 1838, has a library of over 50,000 volumes, and the Providence public library (1878), 45,000 volumes.

The Rhode Island hospital was completed in 1868, at a cost of more than \$450,000. The Butler hospital for the insane (1847) accommodates about 200 patients, and occupies about 120 acres of land, overlooking the Seekonk River. The Dexter asylum (or city almshouse), erected in 1827, receives about 125 inmates, and devotes about thirty-nine acres to a very profitable system of market-gardening. The State penal and reformatory institutions, formerly within the city limits, were in 1878 removed to new quarters in Cranston, about three miles south of the city boundary. The State-house, erected in 1762, stands on the East Side, as does also the courthouse (1877), erected at a cost of \$400,000. On the West Side is the city hall (1879), costing nearly one million dollars. In front of the latter stands the Soldiers' and Sailors' Monument (1871). There are two principal theaters, erected in 1871 and 1877. Among the churches may be mentioned the cathedral of St. Peter and St. Paul (Roman Catholic), begun in 1878; also Grace, All Saints, and St. John's (Protestant Episcopal), the last dating from 1811; the First Baptist (erected 1775), and the First Congregational (1816). The number of church organizations is about ninety. The predominant interest of Providence is no longer commerce, but manufactures, the census of 1888 ranking it sixteenth among American cities in the value of its products. Out of the total, the value of the cotton products was \$2,250,273, this being one of the chief cotton markets of the Northern states; the woolen and worsted goods, \$7,139,947; iron manufactured products (including steam-engines, boilers, locomotives, sewing-ma-

chines, rifles, screws, hinges, files, machinery, etc.), \$4,757,401; and gold and silver manufactured products (in which department this is among the first), \$6,865,192. An extensive system of street railways, comprising forty-five miles of track, connects all portions of the city and suburbs with the center. The Providence telephone exchange, organized in 1879, controls over 1,500 miles of wire. The city is lighted both by gas and by electric light. It has also an extensive system of water supply and sewerage. There are fifteen newspapers, four being dailies. The population has increased as follows:

1708.....1,446	1810.....10,071	1860.....50,666
1730.....3,916	1820.....11,767	1870.....68,904
1774.....4,321	1830.....16,836	1880.....104,857
1790.....6,380	1840.....23,172	1885.....118,070
1800.....7,614	1850.....41,513	1890.....132,146

In the ratio of its valuation to its population Providence ranks as one of the wealthiest of American cities.

The first settlement within the limits of Providence was made in 1636, by Roger Williams, who had been obliged to leave the neighboring colony on account of his religion and political opinions. He obtained a large tract of land from the Indians by friendly negotiations, the original "deeds" being still preserved in the city archives, and gave the name of Providence to the settlement. The town of Providence united with two others in 1643-44, in applying for and receiving from the Parliamentary government in England the first charter of the colony. The most of the houses were destroyed during an attack by the natives in 1676. The War of Independence in 1775-83 also had the effect of very materially prostrating the commerce and trade of the town. In 1832 the town form of government was exchanged for that of a city, the charter providing for a division into six wards. The present number of wards is ten.

PROVINCE (*provincia*, etymology uncertain), in the Roman sense, may be defined as the department or sphere of duty assigned to one of the higher magistrates (the consuls and prætors). But when, with the spread of the Roman arms, the government of conquered countries grew to be one of the most important duties of the higher magistrates, the term province, from designating the government of a conquered country as one particular duty of a Roman magistrate, came to be used generally as a designation of the country itself.

PROVINS, a town of France, at the head of an arrondissement of the department of the Seine-et-Marne, at the junction of the Durtain with the Voulzie (an affluent of the Seine), fifty-nine miles southeast of Paris by a branch railroad. The population of the town in 1881 was 6,949.

PROVO CITY, a town of the United States, and the capital of Utah county, Utah, is handsomely situated on the Provo river, southeast of Salt Lake City. Located as it is at the base of the Wahsatch mountains, and within three miles of Utah Lake, a beautiful expanse of water, and easily accessible by railroad, the town has become a favorite resort for tourists, as also a prosperous corporation. It contains a bank, theater, town-hall, three hotels, stores, flouring-mills, tanneries, saw-mills, planing-mills, foundry, canning works, machine-shop, electric light works, etc., and is in the midst of a cultivated section of the territory. The population in 1880 was 3,431, and in 1890, 5,153.

PROVOST. See BOROUGH and MUNICIPALITY, also CATHEDRAL and UNIVERSITIES.

PROXY. See PROCTOR.

PRUDENTIUS, AURELIUS CLEMENS, a Christian versewriter. apparently a native of Spain, who flourished during the latter half of the fourth century and in the

beginning of the fifth. According to the meager and vague autobiographical notices given by himself in the preface to his poems he was born in the year 348, and after receiving a liberal education, practiced at the bar and subsequently held judicial office in two important cities. At the time of the publication of his poems in 405 he held from the emperor a high military appointment at court. Of his subsequent history nothing is known.

PRUD'HON, PIERRE, French painter, born at Cluny on April 4, 1758, was the third son of a mason. The monks of the abbey undertook his education. The paintings which decorated the monastery excited his emulation, and by the aid of Moreau, bishop of Mâcon, he was placed with Devosges, director of the art school at Dijon. In 1778 Prud'hon went to Paris. In 1808 he exhibited *Crime pursued by Vengeance and Justice*, and *Psyche carried off by Zephyrs*. These two remarkable compositions brought Prud'hon the Legion of Honor; and in 1816 he entered the Institute. Easy as to fortune, and consoled for the misery of his marriage by the devoted care of his excellent and charming pupil, Mademoiselle Mayer, Prud'hon's situation seemed enviable; but Mademoiselle Mayer's tragical suicide on May 26, 1821, brought ruin to his home, and two years later, February 16, 1823, Prud'hon followed her to the grave.

PRUSSIA, (Ger., *Preussen*; Lat., *Borussia*), a kingdom of northern Europe and by far the most important member of the German empire, occupies almost the whole of northern Germany, between 5° 52' and 22° 53' E. longitude and 49° 7' and 55° N. latitude. It now forms a tolerably compact mass of territory, with its longest axis from southwest to northeast; but within the limits just indicated lie the "enclaves" Oldenburg, Mecklenburg, Brunswick, and other small German states, while beyond them it possesses Hohenzollern, in the south of Würtemberg, and other "exclaves" of minor importance. On the north Prussia is bounded by the North Sea, Denmark, and the Baltic; on the east by Russia and Poland; on the south by Austrian Silesia, Moravia, Bohemia, Saxony, the Thuringian states, Bavaria, Hesse-Darmstadt, the Rhenish Palatinate, and Lorraine; and on the west by Luxemburg, Belgium, and the Netherlands. With the exception of the sea on the north and the mountain-barrier on the south-east, the frontiers are political rather than geographical, a fact that has always been characteristic of Prussia's limits and that has had considerable influence in determining its history. The Prussian monarchy, with an area of 134,490 square miles, comprises nearly two-thirds of the entire extent of the German empire. Its kernel is the Mark of Brandenburg, round which the rest of the state has been built up gradually, not without costly and exhausting wars. The territory ruled over by the first Hohenzollern elector (1415-40) did not exceed 11,400 square miles, an area that had been quadrupled before the death of the first king in 1713. Frederick the Great left behind him a realm of 75,000 square miles, and the following two monarchs, by their Polish and Westphalian acquisitions, brought it to a size not far short of its present extent (122,000 square miles in 1803). After the disastrous war of 1806 Prussia shrank to something smaller than the kingdom of Frederick the Great (61,000 square miles), and the readjustment of Europe in 1815 still left it short by 14,000 square miles of its extent in 1803. Fully one-fifth of its present area is due to the war of 1866, which added Hanover, Hesse-Cassel, Hesse-Nassau, Schleswig-Holstein, and the city of Frankfort-on-the-Main to the Prussian dominions.

The claims which Prussian history makes upon our

attention are based neither upon venerable antiquity nor upon uniformity of origin. The territorial and political development of the country has taken place wholly within the last thousand years; and the materials out of which it has been built up—marquisates and duchies, ecclesiastical principalities and free imperial cities—are of the most heterogeneous description. The history of Prussia acquires its primary significance from the fact that this state was the instrument by which the political regeneration of Germany was ultimately effected from within, and the unity and coherence of the narrative are best observed when we consider it as a record of the training that fitted the country for this task.

The North Mark of Saxony, corresponding roughly to the northern part of the present province of Saxony, to the west of the Elbe, was established by the emperor Henry I. about the year 930, and formed the beginning of the Prussian state. His son Otho I. (936-973) followed in his father's footsteps and founded the bishoprics of Havelberg and Brandenburg. Toward the end of the tenth century, however, the Wendish floodswept over the whole territory to the east of the Elbe, and the Germans were confined to the original limits of the North Mark. Christianity was rooted out and the bishop of Brandenburg reduced to an *episcopus in partibus*.

Things begin to grow a little clearer in 1134, when the emperor Lothair rewarded the services of Albert the Bear, a member of the house of Anhalt, and one of the most powerful princes of the empire, by investing him with the North Mark. The North Mark henceforth began to be known as the Altmark, or Old Mark, while the territory round Brandenburg was for a short time called the New Mark, but more permanently the Mittelmark, or Middle Mark. Albert's descendants, generally known as the Ascanian line from the Latinized form of the name of their ancestral castle of Aschersleben, ruled in Brandenburg for nearly two hundred years; but none of them seem to have been on a par with him in energy or ability.

With Waldemar's death in 1319 the Ascanian line became extinct, and a period of anarchy began, which lasted for a century, and brought the once flourishing country to the verge of annihilation. Internal order completely disappeared, and the nobles made war on each other, or plundered the more peaceful citizens without let or hindrance. Powerful neighbors again took the opportunity of appropriating such parts of Brandenburg as lay most convenient to their own borders, and the final dissolution of the electorate seemed imminent. Jobst, to whom the electorate of Brandenburg had been given in 1388, died in 1411; and Sigismund, who succeeded to the imperial throne mainly through the help of Frederick VI., burgrave of Nuremberg, conferred the electorate on this stout supporter, partly in gratitude for services rendered, and partly as a mortgage for money advanced.

The Brandenburg to which Frederick succeeded was considerably smaller than it had been in the best days of the Ascanians, consisting merely of the Altmark, Priegnitz, the Mittelmark, part of the Uckermark, and the territory of Sternberg. Including his family possessions of Anspach and Baireuth, he ruled over a territory of about 11,400 square miles in extent. The internal condition of Brandenburg had declined as much as its territorial extension had decreased. The central power had become weakened and the whole inner organization relaxed, while the electorate had also lost most of the advantages that once favorably distinguished it from other imperial fiefs. Thus rotten within, it is no wonder that the electorate completely lost its independent political importance.

Frederick, who as elector of Brandenburg assumed the style of Frederick I., showed himself equal to the troublesome task before him, and would have been still more successful had his interests been limited to the electorate. While thus regulating the affairs of Brandenburg, Frederick was also a conspicuous figure in imperial politics, especially in the Hussite wars. His candidature for the imperial throne in 1438 may be regarded as the first occasion on which the houses of Hohenzollern and Hapsburg came into competition. Frederick was succeeded in Brandenburg by his son Frederick II. (1440-1470), and in his Franconian possessions by his son Albert. The former followed in his father's footsteps by taking energetic measures to consolidate his power and restore the electorate to its former extent.

Under his brother and successor Albert (1470-1486), surnamed "Achilles" from his chivalrous valor and military talent, the Franconian lands were again united with Brandenburg. Albert allowed his devotion to the emperor to interfere to some extent with his own interests, but he carried on successful wars with Mecklenburg and Pomerania, and effectually resisted the attempts of the Teutonic knights to repossess themselves of the Neumark. His name is best remembered by the *Dispositio Achillea*, a family ordinance providing for the future separation of Brandenburg and Ansbach-Baireuth, and establishing the custom of primogeniture in each. According to Hallam, this was the first instance of the legal establishment of primogeniture, and, when we consider the effect it had in keeping the Brandenburg possessions together, while those of Saxony (for instance) were frittered away among younger sons of their descendants, we shall not fail to discern its importance in determining Prussia's future. With the accession of John (1486-1499), surnamed "Cicero" on account of his eloquence or of his knowledge of Latin, begins a short period in which the rulers of Brandenburg take little share in imperial politics. At home John found his hands full in repressing the disorders that had arisen through Albert's long absence from the electorate, and he acted with such vigor and address that he succeeded in obtaining from the towns an important excise on beer, frequently refused to his father. The old claim to feudal supremacy over Pomerania, dating from the days of the Ascanians, was compromised in 1493 for an assurance of eventual succession on the extinction of the Pomeranian dukes. The next elector, Joachim I. (1499-1535), acquired the surname of "Nestor" from his encouragement of learning, which he showed *inter alia* by the foundation of a university at Frankfort-on-the-Oder. In violation of the family law, Joachim I. bequeathed the Neumark to his younger son John, and thus Joachim II. (1535-1571) succeeded to only a part of the paternal possessions.

Between the accession of the Hohenzollern dynasty and the period at which we have now arrived the area of Brandenburg had been increased to nearly 15,000 square miles, and its material prosperity had grown in at least an equal ratio. It was still, however, far from being a compact or united state, nor had it as yet any pretension to an independent part on the European stage. Perhaps the most marked internal change was the increase in the power of the estates, resulting in great measure from the financial needs of the electors. Under Joachim's son, John George (1571-1598), who permanently reunited the Neumark with Brandenburg, the tendencies just noticed received emphatic expression. All vacant official positions were filled with members of the noblesse, who also received the right of exacting compulsory service from the peasants and other similar privileges: During his undisturbed reign

the material prosperity of Brandenburg advanced considerably, and the population was increased by numerous Protestant refugees from France and Holland. John Sigismund (1608-1619) does not seem to have been a man of marked personal character, but his reign is of great importance in the history of Brandenburg on account of the extensive territorial enlargement that fell to its lot. During his reign his territories were more than doubled in extent, covering at his death an area of 31,000 square miles.

The duchy of Prussia, acquired by the elector, formed the eastern half of the territory bearing the name of Preussen, and stretched along the Baltic Sea from the Vistula to the Memel. It still remained a Polish fief, and was separated from the rest of the electoral dominions by West Prussia, which the Teutonic Order had been forced to resign to Poland a century and a half before. The native Prussians were of a race akin to the Letts and Lithuanians, and their name (*Pruzi, Prutheni*) was probably derived from a Lettish root meaning "intelligence."

John Sigismund left his territories to his son George William (1619-1640). This unfortunate prince may perhaps be described as the first utterly incompetent ruler of his line, though due allowance must be made for the extreme difficulty of his position. In 1639 the elector removed his court to Königsberg in Prussia, the only part of his realms in which he was sure of comparative tranquillity, and there he died in 1640, leaving a land devastated in great part by fire and sword and at the lowest ebb of dignity and power.

Frederick William (1640-1688), whom both his contemporaries and after ages have agreed to dignify with the title of the "Great Elector," was only twenty years old when he succeeded to the throne, but he at once began to manifest a decided and vigorous character very different from that of his father. He emancipated himself without delay from the guidance of Schwarzenberg, and, in spite of the emperor's displeasure, concluded a peace with Sweden, which provided for the withdrawal of the Swedish troops from the electorate. During the following years of war Frederick William preserved a strict neutrality and utilized the opportunity to restore the material resources of his country and reorganize and strengthen his army. The fruits of this line of action were seen at the peace of Westphalia (1648). He established his right to the whole of Pomerania, but, as the Swedes refused to give up Western or Hither Pomerania (Vorpommern), he received as compensation the rich ecclesiastical principalities of Magdeburg, Halberstadt, and Minden, in central Germany. In the second Swedish and Polish war, which broke out in 1655, the troops of Brandenburg took a prominent share in the defeat of the Poles at the three days' battle of Warsaw (1656), in return for which service Sweden undertook to recognize the elector as independent sovereign of the duchy of Prussia. Scarcely, however, did the scale of victory begin to turn than the elector deserted his former ally, and in the treaty of Wehlau (1657), received his reward in the formal relinquishment by Poland of its feudal rights over Prussia.

When Louis XIV. attacked Holland in 1672, Frederick William, in spite of tempting offers from France, concluded an alliance with Holland, and at the head of Austrian and Brandenburgian troops joined the Dutch in an ineffectual campaign on the Rhine. In 1673 he was forced to make peace with France; but he joined the triple alliance of Holland, Spain, and the empire in the following year and took part in an indecisive campaign in Alsace. There he received intelligence that the Swedes, at the instigation of France, had broken into Brandenburg. Hastening back to his own coun-

try without delay, he took the enemy by surprise, and at the head of about 6,000 men gained a brilliant victory over twice that number of Swedish troops at Fehrbellin (1675), a small town to the northwest of Berlin. This success over the hitherto invincible Swedes lent great prestige to the elector's arms, and he followed it up by a series of vigorous campaigns, in which, with the aid of Denmark, he swept Brandenburg and Pomerania clear of the invaders, capturing Stettin in 1677 and Stralsund in 1678. The invasion of Prussia from Livonia, which formed the last effort of the Swedes, was also triumphantly repelled, the most memorable incident of the short struggle being the elector's forced march over the frozen surface of the Frische Haff. The policy of the last years of the Great Elector may be described as an endeavor to hold the balance between France and the emperor. At his death, which took place in 1688, he was engaged in helping the prince of Orange to prepare for his descent on England. The reign of the Great Elector forms one of the most signal instances in history of the conquest of adverse circumstances by personal energy and merit; and it is with reason that Prussian historians describe him as the second founder of the state. At his accession the greater part of his territory was in the occupation of strangers and devastated by war, and in European politics Brandenburg was regarded as merely an appendage of the empire. At Frederick William's death the new north German state of Brandenburg-Prussia was a power that had to be reckoned with in all European combinations. Its area had been raised to 43,000 square miles; its revenue had multiplied fivefold; and its small army was nowhere surpassed in efficiency. The elector had overthrown Sweden and inherited her position on the Baltic, and he had offered a steady and not ineffectual resistance to the ambition of France. While thus winning for himself a position in the councils of Europe, the elector was not less active in strengthening the central authority within his dominions, and the transformation effected during his reign in the internal government of the state was not less striking than that in its external importance.

In matters of general administration Frederick William showed himself a prudent and careful ruler, and laid the foundation of the future greatness of Prussia in almost every department. The military and bureaucratic systems of the country both received their first important impulse in this reign. The wounds inflicted by the Thirty Years' War were in a great measure healed, and the finances and credit of the state were established on a firm basis. Agriculture and commerce were improved and encouraged by a variety of useful measures, and education was not neglected. The elector even established Prussian colonies in Africa, and formed a small but efficient navy. In matters of religion Brandenburg stands out prominently as the only country of the time in which all Christian confessions were not only tolerated but placed upon an equal footing. The condition of the peasantry, however, reached almost its lowest ebb, and the "recess" or charter of 1653 practically recognizes the existence of villainage. The state of public morals also still left much to be desired, while the clergy were too much occupied with squabbles over Lutheranism and Calvinism to be an effective instrument of reform.

The Great Elector's son Frederick I. (1688-1713) was an ostentatious and somewhat frivolous prince, who hazarded the acquisitions of his father by looking on his position as assured and by aiming rather at external tokens of his dignity than at a further consolidation of the basis on which it rested. The most notable incident in Frederick's reign was his acquisition of the

title of king of Prussia, which long formed the principal object of his policy, and which led him to make important concessions to all whose coöperation was necessary. The emperor's consent was finally purchased by the promise of a contingent of 8,000 men to aid him in the War of the Spanish Succession, and on January 18, 1701, Frederick crowned himself at Königsberg with accompanying ceremonies of somewhat inflated grandeur becoming thenceforth King Frederick I. of Prussia. About the same time (1697) the elector of Saxony also acquired the kingly dignity by his election to the throne of Poland, but in doing so he had to become a Roman Catholic, and thus left the Hohenzollerns without a rival among the Protestant dynasties of Germany. Frederick was an extravagant ruler, who lavished large sums in maintaining his personal state; but his expenditure was not wholly of this profitless nature, since he founded the university of Halle as a school of liberal theology, established academies of art and science at Berlin, and patronized men of literary eminence. Perhaps the general estimate of Frederick's character is unduly low owing to the fact that he was followed as well as preceded by a ruler of unusual capacity. His son Frederick William I. (1713-1740) possessed administrative talents of no mean order and was singularly painstaking, industrious, and determined in carrying out his plans. Though marked by no great external achievements or exciting events, his reign is of the utmost importance in the Prussian annals from having checked the threatened downfall of Prussia and paved the way for Frederick the Great.

After the accession of Frederick the Great (1740-1786) the history of Prussia coincides with that of the German empire, and is treated under GERMANY. The outline of Frederick's foreign policy was probably determined in some degree by the events of the later years of his father's reign. Within a year of his accession he had embarked on the first Silesian War, and this was closely followed by the second, which ended in 1745, leaving Frederick in undisputed possession of almost the whole of Silesia, with the frontier which still exists (See GERMANY and MARIA THERESA).

Though without gain in extent or population, Prussia emerged from the Seven Years' War as an undoubted power of the first rank, and henceforth completely eclipsed Saxony, Bavaria, and Hanover, while it was plain that Austria would no longer stand without a rival for the hegemony of the German empire. The glorious victories over the French and Russians also awakened a spirit of German patriotism that had hitherto been almost unknown.

Frederick's methods of administration did not greatly differ from those of his predecessor, while his industry and activity were as great as those of his father, his insight keener, and his views more liberal. He endeavored to spare his subjects as far as was compatible with the immense army he maintained, and sought to raise the necessary revenues rather by improving the resources of the country than by additional taxation. He kept the charges of civil administration down to the lowest point consistent with efficiency, and the court establishment was very economical, though it avoided the extreme of shabbiness witnessed under Frederick William. His efforts to improve the administration and the bureaucracy were unceasing, and he succeeded in training a body of admirable public servants. In matters of religion Frederick exercised the greatest toleration. Equal liberty was granted in speaking and writing. The paramount defect of Frederick's administration, as future events proved, was the neglect of any effort to encourage independence and power of self-government among the people. Frederick died on

August 17, 1786, having increased his territories to an area of 75,000 square miles, with a population of five and a half millions.

He was followed by Frederick William II., who had neither the energy nor the insight that his position demanded. He was in turn succeeded by Frederick William III. who, in 1797, began a career that ended in 1840. He possessed many of the virtues that did him credit in his private capacity, but lacked the vigor that was at this juncture imperatively required from a ruler of Prussia. Frederick William IV. commenced his reign in 1840. He was a man of character and intelligence, began his reign promisingly by an amnesty for political offenders and by well-meant concessions to the dissatisfied Ultramontanes; but it soon became evident that he held too exalted an idea of the divine right of kings willingly to grant such a constitution as was required. Then followed the contest between the crown and the people, the various steps of which have been chronicled in the article GERMANY.

In 1858 William, prince of Prussia, became regent in consequence of the mental illness of his brother, and in 1861 he succeeded to the throne as William I. His accession was hailed as likely to increase both the liberalism of Prussia's internal institutions and the vigor of its external policy; and the second at least of these expectations was not disappointed. But at an early period of his reign the king became involved in a constitutional dispute with the House of Representatives, which declined to grant the supplies necessary for an extensive system of military reorganization. Bismarck, who became prime minister in 1862, refused to allow the crown to be hampered by parliamentary restrictions and raised the funds required in defiance of the attitude of the lower house.

Fully three-fifths of Prussia belong to the great north European plain and may be generally characterized as lowlands. In the southeast Prussia is separated from Austria and Bohemia by the Sudetic chain, which begins at the valley of the Oder and extends thence toward the northwest. This chain includes the Riesen Gebirge, with the highest mountain in Prussia (Schneekoppe, 5,266 feet), and subsides gradually in the hills of Lusatia. The Harz Mountains, however, beyond the Saxon plain, follow the same general direction and may be regarded as a detached continuation of the system. To the south of the Harz the Prussian frontier intersects the northern part of the Thuringian Forest, which is also prolonged toward the northwest by the Weser Hills and the Teutoburgian Forest. The southwest of Prussia is occupied by the plateau of the lower Rhine, including on the left bank the Hunsrück and the Eifel, and on the right the Taunus, the Westerwald, and the Sauerland. Between the lower Rhenish and Thuringian systems are interposed the Vogelsberg, the Rhön, and other hills belonging to the Triassic system of the upper Rhine. The Silesian mountains are composed chiefly of granite, gneiss, and schists, while the Harz and the lower Rhenish plateau are mainly of Devonian and Silurian formation. To the north of the Sauerland is the important Carboniferous system of the Ruhr, and there are also extensive coal-fields in Silesia. With the exception of the Danube Prussia is traversed by all the chief rivers of Germany, comprising almost the entire course of the Oder and the Weser. Nearly the whole of the German coast-line belongs to Prussia, and it possesses all the most important seaports, except the two most important of all, Hamburg and Bremen.

The climate of Prussia is more uniform than it would otherwise be by the fact that the average elevation increases from north to south. According to the most recent official returns, about 29 per cent. of the soil con-

sists of good loam or clay, 32 per cent. is mediocre or of loam and sand mixed, 31 per cent. is predominantly sandy, and 6 per cent. is occupied by bogs and marshes.

Prussia contains a greater proportion of woodland than any other large country in the south or west of Europe (France 17 per cent., Italy 12 per cent., Great Britain 3 per cent.), though not so large a proportion as Russia, Austria, and some of the minor German states.

The principal crop is rye, of which the ordinary bread of the country is made; it grows in all parts of the kingdom, especially in the north and east, and occupies about one-fourth of the whole tilled surface. Oats occupy an area equal to about half that devoted to rye, and are also grown most extensively in the northeastern districts. Wheat, which is chiefly cultivated in the south and west, does not cover more than a fourth as much ground as rye. Barley is most largely grown in Saxony and Silesia. Other grain crops are spelt (chiefly on the Rhine), buckwheat (Hanover and Schleswig-Holstein), and millet; maize is grown for fodder in some districts. The produce of grain scarcely covers the consumption and is supplemented by imports of rye and other cereals from Russia and Holland. Potatoes, used both as food and for the distillation of spirits, are cultivated over nearly as large an area as rye and are especially predominant in the eastern provinces. The common beet is extensively grown for the production of sugar in Saxony, Hanover, Silesia, Pomerania, and Brandenburg. Flax and hemp occupy considerable areas in East Prussia, Silesia and Hanover, while hops are raised chiefly in Posen and Saxony.

About one-half of the cultivable soil is in the possession of owners with properties exceeding 180 acres in extent and averaging 860 acres, while one-half of the total number of owners occupy only one-fortieth of the entire area. The manner of distribution varies greatly in different parts of the kingdom, large properties prevailing in the less fertile regions in the east and peasant-holdings in the west.

Although it is obvious that the recent formations of the north German plain can boast of little or no mineral wealth, Prussia still takes rank among the great mining states. Its produce of coal and iron exceeds that of any country in Europe, except Great Britain; in the production of zinc it is the foremost country in the world; and its stores of salt are very considerable. The two great deposits of coal are in the basin of the Ruhr on the west, where about 20,000,000 tons are raised annually, and in Upper Silesia, where the beds are still more extensive but the coal of a somewhat inferior quality. The greater part of the smaller but valuable coal-field of the Saar also belongs to Prussia, and other important beds occur in Lower Silesia, near Halle, and near Aix-la-Chapelle.

The other mineral products include manganese, nickel, pyrites, cobalt, quicksilver, alum, gypsum, and sulphuric acid. Good building-stone is common throughout the country, marble is found in Silesia, and roofing slates in the Devonian formations of the Rhine and the Harz. Chalk pits and cliffs abound in the Island of Rügen. The amber of the Baltic coast is picked up on the beach after a storm, and is also found by digging and dredging. Mineral springs are numerous among the mountains of Silesia, the Taunus, and the Eifel. The most generally known are those in the district of Wiesbaden, including Wiesbaden itself, Ems, Homburg Schlangenbad, and Schwalbach.

About 35 per cent. of the population are supported by industrial pursuits. The district of Düsseldorf is the busiest in Prussia, and Berlin and Elberfeld-Barmen are among the chief hives of industry on the Continent.

The principal manufactured products are woolen, linen, cotton, silk, and iron goods.

The metallic industries, as might be expected, flourish chiefly in the neighborhood of the coal-fields and have reached their highest development in the district of the Ruhr. Steel is made most extensively in the districts of Arnsberg (Westphalia) and Düsseldorf; at Essen in the latter is Krupp's celebrated cannon-foundry, with 20,000 workmen. Small iron and steel goods also come chiefly from the Westphalian and Rhenish districts; and the cutlery of the Solingen, the tools of Remscheid, and the needles of Aix-la-Chapelle enjoy a widespread reputation. Berlin is the chief seat of the manufacture of machinery and locomotives. Small arms are made at Suhl, Spandau, Potsdam, and Sömmerda (Erfurt). Articles in bronze, brass, and electro-plate are largely made at and exported from Berlin, Frankfort-on-the-Main, Iserlohn, and Altena, while gold and silver goods are produced chiefly at Berlin and Hanau. The manufacture covers the home demand, but about one-third of the necessary flax and hemp has to be imported. Jute is made at Bielefeld and Bonn. The manufacture of cotton has of late made great progress, though it is not so important in Prussia as in the kingdom of Saxony and in Alsace. The chief centers of this branch of industry are Düsseldorf, Münster, Elberfeld-Barmen, Hanover, Breslau, and Liegnitz. About 65 per cent. of the woolen yarn of Germany is made in Prussia, and woolen cloth of good quality is produced in the province of the Rhine, Silesia, Brandenburg, and Saxony. Carpets are made at Berlin and Düren in the Rhine province. Silk is manufactured at Crefeld, Elberfeld-Barmen, and other places near the Rhine. Tobacco and cigars are largely manufactured at Berlin and numerous other towns, and to some extent wherever the tobacco plant is cultivated.

The commerce of Prussia is greatly facilitated by its central position, which enables it to carry on a very extensive transit trade; but, as the returns are not separated from those of the other members of the Zollverein, it is impossible to more than guess at the annual value. The chief imports are coffee, tea, sugar, and other colonial products, grain, wine, textile fabrics, fruit, petroleum, and manufactured articles of various kinds. Among the principal exports are grain, cattle, wine, potatoes, woolen and linen goods, hides and leather, chemicals, iron and steel wares, lead, and zinc. The money-markets of Berlin and Frankfort-on-the-Main are among the most influential in Europe.

The first Prussian railway was laid in 1838, but the railway system did not receive its full development until the events of 1866 removed the obstacles placed in the way by Hanover. Most of the lines were easy of construction, and absorbed comparatively little capital. The great majority were laid by private companies, and the government confined itself to establishing lines in districts not likely to attract private capital. At present nine-tenths of the 13,800 miles of railway in Prussia are in the hands of government. The proportion of railway mileage in Prussia (five miles per 10,000 inhabitants) is nearly as high as in Great Britain, but the traffic is much less. The passenger traffic has not increased in proportion to the extension of the railway system and the growth of population, but the freight traffic has steadily advanced. The canal system of Prussia is little beyond its infancy, the total length of all the canals in the kingdom being a very small number as compared with either England or France. Among the most important are those uniting the Pregel with the Memel, and the Vistula with the Oder (*via* the Netze), and those bringing the Spree and Havel into communication with the Elbe on the one side and the

Oder on the other. Canals uniting the Ems and the Rhine, the Ems and the Weser, and the Weser and the Elbe, are still desiderata. On the other hand, Prussia has a large supply of navigable rivers.

Prussia has (1892) over 30,000,000 inhabitants—*i. e.* nearly two-thirds of the entire German empire, with about three-fifths of the population. The following are the provinces into which Prussia is divided:

	Area in sq. m.	Pop. in 1880.	Pop. in 1890.
East Prussia	14,446	1,933,936	1,958,132
West Prussia	9,964	1,405,893	1,433,480
Berlin (city)	25	1,122,330	1,579,244
Brandenburg	15,560	2,266,825	2,542,411
Pomerania	11,762	1,540,034	1,521,211
Posen	11,311	1,703,397	1,752,094
Silesia	15,743	4,007,925	4,223,807
Saxony	9,863	2,312,007	2,579,852
Sleswick-Holstein	7,360	1,127,149	1,217,393
Heligoland	¾	-----	2,086
Hanover	15,031	2,120,168	2,280,491
Westphalia	7,892	2,043,442	2,428,736
Hesse-Nassau	6,128	1,554,376	1,664,000
Rhenish Prussia	10,543	4,074,000	4,710,313
Hohenzollern	447	67,624	66,148
Total	136,075¾	27,279,111	29,959,388

Omitting Berlin and Heligoland, the density of population ranges between 131 (Pomerania) and 452 (Rhenish Prussia) per sq. m.

According to the census returns of 1880, 64.64 per cent. of the population of Prussia were Protestants, 34 per cent. Roman Catholics, and 1.33 Jews. A glance at a confessional map of Prussia shows that the center of the kingdom is solidly Protestant, the proportion of Roman Catholics increasing as the eye travels east or west and reaching its maximum on the Rhine and in the Slavonic provinces. East Prussia, however, with the exception of Ermland, is Protestant. The Roman Catholics outnumber the Protestants in the provinces of the Rhine (three to one), Posen, Silesia, and West Prussia. All religious bodies are granted freedom of worship, and civil rights are not conditional upon religious confession. In 1880 the Protestants numbered 17,633,279, the Roman Catholics, 9,206,283, and the Jews, 363,790.

For the work of education there are 34,000 elementary and 520 high schools in addition to numerous technical schools. The first named have an average attendance of 4,500,000 pupils.

Prussia possesses ten of the twenty German universities, attended by 15,000 matriculated students, or at the rate of one student for 2,125 inhabitants. The largest Prussian university is that of Berlin, while Breslau, Bonn, Göttingen, and Halle are equally leading. The oldest is the university of Griefswald, founded in 1456. Like the schools the universities are state institutions, and the professors are appointed and paid by government, which also makes liberal annual grants for apparatus and equipment. The full obligatory course of study extends over three, and in the case of medicine four years. It is, however, not unusual for nonmedical students also to spend four years at the university, and there is an agitation to make this compulsory. Students qualifying for a Prussian Government appointment are required to spend at least three terms or half-years (*Semester*) at a Prussian university.

Ranking with the universities are the large polytechnic colleges at Berlin, Hanover, and Aix-la-Chapelle, the mining academies of Berlin and Klausthal, and the academies of forestry at Eberswalde and Münden. Departments for the study of agriculture are attached to many of the universities. Music is taught at several conservatoria, the best known of which are at Berlin and Frankfort-on-the-Main.

The science and art of Prussia find their most conspicuous external expression in the academies of science and art at Berlin, both founded by Frederick I.; and each town of any size throughout the kingdom has its antiquarian, artistic, and scientific societies. Recognized schools of painting exist at Berlin and Düsseldorf, and both these towns, as well as Cassel, contain excellent picture galleries. The scientific and archæological collections of Berlin are also of great importance. Besides the university collections, there are numerous large public libraries, the chief of which is the royal library at Berlin, (1,000,000 vols.) (See GERMANY).

The finances of the Prussian Government are well managed, and a deficit is now a rare occurrence. The expenditure has been considerably relieved by the transference of the cost of the army and navy to the imperial treasury, while on the other hand, the customs-dues and several excise duties have been relinquished to the empire and an annual "matricular" contribution paid toward its expenses. The total debt in 1888 was, in round numbers, \$1,000,000,000. The revenue for 1889 was \$300,942,000, and the expenditures for the same period were \$306,480,000.

Local taxation in Prussia is often very high. The state income-tax is limited to 3 per cent. of the assessed income, but the communes and towns are allowed to make an arbitrary addition for local purposes, sometimes amounting to twice or thrice the sum paid to the state. This is chiefly owing to the fact that the state reserved for itself all taxation on real property, while imposing on the communes the principal share in maintaining the expensive system of public schools. Incomes below £45 (900 marks) are not now taxed, but this exemption is of very recent origin.

The Prussian army now forms about 75 per cent. of that of the German empire, of which it also furnished the model. (See GERMANY.) The first attempt at the foundation of a Prussian navy was made by the Great Elector, who established a small fleet of eight or ten vessels. This, however, was completely neglected by his successors, and the present marine establishment is of quite recent origin. The present imperial navy is simply the Prussian navy under a different name. (See GERMANY.)

PRUSSIA, in the original and narrower sense of the word, is a district in the northeastern corner of the modern kingdom of the same name, stretching along the Baltic coast for about 220 miles, and occupying an area of upward of 24,000 square miles. In spite of the contrast between the political and social conditions of the two districts, arising from the difference of their history, they were united in 1824 to form a single province. But, as might have been expected, the union did not work well, and it was dissolved in 1878, giving place to the modern provinces of East and West Prussia.

EAST PRUSSIA, the larger of the two provinces, has an area of 14,446 square miles, and is bounded by the Baltic Sea, Russia, and West Prussia.

WEST PRUSSIA (*Westpreussen*), with an area of 9,964 square miles, is bounded by the Baltic, East Prussia, Poland, Posen, Brandenburg, and Pomerania. It resembles East Prussia in its physical characteristics, but its fertility is somewhat greater and its climate not quite so harsh.

PRUSSIA, RHENISH (German, *Rheinpreussen*, *Rheinprovinz*, *Rheinland*), the most westerly province of the kingdom of Prussia, is bounded on the north by Holland, on the east by Westphalia, Hesse-Nassau, and Hesse-Darmstadt, on the southeast by the Rhenish Palatinate, on the south and southwest by Lorraine, and on the west by Luxemburg, Belgium and Holland. The small district of Wetzlar, in the midst of the prov-

ince of Hesse, also belongs to Rhenish Prussia, which, on the other hand, surrounds the Oldenburg principality of Birkenfeld. The extent of the province is 10,420 square miles, or nearly twice that of the kingdom of Saxony; its extreme length from north to south is nearly 200 miles, and its greatest breadth is just under 90. It includes about 200 miles of the course of the Rhine, which forms the eastern frontier of the province from Bingen to Coblenz, and then flows through it in a northwesterly direction.

The population of Rhenish Prussia in 1880 was 4,074,000, including 2,944,186 Roman Catholics, 1,077,173 Protestants, and 43,694 Jews. The great bulk of the population is of Teutonic stock, and about 250,000 are of Flemish blood. On the northwest frontier reside about 12,000 Walloons, who speak French or Walloon as their native tongue. The Rhine province is the most thickly populated part of Prussia, the general average being 390 persons per square mile, while in the government district of Düsseldorf the proportion rises to 754. Upward of half the population are supported by industrial and commercial pursuits, and barely a quarter by agriculture. There is a university of good standing at Bonn, and the success of the elementary education is borne witness to by the fact that only 0.19 per cent. of the Rhenish recruits are unable to read and write. For purposes of administration the province is divided into the five districts of Coblenz, Düsseldorf, Cologne, Aix-la-Chapelle, and Treves; Coblenz is the official capital, though Cologne is the largest and most important town. In the greater part of the province the Code Napoléon, introduced under the French régime, is still in force. Being a frontier province the Rhineland is strongly garrisoned, and the Rhine is guarded by the four strong fortresses of Cologne with Deutz, Coblenz with Ehrenbreitstein, Wesel, and Saarlouis. In the Prussian parliament the province of the Rhine is represented by twenty-seven members in the upper house and eighty-two in the lower.

The present province of Rhenish Prussia was formed in 1815 out of the duchies of Cleves, Berg, Upper Guelders, and Jülich, the ecclesiastical principalities of Treves and Cologne, the free cities of Aix-la-Chapelle and Cologne, and nearly 100 small independent lordships, knightships, and abbeys. The congress of Vienna assigned the whole of the lower Rhenish districts to Prussia.

PRUSSIAN BLUE is a blue pigment derived from prussic acid (so called because discovered in Prussia), and consists of two parts sesqui cyanide of iron and three parts of protocyanide of iron. In its soluble or basic form one part of sesqui oxide of iron is added. It is a beautiful deep blue color, and is extensively used in both painting and dyeing.

PRUSSIC ACID, the familiar name for a dangerously poisonous, though chemically feeble, acid, known scientifically as "hydrocyanic acid," or "cyanide of hydrogen," is here taken as a convenient heading under which to treat of cyanides generally. This generic term (from blue) is not meant to hint at any generic property; it is due simply to the fact that all cyanides, in an historical sense, are derivatives of a blue pigment which was discovered accidentally by Diesbach,

The foundations of our present knowledge of cyanides were laid by Scheele (1783), whose discoveries were subsequently (from 1811) confirmed and supplemented, chiefly in the sense of quantitative determinations, by Gay-Lussac. The sources of prussic acid are various; it is found in minute quantities in bitter almonds and in fruits of the peach and apricot families, and some mysterious cases of poisoning in older days from eating dessert flavored with extracts from these sources might

be correctly traced to the presence of prussic acid.

A weak solution of prussic acid is used in medicine in cases of bronchitis or affections of the mucous membrane of the throat or other portions of the body.

PRYNNE, WILLIAM, English author, polemic, and statesman, was born at Swainswick near Bath in 1600. He was educated at Bath grammar-school, and became a commoner of Oriel College, Oxford, in 1616, taking his B.A. in 1621: he was admitted a student of Lincoln's Inn in the same year, and in due time became a barrister. His studies led him deeply into legal and constitutional lore, and no less deeply into ecclesiastical antiquities. He was Puritan to the core, with a tenacious memory, a strength of will bordering upon obstinacy, and a want of sympathy with human nature in its manifold variety. His first book, *The Perpetuity of a Regenerate Man's Estate*, 1627, was devoted to a defense of one of the main Calvinistic positions, and *The Unloveliness of Love-locks and Health's Sickness*, 1628, were devoted to attacks upon prevailing fashions, conducted without any sense of proportion, and treating follies on the same footing as scandalous vices. After this the number of his writings is very great and embraces a wide range of subjects. He was several times embroiled with the government and while a member of parliament was accused of altering the text of a bill which had passed to committee.

Prynne died at Lincoln's Inn, October 24, 1669.

PRYTANIS (pl. *prytaneis*) was the title of certain officials in Greek states. They appear to have succeeded the kings at the time when the monarchical form of government was abolished throughout Greece. At Rhodes they continued to be the chief magistrates as late as the first century B.C., but in other states their functions dwindled. Though they were not priests, they had the charge of certain public sacrifices. Their headquarters were in the "prytaneum" or town-hall, the central point of a Greek state, where a fire was kept perpetually burning on the public hearth. When a colony was founded the fire in the prytaneum of the new city was kindled from the fire in the prytaneum of the mother-city, and if this colonial fire ever happened to be extinguished it was rekindled from the same source. At Athens in classical times the prytaneis were those fifty members of the council of five hundred who presided at the council meetings as well as at the popular assemblies.

PRZEMYSL, one of the principal towns of Galicia, Austria, and the seat of a Roman Catholic and of a Greek bishop, is situated on the river San, about 140 miles to the east of Cracow. The population of the town proper is 9,244, of the commune 20,040.

PSALMANAZAR, GEORGE, the assumed name of a pretended native of Formosa, who was in reality a Frenchman, and was born about 1679, probably in Languedoc. In 1704 he published a fictitious *Historical and Geographical Description of Formosa*. In 1707 he published *Dialogue between a Japanese and a Formosan*. There also appeared without date *An Inquiry into the Objections against George Psalmanazar of Formosa, with George Psalmanazar's Answer*. He published *Essays on Scriptural Subjects* (1753), contributed various articles to the *Ancient Universal History*, and completed Palmer's *History of Printing*. He died in London, May 3, 1763. His memoirs appeared in 1764 under the title *Memoirs of \* \* \* commonly known by the Name of George Psalmanazar*, but do not disclose his real name or the place of his birth.

PSALMS, BOOK OF, or PSALTER, the first book of the Hagiographa in the Hebrew Bible.

*Title and Traditional Authorship.*—The Hebrew title of the book is *têhillâm*, or "the book of hymns," or.

rather, "songs of praise." The name is not equally applicable to all psalms, and in the later Jewish ritual the synonym *hallel* specially designates two series of psalms, cxiii.-cxviii. and cxlv.-cl., of which the former was sung at the three great feasts, the encœnia, and the new moon, and the latter at the daily morning prayer. That the whole book is named "praises" is clearly due to the fact that it was the manual of the temple service of song, in which praise was the leading feature. Hippolytus tells us that in his time most Christians said "the Psalms of David," and believed the whole book to be his; but this title and belief are both of Jewish origin, and the title of the apocryphal "Psalter of Solomon" implies that the previously existing Psalter was ascribed to David. Jewish tradition does not make David the author of all the psalms; but as he was regarded as the founder and legislator of the temple psalmody (1 Chron., *ut sup.*; Ezra iii. 10; Neh. xii. 36, 45 *sq.*; Eccles. xlvi. 8 *seq.*), so also he was held to have completed and arranged the whole book, though according to Talmudic tradition he incorporated psalms by ten other authors, Adam, Melchizedek, Abraham, Moses, Heman, Jeduthun, Asaph, and the three sons of Korah. With this it agrees that the titles of the psalms name no one later than Solomon, and even he is not recognized as a psalmist by the most ancient tradition, that of the LXX., which omits him from the title of Ps. cxxvii. and makes Ps. lxxii. be written not by but of him. The details of the tradition of authorship show considerable variation; according to the Talmudic view Adam is author of the Sabbath psalm xcii., and Melchizedek of Ps. cx., while Abraham is identified with Ethan the Ezrahite (Ps. lxxxix.). But, according to older Jewish tradition, attested by Origen, Ps. xcii. is by Moses, to whom are assigned Pss. xc.-c., inclusive, according to a general rule that all anonymous pieces are by the same hand with the nearest preceding psalm whose author is named; and Ps. cx., which by its title is Davidic, seems to have been given to Melchizedek to avoid the dilemma of Matt. xxii. 41 *seq.*

The opinion of Jerome (*Pref. in Ps. Heb.*) and other Christian writers that the collector of the Psalter was Ezra, does not seem to rest on Jewish tradition.

**PSALTERY.** For the mediæval instrument of this name ("sautrie" or "cembalo"), see **PIANO-FORTE.**

**PSAMMETICHUS.** See **EGYPT.**

**PSELLUS**, the name of several Byzantine writers, of whom the following were the most important:

1. **MICHAEL PSELLUS** the elder, a native of Andros and a pupil of Photius. He flourished in the second half of the ninth century.

2. **MICHAEL CONSTANTINE PSELLUS** the younger was born at Constantinople in 1020, of a consular and patrician family. He appears to have been still alive in 1105 and perhaps in 1110.

**PSEUDONYMOUS LITERATURE.** See **BIBLIOGRAPHY.**

**PSKOFF**, a government of the lake-region of north-west Russia, which extends from Lake Peipus to the source of the Dwina, having St. Petersburg on the north, Novgorod, Tver, and Smolensk on the east, Vitebsk on the south, and Livonia on the west. It has an area of 16,678 square miles. Population 900,000.

**PSKOFF**, capital of the above government, is picturesquely situated on both banks of the broad Velikaya river, nine miles from Lake Pskoff and 171 miles by rail southwest of St. Petersburg. Population 22,000.

**PSYCHE.** See **CUPID.**

**PSYCHOLOGY.** *The Standpoint of Psychology.*—In the several natural sciences the scope and subject-

matter of each are so evident that little preliminary discussion on this score is called for. It is easy to distinguish the facts dealt with in a treatise on light from those that belong to one on sound; and even when the need arises to compare the results of two such sciences—as in the case, say, of light and electricity—there is still no difficulty—apart, of course, from any which the imperfect state of the sciences themselves may occasion. Theoretically, a standpoint is attainable from which this comparison can be made, in so far, say, as the facts of both sciences can be expressed in terms of matter and motion. But with psychology, however much it is freed from metaphysics, all this is different. It is indeed ordinarily assumed that its subject-matter can be at once defined: "It is what you can perceive by consciousness or reflection or the internal sense," says one, "just as the subject-matter of optics is what you can perceive by sight." Or, "psychology is the science of the phenomena of mind," we are told again, "and is thus marked off from the physical sciences, which treat only of the phenomena of matter." But, whereas nothing is simpler than to distinguish between seeing and hearing, or between the phenomena of heat and the phenomena of gravitation, a very little reflection may convince us that we cannot in the same fashion distinguish internal from external sense, or make clear to ourselves what we mean by phenomena of mind as distinct from phenomena of matter.

Paradoxical though it may be, we must then conclude that psychology cannot be defined by reference to a special subject-matter as such concrete sciences, for example, as mineralogy and botany can; and, since it deals in some sort with the whole of experience, it is obviously not an abstract science, in any ordinary sense of that term. To be characterized at all, therefore, apart from metaphysical assumptions, it must be characterized by the standpoint from which this experience is viewed. It is by way of expressing this that widely different schools of psychology define it as subjective, all other positive sciences being distinguished as objective. But this seems scarcely more than a first approximation to the truth, and, as we have seen incidentally, is apt to be misleading. The distinction rather is that the standpoint of psychology is what is sometimes termed "individualistic," that of so-called object-sciences being "universalistic," both alike being objective in the sense of being true for all, consisting of what Kant would call judgments of experience. For psychology is not a biography in any sense, still less a biography dealing with idiosyncrasies, and in an idiom having an interest and a meaning for one subject only, and incommunicable to any other. Locke, Berkeley, and Hume have been of late severely handled because they regarded the critical investigation of knowledge as a psychological problem; and set to work to study the individual mind simply for the sake of this problem. But none the less their standpoint was the proper one for the science of psychology itself; and, however surely their philosophy was foredoomed to a collapse, there is no denying a steady psychological advance as we pass from Locke to Hume and his modern representatives. By "idea" Locke tells us he means "whatsoever is the object of the understanding when a man thinks" (*i.e.* is conscious), and having, as it were, shut himself within such a circle of ideas he finds himself powerless to explain his knowledge of a world that is independent of it; but he is able to give a very good account of some of these ideas themselves. He cannot justify his belief in the world of things whence certain of his simple ideas "were conveyed" any more than Robinson Crusoe could have explored the continents whose products were drifted to his desert island, though he might perhaps survey the

island itself well enough. Berkeley accordingly, as Professor Fraser happily puts it, abolished Locke's hypothetical outer circle. Thereby he made the psychological standpoint clearer than ever—hence the truth of Hume's remark, that Berkeley's arguments "admit of no answer;" at the same time the epistemological problem was as hopeless as before—hence again the truth of Hume's remark that those arguments "produced no conviction." Of all the facts with which he deals, the psychologist may truly say that their *esse* is *percipi*, inasmuch as all his facts are facts of presentation, are ideas in Locke's sense, or objects which imply a subject. Before we became conscious there was no world for us; should our consciousness cease, the world for us ceases too; had we been born blind, the world would for us have no color; if deaf, it would have had no sounds; if idiotic, it would have had no meaning. Psychology, then, never transcends the limits of the individual; even the knowledge that there is a real world, as common-sense assumes, is, when psychologically regarded, an individual's knowledge, which had a beginning and a growth, and can have an end. In fact, for the psychologist it is not essentially knowledge, but presentations, partly possible, partly actual, in the mind of A, B, or C; just as this page is for the printer essentially "copy," and only for the reader essentially "discourse." But what the psychologist has to say about knowledge is, of course, itself knowledge, *i.e.*, assuming it to be correct; the knowledge about which he knows is, however, for him not primarily knowledge, but "states of consciousness."

But now, though this Berkeleyan standpoint is the standpoint of psychology—as we find it occupied, say, by J. S. Mill and Doctor Bain—psychology is not pledged to the method employed by Berkeley and by Locke. Psychology may be individualistic without being confined exclusively to the introspective method. There is nothing to hinder the psychologist from employing materials furnished by his observations of other men, of infants, of the lower animals, or of the insane; nothing to hinder him taking counsel with the philologist or even the physiologist, provided always he can show the psychological bearings of those facts which are not directly psychological. Nor, again, are we bound, because we take the individualistic standpoint as psychologists, to accept the philosophical conclusions that have been reached from it, unless, indeed, we hold that it is the right point of view for philosophical speculation. A psychologist *may* be an idealist in Berkeley's sense or in Fichte's, but he need not; he is just as free, if he sees reason, to call himself, after Hamilton, a natural realist; only psychology will afford him no safe warrant for the realism part of it. The standpoint of psychology, then, is individualistic; by whatever methods, from whatever sources its facts are ascertained, they must—to have a psychological import—be regarded as having place in, or as being part of, *some one's consciousness*. In this sense, *i.e.*, as presented to an individual, "the whole choir of heaven and furniture of earth" may belong to psychology, but otherwise they are psychological nonentities. The problem of psychology, in dealing with this complex subject-matter, is in general—first, to ascertain its constituent elements, and secondly, to ascertain and explain the laws of their combination and interaction.

*General Analysis of Mind; its Ultimate Constituents.*—As to the first, there is in the main substantial agreement: the elementary facts of mind cannot, it is held, be expressed in less than three propositions—I feel somehow, I know something, I do something. But here at once there arises an important question, *viz.*, What are we to understand by the sub-

ject of these propositions? Nobody nowadays would understand it to imply that every psychical fact must be ascertained or verified by personal introspection; perhaps no modern writer ever did understand this; at any rate to do so is to confound the personal with the psychological. We are no more confined to our own immediate observations here than elsewhere; but the point is that, whether seeking to analyze one's own consciousness or to infer that of a lobster, whether discussing the association of ideas or the expression of emotions, there is always an individual mind or self or subject in question. It is not enough to talk of feelings or volitions: what we mean is, that some individual, man or worm, feels, wills, acts—thus or thus. Obvious as this may seem, it has been frequently either forgotten or gainsaid. It has been forgotten among details or through the assumption of a medley of faculties, each treated as an individual in turn, and among which the real individual was lost. Or it has been gainsaid, because to admit that all psychological facts pertain to a psychological subject seemed to carry with it the admission that they pertained to a particular spiritual substance, which was simple, indestructible, and so forth; and it was manifestly desirable to exclude such assumptions from psychology, *i.e.*, from a science which aims only at a scientific exposition of what can be known and verified by observation. But, however much assailed or disowned, the conception of a mind or conscious subject is to be found implicitly or explicitly in all psychological writers whatever—not more in Berkeley, who accepts it as a fact, than in Hume, who accepts it as a fiction. This being so, we are far more likely to reach the truth eventually if we openly acknowledge this inexpugnable assumption, if such it prove, instead of resorting to all sorts of devious periphrases to hide it. Now wherever the word *Subject*, or its derivatives, occurs in psychology we might substitute the word *Ego* and analogous derivatives, did such exist. But subject is almost always the preferable term; its impersonal form is an advantage, and it readily recalls its modern correlative *Object*. Moreover, *Ego* has two senses, distinguished by Kant as pure and empirical, the latter of which is, of course, an object, while the former is subject always. By pure *Ego* or *Subject* it is proposed to denote the simple fact that everything mental is referred to a *Self*. This psychological conception of a self or subject, then, is after all by no means identical with the metaphysical conceptions of a soul or mind-atom, or of mind-stuff not atomic; it may be kept as free from metaphysical implications as the conception of the biological individual or organism with which it is so intimately connected.

We might now proceed to inquire more closely into the character and relations of the three states, modes, or acts of this subject, which are commonly held to be the invariable constituents of psychical life and broadly distinguished as cognitions, feelings, and conations. But we should be at once confronted by a doctrine much in vogue at present, which, strictly taken, amounts almost to a denial of this tripartite classification of the facts of mind—the doctrine, *viz.*, that *feeling* alone is primordial, and invariably present wherever there is consciousness at all. Every living creature, it is said, feels, though it may never do any more; only the higher animals, and these only after a time, learn to discriminate and identify and to act with a purpose. The doctrine, as might be expected, derives its plausibility partly from the vagueness of psychological terminology, and partly from the intimate connection that undoubtedly exists between feeling and cognition on the one hand and feeling and volition on

the other. As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (a) a touch, as feeling of roughness; (b) an organic sensation, as feeling of hunger; (c) an emotion, as feeling of anger; (d) feeling proper, as pleasure or pain. But, even taking feeling in the last, its strict sense, it has been maintained that all of the more complex forms of consciousness are resolvable into, or at least have been developed from, feelings of pleasure and pain. The only proof of such position, since we cannot directly observe the beginnings of conscious life, must consist of considerations such as the following. So far as we can judge, we find feeling everywhere; but, as we work downward from higher to lower forms of life, the possible variety and the definiteness of sense-impressions both steadily diminish. Moreover, we can directly observe in our own organic sensations, which seem to come nearest to the whole content of infantile and molluscous experience, an almost entire absence of any assignable *quale*. Finally, in our sense-experience generally, we find the element of feeling at a maximum in the lower senses, and the intellectual element at a maximum in the higher. But the so-called intellectual senses are the most used, and use we know blunts feeling and favors intellection, as we see in chemists, who sort the most filthy mixtures by smell and taste without discomfort. If, then, feeling predominates more and more as we approach the beginning of consciousness, may we not say that it is the only *sine qua non* of consciousness? Considerations of this kind, however impressive when exhibited at length, are always liable to be overturned by some apparently unimportant fact which may easily be overlooked. Two lines, *e.g.*, may get nearer and nearer and yet will never meet, if the rate of approach is simply proportional to the distance. A triangle may be diminished indefinitely and yet we cannot infer that it becomes eventually all angles, though the angles get no less and the sides do. Now, before we decide that pleasure or pain alone may constitute a complete state of mind, it may be well to inquire: What is the connection between feelings of pleasure and pain and the two remaining possible constituents of consciousness, as we can observe them now? And this is an inquiry which will help us toward an answer to our main question, namely, that concerning the nature and connections of what are commonly regarded as the three ultimate facts of mind.

Broadly speaking, in any state of mind that we can directly observe, what we find is (1) that we are aware of a certain change in our sensations, thoughts, or circumstances, (2) that we are pleased or pained with the change, and (3) that we act accordingly. We never find that feeling directly alters—*i.e.*, without the intervention of the action to which it prompts—either our sensations or situation, but that regularly these latter with remarkable promptness and certainty alter it. We have not first a change of feeling, and then a change in our sensations, perceptions, and ideas; but, these changing, change of feeling follows. In short, feeling appears frequently to be an effect, which therefore cannot exist without its cause, though in different circumstances the same cause may produce a different amount or even a different state of feeling. Turning from what we may call the receptive phase of consciousness to the active or appetitive phase, we find in like manner that feeling is certainly not, in such cases as we can clearly observe, the whole of consciousness at any moment. True, in common speech we talk of liking pleasure and disliking pain; but this is either tautology, equivalent to saying we are pleased when we are pleased and pained when we are pained, or else it is an allowable abbreviation, and means that we like pleasurable *objects* and dislike

painful *objects*, as when we say, we like feeling warm and dislike feeling hungry. And feeling warm or feeling hungry, we must remember, is not pure feeling in the strict sense of the word. Such states admit, if not of description, yet at least of identification and distinction as truly as colors and sounds do. Within the limits of our observation, then, we find that feeling accompanies some more or less definite presentation which for the sake of it becomes the object of appetite or aversion; in other words, feeling implies a relation to a pleasurable or painful presentation, that, as cause of feeling and end of the action to which feeling prompts, is doubly distinguished from it. Thus the very facts that lead us to distinguish feeling from cognition and conation make against the hypothesis that consciousness can ever be all feeling.

But, as already said, the plausibility of this hypothesis is in good part due to a laxity in the use of terms. Most psychologists before Kant, and English psychologists even to the present day, speak of pleasure and pain as sensations. But it is plain that pleasure and pain are not simple ideas, as Locke called them, in the sense in which touches and tastes are—that is to say, they are never like these localized or projected, nor elaborated in conjunction with other sensations and movements into percepts or intuitions of the external. This confusion of feeling with sensations is largely consequent on the use of one word pain for certain organic sensations and for the purely subjective state. But, to say nothing of the fact that such pains are always more or less definitely localized—which of itself is so far cognition—they are also distinguished as shooting, burning, gnawing, etc., etc., all which symptoms indicate a certain objective quality. Accordingly all the more recent psychologists have been driven by one means or another to recognize two “aspects” (Bain), or “properties” (Wundt), in what they call a sensation, the one a “sensible or intellectual” or “qualitative,” the other an “affective” or “emotive,” aspect or property. The term “aspect” is figurative and obviously inaccurate; even to describe pleasure and pain as properties of sensation is a matter open to much question. But the point which at present concerns us is simply that when feeling is said to be the primordial element in consciousness, more is usually included under feeling than pure pleasure and pain, *viz.*, some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. No doubt, as we go downward in the chain of life, the qualitative or objective elements in the so-called sensations become less and less definite; and at the same time organisms with well-developed sense-organs give place to others without any clearly differentiated organs at all. But there is no ground for supposing even the *amœba* itself to be affected in all respects the same whether by changes of temperature or of pressure or by changes in its internal fluids, albeit all of these changes will further or hinder its life and so presumably be in some sort pleasurable or painful. On the whole, then, there are grounds for saying that the endeavor to represent all the various facts of consciousness as evolved out of feeling is due to a hasty striving after simplicity, and has been favored by the ambiguity of the term feeling itself. If by feeling we mean a certain subjective state varying continuously in intensity and passing from time to time from its positive phase (pleasure) to its negative phase (pain), then this purely pathic state implies an agreeing or disagreeing something which psychologically determines it. If, on the other hand, we let feeling stand for both this state and the cause of it, then, perhaps, a succession of such “feelings” may make up a consciousness; but then we are including two of our

elementary facts under the name of one of them. *The simplest form of psychical life, therefore, involves not only a subject feeling but a subject having qualitatively distinguishable presentations which are the occasion of its feeling.*

We may now try to ascertain what is meant by cognition as an essential element in this life, or, more exactly, what we are to understand by the term *presentation*. It was an important step onward for psychology when Locke introduced that "new way of ideas" which Stillington found alternately so amusing and so dangerous. By *idea* Locke tells us he meant true appearances in men's minds, or "whatsoever is the immediate object of perception, thought or understanding;" and it was so far a retrograde step when Hume restricted the term to certain only of these appearances or objects, or rather to these appearances or objects in a certain state, viz., as reproduced ideas or images. And, indeed, the history of psychology seems to show that its most important advances have been made by those who have kept closely to this way of ideas; the establishment of the laws of association and their many fruitful applications and the whole Herbartian psychology may suffice as instances (see HERBART). The truth is that the use of such a term is itself a mark of an important generalization, one which helps to free us from the mythology and verbiage of the "faculty-psychologists." All that variety of mental facts which we speak of as sensations, perceptions, images, intuitions, concepts, notions, have two characteristics in common: (1) they admit of being more or less attended to, and (2) can be reproduced and associated together. It is here proposed to use the term *presentation* to connote such a mental fact, and as the best English equivalent for what Locke meant by *idea* and what Kant and Herbart called a *Vorstellung*.

A presentation has then a two-fold relation,—first, directly to the subject, and secondly, to other presentations. By the first is meant the fact that the presentation is attended to, that the subject is more or less conscious of it; it is "in his mind" or presented. As presented to a subject a presentation might with advantage be called an object, or perhaps a psychical object, to distinguish it from what are called objects apart from presentation, *i.e.*, conceived as independent of any particular subject. Locke, as we have seen, did so call it; still, to avoid possible confusion, it may turn out best to dispense with the frequent use of *object* in this sense. But on one account, at least, it is desirable not to lose sight altogether of this which is after all the stricter as well as the older signification of *object*, namely, because it enables us to express definitely, without implicating any ontological theory, what we have so far seen reason to think is the fundamental fact in psychology. Instead of depending mainly on that vague and treacherous word "consciousness," or committing ourselves to the position that ideas are modifications of a certain mental substance and identical with the subject to which they are presented, we may leave all this on one side, and say that ideas are objects, and the relation of objects to subjects—that whereby the one is object and the other subject—is presentation. And it is because only objects sustain this relation that they may be spoken of simply as presentations.

As to the subjective relation of objects, the relation of presentation itself, we have merely to note that on the side of the subject it implies what, for want of a better word, may be called *attention*, extending the denotation of this term so as to include even what we ordinarily call inattention. Attention so used will thus cover part of what is meant by consciousness—so much of it, that is, as answers to being mentally active, active enough at least to "receive impressions." Attention on

the side of the subject implies intensity on the side of the object: we might, indeed, almost call intensity the matter of a presentation, without which it is a nonentity. As to the connection between these two, subjective attention and objective intensity—in that higher form of attention called voluntary we are aware (1) that concentration of attention increases or its abstraction diminishes the intensity of a presentation in circumstances where physically and physiologically there is nothing to prevent the intensity of the presentation from continuing uniform. Again, (2) in circumstances when psychologically we are aware of no previous change in the distribution of attention, we find the intensity of a presentation increased or diminished if certain physical concomitants of the presentation (*e.g.*, stimulus, nervous process, etc.), are increased or diminished. Thus, though this is a point we could hardly establish without the aid of psychophysics, we may conclude that the intensity of a presentation may be altered from two sides; that it depends, in other words, partly upon what we may perhaps call its physical intensity and partly on the amount of attention it receives.

The inter-objective relations of presentations, on which their second characteristic, that of revivability and associability depends, though of the first importance in themselves, hardly call for examination in a general analysis like the present. But there is one point still more fundamental that we cannot wholly pass by: it is—in part at any rate—what is commonly termed the unity or continuity of consciousness. From the physical standpoint and in ordinary life we can talk of objects that are isolated and independent and in all respects distinct individuals. The screech of the owl, for example, has physically nothing to do with the brightness of the moon; either may come or go without changing the order of things to which the other belongs. But psychologically, for the individual percipient, they are parts of one whole; special attention to one diminishes the intensity of presentation of the other and the recurrence of the one will afterwards entail the representation of the other also. Not only are they still parts of one whole, but such distinctness as they have at present is the result of a gradual differentiation. It is quite impossible for us now to imagine the effects of years of experience removed, or to picture the character of our infantile presentations before our interests had led us habitually to concentrate attention on some, and to ignore others, whose intensity thus diminished as that of the former increased. In place of the many things which we can now see and hear, not merely would there then be a confused presentation of the whole field of vision and of a mass of undistinguished sounds, but even the difference between sights and sounds themselves would be without its present distinctness. Thus the further we go back the nearer we approach to a total presentation having the character of one general *continuum* in which differences are latent. There is, then, in psychology, as in biology, what may be called a principle of "progressive differentiation or specialization;" and this, as well as the facts of reproduction and association, forcibly suggests the conception of a certain objective continuum forming the background or basis to the several relatively distinct presentations that are elaborated out of it—the equivalent, in fact, of that unity and continuity of consciousness which has been supposed to supersede the need for a conscious subject.

There is one class of objects of special interest even in a general survey, viz., movements or motor presentations. These, like sensory presentations, admit of association and reproduction, and seem to attain to such distinctness as they possess in adult human experience

by a gradual differentiation out of an original diffused mobility, which is little besides emotional expression. Of this, however, more presently. It is primarily to such dependence upon feeling that movements owe their distinctive character, the possession, that is, under normal circumstances, of definite and assignable psychical antecedents, in contrast to sensory presentations, which enter the field of consciousness *ex abrupto*. We cannot psychologically explain the order in which particular sights and sounds occur; but the movements that follow them, on the other hand, can be adequately explained only by psychology. The twilight that sends the hens to roost sets the fox to prowl, and the lion's roar which gathers the jackals scatters the sheep. Such diversity in the movements, although the sensory presentations are similar, is due, in fact, to what we might call the principle of "subjective or hedonic selection"—that, out of all the manifold changes of sensory presentation which a given individual experiences, only a few are the occasion of such decided feeling as to become objects of possible appetite (or aversion). The representation of what interests us comes to be associated with the representation of such movements as will secure its realization, so that—although no concentration of attention will secure the requisite intensity to a pleasurable object present only in idea—we can by what is strangely like a concentration of attention convert the idea of a movement into the fact, and, by means of the movement, attain the coveted reality.

And this has brought us round naturally to what is perhaps the easiest way of approaching the question: What is a *conation* or *action*? In ordinary voluntary movement we have first of all an idea or re-presentation of the movement, and last of all the actual movement itself—a new presentation which may for the present be described as the filling out of the re-presentation, which thereby attains that intensity, distinctness, and embodiment we call reality. How does this change come about? The attempt has often been made to explain it by a reference to the more uniform, and apparently simpler, case of reflex action, including under this term what are called sensori-motor and ideo-motor actions. In all these the movement seems to be the result of a mere transference of intensity from the associated sensation or idea that sets on the movement. But, when by some chance or mischance the same sensory presentation excites two alternative and conflicting motor ideas, a temporary block, it is said, occurs; and, when at length one of these nascent motor changes finally prevails and becomes real, then we have the state of mind called volition. But this assumption that sensory and motor ideas are associated before volition, and that the volition begins where automatic or reflex action ends, is due to that inveterate habit of confounding the psychical and the physical which is the bane of modern psychology. How did these particular sensory and motor presentations ever come to be associated? It is wholly beside the mark to answer that they are "*organically determined* psychical changes." In one respect all psychical changes alike are organically determined, inasmuch as all alike—so far, at least, as we at all know or surmise—have organic concomitants. In another respect no psychical changes are organically determined, inasmuch as physical events and psychical events have no common factors. Now the only psychological evidence we have of any very intimate connection between sensory and motor representation is that furnished by our acquired dexterities, *i.e.*, by such movements as Hartley styled secondary automatic. But then all these have been preceded by volition: as Mr. Spencer says, "the child learning to walk wills each movement before walking it." Surely, then, a

psychologist should take this as his typical case and prefer to assume that all automatic actions that come within his ken at all are in this sense secondarily automatic, *i.e.*, to say that either in the experience of the individual or of his ancestors, volition, or something analogous to it, preceded habit.

But, if we are thus compelled by a sound method to regard sensori-motor actions as degraded or mechanical forms of voluntary actions, instead of regarding voluntary actions as gradually differentiated out of something physical, we have not to ask: What happens when one of two alternative movements is executed? but the more general question: What happens when any movement is made in consequence of feeling? It is obvious that on this view the simplest *definitely purposive* movement must have been preceded by some movement simpler still. For any distinct movement purposely made presupposes the ideal presentation, before the actual realization, of the movement. But such ideal presentation, being a re-presentation, equally presupposes a previous actual movement of which it is the so-called mental residuum. There is then, it would seem, but one way left, *viz.*, to regard those movements which are immediately expressive of pleasure or pain as primordial, and to regard the so-called voluntary movements as elaborated out of these. The vague and diffusive character of these primitive emotional manifestations is really a point in favor of this position. For such "diffusion" is evidence of an underlying continuity of motor presentations parallel to that already discussed in connection with sensory presentations, a continuity which, in each case, becomes differentiated in the course of experience into comparatively distinct and discrete movements and sensations respectively.

But, whereas we can only infer, and that in a very roundabout fashion, that our sensations are not absolutely distinct but are parts of one massive sensation, as it were, we are still liable under the influence of strong emotion directly to experience the corresponding continuity in the case of movement. Such motor-continuum we may suppose is the psychical counterpart of that permanent readiness to act, or rather that continual nascent acting, which among the older physiologists was spoken of as "tonic action;" and as this is now known to be intimately dependent on afferent excitations so is our motor consciousness on our sensory. Still, since we cannot imagine the beginning of life but only life begun, the simplest picture we can form of a concrete state of mind is not one in which there are movements before there are any sensations or sensations before there are any movements, but one in which change of sensation is followed by change of movement, the link between the two being a change of feeling.

Having thus simplified the question, we may now ask again: How is this change of movement through feeling brought about? The answer, as already hinted, appears to be: By a change of attention. We learn from such observations as psychologists describe under the head of fascination, imitation, hypnotism, etc., that the mere concentration of attention upon a movement is often enough to bring the movement to pass. But, of course, in such cases there is neither emotional experience nor volition in question; such facts are only cited to show the connection between attention and movements. Everybody too has often observed how the execution of any but mechanical movements arrests attention to thoughts or sensations, and *vice versa*. Let us suppose, then, that we have at any given moment a certain distribution of attention between sensory and motor presentations; a change in that distribution means a change in the intensity of some or all of these, and change of intensity in motor presenta-

tions means change of movement. Such changes are, however, quite minimal in amount so long as the given presentations are not conspicuously agreeable or disagreeable. As soon as they are, we find pleasure to lead at once to concentration of attention on the pleasurable object; so that pleasure is not at all so certainly followed by movement as we find pain to be, save of course when movements are themselves the pleasurable objects and are executed, as we say, for their own sakes. In fact, pleasure would seem rather to repress movement, except so far as it is coincident either with a more economic distribution, or with a positive augmentation, of the available attention; and either of these, on the view supposed, would lead to increased but indefinite (*i.e.*, playful) movement. Pain, on the other hand, is much more closely connected with movement, and movement too which for obvious reasons much sooner acquires a purposive character. Instead of voluntary concentration of attention upon a painful presentation we find attention to such an object always involuntary; in other words, attention is, as it were, excentrated, dispersed, or withdrawn. If, therefore, the painful presentation is a movement, it is suspended; if it is a sensation, movements are set up which further distract attention, and some of which may effect the removal of the physical source of the sensation.

PSYCHOPHYSICS. See WEBER'S LAW.

PTARMIGAN. See GROUSE.

PTERODACTYLE. The extinct flying reptiles known as "Pterodactyles" are among the most aberrant forms of animals, either living or extinct. Since the beginning of this century, when Blumenbach and Cuvier first described the remains of these curious creatures, they have occupied the attention of naturalists, and various opinions have been expressed as to their natural affinities. The general proportions of their bodies (excepting the larger head and neck) and the modification of the forelimb, to support a membrane for flight, remind one strongly of the bats, but the resemblance is only superficial; a closer inspection shows that their affinities are rather with reptiles and birds.

PTOLEMIES, the Macedonian dynasty of sovereigns of Egypt. See EGYPT, and MACEDONIAN EMPIRE.

PTOLEMY (CLAUDIUS PTOLEMÆUS), celebrated as a mathematician, astronomer, and geographer. He was a native of Egypt, but there is an uncertainty as to the place of his birth; some ancient manuscripts of his works describe him as of Pelusium, but Theodorus Meliteniota, a Greek writer on astronomy of the twelfth century, says that he was born at Ptolemais Hermii, a Grecian city of the Thebaid. It is certain that he observed at Alexandria during the reigns of Hadrian and Antoninus Pius, and that he survived Antoninus.

We now proceed to notice briefly the contents of the *Almagest*. It is divided into thirteen books. Ptolemy in the first chapter, presupposing some preliminary notions on the part of the reader, announces that he will treat in order—what is the relation of the earth to the heavens, what is the position of the oblique circle (the ecliptic), and the situation of the inhabited parts of the earth; that he will point out the differences of climates; that he will then pass on to the consideration of the motion of the sun and moon, without which one cannot have a just theory of the stars; lastly, that he will consider the sphere of the fixed stars and then the theory of the five stars called "planets." All these things—*i.e.*, the phenomena of the heavenly bodies—he says he will endeavor to explain in taking for principle that which is evident, real, and certain, in resting

everywhere on the surest observations and applying geometrical methods. He then enters on a summary exposition of the general principles on which his *Synaxis* is based, and adduces arguments to show that the heaven is of a spherical form and that it moves after the manner of a sphere, that the earth also is of a form which is sensibly spherical, that the earth is in the center of the heavens, that it is but a point in comparison with the distances of the stars, and that it has not any motion of translation. With respect to the revolution of the earth round its axis, which he says some have held, Ptolemy, while admitting that this supposition renders the explanation of the phenomena of the heavens much more simple, yet regards it as altogether ridiculous. Lastly, he lays down that there are two principal and different motions in the heavens—one by which all the stars are carried from east to west uniformly about the poles of the equator; the other, which is peculiar to some of the stars, is in a contrary direction to the former motion and takes place round different poles. These preliminary notions, which are all older than Ptolemy, form the subjects of the second and following chapters. He next proceeds to the construction of his table of chords, of which we have given an account, and which is indispensable to practical astronomy. The employment of this table presupposes the evaluation of the obliquity of the ecliptic, the knowledge of which is indeed the foundation of all astronomical science. Ptolemy in the next chapter indicates two means of determining this angle by observation, describes the instruments he employed for that purpose, and finds the same value which had already been found by Eratosthenes and used by Hipparchus. This "is followed by spherical geometry and trigonometry enough for the determination of the connection between the sun's right ascension, declination, and longitude, and for the formation of a table of declinations to each degree of longitude. Delambre says he found both this and the table of chords very exact."

In book ii., after some remarks on the situation of the habitable parts of the earth, Ptolemy proceeds to make deductions from the principles established in the preceding book, which he does by means of the theorem of Menelaus. The length of the longest day being given, he shows how to determine the arcs of the horizon intercepted between the equator and the ecliptic—the amplitude of the eastern point of the ecliptic at the solstice—for different degrees of obliquity of the sphere; hence he finds the height of the pole and reciprocally from the same data he shows how to find at what places and times the sun becomes vertical and how to calculate the ratios of gnomons to their equinoctial and solstitial shadows at noon and conversely, pointing out, however, that the latter method is wanting in precision. All these matters he considers fully and works out in detail for the parallel of Rhodes.

Book iii. treats of the motion of the sun and of the length of the year. Ptolemy concludes this book by giving a clear exposition of the circumstances on which the equation of time depends.

Books iv. and v. are devoted to motions of the moon, which are very complicated; the moon, in fact, though the nearest to us of all the heavenly bodies, has always been the one which has given the greatest trouble to astronomers. Book iv., in which Ptolemy follows Hipparchus, treats of the first and principal inequality of the moon, which quite corresponds to the inequality of the sun treated of in the third book. As to the observations which should be employed for the investigation of the motion of the moon, Ptolemy tells us that lunar eclipses should be preferred, inasmuch as they give the moon's place without any error on the score of

parallax. The first thing to be determined is the time of the moon's revolution; Hipparchus, by comparing the observations of the Chaldæans with his own, discovered that the shortest period in which the lunar eclipses return in the same order was 126,007 days and one hour. In this period he finds 4,267 lunations, 4,573 restitutions of anomaly, and 4,612 tropical revolutions of the moon less  $7\frac{1}{2}^{\circ}$  q.p.; this quantity ( $7\frac{1}{2}^{\circ}$ ) is also wanting to complete the 345 revolutions which the sun makes in the same time with respect to the fixed stars. He concluded from this that the lunar month contains 29 days and  $31' 50'' 8''' 20''''$  of a day, very nearly, or 29 days 12 hours  $44' 3'' 20'''$ . These results are of the highest importance. (See ASTRONOMY.) In order to explain this inequality, or the equation of the center, Ptolemy makes use of the hypothesis of an epicycle, which he prefers to that of the eccentric.

The subject of parallaxes is continued in the sixth book of the *Almagest*, and the method of calculating eclipses is there given. The author says nothing in it which was not known before his time.

Books vii., viii. treat of the fixed stars. Ptolemy verified the fixity of their relative positions and confirmed the observations of Hipparchus with regard to their motion in longitude, or the precession of the equinoxes. The seventh book concludes with the catalogue of the stars of the northern hemisphere, in which are entered their longitudes, latitudes, and magnitudes, arranged according to their constellations; and the eighth book commences with a similar catalogue of the stars in the constellations of the southern hemisphere. The eighth book contains, moreover, a description of the milky way and the manner of constructing a celestial globe; it also treats of the configuration of the stars, first with regard to the sun, moon, and planets, and then with regard to the horizon, and likewise of the different aspects of the stars and of their rising, culmination, and setting simultaneously with the sun.

The remainder of the work is devoted to the planets. The ninth book commences with what concerns them all in general. The planets are much nearer to the earth than the fixed stars, and more distant than the moon. Saturn is the most distant of all, then Jupiter and then Mars. These three planets are at a greater distance from the earth than the sun. So far all astronomers are agreed. This is not the case, he says, with respect to the two remaining planets, Mercury and Venus, which the old astronomers placed between the sun and earth, whereas more recent writers have placed them beyond the sun, because they were never seen on the sun. He shows that this reasoning is not sound, for they might be nearer to us than the sun and not in the same plane, and consequently never seen on the sun. He decides in favor of the former opinion, which was indeed that of most mathematicians. The ground of the arrangement of the planets in order of distance was the relative length of their periodic times; the greater the circle, the greater, it was thought, would be the time required for its description. Hence we see the origin of the difficulty and the difference of opinion as to the arrangement of the sun, Mercury, and Venus, since the times in which, as seen from the earth, they appear to complete the circuit of the zodiac are nearly the same—a year. Delambre thinks it strange that Ptolemy did not see that these contrary opinions could be reconciled by supposing that the two planets moved in epicycles about the sun; this would be stranger still, he adds, if it is true that this idea, which is older than Ptolemy, since it is referred to by Cicero, had been that of the Egyptians. It may be added, as strangest of all, that this doctrine was held by Teon of Smyrna, who was a contemporary of Ptolemy or somewhat senior to him.

From this system to that of Tycho Brahe there is, as Delambre observes, only a single step.

Ptolemy is hardly less celebrated as a geographer than as an astronomer, and his great work on geography exercised as great an influence on the progress of that science as did his *Almagest* on that of astronomy. It became indeed the paramount authority on all geographical questions for a period of many centuries, and was only gradually superseded by the progress of maritime discovery in the fifteenth and sixteenth centuries. This exceptional position was due in a great measure to its scientific form, which rendered it very convenient and easy of reference; but, apart from this consideration, it was really the first attempt ever made to place the study of geography on a truly scientific basis.

**PUBLIC HEALTH.** State medicine as an organized department of administration is entirely of modern growth. By the common law of England the only remedy for any act or omission dangerous to health was an action for damages or an indictment for nuisance. (See NUISANCE.) At the same time the jurisdiction of the commissioners of sewers acted to a certain extent as a preventive means. Commissions of sewers were granted by the crown, at first in virtue of the general prerogative, afterward under the provisions of numerous statutes, the earliest dating from 1427. The powers of the commissioners included the removal of obstructions in the rivers, the making of fosses and drains, etc. Their jurisdiction, where still existing, is expressly preserved in the modern Public Health Acts. The indictment for nuisance still lies for many offenses which are now punishable in a summary manner under the powers of recent legislation. But for a long time it was the only, not as now a concurrent, remedy. Its obvious defect is that proceedings can only be taken after the mischief has been done. Old examples of nuisances dangerous to health and punishable at common law are the keeping of swine in a town, the dividing of a house in a town so that by reason of overcrowding it would be more dangerous in time of sickness or plague, and the carrying on of offensive trades, such as the melting of tallow. The court leet seems to have had some jurisdiction in sanitary matters, confined to the prevention of nuisances and the determination of the quality of provisions within its local limits. At a comparatively early date statutes were passed dealing with matters for which the common law had provided too cumbrous a remedy. The attention of parliament, though but to a slight extent, was directed to the health of London as early as the Statute of the City of London in 1285. The earliest legislative enactment affecting the public health generally appears to be forbidding the deposit of offensive matter in rivers and other waters, as well in the city of London as in other cities.

*United States.*—After the Civil War boards of health were established in the chief cities. Public health is under the control of the local authorities to a greater extent than in England. Each State has its board of health, the duties of which vary considerably—among others, in some States, being that of licensing medical practitioners. They also have the power of magistrates to a certain extent, in regard to the abatement of nuisances inimical to public well-being. In some States they have the authority to inspect the food supply, particularly animal food before being slaughtered. The local municipal boards keep records of births and deaths, and issue burial permits; they also have extensive powers in times of epidemics, and can make arrangements for the isolation or quarantine of infected people or goods. They have at all times police jurisdiction in the matter of sanitary affairs. By the Act of

Congress of February 25, 1799, officers of the United States are bound to observe the health laws of the States. A national board of health was created by the Act of March 3, 1879, c. 202. Its main duties are to give advice to local authorities and to carry on investigations in sanitary matters. It has certain jurisdiction in quarantine, and in epidemics of a peculiarly dangerous nature.

The scientific aspect of public health does not fall within the scope of the present article; it has been treated under the title HYGIENE.

*London.*—The metropolis is governed by a series of statutes, some peculiar to itself, others general Acts, repealed as to the rest of England, but separately preserved as to the metropolis by the Public Health Act, 1875. The limits of the metropolis for the purposes of public health depend primarily upon the Metropolis Management Act, 1855 (18 and 19 Vict. c. 120, s. 250, schedules A and B). The local authorities are the metropolitan board of works, the vestries and district boards, and (in the city of London) the commissioners of sewers. Asylums and hospitals are administered by the metropolitan asylums board. The water-supply is regulated by the Metropolis Water Acts, 1852 and 1871, gas by the Metropolitan Gas Act, 1860.

**PUBLIC LANDS.** (See HOMESTEAD). The public land system of the United States, including in its provisions the care, distribution, and disposition of the public domain, is a department, the importance of which, in its relations to the citizen, cannot be over-estimated. The title to the public domain has been acquired through treaties with foreign nations and Indian tribes, also by annexation and cessions of territory; the latter from some of the original thirteen States and from Texas. The total area of public lands surveyed in the United States, June 30, 1889, was 981,621,984 acres, distributed throughout Alabama, Arkansas, California, Colorado, Florida, Illinois, Indiana, Iowa, Kansas, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Nebraska, Nevada, Ohio, Oregon, Wisconsin, Alaska, Arizona, Dakota, Idaho, Indian Territory, Montana, New Mexico, Utah, Washington, and Wyoming; the area of public and Indian lands unsurveyed at the same date was stated at 833,882,163 acres, though the estimate was of a general nature and affords no index to the disposable volume of land remaining, nor of the amount available for agricultural purposes. The most important event for many years in the administration of affairs connected with this system, was the opening of the Oklahoma country in the Indian Territory to settlement and entry. This was of date April 22, 1889, and was followed by efforts to secure the opening for settlement and entry of a tract of 3,600,000 acres bounded on the east by the Indian Territory, south by Texas, west by New Mexico, and north by Kansas and Colorado, and known as "No Man's Land." Oklahoma was organized as a Territory with extended boundaries in May, 1890, and has since shown a great development in population and wealth. In 1892 it is estimated to have 150,000 inhabitants.

The execution of plans for the distribution of the public lands, adopted at an early day in the history of the National government, was attended with results in no inconsiderable degree discouraging. "Land grabbing speculation and speculation were reduced to a system," says a writer on the subject, "producing a general demoralization of the service." The actual settlers and homeseekers were fleeced by the agents of the government, and the government itself systematically plundered by receivers long retained in office. Legislation, however, remedied these and other evils incident to the execution of the trust, and gradually the service improved.

Among the first grants made by the general government, at intervals from 1824 to 1866, were those to canals and river improvements. These grants aggregated 530,000,000 acres, located in the State of Alabama, for the improvement of the Tennessee, Coosa, Cahawba, and Black Warrior rivers; to Illinois for the construction of the Illinois and Lake Michigan canal; Indiana, for the construction of the Wabash and Erie canal; Iowa, for the improvement of the Des Moines river; Michigan, for the construction of St. Mary's ship canal and other waterways; to Ohio, for the Miami canal; and to Wisconsin, for the improvement of the Wisconsin and Fox rivers. In 1841 these conditions were improved upon and the system in a measure perfected by the passage of the Preëmption act, which provided that actual settlers, upon complying with certain regulations therein specified, should be entitled to precedence in the selection and purchase of government lands. This and subsequent legislation, the latter, including the Donation act, providing for the perfecting of titles to lands acquired by the United States, in the settlement of the boundary between the latter country and British Columbia, did much to simplify matters, as also to people the country and develop its resources—though still affording opportunities to the unprincipled for an abuse of the privileges conferred. Such has also been the case in the Homestead and Timber Culture laws. The former was adopted in 1865, and offers to any citizen of the United States, or who has filed his declaration of intention, one quarter section or less, of unappropriated public land, upon his furnishing proof that he is entitled thereto under the provisions of the act, that the entry is for his exclusive use, and for actual settlement and cultivation. The Timber Culture Act was passed in 1878, and vests title to 160 acres of public land, naturally barren of timber, in the person who plants trees thereon and keeps them healthy and growing for a period of eight years. The act also contains provisions with respect to citizenship of the applicant, and to the length of time during which he must reside on the tract, similar to those contained in the Homestead Act. The abuses which had the effect of attracting national attention and careful investigation were the taking up of homestead and timber lands in the names of claimants who existed in the imagination only of those who perpetrated the frauds. They were inaugurated during 1875 and continued until about 1883, and during that period thousands of acres of the public lands in Colorado, New Mexico, and other portions of the Southwest, were fraudulently diverted to the possession of cattle companies. Efforts have been made from time to time to put a period not only to these and other acts of speculation at the expense of those legitimately entitled to the benefits of the Homestead and Timber Culture acts, but also to prevent the holding of a large acreage in the United States by aliens. Little, however, has been accomplished. In nearly all the States there is no distinction made between citizens and aliens in respect to the ownership of lands, and legislation designed to limit foreign holdings, was introduced into the United States Senate in 1884, but failed.

Among the other grants made by the United States of the public lands, were those for the purpose of enabling States to construct levees, made mostly to Oregon, Michigan, Louisiana, and Florida, and grants of desert lands for purposes of reclamation, made to Montana, Oregon, Idaho, and Washington. These too have been the subject of fraudulent speculation. But the most prominent, important, and liberal grants of the government have been made to the railroads. The practice was begun in 1850 and terminated in 1874, but during

that period of a quarter of a century millions of acres have been disposed of to trans-continental and other railway corporations. A portion of the lands thus appropriated have been restored to the government by the vacation of the acts which conferred title, by forfeiture for failure on part of the railroad companies to comply with the conditions under which the grants were made, and by other congressional enactments—not, however, until nearly 20,000,000 acres had been certified to corporations benefited by such grants. During 1889, there were 70,141 patents for agricultural lands issued, 913 patents for mineral, and 155 for coal lands; 425,046,002 acres were certified under the law for the benefit of railroad companies; 259,721.45 acres patented to the States under the swamp-land grants; 132,350.61 approved under various grants to the States under educational grants, and 159,390.21 acres were patented on private land claims in severalty and scrip locations, in the various lands and Territories. At the close of the fiscal year there were pending selections amounting to 29,444,251.64 acres; 2,000,000 acres under swamp-land grants, and 1,795,521.60 acres for educational and internal and improvement purposes.

The business of the department is annually increasing in volume and importance, and its disposition is materially facilitated by the systematic methods employed in its transaction.

**PUBLIC RECORDS.** See **RECORDS, PUBLIC.**

**PUBLILIUS** (less correctly written **PUBLIUS**) **SYRUS**, a Latin writer of farces (*mimi*), flourished in the first century B.C. He was a native of Syria and was brought as a slave to Italy, but by his wit and talent he won the favor of his master, who freed and educated him. His farces, in which he acted himself, had a great success in the provincial towns of Italy and at the games given by Cæsar in 46 B.C.

**PÜCKLER-MUSKAU, HERMANN LUDWIG HEINRICH, PRINCE OF**, a German author, was born at Muskau, in Lusatia, on October 30, 1785. He died at Branitz on February 4, 1871, and in accordance with instructions in his will, his body was burned.

**PUDSEY**, a township of the West Riding of Yorkshire, is situated on an acclivity rising above the valley of the Aire and on the Great Northern Railway, four miles east of Bradford and six southwest of Leeds. The population of the district in 1881 was 12,314.

**PUEBLA**, or in full **LA PUEBLA DE LOS ANGELES**, a city of Mexico, formerly capital of the province of Tlaxcala, now of the State of Puebla, lies seventy-six miles southeast of Mexico, in 19° N. latitude, and 98° 2' W. longitude, at a height of 7,220 feet above the sea. By Humboldt Puebla was ranked as the most important city of Spanish America after Mexico, Guanajuato, and Havana, and in the matter of population it still stands third among the state capitals. Puebla has long been one of the great trading and manufacturing centers of the country, and it has recently become an important point in the rapidly-developing railway system, having lines to Apizaco on the railway from Vera Cruz to Mexico (twenty-eight miles), to Villa de Libres (fifty-eight miles), to San Martin (twenty-four miles), to Matamoros Izucar (thirty-one miles), and to San Juan de los Llanos. Cotton and woolen goods, leather, earthenware, soap, and glass are the leading manufactures. The population, which was about 80,000 in 1746, and 52,717 in 1793, and which greatly decreased during the revolutionary period, is now (1890) stated at 87,000.

Puebla was founded in 1533-34 by Sebastian Ramirez de Fuenleal, archbishop of Santo Domingo, and the Franciscan friar Toribio Motolinia. In 1550 it became the seat of the bishopric which had originally been founded in 1526 at Tlaxcala. The epithet "de los Angeles,"

which is now practically dropped, was in the seventeenth and eighteenth centuries the chief part of the name, which often appears simply as Angeles. It is associated with a popular belief that during the building of the cathedral two or three angels every night added as much to the height of the walls as the workmen had managed to add in the preceding day. In 1845 Santa Anna made an unsuccessful attempt to capture the city. On March 18, 1863, it was invested by the French under Forey, and on May 17th taken by storm.

**PUEBLO**, a city of the United States, and one of the most prosperous between the Rocky mountains and the Missouri river, is the capital of Pueblo county, Col. It is located on the Arkansas river, 100 miles south of Denver, 40 miles east of Cañon City, and is reached from all directions by the Denver and Rio Grande, Denver and New Orleans, Atchison, Topeka and Santa Fé, Rock Island, and other leading trans-continental railway lines. As a manufacturing city, railroad center, and in some other respects, Pueblo is second in importance to no city in Southern Colorado. It is the location of the Colorado Coal and Iron Company, Colorado Smelting Company, Colorado Press Brick Company, Colorado Bridge Company, leading industries of the West, and many other undertakings owned and conducted by home capital. These embrace foundries and machine shops, enterprises devoted to the manufacture of wire fence, cornices, brick, furniture, lumber, sash, doors and blinds, carriages, buggies and wagons, agricultural implements, mining machinery, etc., representing heavy investments and employing a force aggregating largely in number. It has two daily and two weekly papers, one private and two national banks, seven churches, a number of schools, graded and commercial, a large number of stores, eight hotels and two theaters. It is lighted by gas and electric lights, and a well-managed street railway system affords the means of rapid transit throughout the city. The population, 3,217 in 1880, was 24,558 in 1890.

**PUERPERAL FEVER.** See **SEPTICÆMIA.**

**PUERTO CABELLO**, a town and seaport in the South American republic of Venezuela, in the province of Carabobo, possesses one of the finest natural harbors in that part of the world. The entrance, about ninety feet deep, is so clear that no pilot is required; and in the outer bay (100 to 300 feet deep) there is safe anchorage. On a high rock to the southeast of the town is the Mirador of Solano, or castle of Puerto Cabello, which has often proved an obstacle to enemies advancing from the interior. The exports consist of coffee, cocoa, hides, goat and deer skins, bark, woods, indigo, and cotton, but only the first in large quantities. Germany and the United States are the chief recipients. Population, 15,000. Within six miles of the town there are four villages of from 200 to 1,500 inhabitants.

**PUERTO DE SANTA MARIA**, probably the "Menesthei Portus" of Ptolemy, commonly called **EL PUERTO** ("The Port"), a town of Spain, in the province of Cadiz, seven miles to the northeast of that city (twenty-one and a quarter miles by rail), near the mouth and on the right bank of the Guadaiete, which is here crossed by a suspension bridge. The population of the municipality in December, 1887, was 22,125.

**PUERTO PRINCIPE**, or now more correctly **CIUDAD DEL PRINCIPE**, a city at the head of the central department of the island of Cuba. Though for some time after the surrender of San Domingo to France in 1800 Principe was the seat of the central government and supreme courts of the Spanish West Indies, it is no longer a place of much importance. The population is estimated at 31,000.

**PUERTO RICO.** See **PORTO RICO.**

**PUFENDORF, SAMUEL**, German philosopher, jurist, and writer on international and national law, was born at Chemnitz, Saxony, January 8, 1632. His first work was *Elementa jurisprudentiæ universalis, libro duo*. The work was dedicated to Charles Louis, elector palatine, an enlightened prince and patron of science, who offered Pufendorf a chair of Roman law at Heidelberg, and when this was declined he created a new chair, that of the law of nature and nations, the first of the kind in the world. Pufendorf accepted it, and was thus in 1661, at the age of twenty-nine, placed in the most enviable of positions. He showed himself equal to his task, and by his science and eloquence proved himself to be an honor and ornament to the university. The keenly sarcastic tract *De statu imperii germanici, liber unus*, dates from this period of his life.

In 1670 Pufendorf was called to the university of Lund. The sojourn at Lund was fruitful. In 1672 appeared the *De jure naturæ et gentium, libri octo*, and in 1675 a résumé of it under the title of *De officio hominis et civis*. The treatise *De jure naturæ et gentium* is the first systematic work on the subject.

In 1677 he was called to Stockholm in the capacity of historiographer-royal. To this new period belong among others the work *On the Spiritual Monarchy of the Pope*, which was afterward inserted in his *Introduction to the History of the Principal States in Europe at the Present Day*, also the great *Commentariorum de rebus Suecicis, libri XXVI., ad expeditionem Gustavi Adolphi regis in Germaniam ad abdicationem usque Christiænæ* and a *History of Charles Gustavus*. In his historical works Pufendorf is hopelessly dry; but he professes a great respect for truth, and generally draws from archives. He died on October 26, 1694.

**PUFF-ADDER.** See VIPER.

**PUFF-BIRD**, the name first given, according to Swainson (*Zool. Illustrations*), by English residents in Brazil to a group of Birds known to ornithologists as forming the restricted Family *Bucconidæ*, but for a long time confounded, under the general name of Barbets, with the *Capitonidæ* of modern systematists, who regard the two Families as differing very considerably from one another.

**PUFFIN**, the common English name of a sea-bird, the *Fratricula arctica* of most ornithologists, known however on various parts of the British coasts as the Bottlenose, Coulterneb, Pope, Sea-Parrot, and Tammy-Norie, to say nothing of other still more local designations, some (as Marrott and Willock) shared also with allied species of *Alcidæ*, to which Family it has, until very lately, been invariably deemed to belong.

**PUGET, PIERRE**, born at Marseilles on October 31, 1622, painter, sculptor, architect, and engineer, is a rare instance of precocious genius and mature power. He died in 1694. At the age of fourteen he carved the ornaments of the galleys built in the port of his native city, and at sixteen the decoration and construction of a ship were intrusted to him.

Puget was the most vigorous representative of French sculpture in the eighteenth century; in spite of his visits to Paris and Rome his work never lost its local character; his *Hercules* is fresh from the galleys of Toulon; his saints and virgins are men and women who speak Provençal. His best work, the *St. Sebastian* at Genoa, though a little heavy in parts, shows admirable energy and life, as well as great skill in contrasting the decorative accessories with the simple surface of the nude.

**PUGIN, AUGUSTUS WELBY NORTHMORE**, architect, was born in Store street, London, England, March 1, 1812. Pugin was the designer of a large number of important Roman Catholic buildings, and also assisted Sir Charles Barry in the preparation of the designs for the

new Houses of Parliament Westminster. Early in 1852 he was attacked by insanity, which caused his death on September 14th, of the same year.

**PULCI, LUIGI**, an Italian poet of distinguished family, was born at Florence, December 3, 1431, and devoted his life to study and to literary composition. He was one of the most intimate friends of Lorenzo de' Medici and of Poliziano, from the latter of whom he derived no little assistance in the composition of his poem, *Il Morgante Maggiore* (Morgante the Giant). This celebrated work, a burlesque epic (in 28 cantos), of which Roland is the hero, is a vivacious parody of the romances of Carolingian chivalry, which had become (as Pulci thought) undeservedly popular in Italy. His mocking imagination took a pleasure in turning into ridicule the combats with giants, the feats of magicians, and all the incredible adventures that form the basis of the mediæval epic; and he manages to do it with a wonderfully pleasant and original naivete. But although the poem is essentially heroic-comic, it occasionally contains passages of the finest pathos. Pulci died in 1487.

**PULGAR, FERNANDO DE**, Spanish prose-writer of the latter part of the fifteenth century, born probably at Pulgar near Toledo. Pulgar's *Claros Varones de Castilla*, a series of sketches of forty-six of the most celebrated men of the reign and court of Henry IV., is of considerable interest both for its matter and for its style. He wrote, besides, a commentary on the ancient *Coplas de Mingo Revulgo*; and thirty-two of his *Letters* written to various persons of eminence, including some to the queen, are also extant.

**PULKOWA.** See OBSERVATORY.

**PULTENEY, WILLIAM, EARL OF BATH**, an English statesman and politician, was born in 1684. In 1705 he was brought into Parliament for Headon. This seat was held by him without a break until 1734, and though the family was then dispossessed for a time the supremacy was regained in the return of another Pultney in 1739. Throughout the reign of Queen Anne William Pultney played a prominent part in the struggles of the Whigs, and on the prosecution of Sacheverell he exerted himself with great zeal against that violent divine. When the victorious Tories sent his friend Robert Walpole to the Tower in 1712, Pultney championed his cause in the House of Commons and joined with the leading Whigs in visiting him in his prison-chamber. For these acts he was duly rewarded on the accession of George I. In the first ministry of the new king he held the post of secretary of war, a post which in the previous reign had been conferred upon St. John, Walpole, and Granville successively, and when the committee of secrecy on the Utrecht treaty was formed the list included the name of William Pultney. Two years later (July 6, 1716,) he became one of the privy council. He died July 7, 1764.

**PULTOWA.** See POLTAVA.

**PUMA**, a name probably of native origin, introduced into European literature by the early Spanish writers on South America (as Garcilaso de la Vega and Hernandez) for one of the largest feline animals of the New World. It is generally called "cougouar" by the French, "leon" by the Spanish Americans, and "panther" by the Anglo-American hunters of the United States. It is the *Felis concolor* of Linnæus and all subsequent systematic zoölogical authors.

The puma has an exceedingly wide range of geographical distribution, extending over a hundred degrees of latitude, from Canada in the north to Patagonia in the south, and was formerly pretty generally diffused in suitable localities from the Atlantic to the Pacific Ocean, but the advances of civilization have in recent

years considerably curtailed the extent of the districts which it inhabits. Though an expert climber, it is by no means confined to wooded districts, being frequently found in scrub and reeds along the banks of rivers, and even in the open pampas and prairies. Its habits much resemble those of the rest of the group to which it belongs; and, like the leopard, when it happens to come within reach of an abundant and easy prey, as the sheep or calves of an outlying farming station, it kills far more than it can eat, either for the sake of the blood only or to gratify its propensity for destruction. It rarely attacks man and when pursued escapes if possible by ascending lofty trees.

**PUMICE**, a highly porous light mineral substance of volcanic origin, resulting from the solidification of foam or scum formed by the escape of steam or gas on the surface of molten lava. It is principally found of a whitish or gray color, more rarely of a slaty blue or reddish tint. In composition it is allied to the obsidians, containing in every 100 parts about 72 of silica, 17 of alumina, 2 of iron oxide, and 9 of soda potash; and under the blowpipe it fuses to a white enamel. Its porosity renders it so exceedingly light that in the dry condition it floats readily on the surface of water, sinking only when thoroughly saturated. Owing to this property it is found very widely diffused over the ocean-bed, even at points far removed from volcanic vents, considerable blocks having been brought up in the dredgings of the *Challenger* at all the points of its sea-bottom exploration. It is obtained for industrial purposes in the regions of recent volcanoes—the Lipari Islands, Iceland, Auvergne, Teneriffe, etc.—and is highly valued as a smoothing and polishing material for the metals, marble, horn, wood, bone, ivory, and leather.

**PUMP**. See **MINING**, **PNEUMATICS** and **HYDRO-MECHANICS**.

**PUMPKIN**. See **GOURD** and **HORTICULTURE**.

**PUMPKIN**, a member of the gourd family, largely grown in America and Europe for domestic food, and as food for cattle. In some districts the term is applied to squashes, gourds, etc., while in others it is limited to the varieties of the plant itself; grown chiefly in the northern and eastern States of the United States. It is raised from the seed, which sprouts within a fortnight after having been planted, and grows into a hardy vine of a dozen or more feet in length covered with a prickly surface, and bearing large yellow flowers which mature into the fruit. The latter is either round or elongated in shape, yellow of color and grows to a large size. The flesh of the fruit is also yellow in color, generally tough and coarse-grained until cooked, when it is eaten as sauce or made into pies that are highly esteemed for their appetizing qualities and health-giving properties. Among the most desirable varieties for the table are the Vermont and Canadian pumpkins. They are oblong in form, generally round and deep yellow in color. The flesh is sweet and tender, and on some accounts this variety is preferred before all others, though the sugar pumpkin is considered by many as unsurpassed for pies, puddings, and other edible specialties of the household. The seeds of the pumpkin are small, white, and flat, and diuretic in their action, also valuable remedial agents in cases of tape-worm.

**PUNCHINELLO** (It., *Policinella*, *Pulcinella*), the most popular of the puppets, is of Italian origin, though its history is by no means free from obscurity. The earlier etymologists sought to trace the name to various mythical individuals, by whom, it was alleged, the type was first furnished. Galiani adopts the theory which derives it from the name of Puccio d'Aniello, a vintager of Acerra near Naples, who, having by his wit and

grotesque appearance vanquished some strolling comedians in their own sphere, was induced to join the troop, and whose place, by reason of his popularity, was supplied after his death by a masked actor who imitated his dress and manner.

Andrea Perrucci (1699) and Gimma assert with some show of authority that Silvio Fiorillo, a comedian named after his principal part Captain Matamoros (the Italian *Miles Gloriosus*), invented the Neapolitan Pulcinella. It was afterward improved by Andrea Calcese, surnamed Ciuccio, who died of the plague in 1656, and who, according to Gimma, imitated in the character the peasants of Acerra. This would place the origin of the Italian Pulcinella somewhere about the commencement of the seventeenth century, the original character appearing to have been that of a country clown, hook-nosed, shrill-voiced, cowardly, boastful, and often stupid, yet given at times to knavish tricks and shrewd sayings. In thorough accordance with this date, we find that the earliest known appearance of Polichinelle in France is at the commencement of the reign of Louis XIV., in the show of the puppet-playing dentist Jean Brioché. The date of its introduction into England has been disputed, Payne Collier being of opinion that Punch and King William came together, a second theory suggesting an earlier origin with the Huguenot refugees. The older Punchinello was far less restricted in his actions and circumstances than his modern successor. He fought with allegorical figures representing want and weariness as well as with his wife and with the police, was on intimate terms with the patriarchs and the seven champions of Christendom, sat on the lap of the queen of Sheba, had kings and dukes for his companions, and cheated the Inquisition as well as the common hangman. Powell seems to have introduced a trained pig which danced a minuet with Punch, and the French have occasionally employed a cat in place of the dog, Toby, whose origin is somewhat uncertain. A typical version of the modern play, with illustrations, was published by Payne Collier and Cruikshank in 1828.

**PUNCTUATION**. See **PALEOGRAPHY**.

**PUNJAB**, the most northern province of British India. Geographically the region called by this name is the triangular tract of country of which the Indus and the Sutlej (Satlaj) to their confluence form two of the sides, the third being the lower Himálaya hills between these two rivers. The British province now includes a large extent of country outside these boundaries, on all three sides—beyond the Indus to the range of hills running parallel to it on the west; beyond the Sutlej eastward to the Jumna (Jamna) and southward to a distance of sixty miles below Delhi; within the hills, a large highland tract on the east and another on the west, with the Kashmir and Chamba territories between. The British province stretches north and south from 35° 10' N. latitude at the head of the hill district of Hazára to 27° 40' at the south end of the Gurgáon district, and east and west from 69° 36' E. longitude on the Déra Ghází Khán and Sind frontier to 78° 55' on the Jumna. The length of the central line of communication across the province from Delhi to Peshawar by rail is 645 miles.

The name *Punjab* signifies “ [country of] five rivers,” the five rivers being the great tributaries of the **INDUS** (*q.v.*), namely, the Jhelum, Chináb, Rávi, Biás, and Sutlej. These are all rivers of large volume, but, on account of the great width of sandy channel in their passage through the plains, their changing courses, and shifting shoals, they are of very moderate value for steam navigation, though they all support a considerable boat-traffic.

Besides the great rivers, the distinguishing feature of the Punjab, there are some others deserving of notice.

The area of the Punjab proper, the triangular tract of country between the Indus and the Sutlej, is about 62,000 square miles; the whole area of the British province is 106,632, and of the feudatory states 35,817, making a total of 142,449 square miles. This area is for the most part a great alluvial plain.

Besides the rock-salt, the mineral products of the Punjab are not many. Limestone, good for building, is obtained at Chaniót, on the Chináb, and at a few other places. There are extensive alum-beds at Kálábágh, on the Indus.

As in other parts of India, there are commonly two harvests in the year. The spring crops are wheat, barley, gram, various vegetables, oil-seeds, tobacco, and a little opium; the autumn crops, rice, millets, maize, pulses, cotton, indigo, and sugar-cane. Tea is now extensively cultivated in the Kángra district. Flax has been produced successfully, but the cultivation has not been extended.

The forest area of the Punjab consists of 4,694 square miles reserved, under the management of the forest department, and 13,000 square miles under the district officers.

The rainfall in the Punjab varies greatly in different parts, and from year to year. The maximum (126.55 inches in the year) is at Dharmasala, on the face of the high north wall of the Kángra valley; the minimum (5.96) is in the Muzaffargarh district. In a country so open and so far from the sea there are extremes of heat and cold. A temperature of 128° Fahr. in the shade has been recorded, and a winter temperature of 25° at sunrise is not infrequent. At Lahore, on the grass, the thermometer has been known to fall to 17°.

Of the whole area of British Punjab (106,632 square miles) 36,755 square miles are cultivated, and 64,263 uncultivated, the remaining 5,614 being reckoned uncultivable. An area of 75,434 square miles (48,377,760 acres) is held by 33,020 village communities, formed of small proprietors having joint interests and joint responsibility for the land revenue, but cultivating each his own land.

Irrigation for large areas is from canals and from reservoirs, and for smaller areas from wells.

The population of the British province in 1881 numbered 18,850,437; of the feudatory states, 3,861,683; total, 22,712,120.

**PUPPETS.** See **MARIONETTES.**

**PURCELL, HENRY,** English musical composer, was born in 1658 in St. Ann's Lane, Old Pye street, Westminster. In 1690 he wrote the songs for Dryden's version of Shakespeare's *Tempest*, including "Full fathom five," and "Come unto these yellow sands," and the music for Betterton's *Prophetess* (afterward called *Dioclesian*) and Dryden's *Amphitryon*; and in 1691 he produced his dramatic masterpiece, *King Arthur*, also written by Dryden, and first published by the Musical Antiquarian Society in 1843.

Purcell's greatest work is undoubtedly his *Te Deum* and *Jubilate*, written for St. Cecilia's Day, 1694, the first English *Te Deum* ever composed with orchestral accompaniments. Purcell did not long survive the production of this great work. He died at his house in Dean's Yard, Westminster, on November 21, 1695.

**PURCHAS, SAMUEL,** compiler of works on travel and discovery, was born at Thaxted, Essex, in 1577. In 1613 he published *Purchas, his Pilgrimage or Relations of the World, and the Religions observed in all Ages*, which reached a fourth edition, much enlarged, in 1626; in 1619 *Purchas, his Pilgrim or Microcosmus, or the Historie of Man; relating the won-*

*ders of his Generation, varieties in his Degeneration, and necessity of his Regeneration*; and in 1625, in four volumes, *Purchas, his Pilgrimes; or Relations of the World in Sea Voyages and Lande Travels, by Englishmen and others*. He was also the author of the *King's Tower and Triumphal Arch of London*, a sermon on 2 Sam. xxii. 51, published in 1623. He died in September, 1626.

**PURGATORY** (*Purgatorium*). The Roman Catholic Church has no more than two declarations of supreme authority on the subject of its distinctive doctrine of purgatory. The first is that of the council of Ferrara-Florence, in which it was defined, as regards the truly penitent who have departed this life in the love of God before they have made satisfaction for their sins of commission and omission by fruits meet for repentance, that their souls are cleansed by purgatorial pains after death, and for their relief from these the suffrages of the living—the sacrifice of the mass, prayers, alms, and other offices of piety—are helpful. The second is that of the council of Trent, which runs as follows: "Since the Catholic Church, instructed by the Holy Spirit from the sacred writings and the ancient tradition of the fathers, hath taught in holy councils, and lastly in this œcumenical council, that there is a purgatory, and that the souls detained there are assisted by the suffrages of the faithful, but especially by the most acceptable sacrifice of the mass, this holy council commands all bishops to have a diligent care that the sound doctrine of purgatory delivered to us by venerable fathers and sacred councils be believed, maintained, taught, and everywhere preached."

Among the details of the doctrine, which have been the subject of much speculation among Catholics, may be specified the questions relating to the locality of purgatory and the nature and duration of its sufferings. On none of these points has anything authoritative been delivered. It is of course conceived of as having some position in space, and as being distinct from heaven, the place of eternal blessedness, on the one hand, and from hell, the place of eternal woe, on the other. But any theory as to its exact latitude and longitude (such, for example, as underlies Dante's description) must be regarded as the effort merely of the individual imagination. As regards the nature of its pains, there has been a constant disposition to interpret with strict literality the expressions of Scripture as to the cleansing efficacy of fire, but the possibility of interpreting them metaphorically has never been wholly lost sight of. With respect to their duration, it must be inferred from the whole praxis of indulgences as at present authorized by the church that the pains of purgatory are measurable by years and days; but here also everything is left vague.

**PURI** or **POOREE**, a district of British India in the Orissa division of the lieutenant-governorship of Bengal, lying between 19° 28' and 20° 16' N. latitude and 85° 0' and 86° 28' E. longitude, with an area of 2,472 square miles. Puri district is rich in historical remains, from the primitive rock-hewn caves of Buddhism—the earliest relics of Indian architecture—to the mediæval sun temple at Kanarak and the world-renowned shrine of Jagannath. The chief roads in the district are the Calcutta and Madras trunk road and the pilgrim road from Cuttack to Puri. The climate of Puri is dry and healthy, and the average rainfall is 55.80 inches.

The census of 1881 returned the population of Puri district at 888,487 (446,609 males and 441,878 females).

**PURI** or **POOREE**, chief town of the above district, and commonly known as Agannath, is situated on the Orissa coast in 19° 48' N. latitude and 85° 51' E. longitude. Its chief interest is centered in the sacred shrine

of Jagannath, a temple which dates from the twelfth century, and which lies at the southern extremity of the town. In 1881 the population of Puri was 22,095 (males 11,769, females 10,326), of whom 21,913 were Mohammedans.

PURIM (פרים), a feast of the later Jews, celebrated in honor of the deliverance of the nation from the schemes of Haman recorded in the book of Esther. The feast falls on the 14th and 15th of Adar, and is, in accordance with Esther ix. 22, of a joyous character, but quite secular in tone, with a great deal of hard drinking, the only quasi-religious features being the reading in the synagogue of the book of Esther and the section about Amalek, Exod. xvii. 8 *seq.* This celebration appears to have made its way among the Jews only gradually.

PURITANS. See ENGLAND, CHURCH OF; INDEPENDENTS, and PRESBYTERIANISM.

PURNIAH, a district of British India in the Bhagalpur division of the lieutenant-governorship of Bengal, occupying an area of 4,956 square miles, is situated between 25° 15' and 26° 37' N. latitude, and 87° and 88° 33' E. longitude.

The staple product of Purniah is rice, but jute and tobacco are also cultivated to a considerable extent. Its manufactures include indigo, cottons, woollens and silks, but the chief is that of indigo, which is mostly carried on in the south of the district. By the census of 1881 the population numbered 1,848,687 (937,080 males, 911,607 females).

PURNIAH, chief town and administrative headquarters of the above district, is situated on the east bank of the river Saura, in 25° 46' N. latitude, and 87° 30' E. longitude. It contains a population, according to the census of 1881, of 18,016.

PURPLE (πορφύρα), the name given by the ancients to a dye derived from various species of *Murex* and *Purpura*. (See MOLLUSCA, DYEING, and PHŒNICIA.) For the modern sources of the various shades of this color, see DYEING.

PURPURA, a disease characterized by the occurrence of purple-colored spots upon the surface of the body, due to extravasations of blood in the skin, accompanied occasionally with hemorrhages from mucous membranes. Difference of opinion has prevailed among physicians as to whether these symptoms are to be regarded as constituting a disease *per se*, since they are frequently seen in connection with various morbid conditions. Thus, in persons suffering from such diseases as rheumatism, phthisis, heart disease, cancer, Bright's disease, jaundice, as well as from certain of the infectious fevers, extravasations of the kind above mentioned are not infrequently present.

The treatment will bear reference to any causes which may be discovered as associated with the onset of the disease, such as unfavorable hygienic conditions, and nutritive defects should be rectified by suitable diet. The various preparations of iron seem to be the best medicinal remedies in this ailment, while more direct astringents, such as gallic acid, ergot of rye, turpentine, or acetate of lead, will in addition be called for in severe cases and especially when hemorrhage occurs.

PURSLANE, the vernacular equivalent of the botanical genus *Portulaca*. *P. oleracea* is a native of India, which has been introduced into Europe as a salad plant, and in some countries has spread to such an extent as to become a noxious weed. This is the case in certain parts of the United States, where the evil qualities of "pussly" have become proverbial. Like many other succulent plants, its juice is cooling and is used in tropical countries as a refrigerant in fever, while the bruised leaves are employed as an application in cases of local

inflammation. Some of the species, such as *P. grandiflora* and its varieties, are grown in gardens on rock-work owing to the great beauty and deep coloring of their flowers, the short duration of individual blossoms being compensated for by the abundance with which they are produced.

PUSEY, EDWARD BOUVERIE, English divine, originally Edward Bouverie, was born in Oxford in 1800.

His name will be chiefly remembered as the representative of a great religious movement which, whatever may be its ultimate issue, has carried with it no small part of the religious life of England in the latter half of the nineteenth century. His chief characteristic was an almost unbounded capacity for taking pains. His chief influence was that of a preacher and a spiritual adviser. His *Parish Sermons* reproduce the substance of patristic homilies in the massive style of the Caroline divines. His correspondence as a spiritual adviser was enormous; his deserved reputation for piety made him the chosen confessor to whom numbers of men and women unburdened their doubts and sins.

PUTNAM, a post-town in Windham county, Conn., twenty-five miles south of Worcester and thirty-three miles north of Norwich, on the Norwich and Worcester Railroad, where the latter intersects the Eastern Division of the New York and New England road. It is an attractively laid out and neatly built New England town, containing seven churches, a high school, and several school buildings in addition, one national bank, one savings bank, two newspaper offices, two hotels, together with five collar factories, two woolen mills, and other features of thrift and enterprise. The population, 2,000 in 1880, is now (1890) 6,511.

PUTNEY, a suburb of London, in the county of Surrey, is situated on the right bank of the Thames, about eight miles above London Bridge by the river and four and one-half miles west of Hyde Park Corner by road. Putney is included within the metropolitan area. The population of the registration sub-district (area, 2,235 acres) in 1871 was 9,439, and in 1881 it was 13,235.

PUTREFACTION. See FERMENTATION.

PUTTY is a kind of cement composed of fine powdered chalk intimately mixed with linseed oil, either boiled or raw, to the consistency of a tough dough. It is principally used by glaziers for bedding and fixing sheets of glass in windows and other frames, by joiners and painters for filling up nail-holes and other inequalities in the surface of wood-work, and by masons for bedding ashlar-work. The oxidation of the oil gradually hardens putty into a very dense adherent mass. When putty is required to dry quickly, boiled oil and sometimes litharge and other driers are used. "Putty powder" or "polisher's putty" is oxide of tin in a state of fine division used for the polishing of glass, hard metals, granite, and similar substances.

PUY, LE, or more precisely LE PUY EN VELAY, chief town of the department of Haute-Loire, France, 252 miles from Paris by rail and 270 in a direct line, rises in the form of an amphitheater to a height of 2,050 feet above the sea-level upon Mont Anis, the hill that divides the left bank of the Dolézon from the right bank of the Borne (a rapid stream which joins the Loire three miles below). The population of Puy in 1881 was 18,567. The trade is chiefly in cattle, woollens, grains, and vegetables. The principal manufacture is that of laces and blondes (in woolen, linen, cotton, silk, gold, and silver threads), which is carried on by 130,000 workmen in the neighborhood, the yearly turnover being \$5,000,000.

PUY DE DÔME, a department of central France, four-fifths of which belonged to Basse-Auvergne, one

sixth to Bourbonnais, and the remainder to Forez (Lyonnais), lies between  $45^{\circ} 17'$  and  $46^{\circ} 16'$  N. latitude and  $2^{\circ} 23'$  and  $4^{\circ}$  E. longitude. It is bounded on the north by Allier, on the east by Loire, on the south by Haute-Loire and Cantal, and on the west by Corrèze and Creuse. The chief town, Clermont-Ferrand, is 217 miles south of Paris in a direct line. The department contains important paper-mills, factories for lace and braid (in the mountains), for buntings, and camlets. Those for wool, cotton, and hemp contain 3,500 spindles and more than 400 looms. There are wool-carding works and factories for linens, cloths, and counterpanes—also silk-mills, tanneries, manufactories for chamois and other leathers, for caoutchouc, important sugar-works, starch-works, manufactures of edible pastes with a reputation as high as those of Italy, and manufactures of fruit-preserves. The saw-mills and the cheese industry in the mountains complete the list, which includes 201 establishments employing 75,553 persons. The department exports grain, fruits, cattle, wines, cheese, wood, and mineral waters. Traffic is carried on over 294 miles of Government roads, 9,591 miles of other roads, and 178 miles of railway. The department is crossed from north to south by the railway from Paris to Nîmes, and that of Vichy to Thiers; from west to east by that from Bordeaux to Lyons by Tulle, Clermont-Ferrand, and Thiers, with branches from Eygurande to Lagnac and from Vertaison to Billom. It is skirted on the northwest by the line from Montluçon to Gannat, with a branch line for goods to the mines of St. Éloi. Twenty thousand inhabitants of the department, belonging chiefly to the district of Ambert, leave it during winter and find work elsewhere as navvies, chimney-sweeps, pit-sawyers, etc. The department in 1881 contained 566,064 inhabitants and includes five arrondissements—CLERMONT-FERRAND (*q. v.*), Ambert (town, 3,940 inhabitants), Issoire (6,137), Riom (9,590), Thiers (10,583)—50 cantons, and 467 communes. It is attached to the bishopric of Clermont-Ferrand and to the Thirteenth Army Corps in the same town; the superior court is at Riom.

PYATIGORSK, a district town and watering-place of Caucasus, Russia, in the government of Terek, 124 miles by rail to the northwest of Vladikavkaz. It has now nearly 18,000 inhabitants (13,670 in 1882).

PYGMALION is the Greek form of a Phœnician name probably derived from the name of a god, פַּעַם (*C. I. S.*, par. i. t. i. p. 133). Pygmalion or, as Josephus writes, Phygmalion, brother of Dido (Elissa), has been spoken of in PHœNICIA. Another Pygmalion, son of Cilix and grandson of Agenor, King of Cyprus, is the subject of a famous story. He fell in love with an ivory statue he had made; Aphrodite granted life to the image, and Pygmalion married the miraculously born virgin, (Ovid, *Metam.*, x. 243 *seq.*).

PYGMIES. The name "pigmy" (Greek *πυγμαῖος*, from *πυγμή*) means one whose height is measured by the distance between the elbow and the knuckles of an ordinary man, or rather less than an ell. The pygmies appear in Homer (*Il.*, iii. 6) as a tiny folk who dwelt by the streams of Ocean in the far southern land whither the cranes fly at the approach of our northern winter. The cranes made war on them and slaughtered them. These battles between the pygmies and the cranes are often mentioned by later writers and are frequently represented on vases. Philostratus describes a picture of the sleeping Hercules beset by swarms of pygmies, as Gulliver was by the Lilliputians. Aristotle held that the pygmies were a race of little men inhabiting the marshes out of which he supposed the Nile to flow. Other writers localized them in various parts of the world. Ctesias describes at some length a race

of pygmies in the heart of India. They were black and ugly; the tallest of them were only two ells high; their hair and beards were so long that they served them as garments; they were excellent bowmen, and hunted hares and foxes with hawks, ravens, and eagles; their language and customs were those of the rest of the Indians, and they were very honest; their cattle were small in proportion.

PYM, JOHN, was born at Brymore, in Somerset, England, in 1584. His wife, Anna Hooker, died in 1620, and in the following year he entered parliament for the first time as member for Calne.

Pym's name was first prominently brought forward by his speech of November 8, 1621, directed against the Catholics.

After the dissolution Pym was confined for three months in his house in London. In the following parliament he pleaded for the execution of the penal laws against recusants and for the restoration of the silenced Puritan clergy. He was beaten at the time, but his defeat was full of promise for the future. It is much in a man's favor that he is ready to look a difficulty fully in the face. It is characteristic of Pym that nothing is heard of him either during the riotous proceedings in which this parliament closed or during the eleven years which passed without a parliament at all. He had neither the virtue nor the failings which accompany excitability of temperament.

With the Short Parliament Pym's three and a half years of authority begin.

With the dissolution of the Short Parliament Pym once more sinks out of sight. There is, however, good reason to suppose that the summer months of 1640 were for him a time of unusual activity, and that he was a leading spirit in those negotiations with the Scots the exact nature of which cannot now be traced. At all events in the end of August he was in close communication with the leaders of the opposition, and he then drew up, in coöperation with St. John, the petition in which twelve peers demanded the redress of grievances and the summoning of parliament. The rout of Newburn gave emphasis to the language of the peers, and on November 3, 1640, the Long Parliament met.

Pym's leadership of the Commons rested on his sympathy with the feelings of the House, combined with his skill in directing those feelings into a practical course.

The struggle within the House itself was the least part of Pym's labors. In meeting the army plot and the other intrigues of the court he had to develop the powers of a commissioner of police, to be as ready in collecting and sifting information as he was prompt in counteracting the danger which he feared. Charles' attempt to arrest Pym and four other members on January 4, 1642, embittered but did not produce the conflict. For some months there was much fencing between the two parties, and the Civil War was not begun till Charles raised his standard at Nottingham.

During the remaining months of Pym's life he was the most prominent leader of the war party in the House of Commons.

Pym prepared the way for the immediate victory of his party by summoning the Scots and by the financial measures which made the campaigns of 1644 and 1645 possible.

He did not, however, live to reap the harvest which was due to his efforts. Worn out by the strain of constant and agitating work, his health broke down, and on December 8, 1643, he died. His body was followed by both Houses when it was carried to be interred in Westminster Abbey.

PYRAMID. This name for a class of buildings,

though first taken from a part of the structure, and mistakenly applied to the whole of it by the Greeks, has now so far acquired a more definite meaning in its geometrical sense that it is desirable to employ it in that sense alone. A pyramid should therefore be understood as meaning a building bounded by a polygonal base and plane triangular sides which meet in an apex. Such a form of architecture is only known in Middle Egypt, and there only during the period from the IVth to the XIIth Dynasty (before 2000 B.C)—having square bases and angles of about  $50^\circ$ . In other countries various modifications of the tumulus, barrow, or burial-heap have arisen which have come near to this type; but these when formed of earth are usually circular, or, if square, have a flat top, and when built of stone are always in steps or terraces.

Turning now to the architecture of the buildings, their usual construction is a mass of masonry composed of horizontal layers of rough-hewn blocks, with a small amount of mortar; and this mass in the later forms became more and more rubbly, until, in the VIth Dynasty, it was merely a cellular system of retaining walls of rough stones and mud, filled up with loose chips, and in the XIIth Dynasty the bulk was of mud bricks. Whatever was the hidden material, however, there was always on the outside a casing of fine stone, elaborately finished, and very well joined; and the inner chambers were of similar good work. Indeed the construction was in all cases so far sound that, had it not been for the spite of enemies and the greed of later builders, it is probable that every pyramid would have been standing in good order at this day. The casings were not mere "vener" or "film," as they have been called, but were of massive blocks, usually greater in thickness than in height, and in some cases (as at South Dahshur) reminding the observer of horizontal leaves with sloping edges.

Inside of each pyramid, always low down, and usually below the ground-level, was built a sepulchral chamber; this was reached in all cases by a passage from the north, sometimes beginning in the pyramid face, sometimes descending into the rock on which the pyramid was built in front of the north side. This chamber, if not cut in the rock altogether (as in Menkaura's), or a pit in the rock roofed with stone (as in Khafra's), was built between two immense walls which served for the east and west sides, and between which the north and south sides and roofing stood merely in contact, but unbonded. The gable roofing of the chambers was formed by great sloping cantilevers of stone, projecting from the north and south walls, on which they rested without pressing on each other along the center ridge; thus there was no thrust, nor were there any forces to disturb the building; and it was only after the most brutal treatment, by which these great masses of stone were cracked asunder, that the principle of thrust came into play, though it had been provided for in the sloping form of the roof, so as to delay as long as possible the collapse of the chamber.

Of the architectural peculiarities of some particular pyramids some notice must now be given. The great pyramid of Gizeh (Khufu's) is very different in its internal arrangements from any other known. The greater number of passages and chambers, the high finish of parts of the work, and the accuracy of construction all distinguish it. The chamber which is most normal in its situation is the subterranean chamber; but this is quite unfinished, hardly more than begun. The upper chambers, called the "king's" and "queen's," were completely hidden, the ascending passage to them having been closed by plugging blocks, which concealed the point where it branched upward out of the roof of the

long descending passage. Another passage, which in its turn branches from the ascending passage to the queen's chamber, was also completely blocked up. The object of having two highly-finished chambers in the mass may have been to receive the king and his co-regent (of whom there is some historical evidence), and there is very credible testimony to a sarcophagus having existed in the queen's chamber, as well as in the king's chamber. The accuracy of work is such that the four sides of the base have only a mean error of six-tenths of an inch in length and twelve seconds in angle from a perfect square.

The second pyramid of Gizeh has two separate entrances (one in the side, the other in the pavement) and two chambers (one roofed with slabs, the other all rock-hewn); these chambers, however, do not run into the masonry, the whole bulk of which is solid so far as is known. This pyramid has a part of the original casing on the top; and it is also interesting as having the workmen's barracks still remaining at a short distance on the west side, long chambers capable of housing about 4,000 men. The great bulk of the rubbish from the work is laid on the south side, forming a flat terrace level with the base, and covering a steep rock escarpment which existed there. The waste heaps from the great pyramid were similarly tipped out over the cliff on its northern side. Thus the rubbish added to the broad platform which set off the appearance of the pyramids; and it has remained undisturbed in all ages, as there was nothing to be got out of it. The third pyramid was cased around the base with red granite for the sixteen lowest courses. The design of it has been enlarged at one bound from a small pyramid (such as those of the family of Khufu) to one eight times the size, as it is at present; the passages needed therefore to be altered. But there is no sign of gradual steps of enlargement: the change was sudden, from a comparatively small design to a large one. The basalt sarcophagus of this pyramid was ornamented with the panel decoration found on early tombs, unlike the granite sarcophagi of the two previous pyramids, which are plain. Unhappily it was lost at sea in 1838.

On the vexed question of inscriptions on the pyramids it will suffice to say that not one fragment of early inscription is known on the casing of any pyramid, either *in situ* or broken in pieces. Large quantities of travelers' "graffiti" doubtless existed, and some have been found on the casing of the great pyramid; these probably gave rise to the accounts of inscriptions, which are expressly said to have been in many different languages.

The mechanical means employed by the pyramid-builders have been partly ascertained. The hard stones, granite, diorite, and basalt were in all fine work sawn into shape by bronze saws set with jewels (either corundum or diamond), hollows were made (as in sarcophagi) by tubular drilling with tools like our modern diamond rock-drills (which are but reinvented from ancient sources), and small articles were turned in lathes fitted with mechanical tool-rests and jewel-pointed tools. The details of the questions of transport and management of the large stones remain still to be explained.

PYRENEES, a range of mountains stretching with a general trend  $18^\circ$  to the north of west between France and Spain, from Cape Creus, or more properly Cape Cerbera, on the Mediterranean to the Bay of Biscay. The length of the range is about 240 miles, the greatest breadth little more than fifty miles (exclusive of the lower parallel ranges on the Spanish side), and the area covered by it about 13,000 square miles. For the most part the crest of the main chain

constitutes the Franco-Spanish frontier; the principal exception to this rule is formed by the valley of Aran, which, belonging orographically to France but politically to Spain, is closed at the head by a transverse ridge running north and south and connecting the eastern and western halves of the chain.

PYRÉNÉES, the name of three departments in the south of France.

1. BASSES-PYRÉNÉES, a department of southwestern France, at the angle of the Bay of Biscay, was formed in 1790, two-thirds of it from Béarn and the rest from three districts of Gascony—Navarre, Soule, and Labourd—which together constitute the Basque region of France. The department lies between  $42^{\circ} 46'$  and  $43^{\circ} 36'$  N. latitude and between  $0^{\circ} 6'$  E. and  $1^{\circ} 47'$  W. longitude, and is bounded on the north by Landes and Gers, on the east by Hautes-Pyrénées (which has two enclaves, forming five communes, within this department), on the south by Spain, and on the west by the ocean.

The department is mainly agricultural, 287,719 of its inhabitants being dependent on this industry (Reclus). Forest management receives careful attention. The number of inhabitants employed in manufactures is 67,455. There are mines of anthracite, copper, iron, lead, zinc, silver, and kaolin in small quantity. The salt produced amounted to 9,663 tons and is used partly for the famous Bayonne hams (so-called, but really prepared in the neighborhood of Orthez). The department has valuable mineral springs. The population in 1881, was 432,999 (57 per square kilometer), almost entirely Catholic. There are five arrondissements—Pau, Bayonne, Oloron, Orthez (population of town, 4,567), and Mauléon (2,038), divided into 40 cantons, and 558 communes. Basses-Pyrénées constitutes the diocese of Bayonne, and is attached to the superior court of Pau and belongs to the district of the 18th Army Corps (Bordeaux).

2. HAUTES-PYRÉNÉES, a department of southern France, on the Spanish frontier, was formed in 1790, half of it being taken from Bigorre and the remainder from Armagnac, Nébouzan, Astarac, and Quatre Vallées, districts which all belonged to the province of Gascony, and is bounded on the south by Spain, on the west by Basses-Pyrénées, on the northwest by Landes, on the northeast by Gers, and on the east by Haute-Garonne. The formerly extensive forests have suffered considerably from the weather and other causes. Vines, trained upon trees as in Italy, yield on an average 2,464,000 gallons of wine annually. On the lower slopes chestnut trees and fruit trees take the place of the vines. There are various quarries of fine marble, which are sawn and worked at Bagnères, and numerous slate quarries. The mines of iron, nickel, lead, cobalt, manganese, and zinc are worked only irregularly. There is no coal, but a few hundred tons of peat are annually extracted. The mineral waters of Hautes-Pyrénées are numerous and much resorted to. The population in 1886 was 234,825. There are three arrondissements, those of Tarbes (chief town), Argelès (town, 1,682 inhabitants), and Bagnères de Bigorre (7,634 inhabitants), 26 cantons, 480 communes. Hautes-Pyrénées constitutes the diocese of Tarbes, and is attached to the superior court of Pau and to the 18th Army Corps (Bordeaux).

3. PYRÉNÉES-ORIENTALES, a department of southern France, bordering on the Mediterranean and the Spanish frontier, was formed in 1790 out of the old province of Roussillon and to some slight extent out of small portions of Languedoc. It lies between  $42^{\circ} 20'$  and  $42^{\circ} 56'$  N. latitude and  $1^{\circ} 43'$  and  $3^{\circ} 10'$  E. longitude and is bounded on the north by Ariège and Aude, on the east by the Mediterranean, on the south by Catalonia, and on the west by Ariège. The main source of wealth

of the department is its wine, of which 48,840,000 gallons were produced in 1881; some kinds are strongly alcoholic and others are in request as liquor wines (Rivesaltes, Banyuls). Market-gardening (artichoke, asparagus, tomatoes, melons) and fruit culture (peaches, apricots, plums, pears, quinces, pomegranates, almonds, apples, cherries, walnuts, chestnuts) yield abundant returns. The woods produce timber for the cabinet-maker, cork, and bark for tanning. In iron Pyrénées-Orientales is one of the richest departments in France. The greater part of the ore is transported to Aveyron, Gard, or Allier, but 25,000 tons are smelted in blast-furnaces and 1,800 in Catalonian forges within the department. In 1886 the population of Pyrenees-Orientales amounted to 211,187, the majority of whom were Catalans in speech and the rest Provençal. The chief towns of the three arrondissements are PERPIGNAN (*q.v.*), Céret (3,104 inhabitants), and Prades (3,687); there are 17 cantons and 231 communes. The department constitutes the diocese of Perpignan and is attached to the superior court and army corps of Montpellier.

PYRITES (from  $\pi\upsilon\rho$ , fire), a name applied to the native bisulphide of iron, which occurs as a yellow metallic mineral, sufficiently hard to emit sparks when struck with either flint or steel. Nodules of pyrites are common in the lower beds of Chalk, and fragments of these nodules have occasionally been found on prehistoric sites under circumstances which suggest that the mineral was used as a fire-producing medium at a very early period of human culture. Even in late historic times it was often employed instead of flint, as in some of the old wheel-lock guns, whence it came to be known in France as "pierre d'arquebuse." It was afterward found that pyrites might be made available as a source of sulphur, oil of vitrol, and other chemical products.

By modern mineralogists the term "pyrites" has been extended to a number of metallic sulphides, and it is therefore now used rather as a group-name than as the specific designation of a mineral. Hence the typical pyrites is often distinguished as "iron pyrites," while other members of the group are known as "copper pyrites," "cobalt pyrites," "arsenical pyrites," etc.

PYRMONT. See WALDECK.

PYROMETER, an instrument for measuring high temperatures.

The most convenient form of the instrument for general use is Jolly's. The two vertical tubes of the manometer are connected by an india-rubber tube properly strengthened by a cotton covering, and they can be made to slide vertically up and down a wooden pillar which supports them; they are provided with clamps for fixing them in any position and a tangent screw for fine adjustment. The connection between the bulb and the manometer is made by means of a convenient three-way tap. The scale of the instrument is engraved on the back of a strip of plane mirror before silvring, and the divisions are carried sufficiently far across the scale for the reflections of the two surfaces of the mercury to be visible behind the scale. Parallax can thus be avoided and an accurate reading obtained without the necessity of using a kathetometer. In order to allow for the expansion of the glass of the reservoir a weight-thermometer bulb is supplied with the instrument, made from another specimen of the same kind of glass, and the relative expansion of the mercury and the glass can thus be determined by the observer himself. The volume of the air-bulb and that of the capillary tube and the small portion of the manometer tube above the small back of glass, the point of which serves as the fiducial mark, are determined by the instrument-makers. A similar instrument with a bulb

which will resist higher temperatures may be used beyond the softening-point of glass.

PYROTECHNY is the art of producing pleasing scenic effects by means of fire. It is not held to include the manufacture of inflammable and explosive substances for other purposes. The use of fireworks for purposes of display is not a modern invention, for it appears to have existed in China in very ancient times; but the secret of constructing them remained unknown in Europe till about the thirteenth century, when the knowledge of gunpowder crept in from the East. In modern times the art has been gradually improved by the work of specialists, who have had the advantage of being guided by scientific knowledge. The value of such knowledge to the pyrotechnist is extremely great; for he must be governed by the principles of chemistry in the selection of his materials, and his various contrivances for turning them to the best account are subject to the laws of mechanics. As in all such cases, however, science is useless without the aid of practical experience and acquired manual dexterity.

The number of fire mixtures actually employed is very great; for the requirements of each variety of firework, and of almost each size of each variety, are different. Moreover, every pyrotechnist has his own taste in the matter of compositions. They are capable, however, of being classified according to the nature of the work to which they are suited. Thus there are rocket-fuses, gerbe-fuses, squib-fuses, star-compositions, etc.; and, in addition, there are a few which are essential in the construction of most fireworks, whatever the main composition may be. Such are the *starting-powder*, which first catches the fire, the *bursting-powder*, which causes the final explosion, and the *quick-match* (cotton wick, dried after being saturated with a paste of gunpowder and starch), employed for connecting parts of the more complicated works and carrying the fire from one to another. Of the general nature of fuses an idea may be had from the following two examples, which are selected at hazard from among the numerous recipes for making, respectively, tourbillion fire and green stars:

<i>Tourbillion.</i>	<i>Green Stars.</i>
Meal gunpowder.....24 parts.	Chlorate of potash....16 parts.
Niter .....10 "	Nitrate of baryta .....48 "
Sulphur .....7 "	Sulphur .....12 "
Charcoal.....4 "	Charcoal .....1 "
Steel filings.....8 "	Shellac .....5 "
	Calomel .....8 "
	Sulphide of copper....2 "

The following is a brief description of some of the forms of firework most employed:

*Fixed Fires.*—*Theater fires* consist of a slow composition which may be heaped in a conical pile on a tile or a flagstone and lit at the apex. They require no cases. Usually the fire is colored, green, red, or blue; and beautiful effects are obtained by illuminating buildings with it. It is also used on the stage; but, in that case, the composition must be such as to give no suffocating poisonous fumes. *Bengal lights* are very similar, but are piled in saucers, covered with gummed paper, and lit by means of pieces of match. *Marroons* are small boxes wrapped round several times with lind cord and filled with a strong composition which explodes with a loud report. They are generally used in *batteries*, or in combination with some other form of firework. *Squibs* are straight cylindrical cases about six inches long, firmly closed at one end, tightly packed with a strong composition, and capped with touch-powder. Usually, a little bursting-powder is put in before the ordinary composition, so that the fire is finished by an explosion. The character of the fire is, of course, sus-

ceptible of great variation in color, etc. *Crackers* are characterized by the cases being doubled backward and forward several times, the folds being pressed close and secured by twine. One end is primed; and when this is lit the cracker burns with a hissing noise, and a loud report occurs every time the fire reaches a bend. If the cracker is placed on the ground, it will give a jump with each report; so that it cannot quite fairly be classed among the fixed fireworks. *Roman candles* are straight cylindrical cases filled with layers of composition and stars, alternately. These stars are simply balls of some special composition, usually containing metallic filings, made up with gum and spirits of wine, cut to the required size and shape, dusted with gunpowder, and dried. They are discharged like blazing bullets several feet into the air, and produce a beautiful effect which may be enhanced by packing stars of differently colored fire in one case. *Gerbes* are choked cases; not unlike Roman candles, but often of much larger size. Their fire spreads like a sheaf of wheat. They may be packed with variously colored stars, which will rise thirty feet or more. *Lances* are small straight cases charged with composition like those used for making stars. They are mostly used in complex devices, for which purposes they are fixed with wires on suitable wooden frames. They are connected by *leaders*, i.e., by quick-match inclosed in paper tubes, so that they can be regulated to take fire all at the same time, singly, or in detachments, as may be desired. The devices constructed in this way are often of an extremely elaborate character; and they include all the varieties of *lettered designs*, of *fixed suns*, *fountains*, *palm-trees*, *waterfalls*, *mosaic work*, *Highland tartan*, etc.

*Rotating Fireworks.*—*Pin or Catherine wheels* are long paper cases filled with a composition by means of a funnel and packing-wire, and afterward wound round a disk of wood. This is fixed by a pin, sometimes vertically and sometimes horizontally; and the outer primed end of the spiral is lit. As the fire escapes the recoil causes the wheel to revolve in an opposite direction, and often with considerable velocity. *Pastiles* are very similar in principle and construction. Instead of the case being wound in a spiral, and made to revolve round its own centre point, it may be used as the engine to drive a wheel or other form of framework round in a circle. Many varied effects are thus produced, of which the *fire-wheel* is the simplest. Straight cases, filled with some fire-composition, are attached to the end of the spokes of a wheel or other mechanism capable of being rotated. They are all pointed in the same direction at an angle to the spokes, and they are connected together by leaders, so that each, as it burns out, fires the one next to it. The pieces may be so chosen that brilliant effects of changing color are produced; or various fire-wheels of different colors may be combined, revolving in different planes and different directions—some fast and some slowly. *Bisecting wheels*, *plural wheels*, *caprice wheels*, *spiral wheels*, are all more or less complicated forms; and it is possible to produce, by mechanism of this nature, a model in fire of the solar system.

*Ascending Fireworks.*—*Tourbillions* are fireworks so constructed as to ascend in the air and rotate at the same time, forming beautiful spiral curves of fire. The straight cylindrical case is closed at the center and at the two ends with plugs of plaster of paris, the composition occupying the intermediate parts. The fire finds vent by six holes pierced in the case. Two of these are placed close to the ends, but at opposite sides, so that one end discharges to the right and the other to the left; and it is this which imparts the rotary motion. The

other holes are placed along the middle line of what is the under-surface of the case when it is laid horizontally on the ground; and these, discharging downward, impart an upward motion to the whole. A cross-piece of wood balances the tourbillion; and the quick-match and touch-paper are so arranged that combustion begins at the two ends simultaneously and does not reach the holes of ascension till after the rotation is fairly begun. The *sky-rocket* is generally considered the most beautiful of all fireworks; and it certainly is the one that requires most skill and science in its construction. It consists essentially of two parts—the body and the head. The body is a straight cylinder of strong pasted paper and is choked at the lower end, so as to present only a narrow opening for the escape of the fire. The composition does not fill up the case entirely, for a central hollow conical bore extends from the choked mouth up the body for three-quarters of its length. This is an essential feature of the rocket. It allows of nearly the whole composition being fired at once; the result of which is that an enormous quantity of heated gases collects in the hollow bore, and the gases, forcing their way downward through the narrow opening, urge the rocket up through the air. The top of the case is closed by a plaster-of-paris plug. A hole passes through this and is filled with a fuse, which serves to communicate the fire to the head after the body is burned out. This head, which is made separately and fastened on after the body is packed, consists of a short cylindrical paper chamber with a conical top. It serves the double purpose of cutting a way through the air and of holding the *garniture* of stars, sparks, crackers, serpents, gold and silver rain, etc., which are scattered by bursting fire as soon as the rocket reaches the highest point of its path. A great variety of beautiful effects may be obtained by the exercise of ingenuity in the choice and construction of this garniture. Many of the best results have been obtained by unpublished methods which must be regarded as the secrets of the trade. The *stick* of the sky-rocket serves the purpose of guiding and balancing it in its flight; and its size must be accurately adapted to the dimensions of the case. In *winged* rockets the stick is replaced by cardboard wings, which act like the feathers of an arrow. A *girandole* is the simultaneous discharge of a large number of rockets (often from 100 to 200), which either spread like a peacock's tail or pierce the sky in all directions with rushing lines of fire. This is usually the final feat of a great pyrotechnic display.

**PYRRHUS.** The name of Pyrrhus, king of Epirus, owes its chief fame in history to the fact that with his invasion of Italy in the early part of the third century B.C. Greece and Rome for the first time came definitely into contact. Born about the year 318, and claiming descent from Pyrrhus, the son of Achilles, connected also with the royal family of Macedonia through Olympias, the mother of Alexander the Great, he became when a mere stripling king of the wild mountain tribes of Epirus, and learned how to fight battles in the school of Demetrius Poliorcetes (the Besieger) and of his father Antigonus. In 273 he was invited into the Peloponnesus to settle at the sword's point a dispute about the royal succession at Sparta. He besieged the city, but was repulsed with great loss. Next he went to Argos at the invitation of a political faction, and here in the confusion of a fight by night in the streets he met his death in his forty-sixth year from the hand of a woman, who hurled a ponderous roof-tile upon his head.

Pyrrhus was no doubt a brilliant and dashing soldier, but he was aptly compared "to a gambler who made many good throws with the dice, but could not make

the proper use of the game." There was something chivalrous about him which seems to have made him a general favorite. After his death Macedonia had for a time at least nothing to fear, and the liberty of Greece was quite at the mercy of that power.

**PYTHAGORAS AND PYTHAGOREANS.** Pythagoras is one of those figures which have so impressed the imagination of succeeding times that their historical lineaments are difficult to discern through the mythical haze that envelops them. The authentic details of his career are meager enough and merely approximate in character. He was a native of Samos, and the first part of his life may therefore be said to belong to that Ionian seaboard which had already witnessed the first development of philosophic thought in Greece. The exact year of his birth has been variously placed between 586 and 569 B.C., but 582 may be taken as the most probable date. There is thus little more than conjecture to fill out the first half of the philosopher's life. The historically important part of his career begins with his emigration to Crotona, one of the Dorian colonies in the South of Italy. Nothing is known with certainty of the reasons that led to this step, which he appears to have taken about the year 529; perhaps the ethical temper which can be traced in the Pythagorean school attracted the founder toward the sterner Dorian character. At Crotona Pythagoras speedily became the center of a widespread and influential organization, which seems to have resembled a religious brotherhood or an association for the moral reformation of society much more than a philosophic school. Pythagoras appears, indeed, in all the accounts more as a moral reformer than as a speculative thinker or scientific teacher; and it is noteworthy that the only one of the doctrines of the school which is definitely traceable to Pythagoras himself is the ethico-mystical doctrine of transmigration. The aim of the brotherhood was the moral education and purification of the community; and it seems to have been largely based upon a revival of the Dorian ideal of abstinence and hardihood along with certain other traits of a more definitely religious character, which were probably due to the influence of the mysteries. But many details of life and ritual, such as abstinence from animal food and from beans, celibacy, and even community of goods, have been fathered by the organized asceticism of a later period upon the original followers of Pythagoras. Ethics, according to the Greek and especially according to the Dorian conception, being inseparably bound up with the general health of the state, we are not surprised to find the Pythagoreans represented as a political league; nor is it wonderful that their following was among the aristocracy, and that they formed the staunchest supporters of the old Dorian constitutions. It is unfair, however, to speak of the league as primarily a political organization, wide though its political ramifications must latterly have become. Its entanglement with politics was in the end fatal to its existence. The authorities differ hopelessly in chronology, but according to the balance of evidence the first reaction against the Pythagoreans took place in the lifetime of Pythagoras himself after the victory gained by Crotona over Sybaris in the year 510. Dissensions seem to have arisen about the allotment of the conquered territory, and an adverse party was formed in Crotona under the leadership of Cylon. This was probably the cause of Pythagoras's withdrawal to Metapontum, which an almost unanimous tradition assigns as the place of his death in the end of the sixth or the beginning of the fifth century. The league appears to have continued powerful in Magna Græcia till the middle of the fifth century, when it was violently trampled out by the successful democrats. The meeting-houses of the Pytha-

goreans were everywhere sacked and burned; mention is made in particular of "the house of Milo" in Crotona, where fifty or sixty of the leading Pythagoreans were surprised and slain. The persecution to which the brotherhood was subjected throughout Magna Græcia was the immediate cause of the spread of the Pythagorean philosophy in Greece proper.

As the introduction of geometry into Greece is by common consent attributed to Thales, so all are agreed that to Pythagoras is due the honor of having raised mathematics to the rank of a science. We know that the early Pythagoreans published nothing, and that, moreover, they referred all their discoveries back to their master. (See PHILOLAUS.) Hence it is not possible to separate his work from his early disciples. We know that Pythagoras made numbers the basis of his philosophical system, as well physical as metaphysical, and that he united the study of geometry with that of arithmetic.

PYTHEAS of Massilia was a celebrated Greek navigator and geographer, to whom the Greeks appear to have been indebted for the earliest information they possessed, of at all a definite character, concerning the western regions of Europe, and especially the British Islands. The period at which he lived cannot be accurately determined; but it is certain that he wrote before Eratosthenes, who relied much upon his

authority, but before Dicæarchus, who was a pupil of Aristotle, and died about 285 B.C.

PYTHON, a genus of gigantic snakes inhabiting the tropical parts of Africa and Asia, and known in some parts of the British possessions by the name of "rock snakes." On account of their general appearance, beautifully-marked skin, large size, and similarity of habits they are frequently confounded with the true boas of the New World and misnamed "boa-constrictors." They differ from them, however, by having a double row of scutes under the tail, pits in the shields round the margins of the upper and lower jaws, and teeth in the intermaxillary bone.

Africa is inhabited by three species (*Python seba*, *P. regius*, and *P. natalensis*), and Asia by two (*Python molurus* and *P. reticulatus*), the former of these two species being found on the continent of India and in Ceylon, the latter in the large islands of the Archipelago and in the Malayan Peninsula. In Australasia and New Guinea similar snakes occur, but they are of much smaller size and differ in essential structural characters from the rock-snakes. These latter are among the largest of living reptiles; although their dimensions and strength have been much exaggerated, specimens of eighteen and twenty feet have been brought to Europe, and reliable statements of the occurrence of individuals which measured thirty feet are on record.

## Q.

**Q** was written in Greek with the straight stroke vertical, Ϟ, as in the Phœnician alphabet from which it was borrowed, and was called koppa, the equivalent of the Hebrew koph. It is found sparingly on some old inscriptions of Rhodes, of some of the Ægean islands, of Corinth and of Syracuse, and most frequently in the Chalcidian colonies of Sicily and Italy. But it was soon supplanted by kappa, and survived only in numeration as the representative of the number 90. It went to Rome with the Chalcidian alphabet of Cumæ, and was written at first with the vertical line; but the stroke soon became slant, so that the symbol got the form it still retains (Q).

There is a slight but real distinction of sound between the so-called palatal and velar *k*. The first is the ordinary *k*, for which the back of the tongue is raised against the back part of the hard palate. The second is produced by raising the tongue against the soft palate or *velum palati*, that is, rather farther back in the mouth. This sound has a tendency to be accompanied by a slight rounding of the lips; this causes an equally slight *w* sound after the *k*. It is probable that the velar *k* with this parasitic *w* was in use for a time in Greece, and that it was represented by the koppa; the symbol would otherwise have been totally unnecessary, also the koppa is generally followed by *u* or *o*, which on this view, is natural. We know that in Greece *kw* must have been an intermediate sound between *k* and *p* in words where *k* was labialized, such as ἔπομαι from root *sak* (see under K.) But this intermediate sound was not retained in language: either the *w* was dropped and the sound reverted to *k*, or *p* was produced by the assimilating force of the *w*; therefore all need for a symbol koppa vanished. But in Latin the middle step remained, as in *sequor*; therefore the symbol was needed. But the parasitic sound became a complete *w*; and to denote this *v* was regularly written after the *q*. Therefore even in Latin the symbol was really otiose, for *qv* would have been quite sufficient, and did actually suffice for the Umbrian and Oscan, which never possessed the *q*. In old inscriptions we find *q* alone when the following vowel is *u*, as in *Mircurios*, *pequnia*. In later times when *o* passed by weakening into *u*, a preceding *qu* was written *c*; thus *quom* became *cum*, to avoid the double *u* of *quum*. The *qu* of the Latin naturally passed on into the Romantic languages. It passed into the Teutonic languages in borrowed words, such as *quart*, but made its way into Teutonic words also; thus, in English, *cwén*, *cowellan* are now spelt *queen*, *quell*.

**QUADRILATERAL**, a military term applied to any combination of four fortresses mutually supporting each other, but especially to that of the four fortified towns of Mantua, Peschiera, Verona, and Legnago, the two former of which are situated on the Mincio and the two latter on the Adige. The real value of the Quadrilateral, which gave Austria such a firm hold on Lombardy, lay in the extraordinary natural strength of Mantua and in the readiness with which troops and supplies could

be poured into Verona from the north. (See "The Quadrilateral," in the *Cornhill Magazine*, 1862; and Professor Malfatti, *Il Quadrilatero*, Milan, 1866.)

**QUADRUMANA**. See MAMMALIA and APE.

**QUÆSTOR** was the title of a Roman magistrate whose functions, at least in the later times of the republic, were mainly financial. The origin of the quæstorship is somewhat obscure, but on the whole it was probably instituted simultaneously with the consulship in 509 B.C. The number of the quæstors was originally two, but this was successively increased to four (in 421 B.C.), eight (in 267 or 241 B.C.), and by Sulla (in 81 B.C.) to twenty. Caesar raised the number to forty (in 45 B.C.), but Augustus reduced it again to twenty, which remained the regular number under the empire.

**QUAGGA**, or **COUAGGA**, an animal of the genus *Equus* (see HORSE), nearly allied to the zebra, which formerly was met with in vast herds on the plains of South Africa between the Cape Colony and the Vaal river, but now, in common with most of the larger wild animals of that region, becoming extremely scarce, owing to the encroachment of European civilization. In length of ears and character of tail it more resembles the horse than it does the ass, although it agrees with the latter in wanting the small bare callosity in the inner side of the hind leg, just below the hock, characteristic of the horse. The color of the head, neck, and upper parts of the body is reddish-brown, irregularly banded and marked with dark brown stripes, stronger on the head and neck and gradually becoming fainter until lost behind the shoulder. There is a broad dark median dorsal stripe. The under surface of the body, the legs, and tail are nearly white, without stripes. The crest is very high, surmounted by a standing mane, banded alternately brown and white. Though never really domesticated, quaggas have occasionally been trained to harness.

**QUAIL**, a very well known bird throughout almost all countries of Europe, Asia, and Africa—in modern ornithology the *Coturnix communis* or *C. dactylisonans*. This last epithet was given from the peculiar three-syllabled call-note of the cock, which has been grotesquely rendered in several European languages, and in some parts of Great Britain the species is popularly known by the nickname of "Wet-my-lips" or "Wet-my-feet." The Quail varies somewhat in color, and the variation is rather individual than attributable to local causes; but generally the plumage may be described as reddish-brown above, almost each feather being transversely patched with dark brown interrupted by a longitudinal stripe of light buff; the head is dark brown above, with three longitudinal streaks of ochreous-white; the sides of the breast and flanks are reddish-brown, distinctly striped with ochreous-white; the rest of the lower parts are pale buff, clouded with a darker shade, and passing into white on the belly. The cock, besides being brighter in tint, not infre-

quently has the chin and a double-throat band of reddish or blackish brown, which marks are wanting in the hen, whose breast is usually spotted.

America has some fifty or sixty species of birds which are commonly deemed quails, though by some authors placed in a distinct family or sub-family, *Odontophorinae*. The best known is the Virginian quail, or colin, as it is frequently called—that being, according to Hernandez, its old Mexican name. It is the *Ortyx virginianus* of modern ornithology, and has a wide distribution in North America, in some parts of which it is known as the "partridge," as well as by the nickname of "Bob White," aptly bestowed upon it from the call-note of the cock. Many attempts have been made to introduce this bird to England (as indeed similar trials have been made in the United States with quails from Europe); but, though it has been turned out by hundreds, and has frequently been known to breed after liberation, its numbers rapidly diminish until it wholly disappears. The beautiful tufted quail of California, *Lophortyx californica* has also been tried in Europe without success.

**QUAKERS.** The Quakers, or as they call themselves the Society of Friends, are a body of Christians small in number but presenting several features of interest.

*History.*—The history of Quakerism in England may conveniently be divided into four periods: (1) from the first preaching of Fox in 1648 to the establishing of a church organization in 1666; (2) from that date to the Revolution of 1688; (3) from the Revolution to 1835; and (4) from 1835 to the present time.

1. **GEORGE FOX** (*q.v.*), the son of a weaver of Drayton in Leicestershire, was the founder of the Quakers. He began to preach in 1648, and in a few years gathered around him a great body of followers and a considerable number of itinerant preachers like himself, who zealously promulgated his doctrines. Among these Edward Burrough was the most remarkable. In 1655 these preachers numbered seventy-three. Fox and his fellow-preachers spoke whenever opportunity offered—sometimes in churches, sometimes in barns, sometimes at market-crosses. There is some evidence to show that the arrangement of this mission, as it would now be called, rested mainly with Fox, and that the expenses of it and of the foreign missions were borne out of a common fund.

Some of the early Quakers indulged in eccentricities and extravagances of no measured kind. The activity and zeal of the early Quakers were not confined to England; they passed into Scotland and Ireland. Fox and others traveled to America and the West Indian Islands; another reached Jerusalem, and testified against the superstition of the monks.

2. The second period in the history of Quakerism is marked by the introduction into the body, hitherto unorganized, of an organization and a discipline principally due to the mind and energy of Fox, by a more scholarly and learned air given to the Quaker productions by the writings of William Penn and Robert Barclay, and by the part which the Quakers played in the colonization of New Jersey and of Pennsylvania.

During the whole time between the rise of the Quakers and the passing of the Toleration Act they were the objects of an almost continuous persecution, which they endured with extraordinary constancy and patience.

The passing of the Conventicle Act gave fresh vigor to the persecution of Dissenters. But on March 15, 1671-72, King Charles II. issued his declaration for suspending the penal laws in matters ecclesiastical, and shortly afterward by pardon under the great seal re-

leased above 400 Quakers from prison, remitted their fines, and released such of their estates as were forfeited by *præmunire*.

3. With the cessation of persecution in 1689 the zeal of the Quaker body abated. Foreign missions had no existence except in the occasional travels of some wandering minister.

Excluded from political life by the constitution of the country, excluding themselves not only from the frivolous pursuits of pleasure but from music and art in general, with no high average of literary education (though they produced some men of eminence in medicine and science, as Doctor Fothergill and Doctor Dalton), the Quakers occupied themselves largely with trade, the business of their society, and the calls of philanthropy. In the middle and latter part of last century they founded several institutions for the more thorough education of their children, and entered upon many philanthropic labors.

*Doctrine.*—It is not easy to state with certainty the doctrines of a body which has never adopted any creed, and whose views have undoubtedly undergone from time to time changes more or less definite. But the accepted writings of its members and the statements as to doctrine contained in the *Book of Christian Discipline* of the society furnish materials.

The most characteristic doctrine of Quakerism is undoubtedly this—that there is an immediate revelation of the Spirit of God to each individual soul, that this light is universal and comes both to the heathen and to the Christian, and thereby the love and grace of God toward mankind are universal. It is almost needless to call attention to the direct antithesis between this doctrine of the Quakers and the various doctrines of election held by the Puritans, so that, if Quakerism be called the climax of Puritanism, it is so only as the rebound is the climax of the wave. From the doctrine of the sufficiency of the inward light proceed several other of the peculiar views of Quakers. They have denied the necessity and abstained from the practice of the sacraments of baptism and the Lord's supper. The one baptism, says Barclay (twelfth proposition), "is a pure and spiritual thing, to wit, the baptism of the spirit and fire \* \* \* \* of which the baptism of John was a figure which was commanded for a time, and not to continue for ever." "The communion of the body and blood of Christ," says the same author (thirteenth proposition), "is inward and spiritual, which is the participation of his flesh and blood by which the inward man is daily nourished in the hearts of those in whom Christ dwells, of which things the breaking of bread by Christ with his disciples was a figure."

The Quakers not only have no stated ministry, but they hold that no form of worship is so good as a patient waiting upon God in silence "by such as find no outward ceremony, no observations, no words, yea not the best and purest words, even the words of Scripture, able to satisfy their weary and afflicted souls."

The result of these doctrines on Quaker manners was notorious, and proved a continual source of objection to them on the part of their fellow-men, and frequently led to persecutions. They adopted the singular number in addressing a single individual, however exalted; and the "thou" and "thee" used to a magistrate or judge was often a cause of great irritation. They refused to say "good night," "good morrow," or "good speed;" they adopted a numerical nomenclature for the months of the year and the days of the week. They refused to bow or to remove their hats, and for this they suffered much. They forbore the drinking of healths, not merely as a vanity, but as "a provocation to drink more than did people good." They adopted a remarkable simplicity in

their marriages and their funerals. They used also great plainness in their houses and furniture and in their dress; and, by their tenaciously adhering to forms of attire which had fallen into disuse, their dress both for men and women became antique and peculiar, and Quakers were easily recognized as such by the garments they wore. Furthermore they discarded the usual symbols of grief on the death of their relations.

One point of morality on which the Friends have long insisted deserves notice. They require their members who may have been released from their debts by bankruptcy or composition, when able to pay their debts in full, to do so notwithstanding their legal discharge.

In the great doctrines of Christianity embodied in the apostles' creed the Quakers are in accord with their fellow-Christians; they believe in the Father, Son, and Holy Spirit, in the atonement by Christ, and in sanctification by the Spirit; they receive and believe the Scriptures as proceeding from the Spirit of God.

*Statistics of Quakerism.*—The number of Quakers in England and Wales in 1680 was probably about 40,000, and in 1806 about 32,000. In 1883 the total number of members in England, Wales, and Scotland was returned as 15,219 (193 were in Scotland), an increase of 106 on the previous year, and the number of habitual attenders of meetings of the body, not members, was 5,380, an increase of 150. In Ireland there were, in 1883, 2,812 Quakers. The Quakers in America number probably (including all bodies which claim to be Friends) from 50,000 to 60,000 or upward. Besides these there are in Norway about 200, in France from 70 to 80, in Germany from 50 to 60, and in Australia and New Zealand from 500 to 600 Quakers.

QUANTAMPOH, or KUNTAMPOH, a town of the Gold Coast region of western Africa, situated about eighty miles northeast of Coomassie in  $7^{\circ} 36'$  N. latitude and  $1^{\circ} 4'$  W. longitude. According to Captain Brandon Kirby, who was the first white man to reach the place, it had in 1881 a resident population of 15,000, and traders passed through it to the number of about 25,000.

QUARANTINE (Fr. *quarantaine*, a period of forty days) is, in the original sense of the term, a thing of the past in the United Kingdom and in several of the other states of Europe, as well as in America. Its interest is therefore largely historical. In common usage, the same word is applied to the modern substitutes for quarantine, although these are a complete departure in principle or theory from the indiscriminate system of detention of ships and men, unloading of cargo in lazarets, fumigation of susceptible articles, and the like, which used to be carried to great lengths on account of the plague and in connection with the Levantine trade.

*Substitute for Quarantine.*—The modern practice is to detain or refuse "pratique" to no ship unless there be a communicable form of sickness on board, or there had been such during the voyage. It is the duty of the officers of customs to question the captain as to the existence of any catching disease among the passengers or ship's company; if there be any evidence or suspicion of communicable infection, the officers of customs report the same to the port sanitary authorities, who have power to deal with the case.

*Quarantine or its Substitutes in European Countries.*—The principle of inspection, and of isolation of the sick, as stated above, was accepted with small reservation by the sanitary conference of Vienna in 1874, and it is now more or less consistently acted upon by all the larger European maritime states except Spain and Portugal. In times of cholera panic, quarantine of the original kind has been imposed against all arrivals from an "infected country" by ports of the Levant and Black

Sea, and by several Mediterranean states besides Spain. But it is only in the ports of the Iberian Peninsula that the old quarantine traditions remain in force from year to year; and it is only for them that any special account need be given.

*Land Quarantine.*—A land quarantine on a frontier is still enforced on account of cholera from time to time in southern Europe, *e.g.*, in 1884 by Italy against France at Ventimiglia and Modena, and by Spain against France in the passes of the Pyrenees, and in 1885 by Portugal against Spain. The experiment occasionally succeeds. A "sanitary cordon" is the rigorous isolation (by troops) of a pestilence-stricken place from the country around. It is a survival from the times of the plague, and is of no use in cholera.

*Principles of Quarantine.*—Plague, yellow fever, and Asiatic cholera are the three great spreading diseases which have been successively the subject of quarantine restrictions. For many years *plague* has ceased to have any practical interest in this connection.

In the draft of an international bill of health which was adopted by the international sanitary congress at Washington in 1881 smallpox and typhus are scheduled along with plague, yellow fever, and cholera. Although there are few countries where *smallpox* has not obtained a footing, yet every seaport finds it advisable to prevent the free entrance of fresh cases. Thus Denmark, in 1884, took precautions against the importation of smallpox from the Thames. It is mostly in Australia, New Zealand, the Cape, and other colonies that quarantine against smallpox is rigorously carried out. Except for a limited outbreak in Sydney in 1884, that disease has been absolutely excluded from the Australasian colonies, thanks to their admirable quarantine establishments. The case is very different at the Cape, owing to the existence of a virulent native center of variolous disease at no great distance in the interior.

As regards *typhus*, the principles of prevention are entirely different from those that apply to smallpox. To make quarantine effective against typhus, it is necessary to keep in mind that the specific fever may be vicarious to a common condition of filth and general misery. It is a modified form of the same principle of vicarious infection that, in the historical retrospect, gives us the key to the much more important problem of yellow fever, a disease which is to be regarded as a special form of typhus.

*Principles of Quarantine against Yellow Fever.*—The first requirement in the quarantine doctrine of yellow fever is to know where the disease is endemic—that is to say, where its poison exists in such a form that it may rise in exhalations from the harbor mud, alluvial foreshores, or wharves and shipping quarters in general, or may enter the bilges of ships with the water. There is a natural reluctance on the part of seafaring communities in the western hemisphere to admit that they harbor the seeds of yellow fever; but some of the endemic foci of the disease are beyond dispute. The principal are Havana and Rio de Janeiro.

Wherever the line be drawn between endemic and non-endemic ports of yellow fever, it is only the latter that can in reason seek to impose quarantine against the disease. Of such are now the ports on the Atlantic seaboard of the United States, the ports of the River Plate, and the whole European seaboard. There is an overwhelming mass of testimony that the real risk of importing the yellow-fever virus is always in the foul bilges of wooden ships, which had been lying in one of the endemic yellow-fever harbors. The poison is sucked in through the ship's seams; it ferments or multiplies in her bilges, rises as miasmata to infect the hold

or 'tween decks, sometimes clinging to cargo, and perhaps making no sign until the cargo is all out. Again, in temperate latitudes the virus may be imported and do no harm, unless it meet with a tract of exceptionally hot weather, such as happened at Swansea in 1865. According to this principle, all iron ships, which have little or no bilge-water, and all clean ships whatsoever, are practically free from the risk of importing an epidemic of yellow fever, even although one or more of their passengers or crew may have developed the malady on the voyage, having come on board in the stage of its incubation. The only question of practical consequence in the case of iron steamships arises in connection with the modern practice of carrying water-ballast in tanks or compartments of the ship's bottom.

*Principles of Quarantine against Cholera.*—The peculiar dangers of cholera diffusion arise from the vomited and purged matters which are characteristic of the common type of the malady. Under certain circumstances the discharges of the sick are infective; they are probably not infective as they come from the body; but even minute quantities of the choleraic matters, if they have fermented in the ground, or in boxes and bundles of foul linen, bedding, or clothes, may exhale a virus which is often suddenly prostrating in its action. Thus every person with cholera, or even with choleraic diarrhoea in times of epidemic, is a source whence many more may be poisoned. When the choleraic matters percolate into wells or reservoirs the poisoning may be on a great scale. Cholera with such infective properties is an exotic to the soil of Europe and probably of all countries except south-eastern Asia; and, if the infective discharges of cholera patients from the East were kept out of Western soil, no choleraic disease would be likely to become epidemic on the latter. But in the great majority of instances the quarantines against cholera have been "elaborate illustrations of leakiness." Island communities have the best chances of succeeding; but in the case of the British Islands the attempt has been abandoned as impracticable. In 1874 the international sanitary conference of Vienna adopted an abstract resolution by a large majority approximately in favor of the British practice, though the conference of Rome in 1885 was slightly reactionary. According to this practice a case of cholera is received into the country with much the same sort of assurance as a case of typhoid fever would be. The maxim for cholera is—Take care of the conditions, and the disease will take care of itself. The reason why cholera is more difficult to manage than typhoid fever is that it is peculiarly a disease of the poor; "poverty has always been the true quartermaster of cholera." The virus is transported (in the West at least) from place to place largely by emigrants, religious pilgrims (as in Russia), fugitives, tramps, or others hard pressed by circumstances; one of the most remarkable instances of that kind is its alleged transmission, in 1833, from Kansas across the Rocky Mountains to the Pacific by parties of Indians successively infected. The danger from the wandering poor is all the greater that they would be naturally unwilling under any circumstances to sacrifice their small belongings of clothes, bedding, and the like, which are often the real media of infection. It is not to be denied that the old-fashioned detention for a week or more in a lazaret has still something to recommend it for such poor classes of travelers; but the detention will be more likely to give vitality to any lurking virus of the disease than to extinguish it, unless the lazaret be particularly well found in all the conveniences of living.

**QUARANTINE, CATTLE.** The importation of

foreign cattle into England was forbidden at a comparatively early period. Thus 18 Car. II., c. 2 made such importation a common nuisance. In 1869 previous legislation was consolidated by the Contagious Diseases (Animals) Act, 1869, which applied to the United Kingdom. In 1878 this act was repealed and new provisions made by the Contagious Diseases (Animals) Act, 1878, amended by two acts passed in 1884. By this Act the privy council is empowered to make from time to time such general or special orders as they think fit for prohibiting the landing of animals brought from a foreign country. Foreign animals can be landed only at certain ports named by the privy council, and must be slaughtered on landing, unless they are intended for exhibition or other exceptional purposes, in which case they are subject to the quarantine rules given in the fifth schedule of the act. In the United States the importation of neat cattle is forbidden by the act of 1883, c. 121, except as allowed by the secretary of the treasury. The appropriation acts since 1881 have made annual grants of sums of \$50,000 to enable the secretary of the treasury to cooperate with State and municipal authorities in making regulations for the establishment of cattle quarantine stations. The cattle quarantine system of Canada is said to be one of the most perfect existing. In 1876 a quarantine of eight days was established, raised to ninety days in 1879. The chief Canadian act is 42 Vict. c. 23. The effect of the Canadian precautions has been that English orders in council have allowed Canadian cattle to be imported into the United Kingdom for breeding and exhibition purposes.

**QUARANTINE, WIDOW'S,** is the right of a widow to remain in the principal house belonging to her husband for forty days after his death. It is especially recognized in Magna Charta and in some of the State laws in the United States.

**QUARE IMPEDIT,** in English law, is a form of action by which the right of presentation to a benefice is tried. It is so called from the words of the writ formerly in use which directed the sheriff to command the person disturbing the possession to permit the plaintiff to present a fit person, or to show cause "why he hinders" the plaintiff in his right. The action is one of the few surviving real actions preserved. As a real action it could before the Judicature Acts have been brought only in the Court of Common Pleas.

**QUARLES, FRANCIS,** a sacred poet, born in 1592, enjoyed considerable celebrity in his own day, and some of his works have shared in the recent revival of interest in our older literature. The work by which he is best known, his *Emblemes*, was originally published in 1635, with grotesque illustrations, engraved by Marshall, and borrowed from the *Pia Desideria* of Hermann Hugo. The poems, which are diffuse meditations upon Scriptural texts, seem, in modern phrase, to have been "written up" to the illustrations, and are quite in keeping with their quaint mixture of sublime and familiar thoughts. Upon the outbreak of the civil war he wrote on the Royalist side, and died in 1644, in consequence, his widow suggests, of his harsh treatment by the king's enemies.

**QUARTER SESSIONS** (in full, **GENERAL QUARTER SESSIONS OF THE PEACE**) is the name given to a local court with civil and criminal jurisdiction. In England the court consists in counties of two or more justices of the peace, one of whom must be of the quorum (see **JUSTICE OF THE PEACE**), in cities and boroughs of the recorder alone. The quarter sessions are a court of record. The records in a county are nominally in the custody of the *custos rotulorum*, the highest civil officer in the county, practically in that of the clerk of

the peace, who is nominated by the *custos* and removable by the quarter sessions. In a city or borough he is appointed by the council and removable by the recorder. The original jurisdiction of quarter sessions seems to have been confined to cognizance of breaches of the peace.

QUARTZ, the name of a mineralogical species which includes nearly all the native forms of Silica. It thus embraces a great number of distinct minerals, several of which are cut as ornamental stones or otherwise used in the arts. For a general description of the species, see MINERALOGY, and for its chief varieties see AGATE, AMETHYST, FLINT, and JASPER. The crystallography of quartz has been fully investigated by Des Cloizeaux in his classical *Mémoire sur la cristallisation et la structure intérieure du Quartz*, Paris, 1855.

QUASSIA, the generic name given by Linnæus to a small tree of Surinam in honor of the negro Quassi or Coissi, who employed the intensely bitter bark of the tree as a remedy for fever. This bark was introduced into European medicine about the middle of the last century, and was officially recognized in the *London Pharmacopœia* of 1788. Quassia is used in medicine in the form of infusion and tincture as a pure bitter tonic and febrifuge, and in consequence of containing no tannin is often prescribed in combination with iron. An infusion of the wood sweetened with sugar is also used as a fly poison, and forms an effectual injection for destroying thread worms. Quassia also forms a principal ingredient of several "hop substitutes," for which use it was employed as long ago as 1791, when John Lindsay, a medical practitioner in Jamaica, wrote that the bark was exported to England "in considerable quantities for the purposes of brewers of ale and porter."

QUATERNIONS. The word quaternion properly means "a set of four." In employing such a word to denote a new mathematical method, Sir W. R. HAMILTON (*q.v.*) was probably influenced by the recollection of its Greek equivalent, the Pythagorean Tetractys, the mystic source of all things.

Quaternions (as a mathematical *method*) is an extension, or improvement, of Cartesian geometry, in which the artifices of coördinate axes, etc., are got rid of, *all* directions in space being treated on precisely the same terms. It is, therefore, except in some of its degraded forms, possessed of the perfect isotropy of Euclidian space.

From the purely geometrical point of view, a quaternion may be regarded as *the quotient of two directed lines in space*—or, what comes to the same thing, as *the factor, or operator, which changes one directed line into another*. Its analytical definition cannot be given here. This will be better understood by reference to a work on mathematics.

QUATREMÈRE, ÉTIENNE MARC, one of the most learned of modern Orientalists, was born in 1782. Employed in 1807 in the manuscript department of the imperial library, he passed to the chair of Greek in Ronen in 1809, entered the academy of inscriptions in 1815, taught Hebrew and Aramaic in the Collège de France from 1819, and finally in 1827 became professor of Persian in the School of Living Oriental Languages. He died in 1857.

QUEBEC, a province of Canada, in British North America, lying between 52° 30' and 45° N. latitude, and between 57° 7' and 79° 33' 20" W. longitude; and bounded on the north by Labrador and Hudson's Bay, on the east by Labrador and the Gulf of St. Lawrence, on the south by the Bay of Chaleurs, New Brunswick, and the States of Maine, New Hampshire, Vermont, and New York, and on the southwest and west by the river Ottawa and the Province of Ontario. Its length, from Lake Temiscamingue to Anse au Sablon in the

Straits of Belle Isle, is nearly 1,000 miles on a due east and west course, and from Lake Temiscamingue to Cape Gaspé it is 700 miles; its breadth is 300 miles, and the area 188,694 square miles (120,764,651 acres). The surface of the country is exceedingly varied and picturesque, embracing several ridges of mountains and lofty hills, diversified by numerous rivers, lakes, and forests. There are many islands of great fertility and beauty, cascades and falls of considerable height, and extensive tracts of cultivable land, rendering the scenery everywhere bold and striking. Mountain ranges extend from southwest to northeast, and run parallel to each other.

The whole country is exceptionally well watered, and abounds in numerous large rivers, bays, and lakes. The principal river is the ST. LAWRENCE (*q.v.*), which flows through the entire length of the province.

The principal lakes are Lake St. John, which possesses an area of 360 square miles; Lake Temiscamingue, 126 miles; St. Peter, Metapedia, Kempt, Megantic, Memphremagog, Pipmuakan, the northern part of Lake Champlain; Manouan, Grand Wayagamack, Asturagamicook, Piscatonque, Kakebonga, Mijizowaja, Keepawa, Papimonagace, Edward, Matawin, St. Louis, Massawipi, Pamusachiou, Graves, Grand, St. Francis, and hundreds of others of lesser note, and all stocked with fish. The chief bays along the coast are Chaleurs (in part), with its bold and precipitous cliffs; Malbaie, Mille Vaches, Ha Ha, etc. Quebec's principal islands are Anticosti, sterile and almost uninhabited; Bonaventure, an important fishing station to the east of Gaspé, and the Magdalen Islands, situated in the Gulf of St. Lawrence, about fifty miles north of Prince Edward Island. This group is inhabited by about 3,200 persons, mostly French fishermen. Other islands are the island of Montreal, St. Helen's, Jesus, the island of Orleans, twenty-two miles long, below Quebec; Grosse Isle, Isle aux Coudres, Hare, Bic Island—all in the St. Lawrence; and islands of Calumet and Allumette in the Ottawa River.

The climate of Quebec is variable. In winter the cold is generally steady, and the atmosphere is clear and bracing. The thermometer often registers 20° below zero. Snow lies on the ground from the end of November until the middle of April, affording good sleighing for five months of the year. The inhabitants enjoy with zest and spirit all the out-door sports common to the country, such as skating, curling, tobogganing, snow-shoeing, coasting, and sliding. In Montreal winter carnivals are held which attract from all parts of Canada and the United States thousands of spectators. Snow falls to a very great depth, and though the winds are often sharp they are not often raw or damp, nor is there any fog. The summer is warm and pleasant, and the extreme heat is indicated at 90°. The finest season of the year is the autumn, which lasts about six or eight weeks.

Vegetation develops rapidly in Quebec. Much of the country is well adapted for agricultural purposes, the soil being rich and loamy, and well suited for the growth of cereals, hay, and fruit crops, all of which ripen perfectly. Wheat, barley, oats, rye, flax, pulse, buckwheat, maize, potatoes, turnips, carrots, beets, parsnips, celery, and the various roots thrive well. The principal fruits are plums, apples, melons, grapes, strawberries, raspberries, blueberries, gooseberries, cranberries, currants, and cherries. Hay has always been considered a leading crop, and much of it is exported to the United States, where it finds a ready market. Farming is carried on extensively in the eastern townships, and in all parts of the country agriculture is prosecuted with more or less activity.

Dense forests cover enormous tracts of territory, and afford a principal means of revenue to the province, as well as a source of industry for the people. The chief trees are white and red pine, spruce, ash, elm, beech, birch, maple, butternut, black walnut, fir, poplar, cedar, oak, cherry, hickory, basswood, etc. Upwards of fourteen hundred varieties of plants may be found, of which two hundred possess medicinal virtues. Lumbering is extensively carried on, and large quantities of dressed lumber and square timber are annually shipped to England.

Shipbuilding, once a leading industry of the province, has fallen off considerably, steamships and iron vessels having superseded wooden ships in the carrying trade. Other industries are shingle-making, manufactures of wool and cloth, cheese and butter making, iron-working, sash, door, and blind factories, sugar-refining, boat-building, brewing and distilling, and the manufacture of edge tools, india-rubber goods, and boots and shoes.

Quebec derives great importance from its fisheries, which are extensive and valuable, particularly those of the St. Lawrence, which consist principally of cod, haddock, halibut, salmon, mackerel, shad, white fish, herrings, lobsters, and seals. In the lakes and rivers there are salmon, trout, and bass, and the sporting streams are among the best in the world. The right of fishing in inland waters belongs to the owners of the lands in front of or through which such waters flow. The Provincial Government holds a large number of ungranted lands bordering on rivers and lakes, and derives an income from the leasing of fishing privileges. A fish-breeding establishment is maintained by the Dominion Government at Tadousac, from which there are encouraging results.

Game is plentiful in Quebec, (wild duck, teal, wild geese, partridges, woodcocks, snipe, pigeons, plover, etc.) About 295 different birds exist. Of wild animals the principal are bears, wolves, cariboo, deer, lynxes, foxes, musk rats, minks, martens, squirrels, beavers, and hares.

Gold, iron, and copper ores abound in notable quantities. The former is found chiefly on the banks of the Chaudière in the county of Beauce. Copper is obtained in the eastern townships, and iron of superior quality abounds almost everywhere throughout the province. In some sections small quantities of lead are found.

Good wagon roads intersect the province wherever there is a settlement. Telegraphic lines are established throughout the province, each line of railway, besides the great roads, having special wires. The postal facilities are excellent, and regular mails penetrate every part. Railway communication is ample and extensive, the chief lines being the Grand Trunk, the Canadian Pacific, and the Intercolonial. The canal system is very complete, and commerce is greatly helped by the several waterways in operation. These are the Lachine Canal, extending from Montreal to Lake St. Louis; the Beauharnois Canal, uniting Lakes St. Francis and St. Louis; the Chambly Canal, uniting Lake Champlain with Richelieu river; and the Carillon and Grenville Canal.

The province is divided into sixty-three counties, with total area of 120,764,651 acres. The population was 1,191,516 in 1871; in 1881 it was 1,359,027 (in 1891 it had increased to 1,488,581). The prevailing religion is that of the Roman Catholic Church, of which there are seven dioceses, viz., the archdiocese of Quebec, and the diocese of Montreal, Three Rivers, St. Hyacinthe, Sherbrooke, Rimouski, and Chicoutimi. The Protestant dioceses are two in number—Quebec and Montreal.

The affairs of the province are administered by a lieutenant-governor, and an executive council composed

of six members with portfolios, assisted by a legislative assembly of sixty-five members, and a legislative council of twenty-four councilors. The latter hold their appointments for life, and the former are elected by the people every five years. The lieutenant-governor is appointed by the governor-general in council. Quebec returns to the Dominion House of Commons sixty-five representatives, and twenty-four appointees to the Dominion Senate.

QUEBEC, the ancient capital of Canada, and present capital of the province of Quebec, is situated on the northwest bank of the river St. Lawrence at its junction with the St. Charles, about 300 miles from the Gulf of St. Lawrence and 180 miles below Montreal, in  $46^{\circ} 49' 6''$  N. latitude and  $71^{\circ} 13' 45''$  W. longitude. It is the most picturesque and most strongly fortified city on the continent. The harbor of Quebec is spacious and capable of accommodating ships of the largest tonnage, and its docks and tidal basin, when completed, will rank among the most perfect works of the kind in the world. They are constructed of limestone and iron, and, including the graving dock on the Levis side of the river, will cost very nearly \$3,000,000. The harbor is protected toward the northeast by the island of Orleans, on either side of which there is an approach. The spring tides rise and fall about eighteen feet. Quebec is divided into upper and lower town—access to the former being obtained by a steep and winding street, several flights of narrow steps, and an elevator. In the lower town are situated the principal banks, merchants' offices, and wholesale and retail stores. The streets, with one or two exceptions, are narrow and irregular. In the upper town, where the streets are wider and well paved, are the better class of dwelling houses, the public buildings, most of the churches, the public walks and gardens, retail stores and small shops. To the west are the suburbs of St. John, St. Louis, and St. Roché. The latter occupies the lower plain, and is rapidly becoming a place of public importance. The other two suburbs are on the same level with the upper town. Southwest of St. John stretch the historic Plains of Abraham. On this battle-ground a column forty feet high has been erected to mark the spot where General Wolfe, in 1759, died victorious. In the governor's garden, which overlooks the St. Lawrence, is a stately monument sixty-five feet in height, which is dedicated to the memory of Wolfe and Montcalm. An iron pillar surmounted by a bronze statue, the gift of Prince Napoleon Bonaparte, stands on St. Foye road, and commemorates the achievements of the British and French troops in 1760. Four martello towers occupy commanding positions. A point of interest in the upper town is Dufferin Terrace, a magnificent promenade 1,400 feet long and 200 feet above the level of the river. Part of this terrace occupies the site of the old Château St. Louis, which was destroyed by fire in 1834. The view from the platform is very striking and beautiful. The Grand Battery also affords a fine prospect. Quebec was once the walled city of the north, but several of its ancient fortifications have been dismantled, and the old gates taken down. There are three gates now, instead of five as in former years, viz., St. Louis, Kent, and St. John's, each of which is very handsome and massive. Among the principal edifices are the parliamentary and departmental buildings—a stately pile situated on Grande Allée—the new court house now building, the post-office, custom-house, city hall, masonic hall, the Basilica, or Roman Catholic cathedral (an irregular cut-stone building 216 feet long by 180 feet wide, and containing many fine oil paintings), the archiepiscopal palace, the Anglican cathedral (a plain structure in the Roman style), the skating rink, and the hall of the Young Men's

Christian Association; four large markets supply the people with meat and country produce. There are eight Roman Catholic churches, five Church of England, two Presbyterian, one Methodist, one Baptist, one Lutheran, one Congregational, one Scandinavian, one French Protestant, and a Jewish synagogue, which is situated in the Masonic Hall. Laval University, which derives its name from the first bishop of Quebec, who founded in 1663 the seminary for the training of priests, is the principal educational establishment of the Roman Catholics. It was instituted in 1852 by a royal charter from Queen Victoria and a charter from Pope Pius IX. The building is large and spacious, and the university, which is held in high esteem, is well equipped with apparatus, a library of over 85,000 volumes, a museum, geological specimens, and a picture gallery. Laval has a strong staff of professors, lay and clerical, and the faculties are theology, law, medicine, and arts. In connection with this institution are the grand seminary founded in 1663, where theology is taught, and the minor seminary for literature and philosophy. Laval Normal and Model School, the Ursuline Convent—a very large establishment for the education of young ladies, founded in 1641—the Convent of the Good Shepherd, and several nunneries complete the list of Roman Catholic educational institutions. Morrin College (Presbyterian) was founded by Doctor Morrin, and is affiliated with M'Gill University. Other Protestant schools are the boys' high school, the girls' high school, a number of academies, and public and private schools, all in a state of efficiency. There is no free public library in the city, but the Literary and Historical Society—the oldest chartered institution of the kind in Canada, founded by Lord Dalhousie in 1824—the Canadian Institute, the Geographical Society, the Young Men's Christian Association, the Advocates' Library, and the Parliamentary Library have valuable collections of books. The principal benevolent institutions are the marine hospital, the Hôtel Dieu, founded in 1639 by the duchess of Aiguillon, the general hospital (1693), the Finlay Asylum, the Jeffrey Hale Hospital, the Church of England Female Orphans' Asylum, the Ladies' Protestant Home, St. Bridget's Asylum, Grey Nunnery, and the lunatic asylum at Beauport. Nine daily newspapers are published at Quebec, six of which are in the French language. A good supply of water is afforded from Lake St. Charles, but the city has suffered so severely from devastating fires in the past that in 1883 the common council ordered an additional pipe to be laid at a cost of half a million of dollars. Quebec is well lighted with gas and the electric light. Connection is had with all parts of Canada and the United States by several railway lines, and the city is at the head of ocean steamship navigation to Europe. There are two lines of street cars. The head offices of three banks are situated in Quebec, viz., the Quebec Bank, the Union Bank of Lower Canada, and La Banque Nationale. Besides these there are two savings banks, the Post Office Savings Bank, and the agencies of the Bank of Montreal, the Bank of British North America, and the Merchants' Bank. The population of the city in 1871 was 59,699; in 1881, 62,446; in 1891, 63,090.

QUEDAH or KEDAH. See MALAY PENINSULA.

QUEDLINBURG, an ancient town of Prussian Saxony, in the district of Magdeburg, is pleasantly situated on the Bode, near the northwest base of the Harz Mountains. It is still partly surrounded by a turreted wall. The population in 1885 was 19,323, almost all Protestants.

QUEEN ANNE'S BOUNTY is the name applied to a perpetual fund of the first-fruits and tenths granted by a charter of Queen Anne, and confirmed by statute in

1703, for the augmentation of the livings of the poorer Anglican clergy.

QUEEN CHARLOTTE ISLANDS, a group of islands lying off the west coast of British Columbia, to which they belong. They were so called by Captain Dixon, who visited them in the "Queen Charlotte" in 1787, and spent more than a month on the coasts. They are composed of two chief islands, Graham Island to the north and Moresby Island to the south, separated by a very narrow channel; but around these, especially in the south, are innumerable smaller islands. The whole group has the form of a wedge with the point toward the south. The extreme length is about 180 miles, and the greatest breadth sixty miles. The total area cannot be determined, as the longitude of the west coast has not yet been definitely ascertained.

QUEENSBERRY, JAMES DOUGLAS, SECOND DUKE OF, was born at Sanquhar Castle, Scotland, December 18, 1662, and educated at the university of Glasgow, after which he spent some time in foreign travel. He sided with the prince of Orange at the Revolution. In recognition of his services he received a pension of \$3,000 per annum, and on May 26, 1708, was created a British peer by the title of duke of Dover. On February 9, 1709, he was appointed third secretary of state. He died July 6, 1711.

QUEEN'S COUNTY, an inland county in the province of Leinster, Ireland, is bounded northwest and north by King's county, east by Kildare and a detached portion of King's county, south by Carlow and Kilkenny, and west by Tipperary. Its greatest length from east to west is about thirty-five miles, and its greatest breadth from north to south about thirty miles. The area is 424,854 acres, or about 663 square miles.

*Agriculture.*—The climate is dry and salubrious. Originally a great extent of the surface was occupied with bog, but by draining much of it has been converted into good land. For the most part it is very fertile except in the hilly districts toward the north, and there is some remarkably rich land in the southeast.

Agriculture forms the chief occupation, but the manufacture of woolen and cotton goods is carried on to a small extent.

*Administration.*—The county is divided into eleven baronies, and contains 53 parishes and 1,156 townlands.

*Population.*—Within the last forty years the population has diminished by more than one-half. In 1841 it numbered 153,930, which in 1871 had diminished to 79,765, and in 1891 to 64,639. The following were the largest towns:—Mountmellick (3,126), Maryborough (2,872), Portarlinton (partly in King's county) (2,357), and Mountrath (1,865).

QUEENSLAND, a British colony, the northeastern portion of Australia, is situated between New South Wales and Torres Strait, and between the Pacific Ocean and the Northern Territory of South Australia. Its southern boundary is about 29° S. latitude, its western is 141° E. longitude, from 29° to 26° S. latitude, and 138° E. thence to the Gulf of Carpentaria; its northern is about 9° S. including the Torres Straits islands. In extreme length it is 1,400 miles; in breadth, 1,000. Its area is 669,520 square miles, or about five and one-half times that of the United Kingdom.

*Minerals.*—Gold is found in alluvial deposits and in quartz veins. The most important of the former were near the northern Palmer river, but auriferous quartz now almost monopolizes the digger's attention. The recognized gold workings are over 7,000 square miles. Gold is often found mixed with silver, copper, or lead.

*Agriculture.*—Until the last few years little cultivation was to be seen. Labor was supposed to pay better

in other employments. Still there can be grown in Queensland corn of all varieties, hay, English vegetables, sweet potatoes, melons, cassava, cocoa, indigo, arrow-root, ginger, coffee, rice, tobacco, cotton, spices, cinchona, cocoa-nut, bread-fruit, and sugar-cane, with the fruits of England, India, and China. Lucerne is much grown for stud stock, where winter food is needed. Bananas, oranges, grapes, pine-apples, mangoes, guavas, tamarinds, and dates thrive well. Coffee is being extensively produced.

Pastoral farming is still the leading industry of the colony, and is rapidly extending over all districts.

*Administration.*—The governor is appointed by the queen. The executive council has eight members, the legislative council thirty-three, and the assembly fifty-five. The term of parliament is five years.

*Population.*—The estimated population in 1890 was 406,658, males largely predominating.

*History.*—The Portuguese may have known the northern shore nearly a century before Torres, in 1605, sailed through the strait since called after him, or before the Dutch landed in the Gulf of Carpentaria. Captain Cook passed along the eastern coast in 1770, taking possession of the country as New South Wales. Flinders visited Moreton Bay in 1802. Oxley was on the Brisbane in 1823, and Allan Cunningham on Darling Downs in 1827. Sir T. L. Mitchell in 1846–7 made known the Maranoa, Warrego, and Barcoo districts. Leichhardt in 1845–7 traversed the coast country, going round the gulf to Port Essington, but was lost in his third great journey. Kennedy followed down the Barcoo, but was killed by the blacks while exploring York Peninsula. Burke and Willis crossed western Queensland in 1860. Landesborough, Walker, M'Kinlay, Hann, Jack, Hodgkinson, and Favence continued the researches. Squatters and miners have opened new regions. Before its separation in 1859 the country was known as the Moreton Bay district of New South Wales. A desire to form fresh penal depots led to the discovery of Brisbane river in December, 1823, and the proclamation of a penal settlement there in August, 1826. The convict population was gradually withdrawn again to Sidney, and the place was declared open to free persons only in 1842. The first land sale in Brisbane was on August 9, 1843. An attempt was made in 1846, under the ministry of Sir James Graham and Mr. Gladstone, to establish at Gladstone on Port Curtis the colony of North Australia for ticket-of-leave men from Britain and Van Diemen's Land. Earl Grey's Government under strong colonial appeals arrested this policy, and broke up the convict settlement. In 1841 there were 176 males and 24 females; in 1844, 540 in all; in 1846, 1,867. In 1834 the governor and the English rulers thought it necessary to abandon Moreton Bay altogether, but the order was withheld. The first stock belonged wholly to the colonial Government, but flocks and herds of settlers came on the Darling Downs in 1841. In 1844 there were 17 squatting stations round Moreton Bay and 26 in Darling Downs, having 13,295 cattle and 184,651 sheep. In 1849 there were 2,812 horses, 72,096 cattle, and 1,077,983 sheep. But there were few persons in Brisbane and Ipswich. The Rev. Dr. Lang then began his agitation in England on behalf of this northern district. Some settlers, who sought a separation from New South Wales, offered to accept British convicts if the ministry granted independence. In answer to their memorial a shipload of ticket-of-leave men was sent in 1850. In spite of the objection of Sydney, the Moreton Bay district was proclaimed the colony of Queensland on December 10, 1859. The population was then about 20,000, and the revenue £6,475. Little trade, no manufactures, wretched roads,

defective wharfage, struggling townships, and poor schools marked that epoch. Political liberty occasioned a general advance. The first parliament, with the ministry of Mr. (now Sir R. G. W.) Herbert, organized a good school system, carried an effective land bill, and established real religious equality. While the pastoral interest rapidly grew, the agricultural and trading classes got firm footing. The revelation of gold and copper treasures increased the prosperity. But a reaction followed; wool prices fell, cotton-growing ceased, early sugar-cane efforts failed and trouble succeeded excessive speculation in land and mines. A steady application to legitimate pursuits, however, soon restored confidence; and the colony as its resources have gradually developed, has continued to advance and prosper.

QUEENSTOWN, formerly COVE OF CORK, a market town and seaport in the county of Cork, Ireland, is picturesquely situated, thirteen miles east-southeast of Cork, on the south side of Great Island, on the slope of an eminence rising somewhat abruptly above the inner Cork harbor. It consists chiefly of terraces, rising above each other, and inhabited by the wealthier classes. On account of the mildness of the climate it is much frequented by valetudinarians in winter. Previous to the American War the Cove of Cork was a very small fishing village, but within the last fifty years it has rapidly increased. It received its present name on the occasion of the visit of Queen Victoria in 1849. The harbor, which is four miles long by two broad, and is defended by the Carlisle and Camden Forts at its entrance, and by Fort Westmoreland on Spike Island, can afford shelter to a very large fleet of vessels. The port is the calling station for the American mail steamers. The population of Queenstown in 1871 was 10,334, and in 1891 it was 9,123.

QUERCITRON is a yellow dye-stuff obtained from the bark of the quercitron oak, *Quercus tinctoria*. The tree is a native of the United States, but is now also cultivated in France and South Germany. The dye-stuff is prepared by grinding the bark in mills after it has been freed from its black epidermal layer, and sifting the product to separate the fibrous matter, the fine yellow powder which remains forming the quercitron of commerce. The ruddy-orange decoction of quercitron contains quercitannic acid and an active dyeing principle, quercitrin. The latter substance is a glucoside, and in aqueous solution under the influence of sulphuric acid it splits up into a rich tinctorial principle, quercetin, and a variety of sugar called isodulcite.

