(2) Tænioglossa, with teeth 2, 1, 1, 1, 2. Here belong the marine forms (*Naticidæ*) which are common on the shores of the U. S., and which lay their eggs in those peculiar bands commonly known as "sand-saucers." In these the siphon is imperfect. The other tænioglossate forms are very numerous, and but a few of the more prominent families can be mentioned; among them the periwinkles (*Littorinidæ*), the slipper limpets (*Calyptræida*), the *Cerithiidæ*, the strombs (*Strombidæ*), triton-shells (*Tritonidæ*), tun-shells (*Doliidæ*), violet shells (IANTHINIDÆ, *q. v.*), and the HETEROPODA (*q. v.*), all of which are marine; the fresh-water limpets (*Valvatidæ*) and the melanians, also fresh-water; and a few forms which, like the *Cyclostomidæ* and *Truncatellidæ*, dwell on the land.

(3) Stenoglossa or Rachiglossa, with teeth 1, 1, 1, the principal members of which are the whelks (*Buccinidæ*), volutes, olive-shells, miter-shells, cones, etc. The cones are especially noticeable from the fact that there is an unpaired poison-gland connected with the lingual teeth. J. S. KINGSLEY.

Monotrem'ata [Mod. Lat.; Gr. *μόνος*, single + *τρῆμα*, perforation, hole, deriv. of *τιτραίνειν*, bore, pierce, perforate]: the lowest order of mammals, the sole existing order of the subclass Ornithodelphia or Prototheria. The name is derived from the fact that, as in the birds, one external orifice, opening into a common cloaca, serves for the discharge of alvine and renal excretions and for reproductive purposes. They are by far the most primitive forms of their class, and in their structure depart less from the old-fashioned reptiles and amphibians than many others. One of the most interesting and significant points of their economy is that they mature very much larger eggs than other mammals, and they are even *oviparous*. The brain has a small cerebrum, whose hemispheres are chiefly connected by a well-developed "anterior commissure," the "corpus callosum" being rudimentary; but the most striking and peculiar structural characteristics appertain to the sternal apparatus; the sternum has a peculiar T-shaped bone (the episternum or interclavicle) in advance of the manubrium or presternum; the coracoids extend from the clavicle to the sternum, and only toward maturity become anchylosed with the scapula. Such features contrast remarkably with the simple sternum of all other mammals. The oviducts are enlarged below into uterine pouches, but open separately (as in oviparous vertebrates generally), and debouch into a cloacal chamber, as already noted, no true vagina being developed. The testes are abdominal in position throughout life, and the vasa deferentia do not open into a distinct urethral channel, but into the cloaca. The mammary glands have no nipples. Of the only two types known, one (the Ornithorhynchids) lays two eggs in a nest, while the species of the other (the Tachyglossids) as a rule only develop a single egg, which is carried in a pouch developed by the mother. See DUCKBILL, ECHIDNA, ORNITHORHYNCHIDÆ, and TACHYGLOSSIDÆ. THEO. GILL.

Monrea'le: town; in the province of Palermo, Sicily; 4 miles S. W. from the city of Palermo (see map of Italy, ref. 9–E). It has little of interest except its cathedral, one of the most splendid temples in the world. It is in form a Latin cross; the exterior has undergone modifications, though some original portions remain unchanged; the bronze doors date from 1186. The interior (325 feet long and 125 broad) consists of three naves supported by sixteen gigantic columns of Oriental granite, with capitals of exquisite workmanship. Adjoining the cathedral is the great monastery of the Benedictines. The terrible massacre known as the Sicilian Vespers (1282) began on the road from Palermo to Monreale. Pop. about 13,900.

Monro', ALEXANDER, M. D., F. R. S.: anatomist; b. in London, England, of Scotch parents, Sept. 8, 1697; studied medicine and surgery at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave; was admitted as a surgeon at Edinburgh 1719; was elected by the town council in Jan., 1721, first Professor of Anatomy to the new medical school established in connection with the university, and instituted a course of instruction which soon made that school the best medical college in the world. He was one of the two principal promoters of the Royal Infirmary at Edinburgh, where he delivered clinical lectures; founded a society for collecting and publishing professional papers; edited six volumes of *Medical Essays and Observations* (1732), and two volumes of *Essays, Physical and Literary*, for the same body, which had then taken the name of the Edinburgh Philosophical Society. His own publications comprised *Osteology, or Treatise on the Anatomy of the Bones* (Edinburgh, 1726); *Essay on Comparative Anatomy* (London, 1744); *Observations, Anatomical and Physiological* (Edinburgh, 1758); and an *Account of the Success of Inoculation of Smallpox in Scotland* (1765). These, with other tracts left in MS., were printed together in 1781. Dr. Monro resigned the chair of anatomy to his youngest son, Alexander, in 1759, but continued his clinical lectures at the infirmary. D. in Edinburgh, July 10, 1767. Dr. Monro is often styled *Primus*, to distinguish him from his son and grandson of the same name.—His eldest son, DONALD, b. 1731, was also an able physician, and published several medical books, besides a memoir of his father (1781). D. in July, 1802.

