nimANA, the frog, in zoology ; a genus belonging to the order of amphibia reptilia. The body is naked, furnished with four feet, and without any tail. There are 17 species. The mott remarkable are,
r. The temporaria, or common frog. This is an animal fo well know:, that it needs no defeription; but found of its properties are very fingular.

Its firing, or power of taking large leaps, is remarkably great, and it is the belt fwimmer of all fourfooted animals. Nature hath finely adapted its parts for thole ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnimed with very ftrong muffles.

While in a tadpole fate, it is entirely a water manimal ; the work of generation is performed in that delemont, as may be feen in every pond during firing, when the female remains oppreffed by the male for a number of days.
The work of propagation is extremely fingular, it being certain that the frog has not a penis intrans. There appears a ftrong analogy in this cafe between a evertain clays of the vegetable kingdom and thole animals ; for it is well known, that when the female frog depofits its Spawn, the male inftantaneoufly impregnates it with what we may call a farina facundans, in the fame manner as the palm-tree conveys fructification to the flowers of the female, which would otherwife be barren.

As foo as the frogs are released from their tadpole fate, they immediately take to land; and if the wealthee las been hot, and there fall any refreshing flowers, you may fee the ground for a considerable face perfectly blackened by myriads of there animalcules, fecking for forme fecure lurking places. Some phitufophers, not giving themselves time to examine into this phenomenon, imagined them to have been generated in the clouds, and flowered on the earth; but had they, like our Derlam, but traced them to the next pool, they would have found a better folution of the difficulty: See Preternatural Rains.

As frogs adhere clofely to the backs of their own Species, fo we know they will do the fame !by fifth. Walton mentions a ftrange flory of their deftroying pike ; but that they will injure, if not entirely kill carp, is a fact indifputable, from the following veladion. Not nary years ago, on filing a pond belonging to Mr Pitt of Encomb, Dorfethire, great numbers of the carp were found each with a frog mounted on it, the hind legs clinging to the back, and the fore legs fixed in the corner of each eye of the fill, which were shin and greatly waited, seized by carrying fo difagree-

## R A N

Rana.
of them are rogether, they make fueh a horrid noife, that two yeuple carnet underftawel each other's fpeech. Z'luy croak all tegether, and then Itop for a litue and begin again. It feems as it tbey lad a captain among then: for when he hegins to croak, all the others folhow; and when lie lops, they allo become filent. Whan this eapain gives the fignal for tomping, you hear a rote like fonf coming from hirn. In the dity-time they foldom make any greit noife, unlefs the fey is cosered; tut in the niglt-time they may be focad at the difance of a mile and an laaff. When they cro:k, they are commonly near the furface of the water, under the bufhes, and have their heads cut of the water. By goire flowly, therefore, one may get up almolt quite clofe to then before they go away. A. foun as they are quite under water, they think themidses fate, thotarh it be ever fo fhallow. Thefe creatures sill and eat young ducklines and gonings, and fumetimes carry off chickens that come too oear the water ; when beaten, they cry out almolt like little children. As foon as the air begins to grow a little cool in autumn, they hide thembelves under the mud in the botton of ftasnant waters, and lie there torpid during the winter. As foon as the weather grows mild towards fummer, they begin to get out of their holes and croak. They are fuppufed by the people of Virginia to be the purifiers of waters, and are refpected as the geniii of the fountains. Sume of them were brought to England alive feveral years ago.
4. 'l'lee bufo, or toad, is the nott deformed and hidcous of all animals. The body is hroad ; the back flat, and covered with a pimply dufky linde ; the belly large, fwagring, and fwelling out ; the legs frort, and its pace laboured and crawling; its retreat gloomy and filthy: in thort, its general appearance is fuch as to ftrike one witld difgult and hortor. I't it is faid by thofe who have refolution to view it with attention, : hat its eyes are fine; to this it feems that Shakefpeare aludes, when he make's his Juliet remark,
sime lay tie lark and loathed toad chanse eyes;
As if they would have been better beflowed on fo - larning a fongfter than on this raucous reptile.

But the hideous appearance of the tuad is fuch as to manc this one adsantageous feature overlooked, and to tave rendered it in all ages an wbject of horror, and the origin of molt tremendaus inventions. Elian nishers is venom fo potent, that bafilifk-like it convey. ed death by its very look and breath; but Juvenal is content with naking the Roman ladies who were weary of their hubands furm a potion from its entrails, in order to get rid of the good man. This opinion begat others of a more dreadful nature ; for in after-times iuperflition gave it preternatural powers, and made it at principal ingredient in the incantations of nocturnal hags.

This animal was believed by fome old writers to J.ave a flone in its head fraught with great virtucs medical and magical: it was dillinguified by the name of the reptile, and called the tond-fone, bufonites, crapourine, Kreteog/ein; but all its fancied powers vanilh-
I See six.y ed on the difcovery of its being nothing but the fuffit-
rbisto. tooth of the fca-siulf $f$, or of fome other flat-toothed

Efh , not unfrequent in our ifland as well as feveral other countrics.

But thefe fables have been long exploded. And as to the nution of its being a poifonous animal, it is probable that its exceflive deformity, joined to the ficulty it has of cunitting a juice from its pimples, and a dutky liquid fron its lind parts, is the foundation of the repurt.

That it has any noxious qualities there feem to have buen no proofs in the fmalletl degree fatisfactory, the' we have heard many ftrange relations on that point. On the contary, there have been many who have taken them in their naked lands, and held them long without receiving the leaft injury: it is alfo well known that quacks have eaten them, and have befdes fqueesed their juices into a glafs and drank them with impunity. We may fay alfo, that thefe reptiles are a common frod to many animals ; to buzzards, owls, Norfolk plowers, ducks, and fnakes, who would not touch them were they in any degree noxious.

So far from having venomous qualities, they have of late been confidered as if they had benefieent ones; particularly in the cure of the mofk terrible of difeafes, the cancer, by fuction: (See Britifb Zoology, vol. iii. Append. p. 389 , at leq.) But, from all circumitances, as Mr Pennant obferves, they feem only to have rendered a horrible complaint more loathfome.

The mott full information concerning the nature and qualities of this animal is contained in the following letters from Mr Arfcott and Mr Pittfield to Dr Milles. "It would give me great pleafure (fays Mr Arfeott) to be able to inform you of any particulars worthy Mr Pennant's notice, concerning the toid who lived fo many years with us, and was fo great a furourite. "lhe greateft curiolity in it was its becoming fore markably tame. It had frequented fome fteps before the hall-door fonte jears before my acquaintance commenced with it, and had been admured by my father for its fize (which was of the largeft I ever inet with), who conttantly paid it a vifit every evening. I knew it myfelf above 30 years; añd by conitantly feeding it, brought it to be fo tame, that it always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with infects of all forts; it was fondeft of flef maggots, which I kept in bran; it would follow them, and, when within a proper diftance, would fix its eye, and remain motionlefs for near a quarter of a minute, as if preparing for the itroke, which was an inflantaneous throwing its tongue at a great diftance upon the infect, which ltuck to the tip by a glutinous matter : the motion is quicker than the eye can follow (A).
" I always inragined that the root of its tongire was placed in the furepart of its under jaw, and the tip towards its throat, by which the motion mult be a half circle; by whieh, when its tongue recovered its fituation, the infect at the tip would be brought to the place of deglutition. I was confirmed in this by never obferving any internal mution in its mouth, excepting orre fwallow the inftant its tongue returned. Poflibly I might be miftaken; for I never diffected one, but contented
(A) This rapid capture of its prey might give ocsafion to the report of its fafcinating powers, Linnæus fays, Injew'a in fauces jufino remocal.

## R A N

tented myleff with opening its mouth, and flightly infpecting it.
"You may imagine, that a toad, generally detefted, (although one of the moft inoffenive of all aximala), fo much taken notice of and befriended, excited the curiofity of all comers to the houfe, who all defired to fee it frd ; fo that even ladies fo far conquered the horrors infilled into them by nurfes, as to delire to fee it. This produced innumerable and improbable reports, making it as large as the crown of a hat, \&c. \&c."

The following are anfwers from the fame genteman to fome queries propofed by Mr Pennant.
"Firgl, I cannot fay how lung my father had been acquainted with the toad before I knew it ; but when 1 firft was acquainted with it, he ufed to mention it as the old toad I've known fo many ycars; I can anfwer for 36 years.
"S Secondly, No toads that I ever faw appeared in the winter feafon. The old toad made its appearance as foon as the warm weather came, and I always concluded it retired to fome dry bank to repofe till the fpring. When we new-lay'd the feps, I had two holes made in every third fep, with a bullow of more than a yard long for it, in which I imagine it flept, as it came from thence at its frit appearance.

Thirdly, It was feldom provoked: neither that toad, nor the multitudes I have feen tormented with great cruelty, ever fhowed the lealt defire of revenge, by fpitting or emitting any juice from their pimples. Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as I have often feen it do the fame upon the fleps when quite quict, was certainly its urine, and no more than a natural evacuation.

Fourthly, A toad has no particular enmity for the fpider; he ufed to eat five or fix with his millepedes (which I take to be its chief food) that I generally provided for it before I found out that flefh maggots, by their coutinual motion, was the moft tempting bait;

## 3 ) R A N

but, when offered, it eat blowing fies and humble bres that come from the rat-tailed maggot in gutters, or in flort any infect that moved. I imagine, if a bee was to be put before a toad, it would certainly eat it to its coft ; but as bees are feldom firring at the fame time that toads are, they cann feldom come in their way, as they feldom appear after fun-rifing or before fun-fet. In the heat of the day they will come to the mouth of their hole, I believe, for air. I once from my parlour window obferved a large toad I had, in the bank of a bowling-green, about 12 at noon, a very hot day, very bufy and active upon the grafs; fo uncommon an appearance made me go out to fee what it was, when I found an innumerable fivarm of winged ants had dropped round his hole, which temptation was as irrefiftible as a turtle woald be to a luxurious alderman.
"Fifflly, Whether our toad ever propagated its fpecies, I know not ; rather think not, as it always appeared well, and not kffened in bulk, which it muft laave done, I fhould think, if it had difcharged fo large a quantity of fpawn as toads generally do. The females that are to propagate in the ipring, I imagine, inftead of retiring to dry holes, go into the bottom of ponds, and lie torpid among the weeds: for to my great furprife, in the middle of the winter, having for amufement put a long pole into my pond, and twitted it till it had gathered a large volume of weed, on taking it off I found many toads; and having cut fome afunder with my knife, by accident, to get off the weed, found them full of fpawn not thoroughly formed. I am not pofitive, but think there were a few males in March; 1 know there are 30 males ( E ) to one female, 12 or it of whom I have feen clinging round a female: I have often difengaged her, and put her to a folitary male, to fee with what eagerncfs he would feize her. They impregnate the fpawn as it is drawn (c) out in long Atrings, like a neeklace, many yards long, not in a large quantity of jelly, like frogs fawn.
(в) Mr John Hunter has aflured me, that during his refidence at Belleifle, he diffected fome hundreds of toads, jet never met with a fingle female among them.
(c) I was ineredulous as to the obpectrical offices of the male toad; but fince the end is fo well accounted for, and the fact eitablifhed by fuch good authority, belief mult take place.
Mr Demours, in the Memoirs of the French Academy, as tranlated by Dr Templeman, vol. i. p. $37^{\text {i }}$, has been very particular in refpect to the male toad as acting the part of an accoucbeur : His account is curious, and claims a place here.
"In the evening of one of the long days in fummer, Mr Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed in part by a great flone at the top.
"Curiofity drew him to fee what was the occafion of the motions he obferved, when, two facts equally new furprifed him. The firf was the extrene' difficulty the female had in laying her eggs, informuch that the did not feem capable of being delivered of them without fome affitance. The fecond was, that the male was mounted on the back of the femaie, and exerted ail his ftrength with his hinder feet in puiling ont the egss, whitht his fortfeet embraced her breafto
"In order to apprehend the manner of his working in the delivery of the fermalc, the reader munt obferve, that the paws of thefe animals, as well thofe of the fore-feet as of the hinder, are divided into feveral toes, which can perform the office of fingers.
" It muft be remarked likewife, that the eggs of this fpecies of toads are included each in a membranous coat that is very tirm, in which is contained the embryo: and that thefe eggs, which are oblong and about iwu lines in length, being faftened one to another by a fhort but very frong cord, form a kind of chaplet, the beads of which are dittant from each other about the half of their length. It is by drawing this cord with his parv that the male performs the function of a midwife, and acquits himelf in it with a dexterity that one would not expeet from fo lumpift an animel.
*The prefence of the obferver did not a little difcomprefe the male: for fome time he flopped inort, and herex
manner of their production. The eggs, when formed in the owary, are fent, by forne internal canals, which :natomitts have not hitherto defcribed, to lie and come (1) maturity under the bony fublance of the back: in this ftate they are impregnated by the male, whofe feed falds its way by pores very fingularly contrived, and pierees not only the fkin but the perioftum : the fkin, howewer, is still apparently entire, and forms a rery thick covering over the whole brood; but as they advance to maturity, at different intervals, one afier itro other, the egg feenis to thart forward, and burgemis from the bact,, becomes more yellow, and at laft breaks; when the young one puts forth its head: it llill, however, keeps its fituation until it has acquired a projer degree of flrength, and then it leaves the fhell, but tith continues to keep upon the back of the parent. In this manner the pipal is feen travelling with her wooderous family on her back, in all the diffurent tages of maturity. Some of the Atrange progeny, not yct come to fufficient perfection, appear quite torpid, and as yet without life in the egg: others feem juft beginning to rife through the fiin; here peeping furth from the fhell, and there having entirely forfiken their prifon: fone are fporting at large upon the parent's back, 'and others defecadinet to the ground to try their own fortune below. The male pipal is every way larger than the female, and has the fkin lefs tightly drawn round the body. 'The whole budy is covered with puftules, refembling pearls; and the belly, which is of a bright yellow, feems as if it were fewed up from the throat to the vent, a feam being feen to run in that direction. This animal, like the reft of the frog kind, is moft probably harmlefs.
8. The water frog of Catefly las large black eyes, yellow irides, and long limbs: the upper part of the head and body is of a dufly green, fpotted with black; and from each cye to the nofe is a white line; and alfo a yellow line along the fides to the rump. They frequent rivulets and ditches, which they do not quit for the dry land. It is faid they will §pring five or fix yards at a leap.
9. The rana arborea, or green tree frog of Catefby, is of a fender fhape and bright green colour, narked ont each finde with a line of yellow: the eyes are black; the irides ycllow ; they have four toes hefore and five behind; at the end of each toe there is a romed mem. brane, concave beneath, and not milike the mouth of a lewch. They hark under the lower fides of leaves, even of the talleft trees, and asticere firmly, by means of the membranes at the ends of their tocs, Alicking to the fmuctheft furface: a looking-glafs was held befure one,
$\therefore$ :rew on the curious imfertinent a fixed look that marked his difquietuefs and fear; but he foon returned to his work with more precipitation than before, and a moment after lie appeared undetermined whether he fhould coutimue it or rant. "I he female likewice difeovered her mealinefs at the tight of the ftranger, by motions that interrugted formetimes the male in his operation. At length, whether the filence and fleady pofture of the fpeci.tor lizd diftipated their fear, or that the caje was urgent, the male refuned his work with the fame vigonr, and lucceffsfuly perfurmed his fiuntion."
(D) This queftion arole from an affertion of Linnæus, that the toad delighted in filhy herbs. Delestatur con colv, odred, flititg ce fotide. The unlappy defornity of the animal fecms to be the only ground of this as well as ancther mifreprefentation, of its conveying a poifon with its pimples, its toxch, and cren its breath. Verre-

## R A N

Ranai at four yards dintance ; it reached it at one leap, and fuck clofely to it. At night thefe frogs make an inceffant chirping, and leap from fpray to fpray in fearch of infects. This fpecies is common to America and the warmer parts of Europe.
10. The land frog of Catefloy has much the appearance of a toad: abore it is grey or brown, fpotted with dufky; below white, faintly fputted; the irides are red; and the legs fhort. 'They frequent the high-lands, and are feen moft frequently in wet weather and in the hottelt time of the day: they leap, feed on infects, particularly the fire-fy and ant. Sometimes the Americans bake and reduce this fpecies to powder, which, mised with orrice root, is taken as a cure for a tympany.
11. The cinercous frow has a gibbous, cinereous, and finooth back; the belly is yellow and granulated: on each lide, from the nofe to the rump, there is a white line; and there is the fame on the outfide of the thighs and legs; the toes are bullated at their ends. 'They inhabit Carolina.

RANAI, one of the Sandwich iflands difcovered by Captain Cooke, is about nine miles diftant from Mowee and Morotor, and is fituated to the fouth-weft of the palfage between thofe two illes. The country towards the fouth is elevated and craggy ; but the other parts of the in?and had a better appearance, and feemed to be well inhabited. It abounds in roots, fuch as fweet potates, taro, and yams; but produces very few plantains and bread-fruit trees. The fouth point of Ranai is in the latitude of $20^{\circ} 4^{\prime}$ north, and in the longitude of $203^{\circ} \mathrm{S}$ eaft.

RANCID, denotes a fatty fubflance that is become rank or mufty, or that has contracted an ill fmell by being kept clofe.

RANDIA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is menophyllous; the corolla falver-fliaped; the berry unilocular, with a capfular rind. There are two fpecies, viz. the mitis and aculeata.

RANDOLPH (Thomas), aneminent Englifh poet in the 17 th eentury, was born in Northamptonflire 1605. He was cducated at Weltminiter and Cambridge, and very early diftinguithed for his excellent genius ; lor at ahout nine or ten years of age he wrote the Hiftory of the Incarnation of our Saviour in verfe. His fubfequent writings efablifhed his claracter, and gained him the efteem and friendikip of fome of the greateft men of that age, particularly of Ben Johnfon, who adupted him one of his fons in the mufes. He died in 63 1, and was bonourably interred. He wrote, bothe Mufes Look.

## 5 ] <br> R A N

ing-glars, a comedy, 2. Amyntas, or the Impolible Random Dowry, a pattoral, acted before the king and queen. 3. Aritippus, or the Jovial Philofopher. 4. The Conceited Pedlar. 5. The Jealous Lovers, a comedy. 6. Hey for Honefty, down with Knavery, a comedy ; and feveral poems.

RANDOM sнor, in gunners, is a thot made when the muzzle of a gun is raifed above the horizontal line, and is not defrgned to fhoot directly or puint-blanks.

The utmoft random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go fartheft when the piece is mounted to about $45^{\circ}$ above the level range. See Gunnery and Projectiles.

RANGE, in gunnery, the path of a bullet, or the line it defcribes from the maith of the piece to the point where it lodges. If the piece lie in a line parallel to the lorizon, it is called the risht or leatel range: if it be mounted to $45^{\circ}$, it is faid to have the utmof range; all others between 00 and $45^{\circ}$ are called the inter mediate ranges.

RANGER, a fworn officer of a foref, appointed by the king's letters patent ; whofe buinefs is to walk through his charge, to drive back the deer out of the purlieus, \&ic. and to prefent all trefpaftes within lois jurifdiction at the next foreit-court.

RANII, the order or place affgned a perfon fuitable to his quality or merit.
$R_{A}: \mathrm{K}$, is a ftraight line made by the foldiers of a battalion or fquadron, deawn up fide by fide: this order was eitablihned for the marches, and for regulating the different booies of troops and officers which compufe an army.

Rank and Precedence, in the army and navy, are as follow:

Engineers RaNA. Chief, as colonel; director, as ' lieutenant-colonel ; fub-director, as major; engineer in ordinary, as captain; en inetr extraordinary, as captainlieutenant; fub-enginter, as lieutenaut; practitioner-engineer, as enfign.

Nuay Rank. Admiral, or commander in chief of his majelly's fieet, has the rank of a feld-marhal ; admirals, with their flags on the main-top malt licad, rank with generais of horfe and foot; vice-admirals, with lientenant-gencials; rear-admirals, as majur-gencrals; commodores, with bread pendants. as briçadier-gencrals; captains of put-hips, after three years from the date of their firlt commiffion, as colonels ; cther captains, as commanding poft-hips, as lentenatut-cutonels; eaptains, rot taking poit, as majurs; lientenales, dis captains.

Rask between the Army, Navy, and Covernors.

| Axmy. | Nayy. | Governors. |
| :---: | :---: | :---: |
| General in chief | Admiral in chicf | Commander in chief of the forces in America |
| Generals of horfe | Admiral with a flag at the main-top-maft | Captain-general of provinces |
| Licutenant-generals | Vice-admirals | Licutenant-gencrals of provinces |
| Major-rencrals | Rear-admirals | Lieutenant-governors and prefudents |
| Culonels | Poft-captains of 3 ycars | Lieutenant-governors not commanding |
| Licutenant-colonels | Poft-captains | Governors of charter colonies |
| Majors | Captains | Deputy-gavernors |
| Captains | Lieutenants | Eftablifled by the king, 1760 |

$\underbrace{\text { lus. }}$

Doulling of the Ranks, is the placing two ranks in one, frequently ufed in the manceusres of a recriment.

Ranks and Files, are the horizonta! and vertical lines of foldiers when drawn inp for forvice.

RANSOM, a fum of money paid for the redemption of a flase, or the liberty of a prifoner of war. In enr law-books, ranfom is alfo ufed for a fum paid for the pardon of fome great offence, and to obtain the oftender's liberty.

RANULA, a turnor under a child's tnngue, which, like a ligature, hinders it from speaking or fueking.

RANUNCULINS, crowroot: $\AA$ graus of the polygamia order, belonging to the polyandria clats of plants; and in the natural method ranking under the 2 cith order, Mulifiliquie. 'The calyx is pentaphyllous; there are fire petals, each with a melliferous pore on the infide of the lieel; the feeds naked.

Species. 'There are near 40 different fpecies of this genus, fix or cight of which claim general efteem as flowery plants for omamenting the gardens, and a great number are common weeds in the fields, waters, and pafture ground, not having merit for garden culture. Of the garden kinds, the principal fort is the Afratic or Turkey and Perfian ranunculus, which comprifes many lundred varietics of large, double, molt heautiful fowers of various colours: but feveral other fyecics having varieties with fine double flowers, make a good appearance in a collection, though as thofe of each fpeceies confift only of one colour, fome white, whers fellow, they are inferior to the Afiatic ramunculns, which is large, and diverfified a thoufand ways in rich colours, in different varicties. However, all the garden kinds in general effect a very agrecable diverfity in allemblage in the flower compartments, \&e. and they being all very hardy, fueceed in any open beds and borLers, Sic.

Culture. The Afiatic fjecics in all its wanieties will fuoceed in any light, rieh, garden carth; but the floritts often prepare a particular comport for the fine varictics, conliting of good garden-mould or palturecarth, fward asd ail, a fourth part of rotted cow-dune. and the lide portion of fca-fund; and with this they
prepare loeds four feet wide and two deep: however, in default of fuch compoft, ufe beds of any good light eartli of your garder; or, if neceffary, it may be made light and rich with a portion of drift-fand and rotten dung, cow-dung is mot commonly recommended; but they will alfo thrive in beds of well-wrought kitehengarden earth, and they often profper well in the comnon flower-borders.

The feafon for planting the roots is both in autumn and fpring; the autumn plantings generally flower ftrongeft and fooneft by a month at leaf, and are fucceeded by the fpring-planting in May and June. Perform the autumnal planting in OQuber and early part of November, but fome plant towards the latter end of September in order to have a very early bloom ; but thofe planted in that month and beginning of October often come up with rank leaves foon after, in winter, fo as to require protection in hard frofts; thofe, however, planted about the middle or latter end of October, and beginning of November, rarely hoot up ftrong till towards fpring, and will not require fo much carce of covering during winter; and the fpring-planting may be performed the end of January or beginning of February, or as foon as the weather is fettled; they will not require any trouble of covering, and will fucceed the autumal plants regularly in bloom, and will flower in good perfection. Thus by two or three different plantings you may obtain a fuccelfion of there beautiful flowers in conitant bloom from Aprit till the middle of June; but the autumnal plants, for the general part, not only flower ftronget, but the roots increafe more in firc, and furnifh the but off-fets for propagation : it is, however, proper to plant both in spring and autumn.

Prepare for the choicer forts four-feet beds of light earth, and rake the furface fmooth: then plant the roots in rows lengthwife the beds, either by drilling them in two inches deep, and fix inches diftance in the row, and the rows fix or eight afunder; or you may plant them by bedding-in, or by dibble planting, the tame deptl and diflance.

Thofe defigned for the borders fhould be planted generally

## $R$ A $P$

banneu- nerally towards the fpring, in little clumps or patches, lus thee, four, or five ronts in each, putting them in either with a dibble or trowel, two or three inches acep, and three or four afunder in each patch, and the patches from abont three to five or ten feet diftance, placing them rather forward in the border.

Propigation. All the varicties of the A fratic ranunculus propagate abundantly by off-fets from the root, and new varieties are gained by feed.-I. By off-fets. I'he time for feparating the off-fets is in fummer when the flower is pall, and the leaves and ftalks are withered : then taking up all the roots in dry weather, fepa. rate the off-fets from each main root, and after drying the whole gradually in fome fhady airy room, put them up in bags till the autum and fpring feafons of planting; then plant thens as before, placing all the off-fets in feparate beds: many of then will blow the fint year, but in the fecond they will all fower in grood perfec-tion.-2. By feed. Save a quantity of feed from the tineit femi-double flowers, and fow it either in Angult, or in March, or April, thongh, to fare trouble of win-ter-covering, fome prefer the fpiring : it thould be fowed in light rich mould, either in pots or in an eait border, drawing very fatlow flat drills five or fix inches afunder, in which fow the feeds thinly, and cover them lightly with earth, giving frequent refrefhments of water in dry weather, and in a month or fix wetks the plants wili rife with fnall leaves; obferving to continue the light waterings in dry weather, to preferve the foil moilt during their funmer's growth to increafe the fize of the roots; and in June when the leaves decay, take up the roots and preferve them till the feafon for planting, then plant them in common heds, as before directed, and they will flower the foring following, when all the doubles of good properties fhonld be marked, and the firgles thrown away.

The juice of many fpecies of ranunculus is fo acrid as to raife blifters on the fikin, and yet the roots may be eaten with fafety when boiled.

RAPACIOUS animals, are fuch as live upen prey.

RAPE, in law, the carnal knowledge of a woman forcibly and againft her will. This, by the Jewifh law, was punifned with death, in cafe the damfel was betrothed to another man: and, in cafe the was not betrothed, then a heavy fine of fifry flekels was to be paid to the damfel's father, and the was to be the wife of the ravifher all the days of his life; without that power of divorce, which was in general permitted by the Mofaic law.

The civil law punihes the crime of ravifhment with death and confifcation of goods: under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and alfo the prefent offence of forcibly difhonouring her ; either of which, without the other, is in that law fufficient to confitute a capital crime. Alfo the Atealing away a woman from her parents or guardians, and debaucling her, is equally penal by the emperor's edict, whether the confent or is forced. And this, in order to take away from women every opportunity of offending in this way; whom the Roman laws fuppofe never to go aftray without the feduction and arts of the other fex ; and therefore, by reftraining and making fo highly penal the folicitations of the men, they meant to ficure effectually the hoomor
of the women. But our Engligh law does not entertain quite fuch fublime ideas of the honour of cither fex, as to lay the blame of a mutual faule upon one of the tranfgreffors only; and therefore makes it a necelfary ingredient in the crime of rape, that it mult be againt the woman's will.

Rape was punithed by the Saxon laws, particularly thofe of king Athelfan, with death; which was alfo agrecable to the old Gothic or Scandinavian conftitution. But this was afterwards thought too hard: and in its ftead anotleer fevere, but not capital, punifhment was inflicted by William the Conqueror, viz. caftration and lofs of cyes; which continued till after Bracton wrote, in the reign of Henry IIK. But in order to prevent malicious accufations, it was then the law, (and, it feem, fili continues to be fo in appeals of rape), that the woman hould, immediately after, go to the next town, and there make difcovery to fome credible perfons of the injury fhe has fuffered; and afterwards fhould acquaint the high confable of the lundred, the coroners, and the fheriff, with the outrage. This feems to correfpond in fome degree with the laws of Scotland and Arragon, which require that complaint muft be made within $2+$ hours: though afterwards by ftatute Weftm. I. c. 13. the time of limitation in England was extended to 40 days. At prefent there is no time of limitation fixed: for, as it is ufually now punifhed by indictment at the fuit of the king, the maxim of law takes place, that " nullum tempus occurrit regi:" but the jury will rarely give credit to a ttale complaint. During the former period alfo it was held for law, that the woman (by confent of the judge and her parents) might redeet the offerder from the execution of his fentence, by accepting him for her hufband; if he alfo was willing to agree to the exchange, but not otherwite.

In the 3 Edw. I. by the flatute Weltm. I. c. I 3 . the punifhment of rape was much mitigated: the offence itfelf, of ravihing a danfel within age, (that is, twelve years old) either with her coufent or without, or of any other woman again!t her will, being reduced to a trelpafs, if not profecuted by appeal within 40 days, and fubjecting the offender ouly to two years imprifonment, and a fine at the king's will. But this lenity being preductive of the molt terrible confequences, it was, in ten years afterwards, 13 Ediw. I. fonnd neceffary to make the offence of forcible rape felony by itatute Weftm. 2. c. 34 A A by flatute 18 Eliz. c. 7. it is made felony without benefit of clergy: as is alfo the aboninable wickednefs of carnally knowing or abufing any woman-child under the age of ten years; in which cafe the confent or non-confent is immaterial, as by reafon of her tender years she is incapable of judgment and difcretion. Sir Matthew Hale is indeed of opinion, that fuch profligate actions committed on an infant under the age of twelve years, the age of female difcretion by the common law, either with or without confeut, amount to rape and felony; as well fince as before the ftatute of queen Elizabeth : but that law has in general been held only to extend to infants under ten ; though it fhonld feem that damfels between ten and twelve are ftill under the protection of the ftatute Weflan. 1. the law with refpeet to their feduction not having been altered by either of the fnbfequent itatutes.

A mule infant, under the age of fourteen years, is

## $R$ A $P$

prefumed hy law incapable to commit a rape, aned
therefore it fecmis cannot be found guiley: of it. Ion though in other felonies "malitia fupplet zetatem;" yet, as to this particular fpecies of felony, the law fup. pofer an imbecillity of body as well as mind.

The cin! law fecms to fuppofe a prollitute or common harlot incapable of any injuries of this kind : not allowing any punifhent for violating the chatity of her, who hath indecx me chantity at all, or at leaft hath no regard to it. But the law of England does not judge fo lardly of offienders, as to cut off all op. portumity of retreat even from common frumpits, and of treat thein as never capable of amendment. It therefore holds it to be felony to force even a concubine or harlot; becaufe the woman may have forfaken that unlawfint courfe of life: for, as Bractur well obierves, " liset meretrix fucrit antea, certe tunc tempuris non fuit, cum reclamando uequitix ejus confentire moluit.'

As to the material facts requilite to be given in evidence and proved upon an indictment of tape, they are of fuch a nature, that, though necelfary to be known and iettect, for the comviction of the grilty and prefervation of the innocent, and therefore are to be found in fuch coiminal treatif's as difcourfe of thete matters in detail, yet they are highly improper to be publicly difcullied, except only in a court of juttice. We thall therefore merely add upon this heid a few remarks from Sir Mathew Hale, with regard to the competenc! and credibility of wituefles ; which may, falvo pudore, be conficered.

And, firt, the party ravificel mary give evidence upon oath, and is in law a competent witnefs ; but the credibility of her teftimony, and how far forth the is to be believed, muft be left to the jury upon the circumflances of fact that concur in that tellimony. For inflance: if the witnefs be of good fame; if the prefently difcovered the effence, and made fearch for the offender; if the party accufed fed for it; thefe and the like are concurring circunflances, which give greater probability to her evidence. But, on the other fide, if the be of evil fame, and Itand unfupported by others; if fhe concealed ithe injury for any conliderable time after the had opportunity to complain; if the place, where the fact was allered to be committed, was where it was poffible The might have been heard, and the made no nutcry: thefe and the like cireumftances carry a flrong, but not conclufive, prefumption that her tellimony is falie or feigned.

Morenver, if the rape be charged to be conmitted on an infant under 12 years of agge, the may thill be a competent witnefs, if the hath fenfe and underitanding to know the nature and obligations of an oath; and, even if the liath not, it is thought by Sir Matthenv Hale, that fhe ouglit to be heard without oath, to give the court information; though that alone will not be fufficient to convict the offender. Arid lie is of this opinion, firtt, Becaufe the nature of the offence being fecret, there may be no other pofible proof of the actual fact ; though afterwards thete may be concurrent circunillances to corroborate it, proved by other witneffes: and, fecondly, Becaufe the law allows what the child told her mother, or other relatuons, to be given in evidence, fince the nature of the
cafe admits frequently of no better prowf; and there is much mone reafon for the court to hear the narration of the child herfelf, than to receive it at fecondland from thofe who fwear they heard her fay fo. And indeed it feems now to be fetled, that in thefe cafes infants of any age are to be lieard; and, if they have any idea of an oath, to be alfo fworn: it being found by experience, that infants of very tender years often give the clearef and trueft teftimony. But in any of thefe cafes, whether the child be fworn or not, it is to be wihed, in order to render her evidence credible, that there fhould be fome concurrent tellimony of time, place, and circumitances, in order to make out the fret ; and that the conviction dhould not be grounded fingly on the unfupported accufation of an infant under years of difcretion. There may he therefore, in many cafes of this nature, witneffes who are competent, that is, who may be admitted to be hard; and yet, after being heard, may prove not to be credible, or fuch as the jury is bound to believe. loor one excellence of the trial by jury is, that the jury are triers of the credit of the wituefles, as well as of the truth of the fack.
" It is truc (fays this leamed judge), that rape is a moft detellable crime, and therefore ought feverely and impartially to be punifhed with death ; but it muit be remembered, that it is an accufation eafy to be made, hard to be prosed, but harder to be detended by the party acculcd, though innocent." He then relates two very extraordinary cafes of malicious profecution for this crime, that had happened within his own obfervation; and concludes thus: "I mention thefe inftances, that we may be the roore cautious upon trials of offences of this nature, wherein the court and jury may with fo much eafe be impofed upon, without great care and vigilance ; the hcinoufnefs of the offence many times tranfporting the judge and jury with fo much indignation, that they are over-hattily carried to the conviction of the perfons accufd thereof, by the confident teltimony of fometimes falfe and malicious witnefles."

RAPHAEL (D'Urhino), the greateft, mof fublime, and mott excellent painter that has appeared, fince the revival of the fine arts, was the fon of an indifferent painter named Sanzio, and was born at Urbino on Guod Friday 1482. The popes Julius II. and Leo X. who employed him, loaded him with wealth and honour ; and it is faid that cardinal De St Bibiana had fuch a value for him, that he offered him his niece in marriage. His genius is admired in all his pictures; his contours are free, his ordonnances marnificent, his defigns correct, his figures elegant, his expreffions lively, his attitudes natural, his heads graceful; in fine, every thing is beautiful, grand, fublime, juft, and allorned with graces. Thefe various perfections he derived not only from his excellent abilities, but from his Itudy of antiquity and anatony; and from the friendfhip he contraeted with Ariolto, who contributed not a little to the improvemont of his tafte. His pictures are principally to be found in Italy and Paris That of the Transtiguration, preferved at Rome in the church of St Pcter Monterio, paffes for his mafler-piece. He had a handfume perfon, was well proportioned, and had griat fweetnefs of temper; was polite, affable, and mon-

-FPaphilitias.

${ }^{4}$ thin deft. He, however, lived in the utmoft fplendur ; mot phidia. of the eminent mafters of his time were ambitious of working under him ; and he gever went out withour a crowd of artits and others, who followed him purely through refpect. He was not only the beft painter in the world, but perhaps the beft architect too ; on which account Leo X. charged him with building St Peter's church at Reme : but he was too much addicted to pleafure, which occalioned his death at 37 years of age. He left a great number of difciples; among whom were Julio Romano and John Francis Penni, who were his heirs. Many able engravers, as Raimondi, George Mantuan, and Bloemart, engıaved after Raphael. See Painting, p. 595 and 598.

RAPHAIM, or Rephaim, (Mofes), a name fignifying Giants, as they really were, and an atual people too, fituated in Bafan or Batanea, beyond Jordan, feparated from the Zanzummim by the river Jabbok. Alfo a valley near Jerufalem: Jofhna $x$.

RAPHANUS, RADISH; a genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural metbod ranking under the 39 th order, Siliquofe. The calyx is clofe; the filiqua torofe, or fwelling out in knots, fubarticulated, and round. There are two melliferous glandules between the florter ftamina and the pirtil, and two between the longer ftamina and the calyx.

There is only one fpecies, viz. the fativus, or common garden radih; of which there are feveral varieties. They are annual plants, which being fowed in the fpring, attain perfection in two or three months, and fhoot up foon after into ftalk for flower and feed, which, ripening in autumn, the whole plant, root and top, perifhes; fo that a frefh fupply mult be raifed annually from feed in the fpring, performing the fowings at feveral different times, from about Chrittmas until May, in order to continue a regular fucceffion of young tender radifhes throughout the feafon: allowing only a fortnight or three weeks interval between the fowings; for one crop will not continue good longer than that fpace of time, before they will either run to feed, or become tough, fticky, and too hot to eat.

RAPHANIDOSIS, a punifhment inflicted at Athens upon adulterers. The manner of it was this: The hair was plucked off from the privities of the offender, hot afhes laid upon the place, and a radifh or mullet thruf up his fundament, as has been mentioned under Adultery. To this Juveral alludes, Sat. x. ver. 317. 2uofdam machos et mugilis intrat. Perfons who had been thus punifhed were called evipunk7:. The word raphanidyfis is derived from $f^{\alpha p a v i s}$, a radifh.

RAPHIDIA, in zoology ; a genus of infects, of the neuroptera order; the characters of which are thefe: The head is of a horny fubitance, and depreffed or flattened: the mouth is armed with two teeth, and furnifhed with four palpi : the flemmata are three in number: the wings are deflected : the antenne are filiform, as long as the thorax; the anterior part of which is lengthened out, and of a cylindrical form : the tail of the female is terminated by an appendix, refembling a flexible crooked brifte. - There are three fpecies. The moft remarkable is the ophioptis; whicts
for its fhape is one of the moft fingular that can be
feen $\dagger$. It has an oblong head, Chaped like a heart,
Voz. XVI. Part I.

## $9]$ <br> R A P

with its point joined to the thorax, and the broad part before. It is fmooth, black, flattened, continually fhaking, with fhort antennx, yellowifh maxillx, and four palpi. Towards the middle of the upper part of the head, between the eyes, are the three flemmata, placed in a triangle. The thorax, to which this head is fattened, is narrow, long, and cylindrical. The abdomen, broader, is black like the ref of the body, with the fegments margined yellow. The feet are of a yellowifh caft. The wings, which are faltigiated, are white, diaphanous, veined, and as it were covered with a very fine net-work of black. 'This infect, in the figure of its head, refembles a fnake. It is found but feldom, and in woods only. Its larva, chryfalis, and tabitation, are abfolutely unknown.

RAPIER, formerly fignified a long old-fafhioned fword, fuch as thofe worn by the common foldiers: but it now denotes a fmall fword, as contradiltinguiihed from a back-fword.
RAPIN (Rene), a Jefuit and eminent French writer, was born at Tours in 1621. He taught polite literature in the fociety of the Jefuits with great applaule, and was juftly efteemed one of the beft Latin poets and greatef wits of his time. He died at Paris in 1687 . He wrote, I. A great number of Latin poems, which have rendered him famous throughout all Europe; among which are his Hortorum libri guatuor, which is reckoned his mafter-piece. 2. Reflections on Eloquence, Poetry, Hiftory, and Philofophy. 3. Comparifons between Virgil and Homer, Demofthenes and Cicero, Plato and Ariftotle, Thucydides and Titus Livius. 4. The Hittory of Janfenifm. 5. Several works on religious fubjects. The beft edition of his Latin poems is that of Paris in $17^{2} 3$, in 3 vols 12 mo .

Rapin de Thoyras (Paul de), a celebrated hiftorian, was the fon of James de Rapin lord of Thoyras, and was born at Caftres in 1661 . He was educated at firt under a tutor in his father's houfe; and afterwards fent to Puylaurens, and thence to Saumur. In 1697 he returned to his father, with a delign to apply himfelf to the fudy of the law, and was admitted an advocate : but fome time after, reflecting that his being a Proteftant would prevent his advancement at the bar, he refolved to quit the profeffion of the law, and apply himfelf to that of the fword; but his father would not confent to it. The revocation of the edict of Nantes in 1685 , and the death of his father, which happened two montlis after, made him refolve to come to England; but as he had no hopes of any fettement here, his flay was but thort. He tberefore foon after went to Holland, and lifted himfelf in the company of French volunteers at Utrecht, commanded by M. Rapin his coulin-german. He attended the Prince of Orange into England in 1688 : and the following year the Lord Kingfton made him an enfign in his regiment, with which he went iuto I veland, where he gained the etteem of his officers at the fiege of Carrickfergus, and had foon a lientenant's commilion. He vaas prefent at the battle of the Boyne, and was thot iliso' the .houlder at the fiege of Limerick. He was foon after captain of the company in which he had been entign ; but, in 1693 , refigned his company to one of his brothers, in order to be tutor to the earl of lortland's

Rapicr,
Rapı:1.

Rayise fon. In 1699, he married Marianne Tetard; but this marriage neither abated his care of his pupil, nor presented his accompanying him in his travels. Having finifleil this conployment, he returned to his family, Which he had fettled at the Hague; and here he continued fome years. But as he found his family increafe, he refolved to retire to fome cheap country ; and aecordingly removed, in 1707, to Wefel, where he wrote his Hiltory of England, and fome other pisces. Though he was of a ftong conflitution, yet feventeen sears application (for fo long was he in compofing the hittury jutt mentioned) entircly ruined his health. He died in 1725. He wrote in Prench, 1. A Differtation on the Whigs and Tories. 2. His Hittory of Engladed, printed at the Hague in 17.26 and 1727 , in 9 wols $\boldsymbol{q}^{(0)}$, and reprinted at Trcroux in 1728 , in 10 vols 4to. This latt edition is more complete than that of the Hague. It has been trandated into Englifh, and in.proved with Notes, by the Keverend Mr Tindal, in 2 vols fotio. This perfermance, though the work of a foreigner, is defervedly eftemed as the fulleft and mof impartial collection of Englith political tranfactionsextant. "The readers of wit and viracity, however, may he apt to complain of him for being lometimes rat ther tedious and dull.

RAPINE, in law, the taking away another's goods Eic. by vioknce.

RAPIPERSWIL, a town of Swifferland, on the conimes of the canton of Zurich, and of the territory of Gatker, with an old caftle. It is ftrong by fituation, being feated on a neck of land which advances ints the lake of Zurich, and over which there is a hridere 850 paces long. It is fubject to the cantons of Zurich and Berne. E Long. 8. 57. N. Lat. 47. 20.

RAPPOLSTEIN, a town of France in Upper Alface, which, before the Revolution, had the title of a hatony. All the mufieians of Alace likewife depended upon this baron, and were obliged to pay him a certain trihute, without which they could not play upon their influments. E. Long. 7. 28. N. Lat. 4 8. 15 .

RAl'TURE, an ecttaly or tranfport of mind. Sce Extasy

KARE, in phyfic, ftands oppofed to denfe ; and denotes a body that is very porsus, whofe parts are at a great diflance from one another, and which is fuppofed to contain but little matter under a large bulk. See the following article.
R.AREFACTION, in plyfics, the act wherchy a body is rendered rare; that is, brought to pofiefs more room, or appear under a larger bulk, without acceffion of any new matter. - 'lhes is very frequently the effet of fire, as has long been univelfally allowed. In many cafes, however, philofophers have attributed it to the action of a repultive principle. However, from the many difcoveries concerming the nature and propertics s. the electric fluid and firc, these is the greatell reafon to believe, that this repulfive principle is 10 ether than clementary fire. Sice Repulsion.

RAS-LT. FELL, one of the frontier provinces of $A$ byfrniz, of which the late celebrated traveller Mr Brucc was made governor while in that country It is but of fmill extent, and in its mult profperous ftate contained only 39 villages. The climate is extremely hot, in $N!r$ Truce's upinion one of the hoted in the world. IIc infurms us, that on the firft day of March, at three
$0^{\circ}$ cluck in the af:ernoon, the thermometer itood at $114^{\circ}$ in the fhadc, and in the evening at $82^{\circ}$; though at funrife it had been no higher than 61. Notwithltandiner this appearance of extreme heat, however, the fenfation was by 110 incaus intolerable ; they could hunt at mid.day, and felt the evenings rather cold. The foil is a fat, loofe, black earth, which our author fays is the fame from $13^{\circ}$ to $16^{\circ}$ of north latitude; at leaft till we come to the deferts of Atbara, where the tropical rains ceafe. 'This country divides that of the Shangalla into two parts, nearly equal. These people inhabit a belt of land about 60 miles broad, all along the northern frontier of Abyffnia, excepting two large gaps or fpaces which have been left open for the fake of commerce, and which are inhabited by ftrangers, to keep the Shangalla in awe. The latter trade in gold, which they pick up in the flreams as it is wathed down from the mountains; for there are no mines in their country, neither is there any gold in Abyfinia, excopting what is imported from this or fome other country. The Shangalla are the natural enemies of the inhabitants of Ras-el-keel, and much blood has been thed in the various incurfions they have made upon one another ; though of late thole of Ras-el-Feel, by the affiftance of the emperors, have been enabled to keep the Shangalla at bay.

RAS-SEm, a city of Tripoli in Barbary, concerning which a number of fables were told by the Tripoline ambaffador, all of which were believed in England and other parts of Europe in the heginning of this century. (See PFqKIFIED-(ity)'. Mr Bruce informs us, that it is lituated about five days journey fouth from ljengazi; but has no watcr excepting one fonntain, which has a difagrecable tafte, and feems to be impregnated with alum. Hence it las obtained the name of Ras-Sen, or the fountain of poifon. The only remains of antiquity in this place conlift of the ruins of a tower or fortification, which, in the opinion of Mr Bruce, is as late as the time of the Vandals; but he fays he cannot inagine what ufe they made of the water, and they had no other within two days journey of the place. Here our traveller faw many of the animals called jerboa, a kind of mice; which, he fays, feem to partake as much of the nature of a bird as of a quadruped.

RASAY, one of the Hebrides Inands, is ahout 13 miles long and 2 broad. It contains $7 c 0$ inlabitants, has plenty of liine-ftone, free-ftone; and feeds great numbers of black eattle; but has neither deers, hares, norrabbits. The only appearance of a harhour in Rafay is at Clachan Bay, where Mr Macleod the proprictor of the ifland refide. Rafay prefents a bold fhore, which rifes to the height of mountains; and here the natives have, with incredible labour, formed many little corn fields and patato grounds. Thefe heights decreafe at the fouth end, where there are fome farms and a goodIonking country. Mr M facieod is fole proprictor of this ifland, and of Rona and Eladda at the north end of it, which are only proper for graxing.

The houfe of Rafay is pleafantly fituated near the fonth-weet end of the illand, which is the moft level part of it. It has all extentive and excellent garden, and is furrounded with forett trees of confiderable magnitude; another proof that trees will grow upon the edge of the fea, though it must be allowed that the 6 channel

Ras_sem Rafay.

Rafians channel here is narrow. Immediately behind the houfe H
Ranenbure. of Rafay are the ruins of an ancient clapel, now ured as the family burging-place.
Dr Jolnfon, in his I our, expreffes the higheft fatisfac- tion at the reception he met with when in Rafay from Mr Macleod.

RASCIANS, a poor oppreffed people who dwelt on both fides of the Danube, and who, about the year 1594, being weary of the Turkifh thraldom, firt tonk 13 of their veffels upon that river; and then drawing together a body of fifteen thoufand men between Buda and Belgrade, twice defeated the pâfhà of Temefwar with a body of fourteen thoufand Turks. They afterwards took Baczkerek, four miles from Belgrade, and the caftle of Ottadt ; then laying fiege to that of Beche, on the Theyffa, the old paifhà of Temefwar marched to relieve it with eleven thoufand men; but the Rafcians encountering them, flew near ten thoufand, and took 18 pieces of canon. The confequence of this victory was the reduction of Werfetza and Lutz. Then, fending to the archduke for aid and gunners, they offered to put themfelves and their country under the emperor's protection.

## RASOR-bilz. See Alca, no 4.

Rasok-Fifl. Sce Solen.
RASTALL (John), a printer and mifcellaneous writer, was born in London, probably abont the end of the 15 th century, and educated at Oxford. Returning from the univerity, he fettled in the metropolis, and commenced printer, " then efteemed (fays Wood) a profeffion fit for any fcholar or ingenious man." He married the fifter of Sir Thomas More, with whom, we are told, he was very intimate, and whofe writings he Atrenuoufly defended. From the title-page of one of his books, he appears to bave lived in Cheapfide, at the fign of the mernaid. He died in the year 1536; and left two fons, William and John : the firft of whom became a judge in queen Mary's reign, and the latter a juttice of peace. This John Raftall, the fubject of the prefent article, was a zealous Papilt; but Bale fays, that he changed his religion before his death. He wrote, 1. Natura naturata. Pits calls it a copious (proliva) and ingenious comedy; defcribing Europe, Afra, and Africa; with cuts. What fort of a comedy this was, is not eafy to conceive. Probably it is a cofmographical defcription, written in dialogue, and therefore ftyled a comedy. 2. The paltyme of the people; the cronycles of diverfe realmys, and moft efpecially of the realm of England, brevely compiled and emprinted in Cheapefyde, at the fign of the mearmaid, next Pollyfgate, cum privilegio, fol. 3: Ecclefin Jubannis Raftall, $154^{2}$. Was one of the prohibited broks in the reign of Henry VIII. 4. Legum Anglicanarum vocabula explicata. French and Latin. Lond. 1567, 8vo. And fome other works.

RASTADT, a town of Germany, in the circle of Suabia and marquifate of Baden, with a handfome cafte. It is remarkable for a treaty concluded here between the French and Imperialifts in 1714 ; and is feated on the river Merg, near the Rhinc. E. Long. 9. 14. N. Lat. $4^{8 .} 52$.

RASTENBURG, a fine city in Piufla, on the Guber, furrounded with a wall, and fince 1629 alfo with a sampart.

The following receipt is faid to have been found effectual for the deftruction of rats. Take of the feeds of ftavelacre or loufewort, powdered, more or lefs as the occafion requires, one part; of oat-meal, three parts; mix them well, and make them up into a pafte with honey. Lay pieces of it in the holes, and on the places where mice and rats frequent; and it will effectually kill or rid the place of thofe kind of vermin by their eating thereof.
Some time ago, the fociety for encouraging arts propofed a preminm of 501 . for a preparation capable of alluring or faccinating rats fo that they might be taken alive. In confequence of this, a great number of new traps, \&c. were invented; and the following methods of alluring the rats to a certain place were publifhed.

One of thofe molt eafily and efficacionfy practifed is the trailing fome pieces of their moft favourite food, which fhould be of the kind that has the ftrongelf feent, fuch as toafted cheele or broiled red herrings, from the holes or entrances of the clofet to their recelies in cwery part of the houfe or contiguous building. At the extremities and in different parts of the courfe of this trailed track, fmall quantities of meal, or any other kind of their food, fhould be laid, to bring the greater number into the tracks, and to encourage them to purfue it to the place where they are intended to be taken : at that place, when time adinits of it, a more plentiful repaft is laid for them, and the trailing repeated for two or three nights.

Belides this trailing and way-baiting, fome of the moft expert of the rat-catchers have a fhorter and perhaps more effectual method of bringing them together; which is the calling them, by making fuch a whitling noife as refembles their own call; and by this means, with the affitance of the way-baits, they call them out of their holes, and Iead them to the repaft prepared for them at the place defigned for taking them. But this is much more difficult to be practifed than the art of trailing; for the learning the exact notes or cries of any kind of beafls or birds, fo as to dective them, is a peculiar talent which is feldon attained: though fome perfons have been known who could call together a great number of cats; and there was a man in London who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his land, fo as to be taken.
In practifing either of thofe methods, of trailing or calling, great caution mult be ufed by the operator to fupprefs ard prevent the feent of his fect and body from being perceived; which is done by overpowering that fcent byy others of a tronger nature. In order to this, the feet are to be covered witb cloths rubbed over with afafeetida, or other ftrong-mmelling fubfances ; and even oil of rhodium is fometmes wed for this purpoie, but fparingly, on account of its dearnefs, though it has a very alluring as well as difguifing effect. If this caution of avoiding the fcent of the operator's feet, near the track, and in the place where the rats are propofed to be collected, be not properly obferved, it will very much obitruct the fuccefs of the attempt to take then ; for they are very fhy of coming where the fcent of hutman feet lies very frefh, as it intimates to their fagacious inflinet the prefence of human creatures, vinom they

naะural'!

## R A T [12] R A T

RA:- naturally dread. To the above-mentioned means of alhuring by trailing, way-bating, and calling, is added another of a very material eflicacy, which is, the wfe of oil of rhadit:m, which, like the narum Syriacum in the cafe of cats, las a very extraordinary facinating power on the ee animak. This oil is extremely dear, and therefore fpariegly bed. It is exalted in a fmall quantity in the place, ard at the entrance of it, where the rats are internded to be takea; particularly at the time when they are to be laft brought together, in order to their deftruction; and it is ufed alfo by fincaring it on the firface of fone of the implements ufed in taking by the method betow deferibed; and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraoldinary.

It is ufunl, likewife, for the operator to difguife his figure as well as fent, which is done by putting on a fort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a poft or fome fuch inanimate thing; which hahit must likewite be feented as above, to overpower the fincll of his perfon ; and belides this, he is to avoid all motion till he has fecured his point of having all the rats in his power.

When the rats are thus enticed and collected, where time is afforded, and the whole in any houfe and outbuildings are intended to be cleared away, they are fuffired to regale on what they moft like, which is ready prepared for them, and then to go away quietly for two or three nights; by which means thofe that are not allured the firt night are brought afterwards, either by their fellows, or the effeets of the trailing, \&ce. and will not fail to come duly again, if they are not difturbed or molefted. But many of the rat-catchers make forter work, and content themfelves with what can be brought together in one night or two; but this is never citectual, unlefs where the building is fmall and entire, and the rats but few in number.

The means of taking them, when they are brought together, are various. Sumc entice them into a very large bar, the mouth of which is fufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by fmearing fome veffel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mouth Spread open, is to be fuddenly clofed when the rats are all in. Others drive or fright them, by night noifes or motions, into a bag of a long form, the mouth of which, after all the rats ate cone in, is drawn up to the opening of the place hy which they entered, all other ways of retrcat being fecured. Others, again, intoxicate or pifon them, Ey mixing with the repalt prepared for them the coculus Indicus, or the nux vomica. They direet four ounces of the coculus Indicus, with twelve ounces of oatmeal, and two ounses of ireacle or honey, made into a moitt patte with ftrong-beer : but if the nux vomica be ufed, a much lefs proportion will ferve than is here givin of the cuculus. Any limilar compofition of thefe drugs, with that kind of food the rats are molt fond of, and which has a flrong flavour, to hide that of the drugs, will equally well anfwer the end. If iadeed the coculus Indicus be well powdered, and infufed in 1trong-beer for fome time, at leaft half the quantity here circtied will ferve as well as the quantity before-mensoned. Whbon the rats appear to be thoroughly in-
toxicated with the coculus, or fick with the nux vomica, Rat-'fland they may be taken with the hand, and put into a bag or cage, the door of the place being -firt drawn to, left

RAg-I/and, a finall detached part of the ifland of Lundy, off the north coalt of Devon. 'Phough noted in Donn's map of the county, it is not worth mention here, but as giving opportunity to fubjoin a farther notice of Lundy, which illand was purchafed a few years fince by Mr Cleveland M. P. for about 1200 guineas, who has a fmali villa on it: not more than 400 acres are cultivated: it is let altogether for 7ol. a-year. The foil is good, though no trees will grow on the ifland. It has fine fprings of water: the houles are feven: the inhabitants, inen, wonsen, and children, do not exceed 24. 'The bird called murr, whofe eggs are very large and fine, the Lundy parrot, and rabbits, are the chief produce ; thele abound, and are taken for the feathers, eggs, and Asins, principally. They have now (1794) 70 bullocks and 400 fheep, but the latter do not theive. They pay un taxes: fifhing 隹fs often call with necef. faries: the fituation is very pleafant, and the rocks around, which are large, and partly granite, are wild, romantic, and novel. It had probably more inhabitants once, as human bones have been ploughed up. It has no flace of worhip, nor public-houfe; but ftrangers are always weleome. Eight cannon lie on the battle. ments on the top of a very fteep precipice, under which is a curious cavern. Lord Gower, Mr Benfon, and Sir J. B. Warren, K. B. have been former proprietors. See Lundy.

Rat-Tai/s, or Arrefls. See Farriery, § xxxvii.
RATAFIA, a fine fpirituous liquor, prepared from. the kerncls, \&c. of feveral kinds of fruits, particularly of cherries and apricots.

Rataha of cherries is prepared by bruifing the cherries, and putting them into a veffel wherein brandy has been long kept; then adding to them the kernels of cherries, with itrawberries, fugar, cinnamon, white pepper, nutmeg, cloves; and to 20 pound of cherries 10 quarts of brandy. The veftel is left open ten or twelve days, and then ftopped clofe for two months before it be tapped. Ratafia of apricots is prepared two ways, viz. either by boiling the apricots in white-wine, adding to the liquor an equal quantity of brandy, with fugar. cinnamon, mace, and the kernels of apricots; infuling the whole for eight or ten days; then ftraining the liquor, and putting it up for ufe : or elfe by infufing the apricots, cut in picces, in brandy, for a day or two, pal fing it through a fraining bag, and then putting in the ufual ingredients.

RA' ${ }^{\prime} \mathrm{CH}$, or rash, in clock-work, a fort of wheel having twelve fangs, which ferve to lift up the detents every hour, and make the clock frike. See Clock.

RATCHETS, in a watch, are the fmall teeth at the bottom of the fufy, or barrel, which ftops it in winding up.

RATE, a ftandard or proportion, by which either the quantity or value of a thing is adjufted.

RA'TES, in the navy, the orders or claftes into which the fhips of war are divided, according to their force and magnitude.

The regulation, which limits the rates of men of war to the fmalleft number poffible, feems to have been dictated by confiderations of political economy, or of that

## $R$ A T

「
of the fimplicity of the fervice in the royal dock-yards. The Britifh fleet is accordingly diftributed into fix rates, exclufive of the inferior veffels that ufually attend on naval armaments ; as floops of war, armed hips, bombletches, fire-finips and cutters, or fchooners commanded by lieutenants.

Ships of the firit rate mount 100 cannon, having 42 pounders on the lower deck, 24 -pounders on the middle deck, 12 -pounders on the upper deck, and 6 -pounders on the quarter-deck and fore-caftle. They are mamed with 850 men, including their officers, feamen, marines, and fervants.

In general, the fhips of every rate, befides the captain, have the mafter, the boatfwain, the gunner, the chaplain, the purfer, the furgeon, and the carpenter; all of whom, except the chaplain, have their mates or affifants, in which are comprehended the fail-maker, the mafter at arms, the armourer, the captain's clerk, the gunimith, \&c.

The number of other officers are always in proportion to the rate of the fhip. Thus a firt rate has fix licutenants, fix mafter's mates, twenty-four midhipmen, and tive furgeon's mates, who are confidered as gentlemen: befides the following petty officers; quarter-mafters and their mates, fourteen; boatfwain's mates and yeomen, eight ; gunner's mates and affitants, fix; quar-ter-gunners, twenty-five ; carpenter's mates, two, befides fourteen affiftants; with one fteward, and fteward's mate to the purfer.

If the dimenfons of all Mips of the fame rate were equal, it would be the fimpleft and molt perfipicuous method to collect them into one point of view in a table: but as there is no invariable rule for the general dimenfions. We muft content ourfelves with but a few remarks on fhips of each rate, fo as to give a gereral idea of the difference between them.

The Viftory, one of the laf built of our fir!t rates, is 222 feet 6 inches in length, from the head to the ftern ; the length of her keel, 15 Ifeet 3 inches; that of her gun-deck, or lower deck, iS6 feet ; her extreme breadth is 51 fect ! 0 inches; her depth in the hold, 21 feet 6 inches; lier burden, 2162 tons; and her poop reaches 6 feet before the mizen-maft.

Ships of the fecond rate carry 90 guns upon three decks, of which thofe on the lower battery are $32-$ pounders; thofe on the middle, 18 -pounders; on the upper deck, 12 -pounders; and thofe on the quarterdeck, 6 -pounders, which wfually amount to four or fix. Their complement of men is 750 , in which there are fix licutenants, four mafter's mates, $2+$ midmipmen, and four furgeon's mates, 14 quarter-maiters and their mates, cight boatfwain's mates and yeomen, fix gunner's mates and yeomer, with 22 quatter-gunuers, two earpenter's mates, with 10 afflants, and one íleward and Iteward's mate.

Sluips of the third rate carry from $\sigma_{f}$ to 80 cannon, which are 31, 18, and 9 pounders. The $80-$ gin hips however begrin to grow out of repute, and to give way to thofe of 74, 70, Sxc. which have only two whole batteries; whereas the former have three, with 23 guns planted on each, the cannon of their upper deck being the fame as thofe on the quarter-deck and fore-caltle of the latter, which are 9 -pounders. The complement in a 74 is 650 , and in a 64,500 men; having, in peace, four lieutenants, but in war, five; and when an adniral

## 13 ] <br> R A ${ }^{r} \Gamma$

is aboard, fix. They have three mafter's mates, 16 R.ree. midhipmen, three furgeon's mates, 10 quarter-mafters and their inates, fix boatfwain's mates and yeomen, four gunner's mates and ycomen, with is quarter-gunners, one carptniter's mate, with cight affifants, and one f.ew: ard and fteward's mate under the purfer.

Ships of the fourth rate mount from 60 to 50 guns, upon two decks, and the quarter-deck. The lower tier is compofed of 24 -pounders, the upper tier of 12 pounders, and the cannon on the quarter-deck and fore-cafle are $\delta$-pounders. The complement of a 50 gun hip is 350 men, in which there are three lieutenants, two mafter's mates, 10 midihipmen, two furgeon's mates, eight quarter-malters and their mates, four boatfwain's mates and yeomen, one gunner's mate and onc yeoman, with 12 quarter-gunners, one carpenter's mate and fix affiltants, and a feward and fteward's mate.

All veffels of war, under the fourth rate, are ufual ly comprehended under the general name of frigates, and never appear in the line of battle. They are divided into the 5 th and Gth rates ; the former mounting from 40 to 32 guns, and the latter from 28 to 20. The largeft of the fifth rate liave two decks of cannon, the lower hattery being of 18 -pounders, and that of the upper deck of 9 -pounders; but thofe of 36 and 32 guns have one complete deck of guns, mounting $12=$ pounders, befides the quarter-deck and fore-cafte, which carry 6 -pounders. The complement of a mip of 44 guns is 28 c men; and that of a frigate of $3^{6}$ guns, 240 men. The firt has three, and the fecond two, lieutenants ; and both have two mafter's mates, fix midfhipmen, two furgeon's mates, fix quarter-mafters and their mates, two boatfwain's mates and one yeoman, one gunner's mate and ore yeoman, with 10 or 11 quar-ter-gunners, and one purfer's fleward.

Frigates of the 6 th rate carry 9 -pounders, thole of 28 guns having 3 -pounders on their quarter-deck, with 200 men for their complement ; and thofe of 24, 160 men : the former has two lientenants, the latter, one ; and both have two mafter's mates, four midhipmen, one furgeon's mate, four quarter-mafters and their mates. one boat fwain's mate and one yeoman, one gutuer's mate and one yeoman, with fix or feven quarter-gun. ners, and one purfer's fleward.

The floops of was carry from 18 to 8 camon, the largett of which have fix-pounders; and the fmalleft, viz. thofe of 8 or 10 guns, four-pounders. Their off cers are generally the fame as, in the 6th rates, with little variation; and their complements of men are from 120 to 60 , in proportion to their foree or magnitude. N. B. Bomb-veffels are on the fame eftabilhanent as floops; but fire-Bhips and hofpital-hips are on that of fiftle rates.

Nothing more evidently manifeits the great improvement of the marine art, and the degree of perfection to which it has arrived in Britain, than the facility of managing our firft rates; which were formerly efteemed incapable of government, unlefs in the molt favourable weather of the fummer.

Ships of the fecond rate, and thofe of the third, which have three decks, carry their fails remarkably well, and labour very little at fea. They are excellent in a general action, or in cannonading a fortsefs. Thefe of the third rate, which have two tiers, ase Et for the

## $R$ A T $\left[\begin{array}{lll}14 & \text { i }\end{array}\right] \quad$ A T

Raseen line or batte, to lead the convoys and fquadrons of Mips irencicu of the naval fervice.

The fourth-rates may be employed on the fame occatuons as the third-rates, and may be allo deltined amonglt the foreign coloniss, or on expeditions of great dislance; fince thefe veffels are ufualiy excellent for kesping and futtaining the fea.

Viffls of the fifth rate are too weak to fuffer the Phock of a line of battle; but they may be deftined to lead the consoys of merchant fhips, to protect the commerce in the colonies, to cruize in diferent llations, to accompany- fquadrons, or be font exprefs with neceflary intelifence and orders. The fame may be obferved of the lixth rates.
'1he frigates, which mount from 28 to $3^{S}$ gुuis upon one deck, with the quarter-deck, are extrentely froper for cruising aspaint privatecrs, or for fhort expeditions, being light, long, and ufially excellent Cuilors.

RATEEN, or RATTFN, in commerce, a thick woollen fluff, quilicd, woven on a loum with fur treddles, like ferges and other Itulfs that have the whale (1) quilling. "There are fome rateens drelled and prepared like cloths; others left fimply in the hair, and others where the hair or knap is fized. Rateens are chefly manfactured in France, Holland, and Italy, and are moltly ufed in linings. The frize is a fort of coarfe tateen, and the drugget is a rateen half linen half woolkn.

RATIFICATION, an act approving of and confirming fomething done by another in our name.

RA ${ }^{\prime} I O$, in arithmetic and gcometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intersemtion of a third.

Thwo numbers, lines, or quantities, A and B , being propoled, their relation one to another may be conliderad under one of thefe two heads: 1. How much A excieds B, or B exceeds A ? And this is found by taking A from $B$, or $l$ l' from $A$, and is called arithmetic rea$i n$, or ratio. 2. Or how many times, and parts of a tine, $A$ contains $B$, or $B$ contains $A$ ? And this is called geometric resfon or ratio; (or, as Euclid defines it, it is the mutual babitude, or refped, of two magnitudes of the fame kind, according to quantity; that is, as to how often the one contains, or is contained $i n$, the other) ; and is found by dividing $A$ by B , or B by A. And here note, that that quantity which is referred to another quantity is called the antecedent of the ratio: and that to which the uther is referred is called the confiquini of the ratio; as, in the ratio of $A$ to $B, A$ is the antecedent, and $B$ the confequent. 'Therefore any quantity, as antecedent, divided by any quancity as a conferpent, gives the ratio of that antecedert to the confequent.
'Ihus the ratio of $A$ to $B$ is $\frac{A}{B}$, but the ratio of $B$ to $A$ is $\frac{B}{A}$; and, in numbers, the ratio of 12 to 4 is $\frac{12}{4}=3$, or triple ; but the ratio of 4 to 12 is $\frac{4}{12}=\frac{1}{3}$, or fuberiple.

And here note, that the quantices thus compared
munt be of the fame kind ; that is, fuch as by multipli- Ratiocina. cation may be made to exceed nne the other, or as thefe guantities are faid to have a ratio between them, which, buing muliplied, may be made to exceed sne another. Thus a line, huw fhort foever, may be multiplied, that is, produced fo long as to exceed any given right line; and confequently thefe may be compared togcther, and the ratio expreffed: but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a fuperficies, how fmall foever ; thefe can therefore never be compared together, and confequently have no ratio or refpect one to another, according to quantity ; that is, as to how often the one contains, or is contained in, the other. See Quantity.

KA'PIOCINATION, the act of reafoming. See Reasoning.

RALION, or RATsAs, in the army, a portion of ammunition, bread, drink, and forage, diftributed to cach fuldier in the army, for his daily fubfitence, \&e. 'lhe horfe have rations of hay and oats when they cannot go out to forage. 'The rations of bread are regulated by weight. The ordinary ration of a foot foldier is a pound and a half of bread per day. The officers have feveral rations according to their quality and the number of attendants they are obliged to keep. When the ration is augmented on occafions of rejoicing, it is called a double ration. 'The fhip's crews have alfo their rations or allowances of bifket, pulle, and water, pioportioned according to their Itock.

RATIONALE, a fulution or account of the principles of fome opinion, action, hypothefis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silefia, and capital of a duchy of the fame name, with a caftle. It has been twice taken by the Swedes, and is feated on the river Oder, in a country fertile in corn and fruits, 15 miles nurth-ealt of T'roppaw, and 142 catt of Prague. E. Long. 22. 24. N. Lat. 50. 14.

RATISBON, an ancient, large, rich, handfome, and Itrong city of Germany, in Bavaria, free and imperial, with a bifhop's fee, whofe bifhop is a prince of the empire. It is called by the Germans Regenfourg. from the river Regens, which runs under a fine ftone bridge, and throws itfelf into the Danube below the city; and the rivers Luber and Nab mix with it above the city. The French call it Ratifbon, in imitation of the Latins; it hath formerly been fubject to the kings of Bavaria, who made it the place of their refidence; but it was declared free by the emperor Frederick 1. which does not however hinder the dukes of Bavaria from dividing the toll with the citizens, according to an agreement between them. Thefe princes have alfo the criminal jurifdiction, for which the magiftrates of the city pay them homage. It is the firlt city of the bench of Suabia, and contains at prefent within its walls five different free ftates of the empire; namely, the bifhop, the abbot of St Emmeran, the abbeffes of the Low and High Munfter, and the city. The inhabitants of Ratifbon have the privilege not to be cited before other tribunals, unlefs for actions above 400 florins. The fenate is connpoled of 17 members, and there is a council of 10 , which is charged with the government of the ftate. The citizens have'a right to clect a chief, who judges of the affairs of police. The catholics have the excreife of their religion in the cathedral chureb, and uthers, and

Ratiines the Lutherans in three churches, which they have built. The magiftrates and officers of the city are all Proteftants; and it is to be remarked, that although there are about 22 Catholic churches, yet there are very few Ca tholic citizens, the magifracy not allowing the freedom of the town to be given to Catholics living there. As this city is larve, elegant, and full of magnificent houfes, it has been chofen many years for the place of holding the diet, upon account of the conveniency, to many neighbouring princes and flates, of fending their provifions by land and water, without great expence. The town-houfe, in the hall of which the Diet meets, is extremely magnificent. In the year $17+0$, however, when there was a war in Germany, the Diet met at Frankfort on the Main, till after the death of the emperor Charles ViI. Provifions are very plentiful at Ratifbon in tine of peace. The inhabitants have a good deal of trade, the river on which it itands being navigable, and communicating with a great part of Germany. it is 55 miles fouth eaft of Nurembers, 62 north of Munich, and 195 welt of Vienna. E. Long. 12. 5. N. Lat. 48. 59.

RATLINES, or, as the failors call them ratins, thofe lines which make the ladder fteps to go up the florouds and puttocks, hence called the ratiins of the Jbrouds.

RATOLFZEL, a ftrong town of Germany, in Suabia, near the weft end of the lake Conitance. It is feated on that part of it called Bodenfec, and belongs to the houfe of Auftria, who took it from the duke of Wirtemburg, after the battle of Nordlingen. It is 12 miles wett of the city of Conitance. It is defended by the impregnable cafle of Hohen Dwel, on an inaccef. fible hill in the middle of a plain, the rock of which is fint, fo that a few men may hold it out againtt an army.

## RATtLESNAIE. See Crotalus.

Ratflemare Rost. Sce Polygala.
Ratzeburg, or Ratzemburg, an ancient town of Germany, in the circle of Lower Saxony, and in the duchy of Lawenburgh, with a bifhop's fee and a cafle. The town depends on the duchy of Lawenburg, and the cathedral church on that of Ratzburg. It is feated on an eminence, and almoft furrounded with a lake 25 miles in length and three in breadth. The Duke of Lawenburg feized and fortified it in 1689 , and the king of Denmark took it in t693; but it was difmantled, and reitored in 1700 to the Duke, who re-fontified it. This town has been frequently pillaged, part:cularly in 3552. by Francis duke of Saxe Lawenburg, becaufe the ranons refufed to clect his fon Magnus their bilhop. It lies nine miles fouth of Lubec. This place is noted for its excellent beer. E. Long. 10. 58. N. Lat. 53.47

RAVA, a town of Great Poland, and capital of a palatinate of the fame name, with a fortified cafte, where they keep flate prifoners. The houfis are built of wood, and tinere is a Jefuits college. It is feated in a morafs covcred with water, which proceeds from the river Rava, with which it is furrounded. It is 45 miles fouth of $B 1$ fho, and jo fouth-we.t of Wiarfaw. The nalatinate is bounded on the north by that of Blofko, on the eall by that of Mazovia. on the fouth by that of Sandomer, and on the welt by that of Lencieza.

RAVEL!N, in fortificautu, was anciently a fat
baftion placed in the middle of a curtain; bue new a detached work compofed only of two faces, which make a faliant angle without any flanks, and raifed before the counterfiarp of the place. See Fortifica tion.
RAVEN, in ornithology: See Corvus.
Sea Raven, or corva marinn of Kongo in Africa, in ichthyology, is about fix feet leng, and big in p:oportion; but the moft fingular circumilatice apper aining. to this creature is the fone found in its head, to which the natives afcribe fome mediciual virtues, and the cellicate tafte of its hard roe, which is ttill much admired, when dried in the fun, and becomes as hard as a Ilome.
RAVENGLAS, a town of Cumberland in ERgland, fituated between the rivers Irt and ERk, whicli, with the fea, encompafs three parts of it. It is a well built place, and has a good road for flipping, which brings it fome trade. E. Long. 0. 5. N. Lat. 54. 20.

RAVENNA (anc. geog.), a noble city of Gullia Cifpadana; a colony of Thelfalians, on the Adriatic, in wa?nes or a boggy fituation, which proved a natural fecurity to it. The houfes were all of wood, the communication by bridges and boats, and the town kept fiveet and clean by the tides carrying away the mud and foil, (Straho). Anciently it had a port at the mouth of the Bedefis; Ausuftus added a new port, capacious to hold a fleat, for the fecurity of the Adriatic, between which and the city lay the Via Crefaris. In the lower age it was the feat of the Oitrogoths for 72 years; but being recovered by Narfes, Juttinian's general, it became the refidence of the exarchs, magittrates fent by the emperor from Conitantinople, for 175 yeare, when it was taken by the Longobards. It is ftill called Raverna, capital of Romania. The feat of the weftern or Roman Empire was by Honorius tranflated to Ravenna about the year 404, and hence the country in which it flood was called Romania, in the pope's territory. It had a very flourihing trade till the fea withdrew two miles from it, which has been a great oetriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now moft remarkable for the exceilent wine produced in its neighbourhood. The maufolum of Theodoric is ftill to be \{een, remarlsable for bsing covered by a lingle ftone 28 feet in diameter and 15 thick. It was at Ravenna that the duse of Nemours fell, after having gained a moft diccifive wetory over tile confederate army, in 1511. See Fraver, n 129, and Modern Univerfal Hittory, vol. xx. p. $3 \approx$ \&. ※̌c.

RAVENSPURG, a county of Germany, in Tienphaiia, bounded on the north by the bihoprics of Ofnalurg and Minden, on the ea!t by Lempow, on the fouth by the bithopric of Paderborn, and on the well by that of Munter. It belongs to the kiag of Pruflia, and has its name from the catic of Ravin!burg.

Karensburg, a free and iniperial town of Germany, in Algow, in the circle of S:abid. It is w:? built, and the public ftructures are handfome. The inhabitants are partly Protefants and partly Papits. It is feated on the tiver Chenfs, in E. Lone. S. $f^{\prime \prime}$ N. Lat. $+7.4+$ •

RAVILLIAC（Irancis），the infamous affaffin of Henry 1V．of France，was a native of Angoukfmc， and at the tins：of his execution was about one or two and thirty ycars of age．See France，$n^{\circ}$ 146，and Hrary IV．of France．Favilliac was the fon of pa－ rents who lived upon alms．His father was that fort of inferior retainer to the law，to which the vilgar give the name of a pellifogzer，and his fon had been bred up in the fame way．Revilliac had fet up a claim to an cltate，but the caufe went againt him：this dif－ appointment affected his mind decply：he aftenvards taught a felrool，and，as himfelf faid，reccived chari－ table gifts，though but of a very finall value，from the parents of thofe whom he taught；and yet his diftrefs was fo creat，that he had much ado to live．When he was feized for the king＇s murder，he was very loofely gruarded；all were permitted to fpeak with him who pleafetl；and it was thought very remarkable that a Je－ fint fhould fay to him，＂Friend，take care，whatever you do，that you don＇t charge honeft people．＂IIc was removed next day from the houfe of Efpernon to the Conciergeric，the proper prifon of the parliament of Paris．When he was firt interrogated，he an－ fiwered with great boldnefs，＂That he had done it， and would do it，if it were to do again．＂When he was told that the king，though thangerouny wound－ d，was living，and might recover，he faid that he had thruck him home，and that lie was fure he was dead． In his fubfequent examinations he owned that he had long had an intention to kill the king，bocaufe he fuf－ fered two religions in his kingdoni；and that he en－ deatured to ebtain an audience of him，that he might admonith him．He alfo faid that he undertood the king＇s great armament to be againft the pope，and that，in his opinion，to make war againft the pope，was to make way againft God．We have no diftinct account of the three laft examinations；but he is faid to have perfifted， in the mont fulenm affeverations，that he had no accom－ fuices，and that mobody had perfuaded him to the fact． He appeared furprifed at nothing fo much as at the univerfal ablorrence of the people，which，it feems， he did not expect．Tiney were forced to guard him Itrictly from his fellow－prifoncers，who would otherwife lave murdered him The butchers of Paris detired to fave him pue into their hands，affirming that they would fay him alive，ans that he fould flill live 12 days． When he was put io the tulture，lee broke ont into lurid excerations，and always inlifed that he did the fuet from his con motive，and that he could accule nobody．On the day of his execution，after he had made the aneate lichonarable before the church of Notre Dame，he was carried to the Greve；and，being brought upun a feaffule，was tied to a worden engine in the thape of a St Andrew＇s crofs．The bnife with which he cid the muscer being faftened in his right land，it ：as lirat bernt in a flow fire；then the flefhy parts of his body were torn with red－hot pineers，and melted 1．ad，oil，pitch，ans rcfin，poused intu $\mathrm{t}_{1}$ s wounds，
and thourh a clay funcl into lus bowels by the navel．Pavilize The people refufed to pray for lim ；and wher，ac－ conding to the fentence pronounced upon him，he came to be dragged to pieces by four horfes，one of thofe that were brought appearins to be but wack，one of the fpeetators offered bis own，with which the eriminal was much moved：he is faid to have then made a con－ felfon，which was fo written by the greffier Voifin， that not fo much as one worl of it conld ever he read． Ie was very earncit for abfolution，which his eenfeffor refufed，unlefs lee would reveal his accomplices；＂Give it me conditionally（fail he）；vipon condition that I have told the truth，＂which they did．His body was fo robuk，that it refifted the force of the horfes；and the exccutioner was at length obliged to cut him into quarters，which the people dragged through the freets． ＇I＇he loufe in which he was born was demolifhed，and a column of infamy erected；his father and mother were banifhed from Angoulefme，and ordered to quit the kingdom upon pain of being hanmed，if they return－ ed，without any form of procels；his brothers，fifters， uncles，and other relations，were commanded to lay afide the name of Ravilliac，and to affume fome other． Such was the fate of this execrable inonfter，who，ac－ cording to his own account，fuffered himfelf to be im－ pelled to fuch a fact by the feditious fermons and books of the Jefuits，whom Henry，rather out of fear than love，had recalled and careffed，and to whom he had bequeathed his heart．

Neither the dying words of Ravilliac，nor fo much of his procels as was publifhed，were credited by his cotemporaries．Regalt the hiftorian fays，that there were two different opinions concerning this affaffina－ tion；one，that it was conducted by fome grandees，who facrinced that monarch to their old refentments；the other，that it was done by the cmiffaries of the Spa－ niards．Letters from Bruffels，Antwerp，Mechlin，and other places，were received before the 15 th of May， with a report of the king＇s death．Though nothing occurs in the examinations of Ravilliac that were firlt publifhed，in reference to his journeys to Naples and other places；yet as thefe are fet down as certain truths by grood authors，fo there are probable grounds to be－ lieve that they were not fictitious．It appears from Sir Ralph W＇inwood＇s Memorials，that Ravilliac had been not long lefore at Bruffels．Amonglt other cir－ cumfanees that created a very great doubt，whether the aflaffin fpoke truth，were the things found in his pocket at the time he was feized；amongtt which was a chaplet，the figure of a heart made in cotton，in the centre of which he faid there was a bit of the true erofs，but when eut there wats none，which he affimed was given him lyy a canon at Angoulefme，a piece of Paper with the arms of France painted upon it，ano－ ther fult of eharacters，and a third containing verfes for the meditation of a criminal going to execution．The provoft of I＇luviers，or letiviers，in Beance，about fix miles from Paris，had faid openly on the day that Hen－ ry IV．was murdered，＂＇Whis day the king is either＂ fain or dangerouny wounded．＂Afier the king＇s death was known，he was feized and fent prifoner to Paris； but，before he was examined，he was found hanged in the ftriugs of his drawers．His body wat，notwith－ ftanding，loung up by the heels on the common gibbet on the Igth of june．What iucrealed the fufpicions

RAUN, upon the river Miza, a town of fome Atrength, remarkable for a bloody kirnilh between the Pruffans and Autrians, in Auguft 17+\%. The kin $\bar{y}$ of Pruffia, intending to get poffeffion of Beraun, fent thither fix battalions, with eight cannon, and 800 huffars; but General Eeftitit\% being there with a great party of his corps, and M. Luchefi with rooo horfe, they not only repulfed the Pruffians, but attacked them in their tarn, and, after a warm difpute, oblyred them io retire with eonfiderable lofs.

RAURICUM (anc. geog.), a town of the Raurici, fituated over againit Abnoba, a mountain from which the Danube takes its rife. A Roman colony led by 1. Namtins Planeus the fuholar and friend of Cicero: called Colonia Ruariaca (Pliny), Raurica (Infeription), AusuR: Rauricorum. The town was deftroyed in Julian's time. It is now commonly called $A u g h$, a village greatly deeayed from what it formerly was. It is fituated on the Rhine, difant about two hours to the eaft of Batil. The country is now the canton of Bdil.

RAY (John), a celebrated botanift, was the fon of Mr Roger Ray a blackfmith, and was born at Black Notly in Efex in 162S. He reccived the firft rudiments of learning at the grammar-fchool at Braintree; and in $16+1$ was admitted into Catharine hall in Cambridge, fiom whence he aftenwards removed to Trinity college in that univerfity. He took the degree of mafter of arts, and became at length a fenior fellow of the college; but his intenfe application to his ftudies having injured his health, he was olliged at his leifure hours to exercife hinneif by riding or walkjner in the ficlds, which led him to the ftudy of plants. He noted from Johnfon, Parkinfon, and the Pbytologiu Britannica, the places where curious plants grew ; and in 1658 rode from Cambridge to the city of Chelter, from whence he went into North Walea, viliting many places, and among others the famous hill of Snowdon; returning by Shrewfbury and Gloucelter. In 1660 he publifhed his Catal)gus Plantarum circa Cantabrigiam nafcentium, and the fame ycar was ordained deacon and priett. In 1661 he accompanied Francis Willoughby, Efq; and others in fearch of plants and other natural curiofities, in the north of England and Scotland; and the next year made a weftern tour from Chefter, and through Wales, to Cornwall, Deronhire, Dorfethire, Hamphire, Wiltthire, and other counties. He afterwards travelled with Mr Willoughby and other genzlemen through Hollanc, Germany, Italy, France, \&ce. took feveral tours in England, and was admitted fellow of the Royal Society. In 1672 , his intimate and beloved friend Mr Wrilloughb died in the 37 th year of his age, at Middleton Hall, his feat in Yorkfhire; " to the infinite and unfpeakable lofs and grief (fays Mr Ray) of myfelf, his friends, and all good men." 'There having been the clofeft and fincerelt friendihip between Mr Willoughby and Mı Ray, who were men of fimilar natures and taftes, from the time of their being fellow collegians, Mr Willoughby not only confided in Mr Ray, in his lifetime, but alfo at his death: for he made him one of the executors of his will, and charged him with the education of his fons Francis and Vos. XVI. Part.

Thomas, leaving him alfo for life 60 l . per annum. The eldeft of thefe young centlemen not being four years of age, Mr Ray, as a faithful truftec, betook himelf to the inftuction of them; and for their ufe eompofed his Nomenclator Clafle us, which was publithed this very year, $16 \cdot 2$. Francis the eldeft dying hefure he was of age, the younger became Lord Wid lleton. Not many months after the death of Mr Willoughby, Mr Ray lutt another of his belt friend.s, biThop Wilkins; whom he vifited in London the 8 th of November 16,2, and found near expiring by a total fupprefion of urixe for eight days. As it is natural for the mind, when it is hurt in one part, to feek relief from another; fo Mr Rar, haviny loft fome of his beft friends, and being in a manner left deftitute, conecived thoughts of marriage ; and accordingly, in Juae 16.3 , did actually marry a gentlewoman of about 20 Years of age, the daughter of Mr Oalley of Launto:n in Oxfordhhire. 'Towards the end of this ycar, came forth his "Obferwations Topographical, Moral, \&ec." made in foreign countries; to which was added his Catalogus Stirpium in exteris reginnibus obferatathrum: and about the fame time, his Colleaion of unujual or local Englifh atords, whieh he had gathered up in his travele through the comnties of England. After having publifhed many books on fubjects foreign to his profeftions he at length refolved te publifh in the character of a divine, as well as in that of a natural philofopher : in which view he publifhed his excellent demonfration of the being and attributes of God, entitled The ${ }^{[ } \mathrm{V}_{\mathrm{i}} / \mathrm{Cl}_{3} \mathrm{~m}$ of God manifefled in the Works of the Creation, 8 vo, 1697. The udiments of this work were read in fome eollege lectures; and another collection of the fame kind he enlarged awd publifhed under the title of Three $P_{2 j} \sqrt{3}$ o. thenlogical Difcourfes, concerning the Chaos, Deluye, and 1)ifolution of the IV orld, $8 \mathrm{vn}: 692$. He died in 1705. He was modeft, affable, and communicative; and was diftinguithed by his probity, charity, fobriety, and piety. He wrote a great number of works; the principal of which, befides thofe already mentioned, are, 1. Cotaloyus Plantarum Anglic. 2. Dizionarialum Triingue fecumizm locos communes. 3. Hifloria Pianzarum, Species, Iutienus editas, aliafque infuper multas noviter inverias e: defcriptas compleciens, 3 vols. 4. Metbodns Plantaruna nova, cum Tabulis, 8ve, and feveral other worls on plants. 6. Synopfrs Methodica Auinalium qualrupectum et Serpentini generis, 8vo. 6. Synopfis Methodiva Avium et Pifcium. 7. Hiforia Infeforun, of us pollum:m. 8. Metbodus Jr.f.garum. 9. Philofophical Letters, ïe.

Rar, in optics, a beam of light emitted from a radiant or luminous bodj: See Lieht and Optics.

Irfected Rays, thofe rajs of light which, on their near approach to the edges of bodies, in paffing by them, are bent out of their courfe, being turned either from the body or towards it. This property of the rays of light is generally termed diffraction by foreigners, and $\mathrm{D}_{5}$ Hooke fometimes called it "deflegion.

Reflected Rars, thofe rays of light which, after falling upon the body, clo not go beyond the furface of $i t$, but are thrown back again.

Refracied Rars, thufe ruys of light which, after failing upon any medium, enter its furface, being bent either towards or from a perpemdichar to the point on which they feld.

Pencil of Rars, a number of rays, iffuing from a

HAZOR, a well-kunni intrument, ufed by furgeons, barbers, 太is. for thaving off the haie from vat rious parts of the budy.-As having to many poople is a mort patuful operation, cutlers in different comtrics have long applied their akill to remove that inconvenience. Some have invented foaps of a peculiar kiad to make the operation more caly, and forne have invented Riraps. With relpect to razors, fome artifts have foccocded rather by accident than from any lixed prinsiple; and therefore we have found great inequality in Lhe goodnefs of razors made by the fame artitt.
A correfpondent affures us, that he has for to years palt heen at much pains 10 find ont razors made by the befl makers both in Englated and Scotland, and was fortunate enough, about 22 years aso, to difeover a kind made by a Sicutchnan of the mane of Logan, which he called magnetical razors, becaufe they were directed to be touched with au artificial magnet before ufing. 'Ihele, our friend affures us, are molt excellent razors, and he lias ufed them for upwards of 20 years. He fays likewife that they continue in good order, without requiring to be ground; but that the great draw-back on their Leing generally ufed, is the priee, which is higher than motl people are able or difpofed to give fur that inflrument. Our correfpondent, who refides in the vicinity of London, alfo iuforms us, that lately the famous furgeon's inflruncut-maker, Mr Savigny in 1'all Mall, after numberkefs experiments, in the coulfe of above 22 years, has at lengeh brought razors to a degree of perfection never yet equalled; and with fuch certainty, that the purchafer is in no danger of a difappointment, though the price is very moderast: By thefe, we are told, the operation of having is performed with greater eafe, more perfectly, and more expeditioufy, than with any other.

RE, in grammar, an infeparable particle added to the beginning of words to double or otherwife modify their meaning ; as in re-action, re-move, re-export, sic.

RE-ACTION, in phyfiology, the refiftance made by all bodies to the action or impulfe of others that endeavour to change its flate whether of motion or re!t, \&c.

READING, the art of delivering written language with propricty, force, and elegance.
"We mutl not judge fo mnfavourably of eloquence or good reading (fays the illuttrious Fenclon), as to reckon it only a fivolous art, that a declaimer ufes to impofe upon the weak imagination of the multitude, and to ferve his own ends. It is a very ferious art, deligned to inftruct people; to fupprefs their paffions and reform their manners; to fupport the laws, direet pullic councils, and to make men good and happy."
Deiivery in reading on uld he les arimated thar in intereties rgeaking.

Reafon and experience desmonftrate, that delivery in reating ought to be lefs animated than in intertlled fpeaking. In every exercife of the faculty of fpecel, and thofe expreflions of countenance and gefure with which it is generally attended, we may be confidered to be always in one of the two following fituations: Firft, delivering our lioforn fertimerts on circumftances which relate to ourtelves or others, or, fecondly, repeating fomething that was foken on a certain occafion for the amufe-
ment or information of an auditor. Now, if we obforve Resaing. gid, that the firlt may be accompanied with every degeec of expreffion which can manifelt itfelf in us, from the lowedl of fynpathy to the moit violent and energetic of ele fuperior palfions; while the latter, from the fpeaker's ehicf bufuefs being to repeat what he heared ruild accuracy, difcovers unly a faint imitation of thofe firns of the emotions which we fippofe agitated him from whon the words were firt borrowed.--'lhe ufe and neceffity of this difference of manner is evident ; atd if we are attentive to thefe natural figns of expreflion, we fhall find them conforming with the greateft nicety to the lliglatef and mold minute movernerts of the breafl.

This repetition of another's words might be fuppofes to pa!s through the mouth of a fecond or third perfon; and in thefe cafes, fince they were not ear and eye witneffes of him who firt fpoke them, their manace of delivery would waut the advautage neceffarily arifing from an immediate iden of the original one ; hence, on this aceount, this would be a fill lefs lively reprefentation than that of the lird repenter. But as, from a daily obfervation of every variety of feech and its affociated ligns of emotion, mankind foon become pretty well acquainted with them, and this in different degrees, aecording to their difeermment, fenfibility, Sic. experience fhows us that thefe latter repeaters (as we call them) might conceive and ufe a manner of delivery which, though lefs charaiterillic peuthaps, would on the whole be no way inferior to the firt, as to the common natural expreffion proper for their fituation. It appears, therefore, that repeaters of every degree may be elteemed upon a level as to animation, and that our twofold diltinction above contains accurately enough the whole variety of ordinary delivery ;-we fay ordinary', becaufe

There is another very peculiar kind of delivery fometimes ufed in the perfon of a repeater, of which it will in this place be neceffary to take fome notice. What we mean here is mimicry; an accomplifhment which, when perfectly and properly difplayed, never fails of yiclding a high degree of pleafure. But fince this pleafurc chiefly irefults from the principle of imitation refpecting manner, and not from the purport of the maller communicated; fince, comparatively fpeaking, it is ouly attaimable by few perfons, and practifed only. on particular occafions;-on thefe accounts it mult be refufcd a place among the modes of uleful delivery taught us by general nature, and efteemed a qualification purely anomalous.

Thefe difinctions with regard to a \{peaker's fitnation of mind premifed, let us fee to which of them ans author and his reader may molt properly be. seferred, and how they are circumftanced with regard to one another.

The matter of all books is, either what the author fays in his owun perfon, or an acknowledged recital of the words of others: heuce an author may be eftecmed both an original fpeaker and a repenter, according as what he writes is of the firlt or fecond kind. Now a reader muft be fuppofed either actually to perfonate the author, or one whofe office is barely to commennicate what he has faid to an auditor. But in the Grlt of thefe fuppofitions he;would, in the delivery of what is the au, thor's own, evidently commence mimic; which being, as

## R E A

Readirg
above obferved, a charakter not acknowledged by general nature in this department, ought to be rejected as generally improper. The other fuppofition therefore muft be accounted right; and then, as to the wobole matter of the book, the reader is found to be exactly in the fituation of a repeater, fave that he takes what he delivers from the page before him inftead of his memory. It follows then, in proof of our initial propofition, that, if we are directed by nature and propricty, the manner of our delivery in reading ought to be inferior in warmth and energy to what we fhould ufe, were the language before us the fpontaneous effufions of our own hearts in the circumftances of thofe out of whofe mouths it is fuppofed to proceed.

Evident as the purport of this reafoning is, it has not fo much as been glanced at by the writers on the fubject we are now entered upon, or any of its kindred ones; which has oecafioned a manifeft want of accuracy in feveral of their rules and obfervations. Among the reft, this precept has been long reverberated frons author to author as a perfect ftandard for propriety in reading. "Deliver yourfelves in the lame manner you would do, were the matter your own original fentiments uttered directly from the heart." As all kinds of delivery muft have many things in common, the rule will in many articles be undoubtedly right ; but, from what has been faid above, it muft be as certainly faulty in refpect to feveral others; as it is certain nature never confounds by like figns two things fo very different, as a cofy and an original, an emanation darted immediately from the fun, and its weaker appearance in the lunar 1 eflection.

The precepts we have to offer for improving the above-mentioned rule, fhall be delivered under the heads of accent, emphafis, modulation, expreffion, faufes, \&c.
I. Accent. In attending to the affections of the voice when we fpeak, it is eafy to obferve, that, independent of any other confideration, one part of it differs from another; in firefs, energy, or force of utterance. In words we find one fyllable differing from another with refpect to this mode; and in fentences one or more words as frequently vary from the relt in a fimilar manner. This ftrefs with regrard to fyllables is called accent, and contributes greatly to the variety and harmony of language. Refpecting words, it is termed emphafis; and its chief office is to affift the fenfe, force, or perfpicuity of the fentence-of which more wader the next head.
"Accent (as defcribed in the Lectures on Elocution) is made by us two ways; either by dwelling longer upon one fyllable than the reft, or by giving it a fmarter percufition of the voice in utterance. Of the fift of thefe we have inftauees in the words glöry, fäther, boly; of the laft in bat the, bal'it, bor'row. So that accent with us is not referred to tune, but to time; to quantity, not quality ; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In theatric declamation, in order to give it more pornp and folemnity, it is ufual to dwell longer than common upon the unaccented fyllables; and the author now quoted has endearoured to prove (p. 51. 54.) the practice faulty, and to thow (p. 55.) that "though it (i. e. true folemnity) may demand a Sower utterance

## $19]$

## R E A

than ufual, yet (it) requires that the fame proportion Reading. in point of quantity be obferved in the fyllables, as there is in mufical notes when the fame tune is played in quicker or flower time." But that this deviation from ordinary fpeech is not a fault, as our author afferts; nay, that on the contrary it is a real beauty when kept under proper regulation, the following obfervations it is hoped will fufficiently prove.
(I.) It is a truth of the moft obvious nature, that thofe things which on their application to their proper fenfes have a power of raiting in us certain ideas and emotions, are ever differently modified in their conflituent parts when different effects are produced in the mind: and alfo (1I.) that, within proper bounds, were we to fuppofe thefe conftituent parts to be proportionally increafed or diminihhed as to quantity, this effect would Atill be the fame as to quality.- For inflance: 'The different ideas of ftrength, fwiftnefs, \&c. which are raifed in us by the fame fpecies of animals, is owing to the different form of their correfponding parts; the different effects of mufic on the paffions, to the different airs and movements of the melody; and the different expreffions of human fpeech, to a difference in tone, fpeed, \&ec. of the voice. And thefe peculiar effects would trill remain the fame, were we to fuppofe the animals above alluded to, to be greater or lefler, within their proper bounds; the movement of the mufic quicker or flower, provided it did not palpably interfere with that of fome other fpecies; and the pitch of the voice bigher or lower, if not carried out of the limits in which it is obferved on fimilar occafions naturally to move. Farther (III.) fince, refpecting the emotions more efpecially, there are no rules to determine $a$ priori what effect any particular attrihute or modification of an object will have upon a percipient, our knowledge of this kind muft evidently be gained from experience. Laftly, (IV.) In every art inntating nature we are pleafed to fee the charaeteritic members of the pattern beighiened a little farther than perhaps it ever was earried in any real example, provided it be not bordering upon fome ludicrous and difagrecable provinces of excets.

Now for the application of thefe preniffes.-To keep pace and be confittent with the dignity of the tragic mufe, the delivery of her language fhould neceffa، ily be dignified; and this it is plain from obfervation (I.) cannot be accomplifhed otherwile than by fomething different in the manner of it from that of ordinary fpeech; frnce dignity is effentially different from familiarity. But how muft we dicover this different mamer ? By attending to nature : aud in this cafe the tells us, that befides ufing a flozer delivery, and greater diflitignefs of the words (which every thing merely grave requires, and gravity is a concomitant of dignity, though not its e(fence), we mult dwell a little longer upon the unaccented fyllables than we do in common. As to what our author obferves in the above quotation, of dignity's only requiring a flower utterme than ordinary, while the proportion of the fyllables as to quantity continues the fame; it is apprehended the remark (II.) refpecting quicknefs and flownefs of movencnt, will fhow it to be not altogether true. For fince the delivery is not altered in form, its expreffion mult be flill of the fame kind, and perhaps what may be rightly fuggelted by the term gravely familiar.

Reading. Buat fomething farther may be yet faid in defence of this artijizial delivery, as our author calls it. Is not the movement of any thing, of whatever fpecies, when dignified or folenm, in general of an equable and deldernfe nature (as in the minuet, the military ftep, Sce.)? And in theatrical declamation, is not the propenfity to intioduce this equabtinefs fo ftrong, that it is almott imfolflle to avoid it wholly, were we ever fo determined to do it? ]f thele two queries be anfwered in the affirinative (as we are perfuaded they will), while the firlt furports our argunent for the fropriety of the manner of delivery in queltion, the fecond difcovers a kind of neeeffly for it. And that this manner may be carried a little firther in quantity on the fage than is ufual in real life, the prineiple (IV.) of heighterning nature will juRify, provided faftion (which Las ever fomethiug to do in thefe articles) give it a fanction; for the procife quantity of feveral heightenings may be varied by this great legiflator almoft at will.
11. Empbafis. As emplofifs is not a thing annexed to particular words, as anceat is to fyllables, but owes its rife chiefly to the meaning of a paffage, and muft therefore vary its feat according as that moaning varies, it will be neceffary to explain a little farther the general idea given of it above.

Of man's firft difobedience, and the fruit
Of that forbidden tree, whofe mortal tafte
Brought death into the worhl, and all our woc, \&cc.
Sinerg lieav'uly muse, \&e.
Suppofine, in reference to the above well-known lines, that originally other beings, befides men, had difobeyed the commands of the Almighty, and that the circumitance were well known to us, there would fall an ems,b ifis upon the word nun's in the firt line, and hence it would be read thas;

Of man's firf difobedience, and the fruit, \&c.
But if it wete a notorious truth, that mankind had tranfgreffed in a peculiar manner more than once, the (mplinfis wuld lall on fir $\rho_{2}$, and the line be read,

Of man's firf difobedience, \&c.
Argain, admitting death (as was really the cafe) to
have been an unleard-of and dreadful punifment Reading. brought upon man in confequence of his tranforeffion; on that fuppofition the third line would be read,

Brought deafl into the world, \&c.
But if we were to fuppofe mankind knew there was fuch an evil as cleath in other regions, though the place they inhabited had been free from it till their tranfyreffion; the line would sun thus,
bronght eleath into the zuorld, Sic.
Now from a proper delivery of the above lines, with regard to any one of the fuppofitions we have chofen, out of feveral others that might in the fame manner have been imagined, it will appear that the emporafis they illuflrate is effecled by a manifett deiay in the pronunciation, and a tone fomething fuller and louder than is ufed in ordinary; and that its office is folely to determine the meaning of a fentence with reference to fomething faid before, prefuppoled by the author as general knowledge, or in order to remove an ambiguity where a paflage is capable of havmg more fenfes gisen it than one.

But, fuppofing in the above example, that none of the fenfes there pointed out were prectiely the true one, and that the meaning of the lines, were no other than what is obvioully fugselled by their fimple conftruction; in that cafe it may lee afked, if in reading them there fhould be no word dignitied with the emphatical aceompanyments abowe deleribed?-The anfwer is, Not one with an emphalis of the fame kind as that we have juit been ibluilrating ; yet it is neverthelefs true, that on haring thefe lines well read, we fladl find fome words didinguifhed from the rell by a manner of delwery bordering a little upon it (A). And thele words will in general be fuch as feem the mof important in the fentence, or on other accomats to merit this diltinetion. But as at beft it only enforces, graces, or enlivens, and not fixes the meaning of any paftage, and even capriee and faflion ( $s$ ) have often a hand in determining its place and magnitude, it cannot properly be reckuned an effential of delivery. However, it is of too much moinent to be neglected by thofe who would wilh to be good readers; and, for the fake of diftinction, we niay
(A) The following lines will illuftrate both thefe kinds of ftreffes: For, to convey thoir right meaning, the word ANy is evidently to be pronounced louder and fuller than thofe with the aceents over them.

Get wealth and place, if poffible with gráce;
If not, by axy meáns get weálth and pláce. Pope.
This couplet is accented in the mauner we find it in the Eflay on Elocution by Mafon. Andif, according to the judgment of this author, the words thus diftinguifhed are to have an emphatical firefs, it muft be of the inferior kind above-mentioned, and which a little farther on we call emphafis of force; while the word any in a different type alone poffeffes the other fort of energy, and which is there contradiftinguifhed by the term emphafs of fenje.
(B) Among a number of people who have had proper opportunities of learning to read in the beft manner it is now taught, it would be difficult to find two, who, in a given inftance, would ufe the emphafis of force alike, either as to place or quantity. Nay fome fcarce ufe any at all : and others will not fcruple to carry it much beyond any thing we have a precedent for in common difcourfe; and even now and then throw it upon words fo very trifing in themfelves, that it is evident they do it with no other view, than for the fake of the variely it gives to the modulation. - Ihis practice, like the introduction of difcords into mufic, may without doubt be indulged now and then; but were it too frequent, the capital intent of thefe energies would manifeftly either be deftroyed or rendered dubious.
ins. nnt unaptly denominate both the kincis of enersies in quellion, ly the terms emphafis of fenfe, and empibifs of fo:ce (c).

Now from the above account of thele two fpecies of cmophefis it will appear, "that in reading, as in fpeaking, the fritt of them mut be determined entindy by athe fenfe of the paffage, and aimons made orike: But as to the other, cofie aione feems to have a right of fixing itc fitmation ard quantiy." - Farther: Sirce the more effential of thefe two entrgies is follely the work of atare (as apyears by its being comfinnly found in the common converfation of people of all kinds ol capaciies and degrees of knowledge), and the moft ignorant ferfon never fails of wing is righty in the effuftons of his own heart, it happens very luckily, and ought always to be romembered, that provided we undertand what we read, and give way 10 the dictates of nur own feeling, the emp boftrs of ferfe can fcance ever avoid falling fpontaneouny upon its proper place.

Here it will be neceflary to fay fomething by say of reply to a quetion which will naturally oceur to the mind of every one. As the rule for the emphafis of ferfe tequires we mould underfand what we read before it can be properly ufed, it is nombent upon us never to attempt to read what we have not previnufy fludied for that purpofe? In anfwer to this, it mut he obferved, that though fuch a ftep will not be without its advartages; yet, as from the faimefs of printed types, the well-known paufes of punctuation, and a long acquaintance with the phrafeology and conftruction of our language, \&c. experience tells us it is foftible to comprehend the fenfe at the firt reading, a previous perufal of what is to be read does not feem neceflary to all, though, if they would wifh to appear to advantage, it may be expedient to many; and it is this circumftance
which makes us venture upon extemporate reading, and Readirg. give it a place among our amifements.-Sibilar remarks might be made with regard to modulakion, expro fron, Sce. did not what is here obfersed naturall: anticipate them.
III. Modulation (刀). Every perfon muft have obfer-Mo? ${ }^{4}$. ved, that, in fpeaking, the voice is fubject to an altera. tiontion of found, which in fome meafure refembles the movement of a tune. Thcfe founds, however, are evidently nothing like fo much varico as thofe that are ftriely mufical; and we have atternated to thow in the precediag clapter, that, befides this, ther have an effertial difference in themlelves. Neverthelefs, from the geneial fumilitude of tliefe two articles, they poffefs feveral terms in common; and the particular we have now to examine is in both of them called modulatioz. This affection of the voice, being totally artisrary, is differently characterized in different parts of the world; and, through the power of cuftom, every place is inclined to think their own the only one natural and ngreeable, and the well affected with fome barbarons twang or ungainly variation ( $k$ ). It may be obferved, however, that though there is a general uniform cat or fafhion of modulation peculiar to every courtry, yet it hy no means follows, that there is or can be any thing fixed in its application to particular pafiages; and therefore we find different jeople will, in any given inftance, ufe modulations fomething different, and neverthelefs be each of them equally agreeable.

But, quitting thefe general remarks, we fhall (as our purpofe requires it) confider the properties of modula. tion a little more minutely-

Firft, then, we may obferve, that, in fpeaking, there is a particular found (or key-note, as it is often called) in which the modulation for the moft part runs, and to which
(c) The firft of thefe terms anfwers to the fimple emphafis defcribed in the Leaures on Elocution, and the fecond rearly to what is there called complex. The difference lies in this. Under complex emphafis the author feems (for he is far from being clear in this article) to include the tones fimply confidered of all the emotions of the mind; as well the tender and languid, as the forcible and exulting. Our term is intended to be confined to fuch modes of expreffion alone as are marked with an apparent flefs or increafe of the voice.
(D) The author of the Introducion: to the Alt of Readiry, not allowing that there is any variation of tone, as to bigh and low, in the delivery of a complete period or fentence, places modulation folely in the diver fification of the key-note and the variety of fyllables, as to long or flort, jwift or flow, ftrong or weak, and loud or foft. As we are of a different opinion, our idea of modulation is confined purely to barmonious inflexions of voice. Thefe qualities of words, it is true, add greatly both to the force and beauty of delivery ; yet, fince fome of them are fixed and not arbitrary (as long and foort), and the others (of fwift and flow, frong and woul, loud and foft), may be confidered as modes of expreffion which do not affect the modulation as to tone, it will agree beft with. our plan to efteem thefe properties as refpectively belonging to the eftailifthed laws of frouunciation and the imisative branch of expreffion mentioned in the end of the cnfuing head.
(E) From what accounts we have remaining of the modulation of the ancients, it appears to have been highly ornamented, and apparently fomething not unlike our modern recitative; particularly that of their theatric declamation was mufic in its ftricteft fenfe, and accompanied with inftruments. In the courfe of time and the progrefs of refinement, this modulation became gradually more and more fimple, till it has now loft the genius of mufic, and is entirely regulated by tafte. At home here, every one has hard the fing-fong cant, as it is. called, of

Ti tidum dum, ti ti dum ti dum de,
Ti dum ti dum, ti dum ti dum dum de ;
which, though difgufful now to all but mere ruftics on account of its being out of famion, was very probahly. the favourite modulation in which heroic verfes were recited by our anceftors. So fluctuating are the tafte and practices of mankind! But whether the power of language over the paffions has received any advantage from the. change juft mentioned, will appear at leaft very doubtfil, when we recollect the fories of its former triumphs, and the inherent charms of mufical founds.

## R E A [ 22 ] R E A

Reabig which its nocafonal inflexions, either above or below, may in fome refpects be conecived to have a reference, like that which common mufic has to its key-note. Set there is this difference between the two kinds of modulation, that whereas the firt always concludes in the key-note, the other frequently conchudes a little below it ( $\mathbf{r}$ ). This key-note, in feraking, is generally the found given at the outfet of every complete fentence or period; and it may be obfersed on fome oceahons to vary its pitch through the limits of a mufical interval of a confiderable magritude. The tones, that fall a little lower than the key at the clofe of a fentence or perind, are called cadences. 'Ihefe calduees, if we are accurnte in our diflinctions, will, with refpect to their offices, be found of two kinds; though they meat fo frequently together, that it may be beft to conceive them only as anfweing a double purpofe. One of thefe offices is to affift the fenfe, and the other to dccorate the modulation. An account of the firlt may be feen in the fection on Poufes; and the latter will be found to thow itfelf pretty frequently in every thing grave and plaintive, or in poetic defeription and other highly ornamented language, where the mind is by its influence broughe to feel a placid kind of dignity and fatisfaction. Thefe two eadences, therefore, may be conseniently diftinguifhed by applying to them refpectively the cpithets fignificont and ornamental.

We have already obferved, that reading fhould in fome things differ from fpeaking; and the particular under confideration feems to be one which ought to vary a little in thele arts. For,

Modulation in reading ferves a twofold purpofe. At the fame time that it gives pleafure to the car on the minciples of harmony, it contributes through that medium to preferve the attention. And fince written language (when not purely dramatical) is in general more clegant in its conflruction, and mufical in its periods, than the oral one; and funce many interefting particulars are wanting in reading, which are prefent in \{peaking, that contribute greatly to fix the regard of the hearer ; it feems reafonable, in order to do juttice to the language, and in part to fupply the incitements of attention jult alluded to, that in the former of thefe two articles a modulation fhould be ufed fomething more larmonious and atificial than in the latter. Agreeably to this reafoning, it is believed, we fhall find every reader, on a narrow examination, adopt more or lefs a modulation thus ornamented: though, after all, it muft be acknowledged there are better grounds to bclieve, that the practice has been litherto directed intuitively by nature, than that it was difeovered by the inductions of reafon. Wre thall conclude this head with a rule for modulation in reading. "In every thing dramatic, colloçuial, or of fimple narrative, let your modulation be the fame as in fpeaking; but when the fubject is flowery, folemn, or dignified, add fomething to its harmony,
diverfify the key-note, and increafe the frequency of Readin. cadences in proportion to the merit of the compofttion."
It will readily he feen, that the precepts here drawn from a comparion between fpeaking and reading, would be very inadequate, were they left deftitute of the affiltance of tafte, and the opportunity of frequently learing and imitating maferly readers. And indeco, to thefe two great auxiliaries we might very properly have reforred the whole matter at once, as capable of giving fufficient directions, had we nut remembered that ous plan required us to found fereral of our rules as much on the principles of a philofophical analyfis, as on thofe more familiar ones which will be found of greater efficacy in real praćtice.

1V. Lixpreflion. I. There is no componition in mufic, Expreflio as to the however perfect as to key and melody, lout, in grder tones of to do juftice to the fubject and ideas of the author, woice. wall require, in the performing, fonsething more than an exact adherence to tune and time. This fomething is of a nature, too, which perhaps ean never be adequately pointed out by any thing graphic, and refults entively from the tatte and feeling of the performer. It is that which chiefly gives mufic its power over the palfions, and characterifes its notes with what we mean by the words frucet, larfb, dull, lively, plisintive, joyous, \&ic. for it is evident every found, conffdered abftrackedly, without any regard to the movement, or high and low, may be thus modified. In practical mufic, this commanding particular is called Expreffion; and as we find certain tones analogous to it frequently coalefcing with the modulation of the voice, which indicate our paffions and affections (thereby more particularly pointing out the meaning of what we fay), the term is ufually applied in the fame fenfe to fpeaking and reading.

Thefe tones are not altogether peculiar to man. Every animal, that is not dumb, las a power of making feveral of them. And from their being able, unaffited by words, to manifett and raife thear kindred emotions, they conttitute a kind of language of themfelves. In this language of the heart man is eminently converfant ; for we not only underfand it in one another, but alfo in many of the inferior creatures fubjected by providence to our fervice.

The expreffion here illuftrated is one of the mof effential articles in good reading, lince it not only gives a finifhing to the fenfe, but, on the principles of fympathy and antipathy, has alfo a peculiar efficacy in interelling the heart. It is likewife an article of moft diffieult attainment ; as it appears from what follows, that a mafterly reader ought not only to be able to incorporate it with the modulation properly as to quality, but in any degree as to quantily.

Every thing written being a proper imitation of fecech, expreffive reading mult occafionally partake of
(F) As mufieal founds have always an harmonical reference to a key or fundamental note, and to which the mind is fill fecretly attending, no piece of mufic world appear perfect, that did not elofe in it, and fo naturally put an end to expectation. But as the tones ufed in feech are not mufieal, and therefore cannot refer harmonically to any other found, there can be no neceflity that this terminating found (and wbich we immediately benow term the cadence) Mould either be ufed at all, or follow any particular law as to form, \&c. farther than what is impoled by tafte and ceflom.

R E A T.
ng. all its tones. But from what was laid above, of the difference between reading and fpeaking, it follows, that thefe figns of the emotions thould be lefa ftrongly characterifed in the former article than in the latter. Again, as feveral of thefe tones of expreffion arc in themfelves agreeable to the mind, and raife in us agreeable emotions (as thofe of $p: 1$ y, benevolence, or whatever indicates bappinefs, and goodnefs of heart), and others difagreeable (as thofe of a boifferous, malevolent, and $d \varepsilon$ praved nature, \&c.) it farther appears, fince reading is an art improving and not imitating nature, that, in whatever degree we abate the expreffions of the tones above alluded to in the finft cafe, it would be eligible to make a greater abatement in the latter. But as to the quantities and proportional magnitudes of thefe abatements, they, like many other particulars of the fame nature, muft be left folely to the tafte and judgment of the reader.

To add one more remark, which may be of fervice on more accounts than in fuggefting another reafon for the doctrine above. Let it be remembered, that tho' in order to acquit himfelf agreeably in this article of expreffion, it will be neceflary every reader thould feel his fubject as well as underfland it; yet, that he may preferve a proper eafe and matterlinefs of delivery, it is alfo neceffary he hould guard againt difcovering too much emotion and perturbation.

From this reafoning we deduce the following rule, for the tones which indicate the paffions and emotions.
"In reading, let all your tones of expreffion be borrowed from thofe of common fpeech, but fomething more faintly characterifed. Let thofe tones which fignify any difagreeable paffion of the mind, be ftill more. faint than thofe which indicate their contrary; and preferve yourfelf fo far from being affected with the fubject, as to be able to proceed through it with that peculiar kind of eafe and malterlinefs, which has its charms in this as well as every other art."

We fhall conclude this fection with the following obfervation, which relates to fpeaking as well as reading. When words fall in our way, whofe "founds feem an echo to the fenfe," as fruirr, buzz, bum, rattl, bifs, jar, \&c. we ought not to pronounce them in fuch a manner as to heiglaten the imitation, except in light and ludicrous fubjects. For inflance, they frould not in any other cafe be founded fquir.r.r-buzz.z.z-bum.m.mr.r.rattle, Exc. On the contrary, when the imitation lies in the movement, or flow and firuaure of a whole paffage (which frequently happens in poetry), the dclivery may always be allowed to give a heiglitening to it with the greateft propricty; as in the following inftances, out of a number more which every experienced reader will quickly recollect.

In thefe deep folitudes and awful cells,
Where beav'nly-penfive Contemplation dwells,
And ever-mufing Melancholy' reigns-
Pope's Eloifa to Alelard.
With eafy courfe
The veflels glide, unlefs their fpeed be ftopp'd -
By dead calms, that ofi lie on thefe finooth feas.
Dyer's Fleece.
Softly freest in Lydian meafure,
Soin be footl'd ber foul to pleafure.
Dryden's Ode on St Cccilia's day'.

Still gathering foree it fmokes, and, urg'd amain, Readinz. Whirls, leaps, and thyuders do we impetuous to the plain. Pope's Lliad, B. I3.

## For who to.dumb forgetfulnefs a prey,

This pleafing anxious being ere relign'd,
Left the warm precincts of the cheerful day,
Nor caft one longing linn'ring look belind?
Griy's Elegy.
2. Befides the particular tones and modifications of Expreflion voice above defcribed, which always accompany and face to the exprefs our inward agitations, nature has in thefe cafes face and endowed us with another language, which, inftead of efluce. the ear, addreffes itfelf to the eye, thereby giving the communications of the heart a double advantage over thofe of the underftanding, and is a double chance to preferve fo inetimable a bleffing. This language is . what arifes from the different, alno? involuntary movements and configurations of the face and body in our emotions and paffions, and which, like that of tones, every one is formed to underftand by a kind of intuition.

When men are in any violent agitation of mind, this co-operating ex.xpreffion (as it is called) of face and gefture is very trongly marked, and totally free from the mixture of any thing which has a regard to graceful. nefs, or what appearance they may make in the eyes of others. But in ordinary converfation, and where the emotions are not fo warm, fathionable people are perpetually infinuating, into their countenance and action, whatever they imagine will add to the eafe and elegance of their deportment, or imprefs on the fpeeator an idea of their amiablenefs and breeding. Now, though the above-mentioned natural organical figns of the 'emotions fhould accompany every thing fpoken, yet from what was obferved in the introductory part of this article (like the tones we have juft treated upon), they fhould in reading be much lefs flrongly exprcffed, and thofe fuffer the greatef diminution that are in themfeives the moft ungainly. And as it was in the laft fection recommended to the reader to preferve himfelf as far from being affected in ail paffionate fubjects as to be able to keep a temperate command over the various affections of the roice, $\& \mathrm{c}$. fo under the fanction of this fubordinate feeling he may accompany his delivery more frequently with any eafy action or change of face, which will contribute to fet oft his manner, and make it agreeable on the principles of art.
As thefe calm decorations of action (as we may call them) are not altogether natural, but have their rife from a kind of intitution, they mult be modelled by the practices of the polite. And though mankind differ from one another fcarce more in any particular than in that of talents for adopting the graceful actions ofthe body, and hence nothing determinate can be faid of their nature and frequency, yct even thofe, morl. happily calculated to acquit themfelves well in their ufe, might profit by confidering that it is better greatly to abridge the difplay, than to over-do it ever fo little. For the peculiar modefly of depertment with which the inhabitants of this kingdom are endowed, makes us in common enceavour to fupprefs many figns of an agitated mind ; and in fuch cafes the bodily ones in particular are very fparingly ufed. We have alfo a natural and rooted difike to any kind of affectation; and to nofpecics;
fuecest, that we cm ree illect, a greater, than to that which is $f$ etn in a perfon who prete:uls to mimiery and courtly geflare, widhout poffefins the adsautages and thents they require : and of which wot many propic, comparatively fucaking, have any remakable 117 ris .
The inference of this is ton olvions to need drawing nut, and we would particularly reconnend it to the conlideration of thofe readers who think the common orcuitences of a new fayper. \&ec. cannot be properly delivered without a g(0) I deal of ellow-ronm
Althonyl it is impofille to come to particulurs in any directions of this kind, yet there is one article of onis pefent fubjest on which a ferviceable remarl: may he made. Ia ordiury difcourfe, when we are particharly preffins and earnen in what we fay, the cye is naturally thrown umon thofe to whom we addrefs ourFolves: And in readin $r$, a turn of this organ now and then upon the hearers, when any thing very remark:able or iute- Altins falls in the way, has a giod effect in anining it a proper attention, sic. But this fhould not be too frequently ufed ; for if fo, befides it having a tendency to confound the matural insportance of difterent paffages. it may not be altogether arreeable to rame to have their nwn reflections broken in upon by a fignal, which might be interpreted to hint at their wanting regulation.
One oblervation more, and then we fhall attempt to recapitulate the fublance of this fection in the form of a precept. Though it is, when ftrictly examined, inconfiftent, both in fpeaking and readin?, to imitate with action what we are deferibing, yet as in any thing comic fuch a practice may furge.t ideas that will accord with those of the fubjeet, it may there be now and then indulged in either of thefe articles.
"In a manner fimilar to that directed with regard to tones, moderate your bodily expreffions of the figns wr the emotions. And in order to fupply, as it were, this deffiency, introduce into your carriage fuch ant eafy gracefulnefs, as may be confiftent with your acquirements in thefe particulars, and the neceflary dread which thould ever be prefent of falling into any kind of affectation or grimace."
V. Faufes. Speech confinting of a fucceflion of diftint words, muft naturally be liahle (buth from a kind of accident, and a difficulty there may be in beginning certain founds or portions of phrifes immediztely on the enling of certain others) to feveral fmill intermiffions of voice: of which, as ilhey can have no meaning, nothing farther need here be faid. There are, however, fome paufes, which the fenfe neceflarily denaads; and to thefe the fubftance of this fection is direeted.

The punfes are in part to diftinuuifh the members of fentences from one another, the terminations of complete periods, and to afford ath opportmaty for takiure breath. lislids this, they have a very graceful effect in the modulation, on the fame account they are fo effential in mutic. -In both articles, like blank fpaces in pietures, the let off and render more confpicuous whatfoever they disjoin or terminate.

Were language made up of nothing lout faort colloquial fentences, thefe paufes, thourh they miryt do no ham, and would generally be graceful, would however be fuperfeded as to ufe by the completenels and narruzurefs, as we may fay, of the meanime. But in more diffufe language, compofed of feveral detached fertences, and which require fome degree of attention in order to take in the fenfe, the intermiffons of woice under confideration are of the greatef fervice, by fis 5 mifying to the mind the progrefs and corpletion of the whole panage. Nuw, though in extenfive and differently formed periods there may be members whofe completencis of fenfe min the be conccived of various degrees, and hence might feem to require a fet of paufes equally mumerons; yet, fince the fenfe docs not alto. gether depend upon thefe intermiffions, and their ratios to one another, if capable of beine; properly defned, could not be accuratcly obferved, grammarians have ventured to conceive the whole clafs of panfes as reducible to the four or five kinds now in ufi, and whofe marks and ratios are well known (c) : prefu~ ming that under the eye of tafte ; and with the affittance of a particuldr to be next mentioned, they woul ! not fail in all cafes to fuggect interniffions of voice fuitable to the fencc. But in many of thefe extenfive and complex periods, rounded with a kind of redundancy of matter, where the full fenfe is long furpended, and the final words are not very inportant, there would be fome hazard of a mifapprehention of the termination, had we not more evident and! infallible notice of it than that which is given by the parfe. This matice is the calence, referred to in the fection on $M$ )dus. lution; which, as is there abferved, befides the orna. mental variety ${ }^{\text {it }}$ affords, appenrs from thefe remarks to be a very neceflary and ferviceable article in perfpicuons delivery.

As this cadence naturally accompanics the end of every entire fenfe, ciccumiftanced as above-mentioned, it may fometimes fail before the femicsion, but more generally before the colon, as well as the period: For thefe marks are often found to terminate a complete fenfe; and in thefe calces, the relation what follows has to what went before, is fignilied to the mind liy the relative fhortnefs of the ftop, and the form of introducing the additional matter. Nor can any bad confequence
(c) Suppofint the comma (,) one fime, the fomioglon (;) will be two; the colon (;) three, and the perind (.) is aifo the marks of inter rogation (!) and afmiration (!) four of thefe tines. The blakk line ( - or $-\ldots$ ), and :lac Lrenks between parazrapher, intimate fill grater times; and by the fame analogy nay be reckoned a double and quadruple period refpectively. Now and then thete hlank lines are placed immediatcly after the ordinary points, and then they are conccived only as feparatin f for the eye the differeat natures of the mater ; - as a queltion from an anfwer, -precept from example, -premifes from inferences, $\mathcal{S}=$. in which cafe their import is "vie'nt. But of late fome authors have not ferupled to confound thefe ditinetions; and to make a blank ferve tor all the paufes univerfally, or the mark of an indefinite reft, the quautity of which is left to the deternination of the reader's tafte. A practicc, it is imagined, too deftructive of the intended precifion of thefe typical nosices to be much lorger adopted.

## R E A

[ 2 guence arife from thus foumding ditinetions on ratios of time, which it may be faid are too nice to be often rightly hit upon: for if a confution flould happen hetween that of the coion and period, there is perhaps fo trifing a difference between the nature of the paflates they fucceed, as to make a fmall inaccuracy of no confequence. And as to the refts of the femicolon and period, it will not be ealy to miltake about them, as their ratio is that of two to one. Add to this the power which the matter and introduction of the fubfequent paflages have to rectify any llight error here made, and we thall be fully fatistied, that the paufes as ufually explained, with the cadence above deferibed, and a proper knowledge of the language, will convey fufficient information to the underflanding of the conftructive nature of the paflages after which they are found.

It may be obferved, that in natural fpeech, according to the warnth and agitation of the fpeaker, the refts are often fhort and injudiciounly proportioned, and hence that every thing thus delivered cannot be fo graceful as it might have been from a proper attention to their magnitude and effects.

Paufes then, though chicfly fubjected to the fenfe, are, as was renarked at the outfet, ferviceable in beautifying the modulation, \&c.-And fince books are often inaccurately printed as to points, and people's taftes differ fome little about their place and value, it appears, that, "although in reading great attention flould be paid to the ftops, yet a greater Thould be given to the fenfe, and their corcfpondent times occafionally lengthened beyond what is ufual in common fpeech;" which obfervation contains all that we fhall pretend to lay down by way of rule for the management of paufes in the delivery of written language.

As there are two or three fpecies of writing, which have fumething fingular in them, and with regard to the manner in which they fhould be read, a few particular remarks feem neceflarily required, we fhall conchude this article with laying them before the reader:
r. Of Plays, and fuch like conversation-pieces. Writings of this kind may be confidered as intended for two different purpofes; one to unfold fubject matter for the exercife of theatric powers; and the other to convey anufement, merely as fable replete with pleafing incidents and characterittic manners. Hence there appears to be great latitude for the difplay of a confifent dellivery of thefe performances: for while, on one hand, a good reader of very inferior talents for mimicry may be heard with a tolerable degree of pleafure; on the other, if any perfon is qualificd to give a higher degree of life and force to the dialogue and characters by delivering them as an actor, he mult be fully at liberty to thart from the confinement of a chair to a pofture and area nore fuit$e d$ to his abilities; and, if he be not deceived in himfelf, his hearers will be confiderable gainers by the change.'The next article is,
2. Sermons or other orations, which in like manner may be conceived intended for a double purpofe. Firf, as matter for the difplay of oratorical powers; and, fecondy, as perfuafive dilcourfes, \&c. which may be read like any other book. Therefore it appears (fur reafons fimilar to thofe above) that according as clergymen are poffefed of the talents of clocution, they VoL. XVI. Part I.
may confitertly either rehearfe licir furmone, in the Readiog. manaer of an extemporary harangue, or diliver them in the more humble capacity of one who is content to entertain and inltruct his hearers with readian to them his own or fome other perfun's writton difcourfe.

That either of thefe mannars of delivery (or a misture of them), in either of the cafes above-mentioned, is agrecable, we find on a careful examination. For this will thow us how frequently thes run into one another: and that we are fo far from thinking fuch tranition: wrong, that, without a particular atiention that way, we fearce ever perceive them at all.
3. Poetry is the next and laft object of our prefent remarks. This is a very peculiar kind of writing, and as much different from the language of ordinary difourfe as the movements of the dance are from cominon walking. To ornament and improve whatever is fubfervient to the pleafures and amufements of life, is the ddight of human nature. We are alfo pleafed with a kind of excefs in any thing which has a power to amufe the fancy, infifire us with enthufiafn, or awaken the foul to a confcioufnefs of its own importance and dignity. Hence one pleafure, at leaft, takes its rife, that we feel in contemplating the performances of every art ; and hence the language of poetry, condifting of a meafured rythmus, harmonious cadences, and an elevated picturefque diction, has been fludied by the ingenious, and found to have a powerful infuence over the human breaft in every age and region. There is fuch an affinity between this language and mufic, that they were in the earlier ages never feparated; and though modern refinement has in a great meafure deftroyed this umion, yet it is with fome degree of difficulty in relcarfing thefe divine compolitions we can forget the finging of the mufe.
From thefe conliderations (and fome kindred onementioned in fect. iii.) in repeating verfes, they are generally accompanied with a modulation rather more urnamented and mufical than is ufed in any other kind of writing. And accordingly, as there feems to be the greatef propriety in the practice, the rele for this particular in the fection juft referred to, will allow any latitude in it that can gain the fanction of talte and pleafure.

Rhymes in the lighter and mole foothing provinces of poetry are found to have a good effect ; and hence. (for reafons like thofe juft fuggefted) it is cerrainty abfurd to endeavour to finother them by a feebie pronunciation, and running one line precipitately inte annther, as is often affected to he done by many of our mo. dern readers and fpeakers. By this method they not only deftroy one fource of pleafure intended by the cumpofer (which though not great is neverthelefs genuine), but even often fupply its place with what is really difagreeable, by making the rhymes, as they are interruptedly perceived, appear accidental blemifhes of a different Alyle, arifing from an unmeaning recurrence of fimilar founds. With regard then to reading verfes terminated with rhyme, the common rule, which directs to pronounce the final words full, and to diftinguif them ly a flight paufe even where there is none required by the fenfe, feems the moft rational, and confequently moft worthy, of being followed. See Declamation, Narr.ation, and Okatory.

Reading, a town of Berkhire in England, pleafantly feated on the river liemeth, near thic confuence with the Thanies. It had once a fine rich monaftery: D

## R E A

Rea. ${ }^{\text {nome }}$ ne which there are large ruins re maining. It had alfo a Il caßle built by hing Henry 1. hut it was afterwards le-

- veral privileges, and fenls zwo inembers to parliament.
'ilue two mavigalle nivers render it a fit place for trade. W. Long. 1. O. N. Lat. 5 t. 25.

READingS, or l'arious Rfadings, in criticifm, are the different manner of reading the texts of authors in ancient manuferipts, where a diverlity has arifen from the corraption of time, or the ignorance of copyifls. A great part of the bufinefo of eritics lies in fettling the readings by confronting the various readiugs of the feyeral manuferipts, and confidering the agreement of the words and fenfe.

Readinzs are alfo ufed for a fort of commentary or glofs on a law, text, paifage, or the like, to fhow the fenfe an author takes it in, and the application he conceives to be male of it.

RE-AGGRAVATION, in the Romilh ecclefiaftical law, the halt monitory, publifhed after three admonitions, and before the laft excormmication. Before they proceed to fulaninate the laft excommmication, they publifh an aggravation, and a re-argravation. Ferret oLferves, that in Fiance the minifter is not allowed to come to re-aggravation, without the permiffion of the 1.ihop or official, as well as that of the lay judge. See Excommuntcation.

REAL (Crefar Vichard de St), a polite French writer, fon of a counflllor to the fenate of Chamberry i: Savoy. He came yours to France, dittinguifhed himfalf at Paris hy feveral ingenious productions, and refided there a long time without title or dignity, intent upon literary purfiuts. He died at Chamberry in 1602 , advanced ia years, though not in circumftances. Ite wes a man of ereat pats and penctration, a lover of the feiences, and particularly fond of hillory: A complate edition of his works was printed at l'a is, in 3 buls quo, $^{1} 1+5$, and another in 6 vols 12 mo .

Reail Perfence. Sice Transubstantiation.
REAll,iIR. Sce Curmistry, $\mathrm{n}^{\circ} 12: 9$.
REALISTS, a feet of fehool-phitufoplers formed in oppofition to the nominalills. Under the Readils are included the sicurits, Thumifs, and all excepting the followers of Ocham. Their dilk mighinher tenet in, that unicufals ane realitics, and have an actual exifknce out of an illea or imagination; or, as they exprefs it in the felhouls, a parte rei; whereas the nominalifts contend, that they cxif only in the mind, and are ouly idcals, or manners of conceiving things. I) OLo, or Oudard, a native of Otcans, afterwards a libot of St Martin de Tournay, was the chicf of the fict of the realith. He wrote three books of dialec1ics, where, on the principles of Boethins and the ancents, he maintained that the objeject of that art is thin_s, not words; whence the feet took its rife and name.

REALITY, in the felools, a diminutive of res, "thine," firlt ufed by the Scotifs, to denote a thing which naly exir of itfelf; or which has a full and abf(ulie being of iifelf, and is not confidered as a part of a.ay char.

REALM, a country which gives its head or governor the demomination of a king.

RE-ASIMATION means the reviving or refloring io lif tho who are apparcotly dead. Surden death is
drcaded by every human being, and it is one of thofe evils againtt which the Church of England pmys in her Litany. Accidents, however, cannot always be prevented; but, after they have happened, it is often poffible to prevent their eficets. This, by the eftablinhnent of what with great propricty has been called the $H u$ mane Sxciely, has been abundantly proved: for, in the courfe of 12 years immediatcly iffer their inftitution, they were the meaus of faving the lives of 850 perfons, who otherwife would in all human probability have been lult to the commanity. Siace that period, they have faved many more; and various perfons, even in the mort dillant paits of the kingdom, by following their directions, have done the fane. 'To preferve one human being from premature death, we muit confider as of the utmant coufequence both as citizens and Chrilians; how much more the preferwation of thonfards. It appears from the writings of Doctors Mead, Winfow, Bruhier, Fothergill, Haller, Lecat, Tinot, Van Engelen, Gunmer, and others, that they had prepared the way for inflitutions fimilar to the Hunane Socicty: for in their works they have elucidated the principles on which they go, and furnifhed directions for the practice they favour. See Death, Promalure Inffiment, and Drowning.

REAR, a term frequently ufel in compofition, to denote fonething behind, or backwards, in refpect of another; in oppofition to van.

Rear of an Arar, fignifies, in general, the hindermoll part of an army, battalion, regiment, or fquadron; alfo the ground behind either.

RE.tk-Gurrd, is that body of an army which marches after the main-body; for the march of an army is always compofed of an advance-guard, a main-body, and a rcar-guard; the firtt and laft commanded by a general. The old grand-gurds of the canp always form the rear-guard of the army, and are to fee that every thing come fafe to the new camp.
Hifar Half-files, are the three hindmoft ranks of the batalion, when it is dratwn up fix deep.

Reak-Line, of an arny encamped, is always 1200 feet at le:ff from the centre line; both of which rum parillel to the front line, as alfo to the referve.
Redh-Rank, is the laft rank of a batalion, when drawn up, end generslly 16 or 18 feet from the centreline when drawn in open order.

REASON, a feculty or power of the mind, whereby it dillinguilhes good from evil, truth from falfehood. Sue Metaphysics.
REASONING, ratiocination, the excrcife of that faculty of the mind called reafon; or it is an act or operation of the mind, deducing fome unknown propofition from other previons ones that are evident and known. See Logic, Part III.

REIUMUR (Rene Antoinc Ferchault, S:eur de), a perion dillinguifled for his laborious refearches into natural knowledge, was horn at Rochelle in 1683 , of a family belonging to the law: After having finithed his early thedies in the place of his hirth, he began a counle of philofoplyy at Puitiers, and of civil law at Bourges ; but foon relinquified the latter, to apply himelelf, according to his tafle, to mathematics, phytics, and natural hiitury. Being come to Paris, hee was rectived into the Academy of Seciences in 1708 . From that hour he "as wholly employed in natural hiftory, to which his inclination
aunur. clination particularly led him, and his incquines were not confined to any one part of it. His memoirs, his obfervations, his difeoveries on the formation of hells, friders, mufcles, the marine flea, the berry which affords the purple colour, and on the caufe of the numbnels of the torpedo, excited the curiofity of the public, and early procured our author the character of an able, curious, and entertaining naturalift. Filled with zeal for the welfare and advantage of fociety, and the progrefs and perfection of arts, he endeavoured in all his rcfearches to promote the public good. We were indebted to him for the difcovery of the Turquois inines in Lenguedoc. He alfo found out a fubftance, which is uied to give falfe ftoncs a colour, which is obtained See Beton, from a certain fifh called in the French ble or Ablete:* 9.; ard on account of its whitenefs, and which is the Bleak or nmant s Blay of our writerst. His experiments on the art of wary, 1. in. 315. See Cy inus, '9. Sec Por-山in turning iron into tteel obtaincd him a penfion of 12,000 livres; and this reward was be continued to the Academy to fupport the expence which might accrue in this art.

He continued his inquiries on the art of making tin and porcclain $\ddagger$, and endeavoured to render our thermome- ters more ufeful than thofe of former times : he compofed a curious hitory of rivers where gold duft is found in France : and gave fo fimple and eafy a detail of the art of gathering this dult, that perions have been employed for that purpofe.

He alfo made curious and important obfervations on the nature of flints, on the banks of foffil fhells, from whence is obtained in Touraine an excellent manure for land; as likewife on birds and their prefervation, on their method of building nefts; on infects; and a great number of other fubjects, not lefs curious than ufeful.

He imagined at firft, that a certain varnifh would keep egrs frefh; but the wafte of time and money, \&ce. frowed him the inconveniences of fuch a procefs. He afterwards adopted the method practifed for time immemorial in Greece and the iflands of the Archipelago, which is to feep or immerfe eggs in oil, or melted fat ; by this means, not being expoled to the air or to froft, they are well preferved, and contract no bad fmell. Another experiment ftill more important, made by onr author, was to introduce into France the art of hatching fowl and birds, as practifed in Egypt, without covering the eggs. Active, fedulous, and attentive, he was early in his fudy, often at fix in the morning. Exact in his experiments and ohfervations, he let no circumilance efcape him. His writings muft be of great ufe to future philofophers. In fociety, he was diftinguifhed through life for his modeft and agreeable behaviour. His probity, benevolence, goodnefs of heart, and other amiable qualities, as well natural as acquired, endeared him to his countrymen. He died in the 7 bth year of his age, on the 18 th of October 1757 , and left this world filled with fentiments of piety. His death was the confequence of a fall, which happened at the caftle of Barnardiere on the Mainc, where he went to pafs his racation. He bequeathed to the Academy of Sciences his manufcripts and all his natural productions. His works are, I. A very great number of memoirs and obfervations on diffcrent parts of natural hiftory; they are printed in the collections of the Academy of Sciences. 2. A large work printed feparately in 6 vols in 4 to, insitled, A Natural Hifory of Infects. This important
work contains a defcription of vaft numbers of caterpil- Reaumur lers, moths, gall infects, flies with two and four wings, Rebel'ior. lady-birds, and thofe ephemeron fiics which live only in that form a few hours; and latly, of thone fagular and wonderful infeets which are called folypes, which being cut into [everal pieces, each picce lives, grows, and becomes an infect, and affords to our eycs a great number of p:odigies*. The works of M. de Reammar are exact, * see Pos curions, intereting, and very ingenious. They are written with much candour, clearnefs, and elegance; b:at it mult be ackowledged his manner is fomewhat too diffufe. But we mult not deceive the reader ; he olten raifes our expectations, and docs not give us all the fatisfaction we promife ourfelves from his writings. His method of raifing poultry, in particular, rather difappoints us. He fpared neither care, time, nor expencis, to render it practicable : he flattered himielf and his countrymen with the greatef hopes; but notwithtanding his affiduous indultry, and vaft charges, it proved ahortive. The late M. l'Advocat recommended him to obtain better information from Egypt on the fubject ; and if poffible to procure a perfon verfed in the ait to inftruct him in it ; but his death prevented the comple. tion of the fchemc. If the native of Egypt had ar. rived, fhowed M. de Reaumur a better method than his own, and practifed it with fuccefs, as in his country, the community would have been benefited; on the other hand he wonld have feen, had it failed, that the climate of France was not proper for fuch experiments M. Maillet, conful at Cairo, to whons Nonficur the regent had written to'obtain the art, offered to fend over a native of Egypt, if the government would pay the expence of his royage, and allow him a penfion of 1 j00 livres. M. Maillst rightly judged, when he preferred this method ot proceeding. M. de Reaumur was not ignoraat of the defign ; but he flattered himfelf, that his cfforts would be fuccefsful withont further aid, and thought he fhonld acquire fome honour. . He certanly had great talents, induftry, fagacity, and every other requifite which are neceffary in fuch attempts; but it is morally impofible that a fingle man, in a different climate, can attain fuch knowledge in an art as thofe who live in a mose favourable country, and hare had the experience of many ages to profit by: however M. de Reaumur may have been unfuccefsful, pofterity is indebted to him for his repeated trials. He has removed fome difficultics in the road, and thofe that travel it may difcover what he only faw at a diftance.

REAUMURIA, in botany : A genus of the pentagynia order, belonging to the pentandria clais of plants; and in the natural method ranking under the ${ }^{1} 3^{\text {th }}$ order, Succulenta. The calyx is hexaphyllous, and there are five petals; the capfule is unilocular, quinquevalved, and polyfpermous.

REBATE, or Rebatrment, in commerce, a term much ufed at Amfterdam for an abatement in the price of feveral commodities, when the buyer, inftead of taking times advances ready money.

Rebatement, in heraldry, a diminution or abatement, of the bearings in a coat of arms. See Abate. MENT.

REBELIION, Rebelio, among the Romans, was where thofe who had been formerly overcome in batthe and yielled to their fubjection, made a fecond refittance: but with us it is generally ufed for the taking D. 2

## R E B

## R E C

Rebeilinus up of arms traiteroully againt the king, whether by naII tural fubjects, or others when once fubdued; and the word rebel is fometimes applied to him who wilfully breaks a law ; alfo to a villein difobeying his lord.

There is a difference between enemics and rebels. Fincmics are thofe who are out of the king's allegiance: therefore fubjects of the king, cither in open war, of rebellion, are unt the king's cnemies, but traitors. And 1) avid P'rinee of Wrales, who levied nar againlt Edw. I. becaule he was within the allegiance of the king, had fentence pronounced again! him as a traitor and rebel. Private perfons may arm themfelves to fupprefs rebeli, enemics, \&e.

REBELLIOUS ASSEMRLY is a gathering together of timelve perfons or more, intending or going ahout to practife or pat in ufe unlawfully, of their own auhority, any thing to change the law or flatutes of the realm; or to deltroy the inclofures of any ground, ni banks of any fill-pond, pool, or conduit, to the inent the fance thall lie wate and void; or to detitroy the deer in any park, or any warren of conics, dove-houfes, or $6 \mathrm{f}_{1}$ in ponds ; or any houfe, barns, mills, or bays; or to burn lacks of corn ; or abate rents, or prices of victuals, \&c.

REBUS, an er.igmatical reprefentation of fome name, \& © by ufing figures or pictures inftead of words, or parts of words. Camden mentions an inftance of this abfurd kind of wit in a gallant who expreffed his love to a woman named Rofe Hill, by painting in the borther of his gown a rofe, a hill, anl eye, a loaf, and a well ; shich, in the thyle of the rebus, reads, "Rofe Hill I leve wed." Truis hind of wit was long practifed by the sitat, who tonk the pains to find devices for their names. It iwas, luwever, happily ridiculed by Ben Jhane:. is the humorous defeription of Abel Drugger"s duvie in the Alehenilt; by the Spectator, in the device of Jack of Newberry; at which time the rebus, being raifed to fign-polts, was grown out of fallion at conart.

Rebus is alfo uled by the chemical writers fometimes $t$ ') lignify four nilk, and furncsimes for what they call the uitimate matter of which all bodies are compofel.

Rfoes, in heraidry, a cuat of arms which bears an ath: hion to the name of the perfon; as three caftles, for Calleton ; three cups, for Butler; three conies, for Conisby; a kind of bearings which are of great anti${ }^{2}$ uity.

REBUTTER (from the Fr. bonter, i. e. repellere, to) put back or bar), is the anfwer of defendant to plaintiff's furrejoinder; and plaintiff's anfwer to the rebutter is called a furrebufter: but it is very rare the parties go to lar in pleading.

Rebutter is alfo where a man by deed or fine grants t.) warranty any land or hereditament to another; and the perfon making the warranty, or his heir, fues him to whom the warranty is made, or his heir or affignee, for the fame thing; if he who is fo fued plead the deed or fine with warranty, and pray judgment, if the plain. tiff thall be received to demand the thing which he ought to warrast to the party againt the warranty in the deed, ic. this is called a rebutter. And if I grant to a tenant to hold without impeacbinent of walte, and after. wards implead him for wafte done, he may debar me of this ation by thewing my grant, which is a rebutter.

RECAPITULATION, is a fummary, or a con-Recap:tuh cife and tranfient enumeration of the principal things infilted on in the preceding difcourfe, whereby the force of the whole is collected into one view. See Orators; Recijrocal a 37 and 127.

RECEIPT, or Receit, in commerce, an acquittance, or difcharge, in writing, intimating that the party has received a certain fum of money, either in full for the whole debt, or in part, or on account.

RECEIVER, in pneumatics, a glais veffel for containing the thing on which an experiment in the airpump is to be made.

Receirer, rece/for or recepator, in law, is commonly underfood in a bad fenfe, and ufed for fuch as knowingly receive tholen goods from thieres, and conceal them. This crime is felony, and the punifment is tranfporta. tion for 14 years.

RECENSIO was an account taken by the cenfors, every luftrum, of all the Roman people. It was a geseral finvey, at which.the equites, as well as the redl of the poople, were to appear. New names were now put upon the cenfor's litt, and old ones cancelted. The recenfio, in thort, was a more folemn and accurate furt of probatio, and anfwered the purpofe of a review, by fhuwing who were fit for military fervice.

RECEPTACULUM, in botany, nne of the feven paits of fructification, defined by Linnæus to be the bafe which connects or fupports the other paits.

Receptaculum Cliyli, or Pecquet's Refervatory, the refurvoir or receptacle for the chyle, fituated in the left fide of the upper vertebra of the loins, under the aurta and the veffels of the left kidney.

RECHABITES, a kind of religious order among• the ancient Jews, inllituted by Jonadab the fon of Rechab, comprebending only his own family and potterity. 'hicir founder preferibed them three things: firll, not to drink any wine; fecondly, not to build any houfes, but to dwell in tents; and thirdly, not to fow any corn, or plant vines.
'The Rechal ites obferved thefe rules with great ftrictners, as appears fron Jcr. xxxv. 6, Sic. Whance St Juone, in his 13 th epille to Paulinus, calls them monachi, monks. Jonadab, their founder, lived under Jehoath, king of Judah, contemporary with Jchn king of Ifracl; his father Rechab, from whom his pullerity were denominated, defcended from Raguel or Jethro, father-inLaw to Mofes, who was a Kenite, or of the race of Ken: whence Kenite and Rechabite are uled as fynonymons in Scripture.

RECHEAT, in hunting, a leffon which the huntfman plays on the hom, when the hounds have bit their game, to call them back from purfuing a connter feent.

RECIPE, in medicine, a prefcription, or remedy, to be taken by a patient: fo called becaufe always beginning with the word recife, i. e. take; which is generally denoted by the abhreviature Ro.

RECIPROCAL, in general, fomething that is mutual, or which is returned equally on both fides, or that affects both parties alike.

Reciprocal Terms, among logicians, are thofe whic! have the fame fignification; and confequently are convertible, or may be ufed for each other.

Recifrocal, in mathematics, is applied to qqanti-

## $R$ E C

jipreas ties which multiplied together prodace unity. Thus eclud eclure. $\frac{1}{x}$ and $x, y$ and $\frac{1}{y}$ are reciprocal quantities. Likewife $\frac{1}{x}$ is faid to be the reciprocal of $x$, which is again the reciprocal of $\frac{1}{x}$.
Rectizzocal Figures, in geometry, thofe which have the antecedents and confequents of the fame ratio in both figures.

Reciprocal Profortion, is when in four numbers the fourth is lefs than the fecond by fo much as the third is greater than the firl, and vice veffa. See Proportions and $A_{\text {rithmetic, clap. vi. Great ufe is made of this }}$ reciprocal proportion by Sir Ifrac Newtou and others, in demonffrating the laws of motion.
RECTCAL, in law, means the rehearfal or making mention in a deed or writing of fomething which has been done before.
recitativo, or Recitative, in mufic, a kind of finging, that differs but little from ordinary promunciation; fuch as that in which the feveral parts of the liturgy are rehearfed in cathedrals; or that wherein the acturs commonly deliver themfelves on the theatre at the opera, when they are to exprefs fome action or paffion; to relate fome event ; or reveal fome defign.

RECKENHAUSEN, a Arong town of Cologne, in Germany, in the middle territory of that name. The abbefs of its numnery has power of punifhing offenders with death, and fhe alune is obliged to the vow of char. tity.

RECKONING, or a Sbip's Rfckoning, in navigation, is that account whereby at any time it may be known where the thip is, and on what courfe or courfes the is to tleer, in order to gain her port; and that account taken from the leg-board is called the dead reckon. ing. See Navigation.

RECLAIMING, or Reclaming, in out anciert cuttoms, a lord's purfuing, profecuting, and recalling, his vaffal, whio had gone to live in another place without his permifinon.

Reclainizg is alfo ufed for the demanding of a perfon, or thing, to be delivered up to the prince or Hate to which it properly belongs; when, by any irregular means, it is cone :hen another's poffeffion.

Reclaming, in falconry, is taming a hawk, sc.and making her ge:tle and familiar.

A partridre is faid to reclaim, when fie calls her young ones together, upon their fcattering tuo much from her.

RECLINATION of a plane in dialling. See Diallisg.
RECLUSE, among the Papits, a perfon thut up in a fmall cell of an hermitage, or monattery, and cut off, not only from all converfation with the world, but even with the houfe. This is a kind of voluntary imprifonment, from a motive either of derotion or penance.

The word is alfo applied to incontinent wives, whom their hufbands procure to be thus kept in perpetual imprifonment in fome religious houfe.
Reclufes were anciently very numerous, They took an oath never to fir out of their retreat : and having entered it, the bifhop fet his feal upon the door ; and the reclufe was to have every thing neceffary for the fupport of life conveyed to kim through a window, If
he was a prief, he was allowed a fmall oratery, with a Recogriwindow, which looked into the church, through which he might make his offerings at the mafs, hear the finging, and anfwer thofe who fpoke to him ; but this window had curtains before it, fo that he could not be feen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbis, and breathe a little freh air. It he had difciples, their cellis were contiguous to his, with only a window of communication, thro' which they conveyed neceffaries to him, and received his infructions. If a reclufe fell fick, his door might be opencd for perfons to come in and affift him, but he himfelf was not to fir out.

RECOGNITION, in law, an acknowledgment ; a wore particularly ufed in our law-books for the fint chapter of the flatute I Jac. I. by which the parliament acknowledzed, that, after the death of queer Elifabeth, the crown had rightfully defcended to king Janies.
RECOGNIZANCE, in law, is an obligation of record, which a man enters into before fome court of record or magiftrate duly authorifed, with condition to do fome particular act ; as to appear at the affizes, to keep the peave, to pay a debt, or the like. It is in moit refpects like another bond: the difference being chiefly this, that the bond is the creation of a fref debt or obligation de novo, the recognizance is an acknowledgment of a former debt upon record; the form whereof is, " that A. B. doth acknowledge to owe to our lord the king, to the plaintiff, to C. D. or the like, the fum of ten pounds," with condition to be void on performance of the thing ftipulated: in which cafe the king, the plaintiff, C. D. \&c. is called the cognizee, is crii cormfitur ; as he that enters into the recognizance is called the cognizor, is qui cognifcit. This being ccrtified to, or taken by the oficer of fome court, is witneffed only by the record of that court, and not by the party's feal : fo that it is rot in ftrict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of pajoinent, and binding the lands of the cognizor from the tinie of earolment on record.

RECOIL, or Rebouno, the Rarting backward of a fire-arm after an explofion. Merfenus tells us, that a catmon 12 feet in length, weighing $6+00 \mathrm{lb}$. gives a ball of $2+\mathrm{lb}$. an uniform velocity of 640 feet per fecond. Puting, therefore, $\mathrm{W}=640 \mathrm{y}, w=14, \mathrm{~V}=$ 640 , and $v=$ the velocity with which the cannon recoils; we flall have (becaufe the momentums of the cannon and bail are equal) $\mathrm{W} y=w \mathrm{~V}$; and fo $x=\frac{w \mathrm{~V}}{\mathrm{~W}}=$ $\frac{2+\times 6+4}{6+00}=2,4$; that is, it would recoil at the rate of $2 \frac{4}{50}$ feet per fecond, if free to move.

RECOLLECTION, a mode of thinking, whe which ideas fought atter by the mind are found and brought to view.

RECONNOITRE, in military affairs, implies to view and examine the fate of things, in order to make a report thereof.
Parties ordered to recornoitre are to obferve the country and the enemy; to temark the routes, conveniences, and inconveniences of the firlt; the poition, march, or forces of the feconc. In either cate, they mould tive fin expert gengrephier, capable of takirg

Reoes plans readily: he fhould be the hen mounted of the 11 whole, in cate the enemy happen to feater the eicotte, Reonvry; that he may fave his works and idens. See War.

RECORD, an authontic teltimony in witing, contained in rolls of parchment, and preferved in a court of record. Sec Court.

Trial by Rfcorn, a fpecies of trial which is ufed only in one particular inftance: and that is where a natter of record is pleaded in any action, as a line, a judgment, or the like; and the oppolite party plead., nul biel reoord, that there is no fuch matter of rccont exiting. Upon this, iffue is tendered and joined in the following form, " and this he prays may be inguired of by the record, and the other doth the like;" and hereupon the party pleading the record has a day given him to bring it in, and proclamation is made in court for him to "briug forth the recort by him in pleadins alleged, or elfe he fhall be coudemned;" and, on his failure, his antagonit flatl have judrment to vecover. "I'he trial, therefore, of this iflue, is merely by the record: for, as Sir Edward Coke olferves, a rccord or enrolnent is a roumament of fo high a nature, and importeth in itfelf fuch ablolute verity, that if it be pleadcd that there is no fuch record, it thall not receive any trial by witnefs, jury, or otherwife, but only b; itfelt. 'Thus titles of nobility, as whether carl or not eanl, beron or not baron. nall be tried by the king's writ or patent only, which is matter of record. Alfo in cafe of an alien, whether alien friend or enemy, fhall be tried by the lague or treaty loetween his fovercign and ours; for every lague or traty is of record. And alio, whether a manor be held in ancient demefne or not, Ghall be :ried by the record of domefday in the king's exchequer.

RECORDER, a perfon whom the mayor and other magiftrates of a city or corporation affociate to them, for their better direction in matters of juftice and proceedings in law ; on which account this perfon is generally a counfellor, or other perfon well fkilied in the law.

The recorder of L.ondon is chofen by the lord mayor and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and certifies the city-cuftoms. See

## Lovion, $n^{3}$.

RECOVERY, or Common Recoverr, in Englinh law, a [pecies of afturance by matter of record ; concerning the oririnal of which it mult be remarked, that common recoveries were invented by the ecclefiatics to clude the flatutes of mortmain (fee TArt); and afterwards encouraged by the fineffe of the courts of law in 12 Edward IV. in order to put an end to all fettered inheritances, and bar not only eflatesstail, but alfo all remainders and reverfions expectant thereon. We have here, theiefore, only to conlider, firt, the nature of a common recovery; and, fecondly, its force and effect.
Tin: $1 /$.
Commicn:.
ders, and rewarfous, and to convey the lame in fee-fimple, Recoves to Francis Golding. To effect this, Golding is to bring an action agarelt him for the lands; and he accordingly fues out a writ called a precife quod reddat, becaule thefe were its initial or molt operative words when the lawprocecdings were in Latin. In this writ the demandant Golding alleges, that the defendant Edwards (hete called the tenarit) lins no legal title to the land; but that he came into poffeflion of it after one Fugh Hunt had turned the denandant out of it. 'The fubfequent procedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are finf recited: whereupon the tenant appears, and calls upon one Jacob Morland, who is fuppofed, at the original purchafe, to have warranted the titie to the tenaut; and thereupon he prays, that the faid Jacoh Nortand may be called in to detend the title which he fo warranted. This is called the voucher, "vocatio," or calling of Jacob Morland to warranty ; and Morland is called the rouchee. Upon this Jacob Morland, the vouchee, appears, is impleaded, and defends the title. Whereupon Golding the demandant defires leave of the coust to imparl, or confer with the vouchee in private; which is (as ulual) allowed him. And foon afterwards the demandant Golding returns to court ; but Morland the vouchce difappears, or makes default. Whereupon judgment is given for the demandant Golding, now called the recoverer, to recover the lands in quethon againt the tenant Edwards, who is now the recoveree: and Edwards has judgment to recover of Jacob Murland lands of equal value, in recompenfe for the landa fo warranted by him, and now lolt by lis default; which is agrecable to the doctrine of warranty mentioned in the preceding chapter. This is called the recompenfe, or recovery in value. But Jacob Morland having no lands of his own, being ufually the crier of the court, who, from being frequemty thus vouched, is called the common voucliee, it is plain that Edwards has only a nominal recompenfe Eor the lands fo recovered argaintt him by Golding; which lands are now abfolutely vefted in the faid recoverer by judgment of law, and feilin thereof is delivered by the fheriff of the county. So that this cotlulive recovery operates merely in the nature of a conveyance in fee-fimple, from Edwards the tenant in tail to Golding the purchafer.

The recovery here defcribed, is with a fingle voucher only; but fumetimes it is with a double, treble, or farther woucher, as the exigency of the cafe may require. And indeed it is now ufual always to have a recovery with double voucher at the leaft: by firt conveying an eltate of frechold to any indifferent perfon, againf whom the precipe is brought; and then he vonches the tenant in tail, who vouches over the common vouchee. For, if a recovery be had immediately againft tenant in tail, it bars only fuch eftate in the premifes of which he is then actually feifed; whereas if the recovery be had againft another perfon, and the tenant in tail be vouch. ed, it bars cvery latent right and intereft which he may have in the lands recovered. If Edwards therefore be tenant of the frechold in poffeffion, and John Barker be tenant in tail in remainder, here Edwards doth firtt visuch Barker, and then Barker vouches Jacob Moiland the common rouchce; who is always the laft perfon vouched, and always makes default; whereby the demandant Golding recovers the land againg the temant

Edwards value againtt Barker the firtt rouchee; who recovers the like againt Morland the common vouchee, againt whom fuch ideal recovery in value is always utimately awarded.

This fuppofed recompenfe in value is the reafon why the iflue in tail is held to be barred by a common recovery. For, if the recoveree thould obtain a recompenfe in lands from the common vouchee (which there is a pofibility in contemplation of law, though a very improbable one, of his coving), thefe lands would fupply the place of thofe fo recovered from him by collufion, and would defcend to the iffie in tail. The reafon will alfo hold with equal force as to moft remaindermen and reverfoners, to whom the poffibility will remain and revert, as a full recompenfe for the reality which they were otherwife entitled to: but it will not always hold ; and therefore, as Pigott fays, the judges have been even afiti, in inventing other reafons to maintain the authority of recoveries. And, in particular, it hath been faid, that though the eftate-tail is gone from the recoveree; yet it is not defiroyed, but only transferred, and ftill fubfitts; and will ever continue to fubfift (by confruction of lar) in the recoveror, his heirs and affigns : anc as the eftate-tail fo continues to fubbit for ever, the remainders or reverfions expectarit on the determination of fuch eftate-tail can never take place.

To fuch ankward fifts, fuch fubtile refinements, and fuch itrange realoring, were our ancettoss obliged to have recourfe, in order to get the better of that tubborn ftatute de donis. 'The defign for which thefe contrivances were fet on foot, was certainly laudable; the unrivetting the fetters of eftates-tail, which were at. tended with a legion of mifchiefs to the commonwealth: but, while we applaud the end, we catinot but admire the means. Our modern courts of jufice have indeed adopted a more manly way of treating the fubject ; by confidering common recovcrics in no other light than as the formal mode of cmineyance by which tenant in tail is enabled to aliene his lands. But, fince the ill confequerces of fettered inheritances are now generally fern and alowed, and of courfe the utility and expedience of fetting them at liberty are apparent, it hath often been wifhed that the procefs of this contcyance was thortened, and rendered lefs fubject to niesties, by either totally repealing the ftatute de donis; which perhaps, by reviving the old doctrinc of corditional fees, might give birth to many litigations: or by vetting in every tenant in tail, of full acge, the fame abfolute fee-fimpie at once, which now he may obtain whenerer lie pleifts, by the collufive fetion of a common recoviry; though this might poffibly bear hard upon thofe in remainder or reverfion, by abridging the chancus they would otherwife frequently have, as no recovery can be fufiered in the intervals between tein and term, which fometimes continue for near five months together: or, lafly, by empoweing the telant in tail to bar the eftate-tail ly a folemn died, to be made in tern-time, and enrolled in fome court of record; which is liable to neither of the other objections, and is warranted not only by the ufage of our American colonies, but by the precedent of the feture 21 J ac. I. c. 19 which, in the cafe of a bankrupt tenant in tail, cinpowers his commiffoners to fell the eftate at any time, byi deed indented and enrolicd. Aud if, in fo national
a concern, the emoluments of the officers concerned in pafing reoveries are thought to be worthy attention, thofe might be providud for in the fees to be paid upou cach enrollment.
2. The force and effect of common tecoveries may appear, from what has been faid, to be an abfolute bar neot only of all cflates tail, but of remainders and reverfions expectant on the determination of fuch iffates. So that a temant in tail may, by this methou of afitrance, convey the lands held in tail to the recoverer, his heirs and affigns, abfoletely free and difcharged of all conditions and limitations in tail, and of all remainders and reverfions. But, by flatute $34 \& 35 \mathrm{H}$. VIIf. c. $2 c$. no recovery had againft terant in tail of the king's gift, whereof the remainder or reverfion is in the king, thall bar fuch eftate-tail, or the remainder or reverfion of the crown. And by the fatute 11 H . VII. c. 20. no woman, after her hufband's death, fhall fuffer a recovery of lands fettled on her by her hufband, or fettied on her hwfland and her lyy any of his anceftors. And by flatute It Eliz. c. 8. ino terant for life, of any fort, can fuffer a recovery fo as to bind them in remainder or reverfion. For which reafon, if there be tenant for life, with remwinder in tail, and other remaindens over, and the tenant for life is defrons to fuffer a valid recorety, either he, or the temant to the precife by him made, muft vouch the remainder-inan in tail, ctherwife the secovery is void: but if he does vouch fuch remainder-man, and he appeass and vouches the common vouclice, it is then good; for if a man be vouched and appears, and fuffers the recovery to be had, it is as effectual to bar thie eftate-tail as it he himfelf were the recorcree.

In all recoverics, it is neceflary that the recoverec, or tenant to the pracipe, as he is ufually called, be aetuall5 feifed of the freehold, elfe the recovery is void. For all actions to recover the fuifin of lands muf? be brought againt the actual tenant of the freehold, elie the fiuit will lufe its offect ; fince the freehold cannot be recovered of tim who has it not. And, though thefe recoveries are in themfelves fabulous and fectitious, $y: t$ it is neceffary that there be actores fahuto. properly qualified. But the niecty thought by fome modern practitioners to le requifite in conveying the legal freco hold, in order to make a good tenant to the praciipe, is removed by the proviions of the Atate 14 Gco . II. c. zo. which enacts, with a retrofpect and conformity to the ancient rule of lav, that, though the legal freelold be vefted ia leffees, yet thofe who are entitled to. the next ficthold cttate in remainder, or reverfion, may make a good tenant to the tracipe; end that, thouglt the deed or fine which creates fuch tenant be fublequent to the judgment of recovery, yet if it lee in the fane term, the recovery fall he valid in lew: and that though the recovery iticlf co not appear to be entered, or be not regularly entered on record, yet the deed to make a tonant to the pravipe, and declare the ufes of the recovery, fiall after a picfeffion of 20 years be fufficient cridence on behaif of a purchafer for valuable confderation, that fuch recovery was duly fuficuel.

Recorary of purforis drowned, or afparently dead Sce Renimatiox, and the articles there referred io.

RECRLAIIT, Cowardly, Fi ind-latarted; formesly a word very reproachiful. See Meittel.

RECl'I IUDE, in phitofophy, refers either to the act of judging or of willing; and therefore whatever comes under the denomination of rectitule, is either what is tree or what is eood, thefe being the only objects ahout which the mind exereifes its two faculties of jud riny and willing.

Noral rectitude, or uprightncrs, is the choofing and pufving thofe things which the mind, upon due inquiry and attention, clearly perecises to be good; and avoring thole that are cwil. Sice Moxal P'bilofophy.

RECPOR, a tem applied to feveral perfons whofe office are very different: as, 1 . 'The rector of a parifh is a clergyman that has the charge and eure of a parifh, and pofiffes alt the tithes, \&ec. 2. 'Ihe fame name is alfo given to the chicf cleclive officer in feveral forcign miverfitics, particularly in that of laris, and alfo in There of Sicotland. It is alfo applied to the head mafter of large fchouls in Scotland, as in the high fehool of Ediaburgh. 3. Rector is alfonfed in feveral convents Sor the fuperior officer who governs the houle : and the Jefuits yive this name to the fuperiors of fuch of their homice as are either feminarics or colleges.

RECTORY, a parilh-chnrch, parfonage, or fpiritual Living, with ald its rights, tithes, and glebes.

Rectory is alfo fometimes ufed for the rector's manfon or paufonage-houfe.

REC'LUAI, in aratomy, the third and latt of the large intlines or guts. S'e Anatomy, n' 9.3 .

R1:CLUS, in anatomy, a name comnom to feveral pairs of mufles, fo called on account of the itraightnefs of their tibres.

RECUPERATORES, among the Romans, were commifioners appointed to take cognizance of private matters in difpute, between the fubjects of the tate and forcigners, and to take care that the former lad juftice done them. It came at latt to be ufed for commiflioners, to whom the pretur referred the determination of any affair between one fubject and another.

RECURRI:NTS, in matomy, a mame given to feveral large branches of nerves fent out by the par vagum from the upper part of the thorax to the larynx.

RECURVIROS'IRA, in ornithology ; a genus belonging to the order of grallse of Linneus, and that of palmipedes of Pemnant and Latham. The bill is long, futulated, bent back, tharp and flexible at the point. The feet are webbed, and furnifhed with three toes forwards, and a fhort one behind. Mr Lathans notes of this gemns three fpecies, viz. the Avofetta, or the one commonly known, the Americana, and the Alba. This latt, it is probable, has fome alfinity to the Americana. The recurvirollra avofetta is about the lize of a lapwing in body, lout has very long legs. The fubftance of the bill is foft, and almoft membranous at its tip; it is thin, weak, flender, conprefled horizontal$l_{y}$, and incepable of defence or effort. 'Ihefe birds are variegated with black and white, and cluring the winter are frequent on the ealtern fhores of Great Britain. 'They vifit alfo the Severn, and fometimes the pools of Shropthire. They feed on worms and infeets, which they froop ont of the fand with their bills. 'Ihey lay two eggs, white, with a greenifh hue, and large fpots of black ; thefe eggs are about the fize of a pigeon's. 'I"hey are found alfo in various parts of the continent of Europe, in Ruffia, Denmark, and Sweden, but they are not numerous. 'They are alfo found in Siberia, but oftencr about the falt lakes of the Tartarian defert, and about the Cafpian fea. They are found likewife on the coalts of Picardy in France in April and November, and at Qiteans, but rarely. In brceding-time they are very plentiful on the coafts of Bas Poictou. They do not appear to wander farther fouth in Europe than Italy. Whether from timidity or addrefs, the arofet thuns furres, and is not eafily taken. The Amorican avofet is rather larger and longer than the laft. The bill is funilar, and its colour black: the forehcad is dully white: the head, neck, and upper part of the breaft, are of a decp crean-colour : the lower parts of the ueck behind white: the back is black, and the muder parts from the breaft pure white: the wings are partly black, partly white, and partly afb-coloured. Thefe hirds inlabit North America, and were found by Dampier in Shark's Bay, on the coaft of New Holland. See Plate CCCCXXXV.

The recurviroftra, or fcolopax alha, is aloout 14 inches and a quater long, its colour white, the inferior coverts of its wings cunkifn, its bill orange, its legs bromn. Edwards remarks, that the bill of this bird is bent upwards, as in the avolet ; its bill black at the tip, and orange the rett of its length; all the plumage is white, except

## R E D

culants, except a tint of yellowifh on the great quills of the wlitenefs is produced by the cold climate of Hudfon's Day, from which he received it, and that they refume their brown feathers during the fummer. It appears that feveral fpecies of this bird have fpread further into America, and have even reached the fouthern provinces: for Sloane found our third fpecies in Janaica; and Fernandez fcems to irdicate two of them in New Spain, by the names chiquatitotl and elototasl; the former being like our woodeock, and the latter lodging under the talks of maize.

A bird of this kind, Mr Latham fays, was fent from Hudfon's Bay, and from the figure, has every appearance of an avofet : however, in Edwards's plate, the toes appear cloven to the bottom; a circumflance feeming to overturn the fuppolition, and only to be authenticated when other fpecimens fhall have come under the eye of the well- informed naturalit.

RECUSANT'S, fuch perfons as acknowledge the pope to be the fupreme head of the church, and refufe to acknowledge the king's fupremacy; who are hence called Popifl recufants. The penal laws againt Papits are now abolifhed in Britain and in Ireland; and in all probability they will quickly be allowed the ampleft privileges.

RED, one of the colours called fimple or primary: being one of the fhades into wbich the light naturally divides itfelfwhen refracted through a prifm. See Caromatics.
$R_{E D}$, in dyeing, fee that article.-Some reckon fix kinds or cafts of red, viz. fcarlet-red, crimfon-red, mad-der-red, half-grain red, lively orange-red, and fcarlet of cochineal: but it is eafy to fee that there can be but one proper fpecies of red; namely, the reflection of the light exactly in fuch a manner as it is refracted by the prifm ; all other fhades being adulterations of that pure colour, with yellow, brown, \&c.

Red, in heraldry. See Gules.
Red-Bird. See Muscicapa, $n^{3} 7$.

$R_{E D-B o o k}$ of the exchequer, an ancient record or manufeript volume, in the keeping of the king's remembrancer, containing divers mifcellany treatifes relating to the times before the conquef.

Reo-Lead. See Chemistry, n 1213.
RED Precipitate of Mercury. See Chemistry, $n^{\circ}$ 764.
$R_{E D-R u f i a, ~ o r ~ L i t t l e ~ R u f f a, ~ a ~ p r o v i n c e ~ o f ~ P o l a n d, ~}^{\text {, }}$ bounded on the weit by Upper Poland, on the north by Lithuania, on the eaft by the country of the Little Tartars, and on the fouth by Moldavia, Tranfylvania, and a part of Hungary. It comprehends Ruffia properly fo called, Volhinia, and Podolia. It is about 650 miles in length, and from 150 to 250 in breadth. It confifts chiefly of large fields, but little cultivated on account of the frequent inroads of the Tartars, and becaufe there is no water-carriage. It had the name of Red Ruffia, from the colour of the hair of its inhabitants. Ruffia, properly fo called, comprehends the three palatinates of Leopol or Lemburs, Belfko, and Chelm.

ReD. Sea, or Arabic Gulph, fo much celebrated in fa. cred hiftory, feparates Arabia from Upper Ethiopia and part of Egypt. This fea is $35^{\circ}$ l leagues in length Vol. XVI. Part I.

## R E D

and 40 in breadth. As no river falls into it of fuffo- Red Se3., cient force to counteract the influence of the tide, it is more affected by the motions of the great ocean than any of the inland feas nearly in the fame latitude. It is not much expofed to tempefts: the winds ufually blow from north to fouth, and being periodical, like the monfoons of India, invariably determine the feafor of failing into or out of this fea. It is divided into two gulphs ; that to the eaft was called the Elaritic gulph, from the city Elana at the north end of it; and that to the weit the Heroopolitic, from the city of Heroopolis ; the former of which belongs to Arabia, and the latter to Egypt.
Mr Bruce has nade many obfervations on this fea, which are worthy of notice. With regard to the name, he fays it was certainly derived from Edom or Efars the fon of Jacob; though in another place he fays, he wonders that writers have not rather fuppofed it to have got the epithet of Red, from the colour of the fand on its coafts, than for other reafons they have al. leged. With regard to any rednefs in the water itfelf, or in the bottom, which fome have afferted, our traveller affures us that there is no fuch thing. It is more difficult to affign a reafon for the Hebrew name of it, which lignifies the Sea of Weeds; as he never faw a weed throughout the whole extent of it. "Indeed, (fays he) upon the flighteft confideration, it will occur to any one, that a narrow gulph, under the immediate influcnce of the monfoons, blowing from contrary points fix months each year, would have too much agitation to produce fuch vegetables, feldom found but in flagnant waters, and feldom, if evcr, found in falt ones. My opinion then is, that it is from the large trees or plants of white coral, fpread everywhere over the bottom of the Red Sea, perfectly in imitation of plants on land, that the fea lias obtained this name- I faw one of thefe, which, from a root nearly central, threw out ramifications of an almoft circular form, meafuring 26 fect every way."
Our author has alfo made many ufeful oberervations on the navigation of this fea. "All the weftern fhore (he fays) is bold, and lias more depth of water than the eatt; but on this fide there is neither anchoring pround nor fhoals. It is rocky, with a confiderable depth of water everywhere; and there are a number of funken rocks, which, though not vifible, are fufficiently near the furface to deftroy a large flip." The caufe of this, in Mr Bruce's opinion, is, that the mountains on the fide of Abyffinia and Egypt are all of hard ftone, porphyry, many different kinds of marble, granite, alabafter, and bafaltes. Thefe being all compofed of folid materials, therefore, can part with very little dult or fand, which might otherwife be blown from them into the fea. On the oppofite coaft, viz. that of He. jaz and Tahamah, on the Arabian fide, the whole con. lifts of moving fands; a large quantity of which is blown from the fouth-ealt by the dry winter monfoons; which being lodged among the rocks on that fide, and confined there by the north-catt or fummer monfoon, which is in a contrary direction, linders them from co. ming over to the Egyptian fidc. Hence the weftern coatt is full of funk rocks for want of fand to cover them, with which they would otherwife become iflands. They are naked and bare all round, with fharp points like fpears ; while, on the eal-fide, every rock becomes

## R E D | 37 1 R E D

Red jes. an ifland, and every two or three iflands become an - habour. On the ends of the principal of thefe harbours the people have piled up great heaps of ftones t.) ferve aq lignals: "and it is in thefe (fays Mr Bruce) that the large veffels from Cairo to Jidda, equal in fize to our laree it gun-hips (but from the cifterns of ma-fon-work built within for holding water, I Cuppofe double :heir weight), after navigating their portion of the channel in the day-tince, come fafely and quietly to at four o'clock in the afternoon ; and in thefe little harbours pafs the night, to fail into the clauncl again next morning."

The weftern channel of the Red Sea was chofen, in the days of the Ptolemies, for the track of the Indian atud African. Thefe monarchs crected a great number of cities all alony the weftern coall ; and notwithtanding the danzers of the navigation, we do not hear that it was ever abandoned on account of them.

From the oblervations made by our auchor on the navigation of the Red Sea, he undertakes to point out a fafe palfage for large mips to the gulph of Suez, fo that they may be able to judge of the propriety of their own coirfe themfelves, without tru:ling inplicitly to the pilots they meet with, who are often very ignorant of their profefion. This fea, according to Mr Bruce, may be divided into four parts, of which the channel accupies two, till near the latitude of $26^{2}$, or that of Colair. On the welt it is deep water, with many rocks; and on the ealt it is full of iflands, as has been already mentioned. Between thefe illands there are chanmels and harbours of deep water, where fhips may he protected in any wind; but a pilot is neceiflary in failing among thefe from Mucka to Suer, and the voyuce betides can be continued only during part of the iay. Ships bound to Suez without the confent of the theriffe of Mecca, that is, without any intention of felling their cargo at Jidda, or paying cuftom there, ought to take in their frefh water at Mocha; or if there be any reafon againtt this, a few hours will earry them to Azab or Sala on the AbyGinian coal, where they may be plentifully fupplied: but it mult be remembered, "that the pecple here are Galla, the moft treacherous and villanous wretches on carth." Here not only water may be procured, but plenty of heep, goats, with fone myrrh, and incenfe in the proper feafon. Great caution, however, mull be ufed in dealing with the people, as eveln thofe of Mocha, who are abfolutcly neceffary to them in their co:nmercial dealings, eannot truil them without furety or hoflages. Not many ycars ago, the furgeon and inate of the Elyin Eaft Indiasian, with feveral other fajors, were murdered by thefe livages as they went afhore to purchafe myrrl, though they liad a letter of fafe conduct from the fackl.

To fuch as do not want to be known, our author recommends a low black ifland on the coalt of A rabia, named Commerun, in latitude $15^{\circ} 30^{\prime}$. It is diftinguifhcul by a wh:te lioufe or fortrel's on the wett end of it ; where water is to be had in fill greater plenty than at Azab ; but no provifions, or fuch only as art very bad, can be procured. If it is neceflary not to be feen at all on the coart, the ifland of Foofht is recommended by our author as laving excellent water, with a faint or monk, whofe office is to keep the wells clean. This is one of the chain of iflands which ftretches almoft acrofs the gulph from Loheia to Mafuah, and nom ac-
tual obfervation by Mr Bruce, is found to be fituated Red Sc: in N. L, at. $15^{\prime} 59^{\circ} 43^{\prime \prime}$. E. Long. $42^{\circ} 47^{\circ}$. From this to Yambo there is a fafe watering-place ; and there is an abfolute neceffity for having a pilot before you come to Ras Mahomet ; becaufe, over the Elanitic gulph, the mountains of Aucha, and the Cape itfelf, there is often a thick haze which lafts for many days together, and a number of fhips are loft by miftaking the eaftern bay or Nlanitic gulph for the entrance of the gulph of Suez; the former has a ridge of rocks nearly acrofs it. After reaching Sheduan, a large ifland, about three leagues farther in a north by weit direction, there is a bare rock diflinguithed lyy no particular name; but fo fitwated that hips ought not to come within three leagnes of it. This rock is to be left to the weftward at the diftance juft mentioned; after paffing which you meet with fhoals forming a pretty broad channel, with foundings from 15 to 30 fathonss; and again, on ftanding directly for Tor, there are two other oval fands with funk rocks in the channel, between which you are to fteer. Tor may be known at a diftance by two hills that fland near the water fide; which, in elear weather, may be feen fix leazucs off. Juft to the foutlıea! of thefe is the town and harbour, whene there are fome palm-trees about the houfes, the more remarkable, as being the firf that are fien on the coall. The foundings in the way to Tor harbour are clean and regular; "and, by giving the beacon a fmall birth on the larboard hand, you may hanl in a little to the morthward, and anchor in five or fis fashom." In fpring-tides, it is high water at Tor nearly about 12 o'clock: in the middle of the gulph there is no perceptible tide, but at the fides it runs at the rate of more than two knots in the hour. Tor itSelf is but a fmall villace, with a convent of monks belonging to thofe of Mount Sinai. It was taken by Don Joln ale Catro, and fortified foon after its difeovery by the Porturuefe; but has never fince been a place of any confideration; ferving now only for a watering place to the hips trading to or from Suez. From this place there is a diftinct view of mounts Horeb and Sinai, which appear above and behind the others, with their tops frequently covered with fnow in the winter.

Mr Bruce next proceeds to confider fome queftions which may be reckoned matters of curiofity rather than any thing elfe. One of thefe is concerning the level of the water of this fea itfelf, which has been fuppofed feveral feet above that of the Mediterranean. " Гo this (fays our author) I anfwer, that the fact has been fuppofed to be fo by antiquity, and alleged as a renfon why $l^{2}$ tolemy's canal was made from the bottom of the Heroopolitic gulph rather than brought due north acrofs the ithmus of Suez ; in whie! laft cale it was feared it would fubmerge a great part of Afia Minor. But who has ever attempted to verify this by experiment ? or who is capable of fettling the difference of levels, amounting, as fuppofed, to fonse feet and inches, between two points 120 miles diftant from each other, over a defert that has no fetcled furface, but is changing its beight every day? Befides, fince all feas are in fact but one, what is it that hinders the Indian ocean to flow to its level? What is it that keeps the Indian ocean up? 'I'ill this lall branch of the queftion is refolved, I fhall take is for granted that no fuch difference
od $S_{e} 3$ of level exifts, whatever Ptolemy's engineers might have pretended to lim; becaufe, to fuppofe it fact, is to fuppofe the violation of one very material law of nature."

The next thing confidered by our autlor is the paffage of the Ifraclites through the Red Sea. At the place where he fuppofes the paffage to have been, the fea is not quite four leagues broad, fo that it might eafily have been croffed in one night without any miracle. There is about 14 fathom water in the channel, and 9 at the lides, with good anchorage everywhere; the fartheit fide is a low fandy coait, and a very eafy landing place. "The draught of the bottom of the gulph (fays he) given by Dr Pococke, is very erroneous in every part of it. It was propofed to Mr Niebuhr, when in Egypt, to inquire upon the fpot, whether there were not fome ridges of rocks where the water was fhallow, fo that an army at particular times might pafs over? Secondly, whether the Etelian winds, which blow Atrongly all fummer from the north-weft, could nut blow fo violently asainht the fea. as to keep it back on a heap, fo that the Ifraelites might have paffed without a miracle? And a copy of thefe queries was left for me to join my inquiries likewife. But I mult confefs, bowever leamed the gentlemen were who propoled thefe doubts, I did not think they merited any attention to folve them. If the Etefian winds, blowing from the north-weft in funmer, could heap up the fea as a wall on the right or to the fouth, of 50 feet hizh, ftill the difficulty would remain of building the wall on the left hand or to the north. Befides, water flanding in that polition for a day, mult have loft the nature of a Auid. Whenee came that cohefion of partieles that hindered that wall to efcape at the fides? This is as great a miracle as that of Mofes. If the Etefian winds had done this once, they mult bave repeated it many a time before and fince, from the fame caufes. Yet Diodorus Siculus fays, the Troglodytes, the indigen is inhabitants of that very fpot, had a tradition from father to fon, from their very earlieft and remoteft ages, that once this divifion of the fea did happen there; and that, after leaving the bottom fome time dry, the fea agaia came back and covered it with great fury. The words of this author are of the moft remarkable kind. We cannot think this heathen is writing in favour of revelation. He knew not Mofes, nor fays a word about Pharaoh and his hoft; but records the miracle of the divifion of the fea in words nearly as ftrong as thofe of Mofes, from the motths of unbiaffed undefigning pagans."

RFD-Shank, in ornithology. See Scolopax.
Reo-Start, a fpecies of Motacilla.
Rfd-Wing. See Turdus.
REDANS, in field fortification. See the article Redens.

REDDENDUM, in law, is ufed fubtantively for the claufe in a leafe wherein the rent is referved to the leffur. The proper place for it is next after the limitation of eftate.

REDDI ГIO, was the third part of the facriñee of the beathens, and confifted of the folemn act of putting in again the entrails of the victims, after they had been religioufly infpected. See Sacrifice.

REDDLE, a foft, heavy, red marle, of great ufe in colouring; and being wafhed and freed from fand,
is often fold by our druggitas under the name of bole Redemp. armenic.
REDEMPTION, in law, a faculty or right of re-Refuction. entering upon lands, \&c. that have been fold and affigned, upon reimburfing the purcbafe-money with le. gal cofts.

Redemption, in theology, denotes the recovery of mankind from tin and death, by the obedietice and faerifice of Chrift, who on this account is calied the $R_{c^{-}}$ deemer of the world. See Theology:

Redens, Redans, or Redunt, in fortification, a kind of work indented in form of the teeth of a faw; with faliant and re-entering angles; to the end that one part may flank or defend another. It is likewife cailed facw-surk' and indented cwork. The lines or faces in this flank ore another.

Redens are ufed in fortifying walls, where it is not neceffary $t o$ be at the expence of building baftions; as when they ftand on the fide of a river runnin5 through a garifion town, a marfh, the fea, Sic. But the fault of fuch fortification is, that the befiegers from one battery may ruin both the fides of the tenaille or front of a place, and make an afflault without fear of being enfiladed, fince the defences are mined. The paraptt of the corridor is likewifc often redented or carried on by the way of redens. The redens was ufed before baitions were invented, and fome people think them preferable.

REDI (Francis), an Italian phyfician and polite feholar, was born at Arezzo in '「ufcany in 1626. His ingenuity and learning recommended him to the office of firlt phytician to Ferdinand II. duke of Twicany; and he contributed not a little toward the compiling of the Dictionary of La Crufca. He wrote upon vipers, upon the generation of infects, and compofed a goor deal of poetry. All his writings are in Italia.1; and his language is fo fine and pure, that the authors of th: Dictionary of La Crufea have often cited them as ftan. dards of perfection. He died in 1697.

REDOUBT, in furtification, a fmall fquare furt. without any defence but in front; ufed in trenches, lines of circumvallation, contravallation, and approach : as alfo for the lodgings of corps-de-gard, and to defend paffares.

REDUCTIOI, in the fchools, a manner of bring. ing a term or propofition, which was before oproite to fome other, to be eq rivalent to it.

Reduction, in anithmetic, that rule whereby num. bers of different denominations are brought into one denomination. See Arithmetic.

Reduction of Equations, in algebra, is the clearing them from all fuperfluous quantities, bringing them to their loweft terms, and feparating the known from the unknown, till at length only the unknown quantity is found on one fide, and known ones on the ocher. The reduction of an equation is the la.t part of the refolution of the problem. See Algebra.

Reduction of a figure, deti jn, or draught, is the making a copy thereof, either larger or finaller tha: the original; ftill preferving the form and proportion. The great ufe of the proportional compafies is the reduction of figures, \&c. whence they are called 6 mn? \&fes of reduzion. See the article Compass.

There are various methods of reducing figures, \&e.

Reduation the melt eafy is by means of the pentagraph, or paral-
II Lelogram ; but this hath its defects. Sce the article Pex m$\underbrace{\text { Redurdant. }}$ TAGRAPH.

The beet and moft ufinal methods of reduction are as follow: 1. To reduce a figure, as $\mathrm{ABCDE}\left(\mathrm{n}^{\circ} \mathbf{T}\right)$, into a lefs compals. Abnut the middle of the figure, as 2 , pitch on a point, and from this point draw lines to its foveral angles $\mathrm{A}, \mathrm{B}, \mathrm{C}$, \&ce. then drawing the line a $b$ parallel to $\mathrm{AB}, \ell c$ parallel to BC , \&cc. you will lave the figure $a b c$ de immilar to ABCDE.

If the figure $a b c$ de had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as $\approx \mathrm{D}, \approx \mathrm{C}, \& \mathrm{c}$. and to draw lines, iiz. $\mathrm{DC}, \mathrm{CB}$, \&c. parallel to the fides $d c, c b$, sic.
2. To reduce a figure by the angle of proportion, fuppofe the figure $\mathrm{ABCDE}\left(\mathrm{n}^{3} 2\right.$ 2.) required to be diminithed in the proportion of the line $A B$ to a $b$ ( $\mathrm{n}^{\circ} 3$. ), draw the indefinite line $\mathrm{GH}\left(\mathrm{n}^{\circ} 4\right.$.), and from $G$ to $H$ fet off the line $A B$. On $G$ deferibe the arch HI. Set off the line $a b$ as a chord on HI, and draw GI. 'Then with the angle IGH, you have all the meafures of the figure to be drawn. Thus to lay down the point $c$, take the interval BC , and upon the point $G$ defcribe the arch KL. Alfo on the point $G$ deferibe $M N$; and upon $A$, with the diftance $M N$, deferibe an areh cutting the preceding one in $c$, which will determine the fide $b c$. And after the fame manner are the other fides and angles to be defcribed. The fame procefs will alfo ferve to enlarge the figure.
3. To reduce a figure by a fcale. Meafure all the fides of the figure, as $\operatorname{ABCDE}\left(\mathrm{n}^{\circ}\right.$ 2.) by a feale, and lay down the fame meafures refpectively from a fmaller fcale in the proportion required.
4. To reduce a map, defign, or figure, by fquares. Divide the original into little fquares, and divide a frech paper of the dimentions required into the fame number of fquares, which are to be larger or lefs than the former, as the map is to be enlarged or diminifhed. This Gone in every fquare of the fecond figure, draw what you find in its correfpondent one in the firt.
Reduction, in metallurgy, is the bringing back metalline fubflances which have been changed into feorix or athes, or otherwife divefted of their metallic form, into their natural and original fate of metals again.
 and 320 .

Reduction, in furgery, denotes an operation whereby a diflocated, luxated, or fractured bone, is retlored to its former flate or place.

REDUNDANCY, a fault in difcourfe, confifting in the ufe of a fuperfluity of words. Words perfectly fynonyinous are redundant, and ought to be retrenched.

REDUNDANri, in mufic. What the French call une accord fuperfiue, which we have tranflated a redun. dont chord in the article Music (from D'Alembert), bas by others been rendered a chord extrenely /barp, as in the tranflation of Rameau's Principles of Compofition. Their nature will be beft underftood by a few examples, and an account of the number of tones, $f$ emitones, or lefler intervals, contained in each.

The fecond redundant is compofed of a major tone, and a minor femitone; as from fa to fol fharg. Its proportion is as $6 \pm$ to 75 .

The third redundint confith of two tones and a femitone, as $f a$, la, flarp. Its proportion is as 96 to 125. The fourth redundant is the fame with the tritone.
From thefe examples compared with the fame intervals in their natural ftate, the reader may form a general idea of what is meant by redundant.

REE, Reis, or Res, a little Portuguefe coin. See Moner-Table.
Reed, in botany. See Arundo and Bamboo.
There are two forts of reeds, fays Haffelquilt, growing near the Nile. One of them has fcarce any branches; but is furnifhed with numerous leaves, which are narrow, fmooth, channelled on the upper furface ; and the plant is ahout II feet high. The Egyptians make ropes of the leaves. They lay them in water like hemp, and then make them into good ftrong cables. Thefe, with the bark of the date-tree, form almolt the only cable ufed in the Nitc. The other fort is of great confequence. It is a fmall reed, about two or three fect high, full branched, with fhort, fharp, lancet-haped leavcs. The roots, which are as thick as the ftem, creep and mat themfelves together to a confiderable diftance. This plant feems ufelefs in common life: but to it, continues the learned author, is the very foil of Egypt owing: for the matted roots have flopped the earth which floated in the waters, and thus formed, out of the fea, a country that is liabitable.

## Fire-Reeds. See Fire-Ship.

Reed, a term in the weft of England for the Araw ufed by thatehers, whieh is wheat Itraw finely combed, confifting of ftiff, unbruifed, and unbroken falks of great length, carefully feparated from the firaw ufed for fodder by the threfler, and bound in fheaves or nitches, each of which weighs 28 lb . and are fold from 21 s. to 31 s . per hundred nitches, according to the feafon. This is a great improvement in the art of thatching, as it gives a fnifh to the work which cannot be attained by ftraw, rough and tumbled together, without any feparation of the long and fhort: it alfo is a readier mode of working.
REEF, a term in navigation. When there is a great gale of wind, they commonly roll up part of the fail below, that by this means it may become the narrower, and not draw fo much wind ; which contracting or taking up the fail they call a reef, or reefing the fuil: fo alfo when a top-maft is fprung, as they call it, that is, when it is cracked, or almoft broken in the cap, they cut off the lower piece that was near broken off, and fetting the other part, now mueh thorter, in the ftep again, they call it a rcefed top-maff.

REEL, in the manufactories, a machine ferving for the office of reeling. There are various kinds of reels; fome very fimple, others very complex.

REELING, in the manufactorics, the winding of filk, cutton, or the like, into a $\rrbracket_{\text {iair, }}$ or upon a bution, to prevent its entangling. It is:alfo ufed for the charging or difcharging of liobbins, or quills, to nfe them is the manufacture of different ftuff, as thread, filk, cotton, s.c. Reeling is performed in diferent ways, and on different engines.

REEVING, in the fea-language, the putting a rope through a block: hence to pull a rope out of a block is called unreeving.

RE-EXCHANGE, in commerce, a fecond payment of the price of exchange, or rather the price of

## R E F

dion a new exchange duc upon a bill of exchange that comes to be protcfted, and to be refunded the bearer by the drawer or indorfer.

REFECTION, among ecclefiaftics, a fpare meal or repaft, juft fufficing for the fupport of life: hence the hall in convents, and other communities, where the monks, nuns, \&c. take their refections or meals in common, is called the refealory.

REFERENCE, in writing, \&c. a mark relative to another finilar one in the margin, or at the bottom of the page, where fometling omitted in the text is added, and which is to be inferted either in reading or copying.

REFINING, in general, is the art of purifying a thing; including not only the effaying or refining of metals, but likewife the depuration or clarification of liquors. See Metaliurgy, Part II. Clarification; and Pharmacy.

Gold and filver may be refined by feveral methods, which are all fuunded on the effential properties of thefe metals, and acquire different names according to their kinds. Thus, for inftance, gold having the property which no other metal, not even filver, has of refilling the action of fulphur, of antimeny, of nitrous acid, of marine acid, may be purified by thefe agents from all other metallic fubftances, and confequently may be refined. Thefe operations are diftinguifhed by proper names, as furificution of gold by antimony, parting, concen: Partutrated parting, dry parting *. In a fimilar manner, as filver has the property, which the inmperfect metals have not, of refiting the action of nitre, it may be refined by this falt : but the term refining is chiefly applied to the purification of gold and filver by lead in the cupel.

This is performed by the defluction, vitrification, and Ccorification, of all the extrancous and deftructible metallie fubftances with which they are all allayed.

As none but the perfect metals can refit the combined action of air and fire, withont loling their inflammable principle, and being ehanged into earthy or vitreous matters, incapable of remaining any longer united with fubftances in a metallic Atate, there is then a poffibility of purifying gold and filver from all allay of imperfect metals merely by the action of fire and air; only by keeping them fufed till all the allay be deftroyell : but this purifieation would be very expenfive, from the great confimption of fuel, and would be exceedingly sedious. Silver allayed with copper las been expoled longer than 60 hours to a glafs-houfe fire without being perfectly refined : the reafon of which is, that when a fmall quantity only of imperfect metal remains united with gold or tilver, it is covered and protected from the action of the air, which is neceffary for the combuftion of the imperfeet metals, as of all combuftible matters.

This refining of gold and inver merely by the action of fire, which was the only method anciently known, was very long, difficult, expenfive, and imperfest ; but a much thorter and more advantageous method has been difcovered. This method confifts in adding to the allayed gold and filver a certain quantity of lead, and in expoling afterwards this mixture to the action of the fire. Lead is one of the metals which lofes moft quickly and eafily a fufficient quantity of its inflammable prisciple to ceafe to be in a metalicic tate; but, at the
fame time, this metal has the remarkable property of ReEning:
retaining, notwithatanding the action of the fire, enough of this fame inflammable principle to be very eaflly melted into a vitrified and powerfully vitrifying matter, called litbarge.
'The lead then which is to be added to the gold and filver to be refined, or which happens naturally to be mixed with thefe metals, produces in their refining the following advantages: 1. By increaling the proportion of imperfect metals, it prevents them from being fo well covered and protected by the perfect metals.2. By uniting with thefe imperfect metals, it communicates to them a property it has of lofing very eafily a great part of its inflammable principle. 3. By its virifying and fufing property which it exercifes with all its force upon the calcined and naturally refractory parts of the other metals, it facilitates and accelerates the fufion, the fcorilication, and the feparation of thefe metals. Thefe are the advantages procured by lead in the refining of gold and flver.

The lead, which in this operation is fcorified, and feorifes along with it the imperfect metals, feparates from the metallic mals, with which it is then incapable of remaining united. It floats upon the furface of the melted mafs; becaufe, by lofinig part of its phlogifton, it lofes alfo part of its fpecific gravity, and lafty it vitrilies.

Thefe vitrified and melted matters aceumulating, more and more upon the furface of the metal while the operation advances, would protect this furface from the contact of air which is fo abfolutely neceflary for the fcorifieation of the reft, and would thus ftop the progrefs of the operation, which euuld never be finifhed, if a method had not been contrived for their removal. This removal of the vitrified matter is procured either by the nature of the vefled in which the melted matter is containcd, and which being porous, ablorbs and imbibes the fcoritied matter as falt as it is formed, or by a ehannel cut in the edge of the veffel through which the matter flows out.

The veff $;$ in which the refining is performed is flat and fhallow, that the matter which it contains may prefent to the air the greatef furface poffible. This form refembles that of a cup, and hence it has been called cupel. The furnace ought to be vaulted, that the heat may be applied upon the furface of the metal during the whole time of the operation. Upon this furface a crutt of dark-coloured pellicle is continually forming. In the inftant when all the imperfect metal is deltrojed, and confequently the fcorification ceafes, the furface of the perfect metals is feen, and appears clean and brilliant. This forms a kind of fulsuration or curufcation. By this mark the metal is known to be refined. If the operation be fo conducted that the metal fuftains only the precife degree of heat neceffary to keep it fufed before it be perfectly refuned, we may oblerve that it fixes or becones fulid all at once in the very inflant of the corufeation ; becaufe a greater heat is required to keep filver or gold in fufion when they are pure than when allafed with lead.

The operation of refining may be performed in finall or in large quantities, "pon the fame principles, but only with fone difierences in the management. As the relinng of fmall quantities of perfect metals is performe ed in the fane manner as thele metals a:s cffared, the

## $R$ E F $\left[\begin{array}{lll}3^{8} & ] & R \\ E & F\end{array}\right.$

Refeation eTay being only a very accurate refining, we refer to the to better. But it appears at prefent to have been ${ }^{H}$ article lissar of the Value of Silver.
Reform.
Large quantities of liver are thus purificd, after the operations by which that metal is obtaincel from its ores. 'This filver, being always much allayed, is to be mixed with a fufficient quantity of lead to complete its purification, unlefs laad has beer: added in its firt fufion from the ore, or unlefs it las been extracted from an ore which alfo contains lead; in which latter cafe, it is allaved naturally with a fulficient quantity, or more than fulticient, for the retiming of it.

REFLECTION, the return or progrcflive motion of a movingr beriy, occationed by func obilacle which hinderel it from purfuing its former direction.

Liectalir. Inglrument of Rratherions an inftrument for mealiiring ancles to a very great degree of accuracy. It was invented liy the celebrated aftronomer Mr Tobias Mayer of Cottingen, principally with a view to do away the errors of the divifious of the limb: and has fince been much improved by the Chevalier de Dorda, and M. J. H. de Magellan. This inftrument is particularly applicable to the meafuring of the diftances of the heavenly bedies, and was ufed by the French in their part of the operation for deterieining the differchee of meridians of l'aris and Greenwich. For the deferipzion, rcetification, and ufe of this inftrument, fee the article Navicarion, and Mackay on the Longitude, wh. i. p. ft.

Reflaction of the Reys of Lizht, in catoptrics, is their retura, after approaching fo aear the furface of bralies as to be therel)y repelled or driven backwards. Tor the caufes of refiction, fec Optics, Index at Rays of Light, and Reflection of Light, \&c. For the apprication of the doctrine of reflection to mirrors, fee (iptice, p. 347-349. See alfo Mirror, BurninciGiafs, and Ginfs-Grinding ; and for the coating or foliaking of mirrors, fee the article Foliaqing of Lookingshifles, Se. Sice alfo Tri.e escope.

Reblection is alfo ufed, figuratively, for an operation of the nind, whereby it turns its view backwards as it were upon itielf, and makes itfelf and its own operations the object of its difquifition; an' by contemIJating the manner, order, and laws, which it obferves in perciving ideas, comparing them together, reafoning, \&c. it frames new ideas of the relations difcovered therein. See Metaphysics.

REFLL:X, in painting, mcans thofe places in a picture which are fuppofed to be illuminated by light refleeted 1 uni fome cother body in the fame piece. See l'ant. inc, Fant J. fect. 2. and 5 .

REFI.UX, the backward courfe of water, has the fome meaning as the ebbing. of the fea, and is oppofed to flood, flux, or the flowing of the fea. See 'lides.

REFORM means a change from worfe to better, a reectablifhment or revival of former neglected difcipline, or a currection of abufes therein. The term is much 1:fud in a monaftic fenfe for the reducing an order or congeration of rcligious to the ancient feverity of the twle trom which it had gradually fwerved, or ceen for improvine on the ancient rule and inftitution itfclf, and whluntarily making it more fevere. In this fenfe the order of St Dernard is faid to be only a reform of that of St Benedict. In this country it is applied both to politics and celigion, and may innocently be applied to any uideavours to change an eflablfhment from worfe
chichy made a pretence for deligns which could not fairly or fafcly be avowed.
A) reform in religion and in parliament (fee ParliaMENT) has, we know, been mot loudly called for by men whofe religious notions are immenfely different from whar has been generally reckoned Chriftianity, and whofe defigns, as has been legally proved, went to the overthrow of all civil order. For inhicious purpofes like thefe, the word reform is a good cloak, elpecially if any thing cau be fixed upon, either in the religion or goverment of the ftate, which, with the liclp of exargeration and diflotion, can be reprefented to the weak and unthinking as extremely defective and erroneous.

The general error of thefe men feems to be, that having picked up a fet of fpeculative notions which flatter their own pride and the pride of thofe who liften to them, they will allow nothing to the arguments of their oppoilents or the experience of mankind. They think fo often and fo much upon their ideal reforms, that while they imagine their notions are liberal and externfive, they become contracted beyond imagination; while their judgments, of courfe, are warped with the moit insterate prejudices (iee Prejudice.) They fee, or think they fee, the propriety of their fchemes; but they feldon, perhaps never, reflect, that that may be true in fpeculation or in theory which cannot poffibly be rednced to practice. They will not take the world as it is, and alluw it to profit by the wifdom and experience of ages; but they will reform it according to thofe ideas of right which they have learned from their own fpeculations and airy theories; feldom confidering what may be done, they are determined to do what they think ought to be done. Liberty of confcience, and liberty of action, have been claimed by them as the unaicmable rights of man ; and fo we ourfelves are difpofed to thiuk them : nor have we heard that in this country they have been denied to any man, or fet of men, fo far as has been thought confintent with the fafety of the fate, and that of the other individuals who compofe it. At the fame time, the very fame men hefitate not to blame, with acrimony the molt vioknt, and to the utmolt of their power to rellrain, the actions and opinions of thofe who with equal conviction, often on better grounds, and generally with more modetty, differ from them.

A midit that exceffive ardour, too, with which they propagate their opinions, they forget the extreme danger of withdrawing the attention of that part of the community, who mutt earn their bread by the fweat of their brow, from their proper occupations, to the tempefluous fea of political debate, for which their education and mode of life cannot poffibly have qualified them. It requires but very little penetration, however, to be able to fee, that it can be of no real fervice either to the individuals thenselves, or to the community at large, in whatever light we look upon it. Indeed, to make thofe the judges of the law, and the reformers of the legiflature, who have all their lives been employed in manual labour, is the extreme of folty ; and yet it is what fome men of confiderable abilitics, and trom whom we had reafon to expect better things, have more than once attempted. The effect of fuch a mode of feduction (and it deferves no better name), when it fhall become general, inllead of ferving the purpofes of a real reform, muft be to annihilate all civil order. Diffatisfaction wanderings of fuch men in the labyrinths of politics ; which, for uncultivated minds efpecially, paves the way for every fpecies of vice, and gradually ripens them for any wickednefs, however atrocious. For the truth of thefe remarks, we appeal to the hiftory of mankind from the Creation to the prefent time: and we would feriounly requett the jober fricnds of reform, and many fuch, we doubt not, there are, to reflect, that in the prefent day we have more to fear from licentioufnefs than from defpotifm ; from reform earried to an extreme than from the pretended attempts either of kings or miniters to annihilate our real liberty (fee Retolutiov).

It may alfo be worth their while to confider, that times of public danger are not generally the beft adapted to attempt changes of government ; becaufe what might fatisfy one party would probably be thought ton litte by another, and divifions at fuch a period are moft dangerons. When, therefore, attempts are made for reform which appear to be inconfiftent with the fafety of the ftate, reftrictions muft be uled, which may by fpeeulative men be thourlit fevere and unneceffary, but of which they themfetves are the caufes. Thefe reftrictions too will be patiently fubmitted to by the wifer part of the community, when in more peaceable times they would neither have been thought of nor allowed.

Speculative reafoners may fpeak as much as they will of enlightening the minds of men, and of reforming government by the dictates of a refined and difpaffionate philofophy; but when they come to apply their notions to practice, they will either find their reprefentations little better than empty founds, and therefore ineffectual ; or, as is more generally found to be the cafe, thofe fchemes which in theory appeared to be perfect, will in practice, when combined with the malignant and ambitious paffions of men, lead to ruin and diforder. The firt inflitution of government, except among the Jews, was unqueftionabiy the effect of paffion and intereft combined; and this paffion and this intereft, reftrained within due bounds, is productive of much happinefs. That government, we believe, too, will be belt fupported, and moft productive of happinefs, in which the mutual paffions and interelts of the individuals who compofe it are fo equally poifed as to fupport one another, and to promote each the ends aud fuccefs of the other: and this by the ablefl reafoners and the bell men has been thouglit to be the eafe with the Britifh conftitution. If the modern favourers of reforn frould think this an untabie fupport, if they will eonfuder the world as it ever has been, and as it is, they will find it the only ene we have, except religion ; and they will thence be inclined to make the beth of it. If, after all, however, they fhould be difioned to dimbt the polition, we have only fur:her to requelt them, with the fulucerity of men and of Chillians, to confult their own breatts, and ferion?y to confider the probaile motives of thofe who act with them. They will then perhaps fee, and they furely ought to acknowledge, tiat few men lave acted more according to the impulfe of paffion, intereft, and ambition, than thofe who liave for fome time part fourded the toczin of reform.

REFORMATION, in general, an act of reforming or corseting an error or ainufe in religion, dici.
pline, or the like. By way of eminence the word is ufed for that great alteration and reformation in the corrupted fyftem of Chriftianity, begun by Luther in the year 1517.

Under the artiele History (fect. ii.), the various corrupzions in relizion, the oppreffions and ufurpations of the clergy, and the extreme infolence of the popes, have been fo fully treated of, that any further detail here is unneceffary. It is fufficient to obferve, that, before the perid of the Refore the pope年e the period of the Reformation, the Pope had in uffunics the the moft andacious manner declared himfelf the fovereign difpofat of of the whole world. All the parts of it which were the whole inhabited by thofe who were not Chrifians, he aecount wolld. ed to be inhabited by $n o-b o d y$; and if Chriltians took it into their heads to poffefs any of thofe countries, he gave them full liberty to make war upon the inhabitauts without any provocation, and to treat them with no more humanity than they would have treated wild beafts. The courtries, if conquered, were to be parcelled out aecording to the pope's pleafure; and drcadful was the fituation of that prince who refufed to obey the will of the holy pontiff, of which many infacias will occur to the reader in the various hiftorical atticles of this work. In confequence of this extraordinaty authority which the pope had affumed, he at laft granted to the king of Portugal all the countries to the eattward of Cape Non in Africa, and to the king of Spaiu all the countries to the weftward of it. In this, according to the opinions of fome, was completed in h:s perfon the character of Antichrifl fitting in the sempele of Goit, an! flewing binyclf as God*. He had long before, fay they, affumed the fupremacy belonging to the Deity himfelf in figiritual matters; and now he antumed the fame fupremacy in woildly matters alfo, giving the extreme regions of the earth to whom he pleafed. The Reformation, therefore, they confider as the immediate effect of divine yower taking vengeance on this and all other deviations from the fyttem of truth; while others confider it merely as an effect of natural caufes, and which might have been forefeen and prevented, without abridging the papal power in any confiderable degree.