QUERÉTARO, a city of Mexico, capital of the state of the same name, lies on a plateau 5,900 feet above the sea, 152½ miles northwest of Mexico by the Central Mexican Railway. The population of the city (1892) is 36,000.

Querétaro was captured by the Spaniards in 1536, and made a city in 1655. In 1848 it was the seat of a congress by which peace between Mexico and the United States was ratified, and in 1867 the emperor Maximilian, unable to hold it against the republicans under Escobedo, was made prisoner and shot on the Cerro de las Campanas to the north of the town.

QUERN. See FLOUR.

QUESNAY, FRANÇOIS, was one of the most eminent economists of the eighteenth century. He was born at Mérey, near the village of Montfort l'Amaury, about twenty-eight miles from Paris, on June 4, 1694. He died in 1774, having lived long enough to see his great pupil, Turgot, in office as minister of finance. Quesnay had married in 1718, and had a son and a daughter; his grandson by the former was a member of the first Legislative Assembly.

**QUESNEL, PASQUIER**, Roman Catholic theologian, was born in Paris on July 14, 1634, and, after graduating in the Sorbonne with distinction in 1653, joined the Congregation of the Fathers of the Oratory in 1657, receiving priest's orders in 1659. Quesnel died at Amsterdam on December 2, 1719. A complete list of his works is given by Moreri.

**QUETELET, LAMBERT ADOLPHE JACQUES**, astronomer, meteorologist, and statistician, was born at Ghent, February 22, 1796, and educated at the lyceum of that town. From 1834 he was perpetual secretary of the Brussels Academy, and published a vast number of articles in its *Bulletin*, as also in his journal *Correspondence Mathématique et Physique* (eleven vols., 1825-39). He died on February 17, 1874.

**QUETTA**, a valley in Baluchistan, and the most northern district in the province. It embraces an area of about ninety square miles, and is situated near the Afghan frontier. The town of Quetta is surrounded by a mud wall; in its center, on an artificial mound, is a fort which commands a very fine and extensive view of the neighboring valley.

**QUEVEDO VILLEGAS, FRANCISCO**, the greatest satiric writer of Spain, was born in 1580 at Madrid. As a satirist and humorist Quevedo stands in the first rank of Spanish writers; his other literary work does not count for much. His style indeed is not absolutely pure, and already belongs to the period of decadence. Quevedo, who ridiculed so well the bad taste of "cultism," fell himself into another fault and created the style called "conceptism," which hunts after ambiguous expressions and "double entendres." But though involved and overcharged with ideas, his style is of singular force and originality; after Cervantes he is the greatest Spanish writer of the seventeenth century. He died September 8, 1645.

**QUEZAL**, or **QUESAL**, the Spanish-American name for one of the most beautiful of birds, abbreviated from the Aztec or Maya *Quetzal-totoll*, the last part of the compound word meaning fowl, and the first, also written *Cuetzal*, the long feathers of rich green with which it is adorned. The Quetzal is one of the **TROGONS**, and was originally described by Hernandez, whose account was faithfully copied by Willughby.

The Quetzal is hardly as big as a turtle-dove. The cock has a fine yellow bill and a head bearing a rounded crest of filamentous feathers; lanceolate scapulars overhang the wings, and from the rump spring the long flowing plumes which are so characteristic of the species, and were so highly prized by the natives prior to the Spanish conquest that no one was allowed to kill the bird when taken, but only to divest it of its feathers, which were to be worn by the chiefs alone. These plumes, the middle and longest of which may measure from three feet to three feet and a half, with the upper surface, the throat, and chest are of a resplendent golden-green, while the lower parts are of a vivid scarlet. The middle feathers of the tail, ordinarily concealed, as are those of the Peacock, by the uropygials, are black, and the outer white with a black base. In the hen the bill is black, the crest more round and not filamentous, the uropygials scarcely elongated, and the vent only scarlet. The eyes are of a yellowish-brown.

**QUEZALTENANGO**, a city of Guatemala, capital of the province of its own name, lies on the Sigüila in a fertile district about twenty-five or thirty miles to the west of Lake Atitlan, on the high road between the city of Guatemala and the Mexican province of Chiapas. It has a cathedral and other public buildings, carries on the manufacture of cotton and wool, and contains from 20,000 to 30,000 inhabitants, mostly Indians.

**QUIETISM**, a peculiar form of **MYSTICISM** (*q.v.*) within the modern Catholic Church, mainly associated with the names of Madame **GUYON** and **MIGUEL DE MOLINOS**, (*q.v.*) See also **FÉNELON**.

**QUILIMANE**, or **KILIMANE** (the former being the Portuguese spelling), a Portuguese town on the east coast of Africa, at the head of a district of the province of Mozambique, lies twelve miles inland from the mouth of the river Quilimane or Qua Qua. The whole site is low and unhealthy, and the Portuguese have done next to nothing to improve it. The total population is between 6,000 and 7,000.

**QUILL**. See **FEATHERS** and **PEN**.

**QUILLOTA**, a town of Chili, at the head of a district in the province of Valparaiso, lies thirty miles by rail northeast of Valparaiso, on the south or left bank of the Aconcagua, about twenty miles from its mouth. It is one of the oldest towns in the country, and since the opening of the railway in 1863 it has grown so that in population (13,000 in 1890) it is exceeded only by the capital and six other towns. It is famous for the quality of its chirimoyas (*Anona Cherimolia*) and lucumas; and in the neighborhood there are rich copper mines. In 1822 and 1851 it suffered from earthquakes.

**QUILON**, a seaport town in Quilon district, Travancore state, Madras presidency, India, between the towns of Trevandrum and Aleppi, in 8° 54' N. latitude and 76° 37' E. longitude. It is a healthy town, and contained in 1881 a population of 13,588.

**QUIMPER**, or **QUIMPER-CORENTIN**, a town of France, formerly the capital of the county of Cornouailles, and now the chief town of the department of Finistère, is situated 158 miles northwest of Nantes and 68 miles southeast of Brest on the railway between those towns. With its communal population of 17,171, Quimper ranks in Finistere next to Brest and Morlaix.

**QUINAULT, PHILIPPE**, a dramatist of merit, and the only European writer who made the opera libretto a work of literature, was born at Paris on June 3, 1635. He died on November 26, 1688.

**QUINCE**. The common quince is a native of Persia and Anatolia, and perhaps also of Greece and the Crimea, but in these latter localities it is doubtful whether or not the plant is not a relic of former cultivation. The fragrance and astringency of the fruit of the quince are well known, and the seeds are used medicinally for the sake of the mucilage they yield when soaked in water, a peculiarity which is not met with in pears. This mucilage is analogous to, and has the same properties as, that which is formed from the seeds of linseed. The common quince and its varieties are very largely used as "dwarfing" stocks on which choice pears are engrafted. The effect is to restrain the growth of the pear, increase and hasten its fruitfulness, and enable it to withstand the effects of cold. The common Japan quince, *Pyrus* or *Cydonia japonica*, is grown in gardens for the sake of its flowers, which vary in color from creamy white to rich red, and are produced during the winter and early spring months. *C. Maulei*, a recently introduced shrub from Japan, bears a profusion of equally beautiful orange-red flowers, which are followed by fruit of a yellow color and agreeable fragrance, so that, when cooked with sugar, it forms an agreeable conserve, as in the case of the ordinary quince. The fruit of the ordinary Japan quince is quite uneatable.

**QUINCY**, a city of the United States, the county seat of Adams county, Ill., occupies a limestone bluff 125 feet above low-water mark on the east bank of the Mississippi at the extreme western point of the State. The river is crossed here by the great bridge of the Hannibal and St. Joseph Railroad. Quincy Bay, an arm

of the river, is the finest natural harbor for steamboats on the upper Mississippi. By water Quincy is 160 miles above St. Louis, and by rail 263 miles southwest of Chicago *via* Galesburg. Commanding an extensive view, being well built, having excellent waterworks, and forming an important center in the railway system of the region, Quincy is both an attractive and a prosperous place, with very miscellaneous industries. Among the public buildings are the court-houses, St. John's cathedral (1877), a medical college (1873), a city library, and several hospitals and asylums. The population in 1860 was 13,718; in 1870, 24,052 (1,073 colored); in 1880, 27,268 (1,508 colored) and in 1890, 31,494. Laid out in 1825 or about three years after the arrival of the first white settler, Quincy was made a town in 1834, and a city in 1839.

QUINCY, a township and seaport of the United States, in Norfolk county, Mass., on a small bay of its own name in the south of Massachusetts Bay and seven miles south-southeast of Boston by rail. It is best known for its great granite quarries, in connection with which was constructed in 1827 the first (horse) railway in the United States, and as the birthplace of Gov. John Hancock and Presidents John Adams and John Quincy Adams. Among the principal buildings—chiefly situated in the village, which lies on an elevated plain near the center of the township—are the granite town-house, the so-called Adams Temple (a church erected in 1828), beneath the portico of which are the tombs of the two Presidents Adams, the Adams Academy, a home for infirm sailors, a public library, and the mansions of the Quincy and Adams families, whose estates occupied the greater portion of the township. Quincy, which till 1792 formed part of Braintree, had 5,017 inhabitants in 1850, 6,779 in 1860, 7,442 in 1870, 10,570 in 1880, and 16,723 in 1890.

QUINCY, JOSIAH, JR., born in Boston, Mass., 1744, is the most eminent of a well-known family whose founder emigrated to New England in 1633. At the time of his death, at the age of thirty-one, he had won distinction as a lawyer, and his place was secured in history as among the most eloquent, the most clear-sighted, and the most devoted of the men who led the American colonists in the measures preliminary to the revolution. In 1770 he wrote *An Address of the Merchants, Traders and Freeholders of Boston* in favor of a non-importation Act, asserting, about the same time, in a newspaper article, that Americans would "know, resume, assert, and defend their rights" by the "arts of war" if the "arts of policy" should fail. In December, 1773, he took an active and leading part in the town-meeting which virtually ordered the destruction of the cargoes of the tea-ships in Boston harbor. He sailed a few months afterward for England with the approval of the leading revolutionists, to present, though unofficially, to the ministry and other public men, the grievances and the determination of the colonists. After six months failing health—he had long been threatened with consumption—compelled him to return home, and he died on shipboard as the vessel was entering the harbor of Gloucester, Mass., April 26, 1775.

QUINET, EDGAR, eminent French author and politician, was born at Bourg-en-Bresse, in the department of the Ain, France, on February 17, 1803.

As a writer his chief fault is want of concentration, as a thinker and politician vagueness and want of practical determination. His work is very extensive and abounds in passages of great beauty. But no single book of his can be called a masterpiece, and none is of such a kind that the reader feels the subject to have been thoroughly treated in accordance with a definite

and consistent principle or series of principles. As a politician he acted with the extreme Radicals, yet universal suffrage, the cardinal doctrine of Radicalism, disgusted him as unreasonable in its principle and dangerous in its results. He continued to write till his death, which occurred at Versailles on March 27, 1875.

QUININE, the most important of the active principles contained in cinchona bark. The quinine of commerce is the neutral sulphate, containing seven and one-half molecules of water of crystallization. When crystallized from alcohol, or when dried over sulphuric acid, it contains only two molecules.

Two other sulphates are known. The one contains a single equivalent of acid, and in commerce bears the name of acid sulphate or soluble sulphate of quinine; it is soluble in eleven parts of water, but with considerable difficulty in absolute alcohol. The other sulphate contains two equivalents of sulphuric acid, is very soluble in cold water, but quite insoluble in ether; it is not an article of commerce. Both these sulphates crystallize with seven molecules of water.

Although quinine is manufactured in the United States, a large portion has been imported from Europe since the high duty levied on its manufacture has been removed. There is considerable difficulty in obtaining trustworthy statistics as to the extent of the manufacture of quinine. The largest sale that has taken place in America appears to have been in 1883, when 1½ tons were put up to auction, and in the same year 16,000 ounces were sold in London and a similar quantity at Berlin.

*Physiological Action.*—Quinine arrests the movements of the white corpuscles of the blood, rendering them round and darkly granulate, and, by preventing them from making their exit from the blood-vessels, diminishes or arrests the formation of pus in inflammation and causes contraction of the spleen when that organ is enlarged. It acts upon the cerebro-spinal nervous system giving rise to headache and a sense of tension in the brain; these symptoms may be removed by the addition of hydrobromic acid or prevented by the use of the hydrobromide of quinine. It acts through the sympathetic nervous system on the heart, and is thus capable of restraining all the animal processes which develop heat, organic changes, or muscular action. It is antagonistic to atropine in its physiological action.

The use of quinine in medicine dates from its discovery in 1820. Its chief value is as an antiperiodic, especially in intermittent fevers, but also in other diseases, when they assume a periodic character, such as neuralgia, asthma, hooping cough, etc. In blood poisoning, whether arising from natural or traumatic causes, it has been found of great utility. Its curative powers in sunstroke have been repeatedly proved in the East Indies, and a dose of quinine will often cut short an attack of catarrh if taken in the early stage. In malarial districts persons have been exposed to miasmatic influence without danger after taking a dose or two of five grains of quinine once or twice a day. In the smallest medicinal doses it is purely tonic, in larger ones stimulant; but it differs from other medicines of the same class in the stimulant action being longer sustained. In larger doses it acts as a sedative, and in excessive doses it is poisonous. In some individuals it produces an erythematous eruption, and it is also known to act as an oxytocic. Large doses also sometimes produce deafness, and act injuriously in all inflammatory states of the mucous membrane.

The other alkaloids of cinchona bark—quinidine, cinchonidine, and cinchonine—also possess similar properties, quinidine being even more effectual than quinine; but cinchonine appears to produce nausea and

gastric disturbance. This is also the case with the cinchona febrifuge prepared from *C. succirubra*.

QUINSY. See TONSILITIS.

QUINTANA, MANUEL JOSÉ, Spanish poet and man of letters, was born at Madrid on April 11, 1772, and died at Madrid on March 11, 1857.

QUINTILIAN (M. FABIVS QUINTILIANVS) was born in the obscure Spanish town of Calagurris (Calahorra), on the Ebro, in the country of the Vacones, not later than 35 A.D. His father taught rhetoric, with no great success, at Rome, and Quintilian must have come there at an early age to reside, and must have there grown up to manhood. The years from sixty-one to sixty-eight he spent in Spain, probably attached in some capacity to the retinue of the future emperor Galba, with whom he returned to the capital. For at least twenty years after the accession of Galba he was at the head of the foremost school of oratory in Rome, and may fairly be called the Isocrates of his time. He also gained some, but not a great, repute as a pleader in the courts. For a member of a learned profession his circumstances were easy. Vespasian created for him a professorial chair of rhetoric, liberally endowed with public money, and from this time he was unquestionably, as Martial calls him, "the supreme controller of the restless youth." About the year 88 Quintilian retired from teaching and from pleading, to compose his great work on the training of the orator (*Institutio Oratoria*). After two years' retirement he was intrusted by Domitian with the education of two grand-nephews, whom he destined as successors to his throne. Quintilian gained the titular rank of consul, and probably died not long before the accession of Nerva, (96 A.D.)

QUINTUS SMYRNÆVS, a late epic poet of Greece, sometimes called Quintus Calaber because his poem was discovered at Otranto in Calabria. Next to nothing is known of him. He appears to have lived in the latter part of the fourth century, shortly before Nonnus.

QUITO, the capital of the republic of Ecuador, South America, an archbishopric, and the chief town of a department, lies 14' of latitude south of the equator, and in 79° 45' W. longitude, at a height of 9,520 feet above the sea. The houses, mostly of sun-dried brick, are usually low and squat, and not a chimney is to be seen. The public buildings are also of a massive and heavy looking Spanish type. In the principal square are the cathedral, with a fine marble porch, the government house, with a colonnade running the whole length

of the façade, and the palace of the nuncio. But the finest building in Quito is the college of the Jesuits, part of which is occupied by the university, an institution long rendered interesting to Englishmen by the presence of the venerable botanist, Dr. William Jameson. There is a public library in the city of 20,000 volumes, and a polytechnic school was instituted in 1872. The local manufactures are confined to coarse cotton and woolen stuffs, thread, lace, hosiery, silk, and a certain amount of jewelry. About 1870 the population was estimated by Doctor Jameson at between 30,000 and 40,000; it is now (1892) said to exceed 50,000.

QUOITS. This pastime resembles the ancient discus-throwing which formed one of the five games of the Greek pentathlon. The modern quoit, however, is a far lighter missile, and consists of a circular iron ring to be thrown or pitched in play at a fixed object. This ring is flattened, having a thick inner edge and thin outer one. The latter is slightly indented at a given spot to receive the tip of the player's forefinger without cutting it. There is no limit to the weight of a quoit, but this should be specified before commencing a match. The diameter is restricted to eight inches over all. Two iron pins, called "hubs," are driven into the ground at a certain distance apart, generally nineteen yards. There may be one or more players a side, and each has two quoits. These he may throw successively; or else each player throws one only at a time and a second round follows in the same order, as may have been agreed on. The throwing takes place the reverse way after each round. Each player attempts to make his quoit pitch on the hub or pin so that the head of the latter passes through the circular opening in the center of the missile. Such a success is termed a "ringer," and two is scored. Quoits of opposite sides alighting equidistant from the pin do not score at all. If a player has both his quoits nearer the pin than any of his opponents he scores two; while if only one be nearer he is entitled to count one to his credit.

QUO WARRANTO, in English law, is the name given to an ancient prerogative writ calling upon any person usurping any office, franchise, liberty, or privilege belonging to the crown to show "by what warrant" he maintained his claim. It lay also for non-user or misuser of an office, etc. If the crown succeeded, judgment of forfeiture or ouster was given against the defendant.

## R.

**R** was written in Greek originally as P, following the Phœnician form; sometimes, however, a triangle takes the place of the semicircle; not frequently also a short stroke appears where we have the lower limb on the right hand; the reason of this addition is not plain: it can hardly have been a diacritical mark to distinguish R from P (as G from C at Rome) because the latter symbol in Greece always kept its two vertical lines (Ϝ), the curved line (P) appearing first in the Roman alphabet.

The sounds denoted by the same symbol *r* differ considerably. First, there is the true consonantal *r*—our English *r* in *reed*, etc.—produced by raising the tip only of the tongue toward the front palate; the voice escapes by this aperture, the side passages between the tongue and the palate being closed; the mechanism, therefore, is just the opposite to that which produces *l* (see letter L). Secondly, there is the vowel *r*; this is due to the space between the tip of the tongue and the palate being sufficiently great to allow the voice to escape without any friction; the difference between this and consonantal *r* is parallel to that between *u* and *w*, or between *i* and *y*. This vowel-sound, though not heard regularly in any modern language, is not infrequent in several in certain combinations; for example, it is quite possible to articulate “father” as “fath-*r*,” where the *r* alone forms a syllable and is therefore vocalic. This vowel-sound was a regular sound in Sanskrit, and was probably also heard in the parent language; but in the derived languages (except Sanskrit) it became consonantal *r* with an independent vowel preceding or following; thus a presumed original “krd” (=heart), where *r* denotes the vocalic *r*, gave in Sanskrit “hrd,” in Greek *κρᾶδ-ίη*, in Latin “cor(d).” Thirdly, *r* may denote a trill,—that is to say, a sound produced by the vibration of the tongue when laid loosely against the palate and set in motion by a strong current of breath or voice. When the point of the tongue is laid loosely in this way against the palate just behind the gums and made to trill as voice passes over it, we hear the Scotch and the French *r*, each of which is a trill, not a consonantal *r*. The same sound, but unvoiced, is heard in the French “théâtre,” etc., and is also the Welsh *rh*. A similar trill at the back part of the palate gives the Northumbrian “burr.”

RAAB (Hungarian *Γγῶρ*), the capital of an Hungarian province of the same name, lies at the influx of the Raab into a branch of the Danube, seventy miles to the southeast of Vienna. The inhabitants, who numbered 20,980 in 1880, manufacture cloth and tobacco, and carry on a considerable trade in grain and horses.

RAB, RABBI, RABBAN, RABBONI, RABBENU, Jewish titles of honor. *Rab* (רב), “lord,” “master,” “teacher,” is the title prefixed to the name of such a Babylonian teacher of the Law or expounder of the Mishnah as, though authorized to “judge” and to decide other religious questions, has not been ordained, or fully ordained, in Palestine. *Rabbi* (רבי, ῥαββεί.

Matt. xxiii. 7, etc.), “my teacher,” is the title of a teacher fully ordained in Palestine. *Rabbān*, “our teacher,” or “our lord,” but also “their,” *i.e.*, all Israel’s teacher (רבִּין, later form of רַבִּים), was the title of the prince (president of the synedrium) from the time of Gamliel I. (the Gamaliel of St. Paul) and onward.

RAB, when the title is not followed by an individual name, denotes *par excellence* Abbā Arēkhā (Arikha), so called either from the place Arēkhā in Babylonia, or because of his high stature, or his eminence as a man and scholar. Abbā Arēkhā was the most successful teacher of the Law and interpreter of the Mishnah in Babylonia.

RABBI, when the title is not followed by a proper name, denotes *par excellence* Rabbi Yehudah Hannasi, the principal editor of the Mishnah.

The Hellenistic RABBONI (ῥαββουνει, John xx. 16) is the Aramaic *ribboni* used by a slave of his master, a son of his father, a wife of her husband, a worshiper of his God. (Compare the similar variation of the vowel in pisho = πᾶσχα.)

RABBENU signifies “our teacher” *par excellence*, and means in Palestine R. Yehudah Hannasi, and in Babylonia Rab (*i.e.*, Abbā Arēkhā).

RABA (ROBO)—*i.e.*, RAB ABA B. YOSEPH B. HAMA (Hōmō)—was, like his teacher Rabbāh and his fellow-pupil Abayye, a scion of the house of Eli, on whom rested the double curse of poverty and that none of them should reach old age. According to T. B., *Rosh Hasshanah*, 18a, he sought to remove this curse, if not by sacrifices and offering, then by the study of the Law, while Abayye also practiced works of charity. Rābā was rabbi and judge of the congregation and head of the school (*methibtā*) of Mahūzā. He lived in the middle of the fourth Christian century, and became on the death of his fellow-pupil Abayye head of the famous academy of Pumbadithā, which was only closed in 1040. He was noted, like his predecessor, for his genius.

RABAD (רַבֵּב). Under this abbreviation five Jewish scholars are known, all of whom, singularly enough, lived during the twelfth century.

I. RAB AB-BETH-DIN, *i.e.*, the chief rabbi *par excellence*. His real name was R. Abraham b. Yishak of Narbonne. He was the teacher of the most distinguished rabbis of Provence.

II. R. ABRAHAM B. DAVID (Dāūd, רַבֵּב) HALLEVI of Toledo, the historiographer, who suffered martyrdom in 1180. His chief-work has been printed innumerable times, and repeatedly with historical additions from earlier sources.

III. R. ABRAHAM B. DAVID, disciple and son-in-law of Rabad I. This is the “great Rabbi of Posquières,” the only opponent whom Maimonides thought a match for himself. He died in 1198.

IV. R. ABRAHAM B. DAVID, author of the commentary on the *Sepher Yesirah*. His commentary has been printed innumerable times with the work itself,

the *editio princeps* at Mantua in 1562, 4to. Part of its preface was done in Latin by Rittangelius, (Amsterdam, 1642, 4to.)

V. R. ABRAHAM B. DAVID. He wrote *Strictures (Hassagoth)* on Rashi on the Pentateuch. This little and most interesting book was either written by a Sepharadi or Provençal, and lies in MS. (Add., 377, 3, 1) in the Cambridge University Library. No other copy is known.

RABAN (רַבָּאֵן)—*i.e.*, RABBENU ELI'EZER B. NATHAN of Mainz—was one of the most famous Halakhic teachers of the twelfth century. He lived at Mainz and corresponded with Rashi's son-in-law, Rabbenu Meir b. Shemuel, and his three distinguished sons, RASHBAM (*q.v.*), Ribam (R. Yishak b. Meir) and Rabbenu Tham (R. Ya'akob). His great Halakhic work, *צפנת פענח*, or *סבן העזר*, is commonly called by the combination of the author's initials which heads this article, the Book of Rābān, and was printed at Prague in 1610 fol.

RABANUS MAURUS. See HRABANUS MAURUS.

RABĀT. (RIBĀT,) RBĀT, or ARBĀT, also known as NEW SALLEE, a city of Morocco, on the coast of the Atlantic, 130 miles south of Cape Spartel at the mouth of the Bú Rakrak, which separates it from Sallee proper on the northern bank. It is a commercial town of about 26,000 to 30,000 inhabitants, occupying a rocky plateau and surrounded by massive but dilapidated walls, strengthened by three forts on the seaward side.

RABBA, a town of Nupi or Nufi, on the bank of the Kworra (Niger), opposite the island of Zagozhi, in 9° 6' N. latitude and 200 miles above the confluence of the Kworra and the Binue. At the time of Lander's visit in 1830 it was a place of 40,000 inhabitants and one of the most important markets in the country. In 1851 Dr. Barth reported it "in ruins," and in 1867 Rohlf found it with only 500 inhabitants.

RABBAH—*i.e.*, RAB ABBAH BAR NAHMANI—was of the house of Eli, on whom the curse rested that none of them should reach a high age. Like Rābā, he tried to remove this curse (T. B., *Rosh Hasshanah*, 18a; see RABA). He was twenty-two years head of the academy of Pumbadithā, from which he fled in the year 330, pursued by a troop of the Persian king (Shāpūr II.), and perished miserably in a jungle (T. B., *Bobo Mets'io*, leaf 86a).

RABBI. See RAB.

RABBIT. This animal is, with the hare, a member of the Rodent genus *Lepus*, which contains about twenty-five other species spread over the greater part of the world, and whose more important characters have already been referred to.

The rabbit (*Lepus cuniculus*), speaking for the present of the wild race only, is distinguished from the hare externally by its smaller size, shorter ears and feet, by the absence or reduction of the black patch at the tip of the ears so characteristic of the hare, and by its grayer color. The skull is very similar to that of the hare, but is smaller and lighter, and has a slenderer muzzle and a longer and narrower palate. Besides these characteristics, however, the rabbit is sharply separated from the hare by the fact that it brings forth its young naked, blind, and helpless; to compensate for this, it digs a deep burrow in the earth in which they are born and reared, while the young of the hare are born fully clothed with fur, and able to take care of themselves in the mere shallow depression or "form" in which they are born. The weight of the rabbit is from 2½ to 3 pounds, although individuals perfectly wild have been recorded up to more than 5. Its general habits are too well known to need a detailed description here. It breeds

from four to eight times a year, bringing forth each time from three to eight young. Its period of gestation is about thirty days, and it is able to bear when six months old. It attains to an age of about seven or eight years.

RABELAIS, FRANÇOIS, the greatest of French humorists and one of the few great humorists of the world, was born at Chinon on the Vienne in the province of Touraine. The date of his birth is wholly uncertain; it has been put by tradition and by authorities long subsequent to his death as 1483, 1490, and 1495.

With regard to his birth, parentage, youth, and education everything depends upon tradition, and it is not until he was according to one extreme hypothesis thirty-six, according to the other extreme twenty-four, that we have solid testimony respecting him. In the year 1519, on April 5th, the François Rabelais of history emerges. The monks of Fontenayle Comte bought some property (half an inn in the town), and among their signatures to the deed of purchase is that of François Rabelais. Before this all is cloudland. From Seuilly at an unknown date tradition takes him either to the university of Angers or to the convent school of La Baumette or La Basmette, founded by good King René in the neighborhood of the Angevin capital. Rabelais was in all probability disgusted with the cloister—indeed his great work shows this beyond doubt.

In 1532, and probably rather early than late in that year, he moved from Montpellier to Lyons. Here he plunged into manifold work, literary and professional. He was appointed before the beginning of November physician to the hôtel Dieu, with a salary of forty livres per annum. He edited for Sebastian Gryphius, in the single year 1532, the medical *Epistles* of Giovanni Manardi, the *Aphorisms* of Hippocrates, with the *Ars Parva* of Galen, and an edition of two supposed Latin documents, which, however, happened unluckily to be forgeries. These three works were dedicated in order to his three chief friends of Touraine and Poitou, André Tiraqueau, the bishop of Maillezais, and Bouchard. We also have a Latin letter written on December 1, 1532, to a certain Bernard de Salignac, otherwise unknown.

It is certain that at this time Lyons was the center and to a great extent the headquarters of an unusually enlightened society, and indirectly it is clear that Rabelais became intimate with this society. A manuscript distich, which was found in the Toulouse library, on the death of an infant named Theodule, whose country was Lyons and his father Rabelais, would seem to show that he here entered into other connections than those of friendship. Absolutely nothing, however, is known about the child and its mother; it is enough to say that the existence of the former would have been by the manners and morals of the time very easily condoned. But what makes the Lyons sojourn of the greatest real importance is that at this time probably appeared the beginnings of the work which was to make Rabelais immortal. It is necessary to say "probably," because the strange uncertainty which rests on so much of his life and writings exists here also. There is no doubt that both Gargantua and Pantagruel were popular names of giants in the Middle Ages, though, curiously enough, no mention of the former in French literature much before Rabelais' time has been traced. In 1526, however, Charles de Bordigné, in a satiric work of no great merit, entitled *La Légende de Pierre Faifeu*, has the name Gargantua with an allusion, and in 1532 (if not earlier) there appeared at Lyons *Les Grandes et Inestimables Chroniques du Grand et Énorme Géant Gargantua*. This is a short book on the plan of the later burlesques and romances of the

Round Table. Arthur and Merlin appear with Grantosier, as he is here spelled, Galemelle (Gargalelle), Gargantua himself, and the terrible mare. But there is no trace of the action or other characters of *Gargantua* that was to be, nor is the manner of the piece in the least worthy of Rabelais. No one supposes that he wrote it, though it has been supposed that he edited it and that in reality it is older than 1532, and may be the direct subject of Bordigné's allusion six years earlier. What does, however, seem probable is that the first book of *Pantagruel* (the second of the whole work) was composed with a definite view to this chap book and not to the existing first book of *Gargantua*, which was written afterward, when Rabelais discovered the popularity of his work and felt that it ought to have some worthier starting-point than the *Grandes Chroniques*. The earliest known and dated edition of *Pantagruel* is of 1533, of *Gargantua* 1535, though this would not be of itself conclusive, especially as we actually possess editions of both which, though undated, seem to be earlier. But the definite description of Gargantua in the title as "Père de Pantagruel," the omission of the words "second livre" in the title of the first book of *Pantagruel* while the second and third are duly entitled "tiers" and "quart," the remarkable fact that one of the most important personages, Friar John, is absent from book ii., the first of *Pantagruel*, though he appears in book i. (*Gargantua*), and many other proofs show the order of publication clearly enough. There is also in existence a letter of Calvin, dated 1533, in which he speaks of *Pantagruel*, but not *Gargantua*, as having been condemned as an obscene book. Besides this, 1533 saw the publication of an almanac, the first of a long series which exists only in titles and fragments, and of the amusing *Prognostication Pantagrueline* (still, be it observed, *Pantagrueline*, not *Gargantuine*). Both this and *Pantagruel* itself were published under the anagrammatic pseudonym of "Alcofribas Nasier," shortened to the first word only in the case of the *Prognostication*.

This busy and interesting period of Rabelais' life was brought to a close apparently by his introduction or reintroduction to Jean du Bellay. They had been, it has been said, schoolfellows, but Bellay does not appear among the list of Rabelais' friends in the first years of his emancipation. From 1534, however, he and the other members of his family appear as Rabelais' chief and constant patrons during the remainder of his life. It was just before Christmas that Jean du Bellay, passing through Lyons on an embassy to Rome, engaged Rabelais as a physician. The visit did not last very long, but it left literary results in an edition of a description of Rome by Marliani which Rabelais published in September, 1534. It is also thought that the first edition of *Gargantua* may have appeared this year.

Up to this time Rabelais, despite the condemnation of the Sorbonne referred to above, had experienced nothing like persecution or difficulty. Even the spiteful or treacherous act of Dolet, who, in 1542, reprinted the earlier form of the books which Rabelais had just slightly modified, seems to have done him no harm. But the storm of persecution which, toward the end of the reign of Francis I., was fatal to Dolet himself and to Despériers, while it exiled and virtually killed Marot, did not leave Rabelais scatheless. There is no positive evidence of any measures taken or threatened against him; but it is certain that he passed nearly the whole of 1546 and part of 1547 at Metz in Lorraine as physician to the town at the salary of 120 livres, that Sturm speaks of him as having been "cast out of France by the times" (with the exclamation *φεῦ τῶν χρόνων*) in a contemporary letter, and that he himself in a letter,

also contemporary, though it is not clear whether it is of 1546 or the next year, gives a doleful account of his pecuniary affairs and asks for assistance. At Francis' death, on March 31, 1547, Du Bellay went to Rome, and at some time not certain Rabelais joined him. He was certainly there in February, 1549, when he dates from Du Bellay's palace a little account of the festivals given at Rome to celebrate the birth of the second son of Henry II. and Catherine de' Medici. This account, the *Sciomachie* as it is called, is extant. In the same year a monk of Fontevault, Gabriel du Puits-Herbault, made in a book called *Theotimus* the first of the many attacks on Rabelais. It is, however, as vague as it is violent, and it does not seem to have had any effect. Rabelais had indeed again made for himself protectors whom no clerical or Sorbonist jealousy could touch. The *Sciomachie* was written to the cardinal of Guise, whose family were all-powerful at court, and Rabelais dedicated his next book to Odet de Chatillon, afterward cardinal, a man of great influence. Thus Rabelais was able to return to France, and was presented to the livings of Madon and St. Christophe de Jambet. It may, however, surprise those who have been accustomed to hear him spoken of as "curé de Meudon" and who have read lives of him founded on legend to find that there is very little ground for believing that he ever officiated or resided there. He certainly held the living but two years, resigning it in January, 1552, along with his other benefice, and it is noteworthy that at the episcopal visitation of 1551 he was not present. To this supposed residence at Meudon and to the previous stay at Rome, however, are attached two of the most mischievous items of the legend, though fortunately two of the most easily refutable. It is said that Rabelais met and quarreled with Joachim Du Bellay the poet at Rome, and with Ronsard at Meudon and elsewhere, that this caused a breach between him and the Pléiade, that he satirized its classicizing tendencies in the episode of the Limousin scholar, and that Ronsard after his death avenged himself by a libelous epitaph. The facts are these. Nothing is heard of the quarrel with Du Bellay or of any meeting with him, nothing of the meetings and bickerings with Ronsard, till 1699, when Bernier tells the story without any authority. The supposed allusions to the Pléiade date from a time when Ronsard was a small boy, and are mainly borrowed from an earlier writer still, Geoffroy Tory. Lastly, the epitaph read impartially is not libelous at all but simply takes up the vein of the opening scenes of *Gargantua* in reference to Gargantua's author. There is indeed no reason to suppose that either Ronsard or Du Bellay was a fervent admirer of Rabelais, for they belonged to a very different literary school; but there is absolutely no evidence of any enmity between them or even of any acquaintanceship which could have given rise to enmity.

Some chapters of Rabelais' fourth book had been published in 1548, but the whole did not appear till 1552. The Sorbonne censured it and the parliament suspended the sale, taking advantage of the king's absence from Paris. But it was soon relieved of the suspension. This is the last fact we know about Rabelais. It is supposed that he died in 1553, but actual history is quite silent, and the legends about his deathbed utterances—"La farce est jouée," "Je vais chercher un grand peut-être," etc.—are altogether apocryphal. The same may be said of the numerous silly stories told of his life, such as that of his procuring a free passage to Paris by inscribing packets "Poison for the king," and so forth.

RABENER, GOTTLIEB WILHELM, German satirist, was born in 1714 near Leipsic, and died March 22, 1771.

RABIES. See HYDROPHOBIA.

RABUTIN, ROGER DE, COMTE DE BUSSY, commonly known as BUSSY-RABUTIN (and for shortness, BUSSY), is perhaps the most characteristic figure among the lesser noblesse of France in the seventeenth century, as La Rochefoucauld is among the greater. Bussy, however, except in point of gallantry and literary power, chiefly illustrated the evil sides of the character. He was born in 1618 and died in 1693.

RACCOON. This name, familiar to all readers of works on American natural history, is borne by a small carnivore belonging to that section of the order which contains the bears, weasels, badgers, etc. (see MAMMALIA). The raccoon resembles in many respects a diminutive bear, both in its general build and in the proportions of its skull and teeth, which last are broad, blunt, and rounded, and more suited for a semi-vegetarian than for an exclusively animal diet. Its other more important zoölogical characteristics, with an account of its systematic position, have been already noted in the article just referred to. The common North American raccoon (*Procyon lotor*) is a clumsy, thickly-built animal, about the size of a badger, with a coat of long, coarse, grayish-brown hairs, short ears, and a bushy black and white ringed tail. Its range extends over the whole of the United States, and stretches on the west northwards to Alaska, and southwards well into Central America, where it attains its maximum size. The following notes on the habits of the raccoon are extracted from Dr. C. Hart Merriam's charming work on the mammals of the Adirondacks (northeast New York):

"Raccoons are omnivorous beasts, and feed upon mice, small birds, birds' eggs, turtles and their eggs, frogs, fish, crayfish, molluscs, insects, nuts, fruits, maize, and sometimes poultry. Excepting alone the bats and flying-squirrels, they are the most strictly nocturnal of all our mammals, and yet I have several times seen them abroad on cloudy days. They haunt the banks of ponds and streams, and find much of their food in these places, such as crayfish, mussels, and fish, although they are unable to dive and pursue the latter under water, like the otter and mink. They are good swimmers, and do not hesitate to cross rivers that lie in their path.  
\* \* \* The raccoon hibernates during the severest part of the winter, retiring to its nest rather early, and appearing again in February or March, according to the earliness or lateness of the season. It makes its home high up in the hollow of some large tree, preferring a dead limb to the trunk itself. It does little in the way of constructing a nest, and from four to six young are commonly born at a time, generally early in April in this region. The young remain with the mother about a year."

The South American species, *Procyon cancrivorus*, the crab-eating raccoon, is very similar to *P. lotor*, but differs by its much shorter fur, larger size, proportionally more powerful teeth, and other minor characteristics. It extends over the whole of South America, as far south as the Rio Negro, and is very common in all suitable localities. Its habits are similar to those of the North American species.

RACHEL, the stage name of a French actress, whose true name was ELIZABETH FÉLIX, and who was the daughter of Jacob Félix and Esther Haya, Alsatian Jews, who traveled on foot through France as peddlers. She was born, according to one account, on March 24, 1820, according to another, on February 28th of the following year, in a small inn in Mumpf in the canton of Aargau, Switzerland. At Rheims she and her eldest sister Sophia, afterward known as Sarah, joined a troupe of Italian children who made their living by singing in the cafés. In 1830 they came to Paris, where

they sang in the streets, Rachel giving such patriotic songs as the *Parisienne* and the *Marseillaise*. Choron, a famous teacher of singing, was so impressed with the talents of the two sisters that he undertook to give them gratuitous instruction, and after his death in 1833 they were received into the Conservatoire. Rachel made her first appearance at the Gymnase in the *Vendéenne* in 1837. On June 12th of the following year she succeeded, after great difficulty, in making her début at the Théâtre Français, appearing as "Camille" in *Les Horaces*, when, attention having been directed to her remarkable genius by Jules Janin in the *Débats* and Madame de Gerardin in the *Presse*, it at once received universal recognition. She appeared successively as "Émilie" in *Cinna*, "Hermione" in *Andromaque*, "Ériphile" in *Iphigénie*, "Monime" in *Mithradate*, and "Aménaïde" in *Tancrède*; but it was in *Phèdre* which she first played on January 21, 1843, that her peculiar gifts were most strikingly manifested. In modern plays she created the characters of "Judith" and "Cleopatra" in the tragedies of Madame de Girardin, but her most successful appearance was in 1849 in *Adrienne Lecouvreur*. In 1840 she visited London, and in 1855 she made a tour of the United States. She died of consumption at Cannet, near Cannes, on January 4, 1858.

RACINE, a city of the United States, the county seat of Racine county, Wis., lies twenty-three miles by rail south of Milwaukee, and occupies a plateau projecting for about six miles into Lake Michigan, forty feet above its level. The city contains an elaborate school system, embracing in the curriculum taught all branches necessary to a complete classical, scientific, and commercial education, and affording every facility and equipment adapted to the requirements of the service. Besides being the location of Racine (Episcopal) College, founded in 1852, and a Roman Catholic academy, the city contains a high-school building, graded schools, also a number of commodious and handsomely-appointed church edifices, county court house, orphan asylum, and other public buildings, three large hotels, three national banks, one or two public halls, and is lighted by gas and electricity. The city is the seat of extensive manufacturing industries, including carriages, wagons, plows, threshing-machines, portable steam-engines, fanning-mills, leather, blinds and sashes, school furniture, wire, linseed oil, baskets, etc.; is engaged in the lumber trade, and general commerce. The harbor is open to vessels drawing fifteen feet. Racine, first settled in 1834, was incorporated in 1848, four years after the first steamer had entered the port. The population was 7,822 in 1860, 9,880 in 1870, 16,031 in 1880, and 21,014 in 1890.

RACINE, JEAN, the most accomplished, if not the greatest, tragic dramatist of France, was born at La Ferté Milon in the old duchy of Valois in the month of December, 1639. He was sent to the Collège de Beauvis at an early age, and in October, 1658, was entered at the Collège d'Harcourt. In November, 1661, he went to Uzès, Languedoc, to live with an uncle, through whose influence it was hoped Racine would be able to secure a benefice. Two years later he returned to Paris, where he gave himself to letters and courtiership.

The first but the least characteristic of the dramas by which Racine is known, *La Thébaïde*, was finished by the end of 1663, and on Friday, June 20, 1664, it was played by Molière's company at the Palais Royal theater.

We have no definite details as to Racine's doings during the year 1664, but in February, 1665 he read at the Hôtel de Nevers before La Rochefoucauld, Madame de la Fayette, Madame de Sévigné, and other scarcely less redoubtable judges the greater part of his second

acted play, *Alexandre le Grand*, or, as Pomponne (who tells the fact) calls it, *Porus*. He was now for the first time proposed as a serious rival to Corneille. In reply to criticisms of his work Racine wrote a savage letter and pamphlet, but was persuaded by Boileau to suppress the latter together with a preface to both which he had prepared with a view to publishing them together. In this respect Boileau was certainly Racine's good angel, for no one has ventured to excuse the tone of these letters. The best excuse for them is that they represent the accumulated resentment arising from a long course of "excommunications."

After this disagreeable episode Racine's life for ten years and more becomes simply the history of his plays, if we except his liaisons with the actresses Mademoiselle du Parc and Mademoiselle de Champmeslé (which are undoubted, though there is not much to be said about them) and his election to the Academy on July 17, 1673. Mademoiselle du Parc (Marquise de Gorla) was no very great actress, but was very beautiful, and she had previously captivated Molière. Racine induced her to leave the Palais Royal company and join the Hôtel. She died in 1668, and long afterward the infamous Voison accused Racine of having poisoned her. Mademoiselle de Champmeslé was plain and stupid, but an admirable actress and apparently very attractive in some way, for not merely Racine but Charles de Sévigné and many others adored her. She was cruel to none, but for five years before his marriage Racine seems to have been her *amant en titre*. Long afterward, just before his own death, he heard of her mortal illness and speaks of her to his son without a flash of tenderness; the series of his dramatic triumphs began with *Andromaque*, and this play may perhaps dispute with *Phèdre* and *Athalie* the title of his masterpiece. It is much more uniformly good than *Phèdre*, and the character of "Hermione" is the most personally interesting on the French tragic stage. *Andromaque* was succeeded, at the distance of not more than a year, by a play which, taken in conjunction with his others, is perhaps the best proof of the theatrical talent of Racine—the charming comedietta of *Les Plaideurs*. We do not know exactly when it was played, but it failed completely. The piece, however, was suddenly played at court a month later; the king laughed, and its fortunes were restored. It was followed by a very different work, *Britannicus*, which appeared on December 13, 1669. The next play of Racine, *Bérénice*, has, except *Phèdre*, the most curious history of all. Henrietta of Orleans proposed (it is said without letting them know the double commission) the subject to Corneille and Racine at the same time, and rumor gives no very creditable reasons for her choice of the subject. Her death, famous for its disputed causes and for Bossuet's sermon, preceded the performance of the two plays, both of which, but especially Racine's, were successful. *Bajazet* was first played on January 4, 1672. As a play, technically speaking, it has great merit, but the whole thing is not only French but ephemerally French—French of the day and hour; and its ingenious scenario and admirable style scarcely save it. This charge is equally applicable with the same reservations to *Mithridate*, which appears to have been produced on January 13, 1673, the day after the author's reception at the Academy. His next attempt, *Iphigénie*, was a long step backward and upward in the direction of *Andromaque*. It is not that the characters are eminently Greek, but that Greek tragedy gave Racine examples which prevented him from flying in the face of the propriety of character as he had done in *Bérénice*, *Bajazet* and *Mithridate*, and that he here called in, as in *Andromaque*, other passions to the aid of the mere sighing

and crying which form the sole appeal of these three tragedies. It succeeded brilliantly and deservedly, but, oddly enough, the date of its appearance is very uncertain. It was assuredly acted at court in the late summer of 1674, but it does not seem to have been given to the public till the early spring of 1675, the usual time at which Racine produced his work. The last and finest of the series of tragedies proper was the most unlucky. *Phèdre* was represented for the first time on New Year's Day, 1677, at the Hôtel de Bourgogne. Within a week the opposition company or "troupe du roi" launched an opposition *Phèdre* by Pradon. This singular competition, which had momentous results for Racine, and in which he to some extent paid the penalty of the *lex talionis* for his own rivalry with Corneille, had long been foreseen. It has been hinted that Racine had from the first been bitterly opposed by a clique, whom his great success irritated, while his personal character did nothing to conciliate them. His enemies at this time had the powerful support of the duchess of Bouillon, one of Mazarin's nieces, a woman of considerable talents and imperious temper, together with her brother the duke of Nevers and divers other personages of high position. These persons of quality, guided, it is said, by Madame Deshoulières, a poetess of merit whom Boileau unjustly depreciated, selected Pradon, a dramatist of little talent but of much facility, to compose a *Phèdre* in competition with that which it was known that Racine had been elaborating with unusual care. Pradon, perhaps assisted, was equal to the occasion, and it is said that the partisans on both sides did not neglect means for correcting fortune. It was of no value, but the measures of the cabal had been so well taken that the finest tragedy of the French classical school was all but driven from the stage, while Pradon's was a positive success. He now broke off his dramatic work entirely, and in the remaining twenty years of his life wrote but two more plays, and those under special circumstances, and of quite a different kind. He now married, became irreproachably domestic, and almost ostentatiously devout.

The almost complete silence in the literary sphere which Racine imposed on himself after the comparative failure, shameful not for himself but for his adversaries, of *Phèdre* was broken once or twice even before the appearance of the two exquisite tragedies in which under similar circumstances he took leave of the stage. The most honorable of these was the reception of Thomas Corneille on January 2, 1685, at the Academy in the room of his brother. The discourse which Racine then pronounced turned almost entirely on his great rival, of whom he spoke even more than becomingly. But it was an odd conjunction of the two reigning passions of the latter part of his life—devoutness and obsequiousness to the court—which made him once more a dramatist. Madame de Maintenon had established an institution, first called the Maison Saint Louis, and afterward the Maison de Saint Cyr, for the education of poor girls of noble family. The tradition of including acting in education was not obsolete. At first the governess, Madame de Grignon, composed pieces for representation, but, says Madame de Caylus, a witness at first hand and a good judge, they were "detestable." Then recourse was had to chosen plays of Corneille and Racine, but here there were obvious objections. The favorite herself wrote to Racine that "nos petites filles" had played *Andromaque* "a great deal too well." She asked the poet for a new play suited to the circumstances, and, though Boileau advised him against it, it is not wonderful that he yielded. The result was the masterpiece of *Esther*, with music by Moreau, the court composer and organist of Saint Cyr.

Although played by schoolgirls and in a dormitory, it had an enormous success. Almost immediately the poet was at work on another and a still finer piece of the same kind, and he had probably finished *Athalie* before the end of 1690. The fate of the play, however, was very different from that of *Esther*. It was printed in March, 1691, and the public cared very little for it. Thenceforward Racine was practically silent, except for four *cantiques spirituelles*, in the style and with much of the merit of the choruses of *Esther* and *Athalie*. Disease of the liver appears to have been the immediate cause of his death, which took place on April 12, 1699.

**RACKETS.** Like tennis, this game of ball is of French origin, and its name is derived from "raquette," the French term for the bat used in the pastime. In the United Kingdom it is not so universally pursued as cricket and football, and is essentially an indoor game, which is played only in prepared and covered courts. Such buildings have been erected at many of the large public schools, at the universities, and in garrison towns.

The usual dimensions of a "close" court are 80 feet by 40 feet for four-handed matches, while 60 feet by 30 feet are sufficient for a single match.

The game is played with no other implements but bats and balls. The striking portion of the former is oval-shaped and strung tightly across with catgut. The handle is of pliant ash covered with leather in order to give the hand a tight grip. The balls are about  $1\frac{1}{4}$  inches in diameter, and very hard in order to rebound evenly and quickly.

The game has been introduced into the United States, but is rarely played.

**RADAUTZ**, a town in the Austrian duchy of Bukovina, is situated on the Suczava, about fifteen miles from the frontier of Moldavia. It was formerly the seat of a Greek bishopric, removed to Czernowitz in 1786, and possesses a cathedral with the tombs of several Moldavian princes. It contains a government stud, and manufactures paper, glass, machinery, beer, and brandy. In 1880 Radautz had 11,162 inhabitants and between 12,000 and 15,000 in 1890.

**RADBERTUS**, head of the Benedictine abbey of Corbie, near Amiens, from 844 to 851, was born at or near Soissons toward the close of the eighth century, and became a monk of Corbie in 814, when he assumed the cloister name of PASCHASIUS. In 844 he was chosen abbot, but as a disciplinarian he was more energetic than successful, and in 851 he resigned the office. In his official capacity he took part in the synod of Chiersy which condemned Gottschalk. Of the closing period of his life nothing is known, except that it was one of great literary activity. His work includes an *Expositio in Mattheum*, in twelve books, a favorable specimen of the exegesis of that period, and the *Liber de Corpore et Sanguine Christi*, a pious and popularly written treatise, designed to prove that the elements in the sacrament are completely changed.

**RADCLIFFE**, a town of Lancashire, England, is situated on the river Irwell, crossed by a bridge of two arches, and on the Lancashire and Yorkshire railway, seven miles northwest of Manchester, and two southwest of Bury. Cotton-weaving, calico-printing, and bleaching are the principal industries, and there are extensive collieries in the neighborhood. The town is governed by a local board of health established in 1866. The area of the urban sanitary district is 2,453 acres, with a population in 1871 of 11,446; in 1881 of 16,267 and in 1890, estimated at 20,000.

**RADCLIFFE, ANN WARD**, novelist, was born in London on July 9, 1764. She was the author of three novels unsurpassed of their kind in English literature,

*The Romance of the Forest* (1791), *The Mysteries of Udolpho* (1794), *The Italian* (1797). She wrote two other novels before any of these, the *Castles of Athlin and Dunbayne* (1789) and the *Sicilian Romance* (1790), but they attracted no special attention and deserve none, although in them she works with the same romantic materials—dreadful castles, wild adventures, terrible characters. One other was written after the famous three, but not published till 1826, three years after her death—*Gaston de Blondville*, interesting as an elaborate study of costume and scenery, and valuable as a monument of her accurate archæological learning, but comparatively tedious as a story, though not without passages in her best style. She died in February, 1823.

**RADETZKY, JOHANN J. W. A. F. C., COUNT OF RADETZ**, field-marshal of Austria, was born at Trzebnitz in Bohemia in 1766, to the nobility of which province his family belonged. He entered a cavalry regiment in 1784 and served under Joseph II. and Laudon against the Turks in 1788 and 1789. In 1793 his regiment was sent to the lower Rhine, and from this time onward Radetzky was engaged in the wars which were continued (with intermission) between Austria and France, for the next twenty years. In 1796 he was adjutant to General Beaulieu, over whom Bonaparte won his first victories in Italy. In 1799, when the Austrians with Suwaroff's help reconquered Northern Italy, he distinguished himself at the battles of Novi and the Trebbia, and after the defeat of Marengo he was removed from Italy to Germany, and there took part in the still more disastrous engagement of Hohenlinden. In 1805 Radetzky, now major-general, was back in Italy, serving under the archduke Charles in the successful campaign of Caldiero, the fruits of which were lost by Mack's capitulation at Ulm and the fall of Vienna. In 1809 he fought at Wagram. He entered Paris with the allied sovereigns in March, 1814, and returned with them to the congress of Vienna, where he appears to have acted as an intermediary between Metternich and the czar Alexander, when these great personages were not on speaking terms. During the succeeding years of peace he disappeared from the public view and narrowly escaped being pensioned off in 1829. The insurrection of the Papal Legations in 1831 brought him, however, into active service again; and on the retirement of General Frimont he was placed in command of all the Austrian forces in Italy, receiving in 1836 the dignity of field-marshal. He retired from service in 1857, and died at the age of ninety-two in the following year.

**RADHANPUR**, a petty state of India, within the group of states under the supervision of the political superintendent of Palanpur; it is situated in the north-western corner of Gujarat, close to the Runn of Cutch, Bombay presidency, and lies between  $33^{\circ} 26'$  and  $23^{\circ} 58'$  N. latitude and between  $71^{\circ} 28'$  and  $72^{\circ} 3'$  E. longitude. The country is an open plain without hills and with few trees, square in shape, and about thirty-five miles across. Including the pergunnahs of Munjpur and Sami, it contains an area of 1,150 square miles with a population (1881) of 98,129 (males 50,903, females 47,226), the majority being Hindus. Though subject to very great extremes of heat and cold, the climate is healthy. The estimated yearly revenue of the state is from £50,000 to £60,000. Its chief products are cotton, wheat, and all the common varieties of grain; the only manufacture of any importance is the preparation of a fine description of saltpeter.

**RADHANPUR**, chief town of the state and the seat of the nawab, had a population of 14,722 in 1881. The nearest railway station is at Kharagoda, forty miles distant.

**RADIATA.** This term was introduced by Cuvier in 1812 to denote the lowest of his four great animal groups or "embranchements." He defined them as possessing radial instead of bilateral symmetry, and as apparently destitute of nervous system and sense organs, as having the circulatory system rudimentary or absent, and the respiratory organs on or coextensive with the surface of the body; he included under this title and definition five classes—Echinodermata, Acalepha, Entozoa, Polypi, and Infusoria. Lamarck (*Hist. nat. d. Anim. s. Vertèbres*) also used the term, as when he spoke of the Medusæ as *radiata medusaria et anomala*; but he preferred the term Radiaria, under which he included Echinodermata and Medusæ. On radiate symmetry, see MORPHOLOGY. Compare also CUVIER, ANIMAL KINGDOM, ECHINODERMATA, CORALS, etc.

**RADIATION AND CONVECTION.** When a red-hot cannon ball is taken out of a furnace and suspended in the air it is observed to cool, *i.e.*, to part with heat, and it continues to do so at a gradually diminishing rate till it finally reaches the temperature of the room. But the process by which this effect is produced is a very complex one. If the hand be held at a distance of a few inches from the hot ball on either side of it or *below* it, the feeling of warmth experienced is considerable; but it becomes intolerable when the hand is held at the same distance *above* the ball. There is, in fact, a column of air very irregularly heated by contact with the ball, and rising, in obedience to hydrostatic laws, in the colder and denser air around it. This conveyance of heat by the motion of the heated body itself is called *convection*; the process by which heat is lost indifferently in all directions is called *radiation*.

To illustrate how the third method by which heat can be transferred, *viz.*, *conduction*, let the cannon ball be again heated and at once immersed in water until it just ceases to be luminous in the dark, and be immediately hung up in the air. After a short period it again becomes red-hot all over, and the phenomenon then proceeds precisely as before, except that the surface of the ball does not become so hot as it was before being plunged in the water. This form of experiment, which requires that the interior shall be very considerably cooled before the surface ceases to be self-luminous, does not succeed nearly so well with a copper ball as with an iron one, on account of the comparatively high conductivity of copper.

In conduction there is a passage of heat from hotter to colder parts of the same body; in convection an irregularly heated fluid becomes hydrostatically unstable, and each part carries its heat with it to its new position. In both processes heat is conveyed from place to place. But it is quite otherwise with radiation. That a body cools in consequence of radiation is certain; that other bodies which absorb the radiation are thereby heated is also certain; but it does not at all follow that what passes in the radiant form is heat. It is undoubtedly a transference of energy which was in the form commonly called heat in the radiating body, and becomes heat in a body which absorbs it, but it is transformed as it leaves the first body and retransformed when it is absorbed by the second.

**RADIOMETER**, a form of the now obsolete cross-staff, formerly used by navigators to obtain the altitude and angles of stars, etc.; used in the calculation of latitude and longitude.

**RADISH.** A vegetable indigenous to the temperate zone, used as an edible, and as food for stock.

**RADNOR**, an inland county of South Wales, is bounded east by Hereford and Shropshire, north by Montgomery, west by Cardigan, and south by Breck-

nock. Its greatest length from north to south is about thirty miles, and its greatest breadth from east to west about thirty-three miles. The area is 276,552 acres, or 432 square miles. The greater part of the surface of the country is hilly, and the center is occupied by a mountainous tract called Radnor Forest, running nearly east and west, its highest summit reaching 2,163 feet. The hills for the most part present smooth and rounded outlines, but the valley of the Wye is famed for its beauty. The higher ranges are covered with heath, but there is good pasturage on the lower slopes. The smaller elevations are frequently clothed with wood. Lead and copper are said to exist, but not in quantities sufficient to pay the working. There are saline, sulphurous, and chalybeate wells at Llandrindod.

The climate is somewhat damp, and, in the spring, cold and ungenial. The greater part of the country is suitable only for pasturage, but there is some good arable land in the valleys in the southern and south-eastern districts, which produces excellent crops of turnips, oats, and Welsh barley, the soil being chiefly open shaley clay, although in the east there is an admixture of red sandstone soils. The inhabitants are dependent almost solely on agriculture, the manufactures being confined chiefly to coarse cloth, stockings and flannel for home use. The county is intersected by several lines: the Central Wales Railway runs southwest from Knighton to Llandovry; another line runs southeastward by Rhayader and Builth, and joins the Hereford line, which passes by Hay and Talgarth; while another branch line passes by Kington to New Radnor.

Radnor comprises six hundreds, but contains no municipal borough. It has one court of quarter sessions, and is divided into six petty and special sessional divisions. It returns one member to the House of Commons. The population, in 1871, was 25,430; in 1881 it was 23,528. The present population (1890) is estimated at 27,000.

**RADOM**, a government of Poland, occupying a triangular space between the Vistula and the Pilica, and bounded on the north by Warsaw and Siedlce, on the east by Lublin, on the south by Austrian Galicia and Kielce, and on the west by Piotrków. The area is 4,765 square miles. The population, 644,830 in 1882, and in 1890 about 650,000, is Polish for the most part, one-seventh being Jews. The chief occupation is agriculture, the principal crops being wheat, oats, rye, potatoes, and beetroot (for sugar). Corn is exported and potatoes largely used for distillation. In 1879 there were 148 manufacturing establishments (197 in 1883), employing 1,708 hands, with an aggregate production of 2,121,000 rubles (\$1,060,000), the more important being tanneries, flour-mills, sugar-works, and several machinery and iron-works. These last are suffering, however, from want of wood-fuel, and many of them have recently been closed. Trade is not very extensive, the only channel of commerce being the Vistula. The educational institutions include two lycées or gymnasias and two progymnasias (all at Radom), with 813 male and 287 female pupils, a normal school, a theological seminary at Sandomir, and 170 primary schools, 112 in villages, with 8,465 scholars.

**RADOM**, capital of the above government, situated on the Mleczna, a tributary of the Radomka, sixty-five miles south from Warsaw, is one of the best-built provincial towns of Poland. Lublin street has a number of fine shops, and there are two well-kept public gardens. The manufactures are unimportant, but trade has been lately increasing.

**RAEBURN, SIR HENRY**, portrait-painter, was born at Stockbridge, a suburb of Edinburgh, on March 4, 1756, the son of a manufacturer of the city. In 1822

he was knighted by George IV., and appointed His Majesty's limner for Scotland. He died at Edinburgh, July 8, 1823.

RAFF, JOSEPH JOACHIM, composer and orchestral conductor, was born near Zurich May 27, 1822, and educated chiefly at Schwyz. When in 1843 he sent some MSS. to Mendelssohn, that warm encourager of youthful talent felt justified in at once recommending him to Breitkopf & Härtel of Leipsic, who published a large selection of his early works. Soon after this he became acquainted with Liszt, who gave him much generous encouragement. In 1859 he married Doris Genast, an actress of high repute, and thenceforward devoted himself with renewed energy to the work of composition, displaying an inexhaustible fertility of invention tempered by an amount of technical skill which stamped even his lightest works with the dignity to which the union of natural talent with high artistic cultivation can alone give birth. He resided chiefly at Wiesbaden till 1877, when he was appointed director of the Hoch-Conservatorium at Frankfort, an office which he retained until his death, June 25, 1882.

RAFFLES, SIR THOMAS STAMFORD, the son of a captain in the West India trade, was born at sea off the coast of Jamaica on July 5, 1781. Returning with his mother to England, he was placed in a boarding-school at Hammersmith, where he remained till the age of fourteen, when he entered the East India House as an extra clerk. In 1808 he had to visit Malacca to recruit his shattered strength; here he began his elaborate researches into the history, laws and literature of the Hindu and Malay races. In zoölogy he took special interest, and on his return to England became founder and first president of the Zoölogical Society.

Having received knighthood, Sir Stamford Raffles set out for Sumatra as lieutenant-governor of Bencoolen, in March, 1818. In 1819 he induced the marquis of Hastings to annex Singapore. In 1820 he sent home a large collection of preserved animals, now in the museum of the London Zoölogical Society, described in the *Transactions* of the Linnean Society. He died of apoplexy at his house near London on July 5, 1826.

RAFN, CARL CHRISTIAN, Danish archæologist, was born in Brahesborg, Fünen, on January 16, 1795, and died at Copenhagen on October 20, 1864. He is chiefly known in connection with the controversy as to the question of the discovery of America by the Norsemen.

RAGATZ, or RAGAZ, a watering-place in Switzerland, in the canton of St. Gall, with a station on the railway to Coire, sixty-four miles southeast of Zurich, stands 1,700 feet above the sea at the mouth of the magnificent gorge through which the impetuous Tamina forces its way to the Rhine; its baths are supplied with mineral water from the hot springs of Pfäfers, which issue from the right side of the ravine two and one-half miles higher up. As the tourist center for one of the most picturesque districts of Switzerland, Ragatz has greatly increased since the middle of the century. It had then only 650 inhabitants; in 1870 there were 1,825, in 1880 1,996, and in 1890 about 2,500, while the annual number of visitors is about 50,000.

RAGLAN, FITZROY JAMES HENRY SOMERSET, BARON, English general, was the eighth and youngest son of the fifth duke of Beaufort by Elizabeth, daughter of Admiral the Hon. Edward Boscawen, and was born on September 30, 1788. He entered the army in 1804. From 1818 to 1826 he sat in the House of Commons as member for Truro. In 1819 he was appointed secretary to the duke of Wellington as master-general of the

ordnance, and from 1827 till the death of the duke in 1852 was military secretary to him as commander-in-chief. He was then raised to the House of Lords as Baron Raglan. In 1854 he was appointed to the command of the English troops sent to the Crimea. For the hardships and sufferings of the English soldiers in the terrible Crimean winter owing to a failure in the commissariat, both as regards food and clothing, Lord Raglan and his staff were at the time severely censured by the press and the government. The monotony of the siege was broken by the battles of Balaclava on October 26, and of Inkermann on November 5, in which the accurate and rapid decision of Lord Raglan changed impending disasters into brilliant victories. He died of dysentery on June 28, 1855.

RAGMAN ROLLS, the name given to the collection of instruments by which the nobility and gentry of Scotland were compelled to subscribe allegiance to Edward I. of England between the conference of Northampton in May, 1291, and the final award in favor of Baliol in November, 1292, and again in 1296. The derivation of the word "ragman" has never been satisfactorily explained, but has been sometimes confined to the record of 1296, of which an account is given in *Calendar of Documents relating to Scotland preserved in the Public Record Office, London* (1884).

RAGUSA (Slavonic *Dubrovnik*, Turkish *Paprovnik*), a city on the east coast of the Adriatic, for many centuries an independent republic, now at the head of a district in the province of Dalmatia in Austria-Hungary. It is built close to the sea at the foot of the bare limestone mass of Monte Sergio, on which stands an unfinished Fort Impérial erected by the French. In front lies the island of Lacroma, the traditional landing-place of Cœur-de-Lion. Ragusa can never have been a large city. In the sixteenth century it is said to have contained 30,000 or 40,000 inhabitants; in 1881 it had only 7,245, and its commune, with its fifteen additional villages, 10,936. The harbor, once one of the great ports of southern Europe, is altogether too small for modern requirements, in spite of the new breakwater constructed in 1873 to protect it from the southwest winds. The staple trade is that of oil, but the whole supply is sent to the Trieste market. Ragusan Malmsey, once famous, has disappeared before the vine disease since 1852.

RAGUSA, a city of Italy in the province of Syracuse (Sicily), sixteen miles east of Vittoria and ten north-northwest of Modica, lies on the right side of the valley of the Ragusa or Erminio (Herminius). It consists of an upper and lower town, with a total population in 1890 of about 35,000. Ragusa possesses a large cotton factory. Stone impregnated with petroleum is quarried in the Grotta Oleosa in the neighborhood, and after the oil is burned out becomes an article of export under the name of *pietra nera*. The city, which was destroyed by earthquake in 1693, is of considerable antiquity, as is proved by the numerous ancient tombs existing in the district.

RAHEL. See VARNHAGEN VON ENSE.

RAHWAY, a city of the United States in Union county, N. J., nineteen miles by rail southwest of New York, lies on Rahway river at the head of schooner navigation, about four miles above its mouth in Staten Island sound. It is best known for its carriage-factories, but has also a wool-mill, a printing-press manufactory, a printing-house, a shirt-factory, a hunting-goods factory, etc. The population was 6,258 in 1870, 6,455 in 1880, and 7,095 in 1890. First settled in 1720 and named after Rahwack, the Indian owner of the site, Rahway was incorporated as a city in 1858.

RAI BARELI or ROY BAREILLY, a district of

British India, in the Rai Bareli division of Oudh, under the jurisdiction of the lieutenant-governor of the Northwestern Provinces, has an area of 1,738 square miles, is bounded on the north by the districts of Lucknow and Bara Banki, on the east by Sultampur, on the south by Partabgarh and the Ganges, and on the west by Tuao. The general aspect of the district is slightly undulating and the country is beautifully wooded; in fact, the beauty of the country is not to be surpassed by any part of the real plain of Hindustan. The soil is remarkably fertile, and the cultivation of a high class. The principal rivers of the district are the Ganges and the Sai. Other rivers are the Basha, the Loni, and the Naiya. The indigenous products of Rai Bareli consist of several magnificent and useful timber trees, numerous kinds of grazing and thatching grasses, and a variety of rice known as "pasahi," which grows wild in many tanks and marshes; its jungle products are lac and silk cocoons. Herds of wild cattle are to be found in the south of the district, near the Sai river, and do much harm to the crops; nylghau are common near the Ganges, and wolves are occasionally met with in the jungles.

According to the census of 1881 Rai Bareli district contains a population of 951,905 (males 466,906, females 484,999). By religion 874,180 are Hindus, 77,424 Mohammedans, and 123 Christians. The most numerous castes are Ahirs (114,869), the Brahmans (113,212), and the Rajputs (70,757).

RAI BARELI or ROY BAREILLY, town and administrative headquarters of the above district, is situated on the banks of the Sai in 26° 14' N. latitude and 81° 17' E. longitude. It was founded by the Bhars, who called it Bharauli, but it was subsequently corrupted into Bareli. It possesses many architectural features, chief of which is a spacious and strong fort erected in 1403, and constructed of bricks two feet long by one foot thick and one and a half wide.

RAIKES, ROBERT, the founder of Sunday schools, was the son of Robert Raikes, a printer in Gloucester and proprietor of the *Gloucester Journal*, and was born on September 14, 1735. On the death of his father in 1757 he succeeded him in the business, which he continued to conduct till 1802. Along with some others he started a Sunday school at Gloucester in 1780. For nearly thirty years he continued actively engaged in the promotion of his undertaking, and he lived to witness its wide extension throughout England. He died on April 5, 1811.

RAIL (German *Ralle*, French *Râle*, Low Latin *Rallus*), originally the English name of two birds, distinguished from one another by a prefix, as land-rail and water-rail, but latterly applied in a much wider sense to all the species which are included in the family *Rallidæ* of Ornithology.

The land-rail, also very commonly known as the corn-crake, and sometimes as the daker-hen, is the *Rellus crex* of Linnæus and *Crex dratensis* of recent authors. It looks as big as a partridge, but on examination its appearance is found to be very deceptive, and it will hardly ever weigh more than half as much. The plumage above is of a tawny brown, the feathers being longitudinally streaked with blackish brown; beneath it is of a yellowish white; but the flanks are of a light chestnut. The species are very locally distributed and in a way for which there is at present no accounting. In some dry upland and corn-growing districts it is plentiful; in others, of apparently the same character, it but rarely occurs; and the same may be said in regard to low-lying marshy meadows, in most of which it is in season always to be heard, while in others having a close resemblance to them it is never met with. The nest is

on the ground, generally in long grass, and therein from nine to eleven eggs are commonly laid. These are of a cream-color, spotted and blotched with light red and gray. The young when hatched are thickly clothed with black down, as is the case in nearly all species of the family.

The water-rail, locally known as the skiddy or bill-cock, is the *Rallus aquaticus* of Ornithology. Having a general resemblance to the land-rail, it can be in a moment distinguished by its partly red and much longer bill, and the darker coloration of its plumage—the upper parts being of an olive brown with black streaks, the breast and belly of a sooty gray, and the flanks dull black barred with white. Its geographical distribution is very wide, extending from Iceland (where it is said to preserve its existence during winter by resorting to the hot springs) to China; and though it inhabits Northern India, Lower Egypt, and Barbary, it seems not to pass beyond the tropical line. It never affects upland districts as does the land-rail, but always haunts wet marshes or the close vicinity of water. The eggs resemble those of the preceding, but are more brightly and delicately tinted.

RAILWAYS had their origin in the fact that wheels carrying loads move more easily on hard continuous surfaces. "Railroad" is the term almost exclusively in use in the United States. In 1676 tramways consisted of rails of timber. By and by an additional or wearing rail, which could be easily renewed when worn, was placed above the supporting rail, and it became a common practice to nail down bars of wrought iron on the surfaces of the ascending inclines of the road. These bars or rails were about two inches wide and half an inch thick, and were fastened to the wood rails by countersunk spikes. Cast iron was first tried incidentally as a material for rails in 1767. The iron rails were cast in lengths of five feet, four inches wide, and one and one-fourth inches thick, formed with three holes, through which they were fastened to the oak rails. The tramway was developed into the railway by the employment of cast-iron flange rails to replace the wooden rails; the continuous flange or ledge on their inner edge kept the wheels on the track.

The benefits derived from the use of the tramway or railway for the transport of coal suggested to reflective persons the employment of it for the conveyance of general merchandise and of passengers. The first great movement in that direction was the passing of the act in 1821 for the construction of the Stockton and Darlington Railway, in England. This was to be worked with horses. By another act applied for at the request of George Stephenson, who became engineer to the line, the company was empowered to work the railway with locomotive engines. The line, with three branches, was over thirty-eight miles in length, and was at first laid as a single line, with passing places at intervals of a quarter of a mile, the way being constructed with wrought-iron fishbelly rails, weighing twenty-eight pounds per yard. It was opened in September, 1825, by a train of thirty-four vehicles, making a gross load of about ninety tons, drawn by one engine driven by Stephenson, *with a signalman on horseback in advance*. The train moved off at the rate of from ten to twelve miles an hour, and attained a speed of fifteen miles per hour on favorable parts of the line. A train weighing ninety-two tons could be drawn by one engine at the rate of five miles per hour. In October, 1825, the company began to run a daily coach, called the "Experiment," to carry six inside, and from fifteen to twenty outside, making the journey from Darlington to Stockton and

back in two hours. The Monklands Railway in Scotland, opened in 1826, was the first to follow the example of the Stockton and Darlington line, and several other small lines—including the Canterbury and Whitstable, worked partly by fixed engines and partly by locomotives—quickly adopted steam traction. But the inauguration of the Liverpool and Manchester Railway, opened in 1830, made the first great impression on the national mind that a revolution in the modes of traveling had really taken place. In 1838 a line was opened between London and Birmingham, and the first train accomplished the whole distance—one hundred and twelve and a quarter miles—at an average speed of over twenty miles per hour.

The earliest four-wheeled locomotive constructed by Robert Stephenson & Co., as an article of regular manufacture, weighed nine tons in working order. The six-wheeled engines which followed weighed eleven and a half tons. In the course of business locomotives of greater power and greater weight were constructed; and there are locomotives of the present time which weigh forty-seven and a half tons in working order, and with the tender full of water and coal about eighty tons gross. There are other engines of special design with twelve wheels which weigh in working order, with fuel and water, seventy-two tons.

Locomotives may broadly be reduced to two classes, according to the situation of the working cylinders. In the first class these are within the framing, under the boiler, with the main driving axle cranked at two points to receive the power from the two cylinders. This is almost exclusively the English form. The American locomotive engine has the cylinders outside the framing, and connected, not to the axle, which is straight, but to crank-pins fixed between the spokes of the wheels, in connection with the nave. In the latter the general contour of the cylinders is usually visible at the fore end of the machine. The tenders have eight wheels, four to a truck, and they are supplied with powerful brakes, included in the pneumatic system invented by Mr. Westinghouse, and in almost universal use for the past eighteen years. A water tank forms the upper part of the tender, namely, the two sides and the back, usually in the form of a horse-shoe, holding from 1,000 to 3,000 gallons; and in the hollow of the shoe the fuel is deposited, of which a full charge may weigh from 3,000 pounds to three and a half tons. The engine and the tender are sustained on springs placed over the axle bearings. Again, there is the general classification of locomotives into passenger engines and freight engines. As the power of the engine is brought into action through the grip of the driving wheels upon the rails, it is necessary, for the exertion of maximum power in freight engines, to make two or more pairs of the wheels of one size, and transmit the driving force from the central pair of wheels to the front and back pairs by means of coupling rods attached to crank pins at the naves of the wheels. An engine thus coupled can take the heaviest train on a good straight railway—that is, one free for the most part from curves; but shorter coupled engines work more economically on lines with frequent curves, and may be made so as to take, in average practice, as great a load as the others. Passenger locomotives have never been constructed in this country with a single pair of driving wheels; and express trains are worked with four-coupled engines. In recent years the fore part of engines has in all cases been placed on a four-wheeled truck connected by a central bolt or pivot to the frame of the engine, so that the fore wheels can swing to

the curves of the line. American practice, many years since, arrived at two leading types of locomotive for passenger and for freight traffic. The passenger locomotive has eight wheels, of which four in front are framed in a truck, and the four wheels behind are coupled drivers. This is the type to which English practice has been approximating. Freight locomotives are made with four, six or eight drivers; the leading pair of wheels, similar in pattern to those used under all cars, are universally known as “trucks,” or, in the case of locomotives, as “pilots,” and are connected with a swing bolster and radius bar, to conform laterally and radially with curves.

The common varieties of vehicle employed in railway traffic are as follows:—(1) Passenger train stock: first-class carriage, second-class carriage, and “smoking car.” To these may be added the U. S. Postal car, generally attached to all “through,” or express trains. (2) Freight stock, consisting of box cars, flat, or platform cars, stock cars. There are now in addition to these cars specially designed for carrying certain freight, as coal, oil, salt, ballast, heavy machinery, etc. Among these, and in extensive use, are what are known as refrigerator cars, of various design, by means of which the fruits of one region are placed fresh in the markets of another some thousands of miles away. There are also in extensive use stock cars of special pattern for the transportation of live stock without suffering and loss. The industry of making special cars for special purposes is constantly growing.

The early railroad passenger cars in England weighed three and a quarter tons, the bodies or upper parts being fifteen feet long, six and a half feet wide, and four feet nine inches high, divided into three compartments, to hold six passengers each, or eighteen in all. They now weigh from eight to thirteen tons each, and are from twenty to thirty feet in length and from eight to eight and a half feet wide. They were there until recent years placed almost all on four wheels; but six wheels on three axles are now generally in use. A modern first-class carriage, twenty-eight to thirty feet long with four compartments, gives seven to seven and a half feet of total length for each compartment, as against five feet in the early carriages. Second and third class carriages, in length from twenty-eight to thirty-one feet, are divided into five compartments, each from five feet seven inches to six feet two inches long. Saloon carriages are occasionally used, so called because two or more of the ordinary compartments are merged in one. Second-class carriages originally were destitute of cushioning, hard and square, on the nearly obsolete policy of making them uncomfortable in the hope of inducing passengers to travel first class. Third-class carriages have been improved, under the stimulating example of the Midland Railway Company, who abandoned their second-class carriages, and raised their third-class stock to an equality with the second-class vehicles of other lines.

The long double truck passenger car universally in use in the United States, originally introduced by Ross Winans on the Baltimore and Ohio Railroad, is distinguished essentially from the carriages on British railways by the longitudinal passage in the center of the body, reaching from end to end of the car, with seats at each side, and admitting of the free passage of the conductor throughout the train. The absence of doors at the sides permits of the enlargement of the body laterally. These cars are also distinguished by the use of two six-wheeled bogies or trucks on which the body is carried, and to which it is pivoted,

allowing the cars to pass with facility over quick curves. Ordinary passenger cars are nine and a half to ten feet wide and forty-four and a half in length of body, or forty-nine feet over the extreme platforms. They are about seven and a half feet high at the sides, inside the body, and nearly ten feet high at the center. The car is constructed with an open platform at each end, reached by steps at each side. The middle passage is about two feet wide. On each side there are fourteen to eighteen or twenty seats, placed transversely, each thirty-eight inches long and holding two persons. The backs of the seats, which do not rise more than thirty-four inches above the floor, are mounted on swivels, by which the seat is made reversible. A window is placed next each seat, having a movable glass and a venetian blind. The cars are heated by stoves or steam heaters, burning coal, and are lighted by oil lamps or candles, on some lines by compressed coal gas. Each car is provided with a water-closet, and a supply of iced water, and a vendor of books, papers, and cigars patrols the cars. There is a cord of communication with the engine driver, running invariably in loops through the length of the car above the aisle or passageway. The car complete weighs from seventeen to twenty tons, and sleeping cars about one-half more.

Mechanical means were first tried, in the systems of Fay and Newall, in England, in which the brakes are worked by a continuous rod passed under the vehicles. These systems were found to be available only on sections of not more than four or five vehicles. Subsequently many inventions were tried—brakes worked by fluid pressure, others worked by chains; but no practical solution of the automatic application of brakes under the control of the engine driver appears to have been arrived at until Mr. Westinghouse, of Pittsburgh, invented a really continuous brake worked by compressed air, which was quickly adopted in the United States, and was tried a few years later in England. This or a similar automatic brake worked by vacuum or pneumatic pressure, is in universal use in the United States.

The first American passenger coaches to be generally used presented the radical change upon English and continental construction noted above in respect to the doors at the ends, and the free aisle through the center of the car. In the compartment system there is merely a survival of the stagecoach and diligence idea, since the supposition of privacy cannot be maintained where the occupants are strangers to each other. Locked doors have also never been tolerated by the American public. The separate closets for women and men have existed also from the beginning, often supplemented by hand-basins, water, and a retiring-room furnished with a couch or sofa. Since the earliest days of railroads the people have habitually traveled, and have traversed long distances by rail, and all railroads, depending solely upon the public for support, have diligently catered to its comfort.

The result of this was the invention known as the sleeping car, for a long time, and chiefly yet, an American institution. The idea was carried to its present perfection and universal use by Mr. Pullman, of Chicago, supplemented in later years by other inventors and promoters. The Pullman car and its congeners have long since overcome all prejudice, and are well known by all travelers, native or foreign.

The second great stride toward perfection in American railroad travel was the dining car. This is a palatial restaurant on wheels, where all viands are cooked as well as eaten on board the car. The menu

is in no case limited to portable viands, is ordered by card, and is served with all accessories of a hotel of the first class. On some American lines the sleeping berth, with its luxurious seats and constant attendance by day, and the restaurant with its elaborate kitchen, service, wines, cigars and ices accompany the traveler across hundreds of miles of mountain and plain, and through regions a few years since uncivilized and inaccessible.

The link-and-pin coupling for passenger coaches in the United States was abandoned previous to 1870, and the Miller platform coupler and buffer substituted therefor, and the sudden and uncomfortable jerking and sudden starting has been unknown to the present generation. But the latest improvement in coupling, comparatively new, is the vestibuled train. By this the entire train is made practically continuous from end to end, and all platforms and passages are protected from dust, wind and storm. Dining car, parlor car, smoking car, and in a measure, the sleeping car, have all been made possible, and are finally practically continuous, through the distinctively American construction of passenger coaches with aisles and with doors only at the ends.

Railway development in the United States has had to adapt itself to the needs of a new and rapidly growing country, a large part of which was first made available for settlement by railways. Different authorities give somewhat differing statements as to the first line constructed in this country, the disposition being to make a distinction between steam roads and others upon which steam was not at first used. Without doubt the first built was intended to supply the Quincy granite for the erection of the Bunker Hill monument. It was four miles in length, and was projected and constructed in 1826 by the man who invented the American "truck,"—making it possible to give to a car eight, and afterwards twelve, wheels instead of four,—Mr. Gridley Bryant, who afterwards also invented the turntable and the switch. This road was so graded as to be partially worked by gravity. The next construction was nine miles in length, built as a coal road, at Mauch Chunk, Penn. This was so constructed that the coal was borne away by gravity, the cars being returned by horses. The first experiment with locomotive steam power on an American road was on what is now the Baltimore and Ohio, though that road continued for some time afterwards to use horses. The first railroad which was constructed for the use of steam power was probably a short line in South Carolina, in 1827-28. The first road to use T rails was built between New Orleans and Lake Ponchartrain, curiously enough by the first graduate of the U. S. Military Academy, Gen. Swift. But all the first roads were works of absolute necessity. The first actual connecting line, constructed with a view to commerce which should grow, was the Baltimore and Ohio—1828-1833. This was followed by the Camden and Amboy, the Baltimore and Susquehanna, the Boston and Providence, and others. Since those times most American roads have been built to supply a want which was *created by themselves*. Economically considered this is the striking feature of a vast and involved system which, more than any other agency, is the cause of a growth and prosperity heretofore unequalled in the annals of civilization.

Three locomotives were imported from England in 1829, and the first trial in America took place on August 8, 1829, at Honesdale, Penn. The mileage completed amounted to 40 miles at the end of 1830, to 3,361 miles in 1841, and to 5,206 miles in 1847, of which 1,350 miles had been opened within six years.

Then there was a sudden and great increase, the yearly additions for seven years being 1,056 miles in 1848, 1,048 in 1849, 1,261 in 1850, 1,274 in 1851, 2,288 in 1852, 2,170 in 1853, 3,442 miles in 1854. The civil war checked railway construction, only 3,257 miles being opened during the five years ending with 1865, when the aggregate amounted to 32,996 miles.

Between 1865 and 1873, the mileage increased more than 100 per cent., including one road in operation and a second line in progress of construction to the Pacific coast. The greatest increase of this period was in the western and southwestern States, in which fully 25,000 miles of trackage were made ready for traffic. At the close of 1873 the total capital invested in railroads of the United States aggregated \$3,784,543,034 of which \$1,836,904,450 represented the bonded indebtedness. The depression which followed the panic of that year continued until 1879. In the latter year the construction again increased 100 per cent., and between 1874 and 1888, there were built 85,814 miles of new railroad. Since the revival of railroad construction in 1879 there have been completed three additional through transcontinental roads, and at least three great western railroad systems are now stretching westward in the direction of the same terminus. The total number of miles of railroad in the United States at the opening of the year 1889 was, in round numbers, 160,000, and the total share capital and indebtedness of all kinds of all the roads equaled \$9,369,398,954. The roads cost nearly \$60,732 per mile and the gross earnings of all the lines amounted to \$960,256,270. During 1888, the roads transported 451,353,655 passengers, an increase of 5.4 per cent. over the number carried in 1887, and 589,398,317 tons of freight, the value of the latter being estimated at \$14,633,957,925.

In the early days of railroad development improvements were made under and by virtue of charters granted by the State legislatures, and all railroad corporations are organized under a charter granted by some State. Later, railroad commissioners appointed by the various States have been created, and later still laws were adopted having special reference to the organization of companies for the purpose of constructing, operating and maintaining a line or lines of railway.

The laws governing the formation of railway corporations and authorizing railway construction differ in different States, but in most it is open to any association of men with the necessary capital to form a company and construct a railway anywhere. Generally the laws relating to raising and extending capital and the disposition of income are very lax, and under them great abuses have occurred. All but a very small number of the railways have been projected and constructed by private enterprise; but many companies have received aid from towns, cities, counties, or States, and the Federal Government and the State of Texas (the only State owning the public land within its borders) have subsidized many railways, mostly west of the Mississippi, by immense grants of public lands, in the aggregate amounting to 200,000,000 acres. The Federal Government also lent its bonds to the amount of \$65,000,000 to aid in the construction of lines between the Missouri and the Pacific coast. Between 1830 and 1840 several States undertook to construct railways on their own account; but all of these attempts ended in disaster, and the railways were completed by companies, if completed at all. There remain, however, two State railways, one 138 miles long owned by Georgia, which it leases to

a corporation for working, and the other by Massachusetts, mostly in the long Hoosac tunnel.

Some years ago legislation was had in a number of States designed to regulate the traffic rates of roads operating within their jurisdiction. The laws passed, however, were in some instances declared to be unconstitutional, and the questions raised were finally carried to the Supreme Court of the United States, where the decisions above referred to were reversed, and what has since been known as the "Granger Law" sustained. Commissions in the States also held diverse opinions respecting certain enactments on subjects connected with the operation of railroads. Finally the Inter-State Commerce Commission was organized as the representative of the national government, and began a systematic regulation of the traffic of railroads and other transportation companies between the States. The object of the commission seems to be to obtain a fixed and uniform charge for services rendered by the roads, and the opinion is gradually obtaining that the workings of the law will prove advantageous to the railroads, the public and the State governments.

The "railway pool," as it formerly existed, was an agreement by which at stated periods, the common business of competing lines was aggregated and apportioned upon agreed percentages, the lines in excess paying over to the lines in deficit such sums of money as were required to produce the necessary equalization among the shares of traffic assigned to the several roads. This custom exists in England to-day. Our interstate commerce law has abolished it at short order. No railway pools exist now in the United States. Most railroads charged greater proportionate rates upon a shorter than upon a longer haul on the same line of transportation. This was abolished by the "short-haul" section of the law. It overturned customs, rate-sheets, and classifications of long standing in every part of the land, and involved a great loss of revenue to the roads. But it was generally submitted to by the companies, in spite of being felt as a grievous burden. Taking everything into consideration the interstate commerce law has had a beneficial effect and justifies this new line of Federal legislation fully.

In conclusion it might be said that in no country in the world are the equipments and appointments for railway travel equal to those available in the United States. To a substantial road bed, thoroughly ballasted and laid with steel rails, is added rolling stock unsurpassed in respect to its construction, elegance and appliances for the promotion of the comfort of travelers. Superb dining cars, luxurious sleepers and buffet cars are features of every railway system, whose tourists can secure meals and sleeping accommodations equal to any obtainable at a first-class hotel, and at but a moderate cost. These acquisitions which have come into universal use in the United States are gradually being adopted in England and other European nations, where their advantages are conceded and commended.

RAIMBACH, ABRAHAM, line-engraver, a Swiss by descent, was born in London in 1776. Educated at Archbishop Tenison's Library School, he was an apprentice to J. Hall the engraver from 1789 to 1796. *The Village Politicians*, and *Rent Day*, the *Cut Finger*, *Blind Man's Buff*, the *Errand Boy*, *Distraint for Rent*, the *Parish Beadle*, and the *Spanish Mother and Child* raised him in the estimation of connoisseurs, the French especially holding him in great honor. At his death in 1843, he held a gold medal awarded to him for his *Village Politicians* at the Paris

Exhibition of 1814. He was elected corresponding member of the Institute of France in 1835.

RAIMONDI, MARCANTONIO. See MARCANTONIO.

RAIN. See METEOROLOGY and GEOLOGY.

RAINBAND. Every transparent substance is perfectly opaque to some particular kinds of light. A certain shade of orange light is absorbed by the vapor of water, and, when sunlight which has traversed a stratum containing this vapor is decomposed in a spectroscopy, the blank caused by the missing rays appears as a black band or group of fine lines. This is called the *rainband*, because from its intensity the amount of moisture in the atmosphere may be guessed at, and the occurrence of rain predicted with considerable certainty.

RAINBOW. See LIGHT.

RAINGAUGE (PLUVIOMETER, HYETOMETER, UDOMETER). The value of the measurement of rainfall (see METEOROLOGY) has long been understood, although it is within the last 100 years that trustworthy results have been obtained. Marriotte is claimed as the originator of the raingauge in 1677. The simplest form is an open vessel of uniform diameter exposed to the rain, in which the depth of water collected during any interval of time may be measured. Raingauges on this plan cannot be very accurate; their one advantage is that the area of the collecting surface does not require to be known. Almost all raingauges now used have a circular funnel of known diameter, which conducts the rain-water to a receiver, from which it may be poured into a special narrow measuring-glass so graduated that what would cover a space of the area of the funnel to the depth of one inch fills a portion of the glass large enough to be easily graduated into 100 parts. The funnel may have any diameter from three to twenty-four inches without introducing a greater discrepancy than 1 or 2 per cent. of the amount of rain collected, but five and eight inches are the diameters usually employed, and the measuring-glasses are graduated accordingly.

RAIPUR, a district of India, in the Chhatisgarh division of the Central Provinces, lying between  $19^{\circ} 48'$  and  $21^{\circ} 45'$  N. latitude, and  $80^{\circ} 28'$  and  $82^{\circ} 38'$  E. longitude, with an area of 11,855 square miles. It is bounded on the north by Bilaspur, on the east by Sambalpur and Patna, on the west by Balaghat, Bhandara, and Chanda, and on the south by Bastar and Jeypur.

The population of Raipur in 1881 was 1,405,171 (males 696,242, females 708,929). By religion 856,492 were Hindus, 14,991 Mohammedans, and 821 Christians. The only town with a population exceeding 10,000 is RAIPUR (see below). Attached to the district are four feudatory states, viz., Chhuikhadan (with 32,879 inhabitants), Kanker (63,610), Khairagarh (166,138), and Nandgaon (164,339). Their combined area is 2,658 square miles.

RAIPUR, chief town of the above district and headquarters of the Chhatisgarh division of the Central Provinces, is situated in  $21^{\circ} 15'$  N. latitude and  $81^{\circ} 41'$  E. longitude, on a plateau 950 feet above the sea-level. In 1881 its population amounted to 24,948 (12,447 males and 12,501 females). The modern town dates from 1830, and carries on a flourishing trade in grain, lac, cotton, etc.

RAIS, RAIZ, or RETZ, GILLES DE, marshal of France, seigneur of Hautpart, and of many other lordships, who was hanged and burned at Nantes in 1440, has left a name connected directly with one of the most horrible stories in history, and indirectly with other curious matter. Not much is known of Rais before the trial which made his name infamous. The crimes with which he was charged extended over some fourteen years. During that period it was alleged that he

had, through different agents, especially a woman called La Meffraie, kidnaped or enticed to his various abodes large numbers (Monstrelet says 160, others 140) of children. These children, after being subjected to every outrage of lust and cruelty, were sacrificed to the devil, their blood used for magical ceremonies, their bodies burned, and their bones buried in the precincts of Rais' castles. The ultimate purpose of this devil-worship was asserted to be the acquisition by Rais (who was assisted by divers sorcerers, especially an Italian imported for the purpose) of power and honors in the State. The depositions were full, and still exist; and on them and his confession Rais was executed.

RAISINS are the dried fruits of certain varieties of the grape vine, *Vitis vinifera*, which grow principally in the warm climate of the Mediterranean coasts, and are comparatively rich in sugar. "Raisins of the sun" are obtained by letting the fruit continue on the vines after it has come to maturity, where there is sufficient sunshine and heat in the autumn, till the clusters dry on the stocks. Another plan is to partially sever the stalk before the grapes are quite ripe, thus stopping the flow of the sap, and in that condition to leave them on the vines till they are sufficiently dry. The more usual process, however, is to cut off the fully ripe clusters and expose them, spread out, for several days to the rays of the sun, taking care that they are not injured by rain. In unfavorable weather they may be dried in a heated chamber, but are then inferior in quality. Of late years the chief source of supply for American raisins has been California, the quality of whose productions will compare favorably with those of any other part of the world. The greater proportion of the common large raisins of English commerce come from the provinces of Malaga, Valencia, and Alicante, in Spain; these are known by the common name of Malaga raisins.

RAJÁ (English form RAJAH), Sanskrit nom. sing. of the stem *raján* (in modern Indian vernaculars *rájá*, *rājah*, *rāja*, *rājan*, *rāzu*, *irāsen*, also the forms *rái*, *ráo*, *ríná* are traceable to the same stem) = king, prince, chief, from the root *rāj*, to be resplendent. In the oldest times the headman of any petty tribe was called *rájá* from the fact of his being conspicuous for the number of golden ornaments with which he was decked out. Then *rájá* became the common designation for a king, whether of a small tribe or of a large state. The constitution of all states was monarchical, mostly hereditary, occasionally also electoral, but in no case absolute, for the people had a voice in the government.

RAJAMAHENDRI (Rajamahendravaram, Rajah-mundry), a town of India, in the Godavari district, Madras presidency, situated on high ground on the left bank of the Godavari river in  $17^{\circ}$  N. latitude and  $81^{\circ} 49'$  E. longitude, and 365 miles northeast of Madras. Its population in 1881 numbered 24,555 (males 12,290, females 12,265). Rajamahendri was formerly the headquarters of a separate district of the same name, but is now incorporated with Godavari.

RÁJPUTÁNA, an immense tract of country in India, consisting of twenty states, having each its own autonomy and separate chief, besides the small British division of Ajmere, which is situated almost in the center of the province. These territories lie between  $23^{\circ}$  and  $30^{\circ}$  N. latitude, and between  $69^{\circ} 30'$  and  $78^{\circ} 15'$  E. longitude, and their combined area is approximately estimated at 130,000 square miles.

The census of 1881, which was the first general enumeration of population in Rájputána since England's connection with India, gave a total number (including Ajmere division) of 10,729,114. The mass of the people are occupied in agriculture. In the large towns banking and commerce flourish to a degree beyond what

would be expected for so backward a country. In the north the staple products for export are salt, grain, wool, and cotton, in the south opium and cotton; while the imports consist of sugar, hardware, and piece goods. Rájputána is very poor in industrial production. The principal manufactures are salt, cotton, and woolen goods, carvings in ivory, and working in metals, etc., all of which handicrafts are chiefly carried on in the eastern states. The system of agriculture is very simple; in the country west of the Aravallis only one crop is raised in the year, while in other parts south and east of the Aravallis two crops are raised annually, and various kinds of cereals, pulses, and fibers are grown.

RÁJSHÁHÍ or RAJESHAYE, a district of India, in the lieutenant-governorship of Bengal, forming the southwestern corner of the Rájsháhí with Kuch Behar division. It lies between  $24^{\circ} 3'$  and  $24^{\circ} 59'$  N. latitude and between  $88^{\circ} 21'$  and  $89^{\circ} 24'$  E. longitude, and is bounded on the north by the districts of Dinájpur and Bogra, on the east by Bogra and Pabna, on the south by the Ganges and Nuddea district, and on the west by Maldah and Murshidábád.

*Population.*—The census of 1881 gave a population, almost entirely rural, of 1,338,638. The only town with over 10,000 inhabitants was Rampur Beaulah (19,228), which is the chief town and administrative headquarters of the district. This town is situated on the north bank of the Ganges in  $24^{\circ} 22'$  N. latitude and  $88^{\circ} 39'$  E. longitude; it is of modern growth and is built for the most part on river alluvia. It was formerly the seat of the Dutch and East India Company's factories, and is still a center of the silk and indigo trade.

Rice is the staple crop of the district; other cereal crops are wheat, barley, and Indian corn, which are grown to a small extent; among miscellaneous crops are indigo, sugar-cane, mulberry, and tobacco. Ganja is also grown in a small tract to the north of the district. Silk spinning and weaving and the preparation of indigo are the chief manufactures, but these are now both declining. The total revenue of Rájsháhí in 1883-84 amounted to \$600,000, toward which the land-tax contributed \$440,000.

RÁKÓCZY, the name of an old and wealthy family of upper Hungary. SIGISMUND was on February 11, 1607, elected prince of Transylvania, but in the following year abdicated in favor of Gabriel Báthori, to whom succeeded Bethlen Gábor. Bethlen died in 1629, and GEORGE I., son of Sigismund, born in 1591, was, after the demission of Gábor's widow, Catherine of Brandenburg, November 26, 1631, elected prince of Transylvania by the estates. He died on October 24, 1648. GEORGE II. (1615-1660), son of the preceding, was chosen by the estates to succeed him as prince of Transylvania. His procedure against Poland provoked the hostility of the Turks, with whom he was engaged in continual war until his death at Grosswardein on June 26, 1660, from wounds received at the battle of Klausenburg. FRANCIS I. (1642-1676), son of the preceding, did not succeed his father as prince of Transylvania. He edited a volume of prayers, which had an extensive circulation in Hungary. He died on July 8, 1676. FRANCIS LEOPOLD (1676-1735), son of the preceding, was at the age of twelve along with his mother made prisoner by the Austrians, and by them was educated in a Jesuit college in Bohemia. In 1707 Rákóczy was elected prince of Transylvania, and on May 31st of this year the independence of Hungary was proclaimed. From this time, however, the fortunes of the Hungarian cause began to decline, and Rákóczy finally in despair, having refused an amnesty and offers of pardon, retired to the frontiers of Poland, after

which, on May 1, 1711, peace was concluded at Szatmár. Rákóczy refused to accept it, and retired to France and subsequently to Turkey, where he died at Rodosto on April 8, 1735.

RALEIGH, a city of the United States, the capital of North Carolina and the seat of justice of Wake county, is situated in  $35^{\circ} 47'$  N. latitude and  $78^{\circ} 48'$  W. longitude, a little to the northeast of the geographical center of the State, and occupies a kind of high ground in the upper valley of the Neuse, a river flowing southeast toward Pamlico Sound. It is the meeting-place of three railways—the Raleigh and Gaston, the Raleigh and Augusta, and the Richmond and Danville lines—and its railway distance from Portsmouth is 177 miles and from Washington 230. Raleigh is laid out round a park of ten acres called Union Square and divided into four sections by four broad streets which strike out symmetrically from this center; the fine old trees which were spared by the original settlers give it the sobriquet of "City of Oaks." Besides the State-house or capitol (a substantial granite structure in Union Square), the public buildings comprise the county court-house, the governor's mansion, the United States court-house and post-office (1875), the State geological museum, a State insane asylum, institutions for the blind and the deaf and dumb, the penitentiary, and the Shaw institute for the higher education of colored pupils. There are a normal school and a graded school system for both white and colored pupils. Raleigh is a center of the cotton and tobacco trades, has railway machine and car shops, and manufactures steam-engines, shuttle blocks and bobbins, ice, cotton-seed oil, fertilizers, hosiery, clothing, agricultural implements, carriages, carpentry, cigars, marble wares, etc. The population was returned at 12,678 in 1890. Raleigh was selected as the seat of government in 1788, was laid out in 1792, and made a city in 1794.

RALEIGH, SIR WALTER, admiral and courtier, was born at Hayes, in Devonshire, in 1552. In one way or another Raleigh's conduct gained the favorable notice of Elizabeth. In 1585 he became lord warden of the Stannaries, soon afterward he was vice-admiral of Devon and Cornwall, and in 1587 was captain of the guard. But he was one of those who were dissatisfied unless they could pursue some public object in connection with their chase after a private fortune. In 1583 he risked \$10,000 in the expedition in which Sir Humphrey Gilbert perished. In 1584 he obtained a charter of colonization, and sent Amadas and Barlow to examine the country which he named Virginia. In 1585 he dispatched a fleet laden with colonists. They were, however, soon discouraged, and were brought back to England by Drake in the following year. Shortly afterward fifteen fresh colonists were landed, and another party in 1587. All these, however, perished, and, though Raleigh did all that was possible to succor them, the permanent colonizing of Virginia passed into other hands.

In 1584 Raleigh obtained a grant of an enormous tract of land in Munster, in one corner of which he introduced the cultivation of the potato. To people that land with English colonists was but the counterpart of the attempt to exterminate its original possessors. This view of the policy of England in Ireland was not confined to Raleigh, but it found in him its most eminent supporter. Wherever the strife was hottest Raleigh was sure to be found. If he could not succeed in Ireland he would fight it out with Spain. In 1588 he took an active part against the Armada, and is even supposed by some to have been the adviser of the successful tactics which avoided any attempt to board the Spanish galleons. In 1589 he shared in the unsuccess-

ful expedition commanded by Drake and Norris, and for some time vessels fitted out by him were actively employed in making reprisals upon Spain.

Raleigh was a courtier as well as a soldier and a mariner, and as early as 1589 he was brought into collision with the young earl of Essex, who challenged him, though the duel was prevented. In the end of 1591 or the beginning of 1592 Raleigh seduced and subsequently married Elizabeth Throckmorton, and was consequently thrown into the Tower by Elizabeth, who could not endure that the fantastic love-making to herself which she exacted from her courtiers should pass into real affection for a younger woman. Previously to his imprisonment Raleigh had been forbidden to sail in command of a fleet of which a great part had been fitted out at his own cost for service against Spain. The ships, however, sailed, and succeeded in capturing a prize of extraordinary value known at the time as the "Great Carrack." No one but Raleigh was capable of presiding over the work of securing the spoils. He was sent to Plymouth, still in the name of a prisoner, where his capacity for business and his power of winning the enthusiastic affection of his subordinates were alike put to the test. The queen at last consented to restore him to complete liberty, though she tried to cheat him of his fair share of the booty.

Raleigh resolved to use his regained liberty on an enterprise more romantic than the capture of a carrack. The fable of the existence of El Dorado was at that time fully believed in Spain, and in 1594 Raleigh sent out Captain Wheddon to acquire information about the lands near the Orinoco. In 1595 he sailed in person with five ships for Trinidad. On his arrival he found that the Spaniards, who had occupied a place called San Thomè at the junction of the Orinoco and the Caroni, had been obliged to abandon it. Raleigh ascended the river to the spot, heard more about El Dorado from the Indians, brought away some stones containing fragments of gold, and returned to England to prepare a more powerful expedition for the following year. When he came back he published an account of his voyage. In the next year, 1596, however, he was wanted near home, and was compelled to content himself with sending one of his followers, Captain Keymis, to extend his knowledge of Guiana. He was himself called on to take the command of a squadron in the expedition sent against Spain under Lord Howard of Effingham and the earl of Essex. It was Raleigh who, on the arrival of the fleet off Cadiz, persuaded Howard and Essex to begin by an attack on the Spanish fleet, and who himself led the van in sailing into the harbor. Before long the Spanish fleet was thoroughly beaten, and all of it, except two vessels which were captured, was destroyed by the Spaniards themselves. Raleigh was wounded in the action, and the subsequent capture of Cadiz was carried out by others.

After the death of Essex the question of the succession assumed a pressing importance with the imminence of the close of Elizabeth's reign. Cecil, allying himself with the intriguing Lord Henry Howard, assured himself of James' favor, and poisoned his ear against Raleigh and Cobham. Into Raleigh's feelings at this time it is impossible to penetrate with certainty, but it can hardly be doubted that, though he professed himself ready to support James' claim, he did not throw his whole heart into the cause of the Scottish king. When James came to the throne, therefore, he was certain to come into conflict with Raleigh, and not being able to see the advantage of keeping about him men of different tempers he dismissed him from the captaincy of the guard, compelled him to surrender the wardenship of the Stannaries, suspended his patent of wine licenses as a monopoly, and

took from him the governorship of Jersey, though for this he gave him a pension to compensate for his loss. That which followed it is impossible to fathom to the bottom. Raleigh must have been very angry, and it is quite possible that he may have used violent language, and have even spoken of a Spanish invasion as preferable to the rule of James, or have declared his preference of the title of Arabella Stuart to that of the existing sovereign. The main witness against him was Cobham, and Cobham made and retracted his charges with such levity that it is impossible to trust to his evidence. Raleigh, however, was imprisoned, and, after attempting to commit suicide, was brought to trial at Winchester in November, 1603, when he was condemned to death. The king, however, commuted his sentence upon the scaffold to one of imprisonment.

During his imprisonment in the Tower Raleigh devoted himself to chemical experiments and to literary work. It was here that he composed so much of the *History of the World* as was ever finished, and that he also issued pamphlets on questions of passing politics.

Raleigh's thoughts had often turned to Guiana. An offer made by him in 1612 to send Keymis to the gold mine which he believed to exist near the Orinoco was rejected, but in 1616 he was himself released at the intercession of Villiers, on the understanding that he was to go in person to Guiana, and was to visit the gold mine. The expedition turned out badly. His sailors would not ascend the Orinoco unless he remained at the mouth to keep off the Spaniards. Those who ascended found a Spanish village in the way, and after a sharp fight drove the Spaniards out and burned the place. The mine, if it really existed, they never reached, and Raleigh had to return to England with failure on his head. He was soon arrested and lodged in the Tower. He was brought before the commission of the privy council. At last the commission decided against him, and he was sent to execution formally on his old sentence at Winchester, in reality for having allowed his men to shed Spanish blood after engaging that he would not do so. He was executed on October 29, 1618.

RAMAH. See SAMUEL.

RAMÁYÁNA. See SANSKRIT LITERATURE.

RAMBAN. R. MOSHEH BEN NAHMAN, or NACHMANIDES, was born before 1200 at Gerona, where he was rabbi and physician, and died between 1268 and 1270 in Palestine, probably at Acre. Although a Sepharadi in the later and larger sense of the word, he was the disciple of the greatest Provençal rabbis, and became the most celebrated Talmudist and cabalist of his age in his own country.

RAMBOUILLET, chief town of an arrondissement in the department of Seine-et-Oise, France, thirty miles southwest of Paris on the line to Brest, is a small place of 5,186 inhabitants, and derives its whole interest from the associations connected with the ancient château, which stands surrounded by a beautiful park of 2,965 acres and a wide forest dating from the fourteenth century.

RAMBOUILLET, CATHERINE DE VIVONNE, MARQUISE DE, a lady famous in the literary history of France, was born in 1588 and died in 1665.

RAMEAU, JEAN PHILIPPE, musical theorist and composer, was born at Dijon, September 25, 1683. Rameau first set forth his new theory in his *Traité de l'Harmonie* (Paris, 1722), and followed it up in his *Nouveau Système* (1726), *Génération Harmonique* (1737), *Démonstration* (1750), and *Nouvelles Réflexions* (1752). King Louis XV. appointed him composer to the court in 1745, and in 1764 honored him with a patent of nobility and the order of Saint Michael. But

these last privileges were granted only on the eve of his death, which took place in Paris on September 12, 1764.

RAMESES (Gen. xlvii. 11; Exod. xii. 37; Num. xxxiii. 3), or, with a slight change in the vowel points, RAAMSES (Exod. i. 11), the name of a district and town in Lower Egypt, is notable as affording the mainstay of the current theory that King Rameses II. was the Pharaoh of the oppression and his successor Menptah the Pharaoh of the exodus.

RAMESWARAM, a small island situated between Ceylon and India, at the entrance of Palk Strait in the Gulf of Manaar, in  $9^{\circ} 18'$  N. latitude and  $79^{\circ} 22'$  E. longitude. It is about fourteen miles long by five wide, is low and sandy, and for the most part uncultivated. The estimated population of the island is about 14,000. It contains one of the most venerated Hindu shrines, which for centuries has been the resort of thousands of pilgrims from all parts of India.

RAMMOHUN ROY. See ROY.

RÁMPUR, a native state of India, in the Rohilkhand division of the Northwestern Provinces, lying between  $28^{\circ} 26'$  and  $29^{\circ} 10'$  N. latitude and between  $78^{\circ} 54'$  and  $79^{\circ} 33'$  E. longitude. It is bounded on the north and west by the British district of Murádábád, and on the northeast and southeast by the district of Bareilly. The total area of the state is 945 square miles, with a population (1881) of 541,914 (males 282,359, females 259,555), of whom 302,989 were Hindus and 238,925 Mohammedans.

RÁMPUR, capital of the above state, stands on the left bank of the Kosila in  $28^{\circ} 48'$  N. latitude and  $79^{\circ} 4'$  E. longitude. The population of the town in 1881 numbered 74,250 (males 36,355, females 37,895); it is famous for fine shawls and damask, which are exported to all parts of India.

RAMPUR BEULEAH. See RÁJSHÁHÍ *ante*.

RAMSAY, ALLAN, author of the *Gentle Shepherd*, a pastoral drama in the Lowland Scotch dialect, was born in Lanarkshire in 1686. The *Gentle Shepherd* is the only production of Ramsay's that has much claim to remembrance. His lyrics for the most part are poor artificial imitations, adorned here and there with pretty fancies, but devoid of sincerity of feeling. A collection of *Fables*, published complete in 1730, part original, part translated from La Motte and La Fontaine, was Ramsay's last literary work, but he lived to an advanced age, dying in 1758, the year before the birth of Burns.

RAMSAY, ALLAN, portrait-painter, the eldest son of the author of *The Gentle Shepherd*, was born at Edinburgh about 1713. He died at Dover on August 10, 1784.

RAMSAY, ANDREW MICHAEL, commonly called the "Chevalier Ramsay," who was born at Ayr, Scotland, on January 9, 1686, is noteworthy as having been among the few writers not of French birth who are admitted by French criticism to have written in French with purity and scholarship. He died at St. Germain-en-Laye (Seine-et-Oise) on May 6, 1743.

RAMSAY, DAVID, American physician and historian, was the son of an Irish emigrant, and was born in Lancaster county, Penn., on April 2, 1749. From 1782 to 1786 he was a member of Congress. His interest in the revolutionary struggle led him to devote his leisure to the preparation of several historical works on the subject, and in 1785 he published in two volumes *History of the Revolution in South Carolina*, in 1789 in two volumes *History of the American Revolution*, in 1801 a *Life of Washington*, and in 1809 in two volumes a *History of South Carolina*. He was also the author of several minor works. He died at Charleston, on May 8, 1815, from a wound inflicted by a lunatic.

RAMSDEN, JESSE, astronomical instrument maker, was born at Salterhebble near Halifax, Yorkshire, in 1735. He died on November 5, 1800.

RAMSGATE, a seaport and watering-place of England, in the Isle of Thanet, Kent, and a "vill" of the old Cinque Port of Sandwich, is finely situated between chalk cliffs at the northern extremity of Pegwell Bay, on the London, Chatham and Dover Railway, seventy-nine miles east-southeast of London. Ramsgate was incorporated as a borough in 1884. The population of the urban sanitary district (area 2,278 acres) in 1871 was 19,640, and in 1881 22,683, or, including 638 fisherman at sea, 23,321.

RAMUS, PETER, or PIERRE DE LA RAMÉE, logician, was born at the village of Cuth in Picardy in the year 1515. He perished by the hands of hired assassins in the massacre of St. Bartholomew (1572).

The logic of Ramus enjoyed a great celebrity for a time, and there existed a school of Ramists boasting numerous adherents in France, Germany, and Holland. As late as 1626 Burgersdyck divides the logicians of his day into the Aristotelians, the Ramists, and the Semi-Ramists, who endeavored, like Goclenius of Marburg, to mediate between the contending parties. Ramus' works appear among the logical text-books of the Scottish universities, and he was not without his followers in England in the seventeenth century.

RAMUSIO. The noble family of Ramusio was one of note for literary and official ability during at least four generations.

PAOLO THE ELDER, born about 1443, the first of those thus commemorated, migrated in 1458 from Rimini to Venice, where he obtained full citizenship, studied law, and became a member of the magistracy, filling the offices of *vicario*, of judicial assessor, and of criminal judge under various administrators of the Venetian provinces on the continent. He died in 1506.

GIROLAMO, younger brother of Paolo, born 1450, had a notable history. After he had studied medicine at Padua public suspicion was roused against him in connection with the death of a lady with whom he had had some love passages, and this ran so high that he was fain, by help of his brother Paolo, to whom he transferred his property, to make his escape (about 1481-83) to Syria and to take up his abode at Damascus. In 1486 he removed to Beyrout, and died the same year, killed, as the family chronicler relates, by a surfeit of "certain fruit that we call *armellini* and *albiccocche*, but which in that country are known as *mazzafranchi*," a title which English sailors in southern regions still give to apricots in the vernacular paraphrase of *killjohns*.

GIAN BATTISTA, the eldest son of Paolo Ramusio and Tomyris Maccachio, was born at Treviso in 1485 (June 20th). Having been educated at Venice and at Padua, at an early age he entered the public service (1505), becoming in 1515 secretary of the senate and in 1533 secretary of the Council of Ten. He also served the republic in various missions to foreign states. A few days before his death Ramusio removed to Padua, and there died, July 10, 1557, at the age of seventy-two.

PAOLO (GIROLAMO GASPARE), was the only child of Gian Battista, and was born on July 4, 1532. Like his father he maintained a large correspondence with many persons of learning and note. He died in 1600.

GIROLAMO GIUSEPPE, the son of Paolo, was born at Venice in 1555. He entered the public service in 1577, and was employed in connection with various foreign missions. He died at Padua in 1611, and his posterity did nothing to continue the reputation of the family, official or literary.

RANCE, ARMAND JEAN LE BOUTHILLIER DE. See TRAPPISTS.

RANDERS, a town of Denmark, at the head of an amt in the province of North Jutland (Nørrejyland), on the Gudena, about eight miles above its junction with Randers Fjord, an inlet of the Cattegat. The population was 11,354 in 1870 and 13,457 in 1880.

Randers is best known in history as the scene of the assassination of Count Geerts by Niels Ebbesön in 1340. In the Middle Ages it had six churches and four monastic establishments—the oldest a Benedictine nunnery (1170). The Grey Friars' building was turned into a castle (Dronningborg) after the Reformation; its church was burned down in 1698.

RANDOLPH, JOHN, of Roanoke, American statesman, was descended from an influential and wealthy Virginian family, and was the third and youngest son of John Randolph of Cawsons, Chesterfield county, where he was born on June 2, 1773. His father having died in his infancy, his early years were passed under the care of his stepfather. He attended schools at Williamsburg and Princeton and for a short time studied at Columbia College, New York, but, although well read in modern works bearing on politics and philosophy, his own statement, "I am an ignorant man, sir," was in other respects not inaccurate. Both his religious and his political views were radical and extreme. At an early period he imbibed deistical opinions, which he promulgated with extreme eagerness. He was also so strongly opposed to the new constitution of the United States that he could not bear to hear Washington take the oath to support it. In order to assist in asserting the right of resistance to national laws, and to withstand the "encroachments of the administration upon the indisputable rights" of Virginia, he was in 1799 elected as a Democrat to Congress, where he sat, with the exception of two terms, till 1825. After the election of Jefferson as president in 1801 Randolph was elected chairman of the committee of ways and means. He took an active part in agitating for the reform of the judiciary, and in 1804 moved the impeachment of Judge Chase. The part he took in this matter tended to widen his breach with Jefferson, from whom he finally separated in 1806. Possessing considerable wit, great readiness, and a showy eloquence, he would undoubtedly have risen to high influence but for his strong vein of eccentricity and his bitter and ungovernable temper. The championship of State rights was carried by him to an extreme utterly quixotic, inasmuch as he not only asserted the constitutional right of Virginia to interpose her protest against the usurpation of power at Washington, but claimed that the protest should be supported by force. On account of his opposition to the war with England in 1812 he was not returned to Congress in 1813, but he was reelected in 1815. In 1825 he was elected to the United States Senate, where he continued to sit till 1827. In 1830 he was for a short time minister to Russia. He was elected to Congress in 1832, but died of consumption at Philadelphia before he took his seat, May 24, 1833.

RANDOLPH, THOMAS, an English poet, was born in Northamptonshire in 1605. He died under thirty in 1634, before his powers had reached their maturity. His principal works are—*The Muses' Looking-Glass, a Comedy; Amyntas, or the Impossible Dowry*, a pastoral acted before the king and queen; *Aristippus, or the Jovial Philosopher; The Conceited Pedlar; The Jealous Lovers, a Comedy; Hey for Honesty, down with Knavery, a Comedy*; and several other poems. His works have recently been edited by W. Carew Hazlitt.

RANGOON TOWN, a district in the Pegu division

of the province of British Burmah, situated in  $16^{\circ} 47'$  N. latitude and  $96^{\circ} 13'$  E. longitude, on the left bank of the Hlaing or Rangoon river at its junction with the Pegu and Pu-zwon-doung streams, twenty-one miles from the sea. In 1880 the town was detached from the surrounding area of the old district of Rangoon and constituted a separate district, the remainder of the country being formed into a distinct jurisdiction under the title of Hanthawady. Rangoon comprises an area of twenty-two square miles, with a population in 1881 of 134,176 (males 91,504, females 42,672); Hindus numbered 35,871, Mohammedans 21,169, Christians 9,741, and Buddhists 67,131.

RANGPUR, a district of British India, in the lieutenant-governorship of Bengal, lying between  $25^{\circ} 3'$  and  $26^{\circ} 19'$  N. latitude, and  $88^{\circ} 47'$  and  $89^{\circ} 56'$  E. longitude, is bounded on the north by Jalpaiguri district and Kuch Behar state, on the east by the Brahmaputra, separating it from Goalpara and Maimansinh, on the south by Bogra, and on the west by Dinajpur and Jalpaiguri. In 1881 the population was 2,097,964.

The district contains an area of 3,486 square miles, about three-fourths being under continuous cultivation. The staple crops are rice, wheat, and other grains, oil-seeds, and jute; among the miscellaneous crops are indigo, sugar-cane, betel-leaf, betel-nut, and mulberry for silkworms. Spare land capable of cultivation can hardly be said to exist—even the patches of waste land yield a valuable tribute of reeds and cane. Of industries the chief is the manufacture of paper from jute fiber; other products are striped cotton carpets, silk cloth woven from the cocoon of a worm fed on the castor-oil plant, baskets and mats, brass-ware, and ornaments carved in ivory and buffalo horn.

RANGPUR, principal town and administrative headquarters of the above district, is situated on the north bank of the Ghaghat river in  $25^{\circ} 44'$  N. latitude and  $89^{\circ} 17'$  E. longitude, and contains a population (1881) of 13,320.

RANJÍT SINGH (RUNJEET SINGH). See PUNJAB, INDIA.

RANKINE, WILLIAM JOHN MACQUORN, a descendant of old Scottish families, the Rankines of Carrick and the Cochranes of Dundonald by the father's side, and the Grahames of Dougalston by the mother's, was born at Edinburgh in 1820, and completed his education in its university. He was trained as an engineer under Sir J. Macneill, working chiefly on surveys, harbors, and railroads, and was appointed in 1855 to the chair of civil engineering in Glasgow, vacant by the resignation of Lewis Gordon, whose work he had undertaken during the previous session. He was a voluminous writer on subjects directly connected with his chair, besides contributing almost weekly to the technical journals. Rankine died in 1872.

RANPUR, a native state of India, in the province of Orissa in the lieutenant-governorship of Bengal, situated on the western boundary of the British district of Puri, in about  $20^{\circ}$  N. latitude and  $85^{\circ} 20'$  E. longitude. Its population in 1881 was 36,539 (18,382 males, 18,157 females). The only town is the rájá's place of residence, which consists of one long and wide street.

RANUNCULUS. Familiarly known as "buttercups," the species of this genus form the type of the order *Ranunculaceæ*. The genus is large as to number of species, which occur in most temperate countries in the northern and southern hemispheres, and, while they extend into arctic and antarctic regions, they show little or no tendency to inhabit tropical countries except on the higher mountains.

RAOUL ROCHETTE, DÉSIÉR, French archæologist, was born in 1783 at St. Amand in the depart-

ment of Cher. At his death in 1854 Raoul Rochette was perpetual secretary of the Academy of Fine Arts and a corresponding member of most of the learned societies in Europe.

RAOUX, JEAN, French painter, was born at Montpellier in 1677, and died at Paris in 1734. The list of his works is a long series of sets of the *Seasons*, of the *Hours*, of the *Elements*, or of those scenes of amusement and gallantry in the representation of which he was immeasurably surpassed by his younger rival Watteau.

RAPANUI, or EASTER ISLAND (*Paascheylandt*, *Osterinsel*, *Ile de Pâques*, etc.), the WAIHU or TEAPI of Cook, an island in the eastern part of the South Pacific, lying in 27° 8' S. latitude and 109° 25' W. longitude, 1,000 miles east of Pitcairn. It is rudely triangular in shape, with its hypotenuse twelve miles long running northeast and southwest, and its three angles marked by three volcanic peaks. The coasts have no natural harbors of any importance, and landing is difficult. There is no lack of fertile soil, and the climate is moist enough to make up for the absence of running water. At one time the island would appear to have been wooded, but it now presents only a few bushes (*Edwardsia*, *Broussonetia*, etc.), ferns, grasses, sedges, etc. The natives keep a few goats and a large stock of domestic fowls, and the French house which now owns a large part of the island feeds about 10,000 sheep.

RAPE OIL. This important fatty oil, known also as "sweet oil," is obtained from seeds of various cultivated varieties of the cruciferous genus *Brassica*, the parent form of the whole apparently being the wild navev, *B. campestris* (Lin.), the *B. præcox* of De Candolle.

The oil yielded by these seeds is, in physical and chemical properties, practically the same, the range of fluctuations not being greater than would be found in the oil of any specific seed under similar varying conditions of production. Newly pressed rape oil has a dark sherry color with, at first, scarcely any perceptible smell; but after resting a short time the oil deposits an abundant mucilaginous slime, and by taking up oxygen it acquires a peculiar disagreeable odor and an acrid taste. Refined by the ordinary process the oil assumes a clear golden yellow color.

The principal uses of rape oil are for lubrication and lighting; but since the introduction of mineral oils for both these purposes the importance of rape has considerably decreased.

RAPHAEL (רפאל, "God heals") first appears in literature in the book of Tobit, where in human disguise and under the name of Azarias ("God helps") he accompanies Tobias in his adventurous journey and conquers the demon Asmodæus. He is said to be "one of the seven angels [archangels] who present the prayers of the saints and enter into the presence of the glory of the Holy One." In the book of Enoch Raphael is the angel of the spirits of man, and it is his business to gather the souls of the dead in the place where they are reserved till the day of judgment—a conception which seems to imply a derivation from רפאים, "ghosts." In later Midrash Raphael appears as the angel commissioned to put down the evil spirits that vexed the sons of Noah with plagues and sicknesses after the flood, and he it was who taught men the use of simples and furnished materials for the "Book of Noah," the earliest treatise on materia medica, (Rönsch, *Buch der Jubiläen*, p. 385 seq.)

RAPHAEL, RAPHAEL SANZIO, born in 1483, was the son of Giovanni Santi, a painter of some repute in the ducal city of Urbino, situated among the Apennines on the borders of Tuscany and Umbria. On the death of his father in 1494 young Raphael (then aged eleven) was left in the care of his stepmother (his own mother, Magia Ciarla, having died in 1491) and of his uncle, a priest called Bartolomeo. In what year Raphael was apprenticed to Perugino and how the interval before that was spent are matters of doubt.

Before long Raphael appears to have been admitted to take a share in the execution of paintings by his master; and his touch can with more or less certainty be traced in some of Perugino's panels which were executed about 1502.

About 1502 Raphael began to execute independent works; four pictures for churches at Città di Castello were probably the earliest of these, and appear to have been painted in the years 1502-4.

From 1504 to 1508 Raphael's life was very stirring and active. In the first of 1504 he visited Urbino, where he painted two small panels for Duke Guidobaldo, the *St. George* and the *St. Michael* of the Louvre. His first and for him momentous visit to Florence was made toward the end of 1504, when he presented himself with a warm letter of recommendation from his patroness Joanna della Rovere to the gonfaloniere Pier Soderini. In Florence Raphael was kindly received, and, in spite of his youth (being barely of age), was welcomed as an equal by the majority of those great artists who at that time had raised Florence to a pitch of artistic celebrity far above all other cities of the world.

The transition in Raphael's style from his first or Perugian to his second or Florentine manner is well shown in the large picture of the *Coronation of the Virgin* painted for Maddalena degli Oddi, now in the Vatican, one of the most beautiful that he ever produced, and especially remarkable for its strong religious sentiment.

His first visit to Florence lasted only a few months; in 1505 he was again in Perugia painting his first fresco, the *Trinity and Saints* for the Camaldoli monks of San Severo, now a mere wreck from injury and restorations.

In 1506 Raphael was again in Urbino, where he painted for the duke another picture of *St. George* which was sent to England as a present to Henry VII.

Toward the end of 1506 Raphael returned to Florence, and there (before 1508) produced a large number of his finest works, carefully finished, and for the most part wholly the work of his own hand.

In 1508 Raphael was painting several important pictures in Florence; in September of that year we find him settled in Rome.

A series of rooms in the Vatican, over the Appartamenti Borgia, were already decorated with frescoes by Bonfigli, Perugino, Piero della Francesca, Andrea del Castagno, Signorelli, and Sodoma; but so rapidly had the taste of the time changed that Julius II. decided to sweep them all away, and re-cover the walls with paintings in the more developed but less truly decorative style of Raphael.

It was not without regret that Raphael saw the destruction of this noble series of frescoes. One vault, that of the *Stanza dell' Incendio*, painted by his master Perugino, he saved from obliteration; it still exists, well preserved, a most skillful piece of decorative work; and he also set his pupils to copy a number of portrait-heads in the frescoes of Piero della Francesca before they were destroyed.

The paintings in the stanze were only a small part of Raphael's work between 1509 and 1513. To this period belong the *Madonna of Foligno* (Vatican), painted in 1511 for Sigismondo Conti; it is one of his most beautiful compositions, full of the utmost grace and sweetness of expression, and appears to be wholly the work of his hand. It has suffered much from repainting. Of

about the same date are the gem-like *Garvagh Madonna* (National Gallery, bought for \$45,000 once in the possession of the Aldobrandini family), the *Diademed Virgin of the Louvre*, and the *Madonna del Pesce* at Madrid. The last is a very noble picture, but the design is more pleasing than the color, which, like other paintings of Raphael's at Madrid, suggests the inferior touch of a pupil; it was executed in 1513 for S. Domenico in Naples. In addition to other easel pictures a number of his finest portraits belong to this period—that of Julius II. (Uffizi), of which a good replica or contemporary copy exists in the National Gallery, the so-called *Fornarina* in the Palazzo Barberini, the *Baldassare Castiglione* of the Louvre, and the unfinished portrait of Federigo Gonzaga of Mantua.

Among the latest works of Raphael are the large *St. Michael and the Devil*, in the Louvre, signed "Raphael Urbinas pingebat, MDXVIII.," and the very beautiful portrait of the violin-player, in the Sciarra-Colonna Palace in Rome, also dated 1518; this last bears much resemblance to the painter himself. The British Museum possesses one of Raphael's finest portraits, though only a chalk drawing, that of his friend the painter Timoteo della Vite, a masterpiece of expression and vigor; it is executed in black and red, and is but little inferior in chromatic effect to an oil-painting; it is life-size, and is executed with wonderful skill and evident keen interest in the subject.

In 1519 Cardinal Giuliano de' Medici (afterward Clement VII.,) as bishop of Narbonne, ordered two altar-pieces for his cathedral—the one by Raphael, the other by Raphael's Venetian rival Sebastiano del Piombo. That by the latter painter is the noble *Resurrection of Lazarus*, now in the National Gallery, in the drawing of which the Venetian received important aid from Michelangelo. Several studies for Raphael's picture exist, showing that he at first intended to paint a Resurrection of Christ as a pendant to Sebastiano's subject, but soon altered his scheme into the Transfiguration. The eight or nine existing studies are scattered through the Oxford, Lille, Windsor, and some private collections. A great part of the lower group was unfinished at the time of the painter's sudden death in 1520, and a good deal of the heavy coloring of Giulio Romano is visible in it. On the death of Raphael the picture became too precious to send out of Rome, and Cardinal de' Medici contented himself with sending the *Resurrection of Lazarus* to Narbonne. *The Transfiguration* was bequeathed by him to the monks of S. Pietro in Montorio, in whose church it remained till it was stolen by Napoleon I. It now hangs in the Vatican Gallery.

A sober criticism of Raphael's architectural works must force one to refuse him a high position in this branch of art. In the church of S. Eligio and the Chigi chapel he is merely a copyist of Bramante, and his more original works show but little power of invention or even mastery of the first principles of architectural design. His details are, however, often delicate and refined (especially in the Palazzo Pandolfini), and he was supremely successful in the decorative treatment of richly ornamented interiors when he did not, as in some of the Vatican stanze, sacrifice the room to the frescoes on its walls.

Like other great artists, Raphael did not disdain to practice the lesser branches of art: a design for a silver perfume-burner with female caryatids is preserved in an engraving by Marco da Ravenna; and he also designed two handsome repoussé salvers for Agostino Chigi, drawings for which are now at Dresden. In designs for tarsia-work and wood-carving he was especially skillful; witness the magnificent doors and shutters of the stanze

executed by his pupil Giovanni Barile of Siena. The majolica designs attributed to him were by a namesake and relation called Raffaello di Ciarla; and though many fine dishes and ewers of Urbina and other majolica are decorated with Raphael's designs, they are all taken from pictures or engravings, not specially done by him for ceramic purposes. With the frivolty of his age Leo X. occasionally wasted Raphael's skill on unworthy objects, such as the scenery of a temporary theater; and in 1516 the pope set him to paint in fresco the portrait life-size of a large elephant, the gift of the king of Portugal, after the animal was dead. This elephant is also introduced among the stucco reliefs of the Vatican loggie, with the poetaster Barrabal sitting in mock triumph on its back.

Though Raphael himself does not appear to have practiced the art of engraving, yet this formed one of the many branches of art which were carried on under his supervision. A large number of his designs were engraved by his pupils Marcantonio Raimondi and Agostino Veneziano. These valuable engravings are from Raphael's sketches, not from his finished pictures, and in some cases they show important alterations made in the execution of the picture. Raimondi's engraving of the S. Cecilia of Bologna in design is very inferior to that of the actual painting. Several of Raphael's most important compositions are known to us only by these early engravings, e.g., the *Massacre of the Innocents* (engraved by Raimondi), which is one of his finest works, both for skillful composition and for masterly drawing of the nude. Another magnificent design is the *Judgment of Paris*, containing a large number of figures; the nude figure of Minerva is a work of especial force and beauty. A standing figure of Lucretia about to stab herself is also one of his most lovely figures. Many of Raphael's studies for Marcantonio's engravings still exist.

As an antiquary Raphael deserves to take the highest rank. His report to Leo X. in 1518 is an eloquent plea for the preservation of ancient buildings. In 1515 he had been appointed by Leo X. inspector of all excavations in Rome and within ten miles round. His careful study of the antique, both statues and modes of decoration, is clearly shown in many of his frescoes, and especially in the graceful stucco reliefs and painted grotteschi, of which he and his pupils made such skillful use in the decorations of the Vatican loggie, the Villa Madama, and elsewhere.

When we consider the immense field over which his labors were spread and the strong personal individuality which appears in all these varied branches of art, together with the almost incredible number of paintings that issued from his studio, it will be seen that he must have labored with an amount of unflagging industry which has perhaps never been surpassed, and that too in a time and in a city of which the social habits and luxurious splendor certainly threw every possible temptation in the way of steady application and regular work.

Among all the painters of the world none has been so universally popular as Raphael, or has so steadily maintained his preëminent reputation throughout the many changes in taste which have taken place in the last three and a half centuries. He died in 1520.

RAPIN, PAUL DE, sieur of Thoyras, French historian, was the son of Jacques de Rapin, avocat at Castres (Tarn), where he was born March 25, 1661. He died in 1725. Rapin was the author of a *Dissertation sur les Whigs et les Torys*, 1717. *L'Histoire d'Angleterre*, embracing the period from the invasion of the Romans to the death of Charles I., was printed at The Hague in 1724 in 8 vols.

RASGRAD or RESARGRAD, a town of Bulgaria, with

a station about two miles distant, on the Varna and Rustchuk Railway, is situated on the Byaly Lom, 970 feet above the sea-level. It has increased in population during the last fifty years from 3,000 to 10,000 inhabitants. In 1810 it was the scene of the defeat of the Turks by the Russians.

RASHBA (רשב"א) stands for three rabbins of various ages and various countries.

1. R. SHIME'ON BEN EL'AZAR was a Mishnic teacher of the second century.

2. RABBENU SHIMSHON BEN ABRAHAM of Sens wrote commentaries on various Mishnic treatises (see MISHNAH).

3. R. SHELOMOH BEN ABRAHAM (or Ben [Ibn] Addereth) was a disciple of Nachmanides, upon whom his master's mantle had fallen (see RAMBAN). He became chief rabbi of Barcelona. Here so many disciples from the neighboring provinces flocked to him as to excite emulation among the Jews in the capital of Castile, who thereupon appointed the German Rabbi Asher b. Yehiel (Rosh). At the same time religious questions poured in upon him from all Israel, so that it is a marvel how he could go through his mere clerical work.

RASHBAM. RABBENU SHEMUEL BEN MEIR, commonly called, from his title and the initials of his own and his father's names, Rashbam, was born at Rameru (Ramerupt near Troyes, in France) about 1080. He was almost the greatest Talmudist of his time, the only two excelling him till 1105 being Rashi and later on his own younger brother, Rabbenu Ya'akov, better known as Rabbenu Tham. He died about 1160.

RASHI (רש"י), that is, RABBENU SHELOMOH JARCHI (Solomon, son of Isaac), whence by Christian writers he is also called Isacides, born in 1040, was the greatest rabbi of the Middle Ages. He is equally important for Biblical and Talmudic study, and in the former connection as interesting to Christians as to Jews from the influence of his exegesis on Luther's Bible and on the English version of the Old Testament (mainly through Ibn 'Ezra, and still more through Kimhi). Rashi is the most eminent of the "sages" or "great men of Lothaire" (לוֹתֵיר, *i.e.*, Lorraine) in whom culminated that movement of Jewish scholarship to which Charlemagne had given the first impulse. He died in 1105.

RASHT (also Räscht, Rescht, Rashd, and Resht), a town in northern Persia, situated in 37° 18' N. latitude and 49° 37' E. longitude, capital of the richly wooded maritime province of Gilan, contains from 15,000 to 20,000 inhabitants.

RASK, RASMUS CHRISTIAN, an eminent scholar and philologist, was born at Brändekilde in the Island of Fünen or Fyen in Denmark in 1787. He died at Copenhagen on November 14, 1832.

RASKOLNIKS. See RUSSIA.

RASPBERRY. See HORTICULTURE.

RASTATT, or RASTADT, a small town in Baden, is situated on the Murg, four miles above its junction with the Rhine and twelve miles southwest of Carlsruhe. The industry of Rastatt is almost confined to local needs, and the town may be said to live on the garrison, which forms nearly half of its population (1885) of 11,743. Two-thirds of the inhabitants are Roman Catholics.

RASTELL, the name of two early English printers.

I. JOHN RASTELL or RASTALL, printer and author, was born at London toward the end of the fifteenth century. He died at London, leaving two sons—William, printer and judge (see below), and John, a justice of the peace.

II. WILLIAM RASTELL, printer and judge, son of the above, was born in London about 1508. He died at Louvain on August 27, 1565.

RASTRICK, an urban sanitary district in the West Riding of Yorkshire, is situated on an acclivity near the Calder, and on the Lancashire and Yorkshire Railway five miles southeast of Halifax and three and one-half north of Huddersfield. It possesses woolen and silk manufactures, and there are stone quarries in the neighborhood. The population of the urban sanitary district (area, 1,371 acres) in 1871 was 5,896, and in 1881 it was 8,039.

RAT. Under the article MOUSE an account has been already given of the relationships and chief allies of the animals known as rats, and the present article is confined to the two species to which the name rat is most strictly applicable. These are the so-called old English black rat, *Mus rattus*, and the common brown or Norway rat, *M. decumanus*. The first of these is a comparatively small and lightly built animal, seldom exceeding about seven inches in length, with a slender head, large ears, and a long thin scaly tail about eight or nine inches in length. Its color is, at least in all temperate climates, a peculiar shining bluish black, rather lighter on the belly, the ears, feet, and tail being also black; but in tropical regions it is represented by a gray or rufous-backed and white-bellied race to which the name of Alexandrian rat (*M. alexandrinus*) has been applied, owing to its having been first discovered at Alexandria, but which cannot be considered to be really specifically distinct from the true black rat. Its disposition is milder and more tamable than that of *M. decumanus*, and it is therefore the species to which the tame white and pied rats kept as pets commonly belong. It is said that in some parts of Germany *M. rattus* has been lately reasserting itself and increasing at the expense of *M. decumanus*, but this seems very unlikely from the previous history of the two animals.

The brown or Norway rat, *M. decumanus*, is a heavily built animal, growing to eight or nine inches in length, with a bluff rounded head, small ears, and a comparatively short tail—always shorter than the head and body combined, and generally not longer than the body alone. Its color is a uniform grayish brown above, and white below, the ears, feet, and tail being flesh-colored; melanistic varieties are by no means rare, and these are often mistaken for true black rats, but the differences in size and proportions form a ready means of distinguishing the two. The brown rat is believed to be a native of western China, where a wild race has been recently discovered so like it as to be practically indistinguishable. The two species agree fully in their predaceous habits, omnivorous diet, and great fecundity. They bear four or five times in the year from four to ten blind and naked young, which are in their turn able to breed at an age of about six months. The time of gestation is about twenty days.

RATAFIA is a term applied to a flavoring essence, the basis of which is the essential oil of bitter almonds. Peach kernels are properly the source of ratafia, but any of the other substances yielding bitter almond oil is used. The name "ratafia" is also applied in France to a variety of liquors, and from Dantzic a special liqueur is sent out under the name of "ratafia."

RATEL. The animals known as Ratels or Honey-badgers are small clumsy-looking creatures of about the size and appearance of the true badgers, and belong to the same natural group of the *Carnivora*, namely, the subfamily *Melinæ* of the large family *Mustelidæ*, which contains the otters, badgers, stoats, weasels, etc. Of the ratels two species are generally recognized, viz., the Indian Ratel (*Mellivora indica*), a native of all the peninsula of India, and the African (*M. ratel*), which ranges over the whole of the African continent. All the ratels are of much the same color, namely, iron-gray

on the upper parts of the head, body, and tail, and black below, a style of coloration rather rare among mammals, as the upper side of the body is in the great majority darker than the lower.

RATHENOW, a small town of Prussia in the province of Brandenburg, lies on the right bank of the Havel, forty-four miles to the west of Berlin. It is known for its "Rathenow stones," *i.e.*, bricks made of the clay of the Havel, and for its spectacles and optical instruments, which are exported to various parts of the world. It contains no buildings of note. The population in 1889 was 11,394, including 174 Roman Catholics and 68 Jews.

RATIBOR (Polish, *Raciborz*), a town of Prussian Silesia in the department of Oppeln, is pleasantly situated on the left bank of the Oder at the point where the river becomes navigable, about twelve miles from the Austrian frontier. The population in 1889 was 18,373, or, including the immediately adjacent villages, 27,100, five-sixths of whom are Roman Catholics.

RATIONALISM. In modern usage the term "rationalism" is employed almost exclusively to denote a theological tendency, method, or system, and is then applied in a narrower and a wider sense. In its wider sense, which is most common in English theological literature, it is the name of that mode of thought generally which finds the final test of religious truth in the human understanding, conscience, or reason, and particularly in the understanding. In its narrower sense, which is almost the only sense it bears in Germany, it denotes a definite school, or rather phase of theological thought, and a phase of thought which has now been outlived.

German rationalism was a specific theological form of the general intellectual movement of the last century known as "illuminism" or *Aufklärung*; but while the illuminati generally ended in rejecting Christianity, the rationalist retained and defended it in a form approved by the logical understanding or the moral sense. While rationalism, as a child of the general intellectual movement of the age in which it appeared, owed much to the philosophy, science, and humanism of the intellectual life of Europe, as a specially theological tendency it was powerfully influenced by English deistical writings. Thus both orthodoxy and pietism were agents in calling forth rationalism, which was to prove the most dangerous opponent to both. More than one of the foremost rationalists had passed through the school of pietism.

Regarding rationalism as the opponent of supernaturalism and naturalism, and as an opponent which appealed in the conflict almost exclusively to either the logical understanding or the moral sense as the criterion of religious truth, it may be said to have existed in Germany for nearly a century (*c.* 1740-1836), and to have flourished about half that length of time (*c.* 1760-1810)—that is, it took its rise simultaneously with the publication of Wolff's writings (1736-50) and the translation into German of the works of the English deists (Tindal's *Christianity as Old as the Creation* was translated in 1741), displayed its greatest strength in Semler's critical works (1760-73) and in Kant's philosophy (1781-93), began then to decline gradually under the influence of the works of Herder, Jacobi, Fichte (in his later period), and Hegel, and at last died out when Schleiermacher especially, in the department of theology proper, and Baur and Strauss, among others, in the department of Biblical criticism, had given currency to ideas and issues which rendered its main contentions objectless and its criteria of religious truth invalid.

It was in the application of its principles and method to Biblical studies that rationalism won its greatest triumphs, and really accomplished its greatest measure of

good work. Johann Salomo Semler (1725-1791), the father of modern Biblical criticism, as the Germans call him, was the greatest representative of the school in this department. A pietist by education, with something of Gottfried Arnold's liking for heretics and all his dislike of ecclesiasticism, but with none of Arnold's mysticism, a man of immense learning, without any clear and systematic management of it, he was the first German to apply the strict principles of historical criticism, in conjunction with the rationalistic truths and errors of his day, to the study of the Scriptures and ecclesiastical history, particularly the history of doctrines. He assailed with all the wealth of his learning the traditional view of the limits and authority of the Biblical canon especially, and having, as he held, demonstrated its human origin and fallibility, he proceeded to deal freely with the books composing it, as sharing the failings common to everything human. He found the Scriptures pervaded with "local ideas," and his Christianity was really limited to the "natural religion" of the deists and the moral truths taught by Christ. As a man who had been under a pietistic training, he was, it is true, unwilling to refer to the understanding alone for evidence of the truths of Christianity, but his enlargement of the test is confined to the admission of an appeal to the measure of virtue and happiness produced. By this extended test he tries the matter of the Scriptures, assigning to his category of local ideas "whatever is not adapted to make men wise unto their true advantage." The supernatural origin of the Scriptures as writings and most of the miracles recorded in them he rejected; but, on the other hand, he was a vigorous opponent of the adversaries of Christianity and of the naturalists who denied revelation altogether—Reimarus, for instance, the author of the *Wolfenbüttel Fragmente*. Other decided rationalists contemporaneous with Semler were Teller (1734-1804), Eberhard (1739-1809), and Steinbart (1738-1809), who all agreed in confounding religion with morality, and in reducing Christianity to a popularization of utilitarian morals.

RATISBON (German, *Regensburg*), an ancient city of Bavaria, the seat of a bishop, and the capital of the Upper Palatinate, is pleasantly situated on the right bank of the Danube, opposite the influx of the Regen, from which it derives its German name. It lies almost exactly in the center of the kingdom, about sixty-five miles to the northeast of Munich and fifty-three miles to the southeast of Nuremberg.

The town-house, a somewhat gloomy pile, dating in part from the fourteenth century, contains the rooms occupied by the imperial diet of Germany from 1663 to 1806. An historical interest also attaches to the Golden Cross Inn, where Charles V. made the acquaintance of the fair Barbara Blumberger, the mother of Don John of Austria. Among the chief manufactures of Ratisbon are iron and steel wares, pottery, parquet flooring, and lead pencils. Boat-building is also prosecuted, and a brisk transit trade is carried on in salt, grain, and timber. In 1880 the town contained 34,516 inhabitants.

RATLAM or RUTLAM, a native state of India, in the Western Malwa Agency (Central India Agency), lying between 23° 2' and 23° 36' N. latitude and 74° 42' and 75° 17' E. longitude, with an area of 729 square miles, and a population (1881) of 87,314 (males 45,779, females 41,535), Hindus numbering 54,034, Mohammedans 9,913, Jains 6,038, Christians 19, and aboriginals 17,297.

RATNARIGI or RUTNAGHERRY, a British district of India, in the Konkan division of the Bombay presidency, with an area of 3,922 square miles. It lies

between  $15^{\circ} 40'$  and  $18^{\circ} 5'$  N. latitude and  $73^{\circ} 5'$  and  $73^{\circ} 55'$  E. longitude, and is bounded on the north by the Savitri river, separating it from the Janjira Agency, and by Kolaba district; on the east by the Western Ghats, dividing it from the districts of Satara and Belgaum and the native state of Kolhapur; on the south, where it is reduced to a strip of sea-coast not more than four miles wide, by the Portuguese possessions of Goa; and on the west by the Arabian Sea. In 1889 the population of Ratnagiri district was 997,090.

Ratnagiri formed part of the dominions of the peshwa, and was annexed by the British Government in 1880 on the overthrow of Baji Rao.

RATNAGIRI or RUTNAGHERRY, chief town of the above district, is situated on the Konkan coast in  $16^{\circ} 59'$  N. latitude and  $73^{\circ} 19'$  E. longitude, 136 miles south-by-east of Bombay. A leading industry connected with the town is the sardine fishery, which usually takes place in January and February, and engages fleets of canoes. A single net-caster will fill his canoe in the course of a morning. The lighthouse was erected in 1867; its light, visible eighteen miles distant, is 250 feet above high water. The population of the town in 1881 numbered 12,616 (males 6,418, females 6,198).

RATRAMNUS, a theological controversialist of some mark, who flourished in the ninth century, was a monk of the Benedictine abbey of Corbie near Amiens, but beyond this fact almost nothing of his personal history has been preserved. He is now best known by his treatise on the Eucharist (*De Corpore et sanguine Domini liber*), in which he controverted the doctrine of transubstantiation as taught in a similar work by his contemporary Radbertus Paschasius.

RATTAN. See CANE and PALM.

RATTAZZI, URBANO, Italian statesman, was born on June 29, 1808, at Alessandria, and from 1838 practiced with great success at the bar. In 1848 he was sent to the chamber of deputies in Turin as representative of his native town. The defeat at Novara compelled the resignation of Rattazzi in March, 1849. His election as president of the chamber in 1852 was one of the earliest results of the so-called "connubio" with Cavour, and having become minister of justice in 1853 he in that and the next following years was able to carry a number of measures of reform of considerable importance. He was intrusted with the formation of a new ministry in March, 1862. He was again prime minister in 1867, from April to October. His death took place at Frosinone on June 5, 1873.

RATTLESNAKE. Rattlesnakes are a small group of the family of Pit-vipers (*Crotalidæ*), characterized by a tail which terminates in a chain of horny, loosely connected rings, the so-called "rattle." The "pit" by which the family is distinguished from the ordinary vipers is a deep depression in the integument of the sides of the snout, between the nostrils and the eye; its physiological function is unknown. The rattle is a complicated and highly specialized organ, developed from the simple conical scale or epidermal spine, which in the majority of snakes forms the termination of the general integument of the tail. The bone by which the root of the rattle is supported consists of the last caudal vertebræ, from three to eight in number, which are enlarged, dilated, compressed, and coalesced. This bone is covered with thick and vascular cutis, transversely divided by two constrictions into three portions, of which the proximal is larger than the median, and the median much larger than the distal. This cuticular portion constitutes the matrix of a horny epidermoid covering which closely fits the shape of the

underlying soft part and which is the first commencement of the rattle, as it appears in very young rattlesnakes before they have shed their skin for the first time. When the period of a renewal of the skin approaches a new covering of the extremity of the tail is formed below the old one, but the latter, instead of being cast off with the remainder of the epidermis, is retained by the posterior swelling of the end of the tail, forming now the first loose joint of the rattle. This process is repeated on succeeding exuviations—the new joints being always larger than the old ones as long as the snake grows. Perfect rattles therefore taper toward the point, but generally the oldest (terminal) joints wear away in time and are lost. As rattlesnakes shed their skins more than once every year, the number of joints of the rattle does not indicate the age of the animal but the number of exuviations which it has undergone. The largest rattle in the British Museum has twenty-one joints. The rattle consists thus of a variable number of dry, hard, horny cup-shaped joints, each of which loosely grasps a portion of the preceding, and all of which are capable of being shaken against each other. If the interspaces between the joints are filled with water, as often happens in wet weather, no noise can be produced. The motor power lies in the lateral muscles of the tail, by which a vibratory motion is communicated to the rattle, the noise produced being similar to that of a weak child's rattle and perceptible at a distance of from ten to twenty yards.

The habit of violently and rapidly agitating the tail is by no means peculiar to the rattlesnake, but has been observed in other venomous as well as innocuous snakes with the ordinary termination of the tail, when under the influence of fear or anger. The special object for which the rattle has been developed in these snakes is unknown.

Rattlesnakes are entirely confined to the New World. North-American authors distinguish now a great number of different kinds, the most recent, Garman (*Reptiles and Batrachians of North America*, 1883, 4to), enumerating twelve distinct species and thirteen additional varieties; but all these species or varieties fall into two groups, viz., one which has the upper side of the head covered with the ordinary nine dermal shields, and the other in which the shields between and behind the eyes are broken up or replaced by small scales. The former group consists of two species only, of comparatively small size, both North American, *Crotalus miliarius* being the more generally known. The second group comprises the more formidable kinds of South as well as North America, which are generally described under the names of *C. horridus* and *C. durissus*.

RAU, KARL HEINRICH, German political economist, was born at Erlangen on November 23, 1792. He was elected a corresponding member of the French Institute in 1856. After a useful and honorable career he died at Heidelberg on March 18, 1870.

His principal work is the *Lehrbuch der politischen Oekonomie* (1826-37), an encyclopædia of the economic knowledge of his time, written with a special view to the guidance of practical men. The doctrines are, in the main, those of Smith and Say; but they are treated in an independent manner, and the conclusions of his predecessors are modified, especially by giving larger scope to the action of the state.

RAUCH, CHRISTIAN DANIEL, one of the most celebrated sculptors of modern times, was born at Arolsen, in the principality of Waldeck, on January 2, 1777. He died December 3, 1857.

RAUMER, FRIEDRICH LUDWIG GEORG VON, German historian, was born at Wörlitz in Anhalt, on May

14, 1781. He died at Berlin on June 14, 1873. Raumer made many contributions to history, in all of which he embodied the results of independent research and gave evidence of a sound and penetrating judgment. His style is direct, lucid, and vigorous, and his best books have been as warmly appreciated by ordinary readers as by scholars.

1 RAUPACH, ERNST BENJAMIN SALOMO, German dramatic writer, was born on April 21, 1784, at Staupitz, a village near Liegnitz in Silesia. He died at Berlin on March 18, 1852.

RAVAILLAC, FRANÇOIS, the assassin of Henry IV. of France, was born near Angoulême in 1578. Various disappointments tended to foster a violently fanatical temperament, and widely-spread rumors that the king was intending to make war upon the pope suggested to him the idea of assassination, which he deliberately and successfully carried out on May 14, 1610. He was put to death by torture on May 27th.

RAVEN, the largest of the birds of the order *Passeres*, and probably the most highly developed of all birds. The raven breeds very early in the year, in England resorting to its nest, which is usually an ancient if not an ancestral structure, about the middle or toward the end of January. Therein are laid from five to seven eggs of the common Corvine coloration, and the young are hatched before the end of February. In more northern countries the breeding-season is naturally delayed, but everywhere this species is almost if not quite the earliest of birds to enter upon the business of perpetuating its kind. The raven measures about twenty-six inches in length, and has an expanse of wing considerably exceeding a yard. Its bill and feet are black and the same may be said of its whole plumage, but the feathers of the upper parts, as well as of the breast are very glossy, reflecting a bright purple or steel-blue. The species inhabits the whole of Europe, and the northern if not the central parts of Asia; but in the latter continent its southern range is not well determined. In America it is, or used to be, found from the shores of the Polar Sea to Guatemala if not to Honduras, but is said hardly to be found of late years in the eastern part of the United States. In Africa its place is taken by three allied but well-differentiated species.

RAVENNA, chief city of an Italian province of the same name, contained 18,571 inhabitants according to the census of 1881. It is situated in the northeast of Italy, in 44° 25' N. latitude and 12° 12' E. longitude, about four miles from the Adriatic, with which it is now connected by the Corsini Canal, the two small rivers Ronco and Montone no longer serving as means of communication between the city and the sea. A railway, twenty-six miles long, unites Ravenna with Castel Bolognese on the line from Bologna to Rimini.

RAVENSBURG, an industrial town of Würtemberg, is pleasantly situated amid vine-clad hills on the small river Schussen, twelve miles to the north of Friedrichshafen on the Lake of Constance. The industrial products of Ravensburg are varied, including linen, cotton, embroidered muslins, pottery, glass, and playing cards. The fruit market is of considerable importance, and trade is also carried on in cattle, grain, and wood. The population in 1880 was 10,550, of whom 2,620 were Protestants.

RÁWAL PINDÍ or RAWUL PINDEE, a district of British India, in the division of the same name, under the jurisdiction of the lieutenant-governor of the Punjab, lying between 33° and 34° N. latitude and 71° 46' and 73° 41' E. longitude. It is situated on the southern slopes of the northwestern extremities of the Himálayas, and contains large mountain tracts, with

rich valleys traversed by many mountain torrents. Its area is 4,861 square miles.

The population in 1881 was 820,512 (males 449,287 females 371,225), Hindus numbering 86,162, Moham medans 711,546, Sikhs 17,780, Christians 3,822, and "others" 202. The only town with a population exceeding 10,000 is the capital. The inhabitants are mostly scattered in small hamlets over the surface of the country. The staple product is wheat in the spring and bajra in the autumn. Inferior grains are giving place to more valuable cereals, and to cotton and potatoes.

RÁWAL PINDÍ or RAWUL PINDEE, principal town and administrative headquarters of the above district, lies in 33° 37' N. latitude and 73° 6' E. longitude. The population of the town in 1881 was 52,975 (35,985 males and 16,990 females).

RÁWANDÍS. See MOHAMMEDANISM.

RAWITSCH (Polish *Ravicz*), a small manufacturing town of Prussia in the province of Posen, lies near the Silesian frontier, thirty-seven miles to the north of Breslau. The population in 1880 was 12,260, made up of 7,587 Protestants, 3,539 Roman Catholics, and 1,123 Jews. Rawitsch is of comparatively modern origin, having been founded by Protestant refugees from Silesia during the Thirty Years' War.

RAWMARSH, a large village and urban sanitary district in the West Riding of Yorkshire, is situated on the ridge of a hill above the valley of the Don and on the Midland Railway, two miles north of Rotherham and twelve southwest of Doncaster. It possesses extensive iron-works and steel rolling-mills, and there are collieries in the neighborhood. The population of the urban sanitary district (area, 2,578 acres) in 1871 was 6,869, and in 1891 it was 11,983.

RAWTENSTALL, a town of east Lancashire, is situated on the Lancashire and Yorkshire railway, eight miles north of Bury and twelve southeast of Blackburn. The cotton and woolen mills are very extensive, and in the neighborhood there are stone quarries. The population of the urban sanitary district (area, 1,667 acres) in 1871 was estimated at 11,307, and in 1881 it was 12,571.

RAY. The rays (*Batoidei*) together with the sharks (*Selachoidei*) form the suborder *Plagiostomata* of cartilaginous fishes, and are divided into six families.

The first family contains only the Saw-fishes (*Pristis*), of which five species are known, from tropical and subtropical seas. Although saw-fishes possess all the essential characteristics of the rays proper, they retain the elongate form of the body of sharks, the tail being excessively muscular and the sole organ of locomotion. The "saw" is a flat and enormously developed prolongation of the snout, with an endoskeleton which consists of from three to five cartilaginous tubes; these are, in fact, merely the rostral processes of the cranial cartilage and are found in all rays, though they are commonly much shorter. The integument of the saw is hard, covered with shagreen; and a series of strong teeth, sharp in front, and flat behind, are embedded in it, in alveolar sockets, on each side. The saw is a most formidable weapon of offense, by means of which the fish tears pieces of flesh off the body of its victim, or rips open its abdomen to feed on the protruding intestines.

The third family, *Torpedinidæ*, includes the electric rays. The peculiar organ by which the electricity is produced the fish uses voluntarily either to defend itself or to stun or kill the smaller animals on which it feeds. To receive the shock the object must complete the galvanic circuit by communicating with the fish at two distinct points, either directly or through the medium of some conducting body. The electric currents created

in these fishes exercise all the other known powers of electricity. All the rays of this family have, like electric fishes generally, a smooth and naked body.

The fourth family, *Raiidae*, comprises the skates and rays proper, or *Raia*. More than thirty species are known, chiefly from the temperate seas of both hemispheres, but much more numerous from the northern than the southern. A few species descend to a depth of nearly 600 fathoms, without, however, essentially differing from their surface congeners. Rays, as is sufficiently indicated by the shape of their body, are bottom-fishes, living on flat sandy ground, generally at no great distance from the coast or the surface.

The members of the fifth family, *Trygonidae* or Sting-rays, are distinguished from the rays proper by having the vertical fins replaced by a strong spine attached to the upper side of the tail. Some forty species are known, which inhabit tropical more than temperate seas. The spine is barbed on the sides, and is a most effective weapon of defense; by lashing the tail in every direction the sting-rays can inflict dangerous or at least extremely painful wounds.

The rays of the sixth and last family, *Myliobatidae*, are popularly known under various names, such as "devil-fishes," "sea-devils," and "eagle-rays." In them the dilatation of the body, or rather the development of the pectoral fins, is carried to an extreme, while the tail is very thin and sometimes long like a whipcord. Caudal spines are generally present and similar to those of the sting-rays; but in the pectoral fin a portion is detached and forms a "cephalic" lobe or pair of lobes in front of the snout. The dentition consists of perfectly flat molars, adapted for crushing hard substances. In some of the eagle-rays the molars are large and tessellated, in others extremely small. Of the twenty species which are known, from tropical and temperate seas, the majority attain to a very large and some to an enormous size; one mentioned by Risso, which was taken at Messina, weighed 1,250 pounds.

RAY or WRAY (as he wrote his name till 1670) JOHN, sometimes called the father of English natural history, was the son of the blacksmith of Black Notley near Braintree in Essex. There he was born, November 29, 1628, or, according to other authorities, some months earlier.

In 1667 Ray was elected a fellow of the Royal Society, and in 1669 he published in conjunction with Willughby his first paper in the *Philosophical Transactions* on "Experiments concerning the Motion of Sap in Trees." He lived to the age of seventy-six, dying January 17, 1705.

RAYMOND LULLY. See LULLY.

RAYMOND, OF SABUNDE (Sebonde, Sebeyde, etc.) appears to have been born at Barcelona toward the end of the fourteenth century. He combined the training of a physician and a theologian, and was professor of theology at Toulouse, seemingly from the year 1430 onward. He published there in 1436 his chief work, *Theologia Naturalis, sive liber creaturarum*.

RAYNAL, GUILLAUME THOMAS FRANÇOIS, French author, was born on April 12, 1713, in the province of Rouergue. He did not a little journalism and book-making of divers kinds; but his name would be entirely forgotten were it not for the *Histoire philosophique et politique des Établissements et du Commerce des Européens dans les Deux Indes*. He died on March 6, 1796.

RAZORBILL or RAZOR-BILLED AUK, known also on many parts of the British coasts as the marrot, murre, scout, tinker, or willock—names which it, however, shares with the guillemot, and to some extent with the puffin—a common sea-bird of the North-

ern Atlantic, resorting in vast numbers to certain stations on rocky cliffs for the purpose of breeding, and, its object being accomplished, returning to deeper waters for the rest of the year. It is the *Alca Torda* of Linnæus. In habits the razorbill closely agrees with the true guillemot, laying its single egg (which is not, however, subject to the same amazing variety of coloration that is preëminently the Guillemot's own) on the ledges of the cliffs to which it repairs in the breeding season, but it is said then as a rule to occupy higher elevations, and when not breeding to keep further out to sea. On the east side of the Atlantic the razorbill has its stations on convenient parts of the coast from the North Cape to Brittany, besides several in the Baltic, while in winter it passes much further to the southward, and is sometimes numerous in the Bay of Gibraltar, occasionally entering the Mediterranean, but apparently never extending to the eastward of Sicily or Malta. On the west side of the Atlantic it breeds from 70° N. latitude on the eastern shore of Baffin's Bay to Cape Farewell, and again on the coast of America from Labrador and Newfoundland to the Bay of Fundy, while in winter it reaches Long Island.

RAZZI, GIANANTONIO. See SODDOMA.

RÉ, ISLE OF, a long, low island three miles off the coast of the French department of Charente Inférieure, runs southeast and northwest with a breadth of about three miles and a length of eighteen and one-half miles. The northwest point (Pointe des Baleines) has a lighthouse of the first class. The Pertuis Breton separates the island from the coast of La Vendée to the north, and the Pertuis d'Antioche from the Isle of Oléron to the south. With a surface of 18,259 acres, the Isle of Ré has 15,370 inhabitants, whose chief source of income is the salt marshes, producing annually 31,500 tons of salt. Tradition says that the city of Antioche on the west coast was destroyed by the Atlantic storms, which still constantly threaten to cut the island in two at the isthmus (only 230 feet wide) formed by the gulf called Fier d'Ars. There are two cantons—St. Martin and Ars-en-Ré—in the arrondissement of La Rochelle. St. Martin, with a secure harbor, was fortified by Vauban, and is the depot for convicts on their way to New Caledonia.

READE, CHARLES, holds a high and distinctive place among the English novelists of the third quarter of the nineteenth century. The son of an Oxfordshire squire, he was born at Ipsden in 1814, and was educated for the bar. He entered Magdalen College, Oxford, proceeded B.A. in 1835, with a third class in classics, was elected Vinerian Reader in 1842, and was called to the bar (Lincoln's Inn) in 1843. It was comparatively late in his life that he made his first appearance as an author. He was dramatist first and novelist afterward, not merely chronologically but in his aims as an author, always having an eye to stage-effect in scene and situation as well as in dialogue. *Gold*, his first play (1850), was but a moderate success. He did not achieve popularity till 1856, when he produced *It's Never Too Late to Mend*, a novel written with the purpose of reforming abuses in prison discipline and the treatment of criminals. *It's Never Too Late to Mend* was his first great success, but before this he had gained the respect of critics with two shorter novels, *Peg Woffington* (1852), a close study of life and character behind the scenes, and *Christie Johnstone* (1853), an equally close study of Scotch fisher folk.

He had also established his position as a dramatist by writing (in combination with Mr. Tom Taylor) a stage version of *Peg Woffington* under the title of *Masks and Faces* (1854), the most successful and most frequently reproduced of his plays, besides three that were less

successful, *The Courier of Lyons* (a powerful melodrama), *Two Loves and a Life*, and *The King's Rivals* (1854). From 1856 onward he kept his position in the foremost rank of contemporary novelists. Five minor novels followed in quick succession—*The Course of True Love never did Run Smooth* (1857), *Jack of all Trades* (1858), *The Autobiography of a Thief* (1858), *Love Me Little, Love Me Long* (1859), *The Double Marriage, or White Lies* (1860). Then appeared, in 1861, what most critics regard as his masterpiece, *The Cloister and the Hearth*. Returning from the fifteenth century to modern English life, he next produced another startling novel with a purpose, *Hard Cash* (1863), in which he strove to direct attention to the abuses of private lunatic asylums. Three others followed—*Foul Play* (1869), in which he exposed the iniquities of ship-knackers, and paved the way for the labors of Mr. Plimsoll; *Put Yourself in his Place* (1870), in which he grappled with the tyrannous outrages of trades-unions; and *A Woman-Hater* (1877), in which he gave a helping hand to the advocates of woman's rights. The *Wandering Heir* (1875), of which he also wrote a version for the stage, was suggested by the Tichborne trial. Outside the line of these moral and occasional works Reade produced three that might be classed as psychological, inasmuch as they were elaborate studies of character—*Griffith Gaunt* (1866), *A Terrible Temptation* (1871), *A Simpleton* (1873). His greatest success as a dramatist attended his last attempt—*Drink*—an adaptation of Zola's *L'Assommoir*, produced in 1879. At his death in 1884 (April 11th), Reade left behind him a completed novel, *A Perilous Secret*, which showed no falling off in the art of weaving a complicated plot and devising thrilling situations.

READING, a market town and ancient borough of Berkshire, is pleasantly situated on slightly elevated ground on the banks of the Kennet, a short distance above its junction with the Thames, and on branches of the Great Western, South-Eastern, and South-Western Railways, twenty-eight miles south-southeast of Oxford and thirty-five and a half west of London by rail. The population of the borough (area, 2,186 acres) in 1871 was 32,324, and in 1891 it was 55,752.

READING, a city of the United States, capital of Berks county, Penn., on the east bank of the Schuylkill river, and on the Schuylkill and Union Canals, fifty-eight miles northwest of Philadelphia at the intersection of some sixteen railway lines, representing eight different companies. It occupies an elevated and healthy position on a plain that gradually rises toward an amphitheater of hills, including Penn's Mount on the east and Neversink Mountain on the south. The plain is extremely regular and the principal streets cross at Penn Square, the business center of the city. An abundant supply of excellent water helps to keep the whole place sweet and clean. Conspicuous buildings are—the courthouse, the city hall, Trinity Church (Lutheran), Christ Church (Episcopal), the opera house, Mishler's academy of music, and the railway station. Besides a very extensive and varied manufacture of iron and iron wares from steam-boilers down to nails, Reading carries on distilling, tanning, cotton-weaving, cigar-rolling, paper-making, and many other industries, and is the seat of extensive machine-shops of the Philadelphia and Reading Railroad. The population—2,385 in 1800, 15,743 in 1850, 33,930 in 1870, 43,278 in 1880, and 58,661 in 1890—is largely of German origin.

Laid out in 1748 by Thomas and Richard Penn, Reading received incorporation as a borough in 1783, and was made a city in 1847.

REALEJO, a town and harbor on the Pacific coast of Nicaragua, situated in the neighborhood of 12° 28'

N. latitude. The harbor is spacious and well sheltered, and altogether the best which Nicaragua possesses on that coast; it is protected by a peninsula and two considerable islands, Cardon and Asserradores or Corinto. The town lies nine miles inland, and as a port is now superseded by the new town of Corinto, founded about 1849, and since 1881 connected with Leon and the interior by a railway. Realejo was the terminus adopted by Bedford Pim for his scheme of an interoceanic canal; but the route actually sanctioned reaches the coast of the Pacific at Brito, some distance to the south.

REAL ESTATE. The land law of England, and of countries whose law is based upon that of England, stands in a peculiar position, which can be understood only by an outline of its history.

*History.*—Such terms as "fee" or "homage" carry us far back into feudal times. Rights of common and distress are based upon still older institutions, forming the very basis of primitive law. The conception of tenure is the most fundamental ground of distinction between real and personal estate, the former only being strictly entitled to the name of estate (see ESTATE). The division into real and personal is coincident to a great extent with that into immovable and movable, generally used by systems of law founded on the Roman (see PERSONAL ESTATE). That it is not entirely coincident is due to the influence of the Roman law itself. The Greeks and Romans of the republic were essentially nations of citizens; the Teutons were essentially a nation of land folk; the Roman empire bridged the gulf between the two. It is probable that the English land law was produced by the action of the policy adopted in the lower empire, finally developed into feudalism, upon the previously existing course of Teutonic custom (see FEUDALISM). It is sufficient to say here that the distinguishing features of the Teutonic system were the enjoyment in common and the absence of private ownership, except to a limited extent. The history of the development of the old English land law before the Conquest will be found under ENGLAND and LAND. Its principal features, stated as shortly as possible, were (1) liberty of alienation, either by will or *inter vivos*, of such land as could be alienated, chiefly, if not entirely, bockland, subject always to the limits fixed by the *boc*; (2) publicity of transfer by enrollment in the shire-book or church-book; (3) equal partition of the estate of a deceased among the sons, and, failing sons, among the daughters; (4) cultivation to a great extent by persons in various degrees of serfdom, owing money or labor rents; (5) variety of custom, tending to become uniform, through the application of the same principles in the local courts; (6) subjection of land to the *trinoda necessitas*, a burden imposed for the purpose of defence of the realm.

The elements of feudalism so far existed in England under the Anglo-Saxon and Danish kings as to make it easy to introduce it in full at the Norman Conquest. The land forfeited to the Conqueror was regranted by him to be held by military service due to the king, not to the mesne lord as in Continental feudalism. In 1086 at the council of Salisbury all the landholders swore fealty to the crown. In the full vigor of feudalism the inhabitants were either free or not free. The free inhabitants held their lands either by free tenure (*liberum tenementum*, franktenement) or by a tenure which was originally that of a non-free inhabitant, but attached to land in the possession of a free man. Franktenement was either military tenure, called also tenure in knight service or chivalry (including barony, the highest tenure known to the law, grand serjeanty and the special forms of escuage, castle-guard, cornage, and others), or socage (including burgage and petit serjeanty), or frankalmoign

(*libera elemosina*) or in *vine* service, by which ecclesiastical corporations generally held their land. The non-free inhabitants were in Domesday Book *servi*, *cotarii*, or *bordarii*, later *nativi* or *villani*, the last name being applied to both free men and serfs. All these were in a more or less dependent condition. The most important difference between the military and socage tenures was the mode of descent. Whether or not a feudal benefice was originally hereditary, it had certainly become so at the time of the Conquest, and it descended to the eldest son.

The common law as far as it dealt with real estate had in the main assumed its present aspect by the reign of Henry III. The changes which have been made since that date have been chiefly due to the action of equity and legislation, the latter sometimes interpreted by the courts in a manner very different from the intention of parliament. The most important influence of equity has been exercised in MORTGAGE (*q. v.*) and trusts (see TRUST), in the doctrine of specific performance of contracts concerning real estate, and in relief from forfeiture for breach of covenant.

Corporeal hereditaments are all necessarily freehold; an interest in land less than freehold, such as a term of years, is personalty only. There was no room for such an interest in the feudal gradation of tenure; it was regarded as a mere personal contract, and was incapable of the incidents of tenure. By the Conveyancing Act, 1881, the residue of a long term of years may in certain cases be enlarged into the fee-simple. A copyhold is in strict law only a tenancy at the will of the lord (see COPYHOLD). Estates of freehold are either estates for life or in fee (called also estates of inheritance), the latter being in fee-tail or in fee-simple. An estate for life may be either for the life of the tenant or for the life of another person, the latter called an estate *pur autre vie*. The former kind of estate includes estates of dower and curtesy (see HUSBAND AND WIFE). An estate in fee is called a fee simply, an obvious sign of its feudal origin. Estates tail are either general or special, the latter being in tail male or (rarely) in tail female. There may also be a quasi-entail of an estate *pur autre vie* (see ENTAIL). An estate in fee-simple is the largest estate known to English law. Its ordinary incidents are an oath of fealty (never exacted), ESCHEAT (*q. v.*), and (in a manor) suit of the court baron, and occasionally a small quit-rent and relief. All these are obviously relics of the once important feudal incidents. Incorporeal hereditaments consist chiefly, if not wholly, of rights *in alieno solo*. They are divided by Mr. Joshua Williams (*Real Property*, pt. ii.) into (1) reversions, remainders, and executory interests, (2) hereditaments purely incorporeal, the last being either appendant, appurtenant, or in gross. Examples are profits *a prendre* (such as rights of common), easements (such as rights of way), seignories, advowsons, rents, tithes, titles of honor, offices, franchises. Before 1845 corporeal hereditaments were said to lie in livery, incorporeal in grant. But by 8 and 9 Vict. c. 106, s. 2, all corporeal hereditaments are, as regards the conveyance of the immediate freehold thereof, to be deemed to lie in grant as well as in livery. With regard to the *time* of enjoyment, estates are either in possession or in expectancy—that is, in reversion or remainder or executory interests (see REMAINDER). With regard to the *mode* of enjoyment, estates are either joint, in common, in coparcenary, or in severalty.

*Exceptional Tenures.*—It has been already stated that there are still to be found survivals of the old pre-Conquest customary law. They are found both in the tenure and in the conveyance of land. The only customs of which judicial notice is taken are GAVELKIND

(*q. v.*) and BOROUGH-ENGLISH (*q. v.*). Any other local customs, as in manors, must be proved by evidence. The tenures of frankalmoign and grand serjeanty were specially preserved by 12 Car. II. c. 24. Tenure in frankalmoign is the nearest approach in English law to absolute ownership. An estate in frankalmoign has no incidents, as it is held simply by divine service and is not subject to escheat. All tenures in frankalmoign must (except where created by the crown) be older than *Quia Emptores*. The tenure of grand serjeanty is the holding of lands by doing a personal service to the king, as carrying his banner or sword. Petit serjeanty consists in the payment to the king yearly of a bow, sword, dagger, or such other small things belonging to war (Littleton, § 159). It is in effect socage.

*Restraints on Alienation.*—The alienation of real estate may be subject to almost any conditions, provided that such conditions do not contravene the law. As a general rule there can be no restrictions upon the alienation of an estate in fee-simple; the two ideas are incompatible.

*United States.*—The law of real estate in the United States is the law of England modified to suit a different state of circumstances. The main point of difference is that in the United States the occupiers of land are generally wholly or in part owners, not tenants, as in England. This is to a great extent the effect of the homestead laws (see HOMESTEAD). The traces of the feudal origin of the law are, as might be expected, considerably less prominent than in England. Thus estates tail are practically obsolete; in some States they are specially forbidden by the State constitutions. The law of descent is the same in real and personal estate (see INHERITANCE). Manors do not exist, except in the State of New York, where they were created by the crown in colonial days (Bouvier, *Law Dict.*, "Manor"). Registration of deeds is general (see REGISTRATION). In some States forms of deed are prescribed by statute. Conveyancing is for the most part simpler than in England. The holding of real estate by religious or charitable corporations is generally restricted by the act creating them rather than by anything like the English law of mortmain. In Pennsylvania such a corporation cannot hold land without an act of the legislature, and in Territories of the United States it cannot hold real estate of a greater value than \$50,000. Perpetuities are forbidden in most States. The right of eminent domain is at once acknowledged and limited by the constitution of the United States. By art. 5 of the amendments private property is not to be taken for public use without just compensation. A similar provision is found in many of the State constitutions. By an act of Congress of April 9, 1866, c. 31, all citizens of the United States have the same right in every State and Territory as is enjoyed by white citizens thereof to inherit, purchase, lease, sell, hold, and convey real and personal property. In most States aliens may hold land; but in some States they cannot do so without becoming naturalized or at least filing in the specified manner a declaration of intention to become naturalized. For the State laws affecting the capacity of aliens to hold land, see Washburn, *Real Property*, vol. i. p. 64.

*International Law.*—The law of the place where real estate is situated (*lex loci rei sitæ*) governs its tenure and transfer. The laws of England and of the United States are more strict on this point than the laws of most other countries. They require that the formalities of the *locus rei sitæ* must be observed, even if not necessary to be observed in the place where the contract was made. The *lex loci rei sitæ* determines what is to be considered real estate. A foreign court cannot, as a

general rule, pass title to land situated in another country. The English and United States courts of equity have to a certain extent avoided the inconvenience which this inability to deal with land out of the jurisdiction sometimes causes by the use of the theory that equity acts upon the conscience of the party, and not upon the title to the foreign land. Thus, in the leading case of *Penn. v. Baltimore*, in 1750, the Court of Chancery on this ground decreed specific performance of articles for settling the boundaries of the provinces of Pennsylvania and Maryland. The difficulty always arises that, although the court professes to act upon the conscience, it must indirectly act upon the property, and that it can not carry its decision into execution without the aid of the local tribunals.

REALISM. See SCHOLASTICISM.

RÉAUMUR, RENÉ ANTOINE FERCHAULT DE, the eldest son of a French nobleman, was born on February 28, 1683, at La Rochelle, and received his early education there. In 1731 he invented the thermometer which bears his name. He loved retirement, and lived much at his country residences, at one of which, La Dermondière (Maine), he met with an accident, a fall from horseback, the effects of which proved fatal on October 17, 1757.

Réaumur was a man of wide attainments, and great industry. His writings, sometimes on trivial topics, were frequently diffuse, yet always interesting.

Réaumur's scientific papers are too numerous to be recapitulated; they deal with nearly all branches of science. His first paper, in 1708, was on a general problem in geometry, his last, in 1756, on the forms of birds' nests.

REBUS, an enigmatical representation of some name or thing, by using figures or pictures instead of words or parts of words. Camden mentions an instance of this kind of wit in a gallant who expressed his love to a woman named Rose Hill by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; this in the style of the rebus, reads "Rose Hill I love well." This kind of wit was long practiced by the great, who took the pains to find devices for their names. It was, however, happily ridiculed by Ben Jonson in the humorous description of Abel Drugger's device in the *Alchemist* and by the *Spectator* in the device of Jack of Newberry. The name is also applied to arrangements of words in which the position of the several vocables is to be taken into account in divining the meaning. Thus "I understand you undertake to overthrow my undertaking" makes the rebus

stand	take	to	taking
I	you	throw	my;

or in French

pir	vent	venir
un	vient	d'un

may be read "un soupir vient souvent d'un souvenir." The original use of the word, which comes to us from France, was, however, wider: any equivoque or satirical pleasantry might be so named, and the origin of the term is ascribed by Ménage to the clerks of Picardy, who at carnival time used to put out satirical squibs called "De rebus quæ geruntur." "Rebus," in heraldry, is a coat of arms which bears an allusion to the name of the person—as three castles for Castleton, three cups for Butler, three conies for Coningsby.

RÉCAMIER, MADAME (whose maiden name was JEANNE FRANÇOISE JULIE ADELAIDE BERNARD), was born on December 4, 1777, at Lyons, and died at Paris on May 11, 1849. She was married at fifteen to the banker Récamier, who was more than old enough to be her father. Beautiful, accomplished, with a real love for literature, she possessed at the same time a tempera-

ment which protected her from scandal, and from the early days of the consulate to almost the end of the July monarchy her salon was one of the chief resorts of literary and political society that pretended to fashion. Madame Récamier never even in old age, ill-health, and reduced circumstances lost her attraction. After her death *Souvenirs et Correspondances tirés des Papiers de Madame Récamier* were published.

RECANTI, a city of Italy, in the province of Macerata, seventeen and one-half miles from Loreto, on the highway between Ancona and Rome, is built on a hill 910 feet above the sea, and still retains portions of its fifteenth century walls and gateways. It is now perhaps best known as the birthplace of the poet Leopardi. The population in 1881 was 8,864 in the town and port (3,040) and 19,524 in the commune.

RECHABITES, or SONS OF RECHAB, in ancient Israel formed a sort of religious order in some respects analogous to the Nazarites, with whom they shared the rule of abstinence from wine. They went farther than the latter, however, in eschewing the luxuries and pursuits of settled life, living in tents and refusing to sow grain as well as to plant vineyards. Their origin must have been in northern Israel, for their "father" or founder, to whom they referred their rule of life, was that Jehonadab or Jonadab, son of Rechab, who lent his countenance to Jehu in the abolition of Tyrian Baal-worship.

RECIFÈ. See PERNAMBUCO.

RECOGNIZANCE, in law, is, in the words of Blackstone, "an obligation of record, entered into before some court or magistrate duly authorized, whereby the party bound acknowledges that he owes to the king or a private plaintiff (as the case may be) a certain sum of money, with condition to be void if he shall do some particular act—as if he shall appear at the assizes, keep the peace, pay a certain debt, or the like." The term itself means that the person bound *recognizes* the existence of a debt. Recognizance was at one time used as a security for money lent, something in the nature of a mortgage. In this sense it is practically obsolete. The principal use of recognizance at the present day is in chancery and criminal procedure. In chancery recognizances are entered into as a form of security by certain persons appointed to positions of trust, such as guardians or receivers. In criminal practice they affect either suspected or accused persons, or witnesses. As early as 1360 the Act of 34 Edw. III., c. 1, empowered justices to take of all them that were not of good fame sufficient surety and mainprize of their good behavior. The wide terms of this provision are not acted upon at the present day. The only recognizances of this kind practically enforced are those entered into as security for keeping the peace. Such recognizances are forfeited by any act tending to a breach of the peace.

In the United States recognizances are used for much the same purpose as in England.

RECORDE, ROBERT, a physician and eminent mathematician, was descended from a respectable family at Tenby in Wales, and was born about 1500. He died in the King's Bench prison, Southwark, where he was confined for debt, in 1558.

RECORDER. See COURT and QUARTER SESSIONS.

RECORDS, PUBLIC. According to the definition of the Record Commissioners appointed at the commencement of this century to report upon the nature of the archives, the national muniments of England constitute four great classes. The first class consists of independent documents relating to various subjects, persons, and places, but making altogether one whole, such as, for instance, *Domesday Book*, or the *Valor*

*Ecclesiasticus* of Henry VIII. The second class consists of the series of enrollments, including within one roll great varieties of distinct and separate entries classed according to their formal character, as, for instance, the close rolls and patent rolls, or classed according to their subject-matter, as are the Liberate and the Norman rolls. The third class embraces those records which contain entries of judicial proceedings and those where each subject has a distinct roll; while the last class comprises all separate documents, such as letters, inquisitions, privy seals, commissions, and other various descriptions of formal instruments.

In consequence of the neglect and indifference from which the national archives suffered before being housed in their present quarters, it is as much a matter for wonder as for congratulation that any of them are still in existence. In the earlier periods the records of the courts were preserved in the palace of the king; but, when the law courts became stationary and were held within the precincts of the royal palace, instead of following the sovereign from place to place, all legal documents remained in the custody of their respective courts. On the business of the country increasing, the records began to assume such vast proportions that further accommodation had to be obtained. Gradually three warehouses for the custody of public documents came into existence. The records of the King's Bench and Common Pleas were removed to the palace at Westminster, to the old chapter-house, and to the cloister of the abbey of Westminster, and thus laid the foundation of the well-known "chapter-house repository." Toward the end of the reign of Richard I., the Court of Chancery became separated from that of the Exchequer, the wardrobe in the Tower of London was used as the chief place of deposit for all Chancery documents, and thus the Record Office in the Tower sprang up. On the accession of Charles II., William Prynne, then keeper of the records in the Tower, implored the king "to preserve these ancient records not only from fire and sword, but water, moths, canker, dust, cobwebs, for your own and your kingdom's honor and service, they being such sacred reliques, such peerless jewels that your noble ancestors have estimated no places so fit to preserve them in as consecrated chapels or royal treasuries and wardrobes where they lay up their sacred crowns, jewels, robes; and that upon very good grounds, they being the principal evidences by which they held, supported, defended their crowns, kingdoms, revenues, prerogatives, and their subjects their respective lands, lives, liberties, properties, franchises, rights, laws." This earnest appeal was not urged before it was required. On his appointment to office Prynne made an inspection of the records under his custody. He found them "buried together in one confused chaos, dust, and filth in the dark corners of Cæsar's chapel in the White Tower." He employed soldiers and women to remove and cleanse them, "who soon growing weary of this noisome work left them as foul, dusty, and nasty as they found them." He then begged the aid of the clerks of his department, but these officials "being unwilling to touch the records for fear of fouling their fingers, spoiling their clothes, endangering their eyesight and healths by their cankerous dust and evil scent," declined the task. To the energetic Prynne the labor of methodizing the papers in his charge seemed hopeless; he saw them in confused heaps here and scattered there and destitute of anything approaching to an index. He lamented that it would require "Briareus his hundred hands, Argus his hundred eyes, and Nestor's centuries of years to marshal them into distinct files and make exact alpha-

betical tables of the several things, names, places, comprised in them." Still nothing was done to remedy the evils complained of. Addresses were presented to parliament upon the subject; reports were drawn up and committees frequently sat; but it was not until the beginning of this century that a complete and satisfactory investigation of the public records was entered into. In the summer of 1800 a very able report upon the state of the archives was drawn up; and a commission was appointed "to methodize, regulate, and digest the records." But the commission directed its attention exclusively to the printing of antiquarian matter, and nothing was attempted for the better preservation of the archives. Dissatisfaction arose, and a select committee of the House of Commons was appointed to inquire into the working of the Record Commission. The result of its sittings was the passing of a special act of Parliament, which placed the public records in the custody and under the superintendence of the master of the rolls for the time being, and directed the treasury forthwith to provide a suitable building. In 1851 the foundations of the present Record Repository were laid, and seven years afterward the public records were removed from their different places of deposit and housed in their new quarters, where they are now most carefully preserved.

In the United States there is no central depository of public records, each municipality, county and state preserving in its own appointed places of safe-keeping the various public documents which may accumulate in connection with the administration of its own particular branch of the government. The documents of national character are placed on file with the heads of each department concerned (in Washington city), or in the Congressional library. In the nature of our government there can be nothing analogous to the English public records offices. The records themselves are chiefly papers relating to legislative action, records of court transactions, and conveyances of property.

REDBREAST, the name of a bird which from its manners, no less familiar than engaging, has for a long while been a great favorite among all classes.

From its abundance, or from innumerable figures, the redbreast is too well known to need description, yet there are very few representations of it which give a notion of its characteristic appearance or gestures—all so suggestive of intelligence. Its olive-brown back and reddish-orange breast, or their equivalents in black and white, may be easily imitated by the draughtsman; but the faculty of tracing a truthful outline or fixing the peculiar expression of this favorite bird has proved to be beyond the skill of almost every artist who has attempted its portraiture. The redbreast exhibits a curious uncertainty of temperament in regard to its nesting habits. At times it will place the utmost confidence in man, and again at times show the greatest jealousy. The nest, though generally pretty, can seldom be called a work of art, and is usually built of moss and dead leaves, with a moderate lining of hair. In this are laid from five to seven white eggs, sprinkled or blotched with light red.

REDDITCH, a town of Worcestershire, England, is on an eminence near the Warwickshire border, sixteen miles southwest of Birmingham by the Midland Railway. The urban sanitary district (area about 926 acres) had a population of about 7,871 in 1871, and of 11,295 in 1891.

REDEMPTORISTS. See LIGUORI.

RED RIVER. Three at least of the many Red Rivers of the world deserve to be mentioned,—(1) the Red River or Fleuve Rouge, the Songcoi or Thao of the Anamese, the Hoang-Kiang of the Chinese, which

flows through the heart of TONG-KING (*q.v.*); (2) the Red River which rises in the Staked Plain in Texas, passes through a magnificent cañon 100 miles long, and from 200 to 1,000 feet deep, and furnishes a navigable channel of 1,200 miles before it reaches the MISSISSIPPI (*q.v.*); (3) the Red River of the North, a somewhat smaller stream, which, rising in Elbow Lake (so called from its shape) in Minnesota, not far from the sources of the Mississippi, crosses into Canada at Pembina, and falls into Lake Winnipeg, after a course of 565 miles (110 in Canada).

**RED RIVER SETTLEMENT.**—In 1811 the fifth earl of Selkirk (1771–1820), who had devoted special attention to emigration as a means of providing for the surplus population of the Scottish Highlands, obtained from the Hudson's Bay Company a grant of land in what was then called the district of Ossiniboia (Assiniboia). In 1813 a settlement was founded by his agent, Mr. Miles Macdonell, on the banks of the Red River, the first fort (Fort Daer) being at Pembina. By 1814 the settlers numbered 200. The North-West Fur-Traders of Manchester (a company which was the bitterest rival of the Hudson's Bay Company till the two amalgamated in 1821) did all they could by force and fraud to break up the colony, which, by 1816, had taken up its headquarters at Fort Douglas, on the site of the present town of Winnipeg. The French-Indian half-breeds (Bois-Brûlés) were incited against it, and its mills and houses were burned. The earl of Selkirk, arriving on the scene, succeeded in reorganizing the community, to which the name of Kildonan was now given, after Kildonan in Helmsdale, Sutherlandshire. He found himself personally involved in a very network of hostile intrigue; but the colony was saved, and after his premature death it continued to be more or less supported by his heirs till 1824. In 1835 Lord Selkirk's territorial claims were transferred to the Hudson's Bay Company, who undertook to pay the expenses incurred by the family. At that date the population of the settlement consisted of about 5,000 Highlanders, Bois-Brûlés, English half-breeds, and retired company officials. At the transfer of territorial jurisdiction to the Canadian Government in 1869 the Bois-Brûlés, under a certain Louis RIEL (*q.v.*) (son of a Frenchman who had built the first mill on the Red river), revolted and declared an independent republic. Colonel (now Lord) Wolseley was dispatched with a force of 1,400 men, and without bloodshed took possession of Fort Garry on August 24, 1870. The only striking feature of the expedition was the remarkable energy with which the difficulties of transport were overcome. Riel in 1885 became the leader of another unsuccessful insurrection of half-breeds in the same region, was captured, tried, and hanged.

**REDRUTH**, a market town of Cornwall, England, is pleasantly situated on the West Cornwall Railway, about nine miles west of Truro. The population of the urban sanitary district (area 4,006 acres) in 1871 was 10,685, and in 1891 was 10,324.

**RED SEA.** The Red Sea runs north-northwest from the Gulf of Aden in the Indian Ocean for about 1,200 miles, extending from 12° 40' to 30° N. latitude. The Strait of Bab-el-Mandeb at the entrance to the Gulf of Aden is thirteen and a half miles across, and is divided by Perim Island into two channels, the northeastern narrow and shallow, the southwestern ten miles wide, and deep. The sea widens rapidly to 230 miles in 16° N. latitude, and more gradually to 250 miles off Kunfuda in 19° N. latitude; from this point it narrows to 130 miles in 24° N. latitude, a breadth which is maintained up to 27° 45' N. latitude, where the sea divides into two gulfs, those of Suez and

'Akaba. The Gulf of Suez continues in the north-northwest direction for 170 miles, with an average width of 30 miles; that of 'Akaba is narrower, and runs north-northeast for 97 miles. The Sinaitic peninsula between the two gulfs bounds the Red Sea to the north; on the east the Arabian coast and on the west the coasts of Egypt, Nubia, and Abyssinia form the boundaries.

The Red Sea area is in a state of gradual upheaval, the former seaport of Adulis on Annesley Bay is now four miles from the shore, and at Suez the former limits of the sea can be traced for several miles northward; whereas the north coast of Egypt is undergoing gradual subsidence.

The tides are imperceptible at many places on the Red Sea, and where observable they are extremely uncertain, varying both as to time and to amount of rise with the direction and force of the wind. At Suez, where they are most regular, the rise varies from seven feet at spring to four feet at neap tides. The surface-currents of the sea are also variable and perplexing; they are chiefly produced by the wind, and change in velocity and direction accordingly.

**Traffic.**—From the decline of the old Indian trade with Egypt till the formation of the Peninsular and Oriental Steam Navigation Company and the overland route to India in 1840, traffic in the Red Sea was almost entirely confined to small native vessels trading with grain and fruit between Egypt and Arabia, and carrying pilgrims to Jiddah, the port of Mecca. Since 1840 passenger traffic, and since the opening of the Suez Canal in 1869 trade of all kinds in European vessels, have greatly increased. A telegraphic cable was laid from Bombay to Suez in 1859.

**Meteorology.**—The climate of the Red Sea region is one of the hottest in the world. The altitude of the sun, the almost continually cloudless skies, the arid rainless character of the shores, and the complete absence of rivers combine to make the mean temperature high. That of the air usually ranges from 70° to 94° Fahr., though it has been frequently observed as high as 105° in the shade on board ship, and in the northern part of the sea the clearness of the nights promotes radiation, so that by morning the thermometer may fall to the freezing-point on shore.

The temperature of the water at the south end of the sea is usually in excess of that of the air, and it is on record that on four consecutive days the temperature of the surface-water was 100°, 106°, 100°, and 96°, while at the same time that of the air was 80°, 82°, 83°, and 82°. The surface-temperature varies from 70° to 90°, according to the position and the season.

**REDSHANK**, the usual name of a bird—the *Scolopax calidris* of Linnæus and *Totanus calidris* of modern authors—so called in English from the color of the bare part of its legs, which, being also long, are conspicuous as it flies over its marshy haunts or runs nimbly beside the waters it affects. The body of the redshank is almost as big as a snipe's, but its long neck, wings, and legs make it appear a much larger bird. Above, the general color is grayish drab, freckled with black, except the lower part of the back and a conspicuous band on each wing, which are white, while the flight-quills are black, thus producing a very harmonious effect. In the breeding season the back and breast are mottled with dark brown, but in winter the latter is white. The nest is generally concealed in a tuft of rushes or grass, a little removed from the wettest parts of the swamp whence the bird gets its sustenance, and contains four eggs, usually of a rather warmly tinted brown with blackish spots or blotches; but no brief description can be given that would point out their

differences from the eggs of other birds, more or less akin, among which, those of the LAPWING especially, they are taken and find a ready sale.

REDSTART, a bird well known in Great Britain, in many parts of which it is called Firetail—a name of almost the same meaning, since “start” is from the Anglo-Saxon *steort*, a tail. This beautiful bird, the *Ruticilla phœnicurus* of most ornithologists, returns to England about the middle or toward the end of April, and at once takes up its abode in gardens, orchards, and about old buildings, when its curious habit of flirting at nearly every change of position its brightly-colored tail, together with the pure white forehead, the black throat, and bright bay breast of the cock, renders him conspicuous, even if attention be not drawn by his lively and pleasing though short and intermittent song. The hen is much more plainly attired; but the characteristic coloring and action of the tail pertain to her equally as to her mate. The nest is almost always placed in a hole, whether of a tree or of a more or less ruined building, and contains from five to seven eggs of a delicate greenish-blue, occasionally sprinkled with faint red spots. The young on assuming their feathers present a great resemblance to those of the redbreast at the same age; but the red tail, though of duller hue than in the adult, forms even at this early age an easy means of distinguishing them.

In America the name redstart has been not unfittingly bestowed upon a bird which has some curious outward resemblance, in both looks and manners, to that of the old country, though the two are in the opinion of some systematists nearly as widely separated from each other as truly passerine birds well can be. The American redstart is the *Setophaga ruticilla* of authors, belonging to the purely New-World family *Mniotiltidæ*, and to a genus which contains about a dozen species, ranging from Canada (in summer) to Bolivia. The wonderful likeness, coupled of course with many sharp distinctions, upon which it would be here impossible to dwell, between the birds of these two genera of perfectly distinct origin, is a matter that must compel every evolutionist to admit that we are as yet very far from penetrating the action of creative power, and that especially we are wholly ignorant of the causes which in some instances produce analogy.

REDWING, the *Turdus iliacus* of authors, which is an abundant winter visitor to the British Islands, arriving in autumn generally about the same time as the fieldfare does. This bird has its common English name from the sides of its body, its inner wing-coverts, and axillaries being of a bright reddish-orange, of which color, however, there is no appearance on the wing itself while the bird is at rest, and not much is ordinarily seen while it is in flight. In other respects it is very like a song-thrush, and indeed in France and some other countries it bears the name mauvis or mavis, often given to that species in some parts of Britain; but its coloration is much more vividly contrasted, and a conspicuous white, instead of a light brown, streak over the eye at once affords a ready diagnosis. The redwing breeds in Iceland, in the subalpine and arctic districts of Norway, Sweden, and Finland, and thence across Northern Russia and Siberia, becoming scarce to the eastward of the Yenissei, and not extending beyond Lake Baikal. In winter it visits the whole of Europe and North Africa, occasionally reaching Madeira, while to the eastward it is found at that season in the northwestern Himalayas and Kohat.

RED WING, a city of the United States, capital of Goodhue County, Minn., occupies a commanding site on a plateau encircled by high bluffs (nearly 300 feet high), on the west bank of the Mississippi, forty-one

miles south of St. Paul on the La Crosse division of the Chicago and St. Paul railroad; it is also the eastern terminus of the Cannon Valley branch of the same railway. Red Wing has an opera house and a music hall; it trades in lumber, manufactures earthenware, wagons and carriages, furniture, flour, leather, and boots and shoes, and exports large quantities of wheat. The population was 4,260 in 1870, and 5,876 in 1880; in 1890 it was 6,277.

REDWOOD. See SEQUOIA.

REED, a term applied to several distinct species of large, water-loving grasses. The common or water reed, *Phragmites communis*, Trin. (*Arundo phragmites*, L.), occurs along the margins of lakes, fens, marshes, and placid streams, not only throughout Britain, but over the Palæarctic and Nearctic regions, and even in South Australia. Another very important species is *Psamma arenaria* R., and S. (*Ammophila* or *Arundo arundinacea*, Host.), the sea-reed or marram grass, a native of the sandy shores of Europe and North Africa. Other reeds are *Calamagrostis* (various species), *Gynurium argenteum* (pampas grass), *Deyeuxia*, etc.; also, *Arundo Donax*, the largest European grass (six to twelve feet high), which is abundant in southern Europe. Reeds have been extensively used from the earliest times in thatching and other branches of construction, and also for arrows, the pipes of musical instruments, etc. Reed pens are still used in the East (see PEN).

REED, in music. See OBOE, HARMONIUM and ORGAN.

REEVE, CLARA, one of the imitators of Horace Walpole in Gothic romance, was born at Ipswich in 1725. She was the daughter of a Suffolk clergyman, and died at Ipswich in 1803.

REFEREE, in law, is a person to whom a matter is delegated by a superior for report or decision. Inquiry and report may be directed in any case—trial only by consent of the parties, or in any matter requiring any prolonged examination of documents or accounts, or any scientific or local investigation which cannot be tried in the ordinary way.

REFLECTION. See LIGHT.

REFORMATION. The period occupied by the great movement known as the Protestant Reformation stands identified, for the most part, with the period which marks the transition from the mediæval to the modern era in European history. Taken within its narrowest limits, it may be looked upon as commencing with the year 1517 and as finding a certain consummation with the year 1545. In the former year Luther's theses, published at Wittenberg, represent the commencement of that direct and open renunciation of mediæval doctrine which he initiated; in the latter year the assembling of the council of Trent marks the renewed sanction and promulgation of that doctrine whereby an insuperable barrier was erected between the communion of Rome and the churches of Protestantism. From that time each communion possessed its distinctive organization and formulary of faith, and the struggles which subsequently took place between Romanism and Protestantism represent, not attempts to bring about or to resist reform (whether of discipline or of doctrine), but endeavors on the part of both communions to bring about, if possible, the extinction of the opposed form of faith.