Monro, Alexander, M. D., F. R. S. E.: anatomist; son of Alexander Monro (1697–1767); b. in Edinburgh, Mar. 24, 1733; studied surgery in the University of Edinburgh under his father, to whom he became Assistant Professor of Anatomy July, 1756; spent some time at the medical schools of Berlin and Leyden; succeeded his father as full professor in 1759, and also as secretary of the Philosophical Society, which in 1783 took by royal charter the title of Royal Society of Edinburgh. Among his publications were *De Venis Lymphaticis Valvulosis* (Berlin, 1757), which involved him in a controversy with Dr. William Hunter of London; *On the Structure and Functions of the Nervous System*, a large illustrated folio (Edinburgh, 1783); *On the Structure and Physiology of Fishes* (folio, 1785); *Description of all the Bursæ Mucosæ of the Human Body* (1788); and *Three Treatises on the Brain, the Eye, and the Ear* (illustrated, 1797), besides several papers in the *Transactions* of the Edinburgh Royal Society. He retired from his professorship in 1808. D. in Edinburgh, Oct. 2, 1817. He was succeeded by his son Alexander, called *Tertius* (b. 1773; d. 1859), who wrote *Anatomy of the Human Body* (1813).

Monroe: city (settled by Spaniards in 1796); capital of Ouachita parish, La. (for location of parish, see map of Louisiana, ref. 7–D); on the Ouachita river, and the Queen and Cresc. and the St. L., Iron Mt. and S. railways; 75 miles W. by N. of Vicksburg, 400 miles N. W. of New Orleans. It contains 5 churches, U. S. Government building, 2 national banks with combined capital of $110,000, a merchants' and farmers' bank with capital of $100,000, and a daily and 3 weekly newspapers. The industrial establishments include a cotton compress, 90-inch Morse press, ice-factory, 2 cotton-seed oil-mills, 2 shingle-mills, 2 sawmills, 2 brick-factories, a stave-factory whose total output is shipped to Bordeaux, France; a sash, door, and blind factory, and a cigar-factory. Over 40,000 bales of cotton are pressed here annually. Pop. (1880) 2,070; (1890) 3,256; (1900) 5,428.

Editor of "Telegraph-Bulletin."

Monroe: city; capital of Monroe co., Mich. (for location of county, see map of Michigan, ref. 8–K); on the Raisin river, and the Flint and Pere Marq., the Lake Sh. and Mich. S. and the Mich. Cent. railways; 35 miles S. of Detroit. It contains a city library (founded 1837), seminary for young women, conservatory of music, a national bank with capital of $50,000, a private bank, and two weekly newspapers; has extensive nurseries and vineyards; and manufactures flour, lumber, and sash and blinds. Pop. (1880) 4,930; (1890) 5,258; (1900) 5,043. Editor of "Commercial."

Monroe: town: capital of Union co., N. C. (for location of county, see map of North Carolina, ref. 4–E); on the Carolina Cent. Railroad; 25 miles S. E. of Charlotte. It is a manufacturing town, with carriage-factory, iron-works, cotton-mills, foundry, and other industrial establishments. Pop. (1880) 1,564; (1890) 1,866; (1900) 2,427.

Monroe: city; capital of Green co., Wis. (for location of county, see map of Wisconsin, ref. 7–D); on the Chi., Mil. and St. P. and the Ill. Cent. railways; 34 miles W. by S. of Janesville. It is in an agricultural, dairying, and stock-raising region, and has a large cheese-factory, boiler-works, wagon-factory, agricultural-implement works, a national bank with capital of $100,000, a State bank with capital of $75,000, and a daily and 5 weekly newspapers. Pop. (1880) 3,293; (1890) 3,768; (1900) 3,927.