Be this as it will, however, the above-mentioned partition was the laft piece of infolence which the pope ever had, or in all prubability ever will have, in his power to exereife, in the way of parcelling out the globe to his adherents. Every thing was quict, every heretic exterminated, and the whole Chrittian world fupinely acquieleed in the enormous abfurdities which were inculcated upos them; when, in 1517 , the empire of fup $\%$ frition began to ducline, and has continued to do fo ever linee. 'The perfon who made the firl attack on th: extravagat liperflitions then prevaling was Martin Laither; the oecalion of which is filly related under the artiele leviser. Dy fome it is pretended, that the on'y motive which Luther had in heginaing the Reformation was his enmity to the Domiaican friars, who had excluded his order (the Aurudins) from all fhare Reformain the gamful traf:e of indulgences. But this does not tin brgus feera at ail probable, if we confider that fuch a motive Would not naturally have led him to deny the vi tue of indulgenees, as fuch conduct conid not but exichude him for ever from any chance of a thare in the traffic, which otherwife parlaps he might lave obtained. Befides, the extreme contrariety of this trefic to the common principle, of reaíon and honcfy was fo great, that we

Zull 'hius. colle enourda to difecrn it, and vitue enon th to oppofe fu in an infamous practice. In all prokahility, however, the imfignificancy of the firt reformer was the reafon why lee was not perfeculed and exterminated at his firfer ixcrimuing, as others had been before him. Another reafon probably might be, that he did not at ones ata.wek the whole irrois of Popery, but brought about his refiomation gradually, probably as it occured to himCulf, :and 1 is we have related in the account of his life. in Saxuyy berwas unt long confined either to that ty or prosines In 500 the Francilcan finars, who had the care of promulfating indulgences in Switzerland, were oppofid by Zuingtius, a man not inferior in naduritanding and knowledge to Luther himfelf. He procecded with the greatelt vigour, even at the very beginming, to overturn the whole fabric of Pepery; but his opinions were dechared crroneous by the univerfities of Cologne and Lonvain. Notwithltanding this, the magiltrates of Zurich approved of his proceedings ; and that whole caaton, oogether with thofe of Bern, Bafil, and Chuffarten, embraced his opinions.
In Germany, tuther continued to make great advances, writhout being in the lealt intinidated by the ecclefiattical cenfures which were thundered againft him from all quarters, he being continually protected by the German princes either from religious or political motives, fo that his adverfaries could not accomplifh his deflruction as they hall done that of others. The princes, who were upon bad terms with the court of Rome, took adrantage of the fuccefs of the new ductrines; and in their own dominions eafly overturned a church which had luit all the refpect and veneration of the infurior ranks. 'The court of Rome had difobliged forne of the fmaller princes in the north of Germany, whom the Pope probably thought too infignificant to be worth the managing, and they univerfally ettablifhed the Reformation in their own dominions. Melancthon, Carloftadius, and other men of eminence, alfo greatly forwarded the work of Luther; and in all probability the Popith hierarcly would have foon come to an end, in by Char.V the northern parts of Europe at lcaft, had not the cmperor Chartes V. given a fevere check to the progrefs of refurmation in Germany. In order to follow out the fchemes dictated by his ambition, he thought it neceffary to ingratiate himfelf with the pope; and the mof effectual inethod of doing this was by deftroying Luther. 'The Pope's legates infilted that Luther ought to be condemied by the dict of Worms without either trial or hearing; as being a moft notorious, avowed, and incorrigible heretic. However, this appeared mjuf to the members of the diet, and he was fummoned to appear ; which he aceordingly did without hefitation *. Tlicre is not the lealt doubt that his appearance there had been his laft in this world, had not the affonithing refpect that was paid him, and the crowds who came daily to fee him, deterred his judges from delivering the church from the author of fuch a peftilent herefy; which they were Itrongly folicited by the pope's party to do. He was therefore permited to depart with a fafe conduct for a certain time; ; after which he was in the fate of a profcribed criminal, to whom it was unlawful to perform any of the offices of humanity.
During the confincment of Luther in a caftle near

Warburg, the Reformation advanced rapidly; almot cvery city in Saxony embracing the Lutheran opinions. At this time an alteration in the eftablifhed ferms of worfnipwas firlt ventured uponat Wittemberg, by abolifh. in form of ing the celebration of private mafees, and by giving the worihip fi cup as well as the bread to the hity in the Lord's lup-aitered it per. In a fhort time, however, the new opinions were Wittencon lemned by the unicerfity of Paris, and a refutation beig. of them was attempted by Henry VIII. of England. But Luther was not to be thas intimidated. Fle publithed his animadverfions on both with as much acrimony as if he had been refuting the meanel adverfary; and a controverfy managed by fuch ithuftrious antiryonifts drew a general attention, and the Reformers daily gained new converts both in France and Enghand.

But while the efforts of Linther were thus everywhere Dif ${ }^{6}$ utes crowned with fuccefs, the divifions began to prevailam ng th which have lince fo much agitated the reformed church-Reformer cs. The firf difpute was between Luther and Zuinglius concerning the manucr in which the body and blood of Chrift were prefent in the encharift. Luther and his followers, though they had rejected the notion of tranfubftantiation, were newerthelefs of opinion that the body and blood of Chrift were really piefent in the Lord's fupper, in a way which they could not pretend to explain. Carlofladt, who was Luther's colleague, firit fuggefted another view of the fubject, which was afterwards confirmed and illuftrated by Zuinglius, namely, that the body and blood of Chrift were not really prefent in the eucharift; and that the bread and wine were no more than external fymbols to excite the remembrance of Chrift's fufferings in the minds of thofe who received it. Both partics maintained their tenets with the utmoft obllinacy; and, by their divifions, firft gave their adverfaries an argument againft them, which to this day the Catholics urge with great force; namely, that the Proteftants are fo divided, that it is impoffible to know who is right or wrong; and that there camot be a ftronger proof than thefe divifions, that the whole doctrine is falfe.

To thefe intertine divifions were added the horrors of a civil war, occafioned by oppreffion on the one hand, Difturban and enthufiafm on the other. In 1525, a great num-mang. ber of feditious fanatics arofe on a fudden in different parts of Germany, took arms, united their forces, and made war againft the empire, laying wafte the country with fire and fword, and committing everywhere the greatef cruclties. The greatcit part of this furious mob was compofed of peafants and vaffals, who groaned under heavy burdens, and declared that they were no longer able to bear the defpotic government of their chiefs; and hence this fedition had the name of the ruflic war, or the war of the peafants. At firlt this rabble declared, that they had no other motives than the redrefs of their grievances ; but no fooner had the enthufialt Munzer, or Munlter, the anabaptif, put himfelf at their head, than the face of things was entirely changed, and the civil commotions in Saxony and 'Thuringia exceedingly increafed, of which an account is given under the article Anabaptists.

In the mean time Frederic, furnamed the Wi fe , elector of Saxony, and Luther's great patron, departed this life, and was fucceeded by his brother John. Frederic, though he had protected and encouraged Luther, yet was at no pains to introduce the reformed religion into

## R E F

Reforma- his dominions. But with his fucceffor it was otherwife; forlhe, convinced that Luther's doctrine mult foon be totally deftroyed and fuppreffed unkefs it received a fpeedy and effectual fupport, ordered Luther and Melancthen to draw up a body of laws relating to the form of ecelcfiaftical goverument, the method of public worfhip, \&cc. which was to be proclaimed by heralds throughout his dominions. This example was followed by all the princes and flates of Germany who renounced the papal tupremacy ; and a like form of worfhip, difcipline, and government, was thus introduced into all the churches which diffented from that of Rome. This open renunciation of the Romifh juridiction foon changed the face of affairs; and the patrons of Popery foon intimated, in a manner not at all ambiguous, that they intended to make war on the Lutheran party; which would certainly lave been put in execution, had not the troubles that took place in Europe difconcerted their meafurcs. On the other hand, the Lutherans, apprized of thefe hoftile intention:s, beran affo to deliberate on a proper plan of defence againft that fupertitious violence with which they were in danger of heing aifailed. The diet of the empire affernbled at Spire, in the ycar 1526; where the emperor's ambaliadors were defired to the their utmolt endeavours to fupprefs all difputes about religion, and to infift upon the rigorous exccution of the fentence which had been pronounced againft Luther and his followers at Worms. The greateft part of the German princes oppofed this motion with the utmoft refolution, declaring that they could not execute that fentence, nor come to any determination with regard to the doctrines by which it had been occafioned, before the whole matter was fubmitted to the decifion of a council lawfully afiembled; allering farther, that the decifion of controverfies of this nature belonged properly to it, and to it alone. This opinion, after long and very warm debater, was adopted by a great majority, and at length confented to by the whole affembly: for it was unanimouly agreed to prefent a folemn adddrefs to the emperor, intreating him to affemble, without delay, a free and general council; white in the mean time it was aifo aurced, that the princes of the empire fhould, in their refpective duminions, be at liberty to manage ecelefiaftical affairs in the manner they fhould think moft proper ; yet fo as to be able to give to God and the emperor al proper account of their adminiftration when it fhould te required of them.

Thefe refolutions proved extremely favourable to the caufe of reformation; neither had the emperor eny leifure for fome time to give difturbance to the reformed. The war, which at this time enfued between him and the pope, gave the greateft advantage to the friends of the reformed, and confiderably angmented their number. Several princes, whom the fear of perfectution and pun:lhment had hitherto prevented from lending thcir attiftance, publicly renounced the Romifh fuperflition, and introdiced among their fubjeets the rame forme of religious wormip, and the fame fytten of doctrine, that had been received in Saxony. Others, though placed in fuch circumftances as difcouraged them from acting in an open mamer againft the interefts of the Roman pontiff, were, however, far from difcovering the fmallent oppofition to thofe who withdrew the people from his defpotic yoke; nor did they moleft the private affemWies of thofe who had feparazed themfelves from the

VoL XVI, Part 1.
church of Romc. And in general, ali the Germant Reforma, who, before theferefolutions of the diet of Spire, had tim. rejected the papal difcipline and doftrine, were now, in confequence of the liberty they enjoyed, wholly employ. ed in britging their fchemes and plans to a certain de. gree of confittence, and in adding vigour and firmnef3 to the caufe in which they were engaged. But this tranquillity and liberty was of no long duration. In 1529, a thew dict was affembled at the fame place by the emperer, after he had quieted the troubles in varicus parts of his dominions, and concluded a peace with the pope. The power which had been granted to prin- 10 ces of managing ecclefiaftical affairs till the meeting of Revoledthy a general council, was now revoked by a maja rity of ror. votes; and every change declared unlawful that fhould be introduced into the doctrine, difcipline, or worhip of the eltablithed religion, before the determination of the approaching council was known. This decree was confidercd as iniquitous and intolerable by the elector of Saxony, the land rave of Heffe, and other members of the d:et, who were perfuaded of the neceflity of a reformation. The promife of fpeedily affembling a general council, they looked upon to be an artifice of the church of Rome; well knowing, that a free and lawful council would be the laft thing to which the pope would confent. When, therefore, they found that all their arguments and remonftrances made no impreffion upon Ferdinand the emperor's brother, who prefided in the diet, Charks himfelf being then at Barcelona, they entered a folemn proteft againft this decree on the rgth of April, and appealed to the emperor and a future council. Hence arofe the denomination of Protefunts, , rigisi of which from this period has been given to thofe who fc- the name parate from the communion of the church of Rone. Protefants. The princes of the empire who entered this proteft were, John elector of Saxony ; George elector of Brandenburg; Ernett and Francis dukes of Lunenburgh ; the landgrave of Hefle; and the prince of Anhalt. Thefe were feconded by 13 imperial towns, viz. Strafburg, Ulm, Nuremberg, Confance, Rottingen, Windfeim, Memmingen, Nortlingen, Lindaw, Kempton, Heilbron, Wiffemburg, and St Gall.

The difenring princes, who were the protedors and heads of the reformed churches, had no fooner cntered. their protelt, than they fent proper perfons to the emperor, who was then upon his paffage from Spain to Italy, to acquaint him with their proceedings in this mater. The minitters en.ployed in this commiffion executed it with the greatef intrepidity and prefence of mind; but the emperor, exafperated at the audacity of thofe who prefumed to differ frona him, caufed the ambafladors to be arrefted. The news of this violent Atep mace the Protellant princes conclude, that their perfonal fafety, and the fuccefs of their caufe, depended entirely upon their own courage and mion. They determined, therefore, to enter into a folemn confederacy: for which purpofe they hed feveral meetings at Rot, Nuremberg, Smalcald, and other places: but fo different were their opinigas and views, that they could determine upon nothing.
One great obftacle to the intended confederacy wascont ${ }^{13}$ the difpute which had arfen between Luther and Zuin-between ghius concerning the real prefence of Chrift in the Luther and Lord's Supper. To terminate this difpute, if poffible, ${ }^{2}$ uingliys, Philip, landgrave of Heffe, invited, in the year $15: 9$, to

## $\pi$ E F [ 42 1

## $R \quad E \quad F$

Beforna- a eonferenea at Marpurg, Luther and Zuirglius, togefion. ther with feveral other of the more eminent doetors who adhered to the refpective parties of thete contending chiefs: but this meafure was rot attended with the fitJutary effects which were experted from it. 'The divines d: p puted for four days in prefence of the land;rave. La. ther attacked Oecolampadius, and Zuinslius was ateack:d by Melanethon. Zuinglius mas accufed of herefy, not only on account of his explanation of the nature and defien of the Lord's Supper, but alfo in eonfequence of the falfe notions he was fuppofed to have adopted concerning the tlivinity of Clirift, the cfficacy of the divine word, original fin, and fome other parts of the Chrikian doetrine. This illultrious seformer, how cher, cleared himfelf from the greatef part of thefe charges with the mof triumplant evidence, and in fuch a manner as appeared fatisfactory even to Isther himfeif: but their diffenfion concerning the manner of Cheith's prefence in the eucharit ftiit remained; nor could cither of the conteneling parties be perfuaded to abandon, or even to modify, their opinions on that matter. The only advantage, therefore, which refuted from the meeting was, that the jarring coetors formed a kind of truce, by agreeing to a mutual toleration of their fentiments, and leaving to the dippofitl of Prowidence the cure of their divifions.

In the mean time news were received that the emperor defigned to come into Germany, with a view to terminate all relicious differences at the epproaching diet of Augfourg. Having forefeen fome of the confequences of thofe difputes, and, befides, taken the advice of raen of wifdom, fagacity, and cxperience, he became at certain times more cool in his proceedings, and more impartial in his opinions both of the contending parties and the merits of the canfe. He, therefore, in an interview with the pope at Dologna, infifted, in the moft ferious and urgent manner, on the neceffity of a gencral council. His remonftrances and expoftulations, howcier, could not move the pontiff; whe maintained with zeal the papal prerogatives, reproached the emperor with an ill-judged clemency, and alleged that it was the duty of that prince to fupport the church, and to execute fpecdy vengeance upon that obftinate heresical faction who dared to call in queftion the anthority of Rome and its pontiff. To this difcourfe the emperor paid no regard ; looking upon it as a mof iniquitous thing, and a meafure directly uppofite to the laws of the cmpire, to condemn unheard a fet of men who had always approved themfelves gond citizens, and therto indeed it was not ealy for the emperor to form a clea: idea of the inatters in dehate, fince there was no regular fyftem as yet compofed, hy which it might be known with certainty what were the true caufes of Luther's oppofition to the pope. The elector of Saxony, therefore. ordered Luther, and other eminent divines, to cominit to writing the chief articles of their religious fyfrem, and the principal points in which they differed from the church of Rome. Luther, in compliance with this older, delivered to the elector at Torgaw 17 art:cles which had been agreed upon in a conference at Sulizbach in 1529; fron whence thefe rezeived the name of the articles of Torgazv. But though thefe were deemed by Luther a fufficient declaration of the fentiaerts of the reformers, ytt it was judged proper to ca
large them, is order to give perfpicuity to their argu. ments, and ftrengtls to their caufe. In this work Mclanethon was employed; in which he foowed a proper deterence to the counfels of Luther, and expreffed his fentinents and dectrine with the greateft elegance and perficuity; and thus came forth to view the farnous Confiffion of Augsiurg.

On the r 5 th of June 1530 , Charles arrived at Augfo burg, and the diet was oppened five days after. The Proteftants received a formal permiffion to prefent ata account of their tenets to the diet on the 25 th of the fame inonth; in confequence of which, at the time appointed, Chriltian Bayer, chancellor of Saxony, read, in the German language, before the emperor and the princes affembled, the confelfion of Aughourg above. inentioned. It contained 28 chapters, of which 21 were employed in reprefenting the religinus opinions of the Protefants, and the other feven in pointing out the errors and fuperflitions of the church of Rume. The princes heard it with the decpert attention and recollection of mind: it conlirmed fome in the principles they had embraced ; furprifed others; and many, who hefore this time had little or no idea of the relig!ous fentiments of Luther, were now not only convinced of their innocence, but delighted with their purity and fimplicity. 'the copies of this Confeffion, which after it is pres. being read were delivered to the emperor, were fignedfented to by John elector of Saxony, George marquis of Bran-the empedenburg, Erneft duke of Lunenburg, Plilip landgrave ${ }^{\text {ror. }}$ of Heffe, Wolfgang prince of Anhalt, and by the im. perial cities of Nuremberg and Reutlingen.
The creatures of the chureh of Rome who were pre. A refuta. fent at this diet employed John Faber, afterwards bifhop tion of it, of Vienna, together with Eekius, and another doctor in which named Cocklouss, to draw up a refutation of the Protef- tants are tant cunfeffion: which refutation laving been publicly ordercd to read, the emperor required the Proteftant members to ${ }^{\text {acquiefce. }}$ acquicfee in it, and put an end to the religious difputes by an unlimited fubmiffion to the opinions and doetrines contained in this aufwer. But this demand was far from being complied with. The Proteftants declared on the contrary, that they were by no means fatisficd with the reply of their adverfaries; and earnefty defired a copy of it, that they might more fully demonftrate its extreme infufficiency and weaknefs. But this reafonable requeft was refufed by the emperor ; who interpofed his fupreme authority to prevent any farther proceedings in this matter, and folemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out thefe religious debates. This, however, did not reduce the Proteftants to filence. The divincs of that communion, who had been prefent at the diet, endeavoured to recollect the arguments and objections empluyed by Faber, and had again recourfe to the pen of Melanethon, who refuted them in an ample and fatisfatiury manner in a piece which was prefented to the emperor on the 22d of September, but wluch Charles. refufed to seceive. This antwer was afterwards enlarged by Melancthon, when he had obtained a copy of Faber's reply; and was publined in the year 1531, with the other pieces that related to the dostrime and difcipline of the Lutheran church, under the title of $A$ Defence of the Conf: fion of Augsturg.

Matters now began to draw towards a crifis. There were orly three ways of bringing to a conclufion thefe seligious

Refirma-seligious diferences. x. To grant the Proteltants a toleration and privilege of Serving God as they thought proper: 2. To compel them to return to the ehurch of Rome by the violent methods of perfecution : or, 3. That a reconciliation fhould be made, upon fair, candid, and equitable terms, by engaging each of the parties to temper their zeal with moderation, to abate reciprocally the rigour of their pretenfions, and semit fosething of their refpective claims. The third expedient was moft generally approved of, being peculiarly agreeable to all who had at heart the welfare of the empire; nor did the pope feem to look upon it either with averfion or contempt. Various conferences therefore were held between perfons eminent for piety and learning on buth fides; and nothing was omitted that might have the lealt tendency to calm the animolitics and heal the divifions which reigned between the contending parties. But the differences were too great to admit of a reconciliation; and therefore the votaries of Rome had recourfe to the powerful arguments of imperial edifts, and the force of the fecular arm. On the evere de. 19th of November, a fevere decree was ilfued out by ere againg the exprefs order of the emperor (during the abfence re Prote- of the Heflian and Saxon princes, who were the chicf
fupporters of the Proteftant canfe), in which every thing was manifettly adapted to deject the friends of religious liberty, excepting only a faint and dubious promile of engaging the pope to affemble a general council about fix months after the feparation of the diet. In this decree the dignity and excellence of the Popifh religion were extolled beyond meafure, a new degree of feverity and force was added to that which liad been publifhed at Worms againft Luther and his adherents, the changes which had heen introduced into the doctrine and difcipline of the Proteftant churches were feverely cenfured, and a fulenn order was addreffed to the primecs, eities, and flates, who had thrown off the Papal yoke, to return to their allegiance to Rome, on pain qf incurring the indigration and vengeance of the emperor as the patron and proteftor of the church. Of this formidable decree the elector of Saxonyand confederated princes were nofooner informed, than they affembled in order to deliberate on the meafures proper to be taken in fuch a crifis. In the years 5530 and 1531 they met, firlt at Smalcald, and afterwards at irranclort, where they formed a folemn alliance and confederacy, with the intention of defending vigoroully their religion and liberties againtt the dangers and encroachnents with which they were threatened by the edict of Auglburg, without attempting, however, any thing offenive againft the votaries of Rome; and into this confederacy they invited the kings of England, France, Dennark, \&ic. leaving no means unemployed that might corroborate and cement this importait alliance.

This confederacy was at firf oppofed by Luther, from an apprehention of the calamitics and troubles which it might produce; but at lait, perceiving the necelity of it, he confented; though he mucharitably, as well as imprudently, refufed to comprehend in it the followers of Zuinglius among the Swiis, together with the German itates and cities who had adopted the fentiments and confeffion of Buccr. In the invitation addreffed to Henry VIII. of England, whom the confederate princes were willing to declare the head and protctor of their leaguc, the following things, among
others, were exprefsly ftipulated: That the king fhould Refirana encourage, promote, and maintain, the true doctrine of tiono Chritt as it was contained in the confefion of Augfburg, and defend the fame at the next general council: that he fhould not agree to any council lummoned by the bifhop of Rome, but proteft againf it ; and neither fubmit to its decrees, nor fuffer them to be refpected in his duminiuns: that he fhould never allow the Roman pontiff to have any pre-eminence or jurifdiction in his dominions; that he fheuld advance 100,000 crowns for the ufe of the confederacy, and double that fum if it became necefflary: all which articles the corfederate princes were equally obliged to oblerve on their part. To thefe demands the king replied, that he would maintain and promote the true duetrine of Chrift ; but, at the fame time, as the true ground of that doctrine lay only in the holy Scriptures, he would not accept at any one's hand what thould be his own faith, or that of his kiugdom ; and therefore defired that they would fend over two learned men to confer with him, in order to promote a religious union between him and the confederates. However, he declared himfelf of their opinion with regard to the meeting of a free general council, and promifed to join with then in all fuch councils for the defence of the true doctrine ; but thought the regulation of the ceremonial part of religion, being a matter of indifference, ourgt to be left to the choice of each fovereign for his own dominions. After this the king gave them a fecond anfwer more full and fatisfactory; but after the execution of queen Anne, this negociation came to nothing. On the one hand, the king grew cold when he perceived that the confoderates were no longer of ufe to him in fuppoiting the validity of his marriage ; and, on the other hand, the German princes became fenfible that they could never fucceed with Henry unlefs they allowed him an abfolute dictatorhip in matters of religion.

While every thing thus tended to an open war between the two oppofite partics, the elector Palatine, and the clector of Mentz, offered their mediation, and endeavoured to procure a reconciliation. The emperor himelf, for various realons, was at this time inclined to peace: for, on the one hand, he ftood in need of fuccours againil the Turks, which the Proteftant princes refufed to grant as long as the edicts of Worms and Augfourg remained in force; and, on the other, the dection of his brother Ferdinand to the dignity of king of the Rumans, which had becn carried by a majority of votes at the diet of Cologne in 153 r, was by the fame princes contefted, as being contrary to the funda. mental laws of the empire. In confequence of all this, Peace of after many neyociations and projects of reconciliation, Nuremberg a treaty of ptace was concluded at Nuremberg in 1532 , concluded. between the emperor and the l'roteltant princes, on following conditions; viz. That the latter fhould furnifh a fubbidy fur carrying on the war againtt the Turks, and acknowledge Ferdinand lawful king of the Romans; and that the emperor on his part fhould abroyate and annul the edicts of Worms and Augfourg, and allow the Lutherans the free and undilurbed exercife of their rehigious doctrine and difcipline, until a ruke of faith was fixed either in the free general council that was to be affembled in the fpace of fix months, or in a diet of the empire.
Soon after the conclufion of the peace at Nuremberg

## R E F

Repomz. died John eleetor of Sixony, who was fucceeded by his Binn. fon Joln Frederic, a prince of iu"incihle fortitude and magnanimity, but whole reign was litte better than ane continued train of difappointmonts and - damities. 'I he religious truce, howewer, gave new vigour to the reformation. 'Ihofe who had hitherto been only fecret cnernies to the Roman pontiff, now publicly threw off his yoke; aud varions citics and provinces of Geran any enlifted themfelees under the religions flandards of l.uther. On the other hand, as the emperor had now mo other hope of terninating the religious difputes but by the neeting of a general council, he repeated his reyusils to the pope for that purpole. The

20
A general cruncilpo rofed. pontill (Clement VII.), whom the hittory of patt conncil; filded with the geteatel uncalinefs, endeavoared to retard what lue cond not with decency refute, At laft, in 15.33 , he made a propolal by his legate to affemble a council at Mantun, placentis, or leolorna; but the Protelants refifed their confont to the nomination of an Italian comncil, and infinted that a contoverfy which had its rife in the leart of Germany, fionuld be determines within the limits of the empire. "The pope", by his ufual artifices, eluded the performance of his own pronile; and, in 1534 , was cut off by death, in the midt of his ftratagens. His fucceffor paul IIl. feemed to thow lefs reluctance to the affembling a general council, and in the year 1535 exprefled his inclination to convoke one at Mantua; and, the year following, actually fent circular letters for that purpofe through sllt the fi.,tes and kingdoms under his juridiction. 'I'nis council was [ummoned by a ball iftued ont on the ad of Jume 1536, to niect at Mantua the following yuar : but feveral ohthacles prevented its meetiver; one of the noft naterial of which was, that Frederic duke of Mantua had no inclination to reccive at once fo many guctte, fome of them vory turbulent, into the phace of lais refiedence. On the other hand, the lroteftantswere firmly perfuaded that, as the council was affembled in Italy, and by the authority of the pope alone, the latier mult have had an undue influence in that affembly;
of confequence, that all things muft have been carried by the votaries of Rome. For this reafon they affemhild at Smalcald in the year 1537, where they folemnly protefted againft this partial and compt council, anel, at the farne time, had a new fummary of their ducuine drawn up by Luther, in order to prefent it to the aflembled bifhops if it flould be required of them. I'uis fummary, which had the title of The Arsicles of Smalcald, is commonly joined with the creeds and confefions of the Lutheran church.

After the mecting of the general council in Mantua was thus prevented, many fehemes of accommo. dation were propofed both by the emperor and the Proteftants; but, by the artifices of the chuch of Rone, all of them came to nothing. In 1541, the empeior appointed a conference at Worms on the fubject of religion, between perfens of piety and learning chofen from the contending parties. This conterence, Eowever, was, for certain reafons, remeved to the ditt which was to be held at Ratimon that fame year, and in which the principal fubject of deliberation was a memorial prefented by a perfon unknown, containing a project of peace. But the conference produced no other effect than a mutual agreement of the contending parties to refer itheir matters to a geaeral council, or, if
the meeting of fuch a council fhould be prevented, to the next German dies.

This refolution was rendered ineffeetual by a va. riety of iucidents, which widened the breach, and put off to a farther day the deliberations which were defigued to heal it. The pope ordercd his legate to declare to the dict of Spire, afembled in 1542, that lie would, according to the promife he had already made, affemble a gencral conucil, and that ' $\Gamma_{1}$ out mould be the plaee of its meeting, if the diet had no pofed. objection to that city. Ferdinand, and the princes who adhered to the caufe of the pope, gave their confemt to this propofal; but it was vehemently objected to) by the Proteftants, both becaufe the evoncil was fummoned by the allthority of the pope only, and al. fo becaule the place was within the juifdiction of the Pope; wherca, they defired a free council, which fhould not he biaffed by the dictates, nor awed by the proximity, of the pontiff. But this proteftation produced no clfeç. Panl IIt. perfited in his purpule, and ilfued out his ciscular letters for the convocation of the conncil, with the approbatiun of the cmperor. In Plan of res jullice to this pontiff, however, it mult be obferved, formation that he foowed himfelf not to be averfe to every refor. propused ination. He appointed fom cardinals, and three other by the perfons eminent for their learning, to draw up a plan for the reformation of the church in çeneral, and of the churel of Rome in particular. 'The reformation propoled in this plan was indeed extremely fuperticial and. partial, yet it contained fome particulars which could fearcely have becon expected from thofe who compoled it. 'They complained of the pride and ignorance of the bithops, and propofed that none thould receive orders but learned and pious ment ; and that therefore care fhould' be taken to have proper maters for the inftruction of vouth. They condemned tranflations from one benefice to another, grants of refervation, mon-refidence, and piuraities. They propofed that fume convents fould he abolithed; that the liberty of the prefs fhould be refirained and limited; that the colloquies of Erafmus. frould be fuppreffed; that no ecelefiaftic fhould enjoy a benefice out of his own country; that no cardinal frould have a hifnopric ; that the queftors of St Anthony and feveral other faints fhould be abolifhed; and, which was the beft of all their propofals, that the effeets and perfonal eflates of ecelefratices fhond be given to the poor. They concluded with complairinis of the prodigions number of indigent and $r$ :gged prieits who frequented St l'eter's church; and declared, that it was a great fcandal to fee the whores lodiged fo magnificently at Rome, and riding through the ftreets on. fine mules, while the cartinals "and other ecclefiattics accompanied them in the moft courteons manner. This plan of reformation was turned into ridicule by Luther and Sturmins; and indeed it left untedeffed the moft intolerable grievances of which the l'ruteftants complained.

All this time the emperor had been labouring to War beperiuade the Protefants to confent to the meeting of ween the the council at Trent ; but when he found them fixed emperor in their oppofition to ahis meafure, he began to liften Prutefant to the faggainary meafures of the pope, and refolved. to terminate the difputes by force of arms. The elector of Saxony and landgrave of Heffe, who were the chief fupporters of the Proteftant caufe, upon this took.

## R E F [ 45 ] R E F

a. proper meafures to prevent their being furprifed and overwhelmed by a fuperior force ; bitt, before the horsors of war commenced, the great reformer Luther died in peace at Ayfelben, the place of his nativity, in 1546.

The emperor and the pope had matuatly refolved on the deftraction of all who fhonld dare to oppofe the council of Trent. The meeting of it was to ferve as a fignal for taking up arms; and accordingly its deliberations were fearcely begua in 1546 , when the Proteftants perceivel undoulhted figns of the approaching ftorm, and a formidable union betwixt the emperor and popre, which threatened to cruth and uverwhelm tlem at once. 'Ihis year indeed there had been a new conference at Ratibon upon the old fubject of accommodatins differences in religion ; but from the manner in which the dehates were carried on, it planly ap. peared that thefe ditferences could only be decided in the field of battle. 'I'be council of 'Trent, in the mean time, promulgated their decrecs; while the reformed princes, in the diet of Ratifbon, protefted againft their anthority, and were on that account proferibed by the emperor, who raifed an army to reduce them to obedience. See Father Paul's Hifory of the Council of Frent', and our avticles Paul (Father), and Trent.

The elector of Saxony and the landgrave of Haffe led their forces isto Bavaria againft the emperor, and cannonaded his camp at Ingolỏalt. It was fuppofed that this would bring on an engagement, which would probably have been advantageous to the caufe of the reformed; but this was prevented, chiefly by the perfidy of Maurice duke of Saxony, who invaded the dominions of his uncle. Divifions were alfo fomented smong the confederate princes, by the difimulation of the enuperor: and France faike in phying the fubfidy which had beer promied ty its monarch : all which fo difeouraged the heads of the Proteltant party, that their army foon difperfed, and the elector of Saxony was ohliged to direct his march homewards. But he was purfued by the emperor, who made feveral forced marches, with a view to deftroy his enemy before he finould have time to recover his vigour. The two armies met near Muhiberg, on the Elbe, on the $2+$ th of A pril $15+7$; and, after a bluody action, the clector was entircly defeated, and himfelf taken prifouer.Mamice, who had fo bafely betrayed him, was now declared elector of Saxony; and by his intreaties Philip landgrave of Heffe, the other chief of the Protethants, was perfuaded to throw himfll on the nercy of the emperor, and to implore his pardon. To this he confented, relying on the promife of Charles for obtaining forgivencfs, and being reflored to liberty; but, notwithfanding thefe expectations, he was unjuftly detained prifoner, by a fcatdalous violation of the moft folemn convention. It is fard that the emperior retracted lis promife, and deluded this unhappy prince by the ambiruity of two German words. Hiltory indeed can fcarce afford a parallel to the perfidious, mean-fpirited, and defpotic behaviour of the emperor in the prefent cafe. After having received in public the humble fubmiffion of the prince on his knees, and after having fet him at liberty by a folemn treaty, he lad him arrefted anew without any reafon, nay, without any pretence, and kept him clofe prifoner for feveral years. When Maurice remonftrated againf this new confinement, the emperor anfwered,
that he had never promifed that the landgrave mould Reformanat be impifoned anew, but only that he fhould be exempted from perpetual imprifonment; and, to fupport this alfertion, he produced the treaty, in which lus minifters had perfidionfy foitted eraiger gefangnis, which fignifies a " perpetual prifon," inftead of einizer gefangnis, which fignifies " any priton." 'I'his, however, is contelted by fome hifforians.

The affairs of the Proteflants nuw feemed to be defperate. - In the diet of Augfourg, which was foor after called, the emperor required the lroteitants the leave the decifion of thefe religious difputes to the wiffom of the comncil which was to meet at Trent. The greateft pant of the members comiented to this propofal, being convinced by the powerful asoument of an imperial army, which was at hand to dipese the darknefs from the cyes of fuch as mirht otherwife have been blind to the force of Churles's reafoning. However, this general fuomiffon did not produce the effect which was expected from it. A playbue which broke out, or was faid to do fo, in the city, caufed the cilfuddeno broke out, or was fald to do 10 , in the city, eauled thely diful-
greateft part of the bifhops to retire to Bu!ogna; by ved. which means the council was i. effect diffolved, nor could all the intreaties and remontrances of the emperor prevail upon the pope to re-affemble it without delay. During this interval, therefore, the emperor judged it neceftring to fall upon fome method of accommodating the religious differences, and maintaining peace uatil the council fo long expected fhould be finally obtained. With this view le ordered Julius a formula Pelugius bilhop of Naumberg, Nichael Sidonius, ary drawn creature of the pope, and John Agricola, a native up by the: of Ayfelber, to daw up a furmulary which might emperor, ferve as a rule of faith and worfip, till the council fhould be affembled: but as this was only a temporary expedient, and had not the force of a permanent or perpetual inftitution, it thence obtained the name of the Interin.

This project of Charles was formed partly with a defigit to vent his refentment againit the pope, and partly to anfwer other political purpofes. It containcd all the effential dectrines of the church of Rome, though confiderably foftened by the artful terms which were employed, and which were quite different from theufe empluyed before and alter this perind by the council of Trent. There was even an affected ambiguity in nany of the exprefions, which made them fufceptible of different fenfes, and applieable to the $22^{\circ}$ fentiments of both communions. The confequence Difpleafes of all this was, that the imperial creed was reprobated both pasa by both parties. However, it was promulyated with ties. great folemnity by the emperor at Auging. The elector of Mentz, without even afking the opinion of the princes prefent, gave a fanction to this formula, as if he had been commiflioned to reprefent the whole diet. Many kept filence through fear, and that filence was interpreted as a tacit confent. Some had the courage to oppore it, and thefe were reduced by force of arms ; and the molt deplorable fcenes of bloodthed and violence were acted throughout the whole empire. Maurice, clector of Saxony, who had hitherto Eept neutral, now afferabled the whole of his nobility and clergy, in order to deliberate on this critical affair. At the head of the latter was Melancthon, whofe word was refpected as a law anong the Droteftants. But

## R F F

Refarma- this man had not the courage of luther; and was tion. therefore on all occafions ready to make conceffious, and to propofe fecmes of accommodation. In the prefent cafe, therefore, he gave it as his opinion, that the whole of the book called Interion could not by any means be adopted by the Protefants; but at fame time he ceclared, that he faw no reafon why this book mirght not be appproved, adopted, and reccived, as an authoritative vale in things that did not relate to the effential parts of religion, and which he accounted indifferent. But this fehome, inflead of consenting the differcuces, made them much worfe than ever: and produced a divifion anong the Protetants thembelves, which might have overthrown the Reformation entiacly, if the emperor and pope had feized the opporqunity.

In the year $15+9$, the pope (Paul III.) died; and was fucceeded by Julius III. who, at the repeated folicitations of the emperor, conlented to the re-affembling of a council at "rent. A dict was again held at Augforg under the cannon of an imperial anny, and Charkes laid the matter before the prinecs of the empire. Moft of thefe prefent gave their confent to it, and among the reft Maurice dector of Saxony; who confented on the fullowing conditions: I. 'Jhat the puints of ductrine which had alreads heen decided there, fould be recexamined. 2. That this examination thould be made in prefence of the Protefant divincs. 3. That the Saxon Proteftants thould have a liberty of voting as well as of deliberating in the council. 4. I'hat the pope fhould not pretend to prefide in that affembly, cither in perfon or by his legates. This declaration of Maurice was read in the dict, and his deputies iufifed upon its being entered into the regiflers which the archbifhop of Mentz obstinately refufed. The diet was concluded in the year 1551; and, at its breaking up, the emperor defired the affembled princes and ftates to prepare all things for the approaching council, and promifed to wfe his utmoft cudeavours to procure moderation and harmony, impartiality and charity, in the tranfactions of that affembly:

On the breaking up of the dict, the Proteftants took fuch fleps as they thought moft proper for their own fafty. The Saxons empioyed Melancthon, and the Wurtemberesers Brengius, to draw up Confeffions of Faith to be laid before the new cuuncil. The Saxon divines, however, procceded no farther than Nuremberg, having received fecret orders from Manice to ftop there: For the elector, perceiving that Charles lad formed delions againft the liberties of the German princes, refulved to take the mut effectual meafures for erufhing his ambition at ouce. He therefore entered with the utmott fecrecy and expedition into an alliance ${ }_{3} 2$ with the king of France, and feveral of the German The emper. princes, for the fecurity of the rights and liberties of or is fur- the empire; after which, aflembling a powerful army prifed, and in 1552 , he marched againft the emperor, who lay with peace hy a handful of troups at Infpruck, and expeeted no fuch the eleetor thing. By this fudden and unforefeen accident Charles of Sacony, was fo much difpirited, that he was willing to make peace almoll on any terms. The confequence of this was, that he concluded a treaty at Palfau, which by the Proteftants is confidered as the bafis of their religious liberty. By the firf three articles of this treaty it
was arreed, that Maurice and the eonfederates flould
lay down their arms, and lend their troops to Ferdinand to affit him argaint the "rurks; and that the land; rave of Heffe fhould be fet at liberty. Dy the fourth it was agreed, that the Rule of Faith called the Intering mould be confidered as null ind void: that the contending parties fiould cnjoy the free and undinurbed exercife of their religion, until a dict fhould be affembled to determine amicably the prefent difputes (which diet was to meet in the fpace of fix months) ; and that this relirious liberty thould continue always, in cafe it nould be found impoffible to come to an uniformity in doetrine and wormip. It was alfo determined, that all thofe who had fuffered banibument, or any other calamity, on account of their having been concerned in the leaguc or war of Smalcald, Mould be seinitated in their privileges, poffefions, and tinployments; that the ja:perial chamber at Spire frould be open to the ProtiItants as well as to the Cathulics; and that there fould always be a certain number of Lutherans in that high court.- To this peace Albert, marquis of Brandenburg, refufed to fubferibe; and continked the war againft the Roman-cathulics, cummitting fuch ravares in the empirc, that a confederacy was at laft formed againit him. At the head of this confederacy was Maurice elector of Saxony, who died of a wound he received in a battle fought on the occation in 1553.

The affembling of the diet pronsifed by Charles was prevented by various incidents; however it met at Augburg in 5555 , where it was opened by Ferdinand in wame of the emperor, and terminated thofe deplorable calamities which had fo long defolated the empire. After various debates, the following acts were pafied, on the 25 th of September: 'That the Protefants who followed the Confellion of Aughourg thould be for the future confudered as entirely fuee from the jurifdiction of the Roman puntiff, and from the authority and fupcrintendance of the bifiops; that they were left at perfeet liberty to enact laws for themfelves relating to their religious femiments, difcipline, and worfhip; that all the inhabitants of the German empire flould be allowed to judge for themfles in religious matters, and to join themfelves to that church whofe doctrine and worihip they thought the moit pure and confonant to the fpirit of trne Chritianity; and that all thofe who Mould injure or perfecute any perfon under religions pretences, and on account of their opinions, thould be declared and procceded againft as public enemies of the ennpire, invaders of its liberty, and diturbers of its peace.

Thus was the Reformation eltablifhed in many parts of the German empire, where it continues to this day; nor have the efforts of the Popifn powers at any time been able to fupprefs it, or even to prevent it from gaining ground. It was not, however, in Germany alone that a reformation of religion took place. Al. molt all the kingdoms of Europe began tw open their eyes to the truth about the fame time. The reformed religion was propagated in Sweden, foon after Luther's rupture with the church of Rome, by one of his difeiples named Ulous Petri. The zealous efforts of this mifionary were feconded by Guftavus Vafa, whom the Swedes had raifed to the throne in place of Chritiern king of Deumark, whofe horrid barbarity luft him the crown. This prince, however, was as

## R E F [47] R E F

prudent as he was zealous; and, as the minds of the Swedes were in a fluctuating fate, he wifely avoided all kind of vehemence and precipitation in fpreading the new doctrine. Accordingly, the firt object of his attention was the infruction of his people in the facred doctrines of the Holy Scriptures: for which purpofe he invited into his dominions feveral learued Germans, and fpread ahroad through the kingdom the Swedifh tranflation of the Bible that had beer made by Olaus Petri. Some time after this, in 1526 , he appointed a conference at Upfal, between this reformer and Peter Gallius, a zealous defender of the ancient fuperftition, is which each of the champions was to bring forth his arguments, that it might be feen on which fide the truth lay: In this difpute Olaus obtained a fignal victory; which contributed much to confirm Guftavus in his perfuafion of the truth of Luther's doctrine, and to promote its progrefs in Sweden. The following year another event gave the finithing flroke to its propagation and fuccels. This was the affembly of the ftates at Wefteraas, where Guftavus recommended the doctrine of the reformers with fuch zeal, that, after warm debates fomented by the clergy in general, it was unanimoully refolved that the reformation introduced hy Luther fhould have place in Sweden. This refolution was principally owing to the firmnefs and magnanimity of Guftarus, who declared publicly, that he would lay down the fceptre and retire from the kingdom, rather than rule a people enflaved by the orders and authority of the pope, and more controuled by the tyrany of their bifhops than by the laws of their monarch. From this time the papal empire in Sweden was entirely overthrown, and Guftavus declared head of the church.

In Denmark, the reformation was introduced as early as the year 152 I , in confequence of the ardent defire difcovered by Chriftiern II. of having his fubjects in. Aructed in the doetrines of Luther. This monarch, notwithftanding his cruelty, for which his name has been rendered odious, was neverthelefs defirous of delivering his dominions from the tyranny of the church of Rome. For this purpofe, in the year $: ~ \varsigma 20$, he fent for Martin Reinard, one of the difeiples of Carloftadt, out of Saxony, and appointed him profeffor of divinity at Harnia; and after his death, which happened in 1521 , he invited Carloftadt himfelf to fill that important place. Carloftadt accepted of this office indeed, but in a fhort time returned to Germany; upon which Chriftiern ufed his utmoit endeavours to engage Luther to vifit his dominios, but in vain. However, the progrefs of Chriftiern, in reforming the religion of his fubjects, or rather oi advancing his own power above that of the church: was checked, in the year 1523 , by a confpiracy, by which he was depofed and banifhed; his uncle Frederic, duke of Holltein and Slefwic, being appointed his fucceffor.

Frederic condacted the reformation with much greater prudence than his predeceffor. He permitted the Proteftant doctors to preach publicly the fentiments of Luther, but did not venture to change the eftabiifhed government and difcipline of the church. However, he contributed greatly to the progrefs of the reformation, by his fuccefsful attempts in favour of religious liberty in an alfembly of the ftates held at Odenfee in 152\%. Here he procured the publication of a famous
edict, by which evely fubject of Denmark was decla- Reforms. red free either to adhere to the tenets of the church of tion. Rome, or to the doctrine of Luther. The papal tyranny was totally deftroyed by his fucceftor Chriftiern III. He began by fuppreffing the defpotic authority of the bifhops, and reftoring to their lawful owners a great part of the wealth and poffeffions which the clurch had acquired by various fratagems. This was followed by a plan of religious cloctrine, wor?hip, and difeipline, laid down by Bugenhagius, whom the king had fent for from Wittemberg for that purpofe; and in 1539 an affembly of the ftates at Odenfee gave a folemn fanction to all thefe tranfactions.

In France alfo, the reformation began to make fome in Franes. progress very early. Margaret queen of Navarre, fifter to Francis I. the perpetual rival of Charles V. was a great friend to the new doctrine; and it appears that, as early as the year 1523, there were in feveral of the provinces of France great numbers of people who had conceived the greatelt averfion both to the doctrine and tyranny of the church of Rome ; among whom were many of the firt rank and dignity, and even fome of the epifcopal order. But as their number increafed daily, and troubles and commotions were excited in feveral places on account of the religious differences, the authority of the king intervened, and many perfons eminent for their virtue and piety were put to death in the moft barbarous manner. Indeed Francis, who had either no religion at all, or, at beft, no fixed and conliftent fyltem of religrious principles, conducted himfelf towards the Proteftants in fuch a manner as beft anfwered his private views. Sometimes he refolved to invite Melancthon into France, probably with a view to pleafe his fifter the queen of Navarre, whom he lowed tenderly, and who had ftrongly imbibed the Proteftant principles. At other times he exercifed the moft infernal cruelty towards the reformed. and once made the following mad declaration, That if he thought the blood in his arm was tainted by the Lutheran herefy, he would have it cut off; and that he would not fare even his own children, if they entertained fentiments contrary to thofe of the Catholic church.

About this time the famous. Calvin hegan to draw the attention of the public, but more efpecially of the queen of Navarre. His zeal expofed him to danger; and the friends of the reformation, whom Francis was daily comnitting to the flames, placed him more than once in the moft perilous fituation, from which he was delivered by the interpofition of the queen of Navarre. He therefore retired out of France to Bafil in Swiffer land; where he publified lis Chritian Infitutions, and became afterwards fo famous.

Thofe among the French who firft renounced the jurifdiction of the Romifh church, are commonly called Lutberans by the writers of thofe early times. Hence it has been fuppofed that they had all imbibed the peculiar fentiments of Luther. But this appears by no means to have been the cafe: for the vieinity of the cities of Geneva, Laufanne, \&c, which had adopted the doE ines of Calvin, produced a remarkatle effeet upon the French Proteftant churches; infomuch that, about the middle of this century, they all entered into communion with the church of Geneva. The French Proteftants were called Huguenots* by their ad * See Fis 4

Reform3. vitifaries, by way of contempt. Their fate was very $\underbrace{\text { tion. }}$ fevere, being perfecuted with unparalleled fury ; and though many princes of the blowd, and of the firlt nobility, had embraced their fentiments, yet in no part of the world did the reformers fuffer fo much $\dagger$. At laft all commotions were quelled by the fortitude and magnanimity of Henry IV. who in the ycar 1598 granted all his fubjects full liberty of confcience lhy the famous Ediet of Nantes, and feemed to have thoroughly eftablifhed the refurmation throughout his dominions. During the minority of Louis XIV. However, this ediet was revoked by Cardinal Mazarine, fince which time the Proteftants have often been cruclly perfecuted; nor was the profeffion ofthe reformed religion in France at any time fo fafe as in moft other countries of Europe. Sce Revolution.

In the other parts of Europe the eppolition to the church of Rome was but faint and ambiguous before the diet of Augforg. Before that period, however, it appears from undoubted teftimony, that the doetrine of Luther had made a confiderable, though probahly fecret, progrefs through Spain, Hungary, Bohemia, Britain, Poland, ard the Netherlands; and had in all thefe count:ies many friends, of whom feveral repaired to Wittemberg, in order to enlarge their knowledge by means of Luther's conserfation. Some of thefe countries threw off the Romifh yoke entirely, and in others a prodigions number of families embraced the principles of the reformed religion. It is certain indeed, and the Roman-catholics themielves acknouledge it without heftation, that the Papal doetrines and authority would have fallen into suin in all parts of the world at onec, had not the force of the fecular arm been employed to fupport the tottering edifice. In the Netherlands pasticularly, the moft grievous periccutions took place, fo that by the emperor Charles V. upwards of 100,000 were defroyed, while fill greater crueltics were exercifed upon the people by his fon Philip II. The revolt of the United Provinces, however, and motives of real policy, at lat put a ftop to thefe furious proccedings; and, though in many provinces of the Aetherlands, the eftablifment of the Popifh religion was Atill comtinued, the Protefants have been long free of the danger of perfecution on account of their $3^{38}$ principles.
The reformation made a confiderable progrefs in Spain and Italy foon after the rupture between Luther and the Roman pontift. In all the provinces of Italy, but more cfpecially in the territories of Venice, Tufeany, and Naples, the fuperltition of Rome luft ground, and great numbers of people of all ranks exprefed an averfion to the l'rpal yose. 'This occation ed violent and dangrerous commetions in the kingdom of Naples in the year $154^{5}$; which, however, were at laft quelled by the united cfiorts of Charles V. and his - ieeroy Don Pedro di Tuleso. In feveral places the pope put a ftop to the progrefs of the reformation, by letting lonse the inquifitore; who fpread dreadful marks of their barbarity through the greateft part of Italy. Thefe formidable minifters of fupetfition put fo many to death, and peiperated luch horrid acts of ruelty and opprelfion, that mont of the reformed confulted their fafcty by a voluntary exile, while others returned to the religion of Knme, at least in external appearance. Iut the inquifition, which friglited into the profeffion of Popery ieveral Proteftants in other parts of Italy,
could never make its way into the kingdom of Naples; nor could either the authority or intreaties of the pope engage the Neapolitans to admit even vifiting inunuilitors.

In Spain, feveral people embraced the Proteftant ${ }^{1 n} S_{p i}^{3}$ religion, not only from the controverfies af Luther, but even from thofe divines whom Charles $V$. lad brought with him into Germany in order to refute the doctrines of Luther. For theefe doctors imbibed the pretended hacresy inftead of refuting it, and propagated it more or lefs on their return home. But the inquifition, which could obtain no footing in Naples, reigne. ed triumphant in Spain, and by the moft dreadful methods frightened the people back into Popery, and fuppreffed the defire of exclanging their fuperftition for a mose rational plan of celigion. It was indeed prefumed that Charles himfelf died a Proteftant ; and it feems to be certain, that, when the approach of death. had diffipated thofe felemes of ambition and grandeur which had fo long blinded him, his fentiments became much more rational and agrecable to Chriftianity than they lad ever been. All the ecclefiaftics who had attended him, as foon as he expired, were fent to the inquifition, and committed to the flames, or put to death by fome other method equally terrible. Such was the fate of Auguftinc Cafal, the emperor's preacher ; of Couftantine Pontius, his confeffor ; of Egidius, whom he had named to the bifhepric of Tortofa; of Barthulomew de Caranza, a Dominican, who had been confefior to King Philip and Queen Mary ; with 20 others of lefs note.

In England, the principles of the reformation he-In E gan to be adopted as foon as an account of Luther's doctrines could be conveyed thither. In that kingdom there were ftill great remains of the fect called Lol lards, whofe doctrine refembled that of Luther; and among whom, of confequence, the fentiments of our reformer gained great credit. Henry VIII. king of England at that time was a vioknt partian of the chureh of Rome, and had a particular veneration for the writings of thomas Aquinas. Being informed that Luther fpoke of his favourite auther with contempt, he conceived a violent prejudice againf the reformer, and ewn wrote againft him, as we have already obferved. Luther did not helitate at writing againt his majeft, overcame him in argnment, and treated. him with very little ceremony. The firf fep towards public reformation, howeser, was nut taken till the year 1529. Great complaints had been made in Engjand, aned of a very ancient date, of the ufurpations of the cle:gy; and by the prevalence of the Lutheran opinions, thefe complaints were now become more general than before. The Houfe of Commons, inding the vccafion favourable, paffed feveral bills, relraining the impofitions of the clergy: but what threatened the ecelefiatical order with the greateft danger were the fevere reproaches thrown cut almoft without oppofition in the luoufe agaim the diffolute lives, ambition, and avarice of the priers, and their continual encroachments on the privileges of the laity. 'The bills for regrulating the clergy met with oppolition in the Houfe of Lords; and bifhop Fifher imputed them to want of faith in the Commons, and to a formed defign, procceding from heretical and Lutheran principles, of robbing the church of her patrimony, and overturning the natival religion. The Commons, however, complain-

[
 billop was ohliged to retract his words.

Though Henry had not the lealk idea of rejeceing any, even of the moft abfurd Rominh fupertlitions, yet as the opprefions of the clergy fuited very ill with the riolence of his own temper, hic was pleared with every upportunity of leffening their power. In the parliamrent of T 53 r , he fhowed his defign of humbling the rilergy in the moit effectual manner. An obfolete ftatute was revived, from? which it was pretended that it was criminal to fubmit to the legatine power which Lad been exercifed by cardival Wolfey. Diy this froke the whole body of clergy was declared guilty at once. 'They were too well requainted with Henry's difpofition, howeerer, to reply, that their ruin would have been the certain confequence of their not fubmitting to Wolify's commifion which had been given by royal authority. In itead of making any defence of this kind, they chofe to throw thenfelves on the mercy of their fovereign; which, howerer, it coft them $118,8 \pm 0$ ). to procure. A confeffion was likewife extorted from them, that the king was protector and fupreme head of the church of England; though fome of them had the dexterity to get a ciaure inferted, whici invalidated the whole fubmifion, viz. in fo fur as is pernuited ly the: laze of Corijz
The king, having thus begun to reduce the power of the clergy, bept rou lounds with them afterwards. He did not indeed attempt any refornation in religious matters; nay, he perfecuted moft violently fuch as did attenipt this in the leaf. Indced, the molt effential article of lis creed feems to have been his own fupremacy; for whoever denied this, was fure to fuffer the inot fevere penalties, whether Protetlant or Papill. But an account of the abfird and cruel conduct of this prince, and of his final quarrel with the pupe on account of his refufing a difipenfation to marry Amne Boleyn, is given under the article Engla*i, $n^{\circ} 253-$ 29 ?
He died in 1547, and was fucceeded by his oaly fon Edward VI. This amiable prince, whofe early youth was crowned with that wi:Com, faraceity, and wirtue, that wowld have done honour to advanced years, gave new fpirit and vigour to the Proteftant caute, and was its brightect omament, as well as its mott effectual fupport. He encuuraged leyrned and pious men of fortign countrits to fettle in England, and addreffed a particular invitation to Martin Bucer and Paul Fagius, whofe moderation added a luftre to their other virtues, that, by the minitry and labours of thefe eminent men, in cencert with thofe of the friends of the Reformation in England, he might purge his dominiens from the fordid fictions of popery, and eftablifh the pure doternines of Chritianity in thcir place. For this purpofe, he ifued out the wifett orders for the refloration of true religion; but his. reign was too fhort to àccomplifh fully fuch a ghlorious purpofe. In the year 1553, he was taken from his lociug and aflicted fubjets, whofe forrow was inexpreffible, and fuited to their lofs. Fiis filter Mary (the daughter of Catharine of Arragon, from whom Henry liad been feparated by the famous divorce), a furious bigat to the church of Rume, and a princeits whofer natural eniaracter, like the fpirit of her religion, was defpotic and cruel, fucceeded Siin on the Britilh throne, and impofed anew the arbiVol. XVI. Part I.
trary lars and the tyrannical yoke of Rome upon the people of England. Nor were the methods the em. ployed in the caufe of fuperilition better than the caufe itfelf, or tempered by any fentiments of equity or compaffion. Barbarous tortures and death, in the molt fhocking forms, awaited thefe who oppofed her will, or made the leaf ftand againft the reftoration of Popery. And among many other victims, the learned and pinis Cranmer, archbithop of Canterbirr; who had been ane of the moll illuftrious inftruments of the Reformation in England, fell a facrifice to her fury. This odiouis feene of perfecution was happily concluded in the year 1553 , by the death of the queen, who left no ifte: and, as foor as her fisceeffor the lady Eitizabeth afeended the throne, ail thingrs affumed a new and a pleating alpect. This illuttrious princefs, whofe fentiments, counfels, and projess, breathed a fpirit fuperior to the natural fofteds and delicacy of her fex, exerted this vigorous and inanly fipirit in the defence of opprefed confcience and expiriarg liberty, broke anew the defpotic yoke of Papal authority and fuperfition, and, delivering her people from the bondage of Rome, efta= blifhed that form of relisious doctrine and ecclefiattical government which fill fubifts in England. This religious eftablifmment difiers, in forne refpects, from the plan that had been formed by thofe whom-Edward VI. had employed for promosing the canfe of the Refornation, and approaches nearer to the rites and difecipline of former times; though it is widely different, and, in the moll important points, entirely oppofite to the principles of the Roman hierarchy. Sce England, no 293, \& c .
The cauie of the reformation underwent in Ireland in $l_{\text {cland. }}^{48}$ the fame vic:ffitudes and revolutions that lind attended it in Ergland. When Henry VIII. after the abolition of the Papal authority, was declared fupreme head upor carth of the church of England, George Browin, a native of England, and a monk of the Auguitine order, whom that monarch had created, in the year 1535 , archbifhop of Dublin, began to act with the ntmolt vigour in confequence of this change in the hicrarehy. He purged the churches of his diocefe from fuperfittion in all its various forms, pulled down images, deftroycd relics, abolithed abfurd and idolatrous rites, and, by the influence as well as authority he had in Ireland, caufed the king's fupremacy to be acknowledged in that nation. Heniy fhowed, foon after, that this fupremacy was not a vain title; for he banifhed the monks out of that kingdom, conlifeated their revenues, and deftroyed their conrents. In the reign of Edward VI. till farther progrefs was made in the removal of Popifh fupertitions, by the zealous labours of bifhup Brown, and the aufpicious encomagement he granted to all who exerted themfelves in the caufe of the Reformation. But the death of this excellent prince, and the acceffion of queen Mary, had like to have changed the face of affairs in Ireland as much as in England; but her defigns were difappointed by a very curious adventure, of which the following account has been copied from the papers of Richard eart of Corke. " Qneen Mary having dealt fevercly with the Proteflants in England, about the latter end of her reign 42 figned a commiffion for to take the fame courfe with Curinus difo them in Ireland; and to execute the fame with greater appuis. force, the nominates Dr Cole one of the commiffioners. ment of a This Doetor coming, with the commifion, to Cheiler eof is S.us. G
ozland.

Reinema. ons his journer. the matyor of that eity hearing that her tic. majeny was fendian a mefferger into Irclund, and he being a chuschman, waited on the Doctor, who in dif. rourfe with the mayor taketh out of a cloke-bag a leather box, laying unto him, Here is a commilfion that Sail iaft the Fliretiis of Ireland, calling the Protettants by that title. The good woman of the houfe being will affected to the Proteflant religion, and alfo having a lirether maned Fohn Edmonds of the fame, then a ei. tizen in Dubli:, was much troubled at the Doctor's words; but watching her convenient time while the mayor wok tis leave, and the Doctor complimented himi duwn the itairs, the opens the box, takes the comniffion ont, and places in licu thercof a theet of paper with a pack of cards wrapt up therein, the huave of clubs wine faced unpermoit. 'Tle Doctur coming up to his chanber, fuppetiner nothing of what had been done, put up the box as form rly. The next day going to the water.fice, wind and weather ferving him, he Cails towards Ireland, :und la::ded on the 7 th of Octwber 1558 at I) ablin. Then coming to the calle, the Lond Irize.Walters being lord-deputy, fent for bim to come hefore him and the privy-conncil; who, corving in, after he had make a fpeech relating upon what account he caine over, he prefents the bux unto the lorddeputy; who caufing it to be opened, that the fecetary might read the commillion, there was nothing fave a pack of cards with the kuave of cluhs uppermoof ; which not only Itarted the lord-deputy and council, but the Doctor, who affured them he had a conmiffion, but knew not how it was grone. Then the lord-deputy made anfwer: Let us have another commiffion, and we will guffic the cards in the meanwhile. The Doetor being troubled in his mind, went away, and returned into England, and coming to the court obtained another commiffion; but flaying for a wind on the water-lide, news eame to him that the queen was dead: and thus God preferved the Proteftants of Ircland." (2neen Elizabeth was fo delighted with this fory, which was related to lier by lord Fitz-Walter on his return to Eingland, that fle fent for Elizabeth Edmonds, whofe hurband's name was Matter/bud, and gave her a penlion of 40 l . during her life.

In Scotland, the feeds of reformation were very early fown, by feveral nollemen who had refided in Germany during the religious difputes there. But for raany years it was fuppreffed by the power of the pope, feconded by inhurran liws and balbarous executions. 'The mofteminent oppofer of the lapal juriddiction was John Knox, a difciple of Calvin, a man of great ycal and invincible fortitude. On all occafions he raifed the drooping fpinits of the reformers, and encouraged them to go on with thcir work nutwithtanding the oppofition and treachery of the qucen-regent; till at laft, in 156 r , by the affltance of an Engliih army fent by Elizabeth, Popery was in a manner cotally extirpated throughout the bingdom. From this period the form of doctrine, worfhip, and difcipline eftablifhed by Calvin at Geneva, has had the afcendancy in Scothand. But for an account of the dificulties which the Scottifh reformers had to Hruggle with, and the nanner in which thefe were avercume, ecc. fee Scotland.

REFRACTION, in gencral, is the deviation of a moving body from its direet courfe, occafioned by the diferent denlity of the medium in which it moves; or it is a changc of direction occafioned by a body's falling obliquely out of one medium into another. The word is chicfly made ufe of with regard to the rays of light. Sce Optics (Index) at Refragion.

REFRANGIBILITY ©f Light, the difpufition of rays to be refracted. The term is chiefly applied to the difpolition of rays to produce different colours, according to their different degrees of refrangibility. Sce Chromatics and Optics paffrm.

REFRIGERATIVE, in medicine, a remed $\boldsymbol{y}$ which refrefhes the inward parts by cooling them; as clyfters, ptifans, \&c.

REFRIGERATORY, in chemiftry, a veffel lilled with cold water, through which the worm pafies in difillations; the ufe of which is to condenfe the vapours. as they pafs through the worn.

Cities of REFUGE, were phaces provided as $A / y-$ la, for fuch as againft their will fhould happen to kill a man. Of thefe cities there were three on each fide Jordan: on this fide were. Kedelh of Naphtali, Hebron, and S'chechem; beyond Jordan were Bezer, Golan, and Ramoth-Gilead. When any of the Hebrews, or flangers that dwelt in their country, happened to fpill the blood of a man, they might retirc thither to be out of the reach of the viok ent attempts of the relations of the deceafed, and to prepare for their defenec and juftification before the judges. 'The manlayer underwent two trials: fint before the judges of the eity of refuge to which he had ficd ; and fecondly before the judges of his own eity. If found guilty, he was put to death. with all the feverity of the law. If he was acquitted ${ }^{2}$. he was not immediately fet at liberty ; but, to iufpire $x^{-}$. degree of horror againit even involuntary homicife, he was reconducted to the place of refuge, and obliged to continue there in a fort of banifhment till the death of the high-prief. If, before this time, he ventured out, the revenger of blood might freely kill him; but after the high-prief's death he was at liberty to go where he pleafed without mo'eftation. It was neeefiary that the perfon who fled to any of the eities of refuge fhould underftand fome trade or calling, that he might not be burthenfome to the inhabitants. The cities of refuge were required to be well fupplicd. with water and neceffary provifions. They were alfo to be of eafy accefs, to have good mads leading to them, with commudious bridges where there was oecation.. The width of the roads was to be 32 cubits or 48 feet at leaft. It was further required, that at all clofs-ways direction-pols fhould be crected, with an infeription: pointing out the road to the cities of refuge. The 15th of Adar, which anfwers to our Fehruary moon, was appointed for the city magifrates to fee that the roads were in good condition. No perfon in any of thefe cities was allowed to make weapons, left the relations of the deceafed fhould be furnifhed with the means of gratifying their revenge. Deut. xix. 3. iv. 41.43 .5 . Jofh. xx. 7. Three other cities of refuge were conditionally promifed, but never granted. See Asylum.

REGU

REFUGEES, a term at finf applied to the French Proteftants, who, by the revocation of the edict of Nantz, were conftrained to fly from perfecution, and take refuge in foreign countries. Since that time, however, it has been extended to all fuch as leave their country in times of diftefs; and hence, fince the revolt of the Britifh colmies in America, we have freguently heard of American refugees.

REGALE, a magnificent entertainment or treat, given to ambafiadors and other perfons of ditinction, to entertain or do them honour.

It is ulual in Italy, at the arrical of a traveller of eminence, to fend him a regake, that is, a prefent of fweetmeats, fruits, \&c. by way of refrefhment.

REGALIA, in law, the 1 ights and prerogatives of a king. Sce Prerogative.

Regalia is alfo ufed for the apparatus of a coronation; as the crown, the fecpure with the crofs, that with the dove, St Edward's faff, the globe, and the orb with the crofs, four feveral fwords, \&e. - The regalia of Scotland were depolited in the eaftle of Edinburgh in the year 1707, in what is called the fowel Office. This room was lately opened by fome commiffioners appointed by the king, when the large chelt in whicly it is fuppofed they were placed was found ; but as it has not, that we have heard of, been opened, it is impoffible to fay whether they be there or not. It is very generally thought they were carried to the Tower of London in the reign of Queen Anne; and a crown is there fhewn which is called the Seoteh crown. Wo do not believe, however, that that is the real crown of Scotland; and think it probable that the Scoteh regalia are in the cheft which was lately found. If they are not there, they mult have been taken away by itealth, and either deftroyed or melted down, for we do not believe that they are in the Tower of London.

Lord of REGALITY, in Scots law. See Law, n clviii. 4 .

Court of REGARD. See Forest-Courts:
REGARDANT, in heraldry, fignifies looking beLind ; and it is ufed for a lion, or other beat, with his face turned towards his tail.

REGARDER, 'an ancient officer of the king's foreft, fworn to make the regard of the forelt every Jear; that is, to take a view of its limits, to inquire into all offences and defaults committed by the forefters within the foreft, and to obferve whether all the officers executed their refpective duties. Sce ForestLaqus.

REGATA, or Regatta, a fpecies of amufement peculiar to the republic of Venice. 'Ihis fpectacle has the power of exciting the greatef emotions of the heart, admiration, enthufiafin, a fenfe of glory, and the whole train of our beft feelings. The grand regata is only Exhibited on particular occafions, as the vitits of foreign princes and kings at Venice.

It is difficult to grive a juit ideal of the ardour that the notice of a reguta fpread among all clafles of the inhabitants of Venice. Prond of the exclulive privilege of riving fuch a fpectacle, through the wonderful local cirrumftances of their eity, they are highly delighted with naking preparations a long time before, in order to conzribute all they can towards the perfection and enjoyment of the fpectacle. A thoufand interelts are fonned and augmented every day ; parties in favour of the different comptiters who arc known; the protection of joung
notlemen gisen to the gondoliers in their fervice ; the thent defire of honours and rewards in the afpirants; and, in the midft of all this, that ingenious national indufig, which awakes the Venctians from their habitual indolence, to derive advantage from the bufnefs and acitation of the moment: all thefe circumptances united give to the numerous inhabitants of this lively city a degree of fpirit and animation which render it during that time a delightful abode in the eyes of the philofopher and the ftranger. Crowds of people fiock from the adjacent parts, and travellers joyfully repair to this feene of gaicty and pleafure.

Although it is allowable for any man to go and inferibe his name in the lift of combatants until the fixed number is complete, it will not be amifs to remark one thing, which has relation to more ancient times. The flate of a gondolier * is of much confideration among *See Gono the people; which is very natural, that having been the dolut primitive condition of the inhabitarts of this country. But, befides this general confideration, there are among then fome families truly diftinguifaed and refpected by their equals, whofe antiquity is acknowledged, and whe, on account of a fucceffion of virtuous men, able in their profeffion, and honoured for the prizes they have calried off in thefe contelts, form the body of noble gondoliers; often more worthy of that title than the higher order of nobility, who only derive their honvurs from the merit of their anceftors, or from their own riches. The confideration for thofe families is carried fo far, that, in the difputes frequently arifing among the gondoliers in their ordinary paffage of the canals, we fometimes fee a quarrel inflantly made up by the fimple interpolition of a third perfon, who has chanced to be of this reverend body. They are rigid with refpect to mifalliances in their familics, and they endeavour reciprocally to give and take their wives among thofe of their own mak. But we muit remark here, with pleafure, that thefe diltinetions infer no inequality of condition, nor ädmit any upprefion of inferiors, being founded folely on laudable and virtnous opinions. Diftinctiuns derived from fartune only; are thofe which always ontrage nature, and often vitue.

In general, the conpetitors at the great regatas are chofen from among theie tamilies of reputation. As foon as they are fixed upon for this exploit, they fpend the internediate time in prepaning themiches for it, by a daily affiduous and fatiguing exercife. If they are in fervice, their mafters during that time not only give them their liberty, but alio augment their wages. "This cultom would feem to indicate, that they look upon then as perfons confecrated to the honour of the nation, and under a lort of obligation to contribute to its glory.

At laft the great day arrives. Their relatiotis affemble together : they encourage the herocs, by calling to their minds the records of their families; the women prefent the oar, befeching them, in an epic tone, to remember that they are the fons of fanous men, whofe fteps they will be expeeted to follow : this they do with as much folemnity as the Spartan women prefented the fhisld to their fons, bidding them either return with or upon it. Religion, as practifed anorig the lower clafs of people, has its fhare in the preparations for this enterprize. They caufe mafles to be faid; they make vows to fome particular chureh; and they arm their boats for the conteft with the images of thore faints who are moll in voguc. Sorcerers are not forgotten

Regat2. upon this occaftun. For gonduliers who have loft the race often deckare, that wieheratt had been practifed araintl them, or cutainiy they muft have won the day. Such a feppofition pletents a pror fellow from thinkang ill of himifelf ; an opsmion that night be favourable to thim anthether time.

It he courfe is about four miles. The boats flart from a certain place, run through the great winding canal, which divides the tawn into two parts, turn round a picket, and, conning back the fane way, go and feize the prize, which is fixul at the acutelt angle of the arcat eanal, on the convex fide, fo that the point of fieht may he the more extended, and the prize feized .a the fight of the fyectators on both fides.

According to the number of competitors, different :acts are pcrformed in different forts of boats; fome with one oar and others with two. The prizes propofed are four, indicated by four flags of difierent colours, with the different value of the prizes marked upon them. Thefe flays, pullic and glorious monuments, are the prizes to which the compctitors particularly afpire. But the gorernment ahways adds to cach a genteel fum of moncy ; befides that the conquerors, immediately after the a clory, are furrounded by all the lenu nonde, who congratulate and make them prefents; after which they tro, bearing their honourable trophy in their hand, down the whole length of the canal, and receive the :pplasfe of innumerable fpectators.

Ihis grand canal, ever flriking hy the fingularity and beauty of the buildingrs which bonder it, is, upon theic occalions, covered with an infinity of fyectators, in all forts of barges, boats, and gondulas. The clement on which they move is fearcely fien; but the noife of oars, the aritation of amns and bodies in perpetual motion, indicate the fpectacle to be upon the water. At cestain ditances, on each fide of the finore, a:e erected little amphitheatres and fcaffoldings, where are placed bands of mufic ; the harmunious found of which predominates now and then over the buzzing nuife of the people. Some days before a reguta, one may fee on the gireat canal many boats for pleafure and entertaiment. The young noble, the citizen, the ricts artizan, mounts a long bost of fix or eight oars; his frondol ers decorated wieh rich and fingular dreffes, and the veffel iteclf adorned with various Ituffs. Among the notles there are always a number who are at a conliderable expence in thefe decorations; and at the regnta itfolf exlibit on the water perfonages of mythologic Rury, with the hernes of antiquity in their train, or مnnufe themfelves with repreferting the coftumi of dif. fcrent nations: in fhort, people contribute with a mad fort of magrinicence, from all quarters, to this mafque rade, the favourite divertion of the Venetians. But thefe great machines, not being the lefs in motion on aecount of their ornaments, are not merely deftined to grace the flow: they are employed at the regata, at ciery moment, to tange the people, to protect the courfe, and to keep the avenue open and clear to the groal. The nobility, kneeling upon cufhions at the fiow of their vefels, are attentive to thefe natters, and announce their orders to the moll reftive, by darting at them little gilded or filvered balls, by means of certain bows, with which they are furnified on this occafion. And this is the only appearance of cocrcion in the Ve ectian police on thefe days of the greateft tumult: nor is there to be feen, in any part of the city, a body of
guards or patrol, nor even a gun or a halbert. The mildnefs of the nation, its gaiety, its cducation in the habhit of believing that the government is ever awake, that it knows and fees every thing; its refpectul attacluncut to the body of patricians; the fole afpect of certain officers of the police in their robes, difperfed in difierent places, at onec operate and explain that tranquillity, that fecurity, which we fee in the midat of the greatelt confufion, and that furprifing docility in so lively and ficry a people. Regattas have been attenpted on the river Thanes, but they were but humble imitations of the Venctian amufement.

REGEL, or Rigel, a fised ftar of the firf magnitude, in Orion's left foot.

REGENERATION, in theology, the aft of being bom again by a firiritual birth, or the change of heart and life experienced by a perfon who forfakes a coufe of vice, and fincerely embraces a life of virtse and piety-

Regensburg, or Ratisbon. Sce Ratisbon.
REGENT, one who governs a kingdom during the minority or abfence of the king.

In France, the queen-mother had the regency of the kingdom during the minority of the king, undtr the title of quen-regent.
In England, the methods of appointing this guardian or regent have been fo various, and the duration of his power fo uncertain, that from hence alone it may be collected that his office is unknown to the common law ; and therefore (as Sir Edward Coke fay:, 4 Inft. 58.) the furelt way is to have him made by authority of the great council in parliament. 'The carl of Pembroke by his own authority aflumed in very troublefome tines the regency of Henry III. who was then only nine years old; but was declarech of faill arge by the pope at 17 , confirmed the great charter at $1 \times$, and took upon him the adminiftration of the goveroment at 20. A guardian and councils of regency were named for Edward III. by the parliament, which depofed his father ; the young king being then 15 , and not affumins the government till three years after. When Richard II. fuceeeded at the age of 11 , the duke of Lancatter took upon him the management of the kingdom till the parliamicnt inet, which appointed a nominal council to affilt him? Henry $V$. on his death-led named a regent and a guardian for his infant fon Henry VI. then nine months old : but the parliament altered his difpolition, and appointed a protector and council, with a fpecial limited authority. Both thefe princes remained in a fate of pupilage till the age of 23. Edward V. at the age of 133 was recommended by his father to the care of the duke of Gloucefer; who was declared protector by the privycouncil. The flatutes 25 Hen. VIII. c. 12. and 28 Hen. VIII. c. 7. provided, that the fuccefor, if a male and under 18 , or if a female and under 16 , fhould be till fuch age in the governance of his or her natural mother, (if approved by the king), and fucla other counfellors as his _majefty flould by will or otherwife appoint : and he accordingly appointed his to exccutors to have the governnient of his foa Edward VI. and the kingdon, which executors eleted the eall of Hartford protector. The flatutes 24 Geo. II. c. 24 , in cale the crown hould defcend to any of the children of Frederic lase prince of Wales under the age of 18 , appointed the princefs dowager;-and that of 5 Geo. III. c. 27. in cafe of a like delcent to any of his prefent majelty's children, empowers the king to name either the

## $R$ E G [53

queen or princefs doyiager, or any defienciant of king George II. refiding in this kingdom;-to be guardian and regent till the fuccefior attains fuch age, aflited by a council of regency; the powers of them ali being es prefsly defined and fet down is the feveral aets.
Regext alfo fignifes a profeffor of arts and fciences in a college, baving pupils under his care; bas it is generally reltrained to the lower claftes, as to rhetosic, logic, \&e. thofe of philofophy being called profefors. In the Euglifh univer fitics it is applied to Mafters of Arts under five years flanding, and to Doetors uider two, as non-regent is to thofe above that flanding.

REGGIO, an ancient and confiderable town of Italy, in the kingdom of Naples, and in the Farther Calabria, with an arclibithop's fee, and a wooilen manufactory. It is feated in a delightful country, which produces plenty of oranges, and all their kindred fruits. The oilives are exquilite, and high-flavoured. The town, however, can boalt of meither beautiful buildings nor ftrong fortifeations. Of its editices the Gothic cathedral is the only friking one, but it affords nothing curious in architecture. The citadel is far from formidable, according to the prefent fy flem of taeties; nor could the city walls make a long refiftarice againt any enemy but Barbary corfairs; and even thefe they' have not always been able to repel, for in 1543 it was laid in athes hy Barbarolla. Mulapha facked it 15 years after, and the defolation was renewed in 1593 by another fet of Tuiks. Its expofed litnation, on we very threfhold of Italy, and fronting Sicily, has from the carlieft period rendered it liaide to attacks and devaltation. The Chaleidians feized upon it, or, according to the ufual Greek plirafe, founded it, and called the coluny Rhiegion, frem a word that means a break or crack, alluding to its polition on the point where Sicily broke off from the continent. Anaxilas oppreffed its liberties. Dionyfius the Elder took it, and put many of the principal citizens to death, in revenge for their having refufed his alliance. The Campanian legion, fent to protect the Khegians, turned its fword againft them, maflacred many inhabitants, and tyrannized over the remainder, till the Koman fenate thought proper to punifh thefe traitors with exemplary feverity, though at the fame time it entered into league with the sevolted garrifon of Meffina. This - nion with a fet of villains, guilty of the fame crime, proved that no love of jultice, but political reafons alone, drew down its vengeance on the Campanians. It is about 12 miles S. E. of Meffina, and 190 S. by E. of Naples. E. Long. 16. c. N. Lat. 38. +

ReGGIO, an ancient, handfome, and ftrong town of Italy, in the duchy of Modena, with a ftrong citadel, and a bihop's fee. It bas been ruined feveral times by the Goths, and otber nations. In the cathedral are paiatings by the greateft mafters; and in the fquare is the flatue of Brennus, chief of the Gauls. The inbabitants are about 22,500 , who carry on a great trade in filk. It was taken by prince Eugene in 1706, and by the king of Sardinia in $\mathbf{1 7 4 2}$. It is feated in a fertile country to the fouth of the Apennines, and to the north of a fpacious plain, 15 miles north-welt of Modena, and 80 fouth-talt of Milan. E. Long. 11.5. N. Lat. 44-43. -The duchy of this name is bounded on the weft by that of Modena, and produces a great deal of filk, and belongs to the duke of Modena, except the marquifate of St Martin, which belongs to a prince of that name.

Regiam majestatem. See Law, n ${ }^{5}$ clv. 3. Refiza REGICIDE, кiNG-kILLER, a word chiefly ufed Reginient. with us in fpeaking of the perfons concerned in the trial, Regiment. condemnation, and exccution, of king Charles I.

REGIFUGIUM was a fealt celebrated at Rome on the zath ef February, in cominemoration of the expulfion of Tirquinius Superbur, and the abolition of regal power. It was alio perforned on the $2 G$ th of May; when the king of the iacrinces, or Rex Sacrorum, offered bean fluur and bacon, in the place where the aftemblies worc held. The faerifice being over, the people hafted away with all fpeed, to denote the precipitate fight of King Tarquirs.

REGIMEN, the regulation of diet, and, in a more general fente, of all the non-naturals, with a view to preferve or rellore health. See Abstinence, Aliment, Food, Diet, Drink, and Medicine.

The vieifitude of excreife and reit forms alfo a neceifary part of regimen. See Exercise.

It is beneicial to be at reft now and then, but more fo frequendly to ufe exercife; becaufe iuaction readers the body weak and liftefs, and labour ftrengthens it. But a medium is to be obferved in all things, and too much fatigue is to be avoided: for frequent and violent exercife oierpowers the natural ftrength, and wattes the lody; but moderate exercife ought always to be ufed. before meals. Now, of all kinds of exercife, riding on horfeback is the moit convenient: or if the perfon be too weak to bear it, riding in a coach, or at leaft in a litter: next follow fencing, playing at ball, running, walking. But it is one of the incooveniences of old age, that there is feldom futficient ftrength for ufing bodily exercile, though it be extremely requifite for health: wherefore frictions with the flefh-brufh are neceffary at this time of life; which fhould be performed by the perfon himfelf, if pulfible; if not, by his fervants.

Sleep is the fiveet foother of cares, and reftorer of Atrength; as it repairs and replaces the walles that are made by the labours and exereifes of the day. But exceffive Ifeep has its inconveniences; for it blunts the fenfes, and renders them lefs fit for the duties of life. 'The proper time for-fleep is the night, when darknefs. and filence invite and bring it on: day-fleep is lefs refrehing; which rule if it be proper for the multitude to obferve, much more is the oblervance of it necefliary for perfons addicted to literary thudies, whofe minds and bodies are more fufceptible of injuries.

Regimen, in grammar, that part of fyntax, or conAruction, which regulates the dependency of words, and the alterations which one occafions in anotlier.

Regimen for Seamen. See Seamen.
REGIMENT, is a body of men, either horfe, foot?. or artillery, coinmanded by a colonel, lieutenant-colonel, and major. Each regiment of foot is divided into companies; but the number of companies differs: though in Britair our regiments are generally 10 companies, one of which is always grenadiers, exclufive of the two. independent companies. Regiments of horfe are commonly fix troops, but there are fome of nine. Dragoon reginents are generally in war-time 8 troops, and i: time of peace but 6. Each regiment has a chaplain, quarter-mafter, adjutant, and furgeon. Some German. regiments confift of 2000 foot; and the regiment of Picardy in Fraice condifted of 6000 , being 120 companies, of 50 men in each company.

Roneinen- Regine 's were fuft formed in lirance in the year
REGIOMONTANUS. Sec Meler.
REGION, in geography, a lage extent of land, ins- lanited by many people of the fame nation, and inchofed within certain limies or hounds.

The modern aftronmers divide the moon into feveral :crions, or large tracts of land, to each of which they give its proper name.

R:gox, in phyfislogy, is taken for a dirion of our atmofphere, which is divided into the upper, middle, and iower regions.

The upper region commences from the tops of the mountains, and reaches to the utmof limits of the attrofphere. In this recgion reign a perpetual, equable, calninefs, clearnefs, and ferenity. The middle region is that in which the clouds refide, and where meteors are formed, extending from the extremity of the lowed in the tops of the higheft mountains. The lowed region is that in which we breathe, which is bounded by the reflection of the fun's rays; or by the height to which they rebound from the earth. See Atmusprere and Ar.

AEthereal Reciov, in coffnography, is the whole eateut of the misiverfe, in which is included all the heasenly bodies, and even the orb of the fixed ftars.

Eilementary Region, according to the Aritotelians, is - Fphere terminated by the coneavity of the moon's orb, comprehending the atmoffere of the earth.

Regios, in anatony, a divifion of the human body, otherwife called cavily, of which anatomits reckon three, si/. the upper region, or that of the head; the middle region, that of the thorax or brealt; and the lower, the abdomer, or belly. See Anatomy.

Reglos, in ancient Rume, was a part or divifion of the eity. The regions were only four in number, ti.l Auguttus Cafar's time, who divided the city into fourtech; over each of which he fettled two furveyors, call. ed curatores vyarum, whon were appointed amually, and inok their divifions by lot. Thete fourteen regions containcd four hundred and twent P -four itreets, thirtyone of which were called greater or royal glecets, which began at the gilt pillar that flood at the entry of the open phace, in the midule of the city. The extent of thefe divifions varied greatly, fome being from 12000 or 13000 to 33000 feet or upwands in circumference. Authors, howecer, are not a morced as to the exact limits of each. The curatores viarum wore the purple, has tach two lichors in their proper divilions, had faves umticr them to take care of fires, that happened to break out. 'They had alfo two officers, called denunciatores, in each region, to give account of any diforders. Four aico-magifri alfo were appointed in each ftreet, who took care of the frects allotted then, and carried the orders of the city to each citizen.

REGISTLER, a public bowk, in which are entered and recorded memoirs, acts, and minutes, to be had recourfe to occafionally for knowing and proving matters of fact. Of thefe there are feveral kinds; as,

1. Regiter of deeds in Yorkhine and Middlefex, in which are regiftered all deeds, convejances, wills, \&ec. that affect any lands or tenements in thofe counties, which are otherwife void againtt any fubfequent purshafers or mortgagces, \&c. but this docs not extend to - ny copyhold citate, nor to leafes at a rack-rent, or
where they do ruct exceed 21 years. The regitoad $R$ mencrials muld be ingroffed on parchneant, under the hand and feal of fume of the granters or gramtecs, attelled by witneffes who are to prote the figutigy or feal. ing of shicto and the execution of the decd. But thefe regifters, which are confincel to two conatics, are in 3cotland general, by whish the laws of North Britain arc rendered very caly and regular. Of elefe there are two kinds; the one general, fixed at Ediuburgh, under the direction of the lord-regifter ; and the other is kept in the feveral fhires, ftewarties, and regalities, the clerks of which are obliged to tranfmit the regifters of their refpective courts to the general regifler.
2. Parih-regitters are books in which are regittered the baptifms, marriages, and burials, of eack parihh.

Registirs were kept both at Athens and Rome, in which were inferted the names of fuch childeren as were to be brought up, as foon as they were born. Marcus Aurchins requird all free perfons to give ia accounts of their cluildren, within. 30 days after the birth, to the treafurer of the empire, in order to their being depofited in the temple of Saturn, where the public acts were kept. Officers were alfo appointed as public regiters in the provinecs, that recourle might be had to their lith of names, for fettling dijutes, or proring any perfon's freedom.

Rkgister Ships, in commerce, are veftls which obtain a permiflion either from the king of Spain, or the conncil of the Indice, to traffic in the ports of the Spanim Wedt Indies; which are thus called, from their being regiftered before they fet fail from Cadiz for Buenos Ayres.

REGISTERS, in chemiftry, are lioles, or chinks with Itupples, contrived in the lides of furnaces, to regulate the fire ; that is, to make the heat more intenfe or remifs, by opening them to let in the air, or keeping them clofe to exclude $i t$. There are alfo regifens in the fteam-engine. See Stran-Endine.

REGISTRAR, an officer in the Englifh univerfities, who has the kecping of all the public records.

REGIUM, Regium Lepidi, Regium Lepilum, (anc. geog.) ; a town of Cifalpine Gaul, on the Via Emilia, fo called from ARmilius Lepidus, who was conful with C. Plaminius ; but whence it was furnamed Regium is altogether uncertaint Tacitus rclates, that at the battle of Bedriacum, a bird of an unufual fize was feen perching in a famous grove near Regium Lepidum. Now called Reggio, a city of Modena. E. Long. 11.o. N. Lat. 44. 45. Sec Reggin.

REGNARD (John Francis), one of the beft French comic writers after Moliere, was born at Paris in 1647. He had fcarcely finifled his Audics, when an ardent paffion for travelling carried him over the greatelt part of Europe. When he fetted in his own country, he was made a treafurer of France, and lieutenant of the waters and forelts: he wrote a great many comedies; and, though naturally of a gay gemius, died of chagrin in the $52 \mathrm{~d} y$ year of his age. His works, confinting of comedies and travels, were printed at Rowen, in 5 vols $12 \mathrm{mn}, 1732$.

REGNIER (Mathurin), the firt French poet who fucceeded in fatire, was born at Chartres in 1573. He was brought up to the church, a place for which his delaucheries rendered him very unfuitable ; and thefe by his own coafeffion were fo excelfive, that at 30 he hat
:o ali the infirmities of are. Yet he obtained a canonry ia the church of Chartres, with other benefices; and died in 16ty. There is a neat Flzevir edition of his works, $12 m \mathrm{mo}, 1652$, Leyden; but the moft elegant is that with notes by M. Broffette, 4to, 1729 , London.

Regnier des Marets (Seraphin), a French poet, born at Paris in $16_{3} 2$. He diftinguifhed himfelf early by his poetical talents, and in 168 \& was made perpetuel fecretary to the French academy on the death of Mezeray: it was he who drew up all thofe papers in the name of the academy againtt Furetiere: the king gave thin the priory of Grammont, and lie had allo an abbey. He died in 1713 , and his works are, French, Italian, Spanifh, and Latin poems, 2 vols; a French grammar; and an Italian tranflation of Anacreon's odes, with fome other tranflations.

REGNUM (anc. geog.), a town of the Regni, a people in Britain, next the Cantii, now Surry, Suffex, and the coaft of Hampliire, (Camden); a town fituated, by the Itinerary numbers, on the confines of the Belgx, in a place now called Ringruood, in Hampflire, on the rivulet Avon, running down from Solifbury, and abbut ten miles or more diftant from the fea.

REGRATOR, fignilies him who buys and fells any wares or victuals in the fame market or fair : and regrators are particularly defcribed to be thofe who buy, or get into their hands, in fairs or markets, any grain, fifh, butter, clieefe, fheep, lambs, calves, fwine, pigs, geefe, capons, hens, chickens, pigeons, conics, or other dead vietuzls whatfoever, brought to a fair or market to be fold there, and do fell the fame again in the fame fair, market, or place, or m fome other within four milcs thereof.

Regrating is a kind of buckifry, by which rictuals are made dearer ; for every feller will gain fomething, which mutt of confeguence enhance the price. And, in ancient times, both the engroffer and regrator were comprchended under the word foreflaller. Regrators are punihable by lofs and forfeiture of goods, and imprifonnent, according to the firft, fecond, or third offence, \& c .

REGENSBERG, a bandfome, though fimall town of Swifferlend, in the canton of Zurich, and capital of a bailiwick of the fame name, with a ftrong catlle ; feated on a hill, which is part of Meunt Jura. There is a well funk though a rock, ${ }_{3} 6$ fathoms deep.

REGULAR, denotes ans thing that is agrecable to the ruics of art : thus we fay, a regular building, verb, \&c.

A regular figure, in geometry, is one whofe fides, ald confequently angles, are equal; and a regular figure with three or four fides is commonly termed an equilateral triangle or fyuare, as all others with more fides are called regular polygons.

Regular, in a monaffery, a perfun who has tuken the vows; becaufe he is bound to obferve the rules of - she order he bas embraced.

RECULATION, a rule or order prcferibed by a fuperior, for the proper manarement of fome affair.

REGULATOR of a Watch, the fmall fring belenging to the balance; ferving to adjuft its motions, and make it go fafter or flower. Sec Waten.

REGULBlUM, or Regulitus, (Notitia Imperii); mentioned nowhere elfe more early: a town of the Cantii, in Britain. Now Reculver, a village on tles
roaft, near the iflard Thanet, towas
REGULUS (M. Attilivs), a conful during the frft Punic war. He reduced Brundufum, and in his fecond confulfhip he took 64 and funk 30 galle $\}$ s of the Carthaginian fieet, on the coatts of Sicily. Afterwards he landed in Africa; and fo rapid was his fuce-fs, that in a fhort time he made himelf mafter of about 200 places of coarequence on the ccaft. The Carthaginians fued for peace, but the conqueror refufcl to grant it ; and foon after he was defeated in a battle by Xanth:ppus, and 30,000 of his men were left on the field of battle, and 15,000 taken frifoners. Regulus was in the number of the captives, and he was carricd in triumph to Carthage. He was fent by the enciny to Rome, to propofe an accommodation and an exchange of prifoners; and if his commifion was unfucceffiful, he was bound by the moit folemn oaths to return to Carthage without delay. When he came to Rome, Rcgulus difuaded his countrymen from accepting the terms which the enemy propofed : and when his opinion had had due infuence on the fenate, Regulus retired to Carthage agreeable to his engagements. 'The Carthaginians were told that their offers of peace had been rejected at Rome by the means of Regulus; and therefore they prepared to punifh him with the greateft feverity. His eye-brows were cut, and he was expofed for fome days to the exceflive heat of the meridian fun, and afterwards confined in a barrel, whofe fides were everywhere filled with large iron 〔pikes, till he died ia the greateft agonies. His fufferings were heard of at Rome; and the fenate permitied his widow to inflict whaterer punifhment the pleafed on fome of the moft illuftrious captives of Carthage which were in their lands. She coutined them alfo in preffes filled with fharp iron points; and was fo exquifite in her cruelty, that the fenate interfered, and ftopped the barbarity of her punifhment. Regulus died about 251 years before Chrift.-Memmius, a Roman, made governor of Gicece by Caligula. While Regulus was in his province, the emperor wifhed to bring the celebrated ftatue of Jupiter Olympius by Phidias to Rome, but this was fupernaturally prevented; and according to ancient anthors, the Thip which was to convey it was deftroyed by kightning, and the workmen who attempted to remove the fatue were terrified away by fudden noifes.-A man who condemned Sejanus. - Rofcius, a man who held the confulhip but for one day, in the reign of Vitell:us.

Regulus, in chemiltry, an imperfect metallic fubftance that falls to the bottom of the crucible, in the. melting of ores or inpure metallic fubftances. It is the fincit or pureft part of the metal; and, according to the alchemifts, is denominated regulus, or little kiniz, as being the fint-born of the royal metallic blood. According to them, it is really a fon, but not a perfen max ; i. e. not yet a perfect metal, for want of time and proper nourifhnicht. To procure the regulus or mercurial parts of metals, \&c. flux powders are comnoonly $u$ fed; as mitre, tartar, \&c. which purge the fulphureous part adhering to the metal, by attracting and abforbing it to themfilucs.

Rfgulus of Antimony. See Chemistry, $\mathrm{n}^{\circ} 1252$ -1257; and fee Index there, at Antimony.

Recclu's of Atéenic. See Chemistry, io 1267 , Se. and $1285-129+$ The ancient procefs for making regulus

## RE C 150 1 $\quad$ R E G

tazgitue whlos of arfenic contifed in mising four parts of arfenic with two parts of black flux, one part of horas, and no part of flings of iron or of copper, and quickly futing the mixture in a crucible. After the eqeration is linillscd, aregulhs of aremic will be found at the bottom of the erueible of a white livid colour, and of comflumale fofdity. The iron and copper employed in this procefs are not intended, as in the operation for the martial regulus of antimony, to precipitate the arfenic, and to teparate it from fulphur er any other fubtance; for the white alenic is pure, and nothing is to be taken from it; but, on the contrary, the inflamnable principle is to lec added to reduce it to a regulus. The true ufe of thefe metals in the prefent operation is to unite with the terenlus of arfenic, to gise it more body, and to prevent its entire diflipation in vapours. Hence the addition of iron, while it procures thele advantages, has the incenveniency of altering the purity of the regulu3: for the metallic fubftance ubtained is a regulus of arfenie allayed with iron. It may, however, be puritied from the iron by fullimation in a clofe vefel; by which ope1ation the regulifed arfenical part, which is very whatile, is fublimed to the tup of the veffel, and is feparated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certaio, that in this kind of reetification the regulus of arfenic does rot carry along with it a certain quantity of iron; for, in general, a volatile fubftance raifes along with it, in fublimation, a part of any fixed matter with which it happened to be united.

Mr Brandt propofes another method, which we believe is preferable to that defribed. He direets that white arfenic fhould be mixed with foap. Inftead of the foap, olive-oil may be ufcd, which las been found to facceed well. The mixture is to be put into a retort or glafs matrafs, and to be diftilled or fublimed with fire, at firft very moderate, and only fuffcient to raife the cil. As the oils, which are not volatile, cannot be dintiled but by a heat fufficient to burn and decompofe them, the oil therefore which is mixed with the arfenic undergoes thefe alterations, and after having fenetrated the arfenic thoroughly is reduced to a coul. When no more oily vapours rife, we may then know that the oil is reduced to conal. Then the fire mult be increafed, and the metallifed arfenic will be foon fublimed to the upper part of the veffel, in the infide of which it will form a metallic cruit. When no more fublimes, the veffel is to be broken, and the adhering cruft of regulus of arfenic is to be feparated. The regulus obtained by this firt operation is not generally perfect, or not entirely fo, as a part of it is always envercharred with fuliginons matter, and another part las not enough of plitogiton; which latter part ad heres to the inner furface of the cruft, and forms grey or hrown cryftals. 'This fublimate mult then be nixed with a lefs quantity of oil, and fublimed a fccond time like the firt: and even, to obtain as good regulus as may be made, a third fublimation in a clofe veffel, and withnut nil, is neceflary. During this operation, the wil which rifes is more fetid than any other empreseumatic oil, and is admoft infupportable. This fmell certainiy paceeds from the arfenic ; the fmell of which is exceediegly itrong and difagreeable when heated.

Regulus of artenic made by the method we have deScrilsed, and which we comider as the only one which
is purce, hes nil the propertics of a femimetal. It has metallic egravity; opacity, and luftre. Its colour is white and livid, it tamifies in the air, is wery britte, lout much more volatile than any other femimetal. It catily lofes its infanmante principle, when foblimed in verfels into which the air has aceefs; the fublimate having the appearance ne grey flowers, which hy repeated fublimations become entirely white, and fimilar to white crytalline arfenic. When ragulus of arfenic is heated quickly and ftrongly in open air, as under a munle, it hurns with a white or bluilh ilame, and diffipates in a thick fume, which has a very fetid fmotl, like that of yarlic.

Regulus of arenic may be combined with acids ani molt metals. Sce Arsenic, $n^{\circ} 17$. We fhall only far ther obferve here, that, accordins to Mr Brand, in the Swedifh Niemoirs, the regulus of arfonic cannot be uoited with meremy. Although the phenomena exhibited by white arfenic and regulus of affenic in folutions and allays are probably the fame, yet an acenrate comparifon of thefe would deferve notice, efpecially if the regulus employed were well made; fur fome difierence mult procecd from the greater or lifs quar. tity of what in the old chemillry is called phlogitlon with which it is united. See Chemistrir, $11^{0} 1288$. \&c.

Regulus of Colati, is a femimetal lately difeoverei, and not yet perfectly well known. It receives its name from cobalt, becaufe it can only be extracted from the mineral property fo called. The procefs by which this femimetal is oltained, is fimilar to thofe grenerally ufed for the extraction of metals from their ores. The cobalt mult be thoroughly torrified, to deprive it of all the fulpbur and arfenic it contains; and the unmetallic earthy and flomy matters mult be feparated by wathing. The cobalt thus prepared is then to be mixed with double or triple its quartity of hlack flux, and a little decrepitated fea-falt; and mult be fufed either in a forge or in a hot furnace, for this ore is very difficult of fufion. When the fution has been watli made, we find upor breaking the crucible, after it has cooled, a metallic regulus covered with a feoria of a deep blue conlour. The regulus is of a white metallic colvor. The furface of its fracture is clofe and fmall-grained. The fonimetal is hard, but brittle. When the fulion has been well made, its furface appears to be carved with many convex threads, which crofs each other diverfely. As almoft all cobalts contain alfo bifmuth, and even äs much as of the regulus itfelf, this bifmuth is reduced by the fame operation, and precipitated in the fame mamer, as the regulus of cobalt ; for although thefos two metals are frequently mixed in the fame mincral, that is, in cobalt, they are incapable of uniting together, and are always found diffinct and fcparate frome one another when they are melted together. At the bottom of the crucible then we find both recrulus of cobalt and bifinuth. 'the latter, having a greater fpecific gravity, is found under the former. They may be feparated from each other by the blow of a hamener. Bifmatis may be eality diftinguifned from the regulus of cobalt, not only from its fituation in the crucible, but alfo by the large thaning facets which appear in its fracture, and which are very different from the clofe afhcoloured graiu of regilus of colvalt.

This femimetal is more difficult of fufion than any other;

## R E I [

zulue other : is lefs cafly caleinable, and much lefs wolatile. lits calk is grey, and more or lefs brown ; and when fufed with vitrifiable matters, it changes into a beautiful blue glafs ealled fralt. This calx, then, is one of thofe which prefurse always a part of their inflammble principle. It is foluhle in acids, as the regulus is. This regulus is foluble in vitriolic, marine, nitrous acids, an? in aqua-regia, to all which it communicates colours. The folution in vitriolic acid is reddifh ; the foution in marine acid is of a fine bluifh-green when liot, and its colour is almoft totally effaced when cold, but is eafily recoverable by heating it, without being obliged to sincork the bottle containing it. This folution of the calx of regulus of cobalt is the bafis of the fympathetic ink ; for without marine acid this ink cannot be made. All the folutions of regulus of cobalt may be preeipitated by alkalis; and thefe precipitates are blne, which colour they retain when vitrified with the frongeft fire.

Not only fympathetic ink, but alfo regulus of cobalt, may be made from the zafire commonly fold; which is nothing elfe than the calx of regulus of eobalt mixcd with more or lefs pulverifed fints. For this purpofe we muth feparate as well as we can the powder of flints from it, by wafhing, as M. Beaumé doce, and then reduce it with black flux and fea-falt. Regulus of cobalt feems ineapable of uniting with fulphur : but it eafily unites with liver of fulphur ; and the union it forms is fo intimate, that M. Beaumé could nut §eparate thefe two fulstances otherwife than by precipitation with an acid.

Many curious and interefling remarks are Atill to be difcovered concerning this fingular femimetal, and we may hope to receive further information from the endeavours of chemifts who have undertaken the examination of it. M. Beaumé particularly has made confiderable experiments on this fubject, part of which he communicates to the public in his Courfe of Chemitry, and from whom we have borrowed the moft of the above obfervations. See Chemistry, n ${ }^{\circ}$ 12g4, \&c.

REHEARSAL, in mufic and the drana, aneeflay or experiment of fome compofition, generally made in private, previous to its reprefentation or performance in public, in order to render the actors and performers more perfect in their parts.

REICHENBERG, in Bohemia, 95 miles weft of Prague, 205 north-wett of Vienra, N. Lat. 50. 2. E. Long. 12. 2 2. is only remarkable as the place where the Pruffian army defeated the Auftriais on the 2 I f of April 1757. The Auftrian army, commanded by Count Konigfeek, was poted near-Reichenberg, and was attacked by the Pruffians under the command of the prince of Brunfwick Bevern. The Prufians were 20,000, and the Auftrians 28,000: the action began at half after fix in the morning, when the Pruffian lines were formed, and attacked the Auttian cavalry, which was ranged in three lines of 30 fquadrons, and their two wings futtained by the infanitry, which was polled among felled trees and intreneliments. The Autrians had a village on their right, and a wood on their left, where they were intrenched. The Pruffian dragoons and grendiers cleared the intrenchment and wood, and entirely ronted the Auftrian cavairy; at the farne time, the redoubts that covered Reichenberg were taken by General Leflewitz; and the Auftrians were entirely

Vol. XVI. Part I.
defeated. The Prufins had feven oficers and roz men killed; it officers and 550 men wounded. The Auftrians had 1002 men killed and wounded; 20 of their officers and qoo men taken prifoners. The action ended at eleven.

REIN-orer, or Tarandur, See Cervus, n' 4.
REINS, in anatomy, the fame with Kidneys. See Avatomy, $n^{\circ}$ iol.

Reivs of a Brille, are two long fips of lenther, fifened on ezell ficle of a curb or inafle, which the rider holds in his hand, to keep the horle in fubjection.

There is alio what is catild fale reirs; which is a lath of leather, pafcd fomet mes through the areh of the banguet, to bend the honfe's areck.

REJONNDER, in law, is the defondant's anfwer to the plaintiff s replication or reply. Thus, in the court of chancery, the defendant puts in an anfwer to the plaintiff's bill, which is fometimes alfo called an exception ; the plaintlf's anfiver to that is called a replication, and the defendant's anfwer to that a reioindre.

REL.AND (Adriar), an emiuent Orientalift, bora at Ryp, in North Ifolland, in $16 ; 5$. During three years itudy under Surenhutius, he made an uncommon progrefs in the Hebrew, Syriac, Chaldee, and irabic languages; and thefe languages were always his favourite ftudy. In $170 r$, he was, by the recommendation of King William, appointed profeffor of Oriental languages and ecelefiatical antiquities in the univerfity of Utrecht; and died of the timall-pox in 1718 . He wis diftinguifned by his modefty, humanity, aud learnins; and carried on a correfpondence with the mott eminent fcholars of his time. His principal works area 1. An excellent defeription of Paleftine. 2. Five differtations on the Medals of the ancient Hebrews, and feveral otber differtations on different fubjects. 3. An Introcluction to the Hebrew Grammar. 4. The An tiquities of the ancient Hebrews. 5. On the Mahometan Religion. Thefe works are all written in Latia.

nerally wied therwin are "remifed, releafed, and for ever quit-clained." And thefe releafes may cnure, either, 1. By vay of enlarging an elfote, or enlarger lefate: as, if there be teant for life or years, remander to anotior in fee, and he in remainder releafes all his right to the particular tenant and his heirs, this gives him the eftate in lice. Fut in this cafe the relefice inult be in folfefion of fome cllate, for the releafe to work upon; for if these be leffee for years, and, before Le cuters and is in polleftion, the leffor releafes to him all his right in the rewerfion, fuch releafe is soid for want of ponffion in the relefice. 2. By way of fay, the offote or mitter refate: as, when one of two coparechers selcafcth all lis rieglat to the other, this paffeth the lice-funple of the whole. And, in both theie cafes, these mutt be a privity of eftate between the relefor and relefice; that is, one of their eflates math be fo rulated to the other, as :o make but one and the fime ctate in law. 3. By way of paffirg a right, or mitter lo dsuit: as if a man be diftifed, and reicafeth to hie diffeifur all his rightit hereby the diffeifor acquires a new right, whel, changes the quality of his eflate, and renders that lawful which before was tortious. 4. By way of extinguifhnent: as if my tenant for life makes a leafe to A for life, remainder to B and his heirs, and I releafe to A ; this extinguifhes my right to the reverfion, and thall cmure to the advantare of B's remainder as well as of A's particular eftate. 5. By way of entry and feofinent: i:s if there be two joint diffeifors, and the diffeifec releafes to one of them, he thall be fole feifed, and fhall keep out his former compranion; which is the fame in a fect as if the diTcifee had entered, and thereby put an end to the difficin, and afterwards had enfeoffed one of the diffeifors in fee. And hereupon we may ablerve, that when a nan has in himfelf the poffeffion of lands, be mufl at the common law convey the freefold by feoffment and livery; which makes a notoriety in the country : but if a man las only a right or a fature intercit, he may convey that right or interch by a mere releafe to him that is in polfeflion of the Fnd: for the erecupancy of the releflice is a matter of fuffeient notorrety already.

RELEVANCY, in Scots law. See LAw, No cloxxui. \&я.

RELICS, in the Romifh church, the remains of the bodies or clothes of faints or martyrs, and the inAruments by which they were put to death, devoutly preferved, in honour io their memory ; kiffed, revered, ard carried in proceltion.

The refpect which was jufly due to the martyrs and teachers of the Chrillian saith, in a few ages increafed alroft to adoration; and at length arloration was really paid hoth to departed faints and to relies of holy men or holy things. The abufes of the church of Rome, with refpect to relics, are very flagrant and notorious. For fuch was the rage for them at one time, that, as F. Mabillon a ljenediEtinc jufly complains, the altars were loaded with furpected relies; numerous fpurious ones being everywhere offered to the picty and devo. sion of the faithful. He adds, too, that bones are often confecrated, which, fo far from belunging to faints, frobably do not belong to Chriliaus. From the catacombs numerous relics have been taken, and yet it is
not known who were the perfons interred therein. In the IItll century, relics were tried by fire, and thofe which did nut confume were reckoncd genuine, and the refl not. Relics were, and fill are, preferved on the altars whereon mals is celebrated; a fquare hole beins made in the middle of the altar, big enough to receive the hath, and herein is the relic depofited, bein! firf wrapped in red filk, and inclofed in a leaden box.

The Romaniths plead antiquity in behalf of relics: For the Mancliees, out of hatred to the Alfh, which they confidered as an cril principle, refufed to honour the relics of faints; which is reckoned a kind of proof that the Catholies did it in the firt ages.

TVe know, indeed, that the touching of linen elnths on relics, from an opinion of fome extraordinary virtue delived therefrom, was as ancient as the firt agee, there beices a hole made in the colfins of the 40 martyrs at Confantinople exprefly for this purpofe. The loonotring the ribics of faints, on which the church of Rone afterwards founded her fuperftitions and lucrative vife of them, as ohjects of devotion, as a kind of charms or amulets, and as infruments of pretended miracles, appcars to have originated in a very ancient cuftom, that prevailed among Clurifians, of aftembling at the cemcteries or burying-places of the martyrs, for the purpofe of commemorating them, and of performing divine worfhip. When the profeffion of Chiftianity obtained the protection of the civil government, under Conflantine the Great, flately churches were erected over their fepulchres, and their names and memories were treated with every poflible token of affection and refpect. I'his reverence, however, gradually exceeded all reafonable bourds; and thofe prayers and reliofous fervices were thought to have a peculiar fanctity and virtue, which were performed over their tombs. Hence the practice which afterwards obtained, of depofiting relics of faints and martyrs under the altars in all churches. This practice was then thought of fuch importance, that St Ambrofe would not confecrate a church becaufe it had no relics; and the council of Conflantinople in Trullo ordained, that thofe altars fhould be demolified under which there were found no rclics. The rage of procuing relics for this and other purpofes of a finilar nature, became fo exceffive, that in 386 the emperor 'Theodofius the Great was obliged io pafs a law, forbidding the people to dig up the bodics of the martyrs, and to traffic in their relics.

Such was the origin of that refpect for facred relics, which afterwards was perverted into a formal worthip. of them, and became the occafion of innumerable proceffions, pilgrimages, and miracles, from which the churels of liome hath derived incredible advantage. In the end of the ninth century, it was not fufficient to reverence departed faints, and to confide in their inter. ceflions and fuccours, to clothe them with an imaginary power of healing difeafes, working miracles, and delivering from all forts of calamities and dangers; their bones, their clothes, the apparel and furniture they had poffeffed during their lives, the very ground which they had touched, or in which their putrified carcales wese laid, were treated with a flupid veneration, and fuppofed to retain the marvellous virtue of healing all diforders. both of body and mind, and of defending fuch as poffefled them againlt all the aliaults and devices of the de-
vil. The confequence of all this was, that every one was cager to provide himfelf with thete falutary remedies ; confequently, great numbers undertonk fatiguing and perilous voyages, and fubjected themfelves to all forts of hardhips; while others made ufe of this delufion to accumulate their riches, and to inpofe upon the miferable multitude by the molt impious and fhocking inventions. As the demand for relics was prodigious and univerfal, the elergy employed the utmot dexterity to fatisfy all demands, and were far from being nice in the methods they ufed for that end. The bodies of the faints were fought loy fafting and prayer, illHituted by the priell in order to obtain a divine anfwer and an infallible direction, and this pretended direction never failed to accomplifh their detires; the holy carcafe was always found, and that always in conlequence, as they impioully gave out, of the fuggeftion and infpiration of God himfelf. Each difcovery of this kind was attended with exceffive demonitrations of joy, and animated the zeal of thefe devout feekers to enrich the church itill more and more with this new kind of treafure. Many travelled with this view into the Ealkern plovinces, and frequented the places which Chrift and his difciples had honoured with their prefence, that, with the bones and other facred remains of the firt heralds of the gofpel, they might comfort dejected minds, calm trembling confciences, fave finking fates, and defend their inhabitants from all forts of calamities. Nor did thefe pious travellers return home empty; the craft, dexterity, and knavery of the Grecks, found a rich prey in the ftupid credulity of the Latin relic-hunters, and made a profitable commerce of this new devotion. The latter paid confiderable fums for legs and arms, Rinlls and jaw-bones (feveral of which were Pagan, and fome not human), and other things that were fuppofed to have belonged to the primitive worthies of the Chrittian church; and thus the Latin churches came to the poffeffion of thofe celebrated relics of St Mark, St James, St Bartholomew, Cyprian, Pantaleon, and others, which they fhow at this day with fo much oftentation. But there were many who, unable to procure for themfelves thefe fpiritual treafures by voyages and prayers, had recourfe to violence and theft; for all forts of means, and all forts of attempts in a caufe of this nature, were confidered, when fuccessful, as pious and acceptable to the Supreme Being.Befides the arguments from antiquity to which the Papitts refer, in vindication of their worthip of relics, of which the reader may form fome judgment from this article, Bellarmine appeals to Scripture in fupport of $\dot{r}$, and cites the following paffages, viz. Exod. xiii. 19. ; Deut. xxxiv. 6. ; 2 Kıngs xiii. 2 1. ; 2 Kings xxiii. 16, 17, 18.; Ifaiah xi. 10.; Matthew xi. 20, 21, 22.; Acts v. 12-15.; Acts xix. 11, 12. See Porery.

The Roman Catholics in Great Britain do not acknowledge any wor fhip to be due to relics, but merely a high veneration and refpeit, by which means they think they honour God, who, they lay, has often wrought very extraondinary miracles by them. But, however proper this vencration and refpeet may be, its abule has been fo great and fo general, as fully to warrant the rejection of them altogether.

Relies are forbidden to be ufed or bronght into England by feveral ttatutes; and jutices of peace are enıpowcred to fearch houfes for popith books and relics,
which, when found, are to be defaced and burnt, \&e. 3 Jac. I. cap. 26.

RELICT', in law, the fame with W100w. Relevium), lignifies a certain fum of money, which the tenant, holding by knight's fervice, grand leyjeanty, or other tenure, (for which homage or lesal fervice is due), and being at full age at the death of his an. ceftor, paid unto his lord at his entrance. Sce Primer.

Though reliefs had their original while feuds were only life-eftates, yet they continued aiter feuds be. came hereditary; and were therefore looked npon, very juilly, as one of the greatell grievances of tenure : elpecially when, at the firt, they were merely arbitrary and at the will of the lord; fo that, if le pleafed to demand an exorbitant relief, it was in effect to difinherit the heir. The Englifh ill brooked this confequence of their new-adopted policy; and therefore William the Conqueror by his laws afcertained the relief, by directing (in imitation of the Daniih heriots), that a certain quantity of arms, and habiliments of war, fhould be paid by the carls, barons, and vavafours refpectively; and, if the latter had no arms, they fhould pay Icos. William Rufus broke through this compofition, and arain demanded arbitrary une. certain reliefs, as due by the feodal laws; thereby in effect obliging every heir to new-purchafe or redeem his land: but his brother Hemy I. by the charter be-fore-mentioned, reftored his father's law ; and ordained, that the relief to be paid foould be according to the law fo cftablifhed, and not an arbitrary redenption. But afterwards, when, by an ordinance in 27 Hen. II. called the affle of arms, it was provided, that every man's armour fhould defcend to his heir, for defence of the realm, and it thereby became impracticable to pay thefe acknowledgments in arms according to the laws of the Conqueror, the compofition was univerfally accepted of $100 . \mathrm{s}$, for every knight's fee, as we find it ever after eftablifhed. But it muft be remembered, that this relief was only then payable, if the heir at the death of his anceltor had attained his full age of 21 years.

To RELIEVE the Guard, is to put freth men upon guard, which is generally every ${ }^{2}+$ hours.

To Relieve the Trenches, is to relieve the guard of the trenches, by appointing thofe for that duty who have been there before.

To Kelieve the Sentries, is to put freflimen upon that duty from the guard, which is generally done every two hours, by a corporal who ataends the relict, to fee that the proper orders are delivered to the foldie: who relieves.

RELIEVO, or Relief, in feulpture, sic. is the projecture or ftanding out of a figure which arifes promirent from the ground or plane on which it is formed; whether that figure be cut with the chiffel, monlded, or call.

I here are three kinds or degrees of relievo, viz. alto, bafto, and dem-relievo. The alto-relievo, calicd alio h.jut-ieltef, or bish-reliexc, is when the fgure is formad atter nature, and projects as much as the lite. Euflorelievo, hads-iclief, or low-relievo, is when the work is raifed a little from the ground, as in medals, and the frutifpicces of buildings; and paticularly in the hifoH2

## 

Kellem, nies, fithers, fuliapes, arid other ompacata of friezes. Botr, 1 n . Then relievo is shen onc hatf of the figure rifes from the plare. When, in a bafforetievo, there are parts that fiane clear ont, detached soom the reft, the work is called at ${ }^{\prime}$ mim. ${ }^{1}$ ? .

In architectiti, the: relieve or frojecture of the oma. ments cherlit alwes to be proportioned to the magrio fude of the buidline it adorns, and to the ditanee at wiohe it is to lee vitwed.

Relavo, or R-\%if, in puintire, is the degree of boldpefs with which the figures leem, at a due dithance, to fond out frose the cround of the painting.
'I he rifiew depends much upon the depth of the fladow, and the flrength of the light; or on the height of the difetert cotouse, horecring on one another ; and particularly on the diffrence of the evlour of the firure from that of the grourd: thus, when the light is fo difpofed as to make the nearett parts of the figure advance, and is well diffufed en the mafles, yet infofibly diminibing, ated terminating in a large fpacious, thadow, boun lit of inenfbly, the welicio is faid to be bote, and the clair obfeuse well mederthoud.

cefined:

RELICION (RfligIo), is a Latin word derived, according to Cicern*, from rifger, "to re-confider;'"but accerding in Servius and mont modern grammanians, frome religare, "to lind fatt." "lhe teafon affigned by the Reman olator for deducing reingin from relegr, is in liefe words, "qui autom omnia, quer ad cultum deorum petincrert, diligenter retracterent, et tanouam relegereni, lunt dicti religinfi es relegendo." The reafon gisen by scrvius for his derivation of the worl is, "quod mentem religio religet." If the Ciceronian etymology be the true onc, the word reifgion will denote the diligent fudy of whaterer pertains to the worfip of the gods ; hent according to the other deriva. tion, which we are inclined to prefer, it denotes that obligation which we feel on our ninds from the relation And ${ }^{2}$ difir. in $^{\text {w }}$ which we ftand to rome feperior perwer. In either
guibre?
trem t.'co-
Lug\% calc, the import of the word reliopon is different from that of theoleg', as the former dignifies a number of praetical duties, and the latter a follem of fpeculative truths. Thalagy is therefore the Soundationi of redeion, or the frience from which it forings; for no man can fudy What pertains to the worfip of fuperior powers till he believe that fuch powers exith, or feel any obligation on his mind from a relation of which he knows nothing.

This idea of religion, as diftinguifted from theofogy, comprchends the duties not only of thofe more refince and complicated fyftems of theifm or polytheifm which have premiled among civilized and onightenced sations, fuch as the polytheifm of the Greeks and Romans, and the theifm of the Jews, the Mahometans, and the Chailtions; it compochends every fentiment of obligation which human beings have ever conceivel themflics under to ftiperior powers, as well as all the forms of worth:p which have ever heen practifd tbrough the work, howerer fantallic, immoral, or abSurd.
by cxalicd above them, by being made eapable of religions nurims and religiots fentiments. The flighteft knowledere of hiflory is fufficient to inform us, that reliston has ewer nad a powerful inflience in moukling the fentiments and manners of men. It has fometimes dirnithed, and Semetiones degiaded, the human character. In one region or age it has been favourable to civilization and refinement ; in another, it has ncealionally cramped the genius, depraved the morals, and deformed the mamers of men. 'The varictics of icligion are inminerable; and the members of every dithinct fect mutl view ell who differ from them as more or lefs miftaken with refpect to the molt inspentant conecrns of mat. Religion feems to be congenial to the heart of man; for wherever hmman focicty fubfints, there we are certain of fuding religions opinions and fentiments.

It mult, therefore, be an mportant fulject of fpeen- Chreeque lation to the man and the philufopher to confuder the cism-conorigiu of religion ; to inguire, How far religion in gene-coning te ra! has a terdency to promote or to injure the order and ligion. happisels of fociety ? and, abowe all, to examine, What paticular religion is belt calculated to produce an happy inthence on humanlife ?

We thall endeavour to give a fatisfactory anfwer to cach of thele queflions, referving to the article THEOLocy the corlideration of the dogmas of that particular religion which, from our prefent inquiries, fhall appear to be true, and to have the happief influcnce on human life and manners.

1. 'The foundation of all religion refts on the beliefor the of the exiftence of one or more fuperior beings, who govem the world, and upon whom the lappinefs or mifery of mankind ultimately depends. Ot this belief, as it may be faid to have been unierlal, there feem to be but three fources that ean be conccived. Either the image of Deity mult be famped on the mind of every human being, the favare as well as the fage; or the founders of fociefies, and other emineut perfons, tracing by the efforts of their own reafon vifible effects to invifible caufes, muft have difensered the exiftence of fuperior powers, and communicated the diforvery to their affociates and followers; or, lafly, the univatial belief in fuch powers mult hase been derived by tradition from a primxval revelation, communicated to the progenitors of the human race.

One or other of thele hypothefes inult be true, be-fodnes not caufe a fouth cannot be framed. But we have elfe-arife from where (Polythersus, $n^{\circ}$ 2.) examined the reafoning an crsinat which has been employed to ettablith the firtt, and thewn that it proceeds upou falfe notions of human nature. We flould likewife pronounce it contrary to fact, could we believe, on the authority of fome of its patrons, who are not athamed to contradict one another, that the Famtlchatkans, and other tribes, in the loweft fate of realoning and morals, have no ideas whatever of Deity. We proceed, therefore, to contider the fecond hypothefis, which is much more plaufible, and will bear a itricter feruting:

That the exiftence and many of the attributes of the Nor fom Deity are capable of rigid demonftration, is a truthreafoning; which cannot be controverted either by the philofopher or the Chriftian ; for "the invinhle things of Him from the creation of the world are clearly feen, being underHood by the things that are made, even His eternal power and Godhead, ${ }^{2 \prime}$ (fec Metaphysics, Part III.
ier chap. and Theologr, $n^{\circ}$ 8, 0.) Bit furely it would be rafh to infer, cither that every truth for which, when it is known, the ingeruity of man can frame a demonftration, is therefore ailcoacrable by human fagacity, or that all the truths which have been difcowered by a Nezuton or a Lorke might therefore have been discovered by untaught barbariuns. In mathematieal feience, there are few demonftrations of eafier compreleufion than that giren by Euclid, of the theorem of which Pythagoras is the reputed author ; yet no man ever dreaned that a boy capable of hoing made to underfand that theorem, mutt therefore have fagacity equal ro the fage of Samos; or that fucha boy, having never head of the relation between the hyputhenule and other two fides of a right angled triangle, wonld be likely to difoover that the feuare of the fomer is precifcly equal to the fum of the fupares of the latter. Juit fo it feems to be with the fundamental truths of theology: 'I liere can hardly be conceived a demontiation lefs intricate, or more conclufive, than that which the man of feience employs to prove the exitence of at leaft one God, poffeffed of boundels power and periect wiffon, And could we huppofe that the human race had remained without any knowledge of God in the world, till certain lucky individuals had by lome means or other made thenfolves mathers of the rules of logric, and the philofoplyy of caufes, there can be no doubt but that thefe individuals might have difcorered the exithence of fuperior powers, and communicated their difcovery to their affociates and followers. But this luppotition cannot be admitted, as it is contradicted by the evidence of all hitory. No nation or tribe has ever been found, in which there is not reafon to bulieve that fome notions were entertained of fuperior and invilible powers, bpon which depends the happinefs or mifery of mankind: and from the molt authentic records of antiquity, it is apparent that very pure principles of theifm prevailed in fome nations long before the rules of logic, and the philufupliy of caufes, were thought of by any people under heaven.

Thie fupfultion before us is inadmiffible upon other accounts. Sume modern philofophers have fancied that the original progenitors of mankiid were left entirely to themfelves from the moment of their cuation; that they wandered about for aqes without the ule of fpeech and in the lowelt fate of davagifm; but that they gradually civilized themfelves, and at late thumbled upon the contrivance of making articulate founds lignificant of ideas, which was followed by the invention of arts and fciences, with all the bleflings of religion and legination in their train. But this is a wild reverie, inconfitent with the phenomena of human nature.

It is a well known fact, that a $n: a n$ blind from his birth, and fuddenly made to fee, would not by means of his newly acquired fenfe difeern either the magnitude er figure or diktance of objects, but would conceive every thing which communicated to hin vibble fenfations as infeparably united to his ere or his mind (See Meтaphysics, $\mathrm{n}^{\prime \prime} 49-53$ ). How long his fenfe of fight would remain in fuch an imperfect ftate, we cannot pofitisely fay; but from attending to the vilible fenfations of infants, we are contident that wecks, if not months, clapfe betore they can diftinguifh one thing from anuther. We have indeed been told, that Chefelden's rit mous patient, though he was at firt in the flate which
we have defcribed, learned to ditinguih obje Ets by Religen fisht in the courfe of a few hours, or at the mut of a tcw days: but almutting this to a certain extc.t to be trie, it may ealily be accounted for: I he difeafe called a cataruäl feldum occalions total blindnefs: but let us fuppule the eyes of this man to have been fo completcly dimmed as to communicate no fenfation whate. ver upon being expofed to the rays of light; ftill we. muft remember that he had long poficfed the power of locu-motion and all his other fanles in perfection. Is was therefore well acquainted with the real, $i$. $\therefore$ the tangible margitude, firure, and dittance of many ohjects; and having been often toid that the things which he tonclaed would, upon luis acquitition of fight, communicate new ichlators to his minc, differing from each other according to the diltance, figure, aid masnitude of the objecis by which they were occutioned, he wobld foon lamn to infer the one from the other, and to ditinguifh nar objects ly neans of his light.

Ite progentors of the human race, however, it ket: to themiclves from the moment of their creation, hat not the fane advantages. When thicy firit upener! their cyes, they had neither moved, nor handled, nor heard, nor imelled, nor tafted, nor had a fingle idez or notion treafured up in their memories; but were in all thefe refpects in the flate of new born infants. Now we thould be glad to be informed by thole fages who lave conducied mankind through many gencrations in which they were mutun ef turfe pecus to that happy piried when they invented language, how the frit mun were taught to dilinguith objects by their fenfe of fight, and how they contrived to lize till this molt necellary faculty was acquired ? It does not appeas that nicn are like brutes, provided with a number of intincts which gnide them blindfuld and without experience to whaterer is neceffary for their own prefervation (fee Instinct) : On the contrary, all voyagers tell us that, in Itrange and unimhabited commeries, they dare not venture to talle unknown fruits unlefs they perecive that thefe fruits are eaten by the fowls of the air. But with. out the aid of initiact, or of fome cther guide equally to be depended upon, it is not in our power to conceive how men dropt Irom the hands of their Creator, and left from that inftant wholly to themfelses, could more a lingle ftep without the motl imminert danger, or ewen itretcin out their hands to lay hold of that food which ve may fuppofe to have been placed within sheir reach. 'They could not, for many days, ditin. grailh a precipice from a plane, a rock from a pit, or a niver from the meadows through which it rolled. And in fuch circumftaaces, how could they pofibly exift, till their fente of fight has acquired fuch perfection as to be a fuffecient guide to all their receffay motions? Can any conliftent theilt fuppofe that the God whofe goodnels is fo conpicuonfly difplayed in all his works, would leave his noblelt creature on earth, a creature for whofe comfort alone many cther creatures feem to bave been formed, in a dituation fo lorlorn as this, where his imnediate deftruction appears to be inevitable? No!. 'Ihs fuppolitoon cannot be formed, beceufe mankind tiil exit.

Will it thea be faid, that nhen Ged formed the firt Eut frem inen, he not only gave them organs of fenfation, and ata frem fouls capable of anving by difeipline at the exercife of repatatore reaton, but that he alio imprelied uron their minds adequate

## R E L

Reityi n. adequate idceas and notions of evcry objeet in which they were intecefled, brought all their organs, external and intesmal, at once to their utmoll pofible fate of perfection; taught them inil:meancouny the laws of reafoning; and, in one word, flored their minds with every

9
This miriot agree a'le to :he rringto of al les. branch of ufeful knowledge? This is indeed our own opinion: and it is perfacly agrecable to what we are tanght by the Hebren lawgiver. When God had formed Adlan and Ese, Nofes docs not fiy that he left them to acquire by llow degrees the wife of their fenfes and reafoning powers, and to dillinguifh as they could fruits that were falutary from thofe that were poifonous. No: he placed them in a garcen where every tree but one bore fruit fit for food; he warned them particulaly againt the finit of that tree; he brouglit before then the rarioue animals which roamed through the garden; he arranged thefe animals into their proper genera and fpecies; and by teaching Adam to give them names, he commmicated to the finft pair the elements of languare. This condefcenfion appears in every refpect worthy of perfect benevolence; and indeed without it the helphefs man and woman could not have lived owe whole weck. But it camot be fuppofed, that amidn fo much ufeful inftruetion the gracions Creator would neglet to communicate to his rational creatures the knowledge of himfelf; to inform them of their own origin, and the relation in which they flood to him; and to flate in the plainefterms the duties incumbent on them in return for fo much

10
The rinde af conmus. sucatimu
nos certair dy liaumb.

In what manner all this knowledge was communicatel, cannot be certainly known. It may have been in cither of the following ways conctivable by us, or in others of which we con form not conception. God may have miraculouily flom the minds of the firft pair with adequate ideas and notions of fenfible and intellectual objects; and then by air internal operation of his own Spirit have cmabled them to exert at once their rational faculties fo as to difcover his exiftence and attributes, logether with the relation in which as creatures they flood to him their Almighty Creator. Or, after rendering them capable of dittinguithing objects by means of their fenfes, of comparing their ideas, and undertandin.g a language, he nay have exhibited himfelf under forne fenible emblem, and conducted them by degrees from one branch of knowledge to another, as a fehoolmafter conducts lis pupile, till they were fufticiently acquainted with every thiug relating to their own hap)pincts and duty as rational, moral, and religious, creatures. In determining the queftion before us, it is of r.o importance whether infinite wifdom adopted either of thefe methods, or fome other different from them, both which we eannot conccive. 'The ordinary procefs i.s which men acquire knowlalye is, by the laws of their rature, extiemuly tedious. They canment reafon before thecir miads be flored with ideas and notions; and they cannot acquire thefe but through the medium of their fen'es long exercifed on external objeets.

Be ${ }^{51}$ Buewte. ther ister. H1/res'er
 sin lly a sexia:ios,

The progenitors of the human race, left to inform tincmflyss hy this procefs, mint have inevitably perithed before ther had acquired one dilitinet notion; and it is the fame thing with refpect to the orision of teligion, whether (iod peefrwad them from cielruation by an interal or ixterna.' revelation. If he floted their minds at once widh the rudiments of all ufful knowledg:, and
rendered them capable of everting their rational facul-
tics, fo as, by tracins effects to their caufes, to difcover his being and attributes, he reqeated himfelf to them as certainly as he did afterwards to Niofes, when to him he condefcended to fpeak face to face.

12
If this reafoning be admitted as fair and conclufive, Such a m and we apprehend that the srinciples on which it pro- velat on ceeds cannot be confidered as ill-fuunded, we have ad ${ }^{\text {ranlly }}$ be be vanced fo far as to prove that mankind mut have been havded "e originally enligitened by a revelation. But it is fcarcepofferity, neceflary to oblerve, that this revelation mult have been handed down through froceeding generations. It could not fail to reach the era of the deluge. It is not abfurd to fuppofe, that he who fpake from heaven to Adam, fpake alfo to Noah. And both the revelation which had been handed down to the poftcluvian patriarch hy tradition, and that which was communicated immediately to himfelf, would be hy him made known to his defeendants. Thus it appears almoft impofible that fome part of the rell:gious fentiments of mankind thould not have been derived from revelation; and that not of the religious fentiments of one particular family or tribe, but of atmot all the nations of the earth.

This conclufion, which we have deduced by fair rea-Tho authu foning from the benevolence of God and the nature of raty of the man, is confirmed by the authority of the Jewifl and Jewifin ant Chriftian Scriptures, which are entitled to more in- Chriutian plicit credit than all the other records of ancient hiff-\& tory.
When we revicw the internal and external evidence of the authenticity of thefe facred books, we cannot for a momert hefitate to receive them as the gemuine word of God. If we examine their internal character, they everywhere appear to be indeed the voice of Heaven. The creation of the world-the manner in which this globe was firt peopled-the deluge which fiwept away its inhabitants-the fucceeding views of the flate of mankind in the next ages after the deluge-the calling of Ahraham-the legilation of Mofes-the whole feries of events which befel the Jewifl nation - the pro-phecies-the appearance of Jefus Chrift, and the promulgation of his gofpel, as explained to us in the Scrip-tures-form one ferics, which is, in the highelt degree, illurtrative of the powcr, wifdon, and goodnefs of the Supreme Being.

While it numt be allowed that the human mind is ever prone to debafe the fublime principles of truc religion by enthuliafm and fuperflition, reafon and candour will not for a moment helitate to acknowledge, that the whole fylten of revelation reprefents the Supreme being in the moft fublime and amiable light : that, in it, religion appears effentially connected with morality: that the legilative code of Mofes was fuch as no legiflator ever formed and eftabliflied among a people equally mide and uncultivated: that the manners and morals of the Jews, vicious and favage as they may in fome inflances appear, yet merit a much higher claracter than thofe either of their neighbours, or of almolt any other nation, whofe circumftances and character were in other repects fimilar to theirs: that there is an imminite difference between the Scripture prophecies and the oracles and predictions which presailed among heathen mations: and that the miracles recorded in thofe writings which we efteem facred were attended with circumpanees which entitle them to be ranked in a very different

## R E L

ion. different ciafs from thofe which enthufiafm and impolture have fabricated among other nations. See Mrasclf and Prophecy.

But as the evidence of the divine origin of the primrval religion relts particularly on the authority of the firlt five books of the Old T'elament, it may be thought incumbent on us to fupport our reafoning on this fub. ject, by proving, that the author of thofe books was indeed infpired by God. This we fhall endeavour to do by one docilive argument; for the nature of the article, and the limits prefcribed us, admit not of our entering into a minute detail of all that has been written on the divine legation of Mofes.

If the miracles recorded in the book of Exodus, and the other witings of the EBehrew lawoiver, were really performed ; if the firt -born of the Egyptians were all cut off in one night, as is there related; and if the children of Ifrael patfed through the Red fea, the waters being divided, and forming a wall on their rizht hand and on their left-it muft neceflarily be granted, that Mofes was fent by God; becaufe nothing lefs than a divine power was fufficient to perform fuch wonderful works. But he who fuppofes that thofe works were never petformed, muft affirm that the books recording them were forged, either at the era in which the miracles are faid to have been wrought, or at fome fubfequent era: There is no other alternative.

That they could not be forged at the era in which
number of 600,000 , out of Egypt with a high hand; that they were led by a pillar of cloud through the day, and by a pillar of fire through the night, to the brink
of the Red fea, where they were almoft overtaken by and by a pillar of fire through the night, to the brink
of the Red fea, where they were almoft overtaken by the Egyptians, who had purfued them with chariots and horfes ; that, to make a way for their efcape, Mofes flretched out his rod over the fea, which was immediate$1 y$ divided, and permitted them to pafs through on dry ground, between two walls of water ; and that the Egyptians, purfuing and going in after them to the mid\& of the fea, were all drowned by the return of the waters to their ufual itate, as foon as the Hebrews arrived at the further fhore. Is it poffible now that Mofes or any other man could have perfuaded 600,000 perfons, however barbarous and illiterate we fuppofe them, that they had been witneffes of all thefe wonderful works, if no fuch works had been performed? Could any art or clo-
quence perfuade all the inhabitants of Edinburgh and fuch works had been performed? Could any art or elo-
quence perfuade all the inhabitants of Edinburgh and Leith, that they lad yefterday walked on dry ground through the Frith to Kinghorn, the watirs being divided and forming a wall on their right hand and on their left ? If this queftion muft be anfwered in the negative, it is abfolutely impofible that the books of Mofes, fupit is abfolutely impolible that the books of Mofes, fup-
pofing them to have been forged, could have been receired by the people who were alive when thofe wondere are faid to have been wrought.
Let us now inquire, whether, if they be forgeries, they could have been received as zuthentic at any fubfequent period; and we fhall foon find this fuppofition as impoffible as the former. The books claining Mofes for their author fpeak of themfelves as delivered by him, un zxxi. and from his days kept in the ark of the covenant ; an they affirm the niracles to have been wronght, a very few reflections will make incontrovertibly evident. Thefe books inform the people forwhofe ufe they were written, that their author, after having inflicted various plagues hey upon Pharaoh and his fubjects, brousht them, to the
atk which, upon this fuppofition, had no exitence prior Rellyis. to the forgery. They fpzak of themfelves likewife, not only as a hiftory of miracles wrought by their aathor, but as the ftatutes or municipal law of the nation, of which a copy was to be always in the poffeffor of the prielts, and another in that of the fupreme magiltate + . tDeut. Now, in whatever-age we fuppofe thefe books to have xviii. 19 . been forged, they could not ponibly be received as au. theritic ; becaule no copy of them could then be found cither with the king, with the prieits, or in the ark, though, as they contain the flatute law of the land, it is not conceivable that, if they had exitted, they could have been kept fecret. Conld any man, at this day, force a book of Atatutes for England or Scotland, and make it pafs upon thefe nations for the only book of flatutes which they had ever known? Was there ever fince the wrorld began a book of tham fatutes, and theie, roo, multifarious and burdenfome, impoled upon any pcople as the only fatutes by which they and their tathers had been rovemed for ages? Such a forgerg is evidently impofible.

But the books of Mofes have internal proofs of atithenticity, which no other books of ancient. ftatutes $\mathrm{e}=$ ver had. They not only contain the law, but alfo give an lifforical account of their enactment, and the reafons upon which they were founded. Thus they tell us $f$, that the rite of circumcifion was inftituted as a mark of the covenant between God and the founder of the Jewifi nation, and that the practice of it was enforced by the declaration of the Almighty, that every uncircumeifed man-child thould be cut off from his people. They inform us that the annual folemnity of the paffover was inftituted in commemoration of their deliverance when God new, in one night, all the firt-born of the Eryptians; that the firft-boen of Ifrael, both of men and beaft, were on the fame occafion dedicated for ever to God, who took the Levites inttead of the firt born of the men $f$; that this tribe was confeerated as priefts, by whofe hands alone the facrifices of the peop'e were thent, xit be ofitred; that it was death for any perfon of a differ-vif. ent tribe to approach the altar, or even to tonch the ark of the covenant; and that Aaron's buddin: iod was kept in the ark in memory of the wonderful deftruction of Korah, Dathan, and Abiram, for their rebellion a. gaint the pricthood.

Is it poffible now, if all thefe things had not been practifed among the Hebrews from the era of Mofes, with a retrofpect to the fignal mercies which they are faid to comnemorate, that any man or body of men could have perfuaded a whole nation, by means of forged books, that they had slways religiounty obferved fuch inftitutions? Could it have been pofible, at any period pofterior to the Exodus, to perfuade the Ifraelites that they and their fathers had all been circumcifed on the eighth day from their birth, if they had heen confcious themflves that they had never been circumeifed at all? or that the paffover was kept in memore of their deliverance from Egyptian bondage, if no fuch feflival was known among them ?

Eut let us fuppofe that circumecifon lad been practifed, and all their other rites and ceremonies olferved from time immemorial, without their lenowing any reafon of fuch inflitutions; fill it muft be confeffed that the forger of thefe books, if they were forged, conflucted his narrative in fuch a manner as that no man

## Gen. xvif.

Religion. of common finfe collal receive it as authentic. He fays it was death, to touch the ark! As fuch an aflirtion was never heard of lofore, and as the ritual be was endeavouring to make then theem facred was opprettively multifarions; furcly fome daring fpirit would have vertured to put his veracity to the telt by meving the ark and exen of(roint facrifices; and fuch a tect would at once lave expoful the impuflure. 'The hudding rod, too, and the hat of manna, which, thourh loug preferved, were never hefore heard of, mult have pronluced inquiries that could not fail to end in detection. Thefe books fpeak likewife of weekly fabbaths, daily facrifices, a yearly expiation, and monthly fctivals, all to le kept in remembrance of great things partieularly fpecified as clone for the nation at an carly period of its exiflchec. If this was not the cafe. could the forger of the books have perfuaded the peorfe that it really was fo? The enlighlitened reafeners of this nation would be offended were we to compare them with the ancient ifraelites; but furcly they will net fay that we are partial to that people, if we bring them to a level with the moft favage tribes of the Ruflian empire, who profefs Chrittianity? Now, were a brok to be forged containing an account of many flrange things donc a thoufaud years ago in Siberia by aut Apollonius, or any other philufopher or hero, numbers of the barbariars inhabiting that country would, we doubt act, give inplicit credit to the legend: But were the author, in contirmation of his marrative, to allim, that all the Sibelkns hat from that day to this kept facred the tirlt day of the week in memory of his heros that they had all beea baptiecd or circumcifed in his name ; that in their public judicatories they had fworn by his name, and upoo that very book which they had never feen before; and that the sery fame book wats their law and their golpel, by which for a thoufard $y$ cars back the actions of the whole people had been regulated-furely the grofed favage among then would reject with contempt and indignation a forgery fo palpable.

If this reafoning be couclufive, the hooks of Mofes mult indubitably be authentic, and he himfelf mult bave been infpired by the fpirit of God. But this point being eftablifhed, the quaftion refpecting the origin of the primxval religion is completcly anfuered. The writer of the book of Getelis informs us, that Adan and Niwah received many revelations from the Author of their being, and that their religion was founded on the principles of the pureft theifm. How it degenerated among the greater part of their defeendants into the grofeit idulatry, has been fhown at large in another place. Sce Polytheism.
II. Having thus anfwered the firf queftion propofed for difurfion in the prefert article, we now procsed to confider the fecond, and to inquire whether and how far religious fentiments have a tendency to injure or to promote the welfare of fociety ? This is a fubject of the utmof importance; and it we prove fuccefisful in our inquirics, we fhall be enabled to determine whether the govenors of mankind ought carefully to fupport religious chablifhments, or whether the philufopher who calls himfilf a citizen of the world, and profefies to feel the moll eager defire to promote the interctis of his fpecies, acts confiftently when he lubours to exterminate rcligion from anong men.
*1. Nico ler.
and virtuc; who has publified a book on the importance of religious opinions, ladours to fhow that religious ettablifhments are indifpenfally nceeffary for the maintenance of civil orde., and demonitrates hoiv weak the infuence of political inltitutions is on the morals of mankind; but he refufes to review the hiftory of paft aşes in order toadifcover how far religious opinions have actually been injurious or bencficial to the welfare of foeciety ; choofing rather to content himfelf with the refult of a ferics of metaphayfical difipuifitions.

We admine the ferit which induced a man who had frent a confidcrable part of his life amid the hurry of public buinefs, to become the fremuons advocate of religion; but we caunot help thinking that, notwithftanding the eloquence, the aentenefs, and the knowledge of manhind which he has difplayed, his refufing to admit the evidence of facts conceruing the infuence of religion on fuciety may polibly be regarded by its enemics as a tacit acknowledgment that the evidence of facts would be unfavourable to the eaufe which he wiffes to defend. The fallacy of general reafonings, and the inutility of metaphyics for the purpofes of life, are fo univerfally acknowledged, that they have long been the theme of declamation. Though the abufes of retigion, as well as the albufes of reafon, the perverfion of any ${ }^{18}$ of the principles of the human mind, and the mifate ef eve ace plication of the gifts of providence, may have oftenc crunt of produced offects hurtful to the virtue and the happinefo abufen of of maskind ; yet, atter tracing religion to a divine origin, we cannot, for a moment, allow ourfelves to think that the puimary tendency of religion mult be hoftile to the interetts of focicty, or that it is neceflary to view it abitractly in order that we may not behold it in an odions light. Often has the feeptic attacked religion with artful malice ; but perhaps none of his attacks has Leen fo filfully directed as that which has firtl ridiculed the abfurdity of the moll alffurd fupertitions, and afterwards laboured to prove that the moft abfurd fyttem of polytheifin is more favourable to the interefts of fociety than the purch and moft fublime theifm. InHances in which the abufe of religion had tended to deprave the human heart, and lad led to the mof thoeking crimes, have been affidnouly collected, and difplayed in all the aggravating colours in which eluquence could array them, till at length even the triends of true religion have been abafhed; and it has become a fahionable opinion, that nothing but fulf-interef or bigotry can prompt men to reprefent religion as the friend of ei.il order. But let us try if, by a candid confideration of what effects have refulted to focisty from religious prineiples, in general, without comparing thefe with regard to truth or falfehood, we can advance any thing to vindicate the character of religion.

Notions of Deity in gencral, of various orders of divinities, of their moral character, of their influence on human life, of a future ftate, and of the immortylity of the human foul, comtitute the leading articles of raligion. Let us view thefe together with the rites to whic!, they have given, rife; and we may perhaps be enabled to form fome well-grounded notions on this the firft important point.

1. Having proved that the firt religions principles entertained by men were derived from revelation, it is impufille to fuppofe that they could produce effects in-

## R I l

nir. jurious to faciety. If religion of any hind has ever leffened the virtue or difturbed the peace of men, it mult have been that religion which fprings from a beLief in a multitude of fuperior powers actuated by paffions, and of whom fome were conccived as benevolent and others as malicious beings. That fuch fentiments fhould have produced vices unknown in focieties where pure theifm is profeffed, will be readily admitted. Even the few atheifls who live in Chrillian or Mahometan countries are reftained by the lavys, loy a defire to promute the honour of the fect, and by many other confiderations, from indulging in practices which the example of the falle gods of antiquity fanctioned in their votaries. But in determining the prefent quettion, we muft not compare the virtues of the pagan world with thofe of individual ahheifts in modern Europe, but with thofe of nations profefling alleifin: and fuch nations are nowhere to be found. We can however eafily conceive, that in a fociety unawed by any notions of God or a future itate, no fuch lavs would be enacted as thofe which reftrain the fenfual appetites; of which the criminal indulgence was one of the greateit ftigmas on the pagan worfhip of antiquity. In fuch focieties, therefore, thofe vices would be practifed conflantly to which paganifm gave only in occational fanetion ; and many others, in fpite of the utmoft vigilance of human laws, would be perpetrated in fecret, which the moft profligate pagans viewed with horror. Confcience, though acting with all her energy, would not be able to command any regard to the laws of morality: No virtue would be known; focial order would be nowhere obferved; the midnight affaffu would everywhere be found: and in the general feramble maakind would be exterminated from the face of the earth.

The wort fpecies of paganifm, even that which prevails among favages who worlhip evil fpirits, affords greater fecurity than this. It is indeed fhocking to think that demons fhould be worfhipped, while deities, who are regarded as being all benevolence, are treated with contempt: And it has been atked, If the influence of fuch relicious fentiments on the moral practice of the idolaters mult not naturally be, to caufe them to treat their friends and benefactors with ingratitude, and to humble themfelves with mean fubmifion before a powerful enemy?

They do not appear to have produced fuch effects on the morality of the favages by whon they were entertained. The benevolent deities were neglected, only bucaule their benevolence was neceflary. A voluntary favour merits a grateful return : a defigned injury provokes refentment. But when you become, by accident, the inftrument of any man's good fortune, the world will fcace conider him as owing you any abligation : the flone which bruifes your foot excites only a momentary emation of refent ment. - Thofe gods who could not avoid doing good to men might not receive a profufion of thanks for their fervices; and yet a favour conferred by an hunaa benefactor commands the sarmeft gratitude. But thofe rude tribes appear to have had fo much wifdons as to confer a lefs abfolute malice on their malevoleat deities, than the benevolence which they attributed to their more amiable order of fuperior beings: though the latter could not pofirbly do them any thing but good, and that contantly; yet the former were not under an equaliy indifpulable neceflizy of

Voz. XVI. Pait I.
$65 ? \quad \mathrm{R} \quad \mathrm{L}$
perfesering ins deprefling them under calamities. On Religion. their malevolent deities they conferred a freedom of agency which they denied to the benevolent. No wonder, then, that they 'were more affiduousin paying their coart to the one than to the other. They might with as much propriety have thought of being grateful to the boar or flag whofe flefh fuppurted thern, as to deities who were always benevolent, becarife they could not poffibly be otherwife. Though negligent of fuch deities, this can fcarce be thought to have had any tendency to render them ungrateful to benefactors like themfelves. And yet, it mult not be difembled, that the American Indians, among whom fuch religious fentiments have been found to prevail, are faid to be very little fenifible to the emotions of gratitude. An Indian receives a prefent without thinking of making any gratcful acknowledrments to the beftower. He pleafes his fancy or gratihes his appetite with what you have given, without feeming to confider himfelf as under the fmalicfl obligation to you for the gitt.

It nay be doubied, however, whether this firit of ingratitude originates from, or is only collateral with, that indifference which refuies adoration and wormip to the benevolent divinities. If the former be actually the cafe, we mult acknowledge that thofe religious notions which we now confider, though preferable to generak atheifm, are in this refpect unfriendly to virtuc. But if the Indians may be thought to owe the ingratitude for which they are diftinguifhed to the opinion whieh they entertain of the exiftence of a benevolent order of deities, whofe benevolence is neceflary and involuntary, their ideas of the nature of their malevolent demons do not appear to have produced equal effects on their mo. ral fentiments. However fubmifive to thofe dreaded beings, they are far from fhowing the fame tame and cuwardly fubmifion to their human enemies: towards them they feen rather to adopt the fentiments of their demons. Inveterate rancour and brutal fury, inluman cruelty and ineonccivable cumning, are difplayed in the hoftilities of tribes at war; and we know not, after all, if even thefe fentiments do not owe fomewhat of their force to the influence of religion.

Yet let us remember that thefe fame Indians have not been always reprefented in fo unamiable a light ; or, at leaft, other qualities have been aferibed to them whicla feem to be inconliftent with thofe barbarous difpofitions. They have been defcribed as peculiarly fufceptible of conjugal and parental love ; and he who is fo cannot be deftitute of virtue.
2. But leaving the religion of favages, of which very The influo little is known with certainty, let us proceed to exa- ence ef mine what is the natural influence of that mixed fyltem Grcek and of theology which reprefents to the imagination of men Ruman poo a number of fuperior and inferior divinitics, actuated by the fame paifions and feelings with themfelves, and often making ufe of their fuperior power and knowledge for no other purpofe but to enable them to violate the laws of moral order with impunity. This is the celebrated polytheifm of the Greeks and Romans, and muft ether nations of antiquity (fee Polytheisia). Could its intluence be favourable to virtue?

At a firlt view every perfon will readily declare, that apparently fuch a fy tem muft have been fiieridly to profigacy. If friendiy to you commit the government of the univerfe, and the profligacje infpection of human fociety, to a fet of beings who are

## R E L

Relipion, often difpofed to regard sice with a no lef favourable eye than virtue, and who, though there be an ctablifh. ed order by which vintue is diferiminated from vice, and right from wrong, yet feruple not to violate that order in their own conlưt you cannot expect them to require in you a degree of reatitude of which they themfelves appear incapable. A Mercury will not difcourage the thiewith arts of the trader; a Bacchus and a Venus cannot froun upon debauchery; Mars will behold with favage delight all the crueltics of war. The Thracians indced, one of the molt barbarous nations of antiquity, whofe ferocity was little if at all inferior to that of the Indians who have heen ditinguihed as canibals, was the fovourite nation of Mars; among whon Alood his palace, to which he repaired when about to monnt his chariot, and ann himfelf for batile. Even Jupiter, who had been givity of fo many acts of ty. ramical caprice, had been ensaged in fuch a multitude of amo:ous intrigues, and feemed to owe his elevated Atation as monareh of the Aky, not to fuperior goodnels or wifdom, but merely to a fuperior degree of brutal force, could not be fared as the avenger of crimes, or revered as the impartial rewarder of virtues.

That this fyftena had a pernicious effect on morals,
2.3

But when contrafted with a-
theifm its effed, wele favuurable and that, as compared with pure theifm, it was injurious to focicty, cannot be denied; but yet, when contralted with atheifm, it was not without its favourable effects. It was fo connected with the order of faciety, that, without its fupport, that order could fearce have been maintained. The young rake might perhaps jufify limelf by the example of Jupiter, or Apullo, or forne other amorous divinity; the frail virgin or matron :ni ght complain of Cupid, or boaft of imitating Vemus; athd the thief might practife his craft under the patronare of Mercury: But if we take the whole fyttem torether, if we confider with what views thofe deities were puolicly wornipped, what temples were raifed, what rites inflituted, what facrifices offered, and what ferie confecrated; we thail perhaps find it neeeffary to acknowledge that the general effects even of that mixed and incuherent fyttem of polytheifm which prevailed among the Greeks and Romans were favourable to fociety. Jo fate a particular inftance; the ancilia of Mars and the fire of Vefta were thought to fecure the perpetuity of the Roman empire. As long as the facred ancile, which had been dropped from heaven for that benero!ent purpole, was fafely preferved in thole holy archives in which it had been depolsied; and as long as the facred fire of Vefta was kept burning, withcut being once extinguithed, or at leaft fuffered to remain for an inftant in that fate; fo long was Rome to fubinf and flourifh. And, however fimple and abfurd the idea which connected the profperity of a nation with the prefervation of a piece of wood in a certain place, or with the confant blazing of a flame upol iu: hearth ; yet no fact can be more certain, than that the patriotifm and enthufiatic valour of the Romans, which we fo much extol and admire, were, in many infances, owing in no incunfiderable degree to the veneration which they entertained for the ancilia and the veftal fire.
ferics of
was the influenc: of the facramentum adminitered to the fodiders when they enlifted in the lervice of their country? The promifes made, the idea of the powers invoked, and the rites performed on that occafion, pro. duced fo deep and for awful an imprefion on theit minds, that no danger, nor difteff, nor difcontent, could prompt them to violate their engagements. The reEpunfes of the oracles, too, though the dictates of deecit and impusture, were often of tingular fervice to thofe to wham thoy were uttered; when they infpired the watrior, as he marched out to battle, with the con. fidence of fuccefs, they commenicated to him new sto gour, and more heroic valour, by which he was attually crabled to gain, or at leaft to deferve, the fuscefs which they promiled. Again, when in times of publie diftels, the augur and the prief dire 7ed fome game to be celebrated, certain facrifices to be offered, or fome other folemnities to be performed, in order to appeafe the wrath of the offeniled deities; it is plain that the means were not at all fuited to accomplimithe end propofed by them ; yet ftill they were highly beneficial. When the attentio: of the whole people was turned en. tirely to thofe folemnities by which the wrath of heav ven was to be averted, they were rouled from that defpondency under which the fenfe of the publie diftrefs or danger might have fitherwife cauled then to fiuk: the public union was at the fame time more clofely ce. meated, and the hearts of the people lsuit together : and when perfuaded, that by propitiating the gods they had removed the caufe of their ditireds, they acquired fuch calmnefs and frength of mind as enabled them to take more direct and proper meafures for the fafety of the tlate.

Could we view the ancient Greeks and Komans acting in public or in private life under the intluence of that fyftem of fuperfition which prevailsd among them; could we perceive how much it contributed to the maintenance of civil order; could we behold Numa and L.ycurgus eftablithing their laws, which would otherwife have met with a very different reception under the fanction of divinitics; could we oblerve all the beneficial effects which arofe to communities from the celebration of religious ceremonies - we thould no longer hefitate to acknowledge, that thofe principles in the human heart by which we are fuceptible of religions fentiments, are fo eminently calculated to promote the happinefs of mankind, that even when perverted and abufed, their influence is ftill favourable.

The ideas which prevailed among the nations of the Their no heathen world concerning a future ftate of retribution tion of a were, it mult be confeffed, not very correct. Some of the pocts, we believe, have reprefented them in no un- cion inve fair light : both Honter and Virgil have conducted their rect; heroes through the realms of Pluto, and have taken occafion to unfold to us the fecrets of thufe dreary abodes. The fcenes are wild and fanciful; the rewards of the juft and virtuous are of no very refined or dignified nature: and of the punifhnents inflieted on the guilty, it is often hard to fay for what ends they could be inflicted; whether to correet and improve, or for the gratification of revenge or whim : they are often fo whimfical and unfuitable, that they cannot with any degree of propriety be afcribed to any caufe but blind chance or wanton caprice. A great dog with three tongues, a peevih old boat-man with a leaky ferry-boat, de-

## R E L

tian. manting lie freight in a furly tone, 3 and an usorious monarch, are objects too familiar and ludiereus not to degrade the dignity of thofe awful feenes which are reprefented as the manlions of the dead, and to prevent them from making a deep enough impreffion on the imagination. The actions and qualitice, too, for which Separted Ipirits were admitted into Elyfium, or doomed to the regions of fufficing, were not always of fuch a nature as uider a well-regulated government on earth would have been thought to merit reward, or to be worthy of punimment. It was not always virtue or wifiom which conciucted to the Elyfian fields, or gain. chadmifion into the fociety of the inmortal gods. Ganimete was for a very different reafon promotcd to be the sup-bearer of Jove; and Hercules and Bacchus could not furely plead that any merits of that kind ensitied them to feats in the commeik, and at the banquets of the immoreals. That doetrine, likewife, which reprefented mortala as hurried by fate to the commiffion of crimes, which they could no more abfain from com. mitting than the froord can avoid to ohey the impulfe of a powerfin' and furious arm plunging it into the breaft of an unrefiting antagunift, could not but produce effects unfavourable to virtue; and it afforded a ready excufe for the moll extravagant crimes.

Yet, after all, he who attentively confiders the idcas of the Greeks and Romans conccrning the moral government of the world and a future thate of rewards and punifhments, will probably acknowledge, that their general influence wult have been farourable to virtue and moral order. Alow them to have been incorreet and dafled with abfurdity; fitl they reprefent pusithments prepared for fuch qualitics and astionzas were injurious fo the welfare of iociety ; whillt, for thofe qualities which rendered men eminently ufeful in the world, they hold forth a reward. Though incorrect, their ideas concerning a future fate were exceedingly diftinct ; they were not vague or general, but fuch as might oe readily conceived by the imagiation, in all their circum. flences, aa really exiting. When a man is told that for fuch a deed he will be put to death, he may thudदer and be alarmed, and think of the deed as what he muft by no means commit; but place before him the frene and the apparatus fo: hiz execution, call him to behold fome other critainal mounting the fcaffold, adddrefing him lat words in a wild fcream of defpair to the furrounding fpectators, and then launching into cternity - his horror of the crinne, and his dread of the punifiment, will now be much more powerfully excited. In the fame manner, to encourage the foldier marching out to battle, or the mariner fetting fail under the proficee of a itorm, pronife not, merely in general terms, a liberal reward; be fare to fpecify the nature of the reward which you mean to beftow; defcribe it fo as that it may cule hold on the imagination, and may rife in ofpofition to the imayes of death and danger with which his courage is to be affailed.

If thefe phenomena of the human mind are fairly stated, if it be true that general ideas produce no very powerful efiects on the fentiments and difpofitions of the human heart, it muft then be granted, that though the feenes of future reward and punihment, which the heathens confidered as prepared for the righteous and the wicked, were of a fomewhat motley cumplexion; yez fill, as they wise difinct and even minute draughte,
they mul have been favourable to virtue, and contribus Rciiginu, ted in no inconfiderable degree to the fupport of civil order.

Another thing of which we may take notice under The notion this head, is the saft multiplicity of deities with which of deities the Greek and Roman mythology peopled all the re- pe pling gions of nature. Flocks and fields, and woods and $f$ a ufeful oaks, and flowers, and many much more minute objects, tentel.cy had all their guardian deities. Thefe were fomewhat when comcapricius at times, it is true, and expected to have ate ared with tention paid the:n, But yet the faithful frepherd, and the induitrious farmer, knew generally how to acquire their friendhip; and in the idea of deities enjoying the fame timple pleafures, partaking in the fame labours, protcting their poffentions, and bringing forward the fruits of the year, there could not but be fomething of a very pleafing mature, highly favourable to induftry, which would animate the labours, and cheer the fertivals, of the good people who entertained fuch a notion; may, would diffufe a new charm over all the feenes of the country, even in the gayeft months of the year.

From all of thefe particular oblervations, we think ourfelves warranted to conclude, that notwithftanding the mixed characters of the deities who were adored by the celebrated nations of antiquity; though they are in many inftances reprefented as conipicuous for wices and frolics; however vain, abfurd, and morally criminal, fome of the rites by which they were worhipped may have been, and however incorrect the notions of the heathens concerning the moral government of the univerfe and a future flate of retribution ; yet fill, after making a jult allowance for all thefe imperfections, the general in. fluence of their religious fyllem was rather favourable than unfavourable to virtue and to the order and hap. p:aefy of focicty.
It was not with 28 hators generilly ent goce reafon that the earliet legi- The advanintors generally endeavoured to eftablifh their laws and tage of conftisutions on the bafis of religion; government needs enababifining the fupport of opinion; the governed mult be im- ons the bapreffed with a belief that the particular eitablifhment fis of relito whith they are required to fubmit, is the beft calcu-gion. latce for their fecurity and happinefs, or is Supported on fome fuch folid foundation, that it mult prove impofihle for them to overturn it, or is connected with fomie awful fanction, which it would be the moft heinous impiety to oppofe. Of thefe feveral notions, the laft will ever operate on moft men with the moft Iteady influence. We are frequently bliad to our own intereft ; even when eager for the attainment of happinefs, we often refufe to take the wifet meafures for that cnd. The great bulk of the ptople in every community are fo little capable of reafoning and forefight, that the public minifter who fhall moft fteadily direct his views to the public good will often be the moll unpopular. Thofe laws, and that fyftem of govermment, which are the mof beneficial, will often excite the Atrongeft popular difcontents. Again, it is not always eafy to perfuade people that your power is fuperior to theirs, when it is not really fo. No one man will ever be able to perfuade a thoufand that he is ftronger than they all together: and therefore, in order to perfuade oue part of his fubjects or army that it is abfolutely neceflary for them to fubmit to him, becaufe any attempts to refift his power would prove ineffectual, a monarch or general mult take care firft to perfuade another part that it is for their in-

Reipinn. teref to fabmit to him: or to imprefs the whole with a belief that, seak and pitiful as he himfelf may appear, when viewed fingly in oppofition to them all, yet by the affifance of fome awful invifible beings, his friends and protectors, he is fo powerful, that any attempts to refift his authority mutt prove prefumptuous folly. Here, then, the aid of religion becomes requifite. Relistivus fentiments are the noft lappily calculated to ferve this purpofe. Scarce ever was there a fociety fomed, a mode of govemment ellablithed, or a c ce of laws framed and ena"ed, without having the religivus fentiments of mankind, their notions of the exiltenee of fuperior invible beings, and their hopes and fears from thofe beings, as its furdamental principle. Now, we believe, it is almont univertally agreed, that even the rudeft form of fociety is more favuurable to the hrppinefs of mankind, and the dignity of the human claracter, than a folitary and favage fatc. And if this, with what we have afferted concerning religion as the balis of civil government, be hoth granted, it will follow, that even the moft imperfect religious notions, the moft foolith and abfurd rites, and the wildeft ideas that have becn entertaincd concerning the moral government of the univerfe by fuperior beings, and a future Itate of retriburion, have been more advantageous than atheiim to the happinefs and virtue of human life. We have already gianted, nor can it be denied, indeed, that many of the religious opinions which prevailed among the an* cient leathens, did contribute, in fome degree, to the depravation of their morals: and all that we argue for is, that on a comparative view of the evil and the good which refulted from them, the latter mult appear more than adequate to counterbalance the effects of the former.

But if fuch be the natural tendency of thofe principles by which the human heart is made fufceptible of religions fentiments, that even enthuliafin and absurd fuperftition are produdive of beneficial eflects more than fufficient to counterbalance whatever is malignant in their influence on focity - furely a pure rational religion, the doctrines of which are founded in undeniable iruth, and all the obfervances which it enjoins, calculated to promote by their direct and immediate effeets fome ufutul purpofes, mult he in a very high degree conducive to the dignity and the happinefs of human nature. Indecd one collateral proof of the truth of any religion, which mut have very confderable weight with all who are not of opinion that the fyftem of the univerfe has been produced and hitherto maintained in order and exiftence by blind chance, will be its having 2 ftronger and more direct tendency than others to promote the interefts of moral virtue and the happinels of mankind in the prefent life. Even the teltimony of thoulands, cien iniracles, propheeies, and the fanction of remote antiquity, will fcates have fuflicient weight to perfuade us, that a religios is of divine origin, if its generd tendency appear to be rather unfavourable than advantageous to moral virtue.
III. We fhall therefore, in the next place, endervour to determine, from a comparative view of the effects produced on the character and circumftances of fociety by the moft eminent of thefe various fyftems of religion which have been in different ages or in different countries eflablimed in the world, how far any one of them has in this refpect the advantage over the ten; and, if the utility of a fytem of religion were to
be received as a teft of its truth, what particular fyRem might, with the belt reafon, be received as true, while the rell were rejected.
ift, The principle upon which we here fet out is, that all, or almolt all, fyltems of religion with which we are actuainted, whether true or falfe, contribute more or lefs to the welfare of fociety. But as one field is more fruitful, and one garden lefs overgrown with weeds than another; $f 0$, in the fame manner, one fyftem of religions opinions and ceremonies may be more happily ca.culated than others to promote the truelt interefls of mankind. In oppofition to thele philofophers Advant who are fo vehement in their declamations againft the of civili inequality of ranks, we have ever been of opinion, tion; that refnement and civilization contribute to the happinefs of human life. The character of the folitary favage is, we are told, more dignified and refpectable than that of the philofopher and the hero, in proportion as he is more independent. He is indect more independent; but his independence is that of a ftone, which receives no nourifhment from the earth or air, and communicates none to animals or vesetables around it. In point of happinefs, and in point of refpectability, we cannot hefitate a moment, let philofophers fay what they will, to prefer a virtuvus, enlightened, and polifhed Briton to any of the rudeft Cavages, the leaft acquainted with the reftraints and the fympathics of focial life, that wander through the wild forefts of the weftern world. But if we pie-And the fer civilization to barbarifm, we muf admit, that in frere of this view Chriltianity has the advantage over every other religious fy-fem whici has in any arge or conntry prevailed among men; for nowhere has civilization and ufeful fcicuce been carried to fuch a height as among Chritians.

It is not, indeed, in any confiderable degree that the view of abfurd fuperftitions of thofe rude tribes, who can fearce the varic be faid to be formed into any regular fociety, can con. "eleqinus tribute to their happinefs. Amony them the faculty pagin $n$ of reafon is but in a very low fate; and the moral prin- tans. ciple ufually follows the improvement or the depretion of the reafoning faculty. Their appetites and merely animal paffions are alinof their only principles of action: their firtt religious notions, if we fippofe them not to be derived from revelation or tradition, are produced by the operation of gratitude, or grief, or hope, or fear, upon their imaginations. And to the fe, lowever wild and fanciful, it is not improbable that they may owe fome of their carlieft moral notions. The idea of fuperior powers naturally leads to the thought that thofe powers have fome influence on human hife. From this they will mof probably proceed to fancy one fet of actions agreeable, another offenfive, to thofe beings to whom they believe themfelves fubject. And this, perhaps, is the firft difinction that favages can be fuppoled to form bet ween actions, as right or wrong, to. be performed or to be avoided. But if this be the cale, we muft acknowledge that the religious notions of the favage, however abfurd, contribute to clevate his character, and to improve his happinefs, when they call forth the moral principle implanted in his breaft.

But if the focial flate be preferable to a flate of wild. and folitary independence, even the rude fuperttitions of unenlightened tribes of favages are in anuther relpect beneficial to thole among whom they prevail. 'They ufually'

## R E L

uftully form, as has been already olferved under this article, the bafis of civil order. Religious opinions may lead the great body of the community to reverence fome particular fet of inflitutions, fome individual, or fome family, which are reprefented to them as peculiarly connected with the gods whom they adore. Under this fanction fome form of government is eftaBlifhed; they are taught to perform focial cuties, and rendered capable of focial enjoyments. Not only Numa and Lycurrus, but almof every legiliator who has fought to civilize a rude people, and reduce them under. the reftraints of legal govemment, have endeavoured to imprefs their people with an idea that they acted with the approbation, and under the immediate direccion, of fuperior powers. We cannot but allow that the rude fupertitions of early agce are pioducive of thefe advantages to fociety ; but we have already acknowledged, end it cannot be denied, that they are alfo attended with many unhappy effects. When we view the abfurdities internixed with the fytems of religion which prevailed among moft of the nations of antiquity, we cannot help lamenting that fo noble a principle of human nature as our religions fentiments fhould be liable to fuch grofs perverfion; and when we view the effects which they produce on the morals of mankind, and the forms of fociety, though we allow them to have been upon the whole rather beneficial than hurtful, yet we cannot but obferve, that their unfavour. able effects are by far more numerous than if they had been better directed. What unhappy effects, for inftance, have bcen produced by falfe notions concerning the condition of human fouls in a future flate. Various nations have imagined that the feenes and objects of the world of firits are only a fhadowy reprefentation of the things of the prefent world. Not only the fouls of men, according to them, inhabit thofe regions; all the inferior animals and regetables, and even inanimate bodics that are killed or deftroyed here, are fuppofed to pafs into that vifionary world; and, exifting there in unfubftantial forms, to execute the fame functions, or ferve the fame purpofes, as on earth. Such are the ideas of futurity that were entertained by the inhabitants of Guinea. And by thefe ideas they were induced, when a king or 'great man died among them, to provide for his comfortable accommodation in the world of fpirits, by burying with him meat and drink for his fubfiftence, flaves to attend and ferve him, and wives with whom he might Atill enjoy the pleafures of love. His faithful fubjects vied with each other in offering, one a fervant, another a wife, a third a fon or daughter, to be fent to the other world in company with the monarch, that they might there be employed in his fervice. In New Spain, in the iffand of Java, in the kingdom of Benen, and among the inlabitants of Iadoftan, fimilar practices on the fame occafion, owing no doubt to fimilar nutions of futurity, have been prevalent. But fuch practices as thefe cannut be riewed with greater contempt on account of the opinions which have given rife to them, than horror on account of their unhappy effects on the condition of thofe among whom they prevail. A lively impreffion of the enjoyments to be obtained in a future flate, together with fome very falfe or incorrect notions concerning the qualities or actions which were to entitle the departing foul to admiffion into the feene of thofe enjoy-
ments, is faid to have produced equally unhappy effects amons the Japanefe. They not only bribed their priefts to fillicit for them; but looking upon the enjoj-. ments of tise prefent life with difgut or contempt, they ufed to dath themfelves from precipices, or cut their throats, in order to get to paradife as foon as poffible. Varinus other fuperfitions fubifing anong rude nations might here be enumerated, as inftances of the perverfion of the relisious principles of the human heart, which render them injurious to virtue ard hapo pinefs. The aufteritics which have been pract:fed, chiefly among rude nations, as means of propitiating fuperior powers, are efpecially worthy of notice.When the favourite idol of the Banians is carried in folemn proceflion, fome devotees proftrate themfelves on the ground, that the clariot in which the idol is carried may run over them; others, with equal enthufiafm, dafh themlelves on fpikes faftened on purpofe to the car. Innumerable are the ways of torture which have been invented and practifed on themfelves by men ignorantly friving to recommend themfelves to the favour of heaven. Thefe we lament as inftances in which religious fentiments have been fo ill directed by the influence of imagination, and unenlightened erring reafon, as to produce unfavourable effects on the human character, and oppofe the happinefs of focial life. Though we have argued, that cven the moft abfurd fyflems of religion that have prevailed in the world, have been upon the whole rather beneficial than injurious to the dignity and happinefs of human nature; yet if it fhall not appear, as we proceed farther in our comparative view of the effects of religion on fociety, that others have been attended with happier effects than thefe fupertitions which belong to the rude ages of fociety, we may fcaree venture to brand the infidel with the appellation of fool, for refufing to give his affent to religious doctrines, or to aet under their influence.
zd, The polytheifn of the Greeks and Romans, and other heathen nations in a fimilar tate of civilization, we have already contidered as being, upon the whole, rather favourable than unfavourable to virtue; but we muft not partially conceal its defects. The vicious characters of the deities which they worfhipped, the incorrect notions which they entertained concernmg the moral government of the univerfe and a future retribution, the abfurdity of their rites and ceremonies, and the criminal practices which were intermixed with them, mult have altogether had a tendency to pervert both the reaforing and the moral principles of the human mind. The debaucheries of the monarch of the gods, and the fidelity with which his cxample in that refpect was followed by the whole crowd of the inferior deities, did, we know, difpofe the devout heathen, when he felt the fame palfions which had afferted their power over the gods, to gratify them without feruple. It is a truth, however, and we will not attempt to deay or conceal it, that the genius of the polytheifn of the Greeks and Romans was friendly to the arts; to fuch of them efpecially as are raifed to excillence by the vigorous exertion of a fine imagination; mufic, poetry, fculpture, architecture, and painting, all of thele arts appear to have been confiderably indebted for that perfection to which they attained, efpecially among the Greeks, to the fplendid and fanciful fytem of inythology which was. received amons that ingenieus people.-

## R E L

Nalbitor. rut we cannot give an equally faysurnbic account of its indleence on the feiences. There was little in that fypton that couid contribute to call forth reafon. We may grant indeed, that if reafen car be fo thocked with atifurdity as to be roufed id a more vigorons exertion ot her powers, and a more determined afertion of her rishts in confequence of furveying it ; in that eafe this fyfom of mythology might be favourable to the exersife and improvement of reafon; not otlierwife:

I'he comection of paganifm with murality was too jinperfect for it to produce any very important effect. on the morals of its votarics. Sacrifices and prayer, and temples and fellivals, not purity of heart and inlegrity of life, were the means preferibud for propitialing the favour of the deities adored by the Pagans, 'Ihcre were other means, toa, befides true heroifm and patriotifm, of gaining admiffion into the Elyfian fictds, or obtainine ar feat in the council of the gods. Xenophon, in one of the mof beautiful parts of his Memoirs of Socrates, reprefents Flercules wooed by Virtue and Pleafure in two fair female forme, and deliburating with much anxicty which of the two he thould prefer. 3ut this is the fiction of a philofopher defirous to im . prove the fables of antiquity in fuch a way as to render them truly ufeful. Hereutes does not appear, from the tales which are told us of his adventures, to have been at any fuch pains in choofng hia way of !!fe. He was reccived into the palace of Jove, without having occafion to plead that he liad through life been the fathful follower of that goddefs to whom the philofopher makes him give the preference ; his being the fon of Jove, and his wild adventures, were fufficient without nay other merits to gain him that honollt. The fame may be faid concening many of the other demi-gods and herocs who were advanced to heaven, or conveyed to the btefor ful fichds of Elyfurm. And whatever might be the good effeets of the retigion of Greece and Kume in ge. neral upon the civil and political eftablihments, and in fome fow inflances on the manuers of the people, yet ftill it muft be acknowtedged to have been but ill calculated to imprefs the heart with fuch principles as might in all circumftances direct to a firm, uniform, tcnor of virtuons conduct.

But after what has been faid on the charakter of this religion elfewhere (fee Polytheism), and in the fecond part of this article, we cannot without repetition enlarge farther on it here, Of the Jewin reliv gion, however, we have as yet faid little, having on purpole referved to this phace whatever we mean to introduce under the article, concerning its influence on fociety.

3d, When we take a general view of the circumfances in which the Jewih religion was eftablithed, the effeets which it produced on the character and fortune of the nation, the rites and ceremonics which it enjoined, and the ingular political inftitutions to which it gave a fanction, it may perhaps appear hard to deter. nine, whether it were upon the whole more or lefa beneficial to fociety than the polytheifm of the Egyptians, Grect:s, and Romans. But if fuch be the judge. ment which preconceived prejudices, or an hafly and carelefs view, have induced fome to form of this celcbrated fyttem; there are others who, with equal keennefa, and founder reafoning, maintain, that it was happily calculated, not only to accomplifh the great defign of
preparing the way far the promulgation of the Ceferl, Retion but likewile to render the Jows a more rcinged and vir. thous prople, and a better regulated community, than any neighbouring nation. To the firft place, the ater? butes of the Deity were very clearly exhibited to the Jews in the eitablifhment of their religion. The mio racles by which he delivercd then from fervitude, and condueted them out of Egypt, were Atriking demonftrations of hin power: that condefeenfon with which be forgave their repeated acts of perverfenefa and reted: lion, was a moft convincing proof of his tenevolence and the impartiality with which the obfersance and che violation of his taws were rewarded and gunifhel, even in the prefent life, might well convince them uf his juftice. A part of the laws which he dictated to Muo fes are of cternal nud univerfal obligation ; others of them were tocal and particular, fuited to the character of the Jews, and thcir circumtances in the land of C.4nam. The Jowible code, taken altogether, is not to bo confidered as a complyte fyltem of religion, or lawa calo culated for all countries and all agen of fociety. Wher we confider the expediency of this fytem, we muft take care not to overlonk, the defign for which the Jews are faid to lave been feparated from ofher nationa, the circumitances in which they hat lived in Egypt, the ch: ftoms and mannera which they had contracied by their intercourfe with the natives of that country, the mato ner in which they were to acquire to themfelyes fettle. ments by extirpating the nations of Canaan, the rant which they were to hold among the nations of Syria and the "adjacent comerries, together with the difficulty of reftraining a poople fo little civilized and enlighteno ed from the idolatrews worthip whith prevailed ameng their neighbours: All thehe circurnfancea were certainly to be taken into accounts and had the legifator of the Jews not atterded to them, his infitutions mult have remained in foree only for a mort period; nor could they have prodnced any lafting effects on the character of the nation. With a duc attention to thete circumitances, let us defcend to an examination of paro ticulare.
Although in every religion or fupertition that has The Gata prevailed through the wortd, we find one part of its inw bath, Ptitutions to conifit in the enjoining of certain feltivala to be celebrated by relaxation from labour, and the pero formance of certain ceremonies in honour of the gools: yet in none, or almof none befides the Jewith, do we find every feventh day ordained to be regulariy kept holy: One great end which the legifator of the Jews had in view in the infitution of the Sahbath was, to irnv prefs them with a betief that God was the maker of the uriverfe, In the carly ages of the warld a great gart of mankind imagined tire thara, the fun, the moon, and the orber planets, to be eternal, and confequently ober jeste highly worthy of adoration. To convince the Ifo raclites of the absurdity of this beliff, and prevent them from adopting that idolatry, Mofes taught them, that thofe conipicuous obje 9 a which the Gentile nations re. garded as cternal, and endowed with divine power and intelligence, were created by the hand of God; who. after bringing all things oht of nothing, and giving them form, ordcr, and hammony, in the fpace of fix days, yefted on the feventh front all his works. Varinus paflages in the Old Teftament concur to thow, that this war one great cod of ike infitution of the sabhatia.
jon, Sabbath. The obfervance of the Sabbat $\mathrm{l}_{1}$, and deteitation of idolatrous worfhip, are frequently inculcated together; and, arain, the breash of the Sabbath, and the wornip of ijuls, are ufually reprobated at the fame time. Anotler good reafon for the inticution of a Sabbath might be, to remind the Jews of their deliverance from bondage, to infpire them with humanity to frangers and domeftics, and to mitigate the rigours of fervitude.

The purpofes for which the other feftivals of the Jewifh religion were intituted appear alfo of fufficient importance. The great miraele, which, after a feries of other miracles, all directed to the fame end, finally effected the deliverance of the Jews out of Egypt : and their actual departure from that land of fervituse, might well be commenorated in the feaft of the paffover. To recal to the minds of pofterity the hiftory of their anceflors, to imprefs thein with an awful and grateful fenfe of the goodnefs and greatnefs of God, and to make them think of the purpofes for which his almighty power had been fo fignatly exerted, we:e furely good reafons for the inftitution of fuch a fellival. The fealt of Pentecolt celebrated the firf declaration of the law by Mofes, in the fpace of fifty days after the fealt of the paffover. It ferved alfo as a day of folemn thankgiving for the bleffings of a plenteous harvelt. On the featt of tabernacles, they remembered the wanderings of their anceltors through the wildernefs, and expreffed their gratitude to heaven for the more comfortable circumatarces in which they found themielves placed. The feaf of new moons ferved to fix their kalendar, and determine the times at which the other fellivals were to be celebrated; on it trumpets were founder, to give prablic notice of the event whicla was the caufe of the fethial ; no fervile works were performed, divine tervice was carefully attended, and the firt fruits of the month were offted to the Lord. The Jewifh legiflator limited his fellivals to a very fmall number, while the heathens devored a confiderable part of the year to the celebration of theirs. But we perecive the occafions upon which the Jewiff feftivals were celebrated to have been of fuitable importance; whereas thofe of the heathens were often celebrated on trifting or ridiculous occafions. Piety and iunocent recreation fhared the Jewifh felival; the feftivals of the heathens were chiefly devoted to debauchery and idlenefs. e fabba- The Helrews had other folemn feafons of devotion :ilee, and Every feventil year they refted from labour: they were
addition, that on the vear of the jubilee naves obtained therr fiecedum, and the lands reverted to the old proprieto:s. On the year of the jubilce, as on the Sabbatical jear, the lands were to relt uncultivated, and lawfuits were now to terminate. The chief defign of this inflitution appears to have been, to preferve the order of ranks and property originally ettablihed in the Ifebrew dtate. None but Ifraelites or circumefed converts could enjoy the benefit of this inflitution; nor could even thefe hope to regain their eftates on the year of the jubilee, if they fold them for any cher purpofe but to lupply their necelfiter. The law relative to ufury was evidently founded on the fame plan of polity with refpect to property. To alrnoft any other nation fuch a law, it mun be confeffed, would have been unfuitable and unjult: hut as the Jews were not defigned for a trading nation, they could have little occafion to borrow, unlefs to relieve diltuefs; and as an indulgence to people in fuch circumblances, the Jew was forbidden to exact ufury from his brother to whom he had lent masey.

The Jewith legilator, we may well think, would be of clean difpofed to adopt every proper method to prevent his beafte, and nation from falling away into the idolatry of heathen che plase nations. Probably one reafon of the dittinctions beoof workip. tweer clean bealts which they were permitted to eat, and unclean bealts, the eating of which they were taught to conficier as pollution, was to prevent then from convivial intercouffe with profane nations, by which they might be feduced to idolatry. We do not readily fit down at table with people who are fond of diftes which we regard with abhorrence: And if the Jews were taught to loathe the fleth of fome of thofe animals which were among the greaten delicacies of the Gentiles, they would naturally of confequence avoid fitting down at meat with them, either at their ordinary meals or at thofe entertainments which they prepared in honour of their deities; and this we may with good reafon conlider as one happy mean to preferve them from idolatry. Befides, the Jews were permitted, or rather injoined, to eat animals which the Gentiles reverenced as facred, and from which they religioully with-held all vivience. Goats, freep, and oxen, were worthipped in Esypt (fee Polythersm and Pav); and feveral learned writers are of opinion, that Moles directed his people to factifice and cat certain of the favourite animals of the Egyptians, in order to reniove from their minds any opinions which they might have otherwife entertained of the fanctity of thefe pretended deities. Many of the obfervances which Mofes injoincd with regard to fond, appear to have been intended to infire the Ifralites with contempt for the fuperflitions of the people among whom they had fo loag fejuarned. They were to kill the animal which the Egyptians worfhipped; to roalt the fleth which that poople ate raw; to eat the head, which they never ate; and to drefs the entrails, which they fet apart for divination. Thefe ditinctions concurred with the pecul:arities of their drefs, language, government, cuftoms, places, and times of worfhip, and even the natural fituation of their country, by which they were in a manner confined and fortified on all fides, to feparate them in fuch a manner from neighbouring nations, that they might efeape the infection of their idolatry. And if we reflect both on the degign for which Providence feparated the Ifialites from othy:

## TE I. [72] R E I

Fotizinn. nations, and on the probability that, in the fate of focicty in which mankind were during the carlier period of the Jewin hifory, the Jews, by mising with other nations, would : ather have been themfelves converted to ilolatry than have converted idolatrous nations to the worflip of the true God; we cannot but be fatisfied, that cven this, however it tnay at firl appear, was a benefit, not a difadvantage; and in the author of their

39
legilation wifdom, not caprice.

But not only in the diftinctions of meats, and between clean and unclean animals, does the legillator of the Jows appear to have laboured to fis a barrier between them and other nations which might preferve them from the contarion of idolatry - we thall not err, petlaps, if we aferibe many particulars of their worthip to this defign in the infitutor. The heathens had gods who prefided over woods, rivers, mountains, and valleys, and to cach of thefe they offered facrifices, and performed other rites of worfhip in a fuitable place. Sometimes the grore, fornctimes the mountain top, at other times the bank of the river or the brink of the fpring, was the feere of their devotions. But as the mity of the divine nature was the truth the mof earnefly inculcated on the children of Ifrael; fo in order to imprefs that truth on their minds with the more powerful efficacy, they were taught to offer their facrifiecs and other offerings only in one place, the place chofen by the Lord; and dcath was threatened to thofe who dared to difobey the command. To confirm this juea, one of the prophets intinates, that when idolatry thould be abolifhed, the worhhip of Cod thould not be confined to Jerufalem, but it would then Le lawful to worthip hin anywherc.

The whole inltitutions and obfervances of the Jewifh religion appear to have been deliened and happily calculated to imprefs the minds of the people with veneration aud refpect for the Deity. All the feftivals which either commemorated fone gracious difpenfation of his providence towards their ancellors, or ierved as days of thankfriving for the conttant returns of his goodnefs to thule who celebrated them, and all the other nites delogned to fortify them againft idolatry, ferved at the fame time to imprefs their hearts with awful reverence for the God of Jaenb. Various other particulars in the inflitutions of the Jewift economy appear to have been directed folely to that end. Into the mon facred place, the Holy of Holies, none but the high prielt was admitted, and he only once a year. No fire was ufed in facrifee but what was taken from the 'altar. Severe punifhments were on various occafions inflicked on fuch as prefumed to intermeddle in the fervice of the fanetwary in a manner contrary to what the law had direeted. All the laws refpectias the charneser, the circumflances, and the fervices, of the prielts and the Levites, appear plainly to have a fimilar tendency.

In compliance with the notions of Deity which naiurally prevailed among a grofs and rude people, though no viifible object of worhip was granted to the Jews, yet they were allowed in their wanderings through the sviddernefs to have a tabernacle or portable temple, in which the fosereign of the univerfe fometimes deigned to difplay fome rays of his glory. Incapable as they were of conceiving aright concerning the firitual nature and the omniprefence of the Deity, they might
pofibly lave thnught Jehovah carelcfs and indifferent about them, had they heen at no time favoured with a witible demonftration of his prefence.

The facrinicts in ufe among the Gentiles in their worfhij, of idols were permitted by the-Jewifh legiflator; but he directed them to be offered with views rery different from there with which the Gentiles facrificed to their idolo. Some of the facrifices of the Jewifh ritual were defigned to avert the indignation of the Deity; fome to expiate offences and purify the heart ; and all of them to abolif or remove idolatry. Lultrations or ablutions entered likewife into the Jewifh ritand; but tlefe were recommended and cujoined by Mores for purpofes widely difterent from thofe which induced the heathens to place fo high a vadue upon then. The heathens pract:fed them with magrical and fupertlitiou: ceremonies; but in the Jewith ritual they were intended fimply for the clanfing away of impurities and pollutions.

The theocratical form of government to which the Tenden: Jews were fubject, the rewards which they were fure of of the th receiving, and the punifhments which they were equally eracy an liable to fufier in the prefont life, had a powerful effect faneliva to semove foperflition and preferve them from idolatis, as well as to fupport all the focide virtues among them. They were pronifed a numeroue offspring, a land fowing with milk and honey, long life, and victory over their enemies, on the condition of their paying a faithful obedience to the will of their heavenly Sovereign; plague, famine, difeafe, defeats, and death, were threatened as the punifhments to be inflicted on thofe who violated his laws: and thefe fanctions, it mult be allowed, were happily accommodated to the genius of a rude and carnal-minded people, attentive only to prefent objects, and not likely to be influenced by remote and fpiritual confiderations.

There were other rites and prohibitions in the Mo-Riles an faic law, which appear to havegliad but little connection prohibiwith religion, morals, or policy. 'Thefe may be more tuons of liable to be objected againit, as adding an unneceffary lef, apps unti weight to a burden which, though heavy, might yet ty, have been otherwife horne in conlideration of the advantages connected with it. Even thele, however, may perhaps admit of being viewed in a light in which they hall appear to have been in no way unfavourable to the happinefs of thofe to whom they were enjoined. 'They appear to have had none of them an immoral tendency: all of them had, in all probability, a tendency to remove or prevent idolatry, or tu fupport, in fome way or other, the religious and the civil eflablimment to which they belonged.

From thefe views of the fpirit and tendency of the The whr ${ }^{44}$ Jewifh rclizion, we may fairly conclude it to have beenalmirabl happily calculated to promote the welfare of Cociety. ealeulate In comparing it with other relifrions, it is neceffary to por the reflect on the peculiar purpofes for which it was given ; iarended. that its two principal objects were to preferve the Jews a feparate people, and to guard them againt the contagion of the furrounding idolatry. When thefe things are taken into confideration, every candid mind acquainted with the hiftory of ancient nations will readily acknowledse that the whole fytem, though calculated indeed in a peculiar manner for them, was as happily ndapted for the purpofes for which it had been wifely and gracioufly intended, as it is poffible to inagine any
ligion. fuch fyttem to be. It would be unhappy, indeed, if, on a comparifon of pure theifm with polytheifm, the latter, with all its abfurdities, hould be found more beneficial to mankind than the former. The theifm of the Jews was not formed to be diffeminated through the earth; that would have been inconfiftent with the purpofes for which it is faid to have been defignied. But while the Jews were feparated by their religion from all other nations, and perhaps, in fome degree, fixcd and rendered ftationary in their progrefs towards refinement, they were placed in circumfances, in refpect to laws, and government, and religion, and nooral light, which might with good reafon render them the enry of every other nation in the ancient world.
IV. The Chriftian religion next demands our attention. It is to be confidered as an improvement of the Jewifh, or a new fuperitructure raifed on the fame bafis. If the effects of the Jewilh religion were beneficial to thofe among whom it was eltablifhed, they were confined almoft to them alone. But is the fpirit of Chriftianity equally pure and benignant? Is its influence equally beneficial and more diffufive than that of Judaifm? Does it really merit to have triumphed over both the theifm of the Jews and the polytheifm of the heathens ?

If we confider the doetrines and precepts of the Chrifian religion, nothing can be more happily calculated to raife the dignity of human nature, and promote the happinefs of mankind. The happinefs of the indisien ual is beft promoted by the exercife of love and gratitude towards God, and refignation to his providence ; of humanity, integrity, and good will towards men; and by the dus government of our appetites and paffions. Social happinefs again proceeds from the members of fociety entertaining a difinterefted regard for the public welfare; being actively induftrious each in his proper fphere of exertion ; and being ftrictly juit and faithful, and generoully benevolent in their mutual intercourfe. The tenor of the gofpel inculcates thefe virtues; it feems everywhere through the whole of the Chritian cude to have been the great defign of its Author to infpire mankind with mild, benevolent, and peaceable difpofitions, and to form them to courteous manners. Chritianity again reprefents the Deity and his attributes in the faireft light; even fo as to render our ideas of his nature, and the manner in which he exerts his power, confiftent with the mof correct principles of morality that can be collected from all the other religions that have prevailed in the earth, and from the writings of the moft admired philofophers. The ritual obfervances which Chrittianity enjoins are few in number, cafy to perform, decent, expreffive, and edifying. It inculcates no duties but what are founded on the principles of human nature, and on the relation in which men fland to God, their Creator, Redeemer, and Sanctifier ; and it prefcribes accurate rules for the regulation of the conduet. The affifance of the finit of God is promifed in this facred solume to thofe who affiduoufly labour to difcharge the duties which it enjoins; and it exhibits a friking example of fpotefs purity, which we may fafely venture to imitate. 'I he gofpel teaches that worldly aflietions are incident to both good and bad men; a doctrine lighly conducive to virtue, which confolcs us in dilteefs, prevents defpair, and cncourages us to perfift firmly in our integrity un.

VoL, XVI. Part I.
der every difficuity and trial. Chriftianity reprefents Relizion. all men as children of the fame God, and heirs of the fame falvation, and levels all diftinctions of rich and poor, as accidental and infignificant in the fight of him who rewards or punifhes with impartiality according to the merits or demenits of his creatures. This doctine is highly favourable to virtue, as it tends to humble the proud, and to communicate dignity of fentiment to the lowly ; to render princes and inferior magiftrates moderate and juft, gentle and condefcending, to their inferiors. It farher requires hufbands to be affectionate and indulgent to their wives, wives to be faithful and refpectful to their hufands, and loth to be true and conitant to each other. Such is the purity of the gofpel, that it forbids us even to harbour impure thonghts; it requires us to abandon our vices, however dear to us; and to the cautious wifdom of the ferpent it directs us to juin the innocent fimplicity of the dove. The Chriltian difpenfation, to prevent a perfeverance in immorality, offers pardon for the patt, provided the offender forfake his vicious practices, with a firm refolution to act differently in future. The fanctions of the gofpel have a natural tendency to exalt the mind above the paltry purfuits of this world, and to render the Chriftian incormptible by wealth, honours, or pleafures. The true Chriftian not only abftains from injuftice towards others, but even forgives thofe injuries which he himfelf fuffers, knowing that he cannot otherwife hope for forgivenels from God. Such are the precepts, fuch the fipirit, and fuch the general tendency of the gofptl. Even thofe who refuled to give credit to its doctrines and hiftory have yet acknowledged the excellence of its precepts. They have acknowledged, that " no religion ever yet appeared in the world of which the natural tendency was fo much directed to promote the peace and happinefs of mankind as the Chriftian; and that the gofpel of Chrift is one continued leffon of the ftricteft morality, of juitice, benevolence, and univerfal charity." Thefe are the words of Bolingbroke, one of its keeneft and molt infidious opponents. Without examining the effeets of this religion on fociety, we might almoit venture to pronounce with confidence, that a religion, the precepts of which are fo happily formed to promote all that is juit and excellent, cannot but be in the higheft degree beneficial to mankind. By reviewing the effects which it has actually produced, the favourable opinion which we naturally conceive of it, after confidering its precepts, cannot but be confirmed.

One circumftance we mult take rotice of as rather The virtues unfarourable to this review. It is really impoffible to it recom. do jultice to Chrittianity by fuch a difcumfion of its me- mends rits. The virtues which it has a natural tendency to unofen. produce and cherifh in the human heart, are not of a noify oflentatious kind; they often efeape the obfervation of the world. Temperance, gentlenefs, patience, benevolence, juttice, and general purity of manners, are not the qualities which moit readily attrakt the admiration and obtain the applaufe of men. 'Ilse man of Rots, whom Mr Pope has fo jufly celebrated, was a private charafter ; his rame is no w likely to live, and his sirtues to be known to the latef poiterity: and yet, however difinterefted his virtues, however beneficial his influence to all around him, had his character not attracted the notice of that cminent poet, his name

[^2]graclualiy foftersu: even barbarians have been formed to mildnefs and humanity : the influence of felfinnefs has been clecked and rellrained; and even war, amid all the pernicious imporements by which men have fought to render it more tentible, las affuned much more of the fpirit of mihlnefs and peace than ever cutered into it during the reigu of heathenifin.

If we review the hillory of mankind with a view to their political circumllances, we fhall find, that by fome means or other, it has happened, fince the time when the Gofpel was firt proached, that boih fyttems of legifhature and forms of goverument have been raifed to muck greater perfection, at leald in thofe parts of the word into whel the religron of Jefus has made its way, and obtained an eftablifhment.

The popular rovernment of the Romans, notwithfanding the multiplicity of their laws, and the inperfection of their political conllitution, was, no doubt, happily enourg adapted to promote the increafe of the power and the extenfion of the empire of Rome. In Grece there were various republies, the wifdom and impartality of whofe laws have been highly celebrated. But we appeliend that there is a fufficient number of well authenticated facts to warrant us to affirm, that fince Clnittianity has been propagated, and has had fufficient time to produce its full effeet on arts, manners, and literature, even under governments the form of which might appear lefs favourable than the celebrated models of antiquity to the liberty and happinefs of the people in general, thefe actually have been much better. provided for than under the laws of Athens or Sparta, or even of Rome in the days of the confuls. It is a jult and happy obfervation of Montelquieu, who has attibuted fo much to the ind sence of clinate and local circumlanees, that " the mildufs fo frequently recommended in the Gofpel is incompatible with the defpotic rage with which an arbitrary tyrant punifhes his fubjects, and excreifes himfelf in cruelty. It is the Chriflian religion (fars he) which, in fpite of the extent of empire, and the influence of climate, has hindered defpotifin from beiny eftablifhed in Ethiopia, and has carried into Africa the manners of Europe. The heir to the empire of Ethiopia enjoys a principality, and gives to other fubjects an example of love and obedienceNot far from hence may be feen the Mahometan fhutting up the children of the king of Senmaar, at whofe death the council fends to murder them in favour of the prince who afcends the throne. Let us fet before our eyes (continues that eloquent writer), in the third chapter of the 24th book of his Spirit of Laws, on one hand the continual maffacres of the kings and generals of the Greeks and Romans, and on the other the deftruction of people and cities by the famous conquerors Timur Beg and Jenohiz Kan, who ravaged Afia, and we fhall perceive, that we owe to Chriftianity in govermment a certain political law, and in war a certain law of nations, which allows to the conquered the great advantages of liberty, laws, wealth, and always religion, when the conqueror is not blind to his own intereft."

Thefe are the reflections of no common judge in this matter, but one who had long fudied the hiftory of nations, and obferved the phenomena of the various forms of fociety, with fuch fuccefs as few others have attained.

But

## R E L

But on no occation has the mild influence of Chrittianity been more eminently difplayed, or more happily exerted, than in foftening and humanizing the barbarians who overturned the Roman empire. The idolahuma. trons religion which prevailed among thofe tribes before ing bar- their converfion to Chriftianity, inflead of difpoling
rıan!. them to eultivate humanity and mildnefs of manners, contributed frongly to render them fierce and bloodthirfly, and eager to diftinguith themfelves by decds of favage valour. But no fooner had they fettled in the dominions of Rome, and embraced the principles of Chriftianity, than they became a mild and generous people.

We are informed bs Motheim, who was at pains to collect his materials from the moft authentic fources, that in the 10 th century Chrilian princes exerted themfelves in the conscrfion of nations whofe fiercenefs they had experienced, in order to folten and render them more gentle. The mutual humanity with which nations at war treat each other in modern times, is certainly owing, in a great meafure, to the influence of the mild precepts of the Gofpel. It is a fact worthy of notice ton, that during the barbarons ases, the fpirimai courts of juftice were more rational and impartial in their decifions than civil tribunals.

How many criminal practices which prevailed among heathen nations have been aholifhed by their converGon to Chriftianity ! Chritians of all nations have been obferved to retain the virtues and reject the vicious practices of their refpective countries. In Parthia, where polygame prevailed, they are not polygamilts; in Perfia, the Chritian father does not marry his own daughter. By the laws of Zoroaller the Perlians committed incoft until theyembraced the Gofpel ; after which period they abfained from that crime, and oblerved the duties of chaftity and temperance, as enjoined by its precepts. Even the polifhed and enlightened Romans were cruel and blood-thirty before the propagation of the Gofpel. The breaking of a glafs, or tome fuch trifling offence, was fufficient to provole Vidius Pollio to caft his flaves into fifh-ponds to be devoured by lampreys. The effulion of human blood was their favourite entertainment ; they delighted to fee men combating with beafts, or with one another; and we are infumned on refpectable authority, that no wars ever made fluch havock on mankind as the fights of gladiators, which fometimes deprived Europe of 20,000 lives in one month. Not the humanity of Titus, nor the wifdom and virtue of Trajan, could abulifh the barbarous fpectacle. However humane and wife in other inftances, in this practice thofe princes complied with the cuitom of their conntry, and exhibited fplendid thows of gladiators, in which the combatants were inatehed by pairs; who, though they had never injured nor offended each other, ytt were obliged to maim and murder one another in cold blood. Chriftian divines foon exercifed their pens argainlt thefe horrid practices; the Chriftian emperor Conftantine reflrained them by ediets, and Honorius finally abolifhed them. It would be tedious to proceed through an chumeration of particulars; but wherever Chriltianity has been propagated, it has conItantly operated to the civilization of the maniers of mankind, and to the abolition of abfurd and criminal practices. The Irifh, the Scotch, and all the ancient arhabitants of the Britilh ifies, were, notwithtarding

## R E L

their intercoure with the Romans, ride barbarians, till Religina. fuch time as they were couserted to Chriftianity. The -imhuman practice of expoling infant eashich once prevailed fo generally over the world, and till prevails among fome Pagan nations, even under very humane and enlightened legiflatures, jielded to the infuence of Chrifitanity.

Let us likewife remember, in honour of Chriftianity, I.earn rs that it has contributed eminently to the diffufion of much knowledge, the prefervation and the advancement of Chrifi- to learning. When the barbarians overfpread Europe, arits. what munt have become of the precious remains of polifhed, enlightened antiquity, had there been no other depolitaries to preferve them but the heathen priefts? We allow that even the Romifn clergy during the dark ages did not fludy the celebrated models of ancient times with much advantage themfelves, and did not labour with much affiduity to make the laity acquainted with them. It mift even be acknowledged, that they did not always preferve thofe nomuments of genius with fufficient care, as they were often ignorant of their real value. Yet, after all, it will be granted, it cannot be denied, that had it not been for the clergy of the Chriftian church, the lamp of learning would, is all probability, have been cntirely extinguihed, during that night of ignorance and barbarity in which all Etrope were buried for a long feries of centuries, after the irruption of the barbarians into the Roman empire.

Such is the excellence of the Chritian fygtem, and rhe benc. fuch its tendency to meliorate the human character, ficial influ= that its bencficial influence has not been confined to erce of thofe who have received its doctrines and precepts, and have profeffed themfelves Chriltians; it has even produ nity has exced many happy effects on the circumitances and the even to characters of Pagans and infidels, who have had oppor- thofe who tunities of bcholding the virtues of Chrittians, and havenotaced learning the excellence of the morality of the gofpel. 1:
Thofe virtues which diftinguihed the character of the apoftate Julian were firely owing in no inconfiderable degree to his acquaintance with Clriftianity; and it is an indeniable fact, that after the propagation of Chriftianity through the Roman empire, even while the purity of that holy religion was gradually debaled, the natuers of thofe Pagans who remaincd unconvertel became more pure, and their religions doctrines and worlhip lefs immoral and abfurd. - We might lere adduce a tedious feries of facts to the fame purpofe. Whenever Carifians have had any intercourle with Pagan idolaters, and have not concealed the laws of the gofpel, nur fhown by their conduct that they difregarded them, even thofe who have not been ceaverted to Chrittianity have, however, been improved in their difpulitions and manners by its influence. The emperor, whole cirtues we have mentioned as arifing, in a certain degree, from his acquaintance with Chritliani$t y$, in a letter to an Heatherr pontiff, delires him to turn his eyes to the means by which the fuperftition of Cluriftians was propagated: by kinduefs to ftrangers, by fanctity of life, and by the attention which they paid to the burial of the dead. He recommends an imstation of their sirtues, exhorts him to caufe the priefts of Galatia to be attentive to the worfhip of their gods, and authorifes him to ftrip them of the facerdotal function, undefs they obliged their ivives, children, and iersarts,

to pry attestion to the fame duties. He likewife cujuins warks of baneficence, defires the prictl to relieve the difreffect, and to build houfes for the accommodation of Arangers of whatever religion: and fays, it is a dilerace for Pagans to difregard thofe of their own relygion, while Chrithians do kind ofteres to ftrangers and enemies. This is indoed an eminent inflatece of the harpy infuence of Chriblanity even on the fentiments and manuers of thofe who regarded the Chrillian name

Upon the whole then, may we not, from the particulas here exhibited concerning the influence of this religion on the manners and happinefs of men in fociety, conclude that Chriftianty is infintely fuperim to the fuperftitions of Paganifm? as being in its tendency uniformly favonrable to the virtue and the lappinefs of mankind, and even to the fyllem of religion and laws delivered by Mofes to the children of Ifract: becaufe, while the religion of the Jews was calculated only for one particular nation, and it may almoll be faid for one particular flage in the progrefs of fociety, Cluritianity is an univerfal religion, formed to exert its happy inflaence in all ares and among all nations; and has a tendency to difpel the fhades of barbarifm and ignorance, to promote the cultivation of the powers of the human undertanding, and to encourage every virtuous refine-
V. Another religion, which has made and ftill makes a confpicuous figure in the world remains yet to be examined. The religion of Mahomet is that which we here allude to. Whether we confider through what an extenfive part of the globe that religion prevails, the political importance of the nations among whom it is profefled, or the friking peculiarity of character by which it is diftinguifned from all other religious fyttems--it is for all thefe reafons well worthy of particular notice. Like the Jewifh religion, it is not harely a fyllem of religious doctrines and general moral prccepts; it forms both the civil legillature and the religious fyftem of thofe nations among whom it is profeffed; and, like it too, it would appear to be calculated rather for one partictlar period in the progrefs of mankind from rudenefs to sefmement, than for all ages and all flates of fociety.

The hitory of its origin is pretty well known, and we lave had occation to enlarge upon it under a former article (fee Mahomet and Mahovetanismi). We are not here to trace the impoftures of the prophet, or to confider the arts by which he fo fucceiffully accomplifhed his defigns; but merely to confider the morality of his religion, ard its infuence on civil orler and the haplinefs of fociets.

If we view the flate of the nations among whom it ly tn agno- is ellablifhed, we cannct helitate a moment to declare rance, def- it friendly to isnorance, to defpotifm, and to impurity porifn, and of manners. The Turks, the Perfians, and the Malays, sosputisy are all Mahometans; and in revicwing their latiory and confolering their prefut flate, we might find a fuficient number of facis to jutlify the above affertion: and we auft not neglect to ublerse, that, as thofe nations are not known to have cver been fince their converfon to Mahometanifm under a much happier government, or in a much nwre civilized Alate than at prefent, it cannot be, with any degree of fairnefs, arghed, with refpect to Madometanifm as with refpeit to Ciu:idimil-
ty, that it is only when its influence is fo oppofed by other caufes as to prevent it from producing its full effects, that it does not conduct thofe focieties among which it is cllablifhed to an ligh flate of civilization and refinement.

One, and that by no means an inconfiderable, part of the Koran, was occafionaliy invented to folve fome difficulty with which the prophet found himfelf at the time perplexed, or to help him to the gratification of his ruling pafions, luft and ambition. When he and his followers were, at any time, unfucceffful in thofe wars by which he fought to propagate his religion, to preveut them from falling away into unbelief, or finking into defpondency, he took care to inform them that God fuffered fuch misfortunes to belal believers, as a punifhment for their fins, and to try their faith. The doctrine of predeftination, which he affiduonfly inculcated, had an happy effect to perfuade his followers to rufl boldly into the midlt of dath and danger at his command. He prevailed with Zeyd to put away his wife, married her himfelf, and pretended that his crime had the approbation of heaven; and, in the lioran, he introduces the Deity approving of this marriage. Being repulfed from the fiege of Mecca, he made a league with the inhabitants; but on the very next year, finding it convenient to furprife the city, by violating this treaty, he juftified his perfidy by teaching his followers to difregard promifes or leagues made with infidels. In fome infances again, we find abfurd prohibitions enjoined for fimilar reafons: his officers, having on fome occafion drunk to excefs, excited much riot and confufion in the camp, he prohibited the ufe of wine and other inebriating liquors among his followers in future. Now, thongh it mult be acknowledged that many evils arife from the ufe of thefe liquors, yet we camot but think that, when ufed in moderation, they are in many cales beneficial to men; and certainly as much allowed by God as opium, which the Mahometans have fubllituted in their place.

Mahomet is allowed to have copied from the Clur- Mah meflian and the Jtwifh religions, as well as from the ido-tanifm a latrous fuperlfitions which prevailed through Arabia, Mixture of and thus to have formed a motley mixture of reafon and Chrittiaabfurdity, of pure theifm and wild fuperltition. He dafin, ant confidered alfo the circumftances of his comntry, and the fuper: the prejudices of lus countrymen. When he attended llitions ut to the former, he was generally judicious enough to

```
irablac
``` fuit his doctrines and decifions to them with fuficient fikill ; the latter he alfo managed with the greatelt art : but he entered into accommodation with them in inftances when a true prophet or a wife and upright legifator would furely have oppofed them with decifice vigour. Where the proplet indulges his own Cancy, or borrows from the fupertitions of his countryme:t nothiser can be more ridiculous than that rhapfody of lies, contradietions, and extravagant fables, whic! he delivers to his followers. Amazing are the abfurditics wlech he relates concorning the patriarchs, concernin:r Solomon, and concerning the amimas that were afienbled in Noah's ark.