But, although the contest which Luther initiated had, long before his death, resulted in complete and irreparable rupture between the contending parties, it is certain that in order to understand the true nature and origin of that contest we must go back to events long anterior to 1517; while in order fully to estimate its effects we

must follow the history of events long after 1545. In Germany, for example, the Reformation can hardly be regarded as finding even a formal consummation before the peace of Augsburg (1555); in Switzerland the movement went on with important modifications down to the death of Calvin in 1564; in France the onward progress was not materially checked before the massacre on the eve of St. Bartholomew (1572); in Bohemia its independent and peculiar fortunes found a final solution only with the battle of the White Hill in 1620; while in England and in Scotland, in the Netherlands, in Scandinavia, in Italy and in Spain, the movement assumed so much variety of character, and was decided by circumstances of time and place of so different a kind, that its essential features often become merged and almost lost in their combination with other and altogether extraneous elements.

Not a few, and some very memorable, efforts had been made before the sixteenth century to bring about a reformation of doctrine, but these had almost invariably been promptly visited with the censure of the church. Long after the "heresies" of the fourth century had died away and after the controversies of the turbulent ninth century—such as those on the eucharist between Paschasius Radbertus and Ratramnus, and on predestination between John Scotus Erigena and Gottschalk—had been silenced by the decisions of the pontiffs, we find movements arising, which, however much they differ in other characteristics, all attest the existence of a widespread desire among large sections of the community to revert to a simpler form of religious belief and practice. The Paulicians (or Manichæans of the East), the Albigenses or (Manichæans of the West), the Waldenses, the Cathari, and the Leonists (or Poor Men of Lyons)—sects which made their appearance mainly in the twelfth and thirteenth centuries, and for the most part in Switzerland, Languedoc, and northern France—the Lollards in England and the Hussites in Bohemia, may be looked upon as the ancestors in faith of the Huguenots and the Puritans of after-times, and were all more or less characterized by an aversion to the Roman ritual, to splendid churches, to crosses and crucifixes, combined with a more definite denial of such doctrines as that of baptismal regeneration, of transubstantiation, of masses for the dead, and of the obligation to observe Lent. The ultimate fate of these different sects was singularly similar.

In the whole history of the Reformation, and of the period by which it was immediately preceded, the political relations of the popedom to the other European powers and more especially to Germany, constitute, in fact, elements of primary importance. In the latter part of the fifteenth century those relations were still further embittered by the personal character and aims of the reigning pontiffs. At the very time when the existence of the popedom as a temporal power was menaced by the rising spirit of innovation, the reverence and sympathy of Europe were still further alienated by the spectacle of the career of Alexander VI. and of his end—the result, it was commonly reported, of the poison which he had designed for the destruction of another. The character of his successor, Julius II. (1503–1513), might well seem virtuous by comparison; but at no period in the history of the pontificate does its religious character seem more completely lost sight of in purely secular interests. It had long before (see *POPEDOM*) been the aim of each more ambitious pope to become a great territorial prince and thus to lay the foundation of the private fortunes of his house. But Julius aimed at something more than this—at the assertion of political supremacy throughout Italy and of the right to rank with the great powers of Europe as

wielding at once material resources but little inferior to theirs, and as commanding a widespread organization to the like of which not one of them could aspire. Such were the objects to which his untiring energies were systematically directed. Within four years of his accession he had added Perugia and Bologna to the possession of the church, and from Piacenza to Terracina his sway extended over all the great strongholds and the most fertile territory; even the great powers of France and Spain, notwithstanding their newly consolidated strength, could not but regard with jealousy and apprehension his genius and his policy.

While the popular feeling in Germany was being effectually alienated from the papal see, the learning of Germany was also pursuing that ominous track, first delineated by Gregory of Heimburg, which marks its complete divergence from the Italian humanism. The names of Johann von Goch (d. 1475), Johann Wessel (d. 1489), Johann Reuchlin (d. 1522), and Erasmus stand associated, although in different ways, with a great movement which, by attacking at once the doctrine and the discipline of the church, opened up the way for Luther.

Four years after Erasmus came an Augustinian monk from Erfurt, full of reverence for the traditions, the grandeur and the sanctity of Rome. Martin Luther appears to have been less struck than was Erasmus by the unpriestly character of Julius II., who, as he admits, maintained order and watched over the sanitary condition of the Sacred City. But he was shocked beyond measure by the corruption, the profanity and the immoral lives of the Roman clergy. The fond illusion of his monastic life was at an end; and he returned to Germany not only prepared to counsel resistance to papal extortion but shaken in his whole allegiance to the holy see. A few months after Luther came Ulrich von Hutten. It would be difficult to select a better representative of the temper and feeling of the higher classes in Germany at that time. To pride of birth and devotion to the new learning he united a love of adventure which no physical suffering or misfortune seemed able to subdue, and a chivalrous spirit which could but impatiently brook the assertion of even legitimate authority. Already burning with resentment at the systematic extortion to which his countrymen were subjected, his feelings were still further intensified as he listened to the contemptuous language and observed the supercilious demeanor which marked the Roman estimate of those who bore the German name.

It must be admitted that the character of the German episcopate at this time was such that it scarcely appeared to advantage even when compared with the ecclesiastics of the Roman Curia. Its members were generally scions of princely houses, caring little for the spiritual interests of their dioceses, but delighting in field sports and martial exercises, given to building palaces for their own residence rather than to the erection of churches, and often without the slightest tincture of learning. Their primate at this time was Albert, brother of the elector of Brandenburg, archbishop of Mainz and Magdeburg, a young and ambitious voluptuary, caring for little but pleasure and display. On the great prelates the extortion of Rome sometimes fell not less heavily than on the laity; and the archbishop, before he could receive his pallium, was called upon to pay the sum of 30,000 gulden into the papal exchequer. Leo X. was at that time intent on carrying out the great design of his predecessor, the rebuilding of St. Peter's. It has been observed by Pallavicino that the millions devoted to the erection of the material church were acquired at the cost of many more millions to the spiritual church. Leo proclaimed a fresh issue

of indulgences, and the archbishop Albert was appointed his commissioner to carry out the sale in a large portion of Germany. He seized the occasion to prevail upon the pope to allow him to appropriate one-half of the money collected for the indulgences in order to pay for his pallium. As his chief agent in the sale he imprudently selected one Tetzel, a Dominican friar, whose unscrupulousness in such work was so notorious that the papal collector at Mainz refused to employ him. In the course of his progress Tetzel came to Jüterbogk, near Wittenberg, and his superstitious traffic and the impudent devices which he employed to cajole the people were thus brought directly under the notice of Luther. The young professor seized the opportunity of directing the attention of the university, where he was already highly popular, to the abuses associated with the sale of indulgences. He did not as yet impugn the doctrine of indulgences itself, and he expressed his conviction that their good father the pope must be altogether unaware of the extent to which such abuses were allowed to prevail. His celebrated theses were forwarded by himself to the archbishop, as well as to the elector of Saxony, his patron, and also the munificent founder of the university. The elector, who had seen with no small dissatisfaction the manner in which his provinces were being plundered in order to pay for the extravagance of a neighboring prelate, extended his protection to the courageous polemic, and Luther thus gained the all-precious interval of freedom from molestation, which enabled him to compose the memorable treatises whereby he produced such an immense effect on the minds and consciences of his countrymen. To Leo, however, the vague reports that reached Rome conveyed only the impression of a dispute between the two monastic orders of which Luther and Tetzel were respectively the representatives. He declared that Luther was a man of genius, and refused to interfere. Even Ulrich von Hutten, at that time residing not far from Wittenberg, seems to have shared in this misapprehension, and writing to his patron, he expresses the hope that the two contending parties may eventually tear each other to pieces.

But in the course of a few months the importance of the struggle began to be more clearly apprehended. John Eck of Ingoldstadt drew attention to the resemblance between the doctrines put forth in the theses and those of the Hussites, and at the mention of that undoubted heresy not a few of Luther's supporters recoiled. The danger that menaced the Roman see could now no longer be disguised; and in June, 1520, Leo fulminated his bull of excommunication against Luther. On the eighth of the following July he addressed a letter to Frederick of Saxony in which he deplores that he can no longer speak of Luther as a son. He feels certain that the elector will prove loyal to the church, although he does not disguise the fact that he has heard of his friendship for the heretical leader and that the latter relies on his support. He has ordered the bull to be circulated among the nobility of Saxony, and he feels equally assured that he may reckon on their assistance in extinguishing this "incendiary conflagration." As for Luther himself, he denounces him as one who is seeking to revive the heresies of the Waldenses, the Hussites, and the Bohemians, and who, by the manner in which he has condemned the burning of heretics, has clearly shown that he sympathizes with the Turks and aims at the destruction of the true church.

The bull of excommunication, along with numerous volumes of the decretals, was burned by Luther himself at Wittenberg in the following December, a proceeding by which he formally intimated his repudiation of the decrees and canons of the church.

The Reformation in England had already commenced, and its origin must be looked upon as in a great measure independent of the Lutheran movement; as in Germany, it had been preceded by a kindred movement, and endeavor to bring about a reform of discipline. The nation was not compelled, as in Italy, to witness the corruptions of the papal court, nor were the laity equally opposed with the people of Germany by imposts and exactions of every kind. But the unsparing extortion practised by Wolsey's agents after his appointment as *legatus a latere* was severely resented, and appeared all the more grievous when contrasted with that immunity from arbitrary taxation which it was the Englishman's special boast to inherit as his birthright; and the arbitrary procedure of the ecclesiastical courts and the licentious lives of the clergy were the subjects of loud and continual complaint. In the year 1514 the notable case of Richard Hunne roused popular indignation to the highest pitch. He had been so bold as to resist what he regarded as an unjust exaction of mortuary fees, by pleading in the ecclesiastical court that the action brought against him was unlawful by the Statute of Præmunire—a plea which virtually raised the whole question of benefit of clergy. Hunne was committed to the Lollards' Tower and was shortly after found dead—murdered, as it was popularly believed, by the contrivance of the chancellor of the bishop of London. The case gave rise to a fierce legal controversy, in which the authority of an act of Parliament was opposed by the precedents established by a decretal of the church. It was followed by the memorable trial of Doctor Standish (1515), by which the question of the royal supremacy was distinctly raised, and Henry himself not improbably led to conceive that theory of his legitimate authority in matters ecclesiastical which was afterward attended with such important results. The state of discipline among the clergy at large was but little, if any, better than in Germany, and their addiction to secular pursuits and pleasures, their covetousness, ambition, and licentiousness are attested not only by satirists like Roy and Skelton, but by grave and temperate censors such as Dean Colet, Archbishop Warham, Bishop Fisher, and Sir Thomas More, and form the subject of their earnest remonstrance and appeals for reform.

The effects of the concurrent action of religious and national sentiment thus brought about were soon to receive a memorable illustration in Italy. The soldiers who made their way under the leadership of Frondsberg, Ferdinand's lieutenant, across the Alps, in the snows of November, 1526, into the plains of Lombardy, and afterward mingled with the Spanish forces which Bourbon led on to the assault on Rome, were almost entirely avowed supporters of Luther's cause and full of fierce hatred of popery. Frondsberg himself loudly declared that as soon as he had taken Rome he would hang the pope. The Spaniards, notwithstanding their unshaken devotion to Catholicism, entered the city burning with the spirit of national antipathy, and eager to revenge the long series of wrongs and exactions which their countrymen had suffered at the hands of Italian ecclesiastics. Among the horrors which followed upon the capture of the capital (May, 1527) nothing more completely shocked the sense of Latin Christendom than the savage contempt manifested by the German soldiery for everything that symbolized the Roman faith, their wanton destruction of relics and images, mock religious services, and especial brutality in the treatment of priests. Even their Spanish confederates, though equally merciless in their excesses, looked on with indignation as they saw them disguising themselves as cardinals and holding a mock consistory under the

windows of St. Angelo for the purpose of electing Luther as pope. But even the impressions thus produced were evanescent when compared with the constantly renewed and unavailing regret which filled the breast of the scholar and the churchman in after years, as he realized the irreparable losses inflicted upon art and learning, the destruction of unique manuscripts and ancient records. Nor can it be a matter of surprise that a sentiment of deep revenge should have arisen in Rome against the Lutheran destroyer, and that even the Swabian and the Spanish invader alike should have afterward been solicitous in a manner to disguise their own responsibility, by professing to look upon the blow thus struck at the sanctity and inviolability of the sacred city as a direct judgment of God. For a time, though only for a few months, it was believed, even by politicians so shrewd and well informed as Wolsey, that the emperor himself was designing to aid the Reformation. The approach of the Turks, who had overrun Hungary, and the hostility of France demonstrated the urgent necessity of maintaining concord among his subjects in the empire; and it is possible that he may really have contemplated placing himself at the head of the Lutheran movement and keeping Clement VII. permanently a prisoner at Gaeta. But his Spanish blood, his education under Adrian of Utrecht, and the traditions of the imperial dignity proved too powerful a counterpoise, and Charles eventually not only deigned to lay before the courts of Europe a partial explanation and apology for the tragedy at Rome, but in a treaty (November 26, 1527) with the pontiff he entered upon an agreement for the adoption of a distinct anti-Reformation policy. It has been asserted that Clement also undertook on this occasion not to declare the marriage of Henry VIII. and Catherine illegal, but no such stipulation appears in the existing treaty.

In pursuance of his anti-imperial policy Wolsey did not fail to seek to turn to the best account the sensation caused by the triumph of the imperial arms. He enjoined the observance of a three days' fast and the offering up of prayers in every church in England for the captive pontiff's deliverance. He could not, however, but be conscious that his policy was regarded with but little favor by the nation at large. The young emperor was highly popular among the citizens of London, and the ancient amicable relations with the house of Burgundy and the actual important commercial relations with Flanders combined to render Spain in the eyes of Englishmen their natural ally, while France they still regarded as their hereditary foe. An expedient to which he had recourse about this time only served still further to fan this feeling. He had sought to render France, instead of the Low Countries, the main channel of the commerce between England and the Continent by making Calais the chief port for merchandise. The merchants of the Hanse towns took alarm; and, as it was in their vessels that Luther's writings, which were now eagerly purchased in England, even at exorbitant prices, chiefly found their way across the Channel, the preachers of the Reformation found no difficulty in representing to their countrymen that an Anglo-French alliance could not fail to prove inimical to the gospel. On the other hand, the Catholic party both in England and in Germany, as soon as the project of the divorce became noised abroad, could not but recognize in Catherine the representative of the interests of the true church, while they looked upon the emperor as her champion, and upon Wolsey as a traitor to the cause of truth and justice. During the last five years the cardinal's efforts to reform the clergy and repress the Reformation in England had been strenuous and constant. In the year 1521 he had enjoined all the bishops

"to take order that any books, written or printed, of Martin Luther's heresies and errors should be brought in to the bishop of each diocese." The movement at Cambridge continued, however, to progress, and in 1523 some of the bishops suggested the appointment of a visitation to the university "for trying who were the fautors of heresy there." This proposition was not acted upon by Wolsey, who probably in his heart sympathized with the genuine spirit of learning developing in the university, and the matter was subsequently made the ground of an accusation against him by his enemies. We find, accordingly, George Stafford, a member of Pembroke Hall, venturing in the following year to adopt the example set by Luther, of taking the Scriptures themselves, instead of the *Sentences* of Peter Lombard (the theological text-book of the universities), as the basis of a course of divinity lectures. In the following year William Tyndal published at Antwerp the first edition of his translation of the New Testament, and in 1526 we hear of its introduction into Oxford by Thomas Garret, and of the volume being burnt at Paul's Cross. On November 27, 1527, Bilney and Arthur were examined at the Chapter House at Westminster before Wolsey and other ecclesiastics, as to whether they had preached or taught to the people the opinions of Luther or any others condemned by the church. Owing to the proximity of Cambridge to the seaports and commercial towns of the eastern counties, such as Yarmouth, Harwich, and Norwich, the university would appear to have become familiarized with the Lutheran doctrines much sooner than Oxford. From July 3 to September 20, 1527, Wolsey was in France, intent on bringing about the marriage of Princess Mary with the duke of Orleans, and on gaining the support of Francis in the matter of the royal divorce.

Henry himself had at this time fully resolved to carry the latter project into effect, and the doubts raised with respect to the validity of his marriage and the legitimacy of Mary cannot be regarded as anything more than official formalities, designed to give a veil of decency to his real purpose. While in France Wolsey learned from Flanders that the emperor had become apprised of Henry's real intentions, and he himself now proceeded (to quote his own words) to employ "all possible ways and practices for the obtaining of the pope's consent." Unfortunately for the success of his efforts, Henry at this juncture conceived the design of sending another agent to Rome, to act altogether independently of Wolsey, and charged to procure, not only the appointment of a commission empowered to dissolve the marriage with Catherine; but also a dispensation removing all obstacles to the king's second marriage with Anne Boleyn. Clement was still a prisoner in the castle of St. Angelo, but on the evening of December 9, 1527, disguised in a blouse and carrying a basket and an empty sack on his back, he effected his escape, and with the assistance of a guide arrived the next morning at Orvieto. From that day his resolve was probably definitely taken, and, notwithstanding his previous promises and his subsequent apparent concessions, he would seem to have been firmly resolved not to grant his consent to a measure deeply humiliating to himself and certain to expose him to the full brunt of the emperor's resentment. But at Orvieto Henry's delegate, Knight, although untrained and ill qualified for the task of a diplomatist, obtained both a commission and a dispensation, which, however, on his reaching England, were both found to be worthless, owing to a designed non-observance of the necessary technicalities. In the following year Foxe and Gardiner were dispatched on a like errand. The latter was far better suited for the work than Knight; and he did not scruple to threaten

the trembling pontiff with the complete withdrawal of Henry's support, and to predict as the inevitable consequence the collapse of the already tottering apostolic see—a result which, he declared, "would be attended by the applause and satisfaction of the whole world." By such menaces Clement was eventually induced again to grant a commission and a dispensation. A decretal bull, formally annulling Henry's first marriage, was handed to Campeggio, which he was instructed to show to the king and then to destroy. But in the meantime the celebrated brief executed by Julius II., in which the dispensation for Henry's first marriage was reenacted in more precise and unqualified terms, was discovered in the Spanish archives. It was sought to show that the brief was a forgery, but to this view of the matter Clement altogether refused to assent. At length, however, in May, 1529, the legate proceeded to open his court at Westminster. The courageous conduct of Catherine put honorable men to shame; and no slight impression was produced by Bishop Fisher's heroic declaration of his willingness to stake his life that her marriage with the king was perfectly valid. Campeggio, under various pretexts, still hesitated and delayed. In July the news of the peace of Cambray arrived, and it was known that the influence of the emperor would henceforth be paramount in Italy, while it was believed that the projected marriage between the French monarch and the sister of the emperor augured a durable peace between the empire and France. Then the legate adjourned the court and the pontiff revoked the cause to Rome. All around Wolsey saw the plans which he had laid with so much toil and skill breaking up, and on him the royal displeasure vented itself. He died November 30, 1530, a victim to the wanton caprice of one whom he had served only too faithfully, and with him the ablest supporter of papal influence and the most formidable opponent of Reformation principles in England disappeared.

Henry would not condescend to appear before a Roman court, and as a last expedient it was proposed that the question of the legality of his first marriage should be submitted to the learned bodies, the universities and eminent canonists of Europe. This scheme had already been recommended by the episcopal bench, but to Cranmer's ingenuity is attributed the further suggestion that the opinion thus obtained should be carried into effect by a court convened in England. Commissioners, among whom Richard Croke appears as the most conspicuous and indefatigable, were accordingly dispatched on the proposed errand. The means to which they had recourse in order to obtain opinions such as their royal employer desired are plainly described by a contemporary writer, who says that "there was inestimable sums of money given to the famous clerks to choke them, and in especial to such as had the governance and custody of their universities' seals." The evidence more recently brought to light enables us to accept this statement as substantially correct. The unpopularity of the divorce among the nation at large was especially shown at the two universities, where the junior members made demonstrations of the greatest dissatisfaction, while their seniors were mostly bribed or intimidated into acquiescence by the royal agents; nor could the authorities at either Oxford or Cambridge disguise the fact that they found themselves at variance with the feeling of the country at large.

It is at this juncture that Cranmer assumes a foremost place as a leader of the English Reformation. He had written in defense of the divorce, and had taken a part in embassies sent by Henry to treat on the question with the emperor and the pope; and Clement had shown his sense of the value of his influence by appoint-

ing him to the lucrative post of grand penitentiary for England, in the hope of winning him over to the papal interests. Cranmer's whole policy, however, had been directly opposed to that of Wolsey. He had used his best efforts to confirm the commercial relations with the Netherlands, and had superintended the negotiation of a commercial treaty between that country and England. He had resided for some months in Germany, and while there had married Margaret, the daughter of Andrew Osiander, a distinguished preacher and leader of the Lutheran party at Nuremberg. From Germany he was now summoned back to England to become the successor of Warham, the primate, who had died in August, 1532. As there had as yet been no formal rupture with the see of Rome, it became necessary for him to apply to Clement for the customary bull of consecration, and also for his pallium as metropolitan, and on receiving these it was also requisite that he should take the oaths of canonical obedience and subjection to the Roman pontiff. His conduct in this dilemma has been generally regarded as indefensible. In order to show that he disclaimed the right of the pontiff to nominate to ecclesiastical offices in England, he surrendered the several bulls, eleven in number, into Henry's hands; and, having done this, he took the usual oath of obedience to the see of Rome. Before doing so, however, he made a protestation to the effect that he did not intend thereby to bind himself to do anything contrary to the laws of God, the king's prerogative, or the commonwealth and statutes of the kingdom. On May 23, 1533, he proceeded, as archbishop and legate of the apostolic see, to pronounce the king's marriage with Catherine of Aragon null and void *ab initio*, as contrary to the divine law; and five days later he gave judicial confirmation to the royal marriage with Anne Boleyn. In the following year (March 23, 1534,) Clement rejoined by a manifesto declaring the validity of the first marriage, and calling upon Henry to take back his first wife and to observe "a perpetual silence" in relation to the question for the future. This decisive step was mainly the result of the parliamentary action that had in the meantime been going on. The parliament of 1529 had in various ways limited the privileges of the clergy, and by the Act 21 Hen. VIII. c. 13 had deprived them of the power of holding pluralities by virtue of licenses obtained from Rome for money. Fisher, from his place in the House of Lords, vainly sought to combat these reforms by declaring that Lutheranism was spreading in the nation and by reminding his audience of Germany and Bohemia and the miseries that had already befallen those countries. The allusion to the Lutheran movement appears to have been, indeed, singularly injudicious, and there can be no doubt that at this period it was the aim not only of the king but of the bishops to dissociate the Reformation movement in England from the movement that was in progress in Germany. As yet the repudiation of the papal supremacy and a reform in matters of discipline were all that was contemplated by either the crown or the parliament. In 1531 appeared a proclamation making it penal to introduce bulls from Rome, and this was shortly followed by an act visiting with severe penalties all who should be found going about the country for the purpose of carrying on the sale of indulgences; while under the famous Statute of Præmunire the whole body of the clergy were convicted of having recognized the validity of Wolsey's acts as papal legate, and thereby placed both their liberties and possessions at the mercy of the king. In April, 1533, there followed an act providing that all causes should henceforth be tried in the courts of the kingdom, and forbidding appeals to Rome under any circumstances whatever—the body "now

being usually called the English Church," being held "sufficient and meet of itself to declare and determine all such doubts and duties as to their rooms [*i.e.*, offices] spiritual doth appertain." These successive enactments had already paved the way for Henry's final rejoinder to Clement's demands, the Act of Supremacy (November, 1534), whereby the king was not only declared to be supreme head of the Church of England, but was at the same time invested with full power "to repress and amend all such errors and heresies as, by any manner of spiritual jurisdiction, might and ought to be lawfully reformed."

While such was the progress of events in England and in Germany there had been going on in Switzerland a corresponding movement, second only in importance to that initiated by Luther.

In no country was the Reformation so closely associated with political feeling as in Switzerland; and its upholders, amid surrounding despotism, were advocates of republican institutions. Zwingli and his followers looked on with shame and sorrow as they saw their countrymen hastening to cross the Alps to become the mercenaries of the pope. With no less sense of humiliation did they regard the venal spirit of their public officials stooping to become the pensioners of the French court. The progress of these new opinions was, as is usually the case, much more rapid in the large towns than in the more rural and mountainous regions.

In the year 1531 the feud between the Catholic and Protestant cantons had reached a climax; in the former the more bigoted section, aided by Ferdinand of Austria, had commenced an active persecution, and some of the Protestant preachers had been put to death. In order to repel these aggressions a league was formed between Zurich, Strasburg, and the landgrave of Hesse, and Zwingli strongly advised that a combined attack should forthwith be made on their opponents in Lucerne and Schwyz, and freedom of conscience obtained by an armed demonstration. Divided counsels, however, prevailed; and eventually Zurich was left to bear the brunt of the contest almost entirely alone. At the battle of Chappel (October 11, 1531) Zwingli fell, and his followers sustained a defeat which, although they carried on a war of fierce retaliation, they were unable to retrieve, and a decided reaction in favor of Catholicism now set in.

In Germany, on the other hand, the Reformation continued to progress. In 1533 Philip of Hesse, who was subsidized by France, inflicted a severe defeat on Ferdinand, and was able shortly after to reinstate Ulrich, duke of Würtemberg, in his dominions. The emperor at the peace of Kadan (June 29, 1534) undertook to abstain from further interference in the ecclesiastical affairs of the duchy, and the understanding arrived at on that occasion is regarded by Ranke as marking the second important stage in the history of the Reformation in Germany. The Reformed faith was forthwith established throughout Würtemberg, and soon after was introduced into Holstein, Pomerania, the Mark of Brandenburg, Upper Saxony, Brunswick, and the Palatinate.

As elsewhere, the history of the Reformation in France is that of a twofold struggle—an endeavor to bring about a reform of discipline, and a contest which pointed in the direction of doctrinal change. The abuses that prevailed in the Gallican Church at this period were scarcely less glaring than those in Germany. The appointments to the higher benefices were dictated solely by the most sordid motives—political ambition, court favoritism, and family interest. Pluralism largely prevailed; and both bishoprics and abbeys were granted *in commendam* to such an existence that

residence was almost unknown. Preferments were often bestowed upon laymen, and even upon females and children. But in no country was the movement, that aimed at the correction of abuses such as these, more completely dissociated from the religious revolution contemplated by the Protestant leaders.

At the period at which we have now arrived the main influences which guided the later history of the Reformation may be discerned in full activity. Largely political almost from the commencement of the movement, they continued more and more to partake of that character or became mingled with elements not less secular. Foremost among these latter must be placed the appeal made to baser motives both in Germany and in England, by the manner in which the nobility of both countries were bribed to acquiesce in the suppression of the religious orders, by being allowed to become large sharers in the property and revenues of the monastic and conventual foundations. Among the lower classes, on the other hand, who were often painfully reminded of the loss they had sustained in the withdrawal of that charity which, amid all the degeneracy of the monasteries, had still been one of their recognized functions, a certain genuine sympathy with Catholicism and traditional regard for its institutions long continued to survive. But even among these classes men could not but be conscious that a higher standard of belief and practice had been introduced by the Reformation, while the superior ability shown by those who preached its doctrines, in adapting their discourse to the comprehension and spiritual needs of the poor, invested them with a highly effective influence.

In Germany the policy of the emperor, nearly always ambiguous, became complicated with new difficulties. Charles himself, from political motives, appears at this time to have been really desirous of bringing about a termination of the prevailing religious controversies, but his vice-chancellor, Held, on whom it devolved to carry out his intentions, pursued a singularly infelicitous line of action, which ultimately led to the formation of the League of Nuremberg. In the meantime Protestantism continued to advance; Hermann von Wied, elector of Cologne, became a supporter of its doctrines; and Pomerania, Anhalt, Mecklenburg, and the imperial cities were added to the territories in which it became the dominant faith. It was at this juncture, when the Reformation in Germany may be considered to have advanced to its highest point, that Paul III. brought forward a proposal for assembling a general council—a proposition to which it was decided by the Protestant party at the diet of Worms (March, 1545) not to accede, inasmuch as it would be a council convened by the pope. In the following December, however, the council (see TRENT, COUNCIL OF) assembled.

Two months after the first assembling of the council of Trent Luther died. His latter days had been embittered by the defection (as he regarded it) of Melancthon to a hostile camp, in the espousal of the latter of the tenets maintained by Ecolampadius and Bucer.

In the Scandinavian kingdoms the Reformation was materially assisted by political motives; the introduction of Lutheranism into Denmark by King Christian II. in 1520 was to a great extent the result of his desire to raise the lower classes with a view to the corresponding depression of the nobility and the more powerful ecclesiastics of the realm. He sanctioned the marriage of the clergy and caused the New Testament to be translated into Danish.

In Bohemia the Hussite movement (see HUSS and HUSSITES) must be held to have become almost absorbed in the broader current of Lutheranism, al-

though the Calixtines (or moderate Utraquists) and the Taborites (or extreme party) long continued to differ on questions of discipline. In the earlier part of the seventeenth century, however, the trained activity and energy of the Jesuits led to the almost entire expulsion of both parties, and Protestantism as a professed creed nearly ceased to survive.

In Poland Protestantism prevailed before the first quarter of the sixteenth century closed. In Dantzic, Elbing, and Thorn it was established by overwhelming majorities. But here again the influence of the Jesuits ultimately proved victorious. The nobles were gained over by their arts, and Catholicism reasserted itself.

In the Netherlands, where the free spirit of the great mercantile communities was in singular harmony with the movement, the progress was still more rapid. The church organization was modeled on the political organization of the provinces, each province being subdivided into classes, while the mode of government was nearly identical with that known as Presbyterian.

In England the reformation of doctrine made but little progress during the reign of Henry VIII., for although by the Ten Articles (1536) the royal assent was given to the adoption of the doctrine of justification by faith and to the recognition of the Bible and the three ancient creeds as the standard of belief, a marked reaction in favor of Catholic doctrine took place in the enactment of the Six Articles in 1539. For a brief period heresy became a statutable offense and death was inflicted under the new provisions. The anomalous position of the English Church became a scandal to Europe; for a while some men were burnt for denying the doctrine of transubstantiation or for refusing to admit the royal supremacy, others, as Barnes and Gerard, suffered at the stake for their profession of Lutheran opinions, and even Cromwell must be regarded as in some measure a victim of his attachment to German Protestantism. During the reign of Edward VI. Somerset, in conjunction with Cranmer, pressed on the work of the Reformation apace. Chantry and hospitals were everywhere suppressed and their endowments confiscated. The bishops were compelled to acknowledge their direct subordination to the crown by being required to take out licenses for the exercise of their jurisdiction. In 1549 the first Book of Common Prayer was published, and the Act of Uniformity prescribed its use, while that of all other forms of devotion was forbidden under heavy penalties. The canon law was revised by a body of commissioners especially appointed for the purpose, and the new code was completed for future use, although it never received the young king's signature. By these and other similar reforms, carried out in a great measure under Cranmer's direction, it was sought to make the Reformation in England a complete rejoinder to the proceedings of the council assembled at Trent.

In Scotland the Reformation assumed a different character from that of the movement in England. It was inspired directly and solely by Germany, and may be regarded as commencing from the martyrdom of Patrick Hamilton, in the year 1528, there being no evidence of any prior spontaneous efforts in the direction of doctrinal reform on the part of the people.

In Ireland the circumstances which favored the introduction of Protestantism in England were altogether wanting. The Roman ritual was in harmony with the genius of the people, whereas the aversion naturally inspired by a creed imposed at the dictation of the conqueror was in itself a formidable obstacle. Protestantism became odious in the eyes of the Irish people; and, when, after long years of oppression and neglect, it was sought to inaugurate a juster policy and to render the

established church in some degree really national, the obstacles thus created could not be overcome.

**REFORMATORY AND INDUSTRIAL SCHOOLS.** There exist two classes of schools for the reformation and industrial training of children in the United States both to a certain extent under state control when duly certified. Reformatory schools are for the better training of juvenile convicted offenders; industrial schools, in which industrial training is provided, are chiefly for vagrant and neglected children and children not convicted of theft. These schools are of modern but gradual growth, the result in part of humane endeavors to rescue children from evil courses already embarked on or likely to be their lot, in part of the conviction that, as a matter of social economy, the expenditure incurred in early restraint is less costly than the punishment of matured crime. Nearly every State in the Union and many of the large cities have established reformatory and industrial schools—New York being the pioneer in this direction. In addition to the reform schools directly under State control there are some denominational schools to which juvenile offenders can be committed by law and there kept until released by their parents or until they arrive at their majority. Examples of this kind of schools may be seen in the House of the Good Shepherd, the Magdalene Home, etc., in different cities.

**REFORMED CHURCHES,** the designation of those Protestant bodies who adopted the tenets of Zwingli (and later of Calvin), as distinguished from those of the Lutheran or Evangelical divines. Compare **PRESBYTERIANISM, REFORMATION, and GERMANY.**

**REFORMED CHURCH IN AMERICA (DUTCH),** formerly the Reformed Protestant Dutch Church, a religious denomination which arose in Holland in the sixteenth century. (See **PRESBYTERIANISM.**)

**REFRACTION.** See **LIGHT and OPTICS.**

**REFRIGERATION.** See **ICE and PRESERVED FOOD.**

**REGALIA,** insignia of royalty used at the coronation of the sovereign and other great state ceremonials. The regalia of England were in very early times deposited for security in some religious house dependent on the crown, most generally in the treasury of the Temple. The first mention of their being deposited in the Tower of London is in the reign of Henry III., who on his return from France in 1230 commanded the bishop of Carlisle to replace the jewels in the Tower as they had been before. From this time down to the present the regalia (with the exception of the ancient crown of Edward the Confessor, long retained in Westminster Abbey) have been generally in the Tower under the care of a keeper, but both Henry III. and several of his successors, when in money difficulties, had recourse to the expedient of pawning the crown jewels to raise a loan.

**REGENSBURG.** See **RATISBON.**

**REGENT.** The position of a regent as an administrator of the realm during the minority or incapacity of the king is one unknown to the common law. For reasons of necessity a regency, however anomalous it may be in strict law, has frequently been constituted in various countries. There are fifteen instances in English history, the earliest of which is the appointment of the earl of Pembroke with the assent of the loyal barons on the accession of Henry III.

**REGGIO DI CALABRIA,** a city of Italy, in the province of its own name, formerly Calabria Ulteriore Prima, is admirably situated on the Strait of Messina some miles farther south than the city of Messina on the other side. The population of Reggio was, in 1881, 23,853 in the city, or including the various suburban

villages—Sbarre (3,622), Santa Catarina (1,147), etc.—35,437, and in the commune 39,296.

REGGIO NELL' EMILIA, a city and episcopal see of Italy, in the province of Reggio nell' Emilia (up till 1859 part of the duchy of Modena), is situated on the line of the old Via Æmilia, seventeen miles by rail southeast of Parma. It is a large, well-built and flourishing place with a population in 1881 of 18,634 (commune 56,031) within the circuit of its walls.

REGIOMONTANUS. The real name of this astronomer was JOHANN MÜLLER, but from his birth-place, Königsberg, a small town in Franconia, he called himself JOH. DE MONTEREGIO. The name Regiomontanus occurs for the first time on the title page of his *Scripta*, published in 1544, but he has since become best known by it. He was born in June, 1436. He died very shortly after his arrival in Rome, July 6, 1476.

REGISTRATION. In all systems of law the registration of certain legal facts has been regarded as necessary, chiefly for the purpose of insuring publicity and simplifying evidence. Registers, when made in performance of a public duty, are as a general rule admissible in evidence merely on the production from the proper custody of the registers themselves or (in most cases) of examined or certified copies. The extent to which registration is carried varies very much in different countries. For obvious reasons judicial decisions are registered in all countries alike. In other matters no general rule can be laid down, except perhaps that on the whole registration is not as fully enforced in the United Kingdom and the United States as in Continental states. The most important uses of registration occur in the case of judicial proceedings, land, ships, bills of sale, births, marriages, and deaths, companies, friendly and other societies, newspapers, copyrights, patents, designs, trade marks, and professions and occupations. The registration of qualified voters in elections in the United States is treated in a separate section below.

In every State of the Union, the voter as a prerequisite to suffrage, must appear by name on a list of electors for the State. The law governing such registration varies slightly in every State. We append a copy of the law of Illinois, which with a few modifications will furnish the substance of all other legislation on the same subject:

Article III. *General Registration*.—1. The judges of election shall constitute the board of registry in the precinct for which they shall be appointed.

2. Every person having resided in the State one year, in the county ninety days, and in the election precinct thirty days next preceding any election therein, who was an elector in this State on the first day of April, in the year A. D. 1848, or obtained a certificate of naturalization before any court of record in this State prior to the first day of January, 1870, or who shall be a male citizen of the United States above the age of twenty-one years, shall be entitled to vote at such election.

3. Such board of registry and the election clerks shall meet in the precinct on Tuesday, four weeks preceding the first general city, village or town election, or the first general State or county election which may occur after the first appointment of such board of election commissioners, at the place designated by such board of commissioners, and they shall then proceed to make a general registration of all the voters in such precinct. A new general registration shall be made by the board of registry prior to and for each presidential election, in the same way as required hereby for the first registration hereunder. Three registry books shall be furnished to such board by the board of election commissioners for the purpose of such registration.

The following is an extract from the Illinois laws as to the registration of deeds, etc., and may be taken as a sample of legislation in other States:

28. Deeds, etc., to be recorded. Deeds, mortgages, powers of attorney, and other instruments relating to or affecting the title of real estate in this State, shall be recorded in the county in which such real estate is situated; but if such county is not organized, then in the county to which such unorganized county is attached for judicial purposes. (As amended by act approved April 3, 1873. In force July 1, 1874. R. S. 1845, p. 108, 22).

30. Effect of recording as to creditors, etc. All deeds, mortgages, and other instruments of writing which are authorized to be recorded, shall take effect and be in force from and after the time of filing the same for record, and not before, as to all creditors and subsequent purchasers, without notice; and all such deeds and title papers shall be adjudged void as to all such creditors and subsequent purchasers, without notice, until the same shall be filed for record. (R. S. 1845, p. 108, 23, *Buchanan v. International bank*, 78 Ill., 500).

REGNARD, JEAN FRANÇOIS, who in general estimation ranks next to Molière among French comic dramatists, was born at Paris in 1656, and died on September 4, 1709.

REGNAULT, HENRI, French painter, born at Paris on October 31, 1843, was the son of Henri Victor Regnault (noticed below). The war between France and Germany arose, and found Regnault foremost in the devoted ranks of Buzenval, where he fell on January 19, 1871.

REGNAULT, HENRI VICTOR, French chemist, was born on July 21, 1811, at Aix-la-Chapelle.

Regnault is perhaps best known by his careful re-determination of the specific heats of all the elements obtainable, and of many compounds—solids, liquids, and gases—by which he was enabled to correct the values obtained by Dulong and Petit, and to reduce the number of exceptions to their law that *the specific heat of an element varies inversely as its atomic weight, and of a compound as its molecular weight*. He also paid attention to hygrometry and devised a hygrometer in which a cooled metal surface is used for the deposition of moisture.

In 1854 he was appointed to succeed Ebelman as director of the celebrated porcelain manufactory at Sèvres. He carried on the great research on the expansion of gases in the laboratory at Sèvres, but all the results of his latest work were destroyed during the Franco-German War, in which also his son Henri (noticed above) was killed. Regnault lived until January 19, 1878.

REGNAULT, JEAN BAPTISTE, French painter, was born at Paris on October 9, 1754, and died in the same city on November 12, 1829.

REGNIER, MATHURIN, the greatest satirist of France, was born at Chartres on December 21, 1573. He died in 1613.

REGULUS, MARCUS ATILIUS, was consul for the second time in the ninth year of the First Punic War (256 B.C.) and so was one of the commanders in the great naval expedition which shattered the Carthaginian fleet and successfully landed an army on Carthaginian territory at Clupea. At first the invaders had such success that half the army and the other consul Manlius could be recalled to Rome, and yet leave good hope that Regulus with the insurgent Numidian subjects of the Phœnicians would finish the war in the second campaign. But Carthage, which had found an able general in the Spartan Xanthippus, used the winter

to such good account that in the spring of 255 Regulus was decidedly inferior in strength, and, hazarding a pitched battle on ground favorable to the enemy, had his army cut to pieces and was himself taken captive. Regulus perished in captivity, and was supposed at Rome to have been done to death: according to the common story he was sent to Rome on parole to negotiate a peace or exchange of prisoners, but on his arrival strongly urged the senate to refuse both proposals, and returning to Carthage was slain with horrid tortures.

REICHA, ANTON JOSEPH, musical theorist and teacher of composition, was born at Prague, February 27, 1780. He died at Paris, May 28, 1836.

REICHENAU, a picturesque island in the Untersee or western arm of the lake of Constance, is three miles in length by one in breadth, and is connected with the east bank by a causeway three quarters of a mile long. It belongs to the duchy of Baden, and comprises the three parishes of Oberzell, Mittelzell, and Unterzell, with a joint population of 1,463 in 1880.

REICHENBACH, a manufacturing town of Saxony, in the province of Zwickau, lies in the hilly district known as the Voigtland, fifty miles to the south of Leipsic. Its importance is of recent origin, and the population, amounting to 18,330 in 1885, has trebled itself within the last fifty years.

REICHENBACH, a cotton-manufacturing town of Prussian Silesia, with 7,368 inhabitants (1891) and an old castle, lies thirty miles to the south-southwest of Breslau, and demands mention chiefly from its connection with several important historical events.

REICHENBACH, GEORG VON, astronomical instrument maker, was born at Durlach in Baden on August 24, 1772. He died at Munich on May 21, 1826.

REICHENBERG (Bohem. *Liberec*), a town of Bohemia, with an independent jurisdiction, lies on the Neisse, about fifty miles to the northeast of Prague and not far from the Saxon and Prussian frontiers. The population in 1880 was 28,090.

REICHENHALL, a small town and watering-place of Upper Bavaria, is finely situated in an amphitheater of lofty mountains, on the river Saale or Saalach, 1,570 feet above the level of the sea and nine miles to the southwest of Salzburg. The resident population in 1890 was 3,436, almost all Roman Catholics. The saline springs are used both for drinking and bathing, and are said to be efficacious in scrofula and incipient tuberculosis. In addition to numerous large hotels, the most prominent edifices are the Romanesque church, recently restored, and the handsome and extensive building of the salt-works.

REICHSTADT, DUKE OF. See NAPOLEON II. The title is derived from the little town of Reichstadt in northern Bohemia.

REID, MAYNE, captain in the United States army, was in his generation one of the most popular of writers of stories of adventure. His own early life was as adventurous as any boy reader of his novels could desire. He was a native of Ulster, born in 1818, and was educated for the church, but, disliking the prospect of a regular profession, went to America at the age of twenty in search of excitement and fortune. Among other experiences he made trading excursions on the Red River, and studied the ways of the retiring red man and the white pioneer on the spot. He made acquaintance with the Missouri in the same practical manner, and roved about through all the States of the Union. When the war with Mexico broke out in 1845 he obtained a commission, was present at the siege and capture of Vera Cruz, and led a forlorn hope at Chapultepec. Thereafter he settled in England, and

began his career of a novelist in 1849 with the *Rifle Rangers*. This was followed next year by the *Scalp Hunters*. He never surpassed his first productions, except perhaps in *The White Chief* (1855) and *The Quadroon* (1856). He died in London, October 22, 1883.

REID, THOMAS, the chief founder of what is generally designated the Scottish school of philosophy, was born at Strachan in Kincardineshire, about twenty miles from Aberdeen, on April 26, 1710. He died in 1796.

The key to Reid's whole philosophy is to be found in his revulsion from the skeptical conclusions of Hume. In several passages of his writings he expressly dates his philosophical awakening from the appearance of the *Treatise of Human Nature*.

The principles which Reid insists upon as everywhere present in experience evidently correspond pretty closely to the Kantian categories and the unity of apperception. Similarly, Reid's assertion of the essential distinction between space or extension and feeling or any succession of feelings may be compared with Kant's doctrine in the *Æsthetic*.

REID, SIR WILLIAM, administrator and man of science, was born in 1797 at the manse of Kinglassie, Fifeshire, Scotland. He died in October, 1858, shortly after his return to England.

REIGATE, a market town and municipal borough of Surrey, England, is at the head of the long valley of Holmsdale Hollow, on three railway lines, twenty-three miles south of London. The area of the municipal borough is 6,015 acres, with a population in 1871 of 15,916, and in 1891 of 22,646.

REIMARUS, HERMANN SAMUEL, known to history chiefly as the author of the *Wolfenbüttel Fragments*, was born at Hamburg, December 22, 1694. He died in 1768.

REIMS. See RHEIMS.

REINAUD, JOSEPH TOUSSAINT, a distinguished French Orientalist, was born in 1795 at Lambesc, Bouches du Rhône. He died in 1867.

REINDEER. See DEER.

REINEKE VOS. See GERMAN LITERATURE and ROMANCE.

REINHOLD, KARL LEONHARD, who played a considerable part in the early spread and development of the Kantian philosophy, was born at Vienna in 1758. He taught at Kiel (having previously occupied a chair at Jena) till his death in 1823.

REISKE, JOHANN JACOB, scholar and physician, was born December 25, 1716, in the little town of Zörbig, in Electoral Saxony. Reiske died August 14, 1774, and his MS. remains passed, through Lessing's mediation, to the Danish minister Suhm, and are now in the Copenhagen library. Reiske certainly surpassed all his predecessors in the range and quality of his knowledge of Arabic literature.

RELAND, ADRIAN, a meritorious Dutch Orientalist, was born at Ryp, July 17, 1676, studied at Utrecht and Leyden and successively professed Oriental languages with great success at Harderwijk (1699) and Utrecht (1701). In the latter chair, from which he also lectured on sacred antiquities, he remained till he died of smallpox February 5, 1718.

RELICS. Relics, in what may be called their merely human and historic aspect, appeal to many of the most obvious and most deeply seated principles of human nature—to that power of connection with the past which has been justly called one of the divinest elements of our being, to the law of association, and to that love of something like ocular testimony which so notoriously affects the mind more forcibly than "the hearing of the ear."

It would be strange indeed if religion (which alike in its good features and in its abuses, penetrates more deeply than anything else into the human heart) were found to be dissociated from relics. Probably all the more widely spread creeds claim some such material links with the past. Let it suffice to mention here the Ka'ba at Mecca, and the tooth of Buddha exhibited in Ceylon.

We turn to the pre-Christian and Christian dispensations. The Old Testament contains allusions to relics too numerous to mention.

Certainly, however, in one respect, perhaps in two (though of seemingly opposite tendencies), Judaism stands in this matter distinguished from contemporary religions. Nowhere else should we read of a valued and most interesting relic being destroyed by a devout ruler because it was found to have been abused and to have led to idolatry, as was done to the brazen serpent by Hezekiah (2 Kings xviii. 4). But it may also be questioned whether the records of any other people contain an account of a miracle wrought by the relics of a deceased prophet. But the second book of Kings relates the revival of a dead man by the bones of Elisha—a narrative rendered the more remarkable by the fact that, as a rule, the contact with a corpse, a bone, or a grave made a man unclean for seven days (Num. xix. 11-22).

The New Testament does not relate any case precisely similar to that of Elisha. The remains of the proto-martyr Stephen are simply committed to the tomb, with much lamentation by devout men (Acts viii. 2); and of the funeral of the first martyred apostle, James, we have no record. It is not, however, to be denied that the book of Acts tells of miracles of healing resembling that of her who was cured by the touch of our Lord's garment (Matt. ix. 20-22). Even the shadow of Peter, it is implied, may have healed the sick; and handkerchiefs or aprons which had been worn by Paul relieved not only the diseased but the possessed (Acts v. 15; xix. 12).

Relics from the fourth to the sixteenth century occupied a large space in the mind of Christendom. The word relics (*reliquiæ*, *λείψανα*) became almost restricted, in theological language, to the bodies (or parts of the bodies) of saints, or, as has been intimated, to memorials of Christ's passion, or instruments which had been used in the torture and execution of martyrs. Inquiries connected with their genuineness are, as is well known to students of ecclesiastical history, conspicuous in the life of the mother of Constantine, St. Helena, who claimed to have discovered the true cross on which our Lord suffered, and in the career of St. Ambrose at Milan. Once at least a real glorious series of campaigns, those of the emperor Heraclius against the barbarian Avars and the Persians (622-628), is connected with a successful endeavor to regain the cross. It is remarkable that the Persians are reported to have kept the cross in its case with the seals unbroken.

Marauding campaigns between monastery and monastery were by no means uncommon; but these sink into insignificance compared with the spoliation exercised by the crusaders from the West who captured and sacked Constantinople in 1203-4.

The next two centuries saw no diminution of such zeal, and there grew up, it can hardly be doubted, an increase of lower motives and of fraud. By the time of the Reformation the condition of matters was such as in many respects to offer a mark for all assailants of the existing state of things, and a practical admission on the part of those in authority that it was to a large extent simply indefensible.

As regards the Church of Rome, although in theory

the events of the sixteenth century may have left its teaching untouched, yet it can hardly be questioned that this is one of the many departments of religious life in which that great commotion, as De Maistre calls it, has in his great words, even among Roman Catholics, worked a most sensible revolution.

Still, however, the Church of Rome stands alone, we believe, in considering the possession of relics an indispensable condition of the performance of the highest acts of public Christian worship. Every altar used for the celebration of mass must, according to Roman Catholic rule, contain some authorized relics. These are inserted into a cavity prepared for their reception, called "the tomb," by the bishop of the diocese, and sealed up with the episcopal seal. A collect in the *Ordo Missæ* assumes their presence, and makes reference to the saints whose relics are thus preserved.

RELIGIONS. Religions, like living organisms, have a history, and therefore this is to be studied first, so far as can be known, how they rise and spread, grow and fade away; how far they are the creations of individual genius, and how far of the genius of nations and communities; by what laws, if it is possible to discover them, their development is ruled; what are their relations to philosophy, science, and art, to the state, to society, and above all to ethics; what is their mutual historical relation, that is, if one of them sprang from another, or if a whole group are to be derived from a common parent, or if they only borrowed from one another and were subject to one another's influence; lastly, what place is to be assigned to each of those groups or single religions in the universal history of religion. The first result of this historical inquiry must be an attempt at a genealogical classification of religions, in which they are grouped after their proved or probable descent and affinity.

There is no difficulty in determining the descent and relationship of religions which have taken rise in historical times, such as Confucianism, Buddhism, Judaism, Christianity, Mohammedanism, and some others of minor importance. But the great majority of ancient religions had their origin in prehistoric times, of which neither documents nor trustworthy traditions are extant. In that case their mutual relation has to be established by reasoning from the myths, ideas, rites, and characteristics common to them.

Comparative mythology and the history of religion leave no doubt that all the religions of the Aryan Indo-Germanic nations, viz., Eastern Aryans (or Indians, Persians, and Phrygians) and Western Aryans or Greeks, Romans, Germans, Norsemen, Letto-Slavs, and Celts), are the common offspring of one primitive Old-Aryan religion.

However, the degree in which the Aryan religions are mutually related is not always the same. None of them came directly from the Old-Aryan religion. They consist of five pairs, each of which must have been first a unity: the Indo-Persian, the Græco-Roman, the Letto-Slavic, the Norse-Teutonic, and the Gaelo-Cymric. The fact that the members of those pairs are more closely allied with one another than with the other members of the family obliges us to assume five prehistoric Aryan religions: the Old East-Aryan, the Old Pelasgic, the Old Windic, the Old German, and the Old Celtic prehistoric religions, forming so many links between those historical religions, and the common parent of all, the primeval Aryan worship, which has been suppressed by Christian religions.

Though there is so much wanting in our knowledge of the Semitic religions, especially as regards those of the pre-Christian Aramæans, of the pre-Islamic Arabs, and of the old Hebrews, all we know about them tends

to prove that they too must have descended from a common source. When we find that the same divinities were worshiped by several North-Semitic nations it might be contended that they were borrowed from one of them, as trade and conquest had brought them from ancient times into close contact with one another. But no such relation existed till the very last centuries of the Assyrian empire between the Northern Semites and the various tribes of the Arabian desert. The myth of the dying and reviving Thammuz, Dumuzi, common to all Northern Semites, seems not to have been current among the ancient Arabs, though some scholars (Krehl, Lenormant) think there are traces of it left in their traditions and rites. Tree worship and stone worship were particularly developed among both Northern and Southern Semites, which is proved by the use of Betyles (בֵּית-אֵל) by the black stone in the Ka'ba, the stone at

Bethel, that in the temple of the great goddess of Cyprus at Paphos, at Edessa, and elsewhere, by the seven black stones representing the planet-gods at Erech (Uruk) in Chaldæa, etc. Finally all Semitic religions without a single exception understand the relation between God and man as one between the supreme lord and king and his subject or slave. They are eminently theocratic, and show a marked tendency to monotheism, which, both in Israel and in Arabia, is the last word of their religious development. It is not so easy to determine the grade of relationship between the different Semitic religions as it is to show that they all descend from a common parent. Moreover the question is complicated by another problem—Whether the Babylonians and Assyrians borrowed the greater part of their religious conceptions and institutions from a foreign, non-Semitic people, the primitive inhabitants of their country, and if this be the case what they then have of their own and what is due to the influence of that ancient civilization. Whatever may be the final solution of this question, we shall not go far wrong if we distinguish the Semitic religions into two principal groups—the one comprising the southern or Arabic, with perhaps the most ancient Hebrew, the other all the Northern Semitic religions from the Tigris to the Mediterranean—leaving it undecided whether the undeniable relationship between the northeastern and the northwestern Semitic religions be due to the influence of the superior culture of the former or to the fact that they all have radiated from a common center. This only is beyond doubt, that the Assyrian religion is a daughter of the Babylonian, and that the Canaanitic and Phœnician modes of worship are closely allied.

The first problem to be solved in respect to African religions is the classification of the Egyptian religion. It is neither Semitic and theocratic nor Aryan and theanthropic. All we know is that the Egyptians themselves mention a people called Punt (the Phut of the Bible), with whom they had commercial relations and whose religion was akin to their own, so much so that they called the country of Punt, on the western Arabian and on the opposite African coast, the Holy Land.

That the primitive religion of southern Mesopotamia, commonly called Accadian or Sumerian, was related to the Egyptian, is also a mere conjecture, which does not seem to be favored by the newly discovered facts. Finally, the scanty remains of the pre-Islamic religion of the Imōshaghī or Berbers, the ancestors of the Libyans (in Egyptian Ribū), the Gætulians, the Mauritanians, and the Numidians resemble in some degree Egyptian customs and notions; but, whether they point to genealogical relationship or are due to early Egyptian influence, it is hard to say. If, as is generally

supposed, the dominant race sprang from Asiatic settlers and conquerors, who long before the dawn of history invaded the country, subjugated the dark-colored inhabitants, and mixed with them, and if it is to these foreigners that the more elevated elements in the Egyptian religion are due, the basis of this religion is of a purely Nigritian character.

All we can say about the other original religions of the dark continent is that they resemble one another in many respects. The prominent characteristic of the Negroes proper, is their unlimited fetichism, combined as usual with tree worship, animal worship, especially that of serpents, with a strong belief in sorcery and with the most abject superstitions, which even Islām and Christianity are not able to overcome.

Among the Abantu or Kaffrarians (Ama-Khosa, Ama-Zulu, Be-Chuana, Ova-Herero), fetichism is not so exuberant. Their religion is rather a religion of spirits. The spirits they worship, not sharply distinguished from the souls of the departed ancestors (Imi-shologu, Barimi), are conjured up by a caste of sorcerers and magicians, Isintonga (Isinyanga, Nyaka), and are all subordinate to a ruling spirit, regarded as the ancestor of the race, the highest lawgiver who taught them their religious rites, but who seems to have been originally a moon-god as the lord of heaven. The Khoi-Khoi or Hottentots, who are not black but brown, and who now live in and near the Cape Colony, also have a supreme deity, called Tsui- or Tsuni-Koab (the wounded knee) by the colonial Hottentots, Heitsi-eibib (wooden face) by the Namaqua. He, too, like the highest god of the Bantu, is the ancestor of the race and the chief of souls and spirits. The great difference between the religions of the Khoi-Khoi and the other Nigritians is the total absence of animal worship and of fetichism by which it is characterized.

What the ancient national religion of the Chinese was can only be gathered from its survivals in the still existing faiths. Confucianism claims to be a restoration of the old and pure institutions of the fathers, though it may just as well be said to be a thorough reform, and Taoism is, according to some European scholars, the original Chinese religion in its latest development. Without venturing to speculate on the origin of the Chinese nationality, nor on the possibility that this ethnic dualism may be the source of the two streams of religious development in China, we have some ground to hold Confucius' reform as the renewal of a much older reform (Chowkung's or even earlier), limited to the learned and the greater part of the upper classes—Taoism on the contrary being a revival of the ancient popular Chinese religion, to which the *Tao-tĕ-King* had to give the appearance of a philosophical basis. Chinese Buddhism does not differ much from the latter, and is now equally despised.

In Japanese religions we have again the same triad, nearly parallel to the Chinese: the old national religion Kami-no-madsu (the way, *i.e.*, the worship, of the gods), called frequently Sin-to (Chinese Shin-tao, the way or worship of the spirits), with the mikado as its spiritual head, just as Chinese Taoism had its popes; Confucianism, imported from China in the seventh century; and Buddhism, imported from Corea and nearly exterminated in the sixth century, but reviving, and at last, in the beginning of the seventh century, triumphant.

The Roman branch of the Ural-Altai religions, all recognizing the same heaven-god Num, Yum, Yummal, Yubmel, Yumala, as supreme. By far the best known of this family are its North-European members, the religions of the Lapps, the Esthonians, and the Finns, but the two last named are not pure specimens of Ural-Altai worship, as they borrowed much from the

Germanic, especially from the Scandinavian, mythology. It is highly probable that the other branches of the same ethnic family, the Mongolian and the Turkish, and the other members of the same branch, *e.g.*, the Magyars, originally did not differ much from the Finnic in religious ideas and customs. Nor do we know in how far the Tibetans, Burmese, Siamese, and other peoples nearly related to the Chinese had originally a similar worship, as all of them are now faithful Buddhists. The question whether the religion of the primitive inhabitants of Mesopotamia (SumérAkkad) has any genealogical relation to that of the Chinese and the Ural-Altaic family, as some scholars now try to prove, is not yet ripe for solution.

Among the American nations, the religion of the Eskimo should be clearly distinguished as having been borrowed from the Ural-Altaic religion. Their division of the world of spirits into those of the sea, the fire, the mountains, and the winds, with Tomgarsuk, the heaven god as the highest, and their belief in the magical power of their sorcerers, the Augekoks, do not differ from those which characterize the Ural-Altaic religions. At any rate the religion of the Eskimo is the connecting link between the latter and those of the American aborigines. That all the other religions of North and South America are most closely allied is generally admitted, and is indeed beyond doubt. However, fetichism and idolatry are much less developed among the Americans; a marked tendency to gloomy rites and bloody self-torture is common to all. They embrace the religion of the Redskins from Canada to the Gulf of Mexico, all of whom have in common the worship of the Great Spirit; the religion of the Aztec race which is spread from Vancouver's Island to Nicaragua; that of the original inhabitants of the Antilles and of the Muyscas in South America, to which branches belonged elevated religious ideas mixed with barbarous rites; also the religion of the Quichua Aymara, which culminated in the sun worship of the Incas in Peru; that of the Caribs and Arowaks, the Brazilian aborigines whose religious notions and customs are said to have been in accordance with the low degree of their civilization, only the Avancanicus having a somewhat advanced sun worship, owing, doubtless, to the ascendancy of Peruvian culture; and finally the religion of the Malayo-Polynesian family, which so far as investigation can determine did not differ more from the Polynesian than do the languages.

What may have been the state of religion before the oldest religion known to us sprang into being, and even before that animistic stage of development which we know only by its survivals in the higher, and its ruins in the still existing lower religions, certain it is that the oldest religions must have contained the germs of all the later growth, and, though perhaps more thoroughly naturistic than the most naturistic now known, must have shown some faint traces, at least, of awakening moral feelings.

With regard to the ethical religions—Buddhism, Christianity, and Mohammedanism—there is a real difference between two at least of the three named, which are still contending with one another for supremacy over the nations of the globe, and the other religious communities which no longer try to make proselytes—between Buddhism and Christianity, on the one hand, and Confucianism, Brahmanism, Jainism, Mazdaism, and Judaism on the other. And this difference, which ought to be maintained, is indeed one of principle, not of fact only.

Buddhism, Islâm, and Christianity were neither national nor particularistic. All of them were the representatives of ideas surpassing so to say the national horizon; all of them had in view, not the special relig-

ious wants of the nation, but more general aspirations of the human heart and mind. Two of them, therefore, were rejected, after a shorter or longer struggle, by the peoples to which their founders belonged by birth; and it is a well-known fact that Mohammedanism, though founded by an Arab, took its fundamental ideas from Judaism and Christianity, and that not the Arabs, but foreign nations, especially the Persians, raised it to the high position which it would not have occupied in the world without them. The national form of the Buddhistic idea was Jainism, that of the Christian idea Ebionitism, and perhaps the Wahhabites may be considered as the national reformers of Mohammedanism; and it is only natural that none of these sects found adherents except among the peoples in the midst of which they arose. Nor were Buddhism, Islâm, and Christianity particularistic. Buddhism "looks for the man; the miseries of existence beset all alike, and its law is a law of grace for all."—So too in its way does Islâm; in the beginning it spreads by conquest, but the faithful of every nationality, whether converted by the force of arms or by the preaching of missionaries, acquire the same rights and dignity as the Arabs. The universalism of Christianity needs no proof. Here, however, the difference begins. We class these three religions under one head, because they resemble one another in so many respects, and because they differ from the other religious communities founded by individuals precisely in that in which they are mutually alike. But we are far from placing them on the same level. Islam, *e.g.*, is not original, not a ripe fruit, but rather a wild offshoot of Judaism and Christianity. Buddhism, though the most widely spread, has never been victorious except where it had to contend with religions standing on no very high degree of development. For a short time it had a footing in Persian countries, but there its influence was neither deep nor durable, and in China it was not even able to overcome Confucianism and Taoism; it seems to have been driven from India by Brahmanism, without being actually persecuted. Both Islam and Buddhism, if not national, are only relatively universalistic, and show the one-sidedness, the one of the Semitic, the other of the Aryan race. The former represents an important religious idea—the absolute sovereignty of the one God, toward whom man, being nothing himself, has only one duty, that of tacit obedience; it exalts the divine, not combining it with, but opposing it to, the human, which it despises, and therefore neglects the development of ethics. Buddhism on the contrary neglects the divine, preaches the final salvation of man from the miseries of existence through the power of his own self-renunciation; and therefore, as it is atheistic in its origin, it very soon becomes infected by the most fantastic mythology and the most childish superstitions. If religion really is the synthesis of dependence and liberty, we might say that Islâm represents the former, Buddhism the latter element only, while Christianity does full justice to both of them. Christianity, the pure and unalloyed at least, has fused dependence and liberty, the divine and the human, religion and ethics, into an indivisible unity.

We now give the following sketch of a morphological classification of religions:

#### I. NATURE RELIGIONS.

##### (a) Polydæmonistic Magical Religions under the control of Animism.

To this class belong the religions of the so-called savages or uncivilized peoples, but they are only degraded remnants of what they once must have been.

##### (b) Purified or organized Magical Religions. Therianthropic Polytheism.

1. <i>Unorganizea.</i>	2. <i>Organized.</i>
Japanese Kami-no-madsu.	The semi-civilized religions of America: Maya, Natchez, Toltecs-Aztecs, Muyscas, Incas in Peru.
The non-Aryan (Dravidian) religions of India, principally in the Deccan.	The ancient religion of the Chinese empire.
Religion of the Finns and Ehsts.	Ancient Babylonian (Chaldæan) religion.
The old Arabic religions.	Religion of Egypt.
Old Pelasgic religion.	
Old Italiote religions.	
Etruscan religion before its admixture with Greek elements (?)	
The old Slavonic religions.	

(c) Worship of manlike but superhuman and semi-ethical beings. Anthropomorphic Polytheism.

The ancient Vaidic religion (India).  
 The pre-Zarathustrian Iranic religion (Bactria, Media, Persia).  
 The younger Babylonian and Assyrian religion.  
 The religions of the other civilized Semites (Phœnicia, Canaan, Aramæa, Sabæans in South Arabia).  
 The Celtic, Germanic, Hellenic, and Græco-Roman religions.

## II. ETHICAL RELIGIONS.

(a) National Nomistic (Nomothetic) religious communities.

Taoism and Confucianism in China.  
 Brahmanism, with its various ancient and modern sects.  
 Janism and primitive Buddhism.  
 Mazdaism (Zarathustrianism), with its sects.  
 Mosaism.  
 Judaism.

(b) Universalistic religious communities.

Islam, Buddhism, Christianity.

There are some vague allusions to an early Babylonian conquest of western Asia, which might account for the agreement of some ancient modes of worship in the Western countries with those of Babylonia; but, before the XVIIIth Dynasty of Egypt (fifteenth or sixteenth century B.C.), the empires on the banks of the Euphrates and Tigris, and that on the banks of the Nile, seem not yet to have come into contact. From that time, at least during the rule of the XIXth Dynasty, not a few Semitic deities were admitted into the Egyptian pantheon. In a well-known hymn the victorious Egyptian king is compared to the Semitic Ba'al, as well as to the national god Mentu.

Modern history of religions is chiefly the history of Buddhism, Christianity, and Islâm, and of their wrestling with the ancient faiths and primitive modes of worship, which slowly fade away before their encroachments, and which, where they still survive in some parts of the world, and do not reform themselves after the model of the dominant religion, draw nearer and nearer to extinction. But the subject is too vast to be treated of in detail here. It has been our object only to show, even for the ancient history of religions, the continuity and coherence which nobody will deny with regard to the modern. In both ancient and modern times, religions spread (1) by the influence of superior civilization, (2) by conquest, (3) by colonization or commerce, (4) by missions. Examples are too numerous and too well known to require mention here.

**REMAINDER, REVERSION.** In the view of English law a remainder or reversion is classed either as an incorporeal hereditament or, with greater correctness, as an estate in expectancy (see **REAL ESTATE**). That is to say, it is a present interest subject to an existing estate in possession called the particular estate, which must determine before the estate in expectancy can become an estate in possession. A remainder or reversion is in strictness confined to real estate, whether legal or equitable, though a similar interest may exist in personalty. The particular estate and the remainder or reversion together make up the whole estate over which the grantor has power of disposition. Accordingly a remainder or reversion limited on an estate in fee simple is void. The difference between a remainder and a reversion, stated as simply as possible,

is that the latter is that undisposed-of part of the estate which after the determination of the particular estate will fall into the possession of the original grantor or his representative, while a remainder is that part of the estate which under the same circumstances will fall into the possession of a person other than the original grantor or his representative.

REMBRANDT, REMBRANDT HARMENS VAN RIJN, the chief of the Dutch school of painting and one of the greatest painters the world has seen, was born in the house No. 3 Weddesteg, on the rampart at Leyden overlooking the Rhine, July 15, 1607.

Rembrandt's earliest pictures were painted in the last four years of his stay at Leyden, from 1627 to 1631. His work was now attracting the attention of the lovers of art in the great city of Amsterdam; and urged by their calls, he removed about 1631 to live and die there. The excellent painter Thomas De Keyser was then in the height of his power, and his influence is to be traced in some of Rembrandt's smaller portraits. The first important work executed by Rembrandt in Amsterdam is *Simeon in the Temple*, of the Hague Museum, a fine early example of the treatment of light and shade and of his subtle color. Between the small *Simeon* of 1631 and the life-sized *Lesson in Anatomy* of 1632 there is a great difference. In the latter we have the first of the great portrait subjects—Tulp the anatomist, the early friend of Rembrandt, discoursing to his seven associates, who are ranged with eager heads round the shortened body. The subject was not new, for it had been treated in former years, but it was reserved for Rembrandt to make it a great picture by the grouping of the expressive portraits and by the completeness of the conception.

Rembrandt's work about this period included one of the greatest portraits of 1634, the superb full length portrait of *Martin Daey*, which with that of *Madame Daey*, painted according to Vosmaer some years later, formed one of the ornaments of the Van Loon collection at Amsterdam. Both now belong to Baron Gustave de Rothschild. The life of Samson supplied many subjects in these early days. The so-called *Count of Gueldres Threatening his Father-in-law* of the Berlin Gallery, has been restored to its proper signification by M. Kolloff, who finds it to be Samson. But the greatest of this series, and one of the prominent pictures of Rembrandt's work, is the *Marriage of Samson* of the Dresden Gallery, painted in 1638. Here Rembrandt gives the rein to his imagination and makes the scene live before us. The story of Susannah also occupied him in these early years, and he returned to the subject in 1641 and 1653. The *Bather* of the National Gallery may also be another interpretation of the same theme. In all of these pictures the woman is coarse in type and lumpy in form, though the modeling is soft and round, the effect which Rembrandt always strove to gain. Beauty of form was outside his art. But the so-called *Danae* (1636) at St. Petersburg is a sufficient reply to those who descry his nude female forms. As flesh painting it glows with color and life, and the blood seems to pulsate under the warm skin. In the picturesque story of Tobit Rembrandt found much to interest him, as we see in the beautiful small picture of the Arenberg collection at Brussels. Sight is being restored to the aged Tobias, while with infinite tenderness his wife holds the old man's hand caressingly. The momentary action is complete, and the picture goes straight to the heart. In the Berlin Gallery he paints the anxiety of the parents as they wait the return of their son. In 1637 he painted the fine picture now in the Louvre of the *Flight of the Angel*; and the same subject is grandly treated by him, apparently about

1645. in the picture exhibited in the winter exhibition at Burlington House in 1885. Reverence and awe are shown in every attitude of the Tobet family. A similar lofty treatment is to be found in the *Christ as the Gardener appearing to Mary* of 1638 (Buckingham Palace).

The year 1642 is remarkable for the great picture formerly known as the *Night Watch*, but now more correctly as the *Sortie of the Banning Cock Company*, another of the landmarks of Rembrandt's career, in which twenty-nine life-sized civic guards are introduced issuing pell-mell from their club houses.

But this year of great achievement was also the year of his great loss, for Saskia, his wife, died in 1642. With her death his life was changed. Bode has remarked that there is a pathetic sadness in his pictures of the *Holy Family*—a favorite subject at this period of his life. All of these he treats with the naïve simplicity of Reformed Holland, giving us the real carpenter's shop and the mother watching over the Infant reverently and lovingly, with a fine union of realism and idealism. A notable example of this feeling is to be found in the *Woman Taken in Adultery* of the National Gallery, painted in 1644 in the manner of the *Simeon of the Hague*. A similar lofty ideal is to be found in his various renderings of the *Pilgrims at Emmaus*, notably in the Louvre picture of 1648, and the same year we have the *Good Samaritan* of the Louvre, the story being told with intense pathos. At this period of his career we come upon a branch of his art on which he left, both in etching and in painting, the stamp of his genius, viz., landscape. In all these pictures light with its magical influences is the theme of the poet-painter. From the number of landscapes by himself in the inventory of his sale, it would appear that these grand works were not appreciated by his contemporaries. The last of the landscape series dates from 1655 or 1656, the close of the middle age or manhood of Rembrandt.

But evil days were at hand. The long-continued wars and civil troubles had worn out the country. Trade and commerce languished, and in Amsterdam hundreds of houses were empty. Rembrandt's brothers had suffered, and money was scarce and nothing could avert the ruin of the painter, who was declared bankrupt in July, 1656, an inventory of all his property being ordered by the Insolvency Chamber. The first sale took place in 1657. The sum realized, under 5,000 guilders, was but a fraction of their value. Driven thus from his house, stripped of everything he possessed even to his table linen, Rembrandt took a modest lodging in the Keizerskroon hostelry, apparently without friends and thrown entirely on himself. But there was no failure here, for this dark year of 1656 stands out prominently as one in which some of his greatest works were produced, as, for example, *John the Baptist Preaching in the Wilderness*, belonging to Lord Dudley, and *Jacob Blessing the Sons of Joseph*, of the Cassel Gallery. After the sale of the house in the Breedstraat Rembrandt retired to the Rosengracht, an obscure quarter at the west end of the city. Here he painted the *Old Man with the Gray Beard* of the National Gallery (1657), and the *Bruyningh, the Secretary of the Insolvents' Chamber, of Cassel* (1658), both leading up to the great portraits of the *Syndics of the Cloth Hall* of 1661. About the year 1663 Rembrandt painted the (so-called) *Jewish Bride* of the Van der Hoop Gallery and the *Family Group of Brunswick*, the last and perhaps the most brilliant works of his life, bold and rapid in execution and marvelous in the subtle mixture and play of colors in which he seems to revel. The woman and children are painted with such love

that the impression is conveyed that they represent a fancy family group of the painter in his old age. In 1668 Titus, the only son of Rembrandt, died, leaving one child, and on October 8, 1669, the great painter himself passed away, leaving two children, and was buried in the Wester Kerk.

REMIGIUS (or REMEDIUS, as the name is spelled in Fredegarius and elsewhere), or REMI, was born of noble parents and, according to a later tradition, in the district of Laon. In one of his own letters, written apparently about 512 A.D., Remigius speaks of himself as having been a bishop for fifty-three years. This throws back his election to about 459; and, as all his earlier biographers agree in making him twenty-one years of age on his appointment to this office, the date of his birth may be fixed at somewhere about the year 438.

Gregory has also preserved the tradition that Remigius was bishop of Rheims for more than seventy years (*De Gloria Conf.*, 89), a fact which inclines us to lay some confidence on the more detailed statement of Hincmar that he died on January 13th, in the ninety-sixth year of his age, after an episcopate of seventy-four years. Hence we may fix upon 533 as the date of his decease, more especially as this conclusion coincides well enough with the little that is known as to the chronology of his two immediate successors.

REMIREMONT, the chief town of an arrondissement of the department of the Vosges, France, seven miles south-southeast of Épinal by rail, on the banks of the Moselle where it is joined by the Moselotte. It is a pretty and well-built town picturesquely surrounded by forest-clad mountains, and commanded by Fort Parnont, one of the line of defensive works along the Moselle. Besides a great cotton spinning-mill (30,000 spindles) brought from Mülhausen after the war of 1870, it possesses tanneries, weaving-factories, and saw-mills; and it trades in timber, cattle, cheese, coopers' wares, etc. The more interesting buildings belong to the ancient abbey, to which the town owes most of its fame. The abbey church was consecrated to Pope Leo IX. in person in 1051. The abbatial residence (which now contains the mairie, the court-house, and the public library) has been twice rebuilt in modern times (in 1750, and again after the fire of 1871), but the original plan and style have been preserved in the imposing front, the vestibule, and the grand staircase. The population of the town was 6,212 in 1871, 7,857 in 1881, and estimated at 10,000 in 1890.

REMONSTRANTS meant originally those Dutch Protestants who, after the death of ARMINIUS (*q.v.*), continued to maintain the views associated with his name, and in 1610 presented to the states of Holland and Friesland a "remonstrance" in five articles formulating their points of departure from stricter Calvinism. Their adversaries met them with a "counter remonstrance," and so were known as the Counter Remonstrants. The conflict continued to rage till 1618-19, when the synod of Dort (see DORT, SYNOD OF) established the victory of the stricter school. The judgment of the synod was enforced by the deposition, and, in some cases, the banishment of Remonstrant ministers; but the government soon became convinced that their party was not dangerous in the State, and in 1630 they were formally allowed liberty to reside in all parts of Holland, and build churches and schools. In 1621 they had also received liberty to make a settlement in Schleswig, where they built themselves the town of Friedrichstadt. This colony still exists. The Remonstrants are now a small body (see HOLLAND), but respected for their traditions of scholarship and liberal thought.

REMSCHEID, a manufacturing town of Rhenish Prussia, in the district of Düsseldorf, sometimes digni-

fed with the title of the "Rhenish Sheffield," is situated about twenty miles to the northeast of Cologne, at a height of 1,120 feet above the sea. It is the center of the German hardware industry, and large quantities of tools, scythes, skates, and other small articles in iron, steel, and brass are annually made here for exportation to all parts of Europe, the East, and North and South America. In 1880 the commune contained 30,029 inhabitants, of whom 11,000 belonged to Remscheid proper, and the rest to the manufacturing villages with which it is grouped. The population in 1890 had increased to 40,500.

REMUSAT, ABEL, a distinguished Chinese scholar, was born at Paris, September 5, 1788. His father, a surgeon, superintended his early education in person, and designed him for the medical profession. Jean Pierre Abel Rémusat graduated with distinction as M.D. in 1813, and for a short time held a hospital appointment, but his heart had long been in other studies. In 1814 a chair of Chinese was founded at the Collège de France, and Rémusat was placed in it. From this time he gave himself wholly to the languages of the Extreme East, and published a long series of useful works, among which his contributions from Chinese sources to the history of the Tartar nation claim special notice. He died at Paris, June 4, 1832, and his *éloge* was written by De Sacy.

RÉMUSAT, CHARLES FRANÇOIS MARIE, COMTE DE, French politician and man of letters, was born at Paris on March 13, 1797. He very early developed political views more decidedly Liberal than those of his parents, and, being bred to the bar, published in 1820 a short pamphlet on jury trial. In 1848 he was elected, and in 1849 reëlected, for the department of Haute Garonne and sat on the Conservative side. But he would not support Louis Napoleon, and had to leave France after the *coup d'état*; nor did he reënter political life at all during the second empire. He died at Paris April 6, 1875.

RENAISSANCE is a term which has recently come into use to indicate a well-known but indefinite space of time and a certain place in the development of the European races. On the one hand it denotes the transition from that period of history which we call the Middle Ages to that which we call Modern. On the other hand it implies those changes in the intellectual and moral attitude of the Western nations by which the transition was characterized. If we insist upon the literal meaning of the word, the Renaissance was a re-birth; and it is needful to inquire of what it was the re-birth. The metaphor of Renaissance may signify the entrance of the European nations upon a fresh stage of vital energy in general, implying a fuller consciousness and a freer exercise of faculties than had belonged to the mediæval period. Or it may mean the resuscitation of simply intellectual activities, stimulated by the revival of antique learning and its application to the arts and literatures of modern peoples. The former has the disadvantage of making it difficult to separate the Renaissance from other historical phases—the Reformation for example—with which it ought not to be confounded. The latter has the merit of assigning a specific name to a limited series of events and group of facts, which can be distinguished for the purpose of analysis from other events and facts with which they are ultimately but not indissolubly connected. In other words, the one definition of Renaissance makes it denote the whole change which came over Europe at the close of the Middle Ages. The other confines it to what was known by our ancestors as the Revival of Learning.

The Renaissance, if we try to regard it as a period, was essentially the transition from one historical stage

to another. It cannot therefore be confined within strict chronological limits. This indecision inherent in the nature of a process which involved neither a political revolution nor the promulgation of a new religious creed, but was a gradual metamorphosis of the intellectual and moral state of Europe, is further augmented by the different epochs at which the several nations were prepared to bear their share in it. England, for example, was still feudal and mediæval when Italy had socially and mentally entered on the modern stadium. There is one date, however, which may be remembered with advantage as the starting-point in time of the Renaissance, after the departure from the Middle Ages had been definitely and consciously made by the Italians. This is the year 1453, when Constantinople, chosen for his capital by the first Christian emperor of Rome, fell into the hands of the Turk.

If we look a little forward to the years 1492–1500, we obtain a second date of great importance. In these years the expedition of Charles VIII. to Naples opened Italy to French, Spanish, and German interference. The leading nations of Europe began to compete for the prize of the peninsula, and learned meanwhile that culture which the Italians had perfected. In these years the secularization of the papacy was carried to its final point by Alexander VI., and the Reformation became inevitable. It must not be imagined that so great a change as that implied by the Renaissance was accomplished without premonitory symptoms and previous endeavors. In the main we mean by it the recovery of freedom for the human spirit after a long period of bondage to oppressive ecclesiastical and political orthodoxy—a return to the liberal and practical conceptions of the world which the nations of antiquity had enjoyed, but upon a new and enlarged platform. This being so, it was inevitable that the finally successful efforts after self-emancipation should have been anticipated from time to time by strivings within the ages that are known as dark and mediæval.

Philosophy attempted to free itself from the trammels of theological orthodoxy in the hardy speculations of some schoolmen, notably of Scotus Etigena and Abelard. The schools meanwhile resounded still to interminable dispute upon abstractions. Are only universals real, or has each name a corresponding entity? From the midst of the Franciscans who had persecuted Roger Bacon because he presumed to know more than was consistent with human humility arose John of Parma, adopting and popularizing the mystic prophecy of Joachim of Flora. The Fraticelli spiritualists, and similar sects who fed their imagination with his doctrine, expired in the flames to which Fra Dolcino, Longino, and Margharita were consigned. It is only certain that at this epoch the fabric of Catholic faith was threatened with various forms of prophetic and Oriental mysticism, symptomatic of a widespread desire to grasp at something simpler, purer, and less rigid than Latin theology afforded.

When due regard is paid to these miscellaneous evidences of intellectual and sensual freedom during the Middle Ages, it will be seen that there were by no means lacking elements of native vigor ready to burst forth. What was wanting was not vitality and license, not audacity of speculation, not lawless instinct or rebellious impulse. It was rather the right touch on life, the right feeling for human independence, the right way of approaching the materials of philosophy, religion, scholarship, and literature, that failed. The courage that is born of knowledge, the calm strength begotten by a positive attitude of mind, face to face with the dominant overshadowing Sphinx of theology, were lacking. We may fairly say that natural and untaught

people had more of the just intuition that was needed than learned folk trained in the schools. But these people were rendered licentious in revolt or impotent for salutary action by ignorance, by terror, by uneasy dread of the doom declared for heretics and rebels. The massive vengeance of the church hung over them, like a heavy sword suspended in the cloudy air. Superstition and stupidity hedged them in on every side, so that sorcery and magic seemed the only means of winning power over nature or insight into mysteries surrounding human life. The path from darkness to light was lost; thought was involved in allegory; the study of nature had been perverted into an inept system of grotesque and pious parable-mongering; the pursuit of truth had become a game of wordy dialectics. The other world with its imagined heaven and hell haunted the conscience like a nightmare. However sweet this world seemed, however fair the flesh, both world and flesh were theoretically given over to the devil. It was not worth while to master and economize the resources of this earth, to utilize the goods and ameliorate the evils of this life, while every one agreed, in theory at any rate, that the present was but a bad prelude to an infinitely worse or infinitely better future. To escape from these preoccupations and prejudices except upon the path of conscious and deliberate sin was impossible for all but minds of rarest quality and courage; and these were too often reduced to the recantation of their supposed errors no less by some secret clinging sense of guilt than by the church's iron hand.

It is just at this point that the revival of learning intervened to determine the course of the Renaissance.

It is obvious that Italian literature owed little at the outset to the revival of learning. The *Divine Comedy*, the *Canzoniere*, and the *Decameron* were works of monumental art, deriving neither form nor inspiration immediately from the classics, but applying the originality of Italian genius to matter drawn from previous mediæval sources. Dante showed both in his epic poem and in his lyrics that he had not abandoned the sphere of contemporary thought. Allegory and theology, the vision and the symbol, still determine the form of masterpieces which for perfection of workmanship and for emancipated force of intellect rank among the highest products of the human mind. Yet they are not mediæval in the same sense as the song of Roland or the Arthurian cycle. They proved that, though Italy came late into the realm of literature, her action was destined to be decisive and alterative by the introduction of a new spirit, a firmer and more positive grasp on life and art. These qualities she owed to her material prosperity, to her freedom from feudalism, to her secularized church, her commercial nobility, her political independence in a federation of small states.

The relation of the plastic arts to the revival of learning is similar to that which has been sketched in the case of poetry. Cimabue started with work which owed nothing directly to antiquity. At about the same time Niccola Pisano studied the style of sculpture in fragments of Græco-Roman marbles. His manner influenced Giotto, who set painting on a forward path. Fortunately for the unimpeded expansion of Italian art, little was brought to light of antique workmanship during the fourteenth and fifteenth centuries. The classical stimulus came to painters, sculptors, and architects chiefly through literature. Therefore there was narrow scope for imitation, and the right spirit of humanism displayed itself in a passionate study of perspective, nature, and the nude. But the perfect plastic art of Italy, the pure art of the Cinque Cento, the painting of Raphael, Da Vinci, Titian, and Correggio,

the sculpture of Donatello, Michelangelo, and Sansovino, the architecture of Bramante, Omodeo, and the Venetian Lombardi, however much imbued with the spirit of the classical revival, takes rank beside the poetry of Ariosto as a free intelligent product of the Renaissance.

In the fields of science and philosophy humanism wrought similar important changes. Petrarch began by waging relentless war against the logicians and materialists of his own day. With the advance made in Greek studies scholastic methods of thinking fell into contemptuous oblivion. The newly aroused curiosity for nature encouraged men like Alberti, Da Vinci, Toscanelli, and Da Porta to make practical experiments, penetrate the working of physical forces, and invent scientific instruments. Anatomy began to be studied, and the time was not far distant when Titian should lend his pencil to the epoch-making treatise of Vesalius. At the same time the texts of ancient authors supplied hints which led to discoveries so far-reaching in their results as those of Copernicus, Columbus, and Galileo. In philosophy, properly so-called, the humanistic scorn for mediæval dullness and obscurity swept away theological metaphysics as valueless. The thinkers of southern Italy, Telesio, Bruno, and Campanella, at last opened the two chief lines on which modern speculation has since moved. Telesio and Campanella may be termed the predecessors of Bacon. Bruno was the precursor of the idealistic schools. All three alike strove to disengage their minds from classical as well as ecclesiastical authority, proving that the emancipation of the will had been accomplished. Humanism in its earliest stages was uncritical. Yet it led in process of time to criticism. The critique of literature began in the lecture-room of Politian, in the printing-house of Aldus, and in the school of Vittorino. The critique of Roman law started under Politian's auspices, and, finally, in the court of Naples arose the most formidable of all critical engines, the critique of established ecclesiastical traditions and spurious historical documents. Valla, by one vigorous effort, destroyed the False Decretals and exposed the Donation of Constantine to ridicule, paving the way for the polemic carried on against the dubious pretensions of the papal throne by scholars of the Reformation. A similar criticism ransacked the moral abuses of the church and played around the very foundations of Christianity. This was tolerated with approval by men who repeated Leo X.'s witty epigram: "What profit has not that fable of Christ brought us!" The same critical and philosophic spirit working on the materials of history produced a new science, the honors of which belong to Machiavelli. What has come to be called a classical education was the immediate product of the Italian Renaissance. The universities of Bologna, Padua, and Salerno had been famous through the Middle Ages for the study of law, physics, and medicine; and during the fifteenth and sixteenth centuries the two first still enjoyed celebrity in those faculties. But at this period no lecture-rooms were so crowded as those in which professors of antique literature and language read passages from the poets and authors, taught Greek, and commented upon the systems of philosophers.

The humanists effected a deeply penetrating change in social manners. Through their influence as tutors, professors, orators, and courtiers, society was permeated by a fresh ideal of culture. To be a gentleman in Italy meant at this epoch to be a man acquainted with the rudiments at least of scholarship, refined in diction, capable of corresponding or of speaking in choice phrases, open to the beauty of the arts, intelligently interested in archæology, taking for his models

of conduct the great men of antiquity rather than the saints of the church. He was also expected to prove himself an adept in physical exercises and in the courteous observances which survived from chivalry.

This picture has undoubtedly a darker side. Humanism, in its revolt against the Middle Ages, was, as we have seen already, mundane, pagan, irreligious, positive. The Renaissance can, after all, be regarded only as a period of transition, in which much of the good of the past was sacrificed while some of the evil was retained, and neither the bad nor the good of the future was brought clearly into fact. It is needful to study at some length the main phenomena of the Renaissance in Italy, because the history of that phase of evolution in the other Western races turns almost entirely upon points in which they either adhered to or diverged from the type established there. Speaking broadly, what France, Germany, Spain, and England assimilated from Italy at this epoch was in the first place the new learning, as it was then called.

Germany was already provided with universities, seven of which had been founded between 1348 and 1409. The cities of Strasburg, Nuremberg, Augsburg, Basel, became centers of learned coteries. Academies in imitation of Italian institutions came into existence, the two most conspicuous, named after the Rhine and Danube, holding their headquarters respectively at Heidelberg and Vienna. Crowned poets emulated the fame of Politian and Pontano. Yet, though the Renaissance was thus widely communicated to the centers of German intelligence, it displayed a different character from that which it assumed in Italy. To a student of the origin of German humanism it is clear that something very different from the Renaissance of Lorenzo de' Medici and Leo X. was in preparation from the first upon Teutonic soil. Far less plastic and form-loving than the Italian, the German intelligence was more penetrative, earnest, disputative, occupied with substantial problems. That attempt to extinguish honest thought prepared the Reformation; and humanism after 1518 was absorbed in politico-religious war.

The point of contact between humanism and the Reformation in Germany has to be insisted on; for it is just here that the relation of the Reformation to the Renaissance in general makes itself apparent. As the Renaissance had its precursory movements in the mediæval period, so the German Reformation was preceded by Wycliffe and Huss, by the discontents of the Great Schism, and by the councils of Constance and Basel. The touch of the new spirit which had evolved literature, art and culture in Italy sufficed in Germany to recreate Christianity. This new spirit in Italy emancipated human intelligence by the classics; in Germany it emancipated the human conscience by the Bible. The indignation excited by Leo X.'s sale of indulgences, the moral rage stirred in northern hearts by papal abominations in Rome, were external causes which precipitated the schism between Teutonic and Latin Christianity.

The part played by Spain in this period of history was determined in large measure by external circumstance. Architecture in Spain, emerging from the Gothic stage, developed an Early Renaissance style of bewildering richness by adopting elements of Arabic and Moorish decoration. Sculpture exhibited realistic vigor of indubitably native stamp; and the minor plastic crafts were cultivated with success on lines of striking originality. Painting grew from a homely stock, until the work of Velazquez showed that Spanish masters in this branch were fully abreast of their Italian compeers and contemporaries. To dwell here upon the Italianizing versifiers, moralists, and pastoral

romancers who attempted to refine the vernacular of the *Romancero* would be superfluous. The Spanish drama, meanwhile, untrammelled by those false canons of pseudoclassic taste which fettered the theater in Italy and afterward in France, rose to an eminence in the hands of Lope de Vega and Calderon which only the English, and the English only in the masterpieces of three or four playwrights, can rival. What has chiefly to be noted regarding the achievements of the Spanish race in arts and letters at this epoch is their potent national originality. The revival of learning produced in Spain no slavish imitation as it did in Italy, no formal humanism, and, it may be added, very little of fruitful scholarship. The Renaissance here, as in England, displayed essential qualities of intellectual freedom, delight in life, exultation over rediscovered earth and man.

We have now to speak of France, which earliest absorbed the influence of the Italian revival, and of England, which received it latest. The Renaissance may be said to have begun in France with Charles VIII.'s expedition to Naples, and to have continued until the extinction of the house of Valois. French architecture was stimulated and developed; painting and sculpture were practiced with originality and power, and literature was quick to respond to Renaissance influences, while French scholarship was hardly less rich, and the revival of learning in those periods had a noble muster-roll of names. The Renaissance of the Low Countries, as elsewhere, had its brilliant age of arts and letters. Flemish and Dutch painting, scholarship and wars of independence gave to the world a Rubens, a Vandyck, a long list of critical scholars and editors; and the Netherlands became the battlefield of Reformation and Counter-Reformation in even a stricter sense than France.

The insular position of England, combined with the nature of the English people, has allowed them to feel the vibration of European movements later and with less of shock than any of the continental nations. Both Renaissance and Reformation had been anticipated by at least a century in England. Chaucer's poetry, which owed so much to Italian examples, gave an early foretaste of the former. Wycliffe's teaching was a vital moment in the latter. But the French wars, the Wars of the Roses, and the persecution of the Lollards deferred the coming of the new age; and the year 1536, when Henry VIII. passed the act of Supremacy through Parliament, may be fixed as the date when England entered definitely upon a career of intellectual development abreast with the foremost nations of the continent. The first period of the English Renaissance was one of imitation and assimilation. Academies after the Italian type were founded. Tragedies in the style of Seneca, rivaling Italian and French dramas of the epoch, were produced. Attempts to Latinize ancestral rhythms, similar to those which had failed in Italy and France, were made. Tentative essays in criticism and dissertations on the art of poetry abounded. It seemed as though the Renaissance ran a risk of being throttled in its cradle by superfluity of foreign and pedantic nutriment. But the natural vigor of the English genius resisted influences alien to itself, and showed a robust capacity for digesting the varied diet offered to it. As there was nothing despotic in the temper of the ruling classes, nothing oppressive in English culture, the literature of that age evolved itself freely from the people. It was under these conditions that Spenser gave his romantic epic to the world, and the Elizabethan drama, which in its totality is the real exponent of the English Renaissance, came into existence. This drama, breathing into antique histories the breath of actual life, embracing the romance of Italy and Spain,

the mysteries of German legend, the fictions of poetic fancy and the facts of daily life, humors of the moment and abstractions of philosophical speculation, in one homogeneous amalgam instinct with intense vitality, this extraordinary birth of time, with Shakespeare for the master of all ages, left a monument of the Renaissance unrivaled for pure creative power by any other product of that epoch. To complete the sketch, we must set Bacon, the expositor of modern scientific method, beside Spenser and Shakespeare, as the third representative of the Renaissance in England. Nor should Raleigh, Drake, Hawkins, the semi-buccaneer explorers of the ocean, be omitted. They, following the lead of Portuguese and Spaniards, combating the Counter-Reformation on the seas, opened for England her career of colonization and plantation. All this while the political policy of Tudors and Stewarts tended toward monarchical absolutism, while the Reformation in England, modified by contact with the Low Countries during their struggles, was narrowing into strict reactionary intolerance. Puritanism indicated a revolt of the religious conscience of the nation against the arts and manners of the Renaissance, against the encroachments of belligerent Catholicism, against the corrupt and Italianated court of James I., against the absolutist pretensions of his son Charles. In its final manifestation during the Commonwealth, Puritanism won a transient victory over the mundane forces of both Reformation and Renaissance, as these had taken shape in England. It also secured the eventual triumph of constitutional independence. Milton, the greatest humanistic poet of the English race, lent his pen and moral energies during the best years of his life to securing that principle on which modern political systems at present rest. Thus the geographical isolation of England, and the comparatively late adoption by the English of matured Italian and German influences, give peculiar complexity to the phenomena of Reformation and Renaissance simultaneously developed on that island. The period of its history between 1536 and 1642 shows how difficult it is to separate these two factors in the re-birth of Europe, both of which contributed so powerfully to the formation of modern English nationality.

RENAIX, a manufacturing town of Belgium, in the province of East Flanders, eight miles by rail south of Oudenarde, with a communal population of 14,089 in 1876, and in 1890 about 15,500. It contains the ruins of a castle built in 1638 by Count John of Nassau-Siegen, and a church with the tomb of St. Hermes, to whom it is dedicated.

RÉNAUDOT, EUSÈBE, theologian and Orientalist, was born in Paris in 1646, and was educated for the church. Notwithstanding his taste for theology and his title of abbé, he never took orders, and much of his life was spent at the French court. He died in 1720.

RENDSEBURG, a town in Prussia, in the province of Schleswig-Holstein, is situated on the Eider, in a flat and sandy district, twenty miles to the west of Kiel. Its present importance rests on the commercial facilities afforded by its connection with the North Sea and the Baltic through the Eider and the Eider Canal, by which a brisk transit trade is carried on in grain, timber, Swedish iron, and coals. The principal industries are cotton-weaving, tanning, and the manufacture of artificial manures; and there is a large iron foundry in the immediate neighborhood. The population in 1880 was 12,776, and estimated at 13,750 in 1890, including a strong garrison.

RENÉ I., duke of Anjou, count of Provence, and titular king of Naples, was the second son of Louis II. of Aragon, king of Naples, and Yolande, daughter of John I. of Aragon, and was born January 16, 1409.

Although his father was crowned king of Naples at Avignon by Pope Clement VII. in 1384, he was unable to make good his claims. After his death Louis III., the elder son, assumed the title, and in 1423 was adopted by Johanna II. of Naples, and obtained possession of the throne. Dying November 15, 1434, he left his claims to his brother René, who was also appointed heir by Johanna II. at her death in the following year. In 1444 he took part at Tours in the peace negotiations between England and France; and, to cement the alliance, Henry VI. espoused his daughter Margaret of Anjou. Subsequently he ceased to concern himself with politics, and devoted his chief attention to literature. He died July 10, 1480.

RENFREW, a county of Scotland, skirting the Firth of Clyde, lies between  $55^{\circ} 40' 34''$  and  $55^{\circ} 57' 45''$  N. latitude, and between  $4^{\circ} 13'$  and  $4^{\circ} 54'$  W. longitude, and is bounded north by the Clyde, northeast by Dumbarton and by Lanark, east by Lanark, south by Ayr, and west by the Firth of Clyde. Its greatest length from west-northwest to east-southeast is  $30\frac{1}{2}$  miles, and its greatest breadth at right angles to this  $13\frac{1}{4}$  miles. The area is 253,793 square miles or 162,427,958 acres, of which 2,021,179 acres are foreshore and 3,621,342 are water. Except a small portion opposite the burgh of Renfrew, the whole county lies to the south of the Clyde. For local purposes the county is divided into an upper and a lower ward, the former embracing the two-thirds lying to the east, and having its district center at Paisley, while the latter contains the parishes of Innerkip, Greenock, Port Glasgow, and Kilmacolm, and has its district center at Greenock. The southern border and western part of the county are hilly, but none of the heights rise very much above sea-level. The central part is undulating and, as much of the higher portion of it is well wooded, the scenery is in some places picturesque. Along the greater part of the northern border is a flat tract of clayey carse-land known locally as the "laich lands," and very fertile in favorable seasons.

The principal river is the Clyde, which forms a considerable portion of the northern boundary; and the other chief streams are the White Cart, Black Cart, and Gryfe. A number of smaller streams flow direct to the Clyde, the most important being the Kip and the Kelly Burn in the west of the county. The principal lochs are Loch Thom and Gryfe Reservoir, two and a half miles south of Greenock; Castle Semple Loch, near the center of the southern border; Long Loch and Loch Goin, further east near the same border; and Balgray and Glen Reservoirs, connected with the Glasgow water supply near the center of the eastern part of the county. The Glasgow, Paisley, and Johnstone Canal, which formerly united these three towns, has since 1882 been laid dry along the greater part of its course and the bed converted into a railway line. The rocks throughout the county are Carboniferous, and almost the whole of the Lower Carboniferous Calciferous Sandstone series is here represented by a thick set of volcanic deposits. The oldest beds are the red sandstones, cornstones, and conglomerates which occupy the extreme west corner between Innerkip and Loch Thom. Farming operations do not differ in detail from those carried on in the adjoining middle and lower wards of Lanarkshire. The climate is very variable; and, as the prevailing west and southwest winds come in from the Atlantic warm and full of moisture, contact with the colder land causes very heavy rains, and the western part of Renfrewshire is one of the wettest districts in Scotland, the mean annual rainfall amounting to over sixty inches. The mean annual temperature is about  $48^{\circ}$ .

Besides the coal, iron, and oil industries already mentioned, the county has extensive, varied, and valuable manufactures of which the chief are at Greenock and Paisley. Elsewhere there are chemical works, engineering works, foundries, and bleaching, dyeing, and weaving works. There are throughout the shire a large number of excellent roads; and numerous lines and branches of the Caledonian and the Glasgow and Southwestern systems afford ample railway communication along the center, north, and west for both general traffic and minerals. The population has risen from 78,501 in 1801 to 216,947 in 1871 and to 263,374 in 1881 (126,743 males, 136,631 females), more than 100,000 of the increase having taken place between 1851 and 1881. Of the whole number 49,681 men and 21,734 women were engaged in industrial handicrafts or dealt in manufactured substances, and of these 7,741 men and 15,547 women were connected with the making of textile fabrics, while 7,086 men and 172 women were connected with the working of mineral substances.

RENFREW, a royal parliamentary burgh and the county town of the above county, is situated in the northeast near the south bank of the Clyde, connected with which is a small harbor. The industries are connected with two shipbuilding yards, a chemical works, a forge, a dyeworks, and weaving. Population in 1881, 5,115, 7,000 in 1890.

RENI, GUIDO, a prime master in the Bolognese school of painting, and one of the most admired artists of the period of incipient decadence in Italy, was born at Calvenzano, near Bologna, on November 4, 1575. He is most usually named Guido. His father was a musician of repute, a player on the flageolet; he wished to bring the lad up to perform on the harpsichord. At a very childish age, however, Guido displayed a determined bent toward the art of form, scribbling some attempt at a drawing here, there, and everywhere. He was only nine years of age when Denis Calvart took notice of him, received him into his academy of design by the father's permission, and rapidly brought him forward, so that by the age of thirteen Guido had already attained marked proficiency. Albani and Domenichino became soon afterward pupils in the same academy.

Toward 1602 he went to Rome with Albani, and Rome remained his headquarters for twenty years. Here, in the pontificate of Paul V. (Borghese), he was greatly noted and distinguished. In the garden-house of the Rospigliosi Palace he painted the vast fresco which is justly regarded as his masterpiece—*Phabus and the Hours preceded by Aurora*. He founded now chiefly upon the antique, more especially the *Niobe* group and the *Venus de' Medici*, modified by suggestions from Raphael, Correggio, Parmigiano, and Paul Veronese. The pontifical chapel of Montecavallo was assigned to Reni to paint; but, being straitened in payments by the ministers, the artist made off to Bologna, where he established a celebrated school, numbering more than 200 scholars. He now left Bologna hardly at all; in one instance, however, he went off to Ravenna, and, along with three pupils, he painted the chapel in the cathedral with his admired picture of the *Israelites Gathering Manna*. The closing years of his life were unproductive of professional results. He died August 18, 1642.

RENNELL, JAMES, probably the most celebrated of English geographers, was born December 3, 1742, near Chudleigh in Devonshire, where his father John Rennell was the owner of a small farm called Waddon. He died March 29, 1830, and was buried in Westminster Abbey.

RENNES, a town of France, formerly the capital of Brittany and now the chief town of the department of

Ille-et-Vilaine, is situated at the meeting of the Ille and the Vilaine, and at the junction of several lines of railway connecting it with Paris (232 miles east-north east), St. Malo (51 miles north), Brest (147 west-north west), etc. It is the seat of an archbishop and the headquarters of the tenth corps d'armée (with a large arsenal and barracks.) The local industries are varied but not extensive. The population of the town in 1886 numbered 62,482.

RENNIE, JOHN, engineer and architect, was the son of a farmer, and was born at Phantassie, East Lothian, June 7, 1761. By Professor Robison of Edinburgh he was introduced to Messrs. Boulton & Watt of Soho near Birmingham, for whom in 1786 he superintended the construction of the Albion flour mills near Blackfriars Bridge, London. It is believed that the difficulties which occurred at the Albion mills in regard to the ebb and flow of the tide first led Rennie to the study of that branch of civil engineering connected with hydraulics and hydrodynamics, in which he became so celebrated as to have no rival after the death of Smeaton. Of the bridges connecting the banks of the Thames at London, three have been built from his designs—Southwark Bridge, in the construction of which he introduced a method of employing cast iron which formed a new epoch in the history of bridge-building; Waterloo Bridge, which then had no parallel for its magnitude, elegance, and solidity; and London Bridge, on the model of Waterloo Bridge. Bridges at Leeds, Musselburgh, Kelso, Newton-Stewart, Boston, New Galloway, and numerous other places bear similar testimony to his skill and taste. His earliest canal project was that of the Crinan Canal, and following it was the Lancaster Canal, which besides other difficulties presented that of an aqueduct over the Lune. But even these works must yield to what he executed in connection with the Government dockyards at Portsmouth, Chatham, Sheerness, and Plymouth. One other effort of his genius falls to be mentioned, the drainage of that vast tract of marsh-land bordering upon the rivers Trent, Witham, Welland, and Ouse which for centuries had baffled the skill of some of the ablest men in that department of civil engineering. In person he was of great stature and strength; and his noble bust by Chantrey, when exhibited in Somerset House, obtained the name of Jupiter Tonans. He died October 16, 1821.

RENO, a growing city on the Truckee river, in Washoe county, Nev., derives its importance from its location as the county seat, as the transfer station for Virginia City, Gold Hill, Carson, and Washoe on the south; Honey Lake, Susanville, and other points on the north; and as the distributing point for a large area of mining territory. The railway facilities embrace the Central Pacific, Virginia and Truckee, and Nevada and Oregon roads, to all of which Reno contributes a large and steadily increasing patronage. The city contains two banks with a cash capital of \$350,000, and \$100,000 surplus, six churches, a female seminary, and other educational establishments, two daily papers, and many stores. The manufacture of carriages, sash, doors and blinds, powder, brooms, etc., is extensively carried on, both steam and water-power, the latter from the Truckee river, being employed in their behalf. The smelting works of the Nevada Land and Mining Company are also located at Reno, and the court-house and state prison are among the public buildings of prominence and importance. The population of the city was 5,000 in 1890.

RENT is classed in English law as an incorporeal hereditament, that is, a profit issuing out of a corporeal hereditament (see REAL ESTATE). A rent issuing out

of an incorporeal hereditament can only be possessed by the crown, or by a subject under statutory authority. Rent is said to lie in *render*, as distinguished from profits à prendre in general, which are said to lie in *prendre*. At the present day rent is generally a sum of money paid for the occupation of land.

Rents as they now exist in England are divided into three great classes—rent service, rent charge, and rent seck. A rent service is so called because by it a tenure by means of service is created between the landlord and the tenant. The service is now represented by fealty, and is nothing more than nominal. A rent charge is a grant of an annual sum payable out of lands in which the grantor has an estate. It may be in fee, in tail, for life, or for years. It must be created by deed or will, and may be either at common law or under the Statute of Uses. The grantor has no reversion, and the grantee has at common law no power of distress. Such power must have been given him by the instrument creating the rent charge. A rent seck (*redditus siccus*) is a rent charge reserved without power of distress. But, as power of distress for rent seck was given by 4 Geo. II. c. 28, the legal effect of such rent has been since the Act the same as that of a rent charge.

*Remedies.*—Rent is due in the morning of the day appointed for payment, but is not in arrear until after midnight. It should be demanded just before sunset. The landlord has besides distress his ordinary remedy by action. In addition special statutory remedies are given in the case of tenants holding over after the expiration of their tenancy.

*United States.*—Agricultural rents are, from the different position of the cultivators of the land, of less importance than in England. The law is in general accordance with that of England. The tendency of modern State legislation is unfavorable to the continuance of distress as a remedy. In some States, such as Ohio and Tennessee, it never existed. Fee farm rents exist in some States, like Pennsylvania, which have not adopted the Statute of *Quia Emptores* as a part of their common law.

REPLEVIN, in law, is a form of action by which goods which have been seized under an illegal distress are taken back (security being given to the amount for which the goods were distrained) and the action of replevin commenced to try the legality of the seizure. When the writ issues against the Sheriff it is served by the Coroner, he being the next highest legal officer in the county. Replevin is a form of action much used for the recovery of personal property illegally levied upon, and affords a ready remedy. The law of replevin was inherited from the English law, and the practice in this country and in England is nearly identical.

REPORTING. The curious among those who seek to trace political developments may, without any great strain on the imagination, find an intimate relation between the growth of newspaper reporting and the growth of democratic institutions; at any rate the two have always been found together. The history of reporting in Great Britain brings out the relationship with much clearness. There was no truly systematic reporting until the beginning of this century, and not until many years afterward did it grow to be a most important, if not the most important, feature in newspapers. There was parliamentary reporting of a kind almost from the time when parliaments began. Single speeches, and even some consecutive account of particular proceedings in parliament, were prepared. But long after newspapers were commonly published no effort had been made to give reports either of the pro-

ceedings of parliament or of those of any other assembly dealing with the public interests. The first attempts at parliamentary reporting, in the sense of seeking to make known to the public what was done and said in parliament, began in a pamphlet published monthly in Queen Anne's time called *The Political State*. Its reports were mere indications of speeches. Later, the *Gentleman's Magazine* began to publish reports of parliamentary debates. Access to the Houses of Parliament was obtained by Cave, the publisher of the magazine, and some of his friends, and they took surreptitiously what notes they could. These were subsequently transcribed and brought into shape for publication by another hand. There was a strict prohibition of all public reporting; but the *Gentleman's Magazine* appears to have continued its reports for some time without attracting the attention or rousing the jealousy of the House of Commons. The publisher, encouraged by the immunity from prosecution by parliament, grew bolder, and began in his reports to give the names of the speakers. Then he was called to account. The latest standing order on the subject at that time was one passed in 1728, which declared "that it was an indignity to, and a breach of, the privilege of this House for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper this House will proceed against the offenders with the utmost severity." Under this and other standing orders, Cave's reports were challenged, as were those of other publishers in other magazines. They were denounced by resolution; and threats of prosecution were made, with the result that the reports appeared still, but without the proper names of the speakers, and under the guise of "Debates in the Senate of Lilliput" or some other like title. Long afterward, in the latter half of the century, the newspapers began to report parliamentary debates more fully, with the result that, in 1771, several printers, including those on the *Morning Chronicle* and the *London Evening Post*, were ordered into custody for publishing debates of the House of Commons. A long and bitter struggle between the House and the public ensued. John Wilkes took part in it. The lord mayor of London and an alderman were sent to the Tower for refusing to recognize the Speaker's warrant for the arrest of certain printers of parliamentary reports. But the House of Commons was beaten. In 1772 the newspapers published the reports as usual; and their right to do so has never since been really questioned. Both Houses of Parliament, indeed, now show as much anxiety to have their debates fully reported as aforesaid they showed resentment at the intrusion of the reporter. Provision has been made in the House of Lords and in the House of Commons for reporters. There are galleries in which they may take notes, and writing rooms in which those notes may be extended. In short, reporting is now one of the best marked of parliamentary institutions.

In the Congress of the United States the reporter is as necessary to the machinery of the body as are the committee clerks. The custom of publishing the proceedings of Congress has never been prohibited, but the establishment of an official organ for publishing the reports is of comparatively recent date. The reports, previous to the establishment of the *Congressional Record*, were printed in the *National Intelligencer*, and before that time in other newspapers in a desultory sort of way. The establishment for the printing of the *Record* will rival that of any of our great dailies. The work of composition begins usually in the afternoon or early in the evening, as the amount of matter may be small or

great, and all documents printed in the *Record* must be ordered to be printed in response to a request of leave so to do. The reports of various documents are furnished from different sources—committee clerks, and official reporters, and stenographers, all contributing to make up the issue. The publication is generally in pamphlet form, and is issued daily during the session of congress. The expenses of the publication are defrayed from appropriations made for the purpose, and the matter of superintendence falls under the care of the public printer.

Parliamentary reporting, important as it is, yet forms a small part of the reporting which is done by the newspapers. All the public expositions of our complicated and busy social and national system are reported with a fullness, and on the whole with an amount of accuracy, that are surprising. Every newspaper of importance has a more or less numerous staff of reporters at its command. In some cases papers have separate staffs in different parts of the country. It is the business of these gentlemen to report all that is worth reporting for their journal. But no newspaper is able to confine its reporting to events in its own neighborhood. It must give to the public full accounts of speeches of prominent public men, no matter where they are delivered. Sometimes a reporter is sent far away to do this work. But, for the most part, speeches of statesmen in different parts of the country are reported for newspapers at a distance by one or other of the news agencies which send down staffs of reporters for the work. In some cases all these modes of working are seen together—there are representatives of individual newspapers from far and near, and there are the staffs of the news agencies.

As a rule, reporters are shorthand writers. That became a necessity when the demand for reporting greatly increased, and when the very words of a speaker had to be given. But what is spoken of as verbatim reporting is in no sense the best. It is a necessity, but to a great extent is merely mechanical. The reporter has acquired dexterity in shorthand writing, and he can read his notes fluently. Far more is required for that better reporting which conveys to the public the full sense of what a speaker has said without giving all his superfluous words. This is an art which is not universally acquired by reporters. They have learned to depend so much upon their notes that they do not learn to exercise their brains. There is much reporting which shortens speeches by wholesale excisions rather than by judicious and intelligent compression. It would, however, be unjust to pass over the many proofs of high intelligence which the reporting in our newspapers contains. The task of the reporter is often not easy. He has, to use a familiar adage, to make many silk purses out of sows' ears; and he does it patiently and well—so well that the author of the material operated upon is often inclined to take all the credit to himself.

So far, the reporting which has been spoken of is that by which speeches and debates are produced in print for the public information. But there is another kind of reporting which ought not to be passed over. What is commonly called "descriptive reporting" has in some cases nearly shouldered the reporting of speeches out of newspapers. Is there a royal progress, or a military display, or a pageant of any kind—the descriptive reporter is called into requisition. He has to describe as best he can all that happens. It is a simple statement of fact to say that newspapers have on many occasions had word pictures from their descriptive reporters which have never been surpassed in prose writing for elegance and vividness and force. The special

correspondent is a "descriptive reporter." He goes to war to describe what he sees. The electric telegraph has made a great change in the manner and perhaps in the character of his work; but he is still among those who help in newspaper reporting.

Mention has been made of the connection of the electric telegraph with reporting; and it has been said that, since the telegraphs have been extended and telegraphing has been cheapened, the sphere of reporting has been widened and the demand for it has increased. No daily newspaper now confines its reporting to the affairs of the part of the country in which it is published. The electric telegraph brings the most distant places within easy reach of every newspaper. It has also made the work of the reporter more arduous and his responsibility greater. He cannot postpone the transcription of his notes to another day. The speech that is not finished in Chicago at midnight must be printed in full in the New York newspaper which goes to press before three o'clock in the morning. The meeting which does not finish at New Orleans till midnight must be reported in the next day's papers in Philadelphia. All this means that the reporter must work under great pressure, and that he must exercise the greatest care in extending his notes. He has no time for revision, no opportunity of amending any doubtful passage. When these drawbacks are considered, it will most likely be felt that the work of reporting is not easy. Yet its importance could not well be overrated. Reporting is the feature in the journalism of to-day which the public could least afford to lose. The editor of a newspaper may influence public opinion, but the reporter furnishes the material for its formation. Fair reporting is indeed a great security for freedom and for moderation. It enables all who can read to see the arguments for and against any proposal; it shows how public bodies discharge their duties; it indicates the wants and wishes, the hopes and fears of the public; it puts within easy reach the means of combating wild and foolish propositions, however superficially attractive they may be; in short, it makes the whole country an open council on all questions affecting the souls and bodies, the education and the government, of the people. It is but fair to add that reporting is done as a rule with great ability and fairness. The reporter rarely carries his likes or his dislikes into his work. He is scrupulously just, and as scrupulously impartial, though it may be that this is not always the opinion of some men who make speeches of which little is seen in the shape of reporting.

REPOUSSÉ. See METAL-WORK and PLATE.

REPRODUCTION. I. ANIMAL REPRODUCTION.

#### § 1. ASEXUAL REPRODUCTION.

As a general account of this process has already been given (see BIOLOGY), and the details of its occurrence in the various groups are described in the articles devoted to them (PROTOZOA, HYDROZOA, TAPEWORM, etc.), it suffices here to recall the very broadest aspect of the phenomena—that asexual reproduction is simply discontinuous growth, and that, as we make an ascending survey of the *Metazoa*, that simple form of discontinuous growth which we term asexual reproduction becomes more and more subordinated to, and at last wholly replaced by, that more differentiated or "sexual" form of reproduction characterized by the union of two heterogeneous cell-elements—never to reappear save in degenerate forms. See SEX.

#### § 2. SEXUAL REPRODUCTION.

In the lowest forms of animal life the process of sexual reproduction is found in its simplest imaginable expression unassociated with any of those complexities

which arise among the higher animals and plants. All that is to be observed is the growth of the reproductive organs, the maturation of their products, and the passive liberation of these—the fecundation of the ovum and the fate of the embryo being entirely left to the circumstances of the environment. In higher forms, however, not only does this process of maturation become more complex and of far more marked influence over the other functions of the organism, but the attraction of the sexes becomes distinct, and leads to new specializations of function and structure.

*Maturation.*—The maturation of the sexes acquires, as has been said, increasing definiteness in the higher forms, where it is associated with various characteristic accompaniments. The profound reaction of reproductive maturity upon the whole system is best marked in birds and mammals, and perhaps most of all in man.

Thus in a young male bird the circulation in the testes is greatly increased, and these organs increase greatly in size and weight and commence to develop spermatozoa. Meanwhile the “secondary sexual characters” of the adult—gayer plumage for alluring the female, or weapons for contest with other males—make their appearance, the voice and note may alter, and a marked increase of strength and courage may appear. Among mammals the changes are of similar order, the secondary sexual characters, of course, differing in detail. The minor changes at puberty in man, associated with the commencement of spermatogenesis are (beside the reflex excitation of erection due to the distension of the seminal vesicles, and the more or less periodic expulsion of their contents during sleep) the growth of hair on the pubic region, and later on the lower part of the face, and the rapid modification of the laryngeal cartilages, and the lengthening of the vocal chords, so rendering the voice harsh and broken during the change and ultimately deepening it by an octave. The marked strengthening of bones and muscles, and the profound physical changes which accompany the whole series of processes, are also familiar. See SEX.

The local and cellular activity within the ovary, which is the fundamental part of maturation in the female, is not less remarkable than that in the testes. That even in lower Invertebrates the enlargement and escape of the ova are part of a normal cellular rhythm is interestingly shown by their not infrequent relapse to the amœboid state, or by the fatty degeneration and death of ova which have not accomplished their destiny. The escape of ripe ova in the Vertebrate ovary is especially remarkable: each Graafian follicle, as it ripens, bursts, expelling its ovum; its cavity contracts; it is filled up by blood, of which the white corpuscles form a framework resembling connective tissue, in which the solids and corpuscles of the serum with coloring matter derived from the hæmoglobin of the latter are retained; and the whole constitutes the “corpus luteum,” which, should pregnancy occur, may persist and undergo further retrogressive changes, or otherwise gradually disappear.

The direct causes of this process of ovulation have been sometimes ascribed to the congestion of the blood-vessels of the ovary and to its own internal turgidity, or to the existence of a slight contractility of its stroma; it seems, however, rather to depend upon the growth and turgescence of the individual follicle. The question of the relation of ovulation to the process of copulation in the higher animals has also been much discussed. Though we certainly know that ovulation is of regular occurrence whether fecundation takes place or not, it seems that in many cases copulation is speedily followed by the liberation of ovum; nor is it difficult to see how the profound nervous and circulatory excitement asso-

ciated with the former process might accelerate the bursting of a follicle. Leopold has conclusively shown, however, that ovulation may also long precede impregnation.

In many forms it is not easy to see how the ova once liberated into the body-cavity find their way safely into the small opening of the discontinuous oviduct. In the frog, however, tracts of the peritoneal epithelium become ciliated, so propelling the ova in the right direction. In Reptiles, Birds, and Mammals the open end of the oviduct is widened and fringed, and lies close to or even touching the ovary; muscular fibers, too, are present, and more or less active movements of this dilated end over the ovarian surface have been alleged to occur. The oviduct once reached, the downward progress of the ovum is insured by the cilia of the epithelial lining, and probably also by peristaltic movements of its muscular coat.

*Menstruation.*—The process of menstruation (menses, catamenia), although from the earliest times the subject of medical inquiry, is by no means yet clearly understood. It occurs usually at intervals of a lunar month in all women during their period of potential fertility (fecundity), and, so far from being confined to the human species, has been observed at the period of “heat” in a large number of Mammals. Though thus clearly a normal physiological process, it yet evidently lies on the borders of pathological change, as evidenced not only by the pain which so frequently accompanies it, and the local and constitutional disorders which so frequently arise in this connection, but by the general systemic disturbance and local histological changes of which the discharge is merely the outward expression and result. The histological facts are briefly as follows: The mucous lining of the uterus consists of a loose vascular connective tissue covered by ciliated epithelium and containing numerous glands of clear alkaline secretion. This mucous lining before the outset of menstruation becomes loose and œdematous, its lymphatics being greatly distended; it thus thickens considerably, pressing against the cervix of the uterus. An extravasation of blood from the capillaries next takes place over the whole surface of the mucous layer, and the discharge is thus set up. This consists at first of blood largely diluted with the secretion of the uterine glands, but soon becomes mixed with detritus from the disintegration of the mucous coat, of which not only the general epithelial cells but those of the neck of the glands, and even part of the subjacent connective tissue, undergo fatty degeneration and fall off, occasionally even in a mass. After from three to six days the blood ceases to appear, and the lost epithelium is rapidly replaced, apparently by proliferation from the necks of the glands. By the ninth or tenth day the mucous coat is fully healed and the beginnings of the next menstrual process recommence.

The age at which the process commences varies with race and climate, with nutrition and growth, with habit of life (*e.g.*, with differences between town and country life), and with mental and moral characteristics. Of these, however, climate seems most important; thus, while in northern Europe the average age is reckoned at the beginning of the fifteenth year, in the tropics it seems to commence in the ninth or tenth. The cessation of menstruation usually takes place between the age of forty-five and fifty, and, somewhat as the secondary characteristics of female puberty coincide with its appearance, a less distinct reduction of these is associated with its close; in many cases secondary resemblances to the masculine type may supervene.

The old theories of menstruation were that it served to rid the system of impure blood, that it simply corresponded to the period of “heat” observed in lower

animals, or, later, that it was associated with ovulation—which indeed seems broadly to correspond with the end of the menstrual period. At present there may be said to be two rival theories. According to the first of these the process is viewed as a kind of surgical “freshening” of the uterus for the reception of the ovum, whereby the latter, during the healing process, can be attached safely to the uterine wall. The other view is exactly the reverse of this. Its upholders regard the growth of the mucous coat before the commencement of the flow as a preparation for the reception of an ovum, if duly fertilized, and the menstrual process itself as the expression of the failure of these preparations—in short, as a consequence of the non-occurrence of pregnancy. A decided majority of gynecologists appear to incline to the latter view.

We have noted above the importance of the copulatory process to secure fertilization of the ovum, and can thus readily understand its occurrence in the higher members of all the more complex animal groups. Though the result is in all cases the same, the process presents curious variations in principle as well as detail. Thus (*e.g.*) the hermaphrodite Earthworms become firmly attached by their characteristic thickened band of fused rings (*clitellum*). Among the higher Crustaceans the spermatozoa are conducted to the ova along the grooves of a modified pair of the appendages of the male, while in Insects the modifications of the posterior abdominal segments and their limbs for copulatory purposes are often extraordinarily complex and varied. In Spiders, again, the spermatic fluid is passed into a receptacle in the chela, and thence pushed into the cloaca. In the higher *Mollusca*, the complex copulatory apparatus of the Common Snail and the process of hectocotylization among the Cephalopods, so curiously analogous to the process in Spiders, are too familiar to need more than mention (see MOLLUSCA, CUTTLE-FISH). In many Fishes no copulatory process exists; thus in any of our Salmon rivers the male fish can be seen voiding the milt upon the ova after their deposition. In many Elasmobranchs a portion of the posterior pair of limbs, presenting very peculiar cartilaginous and glandular structures, though known as “claspers,” seems to be introduced into the cloaca during fertilization. But it is among Amphibians that we find the earliest trace of a true penis; a portion of the cloaca is distinctly eversible in Cæcilians; in Snakes and Lizards paired eversible processes arise from the posterior cloacal wall, while in Chelonians, Crocodiles, and most Birds it is the anterior wall which bears these processes. In Monotremes, too, the organ is distinctly double; in higher Mammals it is single; but the function is in all cases essentially the same. The nervous, muscular, and circulatory mechanisms of the process are described in works on human physiology.

*Gestation and Birth.*—While in the majority of lower forms the offspring leaves the parent as an unfertilized ovum, we have seen even among sponges the impregnation and development of the embryo in its primitive position, and thus almost from the outset of an ascending zoological survey we can recognize the passage from oviparous to viviparous forms. The Invertebrates, however, are mainly oviparous, despite a few exceptions, of which perhaps the most surprising and aberrant are that of *Entoconcha mirabilis*, which exhibits an ordinary Molluscan development within the body of its Holothurian host, and that in what resembles a special ovarian tube, but is really the body of its utterly degenerate parasitic parent. Among insects a certain degree of viviparous development may be reached; and this goes curiously far in the Dipterous Insect *Cecidomyia*, in which larvæ develop within the body of

their parents (themselves at the larval stage), the cavity of which they destroy and burst in order to become free. Thus within the same species there comes about exactly the stage of things in which the ova of a parasite develop at the expense of its host.

Among fishes viviparous birth occurs more commonly; in some Teleosteans the young develop within the ovaries; in many Sharks and Dogfish the development takes place within the oviduct, and in one case (*Mustelus lævis*) an actual placenta is formed by the interdigitation of folds of the yolk sac with those of the oviduct. Even the terrestrial Amphibians usually lay their eggs in water, yet in some types, notably the Alpine Salamander (*Salamandra atra*), development takes place within the oviduct. That this is a clear case of adaptation to the eminently terrestrial environment has indeed been well shown by experiments in which the young larvæ taken from the parent and transferred to pond water developed like ordinary Newts. To all such forms, viviparous in the sense of bringing forth their young alive, the somewhat confusing term “ovoviviparous” is often applied. Birds, and also reptiles, with few exceptions of which the *Ichthyosauria* seem to have presented a striking case, are oviparous; so too, as has been recently established by Caldwell, is the in all respects so curiously bird-like mammal *Echidna*. Its congener *Ornithorhynchus* probably agrees in this; but in Marsupials the embryo is not born until it has reached a comparatively advanced state of development, when it is transferred to the brood pouch or marsupium where the process is completed. In the remaining *Mammalia* intra-uterine development goes much farther, the nutrition of the embryo being, in absence of the abundant food yolk of lower forms, effected by the aid of a placenta analogous but not homologous to that of *Mustelus*, since developed, not from the yolk-sac, but from the allantois (see ANATOMY and MAMMALIA).

The physiological processes of birth show a similar rise in complexity—due chiefly to the increasing strain upon the parental organization which this progress in the nutrition and protection of the embryo during its development involves; for, while an ovum can be extruded by simple ciliary action; or at most by the gentle contractions of the oviduct, the expulsion of the relatively enormous Mammalian fetus involves mechanical difficulties of the most serious kind. And, besides these stresses and strains upon the pelvic basin itself or the muscular and connective tissues of the uterus, vagina, and its outlet, the inevitable rending asunder of the large closely interwoven and highly vascular placenta must evidently occasion an additional physiological disturbance.

*Parental Care*—Not to mention cases of mere concealment of the ova or construction of egg cases, the lowest forms exhibiting such parental care are probably certain Holothurians and Starfishes described by Sir Wyville Thomson during the voyage of the *Challenger*, in which the developing young are borne upon the dorsal surface of the parent. Many Crustaceans carry about their ova during development, and an Amphipod has been described as followed by its newly-hatched young like a hen by its chickens. The female Spider too, though ferocious toward the male, frequently spins a nest and shows some maternal solicitude; but such cases are far commoner among even the lower Vertebrates than the highest Invertebrates. Thus among Fishes the case of the nestbuilding Stickleback is especially familiar; some Siluroids and Lophobranchs (and usually the males) carry about their young—the latter in ventral pouches, the former in the mouth.

But the quaintest examples of care of offspring are

those presented by some of the Amphibians, notably by the Frog *Alytes obstetricans*, where the male winds the string of ova as laid round his body, sits in concealment until their development is sufficiently advanced, and then takes to the water, or in the grotesque Surinam Toad (*Pipa surinamensis*), where the male places the ova one by one in hollows in the loose skin of the back of the female, where they accomplish their development. Reptiles rarely show any care beyond at most burying their ova, but in Birds the evolution of parental care (no doubt associated with the need of high temperature for development) approaches the highest and most general evolution. The case of Mammalia is also too familiar to need any description; but there is evidently good ground for the idea (of late ably popularized by Miss Buckley) that the marked success of Birds and Mammals in the struggle for existence is to be attributed perhaps not less to their peculiar care of offspring than to any advance in organization.

## II. REPRODUCTION OF PLANTS.

The various modes by which plants are reproduced may be conveniently classified in two groups, namely, vegetative multiplication and true reproduction, the distinction between them being this, that, whereas in the former the production of the new individual may be effected by organs of the most various kinds, in the latter it is always effected by means of a specialized reproductive cell. This distinction will become apparent in the following discussion.

*Vegetative Multiplication.*—The simplest case of vegetative multiplication is afforded by unicellular plants. When the cell which constitutes the body of the plant has attained its limit of size, it gives rise to two; either by division or gemmation; the two cells then grow, and at the same time become separated from each other, so that eventually two new distinct individuals are produced, each of which precisely resembles the original organism. A good example of this is to be found in the gemmation of the Yeast plant. This mode of multiplication is simply the result of the ordinary processes of growth. All plant-cells thus grow and divide at some time of their life; but, whereas in a multicellular plant the products of division remain coherent, and add to the number of the cells of which the plant consists, in a unicellular plant they separate and constitute new individuals. In more highly organized plants vegetative multiplication may be effected by the separation of the different parts of the body from each other, each such part subsequently developing the missing members and thus constituting a new individual. This takes place spontaneously, and in a marked manner in Mosses. The main stem gradually dies away from behind forward; the lateral branches thus become isolated, and constitute new individuals.

The remarkable regenerative capacity of plant-members is largely made use of for the artificial propagation of plants. A branch removed from a parent-plant will, under appropriate conditions, develop roots, and so constitute a new plant; this is the theory of propagation by "cuttings." A portion of a root will similarly develop one or more shoots, and thus give rise to a new plant. An isolated leaf will, in many cases, produce a shoot and a root, in a word, a new plant; it is in this way that Begonias, for instance, are propagated. The production of new plants from the leaves occurs also in nature, as, for instance, in the so-called "viviparous" plants, of which *Bryophyllum calycinum* (Crassulaceæ) and many Ferns (*Nephrodium* [*Lastræa*] *Filix-mas*, *Asplenium* [*Athyrium*] *Filix-femina*, and other species of *Asplenium*) are examples. An interesting case of the vegetative development of new individuals from

other plant-organs is afforded by Strasburger's observations on *Cælebogyne ilicifolia*, *Funkia*, *Nothoscordum fragrans*, and Citrus; he found, namely, that in these plants, an adventitious formation of embryos takes place by budding from the tissue of the nucellus bounding the embryo-sac. But it is in the Mosses, of all plants, that the capacity for vegetative propagation is most widely diffused. Any part of a moss, whether it be the stem, the leaves, the rhizoids, or the sporogonium, is capable, under appropriate conditions, of giving rise to filamentous protonema on which new moss-plants are then developed as lateral buds.

In a large number of plants we find that provision is made for vegetative multiplication by the development of more or less highly specialized organs. In Lichens, for instance, there are the *soredia*, which are minute buds of the thallus containing both algal and fungal elements; these are set free on the surface in large numbers, and each grows into a thallus. In the Characeæ there are the *bulbils* or "starch-stars" of *Chara stelligera*, which are underground nodes, and the *branches with naked base* and the *pro-embryonic branches* found by Pringsheim on old nodes of *Chara fragilis*. In the Mosses small tuberous bulbils frequently occur on the rhizoids, and in many instances (*Bryum annotinum*, *Aulacomnion androgynum*, *Tetraphis pellucida*, etc.) stalked fusiform or lenticular multicellular bodies containing chlorophyll, termed *gemmae*, are produced on the shoots, either in the axils of the leaves or in special receptacles at the summit of the stem. *Gemmae* of this kind are produced in vast numbers in *Marchantia* and *Lunularia* among the Liverworts. Similar *gemmae* are also produced by the prothallia of Ferns. In some Ferns (e.g., *Nephrolepis tuberosa* and *N. undulata*) the buds borne on the leaves or in their axils become swollen and filled with nutritive materials, constituting bulbils which fall off and give rise to new plants. This conversion of buds into bulbils which subserve vegetative multiplication occurs also occasionally among Phanerogams, as, for instance, in *Lilium bulbiferum*. But many other adaptations of the same kind occur among Phanerogams, notably among annuals. Bulbous plants, for instance, produce each year at least one bulb or corm from which a new plant is produced in the succeeding year. In other cases, as in the case of the Potato, tubers are developed from subterranean shoots, each of which in the following year gives rise to a new individual. In other cases, again, as in *Dahlia*, *Thladiantha dubia*, etc., tuberous swellings are found on the roots, from each of which a new individual may spring.

*True Reproduction.*—It was mentioned above that the true reproduction of plants is effected by specialized cells; these cells may be generally designated *spores*. The structure of a spore is essentially this: it consists of a nucleated mass of protoplasm, inclosing starch or oil as reserve nutritive material, usually inclosed by a cell-wall. In those cases in which the spore is capable of germinating immediately on its development the cell-wall is a single delicate membrane consisting of cellulose; but in those cases in which the spore may or must pass through a period of quiescence before germination the wall becomes thickened and may consist of two layers, an inner, the *endospore*, which is delicate and consists of cellulose, and an outer, the *exospore*, which is thick and rigid, frequently darkly colored and beset externally with spines or bosses, and which consists of cutin. In some few cases among the Fungi multicellular spores are produced; these approximate somewhat to the *gemmae* mentioned above as highly specialized organs for vegetative multiplication. In some cases, particularly among the Algæ and also in some Fungi

(Peronosporæ, Saprolegniæ, Myxomycetes, Chytridiacæ), spores are produced which are for a time destitute of any cell-wall, and are further peculiar in that they are motile, and are therefore termed *zoospores*; they move, sometimes in an amœboid manner by the protrusion of pseudopodia, but more frequently they are provided with one, two, or many delicate vibratile protoplasmic filaments, termed *cilia*, by the lashing of which the spore is propelled through the water. The zoospore eventually comes to rest, withdraws its cilia, surrounds itself with a cell-wall, and then germinates.

Spores are developed in various ways, and a prefix is in many cases added to the word "spore" to indicate the nature of the process of development. Leaving details for subsequent discussion, we will now confine our attention to the main fact that all spores are developed in one or other of two ways, either *asexually* or *sexually*. In the former case a single reproductive organ gives rise to cells which are capable, each by itself, of developing into a new organism; such an organ is an asexual reproductive organ, and such cells are asexually produced spores. In the latter case the reproductive organs are such that they do not singly give rise to cells capable, each by itself, of developing into a new organism. These are sexual reproductive organs. In some instances the sexual organ does not give rise to reproductive cells at all until it has received into itself more or less of the protoplasmic contents of another different, at least physiologically, sexual organ; and the cells which it then produces are capable, each by itself, of developing into a new organism. In others the sexual organ produces reproductive cells without any such previous fusion of protoplasm, but the cells thus produced are incapable, each by itself, of developing into a new organism. Such cells are *sexual reproductive cells*. It is only by the fusion of two such cells, physiologically different, that a reproductive cell is formed which is capable of developing into a new organism. The fusion either of the protoplasmic contents of two different sexual organs or of two different sexual cells constitutes the *sexual process*. It may take place according to circumstances, either within the organs or, in those cases in which sexual cells are produced and are set free, externally to them. The resulting cells are sexually produced spores.

*Asexual Reproduction*.—Reproduction by means of asexually produced spores is common to nearly all families of plants. It is wanting, among the Algæ, in the Conjugatæ, the Fucaceæ, and the Characeæ, among the Fungi, in a few Peronosporæ (*Pythium vexans*, *Artotrogus*), in *Ancylistes Closterii*, in *Aplanes Braunii*, among the Saprolegniæ; and, among the Ascomycetes, in *Eremascus*, *Sordaria* (*Hypocopra*), *Ascobolus furfuraceus*, *Pyronema* (*Peziza*) *confluens*, *Gymnoascus*, the Collemaceæ, and most other Lichen-Fungi.

In the simplest case the spore is developed from a single cell of the plant, which surrounds itself with the characteristic thick wall. This occurs only in plants of low organization; *Nostoc* and *Bacillus* are examples of it.

In other cases the contents of the cell undergo division, each portion of the protoplasm constituting a spore. Examples of this are afforded, among unicellular plants, by *Yeast* and *Protococcus*, and in multicellular plants by the *Confervaceæ*, the *Ulvaceæ*, and some *Florideæ*.

In this case each cell, the protoplasm of which divides to form spores, may be regarded as a rudimentary reproductive organ of the nature of a *sporangium*. In more highly organized plants special organs are differentiated for the production of spores. In the majority of cases the special organ is a sporangium, that is, a hollow capsule in the interior of which the spores are developed. In the *Thallophytes* the sporangium is a single cell. In

the *Muscineæ* it is a multicellular capsule; in *Riccia*, in which the structure of the capsule is simple, the whole of the internal cells give rise by division to spores; in other *Liverworts*, and in the *Mosses*, in which the structure of the capsule becomes progressively more and more complex, a portion only of the internal cells give rise to spores. In the *Ferns*, *Equisetaceæ*, and *Lycopodiaceæ* the sporangium is multicellular, but simple in structure. This is true also in the *Rhizocarpæ* and in the *Ligulatæ* (*Selaginella*, *Isoetes*), but in these plants there is this peculiarity that there are sporangia of two kinds—some, namely, which produce one, or a few, large spores, *macrospores*, and are hence termed *macrosporangia*, and others which give rise to a large number of small spores, *microspores*, and are hence termed *microsporangia*. The *Phanerogams* also bear two kinds of sporangia, which have received special names:—the macrosporangium, which produces only one mature spore, is termed the *ovule*; the microsporangium, which produces a large number of microspores, is termed the *pollen-sac*. In some cases among the *Fungi* the spores are not produced in the interior of a sporangium, but are formed by abstriction. This occurs in some *Mucorini*, such as *Chætocladium*, in the *Ustilagineæ*, the *Entomophthoræ*, the *Peronosporæ*, the *Ascomycetes*, the *Rusts* (*Uredineæ*), and the *Basidiomycetes*.

These asexually produced reproductive cells are commonly spoken of simply as spores, but in many cases some addition has been made to the word, or an altogether different name is applied to them, in order to mark some peculiarity in their mode of origin, to indicate their order of development, or to assign them without periphrasis to a particular group of plants. Thus, as has been mentioned, *zoöspores* are motile spores unprovided, for a time at least, with a cell-wall; *stylospores* are spores which are developed, not in sporangia, but by abstriction as mentioned above; *tetraspores* is the name given to the spores of the *Florideæ* to denote the fact that four spores are produced by the division of the mother-cell. The *uredospores* of the *Uredineæ* are those which are produced during the summer, whereas the *teleutospores* of these plants are those which are formed in the autumn, at the end of the period of growth. It was the custom, at one time, to speak of the spores of *Fungi* as *conidia*; and at the present time the macrospores and the microspores of *Phanerogams* are better known as embryo-sacs and pollen-grains respectively.

The organs which give rise to the asexually produced spores are usually not confined to a particular part of the plant in the *Thallophytes*. Instances of this do, however, occur among the *Ascomycetous Fungi*—namely, in the *Pyrenomycetes*. Here the production of the stylospores takes place in definite receptacles known as *pycnidia*. In the vascular plants (*Pteridophyta* *Phanerogams*), the development of sporangia, speaking generally, is confined to the leaves. In many of the *Pteridophyta* the sporangiferous leaves do not differ in appearance from the foliage-leaves; but in other cases they undergo considerable modification, as in the *Equisetaceæ*, *Marsiliaceæ*, some species of *Lycopodium* and *Selaginella*, and notably in the *Phanerogams*. In the *Phanerogams* the modification is so great that the sporangiferous leaves have received special names; those which bear the microsporangia (pollen-sacs) are termed the *stamens*, and those which bear the macrosporangia (ovules) are termed the *carpels*. When the sporangiferous leaves are thus modified they are usually aggregated together, and such an aggregate of sporangiferous leaves constitutes a *flower*.

*Sexual Reproduction*.—In nearly all classes of plants above the *Protophyta* spores are formed by a sexual

process; and in those in which no such process can be detected its absence is due, not, as in the Protophyta, to the fact that sexuality has not yet been developed, but to its gradual disappearance. The phenomena of sexual reproduction will be most intelligently stated by tracing them in the different main divisions of the Vegetable Kingdom—the Algæ, the Fungi, the Archeogoniata, and the Phanerogams.

The protophytic Algæ are reproduced by asexually developed spores, but in some forms an indication is already given of the differentiation of these spores into sexual reproductive cells which takes place in the higher forms of the group. In *Protococcus*, for instance, zoöspores are produced, but the zoöspores are not all precisely similar. In some cases the protoplasm of the cell divides only once or twice, the result being the formation of two or four relatively large zoöspores, *macrozoöspores*; in other cases the protoplasm divides a greater number of times so that a considerable number of relatively small zoöspores, *microzoöspores*, are produced. Functionally these zoöspores are alike; they all come to rest, and form new *Protococci*. Among the *Confervoidæ*, which are more highly organized plants than the protophytic Algæ, we find forms, of which *Ulothrix* may be taken as the type, which likewise produce macrozoöspores and microzoöspores in their cells. The macrozoöspores of *Ulothrix* simply come to rest and germinate; they are distinctly asexual spores. The microzoöspores may also do this, but not unfrequently they coalesce in pairs; the product of fusion, the *zygospore*, as it is termed, then develops into a *Ulothrix* filament. This fusion of two similar reproductive cells—this conjugation, as it is termed—is one of the simplest forms of the sexual process; the zygospore is then a sexually produced spore, and the two cells which conjugate to form it are spoken of as *gametes*,—*planogametes* when they possess cilia, *aplanogametes* when they do not.

Comparing *Ulothrix* with *Protococcus*, we see that in both the macrozoöspores are sexual reproductive cells, whereas the microzoöspores of *Ulothrix* exhibit an imperfect sexuality; inasmuch as they may germinate without previous conjugation. The planogametes of *Ulothrix* are, however, to be directly connected with the microzoöspores of *Protococcus*; that is to say, the gametes are to be traced back to asexual spores. This is a point of fundamental importance.

REPSOLD, a family of German instrument makers. JOHANN GEORG REPSOLD was born at Wremen in Hanover on September 23, 1771, became an engineer and afterward chief of the fire brigade in Hamburg, where he started business as an instrument maker early in the present century. He was killed by the fall of a wall during a fire on January 14, 1830. The business has been continued by his sons Georg and Adolf and his grandsons Johannes and Oscar.

REPTILES. Ante-Linnæan writers comprised the animals which popularly are known as tortoises and turtles, crocodiles, lizards and snakes, frogs and toads, newts and salamanders, under the name of Oviparous Quadrupeds or four-limbed animals which lay eggs. Linnæus, desirous of giving expression to the extraordinary fact that many of these animals pass part of their life in the water and part on land, substituted the name of *Amphibia* for the ancient term. Subsequent French naturalists (Lyonnet and Brisson) considered that the creeping mode of locomotion was a more general characteristic of the class than their amphibious habits, and consequently proposed the scarcely more appropriate name of *Reptiles*.

As naturalists gradually comprehended the wide gap existing between frogs, toads, etc., on the one hand,

and the other oviparous quadrupeds on the other, they either adopted the name *Batrachia* for the former and that of *Amphibia* for the latter, or they restricted the term *Amphibia* to Batrachians, calling the remainder of these creatures Reptiles. Thus the term *Amphibia*, as used by various authors, may apply (1) to all the various animals mentioned, or (2) to Batrachians only—and thus it has been used in the article AMPHIBIA in the present work. The term Reptiles is used (1) by some for all the animals mentioned above, and (2) by others, as in the present article, for the same assemblage of animals after the exclusion of Batrachians. Other terms more or less synonymous with Amphibians and Reptiles in their different senses have been used by the various systematists, as we shall see hereafter.

Equally varying are the limits of the term "Saurians," which occurs so frequently in every herpetological treatise. At first it comprised living Crocodiles and Lizards only, with which a number of fossil forms were gradually associated. As the characters and affinities of the latter became better known, some of them were withdrawn from the Saurians, and at present it is best to abandon the term altogether.

#### GENERAL CHARACTERS OF THE CLASS REPTILIA.

Reptiles are vertebrate animals, the skin of which is covered with horny or bony plates (scales or scutes). The heart has two auricles, but with the ventricular chamber generally incompletely divided; two arterial trunks emerge from the right portion of the ventricle; the blood of the arterial and venous systems mixes either in the heart or at the origin of the aortic arches. Respiration takes place by lungs, never by bronchia; portions of the lungs are simple without minute subdivision of the cavity; and the respiratory movements are slow and irregular. In consequence, reptiles are cold-blooded. Their blood-corpuscles are red and nucleated. The thoracic and abdominal viscera are never separated by a complete diaphragm. The intestinal tract and the urogenital organs open into a common cloaca; the oviducts are developed from the Müllerian ducts, and dilated in their lower course for the reception of the ova; all reptiles are oviparous or ovoviparous.

The vertebral column articulates with the skull almost invariably by means of a single convex occipital condyle. The mandible consists of several distinct pieces, of which the articular bone articulates with a quadrate bone, interposed between skull and mandible. When the appendicular parts of the skeleton are present, the sternum is never replaced by membrane bone, and the posterior sternal ribs are attached to a median prolongation of the sternum. The ilia are prolonged farther behind the acetabulum than in front of it; the pubic bones directed downward and forward, and, like the ischia, forming a median symphysis. The metatarsal bones are not ankylosed among themselves or with the distal tarsal bone.

As in birds and mammals, the foetus of reptiles is inclosed in an amnion and allantois (*Amniota*), and nourished from the vitellus of the egg.

In some of the most important characters mentioned reptiles agree with birds, as in the presence of a single occipital condyle, a complex lower jaw articulated to the skull by a quadrate bone, and nucleated blood-corpuscles. The majority of naturalists, therefore, consider the two classes to constitute one of the main divisions of Vertebrates, the *Sauropsida*. At the present epoch, indeed, birds are strikingly differentiated from reptiles, but the discoveries within recent years of a number of extinct birds with reptilian characters offer ample evidence that Birds are descendants of

some branch or branches of the reptilian type, in which the power of flight was developed, and with it other anatomical peculiarities by which birds are now distinguished from living reptiles.

#### THE DIVISION OF REPTILIA INTO ORDERS.

We adopt here a serial arrangement of those orders which seem to be well established, having already referred to the attempts that have been made to arrange these orders into higher groups.

Order 1. *ICHTHYOPTERYGIA* (extinct). Marine reptiles with a cetacean-like naked body and with four limbs formed into paddles, the parts of which after the humerus are not differentiated as to form or function. Tail long. Vertebrae numerous, biconcave; no sacrum. Dorsal vertebrae with double tubercles; ribs movable, the anterior with bifurcate heads. Head large, with long powerful snout, joined to the trunk without neck. Quadrate bone immovably articulated to squamosal. A foramen parietale is present. Orbits very large with a circle of sclerotic plates. A pair of clavicles rest upon an interclavicle and pass laterally to the scapulae; a pair of broad not overlapping coracoids form the posterior part of the pectoral arch. A sternum is replaced by a series of abdominal splints.

Fam. *a. Sauranodontidae*. Edentulous. Genus: *Sauranodon*, from the Jurassic formations of the Rocky Mountain region.

Fam. *b. Ichthyosauridae*. Teeth numerous, implanted in a common alveolar groove. Genus: *Ichthyosaurus*, from Mesozoic strata up to the Chalk.

Order 2. *ANOMODONTIA* (extinct). Lacertiform reptiles, the skull and four limbs of which are Lacertilian in most of their characters. Vertebrae biconcave, four or five of them anchylosed together and forming a sacrum. The tubercular and capitular articulations are separated, the former and longer being on the diapophysis, the latter and shorter on the centrum; ribs movable, the anterior with a bifurcate head. Os quadratum suturally connected with the skull. A foramen parietale is present. Jaws Chelonian and probably cased in horny sheaths; either edentulous or each maxillary bone was armed with a long ever-growing tusk, which sometimes was accompanied by other smaller teeth. The pectoral arch consisted of scapula and coracoid, but a clavicle seems to have been absent. Pelvis very strong, with continuous ischio-pubic symphysis.

Genera: *Dicydonon*, *Galesaurus*.

Order 3. *DINOSAURIA* (extinct). This comprises reptiles of a great diversity of form and size, some adapted for a terrestrial, others for an aquatic life, some carnivorous, the majority herbivorous, but all distinguished by characters leading more or less closely from the Reptilian up to the Avian type. The majority of trunk vertebrae have flat or slightly concave articular ends, sometimes a few of the anterior are convex in front; cervical vertebrae numerous; a sacrum is formed by more than two coalesced vertebrae. Neural arches united to the centra by sutures. Thoracic ribs movable, with a bifurcate head; cervical ribs united to the vertebrae either by suture or anchylosed. Os quadratum suturally connected with the skull. The premaxillary bones are separate, and the rami of the lower jaw united in front by cartilage only. Form of the teeth variable; they are not anchylosed to the bone. Two pairs of limbs are present, of which the hinder pair is the longer and larger, and generally ambulatory. The structure of the pelvis and hind limbs partly Ornithic; the pelvic bones are not coalesced with each other or with the sacrum; the pubis enters into the formation of the acetabulum, and the ilium is prolonged forward in

front of the acetabulum; ischia united in a median ventral symphysis. The head of the femur is placed at a right angle to the condyles; tibia with a procnemial crest, and a ridge for the fibula, which is complete. The proximal row of tarsals is formed by the astragalus and calcaneum only, and the former sometimes anchylosed with the tibia, thus forming the upper portion of the ankle-joint.

Order 4. *ORNITHOSAURIA* (extinct). Reptiles with the fore limb adapted to support a flying membrane, and with the remainder of the skeleton secondarily modified for aerial progression. Vertebrae not numerous, procœlous; from three to six forming a sacrum; cervical vertebrae exceeding in size the others. No neuro-central suture. Anterior ribs with bifurcate heads. Skull large, bird-like, with long jaws. Os quadratum suturally connected with the skull. Orbits very large, with a ring of sclerotic plates. Sternum broad, completely ossified, with a median crest anteriorly. Scapula and coracoid slender, bird-like; no clavicle. Phalanges of the ulnar digit exceedingly elongate. Pelvis weak; hind limb smaller than fore limb. Bones generally hollow, many with pneumatic foramina.

Fam. *a. Pterosauria*. Jaws toothed; scapula and coracoid separate. Genera: *Pterodactylus*, *Rhamphorhynchus*, *Dimorphodon*, from Jurassic formations of Europe; of small or moderate size.

Fam. *b. Pteranodontia*. Edentulous; scapula and coracoid solidly united, the former articulating with the common neural spine of the vertebrae. Genus: *Pteranodon*, from Cretaceous strata of Kansas; specimens with a spread of wing of some twenty feet.

Order 5. *CROCODILIA*. Reptiles with lizard-like body, and long powerful tail adapted for swimming. Limbs short, especially the anterior; five digits in manus and four in pes; only three of the digits are clawed. A dermal armor, consisting of flattened bony scutes, covers the back, and in some genera the abdomen. Teeth in a single row, implanted in distinct sockets. Nostrils generally at or near the end of the snout. Vertebrae with the neuro-central suture persistent. Two sacral vertebrae only. The majority of the cervical and trunk ribs double-headed, attached to the diapophysis and centrum of the vertebrae. From seven to nine of the anterior dorsal ribs are united with the sternum by sternal ribs. Bones of the skull very solid, firmly united by sutures, as is also the quadrate bone. Heart with a double ventricle. Copulatory organ single, situated in the cloaca.

Fam. *a.* (or suborder) *Proœalia*. With procœlous vertebrae. All living genera and the extinct forms down to the Chalk belong to this division.

Fam. *b.* (or suborder) *Amphicœlia*. With amphicœlous vertebrae. All the genera are pre-cretaceous: *Teleosaurus*, *Goniopholis*, *Streptospondylus*, *Steganolepis*, *Galesaurus* (?), *Belodon*.

Order 6. *SAUROPTERYGIA* (extinct). Marine reptiles with long neck, small head, long tail, natatory limbs, and a naked skin. Hind and fore limbs identical in structure and form, transformed into cetacean-like paddles with five digits, which were composed of numerous phalanges and inclosed in a common skin. Teeth in a single row in both jaws, implanted in distinct sockets. Vertebrae amphicœlous, with the neuro-central suture persistent; single-headed ribs are attached to the long diapophyses of the dorsal vertebrae. Sacral vertebrae two. Quadrate bone suturally united with the skull. A parietal foramen. No sclerotic ring. Neither sternal ribs nor sternum are present; but a system of free abdominal ribs is developed. The pectoral arch consists of a pair of large coracoids, meeting in the median

line, and clavicular elements extending from one scapula to the other. Pelvis large, with the ilia, pubes, and ischia not coalesced, and all sharing in the formation of the acetabulum.

These characters may not fully apply to all the genera which have been referred to this order, as some are known from their skulls or other fragments only.

The best known are the PLESIOSAURIANS (*q.v.*) proper—*Neusticosaurus*, from the Trias, with paddles in front and ordinary limbs behind; gigantic forms from the Trias, as *Nothosaurus*, *Simosaurus*, *Pistosaurus* or post-Triassic, as *Plesiosaurus*, and *Pleosaurus*, *Polycotylus*, and *Elasmosaurus* (or *Discosaurus*) from the Lias and Chalk.

Order 7. RHYNCHOCEPHALIA. Lacertiform reptiles, with four limbs. Vertebrae with flat ends; two in the sacrum; the tubercular and articular surfaces are united; ribs single-headed. Os quadratum suturally united with the skull and pterygoid; an osseous infra-temporal bar. Foramen parietale present. Sternum and a system of abdominal ribs well developed. Copulatory organs absent; urinary bladder present.

One recent genus: *Hatteria*. Represented in the Upper Cretaceous and Lower Eocene by *Champsosaurus*, in the Trias by *Rhynchosaurus*, *Hyperodapedon*, and in the Permian by *Proterosaurus*, *Sphenosaurus*, *Telerpeton* (?), *Saurosternum* (?).

Order 8. LACERTILIA. Lizards. Vertebrae generally procœlous, with short or rudimentary transverse processes; sacral vertebrae not exceeding two; ribs single-headed. Os quadratum articulated with the skull. Parts of the aliand orbito-sphenoid regions fibro-cartilaginous. Temporal region without, or with only one, osseous bar. Limbs four, two, or absent; when they are present, a sternum with sternal ribs and a pelvis are developed. Copulatory organs paired; urinary bladder present. Integuments with horny or sometimes bony scutes.

For the numerous recent genera see LIZARDS. Distinguishable representatives of the order appear first in Jurassic formations and thence downward to our period: *Acrosaurus*, *Ardeosaurus*, *Pleurosaurus*, *Saphiosaurus*, *Atoposaurus*, and *Homœosaurus* from the Oölite; *Nuthetes*, *Saurillus*, *Macellodon* from the Wealden; *Dolichosaurus*, *Acteosaurus*, *Coniosaurus*, *Rhaphiosaurus* from the Chalk. From Tertiary formations in Europe numerous small remains are known, while those described from Australia belonged to much larger forms, showing more or less affinities to the lizards of the present Australian fauna.

A distinct division of this order includes the extinct Mosasaurians, which are, in fact, the Pinnipedes among Lacertilians. Their limbs, of which they had two pairs, are transformed into paddles; by their long snake-like body and large size the marine reptiles form the nearest approach in nature to the modern creature of imagination, the "Sea-Snake." There is no question that they deviate more from the Lacertilian type than any of the other fossil forms mentioned above, especially in some of their cranial characters, which are more Ophidian. Hence Cope placed them into a distinct order of reptiles, *Pythonomorpha*. Their body was covered with osseous scutes.

Besides *Mosasaurus*, remains of which have been known and described since the year 1766, a number of other genera from Cretaceous rocks of Europe and North America have been distinguished by Owen, Cope, Marsh, and Dollo: *Liodon*, *Clidastes*, *Sironectes*, *Platecarpus*, *Baptosaurus*, *Diplotomodon*, *Edestosaurus*, *Holosaurus*, *Lestosaurus*, *Tylosaurus*, *Pterycollasaurus*, *Plioplatecarpus*.

Order 9. OPHIDIA. Snakes. Vertebrae procœlous

extremely numerous; no sacrum; ribs single-headed. No chevron bones on any of the vertebrae. Not only the quadrate bone is movably articulated to the skull, but also the suspensorium and the bones of the palatal maxillary apparatus are movable; brain capsule entirely osseous. No quadrato-jugal arch. No foramen parietale. Rami of the mandible united by ligament. No trace of anterior extremities, and posterior only sometimes rudimentally indicated. Copulatory organs paired; urinary bladder absent. Integuments folded into regularly arranged scales.

For the numerous recent genera see SNAKES. Fossil forms are scarce, and do not appear before the Eocene (*Laophis*, *Palœophis*, *Paleryx*).

Order 10. CHELONIA. Tortoises and turtles. Cervical and dorsal vertebrae not numerous. The dorsal vertebrae and expanded ribs (with the exception of *Sphargis*), are united into a carapace, the elements of which are immovable, and which is completed ventrally by a number of dermal bones, a true sternum being absent and replaced by a plastron. All the bones of the skull are suturally united, with the exception of the mandible and hyoid; the dentary portion of the mandible consists of one bone only. Pectoral arch consisting of the scapula, with which the precoracoid is united, and the coracoid. Clavicles are represented by the anterior elements of the plastron. The pelvis consists of the usual bones, but is not attached to a sacrum. Two pairs of limbs. No teeth, these being replaced by horny sheaths of the jaws. Copulatory organ single. Integuments consisting of horny scutes covering the carapace, and of scales and tubercles on the soft parts.

For the numerous living genera see TORTOISES. Remains of extinct tortoises are found from the Trias downward, but they do not show any approximation to some other reptilian type, or indicate a successive development. The most generalized type, *Sphargis*, is not older (according to present evidence) than some of the more specialized genera, its earliest representative being the remarkable *Protostega* from North-American cretaceous formations. Some of the Tertiary fossils exceeded in size the largest of living forms, such as the Himalayan *Colossochelys*, the German *Macrochelys*, the North-American *Atlantochelys*.

#### THE ANATOMY OF REPTILES.

As the principal features known of the anatomy of extinct reptiles have been sufficiently noticed in the several separate articles devoted to them, this chapter will deal almost exclusively with the general structure of living forms.

Inasmuch as the class of reptiles is one of the classes which make up that great primary zoölogical division known as "vertebrate animals," they of course possess all those structural characters which are common to that division (see VERTEBRATA). They also possess in common a certain number of structures which they share with birds (see SAUROPSIDA), and which will be indicated in our notice of the different sets, or systems, of organs which compose the bodies of the animals of which this article treats.

Every reptile has a body made up of a head, a trunk, and a tail, though, as in some *Lacertilia* and many *Ophidia*, these regions are not marked off one from another by any constriction or noticeable alteration of diameter. The posterior aperture of the alimentary tube always marks the termination of the trunk and the commencement of the tail. In some kinds of reptiles—as, *e.g.*, in the genera *Anguis* and *Amphisbæna* among the *Lacertilia*, and in such forms as *Typhlops* and *Uropeltis* among the *Ophidia*—the whole body consists of little more than a very elongated trunk with a small

head at one end and a short or even quite rudimentary tail at the other.

REPUBLICAN PARTY.—The Republican party must be held to date its origin as a national organization from June 18, 1856, the day on which the first national convention known as Republican, met in Philadelphia. That convention was composed of delegates selected under a call of a widespread character. It invited to its counsels all who opposed the repeal of the Missouri Compromise, all who opposed the extension of slavery into the territories, all who favored the admission of Kansas as a free State—all in effect who opposed the dominant faction of the Democratic party. To this convention came anti-slavery Whigs, Free-Soilers, Abolitionists, Knownothings, and Democrats who could not stomach the dictation of the Southern wing of their party. The platform adopted denied the right of Congress or any Territorial legislature to legalize slavery in any territory of the United States, blamed the Pierce administration for the attempt to force slavery upon Kansas, and demanded the immediate admission of Kansas as a free State. It pronounced against polygamy, advocated the construction of a Pacific railroad by government aid, favored appropriations for river and harbor improvements, and in general terms declared for the Constitution, the rights of the States and the perpetuation of the Union.

The Convention completed its work by placing in nomination for President and Vice-President respectively, John C. Frémont, "the Pathfinder," and William L. Dayton, of New Jersey. The Democratic convention nominated James Buchanan, of Pennsylvania and John C. Breckinridge of Kentucky. The American or "Knownothing" party nominated Millard Fillmore, of New York and A. J. Donaldson, of Tennessee. The Democratic nominees carried 19 States out of the 31 then included in the Union, the Republicans carried 11, and Maryland supported the Knownothing ticket. Buchanan had 174 electoral votes, Fremont 114, Fillmore 8. All the slave States and five of the free States went Democratic, but Buchanan failed to obtain a majority of the popular vote, and had the Knownothing ticket been out of the way it is more than probable that the new party would have swept the field at its first essay in politics.

Just before Buchanan's inauguration the Supreme Court of the United States, through Chief Justice Taney, rendered a decision in the famous case of Dred Scott. Although the Chief Justice did not say, as it is often alleged that he did say, that "a negro had no rights which a white man was bound to respect," he and the majority of the Court held that negroes were property, that they could be carried into territories of the United States at the will of their owners, and that their possession like that of other chattels must be protected to the owner. The issue of this decision gave great satisfaction to the Southern Democrats, and equally incensed the anti-slavery sympathizers of the North. Among these were many Democrats. There were many men also, who while content to recognize slavery in the States where it had so long prevailed, were absolutely opposed to its extension north of the limits fixed by the Missouri Compromise. The battle over the admission of Kansas was a long and bloody one. New England sympathizers with abolition sent men, money and arms into the Territory; Missourians of pro-slavery tendencies resisted them by force and fraud. The pro-slavery men carried a Territorial constitution with a slavery provision in it, and the Free-Soilers sought to outwit them by organizing as a State. Congress, then Democratic in both branches,

refused to admit Kansas as a State under the "free" clause, and President Buchanan declared in favor of the Lecompton (pro-slavery) constitution and urged Congress to admit Kansas as a State under that document. The people of Kansas, however, by a majority of over 10,000 decided not to avail themselves of this offer, and it was not until 1861, when the secession of the Southern representatives left Congress with a Republican majority in both houses, that Kansas was finally admitted as a free State.

As the time for choosing a successor to Buchanan approached the situation became intensified. The Democratic party [see Democratic Party, Vol. iv., page 1974] split on the slavery question, and at the Convention held in Charleston, S. C., in April, 1860, a break in the ranks occurred. The Southern delegates stuck by the Dred Scott decision; the Douglas element supported the "Squatter Sovereignty" idea of their leader. In the result two Democratic tickets were placed in the field, Douglas and Johnson representing the Northern wing, who were content to leave the question of slavery in the Territories to the people of those territories, while Breckinridge (then Vice-President) and Joseph Lane, of Oregon, stood for the Southern and pro-slavery element.

The Republican nominating convention met at Chicago and placed in nomination Abraham Lincoln, of Illinois and Hannibal Hamlin, of Maine. The platform reasserted that of 1856, pronounced decidedly against the extension of slavery in the Territories, and favored a protective tariff. The election resulted in the success of the Republican ticket. In addition to the candidates named the "American" party placed in nomination John Bell, of Tennessee, and Edward Everett, of Massachusetts. These candidates succeeded in carrying 3 States—Virginia, Kentucky and Tennessee, with 39 electoral votes. Douglas got 3 votes from New Jersey and 9 in Missouri. Breckinridge obtained 72 votes of the slave States, and Lincoln carried every free State, except that he lost 3 votes in New Jersey. As far as the popular vote was concerned Lincoln had nearly 500,000 more than Douglas, but 350,000 less than the combined Democratic vote. The Bell ticket polled nearly 600,000 votes. The Democrats still had control of Congress and it was not until after the secession of the Southern members that the Republicans obtained control of the legislative department.

Lincoln assumed office March 4, 1861, when eleven States had practically gone out of the Union. The moribund Congress had proposed a resolution providing for non-interference with slavery, but this, although recommended anew by the new President, was lost with everything else of a pacific or compromise character in the echoes of the cannon-shot at Fort Sumter. When the Southern Senators and Representatives withdrew from Congress the Republicans attained a control which they held for thirteen years. The history of the Civil War and of the period of reconstruction is the history of the Republican party during those years. That history is told elsewhere [see article on UNITED STATES in Vol. x.] and we can only note here the special political features.

The Thirty-seventh Congress (March, 1861, to March, 1863) was called upon to deal with exigencies never contemplated when its members were chosen. Its successor, also strongly Republican, bore up the hands of Lincoln, who in June, 1864, received a renomination by the Republican National Convention. By this time it had become evident that slavery was the cause and constituted the strength of the Rebellion, and that to suppress the latter it was absolutely necessary to abolish

the former. Lincoln's notification of September, 1862, had been followed by the Emancipation Proclamation of January 1, 1863, which "freed the slaves where it could not get at them." But as a war measure it proved itself what Lincoln styled it, "a fit and necessary war measure in suppressing said rebellion." In May, 1864, the Senate passed the Thirteenth Constitutional Amendment (that abolishing slavery), but the measure did not obtain the necessary two-thirds vote in the House and went over to the next Congress. In December, 1865, it was adopted by twenty-seven States and was incorporated in the organic law.

The National Convention of the Republican party which renominated Mr. Lincoln in 1864, named Andrew Johnson, the energetic military governor of Tennessee, as vice-president. The Convention demanded the complete extirpation of slavery and pronounced against any form of compromise with those in arms against the government. The Democratic Convention, which met at Chicago in August, 1864, nominated George B. McClellan, of New Jersey, and George H. Pendleton, of Ohio, and raised the direct issue with the Republicans by declaring the war a failure. They demanded a cessation of hostilities and a convention of the States for the purpose of restoring peace "on the basis of the Federal Union of the United States."

The people of the United States (eleven States then in rebellion not voting) pronounced emphatically in favor of the Republican policy. Lincoln received 212 electoral votes from twenty-two States; McClellan got the twenty-one votes of New Jersey, Delaware and Kentucky. On the popular vote Lincoln had a majority of over 400,000.

The accession of Andrew Johnson to the presidency after the assassination of Mr. Lincoln brought about a fierce conflict between the executive and the legislative branches of the government. Backed by a two-thirds majority in both Houses the Republicans passed over the presidential veto the freedmen's bureau bills, the civil rights bill, the tenure of office bill and the several measures of reconstruction, and finally they impeached Johnson before the Senate and came within an ace of securing a conviction. Their failure to accomplish this end was due to the action of a few of their own men, who ranked with the ablest of their party, and who paid for their self-assertiveness by the sacrifice, in some cases at least, of their political future.

In 1868 the Republican party chose as its standard-bearer the most successful general of the Civil War, Ulysses S. Grant, and associated with him on the ticket Schuyler Colfax, of Indiana, formerly Speaker of the House of Representatives. The Republican platform indorsed the policy of reconstruction which had been inaugurated, and practically the campaign was decided on the war issues. The Democratic party named Horatio Seymour, of New York, and Francis P. Blair, of Missouri, and denounced the reconstruction measures as a failure. Grant received 214 of the 294 electoral votes (three States not voting), and had a popular majority of over 300,000. During his first administration the Fifteenth Constitutional Amendment was adopted and by this the negroes were granted every right of citizenship.

The opposition to the re-election of General Grant in 1872 took the shape of an outside movement. A good deal of opposition had been shown inside the Republican ranks to the reconstruction policy, and the evils of "carpet-bag" government in several of the Southern States had been impressed upon many good Republicans. A gathering of the disgruntled was held at Cincinnati under the guise of a "Liberal Republican" Convention, and this body nominated Horace

Greeley, an old-time Whig and Abolitionist, and B. G. Brown, of Missouri, on a platform of general forgiveness and hopeful trust. The Democratic Convention adopted both candidates and platform, but a great many straight-out Democrats repudiated their action. In the result Grant received 2.6 electoral votes out of a total of 352, and as Mr. Greeley died before the electoral colleges met the sixty-six votes given in six States for him were scattered. Henry Wilson, of Massachusetts, was chosen vice-president on this occasion. In 1872 occurred the CREDIT MOBILIER (*q. v.*) exposures and the "salary grab" act was passed. There was a good deal of trouble in the South during General Grant's second term over the conflicting claims of rival State governors and legislatures. In 1874 the Democratic party secured a majority in the Lower House of Congress, which they held uninterruptedly until March, 1881.

The Republican National Convention, which met at Cincinnati in June, 1876, approved the legislation of previous Republican administrations, took strong ground in respect to the enforcement of the constitutional amendments, declared the United States to be "a nation, not a league," and indorsed civil service reform. Rutherford B. Hayes, of Ohio, and William A. Wheeler, of New York, received the nominations. The Democracy met at St. Louis, denounced the tariff, made some promises of reform and economy, and nominated Samuel J. Tilden, of New York, and Thomas A. Hendricks, of Indiana. The fight was a close one. The Democratic candidates carried the "Solid South" (South Carolina, Florida and Louisiana disputed) and in the North had New York, New Jersey, Indiana and Connecticut—a total of 184 electoral votes certain, and one less than the necessary majority. The Republican managers claimed 185 votes, including those of the three Southern States mentioned, and finally by the award of the Electoral Commission [See UNITED STATES, Vol. x., page 6029] Mr. Hayes was declared elected. During his administration the resumption of specie payments was effected. He experienced considerable difficulty in his relations with Congress and during his administration the divisions in the Republican party became marked. The "stalwart" wing objected strongly to the methods of Mr. Hayes and much feeling was displayed in the choice of delegates to the convention called to nominate a candidate in succession to him. This convention, which was held at Chicago, was marked by incidents of an exciting and dramatic character. The friends of General Grant undertook to present his name for a third term and made a strong fight on his behalf. John Sherman and James G. Blaine were also prominent candidates, and in the end a compromise candidate was found in the person of General James A. Garfield, of Ohio, many years prominent in Congress and then United States Senator-elect from his State. With him was associated Chester A. Arthur, of New York, the representative of the "stalwart" division. The platform included a protective tariff plank, while the Democrats advocated a "tariff for revenue only." They placed in nomination General Winfield S. Hancock, of Pennsylvania, and William H. English, of Indiana. The Republican candidates received 214 electoral votes; the Democrats 155. Garfield had a plurality of 7,018 of the popular vote over Hancock, but there was a Greenback-Labor ticket in the field, which polled over 300,000 votes. The House of Representatives became Republican at this election, thus giving that party entire control of the government. President Garfield was shot by a crazy politician in July following his inauguration and died three months later. Mr. Arthur, who succeeded him, did something

toward reconciling the warring factions within the party, but failed to receive a renomination. The National Convention, which met at Chicago in June, 1884, nominated James G. Blaine, of Maine, for president, and John A. Logan, of Illinois, for vice-president. The Republican platform declared for a protective tariff and otherwise was a repetition of previous utterances. The Democratic party nominated Grover Cleveland, of New York, and Thomas A. Hendricks, of Indiana, on a platform of tariff for revenue only. Disaffection among New York Republicans lost Blaine a number of votes and Cleveland carried the State by a few hundreds. The vote of New York was once more decisive and in the electoral colleges Cleveland had 218 votes; Blaine 182. The South voted solidly Democratic. Cleveland's popular vote was 23,000 more than that of Blaine. The House of Representatives became Democratic.

During the administration of Mr. Cleveland the Republican party retained control of the Senate and were thus enabled to prevent the Democratic members of the House from redeeming their pledges in regard to tariff reform legislation. In 1888 the Democratic National Convention re-indorsed their tariff policy and renominated Cleveland, with Allen G. Thurman, of Ohio, for vice-president. The Republican convention met at Chicago, nominated Benjamin Harrison, of Indiana, and Levi P. Morton, of New York, and declared for a protectionist policy. The Republicans carried every northern State with the exception of New Jersey, and secured the election of Harrison by 233 electoral votes against 168 given for Cleveland. The House became Republican (as the Senate already was), and so remained until the elections of the fall of 1890 completely reversed the conditions and returned an overwhelming Democratic majority to the Fifty-second Congress, the principal reason for this popular revolt being the passage of a new high-tariff measure, championed by Mr. McKinley, a Republican member from Ohio.

**REPUDIATION.** It has happened at certain times in the history of many countries that a course of public policy has been adopted, either on account of bad internecine government or costly foreign war, which has resulted in the nation concerned contracting large obligations in excess of its ability to pay. With nations as with individuals the temptation to avoid present trouble at the risk of future liability; to remove an existing financial unpleasantness by incurring one which posterity is to share in, is almost irresistible.

When an individual or a trading corporation amenable to the laws of a state finds himself or itself in straits of this character, there is a remedy known as bankruptcy. The State, through its courts, steps in, realizes the effects of the trading concern which has come to a stop, pays the creditors such a dividend as may be left after the expenses of administration have been met, and so that particular trading firm drops out of existence. But nations cannot be dealt with in this way. There is no international court of bankruptcy to divide their assets among their creditors, and in the natural course of things there never can be. Nations have a decided antipathy to being wiped out, and would resist to the death the enforcement of any such form of international bankruptcy law. It is true that in Egypt the two great powers of France and England stepped in and announced that they would administer the affairs of that country for the benefit of its creditors—most of whom were either English or French. But such a course is only practicable where no active national life exists; could never be adapted to a free people; and even in the case quoted France has withdrawn from the dual

control, and England, after an expenditure of many millions, would only be too glad to let go if she could.

The nation, therefore, which can neither pay, borrow more to go on with, nor be absolved by law, has but one resource, and that is repudiation. When France, after its expulsion of the elder branch of the Bourbons, established a republic and brought upon itself the task of defending its territory against united Europe, the rotten fabric fell. A system of irredeemable paper money based on the confiscated lands of the aristocrats and the church, was tried, but, like all panaceas of its kind, the remedy proved worse than the disease. In the result the old debt of France was wiped out, for the whole forces of the earth would not have sufficed to collect it. After the reconstitution of France under Napoleon I. its credit was established by the wisdom of its rulers and the thrift of its people, and to-day, although the national debt of France is enormous, it is all owed to its own people, and its credit ranks with the highest. Great Britain has always paid its debts and the interest thereon, and its national debt is far lower, and its credit higher than that of any other nation of its strength. Meantime, Russia, Austria, Spain, Portugal, Turkey, the new kingdom of Italy, not to speak of the minor states of Europe and the world, have gone on increasing their debts at a rate which leaves no room for hope of the avoidance of an ultimate general crash. In the case of some of the states quoted, and in that of many of the South American Republics, repudiation in whole or in part has been already made. The word has an ugly sound, but so have the words "usurious interest," and it is entirely true that those who advanced money to such states as stand in the delinquent list, advanced a good many thousand millions less than the face value of their claims, and did so on the poorly-guaranteed promise of extortionate interest.

What has been said of the status of such of the great powers of Europe as have honestly met their obligations, applies with even more force to the republic of the United States. For many years it grew in strength, scarcely disturbed by foreign troubles, and at the outbreak of the great Civil War its indebtedness was less than the municipal indebtedness of many a great city of to-day. The war came, and it cost thousands of millions to bring it to a successful conclusion. Much of this money was borrowed at high rates of interest. There was a question raised, to which the indefiniteness of some of the contracts gave a color, as to whether the cheap money borrowed should be paid back in dear money, but fortunately the good sense of the people united with their instinct of fairness, and the United States met its creditors with an honest one hundred cents on the dollar. Since the war the debt has been so reduced that its burden is as nothing, and the stability thus given to the public credit is seen in the fact that the rate of interest has been reduced one-half, while the bondholders obstinately decline to take money offered to them in full of their claims, or to surrender their bonds until they are fully matured.

In considering the partial repudiation by some of the individual States of the Union of their public indebtedness, there are some interesting points to note. We have said that nations, unlike individuals, cannot be sued or adjudicated upon as bankrupts. Independent nations, however, can be compelled by foreign powers to carry out obligations incurred to the citizens of such foreign powers, the compelling force being commercial reprisals or war. But the federated States of the Union cannot be individually attacked in this way, while under the eleventh amendment to the constitution citizens of their own or of other States cannot sue a State in the United States courts. There is therefore

an absence of the means of enforcement which places contracts between such States and their creditors on a somewhat different footing to those made by, for instance, the European powers, or the independent South American republics. Somewhat early in the history of the Republic certain of the States failed to meet, temporarily, at least, the payment of the interest on loans made to them. The commercial depression which followed 1837 brought about this consequence, although it could not justify it. Pennsylvania repudiated in part in 1842, but afterward paid up in full. Maryland in the same year suspended payment upon a debt of \$12,000,000 contracted for internal improvements, but she also straightened matters out later. Mississippi, Michigan, and Louisiana refused payment of certain claims, but in each case it was because of an alleged informality of some kind.

The so-called repudiation by certain of the Southern States since the Rebellion is susceptible of another name. The war left them bankrupt and desolate, while the extinction of slavery had ruined individual property owners. In several of the States the "carpet-bag" legislatures contracted indebtedness at ruinous rates of interest, voted vast sums in aid, or on pretense of aiding, railroads, and in many cases these loans were, to say the least, of a collusive if not fraudulent character. When the people of South Carolina again acquired control of their own affairs they found themselves confronted by an empty treasury and an enormous debt. They were forced to repudiate—that is, they repudiated the action of their unfaithful legislators, who had held the offices which they abused against the will of the people. In several instances, as in Georgia, Florida, and Louisiana, the courts decided against the validity of the bonds. Louisiana asserted the unconstitutionality of certain issues, and North Carolina repudiated \$12,000,000 of railroad bonds on the ground of collusion. South Carolina ascertained its true indebtedness so far as possible, and scaled it to fifty cents on the dollar. But in this case the validity of the consolidated bond then issued was afterward questioned. In Virginia the chief trouble grew out of the fact that a great portion of her territory had been violently separated from her without provision being made for a partition of the debt between the two divisions. West Virginia declined to pay any part, and Virginia made a provision for funding what she held to be her quota. Subsequently the coupons of these bonds were practically repudiated, and for a long time the re-adjusters, repudiators, and other divisions kept up their fight over the disputed debt.

REQUENA, a town of Spain, in the province of Valencia, forty-one miles to the west of that city on the road to Cuenca, occupies a strong position near the river Oleana in the rocky mountainous district called Las Cabrillas separating Valencia from Castile. The population of the municipality in 1877 was 13,527.

REQUISITION is the name applied to the demand made by the Governor of one State on the Governor of another State of a common confederation for the surrender of a criminal who has committed a crime in the one and escaped to the territory of the other. The essence of a successful requisition is that the crime for which the criminal is claimed shall be an offense against the laws of both States. The relations of the different States of the American Union are such to each other that the requisition exists merely by comity, and not by right, the same degree of independence existing between the States in this regard as exists between independent nations. In a limited degree, the same rule of action as regards honoring a requisition applies also. In numerous instances calls have been made by the executive of a State upon the executive of another for the

surrender of an alleged criminal, and the calls not complied with. An important doctrine in connection with the requisition is that a person shall not be taken from a State on one charge and then tried for another. He shall only be tried on the charge specified in the warrant or indictment accompanying the requisition papers. In case of requisition, the warrant of arrest and indictment (if there be one made) must invariably accompany the requisition papers, which must bear the official seal of the secretary of the commonwealth demanding custody of the alleged criminal. Any irregularity in these details will infallibly lead to the discharge of a person so held, if the case be brought before a court on a writ of *habeas corpus*. For procedure in analogous cases between two nations, see EXTRADITION.

RESERVOIR. Any receptacle for storing up for use a fluid is commonly called a reservoir, although there is no reason why the term should be so limited, as the meaning is simply a place of reserve. For its ordinary use see WATERWORKS.

RESHAL, *i.e.*, RABBENU SHELOMOH LORIA (or Luria, *vulgo* Lurye), was one of the famous "Five Sages" (Rabbis) of the sixteenth century. He was chief rabbi of Lublin, where he died in 1573.

RESHD. See RASHT.

RESINA, a town of Italy, six miles southeast of Naples and practically a southern continuation of Portici, is well known as the usual starting place for tourists on their way up Vesuvius, and as the nearest town to the buried city of Herculaneum. It had 13,626 inhabitants in 1881 (commune 15,593).

RESINS. A resin is a secretion formed in special resin canals or passages of plants, from many of which, such as, for example, coniferous trees, it exudes in soft tears, hardening into solid masses in the air. Otherwise it may be obtained by making incisions in the bark or wood of the secreting plant. Resin can also be extracted from almost all plants by treatment of the tissue with alcohol, and it is formed by the oxidation of essential oils, many authorities being of opinion that all true resins, which are in chemical composition oxidized hydrocarbons, result primarily from the action of oxygen on essential oils. Resinous substances are further produced by the dry distillation of numerous organic compounds and by the drying of fatty drying oils. Certain resins are obtained in a fossilized condition, amber being the most notable instance of this class, and African copal and the kaurie gum of New Zealand are also procured in a semi-fossil condition.

The following are the principal resins:

I. *Copalline or Varnish Resins*:—African Copal or Gum Animé; Mexican Copal, from *Hymenea* sp.; Brazilian Copal, from *Hymenea* sp. and *Trachylobium Martianum*; Piney Resin, or White Dammar, *Vateria indica* and *V. acuminata*; Sal Dammar, *Shorea robusta* and other species; Dammar of *Hopea robusta*; Black Dammar, from *Canarium strictum*; Mastic, *Pistacia Lentiscus* Lac; East Indian Dammar; Kaurie or Coudie Resin, *Dammara australis*; Sandarach, from *Callitris quadrivalvis*; Dragon's Blood.

II. *Soft or Oleo-Resins*:—Manila Elemi, from *Canarium commune*; Mexican Elemi, *Amyris elemifera*; Brazilian Elemi, *Icica Icicariba* and other sp.; Tacamahac (American); *Elaphrium tomentosum*; Tacamahac (East Indian), *Calaphyllum Inophyllum*; Wood Oil, *Dipterocarpus turbinatus*; Chian Turpentine, *Pistacia Terebinthus*; Turpentine, Common Frankincense, and Thus from various *Coniferæ*; Balsam of Canada, *Abies canadensis*.

III. *Fragrant Oleo-Resins and Gum-Resins*:—Myrrh, *Balsamodendron Myrrha*; Bdellium or Googul, *Balsamodendron Roxburghii*; Balsam of Gilead or

Mecca Balsam, *Balsamodendron Berryi*; Olibanum or Frankincense, *Boswellia Carteri*, etc.; Benzoin *Styrax Benzoin* and *Balsamodendron Mukul*; Solid Styrax, *Styrax officinalis*; Liquid Storax, *Liquidambar orientalis*; Balsam of Peru, *Myrospermum periferum*; Balsam of Tolu, *Myrospermum toluiferum*; Labdanum or Ladanum, *Cistus creticus*, var. *labdaniferus*.

IV. *Fetid Gum Resins*.—Ammoniacum, *Dorema ammoniacum*; Asafoetida, *Ferula Narthex* and *F. Scorodosma*; Galbanum, *Ferula galbaniflua* and *F. rubri-caulis*; Opoponax, *Opoponax Chironium*; Sagapenum, *Ferula* sp.; Sarcocol.

V. *Medicinal Resins*.—Gamboge, *Garcinia* sp. Guaiacum, *Guaiacum officinale*; Euphorbium, *Euphorbia resinifera*; Balsam of Copaiba, *Copaifera officinalis*.

VI. *Extract Resins* form a class of products principally important from a medicinal point of view. They embrace Scammony from *Convolvulus Scammonia*, Jalap Resin from *Ipomea Jalapa*, Podophyllum Resin from *Podophyllum peltatum*, Churrus from Indian Hemp (*Cannabis sativa*), Cubeb Resin from *Cubeba officinalis*; and many other medicinal products owe their virtues to resinous bodies present in them.

**RESPIRATION.** The continued existence of an amœba in a pool of water, or of a white blood-cell in the *liquor sanguinis*, depends upon a continual interchange of substances between the organism and the surrounding medium. The substances in question pass from the medium into the organism in a certain chemical form; they pass from the organism into the surrounding medium with their chemical form modified. Regarding merely the initial and final stages of this reconstitution of chemical form, we may speak of it as being of the nature of an oxidation. This view does not profess to be comprehensive; nevertheless, it is true that the metabolic and anabolic processes of cells, taken as a whole, resemble combustion at least to this extent that oxygen and oxidizable carbon take part in them, and that carbon dioxide results from them. Partly as a matter of tradition, and partly as a matter of convenience, physiologists have described the introduction of oxygen into the organism and the emission of carbon dioxide from it as the complementary portions of one process of *respiration*. Although such a combined consideration is not strictly philosophical, inasmuch as it leaves out of view the introduction of the carbon into the organism, yet it is extremely convenient because the two processes referred to do in all classes of the animal kingdom from the highest to the lowest, involve the same organs and tissues in their performance. Respiration may, therefore, be defined as the aggregate of those processes which are concerned in the introduction of oxygen into the system and the escape of carbon dioxide from it.

Respiration in the higher animals may therefore be divided into (1) internal respiration, or the interchange of oxygen and carbon dioxide between the cells of the body and the fluid drenching them, and (2) external respiration, or the gaseous interchange taking place in the special respiratory organs (lungs, gills). The first is really a part of NUTRITION (*q.v.*); the second, or respiration proper, is the subject of the present article.

#### THE MOVEMENTS OF RESPIRATION.

##### *Structure of the Organs of Respiration.*

In order to understand the movements it is necessary first to know the structure of the air passages and thorax.

**Anatomy of the Air Passages.**—The essential organs of respiration consist of an air tube called the *trachea*, communicating at its upper end with the mouth and bifurcating below into two *bronchi*, one on the right hand and one on the left. Each bronchus divides and

subdivides, diminishing in calibre at every division until a diameter of about  $\frac{1}{40}$  is attained; such a diminutive bronchial tube is called a *bronchiole*. Every bronchiole is a cylindrical tube which divides dichotomously and rapidly several times, and finally terminates in irregular *alveolar passages*. The sides of the alveolar passages, and of the subdividing bronchioles in less abundance, are studded with hemispherical dilatations called air cells or *alveoli*. The terminal portion of an alveolar passage, with its air cells, is sometimes spoken of as an *infundibulum*—a term we may wisely forget at once, since it points to a distinction where no essential difference exists. The alveoli cluster in great abundance about the alveolar passages, and, although we have spoken of them as hemispherical, they are in reality made polygonal by mutual compression. They are surrounded by connective tissue of a very elastic quality, which gives to their delicate walls a firm support, and is so disposed about them that all the alveoli derived from one bronchiole are more closely knit together than they are bound to those of a neighboring bronchiole; hence we may speak of a bronchiole with the assemblage of its members as a *lobule*, a term of peculiar importance since it will be evident on reflection that each lobule contains all the essential parts of a lung—is in fact a lung in miniature. By connecting tissue the lobules are compacted to form lobes, of which two on the left side and three on the right go to make up the respective lungs.

The blood-vessels of the lung are of two sorts, nutritive and functional, *i.e.*, concerned in the function of the organs. The former are called *bronchial*, and arise from the aorta or intercostal arteries. They serve to nourish the tissues of the lung, and the blood they contain finds its way, in part into the bronchial veins and thence into the vena azygos, intercostal vein, or superior vena cava, and in part into veins of the functional system. The latter system of vessels consists of the *pulmonary arteries*, which arise in the right ventricle and run through the lung substance *pari passu* with the bronchial tubes to the lobules. Here they branch into a dense network of capillaries which spread over the outside of the alveoli, enmeshing them so tightly as to indent their walls. From the capillaries the blood flows into pulmonary venules which run together to form the large *pulmonary veins*, which open into the left auricle. The pulmonary venules may anastomose freely, but the arteries never do so. The veins possess no valves.

The lymphatic vessels of the lung abound in all parts, but are usually described as having a threefold distribution—(a) in the layer of tissue beneath the membrane investing the whole lung, (b) in the perivascular tissue, and (c) in the peribronchial tissue. When fine carbon particles are introduced into the alveoli of the lung they find their way with the greatest ease into the inter alveolar tissues, and finally come to lie in the three positions just referred to, as may be demonstrated in the lung of any coal miner. The lymphatics of the membrane investing the lung communicate with the free surface of that membrane by means of openings not unlike the stomata of leaves.

The lungs, with the heart and great vessels, are the chief organs contained in the thorax, or that division of the great body cavity which lies above the diaphragm. Each lung is invested with a membrane called *pleura*, which plays a most important part in the mechanism of respiration.

**The Thorax.**—The chest or thorax is formed by the dorsal section of the *spinal column* behind, with the *ribs* that spring from it on each side, and the *sternum*, which lies between the end of the ribs, in front. The

ribs, speaking generally, are bowed with their concavity turned toward the interior of the chest; and if we consider the plane of each rib, *i.e.*, that plane in which the arched rib would (approximately) lie flat, we shall find that it declines from the horizontal in a twofold manner—first, the rib-plane slopes from behind downward and forward, and, secondly, it slopes on each side from the mesial plane of the body downward and outward. The ribs 1–7 are connected with the sternum by means of pieces of cartilage, which really form the anterior portion of each rib arch; these ribs are called “true”; the eighth, ninth and tenth ribs are united by cartilage, not to the sternum, but to the cartilages of the seventh, eighth, ninth and tenth ribs respectively; these ribs are called “false;” the eleventh and twelfth ribs are called “floating” because they are unattached anteriorly. Each rib has a *head*, by which it is joined to the vertebral bodies constituting the spinal column; a *tubercle* or shoulder at a little distance away from the head, by which, in all cases, except those of the tenth and eleventh ribs, it is joined to the transverse process of a vertebra; an *angle* or rough line a little beyond the tubercle, where the rib, rather suddenly, begins to sweep forward; and a *neck*, the part intervening between the head and tubercle. The space between the ribs is filled up by two layers of muscles, called *intercostal*—an outer or superficial layer, whose fibers run from above downward and forward, and a deeper internal layer, whose fibers cross those of the former. The outer layer is not found between the costal cartilages in front, nor the inner layer between the costal necks behind. The upper opening of the thorax is filled by the windpipe blood-vessels and other structures passing into or out of the thorax. The floor of the thorax is formed by

*The Diaphragm.*—This consists of a thin arched muscular partition, whose fibers spring from the edge of the lower opening of the thorax and converge toward a sheet of tendon in the center, which is shaped somewhat like a trefoil leaf. We may group the muscular fibers of the diaphragm according to the quadrant from which they spring:—(1) a vertebral portion, whose fibers stretch down to be attached in two well-marked columns or pillars to the bodies of some of the lumbar vertebræ and by tendinous arches to the transverse processes of the first lumbar vertebra and the twelfth rib; (2) a sternal portion, which springs from the back of the tip of the sternum, and from the sheath of the rectus abdominis muscles below it; (3) and (4) two lateral or costal portions, which spring from the lower edge of the thorax all round from the tip of the twelfth rib to the junction between the sixth and seventh costal cartilage where the sternal portion begins. The whole diaphragm forms a dome or cupola projecting so far into the thorax that the lateral vertical portions of the dome lie in close apposition to the walls of the thorax. The top of the dome is somewhat flat and the right moiety of the top is on a higher level than the left, the highest point corresponding with the level of the junction of the right fifth rib with the sternum.

*Other Muscles of Respiration.*—The ribs are movable in the sense that each rib plane, which has been described as declining in two ways from the horizontal plane, may be made to approach the horizontal, and may afterward return to its original position. To accomplish these movements various muscles are provided, the exact position of which need not be very fully described. Suffice it to say that in general they arise from the vertebral axis, or from some extra-thoracic fixed point, and take hold of the movable parts of the thorax in such a manner that they can pull them up or pull them down.

*Dimensions of the Thorax.*—The circumference of

the chest just below the level of the arms is about thirty-four and one-fourth inches in men, and thirty-two inches in women. At the level of the tip of the sternum it is thirty-two and thirty and one-third inches respectively. The measurement from clavicle to lower edge of thorax varies very much in different cases. The transverse diameter above the nipple is about ten to ten and one-half inches in men, and about nine and one-half to nine and three-fourths inches in women. The antero-posterior diameter, measured from the spines of the vertebræ behind to the surface of the chest in front is in the upper part of the chest about six and one-half inches, and in the lower seven and one-third inches. The right half of the chest is generally somewhat larger than the left, because its muscles are usually better developed.

*Normal Respiration.*—If the naked body of a person asleep or in perfect inactivity be carefully watched, it will be found that the anterior and lateral walls of the chest move rhythmically up and down, while air passes into and out of the nostrils (and mouth also if this be open) in correspondence with the movement. If we look more closely we shall find that with every uprising of the chest walls the membranous intercostal portions sink slightly as if sucked in, while at the same time the flexible walls of the abdomen bulge as if protruded by some internal force. If respiration be in the slightest degree hurried these motions become so marked as to escape the attention of no one. The elevation of the chest walls is called *inspiration*, their depression *expiration*. Inspiration is slightly shorter than expiration, and usually there is a slight pause or momentary inaction of the chest between expiration and the following inspiration. Apparatuses for measuring the excursion of a given point of the chest wall during respiration are called *thoracometers* or *stethometers*. Apparatuses for recording the movements of the chest are called *stethographs* or *pneumographs*.

*Frequency of Respiration.*—The frequency of respiration during perfect rest of the body is 16 to 24 per minute, the pulse rate being usually four times the rate of respiration; but the respiratory rhythm varies in various conditions of life. The following are the means of many observations made by Quetelet: at the age of one year the number of respirations is 44 per minute; at 5 years, 26; from 15 to 20 years, 20; from 25 to 30, 16; from 30 to 50, 18.1. Muscular exertion always increases the frequency of respiration. The higher the temperature of the environment the more frequent is the respiration. Bert has shown that with higher atmospheric pressures than the normal the frequency of respiration is diminished while the depth of each inspiration is increased. The frequency of respiration diminishes until dinner time, reaches its maximum within an hour of feeding, and thereafter falls again; if dinner is omitted, no rise of frequency occurs. The respiratory act can be interrupted at any stage, reversed, quickened, slowed, and variously modified at will, so long as respiration is not stopped entirely for more than a short space of time; beyond this limit the will is incapable of suppressing respiration.

*Depth of Respiration.*—The depth of respiration is measured by the quantity of air inspired or expired in the act; but the deepest expiration possible does not suffice to expel all the air the lungs contain. The following measurements have been ascertained, and are here classified according to the convenient terminology proposed by Hutchinson. (1) *Residual air*, the volume of air remaining in the chest after the most complete expiratory effort ranges from 100 to 130 cubic inches. (2) *Reserve or supplemental air*, the volume of air which can be expelled from the chest after an ordinary

quiet expiration, measures about 100 cubic inches. (3) *Tidal air*, the volume of air taken in and given out at each ordinary respiration may be stated at about twenty cubic inches. (4) *Complemental air*, the volume of air that can be forcibly inspired over and above what is taken in at a normal inspiration, ranges from about 100 to 130 cubic inches. By *vital capacity*, which once had an exaggerated importance attached to it, is meant the quantity of air which can be expelled from the lungs by the deepest possible expiration after the deepest possible inspiration; it obviously includes the complemental, tidal, and reserve airs, and measures about 230 cubic inches in the Englishman of average height, *i. e.*, 5 feet 8 inches (Hutchinson). It varies according to the height, body, weight, age, sex, position of the body, and condition as to health of the subject of observation.

*Certain Concomitants of Normal Respiration.*—If the ear be placed against the chest wall during ordinary respiration we can hear with every inspiration a sighing or rustling sound, called “vesicular,” which is probably caused by the expansion of the air vesicles; and with every expiration a sound of a much softer sighing character. In children the inspiratory rustle is sharper and more pronounced than in adults. If a stethoscope be placed over the trachea, bronchi, or larynx, so that the sounds generated there may be separately communicated to the ear, there is heard a harsh to-and-fro sound during inspiration and expiration which has received the name of “bronchial.”

In healthy breathing the mouth should be closed and the ingoing current should all pass through the nose. When this happens the nostrils become slightly expanded with each inspiration.

*Composition of Air in the Air Cells.*—The whole of the air of the lungs is not expelled at each breath, some remaining in the depths as residual air lodged in the alveoli or air cells. Hence we cannot assume, from an examination of expired air, that we know the constitution of the air in the recesses of the lungs where it comes most intimately into contact with the blood. To attain such knowledge it is necessary to examine the deeper air directly, and the air is obtained for such purposes by means of a lung catheter. In this way it has been ascertained that the alveolar air of a dog's lung contained about 3.8 per cent.  $\text{CO}_2$  at a time when the expired air contained about 2.8 per cent. As to the amount of O we may safely assume that the alveolar air never in ordinary circumstances contains less than 10 per cent. when the expired air contains 16 per cent.

During twenty-four hours an average person would take in about 10,000 grains of oxygen in respiration, and give out about 12,000 grains of carbon dioxide, corresponding to 3,300 grains of carbon; at the same time nine ounces of water would be exhaled. These quantities vary, however, within wide limits according to the conditions of age, sex, atmospheric pressure, and the like. Thus, for example, in young persons the O absorbed is relatively greater than the  $\text{CO}_2$  given off, and a child gives off twice as much  $\text{CO}_2$  in relation to its body weight as an adult. Again, males after the first few years of life give off more  $\text{CO}_2$  than females. When the external temperature is so low as to depress the body temperature, less  $\text{CO}_2$  is given off; if it is so high as to raise the body temperature, the  $\text{CO}_2$  is increased. If, however, the surrounding medium is cooler than the body but not cold enough to lower the body temperature, more O is taken in, and more  $\text{CO}_2$  is given out; and *vice versa*. Muscular exercise also increases considerably the  $\text{CO}_2$  given off; and more  $\text{CO}_2$  is given off a short time after a meal than during fasting, especially when the meal includes substances rich in car-

bon. Speaking generally, alcohols, ethers, tea, etc., diminish the  $\text{CO}_2$ ; but the results are not constant. Again, while the number and depth of the respirations do not influence the formation of  $\text{CO}_2$  in the body, they affect the removal of that which is already formed. Increased rate of respiration and increased depth of respiration both cause an absolute increase in the quantity of  $\text{CO}_2$  expired, although with reference to the total amount of air which passes into and out of the lungs during such labored breathing the  $\text{CO}_2$  is relatively diminished. Lastly, when the atmospheric pressure is diminished, as in ballooning, respiration becomes difficult,  $\text{CO}_2$  is imperfectly removed from the body, and the blood contains less O. When pressure is increased, respiration is easy and slow (2-4 per minute), the capacity of the lungs increases, the activities of the tissues are marked, and as a result of this more O is absorbed and more  $\text{CO}_2$  is excreted.