Monroe, James: fifth President of the U. S.; b. in Westmoreland co., Va., Apr. 28, 1758; son of Spence Monroe, and a descendant of a Scottish Cavalier family; educated at William and Mary College; entered the Revolutionary army in 1776; served with distinction in the principal engagements of 1777–78; was wounded at Trenton; studied law under Jefferson; served again in the latter part of the war; and was delegate to Congress 1783–86. Perceiving the defects of the Articles of Confederation he desired the extension of the powers of Congress, and in 1785 moved to confer on that body the authority to regulate interstate trade. The adoption of this resolution led to the calling of a convention at Annapolis, and ultimately to the formation of the Constitution. Monroe, however, as delegate to the Virginia convention in 1788 opposed the adoption of the new instrument by his native State, and as U. S. Senator 1790–94 he supported the Anti-Federalist party. He was minister to France 1794–96, and Governor of Virginia 1799–1802. He was sent as envoy extraordinary to France in 1802, and with Livingston, the minister resident, negotiated the Louisiana purchase. He was minister to Great Britain 1803–08, but in 1805 his duties there were interrupted for a time by a special mission to Madrid to settle the boundaries of the new purchase. He failed in this, and the treaty which he negotiated with Great Britain was not acceptable to the U. S. Government. Returning home in 1807 he published an elaborate defense of his course as a diplomatist, and in 1811 received a substantial proof of the public confidence by being again elected Governor of Virginia. In the same year he was appointed Secretary of State, and held that office till 1817, combining with its duties those of Secretary of War in 1814–15. In 1817 he was elected President over Rufus King, the Federalist candidate, and in 1820 was re-elected by the almost unanimous vote of the electoral college. The chief events of this prosperous administration, "the era of good feeling," were the conclusion of a convention with Great Britain relating to the Newfoundland fisheries in 1818, the acquisition of Florida from Spain in 1819, the establishment of a system of internal improvements, the enunciation of the Monroe Doctrine, the Missouri Compromise of 1820, the recognition of the independence of the Spanish-American states, and the last visit of La Fayette to the U. S. In 1831 he removed to New York, where he died July 4, 1831. Mr. Monroe was a man of plain and unaffected manners, unquestioned purity and honesty, and of very robust and useful though not brilliant qualities as a public officer. He was beloved by all parties, and few men did more than he to remove the animosities and prejudices so rife in the early part of his political life. See Gilman's *Life* of Monroe.

Revised by F. M. Colby.

Monroe, Will S.: See the Appendix.

Monroe City: town; Monroe co., Mo. (for location of county, see map of Missouri, ref. 3–H); on the Burl. Route and the Mo., Kan. and Tex. railways; 30 miles S. W. of Quincy, Ill. It contains 8 churches, public-school building that cost $25,000, planing, carding, and grist mills, 2 State banks with combined capital of $55,000, and 2 weekly newspapers. It is in a prairie region, and ships annually 200 carloads of railway ties. Pop. (1880) 640; (1890) 1,830; (1900) 1,929.

Editor of "News."

Monroe Doctrine: the name given to a declaration of the policy of the U. S. in opposition to the interference of European powers in the political affairs of the American continents, made by President Monroe in his message to Congress in 1823. It was known that at the Congress of Verona (1822) a project had been discussed of aiding Spain to recover dominion over her revolted American colonies. Mr. Canning, while making his preparations to go to India as governor-general, received the appointment of Secretary for Foreign Affairs in Sept., 1822, and it was by his influence that the British Government was led to take energetic measures against the absolutists' principle of interference in preventing revolution and all political changes proceeding from the people in opposition to the rulers. France early in 1823 was ready to invade Spain for the purpose of overthrowing the revolutionary government. The next measure was likely to be an attempt to subjugate the Spanish colonies, some of which the U. S. Government had recognized as independent nations. The British Government is understood to have suggested to the U. S. the policy of making some protest against such interference in the affairs of the American states or colonies. The suggestion being approved of by the President, by J. Q. Adams, Secretary of State, and by Jefferson, who was consulted, the annual message of Dec., 1823, contained the following declarations: "That we should consider any attempt on the part [of the allied powers] to extend their system to any portion of this hemisphere as dangerous to our peace and safety," and "that we could not view any interposition for the purpose of oppressing [governments on this side of the water whose independence we had acknowledged], or controlling in any manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the U. S." This declaration, together with the known sentiments of the British cabinet and nation, put an end to any designs which may have been entertained looking toward armed interference in American affairs. It was also consistent with international rights, and was fully justified by self-defense. The balance of power had in such a case no application, for that principle is essentially confined to European states, and interference on political, doctrinary grounds is unrighteous. This declaration has received the assent of the country. It may be called a part of its settled