But in the whole tifue of ablurdities of which his 59 fyltem confifts, there is nothing more abfurd, or more heaven an happily calculated to promote impurity of manaers, than hell.
bis deferiptions of heaven and hell; the ideas of future rewards and puafanents which he fught to imprefs

\section*{R E L}
on the ninds of his followers. Paradife was to abound with rivers, trees, fruits, and fhady groves; wine which would not intoxicate was to be there plentifully ferved up to belicvers; the inhabitants of that happr reg:on were all to enjoy perpetnal youth; and their powers of enjoyment were to be enlarged and invigorated, in order that fo many fine things might not be thrown away upon them. : Inftead of infpiring the bleffed inhabitants of pzradife with a liberal talte for harmony and fcience, couverfation, and friendfhip (fays Mr Gibbon), Mahomet idly celebrates the pea.ls and diamonds, the robes of filk, palaces of marilc, difhes of gold, rich wines, artificial dainties, numerous aitendants, and the whole train of fenfual luxury--Scventy two houris, or black-eyed girls of refplendent beautr, blooming you:h, virgin purity, and exounite fenfibility, will be created for the ufe of the meaneft believer; a moment of pleafure will be prolonged for 1000 jears, and his faculties will be increafed 100 fold, to render him worthy of his felicity." It mult be acknowledged that he allows believers other more refined enjoyments than thele ; thus they are to fee the face of God morn. ing and evening ; a plealure which is far to exceed all the other pleafures of paradife. The following is his defeription of the punifhmeats of hell : The wicked are there to drink nuthing but boiling finking water; breathe nothing but hot winds ; dwell for ever in cortinual burning fire and fmoke; eat nothing but briars and thorns, and the fruit of a tree that rifeth out of the bottom of hell, whofe branclies refemble the heads of devils, and whofe fruits fhall be in their bellies like burning pitch.

All that we can conclude from a general view of the religion of Mahumet, from condidering the character of the prophet, or from reviewing the hittory of the nations among whom it has been eftablifhed, is, that it is one tiffue of abfurdities, witlı a few truths, however, and valuable precepts incongruoufy iutermixed; that a great part of it is unfavourable to virtuous manners, to wife and equal laws, and to the progrefs of knowledge and refinement. It often inculcates in a direct manner fentiments that are highly immoral ; it fubltitutes triling, fuperftitious obfervances in the room of genuine piety and moral virtue ; and it gives fuch views of futurity as render purity of heart no neceflary qualification for feeing God.

Surely, therefore, even the deif, who rejects all but natural religion, would not helitate to prefer Chritianity, and even Judaifm, to the religion of Mahomet. Judaifm, calculated for a peculiar people, was undoub:edly much more fublime and much mure lappily framed to reader that people sirtuous and happy in the circumilances in which they were placed; and Chritianity we find to be an univerfal religion, fuited to all circumftances and to all the ftages of fociety, and acting, wherever it is received, with more or leis force to the fupport of civil order, virtuous manners, improvement of arts, and the adwaneement of Forence. Ifowever, as Mahometanifm forms in fume meafure a regular fyftenn, as it has borrowed many of the precepts and docirines of Judaifm and Cbriftianity, not indced without corrupting and degrading them; and as it bas coutributed confiderably to the fupport of civil govemment, although in a very imperfect form, in thofe countries is which it has ubtaiued an eftablifhneent; fo: all thes
realons we carnot but give it the preference to the lio. Religion perfitions of Paganifm.

Rembrar it
The whole refult of our inquiries under this article, mo therefore, is, 1. That as man, loy the conflitution of corie.elin, his mind, is maturally fitted for actuiring certain notions conceming the exitance of indible, feperior beings, and their influctice on human life; fo the religious ideas which we find to lave in ali ages of the world, and in all the different llages of the progrefs of fociety, prevailed among mansind, appear to have originated partly from the natural excrtions of the human imagination, undertlanding, and paffions, in various circumicances, and partiy from fupernatural revelation.
2. That though religious opinians, together with the moral precepts, and the rites of worhip conneeted with them, may appear to have been in rumeruus intances iajurious to the virtue and happinefs of fociety ; yet, as they have often contributed to lead the mind to form moral ditinctions, when it would otherwife in all probability have been an entire ftranger to fuch diftinctions; and as they have always contributed in an effential manner to the eftablifiment and the fupport of civil government - it mult therefore be acknowledged that they have alvays, even in their humbleft Atate, been more beneficial than hurtful to mankind.
3. That when the different fytems of religion that lave prevailed in the world are comparatively niewed with refpect to their influence on the welfare of fociety, we find reafon to prefer the polytheifm of the Greeks and Romans to the ruder, wilder, religious ideas and cercmonies that have prevailed among favages; Mahometanifm, perlaps in iome refpects, to the polytheifm of the Greeks and Romans; Judaifm however to Mahometanifm ; and Chriftianity to all of them.

RELIGIOUS, in a general fenfe, fomething that relates to religion.-We fay, a religious life, religious fociery, Sic.-Churches and church-yards are religious placcs.-A religious war is alfo called a croifade. See Croisade.

Religious, is alfo ufed fubftantially for a perfon engaged by folemn vows to the monaftic life; or a perfon thut up in a monaftery to lead a life of devotion and aulterity, under fome sule or inflitution. The male religions we popularly call monks and friars; the female, nuns and canoneffes.

REMBRANDT (Van Rhin), a Flemif painter and engraver of great eminence, was born in \(16=6\), in a mill upon the banks of the Rhine, from whence he derived his name of Van Rbin. This mafter was born with a creative genius, which never attained perfection. It was faid of him, that he would bave invented painting, if he had not found it already difcovered. Without itudy, without the aflifance of any mater, but by his own initisct, he formed rules, and a certain pracical method for colouring; and the mixture produced the deifyped efice. Nature is not fet off to the greateft advantage in his pictures; but there is fuch a driking truth and fimplieity in them, that his heads, particilanly his portraits, feem animated, and rifing fium the canvas. He was fond of itrong contralls of light and hade. The light entered in his working-room only by a hole, in the manner of a camera obfcura, by which he judged with greater certainty of his produc: tions, Thi.. antit cooldered paisting like the ilege,
 If asgerated. He did not purfue the oncthod of the [leRenem: I ral cers. \(\underbrace{-}\) mifn panters of finithing his pieces. He fometiacs gave his light fuch thick touches, that it focmed more
like notelling than painting. A head of his has becon thown, the nofe of which was fo thick of paint, as that which he copicel from nature. He was told one day, that by his peculiar method of cmploying colours, his pieces appeared rugged and meven-he repliced, he was a prainter, and not a dyer. He took a pleafure in dreffing his figures in an extraordinary manner: with this siev he had collected a great number of eaftern caps, ancient armon, and drapery long fince out of fahion. TVhen he was advifed to conGult antiquity to atain a hetter talle in drawing, as his was ufually heaw and uneve:, he took his comfellor to the clofet where thefe ohl reftunents were depofited, faying, by way of derifion, thofe were his antigues.

Rembrandt, like moit men of genius, had many caprices. Being one day at work, painting a whole family in a fingle picture, word heing brought him that his munkey was dead, he was fo affected at the lofs of this animal, that, without paying any attention to the perfons who were fitting for their pictures, he painted the monkey upon the fame canvas. This whim could not fail of difpleafng thofe the piece was deligned for; thut he would not efface it, choofing rather to lofe the fale of lis picture.

This freak will appear flill more extraordinary in Rembrandt, when it is conlidered that he was extremely avaricious; which vice daily grew upon him. He practifed warious itratagems to fell his prints at a high price. The public were very defirous of purchafing them, and not without reafon. In his prints the fame ralle prevails as in his pictures; they are rough and incegular, but picurefque. In order to heighten the value of his prints, and increafe their price, he made his fon fell them as if he had purloined them from his father; others he expofed at public fales, and went thither himfelf in difguife to bid for them; fometimes lic gave out that le was groing to leave Holland, and fettle in another country. Thefe ftratagems were fucrefsful, and he got his own price for his prints. At other times he would print his plates half binifhed, and expole them to fale; he afterwards finifhed them, and - hey became freth plates. When they wanted retouching, he made fome alterations in them, which promoted the fale of his prints a third time, though they differed but little from the firt imprefions.

His pupils, who were not ignorant of his avarice, one day painted fome pieces of money upon cards; and Rembrandt no fooner faw them, than he was going to take them up. He was not angry at the pleafantry, but his avarice ftill prevailed. He died in 1674 .

KEMEMBRANCE, is when the idea of fomething formerly known recurs again to the mind withont the operation of a like object on the external fenfory. Sec Memory and Reminiscence.

REMEMBRANCERS, anciently called clerks of the rememúrance, certain cfficers in the exchequer, whereof three are diftinguifhed by the names of the king's rememtrancer, the lordirecfurer's remembirancer, and the rememlirancer of the firf fruits. The king's remembrancer enters in his office all recognizances taken before the barons for zry of the king's debts, for appearances or obferving
of orders ; he aho takes ail bonds for the kina's delats, \&c. and makes out procefes thencon. He likewife if. fuesproceftes ageint the collectors of the cuttome, excife, and others, for their accounts; and informations upon penal Itatutes are entered and fued in his olfice, where all proceedings in maters upon Englifh bills in the ex-chequer-chamber remain. His duty further is to make out the bills of compofitions upon penal laws, to take the ftatement of debts; and into his office-are delivered all kinds of incentures and other evidences which concern the affuring any lands to the crown. He crery year incralino animarum, reads in open cout the Alatute for election of theriffs; and likewife openly reada in court the oaths of all the officers, when they are admitted.

The lord treafurer's remembrancer is charged to make out procefs againft all fheriffs, efcheators, rcceivers, and bailifis, for their accounts. He alfo makes out writs of jeri jacias, and extent for debts due to the king, either in the pipe or with the anditors; and procefs for all fuch revenue as is due to the king on account of his tenures. He takes the account of theriffs; and allo keeps a record, by which it appears whether the theriffs or other accountants pay their proffers due at Eatter and Michaelınas; and at the fame time he makes a record, whercby the theriffs or other accountants keep their prefixed days: there are likewife brought into his office all the accounts of cuttomers, comptrollers, and accountants, in order to make entry thereof on record; alfo all ellreats and amercements are certifed here, \&c.

The remembrancer of the firf-fruits takes all compofitions and bords for the payment of firt-fruits and tenths; and makes out procefs. againft fuch as do not pay the fame.

REMINISCENCE, that power of the human mind, whereby it recollects itfelf, or calls again into its remembrance fuch ideas or notions as it had really forgot: in which it differs from memory, which is a treafuring up of things in the mind, and keeping them there, without forgetting them.

REMISSION, in phyfics, the ahatement of the power or ellicacy of any quality; in oppofition to the increnfe of the fame, which is called iuten/tion

Remission, in law, \&c. denotes the pardon of a crime, or the giving up the puniflment due thereto.

Remission, in medicine, is when a diftemper abates for a time, but does not go quite off.

REMIITANCE, in commerce, the traffick or return of money from one place to another, by bills of exchange, orders, or the like.

REMONSTRANCE, an expoltulation or lumble fupplication, addreffed to a king, or other fuperion, befeeching him to reflect on the inconveniences or ill confequences of fome order, edict, or the like. This word is alfo ufed for an expoltulatory counfel, or advice; or a gentle and haudfome reproof, made either in greneral, or particular, to apprize of or correct fome fault, \&c.

REMORA, or Sucking-fish, a fpecies of Echeners. Many incredible things are related of this animal by the ancients; as that it had the power of flopping the largeit and fwifteft veffel in its courfe: and esen to this day it is afferted by the fithemen in the Mediterrasean, that it has a power of retarding the motion of their boats by attaching itfelt to them; for which
which reafon they kill it whenever they perecive this retardation. But in what manner the remora performs this, we have no account.
REMORSE, in its worf fenfe, means that pain or anguilh which one feels after haviug committed fonke Thad action. It alfo means tendernefs, pity, or fympathetic forror. It is mofl generally ufed in a bad fenle, and is applied to perfons who feel compuretion for fome great crime, as murder and fuch like. Murders which have been committed with the ntmon circumfpection and fecrecy, and the authors of which rould never have been difcovered by any luman inveiligation, have been frequently unfolded by the remorfe and confffion of the perpetrators, and that too many years afterwards. Of this there are numerous intances, which are well authenticated, and which are fo generally Enown that it is needlefs to relate them here. Sec Re-

\section*{yentance.}

REMPHAN, an idol or Pagan god whom St Stephen fays the Ifraelites worfhipped in the wilderncfs as they paffed from Egypt to the land of Promife: "Yea, ye took up the tabernacle of Moloch, and the flar of your god Remphan; figures which ye made to worfhip them." That the martyr here quotes the following words of the prophet Amos, all commentators are agreed : "Ye have borne the taber nacle of your Moloch, and Chiun your images, the flar of your god, which se made to yourfilves." But if this coincidence between the Chrifian preacher and the Jewifh prophet be admitted, it Collows, that Cbiun and Rempban are two names of one and the fame deity. This is indeed farther evident from the LXX tranflators having fubftituted in their verfion the word P \(\alpha, q \alpha\), , inftead of Cibiun, which we read in the Hebrew and Englith Bibles. Dut the queflion which fill semains to be anfwered is, what god was worfhipped by the name of Rempban, Raiphan, or Chiun? for about the other divinity here mentioned there is no difputc. See Могосн.
'That Chiun or Remphan was an Egyptian divinity, cannot be quaftioned; for at the cra of the Exodus the Hebrews munt have been ftrangers to the idolatrous worhip of all other nations ; nor are they ever accufed of any other than Egyptian idolatries during their 40 years wanderings in the wildernefs, till towards the end of that period that they became infected by the Moabites with the Werthip of Buat-fior. That Moloch, MoLech, Meltk, or Miliecm, in its original acceptation denotes a king or chief, is known to every oricntal feholar; and therefore when it is ufed as the name of a god, it undoubtedly fignifies the furn, and is the fame divinity with the \(E_{S, y p t i o n}\) Ofris. Reafoning in this way many crities, and \(w=\) believe Selden is in the number, have concluded that Cbiur, aud of courfe Remplon, is the planet Saiurn; becaufe Cbiun is written Ciun, Cevan, Cirunn, Chevern; all of which are modern oriental names of that planct.

But againf this hypothefis infurmountable chjectiens prefent themfelves to our minds. It is univerfally allowed (fee Polytheism), that the firt objects of idolatrous worthip were the fun and mocn, confidered
as the king and queen of heaven. The fised fars, in. Remplan. decd, and the planets, were aftenwards gradually admitted into the Pagen rubric; but we may be fure that thofe would he firft affociated with the two prime laminaries which noof refembled them in brightnefs, and were fuppofed to be mo? benignant to man. But the planet Saturn appears to the noked eye with fo ficbie a luatre, that, in the infancy of altronomy, it could not make fuch an impreftion on the mind as to txcite that adniration which we mult conceive to have always preceded planetary worfhip. It is to be obferved, too, that by the Pagan writers of antiquity Saturn is conftantly reprefented as a flar of baleful inAuesice. He is termed the leaden planet; the planet of malevolent alpect; the difinal, the inlumane fur. That the Egyptians, at fo early a period as that under confideration, fhould lave adored as one of their greateit gods a planet obicure in its appearance, diftant in its fituation, and baleful in its influence, is wholly incredible.

There is, however, another ftar which they might naturally adore, and which we know they actually did adore, as one of their moit beneficeat gods, at a very early period. This is the \(\alpha \pi \eta_{g \pi x u}\) Greeks, the canis or Aella canicularis of the Romans, and the dog-far of modern Europe. By the Egyptians it was called Sothis or Soth, which fignilies fafey, beneficence, fecundity; and it received this rime, becaure making its appearance in the heavens at the very time when the Nile overfowed the country, it was fuppofed to regulate the inundation. On this account Plutarch ( \(/ J\). et Ofir.) tells us, they believed the foul of their ithultrious benefactrefs \(I f s\) to have tranfmigrated into the far Sorthis, which they therefore worfhipped as the divinity which rendered their country fruitful. It made its appearance, too, on the firl day of the month Thook (A), which was the beginning of the Egyptian year, and as fuch celebrated with feafting and feftivity; and being by much the brightell flar in the heavens, Horopollo (cap. 3.) informs th it was confidered as fovereign over the reft. A combination of fo many important circumflances might have induced a people leff fuperftitious than the Egyptians to pay divine homage to that glorious luminary, which was confounded with Ifis, uho had been long regarded with the highell reneration ; and as Ifis was the wife and fitter of Ofiris, and always affociated with him, the flar of Ifis or Remfhan was naturally affociated with Msloch, the fame witin Ofiris.

But it will be afked, how the flar which by the Egyptians was called Suth or Sothis came to be worlhipped by the Hebrews under the appellation of Chiun or Remphion? This is a very pertinent queftion, and we fhall endeavour to anfwer it.

Every one knows that the pronunciation of oriental words is very uncertain; and that as the vowels were often omitted in writing, it is of very little importance to the meaning how they be fupplied, provided we retain the radical confonants. The word Chiun may with equal propristy be written Kiun, Kion, or even Kíon,
(A) This was the cafe at a very remote period; but it is ctherwife at prefent, owing to the PrECESSION sfiljen Equinowes. Sec that article.
 the Romany; but the worls Cane, Chan, Kan, or Khan, which are otten diverfined into Nen. Kyn, Coben, Caban, fugnifyig Heal, (hief, Prince, K゚?ņ, \&c. are difufed through a great part of Alia and Europe. In the Chinete language ©uit, which lignilies a King, is fo fomilar to the word Chiur or Kivian under confideration, that no etymologil will belitate to pronounce theri of the lame original and the fame import. The word Kon or Kban is unicreally known to be an honorary titk in Tastary ; and Kaian or Kain, which is manifeftIy cognate of the wori Cbiun or Kiun, is, in the Plhcvi or old Perfian languace, the epithet applied to the dynally of princes which fucceeded Cyrus the Great. Among the Scythans or ancient 'Tartars, Gbiun fignifies the Sun and likewife the day: and Kung, Kiaung, Kun, runs through all the dialects of the Gothic tongue, every where denoting a chief or fovercion. In the Syrian dialect, Kin fignifies a prince; and hence the Almighty is ftyled (Gen. xiv. 19.) Komah, which is tramlated poffifor, but might have, with perhaps more propriety, been rendered Sovereign of heaven and earth. In Hebrew, the word Katan or Kaben, which is the very fame with Khan or Kan, fignifes either a prief or a prince; and in Egypt Kon was the name of the firft I Lercules or the fun. Hence the fame word in compolition denotes greatnefs, as Can-obus the great ferpent ; Cion-athoth, the great Thoth or Mercury; Canefiris, the great Ofiris.

From this deduction we would conclude, that the word, which is found in fo many tongues, and always denotes Cbief, Prince, Sovereign, is the very word Cbiun which the Egyptians and Hebrews applied to Sothis, as being, in their conceptions, the chicf or fovereign of all the ftars. This will appear fill more probable, when we have afcertained the import of the word Remphan, or, as the LXX have it, Raiphan.

Pban, the latter part of this word, is unqueftionably the fame with Pan, the mof ancient of the Egyptian sods (fie Pan). It is likewife a cognate of the Hebrew Pbanah, confpexit, feectavit, vidit; and the radical word feems to be PHAH, which fignifies fometimes the countenance, and fometimes light. Hence Pbaelion, which is compounded of \(p / a\) light, eth or e/b fire, and on trength, camc to be one of the names of the fun. Rai, whick we commonly write Rajah, has long fignified, among the Indians, a fubordinate prince; and we know, that betwcen India and Egypt there was a very early intercourle. Raiphan, therefore, may be either the roval light or the lright prince, fubordinate to Otiris; and in either fenfe, it was a very proper cpithet of Sollis in the Egjptian kalendar. The word Rem or Rom, again (for it is fometimes written Remphan, and fometimes Rompha), is no other than the Hebrew E! Rum "high, exalted." Hence Remphan is the bigh or exalted light, which Sothis certainly was.

For this etymological difquisition we are indebted to Dr Doig, the leamed author of Letters on the Savoge Shate, who lias written a differtasion on Chiun and Remphan, of fuch valne that we hope it will not be much longer with-held from the public. The afcertaining the identity of thofe mames, and the god to which they bcionged, is the leaft of its merit; for ir will be found to obrow much light upon many paffages in the Old 'I'efarrent. What contirn his interpretation is, that the
idol confecrated by the Egyptians to Sothis or the dory- 1 ftar, was a female figure with a flar on her head; and hence the prophet upbrails his countrymen with having borne the Star of their deity.

Action of REMOVING, in Scots law. See Law, N clxvii. 18.

REMIURIA, feftivals eftablifhed at Rome by Romulns to appeafe the manes of his brother Remus. They were afterwards called Lemuria, anत celebmted yearly.

REMIUS, the brother of Romulus, was expofed together with his brother by the cruelty of his grendfather. In the conteft which happened between the two brothers about building a city, Romulus obtained the preference, and Remus, for ridiculing the riling walls, was put to death by his brother's orders, or by Romn. lus limfelf (fee Romulus). The Romans were aflicted with a plazne after this murder; upon which the oracle was confulted, and the manes of Remus appeafed by the inftitution of the Remuria.

RENAL, fomething belonging to the reins or KıDNEYS.

RENCOUNTER, in the military art, the encoun. ter of two little bodies or parties of forces. In which fenfe rencounter is ufed in oppolition to a pitched battle.

Rencounter, in fingle combats, is ufed by way of contradiftinction to duel.-When two perfons fall out and fight on the fpot without having premeditated the combat, it is called a rencounter.

RENDEZVOUS, or Rendeyous, a place appoint. ed to meet in at a cestain day and hour.

RENEAI,MIA, in botany; a genus of the monogynia order, belonging to the monandria clafs of plants. The corolla is trifid; the nectarium oblong; the calyx monophyllous; the anthera feflile, oppofite to the nectarium; the berry is thefly. There is only one fpecies, which is a native of Surinam.

RENEGADE, or Renegado, a perfort who has apoltatized or renounced the Chriltian faith, to embrace fome other religion, particularly Mahometanifm.

RENFREW, the county-town of Renfrewfhire, ftanding on the fmall river Catheart, which flows into the Clyde at the diftance of five miles from Glafgow, is a fmall but ancient royal borough, the feat of the fheriff's court and of a prefoytery. 'The town is neatly built, and the inhabitants enjoy a tolerable thare of commerce.-Renfrew was originally joined to Lamerk, but was made an independent therifidom by Robert II. who had a palace here. W. Long. +. 26. N. Lat. \(55 \cdot 51\).

RENFREWSHIRE, a county of Scotland, Ayled by way of eminence the barony, becaufe it was the ancient inheritance of the Stuarts, is a imall county, extending about 20 miles from north to fouth, and 13 from eall to weft, parted from Dumbartonfhire by the river \(\mathrm{Cl}_{\mathrm{y}} \mathrm{de}\) on the welt, bordering on the ealt with Lanerkitire, and on the north with Cunningham. The face of the country is raried with hill and vale, wood and ftream; crowded with populous villages, and adorned with the feats of gentiemen. The foil is in general fertile, producing rye, banley, oats, peafe, beans, flax, and fome wheat: it likewife yields pienty of coal, and turf for fuel: and affords abundance of paturage for flecp and cattle. The inhabitants are Lowlanders and Prelbyterians; wealthy and indultrious, addictec so traffic, aud particularly expert in the liuen manufacture.

\section*{\(R \quad E \quad P\)}

Their genius is ftimulated to commeree, by the example of their neighbours of Glafgow, as urell as the convenience of the river and frith of Clyd , along the courfe of which they are fituated.

RENNES, a town of France, in Bretagne, and capital of that province. Before the revolution it had a bifhop's fee, two abbeys, a parliament, and a mint. It is very populous; the houfes are fix or feven ftories hinh, and the fuburbs of larger extent than the town itfelf. The cathedral church is large, and the parlia-ment-houfe a handfome ftructure. The great fquare belonging to it is furrounded with handfome houfes. There is a tower, formerly a pagan temple, which now contains the town-clock. It is feated on the river Villaine, which divides it into two parts, and was ancient. ly fortified, but the walls are now in ruins, and the ditch nearly filled up. The fiege of the city by Ed. ward III. king of England, is very celebrated in hiAtory. The Englifh and Braton army confifted of 40,000 men ; and neverthelefs, after having remained before it fix months, were obliged to retire without fuccefs. E. Long. 0.23 . N. Lat. 48.7 .

RENNET. See Ruinet.
RENT, in law, a fum of money, or other confideration, iffuing yearly out of lands or tenements.

RENTERING, in the manufactories, the fame with fine-drawing. It confilts in fewing two pieces of cloth edge to edge, without doubling them, fo that the feam fcarce appears; and hence is is denominated fus-drazving. It is a French word meaning the fame thing, and is derived from the Latin retrabere, or re, in, and trabere, becaufe the feam is drawn in or covered. We are toid*, that in the Eaft Indies, if a piece of fine munlin be torn and afterwards mended by the five-drawers, it will be impolfible to difcover where the rent was. In this country the dexterity of the line-drawers is not fo great as that of thofe in the eafl; but it is ftill fuch as to enable them to defraud the reverace, by fewing a head or flip of Enclifh cloth on a piece of Dutch, Spanifh, or other foreign cloth : or a llip of foreign cloth on a piece of Englifh, fo as to pars the whole as of a piece; and by that means avoid the cuties, penalties, \&c. The trick was firt difcovered in France by M. Savary.

Rentering, in tapeftry, is the working new warp into a piece of damaged tapeftry, whether eaten by the rats or otherwife deftroyed, and on this warp to reftore the ancient pattern or defign. The warp is to be of woollen, not linen. Among the titles of the French tapeftry makers is included that of renterers. Finedrawing is particularly ufed for a rent or hole, which happens in dreffing or preparing a piece of cloth artfully fewed up or mended with filk. All fine-drawings are reckoned defects or blemines; and fhould be allowed for in the price of the piece.

RENVERSE, inverted, in heraldry, is when any thing is fet with the head downwards, or contrary to its natural way of fanding. Thus, a chevron renverié, is a cherron with the point downwards. They ufe alfo the fame term when a beaft is laid on its back.

RENUNCIATION, the act of renouncing, abdicating, or relinquifhing, any right, real or pretended.

REPARTEE, a fmart, ready reply, efpecially in matters of wit, humour, or raillery. See Ramlery. REPEALTNG, in law, the revoking or annulling of a fatute or the like.

Vol. XVI. Part I.

\section*{\(R\) E \(P\)}

No act of parliament Thall be repealed the fame fention Repellent in which it was made. A deed or will may be repealed in part, and ftand good for the reft. It is held that a pardon of felony may be repealed on difproving the fuggeftion thereof.

REPELLENTS, in medicine, remedies which drive back a morbid humour into the mals of blood, from whence it was unduly fecreted.

REPENTANCE, in general, means forrow for any thing paft. In theology it means fuch a forrow for fia as produces newnefs of life, or fuch a conviction of the evil and danger of a finful courfe as is fuficient to produce fhame and forrow in the review of it, and effectual refolutions of amendment. In this fenfe the evangelical
 Theology.

REPERCUSSION, in mulic, a frequent repetition of the fame found.

REPERTORY, a place wherein things are orderly difpofed, fo ae to be eafly found when wanted. The indices of books are repertories, Thowing where the matters fought for are treated of. Common-place books are alfo kinds of repertories.

REPE'TITION, the reiterating of an action.
Repetition, in mufic, denotes a reiterating or playing over again the fame part of a compolition, whether it be a whole ftrain, part of a train, or double ttrain, Sic.

When the fong ends with a repetition of the firf Itrain, or part of it, the repetition is denoted by \(d\) a capo, or D. C. i. e. "from the heginning."

Repetition, in rhetoric, a figure which gracefully and emphatically repeats either the fame word, or the fame fenfe in different words. See Oratory, \(n^{\circ} 67\) \(-80\).

The nature and delign of this figure is to make deep impreffions on thofe we addrefs. It exprefles anger and indignation, full alfurance of what we affirm, and a we. hement concern for what we have efpoufed.

REPHIDIM (anc. geog.), a ftation of the Ifrael. ites near mount Horeb, where they murmured for want of water; when Mofes was ordered to fmite the rock Horeb, upon which it yielded water. Here Johnua dircomfited the Amalekites. This rock, out of which Mofes brought water, is a fone of a prodigious height and thicknets, rifing out of the ground; on two fides of which are feveral holes, by which the water ran. (Thevenot.)

REPLEGIARE, in law, lignifies to redeem a thing taken or detained by another, by putting in lege? fureties.

De нomine REPLEGIANDO. See Homine.
REPLEVIN, in law, a remedy granted on a difrels, by which the firlt poffeltor has his goods reftored to him again, on his giving fecurity to the fheriff that he will purfue his action againlt the party diftraining, and return the goods or cattle if the taking them thall be adjudged lawful.

In a replevin the perfon ditrained becomes piaintiff; and the perfon diftraining is called the defendant or avouant, and his juftification an avosury.

At the common law replevins are by writ, either out of the king's-bench or common-pieas; but by fatute, they are by plaint in the fherifi's court, and court-baron, for a perfon's more fpeedily obtaining the goods ditrained.

\section*{\(R E P\left[\begin{array}{ll}82\end{array}\right] \quad R E P\)}

Rephory If a plaint in replevin be removed into the court of kiag's.bench, sc. and the plaintiff makes default and becomes non-fuit, or judgment is given argainft him, the defendant in replevin thall lave the writ of reforno babendo of the groods taken in diftrels. See the next auticle.

RLPLEVY, in law, is a tenant's bringing a writ of replevin, or replegiari facios, where his goods are taken by diftefs for rent; whicls mult be done within five days after the ditrefs, otherwife at the five days end they are to be appraifed and fold.
'This worl is alfo ufed for bailing a perfon, as in the cafi. of a bomine replegiando.
REPOR'I', the relation made upon oath, by officers or perfons appointed to vifit, examine, or eftimate the ftate, expences, sc. of any thing.

Report, in law, is a public relation of cafes judicially argued, debated, refolved, or adjudged in any of the king's courts of juftice, with the caufes and reafons of the fame, as delivered by the judges. Alfo when the cuurt of chancery, or any other court, refers the flating of a cale, or the comparing of an account, 10 a maflicr of chancery, or other referee, lis certificate thereon is called a report.

REPOSE, in poetry, \&c. the fame with reft and paufe. See Rest, \&ec.
Reposf, in painting, cortain maffes or large affemblages of light and fhade, which being well conducted, prevent the confufion of objects and figures, by enga ging and fixing the eye fo as it cannot attend to the other parts of the painting for fome time; and thus leading it to confider the feveral groups gradually, proceeding as it were from flage to flage.

REI'RESENTA'TION, in the drama, the exhibition of a theatrical piece, together with the feenes, machinery, \&c.

REPRESENTATIVE, one who perfonates or fupplies the place of another, and is invefted with his right and authority. Thus the houfe of commons are the reprefentatives of the people in parliament. See Commons and Parliament.

REPRIEVE, in criminal law (froria reprendre, "to take back"), is the withdrawing of a fentence for an interval of time; whereby the execution is fufpended. See Judement.
Bixid.
Comment.

Guernfcy, of burning a woman big with child; and, when throngh the violence of the flames the infant fprang forth at the ftakc, and was preferved by the byftanders, after forme deliberations of the priedts who affilted at the facrifice, they caft it into the fire as a young heretic. A barbarity which they never learnct from the laws of ancient Rome; which direct, with the fame humanity as our own, quod pragnantis mulieris dannate pena differatur, quoad pariat: which doctrine has alfo prevailed in England, as early as the firt minnorials of our law will reach. In eafe this plea be made in ftay of execution, the judge muft direct a jury of twelve matron's or diferect women to inquire into the fact: and if they bring in their verdi\& quick with child (for barely with child, unlefs it be alive in the womb, is not fufficient), exccution fhall be faid generally till the next feffion; and fo from feffiou to feffion, till either the is delivered, or proves hy the courfe of nature not to have been with child at all. Bnt if Gre once hath had the benefit of this reprieve, and been delivered, and afterwards becomes pregnant again, fhe fhall not be intitled to the beneth of a farther refpite for that caufe. For The may now be executed before the child is quick in the womb; and mall not, by her own incontinence, evade the fentence of jultice.
Another caufe of regular reprieve is, if the ofiender become non compos hetween the judgment and the award of exccution: for regularly, though a man be compos when be commits a capital crime, yet if he becomes non compos after, he fhall not be indiEted; if after in. dictment, he fhall not be convicted; if after conviction, he fhall not receive judgment ; if after judgment, he thall not be ordercd fur execution : for furiofus folo furore punitur; and the law knows not but he might have offered fome reafon, if in his fenfes, to have flayed thefe refpective proceedings. It is therefore an invariable rule, when any time intervencs between the attainder and the award of execution, to demand of the prifoner what he hath to allege why execution chould not be awarded againt him; and, if he appears to be infane, the judge in his difcretion may and ought to reprieve hin. Or, the party may plead in bar of execution: which plea may be either pregnancy, the king's par. don, an act of grace, or diverfity of perfon, viz. that he is not the fame that was attainted, and the like. In this laft cafe a jury thall be impanelled to try this collateral iffue, namely, the identity of his perfon; and not whetber guiley or innocent, for that has been decided before. And in thefe collateral iffues the trial thall be inflanter; and no time allowed the prifoner to make his defence or prodnce his witneffes, unlefs he will make oath that he is not the perfon attainted:, neither fhall any peremptory challenges of the jury be allowed the prifoner, though formerly fuch challenges were held to be allowable whenever a man's life was in queftion. If neither pregnancy, infanity, non-identity, nor.other plea, will avail to avoid the judgment, and ftay the execution confequen: thereupon, the laft and fureft refort is in the king's moft gracious pardon; the granting of which is the mof: amiable prerogative of the crown. See the article Pardon.

REPRISALS, a right which princes claim of taking from their enemies any thing equivalent to what they unjufly detain from them or their fubjects. For as the delay of making war may fometimes be detrimental

\section*{\(R\) E P}
ifal. mental to individuals who have fuffered by depredations from foreign potentates, our laws have in fome refpects armed the fubject with powets to impel the prerogative; by directing the minitters of the crown to iffue letters of marque and reprifal upon due demand: the frerogative of granting which is nearly related to, and plainly derived from, that other of making war; this being indeed only an incomplete fate of hoftilities, and generally ending in a formal denunciation of war. Thefe Eetters are grantable by the law of nations, whenever the fubjects of one ftate are oppreffed and injured by thofe of another; and jutice is denied by that tate to which the opprefor belongs. In this cafe letters of marque and reprifal (words ufed as fynonymous; and fignifying, the latter a taking in return, the former the palling the frontiers in order to fuch taking) may be obtained, in order to feize the bodies or goods of the fubjects of the offending fate, until fatisfaction be made, whereever they happen to be found. And indeed this cuftom of reprifals feems dietated by nature herfelf; for which reafon we find in the moit ancient times very notable inftances of it. But here the neceffity is obvious of calling in the fovereign power, to determine when reprifals may be made; elfe every private fufferer would be a judge in his own canfe. In purfuance of which principle, it is with us declared.by the fat. 4 Hen. V. c. 7. that, if any fubjects of the realm are opprefled in time of truce by any foreigners, the king will grant marque in due form, to all that feel themfelves grieved. Which form is thus directed to be obferred : the fufferer mult firt apply to the lord privy-feal, and he Thall make out letters of requeft under the privy feal; and if after fuch requeft of fatisfaction made, the party required donot within convenient tinse make due fatisfaction or reititution to the party grieved, the lord-chancellor thall make him out letters of marque under the great feal ; and by virtue of thefe he may attack and feize the property of the aggrefor nation, without hazard of being condernned as a robbet or pirate.

Reprisal, or Recaftion, is a fpecies of remedy allowed to an injured perfon. This happens when any one hath deprived another of his property in goods or chattels perfonal, or wrongfully detains one's wife', child, or fervant : in which cafe the owner of the goods, and the hufband, parent, or matter, may lawfully claim and retake them, wherever he happens to find them; fo it be not in a riotous manner, or attended with a breach of the peace. The reafon for this is obvious; fince it may frequently happen that the owner may have this only opportunity of doing himfelf jutice: his goods may be afterwards conveyed away or deftroyed; and his wite, children, or fervants, concealed or carried out of his reach; if he had no fpeedier remedy than the ordinary procefs of law. If therefore he can fo contrive it as to gain poffeffion of his property again, without force or terror, the law favours and will juitify his proceeding. But, as the public peace is a fupcrior confideration to any one man's private property; and as, if individuals were once allowed to ufe private force as a temedy for private injories, all focial juftice muft ceafe, the ftrong would give law to the weak, and every man would revert to a flate of nature; for thefe reafons it is provided, that this natural right of recaption flall never be exerted, where fuch exertion mult occalion ftrife and bodaly contention, or endanger
the peace of fociety. If, for inftance, my horie is ta- Reprobs ken away, and I find him in a common, a fair, or a public inn, I may lawfully feize him to my own ufe: but I cannot juftify breaking open a private ftable, or cosiodur entering on the grounds of a third perfon, to take him, except he be felonioully ftolen ; but mult have recourfe to an aétion at law.

REPROBATION, in theology, means the act of abandoning, or fate of being abandoned, to eternal deftruction, and is applied to that decree or refolve which God has taken from all eternity to punifh finners who Thall die in impenitence; in which fenfe it is directly oppofed to eleftion. When a finner is fo hardened as to feel no remorfe or mifgiving of confcience, it is confidered as a fign of reprobation; which by the cafuits has been diftinguimed into pofitive and negative. The firt is that whereby Cod is fuppofed to ereate men with a pofitive and abfolute refolution to damn them eternally. This opinion is countenanced by St Augurtine and other Chritian fathers, and is a peculiar tenet of Calvin and moft of his followers. The church of England, in The shirty-nine Artiles. teaches fomething like it ; and the church of Scotland, in the Confelion of Faith. maintains it in the ftrongeft terms. But the notion is generally cxploded, and is believed by no rational divine in either church, being totally injurious to the juftice of the Deity. Negative or conditional reprobation is that whereby God, though he has a finecre defire to fave men, and furnifhes them with the neceflary means, fo that all if they will may be faved, yet fees that there are many who will not be faved by the means, however powerful, that are afforded them; tho' by other means which the Deity fees, but will not afford them, they might be faved. Rcprobation refpects angels as well as men, and refpects the latter either fallen or unfallen. See Predestination.

REPRODUCTION, is ufually underfood to mean the reltoration of a thing beforc exifting; and fince deftroyed. It is very well known that trees and plants may be raifed from nips and cuttings; and fome late obfercations have fhown, that there are fome animals which have the fame property. The polype * was the firft inftance we had of this; but we had fearce time to wonder at the difcovery Mr Trembley had made, when Mr Bonett difoovered the fame proverty in a fpecies of water-worm. Amongt the plants which may be raifed from cuttings, there are fome which feem to poffefs this quality in fo eminent a degree, that the imad. left portion of them will become a complete tree again.

It deferves inquiry, whether or not the great Author of nature, when he ordaimed that certain infeets, as thefe polypes and worms, fhould refemble thofe plants in that particular, allowed them this power of being reproduecd in the fame degree? or, which is the fame thing, whether this reproduction will or will not take place in whatever part the worm is cut? ' \(n\) order to tiy this, Mr Bonett entered on a courfe of many experiments on the water-worms which have this property. Thefe are, at their common growth, from two to tliree inches long, and of a biownifl coluur, with a caft of reddifh. From one of thefe worms he cut off the head and tail, taking from each extremity only a fnall piece of a twelfth of an inch in length ; but neither of thefe pleces were able to reproduce what was wantirg. They both perifhed in about 24 hours; the tail hrif,

\section*{Sce Fo:}

\section*{\(R\) E \(P\)}

Repr due and afterwards the lwad. As to the body of the worm \(\underbrace{[101)}\) from which thele pieces were feparated, it lived as well as before, and feomed indeed to fuffer nothing by the lofs, the head-part being immediately ufed as if the head was thereen, boring the creature's way into the mud. There are, hefides this, two other points in whiel the reproduction will not take place; the one al there is about the filth or fixth ring from the head, and the wher at the fame diftance from the tail; and in all probability the condition of the great artery in thefe parts is the caufe of this.

What is faid of the want of the reproductive power of thele parts relates only to the head and tail ends; for as to the body, it feds very little inconvenience from the lofs. of what is taken off, and very fpeedily reproduees thole paits. Where then does the principle of life relide in fuch worms, which, after having their heads cut off, will have not only the fame motions, but even the inclinations, that they had before? and yet this difficulty is very imall, compared to feveral others whieh at the fame time offer themfelves to our reafon. Is this wonderful reproduction of parts only a natural confequence of the laws of motion? or is there lodged in the body of the creature a chain of minute buds or fhoots, a fort of little embryos, already formed and placed in fuch parts where the reproductions are to begin? Are thefe worms only mere machines? or are they, like more perfict animale, a fort of compound, the fprings of whofe motions are actuated or regulateri by a fort of foul? And if they have themfelves luch a primeiple, how is it that this principle is multiplied, and is frumd in every feparate piece? Is it to be granted, that there are in thefe worms, not a fingle foul (it it is to be fo called) in each, but that each contains as many fouls as there are pieess capable of reproducing perfect animals? Are we to believe with Malpighi, that thefe forts of worms are all heart and brain from one end to the other! 'This may be; but yet if we knew that it was fo, we fhould know in reality but very little the more for knowing it: and it feems, after all, that in eafes of this kind we are only to admire the works of the great Creator, and fit down in filence.

The nice fenfe of fecling in fpiders has been much talked of by naturalifts; but it appea s that thefe worms have vet fomewhat more furpriting in them in regard ro this pasticular. If a piece of ftick, or any other fubllance, be brought near them, they do not llay for its touching them, but begin to leap and frikk about as foon as it comes towards them. There want, however, fome farther experiments to afcertain whether this be really owing to feeling or to fight; for though we can difcuver no dillinet organs of light in thefe creatures, yet they feem affected by the light of the fun or a candle, and always frifk about it in the fame manner at the approach of either; nay, cven the moon-light has fome effect upon them.

A twis of willow, poplar, or many other trees, being planted in the earth, takes root, and becomes a tree, every piece of which will in the fame manner produce other trees. The cafe is the fame with thefe worms: they are cut to pieces, and thele feveral pieces become perfect animals; and each of thefe may be again cut into a number of pieces, each of which will in the fame manner produce an animal. It had been fuppoled by fome that thefe worms were oviparous: but Mr Bo-
nett, on entting one of them to pieces, having obferwed Raper en a flenter lubttance, refembling a fmall filament, to move at the end of one of the pieces, feparated it; and on examining it with glaffes, found it to be a perfect worm, of the fame form with its parent, which lived and grew larger in a veffel of water into which he put it. 'Thefe finall bodics are cafily divided, and very readily complete themfelves again, a day ufually ferving for the production of a hcad to the part that wants one; and, in general, the fmiller and llenderer the worms are, the fooner they complete themfelves after this operation. When the bodies of the large worms are examined by the nierofeope, it is very eafy to fec the appearance of the young worms alive, and moving about within them : but it requires great precilion and exactnefs to be cestain of this ; linee the ramifications of the great artery hase very much the appearance of young worms, and they are kept in a fort of continual motion by the fyftoles and dialtoles of the feveral portions of the artery, which ferve as fo many hearts. It is very certain, that what we force in regard to thefe animals by our operations, is done alfo naturally every day in the brooks and ditehes where they live. A curious oblerver will find in thefe places many of chem withont heads or tails, and fome without cither; as allo other fragments of various kinds, all whieh are then in the act of conpleting themlelves: but whetlier accidents have reduced them to this fate, or they thus purpofely throw off parts of their own body for the reproduction of more anmals, it is not eafy to determine. They are plainly liable to many accilents, by which they lofe the feveral parts of their body, and mult perith very carly if they had not a power of reproducing what was loit: they often are broken into two pieces, by the refiltance of fome hard piece of mud which they enter ; and they are fubject to a difeafe, a kind of gangrene, rotting off the feveral parts of their bodies, and mult inevitably periih by it, had they not this furpinfing property.

This worm was a fecond inltance, after the polype, of the furprifing power in an animal of recovering its molt effential parts when loft. But Nature does not feem to have limited her beneficence in this refpect to thele two ereatures. Mr Bonett tried the fame experiments on another fpecies of water-worm, differing from the former in being much thicker. This kind of woom, when divided in the fummer-feafon, very often thows the fame property: for if it be cut into three or four pieces, the pieces will lie like dead fur a long time, but afterwards will move about again; and will be found in this flate of reft to have recovered a head, or a tail, or both. After recovering their parts, they move very little; and, according to this gentleman's experiments, feldom live more than a month.

It fhould feem, that the more difficult fuecefs of this laft kind of worm, after eutting, and the long time it takes to recover the loft parts, if it do recover them at all, is owing to its thicknefs; fince we always find in that \{pecies of worms which fucceeds befl of all, that thofe which are thinnelt always recover their parts much fooner than the others.

The water-infects allo are not the only ereatures which have this power of recovering their loft parts The earth affords us fome already difcovered to grow in this manner from their cuttings, and thefe not lefs deferving our admiration than thote of the water : the commors

\section*{R \(\mathcal{E} P\)}

Re; rcculas then.
worms have been dividec into two, others into three or four pieces; and fome of thefe picces, after laving parled two or three months without any appearance of life or motion, have then begm to reproduce a head or tail or both. The reproduction of the anus, after fuch a flate of rett, is no long work; a few days do it: but it is otherwife with the head, that dees nut feem to perfurm its functions in the divided picees till about feven morths after the feparation. It is to be obierved, that in all there operations both on c:arth and water-worms, the hinder fart fuffers greatly more than the fore part in the chtting; for it always twilts itfelf about a long time, as if actuated by trong conwalions; whereas the liead ufually crawls away without the appearance of any great uneafincls.

The reproduction of feveral parts of lobiters, crabs, Ac. makes allo one of the great curiofities in naturd hiftory. That, in lien of an organical part of an aniual broken off, another thall rife perfectly like it, may feem inconfiftent with the modern iy ltem of gerieration, where the animal is fuppofed to be wholly formed in the egg. Yet has the matter of fact been well attelted by the fifhermen, and even by feveral virtuofos who have taken the puint into examination, particularly M. de Reaumur and M. Perrault, whofe ikill and exactnefs in things of this nature will hardly be queftioned. The legs of lobiters, Ecc. confift each of tive articulations: now, when any of the legs happen to break by any accident, as in walking, Eec. which frequently happens, the fracture is always found to be in a part near the fourth articulation; and what they thus lofe is precifely reprodnced fome time afterwards; that is, a part of a leg floots out, confiting of four articulations, the firlt whereof has two claws as before; fo that the lofs is entirely repaired.

If a lobiter's leg be broken off by defign at the fourth or fifth articulation, what is thus broken off always comes again; but it is not fo if the fracture be mede in the firt, fecond, or third articulation. In thofe cafes, the reproduction is rery rare if things continue as they are. But what is exceedingly furprifing is, that they do not; for, upon vifiting the lobiter maimed in thefe barren and unhappy articulations, at the end of two or three days, all the other articulations are found broken off to the fourth ; and it is fufpected they have performed the operation on themelves, to make the reproduction of a leg certain.

The part reproduced is not only perfeelly like that retrenched, but alfo, in a certain fpace of time, grows equal to it. Hence it is that we frequently fee lobflers, which have their two big legs unequal, and that in all proportions. This thows the fmaller leg to be a new one.

A part thus reproduced being broken, there is a fecond reproduction. The fummer, which is the only feafon of the year when the lobiters eat, is the molt favourable time for the reproduction. It is then performed in four or five weeks; whereas it takes up eight or nine months in any other feafon. The finall legs are fometimes reproduced, but more rarely, as well as more nowly, than the great ones: the horns do the fame. The experiment is molt eafily tried on the common crab. See Metaphysics, p. 574. note (f) ; and Physiology, \(\mathrm{n}^{\circ} 2 \mathrm{GI}\).

\section*{R E P}

REPTILES, in natural hittory, a kind of animals denominated from their crecping or advancing on the belly. Or reptiles are a genus of animals and infeets, which, intead of feet, jeft on one part of the body, while they advance forward with the reft. Such are earthworms, fnakes, caterpillars, \&c. Indeed, mont of the clafs of reptiles have feet; only thofe very fmali, and the legs remarkably fhort in proportion to the bulk of the budy.

Naturalifts obterve a world of artful contrivance fur the motion of reptiles. 'Thus, particularly in the earthworn, Dr Willis tells us, the whole body is only a chair of annular mufces; or, as Dr. Derham fays, it is only one continued firal mufcle, the orbicular fibres whereof being contracted, render each ring narrower and longer than before; by which neans it is enabled, like the worm of an augre, to bore its paffage into the earth. Its reptile notion might allo be explained by a wire wound on a cylinder, which when flipped off, and one end extended and held fat, will bring the other near to it. So the earthworm having fhot out or extended his body (which is with a wreathing). it takes hold by thefe fimall feet it hath, and fo contracts the hinder part of its body. Dr Tyfon adds, that when the forepart of the body is Itretched out, and applied to a plane at a diftance, the hind part relaxing and fhortening is ealily drawn towards it as a centrc.

Its feet are difpofed in a quadnople row the whole length of the worm, with which, as with fo many hooks, it faftens down fometimes this and fometimes that part of the body to the plane, and at the fame time flretches out or drags after it another.

The creeping of ferpents is effected after a fomewhat different manner; there being a difference in their ftructure, in that thefe lalt liave a campages of bones articulated together.

The body here is not drawn together, but as it were complicated; part of it being applied on the rough ground, and the relt ejaculated and fhot from it, which being fet on the ground in its turn, brings the other after it. The fpine of the back varioully wreathed has the fame effect in leaping, as the joints in the feet of other animals; they make their leaps by means of mufcles, and extend the plicx or folds. See Zoolo. GY.

REPUBL.IC, or commonwealth, a popular ftate or government; or a nation where the people have the government in their own hands. See Government, Aristocracy, Democracy, and Monarchy.

Republic of Letters, a phrafe ufed collectively of the whole body of the ftudious and learned people.

REPUDIATION, in the civil law, the act of divoicing. See Divorce.

REPULSION, in phyfics, that property of bodies whereby they recede from each other, and, on certain occafions, mutually avoid coming into contact.

Repulsion, as well as attraction, has of late been conlidered as one of the primary qualities of all matter, and has been much ufed in explaining the phenomena of nature: thus the particles of air, fire, fteam, electric fluid, \&c. are all faid to have a repulfise pawer with refpect to one another. - That this is the cafe with the air, and sapour of all kinds, is certain; becaufe when they are compreffed into a fmall fpace, they expand with

\section*{R E O}

Reputaten, with great force: but as to fire, light, and clectricity, Kequer. our experiments fail; nay, the fuppofition of a rcpulfive power among the particles of the electric fluid is incon-
fiffent with the phenomena, as has been demonftrated under the article Electricity, Seet. V. and VI. Even in thofe fluids, air and feam, where a repulfive power nof manifetly exits, it is demonitrable that the repulfion cannot be a frimary quality, fince it can be inereafed to a great degree by heat, and diminifhed by cold: but it is impolfible that a primary quality of matter can be increafed or diminifhed by any external circuroftances whatever; for whatever property depends upon external circumttanees, is not a primary but a fecondary one. - The repulfion of electrified bodies is explained under the anticie Electricity: that of ethers is lefs fubject to inrelligation; and the moft that can be faid concerning it is, that is many cafes it feems to be the confequence of a modification of fire, and in others of electricity.

REPUTATION means credit, honomr, or the character of good; and fince we are deftined to live in fociety, is neceffary and ufeful more or lefs to cvery human being. There is no nian, except one who is overgrown with pride and Exf-conccit, or whofe actions are bad, but pays attention to his reputation, and wihes to polfers the good opinion of his neighbours or the world. The love of reputation and of fame are molt powerful frings of action; but thougk they procced from the fame principlc, the means of attaining them, and the cffects of them, are not altogether the fame.

Many means indeed ferve equally to fupport the reputation and to inereafe the fame, differing only in degrees; others, however, belong peculiarly either to the one or to the other. An honett reputation is within the reach of the bulk of mankind; it is obtained by the focial virtucs and the conflant praftice of the common duties of life. This kint of reputation indeed is neither extenfive nor brilliant, but it is ofien the moft ufeful in point of happinefs. Wit, talents, and genius, are the recesfary requifites for fame; but thofe adwantages are perhaps lefs real in their confequences than thofe arifing from a good reputation. What is of real ufe colts little; things rare and fplendid require the greateft labour to procure, and yield perhaps a more ideal happinefs.
Fame can be poffcfel, comparatively fpeaking, but by few individuals; as it requires either very fuperior abilities, fupported by great efforts, or very fortunate circunifances. It is conftituted by the applaufe of mankind, or at leaf by that of a fingle nation; whilf reputation is of much lefs extent, and arifes from different circumftances. That icputation which is founded on deceit and articec is never folid; and the moll honourable will always be foumd to be the noft ufeful. Every one may fafely, and indeed ought to, afpire to the conlideration and praile due to his condition and merit; bur he who afpires to more, or who fecks it by difhoneft means, will at length meet with cuntempt.

REQUES \(i\), in law, a fupplication or petition preferred to a princr, or to a court of juftice; begging relief in fome conici nable cades where the cummon law grants no immediate redrefs.

Curt of Regre. qs (curia requilitionum) was a court of equity, of the fame nature with the court of chaneery, but inferior to it ; principally inftituted for the relief of fuch petitioners as in confcionable cafes addref.

Ied themfelves by fupplication to his majefty. Of this court the lord privy-ical was chief judge, affitted by the mafters of requefts; and it had beginning about the 9 Hen. VII. according to Sir Julius Cafar's tractate upon this fubject: though Mr Crwy, in his preface to his Readings, faith it began from a commifion firt grantcd by king Henry VIII. - This court, having aflumed great power to itfelf, fo that it became burthenfome, Mich. anno 40 and 41 E/iz. in the court of com. mon-pleas it was adjudged upon folemn argument, that the court of requefts was no court of judica. ture, \&ce. and by flat. 16 \& 17 Car I. C. 10. it was taken away.

There are ftill courts of requefts, or courts of con. feience, conftituted in London and other trading and populous diftricts for the recovery of fmall delte. The firt of thefe was eftablimed in London fo early as the reign of Henry VIII. by an act of their common council; which however was certainly infufficient for that purpofe, and illegal, till confirmed by flatute 3 Jac. I. c. 15 . which has fince been explained and amended by flatute 14 Geo. II. c. 10. The conflitution is this: two aldermen and four commoners fit twice a week to hear all caufes of debt not exceeding the value of forty Thillings; which they cxamine in a fummary way, by the oath of the parties or other fwitneffes, and make fuch order thereir as is confonant to equity and good confcience. The time and expence of obtaining this fummary redrefs are very inconfiderable, which make it a great benefit to trade; and thereupon divers trading towns and other diftricts bave obtained atts of parliament for eftablifhing in them courts of confcience upon nearly the fame plan as that in the city of London.

By 25 Gco. III. c. 45: (which is contined to profecutions in courts of confcience in London, Middlefex, and the borough of Southwark), and by 26 Geo. IIf. c. 38. (which extends the provifions of the former aet to all other courts inftituted for the recovery of fmall debts), it is enaeted, that after the firl day of September 1786 , no perfon whofuever, being a debtor or defendant, and who has been or hall be committed to any gaol or prifon by order of any court or commiffioners authorifed by any act or acts of parliament for conttituling or regulating any court or courts for the recovery of Imall debts, where the debt does not exceed twenty fhillings, hall be kept or continued in cuftody, on any pretence what foever, more than twenty days from the commencement of the latt meutioned act; or from the time of his, her, or their comnnitment to prifon: and where the original debt does not amount to or exceed the fum of forty fhillings, more than forty days from the commencement of the faid act, or from the time of his, her, or their commitment as aforelarid ; and all gaolers are thereby required to difcharge fuch perfons accordingly. And by fect. 2. if it fhall be proved to the fatisfaction of the court, that any fuch debtor has monery or goods which he has wilfully and fraudulently concealed: in that cafe the court fhall have power to en. large the aforefaid times of imprifonment for debts under twenty fhillings, to any time not exceeding thirty days, and for dehts under forty fhillings, to any time not exceeding fixty days; which faid ground of farther detention frall be fpecified in the faid commitment. And that (by fect. 3.) at the expiration of the faid refpec. tive times of imprifonment, every fuch perfon thall in:mediately be difcharged, without paying any fum of

\section*{R E S}

Zequiest money, or other reward or gratuity whatfoever, to the gaoler of fuch gaol on any pretence whatfoever ; and every gaoler demanding or recciving any fee for the difcharge of any fuch perfon, or keeping any fuch perfon prifoner after the faid refpective times limited by the faid act, fhall forfeit five pounds, to be recovered in a fummary way before two juftices of the peace, one moiety thereof to be paid to the overfeers of the poor of the parifh where the offence thall be committed, and the other to the informer.

REQUIEM, in the Romith hiftory, a mals fung for the relt of the foul of a perion deceafed.
RESCISSION, inthe civil law, an action intended for the annulling or fetting afide any contraf, deed, \&c.

RESCRIPT, an anfwer delivered by an emperor, or a pope, when confulted by particular perfons on fome difficult queltion or point of law, to ferve as a decifion thereof.

RESEDA, dyer's-weed, Yellow-zueed, Weld, or Wild-zooad: A genus of the order of trigynia, belonging to the dodecandria clafs of plants; and in the natural method ranking under the 54 th order, Mifcellanea. The calyx is monophyllous and partite ; the petals lanciniated; the capfule unilocular, and opening at the mouth. There are II fpecies; of which the moft remarkable is the luteola or common dyer's weed, growirg naturally in walte places in many parts of Britain. The young leaves are often undulated; the ftalk is a yard high, or nore, terminated with a long naked fike of yellowih-green flowers: the plant is cultivated and much ufed for dying filk and wool of a yellow colour. The great recommendation of the plant is, that it will grow with very little trouble, without dung, and on the very worlt foils. Fur this reafon it is commonly fown with, or inmediately after, barley or oats, without any additional care, except drawing a bufh over it to harrow it in. The reaping of the corn does it little or no hurt, as it grows but little the firt year; and the next fummer it is pulled and dried like flax. Much care and nicety, however, is requifite, fo as not to injure either the feed or ftalk; or, which fometimes happens, damaging both, by letting it fland too long, or pulling it too green. To avoid thefe inconveniences, a better method of culture has been devifed. This new method is to plough and harrow the ground very fine, without dung, as equally as poffible, and then fowing about a gallon of feed, which is very fmall, upon an acre, fome time in the month of Augult. In about two months it will be high enough to loe, which muft be carefully done, and the plants left about fix inches afunder. In March it is to be hoed again, and this labour is to be repeated a third time in May. About the clofe of June, when the flower is in full vigour, and the ftalk is become of a greenih-yellow, it fhould be pulled; a fufficient quantity of ftems being left growing for feed till September. By this means the flower and ftalk, both of them being carefully dried, will fell at a good price to the djers, who employ it conftantly, and in large quantities; add to this, that the feed being ripe and in perfeet order, will yield a very confiderable profit. In. a tolerable year, when the feafons have not. been unfavourable, the adeantages derived from this vegetable will anlwer very well; but if the fummer fhould be remarkably fine, and proper care is taken in getting is in, there will be
a very large produce upon an acre. The crop being, as has been thown, fo early removed, the ground may be conveniently prepared for growing wheat the next

Refertio blance. year. Upon the whole, weld is in its nature a very valuable commodity in many refpects, as it ferves equally for woollen, linen, or filk; dycing not only a rich and lafting yellow, but alfo, properly managed, all the different hades of yellow with brightnefs and beauty; and if thefe be previoully dipped blue, they are by the weld changed into a very pleaing green, which our artilts can alfo diverfify into a great variety of thades.

RESEMBLANCE, and Dissimilitude, the rela* tions of likenefs and difference among objects. See Comparison.

The connection that man hath with the beings around Elem. of him, requires fome acquaintance with their nature, their Critioifino powers, and their qualities, for regulating his conduct. For acquiring a branch of knowledge fo eflential to our well-being, motives alone of reafon and intereft are not fufficient : nature hatle providentially fuperadded curiofity, a vigorous propenfity, which never is at reft. This propenfity alune attaches us to every new objeot \(\dagger\); and \(\ddagger\) See \(M\) oo incites us to compare objects, in ordes to dilcover their relly. differences and refemblances.

Refemblance annong objects of the fame kind, and diflimilitude annong objects of different kinds, are too obvious and familiar to gratify our curiofity in any degree: its gratification lies in difcovering differences anong things where relemblance prevails, and refemblances where difference prevails. Thus a difference in individuals of the fame kind of plants or animals, is deemed a difcovery, while the many particulars in which they agree are neglected; and in different kinds, any refemblance is greedily remarked, without attending to the many particulars in which they difer.

A comparifon of the former neither tends to gratify our curiofity, nor to fet the objects compared in a ftronger light : two apartments in a palace, fimilar in fhape, fize, and furniture, make feparately as good a figure as when compared; and the fame obfervation is applicable to two fimilar compartments in a garden: on the other hand, oppofe a regular building to a fall of water, or a good picture to a towering hill, or even a little dog to a large horfe, and the contraft will produce no effect. But a refemblance between objects of different kinds, and a difference between objects of the fame kind, hare remarkably an enlivening effect. The poets, fuch of them as have a juft tafte, draw all their fimilies from things that in the main differ widely from the principal fubject; and they never attempt a contralt, but where the things have a common genus, and a refemblance in the capital circumflances: place together a large and a fmall-fized animal of the fame fpecies, the one will appear greater, the other lefs, than when viewed feparately: when we oppofe beauty to deformity, each makes a greater figure by the comparifon. We compare the drefs of different nations with curiolity, but without furprife; becaufe they have no fuch refemblance in the capital parts as. to pleafe us by contrafing the fmaller parts. But a new cut of a fleeve, or of a pocket, enchants by its novelty ; aud, in oppofition to the former fafhion, raifes fome degree of furprife.

That refemblance and diffimilitude hare an enliveno

Refentb'ance.
ing effect upon objects of fight, is made fufficiently evident; and that they lave the fame effect upon ohjects of the other fenfes, is alfo certain. Nor is that law confined to the extemal fenfes; for characters contialted make a greater figure by the oppofition: Iaro, in the tragedy of Othello, fays,

He hath a daily beauty in his tife That makes me ugly.
The charatter of a fop, and of a rouch warrior, are nowhere more fuccefsfully contrafted than in Shakespeare:

Hotfpur. My liege, I did deny no prifoners: But I remember, whell the fight was done, When I was dry with rage, and extreme toil, Breathlefs and faint, leaning upon my fword, Came there a certain lord, neat, trimly drefs'd, Frefh as a bridegroom; and his chin, new-reap'd. Show'd like a Itubble-land at harvelt-home. He was perfumed like a milliner; And 'twizt his finger and his thumb he held A pouncet-box, which ever and anon He gave his nofe:-and fill he finil'd and tall'd; And as the foldiers hare dead bodies by, He call'd them untaught knaves, umannerly, To bring a flovenly, unhandfome corfe Detwist the wind and his nobility. With many holiday and lady terms He queftion'd me: among the reft, demanded My pris'ners, in your majelty's belalf. I then, all fmarting with my wounds; being gall'd To be fo pefter'd with a popinjay, Out of my grief, and my impatience, Anfwer'd, neglectingly, I know not what: He fhould, or fhould not; for he made me mad, To fee him thine fo brifk, and fmell fo fweet, And talk fo like a waiting gentlewoman, Of guns, and drums, and wounds, (God fave the mark!) And telling me, the fovereign't thing on earth
Was parmacity for an inward bruife;
And that it was great pity, fo it was,
"This villanous faltpetre flould be digg'd Out of the bowels of the harmlefs earth, Which many a good, tall fellow had deltroy'd
So cowardly: and but for thefe vile guns,
He would himfelf have been a foldier.
Firf purt, Henry IV. af 1. fc. 4
Paffions and emotions are alfo enflamed by comparifon. A man of high rank lumbles the byftanders even to annihilate them in their own opinion: Cæfar, beholding the Ratue of Alexander, was greatly moriffed, that now, at the age of 32 , when Alexander died, he had uot performed one memorable action.

Our opinions allo are much influenced by comparifon. A man whofe opulence exceeds the ordinary fandard is reputed richer than he is in reality; and wifdom or weaknefs, if at all remarkable in an individual, is generally carried beyond the truth.

The opinion a man forns of his prefent ciftrefs is heightened by contrafing it with his former happinefs:

\footnotetext{
-C-Could I forget
What I have been, I might the better bear What I'm deftin'd to. I'm not the frit
}

That have been wretched: but to think how much I have been happier.

Soutbern's Innocent Aidultery, all 2.
The diftrefs of a long journey makes even an indif. ferent inn agreeable: and, in travelling, when the road is good, and the horfeman well covered, a bad day may be agrecable, by making him fenfible how fuig he is.

The fame effect is equally remarkable, when a man oppofes his condition to that of others. A flip toffed about in a ftorm, makes the fpectator reflect upon his own eafe and fecurity, and puts thefe in the Atrongeft light.

A man in grief cannot bear mirth; it gives lim a more lively notion of his unlanopinefs, and of courfe makes lim more unhappy. Satan, contemplating the bcauties of the terreftrial paradife, has the following exclamation :
With what delight could I have walk'd thee round, If I could joy in ought, fwect interchange
Of hill and valley, rivers, woods, and plains,
Now land, now fea, and thores with forelt crown'd, Rocks, dens, and caves! but I in none of thefe Find place or refuge: and the more I fee Pleafures about me, fo mach more I feel Torment within me, as from the hateful fiege Of contraries : all good to me becomes Bane, and in heav'n much worfe would be my tate. Paradife 1.ofl, book 9.1.114.
The appearance of danger gives fometimes pleafure, fometimes pain. A timorous perfon upon the battlements of a high tower, is feized with fear, which even the conlcioufnefs of fecurity camot diffipate. But upon one of a firm head, this fituation has a contrary effect: the appearance of danger heightens, by oppofition, the confeioufnefs of fecurity, and confequently the fatisfaction that arifes from fecurity: here the feeling refenbles that abore-mentioned, occalioned by a fiop labouring in a ftorm.

The effect of magnifying or leffening objects hy means of comparifon is to be attributed to the innuence of paffion over our cpinions. This will evidently appear by reflecting in what manner a fpectator is affected, when a very large animal is for the firlt time placed befide a very fmall one of the fame fpecies. The firt thing that flrikes the mind is the difference between the tro animals, which is fo great as to occafion furprife ; and this, like orher emotions, magnifying its object, makes us conceive the difference to be the greateft that can be: we lee, or feem to fec, the one animal extremely little, and the other extremely large. The emotion of furprife arifing from any unufual re\{emblance, ferves equally to explain, why at firit view we are apt to think fich refemblance more entire than it is in reality. And it muit be oblersed, that the circumftances of more and lefs, which are the proper fubjects of comparifon, raife a perception fo indiftinet and vague as to facilitate the effect deferibed; we have no mental ftandard of great and little, nor of the feveral degrees of any attribute; and the mind, thus unreftrained, is naturally difpofed to indulge its furprife to the utmoft extent.

In exploring the operations of the inind, fome of which are extrenely nice and nippery, it is neceffary

\section*{\(R\) E S}
n, to proceed with the utmoft circumfpeation: and after cc. all, Feldom it happens that fpeculations of that kind afford any 「atisfaction. Luckily, in the prefent eafe, our fpeeulations are fupported by facts and folid argument. Firt, a fmall object of one fpecies oppofed to a great object of another, produces not, in any degree, that deception which is fo remarkable when bath objects are of the fame fpecies. The greatet difparity between objects of different kinds, is fo comnon as to be oblerved with perfect indifference; but fueh difparity between the objects of the fame kind being uneom. mon, never fails to produce furprife: and may we not fairly conclude, that furprife, in the latter cafe, is what oceafions the deeeption, when we find no deception in the former? In the next place, if furprife be the fole caufe of the deception, it follows neceffarily that the deception will vanifh as foon as the objects compared become familiar. This holds fo unerringly, as to leave no reafouable doubt that furprife is the prime mover: our furprife is great, the firft time a finall lapdog is feen with a large maltiff; but when two fich animals are conflantly together, there is no furprife, and it makes no differenee whether they be viewed feparately or in company. We fet no bounds to the riches of a man who las recently made his fortune ; the furprifing difproportion between his prefent and his paft fituation being earried to an cxtreme : hut with regard to a family that for many generations hath enjoyed great wealth, the fame falfe reekoning is not made. It is equally remarkable, that a trite fimile has no effeet: a lover compared to a moth feorching itfelf at the flame of a eandle, originally a fprightly fimile, has by frequent ufe loft all force; love cannot now be compared to fire, without fome degree of difgut. It has been juftly obferved againft Homer, that the lion is too often introduced into his fimiles; all the variety he is able to throw into them not being fufficient to keep alive the reader's furprife.

To explain the influence of comparifon npon the mind, we have chofen the fimpleit eafc, viz., the firft fight of two animals of the fame kind, differing in fize only; but to complete the theory, other circumflances muft be taken in. A nd the next fuppofition we make, is where both animals, feparately faniliar to the fpectator, are brought together for the firft tinie. In that cafe, the effect of magnifying and diminifling is found remarkably greater than in that firft mentioned ; and the reafon will appear upon aralyfing the operation: the firit feeling we have is of furprife at the uncommon difference of two creatures of the fame fpecies; we are next fenfible, that the one appears lefs, the other larger, than they did formerly; and that new circumitance inereating our furprife, makes us imagine a alill greater oppofition between the animals, than if we had formed no notion of them beforehand.

Let us make one other fuppofition, that the fpeciator was acquainted beforehand with one of the animals only ; the lapdog, for example. This new circumftance will vary the effect; for, inftead of widening the natural difference, by enlarging in appearance the one animal, and diminithing the other in proportion, the whole apparent alteration will reft upon the lapdog: the furprife to find it lefs than it appeared formerly, directs to it our whole attention, and makes us conceive it to be a moit diminutive creature ; the malliff VoL. XVI. Part 1.

\section*{R E S}
in the mean time is quite overlooked. Fo illu frate this effect by a faniliar example. Take a piece of p?per or of linen tolerably white, and compare it with a pure white of the fame kind : the judgment we form \(f\) of the firtt object is infantly varierl; and the fupmit: oceafioned by finding it lefs white than was thourht, produceth a halty conviction that it is much lefa whit: than it is in reality : withdrawing unw the pure whire, and putting in its place a detp black, the furprife oc. eafroned by that new cireunftance carries us to the other extreme, and makes us conceive the object firl mentioned to be a pure white: and thus experience compels us to acknowledge, that our emotions have an infuence even upon our eye-fight. This experimeit leads to a general obfervation, that whatever is found more Atrange and beautiful than was expected, is judgeed to be more ftrange and beautiful than it is in reality. Henee a common artifice, to depreciate beforehand what we wifh to make a figure in tle opinion of others.

The comparifons employed by pocts and orators are of the kind laft mentioned; for it is aluays a known object that is to be magnified or leffened. The former is effected by likening it to fome grand object, or 1 , \(r\) eontrafting it with one of an nippofite character. T's effectuate the latter, the method nualt the reverfert: the object mult be contrafted with fomething fuperin: to it, or likened to fomething inferior. The whole effect is produced upon the principal object ; which by that means is clevated above its rank, or depreffed below it.

In aecounting for the effect that any unufual refermblanee or diffinilitude hath upon the mind, no eauie has been mentioned but furprife ; and to prevent coutfufion, it was proper to difenfs that caufe firt. But furprife is not the only eaufe of the effect deferibed: another oecurs, which operates perhaps not lefs powerfully, viz. a prineiple in human nature that lies fliil in obfeurity, not having been unfolded by any writer, though its effects are extenfive : and as it. is not diftinguifhed by a proper name, the reader mult be fatisfied with the following defeription. Every man who fludies himfulf or others, muft be fenfible of a tendency or propenfity in the mind to complete every work that is begun, and to carry things to their full perfection. There is little opportunity to difplay that propenfity upon natural operations, which are feldom left inperfect; but in the operations of art it hath great fcope: it impels us to perfevere in our own work, and to wifh for the complction of what another is doing : we feel a fenlible pleafure when the work is brought to perfection; and our pain is not lefo fenfible when we are difappointed. Hence our uncafinefs when an interefting ftory is broke of in the middle, when a picee of nufie ends without a clofe, or when a building or garden is left unfinithed. The fame propenfity operates in making eollections; fueh as the whole works, good and bad, of any author. A certain peifon attempted to collect prints of all the capital paintings, and fucceeded cxcept as to a few. La Bruyere remarks, that an anxious fearch was made for thefe; not for their value, but to complete the fet.
The final caufe of the propenfity is an additional proof of its exifence. Human works are of no fignificancy till they be completed; and realon is not alvers a fufficient counterbalance to iadolence: fome prinA1

\section*{R E S [ 90 ] R E S}

R-fem blacc.
ciple over and abow is necefary to excite our induftry, and to prevent our donping fhort in the middle of the courfe.

We reed not lele time to ar. Fcribe the co-operation of the foregoing renpenfity with furprile, in producing the effeet that fuliows a:y unufual refemblance or diffiniliturle. Surprife fret operates. and carries onir opininn of the eefemblance ois diffinilitude beyond tratio. The propenfty" we hase bren deferibing carries us till farther; for it forets upon the mind a conviction, that the refemblance or liffimilitude is complete. We need 1.o better illuferation, than the refenblance that is fancicd in fome pehbles to a tree or an infeet; which refemblance, however faint in reality, is conceived to be wonderfully perfect. The tendency to complete a refemblance asting jointly with furprife, carries the nind fometimes fo far, as even to prefume upon future events. In the Greek tragedy entited Phineides, thofe unhappy wornen fecing the place where it was intended they thould be nain, cried out wich anguifh, "They now faw their cruel deftiny had condemned them to die in that place, being the fanse where they had been expofed in their infancy."

The propenfity to advance every thing to its perfection, not only co-operates with furprife to deceive the mind, but of itfelf is able to produce that effect. Of this we fee many inftances where there is no place for furprife; and the firt we fall give is of refomblance. Unumquodque codem modo difolvitur quo collisatum \(e / f\), is a maxion in the Roman law that las no foumbation in truth; for tying and loofing, building and demolifhing, are acts oppofite to each other, and are perfurmed by oppolite means: but when thefe acts are connected by their relation to the fame fubject, their connection leads us to imagine a fort of refemblance between them, which by the foregoing propenfity is conceived to be as complete as poffible. The next inftance fhall be of contratt. Addifon obferves, "That the paleft features look the moit agreeable in white; that a face which is overillufled appears to advantage in the dcepeft fcarlet; and that a dark complexion is not a little alleviated hy a black hood." The forecoing propenfity ferves to account for thefe appearances ; to make this evident, one of the cafes fhall fuflice. A complexion, however dark, never approaches to Hack: when thefe colours appear together, their oppofition flrikes 1 s ; and the propentity we have to cimplete the oppofition, makes the darknefs of complexion vanifh out of light.

The operation of this propenfity, even where there is no ground for furprife, is not confined to opinion or conviction : fo powerful it is, as to make us fometimes procced to action, in order to complete a refemblance or diffililitude. If this appear oofenre, it will be made clear by the following inftance. Upon what principle is the lex talionis founded, other than to make the punifament refemble the mifehief? Reafon dictates, that there onght to be a conformity or refemblance between a crime and its pusifhment; and the foregoing propenfity impels wis to make the refermblance as complete as poffible. Titus Livius \(\|\), under the influence of that propenfity, accounts for a certain punifhment by a refemblance between it and the crime, too fubtile for common apprehenfion. Speaking of

Mettus Fuftetive, the Alban general, who, for treaclery to the Komans his allics, was fentenced to be torn to pieces ly horfes, he puts the following fpeceh in the mouth of Tiullus Hoftilius, who decreed the punifhment. "Mette Fuffeti, inquit, fi ipfe difcere poffes fidem ac fadera fervare, vivo otibi ca difciplina a me adbibita c/for. Nunc, quoniann tuam infanabile ingenium off, at tu two Jupplicio doce bumanum genus ea fanda credere, qua a te violata funt. Ut igitur paula ante animum inter Fi denatem Romanantque rem ancipitem geffipi, ita jam corpus paffim difrabenlum dabis." By the fame infuence, the fentence is often executed upon the very foot where the crime was committed. In the Eledra of Sopho. cles, Egitheus is dragged from the theatre into an inner roam of the fuppofed palace, to fuffer death where he murdered Agancmnon. Shakefpeare, whofe knowledge of nature is not lefs profound than eatenfive, has not overlooled his propenfity:
"Othello. Get me fome poifon, Iago, this night. I'll not expotulate with her, lef her body and her beauty unprovide my mind again. This nisht, Iago."
" layo. Do it not with poifon; Arangle her in her bed, even in the bed fhe hath contaminated."
"Orbello. Good, grood: the juttice of it pleafes: very good."

Otbello, ag 4. fc. 5 .
Perfons in their laft moments are generally feized with an anxiety to be buried with their relations. In the Amynta of Taffo, the lover, hearing that his miftrefs was torn to pieces by a wolf, exprefles a defire to die the fame death.

Upon the fubject in general we have two remarks to add. The firl concerns refemblance, which, when too entire, hath no effect, however different in kind the thirgs compared may be. The remark is applicable to works of art only; for natural objects of different kinds have fcarce ever an entire refemblance. To give an example in a work of art : Marble is a fort of matter very difierent from what compofes an animal; and marble cut into a human figure, produces great pleafure by the refemblance: but if a marble ftatue be coloured like a picture, the refenblance is fo entire as at a ditance to make the ftatue appear a real perfon: we difcover the miltake when we approach ; and no other emotion is raifed, but furprife occafioned by the deception: the figure ftill appears a real perfon, rather than an imitation ; and we mult ufe reflection to correct the miltake. This cannot happen in a picture; for the refermblance can never be fo entire as to difguife the imitation.

The other remark belongs to contraft. Emotions make the greatelt figure when contralted in fucceffion; but then the fucceffion ought neither to be rapid, nor immoderately flow: if too flow, the effect of contralt becomes faint by the diftance of the emotions; and if rapid, no fingle emotion has room to expand it felf to its full lize, but is itifed, as it were, in the birth liy a fucceeding emotion. The funeral oration of the bihop of Meux upon the duchefs of Ortcans, is a perfect hodge-podge of cheerful and melancholy reprefentations, following ench other in the quickef fuccelfion: oppofite emotions are beft felt in fucceffion; but cach emution feparately fhould be raifed to its due pitch, before another be introduced.
rem. What is aoove laid down, will enable us to deter- raifed by the fine arts, viz. Whether ought fimilar emotions to fucceed each other, or diffimilar ? The emotions raifed by the fine arts are for the molt part too nearly related to make a fisure by refemblance; and for that reafon their fucceffion ought to be regulated as much as poffible by contraft. This holds confeffedly in epic and dramatic compotitions: and the beft writers, led perhaps by talle more than by reafoning, have generally aimed at that beanty. It holds equatly in mufic: in the fame cantata all the variety of emotions that are within the power of mulic, may not only be indulged, but, to make the greatelt figure, ought to be contrafted. In gardening, there is an additional reafon for the rule: the emotions raifed by that art, are at beft fo faint, that every artifice fhould be employed to give them their utmott vigour: a field may be laid out in grand, fweet, gay, neat, wild, melancholy fcenes; and when thefe are viewed in fuccerfion, grandeur ought to be contralted with neatnefs, regularity with wildnefs, and gaiety with melancholy, fo as that each emotion may fucceed its oppofite: nay, it is an improvement to intermix in the fucceflion rude uncultivated fpots as well as unbounded views, which in themfclves are difagreeable, but in fucceffion heighten the feeling of the agreeable object; and we have nature for our guide, which in her inof beautiful landicapes often intermixes rugged rocks, dirty marfhes, and barren fony heaths. The greateft malters of mufic have the fame view in their compofitions: the fecond part of an 1talian fong feldom conveys any fentiment: and, by its harhnefs, feems purpofely contrived to give a greater relifh for the intereting parts of the compofition.

A fmall garden, comprehendid under a fingle view, affords little opportunity for that embellifhment. Diffimilar emotions require different tones of mind; and therefore in cenjunction can never be pleafant : gaiety and frocetnefs may be combined, or wildnefs and gloominefs ; but a compofition of gaiety and gloominefs is diftaftcful. The rude uncultivated compartment of furze and broom in Richmond garden, lath a good effect in the fucceffion of objects; but a fpot of that nature would be infufferable in the midit of a polifhed parterre or flower-plot. A parden, thereforc, if not of great extent, admits not diffimilar emotions; and in urnamenting a fmall garden, the fafeft courfe is to confine it to a fingle expreffion. For the fame reafon, a landicape ought alfo to bc confined to a fingle expreflion; and aecordiugly it is a rule in painting, that if the fubject be gay, every figure ought to contribute to that emotion.

It follows from the foregoing train of reafoning, that a garden near a great city ought to have an air of folitude. The folitarinefs, again, of a wafte country ouglit to be contrafted in forming a garden ; no temples, no obfeure walks; but jets d'eau, calcades, objeas active, gay, and fplendid. Nay, fuch a garden fhould in fome meafure avoid imitating nature, by taking on an extraordinary appearance of regularity and art, to fhow the bufy hand of man, which in a welte country has a §ne effect by contraft.

Wit and ridicule make not an agreeable misture
with grandeur. Difimilar emotions have a fine effect in a flow fucceffion; but in a rapid fucceffion, which approaches to co-exiftence, they will not be relificd. In the midit of a laboured and elevated defcription of In the midit of a laboured and clevated defcriphich is certainly out of its place:

> Obvies ambultum torrent Chorinxus ab ara Corripit, et venienti Ebufo plagamque ferenti
> Occupat os flamnis: illi ingens barba reluxi:, Nidoremque ambuita dedit. Ens. xii. 29 . E qual tauro ferito, il fuo dolore Verfo mugghiando e fofpirando fuore. Gierifal. cant. +. At. I. It wolld however be too auftere to banifh altogether ludicrous images from an epic poem. This poem doth not always foar above the clouds: it admits great variety; and upon occafion can defcend even to the ground without finking. In its inore familiar tones, a ludicrous fcene may be introduced without improp:iety. This is done by Virgil * in a foot-race : the circumtances of which, not excepting the ludicrous part, are copied from Homer \(\dagger\). After a fit of merriment, we are, it is true, the lels difpofed to the ferious and fublime: but then, a ludicrous fcene, by unbending the mind from fevere application to more intereiting fu'bjects, may present fatigue, and preferve our relifin entire.
RESEN, (Mofes) ; a town on the Tigris, built by Ninrod; thought to be the Larifa of Xenophon; which fee. But as Larifla is a nanie in initation of a Greek city; and as there were no Greek cities, confequently no Larifici in Affyria, before Alexander the Great ; it is probable that the Grecks affing of what city thofe were the ruins they faw, the Affyrians night anfwer, Larefen, "Of Refen;" which word Xenophon expreffed by Larifa, a more familiar found to a Grcek ear, (Wells).
RESENTMENT, means a Atrong perception of good or ill, generally a deep fenfe of injury, and may be diftinguifhed into anger and reverge. "By anger (fays Archdeacon Paley), I mean the pain we fuffer upon the receipt of an injury or aifront, with the ufual effeets of receipt of an injury or aifunt, withe the ulual encets of
that pain upon ourfelves. By revenge, the infictiag of pain upon the perfon who has injured or offended us, farther than the juft ends of punithment or reparation require. Anger prompts to revenge; birt it is poffible to fufpend the effect when we cannot altoge-
ther quell the principle. We are bound allo to endeapoimble to ulpend the effect when we cannot altoge-
ther quell the principle. We are boind allo to endeavour to qualify and correct the principle itfelf. So that our duty requires two different applications of the mind : and for that reafon anger and revenge thould be confidered feparately." See Revenge.

RESERVATION, in Law, an action or claufe
whereby fomething is referved, or fecured to one's fect.
Mental Reserpation, a propofition which, Arictly takent, and according to the natural import of the terms, is falit; but, if qualified by funmething concealed in the mind, becomes true.

Mental refervations are the great rcfuge of relighous hypocrites, who ufe them to accomadate their conhypocites, who ule them to accemandate their con-
feiences with their interelld : the Jefuits are zealous a a vocates for nental refervations: yet are they teal lies, as including an intention to ceccive. * Ew.oid, F \(E\) woid,

RESERVE, in liw, the fame with refervation. See Resirimioy.
Body of Resserf, or Corps de Risfkpr, in military affars, the thind or lat line of an arniy, drawn up for tutere; fo ealle? beeaufe they are referved to futain the re!? as weafion requires, ant not to engage but in cafe v: nect hity.
RIESERVOIR, a place where water is collefted and reterved, in oreler to be conveyed to dilkant places th: ourch p:pes, or fupply a fomain or jet d'eau.

RESE'f, in luw, the rectiving or harburing an omianed peefon. See Outlaskr.
Keset of Theff, ia Scots law. See Law, no clexxvi. 29.

RESIDENCE, in the canon and common law, the abode of a perfons or incumber:t upon his henefiee; and his afidurity in attendiar on the fame.
RESIDENT, a public ininitter, who manages the affias of a kingcium or ltate, at a foreign court.

They are a clafs of pullic minifters inferior to amBaTadors or envoys; but, like them, are uader the protection of the law of mations.

RESIDUE, the remainder or balance of an account, cebe, or nhligation.
KESIGNATION, in general, fignifies the impli--it fubmifion of ourfelves, or of fometling we poffers, to the will of another. In a religious fenfe it fignifies a perfect fuhmifion, without difeontent, to the will of Gud. See Moral Philosorhy, \(11^{\circ}\) Irg.

RISSIN, in natural hiftory, a vifeid juice oozing eit her fpomtanenufy, or hy incifion, from feveral trees, as the Fine, fir, isc. - A promium for feveral years has been ofFered by the London Snciety for Encouraging Asts, Qic. for difeovering a mode of redueing the inflammable nuality of refin, fo as to adapt it to the purpoles of maLina candles; but no fuch difcovery has yet been made.
flaftic Rssia. See Caoutchouc.
Gum Resin, a mixture of gum and refin. See Pharr:ac\% \(n^{n} 3^{S}\).

Red Gum Rrsin, is procured from the red gum tree, Er eucalyptus refinifera; a tree fo large and lofty as to exceed in fize the Englifn oak. The wood of the tree : brittle, and of little ufe but fur fircwood, from the Large quantity of refinous gum it contains. The tree is ciftinguifhed by laving peduncula eed fowers, and an scute or pointed conical ealyptra. To ubtain the juice foon this tree inciions are made in the trumk of it, and fometimes upwards of 60 gallons of red refinous inice have been obtained from one of them. "When this juice is dried, it becomes a very powefful altringent gum-refin, of a red colaur, much refembling that known in the flops by the name of kine, and, for all medical purpofes, fully as efficacious. Mr White adminnifered it to a great number of patients in the dyfentery, which prevailed much foon after the landing of the convicis, and in no one inflance found it to fail. This gun-refin difolves almolt entirely iu fpirit of wine, to which it gives a llood-red tincture. Water difolves aboo: one fixth part only, and the watery folotien is of a bright red. Both thefe folutions are powerIully athi:"gent."

Yellow \(^{\text {fium }} R_{\text {fsin }}\), is procured from the yellow refirn tree, which is as large as the Englifh valnut tree. The profectios of this refin are equal to thofe of the
molt fragrant bulfams.
R E S taneoully, but more readily if incles from the bark foncolour of it is yellow, and at firit it is fluil; but after being infpiffited in the fun, it becones folid. When burnt ou hot coals, it fmells lise a mixture of balfan of 'Jolu and benzoin, approaching fumewhat to llurax. "It is perfectly foluble in fyirit of wiue, but not in wa. Thid ter, nor coen in effential oil of turpentine, unlefs it be diredted in a ftrong heat. The varnith which it makes with either is very weak, and of little ufe. With refpect to its medicinal qualties, Mr White has found it, in many calis, a gond peetoral medieine, and very ballamic. It is not obtainable in fo ereat abundance as the red gum produced by the eucalyptus refinifera, The plant which produces the yellow gum feems to be perfectly unknowin to botanifts, but Mr White has communicated no fpecimens by which its genus or even clafs could be determined."

Resinous electricity, is that kind of electricity which is produced by exciting bodies of the refinous kincl, aud which is generaliy negative. Sce Electricity paffirm.

Resistance, or Resisting Force, in plitofoply, denotes, in general, any power which ackts in an oppofite direction to another, fo as to deftroy or diminith its effect. See Mechanics, Hydrostatics, anil Peeumatics.

Of all the refiltances of bodies to each, there is undoultedly none of greater importance than the refiftance or reaction of fluids. It is here that we mult look for a theory of naval arclitecture, for the inpulfe of the air is our moving power, and this muit be noodified fo as to produce evely motion we want by the form and difpofition of our fails ; and it is the refiftance of the water which munt be overcome, that the thip may proceed in her courfe; and this muft allo be modificd to our purpofe, that the fhip may not drive like a \(\log\) to leeward, but on the contrary may ply to windward, that the may anfwer her helm brifikly, and that the may be eafy in all her motions on the furface of the troubled ocean. The impulfe of wind and water makes them ready and indefatigable fervants in a thoufand fhapes for driving our machines; and we fould lofe much of their fervice did we remain ignoraut of the laws of their action: they would fometimes become terrible mallers, if we did not fall upon methods of eluding or foftening their attacks.

We cannot refufe the aneients a confiderable krow- Tbe a \({ }^{2}\). ledge of this fubject. It was equally interefing to them ents w: as to us; and we cannot read the accounts of the naval t dera! exertions of Phcenicia, Carthage, and of Rome, exertions wcll : which have nut been forpaffed by any thing of modern with date, without believing that they poffeffed much practical and experimental knowledge of this fubject. It was not, perhaps, poffefed by them in a llriet and fyltematic form, as it is now taught by our mathematicians; but the mafter-builders, in their dockyards, did unduobtedly exercife their genios in comparing the forms of their fineft fhips, and in marking thofe circumflances of form and dimenfion which were in fact accompanicd with the dcfirable properties of a thip, and thus framing to themfelves maxims of naval architefture in the fame manner as we do now. For we believe

\section*{R E S}
[
Refinanee believe that eur naval architetts are net dippofed to grant that they have prolited nuch by all the latoras of the mathematicians. Hut the ancienes had not made any great progrefs in the phyticomathematical fciences, which confift chisfly in the application of calculus to the phenomena of nature. In this brancin they could make none, becaufe they had not the means of inveftigation. A knowledge of the nowtions and actions of fluids is acceffible only to thofe who are familiarly acquainted with the flexionary mathematies; and without this key there is no admittatice. Even when paffeffed of this guide, our progrets has been wery flow, helitating, and devious; and we lave not yet been aille to eftablifh any iet of doctrines which are fufceptible of an eafy and confident application to the arts of hie. If we have advanced farther than the ancients, it is becaufe we have come after them, and have profited by their labours, and ceen by their mittakes.

Sir Ifaac Newton was the firlt (as far as we can reSir i. Now- Sir laac Newton was the fritt (as ar as we can re-
ton fif ap-collect) who attempted to make the motions and acflied nas. tions of fluids the fubject of mathematical difcuffion. thematics He had invented the method of fluxions long bffore he engaged in his phyfical refearches; and he proceeded in there fu th mathofis facem praierente. Yet even with this guide he was often obliged to grope his way, and to try varions bye-paths, in the hopes of obtainengs a legitinate theory. Having exerted all his powers in eftatlifhing a theory of the lunar mutions, he was obliced to reit contented with an approximation inflead of a perfect folution of the problem which afeertains the motions of three bodies mutually acting on each other. This corvinced him that it was in vain to expect an accurate invefigation of the motions and actions of fluids, where unillions of unfeen particles combine their influence. He therefore calt about to find fome particular care of the problem which would admit of an accurate determination, and at the fame time furnih circumfances of analogy or refemblance fufficiently numerous for giving limiting cafes, which fhould include between them thofe other cafes that did not admit of this accurate invefligation. Aad thus, by knowing the limit to which the cale propoled did approximate, and the circumftance which regulated the approximation, many ufeful propofitions might be deduced for directing us in the application of thefe doetrines to the arts of life.

He therefore figured to himfelf a lyypothetical collection of matter which poffefed the charactenilic property of fluidity, viz. the quiquiverfun propagation of preffure, and the molt perfect intermohility (pardon the uncouth term) of parts, and which formed a phy. fical whole or aggregate, whofe parts were connected by mechanical forces, determined both in degree and in direction, and fuch as rendered the determination of certain important circumfances of their motion fufceptible of precife invettigation. And he concluded, that the laws which he flould difcover in thefe motions murt have a great analogy with the laws of the motions of real fluids : And from this hypothelis he deduced a feries of propolitions, which form the bafis of almoft all the theories of the impulfe and refillance of fluids which have been offered to the public fince his time.

It muft be acknowledged, that the refults of this theory agree but ill with experiment, and that, in the wayy in zulich it bas been zealoully projecuted by fubbequicht
marbematicians, it proceeds on principles or aftumptions Refinanze. which are not only gratuitons, but even falc. But it afiords fuch a beautiful appl ication of geometry and calculus, that mathematicians lave been as it were fafcinated by it, and have publithed fyftem; fo elegans anel fo cxter:fively applicatle, that one cannot help la. menting that the fuundation is fo flimfy. Joha Bernoulli's theory; in his differtation on the commanaication of notion, and Bouguen's in his Traité du Navire, and in lis Theorie du Manauzve et de la Naiture des Vaif. Seaur, mult ever be comidered as among the fineft fpecimens of phylicomathenatical fience which the world has feen. And, with all its imperfections, this theory but 8 fill furnifaes (as wats expected by its illultrious author) hat is is fiti many propolitions of immenfe practical ufe, they be-v ry corfe ing the limits tw which the real phenomena of the in-derables. pulfe and refintance of fluids really approxinate. So that when the law by which the phenomena derite from the theury is once determined by a well choten feries of experiments, this hypothetical theory becomes almoit as valuable as a true one. And we inay add, that although Mr d'Alembert, by treading warily in the Iteps of Sir Ifaac Newton in another route, has difcovered a genuine and unexceptionable theory, the procefs of inveftigation is fo intricate, requiring every fineffe of the moft abltrufe analyfis, and the fnal equations are fo complicated, that even their moft expert author has not been able to deduce more than one limple propofition (which too was difcovered by Daniel Bernoulli by a more fimple procefs) which can be applied to any ufe. The hypothetical heory of Newtois, therefore, continues to be the groundwork of all our practical knowledge of the fubject.

We fhall therefore lay before our readers a very fhore view of the theory, and the manner of applying it. We Ihall then fhow its defects (all of which were pointed out by its great author), and give an hillorical account of the many attempts which have been made to amend it or to fubllitute another: in all which we think it our duty to fhuw, that Sir Ifaac Newton took the lead, and pointed out every path which others have taken, if we except Daniel Beruoulli and d'Alembert; and we fhall give an account of the chief fets oî experiments which have been made on this important fubject, in the hopes of ettablithing an empirical theory, which may be employed with confideace in the arts of life.

We know by experience that force mult be applied rhe tirm to a body in order that it may move through a fluid, refita arme, fuch as air or water; and that a body projected with si here espany velocity is graduatily retarded in its motion, and liei, cs: generally brought to reft. The analogy of nature planecs. makes us imagine that there is a force acting in the oppoiite direction, or oppofing the motion, and that this force refides in, or is exerted by, the fluid. And the phenomena refemble thofe which accompany the" known refitance of actuve beings, fuch as animals. Therefore we give to this fuppofed force the netaphorical name of Resistance. Wealio know that a fluid in motion will hurry a folid body aleng with the ttream, and that it requires force to maintain it in its place. A limilar analogy makes us fuppofe that the fluid exerts force, in the fame manner as when an active being impels the body before him; therefore we call this the Impulsion of a Fluid. And as our knawledge of nature informs us that the mutual actions of bodies are in.

Reffifunce every cafe cqual and nppofite, and that the obferved change of motion is the only indication, characteriftic, and meafure, of the changing foree, the forces are the fame (whether we call them impultions or refitances) \(v\) hen the relative motions are the fame, and therefore depend entirely on theie relative motions. The force, therefort, which is neceflay For keeping a body immoveable in a tlrean of watex, flowing with a certain velocity, is the fane with what is required for moving this body with this velocity through ftarnant water. To any one who admits the notion of the earth round the fun, it is evident that we can mether cbierve nor reafon from a cafe of a body moving through titl water, nor of a ftream of water piefling upon or impelling a quiefcent body.
A body in motion appears to be refifed by a flagmant fluid, becaufe it is a law of mechanical nature that force mult be employed in orler to put any body in motion. Now the body cannot move forward without preting the contiguous fuid in motion, and force mult be employed for producing this motion. In like manner, a quic feent body is inpelled by a drean of fluid, becaufe the motion of the contiguons fluid is diminifhed by this fulid obflacle: the retitance, therefure, or inpulfe, no way differs from the ordinary commenications of motion among folid budies.

Sir Iface Newton, thercfore, begins his theory of the refiftance and impulfe of fluids, by felecing a cafe where, alfhough he cannot pretend to afcertain the mo. Etions thenfectes which are produced in the particles of , a contiguous fluid, he can tell precilily their mutual ratios.
He fuppofes two fyhtems of bodies fuch, that each body of the firt is fimilat to a correiponding body of the fecond, and that each is to cach in a conitant ratio. He alfo fuppofes then to be finilarly fituated, that is, at the angles of limilar g.gures, and that the homologons lines of thefe figures are in the fane ratio with the diameters of the budies. He farther luppofes, that they attract or repel each other in fimilar directions, and that the aecelerating conneeting forces are alfo proportional ; that is, the forces in the one fyttem are to the correfponding forces in the other fyatem in a conftant ratio, and that, in each fyftem taken apart, the forces are as the fquares of the velocities directly, and as the diameters of the correfponding bodies, or their dillances, inverfly.
2.90.? inf
tise bimilar prots bca, :
 6はに.

This being the cafe, it legitimately follows, that if limilas parts of the two fyitems are put into fimilar motions, in any given intant, they will continue to move firilitrly, kach correfpondent body diferibing fimilar curves, with proportional velocitics: For the borlies being fimilarly lituated, the furces which ąt on a body in cre frtiem, arifing from the conibination of any numazr (i adjoining partiches, will have the fame direction with the force acting on the correfponding body in the other fricum, arifing from the combined action of the fienilar and fimilarly directed forces of the adjoining correfpon. de:t batits of the cther iy fem; and thefe compound furces w:ll have the fame ration with the limple foress which conlitute them, and will be as the fquares of the velucities directly, and as the ciflances, or any hometogons lines iuvertely; and therefore the chords of cimature, having the dircction of the eentripetal or wientritugal forces: and fanilarly inclined to the tangents
of the curves deficibed by the correfponding bodies, Refilane
will have the fanne ratio wit? the diflances of the will have the fane ratio wit! the diftances of the par-
ticics. The curves deferibed by the corcenoudime bodies will therefore be fimitar, the velucities will be proportumal, and the bollies will be fimilarly fituated at the end of the firte moment, and expoled to the action of fimilar and fimilaty fituated centripetal or centrifugal forces; and this will again produce fimilar motions during the next monent, and fo on for ever. All this is evident io any perfon acquainted with the elementary doctrines of curvilineal motions, as delivered in the theory of plyyical aftronony.

From this fiundancatal propofition, it clearly follows, cunfethat if two !imilar bodiss, having their homologrousquence lines proportional to thofe of the two fytems, be fimi- from ite lanly projected among the bodies of thoie two fyftems with any velocitics, they will produce fimilar motions in the two fyltems, and will themfelves continue to more funilarly; and therefure will, in every fubfequent moment, fuffer fimilar diminutions or retardations. If the initial velocities of prujection be the fame, but the denfities of the two fyftems, that is, the quantities of matter contained in an equal bulk or extent, be different, it is evident that the quantities of rootion produced in the two fyltems in the fame time will be proportional to the denfities; and if the denfities are the fame, and unifurn ine each fyltem, the quantities of motion produced will be as the fquares of the velccities, becante the motion communicated to each correfponding body will be proportional to the velocity communicated, that is, to the velocity of the inpelling body; and the number of fimilarly fituated particles which will be agitated will alfo be proportional to this velocity. Therefore, the whole quantities of motion produced in the fane moment of tinte will be proportional to the fquares of the velocities. And lafly, if the denfities of the two fyftems are uniform, or the fame through the whole extent of the fyifems, the number of particles impelled by limilar bodies will be as the furfaces of thefe bodice.

Now the diminutions of the motions of the projected bodies are (by Newton's third law of motion) equal to the motions produced in the fy?tems; and thefe diminutions arc the meafures of what are called the refiftances oppofed to the motions of the projected bodics. Therefore, combining all thefe circumstances, the refiftances are proportional to the fimilar furfaces of the moving bodies, to the denfities of the fyllems through which the motions are performed, and to the fquares of the velocities, jointly.

We cannot form to ourfelves any diftinct notion of \(A\) fuid a fluid, otherwife than as a fyftem of finall bodies, or \(\mathrm{a}_{\text {ds a fidered }}\) collection of particies, fimilarly or fymenetrically arran-of fmall ged, the centres of each being fituated in the angles of bodies fimis regular folids. We muft form this notion of it, whe-larly arther we fuppofe, with the vulgar, that the particles are \({ }^{\text {ranged. }}\) little globules in mutual contact, or, with the partifans of corpuicular attractions and repulfions, we fuppore the particles kept at a ditance from each other by means of thefe attractions and repulfions mutually baLnwing each other. In this laft cafe, no other arrangement is confitent with a quiefcent equilibrium.: and in this cafe, it is evident, from the theory of curvilineal motions, that the agitations of the particles will always be fuch, that the connecting forces, in actual exertion,

Refipance, will be proportional to the \{quares of the velocities directly, and to the chords of curvature haviag the direction of the forces inverfely.

From thefe premifes, therefore, we deduce, in the ftrictent manner, the demonftration of the leading theorem of the refiftance and impulfe of fluids; namely,
\({ }^{17} 4\)
Firft law
the refifto a ce, \&c. oflluido

\section*{85} Elaticity
fProp. I. The refiftances, and (by the third law of motion), the impulfions of fluids on fimilar budies, are proportional to the furfaces of the folid bedies, to the denfities of the fuids, and to the fquales of the relocities, jointly.
The mult now obferve, that when we fuppofe the particles of the fluid to be in mutual contact, we may either fuppofe them elafic or unelattic. The motion communicated to the coilection of elaftic particles muft be double of what the fame body, moring in the fame manner, would communicate to the paticles of an undattic fluid. The impulfe and refiftance of clatlic fluids mult therefore be double of thofe of unelatic fluids. But we mult caution our readers not to judge of the claftieity of fluids by their fenfible comprefficility. A diamond is incomparably more elaltic than the finelt foot- hall, though not compreffibie in any Senfible degree. It remains to be decided, by well chofen experiments, whether wrater be not as elaftic as air. If we fuppofe, with Bofoovich, the particles of perfect fluids to be at a diftance from each other, we flaill find it difficult to conceive a fluid void of claticity. We hope that the theory of their impulfe and refiltance will fuggelt experiments which will decide this queltion, by pointing out what ought to be the abfolutc impulife or refiftance in either cafe. And thus the fundamental propefition of the impulfe and refiftance of fuids, taken in its proper meaning, is fufceptible of a rigid demonitration, relative to the only diftiner rotion that we can form of the internal conftitution of a fluid. We fay, taken in its proter meaning; namely, that the impulfe or refiftance of fluids is a preffure, oppofed and meafured by another preflure, fuch as a pound weight, the force of a fpring, the preflure of the atmofphere, and the like. And we apprehend that it would be very difficult to find any legitimate demonftration of this leading propofition different from this, which we have now borrowed from Sir Ifaac Newton, Prop. 23. B. II. Princip. We acknowledge that it is prolix and even circuitous: but in all the attempts made by his commentators and their enpyifts to fimplify it, we fee great defects of logical argument, or aflumption of principles, which are not only grat nitous, but inadmifible. We fhall have occafion, as we proceed, to point out fome of thefe defects; and doubt not but the illuftrious author of this demonftration hadexercifed his uncommon patience and fagacity in fimilar attempts, and was diffatisfied with them all.

Before we proceed further, it will be proper to make a general renark, which will fave a great deal of difcuflion. Since it is a matter of univerfal experience, that every action of a body on others is accompanied by an equal and contrary re-action; and fince all that we can demonftrate concerning the refiftance of bodies during their motions through fluids proceeds on this fuppofition, (the refiftance of the body being aflumed as equal and oppofite to the furn of motions communicated to the particles of the fluid, eftimated in the direction of the bodies motion), we ase intitled to proceed in the
contrary order, and to confider the impulions which Refifance, each of the particles of Huid exerts on the body at relt, as equal and oppofite to the motion which the body would communicate to that particle if the fluid were at reft, and the body were moving equally fwift in the oppofite direction. And therefore the whole impulion of the flaid mult be conceived as the meafure of the whole motion which the body would thus communicate to the fluic. It muit therefore be alfo conlidered as the meafurcof the refiftance which the body, moving with the fame ve. locity, would fuitain from the fluid. When, therefore, we flall demonftrate any thing concerning the impulion of a fleid, eftimated in the direction of its motion, we muft confider it as demonftrated conceming the refitance of a quiefcent fluid to the motion of that body, having the fame velocity in the oppolite dircetion. The determination of thefe impulfions being much eadier than the determination of the motions communicated br the body to the particles of the fluic, this metkod will be followed in noft of the fubiequent difeuffions.

The general propotition already delivered is by no means fufficient for explaining the various important phenomena obferved in thie mutual actions of folids and fluids. In particular, it gives 11 s no affitance in afcertaining the modifications of this refiftance or impulfe, which depend on the flape of the body and the inclination of its impelled or reffted furface to the direction of the motion. Sir Iface Newton found another hypothefis neceffary ; namely, that the fluid fhould be fo extremely rare that the diftance of the particles may be incomparably greater than their diameters. This additional condition is neceffary for confidering their actions as fo many feparate collifions or impulfons on the folid body. Each particle mult be fuppoled to have abundant room to rebound, or otherwife efcape, after having made its Itroke, without fenfibly affecting the fituations and motions of the paticles which have not yet made their ftroke : and the motion mutt be fo fwit as not to give time for the fenfible exertion of their mutual fosces of attractions and repulfions.

Keeping thefe conditions in mind, we may procced to determine the impulfions made by a fluid on furfaces of every kind: Aud the molt convenient method to purfue in this determination, is to compare them all either with the impulfe which the fome jurface would receive from the fuid impinging on it perpendicularly, or with the impulfe which the jame flream of flail would make when coming perpendicularly on a furface of fuch extent as to oceupy the whole Aream.

It will greatly abbreviate language, if we make ufe \(\Gamma^{16}\) of a few terms in an appropriated fenfe.

By a fream, we Mall mean a quantity of flud moving in one direction, that is, each particle moving in paral. lel lines; and the breadib of the ftream is a line perpendicular to all thefe parallels.

A floment means a portion of this ftream of very fmall breacth, and it courfts of an indefinite number of particles following one another in the fane direction, and fucceflively impinging.on, or gliding along, the furface of the folid body.

The bafe of any furface expofed to a ftream of fluid, is that portion of a plane perpendicular to the ftream, which is covered or procected from the action of the ftream by the farface expofed to its impulie. Thus the bate of a fyhere expofed to a Ateam of fuid is its groce

\section*{\(R\) E S 「 96}

Reilinance.circle, whofe plane is perpendicular to the fream. If Pare BC (fig. 1.) be a plane furface expofed to the action ceciasisinf a ltream of fuid, moving in the direction I) C, then BR , or SE, perpendicular to \(D C\), is its bafe.

Diref impulfe fhall exprefs the earergy or action of the partick or filament, or Atream of fluid, when meeting the furface perpendicularly, or when the furface is perpendicular to the direction of the ftream.

Abforute impulfe means the acoul preflure on the impelled furface, arifing from the action of the flu'd, whether ftriking the furface perpendicularly or obliquely ; or it is the force impreffed on the furface, or tendency to motion which it acquires, and which mult be oppofed by an equal force in the oppofite direction, in order that the furface may be maintained in its place. It is of importance to keep in mind, that this preflure is always perpendicular to the furface. It is a propolition foundcd on miverfal and uncontradidted experience, that the mutual actions of bodies on each other are always exerted in a direction perpendicular to the tonching furfaces. 'Thus, it is oblerved, that when a billiard ball A is ftruck by another \(\mathbf{B}\), moving in any direction whatever, the ball A always moves off in the direction perpendicular to the plane which touches the two balls in the point of mutual contact, or point of inpulfe. This inductive propofition is fupported by every argument which can be drawn from what we know concerning the forces which connect the particles of matter together, and are the immediate caules of the communication of motion. It would employ much time and room to flate then here; and we apprehend that it is unneeeffary : for no reafon can be afligned why the preflure fhould be in any particuiar oblique direction. If any one fhould fay that the impulfe will be in the direction of the frean, we have only to defire hiun to take notice of the effet of the rudder of a fhip. This fhows that the inpulfe is not in the direction of the flream, and is therefore in forme direction tranfverfe to the fream. He witl alfo find, that when a plane furface is impelled obliquely by a fluid, there is no direction in which it can be fupported but the direction perpendicular to itfelf. It is quite fafe, in the mean time, to take it as an experimental truth. We may, perhaps, in fome other part of this work, give what will be received as a rigorous demonftration.

Relative or effecive impulfe means the prefure on the furface eftimated in fome particnlar direction. Thus BC (fig. 1.) may reprefent the fail of a fhip, impelied by the wind blowing in the direction DC. GO may be the direction of the flip's keel, or the line of her courfe. The wind frikes the fail in the direction GH parallel to DC; the fail is urged or prefled in the direction GI, perpendicular to DC. But we are interefted to know what tendency this will give the hip to move in the direction GO. This is the effective or relative impulfe. Or \(B C\) may be the tranfverfe fection of the fail of a common wind-mill. Thas, by the conftruction of the machine, can move only in the direction GP', perpendicular to the direation of the wind ; and it is ouly in this direction that the impulfe produces the defired effect. Or BC may be half of the prow of a punt or lighter, riding at anchor by means of the cable JC , attached to the prow C . In this cafe, GC , pasallel to DC, is that part of the abloluie impulfe which is employed in ftraining the cable.

1 R E S
The arrle of incidence is the angle FGC contained Rcfitama between the direction of the Atream FG and the phave BC.

The argle of obliguty is the angle OGC contained between the plane and the direction GO, in which we wifh to eltimate the impulfe.
Prop. II. The direet impulfe of a fluid on a plane fur- Second la face, is to its ablolute ablique impulfe on the Came fur ol refiftface, as the fquare of the radius to the fquare of the ance. fine of the angle of incidence.
Let a flcam of 月uid, moving in the direction DC, (fig. .1.), act on the plane BC. With the radius CD delcribe the quadrant ABE ; draw CA perpendicular to CE, and draw MN BS parallel to CE. Let the particle \(F\), moving in the direction FG, meet the plane in G , and in FG produced take GH to reprefent the magnitude of the direct impulfe, or the impule which the particle would exert on the plane AC, by meeting it in V. Draw GI and HK perpendicular to BC , and HI perpendicular to GI. Alfo draw BR perpendicular to DC.

The force GH is equivalent to the two forces GI and GK ; and CK being in the direction of the plane has no flare in the impulfe. The abfolute impulfe, therefore, is reprefented by GI; the angle GHI is equal to FCC, the angle of incidence; and therefore GH is to GI as radius to the fine of the angle of incidence : 'Therefore the direct inpulie of each particle or filament is to its abfolute oblique impulfe as radius to the finc of the an'gle of incidence. But further, the number of particles or fila. ments which itrike the furface AC, is to the number of thofe which ftrike the furface BC as AC to NC : for all the filaments between LA and MB go paft the oblique furface BC without ftriking it. But \(\mathrm{BC}: \mathrm{NC}=\) rad. : lin. NBC, \(=\) rad. : fin. FGC, \(=\) rad. \(:\) lin. incidence. Now the whole impulfe is as the impulfe of each filament, and as the number of filaments exerting equal impulfes jointly ; therefore the whole direct inpulfe on AC is to the whole abfolute impulfe on BC , as the fquare of radius to the fquare of the fine of the angle of incidence.

Let \(S\) exprefs the extent of the furface, \(i\) the angle of incidence, o the angle of obliquity, \(v\) the velocity of the fluid, and \(d\) its denfity. Let \(F\) reprefent the direct impulfe, \(f\) the abfolute oblique impulfe, and , the relative or effective impulfe: And let the tabular fines and colines be confidered as decimal frations of the radius unity.
 Sin. \({ }^{\circ} i\), and therefore \(f=\mathrm{F} \times \operatorname{Sin}^{2}{ }^{2}\) i. Alfo, becaufe impulfes are in the proportion of the extent of furface finilarly impelled, we have, in general, \(f=\mathrm{FS} \times\) Sin. \({ }^{2}, i\).

The firft who publithed this theorem was Pardies, in his Oerveres de Matbematique, in 1673. We know that Newton had inveftigated the chief propofitions of the Principia bcfore 1670 .
Prop. III. The direct impulfe on any furface is to the Third lawn effective oblique impulfe on the fame furface, as the cube of radius to the folid, which has for its bafe the fyuare of the fine of incidence, ad the fine of obliquity for its beight.

\section*{R E S [ 9}
nce. For, when \(G H\) reprefents the direet impulfe of a particle, GI is the abfolute oblique impulfe, and GO is the effective impulfe in the direction \(G O\) : Now \(G I\) is to GO as radius to the fine of GIO, and GIO is the complement of IGO, and is therefore equal to CGO, the angle of obliquity.

> Thercfore \(f: \theta=R: \operatorname{Sin} . O\)
> But \(\quad F: f=R^{2}: \operatorname{Sin}^{2} i\)

Therefore \(\mathrm{F}: q=\mathrm{R}^{3}: \operatorname{Sin}^{2} i \times \operatorname{Sin}\). O. and \(0=\mathrm{F} \times \operatorname{Sin}^{2} i \times \operatorname{Sin} .0\).
otion Cor.-The dicet impulfe on any furface is to the effective oblique impulfe in the direction of the ftream, as the cube of radius to the cube of the fine of incidence. For draw I \(Q\) and \(G P\) perpendicular to \(G H\), : im-and IP perpendicular to GP; then the abfolute impulfe \(G I\) is equivalent to the impulle \(G Q\) in the direction of the ftream, and GP, whieh may be called the tranfverfe impulfe. The angle \(G I Q\) is evidently equal to the angle GHI, or FGC, the angle of incidence.

Therefore \(\mathrm{F} \cdot \mathrm{B}\)
\(R^{3}:\) Sinl \(^{3}\) i.
And \(\mathrm{n}=\mathrm{F} \times \operatorname{Sin}{ }^{3}\) 。
Before we procced further, we fhall confider the imce in pulfe on a furface which is alfo in motion. This is evidently a frequent and an important cale. It is perlaps the moll frequent and important: It is the cafe of a thip tinder fail, and of a wind or water-mill at work.

Therefore, let a ftream of Gluid, moving with the dite rection and velocity \(D E\), meet a plane \(B C\), (fig. i. :xxvi. \(n^{\circ} 2^{\prime}\), whith is moving parallel to itfelf in the direction and with the velocity DF : It is required to determine the impulfe ?

Nothing is more cafy: The mutual actions of bodies depend of their relative motions only. The motion DE of the fluid relative to BC , which is alfo in motion, is compounded of the real motion of the fluid and the oppofite to the real motion of the body. Therefore produce FD till \(\mathrm{D} /=\mathrm{DF}\), and complete the parallelogram \(D f e \mathrm{E}\), and draw the diagonal De. The impulfe on the plane is the fame as if the plane were at reft, and every particle of the fluid impelled it in the direction and isth the velocity \(\mathrm{D} e\); and may therefore be determined by the foregoing propofition. This propofition applies to every poflible cafe; and we thall not beflow more time on it, but referve the important modification of the general propofition for the cafes which fhall occur in the practical applications of the whole doctrine of the impulfe and refifance of fluids.
rrion Prop. IV. The direct impulfe of a ftream of fluid,
whofe breadth is given, is to its oblique effective impulfe in the direction of the Itream, as the fquare of radius to the fquare of the fine of the angle of incidence.

For the number of filaments which occupy the oblique plane BC, would occupy the portion \(N^{*} C\) of a perpendicular plane, and therefore we have only to compare the perpendicular impulfe on any point \(V\) with the effective impulfe made by the fame filamen: IVV on the oblique plaue at \(G\). Now \(G H\) reprefents the impulfe which this flament would make at \(V\); and \(G Q\) is the effective impulfe of the fame filament at \(G\), eitimated in the direction \(G H\) of the fream; and \(G H\) is to GQ as \(\mathrm{GH} \mathrm{H}^{2}\) to \(\mathrm{GI}^{2}\), that is, as rad. \({ }^{2}\) to \(\mathrm{fins}^{2}\) \%.

Vol. XVI. Part I.

Cor. t. The effective impulfe in the direction of the Reffaneef Aream on any plane furface \(B C\), is to the direct impulfe on its bafe \(B R\) or \(S E\), as the fquare of the fine of the angle of incidence to the fquare of the radius.
2. If an ifofceles wedge ACB (fig. 2.) be expofed to a fream of fluid moving in the direction of its height CD, the impulfe on the fides is to the direct impulfe on the bafe as the fquare of half the bafe AD to the fquare of the fide AC, or as the fquare of the fine of half the angle of the wedge to the fquare of the radius. For it is evident, that in this cafe the two traniverfe impulfes, fuch as GP in fig. 1, balance each other, and the only impulfe which can be oblerved is the fum of the two impulfes, fuch as GC of fig. I, which are to be compared with the impulfes on the two halves AD, \(D B\) of the bafe. Now \(A C: A B=\) rad. : fin. \(A C D\), and \(A C D\) is equal to the angle of incidence.

Therefore, if the angle \(A C B\) is a right angle, and \(A C D\) is half a right angle, the fquare of \(A C\) is twice the fquare of AD , and the impulfe on the fides of a rectangular wedge is half the impulfe on its bafe.

Alfo, if a cube ACBE (fig. 3.) be expofed to a ftream moving in a direction perpendicular to one of ita frdes, and then to a Atream moving in a direction perpendicular to one of its diagonal planes, the impulfe in the firt cafe will be to the impulfe in the fecond as \(\sqrt{2}\) to I . Call the perpendicular impulfe on a fide \(F\), and the perpendieular impulfe on its diagonal plane \(f\), and the effective oblique impulfe on its fides \(\geqslant\) :-we have
\(\mathrm{F}: f=\mathrm{AC}: \mathrm{AB}=1: \sqrt{2}\), and
\(f:=\mathrm{AC}^{2}: \mathrm{AD}^{2}=2: 1\). Therefore
\(\mathrm{F}:=\quad 2: \sqrt{2},=\sqrt{2}: \mathrm{t}\), or
rery nearly as 10 to 7 .
The fame reafoning will apply to a pyramid whofe bafe is a regular polygon, and whofe axis is perpendicular to the hafe. If fuch a pyramid is expofed to a ftream of fluid moving in the direction of the axis, the direct impulfe on the bafe is to the effective impulic on the pyramid, as the fquare of the radius to the fquare of the fine of the angle which the axis makes with the fides of the pyranid.

And, in like manner, the direct impalion on the bafe of a right cone is to the effective impulition on the conical furface, as the fquare of the radius to the fquare of the fine of half the angle at the vertex of the cone. This is demonitratee, by fuppofing the cone to be a pyramid of an infinite number of fides.

We may in this manner compare the impulfe on any polygonal furface with the impulfe on its bafe, by comparing apart the impulfes on each plane with thofe in their correfpouding bafes, and taking their fum.

And we may compare the impulfe on a curved furface with that on its bafe, by refolving the curved furface into elementary planes, each of which is impelled by an elementary flament of the fream.

The following beautiful fropofition, given by Le Seur and Jaquier, in their Commentary on the fecond Book of Newton's Principia, with a few examples of its application, will fufice for any further account of this theory.
Prop. V.-Let ADB (fig. 4) be the fection of The ins。 furface of fimple curvature, fuch as is the furface of curved furs a cylinder. Let this be expofed to the action of a face comp fluid moving in the direction \(A C\). Let \(B C\) be the pared with N
fection bafe.

\section*{R E S [ 08 [ R E S}
feetion of the plane (which we have called its baie), perpendicular to the direction of the flream. In AC produced, take any length CG; and on CG deferibe the femicircle CHG, and complete the reftangle BCGO. Throngl any point D of the curve draw ED) parallel to \(A C\), and meeting BC and \(O G\) in \(Q\) and P. L.et DF touch the curve in D, and draw the chord GH parallel to DF, and HKM perpendicular to CG, neeting ED in M. Suppofe thi; to he done for every point of the curve ADB , and let IMN be the curve which paffes througli all the points of interfection of the parallels EDI and the correfponding perpendiculars HKM.
The effective impulfe on the curve furface ADB in the direction of the itream, is to its direct impulfe on the bafe BC as the area BCNL is to the rectangle BCGO.

Draw edqmp paraliel to EP and extremely near it. The arch \(\mathrm{D} d\) of the curve may be conceived as the fection of an clementary plane, having the polition of the tangent DF. The angle EDF is the angle of incidence of the filament ED/le. This is equal to CGH, becaule ED, DF, are parallel to \(\mathrm{CG}, \mathrm{GH}\); and (becaufe CHG is a femicirele) CH is perpendicuiar to GH. Alfo CG: \(\mathrm{CH}=\mathrm{CH}: \mathrm{CK}\), and \(\mathrm{CG}: \mathrm{CK}=\) \(\mathrm{CG}^{2}: \mathrm{CH}^{2},=\mathrm{rad}^{2}: \mathrm{fin}^{2}, \mathrm{CGH},=\mathrm{rad}^{2}:{ }^{2}\) fin. \({ }^{2}\) incid. Therefore if CG, or its equal DP, reprefent the direct impulfe on the point \(Q\) of the bafe, CK, or its equal QM, will reprelent the effective impulfe on the point D of the curse. And thus, Qqp P will reprefent the dircet impulfe of the filament on the clement Q 7 of the bafe, and \(\mathrm{Q}_{\mathrm{gm}}^{\mathrm{M}}\) will reprefent the effective impulfe of the fane filament on the element 1) \(d\) of the curve. And, as this is true of the whole curve ADB , the effective impulfe on the whole curve will be reprefented by the area BCNML ; and the direct impulfe on the bafe will be reprefented by the rectangle BCGO; and therefore the impulfe on the curve. furface is to the impulfe on the bafe as the area BLMNC is to the rectangle BOGC.

It is plain, from the conilruction, that if the tangent to the curve at A is perpendicular to AC , the point N will coircide with G. Alfo, if the tangent to the curve at B is paraliel to AC , the point L will coincide with \(B\).

Whenever, therefore, the curve ADB is fuch that an equation can be had to exhibit the general relation between the abfciffa AR and the ordinate DR , we fhall deduce an equation which exhibits the relation between the abfeifs CK and the ordinate KM of the curve LMN; and this will give us the ratio of BLNC to BOGC.

Thus, if the furface is that of a cylinder, fo that the curve BDA \(b\) (fig. 5.), which receives the impulfe of the fuid, is a femicircle, nake CG equal to \(A C\), and conftruct the figure as before. The curve BMG is a parabola, whofe axis is CG, whofe vertex is G, and whofe parameter is equal to CG. For it is plain, that \(\mathrm{CG}=\mathrm{DC}\), and \(\mathrm{GH}=\mathrm{CQ},=\mathrm{MK}\). And \(\mathrm{CG} \times \mathrm{GK}\) \(=\mathrm{GH}^{2}=\mathrm{KM}^{2}\). That is, the curve is fuch, that the fquare of the ordinate KM is equal to the rectangle of the ableifla GK and a conftant line GC; and it is therefore a parabola whofe vertex is \(G\). Now, it is well
known, that the parabolic area EMGC is two thirds Rof mes of the parallelogram BCGO. Therefore the impulie on the quadrant ADP is two thirds of the impulfe on the bafe BC. The fanne may be faid of the quadrant Adb and its bafe cb. 'Therefore, The impulfe on a cy-The linder or half cylinder is tseo thirds of the divett impoulfe on palfe is its tranfuerfe plane throush she axis; or it is two thirds cyline, of the dired impulfe on one fide of a parallelopiped of the fame breadth and height.
Prop. VI. - If the body be a folid generated by the revolution of the figure BDAC (fig. 4.) romd the axis \(A C\); and if it be expofed to the action of a ftream of fluid moving in the direction of the axis \(A C\); then the effective impulfe in the direction of the ftream is to the direet impulfe on its bafe, as the folid generated by the revolution of the figure BLMNC romid the axis CN to the cylinder gencrated by the revolution of the rectangle BOGC.
This fearcely needs a demonftration. The figure ADBLMNA is a fection of thefe folids by a plane paffing through the axis; and what has been demonAtrated of this fection is true of every other, hecaufe they are all equal and fimilar. It is therefore true of the whole folids, and (their bafe) the circle generated by the tevolution of BC romid the axis AC .

Hence we eafly deduce, that The impulfe on a fpbere on a \({ }^{2}\) is one half of the dired impalfe on its great circle, or on the finer bafe of a cylinder of equal diametior.

For in this cafe the curve BMN (fig. 5.) which generates the folid exprefing the impulle on the fphere is a parabcla, and the folid is a parabolic conoid. Now this conoid is to the cylinder generated by the revolution of the rectangle BOGC round the axis CG, as the fum of all the circles generated by the revolution of ordinates to the parabola fuch as KM, to the fum of as many cireles generated by the ordinates to the rectangle fueh as \(\mathrm{K} \mathrm{T}^{\prime}\); or as the fum of all the fquares deferibed on the ordinates KM to the fum of as many \{quares deferibed on the ordinates KT. Draw BG cutting MK in S . The fquare on MK is to the fquare on BC or TK as the abreiffa GK to the ableiffa GC (by the nature of the parabola), or as SK to BC ; becaufe SK and \(B C\) are refpectively equal to \(C K\) and GC. Therefore the fuin of all the fquares en ordinates, fuch as MK , is to the fum of as many โquares on ordinates, fuch as TK, as the fum of all the lines SK to the fum of as many lines TK; that is, as the triangle BGC to the rectangle BOGC; that is, as one to two: and therefore the impulfe on the fphere is one half of the direct impalfe on its great circle.

From the fame conitruction we may very eafily de- on th duce a very curious and feemingly ufeful truth, that off unn of all conical bodies having the circle whofe diameter is \({ }^{3}\) coas AB (fig. 2.) for its bafe, and FD for its height, the one which fuftains the fmalleft impulfe or meets with the imalleft refiftance is the fruftum AGHB of a cone ACB fu conftructed, that EF being taken equal to ED, EA is equal to EC. This fruftum, though more capacious than the cone AFB of the fame height, will be lefs refifted.

Alfo, if the folid generated by the revolution of BDAC (fig. 4.) have its anterior part covered with a fruftum of a cone generated by the lines \(\mathrm{D} a, a\),
forming

\section*{RES \\ [ 99 ] \\ R E S}
annec. forming the angle at \(a\) of 135 degrees; this folid, though more capacious than the included folid, will bc lefs refilted.

And, from the fame prineiples, Sir Ifaac Newton determined the form of the curve ADB which would generate the folid which, of all others of the fame length and bafe, fhould have the leaft refiftance.

Thefe are eurious and important deductions, but are not introduced here, for reafons which will foon appcar.

The reader cannot fail to obferve, that all that we have hitherto delivered on this fubject, relates to the comparifon of different impulfes or reliftances. We have always compared the oblique impulfions with the direct, and by their intervention we compare the oblique impulfions with each other. But it remains to give abfolute meafures of fome individual impulfion ; to which, as to an unit, we may refer every other. And as it is by their preffure that they become ufeful or hurtful, and they muft be oppoled by other preffures, it becomes extremely convenient to compare them all with that preflure with which we are moft familiarly acquainted, the preffure of gravity.

The manner in which the comparifon is marle, is this. When a body advances in a fluid with a known veloeity, it puts a known quantity of the fluid into motion (as is fuppofed) with this velocity; and this is done in a known time. We lave only to cxamine what weight will put this quantity of fluid into the fance motion, by acting on it during the fame time. This weight is conceived as equal to the refiftance. Thus, let us fuppofe that a fream of water, moving at the rate of eight feet per fecond, is perpendicularly obftructed by a fquare foot of folid furface held faft in is place. Conceiving water to act in the matiner of the hypothetical fluid now deleribed, and to be without datticity, the whole effect is the gradual amihilation of the motion of eight cubic feet of water moving eight feet in a fecond. And this is done in a fecond of time. It is equivalent to the gradually putting eight eubic feet of water into motion with this velocity; and doing this by acting uniformly during a fecond. What weight is able to produce this effect? The weight of eight feet of water, acting during a fecond on it, will, as is well known, give it the velocity of thirty-two feet per fecond; that is, four times greater. Therefore, the weight of the fourth part of eirght cubic feet, that is, the weight of two cubic feet, acting during a fecond, will do the fame thing, or the weight of a column of water whofe bafe is a fquare foot, and whofe height is two feet. This will not only produce this effect in the fame time with the impultion of the folid body, but it will alfo do it by the fame degrees, as any one will clearly perceive, by at. tending to the gradual acceleration of the mafs of water urged by \(\frac{1}{4}\) of its weight, and comparing this with the gradual production or extinction of motion in the fuid by the progrefs of the refifted furface.

Now it is well known that 8 cubic feet of water, by falling one foot, which it will do in one-fourth of a fecond, will aequire the velocity of eight feet per fecond by its weight; therefore the force which produces the fame effect in a whole fecond is one-fourth of this. This force is therefore equal to the wcight of a column of
water, whofe bafe is a fquare foot, and whofe height is Refiftance, two feet; that is, twice the height neceffary for acqui. ring the velocity of the motion by gravity. The conclufion is the fame whatever be the furface that is refilted, whatever be the fluid that refifts, and whatever be the velocity of the motion. In this inductive and familiar manner we learn, that the dired impulfe or refge ance of an unetofic fluid on any plane furface, is equal to the zeight of a column of the fluid having the furface for its bafe, and twice the foll neceflory for acquiring the velocity of the motion for its beight: and if the fluid is confidered as elaftic, the impulfe or refiftance is twice as great. See Newt. Princip. 13. II. prop. 35 . and 38.

It now remains to compare this theory with experi- This thenry ment. Many have been made, both by Sir Iface New- tried by difton and by fubfequent writers. It is much to be la-ferent exmented, that in a matter of fuch importance, both to periautnts. the philofopher and to the artift, there is fuch a difa. greement in the refults with each other. We fhall mention the experiments which feens to have been made with the greatelt judgment and eare. Thole of Sir Ifaae Newton were chiefly made by the ofeillations of pendulums in water, and by the defient of balls both in water and in air. Many have been made by Mariotte (Traité de Mouvement des Eaux). Gravefande has publifhed, in his Sy/tm of Natural Philofopby, experiments made on the refitance or impulions on folids in the midlt of a pipe or canal. 'They are extremely well contrived, but are on fo fmall a feale that they are of very little ufe. Daniel Bernoulli, and his pupil Profeffor Krafft, have publifhed, in the Comment. Aicat. Ptiropol. experiments on the impulfe of a Itream or vein of water from an orifice or tube: Thefe are of great value. The Abbé Boffut has publimed others of the fame kind in his Hydrodynamique. Mr Robins has publifhed, in his Ntw Principles of Gunnery, many valuable experiments on the impulie and refiftance of air. The Chev. de Borda, in the Mem. Acal. Paris, 1763 and 1767 , has given experiments on the refttance of air and alfo of water, which are very interefting. The molt complete collection of experiments on the refitlance of water are thofe made at the public expence by a committee of the academy of fciences, confiting of the marquis de Condorcet, Mr d'Alembert, Abbé Boffur, and others. The Chev. de Buat, in his Hydrauligue, has publifhed fome mof curions and valuable experiments, where many insportant circumftances are taken notice of, which had never been attended to before, and which give a view of the fubject totally different from what is ufually taken of it. Don George d'Ulloa, in his Examine Maritimo, has alfo given fome important experiments, fimilar to thofe adduced by Bongenr in his Mlanauvre des Vaifeaux, but leading to very different conclufions. All thefe fhould be confulted by fuch as would acquire a practical knowledge of this fribjeck. We muft content ourfelves with giving their molt general and fleady refuits. Such as,
1. It is very confonant to experiment that the refiltances are proportional to the fquares of the velocities. When the velocities of water do not exceed a few feet per fecond, no fenfible deviation is obferved. In very fmall velocities the refiltances are fenfibly greater than in this proportion, and this excefs is plainly owing to the vifcidity or imperfect fluidity of water. Sir Iface \(\mathrm{N}_{2}\) Newiton

\title{
\(R\) E S
}

Refifance. Newton has finwn that the refifance arifing from this caufe is conftant, or the fame in every velocity; and when he has taken off a certain part of the total refilcance, he fonnd the remainder was very exactly proportionahle to the fquare of the velocity. His experiments to this purpofe werc made with balls a very little heavier than water, fo as to defend very flowly; and they wicre made with his ufual care and accuracy, and may be depended un.
Caures of In the experiments made with bodies floating on the its difagree furface of water, there is an aldition to the refillance thene with arifing from the insertia of the water. The water heaps the:z. up a little on the anterior fiuface of the floating body,
and is depreffed behinit it. Hence arifes a hydroftatical preffire, ateing in concent with the true relittance. A fimilar things is obferved in the refitlance of air, which is con:denfed before the body and rerefied behind it, and thus an additional refiftance is produced by the mibalanced clafticity of the air; and alfo becaule the air, which is acuatly difplaced, is denfer than commen air. Thefe circumalkaces caule the refiftanecs to increafe fafter tion the fylares of the velocities: but, even independent of this, there is an additional refiftance arifing from the tendency to ravefaction behind a very fwift body; hecaufe the preffurc of the furrounding fuid can only make the fluid fill the fpace left with a determined velocity.

We bave had oecafinn to fpeak of this cireumflance more particularly under Guxnery and Preumatics, when contidering very rapid motions. Mir Robins had remarked that tite velocity at which the obferved refiltance of the air began to increafe fo prodigioufly, was that of about it 00 or 1200 feet per fecond, and that this was the veiocity with which air would rufh into a void. He concluded, that when the velocity was greater than this, the ball was expofed to the additional refiftance arining from the unbalanced flatical preffure of the air, and that this contant quantity behoved to be added to the refiflance arifing from the air's inertia in all greater velocitics. This is very reafonable: But he imagined that in finaller velocitics there was no fuch unbalanced preffure. But this cannot be the cale: for although in fmaller velocities the air will ftill fill up the fuace behind the body, it will not fill it up with air of the fame denfity. This would be to fuppufe the motion of the air into the deferted place to be inflantaneous. There mult therefore be a rarefaction behind the body, and a preflure backward; ariing from unbalanced elaticity, independent of the condenfation on the anterior part. The condenfation and rarefaction are caufed by the fame thing, viz. the limited elafticity of the air. Were this infinitely great, the fmalleft condenfation before the body would be infantly diffufed over the whole air, and fo would the rarefastion, fo that no preffure of unbalaneed elafticity would be obferved; but the elafticity is fuch as to propagate the condenfation with the velocity of found only, i.e. the velocity of 1142 feet per fecond. Therefore this additional refiltance does not commence precifely at this veloeity, but is fenfible in all fmaller velocitics, as is very jully obferved by Euler: But we are not yet able to afcertain the law of its increafe, although it is a problem which feems fufceptible of a tolerably accurate folution.

Precifely fimilar to this is the refiftance to the mo- Refif rea tion of floating bodies, arifing from the accumulation or gorging up of the water on their anterior furface, and its depreflion behind them. Were the gravity of the water infinite, while its inertia remains the fance, the wave mifed up at the prow of a hip would be inflantly diffufed over the whole ocenn, and it would therefore he infnitely finall, as allo the depreflion behind the poop. But this wave repluires tine for its dilfution ; and while it is not difufed, it acts by hyurofiotical proffure. TWe are equally unable to afcertain the law of variation of this purt of the reliftance, the mechanifn of waves beiner but vary impertectly underftood. The height of the wave in the experments of the frencin acadensy could not be mealured with fuficient precifion (being only oblerved en peflimet) for atcertaining its relation to the velocity. The Chev. Buat attempted it in his experiments, but withoutfuccels. 'This mult evidently make a part of the retiltance in all velucities: and it flill remains an undecidech quellion, "What relation it bears to the velocities?" When the fulid boody is whelly buried in the fuid, this aceumulation does not take place, or at leaft not in the lame way: it may, however, be oblerved. Every pertion may recollect, that in a very fivift ruming ftrean a large fone at the bottom will produce a fmall fwell ahove it ; unlefs it lies very deep, a nice eye inay ftill obferve it. The water, on arriviner at the oldtacle, glides palt it in. eveny direstion, ancl is deflected on all hands; and therefore what paffes over it is alfo detlected upwards, and caufes the water over it to rife above its level. 'f he nearer that the body is to the furface, the greater will be the perpendicular rife of the witer, hut it will be lefs diflufed; and it is meertain whether the whone elevation will be greater or lefs. By the whole elevation we mean the area of a perpendicular fection of the elevation by a plane perpendicular to the direction of the frean. We are rather difpofeci to think thet this area will be greateft when the body is near the furface. D'Ulitoa has attempted to confider this fubject fcientifeally; and is of a very different opinion, which he confirms by the fingle experiment to be mentioned by and by. Mean time, it is evident, that if the water which glides palt the body cannot fall in behind it with fufficient velocity for filling up the fpace belind, there muft be a void there; and thus a hydroftatical preflure mult be fuperadded to the refiftance arifing from the inertia of the water. All mult lave obferved, that if the end of a ftick held in the hand be drawn flowly through the water, the water will fill the place left by the ftick, and there will be no cmiled wave: but if thie motion be very rapid, a hollow trough or gutter is left behind, aud is not filted up till at fome diftance from the llick, and the wave which forms its fides is very much broken and curled. The writer of this article has often looked into the water from the poop of a fecond rate man of war when the was failing 11 miles per hour, which is a velocity of 16 feet per fecond nearly; and he not only obferved that the back of the rudder was naked for about two feet below the load water-linc, but alfo that the trough or wake made by the fhip was filled up with water which was broken and foaming to a confiderable depth, and to a confiderable diftagce from the veffel: There mult therefore have been

\section*{R E S \\ \(R E S\)}

Refifturnce a void. He never faw the wake perfectly tranfparent (and therefore completely filled with water) when the velocity exceeded 9 or to feet per fecond. While this broken water is obferved, there can be no doubt that there is a void and an additional refiftance. But even when the fpace left by the body, or the fpace behind a fill body expofed to a frean, is complitely filled, it may not be filled fuficiently falt, and there may be (and certainly is, as we thall fee afterwards) a quancity of water behind the body, which is moring more flowly away than the reft, and therefore hangs in fome thape by the body, and is drarged by it, increatine the sefiftance. The quantity of this mult depend partly on the velueity of the bidy or ftream, and partly on the rapidity with which the furrounding water connes in behind. This lait muft depend on the prefure of the furrounding water. It would appear, that whin this adjoining preflire is sery great, as mutt haven when the depth is great, the augmentation of refiitance now fpolen of would be lefs. Accordiugly this appears in Newton's experiments, where the bails were lefs retardtd as they were deeper under water.
Thefe experiments are fo fimple in their nature, and were made with fuch care, and by a perion fo able to detect and appreeiate every circumftance, that they diferve great ercelit, and the conclufons legitimately cravn from them deferve to be conlidered as phyfical laws. We think that the prefent deluction is unexceptionaole : for in the motion of balls, which hardly defeended, their preponderancy being hardly fenfible, the effect of depth mult have borne a very great proportion to the whole refillance, and muft have greatly influenced their motions; yet they were obferved to fall as if the refiltance had nu way depended on the depth.

The fame thing appears in Borda's experiments, w:here a fphere which was deeply immerfed in the water was lefs refifted than one that moved with the fame velocity near the furface; and this was very conftant and regular in a courfe of experiments. D'Uiloa, however, afirms the contrary: He fays that the refiflance of a board, which was a font broad, inmerfed one font in a ftream moving two feet per fecond, was \(15 \frac{1}{2} \mathrm{lbs}\). and the refiflance to the fame board, when inmerfed 2 feet in a flream moving \(1 \frac{1}{3}\) feet per fecond (in which cafe the firface was 2 feet , was \(26^{\frac{2}{*}}\) pomeds ( A ).
We are very forry that we cannot give a proper account of this theory of refiftance by Don George Juan D'Ulloa, an author of great mathennatical reputation, and the infpector of the narine academies in Spain. We have not been able to procure either the original or the French tranfation, and judge of it orly by an cxtract by Mr Prony in his Architeçure Hydraulique, § 868. ac. The theory is enveloped (aceording to Mr Prony's cuftom) in the moft complicated expreffions, fo that the phyfieal principles are kept almont out of fight. When aecominodated to the fimpleft poffible cafe, it is nearly as follows.

Let o be an elementary orifice or portion of the furface of the fide of a veffel filled fuith a heavy fluid, and let \(h\) be its depth under the horizontal furface of the
fluid. Let \(\delta\) be the denfity of the fluid, and o the ac- Reffinance. celerative power of gravity, \(=32\) feet velocity acquired in a fecond.
It is known, fays he, that the water would flow out at this hole with the velocity \(u=\sqrt{2 ; b}\), and \(u^{2}=2 ; b\) and \(b=\frac{u^{2}}{2 p}\). It is alfo known that the prefiure \(p\) on the orifee \(a\) is \(\neq 0: h,=\operatorname{po\delta } \frac{u^{2}}{2 z},=\frac{x}{2} \delta o u^{2}\).

Nuw let this little furface o be fuppofed to move with the veloeity r: The fluid would mect it with the velocity \(u+v\), or \(u-v\), according as it moved in the opp fite or in the fame direction with the effux. In the equation \(p=\frac{1}{2} 80 u^{2}\), fubflitutc \(u= \pm\) for \(u\), and we have the preflure on \(0=p=\frac{10}{2}(u \pm v)^{2},=\frac{i 0}{2}\) \(\left(\sqrt{2=\bar{b}} \pm v^{2}\right)\).

This preffure is a weight, that is, a nafs of matter \(m\) actunted by gravity \(s\), or \(p=s m\), and \(m=s 0\) \(\left(\sqrt{7}= \pm \frac{v^{\prime}}{v^{\prime} 2}\right)^{2}\).

This elementary forface being inmerfed in a ftag. mant fluid, and moved with the velocity \(\tau\), will fuftain on une lide a preflure \(\delta 0\left(\sqrt{ } h+\frac{v}{\sqrt{2}}\right)^{2}\) and on the other fide a preffure \(\delta \circ\left(\sqrt{ } h-\frac{v}{\sqrt{2}}\right)^{2}\); andthe fenfible refiftauee will be the difference of thefe two pieffures, which is \(804 \sqrt{ } h \frac{v}{\sqrt{ } 2}\), or \(804 \sqrt{ } h \frac{v}{8}\), that is, \(\frac{\therefore \sqrt{ } b v}{2}\), becaufe \(\sqrt{2}=8\); a quantity whieh is in the fubduplicate ratio of the depth under the furface of the fluid, and the fimple ratio of the velocity of the retifted furface jointly.

There is nothing in experimental philofophy more certain than that the refiftances are very nearly in the duplicate ratio of the velucities; and we eannot conceive by what experiments the ingenious author has fupported this conelufion.

But there is, befides, what appears to us to be an Defeet in effential defect in this inveftigation. The equation ex-his inveffihibits no reffllanes in the eafe of a flud without weight. gation. Now a theory of the refiftance of fuxids mould exlibit the retardation arifing from inertia alune, and thould diftinguifh it from that ariling from any other caufe: and moreover, while it offigns an ultimate fenible refiltance proportional (cateris paribus) to the fmple velocity, it affumes as a firft principle that the preflure \(p\) is as \(\overline{u-=} v^{2}\). It alfo gives a falfe meafure of the fratical preflures: for thefe (in the eafe of bodics immerfed in our waters at leaft) are made up of the preffure of the incumbent water, which is meaiured by \(b\), and the preflure of the atinofphere, a conitant quantity.
Whatever reafon can be given for fetting out with the principle that the preffure on the little furface o, moving with the velocity \(u\), is cqual to \(\frac{2}{2} 80(u=5)^{2}\), makes it indifpenfably neceflary to take for the velocity
(A) There is fomething very unaccountable in thefe experiments. The refiftances are much greater than any other author has obferved.

\section*{\(R E S\)}

\section*{R ES}

P-nanee. b, no: that with which water would iNue from a hole whofe depth under the furface is \(b\), but the velocity wvith which it will iffue fron a hole whofe depth in \(b+33\) feet. Becaufe the preflime of the atmofphere is equal to that of a column of water 33 feet high: for this is the acknowledyed velocity with which it would ruth in to the void left by the body. If therefore this velocity (which does not exill) has any fhare in the effor, we mult hase fur the tluxion of preffure not \(\frac{+\sqrt{ } b w}{\sqrt{2 i}}\) but \(\frac{4 \sqrt{b+33}}{\sqrt{2}}\). This woukd nut onlv give preffure or refiftances many times exceeding thofe that have been obferved in our experiments, but would alfo totally change the proportions which this theory determines. It was at any rate improper to cm barrafs an inveltigation, already very intricate, with the preflure of gravity, and with two motions of efflux, which do not exift, and are neceflary for making the prcflures in the ratio of \(\overline{u+v}^{2}\) and \(\overline{u-v}^{2}\).

Mr Prony has been at no pains to inform his readers of lis reafons for adopting this theory of refiftance, fo contray to all received opinions, and to the moft dittinct experiments. Thofe of the French academy, made under greater preflures, gave a much fmaller refiltance; and the every experiments adduced in fupport of this theory are extremely deficient, wanting fully \(\frac{1}{3} \mathrm{~d}\) of what the theory requires. The refiflances by experiment were \(15 \frac{1}{2}\) and \(26 \frac{1}{3}\), and the theory required \(20 \frac{1}{2}\) and 39. The equation, howeser, deduced from the theory is greatly delicient in the expreffion of the preflures caufed by the accumulation and depreflion, ftating the heights of them as \(=\frac{\eta^{2}}{2 ;}\). They can never be fo high, becaife the heaped up water flows off at the fides, and it alfo comes in behind by the fides; fo that the preflure is much lefs than half the weight of a column whoue height is \(\frac{q^{2}}{20}\); both becaufe the accumulation and depreffion are lefs at the fides than in the middle, and becuufe, when the body is wholly immerfed, the accunnulation is greatly diminifhed. Indeed in this cafe the final equation does not include their effects, though as real in this cafe as when part of the body is above water.

Upon the whole, we are fomewhat furprifel that an author of D'Ulloa's eminence thould have adopted a theory fo unneceffarity and fo improperly embarraffed with foreign circumftances ; and that Mr Prony fhould have inferted it with the explanation by which he was to abide, in a work dettined for practical ufe.

This point, or the effect of deep inmerfion, is fill much contefted; and it is a received opinion, by many not accufomed to mathematical refearches, that the refiftance is greater in greater depths. This is affumed as an inportant principle hy Mr Gordon, author of \(A\) Thenry of Naval Arclitechure; but on very vague and night grounds; and the author feems unacquainted with the manner of reafoning on fuch fubjects. It thall be conEidered afterwards.

With thefe corrections, it may be afferted that theory and experinent agree very well in this refpect, and that the refiltance may be afferted to be in the duplicate ratio of the velocity.

Wc have been more minute on this fubjeet, becaufe it is the leading propofition in the theory of the ac-
tion of Aluds. Newton's demonflration of it takes no Refinterce. notice of the manner in which the various particles of the fluid are put into motion, or the motion which each in particular acquircs. He only fhows, that if there be nothing concerned in the communication but pure inertia, the fum total of the motions of the particles, eftimated in the direction of the bodies motion, or that of the ftream, will be in the duplicate ratio of the velocity. It was therefore of importance to fhow that this part of the theory was juft. 'I'o do this, we had to conlider the effect of every circumitance which could be cumbined with the inertia, of the fluid. All thefe had heen forefeen by that great man, and are mon bricty, though perfyicuoufly, mentioned in the latt feholium to prop. 36 . B. JI.
2. It appears from a conparifon of all the experi- Imoulfo ments, that the impulfes and refiftances are very nearly anpul refitin the proportion of the furfaces. They appear, huw- ances nearever, to increafe fomewhat fafter than the furfaces. The ly in proChevalier Borda found that the refitance, with the fame the farfa. velucity, to a furface of
\[
\left.\begin{array}{l}
9 \text { inches } \\
16 \\
36 \\

81
\end{array}\right.
\]

The devjation in thefe experimentis from the theory increafes with the furface, and is probably nuch greater in the extenfive furfaces of the falls of flaps and windmills, and the hulls of mips.
3. The reliftances do by no means vary in the duplicate ratio of the lines of the angles of incidence.
As this is the molt interetting circumftance, laving a chief infuence on all the particular modifications of the refitance of fluids, and as on this depends the whole theory of the couftruction and working of fhips, and the action of water on our moft important machines, and feens moit immediately connected with the mechanifm of fluids, it merits a very particular confideration. We cannot do a greater fervice than by rendering more generally known the excellent experiments of the French acadenty.

Fiffcen boxes or veffels were confructed, which were Exp critwo fect wide, and two feet deep, and four feet long. neme of One of them was a parallelopiped of thefe dimentions; the French the others had prows of a wedte-form, the angle \({ }^{\text {a.ademy, }}\) ACB (fig. 7.) varying by \(12^{\circ}\) degrees frum \(120^{\circ}\) to

Plate \(180^{\circ}\); to that the angle of incidence increafed hy 60 eccotxxusis from one to another. Thefe boxes were dragged acrofs a very large bafon of fmooth water (in which they were immerfed two fect) by incanso of a line paffing over a whell connected with a cylinder, from which the actuating weight was fufpended. The notion became perfectly uniform after a. vers little way; and the time of paffing over 96 French feet with this uniform mution was sery carefully noted. The refiltance was meafured by the :weight employed, after deducting a certain quantity (properly eftimated) for friction, and fur the accumulation of the water againit the anterior furfacc. The refults of the many experiments are given in the following table; where column ift contains the angle of the prow, culumn \(2 d\) contains the refiftance as given hy the preceding theory, column 3 d contains the refiftance exhibited in the experiments, and column \(4^{\text {th }}\) contains the deviation of the experiment from the theory.

The refiftance to i fquare foot, French meafure, moving with the velocity of 2,56 feet per lecond, was very nearly 7,625 poiuld French.

Reducing thefe to Englifh meafures, we have the fulface \(=1,1363\) feet, the velocity of the motion equal to 2,7263 feet per fecond, and the reliftance equal to 8,234 pounds avoirdupois. The weight of a column of treth water of this bafe, and having for its height the fall neceeflary for communicating this velocity, is \(8,26+\) pounds avoirdupois. The refiltances to other velocities were aecurately proportional to the fquares of the velocities.

There is great diverfity in the value which different authors have deduced for the abfolute refiftance of water from their experiments. In the value now given nothing is taken into account but the inertia of the water. The accumulation againlt the forepart of the box was earefully noted, and the ftatical preffure backwards, arifing from this caufe, was fubtracted from the whole refittance to the drag. There lad not been a fufficient varicty of experiments for difcovering the fhare which tenacity and friction produced; fo that the number of pounds fet down here may be confidered as fomewhat fuperior to the mere effects of the inertia of the water. We think, upon the whole, that it is the moft accurate determination yet given of the refiftance to a body in motion : but we fhall afterwards fee reafons for believing, that the impulfe of a ruming flream having the fame velocity is fomewhat greater; and this is the form in which moft of the experiments have been made.

Alfo obferve, that the refiftance here given is that to a veffel two feet broad and deep and four feet long. The refirtance to a plane of two feet broad and deep would probably have exceeded this in the proportion of 15,22 to 14,54 , for reafons we fhall fee afterwards.

From the experiments of Chevalier Buat, it appears that a body of one foot fquare, French meafure, and two feet long, having its eentre 15 inches under water, moving thrce French feet per feeond, fuftained a prefflure of 14,54 Freneh pounds, or 15,63 Englifh. This reduced in the proportion of \(3^{2}\) to \(2,56^{2}\) gives 11,43 pounds, confiderably exceeding the 8,24.

Mr Bonguer, in his Manauvre des Vaffeaux, fays, that he found the refiflance of fea-water to a velocity of one foot to be 23 ounces poids des Marc.

The Chevalier Borda found the refiftance of fea-water to the face of a cubic foot, moving againft the water one foot per fecond, to be 21 ounces nearly. But

\section*{103 ] \\ R E S}
this experiment is complieated: the ware was not de. Reffilance, ducted; and it was not a plane, but a cube.

Don George d'Ulloa found the impulfe of a fream of feawater, running two fect per fecond on a foot fquare, to be 15 ! prounds Englifh meafure. 'This greatly exceeds all the values given by others.

From thefe experiments we learn, in the firt place, Confecquena that the direct refiftance to a motion of a plane furface cesf fons through water, is very nearly equal to the weight of a them. column of water having that furface for its bafe. and for its height the fall producing the velocity of the motion. This is but one half of the refiftance determined by the precediag theory. It agrees, however, very well with the beft experiments made by other philofo. plers on bodics totally inunerfed or furrounded by the fluid; and fufficiently hows, that there muft be fome falliacy in the principles or reatoning by which this refult of the theory is fuppofid to be deduced. We fhall have occation to return to this again.

But we fee that the effects of the obliquity of ineidence deviate enormonfly from the theory, and that this deviation inereafes rapidly as the aeutencfs of the prow increafes. In the prow of \(60^{\circ}\) the deviation is nearly equal to the whole refiltance pointed out by the theory, and in the prow of \(12^{\circ}\) it is nearly 4 . times greater than the theoretical refiftance.

The refiftance of the prow of go' thould be one half the refintance of the tafe. We have not fuch a prow ; but the medium between the refiltance of the prow of 96 and \(8 \nmid\) is 5790 , inttead of 500 .

Thefe experiments are very eonfurm to thofe of other authors on plane furfaces. Mr Robins found the refiltance of the air to a pyramid of \(45^{\circ}\), with its apex foremoft, was to that of its bafe as 1000 to 1411 , inAtead of one to two. Chevalier Borda found the refiltance of a cube, moving in water in the direction of the fide, was to the oblique refiftance, when it was moved in the direction of the diagonal, in the proportion of \(5 \frac{1}{T}\) to 7 ; whereas it fhould have been that of \(\sqrt{ } 2\) to 1 , or of 10 to \(;\) nearly. He alfo found, that a wedge whofe angle was \(90^{\circ}\), moving in air, gave for the proportion of the refittances of the edge and bafe \(7281: 10 n 00\), in'tead of \(5000: 10000\). Alfo when the angle of the wedge was \(60^{\prime \prime}\), the refiftances of the edge and bafe were 52 and 100 , inftead of 25 and 100 .

In flort, in all the cafes of oblique plane furfaces, the refiftances were greater than thofe which are affigned by the theory. The theoretical law agrecs tolerably with obfervation in large angles of incidence, that is, in ineidences not differing very far from the perpendicular ; but in more acute prows the refiftances are more nearly proportional to the lines of incidence than to their fquares.

The academicians deduced from thefe experiments an expreffion of the general value of the refiftance, which correfponds tolerably well with obfervation. Thus let \(x\) be the complement of the half angle of the prow; and let \(P\) be the direct preffure or refiftance, with an incidenee of \(90^{\circ}\), and \(p\) the effective oblique preffure: then \(p=\mathrm{P} \times\) cofine \({ }^{2} x+3,153\left(\frac{x^{0}}{6^{0}}\right)^{3,25}\). This gives for a prow of \(12^{\circ}\) an error in defect about \(\frac{r^{\frac{1}{\delta}} \boldsymbol{0} \text {, }}{}\), and in larger angles it is much nearer the truth; and this is exact enough for any practice.

\section*{R E S [ 104 ] R E S}

Refinareer This is an abundantly fimple formula; but if we in troduce it in our calculations of the refiftances of curvilineal prows, it renders then fo complicated as to be almoft ufelefs; and what is worfe, when the calculation is completed for a curvilineal prow, the refiftance which refults is fown to differ widely from experiment. This flows that the motion of the fluid is fo modified by the action of the mult prominent part of the prow, that its impulfe on what fucceeds is greatiy affected, fo that we are not allowed to confider the prow as compofed of a number of parts, each of which is affected as if it were detached from all the reft.

As the very nature of naval architecture feems to require curvilineal forms, in order to give the neceffary ftrength, it feemed of importance to examine more particulary the deriations of the refiftances of fuch prows from the refiftances affigned by the theory. The academicians therefore made veffels with prows of a cylindincal fhape; one of thefe was a half cylinder, and the other was one-third of a cylinder, both having the fame breadth, viz. two feet, the fume depth, alfo two feet, and the fane length, four feet. The refiftance of the half cylinder was to the refiftance of the perpendicular prow in the proportion of 13 to 25 , intead of being as 13 to 1905. The Cheralier Borda found nearly the fame ratio of the refiftances of the half cylinder, and its diametrical plane when moved in air. He alfo compared the refiftances of two prifms or wedges, of the fame breadth and height. The firft had its fides plane, inclined to the bafe in augles of \(60^{\circ}\) : the fecond had its fides portions of cylinders, of which the planes were the chords, that is, their fections were arches of circles of 60 . Their refiftances were as 133 to 100 , inflead of being as I 33 to 220 , as required by the theory; and as the refiftance of the firt was greater in pro. portion to that of the bali than the theory allows, the refiftance of the laft was lefs.

Mr Robins found the relittance of a fphere moving in air to be to the refiftance of its grat circle as I to 2.27; whereas theory requires them to be as 1 to 2. He fornd, at the fame time, that the abfolute refitance was greater than the weight of a cylinder of air of the fane diamster, and having the height neceffary for acguiring the wlocity. It was greater in the proportion of 49 to 40 nearly.

Borda found the refiftance of the fphere moving in water to be to that of its great circle as 1000 to 2508 , and it was one-ninth greater than the weight of the column of water whofe height was that neceflary for producing the velaciry: He alfo found the rctitsance of air to the fiphere was to its relithance to its great circle as \(\mathbb{I}\) to 2,45 .
The theory It appears, oat the whole, that the theory gives the gives fome refitance of ofliqu: plate firfaces too fmall, and that sefinances of cuived furfaces too great ; and that it is quite unfit too fmall for alcertaining the moditications of refiftarce arifing and others from the figure of the body: The molt prominent past of the prow changes the aftion of the fluid on the fuccecding pirts, rendering it totally different from what it would le sere that part detached from the reft, and expofed to the Hream with the fane olliquity: It is of no confequence, therefore, to deduce any formula from the valuable experiments of the French academy. The experincnts themfelves are of great importance, becaule they give us the impulies on plane furfaces with
every obliquity. They therefore put it in our power to felect the moft proper obliquity in a thoufand important cafes. By appealing to them, we can tell what is the proper angle of the fail for producing the grcateft impulfe in the direction of the thinp's courfe; or the beft inclination of the fail of a wind-mill, or the beft inclination of the float of a watcr-wheel, \&c. \&c. Thefe deductions will he made in their proper places in the courfe of this work. We fee alfo, that the deviation from the fimple theory is not very confiderable till the obliquity is great ; and that, in the inclinations which other circumfances would induce us to give to the floats of water-wheels, the fails of wind-mills, and the like, the refults of the theory are fufficiently agreeable to experiment, for rendering this theory of very grcat ufe in the conftruction of inaclines. Its great defect is in the inpuilions on curved lurfaces, which puts a ftop to our improvament of the fcience of naval architecture, and the working of thips.

But it is not enough to detect the faults of this theory : we fhould try to amend it, or to fubfitute ano. ther. It is a pity that fo much ingeruity flould have been thrown away in the application of a theory fo defective. Mathematicians were feduced, as has been already obferved, by the opportunity which it gave for exereifing their calculus, which was a new thing at the time of publifhing this theory. Newton faw clearly the defects of it, and makes no ufe of any part of it in his fubfequent difeuffions, and plainly has ufed it merely as an introduction, in order to gise fome general notions in a fubject quite new, and to give a demonAtration of one leading truth, viz. the proportionality of the impulfions to the fequares of the velocities. While we profefs the higheft relpect for the talents and labours of the great inathematicians who have followed Newton in this moft difficult refearch, we cannot help being forry that fome of the greatell of them contrined to attach themelves to a theory which he neglected, merely becaufe it afforded an opportunity of diplaying their profonnd knowledge of the new calculns, of which they were willing to aferibe the difcovery to Leibnitz. It has been in a great meafure owing to this that we have been fo late in difcovering our iunotance of the fubject. Nowton had himfelf pointed out all the defects of this theory; and he fet himfelf to work to difcover another which thoukl be more conformable to the nature of thinss, retaining only fuch deductions from the c.n. other as his great fagracity affured him would itand the teft of experiment. Evea in this he feems to have been miltaken hy his followers. He retained the proportiont of of the refitance to the fquare of the velocity. I lis they have cudeavoured to demontrate in a manner cunfurmable to Neviton's determination of the oblique impulfes of fluids; and under the cover of the agreement of this propofition with experiment, they iztruduced into niechanics a mode of expreflion, and even of concertion, which is inconfitent with all accurate notions on thefe fubjects. Newton's prupofition was, that the motions communicated to the fluid, and therefore the motions lutt by the body, in equal times, were as the fquares of the velocities; and he conceived thefe as proper meafures of the reliftances. It is a matter of experience, that the furces or preffures by which a body mult be fupported in oppofition to the impulfes of fluids, are in this very proportion. In determining the
fif ce. -rotartion of the direct and oulique refiftances of plane - furfaces, he confiders the refitiances to arife from mutual collifions of the furface and fluid, repeated at intervals of time too fmall to be perceived. But in making this comparifon, he lias no ocealion whatever to confider this repetition; and when he affigns the proportion between the refiftance of a cone and of its bate, he," in fact, affigns the proportion between two fimultaneous and iaftantaneous impulfes. But the mathematicians who followed him lave confidered this repetition as equivalent to an augmentation of the initial or firft impulfe; and in this way have attempted to demonftrate that the refiltances are as the fyuares of the velocitiez. When the velocity is double, each impulie is double, and the number in a given time is double; therefore, fay they, the refiftance, and the force which will withftand it, is quadruple; and obfervation confirms their deduction: yet nothing is more gratuitous and illogical. It is very true that the refiltance, conceived as Newton conceives it, the lofs of motion fuftained by a body moving in the fluid, is quadruple ; but the inflantancous impulfe, and the force which can withtand it, is, by all the laws of mechanics, only double. Wha tis the force which can withfand a double impulfe? No. pà- thing but a double impulfe. Nothing but in?pulfe can he oppofed to impulfe; and it is a grofs mifconception to thiuk of ftating any kind of comparifon between inspulfe and preflure. It is this which has given rife to much jargon and falie reafoning about the force of percufion. This is fated as infinitely greater than any preffure, and as equivalent to a preflure infinitely repeated. It forced the abettors of thefe doctrines at laft to deny the exiftence of all preflures whatever, and to affert that all motion, and tendency to motion, was the refult of impulfe. The celebrated Euler, perhaps the firft mathematician, and the lowelt philefopher, of this century, fays, " fince motion and impulfe are feen to cesit, and firice we fee that by means of motion prefLure may be produced, as when a body in motion ftrikes znother, or as when a body moving in a curved channel preffes upon it, mertly in confequence of its curvilineal motion, and the excrtion of a centrifugal force; and fince Nature is moft wifely economical in all her operations; it is abfurd to fuppofe that preflure, or tendency to motion, has any other origin; and it is the lutinefs of a \({ }^{3}\) hitofopher to difcover oy what motions any obferved preffure is produced." Whenever any prefliare is obierved, fuch as the preflure of gravity, of magnetifm, of clectricity, oi condenfed air, nay, of a fpring, and of clafticity and cuhefion themfelves, howe ver difparate, nay, oppofite, the plilofopher muft immediately caft about, and contrive a fet of motions (creating pro ve mat. 2 the movers) which will produce a preffire like the one obferved. Having pleafed his fancy with this, he cries out 'evonax "this zuill produce the preflure;" et jrultra fit per plura quad feri potel per pauciora, "therefure in this way the preflure is produced." 'Thus the vortices of Defeartes are brought back in trimniph, and have product vortices without number, which fill the univerfe with motion and preffure.

Such bold attempts to overturn long-received doctines in mechanics, could rot be received without much criticifm and oppofition; and many able differtations appcared from time to time in defence of the comnon doctrines. In comfequence of the many objections to

Vol. XVI. Part 1 .
the comparifon of pure preflure with pure percuffion Refilazee. or impulfe, Joha Bernoulli and others were at laft obliged to affert that there were no perfectly hard bodies in nature, nor could be, but that all bodies were elaftic; and that in the communication of motion by percuffion, the velocities of both bodies were gradaally changed by their mutual clafticity acting during the finite but imperceptible time of the collifion. This was, in fact, giving up the whole argument, and banifhing percuffion, while their aim was to get rid of preflure. For what is elafticity but a preffure? and how fhall it be produced: To act in this inftance, muft it arifc from a itill finaller impulfe? But this will require another elaflicity, and fo on without end.

Thefe are all legitimate confequences of this attempt to flate a comparifon between percuffion and preffiure. Numberlefs experiments have been made to confirm the ftatement; and there is hardly an itinerant-lecturing fhowman who docs not exhibit among his apparatus Gravefande's macline (Vol. I. plate xxxy: fig. 4). But nothing affords fo frecious an argument as the experimented proportionality of the impulfe of fuids to the fquare of the velocity. Here is every appearance of thic accumulation of an infinity of minute impulfes, in the known ratio of the velocity, each to each, producing preffures which are in the ratio of the fquares of the velocities.

The preffures are obferved; but the impulfes or percuftions, whofe accumulation produces thefe preffures, are only fuppofed. The rare fluid, introduced by Newton for the purpofe already mentioned, either does not exilt in nature, or does not act in the manner we have faid, the particles making their impulfe, and then efca. ping through among the reft withont affecting their motion. We cannot indeed fay what may be the proportion between the diameter and the diftance of the particles. The firt may be incornparably fmaller than the fecond, even in mercury, the denfelt fluid which we are familiarly acquainted with; but alth:ough they do not touch each other, they act neanly as if they did, in confequence of their mutual attractions and repulfions. We have feen air a thoufand times rater in fome experiments than in others, and therefore the diftance of the particles at kaft ten times greater than their diameters; and \(y \in t\), in this rare flatc, it propagates all preffures or inpulfes made on any part of it to a great diftance, almoit in an inftant. It cannot be, therefore, that fluids ait on bodies by impulfe. It is very pfible to conceive a fluid advancing with a flat furface againft the flat furface of a folid. The very fist and fuperficial particles may make an impulfe; and if they were amnihilated, the next might do the fame: and if the velucity were double, thefe impulfes would be double, and would be withiftood by a double force, and not a quadruple, as is obferved : and this very circumftance, that a quadruple force is neceffary;, thould have made us conclude that it was not to impulfe that this force was oppofed. The fiff particles having made their ftroke, and not being annililated, muft efcape laterally. In their efra- put a vo ping, they efiectually prevent every farther impulfe, inall peate becaufe they come in the way of thofe filaments which of a fuid would have fruck the body. The whole procefs feems \({ }^{\text {can }}\) make to be fomewhat as follows:
When the flat furface of the fluid has come into con-face. tact witla the plane furface AD (fig. 6.), perpendicular Plate O

\section*{R E S}

Refirance. to the direction DC of their motion, they muf deflect to bueli fides equally, and in equal portions, becaufe no reafon can be alfigned why more flould go to cither fide. by this means the lilament EF, which would have fluck the linface in G , is defleeded before it srrives at the furface, and deferibes a curved path EFIHK, comtinung its rectilineal motion to \(I\), where it is inter-- spted by a ilment inmediately adjoining to EF , on the fide of the niddle flament IDC. The different particles of DC may be fuppofed to impinge in fuccedfion at C , and to be depected at right angles; and gliding alons CB, to cfeape at B. Each filanent in fuecelfon, eutwods from DC, i; defeeted in its turn ; and being bindered from even touchine the furface CB, it glides off in a direction parallel io it ; and thus EF is deflected in I, moves parallel to CB from 1 to H , and is again deflecteet at right angles, and deferibes HK parallel to I)C. The fame thing may be fuppofed to happen on the other fide of DC.

And thus it would appear, that except two filaments smmediately adjoining to the line DC, which bifects the furface at ight angles, no part of the fluid makes any impulfe on the lurface \(A B\). All the other filaments are merely preffed againft it by the lateral firaments without them, which they turn afide, and prevent from Itriking the furface.

In like manner, when the fluid frikes the edge of a prim or wedge \(A C B\) (fig. 7.), it cannot be faid that any real impulie is made. Nothing hinders us from not fufeeptible of any impulfe, and fer indivisible point, vide the Itream. Each filament EF is effectually prevented from inpinging at \(G\) in the line of its dircetion, and with the obliquity of incidence EGC, by the filaments between EF and DC, which glide along the furface CA : and it may be fuppofed to be deflected when it comes to the line CF which bifects the angle DCA, and again deflected and rendered parallel to I) C at I . The fame thing happens on the other fide of I) C : and

41
The ordinary theosy of no ufe in ravil archiectlurs. we cannut in this cafe affert that there is any inpulfe.

We now fee plainly how the ordinary theory mult be totally unfit fur furnihing principles of naval architecture, even although a formula could be deduced from fuch a feries of experiments as thofe of the French Academy. Although we fhould know precifly the impulfe, or, to fecak now more cautiouly, the action, of the fluid on a furface G L (fig. 8.) of any obliquity, when it is alone, detached from all others, we cannot in the finalleat dcgree tell what will be the action of part of a Arcam of fluid advancing towards it, with the fame obliquity, when it is preceded by an adjoining furface C̣G, laving a diferent iuclination; for the fluid will not glide along GL in the fame manncr as if it made part of a more extenfive furface having the fame inclination. The previous defexions are extremely different in thefe two cafes; and the previous deflections are the only ehanges which we ean obferve in the motions of the Huid, and the ouly caufes of that preffure which we obferve the body to fultain, and which we call the impulfe on it. 'This theory mutt, therefore, be quite unfit for afeertainiag the action on a curved furface, which may be confidered as made up of an indefisite number of fucceffive planes.

We now fee with equal evidence how it bappens that
the attion of fuids on folid bodies may and mult be op- Refioce. pofed by preflures, and may be compared with and mea. furcd by the preffure of gravity. We are not compa- Prelec, ring forces of different kiads, percuflions with preflures, the ton but preflures with each other. Let us fee whether of \(11 \mathrm{~h}_{\mathrm{i}}\) this view of the fubje? will afford us any method of comparifon or abfolute meafurement.

When a flament of fuid, that is, a row of corpufcles, are turncal out of their courfe EF (fig. 6.), and forced to take another courfe IH, force is required to produce this change of dircction. . The filament is prevented. from proceeding by other filaments which lie between it and the body, and which deflect it in the fame manner as if it were contained in a bended tube, and it will prefs on the concave filament next to it as it would prefs on the concave fide of the tube. Suppofe fuch a bended tube ABE (fig. 9.), and that a ball \(A\) is projected along it with any velocity, and moves in it without friction: it is demonftrated, in elementary mechanics, that the ball will move with undiminifhed velocty, and will prefs on every point, fuch as \(B\), of the concave fide of the tube, in a direction BF perpendicular to the plane CBD, which touches the tube in the point B. This preffare on the acjoining filament, on the concave fide of its path, mult be withfood by that filament which deflects it ; and it mult be propagated acrofs that filament to the next, and thus augment the preffure upon. that next filament already prefled by the deflection of the intermediate filament ; and thus there is a preffure towards the middle filament, and towards the body, arifing from the deflection of all the outer filaments; and their accumulated fum muft be conceived as immediately exerted on the middle filaments and on the body, becanfe a perfect fluid tranfmits every preffure undimio. nifhed.

The preffure BF is equivalent to the two \(\mathrm{BH}, \mathrm{BG}\), one of which is perpendicular, and the other parallel, to the direction of the original motion. By the firt (taken in any paint of the curvilineal motion of any filament), the two halves of the ftream are preffed together; and in the cafe of fig. 6. and 7. exactly balance each other. But the preffures, fuch as \(B G\), mult be ultimately withltood by the furface \(A C B\); and it is hy thefe accumulated preffures that the folid body is urged down the itteam ; and it is thele accumulated preffires. which we obferve and meafure in our experiments. We fhall anticipate a little, and fay that it is mott eafily demonttrated, that when a ball A (fig. 9.) moves with undiminifhed velocity in a tube fo incurvated that its axis at \(E\) is at right angles to its axis at \(A\), the accumulated. adion of the preflures, fuch as BG, taken for every point of the path, is presifely equal to the force which would produce or extinguifh the original motion.

This being the eafe, it follows mof obvioufly, that if the two motions of the filaments are fuch as we have de\{crihed and reprefented by fig. 6. the whole preflure in the direction of the ftrcam, that is, the whole preffure which can be obferved on the furface, is equal to the weight of a Wheer column of fluid having the furface for its bafe, and twice ther: the fall productive of the velocity for its height, pre-cleft \(x\) cifdy as Newton deduced it from other confiderations ; nor. and it feems to make no odds whether the fluid be claftic or unelafic, if the deflctions and velocities are the fame. Nuw it is a fact, that mo differece in this refpees

\section*{凡 E S}
ince. frect atn be obferved in the actions of air and water; - and this had always appeared a great defect in Newton's theory : but it was only a defect of the theory attributed to him. But it is allo true, that the obferved action is but one-haif of what is jult now deduced from this improved siew of the fubject. Whence arifes this difference? The reafen is this: We hase given a very erroneors account of the motions of the filaments. A filament EF does not move as reprefented in fig. 6. with two rectangular inflexions at I and at H , and a path IH between them parallel to C 13. The procefs of nature is more like what is reprefented in fig. 10. It is obfervect, that at the anterior part of the body A \(B\), there remains a quantity of fluid AD B, almoft, if not altogether, ftagnant, of a fingular thape, having two curved concave fides \(\mathrm{A} a \mathrm{D}, \overline{\mathrm{B}} 6 \mathrm{D}\), along which the middle filaments glide. This fluid is very flowly changed.The late Sir Chaules Knowles, an officer of the Britifh nary, equally eminent for his fcientific profeffional knowledge and for his military talents, made many beautiful experiments for afcertaining the paths of the filaments of water. At a diftance up the ftream, he allowed fmall jets of a coloured fluid, which did not mix with watcr, to make part of the flream ; and the experiments were made in troughs with fides and bottom of plate-glafs. A fmall taper was placed at a confiderable height above, by which the fhadows of the coloured filaments were moft diftinctly projected on a white plane held below the trough, fo that they were accurately drawn with a pencil. A few important particulars may be here mentioned.

The fill water ADC lafted for a long while before it was renewed; and it feemed to be gradually watted by abrafion, by the adhefion of the furrounding water, which gradually licked away the outer parts from D to \(A\) and \(B\); and it feemed to renew itfelf in the direction \(C D\), oppofite to the motion of the flream. There was, however, a confliderable intricacy and eddy in this motion. Some (feemingly fuperficial) water was continually, but flowly, flowing outward from the line DC, while other water was feen within and below it, coming inwards and going backwards.

The coloured lateral filaments were moft conftant in their form, while the body was the fame, although the velocity was in Fome cales quadrupled. Any change which this produced feemed confined to the fuperficial filaments.
As the filaments were deflected, they were alfo conftipated, that is, the curved parts of the filaments were nearer each other than the parallel ftraight filaments up the ftream; and this conftipation was more confiderable as the prow was more obtufe and the deflexion greater.
The inner filaments were ultimately more deflected than thofe without them; that is, if a line be drawn touching the curve EFIH in the point H of contrary flexure, wherc the concavity begins to be on the fide next the body, the angle HKC, contained between the axis and this tangent line, is fo much the greater as the filament is nearer the axis.
When the body expofed to the ftream was a box of upright fides, flat botom, and angular prow, like a wedge, having its cdge alfo upright, the flaments weve not all deflected laterally, as theory would make us expcct ; but the illaments near the hottom were allo deHected downwards as well as laterally, and glided along
at fome ditance under the bottom, forming lines of Refifance double curvature.

The breadtls of the fream that was deflesed was much greater than that of the body; and the fenfible deflection begun at a confiderable diftance up the ftream, efpecially in the outer filanents.

Lafly, the forn of the curves was greatly influenced by the proportion between the width of the trough and that of the body. The curvature was always lefs when the trough was very wide in proportion to the body.

Great varieties were allo obferved in the motion or velociry of the filaments. In general, the filaments increafed in velocity outwards from the body to a certain fmall diftance, which was nearly the fame in all cafes, and then diminifhed all the way outward. This was obferved by inequalities in the colour of the filanents, by which one could be obferved to outftrip another. The retardation of thofe next the body fecmed to proceed from friction; and it was imagined that without this the velocity there would always have been greatef.

Thefe obfervations give us confiderable information \(W^{4}\) hinferefpecting the mechanifm of thefe motions, and the ac-rences from tion of fuids upon folids. The prefure in the duplicate \({ }^{\text {tien. }}\) ratio of the velocities comes here again into view. We found, that although the velocities were very different, the curves were precifly the fame. Now the obferved preffures arife from the tranfverfe forees by which each particle of a flament is retained in its curvilineal path ; and we know that the force by which a body is retained in any curve is directly as the fquare of the velocity, and inveriely as the radius of curvature. The curvature, therefore, remaining the fame, the tranfverfe forees, and confequently the preffure on the body, mult be as the fquare of the velocity: and, on the other land, we can fee pretty clearly (indeed it is rigoronfly demonfrated by D'Alembert), that whatever be the velocities, the curves will be the fame. For it is known in hydraulics, that it requires a fourfold or ninefold preffure to produce a double or triple velocity. And as all preffures are propagated through a perfect fluid without diminution, this fourfold preflure, white it produces a double velocity, produces alfo fourfold tranfverfe preflures, which will retain the particles, moving twice as falt, in the fame curvilineal paths. And thus we fee that the impulfes, as they are called, and refiftances of fluids, have a certain relation to the weight of a column of fluid, whofe height is the height neceffary for producing the velocity. How it happens that a plane furface, immerfed in an extended fluid, futtains jut half the preffure which it would have fuftained had the motions been fuch as are fletched in figure Gth, is a matter of more curious and difficult inveftigation. But we fee evidently that the preffure nuft be lefs than what is there affinned; for the ftagnant water a-head of the body greatly diminifhes the ultinate deffections of the filaments: And it may be demonftrated, that when the part BE of the canal, fig. 9. is inclincd to the part \(A B\) in an angle lefs than \(90^{\circ}\), the preflures \(B G\) along the whole canal are as the verfed fine of the uitimate angle of defection, or the verfed fine of the angle which the pat B E makes with the part AB. Therefore, fince the deflexions refcmble more the fecth given in fig. 10 . the accunulated fum of all thefe forces BG of fig. 9 . mul be lefs then the fimilar fum correfponding to fig. 6 . that is, lefs that 03

Refrance the weight of the column of fluid, having twice the productive height for its height. How it is jut onehalf, fhall be our next inquiry.

And here we mult return to the labours of Sir Iface Newton. After many beautiful obfervations on the nature and mechanifin of continued fuids, he fays, that the refilance which they occation is but one-halt of the \(t\) occafioned by the rare fluid which had been the fubject of his former propofition ; "which truth," (fays he, with his ufual cantion and modelty), "I hait endeavour to thow."
He then enters into another, as novel and as difficult an inveftigation, viz. the laws of hydraulics, and endeavours to afcertain the motion of lluils throughorifices when urged by preffures of any kind. He endeavours to afeertain the velocity with which a fluid efcapes through a horizontal orilice in the bottom of a velfel, by the action of its weight, and the preffure which this vein of thuid will cxert on a little circle which occupies part of the orifice. To obtain this, he employs a kind of approxienation and trial, of which it would be extreme ly difficult to give an extra? ; and then, by increaing the diancter of the veffet and of the hole to infinity, he accommodates his realoning to the cafe of a plane furface expofed to an indelinitely extendel fream of Huid; and lafty, giving to the little circular furface the motion which he hal before afcribed to the fluid, he fays, that the refitance to a plane furface moving through an unelaftic continuous fluid, is equal to the wiglht of a column of the fluid whofe height is onehalf of that neceflary for acquiring the velocity; and he fays, that the reliftance of a globe is, in this cafe, the fame with that of a cylinder of the fame diameter. The refitance, therefore, of the cylinder or circle is four times lefis, and that of the globe is twice lefs than their refultances on a rare elallic medium.

But this detcrmination, though founded on principles or aflumptions, which are much nearer to the real ilate of things, is liabte to great oljections. It de- pends on his method for afcertaining the velocity of the ifluing Hoid; a method extremely ingenions, but defective. The cataract, which he fuppofes, cannot exit as he fuppofes, defeending by the full action of gravity, and furrounded by a funnel of flagnant floid. For, in fuch circumflances, there is nothing to balance the hydroftatical preffure of this furrounding fluid; becaufe the whole preflure of the central cataract is employed in produeing its own defcent. In the next place, the preffure which he determincs is beyond all doubt only half of what is obferved on a plane furface in all our experiments. And, in the third place, it is repugnant to ail our experience, that the refitance of a globe or of a pointed body is as great as that of its circular bafe. His reafons are by no means convincing. He fuppofes them place! in a tube or canal ; and fuce they are fuppofet of the fame diameter, and therefore leave equal dpaces at their fides, he concludes, that becaufe the water efcapes by their fides with the fame velocity, they will have the fame refiltance. But this is by no means a neceflary confequence. Even if the water fhould be allowed to exert equal preffures on them, the preffures being perpendicular to their furfaces, and thefe furfaces being inclined to the axis, white in the cafe of the bafe of a cylinder it is in the direction of the axis, there muft be a difference in
the aecumulated or compound preflure in the direction \(R e\) arat of the axis. He indeed fays, that in the cafe of the cylinder or the circle obftructing the canal, a quantity of water remains flagnant on its upper furface; viz. all the water whofe motion would not contribute te the mofl realy pallage of the fluid between the cylinder and the fides of the canal or tube; and that this water may be comidered as frozen. If this bo the cafe, it is indifferent what is the form of the body that is covered with this mafs of frozen or Itagnant water. It may be a hemifphere or a cone; the reliftance will be the fame. - But Ncwton by no means affigns, either with precifion or with diltinct evidence, the form and magnitude of this flagnant water, fo as to give confidence in the refults. He contents himfelf with fayin.t, that it is that water whofe motion is not neceffiry or camot contribute to the molt cafy paflage of the water.

There remains, therefore, many imperfegions in this theory. But notwithitandiug thefe defeets, we cannot difplit. but admire the cfforts and fagacity of this great phi- rear lufopher, who, atter having dilcovered fo many fublime ci'g truths of mechanical naturc, ventured to trace out a path for the folution of a prablem which no perion had yet attempted to bring within the range of mathematical inveitigation. Ane his folution, though inaccurate, fhines througlout with that invertive genius and that testility of relource, which no man ever pof. feffed in fo eminent a degree.

Thofe who have attacked the folution of Sir Ifaas Newton have not been nore finceefifinl. Moft of them, inttead of principles, have given a great deal of calculus; and the chief merit which any of them can claim, is that of having deduced fome lingle propulition which happens to quadrate with fome lingle cale of experiment, while their general theories are either imapplicable, from difficulty and oblcurity, or are difcordaut with more general ubfervation.
We mult, however, except from this number Danicl Bernoulli, who was not only a great geometer, but one of the firlt philofophers of the age. He poffeffed all the talents, and was free from the faults of that eclebrated family; and whike he was the mathematician of Europe who penetrated farthell in the invelligation of this great problem, he was the ouly perfon who felt, or at lealt who acknowledged, its grcat difficulty.
In the 2 d volume of the Comment. Petropol. 1727 , Berman, he propofes a formula for the refilance of fluids, de- generar duced from confiderations quite different from thofe on man fuwhich Newton tounded his folution. But he Ilelivers ded on it with modeft diffidence; becaufe he' found that it gave fothesi a reliftance four times greater than experiment. In the fane differtation he determines the refillance of a fphere to be one half of that of its great circle. But in his fublequent theory of Hydrodynamics (a work which mull ever rark ameng the firt productions of the age, and is equally eminent for refined and elegant mathematics, and ingenious and original thoughts in dynamics), he calls this determination in quevion. It is indeed founded on the fame hypothetical principles which have been unkilfully detached from the rett of Newton's phyfics, and made the ground-work of all the fubfequent theories en this fubject.

In 174 t Mr 1 anicl Bernoulli publifed another difo fertation

\section*{\(R\) E S 「 109 R E S}

Refiance. fertation (in the 8th volume of the Com. Patropol.) on the action and reffitance of fluids; limited to a very particular cafe; namely, to the impulfe of a vein of fluid falling perpendicularly on an infinitely extended plane furface. This le demonitrates to be equal to the weight of a column of the fluid whofe bafe is the area of the vein, and whofe height is twice the fall producing the relocity. This demontration is drawn from the true principles of mechanics and the acknowledged laws of hydraulies, and may be rectived as a frict phyfical demonitration. As it is the only propofition in the whole theory that has as yet received a demonitration acceffible to readers not verfant in all the refinement of modern analyfis ; and as the principles on which it proceeds will undoubtedly lead to a folution of every problem which can be propofcd, once that our mathematical knowledge fhall enable us to apply then-we think it our duty to give it in this place, althongh we muit acknowledige, that this problem is fo very linited, that it will hardiy bear an application to any cafe that differs but a little from the exprefs conditions of the problem. Chere do occur cafes however in practice, where it may be applied to very great advantage.

Danicl Bernonlli gives two demonftrations; one of which may be called a popular one, and the other is more fcientife and introductory to further inveftigation. We fhall give both.

Bernonlli firt determines the whole action exerted in the eflux of the vein of 月uid. Suppofe the velocity of eflux \(v\) is that which would be acquired by falling through the height \(b\). It is well known that a body moving during the time of this fall with the velocity v would defcribe a fpace \(2 \%\). The effect, therefore, of the hydraulic action is, that in the time \(t\) of the fall \(l\), there iffues a ey linder or prifm of water whofe bafe is the crofs feelion f er area of the vein, and whofe length is \(z \%\). And this quantity of matter is now moving with the velocity \(q\). The quantity of motion, therefore, which is thus produced is 2 shv ; and this quantity of motion is produced in the time \(t\). And this is the accumulated effect of all the expelling forces, eftimated in the direction of the eflux. Now, to compare this with the exertion of fome preffing power with which we are familiarly acquainted, let us fuppole this pillar 2 sh to be frozen, and, being held in the hand, to be dropped. It is well known, that in the time \(t\) it will fall through the height \(h\), and will acquine the velocity \(\tau\), and now poffefles the quantity of motion \(2 s b v-\) and all this is the effect of its weight. The weight, thertfore, of the pillar \(2 s b\) prediects the fame eflect, and in the fame time, and (as may eafily be feen) in the fame gradual manner, with the expelling forces of the fluid in the veffel, which expelling torces arife from the preflure of all the fluid in the veffel. 'Iherefore the accumulated hydranlic prefluse, by which a vein of a heayy flud is forced out throngh an oritice in the buttom or fide of a veffel, is equal (when eitimated in the direction of the efflux) to the weight of a colum of the Guid, having for its bafe the fection of the vein, and twice the fall productive of the velocity of effux for its height.
Plate Now let ACDC (fig. II.) be a quadrangular veffl cesravr. with upright plane fides, in one of which is an orifice LT. From every point of the circumference of this
orifice, fuppofe horizontal lines \(\mathrm{E} \rho, \mathrm{F} f, \& \in\). which will Refituace. mark a fimilar furface on the oppolite fide of the veffel. Suppofe the orifice EF to be fhut. There can be no doubt but that the furfaces EF and ef will be equally prefled in oppofite direfions. Now open the orifice EF ; the water will ruih out, and the preffure on E ㅇ is now removed. There will therefore be a tendency in the veffel to move back in the direction Ee. Anl this tendency mult be precifely equal and oppofite to the whole effort of the expelling forees. This is a conclitfion as cvident as any propofition in mechanics. It is thus that a gun recoils and a rocket rifes in the air; and on this is fonaded the operation of Mr Parents or D : Barker's mill, deferibed in all treatifes of mechanics, and molt learnedly ireated by Euler in the Berlin Mcmoirs.

Now, let this itream of water be received en a circular plane MN, perpendicular to its axis, and let this circular plane be of fuch extent, that the vein eicapes from its fides in an infinitely thin fheet, the water fowing off in a direction parallel to the plane. The vein by this means will expand into a trumper-like thape, having curved tides, Elig, FL.H. We abitraft at prefent the action of gravity which would caufe the vein to bend downwards, anci occafion a greater velocity at \(H\) than at \(G\); and we fuppole the velocity equal in every point of the circmenfercoce. It is plain, that if the acrion of gravity be neglected after the water thas iffued through the orifice EF, the velocity in every point of the circumference of the plane MN will be that of the eflux through EF.

Now, becaufe EKC is the natural Chape affumed by the vein, it is plain, that if the whole vein were covered by a tube or mouth-piece, fitted to its fhape, and perfectly polifhed, fo that the water fhall glide along it, without any friction (a thing which we may always fuppofe), the water will exert no preflure whatever on this trumpet mouth-piecc. Laftly, let us fuppofe that the plane \(M N\) is attached to the mouth-piece by fome bits of wire, fo as to allow the water to efcape all round by the narrow chink between the mouth-piece and the plane: We have now a veffel confitting of the upright part ABDC, the trumpet GKEFLH, and the plane MN ; and the water is eicaping from every point of the circumference of the chink GHNM with the velocity 7. If any part of this chink were fhut up, there would be a preflare on that part equivalent to the force of efflux from the oppofite part. Therefore, when all is open, thefe efforts of eflux balance each other all roand. There is ne.t therefore any tendency in this compound rifl to move to any fide. But take away the plane MN, and there would immediately arife a preflure in che direction Ee equal to the weight of the collum? \(2 s h\). I his is therefore balanced by the prefinase on the circuiar plane MN, which is thercfore equal to this weight, and the propofition is demonftrated.
- A momber of experiments were made by Profeffor Kraft at St Peterfburg, by receiving the vin on a plane MN (fig. II.) which was faftened to the arm of a balance OPO, having a feale R hanging on the oppolite arm. The refiltance or preflure on the plane was meafured by weights put into the fcale \(R\); and the velucity
 to which it fpouted on a horizonta! plane.

Ferinance. Thice refults of the es expeniments were as confomable \(\underbrace{}_{53}\) to the theory as could be withed. The refitance was

52
Difierence be:ween be:ween greatly exceciled its half; the refult of the generaily re-
this the sy
ceived theorics. Thi: defect thould be expected ; fo: and experi- ceived theorics. This defect thould be expected; for menta ac. counted sor. always a little lefs than what the theory requircd, but eeved theorics.
the demonfration fuppofes the plare MN to be infinitely extended, fo that the film of water which iffues through the chink may be accurately parallel to the plane. This never can be conapletely effected. Alfo it was fuppofed, that the velocity was jultly meafured by the amplitude of the parabola EGK. But it is well known that the very putting the plane MN in the way of the jet, though at the diftance of an inch from the orifice, will diminim the velocity of the eflux through this orifice. This is caflly verified by experiment. Obferve the time in which the velfel will be emptied when there is no plane in the way. Repeat the experiment with the plane in its place; and more time will be neceffary. The following is a note of a comfe of experiments, taken as they Itand, without any felection.

\]

In order to demonftrate thi: propofition in fuch a manner as to furnift the means of inveltigating the whole mechanilim and action of moving fluids, it is neceffary to premife an elementary theorem of curvilineal motions.

If a particle of matter defcribes a curve line \(A B C E\)
Plate (fig. 13.) by the continual action of deflecting forces, which vary in any manner, both with refpect to intenfity and direction, and if the action of thefe forees, in every point of the eurve, be refolved into two diretions, perpendicular and parallel to the initial direction AK; then,
1. The accumulated effect of the deflecting forces, ellimated in a direction AD perpendicular to \(A K\), is to the final quantity of motion as the fine of the final 53 change of direction is to radius.

\section*{His propo} fition desonftrate

Let us firf fuppofe that the accelerating forces act by flarts, at equal intervals of time, when the body is in the points \(A, B, C, E\). And let \(A N\) be the de Hecting force, which, acting at \(A\), changes the original direction \(A K\) to \(A B\). Produce \(A B\) till \(B H=\) \(A B\), and conaplete the parallelugram BFCH . Then \(F B\) is the force which, by acting at \(B\), changed the motion BH (the continuation of AB ) to BC . In like manner make \(C b\) (in \(B C\) produced) equal to \(B C\), and complete the parallclogram CfEb. Cf is the deflecting force at C, \&ic. Draw BO parallel to \(A N\), and GBE perpendicular to AK. Alfo draw lines through C and E perpendicular to \(A K\), and draw through B , and C lines parallel to AK. Draw alfo HL, bi perpendicular, and FG, HF, bi, parallel to AK.

It is plain that \(B K\) is \(B O\) or AN eftimated in the direction perpendicular so \(A K\), and that \(B G\) is \(B F\) eltimated in the fame way. And lince \(\mathrm{BH}=\mathrm{AB}, \mathrm{HL}\) or 1 M is equal to BK . Alfo CI is equal to BG. 'Therefore \(C M\) is equal to \(A P+B G\). \(B=\) fimilar reaforing it appears that \(\mathrm{E} m=\mathrm{E} i+M=\mathrm{C}(\mathbb{C}+\mathrm{CM},=\) \(\mathrm{C} g+\mathrm{BG},+A P\).

Therefore if CE be taken for the meafure of the final velocity or quantity of motion, Em will be the acenmulated effect of the deflecting forces eftimated in the direction AD perpendicular to \(A 5\). But \(E m\) is
to CE as the fine of \(m \mathrm{CE}\) is to ralius; and the angle Reffarce \(n \mathrm{CE}\) is the angle contained between the initial and final directions, becaufe \(\mathrm{C} m\) is parallel to AK. Now let the intervals of time diminifh continually and the frequency of the impulfes increafe. The defection becones ultinately continuous, and the motion curvilineal, and the propofition is demonftrated.

We fee that the initial velocity and its fuhfequent changes do not affict the conclufion, which depends entirely on the fual quantity of motion.
2. "The accumulated eflect of the accelerating forces, when eftimated in the direction AK of the original motion, or in the oppolite direction, is equal to the difference between the initial quantity of motion and the product of the final quaatity of motion by the cofinc of the change of dirction.
\[
\begin{aligned}
\text { For } \mathrm{C} m & =\mathrm{C} l-m l, \\
\mathrm{BM} & =\mathrm{BL}-\mathrm{ML},=\mathrm{AK} q \\
\mathrm{AK} & =\mathrm{AO}-\mathrm{OK},
\end{aligned}=\mathrm{AO}-\mathrm{PN} .
\]

Therefore \(\mathrm{PN}+\mathrm{FG}+f \mathrm{Q}\) (the accumulated impulfe in the direction \(O A)=A O-C M,=A O-C \overline{C O}\) fine of ECM.

Cor. 1. The fame action, in the direction oppolite to that of the original motion, is neceffary for cauling a body to move at right angles to its former direction as for ltopping its motion. For in this cafe, the coGine of the change of direction is \(=0\), and \(A \mathrm{O}-\mathrm{CE}\) \(\times\) cofine \(E C M=A O-0,=A O\), \(=\) the original motion.

Cor. 2. If the initial and final velocities are the fame, the accumulated action of the accelerating forces, eftimated in the direction OA, is equal to the product of the original quantity of motion by the verfed fine of the change of direction.

The application of thefe theorems, particularly the fecond, to our prefent purpole is very ohvious. All the filaments of the jet were originally moving in the direction of its axis, and they are finally moving along the refiting plane, or perpendicular to their former motion. Therfore their tranfverfe forces in the direction of the axis are (in cumulo) equal to the force which would flop the motion. For the aggregate of the fimultaneous forces of every particle in the whole filament is the fame with that of the fucceffive forces of one particle, as it arrises at different points of its curvineal path. All the tranfverfe forecs, eftimated in a direction perpendicular to the axis of the vein, precifely batance and futtain each other; and the only forces which can produce a femible effect are thole in a direction parallel to the axis. By the ee all the inner filanents are prefred towards the plane MN, and mutt be withtood by it. It is highly probahle, nay certain, that there is a quantity of ftegnant water in the middle of the vein which fuflains the preflures of the moving filaments without it, and tranfinits it to the folid plane. But this does not alter the cafe. And, fortmately, it is of no confequence what changes happon in the velocitics of the particles while each is deferibing its own curve. And it is from this circumftance, peculiar to this particular cafe of perpendicular impulfe, that we are able to draw the con* clufion. It is by no means difficult to demonftrate that the velocity of the external furface of this jet is conftant, and indeed of every jet which is not acted on by external forces after it has quitted the orifice: but thin difcuffion is quite unneceffary here. It is however extremely difficult to afcertain, even in this mold funple

\section*{\(R \mathrm{ES}\) [ II \(] \quad \mathrm{R} E \mathrm{~S}\)}
sitance. cafe, what is the velocity of the internal filaments in the different points of their progrefs.
Such is the demonfration which Mr Bernouilli has given of this propofition. Limited as it is, it is highly valuable, becaufe derived from the true principles of hydraulics.

He hoped to render it more extenfive and applicable to ublique impulfes, when the axis AC of the vein (fig. 13. \(\mathrm{n}^{\circ}\) 2.) is inclined to the plane in an angle ACN. But here all the fimplicity of the cafe is gone, and we are now obliged to afcertain the motion of each
mine what mult happen in the plane of the figure, that is, is a plane paffirg through the axis of the vein, and perpendicular to the plane MN. But even in this cafe it would be exremely difficult to cetermine how
much of the fluid will go in the direction EKG, and what will go in the path FL.H, and to afeertain the form of each flament, and the velocity in its different points. But in the real ftate of the cafe, the water will diffipate from the centre \(C\) on every fide; and we cannot tell in what proportions. Let us however confider a little what happens in the plane of the figure, and fuppofe that all the water gues either in the courfe EKG or in the courfe FLH. Let the quantities of water which take thefe two courfes have the proportiuns of \(p\) aud \(\pi\). Let \(\sqrt{2 a}\) be the velocity at \(A\), \(\sqrt{2 b}\) be the velocity at \(G\), and \(\sqrt{2 \bar{b}}\) be the velocity at H . ACG and ACH are the two changes of direction, of which let \(c\) and -c be the colines. Then, adopting the former reafoning, we have the preffure of the watery plate GKEACM on the plane in the di-
rection \(\mathrm{AC}=\frac{p}{p+\pi} \overline{X_{2}}-2 c t_{1}\), and the preffure of the
pl \({ }^{\text {ate }}\) HLFACN \(=\frac{\mathrm{n}}{f+\mathrm{n}} \times \overline{2 a+2 c \mathrm{~F}}\), and their fum \(=\frac{p \overline{\times_{2 \pi-2}}+\frac{2 \cdot}{p+11} \overline{x_{2 a}+2 c^{\beta}}}{p}\); which being multiplied by the fine of ACM or \(\sqrt{1-\tau^{2}}\), gives the preffure perpendicular to the plane \(\mathrm{MN}=\frac{p \times 2 a-2 c b+\pi \times 2 a}{p+\pi}\) \(\overline{+2 c \beta} \sqrt{1-c^{2}}\).

But there remains a preflure in the direction perpendicular to the axis of the veia, which is not balanced, as in the former cafe, by the equality on oppofite fides of the axis. The preffure arifing from the water which efcapes at \(G\) bas an effect oppofite to that produced by the water which efcapes at H When this is taken into account, we thall fiud that their joint efEorts perpendicular to \(A C\) are \(\frac{p-1}{p+1} \times 2 a \sqrt{I-c^{2}}\), which, being multiplied by the cofine of ACM , gives the action perpendicular to \(\mathrm{MN}=\frac{p-\mathrm{H}}{p+\mathrm{II}} \times 2 a c \sqrt{1-c^{2}}\).

The fum or joint effort of all thefe preflures is \(\frac{p \times 2 i-\frac{2 c b}{}+\pi \times 2 a+2 c, j}{p+\Pi} \sqrt{1-c^{2}}+\frac{1-\Pi}{p+\pi} \times 2 a c \sqrt{1-c^{2}}\).

Thus, from this cafe, which is mueh fimpler than can happen in nature, feeing that there will always be a lateral eflux, the determination of the impulfe is as uncertain and rague as it was fure and precife in the former cafe.

It is therefore without proper authority that the Reiliznec abfolute impulfe of a vein of fluid on a plane which re. ceives it wholly, is afferted to be propertional to the fine of incidence. If indeed we fuppofe the velocity in G and H are equal to that at A , then \(b=3,=a\), and the whole impulie is \(2.2 \sqrt{1-t^{2}}\), as is commonly fuppofed. But this cannot be. Woth the velocity and quantity at H are lefos than thofe at G . Nay, frequently there is no efflux on the fide H when the obliquity is very great. We may conelude in general, that the oblique impulfe will always bear to the diret impule a greater proportion than that of the fine of incidence to radius. It the whole water efcapes at G, and none goes off laterally, the prefure will be \(\overline{2 a+2 a c-2 b c \times}\) \(\sqrt{1-c^{2}}\). The experiments of the Abbe Boffut fhow in the plaineft manner that the preffure of a vein, Atriking obliquely on a plane which receives it wholly, diminifies fafter than in the ratio of the fquare of the fine of incidence; whereas, when the oblique plane is wholly immerfed in the ftrearn, the impulfe is much greater than in this proportion, and in great obliqurties is nearly as the fiae.

Nor will this propofition determine the impulfe of a fuid on a plane wholly immerfed in it, even when the impulfe is perpendicular to the plane. The circumftance is now wanting on which we can eltablifh a calculation, namely, the angle of final deflection. Could this be afcertained for each filament, and the velocity of the filament, the principles are completely adequate to an accurate folution of the problem. In the experiments which we mentioned to have been made under the infpection of Sir Charles Linowles, a cylinder of fix inches diameter was expofed to the astion of a ftream moving precifely one foot per fecord; and when certain deductions were made for the water which was held adhering to the pofterior baie (as will be noticed afterwards), the impuife was found equal to \(3 \frac{1}{8}\) ounces avoirdupois. There were 3 6coloured fitaments diftributed on the fltearn, in fich fituations as to give the moft uferul indieations of their curvature. It was found neceffary to have fome which paffed under the body and fome above it ; for the form of thefe filaments, at the fame diftance from the axis of the eylinder, was confiderably difrerent : and thofe filanents which were fituated in planes neither horizontal nor vertical took a double curvature. In fhore, the curves were all traced with great care, and the deflecting forees were computed for each, and reduced to the direction of the axis; and tiey were fummed up in fuch a manner as to give the impulfe of the whole itream. The dettections were marked as far a-head of the cylinder as they could be affuredly nb. ferved. By this method the impuife was computed to be \(2 \frac{15}{15}\) ounces, differing fonm obervation \(\frac{3}{36}\) of an ounce, or about \(\frac{1}{T}\) of the whole; a difference which may mof reafonably be aferibed to the adhetion of the water, which mula be noft feufible in fuch fmall velo cities. Thefe experiments may therefore be confidered as giving all the confirmation that can be defired of the juftnefs of the principles. This indeed hardly adnits of a coubt : but, alas! it gives us but fmall affilance ; for all this is empirical, in as far as it leaves us in every cafe the tadk of obferving the form of the eurves and the velocities in their differeut points. To derive lero vice from this moft judicious method of Daniel Bernoulli, we mula difcorer fome method of deternining, ì priari,

\section*{R K S [112] K J S}

Sefinance, a proori, what will be the motion of the nuid whofe courfe is obflrutied by a body of any form. And here we cannot omit taking notice of the cafual ubfervation of Sir 1faac Newton when attempting to dotermine the refiflance of the plane furface or cylinder; or fphere expofed to a ftream moving in a canal. He fays that the form of the refitting furface is of lefs confequence, becaufe there is always a quantity of water ilagnant upon it, and which may therefore be confiderid as frozen; and he therefore conliders that water only whofe motion is neceflary for the noft expeditivus difcharge of the water in the reflel. He cudeawours to difcrinninate that water from the reft ; and :Ithough it mult be acknowledged that the principle which he aflumes for this purporfe is very gratuitolts, becaufe it only fhows that if cet tain portions of the suater, which he determines very ingenioufly, were veally frozen, the reft will iffuc as he fays, and will exert the peefure which he afi mos; ftill we mult admire his fertility of refource, and his fagacity in thus forefeeng what fubfequent ohfervation has completely contirmed. We are even difpofed to think, that in this cafual obfervation Sir Ifaac Newton has pointed out the only method of arriving at a folution of the problem; and that if we could difcover what motions are not nectifiry fir the moflexperitious pafage of the water. and could thus determine the form and magnitude of the ftagnant water which adheres to the body, we fhould much nore eafil) afcertain the real motions which occalion the obferved refiftance. We are here difpofed to have recourfe to the economy of nature, the improper ufe of which we have fometimes taken the liberty of reprehending. Mr Maupertuis publithed as a great difovery his principle of fmalleft attion, where he thowed that i, all the mutual actions of bodies the quantity of action was a minimum; and he applied this to the folution of many difficult problems with great fuccefs, imazining that he was really reafoning from a contingent law of nature, felected by its infinitel) wife Author, iz. that in all oceafions there is the fmallef poffible exertion a.f natural powers. Mr D'Alembert has, however, fhown (vid. Encyclopelic Frangoife, Action) that this was tut a whim, and that the ninimum obferved by Maupertuis is mercly a minimum of calculus, peculiar to a iormula which happens to exprefs a cumbination of maShematical quantities which frequently occurs in our way of confidering the phenomena of nature, but which is no natural meafure of action.
But the chevalier D'Arcy has fhown, that in the trains of natural operations which terminate in the production of motion in a particular direction, the intermediate communications of motion are fuch that the fmallett pofible quantity of motion is produced. We feem obliged to conclude, that this law will be obferved in the prefent inflance; and it feems a problem nut above our reach to determine the motions which refult fiom it. We would recominend the problem to the eminent mathematicians in fome fimple cafe, fuch as the propolition already demonftrated by Daniel Bernoulli, or the perpendicular impuife on a cylinder included in a tubular canal ; and if they fucceed in this, great things may be expected. We think that experience gives great encontagement. We fee that the refiftance to a plane furface is a very fnall matter greater than the weight of a colum of the fuid having the fail producive of
the velucity for its height, and the fmall exeefs io mof Refinance prolably owing to adhefion, and the ineafure of the real refillance is probably precifly this weight. The velocity of a fpouting fluid was found, in fact, to be that acquired by falling from the furface of the fluid: and it was by looking at this, as at a pole ftar, that Newton, Bernoulli, and others, have with great fagacity and ingenuity difcovered much of the laws of hydraulics, by fearching for principles which would give this refult. We may hope for linilar fuccefs.

In the mean time, we may receive this as a plyficai trith, that the perpendicular impulfe or refflance of a plane furface, wholly immerfed in the fluid, is equal to the weight of the column having the furface for its bafe, and the fall producing the velocity for its height.

This is the medium refult of all experiments made in thefe precife circumftances. And it is confirmed by a fet of experiments of a kind whenly difierent, and which fecm to point it out more certainly as an immediate confequence of hydraulic principles.

If Mr litot's tube be expofed to a flream of fluid Experimpt ifluing from a refervoir or vefiel, as reprefented in by Mr Pi fig. 14. with the open mouth 1 pointed directly againft tot's phe. the ftream, the fluid is obferved to fland at K in the ccccaxive uprighe tube, precifely on a level with the fluid \(A B\) in the refervoir. Here is a moft unexccptionable experiment, in which the impulfe of the threan is actually oppofed to the hydrofatical preffure of the fluid on the tube. Preflure is in this cafe oppofed to preflure, becaufe the iffuing fluid is deflected by what flays in the mouth of the tube, in the fame way in which it would be deflccted by a firm furface. We thall have occafion by and by to mention fome moft valuable and inftructive experiments made with this tube.