We may now consider the physical conditions of the blood in the lungs. Venous blood is hurried into the capillaries surrounding the air cells; much of its hæmoglobin has been “reduced” (or deprived of its dissociable oxygen), and, further, it is rich in carbon dioxide, which it has obtained from the active tissues in distant organs. In the alveolar walls it comes into relationship with the air of the alveoli; probably these are filled with air which never contains less than 10 per cent. of oxygen, and which (in the dog, be it remembered), contains 3.8 per cent. of  $\text{CO}_2$  at a time when the expired air contains 2.8 per cent. Are these conditions such that, owing to the physical laws described, oxygen must pass into the blood, and carbon dioxide out of it? First, as regards the oxygen. An atmosphere containing 10 per cent. of oxygen implies a partial O-pressure of 76 mm. of mercury (10 per cent. of 760 mm.); as this is far above the dissociation point (25 mm.) of oxyhæmoglobin, it is clear that any reduced hæmoglobin present would greedily absorb oxygen from such an atmosphere. When the air breathed is much rarefied, the case is different; the partial O-pressure in the alveoli may be so far reduced that the absorption of O by the blood becomes most difficult or impossible. As regards the carbon dioxide the matter is not so clear; but, inasmuch as air drawn from the depth of the lung by means of a catheter contains (in a dog) 3.8 per cent. of  $\text{CO}_2$ , while at the same time the venous blood of the right side of the heart possesses a  $\text{CO}_2$  tension of approximately the same percentage, we may assume that  $\text{CO}_2$  escapes from the pulmonary capillaries into the alveoli until equilibrium ensues. It is, however, conceivable that the epithelium of the air cells may assist the elimination of  $\text{CO}_2$  from the blood by a process of true excretion independently of the above merely physical considerations.

When the entrance of air to the lungs is entirely prevented the phenomena of dyspnoea and asphyxia begin to appear. At first respiration is deeper and more frequent than usual (dyspnoea), the extraordinary muscles being called into play in both inspiration and expiration; the heart beats more quickly at first, but afterward more slowly; this is the *first stage*. It is succeeded by the *second stage*, in which the violence of respiration is less marked, although the coördination of the act is more irregular; indeed toward the end of the stage respiratory movements merge in general convulsions of the whole body. Throughout this stage expiration is more marked than inspiration, and the pressure of the blood in the blood-vessels is very great. The *third stage* is one of exhaustion, which supervenes suddenly, and is marked by loss of consciousness, dilated pupils, and absence of the powers of reflex action. The animal seems dead, except that at long intervals feeble inspiratory gasps

occur. Finally there comes one great inspiratory effort: the mouth is fixed wide open, the head thrown back, the body arched backward, the nostrils dilated, and the pulse after a second or two is indistinguishable (asphyxia). The whole series of events lasts from three to five minutes if the interruption to the entrance of air has been absolute. After death the right side of the heart, with the vessels immediately opening into it, viz., the venæ cavæ and veins of the neck and the pulmonary artery, are engorged with black blood containing little or no oxy-hæmoglobin. The left side of the heart and the systemic arteries are contracted and empty. All these phenomena are best explained by the known power of venous blood to stimulate the nervous centers. As the blood becomes more and more venous it stimulates more powerfully the great nerve-centers of the medulla oblongata. The respiratory center is stimulated, especially its expiratory portion; and, finally, the whole muscular centers of the spinal system are excited, causing general convulsions. The vaso-motor center is stimulated, causing the rise of blood-pressure in the early stage. The slowing of the heart during the close of the first and second stages is due to stimulation of the vagus cardio-inhibitory center in the medulla. Finally the centers become exhausted from the impurity of the blood bathing them, and their activity fails altogether.

RESTIF, NICOLAS EDME, called RESTIF DE LA BRETONNE (the form RETIF, though occasionally used by the author himself, and adopted by M. Monselet, has the less authority), was born at Sacy in the present department of the Yonne, France, on October 23, 1734. He was apprenticed to a printer at Auxerre, and, having served his time, went to Paris. It was not till five or six years after his marriage that Restif appeared as an author, and from that time to his death on February 2, 1806, he produced a bewildering multitude of books (amounting to something like 200 volumes, and many of them printed with his own hand) on almost every conceivable variety of subject. The most noteworthy are *Le Pied de Fanchette*, a novel (1769); *Le Pornographe* (same date), a plan for regulating prostitution which is said to have been actually carried out by the emperor Joseph II.; *Le Paysan Perversi* (1774), *La Vie de Mon Père* (1779), a really remarkable monument of filial piety; *Les Contemporaines* (forty-two vols., 1780-85), *Ingénue Saxancour*, also a novel (1789); and lastly, the extraordinary autobiography of *Monsieur Nicolas* (sixteen vols., 1794-97); in which at the age of sixty he has set down voluminously his remembrances, his notions on ethical and social points, his hatreds, and above all his numerous or innumerable loves real and fancied. In 1795 he received a gratuity of 2,000 francs from the government, and just before his death Napoleon gave him a place in the ministry of police, but which he did not live to take up. He died in 1806.

RESTOUT, JEAN, French painter, born at Rouen, March 26, 1692, was the son of Jean Restout, the first of that name; and of Marie M. Jouvenet, sister and pupil of the well-known Jean Jouvenet. In 1717, the Royal Academy having elected him a member on the work which he had executed for the Great Prize, he remained in Paris, instead of proceeding to Italy, exhibited at all the salons, and filled successively every post of academical distinction. He died on January 1, 1768. His works, chiefly of vast size—altarpieces—were much engraved by Cochin, Drevet, and others, his diploma picture may still be seen at St. Cloud.

RESTOUT, JEAN BERNARD, son of the above, was born at Paris, February 22, 1732, and died in the same city on July 18, 1797. In 1758 he won the Great Prize, and on his return from Italy was received into the Acad-

emy. Roland brought him into notice by appointing him keeper of the Garde Meuble, but this piece of favor nearly cost him his life during the Terror: he was cast into prison and was only saved from the guillotine by the reaction of Thermidor. The St. Bruno painted by him at Rome is in the Louvre.

RETFORD, EAST, a market town and borough of Nottinghamshire, England, is situated on the Idle and on the Great Northern and Manchester, Sheffield, and Lincolnshire Railways, thirty-six miles north-east of Nottingham by rail, and eight south-west of Gainsborough. There is a large trade in corn, cheese, and hops, and the town possesses iron foundries, paper and corn mills, and india-rubber works. The population of the municipal borough in 1871 was 3,194, but in 1878 the area was extended to 4,532 acres, and in 1891 the population was 10,603.

RETHEL, ALFRED, historical painter, was born at Aix-la-Chapelle in 1816. He very early showed an interest in art, and at the age of thirteen he executed a drawing which procured his admission to the academy of Düsseldorf. Here he studied for several years, and produced among other works, a figure of St. Boniface which attracted much attention. At the age of twenty he removed to Frankfort where he studied under Philip Veit; and in 1842 he began a most striking and important series of designs dealing with the crossing of the Alps by Hannibal, in which the weird power which animates his later art becomes first apparent. In 1844 Rethel visited Rome, occupying his time both in study and production, and in 1846 he returned to Aix, and commenced his Charlemagne frescoes. But the strain of production, aggravated by a lack of sympathy, and by vexatious delays and interferences, produced a most injurious effect upon both the health and the spirits of the artist. While he hovered between madness and sanity, "with a mind"—as Mr. Ruskin has said in reference to the very parallel case of William Blake—"disturbed, but not deceived, by its sickness, nay, partly exalted by it," Rethel produced some of the most striking, individual, and impressive of his works. He painted *Nemesis Pursuing a Murderer*, and *Death the Avenger*, a skeleton appearing at a masked ball, scraping daintily, like a violinist, upon two human bones. The drawing haunted the memory of his artist friends and disturbed their dreams; and, in expiation, he produced his pathetic design of *Death the Friend*, a skeleton draped in long monk's robes, tolling solemnly the passing bell in a church tower, while beside the open window, lit by the last sunset radiance, sits an old sexton, with the peaceful face of a quiet departure. Rethel also executed a powerful series of drawings—*The Dance of Death*—suggested by the Belgian insurrections of 1848. Rethel died at Düsseldorf on December 1, 1859.

His picture of *Peter and John at the Beautiful Gate of the Temple*, is preserved in the Leipsic Museum, and his *St. Boniface* and several of his cartoons for the frescoes at Aix in the Berlin National Gallery. His life by Wolfgang Müller von Königswinter has been published.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE, was born at Montmirail in 1614, the third son, and according to Tallemant des Béaux was made knight of Malta on the very day of his birth. The death of his second brother, however, destined him for a closer connection with the church. Retz's uncle was archbishop of Paris, and, despite the very unclerical leanings of the future cardinal which were not corrected by the teachings of St. Vincent de Paul, who was his tutor, the intentions of his family never varied respecting him. In 1643 Anne of Austria procured for him the ap-

pointment of coadjutor to the archbishop of Paris, and subsequently he was made Cardinal. He exercised no small influence in the election of Alexander VII, and on more than one occasion formally served as envoy from Louis XIV to Rome. He died at Paris August 24, 1679.

REUBEN, eldest son of Jacob and of Leah (Gen. xxix. 32), plays no great part in the patriarchal legend; in the Elohist version of the story of Joseph he appears in a somewhat favorable light, but in Gen. xxxv. 22 he is charged with a grave offense, which, in Gen. xlix. 4, is given as a reason why the tribe which called him father did not take in Hebrew history the place proper to its seniority. The Reubenites settled east of the Jordan on the Moabite border. In Judges v. they are described as a pastoral tribe which took no share in the patriotic movement under Barak and Deborah.

REUCHLIN, JOHN, the first great German humanist, and the restorer of Hebrew and in large measure also of Greek letters among his countrymen, was born February 22, 1455, at Pforzheim in the Black Forest, and died at the baths of Liebenzell, June 30, 1522.

RÉUNION, formerly BOURBON, an island in the Indian Ocean, belonging to France and considered one of her more important colonies. St. Denis, the capital, stands on the north side in  $20^{\circ} 51'$  S. latitude and  $53^{\circ} 9'$  E. longitude. The island has an area of 721,314 acres or 1,127 square miles. The whole island is the result of a double volcanic action. First there arose from the sea a mountain whose summit is approximately represented by Piton des Neiges (10,069 feet), and at a later date another crater opened toward the east, which, piling up the mountain mass of Le Volcan, turned what was till then a circle into an ellipse forty-four miles by thirty-one. Eruptions, though not infrequent (thirty were registered between 1735 and 1860) are seldom serious; the more noteworthy are those of 1745, 1778, 1791, 1812, 1860, 1870, 1881. Basaltic or vitreous lavas rich in chrysolite are the usual products, and it is hardly possible to conceive of a discharge sufficient in volume to overflow the "ramparts" and carry destruction to the rest of the island. Besides the Piton des Neiges (10,069 feet high), the Bory Peak (8,612 feet), and the Burning Peak (8,294), the principal summits in Réunion are the Grand Bénard (9,490), Morne L'Angevin (7,845), and Cimandef (7,300). Hot mineral springs are found in various parts of the island.

Vertically Réunion may be divided into five zones. The first or maritime zone contains all the towns and most of the villages, built on the limited areas of level alluvium occurring at intervals round the coast (128 miles). In the second, which lies between 2,600 and 4,000 feet, the sugar plantations make a green belt round the island and country houses abound. The third zone is that of the forests; the fourth that of the plateaus, where European vegetables can be cultivated; and above this extends the region of the mountains, which occupies more space than any of the others.

The fauna of Réunion is not very rich in variety of species; it lies midway between the Indian and the African type. In the forest region of the island there is an abundant growth of timber. The gardens of the coast districts display a marvelous wealth of flowers and shrubs, partly indigenous and largely gathered from all parts of the world. Fruits grown in the island are—the banana, the cocoa-nut, bread-fruit, and jack-fruit, the bilimbi, the carambola, the guava, the litchi, the Japanese medlar, the mangosteen, the tamarind, the chirimoya, the papaya, etc. Sugar, introduced in 1711 by Pierre Parat, is now the staple crop of Réunion,

a greater proportion of the soil being devoted to it than to all other objects of cultivation. The average produce of the sugar crop in the five years 1873-77 was 35,493 tons of sugar with 777,710 gallons of syrup and treacle; from 1878 to 1883 the averages were 35,580 tons (40,176 in 1883) and 816,455 gallons. Rum is largely distilled, and is the favorite drink of all classes. Vanilla, coffee and cloves are grown, while potatoes, beans, manioc, sweet potatoes, and yams of local growth furnish a considerable amount of food, the far more important article rice has to be imported from India and Madagascar. India also sends castor-oil, wheat, and lard; Australia, flour and wheat; England, coal; the Cape and Muscat, salt fish; Buenos Ayres and Montevideo, mules and horses; the United States petroleum (largely used throughout the island), lard, pork, and pitch-pine.

The complete absence of natural harbors has all along been a great hindrance to the commercial development of Réunion. Since 1848 an artificial harbor capable of containing forty vessels has been constructed at Pointe des Galets at the northwest corner of the island. The port is connected by rail with La Possession on the one hand and with the Rivière des Galets on the other, and thus communicates with the railway which was completed in 1881 round the coast from St. Pierre, by St. Paul, St. Denis, etc., to St. Benoît, a distance of eighty-three and one-quarter miles. This line is carried through a tunnel nearly six and one-half miles long between La Possession and St. Denis, the latter the capital of the island, lies on the north coast. It is built in the form of an amphitheater and presents a most attractive appearance from the sea. Covering as a commune an area of 37,065 acres, it has a population of 30,835 according to the census of 1881, an increase of 18,000 since 1837. It has an abundant supply of pure water. Though the harbor is only an open roadstead, it has hitherto been the most frequented in the island. St. Pierre, the chief town of the leeward arrondissement, has a communal area of 98,190 acres and a population of 27,748. Its artificial harbor, commenced in 1854, but afterward interrupted, and resumed in 1881, has room for five or six vessels besides coasting craft.

The population was 185,179 in 1872, 183,529 in 1878, and 179,639 in 1885. The males are largely in excess of the females (97,961 to 72,773 in 1882), owing to the number of agricultural laborers introduced from abroad for a term of years. Various elements have been added to the population since the middle of the century—coolies from India in large numbers, Africans from the east coast, Chinese and Anamites, Malays, etc. The immigration of the Indian coolies is controlled by a convention between the British and French Governments of date July 1, 1881.

RÉUS, a town of Spain, in the province of Tarragona, is situated at the foot of a chain of hills in a fertile plain about four miles from the sea. It is connected by rail with Tarragona, nine and one-half miles to the east, and with Lerida, fifty-four and one-half miles to the northwest. It consists of two parts, the old and the new, and next to Barcelona itself, is the most flourishing manufacturing center in Catalonia, the staples being silk and cotton; imitations of French wines are also extensively made, and the miscellaneous industries include tanning, distilling, and the like. The cotton factories exceed eighty in number, and one of them employs upward of 600 hands. Most of the traffic of Réus passes through the comparatively sheltered port of Salou, four miles distant. The population of Réus in 1889 was 28,000.

REUSS is the name of two small sovereign principalities of the German empire, with a joint area of 440

square miles, forming part of the complex of Thuringian states, and consisting, roughly speaking, of two principal masses of territory, separated by the Neustadt district of the duchy of Saxe-Weimar. The more southerly and much the larger of the two portions belongs to the bleak, mountainous region of the Frankensteinwald and the Voigtland, while the northern portion is hilly but fertile. The chief rivers are the Elster and the Saale. About 37 per cent. of the total surface is occupied by forests, while 40 per cent. is under tillage, and 19 per cent. in meadow and pasture.

REUSS-GREIZ, or REUSS ÄLTERER LINIE, with an area of 122 square miles, belongs to the larger of the two main divisions above mentioned. The soil is on the whole little favorable for agriculture, but cattle-rearing is carried on with some success. No less than 63 per cent. of the inhabitants are supported by industrial pursuits, the chief products of which are the woolen fabrics of Greiz, the capital, and the stockings of Zeulenroda, both largely exported. The population of the principality in 1889 was 59,782.

REUSS-SCHLEIZ, or REUSS JÜNGERER LINIE, with an area of 318 square miles, includes part of the southern and the whole of the northern of the two main divisions above indicated, touching Bavaria on the south and Prussian Saxony on the north. The former portion is known as the Oberland, the latter as the Unterland. Owing to the fertility of the Unterland, agriculture is carried on here with greater success than in Reuss-Greiz, fully one-quarter of the population being supported by tillage and cattle-breeding. The industrial activity is, however, also large, supporting one-half of the population. The principal product consists, as in Reuss-Greiz, of woolen goods, and the manufacture centers in the capital, Gera, a busy town with 27,118 inhabitants. A considerable trade is carried on in the products of the manufactories, and in timber, cattle, and slate. The iron mining of the Oberland is limited by the want of sufficient railway communication. Large quantities of salt are yielded by the brine springs of Heinrichshall. In 1889 Reuss-Schleiz contained 110,330 inhabitants.

REUTER, FRITZ, the greatest writer in Platt Deutsch, was born on November 7, 1810, at Stavenhagen, in Mecklenburg-Schwerin, a small country town which had few means of communication with the rest of the world. Until his fourteenth year Reuter was educated at home by private tutors. In 1832 he went to the university of Jena. The German Governments, alarmed by the revolutionary agitation of 1830, were on the alert to detect symptoms of popular discontent; and a formidable riot at Frankfort in 1833 gave them an excuse for treating the universities with great harshness. Reuter was arrested by the Prussian Government; and condemned to death for high treason. This monstrous sentence was commuted by King Frederick William III. of Prussia to imprisonment for thirty years in a Prussian fortress. In 1840 he was set free, an amnesty having been proclaimed after the accession of Frederick William IV. to the Prussian throne, and from that date onward was almost continuously engaged in literary pursuits. He died at Eisenboch June 12, 1874.

Reuter is the most realistic of the great German writers. To the dreamers of the romantic school he has not the faintest resemblance, nor does he ever attempt to describe ideally perfect characters. The men and women of his stories are the men and women he knew in the villages and farm-houses of Mecklenburg, and the circumstances in which he places them are the circumstances by which they were surrounded in actual life. Reuter's only serious defect as an artist is that he fails to maintain the due proportion between the different parts of his

stories. If an idea attracts him, he cannot resist the temptation to unfold its full significance, whether or not it is in organic relation with his scheme as a whole. To some extent, however, the reader is compensated for these interruptions by happy strokes of humor which would have been rendered impossible had Reuter forced himself to adopt a more rigid method.

REUTLINGEN, a manufacturing town of Würtemberg, situated in a fertile and pretty district on the Echatz, an affluent of the Neckar, near the base of the Achalm, and twenty miles to the south of Stuttgart. It is a quaint but well-built town, with numerous picturesque houses and a fine Gothic church of the thirteenth and fourteenth centuries, overtopped by a lofty spire. The tanneries of Reutlingen are extensive, producing large quantities of leather; and its other industrial products are very multifarious, including cotton, woolen, and knitted goods, lace, ribbons, hats, shoes, paper, machinery, hardware, and lime. To fruit-growers Reutlingen is interesting as a seat of a celebrated pomological institute, while the Christian-socialist refuges of Pastor Werner are widely known in philanthropic circles. In 1889 the town contained 17,609 inhabitants.

REVAL, or REVEL, a seaport of Russia, capital of Esthonia, is situated in a bay on the southern coast of the Gulf of Finland, in 59° 27' N. latitude and 24° 45' E. longitude, 230 miles west of St. Petersburg by rail. The city consists of two parts—the "Domberg" or "Dom," which occupies a hill, and the lower town on the beach—and is surrounded by pleasant suburban houses with gardens. Water is brought from Lake Järväkylä by an aqueduct. The pleasant situation of the town, surrounded by beautiful parks, attracts in summer thousands of people for sea-bathing.

The population of Reval has increased rapidly since it has been connected by rail with St. Petersburg and the Baltic Port, thirty miles distant; it reached 50,490 in 1881, against 27,325 in 1867, of whom one-third are Germans, the remainder Esthonians, with a few Russians and Jews. It is at present (1890) estimated at 60,000. Nearly 15,000 inhabitants belong to the Greek Church. The manufactures are not important, but trade grows steadily. In 1882 the exports (grain, spirits, etc.) were \$5,731,220, the imports (coal, iron, chemicals, etc.) \$34,291,235. Both exports and imports had, by 1889, increased fully 25 per cent. It has regular steam communication with St. Petersburg, Helsingfors, Königsberg, etc.

REVELATION, BOOK OF. The book of the New Testament called "Revelation of John" (*Ἀποκάλυψις Ἰωάννου*) so long passed for the most obscure and difficult document of early Christianity that scholars hesitated to apply to it the historico-critical method of investigation. Since this hesitation has been overcome, it appears that the matter of the book is neither obscure nor mysterious, although many special points still remain to be cleared up. Without being paradoxical we may affirm that the Apocalypse is the most intelligible book in the New Testament, because its author had not the individuality and originality of Paul or of the author of the Fourth Gospel, and because historically we can trace and comprehend its author's position much better than we can, for instance, the theology of Paul.

The revelation proper begins with iv. 1—the first three chapters forming an introduction (the seven letters to the seven churches of Asia Minor, which are prefixed, are marked by poetical beauty and power of language). The future is written in a book with seven seals, which the Lamb opens one after the other, (iv., v.) The opening of each seal brings a plague upon the earth, (vi.) Before the seventh seal is opened, the church of the latter day is itself sealed that it may be

preserved harmless from the assaults of the powers of hell, (vii.) At the opening of the seventh seal seven angels with trumpets appear on the scene, each of whom blows a trumpet-blast as a prelude to new horrors on the earth, (viii., ix.) With the sixth trumpet the preliminary judgments are at an end, (hence the episode ch. x.) The judgment proper begins with the fall of Jerusalem, (xi.) Then the seventh trumpet sounds as the signal for the last dread horrors, and for the final judgment of the world and of all wickedness. This is preceded, however, by a description of the preservation of the church of the latter days (xii.), forming one of those pauses in the narrative which give the reader breathing time and relieve the horror of the description by the introduction of scenes of peace and words of comfort. The power of the world that opposes Christ (the Roman empire) is described along with all its devilish accomplices (xiii.), and (xiv.) its destruction is by anticipation set forth in figures. The seven angels follow with the seven vials of wrath, which are poured forth, and represent the beginning of the final catastrophe, (xv., xvi.) This final catastrophe, involving the imperial city, the antichristian emperor, his governors, and, last of all, the devil himself, is described in xvii.—xx. 3—xix. 11 *seq.* forming the climax, when Christ himself appears on a white horse and vanquishes all his foes. The devil is chained in the bottomless pit for a thousand years; during this time the saints of the latter days—not all believers—reign with Christ. After the devil has been released once more and has made war on the holy city, he is forever overthrown and the last judgment follows, (xx.) In xxi.—xxii. 5 the glory of the heavenly and eternal Jerusalem is set forth. In xxii. 6–21 several epilogues may be detected.

The above analysis will have shown the essential unity of the book. The more attentively we scan the connection of the descriptions with each other the more clearly do we perceive the unity, the artistic and systematic arrangement, of the book. This is completely overlooked by those who fancy that in the seven seals, the seven trumpets, the seven vials of wrath, the whole course of the judgment is simply repeated in ever new imagery. Leaving all other objections out of account, this supposition is refuted by the simple observation that the author has not merely placed the different scenes side by side but has linked them together in such a way that each scene follows as a consequence from the scene before. A correct perception of the plan of the book further negatives the opinion of older scholars and of Völter in modern times (*Die Entstehung der Apokalypse*, 1882) that the book consists of different parts by different authors.

That the book is not written by a disciple of the apostle Paul, that its author is filled with Jewish hatred and abhorrence of the heathen state, that in other ways traces of the Jewish spirit crop up here and there in the Apocalypse, is beyond question. But many critics, especially the so-called Tübingen school, as well as Renan, Mommsen, and others, have gone still farther; the author of the Apocalypse, say they, was an Ebionite and a decided opponent of the apostle Paul.

The point in dispute is of the highest importance for the proper understanding of the history of primitive Christianity. If the Tübingen school is right, the Pauline epoch was followed in Asia Minor by an Ebionitic epoch, and in this case Catholicism may very well be the product of a compromise between Paulinism and Jewish Christianity.

The arguments to prove the Ebionitism of the Apocalypse are insufficient; rather, we should say, the Apocalypse shows us a Christianity free from the law, free from national prejudices, universal, and yet a Christi-

anity which is quite independent of Paul. It is this that constitutes the high importance of the book.

All impartial scholars are now agreed that in chapters xiii. and xviii. of the Apocalypse we must look for the key to the comprehension of the book as well as to the question of the date of its composition. That the beast (xiii. 1 *seq.*; xvii. 3 *seq.*) is the Roman empire, that the seven heads are seven emperors, that the woman (xvii. 3–9) is the city of Rome, that the ten horns (xiii. 1; xvii. 3, 12 *seq.*) are imperial governors—all this is now beyond dispute. Also it is settled that a Roman emperor will be the antichrist, and that the author abhorred nothing so much as the worship of the emperor. Hence it is very probable, and has been maintained by Mommsen especially on good grounds, that the second beast (xiii. 11) is meant to describe the imperial representatives in the provinces, especially the Roman governors in the Asiatic continent. Finally, almost every one regards the year 64 as the *terminus a quo* of the composition of the book, inasmuch as the bloody persecution of the Christians in Rome (xiii. 7; xvii. 6; xviii. 20–24) is presupposed in the narrative.

But, while scholars are at one on these points, they still differ on the question of the person of antichrist. The one side affirm that the author regarded Nero returned from the grave as antichrist; the other side deny this, and try to identify antichrist either with Domitian or with an emperor not defined. But the grounds on which they combat the former hypothesis are of little moment. That the antichrist of the Apocalypse is Nero returned to life results from the following considerations:—

(1) In ch. xiii. 3 it is said that one of the heads of the beast received a deadly wound but was afterward healed to the astonishment of the world. Now if it is settled that the beast is the Roman empire, and that by the heads are designated the emperors, the statement is only applicable to Nero, in whose death it is well known that the people did not believe, many persons expecting that he would return from the East. (2) In xvii. 8, 11 one head is identified with the whole animal, and of the animal it is said that "it was and is not and will come again," meaning that the eighth head is not a new one but one of the seven. From this it necessarily follows that in the author's view the antichrist will be an emperor who has reigned once already and who represents the whole wickedness of the empire (the beast) concentrated and embodied in himself; but this can only be Nero, for of no other emperor was the report current in the empire that he would come again, and no emperor but Nero had instituted a persecution of the Christians. (3) In xiii. 18 it is said that the number of the beast—that is, according to the Hebrew art of Gematria, the sum of the numerical values of the letters of his name—is the number of a man, and is 666. Down to 1835 this saying was a riddle which no man could read, though Irenæus (v. 30) had attempted an explanation; he thought of Teitan, Evanthes, Lateinos. But in 1835 Fritzsche, Benary, Reuss, and Hitzig discovered simultaneously that the numerical values of the words קסר נרון ("Emperor Neron") = 100 + 60 + 200 + 50 + 200 + 6 + 50 = 666. The old variant 616 must be regarded as a confirmation of this explanation, for 616 is = קסר נרו ("Emperor Nero"). It may certainly appear strange that the calculation is made according to the numerical value of the Hebrew letters, while the book is written in Greek; but, as there is no doubt that the author has thought as a Semite from first to last, it is not surprising that he has set forth his great secret in Hebrew letters (comp. Ἀρμαγεδών, xvi. 16). (4) Down to the fifth century it was believed by Western Christians that Nero would come again and be the

antichrist or his precursor. In the East also this belief can be shown (see the Sibylline oracles) to have still existed in the second century.

For these four reasons it is certain that the author of the Apocalypse believed that Nero would come again, and regarded him as the antichrist. He wrote under the impression of the story current in the East that Nero had gone to the Parthians and would return with them to reclaim his empire.

Hence the Apocalypse was written after the summer of 68 A.D., but the question still remains whether it was written under Galba, or Vespasian, or Domitian. Most of the scholars who accept the right explanation of the antichrist suppose it to have been written under Galba; the beginning of Vespasian's reign is preferred by Lücke (whose earlier opinion was different), Bleek, Böhmer, and also Düsterdieck and Weiss; Mommsen upholds the later years of Vespasian; but the old tradition of the church represents the work as written under Domitian and even toward the close of his reign.

That the Apocalypse was written at some place on the west coast of Asia Minor has never been doubted by any critic of note.

The tradition of the church ascribes the Apocalypse to the apostle John, and the Tübingen school has felt bound in this case to agree with tradition. Within the last twenty years or so the question has been much complicated by being mixed up with the question of the origin of the Fourth Gospel; all, however, agree that the book was written by a born Jew. At present the following views are maintained—(1) the Gospel and the Apocalypse of John are by the apostle John (Ebrard, Hengstenberg and his school, Hofmann and his school, Kliefoth); (2) the Gospel is by an unknown author, the Apocalypse is by the apostle John (Baur, Schwegler, Kostlin, Hilgenfeld); (3) the Gospel is by the apostle John, the Apocalypse is by a man called John, the otherwise known presbyter, who had no wish to be taken for the apostle (Lücke, Bleek, Ewald, Credner, De Wette, Neander, Reuss, Düsterdieck, Keim, Holtzmann, etc.); (4) the Apocalypse is by another John, one of the apostle's disciples, who afterward received the tacit approval of the apostle, so that the Revelation passed in the church as a work of the apostle (Renan); (5) the Apocalypse was foisted on the apostle John without his knowledge (Volckmar, etc.) Of these views the first and fourth may be summarily dismissed, the latter because Renan has not brought forward even the shadow of a proof, the former because the differences between the Apocalypse and the Gospel in language and opinions are too great to allow us to suppose that the books are by the same author. But the following considerations speak against the apostle John as author—(1) the so-called "Alogi" (Epiph. *Hær.*, li.) denied that the work was by the apostle, and declared that it came from Corinth and hence was a forgery; (2) the author of the Apocalypse does not style himself an apostle, and nowhere does he designate himself as a personal disciple of Jesus or as an eye-witness; (3) the author speaks (xxi. 14) in such an objective way of the twelve apostles of the Lamb that it is scarcely credible that he himself belonged to them; (4) the descriptions of Christ in the Apocalypse are psychologically scarcely intelligible on the assumption that they were written by a personal disciple of the Lord. On these grounds we must say that, though not quite impossible, it is very improbable that the apostle John was the author of the Apocalypse. But not less improbable is the supposition that the real author wished to pass for the apostle John and fathered the work on him.

In this difficult subject absolute certainty is unattainable, but the supposition that the Revelation was

written by an unknown Christian of Asia Minor, and that the name of John is a later addition in order to ascribe the Revelation to the apostle John, labors under fewer difficulties than any other that has hitherto been started. That, thus introduced, John is not expressly designated as apostle need not surprise us, for at the beginning of the second century every one in Asia Minor knew who "John the servant of God" was. The epistles also with the heading "the elder" are meant to be regarded as written by the apostle John, although they do not contain the title apostle.

REVERSION. See REMAINDER.

REVIVAL OF LEARNING. See RENAISSANCE.

REWAH, the principal native state in Bâghelkhand, and Central India Agencies. It has an area of about 10,000 square miles; it is bounded on the north by the British districts of Banda, Allahabad, and Mirzapur in the Northwestern Provinces; on the east by Mirzapur district and by native states in Chutia-Nagpur; on the south by the districts of Chhatisgarh, Mandla, and Jabalpur in the Central Provinces; and on the west by other native states of Bâghelkhand. Rewah state is divided into two well-defined portions. The northern and smaller division is the plateau lying between the Kaimur range of hills and that portion of the Vindhyas known as Binjh, is for the most part cultivated and well peopled; the soil varies from a rich black loam to a sandy laterite; but in the greater part of this area good land predominates, and rich harvests both of kharif and of rabi crops are generally obtained. The country to the south of the Kaimur Hills comprises by far the largest portion of the state; but here cultivation is restricted to the valley between the hills and the Sone river, and to a few isolated patches in scattered parts of the wild and magnificent forest wastes. Rewah is rich in minerals and forests. Operations lately undertaken to determine the extent of its coal fields have proved highly successful. Until very recently Rewah possessed no roads to speak of or means of internal communication; but good progress is now being made, and by this means it is anticipated that the state will soon develop its rich resources. The principal river is the Sone; another important river is the Tons; but none of the rivers are navigable.

The population of the state in 1881 was 1,305,124 (654,182 males, 650,942 females). The chief town is Rewah, situated in 24° 31' 30" N. latitude and 81° 20' E. longitude, and containing in 1881 a population of 22,016.

REYNOLDS, SIR JOSHUA, English portrait-painter, was born at Plympton Earl, in Devonshire, on July 16, 1723. He was educated by his father, a clergyman and the master of the free grammar school of the place, who designed his son for the medical profession. But the boy showed a distinct preference for painting. It was at length decided that the lad should devote himself to art, and in October, 1741, he proceeded to London to study under Thomas Hudson, a mediocre artist, a native of Devonshire, who was popular in the metropolis as a portrait-painter. Reynolds remained with Hudson for only two years, and in 1743 he returned to Devonshire, where, settling at Plymouth Dock, he employed himself in portrait painting. By the end of 1744 he was again in London, and painted the portraits of Captain Hamilton, father of the marquis of Abercorn, of Mrs. Field, of Alderman Tracy, now in the Plymouth Athenæum, and of the notorious Miss Chudleigh, afterward duchess of Kingston. To this period, or perhaps to one slightly later, is referable the artist's excellent oval bust portrait of himself, which was included in the Grosvenor Gallery Exhibition of 1884. At Christmas, 1746, he was recalled to Plympton to attend the last hours of his father, after

whose death he again established himself, now with two of his sisters, at Plymouth Dock, where he painted portraits, and, as he has himself recorded, derived much instruction from an examination of some works by William Gandy of Exeter. In December, 1749, he sailed for Leghorn, and thence made his way to Rome.

After a residence of two years in Rome, Reynolds, in the spring of 1752, spent four months in visiting Parma, Florence, Venice, and other important cities of Italy; and after a brief stay in Devonshire, he established himself as a portrait painter in St. Martin's Lane, London, whence he afterward removed to Great Newport Street, and finally in 1760, to Leicester Square, where he continued to paint till his death. During the first year of his residence in London he had made the acquaintance of Doctor Johnson, which, diverse as the two men were, became a friendship for life. To him Burke and Goldsmith, Garrick, Sterne, Bishop Percy, and, it seems, Hogarth, were before long added. At the hospitable dinner table of Reynolds such distinguished men enjoyed the freest and most unconstrained companionship, and most of them were members of the "Literary Club," established at the painter's suggestion in 1754.

In December, 1768, the Royal Academy was founded, and Reynolds was elected, by acclamation, its first president, an honor which more than compensated for his failure to obtain the appointment of king's painter, which the previous year had been bestowed on Allan Ramsay, a more courtly but more commonplace artist. In a few months the king signified his approval of the election by knighting the new president, and intimating that the queen and himself would honor him with sittings for portraits to be presented to the Academy. In 1784, on the death of Ramsay, Reynolds was appointed painter to the king. Two years previously he had suffered from a paralytic attack; but, after a month of rest, he was able to resume his painting with unabated energy and power. In the summer of 1789 his sight began to fail; he was affected by the *gutta serena*, but the progress of the malady was gradual, and he continued occasionally to practice his art till about the end of 1790. Toward the end of 1791 it was evident to the friends of Reynolds that he was gradually sinking. For a few months he suffered from extreme depression of spirits, the result of a severe form of liver complaint, and on February 23, 1792, this great artist and blameless gentleman passed peacefully away.

RHADAMANTHUS, in Greek mythology, a son of Zeus and Europa and brother of Minos, king of Crete. At first he helped his brother to rule his island empire. His justice earned him the admiration of his subjects and the jealousy of his brother, wherefore he fled to Bœotia, where he wedded Alcmene. On account of his inflexible integrity he was made one of the judges of the dead in the other world. According to Plato, Rhadamanthus judged the souls of Asiatics, while Æacus judged those of Europeans, and when they could not agree Minos had a casting vote.

RHÆTIA was the name given in ancient times to a province of the Roman empire, which included a considerable tract of the Alpine regions that separated the great valleys of the Po and the Danube, comprising the districts occupied in modern times by the Grisons and the Austrian province of Tyrol.

The name of the Rhætians is first mentioned by Polybius, but merely incidentally, and they played no part in Roman history till after the fall of the republic. In the time of Strabo their territory was considered as extending from the Lakes of Como and Garda to that of Constance (the Lacus Brigantinus), while the allied people of the Vindelici, who had shared in their contest against the Roman arms, as well as in their final sub-

jugation, extended down the northern slope of the Alps as far as the Danube. By far the greater part of this extensive region was occupied by rugged mountains. Some of the valleys, however, which extended on the south side down to the plains of Italy, were rich and fertile.

The boundaries of the Roman province were repeatedly changed. At first it appears to have comprised all Vindelicia, so as to have extended to the Danube from its sources to its confluence with the Inn. But at a later period this northern tract was separated from the central mountain region, and the two were named Rhætia Prima and Rhætia Secunda. The only important town in the northern part of the province was the Roman colony of Augusta Vindelicorum, which still retains the name of Augsburg. The same is the case with Curia, now Chur or Coire, the capital of the Grisons, and Brigantia (Bregenz), which gave name in ancient times to the lake now called the Lake of Constance.

RHAZES. An Arabian physician of the tenth century.

RHEA, the name given in 1752 by Möhring to a South-American bird which, though long before known and described by the earlier writers—Nieremberg, Marcgrave, and Piso (the last of whom has a recognizable but rude figure of it)—had been without any distinctive scientific appellation. Adopted a few years later by Brisson, the name has since passed into general use, especially among English authors, for what their predecessors had called the American ostrich. The resemblance of the rhea to the ostrich is at once perceived, but the differences between them scarcely less soon noticed, for some of them are very evident. The former, for instance, has three instead of two toes on each foot, it has no apparent tail nor the showy wing-plumes of the latter, and its head and neck are clothed with feathers, while internal distinctions of still deeper significance have since been dwelt upon by Prof. Huxley (*Proc. Zool. Society*, 1867, pp. 420-422) and the late Mr. W. A. Forbes (*op. cit.*, 1881, pp. 784-787), thus justifying the separation of these two forms more widely even than as families. Structural characters no less important separate the rheas from the emeus. Its breeding habits are precisely those which have been already described in the case of other Ratite birds; and though considerably smaller than the ostrich, and, as before stated, wanting its fine plumes, the rhea in general aspect far more resembles that bird than the other *Ratita*. The feathers of the head and neck, except on the crown and nape, where they are dark brown, are dingy white, and those of the body ash-colored tinged with brown, while on the breast they are brownish-black, and on the belly and thighs white. The *Rhea darwini* differs materially from the earlier known *R. americana*.

Its bill is shorter than its head; its tarsi are reticulated instead of scutellated in front, with the upper part feathered instead of being bare; and the plumage of its body and wings is very different, each feather being tipped with a distinct whitish band, while that of the head and neck is grayish-brown. A further distinction is also asserted to be shown by the eggs—those of *R. americana* being of a yellowish-white, while those of *R. darwini* have a bluish tinge. Some years since Mr. Sclater described a third and smaller species, more closely resembling the *R. americana*, but having apparently a longer bill, whence he named it *R. macrorhyncha*, more slender tarsi, and shorter toes, while its general color is very much darker, the body and wings being of a brownish-gray mixed with black. The precise geographical range of these three species is still undetermined. While *R. americana* is known to

extend from Paraguay and southern Brazil through the state of La Plata to an uncertain distance in Patagonia, *R. darwini* seems to be the proper inhabitant of the country last named, though M. Claraz asserts (*op. cit.*, 1885, p. 324) that it is occasionally found to the northward of the Rio Negro, and moreover, that flocks of the two species commingled may be very frequently seen in the district between that river and the Rio Colorado. On the "pampas" *R. americana* is said to associate with herds of deer (*Cariacus campestris*), and *R. darwini* to be the constant companions of guanacos (*Lama huanaco*)—just as in Africa the ostrich seeks the society of zebras and antelopes. As for *R. macrorhyncha*, it was found by Forbes (*Ibis*, 1881, pp. 360, 361) to inhabit the dry and open "sertoes" of northeastern Brazil.

RHEA (or RHEEA) FIBER is a textile material yielded by one or more species of *Böhméria* (nat. ord. *Urticacæ*), plants found over a wide range in India, China, the Malay Peninsula and island, and Japan. Rhea is also capable of being grown in temperate latitudes, and has been experimentally introduced into the south of France and Algeria. Among the Chinese much care is bestowed on the cultivation of Chu or Tchou Ma, as rhea is called by them, and they prepare the fiber by a tedious and costly process of selection and manual labor. The plant thrives in hot, moist, shaded situations; it throws up from three to five crops of stems in the course of a season, although not more than three crops are reckoned on. Each such crop may yield about 250 pounds of marketable fiber per acre, that total output being exceeded only by the jute crop. The stems when either ripe or cut down, stripped of leaves and branchlets, and, either split or whole, are freed from their cortical layers till the bast layer is exposed. In this state they are made up in small bundles and placed where they receive strong sunlight by day and dews by night for several days, after which the fibrous bast layer is peeled with ease off the woody core, and the separated fibers are thereafter treated with boiling water to remove as far as possible adherent gummy and resinous matter in which the fibers are imbedded in the stalks. The fiber so obtained is usually bleached by exposure on the grass, and it comes into the market as brilliant white filaments with a fine silky gloss, having a strength, luster, and smoothness unequaled by any other vegetable fiber.

RHEGIUM. See REGGIO.

RHEIMS, a city of France, chief town of an arrondissement of the department of Marne, lies eighty-one miles east-northeast of Paris (ninety-nine miles by rail) on the right bank of the Vesle, a tributary of the Aisne, and on the canal which connects the Aisne with the Marne. To the south and west rise the "montagne de Rheims" and the vine-clad hills where the wine is grown which constitutes the chief object of the industry and commerce of the town.

The spinning and weaving of wool is carried on in seventy factories, employs 10,000 hands, and annually turns \$17,500,000 worth of raw material into flannels, merinoes, cloth, blankets, etc. Dyeing and "dressing" are carried on in the outskirts of the town. Fifty firms with 2,000 workmen are employed in the champagne manufacture; the cellars are vast excavations in the chalk rock. Rheims is also famous for its biscuits, gingerbread, and dried pears. Machinery, chemical products, candles, soap, stained glass, common glass, and paper are also manufactured. In respect of population (95,683 in 1889) Rheims ranks as the eleventh city of France.

Rheims (Durocortorum), an important town in the time of Cæsar, made voluntary submission to the

Romans and by its fidelity throughout the various Gallic insurrections secured the special favor of its conquerors. Christianity was introduced about the middle of the fourth century. In the tenth century Rheims had become a center of intellectual culture, Archbishop Adalberon, seconded by the monk Gerbert (Sylvester II.), having founded schools where the "liberal arts" were taught. Adalberon was also one of the prime authors of the revolution which put the Capet house in the place of the Carolingians. The treaty of Troyes (1420) ceded it to the English, who had made a futile attempt to take it by siege in 1360; but they were expelled on the approach of Joan of Arc, who in 1429 caused Charles VII to be duly consecrated in the cathedral. A revolt at Rheims caused by the salt tax in 1461 was cruelly repressed by Louis XI. The town sided with the League (1585), but submitted to Henry IV. after the battle of Ivry. In the foreign invasions of 1814 it was captured and recaptured; in 1870-71 it was made by the Germans the seat of a governor-general and impoverished by heavy requisitions.

RHEINGAU. See RHINE.

RHENANUS, BEATUS, a German humanist, was born about 1485 at Schlettstadt in Alsace, where his father, a native of Rheinau, was a prosperous butcher. He received his early education in Schlettstadt, and afterward (1503) went to Paris, where he came under the influence of Faber Stapulensis; here, among his other learned pursuits, we must include that of correcting the press for Henry Estienne. In 1511 he removed to Basel, where he became intimate with Erasmus, and took an active share in the publishing enterprises of Frobenius. Some time after 1520 he became a comparatively wealthy man through the death of his father; returning to Schlettstadt he devoted himself to a life of learned leisure, enlivened with free epistolary and personal intercourse with Erasmus, Reuchlin, Pirckheimer, Lasky, and many other scholars of his time. He died at Strasburg, while returning from Baden in Switzerland, whither he had gone for his health, in 1547.

RHENISH PRUSSIA. See PRUSSIA, RHENISH.

RHETICUS, RHÆTICUS, a surname given to GEORGE JOACHIM, born in 1514, and appointed professor of mathematics at Wittenberg in 1537. His first appearance before the public was in the character of an enthusiastic convert to the newly broached opinions of Copernicus. No sooner had he adopted these opinions than, resigning his chair, he repaired to Frauenberg to sit at the feet of their great promulgator. All his energy was forthwith devoted to the new system, and, as has been mentioned under COPERNICUS, it was he who superintended the printing of the *De Orbium Revolutione*. Rheticus now commenced his great treatise, *Opus Palatinum de Triangulus*, containing tables of cosines, sines, tangents, etc., for every ten seconds calculated to ten paces, and continued to work at it while he occupied his old chair at Wittenberg, while he taught mathematics at Leipsic, while he traveled over different parts of the Continent, and indeed up to his death in Hungary in 1576. The *Opus Palatinum* of Rheticus was published by Otho in 1596.

RHETORIC. A lost work of Aristotle is quoted by Diogenes Laertius (viii. 57) as saying that Empedocles "invented" (*εὑρεῖν*) rhetoric; Zeno, dialectic. This is certainly not to be understood as meaning that Empedocles composed the first "art" of rhetoric. It is rather to be explained by Aristotle's own remark, cited by Laertius from another lost treatise, that Empedocles was "a master of expression and skilled in the use of metaphor"—qualities which may have found scope in his

political oratory, when, after the fall of Thrasydæus in 472 B.C., he opposed the restoration of a tyranny at Agrigentum.

Rhetoric is properly an art. This is the proposition from which Aristotle sets out. It is so because, when a speaker persuades, it is possible to find out why he succeeds in doing so. Rhetoric is, in fact, the popular branch of logic. Now hitherto, Aristotle says, the essence of rhetoric has been neglected for the accidents.

Here we may venture to interpolate a comment which has a general bearing on Aristotle's *Rhetoric*. It is quite true that, if we start from the conception of rhetoric as a branch of logic, the phantom of logic in rhetoric claims precedence over appeals to passion. But Aristotle does not sufficiently regard the question—What, as a matter of experience, is most persuasive? The phantom of logic may be more persuasive with the more select hearers of rhetoric; but rhetoric is not for the more select; it is for the many, and with the many appeals to passion will sometimes, perhaps usually, be more effective than the semblance of the syllogism. And here we seem to touch the basis of the whole practical vice, in the old world's views of rhetoric, which, after Aristotle's day, was ultimately Aristotelian. No formulation of rhetoric can correspond with fact which does not leave it absolutely to the genius of the speaker whether reasoning (or its phantom) is to be what Aristotle calls it, the "body of proof" (*σῶμα πίστεως*), or whether the stress of persuading effort should not be rather addressed to the emotions of the hearers. This is a matter of tact, of instinct, of oratorical genius.

But we can entirely agree with Aristotle in his next remark, which is historical in its nature. The deliberative branch of rhetoric had hitherto been postponed, he observes, to the forensic. We have already seen the primary cause of this, namely, that the very origin of rhetoric in Hellas was forensic. The most urgent need which the citizen felt for this art was not when he had to discuss the interests of the city, but when he had to defend (perhaps) his own property or his own life. The relative subordination of deliberative rhetoric, however unscientific, had thus been human. Aristotle's next statement, that the master of logic will be the master of rhetoric, is a truism if we concede the essential primacy of the logic element in rhetoric. Otherwise it is a paradox; and it is not in accord with experience, which teaches that speakers incapable of showing even the ghost of an argument have sometimes been the most completely successful in carrying great audiences along with them. Aristotle never assumes that the hearers of his rhetorician are as *οἱ χάριεντες*, the cultivated few; on the other hand, he is apt to assume tacitly—and here his individual bent comes out—that these hearers are not the great surging crowd, the *ὄχλος*, but a body of persons with a decided though imperfectly developed, preference for sound logic.

What is the use of an art of rhetoric? It is fourfold, Aristotle replies. Rhetoric is useful, first of all, because truth and justice are naturally stronger than their opposites. When awards are not duly given, truth and justice must have been worsted by their own fault. This is worth correcting. Rhetoric is, then, (1) *corrective*. Next, it is (2) *instructive*, as a popular vehicle of persuasion for persons who could not be reached by the severer methods of strict logic. Then it is (3) *suggestive*. Logic and rhetoric are the two impartial arts; that is to say, it is a matter of indifference to them, as arts, whether the conclusion which they draw in any given case is affirmative or negative. Suppose that I am going to plead a cause, and have a sincere conviction that I am on the right side. The art of rhetoric will suggest to me what might be urged on the other

side; and this will give me a stronger grasp of the whole situation. Lastly, rhetoric is (4) *defensive*. Mental effort is more distinctive of man than bodily effort; and "it would be absurd that, while incapacity for physical self-defense is a reproach, incapacity for mental defense should be no reproach." Rhetoric, then, is corrective, instructive, suggestive, defensive. But what if it be urged that this art may be abused? The objection, Aristotle answers, applies to all good things except virtue, and especially to the most useful things. Men may abuse strength, health, wealth, generalship.

The function of the medical art is not necessarily to cure, but to make such progress toward a cure as each case may admit. Similarly it would be inaccurate to say that the function of rhetoric was to persuade. Rather must rhetoric be defined as "the faculty of discerning in every case the available means of persuasion." Suppose that among these means of persuasion is some process of reasoning which the rhetorician himself knows to be unsound. That belongs to the province of rhetoric all the same. In relation to logic, a man is called a "sophist" with regard to his moral purpose (*προαίρεσις*), *i. e.*, if he knowingly uses a fallacious syllogism. But rhetoric takes no account of the moral purpose. It takes account simply of the faculty (*δύναμις*)—the faculty of discovering any means of persuasion.

Aristotle's *Rhetoric* is incomparably the most scientific work which exists on the subject. It may also be regarded as having determined the main lines on which the subject was treated by nearly all subsequent writers. It might, indeed, be said of Aristotle's treatise that it is rather a Philosophy of Rhetoric than a Rhetoric power. It is a body of abstract principles and general rules. These will enable the student to dissect a good speech; but, by themselves, they will not go far toward enabling him to make one. Aristotle's purpose was to annex rhetoric to the realm of science. He succeeded, as far as success was possible. During the three centuries from the age of Alexander to that of Augustus the fortunes of rhetoric were governed by the new conditions of Hellenism. Aristotle's scientific method lived on in the Peripatetic school.

Cicero's rhetorical works are to some extent based on the technical system to which he had been introduced by Molon at Rhodes, and by other contemporary teachers. But Cicero made a further independent use of the best among the earlier Greek writers, Isocrates, Aristotle, and Theophrastus. Lastly, he could draw, at least in the later of his treatises, on a vast fund of reflection and experience. The same thought is present to Quintilian, in whose great work, *De Institutione Oratoria*, the scholastic rhetoric receives its most complete expression, (*c.* 90 A.D.) Quintilian treats oratory as the end to which the entire mental and moral development of the student is to be directed. After Quintilian, the next name which deserves to be signalized in the history of the art is that of Hermogenes, who continued for nearly a century and a half to be one of the chief authorities in the schools. Longinus (*c.* 260 A.D.) published an *Art of Rhetoric* which is still extant; and the more celebrated treatise *On Sublimity* (*περὶ ὑψους*), if not his work, is at least of the same period. About 315 A.D. Aphthonius composed the "exercises" (*προγυμνάσματα*), which suspended the work of Hermogenes. At the revival of letters the treatise of Aphthonius once more became a standard text-book. Much popularity was enjoyed also by the exercises of Ælius Theon, (380 A.D.)

Vespasian (70-79 A.D.), according to Suetonius, was the first emperor who gave a public endowment to the teaching of rhetoric. But it was under Hadrian and

the Antonines (117-180 A.D.) that the public chairs of rhetoric were raised to an importance which made them objects of the highest ambition. The complete constitution of the schools at Athens was due to Marcus Aurelius. The Philosophical School had four chairs (*θρόνοι*)—Platonic, Stoic, Peripatetics, Epicurean. The Rhetorical School had two chairs, one for "sophistic," and the other for "political" rhetoric. By "sophistic" was meant the academic teaching of rhetoric as an art, in distinction from its "political" application to the law-courts. The "sophistical" chair was superior to the "political" in dignity as in emolument, and its occupant was invested with a jurisdiction over the youth of Athens similar to that of the vice-chancellor in a modern university.

In the mediæval system of academic studies, grammar, logic, and rhetoric were the subjects of the trivium, or course followed during the four years of undergraduateship. Music, arithmetic, geometry, and astronomy constituted the quadrivium, or course for the three years from the B.A. to the M.A. degree. These were the seven liberal arts. According to Hallam (*Lit. Eur.*, vol. i.), the idea of a trivium and quadrivium dates from the sixth century. In the Middle Ages, the chief authorities on rhetoric were the latest Latin epitomists, such as Martianus Capella (fifth century), Casiodorus (fifth century), or Isidorus (seventh century).

After the revival of learning, the better Roman and Greek writers gradually returned into use. Some new treatises were also produced. Leonard Cox (died 1549) wrote *The Art or Craft of Rhetoryke*, partly compiled, partly original, which was reprinted in Latin at Cracow. The *Art of Rhetorique* by Thomas Wilson (1553), afterward secretary of state, embodied rules chiefly from Aristotle, with help from Cicero and Quintilian. About the same time, treatises on rhetoric were published in France by Tonquelin (1555), and Courcelles (1557). At Cambridge in 1570 the study of rhetoric was based on Quintilian, Hermogenes, and the speeches of Cicero viewed as works of art. An Oxford statute of 1588 shows that the same books were used there. In 1620 George Herbert was delivering lectures on rhetoric at Cambridge, where he held the office of public orator. The decay of rhetoric as a formal study at the universities set in during the eighteenth century. The fortunes of rhetoric in the modern world, as briefly sketched above, may suffice to suggest why few modern writers of ability have given their attention to the subject. The best modern book on the subject is Whately's *Elements of Rhetoric*.

The conditions of modern life, and especially the invention of printing, have diminished the importance which belonged in antiquity to the art of speaking. But few would deny that a large measure of value may still be claimed for rhetoric in the more comprehensive sense which Whately gives to it, as the art of argumentative composition. His treatise, the work of an able and also witty man, will be found instructive and entertaining even by those who do not go to it for a discipline. Nor can it fail to suggest a further remark. While abounding in fresh thought and modern illustration, it constantly reminds us that, in almost all essentials, the art of rhetoric must be regarded as the creation of Aristotle.

RHEUMATISM, a constitutional disease having for its chief manifestations inflammatory affections of the fibrous textures of joints and other parts, together with a liability to various complications. Acute rheumatism, frequently called rheumatic fever, is mainly characterized by inflammation affecting various joints, with a tendency to spread in an erratic manner, and accompanied with much pain, febrile disturbance and perspiration.

An attack of acute rheumatism is usually ushered in by chilliness or rigors followed with feverishness and a feeling of stiffness or pain in one or more joints, generally those of larger or medium size, such as the knees, ankles, wrists, shoulders, etc., which soon becomes intense, and is accompanied with severe constitutional disturbance and prostration. The patient lies helpless in bed, unable to bear even the weight of the bed-clothes. The face is flushed, and the whole body bathed in perspiration, which has a highly acid reaction and a sour disagreeable odor. The temperature is markedly elevated ( $103^{\circ}$  to  $105^{\circ}$ ), the pulse rapid, full, and soft; the tongue is coated with a yellow fur; and there are thirst, loss of appetite, and constipation. The urine is diminished in quantity, highly acid, and loaded with urates. At first the pain is confined to only one or two joints, but soon others become affected, and there is often a tendency to symmetry in the manner in which they suffer, the inflammation in one joint being shortly followed by that of the same joint in the opposite limb. The affected joints are red, swollen, hot, and excessively tender. The inflammation seldom continues long in one articulation, but it may return to those formerly affected. In severe cases scarcely a joint large or small escapes, and the pain, restlessness, and fever render the patient's condition extremely miserable.

An attack of acute rheumatism is of variable duration, sometimes passing away in the course of a few days, but more frequently lasting for many weeks. Occasionally, when the disease appears to have subsided, relapses occur which bring back all the former symptoms and prolong the case, it may be for months. Again, after all acute symptoms have disappeared, the joints may remain swollen, stiff, and painful on movement, and the rheumatic condition thus becomes chronic. After an attack the patient is much reduced in strength and pale-looking for a considerable time, but should no complication have arisen there may be complete recovery, although doubtless there remains a liability to subsequent attacks. This disease derives much of its serious import from certain accompaniments or complications which are apt to attend its progress. Among these may be mentioned excessive fever (hyperpyrexia), which is sometimes developed in a sudden and alarming manner, the temperature rising quickly to  $108^{\circ}$ - $110^{\circ}$  or more, and thus endangering life. Indeed in most of such instances death speedily follows, unless prompt treatment be resorted to. Another danger is the occurrence of serious head symptoms in the form of delirium or excitement, which may exist in conjunction with hyperpyrexia or independently. Chorea, or St. Vitus' dance, is also an occasional accompaniment of acute rheumatism. Besides these, other complications pertaining to the respiratory organs, such as pleurisy, pneumonia, bronchitis, etc., sometimes arise in the course of the disease, as well as certain disorders of the skin. But the most frequent and important of all are those affecting the heart. Pericarditis (inflammation of the investing membrane of the heart) and endocarditis (inflammation of the lining membrane of the heart) are the two most common forms which these heart complications assume, and it is the latter which is specially important as tending to lay the foundation for valvular heart disease (see HEART). It is the liability to these inflammatory heart affections that causes special anxiety during the earlier stages of an attack of acute rheumatism, when it would appear they are more apt to occur. The risk of cardiac complications seems to be greater the younger the patient, and doubtless the foundation of organic heart disease is often laid in early childhood, when, as is now well known, rheumatism is by no means uncommon.

Chronic rheumatism appears occasionally to be developed as the result of the acute form, but is more frequently an independent constitutional affection, and is usually a complaint of later life. It differs from acute rheumatism in being less frequently attended with fever and constitutional disturbance, and less liable to dangerous complications, but on the other hand it is much more apt to produce permanent alterations in the joints and parts affected. The chief symptoms are pain and stiffness in movement, more particularly when the efforts begin to be made, becoming less after the limbs and body have been in exercise. Creaking or cracking noises accompany the movements. The pain is apt to be increased during the night, and is besides markedly influenced by the state of the atmosphere, cold and damp aggravating it.

The treatment differs in the two forms of the disease. As regards acute rheumatism the general management of the case from the outset requires attention. The patient should be placed in bed between blankets, and should wear a flannel shirt, the front and arms of which should be opened to admit of the examination of the heart and of the joints. Movements of all kinds should be as far as possible avoided. The affected joints should be enveloped in cotton wool, kept in position by a light bandage. Sometimes the bathing of these parts with warm water containing opium or other sedative affords relief. The local application of blisters in the neighborhood of the painful joints, as proposed by Dr. Herbert Davies, is in some instances followed with benefit, but is obviously applicable only where the rheumatism is limited in its extent. The same may be said of the local application of electricity to the joints. Constitutional remedies are of undoubted value in this disease, and the number of available agents for this purpose is so large that mention can only be briefly made of some of the more approved. For long the alkalis, especially the salts of potassium, were the chief remedies resorted to, and for them it was claimed that they shortened the attack, relieved pain, and prevented heart complications. They are certainly very valuable in many instances. Of late a new series of substances has been tried with great success, namely salicin (first suggested for acute rheumatism by Dr. T. J. MacLagan), salicylic acid, and salicylate of soda. These remedies, which are known to have a powerful effect in reducing febrile temperatures, appear to exercise a special influence in acute rheumatism, not merely by lowering the fever, but by relieving pain and cutting short the attack, thereby lessening the risk of complications. From twenty to thirty grains of these drugs every two hours require to be given for about twenty-four hours in order to produce the desired effect, and the quantity is reduced as the acute symptoms subside. Tonics, such as iron and quinine, have also been employed in acute rheumatism, but their advantage is more apparent in the convalescence, when there are anæmia and debility, rather than in the height of the disease. In the dangerous complication of hyperpyrexia the cold bath (in which the water is quickly cooled down from 94° to 68°) has frequently been successful in speedily lowering the temperature and saving life.

In chronic rheumatism the remedies are innumerable. This form of the disease is less under the power of medicinal agents than the acute, although much may be done to alleviate the suffering produced by it as well as to limit its extension. Alkalies in combination with sulphur, iodine, arsenic, and tonics, such as iron, quinine, cod-liver oil, etc., are the most serviceable remedies. Turpentine is also recommended. Friction of the affected parts with stimulating or soothing lini-

ments, counter-irritation with blisters, iodine, or the button cautery are useful local applications, as is also galvanism. Hot baths or Turkish baths may occasionally be used with advantage. The mineral waters and baths of various well-known resorts are of undoubted benefit. Warmer climates during the colder season, where practicable, are also to be recommended, as well as every other measure calculated to improve the general health.

**RHEUMATOID ARTHRITIS.** This term is employed to designate a chronic inflammatory affection of joints, involving specially the synovial membranes and articular cartilages, of slow development and progressive character, resulting in stiffening and deformity of the parts. This disease is held by some to partake of the nature of both rheumatism and gout (hence occasionally termed rheumatic gout); others regard it as simply a variety of chronic rheumatism; while in the opinion of several eminent authorities it is an independent constitutional affection occurring in persons with a strumous or tubercular tendency. The disease in most cases is slowly developed, and shows itself first by pain and swelling in one joint (knee, wrist, finger, etc.) which soon subside and may remain absent for a considerable time. Sooner or later, however, another attack occurs either in the joint formerly affected or in some other, and it is noticed that the affected articulation does not now regain its normal size but remains somewhat swollen. The attacks occur with increasing frequency gradually involving more joints, until in course of time (for its progress is very chronic), scarcely an articulation in the body is free from the disease. This disease often lasts for many years, sometimes continuing for a lengthened period without much change, but tending gradually to progress and to render the patient more and more helpless. It is less amenable to treatment than rheumatism, the remedies for which are not found to be of much value in this disease. Most success is obtained if it is recognized early and measures are taken to strengthen the patient's general health. The best medicinal agents are iron, quinine, codliver oil, arsenic. Chalybeate mineral waters, such as those of Schwalbach, Spa, Pyrmont, etc., are often of service. Locally blisters or milder counter-irritation to the affected joints, as well as the employment of galvanism, may be advantageously resorted to.

**RHEYDT**, a manufacturing town of Rhenish Prussia, is situated on the Niers, fourteen miles to the west of Düsseldorf. The principal products of its numerous factories are silk, cotton, woollen, and mixed fabrics, iron goods, machinery, lamp wicks, and roofing pasteboard. Dyeing and finishing are also carried on. The most prominent buildings are the old parish church and a new one erected in 1866. Rheydt is an ancient place, but its industrial importance is of very recent growth. At the beginning of the present century it did not contain more than 2,000 to 3,000 inhabitants, whereas in 1880 the population of the municipal commune was 19,087, two-thirds of whom were Protestants.

**RHIN, HAUT-**, a department of France before 1871.

**RHINE** (Lat. *Rhenus*, Germ. *Rhein*, Pr. *Rhin*, Dutch *Rhijn*) the chief river of Germany and one of the most important in Europe, is about 800 miles in length and drains an area of 75,000 square miles. The distance in a direct line between its source in the Alps and its mouth in the German ocean is 460 miles. About 250 miles of its length are in Switzerland, 450 in Germany, and 100 in Holland; but the German half is in every respect so much the more important that it is no misnomer to call the Rhine a German river, even if the word German be confined to its modern political signification. The name Rhine, which is apparently of Celtic origin,

is of uncertain import, but has been supposed to mean "flowing" or "clear."

The Hinter Rhein has its cradle in the Rheinwald glacier, near the St. Bernardino Pass, 7,270 feet above the sea and 40 miles south of Reichenau. The Vorder Rhein contributes the greater volume of water to the joint stream, but the Hinter Rhein belongs to a more developed system. Beyond Reichenau the united stream, 150 feet in width, bears the name of Rhine without any qualifying epithet. It is now navigable for rafts, and small boats begin to be seen a little further on, at Coire, where it turns to the north. Between the lake Constance and Basel the Rhine flows toward the west and practically forms the boundary between Germany and Switzerland. At Schaffhausen, in penetrating the barrier of the Jura, it forms the imposing falls of the Rhine, where it is precipitated over a ledge of rock in three leaps fifty to sixty feet in height. Near Lauterburg, where the river encounters the gneiss of the Black Forest, is a series of formidable cataracts, and about fifteen miles lower down are the rapids of Rheinfelden. At Basel, which it reaches after a tortuous course of 250 miles, though it is only about a third of that distance from its source in a direct line, the Rhine turns once more to the north and enters Germany. Its breadth here is between 550 and 600 feet, while its surface now lies no more than 800 feet above the sea, showing that the river has made a descent of 6,900 feet by the time it has traversed a third of its course. From Basel to Mainz the Rhine flows through a wide and shallow valley, bordered on the east and west by the parallel ranges of the Black Forest and the Vosges. Its banks are low and flat, and numerous islands occur. At Mannheim the river is nearly 1,500 feet in width, and at Mainz, where it is diverted to the west by the barrier of the Taunus, it is still wider. It follows the new direction for about twenty miles, but at Bingen it again turns to the north and begins a completely new stage of its career, entering a narrow valley in which the inclosing rocky hills abut so closely on the river as often barely to leave room for the road and railway on the bank. This is the most beautiful part of the whole course of the river, abounding in the ruined castles, the romantic crags, the sunny vineyards, and the picturesque lateral ravines that have combined to make the Rhine so favorite a resort of lovers of natural beauty. At Coblenz the valley widens and the river is 1,200 feet broad, but the hills close in again at Andernach, and this ravine-like part of its course cannot be considered as ending till below the Seven Mountains, where the river expands to a width of 1,300-1,600 feet. Beyond Bonn and Cologne the banks are again flat and the valley wide, though the hills on the right bank do not completely disappear till the neighborhood of Düsseldorf. Further on the country traversed by the Rhine is perfectly level, and the current becomes more and more sluggish. On entering Holland, which it does below Emmerich, its course is again deflected to the west. Within Holland the banks are so low as to require at places to be protected by embankments against inundations. The river now loses its individuality in a number of separate branches, and the name of Rhine has often arbitrarily clung to the smaller arm after a bifurcation.

The Rhine is said to receive, directly or indirectly, the waters of upward of 12,000 tributaries of all sizes. Leaving out of account the innumerable glacier streams that swell its volume above the Lake of Constance, the most important affluents to its upper course are the Wutach, the Alb, and the Wiese, descending on the right from the Black Forest, and the Aar, draining several Swiss cantons on the left. In the Upper Rhenish

basin, between Basel and Mainz, the tributaries, though numerous, are mostly short and unimportant. The Ill and the Nahe on the left, and the Neckar and the Main on the right are, however, notable exceptions. Before joining the Rhine the Ill runs almost parallel with it and at no great distance for upward of fifty miles. In the narrow part of the valley, between Bingen and Cologne, the Rhine receives the waters of the Lahn and the Sieg on the right, and those of the Moselle (bringing with it the Saar) and the Ahr on the left. Still lower down, but before the Dutch frontier is reached, come the Ruhr and the Lippe on the right, and the Erft on the left.

The Rhine connects the highest Alps with the mud banks of Holland, and touches in its course the most varied geological periods; but the river valley itself is, geologically speaking, of comparatively recent formation.

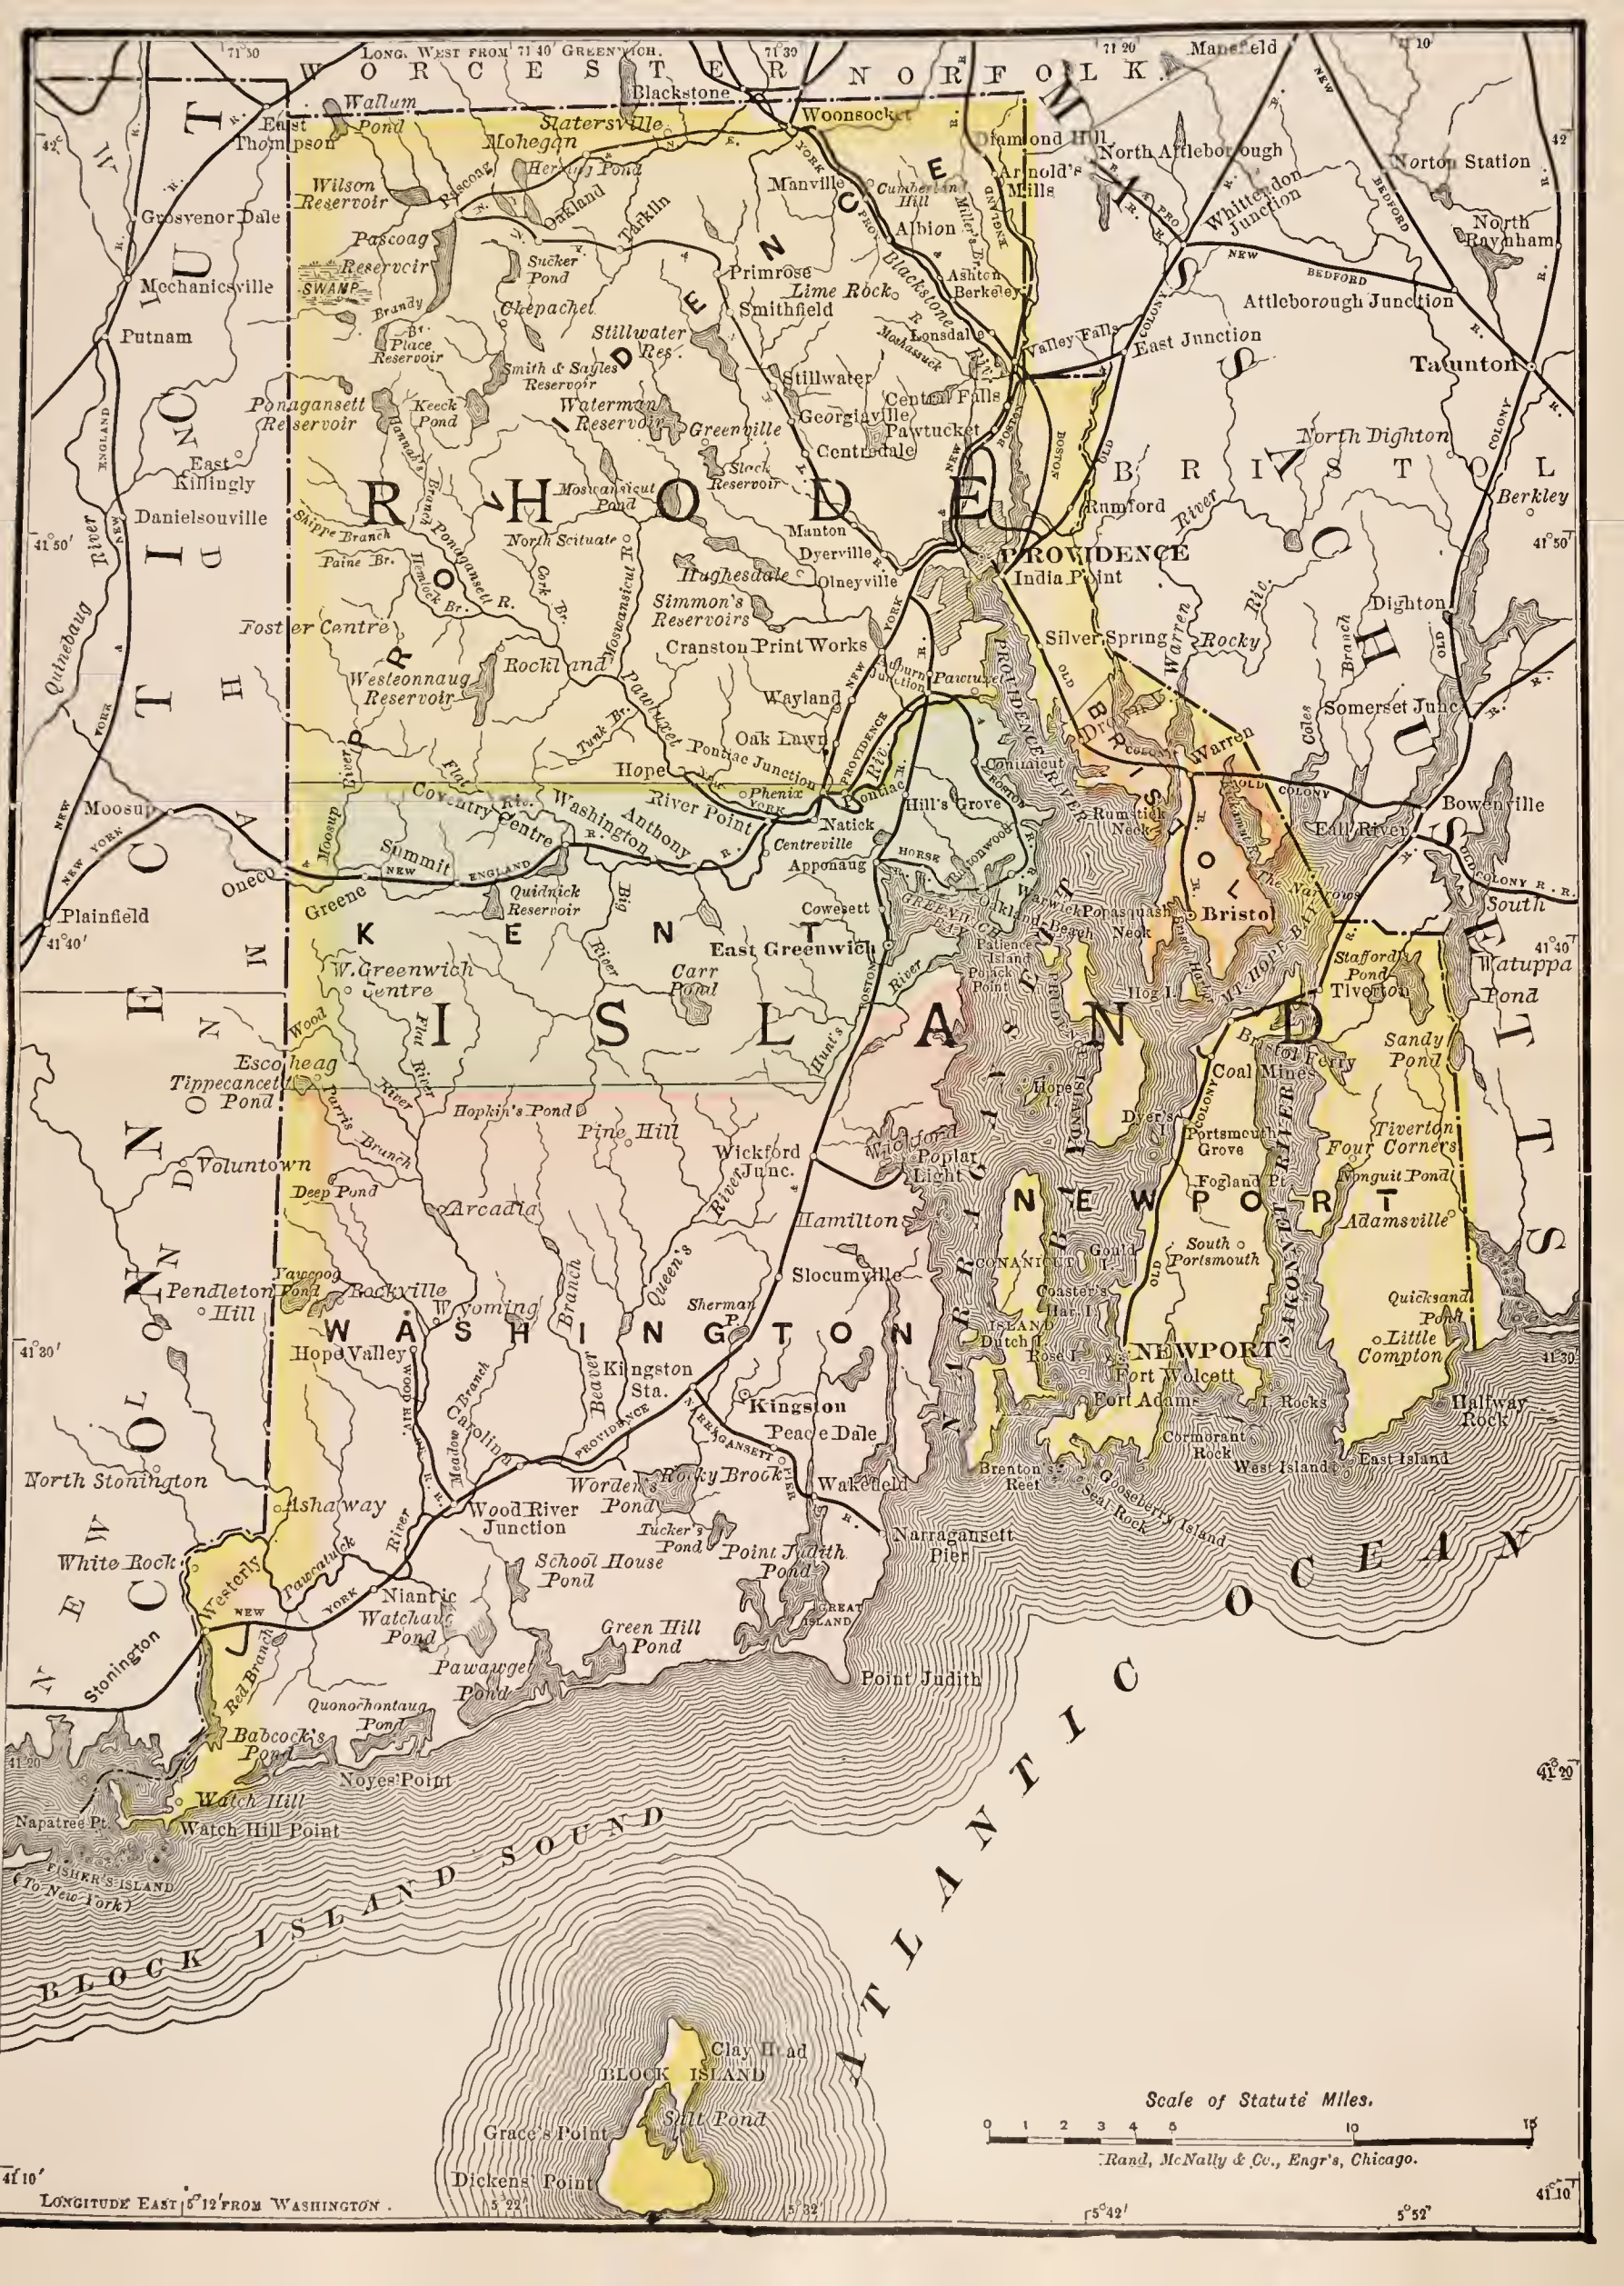

The river has been one of the chief waterways of Europe from the earliest times; and, as its channel is not exposed to the danger of silting up like those of the Elbe and the Oder, it has always been comparatively easy to keep it open.

The introduction of steam has greatly increased the shipping on the Rhine. The first Rhine steamer was launched in 1817; and now the river is regularly traversed by upward of a hundred, from the small tug up to the passenger saloon-steamer. The steamboat traffic has especially encouraged the influx of tourists, and the number of passing travelers may now be reckoned as between one and two millions annually. The river is navigable without interruption from Basel to its mouth, a distance 550 miles, of which 450 lie within Germany.

The long array of ancient and flourishing towns along its banks bear witness to the great importance of the river. These are most frequent in the upper Rhenish basin and again below Bonn, the places in the narrower part of the valley being generally more remarkable for their picturesque situation than for their commercial or political influence. Politically the Rhine has always played a great part; and it would require no great straining to write a history of this majestic river which would also be a history of the western half of continental Europe. For 200 years the Rhine formed the boundary between the Roman empire and the Teutonic hordes; and during that period the left or Roman bank made prodigious strides in civilization and culture. At the partition of the domains of Charlemagne in 843 A.D. the Rhine formed the boundary between Germany and the middle kingdom of Lotharingia; but by 870 it lay wholly within the former realm. For nearly 800 years it continued in this position, the frontier of the German empire coinciding more or less with the line of the Rhine. During the early Middle Ages the bank of the Rhine formed the most cultured part of Germany, basing its civilization on its Roman past. The Thirty Years' War exercised a most prejudicial effect upon the district of the Rhine; and the peace of Westphalia gave France a footing on the left bank of the hitherto exclusively German river by the acquisition of Alsace. The congress of Vienna (1815) restored the lower part of the Rhenish valley to Germany, but it was not till the war of 1870-71 that the recovery of Alsace and Lorraine made the Rhine once more "Germany's river, not Germany's frontier."

The Rhine has always exercised a peculiar sort of fascination over the German mind, in a measure and in a manner not easily paralleled by the case of any other river. "Father Rhine" is the center of the German's patriotism and the symbol of his country. In his literature it has played a prominent part from the *Nibe*

*lungenlied* to the present day; and its weird and romantic legends have been alternately the awe and delight of his childhood.

RHINOCEROS, a name applied by the ancients to an animal the most striking external peculiarity of which is certainly the horn growing above its nose (*ῥινόκερως*, nose-horn).

The various existing and extinct species are grouped into a family, *Rhinocerotidae*, which is a division of the Perissodactyle (odd-toed) section of the great order of *Ungulata* or hoofed mammals, of which section the tapirs and horses are the only other surviving members.

The *Rhinocerotidae* are all animals of large size, but of little intelligence, generally timid in disposition, though ferocious when attacked and brought to bay, using the nasal horns as weapons, by which they strike and toss their assailant. Their sight is dull, but their hearing and scent are remarkably acute. They feed on herbage, shrubs, and leaves of trees, and, like so many other large animals which inhabit hot countries, sleep the greater part of the day, being most active in the cool of the evening or even during the night. They are fond of bathing and wallowing in water or mud. None of the species have been domesticated. Animals of the group have existed in both the Old and New Worlds since the beginning of the Miocene period. In America they all became extinct before the end of the Pliocene period. In the Old World their distribution has become greatly restricted, being no longer found in Europe and North Asia, but only in Africa and in portions of the Indian and Indo-Malayan regions.

RHODE ISLAND, one of the six New England States, and the smallest in extent of all the States, is one of the original thirteen which formed the American Union. It has an actual land area of only 1,054.6 square miles, the waters of Narragansett Bay, its chief physical feature, comprising an additional area of not far from 360 square miles. It lies between  $41^{\circ} 18'$  and  $42^{\circ} 3'$  N. latitude and  $71^{\circ} 6'$  and  $71^{\circ} 55'$  W. longitude, its greatest length from north to south being about forty-eight miles, and its greatest width from east to west about thirty-five miles. It is shut in on the east and north by Massachusetts, and on the west by Connecticut, while its southern shores are washed by the Atlantic Ocean.

The geological formation of the western portion of the State is chiefly that of the Montalban gneiss, which characterizes a great part of southern New England, but under the bay and to the east of it is an extensive coal-bearing formation, from which at different times upward of 750,000 tons of coal have been taken. The only other important deposit is one of magnetic oxide of iron. The climate of Rhode Island, though variable, differs from that of the exposed coast of Massachusetts Bay in the absence of harassing east winds; while the proximity of the southern parts of the State (Newport and vicinity) to the Gulf Stream results in an atmosphere of unusual warmth and moisture, and at the same time comparatively equable. No great extremes, either of heat or of cold, are experienced in the State.

The earliest authentic estimate of population is that of 7,181 in 1708. The War of Independence (1775-83) had the effect of reducing it from 59,707 in 1774 to 52,347 in 1782. The subsequent United States censuses show steady gains, as follows:—1790, 68,825; 1800, 69,122; 1810, 77,031; 1820, 83,059; 1830, 97,210; 1840, 108,830; 1850, 147,545; 1860, 174,620; 1870, 217,353; 1880, 276,531 (143,501 males, 133,030 females); while a State census in 1885 gave 304,419, an increase of 27,888 over that of 1880, and the census of 1890 showed a total of 345,506. A large percentage of the population is of foreign birth, principally from Great Britain

or Ireland, but lately the immigration shows a marked increase of French and Italians. About 100,000 of population are Roman Catholics; of the remainder, the Baptists (who have been in Rhode Island from its earliest settlement) are most numerous, while the communicants of the Protestant Episcopal church, with the Congregationalists and Methodists, have also a large representation.

No portion of the State can be described as exceptionally fertile; and only 3 per cent. of the population are engaged in agriculture. The favorable situation of Newport and Providence, at the two extremities of Narragansett Bay, led to the development in the last century of a flourishing trade. This was long ago greatly reduced, and the tonnage of these ports is now chiefly that of a coasting trade. With the final check given to foreign commerce in the war of 1812-14, manufactures gained at once that prominence in the local industries of the State which they have ever since held. From Samuel Slater's efforts at Providence and Pawtucket Falls, in 1790-93, may in fact be dated the real development of the cotton manufacturing industry in America, Slater, who had served an apprenticeship in England with a partner of Arkwright, having then been able from memory to set up in Rhode Island the whole set of recently improved spinning machinery. In 1791 only 5,858 yards of cotton cloth were made in Providence and vicinity, but in 1810 in Rhode Island 735,319 were made. Two years later, in 1812, there were fifty-three cotton mills within a radius of thirty miles of Providence.

During the past eighty years the development of manufacturing industry in Rhode Island, especially in the line of textile fabrics, has been constant. The latest available official reports show that the State contains 2,393 manufacturing establishments, with an invested capital of \$59,616,229, and employing 63,349 persons. The wages earned during the year amounted to \$23,253,099; the value of material used was \$48,271,448, and the total value of the products was \$95,452,085. Almost one-fourth of the total production was represented by cotton manufacturers and one-fifth by woolen manufactures; the figures being 21,771,504 and \$18,983,634 respectively. The agricultural products were valued at \$7,204,642, fisheries at \$1,613,046, making a grand total of \$104,269,773.

Rhode Island is a wealthy and prosperous State. Its taxable valuation for 1891 is given as follows: Real estate, \$291,907,716; personal property, \$104,886,836; a total of \$396,794,552. On January 1, 1891, the State debt was \$1,283,000; the sinking fund (par value) was \$951,703; leaving a net debt of \$331,296; and showing a reduction of debt during the year of \$91,279. The receipts of the State Treasury during the year, including a balance from the previous year, were \$1,255,131; the expenditures \$1,169,602, leaving a balance in the treasury January 1, 1891, of \$85,528.

Rhode Island is the most-thickly populated of all the States composing the American Union. Although it contains but three cities of importance it has thirty-three towns, and in fact is thoroughly built up throughout, forming practically a series of manufacturing towns. Its water-power is magnificent and is utilized in hundreds of places. Narragansett Bay with its tributaries extends throughout the heart of the State, thus affording a ready means of communication, while the railroad facilities are not surpassed even in New England. Although manufactures occupy so large a proportion of the population, agriculture is far from being neglected, and indeed the State is practically a market garden. Stock and dairy products, fruits and

seeds, are produced in great luxuriance and find a ready market.

It was not until 1828 that the present public school system was established; but, owing largely to the exceptional organizing ability of the first commissioner of public schools, Henry Barnard, a most efficient system was securely built up. Educational institutions, other than public, include Brown University, the Friends' School, and various others at Providence. Brown University was founded in 1764, under the name of Rhode Island College, and was the seventh college established in America.

The Redwood Library, at Newport, still in existence, incorporated in 1747, was the fourth public library founded in New England. The Providence Library was founded only a few years later, and is still perpetuated in the Providence Athenæum, an admirably conducted shareholders' library of 43,656 volumes. The Brown University Library, founded 1772, has more than 62,000 volumes, including several special collections of great rarity and value. There are, moreover, thirty-two "public libraries" in the State (free to all readers), with a total of about 100,000 volumes. The largest of these, 31,650 volumes, is the Providence Public Library.

The planting of the three scattered and independent settlements (Providence, 1636; Portsmouth, 1638; Newport, 1639) by Roger Williams and others whose views of church polity and doctrine had been found unpalatable to the Massachusetts Puritans, was not in the outset a movement for the establishment of a colony. The need of mutual protection, however, led to their combination; and the first general union of these three towns (together with a fourth, Warwick), was secured in 1647, under the charter of March 14, 1643-44. The union effected by this instrument was of the very loosest description, but under the pressure of causes which threatened the very existence of the colony a new and much more comprehensive charter was obtained in 1663. This extraordinarily liberal instrument constituted the fundamental law of Rhode Island for the next 180 years, through a succession of remarkable vicissitudes. The charters of Massachusetts and other American colonies were withdrawn in 1686, but the efforts of the royal agent were frustrated in Connecticut and Rhode Island; and in this colony the government was simply committed temporarily to the separate towns which had constituted the colony, the charter government being peacefully resumed three years later, in 1689. Rhode Island was hardly free, during the next seventy years, from some form of conflict with the mother country over the question of charter rights; and in the steps which served to precipitate the War of Independence (1775-83), as well as in the war itself, it was among the foremost. In the military operations of this war Nathaniel Greene, a Rhode Island officer, ranks easily second to Washington in generalship. Reluctant as Rhode Island was to acknowledge other authority than that of its own colonial charter, even after the close of the war, it did not accede to the constitution of the United States until June, 1790, more than a twelvemonth after the new government had gone into operation under Washington as president. Nor did it even then follow the example of the other States in framing a State constitution for the government of its local affairs, but retained its colonial charter of 1663 until almost the middle of the present century. In 1841 and 1842 the dissatisfaction with this mode of government culminated in a series of revolutionary movements; and a convention called by the citizens of the State adopted what was known as the "people's constitution," under whose provisions it was claimed that Thomas Wilson Dorr was chosen governor. Later in

the year 1842 a convention called by the regularly constituted authorities adopted the present constitution, under whose provisions the State government was organized in 1843. The governor (chosen annually) has no veto power. The legislative body, known as the General Assembly, comprises a senate and a house of representatives, each one of the thirty-six cities and towns choosing a single senator. The General Assembly begins its annual sessions in May at Newport, adjourning, after a few days, for a much more extended session at Providence beginning in the following January. The judicial body consists of one supreme court, with subordinate courts for the respective counties, the justices being chosen by vote of the General Assembly. The State is represented in the national Congress by two senators and two representatives. In the quadrennial election of president, Rhode Island has four votes in the "electoral college."

Since 1885 a number of amendments have been made to the State constitution, the more important of which is the extension of suffrage to soldiers and sailors of foreign birth who served in the army or navy from Rhode Island during the Civil War; also an amendment practically limiting the right of suffrage in the election of a city council, or in an election for the imposition of any tax or the expenditure of any money, to those who during the preceding year have paid tax on property assessed at \$134 in value. Amendments extending the right of suffrage to women, and prohibiting the manufacture and sale of intoxicating liquors to be used as a beverage were defeated. In the Civil War of 1861-65 Rhode Island took an active part, furnishing for the defense of the Union 24,042 men.

RHODES, an island in the Ægean Sea, belonging to the Turkish empire, lying off the southwest coast of Asia Minor, between 35° 52' and 36° 28' N. latitude and 27° 40' and 28° 15' E. longitude, about ten miles south of Cape Alepo. Its length is about forty-five miles from northeast to southwest, its greatest breadth twenty-two miles, and its area nearly 424 square miles. The island is diversified in its surface, and is traversed from north to south by an elevated mountain range, the highest point of which, named in ancient times Atabyris or Atabyrium, and still called Atairo, rises to an elevation of 4,560 feet. It commands a view of the elevated coast of Asia Minor toward the north, and of the Archipelago, studded with its numerous islands, on the northwest; while on the southwest is seen Mount Ida in Crete, often veiled in clouds, and on the south and southeast the vast expanse of waters which wash the African shore. The rest of the island is occupied in great part by ranges of moderately elevated hills, on which are found extensive woods of ancient pines, planted by the hand of nature.

The air is pure and salubrious, and it is said that there is hardly a day throughout the year in which the sun is not visible. The winds are liable to little variation.

Rhodes, in addition to its fine climate, is blessed with a fertile soil, and produces a variety of the finest fruits and vegetables. Numerous streams and rivulets, which take their rise in the central range, water the surrounding plains and valleys of the island. The valleys afford rich pastures, and the plains produce every species of grain; the wheat is of an excellent quality; and, but for the extortions of its barbarian rulers, the island might be the seat of agriculture as well as commerce, and might export large quantities of corn.

The commerce of the island has been of late years increasing at a rapid rate. Many British manufactures are imported by indirect routes, through Smyrna, Constantinople, Beyrout, and other places. Cotton

stuffs, calicoes, and gray linen are among the goods most in demand. The expansion of the trade has been very much owing to the establishment of steam navigation direct to the island, which is now visited regularly by French and Austrian steamers, as well as by some from England to Smyrna. The only town of any importance in the island is the capital, Rhodes, which stands at the northeast extremity.

Rhodes has at present two harbors. The least of these lies toward the east, and its entrance is obstructed by a barrier of rocks, so as to admit the entrance of but one ship at a time. The other harbor is larger, and also in a bad condition; here frigates of thirty guns may anchor, and are sheltered from the west winds, though they are exposed to the north and northeast winds. The two harbors are separated by a mole which runs obliquely into the sea. At the eastern entrance is the fort of St. Elmo, with a lighthouse; but the light is very feeble, and visible only a few miles.

The numerous poetical legends current among the Greeks with respect to Rhodes bear testimony to the importance which it attained in very early times.

Notwithstanding the evidences of early prosperity and power, we meet with very scanty notices of the Rhodian cities in the first period of Greek history. After the Persian War they appear to have passed into the condition of tributaries to Athens, and were compelled as such to join in the Athenian expedition to Sicily, but in 412 B.C. they deserted the Athenian cause and joined that of the Peloponnesians.

When Conon and his fleet restored the Athenian power by his victory off Cnidus (394 B.C.), Rhodes again embraced the victorious cause; but her fidelity during the subsequent contests was not very great. Sparta afterward received the allegiance of the island; and in the Social War (357-5) it joined the alliance against Athens, and, with the assistance of the Carian monarch Mausolus, succeeded in achieving independence. But, finding the power of that king dangerous to their liberties, the Rhodians once more sued for the Athenian protection, which they obtained through the eloquence of Demosthenes. Rhodes received a Macedonian garrison; but it was expelled after the death of Alexander, and a resolute resistance was begun to the Macedonian power. This formed one of the most illustrious periods in the history of the island. For arts as well as arms the island was renowned; the Rhodian laws, especially on maritime affairs, were reckoned the best in antiquity, and many of them adopted into the Roman code. Æschines, who had contended in eloquence with the greatest of orators, opened a school of rhetoric here. Protogenes embellished the city with his paintings, and Chares of Lindus with the celebrated colossal statue. The Colossus, erroneously supposed to have occupied a position striding over the entrance to the harbor, stood for fifty-six years, till an earthquake prostrated it in 224 B.C. Its enormous fragments continued to excite wonder in the time of Pliny, and were not removed till 656 A.D., when Rhodes was conquered by the Saracens, who sold the remains for old metal to a dealer who employed 900 camels to carry them away. More than 3,000 statues are said to have adorned the city, which was said by Strabo to surpass all others in beauty and ornamental character. After acknowledging allegiance to the Roman Empire, the Persians, etc., the island was granted by the emperor Emmanuel to the Knights of St. John, who soon after resisted a siege by the sultan Othman. They strengthened the natural advantages of the place by skillful fortifications, and by discipline and equipments made themselves nearly a match for the superior numbers of the Turks. The last and most famous siege of Rhodes took place in 1522,

when, after a desperate resistance for four months to the overwhelming numbers of the Ottomans, the knights, being left unassisted by all the European powers, capitulated on honorable terms, and evacuated the island. On the first day of 1523 Villiers de Lisle Adam, the grand master, embarked the last of the small band carrying away all the property of the order, and leaving the ruins of their city to the enemy. Rhodes has since been in the possession of the Turks, and is now the residence of the pasha of the Archipelago.

The population of the island is estimated at about 27,000, of whom 6,000 are Turks, 3,000 Jews, and the remainder Greeks. Of these nearly 20,000 are contained in the city and its suburbs; the rest of the island is very thinly peopled, though numerous small villages are scattered over its whole extent.

RHODIUM. See PLATINUM.

RHODODENDRON. Classical writers, such as Dioscorides and Pliny, seem, from what can be ascertained, to have called the oleander (*Nerium Oleander*) by this name, but in modern usage it is applied to a large genus of shrubs and trees belonging to the order heaths (*Ericaceæ*). The rhododendrons, then, are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five or many celled, ripening into a long woody pod which splits from top to bottom by a number of valves, which break away from the central placenta and liberate a large number of small bran-like seeds provided with a membranous wing-like appendage at each end. The species are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay Archipelago and New Guinea, but not hitherto found in South America or Australia. None are natives in Britain. The varieties grown in gardens are mostly derived from the Pontic species (*R. ponticum*) and the Virginian *R. catawbiense*. These are mostly hardy in England.

What are termed greenhouse rhododendrons are derivatives from certain Malayan and Javanese species, and are consequently much more tender. They are characterized by the possession of a cylindrical (not funnel-shaped) flower-tube and other marks of distinction. Azaleas now referred to *Rhododendron* are derived from Chinese and Japanese species chiefly. What are called in gardens Ghent azaleas are hardy varieties with deciduous gummy foliage and tufts of fragrant, brilliantly-colored flowers. These are derivatives from *A. calendulacea*, *A. viscosa*, and other northeast American species. The foliage of rhododendrons contains much tannin, and has been used medicinally. Whether the honey mentioned by Xenophon as poisonous was really derived from plants of this genus as alleged is still an open question.

RHONE (Fr. *Rhône*), the largest European river flowing directly into the Mediterranean, rises in the Swiss canton of Valais, passes through the Lake of Geneva, strikes across the line of the Jura, and turning southward through France falls into the Gulf of Lyons. It has a length of 447 miles according to Strelbitzky (505 according to other authorities), and its principal affluent, the Saône, has a length of 268 miles above the confluence, which is 200 miles inland. The

drainage area of the whole river-system is 38,000 square miles, and the mean discharge at the river mouth is 60,000 cubic feet per second, the maximum being 428,840 cubic feet and the minimum 19,426. Since 1871 the motive power of the river has been utilized for the industries of Bellegarde; a large tunnel twenty feet high and more than half a kilometer long brings the water from the south side of the "perte" to turbine wheels placed in the bed of the Valserine, and wire ropes transmit the power to the Bellegarde workshops on the plateau 400 feet above.

**RHÔNE**, a department of southeastern France, deriving its name from the river on which Lyons, its chief town, is situated, was formed in 1793 from the eastern portion of the department Rhône-et-Loire, comprising parts of Lyonnais and Beaujolais. It is bounded on the north by Saône-et-Loire, on the east by Ain and by Isère, on the south and west by Loire, and lies between  $45^{\circ} 27'$  and  $46^{\circ} 18'$  N. latitude and  $4^{\circ} 15'$  and  $4^{\circ} 53'$  E. longitude. It contains the Beaujolais Mountains, the highest peak of which is 3,320 feet; the Tarare group; the Lyonnais Mountains (nearly 3,000 feet); and Mont Pilât, the highest peak of which belongs to the department of Loire. The lowest point of the department, where it is left by the Rhone, is 460 feet above the level of the sea. The meteorological conditions vary greatly with the elevation and exposure. Snow sometimes lies in the mountains from November to April, while at Lyons and in the valleys the mean temperature in winter is  $36^{\circ}$  Fahr., and in summer  $70^{\circ}$ , the annual mean being  $53^{\circ}$ . The average rainfall is somewhat higher than is general over France, owing to the amount of the precipitation on the hilly region.

Of a total area of 689,545 acres, 286,000 are arable, 120,000 are pasture meadow land, 79,000 under vines, 79,000 wood, and 66,000 moorland. The soil of the department is for the most part stony and only moderately fertile. Fruit trees, such as peaches, apricots, walnuts, and chestnuts, grow well, but the wood in general is little more than copse and brushwood. The wealth of the department is mainly derived from its industries. The population is principally engaged in the manufacture of chemicals, of machinery and of silk. **LYONS** (*q.v.*) is the center for the silk manufacture and Tarare for that of muslins, velvets, plush, calicoes, and prints, there being twenty-six factories with 33,000 spindles, 540 power-looms, 4,800 hand-looms; 2,000 workmen are also employed in the manufacture of counterpanes. The chief workshops for repairing the locomotives of the Paris, Lyons, and Mediterranean are in this department. There are also foundries of copper, bronze, and bell-metal, as also gold, silver, and steel wire works. The manufacture of gold and silver plate and jewelry has an annual turnover of 1,600,000, that of edible pastes amounts to \$2,400,000, and that of paper to \$270,000. The manufacture of wall papers is second only to that of Paris. In addition there are fifteen chemical works, eight glass works employing 1,000 workmen, nine candle works, twelve soap works and 700 mills. Coal and anthracite are found, as well as argentiferous lead, manganese, and copper pyrites; there are also large stone quarries. The cold mineral spring of Charbonnière, containing bicarbonates, iron and sulphur, is nineteen miles west of Lyons. The means of communication include 76 miles of navigable river, 5 of canal (the canal of Givors), 141 miles of government road, 3,685 miles of other roads, and 165 miles of railway connecting Lyons with Paris, with Roanne by Tarare, with Montbrison, St. Étienne, Nîmes, Marseilles, Grenoble, Chambéry, Geneva, Bourg, and Trévoux, Beaujeu with Belleville (on the Lyons and Mâcon line), and Thizy with Cours (two manufacturing towns

in the neighborhood of Tarare on the line from Lyons to Roanne). The population, which owing to the development of industries has doubled since 1801, was 741,470 in 1881, and estimated at 825,000 in 1890. There are two arrondissements, Lyons and Villefranche, twenty-nine cantons and 264 communes. Rhône belongs to the diocese of Lyons, is under the jurisdiction of the superior court of Lyons, and is divided between the corps d'armée of Clermont and of Grenoble. The chief towns are **LYONS** (*q.v.*); Tarare (13,352); Villeurbanne (11,176); Caluire-et-Cuire (9,740), and Oulins (7,536), suburbs of Lyons; Givors (11,470), a stirring town on the Rhone at the junction of the canal by which coal is brought from St. Étienne to the Rhone, with glass works, blast furnaces, foundries, brick and tile works, and potteries; Amplepuis (7,118); and Cours (6,929).

**RHUBARB**. This name is applied both to a drug and to a vegetable.

Rhubarb is used in medicine as a mild purgative and cholagogue, promoting digestion and improving the appetite when given in small doses, probably by stimulating the intestinal secretions. It has a subsequent astringent effect due to the rheotannic acid it contains, but this can be counteracted by giving it with alkaline preparations. It is especially valuable in the treatment of duodenal catarrh or catarrh of the biliary ducts with jaundice; and in certain skin diseases it has proved to be a valuable medicine, the results obtained being probably due to the chrysophan contained in it.

The rhubarb used as a vegetable consists of the leaf stalks of several hybrids between the species *R. raphaniticum*, *R. undulatum*, *R. palmatum*. The petioles of *R. officinale* have also been proved to be edible; but that plant is grown more frequently on account of its ornamental foliage. See **HORTICULTURE**.

**RHYL**, a watering-place of North Wales, in the county of Flint, is situated near the mouth of the Chwyd, thirty miles northwest of Chester and ten northwest of Denbigh, a railway line to which here joins that from Chester to Holyhead. Its chief advantages as a watering-place are the pure air and extensive firm sands. The town possesses a town hall, extensive winter gardens, racquet courts, lawn-tennis grounds, and other attractions. The east and west parades face the sea, and the pier, constructed of iron, is 700 feet in length. There is daily communication by steamer with Liverpool, Llandudno, Bangor, etc. The population of the urban sanitary district (area 600 acres) in 1871 was 4,500, in 1881 it was 6,029, and in 1889 about 7,000.

**RHYMER, THOMAS THE**. See **THOMAS OF ERCELDOUNE**.

**RHYMNEY**, an urban sanitary district of Monmouthshire, on the borders of Glamorganshire, England, is situated in the valley of the Rumney river, twenty miles west of Abergavenny, and twenty-two north of Cardiff. It owes its importance to the neighboring coal mines and to its iron and steel works, which employ nearly the whole population. The works of the Rhymney Iron Company, including blast furnaces and rolling mills, are among the largest of the kind in England. The town consists chiefly of plain houses inhabited by workpeople, the principal building being the church, a handsome structure in the Doric style erected in 1842. The population of the urban sanitary district (area 2,890 acres) in 1871 was 8,138, in 1881 it was 8,663, and in 1889 about 8,900.

**RIAZAN**. See **RYAZAN**.

**RIBAULT**, or **RIBAUT, JEAN**, a French navigator rendered famous by his connection with the early settlement of FLORIDA (*q.v.*), was born at Dieppe, probably

about 1520. Appointed by Coligny to the command of a colonizing expedition, Ribault sailed on February 18, 1562, with two vessels, and on May 1st, landed at St. John's river, or, as he called it, Rivière de Mai. In 1563 he appears to have been in England and to have issued *The whole and true discoverie of Terra Florida*. In 1565 Ribault was again sent out to the new settlement. While he was still there the Spaniards under Menendez de Avila, attacked the French ships at the mouth of the river. Ribault set out to retaliate on the Spanish fleet. Induced to surrender by false assurances of safeguard, Ribault and his men were put to the sword in October, 1565.

**RIBBON-FISHES** (*Trachypteridæ*), a family of marine fishes readily recognized by their long, compressed tape-like body, short head, narrow mouth, and feeble dentition. A high dorsal fin occupies the whole length of the back; an anal is absent, and the caudal, if present, deviates in its direction from the longitudinal axis of the body. The pectoral fins are small, the ventrals composed of several rays or of one long ray only. The largest of ribbon-fishes are the species of *Regalecus* (see OAR-FISH), of which specimens some twenty feet long by twelve inches in depth of body and two inches in thickness have been found. Like all deep sea fishes they occur in all seas.

**RIBBONS.** By this name are designated narrow webs, properly of silk, not exceeding nine inches in width, used primarily for binding and tying in connection with dress, but also now applied for innumerable useful, ornamental, and symbolical purposes. Along with that of tapes, fringes, and other smallwares, the manufacture of ribbons forms a special department of the textile industries. It is obvious that the weaving of very narrow fabrics, piece by piece, on separate looms would be a tedious and expensive process; yet for ages such was the only method of making ribbons. In 1745 the celebrated John Kay, the inventor of the fly-shuttle, obtained, conjointly with Joseph Stell, a patent for improvements in the ribbon loom; and since that period it has benefited by the inventions applied to weaving machinery generally.

Ribbon weaving is known to have been established near St. Étienne (dep. Loire) so early as the eleventh century, and that town to the present day continues to be the headquarters of the industry. In the time of Louis XIV. the ribbon trade there gave employment to about 6,000 persons; now about 17,000 looms are in operation in the district, 1,500 of which are power-looms in factories. Crefeld is the center of the German ribbon industry, the manufacture of black velvet ribbon being there a specialty. In Vienna about 2,000 looms are employed. Next to St. Étienne and Basel, Coventry is the most important seat of ribbon making, and to some extent the industry is also prosecuted at Norwich and Leicester. The average annual value of the ribbon trade of western Europe and America is \$80,000,000. A large proportion of the ribbons now made are mixed fabrics of silk and cotton.

**RIBERA, JUSEPE**, or, in Italian, GIUSEPPE, commonly called LO SPAGNOLETTO, or the Little Spaniard, a leading painter of the Neapolitan or partly of the Spanish school, was born near Valencia in Spain, at Xativa, now named S. Felipe, on January 12, 1588. He died peaceably and wealthy in Naples in 1656. His own signature on his pictures is constantly "Jusepe de Ribera, Español."

**RIBES.** See CURRANT and GOOSEBERRY.

**RICARDO, DAVID**, a celebrated political economist, was born at London, April 19, 1772. His first publication (1809) was *The High Price of Bullion a Proof of the Depreciation of Bank Notes*. This tract was an

expansion of a series of articles which the author had contributed to the *Morning Chronicle*.

In 1811 he made the acquaintance of James Mill, whose introduction to him arose out of the publication of Mill's tract entitled *Commerce Defended*. And in 1815, when the Corn Laws were under discussion, he published his *Essay on the Influence of a Low Price of Corn on the Profits of Stock*. This was directed against a recent tract by Malthus entitled *Grounds of an Opinion on the Policy of Restraining the free Importation of Foreign Corn*. The reasonings of the essay are based on the theory of rent which has often been called by the name of Ricardo; but the author distinctly states that it was not due to him.

In the *Proposals for an Economical and Secure Currency* (1816) he first disposes of the chimera of a currency without a specific standard, and pronounces in favor of a single metal, with a preference for silver, as the standard. He then puts forward a scheme which had been already briefly indicated in the appendix to the fourth edition (1811) of his *High Price of Bullion*. This was that the bank should be obliged to deliver on demand, not coin, but uncoined bullion or gold standard bars, in exchange for its notes, whenever the notes presented together for payment reached a moderate fixed amount. In a later tract (*Plan for a National Bank*) Ricardo proposes that one pound notes should be confirmed to the country districts. The general plan has been objected to on the ground that it would not provide a sufficient metallic reserve to meet sudden emergencies arising from the necessity of foreign payments.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. In 1820 he contributed to the supplement of the *Encyclopædia Britannica* an *Essay on the Funding System*, and in 1822 he published a tract *On Protection to Agriculture*, which is an able application to controversy of the general principles laid down in his systematic work.

Ricardo died on September 11, 1823, at his seat (Gatcomb Park) in Gloucestershire.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings, to which this article has been in great part devoted, as the *Principles*, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist only, not at all a social philosopher in the wider sense, like Adam Smith or John Mill. He had great acuteness, but little breadth. For any large treatment of moral and political questions he seems to have been alike by nature and preparation unfitted; and there is no evidence of his having any but the most ordinary and narrow views of the great social problems. His whole conception of human society is material and mechanical, the selfish principle being regarded, after the manner of the Benthamites, as omnipotent, not merely in practical economy, but, as appears from his speech on the ballot and his tract on reform, in the whole extent of the social field.

**RICCATI, JAMES, COUNT**, a celebrated Italian mathematician, was born at Venice, May 8, 1676, and died at Treviso, April 15, 1754. He studied at the university of Padua, where he graduated in 1696. Riccati's name is best known and will be preserved by mathematicians in connection with his celebrated problem called Riccati's equation, published in the *Acta Eruditorum*, September, 1724.

**RICCI, MATTEO**, is eminent as practically the founder of Christian missions in modern China. He was born of a noble family at Macerata in the March of Ancona, on October 7, 1552, two months before Francis Xavier, burning with the desire to carry his message

into China, died at its gates. After some education at a Jesuit college in his native town, Ricci, at the age of sixteen, was sent by his father to study law at Rome. But the youth had already contemplated entering the Jesuit Company, and this purpose he accomplished about 1571. In 1577 Ricci and several other Italian students of noble birth offered themselves for the East Indian missions; and Ricci, without visiting his family to take leave, proceeded to Portugal. They arrived at Goa, in September, 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several attempts had been made by Xavier, and since his death, to introduce the church into China. In 1571 a house of the Jesuits had been set up at Macao (where the Portuguese were established in 1557), but their attention was then occupied with Japan, and it was not till the arrival at Macao of Alessandro Valignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chau-king-fu on the Si-kiang or West River of Canton, where the viceroy of the two provinces of Kwang-tung and Kwang-si then had their residences, and by favor of this personage they were enabled to establish themselves, and there spent several years. In 1601 he obtained a settlement with an allowance for subsistence in Peking, from which time Ricci's estimation among the Chinese was constantly increasing, as was at the same time the amount of his labors. He died May 14, 1610.

Ricci's character, his acquirements, and the use he made of them, were certainly worthy of all honor. We do not know what amount of success in conversion had rewarded his labors during his life, but some eminent and creditable converts there were, and his work was the foundation of the considerable spread which the Roman Catholic Church has since attained in China. Probably no European name of past centuries is so well known in China as that of *Li-ma-teu*, the form in which the name of the missionary (*Ri-cci Mat-teo*) was adapted to Chinese usage, and by which he appears in Chinese records. The works which he composed in Chinese are numerous. One of the first which attracted attention and reputation among Chinese readers was a Treatise upon Friendship, in the form of a dialogue containing short and pithy paragraphs; this is stated in the *De Expeditione* to have been suggested during Ricci's stay at Nan-chang by a conversation with the prince of Kien-ngan, who asked questions regarding the laws of friendship in the West. In the early part of his residence at Peking, Ricci brought out the *T'ien-chu shih-i*, or "Veritable doctrine of the Lord of Heaven," which deals with the divine character and attributes under eight heads. In 1604 Ricci completed the *Erh-shih-wu yen*, a series of short articles of moral bearing, but exhibiting little of the essential doctrines of Christianity. *Chi-jên shih pien* is another of his productions, completed in 1608, and consisting of a record of ten conversations held with Chinese of high rank.

Ricci's pointed attacks on Buddhism, and the wide circulation of his books, called forth the opposition of the Buddhist clergy. One of the ablest who took their part was Chu-liang, a priest of Hang-chau, who had abandoned the literary status for the Buddhist cloister, wrote three articles against the doctrine of the missionaries. Another work of Ricci's which attracted attention was the *Hsi-kuo fa*, or "Art of memory as practised in the West." Ricci was himself a great expert in *memoria technica*, and astonished the Chinese by his performances in this line. He also wrote, or edited,

various Chinese works on geography, the celestial and terrestrial spheres, geometry, and arithmetic.

RICCIARELLI, DANIELE, Italian artist, generally called, from the place of his birth, DANIELE DA VOLTERRA, was born in 1509, studied painting under Razzi and Peruzzi. He died in 1566. The principal extant works of Ricciarelli are at Rome. These are a *St. John the Baptist* in the picture gallery of the Capitol, a *Savior Bearing the Cross* in the Palazzo Rospigliosi, and a *Descent from the Cross*, his masterpiece, in the church of Trinità de Monti. There is also an *Elijah* at Volterra.

RICCOBONI, MADAME, whose maiden name was Marie Jeanne Laboras de Mézières, and who married and was deserted by an actor and author of little merit, was born at Paris in 1714. She herself was an actress, but did not succeed on the stage. She then took to novel writing and deserves a considerable place in the history of sentimental novel. Her first work was the remarkable *Histoire du Marquis de Cressy* (1758). This was followed by *Milady Catesby*, *Fanny Butler*, *Ernestine* (sometimes thought her masterpiece), three series of *Lettres* in the names of *Adelaide de Dammartin* (often quoted as *Madame de Sancerre*), *Elizabeth Sophie de Vallière*, *Milord Rivers*, and others. She died in 1792 in great indigence. Besides the works named she translated Fielding's *Amelia*, and tried a continuation of Marivaux's unfinished *Marianne*.

RICE. According to Roxburgh the cultivated rice with all its numerous varieties has originated from a wild plant called in India Newaree or Nivara (*Oryza sativa*). The rice plant is an annual grass with long linear glabrous leaves, each provided with a long, sharply-pointed ligule. The spikelets are borne on a compound or branched spike, erect at first but afterward bent downwards. Each spikelet contains a solitary flower with two other small glumes and two inner, larger and folded lengthwise, the outer one of the two rather larger and sometimes provided with an awn. Within these are six stamens, a hairy ovary surmounted by two feathery styles which ripens into the fruit (grain), and which is invested by the husk formed by the persistent glumes. The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hill-sides. It was very early cultivated in India, in some parts of which country, as in tropical Australia, it is, as we have seen, indigenous. There is proof of its culture in the Euphrates valley and in Syria 400 years before Christ. Crawford on philological grounds considers that rice was introduced into Persia from southern India. Rice was first cultivated in Italy near Pisa in 1468.

Rice constitutes one of the most important articles of food in all tropical and subtropical countries, and is one of the most prolific of all crops. The rice yields best on low lands subject to occasional inundations, and thus enriched by alluvial deposits. An abundant rainfall during the growing season is also a desideratum. Rice is sown broadcast, and in some districts is transplanted after a fortnight or three weeks. No special rotation is followed; indeed the soil best suited for rice is ill adapted for any other crop. In some cases little manure is employed, but in others abundance of manure is used. No special tillage is required, but weeding and irrigation are requisite. Payen gives only 7 per cent. of gluten in rice as compared with 22 per cent. in the finest wheat, 14 in oats, and 12 in maize. The percentage of potash in the ash is as 18 to 23 in wheat. The fatty matter is also less in proportion than in other cereals. Rice, therefore, is chiefly a farinaceous food, and requires to be combined with fatty and nitrogenous substances, such as milk or meat gravy, to satisfy the requirements of the system.

Rice was introduced into the United States at Charleston, S. C., during 1694. It was planted first in the vegetable gardens of the city and yielding abundantly grew in importance until now it is the leading agricultural product of that State. Its cultivation there, as also in the other States of Georgia, Louisiana, and elsewhere in the South where it was subsequently introduced, has been scientifically conducted of late years, which, with the favoring conditions of the soil, and the care exercised in harvesting the crop, has secured for the American commodity a reputation for superiority unequalled by that of any other country. The crops fluctuate annually from various causes, the deficiency being made up by importation which, for three months ending June 30, 1889, amounted in round numbers to 12,000 tons. Nearly the whole of this comes from British Burmah and Bengal. A large proportion of the rice brought to Europe is used for starch making, and some is taken by distillers of alcohol. Rice is also the source of a drinking spirit in India, and the national beverage of Japan—saké—is prepared entirely from the fermented grain.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree *Aralia papyrifera* cut into thin slices. The tree grows in the swampy forests of Formosa and apparently nowhere else, and large quantities of the stems are conveyed to Chinchew, where the snow-white delicate pith is carefully sliced by spiral cuts into uniform sheets of a fine ivory-like texture. It is dyed various colors, and extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-color drawings.

RICH, CLAUDIUS JAMES, Eastern traveler and scholar, was born near Dijon, March 28, 1787. While at Shiraz, Persia, he was struck down by cholera October 5, 1821. His early death was a vast loss to Oriental investigation. The work he did accomplish was of great value for Eastern archæology and history.

RICHARD I., king of England, called even before his death "the Lion" or "Cœur de Lion," was the third son of Henry II. and Eleanor of Aquitaine. He was born, probably at Oxford, on September 8, 1157. In 1173 he joined the league against Henry II., but when the rebellion was suppressed in 1174 he was pardoned by his father. The death of his brother Henry in 1184 made Richard heir to the throne. From this time he was the center of the disturbances which troubled the last five years of Henry II.'s reign.

Richard's reign falls into two equal divisions—the one comprising his crusade and captivity, the other his wars against Philip in France. On his father's death he was at once acknowledged as duke of Normandy and count of Anjou. On September 3, 1189, he was crowned with great pomp at Westminster. This is the first English coronation of which we have a full account, and the formalities then adopted have been followed with little alteration ever since. Richard at once set to work to collect funds for the crusade. He raised large sums by various means, formed an alliance with Philip of France, and after obtaining the surrender of Acre on the coast of Syria arrived about Christmas, 1191, within sight of the Holy City, but, owing to the reluctance or desertion of his French allies, he found it impossible to besiege it, and therefore withdrew to the coast. Bad news from England now made him anxious to go home, but he resolved on one more attempt to save Jerusalem. He set out on June 4th, arrived again within sight of the city, and again retired without venturing to attack. Jaffa, which had been taken by Saladin, was retaken on August 1st. This was Rich-

ard's last exploit in the East. On September 1st he made a three years' truce with Saladin, on the basis of the *status quo*; and on October 9th he sailed for home, leaving behind him a name long remembered by the Saracens, but, beyond the capture of Acre, having accomplished none of the objects with which he set out.

Fearing to go through France, Richard sailed up the Adriatic, and made his way on foot, as a pilgrim and almost alone, to Erdburg near Vienna. Here he was discovered (December 21, 1192) by Leopold, duke of Austria, of whom, while at Ascalon, he had made a bitter enemy. After being confined for some time, he was surrendered in March, 1193, to the emperor Henry VI., who imprisoned him first at Trifels and afterward at Worms, whence he was at length liberated, and on the following March 13, 1194, he set foot again in England. He rapidly made himself master of the castles which held out for John, and on April 17, 1194, he was crowned a second time. He died on April 6, 1199, and was buried at Fontevraud.

RICHARD II., king of England, the only son of Edward the Black Prince and Joan of Kent, was born at Bordeaux, April 13, 1366. He succeeded to the throne on the death of his grandfather Edward III., on June 21, 1377. He was crowned on July 16. The weakness and unpopularity of the government produced a ferment among the lower classes, which, aggravated by the heavy taxation of 1379 and 1380, culminated in the Peasants' Revolt of June, 1381. This revolt gave Richard, then a lad of fifteen, his first opportunity of distinguishing himself. On June 14th he met the rebels at Mile End, and, by promising the abolition of villenage, induced the Essex contingent to return home. Next day he met the Kentish men at Smithfield. In the parley which followed, their leader, Wat Tyler, was killed. The mob were about to avenge his death when the young king, riding forward alone, calmed their irritation and induced them to follow him to Islington. Here a body of troops came to the king's aid, but Richard prevented a conflict, and persuaded the rioters to disperse. His presence of mind, extraordinary in one so young, not only saved his own life but averted a general disaster. In January, 1382, he married Anne of Bohemia, daughter of the emperor Charles IV. In 1385 the king led an expedition to Scotland. His refusal to allow the army to penetrate beyond Edinburgh is said to have caused another quarrel with the duke of Lancaster. Between 1385 and 1389 the monarchy was practically superseded by a committee on government, but in May, 1389, Richard threw off the yoke. On the ground that he was now of full age, he suddenly informed his council that he intended to rule alone. Gloucester made no resistance; the nation acquiesced; and Richard was at last really king. For eight years he ruled continuously.

In June, 1394, the queen died. In October of the same year Richard went to Ireland. He remained in Ireland till May, 1395. Next year he concluded a twenty-five years' truce with France, and engaged to marry Isabella, the French king's daughter. In July, 1397, he suddenly seized Warwick, Arundel, and Gloucester. The parliament, which met in September, declared the "appellants" guilty of high treason. Arundel was executed, Warwick imprisoned, Gloucester died, probably by violence, in prison. In February, 1399, John of Gaunt died, and Richard seized the Lancaster estates, thus reducing Hereford to desperation. The latter at once began to prepare to recover his inheritance, and Richard, apparently ignorant of the danger, went over to Ireland, thus leaving the kingdom open to his rival. Henry landed in Yorkshire early in July, and rapidly collected an overpower-

ing force. Richard returned to find Henry in possession of power and himself deserted by the nation. He surrendered to Henry at Flint (August 19th) and was conveyed to London. On September 29th he executed a deed by which he resigned the crown. Next day the deed was read in parliament. Formal sentence of deposition was pronounced, and Henry claimed and received the crown. A month afterward the late king was sentenced to perpetual imprisonment, and was removed to Pontefract. The conspiracy against Henry IV., which was discovered in January, 1400, sealed Richard's fate. The manner of his death is unknown, but there can be little doubt that he died by violence. He is said to have been buried at Langley, February 14, 1400.

RICHARD III., king of England, third son of Richard, duke of York, and Cicely Nevil, was born at Fotheringay on October 2, 1452. Having been sent out of England for safety on the death of his father in 1460, he was recalled next year by his brother Edward IV., who created him duke of Gloucester and appointed him lord high admiral. In 1474 he married Anne, daughter of the earl of Warwick and widow of Prince Edward. In 1482 he led an army into Scotland to aid the duke of Albany against James III., occupied Edinburgh and captured Berwick. On the death of Edward IV. (April 9, 1483) Richard at once made himself master of the situation by seizing Prince Edward, his nephew. Having assumed the title of Protector, he rapidly developed his plans for securing the crown. Under the pretext of a plot against his life, he seized and beheaded Hastings, Grey, and others (June 13th), forced the queen mother to give up her younger son Richard, and, on June 26, 1483, assumed the crown. The children of Edward IV. were set aside on the plea that their father was illegitimate. On July 6 Richard was crowned king. Shortly afterward it was publicly reported that the sons of Edward IV. were dead; their actual fate is to the present day unknown. In October, 1483, the rebellion of the duke of Buckingham was put down; the duke himself was executed on November 2d. A parliament which met in January, 1484, acknowledged Richard as king, in return for which he assented to an Act abolishing benevolences. His short reign was mainly occupied in preparing to resist the invasion of Henry of Richmond. Unable to prevent Henry's landing (August 7, 1485), Richard met his rival in battle at Bosworth (August 22d), and at the same time lost his crown and his life.

RICHARD, earl of Cornwall and king of the Romans, second son of John, king of England, and Isabella, was born at Winchester, January 5, 1209. In 1225 he undertook the government of Gascony. In 1240 he went on a crusade, returning in 1241, after concluding a treaty with the sultan of Egypt. In 1244 and 1246 we find him heading the parliamentary opposition against Henry III. When Henry went to France in 1253, Richard, together with the queen, acted as regent. He had already (1252) declined the pope's offer of the kingdom of Sicily, but in January, 1257, he was elected emperor by a majority of the electors, and soon afterward was crowned at Aix-la-Chapelle. In 1269 he went to Germany again for a short time, and returned to England to die at Kirkham in 1272.

RICHARD, duke of Normandy. See NORMANDY.

RICHARD OF BURY. See AUNGERVYLE, RICHARD.

RICHARD OF CIRENCESTER, historical writer, born 1335, was a member of the Benedictine abbey at Westminster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in 1355. In the year 1391 he obtained a license

from the abbot to go to Rome, his design being to visit *limina Apostolorum*, and in this license the abbot gives his testimony to Richard's perfect and sincere observance of religion for upward of thirty years. In 1400 Richard was in the infirmary of the abbey, where his death took place in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliæ, 447-1066*.

Of the *Speculum* the main value may be said to be of a negative character, in that it affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the *De Situ Britannia*, an elaborate forgery relating to the antiquities of Roman Britain which first appeared at Copenhagen in the year 1758.

This forgery was accepted as genuine by a well-known antiquary of the last century, Dr. William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries. Among their number were Gibbon, John Whitaker, Richard Gough, and Lingard. On the other hand, critics of a later date, such as J. J. Conybeare, Doctor Guest, Wex, Raine, and Woodward, from time to time gave expression, on various grounds, to a contrary conclusion. All doubt on the subject may, however, be held to have been effectually set at rest by the masterly and exhaustive exposure of the whole fraud drawn up by Professor Mayor. He has not only demonstrated, from the external and internal evidence alike, the spuriousness of the whole treatise, but in a collation (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical mediæval authorities, has also traced out the various sources from whence Bertram derived the terminology and the facts which he reproduced in the *De Situ*.

RICHARD OF ST. VICTOR, a Scot by birth, was subprior of his convent in 1159 and prior in 1162, and was a friend of St. Bernard, to whom some of his books are dedicated. Of his works, which embrace exegesis, moral and dogmatic subjects, and mystical contemplation, the first edition appeared at Paris in 1528, the best at Rouen in 1650. He died in 1173.

RICHARDSON, SIR JOHN, naturalist, was born at Dumfries on November 5, 1787, and died near Grasmere on June 5, 1865. He became a surgeon in the navy in 1807, and is known by his share in the arctic explorations of Parry and Franklin, 1819-22 and 1825-26 (see POLAR REGIONS), and in the Franklin search expedition of 1848-49, but especially by his *Fauna Boreali-Americana*. He also wrote *Arctic Searching Expedition* (1851), and other works on the zoölogy of the arctic regions. He was knighted in 1846.

RICHARDSON, SAMUEL, born 1689, as the inventor or the accidental discoverer of a new literary form, the modern novel of domestic life and manners, is entitled to a more prominent place in history than his powers, whether of thought or style, would justify. He was the author of *Clarissa Harlowe* (1749) and *Sir Charles Grandison* (1753).

The epistolary form in which his stories were cast, and which remains as a memorial of their first suggestion, was abandoned by Richardson's first great follower and satirist, Fielding; but it was Richardson that led the way into the new field of literature. He lived long enough to see many imitators. Within twelve years of the publication of *Pamela*, the *Monthly Review* began to complain of the labor of reading the multitude of novels submitted to its judgment, and the masterpieces of Fielding, Smollett, and Sterne were produced before his death in 1761. His correspondence was published in six volumes in 1804.

**RICHELIEU, ARMAND DU PLESSIS, CARDINAL DE**, the greatest French statesman of the seventeenth century, was born in 1585. As the chief events of his life have been recorded in connection with the sketch of his political career in the article **FRANCE**, it only remains briefly to mention here some matters of secondary importance. In the early days of his courtiership, when he retired for a time to Avignon, Richelieu wrote two religious works which attained to considerable popularity—*Principaux points de la foy deffendus contre l'escrit adressé au roy par les quatre ministres de Charenton* (1617), and *La méthode la plus facile et assurée de convertir ceux qui sont séparés de l'Église* (Paris, 1651). After he became master of France, his desire for distinction as a man of letters and especially as a dramatic author led him to resort to various devices that were as undignified and ludicrous as they were high-handed and arbitrary. Even this high treason against art may perhaps be forgiven in consideration of the practical services the cardinal rendered the cause of literature. *Les Thuilleries*, *La Grande Pastorale*, *Mirame*, and the other plays, over whose fate he trembled as over the result of an embassy or a campaign, have long been forgotten; but a permanent interest attaches to his *Mémoires* and correspondence, though owing to his way of working with substitutes and assistants it has been a difficult task to settle how much of what passes under his name is authentic. He died in 1642.

**RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, DUC DE**, marshal of France and grand-nephew of Cardinal Richelieu, was born in Paris, March 13, 1696, and died in the same city August 8, 1788. Besides his reputation as the most scandalous Lovelace of a scandalous age, he attained, in spite of a deplorably defective education, distinction as a diplomatist and general. As ambassador to Vienna (1725–1729) he settled in 1727 the preliminaries of peace; in 1745 he helped to gain the victory of Fontenoy; three years afterward he made a brilliant defense of Genoa; in 1756 he expelled the English from Minorca by the capture of San Felipe fortress; and in 1757–1758 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of *Petit Père de la Maraude*. In his early days he was thrice imprisoned in the Bastille—in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the Regent. He was thrice married: first against his will, at the age of fourteen, to Mademoiselle de Noailles; secondly, in 1734, by the intrigues (according to the witty Frenchman's own account) of Voltaire, to Mademoiselle de Guise; and thirdly, when he was eighty-four years old to an Irish lady.

**RICHELIEU, ARMAND EMMANUEL DU PLESSIS, DUC DE**, was born September 25, 1766, and died May 17, 1822. He was grandson of the marshal and is remembered mainly as the enlightened and heroic governor of Odessa (1803–1813) who guided the city through the terrible years of the plague, and as the minister of foreign affairs under Louis XVIII., to whom it fell to sign the treaty of 1815. A pension of 50,000 francs, voted to him by the two chambers, he bestowed on the public charities of Bordeaux.

**RICHERUS**, a chronicler of the tenth century, son of Rodulf, a trusty councilor and captain of Louis IV., studied at the Rheims under Gerbert, afterward Pope Sylvester II. His intimacy with this famous man gave him many opportunities of knowing the history of his time, and when Gerbert became archbishop of Rheims he charged Richerus with the task of writing a history of the Gauls. This history in four books begins with

Charles the Fat and Eudes, and goes down to the year 995. From 969 onward Richerus had no earlier history before him, and his work is the chief source for the period when the Capets superseded the Carolingians. It was first edited in Pertz's *Monumenta Germaniæ*, vol. iii., and there have since been several separate editions.

**RICHMOND**, a town of Surrey, England, is on the south bank of the Thames, here crossed by a stone bridge of five arches, eight and one half miles west of Hyde Park Corner by road, and nine and three-quarters from the Waterloo station of the Southwestern Railway. The town was anciently called *Syenes* and afterward *Schene* and *Sheen*, until the name was in 1500 changed to Richmond by command of Henry VII. The southeast of the town, at the entrance to Richmond Park, is Richmond Hill, from which is the famous view of the Thames with the surrounding country to the west. The town itself is without special interest, and consists chiefly of one long and irregular street running north and south. The town has a Wesleyan theological college founded in 1834, a free public library, and public baths. The population of urban sanitary district (area 1,210 acres) in 1871 was 15,113, in 1881 it was 19,066, and in 1890 was estimated at 22,500.

**RICHMOND**, a borough in the North Riding of Yorkshire, England, is finely situated on the Swale, at the terminus of the Richmond branch of the North-Eastern Railway, forty-four miles northwest of York and fifteen southwest of Darlington. The interest of the town centers in the castle, said to have been founded by Alan Rufus, son of Hoel, count of Bretagne, who is also said to have rebuilt the town on his obtaining the estates of the Saxon Earl Edwin, embracing two hundred manors of Richmond, and extending over nearly a third of the North Riding. The principal trade is in agricultural produce, but there are a paper mill and an iron and brass foundry. The town received its first charter from Elizabeth. Under the Municipal Corporation Act it is governed by a mayor, four aldermen, and twelve councilors. The population of the Municipal borough (area 2,520 acres) in 1871 was 4,443, in 1889 it was about 5,000.

**RICHMOND**, a city of the United States, the county seat of Wayne county, Indiana, is situated in a fine agricultural region on the east branch of the White Water river (a sub-tributary of the Ohio), sixty-eight miles east of Indianapolis. It is an important railway center, being the junction of the Cincinnati, Hamilton and Dayton, Grand Rapids and Indiana, Pittsburgh, Cincinnati and St. Louis, and Chicago, St. Louis and Pittsburgh Railroads, all of which occupy the same depot. It is, with its surroundings, one of the most delightful and attractive cities in the State—the city park, 135 acres in extent, being a special feature of the improvements made there during recent years. The city contains thirteen churches, a complete and well arranged system of schools, three national banks with a capital of \$500,000 and \$250,000 surplus, a public library with 15,000 volumes, four papers, and a large number of stores and offices, together with a court-house and county buildings of the best character and description. There are six hotels, one theater, one opera house, and public halls with a seating capacity of nearly 5,000. Richmond is also the location of Earlham College, founded in 1859 by the Quaker society and open to both sexes. The manufactures embrace machinery, agricultural implements, sash, doors and blinds, flour, gas and electric lights, etc., etc. The city is well laid out; wide streets, handsomely shaded and maintained, fine residences, commercial and industrial establishments substantial and architecturally desirable are to be seen

everywhere, giving the city a metropolitan appearance. The city was incorporated in 1845. The population was 9,445 in 1870, 12,741 in 1880, and 16,608 in 1890.

RICHMOND, the capital of the State of Virginia, lies on the north bank of the James river, in Henrico county, of which it is also the capital. Its position at the head of tide-water and the rapids in the river just above the city make it the head of navigation, its distance from the sea by water being about 175 miles. Vessels drawing seventeen feet of water can come up to the docks. These docks were constructed to give a means of communication between the old James river and Kanawha canal and the James river, and afford anchorage and piers for nearly two miles of shipping. There are about three miles of moorage below the docks, in the river proper, thus giving the city five miles of frontage on water navigable for large vessels.

The city is built on seven hills, and before the elaborate engineering works of late years had been consummated the ravines which separated the hills formed very pronounced lines of demarkation, and were crossed by long wooden bridges, which gave the only means of access between the different sections. Of late years, however, the bridges have disappeared and grading and filling have together made a city whose streets will compare favorably with those of any other in the country. The inclination of the surface has made the matter of drainage easy, and there is no city in the world whose sewage system is more perfect, or in which refuse matter is more easily and thoroughly cleared away. A slight fall of rain is sufficient to thoroughly cleanse the streets, the water never standing on the surface, but rushing in torrents along the gutters to the sewers, to be carried away by the rapid current of the James river. The river is crossed by two foot and wagon bridges—one of the bridges being the historic Mayo's [toll] bridge, which has been swept away several times by floods in the river, each successive time being raised higher; the other is the "free" bridge, built by the two cities of Richmond and Manchester, which occupy opposite banks of the river. The Richmond and Danville, and the Richmond and Petersburg Railroads, and the Tredegar Iron Works have also bridges for railway transportation across the river connecting the historic (Union prison) Belle Isle with both shores.

The city is replete with buildings and points of interest to the patriot and antiquarian. The old Statehouse occupies a beautiful site on the summit of an eminence in the midst of the "Capitol Square," a magnificent park of thirteen or more acres. This old building, one of the first State Capitols erected in the Union, was built in 1796, and was modeled after the Maison Carée at Nismes, France, the model being furnished by Thomas Jefferson. It faces north and south, the southern end being occupied by a portico with a massive columnar façade. It is entered on the east and west sides by flights of stairs leading to a rotunda, the center of which is occupied by Houdon's celebrated statue of Washington, while around the walls are niches containing busts of various celebrities, the most notable being one of LaFayette, erected by order of the State Legislature to the memory of that friend of America. In the story above is a collection of portraits of the celebrated men the State has produced, and some of the noted actors in the drama of the war of the secession. Among them may be mentioned the elder and younger Tylers, Governor Floyd, John Randolph, Gen. R. E. Lee, General Hood, "Stonewall" Jackson, and others. The Statehouse contains, besides the various offices of the government, the senate and house of representative chambers, and the State library. The library will well repay a long visit, as it contains, in addition to a valu-

able collection of books, an interesting museum, whose relics are intimately associated with the history of the country from earliest times down to the present. North of the Capitol building is the colossal Foley statue of Gen. T. J. (Stonewall) Jackson, in bronze, erected in 1875 by English admirers. To the west stands Crawford's heroic equestrian statue of Washington, mounted on a pedestal of Virginia granite and marble, and surrounded by colossal figures of eminent Virginians, among them being Andrew Lewis, Patrick Henry, Thomas Jefferson, George Mason, John Marshall, and Thomas Nelson. At the base of the main pedestal are minor pedestals occupied by allegorical figures representing the various battles of importance during the revolutionary war. To the southwest stands a marble statue of the "Mill-boy of the Slashes," Henry Clay. This statue, which occupies a canopy, was much mutilated directly after the civil war by relic hunters, but has since been restored. It is said to be a fine likeness of the statesman. To the northeast of the Statehouse stands the governor's mansion, an old house of massive aspect, yet dear to every Virginian on account of its historic association. There are many other notable buildings in and around the city. Old St. John's Episcopal church, on 25th and Broad streets, was the scene of the session of the House of Burgesses during and before the revolutionary war, and here Patrick Henry made some of his stirring addresses, but did not, as has been often repeated, deliver the famous "give me liberty or give me death" speech here. That speech was made at Williamsburg. On Main street between 19th and 20th, still stands the old ante-revolutionary "stone-house" of the Ege family. Here Washington's headquarters were for a time during the last days of the revolution. On 12th and Leigh streets stands the old Breckinridge mansion (commonly called the "Davis mansion,") used as the Whitehouse of the confederacy; on Marshall street is the old Marshall residence, for a long time the home of the great chief justice. The old city hall, now torn down, was the scene of many historical events—among them being the trial of Aaron Burr. The old building stood on the corner of 11th and Broad streets. St. Paul's church is noted as the "official" church of the Confederacy. The Virginia medical college was founded in 1838 by Dr. Thomas Johnston, and has since been one of the foremost medical colleges in the United States. Its peculiar Egyptian architecture makes it a notable building. The old African Baptist church, now replaced by a new structure, is rich also in historic associations. It was in this church that Horace Greeley and John Minor Botts addressed themselves to the task of quieting the frenzied negroes, who were about to indulge in a riot immediately after the war. During the slavery regime the church had a membership of several thousand slaves, necessitating the ministrations of several pastors, the latter being presided over by Doctor Ryland, a white preacher, his subordinates being mostly colored. The old State armory on the canal bank between the river and the docks played an important part in the rebellion. Near by are the famous Tredegar Iron Works, the ordnance factory of the south during the war. These are still in operation and are among the largest in the south. The State penitentiary is located at the foot of Gamble's Hill, covering several acres of ground, and is interesting from its historical associations. It is managed on the silent system, some of the convicts being farmed out to contractors, who have their work done within the walls.

Before the war Richmond was the *entrepot* for the South. Since the war she has made rapid strides toward regaining that position. Here ships from all over the world may be seen, and her commerce is

daily augmenting. The principal manufactures of the city are tobacco and cotton, together with flour, leather, etc. There are over seventy tobacco factories here, and the tobacco made is said to be the finest in the world. Considerable shipments of the raw staple are made, and reprizing establishments are numerous. Cigarettes and smoking tobacco and cigars are included in the list of products as well as chewing tobacco. The Haxall and Gallego flour mills are two among the largest in the world. Hollywood cemetery, to the west of the city is one of the most beautiful cemeteries in the world, having a natural picturesqueness of situation over the falls of the James unsurpassed. A long list of eminent men is included on the rolls of the dead who lie here. Among them may be mentioned President Monroe, Gen. J. E. B. Stuart, Gen. H. A. Wise, Gens. A. P. Hill, G. E. Pickett and others. Several thousand confederate soldiers are buried here. In Oakwood Cemetery at the opposite end of the city lie 15,000 of these defenders of the "lost cause." In both these cemeteries are monuments to the soldiers who fell in defense of the Confederacy.

In the immediate vicinity of the city are numerous granite quarries, while the clay abounding thereabouts is said to produce the finest bricks in the world.

In the James river, between Hollywood cemetery and the Chesierfield shore, lies Belle Isle (rightly named), a beautiful islet on which during the war several thousand Federal prisoners were quartered. The other military prisons were the noted "Libby" prison (now removed to Chicago), which stood on 20th and Dock streets, and "Castle Thunder," which stood on 18th and Cary streets. The latter was burned, but has since been rebuilt. The Richmond Baptist college is one of the foremost educational institutions in the South, having, in fact, adopted a modified university course. Its students are increasing yearly, and its graduates take a rank second to none. Other higher educational institutions are the female seminary, the high school, and several academies. The public school system is generously supported, Richmond having been the first among the Southern cities to adopt free public instruction after the war. The precinct schools are large and commodious, are sixteen in number, each being subdivided into (on an average) twelve schools or rooms. The whites and blacks are separately taught, there being no mixed schools. The average salary of the teachers is \$45 per month. The city owns its gas-works and water-works, and supplies its subscribers with these necessaries at so much per year, both institutions being sources of considerable revenue to the government. There are numerous lines of railways either entering the city or making close connection with it. There are several lines of street railway, one of them an electric motor system. The city is one of the most beautiful in natural situation in the world, and every year sees added attractions of art. Recently (1890) a statue to General Lee was erected on the "Allan lot," near the "New Reservoir" boulevard, thus increasing the noble collection of statuary concentrated in that city.

The city has numerous banks, a cotton and corn exchange, a flour exchange, and a tobacco exchange. There are three theaters—one of them, the old "Marshall," having before the war a stock company, which included in its members Joe Jefferson, Edwin Adams, D'Orsay Ogden, and John Wilkes Booth.

The population, which was only 5,737 in the beginning of the century, has increased as follows:—9,785 in 1810; 12,067 in 1820; 16,060 in 1830; 20,153 in 1840; 27,570 in 1850; 37,910 in 1860; 51,038 in 1870; 63,600 in 1880; and 81,388 in 1890. In 1857 the real

estate of Richmond was assessed at \$18,259,816, and the personal property at \$10,287,278. By 1885 the corresponding figures were \$34,502,903, and \$15,000,000. By 1890 the figures were \$42,604,762, and \$17,379,486.

The first settlement on part of the site of Richmond is said to date from 1609; and Fort Charles was erected as a defense against the Indians in 1644-45. But the real origin of the town, which was incorporated in 1745, was Byrd's warehouse, erected by Col. William Byrd in the close of the seventeenth century. It was still a small village when, in 1779, it was made the capital of the State of Virginia. From May, 1861, till April, 1865, when it was occupied by the Federal army, Richmond was the seat of government of the Confederate States. On the capture of Petersburg by General Grant the Confederate leaders thought it impossible to hold the city, in spite of the strength of its fortifications; and Ewell, who commanded the rear-guard of the retreating army, set the great tobacco factories and flour mills and the arsenal on fire; the conflagration lasted till the evening of the following day. In September, 1870, as had happened several times before, part of the city was laid under water by the floods of the James river, and Mayo's bridge was swept away. Opposite the city lies Manchester, really a suburb of Richmond, though enjoying a separate corporate existence. This town is almost wholly devoted to manufactures, the motive power for which is furnished by the unlimited water power of the falls of the James. It is united to Richmond by several bridges. Its chief manufactures are cotton and flour.

RICHMOND, LEGH, writer of tracts, was born January, 1772, at Liverpool, where his father was a physician. He was educated at Trinity College, Cambridge, where he was graduated B.A. in 1794 and M.A. in 1797. In 1798 he was appointed to the joint curacies of Brading and Yaverland in the Isle of Wight. He took a prominent interest in the British and Foreign Bible Society, the Church Missionary Society, and various other institutions of a similar kind. In 1805 he became chaplain to the Lock Hospital, London, and in the same year was presented to the rectory of Turvey, Bedfordshire, where he remained till his death, May, 1827. The best known of the tracts of Legh Richmond is the *Dairyman's Daughter*, of which as many as 4,000,000 in nineteen languages were circulated before 1849. A collected edition of his tracts was first published in 1814 under the title of *Annals of the Poor*.

RICHTER, ERNST FRIEDRICH EDUARD, writer on musical theory and composition, was born at Grosschönau in Saxony, on October 24, 1808. He first studied music at Zittau, and afterward at Leipsic, where he attained so high a reputation that in 1843 he was appointed professor of harmony and counterpoint at the conservatorium of music, then newly founded by Mendelssohn. On the death of Hauptmann, January 3, 1868, he was elected cantor of the Thomasschule, which office he retained until his death, April 9, 1879. He is best known by three theoretical works—*Lehrbuch der Harmonie*, *Lehre vom Contrapunct*, and *Lehre von der Fuge*—originally written for the use of his pupils.

RICHTER, JOHANN PAUL FRIEDRICH, usually called JEAN PAUL, the greatest German humorist, was born at Wunsiedel, in Bavaria, on March 21, 1763. Having attended the gymnasium at Hof for two years, Richter went in 1780 to the university of Leipsic.

Richter began his career as a man of letters by writing the *Grönländische Processe* and *Auswahl aus des Teufels Papieren*, the former of which was issued in 1783-84, the latter in 1789. These works were not re-

ceived with much favor, and in later life Richter himself had little sympathy with their satirical tone. His next book, *Die Unsichtbare Loge*, a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized by some of the best critics of the day. Encouraged by the reception of *Die Unsichtbare Loge*, he sent forth in rapid succession a series of writings which secured for Richter a great place in German literature, and during the rest of his life every work he produced was welcomed by a wide circle of admirers. In 1801 he married Caroline Mayer, a bright, accomplished, and amiable lady whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Baireuth. Here Richter spent a quiet, simple, and happy life, constantly occupied with his work as a writer. In his last years he began *Wahrheit aus Jean Paul's Leben*, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. He died of dropsy on November 14, 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. His style, too, lacks directness, precision, and grace. The splendor of Richter's genius, however, makes it easy for the class of readers to whom he appeals to forgive even these grave defects. His imagination was of extraordinary fertility, and no German prose writer has presented more fascinating pictures of childhood and youth, of friendship and love; nor has any one shown more finely how sordid circumstances may evoke the noblest qualities of loyal and generous minds.

RICIMER, created "comes" of the empire under Valentinian III., was the son of a chief of the Suevi, who had married a daughter of Wallia king of the Visigoths. He was brought up at Valentinian's court, and served with distinction under Aëtius. In 456 a decisive naval victory over the Vandals off Corsica, followed soon afterward by the defeat of their land forces near Agrigentum, earned for him the title of "Deliverer of Italy" and brought him within sight of the goal of his ambition. Having vanquished and deposed the emperor Avitus in October of that year, he for some time exercised every function of sovereignty over Italy under the title of "patrician," which he received from Leo in February, 457. When Anthemius, invested with the purple by Leo, arrived at Rome in 467, Ricimer was politic enough to acquiesce; subsequently a quarrel with his father-in-law occasioned his withdrawal to Milan, whence he marched at the head of an army upon Rome, which he besieged and sacked, Anthemius being among the slain (July 11, 472). Olybrius was next made emperor at the instance of the Roman "king-maker," who died of a malignant fever on August 18, 472.

RICKETS, a disease of childhood characterized chiefly by a softened condition of the bones and by other evidences of perverted nutrition. The symptoms which precede the outward manifestation of the disease are marked disorders of the digestive and alimentary functions. The child's appetite is diminished, and there is frequent vomiting, together with diarrhea or irregularity of the bowels, the evacuations being clay-colored and unhealthy. Along with this there is a falling away in flesh. The urine contains a large amount of calcareous salts. The bones also from their softened condition tend to become distorted and misshapen, both by

the action of the muscles and by the superincumbent weight of the body. Those of the limbs are bent outward and forward, and the child becomes "bow-legged" or "in-kneed" often to an extreme degree. The trunk of the body likewise shows various alterations and deformities. The pelvis undergoes distortion, which may reduce its capacity to a degree that in the female may afterward lead to serious difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The constitutional conditions of ill-health continue, and the nutrition and development of the child are greatly retarded.

The disease may terminate in recovery, with more or less of deformity and dwarfing, the bones although altered in shape becoming firmly ossified, and this is the common result in the majority of instances. On the other hand, during the progress of the disease, various intercurrent ailments are apt to arise which may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, etc.

The treatment of rickets is necessarily more hygienic than medicinal, and includes such preventive measures as may be exercised by strict attention to personal health and nutrition on the part of mothers, especially where there appears to be any tendency to a rickety development in any members of the family. The management of a child exhibiting any tendency to the rickets is of great importance, but can only be alluded to in general terms. The digestive disorders characteristic of the setting in of the disease render necessary the greatest care and watchfulness as to diet. The medicinal remedies most to be relied on are those which improve the digestive functions and minister to nutrition, and include such agents as the preparations of iron, quinine, and especially cod-liver oil.

When the disease is showing evidence of advancing, it is desirable to restrain the child from walking, as far as possible. But this precaution may be to some extent rendered unnecessary by the use of splints and other apparatus as supports for the limbs and body, enabling the child to move about without the risk of bending and deformity of the bones which otherwise would probably be the result.

RICKMAN, THOMAS, architect and writer on the styles of the Middle Ages, was born in 1776 at Maidenhead, Berkshire, England, where his father practiced as a surgeon, and was brought up as a member of the Society of Friends. He built an immense number of churches, chapels, and other buildings, and was an important factor in the revival of taste for mediævalism, perhaps in that respect only second to Pugin. His book entitled *An Attempt to Discriminate the Styles of Architecture in England* is a work which deserves great credit for its painstaking research; a great many editions of it were published, and it was eventually much improved and enlarged. Rickman died in 1841.

RIDDLES are probably the oldest extant form of humor. They spring from man's earliest perception that there are such things as analogies in nature. Man observes an example of analogy, puts his observations in the form of a question, and there is the riddle ready made. The riddle, to be brief, is an interrogatory form of the fable, and like the fable originates among rude people, and is perpetuated in the folklore of peasantry.

RIDLEY, NICHOLAS, bishop of London, and a martyr to the Reformation, was descended from a family long seated in Northumberland. The second son

of Nicholas Ridley of Unthank near Willimoteswick in that county, he was born in the beginning of the sixteenth century. From the grammar school of Newcastle-upon-Tyne he was sent to Pembroke College, Cambridge, about 1518, was in 1530 chosen under-treasurer of the university; and in 1534 he was senior proctor, when along with the vice-chancellor and the other proctor, Richard Wilkes, he signed the decree of the university against the jurisdiction of the pope in England. In 1540, having been made doctor of divinity, he was appointed king's chaplain; and in the same year he was elected master of his college in Cambridge. Soon after, he was appointed a canon of Canterbury. In 1545 he renounced the doctrine of transubstantiation, and was made a canon of Westminster. In 1552, returning from Cambridge, he paid a visit to the Princess (afterward Queen) Mary, at Hunsdon, Hertfordshire. On account of her unqualified condemnation of the Reformed doctrines, he from this time concurred in the proposals to exclude her from the throne, and he signed the will of Edward VI. settling the crown on Lady Jane Grey. On the death of the king, he, in a sermon at St. Paul's Cross, July 16, 1553, affirmed that Mary was illegitimate, and predicted that her accession would be disastrous to the religious interests of England. After the proclamation of Mary he set out for Framlingham to confess his offenses against her, but was met with a warrant for his arrest and was committed to the Tower. In March, 1554, he was sent down, along with Cranmer and Latimer, to Oxford, to be tried before a committee of convocation. He was convicted of heresy, was sentenced to death, and on October 16, 1555, he, in company with Latimer, was burnt at the stake at Oxford.

RIEMANN, GEORG FRIEDRICH BERNHARD, mathematician, was born on September 17, 1826, at Breselenz, near Dannenberg in Hanover. In 1846, in his twentieth year, Riemann entered himself as a student of philology and theology in the university of Göttingen. It soon became evident that his mathematical studies, undertaken at first probably as a relaxation, were destined to be the chief business of his life; and he obtained his father's permission to devote himself entirely to a scientific career. By this time he had exhausted the resources of Göttingen in the shape of mathematical lectures; and he proceeded in the beginning of 1847 to Berlin. In 1850 he returned to Göttingen and began to prepare his doctor's dissertation, busying himself meanwhile with "Naturphilosophie" and experimental physics, and in November, 1851, he obtained his doctorate. After his return to Göttingen (November, 1857) he was made extraordinary professor, and in 1860 he visited Paris, and met with a warm reception there. In November, 1865, he returned again to Göttingen, but in June, 1866, he returned once more to Italy, where he died July 20, 1866.

RIENZI, COLA DI (1313-1354). See ROME.

RIESENER, JEAN HENRI, the celebrated cabinet-maker of Louis XIV., was born at Gladbeck, near Cologne, 1725. He died January 6, 1806.

RIESENGBIRGE (Bohemian *Krkonoše*), or Giant Mountains, a lofty and rugged group on the common boundary of Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They form the highest portion of the Sudetic system, which separates southeast Prussia from the Austrian empire, and finds its natural continuation toward the northwest in the Erzgebirge, the Thuringian Forest, and the Harz Mountains. Adjoining the Isergebirge and the Lausitzergebirge on the west, and the Eulengebirge and the Adlergebirge on the east and southeast, the Riesengebirge proper run southeast and northwest between the sources of the Zacken and

the Bober, for a distance of twenty-three miles, with a breadth of fourteen miles. They cover an area of about 425 square miles, three-fourths of which is in Austrian and the remainder in Prussian territory.

RIETI, a city of Italy, in the province of Perugia, eighteen and a half miles southeast of Terni, which is sixty-nine miles by rail from Rome. It occupies a fine position 1,396 feet above the sea on the right bank of the Velino (a torrent sub-tributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. Rieti has no small amount of mediæval picturesqueness, and displays a good deal of modern activity in wine-growing, cattle-breeding, and sugar-boiling. The fertility of the neighborhood is celebrated both by Virgil and by Cicero. A Roman bridge over the Velino, Thorwaldsen's monument to Isabella Alfani, and a statue to St. Barbara by Berdini, both in the cathedral, and the Palazzo Vincentini by Vignola deserve to be mentioned. The population was 7,875 in 1871, and 9,618 (with suburbs, 13,679; in the commune, 16,822) in 1881, and estimated at 10,000 in 1890.

RIETSCHHEL, ERNST FRIEDRICH AUGUST, one of the most distinguished of modern German sculptors. Born at Pulsnitz in Saxony in 1804, at an early age he became an art student at Dresden, and subsequently a pupil of Rauch in Berlin. He there gained an art studentship and studied in Rome in 1827-28. After returning to Saxony he soon brought himself into notice by a colossal statue of Frederick Augustus, king of Saxony, was elected a member of the academy of Dresden, and thenceforth became one of the chief sculptors of his country. In 1832 he was elected to the Dresden professorship of sculpture, and had many foreign orders of merit conferred on him by the governments of different countries. His death occurred at Dresden in 1861.

RIFLE. See GUNMAKING.

RIFLEMAN-BIRD, or RIFLE-BIRD, names given by the English in Australia to a very beautiful inhabitant of that country. The cock bird is clothed in velvety-black, generally glossed with rich purple, but having each feather of the abdomen broadly tipped with a chevron of green bronze, while the crown of the head is covered with scale-like feathers of glittering green, and on the throat gleams a triangular patch of brilliant bluish emerald, a color that reappears on the whole upper surface of the middle pair of tail-quills. The hen is grayish-brown above, the crown striated with dull white; the chin, throat, and a streak behind the eye are pale ochreous, and the lower parts deep buff, each feather bearing a black chevron. It inhabits the northern part of New South Wales and southern part of Queensland as far as Wide Bay, beyond which its place is taken by a kindred species, the *P. victoriae* of Gould, which was found by John Macgillivray on the shores and islets of Rockingham Bay. Further to the north, in York Peninsula, occurs what is considered a third species, *P. alberti*, very closely allied to and by some authorities thought to be identical with the *P. magnifica* (Viellot) of New Guinea—the "Promerops" of many writers. From that country a fifth species, *P. wilsoni*, has also been described by Mr. Ogden. Little is known of the habits of any of them, but the Rifleman-bird proper is said to get its food by thrusting its somewhat long bill under the loose bark on the boles or boughs of trees, along the latter of which it runs swiftly, or by searching for it on the ground beneath. During the pairing-season the males mount to the higher branches and there display and trim their brilliant plumage in the morning sun, or fly from tree to tree uttering a note

which is syllabled "yass" greatly prolonged, but at the same time making, apparently with their wings, an extraordinary noise like that caused by the shaking of a piece of stiff silk stuff. Verreaux informed Mr. Elliot that he believed they breed in the holes of trees and lay white eggs; but on that score nothing is really known.

RIGA (Esth. *Ria-Lin*), a seaport of Russia, in 56° 57' N. latitude and 24° 6' E. longitude, 375 miles southwest of St. Petersburg, is in population the fifth city of the empire, while in foreign trade it ranks next to St. Petersburg and Odessa. The town is situated at the southern extremity of the gulf, eight miles above the mouth of the Düna (Dwina), which brings Riga into water communication with an extensive region, as also with the basins of the Dnieper and Volga.

Riga consists of four parts—the old town and the St. Petersburg and the Moscow suburbs standing on the right bank of the Düna, and the Mitau suburb on the left bank, connected by a floating bridge which is removed in winter, and by a viaduct, 820 feet long, resting on light piers of solid stone, and leaving a passage for ships. The old town still preserves its Hanseatic features—and is so limited that its population increases very slowly. The so-called suburbs, on the other hand, with their broad and quiet boulevards on the site of the former fortifications, are steadily growing and undergoing new improvements.

The population was 167,728 in 1881, is now (1890) estimated at about 185,000. About one-half of the population is German, the remainder being Russian and Lettish in nearly equal proportions, with some 2,000 Esthonians, and nearly 5,000 foreigners. The life of the city has a German character throughout, but the Russians (many of whom were serfs until 1861), and still more the Letts and Esthonians, also display a steadily progressive intellectual life. Both are seeking to counteract the German influence by increasing the number of their educational institutions, the Letts also by the stage and the press. The larger commerce is wholly in German and (to a less extent) English hands. Owing to its communication by water and rail with the forests of White Russia and Volhynia, Riga is a great mart for timber, which in value stands third among the exports. Flax and linsced occupy the first place, Riga being the chief Russian port for the extensive flax-producing region of northwest Russia. Owing to the great railway which crosses the country from Riga to Smolensk, afterward dividing into two branches, to Orenburg and Tsaritsyn on the lower Volga respectively, Riga is also the great storehouse and place of export for hemp coming by rail from west central Russia, and for corn, Riga merchants sending their buyers as far east as Tamboff. Oats, in particular, are extensively exported to England from the central provinces. Tallow, leather, tobacco, rugs, feathers, and other minor items add considerable to the total value of the exports. The competition of the port of Libau is counterbalanced by the steady development of the Russian railway system. The imports, consisting chiefly of salt, fish, wine, and cotton, with metals, machinery, coal, oils, fruits, tobacco, and other minor articles, are also rapidly increasing. Riga is in railway communication with Libau (*via* Mitau), and with St. Petersburg (*via* Düna), Warsaw, and central Russia; the traffic is very active.

The manufactures of the town and neighborhood are yearly developing; the chief items are woolen cloth, cottons, machinery, metal wares, cigars, cork, glass, and paper.

The educational institutions include, besides the polytechnic, a Greek seminary, four gymnasiums, some ten private schools for secondary education of boys and

girls, and a comparatively large number of primary schools. The municipal library contains very interesting materials relating to the history of the Baltic provinces. The book trade is rapidly extending.

RIGAUD, HYACINTHE, French painter, born at Perpignan July 20, 1659, was the descendant of a line of painters. Having early lost his father, he was sent by his mother to Montpellier, where he studied under Pezet and was helped by Ranc, then to Lyons, and in 1681 to Paris. Having attained a professional position of unsurpassed eminence, Rigaud died at the age of eighty-four on December 27, 1743, having never recovered from the shock of losing his wife in the year previous.

RIGGING. See illustration in article on SEAMANSHIP.

RIGHT, PETITION OF. See PETITION.

RIGHTS, BILL OF. On February 13, 1688-89, the Declaration of Right was delivered by the Lords and Commons to the prince and princess of Orange. In October, 1689, the rights claimed by the declaration were enacted with some alterations by the Bill of Rights, 1 Will. and M., § 2, c. 2, next to Magna Charta the greatest landmark in the constitutional history of England and the nearest approach to the written constitutions of other countries.

The Declaration of Right and the Bill of Rights introduced no new principle into the English constitution. In the United States, the main provisions of the bill of Rights, so far as they are applicable, have been adopted both in the constitution of the United States and in the State constitutions.

RIMINI. The city of Rimini is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprusa, now called Ausa, on the east, and has the river Marecchia, the Arimnum of the ancients and later known as the Ariminum, on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Mons Titanus crowned by the towers of San Marino. This oldest and smallest of republics commands a prospect of almost unrivaled beauty over hill and plain—to Ravenna on one side, Pesaro on the other, and mountains of Montefeltro, Rimini and its rivers, and across the Adriatic to the Dalmatian coast. During the Middle Ages the history of Rimini has no importance. In 1216 Rimini, being worsted by Cesena, adopted the desperate plan of granting citizenship to two members of the Malatesta family—Giovanni and Malatesta—for the sake of their aid and that of their vassals in the defense of the State, and the conduct of the war. Then followed a long period of confusion in which, by means of conspiracies and crimes of every kind, the Malatesta succeeded in becoming tyrants of Rimini. The Malatesta family ruled for 250 years, but in 1528 Pope Clement VII. became master of the town.

From that time the Malatesta became citizens of Venice; their names were inscribed in the Golden Book, and they were admitted to the grand council. With the death, in 1716, of Christina Malatesta, the wife of Niccolo Boldu, the Rimini branch of the family became extinct. The descendants of Giovanni, brother of Malatesta da Verrucchio, who married one of the Sogliano, were known as the Sogliano-Malatesta. The representatives of this branch settled in Rome. The history of Rimini practically ends with its independence. It fell into obscurity under the rule of the popes, and was not again mentioned in history until, in 1831 and 1845, it took a prominent part in the revolutionary movements against papal despotism, and in favor of Italian independence. Although Rimini, like many

other cities of Romagna, is now harassed by republican and socialistic sets, it is a thriving town, and enjoys increasing prosperity. It had, in 1881, a population of 37,248 souls, and, in 1889, 40,000, being the center of a district containing 88,110 inhabitants, and is part of the province of Forlì, which, divided into three districts of Cesena, Forlì, and Rimini, has a total population of 252,883 souls. Many small manufactures are carried on at Rimini, but agriculture is its principal resource, and its produce in corn and wine is considerably in excess of the local consumption. Rimini also boasts a good public library of 28,000 volumes, inclusive of 850 MSS.; and it has a record office containing several thousand ancient MSS.

RINDERPEST. See MURRAIN.

RING (Gr. *δακτύλιος* Lat. *annulus*). At an early period, when the art of writing was known to but very few, it was commonly the custom for men to wear rings on which some distinguishing sign or badge was engraved (*ἐπίσημον*), so that by using it as a seal the owner could give a proof of authenticity to letters or other documents.

The earliest existing rings are naturally those found in tombs of ancient Egypt.

In ancient Babylonia and Assyria finger rings do not appear to have been used. In those countries the signet took a different form, namely, that of a cylinder cut in crystal or other hard stone, and perforated from end to end, but the Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian, which are a link between the art of Egypt and that of Greece, the design cut on the flat side being Hellenic in style, while the back is shaped like the ordinary Egyptian scarabæus beetle.

Among the Greeks signet rings were very largely worn, and were usually set with engraved gems while the Romans appear to have imitated the simplicity of Lacedæmonia. Throughout the republic none but iron rings were worn by the bulk of the citizens.

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings; Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *jus annuli aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial, and private matters. Among the varieties of rings is the Ring of the Fisherman, worn by the pope, also the Episcopal ring, conferred upon the newly-made bishop, together with his crozier, a special form for this being inserted in the Pontifical. Then there are the Posy rings, so called from the rhymes engraved upon them, Memorial rings, Merchant's rings, engraved with a badge or trade-mark, Papal rings, of which many now exist dating from the fifteenth and seventeenth centuries, given by the popes to new-made cardinals; Poison rings, with a hollow bezel, used in classical times. In the bezel a hollow point, made to work with a spring, was concealed; it communicated with a receptacle for poison in a cavity behind in such a way that the murderer could give the fatal scratch while shaking hands with his enemy.

Another very large and elaborate form of ring is that used during the Jewish marriage service. Fine examples of the sixteenth and seventeenth centuries exist. In the place of the bezel is a model, minutely worked in gold or base metal, of a building with high gabled

roofs, and frequently movable weathercocks on the apex. This is a conventional representation of the temple at Jerusalem. Perhaps the most magnificent rings from the beauty of the workmanship of the hoop are those of which Benvenuto Cellini produced the finest examples. They are of gold, richly chased and modeled with caryatides or grotesque figures, and are decorated with colored enamels in a very skillful and elaborate way. Very fine jewels are sometimes set in these magnificent pieces of sixteenth-century jewelry.

RINGWORM. A common disease of the scalp due to the presence of a fungus.

RIOBAMBA, or ROYABAMBA, a town in the South-American republic of Ecuador, situated on the road from Guayaquil to Quito in "a sand valley or plain of the great central highland of the Andes—Chimborazo, Carguairazo, Tunguragua, and Altar all being visible from its plaza." The town has occupied its present site only since the close of the eighteenth century; in 1797 the old town, which lay about twelve miles to the west at Cajabamba, was completely destroyed by a vast landslip (still recognizable) from Mount Cicalfa in one of the most terrific convulsions recorded even in that region of volcanic activity. Though said to have 16,000 inhabitants, and to manufacture woolen gloves, sacking, and coverlets, the town is poorly built and comparatively lifeless.

RIO DE JANEIRO (in full form SÃO SEBASTIÃO DO RIO DE JANEIRO, and colloquially shortened to RIO), the capital of Brazil, and one of the principal seaports of South America, is situated on the western side of one of the finest natural harbors in the world in 25° 54' 23" S. latitude and 43° 8' 34" W. longitude (the position of the observatory). Along with its environs it is separated from the province of Rio de Janeiro (whose chief town is Nitherohi) and constitutes an independent municipality (*município neutro*), with an area of about 540 square miles, divided into nineteen (formerly sixteen) parishes or *freguezias*. Most of the streets are narrow and mean-looking; even the fashionable Rua do Ouvidor, which is lined on both sides with handsome shops, is a mere alley. The Rua Direita, or, as it is now called officially, Rua Primeiro de Março, is the principal business street, and is wide and pleasant. The churches and monastic buildings of Rio de Janeiro number upward of fifty, mostly built in the "Jesuit" style, but striking from their size and the barbaric magnificence of their decorations, as well as on account of their well-chosen sites. Besides the famous hospital of Dom Pedro II., there are several smaller institutions of the same class in the city; and a large and handsome lunatic asylum, founded in 1841 with funds obtained by selling titles of nobility at a fixed tariff, occupies a good position in the Botafogo suburb. The military hospital is also an extensive establishment. Among the literary and scientific institutions of the city, the College Dom Pedro II. (which is well organized), national museum, institute of history, geography, and ethnology (1838), polytechnic institute, national educational museum, polytechnic school, military, naval, and normal schools, lyceum of arts, musical conservatory, geographical society, and astronomical and meteorological observatory deserve special mention. The great national library owes its foundation to the bequest of João VI., and now numbers upward of 120,000 volumes open to the public daily (see LIBRARIES). One of the pleasant features of the city is the abundant supply of excellent water distributed to numerous stately fountains in the streets and public squares. The bay of Rio de Janeiro has been the subject of poetic panegyric ever since it was discovered; and the traveler who comes to it after a voyage round the world seems as susceptible to its

charm as if it were his first tropical experience. The actual entrance, between Fort St. Juan and Fort Santa Cruz, is 1,700 yards wide. Within there are fifty square miles of anchorage, or even more for vessels of light draught, the bay having a width varying from two to seven miles and stretching inland from the sea for sixteen miles. Its coast line, neglecting minor indentations, measures sixty miles.

How completely (in spite of the fact that Santos and Rio Grande have become more independent) Rio de Janeiro is the commercial as well as the political capital of Brazil is evident from the fact that the exports from Rio are on the average fully equal in value to those from the rest of Brazil. To the large total, coffee has long contributed 40-50 per cent., and in 1880-81 (an exceptional year) the ratio rose to 86 per cent. Though the coffee plant was not introduced till 1770, Brazil is the greatest coffee-producing country in the world, and Rio de Janeiro is consequently the largest coffee-exporting city. The other exports of moment are brandy (in decreasing quantities), sugar, hides, diamonds, tapioca (mainly to France), tobacco and cigars, medicinal herbs, gold dust, and jacaranda, rosewood, and other timbers. The imports comprise cotton goods, machinery, pitch pine, and petroleum. Among the comparatively few local industries are the weaving of colored buckskins (by a German firm) and other woolen and half woolen stuffs, the extensive manufacture of artificial mineral waters and liquors, brewing, carriage-building, and hat-making. Rio de Janeiro is the terminus of the Dom Pedro II. Railway, and thus of nearly the whole railway system of the country; and it communicates regularly by steamer with Niterohi on the other side of the bay, which is the terminus of another line. In 1889 there were 5,781 miles of railway open. The population of the municipality of Rio de Janeiro was in 1850 stated at 266,466, of which 205,906 were in the town proper; but this, like most of the earlier figures, appears to be an exaggeration, as the census in 1872 gave only 274,972, of which about 190,000 were in the town and suburbs, the slaves numbering 48,939 and the foreigners (mainly Germans, French, and Italians) 84,279. The population in 1889 was about 350,000. The Italian element has been rapidly increasing. The bulk of the population is Portuguese with a mixture of Negro blood. The native Indian races are scarcely represented.

The bay of Rio de Janeiro, the Niterohi or "Hidden Water" of the natives, was first observed on January 1st (hence the name) by Alphonso de Souza, who supposed, as the Rio indicates, that he had discovered the mouth of a large river. How Villegagnon in 1558 took possession of the island which now bears his name but was then called after his patron Coligny, and how his colony was destroyed by the Portuguese, has been told in the article BRAZIL. The city of Rio de Janeiro did not become the capital of the viceroyalty till 1763, when José I. chose it in preference to Bahia because it was a better center for defensive operations against the Spaniards. In 1711 it had been captured by Duguay-Trouin, who exacted 70,000 cruzados as ransom. It became the residence of the Portuguese royal family in 1808; in the same year its port was declared free to foreign trade; and in the course of a short time it was made by Dom João VI. the seat of so many important institutions that Portugal became jealous at finding the relation between mother country and colony practically reversed. When João VI. returned to Portugal and Pedro was declared emperor of Brazil in 1822, Rio de Janeiro naturally remained the capital of the new state. On November 29, 1889, when the Republic of Brazil was founded, Rio de

Janeiro was the headquarters of those who promoted the change, and has since been designated as the capital.

RIO GRANDE (that is, "Great River" in both Spanish and Portuguese), a descriptive epithet which in a vast number of cases has become a proper name. (1) RIO GRANDE (or RIO BRAVO) DEL NORTE, which rises in the Rocky Mountains between the La Plata and San Juan ranges in the southwest of Colorado, has a total course of about 1,800 miles, and forms for 1,100 miles the boundary between the United States and Mexico, but owing to the shallowness of its ordinary current is navigable for steamers only to Kingsbury's Rapids, 450 miles from the sea. (2) RIO GRANDE DO NORTE, or Potengi, or Potingi, which gives its Portuguese name to a northern province of Brazil, rises in the Serra dos Cairiris-Novos, passes Natal, the capital of the province, and falls into the sea to the south of São Roque. (3) RIO GRANDE DO SUL, the outlet of the Lagõa dos Patos, wrongly supposed by the early explorers to be the mouth of a great river, gives its name to a city and province of Brazil (see below). (4) RIO GRANDE, a river of Western Africa, enters the sea opposite the Bissagos Archipelago (see SENEGAMBIA).

RIO GRANDE DO SUL, or in full SÃO PEDRO DO RIO GRANDE DO SUL, a city of Brazil, in the province of the same name, near the mouth of the estuary of Rio Grande. Including the suburbs it is a place of from 30,000 to 35,000 inhabitants, with a considerable trade and various manufactures. The bar at the mouth of the "Rio" does not admit vessels of full ten-foot draught; but dredging operations undertaken by the government in 1882 are considerably increasing the depth. In 1881-84 a railway was constructed from Rio Grande do Sul to Bage 125 miles inland. The average annual value of the imports in the six official years ending June 30, 1882, was about \$2,945,215, reckoning the milreis at 50c. In 1881, 651 vessels (133,779 tons) crossed the bar inward, and 555 (133,276) outward. Among the foreign vessels the British are most numerous. The imports are very various, to supply the colonies of Germans, Italians, etc., settled throughout the province; the exports on the other hand are mainly hides, skins, bones, hair, tallow, etc.

Rio Grande do Sul was a long time the chief town of the captaincy of El Rei (which included both the present province of Rio Grande do Sul and that of Santa Catharina). It was first founded as an encampment of Portuguese troops in 1737 on the south side of the Rio Grande. The settlement was removed to its present site by Gomes Freire d'Andrade in 1745. The Spaniards occupied this part of the country from 1763 to 1776. In 1807 the two districts of São Pedro and Santa Catharina were united and erected into a province with São José de Porto Alegre for its chief town; and, though Rio Grande was declared a city in 1809, Porto Alegre retained its position even after the separation into two comarcas in 1812. The name of the province has been rendered familiar in Europe through the remarkable success which has attended the establishment of German and Italian agricultural colonies. In 1872 there were 36,458 foreigners in the province to 330,564 freeborn Brazilians and 67,791 slaves; and by 1882 it was estimated that the German population alone amounted to 102,000, while the Italians, who began to immigrate in 1875, were rapidly approaching 50,000. The first German settlement was that of São Leopoldo on the Rio do Sino, founded by Dom Pedro I. in 1825. By 1830 the inhabitants numbered 5,000, and in 1854 the town was made a municipality. Others of the same nationality are Novo Mundo (1850), Nova Petropolis (1858), Santa Maria da Soledade, Marato, São Benedito, São Salvador, Montenegro, Feliz, Teutonia (1858),

Estrella (1856), Santa Cruz (1849), Mont Alverne, Germania, São Lorenzo (1858), Santa Clara, São Silvano, Domingos, etc. The principal Italian colonies are Caxias, Conde d'Eu, Donna Isabel, and Silveira Martins, which in 1884 had respectively 13,680, 6,287, 9,595, and 6,000 inhabitants. The success of these colonies is one of the most important elements in the development of the Brazilian empire.

RIOM, a town of France, with 9,590 inhabitants, at the head of an arrondissement in the department of Puy-de-Dôme, eight miles north of Clermont-Ferrand on the railway to Paris, occupies an eminence on the left bank of the Ambène (a left-hand tributary of the Allier) rising above the fertile plain of Limagne. It is surrounded with boulevards and has wide streets, but the houses, being built of black lava, have a rather somber appearance. A feature in the town is the fountains, of which some are of the Renaissance period. Riom trades in the products of Limagne—grain, wine, hemp, preserved fruits, and especially a conserve of apricots—and has a tobacco manufactory.

RIONERO IN VOLTURE, a city of Italy, in the province of Potenza, four miles from Atella, is pleasantly situated at the foot of Monte Volture, has the repute of being the best built and best kept of the towns of the Basilicata, and has long been distinguished by the industrious character of its inhabitants (11,383 in 1881). In 1851 it suffered severely from the earthquake.

RIOT is "an unlawful assembly which has actually begun to execute the purpose for which it assembled by a breach of the peace and to the terror of the public." An unlawful assembly is an assembly of three or more persons with intent to commit a crime by force or carry out a common purpose, lawful or unlawful, in such a way as to give reasonable grounds for fearing a breach of the peace. A rout is an unlawful assembly which has made a motion toward the execution of its common purpose. If the unlawful assembly should begin to demolish a particular inclosure, that would be a riot; if it should proceed to pull down all inclosures, that would be treason. It was considered, as early as the fourteenth century, that the common law gave an insufficient remedy against riot. Subsequently Parliament took special cognizance of the crime, giving jurisdiction to justices to restrain, arrest and imprison rioters; also conferring similar powers on the sheriff and *posse comitatus*, and constituting certain statutory offenses similar to riot at common law. Any prosecution for an offense against the act must be commenced within twelve months after the offense.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling a riot. In this duty he is aided by the common law, under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the auxiliary and reserve forces for the suppression of riot, and to close public houses where a riot is apprehended. A matter of interest is the extent of the protection afforded by the Riot Act to soldiers acting under the commands of their officers. The soldier is at the same time a citizen, and the mere fact of his being a soldier, is not sufficient to exonerate him from all responsibility. No case in which the question has called for decision seems to have arisen. The civil remedy given to those whose property has suffered by riot is of an exceptional character. The action is brought against the hundred in which the riot took place. The hundred is supposed to guarantee the orderly conduct of its inhabitants, and is liable to damages for its failure to preserve order. It has been held that damage to a house will not entitle the owner

to compensation from the hundred unless the intention of the rioters was to totally destroy the house.

The Riot Act does not extend to Ireland.

In Scotland a riot may be either rioting and mobbing or rioting and breach of the peace. The first is much the same as the riot of English law. "Mobbing consists in the assembling of a number of people and their combining against order and peace to the alarm of the lieges" (Macdonald, *Criminal Law*, 180). The second offense occurs where concourse or a common purpose are wanting. The liability of the country or burgh for destruction of property by riot is provided for by the Riot Act and by several Acts of Parliament of the reign of George III.

In the United States the law is based upon that of England. In some States there is a statutory proclamation for the dispersion of rioters in words almost identical with those of the British Riot Act. The city, town, or county, according to circumstances, is liable for the damage caused by rioters. In some cases a remedy over against the rioters is given by legislation.

RIPARIAN LAWS. By the law of England the property in the bed and water of a tidal river as high as the tide ebbs and flows at a medium spring tide is presumed to be in the crown or a grantee of the crown, generally the lord of a manor, and the bed and water of a non-tidal river are presumed to belong to the person through whose land it flows, or, if it divide two properties, to the riparian proprietors, the rights of each extending to mid-stream (*ad medium filum aquæ*). In order to give riparian rights, the river must flow in a defined channel, or at least above ground. The diminution of underground water collected by percolation does not give a cause of action to the owner of the land in which it collects, though he is entitled to have it unpolluted unless a right of pollution be gained against him by prescription. As a general rule a riparian proprietor, whether on a tidal or non-tidal river, has full rights of user of his property.

The principal rights enjoyed by riparian owners as such are the right of increase of property by means of alluvion and the right of use of the water.

Alluvion is the gradual and imperceptible increase of land by deposit; a sudden and violent changing of the course of a stream by a flood does not change the property.

The limitations to which the right of the riparian proprietor is subject may be divided into those existing by common right, those imposed for public purposes, and those established against him by crown grant or by custom or prescription. Under the first head comes the public right of navigation, of anchorage and fishery from boats (in tidal waters), and of taking shell-fish (and probably other fish except royal fish) on the shore of tidal waters as far as any right of several fishery does not intervene. Under the second head would fall the right of eminent domain by which the state takes riparian rights for public purposes, compensating the proprietor, the restrictions upon the fishery rights of the proprietor, as by acts forbidding the taking of fish in close time, and the restrictions on the ground of public health, as by the Rivers Pollution Act, 1876. The jurisdiction of the state over rivers in England may be exercised by officers of the crown, as by commissioners of sewers or by the Board of Trade under the Crown Lands Act, 1866. A bridge is erected and supported by the county authorities, and the riparian proprietor must bear any inconvenience resulting from it. An example of an adverse right by crown grant is a FERRY (*q.v.*) or a port. The crown, moreover, as the guardian of the realm, has jurisdiction to restrain the removal of the foreshore, the natural barrier of the sea, by its owner in case of apprehended danger to the coast. The

rights established against a riparian proprietor by private persons must, as a rule, be based on prescription or custom, only on prescription where they are in the nature of profits *à prendre* (see PRESCRIPTION). Among such rights are the right to bathe, to land, to discharge cargo, to tow, to dry nets, to beach boats, to take sand, shingle, or water, to have a sea-wall maintained, to pollute the water (subject to the Rivers Pollution Act). In some cases the validity of local riparian customs has been recognized by the legislature.

A freshwater lake appears to be governed by the same law as a non-tidal river. The preponderance of authority is in favor of the right of the riparian proprietors as against the crown. The law of Scotland is in general accordance with that of England. In the United States the common law of England was originally adopted, the State succeeding to the right of the crown. In Pennsylvania, North Carolina, South Carolina, Iowa, Mississippi, and Alabama, it has been determined that the common law does not prevail, and that the ownership of the bed or soil of all rivers navigable for any useful purpose of trade or agriculture, whether tidal or fresh water, is in the State (Bouvier, *Law Dict.* s.v. "River"). The supreme court of the United States in 1857 declared constitutional an Act of Congress of 1845, extending the admiralty jurisdiction of the United States to all public navigable rivers and lakes where commerce is carried on between different States or with foreign nations. The right of eminent domain has been exercised to a much greater extent than in England in the acquisition of sites for mills under the powers of State legislation in encouragement of trade. The law as to subterranean water seems to be still unsettled. Some State decisions have recognized a public right to moor vessels and place cargo on the shore.

RIPH (פ'רי or ר'יא'), *i.e.* RABBENU YISHAK B. YA'AKOB HAKKOHEN AL-PHASI OR AL-FEZI, after the death of his teachers the greatest rabbi of Africa, and subsequently of the Peninsula, in the eleventh and twelfth centuries, was born in 1013 at Kal'at-Ibn-Hammad near Fez, and died at Lucena in 1103.

RIPLEY, a well-built market town of Derbyshire, England, situated near the river Derwent and the Cromford Canal, and on a branch line of the Midland Railway ten miles north of Derby and ten south of Chesterfield. In the neighborhood there are extensive collieries, and coke is largely manufactured. Besides the large concern of the Butterley Iron Company, which includes foundries, blast furnaces, and boiler works, the town possesses silk and cotton mills. The charter for the market was granted by Henry III. The population of the urban sanitary district (area 1,211 acres) in 1871 was 5,639; in 1881 it was 6,087, and about 7,000 in 1890.

RIPLEY GEORGE, critic and man of letters, was born at Greenfield, in western Massachusetts, on October 3, 1802. He was educated at local schools and at Harvard College, where he took his degree in 1823, and then studying theology was in 1826 ordained pastor of a Unitarian church in Boston. Here his success as a thoughtful preacher was marked; but in 1840 he resigned his charge, and he subsequently retired from the active ministry altogether.

In 1849 he joined the staff of *The Tribune*, founded eight years before by Horace Greeley in New York, and in a short time became its literary editor. This position, which, through his steadiness, scholarly conservatism, and freedom from caprice as a critic, soon became one of great influence, he held until his death on July 4, 1880.

During the greater part of the time of his connection with *The Tribune*, Ripley was also the adviser of a leading publishing house, an occasional contributor to

the magazines, and a coöperator in several literary undertakings. The chief of these, and the most lasting work that bears his name, was the *American Cyclopædia*.

RIPON, a cathedral city and borough in the West Riding of Yorkshire, England, is situated at the confluence of the Ure with the Laver and the Skell, and on the Great Northern Railway, twenty-two miles northwest of York and eleven north of Harrogate. From an early period till the sixteenth century Ripon was celebrated for its manufactures of woolen cloth. After this industry declined the town became so well known for its spurs that "as true steel as Ripon rowels" became a current phrase; and both Ben Jonson and Davenant refer to Ripon spurs in their verses. This manufacture, with those of buttons and various kinds of hardware, continued to prosper till the beginning of the present century, when the rise of the mechanical industries in the large towns caused it to decline. The population of the borough (area 1,580 acres) in 1871 was 6,806, in 1881 it was 7,390, and in 1890 it was estimated at 7,000.

RIPPERDA, JOHN WILLIAM, BARON, a political adventurer, was born of noble parents in the province of Groningen in the Netherlands, in 1680, and was educated in the college of the Jesuits at Cologne. He died at Tetuan toward the end of 1737.

RIPUARIAN LAW. See SALIC LAW.

RIST, JOHANN, German hymn-writer, was born at Ottensen in Holstein on March 8, 1607, and educated at Hamburg, Bremen, Leyden, Utrecht, Leipsic. In 1635 he became a preacher at Wedel on the Elbe, and there he died on August 31, 1667 (see HYMNS).

RITSCHL, FRIEDRICH WILHELM, an eminent German scholar, was born in 1806 in Thuringia. The great event of Ritschl's life was a sojourn of nearly a year in Italy (1836-37), spent in libraries and museums, and more particularly in the laborious examination of the Ambrosian palimpsest of Plautus at Milan. From this journey Ritschl's whole temperament and intellect received a new and richer coloring, and the remainder of his life was largely occupied in working out the material then gathered and the ideas then conceived. He accepted a call to Leipsic, where he died in harness in 1876.

Ritschl's character was strongly marked. To the world in general Ritschl was best known as a student of Plautus. When he began his studies, the text of that author was like some ancient picture, defaced alike by time and by much repainting. He cleared away the accretions of ages, and by efforts of that real genius which goes hand in hand with labor, brought to light many of the true features of the original.

In spite of the incompleteness, on many sides, of his work, Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his *Opuscula* collected partly before and partly since his death. The *Trinummus* (twice edited) was the only specimen of his contemplated edition of Plautus which he completed. The edition has been continued by some of his pupils—Goetz, Loewe, and others—and is still in progress.

RITSON, JOSEPH, was the most militant and ill-tempered, and at the same time one of the most learned and accurate, of the antiquaries of the eighteenth century. Born at Stockton-on-Tees, of a Westmoreland yeoman family, in 1752, he was bred to the law, and settled in London as a conveyancer at the age of twenty-two. His first notable publication was in 1782, an attack on Warton's *History of English Poetry*. In the following year Johnson and Stevens were assailed for their text of Shakespeare. Bishop Percy was next

subjected to a furious onslaught in the preface to a collection of *Ancient Songs* (printed 1787, dated 1790, published 1792). His collection of the Robin Hood ballads is perhaps his greatest single achievement. Spelling was one of his eccentricities, his own name being an example: Ritson is a short pronunciation for Richardson. He died in 1803.

RITTENHOUSE, DAVID, astronomer, was born at Germantown, Penn., April 8, 1732. First a watchmaker, he afterward became treasurer of Pennsylvania and (from 1792) master of the United States mint; he was largely occupied in settling the boundaries of several of the States. As an astronomer, Rittenhouse's principal merit is that he introduced the use of spider lines in the focus of a transit instrument. He died on June 26, 1796.

RITTER, CARL, the greatest geographer of modern times, was born at Quedlinburg on August 7, 1779, and died in Berlin, September 29, 1859.

The service rendered to geography by Ritter was mainly threefold. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, glaciers, etc., were so many distinct kinds of organs, each with its own appropriate functions; and, as his physical frame is the basis of the man, determinative to a large extent of his life, so the structure of each country is a leading element in the historic progress of the nation. Such portions of his universal geography as he completed remain each the standard thesaurus for its territory. This is especially the case with the sections devoted to Palestine and to Central Asia.

RIVAROL, ANTOINE DE, was born at Bagnols in Languedoc on June 26, 1753, and died at Berlin on April 13, 1801. He was well educated, and is said to have been admitted by the bishop of Uzès to a theological seminary, then to have held a tutorship at Lyons under the name of Longchamps. He went to Paris and when the Revolution developed the importance of the press, Rivarol at once took up arms on the royalist side. The *Journal Politique* of Sabatier de Castres and the *Acts des Apôtres* of Peltier were the chief papers in which he wrote. Rivarol has had no rival in France except Piron, and none in England except Sidney Smith, in sharp isolated conversational sayings.

The works of Rivarol were published in five volumes by his friend Chênédollé (who has reported much remarkable conversation of his in his last days) and Fayolle (Paris, 1805); but their perusal as a whole can only be recommended to the student of literature.

RIVE DE GIER, a town of France, in the department of Loire, situated thirteen miles to the east-northeast of St. Étienne, on the Lyons Railway at the head of the canal of Givors on the Gier. The town, which is constantly enveloped in a dense cloud of smoke, and presents a dirty and unattractive appearance, is principally dependent on the coal industry, there being fifty pits in the basin of the Gier, with an annual output of over 19,000,000 bushels. There are twenty-two coke and lamp black furnaces, and five glass works, the products of which—colored glass and so-called Nuremberg mirrors—are celebrated, on account of the fineness and purity of the sand found on the banks of the Rhone and the Saône. Mining machinery, railway plant, and coarse ironmongery are also manufactured, and there are iron and steel works. A large number of persons are also employed in winding and spinning silk and in tape-weaving. The population in 1881 was 15,760, and about 17,000 in 1890.

RIVER. See GEOLOGY.

RIVER ENGINEERING. The improvement of rivers may be considered under two aspects, for rivers

form the natural channels for conveying the surplus rainfall from the districts through which they pass to the sea, and they can also be utilized for the purposes of inland navigation. If a river, owing to the small section of its channel, or the slight inclination of its bed, is incapable of discharging the whole volume of water which drains into it in rainy seasons, the lands along its banks become flooded. If, on the other hand, a river is impeded by rapids, by shoals, or by a bar at its mouth, it is prevented from serving as a natural highway for the traffic of the district through which it flows. Accordingly the mitigation of floods and the regulation of rivers are the problems which have to be grappled with in the engineering of rivers. The first aims at remedying an existing evil, and the second deals with the development of the resources and trade of a country by the improvement of its water communications.

The entire prevention of floods would entail a larger expenditure than the results would justify. In most cases, the prevention of summer floods and the mitigation of winter floods would suffice; for, while summer floods are always very injurious, winter floods prove sometimes beneficial in depositing the mud which they bring down, provided they do not remain very long upon the land. There are three methods by which floods may be prevented or mitigated, namely—(1) improvement of channel; (2) embankment of channel; (3) pumping.

The discharging capacity of a river may be increased by enlarging the section of its channel; by the formation of straight cuts, which reduce its length, and consequently increase its fall; by dredging away shoals, and thus rendering the fall of its bed more uniform; and by removing obstacles to its flow at weirs.

When it is essential that the lands bordering a river should be absolutely protected from inundation, the enlargement of a river bed to an adequate extent for discharging the greatest floods would be too costly, especially when the fall is small: and it becomes necessary to resort to the expedient of increasing the channel, above the surface of the ground, by forming embankments along each side. By making the banks with material excavated from the channel, the earthwork serves the double purpose of enlarging the river bed and forming a bank. A flood channel of considerable dimensions can be readily obtained by placing the embankments some distance back from the margin of the river, thus greatly enlarging the section when the waters rise above the level of the land, while leaving the natural river bed unaltered for the ordinary flow. The Fens of Lincolnshire, a large portion of Holland, the valley of the Po, and large tracts of low-lying land bordering the Mississippi are protected by embankments.

When lands are very flat and low, lying sometimes actually below the general drainage-level of the district and the water-level of the streams, it is impossible for rivers to perform their ordinary function of draining the land by gravitation. It is necessary in such cases to create an artificial fall by pumping the drainage waters up so as to be discharged into the adjacent streams. This method has the advantage of insuring the effectual drainage of the lands, provided adequate pumping power is supplied; but it forms an additional tax on the land, as steam has to be applied to do what is under ordinary conditions effected by nature, and the land has also to be surrounded by banks.

Rivers may be broadly divided into two classes in respect of the lower portion of their course, for the tide is propagated up some rivers to a considerable distance from their mouth, commingling with the fresh water and producing an ebb and flow far into the interior; while rivers flowing into tideless seas descend with an

unimpeded current to their outlet. The effect of the tidal ebb and flow is most readily perceived in contrasting the mouths of tidal and tideless rivers. The mouths of the Mississippi, the Nile, the Danube, and the Rhone present very marked differences to the outlets of the St. Lawrence, the Seine, the Thames, and the Severn. Tideless rivers divide into a number of mouths, whereas tidal rivers are confined to a single outlet; and the effect of tidal influence on this difference is still further confirmed by the instance of the Maas, which, with a very slight tidal range, exhibits a tendency to deteriorate into the dispersion of mouths of a tideless river. The value of tidal flow in maintaining a river is fully manifested by comparing the navigable condition of the Thames or of the muddy Humber with the delta of the Nile or the Rhone, though the latter rivers possess a much larger fresh-water discharge.

The general improvements of the upper portions of both tidal and tideless rivers may be carried out on similar principles, though on approaching their mouths they need a totally different treatment. To give a river a uniform depth, its channel and flow require regulation. Hard shoals may be permanently removed by dredging; but silty shoals, even when dredged away, will re-form unless the channel is contracted. A bar is a ridge or shoal extending across the navigable channel, over which there is less depth than either above or below it. The lowering of such a bar forms one of the main objects of river improvement, as upon the depth that can be obtained over the bar depend the class of vessels that can enter the river, and, in tidal rivers, the period of time during which the entrance can be navigated. A bar may result from the action of the sea, which tends to form a continuous beach across any inlet, and would obliterate the mouths of rivers if the channels were not maintained by the ebb and flow of the tide and the fresh-water discharge; or it may be formed by the conflict of the sea and river water, which checks the current at the mouth and causes the river to deposit the sediment which it held in suspension. The bars at the mouths of the Mersey, the Liffey, and the Adour are due to the first cause; while the bars at the mouths of tideless rivers, such as the Mississippi, the Danube, and the Rhone, are mainly due to the second.

There are three obstructions to which tidal rivers are subject, namely, a bar, a shifting channel, and inadequacy of depth; and there are three general methods which may be resorted to for their improvement, namely, jetties (see JETTIES), training walls, and dredging, in addition to the regulation of their upper portion by longitudinal jetties, or banks, as previously mentioned.

The wandering shallow channel of a river through a wide sandy estuary may be improved by training the channel, in a suitable direction, by means of longitudinal mounds of rubble stone, commonly termed training walls. The proper width between the training walls depends upon the fall, the tidal range, and the fresh-water discharge, and should gradually increase down stream so as to admit as much tidal water as possible with a steady flow. As the scour of the fresh-water discharge is greater with a contracted channel, the tendency is to place the training walls too close together, which, though improving the depth in the channel between the walls, reduces the volume of tidal water that can get up the channel and thus compromises the maintenance of the outlet beyond the walls.

The most careful consideration should be given to all the conditions of an estuary before training works are commenced, for when once begun they must be eventually carried out to deep water; and, if ports exist along the shores of the estuary, they are liable to be injured

by the accretion resulting from the works unless the trained channel can be led close along them.

The improvements effected within recent years in the ordinary dredging machinery, and the introduction of the sand-pump dredger, have facilitated and cheapened dredging operations to such an extent that some of the most remarkable river improvements have been effected by dredging. Dredging merely consists in removing material from the river bed, and thus enlarging and deepening it; and the extent to which this method of improvement may be carried simply depends upon the economical consideration as to how far the improvement of the traffic on the river by an increase of depth will afford an adequate return for the outlay. Dredging, however, furnishes a cheap method of excavation owing to the small cost of carriage by water. Dredging being a purely artificial means of improvement, generally necessitates regular maintenance; whereas the improvement from scour effected by jetties and training walls is permanent, being realized by natural means.

The improvements on the Tyne and on the Clyde have mainly resulted from very extensive dredging operations, but they have been aided by training walls on the Clyde, and by the Tynemouth piers on the Tyne, which protect the entrance channel from drift and the dredgers from waves, and concentrate the scour over the bar. The three methods of improvement described above have been resorted to on the Tees: for training walls have been formed through the wide estuary below Middlesborough for fixing the channel; converging jetties are being constructed for sheltering the channel from wave-born sand, and for directing the scour over the bar; and dredging is being employed for deepening the trained and sheltered channel. On the Maas, also, and at Charleston, dredging is being used for attaining a depth for navigation which the jetties alone were unable to produce.

Tideless rivers on entering the sea have their velocity checked, and consequently deposit the silt which they previously carried in suspension. In process of time this accumulated deposit forms a tract of low-lying land protruding into the sea, through which the river flows in several shallow channels to the sea owing to the impediments offered to its flow by the sediment which it deposits. The form which these diverging channels assume has led to the term delta being applied to the mouths of tideless rivers and the tract of land which they create. These deltas are always advancing, and consequently reducing the very small fall of the channels through them by prolonging their course. The rate of advance varies with the amount of sediment brought down, the depth of the sea in front, and the extent to which the delta spreads out. The Rhone delta has at present a yearly average progression of 140 feet; the Kilia mouths of the Danube delta have been estimated to advance 200 feet annually; while the Mississippi delta, extending 220 miles into the Gulf of Mexico, is supposed to have taken 4,400 years in forming, which would be equivalent to an average annual advance of 264 feet, the present advance being about 207 feet in a year.

The only method of improving the outlet of a tideless river is to concentrate the current flowing through one of the channels, and to prolong the banks of the regulated channel into deep water by means of parallel jetties.

The only other way of remedying the impediments to navigation at the mouths of tideless rivers is by avoiding the delta channels altogether, and constructing a canal connecting the deep river above the delta with the sea at some suitable place beyond the influence of the river alluvium. This expedient has been resorted

to for the trade of the Rhone; for, though the discharge of the river was concentrated into a single outlet by forming embankments on each side, between 1852 and 1857, which shut off the other three outlets and extend into the sea at its mouth, the increased discharge brought down the whole sediment of the river, and a bar formed again farther out. Accordingly the St. Louis Canal was formed, between 1863 and 1873, going from the head of the delta into the Bay of Foz beyond the limits of the delta. A similar plan was proposed for the Mississippi, but was abandoned in favor of the jetty system. The success of the jetty system depends upon the existence of a littoral current to carry away the sediment in the stream conveyed by aid of the jetties into deep water, or upon the gradual prolongation of the jetties to keep pace with the progression of the delta. The outlets of the Danube and the Mississippi have both been improved by training one of their minor delta channels into deep water; and hitherto the depth over the bars has been maintained. In the case of the Danube, the southerly current sweeping across the outlet carries away a portion of the issuing sediment. The Mississippi jetties direct the discharge into such deep water, and with so much velocity, that it may be premature to decide to what extent the maintenance of the depth may be due to a westerly current in the gulf; but hitherto from one cause or the other, or probably from both combined, the bar has not formed again in front of the jetties.

