JULY 1940

PEARS, WESTERN: WEIGHTED AVERAGE AUCTION PRICES OF ALL GRADES, BY VARIETIES, NEW YORK, NORMAL SEASONAL TREND, AND 1939 SEASON

*THE ARITHMETIC MEAN OF THE TEN MIDDLE PRICES FOR EACH MONTH OF THE 14-YEAR PERIOD, 1926-39

T H E F R U I T S I T U A T I O N

Summary

Fruit production in 1940 probably will be slightly smaller than in 1939 but it should provide adequate supplies for all requirements. Prospects for exports to continental Europe this season are not bright; hence, a larger proportion of this season's output apparently will be sold in the domestic market. In that event, supplies of fresh fruits for the United States market will be slightly larger than in 1939. The present outlook is for smaller total supplies of canned and dried fruits this season, but here again the supplies available for the domestic market may be larger than in 1939.

Prospects for some fruits declined slightly during June but the outlook for others improved. The condition of apples in 38 States having commercial production declined during the month as a result of unfavorable weather and a heavier than usual June "drop". Condition as of July 1 was 8 percent below that of a year earlier. Prospects for cherries declined 3 percent; and apricot production is 14 percent smaller than was indicated on June 1. Prospects for peaches, pears, California plums, and dried prunes, however, improved during the month. As compared with production in 1939, the outlook is for smaller crops of apples, apricots, cherries, grapes, peaches and prunes but larger crops of pears, plums, and the citrus fruits.

Marketings of the new crops are getting started later than in 1939, and shipments in mid-July were considerably smaller than a year earlier. Market prices were declining seasonally but averaged about the same as in 1939. Apple prices in mid-July were somewhat higher than a year earlier, as were early grape prices.

Consumer purchasing power, an important factor in the market situation for all fruits is higher than at this time a year ago, and probably will average somewhat higher in the last half of this year than during the first half of 1940 or the last half of 1939.

-- July 22, 1940

DEMAND

The following excerpt from the "Demand and Price Situation" summarizes the prospect for demand for farm products during the remainder of 1940.

"Improvement in business conditions affecting the domestic demand for farm products continued into July. Industrial employment and payrolls have risen along with the expansion of industrial output since April. The domestic consumer demand for meats, dairy and poultry products, fruits and vegetables has been strengthened by this recent stimulation of domestic business and is expected to be better during the last half of 1940 than during either the final half of 1939 or the first 6 months of 1940.

"There are indications, however, that the recent rate of improvement in demand conditions is slowing down. The major portion of the present rise in industrial production may be already over. Whether this slower rate of rise will be followed later by further gains or by a temporary relapse is dependent in considerable degree on continuation of the war by Great Britain, our most important overseas customer."

APPLES

The condition of apples in the 38 States having commercial production averaged 59 percent on July 1, 1940 compared with 64 percent a year earlier and the 10-year (1929-38) average July 1 condition of 56 percent. Condition is reported sharply lower than a year earlier in such important producing States as Vermont, New York, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Missouri, Tennessee, and California but is sharply higher in Maryland, Virginia, Idaho, and Colorado. It appears from these reports that the crop will be smaller than in 1939 in the North Atlantic, North Central, and South Central groups of States but larger in the South Atlantic and Western groups. Unfavorable weather during the blooming period interfered with pollination in many States, and it is indicated that the June "drop" was generally heavier than usual.

Shipments of new crop apples started later than usual this season but the volume has been increasing during recent weeks. In mid-July shipments were considerably below those of a year earlier. Because of a small early supply, available market prices opened well above those of a year earlier. Prices of Transparents (2 inches in diameter) at New York averaged \$1.49 per bushel in mid-July this year compared with 69 cents a year earlier, and the Starr variety (2-1/2 inches) averaged \$1.75 compared with \$1.08.

PEACHES

Only minor changes occurred in the crop outlook for peaches during June. Indicated production as of July 1 in some States was increased slightly but partly offsetting decreases occurred in other States. Total United States indicated production increased 400,000 bushels during the month to a total of 52.4 million bushels. This compares with 30.8 million bushels last season and the 10-year (1929-38) average of 52.7 million bushels. Indicated production in the Southern States, where marketing is now in progress, increased 398,000 bushels while that in the Northern States (excluding California) increased 235,000 bushels. Indicated production of California freestones decreased 209,000 bushels, but there was no change from a month earlier in the estimate of the clingstone crop.