It was this which fuggefted to the great mathema- fulee's tician Euler another theory of the impulfe and refilt-theory. ance of fluids, which mult not be omitted, as it is applied in his elaborate performance On the Theory of the Conltruction and Working of Ships, in two volumes ftu, which was afterwards abridged and ufed as a text-bouk in forne marine academics. He fuppofes a flream of fuid ALCD (fig. 15.), moving with any velocity, to ftrike the plane BD purpendicularly, and that part of it goes through a loole EF, forming a jet EGHF. Nir Euler fays, that the velocity of this jet will be the fame with the velucity of the flrcam. Now compare this with an equal Aream iffuing from a hole in the fide of a veffel with the fame velocity. The une fircam is urged out by the preffure occalioned by the impulfe of the fluid; the other is urged ont by the preffure of gravity. The effects are equal, and the modifying circumfances are the fame. The caufes are therefore equal, and the preflure occafioned by the impuffe of a flream of fluid, moving with any velocity, is equal to the weight of a column of tluid whofe height is productive of this velocity, \(\varepsilon \in c\). He then determines the oblique impulfe by the refolution of motion, and duduces the common rules of relititance, \&e.

But all this is without juft grounds. This gentleman was always fatisfied with the flightelt analogies which would give him an opportunity of exlibiting his great dexterity in algebraic analy fis, and was not afterwards ftartled by any difcordancy with obervationo -Inalifi mayis fulerdum is a frequent affertion with him,

Thourh

\section*{IR E S}
ance. Though he wrote a large volume, containing a theory of light and colours totally oppofite to Newton's, he has publifhed many differtations on optical phenomena on the Newtonian principles, exprefsly becaute his own principles non iteo facile anjam trebebat analyjz inftrucrude.
Not a fhator of argument is given for the leadiag 23. principle in this theory, \(\because \approx\) that the velocity of the jer is the fame with the velucity of the il rean. None can be given, but faying that the preffure is equivalent to its production; and this is aftuming the very thing he lahours to prove. The matter of fact is, that the velocity of the jet is greater than that of the ftream, and may be greater almolt in any proportion. Which curions circumpance was difcorered and ingeniouny explained long ago by Daniel Bernoulli in his Hydrodynamira. It is evident that the velocity mult be greater. Were a ftra:n of fand to come agrainlt the plane, what goes through would indeed preferve its velocity unchanged: but when a real fluid ftrikes the plane, all that does not pafs throurh is defiected on all fides; and by thefe deflections forees are excited, by which the filaments which furround the cylinder immediately fronting the hole are made to prefs this cylinder on ail fides, and as it were fcueeze it between them: and thas the particles at the hole molt of neceffity be accelerated, and the velocity of the jet mult be greater than that of the fream. We are difpofed to think: that, in a fluid perfectly incompreffible, the velocity will be doubled, or at leaft increafed in the proportion of 1 to \(\sqrt{2}\). If the fluid is in the fmalieft cegree comprefible, even in the very fmall degree that water is, the velocity at the firlt impulfe may be much greater. D. Eernoulii found that a column of water moving 5 feet per fecond, in a tube fome hundred feet long, produced a velocity of \(13^{5}\) feet per fecond in the firt moment.

There being this racical defect in the theory of Mr Euler, it is needlefs to take notice of its total infufficiency for explaining oblique impulfes and the refiftance of curvilineal prows.

We are extremely forry that our reacers are deriving of fo little adrantage from all that we have faid ; and that having taken them by the hand, we are thus obliged to grope about, with only a few fcatered rays of light to direct our iteps. Let us fee what affiftance we can get from MIr d'Alembert, who has attempted a folution of this problem int a method entirely new and extremely ingenious. He faw clearly that all the followers of Newton had forfaken the path which he had marked out for them in the fecond part of his invelligation, and had merely amufed themfelves with the mathenatical difeufions with which his introductory hypothefis gave them an opportunity of occupping themfelres. He paid the deferved tribute of applaufe to Daniel Bernoulli for having introduced the notion of pure preflure as the chief agent in this bufinefs; and he faw that he was in the right road, and that it was from hydroftatical principles alone that we had any chance of explaining the phenomena of hydraulics. Dernoulii had orily confidered, the preffuts which were excited in confe. quence of the curvilineal motions of the particles. \begin{tabular}{l} 
Ir \\
\hline
\end{tabular} d'Alembert even thorght that thefe peffurcs were not the comequerces, but the eaufes, of thefe curvilineal motions. No internal motion can happen in a fuid Gut in confequence of an unbalanced proflure; and every Vol. XII. Part I.
fuch motion will produce an inecualty of prefure, Refinance, which will determine the fucceeding inotiuns. Fie there-, \(\longrightarrow\) fore endeavoured to reduce all to the difeovery of thofe ditubing preffures, and thus to the laws of hyciro?atice. He lad long before this hit on a very refined and ingrenions view of the aftom of bociles on cach viher, which had enabled kim to folve many of the mott difficult problerns concening the motions of bodies, fuch as the ceatre of ofcillation, of fpontancous converfion, the preceffion of the equinoxes, \&ic. \&ic. with great facility and elegance. He faw that the fane principle would apply to the action of fluid bodies. The principle is this.
\(\because\) Ir whateuser manner any number of hodies are fûtpred to at on euclo other, ard by thefe afisns come to changre their prefent mations, if ave conceive that the anotion whbich eactl locily zoould bare in the folloroungy inglant (if it became free;, is refolved into twen other mistiuns; one of w'tith is the mution whbich it ratlly tikes in the following ingfant; the otber wuill be fuch, that is earbbody bad no other mirtion tut this fecond, the rethet bolies sum'd bases ranain of in equilibrio." We here rbferve, that "the motion which each body would have in the fullowing in:lane, if it became free," is a continuation of the inotios, which it has in the firt inftent. It may thetefore per. haps be better exprefed thus:

If the we ctions of lodies, arybore nilin; on ea b oticr, l., conflutered in two confecuive in!lants, and if we contive the mation which it has in the fry? ing tant as compoundelt ef two othars, oue of whilb is the motion whititit aitur wh takes in the fecond infant, the other is fucth, tist if caib borly bud on'y thofe fecon! moitins, the atbole fyliem woun'l buve ranained in equild rio.

The propofition itfelf is evident. For it thefe f:cond motions be not fuch as that an equiiibrium of the whole fyflem would refuit from them, tiew othicr component motions would not be thofe which the beriis really have after the change; for they would necelfari1 y be altered by thefe mbalanced motions. See D'A. lembert IEf i de Dyamiqua.

Aftited by this inconte:table principle, Mr d'Alentbert demonftrates, in a maner equally now and fimplthoie propufitions which Newton had io cautiouly d \(\because\) duced from his lupothetical fuid, fhowing that they were not linited to this hypothefis, wiz. that the motions produced by limilar bodies, fimilarly projectal 1 a them, would be fimilar ; that whatever were the preffures, the curves defcribud by the particles would be the fame; and that the refifances would be proportional to the fquares of the velocities. He then comes to confider the fluid as having its motions conffrained by the form of the canal or by folid obftacles interpofed.
We thall here give a fummary account of his funda. Summary mental propofition.

It is evidunt, that if the body ADCE (fig. I6.) did misfonth not form an obfruction to the motion of the water, the m. I 131 ; ros particles would deferibe paralled lines TF,OK, PS, \&ec. tatc But while yet at a difence from the body in \(\mathrm{F}, \mathrm{K}, \mathrm{S}\), cecoxnve. they sradually charge the ir dire ctions, and deferibe the curses \(\mathrm{FM}, \mathrm{K} m, S n\), fo much more incurvated as they are nearer to the bode. At a certain ditance ZY this carvature will be infenfible, and the haid inchaded in the fpace ZYHO ) will move uniformly as if the folid body were not there. The motions on the other fide of the axis \(A C\) will be the fame; and we need only

P
attend

\section*{\(R \quad E \quad S \quad\left[\begin{array}{lll}14\end{array}\right] \quad R \quad E \quad S\)}

Refifaner. attend to one half, and we tall confider thefe as in a ftate of permanency.

No botly changes either its direction or velocity otherwife than by infenfible degrees: thetcfore the particle which is moving in the axis will not reach the vertex A of the horly, where it behoved to defiect intantaneoully at right ancles It will therefore begin to be denected at fome point \(F\) a-head of the body, and will deferibe a curve FM, touching the axis in \(F\), and the body in M; and then, gliding along the body, will ruit it at lome point \(L\), deferibing a tangent curve, which will join the axis again (touching it) in \(R\); and thus there will be a quantity of ftagnant water FAM hefore or a head of the body, and another LCR behind or aftern of it.
l.et \(a\) be the velocity of a particle of the fluid in any intant, and a' its velocity in the next intant. The velucity a may le conffered as compounded of \(a^{\prime}\) and \(a^{\prime \prime}\). If the particles tended to move with the velocities \(a^{\prime \prime}\) only, the whole fluid would be in equilibrio (general principle), and the preffure of the fluid would be the fame as if all were ftagnant, and each particle were urged by a force \(\frac{a^{\prime \prime}}{t}\), expreffing an indefinitely finall noment of time. (N.B. \(\frac{a^{\prime \prime}}{t}\) is the proper caprefion of the accelcrating force, which, by afting during the moment \(r\), would generate the velocity \(a^{\prime \prime}\); and \(a^{\prime \prime}\) is fuppofed an indeterminate quantity, different perhaps for each particle). Now let \(a\) be luppofed conftant, or \(a=a^{\prime}\). In this cafe \(a^{\prime \prime}=0\). That is to fay, no preffure whatever will be exerted on the folid ondy unlefs -here happen clanges in the velocities or dircetions of the particles.

Let \(a\) and \(a^{\prime}\) then be the motions of the particles in two confecutive inftants. They would be in equilibrio if urged only by the forces \(\frac{a^{\prime \prime}}{t^{\circ}}\). Therefore if \(\gamma\) be the point where the particles which deferibe the curve FM begin to change their relocity, the preflure in D would be equal to the preffure which the fluid contained in the canal \% FMD would exert, if each particle were folicited by its force \(\frac{a}{t}\). 'The quetion is therefore reduced to the finding the curvature in the canal \(\gamma\) FMD, and the acselerating forees \(\frac{a^{\prime \prime}}{t^{\circ}}\) in its different parts.

It appears, in the fint place, that no preffure is exerted by any of the particles along the curve FM: for fuppofe that the particle /s (fig. 17.) deferibes the indefinitely fmall ftraight line \(a b\) in the firl inftant, and \(d c\) in the fecond inftant; produce \(a b\) till \(b d=a b\), and joining \(d r\), the motion \(a b\) or \(b d\) may be confidered as compofed of \(b c\), which the particle really takes in the next inftant, and a motion. \(d 6\) which mould be deftroy\(c d\). Draw \(b i\) parallel to \(d c\), and \(i e\) perpendicular to \(b c\). It is plain that the particle \(b\), folicited by the forces \(b e, i\) (equivalent to \(d r\) ) mould be in equilibrio. This being ctablithed, \(b\) e mult be \(=0\), that is, there will be no accelerating or retarding force at \(b\); for if there be, draw \(b\) in (fig. 18.) perpendicular to \(b \mathrm{~F}\), and the parallel \(n q\) infinitely near it. The part \(b n\) of the fluid contained in the canal \(b n q\) in would fuftain fome pref.
fure from b towards \(n\), or from \(n\) towards \%. Therefore Eefince fince the fluid in this flarnant canal thould be in equili- brio, there mult alfo be fome action, at lealt in one of the parts \(b m, m q, q n\), to counterbalance the action on the part \(b \%\). But the fluid is Atugnant in the fpace FAM (in confequence of the law of continuity). Iherefore there is no force which can act on \(b m, m q\), \(q n\); and the preflure in the canal in the direction \(b n\) or \(n b\) is nothing, or the force \(b e=0\), and the force \(i c\) is perpendicular to the canal ; and there is therefore no preflure in the canal FM, except what procects from the part \(\gamma F\), or from the force \(e i\); which lan being perpendicular to the canal, there can be no force exerted on the point M, but what is propagated from the part \(\gamma\) T.
'The velocity therefore in the canal FM is conftant if finite, or infinitely fmall if variable: for, in the fritt cale, the foree \(b e\) wonld be abfolutely nothing ; and in the fecond eafe, it would be an infinitefimal of the fecordl order, and may be confidered as nothing in con. parifon with the velocity, which is of the firft order. We thall fee by and by that the lat is the real tate of the eafe. Therefore the fuid, hefore it begins to change its direction in F, begins to change its velo. city in fome point \(\gamma\) a-head of \(F\), and by the tine that it reaches \(F\) its velucity is as it were annihilated.

Cor. 1. Therefore the prellure ia any puint \(D\) arifes both from the retardations in the part \(\gamma \mathrm{F}\), and from the particles which are in the canal MD: as thefe lat move along the furface of the body, the force \(\frac{a^{\prime \prime}}{t^{\prime \prime}}\), deftrojed in cwery particle, is compounded of two others, one in the direction of the furface, and the other perpendicular to it; call thefe \(p\) and \(p\) '. 'The point \(D\) is preffed perpendicularly to the furface MD ; ift, by all the forces \(p\) in the curve MD; 2d, by the force \(p^{\prime}\) acting on the fingle point \(D\). This may be neglected is comparifon of the indefinte number of the others: therefore taking in the arch MD, an infinitely fmail portion \(\mathrm{N} m,=s\), the preffure on D , perpendicular to the furface of the body, will be \(=f \dot{p}\); and this 9 lle ent mult be fo taken as to be \(=0\) in the point M .

Cor. 2. Therefore, to find the preffure on D , we muft find the force \(p\) on any point \(N\). Let \(u\) be the velocity of the particle N , in the direction Nm in any inftant, and \(u+u\) its velocity in the following inftant; we mult have \(p=-u\). Therefore the whole queftion. is reduced to finding the velocity \(u\) in every point \(N\), in the direction N.

And this is the aim of a feries of propofitions whicher ind follow, in which the author difplays the moft accurateguin and precife conception of the fubject, and great addrefg'r and clegance in his mathematical analyfis. He at length \(\mathrm{bl}_{\mathrm{b}}^{\mathrm{c}}\); bat brings out an equation which expreffes the preffure on the body in the mot general and unexceptionable man. ner. We cannot rive an abftract, becaufe the train of reafoning is already concife in the extreme: nor can we even exhibit the fimal equation; for it is conceived in the moft refined and abltrufe form of indeterminate functions, in order to embrace every poflible circum. ftance. But we can affure our readers, that it truly ex. prelles the folution of the problem. But, alas! it is of

\section*{\(R\) E S \\ [115] \\ R E S}
:asce. no ule. So imperfect is our mathematical knosrledge, plify the application of the equation to the fimpleft cale which can be propofed, fuch as the direct impulfe on a plane furface wholly immerfed in the thuid. All that he is enabled to do, is to apply it (by fome nodifica. tions and fubfitutions which take it ont of its ftate of extreme generality) to the direct impulfe of a vein of Ruid on a plane which deficts it wholly, and thus to fhow its conformity to the folution given by Daniel Berroull:, and to obfervation and experience. He forws, that this impulfe (independent of the deficiency arifing from the plane's not being of infinite extent) is fomewhat lefs then the wright of a column whofe bafe is the fection of the vein, and whofe height is twice the fall neceffary for communicating the velocity. This great philofopher and geometer concludes by faying, that he does not believe that any method can be found for folving this problem that is more diect and fimple; and imagines, that if the deductions from thall be found not to agree with experiment, we mult give up all kopes of determining the reliftance of fluids by theory and analytical calculus. He fays anaititicul calculus; for all the phyfical principles on which the calculus proceeds are rigoroufly demonfrated, and will not admit of a doubt. There is only one bypothefis introduced in his inveltigation, and this is not a phyfical hypothefis, but a hypothefis of calculation. It is, that the quantities whicla determine the ratios of the fecond fluzions of the velocities, eftimated in the directions parallel and perpendiculare to the axis \(A C(f i x .16\).\() are\) functions of the abfciffa AP, and ordiuate PMI of the curve. Any perfon, in the leaft acquainted with mathematical analyfis, will fee, that without this fuppofition no analyfis or calculus whatever can be inftituted. But let us fee what is the phyfocal meaning of this hypothefis. It is fimply tbis, that the motion of the particle \(M\) depends on its fituation only. It appears impoffible to form any other opinion; and if we could forn fuch an opinion, it is as clear as day-light that the cafe is defperate, and that we mult renounce all lopes.

We are forry to bring our labours to this conclufion; but we are of opinion, that the only thing that remains is, for mathematicians to attach themfelves with firmnefs and vigour to fome fimple cafes; and, without aiming at ger.crality, to apply Mr d'Alenbert's or Bernoulli's mode of procedure to the particular circumfances of the cafe. It is not improbable but that, in the folutions which may be obtained of thefe particular cafes, circumftances may occur which are of a more general nature. Thefe will be fo many laws of hydraulics to be added to our prefent very fcanty flock; and thefe may have points of refemblance, which will give birth to laws of ftill greater generality. And we repeat our expreffion of hopes of fome fuccefs, hy endeavouring to determine, in fome fimple cafes, the minimum. pofibile of motion. The attempts of the Jefuit comnientators on the Principia to afertain this on the Newtonian hypothelis do them honour, and have really given us great affitance in the particular caje which came through their hands.

And we flould multiply cxperiments on the refift ance of bodies. Thofe of the French academy are un- coubsedly of ineftimable value, and wild aways be ap-
pealed to. But there are circumfances in thole experf. Refifance. ments which render them more complicated than is proper for a general theory, and which therefore limit the conclufions which we winh to draw from them. The bodies were floating on the furface. This greatly modifies the deffections of the filaments of water, caufing fome to deflect laterally, which would otherwife have remained in one vertical plane; and this circumplance alfo neceflarity produced what the academicians called the remou, or accumulation on the anterior part of the body, and depreflion behind it. This produced an additional refiftance, which was meafured with great diffio culty and uncertainty. The effect of adhefion mu! allo have been very confiderable, and very different in the different cafes; and it is of dificult calculaio. It cannot perhaps be totally removed in any expcriment, and it is neceflary to confider it as making part of the refiftance in the moft important practical cafes, viz. the motion of Rhips. Here we fee that its effect is very great. Every feaman knows that the fpecd, even of a coppcr-fheathed fhip, is greatly increafed by greafing her bottom. The difference is too remarkable to admit of a doubt : nor flould we be furprifed at this, when we attend to the diminution of the motion of water in long pipes. A fmooth pipe four and an half inches diameter, and 500 yards long, yields but one-ifith of the quantity which it ought to do independent of friction. But adhefion does a great deal which cannot be compared with frietion. We fee that water Aowigg thro' a hoke in a thin plate will be increafed in quantity fully one-third, by adding a little tube whofe length is about twice the ciameter of the hole. The adhefion therefore will greatly modify the action of the filaments both on the folid body and on each other, and svill change both the forms of the curves and the velocities in diferent points ; and this is a fort of objection to the only hypothefis introduced by d'Alembert. Yet it is only a fort of objection; for the effect of this adhefion, ton, muft undoubtedly depend on the lituation of the particle.

The form of thefe experiments of the academy is ill. The exfe: fuited to the exaniination of the refiftance of bodies Robins and wholly immerfed in the fluid. The form of expe- Boorda fufriment adopted by Robins for the refiltance of air, ceprible of and afterwards by the Chevalier Borda for water, is conficefree from thefe inconveniences, and is fufceptible of table accucqual accuracy. The great advantage of both is the \({ }^{\text {racy }} \cdot\) exact knowledge which they give us of the velocity of the motion; a circumftance cffentially neceffary, and but imperfectly known in the exneriments of Mariotte and others, who examined quieticent bodies expofed to the action of a ltrcam. It is extremely difficult to meafure the velocity of a threan. It is very different in its different parts. It is fiwiftelt of all in the middle fuperficial filanent, and diminifles as we recede from this towards the fides or buttom, and the rate of diminutiore is not precifely known. Could this be afcertained with the neceffary precifion, we fhould recommend the following form of experinent as the molt limple, eafy, economical, and accurate.

Plate
Let \(a, l, c, d\), (fig. 19.) be four hooks placed in a \({ }_{c}\) cecturx horizontal plane at the corners of a rectangular paral- Sinple erlelogram, the fides \(a c, b d\) being parallel to the direc- formenteas. tion of the Atream \(A B C D\), and the lides \(a b, c d\) being ring the perpendicular to it. Let the body \(G\) be faftened to velcrity of

Resinance araxis of of ailf-tempered neel-wire, fo that the fur-\(\xrightarrow{-r-20}\) frice on which the fluid is to act may be inciuned to the flream in the precile angle we delire. Let this avio have hooks at its cestrentics, which are hitched into the lonys of four equal threads, fufpended fie in the Linoks \(a, b, i, d\); and let H e be a tiflh thread, fupjendcel from the middle of the line joining the points of fuppertion \(a, b\). Let FIIk be a graduated arch, whofe centere is FI , and whofe plane is in the direction of the tercam. It is cvident that the impulie on the body \(G\) will be meafured (by a procefs well known to ceery mathematician) by the deviation of the thread He from the vertical line H1; and this will be dune without any intricacy of calculation, or any attention to the ceatres of gravity, of ofcillation, or of purcufion. Thefe muft hes accurately afeertained with refpect to that form in which the pendulum has atweys been employed for seafuring the impulfe or velocity of a ftram. Thete advantages arife from the circumftance, that the axis of remains always parallel to the horizum. We may be allowed to olferve, by the by, that this would have been a great improvement of the beautiful experiments of Mr Rubins and Dr Hutton on the velocities of cannon-fhot, and would have faved much intricate calculation, and been attended with many important advantages.
The great difficulty is, as we lave obferved, to meafure the velocity of the flrearn. Even this may be done in this way with fome precifion. Let two floating bodies be dragged along the furface, as in the experiments of the acacemy, at tome ditance from each cther laterally, fo that the water between them may not be fenfilly dillurbed. Let a lorizontal bar be attached to them, tranferre to the direction of their motion, at a preper height above the furface, and let a \{pherical pendulum be fufpenecd from this, or let it be fufpended from four puints, as here deferibed. Now let the deriation of this pendulum be noted in a variety of velocitics. This will give us the law of relation between the velecity and the deviation of the pendulum. Now, in making experiments on the reliftance of bodies, let the velucity of the flerenn, in the very filament in which the relifance is meafured, be determined by the deviation of tinis pendulum.

It were greatly to be wihed that fome more palpable argurene conid be found for the exiftence of a quantity of :tagraant fluid at the anterior and pollerior pants of the budy. 'The one already given, derived from the tonliduration that ro motion chan: ges either its velocity or direstion by fivite quantities in an inftant, is unexceptionable. Bue it gives us little infornation. The fmalle:t conceivatle extent of the curve FM in fig. it. will anfiver this cond tion, prowided only that it touchis the exis in tome point F ", and the body in fome point MI, fo as not to make a finite angle with either. But furely there are circumatances which rigoroufly determine the ext.nt of this flagnant fluid. And it appears with uut dout, that if there were no cohefion or frictinnt, this fpace will have a deternined ratio to the fize uf w.e b dy' (the figures of the bodits being fuppofed fimilar). Suppofe a plane furface AB, as in lig. 10. there cen be hio doube but that the figure \(\mathrm{A} a \mathrm{D}) 6 \mathrm{~B}\) will in every cafe be fimilar. But if we fuppofe an adhefion or tenacity which is couftant, this may make a change both in its cateat and its form: for its con-
dlancy of form depends on the diflurbing forces being \(R\) cinn. always as the fquares of the velceity ; and this ratio of the dilturbing forecs is prefervect, whike the ine tia of the fluid is the only ageat and patient in the procefs. But when we add to this the conltant (that is, invaniable) diflurbing force of temacity, a chauge of form and dimenfions muft happen. In like manner, the friction, or fomething analogous to fristion, which produces an effect proportional to the velocity, inuld alter this neecfiary ratio of the whole difturbing forees. We may concluck, that the effect of both thefe circumtances will be to diminiifh the guantity of this ftarnant fluid, by licking it away exterually; and to this we munt afuribe the fact, that the part FAM is never perfectly flagnant, lut is gencrally diturbed with a whirling motion. We may alfo coneluke, that this Magnant 11 nid will be more incurvated between \(F\) and \(M\) than it would have ben, independent of tenacity and friction; and that the arch LK will, on the contrary, be lef's incur-vated.-And, haftly, we may conclude, that there will be fomething oppofite to preflurc, or fomething which we may call siglraithon, exerted on the pollerior part of the body which moves in a tenacious fluid, or is expofed to the ftecan of fuch a fluid; for the ftagnant fluid LCR adheres to the lurtace LC; and the paffing fluid tends to draw it away both by its temacity and by its friction. 'This mult angment the apparent impulfe of the ftream on fuch a body; and it mult greatly augment the refintance, that is, the motion lon by this body in its progrets though the tenacons fluid: for the b dy mult drag atong with it this ltagnant fluid. and dragy it in opporition to the teaccity and friction of the furrounding flaid. 'The effect of this is mont renarkably feen in the refiltances to the motion of pendulums ; and the chevatier lyuat, in his examiation of Newton's experiments, elearly flows that this conltitutes the greateit part of the refiltance.
'I his moll inguivos writer has paid great attention to this part of the procels of nature, and hats laid the foundation of a theory of vetillance entircly dificent from all the preceding. We cannot abridge it ; and it is too imperfect in its prefent condition to be offered as a body of doctrine : bit we hope that the ingenion anthor will profecute the fubject.

We cannot conclude this differtation (which we ac- Accoune of knowledge to be very unfatisfactory and imperject) the Chever better, than by giving an account of fome experiments of the chevalier Buat, which feem of immenle confequence, and tend to give us very new views of the fubjest. Mr Buat obferved the motion of water iruing from a glafs cylinder through a marrow ring formed by a botom of fmaller diameter; that is, the cylinder was open at both ends, and there was placed at ito lower end a circle of fmaller diameter, by way of bottom. which left a ring all around. He threw fonse powdered fealing wax into the water, and obferved with great attention the motion of its fnall particles. He faw thofe which happened to be in the very axis of the cylinder defcend along the axis with a motion pretty uniform, till they came very near the bottom; from this they continued to cefeend very fiowly, till they were almoft in contact with the buttom; they then deviated from the centre, and appruached the orifice in itraight:
R E S
117 ]
k E S
fraight lines and with an siccelerated motion, and at lat darted into the orifice with great rapidity. He had obferved a thing fimilar to this in a horizontal canal, in which he had fet up a fmall board like a dam or bar, over when the water flowed. He had thrown a goofeberg itato the water, in order to meafure the velocity at the buttom, the goofeberry being a finall matter heavier than water. It dpproached the dam eniformly till about three inches from it. Here it alnuilt ifond Itill, but it continued to advance till almolt in contact. It then wofe from the bottom along the inf.de of the dam with an accelerated motion, and quick!y elcaped oser the top.

Hence he concluded, that the water which covers the anterior part of the body expofed to the Aream is not perfuetly flaguant, and that the filamerits recede from the axis in curves, which converge to the furface of the body as different hyperbolas converge to the fame aflymptote, and that they move with a velocity continually increafing till they efcape round the fides of the body.

He had citablifed (by a pretty reafonable theory, consumed by experiment) a propofition concerning the preffure which water in motion eserts on the fu:face along which it glides, viz. that the trefture is equal to thut which it would exert if at rell minus the wei, bt of the cohamn avhenfe hight awou? t produce the vela ity of the pajTrg fream. Confequentiy the preffure which the fteam exerts on the furface perpendicularly expoicd to it will depend on the relocity with which it glides along it, and will diminifh from the centre to the circumference. This, fays he, may be the reafon why the impalife on a plane wholly immerfed is but one half of that on a plane which deflects the whole ftram.

He contrived a very iagenious inftrment for examining this theory. A fquare brals plate ABGF (fig. 20.) was pierced with a great number of holes, and fixed in the front of a hallow box reprefented edgewife in fig. 2I. The back of this box was pierced with a loole ', in which was inferted the tube of glafs CDE, bent fquare at D. 'This inftrument was expoled to a ttream of water, which beat on the brals plate. The water having filled the box throurgh the holes, flood at an equal height in the glafs tube when the furoundin's water was Alaynart; but when it was in motion, it al. ways flood in the tube above the level of the fmooth water without, and thus indicated the preffure occafoned br the action of the flream.

Wrinen tlee inftrument was not wholly immeried, there was always a confiderable accumulation againt the front of the box, and a depreffion behind it. 'The water before it was by no means itagnant: indeed it fhould not be, as Mr Buat ooferves ; for it confifs of the water which was efcaping on all fides, and therefore upwards from the axis of the fream, which meets the plate perpendicularly in \(c\) confiderably under the furface. It efapas upwards; and if the body were fufficiently immorfed, it would efcape in this direction almont as eafly as Iaterally. but in the prefent circumflances, it heaps up, till the elevation occalions it to fall off fidewife as falt as it is renewed. When the inftrument was immerfed more than its femidiameter under the farface, the water fill rofe above the level, and there was a groat deprefion immediately behind this elevation. In confquence of this difficulty of cfaping upwards, the va-
ter flows ofil latemally; and if the horizontal dimenfions Refifares. of the furface is great, this lateral efflux becomes more -ad difficult, and requires a greater accunulation. From this it happens, that the refitance of broad Curfaces equally iminerfed is greater than in the proportion of the breadth. A plare of two feet wide and one foot deep, when it is not completely inmoerfed, will be mure reifted than a plane two fect deep and one foot wide; for there will be an accumulation againt both: and even if thefe were equal in height, the additional firrface wil be greateft in the wilett body; and the elevation will be greater, becaufe the lateral elcape is more difficalt.
'The circumftances elicely to be attended to are Circum ther
'The preffure on the centre was much greater than to cise arty to wards the boeder, and, in general, the height of the wa. ed to is tor in the tube DE was more thana \(\frac{4}{3}\) of the height ne. aing tris ceflary for producing the wlocity when only the cen inftumerts tral hole was opra. When varions holes were opened at different diftances from the centre, the height of the water in DH continnally diminithed as the hole was nearer the border. At a certain ditance finm the border the water at E was level with the furrounding water, fo that no preflure was exerted on that hole. Bit the moft unexpected and rem rkable circumfance was, that, in great velocities, the holes at the very border, and even to a finall ditance from it, not only Iultained no preffure, but even gave out water ; for the water in the tabe was lower than the furrounding water. Mr Buat calls this a non-preflbon. In a cafe in which the velocity of the theam was three feet, and the prefure o: the central hole caufed the water in the rertical tube to fland 33 lines or \(\frac{3}{3} \frac{3}{2}\) of an inch nbove the leval of the furrounding fmooth water, the action on a hole at the lower corner of the fquare caufed it to fand 12 lines lower than the furrounding water. Now the velocity of the ftrean in this experiment was \(3^{6}\) inclies per fecond. This requires \(21 \frac{1}{2}\) lines for its productive fall; wherens the preffure on thie central ho!e was 33. This approaches to the preffure on a furface which deffects it wholly: The internediate holes gave every variation of preflure, and the diminution was more rapid as the. holes were nearer the edire; but the law of diminution could not be obferved.
'This is quite a new and molt meropeted cireum- Not incons ftance in the action of fuids on folid budies, and ren-fiftent with durs the fưjea more intricate than ever ; yct it is by the p i..ctno means inconfiftent with the genuine prineiples of drofarics hydroitatics or hydraulics. In as far as Mr Buat's or hydrapropolition concerning the preffure of movine fluidslics. is truc, it is very reafonable to fay, that when the lateral velocity with which the fluid tends to efcape exceeds the velocity of porculion, the height neceffary for producing this velocity mut exceed that which would produce the other, and a non-prefion mult be obferved. And if we confider the loms of the lateral filaments near the udge of the body, we fee that the concavity of the curte is turned towards the bo. dy, and that the centrifugal forces tend to diminifle their preflure on the body. If the middle alone were Atruck with a confiderable velocity, the water might even rebound, as is frequentiy oblerved. This afmal reboundieg is lere prevented by the furrounding water, which is moving with the fame welocity: bu:

\section*{RES [ 118 ] R E S}

Refifance. the prefure may be almoft annihilated by the tendency ber

72
Gubllance rif Buat's theory.
to rebound of the inner filaments.
Part (and perhaps a confiderable part) of this apparent non-prefion is mudoubtedly produced by the tenacity of the water, which licks off with it the water lying in the hole. But, at any rate, this is an important fact, and gives great value to thefe experiinents. It gives a key to many curious phenomena in the refiltance of fluids; and the theory of Mr Buat deferwes a very ferious confideration. It is all contained in the two following propofitions.
1. "If, by any caufe wobatever, a column of fluid, zubether making part of an indegnite fluid, or contoined in folid conals, comes to move with a given velocity, the prefure qubich it exarted luterally befure its motion, either on the athjoining fluid or cn the fides of the canal, is diminifled by the weight of a column baving the beigbt neceflary for commu. nicaling the velocity of the mation.
2. "The preffire on the centre of a plane furface perpendicular to the flream, and wubolly immerfed in it, is \(\frac{3}{3}\) of the weight of a column baving the beight neetfury for communicating the velocity. For 33 is \(\frac{3}{2}\) of 2 I \(\frac{1}{2}\).'

He attempted to afcertain the medium preflure on the whole furface, by opening 625 hules difperfed all over it. With the fame velocity of current, he found the height in the tube to be 29 lines, or \(7 \frac{1}{2}\) more than the height neceflary for producing the velocity. But he juitly concluded this to be too great a meafure, becaufe the holes were \(\frac{1}{5}\) of an inch from the edge: had there beon holes at the very edge, they would have fuftained a non-preflion, which would hare diminifhed the height in the tube very confiderably. He expofed to the fane ftream a conical funnel, which raised the water to 34 lines. But this could not be confidered 26 a meafurc of the preflure on a plane folid furface; for the central water was undoubtedly foooped out, as it were, and the filaments much more deflected than they would have been by a plane furface. Perhaps fomething of this happened even in every fmall hole in the former experiments. And this fugse fts fome doubt as to the aceuracy of the meafurement of the preffure and of the velocity of a current by Mr Pitot's tubc. It furely renders fome corrections abfolutely neceffary. It is a fay, that when expofed to a vein of fluid coming through a fhort pallage, the water in the tube ftands on a level with that in the refervoir. Now we know that the velucity of this ftream does not exceed what would be produced by a fall equal to \(98^{2} 5\) of the head of waicr in the refervoir. Mr Buat made many valuable obfervations and improvements on this moft ufeful inftruvent, which will be taken noticic of in the articles \(\mathrm{R}_{1-}\) vers and Watek-lWorks.

Mr Buat, by a fcrupulous attention to all the circumitances, concludes, that the medium of preffure on the whole furface is equal to \(\frac{25,5}{21,5}\) of the wright of a co. lumn, having the furface for its bafe, and the productive fall for its height. But we think that there is an uncertainty in this conclufion; becaufe the height of the water in the veftical tube was undoubtedly augmented by an hydroftatical preflure arifing from the accumulation of water above the body which was exprofed to the flream.

Since the preflures are as the fquares of the veloci-
tics, or as the heights \(b\) which produce the velocities, Rafifta), we may exprefs this preffure by the finybol \(\frac{25,5}{21,5} \mathrm{~h}\), or \(1,186 h\), or \(m b\), the value of \(m\) being 1,186 . This exceeds confiderably the refult of the expcriments of the Firench academy. In thefe it does not appear that. \(m\) fenfibly exceeds unity. Note, that in thefe experiments the body was moved through flill water; here it is expofed to a Atream. Thefe are generally fuppofed to be equivalent, on the authority of the third law of motion, which makeserery action depend on the relative motions. We fhall by and by fee fome caufes of difference.

The writers on this fubject feem to think their tafk The \({ }^{74}\) a completed when they have confidered the attion of the che the . fluid on the anterior part of the body, or that part of dir part it which is before the broadeat fection, and have paid hip eqi little or no attention to the hinder part. Yet thofe wholy impo are moft interefed in the lubjcet, the namal architeets, rant wit feem convinced that it is of no lefs importance to at- that on tend to the form of the hinder part of a fhip. And the univerfal practice of all nations has been to make the hinder part inore acute than the fore-part. This has undoubtedly been deduced from experience; for is is in direct oppofition to any notions which a perfon would naturally form on this fulject. Mr Buat therefore thought it very neceffary to examine the action of the water on the hinder part of a body by the fane method. And, previous to this examination, in order to acquire fome fcientific notions of the fubject, he made the following very curious and intructive experiment.

T'wo little conical pipes Al3 (fig. 22.) were inferted into the upricht fide of a prifmatic vefel. They were coccess an inch long, and their dianneters at the inner and outer ends were tive and four lines. A was 57 lines under the furface, and B was 73. A glafs fyphon was made of the hape reprefented in the figure, and its internal diameter was \(1 \frac{1}{5}\) lines. It wais placed with its mouth in the axis, and even with the bale of the conical pipe. The pipes being flhut, the veffel was filled with water, and it was made to ftand on a level in the two legs of the fyphon, the upper part being full of air. When this fyphon was applied to the pipe A, and the water running freely, it rofe 32 lines in the fhort leg, and funk as much in the other. When it was applied to the pipe B, the water rofe 4 I lines in the one leg of the fyphon, and funk as much in the other.

He reafons in this mamner from the experimont. 'The Ard his ring comprehended between the end of the fyphon and reafoninn the fides of the conical tube being the narroweft part opon it, of the orifice, the water iflined with the velucity correfponding to the height of the water in the veffel above the orifice, diminifhed for the contraction. If therefore the cylinder of water immediately before the mouth of the fyphon iffued with the fame velocity, the tube would be enptied through a height equal to this head of water (charge). If, on the contrary, this cylinder of water, inmediately before the mouth of the fyphon, were 隹agnant, the water in it would exert its full preffure on the mouth of the fyphon, and the water in the fyphon would be level with the water in the veffel. Between thefe extremes we muft find the real ftate of the cafe, and we mult meafure the force of nen-preffure by the rife of the water in the fyphon.

Wr fee that in both experiments it bears an accurate

\section*{\(R E S\)}
efinmec. proportion to the depth under the furface. For 57: \(73=32: 41\) very nearly. He therefore enimates the non-preffure to be \(\frac{56}{302}\) of the height of the water above the orifice.

We are difpofed to think that the ingenious author accurate has not reafoned accurately from the experiment. In the frlt place, the force indicated by the experiment, whatever be its origin, is certainly double of what he fuppofes; for it mult be meafured by the fum of the rife of the water in one leg, and its depreffion in the other, the weight of the air in the bend of the fyphon being neglected. It is precifely analogous to the force acting on the water ofcillating in a fyphon, which is acknowledged to be the fum of the elewation and depreflion. The force indicated by the experiment therefore is \(\frac{11}{3} \frac{2}{3}\) of the height of the water above the orifice. The force exhibited in this experiment bears a fill greater proportion to the producrive height ; for it is certain that the water did not iftue with the velocity acquired by the fall from the furface, and probably did not exceed \(\frac{2}{3}\) of it . The effect of contraction mut have been confiderable and uncertain. The velocity hould have been meafured both by the amplitude of the jet and by the quantity of water difcharged. In the next place, we apprelend that much of the effect is produced by the tenacity of the water, which drags along with it the water which would have flowly iffued from the fyphon, had the other end not dipped into the water of the veffel. We know, that if the horizontal part of the fyphon had been continued far enough, and if no retardation were oceafioned by friction, the column of water in the upright leg would have accelerated like any heavy body; and when the laft of it had arrived at the bottom of that leg, the whole in the horizontal part would be moving with the velocity acquired by falling from the furface. The water of the reffel which iffues through the furrounding ring very quick1 I acquires a much greater relocity than what the water defcending in the fyphon would acquire in the fame time, and it drags this lait water along with it both by tenacity asd friction, and it drags it out till its action is oppofed b) the want of equilibrium prodiced in the fyphon, by the clevation in the one leg and the depreftion in the other. We inagine that little can be concluded from the experiment with refpect to the real non-preflure. Nay, if the fides of the fyphon be fuppofed infinitely thin, fo that there would be no curvature of the filaments of the furrounding water at the mouth of the fyphon, we do not rery diftinctly fee any fource of nonpreflure: For we are not altogether fatisfied with the proof which Mr Buat offers for this meafure of the prefture of a ftream of fluid gliding along a furface, and ebfiruded by frition or any ofler caufe. We imagine that the pafling water in the prefent experiment would be a littie retarded by accelerating continually the water defeending in the fyphon, and renewed a-top, fuppofing the upper end open; becaufe this water would not of itfelf acquire more than half this velocity. It however drags it out, till it not only refilts with a force equal to the weight of the whole vertical colmm, but even exceeds it by \(\frac{11}{\text { rox }}\). This it is able to do, becaufe the whole preflure by which the water iffues from an orifice has been fhown (by Daniel Bernoulli) to be equal to twice this weight. We therefore confider this beauti-领 experiment as chiefy valuable, by giving us a mea-
fure of the tenacity of the water; and we wifh that it Refferace. were repeated in a varicty of depths, in order to difcover what relation the force exerted bears to the depth. It would feem that the tenacity, being a certain determinate thing, the proportion of 100 to 112 would not be conttant; and that the obiersed ratio would be made up of two parts, one of them conflant, and the other proportional to the depth under the furface.

But ftill this experiment is intimately connected with the matter in hand; and this apparent non-prefo fure on the hinder part of a body expofed to a itteam? from whatever caufes it procceds, does operate in the action of water on this hinder part, and nout be taken into the account.

We mult therefore follow the Chevaline de Buat in Furtice his difcuffions on this fubjec. A prifnatic body. ha, difeullows ving its prow and poop eoual and paralie! furfaces, and Buat plunged lorizontally into a flud, will require a force to keep it firm in the direction of its axis precifely equal to the difference between the real preffures exericu on its prow and poop. If the fluid is at reft, this difference will be nothing, becaufe the oppolite dead pref. fures of the fluid will be equal: but in a flream, there is fuperadded to the dead prefture on the prow the active preflure arifing from the deflections of the flaments of this fluid.

If the dead preffure on the poop remained in its full. intenfity by the perfect Itagnation of the water behind it, the whole fenfible preflure on the body would be the active preflure only an the prow, reprefented by \(m h\). If, on the other hand, we could fuppofe that the water behind the body moved continually away from it (being renewed laterally) with the velocity of the ftream, the dead prefture would be entirely removed from its poop, and the whole fenfible preffure, or what muft be oppoled by fome external force, would be \(m b+h\). Neither of thefe can happen; and the real tate of the cafe mult be between thefe extremes.

The following experiments were tried: The perfo- Experirated bos with its vertical tube was expofed to the ments. Aream, the brals plate being turned down the flream. The velocity was again 36 inchesper fecond.

The central hole A alone being opened, gave a nonprefture of

13 lines.
A hole \(1, \frac{5}{6}\) of an inch from the edge,
gave -
hole C, near the furface -
15
A hole C, near the furface - 15,7
A hole \(D\), at the lower angle . 15,3
Here it appcars that there is a very confiderable non-preflure, increafing from the centre to the border. This increafe undoubtedly proceeds from the greater lateral velocity with which the water is gliding in from the fides. The water behind was by no means ftag. nant, although moving off with a much fmaller velocity than that of the paffing fream, and it was vifibly removed from the fides, and gradually licked away at its further extremity.

Another box, hasing a great number of holes, all open, indicated a medinm of non-preffure equal to \(13, \frac{1}{5}\) lines.

A nother of larger dimenfions, but having fewer holes, indicated a non-preffure of \(12 \frac{1}{6}\).

But the modt remarkable, and the moft important phenomena, were the following :

The find box was fixed to the fide of another box,

\section*{RES}

f, that, when :ll was norle fincouh, it mate a perfect culce, of which the protorated brafs plate made the poop.

Il is box was thenfeted in the fante manner, fo ass to) latac the perop of a boos thate feet lung. In this Stuation the non-preflires whe as fullow:

Hote A
The : nom-greflons were fall farther diminificed by this increafo of lensth.

The box was then expofid with all the holes open, in thrce different fituations: .

17, Simpte, givine a non-prefure - 13,1
-1, Making the poop of a cube - 5,3
34, Making the poop of a box three fect long 3,0 Another layger box:
\[
\begin{array}{lll}
\text { 1A, Single } & \text { - } & 12,2 \\
\text { ad, Poop of a cube } & \text { - } & 5, \\
\text { sd, Poop of the lone loox } & & \\
\hline
\end{array}
\]

Thefe are moll valuthe experiments. They plain!y fhow how important is is to cunfider the adtion on the hinder part of the body. For the whole impulfe or refilance, which mult bei withiftood or overcenre by the external force, is the fum of the active preffure on the fore-part, and of the non-preflire on the hinder-part ; and they fhow that this does not depend follely on the form of the prow and poop, but alfo, and perhaps chicfiy, a. the lenoth of the budy. We fee that the nonpenime on the hirder-part vas prodigioufly dininifhed (1edueed to one-fourth) by making the length of the body triple of the breadth. And hence it appears, that mercly longthenins a thip, without making any change in the som cither of her prow or leer poop, will gratly diminif' the refitance to her motion through the wator; and this incieafe of length may le made by contidruines the forn of the midntip frame in feveral timbers along the ketl, by which the capacity of the faip, and her penwer of cirrying fail, will be greatly increafed, and her wher qualities improved, whide her fpecd is augnented.
It is furely of importance to confider a little the phyteal caufe of this change. The motions are extremely compliated, and we muft be contanted if wo can but perccise a few leadiug circumftances.

The water is turned afide by the anterior part of the body, and the ellucity of the filaments is increaied, and they acquire a derergent motion, by which they alio purt alide the furroniding water. On each file of the body, therefore, they are moving in a divergent direction, and with aan incralid orlacity. Dut as they are on :lll fal's prefid by the fowid without then, their m tiots itradually appreach to prarallelifm, and their ve1. citics to an cequality with the trean. The progrefI ve wlocity, or that in the diection of the Atrean, is checked, ai lealt at fril. But fince we chberse the filaments conflipated round the body, and that they are sut deffected at rioht angles to their former direction,
it is rain thaf the real velocity of a filament in its ob. Refin. lique path is amgmented. We always ubleme, that a -ro flone hying in the fand, and expofed to the wath of the fea, is lided bare at the lontom, and the fond is genera!": wafted away to fome clitance :.ll rotar\}. 'This is owing to the increafed velocity of the water which eomes into contaet with the flone. It takes up mose fam! than it ean kecp flonting, and it clepofits it at a littls difance all around, forming a little bank, which furrounds the tome at a fmall dittance. Wlicn the filain:uts of water have paffed the body, they are pedted by the ambient fluid into the plate which it has quitted, and they glide round its fien, and fill up the fpace behind. '!he more tivergent and the more lapid thes are, when about (o) fall in behind, the nore of the circumambicnt grefiure mutt be employed to turn them into the trought behini the body, and lefs of it will remain to prels them to the body itfelf. The extrene of this muti obtaine when the tream is ubftruited by a thin plane only. Lut when there is fome difance between the prow and the prop, the divergeney of the filaments which had been turned afide by thic prow, is diminiface! by the time that they have eonse abreat of the Rern, and thould than in behind it. 'They are thercfore more readily made to converge behinit the body, and a more confiderable part of the furronding preffure remains urexpended, and therefure preftes the water againtt the Hem; and it is evideat that this ad. vantage mult be fo much the orcater as the body is longer. Dut the adoantare wil? foon be fufceptible of no very confiderable increafe: for the lateral and divergent, and accelerated flaments, will foon become fo nearly parallel and cqually rapid with the rel of the Itram, that a grcat increale of length with not make any confiderable change in thefe particulars ; and it mutt be aceompanied with an inereafe of friction.

Thefe are very obvious reflections. Ancl if we attend minutely to the way in which the almotk flagnant thuid behind the body is expended and renewed, we thall fee all thefe effects confirmed and augmented. Wut as we cannut fay any thing on this febject that is precife, or that can be made the fubject of computation, it is needlefs to enter into a more minute difuffion. The diminution of the non-preffure towalda the centre mot probahly arifes from the fmaller foree which is necefary to be expended in the inflection of the lateral folaments, already iufected in fome degree, and baving their velocity diminifhed. But it is a fulject highly deferving the attention of the mathematicians; and we prefume to invite them to the fudy of the motions of thefe lateral flaments, palinr the body, and prefed into its wake by forces which are fufceptible of no diffect inveflination. It feems highly probable, that is a prilinatic bos, with a fquare fern, were fitted with an addition precifely thaned like the water which would (abtracting tenaeity and fretion) have been tarnant behind it, the quantity of non-prefli nn wonld be the finalledt pofinhe. 'l he mathomatician would furely difcover circunitances which would furnifh fome masims of conftruction for the hinder par: as well as for the prow. And as his fueculations on this lat have not bern wholly fruitlels, we nay expect a lvaltages fiom his attention to this part, fo much neglected.

In the Ber, ber

\section*{\(R \quad E \quad S\)}
\(\left[\begin{array}{ll}121]\end{array}\right.\)
When the velocity is three feet per fecond, requiring the productive height 21,5 lines, the heights correfponding to the non-preflure on the poop of a thin plane is \(14,+1\) lines (taking in feveral circumftances of judicious correction, which we have not mentioned), that of a foot cube is 5,83 , and that of a box of triple length is \(3.3{ }^{1}\).

Let \(q\) exprefs the variable ratio of thefe to the height producing the velocity, fo that \(q q^{3}\) inay exprefs the nonpreflure in every cale; we have,
\(\begin{aligned} & \text { For a thin plane } \\ & \text { a culee } \\ & \text { a box }=3 \text { cubes }\end{aligned} \quad . \quad . \quad \begin{aligned} & \left.\quad . \quad \begin{array}{l}0,67 \\ 0,271 \\ 0,153\end{array}\right)\end{aligned}\)
It is crident that the value of \(q\) has a dependence on the proportion of the length, and the tranfverfe fection of the body. A feries of experiments on prifmatic bodies flowed Mr de Buat that the deviation of the filaments was firnilar in timilar bodies, and that this obtained even in diffimilar prifms, when the lengths were as the fquare-ronts of the traniverfe fections. Although therefore the experiments were not fufficiently numerous for deducing the precife law, it feemed not impoffible to derive from them a very ufeful approximation. By a dexterous comparifon he found, that if \(l\) expreffes the length of the prifin, and \(s\) the area of the tranfverfe fection, \(a^{-d} \mathrm{~L}\) exprefles the common logarithm of the quantity to which it is prefixed, we fhall exprefs the non-preffure pretty accurately by the formula \(\frac{1}{q}=\) \(\mathrm{L}\left(1,+2 \frac{1}{\sqrt{ } / s}\right)\).

Hence arifes an important remark, that when the height correfponding to the non-preflion is greater than \(\sqrt{ }\) s, and the body is little immerfed in the fluid, there will be a void behind it. Thus a furface of a fquare inch, juft immerfed in a current of threc feet per fecond, will have a void behind it. A foot fquare will be in a fimilar condition when the velocity is 12 feet.

We mut be careful to diftinguifh this non-preflure from the other caufes of reflance, which are always neceflarily combined with it. It is fuperadditive to the active impreffion on the prow, to the fatical preffure of the accumulation a-head of the body, the flatical preflure ariiing from the depreffion behind it, the effects of friction, and the effects of teuacity. It is indeed next to impoffible to eftimate them feparately, and many of them are actually combined in the meafures now given. Nothing can determine the pure non-preffures till we can afcertain the motions of the filaments.

Mr de Buat here takes occafion to controvert the univerfally adopted maxim, that the preffure occafioned by a flream of fuid on a fixed body is the fame with that on a body moving with equal velocity in a quiefcent "fluid. He repeated all thefe experiments with the perforated box in ftill water. The general diftinction was, that both the preflures and the non-preflure in this cafe was lefs, and that the odds was chiefly to be obferved near the edges of the furface. The general factor of the preffure of a flream on the anterior furface was \(m=1,186\); but that on a body moving through a fill fluid is only \(m=1\). He obferved no non-prefure even at the very edge of the prow, but even a fentible preffure. The preflure, therefore, or refiftance, is more equably diffufed over the furface of the prow than the inspulfe is.-He alfo found that the refilances diminifhed in a lefs ratio than the fquares of the velocities, efpecially in fmall velocitits.
Vol. XVI. PartI.

The non-preffures increafed in a greater ratio than the Refnanee,〔quares of the velocities. The ratio of the velocities to a fmall velocity of \(2 \frac{1}{5}\) inches per fecond increafed geometrically, the valuc of \(q\) increafed arithmetically; and we may deternine \(q\) for any velocity V by this proportion
\(\mathrm{L} \frac{55}{2,2}: \mathrm{L} \frac{\mathrm{V}}{22}=0,5: q\), and \(q=\frac{\mathrm{L} \frac{\mathrm{V}}{2,2}}{2,8}\). That is, let the common logarithm of the velocity, divided by \(2 \frac{1}{5}\), be conlid red as a common number; divide this common number by \(2 \frac{6}{8}\), the quetient is 4 , which muft be multiplied by the productive height. The product is the preflure.

When Pitot's tube was expofed to the flream, we had \(m=1\); but when it is carried through fill water, \(m\) is \(=1,22\). When it was turned from the ftream, we had \(q=0,157\); but when carried through fill water, \(q\) is \(=0,138\). A remarkable experiment.

When the tube was moved laterally through the wa. And tupter, fo that the motion was in the direction of the plane prers his of its mouth, the non-prefure was \(=1\). This is one orinien hy of his chief arguments for his theory of non-preffion. at te exps:He does not give the detail of the experiment, and nincuit. only inferts the refult in his table.

As a body expofed to a fream defiects the fluid, heaps it up, and increafes its velocity; fo a body moved through a fill fluid turns it afide, caufes it to fivell up before it, and gives it a real mution alonglide of it in the oppofite direction. And as the body expofed to a ftream has a quantity of fluid almof flagnant hoth before and behind; fo a body moved through a ftill fuid carries before it and drags after it a quantity of fluid. which accompanics it with nearly an equal velucity. This addition to the quantity of matter in motion muit make a dimimition of its velocity; and this forms a very conliderable part of the obferved refiltance.

We cannot, however, help remarking that it would the biecrequire very diftinct and ftrong proof indeed to over tion no: turn the common opinion, which is founded on our mont well iumd. certain and fimple conceptione of motion, and on a lav of nature to which we have never oblerved an exception. Mr de Buat's experiments, tho' moft jucicioully contrived, and executed with ferupulous eare, are br no means of this kind. They were, of abfolute neceffity, very complicated; and many circunitances, impoffible to avoid or to appreciate, rendered the obfervation, or at leaf the comparifon, of the velocities, very uncertain.

We can fee but two circumflances which do not admit of an eafy or immediate comparifon in the two and es reftates of the problem. When a body is expofed to a ments on ftrean in our experiments, in order to have an impulfe of noties made on it, there is a force tending to move the body in rumning backwards, independent of the real impulfe or preflure or nill wao occationed by the defcetion of the fream. We canur have a flream except in confequence of a floping furface. Suppofe a body floating on this fteam. It will not only fail down along with the fream, but it will fail down the fream, and will therefore go fafter along the canal than the fream does: for it is floating on an inclined plane; and if we examine it by the law's of hydroftatics, we thall find, that befides its own tendency to fide down this inclined plane, there is an odds of hydrullatical preffure, which infles it down this plane. It will therefore go along the canal fatter than the ftream For this acceleration depends on the diffirence of preffure at the two ends, and will be more re(2) markable

\section*{\(1 \mathrm{E} \quad \mathrm{S}\)}

Refifance.

\section*{4} markable as the body is larger, and efpecially as it is longer. This nay be diftinctly oblerved. All floating bodies go iuto the fleam of the river, becaufe there they find the fmalleft offernction to the acquifition of this motion dong the inclined plane; and when a number of iondits anc thus floating doun the ftream, the largett whi lonsult outhrip the reft. \(A\) log of wood floating dusn in this manner may be obferved to make its way viry Eaft among the chips and faw-duft which float ahominfor of it.
Now when. in the courfe of our experiments, a body is fupported againtt the action of a tream, and the impulfe is meafured by the force enployed to fupport it, it is plain that part of this force is employed to a to arain that tendency which the body has to out? ip the !lream. 'Ihis dwes not appear in onr experinemt, when we move a body with the welocity of this llream through llith water havin a horizontal furface.

Tlue other di linguidhing eireum lance is, that the retardations of a litram arifing from friction are found to be nearly as the velocities. When, therefore, a "ream moving in a limited canal is checked by a body put in its way, the diminution of velocity occafioned by the friction of the tlream haring already produced its effeet, the impulfe is now affected by it ; but when the body puts the fill water in motion, the friction of the buttom produces fome effect, by retarding the recefs of the water. This, however, mult be next to nothing.

The chief difference will arife from its being almot mopolfible to make an exact comparifon of the velocities: fur when a body is moved againtt the fream, the relative relocity is the fame in all the filaments. But when we expofe a body to a flream, the velocity of the different filaments is 1:ot the fame; becaufe it decerafts

\section*{87}
J.is B..at's
circratann
लitrelis-
ance,
from the middle of the Aream to the fides.
Mr linat found the total fenfible refiftance of a plate 12 inches iquare, and incafured, not by the height of waicer in the tube of the perforated box, but by weights atting on the arm of a balance, having its centre 15 minhes under the furface of a thream moving three feet per fecond, to be 19,46 pounds; that of a cube of the fome dimentions was 15,22 ; and that of a prifin thiree feet long wais \(1,3,87\); that of a prifm fix feet long was 14,27 . The three firlt agree extremely well with the determination of \(m\) and \(q\), by the experiments with the perforated box. The total refiftance of the laft was undoubtedly much increafed by friction, and by the retrograde force of fo long a prifm floating in an inclined ftream. This laft by computation is \(\mathrm{C}, 2 \geq 3\) pounds; this added to \(b(m+q)\), which is 13,59 , gives 13,81 , leaving 0,45 for the effect of friction.

If the fame refillances be computed on the fuppofition that the body moves in thill water, in which cafe we have \(m=1\), and \(q\) for a thin plate \(=0,+33\); and if \(q\) be computed for the lengths of the other two bodiea by the formula \(\frac{1}{q}=\mathrm{L}_{1,42}+\frac{1}{\sqrt{s}^{-}}\); we fhall get for the refiftances 14,\(94 ; 12,22\); and 11,49 .

Hence Mr Buat concludes, that the refiftances in S8 Hefere Mr buat concludes, that the refitances in gniztrity I This, he thinks, will account for the difference obferwater adrering to a ved in the experiments of diferent authors.
bering tom Mr Buat next endeavours to afcertain the quantity is g in fill of water which is made to, adhere in fume degree to a water, cis.
2. R E S
baty which is carried along thro' fill water, or which Refin:e. remains nearly ftagnant in the midt of a fiream. He Tat takes the fum of the motions in the direction of the fream, ciz. the fum of the actual motions of all thofe particles which have loft part of their motion, and he divides this fum by the general velocity of the Hrean. The quotient is equivalent to a cerrain quantity of water perfectly Hagnaat round the body. Without being able to determine this with precifion, he obferves, that it augments as the refitance diminifhes; for in the cafe of a longer body, the filaments are sblerved ti) converge to a greater diftance behind the body: The naguant mafs a-head of the body is more conftant; for the deflection and refillance at the prow are obferved not to be affected by the length of the body. Mr 13uat, by a very nice analylis of many circumfanecs, comes to this couclufon, that the whole quantity of fluid, which in this manner accompanies the folid body, remains the fame whatever is the velocity. He might have deduced it at onee, from the confideration that the curres defcribed by the filaments are the fame in all se. loeities.

He then relates a number of experiments made to \(\Gamma\) certain the abfolute quantity thus made to accompany the body. Thefe were made by canling penduluns to ofcillate in fluids. Newton had determined the reGitances to fuch ofeillation by the diminution of the arches of vibration. Mr Buat determines the quantity of dragged fluid by the increafe of their duration ; for this tlagnation or dragging is in fact adding a quantity of matter to be moved, without any addition to the moving force. It was ingenioufly oblerved by Newton, that the time of ofcillation was not feufibly affected by the reliftance of the fluid: a compenfation, almot complete, being made by the diminution of the arches of vilration ; and experinent conlirnsed this. If, therefore, a great angmentation of the time of vibration be obferved, it mult be aferibed to the additional quantity of matter which is thus dragged into motion, and it may be employed for its meafirement. 'I hus, let a be the length of a pendulum fwinging feconds in vacuo, and I the length of a fecond's pendulum fwinging in a fluid. Let \(p\) be the weight of the bolly in the fuid, and P the weight of the filud difplaced by it; \(\mathrm{P}+p\) will exprefs its weight in racuo, and \(\frac{\mathrm{P}+p}{p}\) will be the ratio of thefe weights. We fhall therefore have \(\frac{P+p}{p}=\) \(\frac{a}{l}\) and \(l=\frac{a p}{P+p}\).

Let \(n \mathrm{P}\) exprefs the fum of the fluid difplaced, and the fluid dragged along, \(n\) being a number greater than unity, to be determined by experiment. The mals in motion is no longer \(\mathrm{P}^{\mathrm{P}}+p\), but \(\mathrm{P}+n \mathrm{P}\), while its weight in the fluid is ftill \(p\). Therefore we mutt have
\(l=\frac{a p}{n \mathrm{P}+p}=\frac{a}{n \mathrm{P}}+1\), and \(n=\frac{p}{\mathrm{P}}\left(\frac{a}{l}-1\right)\).
A prodigious number of experiments made by Mr Buat on Tpheres vibrating in water gave values of \(n\), which were very conftant, namely, from 1,5 to 1,7 ; and by confidering the eircumftances which accompawied the variations of \(n\) (which he found to arife chiefly from the curvaiure of the path defcribed by the
2
ball!,

\section*{R E S}
fonce. ball, he fates the mean value of the number \(n\) at 1,583 . So that a fphere in motion drags along with it about \(\frac{6}{10}\) of its own bulk of fluid with a velocity equal to its own.
He made fimilar experiments with prifms, pyramids, and other bodies, and found a complete con rmation of his affertion, that prifms of equal lengths and fections, though diffimilar, dragged equal quantities of fluid; that fimilar prifms and prifnes not limilar, but whofe length were as the fquare-root of their lections, dragged quantities proportional to their bulks.

He fonnd a general value of a for prifmatic bedies, rhich alone may be conlidered as a valuable truth; nankely, that \(n=0,705 \frac{\sqrt{ } / s}{l}+1,13\).

From all thefe circumftances, we fee an intimate connection between the preffures, non-preflures, and the fluid dragged along with the body. Indeed this is immediately deducible from the firtt principles; for what Mr Buat calls the dragged fluid is in fact a certain portion of the whole change of motion produced in the direction of the bodies motion.

It was found, that with refpect to thin planes, fpheres, and pyramidal bodies of equal bafes, the refitances were inverfely as the quantities of fluid drageved along.
The intelligent reader will readily obferte, that thefe news of the Chevalier Buat are not fo mueh difcoveries of new principles as they are claffications of confequences, which may all be deduced from the general principles employed by D'Alembert and other mathematicians. But they greatly affift us in forming notions of different parts of the procedure of nature in the mutual action of fluids and folids on each other. This mult be very acceptable in a fubject which it is by no means probable that we fhall be able to inveftigate with mathematical precifion. We have given an account of thefe laft obfervations, that we may omit nothing of confequence that has been written on the fubject ; and w.e take this opportunity of recommending the Hydraulique of Mr Buat as a moft ingenious work, containing more original, ingenious, and practically afeful thoughts, than all the performances we have met with. His doctrine of the primiple of uniform motion of furids in pipes and open cancls, will be of immenfe fervice to all engir.eers, and enable them to determine with fufficient precifion the moft important quetions in their profeflion; queftions which at prefent they are hardly able to guefs at. See Rwers and \({ }^{\text {Wafer }}\) Works.

The only circumftance which we have not noticed in dctail, is the change of refiffance produced by the void, or tendency to a void, which ubtains behind the body ; and we omitted a particular difcuffion, mencly becaufe we could fay nothing fufficiently precife on the fubject. Perfons not accultomed to the difcuffions in the phylicomathematical feiences, are apt to entertain doubts or falie notions conncted with this circumitance, which we fhall attempt to remove ; and with this we frall conclude this long and unfatisfactery differtation.

If a fluid were perfectly incomprefible, and were cortained in a veffel incapable of extenfion, it is impoflicle that any rodd conla be formed bethend the body; and in this cafe it io not wely taly to fee how motion conld be performed in it. A tphere woved in fuch a medium could r:ob adrat ou the malicit ditance, uniels forme partcie ot ine fluid. in filling up the fpace left by it, moved with a velocity nest to inurite. Some

\section*{R E S}
degree of compreffibility, however finall, feems necef-Refinanee. fary. If this be infenfible, it may be rigidly demonArated, that an external force of compretion will make no fenfible change in the internal motions, or in the refiftances. This indeed is not ubvious, tut is an immediate confequence of the quaquaverfum pretfure of fluids. As much as the preffure is augmented by the external a mpreffions on one fide of a body, fo much is it augmented on the other fide; and the fame mult be faid of crery particle. Nothing more is neceffary for fecuring the fame motions by the fame partial ard internal forces; and this is fully verified by experimert. Water remains equally fluid under any compreffions. In fome of Sir Ifaac Newton's experiments balls of four inches diameter were made ío light as to preponderate in water only three grains. Thefe balls defcended in the fame manner as they would have defcended in a fluid where the refiftance was equal in every pert ; yet, when they were near the bottom of a veffel nine feet decp, the compreffion round them was at laft 2400 times the moving force; whereas, when near the top of the veffel, it was not above 50 or 60 times.

But in a fluid fentibly compreffible, or which is not confined, a void may be left behind the body. Its notion may be fo fuift that the furrounding preffure may not fuffice for filling up the deferted ipace; and, in this cafe, a flatical preflure will be added to the reliftance. This may be the eafe in a veffel or pond of water having an open furface expofed to the finite or limited pieflure of the atmof phere. The queltion now is, whether the refiftance will be increafed by an increafe of external preflure? Suppofing a fphere mowing near the furface of water, and another moving cqually fat at four times the depth. If the motion be fo fwitt that a void is formed in both cafes, there is no doubt but that the fphere which muves at the greatef depth is moit refilted by the preffure of the water. It there is no void in either cafe,"then, becaufe the quadruple dept. 1 would caufe the water to flow in with only a double velocity, it would feem that the refiltance would be greater; and indeed the water flowing in laterally with a double velocity produces a quadruple non preffure. -But, on the other hand, the preffure at a Imall depth may be infufficient for preventing a void, while that below effectually prevents it; and this was soferved in fome experiments of Chevalier de Burda. The effeet, therefore, of greater immerfion, or of greater compreffion, in an elattic fluid, does not follow a precife ratio of the preffine, but depends partly on abfolvete quartities. It cannot, thertore, be itated by any very timple formula what incrcafe or diminution of refitance wity refult from a greater depth; and it is enichly on this account that experiments made with models of thips and mills are not concluive with refpest to the perfurmance of a large machine of the fame proportions, withoul corrections, funciaino pactiy :....isate. We aflert, however, with great conndence, that this is of aii methor.s the molt exact, and infinitely more ceitain then any thing that can be deduced from the molt chab., rate calculation from theory. If the refilances at ail depths lie equal, the propertionality of the total rcfillanse to the budy is exact, and perfectly con formalie to oblervation. It is only in great velucitic; where the \(\mathrm{dif}_{\mathrm{i}}\) th has any naterral infunce, and the iufnemoe is not near fo ce::liderable as we thould, at inft fight, fuppofe; for, in eitinating the eflet of immerlion, whin has a relatiou

\section*{R E S [ 124 ] R E S}

Refifance to the difference of preffure, we mult aiways take in the preffure of the atmofphere; and thus the preflure at 3.3 feet deep is not 3.3 tinies the prefiure at one fout icep, but only double, or twice as great. The atmofpheric preffure is omitted only when the refilted plane is at the very furface. D'Ulloa, in his Examino Maritimo, has introdueed an equation expreffing this ralation: lout, execpt with wery limited conditions, it will miflead us prodigiomly. To give a general nution of its foundation, let AB (fig. 23.) be the fection of a plane moving through a fuid in the direction CD , with a known velucity. The tluid will be heaped up before it above ies natural level CD, becaufe the water will not r:e purned before it like a folid body, but will be pufl--I afide. And it cannot acquire a lateral motion any other way than by an accumulation, which will diflute itifle in all directions by the law of undulatory motion. The water will alfo be left lower behind the flane, becarfe time mufl clapfe before the preflure of the water behind can make it fill the fpace. We may aequire fome notion of the extent of both the accunnlation and depreffion in this way. 'I here is a certain depth CF \(\left(=\frac{v^{2}}{2 p}\right.\), where \(v\) is the valucity, and p the accelerating power of gravity) muder the furface, fuch that water would flow through a hole at F with the veJocity of the plane's motion. Draw a horizontal hine FG. The water will certainly touch the plane in G, and we may fuppofe that it touchos it no higher up. Therefore there will be a hollow, fuch as CGE. The elevation HE will be regulated by confiderations nearly fimilar. ED noult be equal to the velocity of the plane, and HE mult be its productive height. Thus, if the velocity of the plane be one foot fer fecoud, HE and EG will be \({ }^{\frac{3}{0}}\) - of an inch. This is fufficient (though not exact) for giving us a notion of the thing. We fee that from this mutt arife a preflune in the direction DC , viz. the preffure of the whole column HG .

Soncthing of the fame kind will happen although the plane \(A B\) be wholly immerged, and this even to fome depth. We fee fuch elevations in a fwift moning fteam, where there are large flones at the bootton. This occafions an excefs of preflure in the direction oppofite to the plane's motion; and we fee that there nouf, in every cafe, be a relation between the velocity a!d this excefs of preflure. This D'Ulloa expreflis by an equation. But it is very exceptionable, not taking properly into the account the comparative facility with which the water can heap up and diffufe itfelf. It mult always heap up till it acquires a fufficient head of water in produce a lateral and progreffive diffution fufficient for the purpofe. It is evident, that a fimaller elevation will fuffice when the body is more inmerfed, becaufe the check or impulfe given by the body below is propafated, not vertically only, but in every direction; and
 sho iduface which is immediately above the moving body, thut extends fo much father laterally as the centre of agitation is deper: Thus, the clevation neceflary for the palfage of the hody is fo much fmaller; and it is the thist oaly of this accumulation or wave which deferminies the backward preflure on the body. D'Ulloa's cquation may happen to quadrate with two experiments at difiercht depth, without being nearly juft for any two gointo s..ay be in a curve, without exhibiting its
cquation. Three points will do it with fome approach Renfat; to precifion ; but four, at leaf, arc ueceffary for giving any notion of its nature. 1)'Ulloa has only given two experiments, which we mentioned in another place.

We may here obferve, that it is this circumftance which inmediately produces the great refiftance to the motion of a budy through a fluid in a narrow canal.The fluid cannot pais the body, unlefs the area of the fection be fufficiently extenfive. \(\Lambda\) narrow canal prevents the exteution didewife. The water mult therefore heap up, till the fection and velocity of diffution are fufliciently enlarged, and thus a great backward preflure is produced. (Sec the fecond feries of Expeliments by the French Academicians ; fee alfo Frankliv's Eflays.) It is important, and will be confidered in another place.

Thus have we attempted to give our readers fome account of one of the noof interefling problems in the whule of mechanieal philofophy. We are forry that fo little advantage can be derived from the united efforts of the firt mathematicians of Europe, and that there is fo little hope of greatly improving our feientific knowledge of the fubject. What we have delivered will, however, erable our readers to perufe the writings of thote who have applied the theories to practical purpofes. Such, for inflance, are the treatifes of John impulfic Bernoulli, of Bouguer, and of Euler, on the conltruc-water 6 tion and working of fhips, and the occafional differta-water tions of different authors on water-mills. In this laft nulim application the oldinary theory is not without its value, for the impulfes are nearly perpendicular ; in which cafe they do not materially deviate from the duplicate proportion of the fine of incidence. But even here this thcory, applied as it commonly is, miffeads us exceedingly. The impulfe on one float may be accurately enough fated by it ; but the authors have not been attentive to the motion of the water after it has made itg impulfe; and the impulfe on the next float is ftated the fame as if the parallel filanents of water, which were not thopped by the preceding float, did inipinge on the oppofite part of the fecond, in the fame manner, and with the fame obliquity and energy, as if it were detached from the reft. But this does not in the leall refemble the real procefs of nature.

Suppofe the tloats B, C, D, H (fig. 24.) of a wheel immerfed in a flream whofe furface moves in the direction AK , and that this furface mects the float B in E . The part BE alone is fuppofed to be impecied ; whereas the water, checked by the float, heaps up on it to e. Then drawing the horizontal line BF, the part CF of the next float is fuppofed to be all that is impelled by the paralled filaments of the fream; whereas the watcr bends round the lower edge of the float B by the furrounding preflure, and riles on the float \(c\) all the way to \(f\). In like manner, the float D , inftead of receiving an impulfe on the very finall portion DG, is impelled all the way from D to \(g\), not much below the turface of the ftream. 'The furfaces impelled at once, therefore, greatly exceed what this fovenly apphication of the theory fuppofcs, and the whole impulfe is much greater; but this is a fault in the application, and not in the theory. It will not be a very difficult thing to acquire a knowledge of the motion of the water which has pafied the preceding float, which, though not accurate, will yet approximate confiderably to the truth; and

\section*{R E S}

Jlation then the ordinnry theory will furnith maxims of conftruction which will be very ferviceable. This will be attempted in its proper place ; and we fhall endeavour, in our treatment of all the practieal quetions, to derive ufeful information from all that has been delivered on the prefent oceafion.

RESOLUTION of Ideas. Sec Logic, PartI.ch. 3 . Resolution, in mufic. To refolve a difcord or diffonance, fays Roufleau, is to carry it aecording to rulc into a confonance in the fubfequent ehord. There is for that purpofe a procedure preferibed, both for the fundamental bafs of the diffonant chord, and for the part by which the diffonance is formed.

There is no poffible manner of refolving a diffonance which is not derived from an operation of cadence: it is then by the kind of cadence which we wifh to form, that the motion of the fundamental bals is determined, (fee Cadence). With refpcct to the part by which the diffonance is formed, it ought neither to continue in its place, nor to move by disjointed gradations ; but to rife or defcend diatonically, zecording to the nature of the diffonance. Theorills fay, that major diffonances ought to rife, and minor to defcend; which is not however without exception, fince in particular chords of harmony, a feventh, altbough major, ought not to rife, but to defcend, unlefs in that chord which is, very incorrectly, called the chord of the feventh redundant. It is better then to fay, that the feventh and all its derivative diffonances ought to defcend ; and that the fixth fuperadded, and all its derivative diffonances, fhould rife. This is a rule truly general, and without any exception. It is the fame cafe with the rule of refolving diffonances. There are fome diffonances which eannot be prepared ; but there is by no means one which ought not to be refolved.

With refpect to the fenfible note, improperly called a major diffonance, if it ought to afeend, this is lefs on account of the rule for refolving diffonanees, than on account of that which prefcribes a diatonie procedure, and prefers the thorteft road; and in reality, there are cafes, as that of the interrupted cadence, in which this fenfible note does not afeend.

In chords by fuppofition, one fingle chord often produces two diffonances; as the feventh and ninth, the ninth and fourth, \&e. Then thefe two diffonanees ought to have been prepared, and both mult likewife be refolved; it is beeaufe regard fhould he paid to every thing which is difcordant, not only in the fundamental, but even in the continued bafs.

Resolution, in chemiftry, the reduction of a mixed body into its component parts or firft principles, as far as can be done by a proper analyfis.

Resolution, in medicine, the difappearing of any tumor without coming to fuppuration or forming an abfefs.

RESOLVENTS, in medicine, fuch as are proper for diffipating tumors, without allowing them to come to fuppuration.

RESONANCE, Resounding, in mufic, \&e. a found returned by the air inclofed in the bodits of flringed inftruments, fuel) as lutes, \&cc. or even in the bodies of wind-inftruments, as flutes, \&e.

RESPIRATION, the act of refpiring or breathing the air. Sec Anatomy, \(n^{\circ} 118 . \mathrm{Blood}^{\circ} \mathrm{n}^{\circ} 29\). Me-
dicine, no 104. Physhology, Sect. T. and Putrefac. Reppira. tion pafim.
Reshiration of Fijbes. See Ichthyology, nō \({ }^{\circ}\), 8, 9 .
RESPITE, in law, fignifies a delay, forbearance, or prolongation of time, granted to any one for the paynient of a debt or the like. See Reprieve.

RESPONDENT, in the fchools, one who maintains a thefis in any art or feience; who is thus called from his being to anfwer all the objections propofed by the opponent.

\section*{RESPONDENTIA. See Botromry.}

RESPONSE, an anfwer or reply. A word chiefly ufed in fpeaking of the anfwers made by the people to the prieft, in the litany, the pralms, \&c.
RESSORT, a Fiench word, founetimes ufed by Eirglifh authors to dignify the jurifdiction of a court, and particularly one from which there is no appeal. -Thus it is faid, that the houfe of lords judge en dernier reffyrt, or in the laft reffort.

REST, the continuance of a body in the fame place, or its continual application or contiguity to the fame parts of the ambient or contiguous bodies; and therefore is oppofed to motion. See the article Mo. tion.

Rest, in poetry, is a fhort paufe of the voice in reading, being the fame with the cxfura, which, in Alexandrine verfes, falls on the fixth fyllable; but in verfes of 10 or in fyllables, on the fourth. See PoEtry, Part III.
REST-HARROW, or Cammock, the Ononis Aro venfir. A decoction of this plant has been much reeommended to horfes labouring under a ftoppage of urine. It is the peft of fome corn-fields; but in its younger flate, before the plant has aequired its thorns, it is a moft aeceptable food to fheep.

RESTAURATION, the act of re-eftablifhing or fetting a thing or perfon in its former good flate.

RESTIO, in botany; a genus of the triandria order, belonging to the divecia elafs of plants. The male calyx is an ovate fipike of membranaceous feales; the corolla is proper, hexapetalous, and perfiftent. The female ealyx and corolia are as in the male; the germen is roundifh, and fex-fulcated; there are three erect and perfiftent fyles; the capfule is roundifl, with fix plaits, and is roftrated and trilocular ; the fecds are oblong and cylindrieal.

RESTITUTION, in a moral and legal fenfe, is reftoring a perfon to his right, or returning fomething unjutly taken or detained from him.

Restitution of Medals, or Reflituted Medals, is a term ufed by antiquaries for fuch medals as were ftruck by the emperors, to retrieve the memory of their predeceffors.

Hence, in feveral medals, we find the letters rest. This practice was firft begun by Claudius, by his Mriking afrefh feveral medals of Auguftus. Nero did the fame; and Titus, after his father's example, ftruck re. ftitutions of moft of his predeceffors. Gallienus ftruck a general reftitution of all the preceding emperors on two medals; the one bearing an altar, the other an eagle, without the rest.

RESTIVE, or Resty, in the manege, a fubborn, unruly, ill-broken horfe, that ftops, or runs back, inttcad of advaricing forward.

RESTO.

Of a future flate，there have fonsetimes been found a felw wandering and obfeure tribss who fecenced to enter－ tain no notion at all；sthe tigh it flould be erumarked，that fome of thefe were likewile obberved in fo low a degrice of lavage bartaity as not to be acgunaited with the nife of the burv，the dart，or the lling，and as not Knowing how to wield a club，or to throw a fone， 25 a weapon of defence \({ }^{\text {t．}}\)

Wherever the luman mind lias been cultivated，or properly fpeaking，begun to be cultivated，the opinion has likewife generally prevailed that human exitence is nut confined to the prefent feene；nay，fo very gene－ ral has this notion been found anong mankiud，that naany are puzzled low to account for what they fuppofe to be almost next to its univerfality．

To explain the phenomenon，fome have inagined that it is a notion derived by tradition frump primeral re－ velation．They fappof that the firfl parent of man－ kind，as a mooral aģent accountable for his conduci，was informed by his Maker of cuery thing which it was of impuranace for him to know；that he mult have been accequainted with this docirine of a future itate in parti－ culit；and that he could hardly fall to communicate a
matter fo interefling to his polterity．They fuppofe，Refurre too，that the hiftory of the tranflation of Enoch muf have made a great noife in the world，and that the re－ membranes of it malt have been long retained and widely diffufed；and they find in the book of Job plain intinations of a refurrection from the dead，which，from the manner in which they are introduced，they think that very ancient patriarch mult have received through this channel．

It is not thought to be any objection to thefe fuppo．The ufina fitions，that the Mof High，when delivering his laws oly ©ton from the top of Mount Sinai，did not enforce them by op this the awful farictions of a future Rate．The intelligent no force． reader of the Scriptures knows that the fanctions of a future llate belong to a different and more univerfal dif－ penfation than was that of Mofes；that the primeval revelation related to that difpenfation；and that the Jewifh law，with its temporal fanctions，was introduced only to preferve the knowledge and worfhip of the true God among a people too grofs in their conceptions to have been properly influcnced by the view of future re－ wards and punithments，of fuet a nature as cye hath not feen，nur ear heard，neither hath it entered into the heart of man to conceive．He fees at the fame time， evelyuhere feattered through the Old Tcitament，plain indications of the INfaic ceonomy，being no more than preparatory to the bringing in of a better hope；and he thinks it evident，that fich Jews as undertood any thing of the nature of that better hope，mutt have been convinced，that，however the ceremonial rites of their religion might be fufticiently guarded by temporal fanc－ tions，the jundamental frincoples of ail religion and virtue are fupported by reward，and punifhments to be difpen－ fed in a flate beyond the grave．Sce Prophecy and Theology．

That the progenitors of the human race muft have \({ }_{R}\) been infpired by their Creator with the knowledge of fupport of their immortality，and of every thing neceffary to their the opi－ everlatting welfare，cannut，we thould think，be quef－nion． tioned by any one who believes that the world had a beginning，and that it is under the government of good－ nefs and juftice．The progrefs from fenfe to fcience is fo flow，that however capable we may fuppofe the car－ lielt inhabitants of this carth to have becis of making philofophical difooveries，we cannot believe that the Fa－ ther of inercies left his helplefs creature to difcover for himfelf his future cxillence．Death，when firf pre－ fented to him，muft have been a ghaftly object；and had he been left without any hope of redemption from it， he would undoubtedly have funk into liftefs defpondency：

But a profpect of immortality is fo pleating to the homan mind，that if it was communicated to the firlt man，it woulk of courfe be cherithed by his pofteri－ ty ；and there is no difficulty in conceiving how it might be handed down by tradition to very remute ages， anong fuch of his defeendents as were not fattered over the face of the carth in fmall and favage tribes．－ In the connfe of its progrefs，it would frequently be new－modelled by the ever active imacination；and at latt many abfurd and fantaitic chenmitances would doubtlefs be ccmbined with the original tiuth，that death puts not an end to luman exiftence．
but though we are inmly convinced that the firf principles of ufeful knowledge，and among them the ductrine of a future fate，wore communicated to mar

\section*{R E S}

Turree- by his Maker ; and though this doetrine, in large and permanent focieties, might certainly be conveycd more or: lels pure to late polterity through the channel of tra-dition-we are far from attributing fo much to tradition as fome writers are difpofed to do, or thinking it the only fource from which mankind could derive the belief of their exitence beyond the grave. In fmall tribes of favages fuch a tradition could hardly be prelersed: and yet fome indiftinct rintions of a future flate have been found amony tribes who are faid to have loit all tradi. tionary notions even of the being of a God.
Others, therefore, are inclined to believe that, independent of any traditions, mankind might be led by certain phenomena to form fome conjectures of a future ftate. They oblerve, that although a few individuals perhaps may, yet it feldom happens that the whole individuals of any nation are exempted from dreaming : They obferve, too, and this obfervation is founded on experience, that the images of the dead are from the remaining impreffions of memory frequently fummoned up in the fancy; and that it appears from all the languages of rude nations, who pay the greatelt attention to their creams, and who fpeak of feeing the dead in their vifions, that thefe images (A) have always been taken by them for realities; nay, fome of the learned, and the celebrated Baxter is of the number, are difpofed to doubt whether thele appearances be not fomething more than illufions of the brain: But whether they retlly be fo or not one thing is certain, that all nations in all countries, in the darkeft ages and the rucell periods, are accuftomed to dream; and whether feeping or waking, in the ftillnefs of the night, in the gloom of folitude, in the fondnefs of friendilip, in the rovings of love, the delirium of fever, and the anguifh of remorfe, to fee and converfe with the fhates of the departed; and Lacretius * has remarked, that cren the inferior animals are not exempted from fuch illufions of a reftlefs fency.

\section*{For often fleeping racers pant and fweat,}

Breathe fhort, as if they ran their fecond lieat ;
As if the banier down with eager pace
They Aretch'd, as when contending for the race.
And often hounds, when fleep hath clos'd their eyes,
They tofs, and tumble, and attempt to rife;
They open often, often fnuff the air,
As if they preft the footfleps of the deer; And fomctimes wak'd, purfue their fancy'd prey, 'The fancy'd deer, that feem to run away, 'Till quire awak'd, the follow'd thapes decay. And fofter curs, that lie and neep at home, Do often ronfe, and walk about the room, And bark, as if they faw fome flrangers come. And hirds will ftart, and feek the woods, by night, "Whene'er the fancy'd hawk appears in light, Whene'er they fee his wing or hear him fight.

Creech.
Thefe powers of fancy extend wide over animal crea-
tion; and it is on this gencral prineiple that necro. mancers and dreamers have in all ages cltablifhed their trade, that the fories of gobiins have at all times fo

The village matron, round the blazing hearth, Sulpends the infant audience with her tales, Breathinz alonifhment! Of witching rhymes And evil fpints; of the deathbed call
Of him who robh'd the widow and devour'd
The orphan's portion; of unquiet fouls
Ris'n from the grave to cafe the heavy guilt
Of deeds in life conceal'd; of finapes that walk
At dead of night, and clank their chains, and wave
The torch of hell around the murderer's heart.

> Aikfnside.

Mankind in general would willingly difpenfe with thefe troublefome vilits of the dead. To prevent the return of the xumbi or the ghof, fome nations of Africa ule many fuperfitious rites ** and Kolben teils us, Ficyage eo \(^{\text {* }}\) that the frighted Hottentots leave in the hut where a Congo and perfon has died anl the utenfils and furniture, left the \({ }^{\text {Cngola }}\) angry gholt, incenfed at their avarice, fhould haunt Voyages, them in their dreama, and infent them in the night. Divines and moralifts have laboured to thow that thefe are merely imaginary terrors: but God and natu"e feem to have determined that they fhall produce the fame effeces upon certain minds as if they were real ; and that while there is any \{enfibility in the heart, while there is any remembrance of the palt, and any conjuring power in the fancy; the ignorant, the benighted, the timid, fhall ofien meet with the goblins of darknels, the fpeetres of the tomb, the apparitions that hover round the grave, and the forms of the dead in the midnight dream. See Spectre.

From thefe phenomena, which have been fo common Probable in all commtries and in all ages, what would mankind irferences naturally infer? Would they not infer, that there is fream fomething in the nature of nian that furvives death, dramı, \&e: that there is a future fate of exiltence beyond the grave ? Are not ftill many fpecimens of this reafonin. preferved in the aueient poets? and is it not thus that Achillest reafons after imagining that he fas the gholt +IFom. Ihiaz of his friend Patroclus?
'T'is true, 'tis certain, man, though dead, retains
Part of himfelf; the immortal mind remains:
The form fubfifts without the body's aid,
Acrial femblance, and an empty thade.
This night my friend, fo late in battle lof,
Stood at my hide a penfive plantive gholt ;
Ev'n now familiar as in life he cane,
Alas! how dif'rent, yet how like the fame. Pope.
Lucretius *, a fludions obferver of nature, thourh * Lib 3 no friend to the foul's immurtality, acknowledges frankly that thele phantoms often terrify the mind, haunt us in our fleep, and meet ws while awake. He confefles, too, that by fueln appearances mamhind have been led

\section*{\(R E S\)}

Fefurss- to beliere the future exittence of the foul ; but, aware 11013. of the conlequence,

> Ne forte animas Acherunte reamur
> I:jugere, aut umbras inter vives volitar,',
he endeavours to explain thefe curious phenomens on fome of the odd and fantatic principles of the Epicureans. In doing this, however, he pretends not to deny that thefe images appear to be real; but candidly acknowtedges that

> The airy foul, as whey frike and make awake, With ftroke fo lively, that we think we view The abfent dead, and think the image true.

Creech.
We here fee how the helief of the foul's immortality came to be gencral among maakind. But for this information we are much more indebted to the pocts, who have given us faithful tranfcripts of nature, than to the philofophers who have wifhed to entertain ns with their own theories, or to thofe laborious men of erıdition, who have dreaded as much to examine the them tradition is the ultimate boundary of refearch: and as gorgons, chimeras, and hydras, have come down to us by tradition; fo they, with great fagacity, fuf pect, that tradition mult likewife be at the botiom of the foul's immortality, and occafion the vifions and phantoms of the dead.

To tradition we have allowed all that it can juflly claim ; but we cannot allow it to be the only fource of this opinion: and we have felt the higheit indignation upon hearing men of learning and genius affirm, from a falfe zeal for the honour of revelation, that mankind, without this infruction, could never have aequired the art of building huts to fereen them from the cold, or have learned the method of propagating their (pecies! The reader mult not here fuppofe that we allude to Polydore Virgil ( ) . We have in our eye perfons now alive, with whom we have converfed on the fubject, and who (terrified at the length to which fonse philofophers have carried the doctrine of inflincts, and others the reafoning powers of the mind) have contended, with the utmoll earneftuefs, that we know nothing-not cven the functions of our animal nature-but by tradition or written revelation.
22
Opini \(n\), of
Having now feen the fource of the opinion concern. philofoyhers. ing the future exittence of the foul, and pointed out the natural phenomena by which mankind were led to embrace it, we come next to review the arguments by which the philofophers attempted to confirm it.

Pythagoras belicved, with the reff of his country, that annitilation was never the end, and that nonentity, was never the beginning, of any thing that is. His general ductrine upon this fubject was fhortly expreffed in very Pgeh: few words, Ormias mutantur, nibil interit. He afterwards ras's 1 , learned from Eryprian priefts that the foul migrates into tion : new bodies; and being, it feems, a perfon of a molt tianf, extraordinary and altonifhing memory, he found there was fome truth in the itory: for after muling, he herran to remember that he was Euphorbus, the fon of Panthens, that was flain by Menelaus in the Trojan war; and upon a jaunt to Peloponnefus, recollected the fhield which he had worn at the time of the fiege, in ane of the temples of Jumo at Areos! That none might queltion the truth of his affertion, his followers prefently removed all donbts by the fanous argument, the IPSE dixit of Egyptian origin.

As Pythagoras taught that human fouls are frequent. Plato los ly thruft into brute hapes, and, as fome imagined, by trine prer. way of punifhment; it occurred to Plato, that all bodies, even the human, are a fort of prifons; and that, in confequence of this confinement, the foul was fubjected to the rage of delire, appetite, and paflion, and to all the wretched miferics of a jail. To explain this myftery, he Cuppofed that defires and appetites belong to a foul that is purely animal refiding in the body. Bue he was perplexed with another difficulty; for as he thought highly of the goodnefs of Deity, he could not inagine how he fhould inprifon us withont a crime. He fuppofed, therefore, that prior to its union with the prefent body the foul had exilted in one of ether, which it ftill retains; but that even in this etherial body it had fek fomething of impure defire ; and happening to indulge the vicious appetite, had contracted fome ftains of pollution, for which it was confined in its prefent body as a houfe of correction to do penance and improve its morals.

To prove this ideal pre-exiftence of the foul, Plato And ide availed himfelf of an opiaion that was general in his of propg time, that coincided with the doetrines of Pythagoras, it. and that was partly founded on a fort of reafoning and obfervation. He thought that matter and intelligence are coeternal (fee Platonism) ; that there are various orders of fouls; that thofe of both the man and the brute are parts or cmanations (c) of the anims mundi, or foul of the world ; that all are ultimately parts or emanations of Deity itflf; and that all their facultics are more or lefs rellicicted and confined, according to thofe organifed fytherns with which they are connected. Know firt (fays one delivering his doctriues),

Know firf, that heav'n and earth's compaced frame, And flowing waters, and the ftarry flame, And both the radiant lights, one common foul lnfpires, and feeds, and animates, the whole.

This
(B) This writer allots part of a chapter to fhow, "Quis primum inflituerit artem meretriciam," as being, in his opinion, a traditionary practice. See Lib. iii. cap. 17. De Rerum Inventoribus.
(c) The Deity was conceived by the ancients fometimes as a folid, when inferior fouls were called \(\alpha+\rho \sigma \pi \alpha \sigma \mu * i \alpha\), i. e. fragments or parts broken off from hirn; and fometimes as a fluid, when they were conlidered as
 were often after death reunited to the Deity; and their aroposis: often remained Sparate and diflinet for a long while, without lowing back as they ought to have done, and mingling with the great ocean of fpirit.

This active mind, infus'd through all the fpace, Unites and mingles with the mighty mafs: Hence men and beaft the breath of life obtain, A nd birds of air, and monfters of the main ; The ethereal vigour is in all the fame, And every foul is fill'd with equal flame; As much as earthy limbs, and grofs allay Of mortal members, fubject to decay, Blunt not the beams of heev'n and edge of day ( n ). \(\}\) 1)r.yden.

Befides this hypothefis, that in fome meafure was common to orhers, Plate had an argument peculiarly his own. Happening to peep into the region of metaphyfics, he was fomewhat furprifed on oblerving the ideas which we derive from refiction and confciountuels; and fuppofing that they could not have entered by the fenfes, he naturally, though not very jufly, concluded, that we mult have received them in fome flate of prior exittence.

As, according to him, the foul was cternal, as well as the matter which compofed the body, and as their union was only temperary and accidental, he might have been fatisfied that the death of the foul was not to be the confequence of their feparation. But, fome how or other, fatisfied he was not. He had recourfe to a new argument. As the foul, he faid, was an active principle, and a felf-moving, it did not depend for its life on another ; and therefore would alisays continue to exift, though the body were reduced to the gencral mafs out of which it was formed. See Metaphysics, Part III. chap. iv.
Whether Plato had borrowed any of his doctrines from the eaftern magi, we pretend not to fay. We only obferve a ftriking fimilarity, in fome refpects, between his and theirs. In Plato's philofophy, the fun, moon, and ftars, were animated beings, and a fort of divinities that originally had fprung from the great fountain of heat and light, and our earthly bodies a fort of dungeons in which our miferable fouls are benighted and debaled by defires, appetites, and paffions. In the magian philofophy, the Supreme Being was called Oromafdes; was the god of light, or was light irfelf, and reprefented by Mithras, a fubordinate divinity, and the farme with the fun. Another deity of very great power was Arimanes, the god of darknefs, who prefided over matter, and was the origin of ali evil (fee Polytheism).

Vol. XVI. Pait I.

\section*{R E S}

The ancient Gnoftics, who derived their tenets from Refurfece this fource, believed, with Pythazoras and Plato, in a great number of fubordinate genii ; and faid, that Demiurgus, the god of matter and the foul or fpirit of this world, had contrived the bodies of men and brutes; and in the former particulerly, as in fo many prifons, had confined a number of celeftial fpirits, that by expofing them to the low defires of appetite and paffion, he might feduce them from their allegiance to the God of light, and render them more fubmiffive to himfelf. From thefe prifons the Supreme Being was continually making attempts to refcue then; and in the mean time was frequently fending divine meffengers to enlighten and inflruet them, and to render them capable of returning to the regions of light and happinefs, to which they had belonged ( E ).

The Stoics attempted to fimplify this fyftem, which appears ancicntly to lave pervaded Egypt and the eaft, and which would fecm to be no more than varioully modified by Orpheus, Pythagoras, Plato, and others of the more northerly and weftern nations. None of them allowed a creation out of nothing; and the fhaping and modelling of matter into forms was varioufly explained, according as they happened to be moft addiced to fupertition, to morals, or to phyfigs. Some afcribed thefe operations to ancient Time, Chaos, and Darknefs, and explained the future clanges in aature by the genealogies of thefe deities; fome obferving attraction and repulfion, or at leaft a fort of agreement and difcordance among bodies, were inclined to afcribe them to Friendhip and Hatred, or Love and Antipathy; fome oblerving, that while one body rofe another defcended, made Levity and Gravity primary agents; and fome taking notice that living bodies fprung from corruption, were difpofed to confer the fame powers on Moifture and Heat.

The phyfical hypothefes were what had moft charms of the \({ }^{17}\) for the Stoics. From their fyttem immaterial beings stoics, were openly excluded; all things were regulated by phyfical laws or inexorable fate; and all things originated in the \(\mathrm{T}_{3}{ }^{\prime} E\) or the Firfl One, which was probably fuggefted by the minas of Pythagoras. This To \({ }^{\text {En }}\) appears to have been a materia prima devoid of all the qualities of body. In their language it was an \(A_{p} \chi^{n}\) or firgt finciple, not fubject to change. When it was invefted with the properties of body, it then became R
(D) The general doctrine, as delivered here in thefe verfes of Virgil, is the fame with that not only of Pythao foras, but of the Stoics.
(E) Plato made the flars the native refidence of inferior fouls; and when thefe were thoroughly purificd below, returned them home again : and therefore, fays Virgil, alluding to his doarine,
-_ Some have taught
That bees have portions of ethereal thought,
Endu'd with particles of heav'nly fires;
For God the whole created mafs infpires :
Thro' heav'n, and earth, and ocean's depth, he throws
His influence round, and kindles as he goes.
Hence flocks, and herds, and men, and bealts, and fowls,
With breath are quicken'd, and attract their fouls:
Hence take the forms his prefcience did ordain,
And into him at length refolve again.
No room is left for death, they mount the fk ,
Amb to therr own congeniab planets fly.

\section*{R E S}

Refurrec a Ihaxiou or ancement; and then, fo far as refpeted tion. ges qualitics, efpecially its forms, it was fubject to chanfouls of perpetual. matter ( F ). Man was compofed of their four elements, Fire, Air, Water, and Earth; and upon diffulution, every part returned to the element from which it had come, as the water of a veffel fwimming in the fea unites with the ocean when the veftel is broken. This fy tiem, it is plain, cannot poffibly admit of any feparate confcioulnefs of exiftence ( c ). The fame may be Gaid of the fyfems of Deinoerates and Epicurus, and atl thofe who undertook to explain things upon phyfical priuciples ( \(H\) ). The ehief merit of the phyfical fyflems appears to be this: Abfurd as they were, it would feem from the whimfical and the alnoof childih reafoning of Lucretius, that they had a tendency to lead tuankind from extravagant hypothces to fome-

What Ariftotle thought of the feparatc exifence of the foul after death is not very certisin. The foul he calls an Evenexucs and if the reader can divine the meaning of the word, he perhaps can divine the meaning of the Stagyrite, and will then be a better diviner than we. At other times he fays, that the foul is fonething divine; that it refembles the element of the flars; that it is fomething of a fiery nature ; that it is the vicegerent of God in the hody; and that the acntenefs of the fenfes, the powers of the intellect, with the various kinds of appetites and paffions, depend entirely on the qualities of the blood ( 1 ).
Another opinion of very old date was that of the late ingenious Mr IIunter. Aceording to him, the living principle : fides in the blood. This opinion, which is mentioned by Mofes, was adopted by Critias and others of the ancients. Harvey likewife embraced it. But Mr Hunter, who always wifhed to be thought an original, inelines to ftand at the head of the opinion, and fupports it by experiments firnilar to thofe of the farned Taliacotius in neading nofes. Should any of our readers wifh to extract the foul's immortality from fach an opinion, we mut refer them to the many refources
the breath, and that upon the diffolution of the body it maturally vanihed into foft air. The Sadducees denied the cxiftence of either angel or fpirit. Many believed the doctrine of ghofts, and were aectitomed to invoke them at the grave. It is hence that we hear the prophets complaining that they were feeking from the living God unto dead men. Sune imaginet that there was a preexittence of fouls; and, in the cafe of a blind man, aked our Saviour, whetler the man or his parents had fonned that he was hom blind? Others inclined to a revolution of foul and body, and thought that our Saviour wats either Elias or one of the old prophets returned; and a great many new-modelled their opinion of the foul's immortality according to certain paftages in Seripture. The infpired mother of Samenel had faid, "The Lord killeth and maketh alive: he bringeth down to the grave, and bringeth up." Tfaiak lad exclaimed, "[lhy dead thall live; together with my dead body flatl they arife: Awake, and fing, ye that \(d w+11\) in the dult ; for thy dew is as the dew of herbs, ard the earth thall eaf out the dead." i)anitl had declared, that many of them that neep in the dult of the carth thall awake to cverlaftiug life, and forne to thame and everlating contempt. It the vifion of the valley of dry bones, Ezckie! had feen that " at the word of the Lord" the hones came tugether, bone to his bone, the finews and the Helh came upon them, and the Ikin covered them abuve, and the breath eame into the bodies, and they lived and food upon their fect. And a paltage of Jub led them to fuppole, that at fome diflant and fiture period a particular time, which was called the luf or the \(/\) tier disy, was appointed by heaven for the general refurcetion of all thole who are fleeping ia their graves. " 1 know (fiys Job) my Redeemer liveth, and that lie nall thand at the latter day upon the earth; and though after my fkin worns dellroy this body, yet in my fleth lhall I fee God."

Whether thefe paffages were failly interpreted agreeably to their true and uriginal memhuy, it is mos here our hufinefs to inquire. It is Culticient for us to ob ferve, that from them many of the Jews inferred the reality of a general refurrection ( \(k\) ). In this perfuafion, Martha, fpcaking of her brutaer I.azarus, fayṣ to. our Lord, "I know that he Mall rife amain in the refurrection at the lalt day." This refurrection appears
(f) The Apxn of the Stoics appears to be the fame with the \(I, i\) of the Chinefe:
(c) Yet without regarding the inconffency, many of the Stoics belicwed, that the fend continucd feparate. loner after death; though all in general feemed to deny a future ftate of rewards and punillunents.
(H) In his Pbyfial Cofmegony, Plato differed but little from the Stoies; but he had another furt of cofmogony, in which all things appear to have fprung from, and to be almoft wholly compofed of, metaphyfical entities, as. inleas of forms, numbers, and mathematical figures." Thefe kinds of notions were common both to him and Pythagoras; and were originally borrowed from Egypt, iwhere calculation and geometry were half deffied. See Platonism.
(1) The inmortal Harvey has collected thefe different opinions of the Stagryrite in Exercit. 52. Do Generotione Animatism.
(k) At prefent fome are for allowing only thofe of their own nation to thare in the benefits of this refurrece tion; and fome are not even for allowing them, except they be men of piety and virtue. To render this refurrection probable, the rabbins fay, with fome of the Mahometans, that there is a certain bone in the body which refits putrefaction, and ferves as a feed for the next body*. What that bone is, is of no great moment, *See ir as any bone, we believe, in the fkeleton will anfwer the purpofe equally well. With refpect to the manner of risto this refurrection, the learned Hody has quoted feveral opinions of the Jews, and, among others, that of the Chal-
:rec to bave been à general opinion among the Pharifees; for although it was a notion of the feet of the Sadducees that there was no refurreetion, neither angel nor fpirit, yet the Pharifees, we are told, confeffed both. And this affertion is plainly confirmed by St Paul himfelf when his countrymen accufed him before Felix, "I confefs unto thee (fays this eminent apofle), that after the way which they call herefy fo wornlup I the God of \(m y\) fathers, believing all things which arc written in the law and in the prophets, and having hope toward God, which they themfelves alfo allow, that there hall he a refurrection of the dead, both of the juft and unjuft."

This refurrection of the dead to judgment, though ians. not perhaps in the fame fenfe in which the old Pharifees conceived it, is now generally and almolt univerfally ( \(L\) ) maintained by Chriftians ( \(M\) ). Yet the Chriftians differ confiderably with refpect to the nature of the hurann foul. Some imagine, that this fipirit is naturally mortal, and that it is propagated along with the body from the loins of the parent. In fupport of this opinion, it has been obferved that a great number of infects and plants transfer their lives to their poferity, and die foon after the act of propagation ; that after this act the vital principle is in the moft vigorous of plants and animals always found to be much exhaufted; and that 'Tertullian a father of the church, in attempting fome experiments of the kind, became fubject to a mnomentary blindnefs, and feit a portion of his foul going out of him ( s ).

Thefe imagine that immortality was only conditionally promifed to man; that Adam forfeited this inmortality by his difubedience; and that Chrit has reftored us to the hopes of it again by lis fufferings and death : for as in Adam we have all died, fo in Chrith, they Gay, we fhall all be made alive; and that now the fting is taken from death, and the vietory over our fouls from the grave.

Others have conceived the human foul as naturally immortal, and as fetting death and the grave at deflance. Adam, they fay, died only in a figure; and only from the coniequences of this figure, which means
fin, has our Lord fared ws. In this renfe Adam died on the very day in which he had finned; or he died li. terally in 1000 years, which with the Lord are as one day. To the ere arguments their opponents reply, What then is the victory over death and the grave? You munt ftill have recourfe to a new figure, and betake yourfelved to the fecond death; though, after all, where is your grave? To this it is anfwered, that the foul of itfelf is naturally immortal, and that it depends not either for its exiftence or the excrcife of its faculties upon the body; that the propertics of matter, as figure, magnitude, and motion, can produce nothing that is like to perception, menory, and confcioufnefs. This is true, re, join their opponents; but befides thefe few properties of matter, which are only the objects of that philofoplyy which has lately and properly been termed mechanial, the chemical philofophy has difcovered other properties of matter; has found that matter is of various kinds; that it very often does not act mechanically ; that it acquires many new properties by combination; and that no man, till farther experiment and obfervation, fhould venture to affert how far the foul is or is not dependent on its prefent organifed fyftem. The others, proceeding on their hypothetis, maintain that the foul, as being immaterial, is not divifible; and though the body of a frog may live without the head for a whole day; though the body of a tortoife may live without the head for a whole month ; though a human limb may for fome minutes after amputation continue to perform a vital motion, independent of a brain, a ftomach, or a heart; and though the parts of a plant, a polype, or a worm, may furvive their feparation and become living wholes*,* See Fols. yet the foul, they obferve, is not to be compared with pas and \(R_{c}\) the vital principles of plants and animals, nor ought to \({ }^{\text {prodiflion. }}\) be divided on reafons fo flender as thofe of analogy. Even granting, they fay, that the foul were not naturally immortal of itfelf; yet the juftice of God, which is not remarkable for its equal diftribution of rewards and punihments in the prefent world, is bound to make fome amends in the next. And to this again their op: ponents anfwer, as to the equal diftribution of juftice in a future world, of that we are aflured on much betR 2
dee paraphraf of the Canticles, afferting that the prophet Solomon had faid, "When the dead fhall revive, it fhall come to pars that the Mount of Olives fhall be cleft, and all the dead of Ifrael farll come out from thence; and the jult too that died in captivity fhall come through the way of the caverns under the earth, and fhall come forth out of the Mount of Olives." He has likewife quoted Saunderfon's Voyage to the Holy Land, in which, we are told that many of the Jews, by their own account, are to rife up in the vellcy of Jehofaphet; and that in the rowting or devolution of the caveras, thofe at a diftance mult fcrape their way thither with their nails.
(L) The feet of the Quakers explain it figuratively.
(m) The laft quoted author* (Refurrection of the fame Body, aferted from the traditions of the Heathens, * Hodys the ancient Ferus, and the primitive Church) has endeavoured to fhow that this doctrine, in the fame fenfe as we undertand it, has been afferten by the ancient magi, and by the prefent heathen gaurs of Perfia, the relics of the ancient magi ; by fome of the ancient Arabians; by fome of the banians of India; by the prefent inlabitànts of the inand of Ceylon, of Java, of Pegu, of Tranfiana; by fome amongft the Chincfe; by the Arderians in Guinea; and by the ancient \({ }^{1}\) 'uflians. The proofs which he brings, it muft be confefled, are not however always very fatisfactory. It appears, even from his own aceount, that fome of thefe had derived their notions from certain Chriftians, Mahometans, or Jews. But the reader may judge of the great accuracy of his ideas from His bringing old Pythagoras and the Stoics; and even Democritus and Epicurus, in fupport of the fame or a fimilar opinion.

\section*{\(R\) E S [ 132 ] R E S}

Refurrece ter grounds than any of your's : our Lord has declared 110!.

22
Place of
the dead near to the grave.
it in exprefs terms; and whether the foul be inmortal or not, we can ealily bclicve what he faid is true, as we know him whom we have trufted.

Thefe, with Phato, fuppofe, that the foul is here as in prifon; though how or at what time it fhould firft have come into this dungeon they have not determined. They have only agreed, that upon its culargement all its faculties are in receive an increafe of power ; and "ha. ving already cquipped it fo exquifitely with confcioufinefs, activity, and perception in and of itfelf, and put it into fo complete a capacity for happinefs and mifery in a feparate llate," their hypothelis does not requise them to adnit the leaft occalton for a refurrection; which accordingly is faid to have been an article of Baxter's creed (0).

A third opinion, which extends likewife to every fecies of plant and animal, is, that all fouls were created at once with bodies of ether; that thefe badies, occupying only a very fmall fpace, were packed up in their firit progenitors, and there left to be afterwards evolved and clothed with matter of a groffer kind by acts of gencration and confequent nutrition. For the proof of this theory we are referred to the fmall animals ieen through the microfeope, and likewife to thofe which are fuppofed to efcape even microfcopic obfervation ; but, above all, to the eggs of infects, which, though fcarcely perceptible, yet contain in embryo a future caterpillar and all its coats, and within thefe a future butterfly with its legs and wings. Thefe philofophers can perhaps account for the general taint of original fin in fome other way than bas hitherto been done. We have only to add, that on their fcheme the refurrection is not a matter that feems to be indifferent.

The next thing that falls to be confidered is the place of the dead. From a natural enough affociation of ideas, an opinion had very early prevailed, that the fpirit continued near to the body; and the offerings therefore intended for the dead were by moft nations prefented at the grave; and that on which the departed fpirit is fuppofed to reft is always placed near the grave in China.

From the dreans of the night and the natural tendency of the fancy to work and to fummon up fpectres when the world around us is involved in darknefs, it has alfo been imagined, that thefe fpirits delight in the night and fladow of death ( P ), or have been prohibited from enjoying the exhilarating beams of day. And hence we are told,

That in the difmal regions of the dead 'Th' infernal king once rais'd his harrid head ;
Leap'd from his throne, left Neptune's arm hould bay
His dark dominions open to the daj,
And pour in light.
The nations, therefore, who have fancied a general receptacle for the dead, have thus bern induced to
place it in the weft (Q), where the night begins and Refeco the day ends. That part of the world which, in the divifon of his father's dominions, fell to Pluto the infernal god, and where, according to Lactantius, satan In th holds the empire of darknefs, the Friendly Inanders wen have placed to the wellward of a certain ifland which they call Tejee; fome tribes of American Indians, in a country beyond the wettern mountains; and Homer, fomewhere to the weftward of Gisece at the boundarics of the occan,

Where in a lonely land and gloomy cells
The dunky nation of Cinmeria dwells;
The fun ne'er views th' unconnfortable feats
When radiant he advances nor retreats.
Unhappy race! whom endlefs night invades,
Clouds the dull air, and wraps them round in flates.
Another opinion entertained by the Greeks and fome Unde by other nations was, that the place of departed fpirits is earth under the earth. 'I'his opinion is frequently mentioned in Homer, in Virgil, and alluded to by the Jewifh prophets. As for the prophets, we know the cireumitance from which they borrowed it: it was borrowed from thofe fubterraneous vanles where their chiefs were buried, and which have been deferibed by modern travellers. In the fides of thefe caverns there is ranged a great number of cells; and in thefe cells the mighty lay in a fort of ftate, with their weapons of war and their fwords at their head. To thefe kinds of Egyptian ce. meteries Ezekiel alludes, when he fays, "that they flall not lie with the mighty that are fallen of the uncircumcifed, who are gone down to hell with their weapons of war, and they have laid their fwords under their head." And Ifaiah, when thus fpeaking of the prince of Bao bylon, "Thou fhalt be brought down to hell, to the fides of the pit. Hell from beneath is moved for thee, to meet thee at thy coming; it firreth up the dead for thee, even all the chief ones of the earth; it hath raifed up from their thrones all the kings of the riations. All the kings of the nations, even all of them, lie in glory, every one in his own houfe."

Many of the ancient fathers of the church afferted in hidit only, that the dead are now in abditis receptaculis, or in receptas certain hidden and concealed places.

Orphens, Origen, and fome others of the fathers, \(\mathrm{In}^{27}\) the with the ancient Caledonian bard Offian, and the learned Dodwell among the moderns, imagined that the foul, when it left the body, went into the air, and refided fomewhere between the furface of the earth and the moon.

Thofe who believed in a tranfmigration caufed the \({ }^{2}{ }^{28}\) foul at death only to enter a new body, and kept the dies. departed always with the living. 'This creed has been found in India, in Egypt, in Mexico, and in all thofe countries where picturc-writing has been much ufed. In this fpecies of writing, the fame picture is on fancied analogy transferred by metaphor to fignify ei-
(o) An Hiforical Iricw of the Controverfy concerning an Intermediate State, and the Separate Exiflence of the Soul.
(p) Some Turkin ghofts are an exception, who ufe lamps or candles in cheir tombs, when their friends choofe to fupply them with thefe luxuries.
 "O my friends! which is the weft, or which is the eatt, the place of darknefs, or that of the morning, we cansot leara.'

\section*{R E S} an . Inppoied that the loul was aiter death obiged to animate every fpecies of bird and quadruped, of reptile and infect, and was not to return to a human form till after a period of 3500 years. Others have confined their tranmigrations to particular animals, as the foul of man to the human form, and the foul of the brute to the bodies of the fpecies to which it belonged. Some have changed the brute into man, and man into the brute, that man might fuffer injuries fimilar to what he had inflicted, and the brute retaliate what he had fuffered. Others have confined the human foul in plants and in ftones ; and Bell of Antermony mentions an Indian who fuppofed that his anceftors might be in fifhes.

The notions of Homer were probably thofe of many of his time. But thefe notions were difmal indeed. When his hero Ulyffes vifited the frades, many of the ghofts feemed to retain the mangled and ghaftly appearance
which they had at death ; and, what is worfe, feemed Refurree. to be all ftarving with hunger, innumerable multitudes, with lund fhrieks, flocking to the fteams of his fain victim as to a moft fumptuous and delicious banques.
For fcareely had the purple torrent flow'd,
And all the caverns Imok'd with ftreaming blood,
When, lo! appear'd along the dunky coafts
Thin airy floals of vilionary ghofts;
Fair penfive youths, and foft enamour'd maids,
And wither'd elders, pale and wrinkl'd fhades.
Ghafly with wounds, the forms of warriors flain,
Stalk'd with majeftic port, a martial train.
There, and a thouland more, fwam'd o'er the ground,
And all the dire affembly fhriek'd around.
Ulyfles faw, as gholt by ghoit arofe,
All wailing with unutterable woes.
Alone, apast, in difcontented mood,
A gloomy fhade, the fullen Ajax ftood;
For ever fad, with prond diidain he pin'd,
A nd the loft arms for ever ftung his mind.
Upon Ulyfis fiying to dichilies,
Alive, we hail'd thee with our guardian gods;
And, dead, thou rul'tt a king in thefe abodes ;
The flade refly'd:
Talk not of ruling in this dol'rous gloom,
Nor think vain words (he cry'd) can eafe my drons
Rather I choofe laboriounly to bear
A weight of woes, and breatine the vital air,
A slayeto some poor hindthat toils for bread,
Than life a scepter'd monarch of the dead.
In this gloomy region no one is rewarded for his vir. tue, nor is punilled for his crimes, unlefs committed, like thofe of Sifyphus, Tantalus, and Ixion, againlt the gods. All indeed are claffed into groups, from a certain analogy of age, fex, fate, and difpofition; but all appear to be equally unhappy, having their whole heart and affections concentrated in a world to which they are fated never to return.

The Elyfium of Homer is allotted only for the rela. tions and defcendants of the gods ; and Menelaus goes to this country of perpetual fpring ( T ), not as a perfon of fuperior merit, but becaufe be bad married the daughter of Jove.

Even long after a future ftate had become the feene Becomes a of rewards and punifiments, thefe for the moft part ilace of rewere diftributed, not according to moral, but phyfical wards and diftinctions. With the Greeks and Romans, the foul \({ }^{\text {punich- }}\) was condemned to many calamities for a number of ments
(R) A military gentleman who refided at Penobfcot during the late American war, affured us that the Indians, when defired to fubfcribe a written agreement, drew always the picture of the object or animal whofe name they bore. But for fuller information on this fubject, fee Clavigero's Hift. of Mexico.
(s) The quetlion which the Sadducees put to our Saviour about the wife of the feven brothers, is a proof that the Pharifees thought there was marriage and giving in marriage in the future flate, and that it was fomewhat fimilar to the prefent.
(r) Homer fends the ghof of Hercules to the fhades, while Hercules himfelf is quaffing nectar with Hebe in the fkies. One foul of the hero is therefore repining with the ghofts of mortals in the regions below, while the other is enjoying all the happinefs of the gods above. (See Odyssey, B. II. near the end). Philofophers fince have improved on this hint of the poct; and men have now got rational, animal, and regerable fouls, to which fometimes a fourth one is added, as properly belonging to matter in general. Homer ininuater, that Menelaus was to be tranflated to Elyfum withont tafting death. This Elyfium is the habitation of men, and not of ghofts, and is defcribed as being fimilar to the feat of the gods. Compare Ody/J. iv, L 563. and Ody/J. vi, 1. 43 . is the Greek,

Rcrurece years, if the body was not honoured with funcral rites. tion. Among the Seandinavians, a natural death was attendcd with infamy, while a violent death, particularly in battle, gave a title to fit in the halls of Odin, and to quaf lieer from the fikulls of enemies. Among the T"lafealans, it was only the great that were permitted to animate birds and the nobler quadrupeds; the lower ranks were transformed into weafels, into pautery beetles, and fuch mean animals. Among the Mexicans, thofe who were drowned, who died of a droply, tumors, or wounds, or fuch like difeafes, went along with the children that had been facrificed to the god of water, and in a cool and celightfal place were allowed to indulge in delicious repafts and varieties of pleafures: thufe who died of other difeafes, were fent to the north or centre of the earth, and were under tbe dominion of the gods of darknefs. "The fuldiers who died in battle, or in captivity among their enemies, and the women who died in labour, went to the houfe of the fun, who was confidered as the prince of glory. In his manfions they led a life of enollefs delight. Every day the foldiers, on the firlt appearance of his rays, hailed his birth with rejoicings and with dancings, and the mulie of inftruments and voices. At his meridian they met with the women, and in like feftivity accompanied him to his fetting. After four years of this glorious life, they went to animate clouds, and birds of beautiful feathers and of fweet fong; but always at liberty to rife again, if they pleafed, to heaven, or defcend to the -Ctavigero'searth, to warble their fongs, and to fuck flowers *."

Binctions.

Thefe fentiments of a future ftate, conceived in a favage and a rude period, could not lons prevail among an enlightened and civilized people. When the times of rapine and violence therefore began to cenfe; when focieties regulated by certain laws began to be eltablik. ed; when martial prowels was lefs requitite, and the qualities of the heart had begun to give an importance to the character, the future ftate was alfo modelled on a different plan. In the Eneid of Virgil, an author of a highly cultivated mind, and of polifhed manners, it becomes a place of the mont impartial and uncrsing juitice ; every one now receives a fentence fuited to the attions of his pan life, and a god is made to prefide in judgment;

Who hears and judges each conmitted crime,
Inquires into the manner, place, and time.
The confeious wretch muf all his aets reveal,
Loth to confefs, unable to conceal,
From the firk moment of hic vital breath,
To the laft hour of unrepenting death.
The frinits of the dead no longer mingle together as in the lefs enlightenal period of Huncr ; the vicious are difniffed to a place of torments, the virtuons fent to regions of blifs: indifferent characiers are con-
- Or para-
dift offools. fined to a limbus *; and thofe who ale too vituous for hell, but too much polluted with the thains of vice to enter heaven without preparation, are for fome tine dettained in a purgatory.

\section*{35 \\ Virgil's}
purgatory.

For there are varius fenancee enjoin'd,
And fome are hang to bleach upon the wind ;
Some pleng'd in waters, others purg'd in fires,
Till all the dregs are drain'd, and rutt expires;
Till nothing's left of their habitual ftains,
But the pure ether of the foul remais.

When thus purified, they become fitted to receive Refurre the rewards of their paft virtucs, and now enter into thofe regions of happinels and joy.
Witb ether vefted, and a purple iky,
The blifful feats of happy fouls below,
The blifful feats of happy fouls betow,
Stars of their own, and their own funs they know;
Where patriots live, who, for their country's good,
In fighting fiolds were prodigal of blood.
Prietts of nublemifh'd lives here make abode,
And poets worthy their infpiring god;
And fearching wits, of more mechanic parts,
Who grac'd their age with new-invented arts:
Thofe who to worth their bounty did exteed:
And thofe who knew that bounty to commend.
Thefe good men are enraged in various amufements, according to the tafte and genius of each. Orphens is ftill playing on his harp, and the warturs are ftill delighted with their chariots, their horfes, and their arms.

The place of torment is at fome didance.
A gaping gulph, which to the centre lies,
And twice as deep as earth is diltant from the fikies:
From hence are leard the groans of ghofts, the pains
Of founding lahes, and of dragging chains.
Here, thofe who brother's better claim difown,
Expel their parents, and ufurp the throne;
\(D=\) fraud their clients, and, to lucre fold,
Sit brooding on unprofitable gold.
Who dare not give, and even refufe to lend,
To their poor kindred, or a wanting friend.
\(V\) aft is the throng of thefe ; nor lefs the train
Of lufful youths for foul adult'ry lain.
Hofts of deferters, who their honour fold, And bafely broke their faith for bribes of gold:
All thefe within the dungeon's depth remain, Defpairing pardon, and expecting pain.

The fouls of bales, of unhappy lovers, and fome nis \(\frac{38}{38}\) others, feem to be placed in a paradife of fools refid-dife of ing in a quarter diftinet from Elylian 「artarus and Pur- foole gatory.

It is curious to obferve, how much thefe ideas of a. future fate differ from the vague and fimple conjectures of rude nations; and yet from their fimple and ruse conjetures, we can eafily trace the fuccelfive changes in the writings of Homer, Plato, and Virgil ; and may eafily fhow, that thofe laws which different nations have preferibed for their dead, have always burne the lhengted analogy to their flate of improvement, their fyltem of opinions, and their moral attainments. Some nations, as thofe of India, have fancied a number of heavens and hells, correfponding to fome of their principal fhades in virtue and vice; and have filled each of thefe places refpectively with all the feenes of happinefs and milery, which fiendithip and hatred, admiration, contempt, or rancour, could fuggett. But having already obferved the progrefs of the human mind in forming the grand and leading ideas of a future ftate, we nuan not to defeend to the modifications which may have occorred to particular nations, feets, or individuals.

The belief of Chrittians refpecting foterity demands our attention, as being founded un a different principle, The five pamely, on exprefs revelations from heaven. From in the dead many exprefs declarations in Seripture, all Chriftians in scrip. feem to be agreed, that there is a beaven appointed forture.

\section*{RES}
efurrec- the good and a bell for the wicked. In this heaven tion. the faints dwell in the prefence of God and the uninterrupted fplendors of day. Thofe who have been wife fine as the firmament, and thofe who have converted many to righteouinefs as the fars. Their bodies are glorious, immortal, incorruptible, not fubject to difeafe, to pain, or to death. Their minds are Arangers to forsow, to crying, to difappointment ; all their defires are prefently fatistied; while they are calling, they are anfwerel; while they are feeaking, they are heard. Their mental faculies are alo enlarged ; they no more fee things obfcurely, and as through a cloud, but continually beholding new wouders and beauties in creation, are confantly exclaining," Holy, holy, holy! is the Lord of Hoits, worthy is he to reccive grory, and honour, and thankfgiving; and to hins be aferibed wifdom, and puiver, and might; for great and marvellous are his works, ad the whole univerk is fill d with his glory."
'Fheir notions of hell differ confiderably. Some underftanding the Seriptures literally, have plunged the wicked into an abyfs without any bottom; have made this gulph darker than migbt; have filled it with rancorous and inatignant fpirits, that are worfe than furies; and have deferibed it as full of fulphur, burning for cver. 'This frightful gulph has by fome been placed in the bowels of the earth; by fome in the funt; by fome in the moon; and by fome in a comet: but as the Scriptures have determined nothing on the fubject, all fuch conjectures are idle and groundlefs.
Others imagine, that the fre and fulphur are here to be taken in a figurative fenfe. Thefe fuppofe the torments of hell to be troubles of mind and remorfes of confeience ; and frpport their opinion by obferving, that matter cannot act upon fpirit; forgettiug, pei haps, that at the refurrection the fpirit is to be cluthed with a body, and, at any rate, that it is not for man vainly to preferibe bounds to Omnipotence.
What feems to bave tortured the genius of divines much more than leaven or hell, is a riddle flate. On this fubject there being little revealed in Scripture, many lave thought it incumbent upon them to lupply the defect; which they feem to have done in diferent ways. From the Scriptures fpeaking frequently of the dead as 月eeping in thei. graves, thofe who imagine that the powers of the mind are dependent on the body, fuppofe that they feep till the reiurtection, when they are to be awakened by the trump of God, reanited to their bodice, have their facultics relfored, and their lentcnet anarded.

This opinion rhey fupport by what St Yeter fays in the Acts, that David is not afeended into heaven; and that this patriarch could not pullibly be freaking of himide when he faid, "Thou wilt not leave niy foul in hell, i. e. the place of the dead." They obferve, too, that the victory of Chrift over death and the grave fetms to inply, that our fouls are fubject to their pewer; that accordiugly the Scripture fpeaks frequently of the foul's drawing near to, of its being redeemed from, and of its defcending into, the grave ; that the Pfalmit, however, declares plainly, that when the breath of man goeth forta, he returneth to his earth, and that very day his thoughts perifa. And hould any one choofe to confult Ecclefiaftes, he will find, that the living know that they fhall die, but that the dead know not any thing: that their love, and their hatred, and their envy, are perifhed; and that there is so work \(\mathrm{m}_{\text {n }}\) nor device, nor

\section*{135 J R E S}
widdom, nor knowledge, in the grave, whether they Refurrece are gone.

Thofe who believe that the foul is not for the exercife of its faculcies dependent on the body, are uponits feparation at death obliged to difpofe of it fome other way: In eftablinhing their theory, they ufually bergin with attempting to prove, from Scripture or tradition, bath its active and feparate exillence; but with proofs from tradition we intend not to meddle. Their arguments from Scripture being of more value, deferve our ferious confideration : and are nearly as follow.

Abrahan, they fay, Ifaac, and Jacob, are ftill living, Becaufe Jchovah is their God, and he, it is allowed, is not the God of the dead, but of the living. But their npponents reply, That this is the argument which our Siaviour brought from the writugs of Mofes to prove a future refurrection of the dead; and that asy perfon who louks into the context, will fee it was not meant of a middle ftate. From the dead living unto God, our Saviour infers nothing more than that they Gall live at the refurrection; and that thefe gentlemen would do well in future to make a diftinetion between fimply living and living unto God: For though Abraham, Ifaac, and Jacob, be living unto God, our Saviour hans aflured us that Abraham is dead, and the prophets dead.

A lecond argument is that glimple which St Pavt had of paradife about it years before he had written his Secoud Epiftle to the Corinhhans. To this argument their opponents reply, 'that as St Paul could not tell whether, on that occafion, he was out of the body or in the body, it is more than probable that the whole was a vifion; and, at any ratc, it is no procof of a fepasate exiltence.

A third argument is, St Patl's wifhing to be abfent from the body, and prefent with the Lord. But, fay their opponents, St Paul defired not to be inclothed, but to be clothed upon: and as fome of thofe who maintain a feparate exiltencee, bring Scripture to prove that the budy \(|\mid\) continaes united to Chrilt till the refurrec- \(\|\) Sborter tion; in that cafe, St Paul, if he withed to be prefent Catecbijmes with the Iord, flould have rather remained with his bodv than left it.

A fouth argument is, the appearance of Mofes and Elias upon the mount of transfiguration. To which thicir opponents reply, that thefe famis appeared in their bodies; that Elias was never divelted of his body; and that the account which we have of the burial of Mofes, has icd fome of the abteft crities and foundeft divines to conclude, that he wais likewife tranflated to heaver without talting death. At any rate, fay they, he might have been raifed from the dead for the very purpofe of being. prefent at the transfiguration, as the bodies of other faints certainly were, to bear teltimony to our Lord's refurrection and victory over the grave.

A fifth argument is, what our Saviour faid to the thief, "Verily I fay unto thee, to day thou fhalt be with me in paradif." The objeclion ufually made here is, that the expreffion is evidently ambiguous, and that the fenfe depends entively on the punctuation: for if the point be placed after to-day, the meaning will be "Verily, even now, I tell thee, thou thatt be with me in paradife." But the import of paradife in this 1 lace, fay the opponents, is likewife doubtful. We learn fom St Peter's explanation of the xGti. Pfaln, that our Sa-
yiour's

Refurpeg viour's foul was not to be left in hell; and we know tion.
\({ }^{45}\) church

\section*{of Rome}

\section*{dilp pofes a} purgatory.

\section*{47} Oihers furfore that the fuul after death enters a fare of rewards and punillnents in a certain degre.
that on the day of his erncifixion he went not to heaven: for after he had rifen from the place of the dead, he forbade one of the women to touch him, as he had not yet afeended to the Father. Hell, therefore, and faradic, continue they, feem to be in this paffage the very fame thing, the place of the dead; and our Savionr's intention, they add, was not to go to heaven at that time, but to how his vietory over death and the grave, to whofe power all maukind had become fubject by the difobedience of their lirit parents.
Without pretending to enter into the merits of this difpute, the ingenious Bumet, in his Theory of the "Earth, endeavours to prove, upon the anthonity of the ancient fathers, that paradife lies between the earth and the moon; and the learned Dodwell, on the fame allthority, las made it the conmon receptacle of fouls till the refurrection; but has not told us whether or not they are to be accountable for the actions of this Separate exiltence at the latter day, or are only to be judred according to the deeds that were done in their bodies.

This notion of a common receptacle has difpleafed many. The flate of purgation, obfeurely hinted in the doctrines of Pythagoras, and openly awowed by Plato and Virgil, has been adopted by the Romifh divines, who fupport their opinion on certain obfeure paflages of feripture, which are always of a yielding and a waxen nature, may caffly be twifted to any hypothefis, and like general lovers efponfe rather from interef than merit.
It has difpleafed others, becaufe they are anxions that the righteous fhould have a fore-tafte of their joys, and the wicked of their torments, inmediately after death, which they infer to be certainly the cafe from the parable of the rich man and Lazarus( \(v\) ). But to this it is objected, that the rich man is frppoled to be in hell, the place of torments, and that this punifhment ought not to take place on their own hypothefis till after the fentence at the refurrection.

A nother argument effed for the intermediate fate is the vifion of St John in the Apocalypfe. In this vifron the Evangelit faw under the altar the fouls of thofe that were flain for the word of God and for the teftimony which they held. Their opponents doubt whether thefe vifible fouls were immaterial, as St John heard them cry with a loud voice, and faw white robes given unto every one of them. If they had hodies, that circumftance might chance to prove a refurrection immediately after death, and fo fuperfede the general refurrection at the laft day.

While fuch conclufions as are here drawn from the parable and vifion, fay the oppofers of an intermediate confcious exiftence, imply that the dead are already raifed, and are now receiving the refpective rewards of their virtues and their crimes; thofe who maintain an intermediate feparate exiftence, who fpeak of the body as a prifon, and of the foul as receiving an increafe of power when freed from the body, are certainly not more than confiftent with themfelves, when they think that this foul would derive an advantage from its after union with either a new fyftem of matter or the old one, however much altered. Baxter, they fay, who faw the in-
confiftency, was difpofed to reafon fomewhat like Ji. Refurr neas,

O, Father! can it be that fouls fublime
Return to vifit our terreftrial clime?
Or that the gen'rous mind, releas'd at death,
Should covet lazy limbs and mortal breath ?
In no one inftance, they continue, have Chriftians perhaps more apparently than in this argument wretted the feriptures to their own hut : by thus rafly attemping to accommodate the facred doctrines of religion to a preconceived philofophical hypothefis, they have laid themfelves open to the ridicule of deifts, and have been obliged, for the fake of confiftency, either to deny or to \{peak fightingly of the relurrection; which is eertainly the furef foundation of their hope, feeing St Patll hath aflured us, that if there be no refurrection of the dead, then they which are fallen afleep in Chrit are perifhed, and thofe who furvive may eat and drink, and act as they pleafe, for to-morrow they die; and die, too, never to live again.

Though this reproof may be rather fevere, we are forry to oblerve that there feems to have been fometimes too much reafon for it. A certain divinet, whofe picty was eminent, and whofe memory we refpect, having written "An Effay toward the proof of a Ceparate State of Souls between Death and the Refurrec. tion, and the Commencement of the Rewards of Virtue and Vice immediately after death," has taken this motto, "Becaufe fentence againft an evil work is not excelited ipcedily, therefore the heart of the fons of men is fully fet in then to do cvil." "The doctrine, he fays, of the refurtection of the body and the confequent ftates of heaven and of hell, is a guard and motive of divine force, but it is renounced by the enemies of our holy Chriftianity ; and fhould we give up the recompenfes of feparate fouls, white the deif denies the refurrection of the body, I fear, between both we thould fadly enfecole and expofe the caufe of sirtue, and leave it tuo naked and defencelefs."

This author, who wifhes much that the punifhment of crimes thould follow immediately after death, is of opinion, that if heaven intended to check vice and impiety in the world, it has acted unwifely, if it really has deferred the punifhment of the wicked to fo late a period as the refurrection. "For fuch, he obferves, is the weaknefs and folly of our natures, that men will not be fo much influenced and alarmed by diftant profpects, nor fo folicitous to prepare for an cvent which they fuppofe to be fo very far off, as they would for the fame event if it commences as foon as ever this mortal life expires. The vicious man will indulge his fenfualities, and lie down to neep in death with this comfort, I mall take my reft here for 100 or 1000 years, and perhaps in all that fpace my offences may be forgotien; or let the worit come that can come, I thall have a long fweet nap before my lurrows begin: and thus the force of divine terrors is greatly enervated by this delay of punifhment."

Thus far our author, who thinks that his hypothefis, if not true, is at leaft expedient, and that from motives of expediency it ought to be inculcated as a doctrine
(v) Whitby fhows that this parable was conformable to the notions of the Jews at that time; and even the Mahometans, who believe in the refurrection of the dead, fuppofe likewife a fate of rewards and puaifmments is the grave.

\section*{R E S}
trine of Scripture; but how far his reafons can be here juftified we mean not to determine; we fhall leave that to be fettled by others, reminding them only that the diftance of future rewards and punifhments is not greater on the fuppofition of the nleep of the foul than on the contrary bypothefis. Every man who has but dipt into the fcience of metaphyfics knows, and no man ever knew better than he who is believed to hare been the author of the work before us, that time unperceived paffes away as in an inftant; and that if the foul be in a ftate void of confcioufnefs between death and the refurrection, the man who has lain in his grave ros0 years will appear to himfelf to have died in one moment and been raifed in the next. We would likevife recommend to thofe who may henceforth be inclined to inculcate any thing as a dectrine of Seripture merely on account of its fuppofed expediency, always to remember that God is above, that they are below, that he is omnifcient, that they are of yefterday and know little, that their words therefore fhould be wary and few, and that they fhonld always fpeak with refpect of whatever concerns the Sovereign of the univerfe, or relates to his government either in the natural or moral world. For wilt thou, fays the Highetl, difannul my judgement? Wilt thou condemn me that thon mayef be righteous? fhall he that contendeth with the Almighty infruct hin? He that reproveth God let him anfwer it.

If, in ftating thefe oppofite opinions, we may feem to have favoured what has been called the fleep of the foul, it is not from any conviction of its truth, for there are particular texts of Scripture which appear to us to militate againft it. We are fatisfied, however, that it is a very harmlefs opinion, neither injurious to the reft of the articles of the Chriftian faith nor to virtuous practice; and that thole who have poured forth torrents of obloquy upon fuch as may have held it in fimplicity and godly fincerity, have either mifaken the doctrine which they condemned, or been poffeffed by a fpirit lefs mild than that of the gorpel (x).

Whatever be the fate of the middle ftate, the refurrection ftands on a different bafis. It is repeatedly af. - ferted in Scripture; and thofe grounds on which we believe it are authenticated facts, which the affectation, the ingenuity, and the hatred of fceptics, have numberlefs times attempted in vain to difprove. Thefe facts we are now to confider, referring our readers for the character of the witneffes, the authenticity of the go-fpel-hiftory, and the poffibility of miracles, to the parts of this work where thefe fubjects are treated (See Miracle, Metaphysics, Part I. Chap. vii. and Religion) ; or, thould more particular information be required, to the writings of Ditton, Sherlock, and Weft.

Our Lord, after proving his divine miffion by the miracles which he wrought, and by the completion of ancient predictions in which he was defcribed, declared

Vol. XVI. Part I.
that the doctrine of a refurrection was one of thofe truths which he came to announce. To fhow that fuch an erent was pofible, he reftored to life the daughter of Jairus, a ruler of the fynagrogue, a young man of Nain, who was carried out on his bier the pu:T. friend Lazarus, whofe body have become the prey ofy at the time was thought to our Safirt of thefe miracles were wrought in the prefeece of fing feveral a number of witneffes, yet the laft, owing to particular perfons circumftances, produced a much greater noife among from the the Jews. It was performed on a perfon feemingly of dead; fome note, in the village of Bethany, not far from Jerufalem, and in the prefence of a great many perfons who from the metropolis had come to condole with Mary and Martha. No doubts were entertained of the reality of Lazarus's death. Our Lord was at a diftance when he expired, and his body had already been lying for fome days in the grave. When he came forth at the voice of our Lord, all were altonifhed. 'Thofc from Jerufalem, on returning home, are impatient to relate what they had feen ; thofe who heard of fo memorable an event cannot conccal it ; the report reaches the ears of the Pharifees and chief priefts. They are foon made acquainted with every circumftance ; and dreading the iffue, they think it neceffary to call a council upon the occafion, and concert the meafures that ought to be purfued in a matter which was likely to be attended with fo many and important confequences. In this council, it feemed to be agreed that our Lord had performed, and was fill continuing to perform, many miracles: That this laft miracle, as being of an extraordinary kind, would make many converts; and that if meafures were not fpeedily taken to prevent thefe uncommon difplays of his power, all would believe on him : the jealouly of the Romans would be excited, the rulers depofed, and the nation of the Jews deprived of its few remaining privileges. Yet, notwithtanding thefe private conceffions made in the conncil, the members who dreaded to let their fertiments be known to the people, affect in public to treat our Saviour as an impoftor. But he who already had demonftrated the abfurdity of their opinion, who fuppofed that his miracles were wrought by Beclzebub prince of the devils, is again ready to confute the ridiculous affertion of thofe who pretended to fay that they were a deception. His friend Lazarus was ftill living at the diftance of only a few miles, and many of the Jews who had gone to fee him were ready to attelt the truth of the report. If the rulers, apprehending the confequences of the truth, be afraid to know it, and if they are unwilling to go to Bethany, or to fend for Lazarus and thofe who were prefent at his refurrection, our Lord gives them a fair epportunity of detecting his fraud, if there was any fuch to be found in lim. To preferve their power, and remove the jealous fufpicion of the Romans, it had becu already determined in council to put him to deatis; anis auready cetermined in comel S put him to deatir ; ans S
(x) Perhaps no man has been more culpable in this refpect than the celebrated Warburtor, who feerrs at firt to have himfelf denied an intermediate ftate of confcious exiftence. He afterwards imagined that fich a flate is fuppofed, though not exprefsly afferted, in Scripture ; and at laft he maintained it with all the zeal and warmth of a profelyte. To prove the funcerity of his converfion, he treated his advenfaries with fcumilous nicknames, banter, and abufe; a fpecies of reafoning which feldom fucceeds in recommending a bad caufe, and which never corfers credit on one that is good.

\section*{R E S}

Refurrec. our Lord foretels that the third day after his death he tion.
flall rife from the grave. Here no place was referved for deception. The fect of the Pharifees and the chief priefts are openly warned and put upon their guard; and, very fortunately for the caule of Chriltianity, this Engular predietion was not heard with fcom, or indeed, if with forn, it was only affected. We know from the fentiments expreffed in the comeil, that our Lord was fecretly dreaded hy the rulers; that his miracles were far from being diferedited ; and that his predictions, in their private opinion, were not to be flighted. The means aceordingly which they employed to prevent, even in the very appearance, the completion of his prophecy, were admirably calculated to remove the fcruples of the moft wary and feeptical inquirers, if their object was only to feach after truth. At the next feftival of the pafsuver, wherr the feheme o! Caiaphas was put in exccution, and when it was deemed expedient by the council that he thould die, to fave the nation from the jealoufy of the Rumans; as a proof of their fteady loyalty to Rome he was apprchended, was tried as an eneiny to her govermment, was at lait condemned upon falfe evidenee, and furpended on a crofs until they were fully fatisfied of his death. Even after his death, the fpear of a fuldier was thrult into his fide; and the water that gufhed out with the blood is a proof to thofe who are acquainted with the itructure and economy of living bodies, that he mult have been forne time dead.

After he was taken down from the crofs, a feal was put on the door of the fepulchre in which he was laid, as the beft check agrainlt fecret fraud; and a guard of foldiers was ftationed around it, as the beft feeurity againit open violence. In fpite, however, of all thefe precautions, the prediction was accomplihed; the angel of God, deffending from heaven with a countenance like lightaing, and with raiment white as fnow; the watch flake, and become as dead men ; the earth quakes; the ltone is rolled from the mouth of the fepulchre; the angel fits on it, and our Lord comes forth.

It was in vain for the Jews to allege that his difciples came in the night, and fole him away, while the watch were afleep. One munf fmile at thefe puerile affertions. How came the difciples to know that the watch were afleep; or what excufe had the watch for fleeping, and incurring a puniflment which they knew to be capital in the Roman law? and how came they, in the name of wonder, to be brought as an evidence for thofe tranfactions that happened at the tine when they were aflect?

Whatever credit may be given by modern infidels to this ill-framed ftory, it is palt difpute that it had none among the Jewilh rulers at the time that it was current. Not long after our Saviour's refurrection, the apoftles were called before the council, and threatened with death for teaching in the narne of Jefus. Their boldnefs upon that ocealion was fo provoking to the rulers, that the threat would have been inflantly put in execution, had not Gamaliel, a doctor of the law of high reputation, put them in mind of other impoftors who had perifhed in their attempts to miflead the people; and concluded a very fenfible \{peech with thefe remarkable words: "And now, I fay unto yon, refrain from thefe men, and let them alone; for if this counfel, or this work, be of men, it will come to nought ; but if it be
of God, ye cannot overthrow it, left haply ye be found I even to fight againft God." This advice the council follorved. But is it polible that Gamalicl could have given it, or the comncil paid the leaf regard to it, had the fory of the difciples fealing the body been then credited? Surely fome among them would have obferved, that a work or comfel, fomded on imponture and fraut, could not be fuppojed to be of God, and they would unqueftionably have flain the apoftes.

The flory of Itealing the body is indeed one of the molt fenfectefs fictions that ever was invented in fupport of a bad caufe. Our Lord was on earth 40 days after he arofe. He appeared frequently to his difciples. He ate and drank in their prefence; and when fome of them doubted, he bade then haudle him and fee that he was not a fpeetre, flowed the mark of the fpear in his fide, and the prints of the nails in his feet and hands. Befides thus appearing to his difciples, he was feen by more than 500 brethren at one time; all of whom, as well as his difciples, mult neceffarily have known him previous to his fuffering, and conkl therefore attelt that he was the perfon who was once dead, but was then alive. Yet for ltrangers in general, who had not feen him previous to his death, and could not therefore identify his perfon after he arofe, our Lord refervedi many other proofs that were equally convincing. Before his afcenfion, he bade his difciples wait till they received power, by the Holy Ghoit defcending upon thein: That then they Chould be witneffes with him, both in Jerufakm, and in all Judea, and in Sanaria, and unto the uttermoft ends of the earth ; in order that the people of all thefe nations, obferving the mirackes wrought in his name, might themfelves heeome ocular witneffes that thofe who preached his refurrection were warranted to do fo by his authority ; and that this anthority, on which fo numerous miracles attended, mult be divine.

We intend not here to examine the minute objections, and cavils that have been advanced refpecting the truth \(\mathrm{j}_{\mathrm{j}}\) on of this important fact. 'The kinds, however, we fralltore mention in general. Some have doubted of our Lord's \({ }^{v}\) refurrection, as being an event which is not confirmed by general experience, becaufe they imagine that what happens once thould happen again, and even repeatedly, in order to be true. Sume, taking their own to be preferable fchemes, have objected to the way in which it happened, and to the manner in which it is narrated. Some have imagined, that poffibly the golpel hiftory may be-falfe ; that poffibly the difciples werc very ignorant, and might be deceived ; that polfibly, too, they were deep politicians, and a fet of impoftors; and that poffibly the writings which detected their falfehoods may have been deftroyed. It is difficult to reafon, and worfe to convince, againf this evidence of poffibilities: but we flatter ourfelves, that to the candid reader it will appear fufficiently overturned in our article Miracle; where it is Mown that neither clowns nor politicians could have a-ied the part that was acted by the apoftles, had not the refurrection been an undoubted fact.

Some of the objectors to it have alfo maintained, that poffibly there is nothing material without us, that there is nothing mental within us, and that poffibly the whole world is ideas. This mode of arguing we pretend not to explain; it is thought by fome to proceed entirely from a perverfenefs of mind or difpofition, whild in bookz

\section*{\(R \quad \mathrm{E} S\)}
ec. of medicine it is always confidered as a fymptom of difeafe, and the patient reconmended to be treated in the hofpital, and not in the acadeny.

By his raifing others, and particulary by rifing himonce felf, from the dead, our Saviour demonftrated that a re-
a furrection from the dead is poffible. And on that anthority, which by his miracles he proved to be divine, he declared to his followers, that there is to be a general refurection both of the juft and of the unjuft, infructing his difciples to propagate this doctrine through all nations; St Paul confeffing, that if there be no refurrection of the dead, preaching is vain, and our faith is vaiu.

As to the order of fucceffion in which the dead are to be raifed, the Scriptures are almoft filent. St Paul he fays, that every man is to rife in his own order, and d. that the dead in Chrift are to rife firt: and St John obferved in his vifion, that the fouls of them which were beheaded for the witnefs of Jefus, and for the word of God, and which had not worhipped the beaft, "neither lis image, neither had received his mark upon their forcheads, or in their hands, lived and reigued with Chrift a thoufand years; but the reft of the dead lived not again until the thoufand years ( y ) were finifhed.
hat A queftion that has much oftencr agitated the minds diey of men is, with what fort of bodies are the dead to be e. raifed? St Paul has anfwered, with incorruptible and immortal bodies (z). And to filence the difputatious caviller of his day, he illuftrated his doctrine by the growth of grain. "Thou fool (faid he), that which thou foweft, thou fowcit not that body that fhall be, but bare grain, it may chance of wheat or of fome other grain." "To us it appears very furprifing, that any one who reads this paflage with the nighteft attention, fhould perplex himfelf, or difturb the church with idle aitempts to prove the identity of the bodies with which we fhall die and rife again at the laft day. The apoftle exprefsly affirms, that "Alfh and blood cannot inherit the kingdom of God; that we fhall all be changed, in a moment, in the twinkling of an eye, at the laft trump; that there are celeftial bodies and bodies terreftrial ; and that the glory of the ecleftial is one, and the glory of the terreftrial another."

That this implies a total change of qualities, will admit of no difpute; but fill it has been confidered as an article of the Cbriftian faith, that we are to rife with the fame bodies in refpect of fubftance. What is meant by the identity of fubftance, with qualities wholly different, it is not very eafy to conceive. Perhaps the meaning may be, that our incorruptible bodies fhall confit of the fame material particles with our mortal bodies, though thefe particles will be differently arranged to produce the different qualities. But as the particles of our prefent bodies are conftantly changing, and as different particles compofe the body at different times, a queftion has been put, With what fet of particles thall we rife? Here a fingular variety of opinions have been held. itz, Some * contend, that we thall rife with the original

\section*{139 ] \\ R E S}

Itamina of our bodies derived from our parents ; fome Refurfecare for rifing with that fet of particles which they had tion. at birth; fome with the fet which they are to have at death; and fome with the particles which iewrian after maceration in watert; though, God knows, that if this maceration be continued long, thefe may arife with few or no particles at all. Another query has given much alarm. What if any of thefe particles hould enter a vegetable, compofe its fruit, and be eaten by a man, woman, or a child? Will not a difpute, fimilar to tleat apprehended by the Sadducces about the wife of the feven brothers, neceffarily follow, whofe particles are they to be at the refurrection? Againft this confufion, they truft that the goodnefs and wifdom of heaven will take all the proper and neceffary meafures; and they even venture to point out a way in which that may be done. A foot deep of earth, they obferve, in two or three of the counties of England, fuppofing each perfon to weigh on an average about feven ftones and a few pounds, would amply fupply with material bodies \(600,000,000\) of fouls for no lefs a fpace than 25,000 ycars \(\oint\); and therefore there feems to be no neceflity for §Sce \(H\left(\delta_{3}{ }^{\circ}\right.\) s the vamping up of their old materials to lodge and ac- Refurrezion commodate new fouls.

But, unluckily here, the queftion is not about the body aferist. poffibility of keeping the particles of difierent hodies feparate and ditinct. The queftion is rather, What have the Scriptures determined on the fubject? Now the Scriptures fay, that the fpirit returns unto God who gave it. And fhould it be afked, in what place does he referve it till the refurrection ? the Scriptures reply, in the place of the dead; becaufe the foul defcends into the pit, is redeemed from the grave; and the fling of death, the laf enemy that is to be deftroyed, fhall he taken away when the trumpet of God fhall found: at which time the dead that fleep in their graves flall awake, fhall hear the voice, and thall come forth. There is not here fo much as a word concerning the body; and therefore it was afked with what bodies are the dead to be raifed? 'To which it was anfwered, the vile body is to be changed. The body which is, is not the body which fhall be; for the incorruptible muit put on incorruption, and that which is mortal, put ori immortality.

This curious difcovery of the fentiments of Scripture we owe to a lay-man, the celebrated Locke; who, in one of his controverfies with the bithop of Worceiter, came to underltand what he knew hot before, namely, that nowhere have the Scriptures fooken of the refirrection of the fame body in the fenfe in which it is ufually conceived. The refurrection of the fame periun is indeed promifed: and how that promife may be fulthlled, notwithltanding the conttant change of the particlss of the body, has been flown in another place. See Mietaphysics, Part III. Chap. iii.

The adrocates, therefore, for the refurrection of the mortal body, have again been obliged to betake tl - n felves to the fhifts of reafoning. It is proper, fay they, \(\mathrm{S}_{2}\) that
(y) Thefe thoufand years formed the happy millenium fo often mentioned in the ancient fathers; and the learned Burnet, in his Theory of the Earth, has endeavoured to prove, that a fimilar notion prevailed amonthe Jews. See Mileenium.
(z) Our Saviour rofe with the fame body, both as to fubftance and qualitics; becaufe it was neeeffary that his perfon fhould be known and identified after his refurrection.

\section*{\(\left.\begin{array}{lll}\mathrm{R} & \mathrm{E} & \mathrm{T}\end{array}\right] \quad 140\)}

\section*{\(\xrightarrow{+}\)} :cilion.
our vices and virtues, fhould alfo fhare in our rewards and punifhnents. Now, granting they will, fhall one fet of paticlics be bound for the crimes, or be entited to reccive the rewards, of the animal fytere, from its firlt conmercement to its diffolution? or fhall every partick rife up fucceffively, and reccive its dividend of rewards and purithments for the vices and virtues that belonged (1) the fyttern during the time that they were in union with the fentient principle? and is the hand that fell in delending a father to be (as is fuppofed in fonme of thie sallern comatries) rewarded in heaven; while the other that ftruck him when the fon became vicious, is difmiffed isto torments?

Finding this hypothefis fupported by ncither Seripture nor reafon, they next appeal to the ancient fathers. And they, it is confeffed, are for the refurrection of the very farne flefh. But this uotion is directly eontrary to the Seriptures, which have faid, thatt fleth and blood are not to inherit the kingdon of God.

But whatever be the bodies with which the dead are to be raifed at the general refurrection, all mankind muft appear in judgment, and receive fentence according to the deeds done in the body, without regard, fo far as we know, to their actions and conduct in the iniddle ftate. After this fentence, the riglteous are to enter into celeftial and eternal joys, and the wicked to fuffer the punifhments of hell. Thefe punifhments foune have fuppofed to be everlafting; others think, that after fome temporary punifinment, the fouls of the wicked are to be annihilated; and others imagine, that arter doing purgatorial penance for a while in hell, they are to be again received into favour; inclining to explain the denunciations of the Almighty as a child would do the threatenings of his mother, or a lover the affected chidings of his miftrefs (A).

RESUSCITATION, the fame with refurrection and revivitication. See the preceding article and Reanimation.
The term refuffitation, however, is more particularly ufed by chemifts for the reproducing a mixed body from its afhes; an art to which many have pretended, as to reproduce plants, \&ec. from their afhes.

RETAIL, in commerce, is the felling of goods in fmall parcels, in oppoition to wholerale. Sce Commerce.

RETAINER, a fervant who does not continually divell in the houfe of his mafter, but only attends upon fpecial occafions.

RETAINING feF, the firf fee given to a ferjeant or counfellor at law, in order to make him fure, and prevent his pleading on the contrary fide.

RETALIATION, among civilians, the aet of returning like for like.

RETARDATION, in plyfics, the act of diminilhing the velocity of a moving body. See Gunnery, Iifechanics, Pieumatics, and Projectiles.

\section*{R E T}

RE'TE mirabile, in anatomy, a finall plexus or network of veffels in the brain, furrounding the pituitary gland.

RETENTION is defined by Mr Locke to be, a faculty of the mind, whereby it keeps or retains thofe fimple ideas it has once received, by fenfation or reflection. See Metaphysics, Part I. Chap. ii.

Retestion is alfo ufed, in medicine, \&c. for the ftate of contraction in the folids or vafcular parts of the body, which makes them hold faft their proper contents. In this fenfe, retention is oppofed to evacuation and excretion.

RETICULAR body (corpus reticulare), in anatomy, a very fine membrane, perforated, in the manner of a net, with a multitude of foramina. . It is placed immediatcly under the cuticle; and when that is feparated from the cutis, whether by art or accident, this adhcres firmly to it, and is fearce poffible to be parted from it, feeming rather to be its inner fuperficies than a diftinct fubftance. In regard to this, we are to obferve, firt, the places in which it is, found, being all thofe in which the fenfe of feeling is molt acute, as in the palms of the hands, the extremities of the fingers, and on the foles of the feet. The tongue, however, i; the part where it is moft accurately to be obferved : it is more eafily diftinguifhable there than anywhere elfe, and its nature and flucture are moft evidently feen there.

Its colour in the Europeans is white ; but in the negroes and other black nations it is black ; in the tawny it is yellowifh : the fkin itfelf in both is white; and the blacknefs aind yellownefs depend altogether on the colour of this membrane.
The ufes of the corpus reticulare are to preferve the flructure of the other parts of the integuments, and keep them in their determinate form and fituation. Its apertures give paflage to the hairs and fweat through the papille and excretory ducts of the fkin: it retains thefe in a certain and determinate order, that they cannot be removed out of their places, and has fome fhare in preferving the foftnefs of the papilte, which renders them fit for the fenfe of feeling. See AnatoMY, \(\mathrm{n}^{\circ} 8_{3}\).
Reticulum, is a Latin word, fignifying a little or cofling net. It was applicd by the Romans to a pariicular mode of conftructing their buildings. In the city of Salino (fee Salino) are fill to be feen remains of fome walls, cridently of Roman origin from the reticulum. This ftructure confifts of finall pieces of baked earth cut lozengewife, and difpofed with great regularity on the angles, fo as to exhibit to the eye the appearanec of cut diamonds; and was called reticular, from its refemblance to frhing-nets. The Romans always concealed it under a regular coating of other matter ; and Mr Houel informs us, that this was the only fpecimen of it which he faw in all his travels tbrough Sicily, Malta, and Lipari. It appears to be the remains of fome baths,
(a) The Frencli convention, whofe principles are equally new, daring, and duftructive of all that is decent or of good report, have decided this queftion in a very fummary way, by decreeing death to be an eternal fleep; a decree equally ablurd in itfelf and fatal in its confequences. Since this article went to the prefs, however, we have learned, from the molt refpectable authority, that wild and abfurd as the opinion is, it has been indultrioufy propagated in this country, and that in fome places it has gained ground. Thic confequences of this, were it so become general, nult indeed be baneful begond all conception; ard we fhall afterwards take oceation to expofe the opinion and its nefarious confequences at greater length than it is nore polfible to do in this place. Sec Treoloc 3 .

\section*{R E T}

Reuiro which have been built for the convenience of fea-bathing.

RETIMO, the ancient Rbitymnia of Siephen the geomraphel, and called by Ptoleny Rbifymna, is a fine city, lying at one end of a rich and fertile plain, on the north coalt of the inand of Candia. It is but a fmall place, containiag fearce \(60 c 0\) inhabitants ; but it is a bithop's fee, and the harbour is deferded by a citadel, where a bahaw refides. It was takea by the Turks in 1647 , and has been in their liands ever fince. It is about 45 miles from Candia. E. Long. \(24 \cdot 45 \cdot\) N. Lat. 35.22 .

The citadel, which ftands on a rock jutting ont into the fea, would be fuffeient for the defence of the city, were it not lituated at the foot of an high hill, from which it might be cannonaded with great advantage. The liarbour is now almott filled witl fand, and is no longer acceffible to thipping; nor do the Turks in any meafure oppofe the ravages of time, but behold with a carelefs eye the molt valuable works in a ftate of ruin. The French had formerly a rice-conful at Retimo, to which fhews ufed to repair for cargoes of oil ; but thicy have been long unable to get into the harbour: to repair which, however, and to revive the commerce of Retimo, would be a moft ufeful attempt. The plains around the city abound in a varicty of productions. Great quantities of oil, cotton, faffion, and wax, are produced here; and they would be produced in ftill greater quantities if the inhabitants could export their commodities. 'Ihe gardens of Retimo bear the beit fruits in the inand; excellent pomegranates, almonds, piftacho nuts, and oranges. The apricot-tree, bearing the miclimich, the juice of which is fo delicious, and its flavour fo exquifite, is found here. It is a kind of early peach, but fmaller and more juicy than thofe of France.

RETINA, in anatomy, the expanfion of the optic nerves over the bottom of the eye, where the fanfe of vifion is firt received. See Awaromy, \(n^{\circ}\) 142. and Oprics (Index) at Eye and Vifion.

RETINUE, the attendants or followers of a priace or perfon of quality, chiefy in a journey.

RETIRADE, in fortification, a kind of retrench. ment made in the body of a baltion, or other work, which is to be difputed, inch by inch, after the defences are difmantled. It ufually confifts of two faces, which make a re-entering angle. Whien a breacl is made in a baftion, the enemy may alfo make a retirade or new fortification behind it.

RETIREMEN「, means a private way of life or a Dr Knox. fecret habitation. "Few (fays an clegont writer) are able to bear folitude; and though retirement is the oftenfible object of the greater part, yct, when they are enabled by fuccefs to retire, they feel themfelves unhappy. Yeculiar powers aud elegance of mind are neceflary to enable us to draw all our refources from ourfelves. In a remote and folitary sillage the mind maft be internally active in a great degree, or it will be miferable for want of employment. Dut in great and poptulous cities, even while it is paffive, it will be conIlantly amufed. It is impoffible to walk the freets without finding the attention powerfully folicited on every fide. No exertion is ncceflary. Objects pour themfelves into the fenfes, and it would be difficult to prevent their admittance. But, in retirement, there tunt be a fpirit of phelufophy and a Atore of learning,
or elfe the faucied fcenes of blifs will :anifn like the co- Retort; lours of the rainbow. Puor Cowley marght be faid to Retraty. be melancholy mad. He languifhed for folitude, and \(\xrightarrow{-\infty}\) wihhed to hide himfelf in the wilds of America. But, alas ! he was not able to fupport the folitude of a country village within a few miles of the metropolis !
"With a virtuous and cheerful family, with a 5 : \(\%\) fathful and good-humourcd friends, with a well-felected collection of elcgant books, and with a competency; one may enjoy comorts even in the deferted vilage, which the city, with all its diverfions, camot fupply."

RETORT, in chemiftry, an oblong or globular veffel with its neck bent, proper for difillation. Sce CheMISTRY, \(n^{0} 57^{6}\).
- In the fifth volume of the Tranfactions of the Lon. don Socicty for the Encouragement of Arts, p. 96. we nind a paper containing a method fer preventing ftone retort from breaking; or fopping them when cracked, during any chemical operation, without lofing any of the contained fubject. "I have always found it neceffary (fays. the writer) to ule a previous coating for flling up the interftices of the earth or ftone, which is made by diffolving two ounces of borax in a pint of boiling water, and adding to the folution as much naked lime as will make it into a thin palte; this, with a common painter's brufh, may be fpread over leveral retorts, which when dry arc then ready for the proper prefersing cuating. The intention of this firt coating is, that tile fubllarices thus fpread over, readily vitrifying in the fire, prevent any of the diftilling matters from pervading the retort, but does in nowife prevent it from cracking.
": Whenever I want to rife any of the above coated retorts; after I have charged them with the fubtance to be difilled, I prepare a thin palte, made with come men linfeed oil atd flated lime well mixed, and perfectly plafic, that it nay be cafliy fread: with this let the retorts be covered all over except that part of the neck which is to be inferted into the rcceiver ; this is readily done with a painter's bruth : the coating will be fufficiently dry in a day or two, and they will then be fit for ufe. With this coating I have for feveral years worked my fone retots, without any danger of their breakiag, and have frequently ufed the fame re. tort four or five times; obferving particularly to coat it over with the lat mentioned compolition every time it is clarged with frelh materials: Before I made ufe of this expedient, it was an even chance, in conducting operations in ftone and earthen retorts, whether they did not crack every time;-by which means great lols has been fuftained. It at any time during the operation the retorts fhould crack, fpread fome of the oil compofition thick on the part, and fprinkle fome pow. der of flacked lime on it, and it immediately fops ilre fifure, and prevents any of the difliling natter from pervading ; even that fubtile penetrating fubitance the folid phofphoruô will not penetrate throug! it. It may be applied without any danger, eren when the retort is red hot; and when it is made alittle ftiffer, is more preper for lusing veftels than any other I ever have tried ; becaufe if properly mixed it will never crack, nor will it indnrate fo as to endanger the breaking the necks of the veffels when taken off."

RETRACTS, among horfemen, pricks in a hor's's feet, arifing from the fault of the farrier in driving malls

RETRREAT1, in a military fenfe. An army or body of enen are faid to retreat when they turn their backs upon the encmy, or are retiring from the ground they oceupied: hence every 'march in withdrawing from the cnenyy is called a retreat.

That which is done in fight of an ative enemy, who purfues with a fuperior force, is the moft important part of the fubject; and is, with reafon, looked upon as the glury of the profeflion. It is mancenve the mot delicate, and the propereft to difplay the prudence, genius, conraje, and addrefs, of an officer who commands: the hiltorians of all agres teflify it ; and hiftorians have never been fo lavifh of enlogiums as on the fubject of the brilliant retreats of our herocs. If it is important, it is now Iefs difficult to regulate, on account of the varicty of circumftances, each of which demands different principles, and an almoit endlefs detail. Hence a good re--ir:at is eftemed, by experieneed officers, the matherpiece of a general. He flould therefure be well acchrainted with the fituation of the comutry through which he intends to make it, and carcful that nothing is omited to make it fafe and honouralle. See War.

Retreat, is alfo a beat of the drum, at the fring of the evening gun; at which the drum-major, with all the drums of the batalion, except fuch as are upon duiy, beats from the camp-colours on the right to thore on the left, on the parade of encampment : the drums of all the guards beat alfo; the trumpets at the fame time founding at the head of their refpective troops. This is to warn the foldiers to forbear firing, and the rentinels to challenge, till the break of day that the reveille is beat. The retreat is likewife called fetting the suatch.

RETRENCHMENT literally fignifies fomething cut of or taken from a thing; in which fenfe it is the fane with fubtraction, diminution, \&c.

Retrenchment, in the art of war, any kind of work raifed to cover a polt, and fortify it againf the enemr, fuch as fafeines loaded with carth, gambions, barrels of earth, fand-bags, and generally all things that can cover the men and flop the enciny. See Fortification and War.

RETRIBUTION, a handfome prefent, gratuity, or acknowledgrment, given inftead of a formal falary or hire, to perfons employed in affairs that do not fo immediately fall under eftimation, nor within the ordinary commerce in inoncy.

RETROMINGENTS, in natural hiftory, a clafs os divifion of animals, whofe characterittic is, that they fitale or make water backwards, both male and femak.

RETURN (returna or retorna), in law, is uferl in divers fenfes. I. Return of writs by fletiffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ direeted to them. This is wrote on the back of the writ by the offieer, who thus fends the writ hack to the court from whenee it iffued, in order that it may be Hed. 2. Return of a commiffion, is a certificate or anfwer fent to the court from whence the commiffion iffues, concerning what has been done ly the commiffioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, \&ic. Thus Hillary temn has four returns, viz. in the bing'so
bench, on the day next after the oftave, or cighoth day after Hillary day : on the day next after the fifteenth day fron St Hillary; on the day after purification; and on the next after the octave of the puritication. In the common pleas, in cight days of St Hillary : from the day of St Hillary, in fifteen days: on the day after the purification : in cight days of the purification. Eafer term has five returns, viz. in the king's. bench, on the day next after the fifteenth day from Lafler: on the day next after the three weeks from Eater: on the day next after one month from Eailer : on the day next after five weeks from Ealler: and on the day next after the day following afcenfion-day. In the common pleas, in fifteen days from the fealt of Eafter: in three wecks from the feall of Ealter: in one month from Ealler day: in five weeks from Eafter day: on the day after the afcenfion-day. Trinity term has four returns, viz. on the day following the fecond day after Trinity : on the day following the cighth day after Trinity : on the day next after the fifteenth day from Trinity: on the day next after three wecks from Trinity. In the common pleas, on the day after Trinity: in cight days of Trinity: in fifteen days from 'Trinity : in three weeks from Trinity. Michactmas term has fix returns, viz. on the day nest after three weeks from St Michael : on the day next after one month of St Michact: on the day following the fecond day after All-fouls: on the day next after the fecond day after St Martin : on the day following the octave of St Martin : on the day next after fifteen days of St Martin. In the common pleas, in thrce weeks from St Michael : in one month from St Michael: on the day after All-fouls: on the day after St Martin : on the octave of St Martin: in fifteen days from St Martin. It is to be obferved, that, as in the king's-bench, all returns are to be made on fome particular day of the week in each term, care mult be taken not to make the writs out of that court returnable onf a non-judicial day; fuch as Sunday, and All-faints, in Miclaelmas tern, the purifieation in Hillary, the afcenfion in Eafter, and Midfummer-day, except it fhould fall on the firf day of Trinity term.

Returns, in a military fenfe, are of various forts, but all tending to explain the flate of the army, resiment, or company; nainely, how many capable of doing duty, on duty, fick in quarters, barracks, infirmary, or hofpital ; prifoners, abfent with or without kave ; total effective; wanting to complete the eftablifhment, \&c.

RETUSAR'I, an ifland in Ruffa, is a long flip of land, or rather fand, through the middle of which runs a ridge of gramite. It is 20 miles from Pecterflurg by vels into water, four from the fhore of Ingria, and nine frotn the coaft of Carelia. It is about 10 miles in eircumferenee, and was overfyread with firs and pines when Peter firft conquered it from the Siwedes. It contains at prefent about 30,000 inhabitants, including the failors and garrifon, the former of whom amount to abour 12,000 , the latter to 1500 men . The ifland affurds is fmall quantity of palture, produces vegetables, and a few fruits, fuch as apples, currants, froofebenies, and frawberries, which thrive in this northern climate.

RETZ (Cardinal de). See Gondı.
RETZIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants, and
. culingen to the 2 oth natural order, Campanacte. The capfule is bilocular, the corolla cylindrical, and villous without; the figma bifid.

REUTLINGEN, a handfome, free, and imperial town of Germany, in the circle of Suabia, and duchy of Wirtembers ; feated in a plain on the river Efchez, near the Neckar, adorned with handfome public buildings, and has a well frequented college. E. Long. y. 10. N. Lat. \(4^{8 .} 3\) I.

REVE, Refve, or Greve, the bailiff of a franchife, or manor, thus called, efpecially in the weft of England. Hence fhire-reeve, theriff, port-greve, \&c.

REVEILLE, a beat of drum about break of day, to give notice that it is time for the foldiers to arife, and that the fentries are to for bear challenging.

REVEL, a port town of Livonia, fituated at the fonth entrance of the gulph of Finland, partly in a plain and partly on a mountain; 133 miles fouth-weft of Peterburg, and 85 fouth-ealt of Abo. It is a place of great trade, and holds two fairs yearly, which are vifitcd by merchants from all countries, but particularly by thofe of England and Holland. It is a ftrong and a rich place, with a capital harbour. It is furrounded with high walls and deip citches, and defended by a cafle and fout baltions. It was confirmed to the Swedes at the peace of Oliva, conquered by Peter the Great in 1710 , and ceded to Ruffia in 1721 . The conquelt of it was again attempted by the Swedes in 1790. The duke of Sudermania, with the Swedifh fleet, attempted to carry the harbour ; but after an obftinate engagement with the Ruffian fleet, he was obliged to give it up; but it was but for a very fhort while. He retired about 10 leagues from the harhour, to repair the damage his fleet had fufteined, and to prepare for a fecond attack before any relief could be afforded to the Ruffian fleet. As foon as he had refitted, he failed for the harbour, at a league diftant from which the Ruffian fleet was difooverect, ready to difpute with the Swedes the entrance. Upon a council being held by the Duke, it was refolved to attack the Ruffians; and the fignals being given, the fleet bore down for the attack, which was maintained for near fix hours with the utmof fury: at length the Swedes broke the Ruffian line, which thew them into much confufion; when the Swedes, taking the advantage of the general confufion into which the Ruffians were thrown, fullowed them with their whele furce into the harbour, where the conflict and carnage were dreadful on both fides, though the Swedes certainly had the wort of it ; at the fame time that their Ikill and bravery is incifputable.

This valuable place was again confirmed to Ruffia by the peace. The government of Revel or Eitshonia is one of the divifions of the Rutian empire, containing five diftricts. I. Revel, on the Baltic fca. 2. Baltic-port, about to verts weftward from Revel. 3. Habfal, or Haplal, a maritime town. 4. Weifenitein, on the rivulet Saida, about 80 verlis from Revel. 5. Wefenberg, about 100 verlts from Revel, at about an equal diftance from that town and Narva.

REVELATION, the ace of revealing, or making a thing pulhic that was before unknown; it is alfo nfed for the difcoveries made by Ged to his prophets, and by them to the world; and more particulaly for the books of the Old and New Teftameat. Soc Bible,

Christianity, Miracle, Religion, and Theolo-Reveiabir, Gy.
The principal tefts of the truth of any revelation, are the tendency of its practic al doétrines; its conliften. cy with itfelf, and with the known attributes of God ; and fome fatisfactory cvidence that it cannot have been derived from a human fource.

Before any maan can receive a written book as a revelation from God, he muft be convinced that God exifts, and that he is poifefed of almighty power, infinite wifdom, and perfect juttice. Now fhould a book teaching abfurd or immoral doctrineo (as many chapters of the Korais do , and as all the traditionary fyftems of Parganifm did), pretend to be revealed by a God of wiflum and jurtice, we may fafely reject its pretenfions without farther examination than what is necuilary to fatisfy us that we have not mifunderitood its doctrine. Should a book claiming this high origin, enjuin in one part of it, and forbid in another, the fame thing to be done under the fame circumfances, we may reject it with contempt and indignation ; becaure a being of inFinite wifdom can never act capricioully or abfurdly. Still, however, as it is impoffible for us to know how far the powcrs of men may reach in the inveftigation or difcovery of ufeful truth, fome farther evidence is neceffary to prove a doctrine of divine origin, than its merc confiftency with itfelf, and with the principles of morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doctrines are to be looked for which hetman reafon cannot fully comprehend ; and thefe are to be believed on the teltimony of God, and fuffered to produce their practical confequences. At this kind of belief the fhallow infidel may frile contemptuoufly; but it has place in arts and fciences as well as in religion. Whocver avails himfelf of the demonAtrations of Newton, Bernoulli, and others, refpecting the refiftance of fluids, and applies their conclufions to the ant of chip-building, is as implicit. a believer, if he underitand not the principles of fluxions, as any ChriAtian; and yet no man will fay that his faith is not productive of important practical confequences. He believes, however, in man, while the Chrittian believes in God; and therefore he cannot pretend that his faith refts on a furer foundation.

Mr Locke, in laying down the diflinct provinces of reafon and faith, oblerves, 1. That the fame truths may be difoovered by revelation which are difcoverable to us by reafon. 2. That no revelation can be admitted againt the clear evidence of renfon. ?. That there are nany thing of which we have but imperfeet notions, or none at all ; and others, of whofe palt, prefent, or future exitence, by the natural ufe of our faculies we cannot have the lealt kinowledse: and thefe, being beyond the difoovery of our facmitis, and above rezion, when revealed, become the proper object of our faith. He then adds, that our reafun is uot iniured or difurbed, but affilted and improved, by new difcovertes of truth coming fron the forntain of knowiedge. Whatever God has revcaled is certainly true ; but whether it be a divine revelation or not, reafou mult judge, which can never pernit the mind to. seject a greate: evidence to embrace what is lefs evi-

Que"atio. S.r.t. 'T here can be no evidence that any taditionat II
Sucerte. achation is of divine original, in the words we receive ir, and the fenfe we undeftand it, fo clear and to cer-
tain as that of the principles of reafon: and, therefore, rothing that is contrary to the clear and felf-- ident dictates of reafun, has a right to be urged or effented to as a matter of faith, wherein realon has rothing to do.

\section*{Rlvelation of Se Fohn. Sce Apocalypse.}

REVELS, entertaimments of dancing, mafling, act\(i^{\circ} /{ }_{3}\) comedies, farces, \&c. anciently very frequent in the inns of court and in noblemens houfes, but now much diftifd. The oficer who has the direction of the revels at court is called the Mastfr of the Revels.

RE.VENGE, means the return of injury for injury, Rnd differs materially from that fudden refentment which ises in the mind inmediately on being injured ; which, fo far from being culpable when rettrained within due trounds, is abfolutely neceffary for felf-prefervation. Revenge, on the contrary, is a cool and deliberate wickedreff, and is often executed years after the offence was given; and the defire of it is generally the effect of littlenels, weaknefs, and vice ; while, to do right, and to fuffer wrong, is an argument of a great foul, that fcorns to ftoop to fingelted revenges.

> Revenge is but a frailty incident
> To craz'd and lickly minds; the poor content
> Of little fouls, unable to furmount

An injury, too weak to bear affiont.
Revenge is generally the concomitant of favage minds, of minds implacable, and capable of the molt horrid barbarities; unable to fet any limits to their dif. pleafure, they can confine their angre within no bounds of reafon.

Cruel revenge, which fill we find
The weakelt fiailty of a feeble mind.
Degenerous paffion, and for man too bafe,
It feats its empire in the favage race.

\section*{Fuvenal.}

The inftitution of law prevents the execution of prirate revenge, and the growth of civilization fhows its impropriety. Though in modern times a fpecies of revenge is fanctioned by what is called the law of honour, which evades the law of the land indeed, but which is equally mean and difgraceful as the other kinds, and is of confequences equally baneful. See Anger, Duelling, and Resentment.

REVENUE, the annual income a perfon receives from the rent of his lands, hoults, imtereft of money in the ftocks, \&x.

Reyal Revenue, that which the Britifh conftitution lath vefted in the royal perfon, in order to fupport his dignity and maintain his power; being a portion which each fubject contributes of his property, in order to fecure the remainder. This reverue is either ordinary or exirasdinary.
1. 'The king's ordinary revenuc is fuch as has either fubfitted time out of mind in the crown ; or effe Has been granted by parliament, by way of purchate or exclange for fuch of the king's inherent hereditary sevenues as were found inconvenient to the fubject. In faying that it has fublifted time out of mind in the crown, we do not mean that the king is at pre-
fout in the a? polfeffion of the whole of his reve- Revenon. nute. Minch (nay the sreateft part) of it is at this clay in the lands of fuhjects; to whom it has been grantcd out from time to time by the kings of England: which has rendered the crown in fome ineafure depen. dent on the people for its ordinary fupport and fub. fiftence. So that we muft be obliged to recount, as part of the royal revenue, what lords of manors and other fubjects frequently look upon to be their own abfolute ri-hits; becaufe they and their anceftors are and have been volted in them for ages, thougl in reality originally derived from the grants of our ancient princes.
1. The firf of the king's ordinary revenues, which may be taken notice of, is of an ecclefiaftical kind (as are alfo the three fucceeding ones), viz. the cultudy of the temporalities of bifhops. See 'Iemporalities.
2. The king is entited to a CORODY, as the law calls it, out of esery bihopric ; that is, to fend one of his chaplains to be maintained by the bithop, or to have a penlion allowed him till the bifhop promotes him to a benefice. This is alfo in the nature of an acknowledgement to the king, as founder of the fee, fince he had formerly the fame corody or penfion from every abbey or priory of royal foundation. It is fuppofed to be now fallen into total difufe ; though Sir Matthew Hale fays, that it is due of common right, and that no prefeription will difcharge it.
3. I'he king alfo is entitled to all the tithes arifing in extraparochial places: thongh perhaps it may be doubted how far this article, as well as the laft, can be properly reckoned a part of the king's own royal revenue; fince a corody fupports only his chaplains, and thefe extraparochial tithes are held under an implied truft that the king will difribute them for the good of the clergy in general.
4. The next branch confifts in the firf-fmits and tenths of all fpiritual preferments in the kingdom. See 'Tenths.
5. The next branch of the king's ordinary revenue (which, as well as the fubfequent branches, is of a lay or temporal nature) confilts in the rents and profits of the demefne lands of the crown. Thefe demenne lands, terra dominicales regis, being either the fhare referved to the crown at the original diltribution of landed property, or fuch as came to it afterwards by forfeitures or other means, were anciently very large and extenfive; comprifing divers manors, honours, and lordfhips; the tenants of which had very peculiar privileges, when we fpeak of the tenure in ancient demefne. At prefent they are contracted within a very narrow compals, having been almoll entirely granted away to private fibjects. This has occafioned the parliament frequently to interpof: and particularly after King William III. had greatly impoverinted the crown, an act paffed, whereby all future grants or leafes from the crown fer any longer term than \(3^{1}\) years or three lives, are declared to be void; except with regard to houfes, which may be granted for 50 years. And no reverfonary leafe can be made, io as to exceed, together with the eftate in being, the fame tern of three lives or 31 years; that is, when there is a fublifing leafe, of which there are 20 years ftill to come, the king cannot grant a future interelt, to commence after the expiration of the furmer, for any longer term than it
ycarm.

\section*{R E V}
years. The tenant muft alfo be made lable to be punithed for connmitting wafte; and the ufual rent mult be referved, or, where there has ufually been no rent, one-third of the clear yearly value. The misfortune is, that this act was made too late, after almoot every valuable poffeflion of the crown had been granted away for ever, or elfe upon very long leafes; tut may be of bencfit to pollerity, when thofe leafes come to expire.
6. Hither might have been referred the advantages which were ufed to arife to the king from the profits of his military tenures, to which moft lands in the kingdom were fubjeet, till the flatute 12 Car. II. c. 24 . which in great meafure abolifhed thera all. Hither alfo might bave been referred the profitable prerogative of purreyance and pre-emption : which was a ripht enjoyed by the crown of buying up provifions and other neceflaries, by the intervention of the king's purvcyors, for the ure of his royal hourehold, at an appraifed valuation, in preference to all others, and even without confent of the owner: and alfo of forcibly impreffing the carriages and horfes of the fubject, to do the king's bufinefs on the public roads, in the conveyance of timber, baggage, and the like, however inconvenient to the proprietor, upon paying him a fettled price. A prerogative which prevailed pretty generally threughout Europe during the fcarcity of gold and filver, and the high valuation of money confequential thereapon. In thofe early times, the king's houfehold (as well as thofe of inferior lords) were fupported by feecific renders of corn, and other vietuals, from the tenants of the refpective demefnes; and there was alfo a continual market kept at the palace-gate to furnih viands for the royal ufe. And this anfwered all purpofes, in thofe ages of fimplicity, fo long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another (as was formerly vers frequently done), it was found neceeflary to fend purveyors beforehand, to get together a fufficient quantity of provifions and other neceffaries for the houfehoid: and, left the unufual dernand fhould raife them to an exorbitant price, the powers beforementioned were vefted in thefe purveyors; who in procefs of time very greatly abured their authority, and became a great oppreflion to the fubject, though of little advantage to the crown; ready money in open market (when the royal refidence was more permanent, and fpecie began to be plenty) being found upon experience to be the beft proveditor of any. Wherefore, by degrecs, the powers of purvegance have declined, in forcign countries as well as our own : and particularly were abolifhed in Sweden by Guftavus Adolphus, towards the beginning of the laift century. And, with us in England, having fallen into difure during the furfenfion of monarchy, King Charles, at his refloration, confented, by the fame flatute, to refiga entirely thofe branches of his revenue and power: and the parliament, in part of recompenfe, fettled on him, his heirs, and fucceflors, for ever, the hereditary excife of 15 d . per barrel on all beer and ale fold in the kingdom, and a proportionable fum for certain other liquors. So that this hereditary excife now forms the fixth branch of his majefty's ordinary revenue.
7. A feventh branch might alo be computed to have Vos. XVI. Part I.
arifen from wine-licences; or the rents parable to the Revenue, crown by fuch perfons as are licenfed to fell wine by retail thronghout Britain, except in a few privileged places. Thefe were firt fettled on the crown by the flatute 12 Car. II. c. 25 . and, together with the hereditary excife, made up the equivalent in ralue for the lofs fuftained by the prerogative in the abolition of the military tenures, and the right of pre-emption and purveyance : but this revenue was abolifhed by the fatute 30 Geo . II. c. 1g. and an annual fum of upwards of L. 7000 per annum, iffuing out of the new flampduties impofed on wine-licences, was fettled on the crown in its ftead.
8. An eighth branch of the king's ordinary revenue is ufually reckoned to confit in the profits arifing from his forelts. See Forest. Thefe collift principally in the amercements or fines levied for offences againft the forefl-laws. But as few, if any, courts of this kind for levying amercements have been held fince 1632 , 8 Char. I. and as, from the accounts given of the proceedings in that court by our hittories and law-books, nobody would wifh to fee them again revived, it is needlefs to purfue this inquiry any farther.
9. The prefits arifing from the king's ordinaty courts of juftice make a ninth branch of his revenue. And thefe confift not only in fines impofed upon offenders, forfeitures of recognizances, and amercements levied upon defaulters; but alro in certain fees due to the crown in a variety of legal matters, as, for fetting the great feal to charters, original writs, and nther forenfic proceedings, and for permitting fines to be levied of lands in order to bar entails, or otherwife to infure their title. As none of thefe can be done without the immediate intervention of the king, by himfelf or his officers, the law allows him certain perquifites and profits, as a recompenfe for the trouble he undertakes for the public. There, in proces of time, have been almolt all granted out to private perfors, or elfe appropriated to certain particular ufes : fo that, though our law proceedings are ftill loaded with their payment, wery little of them is now returned into the king's exchequer ; for a part of whofe royal maintenance they were originally intended. All future grants of them, however, by the flatute 1 Amn . ft. 2. c. \(7 \cdot\) are to endure for no longer time than the prince's life who grants them.
10. A tenth branch of the king's ordinary revenue, faid to be grounded on the confideration of his guarding and prote \(E\) ing the feas fom pirates and robbers, is the right to royal fib, which are whale and flurgeon: and thefe, when either thrown afhore, or caught near the coafts, are the property of the king, on account of their fuperior excellence. Indeed, our anceftors feem to have entertaincd a very high notion of the importance of this right; it being the prerogative of the kings of Denmarl. and the dukes of Nornandy ; and from one of thefe it was probably derived to ous princes.
11. Another naritime revenue, and founded part! \({ }^{-}\) upon the fame reafon, is that of shipwrecks. See Wreck.
12. A twelfth branch of the royal revenue, the right to mines, has its original from the king's preroyative of coinage, in ordes to fupply him with materials; and ther:-

Revenue, therefore thofe mines which are properly royal, and to \(\xrightarrow{\text { Ren- }}\) which the king is entitled when found, are only thofe of filver and gold. See Mine.
13. To the fame original may in part be referred the revenue of treafure-trove. Sce Tkeasuze-Trove.
14. Waifs. Sce Waif.
15. Eltrays. See Estray.

Befides the particular reafons, given in the different articles, why the king fhould have the feveral revenues of royal fifh, thipwrecks, treafure-trove, waifs, and ettrays, there is alfo onc general reafort which holds for them all; and that is, becaufe they are bona vacantia, or goods in which no one the can claim a property. And, therefore, by the law of nature, they belonged to the firlt oecupant or finder; and fo continued under the imperial law. But, in fetting the modern conftitutions of moft of the governments in Europe, it was thought proper (to prevent that ftrife and contention which the mere title of occupancy is apt to create and continue, and to provide for the fupport of public authority in a manner the leaft burdenfome to individuals) that thefe rights fhould be annexed to the fupreme power by the pofitive laws of the ftate. And to it came to pals, that, as Bracton exprefles it, "hre, "qux nullius in bonis funt, et olim fuerunt inventoris "s de jure naturali, jaun efficiuntur principis de jure gen" tium."
16. The next branch of the king's ordinary revenue confifts in forfeitures of lands and goods for offences; tona conffouts, as they are called by the civilians, beeaufe they belonged to the fifcus or imperial treafury; or, as our lawyers term them, foris fach, that is, fuch whereof the property is gone away or departed from the owner. The true realon and ouly fubilantial ground of any forfeiture for crimes, confint in this; that all property is derived from fociety, being one of thofe eivil rights which are confurred upon individuals, in exchange for that degree of natural frecdom which every man nult facrifice when he enters into focial conmunidits. If, therefore, a nember of any national community violates the fundamental contract of his affuciation, by traufgrefing the municipal law, he forfects his right to fuch privileges as he claims by that contract ; and the ftate may very jufly refume that portion of property, or any part of it, which the laws have before affigned him. Hence, in every offence of an atrocious kind, the laws of England have exated a total confifcation of the moveables or perfonal eftate ; and, in many cafes, a perpetual, in others only a temporary, lofs of the offender's immoveables or landed property; and have vefted them both in the king, who is the perfon fuppofed to be offended, being the one vifitble magiftrate in whom the majefly of the public refides. See Forfeiture and Deodand.
17. Another branch of the king's ordinary revenue arifes from efcheats of lands, which happen upon the defect of heirs to fucceed to the inheritance ; whereupon they in general rcvert to and reft in the king, who is efteemed, in the eye of the law, the original proprietor of all lands in the kingdom.
18. The laft branch of the king's ordinary revenue, confilts in the cuftody of idiots, from whence we fhall be naturally led to confider alfo the euftody of lunaties. See Idiot and Lunatic.

This may fuffice for a chor: view of the king's ordi.
nary revenuc, or the proper patrimony of the erown; which was very large furmerly, and capable of being increaled to a magnitude truly formidable: for there are very few eftates in the kingdom that liave not, at fome period or other fince the Norman conqueff, been veited in the hands of the king, by forfeiture, efchear, or otherwife. But, fortunately for the liberty of the fubject, this hereditary linded revenuc, by a Ceries of improvident management, is funk almon to nothing; and the eafual protirs, arifing from the other branches of the cenfus regalis, are likewife almott all of them alienated from the crown. In order to fupply the deficiencies of which, we are now obliged to have recourfe to new methods of raifing money, unknown to our early anceltors; which methods conflitute.
II. 'The king's extraordinary revenne. For, the public patrimony being got into the hands of private fubjects, it is but reafonable that private contributions thould fupply the public fervice. Which, though it may perhaps fall harder upon fome individuals, whofe ancettors have had no fhare in the gencral plunder, than upon others, yet, taking the nation thoughout, it amounts to nearly the fame; provided the gain by the extraordinary fhould appear to be no greater than the lofs by the ordinary revenue. And perhaps, if every gentleman in the kingdorn was to be itripped of fuch of his lands as were formelly the property of the crown, was to be again fubject to the inconveniences of purveyance and pre-cmption, the oppreffion of fo-reft-laws, and the flavery of feodal-tenures; and was to refign into the king's hands all his royal franchifes of waifs, wrecks, eftrays, treafure-trove, mines, deoclands, forfeitures, and the like; he would find bimfelf a greater lofer than by paying lis grota to fuch taxes as are neceffary to the fupport of government. The thing, theretore, to be wifhed and aimed at in a land of liberty, is by no means the total abolition of taxes, which would draw after it very pernicious confequences, and the very fuppofition of which is the height of political abfurdity. I'or as the troe idea of government and magitracy will be tound to confilt in this, that fome few men are deputed by many others to prefide over public affairs, fo that individuals may the better be enabled to attend their private concerns; it is neceffary that thofe individuals thould be bound to contribute a portion of their private gains, in order to fupport that government, and reward that nagiflracy, which protects them in the enjoyment of their refpective properties. Bu: the things to be aimed at are wifdom and muderation, not only in granting, but alfo in the method of raifing, the neceflary fupplies; by contriving to do both in fuch a manner as nay be moft coducive to the national welfare, and at the fame time mof confitent with economy and the liberty of the fubject; who, when properly taxed, contributes only, as was before oblerved, fome part of his property in order to enjoy the reft.

Thefe extaordinary grants are ufoally called by the fynonymous namcs of aids, fubfidies, and fupplies; and are granted by the commons of Great Britain, in parliament affembled. See Parliament and 'Tas.

The clear nett produce of the feveral branches of the revenue, after all charges of collecting and management paid, amounted in the year 1786 to about L: 15,39 ,, 000 Steling, while the expenditure was found

\section*{R E V［ 147 ］It E V}
vertue．found to be about L．14，477，000．Hon thefe immenfe fums are appropriated，is next to be conlidered．And this is，firlt and principally，to the payment of the intereft of the national debt．Sce Nationat \(D_{i}\) it and Funds．

The refpective produces of the feveral taxes were originally feparate and diftinct funds；being fecurities for the fums advanced on each feveral tax，and for them only．Fut at laft it became neceffary，in order to avoid confution，a3 they multiplicd yearly，to reduce the number of thefe feparate funds，by uniting and blending them together；fuperadding the faith of par－ liament for the general fecuity of the whole．So that there are now only three capital funds of any account， the argregote fund，and the gencral fund，fo called from luch union and addition ；and the Soutb－Sea fund，be－ ing the produce of the taxes appropriated to pay the intereft of fuch part of the national debt as was advan－ ced by that company and its annuitants．Whereby the feparate funds，which were thus united，are become mutual fecurities for each other；and the whole produce of them，thus aggregated，liable to pay fuch intcreft or annuities as were formerly charged upon each diftinct Fund ：the faith of the legilature being moreover en－ gaged to fupply any cafual deficiencics．

The cuftoms，excifes，and other taxes，which are to fupport thefe funds，depending on contingencies，upon exports，imports，and confumptions，muft neceflarily be of a very uncertain amount；but they have always been conliderably more than was fufficient to aufwer the charge upon them．The furpluffes，therefore，of the three great national fuuds，the aggregate．general，and South－Sea funds，over and above the intereft and an－ nuities chargéd upon them，are directed by ftatute 3 Geo．I．c．7．to be carried together，and to attend the difpofition of parliament；and are ufually denomi－ nated the finking fund，becaufe originally deftined to fink and lower the national debt．To this have been fince added many other entire duties，granted in fubfequent years；and the annual intereft of the fums borrowed on their refpective credits is charged on，and payable out of，the produce of the finking fund．However， the nett furpluffes and favings，after all deductions paid，amount annually to a very confiderable fum．For as the intereft on the national debt has been at 「everal times reduced（by the confant of the proprietors，who had their option either to lower their intereft or be paid their principal），the favings from the appropriated revenues muft needs be extremely large．

But，before any part of the aggregate fund（the furpluffes whereof are one of the chief ingredients that form the finking fund）can be applied to diminith the principal of the ptblic debt，it Itands mortgaged by parliament to raife an annual fum for the maintenance of the king＇s houfchold and the civill lif．For this purpofe，in the late reigns，the produce of certain branches of the excife and cuftoms，the poft－office，the duty on wine－licences，the revenues of the remaining crown－lands，the profits arifing from courts of juftice， （which articles include all the hereditary revenues of the crown），and alfo a clear annuity of L．120，000 in noney，were fettled on the king for life，for the fup－ port of his majefty＇s houfehold，and the honour and dignity of the crown．And，as the amount of thefe feveral branches was uncertain，（though in the laft reign they were computed to have fometimes raifed almolt a
million），if they did not arife annuaily to \(\grave{L}\) ỗこ，こここ， the parliament engaged to make up the deficiency．Lut his prefent majefty having，foon after his acceffon，ipon－ tancoully fignified his confent that his own hereditary revenues might be fo difpofed of as might beft conduce to the utility and fatisfaction of the public，and having graciouly accepted a limited fum，the faid hereditary and other revenues are now carried into，and made a part of，the aggregate fund ；and the aggregate fund is charged with the payment of the whote annuity to the crown．The limited annuity accepted by his pre－ Fent majelty was at firft L．800，000，but it has been fince augmented to L． 900,000 ．The expences them－ felves，being put under the fame care and manarement as the other branches of the public patrimony，produce more，and are better collected than heretofore；and the public is a gainer of upwards of L．100，050 fer annum by this difinterefted bounty of his majefty．

The funking fund，thought long talked of as the lat refonce of the nation，proved very inadequate to the purpoie for which it was eftablithed．Miniters foum pretences for diverting it into other channels；and the diminution of the national debt proceeded flowly durng the intervals of peace，whilf each fucceeding war in－ creafed it with great rapidity．To remedy this evil， and reftore the public credit，to which the late war had given a confiderable thock，Mr Pitt conceived a plan for diminihing the debt ly a fund，which fhould be rendered unalienable to any other purpofe．In the feffon \(1-96\) ， he moved that the anmual furplus of the revenue above the expenditure frould be raifed，by additional taxes； from L． 900,000 to one million Sterling，and that cer－ tain commiffioners fhould be velted with the full power of difpoing of this fiun in the purchafe of foock（fee Funds），for the pullic，in their awn names．Thefe commiffioners fhould receive the annual million by quar－ terly payments of L．250，000，to be iffued out of the exchequer before any other money，except the interell of the national debt itfelf；by thefe provifions，the find would be fecured，and no deficiencies in the na－ tional revennes could affect it，but fuch muft be fepa－ rately provided for by parliament．
The accumulated compound interet on a miliona yearly，together with the annuities that would fall into that fund，would，he faid，in 28 years amount to fuch a fum as wrould leave a furplus of four millions annually， to be applied，if neceflary，to the exigencies of the ttate．In appointing the commiffioners，he frould，he faid，endeavour to choofe perfons of fuch weight and character as correfponded with the importance of the commiffion they were to execute．The fpeaker of the houfe of commons，the chancellor of the exchequer， the matter of the rolls，the governor and deputy＇gover－ nor of the bank of England，and the accountant－gene－ ral of the higb court of chancery，were perfons who， from their fercral fituations，he fhould think highly proper to be of the number．
To the principle of this bill no objection was made， though feveral fpecious but ill－founded ones were urged againt the fifficiency of the mode which the chancellur of the exchequer had adopted for the accomplifhment of fo great and fo dclirable an end．He had inade it a claule in his biil，that the accumulating million fhould never be applied but to the purchafe of fock．To this claufe Mr Fox objected，and moved that the commif－ \(\mathrm{T}_{2}\) fioners

\section*{R E V}
fonters therein named fhould be impowered to accept fo much of any future loan as they fhould have cafla belonging to the public to pay for. 'This, he faid, would relieve that diftrefs the country would otherwife be under, when, on account of a war, it might be necelfary to raife a new loan: whenever that flould be the cafe, 1.is opinion was, that the minifter fhould not only raife taxes fufficiently productive to pay the intereft of the loan, but alfo fufficient to make good to the finking fund whatfoever had been taken from it.

If, therefore, for inftance, at any future period a loan of fix millions was propofed, and there was at that time one million in the hands of the commiffioners, in fuch cafe they flould take a million of the loan, and the tonus or douceur thercupon fhould be received by them for the public. Thus government would ouly have five millions to borrow inttead of fix ; and from fuch a mode of proceeding, he faid, it was evident great benefit would arife to the pullic.

This claufe was received by Mr Pitt with the Arongeft marks of approbation, as was likewife another, moved by Mr Pulteney, enabling the conmiffioners named in the bill to continue purchafing ftock for the public when it is above par, unlefs otherwife direqued by parliament. With thefe additional claufes the bill was read a third time on the 15 th of May, and carried up to the Lords, where it alfo paffed without meeting with any material oppofition, and afterwards received the royal aftent.

The operation of this bill furpaffed perhaps the minifter's moft fanguine expectation. The fund was ably managed, and judiciouny applied; and in 1793 the commiffoners lad extinguifhed fome millions of the public debt. The war, however, into which the nation was that year involved, and of which there is yet no certain profpect of a near end, has made it neceflary to borrow additional fums, fo large, that many years of peace muft elaple before the operation of the fund can contribute fentibly to the relief of the people. The clear produce of the taxes raifed on the people of this country was, in the year 1792, very near L. \({ }^{17}, 000,000\); and it muft henceforth, from the accumulation of the debt, and the enormous expence of the prefent war, be neceffarily rendered greater.

Revenue, in hunting, a fiefhy lump formed chiefly by a clufter of whitifh worms on the head of the deer, frippofed to occafion the cafting of their horns by gnawing themat the root.

REVERBERATION, in phyfics, the act of a body repelling or reflecting another after its impinging thereon.

Reverberation, in chemittry, denotes a kind of sirculation of the flame by means of a reverberatory turnace.
reverberatory, or Radrbbirating Furnafe. See Chemistry-Index at Furnace, and Furnace.

REVEREND, a title of refpect given to eccle-faatics.-The religious abroad are called reverend fathers, and abbefles, prioreffes, \&c. reverend mothers. In Englard, bifhops are right reverend, and archbifhops mof reverend. In France, before the Revolution, their bifhops, archbifhops, and abbots, were all alike mof rev.rend. In Scotland the clergy individually are reverend, a fynod is very reverend, and the general affembly is venerable.

REVERIE, the fame with delirium, raving, or diflration. It is ufed alfo for any ridiculous, extra:
vagant imagintrion, action, or propofition, a chimera, Reverl or vifion. But the molt ordimary nfe of the word among Englifh writers, is for a deep diforderly mufing or meditation.

REVERSAL of Judgment, in law. A judgment may be falfified, reverfed, or voided, in the firt place, zuithout a wurit of error, for matters forcign to or delors the record, that is, not apparent upon the face of it; fo that they cannot be afligned for error in the fuperior court, which can only judige from what appears in the recurd itfelf; and therefore, if the whole record be not certified, or not truly certifed, by the inferior court, the party injured thereby (in both civil and criminal cafes) may allege a dimination of the record, and caufe it to be rectificd. Thus, if any judgment whatever be given by perfons who lad no good conmiffion to proceed againt the perfon condemued, it is void; and may be falfified by flewing the fpecial matter, without writ of crror: As, where a commiffion iffucs to \(A\) and \(B\), and twelve others, or any two of them, of which A or \(B\) fhall be one, to take and try indistments; and any of the ohler twelve proceed without the interpofition or prefence of either A or \(\mathrm{B}:\) in this cafe all proccedings, trials, convictions, and judgments, are void for want of a proper authority in the comniffioners, and may be falfified upon bare infpection, without the trouble of a writ of error ; it being a high mifdemeanour in the judges fo proceeding, and little (if any thing) fhort of murder in them all, in cafe the perfon fo attainted be executed and fuffer death. So likewife if a man purchafes land of another; and afterwards the vender is, either by outlawry or his own confeffion, convicted and attainted of treafon or felony previous to the fale or alienation; whereby fuch land becomes liable to forfeiture or efcheat : now, upon any trial, the purchafer is at liberty, without bringing any writ of error, to fallify not only the time of the felony or treafon fuppofed, but the very point of the felony or treafon itfelf; and is not concluded by the confeffion or the outlawry of the ven. der, though the vender himfelf is concluded, and not fuffered now to deny the fact, which he has by confeffion or flight acknowlectged. But if fuch attainder of: the vender was by verdict, on the oath of his peers, the alienee cannot be received to falfify or contradict the \(f a\) at of the crime committed; though he is at liberty to prove a miftake in time, or that the offence was committed after the alienation, and not before.

Secondly, a judgment may be reverfed, by zurit of. error, which lies from all inferior criminal jurifdictions to the court of king's-bench, and from the king'sbench to the houfe of peers; and may be brought for notorious mittakes in the judgment or other parts of the record: as where a man is found guilty of perjury, and rcceives the judgment of felony, or for other lefs palpable errors ; fuch as any irregularity, oniffion, or want of form in the procefs of outlawry, or proclamations; the want of a proper addition to the defendant's name, according to the flatute of additions; for not properly naming the fheriff or other officer of the court, or not duly defcribing where his county-court was held: for laying an offence, committed in the time of the late king, to be done againt the peace of the prefent; and for many other fimilar caufes, which (though allowed out of tendernefs to life and literty) are not much to the credit or advancement of the national juftice.Thefe writs of error, to reverfe judgments in cafe of

\section*{R E V [ 149 ] R E V}
ril mildemeanours, are not to be allowed of courfe, but on fufficient probable caufe fhown to the attorney-general ; and then they are underfood to be grantable of common right, and ex debito juflitio. But writs of error to reverfe attainders in capital cafes are only allowed ex gratia; and not without exprefs warrant under the king's fign-manual, or at leaft by the confent of the at-torney-general. Thefe therefore can rarely be brought by the party himfelf, efpecially where he is attainted for an offence againft the flate: but they may be brought by his heir or executor after his death, in more favourable times; which may be fome confolation to his fanuily. But the ealier and more effectual way is,
Laftly, to reverfe the attainder by act of parliament. This may be and hath been frequently done upon motives of compafion, or perhaps the zeal of the times, after a fudden revolution in the government, without examining too clofely into the truth or validity of the errors affigned. And fometimes, though the crinie be univerfally acknowledged and confeffed, yet the merits of the criminal's family fhall after his death obtain a reftitution in blood, honours, and eftate, or fome or one of them, by act of parliament ; which (fo far as it extends) has all the effect of reverfing the attainder, without catting any reflections upon the juftice of the preceding fentence. See Attainder.
The effect of fallifying or reverfing an outlawry is, that the party fhall be in the fame plight as if he had appeared upon the capias: and, if it be before plea pleaded, he fhall be put to plead to the indictment; if, after conviction, he fall receive the fentence of the law; for all the other proceedings, except only the procefs of outlawry for his non-appearance, remain good and effectual as before. But when judgment, pronounced upon conviction, is fallified or reverfed, all former proceedings are abiolutely fet afide, and the party ftands as if he had never been at all accufed : reflored in his credit, his capacity, his blood, and his eftates: with regard to which laft, though they be granted away by the crown, yet the owner may enter upon the grantee, with as little ceremony as he might enter upon a dififeifor. But he fill remains liable to another profecution for the fame offence: for, the firl being erroneous, he never was in jeopardy thereby.

REVERSE of a medal, coin, \&c. denotes the fecend or back fide, in oppofition to the head or principal figure.

REVERSION, in Scots law. See Law, No clxix. :-3.

Reversion, in the law of England, has two fignifications ; the one of which is an eftate left, which continues during a particular eftate in being; and the other is the returning of the land, \&c. after the partiticular eftate is ended; and it is further faid to be an interett in lands, when the poffeffion of it fails, or where the eftate which was for a time parted with, returns to the granters, or their heirs. But, according to the ufual dchnition of a reverfion, it is the refidue of an eftate left in the granter, after a particular eftate granted away ceafes, continuing in the granter of fuch an effate.

The difference between a remainder and a reverfion confifts in this, that the remainder may belong to any man except the granter; whereas the reverfon returns to. him who conveyed the lands, \&c.

In order to render the doctrine of reverfions eafy, we Reverfion. fhall give the following table; which fhows the prefent value of one pound, to be received at the end of any number of years not exceeding 40 ; difcounting at the rate of 5,4 , and 3 rer cent. compound interen.
\begin{tabular}{|c|c|c|c|}

The ufe of the preceding table.- To find the profent value of any fum to be received at the end of a given term of years, difcounting at the rate of 3,4 , or 5 fer cent. compound intereft. Find by the above table the prefent value of 11. to be received at the end of the given term; which multiply by the number of pounde propofed, (cutting off four figures from the product on account of the decimals), then the refult will be the var lue fought: For example, the grefent value of \(10, \mathrm{ccol}\),

\section*{R E V}

Revivifica to be received 10 years hance, and the rate of interelt \({ }^{\text {tuill }} 5 \mathrm{fer} \mathrm{cer}\) '. is cqual to . \(6139 \times 10,0000=6139.03001\), Recunim. or 6139 . Again, the prefent malue of \(10,0 \mathrm{col}\). due in ten years, the rate of intecett being 3 per cent. is \(.7+4 \times 10,000=74+1\).

Reifrsion of Serics, in algebra, a hind of reverfed operation of an infinite ferics. Sce Series.

RLSIVIFICATION, in chemittry, a tern generally applied to the diflillation of quicktilver from cinnabar.

Commission of REVTEW, is a commifion fometimes granted, in extraordinary cafes, to revife the fentence of the court of delegates, when it is apprehended they have been led into a material error. This commiffon the king may grant, although the flatutes 24 and 25 Hen. VIII. declare the fentence of the delegates definitive: becaufe the pope, as fupreme head by the canon law, ufed to grant fuch comminion of review; and fuch authority as the pope heretofore exerted is now annexed to the crown by flatutes 26 Hen. VIII. c. 1. and I Eliz. c. 1. Lut it is not matter of right, which the fubject may demand ex delito jufilis; but mercly a matter of favour, and which thercfore is often denied.

Review, is the drawing out all or part of the army in line of battle, to be viewed by the king, or a general, that they may know the condition of the troops.

At ail reviews, the officers fhould be properly armed, ready in their exercile, falute well, in good time, and with a good air; their uniform genteel, S.C. 'The men thould be clean and well dreffed; their accoutrements well put on; very well fized in their ranks; the ferjeants expert in their duty, drummers perfect in their beatings, and the fifers play correct. The manual exercife muft be performed in good time, and with life.; and the men carry their arms well; march, wheel, and form with exactnefs. All manocuves mull be performed with the utmoll regularity, both in quick and fow time. The firings are generally \(3^{6}\) rounds; viz. by companies; by grand divifions; by fub-divifioris ; obIiquelv, adrancing, retreating; by files; in the fquare; ftreet firins, advancing and retreating; and latlly, a volley. The intention of a review is, to know the condition of the troops, fee that they are complete and ferform their exercife and evolutions well.

Review is alfo applicd to Literary Journals, which give a periodical view of the flate of literature; -as the Monthly Review, the Critical Review, the Dritifh Critic, and Analytical Review, \&c.

RE-UNION island, an ifland in the South Sca, difcovered by the French on the 16th December 1773; lying, according to M. de Pages, in latitude \(48^{\circ} 2 \mathrm{I}^{\prime \prime}\), and longiturde \(66^{3}+7^{\prime \prime}\), the variation of the needle being \(30^{\circ}\) always towards north-weft. The road and harbour are extremely good, and the latter frum 16 to 8 fathoms deep at the very flore. The coaft on each fide is lofty, but green, with an abrupt defcent, and fwarms with a fpecies of buflards. The penguins and fea-lions, which fwarmed on the fands, were notwife alarmed at the approach of thofe who landed; from whence M. de Pages concluded that the country was wholly uninbabited. The foil produces a kind of grafs, about tive inches long, with a broad black leaf, and feemingly of a rich quality-but there was no weftige of a tree or
human habitation. See Travel's round the W"Ora'llay M, Revoion. de Pagts, Vol. III, chap, viii, and ix.