The method of lowering a bar at the mouths of rivers by means of jetties has been applied to both tidal and tideless rivers; but the systems employed for each type of river are based on different principles which must not be confounded together. A tideless river is maintained solely by its discharge, and therefore the more its channel is contracted the greater is the depth.

The greatest difficulty in training tidal rivers is so to adjust the width of channel that the free admission of the flood tide may be secured while affording adequate scouring power for the current. If the influx of the tide is checked by a sufficient reduction of width to insure improvement in depth by scour, the capacity of the estuary is eventually reduced, and a portion of the scouring power is lost, as in the case of the Seine. It is better, therefore, to regulate the width so as to insure a free admission of the tide, and to provide for any deficiency in scour and depth by dredging. Deepening by dredging can be easily and economically effected to any desired extent, as shown by the Tyne and Clyde improvements; whereas tidal capacity in an estuary, when once lost, can never be regained.

**RIVERSIDE**, located in San Bernardino county, Cal., on the Santa Anna river, was founded early in the seventies by a colony of New Englanders who removed west for the purpose of engaging in the cultivation of fruit. The surrounding country is peculiarly adapted to this pursuit, being supplied with irrigating canals, etc., and the industry and enterprise of the inhabitants have developed a region of unsurpassed fertility, where oranges, lemons, figs, and other tropical fruits of exceptional quality are produced in abundance. The city is situated seven miles from Dalton station on the Southern Pacific road, by which it is afforded easy access to depots of distribution and supply, and is otherwise provided with transportation accommodation adequate to the necessities of the service. It contains four banks, a number of churches, schools, academies, and stores, besides manufactures of furniture, pottery, etc., also fruit-canning and raisin-preserving works. The population in 1890 was 6,000.

**RIVIERA OF GENOA.** See **ITALY.** It is customary to speak of the Eastern and Western Riviera (Riviera di Levante and Riviera di Ponente), which meet at Genoa.

**RIXDORF**, a large village to the southeast of Berlin, and practically an outlying suburb of that city, with which it is connected by tramway, is chiefly interesting as a foundation of Moravian Brethren from Bohemia, who settled here in 1737, under the protection of King Frederick William I. German Rixdorf, which is now united with Bohemian Rixdorf, was a much more ancient place, and appears as Richardsdorf in 1630 and as Riegenstorp in 1435. The inhabitants of the united community (who numbered 18,729 in 1880, and about 10,500 in 1890, though only 3,421 in 1852) are engaged chiefly in weaving, in the manufacture of india-rubber goods, and in the various industries of the neighboring capital.

**RIZZIO, DAVID**, a servant of Mary, queen of Scots, was, according to Buchanan, a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. He entered the queen's service as a musician in 1564, and was also employed by her as private foreign secretary. He was murdered in 1566, as has been related in the article **MARY.**

**RJEV.** See **RZHEFF.**

**ROACH** (*Leuciscus rutilus*), a fish of the family of Carps (*Cyprinidae*) and of the genus *Leuciscus*, which comprises also the Rudd, Chub, and Dace. It is one of the most common freshwater fishes of Europe north of the Alps, and extends northward as far as Lapland. Roach spawn from April to May, and frequently produce hybrids with other allied fishes, such as the rudd and the bream. They never attain to a large size, a roach of one and a half pounds being considered an unusually large fish. As a food-fish this species is not held in esteem; but by the pleasure it affords to a large class of humble anglers it rivals any of the freshwater fishes which give more pretentious sport.

**ROADS AND STREETS.** The earliest roads about which anything definite is known are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to have been followed to some extent when new roads were constructed about the beginning of the eighteenth century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by large stones on edge, which appeared on the surface of the road.

The almost incredibly bad state of the roads in England toward the latter part of the seventeenth century appears from the accounts cited by Macaulay. The turnpike roads were generally managed by ignorant and incompetent men until Telford and Macadam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of Macadam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead

of the exaggerated roundness given before; but while Telford paid particular attention to a foundation for broken stone, Macadam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impervious covering. Macadam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting.

A road should be as short as possible between two points to be connected, but straightness must often be sacrificed to avoid difficulties and expense and to secure good gradients. The latter should be as easy as practicable, having regard to the country to be traversed, and it is desirable that there should be a ruling gradient than which none should be steeper. On a level macadamized road in ordinary repair the force which the horse has to put forth to draw a load may be taken as one thirtieth of the load. But in going uphill the horse has also to lift the load, and the additional force to be put forth on this account is very nearly equal to the load drawn divided by the rate of gradient. Thus on a gradient of one in thirty the force spent in lifting is one-thirtieth of the load, and in ascending a horse has to exert twice the force required to draw the load on a level. In descending, on the other hand, on such a gradient, the vehicle, when once started, would just move of itself without pressing on the horse. A horse can without difficulty exert twice his usual force for a time, and can therefore ascend gradients of one in thirty on a macadamized surface without sensible diminution of speed, and can trot freely down them. These considerations have led to one in thirty being generally considered as the ruling gradient to be aimed at on first-class roads, though one in forty has been advocated.

The thickness to be given to a road made altogether of broken stone will depend on the traffic it is intended for. On a good well-drained soil a thickness of six inches will make an excellent road for ordinary traffic, and Macadam's opinion that ten inches of well-consolidated material was sufficient to carry the heaviest traffic on any substratum if properly drained has proved to be generally correct. In a new road the loss of thickness during consolidation must be allowed for, and the materials should be laid about one-half thicker than the coating is intended to be.

Whenever it is possible a new road should be finished with a roller. The materials are consolidated with less waste, and wear and tear of vehicles and horses is saved.

A pitched foundation like that used by Telford is always desirable for a road that is subject to heavy traffic. It consists of flat stones carefully set on edge in courses across the road with the broadest edges downward. The upper edges should not exceed four inches in breadth, to hold the broken stone well. All inequalities must be knocked off, and small stones and chips must be firmly pinned into the interstices with a hammer, so as to form a regular convex surface, with every stone firmly fixed in place. The thickness of the pitching is generally six or seven inches; it should not be less than four, and it may generally be thicker without any sensible increase of cost. At least four inches of broken stone are required over the pitched foundation, and, when consolidated, six are always sufficient. Burned clay, gravel, or even sand may be usefully employed as a foundation on a clay bottom, to cut off the road material from the clay.

The qualities required in a good road stone are hardness, toughness, and ability to resist the action of the

weather, and these are not always found together in the same stone. Limestones possess another quality, that of furnishing a mortar-like detritus which binds the stone together, and enables it to wear better than a harder material that does not bind. For heavy traffic the best materials are traps, basalts, greenstones, and syenite; quartzose grits and cherty sandstones are always excellent materials. For moderate traffic the harder limestones are sufficiently durable and make the smoothest and pleasantest roads.

Stone for a new road should be evenly broken to a size that will pass every way through a ring two and one-half inches in diameter. For repairs, especially when the material is tough, a gauge of two and one-fourth or two inches may be used with advantage, as the stone covers a larger surface, consolidates sooner, and makes a smoother surface. Stone is best broken by hand, but stone-breaking machines have been introduced which supersede hand-breaking to some extent, especially where large quantities of hard stone are to be broken.

Early pitched roadways consisted of pebbles or rounded bowlders, bedded in the natural surface or in sand or gravel. The next step in advance was to employ roughly-squared blocks; but the wide and irregular joints admitted the water to the subsoil, and the mud worked up and the stones sank irregularly under the traffic. Telford recommended a bed of about six inches of clean river ballast, rendered compact by being traveled upon for some time before the paving was laid, but he subsequently considered that nothing short of twelve inches of broken stone, put on in layers four inches thick and completely consolidated by carriages passing over them, would answer the purpose. He recommended paving stones of considerable depth and of from four and one-half to six or seven and one-half inches in breadth for the greatest thoroughfares, and he pointed out the importance of working the stones flat on the face and square on all sides, so as to joint close and preserve the bed or base as nearly as possible of the same size as the face, and of carefully placing together in the same course stones of equal breadth. Many pavements thus laid with stones of considerable breadth still remain, but experience proved that it was a mistake to suppose that broad stones having a larger base would support better the weight and shocks of heavy traffic; on the contrary, a wide stone has a tendency to rock on its bed, and also to wear round on the top and become slippery. To obtain an even surface and a better foothold for the horses the stones were reduced in width. The reduction of breadth to about three inches was generally followed, but it is only of late years that a concrete foundation has been employed to any great extent, the frequent breaking up to which streets are subject having prevented it.

The best materials for pavement sets are the hard igneous and metamorphic rocks, though millstone grit and hard sedimentary rock of the same nature are used when the traffic is comparatively light. Excessively hard stone which wears smooth and slippery is objectionable in spite of its durability.

Joints simply filled in with gravel are of course pervious to water, and a grout of lime or cement does not make a permanently water-tight joint, as it becomes disintegrated under the vibration of the traffic. Grouted joints, however, make a good pavement when there is a foundation of concrete or broken stone or hard core. Where there is not a regular foundation imperviousness in the joints is of great importance.

*Wood Paving.*—Wood pavements were introduced in 1839. Hexagonal or circular blocks of fir or cedar six to eight inches across and four to six deep, were bedded in gravel laid on a foundation previously leveled and

beaten. The blocks were either beveled off at the edges or grooved across the face to afford foothold. Other wood pavements were tried about the same time, but they soon got out of order from unequal settlement of the blocks, and most of them lasted but a few years. The best of these was Carey's, which consisted of blocks six and one-half to seven and one-half inches wide, thirteen to fifteen long, and eight or nine deep, the sides and ends having projecting and reëntering angles locking the blocks together with the view of preventing unequal settlement. Experience led to a reduction in the width of the blocks to four inches and in the depth to five or six, and the salient and reëntering angles disappeared from the sides. With these modifications Carey's pavement remained in use until after the introduction of more modern systems in recent years. The "improved wood pavement" was first used in 1871. After the foundation was formed to the proper cross section a bed of sand four inches deep was laid, upon which came two layers of inch deal boards saturated with boiling tar, one layer across the other. The wooden blocks were three inches wide, five deep, and nine long; they were dipped in tar and laid on the boards with the ends close together, but transversely the courses were spaced by fillets of wood three-fourths of an inch wide nailed to the floor and to the blocks. The joints were filled up with clean pebbles rammed in and were run with a composition of pitch and tar, the surface being dressed with boiling tar and strewed with small sharp gravel and sand. In this pavement a somewhat elastic foundation was provided in the boards, which were also intended to prevent unequal settlement of the blocks; but the solidity of the pavement depended upon its water-tightness, for, when the surface water reached the sand, as it did sooner or later, settlement and dislocation of the blocks under the traffic arose. This form of pavement is still in use in our western cities, though being fast superseded by stone.

There is some difference of opinion as to the best material for a wood pavement. Pitch pine and the harder red and yellow deals are the most durable, but they are less elastic than the softer woods, and are apt to wear slippery. Soft white woods have been recommended for the sake of a more elastic surface; but on the whole either Memel or Swedish yellow deal is generally considered the best material. Whatever wood is used, it should be sound, close-grained, even in quality, free from knots and sap, and from the blue tinge which is a sign of incipient decay. After the blocks are cut, all those that are unsound, knotty, or badly shaped should be carefully rejected, as defective blocks soon cause holes in the surface and must be replaced, or the adjoining blocks will suffer undue wear and the surface become irregular. The breadth of the blocks never now exceeds four inches, and it is generally three, the length being determined by the breadth of the deal or batten from which they are cut. The depth is usually five or six inches; five inches are considered by many to be enough to give sufficient depth for as long as the pavement will retain a sufficiently good surface without renewing the wood, and blocks of that depth have been laid in many London streets. It is doubtful if any advantage is derived from creasoting or from dipping the blocks in creasote oil or coal tar. Dipping affords a cover for the use of defective or inferior wood, and thorough creasoting, though it preserves the wood from decay, has little or no influence on the wear, which in almost all cases determines the life of the blocks.

*Asphalt Paving.*—Asphalt was first used for street paving in Paris in 1854. It was introduced in London in 1869, when Threadneedle street was paved by the

Val de Travers Asphalt Company, and since then it has been extensively used for paving both streets and footways. Shortly afterward the system was introduced in Washington, D. C., where it yet remains to a limited extent. The material is a hard limestone impregnated with bitumen in the proportion of from 6 to 8 per cent. in the Seyssel rock, and from 10 to 12 in that from Val de Travers. Asphalts containing less than the former proportion have not sufficient coherence for street pavements, and those containing more than the latter proportion soften from heat in the summer. Asphalt is employed either as a mastic or compressed. The mastic is previously prepared in cakes and is melted for use in caldrons with a small quantity of bitumen, and for a street pavement is thoroughly mixed with sand or grit. It is spread in one thickness on a concrete foundation, covered with sand, and beaten to an even surface. This material has not proved so successful for street surfaces as compressed asphalt. To produce this the rock asphalt, previously reduced to a fine powder by mechanical means, is heated in revolving ovens to from 220° to 250°, spread while still hot, and compressed into a solid mass by hot disk-shaped rammers, and afterward smoothed with irons heated to a dull redness. The original rock is thus as if were reconstructed by taking advantage of the power of coherence of the molecules under pressure when hot. In heating the powder the moisture combined in the limestone must be driven off without reducing the proportion of the bitumen more than is unavoidable. The powder cools very slowly and may be conveyed long distances from the ovens; it may even be kept till the next day before use. When laid it should still retain a temperature of from 150° to 200°. It is spread evenly with a rake by skilled workmen for the whole width of the street to a thickness about two-fifths greater than the finished coating is intended to be. Ramming is commenced with light blows to insure equality of compression throughout and is continued with increased force until the whole is solidified. The ramming follows up the spreading, so that a joint is required only when the work is interrupted at the end of a day, or from some other cause. In a few hours after it has been laid an asphalt pavement may be used for traffic. When finished, its thickness may be from one and a half to two and a quarter inches, according to the traffic; a greater thickness than the latter cannot be evenly compressed with certainty.

ROANNE, a town of France, at the head of an arrondissement in the department of the Loire, lies on the left bank of the Loire in 46° 2' 26" N. latitude at a height of 922 feet above the sea. In 1886 Roanne had a population of 30,060.

ROANOKE, a Virginia town, the capital of Roanoke county, lies on the Atlantic, Mississippi and Ohio Railroad, and is of some importance as a tobacco market. The town has banks, telegraphs, schools, churches, etc., and a population (1890) of 16,159.

ROBBERY. See THEFT.

ROBBIA, DELLA, the name of a family of great distinction in the annals of Florentine art. Its members are enumerated in chronological order below.

I. LUCA DELLA ROBBIA, was the son of a Florentine named Simone di Marco della Robbia. He was born about 1400. No sculptured work of the great fifteenth century ever surpassed the singing-gallery which Luca made for the cathedral at Florence between 1431 and 1440, with its ten magnificent panels of singing angels and dancing boys, far exceeding in beauty those which Donatello in 1433 sculptured for the opposite gallery in the same choir. This magnificent work now lies scattered in various parts of the Bargello. The general effect of the whole can best be seen at the South Kensington

Museum, where a complete cast is fixed to the wall. The same museum possesses a study in *gesso duro* for one of the panels, which appears to be the original sketch by Luca's own hand. He died in 1482, after executing numerous other works of art, some of which yet remain to attest his skill. His principal works are those in enameled relief.

II. ANDREA DELLA ROBBIA, the nephew and pupil of Luca, also carried on the production of enameled reliefs. He was born in 1435. One of his finest works is a large retable at Volterra in the church of S. Girolamo, dated 1501; it represents the Last Judgment, and is remarkable for the fine modeling of the figures. He died in 1525.

III., IV. Five of Andrea's seven sons worked with their father, and after his death carried on the Robbia fabrique. Early in life two of them came under the influence of Savonarola, and took monastic orders at his Dominican convent; these were MARCO, who adopted the name of Fra Luca, and PAOLO, called Fra Ambrogio. One relief by the latter, a Nativity with four life-sized figures of rather poor work, is in the Cappella degli Spagnuoli in the Sienese convent of S. Spirito; a MS. in the convent archives records that it was made in 1504.

V. The chief existing work known to be by the second son LUCA is the very rich and beautiful tile pavement in the uppermost story of Raphael's loggie at the Vatican, finely designed and painted in harmonious majolica colors.

VI. GIOVANNI DELLA ROBBIA during a great part of his life worked as assistant to his father, Andrea, and in many cases the enameled sculpture of the two cannot be distinguished. Some of Giovanni's independent works are of great merit. He was born in 1469, and died in 1529.

VII. GIROLAMO DELLA ROBBIA, another of Andrea's sons, was an architect and a sculptor in marble and bronze as well as in enameled clay. He was born in 1488, and died in 1566.

ROBERT I., king of France, son and successor of Hugh Capet, was born at Orleans in 971 and died at Melun in 1031.

ROBERT, called THE BRUCE, king of Scotland, was the son of the seventh Robert de Bruce, lord of Annandale, and was born in 1274. The birthplace of the Bruce—perhaps Turnberry, his mother's castle, on the coast of Ayr—is not certainly known. His youth is said by an English chronicle to have been passed at the court of Edward I. On August 28, 1296, Robert de Bruce "le vieil" and Robert de Bruce "le jeune," earl of Carrick, swore fealty to Edward at Berwick; but (according to Hemingford), in breach of this oath, renewed at Carlisle on the Gospels and the sword of Thomas a Becket, the young earl joined Wallace, who had raised the standard of Scottish independence in the name of Baliol after that weak king had himself surrendered his kingdom to Edward. Urgent letters were sent ordering Bruce to support Warenne, Edward's general, in the summer of 1297; but, instead of complying, he, along with the bishop of Glasgow and the steward of Scotland, laid waste the lands of those who adhered to Edward. On July 7th Percy forced Bruce and his friends to make terms by the treaty called the Capitulation of Irvine. In the campaign of 1304, when Edward renewed his attempt on Scotland and reduced Stirling, Bruce supported the English king, who in one of his letters to him says, "If you complete that which you have begun we shall hold the war ended by your deed and all the land of Scotland gained." But, while apparently aiding Edward, Bruce had taken a step which bound him to the patriotic cause. On June 11th, a month before the fall of Stirling, he met Lamberton at

Cambuskenneth and entered into a secret bond by which they were to support each other against all adversaries and undertake nothing without consulting together. The death of his father in this year may have determined his course and led him to prefer the chance of the Scottish crown to his English estates and the friendship of Edward.

This determination closes the first chapter of his life; the second, from 1304 to 1314, is occupied by his contest for the kingdom, which was really won at Bannockburn, though disputed till the treaty of Northampton in 1328; the last, from 1314 to his death in 1329, was the period of the establishment of his government and dynasty by an administration as skillful as his generalship. The fall of Stirling was followed by the capture and execution of Wallace at London on August 24, 1305. Edward hoped still to conciliate the nobles and gain Scotland by a policy of clemency to all who did not dispute his authority. Challenged by the king with the bond between him and Lamberton (according to one account discovered by the treachery of John Comyn, with whom a similar engagement had been made or attempted), Bruce secretly quitted London, and on February 10, 1306 met by appointment, in the church of the Friars Minor at Dumfries, Comyn, whom he slew at the high altar for refusing to join in his plans.

The bond with Lamberton was now sealed by blood and the confederates lost no time in putting it into execution. Within little more than six weeks Bruce, collecting his adherents in the southwest, passed from Lochmaben to Glasgow and thence to Scone, where he was crowned by the bishop of St. Andrews on March 25th, the bishops of Glasgow and Moray, with the earls of Lennox, Athole, and Errol, being present. Two days later Isabella, Countess of Buchan, claimed the right of her family the Macduffs, earls of Fife, to place the Scottish king on his throne, and the ceremony was repeated with an addition flattering to the Celtic race. Though a king, Bruce had not yet a kingdom, and his efforts to obtain it were till the death of Edward I. disastrous failures. In June he was defeated at Methven by Pembroke, and on August 11th he was surprised in Strathfillan, where he had taken refuge, by Lord Lorn. The ladies of his family were sent to Kildrummy in January, and Bruce, almost without a follower, fled to Rathlin, an island off Antrim (Ireland). Edward, though suffering from his last illness, came to the north in the following spring. While wreaking his vengeance Edward himself was summoned by death at Burgh-on-the-Sands, on the Solway, on June 7, 1307.

Bruce, with the insight of military genius, seized his opportunity. Leaving Edward, now his only brother in blood and almost his equal in arms, in Galloway, he suddenly transferred his own operations to Aberdeenshire. In the end of 1307 and again in May, 1308, he overran Buchan, where, at Inverary on May 22d, he defeated its earl, one of his chief Scottish opponents. Then crossing to Argyll he surprised Lord Lorn in the Pass of Brander and took Dunstaffnage. In 1309 a truce, scarcely kept, was effected by the pope and Philip of France, and in 1310, in a general council at Dundee, the clergy of Scotland—all the bishops being present—recognized Bruce as king. The support given him by the national church in spite of his excommunication must have been of great importance in that age, and was probably due to the example of Lamberton. The next three years were signalized by the reduction one by one of the strong places the English still held—Linlithgow in the end of 1310, Dumbarton in October, 1311, Perth by Bruce himself in January, 1312. Encouraged

by these successes, he made a raid into the north of England, and on his return reduced Butel (in Galloway), Dumfries, and Dalswinton, and threatened Berwick. In March, 1313, Sir James Douglas surprised Roxburgh, and Randolph surprised Edinburgh. In May Bruce was again in England, and, though he failed to take Carlisle, he subdued the Isle of Man. Edward about the same time took Rutherglen and laid siege to Stirling, whose governor, Mowbray, agreed to capitulate if not relieved before June 24, 1314. By the close of 1313 Berwick and Stirling alone remained English. Edward II. felt that if Scotland was not to be lost a great effort must be made. With the whole available feudal levy of England, a contingent from Ireland, and recruits even out of jails—for murderers were pardoned on condition of joining the army—he advanced from Berwick to Falkirk, which he reached on June 22d. After a preliminary skirmish on Sunday the 23d, in which Bruce distinguished himself by a personal combat with Henry de Bohun, whom he felled by a single blow of his ax, the battle of Bannockburn was fought on Monday the 24th; and the complete rout of the English determined the independence of Scotland and confirmed the title of Bruce.

In the career of Bruce it was the turning-point. The enthusiasm of the nation he had saved forgot his late adherence to the popular cause, and at the parliament of Ayr on April 25, 1315, the succession was settled by a unanimous voice on him, and, failing males of his body, on his brother Edward and his heirs male, failing whom on his daughter Marjory and her heirs, if she married with his consent. Soon after she married Walter the Steward.

The last part of Bruce's life, from 1315 to 1329, began with an attempt which was the most striking testimony that could have been given to the effect of Bannockburn, and which, had it succeeded, might have altered the future of the British Isles. This was no less than the rising of the whole Celtic race, who had felt the galling yoke of Edward I. and envied the freedom the Scots had won. In March, 1318, first the town and then the castle of Berwick, the last stronghold of the English, capitulated, and Bruce wasted the English border as far as Ripon.

The chief author of Scottish independence barely survived his work. His last years had been spent chiefly at the castle of Cardross on the Clyde, which he acquired in 1326, and the conduct of war, as well as the negotiations for peace, had been left to the young leaders Randolph and Douglas, whose training was one of Bruce's services to his country. Ever active, he employed himself in the narrower sphere of repairing the castle and improving its domains and gardens, in shipbuilding on the Clyde, and in the exercise of the royal virtues of hospitality and charity. The religious feeling, which had not been absent even during the struggles of manhood, deepened in old age, and took the form the piety of the times prescribed. He made careful provisions for his funeral, his tomb, and masses for his soul. He procured from the pope a bull authorizing his confessor to absolve him even at the moment of death. He died from leprosy, contracted in the hardships of earlier life, on June 7, 1329, and was buried at Dunfermline beside his second wife, Elizabeth de Burgh, whom he had married about 1304, and who bore him late his only son, David, who succeeded him.

ROBERT, the name of two dukes of Normandy. See NORMANDY, for ROBERT I. (died 1035) and ROBERT II. (died 1134); see also ENGLAND.

ROBERT, HUBERT, born at Paris in 1753, deserves to be remembered not so much for his skill as a painter

as for the liveliness and point with which he treated the subjects he painted. Robert fell, struck by apoplexy, April 15, 1808. His brush was in his hand; he had painted till the last moment.

ROBERT, LOUIS LÉOPOLD, French painter, was born at Chaux de Fonds (Neufchâtel) in Switzerland on May 13, 1794. Robert committed suicide before his easel, March 20, 1835, on the tenth anniversary of the melancholy suicide of a brother to whom he had been much attached.

ROBERT OF GLOUCESTER, an English antiquary and historical writer, who lived in the second half of the thirteenth century, was a monk of the abbey at Gloucester, and is supposed by Hearn, the editor of his *Chronicle*, to have been sent to preside over the foundation at Oxford (afterward Worcester College), where the younger members of the abbey were partly educated. This, however, is mere conjecture. The evidence which establishes his claim to be the author of the *Chronicle* (by which he is best known) is also slight.

ROBERT GUISCARD, duke of Apulia and Calabria, was born at Hauteville near Coutances in Normandy about the year 1015. In 1081 he felt himself strong enough to carry his arms abroad against Alexius Comnenus, ostensibly on behalf of the deposed emperor Michael Ducas, the father-in-law of his daughter. The defeat of Alexius under the walls of Durazzo in October, 1081, was followed by the capture of that place in February, 1082, and by a victorious march toward Constantinople. But before Robert had reached the capital he was summoned back by Gregory VII., his suzerain, to rescue him from the emperor, Henry IV., by whom he was being besieged in Rome. After capturing and sacking the city in May, 1084, and conducting Gregory to a place of safety in Salerno, Guiscard resumed his operations against Alexius, defeating the united Greek and Venetian fleets, and raising the siege of Corfu in November, 1084. While still engaged in active warfare he died of pestilence at Cephalonia on July 17, 1085.

ROBERTS, DAVID, landscape painter, was born at Stockbridge, Edinburgh, on October 24, 1796. November 25, 1864, he was seized with an attack of apoplexy and expired the same evening.

ROBERTSON, FREDERICK WILLIAM, one of the most brilliant and influential preachers of modern times, was born in London on February 3, 1816, and died in 1853.

ROBERTSON, THOMAS WILLIAM, English dramatist, was born on January 9, 1829. As a dramatist he had a brief but very brilliant career. It is not too much to say that he was the most successful and distinguished writer of plays in his generation. A farcical comedy by him, *A Night's Adventure*, was produced at the Olympic under Farren's management as early as 1851. He edited a mining journal in 1860 and contributed to it a novel afterward dramatized with the title *Shadow Tree Shaft*. He wrote a farce entitled *A Cantab*, which was played at the Strand in 1861. Then, in 1864, came his first marked success, *David Garrick*, produced at the Haymarket with Sothorn in the principal character. It was not, however, till the production of *Society* at the Prince of Wales Theater in 1865, under the management of Miss Marie Wilton, afterward Mrs. Bancroft, that the originality and cleverness of the dramatist were fully recognized.

Robertson, although his health was already undermined, followed up *Society* in quick succession with the series of characteristic plays which made the reputation of himself, the company, and the theater. Unhappily he did not live long to enjoy his success, but died in London in February, 1871.

ROBERTSON, WILLIAM, an eminent Scottish historian, born at Borthwick, Midlothian, on September 19, 1721. He conceived the plan of his *History of Scotland* as early as the year 1753; in July, 1757, he had proceeded as far as the Gowrie conspiracy, and in November of the following year David Hume, then residing in London, was receiving the proof-sheets from Strahan and making friendly but searching criticisms on the work in letters to the author.

The success of the *History of Scotland* was immediate and splendid, and within a month a second edition was called for. Before the end of the author's life the book had reached its fourteenth edition; and in the opinion of some it remains Robertson's greatest work.

The rest of Robertson's life was uneventful to a degree, even surpassing the proverbial uneventfulness of the lives of scholars. Hume advised him to write a history of Greece or else "Lives" in the manner of Plutarch. Dr. John Blair urged him to write a complete history of England, while Horace Walpole suggested a history of learning. It must be recorded to Robertson's credit that he showed a preference from the first for the subject which he ultimately selected, *The History of the Reign of the Emperor Charles the Fifth*. He took uncommon pains with the work and devoted to it ten consecutive years of labor. It appeared in three volumes quarto in 1769. In 1777 he published his *History of America* and in 1791 his *Disquisition concerning the Knowledge which the Ancients had of India*, which concluded his historical labors and appeared only two years before his death, which occurred near Edinburgh on June 11, 1793. His fame had long been European, and he left no rival in the field of historical composition save Gibbon alone.

ROBERVAL, GILLES PERSONNE DE, French mathematician, was born at the village of Roberval near Beauvais in 1602, and died in 1678.

ROBESPIERRE, MAXIMILIEN MARIE ISIDORE, the most fanatical and most famous of the republican leaders of the French Revolution, was born at Arras on May 6, 1758. Completing his law studies with distinction, and having been admitted an avocat in 1781, Robespierre returned to his native city to seek for practice, and to struggle against poverty. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March, 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent his practicing at the bar, and he speedily became known as a careful and painstaking advocate.

Such had been the life of the future republican leader up to 1788, when he took part in the discussion as to the way in which the states-general should be elected, showing clearly and forcibly in his *Adresse à la Nation Artésienne* that, if the former mode of election by the members of the provincial estates was again adopted, the new states-general would not represent the people of France. In the assembly of the bailliage rivalry ran still higher, but Robespierre had already made his mark in politics; by the *Avis aux Habitants de Campagne* (Arras, 1789), which is almost certainly by him, he secured the support of the country electors, and, though but thirty years of age, poor, and without influence, he was elected fifth deputy of the tiers état of Artois to the states-general.

When the states-general met at Versailles on May 5, 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy; he was a fanatic. While the constituent assembly occupied itself in drawing up an unworkable constitution as the grand panacea, Robespierre turned from the assembly of provincial avocats and wealthy bourgeois to the

people of Paris. However, he spoke frequently in the constituent assembly, and often with great success, and was eventually recognized as second only to Pétion de Villeneuve—if second to him—as a leader of the small body of the extreme left—the thirty voices, as Mirabeau contemptuously called them.

When he instinctively felt that his doctrines would have no success in the assembly, he turned to the Jacobin Club, which had consisted originally of the Breton deputies only, but which, after the assembly moved to Paris, began to admit among its members various leaders of the Parisian bourgeoisie. The death of Mirabeau strengthened Robespierre's influence in the assembly; but in May, 1791, he proved his lack of statesmanlike insight and his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the constituent could sit in the succeeding assembly. The flight of the king on June 21st and his arrest at Varennes excited Robespierre's suspicions, and made him declare himself at the Jacobin Club to be "ni monarchiste ni republicain." But the vigorous conduct of Lafayette and the National Guard on the Champ de Mars on July 17, 1791, terrified him, for he believed that he was a predestined victim, until he was succored by Duplay, a cabinetmaker in the Rue St. Honoré, and an ardent admirer of his, in whose house he lived (with but two short intervals) till his death. At last came his day of triumph, when on September 30th, on the dissolution of the constituent assembly, the people of Paris crowned Pétion and himself as the two incorruptible patriots.

On the dissolution of the assembly he returned for a short visit to Arras, where he met with a triumphant reception. In November he returned to Paris, and on December 18th made a speech which marks a new epoch in his life. Brissot, the *âme politique* of the Girondin party which had been formed in the legislative assembly, urged vehemently that war should be declared against Austria, and the queen was equally urgent in the hope that a victorious army might restore the old absolutism of the Bourbons. Two men opposed the projects of the queen and the Girondins—Marat and Robespierre: Marat opposed them for statesmanlike reasons (see MARAT), and Robespierre on humanitarian grounds and because as a follower of Rousseau he disliked war. This opposition from those whom they had expected to aid them irritated the Girondins greatly, and from that moment began the struggle which ended in the *coups d'état* of May 31st and June 2, 1793.

On the meeting of the convention to which he had been elected first deputy for Paris, the Girondins immediately attacked Robespierre; but Robespierre had no difficulty in rebutting this attack (November 5th). All personal disputes, however, gave way by the month of December, 1792, before the great question of the king's trial, and here Robespierre took up a position which is at least easily understood. This great question settled by the king's execution, the struggle between Robespierre and the Girondins entered upon a more acute stage, and the want of statesmanship among the latter threw upon the side of the fanatical Robespierre, Danton and all those strong practical men who cared little for personal questions, and whose only desire was the victory of France in her great struggle with Europe. In the month of May, 1793, Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his *Histoire des Brissotins* and *Brissot dévoilé*; Isnard declared that Paris must be destroyed; Robespierre preached insurrection at the Jacobin Club; and on May 31st and June 2d the commune of Paris destroyed the Girondin party. For a moment it seemed as if France would avenge them; but patriotism

was stronger than federalism. The defense of Lyons only exasperated the men who were working for France, and the armies who were fighting for her, and on July 27, 1793, when the struggle was practically decided, the convention elected Robespierre to the committee of public safety.

This election marks an important epoch, not only in the life of Robespierre, but in the history of the Revolution. Danton and the men of action had throughout the last two years of the crisis, as Mirabeau had in the first two years, seen that the one great need of France, if she was to see the end of her troubles without the interference of foreign armies, was the existence of a strong executive government. The means for establishing the much-needed strong executive were found in the committee of public safety. The success of this committee in suppressing the Norman insurrection had confirmed the majority of the convention in the expediency of strengthening its powers, and the committee of general security which sat beside it was also strengthened and given the entire management of the internal police of the country. When Danton, who had been a member of the committee from April to July 10, 1793, left it, Robespierre was elected; and it was not until then that he became one of the actual rulers of France. Indeed the committee was not finally constituted until September 13th, when the last two of the "great" twelve who held office until July, 1794, were elected.

With the actual organization of the Terror Robespierre had little or nothing to do; its two great engines, the revolutionary tribunal and the absolute power in the provinces of the representatives on mission, were in existence before he joined the committee of public safety, and the laws of the maximum and of the suspects were by no means of his creation. The reason why he is almost universally regarded as its creator and the dominant spirit in the committee of public safety is not hard to discover. Men like Carnot and Billaud-Varenne were not conspicuous speakers in the convention, nor were they the idols of any section of the populace; but Robespierre had a fanatical following among the Jacobins, and was admittedly the most popular orator in the convention.

After this explanation it may be said at once that Robespierre was not the author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the principles of both parties being obnoxious to him. Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from February 13 to March 13, 1794) from active business in the convention and the committee, apparently to consider his position; but he came to the conclusion that the cessation of the Reign of Terror would mean the loss of that supremacy by which he hoped to establish the ideal of Rousseau, for Danton, he knew, was essentially a practical statesman and laughed at his ideas. He must have considered too that the result of his siding with Danton would probably have been fatal to himself. The result of his deliberations was that he abandoned Danton and co-operated in the attacks of the committee on the two parties. On March 15th he reappeared in the convention; on the 19th Hébert and his friends were arrested; and on the 24th they were guillotined. On March 30th Danton, Camille Desmoulins, and their friends were arrested, and on April 5th they too were guillotined.

It was not until after the execution of Danton that Robespierre began to develop a policy distinct from that of his colleagues in the great committee, an opposition which ended in his downfall. He began by using his in-

fluence over the Jacobin Club to dominate the commune of Paris through his devoted adherents, two of whom, Fleuriot-Lescot and Payan, were elected respectively mayor and procureur of the commune. He also attempted to usurp the influence of the other members of the great committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderatism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the great committee; and the convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the committee, proposed and carried on June 10th the outrageous law of twenty-second Prairial, by which even the appearance of justice was taken from the tribunal, which, as no witnesses were allowed, became a simple court of condemnation. The result of this law was that between June 12th and July 28th, the day of Robespierre's death, no less than 1,285 victims perished on the guillotine at Paris.

At last, on the 26th of July, Robespierre appeared for the first time for more than four weeks in the convention and delivered a carefully studied harangue, which lasted for more than four hours, in which he declared that the Terror ought to be ended, that certain deputies who had acted unjustly and exceeded their powers ought to be punished, and that the committees of public safety and general security ought to be renewed. Great was the excitement in the convention; all wondered who were the deputies destined to be punished; all were surprised that the Terror should be imputed as a fault to the very committee of which Robespierre had been a member. The majority of the great committee determined to act promptly. The convention, moved by Robespierre's eloquence, at first passed his motions; but he was replied to by Cambon the financier, Billaud-Varenne, Amar, and Vadier, and the convention rescinded their decrees and referred Robespierre's question to their committees. On the following day, the 27th of July, or in the revolutionary calendar, the 9th Thermidor, Saint-Just commenced to speak on behalf of the motions of Robespierre, when violent interruptions showed the temper of the convention. Tallien, Billaud-Varenne, and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de Danton qui t'étouffe" (It is the blood of Danton which chokes him) showed what was uppermost in the minds of the Mountain. The excitement increased, and at five in the afternoon Robespierre, Couthon, and Saint-Just, with two young deputies, Augustin Robespierre and Lebas, the only men in all the convention who supported them, were ordered to be arrested. Yet all hope for Robespierre was not gone; he was speedily rescued from his prison with the other deputies by the troops of the commune and brought to the Hôtel de Ville. There he was surrounded by his faithful adherents, led by Payan and Coffinhal, but the day was past when the commune could overawe the convention; for now the men of action were hostile to the commune, and its chief was not a master of *coups d'état*. On the release of Robespierre, the convention had again met, and declared the members of the commune and the released deputies *hors de la loi*. The national guards under the command of Barras had little difficulty in making their way to the Hôtel de Ville; Robespierre was shot in the lower jaw by a young gendarme named Merda while signing an appeal to one of the sections of Paris to take up arms for him, though the wound was

afterward believed to have been inflicted by himself; and all the released deputies were again arrested. After a night of agony Robespierre was the next day taken before the tribunal, where his identity as an outlaw was proved, and without further trial he was executed with Couthon and Saint-Just and nineteen others of his adherents on the Place de la Révolution on the 10th Thermidor (July 28) 1794.

**ROBIN HOOD.** The oldest mention of Robin Hood at present known occurs in the second edition—what is called the B text—of *Piers the Plowman*, the date of which is about 1377. He is next mentioned by Wyntown in his *Scottish Chronicle*, written about 1420; next by Bower in his additions to Fordun's *Scotichronicon* about 1450. Of his popularity in the latter half of the fifteenth and in the sixteenth centuries there are many signs. In the Elizabethan era and afterward mentions abound. Of the ballads themselves, *Robin Hood and the Monk* is possibly as old as the reign of Edward II.; *Robin Hood and the Potter* and *Robyn and Gandelyn* are certainly not later than the fifteenth century. These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding out against the Norman conquerors so late as the end of the twelfth century. Others maintain that he was a follower of Simon de Montfort. A third theory associates him with the earl of Lancaster of Edward II.'s time; Hunter believed that he could identify him with a certain Robin Hood mentioned in the Exchequer accounts of his reign. But, whether he lived or not, and whenever he lived, it is certain that many mythical elements are contained in his story. Both his name and his exploits remind us of the woodland spirit Robin Goodfellow and his merry pranks. He is fond of disguising himself, and devoted to fun and practical jokes. And the connection of the May games with him points to a fusion with some older memory—with some sun-god. In fact, the outlaw would seem to have become a center around which gathered and settled older traditions of men and of spirits and of gods.

**ROBIN REDBREAST.** See REDBREAST.

**ROBINS, BENJAMIN**, an English natural philosopher, was born at Bath in 1707, and died in 1751.

**ROBINSON, EDWARD**, author of the *Biblical Researches*, a son of the Rev. William Robinson, of Puritan ancestry, was born at Southington, Connecticut, on April 10, 1794. He was educated at Hamilton College, New York, where he graduated in 1816. In 1832 he published a revised edition of Taylor's translation of Calmet's *Dictionary of the Bible*, and in the ensuing year a popular *Dictionary of the Bible* and a translation of Buttman's *Greek Grammar*. In 1834 he published a revised edition of Newcome's *Greek Harmony of the Gospels*. In 1836 he issued a translation of Gesenius' *Hebrew Lexicon* and in the same year a *Greek and English Lexicon of the New Testament*. He published his *Biblical Researches* in 1841 in three volumes, simultaneously in Berlin and Boston. His services were recognized by a gold medal from the Royal Geographical Society of London in 1842, the degree of D.D. from the university of Halle in 1842, and the degree of LL.D. from Yale College in 1844. He died in New York city in 1863.

**ROBINSON, JOHN**, one of the founders of Independency in England, was born most probably near Scrooby, in Nottinghamshire, in 1575, and died in 1625.

**ROBINSON, JOHN THOMAS ROMNEY**, the inventor of the cup-anemometer, was born in Dublin on April 23, 1792, and died February 28, 1882.

**ROB ROY**, the popular designation of a famous Highland outlaw whose prowess is the theme of one of

Sir Walter Scott's novels, was by descent a Macgregor, being the younger son of Donald Macgregor of Glen-gyle, who had attained the rank of lieutenant-colonel in the army of James II., by his wife, a daughter of William Campbell of Glenfalloch. He was born about 1660. He received the name Roy from the red hair which clustered in thick curls over his brow, and latterly adopted Campbell as his surname on account of the acts proscribing the name of his clan. He inherited a small property on the Braes of Balquhiddy, and at first devoted himself to the rearing of cattle. Having formed a band of armed clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king, and in the autumn of 1691 made a descent on Stirlingshire to carry off the cattle of Lord Livingstone, when, being opposed by the villagers of Kippen, he also seized the cattle from all the byres of the village. Shortly afterward he married Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693, he managed, though not the nearest heir, to get himself acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhiddy to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the duke of Montrose, and, being on account of losses unable to repay it, he was in 1712 evicted from his property and declared an outlaw. Taking refuge in the more inaccessible Highlands, Rob Roy from this time forward supported himself chiefly by depredations committed in the most daring manner on the duke and his tenants, all attempts to capture him being unsuccessful. According to a notice in the *Caledonian Mercury* he died at Balquhiddy on December 28, 1734. He was buried in Balquhiddy churchyard.

**ROBUSTI, JACOPO**, commonly called IL TINTORETTO or TINTORET, one of the greatest painters of the Venetian or of any school, was born in Venice in 1518, though most accounts say in 1512. His father, Battista Robusti, was a dyer, or "tintore;" hence the son got the nickname of "Tintoretto," little dyer, or dyer's boy. In childhood Jacopo, a born painter, began daubing on the dyer's walls; his father, noticing his bent, took him round, still in boyhood, to the studio of Titian, to see how far he could be trained as an artist. We may suppose this to have been toward 1533, when Titian was already fifty-six years of age. Ridolfi is our authority for saying that Tintoret had only been ten days in the studio when Titan sent him home once and for all. The reason, according to the same writer, is that the great master observed some very spirited drawings, which he learned to be the production of Tintoret; and it is inferred that he became at once jealous of so promising a scholar. The two earliest mural paintings of Robusti—done, like others, for next to no pay—are said to have been *Belshazzar's Feast* and a *Cavalry Fight*, both long since perished. Such, indeed, may be said to have been the fate of all his frescoes, early or later. The first work of his which attracted some considerable notice was a portrait-group of himself and his brother—the latter playing a guitar—with a nocturnal effect; this also is lost. It was followed by some historical subject, which Titian was candid enough to praise. One of Tintoret's early pictures still extant is in the church of the Carmine in Venice, the *Presentation of Jesus in the Temple*; also in S. Benedetto are the *Annunciation* and *Christ with the Woman of Samaria*. For the Scuola della Trinità (the scuole or schools of Venice were more in the nature of hospitals or charitable foundations than of educational institutions), he

painted four subjects from Genesis. Two of these, now in the Venetian Academy, are *Adam and Eve* and the *Death of Abel*, both noble works of high mastery, which leave us in no doubt that Robusti was by this time a consummate painter—one of the few who have attained to the highest eminence by dire study of their own, unseconded by any training from some senior proficient.

Toward 1546 Robusti painted for the church of S. Maria dell'Orto three of his leading works—the *Worship of the Golden Calf*, the *Presentation of the Virgin in the Temple*, and the *Last Judgment*—now shamefully repainted; and he settled down in a house hard by the church.

The next conspicuous event in the professional life of Tintoret is his enormous labor and profuse self-development on the walls and ceilings of the Scuola di S. Rocco, a building which may now almost be regarded as a shrine reared by Robusti to his own genius. The painting of its interior was commenced in 1560.

It was probably in 1560, the same year when he began working in the Scuola di S. Rocco, that Tintoret commenced also his numerous paintings in the ducal palace; he then executed there a portrait of the doge, Girolamo Priuli. Other works which were destroyed in the great fire of 1577 succeeded—The *Excommunication of Frederick Barbarossa by Pope Alexander III.* and the *Victory of Lepanto*. After the fire Tintoret started afresh, Paul Veronese being his colleague; their works have for the most part been disastrously and disgracefully retouched of late years, and some of the finest monuments of pictorial power ever produced are thus degraded to comparative unimportance. We here reach the crowning production of Robusti's life, the last picture of any considerable importance which he executed, the vast *Paradise*, in size seventy-four feet by thirty, reputed to be the largest painting ever done upon canvas. It is a work so stupendous in scale, so colossal in the sweep of its power, so reckless of ordinary standards of conception or method, so pure an inspiration of a soul burning with passionate visual imagining, and a hand magical to work in shape and color, that it has defied the connoisseurship of three centuries, and has generally (though not with its first Venetian contemporaries) passed for an eccentric failure; while to a few eyes it seems to be so transcendent a monument of human faculty applied to the art pictorial as not to be viewed without awe nor thought of without amazement.

After the completion of the *Paradise* Robusti rested for awhile, and he never undertook any other work of importance, though there is no reason to suppose that his energies were exhausted, had his days been a little prolonged. He was seized with an attack in the stomach, complicated with fever, which prevented him from sleeping and almost from eating for a fortnight, and on May 31, 1594, he died.

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar to every one from the *Arabian Nights*, was widely spread in the East; and in later times the home of the monster was sought in the direction of Madagascar, whence the gigantic fronds of the *Raphia* palm, very like a quill in form, appear to have been brought under the name of roc's feathers.

ROCH, ST., according to the *Roman Breviary*, was a native of Montpellier, France. He was born with the mark of a red cross upon his person, and this was at once interpreted as signifying his future eminence. Coming to Italy during an epidemic of plague, he was very diligent in tending the sick in the public hospitals

at Aquapendente, Cesena, and Rome, and effected many miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill, and would have perished as he passed through the forest had not the dog of a certain nobleman daily supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died, having previously obtained from God this favor, that all plague-stricken persons invoking him should be healed. The date of his death was August 16, 1327, in the thirty-second year of his age.

ROCHDALE, a municipal and parliamentary borough of southeast Lancashire, England, is situated on the river Roch and on the Lancashire and Yorkshire railway, eleven miles north-northeast of Manchester, and twelve east of Bolton. The population of the borough (area, 4,172 acres) in 1871 was 63,485, and in 1891 it was 71,458.

ROCHEFORT, a town of France, the chef-lieu of an arrondissement of the department of Charente-Inférieure and of the fourth maritime prefecture, lies on the right bank of the Charente, nine miles from the Atlantic, and is built partly on the side of a rocky hill and partly on old marshland, which renders the position unhealthy. The town is laid out with great regularity in chess-board fashion. The fortifications are sufficient merely to prevent it being taken by surprise. The population of the town was 30,285 in 1886 (33,040 in the commune.)

ROCHEFOUCAULD. See LA ROCHEFOUCAULD.

ROCHELLE, LA, a town and seaport of France, the chef-lieu of the department of Charente-Inférieure, is situated on the Atlantic coast in 46° 9' N. latitude, 296 miles by rail southwest of Paris. Its fortifications, which were constructed by Vauban, have a circuit of three and one-half miles with seven gates. In population (21,591 in 1886; 22,464 in the commune) it ranks after Rochefort. At the Reformation La Rochelle early became one of the chief centers of Calvinism, and during the religious wars it armed privateers which preyed on Catholic vessels in the Channel and the high seas. In 1571 a synod of the Protestant churches of France was held within its walls under the presidency of Beza, for the purpose of drawing up a confession of faith. After the massacre of St. Bartholomew, La Rochelle held out for six and a half months against the Catholic army, which was ultimately obliged to raise the siege after losing more than 20,000 men. The peace of June 24, 1573, signed by the people of La Rochelle in the name of all the Protestant party, granted the Calvinists full liberty of worship in several places of safety. Under Henry IV. the town remained quiet, but under Louis XIII. it put itself again at the head of the Huguenot party. Its vessels blockaded the mouth of the Gironde and stopped the commerce of Bordeaux, and also seized the islands of Ré and Oléron and several vessels of the royal fleet. It was then that Richelieu resolved to subdue the town once for all. In spite of the assistance rendered by the English troops under Buckingham and in spite of the fierce energy of their mayor Guiton, the people of La Rochelle were obliged to capitulate after eight months' siege (October, 1628).

ROCHELLE SALT. See TARTARIC ACID.

ROCHESTER, an episcopal city and municipal and parliamentary borough of Mid-Kent, England, is situated on the Medway, on the Medway canal, and on the London, Chatham and Dover and the Southeastern railway lines, thirty-three miles east of London, contiguous to Chatham and Strood. The population of the borough (area 2,909 acres) in 1871 was 18,352, and in 1891 it was 26,170; this includes 7,000 persons in the town of Strood, situated on the opposite side of the Medway.

ROCHESTER, a New Hampshire town, in Strafford county, lies near the Cocheco river, on a branch of the Boston and Maine railroad, being also a station for several other lines. It has churches, banks, schools, telegraphs, etc., and extensive manufactures of woolen products and shoes. Population (1890), 7,113.

ROCHESTER, a Minnesota town, lies on the south fork of the Zumbro river, and is the capital of Olmstead county. It has churches, schools, banks, railroads, telegraphs, and a population (1890) of 5,321. There are several flouring mills here, and extensive manufactures of furniture, pumps and wagons.

ROCHESTER, a city of the United States, capital of Monroe county, N. Y., lies 229 miles to the west of Albany, in a rich agricultural region, upon a plateau on both banks of the Genesee river, 7 miles from its mouth at Lake Ontario and 263 feet above the lake level. There are three falls in the river of 96, 26, and 83 feet respectively within the city limits, the banks below the first fall varying in height from 100 to 210 feet. To this abundant water-power of the Genesee, supplemented by the transportation facilities afforded by the Erie canal and the various railway connections, Rochester mainly owes its progress and prosperity. The streets of the city are generally wide, and well paved and lighted (partly by electricity), and trees and flowering plants are abundant. Rochester is an important railway center. The New York Central railroad, with elevated tracks through the city, has two lines east to Syracuse, two west to Buffalo and Niagara Falls respectively, and one north to Charlotte, where connection is made with the Rome, Watertown and Ogdensburg line; a branch of the New York, Lake Erie and Western railway connects with the main line at Corning and with the Buffalo branch at Avon; the Rochester and Pittsburgh railway runs south to Salamanca, and the Genesee Valley railway to Olean, crossing the West Shore railway a short distance south of the city line; and there are also railway lines to Irondequoit Bay and Windsor beach, and about 30 miles of street railway, radiating from the center in all directions. The manufactures of Rochester are numerous and varied. Though no longer at the head of the flour industry, it still possesses twenty mills, capable of producing 2,900 barrels daily. The principal manufacture is that of ready-made clothing, the sales reaching \$9,000,000 annually. In its boot and shoe trade the city ranks fourth in the country (5,000 hands; annual sales, \$6,500,000). There are also sixteen breweries and ten malt-houses; some eighty or ninety cigar-makers and tobacconists have a total output of about 2,000,000 pounds of tobacco, 18,000,000 cigars, and 140,000,000 cigarettes; while furniture-making employs 1,000 hands. The lumber business is extensive; and of late years the city has been one of the principal centers for the distribution of the anthracite and bituminous coal of Pennsylvania. Its numerous nurseries are a peculiar feature of the place; and there is a great variety of other industries. The main supply of water is brought in iron conduits (147 miles of pipe) from Hemlock lake, twenty-nine miles to the south; an additional supply for subsidiary purposes is drawn from the Genesee river (eleven and one quarter miles of pipe). The total cost of the works has been \$3,744,749. The principal cemetery, Mount Hope, with an area of 200 acres, is exceedingly picturesque and well cared for. Rochester has two State institutions, the Western House of Refuge and the Western New York Institution for Deaf Mutes. The former, opened in 1849, is a substantial structure of brick, with accommodation for 600 inmates, built at a cost of \$373,000; it receives juvenile delinquents committed by magistrates; they are instructed in trades and labor upon the farm belonging to

the refuge. Among the eleemosynary institutions of the city are the Rochester city hospital, St. Mary's hospital, the Rochester, St. Patrick's, St. Mary's, St. Joseph's, and the Jewish orphan asylums, the home for the friendless, the industrial school, the church home, the home of industry, and the home for truant children. There are seventy-five churches, including the Roman Catholic cathedral, six Baptist, ten Methodist Episcopal, ten Protestant Episcopal, eleven Presbyterian, five Lutheran, and eleven Roman Catholic churches, and five Jewish synagogues. The public school system of Rochester includes a free academy (cost \$125,000) and thirty grammar-schools (with classes in the orphan asylums), in which 200 teachers are engaged and 10,000 pupils taught. There are also thirty private institutions, academies, seminaries, and parochial schools. The university of Rochester was established in 1850, under Baptist auspices; its faculty consists of a president and ten professors, and the annual attendance of students is about 160. It has two buildings—Anderson Hall and Sible Hall. The Rochester theological seminary (Baptist), founded in 1850 and housed in two commodious buildings—Trevor and Rockefeller Halls—has eight professors and about seventy students, besides a German department. Other public libraries in addition to those of the university and the theological seminary are the Central and Reynolds'. There are four English and two German daily newspapers, and twelve weekly and nine monthly publications. Among edifices not already mentioned are the city-hall, the United States Government building, the courthouse, the Warner astronomical observatory, the Rochester and East side savings banks, the Powers buildings, with their famous art gallery, and the Warner and Kimball factories. The population (89,366 in 1880) was 133,896 in 1890.

ROCHESTER, JOHN WILMOT, EARL OF, born in Oxfordshire in 1647, was one of the unworthies of the reign of the "merry monarch, scandalous and poor,"

"Who never said a foolish thing  
Nor ever did a wise one."

Rochester is the author of both these imperishable descriptions of Charles II., and by them and his poem "Upon Nothing," and his death-bed conversation with Bishop Burnet he is now chiefly known. He died on July 26, 1680, at the early age of thirty-three, and the common account is that his constitution was undermined and exhausted by profligate excesses.

ROCHE-SUR-YON, LA, a town of France, the chief town of department of La Vendée, lies 278 miles southwest of Paris by the railway to Sables d'Olonne, on an eminence 164 feet above the sea, on the right bank of the Yon, a little tributary of the Lay, itself an affluent of the Pertuis Breton. In 1889 the population of the town was 8,789; of the commune, 10,200.

ROCKET. See AMMUNITION and PYROTECHNY; for the use of rockets to rescue the shipwrecked, see LIFEBOAT.

ROCKFORD, a city of the United States, the county seat of Winnebago county, Ill., on both banks of the Rock river, which, rising in Wisconsin, falls into the Mississippi after a course of 350 miles. By rail it lies 92 miles northwest of Chicago and is a junction of the Chicago and North-Western, the Chicago, Milwaukee and St. Paul, and the Chicago, Burlington and Quincy Railroads. Abundant water-power was secured by a dam 800 feet long constructed across the river in 1844. The chief objects of industry of Rockford, one of the largest manufacturing centers in the Mississippi valley, are agricultural implements, furniture, watches, silver-plated ware, cutlery, tacks and nails, bolts, wire-cloth, netting, woolen and cotton goods, paper, flour, oat-

meal, glucose. Waterworks on the Holly system are capable of pumping 5,500,000 gallons through the mains in twenty-four hours. The city stands in a fine agricultural district, is handsomely built and well shaded, and has a public library, a public high school, and ten other public school buildings, a seminary for girls (1849), five banks, and twenty-one churches. The population was 6,976 in 1860, 11,048 in 1870, 13,129 in 1880, and 23,589 in 1890 (township, 14,525). Rockford was settled about 1836; in 1852 it received incorporation as a city.

ROCKHAMPTON, a town of Queensland, Australia, is situated some forty miles up the Fitzroy river, nearly on the Tropic of Capricorn. The streets are well formed and kept, bordered by trees, with ever-flowing water down the channels. Embosomed in hills it has a climate, in spite of the heat, of singular salubrity, the death-rate being only about half that of London. The population in 1884 was about 11,000.

ROCKINGHAM, CHARLES WATSON WENTWORTH, SECOND MARQUIS OF, twice prime minister of England, was the only son of Thomas Watson Wentworth. Charles Watson Wentworth was born in 1730 on the 19th of March (Albemarle), or the 13th of May (Collins), and was educated at Eton. He showed his spirit as a boy by riding across from Wentworth to Carlisle in 1745 with but one servant, to join the duke of Cumberland in his pursuit of the young Pretender. He was created earl of Malton in the peerage of Ireland on September 4, 1750, and succeeded his father as second marquis of Rockingham on December 14th in the same year. In 1751 he became lord-lieutenant of the north and west ridings of Yorkshire, and a lord of the bedchamber; and in 1760 was made a knight of the Garter. On July 12, 1765, Lord Rockingham formed his first administration with General Conway and the duke of Grafton as secretaries of state. In May, 1766, the duke of Grafton seceded from the government, and in August, 1766, he succeeded his former chief as lord of the treasury and prime minister. Then followed many years of fruitless opposition to the king's personal authority as exhibited through his ministers, but at last, on March 27, 1782, Lord Rockingham again became prime minister, with Fox and Shelburne as secretaries of state. This time he enjoyed office for but a few weeks, for he died on July 1, 1782.

ROCKINGHAM, a town of Vermont, in Windham county, lies on the Vermont Central R. R., a short distance from Bellows Falls. The town has a bank, an academy, other schools, several manufactories, and a machine shop. It has telegraph and ample church accommodation. Population, 1890, 5,000.

ROCK ISLAND, a city of the United States, the capital of Rock Island county, Ill., is situated opposite Davenport on the left bank of the Mississippi, about three miles above the mouth of the Rock river, and at the foot of the Upper Rapids, which extend for about sixteen miles. Distant by rail 181 miles west of Chicago, and 247 miles north of St. Louis, Rock Island is one of the great centers of railroad and river traffic. With Davenport (in Iowa) it is connected by a two-story road and railway bridge, constructed by the government in 1870. Among the public buildings are a large public library and St. Augustana College, founded by the Swedish Lutherans. Glass-works, a plow factory, a distillery, flour-mills, and a stove-factory are the principal industrial establishments. The city, however, is best known from the great national arsenal situated on the island from which it derives its name. This island is a ridge of limestone rock about three miles long, and with an area of 960 acres. As the site of Fort Armstrong it became known in the Black Hawk

War; the prison was used for the detention of Confederate prisoners during the Civil War; and since that date the government has constructed the present extensive works, intended to be the central United States armory. There are ten vast stone workshops, each with a stone house in the rear, as well as officers' quarters, offices, etc. The population of Rock Island city was 13,634 in 1890. The charter dates from 1849.

ROCKLAND, a city and seaport of Maine, and county town of Knox county, is situated sixty miles by rail east-northeast of Portland, on Owl's Head Bay, an inlet of Penobscot Bay. It was incorporated in 1854, has an area of 7,000 acres, and a sea frontage of about four and one-half miles, and numbered 8,174 inhabitants in 1890 (in 1870, 8,191). Lime-burning is the staple trade (1,000,000 barrels per annum). The adjacent islands—Dix Island, Hurricane Island, etc.—are known by their granite quarries. Water for the city is obtained from Lake Chickawaukie.

ROCKVILLE, a Connecticut town in Tolland county, is a place of some importance as a railroad and a manufacturing center. The power for manufactures is supplied by Snipsic Lake, which furnishes a fall of 280 feet here. The town contains churches, an opera house, schools, banks, newspapers, cotton and woolen mills, and silk, stockingnet and envelope factories; it has telegraph connections with all points. The population, 1890, is 6,500.

ROCKY MOUNTAINS. See UNITED STATES.

ROCROI, a town of France, the chef-lieu of an arrondissement in the department of Ardennes, lies fifteen miles in a straight line north-northwest of Mézières and within two miles of the Belgian frontier, at a height of 1,083 feet above the sea. As a fortified place it commands the Ardennes plateau between the valley of the Meuse and the headwaters of the Oise. The present fortifications were constructed by Vauban. In 1881 the population was 1,649 (commune 2,977).

RODBERTUS, KARL JOHANN, by some considered to be the founder of scientific socialism, was born at Greifswald on August 12, 1805. He died on December 8, 1875.

RODERICK. See SPAIN.

RODEZ, a town of France, chef-lieu of the department of Aveyron and the see of a bishop, 412 miles south of Paris by the railway which continues to Béziers, is built at a height of 2,077 feet on a promontory surrounded by the Aveyron, a sub-tributary of the Garonne by the Tarn. In population—14,560 inhabitants (15,333 in the commune) in 1886—it ranks next to the industrial town of Millau.

RODNEY, GEORGE BRYDGES RODNEY, BARON. English admiral, second son of Henry Rodney of Walton-on-Thames, was born there on February 19, 1718. After minor services of an active character in home waters, he obtained command of the *Eagle*, sixty guns, and in this ship took part in Hawke's victory off Ushant, October 14, 1747, over the French fleet under L'Etandière. During the Seven Years' War Rodney rendered important service. In 1757 he had a share in the expedition against Rochefort, commanding the *Dublin*, seventy-four. Next year, in the same ship, he served under Admiral Boscawen at the taking of Louisbourg (Cape Breton). On May 19, 1759, Rodney became a rear-admiral.

In 1764 Rodney was created a baronet by patent of January 21st, and the same year he married Henrietta, daughter of John Clies, of Lisbon. From 1765 to 1770 he was governor of Greenwich Hospital, and on the dissolution of parliament in 1768 he successfully contested Northampton at a ruinous cost. When appointed commander-in-chief of the Jamaica station in 1771 he

lost his Greenwich post, but a few months later received the office of rear-admiral of Great Britain. Till 1774 he held the Jamaica command, and during a period of quiet was active in improving the naval yards on his station.

Sir George was appointed once more commander-in-chief of the Leeward Islands October 1, 1779, but did not sail until December 29th. He captured a Spanish convoy bound to Cadiz on January 8, 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St. Vincent, taking or destroying seven ships. On April 17th an action, which, owing to the carelessness of some of Rodney's captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable entrepôt of St. Eustatius, and by his strong measures for stopping illegal and contraband trade evoked an attempt at censure on the part of his political opponents. After a few months in England, recruiting his health and defending himself in parliament, Sir George returned to his command in February, 1782, and a running engagement with the French fleet on April 9th led up to his crowning victory off Dominica, when, on April 12th, with thirty-five sail of the line, he defeated Comte de Grasse, who had thirty-three sail. The French inferiority of numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours' fighting. This important battle saved Jamaica and ruined French naval prestige.

Rodney arrived home in August to receive unbounded honor from his country. He had already been created Baron Rodney of Rodney Stoke, Somerset, by patent of June 19, 1782, and the House of Commons had voted him a pension of £2,000 a year. From this time he led a quiet country life till his death, which occurred on May 24, 1792, in London, while on a visit to his son.

RODOSTO, a town of European Turkey, in the sandjak of Tekfur Daghi or Rodosto in the vilayet of Adrianople (Edirne), is situated on the coast of the Sea of Marmora about midway between Gallipoli and Constantinople. The population, formerly about 30,000, was in 1840 about 10,000, and at present may be estimated at 17,000.

RODRIGUEZ, an island in the Indian Ocean in  $19^{\circ} 41'$  S. latitude and  $63^{\circ} 23'$  E. longitude, which, after the Seychelles, forms, since 1814, the most important dependency of the British colony of Mauritius, from which it is distant 344 nautical miles. It is the easternmost of all the islands considered as belonging to Africa. With a length of thirteen miles east and west and a breadth of three to six north and south it has an area estimated at forty-two and a half square miles.

About 1845 the population of Rodriguez was about 250 persons. The original nucleus consisted of slaves from Mauritius, and recruits arrived from Madagascar and the African continent. By 1871 they had increased to 1,108, and by 1890 to 1,978.

ROE. See DEER.

ROE or ROW, SIR THOMAS, an eminent political agent of the reigns of James I. and Charles I., was born in 1568, and died in 1644.

ROEBLING, JOHN AUGUSTUS, civil engineer, was born at Mühlhausen, Prussia, June 6, 1806. He removed to the United States, and in 1831 entered on the practice of his profession in western Pennsylvania. He established at Pittsburgh a manufactory of wire rope, and in May, 1845, completed his first important structure, the suspended aqueduct of the Pennsylvania Canal across the Monongahela river. This was followed by the Monongahela suspension bridge at Pittsburgh and several suspended aqueducts on the Delaware and Hudson canal.

Removing his wire manufactory to Trenton, New Jersey, he began, in 1851, the erection at Niagara Falls of a long span wire suspension bridge with double roadway, for railway and carriage use, which was completed in 1855. Owing to the novelty of its design, the most eminent engineers, including Stephenson, regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire-ropes instead of chain-cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, with a clear span of 1,057 feet, added to Roebling's reputation, and his design for the great bridge spanning the East River between New York and Brooklyn was accepted. While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, July 22, 1869.

ROEMER, OLE (Latinized OLAUS) Danish astronomer, was born at Aarhus in Jutland, September 25, 1644. He died on September 23, 1710.

ROERMOND or ROERMONDE (*i.e.*, "Roer-Mouth"), a town of the Netherlands in the province of Limburg (formerly Guelderland), on the right bank of the Maas (Meuse) at the mouth of the Roer, which separates it from the suburb of St. Jacob. The population of the town was 5,712 in 1840 and 8,797 in 1870; and that of the commune has increased from 6,005 in 1840 to 12,039 in 1890.

ROGATION DAYS, the Monday, Tuesday, and Wednesday before Ascension Day. The week in which they occur is sometimes called Rogation Week. See LITANY.

ROGER I., "grand count" of Sicily, the twelfth and youngest son of Tancred de Hauteville in Normandy, was born about 1031. He died in 1101. See SICILY.

ROGER II., count of Sicily, son of the preceding, was born about 1093 and died in 1154. He obtained from the antipope Anacletus II. the title of king of Sicily in 1130, and was crowned in the same year. The title was afterward confirmed in 1139 by Innocent II. See SICILY.

ROGER OF HOVEDON. See HOVEDON.

ROGER OF WENDOVER, who was a monk in the abbey of St. Albans, and who died prior of Belvoir in 1237, was long regarded as the sole author of a Latin chronicle entitled *Flores Historiarum*, being a history of the world from the creation down to the year 1235.

ROGERS, JOHN, editor of the English Bible known as Matthews, was born in 1500 and died in 1555.

ROGERS, SAMUEL, the "melodious Rogers" of Byron, the "memory Rogers" of the general reader, has a unique reputation among Englishmen of letters. Not only was he a poet of sufficient mark to be hailed by Byron—with perverse but sincere admiration—as one of the few men of genuine weight in an age of scribblers, but he was also for fifty years the most celebrated entertainer of celebrities in London. He was born at Newington Green (London) on July 30, 1763. He died in London on December 18, 1855, in his ninety-third year.

ROHAN, HENRI DE, a general and writer of eminence and one of the last and best representatives of the independent French noblesse, was born at the château of Bleins in Brittany on August 21, 1579. He joined Bernhard of Saxe-Weimar, and was serving in his army when he met with the wound which caused his death at Rheinfelden on March 14, 1638.

ROHAN, LOUIS RENÉ ÉDOUARD CARDINAL DE, prince de Rohan-Guéméné, archbishop of Strasbourg, the hero of the scandal of the diamond neck,

lace, and a cadet of the great family of Rohan (which traced its origin to the kings of Brittany, and was granted the precedence and rank of a foreign princely family by Louis XIV.), was born at Paris on September 25, 1734. Though a man of some ability, he became infatuated with the notorious charlatan Cagliostro in 1780, and lodged him in his palace, and in 1782 he made the acquaintance of Madame de Lamotte-Valois, a descendant of an illegitimate branch of the Valois, but a poor adventuress, and married to an adventurer. These people, having acquired great influence over Rohan, determined to turn his excessive desire to become reconciled to the queen to their own advantage. They persuaded him that Marie Antoinette wished him well, and contrived an interview between him and a girl named Oliva, who greatly resembled the queen, in the gardens of Versailles in August, 1784, so skillfully that he believed he had seen the queen herself and that she had given him a rose. The adventuress then persuaded him that the queen would be much gratified by the present of an extremely valuable diamond necklace which she had refused in 1778 and 1781, and on January 26, 1785, the cardinal purchased it for 1,600,000 francs, to be paid in three installments, and handed it over to a pretended valet of the queen on receipt of a forged letter of thanks signed "Marie Antoinette of France." The comte de Lamotte-Valois at once started for London, and, after breaking up the necklace, began to sell the diamonds separately. The plot soon came to light, and the king sent the cardinal to the Bastille. Though acquitted by the parliament of Paris, the cardinal was deprived of his office as grand almoner and exiled to his abbey of Chaise-Dieu. On February 17, 1803, he died at Ettenheim.

**ROHILKHAND** or **ROHILCUND**, a division or commissionership in the North-Western Provinces of India, lying between  $27^{\circ} 35'$  and  $30^{\circ} 1' N.$  latitude, and between  $78^{\circ} 1'$  and  $80^{\circ} 26' E.$  longitude. It comprises the six districts Bijnaur (Bijnor), Murádábád, Budáun, Bareilly (Bareilly), Sháhjahánpur, and Pilibhit, together containing an area of 10,885 square miles, with a population (1881) of 5,122,557.

**ROHTAK**, a British district of India, in the Hissar division, under the lieutenant-governorship of the Punjab, lying between  $28^{\circ} 19'$  and  $29^{\circ} 17' N.$  latitude, and between  $76^{\circ} 17'$  and  $77^{\circ} 30' E.$  longitude. It contains an area of 1,811 square miles, and is bounded on the north by Karnal, on the east by Delhi, on the south by Gurgaon, and on the west by Hissar and the native state of Jhind. In 1881 the population of Rohtak district numbered 553,609.

**ROHTAK**, municipal town and headquarters of the above district, lying in  $28^{\circ} 54' N.$  latitude, and  $76^{\circ} 38' E.$  longitude, with a population in 1881 of 15,699 (males 8,155, females 7,544).

**ROJAS-ZORILLA**, FRANCISCO DE, Spanish dramatist, a contemporary of Lope de Vega and Calderon, was born about the beginning of the seventeenth century. Of his personal history hardly anything has been recorded. Of his dramatic compositions some thirty still survive.

**ROKITANSKY**, CARL VON ROKITANSKY, FREIHERR VON, the founder of the Vienna school of pathological anatomy, was born in 1804 at Königgrätz in Bohemia. He finished his medical studies at Vienna, graduating there in 1828. Soon after he became assistant to Wagner, the professor of pathological anatomy, and succeeded him in 1834 as prosector, being at the same time made extraordinary professor. It was not till ten years later (1844) that he reached the rank of full professor. His death in 1878 elicited many genuine expressions of affection and of esteem for his upright character.

**ROLAND**. JEAN MARIE ROLAND DE LA PLATRIÈRE, who, along with his wife, MANON JEANNE PHLIPON (1754-1793), played a prominent part in the history of the French Revolution, in connection chiefly with the policy and fortunes of the Girondists, was born at Villefranche, near Lyons, in 1732.

For four years after their marriage Roland lived at Amiens, he being an inspector of manufactures; but his knowledge of commercial affairs enabled him to contribute articles to the *Encyclopédie Nouvelle*, in which, as in all his literary work, he was assisted by his wife. On their removal to Lyons the influence of both became wider and more powerful. In Lyons their views were publicly known; Roland was elected a member of the municipality, and when the depression of trade in the south demanded representation in Paris he was deputed by the council of Lyons to defend the interests of the city before the constituent assembly. Accompanied by his wife, he appeared in the capital in February, 1791.

They had made many and influential friends in advance, and Madame Roland's salon soon became the rendezvous of Brissot, Pétion, Robespierre, and other leaders of the popular movement. Her resolve was fixed, and gradually she impressed it upon all: the France of 1791 was a France of transition; a republic alone was its destiny, was the ideal of philosophy, the expression of liberty, the goal of history. This was the constant aim of her influence and her speech.

In September, 1791, Roland's mission being executed, they returned to Lyons. In December they again reached Paris. Roland became a member of the Jacobin Club. The rupture had not yet been made evident between the Girondist party and that section still more extreme, that of the Mountain. For a time the whole left united in forcing the resignation of the ministers. When the crisis came the Girondists were ready, and in March, 1792, Roland found himself appointed minister of the interior, but was soon dismissed.

After the abolition of royalty on August 10th, Roland was recalled to power, one of his colleagues being Danton. To his dismay he found that the passions which he had lent his aid in evoking he was powerless to allay, and that the party of the Mountain was, on the contrary, utilizing these passions for purposes of incredible excess. From this moment, though too late, the conduct of Roland with his wife, and the whole Gironde, became heroic. They fearlessly denounced the massacres of September, Roland writing boldly to the assembly on the subject. Both husband and wife became the butt of calumny and the object of increasing dislike on the part of the ultra-revolutionists—Robespierre shunning them, Danton denouncing them, and Marat in his journal heaping upon them the foulest falsehoods. Still the Girondists, from Vergniaud downward, banded themselves bravely on their side; but on January 22, 1793, Roland sent in his resignation. It was the day after the execution of the king.

Still they remained in Paris, unflinchingly, but with ever less and less success, attempting to regulate and elevate the Revolution. Calumny continued. Once Madame Roland appeared personally in the assembly to repel the falsehoods of an accuser, and her ease and dignity evoked enthusiasm and compelled acquittal. But violence succeeded violence, and early on the morning of June 1st she was arrested and thrown into the prison of the Abbaye. Roland himself escaped secretly to shelter in Ronen. Released for an hour from the Abbaye, she was again arrested and thrown among the horrors of Sainte Pélagie. Finally she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted

friends. She there wrote her *Appeal to an Impartial Posterity*, those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On November 8, 1793, she was conveyed to the guillotine. One week later Roland, having heard of his wife's death, wandered some miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could only be inspired by the enemies of France, protesting that "from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enemies." He affixed the paper to his breast, and unsheathing a sword-stick fell upon the weapon, which pierced his heart, on November 15, 1793.

**ROLAND, LEGEND OF.** The main incident of this legend is founded upon an undoubted historical event—the Spanish expedition of Charlemagne (778). The Frankish king, having crossed the Pyrenees and captured Pamplona, was beaten back from the walls of Saragossa. On his return the "Gascons" (Basques) surprised his rear guard, and, according to the testimony of Eginhard, cut it off to a man (*Vit. Car.*, c. i.)—"In which battle were slain Eggihard, provost of the royal table \* \* and Hruodlandus, prefect of the Britanic march." This account is supported by other evidence more or less contemporary, as, for example, the *Vita Hludowici*. From this work we gather that at the time of its composition (c. 840) the Roncesvalles disaster was already the subject of popular tradition; for its author, speaking of the Frankish chiefs slain in this battle, says, "quorum, quia vulgata sunt, nomina dicere supersedi." Yet in its earliest extant form the legend has already worked in the names and traditions of a later age, e.g., the traitor Genelon, who probably, as Leibnitz has suggested, represents Wenelon, archbishop of Sens, accused of treason toward Charles the Bald in 859.

**ROLLER**, a very beautiful bird, so called from its way of occasionally rolling or turning over in its flight, somewhat after the fashion of a tumbler-pigeon. It is the *Coracias garrulus* of ornithology, and is widely, though not very numerous, spread over Europe and Western Asia in summer, breeding so far to the northward as the middle of Sweden, but retiring to winter in Africa. The bird seems to be purely insectivorous. The genus *Coracias*, for a long while placed by systematists among the crows, has really no affinity whatever to them, and is now properly considered to belong to the heterogeneous group of birds in this work called *Picariæ*, in which it forms the type of the family *Coraciidæ*; and its alliance to the bee-eaters, *Merodidæ*, and KING-FISHERS, *Alcedinidæ*, is very evident. Some eight other species of the genus have been recognized.

**ROLLER MILL.** See FLOUR.

**ROLLIN, CHARLES**, was born at Paris on January 30, 1661. Rollin's literary work dates chiefly from the later years of his life, when he had been forbidden to teach. His once famous *Ancient History* (Paris, 1730-38) and the less generally read *Roman History*, which followed it, were avowed compilations, and compilations which were not only far from critical, but even somewhat inaccurate. But they have had the merit not merely of instructing but interesting generation after generation almost to the present day. A more original and really important work, though less generally known out of France, was his *Traité des Études* (Paris, 1726-31). Rollin died in 1741.

**ROLLING MILL.** See IRON.

**ROLLO, ROLF**, or **ROU**, Scandinavian rover, born c. 860, died 932. He made himself independent of Harold of Norway, visited Scotland, England, and Flanders in

pirating expeditions, and about 912 established himself on the Seine and laid the foundation of the duchy of NORMANDY. (*q. v.*)

**ROLLOCK, ROBERT**, the first principal of the university of Edinburgh, was the son of Edwin Rollock of Powis near Stirling, and was born in 1555. His death took place at Edinburgh on February 8, 1599.

**ROLLS, MASTER OF THE**, is the third member of the Supreme Court of Judicature in England, the lord chancellor, president of the Chancery Division, being the first and the lord chief justice, president of the Queen's Bench Division, being the second. At first he was the principal clerk of the Chancery and as such had charge of the records of the court, especially of the register of original writs and of all patents and grants under the great seal. Until the end of the fifteenth century he was called either the clerk or the keeper of the rolls, and he is still formally designated as the master or keeper of the rolls. The earliest mention of him as master of the rolls is in 11 Hen. VII. c. 18; and in 11 Hen. VII. c. 24 he is again described as clerk of the rolls, showing that his official designation still remained unsettled. In the beginning he only heard causes in conjunction with the other masters in Chancery and his decrees were invalid until they had been approved and signed by the lord chancellor. But later on he heard causes without assistance and his decrees held good until they were reversed on petition either to the lord chancellor or afterward to the lords justices of appeal.

**ROMAN CATHOLIC CHURCH**, the name generally given to that very numerous body of Christians who acknowledge the pope, or bishop of Rome, as head of their church. This name also signifies that the Roman Catholic Church is "Roman in its center and catholic in its circumference." The number of Catholics throughout the world is variously estimated, some statisticians placing it as low as 152,000,000, others at 213,518,000, and others at 218,000,000. The author of *Katholischer Missions-Atlas* (Rev. O. Werner, S. J.), largely furnished with Propaganda returns, distributes them as follows:—in Europe, 150,684,050; in Asia, 8,311,800; in Africa, 2,656,205; in both Americas, 51,422,566; in Australia and adjacent islands, 443,442; total, 213,518,063. But he considers that this calculation gives less than the whole number of Catholics throughout the world, and adds nearly a million more, making the total 214,370,000. Dr. Hugo Franz Brachelli, superior of the Austrian Statistical Department, in *Die Staaten Europa's*, gives the number of Catholics in Europe as 155,900,000, distributed mainly as follows:

Austria-Hungary	20,229,825
Prussia and German States	16,229,493
Great Britain and Ireland	6,000,000
France	35,387,703
Italy	26,658,679
Russia	8,500,000
Scandinavia: Sweden (1870), Norway (1875), Denmark (1880)	4,075
Netherlands	1,439,137
Luxemburg	207,782
Belgium, (population 5,519,844)	5,501,844
Liechtenstein, Monaco, etc., almost entirely	
Spain and Portugal (population 21,164,380)	21,148,880
Greece and Montenegro, over	124,000
Turkey	218,254
Bosnia and Herzegovina	209,391

The supreme pontiff, who traces his succession from St. Peter (see **POPE**), is regarded by Catholics as "vicar of Christ, head of the bishops, and supreme governor of the whole Catholic Church, of whom the whole world is the territory or diocese." He is also patriarch of the West, bishop of Rome and its district, and temporal prince over the states of the church

known as the Pontifical States—though the exercise of the last prerogative has been in abeyance since the events of 1859 and 1870. The pope has a primacy or supremacy, not only of honor, but of power, authority, and immediate jurisdiction, over the universal church. When he is canonically elected, and has given his consent to the election, he possesses, without any other confirmation, authority over the whole church, even though at his election he may not have been either bishop, priest, deacon, or subdeacon, but a simple layman. Hence the office of sovereign pontiff is a dignity not of order but of jurisdiction. His pronouncements are regarded as infallible when he defines a doctrine regarding faith and morals to be held by the whole church.

The office of pope is elective (see CONCLAVE), and lasts during the life of the occupant, although he may renounce his dignity. When the election has taken place the fact is made known by the cardinal dean. The cardinals are the princes and senators of the church, counselors of the pontiff, coöperators with him, and vicars in the functions of the pontificate. To Pope Evaristus, fifth successor of St. Peter, is attributed the creation of the first *titles* or parishes of Rome, the occupants of which were afterward known as cardinals. The cardinalate, in the sense at present attached to it, is different from what it was in earlier ages, being now the highest dignity after the papacy. The greater part of the administration of the church—the chief subject of this article—is directed by the cardinals who are members of congregations, which correspond, in a certain measure, to the political ministries in modern states. These congregations are established in Rome by the sovereign pontiff, and their objects are to inquire into, discuss, and decide the important affairs of the whole church and of the temporal dominions of the holy see. The cardinals are assisted by consultors or prelates, by distinguished ecclesiastics secular and regular, and by other officials appointed by the pope.

The head of every congregation is a cardinal prefect, though some congregations have the pope as prefect, *e.g.*, the holy office, the apostolic visit, and the consistory. The secretary is ordinarily a prelate; in the holy office he is a cardinal. The acts, decrees, rescripts, and letters issued in the name of a congregation are subscribed generally by the prefect, and always by the secretary. These two officials chiefly regulate the affairs of the congregation and submit to the pope, at periodical audiences, the matters which require its approval. The following are the more important congregations: Inquisition, consistorial, apostolic visit, bishops and regulars, council, residence of bishops, state of regulars, ecclesiastical immunities, propaganda fide, propaganda fide for Oriental affairs, commission for correction of books of the Oriental Church, index, sacred rites, ceremonial, regular discipline, indulgences and relics, examination of bishops, *fabbrica* of St. Peter's extraordinary ecclesiastical affairs and studies.

The work of the church in the world is directed immediately by the bishops, who receive their jurisdiction from the pope. The power inherent in the episcopal character and order is received from God directly and immediately. When established in a diocese by the pope, the bishop, in virtue of his title, receives the power of governing and of taking cognizance of all spiritual causes which regard his flock, whether laymen or ecclesiastics, with the exception of what is specially reserved to the head of the church, and he possesses and exercises these prerogatives under the jurisdiction of and in dependence on the pope. The bishops in the Catholic Church at the present time are (*Gerarchia Cattolica*, March, 1885) thus divided: (*a*) patriarchal sees, of the Latin rite, 7; of the Oriental rite, 5; (*b*)

archiepiscopal sees, of the Latin rite, immediately subject to the holy see, 14; with ecclesiastical provinces, 137; Oriental rite, with ecclesiastical provinces, 3, subject to patriarchates, 21; (*c*) episcopal sees, Latin rite, immediately subject to the holy see, 86; suffragans in ecclesiastical provinces, 579; Oriental rite, immediately subject to the holy see, 2; suffragans in ecclesiastical provinces, 8; subject to patriarchates, 41; (*d*) sees *nullius dioceseos*, 17. The titles dependent on the sacred congregation of Propaganda are—apostolic delegations, 7; vicariates apostolic, 123; prefectures apostolic, 35. The total of these hierarchical titles amounts to 1,085, and, including the 74 cardinalial titles, to 1,159. The vacant titles of all kinds amount to 107, and thus the whole hierarchy of the Catholic Church in March, 1885, reached the total of 1,266. Priests, placed in the second degree of the ecclesiastical hierarchy, who are generally divided into parish priests and curates or assistants, are immediately under the direction of the bishops and administer directly to the people. Their primary office is the offering of the sacrifice of the mass. They also preach, bless, and administer baptism, penance, communion, and extreme unction. Their functions are numerous and important, and they constitute the working force of the church in its direct relations with its members throughout the world. Priests of religious orders exercise like functions, save those properly parochial.

The Oriental churches in communion with the holy see, holding the same belief and the same principle of authority as the Latin Church, have their own special rites, discipline, and liturgical language. These are chiefly the Greek, Melchite, Bulgarian, Ruthenian, Maronite, Syro-Chaldaic, Coptic, Armenian, and Roumanian rites. The Greek Oriental rite is admitted by the pure Greeks, the Slavs (in Slav language), the Melchites of Syria (in Arabic), the Roumanians (in the Roumanian tongue), and the Georgians (in their own language). The Georgian Greek rite has no hierarchy, and many Georgians in Russia have passed to the Latin or Armenian rites. The Greek and Slav languages are approved by the church as ritual languages; Arabic is only tolerated.

ROMANCE in its widest sense includes the entire literature of fiction, as well as the early narrations in which fact and legend were blended in historical form, before the simple minds of the people had acquired a clear conception of their distinctness. There are, however, certain ill-defined limitations in the analysis of fiction which enable us to assign distinct places to the legend, the ballad, the epic, the fable, the tale, the romance, and the novel. As usual in all attempts at precise classification, we find that the lines of demarcation cannot be drawn with rigid exactness, and that many works may be referred to more than one division. But the general conception of romance is the one which will here be followed, and which roughly divides the subject into (*i*) *Romances of Chivalry*—chiefly their prose form—and (*ii*) the *Romances of Love and Adventure*, which follow them.

Romance, as a distinct branch of the literature of fiction, belongs essentially to the Middle Ages and Europe. The romance of chivalry, as it is called, prevailed during the four centuries of knighthood, and there can be little doubt that the institutions of chivalry were considerably influenced by the works of the early romancers. The establishment of the orders of St. John and the Temple was based upon an exalted conception of duty and devotion, which the hard test of experience soon modified, and which would have perished utterly but for the embodiment of its ideal in the Round Table romances. The characters of Galahad

and the original Perceval represent types of unattainable perfection, and were therefore models which, although commanding reverence, failed to excite as deep an interest as did the second Perceval, Sir Lancelot, Sir Tris, and Sir Gawain. In these the noblest qualities were blemished by human frailties, and, as a necessary consequence, the knights miscarried a little below the summit of perfect achievement. Walter Map cannot be sufficiently eulogized for the tact and skill with which he drew the two first-named personages. Galahad is brought upon the stage for but a very short time, and is then dismissed in a blaze of saintly glory, while Perceval, although adapted from the French writer's purer knight of that name, is allowed a much larger space upon canvas, at the cost of a few minor sins which suffice to insure his failure and to prove him a man. The other knights are brave, generous, self-sacrificing, and devout, but the indispensable virtue of chastity is absent from their lives, and they are foredoomed to misfortune. The perfect ideal, however, underlies the description of all their acts and motives, and the reader or hearer was never allowed to forget it amid the powerful attractions of the story.

The real prototype of the chivalric romance was the ancient epic; the Greek and Latin poems upon the winning of the Golden Fleece, the siege of Troy, the wanderings of Ulysses and of Æneas, furnish the truest parallel to the mediæval romances of knighthood. The tales which are usually dignified with the name of "classical romances" have really no claim to that rank; they were produced in the age of decadence and correspond much more closely to the mediæval *fabliau* and the seventeenth century novel than to the romance proper. As a matter of course every nation had its legends and popular tales, coëxistent with literary works of greater importance; but the Greeks at least, and the Romans following their example, never condescended during their ages of intellectual vigor to put such figments into written form, so that even the famous Milesian tales are now quite lost. It was not until the Greeks became a widely dispersed, a subject and deteriorated race, and not till the strength and manhood of Rome were buried in the slough of imperial corruption, that sophists and rhetoricians began to construct those artificial tales which we call Greek and Latin romances. They form, however, an epoch, as the earliest prose works of imagination in a European language, and cannot therefore remain unnoticed here. They were succeeded in time by Christian narratives, usually woven into the lives of saints or used as illustrations in the sermons of great preachers; these latter formed a transition to the semi-religious story of the Grail, a bowl or goblet confounded with the chalice used at the Last Supper, with the cup used to collect the precious blood of our Lord, and symbolically with the Holy Sepulcher itself. The achievers of the Grail-quest, or kings of the Grail, were typified in the Knights Templar and the Knights of St. John; thus the true school of romance arose in intimate connection with the changes in European life and manners which were brought about by the crusades.

The *chansons de geste*, which constituted a poetical introduction to the romances of chivalry, in France, were followed by the *fabliaux*, metrical novelettes which furnished material to the Italian writers of prose tales in the fourteenth and fifteenth centuries—a form of composition which was not acclimatized elsewhere than in Italy till the sixteenth century, and which then became the remote prototype of the modern novel. The older and nobler knighthood blossomed in France for the last time in Bayard, in England in Sir Philip Sidney; but the genuine literature of chivalric romance may be said to have come to an end with the fifteenth

century. The knightly romances produced in the sixteenth century were belated and artificial examples of their class; and although the effects of the conquest of Granada and the discovery of America did not wholly put an end to the lingering romantic spirit in Spain, it hardly survived them for half a century. Hence the inferior character of most of the *libros de caballerias*, which chiefly date from the sixteenth century. Out of them grew the fictions known as the sixteenth and seventeenth century romance in Spain, France, and England—monstrous and uninviting examples of perverted ingenuity, utterly dissonant from the literature of pure romance as we conceive it in the chivalrous fictions of the twelfth, thirteenth, and fourteenth centuries. A more practical and utilitarian spirit set in with the latter half of the seventeenth century, in which readers found themselves out of sympathy with the imaginative and mysterious atmosphere of romance. Accordingly the modern novel arose, a form of composition in which the manners and customs of everyday life were more or less faithfully depicted, and which has remained in undiminished popularity to the present time.

Although the distance in manner is immense between the *Ass* of Lucian and the *Amadis de Gaula*, and again between the latter and *Ivanhoe* or *Eugénie Grandet*, there are few varieties of modern fiction which are not faintly shadowed forth in the literatures of Greece and Rome (including in this denomination the post-classical periods of Italy and Byzantium): fables and tales, historical, philosophical, and religious novels, love-stories and narratives of adventure, marvelous voyages, collections of fictitious letters—all forms are represented.

The first we hear of the Greek or Hellenistic novel is in the time of Trajan (*c.* 110), when Iamblichus, a Syrian by descent and a freeman, born and educated at Babylon, wrote in Greek his *Babylonica*, which is known from Suidas, Photius, and a scholium discovered by Henry Estienne on an ancient MS. of the latter writer. A complete codex existed in 1671; and a considerable fragment has been reprinted by Mai. Suidas states that the *Babylonica* consisted of thirty-nine books, but Photius, who gives a full abstract, only mentions seventeen. The story is that of Sinon and Rhodanes, married lovers, persecuted by Garmus, king of Babylon, who is fascinated by Sinon. They fly, and are pursued by the royal eunuchs, who give them no peace through many adventurous scenes. A remarkable resemblance between the fugitives and another couple, Euphrates and Mesopotamia, is the chief subject of the plot.

The review of the *origines* of the Greek novel shows that it arose with the decay of old Greek literature and carried on a feeble existence down to the twelfth century. Two facts make themselves apparent. First, the romance (or novel) proper came late into the field, where it remained in a secondary place; and secondly, it invariably turned upon a hackneyed circle of incidents and never attained anything of the highly artistic development reached by modern examples. The sameness observable in Greek romance arises from the fact that it was the product of literary decrepitude and impotence.

The contributions of Roman literature are limited to productions by two writers, Petronius and Apuleius and one story by Martianus Capella, of more recent date and typical nature. In the comic romance of PETRONIUS ARBITER (*q. v.*), the tale of the matron of Ephesus first appears among Western popular fictions. This was undoubtedly one of the Ephesian tales already referred to. We find it reproduced in the *Seven Wise Masters*, in the French *fabliaux*, and in Brantôme. It is also to be found in the Chinese.

The wonders revealed through the Asiatic expedition of Alexander gave rise to a remarkable development of the marvelous in historical composition. The histories of Onesicritus, Aristobulus, and Clitarchus, themselves members of the expedition, were so full of unheard-of things that they soon fell into disrepute. Callisthenes, another companion of Alexander, also wrote an account, which is lost, but his name remains connected with a spurious work in which were crystallized all the fabulous tales of the conqueror. The life of Alexander had every quality to appeal to the imagination. His marvelous career, his genius as a soldier and ruler, the beauty of his person, his early death, were subjects for legend almost in his own day; and a cloud of mythical story soon floated round his memory. Quintus Curtius, who drew from some of these suspicious sources, is a more critical authority, though he allowed rhetorical fancy to embellish his narration. It is a great fall from the Latin historian to the Pseudo-Callisthenes. The work we possess under the latter title represents the second stage of the Alexander myth. Some of the MSS. attribute it to Aristotle, Ptolemy, and Æsop, as well as to Callisthenes—all with equal verisimilitude. To reconstruct the true from the spurious work is an impossible task after the increased vogue given to the latter by the re-opening of the East to Europe by the Romans, when all the traditions became remolded in the form they now possess. Among the histories separate from Pseudo-Callisthenes and subsequent to Quintus Curtius is an *Itinerarium Alexandri*, in Latin, but of Greek origin, which is little else than an amplification of the apocryphal letter of Alexander to Aristotle. It is dedicated to Constans, son of the emperor Constantine.

The same origin is to be sought for the Alexander myths found in *Renart le Bestourné* and the *Speculum Historiale* of Vincentius Bellovacensis. Quintus Curtius was largely used for the *Alexandreis* (c. 1176–1202) of Gaultier de Châtillon. It was the theme of poetry in all European languages; six or seven German poets dealt with the subject, and it may be read in English, Spanish, Danish, Swedish, Icelandic, Flemish, and Bohemian.

Toward the close of the fifteenth century an anonymous writer worked up the subject into a prose romance, *L'histoire du noble et vaillant roy Alixandre le Grant* (1506), in which the *Historia de Præliis* is followed with tolerable exactness.

The oldest and certainly the most important of the cycles of mediæval romance is that which passes under the name of King Arthur, or of the Round Table. The names, characters, and actions of its heroes have permeated modern literature throughout Europe; yet so little do we know concerning the *origines* and the first authors of the tales which form the body of Arthurian romance, that there are few subjects in literary history more obscured and undefined. It can only be said with assurance that from about the year 1150 several poems were composed by minstrels (a class of men recruited from all ranks of society) upon incidents and personages familiar to readers of what is known as *Morte Arthur*, a compilation of the second half of the thirteenth century. The *Morte Arthur* was not originally so called, and it was not a direct compilation from the ballad of the twelfth century, but seems rather to have been a mere unskillful reduction into a single *corpus* of some five or six prose romances which had already grown out of the poems, and each of which professed to relate the adventures of nearly the same set of heroes. The first appearance of these stories in prose compositions is here our chief concern; and it is, unfortunately, likewise our chief difficulty. The sources of informa-

tion upon the subject are defective and vitiated to a singular degree; and the light thrown by the investigations of recent writers is frequently of the nature of cross-lights. The following attempt at constructing a brief literary history of the Arthurian romances is not offered as a complete analysis of the work which has been done, but as a summary of facts and probabilities.

The Round Table romances had their starting-point in Geoffrey's *Historia*, first published in 1138–39, revised and republished in its present form in 1147. Yet there is no mention in Geoffrey of Launcelot and Tristan, two heroes of much greater importance in the romances than Arthur himself. It does not seem to have been observed before that there is a curious set of resemblances between the personages of the romances and those of the Homeric siege of Troy.

The success of Geoffrey of Monmouth's *Historia* and of his *Merlin* brought indignant comment from some of the Anglo-Norman historians, but it inflamed the minds of other writers already excited by the extraordinary events of the period. The result was the genesis of modern fiction.

The cycle of Franco-Teutonic or French romance of which the mythical history of Charles the Great forms the central design is, so far as its original literary elements are concerned, more ancient than the Franco-British cycle of Arthur and his knights. The reduction into prose of the old *chanson de geste* and of the *poèmes cycliques* which followed them was, however, of much later date than the similar conversions of Round Table poems.

Arthur had become in Britain not only a national hero of romance but also a leading figure around whom might be grouped the adventures of subordinate knights. Charlemagne filled a similar place for French writers, but had the advantage of being a more distinct historical character than Arthur. In the Iberian peninsula, where we find the next great cycle of stories, the circumstances which produced the national hero (the Cid) were still progressive, and his history was too real to melt into such romantic action as dealt in France and England with remote and shadowy paladins and the wonders of fairyland. Therefore, while the Cid had an ever-present reality in ballads, the earliest appearance of prose romance in Spain was in an artificial imitation of the Franco-British cycle. As it was a work of great merit, its fictitious hero became, as it were, the central figure in the stories which followed and which bore to one another a strong family likeness. Most of the chief heroes are illegitimate, like Amadis; the adventures of two brothers are told; and there is much similarity of incident and character. Many of the scenes are laid in Constantinople. *Amadis de Gaula* is the poetical sire of an extraordinary series of romances, which in the words of Cervantes form an "innumerable linaje," and is itself the most interesting and remarkable of them. Although its reputation is due to the Spanish redaction of Montalvo, there was an earlier Portuguese version by Vasco de Lobeira (d. 1403), a gentleman of the court of João I.

The Anglo-Danish cycle of romance, by reason of its origin and type of adventures, may be fitly supplemented by the stories, eminently English in character, although furnished with an Anglo-Norman setting, which have been called "outlaw romances."

Tales of outlaws form a considerable portion of English fiction, and, as elsewhere, the same incidents occur over and over again, being always attributed to the favorite hero of the day. The oldest was that of Hereward the Saxon, whose exploits against William were renowned in prose and verse soon after his own time.

Most of the outlaw stories remain in ballad form; a prose example is the French *Fulk Fitzwarin* (about 1320), descriptive of outlaw life in the Welsh marches and other parts of England, Spain, etc., an embellished record of actual events from 1201 to 1203.

The inspiration of mediæval romance is gone; but it is necessary briefly to trace its final reflections to the close of the seventeenth century, when prose fiction began to assume more definitely the character of the modern novel.

We have seen how large a place in the history of romances is occupied by France down to the end of the sixteenth century. We first meet with the so-called "pastoral romance" in French in *L'Astrée* (1612) of Honoré d'Urfé, an enormous work inspired by Montemayor. Le Roy de Gomberville led the way to the new school of French romance in *Polexandre* (1632-39) and *La Cythérée* (1640-42), which were the models for the still more ponderous productions of La Calprenède and De Scudéry. These form a link between the genuine romance of chivalry and the so-called heroic style. Nearly all the familiar machinery of the old romances is now absent; we no longer meet with dragons, necromancers, giants, and enchanted castles. Formerly love was secondary to heroic achievement; now it becomes the ruling passion, and knightly deeds are performed only to excite the applauding smile of a mistress, and not for the sake of military glory. The jargon of gallantry used in these fictions exercised an evil influence upon contemporary literature, until it was laughed out of existence by the *Précieuses Ridicules* of Molière and the dialogue of Boileau on *Les Héros de Roman*. Such works as *Marie Stuart* (1675) by P. Le Pesant de Boisguilbert, *Fouvelles d'Élisabeth* (1680), and *Frédéric de Sicile* (1680), are a connecting link between the romance of De Scudéry and the modern historical novel.

ROMANCE LANGUAGES is the name generally adopted for the modern languages descended from the old Roman or Latin tongue, acted upon by inner decay or growth, by dialectic variety, and by outward influence, more or less marked, of all the foreign nations with which it came into contact.

Latin, like all other literary languages, began as a living popular speech. There was during this first period practically little difference between the vulgar and the literary language. In the oldest historical time Latin was spoken only in the small territory called Latium. The greater part of Italy proper was occupied by the Umbro-Oscan tribes, whose languages were Italic, related to Latin, yet so different as to be unintelligible to the Romans. The two most distinct types were Umbrian in the north and Oscan in the south. The chief difference between them is that Umbrian was in a much more advanced state of phonetic decay, and was in many respects a precursor of Italian and Romance, while Oscan was still more antique than Latin. When the territories where these dialects were spoken became subject to the Romans, about the beginning of the third century B.C., the language of the conquerors was introduced, but of course modified by the speech of the conquered. Thus two groups of provincial dialects were formed. (1) The North or Umbrian and Sabelian Latin, with which Etruscan Latin was closely connected, was peculiarly important, since it spread southward and extended to the neighborhood of Rome; thus Falerii, Præneste, and Tusculum spoke it. Later it spread to Northern Italy. Being really a fuller development of the tendencies of the old popular Latin and easier to pronounce than literary Latin, at last from the surrounding peasantry it reached the people of Rome and became the source of the modern tongues. (2)

The South or Oscan Latin was Latin with some slight phonetic modifications, which, in Modern South Italian, have lived through the leveling influence of the north dialect. Between the Umbrians and the Oscans lay the Sabellians, occupying linguistically as geographically a middle position, yet somewhat nearer to the north dialect than to the south. To the west of Umbria lay the mysterious Etruria, whose language, preserved in numerous inscriptions, has long been an unsolved riddle and is still a matter of dispute, some considering it as utterly unconnected with Italic or even Aryan, some, as Deecke and Sophus Bugge, thinking it Aryan, intermediate between Greek and Italic, but partly decayed. In the last respect it has much in common with Umbrian, but its tendency to a rapid and slovenly utterance is still more distinctly traceable than in Umbrian.

Of the other languages spoken in old Italy, such as Messapian, Celtic, Venetian, and Ligurian, too little is known to enable us to form an estimate of their phonetic character; but in general we see the peculiarities of North Latin penetrating more or less everywhere, in the north of Italy and in Spain (subjected at the end of the third century B.C.), as well as in Gaul, of which the southern part, Provincia (later Provence), was subjected first, and the rest, by Cæsar, in the first century B.C. All these countries were rapidly Latinized; but the provincial dialects did not always follow the phonetic development of the mother speech, just as American does not always follow the changes of English.

For the history and distinctive traits of the great modern Romance languages—the reader is referred to the separate articles.

1. *Italian* is distinguished by its harmonious form, its vocalic endings, and the rich fulness of its tones.
2. *Spanish* is distinguished by its regularity, by its short, distinct sounds, and its fixed tones, and by many Arabic words. Certain "thick" sounds, as the *j* (like Dutch and South German *ch*, though in the south of Spain much weaker, almost *h*) and the lisping *c, z* seem to be rather modern developments than due to direct Arabic influence.
3. *Portuguese* is, with *Gallego* (the dialect of Galicia), the western dialect of Spanish, and has almost the same words, but a very different pronunciation; in sound it approaches somewhat to French, as in the nasal vowels (which, however, are less purely vocalic than in French) and the voiced sounds of *s, z, and j*. It has partly retained the Old Spanish form, as in *filho* for Span. *hijo*, and partly it has a character of its own owing to its many obscured vowels and contractions, as *boa* for *bona*, *dôr* for *dolor*.
4. *Provençal* in many respects represents the earliest form of French; in others it has peculiar developments (see PROVENÇAL). *Catalan* is the southern dialect of Provençal.
5. *French* makes up for the want of the full forms and tones of Italian by its grace and delicacy. It has more of a history than the other Romance languages, Old French being very different from Modern.
6. *Ladino* (*Rumonsch*, Germ. *Churwälsch*, from the town of Chur) or *Central Romance* extends from the Grisons to Friuli on the Adriatic. It is not uniform, being only an agglomeration of cognate dialects; and it is scarcely more Latin than any other Romance language. It has chiefly been elucidated by Ascoli.
7. *Roumanian* has probably not survived from the old Roman colonists of Dacia, but been imported from Istria (which has a cognate dialect) or Northern Italy. It has been greatly mixed up with Slavonic words and sounds (such as the "mixed" vowels), and has some distinctive marks, such as the post-positive article,

*Romunul* = Romanus ille; compare the similar phenomenon in the Slavonic dialect of Bulgaria and in the Albanian language.

ROMAN LAW. THE REGAL PERIOD. *Contributions to People, Customs, and Law.*—The union of the Latin, Sabine, and, to a small extent, Etruscan bands that, as conquerors or conquered, old settlers or new immigrants, together constituted the first elements of the Roman people, did not necessarily involve contemporaneous adoption of identical institutions or identical notions of law. Although they were descended from the same Indo-European stock, and inherited the same primitive ideas about religion and government, those ideas must have been modified in the course of centuries of separate and independent development. The characteristics of the Latin race are said to have been its sense of the importance of discipline and the homage it paid to power and might; those of the Sabines were their religious feeling and their reverence for the gods; the characteristic of the Etruscans was their subservience to forms and ceremonies in matters both divine and human. Corresponding influences are very manifest in the growth of Rome's early public institutions, civil, military, and religious. It does not seem too much to say that these same influences are traceable also in the institutions of the private law. The *patria potestas*, with the father's power of life and death over his children; the *manus* and the husband's power over his wife; the doctrine that those things chiefly was a man entitled to call his own which he had taken by the strength of his arm; the right which a creditor had of apprehending and imprisoning his defaulting debtor and reducing him to slavery—all these seem to point to a persuasion that might made right. The religious marriage ceremony and the recognition of the wife as mistress of the household and participant in its sacred offices as well as its domestic cares; the family council of kinsmen, maternal as well as paternal, who advised the *paterfamilias* in the exercise of the domestic jurisdiction; the practice of adoption, to obviate the extinction of a family and to prevent its deceased members being deprived of the prayers and sacrifices necessary for the repose of their souls—these seem to have flowed from a different order of ideas and to bear evidence of Sabine descent. Etruscan influence could make itself felt only at a later date; but to it may possibly be attributed the strict regard that came to be required to the observance of ceremonials and words of style in the more important transactions both of public and private life.

While it can hardly be doubted that the result of the union of Latins and Sabines was that regulations were at once adopted which should apply to their public life as a united people, it is not only conceivable but probable that each tribe, as regarded the private relations of its members, continued for a time to accord a preference to its own ideas and traditions of right and law, and that the amalgamation was a gradual process, partly silent, partly due to regal or pontifical intervention.

*The Regulatives of Public and Private Order.*—We look in vain for, and it would be absurd to expect, any definite system of law in those early times. What passed for it was a composite of *fas*, *jus*, and *boni mores*, whose several limits and characteristics it is difficult to define. This may to some extent be accounted for by the fact that much of what was originally within the domain of *fas*, once it had come to be enforced by secular tribunals, and thus had the sanction of human authority, was no longer distinguishable from *jus*; while it may be that others of its behests, once pontifical punishments for their contraven-

tion, had gone into desuetude, sank to nothing higher than precepts *boni mores*.

By *fas* was understood the will of the gods, the laws given by heaven for men on earth, much of it regulative of ceremonial, but a by no means insignificant part embodying rules of conduct. It appears to have had a wider range than *jus*. There were few of its commands, prohibitions, or precepts that were addressed to men as citizens of any particular state; all mankind came within its scope.

This *jus* might be the result either of traditional and inveterate custom (*jus moribus constitutum*) or of statute (*lex*). We look in vain for any legislative enactment establishing such an institution, for example, as the *patria potestas*, or fixing the rules of succession on death. Statute may have regulated some of their details; but they had taken shape and consistency before Rome had its beginning.

What went by the name of *boni mores*, quite distinct from the *jus moribus constitutum*, must also be regarded as one of the regulatives of public and private order. Part of what fell within their sphere might also be expressly regulated by *fas* or *jus*; but there was much that was only gradually brought within the domain of these last, and even down to the end of the republic not a little that remained solely under the guardianship of the family tribunal or the censor's *regimen morum*. Its function was twofold: sometimes it operated in restraint of law by condemning—though it could not prevent—the ruthless and unnecessary exercise of legal right, as for example, that of the head of a house over his dependants; and sometimes it operated supplementarily, by requiring observance of duties that could not be enforced by any compulsor of law. Dutiful service, respect, and obedience from inferiors to superiors, chastity, and fidelity to engagements, express or implied (*fides*), were among the *officia* that were thus inculcated, and whose neglect or contravention not only affected the reputation but often entailed punishments and disabilities, social, political, or religious. It was the duty of those in authority to enforce their observance by such *animadversio* as they thought proper—the *paterfamilias* in his family, the *gens* among its members, the king in relation to the citizens generally; and many a wrong was prevented not by the fear of having to make reparation to the party injured, but by the dread of the penalties that would follow conduct unbecoming an upright citizen.

*The Quiritian Family.*—The word *familia* in Roman law had at once a more extensive and a more limited meaning than it has in its English form. Husband, wife, and children did not necessarily constitute an independent family among the Romans, nor were they all necessarily of the same one. Those formed a family who were all subject to the right or power—originally *manus*, but latterly *jus*—of the same family head (*paterfamilias*). He might have a whole host dependent on him—wife and sons and daughters, and daughters-in-law, and grandchildren by his sons, and possibly remoter descendants related through males; so long as they remained subject to him they constituted but one family, that was split up only on his death or loss of citizenship. But if his wife had not passed *in manum*—and that was common enough even during the republic, and universal in the later empire—she did not become a member of his family: she remained a member of the family in which she was born, or, if its head was deceased or she had been emancipated, was the sole member of a family of her own. Both sons and daughters on emancipation ceased to be of the family of the *paterfamilias* who had emancipated them. A daughter's children

could never under any circumstances be members of the family of their maternal grandfather; for children born in lawful marriage followed the family of their father, while those who were illegitimate ranked from the moment of birth as *patresfamilias* and *matresfamilias*.

With the early Romans, as with the Hindus and the Greeks, marriage was a religious duty a man owed alike to his ancestors and to himself. Believing that the happiness of the dead in another world depended on their proper burial and on the periodical renewal by their descendants of prayers and feasts and offerings for the repose of their souls, it was incumbent upon him above all things to perpetuate his race and his family cult. In taking to himself a wife, he was about to detach her from her father's house and make her a partner of his family mysteries. With the patrician at least this was to be done only with divine approval, ascertained by *auspicia*. His choice was limited to a woman with whom he had *conubium* (*ἐπιγαμία*) or right of inter-marriage. This was a matter of state arrangement; and in the regal period Roman citizens could have it outside their own bounds only with members of states with which they were in alliance, and with which they were connected by the bond of common religious observances. The *patria potestas* was the name given to the power exercised by a father, or by his *paterfamilias* if he was himself *in potestate*, over the issue of such *justae nuptiae*.

It might happen that a marriage was fruitless, or that a man saw all his sons go to the grave before him, and that the *paterfamilias* had thus to face the prospect of the extinction of his family and of his own descent to the tomb without posterity to make him blessed. To obviate so dire a misfortune he resorted to the practice of adoption, so common in India and Greece. If it was a *paterfamilias* that he adopted the process was called adrogation (*adrogatio*); if it was a *filiusfamilias* it was simply *adoptio*.

The *manus* and the *patria potestas* represent the masterful aspects of the patrician's domestic establishment. Its conjugal and parental ones, however, though not so prominent in the pages of the jurists, are not to be lost sight of. The Roman family in the early history of the law was governed as much by *fas* as by *jus*. It was an association hallowed by religion, and held together not by might merely but by conjugal affection, parental piety, and filial reverence. The purpose of marriage was to rear sons who might perpetuate the house and the family *sacra*. In entering into the relationship the wife renounced her rights and privileges as member of her father's house; but it was that she might enter into a lifelong partnership with her husband, and be associated with him in all his family interests, sacred and civil. The husband was priest in the family, but wife and children alike assisted in its prayers, and took part in the sacrifices to its lares and penates.

In Greece the *patria potestas* never reached such dimensions as in Rome, and there it ceased, *de facto* at least, when a son had grown up to manhood and started a household of his own. But in Rome, unless the *paterfamilias* voluntarily put an end to it, it lasted as long as the latter lived and retained his status. The acquisition of domestic independence by the death of the family head frequently involved the substitution of the guardianship of tutors (*tutela*) for the *potestas* that had come to an end. This was so invariably in the case of females *sui juris*, no matter what their age: they remained under guardianship until they had passed by marriage *in manum mariti*. It was only pupil males, however, who required tutors, and their office came to an end when puberty was attained.

*The Quiritian Law of Property.*—The distribution

of land among the early Romans is one of the puzzling problems of their history. The Servian constitution classified the citizens and determined their privileges, duties, and burdens according to the extent of their freeholds; and yet we know very little with certainty of the way in which these were acquired. We have indeed a traditional account of a partition by Romulus of the little territory of his original settlement into three parts, not necessarily of equal dimensions, one of which was intended for the maintenance of the state and its institutions, civil and religious, the second (*ager publicus*) for the use of the citizens and profit of the state, and the third (*ager privatus*) for subdivision among his followers. Varro and Pliny further relate that to each of them he assigned a homestead (*heredium*) of two jugers, equal to about an acre and a quarter, to be held by him and his heirs (*quae heredem sequerentur*), Pliny adding that to none did the king give more. There can be no doubt that a portion of the territory, gradually augmented through new conquests, was reserved as *ager publicus*; that is sufficiently attested by the complaints made for centuries by the plebeians of its monopolization by the patricians. But it is impossible to admit the accuracy of the account of the mode in which the *ager privatus* was dealt with. The fact that the majority of the Servian local tribes bore the names of well-known patrician *gentes* leads to the conclusion that many at least of the clans held tracts of land in their corporate capacity, and that their constituent families settled alongside each other, each with its own homestead in separate and independent right. It can hardly be assumed, however, that two and a half jugers was its maximum. Seven jugers, about four and one half acres, seems to have been the normal extent of royal grants to plebeians, and a patrician's freehold is not likely to have been less; probably in the ordinary case it was larger, seeing the minimum qualification for the third Servian class was ten jugers, and for the first twenty. To enable him to make grants during pleasure to his clients he must have held more than seven. But he did not necessarily hold all his lands by gratuitous assignation either from the state or from his *gens*; purchase from the former was by no means uncommon; and it may have been on his purchased lands, outside his *heredium* proper, that his clients were usually employed. Those dependents were also employed in large numbers upon those parts of the *ager publicus* which were occupied by the patricians under the name of *possessionses*, and which really were the source of their wealth. These, however, were not the property of their occupant; it was the lands acquired by assignation or purchase that were alone regarded as his *ex jure Quiritium*—what he held in independent ownership to him and his heirs according to the law and custom of the Quirites.

There are some who maintain that in the regal period, anterior to the reign of Servius Tullius, there was no private property in movables. The proposition thus broadly stated is manifestly untenable. If no more be meant by it than this, that movables were not then recognized as objects of quiritarian right that could be vindicated as such by a real action *per sacramentum*, it may be admitted that down to the time of Servius, with exception perhaps of captured slaves and cattle, there was no property in movables. But, if it be meant to negative the right of a man to alienate by tradition what he held as his own, and to protect himself, or have protection from the authorities, against any attempt to deprive him of it by theft or violence, then the non-existence of ownership of movables must be emphatically denied. Theft was theft, though the stolen article had been acquired only by natural means—by barter in the market, by the industry of the maker,

or as the product of something already belonging to its holder.

*The Quiritian Law of Succession.*—The legal order of succession in the regal period was extremely simple. It was this: On the death of a *paterfamilias* his patrimony devolved upon those of his children *in potestate* who by that event became *sui juris*, his widow taking an equal share with them, and no distinction being made between movables and immovables, personalty and realty; and, failing widow and children, it went to his *gens*. The notion that between the descendants and the *gens* came an intermediate class under the name of agnates does not seem well founded as regards the regal period; they were introduced by the XII. Tables to meet the case of the plebeians, who, having no *gentes*, were without legal heirs in default of children.

There were two sorts of testaments made use of by the patricians of the regal period—that made in the comitia of the curies (*test. calatis comitiis*) and that made in the presence of a few comrades on the eve of battle (*test. in procinctu factum*). The first at least—and the second was just a substitute for it on an emergency—was far from being an independent exercise of the testator's *voluntas*.

The accounts of the early distributions of land among the plebeians are even more uncertain than those we have of its distribution among the patricians. They had undoubtedly become freeholders in large numbers before the Servian reforms. But they probably attained that position only by gradual stages. There are indications that their earliest grants from the kings in their character of royal clients (as Cicero calls them) were only during pleasure; but latterly, as they increased in numbers and importance, they obtained concessions of *heredia* varying in extent from two to seven jugers. That those who had the means also frequently acquired land by purchase from the state may be taken for granted.

As regards the law of succession it may safely be assumed that by custom at all events the children of a plebeian usually took his estate on his death. But, as he was not a member of a *gens*, there was no provision for the devolution of his succession on failure of children. The want of them he could not supply by adrogation, as he had for long no access to the assembly of the curiæ; and it is very doubtful if adoption of a *filius-familias* was known before the reforms of Servius Tullius. The same cause that disqualified him for adrogating a *paterfamilias* disqualified him for making a testament *calatis comitiis*; and even one *in procinctu* was impossible, since, although before the time of Servius plebeians may occasionally have served in the army, they were not citizens, and so had not the requisite capacity for making a testament. Until therefore the XII. Tables introduced the succession of agnates a plebeian unsurvived by children was necessarily heirless—that is to say heirless in law. But custom seems to have looked without disfavor on the appropriation of his *heredium* by an outsider: a brother or other near kinsman would have the earliest opportunity, and, if he maintained his possession of it in the character of heir for a reasonable period, fixed by the XII. Tables at a year, the law dealt with him as heir, and in course of time the pontiffs imposed upon him the duty of maintaining the family *sacra*.

*Public and Private Offenses and their Punishment.*—For anything like a clear line of demarkation between crimes, offenses, and civil injuries we look in vain in regal Rome. Offenses against the state itself, such as trafficking with an enemy for its overthrow (*proditio*) or treasonable practices at home (*perduellio*), were of course matter of state concern, prosecution and punishment from the first. But in the case of those that

primarily affected an individual or his estate there was a halting between, and to some extent a confusion of, the three systems of private vengeance, sacral atonement, and public or private penalty. It has been attempted to explain the coexistence of these systems by reference to the different temperaments of the races that constituted united Rome; and this certainly is a consideration that cannot be left out of view. But the same sequence is observable in the history of the laws of other nations whose original elements were not so mixed, the later system gradually gaining ground upon the earlier and eventually overwhelming it.

THE JUS CIVILE. (*From the Establishment of the Republic until the Subjugation of Central and Southern Italy.*) *Formative Agencies of the Law. The Legislative Bodies of the Period.*—The limits and scope of this article do not permit of any detailed account of the consequences of the change from kings to consuls, or of the tribulations of the plebeians during the first two centuries of the republic. Stage by stage they fought and conquered in the uphill battle for social and political equality. In 260 U.C. they got their own special protectors in their tribunes, with the *ædiles* as their assistants, and *judices decemviri* to act under their instructions as arbiters in disputes among themselves. In 283 they obtained state sanction for their *concilium*, and recognition of its power to regulate purely plebeian interests. The XII. Tables of 303 were the fruit of their agitation for a revision and written embodiment of the law. It was in deference to their complaints of their practical disfranchisement through the unduly preponderating influence of the patricians in the comitia of the centuries that in 305 the comitia of the tribes was instituted. Their repeated protests against the monopolization of the public domain land by members of the higher order resulted at last in the definite recognition of their right to participate in its occupation by one of the Licinian laws of 387. The long course of cruel oppression of plebeian insolvents by their patrician creditors was put an end to by the Pœtilian law of 428 abolishing nexal contract, and prohibiting the use of chains and fetters on persons incarcerated for purely civil debt. By the Hortensian law of 467 the resolutions of the plebeian council (*plebiscita*) were declared binding not only on the plebeians themselves but on the whole body of the citizens. And from 333, when a plebeian first reached the magistracy through the quætorship, down to 502, when they attained to the supreme pontificate, they gradually vindicated their right as citizens to share in all the honors and dignities of the state.

The legislative bodies were thus three in number—the comitia of the centuries, the *concilium plebis*, and the comitia of the tribes. The first, if not organized by Servius Tullius, at all events grew out of his distribution of the populace into classes and centuries according to the value of their freeholds as appearing on the census-list. As only the national army assembled for a peaceful purpose (*exercitus civilis*), it could be convened and presided over originally only by a magistrate possessing the military *imperium*, i.e., a consul; but, after the creation of the censorship in 311 and the prætorship in 387, the holders of those offices were entitled to convoke it—the former for its assent to arrangements for the census, and the latter for state trials. It was the centuries that passed the XII. Tables; but for the most part their legislation was upon questions affecting public and constitutional rather than private interests. The procedure in the centuriate comitia was somewhat cumbrous. There was publication of the proposed law (*promulgatio rogationis*) a fortnight before the day appointed, sometimes one or more meetings (*conciones*) being held in the inter-

val for its consideration and discussion. When the day arrived, the *auspicia* were taken by the presiding magistrate, assisted by an augur; if favorable, the citizens were summoned anew by blast of trumpet, and on their assembling, which originally they did under arms, prayer and sacrifice were offered by president, pontiffs, and augurs. A final *concio* might then be held if thought necessary; and, after it was over, on the order to "proceed to the comitia," the citizens marched to the Campus Martius (the formal assembly being incompetent within the city). There the *rogatio* was read and, if no sign from heaven indicated the dissent of the gods and warned the assembly to disperse, was at once put to the vote—"Is it your pleasure, Quirites, to hold this as law?" The vote was taken by centuries, those of the knights and the freeholders of full valuation voting first; if they were unanimous it went no further, for these formed more than a majority of the whole *comitia*. The resolution, if adopted, was *populi jussum*, but not yet law. It had still to run the gauntlet of the "fathers," whether the senate or only its patrician members is disputed; it was in their power to refuse to authorize it (*auctores fieri*), usually putting their dissent on the ground that the gods willed it not; but if they ratified it, then it became a *lex*, ordinarily getting the name of the magistrate by whom it had been proposed. The power of veto, however, was considerably qualified by a Publilian law of the year 415, which enacted that in future the "fathers" should grant (or refuse) their *auctoritas* before the vote was taken.

The points of difference between the enactments of the *concilium plebis* and the later *comitia tributa* are indicated by Mommsen in a paper in his *Researches*. (1) The *comitia* was an assembly of the whole body of the people, voting according to tribes instead of centuries; the *concilium* was an assembly of plebeians only, also voting *tributim*. (2) The *comitia* was convened and presided over by a patrician magistrate, not necessarily, however, with military *imperium*, and therefore very frequently by the prætor; whereas the *concilium* could be convened and presided over only by a plebeian official, either a tribune or an ædile. (3) In the *comitia* the *auspicia* had to be taken before the proceedings commenced; in the *concilium* the will of the gods was not demanded, although listened to if communicated in a thunder-storm or the like. (4) The resolution of the *comitia* required to be confirmed by the "fathers;" while that of the *concilium* did not. (5) An enactment of the *comitia* was a *lex*, and bound the whole people; but before the Hortensian law an enactment by the *concilium plebis* was in the ordinary case no more than a *plebiscitum*, and of force only among the plebeians themselves. But there was an exception when, because of some constitutional change proposed by it, the senate had previously sanctioned the legislation, as in the case of the Terentilian law, which paved the way for the XII. Tables, of the Canuleian law authorizing the intermarriage of patricians and plebeians, of the Licinian laws about the occupation of the public lands, etc.; in such cases, although the final vote was that of the *concilium*, the enactment was binding on the citizens generally, and was spoken of as a *lex* rather than as the *plebiscitum*. The latter name seems practically to have been dropped after the Hortensian law had equalized them so far as their effects were concerned. The greater part of the legislation for amending the private law latterly fell to the *concilium*, owing so far, perhaps, to the greater simplicity of its procedure, but also to some extent to the fact that the prætors preferred making their amendments tentatively by edicts (which were revocable), instead of embodying them in statutes, which, as passed under divine *auspices*

and representing the divine will, could not easily be repealed.

*Development of the Substantive Institutions of the law. The Citizen and his "Caput."*—The early law of Rome was essentially personal, not territorial. A man enjoyed the benefit of its institutions and of its protection, not because he happened to be within Roman territory, but because he was a citizen—one of those by whom and for whom its law was established. The theory of the early *jus gentium* was that a man sojourning within the bounds of a foreign state was at the mercy of the latter and its citizens, that he himself might be dealt with as a slave, and all that belonged to him appropriated by the first comer; for he was outside the pale of the law. Without some sort of alliance with Rome a stranger had no right to claim protection against maltreatment of his person or attempt to deprive him of his property; and even then, unless he belonged to a state entitled by treaty to the international judicial remedy of *recuperatio*, it was by an appeal to the good offices of the supreme magistrate, or through the intervention of a citizen to whom he was allied by the (frequently hereditary) bond of *hospitium*, and not by means of any action of the *jus civile* set in motion by himself. A non-citizen—originally *hostis*, and afterward usually called *peregrinus*—in time came to be regarded as entitled to all the rights the *jus gentium* recognized as belonging to a freeman, and to take part as freely as a Roman in any transaction of the *jus gentium*; but that was not until Rome, through contact with other nations and the growth of trade and commerce, had found it necessary to modify her jurisprudence by the adoption of many new institutions of a more liberal and less exclusive character than those of the *jus civile*.

A citizen's civil personality was technically his *caput*. Whenever a citizen either ceased altogether to be a member of a Roman family or passed from one family into another, there was technically *capitis minutio* or *diminutio*, except in the cases of *filiofamilias* and *filiaefamilias* becoming flamens or vestals; for, though they changed their family, yet it was by passing from a human into a divine one. When a citizen forfeited his freedom, his *capitis diminutio* was said to be *maxima*; he lost all capacity, whether under the *jus civile* or the *jus gentium*. When, retaining freedom, he went into exile or joined a Latin colony, or otherwise became a peregrin, the diminution of his capacity was only *media* or *minor*; it was his rights and privileges under the *jus civile* that alone were affected. When both freedom and citizenship remained, and no more occurred than the severance of his connection with a particular family (*familiae mutatio*), the diminution was said to be *minima*.

*The Law of the Family Relations.*—So far as appears no serious inroad was made by the XII. Tables on the law affecting husband and wife, unless in the recognition of the legality of marriage entered into without any solemnity, and not involving that subjection of the wife to the husband (*manus*) which was a necessary consequence of the patrician confarreation and plebeian coemption. These were left untouched.

*Guardianship and the Introduction of the Order of Agnates.*—So long as Rome was patrician the *gens* charged itself with the guardianship of a clansman's orphaned pupil children and his widow, and unmarried daughters above pupilarity after his decease (*tutela*), as well as with that of male members of his family who were *sui juris*, but above the age of pupilarity, when they chanced to be lunatic, imbecile, prodigal, or helplessly infirm (*cura, curatio, curatela*).

But, as this gentile tutory could not be extended to

the plebeians, among whom some law of guardianship was as much required as among their fellow-citizens of the higher order, the decemvirs found it expedient to devise a new one of universal application. The Tables contained no express authority for testamentary nomination of tutors to the widow of the testator, or to his pupil children and grown-up unmarried daughters; but such appointment, if unknown previously, was soon held to be justified by a liberal interpretation of the very inclusive provision, "uti legassit suae rei, ita jus esto." In the absence of testamentary appointment the nearest male agnates of lawful age were to be tutors. This tutory of agnates was an invention of the decemvirs, just as was the agnates' right of succession on intestacy.

*Mancipation and the Law of Property.*—In the early law there was no technical word for ownership of things; it was an element of the house-father's *manus*. In time, although it is impossible to say when, the word *dominium* came into use; but, so far as can be discovered, it did not occur in the XII. Tables, and must have been of later introduction.

*Changes in the Law of Succession.*—The forms of testament of the regal period still remained in use in the early republic; but in course of time they were displaced by the general adoption of that executed with the copper and the scales (*testamentum per aes et libram*.) It seems to be the general opinion that it was to the first two that the words applied which stood in the forefront of the provisions of the XII. Tables about inheritance—"uti legassit suae rei, ita jus esto." Whether resort was to the comitia or to the army, the testator's own will in the matter was henceforth to be supreme. There was to be no more reference to the pontiffs as to the expediency of the testament in view of the interests of the family *sacra* and of creditors of the testator's; from legislators sanctioning a departure from the ordinary rules of succession, the assembled Quirites became merely witnesses—recipients of the oral declaration of the testator's will in regard to his inheritance.

*The Law of Obligations.*—The jurists of the classical period attribute obligation either to contract, or delict, or miscellaneous causes (*variae causarum figurae*); and those arising from contract fill a place in the later jurisprudence vastly greater than those arising from delict. In the XII. Tables it was very different. In them delicts were much more prominent than contracts—wrongs entitling the sufferer to demand the imposition of penalties upon the wrongdoer that in most cases covered both reparation and punishment. The disproportion in the formulated provisions in reference to the two sources of obligation, however, is not surprising. For, first of all, the purpose of the decemviral code was to remove uncertainties and leave as little as possible to the arbitrariness of the magistrates. In nothing was there more scope for this than in the imposition of penalties; and, as different offenses required to be differently treated, the provisions in reference to them were necessarily multiplied. In the next place, the intercourse that evokes contract was as yet very limited. Agriculture was the occupation of the great majority; trade and commerce were more backward than in the later years of the regal period; coined money was just beginning to be used as a circulating medium. Lastly, the safeguards of engagement then lay to a great extent in the sworn oath or the plighted faith, of which the law had hardly begun to take cognizance, but which found a protection quite as potent in the religious and moral sentiments that had so firm a hold on the people.

*Introduction of the Stipulation.*—Few events in the history of the private law were followed by more far-reaching consequences than the introduction of the

stipulation. It exercised an enormous influence on the law of contract; for by means of it there was created a unilateral obligation that in time became adaptable to almost every conceivable undertaking by one man in favor of another. By the use of certain words of style in the form of question and answer any lawful agreement could thereby be made not only morally but legally binding, so that much which previously had no other guarantee than a man's sense of honor, now passed directly under the protection of the tribunals. Stipulations became the complement of engagements which without them rested simply on good faith, as when a vendor gave his stipulatory promise to his vendee to guarantee peaceable possession of the thing sold, or its freedom from faults, and the vendee in turn gave his promise for payment of the price. The question and answer in the form prescribed by law made the engagement fast and sure. Hence the generic name of the contract.

THE *JUS GENTIUM* AND *JUS HONORARIUM*. (*Latter half of the Republic*). *Influences that Operated on the Law. Growth of Commerce and Influx of Foreigners.*—While it may be admitted that commerce was beginning to take root in Rome in the fifth century, yet it was not until the sixth that it really became of importance. The campaigns in which Rome was engaged until the end of the First Punic War absorbed all its energies. But after that time the influx of strangers, and their settlement in the city for purposes of trade, became very rapid—first Latins and other allies, and afterward Greeks, Carthaginians, and Asiatics. For them and the regulation of their affairs the *jus civile*—the law peculiar to Rome and its citizens—was applicable only if they were members of allied states to which *Commercium* and *recuperatio* were guaranteed by treaty. But multitudes were not in this favored position; and even those who were soon found the range of Roman modes of acquiring property and contracting obligations too narrow for their requirements. Hence a *jus gentium* was gradually developed which very early in its history drove treaty covenants *recuperatio* out of use; its application may for a time have been limited to transactions between non-citizens or between citizens and non-citizens, but it was eventually accepted in the dealings of citizens *inter se* and became part and parcel of the *jus Romanorum*. Gaius and Justinian speak of it as "the common law of mankind," "the law in use among all nations;" but the language must not be taken too literally. The Roman *jus gentium* was not built up by the adoption of one doctrine or institution after another that was found to be generally current elsewhere. In the earliest stages of its recognition it was "an independent international private law, which, as such, regulated intercourse between peregrins or between peregrins and citizens on the basis of their common *libertas*;" during the republic it was purely empirical and free from the influence of scientific theory, but its extensions in the early empire were a creation of the jurists—a combination of comparative jurisprudence and rational speculation. To say that it was *de facto* in observance everywhere is inaccurate; on the contrary, it was Roman law, built up by Roman jurists, though called into existence through the necessities of intercourse with and among non-Romans.

It may be a little difficult for a modern jurist to say with a perfect precision what were the doctrines and institutions of the *jus gentium* as distinguished from the *jus civile*. But the distinction must have been very familiar to the Romans; otherwise we should not have had the statement of Marcian in reference to the ἀπόλιδες—that they enjoyed all the rights competent

to a man under the former, but none of those competent to him under the latter.

THE *JUS NATURALE* AND MATURITY OF ROMAN JURISPRUDENCE. (*The Empire until the time of Diocletian.*) *Characteristics and Formative Agencies of the Law during the Period. Characteristics generally and Recognition of a Jus Naturale in particular.*—The first three centuries of the empire witnessed the perfection of Roman jurisprudence and the commencement of its decline. During that time the history of the law presents no such great landmarks as the enactment of the XII. Tables, the commencement of a prætor's edict, the recognition of simple consent as created of a contractual bond, or the introduction of a new form of judicial procedure; the establishment of a class of patented jurists speaking as the mouthpieces of the prince and the admission of all the free subjects of the empire to the privileges of citizenship, are about the only isolated events to which one can point as productive of great and lasting results. There were, indeed, some radical changes in particular institutions, such as the caducary legislation of Augustus, intended to raise the tone of domestic morality and increase fruitful marriages, and the legislation of the same emperor and his immediate successor for regulation of the status of enfranchised slaves; but these, although of vast importance in themselves, and the first of them influencing the current of the law for centuries, yet left upon it no permanent impression. It was by much less imposing efforts that it attained the perfection to which it reached under the sovereigns of the Severan house—a steady advance on the lines already marked out in the latter years of the republic. The sphere of the *jus Quiritium* became more and more circumscribed, and one after another of the formalities of the *jus civile* was abandoned. The *manus* of the husband practically disappeared; the *patria potestas* of the father lost much of its significance by the recognition, notwithstanding it, of the possibility of a separate and independent estate in the child; slaves might be enfranchised by informal manumission; *res mancipi* constantly passed by simple tradition, the right of transferee being secured by the Publican action; servitudes and other real rights informally constituted were maintained as effectual *tuitione prætoris*; an heir's acceptance of a succession could be accomplished by any indication of his intention, without observance of the formal *cretio* of the earlier law; and many of the incidental bargains incident to consensual contract, but varying their natural import, that used to be embodied in words of stipulation, came to be enforceable on the strength of formless contemporaneous agreements.

The preference accorded by jurists and judges to the *jus gentium* over the *jus civile* is insufficient to account for these and many other changes in the same direction, as well as for the ever-increasing tendency evinced to subordinate word and deed to the *voluntas* from which they arose. They are rather to be attributed to the striving on the part of many after a higher ideal, to which they gave the name of *jus naturale*. It is sometimes said that the notion of a *jus naturale* as distinct from *jus gentium* was peculiar to Ulpian, and that it found no acceptance with the Roman jurists generally. But this is inaccurate. Justinian, indeed, has excerpted in the *Digest* and put in the forefront of his *Institutes* a passage from an elementary work of Ulpian's, in which he speaks of a *jus naturale* that is common to man and the lower animals, and which is substantially instinct. This is a law of nature of which it is quite true that we find no other jurist taking account. But many of them refer again and again to the *jus naturale*; and Gaius is the only one (Justinian following him)

who occasionally makes it synonymous with *jus gentium*. There can be no question that the latter was much more largely imbued with precepts of natural law than was the *jus civile*, but it is impossible to say they were identical; it is enough to cite but one illustration, pointed out again and again in the text: while the one admitted the legality of slavery, the other denied it. While the *jus civile* studied the interests only of citizens, and the *jus gentium* those of freemen irrespective of nationality, the law of nature had theoretically a wider range and took all mankind within its purview. We have no hint that the doctrine of the *jus gentium* differed in this respect from the *jus civile*—that a slave was nothing but a chattel; yet we find the latter, when tinctured with the *jus naturale*, recognizing many rights as competent to a slave, and even conceding that he might be debtor or creditor in a contract, although his obligation or claim could be given effect to only indirectly, since he could neither sue nor be sued.

*Concession of Peculiar Privileges to Soldiers.*—While the period with which we are dealing saw the substantial disappearance of the distinction between citizen and peregrin, it witnessed the rise of another—that between soldiers and civilians (*milites, pagani*). The most remarkable effluxes of the *jus militare* (as it is sometimes called) were the military testament and the *castrense peculium*. The first set at naught all the rules of the *jus civile* and the prætors' edict alike as to the form and substance of last wills. It might be in writing, by word of mouth, by the unspoken sign perhaps of a dying man; all that was required was the *voluntas* so manifested as not to be mistaken. More extraordinary still—it was sustained even though its provisions ran counter to the most cherished rules of the common law. Contrary to the maxim that no man could die partly testate and partly intestate, a soldier might dispose of part of his estate by testament and leave the rest to descend to his heirs *ab intestato*. Contrary also to the maxim *semel heres semper heres*, he might give his estate to A for life or for a term of years, or until the occurrence of some event, with remainder to B. Contrary to the general rule, a Latin or peregrin, or an unmarried or married but childless person, might take an inheritance or a bequest from a soldier as freely as could a citizen with children. His testament, in so far as it disposed only of *bona castrensia*, was not affected by *capitis deminutio minima*. It was not invalidated by præterition of *sui heredes*, nor could they challenge it because they had less under it than their "legitim"; nor could the instituted heir claim a Falcidian fourth, even though nine-tenths of the succession had been assigned to legatees. Finally, a later testament did not nullify an earlier one, if it appeared to be the intention of the soldier testator that they should be read together.

THE PERIOD OF CODIFICATION. (*Diocletian to Justinian.*) *Historical Events that Influenced the Law. Supremacy of the Emperors as Sole Legislators.*—From the time of Diocletian downward the making of the law was exclusively in the hands of the emperors. The senate still existed, but shorn of all its old functions alike of government and legislation. The responses of patented jurists were a thing of the past. It was to the imperial consistory alone that men looked for interpretation of old law or promulgation of new.

In the reign of Diocletian rescripts were still abundant; but the constitutions in the Theodosian and Justinian Codes from the time of Constantine downward are mostly of a wider scope, and of the class known as general or edictal laws (*leges generales edictales*). It

would be wrong, however, to infer that rescripts had ceased; for Justinian's *Code* contains various regulations as to their form, and the matter is dealt with again in one of his *Novels*. The reason why so few are preserved is that they were no longer authoritative except for the parties to whom they were addressed.

*Antejustinianian Collections of Statute and Jurisprudence.*—The first of these *Codes* was a collection of imperial rescripts (with a few edicts, etc.) made by one Gregorianus in the very end of the third century, and probably at the instigation of Diocletian, though whether in the east or the west critics are unable to decide. The collection of Hermogenianus, also of rescripts, seems to have been a supplement to the earlier one. As the latest enactment in it belongs to the year 365, the probability is that the collection was published about that time. Both *Codes* although the work of private parties, received statutory recognition from Theodosius and Valentinian in their commission for the preparation of a collection of edictal law; and from the language of Justinian in reference to them there is reason to believe that in the courts they were regarded as authoritative, even to the ignoring of all rescripts not embodied in them. Three years after the publication of the "law of citations" Theodosius nominated a commission to initiate the preparation of a body of law which, if his scheme had been carried into execution, would have rendered that of Justinian unnecessary.

*Justinian's Collection and his own Legislation.*—It is unnecessary to revert to the history of Justinian outside his legislative achievements, or even to speak of his collections in detail, for both have already been described in the article JUSTINIAN I. Ambitious to carry out a reform more complete even than that which Theodosius had planned but failed to execute, he took the first step toward it little more than six months after the death of his uncle Justin, in the appointment of a commission to prepare a collection of statute law (*leges*), among which he included the rescripts of the Gregorian and Hermogenian *Codes*. It was published in April, 529; and in rapid succession there followed his *Fifty Decisions* (529–532), his *Institutes* (November 21, 533), his *Digest* of excerpts from the writings of the jurists (December 16, 533), and the revised edition of his *Code*, in which he incorporated his own legislation down to date (November 16, 534). From that time down to his death in 565 there followed a series of *Novels* (*novellae constitutiones*), mostly in Greek, which were never officially collected, and of which probably many have been lost.

*The Justinian Law-Books. Their Use in the Courts and in the Schools.*—Although the *Institutes* were primarily intended to serve as a text-book in the schools, it was expressly declared that they and the *Digest* and the *Code* should be regarded as just so many parts of one great piece of legislation and all of equal authority, and that, although *Digest* and *Code* were but collections of legislation and doctrine that had proceeded originally from many different hands, yet they were to be treated with the same respect as if they had been the work of Justinian himself. But, while everything within them was to be held as law, nothing outside them was to be looked at, not even the volumes from which they had been collected; and so far did this go that, after the publication of the revised *Code*, neither the first edition of it nor the *Fifty Decisions* were allowed to be referred to. If a case arose for which no precedent was to be found, the emperor was to be resorted to for its decision, as being outside his collections the only fountain of the law. To preserve the purity of the texts Justinian forbade the use of con-

ventional abbreviations (*sigla*) in making transcripts, visiting an offender with the penalties of falsification (*crimen falsi*). Literal translations into Greek were authorized, and indeed were very necessary for many of his subjects; so were *παράτιτλα* or summaries of the contents of individual titles (although the jurists read the word less strictly). Commentaries and general summaries were forbidden under heavy penalties, as an interference with the imperial prerogative of interpretation; but the prohibition does not seem to have been enforced, as we have accounts and remains not only of translations but of commentaries, notes, abridgements, excerpts, and general summaries even in Justinian's lifetime. These, it is true, were mostly by professors (*antecessores*), and their productions may have been intended primarily for educational purposes; but there can be little doubt that they soon passed into the hands of the practitioners and were used without scruple in the courts. A Greek *Paraphrase of the Institutes*, usually attributed to Theophilus, a professor in Constantinople and one of Justinian's commissioners, is commonly supposed to have been used by him in his lectures. It embodies much more historical matter than is to be found in the *Institutes*; but its value has been very differently rated by different critics.

ROMAN LITERATURE. It would be impossible within the limits allowed for this article to attempt, even in outline, any history of the course of Roman literature which would include an account, not only of the extant works which it contains and of their authors, but also of the principal works and writers known to us from ancient testimony. All that is possible to accomplish here is to pass in rapid review the first four of the five periods into which Roman literature may most conveniently be divided, to ascertain the chief literary motives and characteristics of each, and to connect these with the works and writers in whom they are most conspicuously displayed.

The actual beginning of Roman artistic literature can be assigned to a definite date, the year 240 B. C., when Livius Andronicus produced on a Roman stage a drama with a regular plot, instead of the unconnected dramatic dialogues (*saturæ*) by which the holidays of the people had previously been enlivened.

But the historical event which brought about the greatest change in the intellectual condition of the Romans, and thereby exercised a decisive influence on the whole course of human culture, was the capture of Tarentum in 272. After the capture many Greek slaves were brought to Rome, and among them the young Livius Andronicus, who was employed in teaching Greek in the family of his master, a member of the Livian gens. From that time to learn Greek became a regular part of the education of a Roman noble. The capture of Tarentum was followed by the complete Romanizing of all Southern Italy. Soon after came the First Punic War, the principal scene of which was Sicily, where, from common hostility to the Carthaginian, Greek and Roman were brought into friendly relations, and the Roman armies must have become familiar with the spectacles and performances of the Greek theater. In the year following the conclusion of the war (240), after the armies had returned and the people were at leisure to enjoy the fruits of victory ("et post Punica bella quietus," Hor., *Ep.*, ii. 162), Livius Andronicus "took the bold step" ("ausus est primus argumento fabulam serere," Liv., vii. 2) of substituting at one of the public festivals a regular drama translated or adapted from the Greek for the musical medleys (*saturæ*) hitherto in use. From this time dramatic performances became a regular accompaniment of the public games, and came more and more to encroach on the

older kinds of amusement, such as the chariot races. His immediate successor, Cn. Nævius, was not, like Livius, a Greek, but either a Roman citizen or one who enjoyed the limited citizenship of a Latin, and who had served in the Roman army in the First Punic War. His first appearance as a dramatic author was in 235. He adapted both tragedies and comedies from the Greek, but the bent of his genius, the tastes of his audience, and the condition of the language, developed through the active intercourse and business of life, gave a greater impulse to comedy than to tragedy. He was not only the first in point of time, and according to ancient testimony one of the first in point of merit, among the comic poets of Rome, and in spirit, though not in form, the earliest of the line of Roman satirists, but he was also the oldest of the national poets. His younger contemporary Plautus (d. 184) was the greatest comic and dramatic genius of Rome, and is still read as one of the great comic and dramatic writers of the world. He lived and wrote only to amuse his contemporaries, and thus, although more popular in his lifetime and more fortunate than any of the older authors in the ultimate survival of a large number of his works, he is less than any of the great writers of Rome in sympathy with either the serious or the caustic spirit in Roman literature. He is the one extant witness to the humor and vivacity of the Italian temperament at a stage between its early rudeness and rigidity and its subsequent degeneracy. Thus far Roman literature, of which the predominant characteristics are dignity, gravity, and fervor of feeling, and which more than any other literature aimed at fortifying and elevating the character, seemed likely to become a mere vehicle of amusement adapted to all classes of the people in their holiday mood. It was by Q. Ennius (239-169) of Calabria that a new direction was given to Roman literature and new and deeper springs of emotion were elicited from the native genius.

First among his special services to Roman literature was the fresh impulse which he gave to tragedy. He turned the eyes of his contemporaries from the commonplace social humors of later Greek life to the contemplation of the heroic age. He animated the heroes of early Greece with the martial spirit of Roman soldiers, and the spirit of elevation and moral authority breathed into tragedy by Ennius passed into the ethical and didactic writings and the oratory of a later time. His greatest work, which made the Romans regard him as the father of their literature, was his epic poem, in eighteen books, the *Annales*, in which the record of the whole career of Rome was unrolled with idealizing enthusiasm and realistic detail. The idea which inspired Ennius was ultimately realized in both the national epic of Virgil and the national history of Livy. And the metrical vehicle which he conceived as the only one adequate to his great theme was a rude experiment, which was ultimately developed into "the state-liest meter ever molded by the lips of man."

There is still one other name belonging partly to this, partly to the next generation, to be added to those of the men of original force of mind and character who created Roman literature, that of M. Porcius Cato (234-149), the younger contemporary of Ennius. More than Nævius and Plautus he represented the pure native element in that literature, the mind and character of Latium, the plebeian pugnacity, which was one of the great forces in the Roman state. He strove to make literature ancillary to politics and to objects of practical utility, and thus started prose literature on the main lines which it afterward followed. Through his industry and vigorous understanding he gave a great impulse to the creation of Roman oratory, history, and systematic

didactic writing. He was one of the first to publish his speeches and thus to bring them into the domain of literature. Porcius Cato also heads the roll of the Roman historians, at least of those whose works are ranked as literature.

Nævius, Plautus, Ennius, and Cato not only represent but may be said actually to have been the contending forces which strove for ascendancy in determining what was to be the character of the new literature. The work begun by them was carried on by younger contemporaries and successors, that of Plautus by Cæcilius Statius and others, the tragedy of Ennius by his kinsman, Pacuvius, and, in the following generation, by Accius. The impulse given to oratory by Cato, Sulpicius Gallus, and others, and along with it the development of prose composition, went on with increased momentum till the age of Cicero. Terence has nothing Roman or Italian except his pure and idiomatic Latinity. The comedies of Terence give some indication of the tastes of Scipio, Lælius, and their friends, in their youth. The influence of Panætius and Polybius was more adapted to their maturity, when they led the State in war, statesmanship, and oratory, and when the humaner teaching of Stoicism began to enlarge the sympathies of Roman jurists. But in the last years during which this circle kept together a new spirit appeared—C. Lucilius of Aurunca (166?-102). Among the writers before the age of Cicero he alone deserves to be named with Nævius, Plautus, Ennius, and Cato as a great originative force in literature.

The general results of the last fifty years of the first period, from *c.* 130 to *c.* 70, may be thus summed up. In poetry we have the satires of Lucilius, the tragedies of Accius and of a few successors among the Roman aristocracy, who thus exemplified the affinity of the Roman stage to Roman oratory; the "comœdia togata" of Afranius, in which comedy, while assuming a Roman dress, did not assume the virtue of a Roman matron; various annalistic poems; minor poems of an epigrammatic and erotic character; works of criticism in trochaic tetrameters by Porcius Licinus and others, which may be regarded as rude precursors of the didactic epistles that Horace devoted to literary criticism.

The only extant prose work which may be assigned to the end of this period is the treatise on rhetoric known by the title of *Ad Herennium*. But the great literary product of this period was oratory, developed indeed with the aid of these rhetorical studies, but itself the immediate outcome of the imperial interests, the legal conflicts, and the political passions of that time of agitation. The speakers and writers of a later age looked back on Scipio and Lælius, the Gracchi and their contemporaries, L. Crassus and M. Antonius, as masters of their art. In history, regarded as a great branch of prose literature, it is not probable that much was accomplished, although, with the advance of oratory and grammatical studies, there must have been not only greater fluency of composition but the beginning of a richer and more ornate style.

Although the artistic product of the first period of Roman literature which has reached us in a complete shape is limited to the comedies of Plautus and Terence, the influence of the lost literature in determining the spirit, form, and style of the eras of more perfect accomplishment which followed is unmistakable.

The last age of the republic coincides with the first half of the Golden Age of Roman literature. It is the age of purest excellence in prose, and of a new birth of poetry, characterized rather by great original force and

artistic promise than by perfect accomplishment. The five chief representatives of this age who still hold their rank among the great classical writers are Cicero, Cæsar, Sallust, Lucretius, and Catullus. The works of other prose writers, Varro and Cornelius Nepos, have been partially preserved; but these writers have no claim to rank with those already mentioned as creators and masters of literary style. Even oratory was intended quite as much for readers as for the audiences to which it was immediately addressed; and some of the greatest speeches which have come down from that great age of orators were never delivered at all, but were published as manifestoes after the event with the view of influencing educated opinion, and as works of art with the view of giving pleasure to educated taste. Thus the speeches of Cicero (106-43), more certainly than any modern speeches, belong to the domain of literature quite as much as to that of forensic or political oratory. And, although Demosthenes is a master of style unrivaled even by Cicero, the literary interest of most of Cicero's speeches is greater than that of the great mass of Greek oratory—a result of what from a forensic point of view would now be regarded as a serious defect.

Among the many rival orators of the age the most eminent were Hortensius and Cæsar. The former, like other members of the aristocracy, such as Memmius and Torquatus, and like Q. Catulus in the preceding generation, was a kind of dilettante poet and a precursor of the poetry of pleasure, which attained such prominence in the elegiac poets of the Augustan age. Of Julius Cæsar (100-44) as an orator we can judge only by his reputation and by the testimony of his great rival and adversary, Cicero; but we are able to appreciate the special praise of perfect taste in the use of language attributed to him. In his *Commentaries*, by laying aside the ornaments of oratory, he created the most admirable style of prose narrative. While he shows the persuasive art of an orator by presenting the subjugation of Gaul and his own action in the Civil War in the light most favorable to his claim to rule the Roman world, he is entirely free from the Roman fashion of self-laudation or disparagement of an adversary. The man is stamped on every line that he writes, and reveals himself especially in a perfect simplicity of style, the result of the clearest intelligence and the strongest sense of personal dignity.

In the simplicity of his style, the directness of his narrative, the entire absence of any didactic tendency, Cæsar presents a marked contrast to another prose writer of that age—the historian Sallust (87-34). He was the first of the purely artistic historians, as distinct from the annalists and the writers of personal memoirs. He imitated the Greek historians in taking particular actions—the *Jugurthan War* and the *Catilinarian Conspiracy*—as subjects of artistic treatment. He wrote also a continuous work, *Historiæ*, treating of the events of the twelve years following the death of Sulla, of which only fragments are preserved. His style aims at effectiveness by pregnant expression, sententiousness, archaism. He produces the impression of caring more for the manner of saying a thing than for its truth.

While the imaginative and emotional side of Roman poetry was powerfully represented by Lucretius, attention was directed to its artistic side by a younger generation, who molded themselves in a great degree, though not exclusively, on Alexandrian models. Of this small group of poets, who were bound together by common tastes and friendship, one only has survived, fortunately the man of most genius among them, Valerius Catullus (84-54). He, too, was a new force in

Roman literature. His most original contribution to the substance of Roman literature was that he first shaped into poetry the experience of his own heart, as it had been shaped by Alcæus and Sappho in the early days of Greek poetry. No poet has surpassed him in the power of vitally reproducing the pleasure and pain of the passing hour, not recalled by idealizing reflection as in Horace, nor overlaid with mythological ornament as in Propertius, but in all the keenness of immediate impression. He also introduced into Roman literature that personal as distinct from political or social satire which appears later in the *Epodes* of Horace and the *Epigrams* of Martial. His greatest contribution to poetic art consisted in the perfection which he attained in the phalæcian, the pure iambic, and scæzon meters, and he has the interest of being the last poet of the free republic.

The literature of the later republic reflects the sympathies and prejudices of an aristocratic class, sharing in the conduct of national affairs and living on terms of equality with one another. The great inspiring influence of the new literature was the enthusiasm produced first by the hope and afterward by the fulfillment of the restoration of peace, order, national glory, under the rule of Augustus.

The earliest in the order of time of the poets who adorn this age—Virgil (70-19)—is also the greatest in genius, the most richly cultivated, and the most perfect in art. He is the idealizing poet of the hopes and aspirations and of the purer and happier life of which the age seemed to contain the promise. He is the true representative poet of Rome and Italy, of national glory and of the beauty of nature, the artist in whom all the efforts of the past were made perfect, and the unapproachable standard of excellence to future times. While more richly endowed with sensibility to all native influences, he was more deeply imbued than any of his contemporaries with the poetry, the thought, and the learning of Greece. It was by leaning on these supports that his genius felt its way and expanded into higher and wider development.

The second great poet of the time—Horace (65-8)—holds a lower place in the reverence of the world, but is perhaps as much loved and is even more largely and familiarly known. He is both the realist and the idealist of his age. If we want to know the actual lives, manners, and ways of thinking of the Romans of the generation succeeding the overthrow of the republic, it is in the *Satires* and partially in the *Epistles* of Horace that we shall find them. If we ask what there was in the life of that time of more exquisite or more piquant charm, of more elevated enthusiasm, of graver experience, to stir the fancy and move the mood of imaginative reflection, it is in the lyrical poems of Horace that we shall find the most varied and trustworthy answer.

But the poetry of the latter half of the Augustan age destined to survive did not follow the lines either of lyrical or of dramatic art marked out for them by Horace. The latest form of poetry adopted from Greece and destined to gain and permanently to hold the ear of the world was the elegy. The greatest masters of this kind of poetry are the elegiac poets of the Augustan age—Tibullus, Propertius, and Ovid. Of these Tibullus (d. 19) is the most refined and tender. As the poet of love he gives utterance to the pensive melancholy rather than to the pleasures associated with it. A poet of more strength and more powerful imagination but of less refinement in his life and less exquisite taste in his art, is Propertius (c. 50-c. 15), "the Roman Callimachus;" while the most facile and brilliant of the elegiac poets and the least serious in tone and spirit is Ovid (43 B.C.-17 A.D.), the latest in order of time. As

an amatory poet he is the poet of pleasure and intrigue rather than of tender sentiment or absorbing passion. We know him in the intense liveliness of his feeling and the human weakness of his nature more intimately than any other writer of antiquity, except perhaps Cicero. As Virgil marks the point of maturest excellence in poetic diction and rhythm, Ovid marks that of the greatest facility. The past of Rome had always a peculiar fascination for Roman writers. Virgil in a supreme degree, and Horace, Propertius, and Ovid in a less degree, had expressed in their poetry the romance of the past. But it was in the great historical work of Livy (59 B.C.—17 A.D.) that the record of the national life, colored by idealizing retrospect, received its most systematic exposition. The conception of his work must have nearly coincided in point of time with the impulses with which the *Æneid* and the national *Odes* of Horace had their origin. Its execution was the work of a life prolonged through the languor and dissolution following so soon upon the promise of the new era, during which time the past became glorified by contrast with the disheartening aspect of the present. The value of the work consists not in any power of critical investigation or weighing of historical evidence but in the intense sympathy of the writer with the national ideal, and the vivid imagination with which under the influence of this sympathy he gives life to the events and personages, the wars and political struggles, of times remote from his own.

For more than a century after the death of Augustus Roman literature continues to flow in the old channels. Rome continues the center of the literary movement. The characteristics of the great writers are essentially national, not provincial nor cosmopolitan. In prose the old forms—oratory, history, the epistle, treatises or dialogues on ethical and literary questions—continue to be cultivated. Scientific and practical subjects, such as natural history, architecture, medicine, agriculture, are treated in more elaborate literary style.

New elements, however, appear in the literature. As the result of the severance from the active interests of life, a new interest is awakened in the inner life of the individual. The extreme immorality of the age not only affords abundant material to the satirist but deepens the consciousness of moral evil in purer and more thoughtful minds. To these causes we attribute the pathological observations of Seneca and Tacitus, the new sense of purity in Persius called out by contrast with the impurity around him, the glowing if somewhat sensational exaggeration of Juvenal, the vivid characterization of Martial. The literature of no time presents so powerfully the contrast between moral good and evil. In this respect it is truly representative of the life of the age. Another new element is the influence of a new race. This new cosmopolitan element introduced into Roman literature draws into greater prominence the characteristics of the last great representatives of the genuine Roman and Italian spirit—Tacitus and Juvenal.

This fourth period is itself subdivided into three divisions:—(1) that extending from the accession of Tiberius to the death of Nero, 68—the only important part of it being the Neronian age, 54 to 68; (2) the Flavian era, from the death of Nero to the death of Domitian, 96; (3) the period included in the reigns of Nerva and Trajan and part of the reign of Hadrian.

A high ideal of culture, literary as well as practical, was realized in Germanicus, which seems to have been transmitted to his daughter Agrippina, whose patronage of Seneca had important results in the next generation. A fresh impulse was given to letters on the accession of Nero, and this was partly due to the theatrical and artistic tastes of the young emperor.

Four writers of the Neronian age still possess considerable interest—Seneca, Lucan, Persius, and Petronius. The first three represent the spirit of their age by exhibiting the power of the Stoic philosophy as a moral, political, and religious force; the last is the most cynical exponent of the depravity of the time.

A greater sobriety of tone was introduced both into life and literature with the accession of Vespasian. Under Vespasian Pliny the elder is the most important prose-writer, and Valerius Flaccus, author of the *Argonautica*, the most important among the writers of poetry. The reign of Domitian, although it silenced the more independent spirits of the time, Tacitus and Juvenal, witnessed more important contributions to Roman literature than any age since the Augustan—among them the *Institutes* of Quintilian, the *Punic War* of Silius Italicus, the epics and the *Silvæ* of Statius, and the *Epigrams* of Martial.

But it was under Nerva and Trajan that the greatest and most truly representative works of the empire were written, those which at once present the most impressive spectacle to the imagination and have made its meaning sink most deeply into the heart and conscience of the world. The *Annals* and *Histories* of Tacitus (54–119), with the supplementary *Life of Agricola* and the treatise *On the Manners of the Germans*, and the *Satires* of Juvenal (c. 47–130) have summed up for all aftertimes the moral experience of the Roman world from the accession of Tiberius to the death of Domitian. In them alone among the writers of the empire the spirit of the Roman republic seems to revive. The *Letters* of Pliny (61–c. 115), though they do not contradict the representation of Tacitus and Juvenal regarded as an exposure of the political degradation and moral corruption of prominent individuals and classes, do much to modify the pervadingly tragic and somber character of their representation, and to show that life even in the higher circles of Roman society had still sources of pure enjoyment and well-being. With the death of Juvenal, the most important part of whose activity falls in the reign of Trajan, Roman literature as an original and national expression of the experience, character, and sentiment of the Roman state and empire, as one of the great literatures of the world, may be considered as closed. A kind of archaic revival took place in the reign of Hadrian, which showed itself both in affectation of style and in a renewed interest in the older literature. The most important works of the age succeeding that of Juvenal are the *Biographies* of Suetonius (c. 75–160), which did much to preserve a knowledge of both political and literary history. The writer of most original genius among the successors of Juvenal and Tacitus is probably Apuleius, and his most original work, the *Metamorphoses*, has nothing of Roman or Italian coloring. The last writer who combines genius with something of national spirit is the poet Claudian, who wrote his epics under the immediate inspiring influence of a great national crisis and a national hero. As fresh blood came to the nearly exhausted literary genius of Italy from Spain in the first century of the empire, so in the later centuries it came from Africa. Whatever of original literary force appears either in the pagan or Christian literature written in the Latin language between the second and the sixth century is due to Romanized settlements in Africa. We have to remember during all these comparatively barren centuries that secular literature had again found its organ in the Greek language, and that the new spiritual life of the world had come into stern antagonism with many of the most powerful motives of classical poetry.

ROMANS, a town of France, in the department of Drôme, twelve miles northeast of Valence by the rail-

way connecting this town with Grenoble, stands at the foot of an eminence on the right bank of the Isère, 530 feet above the sea. A fine stone bridge unites it with Bourg du Péage on the other side of the river. Both towns owe their prosperity to their situation in the most fertile part of the valley of the Isère, where land is sometimes sold at \$1,000 per acre. The population of Romans was 11,916 (13,806 in the commune) in 1881, and 15,106 in 1890. Romans has a wealthy hospital and a large seminary. Besides the silk trade the local industries comprise shoemaking, tanning, hat-making, oil-refining, etc.

**ROMANS, EPISTLE TO THE.** The origin of the Christian community at Rome is involved in obscurity. According to Catholic tradition it was founded by Peter, who was its bishop for a quarter of a century. But neither allegation has historical support. The most striking proof of the contrary is precisely this epistle of Paul. After the conquest of Jerusalem by Pompey (63 B.C.) numbers of Jewish prisoners of war were brought to Rome and there sold as slaves. Of these many were soon afterward emancipated by their masters, Jewish slaves being a peculiarly inconvenient kind of property on account of the strictness of their observance of their law, especially in the matter of clean and unclean meats (Philo, *Leg ad Caium*, ii. 568, ed. Mangey). These freedmen became the nucleus of a Jewish community, which ultimately settled in Trastevere and organized itself into an independent religious communion.

From the midst of this Jewish community it was that the Christian congregation doubtless arose.

If the foregoing suppositions are correct, Paul's epistle to the church at Rome was written some six or eight years after its formation. The purpose of the epistle, to speak generally, was to secure a connection with the community at Rome, to gain it for himself and the gospel he carried.

Paul was afraid that the Judaizers who had wrought with such effect within the churches founded by himself in Galatia and Corinth might also lay hold on that at Rome. Perhaps they had already arrived there and the apostle knew it. At all events he perceived a threatening danger. He was unwilling to delay until he could visit the church personally, and accordingly sent forth with an elaborate document in establishment and vindication of the gospel as free from the law, so that the Roman Christians might be confirmed in their free practice and might be strengthened to withstand the agitations of Judaizers. This is the explanation of the fact that a letter addressed to a Gentile Christian church, not in bondage to the law, is yet almost entirely devoted to the refutation of the Judaistic positions. The genuineness of the epistle is practically undisputed.

The more recent literature relating to the Epistle to the Romans has been fully catalogued and discussed in the work of Grafe (*Ueber Veranlassung u. Zweck des Römerbriefes*, Tübingen, 1881). The most important works in the list have already been named in the present article.

**ROMANUS I.** (Lecapenus), who shared the imperial throne with CONSTANTINE VII. (*q.v.*) and exercised all the real power from 919 to 944, was admiral of the Byzantine fleet on the Danube when, hearing of the defeat of the army at Achelous (August 17, 917), he resolved to sail for Constantinople. Popular caprice as well as his influence over his sailors aided his ambition, and, after the marriage of his daughter Helena to Constantine, he was first proclaimed "basileopater" in April, 919, and afterward crowned colleague of his son-in-law on December 17th of the same year. His reign,

which was undistinguished and uneventful, was terminated by his own sons Stephen and Constantine, who in 944 carried him off to the island of Prote and compelled him to become a monk. He died in 948.

**ROMANUS II.**, emperor of the East, succeeded his father Constantine VII. in 959 at the age of twenty-one, and died—poisoned, it was believed, by his wife, Theophano—in 963. He was a pleasure-loving sovereign, but showed judgment in the selection of his ministers. The great event of his reign was the conquest of Crete by Nicephorus Phocas.

**ROMANUS III.** (Argyrus), emperor of the East, was an accomplished but otherwise undistinguished member of the Byzantine aristocracy when, summoned to the palace of the dying Constantine VIII., he was informed that he had been selected to marry one of the imperial princesses and succeed the emperor. His hesitation as already a married man was removed by his wife, who generously took the veil; and his union with Zoe and their joint coronation were celebrated on November 19, 1028. Two days later Constantine died. A serious defeat which Romanus sustained in person at Azaz in Syria, when marching to take possession of Aleppo, considerably impaired the popularity among his subjects which he had sought to purchase by lavish concession to various classes, and soon afterward he began to show symptoms of disease, attributed by many to slow poison administered by connivance of the empress. His death took place on April 11, 1034, and he was forthwith succeeded by MICHAEL IV., (*q.v.*)

**ROMANUS IV.** (Diogenes), emperor of the East from 1068 to 1071, was a member of a distinguished Cappadocian family and had risen to distinction in the army when he was convicted of treason against the sons of Constantine X. While waiting execution, he was summoned into the presence of their mother, Eudocia Macrembolitissa, the empress regent, whom he so fascinated that she granted him a free pardon and shortly afterward married him. Taking the field soon after his coronation, he carried on three campaigns against the Saracens and the Seljuk Turks without achieving any decisive success, and in a fourth he was disastrously defeated by Alp Arslan on the banks of the Araxes and taken prisoner. Released from captivity after promising to pay a large ransom and concluding a treaty of peace, he returned homeward only to find revolution in full flood, and after a second defeat of his arms by the troops of Michael VII. he was compelled to resign the empire and retire to the island of Prote, where he soon died in great misery. It was during this reign that by the surrender of Bari (April 15, 1071), the Byzantine empire lost its last hold upon Italy.

**ROMAN WALL.** See ANTONINUS, WALL OF, and HADRIAN, WALL OF.

**ROME, MODERN.** Modern Rome occupies the plain on each side of the Tiber and the slopes of the seven hills. Its geographical position at the observatory of the Collegio Romano is latitude 41° 53' 52" N., longitude 12° 28' 40" E., and its height above the level of the sea, on the Tiber under the Ælian bridge, is twenty feet. The population in 1881 was 272,010 (Commune in 1881, 300,467). The members of religious orders in Rome were 7,400, including thirty cardinals, thirty-five bishops, 2,832 monks and 2,215 nuns. It contained 4,650 Jewish residents, still compelled to inhabit a particular quarter called the Ghetto. Within the last ten years there has been a considerable increase in the population, which was returned in May, 1891, at 355,000.

The city is built on marshy ground and is divided by the Tiber into two very unequal parts, that on the left bank being Rome proper, and that on the right bank

being the Leonine City, or Trastevere. The walls, twelve miles in circuit and containing sixteen gates, of which four are built up, inclose a space of which little more than one-third is inhabited, the greater part to the south of the Capitol being cultivated as gardens or vineyards. The site of the ancient Campus Martius constitutes the lower and most densely-populated part of the town, in which all the trade is carried on. Its central part is crossed by the Corso, a street about one mile long, and running from the Piazza del Popolo, or great northern entrance of Rome, to the Palazzo di Venezia, at the foot of the Capitol. From the Piazza del Popolo, a handsome open space, with an obelisk from the Temple of the Sun at Heliopolis in the middle, branch out to the right and left of the Corso, the Piazza di Spagna, the favorite quarter of foreigners, and the Ripetta. More than half way up the Corso, and to the right, runs the wide street or Strada del Gesù, leading to the noble church and convent of that name, the chief residence of the order of the Jesuits. On either side of the Corso the buildings are regular and substantial and consist of palaces, such as the Borghese, the Rūspoli, the Ghigi, and others, besides many churches. Between the Corso and the Tiber to the west, the streets are irregular, densely peopled with inferior tradesmen, and consisting mainly of market places, shops, and dwellings of a low class. In this quarter is the university La Sapienza, between which and the Corso is the Rotunda or Pantheon. South of Ponte Sisto, on the left bank of the Tiber and winding around the western base of the Capitol to the foot of the Palatine is the Ghetto, or Jew's quarter, consisting of dirty narrow alleys, with rows of high old houses.

Still further south, and on the left bank of the Tiber, runs a series of narrow streets as far as the Palatine, containing some of the oldest churches in Rome, such as the Santa Maria in Cosmedin, built in the third century. Beyond this extend to the southeast the Aventine, Palatine, and Cœlian hills, which are covered with gardens, vineyards, and orchards, besides churches, convents and ruins. At the eastern extremity of the Cœlian stands the magnificent Basilica of San Giovanni in Laterano (better known as St. John Lateran). To the south of the Aventine, and between it, the river, and the walls, are the Prati del Popolo Romano, forming part of the large space of low lying cultivated ground. Near the Prati lies the Protestant cemetery.

On the slope of the Pincian and Quirinal hills, and covering part of the plateau which joins all the eastern hills of Rome, lies the upper town, consisting mainly of palaces, villas, churches, convents, and other buildings on a large scale. It abounds with ample courts and gardens, and is crossed by two long streets, which intersect each other at right angles on the crest of the Quirinal. The Pincian is laid out in fine walks, which are the favorite promenade of the Romans; while between the Pincian and the Quirinal stands the great Barberini Palace. On the summit of the Quirinal is the famous Pontifical palace and garden, now occupied by the King of Italy; and in the square before the palace are the two colossal statues of Castor and Pollux, with their horses, whence the hill receives its other name of Monte Cavallo. On the Esquiline, which here joins the Quirinal, and forms the eastern extremity of the city, stands the magnificent church of St. Maria Maggiore; beyond it to the north, east and south, the Esquiline is entirely covered with gardens, villas, and fields, with here and there a church. The principal buildings on the Capitol are three palaces, the work of Michael Angelo, which form three sides of a square, in the center of which stands the equestrian statue of M. Aurelius Antoninus. One of the palaces is the Capitoline Museum, one of

the finest collections of statuary and sculpture in Italy.

The third great division of the modern city lies on the right bank of the river and is subdivided into two parts—the Vatican (otherwise called Il Borgo) and the Trastevere. Divided from the latter by an inner wall, the Borgo or Leonine city occupies the space between the bridge of St. Angelo and the Piazza of St. Peter's. Its chief buildings are the palace of the Vatican, and the Basilica of St. Peter's. Besides the Vatican and St. Peter's the Leonine city contains the great hospital of Santo Spirito, which accommodates annually 13,500 patients laboring under all diseases, whether mental or bodily. The Castle of St. Angelo, with its massive circular tower, called from its founder the "Mole of Hadrian," is surrounded with ramparts, ditches, and bastions, mounted with cannon, and forms the citadel of Rome.

To the south of the Borgo, and between the Janiculum and the Tiber is the Trastevere, properly so called. The Janiculum, a straight ridge about a mile and a half long from north to south, rises about 300 feet above the level of the river. The northern half of its length is occupied by a long street called the Lungara, running closely parallel to the Tiber, which at the southern extremity of the Lungara, makes a bend to the east, and bounds the greater part of the Trastevere district. On the Janiculum is the Villa Spada, near the gate, outside of which is the Villa Pamfili, a favorite promenade of the Roman youth. On the same hill, the fountain called L'Acqua Paola, the largest in Rome, occupies a commanding site, and as seen from a distance resembles a triple triumphal arch, through which streams of water rush.

The churches, of which there are upward of three hundred, form a notable feature in art, from their architecture, their paintings, and other decorations. So also do the palaces of the aristocracy, which are often of great magnitude, with vast courts and spacious apartments. Of even better style as residences are the villas, both within and without the walls; while the handsome fountains, of which there are at least twelve principal ones, impart a cheerful and refreshing aspect to the city. There are three modern aqueducts, which keep Rome supplied with an abundance of water; the Acqua Vergine, the Acqua Felice (the ancient Acqua Marcia and Claudia), and the Acqua Paola (the ancient Alsietina).

Rome is, on the whole, a healthy city, except at the close of summer and beginning of autumn, when the malaria is prevalent. The Trastevere is its most uniformly healthy district, the inhabitants of which are superior in physical development to those of the other parts. The neighborhoods of the Pincian and the Quirinal, particularly the former, are most frequented by foreigners. The trade of the city is insignificant, consisting of a few trivial manufactures of hats, silk scarfs, gloves, artificial feathers, false pearls, mosaic trinkets, etc., and such articles as artists need and visitors fancy. The only great manufacture, if it can be so called, is that of pictures, original and copied; for the painting of these, are offered not only the advantage of numerous galleries of art, but purity of sky. The worst feature of Rome was formerly its dirty streets and houses. All this has been changed and nowhere, not even in London or Paris, has the march of improvement been more strongly shown than in Rome within the last decade. After the acquirement of the Eternal City by the Italian government, and its establishment as the capital of united and regenerated Italy, plans were prepared for its enlargement and improvement. These plans contemplated the construction of a magnificent system of boulevards, and the consequent demo-

lition of thousands of old houses and the uprooting of the slums. In dealing with such a city as this it was naturally impossible to improve without also destroying, and many historic landmarks had to give way to the exigencies of modern civilization. Rome has been built and rebuilt, destroyed and restored so often that there is scarcely a square foot of it but is of antiquarian interest. In carrying out the latest plan of improvement a wise conservatism has been exercised, and the result is that while Rome now possesses all the modern advantages of fine streets and rural improvements, the great works of ancient art and architecture which mark her for all time have been brought out in bolder relief and freed from the debasing influence of ignoble and squalid surroundings.

Both the city and the state of Rome are represented in tradition as having been gradually formed by the fusion of separate communities. The original settlement of Romulus is said to have been limited to the Palatine Mount. With this were united before the end of his reign the Capitoline and the Quirinal; Tullus Hostilius added the Cælian, Ancus Martius the Aventine, and finally Servius Tullius included the Esquiline and Viminal, and inclosed the whole seven hills with a stone wall. The growth of the state closely followed that of the city. To the original Romans on the Palatine were added successively the Sabine followers of King Tatius, Albans transplanted by Tullus, Latins by Ancus, and lastly the Etruscan comrades of Cæles Vibenna. The structure of the early Roman state, while it bears evident marks of a fusion of communities, shows no traces of a mixture of race. Nor is it easy to point to any provably Sabine element in the language, religion, or civilization of primitive Rome. The theory of a Sabine conquest can hardly be maintained in the face of the predominantly Latin character of both people and institutions. On the other hand the probability of a Sabine raid and a Sabine settlement, possibly on the Quirinal Hill, in very early times may be admitted.

Such is all we know of the manner in which the separate settlements on the seven hills grew into a single city and community. How long Rome took in the making, or when or by whom the work was completed, we cannot say. Nor is it possible to give more than a very meager outline of the constitution and of the history of the united state in the early days of its existence.

The "populus Romanus" was, we are told, divided into three tribes, Ramnes, Tities and Luceres, and into thirty "curiæ." The three tribes probably represent a primitive clan division, older than the Roman state itself.

At their head was the "rex," the ruler of the united people. The Roman "king" is not simply either the hereditary and patriarchal chief of a clan, the priestly head of a community bound together by common sacra, or the elected magistrate of a state, but a mixture of all three.

By the side of the king stood the senate or council of elders. In the descriptions left us of the primitive senate, as in those of the "rex," we can discover traces of a transition from an earlier state of things when Rome was only an assemblage of clans or village communities, allied, indeed, but each still ruled by its own chiefs and headmen, to one in which these groups have been fused into a single state under a common ruler.

The popular assembly of united Rome in its earliest days was that in which the freemen met and voted by their *curiæ* (*comitia curiata*). The assembly met in the *comitium* at the northeast end of the forum, at the summons and under the presidency of the king, or, failing him, of the "interrex." By the "rex" or "interrex" the question was put, and the voting took place "*curiatim*," the *curiæ* being called up in turn.

The vote of each *curiæ* was decided by the majority of individual votes, and a majority of the votes of the *curiæ* determined the final result. But the occasions on which the assembly could exercise its power must have been few.

A history of this early Roman state is out of the question. The names, dates and achievements of the first four kings are all too unsubstantial to form the basis of a sober narrative; a few points only can be considered as fairly well established. If we except the long eventless reign ascribed to King Numa, tradition represents the first kings as incessantly at war with their immediate neighbors. The details of these wars are no doubt mythical; but the implied condition of continual struggle, and the narrow range within which the struggle is confined, may be accepted as true. The picture drawn is that of a small community with a few square miles of territory, at deadly feud with its nearest neighbors, within a radius of some twelve miles round Rome. Nor, in spite of the repeated victories with which tradition credits Romulus, Ancus and Tullus, does there seem to have been any real extension of Roman territory except toward the sea.

With the reign of the fifth king, Tarquinius Priscus, a marked change takes place. The traditional accounts of the last three kings not only wear a more historical air than those of the first four, but they describe something like a transformation of the Roman city and state. Under the rule of these latter kings the separate settlements are for the first time inclosed with a rampart of colossal size and extent. The low grounds are drained, and a forum and circus elaborately laid out; on the Capitoline Mount a temple is erected, the massive foundations of which were an object of wonder even to Pliny. To the same period are assigned the redivision of the city area into four new districts and the introduction of a new military system. The kings increase in power and surround themselves with new splendor. Abroad, too, Rome suddenly appears as a powerful state ruling far and wide over southern Etruria and Latium. These startling changes are, moreover, ascribed to kings of alien descent, who one and all ascend the throne in the teeth of established constitutional forms. Finally, with the expulsion of the last of them—the young Tarquin—comes a sudden shrinkage of power. At the commencement of the republic Rome is once more a comparatively small state, with hostile and independent neighbors at her very doors.

The Etruscan princes are represented, not only as having raised Rome for the time to a commanding position in Latium and lavished upon the city itself the resources of Etruscan civilization, but also as the authors of important internal changes. They are represented as favoring new men at the expense of the old patrician families, and as reorganizing the Roman army on a new footing. From among the leading families of the conquered Latin states a hundred new members were admitted to the senate and these *gentes* thenceforth ranked as patrician, and became known as "*gentes minores*." The changes in the army, begun, it is said, by the elder Tarquin and completed by Servius Tullius, were more important.

The entire available body of freeholders was divided into two equal portions, a reserve corps of "*seniores*" and a corps of "*juniores*" for active service. Each of these corps consisted of eighty-five centuries or 8,500 men, *i. e.*, of two legions of about 4,200 men each, the normal strength of a consular legion under the early republic. The four "tribes," also instituted by Servius, were probably intended to serve as the basis for the levy of freeholders for the new army. As their names show, they correspond with the

natural local divisions of the city territory, but that they included freeholders residing on Roman territory but outside Rome is indicated by the fact that both Ostia and Alba belonged to the Palatine tribe.

The last of these Etruscan lords to rule in Rome was Tarquin the Proud. He is described as a splendid and despotic monarch. His sway extended over Latium as far south as Circeii. Aristodemus, tyrant of Cumæ, was his ally, and kinsmen of his own were princes at Collatia, at Gabii, and at Tusculum. The Volscian highlanders were chastised, and Signia with its massive walls was built to hold them in check. In Rome itself the Capitoline temple and the great cloaca bore witness to his power. But his rule pressed heavily upon the Romans, and at the last, on the news of the foul wrong done by his son Sextus to a noble Roman matron, Lucretia, the indignant people rose in revolt. Tarquin, who was away besieging Ardea, was deposed; sentence of exile was passed upon him and upon all his race; and the people swore that never again should a king rule in Rome. Freed from the tyrant, they chose for themselves two yearly magistrates who should exercise the supreme authority, and thus the republic of Rome was founded. Three times the banished Tarquin strove desperately to recover the throne he had lost. First of all the men of Veii and Tarquinii marched to his aid, but were defeated in a pitched battle on the Roman frontier. A year later Lars Porsena, prince of Clusium, at the head of all the powers of Etruria, appeared before the gates of Rome, and closely besieged the city, until, moved by the valor of his foe, he granted honorable terms of peace and withdrew. Once again, by Lake Regillus, the Romans fought victoriously for their liberty against Tarquin's son-in-law Mamilius, prince of Tusculum, and chief of the Latin name. Mamilius was slain; Tarquin in despair found a refuge at Cumæ, and there soon afterward died.

So, in brief, ran the story of the flight of the kings, as it was told by the chroniclers whom Livy followed. Its details are most of them fabulous; it is crowded with inconsistencies and improbabilities; there are no trustworthy dates; the names even of the chief actors are probably fictitious, and the hand of the improver, Greek or Roman, is traceable throughout. The struggle was doubtless longer and sharper, and the new constitution more gradually shaped, than tradition would have us believe. Possibly, too, this revolution in Rome was but a part of a widespread wave of change in Latium and central Italy, similar to that which in Greece swept away the old heroic monarchies. But there is no room for doubting the main facts of the emancipation of Rome from the rule of alien princes and the final abolition of the kingly office.

PERIOD I. 509-265 B.C.—(a) *The Struggle between the Orders.*—It is characteristic of Rome that the change from monarchy to republic should have been made with the least possible disturbance of existing forms. The title of king was retained, though only as that of a priestly officer (*rex sacrorum*) to whom some of the religious functions of the former kings were transferred. The two annually elected consuls, or "praetores," were regarded as joint heirs of the full kingly authority, and as holding the "imperium," and the correlative right of auspices, by direct transmission from the founder of the city. The revolution which expelled the Tarquins gave the patricians, who had mainly assisted in bringing it about, an overwhelming ascendancy in the state. The plebs had indeed gained something. Not only is it probable that the strictness of the old tie of clientship had somewhat relaxed, and that the number of the "clientes" was smaller and their dependence on patrician patrons less complete, but the

ranks of the plebs had, under the later kings, been swelled by the admission of conquered Latins, and the freeholders among these had with others been enrolled in the Servian tribes, classes, and centuries. The establishment of the republic invested this military levy of freeholders with political rights as an assembly, for by their votes the consuls were chosen and laws passed, and it was the plebeian freeholders who formed the main strength of the plebs in the struggle that followed. But these gains were greater in appearance than in reality.

It was by their own efforts that the plebeians first obtained any real protection against magisterial despotism. The traditional accounts of the first secession are confused and contradictory, but its causes and results are tolerably clear. The seceders were the plebeian legionaries recently returned from a victorious campaign. Indignant at the delay of the promised reforms, they ignored the order given them to march afresh against Volsci and Æqui, and instead intrenched themselves on a hill across the Anio, some three miles from Rome, and known afterward as the Mons Sacer. The frightened patricians came to terms, and a solemn agreement (*lex sacrata*) was concluded between the orders, by which it was provided that henceforth the plebeians should have annual magistrates of their own (*tribuni plebis*), members of their own order, who should be authorized to protect them against the consuls, and a curse was invoked upon the man who should injure or impede the tribune in the performance of his duties. The number of tribunes was at first two, then five, and before 449 B.C. it had been raised to ten.

But from the first the tribunes were for the plebs not only protectors but leaders, under whom they organized themselves in opposition to the patricians. The tribunes convened assemblies of the plebs (*concilia plebis*), and carried resolutions on questions of interest to the order. This incipient plebeian organization was materially advanced by the Publilian law of 471 B.C., which appears to have formally recognized as lawful the plebeian *concilia*, and established also the tribune's right "cum plebe agere," *i.e.*, to propose and carry resolutions in them. These assemblies were "tributa," or, in other words, the voting in them took place not by curies or centuries but by tribes. In them, lastly, after the Publilian law, if not before, the tribunes were annually elected. By this law the foundations were laid both of the powerful "comitia tributa" of later days and also of the legislative and judicial prerogatives of the tribunes. The patricians maintained indeed that resolutions (*plebiscita*) carried by tribunes in the *concilia plebis* were not binding on their order, but the moral weight of such resolutions, whether they affirmed a general principle or pronounced sentence of condemnation on some single patrician was no doubt considerable.

It is at any rate certain that the passing of the Publilian law was followed by increased activity on the part of the tribunes. The attack on the consular authority was continued, and combined with it we have a persistent effort made to secure for the plebs their fair share of the common lands of the state (*agri publici*). The main object, however, of this early agrarian agitation was not economic but political. Membership in a tribe was now more than ever important for a plebeian, as giving a vote not only in the *comitia centuriata* but also in the plebeian "concilia," and membership in a tribe was possible as yet only for freeholders. To increase the number of freeholders became therefore a matter of importance, and the simplest mode of increasing the number of freeholders was for the state to create freeholds on the common lands. But such a policy met with bitter opposition from the patricians, who had long en-

joyed a virtual monopoly of these lands, and had excluded the plebeians even from those more recently acquired tracts which they had helped to win by their swords. Against this patrician monopoly the tribunes unceasingly protested from a few years after the first secession down to 465 B.C. In that year a compromise was effected by the colonization of Antium, which had been taken the year before, and the plebeians obtained land without any disturbance of patrician occupiers. Eleven years later the common lands on the Aventine were reclaimed and assigned to plebeians by a *lex Icilia*.

But this agrarian agitation, though destined subsequently to play an important part in the history, was for the time far less fruitful in results than that which was directed against the consular authority.

The proposal of C. Terentilius Arsa (460 B.C.) to appoint a plebeian commission to draw up laws restricting the powers of the consuls was resolutely opposed by the patricians, but after ten years of bitter party strife a compromise was effected. A commission of ten patricians was appointed, who should frame and publish a code of law binding equally on both the orders. These decemviri were to be the sole and supreme magistrates for the year, and the law of appeal was suspended in their favor. The code which they promulgated, the famous XII. Tables, owed little of its importance to any novelties or improvements contained in its provisions. For the most part it seems merely to have reaffirmed existing usages and laws. But it substituted a public, written law, binding on all citizens of Rome, for an unwritten usage, the knowledge of which was confined to a few patricians, and which had been administered by this minority in their own interest. We are told of a second secession of the plebs, this time to the Janiculum, and of negotiations with the senate, the result of which was the enforced abdication of the decemvirs. The plebs joyfully chose for themselves tribunes, and in the *comitia centuriata* two consuls were created. But this restoration of the old regime was accompanied by legislation which made it an important crisis in the history of the struggle between the orders. With the fall of the decemvirate this struggle enters upon a new phase. The tribunes appear as at once more powerful and more strictly constitutional magistrates; the plebeian "*concilia*" take their place as formal *comitia* by the side of the older assemblies; and finally this improved machinery is used not simply in self-defense against patrician oppression but to obtain complete political equality. This change was no doubt due in part to circumstances outside legislation, above all to the expansion of the Roman state, which swelled the numbers and added to the social importance of the plebs as compared with the dwindling forces of the close corporation of patrician *gentes*. Still the legislation of 449 clearly involved more than a restoration of the old form of government. The Valerio-Horatian laws, besides reaffirming the right of appeal and the inviolability of the tribunes, improved the condition of the plebeian assemblies by enacting that "*plebiscita*" passed in them, and, as seems probable approved by the *patres*, should be binding on patricians as well as plebeians. By this law the tribunes obtained a recognized initiative in legislation. Henceforth the desired reforms were introduced and carried by tribunes in what were now styled "*comitia tributa*," and, if sanctioned by the *patres*, became laws of the State. From this period, too, must be dated the legalization, at any rate, of the tribune's right to impeach any citizen before the assembly of the tribes. Henceforward there is no question of the tribune's right to propose to the plebs to impose a fine, or of the validity of the sentence when passed. The efficiency of these new weapons of attack was

amply proved by the subsequent course of the struggle. Only a few years after the Valerio-Horatian legislation came the *lex Canuleia* (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patriciate broken down. In the same year with this measure, and like it in the interest primarily of the wealthier plebeians, a vigorous attack commenced on the patrician monopoly of the consulate, and round this stronghold of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of Canuleius in 445 that the people should be allowed to elect a plebeian consul was evaded by a compromise. The senate resolved that for the next year, in the stead of consuls, six military tribunes, with consular powers, should be elected, and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing strength of the plebs is shown by the fact that in fifty years out of the seventy-eight between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls. A good omen for their ultimate success was a victory they won in connection with the inferior office of the *quæstorship*. Down to the time of the decemvirate the *quæstors* had been nominated by the consuls, but in 447 their appointment was transferred to the plebeian "*comitia tributa*," and in 421 a plebeian first became eligible to the office. Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this, strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers. Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were ambitious of high office, and the poorer, whose minds were set rather on allotments of land, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, C. Licinius Stolo and L. Sextius, came forward with proposals which united all sections of the plebs in their support. Their proposals were as follows:—(1) that consuls and not consular tribunes be elected; (2) that one consul at least should be a plebeian; (3) that the priestly college, which had the charge of the Sibylline books, should consist of ten members instead of two, and that of these half should be plebeians; (4) that no single citizen should hold in occupation more than 500 acres of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; (5) that all landowners should employ a certain amount of free as well as slave labor on their estates; (6) that interest already paid on debts should be deducted from the principal, and the remainder paid off in three years. The three last proposals were obviously intended to meet the demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed, but at last, in 367 B.C., the Licinian rogations became law, and one of their authors, L. Sextius, was created the first plebeian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulship the administration of civil law,

which was intrusted to a separate officer, "praetor urbanus," to be elected by the comitia of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles ("aediles curules"), who were in like manner to be members of their own order. With the opening of the consulship, however, the issue of the long contest was virtually decided, and the next eighty years witnessed a rapid succession of plebeian victories. Now that a plebeian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebeian candidates was removed. The proposed patrician monopoly of the new curule aedileship was almost instantly abandoned. In 356 the first plebeian was made dictator, in 350 the censorship and in 337 the praetorship were filled for the first time by plebeians, and lastly, in 300, by the lex Ogulnia, even the sacred colleges of the pontiffs and augurs, the old strongholds of patrician supremacy, were thrown open to the plebs. The patricians lost also the control they had exercised so long over the action of the people in assembly. The "patrum auctoritas," the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publilius Philo, a plebeian dictator, enacted that this sanction should be given beforehand to all laws; and by a lex Maenia, carried apparently some fifty years later, the same rule was extended to elections. Henceforward the "patrum auctoritas" sank into a meaningless form, though as such it still survived in the time of Livy. A second Publilian law affirmed afresh the validity of "plebiscita," *i.e.*, of measures carried in the plebeian comitia tributa. Apparently, however, their validity was still left subject to some conditions, for in 287 a lex Hortensia, carried by another plebeian dictator, was found necessary finally to settle the question. From 287 onward it is certain that measures passed by the plebs, voting by their tribes, had the full force of laws without any further conditions whatsoever. The legislative independence of the plebeian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(b) *Conquest of Italy.*—Twelve years after the passing of the lex Hortensia, King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula.

Before this date the city had been in a state of continual warfare with first one and then another alien enemy. She had also acquired new domain by sending out colonies. Her wars with the Sabines continued after the expulsion of the Tarquins, but at the same time she formed an alliance with the Latins and the Hancians, and thus assured her first success from this period. This alliance lasted over one hundred years—till the outbreak of the Latin war. The Aequi and Volsci were also in turn engaged in wars with the republic, and were not fully conquered till after 390 B.C. Veii was captured by the Romans in 396, thus giving to the republic the mastery of Etruria as far as the Ciminian forest. But not long after this she received a severe setback in the shape of the capture and sack of the city by the Gauls. But she soon recovered from the shock, and in 353 she had completed the subjugation of Etruria. In 343 the first Samnite war broke out and lasted two years. This was followed by the Latin war, which was promptly and successfully brought to an end in two campaigns. In 327 the second Samnite war broke out, and lasted twenty-two years, being ended by a treaty between the two states. Meantime Rome had been steadily augmenting her territory by annexing the lands of her weaker neighbors. The peace with the Samnites lasted

only six years; the third war lasted eight years, and ended by the formation of an alliance between the two states. The next war was with Pyrrhus, which resulted as above stated, and left the republic mistress of the peninsula.

A few years later (272) Tarentum was surrendered to Rome by its Epirot garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Samnium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded in Samnium and Lucania—Pæstum in 273, Beneventum in 268, Æsernia in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, and of their neighbors to the east, the Picentes. To guard the Adriatic coast colonies were established at Ariminum (268), at Firmum, and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria.

Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arno on the west to that of the Æsis on the east. Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city state with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and municipia, were allowed a large measure of local self-government. The Roman citizen in a colony or municipium enjoyed of course the right of appeal to the Roman people in a capital case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new and unfamiliar, was provided by the institution of prefects ("praefecti iuridicundo"), who were sent out annually, as representatives of the Roman praetor, to administer justice in the colonies and municipia. To prefects was, moreover, assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

PERIOD II. ROME AND THE MEDITERRANEAN STATES, 265-146 B.C.—(a) *Conquest of the West.*—Though marked out by her geographical position as the natural center of the Mediterranean, Italy had hitherto played no active part in Mediterranean politics, but now that she was for the first time united, it was felt throughout the Mediterranean world that a new power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. With those of the eastern Mediterranean indeed she was not immediately called upon to concern herself. Her repulse of Pyrrhus, and the news that the Greek cities of South Italy had acknowledged her suzerainty, had, it is true, suddenly

revealed to the Eastern world the existence of a powerful Italian state. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution, and character of the Latin republic which had so suddenly become famous. But this was all, and not until fifty years after the retreat of Pyrrhus did Rome seriously turn her attention eastward. Westward of Italy the case was different. The western coasts of the peninsula were the most fertile and populous and wealthy, and it was westward rather than eastward that the natural openings for Italian commerce were to be found. But it was precisely on this side that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the west.

It was above all things essential for Rome that the Carthaginians should advance no farther eastward. But already in 272 Tarentum had almost fallen into their grasp, and seven years later Rome was threatened with a danger at least as serious, the establishment of Carthaginian rule in the east of Sicily, and within sight of the Italian coast. In 265 a body of Campanian mercenaries, who had seized Messana, found themselves hard pressed by Hiero, king of Syracuse. One party among them appealed for aid to Carthage. The Carthaginians readily responded, and a Carthaginian garrison occupied the citadel of Messana. But at Messana, as once at Tarentum, there were others who turned to Rome, and, as Italians themselves, implored the aid of the great Italian republic, offering in return to place Messana under the suzerainty of Rome. The Roman assembly voted that assistance should be sent to the Mamertines, and in 264 the Roman legions for the first time crossed the sea. Messana was occupied, and, after sustaining a defeat, the Carthaginians and Syracusans were forced to raise the siege and withdraw. The opening years of the war which was thus begun gave little promise of the length of the struggle. In the spring of 260 the first regular Roman fleet consisting of one hundred quinqueremes and twenty triremes set sail; and the brilliant naval victory of Mylæ, won by the consul C. Duilius in the same year, seemed to promise the Romans as much success by sea as they had won by land. But the promise was not fulfilled; and in 256 the senate, impatient of the slow progress made in Sicily, determined on boldly invading Africa. It was a policy for which, if Africa were once reached, the defenseless state of the Carthaginian territories, the doubtful loyalty of her Libyan subjects, and the unwarlike habits of her own citizens, gave every hope of success, and, but for the blunders of the Romans themselves, it might have succeeded now as it did fifty years later. The passage to Africa was opened by the defeat of the Carthaginian fleet of Ecnomus; the two consuls, L. Manlius Vulso and M. Atilius Regulus, landed in safety and rapidly overran the country. But these successes led the senate, at the close of the summer, into committing the serious blunder of recalling one of the consuls, Manlius, with a large portion of the troops. The rashness and overconfidence of Regulus aggravated the effects of the senate's action. Emboldened by further successes, and notwithstanding his diminished forces, he met the Carthaginian proposals for peace by terms so harsh that the latter, though the Romans were almost at their gates, their soldiers disheartened, and the nomad tribes swarming on their frontiers, indignantly broke off the negotiations and prepared to resist to the last. At this crisis, so the story runs, the arrival of Xanthippus, a Spartan soldier of fortune, changed the face of affairs,

as that of Gylippus had formerly done at Syracuse. His superior military skill remedied the blunders of the Carthaginian generals; confidence was restored; and in 255 he triumphantly routed the Roman forces a few miles outside the city. Regulus was taken prisoner; and only a miserable remnant of 2,000 men escaped to the Roman camp on the coast. Here they were rescued by a Roman fleet, but their ill-fortune pursued them. On its way home the fleet was wrecked, and all but eighty vessels out of a total of 364 were lost.

Still, though abandoning all thoughts of invading Africa, the Romans were unwilling to renounce all thoughts of facing their enemy on the sea. But fresh disasters followed. Disheartened by these repeated disasters, the senate resolved to trust only to the legions, and by sheer force of perseverance slowly to force the enemy out of the few positions to which he still clung in Sicily. But, though for five years (248-243) no fresh naval operations were attempted, no compensating success by land followed. Hamilcar Barca, the new Carthaginian commander, not only ravaged with his fleet the coasts of Italy, but from his impregnable position at Ercte incessantly harassed the Roman troops in the west of the island, and even recaptured Eryx. Convinced once more of the impossibility of driving the Carthaginians out of Sicily as long as their navy swept the seas, the Romans determined on a final effort. The treasury was empty; but by the liberal contributions of private citizens a fleet was equipped, and C. Lutatius Catulus, consul for 242, started for Sicily early in the summer of that year with 200 quinqueremes. From Drepana, whither he had gone to aid in the blockade, he sailed out to meet a Carthaginian fleet, dispatched from Africa against him; and a battle took place at the Ægates islands, some twenty miles from the Sicilian coast, in which Catulus completely defeated his enemy. The end of the long struggle had come at last. The Carthaginian Government, despairing of being able to send further aid to their troops in Sicily, authorized Hamilcar to treat for peace. His proposals were accepted by Catulus, and the terms agreed upon between them were confirmed in all essential points by the commissioners sent out from Rome. The Carthaginians agreed to evacuate Sicily and the adjoining islands, to restore all prisoners, and to pay an indemnity of 2,300 talents. In its duration and its severity the First Punic War is justly ranked by Polybius above all other wars of his own and preceding times, though neither in the military talent displayed nor in the importance of its results can it be compared with the war that followed. The interval between the First and Second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions.