Shipments from the early States started late this season but by mid-July were heavier than a year earlier. A total of 3,022 cars had been moved by rail by July 13 this season compared with 4,346 cars to July 15 last season. Market prices of peaches declined sharply during recent weeks, and in mid-July averaged somewhat below those of a year earlier.

PEARS

The crop outlook for pears improved slightly during June. Indicated production is now slightly larger than the crop harvested in 1939. In the 3 Pacific Coast States the indicated crop increased 247,000 bushels but the total still remains slightly below production in 1939. In the remainder of the country the increase amounted to 140,000 bushels and widened the margin over last season's production.

The Pacific Coast Bartlett crop is now indicated to total 13.8 million bushels compared with 14.5 million last season. A sharp decrease from a year earlier in California more than offsets a slight increase in the combined total of the other 2 States. Usually there are three outlets for these pears in California - fresh sale, canning, and drying. Because of the reduced prospect for exports of dried pears this season, the demand for this use this season probably will be smaller than usual. A part of this loss in demand is offset by the reduced crop prospect in California, but the carry-over of dried pears is indicated to be rather large. Increased consumer purchasing power this season over last, however, probably will aid in improving the general marketing situation.

The outlook for canned pears is not yet clear because of uncertainties in the export prospect. Ordinarily about 1,600,000 cases, or nearly 30 percent, of the canned supply are exported annually, but this season, because of the action of Great Britain (the principal export outlet) in controlling imports of canned fruits, exports may be reduced materially. At the present time the export movement is negligible, but if the British Government should decide to allow imports to come in, the situation and prospect would be materially improved. It probably would be good business on the part of pear canners, therefore, to pack enough pears for this contingency. Carry-over stocks of canned pears are

negligible this season and the quantity packed for export could be easily used as a reserve supply if the export movement did not materialize.

Present prospects for late pears in the Pacific Coast States indicate a crop slightly larger than in 1939. Usually a large proportion of these pears are exported to Europe during the fall and winter months. Last season a considerable quantity was exported before the full effect of wartime controls became operative, but this season the probabilities are that very small quantities will be exported, and that most of them will have to be sold in the domestic market. The problem appears to be to find an expanded outlet for these pears in the domestic market by widening distribution and by reducing marketing charges. It is probable that the Federal Surplus Commodities Corporation will purchase some quantities for relief distribution.

GRAPES

United States production of grapes in 1940 is indicated to total 2,422,000 tons compared with 2,526,000 tons in 1939 and the 10-year (1929-38) average of 2,220,000 tons. Excluding production in California, the crop totals 288,000 tons, or slightly less than the 298,000 tons in 1939. California production is indicated to be 94,000 tons short of the production last season but 183,000 tons above the 10-year (1929-38) average. Indicated production of wine varieties in California at 570,000 tons is about the same as last year, but that of raisin varieties at 1,182,000 tons and table varieties at 382,000 tons is slightly smaller than in 1939.

Approximately 980,000 tons of the 1,269,000 tons of raisin varieties produced in 1939 were dried and resulted in a raisin pack of 245,000 tons. This pack together with about 105,000 tons of raisins carried over from the previous year made a total supply of raisins of about 350,000 tons. Although the marketing season will not be completed until September 1, the prospect is that the carry-over this season will be reduced to about 80-85,000 tons. It is indicated that approximately 62,000 tons will have been exported, 128,000 tons sold in the domestic market, and 78,000 tons purchased and distributed or diverted by the Federal Surplus Commodities Corporation. If the raisin pack in 1940 is reduced in proportion to the reduction in the crop of raisin grapes, the total supply of raisins for the coming season would be about 310,000 tons, or 40,000 tons less than in the previous season. If the raisin pack is reduced to a greater extent than here indicated, however, the supply will be reduced accordingly.

Exports of raisins during the 1939-40 season are estimated at 62,000 tons compared with 84,000 tons in 1938-39. By far the greater portion of the current season's exports moved during the early months. Recently the movement has been exceedingly small. For the 1940-41 season the prospect is a matter of conjecture, since probably the only important markets that will be available are Canada and the United Kingdom. The spread of the war to the Mediterranean area has stopped imports into the latter country from the Near East and lengthened the route between it and Australia. It is not unlikely that such imports of raisins as the United Kingdom receives will have to come from the United States.

With respect to the demand for wine grapes in the 1940 season, stocks of wine and brandy in terms of fresh grapes as of July 1 are estimated to have been slightly larger than the record large stocks of a year earlier. An increase in stocks of sweet wine more than offset slight decreases in the stocks of dry wine and brandy. It should be noted, however, that the high level of stocks at the beginning of the last two seasons is due almost entirely to the sharp increase in the production of commercial brandy in 1938 occasioned by the grape diversion program of that season. The production of wine during the 1939 season was about one-third larger than in the previous season but withdrawals were up only about 14 percent. As a consequence, stocks of wine have increased about 5 percent during the year.