REVOLUTION, in politics, fignifies a chanpe in Defina. the conflitution of a ftate; and is a word of different irriport from revolt, with which it is fumetimes confounded. When a people withdraw their obedience from their governors fur any particular reafon, withont overturning the government, or waying an offenfive war againft is, they are in a fate of revolt; when they overtum the government and form anew one for themfelves, they effect a revolition.

That which is termed the revolution in Dritain is the Britils. change which, in 1688 , took place in confecinence of volue the forced abdication of king James II. when the 1?roteftant fucceffion was eftablifhed, and the conilitution reftored to its pimitive purity. Ot this important tranfaction, which confirned the rights and libertics of Britons, we have endeavoured to give an impartial account under another article (fee Britalis, 110281, \&ec). Of the sife and progreis of the American resolution, Ame 2n. which is ftill frefh in the memory of our readers, a large detail is given under the article Ambrica: But there are two other revolutions yet depending, of which fome account will be expected in this place.

The Polith revolution, which, in all its circumfances, was perhaps the leall exceptionable of any in the records of hillory, we have already traced to the period when the amiable king, over awed ty the arms of Ruffia, was obliged to undo his patriatic work, and give his fanction to the refloration of the old and wretched goverument (fee Poland). Since that period, Kufciufko's army has been completcly defeated, himfclf made a prifoner, Warfaw takcn, and the whole kingdom fubdued by the powers combined againt it. What will, be the confequence of this fuccefs may perhaps be conceived, but the rumours of the day are various. At one time we are tokd, that Poland is to be no longer an independent flate, but to be divided among the three gecat powers which fornerly wretted from it fume of its mott valuable provinces. At another time, we hear of the difinterelled intention of the Emprefs, to relture the king to his original authurity ; although the has, in the mean time, driven hin from his capital, where fehe heridf exercifes fovereign p ower. And a third report fays, that Staniflaus is to retire with a large pention, and a Ruflian prince to ftep iuto his throne. "lhe firt of thefe rumours we think much mure probable than the other two: efpecially as it feems confirmed by the following letter fent from Grodno, on the I 8 th of January, by the unfortunate king to the Britilh ambaflador.
" Mif dear Gardiner - The characters with whech you and I have been invelted feem to be now almott at an end. I du not expect to fee you again, but it is of importance to me to bid you farewell; and this I do from the bottom of my heart. You will preferve a place in my heart till death; and I hope that at laft we thall meet again, in a place where upright minds, according to my opiniun, will be for ever unted.
" Every thing belunging to the ufual etiquetie has been fo much deranged and interrupted by my fad fate, that moll probably neither you nur I will be able to fulfil the diplomatic cuftoms.
" But be affured, that I love and honour your king

\section*{\(R E V\)}
tion, and nation. This you will apprize them of. Be affured alfo, that I wifh you fhould preferve an-affertion towards your friend. If I am able to fpeak to you no more, my piture will fpeak to you for me ! (Sisned) Simaislievs Augustus, King."
This hows, at lealt, the fate of the king; and leaving that of the kingdom to be afcertained by time, we proceed to fulfil a promife which we made refpe'ting another revolution, to which all the nations of Europe are fitll looking with anxiety and alarm.

When treating of France under a former article, we ftated a few of the more ftriking littorical facts which led to the commencement of the revolution; and we now come to trace the feries of tranfactions which have marked its terrible career. In doing this, we fhall comprefs our ideas as much as pofible; and out of the tadlefs variety of materials of which the public are in poffelfion, we flall endeavour to extract a fhort and, if poffible, a sulerably clear detail. For this purpofe, however, it will be neceffary that we begin, by ftating the internal fituation of France at the period immediately preceding the revolution, along with the mare obvious political circumftances which contributed to the production of that event. The moral hitory of man is always more important than the mere recital of any phyfical occurrences that may take place in his lot. It is not the fall of a mi hty monarch and the difperfion of his family; it is not the convulfion of empires, and the oceans of human blood which have been thed, that render the French revolution peculiarly interefting. Such events, however deplorable, are far from being without example in the hiftory of mankind. In the populous regions of the eaft, where fupertition and flavery have always prevailed, they are regarded as forming a part of the ordinary courfe of human affairs; becaufe an intrepid and fikifful ufurper finds it eafy to intimidate or enfnare millions of weak and credulous men. In Eurnpe the cafe is very different: no adventurer can advance far without encountering thoufands as antful and as daring as bimelf. Events are not the refult either of blind hazard or of individual fkill ; confpiracies or plots produce little effect. Like other arts, the art of goverument has been brought to much perfection; and an eftablifhed conftitution can only be fhaken by the firong convulfion produced by national paffiuns and efforts. The wonderful fpectacle which we are now to contemplate, is that of a mild and polifhed people becoming in an inftant fanguinary and fierce; a well eftablifhed government, celebrated for its dexterity and \&ill, overturned almoft without a Atruggle; a whole nation apparently uniting to defloy every inftitution which antiquity had ballowed or education tauglat thern to refpect; a fuperfitions people treating the religion of their fathers with contempt; a long enflaved people, whofe very chains had become dear to them, occupied in their public comfels in the difcuffion of refined, and even vilionary fchemes of freedom: in fhort, \(25,000,000\) of perfons fuddenly treading under foot every fentiment and every prejudice that they themelves had once regarded as facred and vencrable.

Like the other nations of Europe, France was anciently governed by a barbarous ariftocracy, whofe different members were feebly united by the authority of a fucceffion of kings deftitute of power or influence. The nobles, within their own territories, enjoyed privi-

\section*{15 B R E V}
leges entirely royal : they made peace and war; they coined money; thcy were judges in the lat refort; their vaffals were their flaves, whom they bought and fold along with the lands; the inhabitants of cities, although freemen, were depreffed and poor, depending for protection upon fome tyrannical baron in their neighbourhood. At length, however, by the progrefs of the arts, the cities rofe intu confiderable importance, and therr inhabitants, along with fuch freemen of low rank as refided in the country, were confidered as entitled to a reprefentation in the flates-general of the kingdom. under the appellation of tiers ctut, or thirid elfaie; the clergy and the nobles forming the two firt eftates. But the fovereign, having fpeedily become defpotic, the meetings of the flates generab were laid afide. 'lhis abfolute anthority, on the part of the crown, was not acquired, as it was in England by the houfe of Tudor, by abolithing the pernicious privileges of the nobles and tievating the commons; but by filful encroacirments, by daring exertions of prerogative, and the ufe of a powerful military force. In France, therefore, the monarch was abfolute, get the nobles retained all their feudal privileges, and the eccleflaftical hierarchy did the fame. The following was, in a few words, the tate of that country during thefe two laft centuries.

The kingdom of France, previous to the revolution, was nerez was never reduced to one homogenous mafs. It con-reduced filted of a variety of feparate provinces acquired by dif- into one ferent means; fome by marriage, fome by legacy, and ous nafor. others by conquel. Each province retained its ancient laws and privileges, whether political or civil, as expreffed in their capitularies or conditions by which they were originally acquired. In one part of his dominions the French monarch was a count, in anotlier he was a duke, and in others he was a king ; the only bond which united his vat empire being the flrong military force by which it was overawed. Each province had its barriers; and the intercourfe betwixt one province and another was often more reftrained by local ufages than the intercourfe of either with a foreign country. Some of the provinces, fuch as Pretagne and Dauphine, even retained the right of affembling periodically their provincial itat ss; but thefe formed no barrier againft the power of the court.

The clergy formed the firlt eftate of the kingdom in The clergy point of pricedence. They amounted to \(1.30,000\). fornued the The higher orders of them enjoyed immenfe revences; ärfe efare but the curés or great body of acting clergy feldom in the tuepoffefled more than about L. 28 Sterling a-ycar, and \({ }^{\text {don, }}\) their vicaires about half that funs. A few of their dig.
nified clergy were men of great piety, who nified clergy were men of great piety, who zefided conftantly in their diocefes, and attonded to the duties of their office; but by far the greater number of them pafied their lives at Paris and Verfailles, immerfed iu all the intrigues and diflipation of a gay and corrupted court and capital. 'They were almoft exclufively felected from among the youngcr branches of the families of the moft powerful nobility, and accounted it a kind of dihhonour to the order of bilhops for any pcrfon of low rank to be adnitted into it. The lower clergy, on the contrary, were perfons of mean birth, and had little chance of preferment. At the fame time, we find feveral refpectable exceptions to this laft rule. The clergy, as a body, independent of the tithes, poffefed a revenue ariking from their property in laud, amounting

Frenels Revelutior:

Prench to four or five millions Sterling annually ; at the fame Revoluecon. tine they were exempt from taxation. The crown had of late years attempted to break through this privilegc. To avoid the danger, the clergy prefented to the court a free gift of a fuin of moncy foncwhat hort of a million Sterling every five years.

The nobility the recoid,

The nubility was nominally the fecond order of the ftate, but it was in reality the firf. The nobles amounted to no lcfs than 200,000 in number. The title and sa:ak defcended to all the cliildren of the fanily, but the property to the eldeft alone : hence valt multitudes of them were dependent upon the bounty of the court. They regarded the ufeful and commercial arts as difhoromrable, and even the liberal profeffions of the law and phyfic as in a great neafure bencath their disnity, difdaining to intermarry with the fanilies of their profef. fors. The fudal fyttem in its purity was extremely favourable to the production of refpectable qualities in the ninds of thofe who belonged to the order of the nobles; but the introduction of commerce has sendered its decline equally unfavourable to that elafs of men. Inftead of the ancient patriarchal attachment between the feudal chieftain and his vaffals, the nobility lad become greedy landlords in the provinces, that they might appear in fplendor at court and in the capital. There, loft in intrigue, fenfuality, and vanit \(y\), their characters became frivolous and contemptible. Such of the French moblefle, however, as remained in the provinces, regardcd with indignation this degradation of their order, and fill retained a proud fenfe of honour and of courage, which has always rendered them refpectable. The order of the nobles was exempted from the payment of taxes, ilthough the property of foine of them was immenfe. The eftates of the prince of Conde, for example, weie worth L. 200,000 a year, and thofe of the duke of Orleans nearly twice as much. The crown had indeed impofed fome trifling taxes upon the nobleffe, which, however, they in a great meafure contrived to elude.

Next to the nobles, and as a privileged order poffer-
amaint them. This was done under a kind of legal Fre, fietion: for they pretended that the obnoxious edict Revilon being injurious to the public happinefs, could not be the will of the king, but mult either be a forgery or an impofition by the minifters. Thefe objections were got the better of, either by a pofitive order from the king, or by his coming in perfon and ordering the edict to be regitered. '1he parliaments, however, often carried their oppofition very far, even to the ruin of themfelves and their families as individuals. This rendered them extremely popular with the mation, and enabled them to embarrals a weak adminitration. After all, however, the oppofition of the parliaments was fo feeble, that it was never thought worth while to abolifh them entirely till tewards the end of the reign of Louis XV. but they were refloted as a popular meafure at the beginning of the reign of Louis XV1.
The tiers etat, or commons, formed the lowelt oruer And th of the fate in France, and they were deprefed and mi. commo Cerable in the extremc. To form a conception of their ne the low, fituation, it is neceflary to obferve that they bore the order. whole pecuniary burdens of the flate: They alone cuppref: were liable to taxation. An expenfive and anbitious b.rdenis court; an army of \(200,000 \mathrm{men}\) in time of peace, and of twice that number in war; a confiderable marinc eftablihment, public roads and works, were all fupported exclufively by the loweft of the people. 'To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain fum, over and above which they not only acquired immenfe fortunes to themfelves, but were enabled to advance enormous prefents to thofe farourites or miftreffes of the king or the minifter, by means of whom they procared their places. To raife all this money from the people, they were guilty of the cruellef oppreffion, having it in their power to obtain whatever revenue laws they pleafed, and executing them in the fevereft manner. For this laft purpofe they kept in pay an army of clerks, fubalterns, fcouts, and fpies, amounting to 80,000 men. Thefe men were indeed detefted by the king, whom they deceived and kept in poverty; by the people, whom they opprefled ; and by the ancient nobility, as purfe-proud upitarts. But the court of France could never contrive to manage without them. The peafants could be call. ed out by the intendants of the provinces in what they called corvés to work upon the high roads for a certain number of days in the year, which was a Cource of fevere oppreffion, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any commutation in money. They were moreover fubject to the nobles in a thoufand ways. The nobles retained all their ancient manerial or patrimonial jurifdictions. The common people being anciently flaves, had obtained their freedom upon different conditions. In many places they and their pufterity remained bound to pay a perpetual tribute to their feudal lords. Such tributes formed a confiderable part of the revenue of many of the provincial nobles. No man could be an officer of the arny, by a late regulation, who did not produce proofs of nobility for four generations. The parliaments, although originally of the tiers etat, attempted alfo to introduce a rule that none but the nobleffe flould be admitted into their order. In fuch a fituation, it will not be accounted furprifing that the common people of France were extremely fuperti-

\section*{R E V \\ 「 1537 R E V}

Prench tious and ignorant. 'They were, however, paffionately In to their monarch, and whatever concerned him. In 1754, when Louis XV. was taken ill at Metz, the whole nation was truly in a kind of defpair. The courier and his horfe that brought the news of his recovery to Paris were both almolt fuffocated by the embraces of the people.

We have faid that the French monarch was defpotic. His power was fupported by his army and by a watcliful police, having in pay an infinite holt of fpies and other fervants. In France no man was fafe. The fecrets of private families were fearched into. Nothing was unknown to the jealous inquilition of the police. Men were feized by lettres de cachet when they leaft expected it, and their families had no means of difcovering their fate. The fentence of a court of law againf-a nobleman was ufually reverfed by the miniter. No book was publifhed without the licence of a cenfor-general appointed by the court, and the minilter was accountable to none but the king. No account was given of the expenditure of the public money. Enormous gratifications and penfons were given as the reward of the molt infamous fervices. The fupreme power of the ftate was ufually lodged with a favourite miftrefs, and the was fometimes a woman taken from public proftitution. This was not indeed the cafe un, der Louis XVI. but it was neverthelefs one of the misfortunes of his life that he was far from being abolute in his own family. Still, however, with all its fautts, the French court was the moft fplendid and polifhed in Europe. It was more the refort of men of talents and literature of every kind, and there they met with more ample protection, than anywhere elfe. The court was oftert jealous of their productions, but they met with the moft diftinguifhed attention from men of fortune and rank; infomuch that for a century palt the French have given the law to Europe in all queftions of tafte, of literature, and of every polite accomplifh. ment. The gay elegance that prevailed at court diffufed itfelf through the nation ; and amidit much internal mifery, gave it to a foreigner the appearance of happinefs, or at leaft of levity and vanity.

Such as it was, this government had food for ages, and might have continued, had not a concurrence of caufes contributed to its overthrow. The inferior orders of clergy, excluded from all chance of preferment, regarded their fuperiors with jealoufy and envy, and were ready to join the laity of their own rank in any popular commotion. The inferior provincial mobleffe beheld with contempt and indignation the vices and the power of the courtiers, and the higher nobility wifhed to diminifh the power of the crown. 'The practifing lawyers, almoft entirely excluded from the chance of becoming judges, wifhed eagerly for a change of affairs, not doubting that their talents and profeflional fkill would render them neceflary amidt any alterations that could occur. Accordingly, they were the firlt inflerments in producing the revolution, and have been its moft actire fupporters. The monied interelt wilhed eagerly for the downfal of the ancient nobility. As for the great mals of the common people, they were too ignorant, too fuperftitionfly attached to old eftaolithments, and too much deprefled, to have any conception of the nature of political liberty, or any hope of obtaining it. We have already stated the leading circum-

Vol. XVI. Past I.
ftances which led to the French revolution (fee France, Erench \(n^{\circ} 184\), \&x.) ; but there were other eircumftances which Rev lution. contributed in an equal degree both to its commence. ment and its progrefs.

For to years the principles of libeity had been diffeminated with eagernefs in France by fome men of great talents, as Rouffeau, Helretius, and Raynal, to whom the celebrated Montefquieu had led the way. Belides thefe, there was in France a wat multitude of what were called men of letters, or perions who gave this account of the manner in which they fpent their time. All thefe were deeply engaged on the fide of fome kind of pulitical reform. The men of letters in Paris alone are faid to have amounted to 20,000 . One of the latt acts of the adminitration of the archbilkop of 'Thouloufe was, on the \(5^{\text {th }}\) July 1788 , to publifh a refolution of the king in council, inviting all his fubjects to give him their advice with regard to the fate of affairs. This was confidered as a conceffion of an unlimited liberty of the prefs; and it is fcarcely poffible to form an idea of the infinite variety of political publications which from that period diffufed among the people a diffatisfaction with the order of things in which they had hitherto lived.

The eftablifhed relicion of France had for fome time palt been gradually undermined. It had been folemnly affaulted by philofopliers in various elaborate performances; and men of wit, among whom Voltaire took the lead, had attacked it with the dangerous weapon of rim dicule. The Roman Catholic religion is much expofed in this refpect, in confequence of the multitude of falie miracles and legendary tales with which its hiftory abounds. Without ditcriminating betwixt the refpectable principles on which it rells, and the fupertitions follies by which they had been defaced, the French nation learned to laugh at the whole, and rejected inttead of reforming the religion of their fathers. Thus the firlt order in the ftate had already begun to be regarded as ufelefs, and the minds of men were prepared for important changes.

The immenfe population of the city of Paris, amount ing to upwards of 800,000 fouls, rendered it an important engine in the hands of the conductors of the revolution. An overgrown capital has always proved dangerous to a government that is or attempts to be defpotic, as appears from the hitory of ancient Babylon and Rome, as well as of modern Conltantinople, of Loadon under Charles I. and Paris under feveral of its kings.

We cannot here avoid mentioning a phyfical eient. which afilifed not a little in producing many of the convulfions attendiag the revolution, a general fearcity of grain, which occurred about that peliud. On Sunday the 1 3th of July 1788 , about nine in the mornins, without any eclipfe, a dreatful darknefs fuddeniy over. fpread feccral parts of France. It was the prelude of fuch a tempelt as is unexampled in the teniaerate climates of Europe. Wind, rain, hail, and thunder, fecmed to contenl in impetuofty ; but the hail was the great initrument of ruin. Intead of the rich profpeits of an carly autumn, the face of nature in the fpace of an hour prefented the deary afpect of univerial winser. I he foil was converted into a morals, the tanding corn beaten into the quagmire, the vines broken to pieces, the fruit trees demolifhed, and nameiter hail ly= ing in hangs lake rocks of folld ice. Eica the rotnt

French furef trees were unable to withftand the fury of the Fevolution tempett. The hail was compofed of enomons, folid, 1989 and angular pieces of ice, fome of them weighing from eight to ten ounces. The comatry people, beaten down in the fields on their way to church, anidet this concuifrom of the clementa, concluded that the laft day was arrived; and fearcely attempting to extricate themfelves, lay defpairing and half fuffocated amidlt the water and the mad, expecting the imnediate diffulation of all thengs. The ftorm was irregular in its devatations. While feveral rich diftricts were laid eutirely walle, fome internediate portions of country were commaratively little injured. One of 60 fquare leagues had not a fingle eat of corn or a fruit of any kind left. Of the rio parithes in the diftrict of Pontoife, 43 were entirely Ilefolated, and of the remaining 23 fome loft two thinds and others half their harvefl. The ille of France, being the diftriet in which Paris is fituated, and the Orleannois, appear to have fufered chicfly. The damage there, upon a moderate eftimate, amounted to \(\$ 0,000,000\) of livres, or between three and four millions Sterling. Such a calamity muft at any" period have been feverely felt; but occurring on the eve of a sreat political revolution, and amidit a general feareity throushout Europe, it was pecuharly unfortunate, and wave more emharrafment to the government than perhaps any other crent whaterer. Numbers of families found it neceffary to contract their mode of haing for a tione, and to difmifs their fervants, who were thus left deflitute of bread. Added to the public difcontent and political diffenfions, it produced freh an effect ripon the people in seneral, that the nation fecmed to have changed its character; and inftead of that levity by which it had ever heen ditinguifted, a fettled gloom now feemed fixed on every countenance.

The fpring of the year 1789 was a period of much political anxiety in France. The fuperior orders wifhed to rednce the power of the crown, hut were jeatous of their own privileges, and determined to retain them; while the popular philofophers and others were endeavouring to render them odious, and to roufe the people in a love of freedom. Still, however, the great body of the common people remained carelefs fpectators of the Aruggle and unconfcious of the approaching commotion. Such was their indiference, that few of them tonk the trouble even to attend and vote at the clections os the deputies to the flates-general. In many places, where a thoufand voters were expected, not fifty came forward; but fuch of them as did appear fhowed that a fed was fown which might one day rife into important fruits. In the inflructions which they gave to their deputies, the Britifh conlitution was in general the model of what they wifhed their government to be. Thisy demanded equal taxation, the abolition of letties de cailet or arbitrary imprifonment, the refponfibility of minifters, and the extinction of the fendal privileges of the nobles; but they wifhel that the wbole three orders of the flate fhould fit and vote in one houle, well krowing that their nobility were not prepared to act the moderate part of a Britith honfe of lords. The wobles, on the contrary, although willing to renounce fome of their pecunary privileges, and to facrifice the power of the crown, were molt decifively rufulved neither to furrender their feudal prerogatives nor the right of fitting in threc fepante allemblici; by means of which
\(34] \quad \mathbf{E} \quad \mathbf{V}\)
each of the orders could eafly refit the encroachments of the other two. Mr Neckar has been improperly cenfured for not deciding this lat important quedtion previons to the meeting of the flates-gencral: but it mult be obferverl, that the very purpofe of calling that af. fembly was to overturn the unjuit privileges of the higher orders through its medium, and without any direct interpofition on the part of the minillers. Had the king politively decided in favour of three chambers, the nobles and the elergy would have retained all thofe ancient abufes chablifted in their own favour, of which it was his wilh to deprive them, and the crown and its prerogatives would have been the only objects of facrifice. It was therefore thought fafer to leave the tiers efot to fight its own battle: nor was it yet imagined that the commons of France, depreffed and proor, and difperfed by fituation over a multitude of provinces, could ever unite in enterpuifes dangerous to the fove. reign.

The fates had been fummoned to meet at Verfailles States \(f_{6}\), on the 27th of Aprit, and moft of the deputics arrived moned : at that time; but the elections for the city of Paris mect at not being concluded, the kiner deferred the commencement of their feffens till the \(4^{\text {th }}\) of May. Daring this period, the members, left in idlenefs, began to find out and form acquaintance with each other. Among others, a few members from Brittany (Bretagne) formed themfelves into a club, into which they gradually admitted many other deputies that were found to be zea. lous for the popular caufe, and alro many perfons who were not deputies. This fociety, thas originally cllablithed at Verfailles, was called the Comite Breton; and was one day deftined, muder the appellation of the Facolin Chub, to give laws to France, and to diffufe terror and alarm throughout Europe. On the other fide, the ariftocratic party eflablifhed conferences at the houfe of Madame Polignac, for the purpofe, it is faid, of uniting the nobles and the clergy.

An event occurred at this time which all parties afcri- A popu. bed to fome malicious motive. In the populous fuburb riot in 1 of St Antoine, a M. Revellon carried on a great paper fuburb manufactory. A falfe report was fpread that he in- St Ante: tended to lower the wages of his workmen, and that he had declared bread was too good for then, and that they might fubfift wery well on potato-flour. A commotion was raifed, he was burnt in effigy, and his houfe was thereafter burnt and pillaged by the mob, who were not difperfed till the military had been called in, and much carnage entued. The popular party afferted that the commotion had been artfully excited by the party of the queen and the Count 1'Artois, to afford a pretence for hringing great bodies of the military to the neiglibourhood to overawe the flates-general, or induce the kiner more decifively to refulve on affembling that body at Verfailles, in preference to l'aris, where they and the popular minifter M. Neckar wilhed it to be held.

On the \(4^{\text {th }}\) of May the fates-general affembled at Verfaills. They commenced bufinefs by going in a folemn proceflion, preceded by the clergy, and follow Genere ed by the king, according to ancient cuflom, to church, bulinelif to ferform an act of devotion. The nobles were ar- Veifail. rajed in a fplendid rube, and they and the higher clergy glittered in gold and jewels. 'Ihe commons appeared in black, the drefs belonging to the law. The
affembly

\section*{R E V}
rench aftembly wes thereafter opened by a fort fpeech from olution
deputies of the tiers etat amounted to 600 in number, and thofe of the nobles and clergy to 300 each. During their firf fittings much time was fpent in unimportant debates about trifing points of form; but the firf important queftion, that neceffarily became the fubject of their difcuffion, was the verification of their poseers, or production of the commiffions of the members, and inveftigation of their authenticity. The commons (tiers etat) laid hold of this as a pretext for opening the grand controverfy, whether the itates-general flould fit in one or in three feparate chambers? They fent a deputation inviting the nobles and the clergy to meet along with them in the common hall for the purpofe of verifying their powers in one common affembly. In the chamber of the clergy in 4 members voted for the performance of this ceremony in the general affembly; and 133 againft it. But in the more haughty order of the nobles, the refolution for the verification in their own affembly was carried by a majority of 188 againft 47. The commons paid no regard to this. They were conducted by bold and niilful leaders, who difcerned the importance of the point in conteft, and refolved not to abandon it. Aware of the exigencies of the ftate, they knew that the crown was nearly verging upon bankruptcy ; and that fuch were the deficiencies of the revenue that only a fhort delay was neceffary to accomplifh the abfolute diffolution of the government. They fuffered live weeks to pafs away therefore in total inactivity. During this period propofals were made on the part of the miniffry for a pacification between the three orders, and conferences were opened by commifioners from each. But no art could feduce the commons from their original purpofe, or prevail with them to enter upon the bufiness of the flate.

The nation had expected much from the affembling of the ftates-general, and learnt the news of their inaction with no fmall degree of concern. The tiers etat was naturally popular, and the public cenfure could not readily devolve upon that favourite order. Moreover, from the firt period of their affembling the commons made every cffort to augment their own natural popu-
larity. They admitted all perfoas promifcuouly into Frence the galleries, and even into the body of their hall. No Resoutan, reflraint was attempted to be laid upon the mooft vehe- 1, ment marks of popular applaufe or cenfure. Litts of the voters names were pubicly taken and fent to I'aris upon every remarkable nccaion; and the members fuddenly found themfelves become, according to their pulitical fentiments, the objects of general execratioa or applaufe. The new and hold notions of liberty that were daily advanced by the leaders of the ters ethit werc received with acclamation by their hearers. The cap:tal becane interefted in the iffue of every debate; and the political fervor was cagcrly imbibed by the nation with that viracity which is fo peculiar to the French. The commons accufed the nobles of obftinately impeding the bufinefs of the ftate, by refufing to verify their powers in one common affembly. The accufation was fwallowed by the multitude, who faw not, or were unwilling to fee, that the attack was made by their own favourite order. In the mean time the nobles became rapidly more and more unpopular. Their perfons were infulted, new publications daily came forth, and were greedily bought up, which reviled their whole order, and reprefented thein as an ufelefs or pemicious bod of men, whofe exiftence ought not to be tolerated in a free ftate. Whocver adhered to them was branded with the odious appellation of Arifocrate. The clergy, from the influence of the parith curés or parfons, feencd ready to defert thieir caufe. They were even oppofed by a minority of their own body, which derived luttre from having at its head the duke of Orleans, the firlt prince of the blood. Still, however, the majority of the nobles remained frin; well aware, that if they once confented to fit in the farne affembly, and to vote promifcuoufly, with the ambitions and more numerous body of the commons, their whole order, and all its fplendic privileges, muft fpeedily be overthrown.

The leaders of the commons faw the change that Tak ine ar. was taking place in the minds of men; and they at vantage of length regarded the period as arrived when they ought this poinuto emerge from their inactivity, and executc the daring leize the project of feizing the legiflative authority in their coun- legillative try. They declared that the reprefertatives of the aith rity ; nobles and the clergy were only the deputies of particular incoiporations whom they would allow to tit and vote along with themfelves; but who had no title in a collective capacity to act as the leginators of France. For conductins bufnefs with more facility, they appointed 20 committees. In confequence of a propofal by the Abbć Sieges, a final meffage was fent to the privileged orders requiring their attendance as individuals, and intimating that the commons, as the deputies of 96 out of every hundred of their countrymen, were about to affume the exclufive power of legiflation. None of the nobles obeyed this fummons; but three curés, Meffrs Cefve, Ballard, and Jalot, prefented their commiffions, and were received with loud acclamations. They were next day followed by five more, among whom were Meffrs Gregoire, Dillon, and Bodineau. After fome debate concerning the appellation which they ought to affume, the commons, with fuch of the clergy as had joined them, folemnly voted themfelves the fovereign legillators of their country under the name of the National Alfembly. The retult of the vote was po fooner declared, than the hall refounded

Its fift acts were decifively exprifine of its own fovereignty. All taxes impofed without the confent of the reprefentatives of the people were declared to be null and void; but a temporary fanction was given to the prefent taxes, althourh illegal, till the difulution of the affembly and no lohger. It was added, that "as foon as, in concert with his majelty, the rffembly flould be able to fix the principles of national regeneration, it would take into confideration the national dett, placing from the prefent noment the creditors of the ltate under the "afeguard and honour of the French nation."
23 Majnity of The popular caufe now gained ground fo falt, that the clergy on the isth of Jure a majority of the clergy voted for unte with the verification of their powers in common with the intm.

24 on the following day.
Fears of the Affairs were now come to a crifis, and the nobles nobles. perceived that they muft inflantly make a decifive ftand, or yield up their caufe as finally loft. Such was their alarm, that M. d'Efpremeni! propofed, at one of the fittings of their order, to addrefs the king, intreating hiin to difolve the flates-general. Hitherto that prince had gone along with M. Neckar in favouring the popular caufe in oppofition to the arittocracy. But every art was now ufed to alarm his mind upon the fulbject of the late affumptions of power on the part of the commons, and thefe arts were at length fuccefsful. Repcated comufels were held ; M. Neckar was abfent attending a dying fifter, and the king was prevailed upon to act agreeably to the advice of the leaders of the nobles. But the firft meafure which they adopted was fo ill conducted as to afford little profpect of final fuccefs to their caufe. On the 20th of June, when the prefident and members were about to enter as ufual into their own hall, they found it unexpectedly furrounded by a detachment of the guards, who refufed them admiffion, while the heralds at the fame time proclaimed a royal fofforn. Alarmed by this unforefeen event, the mcaning of which they knew not, but apprehending that an inmediate diffolution of the affembly was defigned, they inllantly retired to a neighbouring tennis-court, where, in the vehemence of their enthufiafm, they took a folemn oath " never to feparate till the conftitution of their country fhould be completed."

On the 22 d a ncw proclamation intimated that the royal feffion, was deferred till the following day. It was now found that the affembly had been excluded from th.cir hall merely becaufe the workmen were occupica in preparing it for the intended folemnity. This information was ill ealeulated to excite favourable expectations of the meafures about to be adopted at a

26
The tifem bly niects in the chusch of SiLcuis. royal feffion, whered in by fuch circumftances of marked difreipect for the reprefentatives of the people. The affembly, after wandering about in fearch of a place of meeting, at length entered the church of St Louis, and were immadiately joined by the majority of the clergy, with their prefident, the arehbihop of Vienne, at their head. Two nobles of Daupliné, the marquis de Blaçonand the count d'A goult, prefented their com-
miffions at the fame time. Encouraged by thefe events, Frenc and by the applaufes of furrounding multitudes, the affembly now expected with firmnefs the meafures about to be adopted.

The royal feffion was held in the mof fplendid form, D fesurf \& but altogether in the ftyle of the ancient defpotifn. the king Soldiers furrounded the hall. The two fuperior orders were feated, while the reprefentatives of the people, left flanding a full hour in the rain, were in no humwur, when at latt admitted, to receive with much complacency the conmands of their fovereign. The king read a difcourfe, in which he declared null and void the refolutions of the 17 th, but at the fame time prefented the plan of a conllitution for France. It containced many good and patriotic principles, but preferved the dittinction of orders, and the exercife of lettres de cachet; it faid nothing about any active thare in the legifative power to be poffifid by the flates-general, and was filent both about the refponfibility of minifters and the liberty of the prefs. The king concluded by commanding the deputies immediately to retire, and to affemble again on the following day. He then withdrew, and was followed by all the nobles and a part of the elergy: The commons remained in gloomy filence on their feats. It was interupted by the grand mafter offlirecein. the ceremonies, who reminded the prefident of the in-lyy the tentions of the king. Infantly the vehement count \({ }^{\text {commor }}\) de Mirabeau, flarting from his feat, exclaimed with indiguation, "The commons of France have determined to dcbate. We lave heard the intentions that have been fuggefted to the king; and you, who cannot be his agent with the ftates-general, you who have here neither feat nor voice, nor a right to fpeak, are nut the perfon to remind us of his fpeech. Go tell your mafter, that we are here by the power of the people, and that nothing fhall expel us but the bayonet." 'Ithe applaufe of the aflembly feconded the enthufarm of the orator, and the matter of the ceremonies withdrew in filence.
M. Camus then rofe; and in a violent fpecel indig- Dclates \({ }^{29}\) nantly ftigmatifed the royal feffion by the obroxionster the appellation of a led of juffice; he conclnded by moving kine's d. that the affembly fhould declare their unqualified adhe-patue. rence to their former decrees. This motion was followed by another, pronomeing the perfuns of tle de. puties inviolable. Both were fupported by Meffrs Pc tion, Barnave, Glaizen, the Abbés Gregoire, Sieyes, and many others, and were unanimouny decreed. The affembly therefore continued their fittings in the ufual form. On the following day the majority of the clergy attended as mombers; and on the 25 th the duke of Orleans, along with 49 of the deputies belonging to the order of nobles, joined them allo. The remaining nobles, as well as the fmall minority of the clergy, now found themfelves aukwardly fituated. Whether on this account, or becaufe their leaders had by this time furmed a plan for carrying their point not by peaceable means but by the aid of a military force, the king, on the \(2 \overline{7}\) th, invited by a prefling letter both orders to join the commons. This requeft was immediately complied with, although many of the nobility difapproved of the meafure.
The fituation of France was now become truly alarm-Alarnir ing. When the king retired from the affembly after Frivation \(\mathbb{E}\) the royal feffion, he was followed by more than 6000 this yer

\section*{R E V [ 157 ] R E V}
reseh citizens, from whom loud clamours and every mark of in aprobation broke forth. All Verfanles was fpeecily difmifion, and the report of this had increafed the popular clamour. Thecourt was in contternation. The king probably difcovered, with no great fatisfaction, that his minifter was more popular than himfelf. At fix o'clock in the evening the queen fent for M. Neckar. When he returned from the palace, he affured the crowd that waited for him that he would not abandon them; upon which they retired fatisfied. At the fame time the news of the royal fefion had thrown the city of Paris into violent agitation. The peace of that capital was at this time endangered by a variety of caules. A dreadful famine raged through the land, which in a great city is ufually moft feserely felt. This prepared the minds of men for receising urfavourable impreffions of their political flate. Every effort was moreover made to diforganize the government, and produce a diflike to the ancient order of things. The prefs poured forth innumerable publications, filled with new and feducing, though generally impracticable, theories of liberty. Thefe were diftributed gratis among the bulk of the people of Paris, and difperfed in the fame manner through the provinces. Philip duke of Orleans (prefumptive heir to the crown failing the children and brothers of the king) is with good reafon believed to have fupplied this expence out of his more than royal revenues. In the gardens of the Palais Rojale at Paris, which belonged to him, an immenfe multitude was daily aftembled, liftening from morning to night to orators who defcanted upon the moft violent fubjects of popular politics. Many of thefe orators were fufpected to be in his pay. It was even believed that his money found its way into the pockets of fome of the moft diftinguithed leaders in the national affembly.

But the government was, if poffible, ftill more dangeroufly afaulted by the methods now generally ufed to feduce the military. Erery officer of the French army belonged to the order of the nohles; and from that quarter, thercfore, it nuight have been imagined that there was little danger. But this very circumfance became the ineans of diferganizing that great engine of defpotifm. As the foldiers could not avoid imbibing fome of the new opinions, their own officers became the fint objecis of their jealoufy; efpecially in confequence of that impulitic edict of Louis XVI. which required every officer to produce prools of four degrees of nobility; and thus infulted, by avowedly excluding the private men from promotion. Perhaps with a view to what might happen, the inftructions to the deputies of the tiers etat had recommended an increafe of the pay of the foldiers. And now at Paris every art was ufed to gain them to the popular caufe. They were conducied to the Palais Royal, and were there careffed and fattered by the fopulace, while they liftened to the popular harangues. Thefe arts were fuccefsful. On the 23 d of June they firl refufed to fire on the mob in a riot. Some of them were on the 30 th reported to be
in confinement for this ofience; a crowd infiantly col- Frerch leeted, and refcued them, the dragoons that were Revolutior. brought to fuppreis the tumult grounding their arms: a deputation of the citizens folicited of the affembly the pardon of the prifoners. The affembly applied to the king, who pardoned them accordingly.

All thefe events, together with the tumultuous flate The \(\frac{33}{33}\) niliof the eapital, which was daily increaling, made it ne-tary called ceffary for the king to call out the military force toout. reftore, if poflible, the public peace. That his intentions were pure, the then flate of affairs will permit no man but a democrate to doubt ; but the arifocracy, with the Count d'Artois at their head, were bringing forward other meafures, which ultimately contributed to the ruin of themfelves, the king, and the kingdom. Crowds of foldiers were collected from all parts of the kingdom around Paris and Verfailles. It was oblerved, that thele confifted chiefy of foreign mercenaries. Camps were traced out. A Iarhal Broglio, a tricd veteran, was fent for and placed at the head of the army: The king was fuppofed to have entirly yielded to new counfele, and cvery thing bore the appearance of a defperate effort to rellore the energy of the ancient government. This is the moft important period of the French revolution ; yet the fecific defigns of the leading actors have never been clearly underftcod. It was rumoured at the time, that Paris was to be fubdued by a fiege and bombardment; that the affembly was to be diffolved, and its leaders put to death. Thefe are incredible exaggerations ; but the crifis of French biberty was univerfally regarded as at hand, and alfo the exitence of the national allembly as an independent body; or at lealt upon any other footing than that propofed by the king on the 23 d of June.

An able and eloquent addrefs to the king againt the The alrem. affemblage of foreign troops in their neighbourhood 'ly addrefs was brought forward by Mirabeau, and voted by the the king to affembly: The king properly replied, that the ftate of reme ve the capital was the caufe of affembling the troops, and which is offered to transfer the fates-general to Noyons or Soif-refufed. fons. "We will neither remove (exclaimed Mirabeau) to Noyons nor to Soiffons; we will not place ourfelves between two hoftile armies, that which is befieging \(\mathrm{Pa}-\) ris and that which may fall upon us from Flanders or Aliace; we have not alked pernifion to run away from the troops; we have delired that the troups Ahould be remored from the capital."

Thirty-five thoufand men were now ftationed in the neighbourhood of Paris and Verfailles. The pols were occupicd which commanded the city, and camps were marked out for a greater force. The Count d'Artois and his party regarded their plans as ripe for execution ; and M. Neckar received a letter frum the king, requiring him to quit the kingdom in 24 hours. That popular (A) miniter took the route of Breffels on the following day, when his departure was made public. In his difmifion the popular, or as it was now called the democratic, party thought they faw the refolution adopted to accouplith their ruin. The afleinbly ayain addrelled the thone; they requetted anew the removal They agairs a darefs che of king;
(A) Popular he certainly was; but he either had not fortitude and talents to execute his own plans, or acted an bafc part to his amiable mafter. From bafenefs we aconit him,

ConternaEinn in Dh. tion by the news of M. Neckar's retreat. His huft
in on Nec-and that of the D)uke d'Ortcans were drefed in mournk3:'s retreat. they were coolly told, that the king was the belt judge of the mode of employing the troups, and that the prefence of the affembly was neceflary at Verfailles. From a fovereign who doubtlefs recollected the proceedings of the long parliament of England, a different reply could not in reafon be expected. On receiving it, however, it was inllautly decreed, on the motion of the marguis de la Fayctt, that the late minithry had carried quitb them the confidence of the affembly; that the troops ought to be removed; that the minifley are and flatll be refpontible to the people for their conduct; that the aftembly perfifted in all its former decrees ; and that as it had taken the public debt under the protection of the nation, no power in France was entitled to pronounce the infamous word lankrupey. ing, and earried through the Itreets. The royal Allemand, a German regiment, broke in picces the bulls, and difperfed the populace. 'T he prince De Lambefa, grand ceuycr of France, was ordered to advance with his regiment of cavaly, and take poit at the 'Thuilleries. Being a man of a vident temper, and emraged by the appearances of difapprobation which were vifilike around lime, he furiounly cut down with his fword a poor old man who was walking peaceally in the grardens. The confequences of this act of inhumanity were fuch as might have been expected; a hout of exceration inftantly arofe; the cry to arms was heard; the military were aftaulted on :lli fides; the Frenclz guards joined their countrymen, and compelled the Germans, overpowered by numbers, and unfupported by the reft of the army, to retire.

All order was now at an end, and as night approached an univerfal terror diffufed itfelf through the city. Bands of robbers were collecting; and from them or from the foreign foldiery a general pillage was expected. The night paffed away in confternation and tumult. It was found in the morning that the hofpital of St Lazare was already plundered. The alarm bells were rung ; the citizens affembled at the Hotel de Ville, and adopted a propofal that was there made, of enrolling themfelves as a militia for general defence, under the appellation of the national guard. This day and the fueceeding night were fent in tolerable quietnefs, without any attempt on the part of the army. On the morning of the menorable it th of July, it was difcovered that the troops encamped in the Champs Elifées had moved off, and an immediate affault was expected. 'Tlie national guard now amounted to 150,000 men ; but they avere in general deftitute of arms. They had affumed a green cockade; but on recollecting that this was the livery of the Count d'Artois, they adopted one of red, bhue, and white. M. de la Salle was named commander in chief, officers wcre chofen, and detachments fent around in queft of arms. In the Hotel des Invalides upwards of 30,000 fland of arms were found, along with 20 pieces of cannon; a variety of weapons was alfo procured from the garde meuble de la couronne, and from the fhops of armonirers, cutlers, \&c.

The celebrated fortrefs of the Baftile was an object
of much jealoufy to the Parifians. At ix oclock in Fren the morning, M. de la Roliere, at the bead of a nume- Revolun, rous depatation, waited upon M. de Launay the go- \(\underbrace{17 y}\) vernor, who promifed, along with the officers of his garrifon, that they would not fire upon the city unlef3 The \({ }^{39}\) they fhould be attacked. But a report was foon fpread tile att. throngh Parris, that M. de Lannay had, in a fhort time ed; thereafter, admitted into the fortrefs a multitude of perfons, and then tracherounly inaffaced them. The caufe of this piece of perfidy has never been explained. The fact itfelf has been denied; but it was attefted at the time by the duke of Dorfet, the Britifh ambafian dor at the court of France. The effect of the report was, that a fudden refolution was adopted of affaulting the Battile ; an immenfe and furious multitude rufhed into its outer, and foon forced their way into its inner, courts, where they reccived and returned a fevere fire for the fpace of in hour. The Frencl guards, whe were now embodied into the national guard, conducted the attack with ikill and coolnefs: they dragged three waggons londed with traw to the foot of the walls, and there fet them on fire ; the fmoke of thefe broke the ainn of the garrifon, while it gave no difturlance to the more diftant affailants. The befieging multitude preffed the attack with incredible obllinaey and vigour for the fpace of four hours ; the garrifon was in confution; the officers ferved the camon in perfon, and fired their mufkets in the ranks ; the governor, in defpair, thrice attempted to blow up the fortrefs. A capitulation, when at lafl fought, was refufed to the And \(\mathrm{f}^{4}\). garifon, and an unconditional furrender took place. render The governor, and M. de Lofme Salbrai his major, a uncont genticman of diftinguifhed humanity and honour, became victins of popular fury in fpite of every effort that could be made for their protection; but the French guards fucceeded in procuring the fafety of the garrifon. Only feven prifoners were found in the Baltile. A guard was placed in it, and the keys were fent to the celebratcd M. Briffot de Warsille, who a few years before had inhabited one of its caverris.
The remaining part of this eventful day was fpent at Paris in a mixture of triumph and alarm. In the poeket of the governor of the Batile a letter was found, encouraging him to refiftance by the promife of fpeedy fuccours, written by M. de Fleffelles, the prevot de marchands, or chief city magitrate, who had pretended to be a mon zealous patriot. This piece of treaclery was punifled by inftant death; and his bloody head was carried through the city on a pole, along with that of M. de Launay. At the approach of night a body of troops advanced towards the city, at the Barriere d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the firf fire : barricadoes were everywhere formed, the alarm-bells were rung, and a general illumination continued during the whole of this night of confution.
In the mean time, it was obvious that the new mini-A newiAry were entering upon a dificult feene of action, iniry? where one falie flep might lead to ruin, and where their own plan of conduct ought to be maturely digelted. Marfhall Lroglio was made minifter of war, the baron de Breteuil prefident of finanee, M. de la Galeziere comptroller-general, M. de la Porte intendant of the war department, and M. Foulon intendant of the
such mavy ; kut thefe were only meant to atc as official men, iution under the Count d'Arcons, and the other leaders of the under the Count d'Arcols, and the other ieaders of the
aritoeracy. To thefe leaders therc did not even remain a chnice of difientities; ro refortec was left but that of - overawing by military power the national affembly and the capital, and of riking the defperate mealure of a national bankruptey, which the coint had not formerly cared to encomenter, and to avoid which it had convoked the ftates-general. No trace remains, however, of any attempt to put this criminal, hut laft refource, in execution. The evening after the departure of M . Neckar was fpent by the court of Verfailles in feafting and joy, as it a vietory had been gained. The courtiers of both fexes went round among the foldiery, ftriving to fecure their fidelity by careffes, largeffes, and every fpecies of flattering attention. The minitry not only failed to fupport the Prince de Lambefq in the poit which lie had been fent to occupy, but they fuffered the whole of the \(13^{\text {th }}\) to pars in indecifion, while the capital was in a fate of rebellion, while an army was formally muftering within its walls, and the names of the principal nobility were put up in lifts of proferiotions. They received the news of the capture of the Batile with confufion and difmay, which were increafed, if poffible, by information given by Marfhal BrogLio, that the troops refuted to act againft Paris or the national aftembly. In this perplexity they adopted the miferable device of concealing from the king the sate of public affairs ; and that unfortunate prince was thus perhaps the only perfon out of millions around him who remained ignorant of the comvulfions in which his country was involved.

At length, at midnight, the Duke de Liancourt forced his way into the king's apartment, and told him of the revolt of lis capital, of his army, and of the furrender of the fortreis of the Bafile. 'The Count d'Artnis, who was prefent, itill attempted to retain the monareh under lits fatal delulion ; but the Duke de Liancourt turning round, exclainied, "As for you, Sir, your life can only be fased by inftant fight; 1 have feen with horror your name in the bloody litt of the proferibed." Accordingly the Count, witl the members of lis fhort-lived adminiftration and trecir adherents, fled to the frontiers. And thus an emigration com. menced, the fource of that terrib!e contelt which has covered Europe with bloodfhed and mourning. 'This miniftry had, no doubt, mary difficulties to contend againft ; but an aceurate attention to their conduct excites a fufpicion which, while it exculpates them from many intended crimes that have been laid to their charge, at the fame time does little lonour to their ia. lents. It is this, that they had come into office withont laving formed any clear plan of conduct ; that they were men acting wibhout decifion and at rancom, and confequently became the fport of thofe events which they wanted dill and vigour to direct or controul. By their introduction into office, and their nifconduct while in it, the royal authority fell proftrate before the popular party in the national affembly. The nobles and the elergy fill remained, but coafounded in one affembly with the more numerous order of the liers etiat; and no longer ralbying round a throne that was tou fectle to afford protection, they foon vielded to that ferce and levelling fpirit of denlocras! ilat now rofe around them.

But the perfon of the monaroh was Alll belowed. Frereh Early next morning the king went to the affembly, but Revoluun with none of the ufual folemnities. He "remretted the \({ }^{1739}\) commotions of the capisal, difavowed any knowledge of an intention againit the perfons of the deputies, and The sing intimated that he had commanded the remosal of the gees in the troops." A deeo and exprefive filence prevailed for a iteabiy, few moments; this was fucceeded by vehement and un:verfal fhouts of applaufe. The king arofe to depatt, and inftantly the whole affembly crowded around, and attended him to his palace. The queen appeared at a balcony with the dauphin in her arms; the mufic played the pathetic air of 0.1 peut-on cire mieus: qu'aus fein de fa famille. The enthudiafm of loyalty communicated itfelf to the funounding multitades, and nothines was heard but acclamations of joy.

On the following day, the king declared his refolu. And exe tion to vilit the city of Pars in perfon. Accordingly day vifr that prince, who never wanted perfonal courage, howe the city ce ever deficient he might be in political fedfatnefs, fet perfon:out, attended by fome members of the affembly and by the militia of Verfailles. He was met by the celebrated M. de la Fayette, at the head of a body of the na. tional guard, of which he had now been chofen commander in chief. M. Bailly, in whofe perfon the ancient office of mayor of Paris lad been revived, received the king at the gates, and delivered to liun the keys. All this while no frout was heard from the crowd of innumerable fpectators but that of Vive la nation. The king adranced to the Hutel de Ville, where the new cockade was prefented to him, which lee put on, and prefented himfelf with it at a window. Ait the fight of this badge of patriotifin an univerfal frout of \(V\) ive le Rai burtt furth from every quarter; and he returned to Verfailles amid.t geceral triumpls and aoplaufe.
Much confufion Atill prevailed in the capital ; but in \(w^{45}: c^{4}\) there was more appearance of regularity than could have much cosbeen expected at the conchaion of fuch important furnon hatid events. This arofe from a cafual concurrence of circumfances. To conduct with eafe the elections to the Ifates-general, Paris had been disived into 60 ditriets, each of which had a feparate place of meeting. The people did not elect the members to the Itates-general; but they chofe delegates, who, under the name of electors, roted for the members. At the commencement of the diturbances, the clectors, at the requet of their fellow-citizens, affumed a temporary authority; of whi:h, however, they were foon weary, and as foon as pomble procured the public election of 120 perfons as municipal officers for the government of the city. The citizens having got the habit of allembling in their diftricte, grew fond of it : they afembled frequently, made rules for their own government, and fent commilioners to communicate with other ditritz. 'Ilee tumutuous nature of thefe meetings, and the velremence of dohate which prevaited in them, will bell be conceived frome the ludicious contrivance of one of theil prelidents, who tlationed a drummer at the back of his chair, and wher the confufion and nuife became aitorether ningovernable, gave the fignal for beating the crum, which fpeedily overfowered every other noife. Thefe mectings, however, gradually ripencd into clubs, in whech mueh dexterity and intrigue were exerted.

The whole of the late minitry efcaped excepting in

\section*{R E V}

\section*{R E V}

Erench Foulon. His charaEter, it may well be imagined, was Revolution, extremely unpopular; for he is faid to have afferted, 1789.

46 that he would " nake the people of Paris eat hay." Fate of M He had retired to the country, but was feized by his Eove Mown vaffals, and brought to Paris with a bundle of hay Foulnn, one tied to his lack. In fpite of every effort made by M. M. of the bsee Bailly and Fayctte to procure him a fair trial at leatt, mand his fon he was carried to the Place de Greve, and hanged at a indaw lamp-iron by the enraged multitude. His fon-in-law Berchicr. i.f. Berthier, attenpting to defend himfelf againt a fimilar fate, fell, covered with wounds. Their heads were carricd round on poles; and thus the populace became habituated to the fight of blood and murder: they were even taught by popular fongs to glory in fuch actions, and particuiarly by the well known fong Ca-ira.
M. Neckar In confequence of an invitation from the king, M. recurns, and Neckar returned to France. He was received by the the mmc- affembly with great applanfe, and in Paris with infinite
diate colldiate conlfequences of it. folemnity and triumph. He here, however, committed a political error that made fome noife. In deploring the late excuffes and murders, and taking notice of the arreft of M. Bezenral, an officer of the Swifs guards, he requefted of the electors at the Hotel de Ville, in a folemn harangue, that the paft fhonld be forgotten; that profcriptions fhould ceafe, and a general amnefy be proclaimed. In a moment of enthufiafm this was agreed to, and the electors decreed what unqueftionably exceeded their powers. The dittricts of Paris vere inftantly in commotion ; the electors alarmed, deelared that tiey onily meant that "henceforth the people woukd punifh no man but according to law ;" and, at the fanc time, to prove that they themfelves were free from ambition, they formally renounced all their own powers. The affembly took up the queftion. Meff. Lally, Tolendal, Mounier, Clermont, 'Tonnerre, Garat jurior, and" others, declared that no perfon ought to be arrefted without a formal accufation. While Meff. Mirabeau, Robefpierre, Barnave, and Gleizen, allcged, on the contrary, that the people were entitled to lay held of any man who had public\(1 y\) appeared at the head of their enemies. The debate ended, by admitting the explanation of the electors, and by a declaration that it was the duty of the affembly to fee jullice executed in all cafes.
The commotions and enthufiafin of the capital were fpcedily communicated to the provinces. In every quarter the people feized upon all the arins that could be found, and the military unifornly refufed to act against them. Many acts of outrage were committed in Brittany, at Strafoourg, in the Lionnois, and tfewhere, in which the nobility were the fufferers. 'The nuifchiefs that occurred were ufuaily magnified at a dif. tance; but that very circumftance was an additionalevil. For example: It was flated in the National Af\{embly that M. de Mefmay, lord of Quincey, invited a number of patriuts, among whom were the officers of a neighouring garrifon, to a fplendid entertainment at his houfe, to celchrate the happy union of the three orders: That in the midft of the fealt the mater of the boufe contrived to withdraw bunoticed, and to fet fire to a train previoufly laid, which communicated with a guantity of gunpowder in the cellars, in ennfequence of which the whole company, by a fudden explofion, wate blown into the air. It was found on inquiry,
that there was not one word of truth in the whole flory. But before this inquiry could be made, all France had refoundel with aecounts of the pretended bloody tragedy; and the whole nobility of the king dom fuffered in a lefs or greater degree, from the prejudices excited ly this unhappy report, the origin of which has never been well explained. It would be vain to flate all the idle rumours to which at this time the blind credu. lity of the multitude gave currency. At one time, the Arilocrates were cuttinu down the green corn, at another time they were burying fur in eommon fewers, or cafting loaves into the Seine. One report was no fonner proved to be falfe than another arofe, and the whole nation was agitated by fufpicion and alarm. The National Affembly were engaged in framing their celebrated decharation of the rights of man, which was to form the bafis of the new conftitution, when the alarming accounts, received from all quarters, of the fate of anarchy into which the kingdom was falling, obliged them fuddenly to turn their attention to objects of practical neceflity. The privileged orders found themfelves become the objects of univerfal jealouly and hatred; and that forncthing muit inftantly be done to fave their families and property, which were menaced on every fide with perfecution and pillage. Regarding the popular torrent as now become irrelifible, to fase fomething they refolved to facrifice a part.

On the afternoon fitting of the \(4^{\text {th }}\) of Auguft, the Vifcou de Vifcount de Noailles, feconded by the Duke d'Aguil- Noaill/ lon, opened one of the moft important feenes in the ard D: French Revolution, or in the hitory of any conntry. propol Thefe noblemen flated, that the true caufe of the com-that motions which convulfed the kingdom exifted in the mifery of the people, who groaned under the double oppreffion of public contributions and of feudal fervices. "For three months (faid M. de Noailles) the people have beheld us engaged in verbal difputes, while their own attention and their wifhes are directed only to things. What is the confequence? They are armed to reclaim their rights, and they fee no profpect of obtaining them but by force." He therefore propofed to do jufticc as the fhorten way of reforing tranquillity, and for that purpufe to decree, that henceforth every tax thould be inpofed in proportion to the wealth of the contributors, and that no order of the flate thould be excmpted from the payment of public burdens; that feudal claims hould be redeemed at a fair valuarion ;hoco but that fuch claims as confifted of perfonal fervices on butors the part of the vaffal chould be abolifhed without compenfation, as contrary to the impreferiptible rights of man. The extenfive poffeflions of the noblemen wh:o made thele propofals added much luftre to the difinterefted factirce uthich they offered. Their \{pecelies were received with the molt enthufiattic applanfes by the Affembly and the galleries, and them propofals were decreed by acclamation without a vote. No nation is fo much led by the infuence of fudden emotions as the French. The patriotic contagion now fpread faft through every breall, and a conteft of generofity enfued. The hereditary jurifdictions poffeffed by the nobles within their own territories were next facrificed. All places and penfions granted by the Court were fuppreffed, unles granted as the reward of nent or of acthal fervices. 'l'he game laws, which condemned the hubandman, under fevere penalties, to leave his proper

ty a prey to infinite multitudes of animals referved for paltime, had always been numbered among the fevere grievances of the French peafantry. Thefe were therefore renouneed, along with the exclufive rights of rahbit warrens, fitheries, and doveeotes. The fale of ofirces was abolifised, and the fees exacted from the poor, together \(w:\) h the privilege of holding a plurality of livings, were relinquifhed by the clergy. 1 he deputies of the Pais \(d^{\prime}\) Eiut, or privileged provinces, with the deputies of Dauphinc at iheir head, next eame forward, and offered a furrender of their aneient privileges, requefting that the kingdom might no longer remain parculled out among Dauphinois, Bretons, Provençaux, \&ic. but that they flould all form one great mafs of French citizens. They were followed by the reprefentatives of Paris, Marfeilles, Lyons, Bourdcaux, Strafoourg, \&e. who requefled leave to renounce all their feparate privileges as ineorporations, for the fake of placing every man and every village in the nation upon a footing of equality. Thus the Affimbly proceeded, till every member had exhaufted his imagination upon the fubject of reform. To clofe the whole, the Due de Liancount propofed that a folemn Te Deum thould be performed, that a medal thould be ftruck in commemoration of the events of that night ; and that the title of Restorer of Galife Liberty fhould be beftowed upon the reigning monarch. A deputation was aceordingly appointed to wait upon the king, refpectfully to inform him of thefe decrees.

Several fueceeding days were neeeflary to form into laws the deerees of the \(4^{\text {th }}\) Anguft, and commitees were appointed to make out reponts for that purpofe. One of thefe reports having ineluded the tithes and revenues of the clergy among the abules that were to be done away, and having propored in lieu of them to grant a certain flipend to the different minifturs of religion to be payable by the nation, the elergy attempted to make a fland in defence of their property, and violent debates enfued. In thefe they were ably fupported by the Abbe Sieyes : but as the clergy had formerly deferted the nob!es, fo they were now in their turn abandoned to their fate by the hereditary ariftoeraey. The popular party had lons regarded the wealth ot the church as an eary refomree for fupplying the wants of the fate. Never was there a more complete proof of tlk influence of opinion over the affairs of men. 'The Catholic elergy of France, though poffeffed of more property than they enjoyed at the time when princes took up arms or laid them down at their command, now found fo few defenders, that they were terrined into a voluntary funender of all that they and their predeceffors had poffeffed for ages. In their overthrow, they fcareely enjoyed even the barren honour of having fallen the laft of thofe privileged orders that fo long had ruled over this ancient kingdom. They and the nobles, and the king, fill poffeffed their former titles and nominal dignity; but all of them were now fubdued, and at the mercy of the commons of France, who fpeedily dif. miffed them at their pleafure.

As a hort feafon of tranquillity in the Court and the National Affembly fueceeded thefe great popular faerifiees, the Iing laid hold of it as a fit opportunity for - the Arehbihop of Vienne, the Arehbihop of Bourdeaux, M. Neckar, the Count de St Prieft, Count de Voc. XVI. Part I.

Montmorin, the Count de la Luzerue, and the Count de la Tour du Pin Paulin. M. Neckar, as minifter of Revolution, finanee, having ftated the diftreffed fituation of the re- \(\underbrace{1 ; 89 .}\) venue, prefented the plan of a loan of thirty millions 55 of lirres. But M. Mirabean, from a fpirit of rivallhip, as Who find it would feem, to M. Neckar, prevailed with the Ar- preat diffembly to alter and to narrow the conditions of it in rainity mos fuch a degree that very few fubferibers were found, and ney. the loan could not be flled up. This failure involved the Affenbly in a confiderable degree of unpopularity; in eonfequence of which they allowed M. Neckar io preferibe his own terms for the purpofe of obtaining a loan of eighty millions. Dut the happy intant of publie confidence liad been ailowed to pafs away, and this; loan was never more than half filled up. Recourfe was next had to patriotic eontributions; and great numbers of gold rings, filver buckles, and pieces of plate, were prefented to the Alembly'. The Royal family themfelves fent their plate to the mint, either to give countenance to thefe donations, or, as M. Neckar has lince afferted, through abfolute necefity, for the purpofe of fupporting themfelves and their fainily. The confufion into which the nation had been thrown by the late events had produced a fufpenfion of the payment of all taxes. 'There exifted, in fuct, no efficient government; and if fociety efcaped entire diffolution, it was merely in eonfequence of thofe habits of order which are pro. duced by a tlate of long continued civilization. The bufinefs of government could not be tranfacted without money, and many vain efforts were made by the miniAry to procure it. At length M. Neckar was driven to the de「perate refouce of propoling a compulfory locr, or that every individual poffelfed of property thould advance to the ftate a fum equal to onc-fourth of his annual income. 'This bold propofition was fupported by Mirabeau, and adopted by the Affembly ; but it does not appear to have ever been effectually executed.

In the mean time, the Affembly was hufly occupicd Difcuflion in framing the celebrated deelaration of the \(R\) ioflts of on the Man, which was afterwards prefixed to the new contti- Riolis of tution. This was followed by the difeufion of a point \(M^{M u \pi_{3}}\) of much delicacy and diffieulty; viz. What thare of leginative authority the king ought to poffers under the new conftitution; whether an abfolute negative or \(z\) to, And the a fufpentive veto, or no veto at all? This queltion opera-king's weso. ted like a touchitone for trying the fentiments of every perfon; and the affembly, confifting of 1200 men, was now feen to arrange itfelf into two violent contending factions. The debates were velement and tumultuons, and continued for many days. As the affembly fat in public, and as multitudes of people of all deferiptions were admitted into the galleries, and even into the body of the hall among the members, many indecent feenes took place in confequence of the interference of the fpectators to applaud or cenfure the fentiments which were delivered. Thus the public at large beeame fpeedily interefted in the difeuffion ; the city of Paris took a fide in oppofition to the reto, and the whole empire was thrown into aggitation \(b ;\) new and fpeculative queftions. The diftinguibhed place which France holds among the nations of Europe rendered thefe fingular events and difcuffions the object of univerfal attention. The eontagious love of novelty fpread rapidly abroad, and gave rife to that well-founded jealoufy on the part of the monarchs of Europe, which

\section*{R E V [ 162 ] R E V}

French was fpeedily to burf forth in a bloody tempelf. - In Revolution the prefent cafe, the people of Paris became mofteager1789. ly interefted. Rumours of plots were fpread through the country, and a new form was obviouny gathering, when the queftion was thus got quit of. M. Mounier remarked, that the executive power could poffefs no negative againt the decrees of the prefent affembly; which had been nominated by the nation with fupreme powers for the exprefs purpole of framing a conftitution, which was to remain binding over all orders of men in the fate; and with regard to future leginatures, the king declared by a meffage, that he wihed to poffefs no more than a fufpenfive veto. It is remarkable that the popular Mirabeau concluded a Speech in favour of the abfolute veto of the crown with thefe words, "That it would be better to live in Conftantinople than in France, if laws could be made without the royakfanction." This political adventurer is, however, aecufed of having takem care to circulate in Paris a report that he had oppofed the veto with all his influence ; and to give credit to the ftory, he is faid to have quitted the affembly juft before the divifion, that his vote might not appcar on record againt it.

In the debates about the veto the month of Auguft was fpent; and in the beginning of September a new
\(5^{8}\)
Difcuflion about th: leginative body, whe ther it
oughe to confif of one or two chambers.

60
State of partics in I'aris. conftitutional queltion was prefented to the affembly by one of its numerous committees. This was, Whether the legiflative body ought to confift of one or of two chambers? Mounier, Lally, Tollendal, Clemont Tornerre, and cthers, who were zealous lovers of freedom upon what were then accounted moderate principles, fupported eagerly the idea of eftablihing two independent chambers in initation of the Britifh conftitution; but they were deferted both by the democratic and ariftocratic parties. The firlt of there regarded an upper houfe or fenate as a refuge for the old ariftocracy, or as the cradle of a new one; while the higher nobles and clergy feared left fuch an arrangement might prevent the future reeftablifment of the ancient divifion into three orders. Of 1000 members who voted, only 89 fupported the propofal for dividing the legilature into two chambers.

Soon after this, the king gave his fanction to the important decrees of the \(4^{\text {th }}\) of Auguit, but not witlsout fome helitation, and expreffing doubts of the wifdom of forne of them in a letter to the affembly. At the fame time the inviolability of the perfon of the monarch was decreed, the indivifibility of the throne, and its hereditary defeent from male to male in the reigning family. - But we fhall not here attempt to enter into a detail of the various articles of the new conftitution as connected with the circumfances under which they became the fubject of debate. We fhall only fate thofe more remarkable circumitances which tend to afcertain the peculiar changes which the fentiments of the nation underwent in the progrefs of a revolution the mot remarkable that occurs in human hiftory.

In confequence of the debates upon the queftions of the veto and the two chambers, the minds of parties had become much irritated. Paris wore the famc threatening afpect that it had done in the months of June and of July preceding; and every thing feemed tending towards an important crifis. The ariftocratic party acculed their antagonifts of a delign to excite cew infurrections; and the charge was retorted, by cir-
culating a report that a plot for conveying the king to Metz was already ripe for execution.

From the period of the defection of the French guards, who were now in the pay of the cupital, the protection of the royal family had been entrufted to the militia or national guard of Verfailles, together witl: the regiment of the gardes du corps, which was compofed entirely of gentlemen. Upon the circulation of the report of the intended flight of the king, the French guards began to wifh to be reftered to. their ancient employment of attending his perfon, for the purpofe of preventing any attempt of this nature. This idea was eagerly cherifhed by the capital ; and, in Spite of every effort ufeo by M. de la Fayette, the obvious appearance of approaching difturbances could not be prevented. The popular party faw the advantages which they would derive from placing: the affem. bly and the king in the midlt of that turbulent metre. polis which had given birth to the revolution, and upon the attachment of which they could moft fecurely depend. Every encouragement was therefore given by the molt active leaders of what was now called the Democratic party to the project of eftablifhing the court at Paris. The miniftry were under no fmall degree of alarm; and the count d' Etaing, who commanded the national guard of Verfailles, requefted the aid of an additional regiment. 'The regiment of Flanders was accordinghy fent for: its arrival caufed no fnall degree of anxicty; and every effort was intantly made to gain over beth officers and foldiers to the popular caule.

On the firtt of Oetober the garde dil corps, probably for the purpofe of ingratiating themfelves with the newly arrived regiment, and perhaps to attach them more fteadily to the royal caufe, invited the officers of the regiment of Flanders to a public entertainment. Several officers of the national guard, and others of the military, were invited. Ihe entertainment was given in the opera houfe adjoining to the palace; feveral loyal toafts were drank : but it is afferted, that when the favourite popular toaft The Nation was given, it was rejeeted by the gardes du corps. In erdinary cafes, fuch a trifling circumflance as this, or even any other of the tranfactions of a night of feftivity, would juftly be regarded as unworthy of notice in recording the more remarkable events in the hiftory of a great nation; but fuch was now the fingular flate of affairs, that the molt trivial occurrences were inftrumental, by their combination, in the production of important confequences. The queen, having feen from a window of the palace the gaiety which prevailed among the military, prevailed with the king, who was juft returned from hunting, to vifit them along with herfelf and the dauphin. Their fudden appearance in the faloon kindled in an inftant the ancient enthufiafin of French loyalty. The grenadiers of the regiment of Flanders, along with the Swifs chaffeurs, had been admitted to the defert; and they, as well as their officers, drank the health of the King, Queen, and Dauphin, with their fwords drawn. The royal tamily having bowed with politenefs to the company, retired. - Of all nations, the French are moft liable to the influence of fudden impreffions: the mufic played the favourite air, O Ricard! O mon Roi! l'univers t'abandonne, "O Richard! O my king! the world abandons thee." In the eagernels of loyalty;

\section*{\(R\) E \(V\) [163] R E V}
rench loyalty, the national cockade, which had been adoptulution, ed by fome of the gardes du corps, was thrown \(789 . \quad\) afide, and white cockiades were fupplied as quickly as they could be made by the ladies of the court.

When thefe cvents were next day reported at Paris, accompanied by a multitude of exaggerations, they gave rife to the moft violent alarm. The capital was at that time fuffering all the horrers of famine; and in fuch a fituation, the news of a feaft which others have enjoyed, feldurn gives much pleafure to hungry men. To the former report of an intended flight on the part of the royal family, it was now added, that a counter revolution was fpeedily to be attempted by furce of arms; and that the prefent fcarcity was artificially created by the court for the purpofe of reducing the people to fubmifion. Their aritucratic antagonills have fince afferted, that the fanine was indeed artilicial ; but that it was ereated by a portion of the violent party in the national affembly, which was then denominated the Cabal, whofe object was to excite commotions as the means of procuring an opportumity of fetting the duke of Orleans at the head of the ftate, either as regent; or in fome other form. 'i'o this laft party Mirabeau is faid to have belonged.

For four days no notice was taken in the afiembly of what had pafied at the entertainment given by the gardes du eorps. On the 5 th of October M. Petion mentioned it for the firlt time, and a violent debate enfued; during which Mirabeau rofe and exclaimed, "Declare that the king's perfon alone is facred, and I myfelf will bring forward an impeachment;" thereby alluding to the conduct of the queen. While this debate was proceeding at Verfailles, the city of Paris was in-commotion. A valt multitude of womer of the loweft rank, with fome men in womens elothes, had affembled at the Hotel de Ville, and were calling aloud for arms and bread. They refolved to proceed inftantly in Verfailles to demand bread from the king and from the national affembly. La Fayette oppofed them in vain; for his own foldiers refufed to turn their bayonets againft the women. Upon this one Stanillaus Maillard, who had diftinguifhed himfelf at the taking of the Battile, offered himfelf as a leader to the infurgents. He had the addrefs to prevail with them to lay affde fueh arms as they had procured; and he fet out for Verfailles about noon with as much order among his followers as could well be expected from fuch an affem. blage. Either becaufe the paffion for going to Verfailles had fuddenly become too infectious to be refilted, or becaufe the multitude already gone thither was now accounted dangerous, the nayor and municipality of \(\mathrm{Pa}-\) ris thought fit to give orders to la Fayette inflantly to fet out for that place at the head of the national guard.
In the mean time, Maillard approached Verfailles with his tumultuous troop; he arranged them in three divifions, and perruaded them to behave with tolerable decency. The kiog was hunting in the woods of Mendon when he was informed of the arrival of a molt formidable band of wornen calling aloud for bread. "Alas! (replied he) if I had it, I foould not wait to be afked." Maillard entered the affembly accompanied by a deputation of his followers to flate the object of their journey. The affembly, to paciry them, fenta deputation of their own number along with them to
lay their complaints befure the king. His majefty recei- French ved the whole with great politenefs, and readily agreed Revelution, to go into any meafures for the fupply of the capital 1789. that could be fuggefted. The report of this belaviour had fuch an effect upon the multitude collected around the palace, that they began to difperfe; but they were speedily fucceeded by another croud not lefs numerous. A fudden refolution of fight feems now to have been propofed by the court; for the king's carriages were brought to the gate of the palace which communicates with the Orangry : but the national guard of Verfailles refufed to allow them to pafs, and the king himfeif refufed to remove, or to allow any blood to be fhed in his caufe.
La Fayette with his army at length arrived about 1, Fayyette 10 o'cluck at night, and fuind the affembly in a very with his unpleafant fituation. Their hall and galleries were my meshes crowded by the Parifian finh-wonen and others of the Verrailles mob, who, at every inftant, interrupted the debates. at nishbt. La Fayette waited upon the king, and informed him of the proceedings of the day, planted guards in every quarter; and alter a feanty banquet had been procured for the multitude, he prevailed with the affembly to clofe their fitting for the night. In this laft part of his conduct M. la Fayette has been much cenfured, and probably not without reafon; för it could fcarcely be expected that fuch a night would be fpent in paace by the inmenfe affemblage of turbulent charaEters that 68 were now brought together. All was quiet, however, De: \(f\) eruce till about fix in the moruing of the 6th, when a greatatempt on number of women and defperate perfons rufhed forward the queen. to the palace, and attempted to force their way into it. Two of the gardes du corps were killed; the croud afcended the ftair-cafe leading to the queen's apartment, but were bravely refifted by M. Miemandre a fentinel, who gave the alarm, and defended his polt till he fell covered with wounds, of which, however, he afterwards fortunately recovered. The ruffians, reeking with his blood, ruhed into the chamber of the queen, and pierced with bayonets and poniards the bed whenee this perfecuted woman had but juft time to fly almolt naked, and, through ways unknown to the murderers, had efcaped to feek refuge at the fect of the king, who was alseady alarnied, and had gone to feek her.

The tumult became more violeat every moment, and The royal fudden death feemed to threaten the royal family; but f.mily fas la Fayette was by this time at the head of his troops, mily faved whom he befeeched earneftly to fave the gardes du by Hayette, corps from maffacre. In this he was fuccefsful; fome that had been taken prifoners were furrounded by the grenadiers of the French guards who protected them, and the retreat of the whole corps was eafily fecured. The croud was fpeedily driven from the different quarters of the palace, which they were already beginning to pillage; and the royal family ventured to fhow themfelves at a balcony. A few voices now exclaimed, Le Rui à Paris, "the King to Paris." The fheut became general; and the king, after confulting with la Fayette, Eeclared that he had no objection to take up his refidence at Paris, provided he was accompanied by the queen and his children. When the propofal was reported to the affembly, the popular leaders expreffed much fatisfaction. They ordered a deputation of 100 members to attend the king thither; they woted the national affembly infeparable from the king. His majefty

\section*{\(R\) [ V [ 164 ] R E V}

Preerh fet out at two o'elock a prifiner in the cuftudy of the kevolution, mob. Two gentlemen were felected from his bady 1759. guard, and, with all the parade of an execution, beheaded in the court of his palace. Their heads were fluck upor fpcars, and led the proceffion; whild the royal captives who followed in the train, and beheld this fpectack, were conducted fo flowly, that a hort journey of twelve miles was protracted to fix hours. The king, the queen, and their children, were lodged in the old palace of the Louvre, white Monfieur went to refide at the Luxemburg. The city was illuminated, and the evening fpent in triumph by the Parifians.

The removal of the king to Paris was regarded as a triumph by the popuiar party. The higher order of nobles confideed it as completcly ruinous to their hopes; and even many inen of talents, fuch as Mounier and Lally Tullendal, whom we cannot avvid regarding as friends to the popular caufe in its out-fet, now regarded every profpect of attaining a happy conltitutional freedom as at an end, as the national reprefentatives muft be for ever expufed to the infults, and overawed by the influence, of a turhulent capital. Many members of the affembly took rcfuge in foreign countrics, and ufed every effort to cxeite the other nations of Europe to hoftility againf France. As the duke of Orleans had been regarded as a chief agent in promoting the late dilturbances, the marquis de la Fayette waited upon him, and infifted upon his leaving the kingdom for a time. 'The duke was overawed, and, on pretence of public bufinefs, went to England, where he remained for feveral months.

On the inth of October, the National Affembly held its fir? Seffion in Paris. The King was clofely guarded in his own palace; and no apparent oppofition now food in the way to prevent the popular party from giving to their countiy fuch a conftitution as they might judge expedient. Much, however, was yet to be done, and many difficultics remained, refulting from the habits of men educated under a very different order of things. 'T'wo days after the Affembly came to Paris, a baker was publicly executed by the mob, upon a falfe accufation of having concealed a quantity of bread.While the Affembly was at a diftance, events of this nature had been little attended to, and the leading party avoided attempting to check thefe ebullitions of popular violerice, from which they had derived fo much advantage ; but that party was now all-powerful, and fo fiagrant an offence committed againft the law was regarded as an iufult upon the fovereignty of the National Affembly. Two leaders of the mob were therefore tried and publicly executed, and a fevere law was paffed, of the nature of the 13ritifl riot aet, authorifing the magiftrates to act by military furce againft any multitude of perfons that thould refufe to difperfe. Thus the peace of the capital was fecured for feveral months; but in the country at la:ge no finall degree of ansiety and trouble ftill fubfited. The fame fufpicious temper which had prevaiked at Paris agitated the provinces with the dread of plots and monopolies of grain. Add to this, that the nobiefle in the country were by no means fatisfied with the liberality with which tbeir reprefentatives had on the \(4^{\text {th }}\) of Auguft voted away their privileges and their property. 'This produced violent jealoufies between the peafants and their lords,
and gradually conveyed to cvery comer, of the kingdom the political ferment which had commenced at Paris.

The National Affembly being nuw, however, in toleable fecurity, proceeded in the arduous attempt of furming a fiee conditution for the great cmpire of the \({ }^{\prime 0}\) France. The Abbé Sieyes preferted a plan for don didividing the kingdom into 83 departinents, of about ded inus. \(3^{2}+\) fquare leagues, and of each department into feve- meents. ral dijlriass, and each diltrict was fuldivided into cantons of four fquare leagues in extent. Thus the whole of the ancient divifions of the kingdon into governments, generalities, and bailicwicks, was in an initant oblitcrated. An attempt was alfo made to fimplify in an equal degree the relative fituation of individuals in civil lifc, by a decree which put an cud to all diftinction of orders and immunities, to far as any privilege whatever was concerned. At the fanc time, a bold and moft important meafure was adoptech, which has fince proved the organ of thofe terrible efforts which lirance has been enabled to make agamit the relt of Europe. This Thechis was the confifcation of the whole of the lands belong-landsco ing to the church, for the purpofe of fupplying the fifcated. exigencies of the flate. In this tranfaction, all regard to juftice was thrown afide. The lands of the church were as certainly the property of the then poffeflors of them as any entailed cthate among us is the property of him who occupies it. The flate may have had a tight to appropriate to itfeif the church lands upon the death of the incumbents ; but it miglt with equal juftice, and perhaps greater propricty, have feized the enormons revenues of the Duke of Orteans, as lave confifated a fangle acre belonging to the mo!t ufelefs abbot without his own confent. This nefarious meafure was propofed by the bilhop of Autun, M. Tallegrand Perigord, a man of no religion, who had been promoted to the bench in a moft irregular manner to ferve this very purpole. The mode in which this property was to be expended was by iffuing afiguments (a/fisnuts) upon it; which affignments were to be received by the ftate for the payment of taxes, or for the purchafe of church lands when fet up to fale. A provifion svas at the fame time made for the national clergy, who were for the future to be paid by the itate. Oin the day following that on which this important meefure was adopted, a decree was paffed, fufpending the parliaments of the kingdom from the exercife of their functions.

Decrees, in which the interefts of fo vait a multitude Fruitlefs of individuals were insolved, could not be carried into attempt: effect without much murmuring and oppofition. The of the p. parlianeents, in particular, began to exert themfelves with vigour, and, by protells and other publications, attempted to invalidate the decrees of the Affembly as illegal; but thefe privileged bodies, who had often been accurtumed to contend with fome fuccefs againit the defpotic adminifltration of their comintry, and on that account had been for ages the objects of public ap. plaufe, now found themfelves utterly forfiken, and unable to refilt the mandate of a popular Affembly. After a few fruitlefs itruggles, they were all of thern under the neeeliity of fubmitting to their fate.

Nothing remarkable now occurred for fome time. - Municir The Affembly procteded to organize the kingdom by ities ent: the ellablifhnent of municipalities, and by reforning blifhed, io the jurifprudence of the country. It is to be obferved, however, that when the parliament of Paris was abo-
lifhed,

\section*{R E V [ 165 ] R E V}

If h linhed, the Chatelet, being the fecond court in that on. city, was retained for the purpofe of trying thofe perfons who had become molt obnoxious by their attachment to the royal eaufe. This court had the fririt to aequit the Baron de Bezenval, Marfhal Broglio, and the Prince de Lambefq. But having incurred much popular odium on this account, they were guilty of the unworthy meannefs of condemuing to death the Marquis de Favres, for a pretended confpiracy (of which no tolerable proof was ever brought) to mafficere La Fayette, Bailly, and Neekar, and to convey the King to Peronne.

During the whole of this winter the King had been very frictiy watched by numerous guards placed around his palaee, infomuch that the other nations of Europe confidered him as in a flate of captivity. To do away this impreffion, if poffible, and to make tleir king ap.pear a voluntary agent in the meafures that had lately been adopted, was now regarded as a matter of fome importance. Every effort was therefore made to prevail with him to come to the Affembly fuddenly, and, as it were, of his own voluntary motion, there to declare his adherence to the meafures whiel had lately been adopted. For fome time he refilted this propofal; but at length, on the \(4^{\text {th }}\) of February, he did fuddenly appear in the National Affembly, where he complained of the attempts that had been made to fhake the new conllitution. He declared his wifh "that it fhould be univerfally known that the monarel and the reorefentatives of the nation were united, and their wifhes were the farme; that he would defend the conftitutional liberty of the flate; that, in conjunction with the Quee:i, he would early form the fentiments of his fon for that new order of things which the circomitances of the empire had introduced." This declaration difpirited the ariftocratic party in no fmall degree, and increafed that unhapoy tendency of looking for aid from foreizn countrics which they had always been too apt to indulge.

On the 13 th of February, monaftic eftablifhments were fuppreffed, and their lands confifcated; but the prefent friars and nuns were allowed penfions for their fubfifterce, and to continue the obfervance of their monaftic vows, if they thought fit. We may obferve here, that, in eonfequence of the eracuation of the monatleries, it is probable that about this time the Breton committee began to affume the appellation of the Facolin Club, from the hall belonging to the Jacobin friars at Paris, in which their meetings were now held.

An event occurred at this time which tended in no fmall degree to increafe the odium under which the old government already lalooured. This was the publication of the Red Book, or lift of penfions and donations granted by the crown. In confequence of the moft prefling inftanees, it had been commurieated by M. Neckar to a committee of the Affembly, afier many intreaties, and the mof fulemn promifes of feerecy. It afforded, however, too ftriking an advantage to the popular party not to be made ufe of, and in a few days M. Neckar, to his no fmall furprife, faw this regitter publicly fold by every bookfeller in Paris. He ought not, indeed, to have been furprifed; and the giving up of this lift is one of the many proofs whick the tranfactions of that period afford of his great unfitnefs for the office which ke held. With much indignation, however, he de-
manded why the committee had publihhed it without the permiffion of the Affembly or the King? But he was told by the eommittee, that " as to the Affenbly, they were fure of its approbat:on; and as to the King, they were not his reprefentatives." To give an idea of Effet of its the effect of this publication, it is only neceflary to re-pubrica. mark, that, under the fhort adminitration of M1. Ca- tion. lonne, the two brothers of the liing had reccived from the public treafury, independent of their legitimate income, nearly two millions flerling, and that L. 600,000 had been granted to an individual, becaufe he was the huband of Madame de P'olignac. M. Neckar's oppofition to this publication tended in no fmad degree to injure his populaity, and the reft of the minitury began to lofe the considence of the public. Indeed, at Nemerous this time, fertile eanfes of alarm prevailed on all fides. f urces of The elergy were attempting to revive in the prorinces \({ }^{\text {alara. }}\) the ancient animofities between the Roman Catholics and the Proteftants, aferibing the late decrees of the Aftembly to the latter. The German Princes with poif fefled property in the nosth of France were e, pla \(7-\) ing loudly of the violation of their rights by the ta - iltion of the feudal fytem, although the Nationai Aifembly had voted to them a compenfation. The mott melancholy intelligence was received from their colonies in the Weit Indies. In regulating thefe, the Affembly had not recognized the right of the free negroes to enjoy the fame privileges with other citizens; at the fame time, they did not go the leugth of denying thefe privileges. This uncertain conduct produced intinite calamities. The whites contended with thofe conmonly called people of roiour. 'Tbefe again fometimes Itood in oppefition to the free negrees, or to the faves; and hence it fometimes happened that no lefs than three hoAtile affemblies were held at the fame time in the fame colony, which made war upon each other with the moft inveterate fury. Eacb party found protectors in the National iffembly of the parent ftate. Thofe who favoured or oppofed the exiftence of diftinctions at home, in general followed out the fame principle with 1egard to the colonies.

On the 14th of May, M. de Montmorency commu-Desate on nicated to the National Affermbly the preparations for the royal war in which England and Spain were engaged. This power to brought forward the conftitutional queftion, "Who pecace and ouglit to poffefs the power of declaring peace and wa:? ? ware
The Count Clermont Tonnerre, Meffrs de Serent, Virieu, and Dupont, fupported the royal prerogative ; while on the otber fide, the exclufive right of the leginative body to exercife this important prerogative was upported by Meffrs d'Aiguillon, Garat jun. Freteau, Jeilot, Charles Lameth, Sillery, Pction, Rohefpierre, \&.. M. Petion propofed a deeree " that the French nation renounced for ever all idea of conqueft, and confined itfelf entirely to defenfive war:" which was paffed with univerfal acclamation. The Count de Mirabeau at length fuecefsfully propofed that peace and war fhould be declared by the king and the legiflative body in eonjunction; and the decree that was paffed on the fubject is a ftrange farrago of contradietions and abfurdities. It enjoined the King to "guard the flate from external attacks." But how could this be done, without repelling any attack that might be made upon it? This, however, he could not do, without previoully informing the National Affembly ; and if that body chnneed

Freveh not to befitting at the time, he was bound to let the Revolution enemy advance without oppofition till he lad convened
1790.

73
Farce acted On the 1gth June, a very fingular faree was acted in the af. in the Affembly: A Pruftan refugee, who called himfombly ty \(a\) Prufian sefuget, \& 6 . felf Anacharfis Clouts, and who was fruggling hard to bring himfelf into public notice, on an evening fitting (which, it is to he obferved, was generally ill attended
by the perfons of the highett rank), introduced to the Affembly a number of perfons drefled in the different habits of all the difierent countries that could be therght of. In a formal harangue, he told the Aftombly that he was come, as the orator of the buman race, at the head of the reprefentatives of all nations, to congratulate them upon the formation of their new conftution Fe was anfwered by the Prefident with abundance of iolemsity, and retirel with his motley groupe. 'This fantaltical piece of folly, which in any other country than France would fearcely, perhape, have excited a fmile, was treated by the Affembly in a ferious light. Alexander Lameth propofed, that the figures of different nations exhibited in chains at the feet of Lonis M. Lambel, a lanyer, at this noment propoled the abolition: of all bereditary titles. He was fupported by La Fayette, St Fargeau, and the Vifcount de Noalles. The decree was paffed, along with auother fuppreffing all armorial bearings. It is our intention at prefent rather to ftate facts than to hazard any political opinion concerning the wifdom or folly of the tranfactions which we record. It may here, however, be remarked, that no part of the proceedings of the French National Affembly was received by perfons of rank upon the Continent of Europe with fo much indignation as this. The feudal fyftem had been overturned, and the property of the church wrefted from it, with little comparative notice; hut when thofe nominal diflinetions were attacked which antiquity had fanctioned, and perfonal vanity rendered dear, the furrounding nations were inftantly alamed, and beheld with terror the levelling precedent. We may likewife add, that no part of their proceedings was more inimical to rational and practical freedom. To preíerve a perfect equality of ranks is impoffible. In a commercial nation, induftry will procure wealth, and wealth will every where procure dependents. Now nothing more contributes to keep kithin fome tolerable bounds the infolence of newly acquired wealth, than the rank attached to birth and nobility, which time and prejudice have confpired to make refpectable. It is not a little remarkable, that of all the King's minifters, Neckar alone, a plebeian, a republican, born and bred in a democracy, advifed his Majefty to refufe his affent to this foolifh decree, as a violent but ufelefs encroachment upon the prejudices of a powetful order of the flate.
81 \({ }^{81}\) opol to In the mean time, the capital was entirely engroffed Propofal to by hurry and buitle. M. Bailly had propofed a plan rate the ta-for commemorating the anniverfary of the taking of king of the the Baftile. It was adopted, becaufe it flattered the
vanity of the people, by prefenting them with a fplendid fpectacle in commemoration of their own exertions. -The army had been much diforganized; and it was refolved to attempt to unite all its branches, as well as the whole departments of the flate in onc common at-
taclument to the new order of things, by collecting into one place deputations, for the purpole of fwearing fide. lity to the new conilitution. In the middle of the Champ de Mars an altar was erected, at which the civic oath, as it was called, was to be taken. Around Ce nong the altar an mombitheatre was thrown up capable of con- "f s was. taining 400,000 fpectators; 2000 workmen were employed in this operation; and the people of Paris, fearing left the plan might not be completed, affilted in the labour. All ranks of perfons, the nobles, clergy, and even ladies, with the cagernefs for novelty fo peculiar to that people, united their efforts. Crowds of foreigners as well as natives hurried to the capital to be prefent at this folemnity, which was called the lionfederation. The long-expected 14 th of July at length arrived. At fix o'clock is the morning the proceffion was ananged on the Boulevards, and conlilled of this electors of the city of Paris, the reprefentatives of the commons, the adminifrators of the nanicipality, a battalion of children, with a flandard, inferibed "The hopes of the nation ;" deputies trom the troops of France wherever quartcred, and of every order, alons with deputies from all the departnents; to thefe were added immenfe detachments of the military, and of the national guards, along with an almoft infinite multitude of druns, irumpets, and mufical infruments. The proceffion was extremely fplendid, as every diftrict had its peculiar decorations. The national aftembly paffed through a grand triumphal arch, and the king and queen, attended by the forcign minifters, were placed in a fuperb box. After a folemin invocation to God, the King approached the altar, and, amidtt the deepelt filence, took the following oath: "I the King of the French do fwear to the nation, that I will employ the whole power delegated to me by the contitutional law of the ftate, to maintain the conftitution, and enforce the exceution of the law." The prefident of the naw tional affembly then went up to the altar, and took the civic oath, "I fivear to be faithful to the nation, the law, and the king; and to maintain with all my powers the conftitution decreed by the national affembly, and accepted by the king." Every member of the affembly ftanding up, faid, "That 1 fwear." La Fayct:e then advancing, took the oath for himfelf; the other deputies of the national guards pronouncing after him, " That I fwear ;'" and thefe words were folemnly pronounced byevery individual of this immenfe affembly. Te Deum was then fung. The performance was fublime beyond the powers of defcription. Never perhaps before was there fuch an orcheftra, or fuch an audience : their numbers baffled the eye to reckon, and their fhonts in full chorus rent the Ries. It is impoffible to enumerate all the means which were employed to add fplendor to this day. It ended with a general illumination, and no accident diflurbed the public tranquillity.

The affembly now procceded in the formation of the Thot conßitution with confiderable tranquillity; which, how-dier ever, was difturbed by an unhappy event at Nancy. \(N\) indif Muit of the officers of the army were unfriendly to the iffo the late revolution, and every means had been enployed quees. by them to difgult the foldiers with it. At Nancy, in particular, neceflaries had been denied them, and their pay was kept back, under pretence that this was the will of the national affembly. Driven to defpair, the regiments in garrion threw off their allegiance, and demanded

\section*{R E V}
:\% manded loudly the regimental accounts. They feized ion, at the fame time the military cheft, and fent a deputation to flate their cafe at Paris to the national affembly. But the officers were before-hand, and prepoffeffed the minitter of war againft them ; upon whofe reprefentation a decree was paffed, authorifing the commander in chief of the province, M. Bouillé, to reduce the infurgents by force. This was no fooner known, than the national guard of Nancy affembled, and fent a deputation to give a fair ftatement of facts. But Bowillé, without waiting the refult of an explanation, hattened to Nancy at the head of all the troops he could fuddenly collect; and haring fallen upon the regiments of Chateauvieux and Meftre de Camp, after putting an immenfe multitude to the fivord, he took 400 prifoners.
The King's regiment was prevented from acting againit Bouille by the intrepidity of a young officer of the name of \(D_{e} / \sqrt{2} / l l e s\), who, however, died of the wounds which he received on the occation. The news of there events filled Paris with indignation. The affembly afterwards reverfed its own decrees againt the infurgents at Nancy. Public honours were decreed to the memory of Deffilles ; but Bouillé could not be punifhed, becaule he had only acted in obedience to authority.
M. Neckar's popularity had been gradually declithe 4th of Scptember, and fpeedily thereafter left the kingdom. He was regretted by no party. He was :d. regarded, on the one fide, as laving conducted the kingdom to its ruin, by the conceffions which he originally advifed the king to make in favour of the tiers etat: while he was defpifed by the oppofite party as a lukewarm politician, of narrow views, and a feeble mind. He departed, however, with the unblemifhed reputation of ffrict integrity. M. Neckar does not feem to have penetrated deeply into the characters of men, or to have had any conception of the effects of that terrible and reftlefs energy which is called forth in a nation which attempts to make important changes in its ancient manners and government. Having no conception of the important era which was about to open upon that country of which he was the minifter, he was far from being qualified to direct or controul it amidt the convulfions which it was deftined to encounter. Unable to brook the lofs of his popularity, he peevihly retired to Swifferland, where he publifhed a work, which fhows to the conviction of every unprejudiced reader the integrity of the French king, and the wicked projects of the leading democrates, whom he himfelf had armed with power.

The remaining part of this year was occupied in attempts to introduce fome degree of fubordination into the navy of France, which had been much diforganized; and in farther regulating the affairs of the clergy. It was now declared, that fuch clergymen as thould not take the following oath, which had been prefcribed fome months before, fhould be confidered as ejceted from their benefices: "To watch carefully over the faithful in the paxifh or diocefe which was entrufted to his care ; to be faithful to the nation, the law, and the king ; and to maintain to the utmoft of his power the new confitution of France, and particularly the decrees relative to the civil conflitution of the clergy." This
decree rendered the fituation of confcientious men ex- Freacin tremely perplexing; efpecially as the pope teftified in Revolution. marked terms his difapprobation of the oath. The people were reduced to the dilemma of chooling between their new political and their old religious prejudices, and the refult was extremely unfavourable to the intereft of religion.
The affembly commenced the new year with a decree, announcing the termination of its fefion, which was to take place as foon as it thould have finifhed the difcuf. Hoarile apesfion of a lift of conftitutional articles. In the mean in Germatime, on the fide of Germany, Spain, Italy, and Savoy, ny, \&c. hoftile appearances began to be exhibited, and bodies of troops advanced around the French frontier. The Emperor Leopold was, however, too cautious to announce lis intentions; and the King foon communicated a letter from him, containing proteftations of amicable difpofitions, but adding, that " the innovations occafioned by the decrees of the 4 th of Augul ought to be done away." The King treated this merely as an official meafure on the part of the Emperor, that he might not appear to renounce the claims of certain German princes connected with Lorraine and Alface. But the affembly expreffed fome alarm, and voted an augmentation of the national force. About this period feveral new efforts were made by the difaffected clergy in various parts of the kingdom to excite difturbances,

\section*{87} which it is unneceffary to mention in detail. On the 20th Deparure of February the public attention was roufed by a cir- \({ }^{\text {nf }}\) kine cumftance that in any other ftate of affairs would have king's been accounted unimportant. The King announced to from the affembly, that his aunts, the daughters of Louis XV. Paris. had that morning left Paris; but as he did not apprehend that the exiting laws laid them under any reftraint in this refpect, he had not oppofed their departure. After fome debate, the affembly agreed that the King had judged well; and thefe princeffes were left to purfue their journey to Rome, which they reached after fome delays occafioned by the jealouly of certain municipalities through which they paffed. Thus the kingdom was gradually deferted by every branch of the royal family, excepting the King and liis eldeft brother Monfeur. The affembly, however, continued its labours with confiderable quietnofs.. In the end of the Death of. month of March died the celebrated M. de Mirabeau, Mirabeaus at the age of 42 years; a man whofe integrity has for many good reafons been much fuipected, but whofe political addrefs and intrepidity, and whofe fplendid powers of eloquence, have been feldom equalied. He received from his countrymen at his death marks of refpect unparalleled in modern hifory. During his fhort illnefs, his door was befieged by anxious citizens. A mourning of eight days was decreed by the affembly, and alfo a grand proceflion, which was attended by all the public functionaries. He was the firt who was interred in the new magnificent Pantheon, confecrated to the reception of the remains of illuftrious men. But his afhes were afterwards removed, in confequence of very clear proofs that he had not been incorruptible by money.
89.

During the whole of this fpring, much fear was en- An emitertained that fome attempts at a counter revolution grantarms were about to be made. The emigrant army affembled on themhed on the borders of Alface was reviewed by the prince of borders of Condé. Their uniform was black, faced with yellow, atrace.

Fren-h with a leath's head, furrounded by a laurd wreath on Revourion, one culf, and a fword on the other; with the motto, "Couquar or die." The king was alfo furromuded by erowds of nonjuring priefts and other diffaficeted perfors. Ihus, that popular jealoufy which in crery period of the revolution las ftrikingly narkel the l'rench to fy of character, was kept on the alarm. O: the 18 th of \(A\). the poolle pril, therefore, when the rojal family was preparins to and miltary left the king and his fa. minly fhould
cinig:ste.
go to St Cloud to pafs fome days, a report was inllat: Iy fpread that the king was about to fy from the commtry. The carriages were immediately furrounded by prople. I.a layctte drew out the national guard, but thry refufed to act. "We know (exclaimed they) that we are volating the laws, but the fafety of our country is the firlt law." The King inftantly went to the affembly, and with much fpirit complained of the infult. He was anfwered refpectfully by the prefident, and continved his journey. As the royal family had enjoyed a conliderable degree of freedom for fome time pift, which was demonftrated by the unfuccefsful oppofition made to this journey-the prefent opportunity was embraced for intimating to Soreign courts his aceeptance of the conftitution; and all obnoxions perfons were difmifted from about his perfon. The breach of difeipline on the part of the national guard on this occahou was fo much refented by La Fayctte, that he refigend his command. Paris was thrown into confternation ; and it was not till alter the moft univerfal folicitation that he was prevailed upon to refume his office.

Brhaviotry of bмиіl.:' -: the fiontiers.

The kirg,

\section*{queen, and} soy 1 family, leave Paris.

About this time M. de Bonille, to whom the protection of the frontiers was entruled, was employing, as it is now faid, ewery means in his power to sender the country defencelefs. The garrifons were left mprovided; difunion was fpread among the national troops; they were removed from the frontiers, and their place was occupicd loy forcigners, wherever it conld be done. The emigrants abroad, and their friends at home, were lying in wait fur an opportunity of revolt:-when fuddenly, on che 2 tt of June, it was announced from the 'Ihuilleries, that the king, the queen, the dauphin, with monficur and madame, had quitted the palace and the capital, without leaving any information of their intention or their route. The emotion excited by this news among the multitude was a mixture of confternation aad rage. The national affembly, however, acted with much coolnefs. They inflantly taok upon themfelves the government, and decreed their fittings permanent. They fent meffengers, at the fame time, in all directions, to attempt to lay hold of the furgitives. Thefe had taken different routs. Monfieur and ma. dame arrived fafely at Bruffels on the 23d. The king, queen, and their children, when they came to a condiderahle diltance from the capital, were furnithed by Botillé with a guard of dragoons, under pretence of protecting treafure for the pay of the troops. ist the clitance of 156 miles , and when only a few leagues from the frontiers, they were arrefted at St Menehould by the pollmatter, M. Drouct, formerly a dragoon in the regiment of Conde. At half paft feven o'cluck in the evening the carriages ftopt 10 clange horfes at his houfe; he thought he recollected the queen, and imagined that the king's face refembled the impreffions flamped upon affignats. The efcort of dragoons increaled the furpicion. He fuffers them to depart at

It o'clock without notice; but taking a companion ticd with him, he went by a fhorter road to Varennes, With the affillance of the poftmatler there he gave the alarm, and overturned a carriage on the bridge, which detained the royal travellers till the national guard of thig the place had affembled, and the arreft was cffected ann cen without bloodhed. They were brouglit hack to l'a- \(\mathrm{V}_{21}\) arel ris by a deputation from the affembly. At his departure, the king had imprudently lett behind him a ne. morial, in which he declared, that he never had thought any facrifice too great for the celtoration of order ; but that the dellruction of the kingdom, and the triumoh of anarchy, being the only reward of all his effors, he thought it neceflary to depart from it. He then takes a revicw of the faults of the new conflitution, the grichances he has fuffered; and protefts againlt every thing that tie had becin compelled to do during his caytivity.

Different partics were very differently affeeted by this ill-conducted and unfortunate flight of the liag. \(A_{y}^{c}\) fmall republican party had already begun to appear, fles and during the king's abfence, attempts were made to induce the public at large to confider the royal ant. thority as no neceflary part of a free conflitution. But the minds of men were by no means prepared for the reeeption of this new doctrine. The idea, however, having been thus publicly propofed, lett fome impreffions, which in time contributed to give rile to important events. By far the greater number of leading men, howerer, were at prefent convinced, that it was impoffible to conduct a great empire like France, well and profperoufy, without the affiltance of an hereditany chief. I'hey therefore determined to pafs over the affair with as much filence as pulfible, and to hatten the perioul when their new conttitution thould be complete. But there is reafon to belies, that this journey was at the long-run highly inftrumental in producing very fatal effects to the perfonal fafety of the monarch.

His flight feemed a fiznal for emigration. Many of the ariltocratic party fent in refignations of their feats in the national aftembly. 'Iroops were levied on the frontiers in the King's name ; who took care, however, to difavow any connection with fuch a procedure. Bouillé emigrated, and afterwards fent to the alfembly a furious threatening letter: "Yon hall anfwer (fays he) for the lives of the king and of the queen to all the monarchs of the univerfe. 'Touch but a fingle hair of their heads, and not one llone Thall be left uponano. ther in Paris. I know the roads. I will conduct the forcign armies. This letter is but the forerunner of the manifctlo of the fovereigns of leurope."

A condiderahle calm throurhout France followed thefe events, and it might be regarded as in a ttate of tranquillity. It contained, indeed, parties entertaining much animofity againlt eachother, and manycitizens bad withdrawn to foreign countries; but the peace was not broken, and moderate men hoped that much profperity would follow from the late agitations. But this calm was delunive ; and in the midit of it thofe projects were formed which were afterwards to prove fo fatal to the peace of France and of Europe. Towards the clofe of this fummer, a convention took place at P'initz in Sax-Piirin ony between the emperor Leopold and the king of Pruflia. Its objcet was not known at the time, but it gradually came jnto view, and is now by many under-

\section*{\(R\) E V}

\section*{R E V}

His majefty the king of Pruffia thall befides acquire Trurch Lnface ; and his ferene highnefs the elector of Saxony Revolution, fhall in exchange receive the refl of Poland, and occupy the throne as hereditary fovereign.

Ifis majelly the prefent king of Poland fhall abdicate the throne on receiving a fuitable anuuity:

His royal highefs the elector of Saxony fhall grive his daughter in marriage to his ferene highnefs the youngett fon of his royal highnefs the grand duke of all the Ruffas, who will be the father of the race of the hereditary kings of Poland and Lithuania. (Signed) Leopold. Princenassau. Count Florida Blanca. Bischoffswerder.

In the mean time, the national affembiy was haten- The \({ }^{94}\) ing faft to the completion of the new conftitution. It congis, ition was finifhed on the \(3^{\text {d }}\) of September, and prefented to corclud:d the king. It begins with the following declaration of fun the at the rights of a man and a citizen, and thereafter follow the different branches; the chief of which are here tranf. lated.
I. All men are born, and remain, free and equal in rights : focial diftinetions cannot be founded but on coinnoon utility.
11. The end of all political affociations is the prefervation of the natural and imprefcriptible rights of man : thefe rights are liberty, property, fceurity, and refiftance againit opprefion.
III. The principle of forereiznty refides effentially in the nation: no body of men, no individual, can exercife an authority that does not emanate exprefoly from that fource.
IV. Liberty confilts in the power of doing every thing except that which is hartful to another : hence the exercife of the natural rights of every man has no other bounds'than thofe that are necefary to enfure to the other menbers of fociety the enjoyment of the fame rights: thofe bounds can be deterninted by the law only.
V. 'The law has a right to forbid thofe actions alone that are hurful to fociety. Whatever is not forbiddeu by the law, cannot be hindered ; and no perfon can be conftrained to do that which the law ordaineth not.
VI. 'The law is the exprefion of the general will : all the citizens have a right to concur perfonally, or by their reprefentatives, to the formation of the law: is ought to be the fame for all, whether it protect, or whether it punith. All citizens being equal in the eye of the law, are egually admifible to dignities, places, and public uffices, according to their capacity, and without any other dillinction but that of their virtue and their talents.
VII. No man can be accufed, arretted, or detained, excert in cales deternined by the law, and according to the forms which the law hath preferibed. Thole who follicit, difpatch, execute, or caufe to be exechted, arbitrary crilers, ought to be punifled; but every citizeni that is fummoned or fuzed in virtue of the law, outht to obey initantly-hic becomes culpable by refiftance.

VIIf. The law ought to eftablifh fuch punifhments only as are ftrictly and evidently neceflary; aud no perfon can be punifhed but in virtue of a law eftablifhed and pronulgated prior to the offence, and legrally applied.
IX. Excry mare being prefumed iunccent till fuch

French time as he has been declared guilty, if it hall be dcemRevolution, ed abfolutcly neceffary to arreft a man, every kind of 1791 rigour employed, not neceflary to fecure his perfon, ought to be feverely repreffed by the law.

X . No perfon thall be molefted for his opinions, even fuch as are religious, provided that the manifeftation of thofe opinions does not difturb the public order eftablifhed by the law.
XI. The free communication of thought, and of opinion, is one of the moft precious rights of man. Every citizen, therefore, may freely fpeak, write, and publifh, his fentiments; fubject, however, to anfwer for the abufe of that liberty, in cafes determined by the haw.
XII. The guarantee of the Rights of Man and Citizens, involves a neceffity of fublic force: this force is then inftituted for the advantage of all, and not for the particular utility of thofe to whom it is confided.
XIII. For the maintenance of pullic force, and for the expences of adminittration, a common contribution is indifpenfably neceflary: this contribution thould be equaliy divided amongt all the citizens, in proportion to their abilitics.
XIV. Every citizen has a night, by himfelf, or by his reprefentatives, to decide concerning the neceffity of the public contribution; to confent to it freely; to look after the employment of it; to determine the quantity, the diftribution, the collection, and duration.
XV. The fociety has a righe to denand from every public ageat an account of his adminittration.
XVI. Every fociety, in which the guarantee of rights is net affured, nor the feparation of powers determined, has no confitution.
XVII. Property being a right inviolable and facred, no perfon can be diprived of it, except when the public neceffity, legally afcertained, fhall cvidently require it, and on condition of a juft and previous indemnification.

The conflitution gurantees, as natural and civil rights,
r. That all citizens are admiffible to places and employments without any diltinction, but that of ability and virtuc.
2. That all contributions thall be divided equally among all the citizcns, in proportion to their means.
3. That the fame crimes fall be fubject to the fame punifhments, without any diftinction of perfons.

The conftitution in like mauncr guarantces, as natural and civil rights,

Liberty to all men of going, ftaying, or departing, without being arrefted, or detained, 'but according to the forms prefcribed by the conftitution.

Liberty to all men of fpeaking, writing, printing, and "publihing their thoughts, withont having their writings fubjected to any examination or infpection before publication;" and of exercifing the religious worfrip to which they are attached.

Liberty to all citizens of affembling peaceably, and without arme, complying with the laws of police.

Liberty of addreffing to all conftitutional authorities petitions individually figned.

The conflitution guarantees the inviolability of property, or a jult and previous indemnity for that of which public neceflity, legally proccd, fhall require the facrifice.

A public infrusion fall be creat
A 11 ind organized, \(F_{i}\) b common to all citizens, gratuitous with regard to thofe Revi in, parts of tuition indifpenfable for all men, and of which the eftablifhment fhall be gradually diftributed in a proportion combined with the divifion of the kingdom.
"The kingdom is one and indivifible;" its territory, for adminiftration, is ditributed into 83 departments, each department into diftricts, each diltrict into cantons.
Thofe are French citizcns,
Who are born in France, of a French father;
Who having been born in France of a forcign fa: ther, have fixed their refidence in the kingdom ;

Who having been born in a foreign country, of a French father, have returned to fettle in France, and have taken the civic oath:
In fine, who having been born in a foreign country; being defcended in whatever degree from a Frenchman or a Frenchwoman, who have left their country from religious motives, come to refide in France, and take the civic oath.

The right of French citizenfhip is lof,
rft, By naturalization in a foreign country ;
2dly, By being condemned to penalties which involve the civic degradation, provided the perfon condemned be not reinflated;
3 dly, By a fentence of contumacy, provided the fen* tence be not anoulled;
4thly, By initiation into any forcign order or body which fuppofes either proofs of nobility " or diftinctions of birth, or requires religious vows."
"The law confiders marriage only as a civil con. tract."

The fovercignty is one, indivifible, "inalienable, and imprefcriptible," and it belongs to the nation : no fection of the people, or individual, can arrogate the exercife of it.
The nation, from which alone flow all powers, cannot exercife them but by delegation.

The French conflitution is reprefentative: the reprefentatives are the legiflative body and the king.
The National Affembly, forming the legiflative body, is permanent, and confifts of one clamber only.

It thall be formed by new elections, every two years.
The legiflative body cannot be diffolved by the king:
The number of reprefentatives to the legilative body thall be 745 , on account of the 83 departments of which the kingdom is conpofed; and independent of thofe that may be granted to the celonies.
The reprefeatatives fhall be diftributed amony the 83 departments, according to the three proportions of land, of population, and the contribution direct.
Of the 745 reprefentatives 247 are attached to thie land. Of thefe cach department fhall nominate thrce, except the department of Patis, which fhall nominate only one.
Two hundred and forty-nine reprefentatives are attached to the population. The total mafs of the active population of the kingdom is divided into \({ }^{2}+9\) parts, and each department nominates as many of the deputies as it contains parts of the population.

Two hundred and forty-nine reprefentatives are atfacled to the contribution direct. The fum total of the direct contribution of the kingdom is likewife divided into 249 parts; and each department nominates as many deputices as it pays parts of the contribution.

\section*{\(R\) E V [171] R E V}
wh In order to form a legillative national aflembly, the tion, active citizens thall convene, in primary allemblies, every I. two pears in the cities and cantous.
" 'The primary affemblies frall meet of full right on the firt Sunday of March, if not convoked fooner by the public officers appoointed to do fo by the law."
To be an ative citizen, it is neceflary,
To be a Frenchman, or to have become a French. man;
To have attained 25 years complete;
To have refided in the city or the canton from the time determined by the law;
To pay in any part of the kingdom a direct contribution, at leaft equal to the value of three days labour, and to produce the acquittance;
Not to be in a menial capacity, namely, that of a fer. vant receiving wages;
To be infribed in the municipality of the place of his refidence in the lift of the national guards;
To have taken the civic oath.
The primary aftemblies fhall name electors in the proportion of the number of active citizens refiding in the city or canton ;
There flall be named one elector to the aftembly, or not, according as there fhall happen to be prefent 100 active citizens.
There fhall be named two, when there fhall be prefent from 151 to 250 , and fo on in this proportion.
The electors named in each department fhall corrvene, in order to choofe the number of reprefentatives, whofe nomination fhall belong to their department, and a number of fublitutes equal to the third of the reprefentatives.
"The affemblies fhall be held of full right on the laft Sunday of Mareh, if they have not been before convoked by the public officers appointed to do fo by lav."
All active citizens, whatever be their flate, profeffion, or contribution, may be chofen reprefentatives of the nation.
Excepting, neverthelefs, the miniftes and other agents of the executive power, \&c.
The members of the legiflative body may be re-elcted to a fubfequent leginature, but not till after an interval of one legiflature.

No active citizen can enter or vote in an affembly if he is armed.
The reprefentatives fhall meet on the frit Monday of May, in the place of the fittings of the laft leginature.
The royalty is indivifible, and delegated hereditarily to the race on the throne from male to male, by order of primogeniture, to the perpetual exclufion of women and their defcendarts.
Nothing is prejudged on the effect of renunciations in the race on the throne.
The perfon of the king is inviolable and facred; his only title is king of the French.
If the king put himfelf at the head of an army, and direct the forces of it againft the nation, or if he do not oppofe, by a formal act, any fuch enterprife undertaken in his name, he fhall be held to have abdicated.

If the king having gone out of the kingdom, do not retum to it , after an invitation by the legiflative Body, within the fpace which fhall be fixed by the pro-
clamation, " and which cannot be lefs thar two months," he thall be held to have abdicated the royalty.

After abdication, exprefs or legal, the king thall be in the clars of citizens, and may be acculed and tried like them, for acts pofterior to his abdication.

The nation makes provifion for the fplendour of the throne by a civil litt, of which the leginative body thall fix the fum at the commencement of each reign, for the whole duration of that reign.

The king is a minor till the age of 18 complete; and during his minority there fall be a regent of the kingdom.

The regency belongs to the relation of the king, next in degree according to the order of fucceffion to the throne, who has attained the age of 25 ; provided he be a Frenchman refident in the kingdom, and not prefumptive heir to any other crown, and have previoully taken the civic oath.

The prefumptive heir fhall bear the name of Prince Royal.
" The members of the king's family called to the eventual fucceflion of the throne, fhall add the denomination of Frencb Prince to the name which fhall be given them in the civil aed proving their birth; and this name can neither be patronymic nor formed of any of the qualifications abolifhed by the prefent confitution."
" The denomination of grince cannot be given to any individual, and fhall not carry with it any privilege or exception to the common right of all French citizers."

To the king alone belongs the choice and difmiffion of minifters.
"The members of the prefent national affembly, and of the fubfequent leginatures, the members of the tribunal of appeal, and thofe who thall be of the high jury, cannot be advanced to the miniftry, cannot receive any place, gift, penfion, allowance, or commiffon of the executive power or its agents during the continuance of their functions, or during two ycars after ceafing to exercife them: the fame fhall be obferved refpecting thole who thall only be infcribed on the lift of high jurors as long as their infeription thall continue."

No order of the king can be executed if it be not figned by him, and counterfigned by the minifter or comptroller of the department.

In no cafe can the written or verbal order of a king fhelter a minifter from refponfibility.

The conflitution delegates exclufively to the legilla. tive body the powers and functions following;

To propofe and decree laws-The king can only invite the legiflative body to take an object into confideration ;

To fix the public expences;
To eftablifh the public contributions, to determise the nature of them, the amount of each fort, the duration, and the mode of collection, \&.c.

War cannot be refolved on but by a decree of the national affembly, paffed on the formal and neceffary propofition of the king, and fanctioned by him.

During the whole courfe of war, the leginative body may require the king to negociate peace; and the king is bourd to yield to this requifition.

It belongs to the legiflative body to ratify treaties of

French
Revolution, 1791.

\section*{R E V}

French peace, alliance, and commetce; and no treaty flall have Pevolution, effect but by this ratitieation.
1791. The dehberations of the legiflative body thall be public, and the minutes of the littinges fhall be printed.
'the legillative body may, however, on any ucealion, form itfelf into a general enmmitte.

The plan of a dectee flall lee rearl thrice, at three intervals, the fhortelt of which cannot be lefs than eight days.
'l'he decrees of the legiflative body are prefented to the hing, who may refufe them lis comfent.

In cafe of a refugal of the royal confent, that refifal is only fufpenive. - When the two following leginatures thall fucecfively prefent the fame decree in the fame terms on which it was originally conecived, the king flall be deemed to have given his fanction.

The king is bound to exprefs his confent or refufal to each decree within two months after its prefentation.

No decree to which the king has refufed his confent can be again prefented to lim by the fame legiflature.

The fupreme excentive power refides exclufively in the hands of the king.

The king is the fupreme liead of the land and fea forces.

Ithe king names ambaffadors, and the other agents of political negociations.

He betlows the command of armies and fleets, and the ranks of marfhal of France and admiral :

He names two-thirds of the rear-admirals, one-half of the lieutenant-generals, camp-narfhals, captains of thips, and colonels of the national gendarmerie:

Fie names a third of the colonels and licutenant-colonels, and a fixth of the licutenants of fhips:

He appoints in the civil adminiftration of the marine, the direstors, the comptrollers, the treafurers of the arfenals, the malters of the works, the under matters of civil buildings, half of the matters of adminiftration, and the under mafters of conftuction.

He appoints the commiffaries of the tribunals:
He appoints the fuperintendants in chief of the ma" nagement of contributions indireet, "and the adminiflration of national domains:"

He fuperintends the coinage of money, and appoints officers entrufted with this Cuperintendance in the general commiffion and the mints.

The effigy of the king is Itruck on all the coinage of the kingdom.

There is in each department a fuperior adminiftration, and in each diftrict a fubordinate adminiftration.

The adminftrators are fpecially charged with dillributing the contributions direct, and with fuperintending the money arifing from the contributions, and the public revenues in their territory.

The king has the right of annulling fuch acts of the acminiftrators of department as are contrary to the law or the ordeistranfinited to them.

He may, in cafe of obllinate difobedience, or of their endangering, by their acts, the fafety or peace of the public, fufpend them from their functions.

The king alone can interfere in foreign political connétions.

Every declaration of war niall be made in thefe tertns: By the king of the Irrench in the name of the nation.

1727 R E V
The judicial power can in no cafe be exercifed either Finh by the legiflative body or the king.

Jullice thall be gratuitoully rendered by judges chofen
from time to tine by the people, and inftituted by leiters patent of the king, who cannot refule them.
"The public accufer fhall be nominated by the people."
"The siglis of citizens to terminate difutes defo nitively by abitiation, cannot receive any infringenent from the acts of the legiflative power."

In criminal matters, no citizen can be judge? except on an accufation received by jurors, or seeceed by the legiflative hody in the cafes in which it belung's to it tes prolecute the accufation.

After the acoufation flall be adinitted, the fact flatl be examined, and declared by the jurors.

The perfon accufed thall have the privilege of challenging 20, "without affigning any realon."

The juiors who declare the fact fhall not be fewer than 12.

The application of the law foll be made by the judges.

The proeefs thatl be public; "and the petfon accufed cannot be denied the aid of counfel."

No man acquitted by a legal jury can be apprehended or accufed on account of the fanse fact.

For the whole kingdom there thall be one tribunal of appeal, eftablifhed near the legiflative body.

A ligh national conrt, compofed of members of the tribunal of appeal and high jurors, thall take cognizance of the crimes of minilers, and the principal agents of the executive power; and of crimes whels attack the general fafety of the ftate, when the legiflative body fhall pafs a decrec of aceufation.

It thall not affemble but on the proclamation of the legillative body; " and at the diftance of 30,002 toifes at lealt from the place of meeting of the leginative body."

The national guards do not form a military body, or an inftitution in the flate; they are the citizens themfelves called to allit the public force.

Officers are cholen for a time, and cannot again be chofen till after a certain interval of fervice as privates.

None fhall command the national guard of more than one diftrict.

All the parts of the public force employed for the fafety of the flate from foreign enemies are under the command of the king.

Public contributions fhall be debated and fixed every year by the legiflative body, and cannot continue in force longer than the laft day of the following feffion, if they are not exprefsly renewed.
"Detailed accounts of the expence of the minifterial departments, figned and certified by the miniters or comptrollers-general, fhall be printed and publifhed at the commoricement of the feffions of each legiflature.
" The fame fhall be done with the flatements of the receipt of the different taxes, and all the public revenues."

The French nation renounces the undertaking of any war with a view of making conquefts, and will never employ its furces againtt the libcrty of any people.
'The conltituting national allembly declares, "That

\section*{R E V [ 173 ] \(\quad\) R E V.}
retch the nation has the imprefcriptible right of changing Inutior, its conflitution; and neverthelefs conlidering that it is more conformable to the national interell to employ only by means provided in the contitution itfeif, the right of reforming tivfe articles of it, of which experience fhall have thown the inconveniencies, dicrees, that the procecding by an affembly of revifion fiall be regulated in the furm following:
" When three fucceffive legiflatures fhall have exprefled an uniform wifl fur the change of any conflitutional article, the revifion demanded thall take place.
"The next leginature, and the following, cannot propofe the reform of any conttitutional articile.
" The furth legiflature, angmented with 249 members, chuen in each department, by doubling the ordinary number which it furnifhes in proportion to its population, nall form the affembly of revifion."

The French colonies and poffeffons in Afia, Africa, and America, "though they form part of the French empire," are not inclurled in the prefent conititution.

With refpect to the laws made by the national affembly which are not included in the act of conflitution, and thofe anterior laws which it has not altered, they fhall be obferved, fo long as they fhall not be revoked or modified by the legiflative power.
On the \(13^{\text {th }}\) of September the King announced, by a letter to the Prefident of the Afiembly, his acceptance of the centlitution. This event was ordered to be notified to all the foreign courts, and the Affembly decreed a general amnefty with refpect to the events of the revolution. On the following day the King repaired in perfon to the National Affembly; and being conducted to a chair of flate prepared for him at the fide of the Prefident, he ligned the contlitutional act, and took an oath of fidelity to it. He then withdrew, and was attended back to the Thuilleries by the whole Affembly, with the Prcfident at their head. On the 3cth of September, this National Affembly, which has fince been known by the name of the Conflituent Alfim\(L / y\), difiolved itfelf, and gave place to the fucceeding Les: Iative National Al Tmbly, which had been elected according to the rules prefcribed by the new conflitution.

On the character and the labours of the Conituent Affembly, we fhall orly remark, that it contained many men of talents, and, in all probability, a conifderable
 feffion, it affumed a very Ariking character of moderation, and appears to liave been completely monarcincal, although its jealoufy of the ancient arifocracy prevented it from fufficiently guarding the throne againlt popular violence; for a very friking defeet in the new conflitution foon appeared. The King poffeffed a veto, or negative, upon the refolutions of the legifative body: but this negative he was bound to exercife in ferfor, without refponfibility, and without the intervention of his mimillers. He had no fenate, or upper clamber, to fand between him and popular vivience; and there was fomething apparently abfurd in fetiling the vote of an individual, in oppofition to the collective wildom and will of a whole nation. In cunfequence of this, he was reduced to the hard alternative of yielding to every vote of the National Affembly, or of expofing himfelf perfonally to public odium.

The new Affembly was optaed by the King on the

Th of OZober, with much apparent union on all Freveh fides. His feech, recommending unanimity and conf-Revolution, dence between the legiflative and executive powers, was 1791. received with un?ounded applaufe. The chnracter of -101 the men who compufed the new National Affembly was The new unaulpicions to the Court. At the commencement of afe n:bly the revolution, the great body of the people at a dif opened by tance from the capital were little interetted in thofe pro- ant the bing, jects of frcedon which oceupied the more enlightened ch iracer or more turbulent inhabitants of Paris. They had gra- of the dually, however, been ronfed from their lethargy:. The menbers, variety of powers corferred by the new conflisation upon the people at large, and the multiplicity of offices of which it gave tbem the patronage, had kindled in the minds of men a love of dominion, and a will 20 interfere in public afiairs. This attached them to the new order of things. The love of power, which is the leadt difiguifed pafion in the human heart, and equally ttron in the brcart of the meaneft and of the highelt of manikind, was thus, under the name of liberty, become it leading paffion throughout this wide empire. 'They who flattered it moft, and were moft loud in praife of the rights of the people, became fpeedily the favourites of the public. The confequence of this was, that the new National Affembly was chietly compofed of courtry gentlemen, of principles highly democratic, or of men of letters who had publifined popular books, or conducted periodical publications. The members of the Conflituent Affembly had been excluded by their own decree from holding feats in the new leginature.The members of the latter, theiefore, had little regaid for a conflitution which they themfelves had not framed. aud which was not protected by the venerable fanction of antiquity.

When this Affembly firt met, it fhowcd a very Thei- \({ }^{102}\) trifing attention to formalities, and a peevin jealoufy 14 ts of of the minitters of the crown. In the mean time, the the maintreaty of Pilnitz, already mentioned, heram to be fu-ferrown ant moured abroad, and France was thrown imto a fate of confeq, ant anxions jealoufy for the fafety of its newly-acquired concuet. liberties. Although the Prufians and Germans (the Elector of Mentz alone excepted) all continued to temporize, the northern powers, Sweden and Ruffa, entered into frict engagements to refore the cld defpotifm of France. On the gth of November, a dccree was paffed, that the emigrants who, after the firit of January next, fhould be found affembled, as at prefent, in a hotile manner, beyond the frontiers, fould be conlidered as guilty of a confpiracy, and fufier death; that the French Princes, and public iunctionarice, who fhould not return before that period, fhou'd be punifhable in the fame manner, and their property forfeited during their own lives. On the 18 th, a feries of icvere decrees was alfo pafted agzinlt fircit of the ejefted clergy as ftill refufed to take the civic oath. To buth thefe decrees the King oppofed his veto, of negative. The moderate party, who were attached to the contitution, rejoiced at this as a proof of the frecdom of their fovercign. But, on the other fide, it excited a raolt violent clamour, and became the means of excitins new fufpicion of the withes of the Court. At this 103 time anfivers were received from the different foreign racifiant Courts to the notification fent them of the King's ace -ecerves ceptance of the new conttitutior. Thefe were general- ferm foly conceived in a file of caution, and avoided giving reizn

But the
court is till
farpeeted.
ros
The mini-
Stry changed. intimated to the Anembly that he had declared to the Elector of Treves, that unlefs the enigrants fhould ceate before the 15 th of January to make hoftile preparations within his territories, he would be confidered as the enemy of France. All this, however, did not picfurve the court from fufpicion; for although the difterent foreign courts had openly declared pacific intentions, yet the French emigrants boldly afterted, that all Europe was actually arming in their favour. Accordingly they ceafed not to folicit their equals in rank, who ftill remained withiu the country, to leave it to join with them in what they called the royal caufe. The unhappy Louis, placed between a republican party that was gradually gathering frength, and an ariftucratical party that was routing Europe to arms againlt a nation of which he was the conltitutional chief, and a combination of Prisces jultly fufpected of wifhing to feize upon a part of his dominions, Itood in a fituation which would have perplexed the moft Rilful flatefman ; and it is no proof of ineapacity that he fell 2 facrifice to circumftances which might have overwhelmed any known meafure of human ingenuity. Addreffes were crowding into the Affembly, difapproving the conduct of the court. M. Montmorin religned; M. Deleffart fucceeded him ; and M. Cahier de Gerville became minitter of the interior. M. dn Portail refigned alfo, and M. Narbonne fucreeded him as minilter of war. In the month of November, M. Bailly's mayoralty terminated; and the once popular La Fayette appeared as a candidate to fucceed him. But he was fuccefsfully oppofed by M. Petion, a violent Jacobin, and a declared republican, who was clected mayor of Paris by a great majority.

At this period the moderate men, who were friends of the confitution, attempted to counteract the influence of the Jacobin club by the eftablifment of a fimilar one. It derived its name from the vacant convent of the Feuillans, in which it affembled. The moft active members of the Conllitnent Aftembly belonged to it, fuch as M. M. D'Andre, Barnave, the Lameths, \(\mathrm{Dit}_{1}\) Port, Rabaud, Sieyes, Chapelicr, Thouret, Labord, Talcyrand, Montefquieu, Beaumetz, sc. The Jacobins contrived to excite a riot at the place of their -meeting, which was in the vicinity of the hall of the National Aftembly. This alforded a pretext for applying to the Aftembly for the removal of the new club. The Affembly flowed their difpolition, by complying with this requeft.

At the end of this ycar, the kingdom of France was by no means profperous. The public revenue had fallen far fhort of the expenditure. The emigrant nobility had carried out of the kingdom the greater part of the current coin, and a variety of manufacturers, who depended upon their oftentatious luxury, were reduced to much diftrefs. The dijpofitions of foreign courts appeared very doubiful. The new ycar, however, opened with delufive profpects of tranquillity.'lhe German Princes appeared fatistied with the mode of compeniation which the French had oflered for the lofs of their poffeffons in Alface and Lorraine. 'The 1'rince of Loweltein accepted of an indemnification. The Princes of Hohenlolec and Saim-Salm declared themfives rady to treat upon the fame terms. Pince

Maximilian, and the Dukes of Wirtemberg and Deux. Frenc Ponts, freely negociated. It is mneceflary to ftate in Revolur, detail the fubterfuges employed, in the mean time, by the crafty Leopold, for amufing the Freneh with the appearances of peace. M. Deleffirt, minitter for foreign affairs, fell a facrifice to them, and probably to the undecided character of Louis. He was accufed by M. Briffot of not having given timely notice to the National Affembly of the difpolitions of foreign powers, and of not prefling proper meafures for fecuring the honour and fafcty of the nation. A decree of accufation paffed againt him in his abfence. He was apprehended, tried by the high national court at Orleans, and executed in confequence of its fentence.

The fudden death of Leopold on the firlt of March The dea gave rife to a tranfient hope that peace might fill be of the er preferved. A fufpicion of poifon fell upon the French, peror an but it was removed by the detail of his difeafe that was murder fpeedily publifhed. On the 1 Gth of the fame month, the king the king of Siweden was wounded by a nobleman of the nance of Ankerftrom, and died on the 29th. This enterprifing Prince had overturned the conititution of his own country, and he had formed the project of conducting in perfon his troops to the frontiers of France, and of commanding or accompanying the combined armies of Europe in their attempt to avenge the caufe of infulted royalty. It was in a great meafure to counteraet this fcheme that he was affaffinated.
'The fudden fall, however, of thefe two enemies rather accelerated than retarded the meditated hoftilities. ror's fuce 'The young King of Hungary, who fucceeded to the for openl empire, made no fecret either of his own intentions or of the exiltence of a concert of Princes againft France. M. Dumourier was now at the head of the war-office, M. Rolland was minifter of the interior, and M. Claviere minitter of finance. The Jacobins were all-power. ful. The Court gave way to the torrent. 'The property of the emigrants was confifcated, referving the rights of creditors. The Imperial minifter, Prince Kaunitz, demanded three things of France; \(\mathrm{I} /\), The rettitution of their feudal rights to the German Princes; \(2 d y\), To reftore Aviguon to the Pope, the inhabitants of which had fome time before thrown off their allegiance, and prevailed with the Conllituent Affembly to receive their country as a part of France ; and lafly, Prince Kaunitz demanded, that "the neighbouring powers fhould have no reafon for apprehenfion from the prefent weaknefs of the internal government of France." On receiving thefe demand, the king propufed a dectaration of war, which was decreed by the National Affembly on the zoth of April, againt the King of Hur: gary and Bobenia.
The French immedianely began the war, by attack. \({ }^{170}\) ing in three different columns the Auftrian Netherlands. M. Theobald Dillon advaneed from Lifle to Tounnay, where he found a flroug body of Autrians ready to \(y\), Netherceive him. The national troops, unaceuffomed to fuftain the fire of regular foldiers, were inftantly thrown into confufion, and fled even to the gates of Lifle. 'The cry of treafon refounded on all fides; and their com. mander, an experienced and faithful officer, was nurdered by his own feldiers and the molb. A fecond divifion of 10,000 men, under Lieutenant-General Biron, took poffeffion of Quiverain on the 29th, and marched towards Mons, General Liron was here attached by

\section*{\(R \quad \mathrm{E} \nabla\) \\ \(\left[\begin{array}{lll}{[ } & 175\end{array}\right]\) \\ REV}
ench the Auftrians, whom he repulfed. Hearing, however, dution, of the defeat of Dillon, he retreated. A third party 192. advanced to Furnes, but afterwards withdrew. La Fayette at the fame time advanced towards Bouvines, lialf way to Namur, from which he aiterwards retreated. The whole of thefe expeditions were ill contrived, in as much as they divided the French undifciplined troops, and expofed them in fmall bodies to the attack of veteran forees. The Auftrians were fome time before they attempted to retaliate. At length, however, on the 11 th of June, they attacked M. Gouvion, who commanded the advanced guard of La Fayette's army near Maubeuge. M. Gouvion was killed by a rolling bullet; but La Fayette himfelf having come up, the Auftrians abandoned the field. In the mean time, matters were haftening in Paris towards a violent crifis. Two parties, both of which were hoftile to the prefent contitution, had gradually been formed in the flate. The one wifhed to give more effectual fupport to the royal authority, by eftablifing a finate or two chambers, to prevent the king's vote from being the fole check upon popular enthufiafm. The other party winhed to fet afide royalty altogether, and to hazard the bold experiment of converting France into a republic. Thefe laft were fupported by the Jacubin club, which had now contrived to concentrate in itfelf an immenfe mafs of influence. Innumerable popular focieties were eftablifhed in every town and village throughout the provinces. With thefe a regular correfpondence was kept up by writing and by emiffarics. Thus fchemes and notivus were inftantaneoufly propagated through a great enpire, and all the violent fpirits which it contained were enabled to act in concert : But the more immediate engine of the republican party confifted of the immenfe population of the metropolis, whom they now endeavourcd to keep in conftant alarm. For this purpofe they alleged, that an Avffrian Committe, that is to fay, a confpiracy in favour of the enemies of the country, exitted among the friends of the court. M. M. Genfunsé aud Briffot even offered in the affembly to prove the exiftence of this pretended Autzian committee. A report was next circulated, that the king intended to abfoond from the capital on the 23 d of May. His majefty publicly contradicted thefe acculations as calumnies, but they made no fmall impreflion upon the minds of the public. New decrets were now made againtt the refractory clergy, but thefe his najefty refufed to fanction. A properal was alfo made and decreed in the affembly to furm a camp of \(=0,000 \mathrm{men}\) under the walls of Paris, and that for this levy every canton in the kingdom fhould contribute one horfman and four infantry. The national guard of Paris difliked the propofal, and the king gave to it his negative. Indeed at this time the king feems to have come to a refolution of ftanding out againit the Jacobin party, to which he had for fome time yielded. The miniftry were therefore difniffed, excepting M. Dumourier, and others were appointed in their ftead. By this event Dunourier loft the confidence of the Jacobin club. He faw his error, refigned his office, and joined the army. In the mean time a decree had been palted, authoriing the manufactory of pikes for the plarpofe of arming cheaply the lower clafs of citizens. All means were ufed to render the king odions by inllamatory wri-
tings and ha:angues; and in both of thefe the noted French incendiary Marat took the lead.

On the 20th of June M. Roederer, the Procureur Ge- 1792. neral Syndic informed the national affembly, that, con- 112 trary to law, formidable bodies of ammed men were pre. An armed paring to prefent petitions to the king, and to the na- mob marchtional affembly. A part of then fpeedily appeared the affeur with St Hurrge and Santerre a brewer at their head. bly, furThey marched through the hall in a proceffion that roundo the lafted two hours, at four o'clock in the afternoon, to Thu lleries the number of about 40,000 . They furrounded the and infults Thuilleries. The gates were thrown open; and on an family. attempt to break the door of the apartment, where the king then was, he ordered them to be admitted. His filter the prineefs Elizabeth never departed from his fide during four or five hours that he was furrounded by the multitude, and compelled to liften to every indignity. All this while Petion, the mayor of Paris, was unaceountably abfent. He at length, however, arrived, and alfo a deputation from the affembly. The queen, with her children and the princefs de Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet expofed to much infult. At laft, in confequence of the approach of evening, and of the entreatics of Petion, the multitude gradually difyerfed.

The indignities fuffered on this day by the royal fa-The more mily were in fome refpects not unfavourable to their reffectable caufe. A great number of the moft rcfpectable inha- inhabitants bitants of the capital were afhamed of fuel proceedings. ed of fuch a They complained of them feverely in a petition to the conduc.. affembly, and addrefles to the fame purpofe were received from feveral departments. The directory of the department of Paris, at the head of which wete M. Rochefaucault and M. Tulieyrand, pubiilhed a declaration difapproving of the conduct of the mayor, and of M. Manuel the procureur of the commune, whom they aftermards fufpended from their oflices, althongh they were fpeedily rcttored by a decree of the affenbly. At the fame time, La Fayette leaving his army fuddenly, appeared on the 26 th at the bar of the national afiembly. He declared that he cane to exprefs the indignation which the whole army felt on account of the events of the 20th : he called upon the affembly to puwifh the promoters of thefe events, and to diffolve the factions clubs. The fudden appearance of La Fayctic threw the Jacobins into confternation, and from that period they never ceafed to calumninte him.

On the it of July, on the motion of M. Jean de The kin Brie, the affembly nrdered a proclamation to be made, of preflia that the country was in danger. On the 6th, the king marches §ave intimation that the king of Prufia was marching \(\begin{gathered}\text { againft } \\ \text { trancs }\end{gathered}\) with 52,000 men to co-operate againft France. The French arms were at this time fomicwhat fuceeffful in the Auftrian Netherlands; but the cabinet fpeedily thought it necelfary to order the armies to retreat : a meafure which was afterwards publicly cenfured by Marfhall Luekner.

On the 7 th, a fingular fcene occurred in the nation \({ }^{115}\) al affembly. At the inftant that M. Briffot was about peech of to commence an oration, M. Lammoureite bifhop of e bimoo?
 expatiated on the neceffity of union among the membe:s of the affombly, and of hacrificing their palfions and pre-
judices

French julices on the altar of their country. We conchuled an fatc. Poth allegations are probably true. Every motive Fres Revolurionsanimated addrefs with thefe words, "Let all who hold
if
Manifeno
of the
duke of
Eruilwick in equal deteftation a republic and two chambers, and who with to maintain the conflitution as it is, vife!" The words were fearely pronounced when the whole aflembly thated from their feats. Men of all partics folemnly embraced each other, and protefled their ad. herence to the conllitution. A deputation amounced this happy crent to the king ; who inmediately eame and congratulated them in a fhort fpeech, which was lcetised with infinite applaufe. The only good effect, however, produced by this tomporary asrecment was, that the fedival of the itth of July, which was ectebratel with the ufual magnificence, pafled oves in tranquillity.

On the \(25^{\text {th }}\) of July, the duke of Branfwick iflued at Coblentz his celchrated manifelo. It declared the purpofe of the intended invafion of France to be the refloration of the l'rench king to full authority. It declared the national grand of France refponfible for the mefervation of tranquillity ; and threatened with the punithonent of death, as rchels to their king, thofe who thoulk appear in ams againft the allied powers. All uren holding offices, civil or military, were threatened in the fane manner, as well as the inlabitants of all citics. 'flhe city of Paris in panticular, and the mational afombly, were declared refponlible for every infult which might lee offered to the royal family. It was cleclared, that if they were not immediately placed in fafety, the allies were refolved to inflict " on thofe who fhould defirve it the moft exemplary and ever memoralle avensing punifhments, by giving up the city of Paris to military exceution, and expofing it to total deftruction; and the rebela who fhould be guilty of illegal refiftance
"thould fuffer the punifments which they frould have deferved." 'This fanguinary and imprudent manifello operated as a warrant for the deftruction of the unfortunate Louis XVI. It left no midelle party in the nation. All who wifhed to preferve freedom in any form, and all who loved the independence of their country, were intantly united. At the fame time, the reproaches caft on the king by the Jacobins now gained univerfil credit. The kings of Pruffia and of Hungary told the French nation, that their monareh was fecretly hoftile to the conflitution; and the refloration of him and his family to defpotic power was made the fole pretence for a tloody and dangerous war.
'The republican party faw the advantage which they had now gained, and refolved upon the depolition of the king. "The chief engine which they meant to em ploy in this fervice confifted of about 1500 men, who had come to Paris at the period of the confederation on the tath of July, and therefore called fuderés, and who were alfo fometimes denominated Marfitilcis, from the place from which the greater number of them came. Next to thefe, dependerice was placed in the populace of the fububs of the capital. The defigns of the re1 ublicans were not unknown to the court, and both parties were forming plans of operation. It is faid that the royal party intented that the hiner and his family foruld fudelen'y leave the capital, and proceed to as great a difance as the conflitution permitted. The republicans are faid to have intended to feize the perfon of the kings, and to confine him in the cafle of Vincenues till a national convention thould decide upon his
which can influence the mind of man mult have inclued I. ouls tuwith to be at atiltance from the factious and fanguinary capital. And the fulbfequent conduct of the republicans anthorife us to believe then capable of the wort crime that was haid to their charge.

Various chatges had been brought forward in the affembly againtt La Fayette, and the Sth of Augut was appointed for their difcuffion. In the mean time, on the zel of Augulf, Petion the mayor, at the head of a depuration from the fections of Paris, appoared at the bar, and in a folemn fpeech demanded the depofition of the king. 'lhe difeuftion of the accufation againf Lia J'ayctte was conliderch as a trial of ftrength between the parties: he was acquitted, however, by a majority of nearly 200 ; and the republican party, defpairing of canyines their point by a vote of the national alfembly, refolved to have recourfe to infurection and force.

On the evening of the gth of Ausurt, about 1500 gentemen, officers of the army, and others, repaired to the palace; icfolved to protect the royal family or to die in their defence : added to thefe were 700 Swis gruards, with a body of cavalry amounting to about 1000. Mandat, the conmander of the national guards, a man who was firmly int ached to the conflimtion, had procured \(2 \not+0\) of that hordy and 12 picces of cannon. With fuch a force, it has been generally thought that, by vigorous and fleady councils, the palace, which is a kind of cattle, might have been fuecefffully defended; and what is now called a revolation might have born the name of a rebellion. Meanwhile the affenbly declared its fittings permanent. Petion was at the palace late on the evening of the 9 th. Some apprelienfions were entertained, or pretended to be entertained, for his fafety (for the wlorle of this bufincif was, on the part of the republicans, the mott infernal plot), and a cleputation from the affembly brought him away. At midnight the toçin or alam bell was founded, and th:c duums beat to arms through the city. At this inftant a number of the moft active leaders of the republican party affembled, and elected a new common ceuncil ut commune. The perfons thas irregularly chofen intantly took poffeffion of the common laill, and drove out the lawful members; who, with that weaknefs with which men are apt to frink from flations of sefponfibility in perilons times, readily gave place to the ufurpers. The hew commone feat repeated meffages to N. Mandat, requiring his attendance upon important bufmefs. Ye was occupied in arranging the troops in the beft order around the palace ; but fufpecting nothins, he went to the common hall, and was there attonifhed os find a different allembly from what he expeeted. Ile was abruptly accufed of a plot to maffacre the people, and ordered to prifon; but as lee defeended the tiairs, he was fhot with a pittol, and Santerre was appointed in his ftead to command the national guad.

On this eventful night no perion in the palace went to bed. About fix o'clock in the morning of the soth the king defcended into the gardens to review the troops. He was reccived with fhouts of Vive le roi excepting from the artillery, who thouted Vive la nation. The king returned to the palace, and the multitude contimued to collect. 'The national guard feemed undetermined about what they were to do, as they affembled in didifons near the palace; and lad a fteaty re-

futane iren made from within，it is probable they rion，weuld have joined the royal party．But towards eight oclock M．Roederer procured admittance to the pa－ lace，and told the kinge that armed multitudes were af－ fembling in hoftile array around the Thulleries；that the national guard was not to be depended upon；and that，in cafe of refiftance，the whole royal family would inoft certainly be maflaced．He thesefore advifed the king to feek protection in the hall of the national af－ fembly．With this advice the king，with his ufual fa－ cility of temper，was ready to cumply ；but the queen oppofed with rehemence the humiliat ing propolal．Be－ coning gradually，however，alarmed for the fafety of lee clildren，the gave her cunfont；and the king gind queen，the princefs Elizabeth，with the prince and princefs royal，wont foot to the hall of the affembly． is I am conte hitlor（faid his majefty）to prevent a great crime．Among you，gentlensen，I believe invfiff in fafety：＂By an article of the conflitution the affem－ bly could not dcliberate in prefence of the king．＇lhe royal family were，therefore，placed in in narrow box fe－ parated from the hall by a railing，where they remain－ ed for 14 hours without any place to which they could retire for refrefhment，excepting a very fimall clofet ad－ joining．Here they fat liltening to debates，in which the royal character and office were treated with every mark of infult．

When the king left the palace of the＂Ihuilleriss， he unfortunately forgot to order it to be immediately furrendered．He recollucted this as foon as he rached the afiembly，and fent orders for this purpofe；but it was now too late．＇The infurgents amounted to ：bout 20，000 effective men．They were drawn up in tolera－ ble order by Wefterman a Prufian，and had about 30 pieces of cannon along with them．The gentlemen within the palace，who had aftembled to protect the king＇s perfon，were now difpirited，nnd knew not what part to act．The commander of the Swifs，M．Affry， was abfent，and the captairs knew not what to do；and the national guard had no leader in confequence of the the death of Mandat．Atout nine o＇clock the outer gates were forced open；and the infurgents formed their line
in front of the palace．A bloody combat commenced chiefly between the Marfeillois and the Swifs．After a brave refiftance of about an hour，the Swifs were over－ powered by numbers，and gave way．All of them that could be found in the palace were maffacred；fome even while imploring quarter on their knees．Others efcaped into the city，and were protected by individu－ als．Of this brave regiment，however，only 200 furvi－ ved；but every human being，even the loweft fervants found in the palace，were put to death．The Swifs taken prifoners in various quarters were conducted to the door of the affembly，and taken by a decree under the protection of the ftate．But the fanguinary mulii－ inde infilted upon putting them to inftant death ；and the affembly would，in all probability，have been unable to proteet them，had not the Marfeillois interfered in their favorir．

The fufpention of the royal authority was now de－ creed，and the nation was invited to elect a Convention to determine the nature of its future government．On this uncommon occaiton all Frenchmen of 21 years of ase were declared capable of electing，and of being dected，deputies to the new national Convention．Com－ Vol．XVI．Part I．
miffoners were，in the mean time，fent on the conse evening to cive to the armies a falle and favourable as． count of thefe tranfactions．The ioyal family were fent to the old palace of the Temple in the midit of the city，to remain there under a ftrict guard；and all per． fons of rank who had been attached to them were fei－ zed and committed to the rifferent prifons．

Tho give an idea of the temper of the people of Pr．Blondy ris at this time，it is proper to remark，that at the fame tmoer of infant when the multitude with bloody fury were maf－he le ple facring the menial fervants in tive palace，and conld \＆c． fearcely be reftrained from offering violence to the Swafs tho were made prifoners，they would fufter no aet of pillage to pais unpunithed．Several attomots of this kind were accordingly followed by the intlant death of the criminals．The plate，the jewels，and money found in the Thuilleries were brought to the mational affembly，and thrown down in the hall．One man，whole，drefs and appearance befpoke extreme po－ verty，calt upon the table an lat fuil of gold．－Eu：the minds of thefe men were elevated by enthufiafm；and they conceived themfelves as at this moment the cham－ pious of freedom，and objects of terror to the kings of the earth．

In the mean time，the fituation of France was cx－crit cal ts

 La Fayette had accidentally got fpeedy notice of the lingdu．． events of the loth of Auguf．FIe advifed the magi－ flates of the town of Sudar to imprifon the commifion． ers from the national affembly when they foould arrive there；which was accordingly done．He，at the fame time，publimed an addrefs to his army；calling upon them to fupport the king and the couftitution；but 125 finding that they were not to be depended upon，on the withlraws 19th Auguft he left his camp in the night，accompa－from the niud only by his flaff and a few fervants．They toos fate and the rout of Rochefort in Liege，which was a neutral harace： countiy ；but were met by a party of the eneny，who took them prifuncrs，and they were detained in Prus－ lian and Auftrian dungeons till autumn 1794，when it is faid that La Fayette himfelf made his efeape． The fevere treatment of this man was probally a conti－ derable error in policy on the part of the allics．His fide． lity to his king is very generally admitted；though fome have entertained ftrong fufpicions of his having acted a very bafe part to that unfortunate monarch；and in the Britifl houfe of commons he has heen called an abandon－ ed ruffian．This exprefion is certainly too ftrong．His errors feem to have been thofe of the head rather than of the lieart；and at all events，he fhould have been protecied by the allits if for no other reafon than to encourage fuble－ querit defertionsanong the officers of the repuolicanarmy．

To return from this digreffio：1．The commifioners were foon fet at liberty at＂Sedan，and received with ap－ plaufe by the army of La Fayette．General Arthu： Dillon at fint entered into the fentiments of La Fayette； but the politic Dumourice diverted him from his pur－ pofe，and by this means regained his credit with the Jacobins，and was appointed commander in clicef，The other gencrals，Diron，Montefquien，Kelleman！，and Cuttine，made no oppofition to the will of the na－ tional affembly：

Meanwhile，the combined armies of Auftria and Prufta had entered France．The duke of Drenfwick＇s

Trenct: arny was above 50,000 Arong. General Clairfait had Revodution, joined him with 15,000 Audrians, and a confiderable
1.92.

127 The comlui. ned armics enter Erance in great futce body of Heflans, along with 20,000 French emigrants; amounting in all to 90,000 men. To oppofe thefe, Dumourier had only 17,000 men collected near the point from which the encmy were approaching in Luxembourg. The French emigrants had given the duke of Brunfwick fuch an account of the diftracted fate of the:r own country, and of the pretended difaf. fection of all orders of men towards the ruling faction in Pari:, that no refiftance of any importance was expecied. When the combined troops, confifting cither of fteady Auftrian or Hungarian battalions, or of thofe well difiplined Pruffians which the great Frederick had innered to the bett inilitary difcipline, were reviewed i:a Germany before fetting out on their march, it is faid that the fpectators, among whom the Fronch caufe was not unpupular, beheld them with anxiety and regret, and piticd the unhappy country againf which this irrefiftible force was directed. The foldiers and their officers regarded themfelves as departing for a hunting match, or an excurfion of pleafure; and many of the ufual accommodations of an army were ill attended to, fuch as hofpitals, \&ic. The begiuning of their progrefs into France juflified thefe expectations. Longwy furrendered after a fiege of 15 hours, although well fortified, poffefed of a garrifon of 3500 men , and defended by 71 pieces of cannon. The news of this cvent irritated the affembly fo much, that they decreed, that, when retaken, the houfes of the citizens fhould be razed to the ground ; and, diftruftrul of the officers of the army, they decreed that the municipal officers of a' town flould hereafter have power to controul the deliberations of the council of war. Verdun was next fummoned; and here the municipality compelled the governor M. Beaurepiare to furrender. That officer, difappointed and enraged, thot himfelf dead with a piflol in prefence of the council, and on the 2d of September the Pruffian troops entered the town.

Alarniat Maris on accuunt rif their fucccif.

The news of this fecond capture, and of the approach of the Pruffians, fpread an inftant alarm through Paris. It was propofcd to raife a volunteer army, which fhould fet out immediately to meet the enemy. The common council, which was now led by Rubefpierre, Danton, Marat, and others of the moft fanguinary character, ordcred the alarm-guns to be fired, and the populace to be fummoned to meet in the Champ de Mars to enroll themfelves to march againft the enemy. The people affembled, and either in confequence of a premeditated plan, or, which is not very probable, of an inftantaneous movement, a number of voices exclaimed, that "the domeftic fues of the nation ought to be deftroyed before its foreign enemics were attacked."
329
Parties of armed men proceeded without delay to the prifons where the non-juring clergy, the Swifs officers, and thofe conlined fince the 1oth of Augult on account of praftices againft the ftate, were detained in cuftody. ihey took out the prifoners one by one, gave them a kind of mock trial before a jury of themfelves, acquitted fome few, and murdered the ref. Among thefe laft was the princefs de Lamballe. She was taken from her bed before this bloody tribunal, and maflacred; her head was carried by the populace to the Temple, to be feen by the queen, whofe friend the was.

Thefe maffacres lafted for two days, and upwards of 1000 perfons were put to death. There is fearce any thing in hiftory that can be reprefented as parallel to them; they were committed, it is faid, by lefs than 300 men, in the midft of an immenfe city, which heard of them with horror, and in the vicinity of the national aftembly, which, by going in a body, could have put an end to them. But fuch was the confufion and difnay of thefe two difgraceful days, that no man dared to ftir from his own houfe; and every one belicved that the whole city, excepting his own Atreet, was engaged in maflacre and bloodihed. The metional guards were all ready at their refpestive polts, bit no man directed them to act : and there is too nuch reafon to furpect that Santerre and the chiefs of the commune connived, at lcaft, at the tranfaction.

In the mean time, general Dumouricr was taking Statei the beft meafures to protract the march of the enemy till the army of Kellerman, confifting of \(20,000 \mathrm{men}\) coukd join him from Lorraine, and that of Bournonville from Flanders, amounting to 13,000 ; together with rier. whatever new levies Luckner might be able to fend him from Chalons. The forelt of Argonne extends from north to fouth upwards of 40 miles; it lay directly in the route of the duke of Brunfwick, who muft either force his way acrofs it, or make a circuit of 40 miles by the pafs of Grandpré on the north, or by Barleduc on the fouth. The pafs that lay directly in his route was that of Biefme. After furveying Dillon's pofition here, he left a party of 20,000 men to watch it; and with the main body of his army took the circuitous rout by Grandpré on the north. Here Du- The of mourier waited to receive him, and was attacked on the fians lige him 12 th and \(13^{\text {th }}\) without fuccefs: bur on the \(14^{\text {th }}\), the attack of the Pruflians was irrefiftible, and Dumourier do n 保 retreating, gave up the pafs. On his march he was folo violently preffed by the advanced cavalry of the Pruffians, that his army, at one time, was feized with a panic, and fled before 1500 men ; who, if they lad pulhed their advantage, might have difperfed it. On the 15 th, however, Dumourier encamped at St Menehould, and began to fortify it. Bournonville's army joined Dumourier on the 17th. The duke of Brunfwick formed a plan of attacking Kcllerman before his junction could be completed. That general arrived on the rgth within a milc of Dumourier's cainp; the projected attack took place; the Pruffians manocurred with their ufual coolnefs and addrefs; they attempted to furround Kcllerman's army, but this could not be accomplifhed. The French troops prcferved' excellent order, while the national vivacity was conftantly fhowing itfclf in their fhouts and patriotic fongs: 400 French were killed, and 500 wounded; the lofs of the Pruffians was much greater: and, in the face of. the enemy, Kellerman joined Dumourier at the end of the engagement without oppofition. At the time that the attack was made on the army of Kellerman, an attempt was made to force Dillon's camp at Biefme by the 20,000 men that had been left in its vicinity, but without fuccefs; and this large detachment was thus. prevented from croffing the foreft of Argonne and joining the duke of Brunfivick. It is to be obferved, that in thefe engagements the French owed their fuperiority chiefly to the excellence of their artillery; a circumftance which ferved to convince their enemies that they 8

\section*{\(R\) E V [179] -R E V}

Th had to contert with regular military bodies, and no with undifciplined inultitudes, as they expected.

The duke of Brunfwick encamped his army at La Iun, nuar the camp of Dumourier. And here the sruf- Pruffrans began to be in extreme diftrefo both from ficknefs and famine. No tenptation could induce the inhabitants of the country to carry provitions to the hoftile camp, while at the fanue time the French army was abundantly fupplied.

Bournonville, with a body of 4050 men, intercepted feveral droves of cattle and other convoys of provitions deftined for the Pruffians. The rain fell in torrents, and the roads were uncommonly deep. Expofed to the cold, the moifure, and want of provitions, the Pruffians raffly ate great quantities of the grapes of Champagne. The confequence of this was, that an epidemical diftemper commenced ard fread through the army to fuch an extent, that 10,000 men at one time were unfit for duty: The duke of Brunfwick, however, fill commanded a force much more numerous than that of Dunourier; and he has been much cenfured for not attacking his camp, and forcing him to engage. It has been faid, that the veteran and numerous force which he commanded would have marched to certain victory againf the raw troops that oppofed them; that, having defeated Dumourier's army, there was nothing to oppofe their march to Paris. But the duke of Brunfwick had entered France upon the fuppofition, that in its prefent diffracted ftate no regular army could be bronght into the field againf him, and that the people at large were hoftile to the ruling faction. The contrary of all this had turned out to be true. He found limfelf in the midtt of an hoftile people, and op. pofed by fialful military; chiefs. A defeat in fuch a fituation would have brought certain ruin to his army ; and even the lofs fuftained in the acquifition of a victory might have proved equally fatal. The remains of the French army would not fail to hang upon hisear; and from the difpofition of the people it appeared impofiible to afcertain to what amount that army might be fuddenly increafed. After propofing a truce, therefore, which lafted eight days, he commenced his retreat towards Grandpré, and no advantage was sained over him in the courfe of it. Verdun was retaken by the French on the 12 th of October, and Longwy on the 18 th; the fiege of Thionville was at the fame time raifed. 'That fmall, but Atrong-fortecfs, under the command of general Felix Wimpfen, had held in check an army of 15,000 men.
While the Pruffians were advancing from the northeaft, the Auftrians under the duke of Saxe Tefchen laid fiege to Lifle. The council-gencral of the commune anfivered the fummofis of the befiegers thus, "We have joft rencwed our oath to be faithful to the nation, and to maintain liberty and equality, or to die at our poft. We will not perjure ourfelves." Such was the cant of thefe men who had already perjured themfelves by contributing to overturn the conftitution which they had iepeatedly fworn to defend. The Aufrian batteries began to play upon the town on the 2gth, and were chiefly directed againf that quarter which was inhabited by the lower clafs of citizens, for the purpore of making them mutinous and feditious. This procedure was ill judged. The lower claffes of mankind are always much accuftomed to hardflips, and they go fartheft in
fupport of any enthufiatic principle they lave been Freneh perfuaded to adopt. Accordingly, though a great part Revolution, of the city was reduced to a heap of ruins, the citizens
of Lifle became daily more obttinate. They of Lifle became daily more obitintte. They received each uther into the houfes that were fill ftanding, and every vault and cellar was occupied. Although upwards of \(30,0=0\). red-hot balls and 6000 bombs werc thrown into the city, befides the cforts made by an in:menfe battering train of artillery, yet the lofs bath to the garrifun and people did not exceed \(; 00\) peifons, moft \(n f\) whom were women and children. After a fortnight of fruitlefs labour the Auftrians raifed the fiege.

War had been declared againtt the king of Sardinia War de on account of the threatening appearances exhibited in lare a a that quarter. On the 2oth of Scptember genera gainz the Montefquicu cntered the territories of Savoy, and wassis dinit, received at Chambery and throughout the whole S.roy tacountry with marks of unbounded welcome. On the \({ }^{k c n, ~ \& \&}\) 29th genaral Anfelm, with another body of troops, took poffefion of Nice and the country around it. On the 3oth general Cuftine adranced to Spires, when he found the Avitrians drawn up in order of battle. He attacked and drove them through the city, taking 3000 of them prifoners. The capture of Worms fucceeded that of Spires; Mentz furrendered by capitulation; and Franckfort fell into the hands of the French on the 23d. Out of this laft place, however, they were afterwards driven on the 2 d of December.

On the 20th of September the French National Con- The navertion affembled. It was found to contain men of alltioial concharacters, orders, and ranks. Many diftinguifhed veni fembles, members of the Conflituting Affembly were elected into fembles, it, and alfo feveral that had belonged to the Leegifative Afiembly; even foreigners were invited to become French legiflators. The famous Thomas Paine and Dr Priefley of England were elected by certain departments; but the latter declined accepting. Clonts a Pruffian, whom we formerly noticed as bringing a deputation to the bar of the conflithent affembly, confifting of perfons reprefenting all the nations of the earth, was alfo chofen. The general afpect of the new convention fhowed that the republican party had acyuired a de- \({ }^{2} 36\) elded fuperiority. On the firft day of mecting M. Collotand \({ }^{\text {P }} 36\) eD'Herbois, who had formerly been an actor, afcerded crese the eo the tribune, and propofed the eternal aivalition of roy ternal alooaity in France. The quetion was carricd by acclanaa- royaity in tion, and the houfe adjourned. Meflages were fent to France. all parts of the countiy to intimate the decree, and by the influence of the Jacobins they were everywlere received with applanie. It was next day decreed, that all public acts fhould be dated by the year of the French repoblic; and all citizens were declared cligible to all the vacant offices and places. The rage of republicanifm foon went fo far, that the ordinary titles of Monfieur and Madame were abolifhed, and the appellation of Citizen fubtituted in their ttead, as more fuitable to the principles of liberty and equality. - It nay be remarked, that in this lalt trifing circumftance an attachment to the form of fpeecl to which they had been accufomed appears even in its abolitien: For, al. though the Roman orators addreffed their countrymen when affembled by the honourable appellation ot Cititzens, yet they never, in accolling an individual, called lim Citizen Cato, or Citizen Cxlar, aecording to the moce'e now' adopted in France.

＂＇os return to the inilitary affairs of the new repub－ lie．On the 1 zth of Octuber General Dumourier came to Patis，and was fpeedily fent to commence a winter campaign is the N＂therlands．He fuddenly at－ tacked the Aluitrians at the village of Boffu，and drove them form their ground．On the sth of November he came in lieht of the enemy upon the heights of \(\mathfrak{F}_{-}\)－ maple．Three rows of fortircations arofe above each uther defented by 100 pieces of cannon．Their right was covered by the viliage and a niver，and their left by thick woods．The Frencle were by their own account 30,000 ，whillt oihers with great probability of truth compute them at double that number，and the number （1f the Auftrians was at lealt 20，00＝．At feven in the murning of the following day a heavy cannonade com－ menced on both fides，and at noon a clole attack was determined on by the French，whole right wing was commanded by Generals Bournonville aud Dampierre， and the centre by Generals Egalite（fon to the duke of Crleans who had affumed that name），Stetenboffe， Defporets，and Drouet．The mulic played thepopu－ lar march of the Marfeillois，and the foldiers rufhed on with euthufialm，flouting＂Vive la nation．＂The en－
gagement was warm and bloody；the Frencin wers Fier twice repulled；but their impetintity was at latt irre－Pevolen fittible，and abont two o＇cluck the enemy fled from their laft eutrenchments．The lufs un buth fides was very great，that of the Aulbians amnomting to \(+00=\) ．ithis netory was decilive of the fate of the Netberlands．Mons and lirufels furrendered to 1）umourier ；＇Vournay，Nalines，Chene，and Autwerp， were taken pufefion of by Ceneral Lasourdunnaje： Lonvain and Namur were taken by General Valence； and the whole，Iutrian Nethorlands，Luxembourg anly excepted，fell iato the hands of the lirench：Liege was then on the 2 Sth of Nowember after a fuccefsful engagement，in which the Aultrians lott 5 or 603 men and ain immenfe train of artillery．

France was now in a fituation not nunfual in the hi－ nory of thute mations that cither are Exe；or are at－ tempting in become fo；fuccet．ful in all guarters abrond， but diftracted by factions ar horne．ithe two parties and the in the convention were cirgaged in a Arugede．Which Wrurt daily became more implacable．＂i hee party called the Alumanin did not nefitate about the mature of the me：ans they were to employ to bring ab out the ruin of their antagonits．＂They are even fufpected of lavins，throu rh the medium of Pache the war－minifler，retarded the fupply of the armies，to render the ruling party oflions by want of fucesfs．I＇hey were for sume time，how－ ever，unfurtunate in this reipect ；and the dily news oi victories fupponted with the public the corclit of the Gironditts．A new fubject was therefore fallen uyon， which was the quation，how the dethrosed king was to be difpoled of？The moderate party wifued to fare him；and this was a fulficiont reatun for their anta，\({ }^{\text {on }}\) nits to refolve upun has ruin．A cummittec was ap． printed to grive in a report nuon his conduct．A vari－ tty of atculations were bronght agaiatt him ；and the convention infanoully refolved is act the part of ac－ cufers and of judges．

It was on the ith of December when the ill－fated monarch was ordaced to the bar of the convertion ：the aft of accufation was read，and the king was fummon－ ed by the prelident，Larreie，to anfwer to each feparate charge．

Pref．＂Lonis，the Frencl mation accules you of having committed a multitude of crimes to citablith your tyranny，in deltroying ber freedum Yon，on the 20th of June 1789，attempted the fovereignty of the people，by fufpending the affemblies of their reprefen－ tatives，and expelling them with violence from the places of their fittings．＇This is proved in the procels verbal entered at the Ienais－court of Verfailles by the members of the conttituent affimbly．On the 23 di of June you wanted to dictate laws to the nation；you furrounded their reprefentatives with troops；yout prefented to them two royal declarations，fubverfive of all liberty， and ordered them to feparate．Your own declaration \(3_{2}\) and the minutes of the affembly，prove thefe attempts． What have you to anfwer？＂

Lous．＂No laws were then exifting to prevent me from it．＂

Pref．＂You ordered an army to march againt the citizens of Paris．Your fatellites have thed the bloud of feveral of them，and you would not remove this army till the taking of the baltile and a general infurrectiox announced to you that the people were viztorious．The fpeeches
fpecelies you made on the gith, 12 th , and 14 th of July to the deputations of the con!titsent affembly, fhew what were your intentions; and the maflacres of the "Thuilleries rife in evidence araindt you. - What have you to anfwer ?"

Lonis. "I was mafler at that time to order the troops to march; but I never lad ars intention of needLing bluch."
iscei. "After thefe erents, amd in fpitc of the promifes Which you nade on the 15 th in the conflituent antenbly, and on the 17 th in the town-houte of Paris, you have porfited in yeur projects againtt mational liherty. You lung cluded the cxecutinn of the deerees of the 1, th of Auguft, refpesting the abolition of perfomal fersituhe, the Teucial government, and tythes : yon lonerefuled acknumid ring the nishts of man: you duubled the number of the life-guards, and called the regiment of ilanders tu Veriailes: you permitted, it orgies held belore your cyes, the natiunal coclacie to te trampled under foot, the white cockace to be boitred, and the nation to be flandered. At laif, you reliiered neceflary a fieth infurrection, ocrialioned the death of feveral citizens, and did nor chanae your languase till after \#our guards had been defeated, when you renewed your perfdious promifes. The pronts of thete facts are in your obfervations of the tsth of septem. her, in the decrees of the itth of Augut, in the miuntes of the contitueat afemuly, i.1 the evernts of Verfailles of the 5 th and 6th of Oitober, and in the converfation you bad on the fame day with a cleputation of the confituent afembly, when you told them you wonld enlighten yourfalf with their councilo, and never recede frum them. - What have you to anfwer ?"

Louis. "I have raade the obfervations which I thought jufe on the two firt beeds. As to the cockade, it is falic ; it did not happen in my prefence."

Pref. "You took an cath at the federation of the 14th of July, which you did not keep. Yo's foon sried to corrupt the paiblic opinion, with the afilitance of Talor who acted in Paris, and Miraheau who was to have excited connter-verolutionary movements in the provinces. - What have you to anfwer ?"

Louis. "I do not know what happened at that time; but the wlole is anterior to my acceptanec of the conalitution."

Pref. "You lavihed millions of noney to effeet this woituption, and you would csen ufe popularity as a means of engaving the people. Thefe tacts are the refult of a menorial of 'talon, on which you have made your marginal comments in your own hand-writing, and of a litter which Laporte wrote to you on the igth of April; in which, recapitulating a converfation !.e had with Rivarol, he told you, that the millions which you had been prevailed upon to throw away had been productive of nothing. For a long time you had rnedi-
* tated on a plan of efcape. A memorial was delivered to you on the zSth of Ftbatary, which pointed out the means for you to effect it; you appro:e of it by marginal notes. - What have you to anfwet:"

Loui. "I felt no greater p.eafure than that of relieving the needy : this proves no defign."

Fref." On the 28 th a great number of the nobles and nulitary came into ycur appartments in the caltle of the 'I huilleries to favour that efcare: fou wanted to
quit Paris on the teth of April to go to St Claud. What have you to anfwer:"

Trenci
Louis. " Hhis accufation is abfurd."
Sevoiutios?
Pref. "S But the refiltance of the citizens made ro: fonible that their dittruit was great ; you endeavoured to difcald it by communicatimg in the conftituent af\(f\) mily a letter, which you audetfed to the agents of the nation near fureign porers, to amounce to them thesr you had fredy accepted the conftitutional articles, whicit iral been prefented to you; and, notwithllanding. or the zut you took figlot isith a falle palliport. Yoa left behind a proteit ara nit tiefferlf-ane conatitutional articles: you orderci the arisittess to ligen rone of the acts ifued by the liationat Afondly : and you fombade the minifter of juft ce wdeliver up the feals of ftate. The public money was lavilhed to infure the fuccels of this ereaclery, and the public force wzs to protect it \(\boldsymbol{t}_{2}\) mider the orcers of Bouille, who fhorly before had been charged weth the maffacte of Naney, and to wliorn: yoa wrote wa this head, " tulake care of his popularity, becaue it would be of lervice to you." 'Ilecf= facts are proved by the memorial of the \(=3\) dof Febrtary, with maginal comments in yuur owu hand writing: by your ceciaration of the soth of June, whoily in your own hand-writing; br your letter of the 4 th of Suptember 1790 to Bunite: ; and by a note of the later, in which he gives you an account of the ufe he made of 993,0=0 livers, given by you, and employed partly in trepanning the troops who were a elcort you. -What have you io andwer ?"
Iosuis. . I have no knowledeg whatever of the memoriai of the 23 d of Eebruary. As to what relates to my journey to Varennes, I appeal to my deelaration to the commiffaries of the conflituert affenbly at that period."

Pref. "After your detention at Varennes, the exercife of the cxecutive power was for a moment fufpended in your hand; and you again forned a cunfpiracy. On the \(1-\frac{t}{4}\) of July the bluod of citizens was thed is the Champ de Narb. A letter, in your own handwriting, written in 1790 to La Fayette, proves that a criminal coalition fublited letween you and La Fayette, to which Mirabeau acceded. The revifion began under thefe c.uel an'pices; all kin's of corruptions were made ale uf. You have paid for libels, pamphlets, and newf. papers, difigned to rormat the public opinion, to dif. credit the aliggrats, and to fupport the caufe of the emigrants. The regifters of Scpteuil thew what immenfe furs have been made ufe of in thefe liberticide ma. secuvec..- What laze ! ou to anfwer ?"
Louis. "What happened on the 1 the of July has: nothing at ail to do with me. I know notinug of it."
\(P_{r}, .\). Iou feemed to acerpt the conflitution on the 14 th ef September ; your lpecches aunounced an intention of Supporting it, and jou were bufy in overturning it, ceren befo:e it was completed A convention was entered into at Piluitz on the 24 th of July, between Let poid of Auttria and Frederic-William of Brandenburgh, who pledged themfelves to re-creet in France the ihrone of abfolute monarchy, and you were filent upon this convention till the moment when it was known by all Europe. - What have gou to anfwer:"

Louis. "I made it kuown as foon as it came \(t \mathrm{n}\) my knowledge ; befides, every thing that refers to this fubject concerns the minitite."

\section*{\(R\) I V [ 182 ] \\ \(R\) E V}

French Pref. "Arlcs had hoifted the ftandard of rebellion; ncvolution, you favoured it by fending thrce civil commiffarics, \(\underbrace{1792 .}\) who made it their burinefs not to reprefs the counterrevolutionifts, but to juftify their proceedings. - What have you to anfwer?"

Louis. "The infructions which were given to the commiffaries muft prove what was their mifion; and I knew none of then when the ininilters propufed them to me."

Pref. "Avignon, and the county of Venaifin, had been united with France; you caufed the decrue to be exccuted ; but a month after that time civil wrar defolated that country. The commiffaries you fent thither helped to ravage it. -What have you to anfwer ?"

Louis. "I do not remember what delay has been caufed in the execution of the decree; beffides, this occurrence has no perfonal reference to me; it only con. cerns thofe that have been fent, not thofe who fent them."

Pref. " Nimes, Montauban, Mende, Jales, felt great Thocks during the firlt days of freedom. You did nothing to fiffe thofe germens of counter-revolution till the moment when Sailiant's confpiracy became manifeftly notorions.-What have you to anfwer ?"

Louis. "I gave, in this refpect, all the orders which were propofed to me by the miniters."

Pref. "You fent 22 battalions againlt the Marfeillois, who marched to reduce the counter-revolutionits of Arles. - "What have yon to anfwer ?"'

Louis." I ought to have the pieces referring to this matter, to give a jult anfwer."

Pref. "You gave the fouthern command to Witgenitein, who wrute to you on the 2 If of A pril 1792, Efter he had been recailed: 'A few inftants more, and I thall call around the throne of your Majefty thoufands of French, who are again become worthy of the wifhes you form for their happinefs.' What have you to anfwet ?"

Louis. "This letter is dated fince his recall; he has not been employed fince. I do not recollect this letter."

Pref." "You paid your late life-guards at Coblentz; the regifters of Septenil attelt this; and general orders figned by you prove that you fent confuderable remittances to Bouille, Roehcfort, Vanguyon, Choifeul, Beaupre, Hamilton, and the wife of Polignae. - What have you to anfwer ?"

Louis. "When I firft learned that my life-guards affembled beyond the Rhine, I fopped their pay: as to the relt, I do not remember?"

Pref. "Your brothers, enemies to the flate, caufed the emigrants to rally under their banners: they raifed regiments, took up loans, and concluded alliances in your name : you did not difchaim them; but at the moment when you were fully certain that you could no longer crofs their projects, your intelligence with them by a note, written by Louis Stanifaus Xavier, figned by your two brothers, was conceived in thefe words:
' I wrote to you, but it was by pof, and I could fay nothing. We are two here, who make but one; one in fentiments, ont in principles, one in zeal of Yerving you. We keep filence; becaufe, were we to break it too foon, it would injure you: but we fhall fpeak as foon as we fhall be certain of general fupport, and that moment is riear. If we are fpoken to on the
part of thofe pcople, we fhall hear nothing; but if on your part, we will liften: we fhall parfue our road flraight. It is therefore defired that you will enable us tu fay fomething. Do not fland on ceremonies. Be eafy about your fafcty: we only exift to ferse you; we are eagerly occupied with this point, and all goes on well; even our enemics feel themfelves too much intereffed in your prefervation to commit an ufelefs crime which
would temmate in their own dettruction. Adieu.
> 'Charles Philipfe.'

would temminate in their own deftruetion. Adieu.
'L. S. Xavier and

\section*{"What have you to anfwer?"}

Louis. "I difowned all the proceedings of my brothers, according as the conftitution prefcribed me to do, and from the moment they came to my knowledge. Of this note I know nothing."
Pref. "The foldiers of the line, who were to be put on the war ellablifhment, confifted but of aco,0こ0 men at the end of December, you therefore neglected to provide for the fafety of the llate from abroad. Narbonne required a lery of 50,000 men, but lie flopped the recruiting at \(25,0 \cdot 0\), in giving affurances that all was ready ; yet there was no truth in thefe affurances. Servan propofed after him to form a cannp of 20,200 men near Paris; it was decreed by the legifative aflem. bly ; you refufed your fanction. - What have you to anfwer?"
Louis. "I bad given to the minifters all the orders for expediting the augmentation of the army: in the month of December laft, the returns were laid before the Affembly. If they deceived themfelves, it is not my fault."

Pref. "A fight of patriotifm made the citizens repair to Paris from all quarters. You iffucd a proclamation, tending to ftop their :narch; at the fame time our camps were withont foldiers. Dumourier, the fucceffor of Servau, declared that the nation had neither quef made to the minifter Lajard, when the legiflative affembly wihed to point out the means of providing for the external fafety of the flate, by propofing the levy of 42 battalions. You gave commiffiou to the commanders of the troops to dilband the army, to force whole regiments to defert, and to make them pafs the Rhine, to put them at the difpofal of your brothers, and of Lcopold of Auftria, with whom you had intelligence. 'I his fact is proved by the letter of Tonlougeon, goverror of Franche Comté. What have you to anfwer?'

Loris. "I know nothins of this circumfance there is not a word of truch in this charge."

Pef. "You charged your diplomatical agents to favour this coalition of foreign puwers and your brothers againft France, and cfpecially to cement the peace between Twrkey and Aurtria, and to procure thercby a larger number of troops againt France from the latter. A letter of Choifeul Gouffier, ambaflador at Confantinople, verifics the fact. - What have you to anfwer ?"'
Louis. "M. Choifeul did not fpeak the truth : oo fuch thing has cver been."

Piff. "The Pruflians advanced againft our fror. tiers: your miniter was fummoned oa the 8th of July to give an account of the itate of our political relations ". If they deceived themfelves, it

\section*{R E V}
ench with Prufia; you anfwered, on the Ioth, that ;0,000 ,lut:on, Pruffians were marehing againft us, and that you gave
notiee to the legillative body of the formal acts of the pending hoftilitics, in conformity to the conflitution. -What have you to anfwer ?"

Louis. "It was only at that period I had knowledge of it : all the correfpondence paffed with the minitters."

Pref. "You entrufted Dabancourt, the nephew of Calonne, with the department of war; and fuch has been the fuecefs of your confpiracy, that the poits of Longwy and Verdua were furrendered to the enemy at the moment of their appearance. - What have you to anfwer ?"
Lcuis. "I did not know that Dabancourt was M. Calonne's nephew. I have not divetted the polls. I would not hare permitted myfelf fuch a thing. I know nothing of it, if it has been fo."

Prefo "You have deftroyed our navy - a vaft number of officers belonging to that corps had emigrated; there fearcely remained any to do duty in the harbours; meanwhile Bertrand was granting paffports every day ; and when the legillative body reprefented to you his criminal conduct on the 8 th of Mareh, you anfwered, that you were fatisfied with luis fervices. - What have you to anfwer?"

Louis. "I have done all I could to retain the officers. As to M. Bertrand, fince the legilative aflembly prefented no complaint-againt him that might have put him in a fate of accufation, I did not think proper to turn him out of office."

Pref. "You have favoured the maintenance of abfolute government in the colonies ; your agents fomented troubles and counter-revolutions throughout them, whieh took place at the fame epoch when it was to have been brought about in France, which indicates plainly that your hand laid this plot.- What have you to anfwer:"
Louis. "If there are any of my agents in the colonies, they have not fpoken the truth; 1 had nothing to do with what you have juft mentioned."
Pref. "The interior of the ftate was convulfed by fanaties; you avowed yourfelf their protector, in manifefting your evident intention of recovering by them your ancient power.- What have you to anfwer ?"
Louis. "I cannot anfwer to this; I know nothing of fuelı a project."
Pref. "The legiflative body had paffed a decree on the 29th of January againit the factious priefts ; you fufpended its execution.-What have you to anfwer ?"
Louis. "The conftitution referved to me the free right to refufe my fanction of the deerces."

Pref. "The troubles had inereafed; the minifter deelared, that he knew no means in the laws extant to arraign the guilty. The legiflative body enacted a frefh decree, whicl. you likewife fufpended. - What have you to fay to this?"
[Louis replied in the fame manner as in the preceding charge.]
Pref. "The uncitizen-like conduct of the guards whom the conftitution had granted you, had rendered it neceflary to difband them. The day after, you fent them a letter expreflive of your fatisfaction, and con-

\section*{R E V}
tinued their pay. This fact is proved by the trea- French furer of the civil litt. - What have you to anfwer?" Revolution,

Louis. "I only continued them in pay till frefh
cree."
Pref. "You kept near your perfon the Swifs guards : the conflitution forbade you this, and the legiflative affembly had exprefsly ordained their departure. What have you to anfwer?"

Louis. "I have executed all the decrees that have been enacted in this refpect."

Pref. "You had private companies at Paris, charged to operate movements ufeful to your projects of a counter-revolution. Dangremont and Gilles were two of your agents, who had falaries from the civil lift. The receipts of Gilles, who was ordered to raife a company of 60 men, fhall be prefented to you. - What have you to anfwer ?"

Louris. "I have no knowledge whatever of the pro. jects laid to their charge : the idea of a counter-revolution never entered into my mind."

Pref. "You wihhed to fuborn, with confiderable fums, feveral members of the legifative and conftituent affemblies. Letters from St Leon and others evince the reality of thefe deeds. - What have you to anfwer ?"

Louis. "Severat perfons prefented themfelves with fimilar decrees, but i have waved them "

Pref. "Who are they that prefented you with thofe projects ?""

Louis. "The plans were fo wague that I do not recollicet them now."

Pref. "Who are thofe to whom you gave money?"
Louis. "I gave money to nobody."
Pref. "You fuffered the French name to be reviled in Germany, Italy, and Spain, fince you omitted to demarid fatisfaction for the bad treatment which the French fuffered in thofe countries. - What have you to anfwer !’

Louis. "The diplomatical correfpondence will prove the contrary; befides, this \(::\) as a concern of the minifters."

Pref. "You reviewed the Swifs on the roth of Auguft at five o'clock in the morning ; and the Swifs were the firlt who fired upon the citizens."

Loris. "I went on that day to review all the troops that were affembled about n:e; the conftituted authorities Wiere with me, the department, the mayor, and municipality; I had even invited thither a deputation of the national affembly, and I afterwards repaired into the midt of them with my family."

Pref. "Why did you draw troops to the cafle ?"
Louis, "All the conflituted authorities faw that the cafle was threatened; and as I was a conflituted authority, I had a right to defend myfelf."

Pref. "Why did you fummon the mayor of Paris in the night between the gth and roth of Auguft to the eaftic ?"

Louis." On aceount of the reports that were circulated."

Pref. "You bave caufed the blood of the French to be fhed."
Louis. "No, Sir, not I."
Pref. "You authorized Septenill to carry on a.
ironch coniderahie trave in com, fugar, and cofiee, at Fiamdecvilution, burg. 'This fact is proved by a letter of Septenil." 1722.
fouis. "I know nothing of what you fay."

Pre!" "Why did you afixix at ereto on the decree which ordained the formstion of a camp of 20,000 :nen ?"
1. \(0 . \%\) "The conftitution left to me the free right of refufing my finction of the decrees; and even from that period I had demanded the aftemblage of a camp at Soiffons."

Prefitent, addreffing the convention. "The quefions are done with." - (I'o Loonis) -"Louis, is there amy thing that yon wifn to add?'

Lou's. "I requelt a communication of the charges which I have heard, and of the pieces miatine thereto, and the liberty of choofing counfel for my defence.

Valazé, who fat near the bar, prefented and read to I.onis Capet the pieces, viz. The memoir of Laporte and Mirabeau, and fome others, containing plans of a counter-revolution.

Laris. "I difern them."
Valazé next prefented feveral other papers, on which the act of accufation was founded, and afked the king if he recognized them. Thefe papers were the fulluwing:

Vaiaze. "Letter of Louis Capet, dated June 29th 5790, fettling his connections with Mirabeau and La layette to effect a revolution in the emntitution."

Louis. "I referve to mylelf to anfwer the con-tents"-(Valazé read the letter.) -"It is only a plan, in which there is no queftion about a counter-revolation; the letter was not to have been fent."

Valazé. "Letter of Louis Capet, of the 22 d of April, relative to converfations about the Jacubins, about the prefident of the committec of finances, and the committee of domains; it is dated by the hand of Louis Capet."

Louis. "I difown it."
Valazé. " Letter of Laporte, of Thurdday morning, March \(\mathbf{3}\) d, marked in the margin in the hand-writing of Louis Capes with March 3d 1791, implying a pretended rupture between Mirabeau and the Jacobins."

> Lotuis. "I difown it."

Palaze. "Letter of Laporte without date, in his hand-writing, but narked i! the margin by the hand of Louis Capet, containing partieulars refpeeting the laft moments of Mirabean, and exprefling the care that had been taken to conceal from the knowledge of men Tome papers of great concern which had beeal depolited with Mirabeau."

Louis. "I difown it as well as the reft."
Valaze. "Plan of a conftitution, or revition of the ronflitution, ligned La Fayette, addreflied to I.onis Capet, A pril 6th 1790, marked in the margin with a line in his own hand-writing."

Louis. "Thefe things have been blotted out by the conltitution."

Taluzé. "Do you know this writing ?"
louis. "I do not."
Va'asé. "Your marginal comments ?"
Louis. "I do not."
Valnx:". "I.etter of Laporte of the 19 th of April, marked in the margin by Louis Capet April 19. 1721, snentioning a converfation with Rivarol.'
J.amir. "I llifown it."

Yalazé. "Letter of I.aporte, marked Aprit if. Revoluns, 5791 , in which it feems complaints are made of Mira. twau, the abbé Perigord, André, and Beaumetz, who do not feem to acknowledge facrifices made for thei: fakc."

Seuis. "I difuwo it hikewife:"
Talaze: "Letter of Laporte of the 23 d of Febru. ary 1791 , marked and dates? in the handwriting of 1.ours Capet; a memorial annesed to it, wipecting the means of his gaining popularity."
l.onis. "I know neither of thefe pieces."

Falazé. "Severd pieces without hignature, fonnd in the cattle of the ' 3 luilleries, in the gap? which wa; Shut in the walls of the palzes, relating to the expences to gein that popularity."

Prefiden. " lrevious to an cxaminstion on this fubject, I wih to afk a preliminary queftion: Have yos canled a prefs with an iron door to be conltructed in the caltle of the I haillenies, and hadd you your papers lucke? up in that prefs ?"

Lo ris. "I have no knowledge of it whatever."
Lalazé. "Here is a day-book written by Louis Capet himfll, containing the penhons he has granted ont of his coffer from 1776 till 179:, in which are oblerved fome douceurs grianted to Acloque." "

Souis. "This I own, but it contils of charitabic donations which I have made."

Palazé. "Different lilts of fums paid to the Scoteh companies of Noailles, Gramont, Montmurency, and Luxembourg, on the sih of July 179 s ."

Iomis. "This is prior to the epoch when I for" bade them to be paid."

Pref. "Louis, where had you sepofited thole pieces which you own ?"

Loutis. "With my treafucr."
Valaze. "Do you know thele peotion-lits of the life-spuards, the one hundred Swifs, and the king's çuards for 1792 ?"

Lawis. "I do not."
Valazé. "Several pieces relative to the confpiracy of the camp of Jales, the miginals of which are depo. fited among the records of the department of L'Ardiche."
loonis. "I have not the fmalleit knowledge of them."

Valazé. "Letter of Boluilé, dated Mentz, beạ. iner an account of 993,0co livres received of Louis Cdpet."
l.ouis. "I difown it."

Falazé. "An order for payment of : 68,000 livres, figned Lomis, indorfed Le Bonncirs, with a beter atud billst of the fame"

I aut. "I difown it."
Palazi. "I'wo pieces relative to a prefent made to the wife of Polignae, and to Lavauguyon and Choifeul."

Lonif. "I difown them as well as the others."
Falazé. "Here is a note figned by the two brothets of the late king, inentioned in the declaratory ačt"
l.nuis. "I know nothing of it."
\(l_{\text {Palare. " Here are pieces relating to the affair of }}\) Choifeul-Gouflier at. Contlantinople."

Louis. "I have no knowledre of them."

\section*{\(R E V \quad[18 j] \quad R E V\)}
ch Valaze. "Here is a letter of the late king to the tion, bilhop of Clermont, with the anfwer of the latter, of the 6 th of April I791."
Louis. "I difown it."
Preficient. "Do you not acknowledge your writing and your fignet ?"

Louis. "I do not."
Prefident. "The feal bears the arms of France."
Lonis. "Several perfons inade ufe of that feal."
Valazé. "Do you acknowledge this lift of fums paid to Gilles?"

Louis. "I do not."
Valazé. "Here is a memorandum for indemnifying the civil lif for the military penfions; a letter of Dufrefne St Leon, which relates to it."

Louis. "I know none of thefe pieces."
Now: When the whole had been inveftigated in this man-wmi- ner, the prefident, addreffing the king, faid, "I have oun- no other queftions to propofe - have you any thing more to add in your defence :"- " I defire to have a copy of the accufation (replied the king), and of the papers on which it is founded. I alio defire to have a counfel of my own nomination." Barrere informed him, that his two firf requefts were already decreed, and that the determination refpecting the other would be made known to him in due time.

It would have been an excefs of cinelty to refufe a requeft fo reafonable in itfelf; it was therefore decreed that counfel flould be allowed to the king, and his choice fell upòn M. M. Tronchet, Lamoignos Malefherbes, and Defeze; he had previoully applied to M. Target, who excufed himfelf on account of his age and infirmity. On the 26th of December, the king appeared for the laft time at the bar of the convention; and MI. Defeze read a defence which the counfel had prepared, and which was equally admired for the folidity of the argument and the beauty of the compofition.

When the defence was finifhed, the king arofe, and holding a paper in his hand, pronounced in a calm manner, and with a firm voice, what follows: "Citizens, you have heard my defence; I now fpeak to you, perhaps for the laft time, and declare that my counfel have afferted nothing to you but the truth ; my confcience reproaches me with nothing: I never was afraid of having my conduct inveftigated; but I obferved with great uneafinefs, that I was accufed of giving orders for fhelding the blood of the people on the ioth of Auguift. The proofs 1 have given through my whole life of a contrary difpofition, I hoped would have faved me from fuch an imputation, which I now folemnly declare is entirely groundlefs."

The difcuffion was fatally clofed on the 16 th of Ja nuary. After a fitting of near \(3+\) hours, the punihment of death was awarded by a fmall majority of the convention, and feveral of thefe differed in opinion from the reft, refpecting the time when it fhould be inflicted; fome contending that it fhould not be pur in execution till after the end of the war, while others propofed to take the fenfe of the people, by referring the fentence to the primary affenblies.
M. Defere then folemnly invoked the affembly in the name of his colleagues, to confider by what a fmall majority the punifhment of death was pronounced againt the dethroned monarcb. "Do not afflict France (added this cloquent advocate) by a judgment that will appear terrible to her, when five vices only were Vos. XVI. Part \(I\).
prefumed fufficient to carry it." He appealed to eternal Frerch juftice, and facred humanity, to induce the convention Revoluton, to refer their fentence to the tribunal of the people. \({ }^{179.3 .}\) "You have either forgotten or deftroyed (faid the celebrated M. Tronchet) the lenity which the law allows to criminals, of requiring at lealt tworthirds of the voices to contitute a definitive judgment."

The fentence was ordered to be executed in twentyfour hours.

The king and his family had been for fome time kept Ane \({ }^{144}\) exe. feparate from each other ; but he was now allowed to fie cuie.s. them, and to choofe an ecclefiaft:c to attend him. The meeting, and, above all, the fenaration from his fanily, was tender in the cxtreme. On Mionday the ant January, at eight o'clock in the morning, the unfortunate monarch was fummoned to his fate. He afcended the fcaffold with a firm air and ftep. Kaifing his voice, he faid, " Frenchmen, I die imnocent ; I pardon all ny enemies; and may France" - at this inflant the inhuma: Santerre ordered the drums to beat, and the executioners to perform their office. When they offered to bind his hands, he flarted back as if about to refift : but recollected himfelf in a moment, and fubmitted. When the inftrument of death defcended, the priett exclaimed, "Son of St Loutis, afcend to heaven." The bleeding head was held up, and a fer of the populace fhouted Vive la Republique. His body was interred in a grave that was filled up with quicklime, and a guard placed around till it fhould be confumed.

Thus fell Louis XVI. He poffeffed from nature Character a good undertanding, which, however, was blunt- of this uro ed by the carly indulgences of a court. He had a mocarcho frong feafe of jultice, and his humanity was perhaps extreme. One defect rendered his virtues of little value, which was the puffenion of an irefolute and unfteady character. Unambitious, and eafly advifed, he was without difficulty induced to change his purpofes, efpecially by his queen, whofe connection with the houfe of Auftria had always tended to render his counfels umpopular. Whether he was or was not connected with the foreign invaders of his country, pofterity mult decide; but all men of fenfe and moderation muft be convinced that he was murdered by a band of ruffians. Indeed a fentence fo infamous, and in all relpects unjuft, is not to be found in the records of hiftory. The greater part of the charges brought again!t hinn were trifing. Thofe which feen to be of importance relate to conduct authorized by the contitution under which he acted; and that conftitution declared his perfon inviolable. The feverelt punifhnent that he could incur by law, was not death, but depofition; and there is no doubt, that in putting him to death the French nation broke the focial compact which their reprefentatives made with him. In a political view, this tragical event was injurious to the republican caufe throughout Europe. No man out of Fiance ventured to juitify it ; and in all countries it excited the moft violent indignation againit the rulers of the new republic.

New enemies were now haftening to join the general Rupture \({ }^{\text {ra }}\) league againft France. We do not mean here to enter with cireat into a detail of the political ftruggles that occurred in Britain. any other country, than that in the narrative of whofe revoletion we are now engaged. It will therefore only be neceflary to remark in general, that the Britilh goverment at this time thought itfelf endangered by the propagation of thofe fpeculative opinions which had

French overturned the French monarchy. Almoft all the men Revolution, 1793. of property in the kingdom concurred with the minittry in thinking a war with France neceffary for the purpofe of fecuring the contitution at home. After the soth of Auguft the Eritifininiter had been recalled; but the nex republie ftill luffered the former ambaffa-

547 Grounls ef anatis of The ntlenfible grounds of quarrel on the part of he quare! Great Britain were chielly two the deeree of the 15 th on the part of November 1792 , by which it was truly obferved that of Great Britain。 encouragement to rebellion was he'd out to the fubjects
of every flate, and that war was thereby waged againft every eftablihed government. Of this decree the French executive council gave explanatione, denying the fairnefs of the interpretation put upon it, and alleging, that the intention of the convention was only to give aid to fuch countries as bad already acquired their freedom, and by a declaration of the general will requefted aid for its prefervation. But this explanation cannot be admitted. The decree exprefsly fays, that the French nation will srant affllance to all who wifb to procure liber\(t y\); and when it is confidered what their notions of li. berty are, it cannot be doubted but that their intention was to excite rebellion in foreign nations. 'The fecond point of difpute referred to the opening of the Scheldt. This river runs from Brabant through the Dutch territory to the fea. The Dutch had flut up the mouth of it, and prevented any maritime commerce from being carried on by the people of Brabant by means of the river. To render themfelves popular in Brabant, the French had declared, that chey would open the navigation of the Scheldt. But Great Britain had fome time before bound herfelf hy treaty with the Dutch to affilt them in obftructing this navigation, and now declared to the French, that the project of opening the Scheldt muft be renounced if peace with Great Britain was to remain. The French alleged, that by the law of nations navigable rivers ought to be open to all who refide on their banks; but that the poitt was of no importance cither to France or England, and even of very little importance to Holland; that if the people of Brabant themfelves chofe to give it up, they would make no objection. It has been thought remarkable, that the Dutch gave themfelves no trouble about the matter. They did not alk the affllance of England; and with that coolnefs which is peculiar to their character, the merchants individually declared, that if the Scheldt was opened, they could manage their commerce as well at Antwerp as at Amfterdam. But in all this there is nothing flrange. Among the Dutch were many republicans, who wifhed for the downfal of the ftadtholder. Thefe rejoiced at every thing which diftreffed him, or had a tendency to render his office ufelefs in the eyes of the people. Others, who thought differently, were afraid to fpeak their fentiments, as Dumourier was in their neighbourhood with a victorious army. The refult of the whole was, that \(M\). Chanvelin was commanded by the Britifh goverument to leave this country. 'The French executive council gave powers to another minifler, M. Maret, to negociate, and requefted a paffport Wior decla- for him ; but lee was not fuffered to land. The hanghty red againa republicans having thus far humbled themielves before the king of Fnolans and fladtt. ade of flulad,
the Britif government, at laf, on the ift of Februt ary 1793, on the motion of Briffot, the national convention decreed, among other articles, that "George king of England had never ceafed fiace the revolution
of the Ioth of Augunt 1792 from giving to the Frih French nation proofs of his attachment to the concert Revoion, of crowned heads; that he had drawn into the fame lake the fladtholder of the United Provinces; that, contrary to the treaty of 1783 , the Eurlifh miniftry lad granted protection to the emigrants and others who have openly appeared in arms againfl France; that they have committed an outrage againt the Frenel republic, by ordering the ambaffador of France to quit Great Britain ; that the Englifh have fopped divers boats and vefiels laden with corn for France, whill, at the fame time, contrary to the treaty of 1786 , they continue the exportation of it to other foreign countries ; that to thwart more efficacioully the commercial tranfactions of the republic with England, they have by an act of parliament prohibited the crrculation of affignats. The convention therefore declare, that in confequence of thefe acts of hottility and aggrefion, the Fruch republic is at war with the king of Enroland and the Itadtholder of the United Provinces."

The abfurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who fled from the fury of the convention, muit be obvious to every reader. The convention was itfelf a rebellious ufurpation of the government with which fuch a treaty was made. The prohibition of affignats was certainly contiary to no law, and was fanctioned by every motive of expediency, unlefs the convention could prove that all uations were bound by the law of nature to rifk their own eredit upon the credit of the French republic.

About a fortnight alter this abfurd declaration againft Andi inf Britain, war was likewife dectared againf Spain; and Spain in the courfe of the fummer France was at war with all Europe, excepting only Swifferland, Sweden, Dermark, and Turkey.

In the mean time General Dumourier, who was pro- Progs ceeding ayreeably to his orders, made an attack upon Duerion Holland; but in doing this he difperfed his troops in fuch a manner as to expofe them much to any attack on the fide of Germany. He commanded General Miranda to invelt Maeftricht, while he advanced to block up Breda and Bergen-op-zoom. The firt of thefe places, viz. Breda, furrendered on the 24 th of February; Klundert was taken on the 26 th; and Gertruydenberg on the \(4^{\text {th }}\) of March. But here the triumphs of Dumourier ended. The fieges of Williamftadt and Berren-opzoom were vigorounly but unfuccefffully preffed. On the ift of Mareh General Clairfait having paffed the feated Roer, attacked the French pofts, and compelled them to retreat with the lofs of 2000 men.

The following day the archduke attacked them anew with confiderable fuceefs. On the 3 d the French were driven from Aix-la-Chapelle, with the lofs of 4000 men killed and 1600 taken prifoners.

The fiege of Maellricht was now raifed, and the French retreated to Tongres, where they were alfo attacked and forced to retreat to St Tron. Dimourier here joined them, but did not bring his army alons with him from the attack upon Holland. After fone Nkirnithes a general engagement took place at Neerwinden. It was fought on the part of the French with great obitinacy; but they were at length overpowered by the number of their enemies, and perhaps alfo by the treachery of their commander. This defeat was fatal. The French lof 3000 men, and \(60=0\) 2. immediately

\section*{R E V}
ch immediately" deferted and went home to France. Dumoution, rier continued to retreat, and on the 22d he was again
hits that his retreat mould ot be ferioully inter. rupted. It was now fully agreed between him and the Imperialifts, that while the latter took poffeffion of Conde and Valenciennes, he fhould march to Paris, difolve the convention, and place the fon of the late king upon the throne.

The rapid retreat and fucceffive defeats of General Dumouricr rendered his conduct fufpicions. Commiffioners were fent from the executive power for the purpofe of difcovering lis defigns. They diffembled, and pretended to communicate to him a fcheme of a coun-ter-revolution. He confeffed his intention of diffolving the convention and the Jacobin club by force, which he faid would not exitt three weeks longer, and of reftoring monarchy. On the report of thefe commirfioners the convention fent Bournonville the miniter of war to fuperfede and arreft Dumourier, along with Camus, Blancal, La Marque, and Quinette, as commiffioners. The attempt on the part of thefe men was at leaft hazardous, to fay no more of it ; and the refult was, that on the firt of April Dumourier fent them prifoners to General Clairfait's head quarters at. Tourwith nesit attempted to feduce his amny from their fidelity to the convention; but he fpeedily found that he had much miftaken the character of his troops. Upon the report that their general was to be carried as a criminal to Paris, they were feized with fudden indignation; but when they found that an attempt was making to prevail with them to turn their arms againt their country, their fentiments altered. On the sth of A pril two proclamations were iffued ; one by General Dumourier, and the other by the prince of Saxe Cobourg, declaring that their only purpofe was to reftore the conititution of 1789, 1790, and 1791. Prince Cobourg announced that the allied powers wihed merely to co-operate with General Dumourier in giving to France her conftitutional king and the conftitution fhe had formed for herfelf, declaring, on his word of honour, that he came not to the French territory for the purpofe of making conquefts. On the fame day Dumourier went to the advanced guard of his own camp at Maulde. He there learned that the corps of artillery had rifen upon their general, and were marching to Valenciennes; and he foon found that the whole army had determined to ftand by their country. Seven hundred cavalry and 800 infantry was the whole amount of thofe that deferted with Dumourier to the Auftrians, and many of them afterwards returned.

By the defection of Dumourier, howerer, the whole arny of the north was diffolved, and in part difbanded, in prefence of a numerous, well-difciplined, and vietorious enemy. 'I he Pruffians were at the fame time advancing on the Rhine with an immenfe force, and about to commence the fiege of Mentz. In the interior of the republic more ferious cvils if poffible were arifing. In the departments of La Vendée and La Loire, or the Provinces of Drittany and Poitou, immenfe multitudes of emigrants and other royalits had gradually affembled in the courfe of the winter. Blay profificd to act in the name of Monfieur, as regent of lirance.

\section*{187 ] R E}

About the middle of March they advanced againt Frerch Nantz to the amount of 40,000 . In the beginning Revelution, of April they defeated the republicans in two pitched \(\underbrace{1 / 93^{\circ}}\) battles, and poffeffed themelves of 50 leagues of country. They cven threatened by their own efforts to is6 fhake the new republic to its foundation. On the 8 th Cong isf of of A pril a congrefs of the combined powers affembled the cuns. at Antwerp. It was attended by the prince of Otange hined and his two fons, with his excellency Vander Spiegel, fowers. on the part of Holland; by the duke of York and Lord Auckland on the part of Great Dritain ; by the prince of Saxe Cobourg, Counts Metterinch, Starenberg, and Mercy Dargenteau, with the Pruffian, Spanifh, and Neapolitan envoys. It was here determined to commence active operations againt France. The prince of Cobourg's proclamation was recalled, and a lchcine of conquadt announced.

Commiffioncrs from the convention now fet up the The repube ftandard of the republic anew, and the feattered bat-lican army talions flocked around it. General Dampierre was ap-azzin arpointed commander, and on the \(13^{\text {th }}\) he was able to fembled. refift a general attack upon his advanced pofts. On the 14 th, his advanced guard yielded to fuperior numbers, but on the 15 th was victorious in a long and well-fought battle. On the 23 d the Autrians were again repulfed, and on the rft of May General Dampierre was himfelf repulfed in an attack upon the enemy. On the 8th another engagement took place, in which the French general was killed by a cannon ball. On the 23 d a very determined attack was nade by the allies upon the French fortified camp of Famars, which covered the town of Valenciennes. The French were overcome, and in the night abandoned their camp. In confequence of this the allies were enabled to commence the fiege of Talenciennes; for Condé had been blociaded from the ift of April.

About the fame time General Curtine on the Rhine made a violent but unfuccefsful attack upon the Pruf fians, in confequence of which they were foon emabled 158 to lay fiege to Mentz. The Corfican General Paoli Revole of revolted at this period; and the new republic, affaulted Paoii. from without by the whole Erength of Europe, was undermined by treachery and faction within.

While the country was in a flate verging upon utter State of ruin, parties in the convention were gradually waxing;arkis in more fierce in their animolity; and regardlefs of what France, and was paffing at a diftance, they feemed only anxious for the revoluthe extermination of each other. In the month of tionary triMarch, the celebrated Revolutionary Tribunal was clta-blifned. blithed for the purpole of trying crimes committed a. gaintt the ftate; and the Girondit party, the mildocis of whofe adminittration had contributed nut a little to inereafe the evils of their country, began to fee the neceflity of adopting meafures of fevcrity. Bur the public calamities, which now rapidly follosed each other in fucceffion, wrre aferibed by their countrymen to their imbecillity or perfidy. This gave to the party of the Momtain a fatal adrantage. On the 15 th of April the communes of the 48 fections of Paris prefented a yetition, requiring that the chiefs of the Girondifts therein named arould be irpeached and expelled front the convention. This was followed up on the tit of May by another petition from the fubub of St Antome. The Girondift party in the mean time impeached Marat, bui he mas acquitted by the jury at his mial. Ale Aaz MOUい

\section*{R E V}

Prene's Minuntain, hy the affltance of the Jacobin club, had Revalution, 1793. paracqured a complite propofed the of fore to remove the conventios from the capital ; and to prevent this, the Mnantoin reforsed to make the fame ufe of the people of the capital againt the Girondit party that they had formerly done againf the monarch on the rooh of Aurult. It is unnccellarg to flate in retail anl the tumults that occurred either in l'as or in the convention duriag the remaining part of the month of May. On the 3 sit, at four o'clock in the momines, the toclin was founded, the generale was beat, and the :larm guns fired. All was commotion and terror. The citizens flew to arms, and affembled round the convention. Some deputations demanded a decree of aceufa. tiun againt 35 of its memburs. The day, however, was fpent withour decifion. On the afternoon of the ilt of June an ammed force made the fasne domand. On the 2 d of June this was repeated, the toctin again founded, and an hundred picces of cannon furrounded the national hall. At laft Barrere mounted the uibune. He was confidered as a moderate man, and refpeeted by both parties; but he now artfully deferted the Girondifts. He invited the denonnecd members voluntarily to refign their character of reprefentatives. some of them complied, and the prefident attempted to diflolve the fitting ; but the members were now imprifoned in their own hall. Hemiot, commander of the armed force, compelled them to remain; and the obnoxious deputies, amounting to upwards of 90 in number, were put under arredt, and a decree of demin.

\section*{The Moun-} tuin party get the up. jer haric. ciation againlt them figned.

It is obvious, that on this occafion the libertics of France wore trodden under foot. 'The minority of the national reprefentatives, by the affiftance of an armed force raifed in the capital, compelled the majority to fubmit to their meafures, and took the leading members prifoners. 'I hus the city of Paris affumed to itfelf the whole powers of the French republic ; and the nation was no longer governed by reprefentatives fiecly chofen, hut by a minority of their members, whofe fentiments the city of Paris and the Jacobin club had thought fit to approve of. Human hillory is a mafs of contradictions. Tlie Mountain party came into power by preaching liberty, and by violating its fundanental principles. How far the plea of political neceffity may excufe their conduct, we thall nut venture to decide explicitly. Certain it is, however, that they foon commenced a carcer of the mof terrible encrgy both at home and abroad that is to be found in the ampals of nations.

The frft refult of their victory in the capital was calamitons to the republic at large. Briffot and fome other deputies efcaped, and endeavoured to kindle the
16 f . flames of civil war. In general, however, the influence
of Menty and Valenciennes protected it againft the imfor one of its internal factions to gain an afcendancy, and thereafter to protect its independence. In the mean time, the political enthufinfin of all orders of perfons was fuch, that even the female fex did not efeape its contagion. A young woman of the name of Char-Mararur, lotte Cordé, in the berginning of Jul, came from the derd a department of Calvades to devote her life for what fhe woma thonght the canfe of freedom and of her country. She requelled an interview with Marit, the moil obnoxious of the Monntain party. Having ohtained it, and converfed with him calmly for fome time, fhe fuddenly planged at dagrew in his brealt, and walked carelefsly ont of the houfe. She was inmediately feized and condernied. At the place of execution the behaved with intinitc conllancy, thouting Vive la republique." The remains of Marat were intersed with sreat fplendor, and the convention attended his funeral. His party perhaps devived advantage from the manner of his death, as it feemed to fatten the odious charge of affaffiration upon their antagenits, and gave then the appearance of fuffering in the caufe of liberty. The truth is, that affafination was fanctioned by both parties under pretence of defending the liberties of the republic.

One of the firt acts of the Mountain junto after the ies. their triumph was to finifh the republican conftitution. lican ec io Previows to their fall, the Girondills had brought for- tution ward the plan of a contlitution, chiefly the work of himed Condorcet; but it never was fanctioned by the conven-tain. tion, and was too intricate to be practically ufeful. The new contitution now framed, which was afterwards fanctioned by the nation, but has never yet been put in practice, abolifhes the former mode of electing the reprefentatives of the people through the medium of elecloral affemblies, and appoints them to be chofen immediately by the primary affemblies, which are made to confift of from 200 to 600 citizens, each man voting by ballot or open vote at his option. 'There is one deputy for every 40,000 individuals, and population is the fole bafis of reprefentation. 'The clections take place every year on the ift of May. Electoral affemblies are ftill retained for one purpofe. Every 200 citizens in the primary affemblies name one elector; and an affembly of all the electors of the dcpartment is afterwards held, which clects candidates for the executive council, or minittry of the republic. The legilative body choofes out of this lift of candidates the members of the executive council. One balf of this council is renewed by each legiflature in the laft month of the ferfron. Every law, after it is paffed by the legillative body, is fent to the department. If in more than lalf of the departments the tenth of the primary affemblies of each have not objected to it, it becomes effectual. Trial by jury is eftablifhed. National conventions may be called for altering the conftitution, and \(m u f\) be called, if required by the tenth of the primary affemblies of each department in a majority of the departments.