A second war with Carthage was no unlooked-for event at Rome; but the senate seems to have confidently expected that it would be waged at a distance from Italy—in Africa and in Spain, where Saguntum would have given them a convenient point of support; and to this hope they clung even after Saguntum was lost. In 218, the first year of the war, one consul, P. Cornelius Scipio, was dispatched to Spain, and the other, T. Sempronius Gracchus, to Sicily, and thence to Africa. But Hannibal's secrecy and promptitude baffled all their calculations. Leaving New Carthage early in 218, in the space of five months he crossed the Pyrenees, reached the Rhone just as Scipio arrived at Massilia on his way to Spain, passed the Alps in spite of endless difficulties and hardships, and startled Italy by descending into the plains of Cisalpine Gaul. In two battles on the Ticinus and the Trebia he defeated the forces hastily collected to bar his progress southward; the Celtic tribes rallied to his standard; and at the be-

ginning of the next year he prepared to realize the dream of his life and carry fire and sword into Italy itself. His own force numbered 26,000 men; the total available strength of Rome and her allies was estimated at over 700,000. But Hannibal's hope lay in the possibility that by the rapidity of his movements he might be able to strike a decisive blow before Rome could mobilize her levies, or get her somewhat cumbrous military machinery into working order. From a first success he expected no less a result than the breakup of the Roman confederacy, and the isolation of Rome herself, while it would also increase the readiness of his own government to render him effective support. His trust in himself and his army was not misplaced, for to the last he had the advantage over the Roman legions wherever he met them in person. Except, however, in South Italy, his brilliant victories and dashing marches brought him no allies, and it was his inability to shake the loyalty of northern and central Italy and of the Latin colonies everywhere, even more than the indomitable perseverance of Rome and the supineness of Carthage which caused his ultimate failure.

In the spring of 217 Hannibal crossed the Apennines and marched southward through the lowlands of eastern Etruria, the route taken before him by the Celtic hordes. In April he annihilated Flaminius and his army at the Trasimene Lake, and pushed on to Spolegium, only a few days' march from Rome. But Rome was not yet his goal; from Spolegium, which had closed its gates against him, he moved rapidly eastward, ravaging the territories of Roman allies as he went, till he reached the Adriatic and the fertile lands of northern Apulia, where supplies and especially remounts for his Numidian cavalry were plentiful, and communication with Carthage easy, and where, moreover, he was well placed for testing the fidelity of the most recent and the least trustworthy of the Italian allies of Rome. A second victory here, on the scale of that at the Trasimene Lake, might be the signal for a general revolt against Roman rule. It was not, however, until the summer of the next year that his opportunity came. The patient tactics of Q. Fabius Cunctator had become unpopular at Rome; and the consuls of 216, L. Æmilius Paulus and M. Terentius Varro, took the field in Apulia, at the head of a larger force than Rome had yet raised, and with orders to fight and crush the daring invader. The result realized for the moment Hannibal's highest hopes. The Roman army was annihilated at Cannæ; and South Italy, with the exception of the Latin colonies and the Greek cities on the coast, came over to his side. Nor did the Roman misfortunes end here. Philip of Macedon concluded an alliance with Hannibal (215), and threatened an invasion of Italy. In the very next year Syracuse, no longer ruled by the faithful Hiero, revolted, and a Carthaginian force landed in Sicily; lastly, in 212 came the loss of the Greek cities on the south coast. But the truth of Polybius' remark that the Romans are most to be feared when their danger is greatest was never better illustrated than by their conduct in the face of these accumulated disasters. Patiently and undauntedly they set themselves to regain the ground they had lost. Philip of Macedon was first of all forced to retire from the allied city of Apollonia which he had attacked (214), and then effectually diverted from all thoughts of an attack on Italy, by the formation of a coalition against him in Greece itself (211); Syracuse was recaptured in 212, after a lengthy siege, and Roman authority reestablished in Sicily. In Italy itself the Roman commanders took advantage of Hannibal's absence in the extreme south to reconquer northern Apulia; but their main efforts were directed to the recovery of Campania, and above all of Capua.

The imminent danger of Capua, which he had named as the successor of Rome in the headship of Italy, recalled Hannibal from the south, where he was besieging a Roman garrison in the citadel of Tarentum. Failing to break through the lines which inclosed it, he resolved, as a last hope of diverting the Roman legions from the devoted city, to advance on Rome itself. But his march, deeply as it impressed the imagination of his contemporaries by its audacity and promptitude, was without result. Silently and rapidly he moved along the course of the Latin Way, through the heart of the territory of Rome, to within three miles of the city, and even rode up with his advanced guard to the Colline gate. Yet no ally joined him; no Roman force was recalled to face him; no proposals for peace reached his camp; and, overcome, it is said, by the unmoved confidence of his foe, he withdrew, as silently and rapidly as he had advanced, to his headquarters in the south. The fall of Capua followed inevitably (211), and the Roman senate saw with relief the seat of war removed to Lucania and Bruttium, and a prospect opening of some relief from the exhausting exertions of the last five years. Their hopes were quickly dashed to the ground. The faithful Massiliots sent word that Hasdrubal, beaten in Spain, was marching to join Hannibal in Italy. The anxiety at Rome was intense, and every nerve was strained to prevent the junction of the two brothers. Equally great was the relief when the news arrived that the bold march of the consul Claudius had succeeded, and that Hasdrubal had been defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended, for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (211-206) were crowned by the complete expulsion of the Carthaginians from the peninsula. Nothing now remained to Carthage outside Africa but the ground on which Hannibal desperately held out, and popular opinion at Rome warmly supported Scipio when on his return from Spain he eagerly urged an immediate invasion of Africa. The senate hesitated. Many were jealous of Scipio's fame, and resented his scarcely concealed intention of appealing to the people, should the senate decline his proposals. Others, like the veteran Q. Fabius, thought the attempt hazardous, with exhausted resources, and while Hannibal was still on Italian soil. But Scipio gained the day. He was elected consul for 205, and given the province of Sicily, with permission to cross into Africa if he thought fit. Voluntary contributions of men, money, and supplies poured in to the support of the popular hero; and by the end of 205 Scipio had collected in Sicily a sufficient force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Masinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed. Hannibal was recalled from Italy, and with him his brother Mago, who had made a last desperate attempt to create a division in Italy by landing in Liguria. Mago died on the voyage, but Hannibal returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly gladly voted that the Carthaginian request for peace should be granted, and intrusted the settlement of the terms to its favorite Scipio and a commission of

ten senators. Carthage was allowed to retain her own territory in Africa intact; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships but ten triremes, her elephants, and all prisoners of war. Finally she agreed to pay an indemnity of 10,000 talents in fifty years. Masinissa was rewarded by an increase of territory, and was enrolled among the "allies and friends" of the Roman people.

The battle of Zama decided the fate of the West. The power of Carthage was broken, and her supremacy passed by the right of conquest to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be confined, and what form it should take. The answer to both these questions was largely determined for her by circumstances. For the next fifty years Rome was too deeply involved in the affairs of the East to think of extending her rule far beyond the limits of the rich inheritance which had fallen to her by the defeat of Carthage; and it was not until 125 that she commenced a fresh career of conquest in the West by invading Transalpine Gaul.

In Africa there was no question at first of the introduction of Roman government by the formation of a province. Carthage, bound hand and foot by the treaty of 201, was placed under the jealous watch of the loyal prince of Numidia, who himself willingly acknowledged the suzerainty of Rome. But it was impossible for this arrangement to be permanent. Every symptom of reviving prosperity at Carthage was regarded at Rome with feverish anxiety, and neither the expulsion of Hannibal in 195 nor his death in 183 did much to check the growing conviction that Rome would never be secure while her rival existed. It was, therefore, with grim satisfaction that many in the Roman senate watched the increasing irritation of the Carthaginians under the harassing raids and encroachments of their favored neighbor, Masinissa, and waited for the moment when Carthage should, by some breach of the conditions imposed upon her, supply Rome with a pretext for interference. At last in 151 came the news that Carthage, in defiance of treaty obligations, was actually at war with Masinissa. In the year 146 Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now ruled by the three sons of Masinissa, remained as an allied state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes. Within little more than a century from the commencement of the First Punic War, the whole of the former dominions of Carthage had been brought under the direct rule of Roman magistrates, and were regularly organized as Roman provinces.

In Italy itself the Hannibalic war was inevitably followed by important changes, and these changes were, naturally enough, in the direction of an increased Roman predominance.

(b) *Rome in the East, 200-133.*—Ever since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the Eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had formed an alliance in 273, and the alliance had been cemented by the growth of commercial intercourse between the two countries. In 228 her chastisement of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece proper. Further than this, however, Rome for the time showed no desire to go. In 214 the alliance between Philip and Hannibal, and the former's threatened attack on Italy, forced her into war with

Macedon, but even then she contented herself with heading a coalition of the Greek states against him, which effectually frustrated his designs against herself; and at the first opportunity (205) she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philopater to the rule of a boy king. To cripple or at least to stay the growth of Philip's power was in the eyes of the senate a necessity, but it was only by representing a Macedonian invasion of Italy as imminent that they persuaded the assembly, which was longing for peace, to pass a declaration of war (200), an ostensible pretext for which was found in the invasion by Macedonian troops of the territory of Rome's ally, Athens.

The war commenced in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been hoped, by any general rising against Philip, yet the latter had soon to discover that, if they were not enthusiastic for Rome, they were still less inclined actively to assist himself. Neither by force nor by diplomacy could he make any progress south of Bœotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achæans and Nabis of Sparta were obstinately neutral, while nearer home in the north the Epirots and Ætolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Cœle-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand.

Antiochus III. of Syria, Philip's accomplice in the proposed partition of the dominions of their common rival, Egypt, returned from the conquest of Cœle-Syria (198) to learn first of all that Philip was hard pressed by the Romans, and shortly afterward that he had been decisively beaten at Cynoscephalæ. It was already too late to assist his former ally, but Antiochus resolved at any rate to lose no time in securing for himself the possessions of the Ptolemies in Asia Minor and in eastern Thrace, which Philip had claimed, and which Rome now pronounced free and independent. In 197-196 he overran Asia Minor and crossed into Thrace.

In 191 Glabrio landed at the head of an imposing force; and a single battle at Thermopylæ broke the courage of Antiochus, who hastily recrossed the sea to Ephesus, leaving his Ætolian allies to their fate. But Rome could not pause here. The safety of her faithful allies, the Pergamenes and Rhodians, and of the Greek cities in Asia Minor, as well as the necessity of chastising Antiochus, demanded an invasion of Asia. A Roman fleet had already (191) crossed the Ægean, and in concert with the fleets of Pergamum and Rhodes worsted the navy of Antiochus. In a space of little over eleven years (200-189) Rome had broken the power of Alexander's successors and established throughout the eastern Mediterranean a Roman protectorate.

The results of the protectorate in Greece, if less dangerous to Roman supremacy, were quite unfavorable to the maintenance of order. But from 189 to the defeat of Perseus in 167, no formal change of importance in

the status of the Greek States was made by Rome. The Greeks were still nominally free, and no separate province with a governor of its own was established, but the needed central control was provided by assigning to the neighboring governor of Macedonia a general supervision over the affairs of Greece. From the Adriatic to the Ægean, and as far north as the river Drilo and Mount Scardus, the whole peninsula was now under direct Roman rule.

Beyond the Ægean the Roman protectorate worked no better than in Macedonia and Greece, and the demoralizing recriminations, quarrels, and disorders which flourished under its shadow were aggravated by its longer duration, and by the still more selfish view taken by Rome of the responsibilities connected with it.

Both the western and eastern Mediterranean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her Western subjects, she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the east, on the contrary, she came as the liberator of the Greeks, and it was only slowly that in this part of the empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners, and thought Greek and not Roman.

PERIOD III. THE PERIOD OF THE REVOLUTION, (146-49 B.C.)—In the course of little more than a century, Rome had become the supreme power in the civilized world. By all men, says Polybius, it was taken for granted that nothing remained but to obey the commands of the Romans. For the future the interest of Roman history centers in her attempts to perform the two Herculean tasks which this unique position laid upon her—the efficient government of the subject peoples, and their defense against the barbarian races which swarmed around them on all sides. They were tasks under which the old republican constitution broke down, and which finally overtaxed the strength even of the marvelous organization framed and elaborated by Augustus and his successors.

Although in its outward form the old constitution had undergone little change during the age of war and conquest from 265 to 146, the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all, and the will of the people in their comitia had been in the most explicit and unqualified manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the "caput" of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistracies were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility. The ascendancy of the senate is too obvious and familiar a fact to need much illustration here.

The causes of this ascendancy of the senate are not to be found in any additions made by law to its consti-

tutional prerogatives, but first of all in the fact that the senate was the only body capable of conducting affairs in an age of incessant war. The voters in the assembly, a numerous, widely scattered body, many of whom were always away with the legions abroad, could not readily be called together, and when assembled were very imperfectly qualified to decide momentous questions of military strategy and foreign policy. The senate, on the contrary, could be summoned in a moment, and included in its ranks all the skilled statesmen and soldiers of the commonwealth, while its forms of procedure were at least better fitted than those of the comitia for securing the careful discussion and prompt decision of the question before it.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports it fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrate when asked to do so, and its decrees were strictly only suggestions to the magistrate, which he was at liberty to accept or reject as he chose.

And from 167 at least, onward, there were increasing indications that both the acquiescence of the people and the loyalty of the magistrates were failing.

But if the senate was not to govern, the difficulty arose of finding an efficient substitute, and it was this difficulty that mainly determined the issue of the struggles which convulsed Rome from 133 to 49.

The first systematic attack upon the senatorial government is connected with the names of Tiberius and Gaius Gracchus, and its immediate occasion was an attempt to deal with no less a danger than the threatened disappearance of the class to which of all others Rome owed most in the past. For, while Rome had been extending her sway westward and eastward, while the treasury had been enriched, and while her nobles and merchants were amassing colossal fortunes abroad, the small freeholders throughout the greater part of Italy were sinking deeper into ruin under the pressure of accumulated difficulties. The Hannibalic war had laid waste their fields and thinned their numbers, and when peace returned to Italy it brought with it no revival of prosperity. The heavy burden of military service still pressed ruinously upon them, and in addition they were called upon to compete with the foreign corn imported from beyond the sea, and with the foreign slave-labor purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses, and gay spectacles to be had in the large towns. The small holders went off to follow the eagles or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, oliveyards, and above all in the great cattle-farms, of the rich, and their own place was taken by slaves. The evil was not equally serious in all parts of Italy. It was least felt in the central highlands, in Campania, and in the newly settled fertile valley of the Po. It was worse in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the government had received plenty of warning in the declining numbers of able-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between 200 and 160 a good deal was attempted by way of remedy. In addition to the foundation of twenty colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium.

In 180 40,000 Ligurians were removed from their homes and settled on vacant lands once the property of a Samnite tribe, and in 160 the Pomptine marshes were drained for the purpose of cultivation. But these efforts were only partially successful. The colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required recolonizing only eight years after their foundation. The veterans who received land were unfitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier's life. Moreover, after 160 even these efforts ceased, and with the single exception of the colony of Auximum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the work.

The remedy proposed by Gracchus amounted in effect to the resumption by the state of as much of the "common land" as was not held in occupation by authorized persons and conformably to the provisions of the Licinian law. Unauthorized occupiers were to be evicted; in other cases the occupation was reduced to a maximum size of 1,000 acres; the public pastures were reclaimed for agriculture and the land thus rescued for the community from the monopoly of a few was to be distributed in allotments. It was a scheme which could quote in its favor ancient precedent as well as urgent necessity. The senate from the first identified itself with the interests of the wealthy occupiers, and Tiberius found himself forced into a struggle with the senate, which had been no part of his original plan. The organizer of this concerted attack upon the position of the senate fell, like his brother, in a riot.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother's law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which converted all land still held in occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor citizens to the state lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.

But, though the agrarian reform failed, the political conflict it had provoked ended only with the dictatorship of Cæsar, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The struggle between the senate and the populares was resumed on account of the Jugurthan wars and again the populares were worsted.

The need of reform was clear, but it was not so easy to carry a reform which would certainly be opposed by the whole strength of the equestrian order, and which, as involving the repeal of a Sempronian law, would arouse the resentment of the popular party. The difficulties of the Italian question were more serious.

Marcus Livius Drusus, who as tribune gallantly took up the task of reform, is claimed by Cicero as a member of that party of the center to which he belonged himself. Noble, wealthy, and popular, he seems to have hoped to be able by the weight of his position and character to rescue the burning questions of the day from the grasp of extreme partisans and to settle them peacefully and equitably. But he, like Cicero after him, had to find to his cost that there was no room in the fierce strife of Roman politics for moderate counsels. His proposal to reform the law courts excited the equestrian

order and their friends in the senate to fury. The agrarian and corn laws which he coupled with it alienated many more in the senate, and roused the old anti-popular party feeling; finally, his known negotiations with the Italians were eagerly misrepresented to the jealous and excited people as evidence of complicity with a wide-spread conspiracy against Rome. His laws were carried, but the senate pronounced them null and void. Drusus was denounced in the senate house as a traitor, and on his way home was struck down by the hand of an unknown assassin. This was followed by the Social war which lasted from 90 to 89 B.C.

The termination of the Social war brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italians themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities, and grievances were aggravated by the wide-spread economic distress and ruin which affected all classes. Lastly, war with Mithradates had been declared; it was notorious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius, the conqueror of Jugurtha, and L. Cornelius Sulla.

For a period of ten years from this time Rome was the scene of civil war and massacres, of first the partisans of Sulla, and then of Marius. Sulla had at first been victorious and had entered Rome at the head of his army, held the consular elections and departed for the seat of war. No sooner had he gone than Cinna raised a revolt, and Marius returned from his flight from Sulla and assumed the government as consul (for the seventh time). His first act was a frightful massacre of his opponents. He did not long survive the triumph, dying in 86. Cinna continued in office as consul together with a trusted colleague. His government was a rank usurpation, and he was at last murdered by his soldiers. Sulla finally returned from Asia, where he had brought the Mithradatic war to a close. He entered Rome at the head of a large army, and, having conquered all opposition, at once seized the reins of government. His victory was instantly followed, not by any measures of conciliation, but by a series of massacres, proscriptions, and confiscations, of which almost the least serious consequence was the immediate loss of life which they entailed. From this time forward the fear of proscription and confiscation recurred as a possible consequence of every political crisis, and it was with difficulty that Cæsar himself dissipated the belief that his victory would be followed by a Sullan reign of terror. The legacy of hatred and discontent which Sulla left behind him was a constant source of disquiet and danger.

The Sullan system stood for nine years, and was then overthrown—as it had been established—by a successful soldier. It was the fortune of Cn. Pompeius, a favorite officer of Sulla, first of all to violate in his own person the fundamental principles of the constitution reëstablished by his old chief, and then to overturn it. In Spain the Marian governor Q. Sertorius (see SERTORIUS) had defeated one after another of the proconsuls sent out by the senate, and was already in 77 master of all Hither Spain. To meet the crisis, the senate itself took a step which was in fact the plainest possible confession that the system sanctioned afresh by Sulla was inadequate to the needs of the state. Pompey, who was not yet thirty, and had never held even the quæstorship, was sent out to Spain with proconsular

authority. Still Sertorius held out, until in 73 he was foully murdered by his own officers. The native tribes who had loyally stood by him submitted, and Pompey early in 71 returned with his troops to Italy, and in conjunction with Crassus (who had put down the servile insurrection of Spartacus) was made consul.

When his consulship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectedly dignified seclusion. But in 67 and 66 the laws of Gabinius and Manilius gave him all and more than all that he expected. The ravages of the pirates, encouraged in the first instance by the inactivity which had marked Roman policy in the East after 167, and by the absence of any effective Roman navy in the Mediterranean, had now risen to an intolerable height, and the spasmodic efforts made since 81 had done little to check them. The trade of the Mediterranean was paralyzed, and even the coasts of Italy were not safe from their raids. Aulus Gabinius, a tribune, and a follower of Pompey, now proposed to the people to entrust Pompey with the sole command against the pirates. His command was to last for three years. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for fifty miles inland. Fifteen legati, all of prætorian rank, were assigned to him, with 200 ships, and as many troops as he thought desirable. These powers were still further enlarged in the next year by the Manilian law, which transferred from Lucullus and Giabrio to Pompey the conduct of the Mithradatic war in Asia, and with it the entire control of Roman policy and interest in the East. The un-republican character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were supported, not only by the tribunes and the populace, but by the whole influence of the "publicani" and "negotiatores," whose interests in the East were at stake.

Pompey left Rome in 67, and did not return to Italy till toward the end of 62. The interval was marked in Rome by the rise to political importance of Cæsar and Cicero, and by Catiline's attempt at revolution.

The Catilinarian outbreak had been a blow to Cæsar, whose schemes it interrupted, but to Cicero it brought not only popularity and honor, but as he believed, the realization of his political ideal. The senate and the equestrian order, the nobles of Rome and the middle class in the country, had made common cause in the face of a common danger; and the danger had been averted by the vigorous action of a consul sprung from the people, under the guidance of a united senate, and backed by the mass of good citizens.

But Pompey was now on his way home, and again as in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment by the help of one political party or another of his immediate aims, which at present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousy of his personal rivals in the senate, aided by the versatility of Cæsar, who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Cæsar's return from his proprætorship in Spain, the coalition was formed which is known

by the somewhat misleading title of the first triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Cæsar's candidature for the consulship. The wealth and influence of Crassus were enlisted in the same cause, but what he was to receive in exchange is not clear. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. Pompey, whom he had hoped to enlist as the champion of constitutional government, had been driven into the arms of Cæsar. The union between the senate and the equestrian order had been dissolved, and the support of the publicani lost by an untimely quarrel over the price to be paid for collecting the taxes of Asia, and, to crown all, both his own personal safety and the authority of the senate were threatened by the openly avowed intentions of Catiline's friends to bring the consul of 63 to account for his unconstitutional execution of Catiline's accomplices. His fears were fully justified by the results. The year 59 saw the republic powerless in the hands of three citizens. Cæsar as consul procured the ratification of Pompey's acts in Asia, conciliated the publicani by granting them the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury, and for the assignment of the rich "ager Campanus." But Cæsar aimed at more than the carrying of an agrarian law in the teeth of the senate or any party victory in the forum. An important military command was essential to him, and he judged correctly enough that in the West there was work to be done which might enable him to win a position such as Pompey had achieved in the East. An obedient tribune was found, and by the *lex Vatinia* he was given for five years the command of Cisalpine Gaul and Illyricum, to which was added by a decree of the senate Transalpine Gaul also. It was a command which not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

P. Clodius as tribune brought forward a law enacting that any one who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero finding himself deserted even by Pompey left Rome in a panic, and by a second Clodian law he was declared to be outlawed. With Cæsar away in his province, and Cicero banished, Clodius was for the time master in Rome. But, absolute as he was in the streets, and recklessly as he parodied the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius' violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in August, 57, in the *comitia centuriata*, to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support and by the salutary effects of Clodius' excesses, Cicero's hopes rose high, and a return to the days of 63 seemed not impossible. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful party in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Cæsar became alarmed at the reports which reached him that the repeal of his

agrarian law was threatened and that the feeling against the coalition was growing in strength; above all he was anxious for a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca (56) the alliance of the three self-constituted rulers of Rome was renewed. Cicero succumbed to the inevitable and withdrew in despair from public life. Pompey and Crassus became consuls for 55. Cæsar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spains and Africa, and Crassus Syria. The coalition now divided between them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In 53 Crassus was defeated and slain by the Parthians at Carrhæ, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Cæsar. The year 54 brought with it a renewal of the riotous anarchy which had disgraced Rome in 58–57. Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy. His provinces were left to his legates, and he himself remained at home to maintain order by the weight of his influence. It was a confession that the republic could not stand alone. But Pompey's mere presence proved insufficient. The anarchy and confusion grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order. At last in 52 he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The rôle of "savior of society" thus thrust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate, and in the senate there was a powerful party who were resolved to force him into heading the attack they could not successfully make without him upon Cæsar. It was known that the latter, whose command expired in March, 49, but who in the ordinary course of things would not have been replaced by his successor until January, 48, was anxious to be allowed to stand for his second consulship in the autumn of 49 without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end at the legal time, and so obliging him to disband his troops and stand for the consulship as a private person, or, if he kept his command, on preventing his standing for the consulship. Through 51 and 50 the discussions in the senate and the negotiations with Cæsar continued, but with no result. On January 1, 49, Cæsar made a last offer of compromise. The senate replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate house, and the magistrates with Pompey were authorized to take measures to protect the republic. Cæsar hesitated no longer; he crossed the Rubicon and invaded Italy. The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Cæsar entered Rome as the master of Italy. The story of the civil war which followed, down to the victory at Munda in the spring of 45, has been told elsewhere. We are concerned here with the work which Cæsar achieved in the brief intervals of rest allowed him during these stormy years, and with the place which his dictatorship holds in the history of Rome.

The task which Cæsar had to perform was no easy

one. It came upon him suddenly; for there is no sufficient reason to believe that Cæsar had long premeditated revolution, or that he had previously aspired to anything more than such a position as that which Pompey had already won, a position unrepugnant indeed, but accepted by republicans as inevitable. War was forced upon him as the alternative to political suicide, but success in war brought the responsibilities of nearly absolute power, and Cæsar's genius must be held to have shown itself in the masterly fashion in which he grasped the situation, rather than in the supposed sagacity with which he is said to have foreseen and prepared for it. In so far as he failed, his failure was mainly due to the fact that his tenure of power was too short for the work which he was required to perform. From the very first moment when Pompey's ignominious retreat left him master of Italy, he made it clear that he was neither a second Sulla nor even the reckless anarchist which many believed him to be. The Roman and Italian public were first startled by the masterly rapidity and energy of his movements, and then agreeably surprised by his lenity and moderation. No proscriptions or confiscations followed his victories, and all his acts evinced an unmistakable desire to effect a sober and reasonable settlement of the pressing questions of the hour; of this, and of his almost superhuman energy, the long list of measures he carried out or planned is sufficient proof. The "children of the proscribed" were at length restored to their rights, and with them many of the refugees who had found shelter in Cæsar's camp during the two or three years immediately preceding the war; but the extreme men among his supporters soon realized that their hopes of "novae tabulae" and grants of land were illusory. In allotting lands to his veterans, Cæsar carefully avoided any disturbance of existing owners and occupiers, and the mode in which he dealt with the economic crisis produced by the war seems to have satisfied all reasonable men. It had been a common charge against Cæsar in former days that he paid excessive court to the populace of Rome, and now that he was master he still dazzled and delighted them by the splendor of the spectacles he provided, and by the liberality of his largesses. But he was no indiscriminate flatterer of the mob. The popular clubs and guilds which had helped to organize the anarchy of the last few years were dissolved. A strict inquiry was made into the distribution of the monthly doles of corn, and the number of recipients was reduced by one-half; finally, the position of the courts of justice was raised by the abolition of the popular element among the judges.

Nor are we without some clue as to the policy which Cæsar had sketched out for himself in the administration of the empire, the government of which he had centralized in his own hands. The much-needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands, but our authorities agree in attributing to him the design of extending the rule of Rome to its natural geographical limits—to the Euphrates and the Caucasus on the east, to the Danube and the Rhine or possibly the Elbe on the north, and to the ocean on the west. Within the frontiers he anticipated Augustus in lightening the financial burdens of the provincials, and in establishing a stricter control over the provincial governors, while he went beyond him in his desire to consolidate the empire by extending the Roman franchise and admitting provincials to a share in the government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces.

On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Cæsar fell a victim to the wounded pride of the republican nobles; and between the day of his death (March 15, 44), and that on which Octavian defeated Antony at Actium (September 2, 31), lies a dreary period of anarchy and bloodshed.

For a moment, in spite of the menacing attitude of Cæsar's self-constituted representative Antony, it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate, house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of seventeen legions. Toward the end of October Antony and his ally Lepidus coalesced with the young Octavian, who had been recently elected consul at the age of twenty, in spite of senatorial opposition; and the coalition was legalized by the creation of the extraordinary commission for the "reorganization of the commonwealth" known as the "second triumvirate." It was appointed for a period of five years, and was continued in 37 for five years more. The rule of the triumvirs was inaugurated in the Sullan fashion, and in marked contrast to the lenity shown by Cæsar, by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of Brutus and Cassius at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundisium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. For the next twelve years, while Antony was indulging in dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of oriental magnificence, Octavian was patiently consolidating his power. Of his only two rivals, Lepidus, his fellow triumvir, was in 36 ejected from Africa and banished to Circeii, while Sextus Pompeius, who had since his defeat at Munda maintained a semi-piratical ascendancy in the western Mediterranean, was decisively defeated in the same year, and his death in 35 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony inflicted one more outrage upon Roman feeling, and openly challenged the hostility of Octavian by divorcing Octavia in favor of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the Eastern world. By a decree of the senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. On September 2, 31, was fought the battle of Actium. Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the Eastern provinces submitted in 29. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy by closing the temple of Janus; at the end of the next year he formally laid down the extraordinary powers he had held since 43, and a regular government was established.

### *The Empire.*

PERIOD I.: THE PRINCIPATE, 27 B.C.—284 A.D.—  
(a) *The Constitution of the Principate.*—The conqueror

of Antony at Actium, the great-nephew and heir of the dictator Cæsar, was now summoned, by the general consent of a world wearied out with twenty years of war and anarchy, to the task of establishing a government which should as far as possible respect the forms and traditions of the republic, without sacrificing that centralization of authority which experience had shown to be necessary for the integrity and stability of the empire. It was a task for which Octavian was admirably fitted. To great administrative capacity and a quiet tenacity of purpose he united deliberate caution and unflinching tact; while his bourgeois birth and genuinely Italian sympathies enabled him to win the confidence of the Roman community to an extent impossible for Cæsar, with his dazzling preëminence of patrician descent, his daring disregard of forms, and his cosmopolitan tastes.

The new system which was formally inaugurated by Octavian in 28–27 B.C. assumed the shape of a restoration of the republic under the leadership of a "princeps." Octavian voluntarily resigned the extraordinary powers which he held since 43, and, to quote his own words, "handed over the republic to the control of the senate and people of Rome." The old constitutional machinery was once more set in motion; the senate, assembly, and magistrates resumed their functions; and Octavian himself was hailed as the "restorer of the commonwealth and the champion of freedom." It was not so easy to determine what relation he himself, the actual master of the Roman world, should occupy toward this revived republic. His abdication, in any real sense of the word, would have simply thrown everything back into confusion. The interests of peace and order required that he should retain at least the substantial part of his authority; and this object was in fact accomplished, and the rule of the emperors founded, in a manner which has no parallel in history. Any revival of the kingly title was out of the question, and Octavian himself expressly refused the dictatorship. Nor was any new office created or any new official title invented for his benefit. But by senate and people he was invested according to the old constitutional forms with certain powers, as many citizens had been before him, and so took his place among the lawfully appointed magistrates of the republic;—only, to mark his preëminent dignity, as the first of them all, the senate decreed that he should take as an additional cognomen that of "Augustus," while in common parlance he was henceforth styled "princeps," a simple title of courtesy, familiar to republican usage, and conveying no other idea than that of a recognized primacy and precedence over his fellow citizens. The ideal sketched by Cicero in *De Republica*, of a constitutional president of a free republic, was apparently realized; but it was only in appearance. For in fact the special prerogatives conferred upon Octavian gave him back in substance the autocratic authority he had resigned, and as between the restored republic and its new princeps the balance of power was overwhelmingly on the side of the latter.

On the accession of Augustus, there could be little doubt as to the nature of the work that was necessary, if peace and prosperity were to be secured for the Roman world. He was called upon to justify his position by rectifying the frontiers and strengthening the frontier defenses, by reforming the system of provincial government, and by reorganizing the finance; and his success in dealing with these three difficult problems is sufficiently proved by the prosperous condition of the empire for a century and a half after his death.

For a century and a half the policy initiated by Augustus secured the peace and prosperity of the empire; of the emperors who ruled during that period the

majority were able and vigorous administrators, and even the follies and excesses of Gaius, Claudius, and Nero did little harm beyond the limits of Rome and Italy. The firm rule of Vespasian repaired the damages inflicted by the wars of the rival emperors after Nero's death, and the abilities of Trajan, Hadrian, and the Antonines, if they failed to revive the flagging energies of the empire, at least secured tranquillity and good government. But few additions of importance were made to the territories of Rome. In Britain the work begun by Cæsar was taken up by Claudius, under whom the southern part of the island was constituted a province; the northern districts were subdued by Agricola (78-84 A.D.), and the limits of the province northward were finally fixed by the Wall of Hadrian (see BRITANNIA). The conquest of Dacia by Trajan (107) was provoked by the threatening attitude of the barbarian tribes on the lower Danube, and, though it remained part of the empire down to 256, its exposed position as lying beyond the Danube frontier rendered it always a source of weakness rather than strength. To Trajan's reign also belongs the annexation of Arabia Petræa. Otherwise on the frontier there was little change. In the north the revolt of Civilis (69-70 A.D.) owed its temporary success mainly to the confusion created by the rivalries of Otho, Vitellius, and Vespasian. The connection of the Rhine with the Danube frontier by a continuous wall, a work gradually carried out under the Flavian and Antonine emperors, was a strategical necessity, and involved no general advance of the Roman lines. On the Rhine itself the peaceful state of affairs is sufficiently proved by the reduction of the force stationed there from eight legions to four; and it was only on the Danube that there was any pressure severe enough to strain the strength of the Roman defense. The presence of Trajan himself was required to quell the Dacians under their able king Decebalus, and, though his campaigns were followed by sixty years of peace, a force of ten legions was considered necessary to guard the Danubian frontier. Far more serious was the irruption of the Marcomanni and other tribes in the reign of Marcus Aurelius (162-175). The tide of barbaric invasion which then swept across the upper Danube and over the provinces of Rhætia, Noricum, and Pannonia, till it touched the Alps and the soil of Italy, was indeed driven back after fourteen years of war, but it first revealed to the Roman world the strength of the forces which were gathered unnoticed in the distant regions beyond the limits of the "Roman peace." In the East Rome and Parthia still faced each other upon the banks of the Euphrates, and contended, now by arms now by diplomacy, for supremacy in the debatable land of Armenia. Trajan's momentary acquisitions were abandoned by Hadrian, and on this side of the empire the first changes of importance on the frontier belong to the reign of Septimius Severus. Within the frontiers the leveling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client states had one by one been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain, and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity in the form of the local constitutions, framed and granted as they all were by imperial edict. Throughout the empire

again the extension of the Roman franchise was preparing the way for the final act by which Caracalla assimilated the legal status of all free-born inhabitants of the empire, and in the west and north this was preceded and accompanied by the complete Romanizing of the people in language and civilization. Moreover, the empire, that was thus becoming one in its administrative system, its laws, and its civilization, had as yet continued to enjoy peace and order. The burdens of military service fell on the frontier provinces, and only the echoes of the border wars reached the Mediterranean territories. Yet, in spite of the internal tranquillity and the good government which have made the age of the Antonines famous, we can detect signs of weakness. Though the evils of excessive centralization were hardly felt while the central authority was wielded by vigorous rulers, yet even under Trajan, Hadrian, and the Antonines, we notice a failure of strength in the empire as a whole, and a corresponding increase of pressure on the imperial government itself. The reforms of Augustus had given free play to powers still fresh and vigorous. The ceaseless labors of Hadrian were directed mainly to the careful husbanding of such strength as still remained, or to attempts at reviving it by the sheer force of imperial authority. Among the symptoms of incipient decline which not the most heroic efforts of the government could entirely remove were the growing depopulation, especially of the central district of the empire, the constant financial difficulties, the deterioration in character of the local governments in the provincial communities, and the increasing reluctance exhibited by all classes to undertake the now onerous burden of municipal office. Lastly, the irruption of Marcomanni, and the revolt of Avidius Cassius (174-175) in the Eastern provinces, anticipated the two most serious of the dangers which ultimately proved fatal to the empire.

Marcus Aurelius died in 180, and his death was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors, such as Septimius Severus, Decius, Claudius, Aurelian, and Probus saved the empire from dissolution. The want of any legal security for the orderly transmission of the imperial power had been partially supplied during the second century by the practice of adoption. But throughout the third century the Roman world witnessed a series of desperate conflicts between rival generals put forward by their respective legions as claimants for the imperial purple. Between the death of Severus, in 211, and the accession of Diocletian, in 284, no fewer than twenty-three emperors sat in the seat of Augustus, and of these all but three died violent deaths at the hands of a mutinous soldiery, or by the orders of a successful rival. Of the remaining three, Decius fell in battle against the Goths, Valerian died a prisoner in the far East, and Claudius was among the victims of the chronic pestilence which added to the miseries of the time. The "tyrants," as the unsuccessful pretenders to the imperial purple were styled, reappear with almost unvarying regularity in each reign. The claims of Septimius Severus himself, the first and ablest of the soldier emperors, were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East, and at the bloody battle of Lugdunum and the sack of Byzantium rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. In 237-38 six emperors perished in the course of a few months. It was, however, during the reign of Gallienus (260-68) that the evil reached its height. The central authority was paralyzed; the barbarians were pouring in from the North; the Parthians were threatening to overrun the eastern provinces; and the legions on

the frontiers were left to repel the enemies of Rome as best they could.

Gallienus was murdered at Milan in 268, and the remaining sixteen years of this period were marked by the restoration of unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome by Aurelian in 273; the next year the Gallic empire came to an end by the surrender of Tetricus, and the successors of Aurelian—Tacitus, Probus, and Carus (265–282) were at last rulers over the whole extent of the empire. While rival generals were contending for the imperial purple, the very existence of the empire which they aspired to rule was imperiled by foreign invasion. As early as 236 a new enemy, the Alemanni, had crossed the Rhine; but had been driven back by the valor of Maximinus (238), and in the same year the Goths first appeared on the banks of the Danube.

At the close of the second century the growing weakness of Parthia seemed to promise an immunity from danger on the eastern frontier. But with the revolution which placed the Sassanidæ upon the throne the whole situation was changed. Although any serious loss of territory had been avoided, the storms of the third century had told with fatal effect upon the general condition of the empire.

PERIOD II. 284–476 A.D.—(a) *From the Accession of Diocletian to the Death of Theodosius (284–365 A.D.)*.—The work begun by Aurelian and Probus, that of fortifying the empire alike against internal sedition and foreign invasion, was completed by Diocletian and Constantine the Great, whose system of government, novel as it appears at first sight, was in reality the natural and inevitable outcome of the history of the previous century. Its object was twofold, to give increased stability to the imperial authority itself, and to organize an efficient administrative machinery throughout the empire. In the second year of his reign Diocletian associated Maximian with himself as colleague, and six years later (292) the hands of the two “Augusti” were further strengthened by the proclamation of Constantius and Galerius as “Caesares.”

Diocletian and Maximian formally abdicated their high office in 305. Eighteen years later Constantine, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of fourteen years was marked by two events of first-rate importance—the recognition of Christianity as the religion of the empire, and the building of the new capital at Byzantium. The alliance which Constantine inaugurated between the Christian church and the imperial government, while it enlisted on the side of the state one of the most powerful of the new forces with which it had to reckon, imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new “City of Constantine” as a second Rome, with a second senate, a prefect of the city, regiones, and even largesses, did more than proclaim once again the deposition of Rome from her old imperial position. It paved the way for the final separation of East and West by providing the former for the first time with a suitable seat of government on the Bosphorus. The death of Constantine in 337 was followed, as the abdication of Diocletian had been, by the outbreak of quarrels among rival Cæsars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterward, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine’s only surviving son Constantius. Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in

355 Constantius reluctantly granted the title of Cæsar to his cousin Julian and placed him in charge of Gaul, where the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alemanni, had excited alarm. But Julian’s successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused, and when the order was repeated replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. The chief importance of the career of Julian, both as Cæsar in Gaul from 355 to 361 and during his brief tenure of sole power (361–363), lies, so far as the general history of the empire is concerned, in his able defense of the Rhine frontier and in his Persian campaign; for his attempted restoration of pagan and in especial of Hellenic worship had no more permanent effect than the war which he courageously waged against the multitudinous abuses which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the barbarian advance across the Rhine, and postponed the loss of the Western provinces, while, on the contrary, his campaign in Persia, brilliantly successful at first, resulted in his own death, and in the immediate surrender by his successor Jovian of the territories beyond the Tigris won by Diocletian seventy years before. Julian died on June 26, 363, his successor Jovian on February 17, 364; and on February 26th Valentinian was acknowledged as emperor by the army at Nicæa. In obedience to the expressed wish of the soldiers that he should associate a colleague with himself, he conferred the title of Augustus upon his brother Valens, and the long-impending division of the empire was at last effected—Valentinian became emperor of the West, Valens of the East. From 364 till his death in 375 the vigor and ability of Valentinian kept his own frontier of the Rhine tolerably intact, and prevented any serious disasters on the Danube. But his death, which deprived the weaker Valens of a trusted counselor and ally, was followed by a crisis on the Danube, more serious than any which had occurred there since the defeat of Decius. In 376 the Goths, hard pressed by their new foes from the eastward, the Huns, sought and obtained the protection of the Roman empire. They were transported across the Danube and settled in Mœsia, but, indignant at the treatment they received, they rose in arms against their protectors. In 378 at Hadrianople Valens was defeated and killed; the victorious Goths spread with fire and sword over Illyricum, and advanced eastward to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining years of Theodosius’ reign (382–395) were mainly engrossed by the duty which now devolved upon the emperor of the East of upholding the increasingly feeble authority of his colleagues in the West against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Cæsar, and left in undisturbed command of Gaul, Spain, and Britain; but, when in 386 he proceeded to oust Valentinian II. from Italy and Africa, Theodosius marched westward, crushed him, and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the per-

son of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westward, and near Aquileia decisively defeated his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(b) *From the Death of Theodosius to the Extinction of the Western Empire* (395-476).—Through more than a century from the accession of Diocletian the Roman empire had succeeded in holding at bay the swarming hordes of barbarians. But, though no province had yet been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized.

It was by barbarians already settled within the empire that the first of the series of attacks which finally separated the Western provinces from the empire and set up a barbaric ruler in Italy were made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders, and the emperors both of East and West their most capable and powerful ministers. The Visigoths whom Alaric led into Italy had been settled south of the Danube as the allies of the empire since the accession of Theodosius. The greater part of them were Christians at least in name, and Alaric himself had stood high in the favor of Theodosius. The causes which set them in motion are tolerably clear. Like the Germans of the days of Cæsar, they wanted land for their own, and to this land-hunger was evidently added in Alaric's own case the ambition of raising himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantinople. Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suevi, and Alani was in a similar manner recognized and approved by the paramount authority of the emperor of the West.

Honorius died in 423. His authority had survived the dangers to which it had been exposed alike from the rivalry of tyrants and barbaric invasion, and with the single exception of Britain no province had yet formally broken loose from the empire. But over a great part of the West this authority was now little more than nominal.

The long reign of Valentinian III. (423-455) is marked by two events of first-rate importance—the conquest of Africa by the Vandals and the invasion of Gaul and Italy by Attila. Carthage was taken in 439, and by 440 the Vandal kingdom was firmly established.

Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe, and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe, and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal; and, in

marked contrast to the Gothic and Vandal chieftains, he treated with the emperors of East and West as an independent sovereign. His advance on Gaul and Italy threatened, not the establishment of yet one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbarous conqueror. But Rome now reaped the advantages of the policy which Honorius had perhaps involuntarily followed. The Visigoths in Gaul, Christian and already half Romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons by Aetius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (453) the western branch of the house of Theodosius came to an end, and the next twenty years witnessed the accession and deposition of nine emperors. The three months' rule of Maximus is memorable only for the invasion of Italy and the sack of Rome by the Vandals under Gaiseric. From 456-472 the actual ruler of Italy was Ricimer, the Sueve. Of the four emperors whom he placed on the throne, Majorian (457-461) alone played any imperial part outside Italy. Ricimer died in 472, and two years later a Pannonian, Orestes, aspired to fill the place which Ricimer had occupied. Julius Nepos was deposed, and Orestes filled the vacancy by proclaiming as Augustus his own son Romulus. But Orestes' tenure of power was brief. The barbarian mercenaries in Italy determined to secure for themselves a position there such as that which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odoacer the Rugian, king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West.

#### HISTORY OF THE ROMAN REPUBLIC IN THE MIDDLE AGES.

The history of the Roman republic during the Middle Ages has yet to be written, and only by the discovery of new documents can the difficulties of the task be completely overcome.

The removal of the seat of the empire to Constantinople effected a radical change in the political situation of Rome; nor was this change neutralized by the formation of the weak Western empire soon to be shattered by the Germanic invasions. But we still find Roman laws and institutions; and no sign is yet manifest of the rise of a mediæval municipality. The earliest germ of one is seen during the barbarian invasions. Of these we need only enumerate the four most important—those of the Goths, Byzantines, Lombards, and Franks.

The wars of Belisarius and Narses against the Goths lasted twenty years (535-555 A.D.), caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was now ruled by a Greek patrician, afterward entitled the exarch, who had his seat of government at Ravenna as lieutenant of the empire.

The new organization outwardly resembled that of the Goths; one army had been replaced by another, the counts by dukes; there was an exarch instead of a king; the civil and military jurisdictions were more exactly defined. But the army was not, like that of the Goths, a conquering nation in arms; it was a Græco-Roman army, and did not hold a third of the territory which was now probably added to the possessions of the state. The soldiery took its pay from Constantinople, whence all instructions and appointments of superior officers

likewise emanated. In Rome we find a *magister militum* at the head of the troops. The Roman senate still existed, but was reduced to a shadow.

All Roman institutions were altered and decayed; but their original features were still to be traced, and no heterogeneous element had been introduced into them. A special state of things now arose in Rome. We behold the rapid growth of the papal power and the continual increase of its moral and political influence. This had already begun under Leo I., and been further promoted by the pragmatic sanction. Not only the superintendence but often the nomination of public functionaries and judges was now in the hands of the popes. And the accession to St. Peter's chair of a man of real genius in the person of Gregory I., surnamed the Great, marked the commencement of a new era. By force of individual character, as well as by historic necessity, this pope became the most potent personage in Rome. Power fell naturally into his hands; he was the true representative of the city, the born defender of church and state. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in Southern Italy.

It was at this moment that the new Roman commune began to take shape and acquire increasing vigor owing to its distance from the seat of the empire and its resistance to the Lombard besiegers. Its special character was now to be traced in the preponderance of the military over the civil power. A Roman element had penetrated into the army, which was already possessed of considerable political importance. The prefect of Rome loses authority and seems almost a nullity compared with the *magister militum*. Hardly anything is heard of the senate. The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. But they avoid an absolute rupture with the empire, lest they should have to face the Lombard power without any prospect of help. Later, when the growing strength of the commune becomes menacing, they remain faithful to the empire in order not to be at the mercy of the people. It was a permanent feature of their policy never to allow the complete independence of the city until they should be its sole and absolute masters. But that time was still in the future. Meanwhile, pope and people joined in the defense of their common interests.

In the midst of these warlike tumults a new constitution, almost a new state, was being set up in Rome. During the conflict with Philippicus, the Monothelite and heretical emperor who ascended the throne in 711, the *Liber Pontificalis* makes the first mention of the duchy of Rome (*ducatu Romanæ urbis*), and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman empire. But, partly through the weakness of the government of Constantinople, and above all through the decomposition of the Italian provinces under the Lombards, who destroyed all unity of government in the peninsula, this dukedom was widely extended, and its limits were always changing in accordance with the course of events.

The constitution of the city now begins to show the results of the conditions amid which it took shape. The separation of the civil from the military power has entirely disappeared.

At that time the inhabitants of Rome were divided into four principal classes—clergy, nobles, soldiers, and simple citizens. The nobles were divided into two categories, first the genuine *optimates*, *i.e.*, members of old and wealthy families with large estates, and filling high, and often hereditary, offices in the state, the church, and

the army. These were styled *proceres* and *primates*. The second category comprised landed proprietors, of moderate means but exalted position, mentioned as *nobiles* by Gregory I., and constituting in fact a numerous petty nobility and the bulk of the army. Next followed the citizens, *i.e.*, the commercial class, merchants, and craftsmen, who, having as yet no fixed organization and but little influence, were simply designated as *honesti cives*. These, however, were quite distinct from the plebeians, *plebs*, *vulgus populi*, *viri humiles*, who in their turn ranked above bondsmen and slaves.

We now come to a question of weightier import for all desiring to form a clear idea of the Roman government at that period. What had become of the senate? It had undoubtedly lost its original character now that the empire was extinct. But, after much learned discussion, historical authorities are still divided upon the subject. Certain Italian writers of the eighteenth century—Vendettini, for example—asserted with scanty critical insight that the Roman senate did not disappear in the Middle Ages. The same opinion backed by much learned research was maintained by the great German historian Savigny. And Leo, while denying the persistence of the curia in Lombard Italy; adhered to Savigny's views as regarded Rome. Papencordt did the same, but held the Roman senate to be no more than a curia. This judgment was vigorously contested, first by Hegel and Giesebrecht, then by Gregorovius. These writers believe that after the middle of the sixth century, the senate had a merely nominal existence. According to Gregorovius its last appearance was in the year 579. After that date it is mentioned in no documents, and the chroniclers are either equally silent or merely allude to its decay and extinction.

During this period the Roman constitution was very simple. The duke, commanding the army, and the prefect, presiding over the criminal court, were the chiefs of the republic; the armed nobility constituted the forces, filled all superior offices, and occasionally met in a council called the senate, though it had no resemblance to the senate of older times. In moments of emergency a general parliament of the people was convoked. The constitution differed little from that of the other Italian communes, where, in the same way, we find all the leading citizens under arms, a parliament, a council, and one or more chiefs at the head of the government.

But Rome had an element that was lacking elsewhere. We have already noted that, in the provinces, the administrators of church lands were important personages, and exercised during the Middle Ages, when there was no exact division of power, both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome, should have a still higher standing, and in fact, from the sixth century, their power increased to such an extent that in the times of the Franks they already formed a species of papal cabinet, with a share and sometimes a predominance in the affairs of the republic. Thus Rome had two tribunals, that of the *judices de clero*, or *ordinarii*, presided over by the pope, and that of the *judices de militia*, leaders of the army, dukes, and tribunes, also bearing the generic title of consuls. First appointed by the exarch and frequently by the pope, these decided both civil and criminal cases. In the latter they were sole judges under the presidency of the prefect.

The pope was thus at the head of a large administrative body with judicial and civil powers that were continually on the increase, and, in addition to his moral authority over Christendom, was possessed of enormous revenues. So in course of time he considered himself the real representative of the Roman republic.

Stephen II. had appealed to Pippin the leader of the Franks, for aid, and Pippin had responded, the pope conferring on him in reward the title *patricius Romanorum* and crowning him king of the Franks.

The position of Rome and of the pope is now substantially changed. Duke, prefect, militia, and the people exist as heretofore, but are all subordinate to the head of the church, who, by the donations of Pippin and Charlemagne, has been converted into a powerful temporal sovereign. Henceforth all connection with Byzantium is broken off, but Rome is still the main-spring of the empire, the Roman duchy its sole surviving fragment in Italy, and the pope stands before the world as representative of both.

Leo III. (796-816) further strengthened the ties between Charlemagne and the church by sending the former a letter with the keys of the shrine of St. Peter and the banner of Rome. Charlemagne had already joined to his office of patrician the function of high justice. The new symbols now sent constituted him *miles* of Rome and general of the church. The pope urged him to dispatch an envoy to receive the oath of fealty, thus placing himself, the representative of the republic, in the subordinate position of one of the bishops who had received the immunities of counts. And all these arrangements took place without the slightest reference to the senate, the army, or the people. And finally on Christmas day, in St. Peter's, before an assemblage of Roman and Frankish lords, clergy, and the people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor.

Thus the new emperor was elected by the Romans and consecrated by the pope. But he was their real master and supreme judge. The pope existed only by his will, since he alone supplied the means for the maintenance of the temporal power, and already pretended to the right of controlling the papal elections.

The death of Charlemagne in 814 was the signal for a fresh conspiracy of the nobles against the pope, who, discovering their design, instantly put the ringleaders to death, and was severely blamed by Louis for this violation of the imperial prerogative. While the matter was under discussion the nobles broke out in fiercer tumults, both in Rome and the Campagna. At last, in 824, the emperor Lothair came to re-establish order in Rome, and proclaimed a new and noteworthy constitution, to which Pope Eugenius II. (824-27) gave his oath of adherence. By this the partnership of pope and emperor in the temporal rule of Rome and the states of the church was again confirmed. When, no longer sustained by the genius of its founder, the Frankish empire began to show signs of dissolution, the popes, finding their power thereby strengthened, began to assume many of the imperial attributes. Soon, however, as a natural consequence of the loss of the main support of the papacy, the nobles regained vigor and were once more masters of the city. Teutonic and feudal elements had now largely penetrated into their organization. The system of granting lands, and even churches and convents, as benefices according to feudal forms, became more and more general. It was vain for the popes to offer opposition, and they ended by yielding to the current. The fall of the Frankish empire left all Italy a prey to anarchy, and torn by the faction fights of Berengar of Friuli and Guido of Spoleto, the rival claimants to the crowns of Italy and the empire. The Saracens were advancing from the south, the Huns from the north; the popes had lost all power; and in the midst of this frightful chaos a way was opened for the rise of the republics. Anarchy was at its climax in Rome, but the laity began to overpower the clergy to such an extent that the *judices de militia* prevailed over

the *judices de clero*. For a long time no imperial missi or legates had been seen, and the papacy was incredibly lowered. The election of the popes had positively fallen into the hands of certain beautiful women notorious for their evil life and depravity. The aristocracy alone gained strength; now freed from the domination of the emperor, it continually wrested fresh privileges from the impotent pontiffs, and became organized as the ruling force of the republic. Gregorovius, notwithstanding his denial of the continuation of the senate after the sixth century, is obliged to acknowledge that it appeared to have returned to life in the power of this new baronage. And, although this body was now permeated with the feudal principle, it did not discard its ancient traditions. The nobles claimed to be the main source of the empire; they wished to regain the dignity and office of patricius, and to make it, if possible, hereditary in their families. Nothing is known of their system of organization, but it seems that they elected a chief bearing the title of *consul, senator, princeps Romanorum*, who was officially recognized by the pope, as a patricius presided over the tribunals, and was the head of the commune.

Theophylact was one of the first to assume this dignity. His wife Theodora, known as the *senatrix*, was one of the women then dominating Rome by force of their charms and licentiousness. She was supposed to be the concubine of Pope John X. (914-928), whose election was due to her influence. Her daughter Marozia, in all things her worthy rival, was married to Alberic, a foreign mercenary of uncertain birth who rose to a position of great influence, and, although an alien, played a leading part in the affairs of the city. He helped to increase the power of Theophylact, who seemingly shared the rule of the city with the pope. In the bloody war that had to be waged against the Saracens of southern Italy, and at the defeat of the latter on the Garigliano (916), Theophylact and Alberic were the Roman leaders, and distinguished themselves by their valor. They disappeared from the scene after this victory, but Marozia retained her power, and bore a son Alberic, who was destined to greater deeds. The pope found himself caught in this woman's toils, and struggled to escape, but Marozia, gaining fresh influence by her marriage with Hugo, margrave of Tuscany, imprisoned the pontiff himself in Castle St. Angelo (928). This fortress was the property of Marozia and the basis of her strength. The unfortunate John died within its walls. Raised to the chair by Theodora, he was deposed and killed by her daughter. The authority of the latter reached its culminating point in 931, when she succeeded in placing her son John XI. on the papal throne. On the death of her second husband she espoused Hugo of Provence, the same who in 928 had seized the iron crown at Pavia, and now aspired to the empire. Dissolute, ambitious, and despotic, he came to Rome in 932, and leaving his army outside the walls, entered Castle St. Angelo with his knights, instantly began to play the tyrant, and gave a blow to Alberic, his stepson, who detested him as a foreign intruder. This blow proved the cause of a memorable revolution; for Alberic rushed from the castle and harangued the people, crying that the time was come to shake off the tyrannous yoke of a woman and of barbarians who were once the slaves of Rome. Then, putting himself at the head of the populace, he closed the city's gates to prevent Hugo's troops from coming to the rescue, and attacked the castle. The king fled; Marozia was imprisoned, Alberic proclaimed lord of the Romans, and the pope confined to the Lateran in the custody of his own brother. Rome was again an independent state, a

republic of nobles. Rid of the temporal dominion of emperor and pope, and having expelled the foreigners with great energy and courage, it chose Alberic for its chief with the title of *princeps atque omnium Romanorum senator*.

In 933 Hugo made his first attack upon the city, and was repulsed. A second attempt in 936 proved still more unfortunate, for his army was decimated by a pestilence. Thoroughly disheartened, he not only made peace, but gave his daughter in marriage to Alberic, thus satisfying the latter's desire to ally himself with a royal house. But this union led to no conciliation with Hugo. For Alberic, finding his power increased, marched at the head of his troops to consolidate his rule in the Campagna and the Sabine land. On the death of his brother, Pope John XI., in 936, he controlled the election of several successive popes, quelled a conspiracy formed against him by the clergy and certain nobles instigated by Hugo, and brilliantly repulsed, in 941, another attack by that potentate. At last, however, this inveterate foe withdrew from Rome, being summoned to the north by the victories of his rival, Berengarius. But Alberic, after procuring the election of various popes who were docile instruments of his will, experienced a check when Agapetus II. (946-955), a man of firmness and resource, was raised to the papal throne. The fortunes of Berengarius were now in the ascendant. In 950 he had seized the iron crown, and ruled in the Pentapolis and the exarchate. This being singularly painful to the pope, he proceeded to make alliance with all those enemies of Berengarius preferring a distant emperor to a neighboring and effective sovereign, with the Roman nobles who were discontented with Alberic, and with all who foresaw danger, even to Rome, from the extended power of Berengarius. And Agapetus recurred to the old papal policy by making appeal to Otho I., whose rule in Germany was distinguished by a prestige almost comparable with that of Charlemagne.

Otho immediately responded to the appeal and descended into Italy; but his envoys were indignantly repulsed by Alberic, and, being prudent as well as firm, he decided to wait a more opportune moment for the accomplishment of his designs. Meanwhile Alberic died in 954, and the curtain fell on the first great drama of the Roman republic. The name of Octavian given by Alberic to his son leads to the inference that he meant to make his power hereditary. But, suddenly, he began to educate this son for the priesthood, and, assembling the nobles in St. Peter's shortly before his death, he made them swear to elect Octavian as pope on the decease of Agapetus II. They kept their word, for in this way they freed themselves from a ruler. Possibly Alberic trusted that both offices might be united, and that his son would be head of the state as well the church. But the nobles knew this to be a delusion, especially in the case of a nature such as Octavian's. The lad was sixteen years old when his father died, received princely honors until the death of Agapetus, and was then elected pope with the name of John XII. He desired to be both pope and prince, but utterly failed to be either. Before long, realizing the impossibility of holding in check Berengarius, who still ruled over the exarchate, he sought in 960 the aid of Otho I., and promised him the imperial crown. Thus the new ruler was summoned by the son of the man by whom he had been repulsed. Otho vowed to defend the church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on February 2, 962, with unheard-of pomp and display.

Accordingly, after being extinct for thirty-seven years,

the empire was revived under different but no less difficult conditions. Otho once more united the empire and the church, Italy and Germany. But the difficulties of the enterprise at once came to light. John XII., finding a master in the protector he had invoked, now joined the discontented nobles who were conspiring with Berengarius against the emperor. But the latter hastened to Rome in November, 963, assembled the clergy, nobles, and heads of the people, and made them take an oath never again to elect a pope without his consent and that of his son. He also convoked a synod presided over by himself in St. Peter's, which judged, condemned, and deposed Pope John and elected Leo VIII. (963-965), a Roman noble, in his stead. All this was done at the direct bidding of the emperor, who thus deprived the Romans of their most valued privilege, the right of choosing their own pope.

But, although the emperor thus disposed of the papacy at his will, his arbitrary exercise of power roused a long and obstinate resistance, which had no slight effect upon the history of the commune. Leo VIII. died in 965, and the imperial party elected John XIII. (965-972).

Pope John XIII. was succeeded by Benedict VI. (973-974) and Otho I. by his son Otho II., a youth of eighteen married to the Byzantine princess Theophano. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescenzo, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in Castle St. Angelo. The national and imperial parties then elected several popes who were either exiled or persecuted, and one of them was said to be murdered. In 985 John XV. was elected (985-996). During this turmoil, the national party, composed of nobles and people, led by Giovanni Crescenzo, son of the other Crescenzo mentioned above, had taken complete possession of the government. But the following year Otho III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescenzo held the castle valiantly against its besiegers. At last, on April 29, 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements. Gregory V. dying shortly after these events, Sylvester II., another German, was raised to the papacy (999-1003).

Thus Otho III. was enabled to establish his mastery of Rome.

By the emperor's death in January, 1002, the race of the Othos became extinct, the papacy began to decline, as at the end of the Carolingian period, and the nobles, divided into an imperial and a national party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own ranks, obtained enlarged privileges and power.

The new emperor, Henry II., endeavored to reestablish order in Rome, and strengthen his own authority together with that of the pope. But the nobles had in all things the upper hand. They were regularly organized under leaders, held meetings, asserted their right to nominate both pope and emperor, and in fact often succeeded in so doing. Even Henry II. himself was obliged to secure their votes before his coronation.

Meanwhile John XIX. was succeeded by his nephew, Benedict IX. (1033-45), a lad of twelve, who placed his own brother at the head of the republic. Thus church and state assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. But the vices and excesses of Benedict were so monstrous that the papacy sank to the lowest depth of corruption;

there followed a series of tumults and reactionary attempts, and so many conflicting elections that in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy.

Pope Paschal II. (1099-1118) found himself entirely at the mercy of the tyrannous nobles who were alike masters of Rome, of its government, and its spiritual lord. The nobles were so completely the masters that the pope, in spite of having trusted them with the government, could only return to Rome with the aid of the Normans. Being now absorbed in the great investiture question, he had recourse to a daring plan. He proposed to Henry V. that the bishops should resign all property derived from the crown and depend solely on tithes and donations, while the empire should resign the right of investiture. Henry seemed disposed to accept the suggestion, but, suddenly changing his mind, took the pope prisoner and forced him to yield the right of investiture and to give him the crown (1111).

The popes were now the sport of the nobles whom they had aggrandized by continual concessions for the sake of peace. And peace seemed at hand when Innocent II. (1130-43), after triumphing over two antipopes, came to terms with Roger I., recognized him as king of Sicily, and gained his friendship and protection. But now still graver tumults took place.

In 1143 the rebellious people rushed to the Capitol, proclaimed the republic, reconstituted the senate, to the almost entire exclusion of the nobles, declared the abolition of the temporal power, issued coin inscribed to the senate, the people, and St. Peter, and began to reckon time from the day of the restoration of liberty. Arnold of Brescia was not, as has been incorrectly stated, the author of this revolution, for he had not yet arrived in Rome. It was the outcome of an historic necessity—above all of the renewed vigor of the people and its detestation of the feudal aristocracy. The pope was requested to resign the temporal power, the regalia, and every other possession, and content himself with the tithes and offerings of the faithful according to the scheme of Paschal II. He indignantly refused, marched at the head of the nobles against the Capitol, but was violently repulsed, and received a blow on the head from a stone, which is supposed to have occasioned his speedy death on February 15, 1145. Eugenius III. was then elected (1145-53), but soon had to fly to Viterbo in quest of armed assistance, in consequence of the senate's resolve to forcibly prevent his consecration until he recognized the new state of things in the Eternal City.

It was at this moment that Arnold of Brescia arrived in Rome. His ideas, already well known in Italy, had inspired and promoted the Roman revolution, and he now came to determine its method and direction. He urged the reconstitution of the ancient senate and senatorial order, which indeed was already partially accomplished, and of the ancient equestrian order, and the reconstruction and fortification of the Capitol. His proposed senate was a body somewhat resembling communal councils of Upper Italy, his equestrian order a mounted force composed of the lesser nobility, since at Rome, as elsewhere, the lower classes had neither time nor means to form part of it. All his suggestions were accepted; the citizens labored strenuously on the fortification of the Capitol. The pope soon beheld the revolution spread beyond the walls, and several cities of the state proclaimed their independence. The barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the church was threatened with dissolution. The pope marched toward Rome with his newly gathered army,

but hoped to come to terms. The Romans, in fact, recognized his authority, and he in turn recognized the republic. The office of patrician was abolished, and seems to have been replaced by that of gonfalonier, and the prefect, answering to the podestà of the other republics, was revived. The senators received investiture from the pope, who returned to Rome at Christmas, 1145.

The republic now seems to have been fully constituted.

As was easily to be foreseen, the agreement with the pope was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, and now reëntered Italy, proclaimed Arnold a schismatic, and then advanced to Tusculum, assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen,

After long hesitation the king of the Romans at last replied to these appeals, stating that he would come "to reëstablish order, reward the faithful, and punish the rebellious." These words promised ill. In fact Conrad had already arranged terms with the pope; but his life came to an end on February 15, 1152.

He was succeeded by Frederick I., surnamed Barbarossa, who took no notice of the numerous letters urging him to come and receive the empire from the Roman people, which alone had the right of conferring it. In accordance with design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give no truce to the Romans, but subject them to their spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the people again rose to arms, and Arnold broke off all negotiations with Eugenius III. Finally, to increase the gravity of the situation, an English pope, Hadrian IV., was elected (1154-59), who was also a man of strong and resolute temper. In fact, even before being able to take possession of the Lateran, he requested the Romans to banish Arnold, who, with greater eloquence than ever, was directing his thunders against the papacy. These utterances increased the wrath of Hadrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had ventured to curse the Eternal City. The interdict put a summary stop to the religious life of the inhabitants. Men's minds were seized with a sudden terror, and a fierce tumult broke out. Thereupon the senators, whose opposition to the pope was less courageous than that of the fallen magnates, prostrated themselves at his feet and implored pardon. But Hadrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome. He was shortly afterward captured and hanged.

But the Romans who had so basely deserted their champion would not give up their republic. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. But Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on June 18, 1155, was forthwith crowned in St. Peter's by the pope. Hadrian IV. died in 1159, and the national party elected Alexander III. (1159-1181), who energetically opposed the pretensions of Frederick, but, having to struggle with three antipopes successively raised against him by the imperial party, was repeatedly driven into exile.

Meanwhile Pope Alexander continued the crafty policy of Hadrian and with better success, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on May 29, 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Hadrian. And by the treaty of Venice (August 1, 1177) the antipope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff, and the prefect of Rome again nominated by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical state, from Acquapendente to Beprano.

From all this it is clear that the church had been made independent of the empire, and that the republic, despite its numerous concessions, was by no means subject to the church. The pope, in fact, had obtained liberty of election, and Frederick I., by resigning the investiture of the prefect, had virtually renounced his claim to imperial power in Rome.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The former sought to dominate Italy, separate the state from the church, and repress the republics. The latter, although really hostile to the Roman free government, joined it against the emperor, who on his side favored the republic of Rome and the nobles most adverse to the pope.

The republic meanwhile preserved its independence against the pope, who, among other concessions, had entirely given up to it the right of coinage. Nevertheless, being much harassed by the factiousness of the nobility, it was obliged in 1252 to decide on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podestà. Accordingly a Bolognese noble, Brancaleone degli Andalò, count of Casalecchio, and a Ghibelline of much energy and talent, was invited to Rome. But before accepting office he insisted on making definite terms. He desired to hold the government for three years; and this, although contrary to the statutes, was granted. Further, to insure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the republic consented. Then, in August, 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and in war, supreme judge and captain in chief. He nominated the podestàs of subject territories, dispatched ambassadors, issued coin, concluded treaties, and received oaths of obedience. The pope, who was then at Perugia, was greatly afflicted by the arrival of this new master, but, despairing of aid from any quarter, was forced to make a virtue of necessity.

The death of Innocent IV. and the election of Alexander IV. (1254-61), who was milder and less shrewd than his predecessor, were favorable events for Brancaleone; but he failed to check the growing discontent of the clergy and the more powerful nobles, who had received deadly injuries at his hands. And when, on the expiration of his three years' term of office, his reelection was proposed, his enemies rose against him, accused him before the *sindacato*, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was only spared on account of the hostages sent to Bologna. The next senator chosen was a Brescian Gueff, Emanuele de Madio, a tool of the nobles, who were now masters of the situation. But soon afterward, in 1257, the guilds rose in revolt, drove the nobles from power, put the pope to

flight, and recalled Brancaleone for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the thunders of the church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancaleone next set to work to destroy the fortified towers of the nobility, and in razing them to the ground ruined many of the adjacent dwellings. Accordingly, a considerable number of nobles became homeless exiles. In 1258, while engaged on the siege of Corneto, Brancaleone was attacked by a violent fever, and, being carried back to Rome, died on the Capitoline Hill. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalò, who, lacking the political genius of his nephew, only retained office until the following spring (1259), in the midst of fierce and perpetual disturbances. Then the people, being bribed by the pope, joined with the nobles and drove him away. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected; and on the death of Alexander IV. a French pope was chosen, Urban IV. (1261-64), thus giving fresh predominance in the church to the anti-Swabian policy. But the internal disturbances of the city soon drove Urban to flight.

After the election of Benedict XII. (1334-42) confusion reached so great a pitch that the Romans named thirteen heads of regions to carry on the government with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two knights of Gubbio, Giacomo di Cante dei Gabrielli and Bosone Novello dei Gabrielli, who were succeeded by two other senators the following year. But in 1339 the Romans attacked the Capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice (*ordinamenti della giustizia*), by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the reconstitution of Rome.

Shortly before this another revolution in Rome had re-established the government of the Thirteen and the two senators. The people, being anxious to show their intention of respecting the papal authority, had dispatched to Avignon as ambassador of the republic, in 1343, a man destined to make much noise in the world. This was Cola di Rienzo, son of a Roman innkeeper, a notary, and an impassioned student of the Bible, the fathers, Livy, Seneca, Cicero, and Valerius Maximus. Thoroughly imbued with a half pagan, half christian spirit, he believed that he had a divinely inspired mission to revive the ancient glories of Rome. Of handsome presence, full of fantastic eloquence, and stirred to enthusiasm by contemplation of the ruined monuments of Rome, he harangued the people with a stilted oratory that enchanted their ears. He hated the nobles, because one of his brothers had been killed by them; he loved the republic, and in its name addressed a stately Latin speech to the astonished pope, and, offering him the supreme power, besought his instant return to Rome. He also begged him to allow the city to celebrate a jubilee every fifty years, and then, as a personal request, asked to be nominated notary to the urban chamber. The pope consented to everything, and Rienzi communicated this good news to Rome in an emphatically worded epistle.

After Easter, in 1344, he returned to Rome, and found to his grief that the city was a prey to the nobles. He immediately began to admonish the latter, and then, draped in a toga adorned with symbols, exhibited and explained allegorical designs to the people, and announced the speedy restoration of the past grandeur of Rome. Finally he and a few burghers and merchants, whom he had secretly inflamed by his discourses, made a solemn vow to overthrow the nobility and consolidate the republic.

The pope, however, was weary of toleration, and, coming to terms with the nobles, incited them to war. They accordingly moved from Palestrina, and on November 30th were encamped before Rome. Rienzi now put forth his energy. He had already called the militia to arms, and a genuine battle took place in which eighty nobles, chiefly of the Colonna clan, were left dead. This was a real catastrophe to them, and the aristocracy never again achieved the rule of the republic. But Rienzi's head was turned by this sudden success. In great need of money, he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and he even sought to conciliate the nobles. At this moment certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and took refuge with a few trusty adherents in Castle St. Angelo, on December 15, 1347. Thence he presently fled to Naples, vainly hoping to find aid, and afterward disappeared for some time from the scene.

In the meantime Rienzi's popularity was increasing in Rome; without money or arms, the ex-tribune succeeded by his eloquence in winning over the two Provençal leaders, brothers of the famous free captain Fra Monreale; and, seduced by his promises and hopes, they supplied him with funds. Then, profiting by his prestige, the apparent favor of the pope, and the sums received, he was able to collect a band of 500 soldiers of mixed nationalities and returned toward Rome. On Monte Mario he was met by the cavallerotti. On August 1, 1354, he entered the Castello gate, took possession of the government, named Monreale's two brothers his captains, and sent them to lay siege to Palestrina, which was still the headquarters of the Colonna. But then money ran short, and he again lost his head. Inviting Fra Monreale to a banquet, he put him to death for the sake of his wealth, and kept the two brothers in confinement. This act excited general indignation. And when, after his ill-gotten gains were spent, he again resorted to violence to fill his purse, the public discontent was vented in a sudden revolt on October 8th. The people stormed the Capitol with cries of "Death to the traitor." Rienzi presented himself at a window waving the flag of Rome. But the charm was finally broken. Missiles were hurled at him; the palace was fired. He hid himself in the courtyard, shaved his beard, and, disguised as a shepherd with a cloth over his head, slipped into the crowd and joined in their cries against himself. Being recognized, however, by the golden bracelets he had forgotten to remove, he was instantly stabbed. For two days his corpse was left exposed to the insults of the mob, and was then burned. Such was the wretched end of the man who, at one moment, seemed destined to fill the world with his name as the regenerator of Rome and of Italy.

In all the Italian cities the overthrow of the aristocracy had led to military impotence and pressing danger of tyranny. The same thing had happened in Rome when the nobility, weakened by the absence of church and empire, received its death-blow from Rienzi. But, whereas elsewhere tyrants were gradually arising in the citizen class, Rome was always in danger of oppression by the pope. Nor was any aid available from the empire, which had never recovered from its abasement under Louis the Bavarian. In fact, when Charles of Luxembourg came to Rome to be crowned, he was obliged to promise the pope that he would not enter the city. On Easter day, 1355, he received the crown, and departed after counseling the Romans to obey the pope. And the pontiffs had greater need than ever of an established kingdom. Their position in France was much endangered by that country's disorder. New states were being formed on all sides; the mediæval unity was shattered, and the shrunken spiritual authority of the church increased her need of material strength. As Italian affairs stood, it would be easy for the popes to found a kingdom, but their presence was required in Rome before it could be firmly established.

The popes, being no longer in safety at Avignon, really decided to return to Italy. Even Urban V. had to pay ransom to escape from the threatened attacks of the free companies. The Romans implored his return, and he was further urged to it by the Italian *literati* with Petrarch at their head. In April, 1367, he finally quitted Avignon, and, entering Rome on October 16th, was given the lordship of the city.

The Romans retained the conservators, conferring on them the political power of the reformers; they reestablished the *banderesi* with the Florentine title of *executores justitiæ* and the four *antepositi* with that of *consiliarii*. Thus the "Felix Societas Balestrariorum et Pavesatorum Urbis" was restored, and the two councils met as before. The new French pope, Gregory XI. (1370-78), had to be content with obtaining supremacy over the senate and the possession of the Castle St. Angelo.

The next pope, Urban VI. (1378-89), a Neapolitan, was the spirit of discord incarnate. His election was not altogether regular: the French party among the cardinals was against him; and the people were ripe for insurrection. But, regardless of all this, Urban threatened the cardinals in his first consistory, saying that church reform must begin with them; and he used the same tone with the people, reproving them for failing to suppress the *banderesi*. In consequence of this the cardinals of the French party, assembling at Fondi, elected the antipope Clement VII. (1378-94) and started a long and painful schism in the church. Clement resided in Avignon, while Urban in Rome was engaged in opposing Queen Joanna I., of Naples, and favoring Charles of Durazzo, who, on conquering the Neapolitan kingdom, was made gonfalonier of the church and senator of Rome, where he left a vicar as his deputy. Shortly afterward the pope went to Naples, and made fierce war on the king. Then, after many adventures, during which he tortured and put to death several cardinals whom he suspected of hostile intentions, he returned to Rome, where the utmost disorder prevailed. The conservators and the *banderesi* were still at the head of the government, and, the pope speedily falling out with them, a riot ensued, after which he excommunicated the *banderesi*. These at last made submission to him, and Urban VI. became master of Rome before his death in 1389. He was succeeded by Boniface IX. (1389-1404), another Neapolitan, but a man of greater shrewdness and capacity. His first act was to crown Ladislaus king of Naples, and secure

the friendship and protection of this ambitious and powerful prince. In all the principal cities of the state he chose the reigning lords for his vicars. But he allowed Fermo, Ascoli, and Bologna the privilege of assuming their own vicariate for twenty-five years. And, as these different potentates and governments had only to pay him an annual tribute, all parties were satisfied, and the pope was able to bestow at least an appearance of order and unity on his state. But fresh tumults soon arose, partly because the conservators and banderesi sought to govern on their own account, and especially because the pope seems for a time to have omitted naming the senator. Boniface was a prudent man; he saw that events were turning in his favor, now that throughout Italy liberty was tottering to its fall, and bided his time. He was satisfied for the moment by obtaining a recognition of the immunities of the clergy, rendering them solely amenable to ecclesiastical tribunals, and thus distinguishing the powers of the church from those of the state in Rome. The republic also pledged itself neither to molest the prelates nor to levy fresh contributions on them toward repairing the walls, to aid in recovering the estates of the church in Tuscia, and to try to conciliate the baronage. This concordat, concluded with the conservators and banderesi on September 11, 1391, was also confirmed on March 5, 1392, by the heads of the regions, together with a fresh treaty binding both parties to furnish a certain number of armed men to combat the prefect of Vico and the adherents of the antipope at Viterbo. With the exception of this city, Orchi, and Civita Vecchia, all other conquered territory was to belong to the republic. But the Romans soon discovered that they were playing into the hands of the pope, who kept everything for himself, without even paying the troops. Upon this a riot broke out; Boniface fled to Perugia in October, 1392, and resolved to exact better terms when next recalled to Rome. Meanwhile the Romans subdued the prefect, captured Viterbo, and, being already repentant, handed it over to the pope and implored his return. He then proposed his own terms, which were approved, not only by the conservators, banderesi, and four councilors, but also by the special council and by the unanimous vote of a general assembly composed of the above-mentioned authorities, heads of regions, other officials, and a hundred citizens (August 8, 1393). These terms prescribed that the pope was to elect the senator, and that, on his failing so to do, the conservators would carry on the government after swearing fealty to him. The senatorial function was to be neither controlled nor hampered by the banderesi. The immunities of the clergy were to be preserved, and all church property was to be respected by the magistrates. The expenses of the pope's journey were to be paid, and he was to be escorted to Rome in state. Boniface tried to complete his work by abolishing the banderesi, the last bulwarks of freedom; but the people, although weakened and weary, made efforts to preserve them, and, although their fall was inevitable, the struggle went on for some time.

During the spring of 1394 the banderesi provoked an insurrection in which the pope's life was endangered; it was only saved by the arrival of King Ladislaus, who came from Naples with a large force in the early autumn. But for the Neapolitan soldiery Boniface could not have withstood the long series of revolts that continually exposed him to fresh perils and the anxiety caused by the persistent schism of the church. The death of Clement VII. in 1394 was followed by the election of another antipope, Benedict XIII. But a new jubilee was in prospect for the year 1400, and this was always an efficacious means of bending the will of the Romans. De-

pending upon this and the assistance of Ladislaus, Boniface not only demanded full powers to nominate senators (none having recently been elected), but insisted on the suppression of the banderesi. Both requests were granted; but, directly Angelo Alaleoni was made senator, a conspiracy was hatched for the reestablishment of the banderesi. However, the pope felt sure of his strength; the plot was discovered and the conspirators were beheaded on the stairs of the capitol. This proved the end of the banderesi and of the liberties of Rome.

Innocent VII. (1404-6) was the next pope. He, too, was a Neapolitan, and on his election the people again rose in revolt and refused to acknowledge him unless he consented to resign the temporal power. But Ladislaus of Naples hastened to his help, and an agreement was made which, under the cover of apparent concessions, really riveted the people's chains. Rome was recognized as the seat of the temporal and spiritual sovereignty of the pope, and the pope continued to appoint the senator.

Innocent, dying in 1406, was succeeded by Gregory XII., a Venetian, who, as we shall presently see, resigned the chair in 1415. On his accession, finding his state firmly established, he seemed to be seriously bent on putting an end to the Great Schism, and for that purpose arranged a meeting with the antipope Benedict XIII. at the congress of Savona in 1408. But Gregory and Benedict only used the congress as a pretext for making war upon each other, and were urged on by Ladislaus, who hoped by weakening both to gain possession of Rome, where, although opposed by the Orsini, he had the support of the Colonna. Gregory, who had then fled from Rome, made a momentary attempt to win the popular favor by restoring the government of the banderesi; but Ladislaus marched into Rome in June, 1408, and established a senator of his own. Meanwhile the two popes were continuing their shameful struggle, and the council of Pisa (March, 1409), in attempting to check it, only succeeded in raising up a third pontiff, first in the person of Alexander V. (1409-10), and then in the turbulent Baldassare Cossa, who assumed the name of John XXIII. The latter began by sending a large contingent to assist Louis of Anjou against Ladislaus. But the enterprise failed, and, seeing himself deserted by all, Pope John next embraced the cause of his foe by naming him gonfalonier of the church. Thereupon Ladislaus concluded a sham peace, and then, seizing Rome, put it to the sack and established his own government there. Thus John, like the other two popes, became a wanderer in Italy. In August, 1414, Ladislaus died and was succeeded by the scandalous Queen Joanna II. The Roman people promptly expelled the Neapolitans, and Cardinal Isolani, John's legate, succeeding in rousing a reaction in favor of the church, constituted a government of thirteen "conservators" on October 19th.

In November, 1414, the council of Constance assembled, and at last ended the schism by deposing all the popes, and incarcerating John XXIII., the most turbulent of the three. On November 11, 1417, Oddo Colonna was unanimously elected to the papal chair; he was consecrated in the cathedral on the 27th as Pope Martin V., and, being acknowledged by all, hastened without delay to take possession of his see. Meanwhile disorder was at its height in Rome. The cardinal legate Isolani governed as best he could, while Castle St. Angelo remained in the hands of the Neapolitans, who still had a party in the city. In this divided state of affairs Braccio, a daring captain of adventurers, nicknamed Fortebraccio, was inspired with the idea of making himself master of Rome. Overcoming the

feebly resisted, he succeeded in this on June 16, 1416, and assumed the title of "Defensor Urbis." But Joanna of Naples dispatched Sforza, an equally valiant captain, against him, and, without offering battle, Fortebraccio withdrew on August 26th, after having been absolute master of the eternal city for seventy days. Sforza marched in on the 27th, and took possession of the city in the name of Joanna. Martin V. instantly proved himself a good statesman. He confirmed the legate Isolani as his vicar, and Giovanni Savelli as senator. Leaving Constance on May 16, 1418, he reached Milan on the 12th of October, and slowly proceeded on his journey. While in Florence he dispatched his brother and nephew to Naples to make alliance with Joanna, and caused her to be crowned October 28, 1419, by his legate Morosini. Upon this she promised to give up Rome to the pope. Her general, Sforza, then entered the service of Martin V., and compelled Fortebraccio, who was lingering in a threatening attitude at Perugia, to make peace with the pope. The latter intrusted Fortebraccio with the conduct of the campaign against Bologna, and that city was reduced to submission on July 15, 1420. The Romans had already yielded to Martin's brother, the legate, and now earnestly besought the arrival of their pope. Accordingly he left Florence on September 19, 1420, and entered the Vatican on the 28th. Rome was in ruins; nobility and burghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the Capitol recorded the fall of two republics.

Martin V. reduced the remains of the free Roman Government to a mere civil municipality. Following the method of other despots of Italy, the old republican institutions were allowed to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was reëstablished and justice rigidly observed. Many rebellious places were subdued by the sword, and many leaders of armed bands were hanged. The pope, however, was forced to lean on his kinsmen the Colonna and again raise them to power by grants of vast fiefs both in his own states and the Neapolitan territory. And, after first supporting Joanna II., who had assisted his entry into Rome, he next sided with her adversary, Louis of Anjou, and then with Alphonso of Aragon, the conqueror of both and the constant friend of the pope, who at last felt safe on his throne. Rome now enjoyed order, peace, and security, but had lost all hope of liberty. And when Martin died (February 20, 1431) these words were inscribed on his tomb: *Temporum suorum felicitas.*

Eugenius IV. (1431-47) leant on the Orsini, and was fiercely opposed by the Colonna, who excited the people against him. Accordingly on May 29, 1434, the Romans rose in revolt to the old cry of "Popolo e popolo," and again constituted the rule of the seven governors of liberty. The pope fled by boat down the Tiber, and, being pursued with stones and shots, narrowly escaped with his life. On reaching Florence, he turned his energies to the recovery of the state. It was necessary to quell the people; but, first of all, the Colonna and the clan of the prefects of Vico, with their renewed princely power, had to be overthrown. The Orsini were still his friends. Eugenius intrusted the campaign to Patriarch (afterward Cardinal) Vitelleschi, a worthy successor of Albornoz, and of greater ferocity if less talent. This leader marched his army toward Rome, and, instantly attacking Giovanni, prefect of Vico, captured and beheaded him. The family was now extinguished; and, its possessions reverting to the

church, the greater part of them were sold or given to Count Everso d'Anguillara, of the house of Orsini. The prefecture, now little more than an honorary title, was bestowed at will by the popes. Eugenius gave it to Francesco, founder of the powerful line of the Gravina-Orsini. The pope at last returned to Rome in 1443, and remained there quietly till his death in 1447.

His successor Nicholas V. (1447-55) was a scholar solely devoted to the patronage of literati and artists. During his reign there was a fresh attempt to restore the republic, but it was rather prompted by literary and classical enthusiasm than by any genuine patriotic ardor. Political passions and interests had ceased to exist. The conspiracy was headed by Stefano Porcari, a man of the people, who claimed to be descended from Cato. He had once been captain of the people in Florence, and was made podestà of Bologna by Eugenius IV. He was a caricature of Cola di Rienzo, and extravagantly proud of his Latin speeches in honor of ancient republican liberty. The admiration of antiquity was then at its height, and Porcari found many enthusiastic hearers. Directly after the death of Eugenius IV. he made a first and unsuccessful attempt to proclaim the republic. Nevertheless Nicholas V., with the same indulgence for scholars that had prompted him to pardon Valla for denying the temporal power of the papacy and laughing to scorn the pretended donation of Constantine, freely pardoned Porcari and named him podestà of Anagni. He filled this office with credit, but on his return to Rome again began to play the agitator, and was banished to Bologna with a pension from the pope. Nicholas V. had conferred all the state offices upon priests and abbots, and had erected numerous fortresses. Hence there were many malcontents in Rome, in communication with Porcari at Bologna, and ready to join in his plot. Arms were collected, and on the day fixed he presented himself to his fellow-conspirators adorned with rich robes and a gold chain, and harangued them in Latin on the duty of freeing their country from the yoke of the priests. His design was to set fire to the Vatican on January 6, 1453, the feast of the Epiphany; he and his followers were to seize the pope, the cardinals, and Castle St. Angelo. But Nicholas received timely warning; the conspirators' house was surrounded; and Porcari himself was seized while trying to escape, confined in Castle St. Angelo, and put to death with nine of his companions on January 9th. Others shortly suffered the same fate.

There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, the heads of the rioni, and an elected council of twenty-six citizens. Now and then also a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the Capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals, all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained to the time of the French Revolution.

For the completion of this system a final blow had to be dealt to the aristocracy, whose power had been increased by nepotism; and it was dealt by bloodshed under the three following popes—Sixtus IV. (1471-84), Innocent VIII. (1484-92), and Alexander VI. (1492-1503)—each of whom was worse than his predecessor.

Nevertheless the republic twice attempted to rise from its grave, and on the second occasion gave proof

of heroism worthy of its past. It was first resuscitated in February, 1798, by the influence of the French Revolution, and the French constitution of the year III was rapidly imitated. Rome had again two councils—the tribunate and the senate, with five consuls constituting the executive power. But in the following year, owing to the military reverses of the French, the government of the popes was restored until 1809, when Napoleon I. annexed to his empire the States of the Church. Rome was then governed by a *consulta straordinaria*—a special commission—with the municipal and provincial institutions of France. In 1814 the papal government was again reinstated, and the old institutions, somewhat modified on the French system, were recalled to life. Pius IX. (1846–77) tried to introduce fresh reforms, and to improve and simplify the old machinery of state; but the advancing tide of the Italian revolution of 1848 drove him from Rome; the republic was once more proclaimed, and had a brief but glorious existence. Its programme was dictated by Joseph Mazzini, who, with Saffi and Armellini, formed the triumvirate at the head of the government. United Italy was to be a republic, with Rome for her capital. The rhetorical idea of Cola di Rienzo became heroic in 1849. The constituent assembly (February 9, 1849) proclaimed the fall of the temporal power of the popes, and the establishment of a republic which was to be not only of Rome but of all Italy. France, although then herself a republic, assumed the unenviable task of reestablishing the temporal power by force of arms. But the gallant defense of Rome by General Garibaldi covered the republic with glory. The enemy was repulsed, and the army of the Neapolitan king, sent to restore the pope, was also driven off. Then, however, France dispatched a fresh and more powerful force; Rome was vigorously besieged, and at last compelled to surrender. With June, 1849, begins the new series of pontifical laws designed to restore the government of Pius IX., whose reign down to 1870 was that of an absolute sovereign. Then the Italian Government entered Rome (September 20, 1870), proclaimed the national constitution (October 9, 1870), and the Eternal City became the capital of Italy. Thus the scheme of national unity, the natural outcome of the history of Rome and of Italy, impossible of accomplishment under the rule of the popes, was finally achieved by the monarchy of Savoy, which, as the true representative and personification of Italian interests, has abolished the temporal power of the papacy and made Rome the seat of government of the united country.

ROME, the capital of Oneida county, N. Y., is one of the most prosperous municipalities in the Mohawk valley. It is handsomely situated on the Mohawk river and Black river canal, 110 miles west-northwest of Albany, 142 miles south of Ogdensburg, 39 miles east of Syracuse, and 15 miles northwest of Utica; and is an important point on the New York Central, and Rome, Watertown and Ogdensburg railroads, besides enjoying close communication with the Erie canal. The city is laid out with considerable regard to beauty of location, and is in all respects attractive. It contains a handsome court-house, thirteen churches, high-school and graded-school buildings, half a dozen hotels, four national and two savings banks, and one private bank, an academy, public library, opera house and other evidences of the enterprise and refinement of the inhabitants. The manufacturing industries embrace locomotive works, iron works, factories for the production of furniture, machinery, hardware, specialties and trimmings, cigars, cement, glue, saddlery, harness, wire, etc., also saw and grist mills, gas works and canning works. It is lighted by

gas, supports one or more papers, and has a population in 1890 of 14,991.

ROME, the capital of Floyd county, Ga., is picturesquely located among the hills that dot the landscape in that portion of the State, at the confluence of Oostenaula and Etowah rivers. The city affords evidences of the taste and public spirit of the citizens, and is considered one of the many promising cities of the Southern States. It is situated on the East Tennessee, Virginia and Georgia, Chattanooga, Rome and Columbus, and Rome and Dalton railroads, and is the western terminus of the Rome railroad, 195 miles northeast of Selma, 71 miles northwest of Atlanta, and 39 miles southwest of Dalton. By the latter road it is placed in direct connection with the Western and Atlantic road. It was incorporated as a city in 1847, and contains a court-house, female seminary, high-school, one private and two national banks, with a total paid-up capital of \$400,000, and \$130,000 surplus; ten churches, one daily and three weekly newspapers, several hotels, an opera house, public hall, with seating capacity of from 500 to 1,000, and a large number of stores. Its manufactures embrace iron, furniture, sash, harness, machinery, nails, and plows; also ice and cotton-seed oil works. In 1870 the population was 2,748; in 1880, 3,877; and in 1890 it was 6,970.

ROMFORD, an old market-town of Essex, England, is situated on the small river Rom, and on the Great Eastern railway about twelve miles east-northeast of London. The ancient church of St. Edward the Confessor was replaced in 1850 by a structure in the Late Decorated style. The large brewery of Ind, Coope & Co., is situated in town, and there are extensive market gardens in the neighborhood. A grant of market was obtained in 1247, and this is still of importance as regards both cattle and corn. The population of the urban sanitary district (area 1,159 acres) in 1871 was 6,512, and in 1891 was 8,408.

ROMILLY, SIR SAMUEL, the great legal reformer who first attempted to relax the barbarity of the English penal code, was the second son of Peter Romilly. Called to the bar in 1783, he went the midland circuit, but was chiefly occupied with chancery practice. Sir Samuel Romilly's efforts made his name famous not only in England but all over Europe, and on July 4, 1818, he had the honor of being returned at the head of the poll for the city of Westminster. He did not long survive his triumph. In October, 1881, Lady Romilly died in the Isle of Wight. Her husband's grief was intense, and he committed suicide in a fit of temporary insanity on November 2d.

ROMNEY, GEORGE, historical and portrait painter, was born at Dalton-le-Furness, Lancashire, on December 26, 1734. Having, at the age of twenty-seven, saved about \$500, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for two brief visits, till he came, a broken-down and aged man, to die. In London he rapidly rose into popular favor. In 1764 he paid a brief visit to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg Gallery. In 1766 he became a member of the Incorporated Society of Artists, and in the beginning of 1773 he started for Rome with Ozias Humphrey the miniature painter.

In 1775 Romney returned to London, establishing himself in Cavendish Square, and resuming his extensive and lucrative employment as a portrait painter. About 1783 Romney was introduced to Emma Hart, afterward celebrated as Lady Hamilton, and she be

came the model from whom he worked incessantly. But her fascinations seem to have been too much for the more than middle-aged painter, and they had their own share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind. He died November 15, 1802.

ROMNY, a district town of Russia, on the Sula river, 112 miles to the northwest of Poltava, and in the government of that name. It acquired commercial importance during the last century, especially on account of its fairs. Of the local industries, the manufacture of agricultural implements is the only one worthy of mention, but the petty trades, both in town and district, are of considerable importance. The population in 1881 was 12,300, and in 1890 (estimated) was 13,500.

ROMULUS, the mythical eponym founder and first king of Rome, is represented in legend as the son of Mars. His mother, the Vestal Silvia or Ilia, was the daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amullus; Silvia's twin sons, Romulus and Remus, were placed in a trough and cast into the Tiber by their cruel granduncle. The trough grounded in the marshes where Rome afterward stood, under the wild fig-tree (*filus ruminalis*). The babes were suckled by a she-wolf and fed by a woodpecker, and then fostered by Acca Laurentia, wife of the shepherd Faustulus. Growing up they became leaders of a warlike band of shepherds, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying the usurper Amulius. They now proposed to found a city on the site where they had been nurtured; but a quarrel broke out between the brothers, and Remus was slain. The story goes on to tell how Romulus strengthened his band by receiving outlaws, found wives for them by capture, and waged war with the indignant parents. The most formidable foe was Titus Tatius, king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius fell in a bloody feud with Laurentum. Romulus now reigned alone till he suddenly one day disappeared from earth in darkness and storm, and was thereafter worshiped as a god under the name of Quirinus, which, however, is really a Sabine form of Mars.

ROMULUS AUGUSTULUS. See ODOACER, and ROME, *supra*.

RONDA, a town of Spain, in the province of Malaga, and about forty-three miles to the west of that city. The old part of the town has a Moorish aspect, with narrow, steep, and crooked lanes, and still retains some Moorish towers and other buildings. The Ronda bull-ring is one of the finest in Spain, and can accommodate 10,000 spectators. Ronda is the seat of a considerable trade in leather, saddlery, and horses, and has an important fair (May 20th). The population within the limits of the municipality was 19,181 in 1877, and 21,500 (estimated) in 1890.

RONDEAU or RONDEL (Ital. *Rondo*). In poetry the rondeau is a short metrical structure which in its perfect form is divided into three strophes of unequal length, knit together by rapidly recurrent rhymes and a refrain. In music the "rondo" seeks much the same effect as in poetry, the melodic emphasis of the refrain. The Italian composer Buononcini seems to have been the inventor of the rondo as thus understood.

RONSARD, PIERRE DE, "Prince of Poets," was born at the Château de la Poissonnière, near the village of Couture in the province of Vendômois (department of Loir-et-Cher) on September 11, 1524. He was first intended for the diplomatic service, but becoming deaf turned his attention to literature.

In 1550 the *Odes* of Pierre de Ronsard were published.

This was followed in 1552 by the publication of his *Amours* with the fifth book of *Odes*. These books excited a violent literary quarrel. He published his *Hymns*, dedicated to Marguerite de Savoie, in 1555, the conclusion of the *Amours* in 1556, and then a collection of *Œuvres Complètes* said to be due to the invitation of Mary Stuart, queen of Francis II., in 1560.

His last years were saddened not merely by the death of many of his most intimate friends, but by constant and increasing ill health. Toward the end of 1585 his condition of health grew worse and worse, and he seems to have moved restlessly from one of his houses to another for some months. When the end came, which, though in great pain, he met in a resolute and religious manner, he was at his priory of Saint Cosme at Tours, and he was buried in the church of that name on Friday, December 27, 1585.

The character and fortunes of Ronsard's works are among the most remarkable in literary history, and supply in themselves a kind of illustration of the progress of French literature during the last three centuries.

RONSDORF, a town in northwestern Prussia, on the Morsbach, a small affluent of the Rhine, eighteen miles west of Düsseldorf, contains considerable iron and brass works, foundries, and wire-works, besides carrying on extensive manufactures of ribbons, trimming, and similar goods. The population in 1889 was 10,100.

Founded in 1737 by the followers of Elias Eller, a religious enthusiast, Ronsdorf received town-rights in 1745. The Ronsdorf sect, the members of which called themselves Zionites, is now extinct.

ROOF. See BUILDING and DOME.

ROOK (Anglo-Saxon *Hróc*, Icelandic *Hrókr*, Swedish *Raka*, Dutch *Roek*, Gaelic *Rocas*), the *Corvus frugilegus* of ornithology, and throughout a great part of Europe the commonest and best known of the Crow-tribe. In a general way the least-known part of the Rook's mode of life is facts relating to its migration and geographical distribution. Though the great majority of Rooks in Britain are sedentary or only change their abode to a very limited extent, it is now certain that a very considerable number visit this country in or toward autumn, not necessarily to abide here, but merely to pass onward, like most other kinds of birds, to winter further southward. As a species the Rook on the European continent only resides during the whole year throughout the middle tract of its ordinary range. Further to the northward, as in Sweden and northern Russia, it is a regular summer immigrant, while further to the southward, as in southern France, Spain, and most parts of Italy, it is, on the contrary, a regular winter immigrant. The same is found to be the case in Asia, where it extends eastward as far as the Upper Irtysh and the Ob. It breeds throughout Turkestan, in the cold weather visiting Afghanistan, Cashmere, and the Punjab, and Sir Oliver St. John found a rookery of considerable size at Casbin in Persia. In Palestine and in Lower Egypt it is only a winter visitant, and Canon Tristram noticed that it congregates in great numbers about the mosque of Omar in Jerusalem.

ROOKE, SIR GEORGE, naval commander, was born near Canterbury, England, in 1650. Entering the navy as a volunteer, he became post-captain in 1680, and vice-admiral in 1692. In May of this year he greatly distinguished himself in a night attack on the French fleet off Cape La Hogue, when he succeeded in burning six of their ships. In 1702 he commanded the expedition against Cadiz, and on the passage home captured the Plate fleet off Vigo. Along with Sir Cloudesley Shovel

he took part in the capture of Gibraltar, July 21, 1704. He died January 24, 1709.

**ROPE.** All varieties of cordage having a circumference of an inch or more are known by the general name of rope. Twisted cordages of smaller dimensions are called cords, twines, and lines, and when the dimensions are still smaller the article becomes thread or doubled yarn.

Vegetable fibers fit for rope-making are numerous, but ordinarily not many are employed. Speaking generally, for the prime requisites of strength, suppleness, flexibility, and durability, none can compete with the common hemp (*q.v.*), which consequently is the staple of the rope-maker. **MANILA HEMP** (*q.v.*) is a fiber of the most remarkable tenacity, of unapproached value for heavy cordage, but too stiff and woody for small cords and twines. After these in utility come sisal hemp of South America (*Agave sisalana*), phormium hemp of New Zealand (*Phormium tenax*) and the sunn hemp of the East Indies (*Crotalaria juncea*)—all fibers of great strength, and largely used by rope-makers. Among fibers more rarely seen in rope-works are Jubbulpore hemp (*Crotalaria tenuifolia*), bowstring hemp (*Sansevieria zeylanica*), and other "hemp" of the East Indies, and plantain fiber (*Musa paradisiaca*) and agave fiber (*Agave americana*) of America. Ropes and twine of cotton are extensively made, especially for driving-bands for machinery. **JUTE** (*q.v.*) is now in considerable use by rope-makers, on account of its cheapness, but it is very deficient in strength and durability. **COIR** is also largely employed, and many other fibers are used, principally in the localities of their production.

A rope is composed of a certain number of "strands," the strand being itself made up of many "yarns." Three strands laid or twisted together form a "hawser-laid" rope, and three such hawsers similarly laid make a "cable-laid rope" or "cable." A "shroud-laid" rope consists of four strands laid around a central strand or core.

The primary object of twisting fibers together in a rope is that by mutual friction they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibers and preventing the penetration of moisture when the ropes are exposed to water. The proper degree of twist is a matter of considerable importance, as all twisting injuriously affects the strength of the individual fibers, and indeed it is possible to twist a cord so hard that it will break under the action. The degree of twist given to ropes is generally such that the rope is from three-fourths to two-thirds the length of the yarn composing it, and the lighter the twist the greater in proportion is the strength of the rope.

To prevent the decay of ropes which are frequently exposed to water, the yarns of which they are composed are soaked in hot Archangel tar before they are formed into strands. M. Duhamel, from a series of investigations made in 1741-46, came to the conclusion that, apart from exposure to wet, untarred cordage in constant service was about one-third more durable than tarred, that it retained its strength for a longer period when kept in store, and that it resisted the ordinary influences of the weather better than when it was tarred. Subsequent experience has fully borne out these conclusions, and now that Manila hemp, which withstands the influence of water well, is so extensively used for heavy cordage, tarring is no longer so generally practiced in rope-making as was at one time the case.

The sequence of operations in ropewalk spinning is:—(1) heckling the fiber; (2) spinning the yarn; (3) tarring the yarn (when necessary); (4) forming the strands; (5) laying the strands into ropes.

The earliest practical attempt to introduce machine rope-spinning was made by Cartwright, the famous inventor of the power loom, who, in 1892, obtained a patent for a machine called by him a "Cordelier." Numerous modifications and improved combinations have been introduced, but the principle on which they are worked is essentially the same. A complete set of rope and twine making machinery includes heckling machines, spreading and drawing frames for line yarns, and carding engines and drawing frames for tow. These machines do not differ from the ordinary preparing machinery in flax manufactures, nor is there any essential difference in the spinning frames for the smaller counts of yarns. The heavier yarns for rope-making are spun upon a gill-spinning frame, such as Goode's automatic spinner, which is fitted with a self-feeding motion by which when the sliver is presented in large quantity the rate of motion and spinning is proportionately increased; when the sliver becomes attenuated the motion is correspondingly slow, and when the sliver is broken the spinner stops. Thus a yarn well laid and uniform in thickness is secured by automatic machinery. For spinning heckled yarn, such as is used in the ropewalk, a machine of simple construction, Ronald's patent, is now extensively used. The yarn in this machine has the advantage of being hand-spun, as the spinner draws out, compresses, and feeds the fiber from a supply round his or her waist, just as on the ropewalk. In this way the strength, evenness, and other good qualities of hand-spun yarn are secured.

The making of twines and small cords forms a distinct branch of the rope trade, the whole of the operations being carried out on a series of machines in which a large number of twines and cords are twisted and otherwise prepared simultaneously, while in rope-making the machines deal only in general with the material of one rope at a time. Common twines are twisted from prepared yarns on a twine-twisting frame; the same in principle as the doubling spindle frames of the ordinary textile trade. The bobbins of yarn are placed on pegs in the creel above the twisting spindles, from two to five bobbins being placed over each spindle according to the number of yarns which go to make up the twine. These yarns are passed round a pair of rollers, which pull them off the bobbins and deliver them evenly and with regularity to the flyer of the spindle, by which they are twisted and wound on the bobbin round which they rotate. By a recent improvement the required number of yarns, instead of being drawn from separate bobbins, are first wound together upon one bobbin in a "doubling winding frame." A series of bobbins so filled are placed on spindles in a twisting frame and twisted by inverted flyers; the twisted twine is drawn off by pairs of conical grooved twist rollers round which it passes, and is wound on taking-up bobbins. Cord or cable laid twine is prepared on cabling machines. At the back of the machine the yarns receive their first twist as above described, and thence the strands from three spindles are drawn off together over a pair of cone rollers, by which they are laid, and thence they pass to the front of the machine, where there is a range of powerful flyers and spindles by which they are twisted and wound upon a large bobbin. From the bobbins they are unwound and passed through a trough of hot water, thence in parallel order over the surface of a set of rubbing rollers covered with strong card cloth revolving at high speed in a contrary direction to that in which the twine is traveling. The friction of the strong card wires shaves and smooths the twine, which then passes through the sizing trough containing a hot paste, usually of potato farina. The superfluous paste is

squeezed out by passing the twine between rollers, and it is next passed over rollers covered with rough coir which presses in all fibers yet protruding from the twine, and finally it is dried by passing round a range of steam-heated cylinders, running parallel with which are coir-covered polishing rollers which smooth the twine while it is being dried. The finished twine is wound into balls of a definite weight on a balling machine.

The machines required for making ropes from spun yarn consist of a forming flyer for forming the strands and a laying machine for twisting the strands into rope. A cabling machine for uniting three-strand hawsers into a cable is only a second laying machine of larger and heavier dimensions; but it is still a common practice to lay the heavy cable on the ropewalk. The two operations of forming strands and laying rope may be performed on one combined machine, especially in dealing with light ropes composed of a few yarns; but as a rule separate machines are preferred for each operation.

Ropes made of wire have only come into use in the course of the present century, but now their employment is very extensive, and they play an important part in connection with traction railways, mines, collieries, hoists, steam plowing, and many other modern developments of industry.

Wire ropes are stranded and laid or closed in machines which do not differ in essential features from the ordinary rope-making machinery. Both vertical and horizontal forms of revolving machines are used; but, as the rope-closing machine has sometimes to carry as many as nine bobbins of strand, each with about two tons of wire, a vertical machine is best for enormous weights. An ingenious wire-rope machine has been invented by Mr. Archibald Smith, in which the bobbins of wire are suspended, and only the framework around them and the wire drawn off are rotated for the forming and laying operations, and thus the necessity for rotating these enormous weights at a high speed is obviated.

The number of wires in a wire-rope strand are few—generally from six to nine, and never more than eighteen. They are lightly twisted in the stranding machine, and they receive no foretwist in the rope-closing apparatus. The strands, on the other hand, which go to form a rope are numerous—from six to nine and upward; and they are always wound round a core, which is generally of hemp, but sometimes a wire core is used. A wire rope thus forms a series of gentle spirals arranged continuously round a core. A large importation of the wire is galvanized to protect it from rusting.

RORQUAL. See WHALE.

ROSA, SALVATOR, a renowned painter of the Neapolitan school, was born in Arenella, in the outskirts of Naples, in 1615; the precise day is given as June 20th, and also as July 21st. The first person to discover that Rosa's work was not as trumpery as it was cheap, was the painter Lanfranco, who bought some of the paintings, and advised the youth to go to Rome. Hither in 1635, at the age of twenty, Rosa betook himself; he studied with enthusiasm, but, catching fever, he returned to Naples and Falcone, and for a while painted nothing but battle-pieces, and these without exciting any attention. This class of work was succeeded by the landscape art peculiarly characteristic of him. He then revisited Rome, and painted for the Chiesa della Morte a large and noticeable picture of the *Incredulity of Thomas*—the first work of sacred art which we find recorded from his hand. He then returned to Naples. Here the monopolizing triumvirate—Ribera, Caracciolo, and Corenzio—were still powerful. Rosa was as yet too obscure to suffer from their machinations; but, having painted a picture of *Tityus*

*Torn by the Vulture*, which went to Rome and there produced a great sensation, he found it politic to follow in the footsteps of his fame, and once more, in 1638, resought the papal city.

In 1646 he returned to Naples, and is said to have taken an active part in the insurrection of Masaniello. His actual share in the insurrection is, however, dubious. He painted a portrait of Masaniello—probably from reminiscence rather than from life; indeed it is said that he painted him several times over in less than life size. On the approach of Don John of Austria Rosa escaped, or at any rate returned to Rome. Here he painted some important subjects, showing the uncommon bent of his mind as it passed from landscape into history—*Democritus amid Tombs*, *The Death of Socrates*, *Regulus in the Spiked Cask* (these two are now in England), *Justice Quitting the Earth*, and *The Wheel of Fortune*.

Cardinal Giancarlo de' Medici now invited the painter to leave Rome—which had indeed become too hot to hold him—for Florence. Salvator gladly assented, and remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape. Finally he reverted once more to Rome, and hardly left that city again. Among the pictures of his closing years were the admired *Battlepiece* now in the Louvre, painted in the short space of forty days, full of long-drawn carnage, with ships burning in the offing; *Pythagoras and the Fishermen*; *The Oath of Catiline* (Pitti Gallery); and the very celebrated *Saul and the Witch of Endor* (Louvre), which is perhaps his latest work. He undertook a series of satirical portraits, to be closed by one of himself, but while occupied with this project he was assailed by dropsy, which, after lasting fully half a year, brought his life to a close on March 15, 1673.

Rosa was indisputably a great leader in that modern tendency of fine art toward the romantic and picturesque which, developing in various directions and by diversified processes, has at last almost totally differentiated modern from olden art. He saw appearances with a new eye, and presented new images of them on his canvases, and deserves therefore all the credit due to a vigorous innovator, even if we contest the absolute value of his product. He himself courted reputation for his historical works, laying comparatively little stress on his landscapes; in portraits he was forcible. In chiaroscuro he is simple and effective; his design has energy and a certain grandeur, without any high type of form or any superior measure of correctness. His color is too constantly of a sandy or yellowish-gray tone. Among his pictures not already mentioned we may name, in the London National Gallery, *Mercury and the Dishonest Woodman*, and two others; in Raynham Hall, *Belisarius*; in the Grosvenor Gallery, *Diogenes*; in the Pitti Gallery, a grand portrait of a man in armor, and the *Temptation of St. Anthony*, which contains his own portrait. This last subject appears in St. Petersburg, and in the Berlin Gallery.

The satires of Salvator Rosa deserve more attention than they have generally received. Though considerably spread abroad during his lifetime, they were not published until 1719. They are all in terza rima, written without much literary correctness, but remarkably spirited, pointed, and even brilliant. They are slashingly denunciatory, and from this point of view too monotonous in treatment.

ROSAMOND, FAIR. Rosamond Clifford, mistress of Henry II., was the daughter of Sir Walter Clifford, a Berkshire knight. She appears to have died in or about the year 1177, and was buried in the nunnery at Godstow. At the command of St. Hugh, bishop of

Lincoln, her body was removed from the church in which it had been buried, and was interred again outside the church. Such are all the facts that are known about Fair Rosamond. She is said to have been the mother of William Longsword, and of Geoffrey, archbishop of York. But this is impossible, for both William and Geoffrey were born before 1155, and Rosamond was still a girl at the time of her death. The story of the labyrinth or maze built by Henry to conceal her from Queen Eleanor occurs first in Brompton (end of twelfth century). The legend of her death at Queen Eleanor's hand is variously related, but does not appear to be traceable beyond the first half of the fourteenth century. It can hardly be true in any form, for Eleanor was in confinement during the last fifteen years of Henry's reign.

ROSARIO, a river-port on the Paraná, and the chief town in a department in the province of Santa Fé in the Argentine Republic, 186 miles by river from Buenos Ayres, now ranks in commercial importance as the second city in the republic, being the center of almost the entire trade of the eleven provinces lying between the Paraná and the Andes, and the terminus of the great railways which since 1863 have gradually been pushed further north and west. The population had been increased to 21,000 by 1870 and to 55,000 in 1887, while the imports have since reached the value of \$23,800,000 and the exports \$19,940,000.

Rosario stands about sixty-five feet above the level of the river. It is laid out chess-board fashion; and the streets are paved and lighted with gas (introduced in 1869). The area, 145 acres in 1870, is now about 2,000 acres. Brick is the principal building material, and the houses are mostly of one story. The industrial establishments are extensive foundries, a large number of brick kilns, a jam and fruit-preserving factory, breweries, tanneries, soap-works, saw-mills, and flour-mills.

The prosperity of the town dates from 1854, when it was made a port of entry by General Urquiza. In 1867 and 1868 it suffered from a severe cholera plague. The proposal to make Rosario the capital of the republic instead of Buenos Ayres has more than once nearly been carried in the legislature.

ROSARY (*Rosarium*, Germ., Rosenkranz) is defined in the Roman *Breviary* as a series of 150 repetitions of the "Ave Maria," with a "Pater Noster" interpolated after each decade, the whole exercise being accompanied with pious meditation on the mysteries of redemption. The word "rosary" or "chaplet" (*capellina*) is also employed to denote the string of beads of larger and smaller size by the use of which in repeating the rosary the faithful secure the due alternation of Ave Marias with Pater Nosters. In strict language the word chaplet is applied only to the "lesser" rosary, consisting of but fifty Aves and five Pater Nosters.

ROSAS, JUAN MANUEL DE, born at Buenos Ayres, March 30, 1793, died in England March 14, 1877. (See ARGENTINE REPUBLIC.)

ROSCOLLINUS (also written ROUSSELIN and RUCELINUS), often called the founder of nominalism (see SCHOLASTICISM), was born in Armorica or Lower Brittany somewhere about the middle of the eleventh century. He is heard of as late as 1121 when he came forward to oppose Abelard's views on the trinity.

ROSCOE, WILLIAM, historian and miscellaneous writer, was born March 8, 1753, at Liverpool, England. At fifteen it was necessary to decide upon a path in life. A month's trial of bookselling sufficed to disgust him, and, in 1769, he was articled to a solicitor. Although a diligent student of law, he did not bid farewell to the Muses, but continued to read the classics, and made that acquaintance with the language and literature of

Italy which became the instrument of his distinction in after life.

Meanwhile he had steadily pursued his Italian studies, and had made extensive collections relating to the great ruler of Florence. The result was his *Life of Lorenzo de' Medici, called the Magnificent*, which appeared in 1796, and at once placed him in the front rank of contemporary historians. His translation of Tansillo's *Nurse* appeared in 1798, and went through several editions. *The Life and Pontificate of Leo the Tenth* appeared in 1805, and was a natural sequel to that by which he had made his reputation. The work, while it maintained the author's fame, did not, on the whole, meet with so favorable a reception as the *Life of Lorenzo*. It has been frequently reprinted, and the insertion of the Italian translation in the *Index* did not prevent its circulation even in the papal states. Roscoe was elected member of Parliament for Liverpool in 1806, but the House of Commons was not a congenial place, and at the dissolution in the following year he declined to be again a candidate. The commercial troubles of 1816 brought into difficulties the banking house with which he was connected, and forced the sale of his collection of books and pictures. In 1822 he issued an appendix of illustrations to his *Lorenzo*, and also a *Memoir of Richard Robert Jones of Aberadron*, a remarkable self-taught linguist. The year 1824 was memorable for the publication of his edition of the works of Pope, which involved him in a controversy with Bowles. He died June 30, 1831.

Roscoe's character was a fine one. Under circumstances uncongenial and discouraging, he steadfastly maintained the ideal of the intellectual life. Sensitive and conscientious, he sacrificed his possessions to a punctilious sense of duty. He had the courage of unpopular opinions, and, while promoting every good object in his native town, did not hesitate to speak out where plain dealing, as in the matter of slavery, was required. Nor was his public life more meritorious than his private career, for he was a sincere friend and exemplary in his domestic relations.

ROSCOMMON, an inland county of Ireland, in the province of Connaught, is bounded northeast by Leitrim, northwest by Sligo, west by Mayo, west and south by Galway, east by Longford, and east and south by Westmeath and King's county. The total area is 607,691 acres or nearly 950 square miles. The greater part of the county belongs to the great limestone plain, and is either flat or very slightly undulating. In the northeast, on the Leitrim border, the Braulieve Mountains attain an elevation at their highest point of 1,377 feet; and in the northwest the Curlew Mountains rise abruptly to a height of over 800 feet. In the east the Slievebawn range, formed of sandstone, have a somewhat similar elevation. The Connaught coal field, which embraces the mountainous district round Lough Allen, touches on Roscommon, but the mineral is not much wrought within the limits of the county. Ironstone is also found in the same district, but mining is no longer prosecuted. The Shannon with its expansions forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for over fifty miles the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish, and the Boyle. The lakes formed by expansions of the Shannon on the borders of Roscommon are Loughs Allen, Boderg, Boffin, Forbes, and Ree. Of the numerous other lakes within the county the most important are Lough Key in the north, very picturesquely situated with finely wooded banks, and Lough Gara in the west.

The subsoil is principally limestone, but there is some light sandy soil in the south. In the level parts the land when drained and properly cultivated is very fertile, especially in the district known as the plains of Boyle, which includes some of the richest grazing land in Ireland. Along the banks of the Suck and Shannon there is, however, a large extent of bog and marsh.

A branch of the Midland Great Western railway traverses the northeastern boundary of the county to Sligo, and another the southwestern boundary to Westport, while a third crosses the southern corner to Galway.

The county is divided into 10 baronies, and contains 53 parishes, 7 parts of parishes, and 1,995 townlands. The population in 1881 was 132,490—a decrease of nearly one-half since 1841, when it was 253,591. In 1891 the population had diminished to 114,894.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth Connaught was included in the two districts of Roscommon and Clare, and when these were subdivided Roscommon was assigned its present limits. It takes its name (Irish *Ros-Comain*, Comain's wood) from the county town, at which a monastery was founded by St. Coman in the sixth century.

ROSCOMMON, WENTWORTH DILLON, EARL OF, one of the pioneers of the so-called "classical" school in English poetry, owed his burial in Westminster Abbey more to his rank than to his achievements in poetry. He was born in 1634 and died during 1684.

Roscommon, a nephew of the great earl of Strafford, was born in Ireland, and educated partly under a tutor at his uncle's seat in Yorkshire, partly at Caen in Normandy, and partly at Rome. He published a translation of Horace's *Art of Poetry* in 1680.

ROSE (*Rosa*). The rose gives its name to the order *Rosaceæ*, of which it may be considered the type. The genus consists of species varying in number according to the diverse opinions of botanists of opposite schools, from 30 to 180, or even 250, exclusive of the many hundreds of mere garden varieties. The species are natives of all parts of the northern hemisphere, but are scantily represented in the tropics unless at considerable elevation. They are erect or climbing shrubs, never herbs or trees, generally more or less copiously provided with thorns of various shapes and with glandular hairs, as in the sweet brier or in the moss rose of gardens. The thorns serve the purpose of enabling the shrub to sustain itself amid other vegetation, and perhaps in some sort serve as a protection against marauders. The viscid hairs which are especially frequent on the flower stalks or in the neighborhood of the flower serve to arrest the progress of undesirable visitants, while the perfume emitted by the glands in question may coöperate with the fragrance and color of the flower to attract those insects whose presence is desirable. The leaves are invariably alternate, provided with stipules, and unequally pinnate, the stipules themselves being in this case perhaps merely the lowest pair of "pinnæ" or leaflets less perfectly developed than the others. The flowers are solitary or in loose cymes (cluster-roses) produced on the ends of the shoots. The flower-stalk expands into a vase or urn-shaped dilatation, called the receptacle or receptacular tube, which ultimately becomes fleshy and incloses in its cavity the numerous carpels or fruits. From the edge of the urn or "hip" proceed five sepals, often more or less compounded like the leaves and overlapping in the bud. Within the sepals are five petals generally broad or roundish in outline, with a very short stalk or none at all, and of all hues except blue. The very numerous stamens originate from about the same spot as the sepals and petals;

each has a slender filament and a small two-celed anther. The inner portion of the receptacular tube whence the stamens spring is thick and fleshy, and is occasionally spoken of as the "disk;" but, as in this case it does not represent any separate organ, it is better to avoid the use of the term. The carpels are very numerous, ultimately hard in texture, covered with hairs, and each provided with a long style and button-like stigma. The carpels are concealed within the receptacular tube, and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule without perisperm. The so-called fruit is merely the receptacular tube, which, as previously mentioned, becomes fleshy and brightly colored as an attraction to birds, which devour the hips and thus secure the dispersion of the seed. The stamens are in whorls, and, according to Payer, they originate in pairs one on each side of the base of each petal (parapetalous), so that there are ten in each row, a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double flowers which are so much admired. The carpels are much less subject to this petaloid change, and, as it generally happens in the most double of roses that some few at least of the anthers are formed with pollen, the production of seed and the possibility of cross-breeding become intelligible. Under natural circumstances rose flowers do not secrete honey, the attraction for insects being provided, according to Müller, by the color and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, close fertilization is not prevented.

Rose water is chiefly produced in Europe from the Provence or cabbage rose, *R. centifolia*, grown for the purpose at Mitcham and much more abundantly in the south of France. Conserve of roses and infusion of roses, two medicinal preparations retained for their agreeable qualities rather than for any special virtue, are prepared from the petals of *Rosa gallica*, one variety of which was formerly grown for the purpose near the town of Provins. Conserve of dog rose is made from the ripe hips of the dog rose, *Rosa cansina*. Its only use is in the manufacture of pills.

The name ROSE OF JERICO is popularly applied to a small Cruciferous weed, *Anastatica hierochuntina*, a native of the desert regions of Egypt, Arabia, Palestine, and Persia.

ROSELLINI, IPPOLITO, a native of Pisa and subsequently professor there of Oriental languages, in which Mezzofanti was his teacher, is best known as the associate of J. F. CHAMPOLLION (*q.v.*), whose studies he shared and whom he accompanied in his Egyptian explorations (1828). On the death of Champollion the publication of the results of their expedition fell to Rosellini, (*Monumenti dell' Egitto e della Nubia*, Florence, 1832-1840, ten vols. fol.) He died in 1843 where he was born in 1800.

ROSEMARY (*Rosmarinus*) a well-known Labiate plant, the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back onto the under surface. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla inclosing two stamens, the other two being deficient. Rosemary is used on account of its fragrance and medicinal value, and is considered as a token of remembrance.

**ROSETTA** (see EGYPT). The celebrated Rosetta Stone, a basalt stele containing a decree of Ptolemy V. Epiphanes in hieroglyphics, demotic, and Greek, which supplied the key for the decipherment of the ancient monuments of Egypt, was found near Fort St. Julien, four miles north of the town, in 1799, by Boussard, a French officer. It is now in the British Museum.

**ROSEWOOD.** Under this name several distinct kinds of ornamental timber are more or less known. That, however, so called in the United Kingdom is Brazilian rosewood, the *palissandre* of the French, the finest qualities of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of *Dalbergia nigra*, a Leguminous tree of large dimensions, called *cabiuna* and *jacaranda* by the Brazilians. The same name, jacaranda, is applied to several species of *Macharium*. Rosewood comes to the United Kingdom from Rio, Bahia, Jamaica, and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the center. Rosewood has a deep ruddy brown color, richly streaked and grained with black resinous layers. It takes a fine polish, but on account of its resinous nature it is somewhat difficult to work.

**ROSH**, also **HAROSH** (ר' אש, ר' אה, *i. e.*, "chief," "the chief"), stands by contraction for Rabbenu Asher, or Harab Rabbenu Asher (b. Yehiel), chief rabbi of all Castile. He was born in Germany about the middle of the thirteenth century and died at Toledo on October 25, 1327.

Rosh enjoys a sixfold celebrity. (1) He was a descendant of a long line of distinguished ancestors, among them **RABAN** (*q. v.*). (2) He was "the distinguished of the most distinguished disciples" of the foremost rabbi of his age in Germany, viz., Rabbenu Meir b. Barukh, better known under the name of R. Meir of Rothenburg. (3) He was the father of eight great Rabbinic scholars. (4) He was in his own right, after 1293 in Germany and after 1310 everywhere, the greatest Talmudist. (5) He was the first rabbi of the Ashkenazic school who possessed powers of systematization. (6) He was a man not merely of the deepest piety but of the sternest and, if we may say so, the most savage morality.

**ROSICRUCIANS** (**ROSENKREUZER**) a celebrated but entirely fabulous secret society that flourished during the seventeenth century. It was said to have been founded two hundred years before by a certain Christian Rosenkreuz, who had acquired on a pilgrimage the hidden wisdom of the East. The society, according to this account, possessed many secret gifts of knowledge, of which goldmaking was one of the least. Its character was Christian and of Protestant type; its chief aim was the gratuitous healing of the sick. It finally came to be seen that the society was fabulous and the name and fable of the Rosicrucians have from time to time been made use of by such impostors as Cagliostro.

**ROSIN**, or **COLOPHONY**, is the resinous constituent of the oleo-resin exuded by various species of pine, known in commerce as crude turpentine (see **TURPENTINE**). The separation of the oleo-resin into the essential oil-spirit of turpentine and common rosin is effected by distillation in large copper stills. The essential oil is carried off at a heat of between 212° and 316°, leaving fluid rosin, which is run off through a tap at the bottom of the still, purified by passing through a straining wadding, and received into a vat, whence it is ladled into barrels ready for the market. Rosin varies in color, according to the age of the tree whence the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance

through grades of brown and yellow to an almost perfectly transparent colorless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale—superior to which are W, "window glass," and WW, "water white" varieties, the latter having about three times the value of the common qualities. Rosin is a very brittle and friable resin, with a faint piny odor, softening at about 176° and melting completely at the temperature of boiling water. It dissolves freely in ether, benzol, and chloroform, and to some extent in alcohol and fatty oils. When exposed to the action of hot dilute alcohol or when boiled with alkaline solutions it takes up a molecule of water and becomes converted into abietic acid, a change which also takes place slowly in the air when the resin is yet mixed with the essential oil as it flows from the trees. Rosin is thus regarded as an anhydride of abietic acid, and its use in yellow soaps is due to the fact that this acid itself combines with caustic alkalies to form a kind of soap. In addition to its extensive use in soap-making, rosin is largely employed in making inferior varnishes, sealing wax, and various cements. It is also used for preparing shoemaker's wax, for soldering metals, for pitching lager beer casks, for rosinning the bows of musical instruments, and numerous minor purposes. In pharmacy it forms an ingredient in several plasters and ointments. On a large scale it is treated by destructive distillation for the production of an oily complex hydrocarbon, having a tarry odor and a whitish opalescent color, which under the name of rosin oil is used as a lubricant. Rosin oil also enters extensively into the common kinds of fatty oils as an adulterant.

The chief region of rosin production is the southern coast states of the United States—the ports of Wilmington, Charleston, Savannah, and Brunswick being the principal centers of the trade. American rosin is obtained from the turpentine of the swamp pine, *Pinus australis*, and of the loblolly pine, *P. Teda*. The main source of supply in Europe is the "landes" of the departments of Gironde and Landes in France, where the sea pine *P. maritima*, is exclusively cultivated. In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris*, and throughout European countries local supplies are obtained from other species of pine.

**ROSMINI-SERBATI**, **ANTONIO**, perhaps the most important figure in modern Italian philosophy, was born at Rovereto, in the Italian Tyrol, in 1797, and died in 1855. He became the founder of a new religious order, named the Institute of Charity, but known in Italy generally as the Rosminians. The members may be priests or laymen. All are prepared to do any works of charity—corporal, intellectual, or spiritual—to which they may be directed by divine providence, under obedience to their superior, to the bishops, and to the pope. They have branches in Italy, England, Ireland, France, and America. In London they are attached to the ancient church of St. Etheldreda, Ely Place, Holborn, where the English translations of Rosmini's works are edited. Rosmini's *Sistema Filosofico* set forth the conception of a complete encyclopædia of the human knowable, synthetically conjoined, according to the order of ideas, in a perfectly harmonious whole. This conception Rosmini developed in more than forty volumes.

**ROSS**, a county in the north of Scotland. **CROMARTY** (*q. v.*) consists of detached portions, scattered throughout Ross, and, for most administrative purposes, the two counties are regarded as one. The united area of their mainland portion lies between 57° 8' and 58° 6' N. latitude, and 3° 47' and 5° 52' W. longitude, and is bounded north by the Dornoch Firth and Sutherlandshire, east by the Moray Firth, south by Inverness-

shire, and west by the Atlantic. It comprehends 2,003,065 acres, of which only about 220,280 acres are included in Cromarty. Its length from east to west is 67 miles, and from north to south 58 miles. The area of the islands is 437,221 acres. Ross includes the northern part of Lewis, and other ten islands of the Hebrides, of which eight only were inhabited in 1881. The outline of Ross and Cromarty is very irregular, and both east and west coasts are much indented by bays and inland lochs, but, except in the more inland recesses of these inlets, the coast scenery is tame and uninteresting.

In the northwest of Ross the Archæan series of rocks, consisting of gneisses, schists, and other crystalline rocks, are well developed. Above them rest unconformably red conglomerates and sandstones of Cambrian age, rising into the picturesque mountains which form such a striking feature of the scenery of western Ross. Farther east they are overlaid unconformably by the quartzites and limestones belonging to the Lower Silurian division. Over these, by enormous terrestrial displacement, the Archæan and Cambrian rocks have been pushed, sometimes for a horizontal distance of ten miles. Along the east coast they are unconformably covered by the Old Red Sandstone formation. Rocks of Jurassic (Oolitic) age fringe the eastern shores. In the Black Isle peninsula they include a thin coal seam. Near the Sutors of Cromarty they abound in ammonites, belemnites, and other shells, and in the remains of various woods and ferns. Ironstone, chiefly in the form of bog iron ore, is found in considerable quantities. Of the various mineral springs the best known is that of Strathpeffer, characterized chiefly by sulphuretted hydrogen gas and various salts. The surface consists principally of lofty mountain groups intersected by comparatively narrow valleys, occupied partly by lakes and rivers; but in the east there is considerable extent of comparatively level ground. A large number of the mountains are over 3,000 feet in height. The principal rivers are the Oykel, which, rising in Sutherland, forms for about twenty miles the boundary with Ross, from which near its mouth it receives the Carron; the Conan, falling into Cromarty Firth; and the Carron, flowing southwest into Loch Carron. The most fertile part of the counties is the eastern district, especially that included in the peninsulas of the Black Isle and Eastern Ross, the soil varying from a light sandy gravel to a rich deep loam. In this district agriculture is quite as advanced as in any other part of Scotland. In the valleys and along the shores of the western coast there are many patches of good soil, but, partly on account of the excessive rainfall, tillage is not prosecuted with the same enterprise as in the eastern districts. On the higher grounds there is a large extent of good pasturage for sheep. According to the agricultural statistics for 1885 the total area in Ross and Cromarty under crops, bare fallow, and grass, was 134,399 acres, of which 47,639 acres were under grain crops, 26,496 under green crops, 40,819 rotation grasses, 19,075 permanent pasture, and 370 fallow.

Horses, principally half-breeds between the old "garrons" and Clydesdales, numbered 7,365 in 1885, of which 5,874 were used solely for purposes of agriculture; cattle numbered 42,976, of which 17,811 were cows and heifers in milk or in calf, and 17,561 under two years old. They are principally the native highland breed or crosses. Sheep in 1885 numbered 309,590, of which 213,522 were one year old and above. Besides black-faced, crosses with Leicesters and crosses between Leicesters and Cheviots are not uncommon. There is still in Ross and Cromarty a considerable extent of native woodland, the trees being principally firs, oaks, ash, and alder. The area under woods in 1881 was 43,201 acres.

The red and roe deer have free scope on the extensive mountain regions, the area under deer forests being 719,305 acres. Foxes, badgers, wild-cats, alpine hares, and other wild animals abound. The usual varieties of winged game are plentiful. The golden eagle and osprey are both common, as well as many other birds of prey. Waterfowl of all kinds abound in the extensive sea lochs, and the rivers and inland lochs are specially abundant in trout and salmon. The pearl mussel is found in the bed of the river Conan.

According to the latest Landowners' Return, 2,043 proprietors possessed 1,971,682 acres in the county of Ross, of a gross annual value of \$1,346,710. The owners of less than one acre numbered 1,719. For Cromarty separately the return gives 231 owners, possessing 18,206 acres, of \$59,825 annual value.

With the exception of distillation, there are no important manufactures within the counties, although home-made woolen cloth is woven in the country districts. The counties depend chiefly on their agriculture and their fishing, which within recent years has greatly developed through improved means of communication with the south. Stornoway and the west coast have regular communication by steamers with Glasgow, and on the east coast a steamer leaves Cromarty and Invergordon for Aberdeen and Leith once a week. Fish, cattle, and sheep, are the principal exports. The Highland railway skirts the Firth of Cromarty by Dingwall and Tain to Bonar Bridge, a branch passing from Dingwall southwestward to Strome Ferry, whence there is communication with Skye by steamer. Salmon fishing is extensively carried on in the bays and the mouths of the rivers, and the deep-sea fishings for herring, and for cod and other large fish, are among the most important in Scotland.

ROSS, SIR JAMES CLARK, arctic voyager, was born in London, England, April 15, 1800. He entered the navy in 1812 under his uncle Sir John Ross, whom he accompanied in his first voyage in search of a northwest passage. From 1819 to 1825, and again in 1827, he was engaged with Captain Parry in his voyages (see POLAR REGIONS). He commanded the *Erebus* and *Terror* to the Antarctic seas from 1839 to 1843, and after his return he received in 1844 the honor of knighthood. In 1847 he published *A Narrative of a Voyage in the Antarctic Regions*, 2 vols. His last expedition was in 1848 in the *Enterprise*, to Baffin's Bay in search of Sir John Franklin. He died at Aylesbury, April 3, 1862.

ROSS, SIR JOHN, arctic voyager, was the fourth son of the Rev. Andrew Ross, minister of Inch, Wigtonshire, where he was born in 1777. He entered the navy in 1786. In 1818 he sailed in command of an Arctic expedition (see POLAR REGIONS), an account of which he published, under the title *Voyage of Discovery for the Purpose of Exploring Baffin's Bay*, in 1819. In 1829 he was able to undertake a second expedition. In accordance with a promise to Sir John Franklin, he undertook a third expedition in 1850 and remained one winter on the ice, but accomplished nothing. He died August 31, 1856.

ROSSANO, a city of Italy, in the province of Cosenza, most picturesquely situated on a precipitous spur of the great mountain mass of Sila (geologically the oldest part of Italy) overlooking the Gulf of Taranto. The railway station, ninety-three miles from Taranto, is about an hour from the town. Rossano is the seat of an archbishop and the center of a circondario; marble and alabaster quarries are worked in the neighborhood; the inhabitants numbered 14,688 in 1881, and 16,156 in 1889 (19,000 in the commune).

ROSSE, WILLIAM PARSONS, THIRD EARL OF, the distinguished constructor of reflecting telescopes, was

born at York, England, on June 17, 1800, a son of the second earl, who, as Sir Lawrence Parsons, Bart., had been a prominent member of the Irish Parliament. From 1827 he devoted himself to the improvement of reflecting telescopes; in 1839 he mounted a telescope of three feet aperture at his seat, Birr Castle, Parsonstown; and in 1845 his celebrated six-foot reflector was finished. Owing to the famine and the disturbed state of the country, which demanded his attention as a large landowner and lieutenant of King's county, the instrument remained unused for nearly three years, but since 1848 it has been in constant use, chiefly for observations of nebulae, for which it was particularly suited on account of its immense optical power. Lord Rosse died on October 31, 1867.

ROSSELLI, COSIMO, a Florentine painter, was born in 1439. According to Vasari, Rosselli died in 1484, but this is evidently a mistake, as his will still exists dated November 25, 1506.

ROSSELLINO, ANTONIO, one of the most skillful of Florentine sculptors, was the son of Matteo di Domenico Gamberelli, and had four brothers, who all practiced some branch of the fine arts. He was born in 1427 and died in 1479. Almost nothing is known about the life of Antonio, but many of his works still exist, and are of the highest beauty, full of strong religious sentiment, and executed with the utmost delicacy of touch and technical skill.

ROSSELLINO, BERNARDO, born 1409, died in 1464, was no less able as a sculptor than his younger brother, and was also a very distinguished architect.

ROSSETTI, DANTE GABRIEL, poet and painter, whose full baptismal name was Gabriel Charles Dante, was born May 12, 1828, at 38 Charlotte street, Portland Place, London, England. He was the first of the two sons and the second of the four children of Gabriele Rossetti, the Italian poet and patriot.

Of the artistic education of foreign travel Rossetti had very little. But in early life he made a short tour in Belgium, where he was indubitably much impressed and influenced by the works of Van Eyck at Ghent and Memling at Bruges. In the spring of 1848 he took an active part in forming the so-called pre-Raphaelite brotherhood, the members of which believed that the time had come for the artist to confront again Nature herself.

But Rossetti's genius absorbed from pre-Raphaelitism all that it had to give, and then passed on its way toward its own special goal.

It was as early as 1849 that Rossetti exhibited in the so-called Free Exhibition the *Girlhood of the Virgin*, one of the most beautiful and characteristic of all his works. He scarcely ever exhibited again in London, though just before his death his largest and most ambitious picture, *Dante's Dream*, was exhibited at Liverpool. Then came, in 1850, *The Germ*, that short-lived magazine of four numbers upon which so much has of late been written. If *The Germ* was really "an official manifesto or apologia of pre-Raphaelitism," all that it had to preach was the noble doctrine of the sacredness, the saving grace, of conscience in art. In it appeared Rossetti's poem the *Blessed Damozel*, the prose poem *Hand and Soul*. The artist who had had the strongest influence upon Rossetti's early tastes was Madox Brown, whose genius, dramatic and historic, has at length obtained universal recognition through the magnificent frescoes at Manchester. He became Brown's pupil; but only once or twice, as in *Found* and *Doctor Johnson at the Mitre*, did Rossetti try his hand at such realistic subjects as Brown loved. *Found*, begun in 1853, still remains unfinished.

Many circumstances—for instance, the beginning of

such grand designs as *Magdalene at the Door of Simon the Pharisee*, *Aspectâ Medusâ*, the *Boat of Love*, etc. —interfered with the completion of *Found*. With the exception of the *Boat of Love*, *Dante's Dream* (1870) was perhaps Rossetti's most ambitious design in purely imaginative art. From the painting of this picture to his death, Rossetti never satisfactorily completed a large and elaborate design. The truth is that he wanted to write more poetry; and those wonderful half-lengths of women, for which, late in life, he became so famous, were not only beautiful and satisfying, but comparatively easy of achievement. Among those half-lengths, however, will be found some of his greatest works. Chief among them (if it is not *Proserpine*) is the marvellous crayon design *Pandora*.

But we must turn to his poetry. *The Blessed Damozel* was written as early as 1848. *Sister Helen* was produced in its original form in 1850 or 1851. The translations from the early Italian poets also began as far back as 1845 or 1846, and may have been mainly completed by 1849. The poet who should go beyond Rossetti would pass out of the realm of poetry into pure mysticism, as certain of his sonnets show. Fine as are these sonnets, it is in his romantic ballads that Rossetti (notwithstanding a certain ruggedness of movement) shows his greatest strength. In this opinion (which is not the general one) we agree with Doctor Hueffer. *Sister Helen*, *The Blessed Damozel*, *Staff and Scrip*, *Eden Bower*, *Troy Town*, *Rose Mary*, as representing the modern revival of the true romantic spirit, take a place quite apart from the other poetry of our time.

In all matters of taste Rossetti's influence has been immense. The purely decorative arts he may be said to have rejuvenated directly or indirectly. And it is doubtful whether any other Victorian poet has left so deep an impression upon the poetic methods of his time. One of the most wonderful of Rossetti's endowments, however, was neither of a literary nor an artistic kind: it was that of a rare and most winning personality which attracted toward itself, as if by an unconscious magnetism, the love of all his friends, the love, indeed, of all who knew him.

ROSSINI, GIOACHINO ANTONIO, Italian dramatic composer, was born at Pesaro, February 29, 1792. Rossini's first opera, *La Cambiale di Matrimonio*, was produced with success at the Teatro San Mosè at Venice in 1810. In 1811 he produced *L'Equivoco stravagante*, at Bologna; but his first real triumph was achieved at Venice in 1812, in *L'Inganno felice*, a work in which his genius unmistakably asserted itself. In the same year he produced *La Pietra del Paragone*, with equal applause, at Milan, besides four other operas in other places. These pieces were all successful, but *Tancredi*, written for the Teatro San Fenice at Venice, in 1813, produced a veritable *furor*. The name of the young *maestro* was now famous; yet, strange to say, his greatest comic opera was hissed on its first performance at Rome in 1816. This delightful inspiration, first entitled *Almaviva*, but now known as *Il Barbiere di Siviglia*, was founded on a libretto which Paisiello had already treated with success, and hence the refusal of the Roman audience to tolerate it. But the beauty of the music overcame the scruples of the most prejudiced listeners, and, by the time the *Barbiere* reached its third representation, Rossini was openly accepted as the greatest dramatic composer in Italy. Between 1815 and 1823 Rossini composed no less than twenty operas, including his masterpieces *Elisabetta* (1815), *Il Barbiere* (1816), *Otello* (1816), *La Cenerentola* (1817), *La Gazza Ladra* (1817), *Mosè in Egitto* (1818), *Le Donna del Lago* (1819), and *Semiramide* (1823), the last of which has lately been

revived, with so great success, by Madame Adelina Patti.

Rossini in 1824 accepted an engagement as musical director of the Théâtre Italien in Paris, where, in 1829, he produced his last great masterpiece, *Guillaume Tell*. After completing this beautiful work he composed no more until 1832, when he wrote the first six movements of the *Stabat Mater* for private performance only. He completed this lovely composition in 1839, and it was first publicly performed at the Salle Ventadour in 1842. In 1855 he settled permanently in Paris, at 2 Rue Chaussée d'Antin, where he composed his last work, the *Petite Messe Solennelle*. After his final return to Paris he spent a part of every year in a suburban villa in the Avenue Ingres, at Passy, and here he died of a very painful illness, November 13, 1868.

Rossini effected a complete revolution in the style of Italian opera. His accompaniments were richer than any that had ever been previously heard in Italy, and in their masterly instrumentation rivaled some of the most notable achievements of German art.

ROSTOCK, the largest town of Mecklenburg-Schwerin, and one of the most important commercial cities on the Baltic, is situated on the left bank of the estuary of the Warnow, about eight miles from the sea. It lies 177 miles northwest of Berlin by railway, 80 miles northeast of Lübeck, and 106 miles south of Copenhagen. Rostock is the seat of the supreme court for both the duchies of Mecklenburg, and is well equipped with schools, hospitals, and other institutions. The population in 1810 was 10,979; in 1880 it was 36,967, of whom only 224 were Roman Catholics, and only 221 were Jews; in 1885 it was 39,212, and in 1889, 42,000.

Although the population, commerce, and wealth of Rostock have all declined since its palmy days as a flourishing Hanse town in the Middle Ages, it has still a very considerable trade, and no Baltic port possesses so large a merchant fleet. In 1882, 314 ships, with a total burden of 97,447 tons, were registered as belonging to Rostock. Ships of more than 200 tons burden must discharge part of their cargo at Warnemünde, at the mouth of the Warnow, the port of Rostock, a fishing village and watering place with 1,766 inhabitants, who are distinguished by a peculiar dialect and costume. By far the most important export of Rostock is grain, which goes almost entirely to British ports; but wool, flax, and cattle are also shipped. The chief imports are coal from Great Britain, herrings from Sweden, petroleum from America, timber, wine, and colonial goods. The industries of the town are varied. One of the chief is shipbuilding, which, however, has declined of late years. Cotton, straw hats, tobacco, carpets, soap, cards, chocolate, and dye-stuffs are among the manufactures of the town, which also contains distilleries, saw-mills, oil mills, tanneries, and breweries.

ROSTOFF, on the Don, is one of those modern towns which have grown up with such remarkable rapidity in South Russia since the definite occupation by the Russians of the Black Sea coast.

The Don, which here has a breadth of no more than 230 to 250 yards, with a hardly perceptible current, offers an excellent roadstead. The navigation, however, is considerably impeded by the shallowness of the branches of the river which are thirty in number at its entrance to the sea, but of which only three (Mertvyi Donets, Kolontcha, and the Don proper) are navigable. During the east winds, however, there is only four feet depth of water on the delta; and ships formerly were often compelled to stay outside for several weeks, waiting for a southwest wind. Recent dredging operations have but partially remedied this evil, and the goods have to be

carried on lighters to Taganrog and Mariupol, where they are shipped. In 1882 only forty-seven ships of small size coming from foreign countries under the Russian and Turkish flags entered the port, but no fewer than 3,175 vessels (349,500 tons) engaged in cabotage or lighter traffic, left the roadstead. The export of corn, oil-seeds, wool, tallow, butter, iron, hides, ropes, coarse linen, pitch, etc., from 12,311,000 rubles in 1865, had risen to 41,634,252 rubles in 1882, while the imports were valued at only 886,120 rubles. The agricultural produce thus exported is drawn from the entire basin of the Don in central Russia, while ores and metals are brought from the Urals. The commercial importance of Rostoff is further increased by its position on the great highway from Kharkoff and Voronezh to Caucasus, on which traffic has greatly increased since Rostoff became connected by rail with Kharkoff and Voronezh on the one side and Vladikavkaz on the other. Rostoff has also excellent fisheries, and in summer it becomes the gathering place of many thousands of laborers on their way to assist in harvesting operations in the provinces of the Don and in northern Caucasia. The population was 70,700 in 1881 and 76,000 (estimated) in 1890.

ROSTOFF, on Lake Nero, a district town of Russia in the government of Yaroslavl, and thirty-five miles by rail southwest of Yaroslavl, is probably the oldest town of northeastern Russia. The specialty of Rostoff is the production of a variety of kitchen-garden produce and apothecary's herbs. Chicory and dried sweet peas are the principal objects of trade. Another industry formerly developed in consequence of the great influx of pilgrims—that of painting sacred pictures on a kind of enamel—still continues to flourish. The saddlery and linen manufactures, and the fishing, may likewise be mentioned. The population of Rostoff in 1883 was 12,500; in 1890 it approximated 14,000.

ROSWITHA. See HROSVITHA.

ROTHER, RICHARD, theologian, was born at Posen, January 28, 1799. Rothe was one of the most if not the most profound and influential of modern German theologians next to Schleiermacher. Like the latter he combined with the keenest logical faculty an intensely religious spirit, while his philosophical tendencies were rather in sympathy with Hegel than Schleiermacher, and theosophic mysticism was more congenial to him than the abstractions of Spinoza, to whom Schleiermacher owed so much. He died in 1867.

ROTHERHAM, a market-town and municipal borough in the West Riding of Yorkshire, England, is situated at the junction of the Rother with the Don navigation, on several railway lines, five miles northeast of Sheffield. The population of the municipal borough (area 5,995 acres) in 1891 was 42,050.

ROTHESAY, a royal burgh, and the principal town of the county of Bute, Scotland, is situated in the island of Bute, at the head of a well-sheltered and spacious bay in the Firth of Clyde, forty miles west of Glasgow and eighteen southwest of Greenock. The population of the royal burgh in 1871 was 8,027, and in 1891 it was 9,034.

ROTHSCHILD, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being MAYER ANSELM (1743-1812), the son of Anselm Moses Bauer, a small Jewish merchant of Frankfort-on-the-Main. His father wished him to become a rabbi, but he preferred business, and ultimately set up as a money lender at the sign of the "Red Shield" (*Rothschild*) in the Frankfort Judengasse. He had already acquired some standing as a banker when his numismatic tastes

obtained for him the friendship of William, ninth landgrave and afterward elector of Hesse-Cassel, who in 1801 made him his agent. In the following year Rothschild negotiated his first great government loan, ten million thalers for the Danish Government. He died at Frankfort September 19, 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris, and Naples, each being in charge of one of the sons, the chief of the firm always residing at Frankfort. Each of the brothers received in 1815 from Austria the privilege of hereditary landowners, and in 1822 they were created barons by the same country. The charge of the Frankfort house devolved on the eldest, ANSELM MAYER, born June 12, 1773, who was chosen a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consul and court banker. The Vienna branch was undertaken by SOLOMON, born December 9, 1774, who entered into intimate relations with Prince Metternich, which contributed in no small degree to bring about the connection of the firm with the allied powers. The third brother, NATHAN MAYER, born September 16, 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He went to Manchester, England, about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London, where he found full scope for his financial genius. He died July 28, 1836, and was succeeded in the management of the London house by his son LIONEL, born November 22, 1808, whose name will always be associated with the removal of the civil disabilities of the Jews. He continued to represent the city of London till 1874. JACOB, the youngest of the original brothers, was intrusted with the important mission of starting the business in Paris after the restoration of the Bourbons, for whom he negotiated large loans. He died November 15, 1868. The Naples branch was superintended by another of the brothers, KARL (1780-1855). It was always the least important of the five, and after the annexation of Naples to Italy in 1860 it was discontinued.

ROTHWELL, an urban sanitary district in the West Riding of Yorkshire, England, situated in a pleasant valley four miles south of Leeds. The population of the urban sanitary district (area 3,302 acres) in 1871 was 3,733, and in 1881 it was 5,105.

ROTIFERA. The *Rotifera* (or *Rotatoria*) form a small, in many respects well-defined, but somewhat isolated class of the animal kingdom.

They are multicellular animals of microscopic size which present a coelom. They are bilaterally symmetrical and present no true metameric segmentation. A head region is generally well marked, and most forms present a definite tail region. This tail region has been termed the "pseudopodium." It varies very much in the extent to which it is developed. It attains its highest development in forms like *Philodina*, which affect a leech-like method of progression and use it as a means of attachment. We may pass from this through a series of forms where it becomes less and less highly developed. In such forms as *Brachionus* it serves as a directive organ in swimming, while in a large number of other forms it is only represented by a pair of terminal styles or flaps. In the sessile forms it becomes a contractile pedicle with a suckorial extremity. A pseudopodium is entirely absent in *Asplanchna*, *Triarthra*, *Polyarthra*, and a few other genera. The pseudopodium, when well developed, is a very muscular organ, and it may contain a pair of glands which secrete an adhesive material.

The *Rotifera* are distributed all over the earth's surface, inhabiting both fresh and salt water. The greater number of species inhabit fresh water, occurring in pools, ditches, and streams. A few species will appear in countless numbers in infusions of leaves, etc., but their appearance is generally delayed until the putrefaction is nearly over. Species of *Rotifer* and *Philodina* appear in this way. A few marine forms only have been described—*Brachionus mülleri*, *B. heptatonus*, *Synchaeta baltica*, and others.

A few forms are parasitic. *Albertia* lives in the intestine of the earthworm; a form has been described as occurring in the body-cavity of *Synapta*; a small form was also observed to constantly occur in the velar and radial canals of the fresh water jelly-fish, *Limnocodium*. *Notommata parasitica* leads a parasitic existence within the hollow spheres of *Volvox globator*, sufficient oxygen being given off by the *Volvox* for its respiration.

ROUROU, JEAN DE, the greatest tragic poet of France before Corneille, was born on August 21, 1609, at Dreux, in Normandy, and died of the plague at the same place on June 28, 1650.

ROTTERDAM, a city of the Netherlands in the province of South Holland, situated in 51° 55' 19" N. latitude and 4° 29' 7" E. longitude, on the right bank of the Nieuwe Maas at the point where it is joined by the Rotte, a small stream rising near Moerkapelle. By rail it is fourteen and a half miles southeast of The Hague and forty-four and a half south of Amsterdam. The population of the commune of Rotterdam, which did not much exceed 20,000 in 1632, was 53,212 in 1796, 72,294 in 1830, 88,812 in 1850, 105,858 in 1860, 132,054 in 1876, and 148,102 in 1879-80. In 1870 the city contained 111,256 inhabitants, the suburbs 3,341, and the ships 2,478, and in 1890 the total, exclusive of the shipping, was 203,472.

Rotterdam probably owes its origin to the castles of Wena and Bulgerstein, of which the former was laid in ruins by the Hoek party in 1426. In 1299 Count John I. granted the "good people of Rotterdam" the same rights as the burghers of Beverwijk, and freedom from toll in all his lands. In 1597 a sixth extension of the town's area took place, and a seventh followed in 1609. Francis of Brederode seized the place in 1488, but had to surrender it to the emperor Maximilian in 1489. The Spaniards were in possession from April 9 to July 31, 1572, having gained entrance partly by treachery and partly by force, (*Dutch Republic*, ii.) It was at a meeting of the states held at Rotterdam in June, 1574, that the relief of Leyden was determined on, though it was not till 1580 that the town obtained a vote in the assembly.

ROUBAIX, a manufacturing town of France, the second in population in the department of Nord, lies to the northeast of Lille on the Ghent Railway and on the canal connecting the lower Deule with Scheldt by the Marq and Espierre. The population of Roubaix, which in 1891 was 115,000 (the commune 121,000), is almost entirely manufacturing, and the trading firms of the town gave employment besides to an equally large number of hands in the vicinity.

ROUBILLAC, LOUIS FRANCOIS, an able French sculptor. Born at Lyons in 1695, he became a pupil of Balthasar of Dresden and of N. Coustou. About the year 1720 he settled in London, and soon became the most popular sculptor of the time in England. He died on January 11, 1762, and was buried in the church of St. Martin-in-the-Fields.

ROUCHER, JEAN ANTOINE, a French poet, to whom a melancholy fate and some descriptive verse equal to anything written during the last three-quarters of a century by any of his countrymen except André

**Chénier**, gave some reputation, was born on February 17, 1745, at Montpellier, and perished by the guillotine at Paris on July 25, 1794.

**ROUEN**, a city of France, the ancient capital of Normandy, and now the administrative center of the department of Seine Inférieure, the seat of an archbishopric and court of appeal, and the headquarters of the third corps d'armée, stands on a level site on the right bank of the Seine in 49° 26' N. latitude and 1° 6' E. longitude, at the point where it is joined by the Aubette and the small Rivière de Robec. The population of the six cantons of Rouen in 1886 was 107,120, but if the suburbs are included the figure may be stated at about 150,000.

Cotton spinning and weaving are carried on in the town, and especially the manufacture of *rouenneries* (cotton fabrics woven with dyed yarn).

Ratuma or Ratumacos, the original name of Rouen, was modified by the Romans into Rotomagus, and by the writers of mediæval Latin into Rodomum, of which the present name is a corruption.

Philip Augustus built a castle at Rouen, but it was rather a fortress than a palace, and the kings of France never treated it as a residence; a round keep called Joan of Arc's Tower still stands. On the other hand, nothing remains of the castle erected by Henry V. of England when he took possession of Rouen in 1418 after a sanguinary siege; he proposed making it one of his continental residences, but it was never completed. It was in Philip Augustus' castle that Joan of Arc was imprisoned and tried, and one of the public squares was the place where she was burned alive in 1431. During the Franco-German War the city was occupied by the invaders from December 5, 1870, to July 22, 1871, and had to submit to heavy requisitions. Among the famous men born at Rouen are the brothers Corneille, Fontenelle, the journalists Armand Carrel and De Villemessant, the composer Boieldieu, the painters Jouvenet, Restout, and Géricault, the architect Blondel, Dulong the physicist, and La Salle the American explorer.

**ROUGE**. This name is applied to various coloring substances of a brilliant carmine tint, especially when used as cosmetics. The least harmful of these preparations are such as have for their basis carthamine, obtained from the safflower (*Carthamus tinctorius*). The Chinese prepare a rouge, said to be from safflower, which, spread on the cards on which it is sold, has a brilliant metallic green luster, but when moistened and applied to the skin assumes a delicate carmine tint. Jeweler's rouge for polishing gold and silver plate is a fine red oxide of iron prepared by calcination from sulphate of iron (green vitriol).

**ROUGET DE LISLE**, **CLAUDE JOSEPH**, one of the most noteworthy of those authors whom a single short piece of work has made famous, was born on May 10, 1760, at Lons-le-Saunier. He entered the army as an engineer and attained the rank of captain. The song which has immortalized him, the *Marseillaise*, was composed at Strasburg, where Rouget de Lisle was quartered in April, 1792, and he is said to have composed both the words and the music in a fit of patriotic excitement after a public dinner. The piece was at first called *Chant de l'armée du Rhin*, and only received its name of *Marseillaise* from its adoption by the Provençal volunteers whom Barbaroux introduced into Paris, and who were prominent in the storming of the Tuileries. The author himself was unfavorably effected by that very event. He was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. Little is recorded of his latter years, and he received no pension

or other mark of favor till the accession of Louis Philippe. He died at Choisy on June 26, 1836.

**ROULERS**, or **ROUSSELAERE**, a town of Belgium, in the province of West Flanders, on the Mandelbeke, a tributary of the Lys, twenty-two and one-half miles south of Ostend on the railway to Courtrai. From time immemorial it has been the seat of a great weaving industry, which now produces both cotton, union, and linen goods; and it also manufactures in various other departments. The population was 16,345 in 1874, and 19,735 in 1887.

**ROOM** (**RÚM**) is the name by which the Arabs call the Romans, *i.e.*, all subjects of the Roman power. *Bilád al-Rúm*, "the lands of the Romans," accordingly means the Roman empire. The parts of the old empire conquered by the Arabs were regarded as having ceased to be Roman, but the Western Christian lands were still called lands of the Rúm, without reference to the fact that they had in great part ceased to pay any allegiance to the "king of Rúm," *i.e.*, the Byzantine emperor.

**ROUMANIA**, a kingdom in the southeast of Europe between the Carpathians, the Pruth, the Black Sea, and the Danube. The Pruth and the Kilia mouth of the Danube now form the frontier with Russia. West of Silistria the Danube is the boundary between Roumania and Bulgaria, while to the east of that point the boundary is formed by an irregular line passing east by south to the coast about ten miles to the south of Mangalia. The territory thus shut off between the Danube and the Black Sea is known as the **DOBRUDJA** (*q.v.*), and differs in its physical features and products from the rest of the kingdom. It was given to Roumania at the close of the last Russo-Turkish War as a compensation for the territory of Bessarabia, east of the Pruth, which was then restored to Russia. The area of the kingdom is estimated at about 49,250 square miles, which is rather less than that of England without Wales. The greatest length of the kingdom is from east to west near the parallel of 45°, along which the length is about 350 miles. The line stretching from northwest to southeast between the extreme points of the kingdom is about fifteen miles shorter.

Of the rivers of Roumania by far the most important is the Danube, which is navigable for large vessels throughout its Roumanian reach, the first obstruction to navigation, the celebrated Iron Gates, occurring just where it enters Roumanian territory.

The climate of Roumania is one of extremes as regards temperature. Winter and summer are almost equally trying. In the former season the thermometer may sink to -15° Fahr., while in the latter it may rise to from 90° to 95°. The mean temperature of spring at Bucharest is 53°, summer 72½°, autumn 65°, winter 27½°. Spring, however, scarcely exists except in name, the interval between the cold winter and hot summer being very short.

Three-fourths of the population are dependent upon agriculture. The plains covered by loess and black soil are admirably adapted for the growth of cereals, and of these the most important are maize, wheat, and barley. The methods of cultivation are to a large extent primitive and imperfect, but great improvements are taking place through the application of foreign capital to the development of the native resources.

Besides forming a valuable article of export maize furnishes the chief food of the people. The great body of Roumanians seldom eat meat except on feast days, and the favorite food is a dish called *mamaliga*, made by boiling maize-meal and flavoring it with a little salt. It thus resembles the hominy of the Americans. In addition to cereals many kinds of vegetables, including

garlic, melons, and cucumbers, are grown. Hemp and colza are also important products, and tobacco furnished a considerable article of export until it was made a monopoly of the state in 1872. The rearing of domestic animals is likewise an important industry, but it has not advanced so much of late years as the growth of cereals.

About one-sixth of the total surface of Roumania is estimated to be covered with forest producing valuable timber trees. Oaks, firs, and beeches are said to be met with having a diameter of more than eight feet at the height of thirty-three feet above the ground.

The mineral wealth on the Roumanian side of the Carpathians is considerable, but at present there are only three minerals that have any great industrial importance. These are rock-salt, petroleum, and lignite. The salt mines are a state monopoly, and two of them, at Ocna-Mare and Telega, are partly worked by convicts. The depth from which the salt is extracted nowhere exceeds 300 feet. The average quantity of salt sold annually is about 62,000 tons. Coal is also found, in some places even at the surface, but, though one or two mines have been opened, the total production is insignificant. Ozocerite, or fossil wax, is frequently found in association with lignite, but is used only in small quantity by the peasantry. Among other minerals are anthracite, iron, gold, copper, lead, sulphur, cobalt, and arsenic; and there is little doubt that some of these at least might be made economically valuable if the resources of the country were adequately developed.

So far the manufacturing industries of Roumania are hardly worthy of mention. There are petroleum refineries, one or two sugar refineries, numerous steam-mills for grinding flour, besides large numbers of floating maize-mills on the Danube; but in addition to these there are only a few manufactories at Galatz.

The first Roumanian railway was that from Giurgevo to Bucharest, opened in 1869. In 1890 there were about 1,200 miles of railway in the kingdom. The internal trade of Roumania is almost entirely in the hands of the Jews. It is greatly hampered by the existence of the octroi in all the large towns, almost all the necessaries of life as well as luxuries being taxed when introduced within the municipal boundaries.

The estimated population of the country is 5,376,000, including about 400,000 Jews and 200,000 Gipsies. About 4,500,000 of the population belong to the Roumanian branch of the Orthodox Greek Church, and there are 114,000 Roman Catholics and 13,800 Protestants.

Of the larger cities Bucharest (Bucurest) numbered in 1888 225,805 inhabitants, Jassy 93,125, and Galatz 86,763.

The peace strength of the permanent army consists of 1,200 officers and 18,532 men, with 180 guns. Besides this, there are the territorial army, consisting of 120,000 men and eighty-four guns; the militia, consisting of thirty-two regiments of infantry; and finally the *levée en masse*. Every Roumanian, from his twenty-first to his forty-sixth year, is obliged to serve his time in one of the above categories. The total of the Roumanian forces, exclusive of the *levée en masse*, amounts to about 150,000 men and 288 guns.

In 1865 a conflict broke out between the government and the people in Bucharest, and in February, 1866, Prince Cuza, whose personal vices had rendered him detestable, was forced to abdicate. The chambers chose first as his successor the count of Flanders, but on his declining the office proceeded to elect Prince Charles of Hohenzollern-Sigmaringen, who was proclaimed hospodar or *Domnu* of Roumania, April 29,

1866. A new constitution was at the same time introduced. Its provisions secure the universal suffrage of tax-paying citizens, ministerial responsibility, trial by jury, freedom of meeting and petition, of speech and of the press (except as regards breaches of the criminal code), gratuitous and compulsory primary education, and the right of asylum for political exiles. Legislative power is shared between the prince and chambers, but bills relating to the budget and army must originate with the chamber of deputies. There are two chambers—the senate and the chamber of deputies. Both houses are elective, and the election is carried out by means of electoral colleges classified according to property and professional qualifications. For the house of deputies each constituency is divided in this way into four colleges, each of which elects a member. The two highest of these colleges also elect the senators, each senator being elected for a term of eight years. The senate also includes *ex officio* certain high officials and ecclesiastics, and members for the universities. The senate consists at present of 120 members, the chamber of deputies of 178. The sovereign has a right of veto reserved to him on all measures. The judicial system is based on the *Code Napoléon*, with some modifications.

On the outbreak of the Russo-Turkish war in 1877 Roumania found herself between hammer and anvil. Yielding to *force majeure* the government of Prince Charles consented to the passage of Russian troops across Roumanian territory, on the understanding that the scene of hostilities was as far as possible to be removed outside the limits of the principality. The Porte, however, refusing to recognize that Roumania had acted under constraint, proclaimed the Roumanians rebels, and the prince's government accordingly resolved to offer active assistance to the Russians. A Roumanian division of 32,000 men under General Cernat, took part in the siege of Plevna, and the Roumanian soldiers distinguished themselves in the opinion of the most competent judges alike for their heroism and endurance. The successful assault by the Roumanian troops on the "indomitable redoubt" of Grivitzza formed in fact the turning point of the siege and of the war. In the peace of St. Stefano, however, Russia insisted on the retrocession of the strip of Bessarabia that had been restored to Moldavia by the treaty of Paris, giving Roumania "in exchange" the islands of the Danubian delta, and the Dobrudja, which had been ceded by the sultan. This territorial readjustment was ratified by the treaty of Berlin (1878). The high contracting powers at the same time consented by art. xliii. to recognize the independence of the principality subject to the provision (art. xlv.) that all the inhabitants should enjoy complete religious freedom, a clause inserted on account of the Jewish persecutions that had previously taken place, and that foreigners in the country should be treated on a footing of perfect equality. All Danubian fortresses were to be razed, and the jurisdiction of the European commission to regulate the Danubian navigation, on which Roumania now acquired the right of representation, was extended from the mouth to the Iron Gates. The coping-stone to Roumanian independence was set by proclamation on March 26, 1881, of Prince Charles as king of Roumania, and on May 22 of the same year his coronation took place with the European sanction. The crown placed on King Carol's head was made from the captured cannon of the Plevna redoubts.

ROUMANIAN LITERATURE. See VLACHS.

ROUMELIA. The name of Roumili, "the land of the Romans," was applied from the fifteenth century downward to all that portion of the Balkan peninsula

westward from the Black Sea which was subject to Turkey. More precisely it was the country bounded north by Bulgaria, west by Albania, and south by the Morea, or in other words the ancient provinces, including Constantinople and Salonica, of Thrace, Thessaly, and Macedonia. The name was ultimately applied more especially to an eyalet or province composed of Central Albania and Western Macedonia, having Monastir for its chief town, and including Kesrie (Castoria), Ocrida (Ochrida), and the Scodra (Scutari); and at length it disappeared altogether in the administrative alterations effected between 1870 and 1875. Eastern Roumania was constituted an autonomous province of the Turkish empire by the Berlin treaty of 1878, to be governed by a Christian governor-general appointed by the sultan for a term of five years. In 1879, in obedience to an international commission, it was divided into six departments and twenty-eight cantons, the departments being Philippopolis (187,095), Tatarbazarjik (117,063), Hassköi (134,268), Eski-Zagra (158,905), Kazanlik, Slivno or Sliven (130,136), and Burgas (88,046). The whole area is estimated at 14,858 square miles, and the population, in 1880, was 815,513, of whom 573,231 were Bulgarians, 176,759 Turks, 42,526 Greeks, 19,524 Gipsies, 4,177 Jews, and 1,306 Armenians.

**ROUND TOWERS.** A peculiar class of round tower exists scattered throughout Ireland; about one hundred and twenty examples once existed; most of these are ruined, but eighteen or twenty are almost perfect. These towers were built either near or adjoining a church; they are of various dates from, perhaps, the eighth to the thirteenth century; though varying in size and detail, they have many characteristics which are common to all. They are built with walls slightly battering inward, so that the tower tapers toward the top. The lower part is formed of solid masonry, the one doorway being raised from six to twenty feet above the ground, and so only accessible by means of a ladder. The towers, within, are divided into several stories by two or more floors, usually of wood, but in some cases, as at Keneith, of stone slightly arched. The access from floor to floor was by ladders, no stone staircase being provided. The windows, which are always high up, are single lights, mostly arched or with a flat stone lintel.

Much has been written as to the use of these towers, and the most conflicting theories as to their origin have been propounded. It is, however, fairly certain that they were constructed by Christian builders, both from the fact that they always are, or once were, near to a church, and also because crosses and other Christian emblems frequently occur among the sculptured decorations of their doors and windows. The original purpose of these towers was probably for places of refuge, for which the solid base and the door high above the ground seem especially adapted.

Round towers wider and lower in proportion than those of Ireland appear to have been built by many prehistoric races at different parts of Europe. Many examples exist in Scotland, and in the islands of Corsica and Sardinia. The most magnificent example of a round tower is the well-known leaning tower of Pisa, begun in the year 1174. It is richly decorated with tiers of open marble arcades, supported on free columns. The circular plan was much used by Moslem races for their minarets. The finest of these is the thirteenth century minar of Kootub at Old Delhi, built of limestone, with bands of marble. It is richly fluted on plan, and when complete was at least 250 feet high.

**ROUNDEL.** See **RONDEAU.**

**ROUS, or ROUSE, FRANCIS,** born 1579, died 1659.

known by his translation of the Psalms. His works appeared at London in 1657.

**ROUSSEAU, JACQUES,** painter, a member of a Huguenot family, was born at Paris in 1630. Besides being a painter in oil and fresco, Rousseau was an etcher of some ability; many etchings by his hand from the works of the Caracci and from his own designs still exist; they are vigorous, though too coarse in execution. He spent the latter part of his life in London, where he died in 1693.

**ROUSSEAU, JEAN-BAPTISTE,** a poet of some merit and a wit of considerable dexterity, was born at Paris on April 10, 1670; he died at Brussels on March 17, 1741.

**ROUSSEAU, JEAN JACQUES,** was born at Geneva, on June 28, 1712. In 1724 he was taken into the house of his uncle Bernard, by whom he was shortly afterward apprenticed to a notary. His master, however, found or thought him quite incapable and sent him back. After a short time (April 25, 1725) he was apprenticed afresh, this time to an engraver. He did not dislike the work, but was or thought himself cruelly treated by his master. At last, in 1728, when he was sixteen, he ran away, the truancy being by his own account unintentional in the first instance, and due to the fact of the city gates being shut earlier than usual. Then began a very extraordinary series of wanderings and adventures, for much of which there is no authority but his own.

Up to his thirty-third year Rousseau's life, though continuously described by himself, was of the kind called subterranean, and the account of it must be taken with considerable allowances. There are, to say the least, grave improbabilities in it; there are some chronological difficulties; and in one or two instances his accounts have been flatly denied by persons more or less entitled to be heard. He had written nothing, and if he was known at all it was as an eccentric vagabond. From this time, however, he is more or less in view.

It was not, however, till 1749 that Rousseau made his mark. The academy of Dijon offered a prize for an essay on the effect of the progress of civilization on morals. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay next year, became famous. In 1752 he brought out at Fontainebleau an operetta, the *Devin du Village*, which was very successful. He received a hundred louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy *Narcisse*, written long before, was also acted, but unsuccessfully. In the same year, however, a letter *Sur la Musique Française* again had a great vogue. Finally, for this was an important year with him, the Dijon academy, which had founded his fame, announced the subject of "The Origin of Inequality," on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 Rousseau saw his old friend and love Madame de Warens. He spent little more than a year at the "Hermitage" near Montmorency, but it was a very important year. Here he wrote *La Nouvelle Héloïse*; here he indulged in the passion which that novel partly represents, his love for Madame d'Houdetot, sister-in-law of Madame d'Epinay, a lady still young and extremely amiable but very plain, who had a husband and a lover (St. Lambert), and whom Rousseau's burning devotion seems to have partly pleased and partly annoyed. Here too arose the incomprehensible triangular quarrel between Diderot, Rousseau, and Grimm which ended Rousseau's sojourn at the Hermitage.

Hitherto Rousseau's behavior had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madamed'Épinay, with Diderot, and through them with the philosophe party, reversed this. In 1758 appeared his *Lettre à d'Alembert contre les Spectacles*, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on D'Alembert, who had condemned the prejudice against the stage in the *Encyclopédie*, and on one of the favorite amusements of the society of the day. Diderot personally would have been forgiving enough. But Voltaire's strong point was not forgiveness, and, though Rousseau no doubt exaggerated the efforts of his "enemies," he was certainly henceforward as obnoxious to the philosophe coterie as to the orthodox party. In 1662 appeared the *Contrat Social* at Amsterdam, and *Émile*, which was published both in the Low Countries and at Paris. For the latter the author received 6,000 livres, for the *Contrat* 1,000.

Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat Social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; the sentimental deism of the "Profession du vicaire Savoyard" in *Émile* irritated equally the philosophe party and the church. On June 11, 1662, *Émile* was condemned by the parlement of Paris, and two days previously Madame de Luxembourg and the Prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdun in the territory of Bern, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practice any of those more or less pious frauds which were customary at the time with the unorthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a *Lettre à M. de Beaumont*. The council of Geneva had joined the condemnation of *Émile*, and Rousseau first solemnly renounced his citizenship, and then, in the *Lettres de la Montagne* (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and gradually he grew unpopular in his own neighborhood.

He was for some time uncertain where to go, and thought of Corsica (to join Paoli) and Berlin. But finally David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence was tolerated for a time, and landed in England on January 13, 1766. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humor, he professed himself tired of the capital, Hume procured him a country abode in the house of Mr. Davenport at Wootton in Derbyshire. Finally he quarreled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the philosophe circles to be rascals. He remained, however, at Wootton during the year and through the winter. In May, 1767, he fled to France. In the summer of 1770 he returned to Paris, resumed music copying, and was on the whole happier than he had been since he had to leave Montlouis. He

had by this time married Thérèse le Vassrur, or had at least gone through some form of marriage with her.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors, though clearly half-insane. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title *Rousseau juge de Jean Jacques*), and began his *Rêveries du Promeneur Solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger rather than weaker, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable boys. On July 2d he died in a manner which has been much discussed, suspicions of suicide having at the time and since been frequent. On the whole the theory of a natural death due to a fit of apoplexy and perhaps to injuries inflicted accidentally during that fit seems most probable. He had always suffered from internal and constitutional ailments not unlikely to bring about such an end.

ROUSSEAU, THÉODORE, a distinguished landscape painter, was born at Paris in 1812, and studied in the École des Beaux-Arts, after which he spent some time in traveling and making studies of landscape and sky effects. He first exhibited at the Salon in 1834, obtained gold medals in 1849 and 1854, and in 1852 received the Legion of Honor. His fame has increased rather than diminished since his death in 1867.

ROUSSILLON, a province of France, which now forms the greater part of the department of PYRÉNÉES ORIENTALES, (*q.v.*) It was bounded on the south by the Pyrenees, on the west by the county of Foix, on the north by Languedoc, and on the east by the Mediterranean. The province derived its name from a small bourg near Perpignan, the capital, called Ruscino (Rosceliona, Castel Rossello), where the Gallic chieftains met to consider Hannibal's request for a conference.

ROVEREDO (in German sometimes *Rofreit*), one of the chief industrial cities in South Tyrol, and, after Trent, the chief seat of the Tyrolese silk industry, is situated on the left bank of the Adige (Etsch), in the fertile Val Lagarina, thirty-five miles north of Verona and 100 miles south of Innsbruck. The population is 8,864.

ROVIGNO, a city of Austria, in the province of Istria, is picturesquely situated on the coast of the Adriatic, about twelve miles south of Parenzo, and ten miles by rail from Canfanaro, a junction of the railway between Divazza (Trieste) and Pola. It has two harbors, with ship-building yards; and it carries on several industries and a good export trade, especially in olive-oil and a cement manufactured in the little island of Saint' Andrea. The population was 9,564 in 1869 and 9,522 in 1880.

ROVIGO, a city of Italy, the chief town of a province, and the seat of the bishop of Adria, lies between the Po and the Adige, and is traversed by the Adigetto, a navigable branch of the Adige. By rail it is twenty-seven miles southwest of Padua. The population of the city proper was 7,452 in 1871 and 7,272 in 1881; the commune in 1881 had 11,460 inhabitants.

ROVIGO, DUKE OF. See SAVARY.

ROWE, NICHOLAS, English playwright, the descendant of a family long resident at Lamerton in Devon, was born at Little Barford in Bedfordshire, England, June 30, 1674. Rowe's tragedies were marked by passionate feeling set off by a graceful diction, and were well adapted for stage effect. If *The Fair Penitent* and *Jane Shore* have been expelled from the stage, their historic reputation and their style will repay perusal. Among Rowe's other literary efforts may be mentioned an edition of the works of Shakespeare. At the time of his death he had also finished a translation of Lucan's *Pharsalia*, a work then much praised and not yet superseded by any competitor. Rowe's minor poems were beneath the level of his age. He died in 1718.

ROWING is the act of driving forward or propelling a boat along the surface of the water by means of oars. It is remarkable how scanty, until quite recent times, are the records of this art, which at certain epochs has played no insignificant part in the world's history. It was the oar that brought Phœnician letters and civilization to Greece; it was the oar that propelled the Hellenic fleet to Troy; it was the oar that saved Europe from Persian despotism; it was the skillful use of the oar by free citizens which was the glory of Athens in her prime. It is to be regretted that so little is known of the details connected with it, or of the disposal of the rowers on board the splendid fleet which started in its pride for Sicily, when 17,000 oars at a given signal smote the brine, and 100 long ships raced as far as Ægina. The vessels of the ancient Greeks and Romans—the biremes, quadriemes, quinquiremes, and hexiremes—owed their pace to the exertions of men who plied the oar rather than to the sails with which they were fitted, and which were only used when the wind was favorable. Professor Gardner has shown that boat-racing was not uncommon among the Greeks; and that it was practiced among the Romans Virgil testifies in the well-known passage in the fifth book of the *Æneid*. And the Venetian galleys which were subsequently used on the shores of the Mediterranean in mediæval times were only a modified form of the older kind of craft. These were for the most part manned by slaves and criminals, and were in constant employment in most European countries.

Rowing was understood by the ancient Britons, as they trusted themselves to the mercy of the waves in coracles composed of wicker-work covered with leather, similar no doubt in many respects to those now used in Wales; but these frail vessels were propelled by paddles and not by oars. The Saxons seem to have been expert in the management of the oar, as well as the Danes and Norwegians, as it is recorded that the highest nobles in the land devoted themselves to it. Alfred the Great introduced long galleys from the Mediterranean, which were propelled by forty or sixty oars on each side, and for some time these vessels were used for war purposes. It is stated by William of Malmesbury that Edgar the Peaceable was rowed in state on the river Dee from his palace, in the city of West Chester, to the church of St. John and back again, by eight tributary kings, himself acting as coxswain.

Apart from the reference already made to the ancients, we do not find any records of boat-racing before the establishment in England of the coat and badge, instituted by the celebrated comedian, Thomas Doggett, in 1715, in honor of the house of Hanover, to commemorate the anniversary of "King George I.'s happy accession to the throne of Great Britain." The prize was a red coat with a large silver badge on the arm, bearing the white horse of Hanover, and the race had to be rowed on August 1st, annually on the Thames, by six

young watermen who were not to have exceeded the time of their apprenticeship by twelve months.

The first record of public-school racing in England which can now be seen is the Water Ledger of Westminster School, which commences in the year 1813 with a list of the crew of the six-oared *Fly*. This craft continued for some time to be the only boat of the school, and in 1816 beat the Temple six-oar in a race from Johnson's Dock to Westminster Bridge by half a length. Eton possessed a fleet of boats in 1811, if not at an earlier date, consisting of a ten-oar and three boats with eight oars. In those days some of the crews had a waterman to pull stroke and drill the crew, but this practice was abolished in 1828, as the waterman frequently rowed a bad stroke, and the crew were obliged to subscribe for his day's pay, beer, and clothes; thenceforward the captain of each crew rowed the stroke-oar. The earliest record of a race at Eton is when Mr. Carter's four rowed against the watermen and beat them in 1817; but the professionals had a boat too small for them. In 1818 Eton challenged Westminster School to row from Westminster to Kew Bridge against the tide, but the match was stopped by the authorities; and it was not until 1829 that the first contest between the two schools was brought to an issue.

Rowing appears to have commenced at the universities soon after the beginning of the century, but earlier at Oxford than at Cambridge. There were college boats on the river for some time before there were any races. Those first recorded at Oxford were in 1815, said to be college eights, but the boats used are more likely to have been fours, when Brasenose was "head of the river" and Jesus their chief opponent.

*Boat-Racing in America.*—This pastime can be traced back to the beginning of the present century. The earliest important affair was in 1811, a sectional match, New York city against all Long Island, four-oared barges, with coxswains, from Harsimus, N. J., to the flag-staff on the Battery. New York won easily, and such was the popular enthusiasm over the race that its boat, the *Knickerbocker*, was suspended in a public museum, where it remained for fifty-four years, a constant recipient of public admiration until destroyed by fire in July, 1865. Since this historic contest no year has been without boat races. At that time the words amateur and professional were unknown on the water; the Castle Garden Amateur Boat Club Association—America's first avowedly amateur club—was founded in 1834.

There had been informal clubs and desultory racing at Yale College as early as 1833, but the first regular organization was in March, 1843. Harvard followed in September, 1844, and Yale and Harvard first met on the water at Lake Winnepiseogee, New Hampshire, August 3, 1852; since 1878 they have met annually at New London, Conn. In 1865 Harvard, Yale, Trinity, and Brown formed the Union College Regatta Association, which lasted three years. The Racing Association of American Colleges, which at one time included sixteen colleges, died in 1876. In 1883 Bowdoin, Columbia, Cornell, Princeton, Rutgers University of Pennsylvania, and Wesleyan formed the Intercollegiate Racing Association, which still flourishes and gives annual regattas.

The control of amateur racing in America belongs to the National Association of Amateur Oarsmen, founded in 1873, whose membership includes all the better class of amateur boat clubs. Its management is vested in an executive committee of nine members, three of whom are elected at each annual meeting of the association. The rulings of this committee are subject to review, approval, or reversal, at each annual meeting of the full association. This association gives an annual open

amateur regatta, similar to the Royal Henley Regatta in being the chief aquatic event of the year, but unlike it in not being rowed always on the same course, but moving about from year to year—having, since 1873, been rowed at Philadelphia, Newark, Troy, and Watkins (N. Y.), Detroit, Washington, and Boston. There are in the United States eleven regularly organized amateur rowing associations, formed by the union of amateur rowing clubs and giving each year one or more regattas. These associations are the National Association of Amateur Oarsmen, the North-Western Amateur Rowing Association, the Mississippi Valley Amateur Rowing Association, the Passaic River Amateur Rowing Association, the Intercollegiate Rowing Association, the Harlem Regatta Association, the Louisiana State Amateur Rowing Association, the Virginia State Rowing Association, the Schuylkill Navy, the Upper Hudson Navy, and the Kill von Kull Regatta Association. At English regattas it is usual to start three boats in a heat, sometimes four, five being the utmost limit, whereas at Saratoga, in the great regattas of 1874 and 1875, there were started abreast, in four separate races, eleven singles (twice), thirteen coxswainless fours, and thirteen coxswainless sixes.

The sliding seat is now superseded by various styles of rolling seats, in which the actual seat travels backward and forward on frictionless wheels or balls. The best of these devices run more easily, are cleaner, and less liable to accident than the ordinary sliding seat. English oarsmen use the sliding seat as a means of making their old accustomed stroke longer and more powerful. American oarsmen hold that what is needed by an oarsman is not the addition of the long slide to the old-fashioned long swing, but the almost total substitution of slide for swing, the transfer of the labor from back to legs—in fact a totally new style.

The primary division of American racing craft is into (a) lapstreaks or clinkers, built of wood in narrow streaks with overlapping edges at each joint, and (b) smooth bottoms, made of wood or paper, and having a fair surface, without projecting joint or seam. Lapstreak boats are, however, now rarely used save in barge races. Then follows the subdivision into barges, which are open inrigged boats, gigs, which are open outrigged boats, and shells, which are covered outrigged boats. These three classes of boats are further subdivided, in accordance with the means of propulsion, into single, double, and quadruple sculling boats, and pair-, four-, six-, and eight-oared boats. In America the double-scul is more frequent than the pair, and the six-oar much more common than the eight-oar.

ROWLANDSON, THOMAS, caricaturist, was born in Old Jewry, London, in July, 1756, the son of a tradesman or city merchant. He died in London, after a prolonged illness, April 22, 1827.

ROWLEY, WILLIAM, actor and dramatist, collaborated with several of the celebrated dramatists of the Elizabethan period—Dekker, Middleton, Heywood, Fletcher, Webster, Massinger, and Ford. Nothing is known of his life except that he was an actor in various companies, and married in 1637. There was another Rowley, an actor and playwright in the same generation, Samuel, and probably a third, Ralph. Four plays by W. Rowley are extant—*A Woman never Vext* (printed 1632), *A Match at Midnight* (1633), *All's Lost by Lust* (1633) and *A Shoemaker a Gentleman* (1638).

ROWLEY REGIS, an urban sanitary district of Staffordshire, England, is situated on the Birmingham canal, and on the Stourbridge branch of the Great Western railway, six miles west of Birmingham. The population of the urban sanitary district (area 3,670 acres) in 1871 was 23,534, and in 1881 it was 27,385.

ROXANA, or ROXANE, daughter of the Bactrian Oxyartes and wife of Alexander the Great (see ALEXANDER, and MACEDONIAN EMPIRE).

ROXBURGH, a border county of Scotland, occupying the greater part of the border line with England, is bounded east and southeast by Northumberland, southeast by Cumberland, southwest by Dumfriesshire, west by Selkirkshire, northwest by Midlothian, and northeast by Berwickshire. It lies between  $55^{\circ} 6' 38''$  and  $55^{\circ} 42' 30''$  N. latitude, between  $2^{\circ} 10'$  and  $3^{\circ} 7'$  W. longitude. Its greatest length from north to south is forty-three miles, and its greatest breadth about thirty miles. The area is 428,464 acres, or about 670 square miles.

*Climate and Agriculture.*—The mean annual temperature approximates to that of Scotland generally, but it is much warmer in the low and arable portions, where also the rainfall is much less than in the hilly regions. The soil varies much in different districts, being chiefly loam in the low and level tracts along the banks of the river, where it is also very fertile. In other parts a mixture of clay and gravel prevails, but there is also a considerable extent of mossy land. The hilly district is everywhere covered by a thick green pasturage admirably suited for sheep. Both in the pastoral and in the arable districts agriculture is in a very advanced condition. The chief attention is devoted to cattle and sheep rearing.

*Manufactures.*—Though essentially an agricultural county, Roxburghshire possesses woollen manufactures of some importance, including tweeds, blankets, shawls, and hosiery, the principal seats being Hawick, Jedburgh, and Kelso.

*Railways.*—The county is intersected by one of the lines of railway from Edinburgh to London (the "Waverley" route), which passes Melrose and Hawick. At Riccarton a branch passes southeastward to Newcastle. The northern district is crossed by the border railway from St. Boswells to Kelso, Coldstream, and Berwick, a branch passing south from near Kelso to Jedburgh.

*Population.*—Between 1831 and 1881 the population increased from 43,663 to 53,442 (25,436 males, 28,006 females), but from 1861 to 1871 there was a decrease from 54,119 to 49,407. The town population numbered 24,273 in 1881, the village 6,627, and the rural 22,542.

ROXBURY, formerly a city of Norfolk county, Mass., now incorporated in BOSTON, (*q.v.*)

ROY, RÉMMOHUN. Rájá Rámmohun Roy (or Ráy), the founder of the Bráhmia Samáj or Theistic church of India, was born at Rádhánagar, Bengal, in May, 1772, of an ancient and honorable Brahman family. He visited France, and wished to visit America, but died unexpectedly of brain fever at Bristol, England, September 27, 1833.

ROY, WILLIAM, a famous English geodesist, was born in 1726, and died in 1790.

ROYAL HOUSEHOLD. In all the mediæval monarchies of western Europe the general system of government sprang from, and centered in, the royal household. The sovereign's domestics were his officers of state, and the leading dignitaries of the palace were the principal administrators of the kingdom. The royal household itself had, in its turn, grown out of an earlier and more primitive institution. It took its rise in the *comitatus*, described by Tacitus, the chosen band of *comites* or companions who, when the Roman historian wrote, constituted the personal following, in peace as well as in war, of the Teutonic *princeps* or chieftain. In England before the Conquest the *comitatus* had developed or degenerated into the thegnhood, and among the most eminent and powerful of the king's thegns

were his dishthegn, his bowerthegn, and his horsethegn or staller. In Normandy at the time of the Conquest a similar arrangement, imitated from the French court, had long been established, and the Norman dukes, like their overlords the kings of France, had their seneschal or steward, their chamberlain and their constable. After the Conquest the ducal household of Normandy was reproduced in the royal household of England; and since, in obedience to the spirit of feudalism, the great offices of the first had been made hereditary, the great offices of the second were made hereditary also, and were thenceforth held by the grantees and their descendants as grand-serjeanties of the crown. The consequence was that they passed out of immediate relation to the practical conduct of affairs either in both state and court, or in the one or the other of them. The steward and chamberlain of England were superseded in their political functions by the justiciar and treasurer of England, and in their domestic functions by the steward and chamberlain of the household. The marshal of England took the place of the constable of England in the royal palace, and was associated with him in the command of the royal armies. In due course, however, the marshalship as well as the constableness became hereditary, and, although the constable and marshal of England retained their military authority until a comparatively late period, the duties that they successively performed about the palace had been long before transferred to the master of the horse. Under these circumstances the holders of the original great offices of state and the household ceased to attend the court except on occasions of extraordinary ceremony, and their representatives either by inheritance or by special appointment have ever since continued to appear at coronations and some other public solemnities, such as the opening of the parliament or trials by the House of Lords.

ROYAL SOCIETY, THE, or, more fully, The Royal Society of London for Improving Natural Knowledge, is an association of men interested in the advancement of mathematical and physical science. It is the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society is usually considered to have been founded in the year 1660, but a nucleus had in fact been in existence for some years before that date. Wallis informs us that as early as the year 1645 weekly meetings were held of "divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in sundry letters written in 1646 and 1647. These weekly meetings, according to Wallis, were first suggested by Theodore Haak, "a German of the Palatinate then resident in London," and they were held sometimes in Doctor Goddard's lodgings in Wood street, sometimes at the Bull-Head Tavern in Cheapside, but more often at Gresham College.

On November 28, 1660, the first journal book of the society was opened. It was agreed at this meeting that the company should continue to assemble on Wednesdays at 3 o'clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Doctor Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of November 28th, and by seventy-three others. On December 12th another

meeting was held at which fifty-five was fixed as the number of the society—persons of the degree of baron, fellows of the College of Physicians, and public professors of mathematics, physic, and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting-place of the society. Sir Robert Moray was chosen president (March 6, 1661), and continued in that office until the incorporation of the society, when he was succeeded by Lord Brouncker. In October, 1661, the king offered to be entered one of the society, and next year the society was incorporated under the name of "The Royal Society," the charter of incorporation passing the great seal on July 15, 1662, to be modified, however, by a second charter in the following year. The council of the Royal Society met for the first time on May 13, 1663, when resolutions were passed that debate concerning those to be admitted should be secret, and that fellows should pay one shilling a week to defray expenses.

After the Great Fire of London, in September, 1666, the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society were therefore invited by Henry Howard, of Norfolk, to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather Thomas, earl of Arundel, and thus the foundation was laid of the magnificent collection of scientific works, probably not far short of 45,000 volumes, which the society at the present time possesses. Of the Arundel MSS. the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3,559, the proceeds being devoted to the purchase of scientific books. These MSS. are still kept in the museum as a separate collection.

Under date December 21, 1671, the journal-book records that "the lord bishop of Sarum proposed for candidate Mr. Isaac Newton, professor of the mathematicks at Cambridge." Newton was elected a fellow January 11, 1671-2, and in 1703 he was appointed president, a post which he held till his death, 1727. During his presidency the society moved to Crane Court, their first meeting in the new quarters being held November 8, 1710. In the same year they were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV., when by the new warrant then issued the president and six of the fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to them by the government in the new Somerset House, where they remained until they removed to Burlington House in 1857. The policy of Sir Joseph Banks was to render the fellowship more difficult of attainment than it had been, and the measures which he took for this purpose, combined with other circumstances, led to the rise of a faction headed by Dr. Horsley. Throughout the years 1783 and 1784 feeling ran exceedingly high, but in the end the president was supported by the majority of the society. An account of the controversy will be found in a tract entitled *An Authentic Narrative of the Dissensions and Debates in the Royal Society*. In connection with this policy of Sir Joseph Banks may be mentioned a further step in the same direction taken in the year 1847, when the number of candidates recommended for election by the council was limited to fifteen, and the election was made annual. Concurrently, however, with this gradual narrowing of the Royal Society's boundaries was the successive establishment of other scientific bodies. The

founding of the Linnean Society in 1788 under the auspices of several fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter. The Geological Society followed in 1807, and the Royal Astronomical Society in 1820. The Chemical, the Royal Geographical, and the Entomological are the remaining chartered scientific societies existing in London at the present time. The Royal Society continues, however, to hold the foremost place among the scientific bodies of England, not only from the number of eminent men included in its fellowship, but also from its close official connection with the government.

ROYAN, a town of France, in the department of Charente Inférieure, is situated on the right bank of the Gironde, where it joins the ocean; a branch line of five and a half miles connects it with Saujon, on the Seudre Railway, which joins the Bordeaux-Nantes line at Pons. Royan, which in 1881 had a population of only 4,573 (5,445 as a commune), is one of the most frequented bathing resorts on the Atlantic seaboard, the visitors numbering about 80,000 annually.

ROYER-COLLARD, PIERRE PAUL, French statesman and philosopher, was born on June 21, 1763, at Sompuis near Vitry-le-Français. He died on September 2, 1845.

ROYLE, JOHN FORBES, a distinguished botanist and teacher of materia medica. His reputation is especially founded upon the results of personal investigations in the Himalaya Mountains and in other parts of Hindustan. He was born in Cawnpore in 1800. In 1851 he superintended the Indian department of the Great Exhibition. He died at Acton near London on January 2, 1858.

RUBENS, PETER PAUL (1577-1640), the most eminent representative of Flemish art, and one of the greatest painters of any school, was born very probably at Siegen, in Westphalia, on June 29, 1577.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. Part of his boyhood he spent as a page in the household of the countess of Lalaing, in Brussels; but, tradition adds, and we may well believe, the youth's disposition was such as to induce his mother to allow him to follow his proper vocation, choosing as his master Tobias Verhaecht, who was in some way connected with the family. Not the slightest trace of this first master's influence can be detected in Rubens' works. Not so with Adam Van Noort, to whom the young man was next apprenticed. Van Noort, whose aspect of energy is well known through Van Dyck's beautiful etching, was the highly esteemed master of numerous painters—among them Van Balen, Sebastian Vrancx, and Jordaens, later his son-in-law. His pictures are almost exclusively to be found in Antwerp churches.

Rubens remained with Van Noort for the usual period of four years, thereafter studying under Otto Vœnius or Van Veen, a gentleman by birth, a most distinguished Latin scholar, and a painter of very high repute.

In 1598, Adam Van Noort acting as dean of the Antwerp guild of painters, Rubens was officially recognized as "master"—that is, was allowed to work independently and receive pupils.

From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. The influence of the master's stay at Mantua was of extreme importance, and cannot be too constantly kept in view in the study of his later works.

Sent to Rome in 1601 to take copies from Raphael for his master, he was also commissioned to paint

several pictures for the church of Santa Croce, by the archduke Albert of Austria, sovereign of the Spanish Netherlands, and once, when he was a cardinal, the titular of that see. A copy of *Mercury and Psyche* after Raphael is preserved in the museum at Pesth. The religious paintings—the *Invention of the Cross*, the *Crowning with Thorns*, and the *Crucifixion*—are to be found in the hospital at Grasse in Provence.

At the beginning of 1603 "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Two of his own works, known to belong to the same period, are in the Madrid Gallery, *Heraculus* and *Democritus*.

While employed at Rome, in 1608, Rubens received most alarming news as to the state of his mother's health. The duke of Gonzaga was then absent from Italy, but the dutiful son, without awaiting his return, at once set out for the Netherlands, though with the full intention of shortly resuming his post at court, as we gather from a letter to Annibale Chieppio, the Mantuan minister. When he arrived in Antwerp his mother was no more. However strong his wish might now be to return to Italy, his purpose was overruled by the express desire of his sovereigns, Albert and Isabella, to see him take up a permanent residence in the Belgian provinces. On August 3, 1609, Rubens was named painter in ordinary to their highnesses, with a salary of 500 livres, and "the rights, honors, privileges, exemptions," etc., belonging to persons of the royal household, not to speak of the gift of a gold chain.

Although so recently returned to his native land, Rubens seems to have been, with one accord, accepted by his countrymen as the head of their school, and the municipality was foremost in giving him the means of proving his acquirements. The first in date among the numerous repetitions of the *Adoration of the Magi* is a picture in the Madrid Gallery, measuring twelve feet by seventeen, and containing no fewer than eight-and-twenty life-size figures, many in gorgeous attire, warriors in steel armor, horsemen, slaves, camels, etc.

Apart from the success of his works, another powerful motive had helped to detain the master in Antwerp—his marriage with Isabella Brant (October, 1609). Pictures have made us familiar with the graceful young woman who was, for seventeen years, to share the master's destinies. We meet her at the Hague, St. Petersburg, Florence, at Grosvenor House, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvas.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality. \* \* \* I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he was very soon called upon to demonstrate most strikingly by a series of twenty-four pictures, illustrating the life of Mary de' Medici, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is now exhibited in the Louvre. On May 13, 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he has never set foot since the palace was begun, sixteen or eighteen years ago."

No painter in Europe could now pretend to equal

Rubens either in talent or in renown, Month after month productions of amazing size left the Antwerp studio.

Of the numerous creations of his pencil, none, perhaps, will more thoroughly disclose to us his comprehension of religious decorative art than the *Assumption of the Virgin* at the high altar of the Antwerp cathedral, finished in 1625.

Able to rely so greatly on his power as a colorist, Rubens is not a mere decorator. He penetrates into the spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The *Massacre of the Innocents*, in the Munich Gallery, is a composition that can leave no person unmoved.

In the midst of the rarest activity as a painter, Rubens was now called upon to give proofs of a very different kind of ability. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; archduke Albert died the same year. His widow sincerely wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The painter's comings and goings, however, did not remain unheeded, for the French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the Infanta. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens was to fail in his efforts to bring about an arrangement with the Netherlands, other events enabled him to render great service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavor to bring about a final arrangement between the crowns of England and Spain.

Through a letter to Peiresc we hear of the familiar intercourse kept up between the painter and the king. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's.

Great as was the king's admiration of Rubens as a painter, it seems to have been scarcely above the value attached to his political services. Far from looking upon Rubens as a man of inferior calling, unworthy to meddle with matters of state, he now commissioned the painter to go to London as bearer of his views to Charles I. Giving up his long cherished hope of revisiting Italy on his return from Spain, Rubens, honored with the title of secretary of the king's privy council in the Netherlands, started at once on his new mission. His popularity must have been very great, for on September 23, 1629, the university of Cambridge conferred upon him the honorary degree of master of arts, and on February 21, 1630, he was knighted, the king presenting him with the sword used at the ceremony, which is still preserved by the descendants of the artist.

Although, it seems, less actively employed as an artist in England than in Spain, Rubens, besides his sketches for the decoration of the Banqueting House at Whitehall, painted the admirable picture of the *Blessings of Peace*, now in the National Gallery.

Rubens was now fifty-three years of age; he had been four years a widower, and before the end of the year (December, 1630) he entered into a second marriage with the beautiful girl of sixteen, named Helena Fourment, with whom his pictures have made the world so well acquainted.

Although the long months of absence could not be

termed blanks in Rubens' artistic career, his return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best creations.

Isabella died in 1633, and we know that to the end Rubens remained in high favor with her, alike as an artist and as political agent.

Spain and the Netherlands went to war again, the king never ceasing to look upon the Dutch as rebels.