Approximately 930,000 tons of California grapes were used for juice purposes in 1939 (most of which went into the production of wine and brandy), about 989,000 tons were used for the production of raisins and dried grapes, and the remainder (309,000 tons, including 12,000 tons canned) of the 2,228,000 tons produced was consumed as fresh grapes. For 1940 a similar distribution of the indicated crop of 2,134,000 tons is in prospect, with a reduction in the use for raisins offsetting most of the reduction in the total crop.

CITRUS

The indicated production of summer oranges in California was increased slightly during June, and the total as of July 1 is 27.2 million boxes. This is about 4 million boxes more than was produced in 1939 and nearly 8 million more than the 10-year (1929-38) average. Marketings of this season's crop are in full swing and market prices have been declining in recent weeks. The freeze in late January destroyed a considerable part of the late winter and spring orange crop in Florida, and created a relative shortage of marketable oranges in May and June. Market prices rose to relatively high levels, but prices declined as soon as the California summer crop became available. In mid-July prices averaged only slightly above those of a year earlier.

Prospects for the coming winter orange and grapefruit crops are good, and it is probable that production will approach the record large crop of 1938.

MISCELLANEOUS FRUITS

The smallest crop of California apricots since 1921 is indicated to be in prospect this season. The crop is expected to total only 102,000 tons compared with 312,000 tons in 1939 and the 10-year (1929-38) average of 231,000 tons. Shipments to the fresh market are about completed, and it is indicated that only about 12,000 tons were so marketed. Also it is reported that the canned pack takes about 29,000 tons, thus leaving only 61,000 tons for drying. The small crop this season about takes care of any reduction in export prospects, and improves to some extent the situation for canned and dried peaches and pears. Shipments of fresh apricots from Washington are now in full swing, and the volume is somewhat larger than last season. The crop is indicated to total 12,600 tons, compared with 10,700 tons in 1939, and the 10-year (1929-38) average of 6,710 tons.

The plum crop in California and Michigan is indicated to be about the same as a year earlier, but the production of prunes in Idaho, Washington, and Oregon is indicated to be reduced materially from the large crops produced in 1939. Most of the reduction occurs in the western areas of these States where the prune crop is the smallest on record. In these areas prunes are used largely for canning and drying. It is probable that the supply of fresh prunes for market will be about as large as that of last season. Marketings of plums from California are in full swing, with the carlot movement this season to July 13 totaling, 2,259 cars compared with 2,379 cars to July 15, 1939. Market prices this season to date have been unusually high.

Indicated production of dried prunes in California was increases slightly to 202,000 tons in the July 1 estimate. The small quantity of dried prunes in prospect in the Northwest together with a reduction in the carry-over from a year earlier, however, is likely to result in the smallest total supply of dried prunes since 1934. The supply probably will be more than ample for all requirements, however, even if exports equal the average of recent years.

A reduction in the indicated production of cherries is reported as of July 1, with a slight increase in that of sweet varieties being more than offset by a decrease in the prospects for sour cherries. Total production indicated at 170,290 tons, however, is the second largest on record, exceeding the 10-year (1929-38) average by 41,000 tons. It is about 17,000 tons short of the record large crop in 1939.

Compiled from reports of the Agricultural Marketing Service.

1/ Relates to crop from bloom of year shown, picking beginning November 1 in California and September 1 in other States. For some States, in certain years, production includes some quantities donated to charity and/or eliminated on account of market conditions. Indicated production for the 1940-41 season will be issued in October.

2/ Short-time average.

3/ Net content of boxes varies. In California and Arizona the approximate average for oranges is 70 pounds net and grapefruit 60 pounds; in Florida and other States, oranges 90 pounds and grapefruit 80 pounds; California lemons about 76 pounds net.

Compiled from reports of the Agricultural Marketing Service.

1/ For some States in certain years, production includes some quantities unharvested on account of market conditions. In 1939, estimates of such quantities were as follows (tons): California, apricots, 8,000; plums, 7,000; prunes, Idaho, 1,200; eastern Washington, 500; western Washington, 4,800; eastern Oregon, 1,200; western Oregon, 18,300.

2/ Short-time average.

3/ In California, the drying ratio is approximately 2-1/2 pounds of fresh fruit to 1 pound dried.

4/ Boxes.