The publication of this conftitution procured no fmall degree of applaufe to the convention and the Mountain party. The rapidity with which it was formed (being only a fortnight) feemed to caft a juit reproach upon the flownefs of their antagonifts, and it was regarded as a proof of their being decidedly fe-

\section*{R E V}
rious in the caufe of republicanifm. No regard, however, has been paid to it by the convention, which has declared itfelf permanent, nor indeed does it fcem poffible to carry it into exccution.

We have mentioned that Condé was invefted from the beginning of April. It did not yield till the 1 cth of July, when the garrifon was fo much reduced by famine and difeafe, that out of 4000 men, of which it originally confifted, only : 500 were fit for fervice. The eyes of all Europe were in the mean time fixed upon the fiege of Valenciennes. Colonel Moncricff had contended, that batieries ought immediately to be placed under the walls without approaching it ly regular parallels; but the Imperial engineer Mr Ferraris affented, that the work of the great Vanban mult be treated with more refpect ; and his opinion was adopted by the council of war. The trenches were opened on the It th of June. Few fallies were attempted by the garrifon, on account of the fmallnefs of their number. The inhabitants at firt wifhed to furrender; but the riolence of the bombardment prevented their affembling or giving much trouble on that head to Gencral Ferrand the governor. Much of the labour of the fiege confilted of miues and countermines. Some of thefe having been fuccefffully fprung by the allies, the town was furrendered on the 27 th of July by capitulation to the Duke of York, who took poffeflion of it in behalf of the emperor of Germany. The fiege of Mentz was at the fame time going on. It fuffered much from famine. At laff, after an unfuccefsful attempt by the Frencl army on the Rhine for its reliet, Mentz fiurrendered on the 22 d of July.

At the termination of the fiege of Valenciennes it is faid that the allied powers were at a lofs how to proceed next. The Auffrian commanders are faid to have prefented two plans: The firl was to penetrate to \(\mathrm{Pa}-\) ris by the affiltance of the rivers which fall into the Scine ; the other was to take advantage of the confternation occafioned by the furrender of Valenciennes, and with 50,000 light troops to penetrate fuddenly to Paris, while a debarkation fhould be made on the coalt of Brittany to affift the royalits. The propofal of the Britifh miniftry was, however, adopted, which was, to divide the grand army, and to attack Wett Flanders, beginning with the fiege of Dunkirk. This determination proved ruinous to the allies. The French found means to vanquifh in detail that army, which they "uld not encounter when united.

It is faid that the Duke of York was in fecret correfpondence with Omeron the governor of Dunkirk; but he was removed before any advantage could lee taker of his treachery. On the 2.4th of Auruft the Duke of York attackèd and drove the French outpoits into the town, after an action in which the Auftrian General Dalton was killed. A naval armament was expected from Great Britain to co-operate in the fiege, but it did not arrive. In the mean time, a froig republican force menaced the covering army of the allies, which was commanded by General Freytag. He was foon attacked and totally routed. The fiege was raifed. The Britifh loft their heavy cannon and baggage, with feveral thoufand men; and the convention, believing that their General Houchard could have cut off the Duke of York's retreat, tried and esecuted him for this neglect of duty.

189 I \(\quad\) E V
Prince Cobourg and General Clairfait in the mean Fromeh time unfuccefsfully attempted to befiege Cambray and Revo'urion, Bouchain. Quefinoy was, however, taken by Genera! 1793. Clairfait on the isth of September; and here finally terminated for the prefent campaign the fuccefs of the allics in the Netherlands.

A confiderabte part of the French army of the narth took a frong polition near Maubeuge, where they were blockaded by Prince Cobourg; bit upon the 15 th and 1 th of October he was repeatecly attacked by the French troops under General Jourdan, who fucceeded 1 Iouchard. The French had now recovered their vigour. They brought into the field a formidable train of artillery, in which were many \(2-7\) pounders. Conmiffioners from the consention harangued the foldiers, threatened the fearful, and applauded the brave. Crowds of women, without confufion, went through the ranks, diffributing fyirituous iiquors in abundance, and carrying off the wounded. I he attacks were repcated and terrible on both fides; but the Auftrians had confiderably the difadvantage, and Prince Cobourg retired during the night. The French now menaced maritimc Flanders. They took Furnes and befieged Nieuport. A detachment of Britifh troops ready to fail to the Weft Indies were haftily fent to Oltend, and prevented for the prefent the farther progrefs of the French.

Such was the nultiplicity of the events that now occurred in France, that it is difficult to flate the outlines of them with any tolerable perfpicuity. We have already mentioned the extenfive diffenfions that occurred throughout the republic in confequence of the triumph of the Mountain party on the 3 it of May. The department of Calvades was firf in arms againft the convention under the command of General Felix Wimpfen; but before the end of July the infarrection was 167 quicted, after a few flight flirmifhes. But the focdera-I.yens belifm of the cities of Marfeilles, Lyons, and Toulon, ftill fieged by remained. Lyons was attacked on the Sth of Augult the convenby the conventional troops. Several actions followed , tional wich were atended artalen. of the affailants and of the befieged. The city was reduced almoft to ruins; but it held out during the whole month of September. The befieging General Kellerman was removed from his command, on account of his fuppofed inactivity; and the city fursendered on the Sth of Oetober to General Doppet, a man who had lately been a phyfician. Such was the rage of party Unrelent zeal at this time, that the walls and public buillings of in:g charac. Lyons were ordered to be deftroyed, and its nameter of the changed to that of Ville Affranclize. Many humdreds corqueture. of its citizens were dragged to the fcafold on account of their alleged treafonable refiftance to the convention. The victorious party, wearied by the flow operation of the guillotine, at laft deftroycd their prifoners in multitudes, by firing grape-fhot upon them. Such indeed was the unrelenting character of the Mountain at this time, not only here but through the whole republic, that they themfelves pretended not to excufe it, but declared that terror was with them the order of the day.
In the end of July General Cartaux was Sent againft The Maro Marfeilles. In the beginning of Auguft he gainedfeillos oblis fome fucceffes over the advanced foederalift troops. On ged to fubthe 24th he took the town of Aix, and the Marfellois nit.

co:rulitional Iy fubzates in lond U100.1, town and harbour of Toulon entered into a negocia. tion, and fubmitted to the Britifh allniral Lard Hood, under condition that he fhould preferve as a depolit the town and thipping for Louis XVII. and under the ftipulation that he ihould affirt in reforing the conftituLion of 1789 . The fiege of Toulon was commenced by General Cartaux in the beginning of September. It continucd wihout nuch vigour during that and the whole of the fucceeding month. Ncapolitan, Spanifl, and Euglifh troops, were brought by fea to affit in its defence. In the beginning of November, General Cartaux was removed to the connmand of the army in Italy, and General Dugomnier fucceeded him. General O' Hara arrived with reinforeements from Gibrattar, and took upon him the command of the town, under a commiftion from his Britannic majelly On the 3oth of November, the garrifon made a powerful fally to deftroy fome batteries that were crecting upon heights which commanded the city. The French were furprifed, and the allies fucceceded completely in their ohject; but, elated by the facility of their concuett, the allicd troops ruthed forward in purfuit of the flying enemy, contrary to their orders, and were unexpectedly met by a trong French force that was drawn out to protect the fugitives. General O'Hara now came from the city to endeavour to briug off his troops with regularity. He was wounded in the arm and taken prifoner. The total lofs of the allies in this affair was eftiti:ated at nearly one thoufand men. The French had now muftered in full force around Toulon, and prepared for the attack. It was begun on the 19 th of December in the morning, and was chiefly dirtcted againft Fort Mulgrave, defended by the Britifh. This fort was protected by

「7I
Who is at length obliged to evacuate it. an entrenched camp, 13 pieces of canuon, 36 and 24 poundere, \&c. 5 mortars, and 3020 troops. Such was the ardour of affault, that it was carried in an hour, and the whole garrifon was defloyed or taken. The allies now found it impoflible to defend the place; and in the courle of the day embarked their troops, after having fet on fire the arlenal and fhips. A fcene of confulion here enfued, fuch as has not been known in the lintory of modern wars. Crowds of people of every rank, age, and fex, hurried on board the hips, to avoid the vengeance of their enraged countrymen. Some of the inhabitants began to fire upon their late allies; others in defpair were fern plunging into the fea, making a vain effort to reach the hips; or putting an end at once to their own exiftence upon the fhore. Thirty-one fhips of the line were found by the Britifh at 'Toulon; thiirteen were left behind; ten were burnt; four had been previounly fent to the French ports of 13 rett and Rochefort, with 5 coo 1epublicans who could not be trufted; and Great Britain finally obtained by this expedition three thips of the line and five frigates.

On the fide of Spain the war produced nothing of importance ; and in the monntainous country of Piedmont it went on flowly. Nice and Chamberry were fill retained by the French: but more terrible feenes wised. were aciing in other quarters. In La Vendée a moft roy ints in quater of the country the language of the reff of France La Verdée is little unduftood. The peopie were fupcrititious, and kad acguired littie idea of the new opinions that had
were chiefly headed by pric refs, af the empire. They Frencl were chiefly headed by pricits, and regarded their caufe as a religious one. Thcir mode of warfare ufually was, to go on in their orlinary occupations as peaceable citizens, and fuddenly to affimble in immenfe bands, infomuch that at one time they were faid to amount to j jc,0:0 men. They bifieged Nantz and the city of Orleans, and even Paris itfelf was nnt thought altogether fafe from their enterprifes. The war was inconceivably bloody. Neither party gave quarter; and La Vendée proved a dreadful drain to the population of France. On the 2 sth of June, the conventional general Biron drove the royalifts from Lucon; and Nantz was relieved by gencial Beyffer. After fome fuccefs, geateal Wefterman was furprifed by them, and compelled to retreat to Jarthenay, lil the beginning of Auguf the royalifls were defeated by general Rollignol ; but on the 10th of that month, under Cliarette their commander in chief, they again attacked Nantz, but fuffered a repulfe. It would be tedious to give a minute detail of this obfcure but conel war. The royalifts were often defeated and feemingly difperfod, but as often arofe in crowds around the aftonifhed republicans. At latt, however, about the middle of October, they were completely defeated, driven from La Vendée, and forced to divide into leparate bodies. One of thefe threw itfelf into the ifland of Noirmoutier, where they were fubdued; another took the road of Maine and Brittany, where they Aruggled for fome time againft their enemies, and were at laft cut to pieces or difperfed.

The royalits had long expected affitance from EngLand; and an armament under the earl of Moira was actually fitted out for that fervice, but it did not arrive till too late, and returned home without attempting a landing. - The Mountain party always difgraced their fucceffes by dreadful cruelties. Humanity is fhocked, and hifto-cruei ff ry would almoll ceafe to obtain credit, were we to thate the \(A\) mo in detail the unrelenting cruelties which were exercifed tain \(\%\) argainft the unfortunate royalifts, chiefly by Carrier, a deputy from the convention, fent into this quarter with unlimited powers. Multitudes of prifoners were crowded on board veftels in the Loire, after which the veffels were funk. No age nor fex was fpared; and thefe executions were performed with every circumftance of wanton barbarity and infult.

On the fide of the Rhine a great variety of events progit occurred during the months of Augult and September. the a 100 Several engagements at firft took place, in which the the f no French were, upon the whole, fuccefsful. In September, however, Landau was invelled by the combined powers; and it was relolved to make every poffible effort to drive the French from the frong lines of Weiffembours, on the river Lauter. On the \(13^{\text {th }}\) of October, the Auftrian general Wurmfer made a grand attack upon there lines. The French fay that their geaerals betrayed them, and fuffered the lines to be taken almolt without refiftance. The general of the allies confeffed that the lines might have held out for fcreral days. The French retreated to Hagenau, from which thcy were driven on the 1 Sth; and fuffered two other defeats on the 25 th and 27 th. Some of the principal citizens of Stratbourg now fent a private dcputation to gencral Whmfer, offering to furrender the town, to be peeferred a depolit to be reftored to

Lovis
ench Louis XVII. Gcneral Wurmfer refufed to accept of dution, it upon thefe terms, infilting upon an abfolute furrender to his Imperial Majetty. In confequence of the delay occalioned by difagreement, the negociation was difcovered, and the citizens of Strafourg engaged in the plot were feized by St Jutt and Lebas, commifioners from the convention, and brought to the feafold. Prodigious efforts were now made by the French to recover their ground in this quarter. General Irembert was fhot at the head of the army on the gth of November, upon a charge, probably ill-founded, of treachery in the affair of the lines of Weiffembourg, On the 14 th, however, Fort Louis was taken by the allies, not without fufpicion of treachery in the governor. But here the fuccefs of general TYurmfer might be faid to terminate. On the 2 if the republican army drove baek the Auftrians, and penetrated almoft to Hagenau. An ariny from the Mofelle now advanced to co-operate with the army of the Rhine. On the \({ }_{17}\) th the Pruffians were defeated near Sarliruck. Next day their camp at Blificaftel was flormed, and the 30th the French were repulfed with great lofs in two violent attacks made on the duke of Brunfwick ncar Lautern. But it now appeared that the French had come into the field with a deternination to conquer whatever it might coft. Every day was a day of battle, and torrents of blood were fhed on both fides. The allies had the advantare of poffeffing the ground, which, in that quarter, at fuch a late feafon of the year, is very ftrong on account of its inequalities and moraffes. In military fkill, the French officers and thofe of the allies were perhaps ncarly equal ; but the French army was by far the noolt numerous; and although not a match in point of difcipline, yet it derived no fnall fuperiority from the enthufiafm with which the troops were animated. On the 8th of \(\mathbf{1}\) )ecember, under the command of general Pichegru, the French carried the redoubts which covered Hagenau by means of the bayonet.

This modern inftrument of deftruction, againft which no defenfive weapon is employcd, is always moft fuecefsful in the hands of the mof intrepid; and it was now a dreadful engine in the hands of French enthufiafm. The finef troops that ever Europe produced were unable to withftand the fury of the republicans, which feemed only to increafe in proportion to the multitude of companions that they loft. On the 22d the allies were driven with immenfe flaughter from Hagenau, notwithltanding the immenfe works they had thrown up for their defence. The entrenehments on the heights of Reifhoffen, Jauderfhoffell, \&c. were confidered as more impregnable than thofe of Jemappe. ' They were formed by the army of the Mofelle and the Rhine, under generals Hoche and Pichegru. On the 23 d and 24 th , the allies were purfued to the heights of \(W\) Vrotte. On the 26 th, the entrenchments there were forced by the bayonet, after a defperate conflict. On the \(27^{\text {th }}\), the republican army arrived at Weiffembourg in triumph. General Wormfer retreated aerofs the Rhine, and the duke of Brunfwick haltily fell back to cover Mentz. The blockade of Landau, which had lafted four months, was raifed. Fort Loulis was evacuated by the allies, and Kaifernatern, Germerfheim, and Spires, fubmitted to the French.-During this laft month of the year 1.793 , the lofs of men on both Gides
in this quarter was immenfe, and unexampled in the Freach hiftory of modern war. It is even faid that it might Revolution, amount to more than 70,000 or 80,000 men.

Thus far we have attended to the military affairs of \(\overbrace{1.6}\) the republic for fome time paft. Very violent efforts violent efwere in the mean time made at Paris by the new admi- fres of the niftration, eftablifhed under the aufpices of the Jacobin Mruntaia club, and of the party called the Mountain. The new parts. republican conflitution had been prefented to the people in the primary affemblies, and accepted. The bufinefs, therefore, for which the convention was called together, that of forming a conftitution for France, was at an end; and it was propofed that they fhoukl diffolve themfelves, and order a new leginative body to alfemble, according to the rules preferibed by that confitution. This was, no doubt, the regular mode of procedure ; but the ruling party confidered it as hazardous to convene a new affembly, pofeffing only limited powers, in the prefent diftracted tlate of the country. It was indeed obvious, that France at this time flood in need of a dictatorthip, or of a government poffeffed of more abfolute authority than can be enjoyed by one that acts, or even pretends to act, upon the moderate principles of freedom. It was therefore determined that the convention fhould remain undifolved till the end of the war; and that a revolutionary government, to be conducted by its members, hould be eftablifhed, with uncontrouled powers. Committees of its own body were felected for the purpofe of conducting every department of bufinefs. The chief of thefe committees was called the committee of public fafety. It fuperintended all the reft, and gave to the adminittration of France all the fecrecy and difpatch which have been accounted peculiar to a military gevernment, together with a combination of Mill and energy hitherto unknown among mankind. A correfpondence was kept up with all the Jacobin clubs throughout the kingdom. Commifioners from the convention were fent into all quarters, with unlimited authority over every order of perfons. Thus a government poffefed of infinite vigilance, and more abfolute and tyrannical than that of any fingle defpot, was eftablifhed; and the whole tranfactions and refources of the flate were known to the rulers. On the 23d of Auguft, Barrere, in name of the committee of public fafety, procured the French nated decrec to be pafted for placing the Whole requiue of vice " Fron a fer fict vice. "From this moment (fays the decrec) till that when all enemies fhall have been driven from the territory of thre republic, all Frenchmen fhall be in permanent readinefs for the fervice of the army. The young men fall marel to the combat : the married men fhall forge arms, and tranfport the provifions; the women fhall make tents and clothes, and attend in the hofpitals ; the childrea thall make lint of old linen; the old men fhall caufe themfelves to be carried to the public fquares, to excite the courage of the warriors, to pieach hatred againit the enemies of the republic; the cellars fhall be wafhed to procure faltpetre; the faddle-horfes Thall be given up to complete the cavility; the unmarried eitizens, from the age of 18 to 25 , fhall march firt, and none fhail fend a fubflitute: every battalion fhall have a banner, with this infeription, The French nation rifen againf tyrants.". The decree alfo regulates the mode of organizing this mafs. A decree more ty-

\(\underbrace{1793 .}\) lofs whether to regard it as a fubline effiort of a power. ful government, or as a wild proiect which could produce nothing but confufion. The effects of it, however, have been troly terrible. We have already mentioned fome of them in the bloody contelt which necurred upon the Rhine, and Europe was foon deftined
fore the revolutionary tribunal, on the 15 th of OEtO-
Murcer of ber. The charges againft her were very various; but the quect. the chief tendency of them was to prove that the had always heen looftile to the revolution, and had excited all thic efforts that had been made by the court againft it. On the 16 th of October, this beautiful woman, whom furtune once placed fo high, ended her days ons a Ceaffold, after a mock trial, in which no regard was paid either to juttice or decency: She behaved with

1 So much dignity and compofure, and appeared deeply imprefled with a fenfe of religion. The members of the : convention who had been at the head of the Gironditt party, and had either been detained in prifon fince the 3 IIt of May, or feized in the departments to which they had retired, werc afterwards brought to trial. On the 30th of October, 21 of them were executed, riz. Brifiot, Vergniaud, Genfonné, Duprat, Lehardi, Ducos, Fonfrede, Boileau, Gardien, Duchatel, Sillery, Fauchet, Dufriche, Duperret, La Source, Carra, Beauvais, Mainville, Antiboul, Vigée, and I.acaze. Seven-ty-one were fill detained in confinement. The duke of Orlcans was afterwards condemncd, on a charge of having afpired to the fovereignty from the beginning of the revolution. His execution gave fatisfaction to all parties. His vote for the punifhment of death upon the trial of the late king had done him little honour even in the opinion of the Mountain, and had rendered him odious to all the reft of mankind.
The executions of perfons of all ranks, particularly of priefts and nobles, became now fo common, that it would be in vain to attempt to give any detail of them. Every perfon brought before the revolutionary tribunal was condemned as a matter of courfe. The Jacobins feemed infatiable in their thirft after blood, and the people at large appeared to regard their conduct with
183 unaccountable indifference.
Anew table When the human mind is once roufed, its activity of weights extends to every ohject. At this time a new table of weights and meafures was eftablifhed by the convention, in which the decimal arithmetic alone is employ- ed. The court of Spain had the liberality, notwithflanding the war, to fuffer M. Meclain to procced in his operations for meafuring a degree of the meridian in that country. He carried on his feries of triangles from Barcelona to Perpignan ; and from this place the menfuration was continued to Paris. M. de Lambre, and his pupil M. le Francois, alfo meafured a degree of latitude in the vicinity of the metropolis. In all, 12 degrees of the meridian were meafured; of which the mean is 57027 toifes, and by this the univerfal fandard of meafure is calculated. M. M. de Burde and Caffini determined the length of a pendulum that fivings fe-
conds, in vacuo and in a mean temperature at Paris, to Frer be 3 tect and 8,05 lines. M. M. lavoifier and Hauy Revoluy found that a cubic foot of dittilled water at the free. 179 zing point weighs in vacun 70 pounds and 60 gros French weight. We flall infert a table of the meafures and weights now ellablifhed.

\section*{R E V}

A piece of filver coin weighing a centigrave, and a :ion. frane of filver, according to the former ftandard will be worth 40 fols \(10 \frac{3}{5}\) deniers. The milliare, or thoufand metres, is fubflituted for the mile; and the are, for the arpent in land-meafure. The latter two are to each other as 49 to 25. The aftronomical circles with which M. M. de Borda and Caffini made the obfervations, are divided according to this plan. The quadrant contains 100 degrees, and each degree 100 minutes. Hence the minute of a great circle on our globe is equal to a milliare, or new French mile. If, for the reduction of this meafure, we efimate the Paris toife, according to the comparifon made with the fandard kept in the Royal Society of London, at 6.3925 Englifh feet, the milliare or minute will be equal to 1093.633 yards, and the metre 3.280899 feet.

At the fame period a new kalendar was formed. By it the year is made to begin with the autumnal equinox, and is divided into 12 months. Thefe are called Vindemaire, Brumaire, Frimaire, Nivos, Ventos, Pluvios, Germinal, Frorial, Praireal, Meffidor, Fervidor, and Fructidor. The months conifitt of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primidi, Duodi, Tridi, \&c. to Decadi ; and the day of rett is appointed for every tenth day, inftead of the feventli. The day (which hegins at midnight) is diftributed into ten parts, and thefe are decimally divided and fubdivided. Five fupernumerary dayy are added every year after the 30 th of Fructidor. To thefe is given the abfurd appellation of Suns Cullottides, a word horrowed from a term of reproach (Sans cullste), which had often been beftowed on the republican party from the meannefs of their rank and fortune; but which that party now attempted to render honourable and popular. The clildifh folly of this innovation has Ilruck every perfon with furprize, as it can ferve no goond purpofe whatever. It is a wonderful inflance of the waywardnefs of the human mind, which can occupy itfelf one mement with deeds of favage barbarity, and the next withra matter fo unimportant as the artificial divififon of time.

The religion of France had been gradually lofing its influence ; and on the 5 th of Novemher, Gobet bilhop of Paris, along with a great multitude of other ecclefiaftics, came into the hall of the convereion, and folemnly refigned their functions and renounced the Chriflian religion. All the elergymen, whether Proteftant or Catholic, that were menibers of the convention, followed this example, excepting only Gregoire, whom we formerly mentioned as having been one of the firth priefts that joined the Tiers Siat after the meeting of the States General. He had the courage to profefs limfelf a Chrifian, although he faid that the emoluments of his hithopric were at the fervice of the republic. With the acclamations of the convention, it was decreed that the ouly French deities hereafter fuould be Liberty, Equality, Reafon, \&c. and they would feers to have confecrated thefe as a kind of new objects of worhip. What political purpofe the leaders in the convention intended to ferve by this proceeding does not clearly appear; unlefs, perhaps, their object was to render the French manners and modes of thinking fo completely new, that it hould never be in their power to return to the flate from which they had jut emerged, or to unite
Vol. XVI. Part I.

193 J R E V
in intercourfe with the other nations of Europe. The French populace, however, could not at once relinquif en- Revolution tirely the religion of their fathers. The Commune of \(\underbrace{1794 .}\) Paris ordercd the churches to be flumt up, but the Convention found it neceflary to annul this order ; and Robefpierre gained no finall degree of popularity by fupporting the liberty of religious worthip on this oceafion. Hebert and Fabre d'Eglantine, who led the appofite party, haftened their own fall by this ill-judged contempt of popular opinion.
For, now that the republic faw itfelf fuccefful in \(\frac{18}{185}\) all quarters, when the Motutain party and the Jacobins beeween had no rival at home, and accounted themfelves in no the Mounimmediate danger from abroad, they began to fplit into factions, and the fiercelt jealoufes arofe. The Jacobin Club was the ufual place in which their contetts were carried on ; and at this time Robefpierre acted the part of a mediator between all parties. He attempted with great art to turn their attention from private animolities to public affairs. He fpread a report that an invafion of Great Britain was fpeedily to take place. He therefore propofed that the Jacobin Club fhould fet themfelves to work to difcover the vulnerable parts of the Britihn conftitution and government. They did fo: They made fpeeches, and wrote eflays without number. And in this way was the moft ficree and turbulent band of men that ever perhaps exited in any country occupied and amufd for a very confiderable time. What is no lefs fingular, a great number of Britifh fubjects favoured the plans of thefe reforming Atheifts, and, under the fpecions appcllation of the Friends of the People, acted in concert with the French Jacobins.

The winter paffed away in tolerable quietnefs, and no \(\frac{189}{189}\) nilitary enterprife was undertaken either by the allies fiowal acor by the French. On the ift of Fchruary, Barrere knowledge. afferted in the Convention that the confederate powers ment of were willing provifionally to acknowlecke the French lic he repub republic, to confent to a ceffation of hoftilities for twoallics reyenrs, at the end of which a lafting peace fhould be ra. jected by tified by the Frencl! people. But this propofal the the conven. Convention declared it felf deternined to reject, as af-ion. fording to the other nations of Eurupe the means of undernining their new government. In the mean time, vigor us the revolutionary govermment was gradually becoming fate of the more vigorous. Thirty committees of the Convention revolutionmanaged the whole bulinefs of the itate, without fha-ary governring much of the direct executive govermment, which ment. refted in the committee of pullic fafety. Thefe different committees were engared in the utmont varicty of oljects. The ruling party had no competitors for puwer. Without confufion or oppofition, therefore, the moft extenfive plans were rapidly carriid into effect. The Convention was little more than a court in which every project was folemnly regittered. In the lame feffrom 30 decrees would fometimes be paffed upon objects the moft widely different. The finances were under marg one comnittee, at the head of which was Canborn - nem of This comnittee found refources for the moll lavifh ex- the finanpenditure. The affignats were recived as money ce, and throughout the fate ; and thus a paper nill was faid to f mer rehave become more valuable than a nine of gold. Their the nation. credit was fupported by an arlitrary law regulating the maximum or higheft price of all provifions, and by the immenfe mals of wealth which hrad come into the hands of the Convention by feizing the church lands, and by confifcating the property of royalifts, cmigrants, and Bb
perfons

\section*{\(R\) E V}

Fretch perfons condemned hy the revolutionary tribunal. So Revintion, unequally had property been divided under the ancient 1794. unequally had property bect divided under the ancient feven-tenths of the national territory was fuppofed to be in the hands of the public. To this was added the plunder of the churches, conliting of gold and filver faints, and utenfils employed in divine worflip, along with other articles of lefs value; among which may be nentioned the innumerable church belis, which were regaried as fufficient for the manufacture of 15,005 piec:s of canaon. Thefe refources formed a mals of propecty fuch as never was polfeffed by any government.

Other conmmittees were en riged in very different objeets. Highways were contrueted, and canals planned and cut throughout the country. Immenfe manafactories of arms were everywhere eftablifhed. At Paris alone 1 :00 mufkets were daily fabricared, and :00 pieces of cannon calt every month. Public fehools were afliduouny inftituted, and the French language taught in its purity from the Pyrences to the Rhine. The French Convention poffeffed imnicufe refources, and they did not hefitate to lavifh them upon their fchemes. Every fcience and every art was called upon for aid, and the moft accomplifted men in cerery profeffion were employed in giving fplendour to their country. The chemifts, in particular, gave effential aid by the facility with which they fupplied materials for the manufacture of gun-powder; and in return for their fervices, Lavoificr, the greateft of them, fuffered death by a molt iniquitous fentence. Not fewer than 200 new dramatic performances were produced in lefs than two years; the object of which was to attach the people to the prefent order of things. The vigour with which the committees of fubfiftence exerted thenfelves is parricularly to be remarked. As all Europe was at war with France, and as Eugland, Holland, and Spain, the three maritime powers, were engaged in the contelt, it had been thought nat impoffible to reduce France to great diftrefs by famine, efpecially as it was imarined that the country had not refources to fupply its immenfe population. But the prefent leaders of that country aeted with the policy of a befieged garrifon. They feized upon the whole provifions in the country, and carried them to public granaries. They regittered the cattie, and made their owners refponfible for them. They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every diftrict, on ftated occafions, what was abfolutely neceffary for fubfittence, and no more. To all this the people fubmitted; and indeed, throughout the whole of the mixed fcenes of this revolution, the calm judgment of the hiftorian is not a little perplexed. We cannot avoid admiring the patience with which the people at large endured every hardhip that was reprefented as neceflary to the common caufe, and the enthufiaftic energy with which they lavithed their blood in defence of the independence of their country. At the fame time, we mult regard with indignation and difgult the worthlefs intrigues by means of which the fanguinary factions in the Convention and the capital alternately maflacred each other.

During the winter the diffenfions of the Jacohins fill increafed. They were divided into two clubs, of which the new one alfembled at a hall which once belonged to the Cordeliers. The leaders of it were He-
bert, Ronfin, Vincent, and others; but the old fociety 1 1ren retained its alceudency, and Robefpierre was now de- Relown cidedly its leader. - I'his extraordinary man had gradually accumulated in his own perfon the confidence of the people and the direction of the government. As the committees were above the Convention, which was becone little more than a fient court of record, fo the committee of public fafety was above the other committees. Robefpierre was the leader of this ruling com. mittee. Barrere, St Juft, Couthon, and others of its member, only acted a fecondary part. They laboured in the bufinefs of the flate, but the radical power was with Robelpierre. He furounded the members of the Convention with fpies. He was jealous and implacable, and fet no bounds to the fledding of blood. On the 25 th of March he brought to trial the following active Jacobins, who were condemned and executed on the following diy: Hebert, Ronfin, Mamoro, Vincent, Ou Croquet, Koeq, Col. Latumur, M. M. Bourgevis, Mazuel, La Boureau, Ancard, Le Clerc, Proly, Defficux, Anacharfis Cloots, Pereira, Florent Armand, Defcombes, and Debuifon. Not fatisfied with this, on the 2d of April he brougltt to trial nine of thofe who had once been his molt vigorous affociates, Danton, Fabre d'Eflantine, Bazire, Chabot, Philippeaux, Camille Defmoulins, Lacroix, Dehunay d'Angers, Herault de Sechelles, who, along with Wetterman, were executed on the evening of the 5 th.

Still, however, the preparations for the enfuing campaign were proceeding with unahated vigour. "Ihe th committee for melitary affairs, at the bead of which were Carnot, La Fitte, d'Anifi, and othors, was bufy in arranging along the frontiers the immenfe force which pla the requitition had called forth. Plams of attack and \({ }^{\text {all }}\) defence were made out by this commitree; and when approved by the committee of public fafety they were fent to the generals to be executed. On the other fide, the allies were making powerful preparations for another attempt to fubjugate France. The Emperor himfelf took the field at the head of the armies in the Nether. lands. The plan of the campaign is faid to have been formed by the Auftrian Colonel Mack. Welt Flanders was to be protected by a ftrong body of men; the main army was to penctrate to Landrecies, and getting within the line of French frontier towns, it was to cut them off from the interior by covering the country from Maubeuge to the fea. I'he plan was bold. It belongs to military men to judge whetber this was not its only merit. When attempting to put it in execution, the allies mult have been ill informed of the immenfe force which the French were collecting agraint them. Even the town of Lifte alone, which is capable of containing a numerous army within its walls, and which was to be left in their rear, fhould have feemed an infurmountable objcetion to the plan.
On the r6th of April the Autrian, Britifh, and st of Dutch armies aflembled on the heights above Cateau, th lied and were reviewed by the emperor. On the following ar:day they advanced in eight columns againft the French, drove in their whole poits, and penetrated beyond Landrecies; which place the French attempted to relieve, but without fuccefs. The allied army now amounted to 187,000 men, who were difpofed in the following manner; 15,000 Dutch and 15,000 Aultrians, under the prince of Orange and general Latour, formed the

\section*{\(R\) E V [ 195 ] R E V \\ \section*{Jay the}}
1.ch fege of Landrecies; 15,000 Britifn and 19,000 Auftri ation ans, commanded by the duke of York and general Otto, 4. cncamped towards Cambray. The emperor and the prince of Saxe-Cobourg, at the head of 60,000 Aultrians, were advanced as far as Guife; 12,000 Heffians and Auftrians under general Worms were flationed near Douay and Bouchain; Count Kaunitz with 15,000 Auftrians defended the Sambre and the quarter near Maubeuge ; and, laftly, general Clairfait, with 40,000 Auftrians and Hanoverians, protected Flanders from Tournay to the fea; 60,000 Pruffians, for whon a fublidy had been paid hy Great Eritain, were expected in addition to thefe, but they never arrived.

The French now commenced their active operations. On the moming of the 26 th of April they attacked the duke of York near Cateau in great force. After a fevere conflict they were repulfed, and their general Chapuy was taken prifoner. At the fame time they attacked the troops under his Imperial majefty, but werc there alfo repulfed in a fimilar manner; lofing in all 57 picces of cannon. On the fame day, however, general Pichegru advanced from Life, attacked and defeated general Clairfait, took 32 pieces of cannon; and, in the courfe of a few days, made himfelf mafter of Warwick, Menin, and Courtray. On the 2gth of April, the garrifon of Landrecies furrendered to the allies. When this event was known in the convention, it excited a confiderable degree of alarn. It was, however, the laft cffectual piece of fucecfs enjoyed by the allies during this difaftrous campaign. General Clairfait was again completely defeated by Pichegru in a gencral engagement; and it was found neceflary to fend the duke of York to his affiftance. This movement was no doubt unavoidable; but the effect of it was, that it fplit down the allied army into a variety of portions, capable of carrying on a defultory warfare, but unfit for the vigorous objects of conqueft. On the roth the duke of York was attacked near Tournay by a body of the enemy, whom he repulfed; but he was unable to join Clairfait, upon whofe deAruction the French were chiefly bent: for at the fame time that the duke of York was occupied by the attack upon himfelf, Pichegru fell upon Clairfait with fuch irrefifible impetuofity, that he was compelled to retreat in confufion, and a part of his army appears to have fled to the neighbourhood of Bruges. While Pichegru was thus adrancing fuccefsfully in Wef Flanders, general Jourdan advanced in Eaft Flanders from Maubeuge, crofled the Sambre, and forced general Kaunitz to retreat. On the 18 th , however, general Kaunitz fucceeded in repuling the enemy in his turn, and they re-croffed the Sambre with confiderable lofs.

The allies now found that no progrefs could be made in France while general Pichegru was advancing fuccefsfully and occupying Weft Flanders in their rear. The emperor, therefone, withdrew the greater part of his army to the neighbourhood of Tournay, and refolved to make agrand effort to cut off the communication between Courtray and Lifle, thus to prevent completely the retreat of Pichegru. On the night of the 16 th, the army moved forwards in five columns for this purpofe. Clairfait was at the fame time directed to crofs the Lys, to effect a general junction, if poffible, and complete the plan. The attempt during that evening feemed to promife fuccefs; but, in the courfe of next
day, the divifion under the duke of York was over. French powered by numbers and defeated. The \(\pm\) grefs of Recolution, the relt of the columns was flopped, and Clairfait compictely deffated. In the confufion of the day, when attempting to rally the different parts of the divifion which he commanded, the duke of York was feparated from his own troops by a party of the enemy's cavalry, and only efcaped being nade prifoner by the fwiftnefs of his horfc. The plan of the allies being thus frutirated, their army withdrew to the neighbous. hood of 'Toumay.
Pichegru fpecdily attempted to retaliate againf the allies. On the 22 d of May he brought down at day break his whole force againft thcm. The attack was commenced by a heavy fire of artillery, and all the ad. vanced pofts were forced. The engagement foon became general; the attacks were repeatedly renewed on both fides; the whole day was fpent in a fucceffion of obfinate battles. Ali that military fill could do was performed on both fides. The French and the allied foldiers fought with equal courage and equal difcipline. At nine o'clock in the evening the French at laft reluctantly withdrow from the attack. The day on which a vanquifhed enemy flies from the field is not always that on which the vitory is won. In this engagement the French were unfuccefsful in thirir immediate object ; but the weight of their fire, their fteady difcipline, and their violeat ouftinacy of attack, railed their military character high in the eftimation of the officers and foldiers of the allied army. It was foon perceived, that in addition to thefe they poffeffed other advantages. Their numbers were immenfe; they implicitly obeyed their generals; who, being men newly raifed from the rank of fubaltems, as implicitly fubmitted to the directions of the committe of public fafety. A combination of efforts was thus produced whofe operation was not retarded by divided counfels. On the other fide, the numbers of the allies were daily declining; their leaders were in. dependent princes or powerful men, whofe fentiments and interefts were often very hoftile to each other, and their exertions were confcquently difunited.

On the 24th the French again croffed the Sambre, but were driven back with much lofs. On the 27 th an attempt was made to befiege Charleroi, but the prince of Orange on the 3 d of June compelled them to raife the fiege. On the 12 th a dimilar attempt was made, and they were again repulfed. In Weft Flan-He 195, ders, however, Pichegru was fufficiently fiong to com- fiege to mence the fiege of Ypres. He was foon attacked by Ypres, and general Clairfait for the purpofe of relieving it, but without fuccefs. - Ypres was garrifoned by 7000 mcn ; reinforcements were therefore daily fent from the grand army to Clairfait for the purpole of relieving it. It is unneceffary to mention the bloody contefts in which that unfortunate general was daily engaged with the French ; it is fufficient to fay, that they were uniformly unfucceffful, and were the means of wafting, in a great degree, the armies of the allies. Ypres hcld out till the \(17^{\text {th }}\) of June, when it capitulated: and fuch was the difcipline of the French army at this time, that no notice could be obtained, for feveral days, of that crent. In confequence of it and of other events, the duke of York found it neceflary to retreat to Oudenarde; for Jourdan, after Atorming the Auftrian camp

of Betignics, now adranced with fuch Arength upoa Charler is in the eaft that its immediate fall was fcared. As this would have emabled the two French armies to ancircle the whole of Flanders, the prince of Cobourg advanced to its relief. Charleroi furrendered at diicretion on the 25 th. "Ihis circumflance was not known by the prince of Cobourg when he adwanced on the \(2 G\) he to attack ia their eneronchunents the arry that covered the fiege near Fleurus: but the cuvering a:my being by this time reinfurced by the aceeftion of the Eeficgina amy, the alliw wete repulfed. Jourdm thest drew his noen out of their entrenchmeats; atd, fis lus tust, attacked the Aultrians. He was rhee thmes refulled, but was at latt fuccedsful: the lof of the vane onshed anew is faid to lave been protierions: but no regula accus of of thave leen puthithed. 'The trench nọustionalis exafgerated their won luccels, when thes faisi that it amunted in 15,200 ment.
'Ilhe allicn how retmated in all quaters. Nieuport, Ottond, and Bruges, were taken; and 「umrnay, Mome, Oadenarde, and Bruffels, opened their gates. At this hat place the French armies of Exf and Weft Thasers united. Landrecies, Valencienres, Condé, anal Ousfoy, were fruithefly left with garrifons in them. The aliced troups, evacuatior Namur, formed a lise from Antwerp to Liege to protect the country lebiad. The lerench adranced in full force, and atached gereaal Chirfait, eut to pieces half the troop's that now remaned under him, and broke the line. The alliss retreated before them. 'The duke of York was juined by fome troups under the earl of Moira that withirich difficulty hat made their way to him from Oftend; and with thefe and the 1)utch troops he retired to the neighbourhood of Bergen-op-zoom and Brada for :he protection of Holland. The prince-of Cobourg twacuated Liege, croffed the Mæ§e, and placed a garrifon in Maellricht. He foon, however, fent back a part of his troops to the neighbourhood of 'longres; for here, to the aftonifhment of all Europe, the French armics made a voluntary paufe in their career of victory, and ccafed to purlue their retiring foes. Sluys in Dutch Flanders was the only foreign polt that they continued to attack, and it furrendered after a hege of 21 days.
On the Rhine the war was equally fuccefsful on the part of the French. On the 12 th, 13 th, and \(14 t \mathrm{l}\) of fuly, reneated engagements were fought ; in which the Freach enjoyed their ufual fuccefs. They had numerous armies in every quarter. 'Their mode of fighting was to make full preparation for accomplifling their object, and to fight in great bodies day after day till it was obtained. The Palatinate was thus over-run, and Treves taken, by general Michaud. Flanders and the Palativate have always been accounted the granaries of Germany; and both of them, at the commencement of the harveft. now fell into the hands of the French.

During the courfe of this fummer Corfica was fubdued by Great Britain ; and the whole of the French Weft India Inands, excepting a part of Guadaulope, yielded to the Britifh troops under the command of Sir Charles Grey and Sir John Jarvis. On the firt of June the Britifh Icet, under the conmand of earl Howe, gained a moft fplendid vittory over the French fleet to the weftward of Ulhant. The Trench committee of f:fety were bnown to have purchaied in America im-
menfe quantities of grain and other fores. Thefe were embarked on board 160 fail of merchantmen, convoyed R by fix fail of the line. I.ord Howe failed to intercept this valuable convor: The Frenel: fleet failed at the fame time to protest it. On the moming of the 2 sth spler. 1 of May the flects came in hight of each' other. 'Ihe vietor \(f\) Britith admiral had previsully difpatelied fix hips of the l! a the line nader admiral Montegne to intereept the der L. 1 Frencle conso:, whike he thould engrage and detain the dowi grand feet. "The lirench difpateled eisht fail to defeat this attempt. In the courfe of the: 2yth Lord If,we got to vindward of the Fiuch Deet. Fis funce was 25, and theirs was 26 , fail of the lince. The following day he bore duwn upun them, and boke their linc. 'The engagement was une of the fevereft ever fonght. The Trench adminal, in lefs than in homer alter the clofe action commenced in the conter, croudd off with 12 of his fhirs. The Britifl fect was to much difalbled, or feparated, that leseral of the lirench difmatathed fhips got away under fails raied on the fump of their toremalts. Seven fail of the line, however, remained in poffotion of the liritith, and two were unquallionatyly fink. In the meen time, adnatal Montague fell in with the French consuy, but it was now guaved by it titit of the line. As lu could at en. counter fuch a fusce, he returned home, and it was fatc1. conveged into port. 'I hus, by one or thofe contradictons which oo often occur in liuman aftirs, the Britill flect was vicurisus, and the Fronels were lift in fome medfure matters of the fea. As this engagement however tellitied that the britifh feamen lad not lot thair ancient fupariority on their own element, the nation regarded the prefent vict ry as a pledere of its independence, and wery general rejoicings took pace in confequence of it.

In the mean time, the revolutionary fyftem of go- The hid vernment in rae hands of committees of the convencion execirs at Paris, and of committees of the popular feceictics in Par throughout the country, was arrived at its highell perfection, and procceded without uppolition in its fevere and fanguinary meafures.

On the soth of May Madame Elizabeth, fifter of the late king, was faerinced by it in confequence of a decree of the revolutionary tribmal. Multitudes of others of every rank and fex were duily farriñed in a fimilar manner ; the rich in particular were the great objects of perfecution, becaufe the conffifation of their property added to the frength of the ruling powers. But neither ware the poor fafe from the bloody vigilance of fower. this new and fengular government. By the different Robeexecutions Robefpierre had contrived to deltroy every pierrs avowed rival. All the contituted authorities confifted wholly of perfons nominated with his approbation; and as the committees which condueted the bufinefs of the ltate were at his difpofal, his will was irrefiltible throughout the republic. He met with no oppofition in the convention; for that body was no longer the turbulent popular affembly which it had once appeared; it was little more than a nane cmployed to give fome fort of refpectahility to fuch fchemcs as were propofed to it.

Amidft this accumulation, however, of feemingly irrcfiftible authority, Robefpierre was at the brink of ruin. The whole of the old Girondift party was indeed fubdued and filent; but many members of the conven. tion fill remained attached to it. The party of the Mountris

\section*{\(R\) E V}
rench Mountain, by means of whom Robefpierre had rifen not only d:fregarded, but ready at every infant to fall a faerifice to that fyttem of terror which they had contributed to ereet. Even the Jacobins themfelves, though neither timid nor cantious ia the thededieg of blood, began to murmur when ther faw that awful privilege confined exclufuetr withis a feiv kiande, or rather monopolized bv as individual. In this thate thinrs remained tior func time; and it appeared how pufible it is for an i.udivital to govern a quat sation tern whe the whole of that nation is holtile to his puwer. The Eanifhment or imprifoment of all toreigners, which hate long been 1:guroufly prattifed, pevents us from pofiefling much accurate information comerning the intemal flate of Binnce at this petide; bit it is certint, that ore circunnlauce in paticular tended wath to accelerate the fall ot Robeipierve. He hat procued a diecee to be pafied, authonifig the conmitter of pubic fafty ta imprifun at its phalure, ard bring to trial, any nember of the convention. s!l the individuals of that body found themferses placed by this decrec in the bands of a man whofe fevere and lufpicious temper they well knew. Still, however, they were fo much furtomind by fpies, that it wa- digicult to form a party or plan of operations; even the majurity of the committee of public fafety were amonss the number of the difconteated, but they dared not to withtand their chicf. At laft, on the 25 th of July, the convention beran to exhibit figris of agitation. It was underfood, that in the courfe of a few days Robefpierre would faerifice a number of the memlets to his fulpiciuns. On the following day the fitting of the convention was litll more tempeftuons. In a long fpecch Rebefpierre defended his own condues againtt thote who had reproached hina with afpiring to the dictatorthip of Frasce. He attacked the party whom he Ityld Míclerates, as wilhing to uverturn the revolutionary rovernment, and to relinne the feeble fyftem of the Briflutines. The refult of a long debate was, that Rubufierre was apparently victorions, and his fpeecle was ardered to be printed. On tie 27 th the convention appeared ipe for a change: St Joit, a member of the committee of public fafety, in attempting to defend Robefpierre, was repeatectly interrupted ; and Billaud Varrentes 1 toud forward and enumerated the crinies, and prochimet the tyranny, of Robefpierre. The fucech was received with turfis of applaufe. Robefpierre in vain attempted to defond himfelf; he was filenced by fhouts of execration from every part of the hall. Tallien feeonded the former fipeaker in his aecufation. 'The fitting was declared permanent, and a dectee of arreft was paticd againit Rohefpierre and a younger buther of liis, alung wich St Jut, Couthon, and Lebas. Tliefe men left the convention, and found fecurity in the hall of the commune of Paris; where the municipal ufficers agreed to protect and iftand by them. The tocin was founded ; the armed foree was. wider their command; an infurrection was therefore attempted again!t the convention : but the fections of Paris refufed their fupport. Very few of the troops could be collected, and thefe were not firm; the hate tyranny had become odious. The hatl of the commune was therefore fpeedily furrounded; and about three o'clock in the morning of the 28th Robefpierre and his affociates were made prifoners. They had been outlawed
by the convention on account of their reffifance. They were not therefore tried, unlefs for the purpofe of identifying their perfons; and, in the courfe of that day, they were esecuted: 50 of the municipal officers were alfo executed for joining in their rebellion; and in this way a ftorm paffed over, which at one time threatened to involve the French capital in ruin, and filled all Europe with aftonifiment. Thus alfo terminated the career of the moft extraurtinary man that the French revolution had brought forward. His talents were undonbtedly coniderable, and his ambition knew no bounds, lidding defance to the oulimary feeliegs of humanity. Had Dumourier pofleffel his cooinefs and caution, or lad be peffefed the military talents of Dunouaier, the convention would ceitainly have been overturaed, and we foonld bave fen a fecond Crumsell on the throne of lis znurdered fovercign. bited 1.o fimall thange of appearance. Luftead of that of terrur filence which fomiacrly prevailed, all was buifle and to that afe noife ; all accufed cach other. There was no longer mothatraany leader, and these was no formed party. the formertifun. fyitem of terrer was declared to be at an end, and a new fy Item of mocicratifm fucceceded. T1 is was carricd to as great a leieght as the fyftem of terror had formerly been; and all means were taken to render popular the fall of their late tyrant. 'i he commitecs wice organifed anew, and their members urdered to be frequently changed. The correfpondence between the affliated Jacobin cluls was prohibited, and at latt the Jacobin club itfelf was abolifhed. This laut event was accomplifhed with eafe ; and that fociety which had been the great engine of the revolution, was itfelf without refifance overturned. Seventy one deputies of the Gironditt party, who had leen imprifoned fince the 3 ift of May 1793, were fet at liberty. The uame of Lyons was reflored to it. Some of the ageints of Robefpierre were punithed, particulaty the infanous Carrier, whofe cructies in La Vendee we formerly mentioned. Still, however, the convention appeared fo little united and fo little decided with regard to objects of the lirft impurtance, that in all probability they would not have conducted the important fruggle againt the nations of Europe with more fuccefs than the Girondif party had formerly done, if the revolutionary government and the late fyltem of terror had not already accumulated in their hands fuch vall refourcts, and traced out fuch a plan of procedure, as iendered it an cafy mater to preferve their numerous ammies in the tain of fuccefs to which they were now habituated.

The allies in their retreat had left flrong garrifons The French in the Fruch towns which had furreadered to them.towns '1 hefe were Condé, Velencienues, Quefnai, and Lan-frongig drecies. They now furrendered to the republican ar- barrifoned mies with fo little retiltance, that the conduct of the em- iies furren. peror began to be confidered as ambiguous, and he wasder withfufpected of having entered into fome kird of com-out refilspromife with the French. This idea proved erroneous; ance. and as foon as the army which had bctieged thefe towns was able to join the grand army under Pichegru and Jourdan, the operations of the campaign were refumed atter a fufpenfion of almoft two months. The French army divided itfelf into two bodics. One of thefe masder Jourdan advanced againft General Clairfait, who had fucceeded the frince of Cobourg in the conmand.

Frenth in the neighbourhood of Maeftriclit. On the \(1 g^{\text {th }}\) of Revolution, Septeniber the Freneh attacked the whole Autrian r794. Aricht. On that and the follouing day the loffes were nearly equal. On the 17 th the French with 50 pieces of cannon attacked General Kiay in his entrenched 'canip before Maeftricht. M. de Kray was already retiring when General Clairfait arrived with a trong reinforcement, and after a fevere combat the French were once more compelled to retire. On the 18th the French rencwed the attack with tenfold fury upon every part of the Auftrian line, and the whole was competled to fly to the neighbourhood of Aix-la-Chapelle. General Clairfait now chofe a flrong polition on the banks of the Roer, where he even declared it to be his wifh that he might be attacked. But by this time the fpirit of his army was humbled, defertions became numerous, and the want of difcipline was extreme. On the ift of October the French crofled the Maefe and the Roer, and attacked the whole Auftrian pofts from Ruremond down to Juliers. After a bloody engagement, the brave and active, though unfortunate, General Clairfait was compelled haftily to crofs the Rline, with the lofs of 10 or 12,000 men. The French general did not attempt to crofs that river, but one detachment of his arny took poffeffion of Coblentz, while others laid clofe fiege to Venlo and Maeltricht, which

The divifion of the French army, in the mean time, under General Pichegru came down upon Holland, and attacked the allied army under the duke of York between Bois-le-due and Grave. They forced the ad- vanced poft of Boxtel. Lieutenant-general Abercromby was fent to attempt to recover this poft on the 15 th of September, but he found the French in fuch force that he was obliged to retreat. Indeed the French were difcovered to be no lefs than 80,000 ftrong in that neighbourhood. The duke of York was unable to contend againft a force fo fuperior, and retired acrofs the Maefe with the lofs of fomewhat lefs than 1500 men. Pichegru immediately laid liege to Bois-le-duc. On the 3 cth of September, Creveccur was taken, and Bois-letiue furrendered in 10 days thereafter. In it 408 French emigrants were taken prifoners; and thefe, as well as 700 that had been taken at Nieuport, 500 at Sluys, and 1100 at Valenciennes, were all put to death, agreeably to the rigorous law formerly made by the convention. The French now followed the duke of York acrofs the Macfe. Upon this the greater part of the allied army under his royal highinefs croffed the Rhine and took poit at Arnheim. The remaining part of the army followed foon after, and Nimeguen was occupied by the French on the 7 th of November. The duke of Brunfwick was at this time requefted to take the command of the allied army, to protect Holland, if poffible. He came to Arnhein for that purpofe; but after examining the flate of things there, he declined the undertaking. The allicd troops had now fo often fled before their victorious and almoft innumerable enemies, they had fo often been in want of every neceflary, and had been received fo ill by the inhabitants of the countries through which they paffed, among whom the French caufe was extremely popular, that they had loft that regularity of conduct and difcipline which alone can afford a fecure profpeet of fuccels in military affairs.

The French, on the contrary, well received, abounding in every thing, and proud of fighting in a popular caufe, now acted with much order, and fubmitted to the fricteft difcipline. In addition to all thefe advantages, the French leaders had the dexterity to perfuade the world that \(\mathrm{Con}^{210}\) new and unknown arts were employed to give aid to dificipline their caufe. At this period the efelegrapbe was firt of the the ufed for conveying intelligence from the frontiers to french a the capital, and from the capital to the frontiers. (See mict. Telegraphe). Balloons were alfo ufed hy the Fretch during this campaign to procure knowledge of the pofition of the enemy. An engineer afcended with the halloon, which was fuffered to rife to a great height. but prevented from flying away by a long cord. He made plaus of the enemies encampment; and during an attack he fent down notice of every hofile move. ment. In the affairs of men, and more efpecially in military tranfactions, opinion is of more importance than reality. The French foldiers confided in their own oficets as men poffeffed of a kind of omnifcience, while the allicd troops, no doubt, heheld with anxiety a new contrivance employed againft them, whofe importance would be readily magnified by credulity and ignorance. With all thefe advantages, however, after the eapture of Nimegnen, they once more made a halt in their carrier, and abttained from the attack of Holland, which now feemed almoft proftrate before them.
While thefe events occurred in the north, the French Their fue arms were fearcely lefs fuccefsful on the fide of Spain. ceifes in Bellegarde was taken; in the Weftern Pyrenees, Fontarabia furrendered, and alfo St Sebaltian; the whole kingdom of Spain feemed panic Itruck. That feeble government, with an almoft impregnable frontier, and the mot powerful fortreffes, could make little reliftance; and the difficult nature of their country was their only protection. The hiftory of this war is only a hittory of victories on the part of the French. In the Eaftern Pyrenees, on the 17 th of November, the French general Dugommier was killed in an engagement, in which his army was fucceisful. On the 20th of that munth the French again attacked the Spaniards, and routed them by means of the bayonet, without firing a fingle mulket-fhot. Tents, baggage, and cannon, for an army of 50,000 men, fell into the hand of the conquerors, along with a great part of the province of Navarre. Towards the end of the year, an army of 40,000 Spaniards, entrenched behind 80 redoubts, the lahour of fix months, fuffered themfelves to be completely routed; tbeir general count de La Urion was found dead on the feld of batte, and the whole Spanifh artillery was taken. In three days thereafter, the fort Fernando de Figuieres, containing a garrifon of 9107 men, [urrendered, althougb it mounted 171 pieces of cannon, and poffefled abundance of provifions. The French continued their conquelts; Rofas was taken, and the whole province of Catalonia was left at the mercy of the invaders.
The fucceffes of this wonderful campaign were not \({ }^{213}\) yet terminated; and the laft part of them is perhaps the quef of moft important, although no great effort was neceffary Hofland to its execution. The winter now fet in with uncom.complets mon feverity. For fome years paft the feafons of Europe had been uncommonly mild; there had been little froft in winter, and no intenfe heat in fummer. But during the late feafon the weather had long been re-
markaby

\section*{\(R\) E V [ 199 ] R E V}
'rench markably dry till the latter part of harvelt, when there
fell a confiderable, though by no means unufual, quantity of rain. Towards the end of December a fevere froft bound up the whole of the rivers and lakes of Holland. The Wraal was frozen over in the beginning of January; a circumfance which had nut occurred for 14 years paft. Taking advantage of this, the French croffed that river, and with little oppofition feized the important pals of Bommell, which at other feafons is fo flrong by its inundations. The allied army had been joined by 17,000 Auftrians, and had rcceived orders to defend Hollaad to the laft. They did fo, and were fuccefsful in repuling the French for fome days between the Waal and the Leck; but the republican army, amounting to 70,000 men, having at laft advanced in full force, the allied troops were compelled to retire acrofs the Yffel into Wettphalia. In the courfe of their march throughthis defert country, in the midit of fevere froft and a deep fnow, they are faid to have fuffered incredible hardihips, and to have loft a very great number of men. The French, in the mean time, advanced rapidly acrofs the country to the Zuyder fea, to prevent the inhabitants from lying, and carrying off their propetty. On the 16 th of January 1795 , a party of horfe, without refiftance, took poffeffion of Amfterdam. The other towns furrendered at difcretion. In confequence of an order from the States General, the ftrong fortreffes of Bergen-op-zoon, Williamftadt, Breda, \&c. opened their gates to the French. The fleet and the fhipping were fixed by the intenfe frolt in their ftations, and fell a prey to the enemy; who thus, with little effort, made a complete conquett of this populous and once powerful country. The French were well received by the people at large. The power of the Stadtholder had been fupported among them merely by the influence of Pruffia and England. Through hatred to this ofice, which had now become odious chiefly to the mercantile ariftocracy of Holland, they were little attached to their allies, and gave them, during the prefent war, as little fupport as poffible. The Stadtholder and his family now fled to England. The French declared, that they did not mean to make fubjects but allies of the Dutch, and invited them to call together popular affemblies for fettling their own government, under the protection of the Frencb republic.

Thus terminated a campaign, the moft aftonihing, perhaps, that has been knows in the hiftory of mankind. In the courfe of it, even before the conqueft of Holland, the French had taken 2000 pieces of cannon and 60,000 prifoners. After that event, the conquered territories added to them a population of nearly is millions of people. Luxembourg and Mentz were the only places on this fide of the Rhine that refifted them. The former was elofely blockaded, for the purpofe of compelling it to furrender; the latter was feveral tines af. take meafures for procuring peace. The Grand Duke of Tufcany concluded a treaty with the French republic. France itfelf, exhaufted by maffacres, emigrations, and the terrible efforts which it had made, wihed for tranquillity; and the Convention found it neceffary to declare that they were willing to treat for peace with any of the powers of Europe, upon honourable terms.

The frequent changes, however, which have with aftonifhing rapidity taken place in the mode of conducting French affairs, and the difierent principles difplayed hy the diferent factions as they fuccefively got into power, have produced in Great Britain and Auftria a 3 zitain very general perfuafion that no peace concluded with the and dunfia prefent Col cond dithe be bernaii.e preent Convention could either be honourable or per- in a vigo-
manent; and therfore thefe two mighty nations have inus prorefolved to continue the war with redoubled vigour. - fecution of In fupport of the wildom of this refolution, it has been the war. obferved, that the hatred of the Mountain to the Girondifts was fuch, that it would have violated any treaty which had been concluded with them; that whenRobefpierre became all powerful, and terror was the order of the day, all former meafures were changed, and peace or war made wholly fubfervient to the ambitious views of that relentlefs tyrant ; that Tailien, having originally belonged to the Mountain, introdnced the prefent fyitem of moderation, not from principle, but only to 1 econcile the people to his ufurped authority, and the fall of his bloody predeceffor ; that he may fuddenly change his meafures, or be denounced and executed by the influence of fome more daring demagogue, who would again introduce the fyltem of terror; and that in fuch a fate of uncertainty, the only confequence to be expected from making peace at prefent is, that it would furnith the next faction which may gain the afcendancy in France with an opportunity of attacking the allies when lefs prepared to receive them. Sucls reafoning as this has been admitted in the Britih parliament, where a loan of fix millions Sterling has been voted to the Emperor, to enable him to begin the enfuing campaign with an army of 200,000 men. In what manner the war ought to be conducted, it is not for us to fay. The Britilh nation feems to reft its hopes on its fuperiority at fea; and the greateft excrions are 2 Ts making to augment and man the uavy. Bl. we are Concluhere under the neceffity of dropping this fubject, with. Gon. out being able completely to fulit the promife which we made to our readers at the end of the article France. There is as little appearance at prefent of peace, and a fteady government being foon reftored to that diftracted country, as there was at the beginning of the troubles; and there is not the fmalleft probability that the republican conftitution, framed by the Convention, will ladt one year after the diffolution of that afiembly.

In tracing the origin and progrefs of this wonderful revolution, we have confulted evcry work from which we had reafon to look for information, and we have confined ourfelves to a fimple narration of facts, feldom giving way to the reflections which they fuggetted. Our facts, too, have been generally flated from writers who are fuppofed to be not unfriendly to democracy, that they may gain the fuller credit with our own reformers; for in the moft favourable point of view in which thofe facts can be placed, they furnith the ftrongeft objection poffible to all their propofed reformations of the Britifh conititution. If the horrible deeds of darknefs which have been acted on the theatre of France cannot make us contented with the government under which we live, and which has been brought to its prefent flate of perfection, not by the metaphyfical fpeculations of reclufe philofophers, but by obfervation and the practical experience of ages, we flall be confidered by pofterity as a

Revulion people incapable of inftruction, and ripe for the greateft II \({ }^{\text {molds. }}\) miferies in which we may be involved.

REVULSION, in medicinc, turning a flux of hu. mours from one part to another by bleeding, cupping, friction, finapifms, bliters, fomentations, bathings, iffues, fetons, ftrong purging of the bowels, \&c.

REIN (Jan de), an eminent hillory and portrait painter, born at Dunkirk in 1610 . He bad the good fortune to be a difciple of Vandyke, was the firlt performer in his fehool, and was fo attached to his mafler that he followed him to London, where it is thought he continued as long as he lived. In thefe kingdoms he is moltly known by the name of Lang fin. He died in 1678 : and it is imagined that the feareity of his works is occafioned by fo many of them being inputed to Vandyke; a circumttace which, if true, is bejond any thing that could be faid in lis praife.

REYNOI.DS (Sir Jofhua), the celebrated painter, was, on July the 16 hh 1723 , born at Plympion, a fnall town in Devonfhire. His father was minifter of the parith, and alfo matler of the grammar fehool; and being a man of learring and plilantlıropy, he was beloved and refpected by all to whom he was known. Such a man, it will naturally be fuppofed, was affiduous in the cultivation of the minds of his children, among whom his fon Jofnua fhone confpicuous, by difplaying at a very early period a fuperiority of genius, and the rudiments of a correct talle. Unlike other boys, who generally contert themfelves with giving a literal explanation of their author, regardlefs of his beauties or his faults, young Reynolds attended to both thefe, difplaying a happy knowledge of what lie read, and entering with ardour into the fpirit of his author. He difcovered likewife talente for compofition, and a natural propenfity to drawing, in which his friends and intimates thouglit him qualified to excel. Ennulation was a ditinguifhing fature in his mind, which his father perceived with the delight natural to a parent; and defigning him for the church, in which he hoped that his talents might raife him to eminence, he fent him to one of the univerfities.

Soon after this period he grew paffionately fond of painting ; and, iy the pernfal of Richardfon's theory of that art, was deternined to make it his profeftion through life. At his own earnett requeft, therefore, he was reinoved to London; and about the year 1742 became a pupil to Mr Hudfon, wino, though nut himfelf an emineat painter was preceptor to feverals who afterwards excelled in the art. One of the firlt advices which he gave io Mr Repmolds was to copy carefully Gucreno's drawing3. 'Theis was done with luch 隹l,
that many of the copies arefaid to be now preferved in Regnole the cabinets of the curious as the originals of that very great matter.

About the year 1749, Mr Reynolds went to Italy under the aufpices, and in the company, of the late Lord (then Commodore) Keppel, who was appointed to the command of the Britih fquadron in the Mediterranean. In this garden of the world, this magic fcat of the arts, he failed not to vifit the fchools of the great mafters, to ftudy the productions of different ages, and to contemplate with unwearied attention the various beaties which are characteriftic of each. His labour here, as lias been obferved of another painter, was "the labour of love, not the tafk of the hireling ;" and how much he profited by it is known to all Europe.

Having remsined about two years in Italy, and ftudied the languarge as well as the arts of the country with great fuccefs, he returned to England, improved by travel and refined by education. On the road to Lendon from the port where he landed, he accidentally found in the inn where he lodged Johnion's life of Suvage; and was fo taken with the charms of compoftion, and the mafterly delimeation of charater dipplayed in that performance, that, having-begron to read it while leaning with his arm on the chimney-piece, he contiaued in that attitude infenfible of pain till he was hardly able to raife his hand to his head. The admiration of the work naturally led him to feck the acquaintance of its author, who continued one of his fincerelt admirers and warmeft friends, till 1784 , when they were feparated by the froke of death.

The orft thing that diftinguifhed him after his return to his native country, was a full length portrait of Commodare Keppel ; which in the polite circles was fpoken of in tcrms of the higheft encomium, and teftified to what a degree of eminence he had arrived in his profeffion. This was followed by a portrait of Lord Edgecombe, and a few others, which at ance introcuced him to the frrt bufinefs in portrait painting; and that branch of the art he cultivated with fuch fuccefs as will for ever eftablith his fame with all deferiptions of refined fucicty. Having painted fome of the firit-rate beauties of the age, the polite world flocked to fee the graces and the charms of his pencil; and he foon became the moit fahionable painter, not only in Eugland, but in all Europe. Ife has indeed preferved the refemblance of fomany illufrieus charactere, that we feel the lefs regret for his having left behind him fo few hitorical paintings; thonsfly what he has done in that way fhows (a) him to have been qualified to excel in builh departme:its. The only landicape, perhaps, which
(A) As the lovers of painting may with to have a catalogue of this great mafter's nifturical pieces, we fuhjoin the following from the European Magazine, which we have good reafon to beilive accurate, as the cditors of that mifcellany grudge neither tronble nor expence to procure authentic infornation. Sir Jonua's principal hiforical pieces, then, are the following: Hope nurfing Love; Venus chatifins Cupid for having learned to ca:t accounts; Count Ugolino in the dungeon; the calling of Samuel ; Ariadne; a Captain of banditti; Beggar Boy; a Lady in the charaCter of St Agres; Thais; Dionyfus the Areopagite; an infant Jupiter; Marter Crewe in the charater of Henry VIII; the death of Dido; a Child afeep; Cupid fleeping; Covent Garden Cupid; Cupid in the Clouds; Cupids painting; Boy laughing; Mafter Herbert in the character of Bacehus; Hebe; Mifs Meyer in the character of Hebe; Madona, a head; the Black-guard Mercury; a little boy (Samuel) praying; and old Man reading; Love looling the zone of Beauty; the Children in the Wood; Cleo-

\section*{\(R\) E Y [ 2017 R E Y}
oids. he ever paintel, except thofe beautiful and chafte ones which compofe the back grounds of many of his portraits, is "A View on the Thames from Richmond," which in 1784 was exhibited by the Society for Promoting Painting and Defign in Liverpool.

In 1764 Mr Reynolds had the merit of being the firt promoter of that club, which, having long exited without a name, became at laft diftinguifhed by the appellation of the Literary Club. Upon the foundation of the Royal Academy of Painting, Sculpture, and Architecture, he was appointed prefident; and his acknowledged excellence in his profeffion made the appointment acceptable to all the lovers of art. To add to the dignity of this new inflitution, his majefty conferred on the prefident the honour of knighthood; and Sir Jofhua delivered his firf difcourfe at the opening of the Academy on January 2. 1769. The merit of that difcourfe has been univerfally admitted among painters; but it contains fome directions refpecting the proper mode of profecuting their ftudies, to which every ftudent of every art would do well to pay attention. "I would chiefly recommend (fays he), that an implicit obedience to the rules of art, as eftablifhed hy the practice of the great mafters, fhould be exacted from the young ftudents. That thofe models, which have paffed through the approbation of ages, flould be confidered hy them as perfect and infallible guides; as fubjects for their imitation, not their criticifm. I am confident, that this is the only efficacious method of making a progrefs in the arts; and that he who fets out with doubting, will find life finithed before he becomes matter of the rudiments. For it may be laid down as a masim, that he who hegins by prefuming on his own fenfe, has ended his ftudies as foon as he has commenced them. Eivery opportunity, therefore, Mould be taken to difcountenance that falfe and vulgar opinion, that rules are the fetters of genius. They are fetters only to men of no genius; as that armour which, upon the ftrong, becomes an ornament and a defence, upon the weak and mifhapen turns into a load, and cripples the body which it was made to protect."

Each fucceeding year, on the diftribution of the prizes, Sir Jofhua delivertd to the fudents a difcourfe of equal merit with this: and perhaps we do not harard too much when we fay, that, from the whole colleeted, the lover of belles lettres and the fine arts will acquire jufter notions of what is meant by tafte in general, and better rules for acquiring a correct tafte, than from multitudes of thofe volumes which have been profeffedly written on the fubject.
In the autumn of \(1 ; 85\) he went to Bruffels, where
Voz. XVI. Part I.
he expended about L. 1000 on the purchafe of paint- Re:nolje ings, which, having been taken from the different monafteries and religious houfes in Flanders and Germany, were then expofed to fale by the command of the Emperor Jofeph! Gainßorough and he had engaged to paint each other's portrait; and the canvas for both being actually fretched, Sir Jofhua gave one fitting to his diftinguifhed rival; but, to the regret of every admirer of the art, the unexpected death of the latter prevented all further progrefs.

In 1790 he was anxioufly defirous to procure the vacant profefforfhip of perfpective in the academy for Mr Bonomi, an Italian architect; but that artif not having been yet elected, an affociate was of courfe no academician, and it became neceffary to raife him to thufe fituations, in order to qualify him for being a profeffor. Mr Gilpin being his competitor for the afociatefhip, the numbers on the ballot proved equal, when the prefident by his calting vote decided the clection in favour of his friend, who was thereby advanced fo far towards the profeflorhip. Soon after this, an academic feat being vacant, Sir Jofhua exerted all his influence to obtain it for Mr Bonomi ; but finding hinifelf outvoted by a majority of two to one, he quitted the chair with great diffatisfaction, and next day fent to the fecretary of the academy a formal refignation of the office, which for twent \(y\)-one years he had filled with honour to himfelf and his country: His indignation, however, fubfiding, he fuffered himfelf to be prevailed upon to return to the chair, which within a year and a lalf he was again defirous to quit for a better reafon.

Finding a difeafe of languor, occafioned by an en. largement of the liver, to which he had for fome tine been fubject, increafe upon him, and daily expecting the total lofs of fight, he wrote a letter to the academy, intimating his intention to refign the office of prefident on account of bodily infirmities, which difabled him from executing the duties of it to his own fatisfaction. The academicians received this intelligence with the refpectful concern due to the talents ard virtues of their prefident ; and either then did enter, or defigned to enter, into a refolution, honourahle to all parties, namely, tha: a deputation from the whole body of the academy fhould wait upon him, and inform him of their wifh, that the authority and privileges of the office of prefident might be his during his life; declaring their willingnefs to permit the performance of any of its daties which might be irkfome to hins by a deputy.

From this period Sir Jofhua never painted more. The lat effort of his pencil was the portrait of the Honourable Charles James Fox, which was executed in his

Reymolds. ben fyle, and fows that his fancy, his imagination, and his other great powers in the art which he profefled, remained unabated to the end of his life. When the lalt touches were given to this pidure,
"The hand of Reynolds fell, to rife no more."
On Thurfday February the 23 1 1792 , the world was deprived of this amiable man and excellent artit at the age of 68 years; a man than whom no one, according to Johnfon, had paffed through life with more obfervation of men and manners. The following character of him is faicl to be the production of Mr Burke:
"IFis illnefs was long, but borne with a mild and checrful fortitude, withont the lealt mixture of any thing itritalie or querulous, agreably to the placid and even temor of his whole lite. He had from the beginning of his malady a difinct view of his diffolution, which he contemplated with that entire compofare which sothing but the innocence, integrity, and uffeulnec; of his life, and an unaffected fulbmiffion to the will of Providence, could beflow. In this fituation he lad every confolation from fanily tendernefs, which his tenderncis to his fanily had alway's merited.
"Sir Joflua Reynolds was, on very mảny accounts, one of the moll memorable men of his time: He was the firt Englifhman who added the praife of the elegant arts to the other glories of his country. In tafte, in grace, in facility, in lappy invention, and in the richneis and larmony of colouring, he was equal to the great mafters of the renowned ages. In portrait he went besond them ; for he commuricated to that defcription of the art in which Englifh artitts are the molt engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even thole who profeffed them in a fuperior manner did not always preferve when they delineated irdividual nature. His portraits remind the Epectator of the invention of hillory and the amenity of landfcape. In painting portraits, he appears not to be raifed upon that platform, but to dcfcend to it from a higher fphere. His paintings illuftrate his leffons, and his leffons feem to be derived from his paintings.
"He poffefed the theory as perfectly as the pracrice of his art. To be fuch a painter, he was a profound and penetrating phitofoplier.
" In full happinefs of foreign and domctic fame, admired by the expert in art, and by the learned in fcience, couited by the great, careffed by fovereign powers, and celebrated by diftinguifhed poets, his native humility, modelty, and candour, never forfook him, even on furprife or provocation; nor was the leat degree of arrogance or affumption vifble to the moft ferutinizing sye in any part of his conduct or difeourle.
" His talents of every kind-powerful fion nature, and not meanly cultivated in Ictters-his focial vitues in all the relations and all the habitudes of life, rendered him the centre of a very grcat and unparalleled variety
of agreeable focieties, which will be diffipated by his dcath. He had too much merit not to excite fome je\%loufy, too much innocence to provoke any enmity. The lofs of no man of his time can be felt with more finccre, general, and unmixed forrow."

REZAN, or Rezanskot, an ancient town of Ruffia, and capital of a duchy of the fame name, with an archbithop's fee. It was formenly confiderable for its extent and riches; but it was almult ruined by the Tartars in 1568. The country is populous, and was formerly governed by its own princes. E. Long. 42.37. N. Lat. 54. 54.

RHADAMANTHUS, a fevere judge, and king of L.ydia; the pocts make him one of the three judges of hell.

RHAGADES, in medicine, denotes claps or clefts in any part of the body. If feated in the amus, and reccut, the patient mult fit fill, and fit over the feam of warm water. The epulotic cerate may alfo be applied. If the lips of thefe fiffures are callons, they mult be cut or otherwife treated as to become new ulcerations.

RHAMA, or Rama, an incarnate deity of the firtit rank, in Indian mythology. Sir William Jones believes he was the Dionyfos ( A ) of the Greeks, whom they named Bromius, withont knowing why; and Bugenes, when they reprefented him borned, as well as Lyaios and Eleutberios the deliverer, and T riambos or Dy yhy rambos the triumphant. " Molt of thole titles (fays Sir William) were adopted by the Romans, by whom he was called Brumn, Tauriformis, Liber, and Triumphus; and both nations had records or traditionary accounts of his giving laws to men and deciling their contelts, of his improving navigation and commerce, and, what may appear yet more oblervable, of his conquering India and other countries with an army of fatyrs, commanded by no lefs a perfonage than Pan; whom Lillius Giraldus, on what authority I know 11ot, afferts to have refided in Iberia ' when he had returned, fays the learned mythologif, from the Indian war, in which he accompanied Bacchus.' It were fuperfluous in a mere effay to run any length in the parallel between this European god and the fovereign of Ayodhya, whom the Hindoos helieve to have been :a appearance on carth of the preferving power; to have been a conqueror of the highef renown, and the deliverer of nations from tyrants, as well as of his confort Sita from the giant Ravan king of Lanca ; and to have commanded in chief a numerons and intrepid race of thole large monkeys, which our naturalifts, or fome of them, have denominated Indian fatyrs: his general, the prince of fatyrs, was named Hanumat, or "with high cheek bones;" and, with workmen of fuck agility, he foon raifed a bridge of rocks over the fea, part of which, fay the Hindoos, yet remains; and it is probable the feries of rocks to which the Muffulmans or the Portuguelic have given the foolif name of Adam's (it thould be called Ruma's) bridge. Might not this
(1) The learned prefident, whofe death will be lamented by every fehclar, by the orientalift and the divire efpecially, imarines, that this would folly appear from comparing together the Dionyfaca of Nonnus and the Ramayan of Valmic, the firt poct of the Hindons. He adds, that, in his opinion, Rhama was the fon of Cufh, and that he might have citablified the firt regular government in that part of A fia, in which his exploita are faid to lave been performed.

\section*{R H A［ 203 ］R H A}
na，army of fatyrs have been only a race of mountaineers， whom Rama，if fuch a monarch ever exifted，had civi－ lized？However that may be，the large breed of Indian apes is at this moment held in high veneration by the Hindoos，and fed with devotion by the Brahmans，who feem in two or three piaces on the banks of the Gan－ ges to have a regular endowment for the fupport of them：they live in tribes of three or four hundred，are wonderfully gentle（I fpeak as an eye－witnefs），and ap－ pear to have fome kind of order and fubordination in their little 反ylvan polity．＂The feftival of Rhama is held on the gth day of the new moon of Chaitra，on which the war of Lauca is dramatically reprefented，conclu－ eing with an exhibition of the fire crdeal，by which the victor＇s wife Sita gave proof of her connubial fdelity． Among the Hindoos there are a varicty of vely fine dramas of great antiquity on the fory of Rhama．

There are three Rlamas mentioned in the Indian mythology，who，together with Crithna，the darlmg god of the Indian women，are deferibed as youths of perfect beauty．The third Rhama is Criftna＇s elder brother，and is confidered as the eighth Avatar（B），in－ vefted with an emanation of his divine radiance．Like all the Avatars，Rhana is painted with gemmed Ethi－ opian or Parthian coronets；with rays encircling his head，jewels in his ears，two necklaces，cee ftraight and one pendant on his bofom，with dropping gems；gar－ lands of well－difpofed many－coloured flowers，or collars of pearls，hanging down below his waift；loofe man－ thes of golden tiflue or dyed filk，embroidered on the hems with flowers elegantly thrown over one fhoulder， and folded like ribbands acrofs the brealt ；with brace－ lets，two on one arm and on each wrift：all che Avatars are naked to the waits，and uniformly with dark azure fiff，in allufion probably to the tint of that primordial fluid on which Narayan moved in the beginning of time ； but their kirts are bright yellow，the colour of the curious pericarpium in the centre of the water－lily．

RHAMNUS，the buckthorn，in botany：A ge－ nus of the monogynia order，belonging to the pentan－ tria clafs of plants；and in the natural method ranking under the 43 d order，Dunioje．The calyx is tubulous， with five ininute feales furrounding the famina；there is no corolla；the fruit is a berry．There are 27 fpe－ cies；of which the moft remarkable are，

1．The catharticus，or common purging buckthorn， growing naturally in fome parts of Britain．This gıows to the height of 12 or 14 feet，with many irregular branches at the extremities．The leaves are oval－lan－ ccolate，finely ferrated on the edges，their nerves con－ verging together．The flowers grow in clufters，one on each foottalk，white，and in this fpecies divided in－ to four legments：the fruit is a round black berry， containing four fecds．The juice of the berries is a
flrong purgative，and is made ufe of for making the Rhamnus． common fyrup of buckthorn kept in the thops．＇The bark is emetic：the juice of the unripe berries with alum dyes ytllow，of the ripe ones a fine green；the bark alfo dyes yellow．The green colour yielded by the berries，called by the French verde．vefle，is much efteemed by miniature painters．

Of this fpecies there are two varieties，viz．the dwarf buckthorn，a thrub of about a yard high，of a greenifh colour but little fhow；and the long－leaved dwaif buck－ thorn，which is a larger farub，with leaves fomewhat larger，but in other refpects very fimilar to the dwarf buckthorn．

2．The zizyphus is the fpecies in which the lac in． fect forms its cells，and produces the wax called gum．＊Sce \＆ lac．See Lacca．

3．The lotus has the leaves，prickles，flowers，and frut，of the zizyphus or jubeb；only with this diffe－ rence，that the fruit is here round，finaller，and more ludeious，and at the fame time the branches，like thofe of the paliurns，are neither fo much jointed nor crook－ ed．The fruit is in great repute，taltes fomething like gingerbread，and is fold in the markets all over the fouthern diftricts of thefe kingdoms．The Arabs call it aneb esta el feedra．or the jubeb of the feedra；which Olavus Cellius had fo high an opinion of，that he has defcribed it as the dudaim of the feriptures．This fpe－ cies is very common in the Jereede and other parts of Bombay；and has been fuppofed by fome to be the fame plant with that celebrated by Honer for its en． chanting property；though the latter is more generally fuppofed to have been a fpecies of Diospyros（which \(\mathrm{fce})\) ．It is proper，however，to diftinguith between both thefe fhrubs and an herb often mentioned by the ancients under the name of lotus，which Homer men． tions as being fed upon by the horfes of Achilles，and Virgil as proper to increafe the milk of theep（fee Lo－ r•נs）．They are alfo differest from the Egyptian lo－ tus defcribed by Herodotus；for which lee Nem＝ PH在A。

4．The frangula，or berry－bearing alder，is a decidu ous Shrub，a native of England and moft of the north． ern parts of Europe，and affords leveral varieties．

5．The Alpine，rough－leaved frangula，or herry－ bearing alder，is alfo a deciduous fhrub，and native of the Alps．It differs in no refpect from the common fort，except that it has no thorns，and that it will grow to be rather taller，with tough，large，and doubly laci－ niated leaves．The fmooth－leaved Alpine frangula is a variety of this fpecies，with fmooth leaves and of a lower growth．

6．The paliurus，or thorn of Chrift，is a deciduous Ahrub or tree，a native of Palelline，Spain，Portugal， and Italy．It will grow to nearly the height of 14 C c 2
（B）Avatur means the defcent of the deity in his capacity of preferver．The three firit of thefe defeents re－ late to fome flupendous convulfion of our globe from the fountains of the deep，and the fourth exhibits the mi－ roculous punifment of pride and impiety，appearing to refer to the deluge．＇Ihree of the others were ordained fo the overthrow of tyrants or giants．Of thefe A vatars se have mentioned in the text，that Rhama is the ei hth ；Buddha，who appears to have been a reformer of the doctrines contaned in Vedas，is the ninth ：the te＂th Avatar，we are told，is jet to come，and is expected to appear mounted（like the erowned conqueror in i Apocalypfe）on a white horfe，with a fcimeter blazing like a comet to mow down all incomigible and impe－ sut：it offenders who fhall then be on the earth．

\section*{R H A}

Thannias, feet, and is armed with fharp thoms, two of which are Rhan)phaftus. at each joint, one of which is about half an inch long, fraight, and upright ; the other is fcarcely half that
length, and bent backward; and between them is the bud for nest year's floot. June is the time of flowering, and the flowers are fucceeded by a fmall fruit, furrounded by a inembrane. "This plant (fays Hanbury) is undoubtedly the fort of which the crown of thorns for our Blefled Saviour was compofed. The brancles are sery pliant, and the fpines of it are at every joint ftrong and harp. It grows naturally about Jernfalem, as well is in many parts of Judiea; and there is no doubt that the barbarous Jews would make choice of it for their cruel purpufe. But what farther confirms the truth of thefe thorns being then uled, are the ancient pictures of our Bleffed Saviour's crucifixion. The thorns of the crown on his head exactly anfwer to thofe of this tree; and there is great reafon to fuppole thefe were taken from the carlieft paintiugs of the Lord of Life: and even now our nodern painters copy from then, and reprefent the crown as compofed of thefe thorns. Thefe plants, therefore, thould principaly have a fhare in thofe patts of the plantation that are more peculiarly defigned for religious retirement; for they will prove excellent monitors, and conduce to- due reflection on and gratitude to " Him who hat!. loved us, and has wafhed us from our fins," Skc.
7. The common alaternus is an evergreen tree, and native of the fouth of Europe. There are feveral varieties of this fpecies; the moft remarkable of which are the broad leared and the jagged-leaved alaternus, which have all been confounded with the plillyrea.
8. The infectorius, or narrow-leaved buckthorn, is an evergreen fhrub or tree, and native of Spain. It grows to the height of 10 or 12 feet, and fends forth feveral branches from the bottom to the top. They are covered with a blackifh or dark-coloured bark, and cach of them is terminated by a long fharp thorn. The fruit continues on the trees all winter, making a beautiful appearance among the narrow-cluftered leaves at that feafon.
9. The oleoides, or olive-leaved buckthorn, is an evcrgrcen thrub, and native of Spain, and grows to the height of 8 or 10 feet. It fends forth numerous branches, each of which is terminated by a long tharp fipine. The flowers are fmall, of a whitifh green colour, and are fucceeded by round black berries.

RHAMPHASTOS, in ornithology, a genus belonging to the order of picr. The bill is very large, and ferrated outwardly. The noftrils are fituated behind the bafe of the beak; and in molt of the fpecies the feet are toed, and placed two forwards and two hackwards. The tongue is long, narrow, and feathered on the edges. Mr Latham ennmerates is diferent fpecies ; of which the toucans are the molt remarkable, and were formerly divided into four or five varieties, though Mr Latham makes them diftinet feecies, of which we fhall only defcribe that called the red-beaked toucan.

This bird is about the fize of a jackdaw, and of a fimilar fhape, with a large head to fupport its monttrons bill: this bill, from the angles of the mouth to its point, is fix inches and an half; and its breadth in the diokelt part is a little more than two. Its thicknefs
near the head is one inch and a quarter; and it is a little rounded along the top of the upper chap, the un. der fide being round alfo; the whole of the bill extremely light, and a little thicker than parchment. 'The upper chap is of a bright yellow, except on each fide, which is of a fine fcarlet colour; as is allo the lower chap, except at the bafe, which is purple. lletween the head and the bill there is a black live of feparation all round the bafe of the bill; in the upper part of which the noftrils are placed, and are almon covered with feathers; which has occafioned fone writers to fay that the toucan lias no noftrils. Round the eyes, on each fide of the head, is a fpace of bluifh fkin , void of feathers ; above which the head is black, except a white fpot on each fide joining to the bafe of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under fide of the head, throat, and the beginning of the hreaft, are white. Between the white on the hreaft, and the black on the belly, is a fpace of red feathers, in the form of a new moon, with its homs upwards. 'l'he legs, feet, and claws, are of an all-colour ; and the toes ftand like thofe of parrots, two defore and two behind.

It is reported by travellers, that this bird, thought furnined with fo formidable a buak, is harmlefs and gentle, being fo eafily made tame as to lit and hatch its young in houfes. It feeds chiefly upon pepper, which it devours very greedily, gorging itelf in fuch a manner that it voids it crude and unconcocted. This, however, is no objection to the natives from ufing it again: they even prefer it before that pepper which is frefh gathered fiom the tree; and feem perfuaded that the ftrength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhautted.

Whatever be the truth of this report, nothing is more certain than that the toucan lives only upon a vegetable dict; and, in a domeftic ftate, to which it is frequently brought in the warm countries where it is bred, it is feen to prefer fuch food to all other. Pozzo, whe bred one tame, afferts, that it leaped up and down, wagged the tail, and cried with a voice refembling that of a magpic. It fed upon the fame things that parrots do; but was moft greedy of grapes, which, being plucked off one by one, and thrown in the air, it would moft dexteroully catch before they fell to the ground. Its bill, he adds, was hollow, and upon that account very light, fo that it had but little ftrength in fo apparently formidable a weapon; nor could it peck or ftrike fmartly therewith. But its tongue feemed to affit the efforts of this unwieldy machine : it was long, thin, and fat, not unlike one of the feathers on the neck of a dunghill cock; this it moved up and down, and often extended five or fix inches from the bill. It was of a flefh colour, and remarkably fringed on each fide with very fmall filaments exactly refembling a feather.

It is probable that this long tongue has greater ftrength than the thin hollow beak that contains it. It is likely that the beak is only a kind of theath for this pecnliar inftrument, ufed by the toucan, not only in making itfelf a neft, but alfo in obtaining its provifion. Nothing is more certain, than that this bird builds its neft in holes of trees, which have been pre-

Plate reccomaysi

\section*{\(\mathrm{R} H \quad \mathrm{~A}\)}
apis vioufly fcooped out for this purpofe; and it is not very likely that fo feeble a bill could be very ferviceable in working upon fuch hard materials.
Be this as it will, there is no bird fecures its young better from external injury than the toucan. It has not only birds, men, and ferpents, to guard againft; but a numerous tribe of monkeys, fill more prying, mifchicvons, and hungry, than all the reft. The toucan, however, fcoops out its neft into the hollow of fome tree, leaving only a hole large enough to go in and out at. There it fits, with its great beak, guarding the entrance; and if the monkey ventures to offer a vifit of curiofity, the toucan gives him fuch a welcome, that he prefently thinks jroper to pack off, and is glad to efeape with riafety.

This bird is only found in the warm elimates of South America, where it is in great requeft, both for the delieacy of its feih, which is tender and nourihing, and for the beauty of its plumage, particularly the feathers of the breat. The flin of this part the Indians pluck off, and when dry glue to their checks; and this they confider as aa irrefiltible addition to their beauty.

RHAPIS, in botany: A genus of the monogynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the firt order, Palme. The calyx is a monophyllous trifid fpatha; the corolla monupetalous and trifid. There are two 1pecies, riz. 1. Flabilliformis, or ground-ratan, a native of China ; 2. A rundinacea, frmple leaved rhapis, a native of Carolina.

RHAPSODI, Rhapsodists, in antiquity, perfons who made a bulinefs of finging pieces of Homer's poems. Cuper informs us, that the Rhapfodi were clothed in red when they fung the Iliad, and in blue when they fung the Odyfley. They performed on the theatres, and fometimes ftrove for prizes in contefts of poetry, linging, \&c. After the two antagonifts had finifhed their parts, the two pieces or papers they were written in were joined together again: whence the na:ne, riz. from \(\rho x=\tau \pi\), fuo, and win canticum : but there feem to have been other Rhapfodi of more antiquity than thefe peopie, who compofed heroic poems or fongs ia praife of heroes and great men, and fung their own compofitions from town to town for a livelihood; of which profeffion Homer himfelf is faid to have been. See Bard.

RHAPSODOMANCY, an ancient kind of oivination performed by pitching on a paffare of a poet at hazard, and reckoning on it as a prediction of what was to come to pafs. Thete were various ways of practiting this thaplodomancy. Sometimes they wrote fevesal papers or fentences of a poet on fo many pieces of wood, paper, or the like, fhook them tugether in an urn, and drew out one which was acconnted the lot: fumetimes they caft dice on a table whereon worfes were written, and that wbereon the die lodged contained the prediction. A third manner was by opening a book, and pitching on fome verfe at firft fight. This method they particularly called the jortes i'rereditis; and afterwards, according to the poet, made ufe of, fortes Homerice, fortes Virgiliuna, \&cc. See Sortes.

RHAPSODY, in antiquity, a difcourfe in verfe fung or rehearfed by a rhapfodift. Others will have shapfody to fignify a collection of rerfes, efpecially
thofe of Homer, which having been a long time dilperfed in pieces and fragments, were at length by Pi fiftratus's order digetted into books called rhapfodies, from pawtu fuo, and oin canticum. Hence, among moderns, rbapfody is alfo nfed for an affemblage of paffages, thoughts, and authorities, raked together from divers authors, to compofe fome new piece.

RHE, or ReE, a little ifland in the Bay of Bifcay, near the coaft of Aunis in France. It was taken during the war with France which ended in 1763 , in the expedition commanded by Hawke and Mordaunt.
rhea americana. The American oftrich of authors has been frequertly mentioned, but till of late years very imperfectly known; being blended by fome with other genera, although forming of itfelf a diftinet one, differing in many things from all others. The older writers, however, have kept it feparate. It does not occur to us whether any author has figured this bird except Nierembery, whofe reprefentation convers no juft idea, which is wouderful, as it is to be met with in fufficient plenty in various parts of South Ameriea; nor has the bird itielf made its appearance in the cabinets of collectors, until the one now in the Leverian mufeum.
M. Bajon, in his Mem. fur Cayenne, gives a figure and defeription of the jabirus, and feems clear that this bird is no other than the oftrich of America. From this affertion, Mr Latham, in his Synop/ts, leaves the matter undecided; but this author, in his Index 0 rmthol. from having met with the fecimen above alluded to, and fupported in an account of its manners given by Mulina in his Hijl. Nut. da Cbili, treats this matter on more certain grounds, fo as to enable us to give the following defription.

In fize the American oftrich is very little inferior to the common one : the bill is floped not unlike that of a goofe, being flat on the top and rounded at the end : the eyes are black, and the lids furnifhed with hairs: the head is rounded, and covered with downy feathers: the neek is two feet eight inches long, and feathered alfo: from the tip of one wing to that of the other extended, the length is eight feet; but from the want of continuity of the webs of the feathers, and their laxity of texture, the bird is unable to raife itfelf from the ground ; it is, however, capable of graatly affiliug itfelf by their motion in running, which it does very fwiftly : the legs are fout, bare of ieathers above the knees, and furnifhed with three toes, all placed forwards, each liaving a ftraight and atout elaw as in the caflowary; on the heel is a callous knoh, ferving in place of a hack toe: the general colour of plumage is dull grey mixed with white, ineli ing to the latter ou the under parts : the tail is very fhort, and not confpicuous, being entirely covered with long loofe and floatiny feathers, having origin from the lower part of the back and sump, and entirely covering it : the bill and legs are brown.
Mulina obferves that this bird vasics; the borly in fome being white, in others black. In refpect to manners, it is faid to be a general feeder, but more fund of flies, which it eatches with great dexterity, and will alfo, like the commen oftrich, fwallow bits of iron and any other traih effered to it. In common with the oftrich of the old world, it lays a number of eggs, from to to 60 , in the fum, weh of them holding a quast:

Rre, Rhea,

Fhredia but it differs from that hird in many particulars, efpecially in wanting the callofity on the flemum, and fpars on the wing. With thefe laft the common oftrich is known to defend itfelf: in defect of them, the one here treated of ufes the feet with fuch addrefs as to become at once a furious and dangesous antagonift. The female calls its young oncs torcther with a kind of whifting note fomewhat finilar to that of a man: when young it is very tame, frequently following the firf veature it meets with.- The nefh of this bird is faid to be very unpalatable. It is found in various parts of Seuth Amorica, from Patargouia to Guians, and is known by the name of Cbique. We are lappy to be able to prefent our readers with an accurate drawing of the bird. Sce Plate CCCCXXXVII.

RHEEDLA, in botany: A genus of the monogy sina order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolla is tetrapetalous; tiere is no calys; and the fruit is a trifpermeus berry.

RHEGIEM (anc. geog.), fo very ancient a city as to he fuppofed to take its name from the violent burfing of the coaft of Italy from Sicily ; thought to have been formerly conjoined (Mela, Virgil). A city of the Bruttii, a colony of Chalcidians from Enubua: a ftrong barrier oppofed to Sicily (Strabo) ; mentioned by Luke; furnamed Fulium (Ptolemy), from a frefh Supply of inhabitants fent thitler by Augutus, after driving Sextus Pompeius out of Sicily (Stràbo); and thus was in part a colony, retaining tlill the right of a municipium (Infeription). The city is now called \(K \%\). gio, in the Farther Calabria.

RHEIMS, a city of France in Champagne, and capital of Rhemois. It is one of the moft ancient, celebrated, and largett places in the kingdom, had an archbifhop's fee, whole archbilhop was duke and peer of France. It is about four miles in circumference, and contains feveral fine fquares, well-built houfes, and magnificent churches. It had a mint, an univerfity, and five abbeys, the moft fanous of which was that of St Remy. There are alfo feveral triumphal arcles and other monuments of the Romans. It is feated on the niver \(V \in f i c\), on a plain furrounded by hills, which produce excellent wine. E. Long. 4. 8. N. Lat. 49. 14.

RHENISH wine, that produced on the hills about Rheims. This wine is much ufed in modicine as a folvent of iron, for which it is well calculated on account of its acidity. Dr Percival obferves, that it is the beft folvent of the Peruvian bark ; in which, however, he thinks its acidity has no thare, becaufe an addition of vinegar to water does not augment its folvent power.

RHETORES, amongt the Athenians, were ten in number, elected by lot to plead public caufes in the fenate-houfe or aftmbly. For every caufe in which they were retained, they received a drachm out of the public money, 'Tluy were fometimes called zurmopst, and their fee to \(\sum_{\text {virynurar. No man was admitted to }}\) this office betore he was 40 years of age, though others fay 3c. Valour in war, fiety to thair parents, prudence in thir affairs, frugality, and temperance, were neceffary qualifications fur this office, and every cond:date underwent an examination concerning thefe virsues provious to the clection. The otators at Rume
were not unlike the Athenian thetores. Sce Ors. Rhenn tor.

RHETORIANS, a fect of heretics in Egypt, fo denominated from Rhetorius their leader. The diftinguifhing tenets of this herefrarch, as reprefented by Philattrius, was, that he approved of all the horefies before lim, and taught that they were all in the right.

RIHETORIC, the art of feaking copioully on any fubject, with all the advantages of beanty and force. Sec Oratory.

RHEUM, a thin ferous humor, occafionally oozing out of the glands about the mouth and throat.

Rheurt, Rhubal: A genus of the monogynia order, belonging to the enneandria clafs of plants; and in the natural method ranking under the 12th order, Holoracea. There is no calyx; the corolla is fex \({ }^{\text {c }}\) d and perfiftent; and there is one triquetrous feed. There are five fpecies, viz. 1. The rlaponticum, or common rhubarb, lath a large, thick, flethy, branching, decplyflriking root, yellowifh within ; crowned by very large, roundifh, heart-fhaped fmooth leaves, on thick, Пightlyfurrowed foot-ftalks: and an upright ftiong ftem, two or three feet high, adorncd with leaves fingly, and terminated by thick clofe fpikes of white flowers. lt grows in Thrace and Scythia, but has been long in the Englifh gardens. Its root affords a gentle purge. It is however of inferior quality to fome of the following forts; but the plant being aftringent, its young falks in fpring, being cut and peeled, are ufed for tarts. 2. The palnatum, palnated-leaved true Chinefe rhubarb, hath a thick firhy root, yellow within; crowned with vory large palmated leaves, being deeply divided into acuminated fegments, expanded like an open hand; upright Atm; five or fix feet high or more, terminated by large fpkes of flowers *. This is now pro- see Eo. ved to be the true foreign rhubarb, the purgative qua- \({ }^{t 37 y, ~ P, 43!}\) lity of which is well known. 3. The compactum, or 'Tartarian rhubarb, hath a large, flefhy, branched root, ycllow within; crowned by very large, heart-fhaped fomewhat lobated, fharply indented, fmooth leaves, and an upright large ftem, five or fix feet high, garnifhed with leaves fingly, and brancling above; having all the branches terminated by nodding panicles of white flowers. 'This has been fuppofed to be the true rhubarb; which, however, though of fuperior quality to fome forts, is accounted inferior to the rheun palnatum. 4. The undulatum, undulated, or waved-leaved Chinefe rhubarb, hath a thick, branchy, deep-ftriking root, yellow within; crowncd with large, oblong, undulate, fomewhat hairy leaves, having equal foot ftalks, and an upright firm ftem, four feet high; garnifned with leaves fingly, and terminated by long loofe fpikes of white flowers. 5. The Arabian ribes, or currant thubarb of Mount Libanus, hath a thick flefhy root, very broad leaves, full of granulared protuberances, and with equal foot-italks, and upight firm fems, thace or four fect hish, terminated by fpikes of flowers, fucceeded by berr-like feeds, being farrounded by a purple pulp. fll thefe plants are peremial in root, and the leaves and ftalks are annual. 'The tuots being thick, flefty, generally disided, frike deep into the ground; of a brownin colour without and yellow within: the leaves rife in the fpring, generally come up in a large liead folded together,
:urn. together, gradually expanding themfelves, having thick foot-fnlks ; and grow from one to two feet high, or more, in length and breadth, fpreading all round : amidt them rife the A wer-ftems, which are garnifhed at each joint by one leaf, ar.d are of ftrong and expeditious growth, attaining their full height in June, when they fiower; and are Succeeded by large triangular feeds, ripening in Augult. Some plants of each fort merit cul. ture in gardens for variety; they will effect a fincularity with their luxuriant foliage, fpikes, and flowers: and as medical plants, they demand culture both for private and public ule.

They are generally propagated by feeds fowed in auttumn foon after they are ripe, or early in the fpring, in any open bed of lizht deep earth ; remarking, thofe intended for medical ufe fhould generaily be fowed where they are to remain, that the roots, being not difturbed by removal, may grow large. Scatter the feeds thinly, either by broad-eaft all over the furface, and raked well in; or in thallow drills a foot and half diftance, covering them near an inch deep. The plants will rife in the fpring, but not flower till the fecond or third year: when they, however, are come up two or three inches high, thin them to eight or ten inches, and cicar out all weeds; though thofe deligned always to fland fhould afterwards be hoed out to a foot and a half or two fect diftance : obferving, if any are required for the pleafure ground, \&e. for variety, they fhould be tranfplanted where they are to remain in autumn, when their leaves decay, or earty in fpring, before they froot: the others remaining where fowed, muft have the ground kept clean between them; and in autumn, when the leaves and ftalks decay, cut them down, and nightly dig the ground between the rows of plants, repeating the fametwork every year. The roots remaining, they increafe in fize annually: and in the fecond or third year many of them will fhoot up falks, flower, and perfect feeds; and in three or four years the roots will be arrived to a large fize; though older roots are generally preferable for medical ufe.

In Mr Bell's Travels we have an account of fome curious particulars relating to the culture of rhubarb. He tells us, that the belt rhubarb grows in that part of Ealtern Tartary called Mangalia, which now ferves as a boundary between Ruffia and China. The marmots contribute greatly to the culture of the rlubarb. Wherever you fee 10 or 20 plants growing, you are fure of finding feveral burows under the thades of their broad-fpreading leaves. Perhaps they may fomctimes eat the leaves and roots of this plant; however, it is probable the manure they leave about the roots contributes not a little to its increafe; and their calting up the earth, makes it thoot out young buds and mu!tioly. This plant does not run, and fpread itfelf, like docks and others of the fame fpecies; but grows in tufts, at uncertain diftances, as if the reeds had been dropped with defign. It appears that the Mongals never accounted it worth cultivating; but that the world is, obliged to the marmots for the quantities feattered, at random, in many parts of this country: for whatever part of the ripe feed happeus to be blown among the thick grafs, can very feldom reach the ground, but mult there wither and die ; whereas, foouk it sall among the loofe earth thrown up by
the marmots, it irmediately takes root, and produces a new plant.

After digging and gathering the rhubarh, the Mongals cut the large ronts into fmall pieces, in order to make them dry more readily. In the middle of every piece they fcoop a hole, through which a cord is drawn, in order to fufpend them in any convenient place. 'Theyhang them for the molt part about their tents, and fometimes on the horns of their Cheep. This is a molt pernicious euftom, as it deftroys fome of the beft part of the root: for all about the hole is rotten and ufelefs; whereas, were people rightly informed how to dis and dry this plant, there would not be one pound of refufe in an hundred; which would fave a great deal of trouble and expence, that much diminifn the profits on this commodity. At prefent, the dealers in this artiele think thefe improvements not worthy of their attention, as their gains are more conliderable on this than on any other branch of trade. Perhaps the government may hereafter think it proper to make fome regulations with
recard to this matter. regard to this matter.
Two forts of rhabarb are met with in the fhop3. The firt is imported from Turkey and Ruflia, in rounjilh pieces freed from the bark, with a hole through the middle of each: they are externally of a yellowith colour, and on cutting appear variegated with lisely reddih freaks. The other, which is lefs efteemed, comes immediately from the Ealt Indies, in longith pieces, harder, heavier, and more compact than the foregoing. The firlt fort, unlefs kept very dry, is apt to grow mouldy and worm-eaten; the fecond is lefs fubject to there inconveniences. Some of the more induftrous artilts are laid to fill up the worm-holes with certain mixtures, and to colour the outfide of the damaged pieces with powder of the finer forts of rhubarb, and fometimes with cheaper materials: this is often fo sicely dore, as effectually to impofe mpon the buyer, unlels he very carefully examines each piece. The marks of good rhubarb are, that it be nirm and folid, but not finty; that it be eafily pulverable, and appear, when powdered, of a fne brigh: yellow colour; that, upon being chewed, it impart to the fyittle a faffron tinge, without proving flimy or mucilaginous in the mouth. Its tafte is fubacrid, bitterifh, and fomewhat aftringent ; the fmell lightly aromatic.

Rhubarb is a mild carhartic, which operates without violence or irritation, and may be given with fafety even to pregnant women and children. Befides its purgative quality, it is celebrated for an aitringent onc, by which it ftrengthens the tore of the Alomach and inteftines, and proves ufeful in diarrbceas and diforders proceeding from a laxity of the fibres. Rhubarb it fubttance operates more poweriully as a cathartic than any of the preparations of it. Watery tinctures purge more than the fpirituous ones; whilt the latter contain in greater perfection the aromatio, altringent, and corroborating virtues of the rhubarb. The dofe, when intended as a purgative, is from a cruple to a dram or more.

The Turkey rhubarb is, among us, univerfally preferred to the Ealt India fort, though this laft is for fome purpofes at leait equal to the other; it is manifeftly more aftriogent, but has fomewhat lefs of an aromatic flayour. 'Tinctares drawn from both with rectifed fpirit have nearly the fane tafte: on diftilling

off the menfruum, the extraCt left from the tincture of the Eaft India rhubarb proved confiderably the flrongett.

Rhubarb has been cultivated of late in this country with confiderable fuccefs, and for medical purpofes is found to equal that of foreign growth, as is proved by the Tranfactions of the London Society for encouraging Arts, Manufactures, and Commerce, who have rewarded feveral perfons both for cultivating and curing it. In the Tranfactions for 1792, the gold medal was adjuldged to Sir William Fordyce, for raifing from feed in the year 1791 upwards of 300 plants of the true rhubarl, or rheum palmatum of the Lnndon Pharmacopreia \({ }_{7} 788\), which in the fecond and third weeks of Oetober were tranfplanted into a deep loan, at four feet diftance from each other, according to rules laid down by the fociety. In 1793 it was adjudged to Mr 'Thomas Jones, from whole papers we derive the following information.

After giving an accurate account of his experiments and obfervations, he concludes, that the feafon for fowing is the fpring ahout March or April, or in autumn about Augurf and September ; that thofe plants which are raifed in the fpring thould be tranfplanted in autumn, and vice verfa; that they cannot have too much room; that room and time are effentially neceflary to their being large, of a good appearance, and perhaps to the increafe of their purgative cqualities; that to effect thefe purpofes, the foil muft be light, loamy, and rich, but sot too much fo, left the roots fhould be too fibrous; that their fituation can fcarcely be too dry, as more evils are to be expected from a fuptrabundancy of moifture than any actual want of it : and laftly, we may conclude, that in particular the injuries which they are fubjeet to are principaliy during their infancy, and to be imputed to infects and inattention to the planting feafon; afterwards, from too great an expofure to froft: but that none can be dreaded from heat; and that in general they are hardy and ealy of cultivation, when arrived beyond a certain term.

The methed of curing rhubarb, as propofed by Dr Tirruogel of Stockholm, is as follows: "No roots fhould te taken up till they have been planted ten years: they Thould be taken out of the ground either in winter, before the frolt fets in, or in the beginning of fpring, and immediately cut into pieces, and carefully barked; let them be fpread upon a table for three or four days, and be frequently turned, that the juices may thicken or condenfe within the roots. After this procefs, make a hole in each piece, and put a thread through it ; by which let them hang feparately, either within doors, or in fome Meltered fhady fhed. Some perfons dry them in a different way : they inclofe the roots in clay, and make a hole in the clay, about the thicknefs of a goofe-quill, and in this manner hang up each piece to dry feparately, that the moitture may not evaporate, nor the flrength of the ront be weakened. But the methods which the Tartars follow is a bad onc : they dig the roots out of the deferts where they grow, bark them, and immediately flring them, and hang them round the necks of their camels, that they may dry as they travel; but this grcatly leffens the medicinal virtue of the root."

Mr Thomas Halley of Pontefract in Yorkfhire, to whom the London Society voted the filver medal in

1793 , informs us, that his father tried various experiments for curing rhubarb, as wahhing, brufhing, barking, and peeling, and he dried them in the fun, on a kiln, in a flove, or in a warm kitchen. But of the fuccefs of all or either of thele methods we have no account, owing to the death of Mr Halley's father. He fent, however, to them five different fpecimens, which the Society acknowledges to be fuperior to any rhubarb hitherto cured in England, and produced to thern. The roots fent, Mr Halley fays, were planted about the year 1781 in a lighe fandyifl foil, but were much neglected. They were taken up in the fpriug of 1792 , and being thoroughly divefted of the adlyering earth, were placed for fome weeks on the floor of a cool warehoufe: the fibres were then taken off, cut up: and dried on the flue of a green-loure; but, from nifmanagement, were entircly fpoiled. The prime roots were fevered in fmall pieces, peeled clean, and thoroughly clearid of every particle of unfoundnefs. Part was feparately haid in fieves, and the remainder perforated, trung, and fufpended in feftoons from the cieling of a warm kirchen. The manner of drefling confifts in paring off the external coat with a fharp knife, as thin and clean as poffible, and then finifhing it off by a piece of fifh.fkin, with its own powder; which powder may be procured from the chips and fmall pieces, cither by grinding or pounding it in a large mortar.

In the year 1794 tbe Society adjudged the gold medal to Mr William Hayward of Hanbury, Oxfordmire, for propagating thubarb by offsets taken from the crowns of large plants, inttead of feeds, for the purpofe of bringing it to perfection in a fhorter time, which fully anfwered his expectations. Mr Hayward was a candidate in the year 1789 for the gold medal; but having mifundertood their rules, he was not entitled to it, though with great propriety they voted to him the filver medal ; in confequence of which he fent them his method of culture and cure. His method of cultivating T'urkey rhubarb from feed is thus explained to the Society: "I have ufually fown the feed about the beginning of February, on a bed of good foil (if rather fandy the better), expofed to an eaft or weft afpect, in preference to the fouth; obferving a full fun to be prejudicial to the vegetation of the feeds, and to the plants whillt youns. The feeds are beft fown moderately thick (broad calt), treading them regularly in, as is ufual with parfueps and other light feeds, and then raking the ground fmooth. I have fometimes, when the feafon has been wet, made a bed for fowing the rhubarb feeds upon, about two feet thick, with new dung, from the ftable, covering it near one foot thick with good foil. The intent of this bed is not for the fake of warmth, but folely to prevent the riing of earthworms, which, in a moift feafon, will frequently dettroy the young crop. If the feed is good, the plants often rife too thick; if fo, when they have attained fix leaves they fould be taken carefully up (where too clofe), leaving the ftanding crop eight or ten inches apart: thofe taken up may be planted at the fame diffance, in a frefh fpot of ground, in order to furnifh other plantations. When the plants in general are grown to the fize that cabbage-plants are ufually fet out for a ftan!ing crop, they are beft planted where they are to remain, in beds four feet wide, one row along the middle of the bed, leaving two yards diftance betwixt the

\section*{R H I}
m. plants, allowing au alley between the beds about a font wide, for conveniency of weeding the plants. In the autumn, when the decayed leaves are removed, if the Shoveling of the alleys are thrown over the crowns of the plants, it will be found of ferwice.

His mode of cultivating the fame plant by offsets is thus giren: "On tiking up fone plants the laff foring, I nlipped off feveral offsets from the heads of lare plauts: thefe I fet with a diblie about a foot apart, in rider, if I found them thrive, to remove them into other beds On cxamining them in the autumn, I was firrprifed to fee the progrefs they had mads, and pleafed to be able to furnifh any beds with to glants in the mort thriving fate. Though this was my firt experiment of its kind, I do not mean to arrogate the difcovery to myfulf, haring known it recently tried by others, but without being informed of their fuccefs. I have reafon to think this valuable drug will, by this method, be brought much fooner to perfection than from ieed."

His method of curing rhubari) is thus deferibed: "T he plants may be taken up either early in the fpring, or in autum, when the leaves are decayid, in dry weather if poffible, when the roots are to be cleared from dirt (without walhing) : let thèm be cut into pieces, and with a fharp knife freed from the outer coat, and expofed to the fin and air for a few days, to render the outfide a little dry. In order to accelerate the curing of the largeft picces, a hole may be fcooped out with a penknife: thefe and the fmaller parts are then to be itrung in packthread, and hung up i: a warm room (I have always had the conveniency of fuch a one over a baker's oven), where it is to remain till perfectly dry. Eaclu piece may be rendered more fightly by a common fik, fixing it is a fmall wice during thas opcration : afterwards rub over it a wery fine powder, which the fmall roots furnifh in beautiful perfection, for this and every other purpofe where rhubarb is required."

In the year 1794, too, the Society adjudged the gold medal to Mr Ball for his methud of curing the true rhubart, which is as follows: "I take the toots up when I find the thalks withering or cying away, clean them from the earth with a dry bresh, cut them in fmall pieces of about four or five inclies in breadth, and about two in depth, taking away all the bark, and make a hole in the middle, and Atring them on pack thread, kceping cvery piece apalt; and every morning, if the weather is clear and fing I place them in the open part of the garden, on ftares, erectci by fixing fmall poits, about fix feet ligh in the ground, and fix feet afunder, into which I fix horizontal pegs, about a foot apart, beginning at the top; and the rhubarb being ftringed crofswife on fmall poles, I place them on thefe pegs; fo that if it flould rain, I could calily remore each pole with the fufpended pieces, into any cowered place. I never fuffer them to be out ai night, as the damps at this feafon would be apt to mould them and if at any time I perceive the lealt mark of mould, I rut, it off with a dry cloth. In fome of the pieces of rhabarb which I have cured tilis year, I have made holes abont half an inch cianeter in the middle, for the free paffage o? air, and
Vdl. Xil. Part I.
have found that every one of thefe pleces dried better than the others where no fuch lioles were made; and have likewife hung feveral ftrings in the kitchen, and never expofed them in the open air, and found them to crye exceedingly well, and muci better than thore in the open air. Some years fince I dried a quantity of Lhubarb on a malt-kiln, keeping ap the thermometer to so degrees, which anfwere! well, but I think rather dried too quick: the roots which I have cured this ycar are a part of the pantation of \(1-89\), and fuis which the Society was fo kind as to give me a medal (A)."

RHEXIA, in botany: A gemis of tine monogynia orter, belonging to the octardria clafs of plants; and in the naturai method ranking with thofe of the \(1-\) th order, Calycanthema. The calyx is quadrifid with four petals inferted into it ; the anthere are declining ; the capfule is quadritucular, within the belly of the calcr.

RHIN.ANTHUS, in botany: A genus of the angiofpermia urder, belongiag to the didynamia class o: plants ; and in the natural method ranking under the: 4 ath order, Pirfonars. The calyx is quadrifid, and veatricofe; the capfule bilocuiar, obtufe, and compref. fed.

RHINE, a large river of Gemmany. fanous both in ancient and modern hifory. It rifes among the Alpes Lepont:e, or Grions; and firt traperfine the Lacus Acronius, diviles the Rhæti and Vindelici from the Fulvetii, and then the Germans from the Ganls and Belgre ; and running from fouth to north for the greatelt part of its way, and at length beuding its courfe wét, it empties itélf at feveral mouths (Calar); at three mouths into the German ocean, (Pliny) ; viz. the weitern, or Helius : the northern, or Fleusis; and the niddle between both thefe, which retains the original name, Ribenys : and in this Ptolemy agrees. Mela and Tacitus mention two channels, and as many mouths, the right and left; the former running by Germany, anc the lateer by Gallia kelgica: and thus alfo Alinius Pollio, and Virgil ; the cut or trench of Drufus not being made in their time, whereby the middle chamel was much dained and reduecd, and thercfore overlooked by Tacius and Mela: and which Fliny calls the Scunty. To account for Cwar's feveral mouths, is a mater of no fmall difficaly with the commertatoss; and they do it no otherwife than by admitting that the Rhine naturally formed frnall drains or rivulets from itfelf; the cut of Drufus being lons pofterior to him; in whofe time Afmus Pollice, çuoted by Strabo, who agrees with him therein, affirmed that there were but iwo monhs, finding fault with thofe who nade them more: and he mult mean the larger month, which enitted Larger ftreanis. The R:mars, efpecially the poets, ufed the term Rbenus for Germany, (Martial). - At prefent, the river, alter entering the Netherlands at Schenkinhaus, is divided into feveral chamels, the two largeft of which obtain the names of the \(L\) Lech and the \(/ \|_{\text {aca! }}\), which running thro the United Provinces, falls into the German ocean kelow Rotterdam.
(A) The Society allo adjudged to Mr Ball the medal in 1 :00, for cultivating rhubarb.

\section*{R HI}
I.awer Circle of the Rut nf, comfits of the palatinate of the Rhine, and the three coclefiatical cleturates, viz. the fe of Cologne, Mentz, and Priers.
Upper circle of she RHine, confined of the landermaiate of Alsace and Heffe, comprehending the Weternas; tut now orly Helle can be accounted a part of Germanny, Alsace being long a yo united to France.

RHINEBERG, a town of Germany, in the circle of the Lower Rhine, and diocese of Cologne. It was in the poffefion of the French, but rellored to the archbishop of Cologne by the treaty of Utrecht. It is Seated on the Rhine, in E. Lung. G. 3y. N. Lat. 51.30.

RHINECK, a town of Germany, in the archbithopric of Cologne, fated on the Rhine, E. Long. 7. (3. N. Lat. 50. 27. -There is another town of the fane name in Swiferl:ud, capital of Rhinthal, feasted on the Rhine, near the lake of Constance, with a good cattle. E. Long. 9. 53. N. Lat. \(47 \cdot 3^{8}\),
RHINFELI), a mall but Itrong town of Germany, in the circle of Suabia, and the bet t of the four furelt.towns belonging to the house of Austria. It has been often taken and retaken in the German wars; and is feated on the Rhine, over which there is a handfome bridge. E. Lone:- 2. 53. N. Lat. +7 . 40.

NHINEGAU, a beautiful diftrict of the electorate of Mont\%, is lituated on the Rhine, about three miles from the city of Mentz, and is fo populous that it looks like one entire town intermixed with gardens and vineyards. The Rhine here grows afonifhiugly wide, and forms a kind of fca, near a mile broad, in which
Açreb's
Travels
\({ }^{7}\) row. 6
fermion,
iii. 226.
riches to this feincigchar hill, which protects it from Rbi the cold winds of the call and north, at the fame time that it leaves room enough for the fun to exercife his beni m influences. The groves and higher dopes of the hills make excellent pallures, and produce large quantities of dunt, which, in a connery of this fort, is of inctitinable value.
'IDe bank of the Rhine, opposite to the Rhine gan, is exceedingly barren, and heightens the beauty of the pr. feet on the other fie by the contra it exhibits; win this fides, you hardly meet allow three or four villages, and the fe are far diltant from each other. The great interval between them is occupied by heath's and ea. dews, only here and there a thick buff affords feme Shade, and a few corn fields among the villages enliven the gloomy landscape. The hack ground of this comtry is the mont pieturefque part of it. It is formed by a narrow gullet of mountains, which diminish in peripective between Rudefheim and Bingen. Perpendicular mountains and rocks hang over the Rhine in this place, and fem to make it the dominion of eternal night. it a distance, the Rhine lems to come ont of this landfcape through a hole under ground; and it appears to run tediunfly, in order to enjoy its course throurl1 a pleafant country the longer. Amidit the darkness which covers this back groomed, the celebrated Male tower lems to fiwim upon the river. In a word, flee is not any thing in this whole tract that does not contribute fomething to the beauty and maniscence of the whole; or, if I. may be permitted the exprefion, to make the paradife more welcome. As jon fut alone the Rhine, between Dent\% and Bingen, the banks of the river form an oval amphitheatre, which makes one of the richest and mol picturefque landicapes to he fen in Europe. The inhabitants of thee regions are forme of them extremely rich, and lome extremely poor. The happy middle tate is not for countries the chief product of which is wine; tor, betides that the cultiration of the vineyard is infinitely \(m\) re tronblefore and expenfive than agriculture, it is fubj:cted wrevolotions, which in an infant reduce the holder of land to the condition of a day -labourer. It is a great if, fortune for this country, that, though retrained by law, the nobility are, through connivance of the Elector, allowed to purchafe as much land as they pleafe 'the peafant generally begins by ruming in debt for his vineyard; fo that if it does not turn out well, he is reduce to day-labour, and the rich man extends his polfeffions to the great detriment of the country. There are feveral peafants here, who having incomes of 30 , 50, or 102,:02 guilders a-year, have laid afire the peafont, and affumed the wine-merchant; but, fplendid as their fituation is, it does not compensate, in the eyes of the humane man, for the fight of fo many poor people with which the villages Swarm. In order to render a country of this kind profperous, the late fold appropriate a fund to the purpose of maintaining the pearant in bad years, and giving him the affitance which his neceffities, and his want of ready money, may from time to time make convenient.

The inhabitants of the Rhinegau are a handfome and uncommonly ftrong race of men. Yon fee at the very firth aspect that their wine gives them merry hearts and found bodies. They have a great deal of natural wit, and a vivacity and jocoseness, which dittinguifhes them
fels rery much from their ncighbours. Fou need only compare them with fome of thefe, to be convinced that the drinker of wine exculs the drinker of beer and water, looth in body and mind, and that the inhabitant of the fouth is much flouter than he who lives in the north; for though the wine drinker may not have quite as rruch fleth as he who drinks only beer, he has better Hood, and can bear much more work. 'Tacitus had alecady obferved thio, in his treatife De moribus \(G_{\text {erma }}\). norun. "The large and corpulent bodies of the Germans ( fays he) have a great appearance, but are not made to laft." At that time alnout all the Germans drank only water; but the mere driaking of wine has ffiected a revolution in fe:eral parts of Gemmany, which makes the prefent inhabitants of thefe eauntrics we:y different fiom thofe deferibed by Tacitns. Black and brown hair is mach commoner here than the white, which made the Germans fo famous in ched Rome. "It will be eafily inagined (fays Baron Reilbeck), that the monks fare particularly well in fo rich a comentry. We made a vifit to the prelate of Erhach. Thefe lordiy monks, for fo in every refpect they are, have an exceltent lunt, rooms magnificently furnihed, billiard tables, half a dozen beamiful finginer women, and a ftupendons wine cellar, the well ranged batteries of which made me fludder. A monk, who faw my altonihhent it the number of the cofks, affured me, that, without the berimn infuence which flowel from then, it would be totally impoffible for the cloifer to fubfit in fo damp a fituation."

RHINFELS, a caftle of Germany, in the circle of the Lower Rhine, in a county of the fame name. It is looked upon as une of the noft important places feated on the Rhine, as well in regard to its Itrength as fituation. It is near St Goar, and built on a craygy rock. This fortrefs commands the whule breadth of the Rhine, and thofe who pals are always obliged to pay a cenfiderable toll. In the time of war it is of great importance to be multers of this place. E. Lony. \(7 \cdot+3\). N. Lat. \(5=3\).

RHINLAND, a mane given to a part of Soutle Holland, which lies on both fides the Rhine, and of which Leyden is the capital town.

RHINOCEROS, in zoology, a genus of quadrupeds belonging to the order of bellure. The name is entirely Greck; but thefe animals were totally unknown to the ancient Greeks. Ariftotle takes no notice of them, nor any other Greek writer till Strabo, nor Roman till Pliny. It is probable they did not frequent that part of India into which Alexander had penetrated, fince it was near 300 years after that Pompey brought them to Europe. From this time till the days of Heliorabalus, the thinoceros was frequently exhibited in the Roman ipectacles: and he has often been tranfported into Europe in mose modern times ; but they were long very ill reprefented, and very inperfectly deferibed, till fome that arrived in London in 1739 and \({ }^{1} 741\) were infpetted, by which the errors and caprices of former whiters were detecied.

Thete are two fuecies of rhnoceros, the firt of which is the unicarni, the length of which, Bufon
tells us, from the extemity of the mazzle to the oni. Rha \(\begin{gathered}\text { cer } 1 \%\end{gathered}\) gin of the tail, is at leaft 12 feet, and the circumfe- Pla-e sence of the body is nearly the fame. "The rhino-eccexvyrir cetos yhich came to London in the year I \(/ 39\) was fent Bati i's from Bengal. Though not above two years of arge, a aturad the erpence of his food and journey amounted to near Hy? L. 100 Sterling. He was fed with rice, fugar, and vi. v. po hay. He liad daily feren pounds of rice, mixed with \(y=\&<c\). three pomids of furgar, and divided into three portion:He had likewife hay and green herbs, which laft he preferred to hay. His drink was water, of which he took large quantitics at a time (A). Ife was of a peaceable difpulition, and allowed all parts of his body to be touched. When hungry, or flruck by any perfon, he beeame mifchicrous, and in both cafes nothing appealed lim but food. When enraped, he fprung forward, and nimbly raifed himfilf to a great hei fht, pufhing at the farne time his head furioully againd the wall, which he performed with amazing quicknefs, netwithttanding his heary afpect and unwieldy mafs. I uften ohferved, fays Dr Parfons, thefe movements p:, duced by rage or impatience, efpecially in the moming 3 Lefore his rice and fugar were brought to him The vivacity and promptitude of his movements, Dr Parfons adds, led me to think, that he is altogether unconquerabit, and that he could cafily overtake any ma: who thould uffend him
"'This rhinuceros, at the age of two years, was not taller than a young cow that has never produced. But his body was very long and very thick. His head wa, difpropurtionally large. From the ears to the horn there is a concavity, the two extrenities of which, namely the upper end of the muzzle, and the part near the ears, are confiderably raifed. The horn, which was not yet above an inch high, was black, fmooth at the top, but full of wrinkl:s directed backward at the bafe. I he noftrils are fituated very low, being not above an inch diftant from the opening of the mouth. The under lip is pretty limilar to that of the ox; but the upper lip has a greater refemblance to that of the hoife, with this advantageons difference, that the rainoceros can leng then this lip, move it from fide to fide, roll it about a ftaff, and fcize with it any object he wihes to carry to his mouth. The tongue of this young rhinoceros was foft, like that of a calf. His cyes had no vivacity: In figure they refembled thofe of the hog, and were fituated lower, or nearer the noiltrils, than in any other quadreped. His ears are large, thin at the extremities, and contrafted at their origin \(1, \mathrm{r}\) a kind of annular rugofity. The neck is wery fhort, and furrounded with two large folds of finin. The fhoulders are very thick, and at their juncture there is anothe: fold of fkin, which defcends upon the fore legs. The body of this young rhinoceros was very thick, and pecty much reiembled that of a cow atbout to bring torth. Between the body and crupper there is another fold, which defeends upon the hind legs Laftly, another fold tranfverfely furrounds the inferior part of the erupper, at fome dilance from the teil. The belly was large, and hung near the ground, particularly its middle part. The legs are romi, thick, frong, and 1) de
their
(1) "Their food in a fate of nature is the groffef herbs, as thitles and thorny farubs, which they prefer to the foft pafture of the beft meadows; they are fond of the fugar cane, and eat all kinds of grain, but for feeh they have no appetite."

\section*{R H I}
shicee os. treir joint Bended backwards. This joint, which, when the animal lics, is covered with a remarkable fol! of the Rkin, appears when he llands. 7 he tail is thin, mill proportionally fhore; that of the rhinoceros fo often mentioned, excecded not it or 17 inches in lengeth. It turns a little thicker at the extremity, which is garrihned with tome flurt, thiek, hard hairs. The form of the penis is very extraordinary. It is contzined in a prepuce or fheath like that of the horfe; and the firlt thing that appears in the time of erection is a fecond prepuce, of a feth-colour, from which there ifiues a bolluw tabe, in the form of a funnel cut and borderes] fome what like a llowerole lace, and contitutes the ghans and extremity of the penis. This anomatous glans is of a puler theth-colour than the fecond prepuce. In the noit vigurons crectiun, the peris extends not above eight inches out of the budy; and it is eafily procured by sutbing the animal with a hand oul of traw when he lies at his eate. 'The dircétion of this organ is hot Atrai, hit, but berded backward. Hence he thruws out his wrine behind; and from this circumfance, it may be inferced that the male corcts not the female, but that they unite with their cruppers to each other. 'I he female organs are fituated like thofe of the cow; and the exactly refembles the male in fgure and grofluefs of body. The thin is fo thick and impenetrable, that when a man lays holel of any of the folds, he would inagine he is turhing a wooden plank of half an inch thick ( B ). When tanned, Dr Grew remarks, it is exceffredy hard, and thicker than the hide of any other terreftrial animal. It is everywhere covered more or kefs with incruftations in the form of galls or tuberofities, which are pretty fmall on the top of the meck and hack, Lut besome larger on the fides. 'The large of are on the flowilders and crupper, are ftill pretty large on the thighs and logs, upon which they are Ppread all round, and even on the feet. But between the folds the fkin is penetrable, delicate, and as foft :o the touch as lilk, while the external part of the fold is equally hard with the ret. This tender fkin between the fulds is of a light fleth-colour ; and the fisin of the belly is nearly of the fame colour and contiftence. Thefe galls or tuberofities fhould not be compared, as fome authors have done, to feales. They are only fimple indurations of the flin, without any regularity in their figure or fymmetry in iheir effpective pofitoons. The flexibility of the flin in the folds enables the hinoceros to move with facility his head, neck, and members. The whole budy, exerpet at the joints, is inflexible, and refembles a coat of rnarl. Dr Parfons remarks, that this animal liftened with a deep and long continued attention to any kind of noife; and that, though he was fieeping, cating, or obeying any other preffing demands of nature, he raifed his head, and liftened till the noife ceafed."

Thefe animals never affemble or march torether in troops like elephants. Being of a more folitary and favage difpulition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very furious and furmidab.e ; but as they fee only before then, and
not very fharply, and as they turn with great difficulty, Rhiu the they may be catily avoided. The flin of thefe animals is fo extremcly hard as to refitt fabres, lances, javelins, and even muiket balls, the only penetrable parto being, the belly, the eyes, and about the cars. Hence the hunters gencrally attack thenz when they lie down to fieep.-. Their fleth is confiedrad as cxectlent by the Indians and Africans, but efpecially by the Hottentots; and it they were trained when yount, they might be rendered domeftic, in which cafe they would multiply more catily than the elephant. They inhabit Bengal, Siam, Cul-chin-China, Quangfi in China, the illes of Java and Sumatra, Congo, Ansola, Ethiopia, and the country as low as the Capre. 'Whey low thaty forets, the neiglibountrod of rivers, and matty plates. They wallow in the mure like hugr, and are faid by that means tu erise fladter in the folds of their thins to feorpions, centipader, and other infeets. 'This is denied by Buffon and Edwards, though the furgeon of the Shaftubury had obferved in a h himoeros, newly taken after having welter. etl in the mud, fevcral infects conceated under the ply. of the fi:1.1. This carrics with it every appearance of probability; for as the creature welters in mud, it is impofible for it to do fo withont bringing up with it fome of the infects which live in that mud ; and when this is the cafe, it furely camot be unnatural to fuppofe that they would fhelter themfelves under the plaits of the Rin. Mr Bruce had an opportunity of examining the nim of a rhinoceros before his muldy covering had been fcraped off, and faw under it feveral very large worms, but not of the carnivorons kind. He faw likewife feverall fmather animals refembling car-wigs, which he took to be young feolopendre; and, though hee fearched no farther, we mult certainly confider this as a proof of what the furgeon of the Shafteßury related. Mr Bruce fuppoofes, too, that they welter in mire, partly in order to fereen themfelves by a cafe of mud from the attacks of that mifchievous fly which infetts the animals of Aby flumia to fuch a degree. "The time of the fly (fays he) being in the rainy feafon, the whole black earth turns into mirc. In the night, when the fly is at reft, the rhimoceros choofes a convenient place, and there, rolling himfelf in the mud, he clothes himelf with a kind of cale, which defends him againnt his enemy the following day. The wrinkles and plaits of his fkin ferve to keep this muddy platter firm up. on him, all but about his hips, fhoulders, and legs, where it cracks and falls off by motion, and leaves him expofed in thofe places to the attacks of the fly. The itching and pain which follow occafion him to rub himfelf in thofe parts againtt the roughelt trees; and this is at lealt one caufe of the puftules or tubercles which we fee upon thefe places, both on the clephant and rhino. cerus." They bring forth only one young at a time, abont which they are very folicitous. They are faid to confort with tygers; a ltory founded merely on their common attachment to the fides of rivers, by whicls means they are olten found near each other. Their fkin, fleh, hoofs, teeth, and even dung, are ufed in India mediciaally. The horn, efpeciaily that of a virgin rhinocerus, is confidered as an antidote againlt poifon. Every
horn,
(в) This Mr Bruce denies to be the cafe, and fufpects, where it does occur, that it is the effect of difeafe, or of a different habit acquired by keeping. In their natural thate, he thitws they prevent this rigidity by wallowing; in the mud.

\section*{R H I}

\section*{R H I}
eeor form, Fowerer, has not this property; fone of them fell-- ing very cheap, while others are cytrmely dear.

Some writers are of cpinion, that the rhinoceros is the unicorn of holy writ and of the ancients, and that the orys or Indian afs of Ariftotlc, who fays it has but one horn, was the fanic, his informers comparing the clumfy hape of the thinoceros to that of the als. It was alfo the \(b_{n s}\) unicornis and fira monocctos of lliny, buth of which were of India ; and in has account of the monoceros he exactly deferibes the great black horn and hor-like tail. The unicorn of Seripture is covifidered as haviing all the properties of the rlinoceros, as rate, untameablenefs, great fivitinefs, and vant freng th. This upiniou is molt ally fupported by Mr Bruce. "The dutiation of the Hebrew word reean (fays he), which in our vertion is tranfated uricorn, both in the Hebrew and the Ethiopic, feems to be from crectnefs, or flanding flraight. This is certainly no particular quality in the animal iffuf, who is not more or even fo much ercect as ntany other qutadrupeds, fer in its knees it is matherer crooked; but it is frem the circumflance and manner in which itshorn is placed. The horns of all other animals are inclined to fome degree of parallelifm with his nofe or os frontis. The horm of the thinoectos is erect and Ferpendicular to this bone, un which it Itands at right angles, thereby poffefing a greater purchafe or power, is a lever, than an horn could poffibly have in any other pecition. The fituation of the horn is sery happily alluded to in Scripture ; ' Miy horn fhalt thon exalt like the horn of an unicorn.' And the horu here alluded to is not whally figurative, but was really an oriament worn by great men in the days of victory, preferment, or 1ejuicing, when they were anointed with tew, fiwet, or frefh oil; a circumftance which David joins with that of erecting the horn.

Some anthors, for what reafon I know not, have made the reem, or unicorn, to be of the deer or antelope kind; that is, of a s genus whofe very claracter is frar and weaknefs, directlly oppofite to the qualities by which the reem is deferibed in Scripture : befides, it is plain that the reem is not of the clafs of clean quadrupeds; and a late modern traveller very whimfically takes him for the leviathan, which certainly was a finh. Dalaam, a prieft of Midian, and fo in the neighbourhood of the haturts of the rhinoceros, and intimately connectid with Ethiopia, (for they themfelves were thepherds of that country), in a tran (port, from contemplating the firength of Ifrael, whom he was brought to curfe, fays, they had, as it were, the fleength of the reem. Job makes frequent allufion to his great firength, feroceity, and indocility. He afls, 'Will the reem be willing to ferve thee, or abiod by thy crib?' that is, Will he willingly come into thy flable, and eat at thy manger? And again, ‘Carilt thou bind the reem with a band in the furrov;' and will he harrow the valleys for thee:' In other words, Car.ft thou make lim go to the plough or harrows?
" The rhinoceros, in Geez, is called Arzee Harich, and in_the Amharic Siuraris; both which names tignify ‘the large wild beat with the horn.' This would feem as if applied to the fyecies with one horn. On the other hand, in the country of the Shangalla aud in Nubia lie
is called C'rnan 3 irn, or ' horn upon horn;' and this weuld RY:inoceros. feem to denote that he had two. The Eihiopic text renders the word re:m, 'Arwe-Harich;' and this the Septrag int trannatcs monoeceros, or uricorn. The principal realon of tranllating the word unicorn rather than rbinsoctros, is from a prejudice that he mnut have had b:t one horm. But this is by no means fo well founded as to be admitted the orly argument for eflallifihing the exittence of an animal, which never has appcared aficr the fearch of fo many aycs. Scriptuic feciak of the horns of the unicorn; fo that even from this ciccurritance the reem may be the thinoceros, as the \(A\) liatic, and past of the African thitioceros, may be the unicorn."

The rhincceros bicornis was long known in Europs merely by the double horns which were preferved in wirious cabinets; and its exitence, thoush now pall all doubt, has been frequently cuuctioured. Dr_Sparman, in his soyage to the Cape of Good Hope, klled two of thefe animals, which he diffected, and wery minutely deferibes. 'The horns, he fays, in the lise animal are fo mobile and looic, that when it walks carel (sly alon:g, one way fee them waggle about, and hear them clath and clatct againt ecch othcr. In the Plilil. 'I ranf. for 1793 , we have a defription of the double-horned rhinoceros of Sumatra, by Mr Bell, furgeon in the fervice of the Eait India Conizany at Bencoolen; aud this account, though it differs confiderably from that of Sparman in fome particulars, we fall infert here. "The animal (fays Mr Bell) herein deferibed was flot with a leaden ball from a mukket about tea miles from Fort Marlboroughl. 1 faw it the day after ; it was then not in the ceatt putrid, and I put: it into the polition from which the accompanying drawing was made. (See Plate ccccxxxvin.) It was a male ; the height at the fhoulder was of feet + inches; at the facrum nearly the fane ; fron the tip of the nofe to the end of the tail eight feet fre inches.From the appearance of its teeth and bones it was but young, and pirobably not near its full fize. The flape of the animal was nuch like that of the hog. The general colour was a hrowninh afl? ; under the belly, be. tween the legs and folds of the fkin, a dirty fech colour. The head nuch refen.bled that of the fingle horned rhinoceros; the eycs were finall, of a browra colour; the membrana nizituans thick and flrong: the finin furrounding the eyes was wrinkled; the noftrils were wide; the upper lip was pointed, and hanging over the under.
" There were fix mellares, or grinders: on each fide of the upper and lower jaw, becoming gradially larger backward, partieulaly in the upper; two tecti in ilhe front of each jaw ; the tongue was quite fmooth : the ears were fmall and pointed, lined and edged with thort black hair, and fituated like thofe of the fingle-horned rhinoceros. The horns were black, the liarger was placed immediately above the nofe, pointing upward, and was bent a little back; it was ahout nine inclus long. The finall horn was four inches long, of a pyramidial thape, flatened a little, and placed above the cyes, rather a little more forvard, flanding in a line with the larger horn, immecliately abuve it. They were both firmily attached to the fikull, nor was there any appearance of jont or mufcles to more them (c). The neek was thick and flort, the fin on the under fide thrown in-

\footnotetext{
(c) Mr Bruce, howewer, fays, that in the living animal the horns are extremely foufible. He informs us,
}

1at meternetu folds, and the fe folds agrain wrinklect. The body was bulky and roun 1 , and from the floulder ran a lim", or fold, as in the fingle loomed rhinoceros, thansh it was but taintly inaked. There were fereral other folds and wrinkles on the body and lers; and the whole gave ruthe: the appearance of foftefes: the kugs were thick, flome an 1 remarkably flown ; the feet armed with three dithen hoofs, of a hackilh colent, whichs furpounded half the foot, one in front, the other; on cach fide. The fulcs of the fect were convex, of a li rht culour, and the cuticle on them not thicker than that on the fore of a man who is ufed to wh King ; the tefticles lavdly appean el externally; the penis was heut beck:wad, and opened abont is inches below the anns. At its or gin it was as thick as a man's lec, and about two feet and a hall lons ; the bend in it oceations the urise to be difcharged backwards. The ghas is very fingto lar; the opening of the uretha is like the mouth of a cup with its, brim berding over a little and is about three quarters of an inch in dameter ; the glans heee is abont half aan inch in diameter, and continues that thickrefs for an inch and a half: it is then inferted into anwher crpp like the firlt, but three times as large; the glans afterwards graduaily becomes thicker, and at about nine inches from the opening of the urethra are placed two bodies on the upper part of the seans, very like the mipples of a milchectur, and as large; thefe become turgid when the penis is creeted; the whole of this is contaised in the propuce, and may be confilered as glens. From the os pubis arifes a ttrong mufce, which foon becomes tendinous: this tenden is continsed alon: the back or upper part of the penis; it is flattened, is about the fize of a man's little finger, and is inferted into the upper part of the glans, near the end. The ufe of this mufcle is to ftraiten the penis. On the under fide of the pea's there are two mufeles, antaronits to the above ; they arife from the os ifchium flefly, run along the luwer fide of the penis, on each fide of the compus iponciofum, and are inferted Aefhy into the lower fide of the glans; the action of thefe mufcles will draw in the penis, and bund it. The male has two mipples, like the female, fitunted hetween the hind legs; they are abont half an inch in length, of a pyramidal form, rouncled at the end.
" The whole fhin of the amimal is rongh, and covered? very thinly with thert black hair. The fein was not more than one third of an inch in thicknefs at the flomget part; under the belly it was hardly a quarter of an inclı; any part of it might be eut through with eafe by a common diffecting huife. The animal had not that appearance of armour which is obferved in the lingle-lomed thinoceros. Since I diffected the male, I lave had ath opportunity of examining a female, which was more of a lead colour: it was younger than the make, and had not fo many folds or wrinkles in its flin; of courfe it had fill lefs the appearance of armour. The anly extermal mark which diftinguifhes it from the male is the vagina, which is clufe to the anus: whereas in the male the opening for the penis is 18 inches below the :nnus."

From the difference between this account and Spar-
man's, whit in fome particulars is conindeabic, and on from the diflerence of thape, we are difpofed to think thenr varictics. Mr Bruce's drawiog of the minnoceros hicomis is ungnettinnall)y a deecption; the Londy of the animal, as there reprefented, correfperads exacty with that of the unicoms except in its having two horns on ics lecad. In the mufeum of the late i ) Whatiam Innter, the two-horned mimal was preferved, a meins exactly with the general accounts and figmres we hase of that anmal, but differing effentially from Mr Bruce' Lar further particulars refpecting thefe curious animals, ve refur to Buffon, vol. ii. p. \(\eta^{2-117 ; ~ S p a r m a n ' s ~}\) Vogage to the Cape, vol. ii. \section*{RHITIMNA. Sce Rethmo.}

RHIZOBALUS, in botany: A genus of the tctragyia order, belonging to the polyandria clads of plants; and in the natural methoul rauking mider the 23 d onde:, Toblituto. Thic ealy \(x\) monaphylluus, flemp, and downy: the corclli confils of five petais, which are round, concave, flethy, and much Ia, ger than the calys; the thunina are very numetous, fliform, and longer than the corolla; the flyli are fom, thitorm, and of the length of the flamina ; ite pericarpium the four drupx, kiducy-fhaped, comprefled with a Holhy fuhItance infide, and in the middle a flat large nut containing a kidncy fhaped kernd. Of this there is only one fpecies, via. P'ckit. The mut is fold in the flops as American nuts; they are flat, tuberculated, and kin-nev-flaped, containing a kernel of the fame fhape, which is fiveet and agrceable. Chulins gives a grood figure of the nut, and Aublet has one of the whole plant.

RIFIZOPHORA, the mangrovi, or Alansle, in lomtany: A genus of the monorynia order, belonering to the dodecandria clafs of plants; and in the natural method tanking under the 12 th order, Hotoraces. The calyx is quadripartite, the corolla partite; there is one feed, very lung, and carnous at the bafe. 'Thefe plants are natives of the Fatt and Wett Indies, and often grow to or eo feet ligh. They grow ouly in water and on the banks of rivers, where the tide flows up twice aday!. Ihey prefurve the verdure of their leaves thronghout the yerFrom the lowett branclies iffue long roots, which hang don.a to the water, and penetrate into the carth. In this pofition they refemble fo many arcades, foun five to ten feet high, which ferve to lupport the body of the tree, and even to advarice it dilly into the bed of the water. Thefe arcades are fo edofely intertwilted one with another, that they form a kind of natural and tranfparent terrace, railed with fuch folidity over the watcr, that one might walk upon them, were it not that the branches are too mudzencumbered with leaven. 'I le meit natural way of propagating thefe trecs, is te fuller the feveral flender fmall thluments which iffue from the main branches to take rout in the carth. The mout common method, however, is that of laving the finall lower Lranches in balkets of mould or earth till they have taken root.
! he defeription juf given pertains chiefy to a particulas frecics of inangore, termed by the Wefl Indian:
that once at a hunting match he faw the point of a rhinoceros's horn broken off by a mufket-hat; the confequence of which was, that the creature was for a moment deprived of all appearance of lif.:

\section*{R H O} pliant hen areen, and mencrally ufed in the k- In, phen when, and generally ufed in the Whet Indin foncs for tammer of leather. Detow this bark les tender. The wood is notaly of the fame colour as the bark; hard pliant, and very lieary. It is frequently ulud for fleet, for which puppofe it is faid to be remarkably proper: the fires which are made of this wood being both ciarer, more ardent and durable than thofe made of any otier materials whatever. - The wood is compact; almol incorrupible; werer fplinters ; is eafily worked; and were it net for its enormous weight, would be commodiouly employed in almolt all kinds of work, as it poffefics every property of good timber. To the roots and brancles of mangroves that are immerfed in the water, oytters frequently attach themdelves; fo that wherever this cmious plant is found growing on tne fea-lhore, oviter-fifhing is very eafy'; as in fueh cales thefe thell-tifh may be literally faid to be gathered upon trees.

The red mangle or mangrove grows on the feafhore, and at the mouth of large risers; but does not advance, like the fommer, into the water. It generally rifes to the height of 20 or 30 feet, with crocked, knotty buanches, which proceed from all parto of the trunk. The bank is fiender, of a brown colum, and, when young, is fnooth, and adheres very clofely to the wood; but when old, appears quite craclied, and is eaflly dutached from it. Under this bark is a fkin as thick as parchment, red, aad adhering clofly to the wood, from which it cannot be ditached till the tree is felled and dry. The wood is hard, compact, heary, of a deep red, with a very fine grain. Ithe pith or heart of the wood being cut into fmall pieces, and boiled in water, imparts a very beantitul red to the liquid, which communicates the fame culour to wool and linen. The great weight and harducfs of the wood prevents it from being generally ufed. From the fruit of this tree, which, when ripe, is of a violet colour, and refembles fome grapes in tatte, is prepated an arreeable liquor, much efteemed by the inhabitants of the Caribbee illands.

White mangle, fo termed from the colour of its wood, grow, like the two former, upon the lanks of rivers, but is feldom fourd near the fa. The bark is grey; the word, as we lave faid, white, and when green, fupple; but dries as foon as cut down, and becomes very light and brixtle. This fpecies is generally called ropu-mingroze, from the ufe to which the bark is applied by the inhabitants of the IVert Indies. This bark, which, by reafon of the great abundance of fap, is ealily detached when g een from the wood, is beaten or bruifed betwixt two dtones, until the hard and woody part is totally feparated from that which is foft and tender. This laft, which is the true cortical fubitance, is twifted into ropes of all fizes, which are exccedingly ftrong, and not apt to rot in the water.

RHODES, a celebrated illand in the Archipelago, the larget and molt eafterly of the Cyclades, was known in ancient times by the names of jleria. 0. phiufu, E:hran, Trinacria, Corymiza, Pueff, Abzlyria, Marcin, O'oeffa, Stadia. Telchinis, Pelagin, aud Rbudus. In later ages, the name of Kloo'ius, or Rhodes, prevailed, from the Greek word rbodon, as is commonly fup-
\(2: 5] \quad \mathrm{R} \quad \mathrm{H} \quad\)
piserel, fignifying a "rofe;" the illand abounding very Rhodemuch with thife flowers. Others, however, give different etymologies, amonr which it is difficult to find one preferable to another. It is about 20 miles diftant from the coafts of Lycia and Caria, and about 120 miles in compafs.

Several ancient authors aflert, that Rholes was for-Its origin merly covered by the fea, but gradually raifed its head above the wawts, and became ant ifland. Delos and Rhodes (fays Pliny), illands which have long been * "riny,
 is fupported by fuch a vaniety oi othe: evidence as render it indubitable. Plizof aferibes the event to the + Pbiong decreafe of the waters of the ccean. If his conjecture Windo. be nor without foundation, molt of the intes of the Archipclago, being lower than Rhodes, muit have had a finilar origin. Fut it is much more probable that the voleanic fres, which in the fourth year of the 135 th O lympiad, raifed Therafii and Thera, known at prekent by the name of ourterin, from the deptlis of the fea, and have in one day; hrown out leveral fmatl ifhands adjacent, alfo inviuced in fome ancient ers Rhudes and Delos.

The frit inhabitants of Rhodes, according to Dio- Frrt irthadurus Sicilus, were called the Telchina, who came originally from the illand of Crete. Thefe, by their naill in athol gy, perceiving that the iflond was foon to be drowned with water, left their habitations, and made room for the Helindes, or grandions of Phcebus, who took poffeffon of the ifland after that god had cleared it from the water and mud with which it was overwhemed. Thef Huliades, it feems, excelled all other men in learning, and efpecially in aftrology; invented naviuation, \&c. In after ases, hov:ever, being infelted with grtat ferpents which bred in the illand, they had recuurfe to an oracle in Delos, which advifed then to admit Phorbas, a Theffalian, with his folluwers, into Rhodes. 'This was accordingly done; and Phorbas having deftroyed the ferpents, was, after his deatli, honoured as a demigod. Afterwards a culony of Cretans fettled in fome part of the inand, and a little before the liojan war, Tlepolinius the fon of Hercules, who was made king of the whole inland, and governed with great juitice ahd moderation.

After the Trojan war, all the ancient inhabitants nriven owe were dri en out by the Dorians, who continued to be by the Domatters of the intind for many ages. The government titns. was at firft monarchical; but a little before the expedition of Xerses into Creece, a republican form of government was introduced; during which the RR.odians applied themflves to navi ration, and became very powerfal by fea, planting feveral colonies in dikant countries. In the time of the Peloponnefian war, the republic of Rhodes was rent into two factions, one of which faroured the Athenians, and anuther tite Spartans; but at length the latter prevailing, democracy was abclithed, and an arifucracy introduced. Abour
35 1 B. C. we find the Rhodians oppreffed by Maufolas king of Caria, and at lait recuced by Artemifia his widow. In this cmergency, they applied to the Athenians; by whote affitance, probably, they regained their liberty.

From this time to that of Alexander the Great, the Surmit to Rhodians enjoyed an uninterrupted tranquillity. Io xanre-, him they voluntarily fubmitied; and witre on that ac- of e: his court death.

\section*{R H O}

Rhateo. count highly favoured by him : but no fooner did they hear of his death, than they druve out the Macedonian yariins, and onee mope bucame a free people. Ahout this time happened a dreadtul inundation at Rhodes; which, heing accomparied with violent Itorms of aain,

凸
Violent i.:-
 Rhodes. and liailtones of an extraordinary bignees, beat donva many h oufes, and hilled geeat numbers of the inhablitants. As the city was built in the form of an amphitheatre, and no care had been taken to clear the pipes and conduits which conveyed the water into the fea, the lower pa:ts of the city were in an inflant laid under water, feveral homifes quite convered, and the inlabitants drowned before they could get to the higher places. As the deluge increafed, and the violeat fhowers continued, fome of the inhabitants made to their flupse, and abasduned the place, white others miferably pirithed in the waters. But while the city was thus threatened wit's utter defruction, the wall on a fudden built afin!er, and the water difeharging itfelf by a violent current into the fei, unexpected! \(y\) delivered the inhabitants from all danger.

The Rhodians fuffered greatly by this urexpected accident, l,mt foon retrieved their lofes by a clofe ap. plication to trade. During the wars which tonk phace amony the fuccuffors of Alexander, the Rhodians obfersed a flectict neutrality; by which means they emriched themfelves fo muth, that Rhodes became one of the moft opulent flates of that age ; infomech that, for the common good of Grecse, they undertonk the piratic sear, and, at their own charge, cleared the feas of the pirates who had for many years inftled the coats of
rife"e ence Emrope and Afia. Huwecer, motwithtanding the neu-
*wih Anti- trality they profefed, as the molt advantageous branchgo:1us.
age at that tine, he committed the whole managenent of the war to his fon 1)emetrius, who appeared before the city of l'hodes with 200 mips of war, 170 tranfpoits having on board to,000 men, and 1000 otlier fiveng veffels laden with prowilions and all forts of warlike en. D.n: gines. is Rhodes had enjoyed for many years a pro. found tranunillity, and been free from all devaltations, the expectation of booty, in the plunder of fo wealthy a city, allured multitudes of pirates and mercenaries to join Demerrius in this expedition; infomuch that the whole fea between the contment and the ifland was covered with hips; which throck the Rhodians, who hat a profpect of this mighty armada from the walls, with great terror and conflemation.

Demetrius, having landed his troups without the reach of the cnemy's machines, detached feveral fmall bodies to lay walte the country romnd the city, and cut down the trees and groves, cmploying the timber, and matwials of the boufes without the walls, to fortify his camp with Itrong rampats ind a treble palifale; which work, as many hands were employed, was finifhed in a few days. The Rhodians, oa their part, prepared for a vigorous defence. Many great commanders, who frad lignalized themfelves on other occafions, threw themfelves into the city, being defirous to try their Kkill in military affairs againf Demetrius, who was duf reputed one of the mofl experienced captains in the condnct of freges that antiquity had produced. The belieged began with difinilines from the city all fuch perfons as were ufelefs; and then taking an account of thofe who were capable of bearing arms, they found that the citizens amounted to 6000 , and the foreigners to 1000 . Liberty was promifed to all the flaves who fhould diftinguith themfelves by any glorious action, and the pulbic enyaged to pay the matters their full ranfom. A proclamation was likewife made, declaring, that whoever died in defence of their conntry fhonld be buried at the expence of the public; that his parents and children fhoukd be maintained out of the treafury; that fortunes Rhould be given to his daughters; and his fons, when they were grown up, fhonld be crowned and prefented with a complete fuit of armour at the great folemnity of Baechus; which decree kindled an incredible ardour in all ranks of men.
D.metrius, having planted all his engines, began to Eqgi batter with increditle fury the walls on the fide of the havbour ; but was for einflat days fucceffively repulfed by the befieged, who fet fire to mof of his warlike engines, and thereby oblised hims to allow them fome refpite, which they made good ufe of in repairing the breaches, and building new walls where the old ones were cither weak or low. When Denetrius had repaired his engines, he ordercel a general affault to be made, and caufed his troops to adwance with loud fhouts, thinking by this means to trike terror into the eneny. But the befleged were fo far from leeing intimidated, that they repulfed the argreffors with great flaughter, and performed the in ft altonithing feats of hravery. Demetrins returned to the affalt next day ; but was in the fame mamer forced to retire, after laving loft a great number of men, and fome officers of diflinction. He had feized, at his firt londing, an eminence at a firall diftance from the city; and, having fortified this adrantageous poit, he caufed fereral batteries to be erected there, with engines, which inceffantly difcharged
theder gaint the walls ftones of iso pounds weight. The towers, being thus furiouly battered night and day, began to totter, and feveral breaches were opened in the walls: but the Rhodians, unexpectedly fallying out, drove the enemy from their poft, overturned their machines, and made à morl dreadful harock ; infomuch that iome of them retired on board their veffela, and were with much ado prevailed upon to come afhore

\section*{again. \\ 'is \\ reraldef- Demetrits now ordered a fcalade by fea and land at} rate af- the fame time; and fo employed the belieged, that ults with they were at a lofs what place they fhould chiefly defend. The attack was carried on with the utmoft fury on all fides, and the befieged defended themfelves with the greateft intrepidity. Such of the enemy as advanced firf wete thrown down from the ladders, and miferably bruifed. Several of the chief officers, having mounted the walls to encourage the foldiers by their example, were there either killed or taken prifoners. After the combat had lafted many hours, with great תlaughter on both fides, Demetrius, notwithftanding all his valour, thought it neceflary to retire, in order to repair his engines, and give lis men fome days ret.

Demetrius being fenfible that he could not reduce the city till he was mafter of the port, after having refrefhed his men, he returned with new vigour againft the fortifications which defended the entry into the harbour. When he came within the caft of a dart, he caufed a valk quantity of burning torches and firebrands to be thrown mito the Rhodian fhips, which were riding there; and at the fane time galled, with dreadful mowers of darts, arrows, and flones, fuch as offered to extinguith the flames. However, in Spite of their utmolt efforts, the Rhodians put a flop to the fire ; and, having with great expedition manned three of their ftrongeft fhips, drove with fuch violence againft the veffels on which the enemy's machines were planted, that they were fhattered in pieces, and the engines difmounted and thrown into the fea. Exceftus the Rhodian admiral, being encouraged by this fuccefs, attacked the enemy's fleet with his three thips, and funk a great many veffels; but was himfelf at laft taken prifoner: the other two veffels made their efcape, and regained the port.

As unfortunate as this lat attack had proved to Demetrius, he determined to undertake another ; and, in order to fucceed in his attempt, he ordered a macline of a new insention to be built, which was thrice the height and breadth of thofe lie liad lately loft. When the work was finihed, he caufed the engine to be placed near the port, which he was refolved, at all adventurcs, to forec. But as it was upon the point of entering the harbour, a dreadful ftorm ariting, drove it againft the fhore, with the veffels on which it lad been reared. The befieged, who were attentive to improve all favourable conjuncures, while the tempeft was ftill raging, made a fally againt thofe who defended the emisence mentioned above; and, though repulfed feveral times, carried it at laft, obliging the Demetrians, to the number of 400 , to throw down their arms and fubmit. After this victory gained by the Rhodians, there arrived to their aid iso Gnof. hans, and \(; 00\) inen fent by Ptolemy from \(E_{g y p t}\) mof

Vol. XVI. Part I.
of them being natives of Rhodes, whe had ferved among the king's troops.

Den:etrius being extremely mortifed to fee all his batteries againft the harbour rendered ineffectual, refolved to employ them by land, in hopes of earrying the city by affault, or at leaft reducing it to the ne- is ceffity of capitulating. With this view, having got Demeerius together a valt quantity of timber and other mate-new ma. rials, he framed the famous engine called belepolis, chine calle which was by many degrees larger than any that had belepolis. ever been invented before. Its bafis was fquare, each fide being in length near 50 cubits, and made up of Iquare pieces of timber, bound together with plates of iron. In the middle part he placed thick planks, about a cubit diftance from each other; and on thefe the men were to fand who forced the engine forward. The whole was moved upon eight ftrong and large wheels, whole felloes were Atrengthened with frong iron plates. [n order to tacilitate and vary the movements of the helepolis, cafters were placed under it, whereby it was turned in an inftant to what fide the workmen and engineers pleafed. From each of the four angles a large pillar of wood was carried to about the height of 100 cubits, and inclining to each other; the whole machine confifting of nine ftories, whofe dimenfons gradually leffened in the afcent. The firf ftory was fupported by 43 beams, and the lat by no more than nine. Three fides of the machine were plated over with iron, to prevent its being damaged by the fire that might be thrown from the city. In the front of each ftory were windows of the fame fize and fhape as the engines that were to be difcharged from thence. To each window were fhutters, to draw up for the defence of thofe who managed the machines, and to deaden the force of the ftones thrown by the enemy, the fhutters being covered with kins ftuffed with wool. Every fory was furnifhed with two large faircafes, that whatever was neceffary might be brought up by one, while others were going down by the other, and fo every thing may be difpatched without tumult or confution. This huge machine was moved forwards by 3000 of the ftrongelt men of the whole army; but the art with which it was built greatly facilitated the motion. Demetrius caufed likewife to be made fereral teftudoes or pent.houfes, to cover his men while they advanced to fill up the trenches and ditches ; and invented a new fort of galleries, throurh which thofe who were employed at the fiege might pals and repars at their pleafure, without the leaft danger. He employed all his feamen in levelling the ground over which the machines were to be brought up, to the fpace of four furlongs. The number of workmen who were employed on this oecafion amounted to 30,000.
In the mean time, the Rhodians, obferwing thefe formidable preparations, were buly in raifing a new wall within that which the enemy intended to batter with the helepolis. In order to accomplifh this work, they pulled down the wall which furrounded the theatre, fome neighbouring boufes, and even fome temples, af. ter having folemnly promiled to build more magnifcent ftructures in honour of the gods, if the city were preferved. At the fame time, they fent out nine of their beit Mips to feize fuch of the enemy's veffels as they could meet with, and thereby ditrefs them for \(\mathrm{E} \in\) waix
> \({ }^{2} 3\) The Rhe: dians raife new wall

Whate. want of provifions. As thefe thips were commanded by their bravelt fea-officers, they foon returned with an immenfe booty, and a great many prifuners. Ansung other vefleds, they took a galley richly laden, on hoard of which they found a great variety of valuable furniture, and a roya! robe, which Phila herfelf had wrought and fent as a prcfent to her hufband Demetrius, accompanied with a letter written with her own hand. The Rhodians fent the furniture, the royal robe, and even the ietter, to I'tolemy; which exafperated Demetrius to, a great degree.

While Demetrius was preparing to attack the city, the Rhodians having affembled the people and magifratics to confult ahout the meafures they foould take, fome propofed in the affembly the pulling down of the flatues of Lutigonus and his fon Demetrins, which till then had been held in the utmont veneration. But this propofal was generally rejected with indignation, and their pudent conduct greatly allayed the wrath both of Antigonus and Demetrius. Huwever, the latter continued to carry on the fiege with the utmoft vigour, thinking it would refect no fmall difhonour

It Thew al!: und rman-d with iuse fuccefo, on him were hic obliged to quit the place without making himfelf mafter of it. He caufed the walis to be fecretly undermined: but, whea they were ready to fall, a deferter very opportunely gave notice of the whole to the townimen; who having, with all expedition, drawn a decp trench all along the wall, began to countermine, and, meeting the enemy under grouad, obliged them to abandon the work. While both parties guarded the mines, one Athemagoras a Mikefian, who had been fent to the affiftance of the Rhodians by Ptolemy with a budy of mercenaries, promifed to betray the city to the Demetrians, and let them in thro' the mines in the night time. But this was only in order to enfinare thein; for Alexander, a noble Macedonian, whom Demetrius had fent with a choice bod; of troops to take poffeffion of a poft agreed on, no fooner appeared, but he was taken prifoner by the Rhodians, who were waiting for bim under arms. Athenagoras was crowned by the fenate with a crown

Demetrius now gave over all thoughts of undermining the walls, and placed all his hopes of reducing the city in the battering engines which he had con- trived. Having therefore levelled the ground under the walls, he brought up his helepolis, with four teftudoes on each fide of it. Two other teftudoes of an extriordinary fize, bearing battering-rams, were likewile moved forwards by 1000 men. Each ftury of the helepolis was filled with all Corts of engines for difcharging of fones, arrows, and darts. When all things were ready, Demetrius ordered the fignal to be given; when his men, fetting up a thourt, affauted the city on all fides buth by fea and land. But, in the heat of the attack, when the walls were ready to fall by the repeated ftrokes of the battering-rams, am. baffadors arrived from Cnidus, earnellty foliciting Iemetrius to fufpend all further hoftilities, and at the fame time giving him hopes that they fould prevail upon the Rhadians to fubmit to an honourable capiculation. A fufpenfion of arms was accordingly agreed on, and ambaffadors fent from both fides. But the Rhodians refufing to capitulate on the conditions of. fered them, the attack was renewed with fo much fury,
and the machines played off in fo brifk a manner, that a large tower built with fquare flones, and the wall that flanked it, were battered down. The befieget, neverthelefs, fought in the breach with fo much conrage and refolution, that the enemy, after varions unfuccefsiul attempts, were forced to abandon the enteprife, and retire.
In this coujuncture, a fleet which Ptolemy had freighted with 300,000 meafures of corn, and differeat kirkls of pulfe for the ufe of the Rhodians, ar-fieged rerived very feafonably in the port, nothwithfanding the fuipl. of virilance of the eneny's mips, which cruized on the provifions coalts of the ifland to furprife them. A few days and fet th atcer canie in fafe two other fleets, one fent by Caf enenyines on fander, with ic0,0 o bufhels of barley; the other fite. by Lyfimachus, with 400,000 buffels of corn and as many of barley. This feafonable and plentiful fupply arriving when the city hegan to fuffer for want of provilions, infpired the beteged with new courage, and raifed theeir drooping fpirits. Being thus animated, they forned a defign of fetting the enemy's engines on fire; and with this view ordered a budy of mea to fally out the aight enfuing, about the fecond watch, with torches and firebrands, having firt placed on the walla an incredible number of-engines, to difcharge ftures. arrows, darts, and firc-balls, agarnit thofe who fhould attempt to opphe their detachment. The K.hodians troups, purfuant to their orders, all on a fudden fallied out, and advancing, in fpite of all oppolition, to the batteries, fet them on fire, whine the engines from the walls played inceffantly on thofe who endeavoured to extinguifl the flames. The Denzetrians on this occalion fell in great numbers, beins incapable, in the darknefs of the night, either to fee the engines that continually dif. charged thowers of ftones and arrows upon them, or to join in one body and repulife the eneny. The conflagration was fo great, that feveral plates of iron falling from the helepolis, that valt engine would have been entirely confumed, had not the troops that were fationed in it with all polfible fpeed quenched the fire with water, before prepared, and ready in the apartments of the engine againit fuch accidents. Demetrius, fearing lett all his machines fhould be confumed, called together, by found of trumpet, thofe whofe province it was to move them ; and, by their help, brought them off before they were entirely deftroyed. When it was day, he commanded all the darts and arrows that had been fhot by the Rhodians to be carefully gathered, that be might from their number form fome judgement of the number of machines in the city. Above 800 firebrands were found on the fpot, and no fewer than 1500 darts, all difcharged in a very fmall portion of the night. This flruck the p:ince himfelf with no fmall terrer; for he never imagined that they would have been able to bear the charges of fuch formidable preparations. However, after having cauled the flain to be buried, and given directions for the curiug of the wounded, he applied himfelf to the repairing of his maclines, which had been difmounted and rendered quite unferviceable.
In the mean tive, the befieged, improving the refpite They build allowed them by the removal of the machines, built \(a^{\text {a third }}\) third wall in the form of a crefcent, which took in all wadl. that part that was molt expofed to the enemy's batteries; and, befides, drew a deep treach behind the

\section*{\(\mathrm{R} \mathrm{H} \mathrm{O}\left[\begin{array}{ll}219\end{array}\right] \quad \mathrm{il} \mathrm{H} \mathrm{O}\)}
hode breach, to prevent the enemy from entering the city that way. At the fame time, they detached a fquadron of their beft fiips, under the command of Amyntas, who made over to the continent of Afia; and there meeting with fome privateers who were commifinoned by Demetrins, took hoth the thips and the men, among whom were I imocles the chief of the pirates, and teveral other officers of diflinction belonging to the fleet of Demetrius. On their return, they fell in with fereral veffels laden with corn for the enemy's camp, which ther likewife took, and brought into the port. 'There were foon followed by a numerous fleet of fmall veffels loaded with corn and provifons fent them by l'toleny, together with 1500 men, commanded by Antigonus a Macedonian of great experience in military affairs. 1)emetrius, in the mean time, having repaired his machines, brought thern up anew to the walls: which he ineelfantly battered till he opened a great breach and threw down feveral towers. But when he came to the affault, the Rhodians, under the command of Aminias, defended themfelves with fuch refolution and intrepidity, that he was in three fuceffive attacks repulfed with great flaughter, and at latt forced to retire. I'he Rhodians likewife, on this occafion, loft feveral officers; and amongf others, the brave Aminias their commander.

While the Rhocians were thus fignalizing themfelves in the defence of their country, a fecond embaffy arrived at the camp of Demetrius from Athens and the other cities of Greece, fuliciting Demetrius to comipofe matters, and ftrike up a peace with the Rhodians. At the requeft of the ambaffadors, who were in all ahove 50 , a ceffation of arms was agreed upon; but the termes offered by Demetrius being anew rejected by the Rhodians, the ambaffadurs returned home without being able to bring the contending parties to an agreement. Hoftilities were thenefore renewed; and Demetrius, whofe imagination was fertile in expedients for fucceeding in his projects, formed a detaehment of 1500 of his beft tronps, under the conduet of Alcimus and Miancius, two officers of great refolution and experience, ordering them to enter the breach at midnight. and, forcing the entrenchment behind it, to poifefs themfelves of the polts about the theatre, where it would be no difficult matter to maintain themfelves againla any efforts of the townimen. In order to facilitate the execution of fo important and dangerous an undertaking, and amufe the enemy with falfe attacks, he at the fame time, upon a fignal given, ordered the reft of the army to fet up a fhout, and attack the city on all fides both by fea and land. By this means the huped that, the befieged being alarmed in all parts, his detachment might find an upportunity of forcing the entrenchments which covered the breach, and afterwards of feizing the advantageous poll about the theatre. This feint had all the fuccefs the prince could expect; for the troops having fet up a fhout from all quarters, as if they were advancing to a general affaul, the detachment commanded by Alcimus and Mancius entered the breach, and fell upon thofe who defended the ditel, and the wall that covered it, with foch vigour, that, having hain the mott part of them and put the reft in confufion, they advanced to the theatre, and feized on the polt adjoining :o it. This accifioned 2 geaeral uproar in the city, as if it had been
aiready taken: but the commanding officers difpatched
Rhindes orders to the foldiers on the ramparts not to quit their polts, nor flir from their refpective flations. Havins thus fecured the walls, they put themfelves at the head of a chofen body of their own troops, and of thofe who were lately come from Egyjt, and with thefe charged the enemy's detachment. But the darknefs of the night prevented them from diflodging the enemy and re. gaining the advantageous polts they had feized. Day, however, no fooner appeared, than they renewed their attack with wonderful bravery. The Demetrians without the walls, with loud Mouts endeavoured to animate thofe who lad entered the place, and infpire them with refulution to maintain their ground till they were reliesed with frefh troops. The Rhodians being fenlible that their fortunes, liberties, and all that was dear to them in the world, lay at ftake, fought like men in the utmoft defpair, the enemy defending their pofts for feveral hours without giving ground in the lealt. At length the Rhodians, encouraging each other to exert themelves in defence of their country, and animated by the example of their leaders, made a laft effort, and, breaking into the very heart of the enemy's battalion, But 20 there But are all there killed both their commanders. After their deathkilled or the rell were eafly put in diforder, and all to a mantaken. either killed or taken prifoners. The Rhodians like. wife on this occafion loft many of their beft commanders; and amons the reft Damotetis, their chief magiftrate, a man of extraordinary valour, who had fignali. zed himfelf during the whole time of the fiege.

Demetrius, not at all difcouraged by this check, was making the neecflary preparations for a new atault, when he received letters from his father Antigonus, enjoining him to conclude a peace with the Rhodians upon the beft terms he could get, left he hould lofe his whole amy in the liege of a lingle town. From this time Demetrius wanted only fome plauible pretence for breaking up the fiege. The Khodians likewife were now more inclined to come to an agreement than formerly ; Ptolemy having acquainted them that he intended to fend a great quantity of corn, and 30:0 men to their affiftance, but that he would firit have them try whether they could make up matters with Demetrius upon reafonable terms. At the fame time ambaffadors arrived from the Etolian republic, foliciting the contending patties to put an end to a war which might invulve all the eaft in endlefs calamities.

An accident which happened to Demetrius in this The F.ele. conjuncture, did not a little contribute towa:ds the polis ren-wifhed-for pacification. 'lhis prinee was pieparing to dered ufe advance his helepolis agaiutt the eit \(\gamma\), when a Rhodian lefo engineer found means to render it quite ufelefs. He undermined the tract of ground urer which the lelepulis was to pafs the next day in order to approneh the walls. Demetries, not fufpecting any itratagem of this nature, caufed the ensine to be muved forward, which comins to the place that was undermine \({ }^{\text {d }}\) funk fo deep into the ground that it was impoflible to draw it out again. This misfortune, if we believe Vegetius and Vitrusius, determined Demetrius to hearken to the Fecolian ambafladors, and at latt to drrike up a peace upon the fol-
luwing conditions: That the republic of Rhodes fioud be maintained in the full enjoyment of their ancient rights, privileges, and liberties, without any foreigw garrifon; that they fhould renew their ancictit alliance

\section*{R H O}

Qhosee with Antigoms, and aflitt him in his trars againft all Itates and princes except Ptolemy king of Egypt ; and that, for the effectual perfornanece of the articles ftipulated between them, they fhould deliver 100 hoflages, fuch as Demetrius thould make choice of, except thofe who bore any public employment.

Thus was the fiege raifed, after it had continued a whole year; and the Rhodians amply rewarded all thofe who had diftinguifhed themfelves in the fervice of their country. They alfo fet up flatues to l'tolemy, Caffander, and Lyfimachus; to all of whom they paid the higheft honours, efpecially to the firlt, whom they worhipped as a god. Demetrius at his departure preCented them with the hilepolis, and all the other machines which he had emplojed in battering the city; from the fale of which, with fome additional fums of their own, they erected the famous cololus. After this they applied thenfelves entirely to trade and navigation ; by which means they became quite mafters of the fea, and much more opulent than any of the neighbouring nations. As far as lay in their power, they endeavoured to preferve a neutrality with regard to the jurring nations of the eaft. However, they could not avoid a was with the Byzantines, the oecafion of which was as follows: The Byzantines being obliged to pay a vearly tribute of 80 talents to the Gauls, in order to raife this fum, they came to a refolution of laying a toll on all hips that traded to the Pontic fea. This refolution provoked the Rhodians, who were a trading nation, above all the reft. For this reafon they immediately difpatched anibaftadors to the Byzantines, complaining of the new tax ; but as the Byzantines had no other method of fatisfying the Gauls, they perfitied in their refolution. The Rhodians now declared war, and prevailed upon Prufias king of Bithynia, and Attalus king of Pergamus, to afift them; by which confederacy the Byzantines were fo intimidated, that they agreed to exact no toll from thips trading io the Pontic fea, the demand which had been the occafion of the war.

About this time happened a dreadful carthouake, which threw down the coloffus, the arfenal, and great part of the city-walls of Rhodes; which calamity the Rhodians improved to their advantage, fending ambaffadors to all the Grecian princes and flates, to whom their loffes were fo much exaggerated, that their countrymen obtained immenfe fums of money under pretence of repairing them. Hicro king of Syracufe prefented them with 100 talents; and, belides, exempted from all *)lls and duties fuch as traded to Rhodes. Ptoleny king of Egypt gave them Icotalents, a millien of meafures of wheat, materials for building 20 quinqueremes and the like number of triremes; and, befides, fent them 100 architects, 300 workmen, and materials for sepairing their public buildings, to a great value, paying them moreover 14 talents a-year for the maintesance of the workmen whom he fent them. Antigonus gave them 100 talents of filver, with 10,000 pieces of timber, each piece being 16 cubits long; 7000 planks; \(3 c 0\) pounds of iron, as many of pitch and refin, and 1000 meafures of tar. Chryfeis, a woman of diftinetion, fent them 100,000 meafures of wheat, and 3000 pounds of lead. Antiochus exempted from all taxes and duties the Rhodian hips trading to his dominuins; prefented them with 10 galleys, and 200,000

\section*{220 ] \\ R H O}
mealures of corn, with many other things of great value. Prufias, Mithridates, and all the princes then reigning in Alia, made them proportionable prefents: in Mort, all the Greek towns and nations, all the princes of Europe and A fia, contributed, according to their ability, to the relief of the Khodians on that occafion ; infumach that their city not unly forn rofe from its ruins, but athaned to an ligher piten of fplendor than ever.

In the year 203 B . C. the Rhodians engaged in a war wit war with Yhilip of Macedon. This monarch had inva-thilip wis ded the territuries of Attalus king of P'ergamis; and Mascion becaufe the Rhodians feemed to farour their ancient friend, fent one Heraclides, by birth a Tarentine, to fet fire to their fiect ; at the fane time thet, Ee dipat, he ed ambaffadors iuto Crete, in order to ftir up the Cre. tans arainft the Rhodians, and prevent them from ferding any aftiftanee to Attius. Upon this war was immediatdy proclaimed. Philip at imt ganed an inconfiderable advantage in a naval engagement; but the nest year was defeated with the lols of \(t 1,=00\) men, while the Rhodians lof but 60 men and Attalus 70. After this he carefally avoided coming to an engagement at fea either with Attalas or the Rhodians. "The conbined feet, in the mean time, failed towards the inand of Aegina in hopes of intercepting lim : but having failed in their purpofe, they-failed to Athens, where they coneluded a treaty with that people; and, on their return, drew all the Cyclades into a confederacy againt lhalip. But while the allies were thus wafting their time in negociations, Philip, having divided his fores intu two budies, fent one, under the command of Philocles, to ravage the Athenian tcrritorics; and put the other aboard his fleet, with orders to fail to Meronea, a city on the north fide of Iharace. He then marched towards that city himfelf with a body of forces, took it by affault, and reduced a great many others; fo that the confederates would, in all probabiiity, have had little reafon to boalt of their fuccefs, lad not the Romans come to their affitance, by whofe help the war was foon terminated to their advantage. In the war which took place between the Romaus and Antiochus the Great king of Syria, the Rhodians were very ufeful allies to the forme:. The beft part of their feet was indeed deftroyed by a treacherous contrivance of Polyweniades the Syrian admir ral ; but they foon fitted out another, aud defeated a Syrian firadron commanded by the celebrated Hannibal, the Carthaginian commander; after which, in conjunction with the Romans, they utterly deleated the whole Syrian Acet commanded by Yolyxeniades; which, together with the lofs of the battle of Maynefia, fo difpirited Antiochus, that be fubmitted to whatever conditions the Romans pleafed.

Fur thefe fervices the Rhodians were rewarded with the provinces of Lycia and Caria; but tyrannizing over the people in a terrible manner, the Lycians applied to the Romans for protedion. This was readily. granted; but the Rhodians were fo much difpleafed with their interfering in this matter, that they fecretly favoured Perfes in the war which broke out between him and the Roman republic. For this offence the two provinces above-mentioned were taken frum them; but the Rhodians, having banifhed or put death thofe who had favoused Perfes, were again admitted into fa.

\section*{R H O}
rour, and greatly honoured by the fenate. In the Mi thridatic war, their alliance with Rome brought upon them the king of Pontus with all his force; but having lof the greatelt part of his fleet before the city, he was obliged to raife the frege without performing any remakable exploit. In the war which Pompey made on the Cilician pirates, the Rhodians affitted him with all their naval force, and had a great Thare in the vietories which he gained. In the civil war betwcen C far and Pompey, they affited the latter with a very numerons Rect. After his death they lided with Cefar ; which drew upon them the refentinent of C. Caflins, who advanced to the inand of Rhodes with a powerful fleet, after having reduced the greatelt part of the contincut. The Rhodians, terrified at his approach, fent ambaffadors intreating him to make up mutters in an amicaole manner, and promifing to fland veuter, and recal the hips which they had fent to the affitanee of the trium. viri. Caffins infifted apon their delivering up their fleet to him, and putuing him in poffeffon both of their harbuur and city. This demand the Rhodians would by no means comply with, and therefore began to put themfelres in a condition to ftand a liege; but frot fent Archelans, who had taught Caflus the Greck tongue white he tudred at Rhodes, to intercede with his difciple in their behalf. Archelaus could not, with all his anthority; prevail upon him to moderate his demands; wherefore the Rhodians, having created one Alexander, a bold and enterpriang man, their pretur or prytanis, squipped a fleet of 33 fail, and fent it out under the command of Mnafeus, an experierwed fea officer, to offer Caffus battle. Buth feets fought with incrediole bravery, and the victory was long doubtful: ©ut the Rhodians, being at length overpowered by nembers, were forced to return with their flect to Rhodes; two of their thips being funk, and the rett very much damaged by the heavy fhips of the Romans. This was the firit time, as our author obferves, that the Rhodians were fairly overcome in a fea-fight.

Caffine, who had beheld this fight from a neighbouring hill, having refitted his fleet, which tad been no kfis damaged than that of the Rhodians, repaired to Loryma, a ftronghold on the continent be'onging to the khudiaus. 'This caftle he took by allaut ; and from hence conveyed his land-forces, under the condues of Fannius and Lentulus, over into the ifland. His feet conlilled of 80 fhips of war and above 200 tranlports. The Risudiaus nu fooner law this mighty deet appear, but they went out again to mect the eueny. Thie feeund engagement: was far mu:e bloudy than the firll ; many fhips were funk, and great numbers of men killed on both fides. But victury anew declared for the Romans; who immediately blocked up the eity of Rhodes both by fea and land. As the Rhodians had not had time to furnifh the city with fufficient fore of provifions, fone of the inhabitants, fearing that if it were taken either by aflaut or by famine, Caffius would put all the inhabitants to the fword, as Brutus had lately done at Xanthus, privately opened the gate to slig him, and put him in poffeffion of the town, whieb he the neverthelefs treated as if it had been aken by alfault. He commanded 50 of the chief citizens, who were fufpected to favour the adverfe party, to be brought before him, and fentenced them all to die; others, to the number of 25 , who had commanded the fleet or army
becaufe they did not appear when fummoned, he pro- Rhodea fcribed. Having thus punifhed fuch as had either acted or fpoken againtt him or his party, he commanded the Rhodians to deliver up to him all their fhips, and whatever money they had in the public treafury. He then plundered the temples; fripping them of all their valuable furniture, veffels, and ftatues. He is faid not to have left one fatue in the whole city, except that of the fun; bragging, at his departure, that he had Atripped the Rhodians of all they had, leaving them nothing but the fan. As to private perfons, be commanded them, under fevere peralties, to bring to him all the gold and filver they had, promifing, by a public crier, a tenth part to fuch as hould difcover any hidden treafures. The Rhodians at firlt concealed fome part of their wealth, inagining that Caffius intended by this proclanation only to terrify them; but when they found be was in earneft, and faw feveral wealthy citizens put to death for concealing only a finall portion of their riches, they defired that the time prefixed for the bringing in their gold and filver might be prolongtd. Cahlus willingly granted then their requett; and then throngh fear they dur up what they had hid under ground, and laid at his feet all they were worth is the world. By this means he. extorted from private perfons above 8000 talents. He then fined the city in 500 more; and leaving I. Varus there with a trong garrifon to exact the fine without any abatument, he returned to the continemt.

After the death of Caffus, Mare Antony reftored the Rhodians to their ancient rights and privileges; bellowisg upon them the illards of Andros, Naxos, 'Tenos, and the eity of Myndus. But thefe the Rho dians fo oppreffed and loaced with taxes, that the fame Antony, though a great friend to the Rhodian republic, was obliged to divelt her of the fovereignty orer thofe places, which he had a little betore fo liberally beftowed upon her. From this time to the reizn of the Emperor Claukias we find no mention made of the Rhodians. That prince, as Dion inforres us, deprived them of their liberty for having crucited fome Roman citizens. However, he foon reltored them to their for mer condition, as we read in Suetonins and Tacitus. The latter adds, that they had been as often deprived of, as reftored to, their liberty, by way of punifiment or reward for their difierent behaviour, as they had obliged the Romans with their aflillance in foreign wars, or prosoked them with their feditions ai home. Pliny, who wrote in the beginning of Vefpafian's reifn, fyles Rhodes a beautiful and free toren. But this liberty they Rhodes res. did not long enjoy, the ifland being foon after reduced duced to a by the fame Vefpatian to a Ruman province, and obli- Rrovinee ged to pay a yearly tribute to their new matlers. This Vefpafian. province was called the province of the iflunds. The Roman pretor who governed it refided at Rhodes, as the chief city under his jurifdiction; and Rome, notwithfranding the eminent fervices rendered her ty this republic, thenceforth treated the Rhodians not as allies, but vaffals.

37
The illand of Rhodes continued fubject to the Ro- Expedimans till the reign of the emperor Andronicus; whent Villare: Villaret, grand-matter of the knights of Jerufalem, then villare: refiding in Cyprus, finding himfett much expofed to lter of the the attacks of the Saracens in that ifland, relolved to knights of exchange it for that of Rhodes. This inand too was jeruialeon

\section*{R H O}

Riodes. almontextirly occupied by the Saracens; Andrumicus the callern emperor poitefing little more in it than a eafle. Neverthlefs he refured to grant the invelliture of the illand to Villaret. The latter, without fpending time in fruitefs nerociations, failed direchly for Rhodes, where he landed his troops'; provifions, and warlike itores, in fpite of the oppufition made by the Saracens, who then united againt the common enemy. As Villarct forefaw that the capital ment be taken before he could reduce the ifland, he intantly laid fiege to it. The inhabitants defended themfelves ohltinately, upon which the erand-mafter thought proper to turn the fiege into a blockade; but he foon found himfelf fo clofely furrounded by the Greeks and Saracens, that

32
He connquers the steacenc, and ieduees the ©faluc. fecold get to fupply either of Corage or provifons for his army. But having at length ohtained a fupply of provifions by means of large fums burrowed of the Florentines, he came out of his trenches and attacked the Saracens, with a full refolution cither to conquer or die. A bloody fight enfued, in which a great numher of the braveft knights were killed: but at length the Saracens gave way, and fled to their fhips; upon which the city was immediately affaulted and taken. The Greeks and other Clrittians had their lives and liberties given them, but the Saracens were all cut to pieces. The reluction of the capital was sollowed by that of all the other places of inferior flength throughout the ifland ; and in four years after their landing, the whole was fubjugated, and the conquerors took the title of the Ḱnighus of Rbodes. For many years thofe knights continued the terror of the Saracens and Turks, and fultained a fevere fiege from Mohammed II. who was compclled to ahandon the enterprife; but at length she Turkifh fultan Solyman refolved at all events to drive them from it. Before he undertook the expedition, he feut a meflage commanding them to depart the illand without delay; in which cafe he promifed that nether they nor the inhabitants fhould fuffer any injury, but threatened them with his utmof vengeance if they sefufed his offer. 'The knights, however, proving ohAinate, Solyman attacked the city with a feet of 400 fail and an army of \(1+0,000\) men.
The trenches were foon brought clofe to the counby terfcarp, and a Atrong battery raifed againft the rown; which, however, did hut little damage, till the fultan being informed by a fpy of this particular, and that he was in danger of receiving fome fatal fhot from the tower of St John which overlooked his camp, he planted a battery againf that tower, and quickly bronght it lown. Solyman, however, finding the whole place in loone meafure covered with Atrong fortifications of fuch leeight as to command all his batteries, ordered an immenfe quantity of ftones and earth to be bruught ; in which fo great a number of hands were employed night and day by turns, that they quickly raifed a couple of hillocks high enough to overtop the city-walls. It hey plied then accordingly with fuch a continual fire, that the grand-maiter was obliged to caufe them to be ftrongly propped within with earth and timber. All this while the frefieged, who, from the top of the grand-matel's palace, could difeover how their batteries were planted, demolifhed them with their cannon almolt as faft as they raifed them.

Here the enemy thought proper to alter their meafures, and to plant a flrong battery againat the tower of

St Niclolas, which, in the former fiege by Mohammed, had refilted all the efforts of the then grand-vizier. This the bafhaw of Romania caufed to be battered with 12 large pieces of brafs cannon, but had the murtification to fee them all difmounted by thofe of the tower ; to prevent which in future, he ordered them to he fired ouly in the night, and in the day had them eovered with gabions and earth. "This had fuch fuccefs, that, atter 500 cannon-flot, the wall begran to fhake and tumble into the ditch; but he was furprifed to find another wall behind it, well terraced, and bordered with artillery, and hinfelf ubliged cither to begin afreflh or give up the enterpife: and yet this laft was what Sulyman preferred, when he was told of its being built on a hard rock, incapable of being fapped, and how firmly it had held out againg all the efforts of Muhammed's vizier. The next attack was therefore ordered hy him to be made agaiuft the baftions of the town, and that with a valt number of the largeft arcillery, which continued firing during a whole inonth; fo that the new wall of the haftion of England was quite demolifhed, though the old one Atood proof againtl all their thot. That of Italy, which was battered by 17 large pieces of cannon, was fill worfe damaged ; upon which Martinengo the engineer advifed the grand-mafter to caufe a fally to he made on the tenches of the enemy out of the breach, whilt he was making fref eatrenchments behind it. His advice fueceeded; and the 200 men that fallied out fword in hand having furprifed the Tu:ks in the trench, cut moolt of them in piecest At the fame time a new detachment, which was fent to repulfe them, being ebliged, as that engineer rightiy judged, to pals by a font which lay open to their artithery, were likewife moftly deftroyed by the contiuual fire that came from it, whilft the affailants were employed in filling up feveral fathoms of the trench before they retired. By that time the breach had been repaired with fuch new work:s, that all the efforts to mount it by affault proved equally ineffectual and deAtnctive.

Unfortunately for the beficged, the continual fire pre: they had made canfed fuch a confumption of their pow- ped it der, that they bergan to feel the want of it; the per- owe fidious d'Amarald, whofe province it had been to vifit mean 1 the magazines of it, having amufed the council with meann ha a falfe report, that there was more than fufficient to defiet maintain the fiege, thongh it fhould latt a whole twelvemonth. But here the grand-mafter found means to fupply in fome meafure that unexpected defect, by the cautions provifion he had made of a large quantity of faltpetre, which was immediately ground and made into gunpowder, though he was at the fame time obliged to order the engineers to be mure fparing of it for the future, and to make ufe of it only in the defence of fueb breaches as the enemy Phould make.

All this while the Tuks had not gained an inch of ground; and the breaches they had made were fo fuddenly cither repaired or defended by new entrenchinents, that the very ubbifh of them muit be mounted by affault. Solyman, therefore, thought it now adrifable in min to fet his numetous pioneers at work, in five different sie. parts, in digaing of mines, each of which led to the baltion oppofite to it. Some of thefe were countermined by a new invented method of Martinengo; who, by the help of braced Rkins, ar drums, could difcover

\section*{R H O} where the miners were at work. Some of there he perceived, which be cauled to be opened, and the miners to te driven out by hand grenadoes; others to be fmothered, or burned, by fetting fie to gunpowder. Fet did not this hinder two confiderable ones to he fprung, which did a valt deal of damage to the baltion of Englasd, by throwintr down about fix fathoms of the wall, and flling up the ditch with its rubbith: whereupon the Turks immediately climbed up fword in hand to the top of it , and planted feven of their ftandards upon the parapet; but being ftopped by a traverfe, the knights, recovering from their furprife, fell upon them with fuch fury, that they were obliged to abandon it with great lofs. The grand-matter, who was then at church, quickly came to the place with his fhort pike in his hand, attended by his knights, encouraring all he met with, burghers, foldiers, and others, to fight bravely in defence of their religion and country, and arrived time enough to affift in the taking down their fandads, and driving down the enemy by the way they came up. In vain did the vizier Multapha endeavour to prevent their flight by killing fome of the foremolt with his fword, and driving the reft back; they were obliged to abandon the baftion, and, which was ftill worle, met with that death in their figint, which they had flove to fhun from the fire-arms which were difeharged upon them from the ramparts. Three fangiacs lof their lives in this attack, befides fome thoufands of the Tusks; the grandmafter, on his fide, loft fome of his bravelt kro ohts, particularly his ftandard-bearer.

The attacks were almot daily rencured with the fame Ill fuccefs and lofs of men, every gentral friving to fig. nalize himelf in tite fight of their emperor. At length the old general Peri, or Pyrrus, having haraffed the troops whith gtuarded the baftion of Italy for feveral days fucceffively without intermiffion, caufed a flyong cetachment, which he had kept concealed behind a cavalier, to mount the place by break of day, on the 1 3th of Septenber; where, finding them overcome with feep and fatigue, they cut the throats of the Eentinels, and, niding through the breath, were jult groing to fall upon them. The Italians, however, quickly recovered themfelves and their arms, and gave them an ubflinate repulfe. The conteft was fierce and bloody on both fides; and the bahnaw, flill fupplying his owe with new reinforeements, would hardly have failed of overpowering the other, had not the grand-mafter, whom the alarm had quickly reacbed, timely intervened, and, by his prefence, as well as example, revived his Rhedians, and thrown a fudden panic among the enemy. Pyrus, defirous to do fomething to wipe off the difgrace of this repulfe, tried his fortune next on an adjoining work, lately raifed by the grand-mafter Carettii: but here his fuddiers met with a ftill worfe treatment, being alnoft overwhclmed with the hand-grenadoes, melted pitch, and boiling oil, which came pouring upon them, whilf the forces which were on the adjaeent fanks made as great a naughter of thofe that fled; ininmuch that the janiffaries began to refume their old mummuring tone, and cry out that they were browgt thither only to be flaughtered.

The grand vizier Muttapha, afraid left their complaints fhould reach his mafter, agreed at length, as the laft refort, to make a freth attempt on the bation

\section*{223 ] R H O}
of En:land, whilf, to caute a diverfon, the bahaw Rh-des, Ahmed fpran= Come freth mines at an oppofite part of the city. "this was accordingly exceuted on the 1 th of September; wen the furmer, at the head of five battalions, refolutely mounted or rather crept ap the breach, and, in Spite of the fre of the Ensthith, atvanced fo far as to pitch fome ftandards on the top; when, on a fudden, a crowd of Enelifi knights, com nanded by one Bouk, or Lurk, fallitd out of their entrench. ments, and, affited by fome other ufficers of difinc. tion, obliged them to retire, though in good order. Mullapha, prowoked at it, led them back, and killed feveral knights with his own hand; and had his men fupported him as they ought, the place mutt have been yielded to hinn: but the fire which was made from the adjacent batteries and muketre difconcerted them to fuch a derree, that neither threats nor entreaties could prevest their abandaning the enterprife, and dragying him away with them by main fore. The Rhodians luft in that action feveral brave knishts, both Englifh and German ; and, in particular, Jolm Burk, their valiant commander: but the Turks loit above 300= men, befides many officers of diftinction. Much the fame ill fuccels having attended Ahmed with his mines, one of which had been opened, and the otber only bringings fome fathoms of the wall down, he was allo obliged to retreat ; his troops, though fome of the very beft, being forced to difperfe thenfelves, after having borne the fire and fory of the Spanifh and Auvergnian knights as long as they were able.

By this time Solyman, afhamed and exalperated at lis ill fuceefs, called a eeneral council ; in which he made fome ftinging reflections on his vizier, for having reprefented the reduction of Rhodes as a very eafy enterprife. To avoid the effects of the fultan's refentment, the fubtle Muftapha declared, that hitherto they had fousht the ernoy as it were upon equal terms, as if they had been afiaid of taking an ungenerous advantage of their fuperionity, by which, faid he, we have given them an opportunity of oppofing us with their united force wherever we attacked them. But let us now refulve upon a general affault on feveral fides of the town; and fee what a poor defence their ftrength, thus divided, will be able to make againlt our united force. The advice was immediately approved by all, and the time appointed for the execution of it was on shet \(24^{\text {th }}\) of that month, and every thing was ordered an affaul? to be got ready againft that day. Accordingly the in fur difo town was actually affaulted at four different parts, after ferent having fuffered a continual fire for fome time from their \({ }^{\text {phess at }}\) heir once. artillery in order to widen thebreaches; by which the grand-matter eafly underfood their delign, and that the baftions of England and Spain, the poft of Provence, and terrace of Italy, were pitched upon for the affault, and took his precautions accurdingly.

The morning was no fooner come, than each party mounted their refpective breach with an undaunted bravery, the yonng fultan, to animate thein the more, hasing ordered his throne to be reared on an eminence, whence he could fee all that was done. The Rhodians, on the other land, were no lefs diligent in repulling them with their cannon and other fire-arms, with their melted lead, boiling oil, ftiak-pots, and other ufual ex. pedients. The one fide afcend the fcaling ladders, fearlefs of all that oppofed thera; the other overturn

\section*{\(\mathrm{R} \mathbf{H}\) O \(\quad[224\)}
of it, in liopes that, when his fury was abated, he flould alfo obtain his pardon.

Solyman, however, was fo difcouraged by his ill fucceffes, that he was on the point of raifing the fiege, and would have actually done fo, had he not been diverted from it by the advice which he received from an Albanian deferter, fome fay by a letter from the traitor d'Armarald, that the far greater part of the knights were either killed or wounded, and thofe that remained altogether incapable of fuftaining a frefh affault. This having determined him to try his fortune once more, the command of his forces was turned over to the bafhaw Achmed; and, to how that he defigued not to ftir till he was mafter of the place, he ordered a hanie to be built on the adjacent mount Philermo for his winter-quarters. Achmed marched directly againf the baftion of Spain, which had fufered the moft; where, before he could open the trenches, his men fell thick and threefold by the conftant fire both of fmall and great guns from the baftion of Auvergne. He lant ftill a much greater number in rearing a rampart of earth to cover the attack, and give him an opportunity of fapping the wall; and, as foon as he faw a large piece fall, ordered his men to mount the breach. They were no fooner come to the top, than they found a new work and entrenchments which Nírtinengo had reared; and there they were welcomed with fuch a brik fire from the artillery, that they were glad to recover their trenches with the utmoff precipitation, after having loft the much greater part of their men. 'The attack was renewed, and a reciprocal fire continued with great obftinacy, till a mufket-fhot deprived that indefatigable engineer of one of his eyes, and the order of his affiduous fervices for fome lime. The grandmatter, having ordered him to be carried to his palaee, took his place, and kept it till he was quite cured, which was not till 34 days after; and continued all the time in the intrenchments with his handful of knights, fcarcely allowing himfelf reft night or day, and ever ready to expofe himfelf to the greatef dangers, with an ardour more becoming a junior officer than an old worn-out fovereign; which made his knights more lavith of their own lives than their paucity and prefent circum. ftances could well admit of.

Soon after this, the treafon of D'A marald was difcovered, and he was condemned to death and executed; but by this time the city was reduced to the laft extremity. The pope, emperor, and other crowned heads, had been lung and often importuned by the grand-matter for fpeeds affiftance, without fuccefs; and, as an addition to all the other difafters, thofe fuecours which were fent to him from France and England perifhed at fea. The new fupply which he had fent for of provifions from Candia had the fame ill fate; fo that the winds, feas, and every thing, feemed combined to bring on the deffruction of that city and order. The only refource which could be thought of, under fo difmal a fituation, was, to fend for the few remaining knights and forces which were left to guard the other inands, to come to the defence of their capital, in hopes that, if they could fase this, the others might in time be recovered, in cafe the T'urks fhould feize upon them. On the other hand, Solyman, grown impatient at the fmall ground his general bad gained, gave him exprefs orders to renew the attack with all imaginable fpeed

\section*{R H O}
idee and vigour, before the fuccours which lie apprehended were coming from Europe, obliged him to raife the fiege. Aclimed inftantly obeyed, raifed a battery of 17 large cannon againlt the baltion of Italy, and quickly after made himfelf mafter of it, obliging the garrifon to retire fartber into the city. Here tinc grand-malter was forced to demolifh two of the churches, to present the enemy's feizing on them; and, with their materials, caufed fome new works and entrenchments to be made to hinder their proceeding farther.

The Turks, however, gained ground cvery day, though they fill lof valt numbers of their men : at length the 30 th of November came, when the grandmafter, and both the beliegers and befieged, thought the laft affault was to be given. The bathaw Pyrrus, who commanded it, led his men directly to the entrenchinents; upon which the bells of all the churches founded the alarm. The grand-matter, and his few knights, troops, and citizens, ran in crowds, and in a confufed diforderly manner, to the entrenchments, each fighting in his nwn way, or rather as his fear directed him. This attack would have proved one of the molt defperate that had yet been felt, had not a molt vehement rain intervened, which carried away all the earth which the enemy had reared to ferve them as a rampart againft the artillery of the baltion of Auvergne; fo that being now quite expofed to their continual fire, they fell in fuch great numbers, that the bahnaw conld no longer make them ftand their ground, but all precipisately fled towards their camp. This laft repulfe threw the proud fultan into fuch a fury, that none of his officers dared to come near him; and the mame of his having now fpent near fix whole months with fuch a numerous army before the place, and having loft fuch myriads of his brave troops with fo little advantage, had made him quite defperate, and they all dreaded the confequences of his refentment.

Pyrrus at length, having given it time to cool, ventured to approach him, and propofe a new project to him, which, if approved, could hardly fail of fuccefs; which was, to offer the town a generous capitulation ; and he obferved, that in cafe the ftubborn knights fhould reject it, yet being now reduced to fo fmall a number, as well as their forces and fortifications almoft deftroyed, the citizens, who were mott of them Greeks, and lefs ambitious of glory than folicitons for their uwn prefervation, would undoubtedly accept of any compofition that fhould fecure to them their lives and cffects.

This propofal being relifhed by the fultan, letters were immediately difperfed about the city in lis name, exhorting them to fubmit to his government, and threatening them at the fame time with the moft dreadful effects of his refentment if they perfited in their obitinacy. Pyrrus likewife difpatched a Genoefe to approach as near as he could to the baftion of Auvergne, and to intreat the knights to take pity of fo many of their Chriftian brethren, and not expofe them to the dreadful effects which muft follow their refufal of a capitulation, fo generoully offered them at their laft extremity. Other agents were likewife employed in other places : to all of whom the grand-mafler ordered fome of his men to return this anfwer, That his order never treated with infidels but with fword in hand. An Albanian was fent next with a letter from the fultan to him, who met with the fame repulfe;

Vol. XVI. Part I.
alter which, he ordered his men to fire upon any that \(R\) h les. fhould prefent themfelves upon the fame pretence; which was actually done. But this did not prevent the Rhodians from liflening to the terms offered by the Turks, and holding frequent cabals upon that fubject ; in which the gencral maffacre of a town taken by affault, the dreadful flavery of thofe that cfcaped, the rape of their wives and daughters, the dettruction of their churches, the profanation of their holy relics and facred utenfils, and other dire confequences of an obitinate refufal, being duly weighed againt the fultan's offers, quickly determined ihem which parts to take. The grand-mafter, however, proving inexuralde to all their intreaties, they applied to their Greck metropolitan, who readily went and reprefented all thefc things to him in the molt pathetic terms: Fet he met with no better reception; but was told, that he and his knights were determined to be buried mader the ruins of the city if their fwords could no longer de. fend it, and be hoped their example would net permit them to fhow lefs courage on that occaliun. 'lhis anfwer produced a quite contrar; effect : and, as the citizens thought delays dangerous it fuch a jurcture, they came in a body to him by the very next mornin:and plainly told him, that if he paid no greater regard to their prefervation, they would not fail of taking the molt proper meafures to preferve the live and chaftity of their wives and children.

This refolution could not but greatly alarm the grand-matter; who thereupon called a council of ail the knights, and informed them himfelf of the condition of the place. Thefe all agreed, particularly the engineer Martinengo, that it was no longer defeniole, and no other refource left but to accept the fultan's offers; adding, at the fame time, that thongh they wore all ready, according to the obligations of their order, to fight to the laft drop of their blood, yet it was no lcfs their duty to provide for the fafety of the inhabitants, who, not being bound by the fame obligations, ought not to be made a facrifice to their glory. It was therefore agreed, with the grand-mafter's confent, to accept of the next offers the fultan hould make. He did not let them wait long: for the fear le was in of a freth fuccour from Enope, the intrepidity of the knights, and the thame of beins forced to raife the fiege, prevailed upon him to hang out his pacific flas, which was quickly anfwered by another on the Rhodian fide; upon which the Turks, coming out of their trenches, delivered up the fultan's letter for the grand. malter, to the grand-prior of St Giles, and the engincer Martinengo. The terms offered in it by Solyman appeared fo advantageous, that they immediatcly exchanged hoftages; and the knights that were fent to him had the honour to he introduced to him, and to hear them confirmed by his own mouth, though not without threats of putting all to fire and fword in cafe of refufal, or even delay. Two ambaffadors were forthwith fent to him, to demand a truce of three days to fettle the capitulation and interefts of the inhabitants, who were part Greeks and part Latins; but this was abfolutely refufed by the impatient monarch, out of a fufpicion of the rumoured fuccour being near, and that the truce was only to gain time till it was come.

He therefore ordered the hoftilitice to be renewed Ff
with with frefl fury; in which the Rhodians made a mof noble defence, coulidering their fmall number, and that they had now only the barbican or falle bray of the badlion of Spain left to defend themfelves, and once more repulfed the enemy: at which the fultan was fo enraged, that he refuived to overpower them by numbers on the next day; which was, after a ftout defence, fo effectually done, that they were foreed to abandon that ontwork, and retire into the city. In the meanwhile, the burghers, who had but a day or two before raifed a Frefh uproar againft the grand-matter, under pretence that he was going to give them up a prey to an infidel who regarded neither vaths nor folemn treaties, perceiving their own danger, came now to delire his to renew the negociations, and only begged the liberty of fending one of their deputies along with his, to fecure their interefts in the capitulation. Ile readily confented to it ; but gave then a charge to thow the bafhaw Achmed the treaty formerly concluded between Bajazet and his predeceffor d'Aubuffon, in which the former had entailed a dreadful curfe on any of his fucceffors that flould intringe it. This was done, in hopes that the fhowing it to his matter, who valued himelf fo much upon his itrict obfervance of his law, might produce fome qualm in him which might lengthen the agreement, for they were ftill as much in hopes of a fuccour from Europe as he was in fear of it ; but to their great furprife, Achmed had no fooner perufed than he tore it all in picces, trampled it under his feet, and in a rage ordsed them to be gonc. The grand-mafter found no other refonce than to fend them baek to him the next day; when that minilter, who knew his matter's inpatienee to have the affair concluded, quickly agreed with them upon the terms, which were in fubftance as follow:
1. That the churehes thould not be profaned. 2. 'That the inhabitants fhould not be foreed to part with their childen to be made janifaries. 3 . That they floould enjoy the free exercife of their religion. 4. I'hat they gould be free from taxes during five years. 5. That thofe who had a mind to leave the illand frould have free leare to do fo. 6. That if the grand-mafter and his knights had not a fuffecient number of veffels to tranfport themfelves and their effeets into Candia, the fultan thould fupplyathat defect. 7. That they flould have 12 days allowed them, from the figning of thie artieles, to fend all their eflects on board. 8. That they fhonld have the liberty of carrying away their relics, chalices, and other facred utenfls belonging to the great chureh of St John, together with all their ornaments and uther effects. 9. That they fhould likewife carry with them all the artillery with which they were wont to arm the galleys of the orler. 10. That the iflands belonging to it, together with the caftle of St Peter, Mould be delivered up to the T'urks. ir. 'I'hat, for the more eafy exccution of thefe articles, the Turkih army fhould be removed at fome miles dittance from the capital. 12. That the aga of the janifaries, at the head of 4000 of bis men, fhould be allowed to go and take pofiefion of the place.

From this time the iffand of Rhodes has been fubject to the 「 jurks ; and, like other ecuntries fubject to that tyannical yoke, has lolt its former importance. The air is good, and the foil fertile, but ill cultivated. The capital is furrounded with triple walls and double
ditultes, and is looked upon to be impregnable. It is Rhod, inhabited by Turks and Jews; the Chrittians being obliged to occupy the fuburbs, as not being allowed to dtay in the town during the night. The town is fituated in E. Long. 28. 25. N. Lat. 36.54.

REIODIOLA, ROSE-WORT, in botany: A genus of the oftandria order, belonging to the dioecia clafs of plants ; and in the natural method ranking under the 13 th order, Sueculenta. 'The male ealyx is quadripartite; the corolla tetrapetalous. The female caly \(x\) is quadripartite, and there is no corolla the nectaria are four; the piltils four ; and there are four polyfpermous capplules. There are two fpeeies, the rofea and the minor: the firft grows naturally in the clefts of the rocks and runged mountains of Wales, Yorkhire, and Wiftmoreland. It has a very thick flethy rout, which when cut or bmifed fends out an odour like rofes. It has thick fuceulent ftalks, like thofe of orpine, about nine inches long, clofely garnifhed with thick fucculent leaves indented at the top. The ftalk is terminated by a clufter of yellowint herbaceous flowers, which have an agrceable feent, but are of flort continuance. The fe. cond fort is a native of the Alps, and has purplith flowers which come out later than the former ; it is alfo of a fmaller lize. Both fpecies are calily propagated by parting their roots; and require a hhady lituation, and dry undunged foil. The fragrance of the firft fpecies, however, is greatly diminified by cultivation.