Ferdinand of Austria, the cardinal-infant of Spain, was called to the government of the Netherlands on the death of his aunt. He was the king's younger brother, and arrived at Antwerp in May, 1635. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens, and certainly never equalled by any other works of the kind. Several of the paintings detached from the arches were offered as presents to the new governor-general, a scarcely known fact, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, etc). Rubens was at the time laid up with gout, but Prince Ferdinand was desirous of expressing his satisfaction, and called upon the painter, remaining a long time at his house. Rubens and Ferdinand had met at Madrid, and only a short time elapsed before the painter was confirmed in his official standing—a matter of small importance, if we consider that the last years of his life were almost exclusively employed in working much more for the king than for his brother. About 120 paintings of considerable size left Antwerp for Madrid in 1637, 1638, and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordeans would finish the work. Rubens breathed his last on May 30, 1640.

RUBIDIUM. See POTASSIUM METALS.

RUBRUQUIS, the name which has most commonly been given to William of Rubruk, a Franciscan friar and the author of a remarkable narrative of Asiatic travel in the thirteenth century. Nothing is known of him save what can be gathered from his own narrative, with the exception of a word from the pen of Roger Bacon, his contemporary and brother Franciscan, indicating personal acquaintance.

RUBY. This name is applied by lapidaries and jewelers to two distinct minerals, which may be distinguished as the true or Oriental ruby and the spinel ruby. The former is a red variety of corundum or native alumina, of great rarity and value, while the latter is an aluminate of magnesium, inferior to the true ruby in hardness and much less esteemed as a gem stone. With ancient writers the confusion was even greater, for they appear to have classed together under a common name, such as the *carbunculus* of Pliny or the *ἀνθράξ* of Greek writers, not only our two kinds of ruby, but also garnets and other inferior stones of a brilliant fiery color. By modern mineralogists it has come to be understood that when the word ruby is used without any qualifying prefix the true or Oriental stone is invariably indicated.

RÜCKERT, FRIEDRICH, an eminent German poet, was born at Schweinfurt on May 16, 1788. Rückert, who was master of thirty languages, made his mark chiefly as a translator of Oriental poetry, and as a writer of poems conceived in the spirit of Oriental masters. As a master of poetical style he ranks with German writers of the highest class. There are hardly any lyrical forms which are not represented among his works, and in all of them, the simplest and the most complex, he wrote with equal ease and grace. He died in 1866.

RÚDAGÍ. Hakím Mohammed Faríd-eddí 'Abdal-

láh, the first great genius of modern Persia, was born in Rúdag, a village in Transoxiana, about 870-900, and died in 954.

RUDD, or RED-EYE (*Leuciscus erythrophthalmus*), a fish of the family of Carps, generally spread over Europe, north and south of the Alps, also found in Asia Minor, and extremely common in suitable localities, viz., still and deep waters with muddy bottom. When adult, it is readily recognized by its deep, short body, golden-coppery tint of the whole surface, red eyes, and scarlet lower fins. The rudd is a fine fish, but little esteemed for food, and very rarely exceeds a length of twelve inches or a weight of two pounds. It feeds on small fresh-water animals and soft vegetable matter, and spawns in April or May. It readily crosses with the white bream, more rarely with the roach and bleak.

RUDDIMAN, THOMAS, an eminent Scottish scholar, was born in October, 1674, at Raggal, in the parish of Boyndie, Banffshire, Scotland. He died at Edinburgh, January 19, 1758, and was interred in Greyfriars churchyard, where in 1806 a tablet was erected to his memory.

RUDE, FRANÇOIS, a French sculptor of great natural talent and force of character. He was born at Dijon, January 4, 1784. He worked all his life with the most extraordinary energy and gave himself no rest in spite of the signs of failing health, and at last, on November 3, 1855, he died suddenly with scarcely time to cry out. One of his noblest works, and easily accessible, is the tomb of Cavaignac, on which he placed beside his own the name of his favorite pupil Christophe.

RUDE STONE MONUMENTS. The raising of commemorative monuments of such an enduring material as stone is a practice that may be traced in all countries to the remotest times. The highly sculptured statues, obelisks, and other monumental erections of modern civilization are but the lineal representatives of the unhewn monoliths, dolmens, cromlechs, etc., of prehistoric times. Judging from the large number of the latter that have still survived the destructive agencies (notably those of man himself) to which they have been exposed during so many ages, it would seem that the ideas which led to their erection had as great a hold on humanity in its earlier stages of development as at the present time. In giving some idea of these rude monuments in Britain and elsewhere, it will be convenient to classify them as follows: (1) Isolated pillars or monoliths of unhewn stones raised on the end are called *Memphirs* (*maen*, a stone, and *hir*, long). (2) When these monoliths are arranged in lines they become *Alignments*. (3) But if their linear arrangement is such as to form an inclosure (*enceinte*), whether circular, oval, or irregular, the group is designated by the name of *Cromlech* (see CROMLECH). (4) Instead of the monoliths remaining separate, they are sometimes placed together and covered over by one or more capstones so as to form a rude chamber; in this case the monument is called a *Dolmen* (*daul*, a table, and *maen*, a stone). This megalithic chamber is sometimes partially or wholly imbedded in a mound of earth or stones so as to form a tumulus or cairn. As, however, there are many tumuli and cairns which do not contain megalithic chambers, we have only partially to deal with them under the category of rude stone monuments.

RUDOLPH I., German king, eldest son of Albert IV., count of Hapsburg, was born on May 1, 1218. He died at Germersheim on July 15, 1291.

RUDOLPH II., Holy Roman emperor, was the son of the emperor Maximilian II., and was born on July 18, 1552. In 1572 he obtained the crown of Hungary, in 1575 that of Bohemia, with the title "King of the

Romans;" and in 1576, after his father's death, he became emperor. He surrendered himself absolutely to the control of the Jesuits, under whose influence he had been brought up at the gloomy court of Spain; and in his hereditary lands they labored assiduously to destroy Protestantism. The Protestants were deprived of the right of public worship in Vienna and other towns; their schools were closed, and many of their preachers banished. Almost all public offices, too, were placed in the hands of Roman Catholics. Trouble followed, and in 1611 the emperor surrendered the hereditary territories to Mathias, his elder brother. Rudolph died on January 20, 1612.

RUDOLSTADT, capital of the German principality of Schwarzburg-Rudolstadt, and chief residence of the prince, is situated on the left bank of the Saale, eighteen miles due south of Weimar, in one of the most beautiful districts of Thuringia. The picturesque little town is a favorite summer watering-place, with pine baths, as well as a frequented tourist resort. Besides containing the government buildings of the little principality, Rudolstadt is fairly well provided with schools and other institutions, including a library of 60,000 volumes. The industries of the district include the manufacture of porcelain and of dyestuffs, wool-spinning, and bell-founding. The population (4,100 in 1817) was 8,747 in 1880, and 9,621 (estimated) in 1890.

RUEDA, LOPE DE. See DRAMA.

RUFF, a bird so called from the very beautiful and remarkable frill of elongated feathers that, just before the breeding-season, grow thickly round the neck of the male, who is considerably larger than the female, known as the Reeve. In many respects this species, the *Tringa pugnax* of Linnæus and the *Machetes pugnax* of the majority of modern ornithologists, is one of the most singular in existence, and yet its singularities have been very ill appreciated by zoölogical writers in general.

The cock-bird, when out of his nuptial attire, or, to use the fenman's expression, when he has not "his show on," and the hen at all seasons offer no very remarkable deviation from ordinary Sandpipers, and outwardly there is nothing, except the unequal size of the two sexes, to rouse suspicion of any abnormal peculiarity. But when spring comes all is changed. In a surprisingly short time the feathers clothing the face of the male are shed, and their place is taken by *papillæ* or small caruncles of bright yellow or pale pink. From each side of his head sprouts a tuft of stiff-curved feathers, giving the appearance of long ears, while the feathers of the throat change color, and beneath and around it sprouts the frill or ruff already mentioned as giving the bird his name. The colors range from deep black to pure white, passing through chestnut or bay, and many tints of brown or ashy-gray, while often the feathers are more closely barred with some darker shade, and the black is very frequently glossed with violet, blue, or green—or, in addition, spangled with white, gray, or gold-color. The white, on the other hand, is not rarely freckled, streaked, or barred with gray, rufous-brown, or black. In some examples the barring is most regularly concentric, in others more or less broken-up or undulating, and the latter may be said of the streaks.

That all this wonderful "show" is the consequence of the polygamous habit of the Ruff can scarcely be doubted. Both Montagu and Graves, to say nothing of other writers, state that the Ruffs, in England, were far more numerous than the Reeves; and their testimony can hardly be doubted; though in Germany Naumann (*Vög. Deutschland's*, vii. p. 544) considers that this is only the case in the earlier part of the season, and that later the females greatly outnumber the males.

Its breeding-grounds extend from Great Britain across northern Europe and Asia; but the birds become less numerous toward the east. They winter in India, reaching even Ceylon, and Africa as far as the Cape of Good Hope. The Ruff also occasionally visits Iceland, and there are several well-authenticated records of its occurrence on the eastern coast of the United States, while an example is stated to have been received from the northern part of South America.

RUFINUS, TYRANNIUS (TURRANIUS, TORANUS), the well-known contemporary of Jerome, was born at or near Aquileia about the year 345. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

RUGBY, a market-town of Warwickshire, England, is finely situated on a table-land rising from the southern bank of the Avon, at the junction of several railway lines, and near the Grand Junction canal, thirty miles east-southeast of Birmingham, and twenty south-southwest of Leicester. It owes its importance to the grammar school, built and endowed by Laurence Sheriff, a merchant grocer and servant to Queen Elizabeth, and a native of the neighboring village of Brownsover. The endowment was obtained in 1653. At the tercentenary of the school in 1867 subscriptions were set on foot for founding scholarships, building additional schoolrooms, rebuilding or enlarging the chapel, and other objects. There are a number of charities, including Laurence Sheriff's almshouses (founded 1567), Elborow's almshouses (1707), Miss Butlin's almshouses (1851), and the hospital of St. Cross, opened in 1884, at a cost of \$100,000. A public recreation ground was provided by the local government board in 1877. The town has an important cattle market. The population of the urban sanitary district (area 1,617 acres) in 1871 was 8,385, and in 1881 it was 9,891.

RUGE, ARNOLD, German philosophical and political writer, was born at Bergen, in the island of Rügen, on September 13, 1803. In his last years he received from the German Government a pension of 3,000 marks. He died on December 31, 1880.

In 1846-48 his *Gesammelte Schriften* were published in ten volumes. After this time he wrote, among other books, *Unser System*, *Revolutionsnovellen*, *Die Loge des Humanismus*, and *Aus früherer Zeit* (his memoirs). He also wrote many poems, and several dramas and romances, and translated into German various English works, including the *Letters of Junius* and Buckle's *History of Civilization*.

RÜGEN, the largest island belonging to Germany, is situated in the Baltic Sea, immediately opposite the town of Stralsund, one and one-half miles off the north-west coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund. Its shape is exceedingly irregular, and its coast-line is broken by very numerous bays and peninsulas, sometimes of considerable size. The greatest length of Rügen from north to south is 32 miles; its greatest breadth is 25½ miles; and its area is 377 square miles. The surface gradually rises toward the west to Rugard (335 feet), the "eye of Rügen," near Bergen, but the highest point is the Herthaburg (505 feet) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. Though much of Rügen is flat and sandy, the fine beech-woods which cover great part of it and the northern coast scenery combine with the convenient sea-bathing offered by the various villages round the coast to attract large numbers of visitors annually.

The official capital of the island is Bergen (3,662 inhabitants), connected since 1883 with Stralsund by a railway and ferry. The other chief places are Garz

(2,014), Sagard (1,447), Gingst (1,285), and Putbus (1,752). Ecclesiastically, Rügen is divided into twenty-seven parishes, in which the pastoral succession is said to be almost hereditary. The inhabitants are distinguished from those of the mainland by peculiarities of dialect, costume, and habits; and even the various peninsulas differ from each other in these particulars. The inhabitants rear some cattle, and Rügen has long been famous for its geese; but the only really considerable industry is fishing—the herring-fishery being especially important. Rügen, with the neighboring islands, forms a governmental department, with a population (1880) of 46,115, and of 50,600 in 1890.

RUHNKEN, DAVID, one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1723, and died 1798.

Ruhnken's principal works are editions of (1) Timæus' *Lexicon of Platonic Words*, (2) Thalelæus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato, and the Greek and Roman grammarians and rhetoricians.

RUHRORT, a busy trading town in Prussia, is situated at the junction of the Ruhr and Rhine, in the midst of a productive coal district, fifteen miles north of Düsseldorf. Ruhrort has the largest river harbor in Germany, with very extensive quays; and most of the one and one-half million tons of coal which are annually exported from the neighborhood are dispatched in the fleet of steam-tugs and barges which belong to the port. About one-half of the coal goes to Holland, and the rest to towns on the upper Rhine. Grain and timber are also exported. The industries of the town include active shipbuilding, iron and tin working, and the making of cordage and machinery. The inhabitants numbered 1,443 in 1816, 9,130 in 1880, and in 1890, 15,000.

RULHIÈRE, or RULHIÈRES, CLAUDE CARLOMAN DE, poet and historian, was born at Bondy in 1735, and died at Paris in 1791. At twenty-five he accompanied Breteuil to St. Petersburg as secretary of legation. Here he actually saw the revolution which seated Catherine II. on the throne, and thus obtained the facts of his best-known and best work, the short sketch called *Anecdotes sur la Revolution de Russie en 1762*. It was not published till after the empress' death. The later years of Rulhière's life were spent either in Paris, where he held an appointment in the foreign office and went much into society, or else in traveling over Germany and Poland. The distracted affairs of this latter country gave him the subject of his longest work, *Histoire de l'Anarchie de Pologne* (1807), which was never finished, and which the patriotism of its latest editor, M. Ostrowski, has rather unjustifiably rebaptized *Révolutions de Pologne*.

RUM is a spirituous liquor, prepared from molasses, skimmings of the boiling house, and other saccharine by-products, and the refuse juice of the cane-sugar manufacture. Its distillation, which is a simple process, may be conducted in connection with any cane-sugar establishment, but the rum which comes to the American and European markets is chiefly the produce of the West India Islands and Guiana. Rum varies very considerably in quality, the finest being known as Jamaica rum, whether it is the product of that island or not. An inferior quality of rum is known among the French as *tafia*; and the lowest quality, into the wash for which debris of sugar cane enters, is called negro rum, and is mostly consumed by the colored workers in the sugar houses and distilleries. The spirit prepared from

molasses of beet-sugar factories cannot be classed with rum. The product has a highly disagreeable odor and taste, and it can only be rendered fit for consumption by repeated distillation and concentration to a high degree of strength, whereby the spirit is rendered "silent," or has only a faint rum flavor. In this condition it is used for mixing with strongly flavored rum, and for the preparation of a fictitious rum, the flavor of which is due to "rum essence," a mixture of artificial ether, birch bark oil, and other substances. Cane-sugar molasses enters largely into the materials from which ARRACK (*q.v.*), the spirit of Java and the Indian Archipelago, is prepared, but its flavor depends more on palm-tree toddy, which also is a constituent of the wash.

RUMFORD, COUNT. See THOMPSON, SIR BENJAMIN.

RÚMÍ. Mohammed b. Mohammed b. Husain albalkhí, better known as Mauláná Jalál-uddín Rúmí, the greatest Súfic poet of Persia, was born September 30, 1207. He died December 17, 1273.

RUMINANTS. See MAMMALIA.

RÜMKER, CARL LUDWIG CHRISTIAN, German astronomer, was born in Mecklenburg on May 28, 1788. He served in the British navy for some years until 1817; in 1821 he went to New South Wales as astronomer at the observatory built at Parramatta by Sir Thomas Brisbane (see OBSERVATORY). He returned to Europe in 1831, and took charge of the school of navigation at Hamburg and the observatory attached to it. His principal work is a *Catalogue* of 12,000 fixed stars from meridian observations made at Hamburg, published in 1843. In 1857 he retired and went to reside in Lisbon, where he died on December 21, 1862.

RUNCIMAN, ALEXANDER, historical painter, was born in Edinburgh in 1736. He studied at the Foulis' Academy, Glasgow, and at the age of thirty proceeded to Rome. He died in Edinburgh on October 4, 1785. His works, while they show high intention and considerable imagination, are frequently defective in form and extravagant in gesture.

RUNCIMAN, JOHN, historical painter, a younger brother of the above, accompanied him to Rome, and died at Naples in 1766. He was an artist of great promise. His *Flight into Egypt*, in the National Gallery of Scotland, is remarkable for the precision of its execution and the mellow richness of its coloring.

RUNCORN, a market-town and seaport of Cheshire, England, is pleasantly situated on the south side of the Mersey and near the terminus in that river of the Bridgewater, the Mersey and Irwell, and the Trent and Mersey canals, fifteen miles southeast of Liverpool and fifteen northeast of Chester. The Mersey, which here contracts to 400 yards at high water, is crossed by a wrought-iron railway bridge 1,500 feet in length. The town was made an independent landing port in 1847, and within recent years large additions have been made to the docks and warehouses. The town possesses ship-building yards, iron foundries, rope works, tanneries, and soap and alkali works. The population of the urban sanitary district (area 1,490 acres) in 1871 was 12,443, in 1881 it was 15,126, and 25,000 in 1890.

RUNE. See ALPHABET, and SCANDINAVIAN LANGUAGES.

RUNEBERG, JOHAN LUDWIG, Swedish poet, was born at Jakobstad, in Finland, February 5, 1804, and died at Borga, May 6, 1877.

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. In an age of conventionality he was boldly realistic, yet never to the sacrifice of artistic beauty. Less known to the rest of Europe than Teg-

ner, he yet is now generally considered to excel him as a poet, and to mark the highest attainment hitherto reached by imaginative literature in Sweden.

RUNNING. In this mode of progression the step is lighter and gait more rapid than in walking, from which it differs in consisting of a succession of springs from toe to toe, instead of a series of steps from toe to heel. In modern times it has been developed almost into a science by the Anglo-Saxon race in Great Britain and North America, till the distances recently covered appear almost fabulous compared with the performances up to the end of the first half of the century.

Running is usually thus classified:—(1) sprinting includes all distances up to 400 yards; (2) medium distances range from one quarter to three quarters of a mile; (3) long distances are those of one mile and upward. A first-class sprinter when at full speed will clear from eight to nine feet in each stride, and his toes leave the ground with inconceivable rapidity. When in good condition he will run 100 yards at top speed in one breath, and probably 150 yards without drawing a second one.

Of medium distances the quarter mile race is by far the most difficult to run, as a combination of speed and endurance is requisite. In fact a runner should be able to sprint the whole way. Six hundred yards and half a mile are the other chief distances in this class of running. The stride is slower than in sprinting, and a man cannot maintain the same speed throughout as is possible up to 300 yards.

Light wiry men are best fitted for long distance running, where stamina and wind are more useful than speed. The strides must be long and light. After some miles a runner is unable to keep the weight of the body on his toes any longer owing to fatigue, and puts his heels down, and runs flat-footed.

A runner's dress should be as light as possible, and consist merely of a thin jersey, a pair of drawers covering the waist and loins and extending downward to the top of the knee caps, and heelless running shoes with a few short spikes in the soles just under the tread of the foot. The spikes are longer for sprinting. Chamois leather socks for the toes and ball of the foot may be added, since they diminish concussion as each foot reaches the ground.

RUPERT (HRODBERT), ST., a kinsman of the Merovingian house, and bishop of Worms, was invited (696) to Regensburg (Ratisbon) by Theodo of Bavaria, but finally settled in Salzburg, the bishopric of which was his foundation. He is regarded as the apostle of the Bavarians—not that the land was, up to that time, altogether heathen, but because of his services in the promotion and consolidation of its Christianity.

RUPERT, prince of Bavaria, the third son of Frederick V., elector palatine and king of Bohemia, and of Elizabeth, sister of Charles I. of England, was born at Prague on December 18, 1619. In 1630 he was placed at the university of Leyden, where he showed particular readiness in languages and in military discipline. In December, 1635, he was at the English court, and was named as leader of the proposed expedition to Madagascar. In 1636 he visited Oxford, when he was made master of arts. Returning to The Hague in 1638, he made the first display of his reckless bravery at the siege of Breda, and shortly afterward was taken prisoner by the Austrians in the battle before Lemgo. For three years he was confined at Linz, where he withstood the endeavors made to induce him to change his religion and to take service with the emperor. Upon his release in 1642 he returned to The Hague, and from thence went to Dover, but, the Civil War not having yet begun, he returned immediately to Holland. Charles now named

Rupert general of the horse, and he joined the king at Leicester in August, 1642, being present at the raising of the standard at Nottingham. He was also made a knight of the Garter. He at once displayed the most astonishing activity, fought his first action with success at Worcester in September, and was at Edgehill on October 23d. At Aylesbury and Windsor, on the march to London, he received severe checks, but after desperate fighting took Brentford. In 1643 he captured Cirencester, but failed before Gloucester, and in the beginning of 1644 he was rewarded by being made earl of Holderness, duke of Cumberland, and president of Wales. At Marston Moor he charged and routed the Scots, but was in turn completely beaten by Cromwell's Ironsides. He escaped to York, and thence to Richmond, and finally by great skill reached Shrewsbury on July 20th. On November 21st he was repulsed at Abingdon, and on November 23d entered Oxford with Charles. In May, 1645, he took Newark by storm. His advice to march northward was overruled, and on June 14th the experiences of Marston Moor were repeated at Naseby.

On June 24th Rupert was taken prisoner by Fairfax at Oxford, and on July 5th, at the demand of the parliament, sailed from Dover for France. He was immediately made a marshal in the French service, with the command of the English there. He received a wound in the head at Armentières during 1647. The greater part of the English fleet having adhered to Charles, and having sailed to Holland, Rupert went with the prince of Wales to The Hague, where the charge of it was put into his hands. He immediately set out in January, 1649, upon an expedition of organized piracy. In February, after passing without molestation through the Parliamentary ships, he was at Kinsale, of which he took the fort. He relieved John Grenville at the Scilly Isles, and practically crippled the English trade. Attacked by Blake, he sailed to Portugal, and was received with kindness by the king; Blake, however, blockaded him in the Tagus, and demanded his surrender. Rupert broke through the blockade and sailed to the Mediterranean, landing at Barbary, and refitting at Toulon; thence he proceeded to Madeira, the Canaries (in 1652), the Azores, Cape de Verd, and the West Indies, sweeping the ocean between the latter places for a considerable time. Finding it impossible, however, to escape the indefatigable pursuit of Blake, he returned to France in 1653. He was now invited to Paris by Louis XIV., who made him master of the horse; he had also an offer from the emperor to command his forces.

At the end of September, 1660, Rupert returned to England. In August, 1664, he was appointed to command the Guinea fleet against the Dutch, and set sail in October. On June 5, 1665, he gained with Monk a great victory over the Dutch, and on his return had his portrait painted by Lely along with the other admirals present at the battle. He again put to sea in May, 1666, to hinder the junction of the Dutch and French, and returned in the beginning of June after a heavy defeat, his ship having stuck on the Galloper Sands during the fight. He was obliged to justify himself before the council. On October 22, 1667, he received with Monk the thanks of the House of Commons for his exertions against the Dutch at Chatham, and he was again at sea in April, 1668. In 1673 he was appointed lord high admiral, and fought two battles with the Dutch fleet on May 28th and August 11th, but could do little through the backwardness of the French in coming to his assistance. Till his death, on November 29, 1682, he lived in retirement at Windsor.

RUPTURE. See HERNIA.

RUSH. Under the name of rush or rushes, the stalks or fistular stem-like leaves of several plants have minor industrial applications. The common rushes (species of *Juncus*) are used in many parts of the world for chair-bottoms, mats, and basket work, and the pith they contain serves as wicks in open oil-lamps and for tallow-candles—whence rushlight. The bulrush, *Typha elephantina*, is used in Sindh for mats and baskets. Under the name of rushes, species of *Scirpus* and other *Cyperaceæ* are used for chair-bottoms, mats, and thatch. The elegant rush mats of Madras are made from *Papyrus pangorei*. The sweet rush, yielding essential oil, is *Andropogon Schananthus*, known also as the lemon grass.

RUSH, BENJAMIN, the Sydenham of America, was born near Bristol (twelve miles from Philadelphia), in 1745, on a homestead founded by his grandfather, who had followed Penn from England in 1683, being of the Quaker persuasion, and a gunsmith by trade. After a careful education at school and college, and an apprenticeship of six years with a doctor in Philadelphia, Rush went for two years to Edinburgh, where he attached himself chiefly to Cullen. He took his M.D. degree there in 1768, spent a year more in the hospitals of London and Paris, and began practice in Philadelphia at the age of twenty-four. He at once became a leading spirit in the political and social movements of the day. He was a friend of Franklin, a member of Congress for the State of Pennsylvania in 1776, and one of those who signed the Declaration of Independence the same year. In 1774 he started, along with James Pemberton, the first anti-slavery society in America, and was its secretary for many years. When the political crisis ended in 1787 with the convention for drawing up a federal constitution, of which he was a member, he retired from public life, and gave himself up wholly to medical practice. He gained great credit when the yellow fever devastated Philadelphia in 1793, by his assiduity in visiting the sick (as many as 120 in a day), and by his bold and apparently successful treatment of the disease by bloodletting. When he began to prosper in practice he gave a seventh part of his income in charity. He died in 1813, after a five days' illness from typhus fever.

Rush's writings cover an immense range of subjects, including language, the study of Latin and Greek, the moral faculty, capital punishment, medicine among the American Indians, maple sugar, the blackness of the negro, the cause of animal life, tobacco smoking, spirit drinking, as well as a long list of more strictly professional topics. His last work was an elaborate treatise on the *Diseases of the Mind* (1812). He is best known now by the five volumes of *Medical Inquiries and Observations*, which he brought out at intervals from 1789 to 1798 (two later editions revised by the author). Epidemiology, and yellow fever in particular, was the subject on which he wrote to most purpose.

RUSHWORTH, JOHN, the compiler of the *Historical Collections* commonly described by his name, was born in Northumberland about the year 1607. In 1684 he was arrested for debt, and cast into the King's Bench prison, where he died, after lingering for some time in a condition of mental infirmity, the result of excessive drinking, in 1690.

RUSSELL, JOHN RUSSELL, EARL, a statesman who for nearly half a century faithfully represented the traditions of Whig politics, was the third son of John, sixth duke of Bedford, and was born in Hertford Street, Mayfair, London, August 18, 1792. Following in the footsteps of Lord Henry Petty, Brougham, and Horner, he went to the university of Edinburgh. On leaving

the university, he determined upon taking a foreign tour. On May 4, 1813, ere he was of age, he was returned for the ducal borough of Tavistock, and in this he resembled Lord Chesterfield and other aristocratic legislators, who were intrusted with the duty of law-making before they had arrived at years of discretion. In foreign politics Lord John Russell's oratorical talents were especially shown in his struggles to prevent the union of Norway and Sweden. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. During the first parliament (1820-26) of George IV. the county of Huntingdon accepted Lord John Russell's services as its representative, but he paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, though he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts in February, 1828, and when Lord Grey's Reform ministry was formed, Lord John Russell accepted the office of paymaster-general, though, strange to say, he was not admitted into the sacred precincts of the cabinet. This exclusion from the official hierarchy was rendered the more remarkable by the circumstance that he was selected (March 1, 1831) to explain the provisions of the Reform Bill, to which the cabinet had given its formal sanction. After many a period of doubt and defeat, "the bill, the whole bill, and nothing but the bill" passed into law, and Lord John stood forth in the mind of the people as its champion. Although it was not till some years later that he became the leader of the Liberal party, the height of his fame was attained in 1832.

In Lord Melbourne's administration Lord John Russell became home secretary and leader of the House of Commons, but on his seeking a renewal of confidence from the electors of South Devon, he was defeated and driven to Stroud. On Sir Robert Peel's resignation (1846) the task of forming an administration was intrusted to Lord John Russell, and he remained at the head of affairs from 1846 to 1852, but his tenure of office was not marked by any great legislative enactments. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary, then without portfolio, and lastly as president of the council. In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop, much to its author's mortification. His popularity was diminished by this failure, and although he resigned in January, 1855, on Mr. Roebuck's Crimea motion, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return he became secretary of the colonies; but the errors in his negotiations at the Austrian capital followed him and forced him to retire. For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Lord John Russell consented to become foreign secretary in Lord Palmerston's ministry, and to accept an earldom. During the American War Earl Russell's sympathies with the North restrained his country from embarking in the contest, but he was not equally successful in preventing the spoliation of Denmark. On Lord Palmerston's death (October, 1865) Earl Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June, on the Reform Bill which they had introduced, was followed by his retirement from

public life. Earl Russell died at Pembroke Lodge, Richmond Park, May 28, 1878.

RUSSELL, WILLIAM RUSSELL, LORD, the third son of Lord Russell, afterward fifth earl and still later first duke of Bedford, and Lady Anne Carr, daughter of the infamous countess of Somerset, was born September 29, 1639. It was not until the formation of the "country party," in opposition to the policy of the Cabal and Charles' French-Catholic plots, that Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton, and others in vehement antagonism to the court. In April, 1679, Russell was one of the council formed by Charles, but in January, 1680, Russell, along with Cavendish, Capell, Powell, Essex, and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 16th he accompanied Shaftesbury, when the latter indicted James at Westminster as a Popish recusant; and on October 26th he took the extreme step of moving "how to suppress Popery, and prevent a Popish successor;" while on November 2d, now at the height of his influence, he went still further by seconding the motion for exclusion in its most emphatic shape, and on November 19th carried the bill to the House of Lords for their concurrence. On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire.

On the breaking out of the Rye Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Before a committee of the council Russell, on June 28th, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. On July 19th he was tried at the Old Bailey, his wife assisting him in his defense. Evidence was given by an informer that, while at Shaftesbury's hiding-place in Wapping, Russell had joined in the proposal to seize the king's guard, a charge indignantly denied by him in his farewell paper, and that he was one of the committee of six appointed to prepare the scheme for an insurrection. Howard, too, expressly declared that Russell had urged the entering into communications with Argyll in Scotland.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford, Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnett and Tillotson, who endeavored to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He went to the place of execution in Lincoln's Inn Fields with perfect calmness, which was preserved to the last. He died on July 21, 1683, in the forty-fourth year of his age.

RUSSELL, JOHN SCOTT, was born in 1808 near Glasgow, Scotland. He attended in succession the universities of St. Andrews, Edinburgh, and Glasgow—taking his degree in the last-named at the age of sixteen. After spending a couple of years in workshops, he settled in Edinburgh as a lecturer on science, and soon collected large classes. His observations led him to propose and experiment on a new system of shaping vessels, which is known as the *wave system*. This culminated in the building of the enormous and unique *Great Eastern*, of which it has been recently remarked by a competent authority that "it is probable that, if a new *Great*

*Eastern* were now to be built, the system of construction employed by Mr. Scott Russell would be followed exactly."

Though his fame will rest chiefly on the great ship mentioned, Scott Russell's activity and ingenuity displayed themselves in many other fields—steam-coaches for roads, improvements in boilers and in marine engines, the immense iron dome of the Vienna exhibition, cellular double bottoms for iron ships, etc. Along with Mr. Stafford Northcote (since Lord Iddesleigh), he was joint secretary of the Great Exhibition of 1851; and he was one of the chief founders of the Institution of Naval Architects. He died at Ventnor, June 8, 1882.

**RUSSIA.** The Russian empire is a very extensive territory in eastern Europe and northern Asia, with an area exceeding 8,500,000 square miles, or one sixth of the land surface of the globe (one twenty-third of its whole superficies). It is, however, but thinly peopled on the average, including only one-fourteenth of the inhabitants of the earth. It is almost entirely confined to the cold and temperate zones. In Nova Zembla (Novaya Zemlya) and the Taimyr peninsula, it projects within the Arctic Circle as far as  $77^{\circ} 2'$  and  $77^{\circ} 40'$  N. latitude; while its southern extremities reach  $38^{\circ} 50'$  in Armenia, about  $35^{\circ}$  on the Afghan frontier, and  $42^{\circ} 30'$  on the coasts of the Pacific. To the west it advances as far as  $20^{\circ} 40'$  E. longitude in Lapland,  $18^{\circ} 32'$  in Poland, and  $29^{\circ} 42'$  on the Black Sea; and its eastern limit—East Cape in the Behring Straits—extends to  $169^{\circ}$  W. longitude.

Russia has no oceanic possessions, and had abandoned those she owned in the last century; her islands are mere appendages of the mainland to which they belong.

The total population of the Russian empire was stated in 1882 at 102,000,000; but as it is increasing rapidly, and as the surplus of births over deaths reaches quite 1,000,000 annually, the population at this time can be easily estimated. In 1885 the total population of European and Asiatic Russia was established at 108,787,250. Statistics of their relative strength, however, are very imperfect. But from such data as is available, the population, so far as the census indicates, is as follows: Russ, 69,770,000; Poles, 6,010,000; Lithuanians, 2,910,000; Germans, 1,120,000; Swedes, 270,000; Tajiks (Persians), 1,125,000; Armenians, 800,000; Jews, 2,954,000; Caucasians, 2,850,000; Finns, 2,000,000; Turks and Tartars, 7,700,000; Mongols, 530,000. The largest cities are St. Petersburg (861,303), Moscow (753,469), and Odessa (240,000).

Only 9,263,000 (or 9 per cent.) of the aggregate population of Russia inhabit towns, the number of which is 601 in the fifty Russian governments. The great number of the Russian towns are mere villages; their inhabitants depend on agriculture, and the houses are mostly built of wood, only 127,000 out of about 787,000 houses in towns being built of stone. Of the 68,600,000 who in 1882 formed the rural population of European Russia the greater part were settled in 555,278 villages, almost entirely built of wood; nearly one-seventieth of the houses are destroyed by fire yearly.

Russia is an absolute and strongly centralized monarchy. The primary unit of state organization is the village community, or *mir*. A number of such communities are united into *volosts*, whose peasant inhabitants elect an elder (*volostnoy starshina*) and a peasants' tribunal (*volostnoy sud*). Placed, however, under the uncontrolled rule of a state official—the *mirovoy posrednik*—and of the police, the elder of the volost and his clerk have become mere organs of the local police and tax-gatherers, while the tribunal of the volost is at the mercy both of influential land-proprietors and of

the wealthier peasants or merchants. The system of local self-government is continued in the elective district and provincial assemblies—the *zemstvo*—on the one hand, and on the other in the elective justices of the peace (*mirovoy sudia*), whose periodical gatherings (*mirovoy syezd*) are courts of appeal against the decisions of the individual justices. But neither of these institutions—and least of all the *zemstvo*—is capable of acquiring the necessary independence. The *zemstvos*—one for each district, and another for the province—consist of a representative assembly (*zemskoye sobraniye*) and an executive (*zemskaya uprava*) nominated by the former. The *sobraniye* consists of three classes of delegates:—the landed proprietors (all nobles possessing more than 590 acres, and delegates from the remainder, along with delegates from the clergy in their capacity of land proprietors); representatives of the merchants, artisans, and urban population; and representatives of the peasants, indirectly elected—matters being usually so adjusted that this class is less numerous than the aggregate of the other two. In theory the *zemstvos* have large powers in relation to the incidence of taxation, as well as in matters affecting education, public health, roads, etc. But in reality they are for the most part compelled to limit themselves to the adjustment of the state taxation, which is so high that new taxes for education, sanitary purposes, and so on, must necessarily be very limited. Moreover, the decisions of the *zemstvos* are jealously controlled by the representative of the central government—the governor—and promptly annulled whenever they manifest a different spirit from that prevailing for the time at the court. Disobedience is punished by dissolution, sometimes by administrative exile. These circumstances have helped to eliminate from the *zemstvos* the better elements which at first entered into their composition. The greater number of them are inspired now with the same red-tapeism as the ministerial chancelleries, or are refuges for proprietors in search of a salary. Still, in several provinces a good deal of most useful work has been done, especially educational, by those *zemstvos* in which the peasants are in a majority or the proprietors are inspired with a more liberal spirit; while several other *zemstvos* have recently made extensive and most valuable inquiries into the condition of agriculture, industry, etc.

Since 1870 the municipalities have had institutions like those of the *zemstvos*. All owners of houses, and tax-paying merchants, artisans, and workmen, are enrolled on lists in a descending order according to their assessed wealth. The total valuation is then divided into three equal parts, each of which elects an equal number of representatives to the *duma*. The executive is in the hands of an elective mayor and an *uprava* which consists of several members elected by the *duma*. Both are, in fact, functionaries under the governor, and the municipal institutions have no real independent life.

The organs of the central government in the provinces are the *uryadniks* (a kind of *gardes-champêtres*) in the villages, the *stanovoy*s and *ispravniks* (chiefs of the police) in the districts, and the governors (a kind of Napoleonic prefect) in each government—all invested, the *uryadniks* included, with powers which are the more extensive as they are totally undefined. There is also in each government a special gendarmerie under the "chief of gendarmes," who usually is also the head of the "third section" of the Imperial Chancery. The name of the third section has been recently abolished, but the institution still continues. It has charge of the secret police of the state, and has most varied functions, such as the arrest of supposed political offenders, their

exile to Siberia, the delivery of separation papers to spouses desiring divorce, and so on. Several governments are placed under special governors-general, whom the recent law on the "state of siege" invests with almost dictatorial powers.

The higher administration is represented by the emperor, who unites the supreme legislative, executive, and judicial powers, and is surrounded by four distinct councils—the committee of ministers, the council of the empire, the senate, and the Holy Synod. The ministers, who are considered as executing the will of the czar, and are nominated by him, are invested with very extensive powers; their circulars for the interpretation of laws have greater weight than the laws themselves. The council of the empire, which consists of members nominated by the emperor, besides the ministers and several members of the imperial family, is a consultative body for matters of legislation. The senate, also nominated by the emperor, has two distinct functions. Seven "departments" of it are administrative; they promulgate the laws, examine the acts of governors, adjudicate in their conflicts with *zemstvos*, and, in theory, can make remonstrances to the emperor—in fact they merely register and promulgate laws. Two other "departments" are courts of cassation. A special department, reinforced by representatives of nobility, pronounces judgment in political cases. The Holy Synod, consisting of metropolitans and bishops who sit there in turn, has the superintendence of religious affairs.

The judicial system introduced in 1864 was conceived in a very liberal spirit, which, unfortunately, has not been maintained. Thus a "preliminary instruction," made by the "third section" in political cases, or by the police, has been subsequently introduced. The "judges of instruction," irremovable by law, have not yet been nominated, their functions being discharged by substitutes entirely dependent upon the ministry. Elective justices of the peace decide in all cases involving less than 500 rubles, or less than six months' imprisonment. Their decisions can be brought by appeal before the district gathering of the justices of the peace, and thence before the senate. All criminal cases involving severer penalties are tried by juries, whose verdicts can be set aside only by a court of cassation, but are not respected in cases having a so-called "political" aspect. Political offenses are tried by tribunals composed *ad hoc*. Civil cases, in which more than 500 rubles are involved, are tried by courts of justices, with appeal to chambers of justice.

The empire is divided for administrative purposes into governments (*guberniya*) or territories (*oblast*), of which there are fifty in European Russia and ten in Poland. Each government, or territory, is divided into eight to fifteen districts (*uyezd*). The Asiatic dominions are divided into one lieutenantancy (*namyestnitchestvo*), that of Caucasia, and four general governments—Turkistan, Steppoye (Kirghiz Steppes), East Siberia, and Amur. They comprise thirty-three governments and territories, besides a few districts (*okrug, otdyel*) in Transcaucasia and the Transcaspian region, regarded almost as separate governments. In Siberia the governors and governors-general are assisted by councils which have a consultative voice. The Baltic provinces have some peculiar institutions. Finland is a separate state, having its own finances, army, and representative institutions, with limited rights, but its ministers of war and the exterior are those of the empire, and its institutions are not always respected by the emperor.

The emperor is not the head of the church, all decisions in theological matters having to be given by

the Synod. His influence, however, is very great, as the nomination of the bishops rests with him.

The established church is the Russo-Greek church officially called the "Orthodox Catholic Faith." According to religions there are Greek Catholics, including Dissenters, 72,990,000; Roman Catholics, 8,910,000; Protestants, 4,766,000; Jews, 2,954,000; Mohammedans, 11,814,000; Pagans, 470,000. In 1835 there were 40,569 orthodox churches, 14,000 chapels with 37,318 priests, 7,009 deacons, and 45,395 singers. There were also 6,752 monks, 3,957 aspirants, 4,945 nuns, and 13,803 female aspirants. The total annual revenue is estimated at 10,000,000 rubles.

Much still remains to be done for the diffusion of the first elements of a sound education throughout the empire; unhappily the endeavors of private persons in this field and of the *zemstvos* are for political reasons discouraged by the government. There are several universities—Dorpat, Kazan, Kharkoff, Kieff, Moscow, Odessa, and St. Petersburg—to which may be added those of Warsaw and Helsingfors. In 1883 the seven Russian universities had 605 professors and 10,528 students, and there were 81 professors and 1,228 students at Warsaw. The standard of teaching on the whole is high, and may be compared to that of the German universities. About 950 students in the theological academies and 2,500 in higher technical schools must be added to the above. There were in 1883 180 gymnasiums and progymnasiums for boys in European Russia, and 24 in the Asiatic dominions, and 27 and 10 respectively for girls; there were also 73 "real" schools in European Russia and 8 in the Asiatic dominions, and 48 normal schools in Russia and 10 in the Asiatic dominions. To these must be added the 14,800 pupils in 53 theological seminaries, and about 3,000 in various secondary schools. The aggregate number of schools for secondary instruction in European Russia in 1882 was 456 for boys and 384 for girls, with 107,930 male and 79,625 female scholars. Of these, 355 schools (45,303 boys and 3,199 girls) give professional education. For primary instruction there are in European Russia proper 28,329 schools with 1,177,504 male and 362,471 female pupils. Of the 6,231,160 rubles expended on primary schools only 747,772 rubles were contributed by government, the remainder being supplied by the *zemstvos* (2,512,113 rubles), by municipalities, or by private persons. Sunday schools and public lectures are virtually prohibited.

In addition to these, notwithstanding government opposition, a series of higher schools, where careful instruction in natural and social sciences is given, have been opened in the chief cities under the name of "Pedagogical Courses." At St. Petersburg a women's medical academy, the examinations of which were even more searching than those of the ordinary academy (especially as regards diseases of women and children), was opened, but after about 100 women had received the degree of M.D., it has been suppressed by government. In several university towns there are also free teaching establishments for women, supported by subscription, with programmes and examinations equal to those of the universities. In 1882 the students numbered 914 at St. Petersburg, about 500 at Moscow, and 389 at Kazan.

Russian finances, long in a very unsatisfactory condition, showed signs of improvement in 1889, the income being slightly in excess of expenditure, and a portion of the debt was reduced under favorable conditions. The total debt at the close of 1888 was \$3,731,103,600, the interest on which was \$208,884,260. The revenue for 1889 was estimated at \$450,000,000.

The great defect of Russian finance is that its direct

taxes are chiefly paid by the peasantry (91 per cent. of the whole), and the revenue is chiefly based on excise duties (direct taxes, excise duties on spirits, duties on tobacco and sugar, and import duties).

The zemstvos, which have an aggregate yearly income of about 30,000,000 rubles, have also a yearly deficit of from 3,000,000 to 5,000,000 rubles.

The Russian army has been completely reorganized since the Turkish War, and compulsory military service was introduced in 1874. In 1889 the strength of the army on a peace footing was 800,000 men serving with the colors, with 3,400 guns; in European Russia, 420,000 combatants with 2,800 guns; in the Caucasus, 250,342 combatants with 300 guns; and in Asia, 131,116 combatants with 196 guns. On a war footing it includes altogether 2,151,000 combatants with 6,696 guns.

The irregular troops consist of ten *voiskos*—Don, Kuban, Terek, Astrakhan, Orenburg, Ural, West Siberia, Semiryetchensk, Transbaikalia, and Amur. All the men of these voiskos between sixteen and forty-one years of age are bound to be ready for service in turn in time of peace, and to equip themselves at their own expense, train and artillery being provided by government. In their twofold capacity as peasant settlers and a military force, these men have contributed much to the conquest of Asia.

Since 1878 compulsory military service has been introduced in Finland. The Finnish troops (nine battalions of 4,833 riflemen) must be employed, as a rule, for the defense of their own country.

Notwithstanding large recent outlays, the Russian navy is by no means adapted to the exigencies of modern warfare; much stress is therefore laid on the good organization of the torpedo flotilla. The navy consists of the Baltic fleet, that of the Black Sea, and of flotillas on the Ural and Caspian Seas and in Siberia, comprising 268 armed vessels (of which 32 are iron-clads of all classes, and 139 torpedo boats), with an armament of 1,348 guns. The number of men enrolled in the service is not far from 35,000.

The great territory occupied by European Russia—1,600 miles in length from north to south, and nearly as much from west to east—is on the whole a broad and elevated plain, ranging between 500 and 900 feet above sea-level, deeply cut into by river-valleys, and bounded on all sides by broad hilly swellings or mountains—the lake plateaus of Finland and the Maanselkä heights in the northwest; the Baltic coast-ridge and spurs of the Carpathians in the west, with a broad depression between the two, occupied by Poland; the Crimean and Caucasian mountains in the south; and the broad but moderately high swelling of the Ural Mountains in the east.

The Ural Mountains present the aspect of a broad swelling whose strata no longer exhibit the horizontality we see in Russia, and moreover are deeply cut into by rivers. It is connected in the west with broad plateaus joining those of central Russia, but its orographical relations to other upheavals must be more closely studied before they can be definitely pronounced on. The rhomboidal peninsula of the Crimea, connected by only a narrow isthmus with the continent, is occupied by a dry plateau gently sloping north and east, and bordered in the southeast by the Yaila Mountains, the summits of which range between 4,000 and 5,113 feet (see CRIMEA and TAURIDA).

The rivers take their origin from a series of great lacustrine basins scattered over the surface of the plateaus and differing slightly in elevation; the Russian rivers describe immense curves before reaching the sea, and flow with a very gentle gradient, receiving numerous large tributaries, which collect their waters from vast

areas. Thus the Volga, the Dnieper, and the Don attain respectively a length of 2,110, 1,330, and 1,125 miles, and their basins cover 645,000, 244,600, and about 115,000 square miles respectively. Moreover the chief rivers of Russia—the Volga, the Duna, the Dnieper, and even the Lovat and the Oka—take their rise in the northwestern part of the central plateau, so close to one another that they may be said to radiate from the same marshes. The sources of the Don are ramified among the tributaries of the Oka, while the upper tributaries of the Kama join those of the Dwina and Petchora. In consequence of this, the rivers of Russia have been from remote antiquity the true channels of trade and migration, and have contributed much more to the elaboration of the national unity than any political institutions. By their means the plains of the central plateau—the very heart of Russia, whose natural outlet was the Caspian—were brought into water-communication with the Baltic, and the Volga basin connected with the Gulf of Finland. The White Sea has also been brought into connection with the central Volga basin, while the sister-river of the Volga—the Kama—became the main artery of communication with Siberia. The Volga is the largest river in Europe, and is navigable almost to its source. In Siberia the Obi, Yenisei, Lena, and Amur are each larger than the Volga, with many important tributaries, and the surface along the southern borders is mountainous, rising in many places above the limit of perpetual snow.

It must be observed, however, that, though ranking before the rivers of western Europe in respect of length, the rivers of Russia are far behind as regards the amount of water discharged. They freeze in winter and dry up in summer, and most of them are navigable only during the spring-floods; even the great Volga becomes so shallow during the hot season that only light boats can pass its shoals.

Russia has a very large number of lakes. The aggregate area of the largest ones is stated at 25,800 square miles.

The soil of Russia depends chiefly on the distribution of the boulder-clay and loess coverings, on the progress made by the rivers in the excavation of their valleys, and on the moistness of climate. The distribution of all these is, however, very unequal, and the five following subdivisions may be established: (1) the *tundras*, (2) the forest region; (3) the middle region, comprising the surface available for agriculture and partly covered with forests; (4) the black-earth (*tchernoziom*) region, and (5) the Steppes. Of these the black-earth region—about 150,000,000 acres—which reaches from the Carpathians to the Urals, extending to the Pinsk marshes and the upper Oka in the north, is the most important. It is covered with a thick sheet of black earth, a kind of loess, mixed with 5 to 15 per cent. of humus, due to the decomposition of an herbaceous vegetation, which developed richly during the Lacustrine period on a continent relatively dry even at that epoch. On the three fields system corn has been grown upon it for fifty to seventy consecutive years without manure. Isolated black-earth islands, less fertile of course, occur also in Courland and Kovno, in the Oka, Volga, and Kama depression, on the slopes of the Urals, and in a few patches in the north. Toward the Black Sea coast its thickness diminishes, and it disappears in the valleys. In the extensive region covered with boulder-clay the black earth appears only in isolated places, and the soil consists for the most part of a sandy clay, containing a much smaller admixture of humus. There culture is possible only with the aid of a considerable quantity of manure. Drainage finding no outlet through the thick

clay covering, the soil of the forest region is often covered with extensive marshes, and the forests themselves are often mere thickets spreading over marshy ground; large tracts covered with sand appear in the west, and the admixture of bowlders with the clay in the north-west renders agriculture increasingly difficult. On the whole it may be said that by far the greater portion of Russia is not fit for cultivation. The barren and frozen *tundras* in the north are mostly unproductive of anything except moss; in Finland of the total area 11½ per cent. is covered with lakes, 54 per cent. with woodland, 10 per cent. under cultivation, and the rest waste land or coarse pasture; in the south, at the head of the Caspian Sea, is an immense sandy desert, while in the interior and nearly the whole of Siberia are covered with forests. Between the Black and the Baltic seas, however, the land is fertile. In European Russia the forests are extensive, embracing an area of 460,000,000 acres, grown principally with fir, pine, birch, oak, maple, and ash.

Notwithstanding the fact that Russia extends from north to south through twenty-six degrees of latitude, the climate of its different portions, apart from the Crimea and the Caucasus, presents a striking uniformity. The aerial currents—cyclones, anti-cyclones, and dry southeast winds—extend over wide surfaces and cross the flat plains freely. Everywhere we find a cold winter and a hot summer, both varying in their duration, but differing relatively little in the extremes of temperature recorded. Everywhere the rainfall is small. Everywhere, too, we find that the maximum rainfall does not take place in winter but in summer, and that the months of advanced spring are warmer than the corresponding months of autumn.

Throughout Russia the winter is of long continuance. The last days of frost are experienced for the most part in April, but also in May to the north of 55°. The spring is exceptionally beautiful in central Russia; late as it usually is, it sets in with vigor, and vegetation develops with a rapidity which gives to this season in Russia a special charm, unknown in warmer climates; the rapid melting of snow at the same time raises the rivers, and renders a great many minor streams navigable for a few weeks. The summer is much warmer than might be supposed; in southeastern Russia it is much warmer than in the corresponding latitudes of France, and really hot weather is experienced everywhere. It does not, however, prevail for long, and in the first half of September the first frosts begin to be experienced on the middle Urals; they reach western and southern Russia in the first days of October, and are felt on the Caucasus about the middle of November. The rivers rapidly freeze; toward November 20th all the streams of the White Sea basin are covered with ice, and so remain for an average of 167 days; those of the Baltic, Black Sea, and Caspian basins freeze later, but about December 20th nearly all the rivers of the country are highways for sledges.

The fauna of European Russia does not very materially differ from that of western Europe. In the forests not many animals which have disappeared from western Europe have held their ground; while in the Urals only a few—now Siberian, but formerly also European—are met with. On the whole, Russia belongs to the same zoö-geographical region as central Europe and northern Asia, the same fauna extending in Siberia as far as the Yenisei and Lena. In southeastern Russia, however, toward the Caspian, we find a notable admixture of Asiatic species, the deserts of that part of Russia belonging in reality rather to the Aral-Caspian depression than to Europe.

Like other races of mankind the Russian race is not a

pure one. Three different branches, which may become three separate nationalities, can be distinguished among the Russians since the dawn of their history:—the Great Russians, the Little Russians (Malorusses or Ukrainians), and the White Russians (the Bielorusses). These correspond to the two currents of immigration, the northern and southern, with perhaps an intermediate one, the proper place of the White Russians not having as yet been exactly determined. The primary distinctions between these branches have been increased during the last nine centuries by their contact with different nationalities—the Great Russians taking in Finnish elements, the Little Russians undergoing an admixture of Turkish blood, and the White Russians submitting to Lithuanian influence. Moreover, notwithstanding the unity of language, it is easy to detect among the Great Russians themselves two separate branches, differing from one another by slight divergences of language and type and deep diversities of national character—the Central Russians and the Novgorodians; the latter extend throughout northern Russia into Siberia. They correspond, perhaps, to subdivisions mentioned by Nestor. The Great Russians number about 42,000,000, and occupy in one block the space inclosed by a line drawn from the White Sea to the sources of the western Düna, the Dnieper, and the Donetz, and thence, through the mouth of the Sura, by the Vetluga, to Mezeń. To the east of this boundary they are mixed with Turco-Finns, but in the Ural Mountains they reappear in a compact body, and extend thence through southern Siberia and along the courses of the Lena and Amur. Great Russian nonconformists are disseminated among Little Russians in Tchernigoff and Moghileff, and they reappear in greater masses in Novorossia, as also in northern Caucasia. The Little Russians, who number about 17,000,000, occupy the Steppes of southern Russia, the southwestern slopes of the central plateau and those of the Carpathian and Lublin mountains, and the Carpathian plateau. The Sitch of the Zaporog Cossacks colonized the Steppes farther east, toward the Don, where they met with a large population of Great Russian runaways, constituting the present Don Cossacks. The Zaporog Cossacks, sent by Catherine II. to colonize the east coast of the Sea of Azoff, constituted there the Black Sea and later the Kubañ Cossack (part of whom, the Nekrasovtsy, migrated to Turkey). They have also peopled large parts of Stavropol and northern Caucasia. The White Russians, mixed to some extent with Great and Little Russians, Poles, and Lithuanians, now occupy the upper parts of the western slope of the central plateau. They number about 4,300,000.

The Finnish-Russians are represented by the Western Finns, Tavastas in Central Finland, Kvanes in Northwestern Finland, Karelians in the East, the Izora and Voa on the Neva, the Esthes in Esthonia and Levonia, the Leves on the Gulf of Riga, the Kors, mixed with the Lapps, in Northern Finland, and the Samoyedes in Archangel. The Turco-Tartars number about 3,600,000, and consist of the Kazan Tartars on the Volga, the Tartars of Astrakhan, at the mouth of the Volga, and the Tartars of the Crimea, most of whom have recently emigrated to Turkey. The Mongolian race is represented by the Lamiate and Kalmuks, most of whom inhabit the steppes of the Astrakhan, between the Volga and the Kuma. They immigrated to the country in the seventeenth century, and live for the most part in tents, supporting themselves by cattle breeding and agriculture. The Jews first entered Poland from Germany during the crusades. They now number 3,000,000 Jews and 3,000 Karians, and are met with everywhere on the

Urals. In the villages they are mostly innkeepers, intermediaries in trade, and pawn-brokers. Less than 600,000 inhabit villages, the remainder being concentrated in towns. The Germans number upward of a million, and in the Baltic provinces constitute the ennobled landlord class, being tradesmen and artisans and artisans in towns. They are mostly Lutherans, and in the districts of Akerman, Odessa, Berdiansk, Kamyschür, and Novonzeusk, constitute from 10 to 40 per cent. of the population. Of the remaining varieties of nationalities, the Swedes, who are very numerous in Finland, hardly reach 12,000 in European Russia, mostly in the Baltic provinces. The Roumanians (Moldavians) number not less than 800,000, and are constantly increasing. They inhabit the governments of Bessarabia, as also do many Bulgarians, Germans, Greeks, Frenchmen, Poles, Tartars, and Jews, mixed together and scattered about in small colonies. The Greeks and Armenians inhabit the towns of Southern Russia, appearing in large numbers only in the district of Rostoff, where they constitute 10 per cent. of the population.

The chief occupation of the population of Russia is agriculture. Only in a few parts of Moscow, Vladimir, and Nijni has it been abandoned for manufacturing pursuits. Cattle-breeding is the leading industry in the steppe region, the timber-trade in the northeast, and fishing on the White and Caspian Seas. Of the total surface of Russia, 1,237,360,000 acres (excluding Finland), 1,018,737,000 acres are registered, and it appears that 39.9 per cent. of these belongs to the crown, 1.9 to the domains (*udel*), 31.2 to peasants, 24.7 to landed proprietors or to private companies, and 2.3 to the towns and monasteries. Of the acres registered only 592,650,000 can be considered as "good," that is, capable of paying the land tax; and of these 248,630,000 acres were under crops in 1884. Those of 1884 (a very good year) reached an average of 18 per cent. higher than those of the year previous, when they aggregated 153,477,000 bushels of wheat, corn, rye and other grains, except oats. The crops are, however, very unequally distributed. In an average year there are eight governments which are some 6,930,000 quarters short of their requirements, thirty-five which have an excess of 33,770,000 quarters, and seventeen which have neither excess nor deficiency. The export of corn from Russia is steadily increasing, having risen from 6,560,000 quarters in 1856-60 to an average of 23,700,000 quarters in 1876-83, and 26,623,700 quarters in 1884. This increase does not prove, however, an excess of corn, for even when one-third of Russia was famine-stricken, during the last years of scarcity, the export trade did not decline; even Samara exported during the last famine there, the peasants being compelled to sell their corn in autumn to pay their taxes. Scarcity is quite usual, the food supply of some ten provinces being exhausted every year by the end of the spring. Orach, and even bark, are then mixed with flour for making bread.

Flax, both for yarn and seed, is extensively grown in the northwest and west, and the annual production is estimated at 6,400,000 hundredweights of fiber and 2,900,000 quarters of linseed. Hemp is largely cultivated in the central governments, the yearly production being 1,800,000 hundredweights of fiber and 1,800,000 quarters of seed. The export of both holds the second place in the foreign trade of Russia.

The culture of the beet is increasing, and in 1884 785,700 acres were under this root, chiefly in Little Russia and the neighboring governments; 68,900,000 hundredweights of beetroot were worked up, yielding 5,119,000 hundredweights of sugar, while fifty-five refineries (twenty-six of them in Poland) showed a produc-

tion valued at 118,888,530 rubles in 1882. Tobacco is cultivated everywhere, but good qualities are obtained only in the south. In 1876-80 an average area of 101,600 acres was under this steadily increasing culture, and the crop of 1884 yielded 86,400,000 hundredweights. The vine, which might be grown much farther north than at present, is cultivated only on Mount Caucasus, in Bessarabia, in the Crimea, and on the lower Don for wine, and in Ekaterinoslaff, Podolia, and Astrakhan for raisins. The yearly produce is 10.8 million gallons in Russia, 10.0 in the Caucasus, and 24 in Transcaucasia. Market gardening is extensively carried on in Yaroslavl for a variety of vegetables for exportation, in Moscow and Ryazan for hops, and in the south for sunflowers, poppies, melons, etc. Gardening is also widely spread in Little Russia and in the more fertile central governments. Madder and indigo are cultivated on Caucasus, and the silk-worm in Taurida, Kherson, and Caucasia. Bee-keeping is widely spread.

Fishing is a most important source of income for whole communities in Russia. No less than 2,000 to 3,000 inhabitants of Archangel are engaged in fishing on the Norwegian coast and in the White Sea, the aggregate yield of this industry being estimated at 200,000 hundredweights, including 150,000,000 herrings. These fisheries are, however, declining. Fishing in the Baltic is not of much importance. In the estuaries of the Dnieper, Dniester, and Bug it gives occupation to about 4,000 men, and may be valued at less than 1,000,000 rubles. The fisheries in the Sea of Azoff, which occupy about 15,000 men, are much more important, as are also those of the lower Don, which last alone are valued at over 1,000,000 rubles a year. The chief fisheries of Russia are, however, on the Caspian and in its feeders; those of the Volga cover no less than 6,000 square miles, and those of the Ural extend for over 100 miles on the sea-coast and 400 miles up the river. The lowest estimates give no less than 4,000,000 hundredweights, valued at 15,000,000 rubles, of fish taken every year in the Caspian and its affluents. The fisheries on the lakes of the lake region are also worthy of notice.

Notwithstanding the wealth of the country in minerals and metals of all kinds, and the endeavors made by government to encourage mining, including the imposition of protective tariffs even against Finland (in 1885), this and the related industries are still at a low stage of development. The chief mining districts of Russia are the Ural Mountains and Olonetz for all kinds of metals; the Moscow and Donetz basins for coal and iron; Poland and Finland; Caucasus; and the Altai, the Nertchinsk, and the Amur mountains.

The Ural Mountains, however, contain nearly all the mineral riches of the country, and are the principal seat of mining and metallic industry, producing gold, platinum, copper, iron of very superior quality, rock-salt, marble, and kaolin or china-clay. In the Altai Mountains are extensive and thoroughly worked mines of silver, gold and lead, while from the naphtha springs, which border the Caspian Sea, the output is so great that the European markets, it might be said, are flooded with petroleum. These springs are continually increasing in importance and volume of production. The same may be said of the annual production of pig-iron and steel, also of coal. Immense beds of this latter commodity, both steam and anthracite, were discovered at a comparatively recent date in the Donetz basin, between Donetz and Dnieper rivers, of which Mariupol, Rostoff and Tangouroth are the outlets. Nearly 34,000,000 hundredweights are imported annually. The extraction of naphtha on the Apsheron peninsula of the Caspian has been greatly stimulated of late, reaching about 20,000,000 hundredweights in 1883 (4,600,000

hundredweights of kerosene, 1,000,000 hundredweights of lubricating oils, and 300,000 hundredweights of asphalt).

Excellent graphite is found in the deserts of the Sayan mountains and Turukhansk. Sulphur is obtained in Caucasia, Kazañ, and Poland. The mining and related industries occupy altogether about an aggregate motive force (steam and water) of 73,500 horse-power and 305,000 hands.

Since the time of Peter I. the Russian government has been unceasing in its efforts for the creation and development of home manufactures. Important monopolies in the last century, and heavy protective, or rather prohibitive, import duties, as well as large money bounties, in the present, have contributed toward the accumulation of immense private fortunes, but manufactures have developed but slowly. A great upward movement has, however, been observable since 1863.

Yet the manufactories of rails and railway plant, and even the Ural ironworks, are in a precarious condition, and the textile industries, though undoubtedly they have made great advances, are subject to great fluctuations in connection with those of the home crops, and are thus in an abnormal state. The artisans labor for twelve, fourteen, and sometimes sixteen hours a day, and their condition, as revealed by recent inquiries, is very unsatisfactory. Many causes contribute to this, the want of technical instruction, the want of capital, and above all the want of markets.

The domestic industries which are carried on by the peasants in conjunction with their agricultural pursuits during the long days of idleness imposed by the climate and the reduced allotments of land, continue, not only to hold their ground side by side with the large manufactures, but to develop and to compete with these by the cheapness of their products. The yearly production of 855,000 kustari who have been registered reaches 218,444,000 rubles; while the total number of peasants engaged in the industries, mostly in Great Russia and northern Caucasia, is estimated at a minimum of 7,500,000 persons, with a yearly production of at least 1,800,000,000 rubles, or more than double the aggregate production of the manufactures proper. Of course the machinery they use is very primitive, and the wages for a day of twelve or sixteen hours exceedingly low.

In those very governments where two-thirds of the textile manufactories of Russia are concentrated domestic weaving (for the market, not for domestic use) employs about 200,000 hands, whose yearly production is valued at 45,000,000 rubles. In Stavropol on Caucasia it has so rapidly developed that 42,400 looms are now at work, with a yearly production of 2,007,700 rubles. But no adequate idea could be given of the petty industries of Russia without entering into greater detail than the scope of the present article permits. Suffice it to say that there is no branch of the industries in textiles, leather, woodwork, or metal work, provided it needs no heavy machinery, which is not successfully carried on in the villages. The aggregate production of industries within the empire, inclusive of mining, was stated in 1882 as follows: European Russia, 1,126,033,000 rubles; Poland, 147,309,000; Finland, 15,130,000. The chief manufactures in European Russia (apart from Poland and Finland), and their yearly production in 1882 in millions of rubles, were as follows: cotton yarn and cottons, 208.6; other textile industries, 103.5; metal wares and machinery, 107.9; chemicals, 6.6; candles, soap, glue, leather, and other animal products, 61.4; distillery products, 156.0; other liquors, 39.0; sugar, 140.9; flour, 74.0. The remainder are of minor importance. The geographical distribution of manufact-

ures in Russia is very unequal. The governments of Moscow and St. Petersburg, with a yearly production of 173 and 134 million rubles respectively, represent together two-fifths of the aggregate production of Russia. If we add Vladimir (91,766,000 rubles), Kieff (73,300,000), Perm (50,500,000), Livonia, Esthonia, Kharkoff, and Kherson (from 30,000,000 to 35,000,000 each), we have all the principal manufacturing centers. In fact, Moscow, with portions of the neighboring governments, contains half the Russian manufactures exempted from excise duties, while the southwest governments of Kieff, Podolia, and Kherson contains two-thirds of those not so exempted.

The main wealth of Russia consisting in raw produce, the trade of the country turns chiefly on the purchase of this for export, and the sale of manufactured and imported goods in exchange. This traffic is in the hands of a great number of middlemen—in the west Jews, and elsewhere Russians—to whom the peasants are for the most part in debt, as they purchase in advance on security of subsequent payments in corn, tar, wooden wares, etc.

Eastern Europe, especially England, purchases articles of native produce. In 1888 the chief exports were: Wheat, valued at \$40,642,240; barley, valued at \$13,318,655; oats, at \$1,827,655; other grains at \$3,787,260; bristles, \$456,810; flax, \$9,721,470; hemp, \$1,220,051; ore, \$542,440; hides and leather, \$495,660; oil-seed cake, \$1,180,580; petroleum, \$2,634,625; seeds of all kinds, \$7,298,685; wood and lumber, \$15,828,470; and wool, \$4,086,025.

The chief imports from Europe for the same year were: Alkali, \$6,838,400; herrings, \$7,380,000; implements and tools, \$338,350; bags and sacks, \$412,000; machinery, \$5,075,010; coal, \$3,010,353; chemical products, \$401,817; metals, \$4,874,480; cotton yarns and cotton manufactures, \$3,559,630; and wool and woolen manufactures, valued at \$1,727,070.

The mercantile marine of Russia in 1886 numbered 2,289 vessels, 653,446 tons. The chief ports are St. Petersburg, Odessa, Riga, Taganrog, Libau, and Reval. Baku has recently acquired some importance in consequence of the naphtha trade.

The rivers of the empire, mostly connected by canals, play a very important part in the inland traffic. The aggregate length of navigable waters reaches 21,510 miles (453 miles of canals), and 12,600 miles more are available for floating rafts.

Twenty-five years ago Russia had only 993 miles of railways; on January 1, 1883, the totals were 13,428 miles for Russia and Caucasia, 888 for Poland, 734 for Finland, and 141 for the Transcaspian region; two years later they had reached an aggregate length of 16,155 miles, and in November, 1888, there were 18,670 miles open to traffic. The railways chiefly connect the Baltic ports with the granaries of Russia in the southeast, and the western frontier with Moscow, whence six trunk lines radiate in all directions.

Only 738 miles of the railways of Russia belong to the state, but most of them have been constructed under government guarantees, involving payment of from 11,000,000 to 21,000,000 rubles yearly. Of the aggregate value of the Russian railways, estimated at 2,210,000,000 rubles, no less than 1,971,000,000 rubles were held by government in shares and bonds. The cost of construction has been altogether out of proportion to what it ought to be; for, whereas the average rate per verst (0.663 mile) in Finland was only 20,000 silver rubles, in Russia it reached 60,000, 75,000, 90,000, and even 100,000 rubles. In 1884 34,674,853 passengers, 2,287,955 military, and 834,500,000 hundredweights of merchandise were conveyed by 5,808 locomotives and

120,940 carriages and wagons. Fully one-half of the merchandise carried consisted of grain (24 per cent.), coal (13 per cent.), firewood (12 per cent.), and timber (8 per cent.)

For the conveyance of correspondence and travelers along ordinary routes the state maintains an extensive organization of post-horses between all towns of the empire, that is, over an aggregate length of 110,170 miles. In 1888 5,200 stations, with a staff of men and horses, were kept for that purpose. In 1887 280,000,000 letters were carried, of which 29,808,100 belonged to international correspondence. The telegraph system had in the same year an aggregate length of 91,000 miles, with 370 telegraph offices.

The derivation of the words Russia, Russian (*Rous, Rossia, Rossiane*), has been much disputed. The old-fashioned view was to identify them with the *Rhoxolani*, who are now generally believed to have been a Medish tribe. The later and probably correct one is to derive the name from the Finnish *Ruotsi* applied to the Swedes, and considered by Professor Thomsen of Copenhagen to be itself a corruption of the Swedish word *rothsmenn*, rowers or seafarers. They are Scandinavian vikings with whom we first become acquainted in northern Russia, and who in a way founded the empire, although from Arabian and Jewish writers we have dim records of a Slavonic race inhabiting the basin of the Dnieper about the close of the ninth century. In recent times Ilovaiski and Gedeonoff have again attacked the view of the Swedish origin of the invaders. They see in them only Slavs, but they are not considered to have shaken the theory which derives the name from *Ruotsi*. As the story goes, three brothers, Rurik, Sineus, and Truvor, were invited to Russia from the north and settled at Novgorod in 862.

Having greatly extended his dominions by subduing the surrounding Slavonic tribes, Rurik died at an advanced age in 879, leaving the regency of the principality and the guardianship of his son Igor to the renowned Oleg. This chief subdued Smolensk, a city of the Krivitchi, in 882. Allured by its wealth and advantageous situation, Oleg now resolved to attempt Kieff, which was held by Askold and Dir. The story goes that he took young Igor with him, and disguised himself and his companions as Slavonic merchants. The unsuspecting Askold and Dir were invited to a conference and slain on the spot. Thus was Kieff added to the dominions of Igor, who was recognized as the lord of the town. In 903 Oleg chose a wife for Igor, named Olga, said to have been a native of Pskoff, the origin of which place, now mentioned for the first time, is unknown. Soon after overcoming the Greeks at Constantinople Oleg died; he had exercised supreme power till the time of his death to the exclusion of Igor, and seems to have been regarded by the people as a wizard. Igor was succeeded by his son Sviatoslaff, the first Russian prince with a Slavonic name. This son was as celebrated a warrior as Oleg; his victories were chiefly over the Petchenegs, a people of mongrel origin inhabiting the basin of the Don. Vladimir, the son of Sviatoslaff, was for some time a monster of cruelty and debauchery. He killed his brother Yaropolk, and seized his dominions; and, Yaropolk having some time before murdered his brother Oleg, Vladimir now became sole ruler. However, he went to Constantinople in 988, and was admitted into the church. As Vladimir introduced Christianity into Russia, so Yaroslaff his son was the first legislator. He was prince of Novgorod, and died in 1054. Vladimir on his death divided his dominions among his sons—to Yaroslaff, Novgorod; to Isiaslaff, Polotsk; to Boris, Rostoff; to Gleb, Murom; to Sviatoslaff, the Drevlians;

and a few other provinces to others of his sons. Kieff, his capital, was seized by his nephew Sviatopolk, who murdered Boris and Gleb, now canonized among the martyrs of the Russian Church. The country was now broken up into petty principalities. Iziaslaff, the son of Yaroslaff, seems to have had a troubled reign of twenty-four years, constantly disturbed by civil wars. On his death in 1078 he left the principality of Kieff to his brother Vsevolod, apparently on a principle common among the Slavs to bequeath the crown to the oldest male of the family; on the death of Vsevolod, Sviatopolk, the son of Iziaslaff, succeeded in 1093. At his death, Vladimir Monomakh came to the throne, and ruled from 1113 to 1125. From 1125 to 1238 George Dolgoruki, one of the sons of Vladimir Monomachus, and Andrew Bololioubski, were two noteworthy princes among a score of unimportant persons who ruled. From 1238 to 1462 Russia was under the yoke of the Mongols. From 1462 to 1613 Ivan III., Basil V., and Ivan IV. maintained an ascendancy. During this period the empire was consolidated, Boris Godunuff usurped the throne of the false Demetrius, and in 1613 the house of Romanoff succeeded to the throne in the person of Michael.

The Romanoffs were connected on the female side with the house of Rurik, Anastasia Romanova having been the first wife of Ivan the Terrible. Before being allowed to ascend the throne, the youthful sovereign, according to some authors, took a constitutional oath. The reign of Michael, however, was not very eventful; he employed it wisely in ameliorating the condition of the country, which had recently suffered so much, and in improving the condition of his army. Foreigners began to visit the country in great numbers, and Russia was gradually opening itself to Western civilization. Gustavus Adolphus, of Sweden, induced the czar to sign a treaty offensive and defensive, and a Swedish ambassador appeared at the Russian court. Dutch and German artisans were taken into the Russian service to assist in the iron foundries, with special view to the manufacture of cannon. The country swarmed with English merchants who had obtained valuable privileges. Scottish adventurers were to be met with in the Russian army in great numbers. From Scottish settlers in Russia sprang the celebrated poet, Lermontoff, the first two syllables of whose name fully show his Caledonian origin. Upon Michael's death in 1645, Alexis, his son, succeeded. The leading events of his reign were: The codification of the laws, the incorporation with Russia of the Ukraine and country of the Cossacks; the restoration to Russia of the towns which had been taken by the Lithuanians and conceded to Poland by the treaty of Lublin (1596); the great riot at Moscow in 1648 on account of the depreciation of the coinage, and the rebellion of Stenka Razin, a Cossack. He in turn was succeeded by his son Feodor, whose reign was uneventful. He was twice married. His first wife Maria Miloseavskaia bore him two sons, Feodor and Ivan, and several daughters; his second wife, Natalia, was the mother of Peter and a daughter, Natalia. Under these circumstances the court was rent by rival factions of both houses. At this juncture Sophia, the daughter of Alexis, a woman of singular energy of character, instigated the murder of some of the family and partisans of Natalia. The result was that Ivan and Peter were declared joint sovereigns, and Sophia regent during their minority. Peter, known in history as Peter the Great, began to rule in 1689, and Ivan died in 1696. In the same year Peter gained possession of Azoff at the mouth of the Don, and afterward made his triumphal entry into Moscow. After touring in Holland, where he worked at the docks of Saardam,

visiting England, defeating Charles XII., and marrying Martha Skavronska, a Livonian or Lithuanian peasant, who received the name of Catherine upon being baptized into the Greek church, he set about his great plan of civilizing the country on the model of the nations of the west. He remodeled the army, abolished the patriarchate, based nobility upon civil or military service, attempted to introduce primogeniture into Russia, etc. In 1721 he promulgated the ukaze, afterward abrogated by Paul, that the sovereign had the right of naming his successor.

On January 28, 1725, the great reformer was dead. An attempt to estimate his character has been made in the separate article assigned to him. Catherine died in 1727. She designated as her successor Peter the son of Alexis, and, in default of Peter and his issue, Anna, who had married the duke of Holstein, and Elizabeth, her daughters. On the death of Peter at the age of fifteen, various claimants of the throne were put forward. The High Secret Council resolved to call to the throne Anna of Courland, thinking that, as she was so much more remote by birth than the daughters of Peter, she would more willingly submit to their terms.

Anna assented to these terms, limiting certain prerogatives exercised by her predecessors, and made her entry into Moscow, which was now to be the capital. But the empress was soon informed how universally unpopular these *pacta conventa* were, which in reality put Russia into the hands of a few powerful families, chiefly the Dolgorukis and Golitzins. She accordingly convened her supporters, and publicly tore the document to pieces, and thus ended the last attempt to give Russia a constitution. In 1740 the empress Anna died; she had reigned exactly ten years. She left the crown to Ivan, the son of her niece Anna, daughter of her sister Catherine, duchess of Mecklenburg. But Elizabeth ingratiated herself into the favor of the soldiers, by whom the name of Peter the Great was still so much cherished. Anna Leopoldovna, as she was called, her husband Anthony Ulrich, the infant emperor, Munich, Ostermann, and the whole German faction were arrested in the night, and Elizabeth ascended the throne. On ascending the throne she summoned to her court the son of her sister Anna and the duke of Holstein, who took the name of Peter Feodorovich on assuming the Greek religion, and was declared heir to the throne. Elizabeth died in December, 1761, and was succeeded by her nephew Peter, son of her sister Anna and Charles Frederick, duke of Holstein-Gottorp. He was suspected of German leanings, but his measures made him very popular. He lived very unhappily with his wife Catherine, and meditated divorcing her and imprisoning her for the rest of her life in a convent. She, however, quietly waited her time, and a conspiracy was concocted in which she was assisted by the Orloffs, Potemkin, the princess Dashkoff, and others, (see PETER III.) Leaving her residence at Peterhof, Catherine boldly put herself at the head of 20,000 men. The miserable emperor abdicated without a struggle, and was soon afterward secretly assassinated at Ropcha, near St. Petersburg.

A great codification of the laws took place under Catherine, which may be styled the sixth great period of Russian legislation. The country was now divided into governments for the better administration of justice, each government being subdivided into *uezdi* or districts. Catherine also took away from the monasteries their lands and serfs, and allotted them payments according to their importance from the state revenues. The plans of Peter I. were thus fully carried out, and the church became entirely dependent upon the state. In 1783 the Crimea was annexed to Russia. A second war with Turkey broke out in 1787; and, to increase

the embarrassed position of the empress, Sweden did the same, requiring from Russia the cession of the southern part of Finland which had been taken from her. But King Gustavus III., in spite of some petty successes, was unable to carry on the war, and soon signed the peace of Verela on the footing of *status quo ante bellum*. The empress met with equal good fortune in the south. She was next occupied with the affairs of Poland. In 1794 Suwaroff stormed Warsaw, and the inhabitants were massacred. In the following year Stanislaus Poniatowski laid down his crown, the third division of Poland took place, and the independence of that country was at an end. In spite of her correspondence and affected sympathies with Voltaire, Diderot, and many of the advanced French thinkers, Catherine showed great opposition to the principles of the French Revolution, and the policy of the latter part of her reign was reactionary. She died suddenly on November 17, 1796.

Paul, who had lived in retirement during the life of his mother, was an object of aversion to her. The events of his reign can be only briefly discussed here. He concluded an alliance with Turkey, and entered into a coalition against the French republic, which he regarded with horror. Suwaroff took the command of the united Russian and Austrian troops at Verona. In 1799 he defeated the French general Moreau on the banks of the Adda, and made a triumphant entry into Milan. After this he won another victory over Macdonald on the Trebbia, and later the same year that of Novi over Joubert. He then crossed the Alps for the purpose of driving the French out of Switzerland, but he was everywhere hampered by the Austrians, and, after fighting his way over the Alps and suffering great losses, he reached his winter quarters between the Iller and the Lech, and soon afterward he was recalled in disgrace. Paul now completely changed his tactics. Accusing England and Austria of having acted treacherously toward him, he threw himself into the arms of Bonaparte, and meditated joining him in a plan for conquering India; but in the night between March 23 and 24, 1801, he was assassinated.

He was succeeded by his eldest son, Alexander I. (1801-1825). One of the first acts of the new emperor was to make peace with England and France. He, however, soon changed his policy, and in 1805 joined the third coalition against France, to which Austria and England were parties. On December 2d of that year took place the battle of Austerlitz, in which the Russians lost 21,000 men, 133 guns, and 30 flags. They accused their Austrian allies of treachery. The war was soon ended by the treaty of Pressburg. In 1807 Napoleon engaged the Russian general Benningsen at Eylau. A defeat at Friedland in the same year was followed by the peace of Tilsit. Frederick William III. lost half his dominions. Nearly all his Polish possessions were to go to the king of Saxony under the name of the grand-duchy of Warsaw. By a secret treaty, it seemed as if Alexander and Napoleon almost aspired to divide the world, or at least Europe, between them. The terms, however, were received by a large party in Russia with disgust. The next important event in the reign of Alexander was the conquest of Finland. The Finns were allowed a kind of autonomy, which they have preserved to this day. The annexation of Georgia to Russia was consolidated at the beginning of this reign, having been long in preparation. It led to a war with Persia, which resulted in the incorporation of the province of Shirvan with the Russian empire in 1806.

In 1809 Alexander, who was obliged by treaty to furnish assistance to the French emperor, did all that he could to prevent the war. Gradually an estrangement

took place between Alexander and Napoleon, not only on account of the creation of the grand-duchy of Warsaw, but because Russia was suffering greatly from the Continental blockade, to which Alexander had been forced to give his adhesion. This led to the great invasion of Russia by Napoleon in 1812.

In 1825 the emperor died suddenly at Taganrog at the mouth of the Don, while visiting the southern provinces of his empire. He had added to the Russian dominions Finland, Poland, Bessarabia, and that part of the Caucasus which includes Daghestan, Shirvan, Mingrelia, and Imeretia. Much was done in this reign to improve the condition of the serfs. The Raskolniks were better treated; many efforts were made to improve public education, and the universities of Kazan, Khar-koff, and St. Petersburg were founded.

The new emperor, Nicholas, the next brother in succession, showed throughout his reign reactionary tendencies; all liberalism was sternly repressed. In 1830 appeared the *Complete Collection of the Laws of the Russian Empire*, which Nicholas had caused to be codified. He partly restored the right of primogeniture which had been taken away by the empress Anna as contrary to Russian usages, allowing a father to make his eldest son his sole heir. In spite of the increased severity of the censorship of the press, literature made great progress in his reign.

Soon after the revolution of 1848 the emperor Nicholas, who became even more reactionary in consequence of the disturbed state of Europe, answered the appeal of the emperor Francis Joseph, and sent an army under Paskewitch to suppress the Hungarian revolt.

In 1853 broke out the Crimean War. The emperor was anxious to distribute the possessions of the "sick man," but found enemies instead of allies in England and France. The chief events of this memorable struggle were the battles of the Alma, Balaklava, Inkermann, and Tchernaya, and the siege of Sebastopol; this had been skillfully fortified by Todleben, who appears to have been the only man of genius who came to the front on either side during the war. In 1855 the Russians destroyed the southern side of the city, and retreated to the northern. In the same year, on March 14th, died the emperor Nicholas, after a short illness. Finding all his plans frustrated, he had grown weary of life, and rashly exposed himself to the severe temperature of the northern spring. He was succeeded by his son Alexander II. (1855-1881), at the age of thirty-seven. One of the first objects of the new czar was to put an end to the war, and the treaty of Paris was signed in 1856. The next important measure was the emancipation of the serfs in 1861.

Among important foreign events of this reign must be mentioned the capture of Schamyl in 1859 by Prince Bariatski, and the pacification of the Caucasus.

In 1877 Russia came to the assistance of the Slavonic Christians against the Turks. After the terrible siege of Plevna, nothing stood between them and the gates of Constantinople. In 1878 the treaty of San Stefano was signed, by which Roumania became independent, Servia was enlarged, and a free Bulgaria, but under Turkish suzerainty, was created. But these arrangements were subsequently modified by the treaty of Berlin. The latter part of the reign of Alexander II. was a period of great internal commotion, on account of the spread of Nihilism, and the attempts upon the emperor's life, which unfortunately were at last successful. In the cities in which his despotic father had walked about fearless, without a single attendant, the mild and amiable Alexander was in daily peril of his life. On April 16, 1866, Karakozoff shot at the emperor at St.

Petersburg; in the following year another attempt was made by a Pole, Berezowski, while Alexander was at Paris on a visit to Napoleon III.; on April 14, 1879, Solovioff shot at him. The same year saw the attempt to blow up the Winter Palace and to wreck the train by which the czar was traveling from Moscow to St. Petersburg. A similar conspiracy in 1881 (March 13) was successful. Five of the conspirators, including a woman, Sophia Perovskaia, were publicly executed. Thus terminated the reign of Alexander II., which had lasted nearly twenty-six years. He was succeeded by his second son Alexander, born in 1845, whose reign has been characterized by conspiracies and constant deportations of suspected persons. It was long before he ventured to be crowned in his ancient capital of Moscow (1883), and the chief event since then has been the disturbed relations with England, which for a time threatened war.

RUSTCHUK (RUSCUK), a city of Bulgaria, Turkey in Europe, on the south bank of the Danube, opposite Giurgevo, at the point where the river receives the waters of the Lom, a fine stream from the northern slopes of the Balkans. Since 1807 it has been connected by rail (139 miles) with Varna. The town was nearly destroyed by the Russian bombardment from Giurgevo in 1877, and the military works have since been dismantled in terms of the treaty in Berlin. Its position on the river frontier of Turkey made it a place of strategic importance. In 1871 the population was about 23,000 (10,800 Turks, 7,700 Bulgarians, 1,000 Jews, 800 Armenians, 500 Gipsies, 800 Wallachians and Serbs, 400 Western Europeans); in 1881 it was returned as 26,163, and in 1889 it was estimated 28,000.

RUTH, BOOK OF. The story of Ruth, the Moabitess, great-grandmother of David, one of the Old Testament Hagiographa, is usually reckoned as the second of the five Megilloth or Festal Roll. On the other hand the Septuagint, the Vulgate, and the English version make Ruth follow Judges. It has sometimes been held that this was its original place in the Hebrew Bible also, or rather that Ruth was originally reckoned as an appendix to Judges, since it is only by doing this, and also by reckoning Lamentations to Jeremiah, that all the books of the Hebrew canon can be reduced to twenty-two, the number assigned by Josephus and other ancient authorities. That the book of Ruth did not originally form part of the series of *Propheta priores* (Judges-Kings) is further probable from the fact that it is quite untouched by the process of "prophetic" or "Deuteronomistic" editing, which gave that series its present shape at a time soon after the fall of the kingdom of Judah. But if the book had been known at the time when the history from Judges to Kings was edited, it could hardly have been excluded from the collection. In truth the book of Ruth does not offer itself as a document written soon after the period to which it refers; it presents itself as dealing with times far back (Ruth i. 1), and takes obvious delight in depicting details of antique life and obsolete usages; it views the rude and stormy period before the institution of the kingship through the softening atmosphere of time, which imparts to the scene a gentle sweetness very different from the harsher colors of the old narratives of the book of Judges. In the language, too, there is a good deal that makes for and nothing that makes against a date subsequent to the captivity, and the very designation of a period of Hebrew history as "the days of the judges" is based on the Deuteronomic addition to the book of Judges (ii. 16 sq.) and does not occur till the period of the exile. An inferior limit for the date of the book cannot be assigned with precision. It has been argued that, as the author seems to take no offense

at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xiii.); but the same argument would prove that the book of Esther was written before Ezra, and indeed "a disposition to derive prominent Jewish families from proselytes prevailed to a much later date," and finds expression in the Talmud (see Wellhausen-Bleek, p. 205). The language of Ruth, however, though post-classical, does not seem to place it among the very latest Old Testament books, and the manner in which the story is told is as remote from the legal pragmatism of Chronicles as from the prophetic pragmatism of the editor of the older histories. The tone of simple piety and graciousness which runs through the narrative, unencumbered by the pedantry of Jewish legality, seems to indicate that the book was written before all the living impulses of Jewish literature were choked by the growing influence of the doctors of the law.

RUTHENIANS. See SLAVS.

RUTHENIUM. See PLATINUM.

RUTHERFURD, or RUTHERFORD, SAMUEL, Scottish divine, was born about 1600 at the village of Nisbet, in Roxburghshire, Scotland, and died March 20, 1661.

RUTHERGLEN, an ancient royal burgh of Lanarkshire, Scotland, is situated near the left bank of the Clyde, two miles southeast of Glasgow. In the vicinity there are extensive collieries and ironworks, and the town possesses chemical works, a paper mill, a pottery, and a shipbuilding yard. The corporation consists of a provost, two bailies, a dean of guild, a treasurer, and fifteen councillors. The population of the royal burgh in 1871 was 9,239; and in 1881 it was 11,473; and 12,500 in 1890.

RUTILIUS CLAUDIUS NAMATIUS is known to us as the author of a Latin poem in elegiac meter, describing a coast voyage from Rome to Gaul in 416 A.D. The literary excellence of the work and the flashes of light which it throws across a momentous but dark epoch of history combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about 700 lines.

RUTLAND, the smallest county in England, is bounded north and northeast by Lincolnshire, southeast by Northamptonshire, and west by Leicestershire. Its shape is extremely irregular. The greatest length from northeast to southwest is about twenty miles, and the greatest breadth from east to west about sixteen miles. The area is 94,889 acres, or about 148 square miles. The surface is pleasantly undulating, ridges of high ground running east and west, separated by rich and luxuriant valleys, generally about half a mile in breadth. The principal valley is that of Catmoss to the south of Oakham, having to the north of it a tract of table-land commanding an extensive prospect into Leicestershire.

The Welland, which is navigable to Stamford, flows northeast, forming the greater part of the boundary of the county with Northamptonshire. The Gwash or Wash, which rises in Leicestershire, flows eastward though the center of the county, and just beyond its borders enters the Welland in Lincolnshire. The Chater, also rising in Leicestershire and flowing eastward, enters the Welland about two miles from Stamford. The Eye flows southeastward along the borders of Leicestershire. The county belongs almost entirely to the Jurassic formation, consisting of Liassic and Oölitic strata—the harder strata, chiefly limestone containing iron, forming the hills and escarpments, and the clay-beds the slopes of the valleys. Formerly the iron was largely dug and smelted by means of the wood in

the extensive forests, and the industry is again reviving.

In the eastern and southeastern districts the soil is light and shallow. In the other districts it consists chiefly of a tenacious but fertile loam, and in the fertile vale of Catmoss the soil is either clay or loam, or a mixture of the two. The eastern portions of the county are chiefly under tillage and the western in grass. Out of 94,889 acres no fewer than 86,477 acres in 1885 were under cultivation, grain crops occupying 22,820 acres, green crops 7,520 acres, rotation grasses 6,553 acres, and permanent pasture 47,816 acres. Over 3,000 acres were under woodland. The principal grain crop is barley, which occupied 9,484 acres, but wheat and oats are also largely grown. Turnips and swedes occupy about five-sixths of the area under green crops. The rearing of sheep and cattle occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. The main line of the Great Northern intersects the northeastern corner of the county, and branches of that system, of the London and Northwestern, and of the Midland connect it with all parts of the country.

Rutland comprises five hundreds and contains fifty-seven civil parishes, and part of the parish of Stoke-Dry, which extends into Leicestershire. Formerly represented by two members of parliament, since 1885 it returns one only. There is no municipal or parliamentary borough. The county has one court of quarter sessions, but is not subdivided for petty sessional purposes. The population was 21,434 in 1881 and estimated at 25,000 in 1890.

RUTLAND, a township and village of the United States, capital of Rutland county, Vt., 117 miles north-northwest of Boston. It is an important railway junction, being the terminus of several minor lines and the seat of machine-shops and engine-houses; but its name is even better known through its quarries of white marble. The population by the United States census of 1890 was 11,760.

RUYSBROECK, or RUYSBROEK, JOHN, mystic, was born at Ruysbroek, near Brussels, about 1293, and died as first prior of the convent of Groenendael, near Waterloo, in 1381. (See MYSTICISM.)

RUYSCH, FREDERIK, anatomist, was born at The Hague in 1638, and died at Amsterdam on February 22, 1731. (See ANATOMY.)

RUYSDAEL, or RUISDAAL, JACOB, the most celebrated of the Dutch landscapists, was born at Haarlem about 1625. The earliest date that appears on his paintings and etchings is 1645. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites, with whom he was connected, petitioned the council of Haarlem for his admission into the alms-house of the town, and there the artist died on March 14, 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at The Hague, Amsterdam, Berlin, and Dresden. His favorite subjects are simple woodland scenes. His views of distant cities, such as that of Haarlem, in the possession of the marquis of Bute, and that of Katwijk, in the Glasgow Corporation Galleries, clearly indicate the influence of Rembrandt.

RUYSSELÈDE, or RUISSELÈDE, a market-town of Belgium, in the province of West Flanders, fifteen miles southeast of Bruges. It is best known as the seat of a great reformatory for boys, founded by the government in 1849. The population was 6,663 in 1874; 6,670 in 1881, and 6,900 in 1890.

RUYTER, MICHAEL ADRIAN DE, a distinguished Dutch naval officer, was born at Flushing, March 24, 1607. In 1676 he was dispatched to the assistance of

Spain against France, in the Mediterranean, and, receiving a mortal wound in the battle on April 21st, off Messina, died on the 29th at Syracuse. A patent by the king of Spain, investing him with the dignity of duke, did not reach the fleet till after his death. His body was carried to Amsterdam, where a magnificent monument to his memory was erected by command of the states-general.

RYAZAN, a government of Central Russia, is bounded by Moscow and Tula on the west, by Vladimir on the north, and by Tamboff on the east and south, with an area of 16,255 square miles, and a population of 1,713,581 in 1882. Ryazañ is an intermediate link between the central Great Russian governments and the steppe governments of the southeast—the wide and deep valley of the Oka, by which it is traversed from west to east, with a broad curve to the south, being the natural boundary between the two. On the left of the Oka the surface often consists of sands, marshes, and forests; while on the right the fertile black-earth prairies begin, occupying especially the southern part of the government (the districts of Ranenburg, Sapojok, and Dankoff). The whole of Ryazañ is a plateau about 700 feet above the sea, but deeply cut by the river valleys and numerous ravines. The geological formations represented are the Devonian, the Carboniferous, the Jurassic, and the Quaternary. Iron-ores, limestone, grindstone grits, potters' clays, and thick beds of peat are worked, besides coal. The northern parts of Ryazañ belong to the forest regions of Russia, and, notwithstanding the wholesale destruction of forests in that part of the country, these (chiefly Coniferous) still cover one-third of the surface in several districts. In the south, where the proximity of the steppes is felt, they are much less extensive, the prevailing species being oak, birch, and other deciduous trees. They cover an aggregate area of more than 2,000,000 acres.

The Ōka is the chief river; it is navigable throughout, and receives the navigable Pronya, Pra, and Tsna, besides a great many smaller streams utilized for floating timber. Steamers ply on the Okato Kasimoff and Nijni Novgorod. The Don and the Lyesnoi Voronezh belong to Ryazañ in their upper courses only. The climate is a little warmer than at Moscow, the average temperature at Ryazañ being 41°.

The chief occupation in Ryazañ is agriculture. Out of 10,100,000 acres only 838,000 are unfit for tillage. 5,482,000 acres are under crops, and the annual produce is estimated at about 4,248,000 quarters of grain and 972,000 quarters of potatoes. The area under cultivation and the crops themselves are increasing, as also is the export of grain. In the northern part of the government various industries are carried on, such as boat-building, the preparation of pitch and tar, the manufacture of wooden vessels, sledges, etc. Various other petty trades, such as weaving, lace-making, and boot-making, are combined with agriculture. Manufactures also have lately begun to make progress, and in 1882 their aggregate production reached 13,000,000 rubles (cotton and flax-spinning mills, glass-works, and metal-ware works, and distilleries, the last-named producing to the value of 1,850,000 rubles). Trade, especially in grain and other agricultural produce and in merchandise manufactures in the villages, is very active. The railway from Ryazañ to Moscow is one of the most important in Russia, from the amount of goods carried from the southeast steppe governments. Large villages are numerous, about sixty having each from 2,500 to 7,000 inhabitants.

RYAZAN, capital of the above government, lies 119 miles to the southeast of Moscow, on the elevated right

bank of the Trubej, a mile above its junction with the Oka. The industries are undeveloped, and the trade has less importance than might be expected from the position of the town in so rich a region. It is, however, an important railway center, no less than 15,000,000 hundredweights, chiefly of grain, being brought from the southeast and sent on to Moscow, while nearly 3,390,000 hundredweights of various manufactured and grocery wares are conveyed in the opposite direction. The loading place on the Oka also has some importance. The population, 30,325 in 1883, is increasing but slowly.

RYBINSK, or RUIBINSK, though but a district town of the government of Yaroslavl, with a permanent population (1883) of only 18,900, is, as being virtually the port of St. Petersburg on the Volga, one of the most important towns of the northern part of Central Russia. It lies fifty-four miles to the northwest of Yaroslavl, and is connected by rail (186 miles) with Bologoye, on the line between St. Petersburg and Moscow. It derives its importance from its situation on the Volga, opposite the mouth of the Sheksna—one of those tributaries which, flowing from the northwest, have since the dawn of Russian history connected the Volga with the regions around Lake Ladoga. The cargoes of the larger boats from the lower Volga, consisting mainly of corn and flour, as also salt, spirits, potash, and tallow, are here transferred to smaller boats capable of accomplishing the navigation to St. Petersburg, and *vice versa*. The amount of goods thus transhipped is estimated at 16,000,000 hundredweights, worth 32,800,000 rubles. Since the opening of the line to Bologoye, a large portion of this merchandise is sent to St. Petersburg by rail. The total number of boats visiting Rybinsk annually is estimated at 5,000 to 7,000, their aggregate cargoes amounting to nearly 20,000,000 hundredweights (about 40,000,000 rubles). Upward of 100,000 laborers (male and female), assemble at Rybinsk during the navigation, and the number of vessels is so great as to cover the Volga and the Sheksna like a bridge. Besides the business of transshipment, Rybinsk has an active trade in grain, hemp, etc., from the neighboring districts.

RYCAUT, or RICAUT, SIR PAUL, traveler and diplomatist, was the tenth son of Sir Peter Ricaut, a Royalist who, on account of his support of King Charles, had to pay a composition of \$7,500. The son was admitted a scholar of Trinity College, Cambridge, in 1647, and took his B.A. degree in 1650. During a residence of eight years in Turkey he wrote *The Present State of the Ottoman Empire, in three books; containing the Maxims of the Turkish Politie, their Religion and Military Discipline*. In 1663 he published at Constantinople *The Capitulation, Articles of Peace, etc., concluded between the King of England and the Sultan of the Ottoman Empire*. Subsequently he was for eleven years consul at Smyrna, and at the command of Charles II. wrote *The Present State of the Greek and Armenian Churches, Anno Christi 1678*. He died on December 16, 1700.

RYDE, a municipal borough and watering place of the Isle of Wight, is finely situated on a sloping eminence above the Solent, five miles south-by-west of Portsmouth, and seven (twelve by rail) from West Cowes. It is connected by rail with the principal other towns in the island, and there is also steamboat communication with Portsmouth, Southampton, Southsea, Portsea, and Stoke's Bay. The town was incorporated in 1868, and is governed by a mayor, six aldermen, and eighteen councilors. The population of the municipal borough (area 792 acres) in 1871 was 11,260, in 1881 it was 11,461, and in 1890, estimated at 13,500.

RYE. As in the case of other cereals, it is doubtful if rye (*Secale cereale*) exists at the present time in a

truly wild state. The best evidence on this point goes to show that the plant is a native of the regions between the Black and Caspian seas. It is also recorded from Afghanistan and Turkestan; but botanists are very chary about admitting the validity of the evidence hitherto adduced. In spite of the uncertainty as to the precise origin of the cultivated plant, its cultivation does not appear to have been practised at a very early date, relatively speaking. Rye is a tall-growing annual grass, with fibrous roots, flat, narrow, ribbon-like bluish-green leaves, and erect or decurved cylindrical slender spikes like those of barley. The spikelets contain two or three flowers, of which the uppermost is usually imperfect. The outer glumes are acute glabrous, the flowering plumes lance-shaped with a comb-like keel at the back, and the outer or lower one prolonged at the apex into a very long bristly awn. Within these are threestamens surrounding a compressed ovary, with two feathery stigmas. When ripe, the grain is of an elongated oval form, with a few hairs at the summit.

In the southern part of Great Britain rye is chiefly or solely cultivated as a forage-plant for cattle and horses, being usually sown in autumn for spring use, after the crop of roots, turnips, etc., is exhausted, and before the clover and lucerne are ready. For forage purposes it is best to cut early, before the leaves and haulms have been exhausted of their supplies to benefit the grain. In the northern parts of Europe, and more especially in Scandinavia, Russia, and parts of northern Germany, rye is the principal cereal; and in nutritive value, as measured by the amount of gluten it contains, it stands next to wheat, a fact which furnishes the explanation of its culture in northern latitudes ill-suited for the growth of wheat. Rye-bread or black-bread is in general use in northern Europe, but finds little favor with those unaccustomed to its use, owing to its sour taste, the sugar it contains rapidly passing into the acetous fermentation. When the ovaries of the plant become affected with a peculiar fungus (*Cordyceps*), they become blackened and distorted, constituting ERGOT (*q. v.*)

RYE, a municipal town and seaport at the eastern extremity of the county of Sussex, England, sixty-three miles south-southeast of London, is built upon a rocky eminence which two or three centuries ago was washed on all sides by the influx of the tide, but now, in consequence of the gradual recession of the sea, lies two miles inland. The trade is chiefly in coal, timber, and bark, and shipbuilding is carried on as well as fishing. There is a large market every alternate Wednesday, and considerable business in cattle, sheep, corn, wool, and hops is transacted. Rye ceased in 1885 to be a parliamentary borough, but gives its name to the eastern division of the county. The population in 1881 was 4,224, and estimated at 5,000 in 1890.

RYEZHITZA, a town of European Russia at the head of a district in the Vitebsk governments  $56^{\circ} 30' N.$  latitude and  $27^{\circ} 21' E.$  longitude, 198 miles northwest from Vitebsk on the railway between St. Petersburg and Warsaw, near the Ryezhitza, which falls into Lake Luban. Its population increased from 7,306 (2,902 Jews) in 1867 to about 9,000 in 1881; but its importance is mainly historical.

Ryezhitza, or, as it is called in the Livonian chronicles, Roziten, was founded in 1285 by Wilhelm von

Harburg to keep in subjection the Lithuanians and Letts. The castle was continually the object of hostile attacks. In 1559 the Livonian order, exhausted by the war with Russia, gave it in pawn to Poland, and, though it was captured by the Russians in 1567 and 1577, and had its fortifications dismantled by the Swedes during the war of 1656-1660, it continued Polish till 1772, when White Russia was united with the Russian empire. In early times Ryzehitza was a large and beautiful town.

RYLAND, WILLIAM WYNNE, engraver, was born in London in July, 1738, the son of an engraver and copper-plate printer. He studied under Ravenet, and in Paris under Boucher and J. P. le Bas. After spending five years on the Continent he returned to England, and having engraved portraits of George III. and Lord Bute after Ramsay (a commission declined by Strange), and a portrait of Queen Charlotte and the Princess Royal after Francis Cotes, R.A., he was appointed engraver to the king. In his later life Ryland abandoned line-engraving, and introduced "chalk-engraving," in which the line is composed of stippled dots, a method by means of which he attained great excellence, and in which he transcribed Mortimer's *King John Signing Magna Charta*, and copied the drawings of the old masters and works of Angelica Kauffman. He was convicted of forging bills upon the East India Company, and, after attempting to commit suicide, was executed at Tyburn on August 29, 1783.

RYMER, THOMAS, historiographer royal, was probably born at Yafforth Hall early in 1641, and was educated at a private school kept by Thomas Smelt, a noted Royalist. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. His first appearance in print was as translator of *Cicero's Prince* (1668), from the Latin treatise (1608) drawn up for Prince Henry. He also translated Rapin's *Reflections on Aristotle's Treatise of Poesie* (1674), and followed the principles there set forth in a tragedy in verse, licensed September 13, 1677, called *Edgar, or the English Monarch*, which was not, however, very successful. These were followed by publications at brief intervals of a dramatic, poetic, and political character, and on November 20, 1704, issued the first folio volume of *Fœdera Conventiones, Literæ et cujuscunque generis Acta Publica inter reges Angliæ et alios quosvis imperatores reges, etc., ab A.D. 1101 ad nostra usque tempora habita aut tractata*. In nine years fifteen volumes were brought out by Rymer. He died in 1713, shortly after the appearance of the fifteenth volume.

RZHEFF, RSHEFF, RJEV, or RZHOFF, a town of European Russia at the head of a district in the Tver government, in  $56^{\circ} 16' N.$  latitude and  $34^{\circ} 21' E.$  longitude, eighty-nine miles southwest of Tver, occupies the bluffs on both banks of the Volga (here 350 feet wide) near the confluence of the river Bazuza. It is the terminus of a branch line from the St. Petersburg and Moscow railway, and had a population of 18,569 in 1880 (19,660 in 1866), carries on a variety of manufactures—hemp-spinning, malting, brewing, ship-building, etc.—and is the center of a great transit trade between the provinces of the lower Volga, Orel, Kaluga, and Smolensk, and the ports of St. Petersburg and Riga.

## S.

**S** represents the hard open (or fricative) sound produced by bringing the blade of the tongue close to the front palate, immediately behind the gums, or rather, this is the normal position for S, as slight varieties can be produced by bringing the tongue farther back. By the "blade" is meant the pointed end of the tongue, not the mere point, which at the same part of the palate produces R. This position differs from that for TH, into which S passes in a lisping pronunciation; a larger part of the surface of the tongue is brought near to the palate for TH than for S. The symbol which represents the soft open sound corresponding to S is Z, though in practice S often stands for both.

In English the symbol *s* alone existed till *z* was introduced from France with words of French origin as "zeal," "zone." An attempt was made to employ it at the end of plural nouns, where the sound is regularly heard except when the last sound of the noun is hard, *e. g.*, "bedz" (beds), but "hops;" but this was not maintained, nor even consistently done, for the symbol was used even when the sound must have been *s*. We regularly write *s* for both sounds—*e. g.*, in "lose" and "loose," "curs" and "curse," "hers" and "hearse." When there is a distinction in spelling the *s* commonly has the value of *z*—*e. g.*, S has the sound of *sh* in "sure," "sugar," and some other words; this is due to the palatal sound heard before the *u*. *Sh*, in spite of its spelling, is a single sound, the position of which differs from that for *s* only in a slight retraction of the point of the tongue; it is commonly found in English words which originally had *sk*—*e. g.*, "shall," O. E. *sceal*; "shabby," a doublet of "scabby;" "fish," O. E. *fisk*. The sound is the same as that of French *ch* in "château," "chef," "sécher," where it is due to assibilation of original *k*.

SAADI. See SA'DÍ.

SAADIA, or SAADIAS (Heb. *Se'adyah*, Arab. *Sa'id*), was the most accomplished, learned, and noble gaon (head of the academy) of Sūrā (see RAB). Mar Rab Se'adyah b. Yoseph was born in the Fayyūm, Upper Egypt, in 892 and died at Sūrā in 942.

SAALFELD, a busy little town of Germany, in the eastern horn of the crescent-shaped duchy of Saxe-Meiningen, is picturesquely situated on the left bank of the Saale (here spanned by a bridge), twenty-four miles south of Weimar and seventy-seven miles southwest of Leipzig. Saalfeld is situated in one of the busiest parts of Meiningen, and carries on a number of brisk industries, including the manufacture of sewing-machines, colors, wax-cloth and wire-cloth, brewing, and iron-founding. It has an active trade in iron, slate, wood, and wooden goods, and there are ochre and iron mines in the neighborhood. The population in 1880 was 7,458, and in 1890 (estimated) 9,160.

SAARBRÜCKEN, an important industrial and commercial town in Prussia, on the left bank of the Saar, a navigable tributary of the Moselle, is situated forty-nine miles east of Metz, at the south end of one of the most extensive coal-fields in Europe, to which it has given

its name. With the town of St. Johann, immediately opposite on the right bank of the river, here spanned by two bridges, Saarbrücken forms in reality a single community, with a united population of nearly 22,000. The industries of St. Johann-Saarbrücken include wool-spinning, brewing, and the manufacture of tobacco, chemicals, tin, and stoneware. The trade is chiefly connected with the produce of the neighboring coal-mines, and that of the numerous important iron and glass works of the district. The Saarbrücken coal-field extends over seventy square miles; and its annual output is about 6,000,000 tons. Of this total the Prussian state mines yield about 5,200,000 tons, Prussian private mines 100,000 tons, the mines in Lorraine 500,000 tons, and mines in Rhenish Bavaria 200,000 tons.

SAARDAM. See ZAANDAM.

SAARGEMÜND, (Fr. *Sarreguemines*), an industrial town and railway junction of Germany, in the imperial province of Alsace-Lorraine, is situated at the confluence of the Blies and Saar, forty miles east of Metz. It carries on considerable manufactures of silk, plush, porcelain, and earthenware, and is a chief depot for the papier-maché boxes (mostly snuff-boxes) which are made in great quantity in the neighborhood. The town, which is garrisoned by four squadrons of cavalry, in 1880 had a population of 9,573; in 1889 it was estimated at 10,500.

SAAVEDRA, ANGEL DE, DUKE OF RIVAS, Spanish poet and politician, was born at Cordova in 1791, and fought with bravery in the Spanish War of Independence. In 1836 he became minister of the interior under Isturiz, and along with his chief had to leave the country. Having returned with Maria Christina in 1844, he again held a portfolio for a short time in 1854; and during the last two decades of his life he was ambassador at Naples, Paris, and Florence for considerable periods. He died in 1865.

SAAVEDRA, MIGUEL DE CERVANTES. See CERVANTES.

SAAVEDRA FLAXARDO, DIEGO DE, diplomatist and man of letters, was born of a noble family at Algazares in the Spanish province of Murcia in 1584. He died in 1648.

SAAZ (Bohemian, *Zatec*), a manufacturing and commercial town in the north of Bohemia, is situated on the right bank of the Eger, 42 miles northwest of Prague. The suspension bridge, 210 feet long, which here spans the river, was constructed in 1826 and is one of the oldest of the kind in Bohemia. Nails, leather, beetroot-sugar, and pasteboard are among the chief manufactures of Saaz, which, however, owes its main importance to being the center of the extensive hop-trade of the neighborhood. The hops of Saaz are said to have been renowned for the last 500 years; and nearly 800 tons are annually raised in the district to which the town gives its name. The population of Saaz was 12,425 in 1880, and 15,000 in 1890.

SABÆA. See YEMEN.

SABAH, or BRITISH NORTH BORNEO, is all that portion of the island of BORNEO (*q.v.*) which was formally recognized by the charter of incorporation granted in November, 1881, as the territory of the British North Borneo Company. It has a coast-line of over 600 miles, and its area, still to a great extent unexplored, is estimated at 30,000 square miles.

The great central feature of Sabah is the magnificent mountain of Kinabalu (compare BORNEO) or Nabalun, built up of porphyritic granite and igneous rocks to a height of 13,698 feet, and dominating the whole northern part of the island, with all its profusion of lesser mountains and hills.

The climate of North Borneo is of course tropical, with a very equable temperature. The lowest minimum of the thermometer recorded in 1883 at Sandakan was 68.5° in December. The greatest interval without rain was eight days in March. The rainfall was 34½ inches (157 in 1880) at Sandakan, 129 at Papar, and 120 at Kudat. In the interior it must often be much above these figures.

That North Borneo should prove rich in minerals was supposed probable from the character of some other parts of the island; but hitherto investigations have not in this matter proved very successful. Coal or lignite exists, but most frequently in thin seams and insignificant pockets; the petroleum springs cannot come into any true competition with those worked elsewhere; gold has been discovered (1885) in the Segama river and may prove a stimulus to immigration; iron-ores appear both abundant and at times productive; and there are indications of the existence of copper, antimony, tin, and zinc ores. As yet the wealth of the country lies in its timber and jungle products (camphor and gutta-percha in great quantities), and in its edible nuts, guano, sago, sugar, tobacco, coffee, pepper, and gambier. Tobacco is most successfully grown by the natives in the inland district of Mansalut, Kandassang, Koporingan, Gana-Gana, Tomborongo, Karnahan, Penusak, Tiong-Tuhan, etc.; and its cultivation has been taken up by several foreign companies. The birds'-nest caves of Gomanton (Gormanton) near the village of Malape on the Kinabatangan yield the government a revenue of from \$6,000 to \$7,000; and other caves of the same kind are still unworked. As the natives (Dusuns, Tagaas-Bajaus, Idaan, etc.) are scattered, mostly in small villages, throughout the unexplored as well as the explored districts, their number can only be guessed, but it is usually stated at 150,000. Since the formation of the company there has been a steady immigration, especially of Chinese from Singapore.

In 1865 an American company started by Mr. Torrey obtained from the sultan of Brunei certain concessions of territory in North Borneo; but this enterprise proved a financial failure and the settlement formed on the Kimanis river broke up. The rights of the American company were bought up by the Austrian Baron von Overbeck and the English merchant Mr. Alfred Dent, who further obtained from the sultan of Brunei and the sultan of Sulu a series of charters conferring on them the sovereign authority in North Borneo under the titles of maharajah of Sabah, rajah of Gaya and Sandakan and Data Bandahara. In spite of the opposition of Spain the English company organized by Mr. Dent succeeded in obtaining a charter of incorporation under Act of Parliament, November 1, 1881, as the "British North Borneo Company," with right to acquire other interests in, over, or affecting the territories or property comprised in the several grants.

SABAS, or SABBAS, St. (Syr., *Mār Sābhā*), one of the early leaders of monasticism in Palestine, was a native of Cappadocia, born about 439. He died about

532 and is commemorated on December 5th. Another saint of this name, surnamed "the Goth," suffered martyrdom at the hands of Athanaric, the Visigothic king, in the reign of Valentinian; he is commemorated on April 15th (or 18th).

SABBATH (*שַׁבָּת*), the day of sacred rest which among the Hebrews followed six days of labor and closed the week. The later Jewish Sabbath, observed in accordance with the rules of the Scribes, was a very peculiar institution, and formed one of the most marked distinctions between the Hebrews and other nations, as appears in a striking way from the fact that on this account alone the Romans found themselves compelled to exempt the Jews from all military service. Strictly speaking, the Sabbath was neither a day of relief to toiling humanity nor a day appointed for public worship; the positive duties of its observance were to wear one's best clothes, eat, drink, and be glad (justified from Isa. lviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service; but it is to be remembered that this service was primarily regarded not as an act of worship, but as a meeting for instruction in the law. So far, therefore, as the Sabbath existed for any end outside itself it was an institution to help every Jew to learn the law, and from this point of view it is regarded by Philo and Josephus, who are accustomed to seek a philosophical justification for the peculiar institutions of their religion. But this certainly was not the leading point of view with the mass of the Rabbins; and at any rate it is quite certain that the synagogue is a post-exilic institution, and therefore that the Sabbath in old Israel must either have been entirely different from the Sabbath of the Scribes, or else must have been a mere day of idleness and feasting, not accompanied by any properly religious observances or having any properly religious meaning.

As the Sabbath was originally a religious feast, the question of the origin of the Sabbath resolves itself into an inquiry why and in what circle a festal cycle of seven days was first established. In Gen. ii. 1-3 and Exod. xx. 11 the Sabbath is declared to be a memorial of the completion of the work of creation in six days. The connection, however, between the seven days' week and the work of creation is now generally recognized as secondary. At the same time, there was a peculiar appropriateness in associating the Sabbath with the doctrine that Jehovah is the Creator of all things; for we see from Isa. xl.-lxvi. that this doctrine was a mainstay of Jewish faith in those very days of exile which gave the Sabbath a new importance for the faithful. Investigations make it safe to reject one often-repeated explanation of the Sabbath, viz., that it was in its origin what it is in the astrological week, the day sacred to Saturn, and that its observance is to be derived from an ancient Hebrew worship of that planet. In truth there is no evidence of the worship of Saturn among the oldest Hebrews; Amos v. 26, where Chiun (*Kaiwan*) is taken by many to mean Saturn, is of uncertain interpretation, and, when the tenses are rightly rendered, refers not to idolatry of the Israelites in the wilderness but to the time of the prophet.

The week, however, is found in various parts of the world in a form that has nothing to do with astrology or the seven planets. In fact the four quarters of the moon supply an obvious division of the month: and, wherever new moon and full moon are religious occasions, we get in the most natural way a sacred cycle of fourteen or fifteen days, of which the week of seven or eight days (determined by half moon) is the half.

From this point of view it is most significant that in

the older parts of the Hebrew Scriptures the new moon and the Sabbath are almost invariably mentioned together.

That full moon as well as new moon had a religious significance among the ancient Hebrews seems to follow from the fact that, when the great agricultural feasts were fixed to set days, the full moon was chosen. In older times these feast days appear to have been Sabbaths (Lev. xxiii. 11; comp. PASSOVER).

We cannot tell when the Sabbath became dissociated from the month; but the change seems to have been made before the Book of the Covenant, which already regards the Sabbath simply as an institution of humanity and ignores the new moon. In both points it is followed by Deuteronomy.

SABELLIUS. Even after the elimination of Gnosticism the church remained without any uniform Christology; the Trinitarians and the Unitarians continued to confront each other, the latter at the beginning of the third century still forming the large majority. These in turn split into two principal groups—the Adoptianists and the Modalists—the former holding Christ to be the man chosen of God, on whom the Holy Spirit rested in a quite unique sense, and who after toil and suffering, through His oneness of will with God, became divine, the latter maintaining Christ to be a manifestation of God himself. Both groups had their scientific theologians who sought to vindicate their characteristic doctrines, the Adoptianist divines holding by the Aristotelian philosophy, and the Modalists by that of the Stoics; while the Trinitarians (Tertullian, Hippolytus, Origen, Novatian), on the other hand, appealed to Plato.

The teaching of Sabellius himself was indubitably very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was to the effect that Father, Son, and Holy Spirit are the same person, three names thus being attached to one and the same being. To explain how one and the same being could have various forms of manifestation, he pointed to the tripartite nature of man (body, soul, spirit), and to the sun, which manifests itself as a heavenly body, as a source of light, and also as a source of warmth. He further maintained that God is not at one and the same time Father, Son, and Spirit, but, on the contrary, has been active in three consecutive energies—first in the prosopon of the Father as Creator, then in the prosopon of the Son as Redeemer, and lastly in the prosopon of the Spirit as the Giver of Life. It is by this doctrine of the succession of the prosopa that Sabellius is essentially distinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Of his later history nothing is known; his followers died out in the course of the fourth century.

SABIANS. See MOHAMMEDANISM. The name is derived from the Aramaic *ܫܒܝܐ*, with a softening of *ܫ* to *ܫ*, such as took place in certain dialects of that speech, and means "Baptists." The older Mohammedan theologians were agreed that the Sabians possessed a written revelation, and were entitled accordingly to enjoy a toleration not granted to mere heathen. But under Al-Mamún (830) a body that had certainly no claim to be deemed other than polytheists began to shield themselves under the same name, viz., the Har-

ranians, or remnant of the old heathen of Mesopotamia. Star-worship had a chief place in the religion of the Harranians, as it had had in the older Babylonian and Syrian faiths, but they had partly disguised their polytheism in a fantastic philosophy, so that they were able on occasion to pose as people of enlightened beliefs. Accounts of these false Sabians reached the West through Maimonides, and then through Arabic sources, long before it was understood that, in this application, the name was only a disguise. Hence it is quite inappropriate to call star-worshippers in general Sabians or Zabians or to speak of a distinct Sabian religion, as older writers do. The religion of the Harranians is simply a modernized form of the old Syrian polytheism.

SABICU WOOD is the produce of a large leguminous tree, *Lysiloma Sabicu*, a native of Cuba, where alone it appears to be found. The wood has a rich mahogany color; it is exceedingly heavy, hard, and durable, and therefore most valuable for shipbuilding. Sabicu, on account of its durability, was selected for the stairs of the Great Exhibition (London) of 1851, and, notwithstanding the enormous traffic which passed over them, the wood at the end was found to be little affected by wear.

SABINE, SIR EDWARD, astronomer, was born in Dublin October 14, 1788, a scion of a family said to be of Italian origin. He was educated at Woolwich and obtained a commission in the Royal Artillery at the age of fifteen. He attained the rank of major-general in 1859. In early life he devoted himself to astronomy and physical geography, and in consequence he was appointed astronomer to various expeditions, among others that of Sir J. Ross (1818) in search of the Northwest Passage, and that of Sir E. Parry soon afterward. Sir Edward Sabine died at East Sheen, Surrey, England, on May 26, 1883.

SABINES. The Sabines (Sabini) were a people of Central Italy, who played an important part in the early history of Rome. According to all old writers they were one of the most ancient nations of Italy, and the parent stock from which many of the other tribes that occupied the central and southern regions of the peninsula derived their origin. The story of their Laconian descent may be safely rejected as one of those fictions by which a certain class of the later Greek writers sought to derive every people in Italy from a Greek origin. But the evidence concerning their language, scanty as it is, is sufficient to prove that they were a cognate race with the neighboring Umbrians and Oscans, as well as, more remotely, with the Latins.

Their power appears to have attained its highest point about the time of the foundation of Rome, and the legendary history, familiar to every schoolboy, of the contests between Romulus and Tatius, the divided sovereignty at one time established between them, and the peaceful reign and legislation of the Sabine king Numa may be taken as representing the historical fact that the population of Rome really contained an important Sabine element, and that Sabine influences were largely intermixed with those of Latin origin, both in the civil institutions and still more in the religious rites and ceremonies of the rising republic. Beyond this it is impossible to pronounce with certainty as to the real value and significance of the traditions preserved to us in the poetical legends transmitted in the garb of history; and it is impossible in an article like the present to give even an outline of the various theories that have been devised by modern writers to put an historical interpretation upon the records thus preserved to us.

No remains of the Sabine language are extant in the form of inscriptions, but coins struck during the Social War with the inscription "Safinim" show that the native

appellation was the same as that in use among the Latins. The form "Sabellus" is frequently found in Latin writers as an ethnic adjective equivalent to Sabine; but the practice adopted by modern writers, of employing the term "Sabellian" to designate all the tribes of Sabine origin, including Samnites, Lucanians, etc., was first introduced by Niebuhr, and is not supported by any ancient authority.

**SABLE** (*Mustela zibellina*). See **MARTEN**, and **FUR**.

**SABLES D'OLONNE**, a seaport town of France, the chef-lieu of an arrondissement of the department of La Vendée, is situated on the Atlantic seaboard in 46° 30' N. latitude, 300 miles southwest of Paris by the railway for Tours and La-Roche-sur-Yon. The port of Sables, consisting of a tidal basin and a wet-dock, is accessible only to vessels of from 350 to 400 tons, and is dangerous when the winds are from the southwest. The entrance is shown by six lights; a seventh lighthouse, that of the Barges, a mile out at sea to the west, has a height of eighty feet and is visible for seventeen to eighteen nautical miles. The staple articles of trade are grain, wine, cattle, timber, salt, tar, fish, building stone, manures; 400 boats are engaged in the sardine fishery. The beautiful smoothly sloping beach, a mile in length, is much frequented by bathers. It is lined by an embankment which serves as a promenade and drive, and is bordered by hotels, villas, and cafés. The population in 1881 was 9,769, that of the commune 10,420; in 1890 it was estimated at 10,746 and 11,640 respectively.

**SACCATOO**. See **SOKOTA**.

**SACCHETTI, FRANCO**, Italian novelist, was the son of Benci di Ugucione, surnamed "Buono," of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.*, c. xvi.), and was born at Florence about the year 1335. The date of his death is unknown; most probably it occurred about 1400, though some writers place it as late as 1410.

**SACCHI, ANDREA**, a leading painter of the later Roman school, was born in Rome in 1600, or perhaps as early as 1598. He died at Rome, in 1661.

**SACCHINI, ANTONIO MARIA GASPARE**, musical composer, of the Italian school, was born at Pozzuoli, July 23, 1734, and educated under Durante at the Conservatorio di San Giosafro at Naples. He died at Paris, October 7, 1786.

**SACHEVERELL, HENRY**, an English church and state politician of extreme views, was born in 1674 and died at the Grove, Highgate, June 5, 1724.

Ample information about his life and trial will be found in Hearne's *Diaries*, Bloxam's *Register of Magdalen*, iii. 98-110, and Hill Burton's *Queen Anne*, vol. ii. Mr. Madan of the Bodleian Library has compiled a Sacheverell bibliography.

**SACHS, HANS**, the most eminent German poet of the sixteenth century, was born at Nuremberg on November 5, 1494. He died on January 19, 1576.

**SACKING AND SACK MANUFACTURE**. Sacking is a stout close-woven fabric, properly of flax, but now very largely made of jute. Sacks, however, are made of many qualities and from different fibers, according to the purposes to which they are devoted. A large proportion of flour sacks, those particularly of American origin, are made of stout cotton. Numerous attempts have been made to manufacture seamless sacks; but none have met with success. The invention of a sewing-machine for the "overhead" seaming of sacks has been successfully solved in the machine of Laing and other inventors.

**SACO**, a city of the United States, in York county, Me., on the left or north bank of the Saco river, op-

posite Biddeford, 9 miles from the sea and 100 from Boston by the Boston and Maine railroad. The water-power furnished by the river, which falls here fifty-five feet, is utilized by various cotton-factories, machine-shops, lumber-mills, etc. Originally included in Biddeford, but separately incorporated in 1762 as Pepperellborough, Saco received its present name in 1805 and was made a city in 1867. The population was 5,755 in 1870, 6,389 in 1880, and 6,075 in 1890.

**SACRAMENT**. The Latin word *sacramentum*, meaning "an oath," is most commonly used by classical writers to denote the military oath of allegiance; for its technical application in legal phraseology see **ROMAN LAW**. In the earliest ecclesiastical Latin traces of the old military meaning are still present. In addition to its general sense the word *μυστήριον* not unnaturally soon came to have for Christians a more special meaning as denoting those external rites of their religion, solemn, instructive, and more or less secret, which had most analogy with the **MYSTERIES** (*q.v.*) of paganism. No attempt, however, was at first made to enumerate or to define these. What proved to be an important new departure was taken by Peter Lombard (d. 1164), in the fourth book of his *Sentences*, which treats "of sacraments and sacramental signs." There for the first time are enumerated the seven sacraments (baptism, confirmation, the Eucharist, penance, extreme unction, orders, matrimony), which were afterward formally recognized by the Church of Rome at the councils of Florence (1439) and of Trent; and there also for the first time it was expressly recognized that not all signs of sacred things can be regarded as sacraments, but only those which are the form of invisible grace in such a sense as to represent it and bring it about ("ut ipsius imaginem gerat et causa existat"). The main points in the Tridentine doctrine are these: the sacraments have the power of conferring grace *ex opere operato* on the recipients who do not resist it ("non ponentibus obicem"); for their validity, however, there must be in the minister the intention of doing that which the church does. Though all are in a sense necessary, they are not so with equal directness for each individual, nor are they alike in dignity. The two principal sacraments are baptism and the Lord's Supper.

**SACRAMENTO**, a city of the United States, the capital of California and the county seat of Sacramento county, 135 miles by rail northeast of San Francisco on the east bank of the Sacramento river, which at this point receives the American river and becomes navigable for large steamboats. The site is only fifteen feet above low water of the river, or thirty above sea-level, and as the river sometimes rises twenty feet the city was originally subject to destructive floods. Those of 1850, 1852, and 1853, however, led to the raising of the level of the principal streets and buildings in the business quarter by five feet, and to the construction of strong levees or embankments, from four to twenty feet high for two miles along the Sacramento and three along the American river. Further measures of the same kind were adopted after the disaster of 1861, which almost rendered the city bankrupt; and the level of the principal districts is now 8 feet above the river. The shops and stores in the city are mostly of brick, but the dwelling-houses generally only of wood. The State capitol, commenced in 1861 and completed at a cost of \$2,500,000, is one of the finest buildings of its kind in the country; it stands in the heart of the city in the midst of a park of fifty acres. The other public buildings—the State printing-office and armory, the agricultural hall, the Oddfellows' hall, the hospital, the grammar-school, etc.—are comparatively unimportant. Besides the State library (36,000 volumes) there are two other public

libraries in the city. The number of industrial establishments has recently been rapidly increasing; they comprise the extensive workshops of the Central Pacific railroad, a woolen-mill, carriage-factories, plow-factories, marble-works, breweries, potteries, glue-works, etc. The population was 6,820 in 1850, 13,785 in 1860, 16,283 in 1870, 21,420 in 1880, and 26,386 in 1890.

In 1841 John Augustus Sutter (b. 1803), a Swiss military officer, obtained a grant of land at the junction of the Sacramento and American rivers, and made a settlement which he called New Helvetia. The discovery of gold on his property in 1848 changed the whole history of California. Sutter's Fort, as the spot was popularly called, became the site of a mining town, which was made the capital of the State in 1854, and obtained a city charter in 1863. The name of Sacramento was first applied to the place in the advertisement for the sale of ground-lots in 1848.

**SACRIFICE.** The Latin word *sacrificium*, from which we have the English "sacrifice," properly means an action within the sphere of things sacred to the gods, so that "sacrificial" and "hierurgic" are synonymous, and, strictly speaking, cover the whole field of sacred ritual. By the Romans, as by all ancient or primitive nations, the gods were habitually approached with gifts, and the presentation of the gift, being the central feature in every ordinary act of worship, is regarded as the sacrifice proper. In all parts of the world, moreover, for reasons which will appear by and by, the stated gifts by which the gods are honored in private worship or public feasts are drawn from the stores on which human life is supported—fruits, grain, wine, oil, the flesh of animals, and the like. All gifts of this kind, which are not merely presented to the god but consumed in his service, fall under the notion of sacrifice, while permanent votive offerings of treasure, lands, temples, images, or the like, not forming part of any stated ritual, are excluded. But again, where we find a practice of sacrificing honorific gifts to the gods, we usually find also certain other sacrifices which resemble those already characterized, inasmuch as something is given up by the worshipers to be consumed in sacred ceremony, but differ from them inasmuch as the sacrifice—usually a living victim—is not regarded as a tribute of honor to the god, but has a special atoning or mystic significance. The most familiar case of this second species of sacrifice is that which the Romans distinguished from the *hostia honoraria* by the name of *hostia piacularis*. In the former case the deity accepts a gift; in the latter he demands a life. The former kind of sacrifice is offered by the worshiper on the basis of an established relation of friendly dependence on his divine lord; the latter is directed to appease the divine anger, or to conciliate the favor of a deity on whom the worshiper has no right to count.

*Honorific Sacrifices* naturally hold the chief place in all natural (as opposed to positive) religions that have reached the stage in which orthodox ritual is differentiated from sorcery, and in which the relations between the gods and their worshipers are conceived as being of a fixed and habitually friendly character, so that the acts by which a continuance of divine favor can be secured are known by well-established tradition and regularly practiced with full confidence in their efficacy. Religions of this type unite the god to a definite circle of worshipers forming a natural unity, so that every man's birth or political and social status determines at once what god he is called upon to worship and may confidently look to for help. Religions of this sort, therefore, are mainly tribal or national, and the deity is regarded as a king, or, if there are several gods worshipped by the same circle, they are lords and ladies

and are naturally to be honored in the same way as earthly grandees. Thus among the Hebrews, whose early institutions afford a typical example of a national religion, the fundamental rule is that no one is to appear before Jehovah empty-handed (Exod. xxiii. 15), just as it would be indecent (and in the East is still indecent) to approach a king or great man without some present, however trifling. In like manner Homer teaches that gods and kings alike are persuaded by gifts. A special request will naturally be accompanied by a special gift proportioned to the occasion or by a vow to be fulfilled when the prayer is heard; but apart from this the general goodwill whether of god or king falls to be acknowledged and secured by offerings renewed from time to time by way of tribute or homage.

A sacrifice, therefore, is primarily a meal offered to deity. In some of the cases already noticed, and in the case of holocausts or whole burnt-offerings, the sacrificial gift is entirely made over to the god; but ordinarily the sacrifice is a feast of which god and worshipers partake together. If all sacrifices are not convivial entertainments, at least the tendency is to give to all feasts, nay to all meals, a sacrificial character by inviting the gods to partake of them (Athenæus, v. 19).

*Human Sacrifices.*—From these observations the transition is easy to those human sacrifices which are not piacular. It is perfectly clear in many cases that such sacrifices are associated with cannibalism, a practice which always means eating the flesh of men of alien and hostile kin. The human wolves would no more eat a brother than they would eat a wolf; but to eat an enemy is another matter. Naturally enough traces of cannibalism persist in religion after they have disappeared from ordinary life, and especially in the religion of carnivorous gods. Thus it may be conjectured that the human sacrifices offered to the wolf-Zeus (Lycæus) in Arcadia were originally cannibal feasts of a wolf tribe. The first participants in the rite were, according to later legends, changed into wolves (Lycaon and his sons); and in later times, as appears by comparing Plato (*Rep.*, viii. 15) with Pausanias (viii. 2), at least one fragment of the human flesh was placed among the sacrificial portions derived from other victims, and the man who ate it was believed to become a were-wolf. All human sacrifices where the victim is a captive or other foreigner may be presumed to be derived from cannibal feasts; but a quite different explanation is required for the cases, which are by far more numerous among people no longer mere savages, in which a father sacrifices his child or a tribe its fellow-tribesman. This case belongs to the head of piacular sacrifices.

*Piacular Sacrifices.*—Among all primitive peoples there are certain offenses against piety (especially bloodshed within the kin) which are regarded as properly inexpiable; the offender must die or become an outlaw. Where the god of the kin appears as vindicator of this law he demands the life of the culprit; if the kinsmen refuse this they share the guilt. Thus the execution of a criminal assumes the character of a religious action. If now it appears in any way that the god is offended and refuses to help his people, it is concluded that a crime has been committed and not expiated. This neglect must be repaired, and, if the true culprit cannot be found or cannot be spared, the worshipers as a whole bear the guilt until they or the guilty man himself find a substitute. The idea of substitution is widespread through all early religions, and is found in honorific as well as in piacular rites; the Romans, for example, substituted models in wax or dough for victims that could not be procured according to the ritual, or

else feigned that a sheep was a stag (*cervaria ovis*) and the like. In all such cases the idea is that the substitute shall imitate as closely as is possible or convenient the victim whose place it supplies; and so in piacular ceremonies the god may indeed accept one life for another, or certain select lives to atone for the guilt of a whole community, but these lives ought to be of the guilty kin, just as in blood-revenge the death of any kinsman of the manslayer satisfies justice. Hence such rites as the Semitic sacrifices of children by their fathers (see MOLOCH), the sacrifice of Iphigeneia and similar cases among the Greeks, or the offering up of boys to the goddess Mania at Rome *pro familiarium sospitate* (Macrob., i. 7, 34). In the oldest Semitic cases it is only under extreme manifestations of divine wrath that such offerings are made (comp. Porph., *De Abst.*, ii. 56), and so it was probably among other races also; but under the pressure of long-continued calamity, or other circumstances which made men doubtful of the steady favor of the gods, piacular offerings might easily become more frequent and ultimately assume a stated character, and be made at regular intervals by way of precaution without waiting for an actual outbreak of divine anger. Thus the Carthaginians, as Theophrastus relates, annually sprinkled their altars with "a tribesman's blood" (Porph., *De Abst.*, ii. 28). But in advanced societies the tendency is to modify the horrors of the ritual either by accepting an effusion of blood without actually slaying the victim, *e.g.*, in the flagellation of the Spartan lads at the altar of Artemis Orthia (Paus., iii. 16, 7; comp. Eurip., *Iph. Taur.*, 1479 sq.; 1 Kings xviii. 28), or by a further extension of the doctrine of substitution; the Romans, for example, substituted puppets for the human sacrifices to Mania, and cast rush dolls into the Tiber at the yearly atoning sacrifice on the Sublician bridge. More usually, however, the life of an animal is accepted by the god in place of a human life. This explanation of the origin of piacular animal sacrifices has often been disputed, mainly on dogmatic grounds and in connection with the Hebrew sin offerings; but it is quite clearly brought out wherever we have an ancient account of the origin of such a rite (*e.g.*, for the Hebrews, Gen. xxii. 13; the Phœnicians, Porph., *De Abst.*, iv. 15; the Greeks and many others, *ibid.*, ii. 54 sq.; the Romans, Ovid, *Fasti*, vi. 162). Among the Egyptians the victim was marked with a seal bearing the image of a man bound, and kneeling with a sword at his throat, (Plut., *Is. et Os.*, chap. xxxi.) And often we find a ceremonial laying of the sin to be expiated on the head of the victim (Herod., ii. 39; Lev. iv. 4 compared with xiv. 21).

**SACRILEGE.** The robbery of churches was in Roman law punishable with death. There are early instances of persons having suffered death for this offense in Scotland. In England, at common law, benefit of clergy was denied to robbers of churches. The tendency of the later law has been to put the offense of sacrilege in the same position as if the offense had not been committed in a sacred building.

**SACRO BOSCO, JOHANNES DE, or JOHN HOLYWOOD,** astronomical author, died 1244 (or 1256) as professor of mathematics at the university of Paris. Nothing else is known about his life.

**SACY, ANTOINE ISAAC, BARON SILVESTRE DE,** the greatest of French Orientalists and the founder of the modern school of Arabic scholarship, was the second son of a Parisian notary, and was born at Paris on September 21, 1758. He died in 1838.

**SACY, ISAAC LOUIS LE MAÎTRE DE,** a figure of some prominence in the literary annals of PORT ROYAL (*q.v.*), and after the death of St. Cyran (1643) and Singlin (1664) the leading confessor and "director" of

the Jansenists in France, was born in Paris on March 29, 1613. He died in 1684.

**SADDLERY** embraces the industries connected with the harnessing and controlling of all beasts of draft and burden. The materials used in harnessing the various creatures so employed and the modifications of harness necessary to suit their structure, temperament, and duties are, of course, exceedingly varied. In a restricted sense saddlery is principally a leather trade, and has to do with the harnessing of the horse. The trade divides itself into two branches, brown saddlery and black saddlery. The former is concerned with saddlemaking and the cutting and sewing of bridles, reins, and all other uncolored leather-work. The saddle is the most important article on the brown saddler's list. It consists of the tree or skeleton, on which the leather is stretched, the seat, the skirts, and the flaps. The tree is commonly made of beech strengthened with iron plates. The whole leather-work ought to be of pig-skin, but often the seat alone is of that material, the other parts being imitation, cleverly grained by means of electro-deposit copper casts from the surface of real pig-skin. There are many varieties of saddles, such as racing, military, hunting, and ladies' saddles, etc. A racing saddle may weigh not more than two or three pounds, while a cavalry saddle will be four times heavier. The saddle-maker has to consider the ease and comfort of both horse and rider. The saddle must fit closely and evenly to the curvature of the horse's back without tendency to shift, and it ought to offer as far as possible a soft and elastic seat for the rider. The black saddler is concerned with the harness of carriage, cart, and draft horses generally. The portions of saddlery by which the horseman controls and guides the horse are the bridle and bit and the reins.

**SADDUCEES (צַדִּיקִים, *i.e.*, Zadokites),** the party of the priestly aristocracy under the latter Hasmonæans. The Sadducees were essentially a political party opposed to the Pharisees or party of the Scribes, and their position and history have therefore already been discussed in ISRAEL. The common view that Sadduceeism was essentially a philosophico-religious school is due partly to Josephus but mainly to later Jewish tradition, which never could realize the difference between a nation and a sect, and fancied that the whole history of Israel was made up of such scholastic controversies as engrossed the attention of later times. The theological tenets of the Sadducees as they appear in the New Testament and in Josephus had a purely political basis. They detested the doctrine of the resurrection and the fatalism of the Pharisees because these opinions were used by their adversaries to thwart their political aims.

**SÁ DE MIRANDA, FRANCISCO DE,** Portuguese poet, was born of noble family on October 27, 1495. He died on his own property at Tapada near Ponte do Lima on March 15, 1558.

**SA'DÍ,** generally called MUSLIH-UDDÍN, but more correctly MUSHARRIF-UDDÍN B. MUSLIH-UDDÍN, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (580 A.H.) in Shíráz, where his father, Abdalláh, a man of practical religion and good common sense, who impressed upon his son from early childhood the great maxims of doing good and fearing nobody, was in the service of the Turkoman race of the Salgharides or Atábegs of Fárs. The fifth ruler of this dynasty, Sa'd b. Zengí, who ascended the throne in 1195 (591 A.H.) conceived a great affection for young Musharrif-uddín, and enabled him, after the premature death of his father, to pursue his studies in the famous medreseh of Baghdád, the Nizámiyyah, where

he remained about thirty years (1196-1224). Strict college discipline and severe theological studies repressed for a long time the inborn cheerfulness and joviality of his nature; but his poetical genius, which rapidly developed, kept alive in him, amid all the privations of an austere life, the elasticity of youth, and some of his "early odes," in which he praises the pleasures of life and the sweetness of love, were no doubt composed during his stay in Baghdád. At any rate his literary fame had already spread about 1210 (606 A.H.) as far as Káshgar in Turkistán, which the young poet (who in honor of his patron had assumed the name of Sa'dí) visited in his twenty-sixth or twenty-seventh year. After mastering all the dogmatic disciplines of the Islamic faith he turned his attention first to practical philosophy, and later on to the more ideal tenets of Súfic pantheism, under the spiritual guidance of the famous sheikh Shiháb-uddín 'Umar Suhrawadí (died 1234; 632 A.H.) Between 1220 and 1225 he paid a visit to a friend in Ispahán, went from there to Damascus, and returned to Ispahán just at the time of the inroads of the Mongols, when the Atábeg Sa'd had been deposed by the victorious ruler of Kirmán, Ghiyáth-uddín (1223). Sa'dí died at Shíráz in 1292 (691 A.H.) according to Hamdalláh Mustaufí (who wrote only forty years later), or in December, 1291 (690 A.H.), at the age of 110 lunar years.

SADLER, SIR RALPH, English statesman, was the son of Henry Sadler, steward to the proprietor of the manor of Gillney, near Great Hadham, Hertfordshire, and was born at Hackney in Middlesex, England, in 1507. In 1537 he was sent to Scotland to strengthen the English interest; in 1539-40 he was commissioned to persuade the Scottish king James V. to cast off the supremacy of the pope; in 1541 he went back to enforce the same counsel; and in 1542 he was appointed to settle the proposed match between Edward prince of Wales and Mary the infant queen of Scots. Although not successful in any of these missions, he continued to retain the full confidence of the king, who, in recognition of his zealous services, conferred on him in 1543 the honor of knighthood. On Henry's death in 1547 Sadler's name was found in the royal will as one of the councilors to the sixteen nobles who were entrusted with the guardianship of the young king. In 1584 he was appointed keeper of Mary queen of Scots in the castle of Tutbury; but on account of "age and infirmity" he was permitted to resign his charge some time before the death of the queen. His last service was to repair to Scotland to pacify the king's indignation on account of Mary's death. He died after his return home at Standon in Hertfordshire, March 30, 1587.

SADOLETO, JACOPO, Italian humanist and churchman, was born at Modena in 1477, and died in 1547.

SÆMUND. See EDDA, and ICELAND.

SAFES. A safe is any repository in which valuable property is guarded against risk of loss by fire or from the attacks of thieves. The protection of valuable documents and possessions was only imperfectly effected in the charter-rooms of old mansions and in iron-bound oaken chests and iron coffers of the Middle Ages; but these in their day represented the strong rooms and safes of modern times. The vast increase in realized wealth and the complication of financial and banking operations necessitate in our days the greatest attention to the safeguarding of securities and property. The ingenuity of inventors has, within practicable limits, effected much in safe-making; but the cunning of thieves has increased in proportion to the obstacles to be overcome and to the value of booty at which they aim. No safe can be held to be invulnerable; for, whatever human ingenuity can put together and close, the same in-

genuity can tear down and open. An impregnable safe would indeed be a source of greater danger than of security to its owner, for, were the key or other means of access lost or rendered unworkable, the contents of the safe would of necessity be irrecoverable. The efficiency of a safe, therefore, does not depend on absolute impregnability, but on the nature of the obstacles it presents to successful attack, and to the generally unfavorable conditions under which such attacks are made. It is common to make safes both thief and fire-resisting, and the conditions necessary for the one object to a certain extent conduce to the attainment of both; but for many purposes security from the one danger alone is requisite.

The devices for baffling thieves are numerous. The safe must in the first place be made heavy and unwieldy, or otherwise it must be so fixed that it can only be carried away with the utmost difficulty. Next, the greatest obstacles to obtaining illegitimate access must be presented. To prevent fracturing a tough metal must be used in the construction, and to resist penetration by drilling metal of great hardness must be interposed. These conditions are commonly met by making the outer casing of the safe of boiler plate, backed by a lining of hard steel, over which is an inner lining of thin boiler plate, the three layers being securely bolted together by screws from within. By some makers a layer of hard metal is poured, in a fluid state, between the outer and inner casing; others case-harden one surface; and there are numerous additional devices for securing the combination of hardness and toughness. To prevent wrenching of joints, the two sides with top and bottom of the outer shell are sometimes made out of a single plate welded at the joint, and the back and front are then attached to that shell by angle irons screwed from within. The frame upon which the door hangs and into which the bolts shoot is made of great strength, with special precautions to prevent the wrenching off of the door by means of crowbars or wedges. In an ordinary safe the massive bolts, three or more in number, shoot only at the front, and fixed dogs or sham bolts fit into slots at the back or hinged side. This arrangement is sufficient to keep the door closed independent of hinges, which are merely the pivot on which the door turns. Safe bolts are shot not by the key, as in an ordinary lock, but by the door handle, and the key simply secures them in their position. The lock of a safe must be a careful piece of mechanism, not subject to derangement, unpickable and gunpowder-proof. The portion of the door on which it is fastened is generally provided with extra precautions against drilling. A safe being well made and securely locked remains vulnerable through the medium of the key, which may be surreptitiously obtained either for direct use or to form a mold by which false keys can be cut. On this account, keyless locks and time locks are in great favor in America. In keyless permutation locks, such as those of Hall, Sargeant, Yale, and Dalton, the bolts can be withdrawn only after an indicator has been successively set against a combination of numbers arranged before the closing of the door; and in the time lock of these inventors the safe can only be opened at any hour to which the time controller is set before closing. Electrical arrangements have also been attached to safes by which signals are conveyed to any spot when a safe so guarded is unlawfully interfered with.

It is much easier to render a safe fire-proof than to guard it against burglary. It requires nothing more than a calculation of the intensity and duration of any fire to which it is likely to be exposed, and the provision of a sufficient lining of fire-resisting material. What

is principally used is a mixture of some absorbent medium—such as sawdust, powdered gypsum or cement, or infusorial earth—with ground alum. Asbestos, silicate cotton, mica, and other non-conductors are also used; and by some makers sealed tubes of alkaline salts are distributed through the absorbent material. These burst when exposed to high heat and their contents saturate the surrounding substance. A carefully packed shell of not less than three and one-half inches of the fire-resisting medium should line the interior of every fire-proof safe; but in many cheap safes a quantity of brick dust is the only fire-resisting medium.

Where an ordinary safe provides insufficient accommodation the strong room takes its place. Such an apartment, being generally in the basement of a building, presents no special difficulties to make it proof against fire and thieves. Thickness of walls, built by preference of hard brick laid in cement, and liberal use of cement within the walls, as well as at the floor and over the arched roof, give strength against both fire and burglars. The interior of a strong room is generally lined with boiler-plate, and, in addition to the massive steel and iron door, it has an inner wrought-iron grill-door, which secures the vault during business hours and permits the ventilation of the apartment. Within such a strong room extra strong chambers or separate safes may be placed, and in this way precautions may be indefinitely multiplied.

SAFE DEPOSIT COMPANIES are among the comparatively recent additions to the list of bodies corporate, organized for a specific purpose, and operating under and by virtue of statutory law or special acts of State legislatures. Deposit companies were formed for the purpose of receiving deposits of valuables of almost every description, such as bonds, notes, mortgages, jewelry, gold and silver ware, family heirlooms, wills, and other legal documents, etc., companies guaranteeing to owners, upon payment by the latter of a premium corresponding to the risk undertaken, absolute security, from loss by fire or otherwise, to the articles deposited. The acts of incorporation also authorize the construction of such buildings, safes, and other appurtenances as will promote the security contemplated, and the faithful execution of the trust created for the benefit of depositors. The company's affairs are directed by an executive board and board of directors elected by the stockholders, and who, with such stockholders, are jointly and severally liable for all debts of the corporation to an amount equal to the par value of their stock. A set of books is kept in which is recorded the names of depositors, together with a minute description of each, of the character and value of the articles deposited by them, together with such other facts in connection with the transaction of the business as will preclude all possible danger of loss to either patron or company. The vaults or safe deposits for the storage of valuables are constructed after the latest designs, of the most substantial material, and provided with every appliance known to scientific investigation or mechanical development for attaining the end in view, *i. e.*, absolute security from visitations either by burglars or the elements. The interior of these vaults is peopled, so to speak, with boxes and safes in which are contained the valuables of clients, access to which is obtained by keys, one being held by the lessee and the other by the company. The vaults are opened and closed by electricity at designated hours, and their protection is further guaranteed by locks and bolts, as also by the presence of custodians, who are relieved at intervals by colleagues. Automatic signals are connected with

the police department and private detective agencies of cities in which the company does business, and either upon the sounding of the alarm or its failure to signal "all is well," as the device is constructed to do, investigation is at once instituted to ascertain the cause. A pass-word is employed by some of the companies as a further preventive against intrusion, and other agencies for the promotion of security are adopted as rapidly as they become available.

SAFETY LAMP. See COAL.

SAFFÁRIDS, a Persian dynasty of the ninth century. (See MOHAMMEDANISM.)

SAFFI (Asafi), a seaport of Morocco, with 6,000 inhabitants, some commerce, and a famous shrine, the House of the Seven Sleepers, frequented by Moslem and Jewish pilgrims.

SAFFLOWER, or BASTARD SAFFRON (*Carthamus tinctorius*), belongs to the natural order *Compositæ*; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt, and to some extent in southern Europe. To obtain the dyeing principle—carthamine—the flowers are first washed to free them from a soluble yellow coloring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this second solution is neutralized with acid, carthamine in a pure condition is precipitated.

SAFFRON (Arab., *za'farān*) is manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*, L., the precise origin of which is unknown. It has long been cultivated in Persia and Kashmir, and is supposed to have been introduced into China by the Mogul invasion. According to Hakluyt, it was brought into England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Hinton in Cambridgeshire, and in Essex at Saffron Walden (*i. e.*, Saffron Woods, not Saffron Walled-in, as the canting crest of the town would imply), its cultivators being called "crokers." This industry, though very important in the fifteenth century, when English saffron commanded the highest prices on the Continent, appears to have died out about 1768.

Saffron was used as an ingredient in many of the complicated medicines of early times. It was, however, mainly used as a dye. It was a royal color in early Greek times, though afterward, perhaps from its abundant use in the baths, and as a scented salve, it was especially appropriated by the hetairæ. In ancient Ireland a king's mantle was dyed with saffron, and even down to the seventeenth century the "lein-croich," or saffron-dyed shirt, was worn by persons of rank in the Hebrides.

SAFFRON WALDEN, a market-town and municipal borough of Essex, England, is finely situated near the Cam in a valley surrounded by hills, on a branch of the Great Eastern railway, forty-four miles north-northeast of London and fourteen south of Cambridge. The town is an important center of agricultural industry and has large corn, cattle, and sheep markets. Brewing and malting are carried on. The population of the municipal borough (area, 7,416 acres) in 1871 was 5,718, and in 1881 it was 6,060.

SAGAN, a manufacturing town in Prussian Silesia, situated on the Bober, a tributary of the Oder, lies sixty miles south-southeast of Frankfort-on-the-Oder and 102 miles southeast of Berlin. The population in 1880 was 11,373.

**SAGAR**, or **SAUGOR**, a British district of India, situated in the extreme northwest of the Central Provinces, and comprised between  $23^{\circ} 4'$  and  $24^{\circ} 27'$  N. latitude, and between  $78^{\circ} 6'$  and  $79^{\circ} 12'$  E. longitude, with a total area of 4,005 square miles.

By the census of 1881 the population numbered 564,950 (294,795 males and 270,155 females). Hindus numbered 498,071, Mohammedans 25,396, Buddhists and Jains 16,432, Christians 1,034, and aboriginals 19,144. The only town except the capital (see below) with a population exceeding 10,000 is Garhakota, which contains 11,414 inhabitants. Of the total area only 1,396 square miles are cultivated, and of the portion lying waste 1,220 are returned as cultivable. Wheat forms the principal crop, which is produced in large quantities all over the district; other products are food grains, rice, oil-seeds, cotton, and sugar-cane. Cattle and buffaloes are bred to a large extent both for draft and carriage, and also for dairy purposes, especially for the manufacture of ghee.

**SAGAR**, principal town and headquarters of the above district, situated in  $23^{\circ} 50'$  N. latitude and  $78^{\circ} 49'$  E. longitude, is well built with wide streets and stands on the borders of a small but beautiful lake, and has military cantonments. The population of the town in 1881 was 44,416 (males 22,556, females 21,860).

**SAGE, LE.** See **LE SAGE**.

**SAGHALIN**, or **SAKHALIN**, is the name improperly given to a large elongated island in the North Pacific, lying between  $45^{\circ} 57'$  and  $54^{\circ} 24'$  N. latitude and  $141^{\circ} 30'$  and  $144^{\circ} 50'$  E. longitude, off the coast of Russian Manchuria. Its proper name is *Karaftu* or *Karafuto*. It is separated from the mainland by the narrow and shallow Strait of Tartary, which often freezes in winter in its narrower part, and from Yezo (Japan) by the Strait of La Pèrouse. This island (670 miles long, 20 to 150 broad, with an area of 24,560 square miles), about equal in size to Belgium and Holland together, must be considered as a continuation of the mountains bordering the Manchurian littoral. Its orography is still imperfectly known.

Saghalin has been inhabited since at least the Neolithic Stone Age. Flint implements, exactly like those of Siberia and Russia, have been found at Dui and Kusunai in great numbers, as well as polished hatchets (of trap, diorite, and argillaceous schists)—also like the European ones—primitive pottery with decorations like those of Olonetz, and stone weights for nets. Afterward came a population to whom bronze was known; they have left their traces in earthen walls and kitchen-middens (in the Bay of Aniva). The present inhabitants consist of some 2,000 Gilyaks, 2,500 Ainos, 500 Oroks, as many Japanese, and about 6,000 Russians. The Gilyaks, who do not differ from those of the Amur, inhabit the northern part of the island. They support themselves by fishing and partly by hunting, but suffer from competition with the Japanese, who take possession of the best fishing-grounds. The Oroks, of Tungus origin, resemble the Orotchons of the Amur; they live by hunting. The Ainos, who are still the subject of so much discussion among ethnologists, are the aborigines of the island; they are closely akin to the Curilians, and, like these, differ from all other Mongolian races by their luxuriance of hair and beard. They now inhabit only the south part of the island, and have been brought into a condition of slavery by the Japanese, by whom they have been driven out of Yezo and Nippon, in both of which they were the aborigines.

**SAGINAW**, capital of Saginaw county, Mich., lies on an elevated plateau about thirty feet above the water on the left bank of the Saginaw river, which falls into Saginaw Bay on Lake Huron, about eighteen

miles lower down. It is a railway junction of some importance, 100 miles northwest of Detroit, is connected with East Saginaw by a street railway, and can be reached by the largest vessels that ply on the lake. The upper branches of the river are also available for boat traffic throughout a considerable district. Saw-mills, planing-mills, and salt-works are the principal industrial establishments. The population was 7,460 in 1870, 29,521 in 1880, and 46,322 in 1890. The city charter dates from 1859, the first settlement from 1822.

**SAGITTA.** The name "Sagitta" was given by Martin Slabber in 1775 to a small marine worm which is now known as the type of a distinct group, the *Chetognatha* (Leuckart). The group comprises two genera (*Sagitta* and *Spadella*) and a considerable number of species; they are small transparent pelagic animals, varying in length from a few lines up to two inches, and are universally distributed.

**SAGO** is a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palm, *Metroxylon Rumphii* (Mart.), and *M. lœve*, (Mart.) These palms are natives of the East Indian Archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low, marshy situations, seldom attaining a height of thirty feet, with a thick-set trunk. They attain maturity as starch-yielding plants at the age of about fifteen years, when the stem is gorged with an enormous mass of spongy medullary matter, around which is an outer rind consisting of a hard dense woody wall about two inches thick. When the fruit is allowed to form and ripen, the whole of this starchy core disappears, leaving the stem a mere hollow shell; and the tree immediately after ripening its fruit dies. When ripe the palms are cut down, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fiber behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for their cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, etc. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting along the marshy river banks of Sarawak.

**SAGUNTUM**, an ancient city of Hispania Tarracensis, was situated near the mouth of the river Palantias (Palància). The modern Sagunto or Murviedro (*muri veteres*), eighteen miles by rail from Valencia on the line to Tarragona, is now about three miles from the sea; the population within the municipal boundaries was 6,287 in 1877.

**SAHARA** is the great desert region which stretches across the continent of Africa eastward from the Atlantic for a considerable distance on both sides of the Tropic of Cancer, and is generally distinguished by aridity of soil, absence of running water, dryness of atmosphere, and comparative scarcity of vegetable and animal life. The physical limits of this region are in some directions marked with great precision, as in part of Morocco and Algeria, where the southern edge of the Atlas range looks out on what has almost the appearance of a boundless sea, and forms, as it were, a bold coast-line, whose sheltered bays and commanding promontories are occupied by a series of towns and villages—Tizgi, Figig, Laghouat, etc. In other directions the boundaries are vague, conventional, and disputed. This is especially

the case toward the south, where the desert sometimes comes to a close as suddenly as if it had been cut off with a knife, but at other times merges gradually and irregularly into the well-watered and fertile lands of the Sudan (Soudan). The desert, indeed, does not end with Africa, but is prolonged eastward through Arabia toward the desert of Sind. The Sahara is estimated to have an area of 3,565,565 square miles, or nearly as much as all Europe minus the Scandinavian peninsula and Iceland; but, while Europe supports a population of 327,000,000, the Sahara probably does not contain more than 2,500,000—a figure, however, which is sufficiently startling to those who think of it as an uninhabitable expanse of sand. The sea-like aspect of certain portions of the Sahara has given rise to much popular misconception, and has even affected the ideas and phraseology of scientific writers. Instead of being a boundless plain broken only by wave-like mounds of sand hardly more stable and little less dangerous than the waves of ocean, the Sahara is a region of the most varied surface and irregular relief, ranging in altitude from 100 feet below to some 5,000 or 6,000, or even it may be 8,000 feet above the sea-level, and, besides sand-dunes and oases, containing rocky plateaus, vast tracts of loose stones and pebbles, ranges of hills of the most dissimilar types, and valleys through which abundant watercourses must once have flowed.

The present population of the Sahara consists almost exclusively of Arabs, Berbers, and Negro tribes. The Berbers (Tuareg or Tuarik, etc.) occupy the west central region almost exclusively, appear sporadically in the western, and stretch northward into Morocco and Algeria; the Negro tribes form a compact block in the east central region northward and northeastward from Lake Tchad; and the Arabs are in possession of all the rest of the country. Politically the Sahara belongs partly to Morocco (Taflet, etc.), partly to Algeria and Tunis (and thus to France), and partly to the Turkish empire (Tripolis, Egypt, etc.). France especially has been steadily pushing south with the purpose of forming a junction ultimately with her colony on the Senegal. The spirit of independence among the Mohammedan populations has been crystallized and stimulated by the remarkable confraternity of Sidi Mohammed ben 'Ali es-Senusi, founded about 1837, and now possessing about 120 convents or zawiga (mostly in the Saharan region), with its headquarters at Jerabub. With this organization the French have already come into conflict in their southward progress. To establish their influence they propose the construction of a trans-Saharan railway and the opening up of the region to the south of Algeria and Tunis by the construction of an inland sea. According to M. Roudaire, the author and protagonist of this scheme, which is familiarly but deceptively styled the "flooding of the Sahara," it is possible by proper engineering works to create an inland sea to the south of Algeria and Tunis with an average depth of seventy-eight feet and an area of 3,100 square miles, or about fourteen times the size of the Lake of Geneva. A government commission decided that the excavation of the necessary canal would not be difficult, and that, in spite of silting-up processes, the work would at least last 1,000 to 1,500 years. M. de Lesseps, M. Roudaire's principal supporter, visited the district in 1883 and reported that the canal would cost five years' labor and 150,000,000 francs. The scheme, which has met with persistent hostility on the part of M. Cosson and others, is based on the following facts. The Gulf of Gabes is separated by a ridge thirteen miles across and 150 feet high from Shott al-Fejej, a depression which extends southwest into the Shott Jerid, which in its turn is separated from the Shott Rharsa only by a still

narrower ridge. Shott Rharsa is succeeded westward by a series of smaller depressions and beyond them lies the Shott Melrir, whose northwest end is not far from the town of Biskra. What we know about such inland seas as the Caspian and the Aral seems to cast serious doubt on the probability of any increase of the rainfall in the Sahara by the formation of Roudaire's sea.

The commerce of the Sahara is not inconsiderable. Among the more important trade routes are—(1) from Morocco to Cairo by Insalah and Ghadames, which is followed by the pilgrims of Western Africa bound for Mecca; (2) from Kuka to Murzuk and Tripolis; (3) from the Soudan to Tripolis by Air and Ghat; (4) from Timbuktu to Insalah, Ghadames, and Tripolis; (5) from Timbuktu to Insalah and thence to Algeria and Tunis; (6) from Timbuktu to Morocco. The two great products are dates and salt. Full details of the date trade will be found in Fischer's *Die Dattelpalme*, 1881. The principal sources of salt are the rock-salt deposits of the Juf (especially Taudeni), the lakes of Kufra, and the rock-salt and brine of Kawar (Bilma).

SAHÁRANPUR, or SEHARUNPOOR, a British district of India, in the Meerut division of the lieutenant-governorship of the Northwestern Provinces. It lies between  $29^{\circ} 35'$  and  $30^{\circ} 21'$  N. latitude, and between  $77^{\circ} 9'$  and  $78^{\circ} 15'$  E. longitude, and is bounded on the north by the Siwálik Hills, separating it from the district of Dehra Dún, on the south by the district of Muzaffarnagar, on the east by the Ganges, and on the west by the Jumna. The climate of Saháranpur is that of the Northwestern Provinces in general; at one season it is tropical, at another partially European. Its average annual rainfall is about thirty-seven inches. Wild animals are plentiful, including the tiger, leopard, wild cat, lynx, hyæna, and wolf. By the census of 1881 the population of Saháranpur numbered 979,544.

SAHARANPUR, principal town and administrative headquarters of the above district, is situated in  $29^{\circ} 58' 15''$  N. latitude and  $77^{\circ} 35' 15''$  E. longitude, on a small stream (the Damaula Nadi) in an open level country. A considerable trade is carried on in grain, sugar, molasses and country cloth. The population in 1881 was 59,194.

SAIDA. See SIDON.

SAIGA. See ANTELOPE.

SAIGON, the capital of French Cochin China, occupies an area of 1,000 acres, on the right bank of the Saigon river or Don-nai (one of the streams that insculcate with the deltaic branches of the Me-kong), about sixty miles from the China Sea. In 1884 it was connected by rail with Mytho, thirty-seven miles southwest on one of the branches of the Me-kong, with which it had obtained direct water communication in 1877 by the opening of the Canal de Cho-gon. The present city has been practically created since 1861, and its fine streets, boulevards, squares, and public buildings make it one of the most attractive towns in the East, as it was well planned and the plan not unworthily carried out. The population of Saigon in 1881 was 13,348. The Europeans, exclusive of the troops, numbered only 965 (913 French).

SAIL, SAILCLOTH, SAILMAKING. A sail is a sheet of canvas (or other material of the requisite flexibility and strength) by the action of the wind on which, when spread out or extended, a vessel is moved through the water. Sails are supported and extended by means of masts, yards, gaffs, booms, bowsprit—all technically termed "spars"—and stays or slanting ropes. In the first experiments for impelling vessels by sails the least complicated form, that of a single square sail erected on a single mast, was no doubt adopted. To the quadrangular the triangular sail would soon be added; and

single sails of both these forms are known to have been used at very early periods. Subsequently the trapeziform and trapezoidal sails also came into use. As vessels increased in size, thereby requiring a greater surface of canvas to impel them, it became necessary to use not only more sails but also an increased number of masts; and the number and disposition of the several kinds of sails could be almost indefinitely varied according to the ideas of navigators, the services required of the vessels, the places in which they were employed, and the size of the crews. Thus a great variety of rig naturally arose. Leaving out of account the many nondescript styles adopted in the case of boats and small craft, all modern vessels may, for general purposes, be considered as belonging to one or other of the following categories—cutter, schooner, three-masted schooner, brigantine, brig, barkentine, bark, or full square-rigged ship; but the cardinal distinction is that by which they are classified as *square-rigged* or *fore-and-aft-rigged* (compare SEAMANSHIP and SHIP). These expressions can be easily explained by reference to any three-masted ship. The mast nearest the bow or head is known as the fore-mast, the next abaft or nearest the middle of the ship as the main-mast, and the third or that nearest the stern as the mizzen-mast. Each mast consists of several sections, that attached to the hull being called the lower or standing-mast, the next above that the top-mast, the next the top-gallant-mast, above which may rise a pole or royal-mast. On each of these masts, and at right angles with it, is a yard denominated "square," which is hung (slung) by the middle and balanced. These yards are named according to their situation, those placed on the fore and main standing-masts being called respectively the fore and main lower-yards, that on the mizzen the cross-jack-yard; the yards on the top-masts are called the top-sail-yards, those on the top-gallant-masts the top-gallant-yards, and those on the royal-masts the royal-yards. To each of these yards a sail is *bent* or attached, taking its name from the yard; thus the principal sail upon the fore-lower-yard is called the fore-course or fore-sail; the next above, upon the fore-top-sail-yard, is the fore-top-sail; above which, upon the fore-top-gallant-yard, is the fore-top-gallant-sail; and above all, upon the fore-royal-yard, is the fore-royal. In like manner on the main-mast we have the main-course or main-sail, main-top-sail, main-top-gallant-sail, and the main-royal. Similar appellations are given to those on the mizzen-mast; in large merchant-ships, by means of a sky-sail-pole, a sail termed "sky-scraper" is sometimes set above the royals, but not so frequently as formerly. Such square sails can be placed at right angles to the direction of the keel of the ship, a position given to them when going before the wind; the same sails can also, by means of braces, be placed obliquely to the keel with a side wind, commonly termed by seamen "on a wind" or "by the wind." In addition to these there are sails between the masts, set either on gaffs (unbalanced) or on stays, also others beyond the extremities of the ship, extended principally by means of the bowsprit, which, in addition to supporting the fore-mast by a stay, also supports the jib and flying-jib-booms for extending the sails still farther forward; the means for extending the after-sail are the driver or spanker-boom and the gaff. Sails extended or set on gaffs and on stays are called "fore-and-aft," and are generally or approximately in a vertical plane passing through the keel; but a certain degree of obliquity can be given them by easing off the sheet or aft lower corner of the sail. A ship fitted as above described would be termed "square-rigged," the square sails predominating both in importance and in number.

*Sailcloth* is obtainable from any description of fibrous material capable of being woven into cloth, having suf-

ficient compactness and closeness of texture, and possessing the requisite strength for sustaining the heavy pressure which sails often have to bear in severe weather. Several descriptions of fiber might be enumerated which would to a certain extent serve for sailcloth but for the absence of quality of endurance or resistance; hemp has been and is now occasionally used, as also a mixture of cotton and linen yarn, or cotton only—especially in America; but in the United Kingdom FLAX (*q.v.*) is the usual staple material, since when well manufactured, it possesses the qualities of flexibility and lightness, and, what is still more important, the element of strength in a very large degree.

*Sailmaking* is a very old branch of industry in connection with the navy and commerce, and it still continues to be important, notwithstanding the enormous extent to which steam is now employed in navigation.

The tools and appliances of a sailmaker are not very numerous:—a bench about seven feet long and fifteen inches high, upon which he sits to perform the greater part of his work; palms for seaming and roping to fit the hand, made of hide lined with leather, a plate properly tempered being fixed in it having chambers to catch the head of the needle, thus acting as a thimble in forcing it through the several parts of canvas in seaming, and between the strands and through the canvas in roping; needles of various sizes, that for seaming being the smallest; and fids, splicing, serving, and stretching knife, rubber, sail-hook, bobbin for twine, and sundry small articles.

SAINFOIN (*Onobrychis sativa*) is a low-growing perennial plant with a woody root-stock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. It is native throughout the whole of central Europe and Siberia. It is grown as a foliage plant, being especially well adapted for dry limestone soils. It has about the same nutritive value as lucerne, and is esteemed for milch cattle and for sheep in winter.

SAINT. The New Testament writers have much to say about the relations of the "saints" (as members of the various churches are usually called) with their living contemporaries, but are comparatively reticent on their duties and privileges with regard to their departed brethren. Long before the close of the fourth century, however, certain very definite practices in the way of commemoration and invocation had sprung up, which ultimately found doctrinal expression in the authoritative documents alike of the Eastern and Western Church. (1) *Commemoration*—Under FUNERAL RITES, MANES, etc., allusion has already been made to the ancient custom of visiting the tombs of the deceased relatives at certain periods and there offering various gifts. With certain modifications, this practice was retained by the early Christians; they celebrated the Eucharist at or near the grave, laid oblations on the altar in the name of the departed, and in the precommunion prayer made supplication for the peace of their souls. If such commemoration was usual in domestic circles, it was little likely to be omitted by Christian congregations in the case of those who had "spoken to them the word of God," least of all when the bishop had also been, as was so often the case, a martyr. (2) *Invocation*—It is not difficult to understand how a belief in the efficacy of the prayers of departed saints—especially of martyrs—should at an early date have taken a practical form. Martyrs were believed to pass into the immediate presence of God, and the supposed nature of their claims there is not dimly indicated in the document already referred to, which once and again speaks of Polycarp

as "a noble victim selected from the flock," "a rich and acceptable sacrifice to God." The readers of Cyprian are familiar with the use made of the intercession of living "martyrs" by the lapsed to secure their reconciliation with the church; but positive evidence of the intercession of the dead being invoked for obtaining favor with God is not forthcoming so soon. Perhaps, indeed, Cyril of Jerusalem (c. 350) is the earliest author to make express allusion to the practice. In the liturgies, however, the oblation still continued to be offered "for all martyrs and confessors" as well as for others, and Augustine was the first to declare that "at the table of the Lord we do not commemorate martyrs in the same way that we do others who rest in peace so as to pray for them, but rather that they may pray for us that we may follow in their footsteps."

ST. ALBANS, a city, municipal borough, and market-town of Hertfordshire, England, is finely situated on an eminence above the river Ver, on the main line of the Midland railway and on branches of the London and Northwestern and the Great Northern lines, about twenty-four miles northwest of London and five miles west from Hatfield. The principal industries are the manufacture of silk and straw-plaiting. There are also breweries and iron foundries. The population of the municipal borough (area, 997 acres, extended in 1879) in 1881 was 10,931; the population of the same area in 1871 was estimated at 8,239.

ST. ALBANS, a township and village of the United States, the capital of Franklin county, Vt., at the junction of several divisions of the Central Vermont railroad. The village lies on an elevated plain about three miles east of Lake Champlain, and has its principal buildings arranged round a public park. Besides being the seat of the extensive workshops of the railroad company, St. Albans is the great cheese and butter market of the eastern States. In the neighborhood, which is celebrated for the beauty of its scenery, are quarries of calico stone and variegated marble. The population of the township was 1,814 in 1850, 3,637 in 1860, 7,014 in 1870, 7,193 in 1880, and 7,500 in 1890. Being only fourteen miles distant from the Canadian frontier, the village has more than once been the scene of political disturbances. In 1866 a band of 1,200 Fenians, on their return from a fruitless invasion of Canada, were disarmed there by the United States troops.

ST. AMEND-LES-EAUX, a town of France, in the department of Nord, at the junction of the Elnon with the Scarpe (a left-hand tributary of the Scheldt), seven and one-half miles by rail northwest of Valenciennes and twenty-two southwest of Lille. The population in 1881 was 7,881 (commune, 11,184).

SAINT-AMANT, MARC ANTOINE GERARD, SIEUR DE, the most eminent of a curious bacchanalian school of poets in France during the seventeenth century, was born at Rouen in the year 1594. He died at Paris in 1661.

ST. ANDREWS, a city, royal burgh, university town, seaport of Scotland, in the county of Fife, is situated on a bay of the German Ocean and on a branch of the North British Railway, nine miles east of Cupar and eleven south-southeast of Dundee. The population of St. Andrews in 1801 was only 3,263, but by 1881 it had nearly doubled, being 6,406. The parliamentary burgh in 1881 numbered 6,458.

ST. ASAPH, a city and parliamentary borough of North Wales, in the county of Flint, is situated on an eminence in the Vale of Clwyd, near the junction of the Clwyd and Elwy, about six miles south-southeast of Rhyl and six north-northwest of Denbigh. The population of the borough (area, 1,155 acres) in 1881 was 1,901, and of the parish 3,177.

ST. AUGUSTINE, capital of St. John's county, Fla., has the distinction of being the oldest city in the United States built by Europeans, and has recently become a popular winter watering-place. By rail it is thirty-six miles southeast from Jacksonville. It stands on a narrow sandy peninsula, not more than twelve feet above the sea, formed by the Matanzas and Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island. The streets are very narrow, the principal thoroughfares being only twelve or fifteen feet wide, and the balconies of the old houses often project so as almost to meet overhead. Along the sea-front for nearly a mile extends a granite-coped sea-wall (1837-43), which forms a fine promenade. At its northern end stands the old fort of San Marco (now Fort Marion), a well-preserved specimen of Spanish military architecture (finished 1756), with moat and outworks, walls twenty-one feet high, bastions at the corners, heavy casemates, dungeons, and subterranean passages. It is in the form of a trapezium, and covers about four acres. Like most of the Spanish buildings, it is constructed of coquina, a curious shelly conglomerate from Anastasia Island, which was easily quarried, but grew very hard on exposure to the atmosphere. The same material was used for paving the streets, which were thus kept extremely clean and firm. At the southern end of the sea-wall is the old Franciscan monastery, now used as United States barracks. Of the Spanish wall which ran across the peninsula and defended the city on the north side there only remains the so-called city gate. In the center of St. Augustine is the Plaza de la Constitucion, which takes its name from the monument in the middle, erected in 1812 in memory of the Liberal Spanish Constitution. On this square stand the cathedral (1793), with a Moorish belfry, the old governor's palace, now used as a post-office and public library, and an Episcopal church in modern Gothic. Other buildings of note in the town are the convent of St. Mary and the convent of the sisters of St. Joseph. Modern villas and hotels have recently been erected in various parts. Palmetto straw goods are largely manufactured in St. Augustine, the palmetto being one of the characteristic features of the surrounding landscape, to which orange and lemon trees also contribute. The climate is remarkably equable, the mean temperature for winter being 58°, and for the other seasons 68°, 80°, and 71° respectively. Frosts seldom occur, though that of 1835 killed many of the orange trees. In 1890 the total population of the city was 2,293, but in winter northern visitors swell the number to 7,000 or 8,000.

Menendez de Aviles arrived off the coast of Florida on August 28 (St. Augustine's day), 1565, and accordingly he gave the name of that saint to the city which he shortly afterward founded. His first act was to attack the French settlement on St. John's river, and two years later the French retaliated on St. Augustine (see FLORIDA and RIBAULT). In 1586 Drake attacked and plundered the town, and throughout the seventeenth century it frequently suffered from the raids of Indians, pirates, and the English settlers of South Carolina and Georgia. Occupied by the British from 1763 to 1783, it ultimately passed to the United States in 1821. During the Civil War it changed hands three times.

ST. BARTHOLOMEW, or ST. BARTHÉLEMY, a French island of the West Indies, in the archipelago of the Antilles, is situated in 17° 55' 35" N. latitude and 63° 60' 15" W. longitude, 108 miles north-northwest of Guadaloupe, of which, politically, it is a dependency. The chief town is Gustavia, near the port. The population was 2,942 in 1883.

ST. BRIEUC, a town of France, *chef-lieu* of the department of Côtes du Nord, 295 miles west of Paris by the railway from Brest, at the junction of a branch to Vannes by Pontivy. The population in 1881 was 14,869 (commune 17,833).

ST. CATHARINES, a city and port of entry of Ontario, Canada, and the capital of Lincoln county, is situated twelve miles northwest of Niagara Falls and thirty-five south of Toronto (by water), on the Welland canal and the Grand Trunk and Welland branch of the Grand Trunk railway. It is celebrated for its artesian mineral wells, and contains a convent and marine hospital. The manufacture of flour has long been a staple industry, and the abundant water-power is also utilized in cotton-mills, machine-shops, agricultural implement works, etc. Incorporated as a town in 1845, St. Catharines had in 1861 a population of 6,284, in 1871 of 7,864, 1881 of 9,631, and in 1890 of 10,000. A city charter was granted in 1875.

ST. CHAMOND, a manufacturing town of France, in the department of Loire, seven and a half miles east-northeast of St. Étienne, at the confluence of the Janon with the Gier (an affluent of the Rhone), and on the railway from St. Étienne to Lyons. The population was 14,149 in 1881.

ST. CHARLES, a city of the United States, the county seat of St. Charles county, Mo., is situated on the left or north bank of the Missouri twenty miles from its mouth, and twenty-three from St. Louis by the St. Louis and Omaha line of the Wabash, St. Louis and Pacific railway, which crosses the river by a great iron bridge 6,535 feet long, erected in 1871 at a cost of \$1,750,000. Besides one of the largest car-factories in the United States, the industrial establishments of St. Charles comprise tobacco-factories, flour-mills, hominy-mills, creameries, woolen-factories, and breweries. St. Charles College (Methodist Episcopal), chartered in 1838, the Lindenwood Female College (Presbyterian), the Convent of the Sacred Heart, and the Roman Catholic public library are the principal institutions. In 1850 the inhabitants numbered only 1,498; by 1870 they were 5,570, in 1880 5,014, and 6,500 in 1890.

A Spanish post was established at St. Charles in 1769. As a town it dates from 1809 and as a city from 1849. The first State legislature of Missouri met in the town in 1821 and St. Charles continued to be the State capital till 1826.

ST. CHRISTOPHER, or ST. KITTS, one of the Leeward Islands, West Indies, situated in  $17^{\circ} 18'$  N. latitude and  $62^{\circ} 48'$  W. longitude. Its length is twenty-three miles, its greatest breadth five miles, and the total area sixty-eight square miles.

ST. CLAIR, a county town of the United States, in Schuylkill county, Penn., three miles east of Pottsville on the Reading and Philadelphia railroad. It mainly depends on its coal-mines. The population was 5,726 in 1870 and 6,950 in 1890.

ST. CLOUD, a village of France, on the left bank of the Seine, seven miles west from the center of Paris and nine and one-half by the railroad from Paris to Versailles, forming part of the canton of Sèvres and of the *arrondissement* of Versailles (Seine-et-Oise). The palace of St. Cloud, which had been a summer residence for Napoleon I., Louis XVIII., Charles X., Louis Philippe, and Napoleon III., was burned by the Prussians in 1870 along with part of the village. In spite of the damage inflicted on the park at the same period, magnificent avenues still make it one of the finest rural haunts in the neighborhood of Paris. It occupies a varied tract of 960 acres, and abounds in picturesque views. Every year in September a great fair, lasting three weeks, is held in the park; and within its pre-

cincts are situated the new national Sèvres porcelain manufacture and the Breteuil pavilion, the seat of the international meter commission. The population in 1881 was 4,081, and 4,126 in the commune.

ST. CROIX, or SAINTE CROIX, one of the Danish West India Islands is situated between  $17^{\circ}$  and  $18^{\circ}$  N. latitude, about forty miles south-southeast of St. Thomas. Twenty-three miles long, and with a maximum width of six miles, it has an area estimated at 51,168 acres. The population of the island was 23,194 in 1860, 22,760 in 1870, 18,430 in 1880. This decrease is due to the comparative failure of the sugar-crops. Destruction of the forests (or some unsuspected cause) has brought diminished rainfall (from twenty to thirty-four inches per annum); and the belt of abandoned cane-ground has been steadily increasing. To help in checking this decay the government constructed (1876) a great central factory, to which the juice is conveyed from the plantations by a system of pipes.

ST. CYR, MARSHAL. See GOUVION ST. CYR.

ST. CYR-L'ÉCOLE, a village of France (Seine-et-Oise), two and a half miles west of Versailles, at the end of the old park of Louis XIV. It had only 2,712 inhabitants in 1881, and its importance is solely due to the famous military school now established in the convent which Madame de Maintenon founded for the education of noble young ladies in indigent circumstances. It was here that Racine's *Esther* and *Athalie* were first acted, having been written expressly for the pupils. Madame de Maintenon's tomb is still preserved in the chapel. The convent was suppressed at the Revolution, and the gardens are now partly transformed into parade-grounds. Two advanced forts of the new enceinte round Paris are situated at St. Cyr.

ST. DAVID'S, a village of Pembrokeshire, South Wales, and the seat of a bishopric, is situated in the valley of the Alan, sixteen miles northwest of Haverfordwest, the nearest railway station, and one and a half miles east from the most westerly point of Wales. The population of the parish in 1881 was 2,053.

ST. DENIS, a town of France, in the department of Seine, four and a half miles north of Paris by the Northern railway, which there divides into two branches leading respectively to Pontoise and Creil, is now a great manufacturing center for machinery, boats, railway carriages, chemical products, printed goods, candles, beer, leather, and flour. Many of the works are supplied with water from the Croud and the Rouillon, which there fall into the Seine; and a canal extends from the Seine to La Villette, the great inner harbor of Paris. In 1881 the population was 43,127. The name and fame of the town are derived from the abbe, founded by Dagobert on the spot where St. Denis, the apostle of Paris, was interred.

St. Denis, the ancient Catulliacum, was a town of no pretensions till the founding of its abbey. The process of rebuilding begun in the twelfth century by Abbé Suger was completed under Philip the Bold. In the meantime St. Louis caused mausoleums to be erected with figures of the princes already buried in the abbey; and from his time onward to Henry II. every monarch in succession had his monument. Louis IV. reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Two years later all the remains and fragments that could be recovered were collected in the museum of the Petit Augustines at Paris; but the bronze tombs had been melted down, the stained-glass windows shattered, and large numbers of interesting objects stolen or lost. Napoleon established in the monastery a school for daughters of the members of the Legion of Honor, which has continued

to flourish. Louis XVIII. caused all the articles belonging to St. Denis to be brought back from the museums to their original site, and added numerous other monuments from the suppressed abbeys. But it was not till after 1848 that, under the intelligent direction of Viollet le Duc, the damage inflicted by revolutionist and unskillful restorer was repaired and the basilica recovered its original appearance. Charles the Bold instituted the famous fair of Landit, which was transferred from the neighboring plain to St. Denis itself in 1552, and is still held in the town. Sheep and parchment were formerly the staples. The abbey was pillaged by Charles the Bad, king of Navarre, in 1358, by the Burgundians and Flemings, in 1411, and by the English in 1430. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighborhood on November 10, 1567.

ST. DENIS, the capital of RÉUNION.

ST. DIÉ, a town of France, chef-lieu of an arrondissement and a bishop's see in the department of Vosges, is situated on the right bank of the Meurthe, 1,030 feet above the sea, on the railway from Lunéville (thirty-two miles northwest) to Épinal (thirty-eight miles southwest). The population in 1881 was 12,677 (15,312 in the commune).

SAINTE-BEUVE, CHARLES AUGUSTIN, the most notable critic of our time, was born at Boulogne-sur-Mer on December 23, 1804. In 1829 he made his first venture as a poet with the *Vie, Poésies, et Pensées de Joseph Delorme*. But the critic in him grew to prevail more and more and pushed out the poet. In 1831 the *Revue des Deux Mondes* was founded in rivalry with the *Revue de Paris*, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d' Août*, in 1837. He himself thought that the activity which he had in the meanwhile exercised as a critic, and the offense which in some quarters his criticism had given, were the cause of the less favorable reception which this volume received. Seven volumes of "Portraits," contributed to the *Revue de Paris* and the *Revue des Deux Mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

The work of Sainte-Beuve divides itself into three portions—his poetry, his criticism before 1848, and his criticism after that year. His novel of *Volupté* may properly go with his poetry.

Perhaps the best way to get a sense of the value and extent of the work done in his life by the critic is to take a single volume of the *Causeries du Lundi*, and look through its list of subjects. As a guide to bring us to a knowledge of the French genius and literature he is unrivaled—perfect, so far as a poor mortal critic can be perfect, in knowledge of his subject, in judgment, in tact, and tone. He died in 1869.

SAINTE-CLAIRE DEVILLE, ÉTIENNE HENRI, French chemist, was born on March 11, 1818, in the island of St. Thomas, West Indies, where his father was French consul. He was educated in Paris along with his elder brother Charles at the Collège Rollin. In 1844, having graduated as a doctor of medicine and doctor of science, he was appointed dean of the new faculty of science at Besançon by Thenard. In 1851 he succeeded Balard in the École Normale and in the Sorbonne. He died at Boulogne-sur-Seine on July 1, 1881.

SAINTE-S, a town in France, the chef-lieu of an ar-

rondissement in the department of Charente-Inférieure, on the left bank of the Charente, eighty-eight feet above the sea and forty-five miles southeast of La Rochelle by the railway from Nantes to Bordeaux. The population in 1881 was 13,341 (15,763 in the commune).

ST. ÉTIENNE, an industrial and manufacturing town of France, chef-lieu of the department of Loire, 312 miles south-southeast of Paris and 36 miles south-southwest of Lyons by rail, with a branch line to Le Puy. The coal-field of St. Étienne is the richest in France after that of Valenciennes and Pas de Calais, giving employment to 12,000 miners and 5,000 workmen at the pit-heads. The national gun-factory, under the direction of artillery officers and employing 4,300 workmen, is almost exclusively devoted to the production of rifles and revolvers for the army. A certain number of gun-makers not engaged in the factory turn out from 80,000 to 90,000 firearms (hunting-pieces, revolvers, etc.) per annum. The population of the town was 28,000 in 1764; by 1876 it was 126,019, but it had decreased to 114,962 (123,813 in the commune) in 1881.

ST. EUSTATIUS, or ST. EUSTACHE, one of the Dutch West India Islands, a dependency of Curaçoa, lying northwest of St. Kitts in 17° 50' N. latitude and 62° 40' W. longitude, consists of two volcanic cones and an intervening valley, and contains the small town of Orangetown and two forts. The population, which from 7,600 in 1786 had decreased to 1,741 (about 1,000 negroes), was again 2,247 in 1882.

SAINT ÉVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE, French author, was born at Saint-Denis-le-Guast near Coutances, the seat of his family in Normandy, on April 1, 1613. He died on Michaelmas Day, 1703, and was buried in Westminster Abbey, where his monument still is in Poet's Corner close to that of Prior.

ST. GALL, in area the sixth (789 square miles), in actual population the fourth (210,491), and in relative density of population the tenth of the Swiss cantons, was formed in 1803, out of the two independent communities of the "town" and the "abbey" (including Toggenburg), Rapperswyl, Uznach, Gaster, Sargans, Gams, Rheintal, Sax (with Forsteck), which belonged to Zurich, and Werdenberg, which belonged to Glarus. It incloses the canton of Appenzell, extending between the Lake of Constance and the Lake of Zurich on the west, and being bounded by the Rhine on the east, while in the southwest lies the valley occupied by the Wallenstätt Lake and the Linth Canal. The Rhine separates St. Gall from Tyrol, and the rest of its frontier is conterminous in succession with Grisons, Glarus, Schwyz, Zurich, and Thurgau. The people of St. Gall are three-fifths Roman Catholic and two-fifths Protestant (126,164 and 83,441 in 1880.)

ST. GALL (German, *Sankt Gallen*), capital of the above canton, occupies along with its suburbs St. Fiden, Neudorf, and Langgasse (to the east), and Lachen and Vonwil (to the west), an area four miles long by one broad in the highland valley of the Steinach, which descends northeast to the Lake of Constance. In 1870 the population was 16,675, in 1880 21,438.

SAINT-GERMAIN, COMTE DE, a celebrated adventurer of the eighteenth century who, by the assertion of his discovery of some extraordinary secrets of nature, exercised considerable influence at several European courts. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had lived 2,000 years. At the court of Louis XV., where he appeared about 1748, he exercised for a time

extraordinary influence, but, having interfered in the dispute between the houses of Austria and France, he was compelled in June, 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St. Petersburg in 1762, and is asserted to have played an important part in connection with the conspiracy against the emperor Peter III., in July of that year. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. After frequenting several of the German courts, he finally took up his residence in Schleswig-Holstein, where he and the landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in 1780.

ST. GERMAIN-EN-LAYE, a town of France, in the department of Seine-et-Oise, eight miles north of Versailles, and thirteen west of Paris by rail. It had 15,545 inhabitants in 1881 (15,790 in the commune). The history of St. Germain centers in the castle, now occupied by a museum of national antiquities.

ST. HELENA, an island in the Atlantic in  $15^{\circ} 55' 26''$  S. latitude and  $5^{\circ} 42' 30''$  W. longitude (Ladder Hill Observatory), lies 1,140 miles from Africa, 1,800 from America, 700 southeast of the island of Ascension (the nearest land), and 4,000 from Great Britain, of which it has been a dependency since 1651. The area is about forty-five square miles, the extreme length from southwest to northeast being ten and a quarter miles and the extreme breadth eight and a quarter. The island is a very ancient volcano, greatly changed by oceanic abrasion and atmospheric denudation. The island is chiefly of interest as the place of detention of Napoleon Bonaparte.

The population of St. Helena was 6,444 in 1871 and 5,059 (2,617 males, 2,442 females) in 1881; it consists of Government officials, of old-established residents ("yam-stalks") of somewhat composite origin, European and Asiatic, and of the descendants of Negroes landed from West African slave ships subsequent to 1840. The only town—Jamestown (3,000 inhabitants)—lies in a deep valley on the northwest coast, and there is a village in the neighboring Rupert's Valley. Ladder Hill, the seat of the garrison, is so called from the almost precipitous ladder-like wooden stair by which its height of 600 feet can be scaled. Longwood, where Napoleon died in 1821, is a farmhouse in an elevated plain (2,000 feet high), about three and a quarter miles inland from Jamestown.

St. Helena was discovered by the Portuguese navigator João da Nova on May 21, 1501. The island received its first known inhabitant in 1513 in the person of Fernandez Lopez, a Portuguese of good family, who preferred being marooned to returning to Europe after the barbarous mutilation to which he had been subjected for some misdemeanor.

ST. HELEN'S, a market-town and municipal and parliamentary borough of southwest Lancashire, England, is situated on a branch of the London and North-Western railway, twenty-one miles west by south of Manchester and ten east-northeast of Liverpool. The population of the borough (area, 6,586 acres) in 1871 was 45,134, and in 1881 it was 57,403.

ST. HELIER. See JERSEY.

ST. HENRI, or TANNERY WEST, formerly a post-village in Hochelaga county, Quebec, and for many years a suburb of Montreal, has since been practically included within the limits of that city. It is located on the Grand Trunk railroad and contains several churches, stores, and manufacturing establishments. Its present (1890) population is 9,000.

SAINT-HILAIRE. See GEOFFROY SAINT-HILAIRE.

SAINT-HILAIRE, AUGUSTE DE, French botanist and traveler, was born at Orleans on October 4, 1799. He began to publish memoirs on botanical subjects at an early age. In 1816-22 and in 1830 he traveled in South America, especially in south and central Brazil, and the results of his personal study of the rich flora of the regions through which he passed appeared in several books and numerous articles in scientific journals. He died at Orleans on September 30, 1853.

ST. HYACINTHE, a city of the province of Quebec, Canada, and capital of St. Hyacinthe county, is located on the Yamaska river, thirty-six miles east-northeast of Montreal, as also on the Grand Trunk and Canadian Pacific railroads. The city contains a court-house, city hall, bank, and market, two printing offices, a college with a faculty consisting of twelve professors, a nunnery, Roman Catholic cathedral, bishops' palace, and other parochial buildings, several hotels and a number of stores. Grist and saw mills, woolen-mills, wooden-ware factories, tanneries, foundries, and machine shops, and boot and shoe factories constitute the leading industrial interests represented. The population in 1890 was estimated at 5,321.

ST. IVES, a seaport and borough of west Cornwall, England, is situated at the west entrance of the beautiful St. Ives Bay on the Bristol Channel, seven miles north of Penzance. The population of the municipal borough (area, 1890 acres) in 1871 was 6,965, and in 1881 it was 6,445.

ST. JEAN BAPTISTE, a suburb of Montreal, Canada, under a separate municipality. It lies north-northeast of Mount Royal Park and is hardly a mile from the center of the city. The population in 1881 was 5,874.

ST. JEAN D'ACRE. See ACRE.

ST. JEAN D'ANGELY, a town in France, the chef-lieu of an arrondissement in the department of Charante-Inférieure, on the right bank of the Boutonne (a right-hand affluent of the Charente) and on the railway from Taillebourg (twelve miles southwest) to Niort (thirty miles north). The population was 6,538 in 1881 (7,279 in the commune).

ST. JOHN, capital of St. John county and the largest city of the province of New Brunswick, is strikingly situated at the mouth of the river of the same name, in  $45^{\circ} 14' 6''$  N. latitude, and  $66^{\circ} 3' 30''$  W. longitude. It stands on an elevated rocky peninsula which projects into the harbor for a considerable distance. The latter, which is protected by batteries and never freezes, is well equipped with wharves and docks, and is capable of accommodating ships of the largest size. Its entrance is guarded by Partridge Island, lying 2 miles south of the city, and containing the quarantine hospital and light-house. About  $1\frac{1}{4}$  miles north of the light-house is situated the Beacon, and below the town, east of the channel, is the breakwater, 2,250 feet long. The St. John river enters the harbor through a rocky and sharply defined gorge, 100 yards wide, and about 400 long, having a total fall of about 17 feet, which is passable to ships for 45 minutes during each ebb and flow of the tide. The river has alternately an inward and an outward fall twice every 24 hours, the high-water tide level immediately below the gorge being 6 to 8 feet higher than the average level above the gorge. The river is here spanned by a stanch suspension bridge 640 feet long and 100 feet above low-water level, and a cantilever railway bridge, 2,260 feet long, with a river span of 825 feet, was opened in 1885. The city, approached from the sea, presents a bold and picturesque appearance, and, next to Quebec, possesses more

natural beauty than any other town in Canada. There are three large public squares, and the streets (lighted with gas and the electric light) are regularly laid out. The water supply is derived from Little river, five miles distant, and brought to the city by three separate mains, with an aggregate capacity estimated at 10,000,000 gallons daily; the present daily consumption (including that of the city of Portland) is 5,000,000 gallons. The works, which are owned by the city, cost \$992,326. The water supply of St. John (West) is derived from Spruce Lake. St. John (East) has also an admirable sewerage system.

On June 20, 1877, two-fifths of St. John (about 200 acres) was destroyed by a fire, which in nine hours burned over \$27,000,000 worth of property. The city was quickly rebuilt, and on a much grander scale, many brick and stone edifices taking the place of the old landmarks, which were principally composed of wood. The chief buildings are—the Roman Catholic cathedral, Trinity, St. Andrew's, the Stone, St. David's, the Centenary, German Street Baptist, and Leinster Street Baptist churches, the custom-house, postoffice, city-hall, savings bank, Wiggins' Orphan Asylum, Victoria skating-rink, lunatic asylum, Victoria and Madras schools, the Masonic and Oddfellows' halls, the young men's Christian association building, the general public, the epidemic and the marine hospitals, the courthouse, jail, police office, and mechanics' institute (with a reading-room, library, and museum). There are thirty-three places of worship (Church of England six, Roman Catholic three, Presbyterian seven, Wesleyan Methodist five, Baptist six, Congregationalist one, Methodist Episcopal one, Christian Brethren one, Disciples of Christ two, and Christadelphians one); the educational institutions consist of a grammar school, a Madras school, Baptist seminary, and several public and private schools and academies. St. John has also a free public library, numerous religious, charitable, scientific, and literary societies, and three daily newspapers. Carleton, on the opposite side of the river, and connected with the east side by ferry, is included within the corporation limits, and is represented in the common council. The population in 1871 was 28,805, in 1881 it was 26,127, the decrease being caused by the great fire of 1877, when many persons left the city. In 1890 it was 45,000.

ST. JOHN, CHARLES WILLIAM GEORGE, naturalist and sportsman, was the son of General the Hon. Frederick St. John, second son of Frederick, second viscount Bolingbroke, and was born December 3, 1809. He died at Wooston near Southampton, England, on July 22, 1856.

SAINT-JOHN, HENRY. See BOLINGBROKE.

ST. JOHN, JAMES AUGUSTUS, traveler and author, was born in Carmarthenshire, Wales, on September 24, 1801. He died on September 22, 1875.

SAINT JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF (see KNIGHTHOOD). In the year 1023 certain merchants of Amalfi obtained permission from the caliph of Egypt to establish a hospital in Jerusalem for the use of "poor and sick Latin pilgrims." The hospice prospered far beyond the hopes of its founders, and grateful travelers spread its fame throughout Europe and sent offerings to its funds, while others voluntarily remained behind to assist actively in its pious purposes. With its increased utility organization became necessary, and in this organization is to be found the origin of the Order of Saint John. When Jerusalem was taken by Godfrey de Bouillon (see CRUSADES), his wounded soldiers were tended by Peter Gerard, rector of the Amalfi hospital of St. John, and the more wealthy of the crusaders eagerly followed the example of their leader in endowing so useful and so practical an institu-

tion. Many of the Christian warriors sought permission to join the ranks of the fraternity. At the proposal of Gerard a regularly constituted religious body was formed; the patriarch of Jerusalem invested every approved candidate with a black robe bearing on the breast an eight-pointed white cross, and received in return a vow of poverty, obedience, and chastity. In 1113 Pope Paschal II. formally sanctioned the establishment of the order by a bull. Five years later Gerard was succeeded by Raymond du Puy, and under his auspices the monastic knights took a fresh oath to become militant defenders of the cause of the Cross. During the first century of its existence the fraternity thus acquired a religious, republican, military, and aristocratic character. About 1289 an overwhelming force was sent from Egypt to besiege Acre, which only fell after a desperate resistance. Under cover of the arrows of their archers the knights sailed for Cyprus (1291). Repeated acts of prowess by sea still served to remind the Moslem corsairs of the survival of their implacable foes. De Villiers died three years later and was succeeded by Odon de Pins, who tried ineffectually to restore the purely conventual character of the order. William de Villaret (elected in 1300) shared the dangers of an expedition to Palestine and prepared for the conquest of Rhodes, which was effected in 1310 by his brother and successor. The revenues of the Hospitallers were now augmented from the confiscated estates of their old rivals the Templars. Fulk de Villaret was attacked at Rhodes by Osman, ruler of Bithynia, but with the assistance of Amadeus of Savoy he defeated the invaders. A serious difference which arose between De Villaret and his subordinate knights enabled Pope John XXII. to appoint his nominee John de Villanova (1319). It was at this period that the order was divided into the seven *langues* of France, Provence, Auvergne, Italy, Germany, England, and Aragon. In 1346 De Gozon became grand-master. His administration and that of his immediate successors are only remarkable for a perpetual struggle for supremacy with the papal court. In 1365 Raymond Beranger captured Alexandria in concert with the king of Cyprus, but the victors contented themselves with burning the city. Philibert de Naillac had no sooner been elected grand-master than he was summoned to join the European crusade against the sultan Bajazet, and took part in the disastrous battle of Nicopolis. The Greek emperor unfortunately invoked the aid of Timur, who overthrew Bajazet, but followed up his success by an attack on Smyrna, the defense of which had been intrusted to the knights. Smyrna was taken and its brave garrison put to the sword. In 1440 and 1444 De Lastic defeated two expeditions sent against him from Egypt. Nine years later Constantinople fell at last into the hands of the Turks. It was evident to the knights that an attack on their sanctuary would follow the triumph of Islam, but it was not till 1480 that the long-dreaded descent on Rhodes took place. Fortunately for the order, Peter d'Aubusson was grand-master, and the skillfully planned attack of the three renegades was valorously repulsed. The heroic D'Aubusson recovered from his wounds, restored the shattered fortifications, and survived till 1503. Nearly twenty years passed away before the sultan Solymán determined to crush the knights, who had just elected L'Isle d'Adam as their chief. After a glorious resistance, D'Adam capitulated, and Charles V., in 1530, with the approval of the pope, ceded the island of Malta and the fortress of Tripoli in Africa to the homeless knights. The order never perhaps seemed to all outward appearances more prosperous than when the storm of the French Revolution broke suddenly upon it. In 1792 the Directory decreed the abolition of

the order in France and the forfeiture of its possessions. The grand-master had taken no pains to conceal his sympathy for the losing cause in France, and his court had become an asylum and home for many French refugees. His successor Ferdinand Hompesch was perhaps the weakest man ever elected to fill a responsible position in critical times. On April 12, 1798, the French Government resolved on the forcible seizure of Malta. Warnings were sent to the grand-master in vain. Within two months from that date the island was in the hands of Bonaparte, and Hompesch was permitted to retire to Trieste with some of the cherished relics of the order.