\section*{Oil of RHODIUM. See Aspalathus.}

RHODODENDRON, dwarf rosebay, in botany: A genus of the monogynia order, belonging to the decandris clafs of plants; and in the: natural nitthod rankingr under the 3 sth order, Bicornes. 'I'he calyx is quinquepartite; the corolla funnel-fhaped; the tamina declining ; the capfule quinquelocular. There are feven fpecies: the moit remarkable of which are, 1. The hirfutum, with naked hairy leaves, grows uaturally on the Alps and feveral mountains of Italy. It is a low fhrub, which feldom rifes two feet high, fetading out many ligneous branches covered with a lightbrown bark, garnifhed elofely with oval Spear-fhapud leaves, fitting pretty clofe to the branches. They are entirc, having a great number of line iron-coloured hairs on their edges and underfide. The flowers are produced in bunches at the end of the branches in May, having one funnel-fhaped petal ent into five obtufe fegments, and of a pale-red colour. 'They make a good fhow, and are fucceeded by oval capfules, containing ripe feeds in Auguft. 2. The ferrugineum, with fmooth heaves, hairy on their underlide, is a native of the Alps and Apennines. It rifes with a Shrubby ftalk near three feet high, fending out many irregular branehes covered with a purplifh bark, and clofely garnifhed with fmouth fpear-flaperl entire leaves, whofe borders are reAcxed backward; the upper fide is of a light lucid green, their under lide of an iron colour. The flowers are produced at the ends of the branches, are funnelfhaped, ent into five fegments, and of a pale rofe colour. Thcle plants are propagated by feeds; but, being natives of barren rocky foils and cold fitnations, they do not thrive in gardens, and for want of their ufual covering of fnow in the winter are often killed by froft in this country. 3: The ehamxciftus, or ciliated-leaved dwarf rofe-bay, is a low deciduous flurub, native of Mount Baldus, and near Saltzburg in Germany. It
grows to the height of about a yard: the branchcs are numerous, produced irregularly, and covered with a purplifl bark. The leaves are oval, fpear-fhaped, fmall. and in the under furface of the colour of iron. The flowers are produced at the end of the branches in bunches, are of a wheel-fhaped figure, pretty large, of a fine crimfon colour, and handfome appearance. 'They appear in June, and are fucceeded by oval capfules containing ripe feeds in September. 4. The Dauricum, or Daurian dwarf rofe-bay, is a low deciduous fhrub, and native of Dauria. Its branches are numerous, and covered with a brownifh bark. The fowers are wheelfhaped, large, and of a beautiful rofe-colom: : they appeat in May, and are fucceeded by oval capfules full of feeds, which in England do not always ripen. 5. The maximum, or American mountain laurel, is an evergreen fhrub, and native of Virginia, where it grows naturally on the higheft mountains, and on the edges of cliffs, precipices, \&c. where it reaches the fize of a moderate tree, though with us it feldom rifes higher than fix feet. The flowers continue by fucceffion fometimes more than two months, and are fucceeded by oval capfules full of feeds. 6. The Ponticum, or Pontic dwarf rofe-bar, is an evergreen fhrub, native of the eatt, and of moft fhady places near Gibraltar. It grows to the height of four or five feet. The leaves are fpear-fhaped, glofly on both fides, acute, and placed on fhort footItalks on the branches: the flowers, which are preduced in clufters, arc bell-fhaped, and of a tine purple colour. They appear in July, and are fucceeded by oval capfules containing feeds, which in England feldom attain to maturity.

In Siberia, a fpecies of this plant is ufed with great fuccefs in gouty and rheumatic affections; of which the following account is given in the 5 th volume of the Me dical Commentaries, p. 434. in a letter from Dr Guthrie of Peterfburgh to Dr Duncan of Edinburgh. "It is the rhododendrum chrsfanthemum, nova fpecics, belonging to the clafs of decandria, difcovered by Profeffor Pallas in his tour through Siberia. This Alpine fhrub grows near the tops of the high mountains named Sajanes, in the neighbourhood of the river Jenife in Siberia; and delights in the firts of the fnow-covered fummits, above the region that produces trees. When the inhabitants of that country mean to exhibit it in arthritic or rlieumatic diforders, they take about two drams of the dried flarub, flalk and leaves, with nine or ten ounces of boiling water, and putting them into an earthen pot, they lute'on the head, and place them in an oven during the night. This infufion (for it is not allowed to boil) the fick man drinks next morning for a dofe. It occafions heat, together with a degree of intoxication, refembling the effects of firituous ligoors, and a fingular kind of uneafy fenfation in the parts affected, accompanied with a fort of vermiculatio, which is likewife confined to the difeafed parts. The pationt is not permitted to quench the thirft which this medicine occafions; as fluids, particularly cold water, produce vomiting, which leffens the power of the fipecific. In a few hours, hewever, all the difagreeable effects of the dofe difappear, commonly with two or three Itouls. Tithe patient then finds himfelf greatly relitved of his diforder ; and has feldom occafion to repeat the medicinc above two or thrce times to complete a cure. The inlabitants of Siberia call this florub chit or
tea, from their drinking, in common, a weak infufion of it, as we do the Chinefe plant of that name. This practice fhows that the plant, ufed in fmall quantitics, muft be innocent. Profefior Pallas informis me, that he fent fome time ago fome of this farub dried to Profeffor Koelpin at Stetin ; ard he fhowed mee a letter from that gentleman, where he fays, that he has given it with fuccefs in feveral cafes, particularly in that he calls the arthritica venerea, with a tophus arthriticus on the carpus, and it produced a complete cure. It nuik be remarked, that the dofe whic thele hardy Siberians take, who are alio in the habit of driaking it as tea, would, in all probability, be too itrong for our countrymen; however, it is a medicine which we may certainly give with fafety, beginning with fmall dofes."

RHCEA. See Rhea.
RHEEADEÆ (rhans, Linneus's name, after Diofcorides, for the red poppy), the name of the \(2 ; \mathrm{th}_{1}\) order in Linnæus's fragments of a natural method, confitling of poppy and a few genera which refemble it in habit and fructure. See Botany, p. 462.

RHONBOIDES, in geometry, a quadrilateral figure whofe oppofite fides and angles are equal, but is neither equilateral nor equiangular.

Rhomboides, in anatomy, a thin, broad, and obliquely fquare felly mufcle, fituated between the balis of the fcapula and the fpina dorfi ; fo called from its figure. Its general ufe is to draw backward and upward the fubipinal portion of the balis fcapule.

RHOMBUS, in geometry, an oblique-angled parallelogram, or quadrilateral figure, whofe fides are equal and parallel, but the angles unequal, two of tise oppofite ones being obtufe and two acute.

RHONE, one of the largelt rivers in France, which. riling among the Alps of Switzenland, palles through the lake of Geneva, vifits that city, and thin runs fu.tiliweft to Lyons; where, joining the river Soane, it cors. tinues its courfe due fouth, pafin, by Oraage, Avignon, and Arles, and falls into the Mediteranean a little above Marfeilles.

RHOPIUM, in botany: A genus of the triandrias order, belonging to the gynandria clafs of plants: ant in the natural method ranking with thofe that arc doubtful. The calyx is monophyilons and fexpartite; there is no corolla nor any ftamina; the three anthere are each attached to one of the flyli; the capfule is tricoccous and fexlocular, each containing two feeds. There is only one fpecies, \(2: z\), the meborea, a native of Guiana. This is a flab rifing about three or four feet in height. The flowers grow in the form of a corymbus; they are of a yellowill green cuivar ; the capfules are black.

RHOPOLA, in botany: A gents of the monerynia order, belouging to the tetrandria clafs of plints: and in the natural method ranking with thole that are doubtful. There is no calyx ; the petals are four, ohlong, obtufe, and narrowing at the bale; the Itamina are four, inferted in the corolia, and basc lagge antheree; the feed-veffel unilocular, and contzins ons lied. There is only one feceict, witw the montana. This; a thrubly plant growing in Guiana. and remaik able for the great number of branches fent off from its truak in eivery direction, and for the fetid Imell of the woud ant bark of this plant.

Rhers

\section*{\(R \quad \mathrm{H}\)}

RIIURARB. See Rheum.

RIfUME, in naviration, a vertical circle of any given place, or interfection of fuch a circle with the horizon; in which lat fenfe rhumb is the fame witla a point of the compafs.

Rtrovs-Line is alfo ufed for the line which a fhip defrribes when failing in the fame collateral point of the compass, or oblique to the meridians.

RFILSS, sumach, in bntany : A genus of the trigynia order, belonging to the pentandria clafs of plants; ind in the natural is*thod ranking under the 43 dorder, Dumpfo. The calyx is quinquepartite; the petals five; the berry monofpermous. There are \(2+\) fpecies, of which the moft renarkable are,
1. The coriaria, or elm-leaved firmach, grows naturally in Italy, Spain, 'Iurkey, Syria, and Paletline. 'The branches of this tree are ufed inftead of oak-bark for tanniug of leather; and it is faid that the T'urkey leather is a!l tanned with this fhrub. It has a ligneous talk, which divides at bottom into mans irregular brancles, rifing to the height of cight or ten feet; the bark is hairy, of an herbaceons brown colour; the leaves are winged, compofed of feven on tight pair of lobes, terminated by an odd one, bluntly faxed on their edges, hairy on their under lide, of a yellowim-green colour, and placed alternately on the branches; the flowers grow in loofe panicles on the end of the branches, which are of a whitifh herbaccous colour, each panicle being compofed of feveral lpikes of flowers fitting clofe to the footlalks. 'Ihe leaves and feeds of this fort are ufed in medicine, and are efteemed very reftringent and diptic.
2. The typlinum, Virsinian fumach, or vinegar plant, grows naturally in almoft every part of Noth America. This hath a woody flem, with many irregular branches, which are generally crooked and deformed. The young branches are covered with a foft velvet-like down, refembling freatly that of a young flag's horm, both in colour and texture, from whence the common people have given it the appellation of flag's born; the leaves are winged, compofed of fix or feven pair of oblung heart-fhaped lubes, terminated by an odd one, ending in acute points, hairy on their underlide, as is alfo the midrib. The flowers are produced in clofe tufts at the sid of the branches, and are fucceeded by feeds, inclofed in purple woolly fucculent covers; fo that the bunches are of a heautiful purple colour in autumn; and the leaves, before they fall in autumn, clange to a purplifh colour at firtt, and before they fall to a fevillemort. This plant, originally a native of North Amesiea, has been long cultivated in the north of Germany, and is lately introduced into Ruffa. It has got the name of the vinegar plant from the donble reafon of the young germen of its fruit, when fermented, producing either new or adding to the 11 rength of old weak vincgar, whilt its ripe berries afford an agreeable acid, which might fupply the place when neceffary of the citric acid. The powerful aftringency of this plant in all its parts recommends it as ufetul in feveral of the arts. As for example, the ripe berries boiled with alum make a good dye for hats. The plaut in all its parts may be ufed as a fuccedaneum for oak-bark in tanning, efpecially the white glove leather. It will likewife anfwer to prepare a dye for black, green, and yellow colours; and with martial vitriol it makes a good ink. The milky juice

\section*{25 ] \\ \(R\) H U}
that flows from incifions made in the trunk or branches, makes when dried the bafis of a varnifh little inferior to the Chinele. Bees are remarkably fond of its fluwers; and it affords more honey than any of the flowering fhrubs, fo that it may prove a uleful branch of econo. my , where rearing thefe inlects is an object. The matives of Ameriea ule the dried leaves as tuhaceo.
3. 'The glabrum, with winged leaves, grows naturally in many parts of North America; this is commouly titled by the gardeners Nerv England fumarh. The flem of this is ftronger and rifes higher than that of the former; the branches fpead more horizontally; they are not quite fo downy as thofe of the laft, and the down is of a brownifh colour; the leaves are compofed of many more pair of lobes, which are fmooth on both fides; the flowers are difpofed in loofe panicles, which are of an herbaceous colour.
4. The Carolinianum, with fawedwinged leaves, grows naturally in Carolina; the feeds of this were brought from thence by the late Mr Cateßy, who has given a figure of the plant in his Natural 1 Hitory of Carolina. This is by the gardeners called the farlet Carolina fumach ; it rifes commonly to the height of feven or eight feet, dividing into many irregular brancles, which are fmooti, of a purple colour, and pounced over with a greyith powder, as are alfo the footttalks of the leaves. The leaves are compofed of feven or eight pair of lobes, terminated by an odd one; thefc are not always plaeed exactly oppofite on the midrib, but are fometimes alternate. The upper fide of the lobes are of a dark green, and their under hoary, but fmooth. The flowers are produced at the end of the branches in very clofe panicles, which are large, and of a bright red colour.
5. The Canadenfe, with winged fpear-fhaped leaves, grows naturally in Canada, Maryland, and feveral other parts of Nortl America. This hath fmooth branches of a purple colour, covered with a grey pounce. The leaves are compofed of feven or eight pair of lobes, terminated by an odd one; the lobes are fpear-fhaped, fawed on their edges, of a lucid green on their upper furface, but hoary on their under, and are fmooth. The flowers are produced at the end of the branches in large panicles, which are compofed of feveral fmaller, each itanding upon feparate fontflalks; they are of a deep red colour, and the whole panicle is covered with a grey pounce, as if it had been fcattered over them.
6. The copallinum, or narrow-leaved fumach, grows naturally in moft parts of North Aınerica, where it is known by the title of beach fumach, probably from the place where it grows. This is of lumblergrowth than either of the former, feldom rifing more than four or five feet high in Britain, dividing into many fpreading bnauches, which are fmooth, of a light brown colour, clofely garnifhed with winged leaven, compofed of four or five pair of narrow lobes, terminated by an odd one; they are of a light green on both fides, and in autumn change purplif. The midrib, which futtains the lobes, has on each fide a winged or leafy border, which runs from one pair of lobes to another, ending in joints at each pair, by which it is eaflly diflinguifhed from the other forts. The flowers are produced in loofe panicles at the end of the branches, of a yellowifh herbaceous colvur.

There

Thefe fix forts are hardy plants, and will thrive in - the open air here. The firft and fourth forts are not quite fo hardy as the others, fo muft have a hetter fit.ation, otherwife their branches will be injured by fevere froft in the winter. They are cafily propagated by feeds, which if fown in autumn the plants will come up the following \{pring ; but if they are fown in fpring, they will not come up till the next fpring; they may be either fown in pots, or the full ground. If they are fown in pots in autumn, the pots fhould be placed under a common frame in winter, where the feeds may be prote Eted from hard froft; and in the fpring, if thic pots are plunged into a very moderate hot-bed, the plants will foon rife, and have thercby more time to get ftrength before winter. When the plants come up, they muft be gradually hardened to bear the open air, into which they fould be remored as foon as the weather is favourable, placing them where they may have the morning fun ; in the fummer, they muft be kept elean from weeds, and in dry weather watered. Toward autumn it will be proper to ftint their growth by keeping them dry, that the extremity of their fhoots may harden; for if they are replete with moiture, the early frofts in autumn will pinch them, which will caufe their fhoots to deeay almolt to the botom if the plants are not fereened from them. If the pots are put under a common frame in autumn, it will fecure the plants from injury: for while they are young and the fhoots foft, they will be in danger of fuffering, if the winter proves very fevere; but in mild weather they mult always en. joy the open air, therefore fhould never be covered but in frott. The fpring following, jut before the plants begin to fhoot, they fhould be flaken out of the pots, and carefully feparated, fo as not to tear the roots; and traniplanted inte a nurfery, in rows rhree feet afunder, and one foot diftance in the rows. In this nurfery they may Itand two years to get frength, and then may be tranfplanted where they are to remain.
7. Betides thefe, Limxus has included in this genus the toxicodendron or poifon-tree, under the name of thus vernix or poifon-afb. This grows naturally in Virginia, Penfylvania, New England, Carolina, and Japan, rifing with a frong woody falk to the heiglit of 20 feet and upwards; though in this country it is feldons feen above 12 , by reafon of the plants being extremely tender. The bark is brown, inclining to grey; the branehes are garnifhed with winged leaves compofed of three or four pair of lebes terminated by an odd one. The lobes vary greatly in their thape, but for the molt part they are oval and fpear-fhaped. The footftalks become of a bright purple towards the latter part of fummer, and in autumn all the leaves are of a beautiful purple before they fall off.

All the fpecies of fumach abound with an aerid milky juice, which is reckoned poifonous; but this property is moft remarkable in the vernix. The molt diftinct account of it is to be found in Profeflor Kalm's Travels in North America. "An incifion (fays he) being made into the tree, a whitifh yellow juice, which has a naufeous fmell, comes out between the bark and the wood. This tree is not known for its good qualities, but greatly fo for the effect of its poifon; which, tho' it is noxious to fome people, yet does not in the leaft affect others. And therefore one perfon can handle the tree as he pleafes, cut it, peel off its bark, rub it or
the wood upon his hands, fmell at it, fpread the juice upon his fkin , and make more experiments, with no inconvemience to limfelf: another perfon, on the contraiy, dares not meddle with the tree while its wood is frefl; nor can he venture to toueh a hand whieh has landled it, nor even to expofe himfelf io the fmoke of a fire which is made with this wood, without foon feel. ing its bad effects; for the face, the hands, and frequently the whole body, fwells excefively, and is affected with a very aeute pain. Sometimes bladders or blifters arife in great plenty, and make the fick perfon look as if he was infected by a leprofy. In fome people the external thin Rin, or cuticle, pecls off in a few days, as is the eafe when a purfon has icalded or burnt any part of his body. Nay, the nature of fome perfons will not even allow them to approaeh the place where the tree grows, or to expofe themfelves to the wind when it carries the efluvia or exhalations of this tree with it, without letting them feel the inconrenience of the fwelling which I have juft now deferibed. Their eyes are fometimes fluyt up for one, or two, or more days together, by the fwelling. I know two brothers, one of whom could without danger handle this tree is what manner he pleafed, whereas the other could not come near it without fwelling. A perfon fometimes does not know that he has touched this poifonous plant, or that he has been near it, before lis face and hands fhow it by their fwelling. J have knowa old people who were more afraid of this tree than of a viper ; and I was aequanted with a perfon who, merely by the noxious exhalations of it, was fivelled to fuel a degree, that he was as ftiff as a log of wood, and could only be turned about in flects.
"I have tried experiments of every- kind with the poifon-tree on myfelf. I have fpread its juice upon my lands, cur and broke its branches, peeled off its bark, and rubbed iny lands with it, finelt at it, carried pieces of it in my bate hands, and repeated all this frequently, without feeling the baneful effects fo commonly arnexed to it ; but I, however, onee experieneed, that the poifon of the funach was not entirely without effect upon me. On a hot day in funmer, as I was in fome degree of perfpiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and fmelt at it now and then. I felt no effects from it in the evening. But next morning I awoke with a violent itching of my eye-lids and the parts thereabouts; and this was fo painful, that I eould hardly keep my" lands from it. It cealed after I had wafaed my eyes for a while with very cold water. But my eye-lidswere very ftiff all that day. At night the itehing returned; and in the morning when I awoke, I felt it as ill as the morning before, and I ufed the fame remedy againft it. However, it continued almoft for a whole week together; and my eyes were very red, and my eye-lids were with difficulty moved during all that time. My pain ceafed entirely afterwards. Ahout the fame time I had fpread the juice of the tree very thick upon my hand. 'Three days after, they oceafinned blifters, which foon went off without affecting me much. I have not experienced any thing more of the effects of this plant, nor had I any defire fo to do. However, I found that it could not exert its power upon me when I was not perfpiring.
"I bave never heard that the poifon of this fumach

Rhyme has been mortal, but the pain ceafes after a few days loops, about their middle, through which the cords or
duration. The natives formerly made their flutes of this tree, becaule it has a great deal of pith. Some people affured me, that a perfon fuffering from its noifome exhlalations, would eafily recover by ipreading a mixture of the wood burnt to charcoal, and hog's lard, upon the fwelled parts. Some afferted, that they had really tried this remedr. In fome places this tree is rooted out, on purpofe that its poifon may not affect the workmen."

The natives are faid to diftinguih this tree in the dark by its extreme coldnefs to the touch. The juice of fome kinds of fumach, when expofed to the heat of the fun, hecomes fo thick and clammy, that it is ufed for bird lime, and the infpiflated juice of the poifon-afh is faid to be the fine varmith of Japan. A cataplafm made with the frefh juice of the poifon-afh, applied to the feet, is faid by Hughes, in his Natural Hiltory of Barbadoes, to kill the vermin called by the Weft Indians chizert. Vcry good vinegar is made from an infution of the fruit of an American fumach, which for that reafon is called the -inergar-tree. The refin called gum copal is from the rhuts copallinum. See Copal.

RHYME, Rhime, Ryme, or Rime, in poetry, the fimilar found or cadence and termination of two words which end two verfes, zec. Or rhyme is a fimilitude of found between the latt fyllable or fyllables of a verfe, fucceeding either immediaedy or at a diftance of two or three lines. See Poetry, \(n^{2} \mathbf{1}_{77} 7\), \&xc.

RHYMER (Thomas the), was a native of the parifh of Earlitown, in the county of Derwick. His real name and title was Sir Thomas Lermont. He lived at the weft end of Earlitown, where part of his houle is ftill Itanding, called Rbymer's Tover; and there is a fone built in the fore wall of the church with this infeription on it,

\section*{Auld Rhymer's race lies in thino place.}

He lived in the \(13^{\text {th }}\) century, and was contemporary with one of the earls of March, who lived in the fame place.

RHYTHM, in mufic, the variety in the movement, as to the quicknefs or nownefs, length or hortnefs, of the notes. Or it may be defined more generally, the propsrtion which the parts of the motion have to each other.

RiAL, or Ryal, a Spanifu coin. See MoneyTalle.

R1ar, or Roval, is alfo the name of a piece of gold anciently current among us tor tos.

RIBAN, or Ribчaw, in heraldry, the e:ghth part of a hend. See Heraldry, p. \(44 \%^{\circ}\)

R1PAND, or RIEBON, a narrow fort of filk, chief. ly uled for head-ornam:ents, badges of chivalry, Sc.

In order to give our readers an idea of the manner in which this curious and valuable brarch of manufuctures is managed, a view of the ribbon-weaver at his loom is reprefented in Plate CCCCXXXV. where, s. Is thic irame of the loom. z. The cattle, containing \(4^{n}\) pulleys. 3. The branches, on which the pulleys turn. 4. The tires, or the riding-cords, which run on the pulleys, and pull up the high.lifes 5. The 1:t-thick;, to which the high-lifes are tied. 6. The hi \(\cdot\)-h-liftes, or lifts, are a number of long threads, with platines, er plate-leads, at the bottom; and ringlets, or

\section*{crofs-threads of the ground-larnefs ride. 7. The plate-}
teads, or platines, are flat pieces of lead, of about fix inches long, and thrce or four inches broad at the top, but round at the bortom; fome ule black flates inftead of them : their ufe is to pull down thofe liffes which the workman had raifed by the tredtle, after his foot is taken off. 8. The branches or cords of the ground harnefs, which go thro' the loops in the midule of the highliffes: on the well-ordering of thete cords chiefly depends the att of ribbon-weaving, becaufe it is by means of this contrivance that the weaver draws in the thread or filk that makes the flower, and rejects or excludes the refl. 9. The batton: this is the wooden frame that holds the reed or fhuttle, and heats or clofes the work: where, obferve, that the ribbon-weaver does not beat his work; but as foon as the shuttle is paffed, zad his hand is taken away, the batton is foreed, by a fpring from the top, to beat the work clofe. 10. The fhuttle, or reed. 11. The fpring of the batton, by which it is made to clofe the work. 12. The long-hamefs are the front-reeds, by which the figure is railed. I3. The linguas are the long pieces of round or fquare lead, tied to the end of each thread of the long-harnefs to keep them tight. 14. The broad piece of wood, about a foot fquare, leaning fomewhat forward, intended to cafe the weaver as he ftoops to his fhuttle; it is fixed in the middle of the brealt-beam. Some weaver3, inflead of this, have a contrivance of a cord or rope that is fattened to the front-frame, and comes acrofs his breaft; this is called a fopfall. 15 . The feat-bench; this leans forward very much. 16. The foot-ftep to the treddles. 17. The breatt-beam, being a crofs-bar that pafles from one of the Itandards to the other, fo as to front the worknan's brealt: to this brealt-bar is fixed a roll, upon which the ribbon paftes in its way to be rolled upon the roller, that turns a little below. 18. The clamps, or pieces of wood, in which the broaches that confine the treddles relt. 19. The treddles are long narrow pieces of wood, to the ends of which the cords that move the liffes are faltened. 20. The treddle-cords are only diflinguifhed from the riding-cords by a board full of holes, which divide them, in order to prevent the plate-leads, which are tied to the highli-lifes, from pulling them too high when the workman's foot is off the treddle: which flop is made by a knot in the treddlecord, too big to be foreed through that hole in the board. 21. I be lames are two pieces of thin narro:y boards, only ufed in plain works, and then to fupply the place of the lons harnefs. 22. The knee-roll, by which the weaver roils up his ribbon as he fees proper, or by bit and bit as it is linihed. 23 . The backrolls, on which the warp is rulled. It is to be obferved, that there is always as many rolls as culours in the work to be wove. \({ }^{24}\). The clarans, which fup. port the rollers. 25 . The returning.fticks, or, as others call them, the returns, or the tumblers, or pul. I.ys, to which the tiers are tied, to clear the courfe of cords through the high.lifes. 26 . The catch-board fut the tumblers. -7. The tire-board. 28. The buttons for the knee-rolls and treddle-board, deferibed in number 20.

Ribbons of all forts are prohibited from being imported.

RIBANDS (from rib and bend), in naval architec-

\section*{R I B \\ [ 23 I \\ R I B}

Is, ture, long narrow flexible pieces of timbcr, nailed upon the outfide of the ribs, from the ftem to the fernpoit, fo as to envelope the flip lengthwife, and appear on her fide and bottom like the meridians on the furface of the globe. The ribands being judiciounly ar ranzed with regard to their height and diftance from each other, and forming regtlar fweeps about the fhip's body, will compose a kind of frame, whofe interior fur face will determine the curve of all the intermediate or filling-timbers which are fationed between the principal ones. As the figure of the Jhip's bottom ap. proaclies to that of a conoid, and the ribands have a limited breadth, it is apparent that they cannot be applied to this convex furface without forming a double curve, which will be partly vertical and partly horizontal ; fo that the verical curve will increafe by approaching tlie ftem, and fill more by draving near the ttern-pof. It is alfo evident, that by deviating from the middle line of the fhip's length, as they approach the extreme breadth at the midfhip-frame, the ribands rill alfo form an horizontal curve. The loweft of thefe, which is termined upon the ftem and ftern-poft, at the height of the riling-line of the flow, and anfwers to the upper part of the foor-timber upon the midthipframe, is called the floor-riband. Tlat which coincides with the wing-tranfom, at the height of the lower-deck upon the midfhip-frame, is termed the breadtb riband; all the reft, which are placed between thefe two, are called intermediate ribanils. See Ship-buildisg.

RIBES, the Currant and Gooseberry-bush: A genus of the monogyuia crdar, belonging to the pen. tandria clais of plants; and in the natural method rarking under the 36 th order, Pomaces. There are five petals, and famina inferted into the calyx ; the ltyle is bitid; the berry polyfpermous, inferior.

The currant and the goofebery were long confidered each as a fcparate genus; rives the currant, and groffuluria the goofcberry; but they are now joined together, the groffinlaria being made a fpecies of ribes; all the curant kinds having inemons or thornlefs branches, and racemous clufters of flowers and fruit ; and the goofeberry have fpinous brancbes, and flowers and fruit for the moft part fingly.

There are three fpecies of the currant-tree, two of which, and their varieties, merit culture for their fruit; the other as it plant of variety or obfervation: all of which are inermous or unarmed, having no thorns on the branches.
1. Rubrun, common red-currant tree, Sc. hath a fhrubby ftem, dividing low into many branches, forming a bufhy head, five or fix feet high or more, without thorns; broad trilobate leaves, and finooth pendulous clufers of plane greenifh fowers, fuccceded by fmall clufters of berries. It grows naturally in woods and the ledges in moft parts of Europe, and comprifes all forts of red and white currants ; as, common fnall red cur-rant-large bunched red currant-Cbampaigne palered currant-common fmall white currant-large white Dutch currant-yellow blotched-leaved. currant-filver ftriped leaved-gold ftriped leaved-gooleberry leaved. All thefe forts are varieties of one fpecies, ribes rubrum, or common red currant; it being the parent from which all the others werc firf obtained from the feed, and improved by culture. They all Hower in the fping, and the fruit ripens in June and

July; and by having the trees in different fituatiens and modes of training, fuch as plantations of ftandards in the open quarters for the general fupply, others trained againt walls or pales of different afpect, the fruit may be continued ripe in good perfection from ahout the miadle of June until November, provided the later crops are defended with mats cr nets from the birds.
2. The nigrum, or black currant tree, hath a Ghrubby ftem, dividing low into mary branches, forming a bufhy head five or fix feet high; broad trilobate leaves of a rank odour, and having racemous clufters of oblong greenifh flowers, fucceeded by thin clulters of black berries. The fruit of this fpecies being of a flrong flavour, and fomewhat phyfical relifh, is not generally liked; it, however, is accounted very wholefome: there is alfo made of it a fyrup of high eltimation for fore throats and quinfies; hence the fruit is often called fouinancy berriss. There is a varicty called the Pennfylvanian black currant, having fmaller thoots and leaves, not flrong fcented, and fmall fruit but of little value; fo the fhrub is eftecmed only for variety and fhrubberies. The mode of bearing of all the varieties of currants is both in the old and young word all along the fides of the branches ard moots, oftea upon a fort of fmall forigs and fnars, producing the fruit in numerous long pendulous cluiters.
3. The groffularia, or common goofeberry bufl, rifes with a low fhrubby ftem, dividing low into a very franchy bufhy head, armed with fpines; triiubate frnallifh leaves, having hairy ciliated foottallis; and fuall greenifh flowers, fucceeded by hairy berriess It confifts of many varietice, of different fizes and colours.
4. The reclinatum, or reclinated broad-leaved goofeberry buth, rifes with a low flrubby ftem, and reclinated fomewhat prickly branches, trilobate broadifh leaves, and fmall greenith flowers, having the pedunculi furnifhed with triphyllous bractea.
5. The oxyacanthoides, or oxyacantha-leaved goofeberry, lath a fhrubby ften, and branches arnied on all fides with fpincs, and largifh trilobate hawthorn leaves.
6. The uva crifpa, or fmooth goofeberry, hath a fhrubby flem, and branches armed with fpines; trilobate leaves; pedicles having monophyllous bractea; and fmooth firuit.
7. The cynofbati, or prickly-fruited goofeberry bufn, hath a fhrubbs ftem and. branches, armed with fpines, mofly at the axillas, and prickly fruit in clutters.

All the above feven fpecies of ribes, both currants and goofeberry kinds, and their refpective varieties, are very hardy fhrubs, that profper almoft anywhere; both in open and fhady fituations, and in any common foil ; bearing plentifully in any expofure, though in open funny fituations they produce the largeft and faireft fruit, ripening to a riclier vinous flavour; but it is eligible to plant them in different fituations and afpects, in order to have the fruit as early and late as poffible.
They are commonly planted in the kitchen-garden, motly as dwarf ftandards, in the open quarters, for the general fupply ; being dippofed fometimes in contimued plantations in rows, eight or ten fect bre fix afunder, where great quantities of the fruit are required for market or other large fupplies ; and are fometines difpofed in singte ranges round the outward
cdge of the quarters, eight feet afunder; frequently in fingle crofs rows, in order to divide the ground into feparate wide plats or breaks, of from 20 to 30 or 43 feet wide, which alfo ferres to fhelter the ground a little in winter; in all of which methods of panting them as flandards, they fhould be generally trained up to a fingle ftem about a foot high, then fuffered to branch out every way all around into bufhy heads, keeping the middle, however, open, and the branches moderately thin, to admit the fun and free air; though if fome are fanned, that is, trimmed on two lides oppofitely, fo as to make the other branches range in a line like an efpalier, they will take up much lefs of the ground, and, by admitting the fun and air more freely, they will produce large fair fruit. They are likewife trained againt walls or palings, like other walltrees, but principally fome of the large red and white Dutch currants, in which they will produce fine large fruit, and thofe againt any fouth fence will ripen early, and be high flavoured; but it is proper to plant a fow both againft fonth, north, eaft, and weft walls, in order to obtain the fruit ripe both early and late, in a long fucceffion. It is alfo proper to plant a few of the finef forts of goofeberries againft a warm fence, both to have early green goofeberrics for tarts, \&c. as well as to ripen early; and they will grow very large and fine. Sometimes both currants and goofeberries are alfo trained in low efpaliers for variety, and they produce very fine fruit.

The fruirs both of the currant and goofeberry are of an acid and cooling nature, and as fuch are fometimes ufed in medicine, efpecially the juice reduced to a jelly by boiling with fugar. From the juice of curzants alfo a very agrecablc wine is made.

RICAUT, or Rycaut (Sir Paul), an eminent Englifh traveller, of the time of whofe birth we find no account; but in \(\mathbf{1 6 6 1}\), he was appointed fecretary to the earl of Winchelfea, who was fent ambafiador extraordinary to the Ottoman Porte. During his continuance in that ftation, he wrote, "The prefent State of the Ottoman Empire, in three books, containing the maxims of the Turkifh policy, their religion, and military difcipline," London, folio, 1670 . He afterwards refided 11 years as conful at Smyrna, where, at the command of Charles II. lie compofed "The prefent ftate of the Greek and Armenian Churches, anno Chrijlli \(1678 . "\) On his return, Lord Clarendon being appointed lord-lientenant of Ireland, made him his principal fecretary for Leinfter and Connaught: king James II. knighted him ; and made him one of the privy council in Ireland, and judge of the court of admiralty ; all which he held to the Revolution. He was employed by King William as refident at the Hanfetowns in Lower Saxony, where he continued fur ten years; but being worn out with age and infirmities, he ohtained leave to return in 1700 , and died the fame year. Ricaut continued " Knolles's Hiftory of the Turks, and Platina's Lives of the Popes;" befides which, there are fome other productions under his name.

RICCIA, in botany: A genus of the natural order of alga, belonging to the cryptogamia clafs of plants. There is no calyx, but a veficular cavity within the fubfance of the leaf. There is no corolla ; the antherre are cylindrical, and feffile, placed on the germer, which is turbinated; the fyle is filiform, perforating the an-
thera; and the feed-cale is fpherical, crowned with the withered anthera; the feeds are hemrpherical and pedicellated.

RICE. Sce Oryza. "Rice bras, (fays Mr Marr- Hir" den) whilft in the hulk, is in India called poddce, and Sum alfumes a different name in each of its other various P. 6 flates. We ubferve no diftinction of this kind in Europe, where our grain retains through all its ftages, till it becomes flour, its original name of barley, wheat, or oats. The following, befide many others, are names applied to rice, in its different ftages of growth and prcparation: paddee, original name of the feed: oof \(/ 2 y\), grain of laft feafon: bunnee, the plants before removed to thic fawoors: bras or bray, rice, the hufk of the paddee being taken off: charroup, rice cleaned for boiling; naflee, boiled rice : peerang, yellow rice: jambar, a fervice of rice, \&c.

Among people whofe general objects of contemplation are few, thofe which do of neceffity engage their attention, are often more nicely diferiminated than the fame objects among more enlightened people, whole ideas ranging over the extenfive field of art and fcience, difdain to fix long on obvious and conmon matters. Paddec, on Sumatra and the Malay iflands, is diftinguifhed into two forts; Latdang or up-land paddee, and Sawoor or low-land, which are always kept feparate, and will not grow reciprocally. Of thefe the former bears the higher price, being a whiter, heartier, and better flavoured grain, and having the advantage in point of keeping. The latter is much more prolific from the feed, and liable to lefs rifk in the culture, but is of a watery fubflance, produces lefs increafe in boiling, and is fubject to a fwifter decay. It is, however, in more common ufe than the former. Befide this general diftinction, the paddee of each fort, particularly the Laddang, prefents a varicty of rpecies, which, as far as my information extends, I fhall enumerate, and endeavour to defcribe. The common kind of dry ground paddee : colour, light brown : the fize rather large, and very little crooked at the extremity. Paddee undallong: dry ground: fhort round grain: grows in whorles or bunches round the ftock. Paddee ebbofs: dry ground: large grain: common. Paddee gallon: dry ground: light coloured: fcarce. Paddee fennee: dry ground: decp coloured; fmall grain : fcarce. Paddee ejoo: dry ground; light coloured. Paddee kuening: dry ground: deep yellow : fine rice : crooked, and pointed. Paddee coocoor ballum: dry ground: much efteemed : light coloured; fmall, and very much crooked, refembling a dove's nail, from whence its name. Paddee pefang : dry ground : outer coat light brown; inner red: longer, limaller, and lefs crooked than the coocoor bollum. Paddce Santong: the finell fort that is planted in wet ground: fmall, ftraight, and light coloured. In general it may be obferved that the larger grained rice is the lealt efteemed, and the fmaller and whiter the moft prized. In the Lampoon country they make a diftinction of paddee crawwang and paddee jerroo; the former of which is a month earlier in growth than the latter."

Rice-Bird. See Oryzivera.

RICHARD I. II. and III. kings of England. Sce Engla:id.

RICHARDIA, in botany: A genus of the monogynia order, belonging to the hexandria class of plants;

\section*{R I C \(\left[\begin{array}{ll}233\end{array}\right] \quad\) R I C}
n. and in the natural method ranking under the 47 th or-- der, Stellata. The calyx is fexpartite; the corolla monopetalous, and fubcylindrical; and there are three feeds.

RICHARDSON (Samuel), a celebrated Englih fentimental novel-writer, born in 1688, was bred to the bufinefs of a printer, which he exercifed all his life with eminence. Though he is faid to have updertood no language but his own, yet he acquired great reputation by his three epiftolary novels, intitled Pamela, Clarifa, and Sir Cbarles Grandifon; which flow an uncommon knowledge of human nature. His purpofe being to promote virtue, his pictures of moral excellence are by much too highly coloured; and he has defcribed his favourite characters fuch rather as we might wifh them to be, than as they are to be found in reality. It is alfo objected by fome, that his writings have not always the good effect intended: for that, inflead of improving natural characters, they have fafrioned many artificial ones; and have taught delicate and refined ladies and gentlemen to defpife every one but their own felf-exalted perfons. But after all that cen be urged of the ill effeets of Mr Richardfon's novels on weak minds, eager to adopt characters they can only burleโque; a fentible reader will improve more by fudying fuch models of perfection, than of thofe nearer to the natural ftandard of human frailty, and where thofe frailties are artfully exaggerated fo as to fix and mifemploy the attention on them. A froke of the pally carried off Mr Richardfon, after a few days illnefs, upon the \(4^{\text {th }}\) of July 1761. He was a man of fine parts, and a lover of virtue; which, for aught we have ever heard to the contrary, he fhowed in his life and converfation as well as in his writings. Befides the works above-mentioned, he is the author of an ÆIop's Fables, a Tour through Britain, 4 vols, and a volume of Familiar Letters upon bufinefs and other fubjects. He is faid from his childhood to have delighted in letter-writing; and therefore was the more eatily led to throw his romances into that form; which, if it enlivens the hiftory in fome refpects, yet lengthens it with uninterefting prate, and formalities that mean nothing, and on that account is fometimes found a little tedious and fatiguing.

The moft eminent writers of our own country, and even of foreign parts, have paid their tribute to the tranfcendant talents of Mr Richardfon, whofe works have been publifhed in almoft every language and country of Europe. They have been greatly admired, notwithftanding every diffimilitude of manners, or every difadvantage of tranflation. M. Diderot, a late celebrated French author, \{peaking of the means employed \(t o\) move the paffions, in his Effay on Dramatic Poetry, mentions Richardion as a perfect mafter of that art: "How friking (fays he), how pathetic, are his defcriptions! His perfonages, though filent, are alive before me ; and of thofe who fpeak, the actions are fill more affecting than the words." -The famous John-James Kouffeau, fpeaking, in his letter to M. d'Alembert, of the novels of Richardfon, afferts, "that nothing was ever written equal to, or even approaching them, in any language."-Mr Aaron Hill calls his Pamela a "delightful nurfery of virtue."-Dr Warton fpcaks thus of Clementina: "Of all reprefertations of madnefs, that of Clementina, in the Hiftory of Sir Charies Grandifun, Vor. XVL. Part I.
is the mof deeply interefting. I know not whether Richarde -s cuen the madnefs of Lear is wrought up, and expreffed, by fo many little ftrokes of nature and paffion. It is abfolute pedantry to prefer and compare the madnefs of Orettes in Euripides to this of Clementina."-Dr Johnfon, in his Introduction to the 97 th number of the Rambler, which was written by Mr Richardfon, obferves, that the reader was indebted for that day's entertainment to an author, " from whom the age has received greater favours, who has enlarged the knowledge of human nature, and taught the paffions to move at the command of virtue;" and, in his Life of Rowe, he fays, "The character of Lothario feems to have been expanded by Richardfon into that of L.ovelace : but he has excelled his original in the moral effect of the fiction. Lothario, with gaiety which cannot be hated, and bravery which cannot be defpifed, retains too much of the Ipectator's kindnefs. It was in the power of Richardfon alone to teach us at once efteenz and deteflation; to make virtuous refentment overpower all the benevolence which wit, and elegance, and courage, naturally excite; and to lofe at laft the hero in the villain."-Dr Young very pertinently obferved, that Mr Richardfon, with the mere advantages of nature, improved by a very moderate progrefs in education, fruck out at once, and of his own accord, into a new province of writing, in which lie fucceeded to admiration. And what is more remarkable, that he not only began, but finithed, the plan on which he fet out, leaving no room for any one after him to render it more complete: and that not one of the various writers that have ever fince attempted to imitate him, have in any refpect equalled, or at all approacleed near him. This kind of ronance is peculiarly his own; and "I confider lim (continues the Doctor) as a truly great natural genius; as great and fupereminent in his way as Shakefpeare and Milton were in theirs."

Richardson (Jonathan), a celebrated painter of Walpole's heads, was born about the Year 1665, and argaint his diverdests of inclination was placed by his father-in-law apprentice Psinting in to a ferivener, with whom he lived fix years; when ob. England. taining his freedom by the death of his mafter, he followed the bent of his difpofition, and at 20 jears old became the difciple of Riley; with whom he lived four years, whofe niece he married, and of whofe manner he acquired enough to maintain a folid and lafting reputation, even during the lives of Kneller and Dahl; and to remain at the head of the profeffion when they went off the itage.

There is ftrength, roundnefs, and boldnefs in his co. louring; but his men want dignity, and his women grace. The good fenfe of the nation is charasterifed in his poitraits. You fee he lived in an age when neither enthufiafm nor fervility were predominant. Yet with a pencil fo firm, poffefed of a numerous and excellent collction of drawings, full of the theory, and profound in refiections on his art, he drew nothin! well below the head, and was void of imagination. His attitudes, draperies, and back-grounds, are totally i.f.pid and unmeaning ; fo ill did he apply to his own practice the fagacious rules and hints he betowed on othcrs. Though he wrote with fire and judgment, leis paintings owed little to either. No man dived decper into the inexhautible fores of Raphacl, or was nore fmitten with the native lutre of Vandyck. Yet though capas

\section*{\(R \quad I C\)}
5. .hardfor. bie of tating the elevation of the one and the ciegauce of the other, he could never contrive to fee with their eyes, when he was to copy nature himfelf. One wonders that he could comment their works fo well, and imitate them fo little.
He quitted bulinefs himfelf fome years before his death ; but his temperance and virtue contributed to protract his life to a great length in the full enjoyment of his underftandiug, and in the felicity of domettic friendhip. He had had a paralytic flroke that afficted his arm, yet never difabled hind fron his cultomary walks and exereife. He had been in St James's Park, and died fuddenly at his hove in Queen's-fquare on his return home, May 28. 1745, when he had paffed the 8oth year of his age. He left a fon and four dauglters, onc of whom was married to his difciple Mr Hudfon, and another to Mr Grigion an attorncy. The tafte and learning of the fon, and the harmony in wlich he lived with his father, are viffle in the joint works they compofed. The father in 1719 publined two difcourfes: I. An Eflay on the whole Art of Criticiifm as it relates to Painting ; 2. An Argument in behalf of the Science of a Coniaioifter ; bound in one volume octavo. In \({ }_{1722}\) came forth \(A_{n}\) Account of fome of the flatues, bas-reliefs, drawings, and picturees, in Italy, \&c. with Remarks by Mr Riehardfon, fenior and junior. The fon made the journey; and from his notes, letters, and obfervations, they both at his return compiled this valuable work. As the father was a formal man, with a llow, but loud and fonorous voice, and, in truth, with fome affectation in his manner ; and as there is much fingularity in his Ityle and expreflion, thefe peculiarities (for they were fcarcely foibles) fruck fuper. ficial readers, and between the laughers and the envious the book was much ridiculed. Yet both this and the former are full of matter, good fenfe, and inftruction: and the very quaintnefs of fome expreffions, and their laboured novelty, fhow the difficulty the author had to convey nere sifible ideas through the medium of language. Thofe works remind one of Cibber's inimitable treatife on the flage: when an author writes on his own profeffion, feels it profoundly, and is fenfible his readers do not, he is not only excufable, but meritorious, for illuminating the fubject by new mectaphors or bolder figures than ordinary. He is the coxcomb that fneers, not he that intructs, in appropriated diction.
If thefe authors were cenfured when converfant within their own circle, it was not to he expected that they would be treated with milder indulgence when they ventured into a fifter region. In 1734 , they publifhed a very thick oetavo, containing explanatory notes and remarks on Milton's Paradife Loft, with the life of the author, and a difcourfe on the poem. Again were the good fenfc, the judicious criticifms, and the fentiments that broke forth in this work, Forgotten in the firgularities that diftinguifh it . The father having faid in apology for being little converfant in claffic literature, that he had looked into them through his fon, Hogarth, whom a quibble could furnih with wit, drew the father peeping through the nether end of a telc. fope, with which his for was perforated at a Visgil aloft on a fhelf. Yet how forcibly Richardfon entered into the fpirit of his author, appears from his com. prehenfive expreftion, that Alilloa wwas an ancient, born
two thoufand years after his time. Richardion, however, Ri ith was as incapable of reaching the fublime or harmonious \(R_{c}\) is in poetry, as he was in painting, though fo capable of illuitrating both. Some fpecimens of verfe that he has given us liere and there in his works, excite no curiofity for more, though he informs us in his Milton, that if painting was his wife, poetry lad been his fecret concubine. It is remarkable, that another commentatcr of Milton has made the fame confeffion,

\section*{-Sunt É mibi carmina, me quoque dicunt \\ Vatem pafores - -}
fays D. Bentley. Neither the doctor nor the painter add fed non ego credulus illis, though all their readers are ready to fupply it for both. Befides his pictures and commentaries, we have a few etchings by his hand, particularly two or three of Milton, and his own head. The fale of his collection of drawings, in February \({ }^{1747}\), latted i8 days, and produced about 2060 I. his pictures about 700 l . Hudfon his fon-in-law bought many of the drawings.

RICHELE' (Cæfar Peter), a French writer, born in 1631 at Chemin in Champagne. He was the friend of Patru and Ablancourt; and like them applied himfelf to the ttudy of the French language with fuccefs. He compiled a dictionary of that language, full of new and ufeful remarks; but exceptionable, as containing many fatirical reflections and obfeenities. The beft edition is that of Lyons, 3 vols folio, 1728. He alfo collected a fmall dictionary of rhymes, and compofed fome other pieces in the grammatical and critical way. He died in 1698.
RICHES, a word ufed always in the plural number, means wealth, money, poffefion, or a Eplendid fumptuous appearance. When ufed to exprefs the fortune of private perfons, whether patrimonial or acquired, it fignifies opulensea; term which exprefles not the enjoyinent, bint the poffeffion, of numerous fuperfluities.The riches of a flate or kingdom expreffes the produce of indultry, of commerce, of different incorporated bodies, of the internal and external adminiftration of the principal members of which the fociety is compofed, \&c.
Our Saviour fays, that it is more eafy for a camel to go through the eye of a needle, than for a rich man to enter the kingdom of heaven; and we find, in fact, that riches frequently bring along with them a degree of inattention, lukewarmnefs, and irreligion, fuch as fufficiently confirms the divine affertion; which is merely a. general truth, and which by no means afferts the abfolute impoffibility of being virtuous and rich at the fame time. For as the ancient philofophers wifely taught, riches, confidered in themfelves, and abftractedly from the bad purpofes to which they may be applied, are not neceffarily incompatible with virtue and wifdom. They are indeed abfolutely indifferent; in good hands they will be ufeful, and promote the caufe of truth, virtue, and humanity; and in bad hands they are the fource of much milchief; on the one hand they confer the power of doing much good, and on the other they are equally powerful in doing ill.

To men, however, whofe principles of virtue are not fufficiently founded, riches are unqueftionably a dangerous and feducing bait; and as the ancients rightly taught, they are to the greatef number of men, in an

\section*{R I C}
infinite variety of circumitances, a powerful obfacle to the practice of moral virtues, to the progrefs of truth, and a weight which prevents them from rifing to that degree of knowledge and perfection of which human nature is capable. They multiply without ceafing the oceafions of vice, by the facility which they give to fatisfy a multitude of irregular paffions, and to turn at length thofe who are attached to them from the road of virtue, and from the defire of inquiring after truth.

It is this which Seneca means to exprefs, when he fays, " that riches in a vait number of cafes have been a great obftacle to philofophy; and that, to enjoy freedom of mind neeeffary for ftudy, a man murt live in poverty, or as if he were poor. Every man (adds he) who wifhes to lead a pleafant, tranquil, and fecure life, mult avoid, as much as poffible, the deceitfulnefs of riches, which are a bait with which we allow ourfelves to be taken as in a fnare, without afterwards having the power to extricate ourfelves, being fo much the more unhappy, that we believe we poffefs them, while, on the contrary, they tyrrannize over us." Senec. Epifl. 17. and Epif. 8.
" The wife man (fays the fame author in another place) does not love riches to exeefs, but he would not choofe wholly to diveft himfelf of them; he does not receive them into his foul, but into his houfe; he is careful of them, and employs them for the purpofe of opening a wide field for virtue, and of making it appear in all its fplendor. Who can doubt that a wife man has not more occafions of difplaying the elevation and greatnefs of his mind when he is poffefled of riches than when he labours under indigence, fince, in the laft condition, he can exercife only one virtue, namely, redignation; whereas, riches give him an opportunity of difplaying, in their greateit luftre, the virtues of temperance, liberality, diligence, regularity, and magnificence. There is no oecafion, then, to prohibit philofophers from the ufe of wealth, or to condemn wifdom to poverty. The philofopher may poffefs the greateft xiches, provided he has not employed force or thed blood in acquiring them; provided he has not gained them by unjuft or illegal means; in a word, provided the ufe which he makes of them be as pure as the fource from which they were derived, and no perfon (the envious excepted) regretting his poffeffion ; lie will not refufe the kindnefs of fortune, and will enjoy, without flame or pride, the wealth acquired by honeft means; he will have mure reafon to glory, if, after expofing his riches to the view of the whole world, he can defire any perfon to carry away the reward of treachery or the fruits of oppreffion. If, after thefe words, his riches continue undiminifhed, this man is truly great, and worthy to be rich. If he has not allowed to enter into his poffeffion the fmallett piece of money gained by unwarrantable means, neither will he refufe the greateft riches, whieh are the bleffings of fortune, and the fuit of virtue: if he can be rich, he will choofe to be fo, and he thall have riches; but he will regard them as bleffings of uncertain polieffion, and of which he may be every moment deprived; he will not permit thern to be a load to himfelf or to others; he will give thens to the good, or to thofe whom he would make good; but he will give them with the nieeft wifdom, taking care always to diftribute them to the moft
worthy, and to thofe who remember that they muft give an account, as well of the wealth which they receive from heaven, as of the purpofes to which it is applied." Senec. de Vita Beata, cap. 21, 22, \& 23.

RICHLIEU (Juhn Armand du Pleffis de), eardi. nal of Richlicu and Fronfac, bifhop of Lucon, \&ec. was born at Paris in 1585. He was of excellent parts; and at the age of 22 had the addrefs to obtain a difpenfation to enjoy the bifhopric of Lucon in 160\%. Returning into Franee, he applied himfelf in a particular manner to the function of preaching; and his reputation this way procurcd him the office of almoner to the queen Mary de Medieis. His abilities in the management of affairs advanced him to be fecretary of ttate in 1616 ; and the king foon gave him the preference to all his other fecretaries. The death of the marquis d'Ancre having produced a revolution in Itate affairs. Richlien retired to Avignon ; where he employed hinnfelf in eompofing books of controverfy and piety. The king having reealled him to court, he was made a cardinal in 1622 ; and, two years after, firlt minifter of ttate. and grand matter of the navigation. In 1626, the ife of Rhée was preferved by his care, and Rochelle taken. heving flopped up the haven by that famous dyke which he ordered to be made there. He accompanied the king to the fiege of Cazal, and contributed not a little to the raifing of it in 1629 . He alfo obliged the Huguenots to the peace at Alets, which proved the ruin of that party; he took Pamerol, and fuccoured Cazal befieged by Spinola. In the mean time the nobles found fault with his conduet, and perfuaded the king to difcard him. The cardinal, for his part, was unmoved with it ; and by his reafonings overthrew what was thought to be determined againit him ; fo that, inftead of being difgraced, he from that moment became more powerful than ever. He punifhed all his enemies in the fame manner as they would have had him fuffer; and the day which produced this event, fo glorious to cardinal Richlien, was called the day of dupes. This able minifter had from thenceforwards an afcendancy over the king's mind ; and he now refolved to humble the excerfive pride of the honfe of Aultria. For that purpoie he concluded a treaty with Guftaphus Adolphus king of Sweden, for carrying the war into the heart of Germany. He alfo entered into a league with the duke of Bavaria; feeured Lorrain ; raifed a part of the princes of the empire againit the eniperor; treated with the Dutch to continue the war againlt \(S\) pain; favoured the Catalans and Porturuefe till they fhook of the Spanifh yoke ; and, in fhort, took fo many different meaiures, that he accomplifhed his defign ; and after having carried on the war with fuceefs, was thinking of concluding it by a peace, when he dicd at Paris on the 4 th of December 1642 , aged 58 . He was interred in the Surbonne, where a magnificent maufoleum is erected to his memory. This great pulitician made the arts and fciences flourilh; formed the botanical grarden at Paris, called the king's g arden; founded the French aeademy ; eftablithed the royal printing-houfe; erected the palace afterwards called l.e Palais Roval, which he prefented to the king; and rebuilt the Sorbonne with a magnificence that appears truly royal. Befides his bouks of controver \(\int\) y and piety, there go under the name of this minifter, A Journal, in 2 vols 12 mo ; and a Political 「ettament, is 12 mo ; all treating of politics and ftate affairs. Cardi-

\section*{R I C [ 236 ] R I D}
nal Mazarine purfued Richlieu's plan, and completed many of the fchemes which he had begun, but left unfinifhed.

RICINUS, or palma Caristi, in botany: A genus of the monodelphis order, belonging to the n:onoecia clafs of flants; and in the natural method ranking under the 3 xth order, Tricoccie. The male calyx is quinquepartite; there is no corolla; the flamina numerous. The fenale calyx is tripartite ; there is no corolla, but three bifid ftyles, with a trilocular capfule, and a fingle feed. There are three fpecies, of which the mo!t remarkable is the communis, or common palma Chrilti. 'This tree is of fpeedy growt!, as in one year it arrives at its full height, which Feldom exceeds 20 fret. The trunk is fuhligneous; the pith is large; the leaves broad and pralmated; the flower fuike is fimple, and thickly fet with yellow bloffoms in the fhape of a cone; the capfules are triangular and prickly, containing three Inooth gray motted fecds. When the bunches begin to turn black, they are gathered, dried in the fun, and the feeds picked out. 'They are afterwards put up for ufe as wanted, or for exportation.

Caltur oil is obtained either by expreffion or by decoction. The firft method is practifed in England ; the latter in Jamaica. It is common firf to parch the nuts or feeds in an iron pot over the fire ; but this gives the oil an empyreunatic talte, fmell, and colour ; and it is beft prepared in this manner : A large iron pot or boiler is firft preparel, and lialf filled with water. The nuts are then beaten in parcels in deep wooden mortars, and after a quantity is beaten it is thrown into the iron veffel. The fire is then lighted, and the liquor is gently boiled for two hours, and kept conftantly ytirred. About this time the oil begins to feparate, and fwims on the top, mixed with a white froth, and is fkimmed off tidl no more rifes. The frimmings are heated in a fmall iron pot, and ftrained through a cloth. When cold, it is put up in jars or bottles for ufe.

Caftor oil, thus made, is clear and well faveured, and if put into proper bottles will keep fweet for years. The expreffed callor cil foon turns rancid, becaufe the mucilaginous and acrid parts of the nut are fqueezed est with the oil. On this account the preference is given to well prepared oil by decoction. An Englifh gallon of the feeds yield about two pounds of oil, which is a great proportion.

Before the difturbances in America, the planters imported train oil for lamps and other purpofes about fugar works. It is now found that the caftor oil can be procured as cheap as the fifh oil of America: it burns clearer, and has not any offenfive fmell. This oil, too, is fit for all the purpofes of the painter, or for the apothecary in ointments and plafters. As a medicine, it purges without ftimulus, a:d is fo mild as to be given to infants foon after bith, to purge off the meconium. All oils are noxious to infecis, but the caftor oil kills and expels them. It is generally given as a purge after uling the cabbage bark fome days. In conftipation and belly-ach this oil is ufed with remarkable fuccefs. It fits well on the ftomach, allays the fpafm, and brings about a plentiful evacuation by flool, efpecially if at the fame time fomentations, or the warm bath, are ufed. -Belly-ach is at prefent lefs frequent in Jamaica than formerly, owing to 「everal caufes. The inhabitants, in geneal, live better, and driak better liquors; but the
exceffive drinking of new rum fill makes it frequent \(\mathrm{F}_{\text {a }}\) amongtt foldiers, failors, and the lower order of white people. It has been known to happen too from vifceral obAructions alter intermittents, or marfh fevers, in Jamaica.

The ricinus Americanus grows as tall as a little tree, and is fo beautiful that Millar fays it deferves a place in every curious garden, and he planted it himfelf at Chelfea. It expands into many branches; the leaves are fometimes two feet in diameter, and the ftem as large as a middle-fized broom ftaff; towards the top of the branch it has a clufter of flowers, fomething refem. bling a bunch of grapes; the flowers are fmall and ftaminous, but on the body of the plant grow bunches of rough tiviaugular lunfs, each containing three fpeckled feeds, generally fomewhat lefs than horfe beans; the thell is brittle, and contains white kernels of a fweet, oily, and naufeous talte. From this kernel the oil is extracted, and if the medicine fhould become officinal, the feeds may be imported at a reafonable rate, as the plant grows wild and in great plenty in all the Britifh and French Anerican iflands. See Oleum Palme Cbrifli. Of the ricinus communis there are a great many varieties; all of them fine majeftic plants, annual, or at mon biennial, in this country; but in their native foil they are faid to be perennial both in root and ftem. They are propagated by feeds fown on a hot-bed, and requirc the fame treatment as other tender exotics.

RICKET'S, in medicine. See there, \(\mathrm{n}^{\circ} 347\).
RICOCHET, in gunnery, is when guns, howit zers, or mortars, are loaded with fnall charges, and. elevated from 5 to 12 degrees, \(f_{0}\) as to fire, over the parapet, and the fhot or lhell rolls along the oppofite rampart : it is called ricoobet-firing, and the batteries are likewife called ricochet-batteries. This method of firing was firf invented by M. Belidor, and firt ufed at the liege of \(A\) th in 1697 . 'This mode of fring out of mortars was firlt tried in 1723 at the military fchool at Strabourg, and with fuccefs. At the battle of Rofbach, in 1757, the king of Pruflia had feveral 6 -inch mortars made with trunnions, and mounted on travel-ling-carriages, which fired obliquely on the enemy's lines, and amongtt their horfe, loaded with 8 ounces of powder, and at an elevation of one degree 15 minutes, which did great execution; for the fhells rolling along the lines, with burning fuzes, made the fouteft of the enemy not wait for their burfting.

RICOTIA, in botany: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquefar. The filiqua is unilocular, oblong, and compreffed, with plainovalvules.

RIDGE, in agriculture, a long piece of rifing land between two furrows. See Agriculture, no ini.

RIDGLING, or Ridgel, among farriers, \&c. the male of any beaft that has been but half-gelt.

RIDICULE, in matters of literature, is that fpecies of writing which excites contempt with laughter. .

The ridiculous, however, differs from the riffble, (fee Risible.) A rifible object produceth an emotion of laughter merely: a ridiculous object is improper as well as rifible; and produceth a mixed emotion, which is vented by a laugh of derifion or feorn..

Burlefque, though a great engine of ricicule, is not oonfined to that fubject; for it is clearly diftinguifhable into burlefque that excites laughter merely, and

\section*{\(\mathrm{N} \quad \mathrm{D}\)}
ul.. burlefque that provokes derifion or ridicule. A grave fubject in which there is no impropricty, may be brought down by a certain colouring fo as to be rifible; which is the cafe of Virgil Travefic, and alfo the cafe of the Secthia Repila; the authors laugh firtt, in order to make their reader3 laugh. The Lutrin is a burlefque poem of the other fort, laying hold of a low and trifing incident, to cxpole the luxury, indolence, and contentions fpirit of a fet of monks. Boileau, the author, gives a ridiculous air to the fubject, by dreffing it in the heroic ftyle, and affecting to confider it as of the utmoft dignity and importance. In a compofition of this kind, no image profefledly ludicrous ought to find quarter, becanfe fuch images deftroy the contraft ; and accordingly the author fhows always the grave face, and never once betrays a finile.

Though the burlefque that aims at ridicule produces its effects by elevating the fiyle far above the fubjeci, yet it has limits beyond which the elevation ought not to be carried : the poet, confulting the imagination of his readers, ought to confine himfelf to fuch inages as are lively and readily apprehended: a ftrained elevation, foaring above an ordinary reach of fancy, makes not a pleafant impreffion : the reader, fatigued with being always upon the itretch, is foon difgutted; and, if he perfevere, becomes thoughtlefs and indifferent. Further, a fetion gives no pleafure unlefs it be painted in colours fo lively as to produce fome perception of reality ; which never can be done effectually where the images are formed with labour or difficulty. For thefe reafons, we cannot avoid condemning the Batrachomuomachia, faid to be the compofition of Homer: it is beyond the power of imagination to form a clear and lively image of frogs and mice acting with the dignity of the higheft of our fpecies; nor can we form a conception of the reality of fuch an action, in any manner fo diltinct as to intereft our affections even in the flighteft degrec.

The Rape of the Lock is of a character clearly diftinguifhable from thofe now mentioned; it is not properly a burlefque performance, but what may rather be termed an beroi-comical poem: it treats a gay and familiar fubject with pleafantry, and with a moderate degree of dignity : the author puts not on armank like Boileau, vor profeffes to make us laugh like Taffoni. The Rafe of the Lock is a genteel fpecies of writing, lefs ftrained than thofe mentioned; and is pleafant or ludicrous. without having ridicule for its chief aim; giving way, however, to ridicule where it. arifes naturally from a patticular character, fuch as that of Sir Plume. Addi-
180:. Jon's Speatator*, upon the exercife of the fan, is extreaely gay and ludicrous, refembling in its fubject the Rape of the Lock.
'There remains to fhow, by examples, the manaer of treating fubjects fo as to give them a ridiculous appearance.

Il ne dit janais, je vous donne, mais, je vous prete le bon jour.

Moliere.
Orleans. I know.him to be valiant.
Conflable. I was told that by one that knows him better than you. .

Orleans. What's he?
Conflable. Marry, be told me fo himfelf; and he faid, he car"d not who knew it.

Henry V. Shaked, ears.

\section*{37 ] P I D}

He never broke any man's head but his own, and Ridicule. that was againft a poft when he was drunk. Abid.

Millamort. Sententious Mirabel! prithee don't look with that violent and inflexible wife face, like Solomon at the dividing of the child in an old tapeftry-hanging.

Way of the Wurld.
A true critic, in the perufal of a book, is like a dog at a feaft, whofe thoughts and fomach are wholly fet upon what the guelts fling away, and confequently is apt to fnarl molt when there are the feweft bones.

Tale of a Tuえ.
In the following infances, the ridicule arifes from abfurd conceptions in the perfons introduced.

Mafcarill. Te fouvientil, vicomte, de cette de-mi-lune, que nous emportames fur les enemis au fiege d'Afras?

Fodelet. Que veux-tu dire avec ta demi-lune? c'eto:t bien une lune tout entiere.

Moliere, les Precieufes Ridicules, fc. II.
Slander. I came yonder at Eaton to marry Mrs Anne Page; and fhe's a great lubberly boy.

Page. Upon my life then you took the wrons-
Slander. What need you tell me that? I think fo when I took a boy for a girl : if I had been married to him, for all he was in woman's apparel, I would not have had him.

Merry Wives of Wiadfor.
Falentine. Your bleffing, Sir.
Sir Sampfon. You've kad it already, Sir: I think I fent it your to-day in a bill for four thoufand pound; a great deal of money, brother Forefight-

Forefght. Ay, indeed, Sir Sampfon, a great dcal of money for a young man; I wonder what he can do with it.

Love for Love, act 2. fc. 7 .
Millament. I naufeate walking ; 'tis a country diverfion; I lothe the country, and every thing that relates to it.

Sir Wilfull. Indeed, hah! look ye, look ye, you do? nay, 'tis like you may-- here are choice of paftimes bere in town, as plays and the like; that muft be confers'd, indeed.

Millament. Ah l'etourdie! I bate the town too.
Sir Wilfull. Dear heart, that's much-hah! that you fhould hate 'em both! hah! 'tis like you may', there are fome can't relifh the town, and others can't away with the country--'tis like you may be one of thefe, Coulin. Way of the World, act 4. Ic. 4.

Lord Froth. I aflure you, Sir Paul, I laugh at nobody's jelts but my own, or a lady's: I affure you, Sir Paul.

Brik. How? how, my Lord? what, affront my wit? Let me perifh, do I never fay any thing worthy to be laugh'd at?

Lord Frosh. O foy, don't mifapprehend nie, I don't fay fo, for \(I\) often fimile at your conceptions. But there is nothing more unbeconing a man of quality than to laugh ; 'tis fuch a vulgar expreftion of the paffions! every body can laugh. Then efpecially to laugh at the jeft of an inferior perfon, or when any body dife of the fame quality does not laigh with one; ridiculous! To be pleas \({ }^{\circ}\) with what pleafes the crowd! Now, when I laugh I always laugh alone.

Doulle Dealer, aet I fc. 4.

\section*{ll I D \\ \(R\) I D}

So marp-righted is pride in blemifhes and fo willing to be gratified, that it takes up with the very fighteft improprieties: fuch as a blunder by a foreigner in fpeaking our language, efpecially if the blunder can bear a fenfe that refeets on the fpeaker:

Quickly. The young man is an honeft man.
Ciaius. What fhall de houeft man do in my clofet? dere is no honeft man dat fhall come in my clofet.

Merry Wives of Windfor.
Love fpeeches are finely ridiculed in the following paffage,

Quoth he, My faith as adamantine,
As chains of deftiny, I'll maintain;
'True as Apollo ever fpoke,
Or oracle from heart of oak;
And if you'll give my flame but vent,
Now in clofe lugger-mugger pent,
And thine upon me but benignly,
With that one and that other pigfney,
The fun and day fhall fooner part
Than love, or you, fhake off my heart;
The fun, that fhall no more difpenfe
His own, but your bright influence:
I'll carve your name on barks of trees,
With true love-knots and flourifhes;
That thall infufe eternal fpring,
And everlafting flourifhing:
Drink every letter on't in flum,
And make it brifk champaign become.
Where'er you tread, your foot thall fet
The primrole and the violet ;
All fipices, perfumes, and fweet powders,
Shall borrow from your breath their odours;
Nature her charter thall renew
And take all lives of things from you:
The world depend upon your eye,
And, when you frown upon it, die.
Only our loves ihall ftill furvive,
New-worlds and natures to out-live ;
And, like to herald's moons, remain
All crefcents, without change or wane.
Hudibras, part 2. canto 1.
Thofe who have a talent for ridicule, which is feldom united with a tafte for delicate and refined beasties, are quick-fighted in improprieties; and thefe they eagerly grafp, in order to gratify their favourite propenfity. Peffons galled are provoked to maintain that ridicule is improper for grave fubjeets. Subjects really grave are by no means fit for ridicule; but then it is urged againft them, that, when called in queftion whether a certain fubject be really grave, ridicule is the only ineans of determining the controverfy. Hence a celebrated queftion, Whether ridicule be or be not a teft of truth ?

On one fide, it is obferved, that the objects of ridicule are falfehood, incongruit \(\hat{y}\), impropriety, or turpitude of certain kinds : but as the object of every excited paffion muft be examined by reafon, before we can determine whether it be proper or improper; fo ridicule muft, apparently at leaft, eftablifh the truth of the improprieties defigned to excite the paffion of contempt. Hence it comes in to the aid of argument and reafon, when its impreffions on the imagination are confiftent with the nature of things; but when it frikes the fancy
and affections with sictitions images, it becomes the inftrument of deceit. But however ridicule may imprefs the idea of apparent turpitude or falfehood in the ima. gination, yet ltill reafon remains the fuprense judge ; and thus ridicule can never be the final telt or touchftone of truth and falfehood.

On the other fide, it is contended that ridicule is not a fubject of reafoning, but of fenfe or talte; (fee and compare the articles Risible and Congrui. TY. Stating the queftion, then, in more accurate terms, Whether the fenfe of ridicule be the proper teft for diftinguilhing ridiculaus objects from what are not fo? they proceed thus: No perfon doubts that our fenfe of beauty is the true teft of what is beantiful; and our fenfe of grandeur, of what is great or fublime. Is it more doubtful whether our fenfe of ridicule be the true telt of what is ridiculons? It is not only the true teft, but indeed the only teft ; for this fubject comes not, more than beauty or grandeur, under the province of reafon. If any fubject, by the influence of fahion or cuftom, have acquired a degree of veneration to which naturally it is not entitled, what are the proper means for wiping off the artificial colouring, and difplaying the fubject in its true light? A man of true taite fees the fubject without difguife; but if he hefitate, let him apply the teft of ridicule, which feparates it from its artificial connections, and expofes it naked with all its native improprieties.-But it is uged, that the gravelt and moft ferious matters may be fet in a ridiculous light. Hardly fo; for where an object is neither rifible nor improper, it lies not open ia any quarter to an attack from ridicule.

RIDING, in general, fignifies the being carried along on any velicle.

Riding on horfeback. See Horsemanship.
Riding, in medicine. During this exercife all the vifcera are fhaken, and preffed againft each other; at the fame time the pure air acts with a greater foree on the lungs. Weakly perfons, or thofe whofe flomachs are infirm, fhould, however, be cautious of riding before their meals are fomewhat digefted.

Riding, in naval affairs, is the ftate of a mip's being retained in a particular flation, by means of one or more cables with their anchors, which are for this purpofe funk into the bottom of the fea, \&c. in order to prevent the veffel from being driven at the mercy of the wind or current. - A rope is faid to ride, when one of the turns by which it is wound about the capitern or windlafs lies over another, fo as to interrupt the operation of heaving.

Riding Athwart, the pofition of a hip which lies acrofs the direction of the wind and tide, when the former is fo ftrong as to prevent her from falling into the eurrent of the latter.

Riding between tbe Wind and Tide, the fituation of a veffel at anchor, when the wind and tide act upon her in direct oppofition, in fuch a manner as to deftroy the effort of each other upon her hull ; fo that the is in a manner balanced between their reciprocal force, and rides without the lealt ttrain on her cables. When a thip does not labour heavily, or feel a great ftrain when anchored in an open road or bay, fhe is faid to ride ealy. On the contrary, when he pitches violently into the fea, fo as to ftrain her cables, mafts, or hull, it is called riding hard, and the veffel is termed a bad

\section*{R I I}

2 5 . ronder. A mip is rarely faid to ride when me is fatten-- ed at both the ends, as in a harbour or river, that fituation being comprehended in the article Mooring.

Riding, a diffrict vifited by an officer.-Yorkfhire is divided into three ridings, viz. the eatk, weft, and north ridings. In all indictments in that county, both the town and riding mult be expreffed.

Riding, as connected with gardening, and fufcep. tible of embellithment. Sce Gardening.

A riding, though in extent differing fo widely from a garden, yet agrees with it in many particulars: for, exclufive of that community of eharacter which refults \&c. from their being both improvements, and both deftined to pleafure, a elofer relation arifes from the property of a riding, to extend the idea of a feat, and appropriate a whole country to the manfion; for which purpofe it muft be diftinguifhed from common roads, and the marks of diftinction muft be borrowed from a gardeu. Thofe which a farm or a park can fupply are faint and few; but whenever eircumftances belonging to a garden'occur, they are immediately received as evidence of the domain. The fpecies of the trees will often be decifive : plantations of firs, whether placed on the fides of the way, or in clumps or woods in the view, denote the neighbourhood of a feat : even limes and horfe-chefnuts are not indifferent; for they have always been frequent in improvements, and rare in the ordinary fcenes of cultivated nature. If the riding be carried through a |wood, the fhrubs, whieh for their beauty or their fragrance have been tranfplanted from the country into gardens, fuel as the fweet-briar, the viburnum, the euonymus, and the wood-bine, fhould be eneouraged in the underwood; and to thefe may be added feveral which are ftill peculiar to flrubberies, but which might eafily be transferred to the wildeft coverts, and would requite no further care.

Where the fpecies are not, the difpofition may be particular, and any appearance of defign is a mark of improvement. A few trees ftanding out from a hedgerow, raife it to an elegance above common rulticity : and ftill more may be done by clumps in a field; they grive it the air of a park. A clofe lane may be decorated with plantations in all the little vacant fpaces: and even the groups originally on the fot (whether it be a wood, a field, or a lane), if properly felected, and thofe only left which are elegant, will have an effect: though every beauty of this kind may be found in nature, jet many of them are feldom feen together, and never unmixed. The number and the choice are fymptoms of defign.

Another fymptom is variety. If the appendages of the riding be different in different fields, if in a lane, or a wood, fome dittinguihing circumitance be provided for every bend ; or when, earried over an open expofure, it winds to feveral points of view; if this be the conduct thronghout, the intention is evident, to ammfe the length of the way: variety of ground is alfo a characterittic of a riding, when it feems to have proceeded from choice; and pleafure being the purfuit, the ehanges of the feene both compenfate and account for the circuity.

But a part undiftinguihed from a common road. fucceeding to others more adorned, will by the contrant alone be fometimes agreeable; and there are beauties Erequent in the high-way, and almoft pecuiliar to it,
which may be very acceptable in a riding: a green lane Ridíg. is always delightful; a paffage winding between thickets of brambles and briars, fometimes with fometimes without a little fpring-wood rifing amongt them, or a cut in a continued fweep through the furze of a down or the fern of a heath, is generally pleafant. Nor will the eharacter be abfolntely loft in the interruption, it will foon be refumed, and never forgotten; when it has been once fltongly impreffed, very flight meaus will preferve the idea.
Simplicity may prevail the whole length of the way when the way is all naturally pleafant, but efpecially if it be a communication between feveral fpots, which in character are raifed above the relt of the country : A fine open grove is unufual, except in a park or a garden; it has an elegance in the difpofition which cannot be attributed to aceident, and it feems to require a degree of prefervation beyond the eare of mere hufbandry. A neat railing on the edge of a teep which commands a profpect, alone diftinguithes that from other points of view. A building is ftill more ftrongly characteriftic: it may be only ornamental, or it may be accommodated to the reception of company; fur though a place to alight at interrupts the range of a riding, yet, as the object of an airing, it may often be acceptable. A fmall fpot which may be kept by the labour of one man, inclofed from the fields, and converted into a fhrubbery or any other feene of a garden, will fometimes be a pleafing end to a fhort excurfion from home : nothing to effectually extends the idea of a feat to a diflanee; and not being conflantly vifited, it will always retain the charms of novelty and variety.

When a riding is carried along a high road, a kind of a vil of property may in appearance be claimed even there, lage. by planting on both fidcs trees equiditant from each other, to give it the air of an approach : regularity intimates the neighbourhood of a manfion. A village therefore feems to be within the domain, if any of the inlets to it are avenues : other formal plantations about it, and ftill more trivial circumftances, when they are evidently ornamental, fometimes produce and always corroborate fuch an effect; but even without raifing this idea, if the village be remarkable for its beauty, or only for its fingularity, a paflage through it may be an agreeable incident in a riding.

The fame ground which in the fields is to more than rough, often feenis to be romantic when it is the fite of a village; the buildings and other circumftances mark and aggravate the irregularity. To ftrengthen this appearance, one cottage may be placed on the edge of a fleep, and fome winding fteps of unhewn fone lead up to the door ; another in a hollow, with all its little appurtenances hanging above it. The pofition of a few trees will fometines anfwer the fame purpofe; a footbridge here and there for a cominunieation between the fides of a narrow dip, will add to the character ; and if there be any rills, they may be conducted fo as greatly to improve it.

A village which has not thefe advantages of ground, may, however, be beautiful ; it is dittinguifhed by its eleganee, when the larger intervals between the houfes are filled with open groves, and little elumps are introduced upon other occafions. The church often is, it generally may be, made a pieturefque object. Eve: tlic cottages may be weat and fonmetimes grouped

\section*{\(R\) I D \(\left[\begin{array}{lll}240\end{array}\right] \quad \mathrm{R}-\mathrm{I}\) D}

Ridirg. with thickets. If the place be watered by a ftream, the croffings may be in a variety of pleafing defigns; and if a furing rife, or only a well for common ufe be funk by the fide of the ray, a little covering over it may be contrived which fhall at the fame time be finple and pretty.

There are few villages which may not eafily be rendered agreeable. A fmall alteration in a houfe will fometimes occation a great difference in the appearance. By the help of a few trifing plantations, the wbects which have a good effect may be fhown to advantage, thofe which have not may be conceated, and fuch as are fimilar be difguifed. And any form which offends the eye, whether of ground, of trees, or of buildings, may fometimes be broken by the nighteft circumftances, by an advanced paling, or only by a bench. Variety and beasty, in fuch a fubject, are rather the effects of attention than expence. humenre pleafant; if the buildings are all alike, or fand in undefigned for ineaning rows and fimilar fituations; if the place furorjecto an anifhes no opportunities to contraft the forms of dwellriding. ings with thofe of out-houfes; to introduce trees and thickets; to interpofe fields and meadows; to mix farms with cottages; and to place the feveral objects in different pofitions: yct on the outfide even of fuch a vil--lage there certainly is room for wood; and by that alone the whole may be grouped into a mafs, which fhall be agreeable when flirted by a riding; and till more fo when feen from a diftance. The feparate farms in the fields, alfo, by planting fome trees about them, or perhape only by managing thofe already on the fpot, may be made very interefting cbjects; or if a new one is to be built, beauty may be confulted in the form of the houfe, and the difpofition of its appurtenances. Sometimes a character not their own, as the femblarce of a cafte or an abbey, may be given to them; they will thereby aequire a degree of confideration, which they cannot otherwife be entitled to: and objects to improve the views are fo important to a riding, that buildings mult fometimes be erected for that purpofe only : but they fhould be fuch as by an atual effect adorn or dignify the fcene; not thofe little flight deceptions which are too well known to fucceed, and have no merit if they fail: for though a fallacy fometimes contributes to fupport a character, or fuggefts ideas to the imagination, yet in itfelf it may bc no improvement of a fcene; and a bit of turret, the tip of a fpire, and the other ordinary fubjects of thefe frivolous attempts, are fo infignificant as objects, that whether they are real or fictitious is almoft a matter of indifference.
\({ }_{4}^{4}\) fimilar in character soa riding

The fame means by which the profpects from a riding are improved, may be applied to thofe from a garden; though they are not effential to its character, they are important to its beauty; and wherever they abound, the extent only of the range which commands them, determines whether they fhall be feen from a riding or a garden. If they belong to the latter, that aflumes in iome degree the predominant properties of the former, and the two charafters approach
very near to each other : but fiil each has its peculiarities. Progrefs is a prevailing idea in a riding; and the pleafantnefo of the way is, therefore, a principal confideration : but particular fpots are more attended to in a garden: and to them the communications ought to be fubordinate; their dire fion muft be generally accommodated, their beauties fometimes facrificed to the fituation and the claracter of the feenes they lead to ; an advantageous approach to thefe muft be preferred to ari agreeable line for the walk; and the circumftances which might otherwife become it are mifplaced, if they anticipate the openings: it Chould fometimes be contrafted to them ; be retired and dark if they are fplendid or gay, and fimple if they are richly adorned. At other times it maj burf unexpectedly out upon them ; not on account of the furprife, which can have its effect only once; but the impreffions are ftronger by being fudden; atid the contralt is enforced by the quicknefs of the tranfition.

In a riding, the fcenes are only the amufements of the way, through which it proceeds without fopping : in a garden they are priacipal; and the fubordination of the walk raifes their importance. Every art, therefore, fhould be exerted to make them feem parts of the place. Diftant profpect cannot be fo; and the alienation docs not offend us; we are familiarized to it; the extent forbids every thought of a clofer connection; and if a continuation be preferved between them and the points which command them, we are fatisfied. But bome-rierws fuggeft other ideas; they appear to be within our reach : they are not only beautiful in profpect, and we can perceive that the fpots are delightful ; but we wifh to examine, to inhabit, and to enjoy thein. Every apparent impediment to that gratification is a difappointment ; and when the fcenes begin beyond the opening, the confequence of the place is lowered ; nothing within it engages our notice: it is an exhibition only of beauties, the property of which does not belong to it ; and that idea, though indifferent in a riding, which is but a paffage, is very difadvantageous to fuch a refidence as a garden. To obviate fuch an idea, the points of view fhould be made important; the objects within be appendages to thofe without ; the feparations be removed or concealed; and large portions of the garden be annexed to the foots which are contiguous to it. The ideal boundary of the place is then carried beyond the fcenes which are thus appropriated to it ; and the wide circuit in which they lie, and the different pofitions in which they may be fhown, afford a greater variety than can generally be found in any garden, the fcenery of which is confined to the inclofure.

Persfield ( \(A\) ) is not a large place; the park con-Defrerptie tains about 305 acres; and the houle flands in the midft of perifiel of it. On the fide of the approach, the inequalities of? the ground are gentle, and the plantations pretty; but nothing there is great. On the other fide, a beautiful lawn falls precipitately every way into a deep vale which Atelves down the middle; the declivities are diverfifed with clurnps and with groves; and a number of large trees flraggle along the botom. This lawn is encom-
pafec with wood; and through the whod are walks, which open beyond it upon thoie romantic feenes which furround the pirk, and which are the glory of Persfield. The Wye runs immediately below the wood: the river is of a dirty colou:; but the flape of its courfe is very various, winding firt in the form of a horfe-fhoe, then proceeding in a large fiveep to the town of Chepfowe, and afterwards to the Severn. The banks are high hitls; in different places fteep, bulging out, or hollow on the fides; rounded, flattened, or irregular at top: and eovered with wood, or broken by rocks. They are fometimes feen in front; fometimes in perfpective ; falling back for the pauajue, or clofing belind the bend of the river; appearing to meet, rifing above, or thooting out beyond one another. The wood which inclofes the lawn crowns an extenfive range of thefe hills, which overlaok all thofe on the oppofite fhore, with the country which eppears above or between them; and winding themfctves as the river winds, their fides, all rich and beautiful, are alternately exhibited ; and the point of view in one fpot becomes an object to the next.

In many places the principal feature is a continued rock, in length a quarter of a mile, perpendicular, high, and placed upon a height. To refemble 1 uins is consmon to rocks: but no ruin of any fingle ftructure was ever equal to this enormons pile; it feems to be the remains of a eity; and other finaller heaps fcattered about it appear to be fainter trace: of the former extent, and ftrengthen the fimilitude. It Aretches along the brow which terminates the foreft of Dean; the face of it is compofed of immenfe hlocks of thone, but not rugged; the top is bare and uneven, but not craggy ; and frem the fout of it, a declivity, covered with thicket, nopes gently towards the Wye, but in one part is abruptly broken of by a ledge of rocks, of a different hue, and in a different direction. From the grotto it feems to rife inmediately over a thick wood, which extends down a hill bclow the point of view, acrofs the valley through which the Wye flows, and up the oppofite banks, bides the river, and continues whthout interruption to the bottom of the rock: from another feat it is feen by itfelf without even its bafe; it faces anothcr, with all its appendages abont it ; and fumetimes the fight of it is partially intereepted hy trees, beyond which, at a diftance its long line continues on through all the operings between them.

Another eapital wbject is the caftle of Chepfowe, a noble ruin of great extent; advanced to the very edge of a perpendicular rock, and fo immediately rivetted into it, that from the top of the battlements down to the river feems but one precipice: the fame ivy which overfpreads the face of the one, twines and clufters among the fragments of the other; many towers, much of the walls, and lurge remains of the chapel, are ftanding Clufe to it is a moft romantic wooden bridge, very ancient, very grotefque, at an extraordinary height above the river, and feemins to abut againft the ruins at one end, and fume rocky hills at the other. The cafle is fo near to the alcove at Persfield, that little circumfances in it may be difeerned; from other fots more dittant, even from the lawn, and from a fhrubbery on the fide of the lawn, it is dittinctly vifible, and al*ays beaatiful, whether it is feen alone, or with the aidge, with the town, with more or with ?.iss of

Vos. XVI. Part I.
the rich meaciows which lie along the bunks of the Wye, to its junction three miles off with the Severa. A lone frese of that river alfo, its red eliffs, and the fine rifing country in the counties of Somerfet and Gloncefter, , enerally terminate the profieet.
Moft of the hills about Persfield are full of rocks; fome are internixed with hanging woods, and eithe: advance a little before then, or retire within them, and are backed, or overhung, or feparated by trees. In the walk to the eave, a long fuccerfion of them is frequently feen in perfpective, all of a dark colour, and with wood in the intervals between them. In other parts the rocks are more wild and uncouth; and fom:times they ftand on the tops of the higheft hills; at other times down as low as the river ; they are homeobjects in one fpot, and appear only in the back-grounc of another.

The woods concur with the rocks to render the feenes of 1 ersfeld romantic: the place everywherc abounds with them; they cover the tops of the hills; they hang ois the thecps; or they fill the depths of the valleys. In one place they front, in another they rife above, in another they fink below the point of view ; they are feen fumetimues retiring beyond each other, and darkening as they reeede; and fometimes an opening between two is clofed by a third at a diftance beyond them. A point, called the Lover's Leap, commands a continued furface of the thickeft foliage, which overfpreads a valt hollow immediately underneath. Below the Chinefe feat the courfe of the Wye is in the fhape of a horfe-fhoe : it is on one fide inclofed by a femicircular langing wood; the direct fteeps of a table-hill fhut it in on the other; and the great rock fills the interval between them : in the midil of this rude feene lies the peninfula formed by the river, a mile at the leaft in length, and in the highef fate of cultivation: near the illhmus the ground rifes confiderably, and thence defeends in a broken furface, till it flattens to the water's edgre at the other extremity. The whole is divided into corn. fields and pallures; they are feparated by hedse-rows, eoppices, and thickets; open clumps and tingle trees ftand out in the meadows; and houfes and other buildings, which belong to the farms, are feattered amongtt them: nature fo cultivated, furrounded by nature fo wild, compofe a moft lovely ladalcape toges ther.

The communications between thefe feveral points are generally by chofe walks; but the covert ends near the Chinefe feat ; and a path is afterwards eonducted through the upper park to a rultic temple, which orerlooks on one fide fome of the romantic wiews which have been deferibed, and on the other the cultivated hills and valleys of Monmouthhire. To the ruce and magnificeat feenes of nature now fucceeds a pleafant, fertile, and beantiful conntry, divided into inclofures, not co:ered with woods, nor broken by rooks and precipices, but only varied by eafy fwells and gentle declivities. Yet the frofpect is not tame : the hills in it are hish; and it is bounded by a valt fiveep of the Severn, which is here viluble for many miles tugether, and receives in its courfe the W ye and the Avon.

Fiom the temple a road leads to the Windeliff, a: eminence much above the rel?, and commanding the whole in one view. She Wye runs at the foot of the hill; the perinfula lies juft below; the deep befom of

Rides. the femicitcular hanging wood is fall in fight; over part of it the great rock appears; all its biffe, all its accompaniments, are fien ; the country immediately beyond it is full of lowely hillocks; and the higher grounds in the counties of Somerfet and Gloucetter iffe in the horizon. The Severn feems to be, as it really is, atove Chepflowe, three or four miles wide; below the town it 「preads almolt to a Cea; the comnty of Monmouth is there the hither fore, and between its beantiful hills appear at a great dittance the mountains of Brecknock and Glamorganhhire. In extent, in varicty, and grandeur, few profpects are equal to this. It comprehends all the nuble feenes of Persticld, encompaffed by fome of the fineft country in Britain. Sce Gardening.

RIDLEY (Nicholas), bifhop of London, and a martyr to the Reformation, was defcended of an ancient family, and born in the beginning of the \(\mathbf{6 t h}\) century, at Wilmontrwick in Northumberland. From the grammar-fchool at Newcaitle upon Tyne, he was fent to Pembroke-lall in Cambridre, in the year 15:8, where he was fupported by his uncle Dr Robert Ridley, fellow of Queen's college. In 1522 he took his firlt degree in arts; two years after, was clected fellow; and, in 1525, he commenced malter of arts. In 1527, having taken orders, he was fent by his uncle, for further improvenent, to the Sorbonne at Paris; from thence he went to Louvain, and continued abroad till the year 1529. On his return to Cambridge, he was chofen under-treafurer of the univerfity; and, in 1533 , was elected fenior proctor. He afterwards proceeded bachelor of divinity, and was chofen chaplain of the univerfity, orator, and magifer glomeric. At this time he was much admired as a preacher and difputant. He loft his kind uncle in 1536; but was foon after patronifed by Dr Cranmer, archbifhop of Canterbury, who made him his domeftic chaplain, and prefented him to the vicarage of Herne in Ealt Kent; where, we are told, he preached the doctrine of the Reformation. In \(15 t^{-}\), having commeaced doctor of divinity, he was made king's chaplain; and, in the fame year, was clected matter of his college in Cambidide. Som after, Riclley was collated to a prebend in the church of Canterbury ; and it was not long before he was accufed in the bithop's cont, at the inftigation of bithop Gardiner, of preaching againft the docirine of the Six Asticles. The matter being reforred to Cranmer, Ridley was acquitted. In 1545 , he was made a prebendary of Weflminter abley; in 1547 was prefented, by the fellows of Pembroke-hall, to the living of Sohan, in the diocefe of Norwich; and the fane year was confecrated bithop of Rocheller. In 15 ; 0 he was tranflated to the fee of London: in which year he was one of the commiffioners for cxamining bithop Gardiner, and concurred in his deprivation. In the year 1552, our prelate returning from Cambridge, unfortunately for hinfelf, paid a vifit to the Princefs, afterwards Queen Mary; to whom, prompted by his zeal for refermation, he expreffed himfelf with too much freedom: for fle was fcarcely feated on the throne when Ridley was doomed a victim to her revenge. With Cranmer and Latimer he was burnt alive at Oxfoid, on the 16th of October 1555. He wrote, 1. A treatife concerning images in shurches. 2, Brief declaration of the Lord's Supper.
3. Certain godly and comfortable conferences hetween bifhop Ridley and Mr Hugh Latimer, during their impritonment. 4. A comparifon between the comfortable doctrine of the Golpel and the traditions of the

RIFLE, in gunnery. Sec Gunnery, \(n^{\circ} 36\), , Seq.

RIGA, a large, ftrong, populons, and rich town of the Ruffan empire, and capital of Livonia. It is a large trading place, and has a very confiderable fortrefs; the trade is chiefly in corn, /kins, leather, and naval tlores. It was taken by the Ruffians in 1710, after they had blocked it up a long white, during which the inlabitants were afflicted with the plague. The calle is fquare, and defended by four towers and fix baftions; befides which, it has a fme arfenat. The Proteftants have Atill a handfome college here. It is feated on a large plain on the 1 iver Dwina. E. Long. \(24.25 . \mathrm{N}\). Lat. 57. 0.

RIGADOON, a gay and brilk dance, borrowed originally from l'rovence in France, and performed in figure by a man and woman.

RFGGING of a SHIP, a general name given to all the ropes employed to fupport the matts, and to extend or rcduce the fails, or arrange them to the difpofition of the wind. The former, which are ufed to fullain the mafts, remain ufually in a fixed polition, and are called flanding rixging ; fuch are the fhrouds, fays, and back-tays. 'The latter, whofe office is to manage the fails, by conmunicating with various blucks or pulleys, fituated in different places of the malts, yards, flrouds, \&c. are comprehended in the general term of rurning rigging; fuch are the braces, fleets, haliards, clue-lines, brails, \&c.

In rigging a malt, the firt thing ufually fixed upon its head is a circular wreath or rope, called the gromet, or collar, which is firmly beat dowa upon the top of the homds. The intent of this is to prevent the flrouds. from being fretted or worn by the trefle-trees, or fhoulders of the maft; after this are laid on the two pendants, from whofe lower ends the main or fore tackles are fufpended; and next, the Mrouds of the ftarboard and larboard lide, in pairs, alternately. The whole is covered by the flays, which are the largelt ropes of the rigging.-When a yard is to be rigged, a gromet is alfo driven firft on each of its extremities; next to this are fitted on the horfes, the braces, and laitly the lifts or top-fail fheet-blocks.
The principal objects to be confidered in rigging a mip. appear to be ftrength, convenience, and fimplicity : or, the properties of affording fufficient fecurity to the mafts, yards, and fails; of arranging the whole machinery in the mort advantagrous manner, to furftain the mafts, and facilitate the management of the fails; and of avoiding perplexity, and icje ing whatever is fuperfluous or unneceffary: 'The perfection of this art, then, confills in retaining all thofe qualities, and in preferving a judicious medium between them. See Ship-building.

RIGHT, in geometry, fignifies the fane with ftraight; thus, a ftraight line is called a \(\cdot \mathrm{igh}\) one.
Right is a title conferred, 1. Together with Reverend, upon all bifhops. 2. Together with Henourable, upon carls, vifcounts, and barons. 3. By courteffy, together with Honouralle, upon the fors of dukes, mar-
t. quifics, and the elderl fnis of carls. 4. Together with Henourable, to the feaker of the houfe if commons; but to no other commoner esecpting thofe who are members of lis majeff \(y^{\prime}\) 's mof honourablic pricy-council ; and the three lord may ors of London, York, and Dub: ln, and the lord provo.t of Edirburgh, during thiia office. See Honoua \(\begin{aligned} & \text { blef and Provost. }\end{aligned}\) Herditary Right. Sce Hereditary.
Right is a word which, in the propriety of the Englifh language, is urcd fometimes as an adjective and fonectimes as a fubtantive. As an adjective it is nearly of the fame import with. fit. fritutle, beconing, tresper ; Rec. end whillt it exprefes a qquality, it indicates a relation ". Thus, when we fay that an action is rizht, we muft not only know the nature of the action, bur, if we fyeak intelligibly, muft alfo perceive its relation to the end for which it was perfurmed; for an action may be right with one cr:d in view which would be zureng with anuther. The conduct of that general would be right, who, to fave an army that could not be otherwife faved, fhould place a fmall detachnent in a flation where he knew tlicy would all be ineritably cut off; but his conduct would be very zurong were he to throw away the life of a fingle individual for any purpute, however inportant, which he knew how to accomplik without fuch a facrifice.
Many philofophers have talked of actions being , ight and zurong i : the abtract without regard to their natural conffequences; and converting the word into a fubitantive, they liave fancied an eternal sule of right, by which the morality of human conduct is in every particular cafe to be tried. But in thefe phrafes we can difcover no meaning. Whatever is riybt mult be So on \(/\) imine account or otber; and whatever is fit, mulf be fit fur fome purpofe. When he whio refls the foundation of virtue on the micral finfe, fpeaks of an action being right, he mul mean that it is tuch as, through the medium of that fenfe, will excite complacency in the mind of the agent, and gain to him the general approbation rf mankinch. When he who reffs moral obligation on the will of God, fpeaks of fome actions as right and of others as cur:nn, he nult mean that the former are agreeable to the divine will, however made known to men, and the latter difageeeable to it ; and the man who dedices the laws of virtue from what he calls the fitinefs of things mutt lave fome end in view, for which thingss are fit, and denominate actions right or aurong as they tend to promote or counteract that end.
But the word right, ufed as a fubftantive, has in common as well as in philofophical language a fignification whicl at firft view appears to be very different from this. It denotes a jeffl lacen or an bonglpodf: fiom. Thus we fay, a father las a right to reverence from his clildren, a luifand to the love and fidelity of his wiff, and a king to the allegiance of his fubjects. But if we trace thefe rights to their fource, we thall find that they are all laws of morad obligation, and that they are called rights only becaufe in is agreeable to the will of God, to the instinctive dietutcs of the moral fenfe, or to the literefs of things, if fucch a phrafc has any meaning, that children reverence their parents, that wives love thecir hubbands, and that fubjects pay allegiance to their forereign. This will be apparent to any man who thall put to himfelf fuch quettions as thefe: " H'sy, lave parents a a cight to aererence from thirir children, hubbands to the love of
their wives, and fovere:gns to the ablegiance of their fubjects "" As thefe gucttions contain i: them nothing ablud, it is ubviotiz that thoy are cach capable of at precte aminer; but it is imporfible to give to ary 0 : them an anfwer which thall have any meaning, and not imply that risht atil olitgation are reciprocal, or, in other words, that whercer there is a right in one perfon, there is a carvelponding obigigation upon otivers. Thus to the queftion, "Why have parents a rishte to reverance from thecir children ?" it may be anfwered, " becauke, under God, they were the authors of their childrens being, and protected them from danger, and turnifhed them with neeeffaries, when they were in a thate fo helplefs that they could do rutlings for themfelves." This anfwer conveys no other meaning than that there is an obligation upon children, in return for benefts received, to reverence ilhcir parents. But what is the fource of this obligation? It can only be the will of Gud, the moral fenfe, or the fitnefs of thinge.

This view of the nature of rishe will enable us to form a proper judgment of the aflertion of a late writcr, "that man has no rights.". 'The arguments by which Cemen's this apparent paradox is mantained, are not merely inl- \({ }_{\sim}^{\text {ofter ab }}\) genions and plaufiole; they are abfulutcly conclutive. F. Five But then our philofopher, who newer choofes to travel in the beaten track, takes the word rigbe in a fenfe re. y different from that in which it has been ufed by all other men, and confiders it as equivalent to diferetionary ponver. "By the word right (lay's he) is madertood a Rights of full and complete power of cither doing a thing or man, onntting it, without the perfon's becoming liatle to animadverfion or cenfure from another; that is, in other words, without his incurring any degree of turpitude or guilt." In this fenfe of the word he affirms, and affirms truly, that a man liaa no rights, no diferetionary power whatever, except in things of fuch total indificrence as, whether "he fhall fit on the right or on the left tide of his fire, or dine on beef to day or tomor10w."

A propofition fo evidently true as this fond not in need of argument to fupport it ; but as his arguments are clearly expreffed, and afford a complete confutation of fome popular errors fanctioned by the refpectablic phrafe rishts of nan, we flall give our readers an opportunity of tudying them in his own words.
"Political fuciety is founded on the principles of morality and juftice. It is impofifible for intellectual beings to be brought into coalition and intercourfe withont a certain mode of conduct, adapted to their nature and connection, irmmediately beconing a duty incurmbent on the parties concernecd. Men would never lave aflociated if they had not imagineal that, in confequence of that alfociation, they would muts sully conduce to the adrantage and happiners of each othin. This is the real purpore, the genume bafis, of thcir intercourte; and, as far as this purpofe is anfivered, fo far doed fociety arfwer the end of its intitution. 1 here is only one poitulate more that is nicecfiry to bring us to a conclafive mode of reafonias upon this fublject. Whatever is meant by the term right, therc can ueither be oppofite rights, nor rights and dutics huitile to cach other. The rights of one man camnot clath with or be deftructive of the rights of another: for this, intlead of rendering the fubject an important branch of truth and morality as the advecates of the rights of man certain-

Rish. Iy undertand it to be, would be to raties it to a heap of unintelligible jargon and inconfiftency. If one mat have a right to be free, another man cannot liave a right to make him a nave ; if one man have a right to infliet chaftifement upon me, I caunot have a right to with. draw myfelf from chatifement ; if my neighbou: have a right to a fum of money in my pofleftion, I cannot have a right to retain it in my pocket. It cannut be lefo incontrovertible, that I have no right to onit what my duty preferibes. From hence it inevitably follows that ince lave no rights.
" It is commonly faid, "that a man has a right to the difpufal of his fortune, a right to the employment of ais time, a right to the uncontrolled choiee of his profifion or purfuits.' But this can never be confittently alfirmed till it can be fhown that he has no duties, preferibing and limiting his mode of procceding in all thefe refpects.
"In reality, nothing ean appear more wonderful to a carctil inquirer, than that two ideas fo incompatible as man and rizbt: fhould ever lave been affociated tosegether. Certain it is, that one of them mult be utterly exclufive and annihilatory of the other. Before we afcribe rights to man, we muft conceive of him as a being endowed with intellect, and capable of difeerning the differences and tendencies of things. But a being endowed with intellect, and capable of difeerning the differences and tendencies of things, inftantly becomes a moral being, and has duties incumbent on him to difcharge: and duties and rights, as has already been fhown, are abfulutely exclufive of each other.
" It has been affirmed by the zealous advocates of liberty, 'that princes and maçiftrates have no rights;' and no pofition can be more incontrovertible. There is no fituation of their lives that has not its correfpondent duties. 'There is no power intrufted to them that they are not bound to exercife exclulively for the public good. It is ftrange, that perfons adopting this princuple did not go a tep farther, and perceive that the fame refrictions were applicable to fubjects and citizens."

This reafoning is unanfwerable ; but it militates not againtt the rights of man in the ufual aceeptation of the words, which are aever employed to denote diferetionary power, but 2 juft claim on the one hand, implying a correfponling obligation on the other. Whether the Hhrafe be abfolutely proper is not worth the debating: it is authorifed by cuftom-the jus et norma loquendiand is univerfally underfood exeept by fuch as the dæmons of faction, in the form of paradoxical writers on political juftice, have been able to millead by fophiftical reafonings.

Rights, in the common acceptation of the word, are of various kinds: they are natural or adventitious, alienoble or unalienable, ferfia or imperfia, particular or general. See the article Liberty.

Natural rights are thofe which a man has to his life, limbs, atd liberty; to the produce of his perfonal labour; to the ufe, in common with others, of air, light, and water, \&c. That every man has a natural right or jull claim to thefe things, is evident from their being abfolutely necettary to enable him to anfwer that purpole, whatever it may be, for which lie was made a liring and a rational being. This fhows undeniably, that the Author of his nature defigned that he fhould have the we of them, and that the man who fhould wanton-
ly deprive hins of any one of them, would be gruity of a breach of the divine law, as well as act inconfillently with the fiteefs of things in cevere benfe in which that plirafe cau polfibly be underilood.

Adventiinus riglats are thofe which a kang las over. Aivent lis fubjects, a general over his foldicrs, a huband to the perfon and affections of his wife, and which every man jias to the greater part of his property. That the rights of the king and the general are adventitious, is univer. fally admitted. The rights of property have been eonfidered elfewhere (fee Property); and though the has man conftitution fhows fufficiently that men and women have a natural sight to the ufe of each other, yet it is evident that the excludive right of any one man to aniy one woman, snd que verfo, mult be an adventitious right: But the important queflion is, EIow are adventitious rights acquited?

In anfwer to this quefion, the moralit who deduees How a:the laws of vintue from the will of God, obferves, that quired. as God ajpears from his works to be a benevolent Be ing, who wills the happinefs of all his creatures (fee Meraphysics, no 312 .), he muft of courfe will every thing which naturally tends to promote that happinels. But the exiftence of civil focicty tvidently contributes in a great degree to promote the fum of human happinefs (fee Society) ; and therefore whatever is neceffary for the fupport of civil fociety in general, or for the conduct of particular focieties already ellablifhed, muft be agrecable to the will of God: But the allegiance of fubjecte to their fovercign, the obedience of foldiers to their leader, the protection of private property, and the fulfilling of contracts, are all abfolutely neceffary to the fupport of fociety: and heace the rights of kings, generals, hubands, and wives, \&c. though adventitious, and immediately derived from human appoiatment, are not lefs facred than natural rights, lince they maty all be ultimately traced to the fame fource. The fame conchition my cafly be drawn by the philofopher, who refts moral obligation on the fitnefs of things or on a moral fenfe; ouly it mult in cach of thefe cafes partake of the inftability of its foundation.
To the faerednefs of the rights of marriage, an au-Objections thor already quoted has lately urged fome declamatory to fenin us objections. "It is abfurd (fays he) to expedt, that thefe the inclinations and wifhes of two human beings fhould coincide through any long period of time. T'o oblige them to ack and to live together, is to fubjes them to fome inevitable portion of thwarting, bickering, and unhappinefs. This cannot be otherwife, fo long as man has failed to reach the ftandard of abfolute perfection. The fuppofition that I mult have a companion for life, is the refult of a complication of vices. It is the dictate of cowardice, and not of furtitude. It fows from the defire of being loved and efteemed for fomething that is not defert.
"But the evil of marriage, as it is practifed in European countries, lies deeper than this. The habit is, for a thoughtefs and romantic youth of each fex to come togethes, to fee cach other for a few times, and under circumflanees full of delufion, and then to vow to each other eternal attachment. What is the confequence of this? In almoft every inflance they find themfelves deceived. They are reduced to make the beft of àn irretrievable miltake. They are prefented witla the ftrongct imaginable temptation to bccome the dupes

\section*{\(R 1 G\)}

\section*{\(R\) i \(G\)}
of falfehood. They are led to conceive it their wifet policy to Thut their eyes ujon tealities; happy if Ly any perverfion of inteliect they can perfuade thomfelves that they were right in their firf erude opinion of their companion.
"So long as two human beings are forbidden by pofitive inftitution to follow the diftates of their own mind, prejucice is alive and vigorons. So long as I feek to enigrofs one woman to myfelf, and to prohibit my neighbour from proving his fuperior detert and reaping the frnits of it, I am cruility of the moft odious of all monapolies. Over this imasinary prize men watch with perpetual jealoufy; and one man will find his defires and lis capacity to circumvent as much excited, as the other is excitel ro traverfe his projects and fruftrate lis hopes. As long as this flate of fociety continues, philanthropy will be creffed and checked in a thoufard ways, and the flill augmenting lircain of abufe will cortinue to fow.
"The abolition of marriage will be attended with no evils. The intercourfe of the fexes will fall under the fame fyflem as any other feecies of friendfhip. Exclufively of all groundiefs and obltinate attachments, it will be impceflele for me to live in the world without finding one man of a worth fuperior to that of any other whom I have an opportunty of obferving. To this man I thall feel a kinduefs in exact proportion to my apprehenfion of his worth. The cale will be precifely the fame with refpeet to the female fex; I hall affiduoufly cultivate the intercoufe of that woman whofe accomplifhments thall thrike me in the moft powerful manner. - But it may happen that other men will feel for her the fame proference that I du.' This will cteate no difficulty. We may all enjoy her converfation; and we thall all be wife enough to confiter the fenfial intercoufe as a very trivial object. This, like every other affair in which two perfors are concemed, muft be regulated in each fucceffive inftance by the unforced conient of either party. It is a mark of the extreme depravity of our prefent habits, that we are indined to fuppofe the Cenfual intercourfe anywife material to the advantages anifing from the purelt affection. Reafonable men now eat and drink, nut from the love of pleafure, but becaufe eating and drinking are effertial to our healthful exiltence. Keafonable men then will propasate their fpecies, not becaufe a certain furible pleafure is annexed to this action, but becaufe it is right the fpecies floovid be propargated; and the manner in which they exescife this function will be regulated by the d.etates of reafon and dint \(y\)."

It is right then, according to this political innovator, that the !pccies monld be propagated, and reafouable men in his Utopian commonwealth would be incited by reafon and duty to propagate them: but the way to fulsil this duty, experience, which is feldom at one with Speculative reformation, has already demonfrated, not to confilt in the promifcuous intercourfe of feveral men with one woman, but in the fidelity of individuals of the two fexes to each other. Common protlitutes among us feldom prove with child; and the fociety of Arreoys in Otaheitee, who have completely divefted themfelves of what our author calls prejudice, and are by no means guilty of his mof odous of all murotoiles, are for the mult part childiefs (fee Orahliter). İe fiems to think that a flate of equal property would ae-
ceflarily deffroy our relifh for lusury, decreate our in- Right. ordinate appetites of every kind, and lead us univerfally to prefer the pleafures of intellect to the plcafures of Fenfe. But here again experience is againd him. The Arreyss, who have a property in their women perfectly equal, are the moft luxurious and fenfual wretches on the face of the earth; fenfual inceed to a degree of which the mult libidinous European can lardly form a conception.

By admitting it to be a duty to propagate the fpccies, our author mult neceflazily grant that every thing is right which is requilice to the faltiling of that duryr and the contrary wrong. If fo, promiicuous concubiwage is wreng, fince we have fien, that by a law of nature it is incompatible with the duty; whence it follows on his own principles, that the fextul umion by fairs muft lee right. 'ithe only queftion therefore to be decided between him and his opponents is, "Whether Thould that uniou be temporary or permanent:" And we think the following obfervations by Mr Paley fufficient to decide it to the conviction of every ferton not blinded by the rage of innovation.
"A lawgiver, whofe counfels sere ditcoted by views of general utility, and obttructed by no local impediments, would make the marriage-contract indiffoluble during the joint lives of the parties, for the fake of the following advantages: Such a union tends to preferve peace and concond between manied perfons, by perpetuating their common interelt, and by inducing a neceffity of mutual compliance. An carlicr termination of it would produce a feparate interelt. The wife would naturally lock forward to the d:ffolution of the partuer:hip, and endeavour to draw to herfelf a fund againil the time when fhe was no longer to have aceefs to the fame refources. This would beget peculation on one fide, and miftruft on the other ; cils which at prefent very litele ditturb the confict:ace of married life. The fecond effect of making the inion determinabic only by death, is not lefs beneficial. I: neceffa:ily happens, that adverfe tempers, habits, and taftes, oftentimes meet in marriage. In which cafe, cach party muft take pains to give up what offends, and practice what may gratify, the other. A man and woman in love with each other do this infenfibly: but love is neither general nor durable; and where that is wanting, no leffons of duty, no delicacy of fentiment, will go half fo far with the generality of mankind and wemankind as this one intelligible reflection, that they munl each make the beft of their bargain; and that fecing they mult either tuth be miferable or both thare in the fame happinefs, neither can find their own comfort but in promoting the pleafure of the other. Thefe compliances, though at filf cxtorted by necefity, bccome in time eafy and inutual; and though lefs endearing than affiduities which take their rife from affectien, gererally p:ocure to the married pair a repof and fatisfaction fulficient for their happineds."
So differently from our author does this judicious writer reafon concerning the effects of a permanent union on the tempers of the marricid pair. Inftead of fubjecting them to fome incvitable pention of thwarting, bickering, and unhappincfo, it lays them, in his opinion, under the neceffity of curbing their unruly paffions, and acquiring habits of gentlenets, forbearance, and peace. 'I'o this we may add, that both believing

It \(\mathrm{Cr}{ }^{\circ} \quad 1\)
the chalien propgated during their marriage the their on a (a belisf mattainalhe hy the fother i: at tate of promifcons concubinate), they come by a matural procefo of the human pafions (fue Passios) to love cach wher through the mediun of thatir offeprin s. 13st if it be the duty of man to acquire a fpirit firt purc, then pascable, gentle, and cafy to be intreated, it inu!! be agrecable to the will of God, and a branch of the fitae's of things, that the fexual union lath duioner the joint lives of the parties; and therefore the exchinec ni, hat of marriage, though adentitious, mult be cquall facred with thofe which are natural.

Buat to return from this digeefion, into which the irpuriance of the fubjeir led us, right, betides heins, naturat or alven:itions, are likewife slienable or un- alichicue. Every man, when he becomes the meniber of a citil community, alictates a past of his natural-ri rhti. In a flati of nature, nu man has a fuperior on earth, and eace? has a right to defend his life, liberty, and property, by all the means which nature has put in his power. In civil fociety, however, thefe rightits are all transferred to the laws and the maciltrate, except in cafes of fuch extreme urgency as leave not time for leyal interpolition. This fingle confideration is fufficient to fhow, that the right to civil liberty is alienable; thousth, in the veleenence of men's real for it, and in tire languare of fome political remonfrances, it has uften been pronounced to be an watienable right. " The true reafon (fays Mr Paley) why mankind hold in deteflation the menory of thofe who have tuld their liberty to a tyrant is, that, together with their own, they fold commonly or endangered the liberty of others; of which they had cettainly no right to difpofe." The rights of a prince never his people, and of a hufband over his wife, are generally and naturally unalienable.

II
अericot ard
injiverfea.

Auother divifion of rights is into thofe which are perfeet and thofe which are imperfect. Perfect rights are fuch as may be precifely afcertained and afferted by force, or in civil fociety by the conrfe of law: 'To imperfect rights neither force nor law is applicable. A man's rights to his life, perfon, and property, are all perfect ; for if any of thefe be attacked, he may repel the attack by inftant vin?ence, punifh the aggreffor by the courfe of law, or compel the author of the injury to make reflitution or fatisfaction. A woman's right to her honour is likewife perfect; for if the cannot otherwife cfcape, fhe may kill the raviher. Every poor man las undoubted rifht to relief from the rich: but his right is imperfect, for if the relief be not voluntarily given, he cannot compel it either by law or by violence. 'There is no duty upon which the Chritian religion puts a greater value than alms-giving; and every preacher of the gufpel has an undoubted right to inculcate the practice of it upon his audience: but even this risht is imperfect, for he cannot refufe the commumion to a man merdy on account of his illiberality to the poor, as he canto another for the neglect of any duty comprehended under the term juftice. In elections or apppointments to offices, where the qualifications are preicribed, the belt qualified candidate has unquertionably a right to fuccefs; yet if he be rejected, hee can neither feize the office by force, nor obtain redeff at law. His right, therefore, is imperfect.

Here a queftion naturally offers itfelf to cur confideration: "How comes a perfon to have a right to a thinj,
"ul yet have no rifht to ure chem ans n. ffory to ohe tain it?". The anfoer is, Thai in fue!, chles the . .hecet or the circunitances of the right are io iden .n. as.., that the parmillion of force, even wicte the ri, bit is real aurd certain, would le:.? to foree in wiher eifis where there exitis no figlit at all. Thus, thou in the pur man hit, a right to relie?, who fhall afeertain tho mode, liafon, and çuantum of it, or the perfon by whoni it and be adminillered? Thefe thinge mul be afcertained before the rifht to tedief ean be enfured by law; but to allow hhen to be afeertines by the poor themfelves, would he to expole property to endlefs claims. In like maunce, the comparative qualineations of the candidate mult be afortaind, before tee can enforce his right to the offics: but to oll wow him to atertain his qual tications himfe.f, woul! be to make him julge in his own caule between himfell and his neighbour.

Wherever the right is imperfect on one fide, the cor- - riveris, refponding ubligation on the other mull be imperfect righo liken:fe. The violation of it, in swever, is often not crelw, 1:fs cri ninal in a moral and relifious wi,w than of a hife perfect obligation. It is well oblersed by Me Patey, th:t greater guilt is incurred by difappointing a worthy candidate of a phee upon which parhaps his livelihood depends, and in which he conid eminently furve the public, than by filching a book out of a library, or picking a pueket of a handkerchief. The fame i-ntiment las heen expreffed by Mr Godwin, but in terms by much too flroug, and fuch as fhow that he was not at the time complete malter of his fubject. "My neighbour (fays he) has juft as much right to put an end to my exiftence with dagger or poifors, as to deny me that pecuniary affilance without which I mult ftarve, or as to deny me that affiltance without which my intehlectual attainments, or my moral exertions, will be matcrially injured. He has juft as much right to anufe himfelf with bu:niag my houfe, or turturing my children upon the rack, as whent himfelf up in a cell, carelefs about his fellow men, and to hide 'his talunt in a mapkin."
It is certainly true, that the man who thould fuffer aoother to Harve for want of that redief which he kneze that he alone could afford him, would be guilty of murder, and murder of the crnelleft kind; bat there is an innmenfe difference between depriving fociety of one of its members, and with-holding frons that member what mi rht be neceflary to enable him to make the greatelt puffible intellectual attainments. Newton might havebeen nifeful and happy thou gh he had never been acquainted with the elonenits of mathematics; and the late celcbrated Mr Fergufon might have been a valuable member of fociety, though he had never emerged from his original condition of a thepherd. The remainder of the paragraph is toro absurd to require a formal contutation. Had our author, burying his taient in a mapkin, thut hinfedf up feven jcars ago in a cell, circlefs' about his fullow men and political juflic, he would have deprived the public of what he doubttefs believes to be anuch ufeful iultruction; bet had he at that period annfed himfelf with burning this neighbour's houfe, and torturing on the rack two or three children, he would have cut off, for any thing he could know, two or three futuse Newtons, and have hiaself been cut off by the infuled laws of his country. Now, without fuppoling the valae

F- are warranted to fay, that however of creat his merits we be, they are not infinite, and that the addition of thofe of one Newton to them would undoubtedly increafe their fum.

Righes, are particular or gcneral. Particular rights are fuch as belong to certain individuals or orders of men, and not to others. The rights of kings, of maflers, of hufbands, of wives, and, in thort, all the rights which originate in focicty, are particular. General rights are thofe which belong to the Species collectively: Such are our rights to the vegetable produce of the earth, and to the flefh of animals for food, though about the origin of this latter right there has been much diverfity of opinion, which we have noticed in another place. (See Theologr, Part I. fect. 2d). If the vegetable produce of the earth be included under the general righes of mankind, it is plain that he is guilty of wrong who leaves any confiderable portion of land wate merely for his own anufement : he is leffening the common thock of provifion which Providence intended to diftribute among the fpecies. On this principle it would not be cafy to vindicate certain regulations refpeet ing game, as will as fome other monopolies which ate protected by the municipal laws of moit countries. Mr Paley, by jutk reafoning, has eftablithed this conclufion, "that nothing ought to be made exclufive pro. perty which can be conveniently enjoyed in conmon." An equal divifion of land, however, the dream of fome vilionary reformers, would be injurious to the general rights of mankind, as it may be demonftrated, that it would leffen the common ftock of provifions, by laying every man under the neceffity of being his own weaver, tailor, fhoemaker, fmith, and carpenter, as well as ploughnaan, miller, and baker. Among the general rights of mankind is the right of neecelfy; ; by which a man nay ufe or dettroy his neighbour's property when it is abfolutely neceflary for his own prefervation. It is on this principle that goods are thrown overhoard to fave the fhip, and houfes pullicd down to top the progrefs of a fire. In fuch cafes, however, at leaft in the laft, reftitution ought to be made when it is in our power; but this reflitution will not extend to the original value of the property deftroyed, but only to what it was worth at the time of deftroying it, which, confidering its danger, might be very little.

RIGHTEOUSNESS, means juftice, honefly, virtue, goodnefs, and amongt Chritians is of exactly the fame import with holinefs, without which, we are told, no man fhall fee the Lord. The doctrine of the fall, and of redemption through Jefus Chiift, has occalioned much difputation, and given rife to many fingular notions in the world. The haughty philofopher, diffatisfied with myfteries, and with the humiliating doctrine of atonement by a crucified Saviour, has made a religion for himfelf, which he calls rationol Chrilfianity; and the enthufiaft, by extracting doctrines from Scripture which are not contained in it, and which are re: pugnant to its firit, has given too much countenance to this prefumption. The doctrine of imputed righteoulnefs, by which the merit of Chrift is faid to bc imputed to us, appears to be of this number; and though it has been held by many good, and by fome learned men, it is certaimly in general unfriendly to virtue, as will be readily allowed by all who have converfed with the more ignorant fort of Methodifts in England or Se-
ceclers in Scotland. That it does not follow. from the doctrine of the atonement, and confequently that it has no foundation in Scripture, will appear elfewhere. See Theology.

Bill of Rigats, in law, is a declaration delivered by the lords and commons to the prince and princefs of Orange, \(3^{\text {th }}\) February 1688 ; and aftewwards enacted in parliment, when they became king and queen. It fets forth, that king Janes did, by the affittance of divers evil counfellors, endeavour to fubvert the lws and liberties of this kingdom, by exercifms a power of difpenling with and fufpending of laws; by levzing money for the ufe of the crown by pretence of prengative without confent of parliament ; by profecuting thofe who petitioned the king, and difcouraging petitions; by raifing and keeping a ftanding army in tirne of peace; by violating the freedom of election of members to ferve in parliament ; by violent profecutions in the court of king s bench; and caufing partial and corrnpt jurors to be icturned on trials, exceflive bail to be taken, exceffive fines to be impofed, and cruel puainments inficted; all which were declared to be illegal. And the declaration concludes in thefe remarkable words: "And they do claim, demand, and infolt upon, all and fingular the premifes, as their undoubted rishts and liberties." And the aet of parliament itfelf (1 W. \& M. fat. 2. cap. 2.) recognizes " all and fingular the rights and liberties, afferted and claimed in the faid declaration, to be the true, ancient, indubitable rights of the people of this kingdom." See Liberty.

RIGIDITY, in phyfics, denotes a brittle hard. nefs. It is oppofed to ductility, malleability, and foftnefs.

RIGOLL, or Regals, a kind of mufical inftru. ment, corfifing of feveral ficks bound together, only feparated by beads. It is tolerably harmonious, being well ftruck with a ball at the end of a ftick. Such is the account which Graffineau gives of this initrument. Skinner, upon the authority of an old Englif ditionary, reprefents it as a clavichorel, or claricord ; pofitibly founding his opinion on the nature of the office of the tuner of the regals, who ftill fubfits in the eftablifhment of the king's chapel at St James's, and whofe bufinefs is to keep the organ of the chapel royal in tune; and not knowing that fuch wind inftruments as the organ нeed frequent tuning, as well as the clivichord and other ftringed inftrunents. Sir Henry Spelman de* rives the word rigoll from the Italian rigabelf, a nufical inftrument, anciently ufed in clurches inftead of the organ. Walther, in his defeription of the regal, makes it to be a reed-work in an organ, with metal and alfo wooden pipes and bellows adapted to it. And he adds, that the name of it is fuppofed to be owing to its having been prefented by the inventor to fome king.From an account of the regal uled in Cermany, and other parts of Enrope, it appears to coulift of pipes and keys on one fide, and the bellows and wind-cheft on the other. We may add, that Loord Bacon (Nat. Hilt. cent. ii. f. 102 ) difinguimes between the regral and organ, in a manner which hows them to be initruments of the fame clafs. Upon the whole, there is reaton to conclude, that the regal or rigoll was a pneumatic, and not a fringed inftrument.

Merlennus relates, that the Flemings invented an inArument, les regales de bois, confiting of 17 cylindical

\section*{\(R \mathrm{~N} \quad[24\)}

3irre picees of wood, decreafing gradually in length, fo as to produce a fueceffion of tones and femitones in the diatonic ferics, which had keys, and was played oñ as a
fipinct; the hint of which, he fuys, was taken from an infrument in ufe amony the Turks, confifting of 12 wooden cylinders, of different lengths, Atruns together, which being fufpended and Atruck with a flick, having a ball at the end, produced mulic. Hawking's Hilt. Mur. vol. ii. p. 449.

RIGCR, in medicine, a convallive huudering from fevere cold, an ague fit, or other diforder.

RIMIN1, an ancient, populous, and handfome town of Italy, in Romagna, which is part of the territory of the church, with a hifhop's fee, an old caltle, and a ftrong tower; as alfo many remains of autiquity, and very tinc buildings. It is famous for a council in \(\mathbf{1 3 5 9}\), conlitting of 400 bithops, who were all Arians except 20 . It is feated in a fertile plain, at the month of the river Marecchia, on the gulph of Venice. E. Long. 12. 39. N. Lat. 44. 6.

R1ND, the llin of aty fruit that may he cut off or pared. Rind is alfo ufed for the imer bark of trees, or that whitinh foft fubftance which adheres immediately to the wood. Sec Plant.

RING, an ornament of gold and filver, of a circular figure, and ufually worn on the finger.
The epileopal ling (which makes a part of the pontifical apparatus, and is eftermed a pledge of the fpiritual marriage between the hifhop and his church) is of very ancient ftanding. The fourth council of Toledo, held in \(G_{33}\), appoints, that a bihop condemued by one council, and foand afterwards innocent by a fecond, thall be refored, by giving him the ring, flaff, \&c. From bifhops, the cuftum of the ring has palfed to cardinals, who are to pay a very great fum pro jure amuli cardinu litit.

RINGS. The antiquity of rings is known from Scripture and profane authors. Judah left his ring or fignet with Tamar (Gen. xxxviii. 18). When Pharaoh committed the government of all Erypt to Jofeph, he took his ring from his finger, and gave it to Joreph (Gen. xli. +2). After the victory that the Ifraelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the ear-rings, that they had taken from the eneny (Numb. xxxi. 50 ): The Ifraelitith women wore rings not only on their fingers, but alfo in their noftrils and their ears. St James diltingryithes a man of wealth and dignity by the ring of gold that he wore on his finger (James ii. 2). At the return of the prodigal fon, his father orders him to be dreffed in a new fuit of clothes, and to have a ring put upon his finger (Luke xv. 22). When the Lord threatened King Jeconiah with the utmoft effects of his anger, he tells him, that though he wore the fignet or ring upon his finger, yet he thould be tom off (Jer. xxii. 24)

The ring was ufed chichy to feal with; and the Scripture gencrally puts it in the havds of princes and great perfons; as the king of Egypt, Jofeph, Alaz, Jezebel, King Ahafuerus, bis favourite Haman, Mordecai, who fucceeded Haman in his dignity, King Darius ( \(\mathrm{I}^{\prime}\) Kings \({ }^{\circ}\) sxi. 8. ; Efther iii. 10, \&c. ; Dan. vi. 17). The patents and orders of thefe princes were fealed with their tings or fignets; and it was this that fecured to them shecir authority and refpect. Sec the article Seal.

Rinc-Gore. See Fauriery, Seet. xxxi.
Ring-Oufle in ornithology, a fpecies of Tuzdus.
Rio.grande, a river of Africa, which rums from ealt to weft through Negroland, and falls into the Atlantic ocean, in it degrecs of latitude. Some take it to be a branch of the Niger, of which there is not the leat proof.

Rio-Grande, a river of South Americ?, in Brafil, which has its fource in an unknown country : it croffes the captainthip of Rio-Grande, and falls into the fea at Natal los Reyes.
\(R_{10-F}\) Ineiro, a river of South America, which rifes in the mountains well of Brafil , and running eail through that country, falls into the At!antic Ocean, in S. Lat 23. 30. The province of Janeiro is one of the richeft in Brafil ; and produces gold, filver, diamonds, and other precious itones.

RIOM, a town of France, in Auverone; feated on a hill, in So agreeable a country, that it is called the garden of Auvergne. E. Long. 3. 12. N. Lat. 45. 51.

RIOT, in law. The riotous affembling of 12 perfons, or more, and not difperfing upon proclamation, was fint made high treafon by flatute 3 \& 4 Edw. VI. c. 5 . when the king was a minor, and a clange of religion to be effeeted: but that fatute was repealed by flatute 1 Mar. c. 1. among the other treafons created fince the 25 Edw. III.; though the prohibition was in fubllance re-enafted, with an inferior degree of puifhment, by ftatute 1 Mar. f. 2. c. 12. which made the fane offence a fingle felony. Thefe flatutes fpecified and particularized the nature of the riots they were meant to fupprefs; as, for example, fuch as were fet on frot with intention to offer violence to the privy-council, or to change the laws of the kingdom, or for rertain other fecific purpues; in which cafes, if the perfons were commanded by proclamation to difperfe, and they did not, it was by the flatute of Mary made felony, but within the benefit of clergy; and alfo the aft indemnified the peace officers and theiraffiftants, if they killed any of the mob in endeavouring to fupprefs fuch riot. This was thought a neceffary fecurity in that fangutinary reign, when popery was iutended to be re-eflablihed, which was like to produce great difcontents: but at firft it was made only for a year, and was afterwards continued for that queen's life. And, by flatute : Eliz. c. 16. when a reformation in religion was to be once more attempted, it was revived and continued during ber life alfo; and then expired. From the acceffion of Janies I. to the death of Queen Anne, it was never once thought expedient to revive it; but, in the firt year of Gcorge 1 . it was judged neceflary, in order to fupport the execution of the act of fettlement, to renew it, and at one ftruke to make it perpetual, with large additions. For, whereas the former acts exprefsly defined and fpecified what fhould be accounted a riot, the flatute 1 Geo. I. c. 5. enacts, generilly, that if any 12 perfons are und lawfully affembled to the difurbance of the peace, and any orte jultice of the peace. theriff, under fheriff, or mayor of a town, fhall think proper to command thens by proclamation to difperfe, if they contemn his orders and continue together for one hour afterwards, fuch coatempt thall he felony without benefit of clergy. And farther, if the readiug of the proclamation be by force oppofed, or the reader be in any manner wilfully
hindered

\section*{R I P}

\section*{\(R\) I P}
hindered from the reading of it, fuch oppofers and hin. derers are felons without benefit of clergy ; and all perfons to whom fuch proclamation ought to bave been made, and knowing of fuch hindrance, and not difperfing, are felons without benefit of clergy. There is the like indemnifying claufe, in cafe any of the mob be unfortunately killed in the endeavour to difperfe them ; being copied from the act of queen Mary. And by a fubfequent claufe of the new act, if any perfon, fo riotoufly affembled, begin even before proclamation to pull down any church, chapel, mecting-houfe, dwell-ing-houfe, or eut-houfes, they fhall be felons without benefit of clergy.

Riots, routs, and unlawful affemblies, mult have three perfons at leaft to conflitute then. An unlawful afjembly is, when three, or more, do affemble themfelves together to do an nnlawful act, as to pull down inclofures, to deftroy a warren or the game therein ; and part without doing it, or making any motion towards it. A rout is where three or more meet to do an unlawful act upon a common quarrel, as forcibly break. ing down fences upon a right claimed of common, or of way, and make fome advances towards it. A riot is where three or more actually do an unlawful act of violence, eitber with or without a common caufe or quarrel; as if they beat a man ; or hunt and kill game in another's park, chafe, warren, or liberty ; or do any other unlawful act with force and violence; or even do a lawful act, as removing a nuifance, in a violent and tumultuous manner. The punifhment of unlawful affemblies, if to the number of 12 , we have juft now feen, may be capital, according to the circumftances that attend it; but, from the number of three to eleven, is by fine and imprifonment only. The fame is the cafe in riots and routs by the common law; to which the pillory in very enormous cafes has been fometimes fuperadded. And by the ftatute 13 Hen IV. c. 7. any two juftices, together with the heriff or under-fheriff of the county, may come with the pofle comitatus, if need be, and fupprefs any fuch riot, aflembly, or ront, arreft the rioters, and record upon the fpot the nature and circumftances of the whole tranfaction; which record alone thall be a fufficient conviction of the offenders. In the interpretation of which flatute it hath been holden, that all perfons, noblemen and others, except women, clergymen, perfons decrepit, and infants under 15, are bound to attend the jufliees in fupprefling a riot, upon pain of fine and imprifonment; and that any battery, wounding, or killing the rioters, that may happen in fuppreffing the riot, is juttifiable. So that our ancient law, previous to the modern riot. act, feems pretty well to have guarded againft any violent breach of the public peace; efpecially as any riotous affembly on a public or general account, as to redrefs grievances or pull down all inclofures, and alfo refifting the king's forces if fent to keep the peace, may amount to overt acts of high treafon, by levying war againft the king.

RIPEN, a town of Denmark, in north Jutland, and capital of a diocefe of the fame name, with a bifhop's fee, a good harbour, a caftle, two colleges, and a public library. The tombs of feveral of the kings of Denmark are in the cathedral church, which is a very handfome ftructure. The harbour, which has consributed greatly to the profperity of this place, is at a
fmall diftarce, being feated at the mouth of the river Ripening Nipfaa, in a country which fupplies the beft beeves in of G:ais. 1)enmark. It is 45 miles north-weft of Slefwick and 25 fouth-by-wct of Wiburg. E. Long. 8. 94. N. Lat. 55.25. The diocefe is bounded on the north by thofe of Wiburg and Athuys, on the fouth by the d:schy of Slefwick, and on the eaft and weit by the fea.

RIPENING of Grain, means its arriving to maturity. The following paper, which appeared in the firft volume of the Tranfactions of the Royal Society of Edinburgh, may be worthy the attention of farmers in this country; where it frequently happens, from continued rains, that the corn is quite green when the froft fets in; in confequence of which, the farmers cut it down, without thinking it can poffibly arrive at further maturity.
"Summer 1782 having been remarkably cold and unfavourable, the harveft was very late, and much of the grain, efpecially oats, was green even in October. In the beginning of October the cold was fo great, that, in one night, there was produced on ponds near Kinneil, in the neighbourhood of Borrowftounsefs, ice three quarters of an inch thick. It was apprehended by many farmers, that fuch a degree of cold would effectually prevent the further filling and ripening of their corn. In order to afcertain this point, Dr Roebuck felected feveral ftalks of oats, of nearly equal fulmefs, and immediately cut thofe which, on the moft attentive comparifon, appeared the belt, and marked the others, but allowed them to remain in the field 14 days longer; at the end of which time they, too, were cut, and kept in a dry room for 10 days. The grains of each parcel were then weighed; when II of the grains which had been left ttanding in the field were found to be equal in weight to 30 of the grains which had been cut a fortnight fooner, though even the belt of the grains were far from being ripe. During that fortnight (viz. from October 7 th to Octaber 2 Ift) the average heat, according to Fahrenheit's thermometer, which was obferved every day at eight o'clock in the morning and fix in the evening, was a little above 43 . Dr Roebuck obferves, that this ripening and filling of corn in fo low a temperature fhould be the lefs furprifing to us, when we reflect, that feed-corn will vegetate in the fame degree of heat ; and he draws an important inference from his obfervations, viz. That farmers fhould be cautions of cutting down their umipe corn, on the fuppofition that in a cold autumn it could fill no more."

A writer in the Scots Magazine for June 1792, under the fignature of Agricola, when fpaking on this fubject, adds the following piece of information, viz. "That grain cut down before it is quite ripe will grow or fpring equally well as ripe and plump grain, provided it is properly preferved. I relate this frem a fact, and alfo on the authority of one of the moft judicious and experieneed farmers in this ifland, William Craik of Arbigland, Efe; near Dumfries, who was taught by fuch a feafon as this threatens to prove. This being the cafe, every wife cconomical farner will preferve his ripe and plump grain for bread, and fow the green and feemingly mrivelled grain, with a perfect conviction that the plants proceeding from fuch feed will yield as ftrong and thriving corn as what grows from plump feed. By this means the farmer will enjoy the double advantage of laving the corn moft productive in nour for bread, and

\section*{\(\begin{array}{lll}\mathrm{R} & \mathrm{S} & {\left[\begin{array}{ll}250 & \end{array}\right]}\end{array}\)}

Rij toan his light fhrivelled grain will go much farther in feed taching himfuf to the fide by hand and foot, hangs there in terrible difmay till the morning, when he difcovers limfelf to be within a foot of the bottom. A rofe remarkably long or fhort, is rifible; but to want it iltogethe:, fo far from provokirit laughter, raifes horror in the fpectator. With refpect to works both of nature and of art, none of them are rifible but what are out of rule; fome reniarkable defect or excefs, a very \(\ln\) ng vifige, for example, or a very fhort one. Hence nothing juft, proper, decent, beautiful, proportioned, or grand, is rifible.

Fiven from this light fketeh it will be readily conjectured, that the emotion raifed by a rifible ohject is of a nature fo fingular, as fearce to find plaee while the mind is occupied with any other paffion or emotion ; and the conijecture is verified by experience; for we fearce ever find that emotion blended with any other. One emotion we mu't except ; and that is, contempt raifed by certain improprieties: every improper act infpires us with forne degree of contempt for the author; and if an improper act be at the fame time rifible to provoke laufther, of which blunders and abfurdities are noted inflances, the two emotions of contempt and of laughter unite intimately in the mind, and produce externally what is termed a hugh of derifion or of forn. Hence objects that caufe lauchter may be diftinguifhed into two kinds: they are either rifilie or ridiculous. A rifible objeet is mirthful only ; a ridiculous object is both mirthful and contem; tible. The firft raifes an emotion of laughter that is altogether pleafant : the pleafant emotion of laughter raifed by the other, is blended with the painful emotion of comtempt; and the mixed emotion is termed the emno tion of ridiculc. The pain a ridiculous object gives me, is refented and puniflied by a laugh of derifion. A rifible object, on the other hand, gives me no pain: it is altogether pleafant by a certain fort of titillation, which is expreffed externally by mirthful laughter. See Rimicile.

Riifible objects are fo common, and fo well underftood, that it is unneceffary to confume paper or time upon them. Take the few following examples:

Falld aff. I do remember him at Clement's inn, like a man made after fupper of a checfe-paring. When he was naked, he was for all the world like a forked radilh, with a head fantaftically carved upon it with a knife. Second parl, Henry IV. af. 3. Fc. 5.

The foregoing is of difproportion. The following cxamples are of flight or imaginary misfortunes.

Fallaff. Go fetch me a quart of fack, put a toa:t in't. Have I liv'd to be carried in a bafket, like a bar* row of butcher's offal, and to be thrown into the Thanes! Well, if 1 be ferved fuch another trick, I'I have my brains ta'en out and butter'd, and give them to a dog for a new-year's gift. 'The rogues llightel me into the river with as little remorfe as they would have drown'd a bitch's blnd puppies, fifteen i'th'litter ; and you may know by my fize that I have a kind of alacrity in finking; if the bottom were as deep as hell, I fhould down. I had been drown'd, but that tl: flore was fhelvy and fhallow; a death that I abhor: for the water fwells a man; and what a thing fhould I have been when I had been fiwell'd? I thould have beca a mountain of mumny.

Marry Wives of IVindfor, aid 3 . fco 15 .

\section*{\(R I V\)}

Falfuff. Nay, you fhall hear, Mafter Bronk, what I have fuffer'd to bring this woman to evil for your good. Being thus cramm'd in the bafket, a couple of Ford's knaves, his linds, were call'd forth by their niftrefs, to carry me in the name of foul clothes to Datelnct-lane. They took me on their Thoulders, met the jealons knave their mafter in the door, who afl'd them once or twice what they had in their bafket. I quak'd for fear, left the lunatic knave would have fearch it ; but Fate, ordaining he should be a cuckold, held his hand. Wcll, on went he for a fearch, and away went I for foul clothes. But mark the fequel, Mafter Brook. I fuffer'd the pangs of three egregions deaths: firt, an intolerable fright, to be detccted by a jealous rotten bell-weatier ; next, to be compars'd like a good bilbo, in the circumference of a peck, hilt to point, heel to head; and then to be ftopt in, like a flrong diftillation, with ftinking clothes that fretted in their own greafe. Think of that, a man of my kidney; thimk of that, that anı as fubject to heat as butter; a man of continual diffolution and thaw; it was a miracle to 'fcape fuffocation. And in the height of this bath, when I was more than half ftew'd in greafe, like a Dutch difh, to be thrown into the Thames, and cool'd glowing hot, in that furge, like a horfe-fhoe; think of that; hiffing hot; think of that, Mr Brook.

Merry Wives of Windfor, af 3. fc. 17.
\(25 \mathrm{I} \quad \mathrm{R}\) I V
RITE, aninng divines, denotes the particular man. ner of celebratinc divine fervice in this or that country.

RITORNEILLO, or Repeat, ill mufic, the burden of a fong, or the repctition of the firl or olle: verfcs of a long at the end of each couplet.

RITIERHUSIUS (Conrad), a learned German civilian, born at Brumfick in 1560 . He was profeffor of civil law at Ahtorf, and puhlifhed a variety of works, particulally as a civilian ; together with an edition of Oppian in Greek and Latin: he was moreover an excellent critic: his notes upon many eminent authors having been inferted in the beft editions of them. He died in \(16 \mathrm{t}_{\mathrm{j}}\).

RITUAL, a book direeting the order and manner to be obferved in performing divine fervice in a particular church, diocelc, or the like. The ancient heathens had alfo their rituals, which contained their rites and ceremonies to be obferved in building a city, confecrating. a temple or altar, in facrificing, and deifying, in dividing the curix, tribes, centuries, and in general, in all their religious ceremonies. There are feveral paflages in Cato's books, De re duftica, which may give us fome idea of the rituals of the ancients.

RIVAL, a term applied to two or more perfons who have the fame prtenfions; and which is properi!y applied to a competitor in love, and figuratively to an antagonift in any other purfuit.

IS a current of frefl water, flowing in a Bed or Channel from its fource to the fea.
The term is appropriated to a cenfiderable collection of waters, formed by the confux of two or more Broors, which deliver into its channel the united Arears of feveral Rivulets, which have collected the fupplies of many Rills trickling down from numberlefs fprings, and the torrents which carry off from the floping grounds the furplus of every fhower.

Rivers form one of the chief features of the furface of this rlobe, ferving as voiders of all that is immediately redundant in our rains and Springs, and allo as boundmies and barriers, and even as highways, and in many countries as plentiful ftorehoufes. They alfo fertilife our foil by laying t:pon our warm fields the richeft mould, brought from the high mountains, where it would have remained ufelefs for want of grenial heat.

Being fuch interefting objects of attention, every branch acquires a proper name, and the whole acquites a fort of perfonal identity, of which it is frequently difficult to find the principle; for the name of the great body of waters which difcharges itfelf into the fea is traced backwards to one of the fources, while all the contributing freans are lot, although their waters form the chief part of the collection. And fometimes the feeder in which the name is preferved is fraller than others which are united to the current, and which like a rich but ignoble alliance lofe their mane in that of the more illutrious family. Some rivers indeed are refpetable even at their birth, coming at once in force from fome great lake. Such is the Rio de la Plata, the rive" St Laurence, and the mighty itreams which ifluc in all directions from the Baciel lake. But,
like the fons of Adam, they are all of equal defeent. and frould take their name from one of the feeders ( \(\frac{1}{6}\) thefe lakes. This is indeed the cafe with a few, frech as the Rhone, the Rhine, the Nile. Thele, afler having nixed their waters with thofe of the like, refum: their appearance and their name at its outfet.

But in general their origis and progret, and even Origin \(\frac{4}{} 8\) the features of their charater, bear forme refen blan celooneis ti(as has been prettily obferved by Pliny) to the life of hilar ", man. 'I he river fprings from the earth; but its origin man. is in heaven. Its beginnings are imilgrificant, and iss infancy is frivolous; it plays among the flowers of a meadow; it waters a garden, or turns a little mill. Gathering flrength in its youil, it Lecomes whid and impetuons. Inpatient of the refraints which it it il meets with in the hollows among the moontains, it is reflefs and fretful; quick in its curaings, and unfleaty in its courle. Now it is a roaring cataraiz, teari f up and overturning whatever oppofis its proseff, and it floots headlong down from arock; then it becomes a fullen and gluony pool, baried in the hotum of a glin. Rucorering breath by repof, it again duhs along, till tired of the uproar and rifchief, it quits a! ! that it less fiwept along, and leaves the opening of the valley Itrewed with the reicectud watho. Nuw, quitinis its retirement, it comes abroad into the worid, jumeo neying with more prudenee and diferetion theongti cultivated lichds, yielding to ciscumfances, and windins 1ound what won!d tomble it to overwhelm or remove. It pafies through the pappotous cities and all the bufyhaunts of man, tendering its fervious on eve! fide, and becopes tiee fuppont and onnanient of the couitry. Now incrafed by wumerons alliances, and admace
in its courfe of exiftence, it becomes grave and fately in its motions, loves peace and quict ; and in majeflic filence rolls on its mighty watcrs, till it is laid to reft in the valt abyfs.

The philofopher, the real lover of wifdom, fees much to admire in the economy ard mechanifn of maning waters; and there are few operations of nature which give lim more opportunities of remarking the nice adjuftment of the moft fimple means for attaining many purpofes of molt extenfive beneficence. All mankind feem to have felt this. The heart of man is ever open (unlefs perverted by the labits of felfifh indulgence and arrogant felf conceit) to impreffions of gratitude and love. He who afcribes the religious principle (debafed, though it be by the humbling abufes of fupertition) to the workings of fear alone, may betray the flavifh meannefs of his own mind, but gives a very unfair and a falfe picture of the hearts of his neighbours. Lucretins was but half a philofopher when he penned his often-quoted apophtinegm. Indeed his own invocations fhow how nuch the animal was blended with the fage.

We apprehend, that whoever will read with an honeft and candid mind, unbiaffed by licentious withes, the accounts of the ancient fuperfitions, will acknowledge that the amiable emotions of the human foul have had their thare in creating the numerous divinities whofe worhip filled up their kalendars. The fun and the holt of heaven lave in all ages and nations been the objects of a fincere worhip. Next to them, the rivers feem to have attracted the grateful acknowleduments of the inhabitants of the adjacent countries. They have everywhere been confidered as a fort of tutelar divinities; and each little diftrict, every retired valley, had its river god, who was preferred to all others with a partial fondnefs. The expoltuJation of Naaman the Syrian, who was offended with the proplet for enjoining him to wafh in the river Jordan, was the natmal effufion of this attachment. "What! (faid he), are not Abana and Pharphat, rivers of Damafeus, more excellent than all the waters of Judrea? Might I not wath in them and be clean? So he went a way wroth."

In thofe countries particularly, where the rumallabours, and the hopes of the Thepherd and the hufbandman, were not fo immediately connected with the approach and recefs of the fun, and depended rather on what happened in a far diftant country by the falls of periodical rains or the molting of collected fnows, the Nile, the Ganges, the Indus, the river of Pegu, were the fenfible agents of nature in procuring to the inhabitants of their fertile banks all their abundance, and they became the objects of grateful veneration. Their fources were fouglit out with anxious care cven by conquering princes; and when found, were univerfally worlhipped with the moft affectionate devotion. Thefe remarkable rivers, fo eminently and fo palpably beneficent, preferve to this day, amidt every change of habit, and every increafe of civilization and improvement, the fond adoration of the inhabitants of thofe fruitful countries through which they hold their ftately courfe, and their waters are itill held facred. No progrefs of artificial refinement, not all the corruption of luxurious fenfuality, has been able to eradicate this plant of native growth from the heart of man. The fentiment is
congenial to lis nature, and therefore it is univerfal; and we could almoft appeal to the feelings of every rea. der, whether lie does not perceive it in his own breaft. Perhaps we may be miftaken in our opinion in the cafe of the corrupted inlabitants of the populous and bufy cities, who are habituated to the fond contemplation of their own individual exertions as the fources of all their hopes. Give the thocmaker but leather and a few tools, and he defies the powers of nature to dif. appoint lim ; but the fimpler inhabitants of the country, the molt worthy and the moft refpectable part of cvery nation, after equal, perhaps greater exertion both of fiill and of indultry, are more accultomed to refign themfelves to the great minifters of Providence, and to look up to heaven for the "early and the latter raus," without which all their Labours are fruitlefs.

\section*{Numenoue excedens terris vefligia fecit.}

And among the hufbandmen and the fhepherds of all nations and ages, we find the fame fond attachment to their fprings and rivulets.

Fortunate fonex, bic inter fumina nota
Et jontes facros frigus caplabis opacum,
was the mournful ejaculation of poor Melibœus. We hardly know a river of any note in our own country whofe fonrce is not looked on with fome refpect.

We repeat our affertion, that this workip was the offspring of affection and gratitude, and that it is giving a very unfair and falfe picture of the human mind to afcribe thefe fuperftitions to the working of fear alone. Thefe would have reprefented the river-gods as feated on ruins, brandifhing rooted-up trees, with angry looks, pouring out their fweeping torrents. But no fuch thing. The lively imagination of the Greeks felt, and expreffed with an energy unknown to all other nations, every emotion of the human foul. They figured the Naiads as beautiful nymphs, patterns of gentlenefs and of elegance. 'They are reprefented as paitially attach. ed to the children of men; and their interference in human affairs is always in acts of kind affiftance and protection. They refemble, in this refpect, the rural deities of the northern nations, the fairies, but without their caprices and refentments. And, if we attend to the defcriptions and reprefentations of their RiverGons, beings armed with power, an attribute which favifh fear never fails to couple with cruelty and vengeance, we find the fame expreffion of affectionate truft and confidence in their kind difpofitions. They are generally called by the refpectable but endearing name of father. "Da Tyberi pater," fays Virgil. Mr Bruce fays that the Nile at its fource is called the aliay or " father.".-.We obferve this word, or its radix, blended with many names of rivers of the eaft; and think it probable that when our traveller got this name from the inhabitants of the neighbourhood, they applied to the fream what is meant to exprefs the tutelar or prefiding fpirit. The river-gods are always reprefented as venerable old men, to indicate their being coeval with the world. But it is always a cruda viridifque feneäus, and they are never reprefented as oppreffed with arge and decrepitude. Their beards are long and flowing, their looks placid, their attitude ealy, reclined on a bank. covered, as they are crowned, with never-fading fedges and bulrufhes, and leaning on their urns, from which they pour out their plentiful and fertilizing ftreams.-

Mr Bruce's defcription of the fources of the Nile, and of the refpect paid to the facred waters, has not a frowning feature; and the hofpitable old man, with liss fair daughter Irepone, and the gentle prietthood which peopled the little village of Geefh, forms a contraft with the neighbouring Galla (among whom a military leader was called the lamb, becaule he did not murder pregnant wormen), which very diftinetly paints the infpiring principle of this fupertition. Pliny fays (VIII. 8.) that at the fource of the Clitumnus thiere is an ancient temple highly refpected. The prefence and the power of the divinity are expreffed by the fates which ftand in the veftibule.-A A ound this temple are feveral little chapels, each of which covers a facred fountain ; for the Clitumnus is the father of feveral little rivers which unite their freams with him. At fome diftance below the temple is a bridge which at vides the facred waters from thofe which are open to common ufe. No one muft prefume to fet his foot in the ftreams above this bridge; and to ftep over any of them is an indignity which renders a perfon infamous. They can only be vifited in a confecrated boat. Below the bridge we are permitted to bathe, and the place is inceffantly occupied by the neighbouring vit. lagers. (Sec alfo Vilius Sequefr. Orbelini, p. 101-103. and 221-223. alfo Sutton. Caligula, c. 43. Virg. Geory. I1. 146.)

What is the caufe of all this? The Clitumnus flows (near its fource) through the richeft paftures, through which it was carefully diftributed by numberlefs drains; and thefe nourifhed cattle of fuch fpotlefs whitenefs and extraordinary beaut \(y\), that they were fought for with eagernefs over all Italy, as the moft acceptable victims in their facrifices. Is not this fuperfition then an effufion of gratitude ?

Such are the dictates of kind-hearted nature in our breafts, before it has been vitiated by vanity and felfconceit, and we fhould not be afhamed of feeling the impreffion. We hardly think of making any apology for dwelling a little on this incidental circumitance of the fuperftitious veneration paid to rivers. We cannot think that our readers will be difpleafed at having agreeable ideas excited in their minds, being always of opinion that the torch of true philofoply will not only enlighten the undeıftanding, but alio warm and cherifh the affections of the heart.
With refpee to the origin of rivers, we have very little to offer in this place. It is obviotis to every perfon, that befides the torrents which carry down into the rivers what part of the rains and melted fnows is not abforbed by the foil or taken up by the plants which corer the earth, they are fed either immediately or remotely by the fprings. A few renarkable ftreams rufh at once out of the carth in furce, and muft be confidered as the continuation of fubterraneous rivers, whofe origin we are therefore to feek out ; and we do not know any circumftance in which their fift beginnings differ from thofe of other rivers, which arc formed by the union of little ftreams and rills, each of which has its own fource in a fpring or fountain. This queftion, therefore, What is the procefs of nature, and what are the fupplies which fill our fprings? will be treated of under the word Spring.

Whatever be the fource of rivers, it is to be met with in almoft every part of the glabe. The crult of
earth with which the rocky framing of this glabe is Hiftory. covered is generally ftratificd. Some of thefe ftrata are extremely pervions to water, having but fmall attraction for its particles, and being very porous. Such is the quality of gravelly ftrata in an eminent degrec. Other ftrata are inuch more firm, or attract water more ftrongly, and rcfure it a pafface. This is the cafe with firm rock and with clay. When a flratum of the firlt kind has one of the other immediately under it, the water remains in the upper feratum, and burfts out whercver the floping fides of the hills cut off the ftra. ta, and this will be in the form of a trickling fpring, hecaufe the water in the porons ftratum is greatly obflructed in its paffage towards the outlet. As this ir. regular formation of the earth is very general, we murt have fprings, and of courfe rivers or rivulete, in evely corner where there are high grounds.

Rivers flow from the higher to the Iow grounds. It They for is the arrangement of this elevation which diftributesfrom the them over the furface of the earth. And this appears sigher o to be accomplifhed with confiderable regularity; and, the lowe except the great defert of Kobi on the confines of Chi- grounds. nefe Tattary, we do not remember any very extenfive track of ground that is deprived of thofe channels for voiding the fuperfluons waters; and even there they are far from being redundant.

The courfe of rivers give us the beft general method Courfe rs for judging of the elevation of a country. Thus it the rivers appears that Savoy and Switzerland are the hig fleft of Europe, grounds of Europe, from whence the ground flopes in every direction. From the Alps proceed the Danube and the Rhine, whofe courfes mark the two great velleys, into which many lateral fireams defcend. The Po alfo and the Rhone come from the fame head, and with a fteeper and fhorter courfe find their way to the fea through valleys of lefs breadth and length. Ois the weft fide of the valleys of the Rhine and the Rhone the ground rifes pretty faft, fo that few tributary ftreams come into them from that fide; and from this geutle elevation France flopes to the weftward. If a line, nearly ftraight, but bending a little to the northward, he drawn from the head of Saroy and Switzerland all the way to Solikannfoy in Siberia, it will nearly pals through the mof clevated part of Europe for in this track moft of the rivers have their rife. On the left go off the various feeders of the Elbe, the Oder, the Wefel, the Niemen, the Duna, the Neva, the Dwina, the Petzora. On the right, after paffing the feedcrs of the Danube, we fee the fources of the Sereth and Pruth, the Duiefter, the Bog, the Dnieper, the Don, and the mighty Volga. The clevation, however, is extremely moderate: and it appears froms the levels taken with the barometer by the Abbe Chappe d'Auteroche, that the head of the Volga is not more than 470 feet above the furface of the ocean. And we may obferve here by the bye, that its mouth, where it difcharges its waters into the Carpian fea, is undoubtedly lower, by many feet, than the furface of the ocean. See Pneumatics, \(11^{\circ} 277\). Spain and Finland, with Lapland, Norway, and Sweden, forn two detached parts, which have litule fymmetry with the relt of Europe.

A chain of mountains begins in Nora Zembla, and of Alia, Atrtches due fouth to near the Cafpian Sea, dividing Europe fiom Afia. About threc or four degrees north
of the Caipian fea it hends to the fouth-eaft, traverfes weftern Tai tary, and paffing between the T'engis and Zaizan lakes, it then branches to the eaft and fonth. The caflern branch runs to the fhores of Korea and Kantfehatka. The fouthern branch traverfes Turkellan and Thibet, feparating then from India, and at the head of the kingdom of Ava joins an arm Itretching from the great ealtern braneh, and here forms the centre of a very fingular radiation. Chains of mountains iffue from it in every direction. Three or four of them keep very clofe together, dividing the continent into marrow flips, which have each a great river flowing in the middle, and reaching to the extreme points of Malacea, Cambodia, and Cochin-china. From the fame central point proceeds another grreat ridye due eait, and paffes a little north of Canton in China. We called this a fingular centre: for though it fends off fo many branches, it is by no means the moft elevated patt of the continent. In the triangic which is inchuded between the firft fouthern ridge (which comes from between the lakes Tanges and Zaizan), the great eaftern ridge, and its branch which almolt unites with the fouthern ridge, lies the Boutan, and part of Tibet, and the many little rivers which ocelupy its furface, flow fouthward and eaftward, uniting a little to the north of the centre often mentioned, and then pafs through a gorge eaftward into China. And it is farther to be obferved, that thefe great ridges do not appear to be feated on the highef parts of the country; for the rivers which correfpond to them are at no great diftance fiom them, and receive their chief fupplies frum the other fides. This is remarkably the cafe with the great Oby, which runs almolt parallel to the ridge from the lakes to Nova Zembla. It receives its fupplies from the eaft, and indeed it has its fource far eaft. The ligheft grounds (if we except the rilges of mountains which are boundaries) of the continent feem to be in the country of the Calmucs, about \(95^{\circ}\) eaft from London, and latitude \(+3^{\circ}\) or \(45^{\circ}\) north. It is reprefented as a fine though fandy country, having many little rivers which lofe themfelves in the fand, or erd in little falt lakes. 'This elevation ftretches north-caft to a great ditance; and in this track we find the heads of the Irtih, Sclenga, and Turgulkaia (the great feederf of the Oby), the Olenitz, the Lena, the Yarra, and fome other rivers which all go off to the north. On the other fide we have the great river Amur, and many finaller rivers, whofe names are not faniliar. The Hoangho, the great river of China, rifes on the fouth fide of the great callem ridge we have fo often mentioned. 'This elevation, which is a contiunation of the former, is fomewhat of the fame comiplexion, being very fandy, and at prefent is a defert of prodiginas extent. It is deferibed, however, as interiperfed with valt tracks of rich palture; and we know that it was formerly the refidence of a great mation, who came fouth, by the name of Turks, and poffefed themftues of mot of the richeft kingdoms of Afia. Iu the funth-weftern cistremity of this constry are found remains not ouly of barbaric magnificence, but even of cultivation ard clegance. It was a proftable privilege sranterl hy Peter the Great to fome adventurers to tearch thefe fandy deferts for remains of former opulence, and mary pieces of delicate workmanflap (tho' not is a fiyle which :we would admire) in gold and fil-
ver were found. Vaults werc found buried in the fand Hi, filled with written papers, in a character wholly un- known; and a wall was difcovered extending feveral miles, built with hewn fone, and ornamented with core niche and battlements. But we are forgetting ourfelves, and return to the confideration of the diftribution of the rivers on the furface of the earth. A great ridge of mountains begins at the fouth-ealt corncr of the Enxine Sea, and proceeds eaftward, ranging along the fonth fide of the Carpian, and ftill advancing unites with the mountains firlt mentioned in Thibet, fending off fome branches to the fouth, which divide Perlia, India, and Thibet. From the fouth fide of this ridge flow the Euphrates, Tigri., Indus, Ganges, \&c. and from the north the ancient Oxus and many unknown flreams.
There is a remarkable circumfance in this quarter of the globe. Although it leems to be neareft to the greatef elevations, it feems alfo to bave places of the greateft depreffion. We have already faid that the Cafpian Sea is lower than the ocean. There is in its neighbourbood another great bafon of falt water, the lake Aral, which reccives the waters of the Oxus or Gihon, which were faid to have formerly run into the Cafpian Sea. There cannot therefore be a great difference in the level of thefe two bafons; neither have they any outlet, tho' they receive great rivers. There is another great lake in the sery middle of Perfia, the Zare or Zara, which receives the river Hindemend, of near 250 miles length, befides other ftrearns. There is another fuch in Afia Minor. The fea of Sodom and Gomorrah is another inflance. And in the high countries we mentioned, there are many fmall fait lakes, which receive little rivers, and have no outlet. The lake Zara in Perfia, however, is the only one which indicates a confiderable hollow of the conntry. It is now afcertained by actual furvey, that the fea of Sodom is confiderably higher than the Mediterranean. This feature is not, however, peculiar to Afia. It obtains alfo in Africa, whofe rivers we now proceed to mention.

Of them, however, we know very little. The Nile of frit indeed is perhaps better known than any river out of Europe ; and of its fource and progrefs we have given a full account in a feparate article. See Nile.
By the regilter of the weather kept by Mr Bruce at Gondar in 1770 and 1771 , it appears that the greatef rains are about the beginning of July. He fays that at an average each month after June it doubles its rains. The califh or canal is opened at Cairo about the gth of Augult, when the river has rifen It peeks (each 21 inches), and the waters begin to decreafe about the 1oth of September. Hence we may form a conjecture concerning the time which the water employs in coming from Abyfinia. Mr Brice fuppoles it 9 days, which fuppofes a velocity not lefs than \(1+\) feet in a fecond; a thing path belief, and inconliftent with all our notions. The genetal flope of the river is greatly diminifhed by feveral great cataracts; and Mr Bruce exprefly fays, that he might have come down from Senriaar to the cataracts of Syeme in a boat, and that it is navigahle for boats far above Semaar. He came from Syene to Cairo by water. We apprchend ihat no boat would venture down a ftream moving evea dix feet in a fecond, and none could row up if the veiccity was three feet. As the waters begin to decreaue about the roth of
\%. Scptember. we mut conclude that the water then fowing patt Cairo had left Abyfinia when the rairs had greatly abated. Judging in this way, we mu凡 fill allow the fream a velocity of more than fix feet. Had the firlt fwell at Cairo beea noticed in 1770 or 177:, we might have gueffed better. The year that Thevenot was in Egypt, the firt fwell of 8 peeks was obferved Jan. 28. The califh was opened for 14 peeks on Augult \(14 \mathrm{t}^{\mathrm{h}}\), and the waters began to decreafe on September 23 d, having rifen to \(21 \frac{2}{3}\) peeks. We may fuopofe a fimilar progrefs at Cairo correfponding to Mr Bruce's obfervations at Gondar, and date every thing five days earlier.

We underfand that fome of our gentlemen ftationed far up the Ganges have had the curiofity to take notes of the fwellings of that river, and compare them with the overflowings at Calcutta, and that their obferrations are about to be made public. Such accounts are valuable additions to our practical kuowledre, and we fhall not neglect to infert the information in fume kindred article of this work.

The fane mountains which attract the tropical vapours, and produce the fertilizing inundations of the Nile, perform the fame office to the famous Niger, whofe exittence has often been accounted fabulous, and with whofe courfe we have very little acquaintance. The refearches of the gentlemen of the African aflociation render its exiftence no longer doubtful, and have greatly excited the public curiofity. For a farther account of its track, fee Niger.

From the great number, and the very moderate fize, of the rivers which fall into the Atlantic Ocean all the way fouth of the Gambia, we conelude that the weftern fhore is the moit elevated, and that the morntains are at no great diffance inland. On the other hand, the rivers at Melinda and Sofala are of a magnitude which indicate a much longer courfe. But of all this we fpeak with much uncertainty.
The frame-work (fo to call it) of America is better kunwn, and is fingular.

A chain of mountains begirs, or at leaft is found, in longitule \(10^{\circ}\) weft of London, aud latitude \(40^{\circ}\) north, on the northern confines of the kinzdom of Mexico, and ftretehing fouthward throngh that kingriom, furms the ridge of the neck ofland which feparates North from South America, and keeping almoft clofe to the thore, ranges along the whole weftern coaft of South America, terminating at Cape Horn. In its courfe it fends off branches, which after feparating from it for a few leagues, rejoin it again, inclofing valleys of great extent from north to fouth, and of prodigious elevation. In one of thefe, under the equatorial fun, flands the city of Quito, in the midit of extenfive fields of barley, oats, wheat, and gardens, containing apples, pears, and goofeberries, and in fhort all the grains and fruts of the cooler parts of Europe; and although the vine is alfo there in perfection, the olive is wanting. Not a dozen miles from it in the low countries, the fugar-cane, the indigo, and all the fruits of the torrid zone, find their congenial heat, and the inhabitants fwelter under a burning fun. At as frall a diftance on the other hand tower aloft the pinacles of Pichincha, Corambouron, and Chemboracais, crowned with never melting fnows.

The individual mountains of this ft:pendous range not on? exceed in height all others in the world (if
we except the Peak of Teneriffe, Mount Ketna, and Hithry. Mount Blanc); but they are fet down on a baíe incomparably more elevated than any other cour.try. They cut off therefore all communication between the Pacific Ocean and the inland continent ; ard no rivers are to be found on the weft roait of Soutb. America which have any confiderable iength of courfe or body of waters. The country is drained, like Ffrica, in the oppofite direction. Not, 100 miles frum the city of Lima, the capital of Peru, which lies zhmoit on the fea hore, and juit at the foot of the l:igh Cordilleras, ariies out of a fmall lake the Maragnon or A mazon's river, which, after running noithward for about 100 miles, takes an eaiterly direction, and crofes nearly the broadeft part of South America, and falls into the great weftern ocean at Para, after a courfe of not lefs than 3500 miles. In the fr!'t half of its defcent it receives a few middle-fized rivers from the north, and from the fouth it receives the great river Combos, fpringing from aiother little lake not 50 miles diftant from the head of the Maragnon, and inelofing between them a wide extent of country. Then it receives the Yuta, the Yuerva, the Cuehivara, and \(\mathrm{Pa}-\) rana Mire, each of which is equal to the Khine; and then the Madeira, which has flowed above 1300 miles. At their junction the breadth is \(\lceil 0\) great, that neither fhore can be feen by a perfon ftanding up in a canoe; fo that the united ftrean muft be about 6 miles broad. In this majeftic form it rolls along at a prodigious rate through a fat country, covered with impenetrable forefts, and mot of it as yet untrodden by human fect. Mr Condamine, who caine down the fleam, fays, that all is filent as the defert, and the wild beafts and numberlefs birds crowd round the boat, eyeing it as fume animal of which they did not feen afraid. The bed was cut deep through an equal and yielding foil, which feemed rich in cvery part, if he could judge by the vegetation, which was rank in the extreme. What an addition this to the poffible population of this globe ! A narrow flip along each bank of this mighty river would equal in furface the whole of Europe, and would probably excced it in .general fertility: and although the relocity in the main ftream was great, he obferved that it was extremely moderate, nay almoft fill, at the fides; fo that in thofe parts where the country was inhabited by men, the Indians paddled up the river with perfect eafe. Boats could go froin Para to near the mouth of the Madeira in 35 days, which is near 1200 nilies.

Mr Condamine made an obfer:ation duri:g his paffage down the Maragnon, which is extremely curious and infructive, although it puzzled him wery much. He obiersed that the tide was fenitule at a vait diftance from the mouth: It was very confiderable at the junc. tion of the Madeira; and he fuppofes that it might have been obferved much farther up. This appeared to him very furpriing, becaufe there could be no doubt but that the fusface of the water there was higher by a great many feet than the furface of the flood of the Atlantic uceal at the moutl of the river. It was therefore very natural for him to afcribe the tide in the Maragnon to the inmodiate action of the mon on its \(\mathrm{wn}^{2}\) ters ; and this explanation was the more reafonable, becaufe the rivcr extends in the direction of terreftrial longitude, which by the Newtonian theory is moft favowatere to the production of a tide. Journeying as le

Hiltory. did in an Indian canoe, we cannot fuppofe that he had
fore are not furprifed that he did not fee that cven this circumflance was of little avail in fo fmall or flaliow a body of water. He carefully noted, however, the times of high and low water as he paffed along. When arrived at Para, he found not only that the high water was later and later as we are farther from the mouth, but he found that at one and the fame inftant there were fereral points of high water between Para and the confluence of the Madeira, with points of low water intervening. This conclution was eafily drawn from his own obfervations, although he could not fee at one inftant the high waters in different places. He liad only to compute the time of high water at a particular fpot, on the day he obferved it at another; allowing, as ufual, for the moon's change of pofition. The refult of his obfervations therefore was, that the furface of the river was not an indined plane whofe flope was lefSened by the tide of flood at the mouth of the river, but that it was a waving line, and that the propagation of the tide up the river was nothing different from the propagation of any other wave. We may conceive it clearly, though imperfectly, in this way. Let the place be noted where the tide happens 12 hours later than at the mouth of the river. It is erident that there is alfo a tide at the very mouth at the fame inftant; and, fince the ocean tide had withdrawn itfelf during the time that the former tide had proceeded fo far up the river, and the tide of ebb is fucceffively felt above as well as the tide of flood, there muft be a low water between thefe two high waters.

Newton had pointed our this curious fact, and obferved that the tide at London-Bridge, which is 43 feet above the fea, is not the fame with that at Gravefend, but the preceding tide (See Phil. Tranf. 67.) This will be more particularly infifted on in another place.

Not far from the head of the Maragnon, the Cordilleras fend off a branch to the north-caft, which reaches and ranges along the fhore of the Mexican Gulf, and the Rio Grande de Sta Martha occupies the angle betweeen the ridges.
Another ridge ranges with interruptions along the caft coaft of Terra Firma, fo that the whole waters of this country are collected into the Oroonoko. In like manner the north and eaft of Brafil are hemmed in by mountainous ridges, through which there is no confiderable paffage; and the ground floping backwards, all the waters of this immenfe track are collceted from both fides by many confiderable rivers into the great river Paraguay, or Rio de la Plata, which runs down the middle of this country for more than 1400 miles, and falls into the fea through a vall mouth in latitude \(35^{\circ}\).

Thus the whole of South America feems as if it had been formerly furrounded by a mound, and been a great bafon. The ground in the middle, where the Parama, the Madeira, and the Plata, take their rife, is an immenfe marfh, uninhabitable for its exhalations, and quite impervious in its prefent fate.

The manner in which the continent of North America is watered, or rather drained, has alfo fome peculiarities. By looking at the map, one will obferve firft of all a general divifion of the whole of the beft known
part into two, by the valleys in which the bedz of the Him. iiver St Laurence and Miffifippi are fituated. The head of this is occupied by a fingular feries of frefh water feas or lakes, viz. the lake Superior and Michigan, which empty themfelves into lake Huron by tiso cata. racts. This again runs into lake Erie by the river Detroit, and the Erie pours its waters into the Ontario by the famous fall of Niagara, and from the \(\mathrm{On}^{-}\) tario proceeds the great river St Laurence.

The ground to the fouth-weft of the lakes Superior and Erie is fonewhat lower, and the middle of the valley is occupied by the Miffiflippi and the Miffoure, which receive on both fides a number of fmaller ftreams, and having joined, proceed to the fouth, under the narae Miffiffippi. In latitude 37 , this river receives into its bed the Olio, a river of equal magnitude, and the Cherokee river, which drains all the country lying at the back of the United States, feparated from them by the ranges of the Apalachian mountains. The Miffifippi is now one of the chief rivers on the globe, and proceeds due fouth, till it falls into the Mexican bay through feveral hifting mouths, which greatly refemble thofe of the Danube and the Nile, having run above 1200 miles.

The elevated country between this bed of the Mif. fiffippi and St Laurence and the Atlantic ocean is drained on the ealt fide by a great number of rivers, fome of which are very confiderable, and of long courfe; becaufe inftead of being nearly at right angles to the coaft, as in othcr countries, they are in a great meafure parallel to it. This is more remarkably the cafe with Hudfon's river, the Delaware, Patomack, Rapahanoc, \&c. Indeed the whole of North America feems to confift of ribs or beams laid nearly parallel to each other from north to fouth, and the rivers occupy the interftices. All thofe which empty themfelves into the bay of Mexico are parallel and almoft perfectly ftraight, unlike what are feen in other parts of the world. The weftermoft of then all, the North River, as it is named by the Spaniards, is nearly as long as the Miffifippi.

We are very little informed as yet of the diftribution of rivers on the north-weft coaft of America, or the courfe of thofe wlich run into Hudlon's and Baffin's bay.

The Maragnon is undoubtedly the greatef river in of the world, both as to length of run and the vaft body gre rio of water which it rolls along. The other great rivers ver fucceed nearly in the following order.
\begin{tabular}{l|l} 
Maragnon, & Amur, \\
Senegal, & Oroonoko. \\
Nile, & Ganges, \\
St Laurence, & Euphrates, \\
Hoangho, & Danube, \\
Rio de la Plata, & Don, \\
Yenifey, & Indus, \\
Miffifippi, & Dnieper, \\
Volga, & Duina, \\
Oby, & \&c.
\end{tabular}

We have been much affitted in this account of the courfe of rivers, and their diftribution over the globe, by a beautiful planifphere or map of the world pubtifhed by Mr Bode aftronomer royal at Berlin. The ranges of mountains are there laid down with philofophical difcernment and precifion; and we recommend it to the
gotice of our geographers. We cannot divine what has caufed Mr Buffon to fay that the courfe of moft rivers is from eaf to weft or from weft to caft. No phyfical point of h:s fyfem feems to require it, and it needs only that we look at his own map to fee its falfity. We fhould naturally expeet to find the general courfe of rivers nearly perpendicular to the line of fea-coaft; and
we find it fo; and the chief exceptions are in oppofition to Mr Buffon's affertion. The ftrueture of Ame. rica is fo particular, that very few of its rivers have their general cousfe in this direftion. We proceed now to conlider the motion of rivers ; a fubject which cat turally refolves itfelf into two parts, theoretical and praco tial.

\section*{Part I. Theory of the MOTION or RIVERS and CANALS.}

"THE importance of this fubject needs no commentary. Every nation, every country, every city, is interefted in it. Neither our wants, our comforts, nor our pleafures, can difpenfe with an ignorance of it. We muft conduct their waters to the centre of our dwellings; we muft fecure ourfelves againft their rarages; we muft employ them to drive thofe machincs which, by compenfating for our perfonal weaknefs, make a few able to peiform the werk of thoufands; we employ them to water and fertilize our fields, to decorate our manfions, to cleanfe and embellih our cities, to preferve or extend our demefnes, to tranfport from county to county every thing which neceffity, convenience, or luxury, has rendered precious to man : for thefe purpofs we mult confine and govern the mighty rivers, we mult preferve or change the beds of the fmaller freams, draw off from them what fhall water our felds, drive our machires, or fupply our looufes. We mult keep up their waters for the purpofes of navigation, or fupply their places by canals; we muit drain our fens, and defend them when drained; we muft undertand their motions, and their mode of feert, flow, but unceafing action, that our bridges, our wharfs, our dikes, may not become heaps of ruins. Ignorant how to procecd in thefe daily recurring cafes, how often do we fee projects of high expectation and heary expence fail of their ubject, leaving the fate burdened with works not only ufelefs but frequently hurtful?

This lias loner been a molt interefing fubject of fudy in Italy, where the fertility of thatir fields is not more indebted to tbeir rich foil and happy climate, than to their numerous derivations from the rivers which traverfe then : and in Helland and Flanders, where their very exiftence requires unceafing attention to the waters, which are every moment ready to fwallow up the inhabitants; and where the inhabitants, having once fubdued this formidabie enemy, have made thole very waters their indefatigable drudges, tranforting through every cormer of the country the materials of the mot extenfive commeree on the face of this globe.

Such having been our inceffant occupations with moving waters, we thould expect that while the operative antifts are continualiy furniking facts and experiments, the man of Geeculative and feientific curiofity, excited hy the importance of the fubject, would ere now have made confiderable progrefs in the feience; and that the Frufefional cngineer would be daily acting from ettab) :hed principle, and be feldom difappointed in lus expetations. Unfortanatcly the reverfe of this is nearIy the true ftate of the cafe ; each engineer is ebliged to collect the greateft part of his knowledge from his own experience, and by many dear-bought leffons, to dircét his future operations, in which the ftill proceeds
Coz. XVI. PartI.
with anxiety and hefitation : for we have not yet acquired principles of theory, and experiments have not yet been collected and puhlinhed, by which an empiricad practice might be fafely formed. Many experiments of ineftimable value are daily made; but they remain with their authors, who feldom have either leifure, ability, or generofity, to add them to the puilic fock.

The motion of waters has been really folitle ine is The motion of waters has been really fo little invef- This scicnce ftudy. We have merely lkimmed over a few common its infancto notions concerning the motions of water ; and the mathematicians of the firt order feem to have contented themfelves with fuch views as allowed them to entertain themfelves with elegant applications of calculus. This, however, has not been their fault. They rarely had any opportunity of doing more, for want of a knowledge of facts. They have made excellent ufe of the few which have been given them; but it required much labour, great varicty of opportunity, and great expence, to learn the multiplicity of things which are combined even in the finmplett cafes of water in motion. Thefe are feldom the lot of the mathematician ; and he is without blame when he enjoys the pleafures within his reach, and cultivates the fcience of geometry in its mont abitracted form. Here he makes a progrefs which is the boaft of human re:fon, being almoft infured from error by the intellectual fimplicity of his fubject. But when we turn our attention to material objcels, and without knowing either the fize and fhape of the elementary particles, or the laws which nature has prefcribed for their action, prefume to fo:efee their effects, calculate their exertions, direet their actions, what muft be the confequence? Nature fhows her independence with refpect to our notions, and, always faithrul to the laws which are injoined, and of which we are ignorant, the never fails to thwart our views, to difconcent our projects, and render ufelefs all our efforts.
To wifh to know the nature of the elements is vain, P poper and our grofs organs are irfufficient for the ftudy. To node of ins. fuppere what we do not know, and to fancy fhapes and vefigation.; fizes at will ; this is to raife plantoms, and will produce a fyftem, but wiil not prove a foundation, for any feience. But to interrogate Nature herfelf, Atudy the laws which ithe fo faithfully obferses, catch her, as we ray, in the fact, and thus wret from her the feeret; this is the only way to become her mafter, and it is the only procedure confiftent with good fenfe. And we fee, that foon after Tiepler detected the laws of the planetary motions, when Galifeo difcovered the uniform acecieration of gravity, when Pafchal difcovered the preffure of the atmofpliere, and Newton difcovered the laws of attraction and the track of a ray of light; aftronoms, mechanics, hydrollatics, chemiftry, optics, quichly beK \(k\)
can!e

Therry. carie bodies of found dogrine; and the deductions from their refpective thewries were found fair reprefenthtions of the phenomena of uature. Whencrer a man lris difeovered a law of mature, he has laid the foundathion of a feience, and he has given us a new mean of fubjecting to our fervice fome element hitherto independent: and folong as groups of natural operations follow a route which appears to us whimfical, and will not admit our calculations, we may be affured that we are ignorant of the principle which connects them all, and regulates their procedure.
Our tgno.
This is remarkably the cafe with feveral phenomena rance of the in the motions of fluids, and particularly in the motion عeneral laws of this notion, of water in a bed or conduit of any kind. Although the firft geniufes of Europe have for this century palt
turned much of their atiention to this fubject, we are almoft ignorant of the general lazes which may be obferved in their motions. We have been able to felect very few points of refenblance, and every cafe remains nearly an individual. "About 150 years ago we difcovered, by experience only, the quantity and velocity of water iffuing from a finall orifice, and, after much labour, have estended this to any orifice; and this is almoll the whole of our confidential knowledre. But as to the uniform courfe of the ftreams which water the face of the earth, and the maxims which will certainly regulate this agrecably to our wifhes, we are in a masner totally ignorant. Who can pretend to fay what is the velocity of a river of which you tell him the breadth, the depth, and the deelivity? Who can fay what fwetll will be produced in different parts of its conre, if a dam or weir of given dimenfons be made in it, or a bridgre be thrown acrofs it? or how much its water3 will be raifed by turning another ftrean into it, or funk by ta. king off a branch to dive a mill? Who can fay with confidence what muft be the dinenfions or 1hope of this branch, in order to furnih the water that is wanted, or the dimenfions and flope of a canal which flall effectually drain a fenny diftrict? Who can fay what form will caufe or will prevent the undermining of banks, the forming of elbows, the poolling of the berk, or the depofition of fands? Y't thefe are the molt important 13 quections.
And the saufes of:

The caufes of this ignorance are the want or uncertainty of our principles; the falfity of our on!y theory, which is belied by experience; and the fmall number of proper obfervations or experiments, and difficulty of making fuch as flall be ferviceable. We have, it is true, made a few experiments on the efflux of water from fmall orifices, and from them we have deduced a fort of theory, dependant on the fall of heavy bodies and the laws of hydroftatic preffure. Hydroftatics. is indeed founded oa very fimple principles, which give a very good account of the laws of the quicfent equilibrium of fluids, in confequence of gravity and perfect fluidity. But by what train of reafoning can we connect thete with the phenomens of the uniform motion of the wa. ters of a river or open ftreans, which can derive its motion only from the flope of its furface, and the modifications of this mation or its velocity only from the width and depth of the fleam ? Thefe are the only circumbltances which can diftinguifh a portion of a river from a veffel of the fame lize and flape, in which, however, the water is at reft. In both, gravity is the fole saufe of prefure and motion; but there mult be fome
circumitance pecoliar tn mming waters which modifes Try. the exertions of this aEtive principle, and which, when -r difcovered, muft be the bafis of hydraulics, and muft ablige us to reject ewery theory founded on fancied hypothefes, and which can only lead to abfurd conclufions: and furely abfurd confequences, when leg: timately drawn, are complete evidence of improper principles.

When it was difeovered experimentally, that the ve- \(P\) iple locities of water iflining from oritices at various depths othe pho muder the furface were as the fymare roots of thofe of ara depths, and the face was verified by repeated experi. hest jee ments, this princiule was immediatcly and without modification applied to every motion of water. Mariotte, Varignem, Gurfielmini, make is the batis of complete fyitems of hydraulies, which prevail to this day, atter having received varions amendments and mudifications. The fame reafoning obtains through them all, though fiequently obfeured by other circumflances, whieh are more peripicumally exprefied by Guglielmini in his Fundarnental 'lheorems.

He conliders every point P (fig. I.) in a mafs of co ate fluid as an orifice in the fide of a veffel, and conceives the particle as having a tendency to move with the fame velocity with which it would iffie from the orifice. Therefore, if a vertical line APC be drawn thro \({ }^{\circ}\) that point, and if this be made the axis of a parabolic ADE, of which \(A\) at the furface of the fluid is the vertex, and AD (four times the height through which a heavy body would fall in a fecond) is the parameter, the velocity of this particle will be reprefented by the ordinate Pll of this parabola ; that is, PD ) is the fpace which it would unifurmy deferibe in a fecond.
From this principle is derived the following theory Th 'h of rumning waters.
Let DC (fig. 2.) be the herizontal bottom of a re.it. fervoir, to which is joined a floping chamel CK of uniform breadth, and let \(A B\) be the furface of the ftanding water in the refervoir. Suppofe the vertical plane BC piersed with an infinity of holss, through each of which the water iflues. The velocity of each flament will be that which is acquired loy falling from the furface \(\mathrm{AB}+\). The filament C , iffing with this ve- \(+\mathrm{S}, \mathrm{G}\). lucity, will then glide down the inclined plane like li,m, any other heavy body; and (by the eommon doctrine of 4 y 1 dia the motion down an inclineej plane) when it has arrived \({ }^{21}\). at F , it will have the fame veloeity which it would lave acquired by falling through the leight OF, the point O being in the horizontal plane AB produced. The fame may he faid of its velocity when it arrives at H or is. The filament immediately above C will alfo iffue with a velocity which is in the fubduplicate ratio of its depth, and will then glide down above the firft filanent. The fame may be affirmed of all the filaments; and of the fuperticial filament, which will occupy the furface of the defeending flream.
From this account of the genefis of a running freant The nitc of water, we may fairly draw the following confequences. fuer:s
1. The velocity of any particle \(R\), in any part of dras frrm the flream, is that acquired by falling from the horizon. this cor tal plane AN.
2. The velocity at the bottom of the ftream is everywhere greater than anyuhere above it, and is leaft of all at the furface.
3. The velocity of the flream increafes continually as. the ftream recede? from its fource.
4. The depths EF, GH, sic, in different parts of - the ftream, will be nearly in the inverfe fubrluplicate ratio of the depths under the fusface AN: for firce the fame quantity of water is running through every fection EF and GH, and the clannel is fuppofed of uniform breadth, the depth of each fection mull be in. verfly as the velocity of the water paffing through it. This velocity is indeed difierent in different filaments of the fection; but the mean velocity in each fection is in the fubduplicate ratio of the depth of the filament under the fluface \(A B\). Therefore the Aream becomes more fha" ow as it recedes from the fource; and in conFequence of this the difference between LH and MG continually diminilhes, and the velocities at the bottom and furface of the fream continually approach to equálity, and at a great diflance from the fource they differ infenfoly.
5. If the breadth of the fream be contracted in any part, the depth of the running water will be increafed in that part, becaufe the fame quantity muft thill pafs through; but the velocity at the buttom will remain the fame, and that at the furface will be lefs than it was before; and the area of the fection will be increafed on the whole.
6. Should a fluice be put acrofs the ftream, dipping a little into the water, the water muft immediately rife on the upperfide of the fluice till it rifes above the lepel of the refervoir, and the fmalleft inmerfion of the fluice will produce this effect. For by lowering the fluice, the arca of the fection is diminithed, and the velocity cannot be inereafed till the water heap up to a greater height than the furface of the refervoir, and this acquires a preflure which will produce a greater velocity of efflux through the orifice left below the nuice.
7. An additional quantity of water coming into this ehannel will increafe the depth of the ltrcam, and the quantity of water which it conveys; but it will not increafe the velocity of the bottom filaments, unlefs it comes from a higher fource.

All thefe confequences are contrary to experience, and fhow the imperfection, at lealt, of the explanation.

The third confequence is of all the mott contrary to experience. If any one will but take the trouble of following a fingle brook from its fource to the fea, he will find it moft rapid in its becrinaings among the mountains, gradually flackening its pact as it winds among the hills and gentler deelivities, and at laft creeping flowly along through the flat grounds, till it is checked and brought to reff by the tides of the ocean.

Nor is the fecond confequence more agreeable to obCervation. It is univerfally found, that the velocity of the furface in the middle of the ftream is the greateft of all, and that it gradually diniminhes from thence to the bottom and fides.

And the firlt confequence, if true, would render the running waters on the furface of this earth the intruments of immediate rain and devaltation. If the waters of our rivers, in the cultivated parts of a country, which are two, three, and four hundred feet lower than their fources, run with the velocity due to that height, they would in a few minutes lay the earth bare to the very bones.
'Ihe velocities of our rivers, brooks, and rills, being 10 greatly inferior to what this theory affigns to them
the other confequences ate equally contrary to experience. When a flream has its feetion diminifhed by narrowing the channel, the current increafes in depth, and this is always accompanied by an increafe of velocity throngh the whole of the fection, and moft of all at the furface; and the area of the fection does not increafe, but diminifles, all the phenomena, thus contradicting in every circurtlance the deduction from the theory; and when the-fection has been diminified by a fluice let down into the tream, the water gradually heaps up on the upper fide of the fluice, and, by its preffure, produces an acceleration of the ftream below the fuice, in the fame way as if it were che beginning of a Aream, as explained in the theory. The velocity now is compofed of the velocity preferved from the fource and the velocity produced by this fubordinate accumulation; and this accumulation and velocity continually increafe, till they besome fiuch that the whole fupply is again difeharged through this contracted fection: any additional water not only iacreales the quantity carried alung the flream, but alfo increafes the velocity, and therefure the fection does not increare in the proportion of the quantity.

It is furpriling that a theory really founded on a \({ }^{23}\) conceit, and which in every the moft familiar and ob- The theory vious circumflance is contradicted by facts, hould have has been, met with fo much attention. That Varignon fhould generally immediately catch at this notion of Guglielmini, and followed by make it the fubject of many elaborate analytical me-the writers. moirs, is not to be wondered at. Th:s author only want-jen, ed donner prife au calcu/; and it was a ufual joke among the academicians of Paris, when any new theorem was iuvented, donnors le à Varignon à generalifer. Lut his numermis theorems and corollaries were adopted by all, and ftill make the fubftance of the prefent fyttems of bydraulics. Gravefande, Mufhenbroik, and all the elementary treatifes of natural'philofophy, deliver no other doctrines; and Belidur, who has been conlidered as the firlt of all the fcientitic engineers, details the fame theory in his great work the Architeaure Hydaulique.

Guglicimini was, however, not altogether the dupe \(\begin{gathered}\text { if } \\ \text { fhough }\end{gathered}\) of his own ingenuity: He was no: only a pretty good fomeugh of the mathematician, but an afiduous and fagacious obferver. more iozeHe had applied his theory to fome important caícs niousfaw Which uccurred in the courle of his profeffion as in. \({ }^{3 t s}\) defecta, fpettor of the rivers and canals in the Milanefe, and to tempted the courfe of the Danube; and could not but perceirecofupply that great corrections were neceffary for making the:hem. theory quadrate in fome tolerable manner with oblervation; and he immediately faw that the motion was greatly obftructed by inequalities of the canal, which gave to the contiguous filaments of the tream tranfverfe motions, which thwarted and confufed the regular progrefs of the ref of the Itream, and thus checked its general progrefs. Thefe obitructions, he oblerved, were molt effectual in the beginning of its courfe, while yet a fmall rill, ruuning among flones, and in a very unequal bed. The whole Aream being fmall, the inequalities bore a great proportion to it, and thus the general effect was great. He alfo faw that the fame caurfes (thefe traniferfe motions produced by the unequal bottom) chiefly affected the contiguous filaments, and: were the reafons why the velocity at the fides and bowtom was fo much diminifhed as to be lefs than the fio pirficial velocity, and that even this might come to be
diminithed by the fame sanfe. For he obferved, that the gencral itream of a river is frequently compofed of a fort of boiling or tumbling motion, by which maffes of water are brought up to the furface and again defend. Evety perfon niuft recullect fuch appearances in the frethes of a muddy river; and in this way Guglielhniui was enahled to account in fonic meafure for the difagreement of his theory with obfervation.

Mariotte had obferved the fame obftuctions even in the fmoothen glais pipes. Here it could not be afribed to the checks occalioned by tranferfe mutums. He therefore aferibed it to friction, which he fuppofed to dimuinif the motion of flaid bodies in the fame manner as of folids: and he thence concludes, that the filaments which inmediately rub on the foles of the tube have their velocity gradually deminifed; and that the filaments inmediately adjoining to thefe, being thus obliged to pais over thenn or ontitrip them, rub upon them, and lave their own velocity diminifhed in like manner, but in a fmaller degree; and that the fuccecding fildments towards the axis of the tube fuffer fimilar but fmaller dininutions. By this means the whole flream maj come to have a fmaller velocity; and at any rate the medium velocity by which the quantity difcharged is determined, is fimaller than it would have been independent of friction.

Guglielmini adopted this opinion of Mariotte, and in his next work on the Motion of Rivers, condidered this as the chief caufe of the retardation; and he added a third circumptance, which he confidered as of no lefs conicquence, the vifcidity or tenacity of water. He obferves that fyrup, oil, and other fluids, where this vifcidity is more remarkable, have their motions prodigioufly retarded by it, and fuppuses that water differs from them only in the degree in which it poffeffes this quality : and he fays, that by this means not only the particles which are moving more rapidly have their motions diminifned by thofe in their neighboumhoed which move flower, but that the filaments alfo which would have moved more flowly are accelerated by their more active neighbours; and that in this manucr the fuperficial and inferior velocities are brought nearer to au equality. Eut this vill never account for the univerfal fact, that the fuperficial particles are the fwiteel of all. The fuperficial particles, fays he, aequire by this means a greater velocity than the parabolic law allows them ; the medium velocity is often in the middle of the depth; the numcrous obitacles, continually multiplied and repeated, caule the current to lofe the velocity acquired by the fall; the lope of the bottom then diminithes, and often becomes very fmall, fo that the force remaining is hardly able to overcome the obflackes which are \&till repeated, and the river is reduced almoft to a fate of fagnation. He obferves, that the Rheno, a river of the Milanefe, has near its mouth a flope of no more than \(50^{\prime \prime}\), which he confiders as quite inadequate to the tafk; and here he introduces another principle, which he confiders as an effential part of the theory of open currents. This is, that therc arifes from tbe very depth of the ftream a propelling force which refores a part of she lof velocity. He offers notbing in proof of this prin--iple, but ufes it to account for and explain the motion of waters in horizontal canals. The principle has been zdopted by the numerous Italian writers on lyydraulics, ard, by various contrivances, interworen with the para.
bolic theory, as it is called, of Guglielmini. Our seater urf may fee it in various modifications in the Ilroftuticne or Idroulica of P. Lecchi, and in the Sperienze Lírauliche of Nich lotet. It is by no meang difinet cithcs in its origin or in the manmer of its ajplication to the explanation of phenomena, and feeras only to ferve for giving fumething like confillency to the vagur and olifcure difeufions which lave been publifacl on this fubject in Italy. We have aldealy romarked, that in that comitriy the fubject is particularly interctiong, and has been much comnented upon. fut the writers of Eingland, France, and Gernany, lave not paid fo much, attention, to it, and have nore generally ocenpied themaleses with the motion of water in elofe conduits, which feen to admit of a more precife application of mathematical reafuning.

Some of thofe have confidered with nore attention; the effects of friction and vifcidity. Sir Ifaci Ncwton, N to with his ufnal penctration, had feen diftinctly the man- ot ner in which it behoved thefe circumblances to operate. th He had oceafion, in his refearches into the mechanifm of the celeftial motions, to examinc the famous hypothefis of Defeartes, that the planets were carriced round the fun by fluid vortices, and faw that there would lee no ead to uncertainty and difpute till the molus operandi of thefe vortices was mechanically confidered. He therefore employed himfelf in the inveltigation of the manner in which the acknowledged powers of matual bodies, acting according to the received laws of mechanies, could produce and preferve thefe vortices, and refore that motion which was expended in carrying the plancts round the fun. Fie therefore, in the fecond book of the Principles of Natural Philofopliy, gives a Serics of beautiful propofitions, viz. 51,52 , \&c. with their corollaries, fho wing how the rotation of acylinder or fplece round its axis in the midelt of a flat will excite a vortical mution in this fuid; and he afcertains with mathematical precifion the motion of every flament of this vo:tex.

He fets out from the fieppofition that this motion is excited in the furrounding flratum of fluid in confequence of a want of perfeet lulnicity, and affumes as an lypothctis, that the initial refiftance (or diminution of the motion of the cylinder) which arifes from this. want of lubricity, is proportional to the velocity with which the furface of the cylinder is frparated from the contiguous furface of the furrounding fluid, and that the whole refifance is proportional to the velocity with which the parts of the thid are mutually feparated from each other. From this, and the equality of action and re-action, it evidently follows, that the velocity of any flratum of the vortex is the atihmetical mediura between the velocitice of the frata immediately within and without it. For the intermediate ffratum caunos be in copuilibrio, unlefs it is as much preficd forward by the fuperior motiou of the ftatunn within it, as it is kept back by the 䐘er motion of the Itratum with out it.

This benutiful inveftigation applies in the mof? per feet manuer to every change produced in the motion of a flidid tilament, in corfequence of the vifcidity and friction of the adjoining filaments; and a flament proceeding along a tube at fome fmall diftance from the fides has, in like manner, a velocity which is the medium betwicen thofe of the filaments immediately furrounding
it. It is therefore a problem of no very difficult folution to affyn the law by which the velucity will gradually diminith as the filament recedes from the axis of a cylindrical tube. I: is fomewhat furprifing that io neat a problem has never occupied the attention of the reathematiciars during the timie that thefe fubjects were to affiduouly ftudied; but fo it is, that nothing precife has been pultlithed on the furjeet. The only approach to a dicention of this kind, is a Memoire of Mr Pitut, rad to the academy of Paris in \(y_{7}=6\), where he confiders thic velocity of eflux through a pipe. Here, by attending io the con:parative Iuperiority of the quartity of motion is: larere pipes, he affirms, that the tutal diminutions arifing from friction will be (cateris paribus) in the inverfe ratio of the diameters. This was thankfully received by other writers, and is now a part of cur hydraulic theories. It has not, however, been attudel to Ly thofe who write on the motion of rivers, though it is evident that it is applicable to thefe with aqual propriety; and had it been introoluced, it would at once have folved all their difficulties, and particularly would have fhown how an almoft imperceptible declivity would produce the gentle motion of a great river, without having vecourfe to the unintelligible principle of Guglielmini.

Mr Couplet made fome experiments on the motion of the water in the great mair pipes of Verfailles, in order to obtain fome notious of the retardations occationed by fristion. They were found prodigious; but were fo irrecular, and surfufceptible of reduction to any general principle, (and the experiments were indeed fo lew that they wore unfit for this reduetion); that he could eftablith no theory. - What Mir fictidor effalliflied on them, and makes a iort of fyftem to direct future engineers, is quite unworthy of attention. --

Tron the whole, this branch of hydraulics, although of nuch greater practical importance than the conduct of water in pipes, has never yet obtained more than a vague, and, we may call it, flovenly atsention from the mathematicians: and we afcribe it to their not having taken the pains to fettle its firf principles with the fame precilion as had been done in the other branch. They were, from the begriuning, fatisfied with a fort of applicalaility of mathenatical principles, without ever making the application. Were it not that fome would accufe us of national patiality, we would afcribe it to this, that Nowton had not pointed out the way in this as in the other loranch. Fur any intelligeat reader of the performances ou the motions of fluids in clufe veffels, will fee that there has nut a principle, nay hardly a ltep of inreftigation, been added to thofe which were ufed or pointed out by Sir Iface Newton. He has nelwhere touched this queftion, the motion of water in an cpen canal. In his theories of the tides, and of the p:opagation of waves, he had an excellent opportunity for giving at once the fundamental principles of mution in a free tluid whofe turace was not horizontal But, by means of fume of thofe happy and fhrewd gueffes, in which, as Daniel Berooulli fays, he excelled all men, he faw the undoubted confequences of fome palpable phenomenon which would anfwer all his prefent purpofes, and thetefore entered no far ther into the inveftigation.

The orizinal theory of Guglielmini, or the principle adopted by him, that each particle of the vestical lec.
tion of a running fieam has a tendency to move as if Theory. it were iffuing from an orifice at that depth under the furface, is falfe; and that it really does fo in the face of a dam when the Good-rate is talken away, is no lefs fo; and if it did, the fubfequent motions would hardly have any refenblance to thofe which he affigns them. Were this the cale, the exterior form of the cafcade would be fomething like what is feretched in fig. 3. with an abrup: angle at \(B\), and a concave furface BEG. This

\section*{Plate} will be eviden: to every one who combines the greater تlucity of the lower filanents with the flower motion of thofe which nualt flide dowa above them. But this greater advance of the luwer filaments cannot tale place without in expenditure of the water muler the furface Ah. The furface therefore finks, and B infantly ceafes to retain its place in the horizontal plane. The water does not fucceffively flow forward from \(A\) to \(B\), and then tumble over the precipice ; but inmediately upo:a opening the flood gate, the water waftes from the fpace imnediately behuid it, and the whole puts on the form reprefented in lig. + . conliting of the curve A a PcEG, convex from \(A\) to \(c\), and concave from thence forward. The fuperficial water begins to accelerate all the way from \(\bar{A}\); and the particles may be fuppofed (for the prefent) to have acquired the velocity correponding to their depth under the horizontal furface. This mutt be undertood as nothing more than a vague nietch of the motions. It requires a very critical and intricate inveltigation to determine either the form of the upper curve or the motions of the different filaments. The place A, where the cervature bergins, is of equally difficult detemination, and is various according to the difiernecs of depth and of inclination of the fucceeding canal.

We have givell this fort of hiftory of the progrefs Uncer-. which had been made in this part of hylraulics, that tainey of our readers might form fome opinion of the many dif the theories fertations which have becu written on the motion of when aprivers, and of the tate of the arts depending on it. practice ex. Much of the bufinefs of the civil congineer is intimately emplisedo connected with it: and we may therefore believe, that fince there was fo little principle in the theories, there could be but very little ce:tainty in the practical operations. The fact bas been, that no exarioeer could pretend to fay, with any precifion, wisat would le the effect of his operations. One whure bufaels had givent him mayy opportunities, ard who kept accurate and juoicions regiters of his own worke, could pronounce, with fome probability, low natch water would be brougbt off by a dmin of certain dimenfuas and a given tlope, when the circumatances of the cafe inappened to tally with fome former work in which he had fucceeded or failed; but out of the pale of his own experience he could conly make a fagacious guefs. A remarkable intance of this occurred not long argo. A fmall aoueduct was lately carried into Paris. It had been conducted on a plan prefented to the academy, who had corscected it, and gave a report of what its performance would be. When execured in the molt accurate mannet, it was deficiest in the proportion of five to mine. When the celebrated Defaguliers was employed by the city of Ediaburgh to fuperintend the bringing in the water for the fupply of the city, he gave a report on the plan which was to be followed. It was execu. ted to his complete fatisfaction ; and the quantity of

Thenry. waner delivered was about one.fixti of the quantity which he promifed, and ahout one edeventh of the quantity which the no lcfe celebmted M"Laurin calculated \({ }_{2} 9\) froin the fanc plan.
Neenfiey of Such being the Hate of our theoretical knowiedre mu'tiply (if it can le called by this nanue), naturalitts began exferr. \(\quad\) to be perferaded that it was hut loting time to make areate. any ufe of a theory fo incongruous with obferva. tion, an! elat the ouly fafe method of proceeding was to mulhiply experiments in every varicty of circumflances, and tu make a ferics of experiments in every intportant cafe, which thould compreliend all the practicalle modifications of that cafe. Perlays circumflances of refemblance might occur, which we uld enable us to cunnect many of them together, and at latt difcover the principles which occationed this comnection ; by which incans a thenry founded on fience miglit be obtained. And if this point frould nut be gained, we might perthaps find a few general facts, which are modifed in all thefe paticular cafea, in fuel a manuer that we can flil trace the gencral facts, and fee the part of the particular cale which depends on it. This would be the acquitition of what may be called an empirical theory, by which every phenomenon would be explained, in fo far as the explanation of a phenomenon is nothing more than the pointing out the general fact or law under which it is compreheaded; and this theory would anfwer every practical purpofe, becaufe we thould confidently forefee what confequences would refult from fuch and fuch promifes; or if we fhould fail even in this, we fhould tlill have a feries of experiments fo conprehenfise, that we could tell what place in the ferics would correfpond
29 to any particnlar cafe which might be propofed.
1.ubure of 'There are two gentlemen, whofe labours in this reMichenti fpect deferve very particular notice, profeffor Micheinchis way, lutti at Turin, and Abbe Boflut at Pariz. The firlt made a prodigious number of experinents both on the motion of water thronoh pipes and in open canals. They were performed at the expence of the fovereign, and no expence was fpared. A tower was built of the finelt mafonry, to feree as a veffel from which the water was to iffue through holes of various fizes, under preflures from 5 to 22 feet. The watcr was received sato hafous contrnesed of malonry and nicely lined with fluce=, foum whence it was conveyed in canals of brickwork lined with fueco, and of various forms and declivities. The cxperiments on the expence of water through pipes are of all that lave-yet been made the mout nuncrous and exact, aud may be appealed to on every ocealion. 'thofe made in open canals are till more numerous, and are no doubt equally accurate; but they have not been fo contrived as to be fo generally ufeful, being in general very unlike the importan cafes which will occur in practice, and they feem to have been contrived chielly with the wiew of eftablithing or overturning certain points of hydraulic doctrine which were probably prevalent at the time among the practical hydraulits.

The experiments of Boflut are alfo of both kinds ; and though on a much fmaller feale than thofe of Micheletti, feeni to deferve equal confidence. As far as they follow the fame track, they perfectly coincide in their refults, which fhould procure confidence in the other: and they are made in fituations much more analogous to the ufual practical cafts. This makes
them doubly valuable, "Ihey are to be found ial his Theory. two volumes intitled Hydrodynamigue. He has opersed \(\underbrace{\text { H. }}\) this path of procedure in a manner fo new and fo judicious, that he has in fome meafure the merit of fuch as fhall follow him in the fame path.

This has been moll candidly and liberally allowed And the him by the chevalier de Buat, who has taken up this progrefive matter where the Ablic Boflut left it, and has profe- expericuted his experiments with great affiduity; and we menss of nult now add with fingular fuecefs. By a very judicious confideration of the fubject, he hit on a particular view of it, which laved him the trouble of a minute confideration of the fimall internal motions, and enabled lim to proceed from a very general and evident propolition, which may be received as the key to a compiete fyftem of practical hydraulics. We fhall follow this ingenious author in what we have farther to fay on the fubject; and we doube not but that our readere will think we do a fervice to the public by making there difeuffions of the chowalier de Buat more generally known in this country. It inult not however be expected that we fhall give more than a fynoptical view of them, connected by fuch familiar reafoning as thall be either comprehended or confided in by perfons not deeply verfed in mathematical fcicnce.

\section*{Sect. I. Theory of Rivers.}

Ir is certain that the motion of open Areams muf, in fome refpects, refemble that of bodies niding down inclined planes perfecty polifhed; and that they would accelerate continually, were they not obftructed: but they are obltructed, and frequently move uniformly. This can only arife from an equilibrium between the forces which promote their defcent and thofe which oppofe it. Mr Buat, therefore, affumes the leading propotition, that

When water flows nniformly on any channel or bed, the ascelerating force which obliges it to move is equal to the fum of all the refiglonces which it meets with, whether arifing from its own vifidiliy, or from the frition of its bed.
'I'his law is as old as the formation of rivers, and fhould be the key of hydraulic feience. Its evidence is clear ; and it is, at any rate, the balis of all uniform mation. And funce it is fo, there mult be fome confiderable analogy between the motion in pipes and in open channels. Botlo owe their origin to an inequaof preflure; both would accelerate continually, if nothing hindered; and both are reduced to uniformity by the vifeidity of the fluid and the friction of the channel.

It will therefore be convenient to exainine the pho- The fubject nomena of water moving in pipes by the action of its of the ful. weight only along the noping channel. But previouslowing difto this, we mult take fome notice of the obftruction cuftion proto the entry of water into a channel of any kind, ari-pofed. ling from the deflection of the many different filaments which prets into the chanal from the refervoir from every fide. Then we fhall be able to feparate this diminution of motion from the fum total that is obferved, and afcertain what part remains as produced by the fublequent obftructions.

We then fhall confider the principle of uniform motion, the equilibrium between the power and the refiftance. The power is the relative height of the column of fluid which tends to move along the inclined plane of its bed ; the refiftance is the friction

Therry. of the bed, the vifciuity of the Auid, and its adhefion to the fides. Here are neeeflarily combined a number of circumflances which muft be gradually detached that we may fee the effect of each, viz. the extent of the bed, its perineter, and its Rope. By examining the effects produced by variations of each of thefe feparately, we difcover what hare each has in the general effect; and having thus analyfed the complicated phenomenon, we fhall be able to combine thofe its clements, and frame a formula which hall comprehend every circumfance, from the greatelt velocity to the extinction of all motion, and from the extent of a river to the narrow dimentions of a quill. .We fhall compare this furmula with a ferics of experiments in all this variety of circumftances, partly made by Mr Buat, and partly collecked from other authors; and we thall leave the reader to judge of the agreement.
Confident that this agreement will be found moff fatisfactory, we fhall then proceed to contider very curforily the chief varieties which nature or art may introduce into thefe beds, the different velocities of the fame ftream, the intenfity of the refiftance produced by the inertia of the materials of the chamel, and the furce of the current by which it continually acts on this channel, tending to change either its dimenfions or its form. We fhall endeavour to trace the origin of thefe great rivers which fprad like the branches of a vigorous tree, and occupy the furface even of a ralt continent. We fhall follow them in their courfe, unfold all their windings, Hudy their train, and regimen, and point out the law of its flability; and we fha!! inveftigate the caufes of their deviations and wanderiugs.

The ftudy of thefe natural laws pieafes the mind: but it anfwers a ltill greater purpofe; it erables us to affitt nature, and to liaften her operations, which our wants and our impatience often find too flow. It enables us to command the elements, and to force them to adminiter to our wants and cur pleafures.

We fhall theefore, in the next place, apply the knowledge which we may acquire to the folution of the moft important hydraulic queltions which oscur in the practice of the civil engineer.

We thall confider the efficts produced by a permanent addition to any river or ftream by the union of another, and the oppofite effect produced by any draught or offset, fhowing the elevation or depreffion produced up the ftream, and the change made in the depth and velocity below the addition or ofset.

We flall pay a fimilar attention to the temporary fwells produced by frethes.

We thell afcertain the effects of Atraightening the courfe of a fream, which, hy increafing its llope, mult increafe its velueity, and therefore fink the waters above the place where the curvature was removed, and diminifh the tendency to overflow, while the fame immediate confequence muft expofe the places farther cown to the rifk of floods from which they would otherwife bave been frec.

The effects of dams or weirs, and of bars, muft then be confidered; the gorge or fwell which they prodece up the frean? mutt be determined for every diftance from the weir or bar. 'This will furnifh us with rules for rendering navigahle or floatable fuch waters as have soo little depth or too great Aope.' And it will appear
that immenfe advantages moy be thus derivai, with a Theory. moderate expence, even from trifling brouks, if we will relinquith all prejordices, and not imayine that fuech conveyance is impofiible, becaufe it cannot be carricd on by fuch boats and finall cralt as we lave been accuitomed to look at.