Subsequent to the departure of Hompesch a number of the knights who had taken refuge at St. Petersburg elected the emperor Paul grand-master. Notwithstanding the patent illegality of the proceeding the proffered honor was eagerly accepted and duly announced to all the courts of Europe (October, 1798). Hompesch was induced to resign in the following year. On the death of Paul an arrangement was arrived at which vested the actual nomination in the pope. From 1805 to 1879 only lieutenants of the order were appointed, who resided first at Catania, then at Ferrara, and finally at Rome. In 1879 Leo XIII. made Giovanni Battista Ceschi grand-master, and he actually rules over portions of the Italian and German *langues* and some other scattered groups of the ancient fraternity.

Two other associations also trace their origin from the same parent stock—the Brandenburg branch and the English *langue*. The former can claim an unbroken existence since its establishment in 1160. In 1853 the king of Prussia (in whom the right of nomination had been vested since 1812) restored the original bailiwick of Brandenburg and the assembled commanders elected Prince Charles of Prussia *Herrn Meister*, who notified his election to the lieutenant of the grand-master at Rome. The "Johanniter" did good service in the German campaigns of 1866 and 1870. As regards the English *langue*, 1 Elizabeth c. 24 annexed to the crown all the property of the order in England. After the restoration of the Bourbons the French knights met once more in chapter-general and elected a permanent capitular commission, which was officially recognized by both Louis XVIII. and the pope. After certain negotiations, the three French *langues*, acting in accord with those of Aragon and Castile, agreed to the resuscitation of the dormant *langue* of England (1827-1831), and Sir Robert Peat was appointed lord prior, taking the customary oath *de fidei administratione* in the Court of King's Bench. During the past half century the good work done by the modern knights—now once more located in St. John's Gate, Clerkenwell—can honorably compare with the memorable deeds of their predecessors. The establishment of the hospice at Jerusalem is due to the energy and zeal of Sir Edmund Leclimere, who has been mainly instrumental in collecting at St. John's Gate the unrivaled historical literature of which the order can boast.

ST. JOHN'S, the capital of Newfoundland, is situated on the eastern shore of the island, sixty miles north of Cape Race, in  $47^{\circ} 33' 33''$  N. latitude and  $52^{\circ} 45' 10''$  W. longitude. It is  $10^{\circ} 52'$  east of Halifax, and stands on what is nearly the most eastern point of America—Cape Spear, five miles south of St. John's, alone projecting a little farther toward the Old World. It is 1,000 miles nearer than New York to England, and but 1,640 from the coast of Ireland. The approach to the harbor of St. John's presents one of the most picturesque views along the coast of America. In a lofty iron-bound coast a narrow opening occurs in the rocky wall, guarded

on one side by Signal Hill (520 feet) and on the other by South Side Hill (620 feet), with Fort Amherst lighthouse on a rocky promontory at its base. The entrance of the Narrows is about 1,400 feet in width, and at the narrowest point, between Pancake and Chain Rocks, the channel is not more than 600 feet wide. The Narrows are half a mile in length, and at their termination the harbor trends suddenly to the west, thus completely shutting out the swell from the ocean. Vessels of the largest tonnage can enter at all periods of the tide. The harbor is a mile in length and nearly half a mile in width. At its head is a dry dock, recently completed at a cost of \$550,000; it is 600 feet in length, 83 in breadth, and 26 in depth, capable of admitting the largest steamers afloat. The city is built on sloping ground on the northern side of the harbor, on the southern side of which the hills rise so abruptly from the water that there is only room for a range of warehouses and oil-factories. Three principal streets, winding and irregular, follow the sinuosities of the harbor and of one another the whole length of the city, and these are intersected by a number of cross-streets. Water street, the principal business locality, presents a very substantial, though not handsome, appearance, the houses being of stone or brick. Shops, stores, and counting-houses occupy the ground floor, while many of the merchants and shop-keepers live in the upper stories. Fish-stores, warehouses, and wharves project from behind on the side next the harbor. The city, three-fourths of which is still of wood, is rapidly extending in several directions, and in recent years many dwelling-houses of an improved description have been erected. There is an abundant supply of excellent water, brought in pipes from a lake five miles off. Epidemics are rare, and the city is very healthy. Of the public buildings the most important are Government House, a substantial and spacious building erected in 1828 by the Imperial Government; the colonial building (1847), containing the chambers of the legislature and government offices; the athenæum (1877), containing a public hall, library, reading-room, savings bank, museum, etc. The foundation of a new post-office was laid in the same year. The churches are—the Church of England and Roman Catholic cathedrals, St. Thomas' and St. Mary's (Church of England), St. Patrick's, three Methodist churches, St. Andrew's Presbyterian church, and the Congregational church. The manufacture of seal and cod oils has long been carried on upon an extensive scale. Of late years other manufactures have been introduced, and have made considerable progress. There are three iron foundries, two large machine shops, two boot and shoe factories, a nail-factory, three furniture-factories, two tobacco-factories, soap-works, two tanneries, and a large and well-equipped factory for the manufacture of cables, ropes, twines, nets, seines, etc. The export trade in fish of various kinds, fish oils, seal oil, and seal skins is very large; the greater part of all the imports into Newfoundland also arrives at St. John's. The population, which in 1780 was 1,605, had in 1801 increased to 3,420, in 1812 to 7,075, in 1835 to 15,000, and in 1874 to 23,890; in 1884 it was 28,610, and 1890 it was 31,000. The census last mentioned also shows the population of the whole island and Labrador to be 197,589, being an increase of 36,209 since 1874, or at the rate of about 22 per cent. in sixteen years. The population of the Atlantic coast of Labrador, which is under the jurisdiction of Newfoundland, was 4,211—1,347 being Eskimo.

ST. JOHNSBURY, capital of Caledonia county, Vt., on the Passumpsic river (a tributary of the river Connecticut), about fifty miles south of the Canadian frontier, and on the railway between Boston (205 miles)

and Montreal. St. Johnsbury is the seat of perhaps the largest scale-factory in the world, which employs about 7,000 hands and works up 6,000 tons of iron per annum. The township contains an athenæum, public library (12,000 vols.), and art gallery. The population has increased from 2,758 in 1850 to 4,665 in 1870, 5,800 in 1880, and 6,100 in 1890. The three villages are distinguished as St. Johnsbury (3,360 in 1880), St. Johnsbury Center, and St. Johnsbury East. Founded in 1786, the township received its name in honor of St. John de Crèvecoeur, French consul at New York, and a benefactor of Vermont.

ST. JOSEPH, capital of Buchanan county, Mo., on the right bank of the Missouri, 260 miles west-by-north of St. Louis. It is an important railway junction, possessing since 1873 a great road and railway bridge over the river constructed of iron; in the extent of its wholesale business it ranks as the third city in the State; and among its manufacturing establishments are flour-mills, starch-works, boot and shoe factories, pork-packing establishments, wagon-factories, a distillery, etc. Besides a city-hall and market-house, it contains a court-house (1875), an opera-house, a State lunatic asylum (1874), an agricultural and mechanical exposition association, a Roman Catholic cathedral, and five public libraries. The population was 8,932 in 1860, 19,565 in 1870, 32,431 in 1880, and 52,324 in 1890.

Founded in 1843 by Joseph Robidoux, a French Roman Catholic, who had settled in the district some years previously as a trader, St. Joseph in 1846 was made the county seat, and before 1857, when it received its first city charter, became well known as the great point of departure for emigrants bound for California and the West. During the Civil War, when it was fortified by the Federals, its natural development was considerably checked, but this revived as soon as the struggle was over. Its growth in the last decade has been marvelous.

SAINT-JUST, ANTOINE, French revolutionary leader, was born at Decize in the Nivernaize on August 25, 1767. Intoxicated with republican ideas, Saint-Just threw himself with enthusiasm into the political troubles of his time, had himself appointed an officer in the National Guard, and by fraud—he being yet under age—admitted as a member of the electoral assembly of his district. He now entered into correspondence with Robespierre, who thenceforward became his hero and ideal. Robespierre invited him to Paris, felt flattered by his worship, saw that he suited his purpose, and in a short time the two became hand and glove. Thus supported, Saint-Just became deputy of the department of Aisne to the national convention, where he made his first speech—gloomy, fanatical, remorseless in tone—on November 19, 1792. He had but twenty months to live; but into these he seemed to crowd the life of twenty years. In the convention, in the Jacobin Club, and among the populace his relations with Robespierre became known, and he was dubbed the “St. John of the Messiah of the People.” Hardly a week passed without the attention of France being arrested by his attitude or his utterances. Both were anxiously watched, as the unfailing indication of the trend of Robespierre’s designs. His appointment as a member of the committee of public safety now placed him at the very height and center of the political fever-heat. What were then called reports were far less statements of fact than appeals to the passions; in Saint-Just’s hands they furnished the occasion for a display of fanatical daring, of gloomy eloquence, and of undoubted genius; and—with the shadow of Robespierre behind them—they served their turn. At last, at the famous sitting of the ninth Thermidor, he ventured to present as the report of the committees

of general security and public safety a document expressing his own views, a sight of which, however, had been refused to the other members of committee on the previous evening. Then the storm broke. He was vehemently interrupted, and the sitting ended with an order for Robespierre’s arrest. On the following day, July 28, 1794, twenty-two men, nearly all young, were guillotined. Robespierre was one, aged thirty-six; Saint-Just another, aged twenty-six.

ST. KILDA, the largest islet of a small group of the Outer Hebrides, Scotland, forty miles west of North Uist, in 57° 48' 35" N. latitude and 8° 35' 30" W. longitude. It measures three miles from east to west and two from north to south, and has an area of 3,000 to 4,000 acres. The inhabitants are an industrious Gaelic-speaking community (110 in 1851, and 77 in 1881). They cultivate about forty acres of land (potatoes, oats, barley), keep about 1,000 sheep, and fifty West Highland cows, and catch puffins and other sea-fowl.

ST. KILDA, a watering-place in Victoria, Australia, on the east shore of Hobson’s Bay, 3½ miles south of Melbourne, with which it is connected by a railway. The borough had an area of 1,886 acres, and a population of 11,662 in 1881.

ST. KITTS. See ST. CHRISTOPHER.

SAINT-LAMBERT, JEAN FRANÇOIS DE, French poet, was born at Nancy in 1716, and died at Paris in 1803.

ST. LAWRENCE. The river St. Lawrence in North America, taken in connection with the great lakes, offers to trading vessels the most magnificent system of inland navigation in the world. Its total length from the source of the St. Louis river, which discharges into Fond du Lac at the head of Lake Superior, to Cape Gaspé is 2,100 miles. The river St. Louis springs from the same spacious plateau in Minnesota that gives birth to the Mississippi and the Red River of the North. The intermediate distances between the source of the St. Lawrence and its mouths are shown in Table I. According to the most recent surveys the approximate area of the basin of the St. Lawrence is 510,000 square miles, of which 322,560 belong to Canada and 187,440 to the United States.

Lake Superior, the most westerly of the lakes, is the largest body of fresh water in the world. In addition to the river Nipigon, which may be regarded as the chief source of the upper St. Lawrence, and the St. Louis and Pigeon rivers, which constitute the international boundary, it receives its waters from 200 rivers, draining an aggregate of 84,000 square miles, including its own area of 32,000.

Its length is 390 miles, its greatest breadth 160, and its mean breadth 80. Its mean depth is 900 feet and its altitude above the sea-level 600 feet. Its coast is generally rockbound. Numerous islands are scattered about the north side of the lake, many rising precipitously to great heights from deep water—some presenting castellated walls of basalt and others rising in granite peaks to various elevations up to 1,300 feet above the lake. The Laurentian and Huronian rocks to the north along the shore abound in silver, copper, and iron ores. The United States side is generally lower and more sandy than the opposite shore, and is also especially rich in deposits of native copper and beds of red hematite iron ores. Both these minerals are extensively worked. Unfossiliferous terraces occur abundantly on the margin of the lake; at one point no fewer than seven occur at intervals up to a height of thirty-three feet above the present level of the water. Lake Superior is subject to severe storms, and the effect of the waves upon the sandstone of the “picture rocks” of

Grand Island presents innumerable fantastic and very remarkable forms. The lake never freezes, but cannot be navigated in winter on account of the shore ice. At the west end of the lake, at the mouth of the St. Louis, is situated the city of Duluth, a place of considerable importance as the eastern terminus of the Northern Pacific railway, and of the St. Paul and Duluth railway, which runs to St. Paul on the Mississippi, 155 miles south of Duluth.

St. Mary's river is fifty-five miles long, is the only outlet from Lake Superior, and its course to Lake Huron is but a succession of expansions into lakes and contractions into rivers. St. Mary's rapids, which in a distance of half a mile absorb eighteen feet out of the total fall of twenty-two feet between the two lakes, are avoided by a ship canal, constructed in 1855.

As originally built, the canal was 1 mile long, had a width of 100 feet at the water line and a depth of 12 feet. The locks were two in number, combined, each 350 feet in length, 70 in width, with a lift of 9 feet. At the time the canal was made these dimensions were sufficient to pass any vessel on the lakes fully laden, but by 1870 it became necessary to provide for more rapid lockage and for the passage of larger vessels. Accordingly the old canal was widened and deepened, and a new lock constructed 515 feet long and 80 wide—the width of the gates being 60 feet, the lift of the lock 18, and the depth of water on the miter sills 17. There is now everywhere a navigable depth of 16 feet from Lake Superior through St. Mary's Falls canal and St. Mary's river to Lake Huron.

Lake Huron is 270 miles long and 105 broad and has an area of 23,000 square miles (the area of its basin, including the lake, being 74,000), a mean depth variously stated at from 700 to 1,000 feet, and an altitude above the sea of 574 feet. Georgian Bay on the northeast lies entirely within the region of Canada, while Thun-

der Bay and Saginaw Bay on the west and southwest are in the State of Michigan. The north and northeast shores of Lake Huron are mostly composed of sandstones and limestones, and where metamorphic rocks are found the surface is broken and hilly, rising to elevations of 600 feet or more above the lake, unlike in this respect the southern shores skirting the peninsulas of Michigan and southwestern Ontario, which are comparatively flat and of great fertility. As in Lake Superior, regular terraces corresponding to former water-levels of the lake run for miles along the shores of Lake Huron at heights of 120, 150 and 200 feet; and deposits of fine sand and clay containing freshwater shells rise to a height of forty feet or more above the present level of the water. At several places these deposits extend to a distance of twenty miles inland. The chief tributaries of the lake on the Canadian side are the French river from Lake Nipissing, the Severn from Lake Simcoe, the Muskoka, and the Nottawasaga, all emptying into Georgian Bay; and on the United States side the Thunder Bay river, the Au-Sable, and the Saginaw.

Lake Michigan is entirely in the territory of the United States. It has a maximum breadth of eighty-four miles and its length is 345 miles from the northwest corner of Indiana and the north part of Illinois to Mackinaw, where it communicates with Lake Huron by a strait four miles wide at its narrowest part. Its depth is variously stated at from 700 to 1,800 feet. Its altitude above sea-level is 578 feet. Its basin is 70,040 square miles in area, of which the lake occupies 22,400. Five of its tributaries are from 135 to 245 miles in length. The country round Lake Michigan is for the most part low and sandy. The rocks are limestones and sandstones of the sub-carboniferous groups, lying in horizontal strata, and never rising into bold cliffs. Along the south shore are post-tertiary beds of clay and sand lying a few feet above the level of the lake, the waters of which probably at one time found their way by the valleys of the Illinois and Mississippi into the Gulf of Mexico.

Chicago (population, 503,185 in 1880; 1,099,850 in 1890) is situated at the southwest angle of the lake. In the receipt and shipment of grain and pork it is the largest market in the world. The first appropriation for the harbor of Chicago, made in 1833, was expended in cutting a straight outlet from the Chicago river into the lake. The available depth was only two feet, but since then the harbor accommodation has been extended, by means of piers, dredging, and a breakwater, to accommodate vessels of fourteen feet draught.

The harbor works at Chicago, as well as at other lake and river ports, are constructed simply of cribs or boxes, composed of logs twelve by twelve inches, filled with stone, and joined to each other, after they have finally settled down, by a continuous timber superstructure raised a few feet above the level of the water. On this plan breakwaters, piers at the mouths of rivers, and wharves have been built within the last sixty years at the most important points along the shores of the St. Lawrence lakes, as well as at most of the river harbors communicating with the Atlantic; and experience has proved that no cheaper and better system could have been devised for such localities.

The St. Lawrence leaves Lake Huron by the St. Clair river at Sarnia, and after a course of thirty-three miles enters Lake St. Clair, twenty-five miles long, and terminating at the head of the Detroit river, near the city of Detroit in Michigan. Eighteen miles farther on the St. Lawrence, with a descent of eleven feet, enters Lake Erie. The navigation through the St. Clair river is easy throughout, but in Lake St. Clair there are extensive sandbanks covered with a depth of water vary-

ing from six to ten feet. Previous to 1858 much inconvenience was experienced in navigating the lake owing to its insufficient depth; but at the end of that year the governments of the United States and Canada dredged a canal through the bed of the lake, which is of soft material, to a minimum depth of 12 feet, with a width of 300 feet. This channel has since been deepened to 16 feet over a width of 200 feet, and works are now in progress to deepen the rocky shoal called the "Lime-Kiln Crossing" in the Detroit river to 18 feet, to enable vessels drawing 15 feet to pass with safety from lake to lake in stormy weather.

The peculiar features of Lake Erie are its shallowness and the clayey nature of its shores, which are generally low. The south shore is bordered by an elevated plateau through which the rivers, which are without importance as regards Lake Erie, have cut deep channels. The mean depth of the lake is only 90 feet and its maximum depth 204. Owing to its shallowness it is easily disturbed by the wind, and is therefore the most dangerous to navigate of all the great lakes. Its length is 250 miles and its greatest breadth 60. The area of the basin of Lake Erie is 39,680 square miles, including 10,000 square miles, the area of the lake. Its waters are 564 feet above the sea and 330 above Lake Ontario. The extreme difference observed in the level of the lake between 1819 and 1838 was five feet two inches, but the average annual rise and fall (taken on a mean of twelve years) is only one foot one and one-half inches. The mean annual rainfall is thirty-four inches. The navigation of Lake Erie usually opens about the middle of April and closes early in December. Besides the Erie and the Welland canals, the lake has two other great canal systems on its south shore—the Ohio and Erie canal, from Cleveland to Portsmouth, and the Miami and Erie canal, from Toledo to Cincinnati.

Buffalo (population, 1890, 255,664) is situated at the northeast angle of Lake Erie, and is therefore much exposed to the violence of southwest winds, in which direction the lake has a "fetch" of 200 miles. Thus more than ordinary care has been taken to provide safe harbor accommodation for the large fleets of vessels constantly arriving at Buffalo from the upper lakes. The Buffalo river, which has been made navigable for more than a mile, is protected at its mouth by a breakwater, 4,000 feet long, built at about half a mile from the shore. The harbor thus formed allows of the entrance of vessels of seventeen feet draught as against thirteen in 1853. Not only is the port situated at the head of the Erie canal and within an hour's sail of the Welland canal, but it is the western terminus of the New York Central, Erie, and several other railways. The possession of these exceptional advantages has constituted Buffalo, next to Chicago, the great commercial center of the inland seas of North America.

Freight propellers are now rapidly doing away with sailing vessels, or causing them to be converted into barges or consorts. The rapid increase in their tonnage capacity has been remarkable. In 1841 there was only one freight propeller with a tonnage of 128 tons; in 1850 there were 50 with an average of 215 tons, in 1860 there were 197 with an average of 340 tons, and in 1880 there were 202 with an average of 689 tons.

The Erie canal connects Lake Erie with the Hudson river at Troy and Albany and with Lake Ontario at Oswego. This canal was constructed in 1825 by the State of New York, for the passage of vessels of sixty tons; but by the year 1862 it was sufficiently enlarged to allow of the passage of vessels of 240 tons.

The Welland canal flanks the Niagara river and is twenty-seven miles in length from Port Colborne on Lake Erie to Port Dalhousie on Lake Ontario. It was

opened in 1833 for the navigation of small vessels and was first enlarged in 1844. Its dimensions are now as follows: number of lift locks, 25; dimensions, 270 by 45 feet; total rise of lockage, 326 $\frac{3}{4}$  feet; depth of water on sills, 15 feet.

The Niagara river flows from Lake Erie to Lake Ontario in a northerly direction. Its width between Buffalo and Fort Erie (the site of the international iron-trussed railway bridge) is 1,900 feet and its greatest depth 48. At this point the normal current is five and a half miles an hour—the extreme variation in the level of the river when uninfluenced by the wind being only two feet. During southwest gales, however, the water occasionally rises as much as four feet in a few hours, and at such times the current attains a maximum velocity of twelve miles an hour. Two miles below the bridge the river is divided into two arms by Grand Island, at the foot of which they reunite and spread over a width of two or three miles. The river then becomes studded with islands, until about sixteen miles from Lake Erie, after a total fall of twenty feet, it narrows again and begins to descend with great velocity. This is the commencement of the rapids, which continue for about a mile with a total descent of fifty-two feet. The rapids terminate in the great cataract of Niagara, the fall of which on the American side is 164 feet and on the Canadian side 150 feet. The falls are divided by Goat Island, which rises forty feet above the water and extends to the very verge of the precipice, where the total width of the river, including the island, is 4,750 feet. The Horse-Shoe Fall on the Canadian shore is 2,000 feet long, and the depth of water on the crest of the fall is about twenty feet. The American fall is only one-half that length, and discharges less than one-fourth the volume of the Horse-Shoe Fall. United, they discharge nearly 400,000 cubic feet per second or 41,000,000 tons per hour. The upper layer of the escarpment down which this enormous mass of water leaps consists of hard limestone about ninety feet thick, beneath which lie soft shales of equal thickness, which are continually being undermined by the action of the spray, driven violently by gusts of wind against the base of the precipice. In consequence of this action and that of the frost, portions of the incumbent rock overhang forty feet, and often, when unsupported, tumble down, so that the falls do not remain absolutely stationary in the same spot. Sir C. Lyell in 1842 came to the conclusion that the cataract was receding at an average rate of one foot annually, "in which case it would have required 35,000 years for the retreat of the falls from the escarpment at Queenstown to their present site." From the foot of the falls to Queenstown, a distance of about seven miles, the river descends 104 feet through a gorge from 200 to 300 feet deep, and from 600 to 1,200 feet wide. Midway in this deep defile the turbulent waters strike against the cliff on the Canadian side with great violence, and being thus deflected from west to north, give rise to the dangerous eddy called the "Whirlpool." The escarpments end abruptly at Queenstown, where the waters suddenly expand to a great width, and finally, seven miles farther on, tranquilly flow into Lake Ontario.

About one-third of a mile below the cataract a carriage road suspension bridge (built in 1869 by Mr. Samuel Keefer) formerly spanned the river with a single opening of 1,190 feet, at a height of 190 feet above the water. This bridge was blown down in 1888. Two miles lower down Roebling's celebrated railway and road suspension bridge (completed in 1855) crosses the river at a height of 245 feet above the water with a single span of 800 feet. In November, 1883, a double-

track railway three-span iron and steel cantilever bridge, situated about 100 yards above Roebing's bridge, was completed for the New York Central and Michigan Central railways. The total length of the bridge is 910 feet and that of the center span 470 feet. The height from the water to the level of the rails is 239 feet.

Lake Ontario is the easternmost and smallest of the great lakes of the St. Lawrence system. Its basin drains 29,760 square miles, including the lake surface of 6,700 square miles. The length of the lake is 190 miles, its greatest width 52 miles, its mean depth 412 feet, and its elevation above the sea 234 feet. It never freezes except near the shore. Its chief tributaries are the Trent on the north shore and the Genesee and the Oswego on the south shore, and its chief ports, Toronto, the capital of Ontario, thirty-two miles north of Port Dalhousie, at the foot of the Welland Canal; Oswego, at the southeast angle of the lake; and Kingston, at its northeast extremity, fifty-two miles north of Oswego.

Kingston, being the port of transshipment for Montreal of three-fourths of the grain that arrives from the upper lakes, is a place of some commercial importance. Formerly lake vessels were sent from Chicago to Montreal through the St. Lawrence canals without breaking bulk. But it was afterward found cheaper to transfer grain at Kingston, and to send it down the St. Lawrence in barges, the cost of such transfer being only half a cent per bushel. Kingston is also at the south terminus of the Rideau canal, which connects it with the city of Ottawa.

Almost immediately after leaving Kingston that part of the St. Lawrence commences which is called the Lake of a Thousand Islands. In reality they number 1,692, and extend 40 miles below Lake Ontario. Near Prescott, a town on the Canadian side about 60 miles below Kingston, begins the chain of the St. Lawrence canals proper, which were constructed to overcome a total rise of 206½ feet—the number of locks being 27, and the total length of the six canals 43½ miles.

Near Cornwall, on the left bank, fifty miles below Prescott, the intersection of the parallel of 45° determines the point where the St. Lawrence and its lakes (Lake Michigan excepted), having been an international boundary from the head of Lake Superior, become exclusively Canadian. Immediately below Cornwall the river flows through Lake St. Francis, which has a length of about thirty miles and a width varying from two to five miles. In the long reach of the river below the lake it has been calculated by the Canadian canal commissioners that the mean volume of water discharged is 510,000 cubic feet per second. Ten miles below the foot of Lake St. Francis, near the head of the island of Montreal, the river flows into Lake St. Louis, which receives the main body of the Ottawa river, a small fraction of whose waters is delivered into the St. Lawrence at the foot of the island thirty-five miles lower down the stream.

After leaving Lake St. Louis the St. Lawrence dashes wildly down the Lachine rapids, a descent of forty-two feet in two miles, and eight miles farther on, after passing beneath the twenty-five spans of the Victoria Tubular Railway Bridge, which has a length of 9,144 feet, reaches the quays of Montreal, 198 miles below Kingston. In the beginning of the present century vessels of over 300 tons burden were unable to reach the city, but by deepening Lake St. Peter and the shoals in the St. Lawrence between Quebec and Montreal the latter has been made accessible to vessels of 4,000 tons burden and drawing twenty-five feet of water. Work is being steadily continued and will not cease until a depth of

twenty-seven and one-half feet is attained, so as to enable the largest vessels afloat to reach the long stretch of new deep-water quays. In 1883 the tonnage of the 660 sea-going vessels which visited the port was 664,263 tons, of which 605,805 belonged to 264 steamships, so that only 9 per cent. of the freight arriving from sea was carried in sailing vessels. The St. Lawrence has an average width of one and three-quarters miles for forty-six miles from Montreal down to Sorel on the right bank, at which point it is joined by the Richelieu river, a tributary that drains 9,000 square miles.

Immediately below Sorel the river flows into Lake St. Peter, twenty miles in length by nine in width, through which prior to 1851 no vessel drawing more than eleven feet could pass. Since then a cutting 300 feet wide has been dredged to a depth of 25 feet. At Three Rivers, eighty-six miles below Montreal, the St. Lawrence first meets the tide and receives from the north the waters from the St. Maurice, which drains about 16,000 square miles. Nearing Quebec the river, which maintains an average width of one and a half miles from Lake St. Peter, narrows into a width of three-quarters of a mile at Cape Diamond, on the left bank, 160 miles below Montreal. The depth here is 128 feet and the rise of spring tides eighteen feet.

The lower town of Quebec, which has extensive harbor accommodation, is built on reclaimed land around the base of the cape, one of its sides being washed by the river St. Charles which flows into the St. Lawrence. At the mouth of the St. Charles the Princess Louise embankment, 4,000 feet long by 300 wide, incloses a tidal area of twenty acres, having twenty-four feet of depth at low water. Connected with it is a wet dock, which is to have a permanent depth of twenty-seven feet with an area of forty acres. On the opposite side, at Pointe Levis, the Lorne graving-dock is nearly completed. Its dimensions are 500 feet in length, 100 in width, and 25½ feet depth of water on its sill. During the year ending June, 1884, the departures for sea of vessels from Quebec were 698, with an aggregate burden of 686,790 tons.

Seven miles below Quebec the St. Lawrence is four miles wide, and divides into two channels at the head of the Island of Orleans, nearly opposite which, on the north shore, are the celebrated falls of Montmorency, with a perpendicular descent of 240 feet and a width of 50 feet. At the foot of the island, which is twenty-two miles long, the river expands to a width of eleven miles. This width increases to sixteen miles ninety miles farther on, at the mouth of the river Saguenay, which drains an area of 23,716 square miles. About 260 miles below Quebec, between Pointe des Monts on the north and Cape Chat on the south, the St. Lawrence has a width of thirty miles, and, as this expanse is doubled thirty miles farther seaward, Cape Chat has been considered by many geographers as the southern extremity of an imaginary line of demarcation between the St. Lawrence river and the gulf of the same name. It may, however, be assumed, with more propriety perhaps, taking the configuration of the gulf into special account, that Cape Gaspé, about 400 miles below Quebec and 430 miles from the Atlantic at the east end of the Straits of Belle Isle, marks the true mouth of the St. Lawrence river.

ST. LEONARDS is the name given to the western and more modern part of HASTINGS (*q.v.*), a watering-place on the coast of Sussex, England. The population of St. Leonards in 1881 was 7,165.

ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, LORD, lord chancellor of England, was the son of a hairdresser in Duke street, Westminster, and was born in February, 1781. In 1822 he was made king's

counsel and chosen a bencher of Lincoln's Inn. Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St. Leonards. He died at Boyle Farm, Thames Ditton, January 29, 1875.

ST. LÔ, a town of France, chef-lieu of the department of Manche, on the right bank of the Vire, 195 miles west by north of Paris. Horse-breeding, cloth and calico weaving, wool-spinning, currying and tanning, are the local industries. The population in 1889 was 9,889 (10,121 in the commune).

ST. LOUIS, a city of the United States, the chief city of the lower Mississippi Valley, the commercial metropolis of the State of Missouri, the fifth city in population in the United States, is situated on the west bank of the Mississippi, less than 20 miles from its confluence with the Missouri, and 185 miles north of the influx of the Ohio. It is distant by river about 1,200 miles from New Orleans, and 729 miles from St. Paul, the head of navigation upon the upper Mississippi. Situated in the center of the great valley, through which the waters of the Missouri, Mississippi, Ohio, Illinois and other smaller but navigable streams find their way to the Gulf of Mexico, St. Louis occupied an impregnable commercial position during the years when trade was carried on almost entirely by the river routes.

St. Louis is built upon a series of undulating hills or terraces that rise one above the other from the river for miles to the west. Unlike many other cities in the country there are no natural or physical obstructions to her unlimited growth. This is shown by the extensive system of suburbs to the west and south, which has created a demand for rapid transit met by capital with the result that the most perfect system of cable, electric and horse cars on the continent is now in operation on the streets of St. Louis, with an elevated railroad of three branches and fourteen miles in length under construction (1890).

St. Louis has a river front of 19.5 miles, of which about eleven are given up to commerce and manufacture. The remainder to the north is low land, that will come into use for railroad yard purposes within a few years, owing to the construction of a second bridge over the Mississippi at that point, opened to traffic May 1, 1890. The greatest width of the city is 6.6 miles, and the greatest length drawn in a straight line is 17 miles. The area of the city is 62½ square miles, of which 40 per centum is suburban in character. The elevation of the city directrix above the Gulf of Mexico is 428 feet; that of the highest point of ground within the limits 203 feet above the directrix. The extreme high water mark above the city directrix is 7 feet 7 inches (1844), and the extreme low water mark below the directrix 33 feet 9¾ inches (1863). High water, which generally follows the June rise of the Missouri, causes but little interruption and no disaster to the trade on the river front, the great bottom of Illinois taking off the surplus flood.

The plan of the city is rectilinear. In the old portion of the city, laid out by the early French inhabitants, the streets are narrow, and the blocks average 300 feet square. In the newer portion of the city the streets are wide and pleasantly lined with shade trees, and 400 feet is the average frontage of a block. The east and west streets run from the river at right angles. One of these, Market street, is the dividing center line. The system of numbering houses is that of allotting 100 house numbers to a block. On the north and south streets the houses are numbered each way from the Market street line.

Broadway, paved in granite and Telford pavement, traverses the city from the extreme northern limit of

building, known as Baden, to the southern limit of the ancient town of Carondelet, now one of the twenty-eight wards of the city. The streets in the central section of the city, and on the main avenues north, south, and west, are paved with granite blocks, quarried but ninety miles from the city. The streets running due west in the center of the city are paved with asphalt or wooden blocks. All other streets are constructed of macadam. The boulevard drives in the western limits are of Telford and gravel, on the same plan of construction usually followed in the making of park drives. Throughout the business section, and on certain specified east and west streets, the sidewalks are of granitoid or other composition in lieu of stone; brick sidewalks being prohibited by ordinance.

In 1890 there were in St. Louis 336.58 miles of improved streets; 76.44 miles of paved alleys; 311.09 miles of public and district sewers. The sewer system is most extensive, surface drainage being unknown in the city. The largest sewer, known as the Mill Creek, following the line of a natural drain, is twenty feet wide and fifteen feet high. The city of St. Louis is lighted every night of the year by electricity. The alleys are brightly illuminated with incandescent electric lights, and the streets proper with arc-lights swung over the streets at an elevation of forty-five feet. The municipal buildings and institutions are all lighted under the same contract, which is made for ten years. A short experience with this complete system of street and alley lighting has had a marked effect in diminishing night crimes and marauding.

Gas is supplied to the citizens at \$1.18½ per thousand cubic feet by the Laclede Gas Light Company, which, in 1890, absorbed three rival companies.

The water supply is derived from the Mississippi river, being pumped directly into settling basins at Bissel's Point by low-service engines, and thence by a high-service system into the mains, which are kept regulated by two water-towers and the Compton Hill reservoir. These works, which are owned by the city, represent an expenditure of \$8,000,000, but have proved inadequate, and the service is being extended at an estimated cost of \$7,000,000. A new low-service plant is being erected at the Chain of Rocks, seven miles above the city. An inlet tower in the river, reached by a tunnel bored through the rock of the river bed, 2,200 feet, six settling and filtering basins, and a conduit of brick construction, eight feet in diameter, to carry the water to Bissel's Point, are now under construction. The work will be completed within five years, and the present capacity of the water works (50,000,000 gallons) will be increased to 100,000,000 gallons daily. The total length of water mains in the city is 350 miles.

The public works of St. Louis are under the control of a board of public improvements, composed of commissioners of streets, sewers, water, parks, and harbor. The president is elected by the people; the commissioners are appointed by the mayor and approved by the council. All ordinances for the improvement of streets, sewers, parks, the harbor, or the water supply must originate with this board.

The public buildings of St. Louis are of fair quality. The court-house, the Four Courts, a building used as general police headquarters, and for the criminal and police courts, with the jail attached, is the most notable. The city hall now in use is a temporary structure ill adapted to its use. A new city hall is in course of construction on the site of Washington park at an estimated cost of \$3,000,000. The city hospital, insane asylum, female hospital, originally built as a social evil hospital, the poor house, work house for minor criminals, and house of refuge, a reformatory for boys, are up to

the average in architecture and equipment of institutions of this class.

The United States Government offices are located in the new custom house, completed in 1880 at a cost of \$7,000,000, and in the remodeled old custom house, a building fifty years old. The Merchants' Exchange is an imposing building, but not up to the modern style in architecture which prevails in St. Louis. Of late years there has been a large increase in the erection of tall fire-proof buildings. Since the burning of the Southern hotel in 1877, there have been no extensive buildings constructed that are not actually fire-proof. The Equitable, Rome, Laclede, Turner, Odd Fellows', Mercantile library, Gay, Houser, Bell Telephone, Crow Museum building, and others going up, are ornaments to the city. One of the most valuable of the new structures is the Public School library building, which contains 75,000 volumes. The Mercantile library contains 68,000. The Diocesan library, in connection with St. John's parish, inaugurated by the venerable Archbishop Kenrick, contains over 30,000 religious and historical works.

The public school system is an admirable one. It is under control of a president and board of directors, twenty-one in number, seven of whom are elected from the city at large and the others from districts consisting of two city wards each. The schools consist of one normal school for the education of teachers, a high school occupying three buildings, and seventy-six district or grammar schools, of which thirteen are devoted to colored children. The total number of schools is eighty, occupying one hundred and nine buildings, and this is exclusive of sixty-nine kindergarten structures. Foreign languages are no longer taught in the grammar schools. The grammar schools are divided into eight grades, the high-school course is two years, and the normal course one year. The value of school property is \$3,734,672. The enrollment of pupils for the current year (1890) is, normal pupils, 127; high schools, 1,332; night-schools, 2,186; grammar schools, 55,688.

The school receipts for the year 1889-90 were \$1,126,722; the expenditures \$1,079,285, of which there was paid out in teachers' salaries \$677,520. The scholastic year consists of forty weeks. There are, in addition to the public schools, ninety parochial schools, of which sixty-four are conducted by the Roman Catholics, twenty-three by the Lutherans and three by the Hebrews.

The St. Louis university, founded in 1823 by the Jesuits, now occupies one of the finest and largest school buildings; the Washington university, with its manual training school; the college of the Christian Brothers; Concordia seminary, a Lutheran institution, are the principal private educational institutions in a list of twenty-one academies and colleges, under which head are included two law schools and nine medical colleges of varied systems of practice; a training school for nurses, a college of pharmacy, and a school of midwifery.

There are published in St. Louis five daily papers in English, two morning and three afternoon, and five German dailies, of which three are issued in the morning. With one exception they all publish Sunday issues.

There are 230 church edifices in the city, as follows: Baptist, nine; Christian, five; Congregational, fourteen; Episcopalian, fifteen; German Evangelical, fourteen; English Evangelical Lutheran, one; German Evangelical Lutheran, twelve; Hebrew, nine; Methodist Episcopal, sixteen; Methodist Episcopal Church South, ten; New Jerusalem, three; Presbyterian, twenty-seven; Presbyterian (Cumberland), two; Reformed, one; United, two; Roman Catholic, forty-eight; Unitarian, three; miscellaneous, thirty-nine, of which twelve are colored.

The value of the church property of St. Louis was at the last appraisement \$6,210,000, this inclusive of

parochial schools, convents, hospitals and cemeteries. The city of St. Louis maintains for the public recreation 2,100 acres divided into nineteen parks. The largest of these, Forest Park, is 1,372 acres in extent. There is but one larger public park in the country, Fairmount at Philadelphia. It is reached by three lines of electric cars and one cable line. There are many miles of roadway in the park. It is graced with large statues of Edward Bates, attorney-general under Lincoln, and of Gen. Frank P. Blair. Tower Grove Park, 277 acres in extent, was the gift of Henry Shaw, the philanthropist, who gave with it at different times bronze statues of Columbus, Von Humboldt and Shakespeare, equal to any public works of art. The Missouri Botanical Garden, unequalled in this country, which adjoins Tower Grove Park, is also the gift by will of Mr. Shaw to the people. O'Fallon Park on the north (158 acres) and Carondelet Park (180 acres) in the extreme south end, are the remaining suburban parks. The others are breathing spots of great beauty located in the thickly populated section of the city. Of the central parks Lafayette is the principal. Lafayette Park, located in the southern portion of the city in the midst of one of the finest residence sections of the city, covers an area of but three acres. It was pronounced by the French commissioner who made a tour of the United States at the conclusion of the Centennial Exposition of 1876, the most perfect piece of landscape gardening in the country. It is so laid out that the visitor can form no adequate idea of its extent. Statues of Washington, Lafayette, and Thomas H. Benton ornament the park. An orchestral concert is given at the park every Thursday afternoon. There is music at Tower Grove Park on Sunday afternoon. Benton Park in extreme south St. Louis and Hyde Park in north St. Louis are points of attraction. The Mill creek valley which divides the city practically into north and south St. Louis is wholly given over to railroad tracks, and as a matter of public safety and convenience the valley is spanned at intervals with bridges. Those at Taylor, Jefferson, and Grand avenues are massive and expensive structures, the last named being one of the objects of interest in the city. It is part of the boulevard system and is crossed by most visitors to Tower Grove park. The cost of the structure was \$440,000.

Eight miles below the city on the line of the Iron Mountain railroad and overlooking the river, is the famous and historical Jefferson Barracks, now a recruiting depot for United States cavalry. This post was established by the government in 1826-27, and memories of nearly every prominent soldier on either side of the civil war cluster about the old fortress. The government in 1870 began extensive improvements at the barracks. Adjoining the military reservation, a portion of which is used by the ordnance department for the storage of powder in a chain of six magazines, is the National cemetery, in which are buried 11,508 soldiers, of whom 1,106 are Confederates. The two principal cemeteries of St. Louis are located in the northern part of the city, Bellefontaine with 350 acres, and Calvary, the Roman Catholic burial ground, 280 acres. Both are noted for their many fine monuments and memorial tombs. At Florissant, a suburb, is located the burial ground of the Jesuits, and in it are buried many of the pioneer missionaries of the last century. There are eighteen other cemeteries belonging to various churches and orders. The total estimated value of the parks and improvements exclusive of the Botanical Garden is \$5,370,000.

Although not a public park, the fair grounds, zoölogical garden, and jockey club track, all in one inclos-

ure, 350 acres in extent, in the northwestern portion of the city, thirty minutes' ride by street-cars from the center of the city, should be properly included as one of the park attractions. There are a number of large beer gardens and picnic grounds within the city, which are heavily patronized by the German population on Sundays. The various points of interest in the city are reached by seventeen lines of street cars, of which four are operated by cable, ten by electricity applied by the overhead system, with a total mileage of 215 miles. There are six regular theaters, and many entertainment halls, the largest of which is the Grand Music hall in the Exposition building. An annual exposition of arts and sciences is given for forty days every autumn, contemporaneously with the St. Louis Fair, illumination of the streets and annual pageant of the Veiled Prophet.

Property in St. Louis is guarded by 700 policemen, and protected from fire by twenty-nine fire companies, three chemical engines, and seven hook and ladder companies.

*Charities, Societies, etc.*—The public charities of St. Louis are numerous and extensive, especially those fostered by the Roman Catholic church. A unique charity is the "Mullanphy Emigrant Relief Fund." In 1851 Bryan Mullanphy, a very wealthy but eccentric man, although an eminent lawyer, died. By his will he left an undivided third of all his vast estate to be held in trust and to be and constitute a fund to furnish relief to all poor emigrants and travelers coming to St. Louis on their way, bona fide, to settle in the West. The estate, which is improved property, is governed by a board of commissioners elected by the city council. It yields an annual revenue of \$75,000. Agents of the trust meet all trains and boats, on the lookout for emigrants in need. They are supplied with food and lodging and then sent to their destination. The only condition is that the emigrant must come from east of the Mississippi river. If the emigrant desires to settle in St. Louis, he is given a sum of money according to the size of his family, and allowed henceforth to shift for himself. The fund is estimated at \$700,000.

Local charity is disbursed through the Provident Association, maintained by private subscription, and the St. Vincent de Paul society, a charitable adjunct of the Catholic church.

There are in St. Louis (1890) twenty-three subordinate lodges A. F. and A. M., seven chapters Royal Arch Masons, six commanderies Knights Templar, six organizations of Scottish Rite Masons, and five chapters of the Order of the Eastern Star; thirty subordinate lodges I. O. O. F.; nineteen lodges Knights of Pythias; thirty subordinate lodges Knights of Honor; fifty-one lodges Knights and Ladies of Honor; forty-five lodges Order of Chosen Friends; ten posts of the Grand Army of the Republic, with nine camps Sons of Veterans; seventy-two lodges A. O. U. W.; twenty-two groves Druids; thirty-two lodges Horugori; twenty-seven lodges Sons of Hermann; twenty-six lodges I. O. Y. B. (True League); thirteen tribes Red Men; sixteen branches of the Order of the Iron Hall; twenty-eight councils of the American Legion of Honor; nineteen councils Royal Arcanum; thirty-two branches Catholic Knights of America; seventeen councils Knights of Father Matthew; and a number of other orders in less numbers. There are six prosperous Turnverein in the city, with an aggregate membership of 15,000.

Labor is much given to organization, forty-two subordinate assemblies of Knights of Labor, eighteen trades unions, and ten councils of the United Brotherhood of Carpenters and Joiners, being the principal bodies. The great railroad strike of 1879, the strike on the

Southwestern railroads in 1885, and two desperate strikes of street railroad employes, within six years, are part of the history of St. Louis.

In a population so largely German, singing societies are numerous, thirty-one Saengerbunds being duly incorporated, representing an aggregate of 8,000 voices.

The following table shows the population of St. Louis at different periods:

1799.....	925	1856.....	125,200
1810.....	1,400	1866.....	204,327
1820.....	4,928	1870.....	310,864
1830.....	5,862	1880.....	350,518
1840.....	16,469	1890.....	451,770
1850.....	74,439		

*Government of St. Louis.*—St. Louis is independent of any county alliance. The constitution of 1875 gave to the city the right to renounce allegiance to the county of St. Louis upon the adoption of a new charter. The city extended its limits so as to take in the county eleemosynary institutions, and in return assumed the debt of the county. The governing power is in the mayor and municipal assembly, the latter, composed of thirteen councilmen, elected from the city at large to hold office four years, and twenty-eight members of the House of Delegates to serve two years, each representing a ward. The mayor has an immense patronage at his disposal which he can only exercise at the middle of his term of four years. The scheme of separation and new city charter were not drawn carefully enough to avoid much vexatious legislation since the inauguration of the new order of things in April, 1877. The charter can only be amended by a three-fifths vote of the voters registered. Elections are now held in St. Louis under what is called the Australian system. The bonded debt of St. Louis at the close of the fiscal year, April 7, 1890, was \$21,873,100. This debt is reduced each year by a sinking fund. The receipts for the fiscal year ending April 7, 1890, were from all sources \$9,949,900. The total disbursements were \$6,874,039.

All appropriations are by the State constitution rigidly limited to available means. The city is not permitted to borrow, or to in any manner increase its bonded debt.

In 1860 the taxable wealth of St. Louis was returned at \$69,846,845; in 1870 it was \$147,969,660; in 1880 it was \$160,493,000; and in 1890 the realty is valued at \$196,041,780, the personalty at \$27,979,220; total, \$223,021,000.

The present rate of taxation in the old city limits is: city tax, \$1.50; state, 30 cents; school, 40 cents; total, \$2.20. In the new limits the total is \$1.60 on the \$100.

There were issued during the year 1889 3,544 building permits, for structures which cost, according to first estimates of contractors, \$9,765,000.

*Commerce.*—A few figures taken from the official records of the Merchants' Exchange for 1889, illustrate the commercial and material wealth of the city: Bank clearings for 1889, \$987,522,629; balances, \$163,461,257. Total foreign value of imports, \$3,249,190. Duties paid, \$1,212,702; United States Internal Revenue collections, \$6,767,225, of which tobacco paid \$3,957,173, and beer \$1,487,604. There were manufactured during the year 1889 in the St. Louis district 42,019,474 pounds of tobacco, and 1,487,604 barrels of beer of thirty-two gallons each.

The total tonnage by steamboats and barges was 1,384,335. Tonnage by railroads, received 9,702,297, shipped 5,207,146. The amount of grain received, including flour reduced to wheat, was 68,466,596 bushels. Shipments of grain to Europe, 1,672,361 bushels of wheat and 13,315,982 bushels of corn. Barrels of flour manufactured in city mills and country mills owned by

St. Louis parties, 3,181,591. Cotton received, 544,189 bales. Receipts of wool, 21,019,920 pounds. Twenty-two boot and shoe factories combined an output of \$7,000,000. In drugs St. Louis holds the position of the leading market of the country, sharing in that line its commercial supremacy in the matter of beer, tobacco, hardware, woodenware, saddlery, while as a wool, hide, and shoe market St. Louis has but one superior.

*Manufactures.*—St. Louis is located so closely to the coal fields of Illinois that cheap fuel has naturally attracted manufacturers to her doors. Among the most important industries may be mentioned iron, steel, cars, glass, flour, shoes, bagging, sugar, beer, tobacco, furniture, agricultural implements, carriages and wagons, stoves and ranges, gas and water pipe, white lead, oils and paints, saddlery, clothing, fire brick, gas retorts. In many of these lines of manufacture St. Louis controls, by reason of the size of her output, the markets of the country. The wholesale grocery, boot and shoe, hat and cap and clothing business has grown to enormous proportions within the past ten years.

*Railroads.*—There is a tendency on the part of business of all kinds to locate on the railway tracks. The river front of St. Louis has been given up to railroad tracks, surface and elevated, connecting the two systems of roads that cross the Illinois and St. Louis (or Eads) Bridge, and the Merchants' Bridge, opened to traffic May 1, 1890. Eighteen railroads, with a total mileage of 27,400, enter the union depot. A new union depot is under construction, and another depot is projected in the north end of the city.

*Bridges.*—The Mississippi is spanned by two bridges, one, the last built, being exclusively a railroad bridge. The greater and the older of the two bridges, the Illinois and St. Louis, is one of the most remarkable structures in the world in character and magnitude. It consists of three arches, the two side spans being 502 feet in the clear, and the center span 520 feet, and carries a roadway for ordinary traffic 54 feet wide, and below this two lines of rail. The dimensions of the abutments and piers are as follows:

	Dimensions at foundations.		Dimensions at top.		Height from foundation to top of M.	Foundation below extreme low water.
	L'n'th	Th'kns	L'n'th	Th'kn's		
	ft.	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.
East abutment	83	70 6	64 3½	47 6	192 9	93 3¼
East pier . . . .	82	60 0	63 0	24 0	197 1¼	86 2¼
West pier . . . .	82	48 0	63 0	24 0	172 1¼	61 2¼
West abutm't	94	62 8½	64 3½	47 6	112 8½	13 3¼

The foundations of abutments and piers rest on solid rock. The two piers and the east abutment were sunk by means of pneumatic caissons. The greatest depth below the surface at which work was done was 110 feet, the air-pressure in the caisson being forty-nine pounds. Each arch consists of four equal ribs; each rib is composed of two circular members, twelve feet apart, which are connected by a single system of diagonal braces. The circular members consist of steel tubes, which are twelve feet long and eighteen inches in diameter; each tube is composed of six steel staves, varying in thickness between one and three-sixteenths and two and one-eighth inches. These staves are held together by a steel envelope, a quarter of an inch thick. The tubes are joined together by couplings, and the end tubes are rigidly connected with wrought-iron skew-

backs, which are fixed to the masonry by long bolts. The arches were erected without using any false work. Work on the bridge was commenced March, 1868, and it was opened for traffic on July 4, 1874. The total cost of bridge and approaches was \$6,536,730. It is connected with the union depot by a tunnel running under some of the principal streets, a distance of a mile.

The capacity of this bridge to handle its freight has been inadequate, and the new bridge came as a welcome relief to the often discommoded business community. There crossed the bridge in 1889, both ways, 224,262 cars, carrying 3,286,867 tons of freight. In addition to this there were hauled between railroad yards on either side by teams over the bridge 621,739 tons of freight. The Merchants' Bridge is located at the northern portion of the city, two and a half miles north of the Eads Bridge. It consists of three spans of about 520 feet each, planned to give openings of 500 feet each in the clear and 52 feet above highwater mark. With the approach spans on either side the length of the bridge structure is 2,420 feet. Work was commenced on January 24, 1889, and the bridge proper was completed December 31, 1889. The connections were then completed, and on May 3, 1890, in the presence of 10,000 people the governors of Missouri and Illinois met on the center span with their trains and saluted each other. But fifteen months elapsed from the date of the driving of the first pile until trains were passing. By means of terminal railway facilities the Merchants' Bridge is connected with every road on either side of the river.

*History.*—Pierre Laclède Liguist, established the first permanent settlement on the site of St. Louis in February, 1764. The treaty of Paris was negotiated in 1763, and it was only after Laclède had founded the "future great city" that he learned that the French title was extinguished and Spain was the possessor of the broad region west of the Mississippi river. In 1771 St. Louis was formally occupied by a small body of Spanish troops, and for thirty years the Spanish governor made his residence here. In May, 1780, on the festival of Corpus Christi, the inhabitants were all without the block house fortresses which guarded the settlement when a sudden attack was made upon them by Indians. Thirty were killed, but the Indians were beaten back. In 1800, Spain ceded her right to the territory of Louisiana back to France, and three years later (1803), the country became the property of the United States by purchase.

In 1810, as appears in the table above, the population of St. Louis was less than 1,500, and twenty years later it had not reached 6,000. It was in this year that the steady growth of the city began. A disastrous fire destroyed the business section in 1849. During the Civil War St. Louis was in possession of the Union troops, but as its business was with the South its prosperity was much retarded. The cholera of 1865 swept off many citizens.

German immigration set in to St. Louis in large numbers after the revolution of 1848. St. Louis was at the time the great outfitting point for Western settlers, and the Irish born additions to the population were numbered by the thousands each year. Feeling ran high against the foreigners, and the Native American spirit was rampant, culminating in 1854 in a series of bloody riots; Know Nothing riots they are called in history.

When the war broke out in 1861, the Germans almost to a man were loyal, and on May 10, 1861, under command of General Lyon they marched upon and captured Camp Jackson, where under the guise of a militia instruction camp, the disloyal element were under arms. This *coup d'état* saved St. Louis

the steady growth of the city set in and continued. A disastrous fire destroyed the business section in 1849. During the Civil War St. Louis was in possession of the Union troops, but as its business was with the South its prosperity was much retarded. The cholera of 1865 swept off many hundred old citizens. The future of St. Louis must continue to grow brighter. She has a steady, conservative population, with the confidence in the city to put their money in it, and not trust entirely to natural advantages to divulge the possibilities of the future.

ST. LOUIS, the capital of Senegambia or Senegal, West Africa, and known to the natives as far as Timbuktu as N'dar, is built on an island ten sea-miles above the mouth of the Senegal river, near the right bank.

ST. LUCIA, a West India island, discovered by Columbus in 1502, is situated in  $13^{\circ} 50'$  N. latitude and  $60^{\circ} 58'$  W. longitude, and has a length of forty-two miles and a maximum breadth of twenty-one. The total population was 40,532 in 1883, of whom 1,000 were white, mostly French.

ST. MALO, a seaport town of France, on the English Channel, on the right bank of the estuary of the Rance, is situated in  $48^{\circ} 39'$  N. latitude, fifty-one miles by rail north-northwest of Rennes. Among French seaports St. Malo stands twelfth in commercial importance, but first in the number of seamen on its register. The annual imports and exports together amount to 184,000 tons, and 3,000 tons of shipping are built yearly. St. Malo has statues to Chateaubriand and Duguay-Trouin. The museum contains remains of the ship *La Petite Hermine*, in which Jacques Cartier sailed for the discovery of Canada; and the natural history museum possesses a remarkable collection of from 6,000 to 7,000 European birds. The population of St. Malo in 1881 was 10,891 (commune, 11,212).

STE. MARIE-AUX-MINES. See MARKIRCH.

ST. MARTIN, one of the Lesser Antilles (West Indies), part of which (twenty square miles) belongs to France and forms a dependency of Guadeloupe, while the remainder (eighteen square miles) belongs to Holland and along with Saba, etc., is a dependency of Curaçoa. The population in 1882 was 7,083 (French portion 3,724, Dutch 3,359). Occupied by French freebooters in 1638 and by the Spaniards between 1640 and 1648, St. Martin was divided between the French and Dutch in the latter year.

SAINT-MARTIN, LOUIS CLAUDE DE, French author, known as "le philosophe inconnu" from the fact that all his works were published under that name, was born at Amboise of a poor but noble family, on January 18, 1743. He died at Aunay, near Paris, on October 23, 1803.

ST. MAUR-SUR-LOIRE, founded by St. Maurus (see MAURUS), was the first Benedictine monastery in Gaul. It was situated on the left bank of the Loire about fifteen miles below Saumur. About the middle of the ninth century it was reduced to ruins by the Normans; shortly before the event and in anticipation of it the relics of the saint were transferred to St. Maur-les-Fossés near Paris. St. Maur-sur-Loire was afterward restored and fortified, but the only extant remains consist of a part of the church and a few shattered columns.

ST. MICHAEL'S. See AZORES.

ST. NAZAIRE, a town of France, in the department of Loire Inférieure, and a port on the right bank of the Loire near its mouth. It has rapidly grown since the new docks rendered it the outport or detached harbor of NANTES (*q.v.*), from which it is distant twenty-nine miles west-northwest by water and forty by

rail. The population was 16,314 in 1881 (19,626 in the commune)

ST NICOLAS, a town of Belgium, in the district of Dendermonde, in the province of East Flanders, nineteen and a half miles from Ghent by the railway to Antwerp. It is a well-built, modern-looking place, with a population of 24,729.

ST. OMER, a town and fortress of France, chef-lieu of the department of Pas-de-Calais, situated on the Aa (which flows into the North Sea), 177 miles north of Paris by the railway to Arras, Hazebrouck, and Calais, at the junction of a line to Boulogne. The arsenal is an extensive series of buildings. Besides 30,000,000 to 40,000,000 tobacco pipes exported to America and the colonies, St. Omer manufactures cloth, hosiery, and tulle, cambric, and muslin embroideries. Its trade (and it is the seat not only of a tribunal but also of a chamber of commerce) is mainly in provisions for England, the products of the local industry, and those of the paper-mills, flour-mills, distilleries, and sugar-factories in the vicinity, especially along the banks of the Aa. The population of the town was 20,479 in 1881 (21,556 in the commune).

SAINTONGE (*Santonnia Santonensis tractus*), an old province of France, of which SAINTES (*q.v.*) was the capital, was bounded on the northwest by Aunis, on the northeast by Poitou, on the east by Angoumois, on the south by the Guienne, and on the west by Guienne and the Atlantic. It now forms a small portion of the department of Charente and the greater part of that of Charente Inférieure.

ST. OUEN, an industrial district in the outskirts of Paris, on the right bank of the Seine, one mile above St. Denis. It had 17,718 inhabitants in 1881.

ST PAUL, a city of the United States, capital of the State of Minnesota and of the county of Ramsey, situated in  $44^{\circ} 52' 46''$  N. latitude, and  $93^{\circ} 5'$  W. longitude; on both banks of the Mississippi river, the larger part of the city being on the eastern side; the practical head of navigation from tide-water, 2,150 miles from the mouth of the river, 2,082 miles from New Orleans and 580 from St. Louis. The city is 360 miles northwest from Chicago, as the crow flies, and 409 miles by the shortest rail route. It is distant from Lake Superior 158 miles by rail, and from the head of navigation of the Red River of the North 250 miles. Built originally upon a series of steep terraces, St. Paul was in earlier years confined by its topography almost entirely to the first and second benches, or terraces, ascending from the river. By 1888, however, the city had spread over the wide and commodious plateaus lying east, west, and north of the surrounding bluffs, and now embraces 35,482 acres. Its business center is still confined chiefly to the lower terraces, while the high plateaus that rise above them on every side are the favorite residence districts of the city.

Underneath the most extensive of the benches, occupied mainly by business structures, is a thick stratum of blue limestone which is excavated at slight cost and furnishes an unlimited supply of foundation and structural material. In the older portions of the city the streets are too narrow for comfort or beauty, but in the newer the thoroughfares are ample in width and laid out according to modern ideas of usefulness and sightliness. On the western bluff, known as St. Anthony's Hill, are many streets paved with asphaltum and boulevarded, which are singularly handsome and attractive, and chief of these is Summit avenue, which for a mile or more skirts the brow of the hill overlooking the picturesque Mississippi and is lined on both sides with residences, many of which would attract the eye of the most experienced observer.

The principal public buildings are the State capitol, built in 1882 at a cost of about \$450,000 and to be replaced by a more imposing and costly structure, the court house and city hall, completed in 1890 at a cost of a little more than \$1,000,000, the market house, the chamber of commerce building, the United States custom house (soon to be superseded by one far larger), and a union depot, which ranks second in the United States in the number of trains arriving and departing daily.

The city government is vested in a mayor and common council of seventeen aldermen—six at large and one from each of the eleven wards—and the powers accorded the mayor, under the revised charter, are larger than those ordinarily conferred. Coördinate branches are the board of education, the board of water commissioners, and the park commission. Members of each of these bodies are appointed by the mayor for a term of two years, and the aim has been to have both of the great political parties fairly represented. The board of education has control of all matters pertaining to the public schools. The water commissioners supervise the water supply, all the paraphernalia, including conduits, mains, laterals, reservoirs, and pumping stations being the property of the city and a source of ultimate revenue. To the park commission is intrusted the purchase, laying out, improvement, and maintenance of public parks, and a fund for such purposes is provided by the sale of bonds. Property holders, as in the case of sidewalks, paved streets, and sewers, must pay assessments for public parks, when located by the authorities, proportionate to their nearness to the place and the size and value of their holdings. The improvements of the streets, enlargement and extension of sewers, etc., are under the immediate control of the board of public works (the members of which are also the mayor's appointees) with the advice and assistance of the city engineer. The fire department has its usual board of commissioners, and in St. Paul the service is very effective, especially in recent years, the water supply having been augmented greatly and the applying machinery increased to keep pace with the city's growth. The police department is without commissioners, being under the direct supervision of the mayor, a chief of police, and a number of captains and lieutenants assigned to the central and outlying stations. The force is one of the smallest in the United States, the size of the city and its population being considered; but the average of crime is notably low, and persons and property are acknowledgedly well protected. This is partly due to the excellent system of police telegraph and telephone lines in service.

Headquarters of the Department of Dakota, a military subdivision of the Division of the Missouri, with headquarters in Chicago, is located in St. Paul, and this city has for years been a highly important point in connection with army detail, distribution, operation, and maintenance. The department is the largest in the United States, and the brigadier-general commanding has under his immediate supervision nearly all the Sioux Indians, all the Crows, and many others which, until within a very few years, have been hostile to the government. Large quantities of supplies for the thousands of officers and soldiers located in the department are purchased from the wholesale merchants of the city, the railroad lines diverging offering special facilities for speedy transportation.

In 1890 there were 137 church organizations, the Roman Catholic slightly in excess of any of the other denominations, St. Paul being the seat of an archbishop of that faith. Of roomy and comfortable church build-

ings there is no lack, but of handsome structures devoted to religious observance there are very few. There are forty-one public school buildings (including a large central high-school, and a manual training school), with 17,500 pupils, and 470 teachers. The comparatively small enrollment is explained by the existence, in a more or less flourishing condition, of forty-four private or parochial schools and seminaries. Of the forty-four mentioned twenty-three are under the control of the Roman Catholic church; and eleven of the twenty-three are very largely attended.

In addition to the charitable organizations connected with the churches, of which there are thirty-one, there are three public hospitals, an orphan asylum, a home for the friendless, babies' home, women's Christian home, and a Magdalen hospital. There are two colleges within the city limits—Hamline, under control of the Methodists, and Macalester, a Presbyterian institution.

St. Paul is the official location of a United States collector of customs, and, in 1889, 103 firms imported goods. The volume and increase of the business is shown in the following table:

	1881.	1885.	1888.	1889.
Value of dutiable goods	\$62,783.00	\$186,574.00	\$538,754.00	\$726,477.00
Total duties collected...	26,983.56	78,368.42	177,686.89	229,386.12
Value of free goods.....	.....	.....	175,658.00	372,372.00

The collections of internal revenue for the years 1888 and 1889, were as follows:

	1888.	1889.
Spirits.....	\$ 77,970.92	\$2,267,455.40
Tobacco, snuff and cigars.....	137,527.24	120,867.07
Fermented liquors.....	302,207.71	293,798.68
Penalties.....	1,314.42	2,153.11
Special taxes.....	.....	120,064.36
Totals.....	\$518,920.18	\$2,804,338.62

The large increase in taxes from spirits in 1889 over 1888, was due to the establishment and operation in South St. Paul of one of the largest distilleries in the United States.

Of newspapers and periodicals there are forty-eight, of which eight are issued daily. The State Capitol contains the public law library, with 16,000 volumes; and in the city's public library, which has quarters in the city hall, there are between 20,000 and 21,000 volumes.

St. Paul has a well founded claim to be regarded as an especially healthy city, the death rate in 1888 being officially reported at 10.48 per thousand. This exceptionally low percentage of mortality is due largely to the climate of Minnesota, which is bracing and invigorating, and in no small measure to the facilities offered for drainage. These natural facilities have been supplemented by a system of main and lateral sewers, cut through solid rock in many instances, and aggregating 103 miles in length. There are 169 miles of water mains, the supply coming from two spring-fed lakes, Vadnais and Phaleñ. In 1883 there were less than two miles of paved streets. In May, 1890, there were 40.4 miles with 536 miles of sidewalks. There are 439 miles of graded streets. The material used for paving is granite, cedar blocks, and asphaltum, the latter confined to the residence portions. The city has thirty-eight public parks, or squares, ranging in size from Como Park with 256 acres of lawn and lake, to small breathing places occupying less than one acre.

The park system is yet in its infancy and is susceptible of marked improvement.

In a city of such rapid growth as St. Paul, real estate values naturally prove an important factor. The years 1886 and 1887 showed the greatest activity in transactions involving real property, and the valuations gave a complete rebound from the depressing conditions consequent upon the failure of Jay Cooke in 1873, and its resultant stringency and stagnation. By 1880, however, signs of the coming revival were manifest, the flood being reached in 1887 as stated. Following is a statement of the recorded realty transactions during eight years:

YEARS.	No. of Transfers.	Consideration.
1882 .....	4,447	\$9,354,841
1883 .....	4,847	12,981,331
1884 .....	5,128	8,359,521
1885 .....	6,928	14,318,867
1886 .....	11,443	27,826,633
1887 .....	16,070	58,174,768
1888 .....	7,501	22,520,184
1889 .....	7,104	22,755,608

It is generally conceded that real estate values in St. Paul have been kept at a conservative basis, but naturally the increment has been very great. Many of the older residents, and not a few who came into the city before 1885, have become very wealthy through this natural ratio of increase and the improved business of which it is a concomitant, and, as a consequence, there are at least fifteen residents each of whose holdings amount to more than a million of dollars, and of these two or three would be included in the multi-millionaires of America. It is to this class or descendants therefrom St. Paul must look for what it now sorely needs—a public library building, an art gallery, and an auditorium.

One company controls all the street railways and by the close of 1890, under the requirements of city ordinances, transit facilities will have been much enlarged and improved, and electricity will supplant horse power on all lines where the latter is in use. There are now ten miles of cable line, and five miles in course of construction, forty-one miles of horse-car track, fourteen and one-half miles of electric car track and the latter will be increased by twenty-two miles of track by November 1, 1890.

Seven large bridges cross the Mississippi river at St. Paul, one is under course of construction, and one, to accommodate a belt line of railroad around the city, will be built within a short time. Of the seven now in use five are for foot passengers, teams, and street cars, and two for railways. One bridge is a peculiarity in architecture of this kind, in that in a length of a little more than half a mile, it has a grade of 100 feet, the southern end being by so much higher than the northern. The Mississippi has been partially diked on the western bank, and government appropriations are available for a system of levees which will reclaim many acres of ground suitable for manufactories, railway shops and yards, from any danger of overflow.

St. Paul is the center of a large railway system, twenty-eight lines radiating therefrom in all directions. There are fourteen lines eastward and four to the Pacific coast with terminals at San Francisco, Portland, Tacoma, Seattle, and Vancouver. During the summer months, the season of greatest travel, about 300 passenger trains arrive and depart daily from the Union Depot. Difficulties of entrance and exit presented by the topography of the city have been overcome by tunnels, embankments, cuts, bridges, and gradients following the course of streams penetrating

the city and emptying into the Mississippi. Yard room has been increased by the diking and filling in of low areas near the river.

St. Paul is essentially a commercial city and, as yet, manufactories on any large scale have not been a conspicuous feature of its growth. But it is the seat of a great many flourishing industrial enterprises, and an organized effort is being made to promote the manufacturing interests of the city on a scale commensurate with its commercial importance.

For years the lack of water power and the high cost of fuel militated against extensive manufacturing. The improved facilities for obtaining coal via Lake Superior have to a great extent eliminated the latter difficulty, and the enlargement of the city's limits so that a considerable fall in the Mississippi is now included seems likely to obviate the former.

The two lines of steamers regularly plying between St. Paul and St. Louis during seven months of the year long acted as a check on transportation rates, but the river is now a minor factor in the regulation of freight tariffs. St. Paul is distant but a few hours by rail from the head of Lake Superior, where the constantly increasing tonnage and consequent reduction in transportation rates make it possible for the city to compete with older and more eastern centers for the trade of the great Northwest. That this competition is not only possible but profitable is shown by the increase in St. Paul's jobbing and wholesale trade within the last few years. The following table shows such increase, and coupled therewith are the yearly aggregates of manufactured products:

YEAR.	Jobbing.	Manufacturing.
1881 .....	\$46,555,999	\$15,466,201
1883 .....	72,048,771	25,855,471
1885 .....	81,596,000	29,437,000
1887 .....	101,025,600	37,231,600
1889 .....	109,126,829	48,598,894

St. Paul is growing rapidly into prominence as a live-stock market. Its nearness to the ranges of Dakota and Montana, the increase of stock in Minnesota itself, and the improved facilities for handling cattle, sheep, hogs, and horses account for this. The Union Stock Yards, located in a southern suburb, were first put into general operation in 1888. The increase in 1889 over 1888 is shown in the following table:

Cattle.....	104 per cent.	Sheep.....	98 per cent.
Calves....	85 per cent.	Horses.....	251 per cent.

The total receipts for 1889 at the Union Stock Yards and at the Minnesota Transfer Yards, located near the western boundary of the city, were as follows:

Cattle.....	142,870
Hogs .....	283,064
Sheep .....	234,538
Horses.....	15,301

The Twin City Stock Yards were opened in 1890 in the northwestern part of the city, and others will follow as cattle raising becomes more general and extensive throughout the Northwest.

The growth of population has been most marked within the last decade. The figures appended were obtained in national, State or municipal enumerations:

Year.	Population.	Year.	Population.
1838 .....	3	1875 .....	33,178
1850 .....	850	1880 .....	41,498
1855 .....	4,400	1882 .....	75,835
1860 .....	10,600	1884 .....	99,322
1865 .....	13,100	1885 .....	111,397
1870 .....	20,300		

The United States census of 1890 gave St. Paul a population of 133,156.

The assessed value of real and personal property subject to taxation increased from \$28,957,831 in 1881 to \$127,669,159 in 1889. The rate of taxation decreased from 20 mills in 1887 to 17.10 in 1889. Since 1884 activity in building has been one of the most noteworthy features of the city.

Building associations thrive in St. Paul, as in all of the younger, well-to-do cities, and the city has one marked feature—more workingmen own their own homes than in any other place of equal population in America.

St. Paul is favored in its suburban surroundings, and the high bluffs of the river and the savanna-like territory in its western wards afford desirable building sites, which have been growing into favor within the past few years.

The city has twenty banks and financial institutions, with an aggregate capital of \$7,750,000.

The first white settler came to the present site of the city of St. Paul in 1832; the first log cabin was built in 1838; the first white child was born in 1839; and the town site was located in 1847. The territorial capital was located in 1851, and the first State election was held in 1857. The first railroad was built in 1862, and extended from St. Paul to St. Anthony (now Minneapolis), a distance of ten miles. In 1874 by a popular vote, a portion of Dakota county was transferred to Ramsey county, and the settlement, which has since grown into the municipal division known as West St. Paul, was absorbed. In 1884 an act of the State legislature extended the city's boundaries, westward, northward, and eastward, so that its area is now rectangular in shape, having a length of ten and a width of four miles.

ST. PAUL, a remarkable volcanic island which, along with the island of New Amsterdam, is situated in the Indian Ocean about midway between Africa and Australia, a little to the north of the ordinary route of the steamers from Plymouth (*via* Cape Town) to Adelaide. Its exact position as determined by the Transit of Venus Expedition in 1874 is 38° 42' 50" S. latitude and 77° 32' 29" E. longitude.

The island now known as New Amsterdam was probably that sighted on March 18, 1522, by the companions of Magellan as they sailed back to Europe under the command of Sabastian del Cano; and in 1617 the Dutch ship *Zeewolf* from Texel to Bantam discovered the island which, instead of the name "Zee-wolf" then bestowed on it, soon after began to be called on the charts St. Paul. The designation "New Amsterdam" is derived from the vessel in which Van Diemen sailed between the islands in 1633. The first navigator to set foot on St. Paul was Willen van Vlaming in 1696. Lord Macartney spent a day exploring it in 1793, his guide being a marooned Frenchman, Captain Péron, whose narrative of his sojourn from September 1, 1792, to December 16, 1795, is a document of great value (*Mémoires du Capitaine Péron*, vol. i., Paris, 1824). In 1843 the governor of Réunion took possession of the islands with a detachment of marines—seal-catching and the fisheries having attracted to them a considerable floating population. In June, 1871, the British frigate *Megara* was wrecked at the mouth of the crater and most of the 400 souls on board had to reside on the island upward of three months. Landing on September 23, 1874, a French Transit of Venus expedition remained on St. Paul till January 8, 1875, and a visit of much importance was paid to New Amsterdam.

ST. PAUL DE LOANDA. See LOANDA.

ST. PAUL'S ROCKS, not to be confounded with the island of St. Paul in the Indian Ocean, are a num-

ber of small islands in the Atlantic, nearly 1° north of the equator and 540 miles from South America, in 29° 15' W. longitude. Their outline is irregular, and as they are only separated by narrow but deep channels they have the appearance of being one island. The whole space occupied does not exceed 1,400 feet in length by about half as much in breadth.

ST. PETER PORT, the capital of the island of GUERNSEY (*q.v.*); its population was 16,658 in 1881.

ST. PETERSBURG, a government of northwestern Russia, at the head of the Gulf of Finland, stretching along its southeastern shore and the southern shore of Lake Ladoga. It is bounded by Finland and Olonetz on the north, Novgorod and Pskoff on the east and south, Esthonia and Livonia on the west, and has an area of 20,750 square miles. The population (apart from the capital) was 635,780 in 1882.

ST. PETERSBURG, capital of the Russian empire, is situated in a thinly-peopled region at the head of the Gulf of Finland, at the mouth of the Neva, in 59° 56' N. latitude and 30° 40' E. longitude, 400 miles from Moscow, 696 from Warsaw, 1,138 from Odessa, and 1,338 from Astrakhan. The city covers an area of 21,195 acres, of which 12,820 belong to the delta proper of the Neva; 1,330 acres are under water.

Communication between the banks of the Neva is maintained by only two permanent bridges—the Nicholas and the Alexander or Liteinyi, the latter 467 yards long; both are fine specimens of architecture. Two other bridges—the Palace and the Troitskiy (720 yards)—across the Great Neva connect the left bank of the mainland with Vasilyevskiy Island and the fortress of St. Peter and St. Paul; but, being built on boats, they are removed during the autumn and spring, and intercourse with the islands then becomes very difficult. Several wooden or floating bridges connect the islands, while a number of stone bridges span the smaller channels; their aggregate number is ninety. In winter, when the Neva is covered with ice two to three feet thick, temporary roadways for carriages and pedestrians are made, and artificially lighted. Numerous boats also maintain communication, and small steamers ply in summer between the more distant parts of the capital. A network of tramways (about eighty miles) intersects the city in all directions, reaching also the remoter islands and suburbs, and carrying about 45,000,000 passengers yearly. Omnibuses and public sledges maintain the traffic in winter.

The bulk of St. Petersburg is situated on the mainland, on the left bank of the Neva, including the best and busiest streets, the richest shops, the great bazaars and markets, the palaces, cathedrals, and theaters, as well as all the railway stations, except that of the Finland Railway.

The topography of St. Petersburg is very simple. Three long streets, the main arteries of the capital, radiate from the admiralty—the Prospekt Nevskiy (Neva Prospect), the Gorokhovaya (Peas' Street), and the Prospekt Voznesenskiy (Ascension Prospect). Three girdles of canals, roughly speaking, concentric, cross these three streets—the Moika, the Catherine, and the Fontanka; to these a number of streets run parallel—the Great and the Little Morskaya, the Kazanskaya, the Sadovaya (Garden Street), and the Liteinaya, continued west by Prospekts Zogorodnyi and Rizhskiy (Riga). The Prospekt Nevskiy is a very broad street running straight east-southeast for 3,200 yards from the admiralty to the Moscow railway station, and thence 1,650 yards farther, bending a little to the south, to the Smolnyi convent, again reaching the Neva at Kalashnikoff harbor. The part first mentioned owes its picturesque aspect to its width, its rich shops,

and still more its animation. But the houses which border it architecturally leave very much to be desired. And neither the Cathedral of the Virgin of Kazan (an ugly imitation on a small scale of St. Peter's in Rome), nor the still uglier Gostinyi Dvcr (a two-storied quadrilateral building filled with second-rate shops), nor the Anitchkoff Palace (which looks like immense barracks), nor even the Catholic and Dutch Churches do anything to embellish it. About midway between the public library and the Anitchkoff Palace, an elegant square conceals the old-fashioned Alexandra theater; a profusely adorned memorial to Catherine II. does not beautify it much. The Gorokhavaya is a narrow and badly paved street between gloomy houses occupied mostly by artisans. The Voznesenskiy, on the contrary, though as narrow as the last, has better houses. In its north part it passes into a series of large squares connected with that on which the monument of Peter I. stands. One of them is occupied by the cathedral of St. Isaac (of Dalmatia), and another by the memorial to Nicholas I., the gorgeousness and bad taste of which strangely contrast with the simplicity and significance of that of Peter I. The general aspect of the cathedral is undoubtedly imposing both without and within; its red granite colonnades are not devoid of a certain grandiose character; but, on the whole, this architectural monument, built between 1818 and 1858, according to a plan of Montferrant, under the personal direction of Nicholas I., does not correspond either with its costliness (23,000,000 rubles), or with the efforts put forth in its decoration by the best Russian artists. The pictures of Brüloff, Bruni, and many others, which cover its walls, are deteriorating rapidly and their place is being taken by mosaics. The entire building, notwithstanding its vast foundations and pile-work, is subsiding unequally in the marshy ground, and the walls threaten soon to give way.

The eastern extremity of Vasilyevskiy Island is the center of commercial activity; the stock exchange is situated there as well as the quays and storehouses. The remainder of the island is occupied chiefly by scientific and educational institutions.

Of the 21,195 acres covered by St. Petersburg, 1,160 remain unoccupied. The gardens and parks, public and private, take up 798 acres, to which must be added Aptekarskiy, Petrovskiy, Elaghin, and Krestovskiy Islands, which are almost quite covered with parks. Nearly 30 per cent. of the total area of the most densely populated parts are squares and streets, the aggregate length of the latter being 283 miles. More than half of them are lighted by gas, the remainder with kerosene. Except in a few principal streets, which are paved with wood or asphalt, the pavement is usually of granite boulders, and is bad and very difficult to keep in order. Many streets and embankments in the suburbs are unpaved. Nearly all the more populous parts have water led into the houses, and the same begins to extend also to the right bank of the Neva.

On December 27, 1881, the population of St. Petersburg was 861,303, exclusive of the suburbs, and 929,100 including them.

When Peter I., desirous of giving a "European" capital to his empire, laid the first foundations of St. Petersburg on the marshy islands of the Neva, in land not fully conquered and remote from the centers of Russian life, it is hardly possible that he could have foreseen the rapid development it has since undergone; it has now a population approaching a million and commands more than one-sixth of the foreign trade and manufactures of Russia. In point of fact, there is no capital in Europe so disadvantageously situated with regard to its own country as St. Petersburg. Desolate wilderness begins

at its very gates and extends for hundreds of miles to the north and east. To the south it has the very thinly peopled regions of Pskoff and Novgorod—the marshy and woody tracts of the Valdai Heights. For 400 miles in each of these three directions there is not a single city of any importance; and toward the west, on both shores of the Gulf of Finland, are foreign peoples who have their own centers of gravitation in cities on or nearer to the Baltic. With the provinces of Russia the capital is connected only by canals and railways, which have to traverse vast tracts of inhospitable country before reaching them. But St. Petersburg possesses, on the other hand, one immense advantage in its site, which has proved of great moment, especially in the present century of development of international traffic. Ruled by the idea of creating a new Amsterdam—that is, a meeting-place for traders of all nationalities—and a great export market for Russia, Peter I. could have selected no better place. St. Petersburg has been for nearly 150 years the chief place of export for raw produce from the most productive parts of Russia.

ST. PIERRE, capital of St. Pierre, an island off the south coast of Newfoundland, and which, with the Miquelon islands immediately northwest, forms a colony of France. The town lies on the southeast portion of the island after which it is named, and is a place of considerable importance as a shipping point, having a safe harbor and superior fishing grounds. It is compactly and solidly built, has a convent and churches, besides a bank, warehouses, stores, hotels, and some manufacturing and packing establishments. The population, 3,200 in 1880, had increased so rapidly that in 1890 it was estimated at 6,400.

ST. PIERRE. See RÉUNION.

ST. PIERRE. See MARTINIQUE.

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, ABBÉ DE, a French writer of much ingenuity and influence, who is not infrequently confounded with the author of *Paul et Virginie*, was born near Barfleur on February 18, 1658. He died at Paris in 1743.

SAINT-PIERRE, JACQUES HENRI BERNARDIN DE, French man-of-letters, was born at Havre on January 19, 1737, and was educated at Caen. His first work of any importance, the *Voyage à l'Île de France*, appeared in 1773 and gained him some reputation. It is the soberest and therefore the least characteristic of his books. The *Etudes de la Nature*, which made his fame and assured him of literary success, did not appear till ten years later, his masterpiece *Paul et Virginie* not till 1787, and his other masterpiece (which, as much less sentimental and showing not a little humor, some persons may be allowed to prefer), the *Chaumière Indienne*, not till 1790. On January 21, 1814, he died at Éragny near Pontoise.

ST. PIERRE AND MIQUELON, two islands ten miles off the south coast of Newfoundland, at the entrance of Fortune Bay, are, with five lesser islets, the last remnants of the North American colonies of France. The population of the islands was 5,564 (town of St. Pierre 4,365) in 1883; but the number is often above 10,000 in the fishing season.

ST. PIERRE-LÈS-CALAIS, a suburb of CALAIS (*q.v.*), with a population of 30,786 in 1881.

ST. POL DE LÉON, a town of France, in the arrondissement of Morlaix and department of Finistère, not far from the shores of the English Channel, thirteen and three-quarter miles northwest of Morlaix by the railway to Roscoff. The population of the town, in 1881, was 3,739, and of the commune, 6,659.

ST. QUÉNTIN, a manufacturing town of France, the chef-lieu of an arrondissement and in population (45,697 in 1881) the largest town in the department of Aisne.

stands on the right bank of the Somme at the junction of the Somme canal with the St. Quentin canal (which unites the Somme canal with the Scheldt), ninety-five and a half miles northeast of Paris. St. Quentin is the center of an industrial district which employs 130,000 workmen in 800 factories, and manufactures the fortieth part of the cotton imported into France, producing goods to the value of about \$17,500,000, mainly calicoes, percales (glazed cottons), cretonnes, jaconas, twills, piqués, muslins, cambrics, gauzes, wool-muslins, Scotch cashmeres, and merinos. Other industries are the making of embroideries by machinery and by hand, turning billiard-balls, and engine-building.

During the Franco-Prussian War St. Quentin repulsed the German attacks of October 8, 1870; and on January 19, 1871, it was the center of the great battle fought by General Faidherbe, one of the last episodes of the campaign.

ST. SEBASTIAN. See SAN SEBASTIAN.

ST. SERVAN, a cantonal town of France, in the department of Ille-et-Vilaine, on the right bank of the Rance to the south of St. Malo, from which it is separated by a creek at least a mile wide (see ST. MALO). In population (10,691 inhabitants in 1881; 12,867 in the commune) St. Servan is slightly the smaller town of the two.

SAINT-SIMON, CLAUDE HENRI, COMTE DE, the founder of French socialism, was born at Paris on October 17, 1760. As a thinker Saint-Simon was entirely deficient in system, clearness, and consecutive strength. But his great influence on modern thought is undeniable, both as the historic founder of French socialism and as suggesting much of what was afterward elaborated into Comtism. Apart from the details of his socialistic teaching, which are vague, inconsistent, and unsystematic, we find that the ideas of Saint-Simon as to the reconstruction of society are very simple. His opinions were conditioned by the French Revolution and by the feudal and military system still prevalent in France. In opposition to the destructive liberalism of the Revolution he insisted on the necessity of a new and positive reorganization of society. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, the former aspect of which had been strengthened by the restoration, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediæval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science. In short, the men who are fitted to organize society for productive labor are entitled to bear rule in it. The social aim is to produce things useful to life; the final end of social activity is "the exploitation of the globe by association." The contrast between labor and capital so much emphasized by later socialism is not present to Saint-Simon, but it is assumed that the industrial chiefs, to whom the control of production is to be committed, shall rule in the interest of society. Later on the cause of the poor receives greater attention, till in his greatest work, *The New Christianity*, it becomes the central point of his teaching and takes the form of a religion. It was this religious development of his teaching that occasioned his final quarrel with Comte.

During his lifetime the views of Saint-Simon had very little influence; and he left only a very few devoted disciples, who continued to advocate the doctrines of their master, whom they revered as a prophet. He died in 1825.

SAINT-SIMON, LOUIS DE ROUVRAY (or ROUV-

ROY), DUC DE, French author and soldier, was born at Versailles, on January 16, 1675. When he died, at Paris, on March 2, 1755, he had almost entirely outlived his own generation (among whom he had been one of the youngest) and the prosperity of his house, though not its notoriety. This last was in strange fashion revived by a distant relation born five years after his own death, Claude Henri, Comte de Saint-Simon, the subject of the preceding article.

ST. THOMAS, one of the Danish West India Islands, lies thirty-six miles east of Porto Rico (Spanish), and forty north-northwest of St. Croix (Danish), with its principal town (Charlotte Amalie) in 18° 20' 27" N. latitude, and 64° 55' 40" W. longitude. It is thirteen miles long from east to west, with an average breadth of three, and is estimated to have an area of thirty-three square miles. Previous to the abolition of slavery in 1848 the island was covered with sugar plantations, and dotted with substantial mansions; but now a few vegetables, a little fruit, and some guinea grass are all that it produces. Green groceries are imported from the United States, poultry and eggs from the neighboring islands. Nor is the exceptional position which St. Thomas has hitherto enjoyed as a commercial depot any longer secure; the merchants of Venezuela, Porto Rico, San Domingo, Hayti, etc., who used to purchase in St. Thomas, now go direct to the markets of the United States and Europe. In 1880 the inhabitants of the island numbered 14,389 (males, 5,757; females, 8,632), of whom about a sixth are white, of various nationalities; the rest have nearly all more or less of negro blood. English has gradually become almost the exclusive language of the educated classes, and is used in the schools and churches of all the various communities. The curious Creole speech of the negroes, which contained a mixture of broken Dutch, Danish, English, etc., though it was reduced to writing by the Moravian missionaries, subsequent to 1770, is rapidly dying out.

ST. THOMAS (Portuguese, *São Thomê*), a volcanic island in the Gulf of Guinea (West Africa), lies immediately north of the equator and in 6° 40' E. longitude. From the Gaboon, the nearest point of the mainland, the distance is 166 miles, and from the Cameroons 297. The extreme length of the island is thirty-two miles and the breadth from west to east twenty-one; the area is estimated at 355 square miles. In 1890 the population in the island was 18,266.

ST. THOMAS, a town of Ontario in the Dominion of Canada, and capital of the county of Elgin, is situated on the Great Western, Canada Southern, Credit Valley, St. Clair Branch, and London and Port Stanley railroads, sixteen miles south of London and eight miles from Port Stanley. Kettle creek flows through a portion of the city, affording considerable water power, a part of which is utilized. The town has grown rapidly of late years, not only in population and influence but as a commercial, financial, and manufacturing center. It contains six banks, seven churches, two daily and two weekly newspapers, between one and two hundred stores, and a dozen hotels. Saw-mills, grist-mills, foundries, machine-shops, car-shops, employing between 500 and 1,000 men, a car-wheel foundry, tanneries and industries of a varied character make up the lines of manufacture to which special attention is paid. The town also contains a number of buildings of a public character, the architectural excellence of which furnishes additional evidence of the enterprise and liberality of the citizens. The population in 1890 was estimated at upward of 10,000.

SAINT-VICTOR, PAUL DE, one of the chief masters of a very ornate style in recent French literature, was born in Paris in 1827 and died there in 1883. He

was of noble birth and inherited the title of count, but rarely used it, his political principles being democratic.

ST. VINCENT, an island in the British West Indies, discovered by Columbus in 1498, is situated in  $13^{\circ} 10'$  N. latitude and  $60^{\circ} 57'$  W. longitude, 100 miles to the west of Barbados; it is 18 miles in length, 11 in breadth, and has an area of 132 square miles. The capital is Kingstown (population, 5,593), the total population of the island being 42,200, including 2,700 Europeans and 30,000 Africans.

ST. VINCENT, SIR JOHN JERVIS, EARL, a distinguished naval officer, was born at Medford, Staffordshire, England, on January 9, 1734. He commanded the *Foudroyant* in July, 1778, when the memorable *rencontre* took place between Admiral Keppel and Count d'Orvilliers, and bore a very distinguished part in that action. In 1782, while in command of the same vessel, he captured the French ship *Pégase*, of 74 guns and 700 men, off Brest Harbor, and was rewarded for his exploit by being made Knight Companion of the Bath. In 1784 he entered parliament as member for Launceston, and he afterward sat for Yarmouth. In 1795 Jervis became full admiral and succeeded Lord Wood in command of the British fleet in the Mediterranean, where he rendered important service in blockading the French fleet in Toulon, and protecting English trade in the Levant. On February 14, 1797, he won his most celebrated victory. With only fifteen ships of the line, seven frigates, and two sloops he encountered off Cape St. Vincent a Spanish fleet of twenty-six sail of the line, twelve frigates, and a brig, and completely defeated it, capturing four of the enemy's largest ships. He still further distinguished himself some months later by his resolute and sagacious conduct in repressing a mutiny in his fleet when off Cadiz. In June, 1799, he resigned his command in consequence of ill-health, but was shortly afterward placed at the head of the Channel fleet. On the formation of the Addington ministry in 1801 he was made first lord of the admiralty, and in that important office, which he held for three years, the great capacity for business with which he was endowed by nature shone forth in all its luster. Advanced age and impaired health led to his final retirement from public life in 1807, but he survived till March 13, 1823, when he died in his ninetieth year.

ST. VITUS' DANCE, or CHOREA, a disorder of the nervous system occurring for the most part in children, and characterized mainly by involuntary jerking movements of the muscles throughout almost the entire body. It is to be regarded as a functional nervous disorder of wide extent, the manifestations of which appear not merely in disturbance affecting the motor apparatus but in various associated morbid phenomena of cerebral origin. Among the predisposing causes age is important, chorea being essentially an ailment of childhood and more particularly of the period in which the second dentition is taking place. The greater number of the cases occur between the ages of nine and twelve. It is not often seen in very young children nor after puberty; but there are many exceptions to this rule. It is twice as frequent with girls as with boys. Hereditary predisposition to nervous troubles is apt to find expression in this malady in youth, more especially if the general health becomes lowered. Of exciting causes strong emotions, such as fright, ill-usage or hardship of any kind, insufficient feeding, overwork or anxiety, are among the most common; while, again, some distant source of irritation, such as teething or intestinal worms, appears capable of giving rise to an attack. It is an occasional but rare complication of pregnancy. The connection of chorea with rheumatism

is now universally recognized, and is shown not merely by its frequent occurrence before, after, or during the course of attacks of rheumatic fever in young persons, but even independently of this by the liability of the heart to suffer in a similar way in the two diseases.

This disease occasionally assumes a very acute and aggravated form, in which the disorderly movements are so violent as to render the patient liable to be injured, and to necessitate forcible control of the limbs or the employment of anæsthetics to produce unconsciousness. Such cases are of very grave character, if, as is common, they are accompanied with sleeplessness, and they may prove rapidly fatal by exhaustion. In the great majority of cases of St. Vitus' dance, however, complete recovery is to be anticipated sooner or later, the symptoms usually continuing for from one to two months, or even sometimes much longer.

For the treatment of St. Vitus' dance the remedies proposed have been innumerable, but it is doubtful whether any of them have much control over the disease, which under suitable hygienic conditions tends to disappear of itself. These conditions, however, are all-important, and embrace the proper feeding of the child with nutritious light diet, the absence of all sources of excitement and annoyance, such as being laughed at or mocked by other children, and the rectification of any causes of irritation and of irregularities in the general health. For a time, and especially if the symptoms are severe, confinement to the house or even to bed may be necessary, but as soon as possible the child should be taken out into the open air and gently exercised by walking. Of medicinal remedies the most serviceable appear to be zinc, arsenic, and iron, especially the last two, which act as tonics to the system and improve the condition of the blood. They should be continued during the whole course of the disease and convalescence, if they do not disagree. As sedatives in cases of sleeplessness, bromide of potassium and chloral are of use. Many other agents, such as conium, belladonna, strychnia, the salts of silver, etc., have been recommended, but they do not seem to possess any special advantages.

ST. UBES. See SETUBAL.

SAIS. See EGYPT.

SALADIN. See EGYPT.

SALAMANCA, a province of Spain, which until 1833 formed part of that of Leon, is bounded on the north by Zamora and Valladolid, on the east by Avila, on the south by Caceres, and on the west by Portugal. It has an area of 4,940 square miles. The population in 1877 was 285,500; but by the year 1886 it was estimated that it had decreased to about 270,000. Since that time it has increased but little if any.

SALAMANCA (*Salmantica Elmantica*), the capital of the above province, lies on the banks of the Tormes, 172 miles northwest of Madrid by rail. In the Middle Ages the trade of Salamanca was not insignificant, and the stamped leather-work produced there is still sought after. Its manufactures are now of little consequence, and consist of china, cloth, and leather. The population within the municipal boundaries in 1877 was 18,007, and in 1886 was estimated at about 20,000.

SALAMANDRA. In the nomenclature of zoölogy this name designates a genus of animals belonging to the vertebrate class *Amphibia*. The genus was first defined under this name by Laurenti. It will be seen on referring to the taxonomic synopsis of the class given at the end of the article AMPHIBIA that the genus *Salamandra* belongs to the first tribe *Mecodonta* of the fifth division *Salamandrida*. The diagnosis of the genus is as follows:—no fronto-squamosal arch in the skull; tongue large, adherent below, free at the sides

and slightly so behind; toes five; tail cylindrical. There are three species.

The genus is confined to the western sub-region of the palearctic region, extending over almost the whole of Europe, especially the central and southern parts, and occurring also in Algiers and Syria. The spotted species is the commonest and most widely distributed, being found in nearly all parts of Germany, France, Italy, and Spain.

The food of *Salamandra* consists of worms and insects, and, like British frogs and toads, the animals can only exist in damp shady localities. As in all *Salamandrida*, the process of reproduction is commenced by a true copulation, which takes place in spring and summer. The seminal fluid is passed into the female cloaca, where it is received into a tube-shaped receptaculum seminis. The eggs are thus fertilized in the oviduct, but the development takes place under somewhat different conditions in the two species *S. maculosa* and *S. atra*. Both species are viviparous; in the former thirty to forty eggs undergo development in the oviducts at one time, and they are brought forth and deposited in stagnant or sluggishly-flowing water when they have reached a stage similar to that of adult *Perennibranchiata*, the newly-born larvæ having long feather-like external gills and a length of twelve to fifteen minima (one-third to one-half an inch). After a period of aquatic life, the larvæ pass through a metamorphosis; the limbs appear; the gill slits close up; and the young animals, having reached the adult condition, leave the water for a terrestrial life. In *S. atra* only the two lowest eggs which pass into the oviducts, one in the duct of each side, undergo development. The rest of the eggs fuse into a mass of yolk material and are devoured by the two developing larvæ.

SALAMIS, in northern times called by the people *Κολοῦρι* (a ring-shaped cake), and by purists *Σαλαμίς*, is an island in the Saronic Gulf, off the coast of Attica, Greece. It is said to have been called in ancient times by other names—Sciras, which associates it with the worship of Athena Sciras; Cychreia, which connects it with the Eleusinian cultus and the sacred serpent (*κυχρείδης ὄφις*) of Demeter; and Pityussa. The name of Salamis is famous chiefly on account of the great sea-fight, 480 B.C., in which the allied Greeks defeated the Persians under Xerxes. The battle took place beside the town of Salamis and the islands of Psyttaleia, at the southeastern end of the straits.

A city on the east coast of Cyprus, near the river Pedæus, said to have been founded by the Salaminian Teucer, son of Telamon, was also called Salamis.

SALAMONIAN. See AMMONIAN.

SALDANHA, JOÃO CARLOS SALDANHA DE OLIVEIRA E DAUN. See Vol. X.

SALE, an urban sanitary district of Cheshire, England, on the Bridgewater canal and the Mersey, about five miles south of Manchester. The population of the urban sanitary district (area, 2,006 acres) in 1871 was 5,573, and in 1881 it was 7,915.

SALE is one of the forms of CONTRACT, (*q. v.*) The law of contract is accordingly applicable as a whole to the law of sale. But the importance of the contract of sale demands a fuller treatment. The law of the United Kingdom and of the United States is based upon the Roman law in its later stage, as modified by the prætors and by legislation. But there are some considerable differences. In Roman law sale originally meant nothing more than barter; but the introduction of coined money converted the contribution of one of the contracting parties into price (*pretium*), as distinguished from article of sale (*merx*) contributed by the other. Sale fell under the head of consensual contracts, *i. e.*, those

in which the *causa* or that which made the contract enforceable was consent.

Sale in English law may be defined to be "a transfer of the absolute or general property in a thing for a price in money" (Benjamin, *On Sales*, p. 1). The words "absolute or general" are inserted because they may be both a general and a special property in certain cases, and a transfer of the special property would not be a sale.

*Real Estate.*—At common law it was not necessary that there should be written evidence of a contract of sale. The publicity of the feoffment obviated the necessity of writing, which was not essential to the validity of a feoffment until the Statute of Frauds (see FEOFFMENT). The earliest statute making a written instrument essential to a sale appears to be the Statute of Enrollments (27 Hen. VIII. c. 16). The bargain and sale operating under the Statute of Uses, and enrolled under the Statute of Enrollments in the High Court of Justice or with the *custos rotulorum* of the county, is no longer in use; a bargain and sale at common law is a mode of conveyance sometimes used by executors exercising a power of sale. Such a bargain and sale must be by deed since 8 and 9 Vict. c. 106, but need not be enrolled (see FRAUD). In an ordinary case of the sale of real estate the contract is formally drawn up on the basis of particulars and conditions of sale, which ought fairly to represent the actual state of the property. The statute, however, is satisfied by informal agreements, such as letters, if they contain the means of determining the property, the parties, and the price. The price must be a sum of money. If it is another estate, the contract is one of exchange; if no consideration passes, it is a gift. The price may be left to be determined by a third person, as by arbitration. For the way in which payment of the price may be made, see PAYMENT. The formation of a binding contract of sale is the most important stage in the transfer of real estate. From the moment at which the parties are bound by the contract the sale is made; the purchaser has the equitable estate in the subject-matter of the contract (see EQUITY), the vendor holding in trust for him, subject to the payment of the purchase money, for which the vendor has a lien. The price becomes personal estate of the vendor, and the land real estate of the purchaser. The latter has the right to accidental benefits and the burden of accidental losses accruing before completion of the purchase. The rights defined by the contract descend to the representatives of a deceased vendor or purchaser. In most cases the personal representative of a deceased vendor may convey the property under 44 and 45 Vict. c. 41, s. 4. After the contract it becomes the duty of the vendor to deliver an abstract of title, to satisfy the purchaser's reasonable requisition as to any question arising on the title of the purchaser, while the purchaser pays a deposit on account within a certain time, the remainder being paid on completion—that is, the execution of the conveyance and payment of the balance of the price.

*Personal Estate.*—At common law, as in the case of real estate, writing was not essential to the validity of a contract of sale. In sales of personalty, unlike sales of real estate, time is usually of the essence of the contract. A sale of goods may be accompanied by an express warranty or collateral contract as to the title to or quality of the goods. No special form of words is necessary to create a warranty, nor need it be in writing. An implied warranty of title—that is, an affirmation that the vendor has a right to sell—exists certainly in executory contracts of sale. It most probably exists in executed contracts, the exceptions to the rule having in recent times become by judicial decision more numer-

ous than the cases falling under the old rule, that there was no such warranty. Warranty of quality exists either by statute or at common law.

*United States.*—The law as to the sale of real estate agrees generally with English law. It is considerably simplified by the system of REGISTRATION, (*q.v.*) The covenant of warranty, unknown in England, is the principal covenant for title in the United States. It corresponds generally to the English covenant for quiet enjoyment. The right of judicial sale of buildings under a mechanic's lien for labor and materials is given by the law of many States. The sale of public lands is regulated by Act of Congress (*Revised Statutes*, 2353-2379). In the law of sale of personal property American law is also based upon English law. The principal differences are that the law of market overt (see THEFT) is not recognized by the United States, and that an unpaid vendor is the agent of the vendee to resell on non-payment, and is entitled to recover the difference between the contract price and the price of resale. The law of Louisiana (*Civil Code*, § 3194) gives the unpaid vendor a still greater right in his preferential claim for the price against the creditors of the purchaser, if the property still remains in the latter's possession. Warranty of title is not carried as far as in England. United States decisions draw a distinction between goods in the possession and goods not in the possession of the vendor at the time of sale. There is no warranty of title of the latter. The Statute of Frauds has been construed in some respects differently from the English decisions. The differences will be found in Mr. Benjamin's work. As to unlawful sales, it has been held that a sale in a State where the sale is lawful is valid in a State where it is unlawful by statute, even though the goods are in the latter State.

SALEIYER (in Mancassarese *Silâyara*, in Buginese *Silâja*), also called *Tana-dawang* ("Land of Shrimps"), is a Dutch island separated from the south coast of Celebes (East Indies) by a strait eight miles wide, which in the west monsoon is used by vessels bound for the Moluccas, the Philippines, and China. With a length of forty-six miles and general breadth of nine, the area is estimated at 315 square miles. The population of Saleiyer and dependencies, mainly a mixed race of Mancassars, Buginese, and natives of Luvu and Buton, was in 1869 55,147, and in 1880, 66,276.

SALEM, a British district of India, in Madras presidency, lying between  $11^{\circ} 1'$  and  $12^{\circ} 57'$  N. latitude and  $77^{\circ} 32'$  and  $79^{\circ} 5'$  E. longitude. It embraces an area of 7,653 square miles, and is bounded on the north by Mysore and North Arcot, on the south by Coimbatore and Trichinopoly, on the east by Trichinopoly and South and North Arcot, and on the west by Coimbatore and Mysore. In 1881 the population was 1,599,595. The staple crops are rice and ragi; other important crops are pulses and seeds. The chief industry is weaving, which is carried on in almost every large town and village. Carpets of great beauty and superior workmanship are made in the Salem jail. Good iron and steel are made, but only on a small scale.

SALEM, chief town of the above district, situate in  $11^{\circ} 39' 10''$  N. latitude and  $78^{\circ} 11' 47''$  E. longitude, is a busy trading place, with a considerable weaving industry. It is tolerably well built and is prettily situated on the river Tirumanimuttar, 900 feet above sea-level, in a long valley inclosed by the Shevaroy hills, which are six miles distant. The population of the town in 1881 was 50,667 (males 24,584, females 26,083).

SALEM, a city of the United States, capital of Essex county, Mass., is built on a peninsula between North and South rivers, in  $42^{\circ} 31' 18''$  N. latitude and  $70^{\circ} 53'$

$53''$  W. longitude, sixteen miles north by east of Boston, on the eastern division of the Boston and Maine railroad. In the latter part of the eighteenth and the early part of the nineteenth century Salem was the seat of a flourishing foreign commerce, especially with the East Indies; but, its comparative shallow harbor failing to accommodate the larger vessels of modern times, it has been supplanted by Boston, and has to content itself with a good share of the coasting trade. Its industrial activity has, on the other hand, increased, and it now possesses steam cotton-mills, jute factories, extensive tanneries, and various minor manufactories. The main interest, however, of Salem consists in its historical and literary associations, and the institutions by which they are represented. Best known of these institutions is the Peabody Academy, founded in 1867, with funds provided by the well-known philanthropist. The academy at once purchased and refitted the East India Marine Hall, originally built in 1824 by the East India Marine Society (1799), which consisted of captains and supercargoes who had doubled either Cape Horn or the Cape of Good Hope; and the building now contains under the trusteeship of the academy the collections of the old East India Museum and those of the Essex Institute, illustrating the zoölogy, natural history, and archæology of the county. The ethnographical collections, such as that dealing with Corea, are specially valuable. The *American Naturalist* has been the organ of the academy since 1867. The Peabody Institute, not to be confounded with the academy, is in the village of Peabody (Danvers), about two miles distant from Salem and about midway between the house in which the philanthropist was born and the grave, in Harmony Grove cemetery, in which he was buried. Plummer Hall, a fine building in Essex Street, erected in 1856 out of the funds left to the Salem Athenæum by Miss Plummer, contains the libraries of the Athenæum, the Essex Institute (founded in 1848 by the union of the Essex Historical and the Essex County Natural History Societies), and the Essex South District Medical Society, making an aggregate of 50,000 volumes. Behind the hall is the frame of the oldest church edifice in New England, erected in 1634 for Roger Williams. Other buildings of note in Salem are a State normal school, the city hall, the court-houses, the custom-house, in which Nathaniel Hawthorne once acted as surveyor of the port, and several of the private houses (such as "Doctor Grimshawe's house," the dwelling occupied for several years by Doctor Peabody, Mrs. Hawthorne's father), which, while not prototypes, have lent much of their versimilitude to the localities of Hawthorne's fiction. The novelist was born at 21 Union Street. Salem had 24,117 inhabitants in 1870, 27,563 in 1880, and 30,801 in 1890.

SALEM, a city of the United States, the county seat of Salem county, N. J., on a small stream of the same name, by which it has steam communication with Philadelphia (on the Delaware), forty-four miles distant to the north-northeast by rail. While Salem depends mainly on the agricultural prosperity of the surrounding district, it also contains foundries and machine-shops, fruit-canning establishments, glass-ware factories, oil-cloth factories, etc. The population was 3,052 in 1850, 4,555 in 1870, 5,512 in 1890.

A colony settled on the site of Salem in 1641, was replaced by a Swedish fort, and this passed through the Dutch to the English. One of the Quakers who, in 1673, bought Lord Berkeley's half of New Jersey, gave the place its present name and restored the settlement, which in 1682 was declared a port of entry. In 1778 the town was plundered by Colonel Manhood.

SALEM, a city of the United States, the capital of

Oregon, in Marion county, on the east bank of Willamette river, fifty-three miles south of Portland by the Oregon and California railroad. It lies in a fertile prairie district, adorned with copses, and possesses a good source of water-power in Mill creek. The capitol, a rather imposing edifice with a tower 180 feet high, erected in 1875-76, occupies a fine site above the city; other public buildings are the Willamette university (Methodist), which grants degrees in medicine, science, and general literature, the opera-house, the Roman Catholic school for girls, the State penitentiary, and State schools for the deaf and dumb and the blind. Lumber, woolen goods, flour, leather, brass castings, furniture, linseed oil, and building materials are the chief articles of manufacture and trade. The population was 2,538 in 1880, and 4,515 in 1890. Settled in 1834, incorporated in 1853, Salem became the State capital in 1860.

SALEM, the largest town in Columbiana county, Ohio, is located on the Pittsburgh, Fort Wayne and Chicago railroad, sixty-seven miles from Pittsburgh, twenty miles from Youngstown, and thirteen miles east of Alliance. Salem is handsomely situated and handsomely built, while the surrounding country, peopled by an enterprising and intelligent community, is cultivated to the highest degree of excellence. It contains five churches, two Friends meeting-houses, two national banks, three weekly papers, a high school, academy, and graded schools, flour-mills, machine-shops, saw-mills, iron-works, foundries, engine-works, etc., and has a present (1890) population of 6,000.

SALEP (Arab. *sahleb*, Gr. ὄρχις), a drug extensively used in the East as a nervine restorative and fattener, and also much prescribed in paralytic affections, probably owed its original popularity to the belief in the so-called "doctrine of signatures." In Europe it is chiefly used as a demulcent drink, but is also supposed to possess nutrient properties; it may be employed with advantage in inflammatory conditions of the mucous membrane, as in bronchitis, diarrhoea, cystitis, and other urinary disorders. It consists of the tuberous roots of various species of *Orchis* and *Eulophia*, which are decorticated, washed, heated until horny in appearance, and then carefully dried.

SALERNO, a city of Italy, and the chief town of a province of its own name (formerly Principato Citeriore), is beautifully situated on the west coast thirty-four miles southeast of Naples. Silk and cotton spinning are the principal industries. The population was 19,905 in 1870, and 22,328 (commune, 31,245) in 1881.

SALES, FRANÇOIS DE. See FRANCIS, ST., OF SALES.

SALFORD. See MANCHESTER.

SALICIN, the bitter principle of willow bark, was discovered by Leroux in 1831. It exists in most species of *Salix* and *Populus*, and has been obtained to the extent of 3 or 4 per cent. from the bark of *S. helix* and *S. pentandra*. According to Herberger, the bark of the young branches affords salicin in larger proportion than that of the trunk and contains less of the other ingredients which interfere with its extraction. Salicin is prepared from a decoction of the bark by first precipitating the tannin by milk of lime, then evaporating the filtrate to a soft extract, and dissolving out the salicin by alcohol. As met with in commerce it is usually in the form of glossy white scales or needles.

Salicin is chiefly used in medicine as an antipyretic in acute rheumatism, for which it is given in doses of five to thirty grains. Its action is less powerful than that of SALICYLIC ACID (*q.v.*), and its depressing effect on the circulation is less marked. It is also given for headache and for ague.

SALIC LAW, AND OTHER BARBARIAN LAWS. The (1) *Lex Salica* is one of these Teutonic laws of the early Middle Ages which are known as *leges barbarorum*, among which we also reckon the (2) *Lex Ripuariorum* or *Ribuvariorum*, (3) *Ewa (Lex) Francorum Chama-vorum*, (4) *Lex Alamannorum*, (5) *Lex Bajuvariorum*, (6) *Lex Frisionum*, (7) *Lex Angliorum et Werinorum*, h.e., *Thuringorum*, (8) *Lex Saxonum*, (9) *Leges Anglo-Saxonum*, (10) *Lex Burgundionum*, (10a) *Lex Romana Burgundionum*, (11) *Lex Wisigothorum*, (11a) *Breviarium Alarici*, (11b) *Edictum Theodorici*, (12) *Leges Langobardorum*, and to a certain extent (13) *Leges Wallie*. All these laws may in general be described as codes of procedure and of rights, which regulated for some indefinite period the internal affairs of the several Teutonic tribes whose names they bear.

(1) The *Salic Law* originated with the Salian Franks, often simply called Salians, the chief tribe of that conglomeration of Teutonic peoples known as FRANKS, (*q.v.*) The latter first appear in history about 240 (Vopisc., *Vit. Aurel.*, c. 7), after which date we find them carrying on an almost uninterrupted struggle with the Roman empire, till 486, when they finally established a kingdom of their own in provinces which had previously been considered Roman.

We have very few means of ascertaining when the Salic Law was compiled, and how long it remained in force. Our knowledge of the code is derived—(i.) from ten texts, preserved in a comparatively large number of manuscripts, chiefly written in the eighth and ninth centuries; (ii.) from allusions to a Salic Law in various charters and other documents. But the Latin texts do not contain the original Salic Law. This is clear (a) from the allusions we find in them to a "Lex Salica" and "Antiqua Lex," which can hardly be anything but references to another and earlier Lex Salica; (b) from a certain peculiarity and awkwardness in the construction of the Latin, which, though it is so-called Merovingian, and therefore very corrupt, would have been different if the texts were original compilations; (c) from a number of words, found in nearly every paragraph of certain groups of the MSS., and now known as "Malberg glosses," which are evidently the remains of a vernacular Salic Law, and appear to have been retained in the Latin versions, in some cases because the translators seemed doubtful as to whether their Latin terms correctly rendered the meaning of the original, in other cases because these words had become legal terms, and indicated a certain fine. We do not know whether the original Frankish law-book was ever reduced to writing, or merely retained in and handed down to posterity from the memory of some persons charged with the preservation of the law. All that we know of such an original is contained in a couple of prologues (apparently later than the texts themselves) found in certain MSS. of the existing Latin versions.

The famous clause in the Salic Law by which, it is commonly said, women are precluded from succession to the throne, and which alone has become known in course of time as *the Salic Law*, is the fifth paragraph of chapter 59 (with the rubric "De Alodis"), in which the succession to private property is regulated. The chapter opens with four (five) paragraphs in which it is enacted that—(1) if a man died without male issue, his mother (so in first recension; the second to fifth have "pater aut mater") would succeed to the inheritance (in hereditatem succedat); (2) failing her (the father and mother), his brother (brothers) or sister (sisters); (3) failing these, the sister of the mother; (4) when there was no sister of the mother, the sisters (sister) of the father; and (5), failing these, the nearest relative.

It seems clear that the first four paragraphs of the

chapter, which admit women to a share in the inheritance, refer to *private, movable* property, and that, by the fifth paragraph, the inheritance of *land* was exclusively confined to males. We know that this exclusion of women from landed property was hardly a rule anywhere in the Frankish empire, and certainly not in the sixth century, but it obtained more or less afterward, especially during the feudal period, when all the owners of landed property (*i.e.*, the tenants of fiefs) were liable to military service. We do not know when this exclusion of women from landed property began first to be applied and extended to an exclusion from the succession of thrones, as we do not read of such a notion until the middle of the fourteenth century during the controversy between Edward III. and Philip of Valois, when it was alleged to be derived from the Salic Law.

**SALICYLIC ACID**, an organic acid found in nature, in the free state, in the flowers of the meadow-sweet (*Spiræa Ulmaria*, L.), and, combined with methylic ether, in the leaves of the wintergreen (*Gaultheria procumbens*, L.) and *Andromeda Leschenaultii*, in the bark of the sweet birch (*Betula lenta*, L.), and in several species of *Viola*. It was discovered in 1838 by Piria, who prepared it artificially by the decomposition of SALICIN, (*q.v.*) It is remarkable as being the first organic compound occurring in nature which has been prepared artificially on the large scale as a commercial article. During the last few years it has been extensively used in medicine as a remedy for acute rheumatism, either alone or in the form of its sodium salt. Possessing powerful antiseptic properties and being poisonous only in large doses (the medicinal dose being from five to thirty grains), it is capable of manifold uses in the arts and manufactures. In the proportion of from 1 to 10 per cent it prevents the development of bacteria in fluids containing them, and if added to the extent of 1 part in 60 it will destroy their life. It also kills *Torula*, and prevents the souring of beer and milk. It hinders the chemical changes brought about by the action of vegetable ferments or enzymes, such as amygdalin and sinnigrin, and consequently can prevent the formation of essential oil of almonds or of oil of mustard, etc. Plants watered with its solution speedily die. The addition of a little of the acid to glue renders it more tenacious; skins to be used for making leather do not undergo decomposition if steeped in a dilute solution; butter containing a small quantity of it may be kept sweet for months, even in the hottest weather. It also prevents the moldiness of preserved fruits, and has been found useful in the manufacture of vinegar. Unless the perfectly pure acid be employed the addition of salicylic acid to articles of food must be considered dangerous, some persons being peculiarly susceptible to its action.

**SALIERI, ANTONIO**, dramatic composer, was born at Legnano, Italy, August 19, 1750. He died at Vienna May 7, 1825.

**SALII.** See **MARS**.

**SALINA**, the capital of Saline county, Kan., and prominent among the cities of the State, is situated on Smoky Hill river forty-seven miles west of Junction City and thirty-nine miles east of Ellsworth. It is also at the junction of the Union Pacific, Missouri Pacific, Atchison, Topeka and Santa Fe, and Chicago, Kansas and Nebraska railroads, making it one of the most important railway centers in that portion of the State, accessible from all directions. The city contains suitable county buildings, six churches, one private bank in addition to two National and two State banks, five weekly papers, gas, water, and street railway systems, a large number of stores and superior educational facilities. It is the seat of the Normal university and

Methodist college of the State, besides having a fine high-school building and commodious and well appointed graded schools. The manufactories embrace flouring mills, factories, and other enterprises employing a large amount of capital and force of operatives. The population, which was 3,111 in 1880, was 6,031 in June 1890.

**SALISBURY**, or **NEW SARUM**, a city and municipal and parliamentary borough, the county town of Wiltshire, England, is situated in a valley at the confluence of the Upper Avon, the Wily, the Bourne, and the Nadder, on the Great Western and South Western railways, eighty miles west-southwest of London. The population of the city and municipal borough (area 616 acres) in 1871 was 12,903, and that of the parliamentary borough (area (676 acres), 13,839; in 1881 the numbers were 14,792 and 15,680.

Salisbury and its neighborhood are remarkably rich in relics of antiquity. To say nothing of Old Sarum and the scanty ruins of the royal palace of Clarendon, Milford Hill and Fisherton are two of the richest fields in the country for palæolithic implements. In the Blackmore Museum Salisbury possesses one of the finest collections of prehistoric antiquities in England; its splendid gathering of objects from the mounds in the New World is probably unsurpassed.

**SALISBURY, ROBERT, EARL OF.** See **CECIL**.

**SALIVA, SALIVARY GLANDS.** See **NUTRITION**.

**SALLEE.** See **RABÁT**.

**SALLUST.** Sallust is the generally accepted modern form of the name of the Roman historian Caius Sallustius Crispus; 86 B.C. was the year of his birth, and the old Sabine town of Amiternium at the foot of the Apennines was his birthplace. Of his *Histories*, said to have been in five books, and to have commenced with the year 78 B.C. (the year of Sulla's death), and to have concluded with the year 66, we have but fragments; which are, however, enough to show the political partisan, who took a keen pleasure in describing the reaction which followed, on the dictator's death, against his policy and legislation. It is unfortunate that the work has not come down to us entire, as it must have thrown much light on a very eventful period, embracing the war against Sertorius, the campaigns of Lucullus against Mithradates of Pontus, and the victories of the great Pompey in the East. A few fragments of his works were published for the first time from a manuscript in the Vatican early in the present century. We have also two letters (*Duæ epistolæ de Republica ordinanda*) addressed to Cæsar, letters of political counsel and advice, which have been commonly attributed to Sallust, but as to the authenticity of which we must suspend our judgment. He died in 34 B.C.

**SALMASIUS, CLAUDIUS**, in the vernacular **SAUMAISE**, the most distinguished French classical scholar of his day, was born at Semur-en-Auxois in Burgundy, April 15, 1588. He died on September 3, 1653, from an injudicious use of the Spa waters.

**SALMON.** It will be convenient to consider this in connection with the other members of the great family to which it belongs. See **SALMONIDÆ**.

**SALMONIDÆ.** The most conspicuous of the external characteristics is the presence of two dorsal fins, of which the anterior is well developed and supported by the usual jointed bones known as fin-rays, while the posterior is thick and fleshy, rounded in outline, and destitute of rays. The posterior fin is thus a rudimentary organ, and it is commonly called the adipose fin. There are two other families of fishes which resemble the *Salmonidæ* in the arrangement of the dorsal fins—the *Percopsidæ* and *Haplochitonidæ*; but the former

consists of only one species, found in the United States, and the latter is confined to the southern hemisphere. Among British fishes a Salmonoid can be always recognized by its dorsal fins.

The *Salmonidæ* retain the open communication of the air-bladder with the intestine, and the original posterior position of the pelvic fins—features which characterize the division of *Teleostei* known as *Physostomi*. In the great assemblage of bony fishes known as *Physoclisti*, these features are lost in the adult condition. It is known that in all cases the air-bladder develops in the young fish as an outgrowth or diverticulum from the intestine; and it is obvious from a survey of Vertebrates in general that the posterior limbs belong originally to the neighborhood of the anus. It follows therefore that in these features the *Salmonidæ*, and all the *Physostomi*, are more similar to the early ancestors of the bony fishes than are those species in which the air-bladder is closed and the pelvic fins have an anterior position.

In the *Salmonidæ* the characteristic Teleostean pseudo-branchia is present. This organ is the diminished remnant of the series of gill-lamellæ belonging to the posterior face of the hyoid arch, as the pseudo-branchia in Elasmobranchs is the rudiment of the series of gill-lamellæ belonging to the posterior face of the mandibular arch. The bones known as maxillæ form a portion of the boundary of the upper jaw in *Salmonidæ*; in many fishes they are excluded from the jaw margin by the backward prolongation of the premaxillæ. There are no scales on the head in this family, and there are no fleshy filaments or "barbels" in the neighborhood of the mouth as there are in many bony fishes—for example, the Cod, in which a single short barbel is attached beneath the lower jaw. The pyloric appendages, cæcal diverticula of the intestinal tube immediately behind the stomach, are nearly always present in considerable numbers. In the female Salmon the oviduct, the tube connecting the ovary with the exterior, is wanting; the eggs when ripe escape from the surface of the ovary into the abdominal cavity and pass thence to the exterior through a pair of apertures in the body wall situated one on each side of the anus; these apertures are the abdominal pores. In the male salmon there is a duct to the testis, and the semen is extruded through it in the usual way. Fertilization takes place outside the body, the spermatozoa and eggs uniting in the water.

*Distribution.*—*Salmonidæ* are found both in the sea and in fresh water. Most of the marine species inhabit the deeper parts of the ocean. Many of the freshwater forms pass a portion of their lives in the littoral parts of the sea, ascending rivers when adult every year in order to deposit their spawn; that is to say, many species are anadromous. Some are confined entirely to fresh water. The *Salmonidæ* are, with the exception of one species, indigenous to New Zealand, peculiar to the temperate and arctic regions of the northern hemisphere. Fossils belonging to the family are found in strata of Mesozoic age. *Osmerus* occurs in the greensand of Ibbenbüren, and the schists of Glarus and Licata. *Mallotus villosus*, indistinguishable from the living Capelin, occurs abundantly in clay in Greenland, the geological age of the bed being unknown. *Osmeroides acrognathus* and *Aulolepis* are fossil genera occurring in the chalk near Lewis in Sussex, and were probably deep-sea Salmonoids.

#### *Life History of the Salmon and Allied Species.*

Up to a period not many years past, when our knowledge of the breeding and life history of the salmon and kindred species was based entirely on desultory observations of the fish in their natural conditions, there ex-

isted a great deal of uncertainty and diversity of opinion on the subject. Within the last twenty or thirty years the extensive practice of salmon culture has removed nearly all obscurity from the phenomena, and the history of Salmonoids is now more accurately known than that of most other fishes.

The salmon proper, *Salmo salar*, breeds in the shallow running waters of the upper streams of the rivers it ascends. The female, when about to deposit her eggs, scoops out a trough in the gravel of the bed of the stream. This she effects by lying on her side and ploughing into the gravel by energetic motions of her body. She then deposits her eggs in the trough; while she is engaged in these operations she is attended by a male, who sheds milt over the eggs as the female extrudes them, fertilization being, as in the great majority of *Teleostei*, external. The parent fish then fill up the trough and heap up the gravel over the eggs until these are covered to a depth of some feet. The gravel heap thus formed is called a "redd." The period of the year at which spawning takes place varies to a certain extent with the locality, and in a given locality may vary in different years; but, with rare exceptions, spawning is confined to the period between the beginning of September and the middle of January.

The eggs of *Salmo salar* are spherical and non-adhesive; they are heavier than water, and are moderately tough and elastic. The size varies slightly with the age of the parent fish, those from full-sized females being slightly larger than those from very young fish. According to rough calculations made at salmon-breeding establishments, there are 25,000 eggs to a gallon; the diameter is about a quarter of an inch. It is estimated that a female salmon produces about 900 eggs for each pound of her own weight; but this average is often exceeded.

The time between fertilization and hatching, or the escape of the young fish from the egg-membrane, varies considerably with the temperature to which the eggs are exposed. It has been found that at a constant temperature of 41° F. the period is 97 days; but the period may be as short as 70 days and as long as 150 days without injury to the health of the embryo. It follows therefore that in the natural conditions eggs deposited in the autumn are hatched in the early spring. The newly hatched fish, or "alevin," is provided with a very large yolk-sac, and by the absorption of the yolk contained in this the young creature is nourished for some time; although its mouth is fully formed and open, it takes no food. The alevin stage lasts for about six weeks, and at the end of it the young fish is about 1¼ inches long. During the next period of its life the young salmon is called a "parr," and is distinguished by the possession of a number of dark transverse marks along the sides known as "parr marks." These marks occur in the young stage of many species among the *Salmonidæ*. The parr doubles its length in about four months.

The great majority of parr remain in fresh water for two years after hatching, at the end of which time they are about eight inches in length. The second spring after they are hatched they develop a coating of bright silvery scales which completely conceal the parr marks, and they pass into a stage in which they are known as "smolts." The smolt is similar to the adult salmon in all respects except size, and the young salmon, as soon as the smolt stage is reached, migrates down the rivers to the sea.

The above facts have been established within recent years by acute observation and experiment. Not very long ago it was a disputed question whether the parr was the young salmon or a distinct species of fish. It has been conclusively ascertained that some parr become

smolts and migrate to the sea in the spring following that in which they were hatched, while the great majority remain in the parr stage until the second spring, and a few do not attain to the smolt condition until the third year. The male parr when only seven or eight inches in length is often sexually mature, the milt being capable of fertilizing the ova of an adult female salmon.

The migration of smolts to the sea takes place in all rivers at about the same time of the year, viz., between March and June. Sometimes the smolts are observed descending in large shoals. Formerly angling for the descending smolts was a recognized sport, but their capture is now illegal. It is the opinion of the most competent authorities that the smolts increase with wonderful rapidity in size and weight when they reach the sea, and then return to the rivers after a few months, during the same year, as "grilse," which name is given to sexually mature salmon up to a little over five pounds in weight. It is surprising that a smolt weighing only a few ounces should increase to three or four or even six pounds in about three months. Nevertheless it has been proved by actual experiment that this is the fact. At Stormontfield, in May, 1855, 1,300 smolts were marked by cutting off the adipose fin, and twenty-two of these were recaptured the same summer as grilse, weighing from three pounds upward. It might be supposed that some smolts do not return as grilse till the summer following the year of their descent, the time of their stay in the sea being variable, as is the period spent by parr in the rivers. But all the evidence is against this supposition; grilse never commence ascending till late in summer; if they had been more than a year in the sea, some would probably ascend early in the season, as do the larger salmon. At the same time it must be borne in mind that a fish which remained in the sea a year after descending as a smolt might not be recognized as a grilse, having reached the size of a small salmon.

The grilse, after spawning in autumn, return to the sea in the winter or the following spring, and reascend the rivers as mature spawning salmon in the following year. Both salmon and grilse after spawning are called "kelts." The following recorded experiment illustrates the growth of grilse into salmon:—a grilse-kelt of two pounds was marked on March 31, 1858, and recaptured on August 2 of the same year as a salmon of eight pounds.

The ascent of rivers by adult salmon is not so regular as that of grilse, and the knowledge of the subject is not at the present time complete. Although salmon scarcely ever spawn before the month of September, they do not ascend in shoals just before that season; the time of ascent extends throughout the spring and summer. A salmon newly arrived in fresh water from the sea is called a clean salmon, on account of its bright, well-fed appearance; during their stay in the rivers the fish lose the brilliancy of their scales and deteriorate in condition. The time of year at which clean salmon ascend from the sea varies greatly in different rivers; and rivers are, in relation to this subject, usually denominated early or late.

In their ascent salmon are able to pass obstructions, such as water-falls and weirs of considerable height, and the leaps they make in surmounting such impediments and the persistence of their efforts are very remarkable. In a great many rivers anadromous Salmonoids have been excluded from the upper reaches by artificial obstructions, such as dams and weirs, constructed for the purpose of utilizing the water of the stream, or to obtain water power, or simply to facilitate the capture of the fish. Other rivers have been rendered uninhabitable to salmon by pollutions.

The life history of *Salmo trutta* and *S. cambricus* is very similar to that of *Salmo salar*. The river trout, *S. fario*, makes a redd in the shallower parts of streams in the same manner as the salmon, the only difference being that the mound of gravel forming the redd is smaller, the eggs lying from one to two feet below the surface. The breeding period of the trout varies in different rivers, within the limits of September and March. The number of eggs produced by each female is about 800 for every pound of the parent's weight; about 40,000 of the eggs make a gallon, so that they are considerably smaller than those of *S. salar*.

The charrs differ from lake trout in the fact that they do not ascend streams in order to spawn, but form their redds in the gravelly shallows of the lakes they inhabit. The spawning period of the charr of the Cumberland lake district is from the beginning of November to the beginning of December. The eggs of the charr have been found to hatch in from sixty to ninety days, the great majority in seventy days, at an average temperature of 40° F. The American species, *S. fontinalis*, breeds at about the same time as *S. fario*; its eggs are only half the size of those of the latter.

The smelt, *O. eperlanus*, is a gregarious fish and exhibits regular migrations in most estuaries. It is common in the Solway, the Firth of Forth, the rivers of Norfolk, and the estuary of the Thames. In most places where it is found it remains in the fresh and brackish water from August until May, spawning about the month of April, and afterward descending to the sea for the summer. At Alloa on the Forth smelts are taken in large numbers by seine nets in spring, before and during the spawning period. There is a regular fishery for them at the same season on the Solway Firth and in Norfolk. The food of the smelt consists chiefly of young fish, especially young herrings, and crustaceans. The eggs are small, yellowish in color, and adhesive, not adhering by the surface merely as in the case with those of the herring, but each egg possessing a short thread the end of which becomes attached to planks, stones, or other solid objects in the water. According to Mr. Day the eggs are deposited near the high-water mark of spring-tides, so that they must be exposed to the air during the ebb. The smelt when in the sea is largely eaten by the picked dog-fish (*Acanthias vulgaris*). The species is absent from the southern coast of England and from Ireland, the smelt recorded as occurring on those coasts being probably the atherine (*Atherina*), often called the sand-smelt. *O. eperlanus* is abundant on the coast of Finland, and also is common there in freshwater lakes, in which it remains all the year round. It is also common on the Atlantic coast of France. It is of interest to note that the smelt in Britain and on other coasts, when not confined to fresh water, is, in its migration, intermediate between anadromous *Salmonidæ*, which ascend to near the sources of rivers, and such fish as the herring, which approach the shore to spawn but do not usually enter rivers. The smelt as a rule ascends estuaries only as far as the region of brackish water.

The various species of *Coregonus* resemble the charr in their habits, spawning in the autumn in the shallows of the lakes they inhabit.

The grayling, *Thymallus vulgaris*, is in Britain exclusively fluviatile; in Scandinavia it is found also in lakes. It is met with chiefly in clear streams with sandy gravels or loamy beds. It was introduced not many years ago into the Tweed by the marquis of Lothian, and thrives there. It is absent from the Thames, but is common in most of the rivers of England and Wales—*e.g.*, the rivers of Yorkshire, the Severn, and the Wye. It is absent from Ireland. It

feeds on insects and their larvæ, crustaceans, and small mollusks. It breeds in April and May, depositing its ova on the surface of the gravel in the shallows, not in a redd. The ova are smaller than those of the trout, and vary in color from white to deep orange, and they hatch from the twelfth to the fourteenth day after extrusion. The fry grow to four or five inches in length by August, and by the following autumn to nine or ten inches.

**SALOME**, widow of Alexander Jannæus, and queen of Judæa from 79 to 69 B.C. Another Salome is the daughter of Herodias, mentioned in Matt. xiv. 6. Her father was Herod, son of Herod the Great and Mariamme, and she became successively wife of her father's brother the tetrarch Philip (son of Herod the Great by Cleopatra; see **HEROD PHILIP**), and of Aristobulus.

**SALONICA**, or **SALONIKI** (Ital. *Salonico*, Turkish *Selanik*, Slav. *Solun*, the ancient *Thessalonica*), during the Roman empire the capital of the province of Macedonia, and still one of the most important cities of European Turkey, the chief town of an extensive vilayet which includes the sanjaks of Salonica, Serres, Drama, and Monastir, and has an aggregate population of 1,500,000.

The prosperity of Salonica has all along been largely that of a commercial city. During the Christian centuries before the Mohammedan conquest the patron saint of the city was also the saint of a great market or fair to which merchants came from all parts of the Mediterranean, and even from countries beyond the Alps. At the beginning of the present century a large export trade was carried on in woolen and cotton fabrics, white and red yarns, grain, wool, tobacco, yellow berries, silk fabrics, sponges, etc.; and silk gauze was manufactured in the city. Direct British trade with Salonica began after the Greek war of independence. Woven fabrics are at present imported from England, Austria, Germany, Switzerland, and Italy; sugar mainly from Austria; coffee from South America (partly direct); petroleum from America and Russia; soap from Greece and Crete; metal goods from England, France and Austria; and coal from England. The exports comprise cereals (wheat, barley, oats, maize, rye), tobacco, wool, cotton, poppy seed, opium, cocoons, prunes, and timber. In 1884 the industrial establishments were steam flour-mills, a cotton-spinning factory (employing 500 hands and sending its goods to Constantinople, Smyrna, and Beyrout), a distillery, several large soap-works, a nail factory, an iron-bedstead factory, and a number of brick and tile works.

**SALOP**. See **SHROPSHIRE**.

**SALSETTE**, a large island to the north of Bombay, with an area of 241 square miles. It lies between  $19^{\circ} 2' 30''$  and  $19^{\circ} 18' 30''$  N. latitude, and between  $72^{\circ} 51' 30''$  and  $73^{\circ} 3'$  E. longitude; it is connected with Bombay Island by bridge and causeway.

**SALT**. Common salt, or simply salt, is the name given to the native and industrial forms of sodium chloride (NaCl). The consideration of this important substance naturally falls under two heads, relating respectively to sea salt or "bay" salt and "rock" salt or mineral salt. As actually found, however, the one is probably derived from the other, most rock salt deposits bearing evidence of having been formed by the evaporation of lakes or seas at former (often remote) geological periods. This is seen from their stratified nature, with their interposed beds of clay, which could only have been deposited from solution. The crystals of selenite (hydrated calcium sulphate), moreover, which they contain can only have been formed in water and can never have since been subjected to any considerable

amount of heat, otherwise their water of crystallization would have been driven off. The beds also of potassium and magnesium salts found at Stassfurt and other places, interposed between or overlying the rock salt deposits, are in just the position in which one would naturally expect to find them if deposited from salt water. Finally, the marine shells often occurring abundantly in the surrounding rocks of contemporary periods also testify to the former existence of large neighboring masses of salt water.

*Sea Salt*.—Assuming a degree of concentration such that each gallon of sea water contains 0.2547 pounds of salt, and allowing an average density of 2.24 for rock salt, it has been computed that the entire ocean if dried up would yield no less than 4,419,360 cubic miles of rock salt, or about fourteen and a half times the bulk of the entire continent of Europe above high-water mark, mountain masses and all. The proportion of sodium chloride in the water of the ocean, where it is mixed with small quantities of other salts, is on the average about 33.3 per 1,000 parts, ranging from 29 per 1,000 for the polar seas to 35.5 per 1,000 or more at the equator. Inclosed seas, such as the Mediterranean, the Red Sea, the Black Sea, the Dead Sea, the Caspian, and others, are dependent of course for the proportion and quality of their saline matter on local circumstances. Forchhammer found the following quantities of solid matter in the water of various seas:

North Sea.....	32.80	grammes per liter.
Cattegat and Sound.....	15.12	"
Baltic.....	4.81	"
Mediterranean.....	37.50	"
Atlantic.....	34.30	"
Black Sea.....	15.89	"
Caribbean Sea.....	36.10	"

Of this sodium chloride constitutes about four-fifths. See **SEA WATER**.

At one time almost the whole of the salt in commerce was produced from the evaporation of sea water, and indeed salt so made still forms a staple commodity in many countries possessing a seaboard, especially those where the climate is dry and the summer of long duration. In Portugal a total of over 250,000 tons is annually made in the salt works of St. Ubes (Setubal), Alcacer do Sal, Oporto, Aneyro, and Figueras. Spain, with the salt works of the Bay of Cadiz, the Balearic Islands, etc., makes 300,000 tons. Italy has salt works in Sicily, Naples, Tuscany, and Sardinia, producing 165,000 tons. In France, between the "marais salants du midi" and those on the Atlantic, 250,000 to 300,000 tons are annually produced, besides those of Corsica. The "Salzgärten" of Austria produce collectively from 70,000 to 100,000 tons annually at various places on the Adriatic, (Sabioncello, Trieste, Pirano, Capo d'Istria, etc.) In England and Scotland the industry has of late years greatly fallen off under the competition of the rock-salt works of Cheshire, but some small manufactories still exist, at North Shields and elsewhere, where salt is made by dissolving rock-salt in sea water, and evaporating the solution to crystallization by artificial heat.

A large piece of land, varying from one or two to several acres, barely above high-water mark, is leveled, and if necessary puddled with clay so as to prevent the water from percolating and sinking away. In tidal seas a "jas," as the storage reservoir is called, is constructed alongside, similarly rendered impervious, in which the water is stored and allowed to settle and concentrate to a certain extent. In non-tidal seas this storage basin is not required. The prepared land is partitioned off into large basins (*adernes* or *muants*) and others (called in France *aires*, *euillets*, or *tables salantes*) which get smaller and more shallow in pro-

portion as they are intended to receive the water as it becomes more and more concentrated, just sufficient fall being allowed from one set of basins to the other to cause the water to flow slowly through them. The flow is often assisted by pumping. The sea salt thus made is collected into small heaps on the paths around the basins or the floors of the basins themselves, and here it undergoes a first partial purification, the more deliquescent salts (especially the magnesium chloride) being allowed to drain away. From these heaps it is collected into larger ones, where it drains further, and becomes more purified. Here it is protected by thatch till required for sale.

The salt is collected from the surface by means of a sort of wooden scoop or scraper which the workman pushes before him, but in spite of every precaution some of the soil on which it is produced is inevitably taken up with it, communicating a red or gray tint. Sea salt is thence known in many of the French markets as *sel gris*, and frequently contains as much as 15 per cent. of impurity.

*Rock-Salt.*—This appears to occur in almost every formation, except in the Primary rocks, strictly so called. The oldest deposit of which the age may be considered to have anything like precisely determined may be said to be the great salt range of the Punjab, which is regarded as belonging to the Permian; and that lately discovered at Middlesbrough, Yorkshire, immediately overlying the magnesian limestone, may be probably referred to the same period. In the northern counties of England there are frequent instances of brine springs rising from the Carboniferous and contiguous formations. The Cheshire and Worcestershire salt-beds are by some attributed to the Permian; more generally, however, they are referred to the Trias. Those of West New York and Gooderich (Canada) are said to belong to the Salina period of the Upper Silurian. The deposits of the Vosges, Salzburg, and others of central Germany and Austria are considered to belong to the Trias; that of Bex in Switzerland to the Lias. Those of Wieliczka in Poland, Cardona in Spain, and some Algerian formations are admitted to be Cretaceous. Those of Bayonne, Dax, and Camarade, in the Pyrenees, are probably Tertiary, while the Dead Sea, Lake Elton in Astrakhan, the Bitter Lakes of the Isthmus of Suez, the Kara Boghaz on the shores of the Caspian, the Limans of Bessarabia south of Odessa, the Runn of Cutch, and certain formations of the sea of Azoff, etc., are instances of salt formations now in actual progress. The frequent association of bitumen and petroleum with rock-salt and brine is one of the most noticeable features in the geology of those substances, and seems to point to some unknown condition of the formation of the two first named. The Dax salt is close to the bitumen deposits of Bastenès and Gaujac. Borings made at Dax, as well as at Salies, about twenty miles distant (where also salt exists), gave vent to an efflux of inflammable gas which continued for several weeks, and the water of several springs in that neighborhood is tainted with petroleum. Bitumen and petroleum occur near Volterra in Tuscany, where a large deposit of salt is being worked. In Wallachia the two occur in the same formation. In the United States and in the south of Russia petroleum and brine are found in many places either actually associated or in near proximity; petroleum has recently been discovered not far from the salt deposits of Hanover, and one of the beds of rock-salt at Nancy is strongly colored by bitumen, while almost all rock-salt has more or less perceptible bituminous odor when struck or rubbed. In the province of Szechuen, China, are some remarkable salt springs, where the brine is accompanied by

such an efflux of inflammable gas that the latter serves as fuel for its evaporation; and other springs accompanied by the same phenomenon exist in the same region. In fact, instances without end might be cited of the two occurring together, and it would appear that petroleum for some mysterious reason can only be formed in presence of salt.

The chief rock-salt districts of Europe may be classified as follows: (1) the Carpathians; (2) Austrian and Bavarian Alps; (3) West Germany; (4) Vosges; (5) Jura; (6) Swiss Alps; (7) Pyrenees and the Spanish or Celtiberian Mountains; (8) the British salt deposits; (9) isolated deposits and springs in Russia, Turkey, Italy, etc.

SALTA, capital of a province of the same name in the Argentine Republic, with a population of about 20,000 (1881), is a well built town occupying a somewhat insalubrious situation, 3,780 feet above the sea, at the confluence of the Rio de la Sillata and Rio de Arias, head streams of the Rio Salado (there called Rio Pasaje or Juramanto), about 820 miles northwest of Buenos Ayres. The town, founded by Abreu in 1582, was originally known as San Clemente de Nueva Castilla.

SALTCOATS, a seaport and watering-place of Ayrshire, Scotland, contiguous to Ardrossan, and nineteen miles north of Ayr. The population, 4,624 in 1871, in 1881 was 5,096.

SALTILLO, the capital of the state of Coahuila in Mexico, sixty-five miles southwest of Monterey by the Mexican National railway, on the slope of a hill overlooking a fertile valley. It has well-paved streets, several good public buildings, and cotton factories and other industrial establishments. The population is about 17,000.

SALT LAKE CITY (originally Great Salt Lake City), a city of the United States, the capital of Utah Territory, and the metropolis of Mormonism, stands nearly in  $41^{\circ}$  N. latitude, and  $112^{\circ}$  W. longitude, at a height of 4,250 feet above the sea, on the brow of a slight decline at the western base of the Wahsatch range, and on the right bank of the Jordan, a stream which flows from Utah Lake into Great Salt Lake. By the Utah Central railroad the city is thirty-six miles south of Ogden Junction on the Union and Central Pacific railroad, and it is the terminus of the Southern and Western Utah railroads. The city is laid out chess-board fashion, with all the streets 137 feet wide and all the blocks 40 rods square. Shade and fruit trees have been freely planted, and on each side of every north and south street flows a stream of pure water in an open channel. With the exception of some modern erections, the houses are nearly all of sun-dried bricks. The largest and ugliest public building is the tabernacle, with its huge oval wooden dome. It is said to accommodate 8,000 to 10,000 persons, and has the second largest organ in America. Within the same inclosure as the tabernacle are the endowment house, where the initiation ceremonies of Mormonism are performed, and the new Mormon temple (1874-5), erected at a cost of \$10,000,000. Other conspicuous buildings are the city-hall, used as the Territorial capitol, the theater, Walker's opera house, the Salt Lake pavilion, the museum, the Deseret university, several hospitals, and the city prison. The population was 5,000 in 1850, 8,230 in 1860, 12,813 in 1870, 20,768 in 1880, and 44,843 in 1890.

When Great Salt Lake City was founded in July, 1847, the whole region lay far beyond the advancing wave of western civilization. But the city did not long remain the isolated oasis in the desert which its first settlers made it; and it has now a considerable non-Mormon population, a United States garrison at Camp

Douglas (between two and three miles distant), and United States judges.

During the past few years the non-Mormon or gentile element in Salt Lake City has steadily increased, and at the spring elections of 1890 the Mormons suffered an overwhelming defeat. The usual cry of fraud was raised, and detectives from various cities employed to unearth the alleged frauds, but with no material effect. The result of the election, together with the laws against polygamy, bids fair to extinguish aggressive Mormonism practically and socially.

SALTPETER, or NITRATE OF POTASH ( $\text{KNO}_3$ ), is a salt obtained as a commercial product in three different ways. (1) It occurs as an efflorescence on the surface or in the superficial stratum of the soil in many parts of the world, but specially to a great extent in the Ganges valley and other parts of India. (2) It is obtained in a semi-artificial manner in nitreries or saltpeter plantations. These consist of heaps of decomposing animal matter mixed with lime ashes, road scrapings, and other rubbish covered over from rain, and from time to time damped with the runnings from stables and other urine. Such heaps develop within them small proportions of the salt and other nitrates, and are, in effect, artificial imitations of the saltpeter-bearing soil of India. They were formerly very common in Switzerland, France, Germany, and Sweden. (3) A large quantity of saltpeter is now prepared from Chili saltpeter, the nitrate of soda, by double decomposition of the soda salt with another salt of potash. Saltpeter is of importance in numerous industries, among the most prominent of which are gunpowder manufacture and pyrotechny. It is also used as an oxidizing agent in glassmaking and in metallurgical operations. In the curing of meat it is extensively employed with common salt and sugar, and it also occupies an important place in pharmacy.

SALUS (Safety), a goddess worshiped in various parts of ancient Italy. At Rome a temple adorned with paintings by Fabius surnamed the Painter (Pictor) was dedicated to her in 302 B.C.; and public prayers were offered to her on behalf of the Roman people and the emperor.

SALUTATIONS, or greetings, are customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically the word *salutation* (Lat. *salutatio*, "wishing health") refers to words spoken, but the conventional gestures are even more purposeful, and both should be considered together. The principal modes of saluting, when classified, fall into a few groups, with well-defined meanings, the examination of which explains the practice of any particular tribe or nation.

Forms of salutation frequent among savages and barbarians may last on almost unchanged in civilized custom, or may be found in modified shapes, while in other cases they may have disappeared altogether and been replaced by new greetings. The habit of affectionate clasping or embracing is seen at the meetings of the rude Andamaners and Australians, or where the Fuegians in friendly salute hug "like the grip of a bear."

The embrace continues habitual through later ages, and, though in modern times a good deal restricted, it still marks the meetings of near kinsfolk and lovers. But the kiss associated with it has no such universality. The idea of the kiss being an instinctive gesture is negatived by its being unknown over half the world, where the prevailing salute is that by smelling or sniffing (often called by travelers "rubbing noses"), which belongs to Polynesians, Malays, Burmese and other Indo-Chinese, Mongols, etc., extending thence eastward to the Eskimo and westward to Lapland, where Lin-

næus saw relatives saluting by putting their noses together. This seems the only appearance of the habit in Europe. On the other hand the kiss, the salute by tasting, appears constantly in Semitic and Aryan antiquity, as in the above cases from the book of Genesis and the *Odyssey*, or in Herodotus' description of the Persians of his time kissing one another—if equals on the mouth, if one was somewhat inferior on the cheek. In Greece in the classic period it became customary to kiss the hand, breast, or knee of a superior. In Rome the kisses of inferiors became a burdensome civility.

The early Christians made it the sign of fellowship, "greet all the brethren with an holy kiss." Strokings, pattings, and other caresses have been turned to use as salutations, but have not a wide enough range to make them important. Weeping for joy, often occurring naturally at meetings, is sometimes affected as a salutation; but this seems to be different from the highly ceremonious weeping performed by several rude races when, meeting after absence, they renew the lamentations over those friends who have died in the meantime. The typical case is that of the Australians, where the male nearest of kin presses his breast to the new comer's, and the nearest female relative, with piteous lamentations, embraces his knees with one hand, while with the other she scratches her face till the blood drops. Obviously this is no joy-weeping, but mourning, and the same is true of the New Zealand *tangi*, which is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not.

Cowering or crouching is a natural gesture of fear or inability to resist that belongs to the brutes as well as man; its extreme form is lying prostrate, face to the ground. In barbaric society, as soon as distinctions are marked between master and slave, chief and commoner, these tokens of submission become salutations. The sculptures of Egypt and Assyria show the lowly prostrations of the ancient East, while in modern Dahomey or Siam subjects crawl before the king, and even Siberian peasants grovel and kiss the dust before a noble.

Bowing, as a salute of reverence, appears in its extreme in Oriental custom, as among the ancient Israelites: "bowed himself to the ground seven times" (Gen. xxxiii. 3). The Chinese, according to the degree of respect implied, bow kneeling or standing. The bowing salutation, varying in Europe from something less than the Eastern salaam down to the slightest inclination of the head, is interesting from being given mutually, the two saluters each making the sign of submission to the other, which would have been absurd till the sign passed into mere civility. Uncovering is a common mode of salutation, originally a sign of disarming or defencelessness or destitution in the presence of a superior. Polynesian or African chiefs require more or less stripping, such as the uncovering to the waist which Captain Cook describes in Tahiti. Taking off the hat by men has for ages been the accepted mode in the Western world, done in a frequent, demonstrative way by such as make a show of politeness, and who by being "free of cappe and full of curtesye" pay cheaply social debts; but modern society has moderated this bowing and scraping (the scrape is throwing back the right leg as the body is bent forward), as well as the curtseys (*courtoisie*) of women. Eastern nations are apt to see disrespect in baring the head, but insist on the feet being uncovered. Grasping hands is a gesture which makes its appearance in antiquity as a legal act symbolic of the parties joining in compact, peace or friendship; this is well seen in marriage, where the hand grasp was part of the ancient Hindu ceremony, as was the "dextrarum junctio" in Rome, which passed on into the Christian rite.

As to words of salutation, it is found even among the

lower races that certain ordinary phrases have passed into formal greetings. Thus among the Tupis of Brazil, after the stranger's silent arrival in the hut, the master, who for a time had taken no notice of him, would say "*Preioubé?*" that is "Art thou come?" to which the proper reply was, "Yes, I am come!" Many formulas express difference of rank and consequent respect, as where the Basuto salute their chiefs with "*Tama sevata!*" *i.e.*, "Greeting, wild beast!" Congo negroes returning from a journey salute their wives with an affectionate *Okowe!* but they, meekly kneeling around him, may not repeat the word, but must say *Ka! Ka!* Among cultured nations salutations are apt to be expressions of peace and goodwill. On the whole, though the half-meaningless forms of salutation may often seem ridiculous, society would not carry them on so universally unless it found them useful. In fact, they serve the substantial purpose of keeping up social intercourse, and establishing relations between the parties in an interview, of which their tone may strike the key note. Montaigne, a master of the courtesy of an age more ceremonious than ours, truly asserts their importance, "C'est au demourant une très utile science que la science de l'entregent."

**SALUZZO**, or **SALUCES**, a city of Italy, at the head of a circondario in the province of Cuneo, forty-two and one-half miles south of Turin (with which it is connected by railway and a steam tramway), is situated 600 to 650 feet above the sea, just where the last hills of the Monte Viso die away into the plain between the Po and its tributary the Vraita. The population of the city was 10,145 (commune 16,247) in 1880.

**SALVADOR**. See **SAN SALVADOR**.

**SALVAGE** is "the reward which is earned by those who have voluntarily saved or assisted in saving a ship or boat, or their apparel, or any part thereof; or the lives of persons at sea; or a ship's cargo or any part thereof from peril; or a wreck from total loss." The word salvage is indifferently used to denote the claim, the reward, or the property saved. Salvage is interesting as being perhaps the one case in English law in which a person may become liable to a claim upon him for services rendered to him without his request, express or implied. Salvage may be either military or civil. Claims for military salvage, *i.e.*, salvage on recapture (for which see **PRIZE**) are decided by a prize court. The tribunal for determining cases of civil salvage, the usual kind, is a court having admiralty jurisdiction. In England or Ireland the High Court of Justice (Admiralty Division), in Scotland the Court of Sessions, have cognizance of salvage claims to any amount.

The rules which guide the courts in the award of salvage are reducible to a few simple principles, depending partly upon the general maritime law, partly upon the Merchant Shipping Acts, 1854 and 1862. (1) The salvage service must have been rendered within the jurisdiction of the **ADMIRALTY**, (*q.v.*) (2) There must be no legal duty on the part of the salvors to render assistance. Therefore there must be very meritorious and exceptional services on the part of the crew, or even of a pilot, a passenger, or a crew of a tug, to entitle any of them to salvage. The same is the case with the officers and crew of a queen's ship, coastguardsmen, etc., who are bound by their position to assist. (3) The property must have been in peril, and rescued by the salvors. (4) The services must have been successful. Of course where a request for help has actually been made, and the property perishes, the right of remuneration nevertheless survives, on the ordinary principles of contract. The basis of salvage proper is service independently of contract.

Salvage is a term also applied by analogy to property

not saved at sea, but from fire on land. In nearly all American cities there is an insurance patrol called "salvage corps," whose duty it is to use every endeavor to save property from destruction by fire. The term is also applied to property recovered from destruction by the aid of voluntary payments. The person making the last advance is entitled to priority in the nature of quasi salvage, as the continued existence of the property at all may be due to him, *e.g.*, the case of a payment made to prevent the forfeiture of a policy of insurance. Charges in favor of a solicitor upon property recovered or preserved by his means have been several times declared by the courts to be in the nature of salvage of this kind.

The law of the United States is in general agreement with that of England. The court of admiralty jurisdiction is the district court. The area in which salvage services may be rendered is much wider than in England, as it includes the great freshwater navigable rivers and lakes. This difference arises from the greater importance of inland navigation in the United States. See **RIPARIAN LAWS**.

**SALVIAN**, a Christian writer of the fifth century, was born in Gaul, and most probably in the neighborhood of Treves or Cologne. His birth has been conjecturally assigned to the period from 390 to 420. He seems to have been still living at Marseilles when Gennadius wrote under the papacy of Gelasius (492-496).

Of Salvian's writings there are still extant two treatises, entitled, respectively, *De Gubernatione Dei* and *Ad Ecclesiam*, and a series of nine letters.

**SALWIN HILL TRACTS**, a district in the Tenasserim division of British Burmah, extending from the northern portion of the province southward to Kawka-rit on the Salwin river, and occupying the whole of the country between that river on the east and the Pong-loung Mountains on the west. The district contains an area of about 4,646 square miles. The population in 1881 was returned at 30,009.

**SALZA**, **HERMANN VON**, one of the most illustrious knights of the Teutonic order, was a scion of the house of Langensalza in Thuringia, where he was born about 1180. He was a faithful and influential councilor of the emperor Frederick II., and took a prominent part in the contemporary affairs of the German empire. The events of his life are involved in the history of the **TEUTONIC ORDER**, of which he was elected master in 1210 or 1211. He died in 1239.

**SALZBRUNN**, a small German watering-place, visited annually by about 4,000 patients, is situated in Silesia, thirty miles to the southwest of Breslau. Its alkalo-saline springs, which are especially efficacious in pulmonary complaints, were known as early as 1316, but afterward fell into disuse until their merits were once more discovered at the beginning of this century. The resident population in 1880 numbered 5,777.

**SALZBURG**, capital of the present Austrian crown-land and formerly of the archbishopric of the same name, occupies a position of singular beauty on the Salzach, eighty-seven miles southeast of Munich, and 154 miles west-by-south of Vienna.

The origin and development of Salzburg were alike ecclesiastical, and its history is involved with that of the archbishopric to which it gave its name.

By the peace of Lunéville Salzburg was given to the archduke of Austria and grand-duke of Tuscany in exchange for Tuscany; and its new owner was enrolled among the electoral princes. In the redistribution following the peace of Pressburg in 1805, Salzburg fell to Austria. Four years later it passed to Bavaria, but the peace of Paris in 1814 restored it to Austria, to

which it has since belonged. Under the designation of a duchy the territory formed the department of Salzach in Upper Austria until 1849, when it was made a separate crown-land, with the four departments of Salzburg, Zell, Tamsweg, and St. Johann. In 1861 the management of its affairs was intrusted to a local diet, consisting of the governor, the archbishop, and twenty-five representatives. The area of the duchy is 2,762 square miles and the population in 1880 was 163,570, almost exclusively Roman Catholic and of German stock. In 1880 the population (including the suburbs) was 20,336.

**SALZKAMMERGUT**, a district in the southwest angle of Upper Austria, between Salzburg and Styria, famous for its fine scenery, forms a separate imperial domain about 250 square miles in area, with a population of over 18,000. The beauty of its lofty mountains, sequestered lakes, and green valleys has made it one of the favorite tourist resorts of Europe, and has gained for it the title of the "Austrian Switzerland;" but it owes its name (literally "salt-exchequer property") and its economic importance to its extensive and valuable salt mines.

**SALZWEDEL**, an ancient town of Prussian Saxony, lies on the Jeetze, a tributary of the Elbe, thirty-two miles to the northwest of Stendal. It is an industrial place of some importance, with linen, cotton, and woolen manufactures, carries on a brisk river trade in grain, and possesses a fine Gothic church of the thirteenth century. The population in 1880 was 8,780.

**SÁMÁNID DYNASTY**, the name of the third among those native dynasties which sprang up in the ninth and tenth centuries in the eastern portions of Persia, and, although nominally provincial governors under the suzerainty of the caliphs of Baghdád, succeeded in a very short time in establishing an almost independent rule over the vast territories round the Oxus and Jaxartes. The Ma'mún, Hárún-alrashíd's son, to whose patronage the Táhirid family owed their supremacy in Khorásán and Transoxiana (820-872, 205-259 A.H.) appointed three sons of Sámán, originally a Tartar chief who claimed descent from the old Sásánian kings, governors of Herát and some districts beyond the Oxus; and these soon gained such an ascendancy over all rival clanships that in 872, when the Táhirids were overthrown by the Saffárids under the leadership of Ya'kúb b. Laith (868-878), they were strong enough to retain in their family the governorship of Transoxiana, with the official sanction of the caliph Mo'tamid (870-892), and to establish a semi-royal court in Bokhárá, the seat of the new Sámánid government. During the reign of Ya'kúb's brother 'Amr b. Laith (878-900) Isma'íl b. Ahmad, Sámán's great-grandson (892-907, 279-295 A.H.), crossed the Oxus with a powerful army, invaded the territory of the Saffárids, sent 'Amr as prisoner to Baghdád, and gradually extended his rule over Khorásán, Khwárizm, Jurján, and the neighboring countries. His successors, all renowned by the high impulse they gave both to the patriotic feelings and to the national poetry of modern Persia (see PERSIA), were Ahmad b. Isma'íl (907-913, 295-301 A.H.); Nasr II. b. Ahmad, the patron and friend of the great poet Rúdagi (913-942, 301-331 A.H.); Núh I. b. Nasr (942-944, 331-342 A.H.); 'Abd al-Malik I. b. Núh (954-961, 343-350 A.H.); Mansúr I. b. Núh, whose vizier, Bal'amí, translated Tabarí's universal history into Persian (961-976, 350-366 A.H.); Núh II. b. Mansúr, whose court-poet Dakíkí commenced the *Sháhnáma* (976-997, 366-387 A.H.); Mansúr II. b. Núh (997-998, 387-389 A.H.); and 'Abd al-Malik II. b. Núh (999), with whom the Sámánid dynasty came to a rather abrupt end,

**SAMAR.** See PHILIPPINE ISLANDS.

**SAMARA**, a government of southeastern Russia, on the left bank of the lower Volga, bounded on the north by Kazañ, on the west by Simbirsk and Saratoff, on the east by Ufa and Orenburg, and on the south by Astrakhan, the Kirghiz Steppes, and the territory of the Ural Cossacks. The area is 58,320 square miles, and the population in 1882 was 2,224,093.

**SAMARA**, capital of the above government, is situated on the slopes of the left bank of the Volga, 743 miles to the southeast of Moscow, at the mouth of the Samara, and opposite the hills of Zheguleff. It is one of the most important towns of the lower Volga for its trade, and its importance cannot fail to increase as the railway to Central Asia advances eastward. Its population rose from 34,500 in 1869 to 63,400 in 1880.

**SAMARANG.** See JAVA.

**SAMARCAND.** See SAMARKAND.

**SAMARIA**, the capital of Northern Israel from the time of Omri to the fall of the kingdom, which was consummated in the long siege of the royal city by Shalmaneser and its capture by his successor Sargon. It stands in the very center of Palestine and of the country of the dominating tribe of Joseph, and, built on a steep and almost isolated hill, with a long and spacious plateau for its summit, was naturally a position of much strength, commanding two of the most important roads—the great north and south road which passes immediately under the eastern wall, and the road from Shechem to the maritime plain which runs a little to the west of Omri's capital.

**SAMARITANS.** This term, which primarily means "inhabitants of Samaritis or the region of Samaria," is specially used, as in the New Testament and in Josephus, as the name of a peculiar religious community which had its headquarters in the Samaritan country, and is still represented by a few families (about 150 souls) at Nábulus, the ancient Shechem. They regard themselves as Israelites, descendants of the ten tribes, and claim to possess the orthodox religion of Moses, accepting the Pentateuch and transmitting it in a text which for the most part has only microscopic variations from the Torah of the Jews. But they regard the Jewish temple and priesthood as schismatical, and declare that the true sanctuary of God's choice is not Zion but Mount Gerizim, overhanging Shechem (John iv. 20); here they had a temple which was destroyed by John Hyrcanus about 128 B.C. (Jos., *Ant.*, xiii. 9, 1), and on the top of the mountain they still celebrate the passover. The sanctity of this site they prove from their Pentateuch, reading Gerizim for Ebal in Deut. xxvii. 4. With this change the chapter of Deuteronomy can be interpreted with a little straining as a command to select Gerizim as the legitimate sanctuary (comp. ver. 7); and accordingly in Exod. xx. and Deut. v. a commandment taken from Deut. xxvii. is inserted at the close of the decalogue. Thus on their reckoning the tenth commandment is the direction to build an altar and do sacrifice on Gerizim—from which of course it follows that not only the temple of Zion but the earlier temple of Shiloh and the priesthood of Eli were schismatical. Such at least is the express statement of the later Samaritans; the older Samaritans, as they had no sacred books except the Pentateuch, probably ignored the whole history between Joshua and the captivity, and so escaped a great many difficulties.

Jews and Samaritans were separated by bitter jealousies and open feuds (Jos., *Ant.*, xii. 4, 1), but their internal development and external history ran closely parallel courses till the Jewish state took a new departure under the Maccabees. The religious resemblance

between the two bodies was increased by the adoption of the institution of the synagogue, and from the synagogue there certainly grew up a Samaritan theology and an exegetical tradition. The latter is embodied in the Samaritan Targum or Aramaic version of the Pentateuch, which in its present form is, according to Nöldeke's investigations, not earlier than the fourth Christian century, but in general agrees with the readings of Origen's *τὸ Σαμαρειτικόν*. For the dogmatic views of the Samaritans our sources are all late; they embrace hymns and other books of little general interest, and mainly at least of mediæval origin.

**SAMARKAND**, a city of Central Asia, anciently *Marcanda*, the capital of Sogdiana, then the residence of the Sámánids, and subsequently the capital of Timur, is now chief town of the Zerafshan district of the Russian dominions. It lies in a richly cultivated region, 185 miles southwest of Tashkend, and 145 miles east of Bokhara, in 39° 39' N. latitude and 67° 17' E. longitude, 2,150 feet above the sea, in the valley of the Zerafshan, at the point where it issues from the extreme western spurs of the Tian-Shan before entering the steppes of Bokhara. Destroyed and pillaged by Jenghis Khan, its population was reduced to one-quarter of what it had been, but it still reckoned 25,000 families within its walls. The present population is estimated at 36,000.

**SAMNITES**, a people of ancient Italy, whose name figures conspicuously in the early history of Rome. They occupied an extensive tract in the center of the peninsula, which derived from them the name of Samnium. The territory thus designated was a wholly inland district, bounded on the north by Marsi, Peligni, and Frentani, who separated them from the Adriatic, on the east by Apulia, on the south by Lucania, and on the west by Campania and Latium.

The Samnites early came into collision with the Romans, having four times engaged in war with that people. The first contest was of short duration; and after two campaigns the Romans were willing not only to conclude peace with Samnium but to renew the previously existing alliance, to which the Samnites continued faithful throughout the great struggle which ensued between the Romans and the allied Campanians and Latins. The Second Samnite War was of a very different character. Both nations felt that it was a struggle for supremacy, and, instead of being brought to a close within three years, it lasted for more than twenty years (326-304), and was marked with considerable vicissitudes of fortune, among which the celebrated disaster of the Caudine Forks (321) stands most conspicuous. Nor was the struggle confined to the two leading powers, many of the neighboring nations espousing the cause of the one side or the other, and often with fluctuating faith, in accordance with the varying fortunes of the war. The result, however, was on the whole favorable to the Roman arms, notwithstanding which they were willing to conclude peace in 304, on condition of the renewal of the previously existing alliance. This interval of tranquillity was of short duration, and little more than five years elapsed between the end of the Second Samnite War and the commencement of the Third (298). In this fresh contest they received a formidable auxiliary in a large body of Gauls, who had recently crossed the Alps, and, together with their countrymen the Senones, espoused the cause of the Samnites against Rome. Their combined forces were, however, defeated in the great battle of Sentinum (294), and after several successive campaigns the consul M. Curius Dentatus was able to boast of having put an end to the Samnite Wars (290), after they had lasted more than fifty years.

**SAMOA**. See **NAVIGATORS' ISLANDS**.

**SAMOS**, one of the principal and most fertile of the islands in the Ægean Sea that closely adjoin the mainland of Asia Minor, from which it is separated by a strait of only about a mile in width. It is about twenty-seven miles in length, by about fourteen in its greatest breadth.

During the Greek War of Independence Samos bore a conspicuous part, and it was in the strait between the island and Mount Mycale that Canaris achieved one of his most celebrated exploits by setting fire to and blowing up a Turkish frigate, in the presence of the army that had been assembled for the invasion of the island, a success that led to the abandonment of the enterprise, and Samos held its own to the very end of the war. On the conclusion of peace the island was indeed again handed over to the Turks, but since 1835 it has held an exceptionally advantageous position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who bears the title of "Prince of Samos," but is supported and controlled by a Greek council and assembly. The prosperity of the island bears witness to the wisdom of this arrangement. It now contains a population of above 40,000 inhabitants, and its trade has rapidly increased. Its principal article of export is its wine, which was celebrated in ancient times, and still enjoys a high reputation in the Levant. It exports also silk, oil, raisins, and other dried fruits.

**SAMOTHRACE** was the ancient name of an island in the northern part of the Ægean Sea, nearly opposite to the mouth of the Hebrus, and lying north of Imbros and northeast of Lemnos. It is still called Samothraki, and though of small extent, is, next to Mount Athos, by far the most important natural feature in this part of the Ægean, from its great elevation—the group of mountains which occupies almost the whole island rising to the height of 5,240 feet.

No modern traveler appears to have visited Samothrace till the year 1858, when it was fully explored by Conze, who published an account of it, as well as the larger neighboring islands, in 1860. The ancient city, of which the ruins are called Paleopoli, was situated on the north side of the island close to the sea; its site is clearly marked, and considerable remains still exist of the ancient walls, which were built in massive Cyclopean style, but no vestiges are found of temples or other public buildings. The modern village is on the hill above. The island is at the present day very poor and thinly peopled, and has scarcely any trade; but a considerable sponge fishery is carried on around its coasts by traders from Smyrna.

**SAMOYEDES**, a Ural-Altaic stock, scattered in small groups over an immense area, from the Altai Mountains down the basins of the Obi and Yenisei, and along the shores of the Arctic Ocean from the mouth of the latter river to the White Sea. They may be subdivided into two main groups. (A) Those inhabiting the southern parts of the government of Tomsk and Yeniseisk have been so much under Tartar influence as to be with difficulty separated from the Tartars; their sub-groups are the Kamasin Tartars, the Kaibals, the Motors, the Beltirs, the Karagasses, and the Samoyedes of the middle Obi. (B) Those inhabiting the subarctic region form three separate sub-groups: (a) the Yuraks in the coast-region from the Yenisei to the White Sea; (b) the Tavghi Samoyedes, between the Yenisei and the Khatanga; (c) the Ostiak Samoyedes, intermingled with Ostiaks, to the south of the others, in the forest regions of Tobolsk and Yeniseisk. Their whole number may be estimated at from 20,000 to 25,000.

**SAMPIERDARENA** (population in 1881, 19,501). See **GENOA**.

**SAMSON** (Hebrew, *Shimshōn*), the great enemy of the Philistines, is reckoned as one of the judges of Israel in two editorial notes which belong to the chronological scheme of the book of Judges (xv. 20, xvi. 31), but his story itself, which is a self-contained narrative by a single hand (Jud. xiii. 2-16, 31a), represents him not as a judge but as a popular hero of vast strength and sarcastic humor, who has indeed been consecrated from his birth as the deliverer of Israel, and is not unaware of his vocation, but who yet is inspired by no serious religious or patriotic purpose, and becomes the enemy of the Philistines only from personal motives of revenge, the one passion which is stronger in him than the love of women. In his life, and still more in his death, he inflicts great injury on the oppressors of Israel, but he is never the head of a national uprising against them, nor do the Israelites receive any real deliverance at his hands. The story of his exploits is plainly taken from the mouths of the people, and one is tempted to conjecture that originally his Nazarite vow was conceived simply as a vow of revenge, which is the meaning it would have in an Arab story. Our narrator, however, conceives his life as a sort of prelude to the work of Saul (xiii. 5), and brings out its religious and national significance in this respect in the opening scene (ch. xiii.), which is closely parallel to the story of Gideon, and in the tragic close (ch. xvi.); while yet the character of Samson, who generally is quite forgetful of his mission, remains much as it had been shaped in rude popular tale in a circle which, like Samson himself, was but dimly conscious of the national and religious vocation of Israel.

**SAMUEL** (שְׁמוּאֵל, *Shēmūēl*), a seer and "judge" of Israel in the time of the Philistine oppression. His history, as told in the first book of Samuel (compare Psalm xcix. 5; Eccles. xlvi. 13 sq.), is too familiar to call for repetition here.

**SAMUEL, BOOKS OF.** The Hebrew Book of Samuel, like the Hebrew Book of Kings, is in modern Bibles divided into two books, after the Septuagint and Vulgate, whose four books of "kingdoms" answered to the Hebrew books of Samuel and Kings. The connection between the books of Samuel and Kings has been spoken of in the article **KINGS**, (*q.v.*) These two books, together with Judges, are made up of a series of extracts and abstracts from various sources worked over from time to time by successive editors, and freely handled by copyists down to a comparatively late date, as the variations between the Hebrew text and the Septuagint show. The main redaction of Judges and Kings has plainly been made under the influence of the ideas of the book of Deuteronomy, and it was in connection with this redaction that the history from the accession of Solomon onward was marked off as a separate book (see **KINGS**). In Samuel the Deuteronomistic hand is much less prominent, but in 1 Sam. vii. 2-4, and in the speech of Samuel, ch. xii., its characteristic pragmatism is clearly recognizable; the nature of the old narrative did not invite frequent insertions of this kind throughout the story. So, too, the chronological system which runs through Judges and Kings is not completely carried out in Samuel, though its influence can be traced. But, though the book of Samuel has been much less systematically edited than Kings, unsystematic additions to and modifications of the oldest narratives were made from time to time on a very considerable scale, and in this book, as in Judges, we not seldom find two accounts of the same events which not only differ in detail but plainly are of very different date.

The book as a whole may be divided into three main sections—(1) *Samuel and Saul*, 1 Sam. i.-xiv.; (2) *The*

*rise and Kingdom of David*. 1 Sam. xv.-2 Sam. viii.; (3) *The personal history of David's court at Jerusalem* (mainly from a single source, which also includes 1 Kings i., ii.), 2 Sam. ix.-xx. Finally the appendix, 2 Sam. xxi.-xxiv., must have been added after the book of Kings had been separated from the context to which 1 Kings i., ii. originally belonged. As the greater part of the book of Samuel is occupied with the history of David, which has been discussed at length in his article, and with that of Samuel and Saul, the chief points of which have been critically examined in the article **ISRAEL**, a very brief resumé of the contents of each of the main sections must here suffice.

**SANAA** (SAN'Á), the capital of Yemen in Arabia, and seat of the Turkish governor of that province, is situated in 15° 22' N. latitude and 44° 31' E. longitude, in a well-watered upland valley, 4,000 feet above the sea and six to nine miles broad, running north and south between two table-lands. The western table-land rises 1,200 feet, the eastern (J. Nokom) is some 300 feet higher, and crowned by the ruins of the fortress Birásh, which local tradition connects with the name of Shem, son of Noah, to whom the foundation of the city is attributed by Hamdání, *Jazírat*, p. 55. In 1872, having been hard pressed by the Bedouins for several years, Sanaa opened its gates to the Turks, who were then engaged in the reconquest of Yemen. In the following year Millingen estimated the population at only 20,000.

The climate is good, though the extreme dryness of the air is trying. Rain usually falls in January and June, and more copiously in the end of July; the markets are well supplied with grain and fruit; vineyards were formerly numerous, but were largely given up after an attack of vine disease some thirty years ago.

**SANÁ'Í.** Abulmajd Majdúd b. Ádam, commonly known as the hakím or philosopher Saná'í, the earliest among the great Súfic poets of Persia, was a native of Ghazna or Ghaznín (in the present Afghánistán), and flourished in the reigns of the Chaznawid sultáns Ibráhím, and his grandson Bahrámsháh. The exact dates of the poet's birth and death are uncertain, Persian authorities giving the most conflicting statements. At any rate, he must have been born in the beginning of the second half of the eleventh century and have died between 1131 and 1150 (525 and 545 A.H.)

**SAN ANTONIO**, the capital of Bexar county, Tex., is handsomely situated on San Antonio river eighty miles west of Austin, 256 miles west of Galveston, and 547 miles west of New Orleans, on the San Francisco and New Orleans division of the Southern Pacific. It has railway communication with the Gulf by the San Antonio and Aransas Pass road, and with Galveston and Harrisburg by the Galveston, Harrisburg and San Antonio road. The city was founded on the site of Fort Alamo, a military post celebrated in the early history of Texas, as the place at which the garrison made an heroic defense against the Mexican army led by Santa Anna in person in which Travis, Crockett, Bowie, and other Texan patriots, together with a force of considerable number were ruthlessly slaughtered. Since the close of the civil war San Antonio has grown rapidly and is among the leading cities in the southwest as a commercial and railroad center, also as a distributing point for a rich country of which cotton, wool, and hides are the principal products and sources of an increasing prosperity. The city contains a court-house, three national and six private banks, Roman Catholic cathedral, eleven churches, a complete and valuable system of education, three daily and four weekly papers and a collection of fine business houses and private residences. In the line of manufactures San Antonio has

ement, iron and electric light works, foundries and machine shops, factories for the production of doors, sash, blinds, cigars and tobacco, hardware and metals, cotton seed oil, and baking powder, etc., all of which are in active operation. The city is well provided with park and amusement facilities lighted by gas and electric lights, and has a present (census 1890) population of 37,673.

SANCHEZ. Three persons of this name once enjoyed considerable literary celebrity:—(1) FRANCISCO SANCHEZ (Sanctius) (born in 1523, died 1601), successively professor of Greek and of rhetoric at Salamanca, whose *Minerva*, first printed at that town in 1587, was long the standard work on Latin grammar; (2) FRANCISCO SANCHEZ, a Portuguese physician of Jewish parentage, professor of philosophy and physic at Toulouse, where he died at the age of seventy in 1632, whose ingenious but sophistical writings (*Quod nihil scitur*, 1581) mark the high-water of reaction against the dogmatism of the traditional schools of his time; (3) THOMAS SANCHEZ of Cordova (born in 1551, died 1610), Jesuit and casuist, whose treatise *De Matrimonio* (Genoa, 1592) is more notorious for its repulsive features than celebrated for its real learning and ability.

SANCHO I. (born 1154, died 1211) and SANCHO II. (born 1208, died 1248), kings of Portugal from 1185 and 1223 respectively. (See PORTUGAL).

SANCHUNIATHON, (that is, סַכְנִיתוֹן, "the god Sakkun hath given") is the name of the pretended author of the Phœnician writings said to have been used by PHILO BYBLIUS, (*q.v.*) See also PHœNICIA.

SAN CRISTOBAL DE LOS LLANOS, otherwise known as CIUDAD REAL, chief town of the Mexican state of Chiapas, stands in a fertile valley on the eastern slope of the central mountain range 450 miles east-southeast from the city of Mexico. Its inhabitants, variously estimated as numbering from 8,000 to 12,000, are chiefly employed in rearing cattle. Coarse woolen and cotton stuffs, and also common earthenware, are manufactured.

SANCROFT, WILLIAM, archbishop of Canterbury, was born at Fressingfield in Suffolk, January 30, 1616, and entered Emmanuel College, Cambridge, in July, 1634. He became M.A. in 1641 and fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He then remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 he was nominated to the deanery of York. In 1664 he was installed dean of St. Paul's. From August 5, 1691, till his death on November 24, 1693, he lived a very retired life in his native place. He is characterized by Macaulay as "an honest, pious, narrow-minded man."

SANCTUARY is the Christian representative of the classical ASYLUM (*q.v.*), and was no doubt suggested in the first instance by the cities of refuge of the Levitical law. Originally every church or churchyard was a sanctuary for criminals. The protection afforded by a sanctuary at common law was this: A person accused of felony might fly for the safeguard of his life to sanctuary, and there, before the coroner, within forty days, confess the felony and take an oath of abjuration entailing perpetual banishment into a foreign Christian country. The privilege of sanctuary as protecting from civil process extended to certain places, parts or supposed parts of royal palaces, such as White Friars or Alsatia, the Savoy, and the Mint.

In Scotland religious sanctuaries were abolished at the Reformation. But the debtor still finds sanctuary from diligence in Holyrood-House and its precincts. The sanctuary does not protect criminals, or even all

debtors, *e.g.*, not crown debtors or fraudulent bankrupts; and a *meditatio fugæ* warrant may be executed within the sanctuary.

SAND, GEORGE. See DUDEVANT.

SANDALWOOD, a fragrant wood obtained from various trees of the natural order *Saatalaceæ* and from the genera *Santalum* and *Fusanus*. The principal source of sandalwood is *Santalum album*, L., a native of India, but it is also yielded by *S. Freycinetianum*, Gaud., and *S. pyrularium*, A. Gray, in the Hawaiian Islands, *S. Homei*, Seem., and *S. anstro-caledonium*, Viell., in New Caledonia, and *S. insulare*, Bert., in Tahiti. The wood of *S. latifolium*, Benth., and also that of *Fusanus spicatus*, R. Br., have been exported from southwest Australia, and that of *Eremophila Mitchellii*, of the natural order *Myoporineæ*, from Queensland, but these have little odor and are chiefly used for cabinet work. Sandalwood is also said to be produced in Nossi-Bé, and has been imported into London from Zanzibar, and into Germany from Venezuela, but of the botanical source of these varieties little is at present known. Until the middle of the eighteenth century India was the only source of sandalwood. The discovery of sandalwood in the islands of the Pacific led to a considerable trade of a somewhat piratical nature, resulting in difficulties with the natives, often ending in bloodshed. About the year 1810 as much as \$400,000 is said to have been received annually for sandalwood by Kamehameha, king of Hawaii. The trees consequently have become almost extinct in all the well-known islands, except New Caledonia, where the wood is now cultivated. Sandalwood of inferior quality derived from *Fusanus acuminatus* was exported from southwest Australia in 1884.

During the last few years oil of sandalwood has largely replaced copaiba, both in the United Kingdom and on the Continent, in the treatment of various diseases of the mucous membrane.

SANDARACH is a resinous body obtained from the small Coniferous tree *Callitris quadrivalvis*, native of the northwest regions of Africa, and especially characteristic of the Atlas Mountains. The resin, which is produced as a natural exudation on the stems, and also obtained by making incisions in the bark of the trees, comes into commerce in the form of small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is a little harder than mastic, has a faintly bitter resinous taste and a pleasant balsamic odor. Sandarach is imported chiefly from Mogador, and is an important ingredient in spirit varnishes. It is also used as incense, and by the Arabs medicinally as a remedy for diarrhœa.

SANDBACH, a town and urban sanitary district of Cheshire, England, is situated on the Trent and Mersey canal, and on the London and Northwestern railway, at the junction for Northwich, twenty-five miles east-southeast of Chester and five northeast of Crewe. The principal industry was formerly silk throwsting, but this is now discontinued, and the inhabitants are chiefly employed in the salt-works and alkali-works. The population of the urban sanitary district (area 2,694 acres) in 1871 was 5,259, in 1881 it was 5,493, and in 1890 about 5,900.

SAND-BLAST. The erosive influence of driven sand is turned to useful account for several industrial purposes by means of an apparatus devised, about 1870, by B. C. Tilghman of Philadelphia. Tilghman's sand-blast consists of a contrivance for impelling, with graduated degrees of velocity, a jet or column of sand, by means of compressed air or steam, against the object or surface to be acted on. The apparatus is principally adapted for obscuring, engraving, and ornamenting glass, but according to the velocity with which the sand

is impelled it may be used to carve deep patterns in granite, marble, and other hard stones, to bite into steel, etc., and even to cut and perforate holes through these and other most refractory materials. In 1884 Mr. Mathewson patented an apparatus in which, by an ingenious exhaust arrangement, the impelling steam is swept away, leaving only cool, dry sand to strike against the object acted on; and the success of this device has already opened up a wider field for the employment of the sand-blast.

SANDBY, PAUL, founder of the English school of water-color painting, was descended from a branch of the Sandbys of Babworth, and was born at Nottingham, England, in 1725. He died in London on November 9, 1809.

SANDEAU, LÉONARD SYLVAIN JULES, a French novelist of much grace and not a little power, was born at Aubusson (Creuse) on February 9, 1811. He died on April 24, 1882. He was never a very popular novelist, judging by the sale of his works; and the peculiar quiet grace of his style, as well as his abstinence from sensational incident, and his refusal to pander to the French taste in fictitious morals, may be thought to have disqualified him for popularity.

SANDEC. See NEU-SANDEC.

SAND-EEL or SAND-LAUNCE. The fishes known under these names form a small isolated group (*Ammodytina*), distantly related to the cod-fishes. Their body is of an elongate-cylindrical shape, with the head terminating in a long conical snout, the projecting lower jaw forming the pointed end. A low, long dorsal fin, in which no distinction between spines and rays can be observed, occupies nearly the whole length of the back, and a long anal, composed of similar short and delicate rays, commences immediately behind the vent, which is placed about midway between the head and caudal fin. The caudal is forked and the pectorals are short. The total absence of ventral fins indicates the burrowing habits of these fishes. The scales, when present, are very small; but generally the development of scales has only proceeded to the formation of oblique folds of the integuments. The eyes are lateral and of moderate size, the dentition is quite rudimentary. They live in shoals at various depths on a sandy bottom, and bury themselves in the sand on the slightest alarm. Sand-eels are very rapacious, destroying a great quantity of fry and other small creatures, such as the lancelet (*Branchiostoma*), which lives in similar localities. They are excellent eating, and are much sought after for bait.

Sand-eels are common in all suitable localities of the North Atlantic; a species scarcely distinct from the European common sand-launce occurs on the Pacific side of North America, another on the east coast of South Africa. On the British coasts three species are found—the Greater Sand-Eel (*Ammodytes lanceolatus*), the Common Sand-Launce (*A. tobianus*), and the Southern Sand-Launce (*A. siculus*). The last species is common in the Mediterranean, but local farther northward.

SANDEMANIANS. See GLAS.

SANDERSON, ROBERT, bishop of Lincoln, and one of the worthies celebrated by Izaak Walton, was born at Rotherham, Yorkshire, England, in 1587. He took orders in 1611, and was promoted successively to several benefices. In 1642 Charles created him regius professor of divinity at Oxford, with a canonry of Christ Church annexed. But the civil war prevented him until 1646 from entering on the office; and in 1648 he was ejected by the visitors whom the parliament had commissioned. He recovered these preferments at the Restoration, and was promoted to the bishopric of Lincoln, but lived only two years to enjoy his new dignities, dying in his seventy-sixth year in 1663.

SAND-GROUSE, the name by which are commonly known the members of a small but remarkable group of birds frequenting sandy tracts, and having their feet more or less clothed with feathers after the fashion of Grouse.

Externally all Sand-Grouse present an appearance so distinctive that nobody who has seen one of them can be in doubt as to any of the rest. Their plumage assimilates in general color to that of the ground they frequent, being above of a dull ochreous hue, more or less barred or mottled by darker shades, while beneath it is frequently varied by belts of deep brown intensifying into black. Lighter tints are, however, exhibited by some species—the drab merging into a pale gray, the buff brightening into a lively orange, and streaks or edgings of an almost pure white relieve the prevailing sandy or fawn-colored hues that especially characterize the group. The sexes seem always to differ in plumage, that of the male being the brightest and most diversified. The nest is a shallow hole in the sand. Three seems to be the regular complement of eggs laid in each nest. These eggs are of peculiar shape, being almost cylindrical in the middle and nearly alike at each end, and are of a pale earthy color, spotted, blotched, or marbled with darker shades, the markings being of two kinds, one superficial and the other more deeply seated in the shell. The young are hatched fully clothed in down (*P. Z. S.* 1866, pl. ix. fig. 2), and though not very active would appear to be capable of locomotion soon after birth. Morphologically generalized as the Sand-Grouse undoubtedly are, no one can contest the extreme specialization of many of their features, and thus they form one of the most instructive groups of birds with which ornithologists are acquainted.

SANDHURST, a city of Victoria, Australia, in the county of Bendigo, is situated in 36° 46' S. latitude and 144° 17' E. longitude, at a height of 758 feet above the sea, on Bendigo creek (a sub-tributary of the Murray), 100¾ miles north-northwest of Melbourne by the railway to Echuca. Besides gold-mining, which in the Sandhurst district employs 6,800 miners, the local industries are brewing, iron-casting, coach-building, the working of bricks and tiles and earthenware, and tanning. The population of the city (which is divided into three wards—Sutton, Darling, and Barkly) was 28,662 in 1881, and about 30,000 in 1889. The value of ratable property is \$319,550.

SAN DIEGO, a port of entry and the chief city in Southern California, is situated in San Diego county within fifteen miles of the Mexican border, and upon San Diego Bay, one of the most beautiful sheets of water and most secure harbors on the Pacific coast. The city was founded by Roman Catholic missionaries over a century ago, and has within recent years become one of the most attractive and fashionable resorts as also one of the most progressive cities west of the Rocky Mountains. It is located on the Southern California Division of the Atchison, Topeka and Santa Fé railroad, 450 miles south-southeast of San Francisco, and 120 miles in the same direction from Los Angeles, direct communication with the coast being also afforded by the Coronado railroad. The soil in the vicinity of the city is of exceptional fertility, the orange, fig, olive, date palm, and other tropical fruits being successfully cultivated, while the cereals and vegetables of every description attain to unusual perfection. The mild climate, a temperature not liable to extremes of heat or cold, and the balmy but bracing atmosphere afford additional inducements for rapid growth and development. The city contains a courthouse, two banks, five churches, two female seminaries and a full complement of school accommodations.

two daily and two weekly newspapers, and many stores, offices, etc. The manufacture of machinery, hardware, plumbing goods, cigars, leather, boilers, cornices, carriages, fencing, beer, wine, etc., are profitably carried on, and other lines of industrial endeavor are successfully established. Easy transit is furnished to all portions of the city by cable and electric railways, and the city is well lighted both by gas and electricity. To the north of the city is the old city of San Diego, and within a short distance of the new city is a lake of boiling mud, half a mile long. The city, which contained a population of 2,637 in 1880, has now (1890) 16,159 inhabitants.

**SAN DOMINGO**, or **SANTO DOMINGO**. See **HAYTI**.

**SANDOMIR**, or **SEDOMIERZ**, a town of Russian Poland, in the province of Radom, is one of the oldest towns of Poland, being mentioned in annals as early as 1079; from 1139 to 1132 it was the chief town of the principality. Under Casimir III. it received extensive privileges and reached a high degree of prosperity and strength. It is now a quite unimportant place, but retains a few remarkable monuments of its past. The beautiful cathedral, rising on a high hill above the Vistula, and facing the plains of Galicia, was built between 1120 and 1191; it was rebuilt in stone in 1360, and is thus one of the oldest monuments of old Polish architecture. In 1881 the population was 6,265, or, including the suburbs, 14,710.

**SANDOWAY**, a district in the south of the Arakan division of British Burmah, ceded to the British by treaty in 1826, embracing an area of 3,667 square miles, and bounded on the north by the Ma-i river, on the west by the Bay of Bengal, on the east by the Arakan Mountains, and on the south by the Khwa river. The whole face of the country is mountainous, the Arakan range sending out spurs which reach down to the coast.

Only 135 square miles of the total area are cultivable, and of these but seventy-five are cultivated. The chief crops are rice, sesamum, tobacco, cotton, sugar-cane, *dhani* palms, and yams. The revenue in 1883-84 was £13,978 (about \$69,000), the land tax realizing £6,749 (\$33,000) of that amount. This mountainous and forest-clad country, with such a small cultivable area, is sparsely inhabited, the population, as returned by the census of 1881, being only 64,010 (males, 32,706; females, 31,304). There are no towns with a population exceeding 2,000.

**SANDPIPER** (Germ. *Sandpfeifer*), according to Willughby in 1676 the name given by Yorkshiremen to the bird now most popularly known in England as the "Summer-Snipe"—the *Tringa hypoleucus* of Linnæus and the *Totanus Actitis*, or *Tringoides hypoleucus* of later writers. Placed by most systematists in the family *Scolopacidae*, the birds commonly called Sandpipers seem to form three sections, which have often been regarded as Subfamilies—*Totaninae*, *Tringinae*, and *Phalaropodinae*, the last indeed in some classifications taking the higher rank of a family—*Phalaropodidae*. This section comprehends three species only, known as Phalaropes or swimming Sandpipers, which are at once distinguished by the membranes that fringe their toes, in two of the species forming marginal lobes, and by the character of their lower plumage, which is as close as that of a duck, and is obviously connected with their natatory habits. The distinctions between *Totaninae* and *Tringinae*, though believed to be real, are not so easily drawn. It usually makes its appearance in May, and thence during the summer months may be seen in pairs skimming gracefully over the water from one bend of the stream to another, uttering occasionally a shrill but plaintive whistle, or running nimbly along

the margin, the mouse-colored plumage of its back and wings making indeed but little show, though the pure white of its lower parts often renders it conspicuous. The nest, in which four eggs are laid with their pointed ends meeting in its center (as is usual among Limicoline birds), is seldom far from the water's edge, and the eggs, as well as the newly-hatched and down-covered young, so closely resemble the surrounding pebbles that it takes a sharp eye to discriminate them. The common sandpiper is found over the greater part of the Old World. In summer it is the most abundant bird of its kind in the extreme north of Europe, and it extends across Asia to Japan. In winter it makes its way to India, Australia, and the Cape of Good Hope. In America its place is taken by a closely kindred species, which is said to have also occurred in England—*T. macularius*, the "Peetweet," or spotted Sandpiper, so called from its usual cry, or from the almost circular marks which spot its lower plumage. In habits it is very similar to its congener of the Old World, and in winter it migrates to the Antilles and to Central and South America. Of other *Totaninae*, one of the most remarkable is that to which the inappropriate name of Green Sandpiper has been assigned. This Sandpiper is characterized by its dark upper plumage, which contrasts strongly with the white of the lower part of the back and gives the bird, as it flies away from its disturber, much the look of a very large House-Martin. The so-called Wood-Sandpiper, *T. glareola*, has a considerable resemblance to the species last mentioned.

Of the section *Tringinae* the best known are the KNOT and the Dunlin *T. alpina*. Next to the Dunlin and the Knot the commonest British *Tringinae* are the Sanderling, *Calidris arenaria*, the Purple Sandpiper, *T. striata* or *maritima*, the Curlew Sandpiper, *T. subarquata*, and the Little and Temminck's Stints, *T. minuta* and *T. temmincki*. Two other birds, however, must be mentioned. These are the Broad-billed Sandpiper, *T. platyrhyncha*, of the Old World, and the marvelous Spoon-billed Sandpiper, *Eurynorhynchus pygmaeus*, whose true home has still to be discovered, according to the experience of Baron Nordenskjöld in the memorable voyage of the *Vega*.

**SANDROCOTTUS** (CHANDRAGUPTA), founder of the Maurya kingdom in India. See **INDIA** and **PERSIA**.

**SANDUSKY**, the capital of Erie county, Ohio, is located on Sandusky Bay at the mouth of the Sandusky river, 60 miles south of Cleveland and 210 miles north of Cincinnati. It is delightfully situated on ground rising gradually from the shores of the bay and stretching back far into the interior where the country is not only picturesque but highly cultivated and productive. It is the lake terminus of the Indiana, Bloomington and Western, and the Lake Erie division of the Baltimore and Ohio roads, and a prominent point on the main line of the Lake Shore and Michigan Southern; Sandusky, Mansfield and Newark, and Sandusky, Dayton and Cincinnati roads. In addition to the unsurpassed transportation facilities thus afforded, the city is in direct communication by water with all points on the great chain of lakes from Duluth to Buffalo and the Canadian Dominion, and steady employment is furnished a fleet of steamers and sailing vessels which ply between the city and these ports, during each annual season. The city is noted throughout the State for the wealth and refinement of its inhabitants and the elegance of its public buildings, notably the court-house and high-school, and private residences. It is also the center of a large vine-growing district, and in addition to being the largest freshwater fish market in the United States is the headquarters of the State fish-hatchery. It contains twenty-five churches, five public

schools, four national banks and one savings bank, with a total cash capital of \$600,000; two daily, one tri-weekly, one semi-weekly and four weekly papers, three hotels, several public halls having an aggregate capacity of 2,500, and the government building or custom-house, a handsome structure of blue limestone. Its manufactures embrace car works, foundries, machine shops, engines and boilers, cutlery, edge-tools, wine, beer, and carved woods. Large exportations of cured fish and fresh fruits are annually made. The population was 18,471 in 1890.

SANDWICH, an English borough, market-town, and Cinque Port, is situated in the east of Kent, opposite the Downs, on a branch of the Southeastern railway, and on the Stour, two miles from the sea, twelve miles east of Canterbury, and four northwest of Deal. The streets are narrow and the houses irregularly built. The old line of the walls on the land side is marked by a public walk. Until the beginning of the sixteenth century Sandwich was of considerable importance as a port, but after the filling up of the harbor with sand, about the beginning of the sixteenth century, it fell into decay. The principal industries of the town are market-gardening, tanning, wool-sorting, and brewing. Coal, timber, and iron are imported. Sandwich returned two members to parliament till 1880, and was merged in the St. Augustine's division of the county in 1885. The parliamentary borough which included Deal and Walmer (area, 2,684 acres), had in 1881 a population of 15,655, while that of the municipal borough (area, 706 acres) was 2,846, and is at present (1890) about 3,250.

SANDWICH, EDWARD MONTAGU, EARL OF, general and admiral, was the son of Sir Sidney Montagu, youngest brother of Edward, Lord Montagu of Boughton, and was born July 27, 1625. At the Restoration, having commanded the fleet which conveyed the king to England, he was made Knight of the Garter, and soon afterward elevated to the peerage as Baron Montagu of St. Neots, Viscount Hinchinbroke, and Earl of Sandwich. After his return to England he was sent to negotiate a peace between Spain and Portugal, and also a treaty of commerce with Spain. On a renewal of the war in 1672 he again commanded the Blue squadron under the duke of York, and during the fight in South-

wold Bay, on May 28th, his ship, the *Royal James*, was set on fire by the Dutch, when he leaped overboard and was drowned. His body was found a fortnight afterward, and was interred in Henry VII.'s Chapel, Westminster Abbey.

SANDWICH, JOHN MONTAGU, FOURTH EARL OF, was born November 3, 1718, and succeeded his grandfather in the earldom, October 20, 1729. He was educated at Eton and at Trinity College, Cambridge, which he entered in 1735. After a voyage round the Mediterranean he returned to England and began to take an active interest in politics as a supporter of Sir Robert Walpole. The high opinion the government entertained of his judgment and his diplomatic abilities was evidenced by his appointment in 1746 as plenipotentiary to the congress at Breda, which was continued till peace was negotiated at Aix-la-Chapelle in 1748. On his return he became first lord of the admiralty, retaining the post until June, 1751. He held the same office from 1763 to 1765, and again from 1771 till the dissolution of Lord North's administration in 1782. He died April 30, 1792.

SANDWICH ISLANDS. See HAWAIIAN ISLANDS.

SANDYS, GEORGE, famous in the reigns of James I. and Charles I. as a traveler and a metrical translator. He was born in 1577, the youngest son of an archbishop of York, studied at St. Mary Hall, Oxford, and afterward probably at Corpus Christi, and began his travels in 1610. Later on in his life he published translations of Ovid's *Metamorphoses*, the first book of the *Æneid*, and various books of Scripture. His verse was praised by Dryden, and deservedly so, for it has vitality as well as a clearly marked rhythm. He died in 1644.

SAN FERNANDO, formerly ISLE DE LEON, a fortified city of Spain, in the province of Cadiz, near the head of the inner bay, and nine and a half miles by rail from the city of Cadiz, is a modern town with straight and level streets, two churches, two hospitals, several barracks, and a school of navigation, with an observatory. It has considerable trade in the salt produced in the neighboring "salinas." The population within the municipal limits (which include the "poblacion" of San Carlos and the naval arsenal of La Carraca) was returned as 26,346 in 1877.