The effects of canait of derivation, the rules or maxims of diaining, and the seneral maxims of embank. ment, come in the next place ; and our difeuffions will comelude with remarks on the molt proper forms for the entry to canals, bocks, docks, harbours, and mouths of tivcrs, the beft fhase for the flartings of bridges and of boats for inland navigrations, awd fuch 1 ke fibordinate but interefling particulars, which will he fuggelted by the general thread of difcuftion.

It is confidered, as phy fically demonitrated (fee Hy- Natural vee drostatics and Hynraulicz), that water iffuing "eter, ceand from a fmall orifice in the bottom or fide of a very large wif harge veffel, alnoll inflantly asquires and maintains the velo. though city which a heary body would acquire by falling to frise uria the orifice from the hoizontal furface of the ftagnant \({ }^{3}\) water. This we fhall call its Natural Velocity. Therefore if we multiply the area of the orisce by this velocity, the prodact will be the bulk or quantity of the water which is difcharsed. This we may call the Natural Expeice of water, or the Natural Discharge.

Let O reprefent the area or fection of the orifice expreffed in fome knowa meafure, and 1 h its depth under the furface. Let \(\sigma\) exprefs the velocity acquired by a heary body during a fecond by falling. Ict V be the medium velueity of the water's motion, Q the quantity of water difchargod luring a fecond, and N the natural expence.
We know that \(V\) is.eq̧ual to \(\sqrt{2 g} \times \sqrt{ } b\). Therefore \(\mathrm{N}=\mathrm{O}, \sqrt{2 \pi} \cdot \sqrt{2}\).
If thefe dimeafions be all taken in Englifh feet, we. have \(\sqrt{25}\) very nearly equal to 8 ; and therefore \(\mathrm{V}=\) \(8 \sqrt{ } h\), and \(N=0.8 \sqrt{ } h\).

But in our prefent bufinefs it is much more convcnient to meafure every thing by inches. Therefore fince a body acquires the velocity of 32 feet 2 inches. in a fecond, we have \(2 g=6\) feet 4 inclues or 772 inch. ts, and \(\sqrt{2 g}=27,78\) inclues nearly \(27 \frac{3}{4}\) inches.
Therefore \(V=\sqrt{772} \cdot \sqrt{ } h,=27,78 \sqrt{ } k\), and \(N=O\). \(\sqrt{77^{2}} \sqrt{h},=0.27,78 \sqrt{ } h\).
But it is alfo well known, that if we were to calcnlate the expence or difchage for every orifice by this fimple rule, we fhould in every inflanee find it much greater than nature teally gives us.
When water iffucs through a hole in a thin plate, the lateral columns, preffing into the hole from all fides, caufe the iffuing filaments to converge to the axis of the jet, and contract its dinnontions at a little dillance from the hole. And it is in this place of greatelt contraction that the water acquires that velocity which we obferve in our experiments, and which we affume as equal to that acquired by falling from the furface. Therefore, that our computed difcharge may beft ayree with obfervation, it mult be calculated on the fuppofition that the orifice is diminifhed to the fize of this finalleft fection. But the contraction is fubject to variations, and the dimenfions of this fmalleft fection

Thents.

3
Motion of filaments i. various farticular cituarions,
are at all times difficult to afcertain with presifion. it is therefore much more convenient to compute from the real dimenfions of the oritice, and to corrett this computed Vifcharge, by neans of an actual comparifon of the computed and effective difcharges in a feries of experiments made in fituations refembling thofe cafes which moft frequently occur in practice. This crirrection or its caufe, in the mechanifm of thofe internal motions, is generally called Contraction by the writers on hydraulics; and it is not confined to a hole in a thin plate: it happens in forte degree in all cales where fluids are made to pafs through narrow places. It happens in the cutry into all pipes, canals, and fluices; nay even in the paffage of water over the edge of a board, fuch as is ufually fet up. on the head of a dam or weir, and even when this is inmerfed in water on both fides, as in a bar or keep, frequently empluyed for raifing the waters of the level flreams in Flanders, in order to render them navigable. We mentioned an obfervation fof Mr Buat to this cffuet, when he faw a gooberry rife up from the bottom of the canal along the face of the bar, and then rapidly fly over its top. We have attempted to reprefent thas motion of the filaments in thefe different fittations.

Fig. 5. A fhows the motion through a thin plate.
13 hows the motion when a tube of about two diameters lung is added, and when the water flows with a tull momh. This does not alsays happen in fo fhort a pipe (and wever in one that is thorter), but the water frequantly detaches itfelf from the fides of the pipe, and flows with a contraetel jet.

C nows the motion when the pipc projects into the infrib of the veffel. In this cafe it is difficult to nake it flow full.
1) reprefents a mouth-piece fitter to the hole, and formed ayreeably to that fhape which a jet would affunce of itfelf. In this cafe all contraction is avoided, becaufe the mouth of this pipe may be confidered as the real orifice, and nothing now dininifies the difcharge lout a trifling friction of the fides.

E fhows the motion of water over a dam or weir, where the fall is free or unobftructed; the furface of the lower ftrean heing lower than the edge or fule of the walle-beard.

F is a fimilar reprefentat:on of the motion of water over what we would call a bar or kecp.

It was one great ain of the experiments of Michehoti and Boffut to determine the effeft of contracion in thefe cales. Michutti, after earefully offerving the form and cimentions of the ratural jot, made varivus nuwth-pieces riembling it, till he obtaned one which produced the fmaileft diminution of the computed difcharge, or till the ditcharge computed for the area of its fradler end approached the nearet to the effective difcharre. And be at laft obtained one which gave a dicharge of \(5,83^{\circ}\), when the natural dicharge would hase been 1000. This pisce was tormed hy the revolution of a trochoid :ound the axis of the jct, and the dimelifine were as foiltow:
\[
\begin{aligned}
\text { Diamecter of the outer orifice } & =36 \\
\begin{aligned}
\text { Leng the of the axis }
\end{aligned} & =96 \\
& =96
\end{aligned}
\]

The refults of the experiments of the Abbe Boffut and of Micleelotti fcarcely difier, and they are expreffed in the following table :
\(N\) or the natural expence
\(\left.\begin{array}{l}\text { Eor the thin plate fig. } A \\ \text { almoll at the furface }\end{array}\right\}\)
for ditto at the depth of 8 feet
Q fir ditto at the depth of 16 feet
Qfor a lube 2 diameters long, \(\}\)
fig. \(B\).
Q for ditto projecting inwards \(\}\)
Q for ditto with a contracted
jet, fig. C.
Q for the mouth-piece, fig. \(D\).
Qfor a weir, fig. E.
Q for a bar, fig. \(F\).
The numbers in the laf column of this little table are the cubical inches of water difcharged in a fecond when the height \(b\) is one inch.

It muft be oblerved that the difcharges afligned here for the weir and bar relate only to the contractions occationed by the pafiage over the edge of the board. The weir may alfo fuffer a diminution by the contractions at its two ends, if it fhould be narrower than the Aream, which is generally the cafe, becaufe the two ends are commonly of fquare malonry or woodwork. The contraction there is nearly the fame with that at the edge of a thin plate. But this could not be iutroduced into this table, becaufe its effect on the expence is the fame in quantity whatever is the length of the wafte-board of the weir.

In like manner, the diminution of dilcharge through a fluice could not be exprefled here. When a flaice is drawn up, but its lower edge fill remains under water, the difcharge is contracted both above and at the fides, and the dimnution of dilcharge hy each is in proportion to its extent. It is not eafy to reduce either of thefe contractions to computation, but they may be very caflly ublerved. We freguently can obferve the water, at coming out of a fluice into a mill courfe, quit the edge of the aperture, and fhow a part of the bottons quite dry. This is always the cale when the velocity of effux is confiderable. When it is very moderate, this place is occupied by an eddy water almod flagnant. When the head of water is 8 or 10 inches, and runs of freely, the face left betwcen it and the fides is about \(1 \frac{1}{2}\) inches. If the fides of the entry have a flope, this void fpace can never appcar; but there is always this itendency to convergence, which diminifies the quantity of the difcharge.

It will frequently abridge computation very much to comficer the water difcharged in thefe different fituations as moving witl a commgn velocity, which we con ceive as produced not by a fall from the furface of the fluid (whicl is exact only when the expence is equal to the natural expence, , but by a fall \(b\) accommodated to the difcharge : or it is convenient to know the heighs which would produce that very velocity which the water iftues with in thefe fituations.

And alfo, when the water is obferved to be actually moving with a velucity \(V\), and we know whether it is coming through a thin plate, through a tube, over a dam, \&c. it is neceffary to know the preffure or HEAD OF wATER \(l\) which has actually produced this velocity. It is convenient therefere to have the following numbees in readinefs.
\[
\begin{aligned}
& h \text { for the naturai expence }=\frac{T}{77^{2}} \\
& b \text { for a thin plate } \\
& =\frac{V^{2}}{29^{6}} \\
& b \text { for a tube } 2 \text { diam. long }=\frac{V^{2}}{505} \\
& b \text { for a dam or weir } \\
& =\frac{V^{2}}{726} \\
& b \text { for a bar }
\end{aligned}
\]
all the figures \(A C D E, B H G F\), S.c. may be fimilar, Theory. we fee that the force arifing folely from the dcclivity, and atting on each particle on the plane \(O Q\), is proportional to its depth under the furface, and that the row of particles ACQDE, BHPGF , \&c. which is to be mo. ved by it, is in the fame proportion. Hence it un. queftionably follows, that the accelerating force on each particle of the row is the fame in all. Therefore the whole plane \(O Q\) tends to advance forward together with the fame velocity ; and in the inftant immediately fucceeding, all thefe particles would be found again in a vertical plane indefinitely near to OQ; and if we fum up the forces, we thall find them the fame as if \(O Q\) were the opening of a תluice, having the water on the fide of \(D\) ttanding level with \(O\), and the water on the other fide ftanding at the height AC. This refult is extremely different from that of the hafty theory of Guglielmini. He confiders each particle in OQ as urged by an accelerating force proportional to its depth, it is tue; but he makes it equal to the weight of the row OP, and never recollects that the greateft part of it is balanced by an oppofite preffure, nor perceives that the force which is not balanced muft be diftributed among a row of particles which varies in the fame proportion with itfelf. When thefe two circumftances are neglected, the refult mult be incompatible with oblervation. When the balanced forces are taken into the account of preflure, it is evident that the furface may be fuppofed horizontal, and that motion Thould obtain in this cafe as well as in the cafe of a noping furface : and indeed this is Guglielmini's profeffed theory, and what he highly values himfelf on. He announces this difcovery of a new principle, which he calls the energy of deep waters, as an important addition to liydraulics. It is owing to this, fays he, that the great rivers are not Aagnant at their mouths, where they have no perceptible declivity of furface, but, on the contrary, have grcater energy and velucity than farther up, where they ate fhallower. This principle is the balis of his improved theory of rivers, and is infifted on at great length by all the fublequent writers. Buffon, in his theory of the earth, makes much ufe of it. We cannot but wonder that it has been allowed a place in the theory of rivers given in the great Encyclofédie of Paris, and in an article having the fignature ( O ) of D'Alembert. We have been very anxious to thow the falfity of this principle, becaufe we confider it as a mere fubterfuge of Guglielmini, by which he was able to patch up the mathematical theory which he had fo hattily takeu from Newton or Galileo; and we thirk that we have fecured our readers from being mifled by it, when we how that this energy muft be equally operative when the furface is on a dead level. The abfurdity of this is evideut. We fhall fee by and by, that deep waters, whea in actual motion, have an energy not to be found in Mailow running waters, by which they are enabled to continue that motion: hut chis is not a moving prin= ciple; and it will be fully exprained, as an immediate refult of principles, not vaguely conceived and indiftinctly expreffed, like this of Guglielmini, but eafily undertood, and appreciable with the greatelt precifion. It is an energy common to all great bodics. Although they lofe as much moncutum in furmounting any obItacle as fmall ones, they lufe but a finall portion of their velocity. At prefent, empluyect only in condider. I. 1
ins
ing the progreflive motion of an open Aream, whofe furface is not level, it is quite enough that we fee that fuch a motion mult obtain, and that we fec that there are propelling forces; and that thofe forces arife foldy from the want of a level furface, or from the flope of the furface; and that, with refpeet to any one particle, the force acting on it is proportional to the difference of level between each of the two eolumns (one on cach fide of the particle) which produce it. Were thic furface level, there would be no motion; if it is not level, there will be motion; and this motion will the proportional to the want of level or the declivity of the furface: it is of no confequence whether the bottom be level or not, or what is its thape.

Hence we draw a fundamental principle, that the mosion of rivers deperids entirely on the lope of the furface.

The slope or declivity of any inclined plane is not properly expreffed by the difference of height alone of its extremities; we muft alfo confider its length : and the ineafure of the Rope mult be fuch that it may be the fame while the declivity is the fame. It mutt thereforc be the fame over the whole of any one inclined plane. We fhall anfwer there conditions exactly, if we take for the meafure of a flope the fraction which exprefles the elcuation of one extremity above the other divided by the length of the plane. Thus \(\frac{A M}{A F}\) will exprefs the dectivity of the plane AF.

If the water met with no refiftance from the bed in which it runs, if it had no adhefion to its fides and bottom, and if its fluidity were perfect, its gravity would accelerate its courfe continually, and the earth and its inhabitants would be deprived of all the advantages which they derive from its numberlefs freams. They would sun off \(\int o\) quickly, that our fields, dried up as foon as watered, would be barren and ufelefs. No foil could refift the impetwofity of the torrents; and their accelerating force would render them a defroying fcourge, were it not that, by kind Providence, the refiftance of the bed, and the vifcidity of the fluid, become a check which reins them in and fets bounds to their rapidity. In this manner the friction on the fidee, which, by the vifcidity of the water, is communicated to the whole mafs, and the very adhefion of the particles to each other, and to the fides of the channel, are the caufes which make the refiftances bear a relation to the velocity; fo that the refiftances augmenting with the velucities, come at lat to balance the accelerating force. Then the velocity now acquired is preferved, and the motion becomes uniform, without being able to acquire new increafe, unlefs fome change fucceeds either in the flope or in the capacity of the channel. Hence arifes the fecond maxim in the motion of rivers, that when a fream moves uniformly, the refillance is equal to the acceleratinz force.

As in the eflux of water through orifices, we pals over the very beginnings of the accelerated motion, which is a matter of Epeculative curiofity, and conlider the motion in a fate of permanency, depending on the had of water, the area of the orifice, the velocity, and the expence; fo, in the theory of the uniform motion of sivers, we confider the flope, the tranfverfe fection or area of the ftream, the uniform velocity, and the ex.
pence. It will be convenient to affx precife meanings to the terins which we flall employ.

The section of a flream is the area of a plane perpendicular to the direction of the general motion.

The refitances arife ultimately from the action of the planely water on the internal furface of the channel, and muft be proportional (creteris paribus) to the extent of the action. Therefore if we unfold the whole edge of this fection, which is rubbed as it were by the paffing water, we fhall have a meafure of the extent of this action. In a pipe, circular or prifmatical, the whole circumference is acted on; but in a river or canal ACDQ (fig. \(\dot{6}\).) the horizontal line \(a \mathrm{O}\) e, which makes the upper boundary of the fection \(a \mathrm{CD}\) e, is frec from all action. The action is confined to the three lines \(a \mathrm{C}, \mathrm{CD}, \mathrm{D} e\). We fhall call this line \(a \mathrm{CD} e\) the border of the fection.

The mean vflocity is that with which the whole fection, moving equally, would generate a folid equal to the expence of the flream. This velocity is to be found perhaps but in one filament of the fream, and we do not know in which filament it is to be found.

Since we are attempting to eftablifh an empirical theory of the motion of rivers, founded entirely on experiment and palpable deductions from them; and fince it is extremely difficult to make experiments on open ftreams which fhall have a precifion fufficient for fuch an important purpofe-it would be a molt defirable thing to demontrate an exact analogy between the mutual balancing of the acceleration and refiftance in pipes and in rivers; for in thofe we can not only make experiments with all the defired accuracy, and admitting precife meafures, but we can make them in a number of cafes that are almoft impracticable in rivers. We can increafe the flope of a pipe from nothing to the vertical pofition, and we can employ every defired degree of preflure, fo as to afcertain its effect on the relocity in degrees which open ftreams will not admit. The Chevalier de Buat has moft happily fucceeded in this demonifration; and it is here that his good fortune and his penetration have done fo much fervice to practical frience.

Let \(A B\) (fig. 7.) be a horizontal tube, through The accel \({ }^{4 \mathrm{r}}\) which the water is impelled by the preffure or HEAD ration anc DA. This head is the moving power; and it may be effifance conceived as conlifting of two parts, performing two of water i diltingt offices. One of them is employed in impref at a tube, fing on the water that velocity with which it aicually moves in the tube. Were there no obftructions to this motion, no greater head would be wanted; but there are obfructions arifing from friction, adhefion, and vilcidity. This requires force. Let this be the office of the reft of the head of water in the refervoir. There is but one allotment, appropriation, or repartition, of the whole head which will anfwer. Suppore E to be the point of partition, fo that DE is the head neceffary for imprefling the actual velocity on the water (a head or preflure which has a relation to the form or circumftance of the entry, and the contraction which takes place there). The rell EA is wholly employed in overcoming the fimultaneous refiftances which take place along the whole tube \(A B\), and is in equilibrio with this refiftance. Therelore if we apply at E a tube EC of the fame length and diameter with \(A B\),
ey. and having the fame degree of polifh or toughnefs; and if this tube be inclined in fuch a manner that the axis of its extremity may coincide with the axis of AB in the point C -we affirm that the velocity will be the fame in both pipes, and that they will have the fante expence; for the moving force in the floping pipe EC is compofed of the whole weight of the column DE and the relative weight of the column EC ; but this relative weight, by which alone it defcends along the inclincd pipe EC, is precifely equal to the weight of a vertical column EA of the fame diameter. Every thing therefore is equal in the two pipes, viz. the lerigths, the diameters, the moving forces, and the refiltances; therefore the velocitics and difcharges will alfo be equal.
This is not only the cafe on the whole, but alfo in every part of \(i t\). The relative weight of any part of it EK is precifely in equilibrio with the refiltances along that part of the pipe; for it has the fame proportion to the whole relative weight that the refiftance has to the whole refiftance. Therefore (and this is the mof inportant circumfance, and the bafis of the subole theory) the pipe EC may be cut fhorter, or may be lengthened to infinity, without making any change in the velocity or expence, fo long as the propcling head DE remains the fame.

Leaving the whole head DA as it is, if wc lengthen the horizontal pipe \(A B\) to \(G\), it is evident that we increafe the refiftance without any addition of force to overcome it. The velocity muft therefore be diminifhed; and it will now be a velocity which is produced by a fmaller head than DE : therefore if we were to put in a pipe of equal length-at \(E\), terminating in the horizontal line AG, the water will not run equally in both pipes. In order that it may, we muft difcover the diminified velocity with which the water now actually runs along AG, and we muft make a head DI capable of impreffing this velocity at the entry of the pipe, and then infert at I a pipe IH of the fame length with AG. The expence and velocity of both pipes will now be the fame ( A ).

What has now been faid of a horizontal pipe AB would have been equally true of any inclined pipe \(A B\), \(\mathrm{A}^{\prime} \mathrm{B}\) (fig. 8.) Drawing the horizontal line CB , we fee that DC is the whole head or propelling preffure for either pipe AB or \(\mathrm{A}^{\prime} \mathrm{B}\); and if DE is the head neceffary for the actual velocity, EC is the head neceffary for balancing the refiftances; and the pipe EF of the fame length with \(A B\), and terminating in the fame horizontal line, will have the fame velocity; and its in-
clination being thus determined, it will have the fame vclocity and expence whatever be its length.

Theory.
Thus we fee that the motion in any pipe, horizontal \({ }^{43}\) or floping, may be referred to or fubftituted for the between motion in another inclined pipe, whofe head of water, there pipes above the place of entry, is that productive of the actual demanfravelocity of the water in the pipe. Now, in this cafe, ted by De the accelerating force is equal to the refiftance: we Baat. may therefore confider this laft pipe as a river, of which the bed and the flope are uniform or conflant, and the current in a flate of permanency; and we now may clearly draw this important conclufion, that pipes and open Itrcams, when in a Atate of permanency, perfeetly refemble each other in the circumftances which are the immediate caufes of this permanency. The equilibriuns between the accelerating force obtains not only in general, but takes place through the whole length of the pipe or ftream, and is predicable of every individual tranfverfe fection of either. To make this more palpably evident if poffible, let us confider a flaping cylindrical pipe, the current of which is in a fate of permanency. We can conceive it as confifting of two half cylinders, an upper and a lower. Thefe are running together at an equal pace; and the filaments of each inmediately contiguous to the feparating plane and to each other, are not rubbing on each other, nor affecting each others motions in the fmalleft degree. It is true that the upper half is preffing on the lower, but in a direction perpendicular to the motion, and therefore not affecting the velocity; and we fhall fee prefently, that although the lower fide of the pipe bears fomewhat more preflure than the other, the refiftances are not changed. (Indeed this odds of preffure is accompanied with a difference of motion, which need not be conididered at prefent ; and we may fuppofe the pipe fo fmall or fo far below the furface, that this fhall be infenfible). Now let us fuppofe, that in an inftant the upper half cylinder is annihilated: We then have an open fream; and every circumftance of accelerating force and of refittance remains precifcly as it was. The mo. tion mult therefore continue as it did; and in this fate the only accelerating force is the flope of the furface. The demonfration therefore is complete.
From thefe obfervations and reafonings we draw a Corfegeneral and important conclufion, "That the famequence. pipe will be fufceptible of different velocities, which it will preferve uniform to any diftance, according as it has different inclinations; and each inclination of a pipe of given diameter has a certain velocity peculiar to itSelf, which will be maintained uniform to any diftance L. 12 what-
(A) We recommend it to the reader to make this diftribution or allotment of the different portions of the preffure very familiar to his mind. It is of the mof extenfive influence in every queftion of hydraulics. and will on every occafion give him diftinct conceptions of the internal procedure. Obvious as the thought feems to be, it has efcaped the attention of all the writers on the fubject. Lecchi, in his Hydraulics publifhed in 1766 , afcribes fomething like it to Daniel Bernoulli ; but Bernoulli, in the paffage quoted, only fpcaks of the partition of preffure in the inftant of opening an orifice. Part of it, fays he, is employed in accclerating the quiefcent water, and producing the velocity of effux, and the remainder produces the preffure (now diminifhed) on the fides of the veffcl. Bernoulli, boffut, and all the good writers, make this diftribution in exprefs terns in their explanation of the motion of water though fucceflive orifices; and it is furprifing that no one before the Chevalier de Buat faw that the refiftance arifing from friction required a fimilar partition of the preflure; but though we flould call this good fortune, we mult alcribe to his great fagacity and juftuefs of conception the beautiful wfe that he has made of it : "fuum cuique."

\section*{Theory.}

46 Refultari De Buat's inveflization oo thi tebject.
whatever ; and this velocity increafes continually, according to fome law, to be difcovered by theory or experiment, as the pofition of the pipe changes, from being horizontal till it becomes vertical ; in which pofition it has the greateft uniform velocity poflible relative to its inclination, or depending on inclination atone.

Let this velocity be called the train, or the rate of each pipe.

It is crident that this principle is of the ntmoft confequence in the theory of hydraulics; for ny experiment we can nind the train of any pipe. It is in train whea an incrcafe of tength makes no change in the velocity. If lengthening the pipe increafes the velucity, the lope of the pipe is too great, and vice serfa. And having difeovered the train of a pipe, and obferved its velocity, and cumputed the head productive of this relocity with the contraction at the catry, the remainder of the head, that is, the תlope (for this is equivalent to EA), is the meafure of the refiftance. 'I'hus we obtain the meafure of the refitance to the motion with a given velocity in a pipe of given diamcter. If we change only the velocity, we get the meafure of the new refibance relative to the velocity; and thus difcover the law of relation between the refiltance and velucity. Then, changing only the diameter of the pipe, we get the meafure of the reliftance rekative to the diameter. This is the ain of a prodigious number of experiments made and collected by Buat, and which we fhall not repeat, but only give the refults of the different parts of his invelligation.

We may exprefs the fope of a pipe by the fymbol \({ }_{3}\), 1 being an inch for infance, ands being the flant length of a pipe which is one inch more elevated at जne end than at the other. Thus a river which has a sleclivity of an inch and a half in 120 fathoms or \(8640^{\circ}\) inches, has its \(₫\) ope \(=\frac{1 \frac{1}{2}}{80.10}\), or \(\frac{1}{5760}\). But in order to obtain the hydraulic Aope of a conduit pipe, the heights of the refervoir and place of difcharge being given, we mult fubtract from the difference of elevation the height or head of water necelfary for propelling the water into any pipe with the velocity \(V\), which it is suppofed actually to have. This is \(\frac{\dot{V}^{2}}{505}\). The remainder \(d\) is to le confidered as the height of the declivity, which is to be diftributed equally over the whole length \(l\) of the pipe, and the flope is then \(\frac{d}{l},=\frac{1}{s}\).

There is another important view to be taken of the Mope, which the reader fhould make very familiar to his thoughts. It expreffes the proportion between the weight of the whole column which is in motion and the weight which is employed in overcoming the refiltance; and the refiltance to the motion of any column of water is equal to the weight of that column multiplied by the fraction \(\frac{1}{s}\), which expreffes its nope.

We come now to confider more particularly the refiftances which in this manncr bring the motions to a flate of t:niformity. If we confider the refiftances which arife from a caufe analogous to friction, we fee that they muft drpend entirely on the inertia of flue
water. What we call the refiftance is the diminution of a motion which would have obtained but for thefe refiftances; and the beft way we have of meafuring them is by the force which we muft employ in order to keep up or reftore this motion. We eftimate this motion by a progreffive velocity, which we meafure by the expence of water in a given timc. We judge the velocity to diminifh, when the quantity difcharged diminifhes; yet it may be otherwife, and probably is otherwife. The abfolute velocity of many, if not all, of the particles, may even be increafed; but many of the motions, being tranfverfe to the general diredtion, the quantity of motion in this direction may be lefs, while the fum of the abfolute motions of all the particles may be greater. When we increafe the general velocity, it is not unreafonable to fuppofe that the im. pulfes on all the inequalities are increafed in this proportion ; and the number of particles thus impelling and deflected at the fame time will increafe in the fame proportion. The whole quantity therefore of thefe ufelefs and loft motions will increafe in the duplicate ratio of the velocities, and the force ncceflary for keeping up the motion will do fo alfo; that is, the relittances fhould increafe as the fquares of the velocities.
\(\mathrm{O}_{1}\) if we confider the refiftances as arifing merely from the curvature of the imperceptible internal motions occafoned by the inequalities of the fides of the pipe, and as meafured by the forces neceffary for producing thefe curvilincal motions; then, becaufe the curves will be the fame whatever are the velocities, the deflecting forces will be as the fquares of the velocities; but thefe deflecting forces are preflures, propagated from the paits urged or preffed by the external force, and are proportional to thefe external preffures by the principles of hydroftatics. Thercfore the preffures or forces neceffary for keeping up the velocities are as the fquares of thefe velocities; and they are our only meafures of the refiftances which muit be confidered as following the fame ratio. Whatever view therefore we take of the nature of thefe refiftances, we are led to confider them as proportional to the fquares of the velocities.

We may therefore exprefs the refiftances by the fyrsbol \(\frac{\mathrm{V}:}{m}, m\) being fome number to be difcovered by ex. periment. Thus, in a particular pipe, the diminution of the motion or the refiftance may be the soooth part of the fquare of the velocity, and \(R=\frac{\mathrm{V}^{2}}{1000^{\circ}}\)

Now if \(g\) be the accelerating power of gravity on any particle, \(\frac{g}{s}\) will be its accelerating power, by which it would urge it down the pipe whole nope is \(\frac{1}{s^{\circ}}\). Therefore, by the principie of uniform motion, the equality of the acceleraing force, and the refiftance, we fhall lave \(\frac{\mathrm{V}^{2}}{m}=\frac{g}{s}\), and \(\mathrm{V} \sqrt{ }=\sqrt{m g}\); that is, the producई of the velocity, and the reciprocal of the fquare roct of the flope, or the quotient of the velocity divided b; the flupe, is a contant quantity \(\sqrt{m g}\) for any given pipe; and the primary formula for all the uniform velucities of one pipe is \(V=\frac{\sqrt{m g}}{X s}\).

Mr Buat therefore examined this by experiment, but found, that even with re feet to a pipe or channel which was uniform throughout, this was not true. We could perinets and coning De Rear press the velocity in every cafe whatever; but this petting would be too empirical. The chief fteps of his very faste refit gracious inveltigation are inftructive. We fall thereBes, \&c. fore mention them briefly, at leaf as far as they tend to give us any collateral information ; and let it always be noted, that the inftuction which they convey is no abstract fpecuiation, but experimental truths, which mut ever remain as an addition to our flock of knowledge, although Mr But's deductions from them should prove faille.

He found, in the frt place, that in the fame clanne the product of V and \(\sqrt{ }\) increaled as \(\sqrt{s}\) increafed; that is, the velocities increafed fatter than the Square roots of the flope, or the refiftances did not increate as fat as the fquares of the velocities. We beg leave to refer our readers to what we faid on the refit. ane of pipes to the motion of fluids through them, in the article Pneumatics, when peaking of bellows. They will there fee very valid reafons (we apprehend) for thinking that the refinances milt increate more flowll than the squares of the velocities.

It being found, then, that \(V_{\sqrt{\prime}}\) is not equal to a conftant quantity \(\sqrt{m g}\), it becomes neceffary to invefrigate rome quantity depending on \(\sqrt{s}\), or, as it is called, forme function of \(\sqrt{s}\), which hall render \(\sqrt{m g}\) a conftant quantity. Let \(X\) be this function of \(\sqrt{s}\), fo that we hall always have VX equal to the conftant quantity \(\sqrt{m} g\), or \(\frac{\sqrt{m g}}{\mathrm{X}}\) equal to the actull velocity \(V\) of a pipe or channel which is in train.

Mr But, after many trials and reflections, the chief of which will be mentioned by and by, found a value of X which corresponded with a waft variety of flopes and velocities, from motions almof imperceptible, in a bed nearly horizontal, to the greater velocities which could be produced by gravity alone in a vertical pipe; and when he compared them together, he found a very difcernible relation between the refiftances and the magnitude of the lection: that is, that in two channels which had the fane lope, and the fame propelling force, the velocity was greatelt in the channel which had the greateft lection relative to its border. This may reafonably be expected. The refiftances arife from the mutual action of the water and this border. The water immediately contiguous to it is retarded, and this retards the next, and fo on. It is to be expected, therefore, that if the border, and the velocity, and the nope, be the fame, the diminution of this velucity will be fo much the leis as it is to be hared among a greater number of particles; that is, as the area of the fection is greater in proportion to the extent of its border. The diminution of the general or medium relocity mut be lees in a cylindrical pipe than in a quatre one of the fame area, because the border of its faction is left.

It appears evident, that the refinance of each particle is in the direct proportion of the whole refinance, and the inverse proportion of the number of particles which receive equal flats of it. It is therefore directly as the
border, and inverfely as the potion. Therefure in the exprefion \(\frac{V^{2}}{m}\) which we have given for the refiftance, the quantity \(m\) cannot be conflant, except in the fame channel; and in different channels it mut vary along with the relation of the lection to its border, becane the reffitances diminifh in proportion as this redo. ion increases.

Without attenptres to difcover this relation by theretical examination of the particular motions of the various filaments, Mr Burt endeavoured to difcover it by a comparifon of experiments. But this required fome manner of fating this proportion between the augmenration of the lection and the auganenarion of its border.

His ftatement is this: He reduces every fiction to a rectangular parallelogram of the fame area, and having its bale equal to the border unfolded into a flraight line. The product of this bare by the height of the rectangle will be equal to the area of the fecton. 'Therefore this height will be a reprefentative of this variable ratio of the lection to its border (We do not mean that there is any ratio between a furface and a line: but the ratio of feetion to lection is different from that of border to border; and it is the ratio of: there ratios which is thus expreffed by the height of this rectangle). If S be the lection, and B the border, S \(\overline{\mathrm{B}}\) is evidently a line equal to the height of this rectangle. Every section being in this manner reduced to a rectangle, the perpendicular height of it may be called the hydraulic mean depth of the lection, and may be expreffed by the fymbold. (But calls it the mean radias). If the channel be a cylindrical pipe, or an open half cylinder, it is evident that \(d\) is half the radius. If the section is a rectangle, whole width is \(w\), and height \(b\), the mean depth is \(\frac{w b}{b+2 b}\), \&ic. In general, if \(g r e-\) prefent the proportion of the breadth of a rectangular canal to its depth, that is, if \(q\) be made \(=\frac{\pi}{b}\), we hal! have \(d=\frac{\varepsilon v}{q+2}\), or \(d=\frac{q b}{q+2}\).
Now, fine the refinances mut augment as the propertimon of the border to the fection augments, \(n m\) in the formulas \(\frac{\mathrm{V}^{2}}{n}=\frac{g}{s}\) and \(\mathrm{V} \sqrt{ }=\sqrt{m g}\), mut follow the proportions of \(d\), and the quantity \(\sqrt{ } \pi / \bar{g}\) muff be proportional to \(\sqrt{ } d\) for different channels, and \(\frac{\sqrt{m g}}{\sqrt{d}}\) fhould be a conftant quantity in every cafe.

Our author was aware, however, of a very fpecions a \(f_{\text {feints }}^{40}\) objection to the clone dependence of the refinance on objedion the extent of the border; and that it might be faid that a double border did not occafion a double refit tance, mules the preffure on all the parts was the fame. For it may be naturally (and it is generally) fuppofed, that the reliffance will be greater when the preflure is greater. The friction or refllance analogous to frictimon may therefore be greater on an inch at the bottom than on an inch of the fides ; but Mr D'Alembert and many others have demonllrated, that the paths of the filaments will be the fame whatever be the preffures.

なの Clvi＝ed to s \(8 x\) forinurn： it）he nf． cl i a W．．．pた 111 1！．1． \(5:!\) x

This might ferve to juntify our ingenious author；but he was deternined to reft every thing on experiment． He therefore made an experiment on the ofeillation of water in fyphons，which we have repeated in the fol－ 1 wing form，which is affected by the fame circum－ itances，and is fufeeptible of much greater precifion， and of more extemive and important application．

The two veffels \(\mathrm{ABCD}, a b c d\)（fig．g．）were con－ nected by the fyphon EFGgfc，which turned round in the fhort tubes E and e，without allowing any wa－ ter to efcape：the axes of thefe tubes being in one Alraight line．The velfels were about 10 inches deep， and the branches FG，\(f g\) of the fyphon were about fise feet long．The veffels were fet on two tables of equal height，and（the hole e being foppod）the veftel ABCD，and the whole fyphos，were filled with water， and water was poured into the veffel abcd till it food at a certain height L．M．The fyphon was then turned into a horizontal polition，and the plug drawn out of \(e\) ， and the time carefully noted which the water enploy－ ed in rifing to the level HK \(k B\) in both veftels．The whole apparatus was now inclined，fo that the water rum back into ABCD．The fyphon was now put in a vertical pofition，and the experiment was repeated． －No fenfible or regular difference was obferved in the time．Yet in this experiment the preflure on the pait \(G_{g}\) of the fyphon was more than fix times greater than before．As it was thought that the friction on this Emall part（only fix inches）was too fmall a portion of the whole obftrucion，various additional obftructions vere put into this part of the fyphon，and it was even leagthened to mine feet；lout diill no remarkable diffe－ rence was ubferved．It was even thought that the t mes were lefs when the fyphon was vertical．

Thus Mr De lunat＇s opinion is completely juftified ； and he may be allowed to affert，that the refiftance de－ pends chicfly on the relation between the fection and its border；and that \(\frac{\sqrt{m g}}{\sqrt{ }} \frac{\bar{d}}{}\) fhould be a conitant quan－ tiry．

To afcertain this point was the object of the next fe－ nics of experiments；to fee whether this quantity was really conflant，and，if not，to difcover the law of its variation，and the phyfical circumftances which ac－ companied the variztions，and may therefore be conin－ dered as their caules．A careful comparion of a very great number of experiments，made with the fame flope， and with very different channels and velocities，fhowed that \(\sqrt{m g}\) did not follow the proportion of \(\sqrt{d}\) ，nor of any power of \(\sqrt{d}\) ．This quantity \(\sqrt{m g}\) increafed by imaller dcgrees in proportion as \(\sqrt{d}\) was greater． In very great beds \(\sqrt{m g}\) was nearly proportional to \(\sqrt{d}\) ，but in fmaller claimels，the velocities diminifled much more than \(\sqrt{d}\) did．Cafting about for fome way of accommodation，Mr Buat conlidered，that fome ap－ proximation at leaft would be had by taking off from \(\sqrt{\bar{d}}\) foroe conftant fmall quantity．This is evident： For fuch a diminution will have but a trifing effect when \(\sqrt{\bar{d}}\) is great，and its effect will increafe rapidly when \(\sqrt{d}\) is very fmall．He therefore tried various values for this fubtraction，and conpared the refults with the former experiments；and he found，that if in
every cafe \(\sqrt{ }\) d be diminifined by one－tenth of an inch， the calculated diecharges would agree very exaetly with the experiment．Therefore，inftead of \(\sqrt{d}\) ，he makes ufe of \(\sqrt{ } \bar{d}-0,1\) ，and finds this quantity always pro－ portional to \(\sqrt{m g}\) ，or finds that \(\frac{\sqrt{m g}}{\sqrt{d}-0,1}\) is a con－ ftaut quantity，or very nearly fo．It varied from 297 to 287 in all fections from that of a very fmall pipe to that of a little canal．In the large fections of canals and rivers it diminifhed fill morc，but never was lefs than 256.

This refult is very agreeable to the moft diftinct no－ tions that we can form of the mutual actions of the water and its bed．We fee，that when the motion of water is obftructed by a folid body，which deflects the pafling filaments，the difturbance does not extend to any confiderable diftance on the 1 wo fides of the body． In like manncr，the fmall difturbances，and impercep－ tible curvilineal motions，which are occafioned by the infinitefimal inequalities of the channel，mull extend to a very fmall diftance indeed from the fides and bottom of the channel．We know，too，that the mutual adhe－ fion or attraction of water for the folid bodies which are moittened by it，extends to a very fmall diflance； which is probably the fame，or nearly \(\int 0\) ，in all cafes． Mr Buat obferved，that a furface of 23 fquare inches， applicd to the furface of flagnant water，lifted 1601 grains；another of \(5 \frac{\pi}{3}\) fquare inches lifted 365 ：this was at the rate of 65 grains per inch nearly，making a co－ lumn of about one－fixth of an inch high．Now this ef－ fect is very much analogous to a real contraction of the capacity of the channel．The water may be conceived as nearly flaguant to this fmall diftance from the border of the fection．Or，to fpeak more accurately，the di－ minution of the progreffive velocity occafioned by the friction and adhefion of the fides，decreafes very rapidly as we recede from the fides，and ceafes to be fenfible at a very fmall dittance．

The writer of this article verified this by a very fimple And \({ }^{53} \mathbf{3}\) nn－ and inftructive experiment．He was making experiments firmed by on the production of vortices，in the manner fuggeltcd by Sir IfaacNewton，by whirling a very accurate and fimooth－ ly polifhed cylinder in water；and he found that the rapid motion of the furrounding water was confined to an ex－ cceding fmall ditance from the cylinder，and it was not till after many revolutions that it was fenfible even at the diftance of half an inch．We may，by the way， fuggeft this as the beft form of experiments for exami－ ning the refiftances of pipes．The motion excited by the whirling cylinder in the ftagnant water is equal and oppofite to the motion loft by water paffing along a furface equal to that of the cylinder with the fane velo－ city．Be this as it may，we are juftified in confidering， with Mr Buat，the fection of the ftream as thus dimi－ nifhed by cutting off a narrow border all round the touching parts，and fuppofing that the motion and dif－ charge is the fame as if the root of the mean depth of the fection were diminifhed by a fmall quantity，nearly conftant．We fee，too，that the effect of this muft be infenfible in great canals and rivers；fo that，fortunate－ ly，its quantity is beft afcertained by experiments made with fmall pipes．This is attended with another con－ veniency，in the opinion of Mr Buat，namely，that the
heory. effect of vifcidity is moft fenfible in great maffes of water in flow motion, and is almoft infenfible in fmall pipes, fo as not to dilturb thefe experiments. We may therefore aflume 297 as the general value of \(\frac{\sqrt{m g}}{\sqrt{d}-0,1}\).
 \(m=\frac{\overline{297}_{g}^{2}}{=} \overline{\sqrt{d}-0,1}^{2},=\frac{88209}{3^{62}}(\sqrt{d}-0,1)^{2},=\) \(243,7 \quad(\sqrt{d}-0,1)^{2}\). This we may exprefs by \(n(\sqrt{d}-0,1)^{2}\). And thus, when we have expreffed the effect of friction by \(\frac{V^{2}}{m}\), the quantity \(m\) is variable, and its general value is \(\frac{\mathrm{V}^{2}}{(\sqrt{d}-0,1)^{1}}\), in which \(n\) is an invariable abftract number equal to 243,7 , given by the nature of the refiftance which water fuftains from its bed, and which indicates its intenfity.

And, laftly, fince \(m_{0}=n(\sqrt{d}-0,1)^{2}\), we have \(\sqrt{m} \bar{g}=\sqrt{n g}(\sqrt{d-0, i})\), and the expreffion of the velocity V , which water acquires and maintains along any channel whatever, now becomes \(\mathrm{V}=\) \(\frac{\sqrt{n g}(\sqrt{d}-0, \mathrm{t})}{\mathrm{X}}\), or \(\frac{297(\sqrt{\bar{d}-0,1)}}{\mathrm{X}}\), in which X is alfo a variable quantity, depending on the flope of the furface or channel, and expreffing the accelerating force which, in the cafe of water in train, is in equilibrio with the refiftances expreffed by the numerator of the fraction.
Having fo happily fucceeded in afcertaining the rariations of refiftance, let us accompany Mr Buat in his inveftigation of the law of acceleration, expreffed by the value of X .

Experience, in perfect agreement with any ditinet opinions that we can form on this fubject, had already fhowed him, that the refiftancess increafed in a flower ratio than that of the fquares of the velocities, or thatthe velocities increafed flower than \(\sqrt{ } \bar{s}\). Therefore, in the formula \(\mathrm{V}=\frac{\sqrt{n g}(\sqrt{ } d-0,1)}{\mathrm{X}}\), which, for one ohannel, we may exprefs thus, \(\mathrm{V}=\frac{\mathrm{A}}{\mathrm{X}}\), we muft admit that X is fenfibly equal to \(\sqrt{s}\) when the 解pe is very fmall or \(s\) very great. But, that we may accurately exprefs the velocity in proportion as the flope augments, we mult have X greater than \(\sqrt{s}\); and moreover, \(\frac{\sqrt{s}}{\mathrm{X}}\) mult increafe as \(\sqrt{-}\) diminifhes. Thefe conditions are neceffary, that our values of \(V\), deduced from the formula \(V=\frac{A}{X}\), may agree with the experiment.

In order to comprehend every degree of nope, we muft particularly attend to the motion through pipes, becaufe open canals will not furnifh us with initances of exact trains with great flopes and velocities We can make pipes wertical. In this cafe \(\frac{1}{5}\) is \(\frac{1}{5}\), and the velocity is the greatelt poffible for a train by the action of gravity: But we can give greater velocities than this
by increafing the head cf water beyond what produces the velocity of the train.

Let AB (fig. io.) be a vertical tube, and let CA be the head competent to the velocity in the tube, which we fuppofe to be in train. The flope is t , and the full weight of the column in motion is the precife meafure of the refiftance. The value of \(\frac{1}{s}\), confidered as a flope, is now a maximum ; but, confldered as expreffing the proportion of the weight of the column in motion to the weight which is in equilibrio with the refiftance, it may not be a maximun; it may furpafs unity, and \(s\) may be lefs than r . For if the veffel be filled to \(E\), the head of water is increafed, and will produce a greater velocit 5 , and this will produce a greater refiltance. The velocity being now greater, the head EF which imparts it muft be greater than CA. But it will not be equal to EA, becaufe the uniform velocities are found to increafe fafter than the fquare roots of the preffures. This is the general fact. Therefore \(F\) is above \(A\), and the weight of the column EB, now employed to orercome the refiflance, is greater than the weight of the column \(A B\) in motion. In fuch cafes, therefore, \(\frac{1}{s}\), greater than unity, is a fort of fictitious flope, and only reprefents the proportion of the refiftance to the weight of the moving column. This proportion may furpafs unity.

But it cannot be infinite: For fuppofing the head of water infinite; if this produce a finite relocity, and we deduct from the whole height the height correfponding to this finite velocity, there will remain an infinite head, the meafure of an infinite refiftance produced by a finite velucity. This does not accord withthe obferved law of the velocities, where the retititances actually do not increafe as falt as the fquares of the velocities. Therefore an infinite head-would have produced an infinite velocity, in oppofition to the refiftances: taking of the head of the tube, competent to this velocity, at the entry of the tube, which head would alfo be infinite, the remainder would in all probability be finite, balancing a finite refiftance.
Thercfore the value of \(s\) may remain finite, although the velocity be infinite; and this is agreeable to all our clearelt notions of the rcfiftances.

Adopting this principle, we mult find a value of \(X\) which will anfiver all thefe conditions. 2. It num be renfibly proportional to \(\sqrt{ } \bar{s}\), while \(s\) is great. It muit always be lefs than \(\sqrt{ } \bar{s}\). 3 . It mult deviate from the proportion of \(\sqrt{s}\), fo much the more as \(\sqrt{\bar{s}}\) is fmaller. 4. It mult not vanih when the velocity is in inite. 5. It mult agree with a range of experiments with every varicty of channel and of llope.
We fhall underitand the nature of this quantity X better by reprefuting by lines the quantities concerned in forming it.

If the relocities were exactly as the fquare roots of the flopes, the equilateral hyperbola NKS (fig. 10. . \(\mathrm{n}^{\circ} 2\) ) between its affymptotes \(\mathrm{MA}, \mathrm{AB}\), would reprefent the equation \(V=\frac{A}{\sqrt{ } s}\). The values of \(\sqrt{s}\) woula be reprefented by the abfciffx, and the velocities by the ordiates, and \(V \vee s=A\) would be the power of the hyperbola. But fince thefe velocities are not fenfibly 6

Thecty. cyual to \(\frac{A}{\sqrt{s}}\) exccpe when \(\sqrt{ }{ }^{3}\) is very great, and deviate the more from this quantity as \(\sqrt{5}\) is fmaller; we may reprefent the velocities by the ordinates of another curse l'GT', which approaehes very near to the hyper. bola, at a great dittance from A along AB ; but fepairutes from it when the abfeifle are fmaller: fo that if \(A Q\) reprefents that value of \(\sqrt{ } s\) (which we have feen ray become lefs than unity), which correfponds to ant infinite velocity, the line QU may be the aflymptote of the new curve. Its ordinates are equal to \(\frac{A}{X}\) while thofe of the hyperbola are equal to \(\frac{\mathrm{A}}{\sqrt{ }}\). Therefore the ratio of thefe ordinates or \(\frac{V s}{\mathrm{X}}\) fhould be fuch that it thall be fo much nearer to unity as \(\sqrt{2}^{-}\)is greater, and fhall furpafs it fo much the more as \(\sqrt{ } s\) is fimaller.

To exprefs X therefore as fome function of \(\sqrt{ } /\) s fo as to anfwer thefe conditions, we fee in gencral that \(X\) muft be lefs than \(\sqrt{ } /\) s. And it mult not be equal to any power of \(\sqrt{ } s\) whofe index is lefs than unity, becaufe then \(\frac{\sqrt{ } \text { s }}{\mathrm{X}}\) would differ fo much the more from unity as \(\sqrt{s}^{-}\)is greater. Nor mult it he any multiple of \(\sqrt{ } s\) fuch as \(q \sqrt{ } s\), for the fame reafon. If we make \(\mathrm{X}=\sqrt{ } s-\mathrm{K}, \mathrm{K}\) being a conttant quantity, we may anfwer the firt condition pretty well. But K muft be very fmall, that X may yot become cqual to nothing; except in fome excecdingly finall ralue of \(\sqrt{ } s\). Now the experiments will not admit of this, becaufe the ratio \(\frac{\sqrt{ } s}{\sqrt{s}-\mathrm{K}}\) docs not increafe fufficiently to correfpond with the velocities which we obferve in certain Mopes, unlefs we make \(\bar{K}\) greater than unity, which again is inconfifent with other experiments. We learn from tuch canvafing that it will not do to make K a conftant quan. tity. If we fhotid make it any fractionary power of \(\sqrt{ } s\), it would make \(\mathrm{X}=0\), that is, nothing, when \(s\) is \(=1\), which is alfo contrary to experience. It would feem, therefore, that nothing will anfwer for K but fome power of \(\sqrt{ } \leqslant\) which has a variable inder. The logaFithm of \(\sqrt{3}\) has this propcity. We may therefore try to make \(X=\sqrt{ } s-\log . \sqrt{ } /\) s. Accordingly if we try the equation \(V=-\frac{A}{\sqrt{s}}-\) hyp. \(\log \cdot \overline{\sqrt{ } s}\), we thall find a rery great agreement with the experiments till the dedivity becomes confiderable, or about \(\frac{1}{2}\), which is much greater than any river. But it will not agree with the velocities obferved in fome mill courfes, and in pipes of a flill greater declivity, and gives a velocity that is too fmall ; and in vertical pipes the velocity is not above one lialf of the true one. We fhall get rid of moot of thefe incongruities if we make \(K\) confint of the hyperbolic logaritlom of \(\sqrt{\mathbf{s}}\) augmented by a finall conitant quantity, and by trying various values for this conitant quantity, and comparing the refults with experiment, we nay hit on one fufficiently exact for all prattical purpofes.

Mr De Buat, after repeated trials, found that he Frild have a very great conformity with experiment
by making \(K=\log \cdot \sqrt{s+1,6}\), and that the velocities exhibited in his experiments would be very well reprefented by the fomula \(V=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-L \sqrt{s+1,6}}\).
There is a circumflance which our author feems to Mutual ad have overlooked on this occafion, and which is undoubt hefion of edly of great effect in thefe motions, viz. the mutual adhefion of the particles of water. This caufes the water which is defcending (in a vertical pipe for example) to drag more water after it, and thus greatly incteafes its velocity. We have feen an experiment in which the water iffued from the bottom of a refervoir through a long vertical pipe having a very gentle taper. It was 15 feet long, one inch diameter at the upper end, and two inches at the lower. The depth of the water in the refervoir was exactly ohe foot \(;\) in a minute there were difcharged \(2 \frac{0}{0}\) cubic feet of water. It mult therefore have iffued through the hole in the bottom of the refervoir with the velocity of 8,85 feet per fecond. And yet we know that this head of water could not make it pafs through the hele with a velocity greater than 6,56 feet per fecond. This increafe muft therefore have arifen from the caufe we have mentioned, and is a proof of the great intenfity of this force. We doubt not but that the difcharge might have been much more iucreafed by pioper contrivances ; and we know many inflances in water pipes where this effeet is produced in a very great degree.
The following cafe is very diftinet: Water is brought An actual into the town of Dunbar in the county of Eaft Lothian cafe from a fpring at the diftance of about \(\mathbf{3}^{200}\) yards. It is conveyed along the firtt 1100 yards in a plpe of two inches diameter, and the declivity is 12 feet nine inches; from thence the water flows in a pipe of \(1 \frac{3}{2}\) diamoter, with a declivity of 44 feet 3 inches, making in 21157 feet. When the work was carried as far as the two-inch pipe reached, the difeharge was found to be 27 Scotch pints, of \(103 \frac{1}{2}\) cubic inches each in a minute. When it was brought into the town, the difcharge was 28. Here it is plain that the defeent along the fecond ftretch of the pipe could derive no impulfion from the firft. This was only able to fupply 27 pints, and to cicliver it into a pipe of equal bore. It was not equivalent to the forcing it into a fmalter pipe, and almof doubling its velocity. It muft therefore have been dragged into this fmaller pipe by the weight of what was defcending along it, and this water was exerting a force equivalent to a head of 16 inches, increafing the velocity from 14 to about 28.

It mult be obferved, that if this formula be juft, Proves that there can be no declivity fo fmall that a current of wa- the feclivily ter will not take place in it. And accordingly none wecill pro. has been obferved in the furface of a flrean when this duce a curo did not happen. But it alfo fhould happen with re-rent. fpect to any declivity of bottom. Yet we know that water will hang on the floping furface of a board without proceeding further. The caufe of this feems to be the adhetion of the water combined with its vifcidity. The vifeidity of a fluic prefents a certain force whicl muft be overcome before any current can take place.

A feries of important experiments were made by our author in order to afcertain the relation between the velocity at the furface of any Itream and that at
hory. the botton. Thefe are curious and valuable on many
foper the accelcrating fore by fope which conflitutes the whole of it. If it were not employed in overcoming this reffifance, it would produce a velocity which (on account of this refiftance) is not produced, or is loft. This would be \(\overline{\sqrt{S}}-\overline{L_{\sqrt{\prime}} /}\). This munt thercfore be taken from the velocity exhibited by our general formula. When thus corrected, it would become \(\mathrm{V}=(\sqrt{d}-0,1)\left(\frac{\sqrt{n_{g}}}{\sqrt{s}-\mathrm{L} \sqrt{\sqrt{s+1,6}}}\right.\) \(\left.-\frac{\sqrt{n g}}{\sqrt{\mathrm{~S}-\mathrm{L}} \sqrt{\mathrm{S}}}\right)\). But as the term \(\frac{\sqrt{n g}}{\sqrt{ } \mathrm{~S}-\mathrm{L} \sqrt{ } \mathrm{S}}\) compounded only of conftant quantities, we may exprefs it by a fingle number. This has been collected from a fcrupulous attention to the experiments (efpecially in canals and great bodies of water moving with very fmall velocities; in which cafe the effects of vifcidity mult become more remarkable), and it appears that it may be valued at \(\sqrt{\text { inch }}\) that it may be valued at \(\sqrt{0,00}\), or 0,3 inches very nearly.

From the whole of the foregoing ennfiderations, drawn from nature, fupported by fuch reafoning as our moft diftinct notions of the internal motions will admit, and authorifed by a very extenfive comparifon with experiment; we are now in a condition to conclude a complcte formula, expreflive of the uniform motion of water, and involvirg every circumflance which appears to have any fhare in the operation.

Therefore let
V reprefent the mean velocity, in inches per fecond, of any current of water, running uniformly, or which is in train, in a pipe or open channel, whofe fection, figure, and fope, are confant, but its length indefnite.
\(d\) the hydraulic mean depth, that is, the quotient zrifeng from dividing the fection of the chanuel, in fquare inches, by its border, expreffed in linear incles.
\(s\) The flope of the pipe, or of the furface of the current. It is the denominator of the fraction expreffing this flope, the numerator being always unity; and is had hy dividing the expanded length of the pipe or chandel by the difference of height of its two extremities.

Vol. XVI. Part I.
\(g\) The velocity (in incles per fecond) which a heavy body acouires by falling during one fecond.
\(n\) An abltract conilant number, determined by experiment to be 243,7 .
\(L\) the hyperbolic logaritlam of the quantity to which it is prefixed, and is had by multiplying the common logarithm of that quantity by 2,3026 .

We fhall have in every inftance
\[
\mathrm{V}=\frac{\sqrt{n g}(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} ., \sqrt{s+1,6}}-0,3(\sqrt{d}-0,1) .
\]

This, in numbers, and Englifh meafure, is
\(\mathrm{V}=\frac{3,7(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \sqrt{5+1,6}}-0,3(\sqrt{d}-0,1)\)
And in French meafure
\[
\mathrm{V}=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-\ln \sqrt{s}+1,5}-0,3(\sqrt{d}-0,1)
\]

The following table contains the real experiments from which this formula was deduced, and the comparifon of the real velocities with the velocities computed by the formula. It confifts of two principal fets of experiments. The firft are thofe made on the motion of water in pipes. The fecond are experiments made on open canals and rivers. In the firl fet, column ift contains the numiher of the experment ; 2.1, the length of the tube; \(3^{\mathrm{d}}\), the height of the refervoir; \(4^{\text {th }}\), the values of S , deduced from column fecond and third; 5 th gives the obferved velocities; and 6th the velocities calculated by the formula.

In the fecond fet, column 2 d gives the area of the fection of the channel; 3d, the border of the canal or circumference of the fection, deducting the horizontal width, which fuftains no friction; 4th, the fquare root \(\sqrt{d}\) of the hydraulic mean depth; 5 th, the denominator \(S\) of the flope; 6th, the obferved mean velocities; and 7 th, the mean velocities by the formula. In the laff ten experiments on large canals and a natural niver the 6th column gives the obfersed velocities at the furface.

This comparion mult be acknowledged to be mut Theory. fatisfactory, and thows the great penetration and ace drefs of the author, in fo fuccersfully lifting and appreciating the fhare which each eo-operating circurnIlance las had in producing the very intricate and conplicated effect. It adds fome weight to the priaciples on which he has proceeded in this amalylis of the mechanifm of hydraulic motion, and mult give us great \(\sigma x\) confidence in a theory fo fairly eftablifhed on a very co. The thent pious induction. The author offers it only as a ratio- 2 wellinal and well-founded probability. To this eharacter it probabilitg, is certainly intitled; for the fuppofitions made in it at.d are agreeable to the oft diftinct notions we can form of thele intermal motions. And it muft always be remembered that the inveftigation of the formula, although it be rendered fomewhat more perfpicuous by thus having recourfe to thofe nutions, has no dependence on the truth of the prineiples. For it is, in fact, nothing but a elaffification of experiments, which are grouped together by fume one circumftance of flope, velocity, form of fection, \&c. in order to difcover the law of the changes which are induced by a variation of the circumftances which do not refemble. The procedure was preciely limilar to that of the aftronomer when he deduces the elements of an orbit from a multitude of obfervations. This was the talk of Mr de Buat; and he candidly and modeflly infornis us, that the finding out analytical forms of exprefion which would exhibit thefe changes was the work of Mr Benezeeh de St Honoré, a young officer of engineers, and his colleague in the experimental courfe. It does honour to his fkill and addrefs; and we think the whole both a pretty and inftructive fpecimen of the method of difcovering the laws of nature in the midat of complieated phenomena. Daniel Bernoullif firlt gave the rules of this method, and they have been greatly improved by Lambert, Condoreet, and De la Grange. Mr Coulomb has given fome excellent examples of their application to the difcovery of the laws of friction, of magnetical and electrical attraction, sic. But this prefent work is the inoft perfpicuous and familiar of them all. It is the empirical method of generaliing natural phenomena, and of deducing general rules, of which we can give no other demonftration but that they are faithful reprefentations of matters of fact. We hope that others, encouraged by the fuccefs of Mr de Buat, will follow this example, where publie utility is preferred to a difplay of nathematical knowledge.

Although the author may not have liit upon the precife modus operandi, we agree with him in thinking that nature feems to act in a way not unlike what is 63 here fuppofed. At any rate, the range of experiments The expe- \(^{\text {ben }}\) is fo extenfive, and fo multifarious, that few cafes can riments oceur which are not included anong them. The ex-luable. vaa periments will always retain their value (as we prefume that they are faithfully narrated), whatever may become of the theory; and we are contident that the formula will give an anfwer to any queltion to which it may be applicable infinitely preferable to the vague guefs of the moft fagacions and experieneed engineer.
We mult hawever obferve, that as the experiments on pipes were all made with ferupulous care in the contrivance and execution of the apparatus, excepting only thofe of Mr Couplet on the main pipes at Verfailles, Mm2

7neor. L61 The velo" isy int 1 l fis oritina r; works.
we may preine e that tae lormula gives the greatent velncities whith can he expected. In ordinary works, where juints are romeh or leaky, where drops of folder nons in the inlide, where cocks intervere with deticient water-ways, where pipes lave aukward bendings, contractions, ir chlargements, and where they may comtin fand or air, we thould reck on on a fmaller velocity thinn what refults foom our calculation : and we prefune thyt an undettaker may with confidenee promife \(\frac{4}{5}\) of this quanciey without any rik of difappointing his employer. We inaanine that the actual performance of canals will be much nearer to the formula.
We have made inpluiry after ur rhes of this kind exccutel in Britain, that we mipl.t compare then with the formula. But all our canals are locked and without motion; and we have only leaned by an accidental information from Mr Watt, that a canal in his neighbourhood, which is 18 feet wide at the furface, and feven fect at the bottom, and four feet deep, and has a flope of one inch in a quarter of a milc, runs with the velocity of 17 inches per fecond at the furface, io at the bottom, and 14 in the middle. If we compute the motion of this canal by our formula, we thall find the mean relocity to be 134 .

No river in the world has had its motions fo much fcrutinifed as the Po about the end of the latt century. It had been a fubject of 100 years continual litigation between the inhabitants of the Bolognefc and the Ferrarefe, whether the waters of the Rheno thould be thrown into the Tronco de Venezia or Po Grande. 'This occafiuntd very numcrous meafures to he taken of its fections and declivity, and the quantities of water which it contained in its different ftates of fullnefs. But, unfortunately, the long ellablifhed methods of meafuring waters, which were in force in Lombardy, made no account of the velocity, and not all the intreaties of Caftelli, Grand', and other moderns, could prevail on the vilitors in this procefs to devate from the ellaWhithed methots. We have therefore no minute a coounts of its velocity, though there are many rough eltimates to be met with in that valuable coliection publifhed at Florence in 1-23, of the writings on the mution of nivers. From them we have extiacted the only precife offervetions which are to te found in the whole work.

The Po Grande reccives no river from Stellata to the fea, and its flope in that interval is found moft furprifingly uniform, mamely fix inches in the mile (reduced to Englifh meafure). The breadth in its great frethes is 759 feet at Lago Scuro, with a very unitorm depth of 31 feet. In its loweft tlate (in which it is called Po Murera), its breadth is not lefs than 702 , and its depth about \(10 \frac{1}{2}\).

The Rheno has a uniform declivity from the Ponte Emilio to Vinarano of 15 inches per mile. Its breadeh in its greatell frefhes is 189 feet, and its depth 9 .

Signor Corrade in his report fays, that in the fate of the great fiefhes the velucity of the Rheno is moett exactly \(\frac{4}{3}\) of that of the Po.

Grandi fays that a great frefh in the Rheno employs 12 hours (by many obfervations of his own) to colne from Ponte Emilio to Vigarano, which is 30 miles. This is a velocity of 44 inches per fecond. And, by Corrade's proportion, the velocity of the Po Grande munf be 55 inches per fecond.

Mortanari's obfervation gives the Po Magra a velocity of 31 inches per fecond.
\(V E R\).
Let us compare thefe velocities with the velocities Theors. calculated by Buat's formula.

The hydraulic mean depths \(d\) and D of the Rheno and \(P_{0}\) in the great frefhes deduced from the above meafures, are \(9^{5,6}\) and \(34+\) incles; and their flupes

\(\frac{3 จ 7(\sqrt{ } \bar{D}-0,1)}{\sqrt{\mathrm{S}}-\mathrm{L} \sqrt{\mathrm{S}+1,6}}-0,3(\sqrt{\mathrm{D}}-0,1)=52,176\) inches and \(\frac{307(\sqrt{d}-0,1)}{\sqrt{s}-L \sqrt{\sqrt{2}}+1,6}-0,3(\sqrt{d}-0,1)=46,727\) inches.

Thefe refults differ very litsle from the velocities above mentioned. And if the velocity correfponding to a depth of 3 , feet be deduced from that oblerved by Muntanari in the Po Magra so feet decp, on the fuppofition that they are in the proportion of \(\sqrt{d_{3}}\) it will be found to be about \(53 \frac{1}{2}\) inches per fecoad.
This comparifon is therefore highly to the credit of Highly in the theory, and would have been very aggreeable to the credit M. de Buat, had he known it, as we hope it is to our of the thercaders.

We have collected many accounts of water pipes, and made the comparifons, and we flatter ourfelves that thefe have enabled us to improve the theory. They flatl appear in their proper place ; and we may jult oblicre here, that the two-inch pipe, which we formerly fpoke of as conveying the water to Dunbar, frould have yielded only \(25^{2}\) Scotch pints per minute by the formula, inftead of 27 ; a finalil error.

We have, therefore, no hefitation in faying that this fingle formula of the uniform motion of water is one of the moll valuable prefents which natural fcience and the arts have received during the courfe of this century.
We hoped to have made this fortunate inveftigation of the chevalier de Buat fill more aceeptable to our rcaders by another table, which fhould contain the values of \(\frac{307}{\sqrt{s}-L \sqrt{s+1,6}}\) ready calculated for cevery declivity that can occur in water pipes, canals, or rivers. Aided by this, which fuperfedes the only difificult part of the computation, a perfon could calculate the velocity for any propofed cafe in lefs than two minutes. But we have not been able to get it ready for its appearance in this article, but we fhall not fail to give it when we relume the fubject in the article \(W_{\text {ater }}-\) Works; and we hope even to give its refults on a feale which may be carried in the pocket, and will enabie the unilearned practitioner to dolve any queftoon with accuracy in half a minute.

We have now eftablifhed in fome meafure a Theory of Hydraulics, by exhibiting a general theorem which expreffes the relation of the clief circumitances of all fuch motions as have attained a flate of permanency, in fo far as this depends on the magnitude, form, and flope of the channel. This permanency we bave exprefled by the term train, faying that the flream is in tratn.
We proceed to confider the fubordinate circumflances contained in this theorem; fuch as, \(1 / 1\), The forms which aature or art may give to the bed of a running ftream, and the manner of expreffing this form in our theorem. 2d, The gradations of the iclocity, by which 7
it decreafes in the different filaments, from the axis or moft rapid filament to the border; and the comnection of this with the mean volocity, which is expreffed by our formuli. \(3^{\prime}\), Having acquired fome dithinct notions of this, we fhall be alle to iee the manner in which undifturbed nature works in forming the heds. of our , ivers, the forms which the affects, and which we m.m? imitate in all their local modifications, if we would fecure that permanency which is the evident aim of all her operations. We flall here learn the mutuat action of the current and its bed, and the circumfances which enfure the Pability of both. 'Thefe we may call the regimen or the conferandion of the flream, and may fay that it is in ergimen. or in confereathoi. This has a relation, not to the dimenfions and the flope alonc, or to the accelerating furce and the reffifance anifing from mere inertia; it refpects immediately the tenacity of the bec, and is different from the train.
\(4 /\), Theie pieces of information will explain the deviation of rivers from the rectilineal courfe; the refittance occafioned by thele deviations; and the circumflances on which the regimen of a winding fream depends.
i 1. Of the Forms of the Cbanncl.
The numerator of the fraition which exprefles the velocity of a river in train has \(\sqrt{t}\) for one of its factors. That form, therefore, is mofl favourable to the motion which gives the grate? value to what we have called the hydraulic mean depth \(d\). T'his is the prerugative of the femicircle, and here \(d\) is equal to half the radius; and all other figures of the fame area are the more favourable, as they approach nearer to a femicircle. This is the form, therefore, of all conduit pipes, and fhould be taken for aqueducts which are built of mafonry. Eafe and accuracy of execution, hewever, have made engineers prefer a rectan rular form ; but neither of thefe will do for a channel formed out of the ground. We fhall foon fee that the femicircle is incompatible with a regimen; and, if we proceed through the regular polygons, we fhall lind that the half hexagon is the only one which has any pretenfions to a regimen; yet experience flows us, that even its banks are too iteep for almoft any foil. A dry carthen bank, not bound together by grafs roots, will hardly fland with a nope of 45 degrees; and a canal which convers running waters will not fland with this ीope. Banks whole bafe is to their height as 4 to 3 will fland very well in moin foils, and this is a flope very ufually given. This form is even affected in the fpontancous operations of nature, in the channels which fhe digs for the rills and rivulets in the higher and ffeeper grounds.

This form bas fome mathematical and mechanical properties which intitle it to fome further notice. Let ABEC (fig. 11.) be fuch a trapezium, and AHGC the rectangle of equal width and depth. Bifect HB and EG by the verticals FD and KI, and draw the verticals \(b \mathrm{~B}, \mathrm{e}\) E. Becaufe \(\mathrm{AH}: \mathrm{HB}=3: 4\), we have \(\mathrm{AB}=5\), and \(\mathrm{BD}=2\), and FD 3 , and \(\mathrm{BD}+\mathrm{DF}=\) BA. From thefe premiffes it follows, that the trapezium ABEC has the fame area with the rcetangle; for HB being bifected in \(D\), the triangles \(A C F, B C D\) are equal. Alfo the border ABEC, which is touched by the pafing ftream, is equal to FDIK. Therefore the mean depth, which is the quotient of the arca divided by the border, is the fame in both; and this is the
cale, whatever is the width BE at the bottom, or cven though there be no reciangle fuch as \(b \mathrm{BE} e\) interpofed between the flant fides.
Of all rectangles, that whofe breadth is twice the Beff fornt height, or which is half of a Iquare, gives the greateft a hai.. mean depth. Iif, therefore, F K be double of \(\mathbb{F} \mathrm{D}\), the nel. trapezium ABEC , which has the fame area, will have the largeft inean depth of any fuch trapezium, and will be the bett form of a channel for conveying running waters. In this cafe, we have \(\mathrm{AC}=10, \mathrm{AH}=\) 3, and \(\mathrm{BE}=2\). Or we may fay that the bell form is a trapezium, whofe hotton width is \(\frac{2}{3}\) of the depth, and whofe extreme width is \(\frac{20}{3}\). 'T his form approach:s very near to that which the torrents in the hills naturally dig for themielves in unifurm ground, where their action is not checked by flonies which they lay bare, or which they depolit in theit courfe. This thows us, and it will be fully confirmed by and by, that the channel of a river is not a fortuitous thing, but has a relation to the couffitency of the Toil and velusity of the Aream.

A rectangle, whofe breadth is \(\frac{4}{3}\) of the depth of water, will therefore have the fame mean depth with a triangle whofe furface width is \(\frac{8}{f}\) of its vertical depth; for this is the dimenfions when the rectangle \(6 \mathrm{BE}_{e}\) is tuken away.
Let A be the area of the fection of any channel, \(\varepsilon \boldsymbol{w}\) its width (when rectangular), and \(b\) its depth of water. Then what we liave called its mean depth, or \(d\), will be \(\frac{A}{w+2 b},=\frac{w b}{w+2 b}\). Or if \(q\) exprefes the ratio of the width to the depth of a reftangular bed ; that is, if \(q=\frac{w}{b}\), we have a very fimple and ready expreffion for the mean depth, either from the width or depth. For \(d=\frac{a v}{q+2}\), or \(d=\frac{q b}{q+2}\).

Therffore, if the depth were infinite, and the width finite, we fhould have \(d=\frac{c y}{2}\); or if the width be intinite, and the depth finite, we have \(d=b\). And thefe are the limits of the values of \(d\); and therefore, in rivers whofe width is always great in compariion of the depth, we may withont nuch error take their real depth for their hydraulic mean depth. Hence we de- enimate rive a rule of cafy recollection, and which will at all of the ertines give us a very near eftimate of the velocity and - ce of 2 expence of a running tream, viz. that the veto ithes are running nearly as the jquare roots of the dipthos. We find this tream confirmed by many experiments of Michelotti.
Alfo, when we are allowed to fuppole this ratio of the velocities and depths, that is, in a rechangular canal of great breadtin and fmall depth, we fhall have the quantitics difcharged nearly in the proportion of the cubes of the velocities. For the quantity difcharged \(d\) is as the velocity and arca jointly, that is, as the beight and velocity jointly, becaufe when the width is the fame the area is as the height. Therefore, we have \(i \doteq b \varepsilon\). But, by the above remark, \(b \doteqdot v^{2}\). Therefore, \(d \doteqdot\) \(v^{3}\); and this is confirmed by the experiments of Boffut, vol. ii. 23 b. Alfo, becaufe \(d\) is as \(v b\), when \(w\) is conitant, and by the above remark (allowable when \(w\) is very great in proportion to \(b\) ) \(v\) is as \(\sqrt{ } h\), we have \(d\) as \(b \sqrt{ } b\), or \(b_{3}^{3}\), or the fquares of the difcharges

Theory:
7?

\section*{Rules for} finding the the wnowiug the mean deptli and the proportion of cincueons fons of the bed, and we liave \(w=q d+2 d\), and \(b=d\) \(+\frac{2 d}{q}\)
2. If we know the area and mean depth, we can in like manner find the dimenfions, that is, \(\tau v\) and \(b\) : for \(A=a v b\), and \(d=\frac{1 w b}{w+2 b} ;\) therefore \(w= \pm \sqrt{\frac{A^{2}}{4 d^{2}}-2 A}\) \(+\frac{A}{2 d}\)
3. If \(d\) be known, and one of the dimenfions be given, we can find the other ; for \(d=\frac{w b}{w+2 b}\) gives \(u=\frac{2 b d}{b-d}\), and \(b=\frac{m d}{\pi-2 d}\).
4. If the velocity \(V\) and the Dope \(S\) for a river in

まolcan
depth, train be given, we can find the mean depth ; for \(\mathrm{V}=\) \(\left(\frac{297}{\sqrt{S-L} \sqrt{S}+1,6}-0,3\right)(\sqrt{d}-0,1) . \quad\) Whence
we deduce \(\sqrt{d}-0,1=\frac{V}{\sqrt{S S}-L \sqrt{ } S+1,6}-0,3\)
\[
44 \quad \sqrt{d}=\text { to this quantity }+0, \mathrm{I}
\]

Auld inje.
5. We can deduce the nope which will put in train a river whole channel las gisen dimenfions. We make \(\frac{297(\sqrt{d}-0,1)}{\mathrm{V}+0,3(\sqrt{d}-0,1)}=\sqrt{ } . \quad\) This fhould be \(=\sqrt{ } \mathrm{S}\) \(-L \sqrt{S+1,6}\), which we correct by trials, which will be exemplified when we apply thefe doctrines to practice.

Ifaving thus effablifhed the relation between the different circumftances of the form of the channel to our seneral formula, we proceed to confider, 2. The gradations of velocity from the middle of the
Arean to the files.

The knowledge of this is neceffary for underfanding the regimen of a river; for it is the velocity of the filaments in contact with the bed which produces any change in it, and occafions any preference of one to another, in refpect of regimen or ftability. Did thefe circumftances not operate, the water, true to the laws of hydraulics, and confined within the bounds which have been affigned them, would neither enlarge nor diminifl the area of the channel. But this is all that we can promife of waters perfectly clear, running in pipes or hewn channels. But rivers, brooks, and fmaller fircams, carry along waters loaded with mud or fand, which they depofit wherever their velocity is checked; and they tear up, on the other hand, the materials of the channel wherever their velocity is fufficiently great. Nature, indecd, aims continually at an equilibrium, and works without ceafing to perpetuate her own performances, by eftablining an equality of action and reacsion, and proportioning the forms and direction of the motions to her agents, and to local circumftances. Her work is flow but unceafing; and what he cannot ac-
complifh in a year fle will do in a century. The beds of cur rivers have acquired fome ttability, becanfe they are the labour of ages; and it is to time that we owe thofe deep and wide valleys which receive and contine our rivers in channels, which are now confolidated, and with flopes which have been gradually moderated, fo that they no longer either ravage our habitations or confound our boundaries. Art may imitate nature, and Nour, by direfting her operations (which the ftill carries on ace be ini 's cording to her own impreferiptible laws) according of in ma \({ }^{2}\), our views, we can haften her progrefs, and accomplifh itrean our purpofe, during the fhort period of human life. J3ut we can do this cnly by ftudying the unaterable laws of mechanifm. Thefe are prefented to us by fpontaneous nature. Frequently we remain ignorant of their foundation : but it is not neceffary for the profperity of the fubject that he have the talents of the fenator; he can profit by the fatute without underftand. ing its gronnds. It is fo in the prefent inflance. We luave not as yet been able to infer the law of retardation obferved in the filaments of a running itream from any found mechanical principle. The piublem, however, does not appear beyond our powers, if we affume, with Sir Ifaac Newton, that the velocity of any particular filament is the arithmetical mean between thofe of the filaments immediately adjoining. We may be aftured, that the filament in the axis of an inclined cylindrical tube, of which the current is in train, moves the fafteft, and that all thofe in the fame circumference round it are moving with one velocity, and that the floweft are thofe which glide along the pipe. We may affirm the fame thing of the motions in a femi-cylindrical inclined clannel conveying an open fream. But even in thefe we have not yet demunftrated the ratio between the extreme velocities, nor in the different circles. Tlus muft be decided experimentally.

And here we are under great obligations to Mr de Buat. He has compared the velocity in the axis of a prodigious number and variety of flreams, differing in fize, form, flope, and velocity, and has computed in them all the mean velocity, by meafuring the quantities of water difcharged in a given time. His method of meafuring the bottom velocity was fimple and juth. He threw in a goofeberry; as nearly as poffible, of the fame fpecific gravity with the water. It was carried along the bottom almoft without touching it. See ResistANCF of F/uids, \(\mathrm{n}^{*} 67\).

He difcovered the following laws: 1 . In fmall velo-Law: cities the velocity in the axis is to that at the bottom the vo in a ratio of confiderable inequality. 2. This ratio di- feren minifhes as the velocity increafes, and in very great ve- tiuns locities approaches to the ratio of equality. 3. What frea was noft remarkable was, that neither the magnitude of the channel, nor its nope, had any influence in changing this proportion, while the mean velocity remained the fame. Nay, though the ftream ran on a channel covered with pebbles or coarfe fand, no difference worth minding was to be obferved from the velocity over. a polifhed channel. 4. And if the velocity in the axis is conftant, the velocity at the bottom is alfo conftant, and is not affected by the depth of water or magnitude of the ftream. In fome experiments the depth was thrice the width, and in others the width was thrice the depth. This changed the proportion of the margitude of the
fection to thic magnitude of the rubbing part, but made no change on the ratio of the velocities. This is a thing which no theory could point out.

A nother moft important fact was alfo the refult of his obfervation, viz. that the mean velocity in any pipe or ofen fream is the aritbmetical mean between the velocily in the axis and the velocity at the files of a pipe or botton of an open fiream. We have already oblerved, that the ratio of the velocity in the axis to the velocity at the bottom diminifhed as the mean velocity increafed. This variation he was cnabled to exprefs in a very fimple manner, fo as to be eafily remcmbered, and to enable us to tell any one of them by obferving another.

If we take unity from the fquare root of the furer. ficial velocity, expreffed in inches, the fyuore of the remainder is the velocity at the botiom; and the mean velacity is the balf fum of thefe truo. Thus, if the velocity in the middle of the ftream be 25 inches per fecond, its fquare root is five; from which if we take unity, there remains four. The fquare of this, or 16 , is the velocity at the bottom, and \(\frac{25+16}{2}\), or \(20^{\frac{2}{2}}\), is the mean relocity.

This is a very curious and molt ufeful piece of information. The velocity in the middle of the flream is the eafieit meafured of all, by any light fmall body floating down it; and the mean velocity is the one which regulates the train, the difcharge, the effect on machines, and all the moft important confequences.
We may exprefs this by a formula of moft eafy recollection. Let V be the mean velocity, \(z\) the velocity in the axis, and \(u\) the velocity at the bottom; we bave \(u=\overline{\sqrt{v}}-\overline{1}\), and \(V=\frac{v+u}{2}\).

Alfo \(v=\left(\sqrt{\bar{V}-\frac{1}{4}}+\frac{2}{3}\right)^{2}\), and \(v=(\sqrt{u}+1)\).
\(\mathrm{V}=\left(\sqrt{v}-\frac{1}{2}\right)^{2}+\frac{1}{2}\), and \(\mathrm{V}=\left(\sqrt{\bar{u}}+\frac{1}{2}\right)^{2}+\frac{2}{2}\).
\(u=(\sqrt{v}-1)^{2}\) and \(u=\left(\overline{\sqrt{V}}-\frac{r}{x}-\frac{r}{2}\right)^{2}\).
Allo \(v-u=2 \sqrt{ } \overline{\mathrm{~V}-\frac{2}{4}}\) and \(v-\mathrm{V},=\overrightarrow{\mathrm{V}}-u,=\) \(\sqrt{\mathrm{V}-\frac{1}{4}}:\) that is, the difference between thefc velocities increafes in the ratio of the fquare roosts of the mean velocities diminifhed by a fmall confant quantity.

This may perhaps give the mathematicians fume help in afcertaining the law of degradation from the axis to the fides. Thus, in a cylindrical pipe, we may conceive the current as confifting of an intinite number of cylindrical thells fliding within each other like the draw tubes of a fpy-glafs. Each of thcfe is in equilibrio, or as much accelerated by the one within it as it is retarded by the one without ; therefore as the momentum of each diminifhes in the proportion of its diameter (the thicknefs being fuppofed the fame in all), the velocity of feparation muit increafe by a certain law from the fides to the axis. The magnitude of the fmall conftant quantity here fpoken of feems to fix this law.

The place of the mean velocity could not be difco- place of vered with any precifion. In moderate velocities it the nean was not more than one-fourth or one-fiftly of the depth velocity difant from the bottom. In very great velocities it not difcawas fenfibly higher, but never in the middle of the vered. depth.

The knowledge of thefe three velocities is of great importance. The fuperficial velocity is eafly obferved; hence the mean velocity is eafily computed 'rhis multiplied by the fection gives the expence; and if we alfo meafure the expanded border, and then obtain the mean depth (or \(\sqrt{\bar{d}}\) ), we can, by the formula of uniform motion, deduce the fope; or, knowing, the flope, we can deduce any of the other circumftances.

The following table of thefe three velocities will fave the trouble of calculation in one of the moft frequenti: queftions of hydraulics.

The knowledre of the velocity at the bottom is of the greatef ufe for enabling us to judge of the action of the flream on its bed; and we flall now make fome obfervations on this particular.

Every kind of foil has a certain velocity confiftent with the ftability of the chanoel. A greater velocity would emable the waters to tear it up, and a fmaller ve- locity would permit the depofition of more moveable matcials from above. It is not cnough, then, for the ftability of a river, that the aceelerating forecs are fo adjuifed to the fize and figure of its ehannel that the current may be in train: it muft alfo be in equilibrio with the tenaeity of the ehamel.

We karn from obfervation, that a velocity of three inches per fecond at the bottom will jull begin to work upoon fine clay fit for pottery, and however firm and compact it may be, it will tear it up. Yet no beds are more ftable than clay when the veloeities do not exceed this: for the water foon takes away the impalpable particles of the fuperficial elay, leaving the partieles of fand ilieking by their lower half in the relt of the elay, which they now protect, making a very permanent but2om, if the Aream does not bring down gravel or eoarfe fand, which will rub off this very thin cruft, and allow
another layer to be worn off; a velocity of tix inches will lift fine fand ; eight inches will lift fand as eoarfe as linfeed; 12 inelies will fweep along fine gravel ; 2.4 inches will roll along rounded pebbles an inch diameter; and it requires three feet per fecond at the bottom to fweep along fhivery angular flones of the fize of an egg.
The manner in which unwearied nature carries on fome of thefe operations is curious, and deferves to be red on. noticed a little. All mult recollect the narrow ridges or wrinkles which are left on the fand by a temporary frefh or ftrean. They are oblierved to lie acrofs the Atream, and each ridge confits of a fleep face AD, BF (fig. H. .) whieh louks down the flream, and a gentler llope DiB, FC, which comects this with the next ridge. As the ttream comes over the fift it:ep AD , it is directed almoft perpendicularly againt the point E immediately below D , and thus it gets hold of a parciele of coarfe fand, whieh it could not have detaehed from the rett had it been moving parallel to the tu face of it, It eatily rolls it up the gentle flope EB; arrived there, the partiele tumbles over the ridge, and lies clofe at the bottom of it at F, where it is protected by the little eddy, which is formed in the very angle ; other par-
ticles lying about \(E\) are treated in the fame way, and, tumhling over the ridge B , cover the firlt partick, and now protect it effectually from any further diturbance. The fame operation is going on at the bottom of each ridge. The brow or fleep of the ridge gradually advances down the fream, and the whole fet change their places, as reprefented by the dotted line \(a d b f\); and after a certain time the particle which was depo. fited at \(F\) is found in an moprotected fituation, as it was in \(E\), and it now makcs another ftep down the ftream.
The Abbe Boflut found, that when the velocity of the flream was jut fufficient for lifting the fand (and a fmall excefs hindered this operation altogether) a ridge advanced about 20 feet in a day.

Since the current carries of the mol moveable matters of the channel, it leaves the bottom covered with the remaining coarfer fand, gravel, pebbles, and larger ftones. To thefe are added many whieh come down the ftream while it is more rapid, and alfo many which roll in from the fides as the banks wear away. All thefe form a bottom much more folid and immoveable than a bottom of the medium foil would have been. But this does not always maintain the channel in a permanent form ; but frequently oceafions great changes, by obliging the current, in the event of any fudden frefh or fwell, to enlarge its bed, and even to change it altogether, by working to the right and to the left, fince it cannot work downwards. It is generally from fuch accumulation of gravel and pebbles in the bottom of the bed that rivers change their channels.

It remains to afcertain, in ablolute meafures, the force which a current really exerts in attempting to drag along with it the materials of its channel ; and which quill produce this effect unlefs refifted by the inertia of thefe materials. It is therefore of practical importanee to know this foree.

Nor is it abtrufe or diffcult. For when a eurrent is in train, the aceelerating foree is in equilibrio with the refiftance, and is therefore its immediate meafure. Now this aecelerating force is precifely equal to the weight of the body of water in motion multiplied by the fraction which expreffes the flope. The mean depth being equal to the quotient of the fection divided by the border, the fection is equal to the product of the mean depth multiplied by the border. Therefore, calling the border \(b\), and the mean depth \(d\), we have the fection \(=d b\). The body of water in motion is therefore \(d b s\) (becaufe \(s\) was the flant length of a part whofe difference of elevation is 1 ), and the accelerating foree is \(d b s \times \frac{1}{s}\), or \(d b\). But if we would only conlider this refiftance as correfponding to an unit of the length of the channel, we mutt divide the quantity \(d b\) by \(s\), and the refiffance is then \(\frac{d b}{s}\). And if we would confider the refiftance only for an unit of the border, we muft divide this exprefion by \(b\); and thus this refiftance (taking an inch for the unit) will be exprefied for one fquare inch of the bed by the weight of a bulk of water which has a fquare inch for its bafe, and \(\frac{d}{s}\) for its height. And lafly, if E be taken for any given fuperficial extent of the channel or bed, and \(F\) the Foz. XVI. Part L.
obfruction which we confider as a fort of friction, we Thenr, \(\underbrace{\text { The }}\) hall have \(\mathrm{F}=\frac{\mathrm{E} d}{\mathrm{~s}}\).

Thus, let it be required to determine in pounds the refiftanee or friction on a fquare yard of a channel whofe current is in train, whieh is 10 feet wide, four feet deep, and lias a flope of orre foot in a mile. Here E is nine feet. Ten feet widh and four feet depth give a fection of 40 fett. The border is 18 feet. Therefore \(d=\frac{4^{\circ}}{18}=2,141 \mathrm{I}\), and \(s\) is 5280 . Therefore the friction is the weight of a eolumn of water whofe bafe is nine feet, and height \(\frac{2,1111}{5280}\), or nearly \(3 \frac{5}{50}\) ounces avoirdupois.

\section*{§ 3. Settlement of the Beds of Rivers.}

He who looks with a carelefs eye at a map of the \(\frac{83}{} \frac{1}{3}\) world, is apt to coulider the rivers which ramble over and wifdon its furface as a chance medley difpofition of the drainers 'tiflayed in which carry off the waters. But it will afford a moft the co duct agreeable object to a confiderate and eontemplative mind, to take it up in this very fimple light; and havins confidered the many ways in which the drenched furface might have been cleared of the fuperfluous waters, to attend particularly to the very way which nature has followed. In following the troubled waters of a mountain torrent, or the pure flreams whieh triekle from their bafes, till he fees them fwallowed up in the ocean, and in attending to the many varieties in their motions, he will be delighted with obferving how the fimple laws of mechanifin are made fo fruitful in good confequenees, both by modifying the motions of the waters themfelves, and alfo by inducing new forms on the furface of the earth, fitted for re-acting ou the waters, and produeing thefe very modifieations of their motions which render them fo beneficial. The permanent beds of rivers are by no means fortuitons gutters haftily foonped out by dafling torrents; but both they and the valleys through which they flow are the patient but unceaing labours of nature, prompted by goodnefs and directed by wifdom.

Whether we trace a river from the torrents which collect the fuperfluous waters of heaven, or from the fprings which difeharge what would otherwife be condemned to perpetual inactivity, each feeder is but a little sill which could not ramble far from its feanty fource among growing plants and abforbent earth, without being fucked up and eraporated, did it not meet with other rills in its courfe. When united they form a body of water fill inconfiderable, but much more able, by its bulk, to overeone the litile obflacle to its motion; and the rivalet then moves with greater fpeed, as we have now leaned. At the fame time, the furface expofed to evaporation and abforption is diminithed by the union of the rills. Four egtal vills have only the furface of two when united. Thus the portion which efcapes arrefment, and travels downward, is continually increafing. This is a happy adjuftment to the other operations of nature. Were it otherwife, the lower and more valuable countries would be loaded with the paffing watess in addition to their own furplus rains, and the inmediate neighbourhood of the fea would be alinoft covered by the drains of the interior 1) Kefs roon ae they adrates, ant by this wife employ: ient of the mod fmple weath, not only are the fuperflusid unacrs strined off lion oue fertile felld, but the drains ifentibes hecome ar uieful part of the cosutry by their mawn tude. 'They become the labitation of a prebigious samber of fiher, which fare the Crentar's boant? : and they fionme the moans uf mutual commanicutiun of all the befiaga of chitivated fociety. The warue rabolings of the rivers fateer them over the face of the country, and brine them to every dune. It is not even an indifieent ciceuntance, that they gather firencth to chat out dcep beds for thenfelves. lyy this beans they cut up:n many fpings. Without this, the poulace of a heavy hower would make a fiwamp which womld not dry up in many dirys. And it mult he ubfers -1, that the fane heat which is neceltary for the vigorous growth of ufeful plants will proluce a very coptuls evaporation. This mut return in fowers much too copions for immediate veretation, and the overplus would be dellructive. Is it not pleafant to contemplate this adjuftment of the great operations of nature, fo dificent from each other, that if chance alone directed the detail, it was almof an infinie odds that the earth woull be urinhabitabie?

But let us follow the waters in their operations, and note the face of the conntris through which they How: atiending to the beath, the depth, and the fope of the vallcys, we fhall bee eonvinced that their prefent fituation is extremely different from what it was in ancient days; and that the valleys themfelses are the works of the rivery, or at hatt of waters which have defoended from the heights, loaded with all the lighter matters which they were able to bring away with them. The rivers flow now in beds which have a confiderable permanency ; but this has been the work of ages. This I as criven fability, both by filling up and fmoothing Bie valleys, and thus leffening the changing caufes, and fio by hardening the beds themfelves, which are now covered with aquatic plants, and lined with the ftones, gravel, and coarfer fand, out of which all the lingter s.atters have been wathed away.

The furface of the high grounds is undersoing a continual change; and the ground on which we now walk is by no means the fane which was trudden oy our remute anceftors. The thuwers from heaven carry down into the valleys, or fweep along by the torrentis, a part of the fuil which covers the heights and feeps. "'he torrents carry this fuil into the brouks, and thefe celiver purt of it into the great rivers, and there difcharge into the fea this fertilizing fat of the earth, where it is fwallowed up, and forever loft for the purpoles of vegetation. Thus the hillocks lofe of their l.sigh, the valleys are filled up, and the mountains are Lid bare, and how their maked precipices, which formerly were covered over with a feth and fkin, but now look like the Releton of this globe. The low countries, raifed and nourithed for fome time by the fubitance of the high lands, will go in their turn to be buried in the ocean; and then the earth, reduced to a cireary flat, will become an immenfe uninhabitable mais. This cataltrophe is far difant, becaufe this glube is in its \%outh, nut it is not the lefs certain ; and the united labours of the human race could not lon sprotract the term.

But, in tle mean time, we can trace a beneficent
purpule, and a mice adjutnent of feemingiv remnte circumblances. The grounds near the fources of all our rivers ane indeed gradually tripped of their mu? fertile ingredients. B.thad they retained them for ases, the fentient inhabitants of the earth, or at leat the mobler animals, with man at their head, would not have derived much advaniage from it. The general laws of nature produce changes in our atmofphere which mult ever render thefe great elevations unfruitfui. 'That gerial warmeh, which is equally neceflary for the ufeful plant as for the animal which lives on it, is contined wo the luwer grounds. The earth, which on the top of monut Hzemus could only bring forth mof and ditany, when brourht into the gardens of Spalatro, prouluced put-heios foluxuriant, that Diockenan told his colleagite Maximian that he had more pleafure in their cultivation than the Roman empire could confer. Thus nature not only provides us manure, but conveys it to our fields. She cren keeps it fafe in fore for us titl it fhalt be wanted. 'The trasts of country which are but newly imabited by man, fuch as great part of America, and the newly difcovered regions of Terra Auttrlit, a fe flill ahnoft occupied by marfies and lakes, or covered vith impenetrable forefts; and they would remain long enough in this Itate, if population, continually incerenfing, did not increafe induftry, and multiply the hands of cultivaturs alung with their neceffities. The Author of Nature was alone able to form the huge tidges of the mountains, to model the hilloeks and the valleys, to mark out the courfes of the great rivers, and give the firl trace to every rivulet ; but has left to man the tafk of draining his own habitation and the fields which are to fupport him, becanfe this is a tafk not beyond his porvers. It was therefore of immenfe advantage to him that thole parts of the globe into which he has not yet penetrated fhould remain covered with lakes, marthes, and forefts, which keep in fore the juice of the carth, which the influence of the air and the rivifying warmth of the fun would have expended long ere now in ufelefs verretation, and which the rains of \(h\) :aven would have fwept into the fea, had they not been thus protected by their fituation or their cover. It is therefore the bulinefs of man to open up thefe nines of hoarded weakh, and to thank the Author of all good, whon has thus hufbinded thein for his ufe, and left them as a rightful heritage for thofe of after days.

The earth had not in the remute ages, as in our day, thofe great canals, thole capacious voiders, always ready to drain off the rain waters (of which only part is abforbed by the thirfty ground), and the pure waters of the [priags from the foot of the hills. The rivers did not then exif, or were only torrents, whofe waters, confined by the gullies and glens, are fearching for a place to efcape. Hence arife thole numerous lakes in the interior of great continents, of which there are fill remarkable relicks in North America, which in procefs of lime will difapiear, and become champaign countries. The moft remote from the fea, unable to contain its waters, finds an iffue through fonce gorge of the hills, and pours over its fupcrfuous waters into a lower bafon, whieh, in its turn, difcharges its contents into another, and the laft of the chain delivers its waters by a river into the ocean. The communication was originally begun by a fimple overfowing at the luweft part of the margin. This made a torrent, which
 firg its velocity, as we have feen, would extend this decpeang backwned to the lake, and draw off more of its raters the work would go on rapidy at firt, white earth and frnall ftomes onls selited the labours of rature: but thele being watiod away, and the channel holluwed out to the firm rock on all fides, the operation mult go on very fowly, till the inmenfe cafcade thall mikdermine what it eannot break off, and then a new ditcharse will commence, aud a quantity of flat ground will enterge all round the lake. The torment, in the me:n time, makes its way down the country, and digs a canal, which may be called the firt 作etch oi a river, which will deepen and widen its bed continually. The waters of feveral hasous united, and running together in a great body, will (according to the principles we have claulihed) hase a mach grcater vilocity, with the fame lope, than thofe of the lakes in the interior parts of the continent ; and the fum of them all united in the tafon ucst thee foa, after having broken through its natural meurd, will make a prodigious torrent, which will dis, for itfelf a bed fo much the decper as it has more fope ard a greater hody of waters.

The formation of the firt valleys, by cutting onen many frings which were fumerly concealed under ground, will add to the mals of rinaing waters, and centricute to drain cff the waters of thefe bafors. In courle of tine many of them will difappear, and flat salloys anoug the mountains and hills are the traces of their foumer esiftence.

When rature thus traces ont tlie coufes of future rivers, it is to be expeced that thofe freans will molt retpen their channels which in their approach to the fea reccive irto their bed the greatelt quantities of rain and fprins waters, and that towards the middle of the continert they will daspen their chamels lefs. In there fatt fituations the natural flope of the faeds caufes the rain-water, rills, and the little mivulets from the fprings, to feek their way to the rivers. The ground can link only by the flattening of the hills and high ;rounds; and this mun procceo with extreme flownefs, tecaufe it is only the gentle, though inecflant, work of the rains and fprings. But the rivers, increating in bulk and tlrength, and of neceffity Howing over every thing, form to themfelves capacious beds in a more yielding foil, and dig them even to the level of like ocean.

The beds of rivers by no means form themfelves in one inclined plane. If we thould fupnofe a canal \(A B\) (fig. 12.) perfectly fraight and horizontal at B , where it joins with the fea, this canal wonld really be an inclited channel of greate: and greater lope as it is farther from D. This is evident ; becaufe gravity is directed towards the centre of the earth, and the angle CAB contained between the channel ard the plunibline at \(A\) is fmaller than the limilar angle CDE; and confequently the inelination to the horizon is greater in A than in D. Such a canal thercfore wonld make the lid of a river: and fome have thought that this was the real form of nature's work ; but the fuppoftion is a whim, and it is falle. Ko river has a !ope at all approaching to ilis. It would be \& inehes declivity in the mule nes.t the occan, 24 inches in the ficond mile, 4o inches in the thirel, and fo on in the duplicate ratio for the whole elevation) of the diftances from the fra. Such a niver would quiclly tar up its bedin the nocian-
tains (were there any rrounds high enourg to reaei:e
Ti.eory. it), and, except its hitt cafeade, woudd foun acquire a more gerile fope. But the fact is, acel it is the refolt of the inpoferiptible laws of nature, that the cuntintied track of a riser is a feectfion of incined chanachs, whofe hope ciminithes by fteps as the river apprachas to the fa. It is not enough to fay that this iffal:3 from the matural flope wi the cointrics throngh whisk it Aows, which we obferse to increafe in dedivity as of go to the interior parts of the continert. lirere it utherwife, the equitibrium to which nature aims in all her operations would fill produce the gradual dimination of the flope of rivers. Withont it they could not be in a pernencut tran.

That we may more eafly form a motion of the man- How the ner in which the permancat counfe of a tiver is eita-perma ens blifhed, let us fuppofe a firtam or mivulet sa (fig. 13.) courie ci a far up the country, male its way throtgh a foll p-re eivertifacd fectly uniferm to the fea, takin, the coute sabcd of, and receiving the fermanent adouiens of the Athans \(g_{a}\). \(b b, i c, l d, l e\), and that its welocity and flope in atl its parts are fo fuited to the tenacity of the loil and magnitude of its fection, that neither do its water3 during the anrual frefles tar up its banks or deepen it hed, nor co they bring down from the high lauds materials which they depofit in the channel in tines of farlicr velccity. Such a river may be fad to be in a formanint flate, to be in conforertion, or to have falaify. Let us call this fate of a river its Regimes, cermetins by the werd the proper adjuftment of the wel city of the flream to the tenacity of the chanod. Ihs ituo city of its regimen muft be the fame thruughout, becaufe it is this which regulates its action on the bettime. which is the fame from its head to the fea. That it: bed may have flability, the mean velucity of the curren: unft be conllant, notwithfanding the hisquabity of ciicharge through its different fections by the browso which it receives in its courfe, and notwilhflatding the augmentation of its fection as it approaches the fed.

On the'other hand, it behoved this exaet reginien to commence at the mouth of the river, by the working of the whule bedy of the siser, in conceit nith the waters of the ocean, which always keep within the fame lunits, and make tle dimate level ineniable. This working will begin to dig the bed, givirox it as little lereadth as puffible: for th's workilg conlifs chicAly in the cfforts of falls and rapid ilreams, which arife of thenfflues in every channd which has too much hope. The bottom deepens, and the fides remain very feep, till they are undernined and crumble down; and being then diluted in the water', they are carried down the ftream, and depelited where the ocean ehecks its fpeed. The banks crumble down anew, the valley or hollow forms; but the fection, always confined to its botton, cannot acquire a great breadth, and it retains a good deal of the form of the trapezium formerly mentioned. In this manner does the regimen begin to be citablinhed from \(f\) to \(e\).

With refpect to the next part \(d e\), the difcharge or produce is ciminifhed by the want of the brook \(/ \mathrm{e}\). It mult take a fimilar form, but its area will be dimirufhed, in order that its velucity may be the fame; and its mean deptla \(d\) being lefs ilan in llee portiun of below, the Acpe muf be greater. Without thafe concitions we cou'd sut have the uniform relucity, shich the affunced

An 2
pernanency

Therr. permanency in an uniform foil neeeffarily fuppofes.

Reafoning after the fame manner for all the portions \(c d, b c, a b, s a\), wee fee that the regimen will be fucceffively efablithed in them, and that the flope neceffary fur this rurpofe will be greater as we approach the river heat. The vertical fection or profle of the courfe of the river sisbocle \(f\) will therefore refemble the line SAECDEF which is factched below, having its different parts varioufly inclined to the horizontal line HF.

Such is the procefs of nature to be obferved in every river ca the furface of the globe. It long appeared a kind of gurale to the theorits; and it was this ohfervecion of the increafing. or at leaft this continued velocity with fnaller hope, as the rivers increafed by the aldition of their tributary Atreams, which caufed Gugliclmini to have recourfe to his new principle, the energy of deep wate1s. We have now feen in what this encrgy confilts. It is only a greater quantity of motion remaining in the middle of a great flream of water after a quantity lias been retarded by the fides and bottom; and we fee clearly, that fince the addition of a new and perlhaps an equal itream does not occupy a bed of double firface, the proportion of the retardations to the remaining mution muft continually diminifh as a river increafes by the addition of new itreams. If thercfore the flope were not dininifhed, the regimen would be deftroyed, and the river would dig up its channel. We have a full confirmation of this in the many works which have becn executed on the Po, which runs with rapidity through a rich and yielding foil. About the year 1600 , the waters of the Panaro, a very confrderable river, were added to the Po Crande; and although it brings along with it in its frefhes a vaft quan. tity of fand and mud, it has greatly deepened the whole Tronco di Venezia from the confluence to the fea. This point was clearly afcertained by Manfredi about the 1720 , when the inhabitants of the valleys adjacent were alarmed by the project of bringing in the waters of the Rheno, which then ran through the Ferracefe. 'Their fears were overcome, and the Po Grande continues to deepen its channel every day with a prodigious advantage to the, navigations; and there are feveral extenfive marhes which now drain of by it, after having been for ages under water: and it is to be particularly remarked, that the Rheno is the foulef river in its frefhes of any in that country. We infert this remark, becaufe it may be of great practical utility, as pointing out a method of preferving and even improving the depth of rivers or drains in flat countries, which is not obvious, and rather appears improper: but it is ftrictly conformable to a true theorj, and to the operations of mature, which never fails to adjuft every thing fo as to hring about an equilibrium. Whatever the declivity of the country may have been originally, the regimen begins to be fettled at the mouths of the rivers, and the 3lopes are diminihed in fucceffion as we recede from the toaft. The original flopes inland may have been much greater; but they will (when bufy nature has completed her work) be kft fomewhat, and only fo much greater, that the velocity may be the fame notwithftanding the diminution of the fection and mean depth.

Freffes will dillurb this methodical progrefs relative only to the fucceffive permanent additions; but their titets clititly accelerate the deepening of the bed, and
the dinimution of the flope, by augmenting the velocity during their continuance. But when the regimen. of the permanent additions is once cflablifhed, the frefhes tend chiefly to widen the bed, without greatly deepen. ing it : for the aquatic plants, which have been growing and thriving during the peaceable flate of the river, are now laid along, but not fwept away, by the frefles and protect the bottom from their attacks; and the fones and gravel, which muft have been left bare in a courfe of years, working on the foil, will alfo collect in the hottom, and greatly augment its power of revitance; and even if the floods thould have decpened the bottom fone fmall matter, fonic mud will be depofited as the velocity of the frefhes diminifies, and this will remain till the next flood.

We have fuppofed the foil uniform through the whole courfe: This feldom happens; therefore the circumftances which infure permanency, or the regimen of a river, may be very different in its different parts and in different rivers. We may fay in general, that the farther that the regimen has advanced up the ftream in any river, the more flowly will it convey its waters to the fea.

There are fome general circumftances in the motion of rivers which it will be proper to take notice of jnit now, that they may not interrupt our more minute examiuation of their mechanifm, and their explanations will then occur of themfelves as corollaries of the propofitions which we fhall endeavour to demonflrate.

In a valley of fmall width the river always occupies the loweft part of it ; and it is obferved, that this is feldon, in the middle of the valley, and is neareft to that fide on which the flope from the higher grounds is fteepeft, and this without regard to the line of its courfe. The river generally adheres to the fteepeft hills, whether: they advance into the plain or retire from it. This general feature may be obferved over the whole globe. It is divided into copartments by great ranges of mountains; and it may be obferved, that the great rivers hold their courfe not very far from them, and that their chief feeders come from the other fide. In every copartment there is a fwell of the low country at a diftance from the bounding rilge of mountains; and on the fummit of this fwell the principal feeders of the grcat river have their fources.

The name valley is given with lefs propriety to thefe immenfe regions, and is more applicable to tracks of champaign land which the eye can take in at one view. Even here we may obferve a refemblance. It is not always in the very loweft part of this valley that the river has its hed; although the waters of the river flow in a channel below its immediate banks, thefe banks are frequently higher than the grounds at the foot of the hills. 'This is very diftincly feen in Lower Egypt, by means of the canais which are carried backward fron the Nile for accelerating its fertilizing inundations. When the califhes are opened to admit the waters, it is always obferved that the diftricts moft remote are the firt covered, and it is feveral days before the immediately adjoining fields partake of the bleffing. This is a confequerice of that gexerad operation of nature by which the valleys are formed. The river in its floods is loaded with mud, which it retains as long as it rolls rapidly along its limited bed, tumbling its waters over and over, and taking up in every foot as much as
it depofits: but as foon as it overflows its banks, the very enlargement of its fection diminifhes the velocity of the water; and it may be obferved ftill running in the track of its bed with great velocity, while the waters on each fide are ftagnant at a very fimall dittance: Therefore the water, on getting over the banks, mult depofit the heavieft, the frment, and even the greatelt part of its burden, and mult become gradualiy ciearcr to it approaches the hills. Thus a gentle fope is given as the valley in a direction which is the reverfe of what one would expect. It is, however, alinoft always the cafe in wide valleys, efpecially :f the great river comes through a foft conntry. The banks of the brooks and diteletes are obferved to be deeper as they approach the river, and the merely fuperficial drains run backwards from it.

We have already ohferved, that the enlargement of the bed of a river, in its approach to the fea, is not in proportion to the inereafe of its waters. This would be the cafe cven if the relocity continued the fame: and therefore, fince the velocity even increafes, in confequence of the greater energy of a large body of water, which we now underitand diftinety, a ftiil fmaller bed is fufficient for convering all the water to the fea.
This general law is broken, however, in the imme-
time. This river is fo belet with flats and hitting fands at it mouth, that the mot experienced pilots are puzaled; and it has protruded its channel above 50 miles in the fhort period that we have known it. The difcharge of the Danube is very fimilar: fo is that of the Nile ; for it is difcharged into a fill comer of the Mediterranean. It may now be faid to have acquired confiderable permanency; but much of this is owing to human indutry, which Atrins it as much as polfible of its fubfickable nuatter. The Ganges too is in a fitua. tion pretty fimilar, and exhibits fimilar phenomena. The Maragnon might be noticed as an exception ; but it is no: an exception. It has fowed very far in a leve! bed, and its waters come pretty clear to Para; but befides, there is a ftrong tranfverfe tide, or rather ,curreat, at its mouth, fetting to the fouth-eaft both during flood and ebb. The mouth of the Po is perlaps the molt remarkable of any on the furface of this globe, and exhibits appearances extremely fingular. Its difcharge is into a fequettered corner of the Adriatic. Though therc be a more remarkable tide in this guif than in any part of the Mediterranean, it is itill but trifling, and it either fets directly in upon the mouth of the river, or retires itraight away from it. The river has many mouths, and they fhift prodigioully: There has been a general increafe of the land very remarkable. The mathes where Venice now ftands were, in the Augufan age, everywhere penetrable by the fifhing boats, and in the 5 th century could only bear a few miferable huts; now they are covered with crowds of fately buildings. Ravenna, fituated on the fouthernmoft mouth of the Po, was, in the Auguitan age, at the extremity of a fwamp, and the road to it was along the top of an artificial mound, made by Auguitus at immenfe expence. It was, however, a fine city, containing extenive docks, arfenals, and other maffy buildings, being the great military port of the empire, where Auguttos laid up his great fhips of war. In the Gothic times it became almoft the capital of the Wettern empire, and was the feat of government and of luxury. It muft, therefore, be fuppofed to have every accommodation of opulence, and we cannot dubut of its having paved ftreets, wharfs, \&c.; fo that its wealthy mhabitants were at lealt walking dryfooted from houfe to houfe. But now it is an Italian mile from the fea, and furrounded with vineyards and cultivated fields, and is acceffible in every direction. All this muit have been formed by depolitions from the Po, flowing through Lombardy loaded with the fpoils of the Alps, which were here arretted by the reeds and bulruthes of the marfh. Thele things are ia common courfe; but when wells are dug, we come to the pavements of the ancient eity, and thefe pavemenss are all on one exact level, and they are cight feet below the furface of the fea at low water. This cannct be aferibed to the fubfiding of the ancient city. This would be irregular, and greateit among the heavy buildings. The tomb of Theoduric remains, and the pavement round it is on a lesel with all the others. The lower ftory is a!. ways full of water; fo is the lower ftory of the cathedral to the depth of three feet. The ornaments of bo:h thefe buildings leave no room to doubt that they were formerly dry; and fuch a building as the cathedral could not link without crumbling into pieces.

It is by no mans saily to account for all this. The depobtrons

Rivers
see colluex a heort the tlream, and the caule of it.
depofitions of the Po and other rivers mufl wife the gromid; and yet the rivers mult fill how over all. We mult conclude that the furface of the Adriatic is by no means level, and that it thepes like a river from the Lagoom of Venice to the eathward. lu all probability it even fopes conliderably sutwards from the fhore. This will not hiuder the alternations of ebb and Row tide, as will he flown in its proper place. The whoke thores of this gulph exlibit moll uncommon anpearances.
The lath general ubfervations which we fhall make in this place is, that the furface of a river is not Ant, confidered athwart the flream, but convex: this is owing to its motion. Suppofe a canal of tharnant water; its durface would be a perfect level. But fuppofe it ;oflible liy any means to give the middle watus a motion in the direction of its length, they mult drate atony with them the waters immedinely comatigunus. Thefe will move lefs livitily, and will in like mamer drag the waters willont them; and thens the water at the fides heing abtracted, the depth mutt be lefs, and the genetal furface mult be convex achuls. The fact in a running ftream is fimilar to this; the fide waters are withheld by the fides, and every filament is moving more flowly than the one next it tewards the middle of the river, Eut faftor than the adjoining filament on the land fide. "This alone muft produce a convexity of furface. But befides this, it is demonftrable that the preffure of a monning Atrean is diminifhed by its motion, and the ciminution is proporional to the height which would produce the velocity with which it is gliding patt the adjoining filament. This convexity mult in all cafes be very finall. Few rivers have the velocity nearly equal to cight feet per fecond, and this requires a height of one foot only: An author quoted liy Mr Buffin fays, that he has obfened on the siver Areiren an clevation of these feet in the middle during floods; but we fufpect -fome crror in the obfervation.

\section*{§4. Of the Windings of Rivers.}

95
Winang sivers, how turn.cd

Rivers are feldom ftraight in their courfe. Formed by the hand of nature, they are accommodated to every clange of circumitance. They wind around what they cannot get over, and work their way to cither ride according as the refiflance of the oppofite bank makes a Itraighticourfe more difficult; and this feemingly fortuitous rambling diftributes then more unitormly over the furface of a country, and makes them every where more at hand, to receive the mumberlefs rills and rivulets which collect the waters of our fprings and the fuperfluitics of our thowers, and to comfurt our habitations with the many advantages which cultivation and fociety ean derive from their prefence. In their feeble beginnings the fmalleft inequality of nope or confiflency is erough to turn them afide and make them ramble through every tield, gising drink to our herds and fertility to our foil. The more we follows nature into the minutix of her operations, the more muft we admire the ineslantible fertility of her refources, and the finnplicity of the micans by which the produces the mait importart and beneficial eflicts. By thus twiffing the courfe of cur rivers into 10,000 frapes, fhe kecps them long amidft our fields, and thes compenfates for the deslivity of the furface, which otherwife wousd tunible them with great rapility into the ocean, loaded with ske befl aid richeft of our foil. Witheut this, the
frowers of heaven would have little influence in fupply. ing the walle of ineeflant evaporation. But as things are, the rains are kept fowly trickling, along the forping fides of our hills and Atecps, wimbing round every elod, nay every plaat, which lengthens thein courfe, diminithes their fope, checks their fpeed, and thus prevents them from quickly burthing off from every part of the furface the lighteft and bett of the foil. The flatedt of our holm lands would be too feep, and the rivers would hoot along though our finett meadows, hurrying esery thing away with them, and would be unfit for the purpofes of inland conveyance, if the inequalities of foil did not make them change this headloug courfe for the more beautiful meanders which we onferve in the courfe of the fmall rivers winding th:ongh our meadows. Thofe rivers are in general the fraighteft in their courfe which are the molt rapid, and which roll along the greatelt bodies of water; fuch are the Rhone, the Po, the Danube. The fmaller rivers continue more devious in their proyrefs, till they approach the fea, and have gathered flrensth from all their tributary ftrams.

Every thing ains at an equilibrium, and this directs what \({ }^{96}\) even the randings of rivers. It is of importance to ure has 1 underiland the relation between the force of a river and the refitance which the foil nppofes to thofe deviations from a rectilineal courfe; for it may frequently happen that the general proccdure of nature may be incontitent with our local purpofes. Man was fet down on this globe, and the tafk of cultivating it was given him Ly nature, and his chicf enjoyment feems to be to, Itruggle with the elements. He malt not find things to his minil, but he mult mould them to his own fancy: Yet even this feeming anomaly is one of nature's mont beneficent laws; and his exertions mult till be made in conformity with the general train of the operations of mechanical nature: and when we lave any work to andertake relative to the courfe of rivers, we mut be carcful not to thwart their general rules, otherwife we thall be fomer or later puifiticd for their infraction. Thiugs will be brought back to their former flate, if our operations are inconfiltent with that equilibrium which is conltantly ained at, or fome new itate of things which is equivalent will be foon induced. If a well regulated river has been improperly deepen ed in fome place, to anfues fome particular purpole of our own, or if its breadth has been improperly aug. mented, we fhall'foon fee a depolition of nud or fand clioak up our fancied improvements; becaufe, as we have colarged the fection withour increating the fope or the fupply, the velocity mutt diminith, and floating matters mull be depofited.

It is truc, we frequently fee pernanent channels where the forms are extremely ilificent from that which the waters would dig for thenfelves in an uniform foil, and which approachers a good deal to the trapezium defcribed formerly. We fee a greater breadth frequently compenfate for a want of depti; ; but all fuch deviations are a fort of confleaint, or zather are indications of incquality of foil. Such irregular forms are the works of nature; and if they are permanent, the ecquilibrium is obtained. Commonly the bottom is barder than the fides, confifing of the coarfeti of the fand and of gravel; and therefore the nect fary fection can be cbtained only by increafing the width. We
eury. are aceutemed to attend chiefly to the appearances which procnolticate mifchief, and we interprtt the appearances of a permanent bed in the fame way, and frequently form very fulle judments. When we fee one bank low and flat, and the other high and absupt, we fuppofe that the waters are palfng along the fint in peace, and with a gentle itream, but that they are rapid on the other fide, and are tearing away the bank: but it is jult the contrary. The hed be ing permancut, things are in equilibrio, and each hank is of a form juit competeut to that equilibrium. If the foil on buth frdes be uniform, the ftream is molt rapid on that lide where the bank is low and flat, fur in no other form would it withltand the action of the fleam; and it has been worn away till its flatnefs compenfates for the greater force of the flream. The ftrearm on the other fide mult be nore gentle, otherwife the bank could not remain abrupt. In fhort, in a ftate of permanency, the velocity of the Itream and form of the bank are jult fuited to each other. It is quite otherwile befure the river las acquired its proper regimen.

A careful conftderation therefure of the rencral features of rivers which have fettled their regimen, is of ufe for informing us concerning their internal motions, and directing us to the molt effectual methods of regulating their courfe.

We have already faid that perpendicular buirss are inconfitent with fabilitg. A femicircular fection is the form which would produce the quickeft train of a river whole expence and ipe are given; but the banks at \(B\) and 1) (tis. 14.) would crimble iu, and lie at the botton, where theirlorizontal furface would fecure them from farther change. The bed will acquirc the form Gelo, of equal fection, but greater widh, and with brims lefs fhelving. The proportion of the velocities at \(A\) and \(c\) may be the fame with that of the velecities at \(A\) and \(C\); bnt the relocity at \(G\) and \(F\) will be lefs than it was fommerly at \(\mathrm{B}, \mathrm{C}\), or D ; and the selceity in any intermediate point \(E\), being fomewhat between thofe at \(F\) and \(c\), mult be lefs than it was in any inter. mediate point of the fumicircular bed. The velociiies will therefore drcreafe along the border from 6 towards \(G\) and \(F\), and the fteepnefs of the border will wurment at the fame time, till, in every point of the new border \(G \in F\), thefe two circumitances will be fo adjufted that the neceflary equilibrium is eftahlithed.

The fame thing mut happen in our trapezien. The flope of the brims may be exae, and will be reaaired; it will, however, be too great anywhere below, where the velocity is greater, and the fedes will be worn away till the banks are undermined and crumble down, and the river will maintain its fection by increafing its width. In Mort, no border made t!p of Araight lines is confifent with that gradation of velocity which will take place whenever we depart from a femicircular form. And we accordingly fee, that in all natural channels the fection has a carviliceal border, with the flope increafing gradually from tbe bottom to the brim.

Thefe oblervations will enable us to undertand how nature operates when the inequality of furface or of tenacity obliges the cument to chanye its direction, and the river forms an elbow.

Suppofing always that the difcharge continues the fame, and that the mean velocity is either preferved or
reitored, the following conditions are necefayy fur a "Theory. Fermanent reginell.
1. The depth of water muft be greater in the elhow concitions than anywhere elfe.
2. The main flream, afier laving feruck the concave fur a perbank, mult be reflected in an equal angle, and muft then monent re. be in the direction of the next reach of the river.
3. The angle of incidence mull be proportioned to the renacity of the foil.
4. There mutt be in tlive elbow an increafe of nope, or of head of water, caprable of overcoming the refiftance occafioned by the elbow.

The reafonablenefs, at leatt, of thefe conditions will appear from the follouing confiderations.
1. It is certain that force is expended in producing Reaforable this change of direction in a channel which by fippofi-nefe ut tion diminifhes the current. The dimiontion atifing thefec.nfrom any canfe which can be compared with friction di:ion=0 mult be greater when the thream is directed againt one of the banks. It may be very difficuit to ftate the proportion, and it would occupy too much of our time to attempt it; but it is fulficient that we be convinced that the retardation is greater in this cafe. We fee no caufe to increare the mean velocity in the elbow, an 3 we mult therefore conclude that it is diminifhed. Hut we are fuppofing that the difcharge continnes the fame; the fection mutt therefore augment, or the channel increafe its tranfverfe dimenfions. The only quefion is, In what manner it does this, and what change of form does it affect, and what form is comperent to the final equilibrium and the confequent permanency of the bee? Here there is much room for conjecture. Mt Buat reafons as follows. If we fuppore that the points B and \(C\) (fig. 15.) continue on a level, and that the prints II and I at the beginning of the neat reach are alfo on a level, it is an inevitable confequence that the fope along CMI mutt be greater than aloug IJEF, becaufe the deprefion of \(H\) lelow \(B\) is equal th that of I below C, and BEI is longer than CMI. Therefore the velocity along the convex bank CMI maff be greater than aloner BELI. There may cven be a ftagnation and an eddy in the contrary direction along the concaveLank. 'lherefore, if the form of the lection were the fame as up the ftream, the fides could not fland on the convex bank. When therefore the fection has attained a permanent form, ard the banks are again in cquilibrio with the action of the current, the convex bank. mult be nuch fatter than the concave. If the water is really fill on the concave bank, that bank will be abfolately perpendicular ; nay, may overhang.-Accordingly, this Itate of things is matter of daily cbfervation, and juftifies our reafoning, and entitles us to fay, that this is the nature of the intermal motion of the filaments whicl we cannot diftinctly obferve. 'The water moves mu't rapially along the convex bank, and the thread of the fream is neareft to this fide. Reafoning in this way, the fection, which we may fuppofe to have been originally of the form \(M b a \mathrm{E}\) (Gg. 16.) affumes the fape MB'AE.
2. Withont prefuming to know the mechanifm of the internal motions of fuids, we know that fuperficial waves are rellected precifely as if they were edaftic bodies, making the angles of incidence and reflection equal. In as far therefore at the fuperficial wave is concerned. in the opcration, Mr Buat's fecond poltion is justo.

The permanency of the next reach requires that its axis tha'l be in the direction of the line El' which makes the angle GEP \(=1\) EN. If the next reach has the direction EO, MR, the wave refiected in the line ES will work on the bank at \(S\), and will be reflected in the line \(5^{\prime} 7\) ', and work again on the oppofite bank at IT. We know that the effect of the fuperficial motion is great, and that it is the principal arent in deftroying the banks of canals. So far therefore Mr Buat is right. We eannot fay with any precilion or confidence how the actions of the under tidaments are modified; but we know no veafon for not extending to the under filaments what appears fo probable with refpect to the furface water.
3. The third pofition is no lefs evident. We do not know the mode of ation of the water on the bank: but our greneral notions on this fubject, confirmed by common experienee, tell us that the more obliquely a llream of water beats on aray bank, the lefs it tends to undermine it or wath it away. A tiff and cohenve foil therefore will fuffer no more from being alnof perpendicularly buffetted by a Aream than a friable fand would fuffer from water gliding along its face. Mr Buat thinks, from experience, that a clay bank is not ferlibly affected till the angle FEB is about 36 degrees.
4. Since there are caufes of retardation, and we ftill fuppofe that the difcharge is kept up, and that the mean velocity, which had been diminifhed by the enlargement of the fection, is again reftored, we munt grant that there is provided, in the mechanifm of thefe motions, an accelerating force adequate to this effect. There can be no accelerating force in all open ftream but the fuperficial tlope. In the prefent cafe it is undoubtedly fo : becaufe by the deepening of the bottom where there is an elbow in the Atream, we have of neceflity a counter flope. Now, all this head of water, which mult produce the augmentation of velocity in that part of the flream which ranges round the convex bank, will arife from the cheek which the water gets from the concave bank. This occafions a gorge or fwell up the ftream, enlarges a little the fection at BVC; and this, by the principle of uniform motion, will augnent all the velocities, deepen the channel, and put every thing again into its train as foon as the water gets into the next reach. The water at the bortom of this bafon has very little motion, but it defends the bottom by this rery circuinftance.

Such are the notions which Mr de Buat entertains of this part of the mechanifm of running waterb. We canot fay that they are very fatisfactory, and they are very oppofite to the opinious commonly entertained on the fubject. Moll perforis think that the motion is mont rapid and turbulent on the ficle of the concave bank, and that it is owing to this that the bank is worn away till it become perpendicular, and that the oppofite bank is flat, becaufe it has nut been gnawed away in this manner. With refpect to this general view of the matter, thefe perfons may be in the right; and when a Areans is turned into cuooked and yielding channel for the firll tinee, this is its mamer of action. But Mr Buat's aim is to inveftigate the circumftanees which obtain in the cafe of a regimen; and in this view he is undoubtedly ri hit is to the facts, though his mode of acepuating for thefe facts may be crroneous. And as
this is the only ufeful view to be taken of the fubject, it ought chiefly to be attended to in all our attempts to procure flability to the bed of a river, without the expenfive helps of mafonry, \&kc. If we attempt to fecure permanency by deepening on the infide of the elbow, our bank will undoubtedly crumble down, diminifh the paflage, and occafion a more violent action on the hollow bank. The molt effectual mean of fecurity is to enlarge the fection: and if we do this on the intide bank, we null do it by widening the ftream very much, that we may give a very iloping bank. Our attention is commonly drawn to it when the hollow bank is giving way, and with a view to ftop the ravages of the ftream. Things are not now in a flate of permanency, but nature is working in her own way to bring it about. This thay not fuit our purpofe, and we muit thwart her. Thie phenomena which we then obferve are frequently very unlike to thofe deferibed in the preceding paragraphs. We fee a violent tumbling motion in the flream towards the hollow bank. We fee an evident accumulation of water on that fide, and the point B is frequently higher than C . This regorging of the water extends to fome diftance, and is of itfelf a eaufe of greater velocity, and contributes, like a head of flagmant water, to force the itream through the bend, and to deepen the bottom. This is clearly the cafe when the velocity is exceffive, and the hollow bank able to abide the Chock. In this fituation the water tlus heaped up efcapes where it beft can; and as the water, obiltructed by an obltacle put in its way, efcapes by the fides, and there has its velocity increafed, fo here the water gorged up againt the hollow bank fwells over towards the oppofite fide, and paffes round the convex bank with an increafed velocity. It depends much on the acjuftment between the velocity and confequent accumulation, and the breadth of the ftream and the angle of the elbow, whether this augmentation of velocity fhall reach the convex bank; and we fometimes fee the motion very languid in that place, and even depofitions of mud and fand are made there. The whole phenomena are too complicated to be accurately defcribed in general terms, even in the cafe of perfect regimen: for this regimen is relative to the confiftence of the channel; and when this is very great, the motions may be moft violent in every quarter. But the preceding obfervations are of importance, becaufe they relate to ordinary cafes and to ordinary channels.
It is evident, from Mr Buat's fecond polition, that the proper form of an elbow depends on the breadth of the ltream as well as on the radius of curvature, and that every angle of elbow will require a certain proportion between the width of the river and the radius of the fweep. M: Buat gives rules and formule for all thefe purpofes, and thows that in one fweep there may be more than one reflection or rebound. It is needlefs to enlarge on this matter of mere geometrical difcuffion. It is with the siew of enabling the engineer to trace the windings of a river in fueh a manner that there fhall be no rebounds which fhall direct the Itream againit the fides, but preferve it always in the axis of every reach. This is of confequence, even when the bends of the river are to be feeured by mafonry or piling; for we have feen the necelity of inereafing the fection, and the tendency which the waters have to deepen the channel on that lide where the rebound is made. This tends
co whatemine ont chentees, and ofliges us to give them deeper and more folind forndations in fich places. But any perfom accuifomed to the ufe of the ficale and compaffes will form to himfelf rules of practice equally fure and more expecitious than Mr de Buat's formule.

We proceed, therefore, to what is more to our purpofe, the confideration of the refiftance caufed by an clhow, and the methods of providing a force capable of osercoming it. We have already taken notice of the falutary confequences arifing from the rambling courfe of rivers, inafmuch as it more effectually \{preads them over the face of a country. It is no lefs beneicial by sliminifhing their relocity. This it does both by lengthening their courfe, which diminifhes the declivity, and by the very refiftance whicl they meet with at every bend. We derive the chief advantages fiom our rivers, when they no longer thoot their way from precipice to precipice, loaded with mud and fand, but peaceably roll along their clear waters, purified during their gentler courfe, and offer themfelves for all the purpofes of pafturage, agriculture, and navigation. The more a river winds its way round the foot of the hills, the more is the refiffance of its bed multiplied ; the more obftacles it meets with in its way from its fource to the fea, the more moderate is its velocity; and in. Stead of tearing up the very bowels of the earth, and digging for itfelf a deep trouoh, along which it fweeps rocks and rooted-up trees, it flows with majeltic pace even with the furface of our cultivated grounds, which it embellithes and fertilizes.

We may with fafety proceed on the fuppofition, that the force necellary for overcoming the refiftance arifing from a rebound is as the fquare of the velucity; and it is reafonable to fuppofe it proportional to the fquare of the fine of the angle of midence, and this for the reafons given for adopting this meafure of the general \(R \varepsilon\) sisfance of Fluids. It cannot, however, claim a greater eonfidence here than in that application; and it has been fhown in that article with what uncertainty and limitations it muft be received. We leave it to our readers to adopt either this or the simple ratio of the fines, and fail abide by the duplicate ratio with Mr Buat, becaufe it appears by his experiments that this law is very exaetly obferved in tubes in inclinations not exceeding \(40^{\circ}\); whereas it is in chefe fmall angles that the application to the general refiftasce of fluids is moft in tault. But the correction is very fimple, if this value thall be found erroneous There can be little doubt that the force neceffary for overcoming the refiftance will increafe as thenumber of rebounds.- Therefore we may exprefs the zefiftance, in general, by the formula \(\mathrm{r}=\frac{\mathrm{V}^{2} s^{2} n}{x l^{2}}\); where \(T\) is the refitanes, V the mean velocity of the fream, \(s\) the fine of the angle of incidence, \(n\) the number of equal rebounds (thet is, having equal angles of incidence), and \(m\) is a mumber to be determined by experiment. Mr de Buat made many experiments on the refiffance occafioned by the bendings of pipes, none of which differed from the refult of the above formum above one part in twelve; and he concludes, that the sefiftance to one bend may be eftimated at \(\frac{V^{2} s^{2}}{3000}\). The experiment was in this form: A pipe of 1 inch diamcter, and 10 feet long, was formed with so reVoL XVI. Past I.

Luwnds of \(36^{\circ}\) eacin A head of water was applied to it, which gave the water a yelocity of fix feet per ferond. A nother pife of the fane diameter and length, but without any bendings, was fubjected to a preffure of a hread of water, which was increafed till the velocity of eflux was allo fix feet per fecond. The additional lead of water was \(5^{\circ} \mathrm{O}\) inclizes. Another of the fame diameter and length, having one bend of \(24^{\circ} 34^{\circ}\). and running 85 incles per fecond, was compared with a fraight pipe liaving the fame velocity, and the difference of the heads of water was \(\mathrm{r}^{3-5}{ }^{3}\) of an inch. A computation from thefe two experinents will give the above refiut, or in Englifh meafare, \(r=\frac{V^{2} s^{2}}{3^{2 c 0}}\) very nearly. It is probable that this meafure of the reififance is too great ; for the pipe was of uniform diameter even in the bends: whereas in a river properly forned, where the regimen is exact, the capacity of the fection of the bend is increafed.

The application of this theory to inclined tubes and Theory apto open ftreams is very obvious, and very legitimate and plied to inEafe. Let AB (fig. 1\%) be the whole height of the clined openter refervoir A B I K, and B C the horizontal length of a fictans. pipe, containing any number of eebounds, equal or unequal, but all regular, that is, conftrueted according to the conditions formerly mentioned. The whole head of water fhould be conceived as performing, or as divided into portions which perform, three different offices. One portion, \(\mathrm{AD}=\frac{\mathrm{V}^{\mathrm{z}}}{505}\), impels the water into the entry of the pipe with the velocity with which it really moves in it ; another portion E \(\dot{B}\) is in equilibrio with the refifances arifing from the mere length of the pipe expanded into a ftraight line; and the third portion DE ferves to overcome the refiftance of the bends. If, therefore, we draw the horizontal line \(B C\), and, taking the pipe \(B C\) ont of its place, put it in the pofiton DH, with its mouth C in H , fo that DH is equal to BC, the water will have the fame velocity in it that it had before. N.B. For greater fimplicity of argument, we may fuppofe that when the pipe was inferted at B, its bends lay all in a horizontal plane, and that when it is inferted at D, the plane in which all its bends lie flopes only in the direction DH , and is perpendicular to the plane of the figure. We repeat it, the water will have the fame velocity in the pipes BC and D H, and the reffitances will be overcome. If we now prolong the pipe 1 H towards I to any diftance, repeating continually the fame bendings in a feries of lengths, each equal to DH , the motion will be continued with the velocity correfponding to the prefue of the column AD ; becaufe the declivity of the pipe is augmented in each length equal to DH , by a quantity precifely fufficient for overcoming all the refiftances in that length ; and the true fope in thefe cafes is B E + ED, disided by the expanded length of the pipe BC or D H.

I he analogy which we were enabled to eftablifh between the uniform motion or the train of pipes and of open ftreams, intitles us now to fay, that when a river has bendings, which are regularly repeated at equal intervals, its flope is compounded of the flope which is neceflary for overcoming the refiftance of a ftraight channel of its whole expanded length, agreeably to

O o the

Tlersy. the formula for uniform motion, and of the flope which su- is acceflary for overcoming the refiftance ariling from its bendings alone.
"Thus, let there be a river"which, in the expanded coure of so:0 fathoms, has 10 clbows, eath of which las \(30^{\circ}\) of rebound; and let its mean velocity be 20 inches in a licond. If we would learn its whale flope in this \(6=00\) fathons, we mult firft fud (by the formula of uniform motion) the fope s which will produce the velocity of 20 inches in a ftraight river of this length, fection, and neean depth. Suppore this to be
₹₹ \(\frac{8}{\sigma} \overline{0}\), or 20 inches in this whole length. We muft Theor then find (by the formula \(\frac{V^{2} \operatorname{Sin}^{2}}{3^{200}}\) ) the nope neceflary for avereoning the refiflance of 10 rebounds of \(30^{\circ}\) each. 'This we thall fies to be \(6 \frac{1}{3}\) inches in the 60co tathums. I'herefore the river mult have a dlupe of \(2 \sigma \frac{2}{5}\) inches in 6000 fathoms, or \(\frac{1 \pi}{\frac{1}{2}} \sigma \bar{\sigma}\); and this llope will produce the fame velocity which 20 inches, or \(\frac{1}{2} \frac{1}{6} \sigma\). would do in a traight running river of the fone lencth.

\section*{Part iI. practical inferences.}

HAVING thus elablifind a theory of a moft important part of hydraulics, which may be confutcd in as a juit reprefentation of nature's procedure, w. Thall apply it to the examination of the chief refults of esery thing which art has contrived for liniting the operations of nature, or modifying them fo as to fuit our particular views. 'Trulting to the detail which we have given of the connecting principles, and the chief circumblances which co-operate in producing the ofenfible efficit ; and ruppofing that fuch of our readers as are interefted in this fubject will not think it too much trouble to make the applications in the fame detail; we frall content ourfelves with morely painting out the tieps of the procefs, and howing their foundation in the theory itfell: and frequently, in place of the direct ana-

103 Apprexination b; trial ard corredion scrommended t practioal caginecers.

104
F.oblenss and exam plea un the effects of fermanent addinions to the wa ters of a ri ves. lylis which the theory enables us to cmploy for the folution of the problems, we fhall reeommend a procefs of approximation by trial and correction, fufficiently aceurate, and more within the reach of practical engineers. We are naturally led to confider in order the following articls.
I. The effects of permanent additions of every kind to the waters of a river, and the moft effectual methods of preventing or remowing inundations.
2. 'The effects of weirs, bars, fluiees, and keeps of wery kind. for raifing the furface of a river; and the himilar efferts of bridges, piess, and ceery thing which contracts the fection of the Itream.
3. The nature of eanals; how they differ from rivers in refucet of origin, difcharge, and regimen, and what conditions are necellary for therr moft perfect couftinction.
4. Canals for draining land, and drafts or canals of derivation from the main ftream. The principles of their confluction, fo that they may fuit their intended purpofes, and the change which they produce on the nain frean, both above aad below the point of derivation.

\section*{if the effeds of permanent additions to the zuaters of a river.}

From what has been faid alrcady: it appears that to every kind of foil or bed there correfponds a certain velocity of current, too fmall to hurt it by digging it up, and ton great to allow the depofition of the materials which it is carrying along. Suppofing this known for any particular fituation, and the quanity of water which the channel mult of neceffity difcharge, we may wifh to learn the fmallef flope which mult be given to this fream, that the waters may run with the reguired velocity. This fuggelts

Prob. I. Given the difeharge D of a river, and V its velocity of regimen: required the finallctit fope \(s\), and the dimenfions of its bed?

Since the flope mult be the fmallen pofible, the bed muth have the form which will give the graatect mean tepth \(d\), and hould therefore be the trapzaium formerly deferibed; and its area and perimeter are the fame with thofe of a rectangle whofe breadth is iwice its height b. Thefe circumftances give us the equation \(\frac{\mathrm{D}}{\mathrm{V}}=2 b^{2}\). For the area of the fection is twice the fquare of the height, and the difcharge is the product of this arca and the velocity. Therefore \(\sqrt{\frac{\bar{D}}{2 V}}=b\) and \(\sqrt{\frac{2 D}{V}}\) \(=\) the breadth \(b\).
The formula of uniform motion gives \(\sqrt{s}-L \sqrt{s+1,6}\) \(=\frac{297(\sqrt{d}-0,1}{V+0,3(\sqrt{d}-0,1)} . \quad\) Intead of \(\sqrt{d}-0,1\), put its equal \(\sqrt{\frac{h}{2}}-0,1\), and every thing being known in the fecond meniher of this equation, we eafily get the value of shy a few trials after the fullowing manner. Suppofe that the fecond member is equal to any number, fuch as 9. Firft fuppofe that \(\sqrt{5}\) is \(=9\). Then the hyperbolic logarithm of \(9+1,6\) or of 12,6 is 2,36 . Therefore we have \(\sqrt{ } s-L \sqrt{ } \cdot+1,6=9-2,36,=664\); whereas it fhould have been \(=9\). '1 herefore fay \(6,64: 9=9: 12,3\) nearly. Now fuppofe that \(v\) 's is \(=12,2\). 'Then L . \(12,2+1,6=\mathrm{L}_{13}, 8,=2,625\) nearly, and \(12,2-2625\) is 9,575 , whereas it flould be 9 . Now we find that changing the value of \(\sqrt{5}\) from9 to 12,2 has changed the aufwer from \(6,6+\) to 9,575 , or a change of 3,2 in our atfumption has made a change of 2,935 in the anfwer, and has left an error of 0,575 . Theretore fay \(2,935: 0,573\) \(=3,2: 0,628\). Then, taking 0,628 from 12,2 , we have (for our next affumption or value of \(\sqrt{5}\) ) 11,572 . Nuw \(11,572+1,6=13,172\), and L 13,172 is 2,58 nearly. Now try this lat value \(11,572-2,58\) is 9,008 , fufficiently exact. This may ferve as a fuccimen of the trials by which we nay avoid an intricate analy fis.

Prob. II. Given the difcharge D, the flope s, and the velocity V , of permanent regimen, to find the dimenfions of the bed.

Let \(x\) be the width, and \(y\) the depth of the channel, and \(S\) the area of the \(f\) fection. This muft be \(=\frac{D}{V}\), which is therefore \(\overline{m x y}\). The denominator \(s\) being given,
atical given, we may make \(\sqrt{ } s-I, \sqrt{s+1,6}=\sqrt{ } B\), and the ences formula of mean velocity will give \(V=\frac{297(\sqrt{d}-0,1)}{\sqrt{B}}\) \(-0,3(\sqrt{d}-0,1)\), which we may exprefs thus: \(V=\) \((\sqrt{d}-0,1)\left(\frac{297}{\sqrt{B}-0,3}\right)\), which gives \(\frac{V}{\frac{297}{\sqrt{B}}-0,3}=\) \(\sqrt{\bar{d}}-0,1) ;\) and finally, \(\frac{V}{\frac{297}{\sqrt{B}}-0,3}+0,1=\sqrt{\bar{d}}\)

Having thus obtained what we called the mean depth, we may fuppofe the fection rectangular. This gives \(d=\frac{x y}{x+2 y}\). Thus we liave two equations, \(S=x y\) and \(d=\frac{x y}{x+2 y}\).
From which we obtain \(\left.x=\sqrt{\left(\frac{\mathrm{S}}{2 d}\right)^{2}-2 \mathrm{~S}} \right\rvert\,+\frac{\mathrm{S}}{2 d}\). And having the breadth \(x\) and area S , we have \(y=\frac{S}{x}\). And then we may clange this for the trapezium often mentioned.

Thefe are the chief problems on this part of the fubject, and they enable us to adjuft the flope and channel of a river which receives any number of fucceffive permanent additions by the influx of other ftreams. This laft informs us of the sife which a new fupply will produce, becaufe the additional fupply will require additional dimenfions of the chamel; and as this is not fuppofed to increafe in breadth, the addition will be in depth. The queftion may be propofed in the following problem.

Prob. III. Given the flope \(s\), the depth and the bafe of a rectangular bed (or a trapezium), and confequently the difcharge D , to find how much the feetion will rife, if the difcharge be augmented by a given quantity.
Let \(b\) be the height after the augmentation, and \(w\) the width for the rectangular bed. We have in any uniform current \(\sqrt{d}=\frac{\mathrm{V}}{\frac{297}{\sqrt{B}}-0,3}\) Railing this to a quare, and putting for \(d\) and \(V\) their values \(\frac{n v b}{w+2 b}\) and \(\frac{D}{w, b}\), and making \(\frac{297}{\sqrt{3}}-c, 3=K\), the equation becomes \(\frac{w h}{w+2 b}\) \(=\left(\frac{\mathrm{D}}{\text { whK }}+0,1\right)^{2}\) Railing the fecond member to a fquare, and reducing, we obtain a cubic equation, to be folved in the ufual manner.

But the folution would be extremely complicated. We may obtain a very expeditious and exact approximation from this confideration, that a fmall change in one of the dimentions of the fection will produce a nnuch greater change in the fection and the difcharge than in the mean deptia \(d\). Having therefore augmented the unknown dimenfion, which is here the height, make ufe of this to form a new mean depth, and then the new equation \(\sqrt{d}=\frac{D}{w h\left(\frac{297}{N^{\prime}}-0,3\right.}+0,1\) will
give us another value of \(h\), which will rarely exceed Pradical the trutlh by \(\frac{1}{T}\). This ferves (by the fame procefs) inferences. for finding another, which will commonly be fufficiently exact. We fhall illuftrate this by an example.

Let there be a river whefe channel is a rectangle iso feet wide and fix feet deep, and which difcharges 1500 cubic feet of water per fecond, having a velocity of 20 inches, and flope of \(\mathrm{x} \frac{\mathrm{r}}{\frac{\mathrm{r}}{6} \delta \sqrt{3}}\), or about \(\frac{7}{T}\). of an inch in 100 fathoms. How much will it rife if it receives an addition which triples its difcharge? and what will be its velocity ?

If the velocity remained the fame, its depth would he tripled; but we know by the gencral formula that its velocity will be greatly increafed, and therefore its depth will not be tripled. Suppofe it to be doubled, and to become 12 feet. This will give \(d=10,344^{8} 3\), or 124,138 inches; then the equation \(\sqrt{d}-0,1=\) \(\frac{\mathrm{D}}{\text { wh }\left(\frac{297}{\sqrt{B}}-0,3\right.}\), or \(b=\frac{D}{w(\sqrt{d}-0,1)\left(\frac{297}{\sqrt{ } \mathrm{~B}}-0,3\right)}\), and in which we have \(\sqrt{ } B=107,8, \mathrm{D}=4500 ; \sqrt{d}-0,1\) \(=11,0+17\), will give \(h=13,276\); whereas it hould have been 12. This fhows that our calculated value of \(d\) was too fmall. Let us therefore increafe the depth by 0,9 , or make it 12,9 , and repeat the calculation. This will give us \(\sqrt{d}-1=11,3927\), and \(b=12,867\), inftead of 13,276 . Therefore augmenting our data 0,9 changes our anfwer 0,409 . If we fuppofe thefe fmall changes to retain their proportions, we may conclude that if 12 be augmented by the quantity \(\times \times 0,9\), the quanticy 13,276 will diminif by the quantity \(x \times 0,409\). Thercfore, that the eftimated value of \(b\) may agree with the one which refults from the calculation, we mult have \(12+x \times 0,9=13,276-x \times 0,403\). This will give \(x=\frac{1,276}{1,309},=0,9748\), and \(x \times 0,9=0,8773\); and \(b=\mathrm{r} 2,8773\). If we repeat the calculation with this value of \(h\), we flall find no change.

This value of \(b\) gives \(d=131,883^{6}\) inches. If we now compute the new velocity by dividing the new difcharge 4500 by the new area \(150 \times 12,8-7\), , we fhall find it to be 27,95 inches, in place of 2 c , the former velocity.

We might have made a pretty exact firft affumption, by recollecting what was formerly obferved, that when the breadth is very great in proportion to the depth, the mean depth differs infenfibly from the real depth, or rather follows nearly the fame proportions, and that the velucities are proportional to the fquare roots of the depths. Call the firl difcharge \(d\), the height \(h\), and velocity \(v\), and let \(\mathrm{D}, \mathrm{H}\), and V , exprefs thefe things in their augmented fate. Whe have \(v=\frac{d}{a b} b\) and \(\mathrm{V}=\frac{\mathrm{D}}{w \mathrm{H}}\), and \(v: \mathrm{V}=\frac{d}{b}: \frac{\mathrm{D}}{\widetilde{L}}\), and \(v^{2}: \mathrm{V}^{2}=\frac{d^{2}}{b^{2}}:\)
\(\frac{\mathrm{D}^{2}}{\mathrm{H}^{2}}\). But by this remark \(v^{2}: \mathrm{V}^{2}=b: H\). Therefore \(b: H=\frac{d^{2}}{b^{2}}: \frac{\mathrm{D}^{2}}{\mathrm{H}^{2}}\), and \(\frac{b \mathrm{D}^{2}}{\mathrm{H}^{2}}=\frac{\mathrm{H} d^{2}}{b^{2}}\), and \(b^{3} \mathrm{D}^{2}=\mathrm{H}^{3} d^{3}\) 。 and \(d^{2}: \mathrm{D}^{2}=b^{3}: \mathrm{H}^{3}\) (a uffful theorem) and \(\mathrm{H}^{3}=\) \(\frac{b^{3} \mathrm{D}^{2}}{d^{2}}\), and \(\mathrm{H}=\sqrt[3]{\frac{\overline{b \mathrm{D}^{2}}}{d^{2}}}=12,4 \mathrm{~S}\).

Or we might have made the fame afliumption by the 002 semar!

Prastical Irsererces.
remark alio formerly made on this cafe, that the fquares of the difcharges are nearly as the cubes of the height, or \(1500^{2}:+500^{2}=6^{3}: 12,4^{3}\).

And in inakior thefe firlt gueffes we thatl do it more exactly, by recollecting that a certaia variation of the nean depth I requires a greater variation of the height, and the increment will be to the height nealy as half the heiglit to the widh, as may calily be feen. 'l'berefore, if we add to \(12,+8\) its \(\frac{6,24}{150}\) th part, or its 24 th part, viz. 0,52 , we have 13 for our firf affumption, exceeding the truth ouly an inch and a half. We mertion thefe circumkanees, that thofe who are difpofed to apply thefe doctrines to the folution of proctical cafes may be at no lofs when one occurs of which the regular folution requires an iutricate aualyfis.

It is evident that the inverfe of the foregoing problems will thow the effects of enlarging the fection ol a niver, that is, will how how much its furface will be fink by any propofed enlargement of its hed. It is therefure needlefs to propufe fuch problems in this pace. Common fenfe di:cets us to make thefe enlargements in thofe parts of the river where their effect will be greatelt, that is, where it is thallowell when its loreadth preatly exceeds its depth, or where it is narrowe? (if its depth exceed the breadth, wheci is a very rare cafe), or in general, where the flope is

\section*{TC6}

Ant direct usil the methand of cmbank. 8n. 6.65.
The in-
verfe of the prom
bevis hine the effrea of enla-ene the fecti:f.f a river, the finallett for a fhor run.
The fame general principles direct us in the method of embankments, for the prevention of tloods, by enabling us to atcertain the heights ncceffary to be given to our binks. 'his will evidently depend, not only on
the addational quantity of water which experience tells us a river baings down duing its frefles, but alfo on thediltance at which we place the banks from the aatural banks of the river. This is a point where miltaken economy frequently defeats its own purpofe. If we raite our embankment at fome difance from the natural banks of the river, not only will a fnaller height fuf. fice, and confequently a fmaller bafe, which will make a faving in the duplicate proportion of the height; but our woiks will be fo much the more durable nearly, if not exactly, in the fame proportion. For by thus enlarging the additional bed which we give to the fwollen river, we diminifh its velocity almolt in the fame proportion that we enlarge its channcl, and thus diminifh its power of ruining our works. Except, therefure, in the cafe of a river whofe frefhes ate loaded with fine fand to deftroy the turf, it is always proper to place the embankment at a confiderable diftance from the natural banks. Placing them at half the breadth of the ftream from its natural banks, will nearly double its channel; and, except in the cafe now mentioned, the fpace thus detached from our fields will afford excellent pafture.

The limits of fuch a work as ours will not permit us to enter into any detail.on the method of embankment. It would require a volume to give inftructions as to the manuer of founding, railing, and fecuring the dykes which muft be raifed, and a thoufand circumitances. which muft be attended to. But a few general obfervations may be made, which naturally occur while we are confidering the manner in which a river works in fetcling or altering its chamel.

E R.
It muft be remarked, is the firt place, that the rim \(P_{\text {ach }}\) ver will rife higher wheu embanked than it does whide \({ }^{1 \text { l. ferent }}\) it was allowed to fpread; and it is by no means eafy to conclude to what height it will rife from the greateit height to which it has been obferved to rife in its floods. When at liberty to expand over a wide valley; then it conkl only rife till it oven fowed with a thicknefs or depth of water fufficient to produce a motion backwards into the valley quick enough to take off the water as faft as it was fupplied; aud we imagine that a foot or two would fuflice in moll cafes. The belt way for a prudent engineer will he to obleave the utmot rife rememberd by the neighbours in fome gorge, where the river cannot fpread out. Meafure the increaled fection in this place, and at the fame time recollect, that the water increafes in a nuch greater proportion than the lection; becaufe an increafe of the hydraulic mean depth products an increafe of velociey in the duplicate propoltion of the depth nearly. But as this augmer.tation of velocity will phtain alfo between the embankments, it will be futficiently exact to fuppofe that the fection mult he increafed here nearly in the fame proportion as at the gorge already mentioned. Neglecting this method of information, and regulating the heiglit of our embankment by the greateit fwell tha: has been obferved in the plain, will affuredly make them too low, and render them totally ufelefs.

A line of embankment fhould always be carried on by a lkrit concert of the proprietors of both banke through its whole extent. A greedy proprietor, by ad. vancing his own embankment beyond that of his neigh. bouts, not only expoles himfelf to rilk by the work. ing of the waters on the angles which this will pio. duce, but expufes lis neighbuurs alfo to danger, hy nar. rowing the lection, and thereby railing the furface and increafing the velocity, and by turning the ftrearn athwart, and caufing it to fhoot againft the oppofite bank. The whole thould be as much as polfible in 2 line; and the general effect mould be to make the courfe of the Itream itraighter than it was before. All bends fhould be made more gentlc, by keeping the embankment further from the viver in all convex lines of the natural bank, and bringing it nearer when the bank is, concave. This will greatly dininith the action of the waters on the bankinent, and infure thoir duration. The fame maxim mult be followed in fencing any brook which difelarges itfelf into the river. The bends given at its mouth to the two lines of embankment fhould, be made lefs acute than thole of the natural brook, although, by this means, two points of land are left out. And the opportunity fhould be embraced of making the direction of this tranfverfe brook more noping than. before, that is, lefs athwart the direction of the river.

It is of great confequence to cover the outfide of the dyke with very compact turf clofely united. If it admit water, the interior part of the wall, which is always more porous, becomes drenched in water, and this water acts with its ftatical prefure, tending to burft the bank on the land-fide, and will quickly flift it from its. feat. The utmolt care flould therefore be taken to. make it. and keep it perfectly tight. It Mould be a continued fine turf, and every bare fpot fhould be care. fully covered with frefh fod; and rat holes mult be: carefully clofed up.

\section*{Cf iraigtsing or chatiging the courfe of rivers.}

We have feen, that every bending of a river requires an additional nope in order to contintie its train, or enable it to convey the fame quanticy of water without fwelling in its bed. Therefore the effect of taking away any of thefe bends muft be to link the waters of the river. It is proper, therefore, to have it in our power to eftimate thefe effects. It may be defirable to gain property, by taking away the fweeps of a very winding flream. But this may be prejudicial, by deftroying the navigation on fuch a river. It may alfo hurt the proprietors below, by increaling the velocity of the ftream, which will expofe them to the rifk of its overflowing, or of its deftroying its bed, and taking a new courfe. Or this inereafe of velocity may be inconfiltent with the regimen of the new ehanoel, or at leatt require larger dimentions than we fhould have given it if ignorant of this effect.

Our principles of uniform motion enable us to anfwer every quettion of this kind which can oceur; and Mr de Buat propofes feveral problems to this effect. The regular folutions of them are complicated and difficult; and we do not think them neceffary in this place, becaufe they may all be folved in a manuer not indeed fo elegant, becaufe indirect, but abundantly accurate, and eafy to any perfon familiar with thofe which we have already confidered.

We can take the exact level acrofs all thefe fweeps, and thus obtain the whole fope. We can meature with accuracy the veloeity in fome part of the charmel which is molt remote from any bend, and where the channel itfelf has the greateft regularity of form. This will give us the expence or difcharge of the river, and the imean depth connected with it. Ife can then examine whether this velocity is precifely fuch as is compatible with flability in the ftraight courfe. If it is, it is evident that if we cut of the bends, the greater flope which this will produce will communicate to the waters a velocity ineomoatible with the regimen fuited to this foil, unlefs we eularge the width of the ftream, that is, un'tfs we make the new channel more capacious than the old one. We mut now calculate the dimenfions of the channel which, with this increafed flope, will conduct the watere wath the velocity that is neceffary. All this may be done by the forgoing problems; and we may eafett accomplif this by Aleps. Firft, fuppofe the bed the fame with the old one, and calculate the veloeity for the increaled flope by the general formula. Ihen. change one of the dimenfions of the channel, fo as to produce the velocity we want, which is a very fimple procefs. And in doing this, the object to be kept chiefly in view is not to make the new velocity fuch as will be incompatible with the tability of the new bed.

Having accomplinted this firf purpofe, we learn (in. the very folution) how much fhallower this channel with its greater flope will be than the former, while it difcharges all the waters.. This diminution of depth mult increafe the flope and the velocity, and muft diminifh the depth of the river, above the place where the alteration is to be made. How far it produces thefe effects may be calculated by the general formula. We then fee whether the navigation will be hurt, either in the ald river up the ftream, or in the new channel. It is
plain that all thefe points eannot be reeonciled. We Pragi al may make the new channel fuch, that it thall leave a \({ }^{\text {rnferet:ces. }}\) velocity compatille with itability, and that it mall nos diminifh the depth of the river up the fream. But, having a greater flope, it snuf have a fmaller mean depth, and alfo a fonaller read depth, unlefs we make it of a very inconrenient form.

The fame things viewed in a different light, will fhow us what depreffion of waters may be produced by rectifying the courfe of a river in order to prevent its overHowing. And the procefs which we would reeommend is the fane with the foregoing. We apprehend it to be quite needlefs to meafure the angles of rebound, in order to compute the flope which is empoyed for fending the river through the bend, with a view to fuper. fede this by ftraighting the river. It is infnitely eatier and more exact to meafure the levels themfelves, and then we know the effect of removing them.
Nor need we follow Mr de Buat in folving problems for dinnininins the flope and velocity, and decpening the channel of a river by bending its courfe. The expence of this would be in every cale enormous; and the practices whieh we are juft going to enter upon afford infinitely eafier methods of aecomplifhing all the purpofes which are to be gained by thefe changes.

\section*{Of Bars, H'eirs, and Yetteys, for raijing the Surface of} Rizers.
We propole, under the article WitER-Works, to Problems, confider in fufficient practical detail all that relates to examples, the conftruction and mechanifin of thefe and other erec- querices of tions in water; and we con-ne ourlelves, in this place, 3 fing the to the mere effect which they will produce on the cur furface of rent of the river.

We gase the name of wir or bar to a dam crected actofs a river for the pupofe of railing its waters, whether in order to take off a draft for a mill or to deepen the chaonel. Befure we can tell the effect which they will produce, we mult have a general rule for afeertaining the relation between the height of the water above the lip of the weir or bar, and the quantity of water which will flow over.

Firft, then, with refpect to a.weir, reprefented in fig. 18. and fig. 1.8. \(n^{\circ}\) 2. 'The latter ligure more refembles their ufual form, confilting of a dam of folid mafonry, or built of timber, properly fortifed with fhoars and banks. On the top is fet up a Atrong plank FR, called the wafteboard, or watter, over which the water flows. This is brought to an accurate level, of the proper height. Such voiders are frequently made in the fide of a mill courle, for letting the fuperfluous. water run off. 'This is properly the waster, void.ER: it is allo called an offset. The fame obfervations will explain all thefe different pieces of practice. The following queftions occur in courfe.

Prob. I. Given the length of an offset or wafteboard, made in the face of a refervoir of ftagnant water, and the depth of its lip under the horizontal furface of the water, to determine the difcharge, or the quantity of water which will run over in a fecond?

Let \(A B\) be the horizontal furface of the ftill water, and F the lip of the wafteboard: Call the depth BF under the furiace \(b\), and the length of the watteboard \(/\). N. B. 'I'he water is fuppoled to How over into another bafon or channel, fo much lower that the furface

Pratical HL of the water is lower, or at leaf not higher, Inferences. than \(F\).

If the water could be fupported at the height \(\mathbf{B F}\), BI might be contidered as an orifice in the fide of a veffel. In which cafe, the difcharge would be the fame as if the whole water were flowing with the velecity acquired from the heirht \(\frac{1}{3} \mathrm{BF}\), or \(\frac{4}{y} / \mathrm{L}\). \(\Lambda\) nd if we fuppofe that thate is no contraction at the orifice, the mean velucity would be \(\sqrt{2 \frac{4}{4}} \bar{h},=\sqrt{772 \frac{4}{9} h}\), in Englifi inches per fecond. The area of this orifice is \(/ / 2\). Thercore the difeharge would be / \(/ \sqrt{772} \frac{7}{6}\), all being meafured in inches. This is the ufual theory ; but it is not an exact reprefentation of the manner in which the effux really happens. The water cannot remain at the height LEF; but in drawing towards the waftehoard from all lides, it foms a convex furface AIH, fo that the puint 1, where the vertical drawn from the edze of the walteboard meets the curse, is confiderably luwer than 5 . Wut as all the mafs above \(I\) is fuppofed perfectly duid, the preffure of the incumbent water is propagated, in the opinion of Mr de Buat, to the folament paffing over at \(F\) without any diminution. "I'he fame may be faid of any filament between \(F\) and \(I\). Each tends, thorefore, to noove in the fame manner as if it were really impelled through an orifice in its place. "Therefore the motions throngh every part of the line or plane IF are the fame as if the water were efcaping through an orifice IF, made by a fluice let down on the water, and keeping up the water of the refervoir to the level AB. It is beyond a doubt (fays he) that the height IF mut depend on the whole height BF, and that there muft be a certain determined proportion between them. He does not attempt to deternine this proportion theoratically, but fays, that his experiments afcertain it with ereat precilion to be the proportion of one to two, or that IF is always one-half of BF. He fays, however, that this determination was not by an inmediais and direct meafurement ; he concluded it from the comprafon of the quantities of water difcharged under different heights of the water in the reServoir.

We carsoct help thinking that this reafoning is very defective in feretal particulars. It cannot be inferred, from the duw: of hydrofatical preffure, that the filament at 1 is prefied forward with all the weight of the column BI. "The particte I is really at the furface; and confiduring it as making part of the furface of a runting flrcan, it is fubjected to hasdly any prefure, any mute thon the particles on the furface of a cup of water held in the hand, while it is carried round the axis of the carth and round the fun. Reafoning according to his own priciples, and availing hinelelf of his own ditcosery, he thould fay, that the particle at I has an acceleratins force depending on its nope only; and then \(h=\) fhomld have endeavoured to afcertain this foupe. The motion of the particle at I has no immediate connection with the profure of the column BI ; and if it had; the motion would be extremely different from what it is: for this preflure alone would give it the velucity which Mr Buat affigns it. Now it is already paflug through the point I with the velocity which it ha, acquired in defcending along the curve AI; and this is the real flate of the cale. The particles are pafing through with a velocity already acquired by a lloping currest ; and they are accelerated
by the hydroftatical preflure of the water above them. The internal mechanifm of thefe motions is inlinitely more complex than Mr Buat here fuppofes; and on this fuppofition, le very nearly abandons the theory which he has fo intreaioully eftablifhed, and adopts the theoyy of Guglichmini which he had exploded. At the fame tine, we think that he is not much miftaken when lee afferts, that the motions are nearly the fame as if a nuice had been let down from the furface to I. For the filament which paftes at I has been gliding down a curved furface, and has not been expofed to any friction. It is perhaps the very cafe of hydraulics, where the obftructions are the fmalleft ; and we fhould therefore expect that its motion will be the leaft retarded.
We have thercfore no hefitation in faying, that the flament at \(I\) is in the very Itate of motion which the theos ry would affign to it if it were paffing under a lluice, as Mr Buat fuppofes. And with refpect to the inferior flaments, witheut attempting the very difficult tafk of inveltigating their motions, we fhall juft fay, that we do not fee any reafon for fuppofing that they will move nower than our author fuppofes. Therefore, thougla we reject his theory, we admit his experimental propom fition in general ; that is, we admit that the aubole wa. ter which paffes through the plane IF moves with the velocity (though not in the fame direction) with which it wonld lave run through a fluice of the fame depth; and we may proceed with his determination of the quantity of water difcharged.

If we make BC the axis of a parabola BEGH, the velocities of the flaments pafing at \(I\) and \(F\) will be reprelented by the ordinates IE and FG, and the difcharge by the area IEGF. This allows a very neat folution of the problem. Let the quantity difelarged per fecond be D , and let the whole heiglit BF be \(b_{s}\) Let \(2 G\) be the quantity by which we mult divide the fquare of the mean velocity, in order to have the producing height. This will be lefs than 2 g , the accele* ration of gravity, on account of the convergency at the fides and the tendency to convergence at the lip \(F\). We formerly gave for its meafure 726 inches, inllead of 772 , and faid that the inches difeharged per fecond from an orifice of one inch were 26,49 , inftead of 27,78 . Let \(x\) be the difance of any flament from the horizontal line \(A B\). An element of the orifice, therefore, (for we may give it this name) is \(l \dot{x}\). The velucity of this element is \(\sqrt{2 G} x\), or \(\sqrt{2 G} \times \sqrt{x}\). The difcharge from it is \(l \sqrt{2 G} x^{\frac{1}{2}} x\), and the fluent of this, or \(\mathrm{D}=f l \sqrt{2 \mathrm{G}} x^{\frac{3}{2}} x\), whick is \(\frac{2}{3} l \sqrt{2 \mathrm{G}} x^{\frac{3}{2}}+\mathrm{C}\).

To determine the comfant quantity C , obferve that M ; de Buat found by experiment that BI was in all cafea \(\frac{3}{2} \mathrm{BF}\). Therefore D muft be nuthing when \(x=\frac{1}{2} b\); confequently \(\mathrm{C}=-\frac{2}{3} / \sqrt{2 \mathrm{G}}\left(\frac{h}{2}\right)^{\frac{3}{2}}\), and the completed fluent, will be \(\mathrm{D}=\frac{2}{5} / \sqrt{2} \mathrm{G}\left(x_{\frac{2}{2}}-\left(\frac{b}{2}\right)^{\frac{1}{2}}\right)\).

Now make \(x=b\), and we have
\(\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(b^{\frac{3}{2}}-\left(\frac{-}{2}\right)^{\frac{1}{2}}\right)=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(1-\left(\frac{1}{2}\right)^{\frac{3}{2}}\right) b^{\frac{3}{2}}\).
But \(1-\left(\frac{1}{2}\right) \frac{3}{2}=0,04645\), and \(\frac{2}{3}\) of this is 0,43 I: I'herefore, finally, pel the water over a weir, and multiply this by 0,43 , we get the following quantity 11,4172 , or, in numbers of eafy recollection, \(11 \frac{1}{2}\), for the cubic inches of water per fecond, which runs over every inch of a watteboard when the edge of it is one inch below the furface of the refervoir ; and this muit be multiplied by \(/ \frac{3}{2}\), or by the fquare root of the cube of the head of water. Thus let the edge of the watteboard be four inches below the furface of the water. The cube of this is \(\sigma_{4}\), of which the fquare root is eight. Therefore a wateboard of this depth wider the furface, and three feet long, will difcharge every fecond \(8 \times{ }_{3} 6 \times 11 \frac{1}{2}\) cubic inches of water, or \(1 \frac{9}{15}\) cubic fect, Enellifh meafure.

The following comparifons will fhow how much this theory may be depended on. Col. 1. Thews the depth of the edge of the board under the furface; 2. fhows the difcharge by theory; and, 3 . the dircharge actually obferved. The length of the board was \(18 \frac{1}{5}\) inches. \(A\) : B. The number in Mr Buai's experiments are here reduced to Englith meafure.
\begin{tabular}{cccc} 
D. & D. Theor. & D. Exp. & E. \\
1,778 & 506 & 524 & 28,98 \\
3,199 & 1222 & 1218 & 69,83 \\
4,665 & 2153 & 2155 & 123,03 \\
5,753 & 3750 & 3771 & 214,29
\end{tabular}

The laft column is the cubic inches difcharged in a fecond by each inch of the wafteboard. The correfpondence is undoubtedly very great. The greateft error is in the firft, which may be attributed to a much fmaller lateral contraction under fo finall a head of water.

But it mult be remarked, that the ealculation proceeds on two fuppofitions. The height FI is fuppofed \(\frac{1}{2}\) of BI ; and 2 G is fuppofed 726. It is evident, that by increafing the one and diminihing the other, nearly the fame anfivers may be produced, unlefs much greater variations of \(b\) be cxamined. Eoth of thele quantitics are matters of confiderable unceltainty, particularly the firl ; and it mult be farther remarked, that this was not meafured, but deduced from the uniformity of the experineents. We prefume that \(M \mathrm{Mr}\) Buat tried various values of \(G\), till he found one which gave the -atios of difcharge which he wherved. We beg leave to obferve, that in a fet of sumerous experiments which we had accefs to examine, BI was uniformly much lefs than \(\frac{5}{8}\); it was very nearly \(\frac{2}{7}\) : and the quantity difcharged was greater than what would refult from Mr Buat's calculation. It was farther ubferved, that IF depended very much on the form of the wafteboard. When it was a very thin hoard of confiderable depth, IF was very confiderably greater than if the board was thick, or natrow, and fet en the top of a broad dam-head, as in fig. I8. \(n^{\circ} 2\).

It may be proper to give the formula a form which wili correfpond to any ratio which experience may difcover between \(B F\) and IF. Thus, let \(\mathcal{B I}\) be \(\frac{\pi}{\pi}\) EF. The formuia will be \(\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(\mathrm{I}-\left(\frac{m}{n}\right)^{\frac{3}{2}}\right)^{h \frac{3}{2}}\)

It is hoped that this and fome other fundamental facts in practical hydraulics will foon be determined by accurate experiments. The Honourable Board for Fin
eries and Improvements in Scotland have allotted a fum Pratical of moncy for making the neceffary experiments, and inferencer. the refults will be publifhed by their authority. Meantime, this theory of Mt de Buat is of great value to the practical engineer, who at prefent mult content himfelf with a very vague conjecture, or take the calculation of the crruneous theory of Guglielmini. By that theory, the board of three feet, at the depth of four inches, fhould dicharge nearly 3 to cubic feet per fecond, which is almott double of what it really delivers.
We prefume, therefore, that the following table willbe acceptable to practical engineers, who are not familiar with fuch computations. It contains, in the frift columa, the depth in Englifh inches from the furface of the flagnant water of a refervoir to the etige of the waflchoard. The fecond column is the cubic feet of water difcharged in a minute by every inch of the walte. board.
\begin{tabular}{|c|c|}
\hline Depth. & Dijcharge. \\
\hline 1 & 0, +1 \\
\hline 2 & 1,140 \\
\hline 3 & 2,095 \\
\hline \(+\) & 3,225 \\
\hline 5 & 4,507 \\
\hline 6 & 5.925 \\
\hline ? & 7,466 \\
\hline 8 & 9,122 \\
\hline 9 & 10,854 \\
\hline 10 & 12,74 \({ }^{3}\) \\
\hline 11 & 14,707 \\
\hline 12 & 16,758 \\
\hline 13 & 18,895 \\
\hline \(1+\) & 21,117 \\
\hline 15 & 23,419 \\
\hline 16 & 25,8=0 \\
\hline 17 & 28,258 \\
\hline 18 & 30,736 \\
\hline
\end{tabular}

When the depth does not exceed four inches, it wil? not he exact enough to take proportional parts for the fraitions of an inch. The following method is exact.

If they be odd quarters of an inch, look in the table for as many inches as the depth contains quarters, and take the eighth part of the anfiwer. Thus, fur \(3 \frac{3}{4}\) inches, take the cighth part of \(22,+19\), which correfounds to 15 inches. This is 2,927 .

If the wafteboard is rot on the face of a dam, but in a running ftream, we muf augment the difcharge by multiplying the fection by the velocity of the flream. But this currection can feldon occur in practice; becaufe, in this cafe, the difcharge is previoully known; and it is \(b\) that we want; which is the object of the next problem.

We unly beg leave to add, that the experiments which we inention as having been already made in this courtry, give a refult fomewhat greater than this table, viz. about \(\frac{1}{10}\). Therefore, haviag obtained the anfwer hy this able, add to it its 16 th part, and we apprehend that it will be extremely near the truth.

When, on the other hand, we know the difcharge over a wafteboard, we can tell the depth of its edge nnder the furface of the ftagnant water of the refervoir becaufe we have \(b=\left(\frac{D^{3}}{1 \frac{1}{2} h}\right)^{\frac{2}{3}}\) very nearls.

Y-actical Anference.

We are now in a condition to folve the problem re fpecting a weir acrufs a river.

Prob. If. The difeharge and fection of a river being given, it is required to determine how much the waters will be raifed by a weir of the whole breadth of the river, difclarging the water with a clear fall, that is, the furface of the water in the lower chamel being below the edge of the weir?

In this cafe we have \(2 C=746\) nearly, becaufe there will be no contraction at the fides when the weir is the whole breadth of the river. But further, the water is not now llagnant, but moving with the velocity \(\frac{1}{S}\), S being the fection of the river.

Therefore let \(a\) be the height of the weir from the bottom of the river, and \(b\) the height of the water above the edge of the weir. We have the velocity with which the water approaches the weir \(=\frac{1)}{1(a+b)^{\prime}}\) \(I\) being the length of the weir or breadth of the river. Therefore the height producing the primary mean velocity is \(\left(\frac{D}{l \sqrt{2 g}(a+b)}\right)^{x}\). The equation given a little ago will give \(b=\left(\frac{D}{0,431 / \sqrt{2} \bar{G}}\right) \frac{2}{3}\), when the water above the weir is fagnant. Therefore, when it is already moving with the velacity \(\frac{\mathrm{D}}{l a+b}\), we flall have \(b=\left(\frac{D}{0,4.31 \sqrt{2 G}}\right)^{\frac{2}{3}}-\left(\frac{D}{1 \sqrt{2 g}(a+b}\right)^{2}\). It would be very troublefome to folve this equation regularly, becaufe the unknown quantity \(b\) is found in the fecond term of the anfwer. But we know that the height producing the velocity above the weir is very fmall in comparifon of \(b\) and of \(a\), and, if only eftimated roughly, will make a very infenfible change in the value of \(b\); and, by repeating the operation, we can correct this value, and obtain \(b\) to any degree of exactnefs.

To illuftrate this by an example. Seppofe a river, the fection of whofe fream is 150 feet, and that it difcharges 174 cubic feet of watcr in a fecond; how much will the waters of this river be raifed by a weir of the fame width, and 3 feet ligh ?

Suppofe the width to be 50 feet. This will give 3 feet for the depth; and we fee that the water will have a clear fall, becaufe the lower ftream will be the fame as before.

The fection being 150 feet, and the difcharge 174 , the mean velocity is \(\frac{1}{3} \frac{7}{5},=1,16\) feet, \(=14\) inches nearly, which requires the height of \(\frac{1}{4}\) of an inch very nearly. This may be taken for the fecond tem of the value of \(h\). Therefore \(b=\left(\frac{D}{0,431 \sqrt{2 G 1}}\right)^{\frac{2}{7}}-\frac{1}{3}\). Now \(\sqrt{2 \mathrm{G}}\) is, in the prefent cale, \(=27,313 ; 1\) is 600 , and D) is \(174 \times 1728,=300672\). Therefore \(h=12,192\) \(-0,2:,=11,942\). Now correct this value of \(b, b y\) correcting the fecond term, which is \(\frac{7}{\frac{1}{5}}\) of an inch, inAtead of \(\left(\frac{D}{\sqrt{2 g} /(a+b)}\right)^{\text {; }}\), or 0,141 . This will give us \(b=12,192-0,141,=12,051\), differing from the fert value about ris of an inch. It is needlef's to carry

\section*{E R}
the approximation farther, Thus we fee tina a weir, which dans up the whole of the former current of three fect deep, will only raife the waters of this river one foot.

The fame rule ferves for flowing how high we ought to raife this weir in oder to produce any given rife of the waters, whether for the purpofes of navigation, or for taking off a draft to drive mills, or for any other fervice; for if the breadth of the river remain the fame, the water will ftill flow over the weir with nearly the fane depth. A very fmall and lardly perceptible difference will indeed arife from the diminution of flope occafioned by this rife, and a confequent diminution of the velocity with which the river approaches the weir. But this difference muft always be a fmall frattion of the fecond tern of our anfwer; which term is itfelf very fmall: and even this will be compenfated, in fome degree, by the freer fall which the water will have over the weil.

If the intended weir is not to have the whole breadth of the river (which is feldom neceffary even for the purpofes of navigation), the waters will be raifed hirgher by the fame height of the wafteboard. The calculation is precifely the fame for this cafe. Only in the fecond tem, which gives the head of water correfponding to the velocity of the river, \(l\) muft ttill be taken for the whole breadth of the river, while in the firft term \(l\) is the length of the ivafteboard. Alfo \(\sqrt{2} \mathrm{G}\) mutt be a little lefs, on account of the contractions at the ends of the weir, unlefs thefe be avoided by griving the mafonry at the ends of the wafteboard a curred thape on the upper fide of the walteboard. This thould not be done when the fole object of the weir is to raife the furface of the waters. Its effect is but trifling at any rate, when the length of the wafteboard is confiderable, in proportion to the thicknefs of the theet of water flowing over it.
'The following comparifons of this rule with experiment will give eur readers fome notion of its utility.
\begin{tabular}{|c|c|c|c|c|}
\hline Difcharge of the Werr persecond & Head pro: ducing the veiociiy ar the Weir. & Head pro dacing the Vesccity above it & Catculated Hei,ht.f the River above the Walleboard & \begin{tabular}{l}

\hline \(2+62\) & 5,385 & 0,3:0 & 5,035 & 4,750 \\
\hline 1112 & 3,171 & 0,116 & 3,055 & 3,166 \\
\hline 259 & 1,201 & 0,0114 & 1,189 & 1,250 \\
\hline
\end{tabular}

It was found extremely difficult to meafure the exact height of the water in the upper flream above the uafteboard. 'The eurvature A I extended feveral feet up the fream. Indeed there muft be fomething arhitrary in this meafurement, becaufe the furface of the fream is not horizontal. The deviation fhould be taken, not from a horizontal plane, but from the inclined furface of the river.

It is plain that a river cannot be fitted for continued navigation by weirs. Thefe occafion interruptions; but a few inches may fometimes be added to the waters of a river by a вar, which may ftill allow a flat-bottomed lighter or a raft to pais over it. This is a very frequent practice in Holland and Flanders; and a very
fatical cheap and certain conveyance of goods is there obtained by means of ftreams which we would think no better than boundary ditches, and unfit for every purpofe of this kind. By means of a bar the water is kept up a very few inches, and the ftream hàs free courfe to the fea. The fhoot over the bar is prevented by means of another bar placed a little way below it, lying flat in the bottom of the ditch, but which may be raifed up on hinges. The lighterman makes his boat faft to a ftake immediately above the bar, raifes the lower har, brings over his boat, again makes it falt, and, having laid down the other bar again, proceeds on his journey. This contrivance anfwers the end of a lock at a very trifing expence; and though it does not admit of what we are accuitomed to call navigation, it gives very fure conveyance, which would otherwifc be impofible. When the waters can be raifed by bars, fo that they may be drawn off for machinery or other purpofes, they are preferable to weirs, becaufe they do not obftruct floating with rafts, and are not deftroyed by the ice.

Prob. III. Given the height of a har, the depth of water both above and below it, and the width of the river, to determine the difcharge ?

This is by no means fo eafily folved as the difcharge over a weir, and we cannot do it with the fame degree of evidence. We imagine, however, that the following obfervations will not be very far from a true account of the natter.

We may frtt fuppofe a refervoir LFBM (fig. 19.) of fagnant water, and that it has a wafteboard of the height CB. We may then determine, by the foregoing problems, the difcharge through the plane EC. With refpeet to the difcharge through the part CA , it Thould be equal to this product of the part of the fection by the velocity correfponding to the fall EC , which is the difference of the heights of water above and below the bar; for, becaufe the difference of \(\mathrm{E} a\) and \(\mathrm{C} a\) is equal to E C, every particle \(a\) of water in the plane CA is preffed in the direction of this ftream with the fame force, viz. the weight of the column E C. The fum of thefe difcharges thould be the whole difcharge over the bar: but fince the bar is fet up acrofs a running river, its difcharge mult be the fame with that of the river. The water of the river, when it comes to the place of the bar, has acquired fome velocity by its ीope or other caufes, and this correfponds tn fome height F E. This velocity, multiplied by the fection of the river, having the height \(\mathrm{F}, \mathrm{B}\), fhould give a difcharge equal to the difcharge over the bar.

To avoid this complication of conditions, we may firt compute the difelarge of the bar in the manner now ponited out, without the confideration of the previous velocity of the flream. This difcharge will be a little too fmall. If we divide it by the fection FB , it will give a primary velocity too fmall, but not far from the truth. Therefore we thall get the height F E, by means of which wee fhall be able to determine a velocity intermediate between D G and C H, which would correipond to a weir, as alfo the velocity CH , which correfponds to the part of the fection C A, which is wholly under water. Then we correet all thefe quantities by repeating the operation with them inftead of our firt aftumptions.
Mr Buat found this computation extremely near the Vos. XYI. Part I.
truth, but in all cafes a little greater than obfervation exhibited.
We may now folve the problem in the moft general terms.

Рrob. IV. Given the breadth, depth, and the flope of a river, if we confine its paflage by a har or weir of a known height and width, to determine the rife of the waters above the bar.

The flope and dimenfions of the channel being given, our formula will give us the relocity and the quantity of water difcharged. Then, by the preceding problem, find the heizht of water above the watteboard. From the fum of thefe two heights deduct the ordinary depth of the river. The remainder is the rife of the waters. For exampic:

Let there be a river whofe ordinary deptls is 3 feet, and breadth 40 , and whofe flope is \(1 \frac{1}{2}\) inches in 100 fathoms, or \({ }^{\frac{8}{8} \sigma \sigma \cdot}\). Suppofe a weir on this river 6 feet high and 18 feet wide.

We mutt firft find the velocity and difcharge of the river in its natural ftate, we have \(l=480\) inches, \(h=\) \(36, \frac{1}{s}=\) दरुण्ठ. Our formula of unifarm motion gives \(\mathrm{V}=23,45\), and \(\mathrm{D}=405216\) cubic inches.

The contraction obtaius here on the three fides of the orifice. We may therefore take \(\sqrt{\overline{2 G}}=26,1\). N. B. This example is Mr Buat's, and all the meafures are French. We have alfo a (the height of the weir) 72, and \(2 g=724\). Therefore the equation \(b=\) \(\left(\frac{\mathrm{D}}{2,431 \sqrt{2 \mathrm{C}} /}\right) \frac{2}{3}-\left(\frac{\mathrm{D}}{\sqrt{2} \frac{2}{2}(a+b}\right)=\) becomes \(30,182\). Add this to the height of the weir, and the depth of the river above the fluice is \(102, \mathrm{I} 82,=8\) feet and 6,182 iuches. From this take 3 feet, and there remains 5 feet and 6,182 inches for the rife of the waters.
There is, however, an important circumftance in this rife of the waters, which mult be diftinctly underfood before we can fay what are the interefting effets of this weir. This fwell extends, as we all know, to a confiderable diltance up the ftream, but is lefs fenfible as we go away from the weir. What is the diftance to which the fwell extends, and what increafe does it produce in the depth at different diftances from the weir?
If we fuppofe that the nope and the breadth of the channel remain as before, it is plain, that as we come down the ftream from that point where the fwell is infenfible, the depth of the channel increafes all the way to the dam. Therefore, as the fame quantity of water paffes through every fection of the river, the velocity mult diminiff in the fame proportion (very nearly) that the fection increafes. But this being an open ftream, and therefore the relocity being infeparahiy connected with the flope of the furface, it follows, that the flope of the furface muft diminin all the way from that point where the fwell of the water is infenfible to the dam. The furface, therefore, cannot be a imple inclined plane, but muft be concave upwards, as reprefented in fig. 20 . where FKIB reprefents the channel of a river, and FB the furface of the water running in it. If this be kept up to A by a weir AL, the furface will be a curve FIA, touching the natural furface F at the beginning of the fwell, and the linc AD which touches it in \(A\) will have the fope \(S\) corr fponding to the velocity which the waters have immediately before going over the weir. We know this fope, becaufe we

Hrachen! are fuppofed to know the difeharge of the river and its
hui rences \(\underbrace{\text { Buf rences }}\) fope and other cireumftance; before barring it with a dam; and we know the height of the dam H , and therefore the new velocity at \(A\), or immediately above A, and confequently the flope \(S\). Thercfore, draving the horizontal lines \(\mathrm{DC}, \mathrm{AG}\), it is plain that CB and CA will be the primary fope of the river, and the flope \(S\) correfponding to the velocity in the immediate neighbourhood of \(A\), becaule thefe verticals have the fane horizontal ditance DC . We have therefore \(\mathrm{CB}: \mathrm{CA}\) \(=S: s\) very nearly, and \(\mathrm{S}-\mathrm{s}: s=\mathrm{CB}-\mathrm{CA}: \mathrm{CA}\), \(=A B\) (ncarly): \(C A\). Therefore \(C A=\frac{A B X_{s}}{S-s},=\) \(\frac{\mathrm{H} s}{\mathrm{~S}-\mathrm{s}}\). But \(\mathrm{DA}=\mathrm{CAXS}\), by our definition of fope; therefore \(\mathrm{DA}=\frac{\mathrm{H} . \mathrm{S} . \mathrm{s}}{\mathrm{S}-\mathrm{s}}\).
'This is all that we can fay with precifion of this carve. Mir Buat examined what would refult from fappofing it an arch of a circle. In this cafe we fhould have \(\mathrm{DA}=\mathrm{DF}\), and \(A \mathrm{~F}\) very nearly equal to 2 AD : and as we can thus fiad AD, we get the whole length FIA of the fwell, and alfo the diflances of any part of the curve from the primitive furface FB of the river; for thefe will be very nearly in the duplicate proportion of their diftances from F . Thus ID will he \(\frac{x}{\frac{x}{1}}\) of AB , Eic. Thercfore we thould obtain the depth \(\frac{I}{I} d\) of the freans in that place. Getting the depth of the ftream, and knowing the difcharge, we get the velocity, and can compare this with the flope of the furface at 1 . This fhould be the llope of that part of the arch of the circlc. Making this comparifon, he found thefe circumitances to be incompatible. He found that the fection and fivell at \(I\), correfponding to an arch of a circle, fave a difcharge nearly th too great (they were as 405216 to 492142). Therefore the curve is fuch, that AD is greater than DF , and that it is more incurvated at \(F\) than at \(A\). He found, that making DA to DF as to to 2, and the curve FIA an arch of an elliple whofe longer axis was vertical, would give a very nice correfpondence of the fections, vclocities, and flopes. The whole extent of the fwell therefore can ncver be double of AD, and muft always greatly furpafs \(A D\); and thefe limits will do very well for every practical queftion. Therefore making DF \(\frac{9}{5}\) of \(A D\), and drawing the chord AD , and making \(\mathrm{DI} \frac{7}{2}\) of \(\mathrm{D} i\), we fhall be very near the truth. Then we get the fivell with fufficient precifion for any point H between F and D , by making \(\mathrm{FD}^{2}: \mathrm{FH}^{2}=\mathrm{ID}: \mathrm{H} b\); and if H is between D ) and A , we get its diftance from the tangent DA by a limilar procefs.

It only remains to determine the fwell produced in the waters of a river by the erection of a bridge or cleaning fluice which contracts the pafflage. This requires the folution of

Pros. V. Given the depth, breadth, and fope of a river, to determine the fwell occafoned by the piers of a bridge or fides of a cleaning fluice, which contract the paflage by a given quaatity, for a given length of channel.

This fwell depends on two circumftances.
1. The whole river mult pals through a narrow fpace, with a velocity proportionably increafed; and this requires a certain head of water above the bridge.
3. The water, in pafling the length of the piers with
a velocity greater than that correfponding to the primary flope of the river, will require a greater flope in order to acquire this velocity.

Let V be the velocity of the river before the erection of the bridge, and \(\mathbb{K}\) the quotient of the width of the river divided by the fum of the widths between the piers. If the length of the picrs, or their dimention in the direction of the 1 lream, is not-very great, KV.will nearly exprefs the velocity of the river under the arches; and if we fuppofe for a moment the contraction (in the fenfe hitherto ufed) to be nothing, the height producing this velocity will be \(\frac{\mathrm{K}^{2} \mathrm{~V}^{3}}{2 \mathrm{~g}}\). But the river will wot rifc fo high, having already a flope and velocity before "etting under the arches, and the height correfponding to this velocity is \(\frac{\mathrm{V}^{2}}{\mathrm{zg}}\); therefore the height for producing the augmentation of velocity is \(\frac{\mathrm{K}^{\prime} \mathrm{V}^{3}}{2 g}\) \(-\frac{V^{2}}{2 g}\). But if we make allowance for contraction, we muit employ a 2 G lefs than 2 g , and we muft multiply the height now found by \(\frac{2 g}{2 \mathrm{G}}\). It will then become \(\left(\frac{\mathrm{K}^{2} \mathrm{~V}^{2}}{2 g}-\frac{\mathrm{V}^{2}}{2 g}\right) \frac{2 g}{2 \mathrm{G}},=\frac{\mathrm{V}^{2}}{2 \mathrm{G}}\left(\mathrm{K}^{2}-1\right)\). This is that part of the fwell which muft produce the augmentation of velocity.
With refpect to what is neceflary for producing the additional תope between the piers, let \(p\) be the natural月ope of the river (or rather the difference of level in the length of the piers) before the erection of the bridge, and correfponding to the velocity V ; \(\mathrm{K}^{2} p\) will very nearly exprefs the difference of fuperficial level for the length of the piers, which is neceffary for maintaining the velocity KV through the fame length. The increafe of flope therefore is \(\mathrm{K}^{2} p-p=p\left(\mathrm{~K}^{2}-1\right)\). Thercfore the whole fwell will be \(\left(\frac{V^{2}}{2 \mathrm{G}}+p\right) \overline{\mathrm{K}^{2}-1}\).

These are the chief queftions or problems on this further a fuhject which occur in the practice of an engineer; and ention 10 the folutions which we have given may in every cafe bethe fubjeal dcpended on as very near the truth, and we are confi- reomdent that the errors will never amount to oue-fifth of the whole quantity. We are equally certain, that of thofe who call themfelves engineers, and who, without hefitation, undertake jobs of enormous expence, not one in ten is able even to guefs at the refult of fuch operations, unlefs the circumftances of the cafe happen to coincide with thofe of fome other project which he has executed, or has diftinctly examined; and very few have the fagacity and penetration neceflary for appreciating the effects of the dittinguifhing circumances which yet remain. The fociety eftablifhed for the encouragement of arts and manufactures could fcarcely doa more important fervice to the public in the line of their inftitution, than by publinhing in their Tranfactions a defcription of every work of this kind executed in the kingdon, with an account of its performance. This would be a moft valuable collection of experiments and facts. The unlearned practitioner would find among them fomething which refembles in its chief circumflances almoft any project which could occur to him in
actical his bufinefa, and would tell him what to expeet in the erences cafe under his management : and the intelligent engineer, affited by mathematical knowledge, and the hahit of claffing things together, would frequently be able to frame general rules. To a gentleman qualified as was the Chevalier de Buat, fuch a collection would be ineftimable, and might fuggett a theory as far fuperiot to his as he has gone before all other writers.

We fhall couclude this article with fome obfervations on the methods which may be taken for rendering fmall rivers and brooks fit for inland navigation, or at leait for floatage. We get much infruction on this fubject from what has been faid concersing the fwell produced in a river by weirs, bars, or any diminution of its former fection. Our knowledge of the form which the furface of this fwell affeets, will furnith rules for fpacing thefe obftructions in fuch a manner, and at fuch dittances from each other, that the fwell produced by one fhall extend to the one above it.

If we know the flope, the breadth, and the depth of a river, in the droughts of fummer, and have determined on the height of the flood-gates, or keeps, which are to be fet up in its bed, it is evident that their flations are not matters of arbitrary choice, if we would derive the greateft poffible advantage from them.

Some rivers in Flanders and Italy are made navigable in fume fort by fimple fluices, which, being fhut, form magazines of water, which, being difcharged by opening the gates, raifes the inferior reach enough to permit the paffage of the craft which are kept on it. After this momentary rife the keeps are thut again, the water finks in the lower reach, and the lighters which were floated through the fhallows are now obliged to draw into thofe parts of the reach where they can lie afloat till the text fupply of water from above enables them to proceed. This is a very rude and in. perfect method, and unjuftifiable at this day, when we know the effect of locks, or at leaft of double gates. We do not mean to enter on the confideration of thefe contrivances, and to give the methods of their conftruction, in this place, but refer our readers to what has been already faid on this fubject in the articles Canal, Iock, Navigation (Inlund), and to what will be faid in the article \(W_{\text {AqER-Works. At prefent we con- }}\) fine ourfelves to the fingle point of hufbanding the different falls in the bod of the river, in fuch a manner that there may be everywhere a fufficient depth of water : and, in what we have to deliver on the fubject, we fhall take the form of an example to illutrate the application of the foregoing rules.

Suppofe then a river 40 feet wide and 3 feet deep in the droughts of fummer, with a llope of 1 in 4800 . This, by the formula of uniform motion, will have a velocity \(V=23 \frac{1}{2}\) inches per fecond, and its difcharge will be 405216 cubic inches, or \(234 \frac{1}{2}\) feet. It is propofed to give this river a depth not lefs than five feet in any place, by means of flood-gates of fix feet high and 18 feet wide.

We firft compute the height at which this body of \(234^{\frac{1}{2}}\) cubic feet of water will difcharge itfelf over the flood-gates. This we thall find by Prob. II. to be \(3 \circ \frac{1}{4}\) inches, to which adding 72 , the height of the gate, we have \(102 \frac{1}{2}\) for the whole height of the water above the
floor of the gate; the primitive depth of the river being 3 feet, the rife or fivell 5 feet \(6 \frac{1}{5}\) inches. In the next place, we furd the range or fenfible extent of this fwell by Prob. I. and the obfervations which accompany it. This will be found to be nearly 9177 fathoms. Now fince the primitive depth of the river is three feet, there is only wanted two feet of addition; and the queftion is reduced to the finding what point of the curved furface of the fwell is two feet above the tangent plane at the hcad of the fivell? or how far this point is from the gate? The whole extent being 9177 fathoms, and the deviations from the tangent plane being nearly in the duplicate ratio of the diftances from the point of contact, we may inftitute this proportion \(66_{\frac{1}{2}}^{2}: 24=9177^{2}: 5526^{2}\). The latt term is the diftance (from the head of the fwell) of that part of the furface which is two feet above the primitive furface of the river. Therefore \(9177-5526\), or 3651 fathoms, is the diflance of this part from the flood-gate ; and this is the diftanee at which the gates fhould be placed from each other. No inconvenience would arife from having them nearer, if the banks be high enough to contain the waters; but if they are farther diltant, the required depth of water cannot be had without increafing the leight of the gates; but if reafons of conveniency fhould induce us to place them nearer, the fame depth may be fecured by lower gates, and no additional height will be required for the banks. This is generally a matter of moment, becaufe the raifing the water brings along with it the chance of flooding the adjoining fields. Knowing the place where the fwell ceafes to be fenfible, we can keep the top of the intermediate flood-gate at the precife height of the curved furface of the fwell by means of the proportionality of the devia. tions from the tangent to the diltances from the point of contact.

But this rule will not do for a gate which is at \({ }^{2}\) greater diftance from the one above it than the 3651 fathoms already mentioned. We know that a higher gate is required, producing a more extenfive fwell ; and the one fwell does not coincide with the other, although they may both begin from the fame point A (fig. 21. ( Nor will the curves even be fimilar, unlefs the thicknefs of the fheet of water flowing over the gate be increafed in the fame ratio. But this is not the cafe ; becaufe the produce of the river, and therefore the thicknefs of the fheet of water, is conflant.

But we may fuppofe them fimilar without erring more than two or three dccimals of an inch; and theri we fhall have \(\mathrm{AF}: \mathrm{AL}=f \mathrm{~F}: \mathrm{DL}\); from which, if we take the thicknefs of the fheet of water already cal. culated for the other gates, there will remain the heirght of the gate BL.
By following thefe methods, inftead of proceeding by random gue \({ }^{2}\) es, we fhall procure the greateft depth of water at the fmalleft expence poffible.

But there is a circumftance which mult be attended Effects of to, and which, if neglected, may in a thort time render firefhes, all cur works ufelefs. Thefe gates mutt frequently be open in the time of frefhes; and as this chamel then lhas its natural flope increafed in every reach by the great contraction of the fection in the gates, and alfo rolls alung a greater body of water, the attion of the ftream on its bed muft be increafed by the augmentation of velocity which thefe circumlances will produce:

Pracical Inferences.

\section*{\(R \quad I \quad V \quad E \quad R\).}

Frafieas and although we may lay that the general flope is neIniceerices ceffurily lecured by the cills of the flood-gates, which are paved with flone or covered with planks, yet this

And of 10 cal circuun dear.ces,
will not hinder this increafed current from digging up the bottom in the intervals, undermining the banks, and lodying the mud and carth thus carried off in plaees where the current meets wilh any check. All thefe confequences will affurcdly follow if the increafed velucity is greater than what correfponds to the regimen relatio to the foil in which the river holds on its cuulf.

In order therefore to procure durability to works of this kind, which arc generally of enormous expence, the local eircumfances munt be molt fcrupuloufly Itudied. It is not the ordiwary hurried furvey of an enginecr that will free us from the rifk of our navigation becoming very troublefome by the rife of the waters being diminiihed from their former quantity, and banks formed at a fmall diflanec below every fluice. We mult attentively itudy the nature of the foil, and difcover experinentally the velocity which is not inconfiftent with the permanency of the channcl. If this be not a great deal lefs than that of the river when accelerated by frefles, the regimen may be preferved after the eftablifhment of the gate, and no great changes in the channel will be neceffary : but if, on the other hand, the natural vlocity of the river during its frefhes greatly exceeds what is confiftent with ttability, we mutt enlarge the widh of the channel, that we may diminifh the hydraulic mean depth, and along with this the velocity. Therefore, knowing the cquantity difcharged during the frefhes, divide it by the velocity of regimen, or rather by a velocity fonewhat greater (for a reafon which will appear by and by), the quotient will be the area of a new fection. Then taking the natural flope of the river for the flope which it will preferve in this enlarged chaunel, and after the cills of the flood-gates have been fixed, we muft calculate the hydraulic mean depth, and then the other dimenfions of the channel. And, laftly, from the known dimenfions of the channel and the difcharge (which we mult now compute), we proceed to calculate the lieight and the ditances of the Hluod-gates, adjulted to their widths, which mult be regulated by the room which may be thought proper for the free paffage of the lighters which are to ply on the river. An example will illuftrate the whole of this proeufs.
Suppofe then a fmall river having a flope of 2 inclees in 100 fathoms or \(\frac{38}{}{ }^{\circ}\) of fuch fmall Atreams, and whofe depth in funmer is 2 feet, but fubject to floods which raife it to nine feet. Let its breadth at the bottom lee 18 feet, and the bafe of its flanting fides \(\frac{4}{5}\) of their height. All of thefe dimenfions are very conformable to the ordinary courfe of things. It is propofed to make this river navigable in. all reafons by meaths of keeps and gates placed at proper diftances; and we want to know the dimentions of a, channel which will be permanent, in a foil which Legins to yield to a velocity of 80 inches per fecond, but will be fafe under a velocity of 24 .

The primitive channel having the properties of a rectangular channcl, its breadth during the frelhes mult be \(\mathrm{B}=30\) feet, or 360 inches, and its depth \(/ 9\) fect or 108 inches; thicrefore ite hydraulic mean depth
\(d=\frac{\mathrm{B} b}{\mathrm{~B}+2 b}=61,88\) inches. Its real velocity there. fore, during the frelhes, will be 38,9447 incles, and its difcharge 1514169 cubic inches, or \(876 \frac{1}{8}\) cubic feet per fecond. We fee theretore that the natural channel will not be permanent, and will be very quickly deitroyed or changed by this great velocity. We have two methods for procuring ftability, viz. diminilhing the flope, or widening the bed. The firft method will require the courfe to be lengthened in the proportion of \(24^{2}\) to \(3988^{2}\), or nearly of 36 to 100 . The expence of this would be enormous. The fecond method will require the hydrawlic" mean depth to be increaled nearly in the fame proportion (becaufe the velocities are uearly as \(\frac{\sqrt{d}}{\sqrt{s}}\). This will evidently be much lefs coftly, and, even to procure convenient room for the mavigation, muft be preferred.

We muft now obferve, that the great velocity, of which we are afraid, obtains only during the winter floods. If therefore we reduce this to 24 inches, it mult happen that the autumnal frefhes, loaded with fand and mud, will ecrtainly depofit a part of it, and choak up our chamel below the flood-gates. We mult therefore felect a mean velocity fomewhat exceeding the regimen, that it may carry off thefe depolitions. We fhall take 27 inches, which will produce this effect on the loofe mud without endangering our channel in any remarkable degree.

Therefore we have, by the theorem for uniform motion, \(V=27,=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-I \sqrt{s+1,6}}-0,3(\sqrt{s-0,1})\). Calculating the divifor of this formula, we find it \(=55,884\). Hence \(\sqrt{d}-0,1=\frac{27 \text { inch. }}{\frac{297}{55,884}-0,3}=\)
5,3843 , and therefore \(d=30 \frac{1}{r^{\frac{1}{2}}}\). Having thus deter. mined the hydraulic mean depth, we find the area \(S\) of the fection by dividing the difcharge 1514169 by the velocity 27. This gives us 56080,368 . Then we get the breadth \(B\) by the formula formerly given, \(B=\sqrt{\left(\frac{S}{2 d}\right)^{2}-2 S}+\frac{S}{2 d^{2}}=1802,296\) inches, or 150,19 feet, and the depth \(b=31,115\) inches.

With thefe dimenfions of the fection we are certain that the channel will be permanent; and the cills of the flood-gates being all fixed agreeable to the primitivenope, we need not fear that it will be changed in the intervals by the action of the current. The gates being all open during the frefhes, the bottom will be cleared of all depolited mud.

We muft now flation the flood-gates along the new channel, at fuch diftances that we may have the depth of water which is proper for the lighters that are to be employed in the navigation. Suppofe this to be four feet. We muft firt of all learn how ligh the water will be kept in this new chamel during the fummer dronghts. There remained in the primitive channel only 2 feet, and the fection in this cafe had 20 feet 8 inches mean width; and the difcharge correfponding to this feetion and flope of \(5 \delta^{2} .0 \mathrm{C}\) is, by the theorem of uniform motion, 130,849 cubic inches per fecond. T'o
al find the depth of water in the new ehannel correfpondes. ing to this difcharge, and the fame flope, we muft take the method of approximation formerly excmplified, semombering that the difcharge \(D\) is \(1300^{\circ} 44\), and the breadth B is 1760,8 at the bottom (the flant fides being \(\frac{4}{5}\) ). Thefe data will produce a depth of water \(=6 \frac{\pi}{3}\) inches. To obtain four feet therefore behind mny of the flood-gates, we muft have a fwell of \(41 \frac{2}{3}\) inches produced by the gate below.
We nuft now determine the width of paffage which muft be given at the gates. This will regulate the thicknefs of the fheet of water which flows over thiem when thut ; and this, with the height of the gate, fixes the fwell at the gate. The extent of this fwell, and the eleration of every point of its curved furface above the new furface of the river, requires a combination of the height of fwell at the flood-gate, with the primitive flope and the new relocity. Thefe being computed, the flations of the gates may be affigned, which will fecure four feet of water behind each in fummer. We need not give thefe computations, having already exemplified them all with relation to another river.

This example not only illuftrates the method of proceeding, fo as to be enfured of fuccefs, but alfo gives us a precife inftance of what muft be done in a cafe which cannot but fiequently occur. We fee what a prodigious excavation is neceffary, in order to obtain pernanency. We have been obliged to enlarge the primitive bed to about thrice its former fize, fo that the excavation is at lealt two thirds of what the other method required. The expence, however, will ftill be vaftly inferior to the other, both from the nature of the work and the quantity of ground occupied. At all events, the expence io enormous, and what could never be repaid by the navigation, cxcept in a very sich and populous country.

There is another circumitance to be attended to. The navigation of this river by fluices muft be very defultory, unlefs they are extremely numerous, and of fluall heights. The natural furface of the fwell being concave upwards, the additions made by its different parts to the primitive height of the river decreafe rapidly as they approach to the place A (fig. 20), where the fwell terminates; and three gates, each of which raites the water one foot when placed at the proper diftance from each other, will raife the water anuch nore than two gates at twice this dillanct, each zafing the water two teet. Moreover, when the elevacon produced by a flood-gate is confiderable, exceeding a very few inches, the fall and current produced by the opening of the gate is luch, that no boat can pulfibly pafs up the river, and it runs inminent rik of being cuerfit and funk, in the attempt to go down the ftream. 'I his renders the navigation defultory. A number of lighters culleet themielves at the gates, and wait their opening. They pafs through as foon as the current becomes moderate. This would not, perhaps, be very hurfful in a regulated navigation, if they could then proceed on their voyage. But the boats bound up the river moult flay on the upper fide of the gate which they have juft now pafled, becarfe the charuel is now too nallow for them to proceed. Thofe bound down the river can only go to the next gate, unlefs it has been opened at a time nicely adjuited to the opening of the one above it. The patiage
downwards may, in many cales, be continued, by rery intelligent and attentive lockmen, but the paffage up muft be exceedingly tedions. Nay, we may far, that
white the paflage downwards is continuous, it is but in a very few cafes that the paffage upward is praticable. If we add to thefe inconveniences the great danger of paffage during the frefhes, while all the gates are open, and the immerse and unavoidable accumulations of ice, on occafion even of night frolts, we may fee that this method of procuring an inland navization is amazingly expenfive, defultory, tedious, and hazardous. It diá not therefore merit, on its own account, the artention we have bettowed on it. But the difcufion was abfolutely neceffary, in order to fhow what mult be done in order to obtain effect and pernianency, and thus to ; revent us from engaging in a project which, to a perfon not duly and confidently informed, is fo feafible and promifing. Many profeflional engineers are ready, andwith honeft intentions, to undertake fuch tafks; and by avoiding this immenfe expence, and contenting themfelves with a much narrower channel, they fucceed, (witnefs the old navigation of the river Merfey). But the work has no duration ; and, not having been found very ferviceable, its ceflation is not matter of much regret. The work is not much foken of during its
continuance. It is foon forgotten, as well as its failure, continuance. It is foon forgotten, as well as its failure, and engineers are found ready to engage for fuch another.

It was not a very refined thought to change this interofuc \({ }_{\mathrm{r}}\) imperfect mode for another free from moft of its incon- tion is veuiences. A boat was brought up the river, through locis. one of thefe gates, only by raifing the waters of the inferior reach, and depreffing thofe of the upper: and it could not efcape obfervation, that when the gates were far afunder, a vaft body of water muft be difcharged before this could be done, and that it would be a great inprovement to double each gate, with a very fmall ditance between. Thus a very finall quantity of water woulc fill the interval to the defired height, and allow the boat to come through; and this thought was the more obvious, from a fimilar practice having preceded it, viz. that of navigating a fmail river by means of double bars, the loweft of which lay flat in the bottom of the river, but could be raifed up on hinges. We bave mentioned? this already; and it appears to have-been an old practice, being neentioned by Stevinus in his valuable work on fluices, publifhed about the beginning of the laft century; yet no trace of this method is to be found of much older dates. It occurred, however, accidentaily, pretty often in the flat countrics of Holland and Flanders, which being the feat of frequent wars, almof every town and village was fortified with wet ditches, comnected with the adjoining rivers. Stevinus mention particulazly the works of Condé, as having been loutr employed, with great ingenuity, for rendering savira-ble a very long flretch of the Scheldt. The boats were. received into the lower past of the foffee, which was feparated from the reft by a fone batardeau, ferving to keep up the waters in the relt of the foffee about tight feet. In this was a fluice and another dam, by whick the boats could be taken into the upper foffee, which communicated with a remote part of the Scheldt by along canal. This appears to be one of the earlieft locks.

In the firf attempt to introduce this improvement ins

Iranicsi the navigation of rivers already kept up by weirs, which fincereses. gave a partial and internupted navigation, it was ufual to avoid the great expence of the fecond dam and gate, by making the lock altogether detached from the riwr, within land, and havius its bafon parallel to the river, and communicating by one end with the river aboue the weir, and by the other end with the river below the weir, and having a flood-gate at each end. This was a moit ingenious thought; and it was a prodigious improvement, free from all the inconveniences of currents, ice, \&.c. \&ec. It was called a Schluffel, or lock, with confiderable propriety; and this was the origin of the word fuict, and of our application of its tranflatiun lock. This practice being once introdaced, it was not long before engineers found that a complete feparation of the navigation from the bed of the river was riot only the moft perfect method for obtaining a fure, caly, and uninternupted navigation, but that it was in general the moft ceconomical in its firtt conftruction, and fubject to no rilk of deterioration by the action of the currem, which was here entirely removed. Lucked canals, therefore, have almot entircly fupplantcd all attempts to improve the natural beds of rivers; and this is hardly ever attempted exeept in the flat countries, where they can hardly he faid to differ from horizental canals. We therefore clofe with thefe obfervations this article, and referve what is yet to be faid on the confruction of canals and locks for the article IV'dqER-Works.

116 Wefervations beg leave, however, to detain the reader for rader.
to the anxiety to rencer this differtation worthy of his noanxicty to rencer this differtation worthy of his notice, by making it practically uleful. We have on every uccation appealed, frum all theoretical deductions, however \{pecious and well fupported, to fact and oofervation of thofe fpontaneous phenomena of nature which are continually paffing in review before us in the motion of running waters. Refting in this manner uur whole doetrines on experiment, on the obfervatin in of what really happens, and what happens in a vay which we cannot or do not fully explain, thefe fpentancous operations of nature came infenfibly to acryiure a particular value in our innagination. It has alfo bappened in the courfe of our refections on thefe fubjecte, that thefe phenomena have frequently prefented themfelves to our view in groups, not lefs remarkable for the extent and the importance of their confequences than for the fimplicity, and frequently the feeming infignificancy, nay frivolity, of the means employed. Our fancy has therefore been formctimes warmed with the view of a fomething; an

Ens agitans molem, et magno fe corpore niffens.
This has fometimes made us exprefs ourfelves in a way that is fufceptible of mifinterpretation, and may even lead into a miftake of our meaning.

We therefore fiad ourfelves obliged to declare, that by the term Natere, which we have fo frequently uled con anore, we do not mean that indefribable idol which the felf-conceit and vanity of our neighbnurs in France have fet up of late, and offentatioufly itand on tiptoe to worthip. This ens rationis, this creature of the imagination, has long been the object of cool contemplation in the clufet of the philofopher, and has frated his atterion with many other play-things of his ever-working faney. But fle has now become the ob-