policy, though Congress never took formal action in regard to it; but it should not be stretched into a warrant to prevent any dealings of an American with a European state which may be distasteful to the U. S. The Monroe doctrine was aimed at interference with the constitution or form of government of an American state forcibly carried out. These limitations are often lost sight of. During the civil war in the U. S., when the French emperor put the Archduke Maximilian on the throne of Mexico, the U. S. Government was too busy and too weak to endeavor to prevent the measure; the time was chosen accordingly; but in ordinary times that or a similar step would have roused government and country to opposition. At the close of the war troops were marched toward the Mexican border, the French forces were withdrawn, and the empire fell. Another declaration of the same message is as follows: That "the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European power." If those words expressed the intention that the South American republics should be prevented from freely surrendering their territory for the purposes of colonization, this was going altogether too far; it was avowing a rule of interference on the part of the U. S. equally to be condemned with the similar one acted on by European absolutists; but it is probable that the words were intended to mean that the western hemisphere was already occupied by a number of states whose territories were contiguous, leaving no space for further colonization, a somewhat doubtful statement. This meaning is to be inferred from what Mr. Adams, then Secretary of State, said in 1825 when he was President, unless he is to be considered as retracting what had been hastily uttered two years before. He says, in reference to a congress of American powers at Panama, that "an agreement between all the parties represented at the meeting that each will guard, *by its own means*, against the establishment of any future European colony within its borders, may be found to be desirable. This," he adds, "was more than two years since announced by my predecessor to the world as a principle resulting from the emancipation of the American continents." The House of Representatives, however, opposed the principle, even when thus interpreted, by a resolution that the U. S. "ought not to become parties" with any of the republics of South America "to any joint declaration for the purpose of preventing the interference of any of the European powers with their independence or form of government, or to any compact for the purpose of preventing colonization upon the continent of America." The majority of the House was quite willing, without question, to approve of independent action with regard to interference when it should be threatened, but to prevent colonization they seem to have regarded as not worth any diplomatic proceedings. This declaration of Mr. Monroe has since fallen into oblivion. The other will probably always carry with it the approval of the U. S. Revised by T. S. Woolsey.

Monrovia: the capital of Liberia (*q. v.*).

Mons: the capital of the province of Hainaut, Belgium; on the Trouille; 38 miles S. S. W. of Brussels (see map of Holland and Belgium, ref. 11–C). It is strongly fortified, has a beautiful cathedral built in the sixteenth century and a very interesting town-house built in 1443, extensive manufactures of linen, lace, earthenware, and tobacco, and carries on considerable trade. As an important strategic point it figures prominently in the history of the wars between Spain and the Netherlands, France and Spain, and France and Austria. After enduring many sieges and changed hands several times, it became by the treaty of Utrecht one of the barrier towns of the Dutch, but in 1746 it was taken by the French, and soon afterward restored to Austria. After the battle of Jemmapes in 1792 it formed a part of the French republic, but was lost to France on the downfall of the first empire. Pop. (1896) 25,514.

Monserrat, mōn-sā-raat', Joaquin, de, Marquis of Cruillas: a Spanish general and administrator, Viceroy of Mexico Jan., 1761, to Aug., 1766. War having broken out between Spain and Great Britain in 1762, Cruillas took active measures to defend the coast, and he was the first to organize a regular militia. The latter measure, by fostering the military spirit of the people, had important effects on the country. H. H. S.

Monsoon' [: Fr. *mousson*: Span. *monzon*: Ital. *monsone*, from Malay *mūsim*, season, monsoon, from Arab. *mausim*, time, season]: a seasonal interchange of wind between continent and ocean—an annual land and sea breeze. The name was first applied to the seasonal periodic winds alternating between the southern part of the continent of Asia and the Indian Ocean, but has since been expanded to include all cases due to similar causes. The continents are warmer in summer (especially below lat. 42° N. or S.), and the cooler and heavier air of the ocean flows in; the reverse occurs in winter. The alternation is the more marked the larger the continent, the more arid its interior, and the greater the elevation of the latter; it is most marked when ranges of mountains are so arranged as to accentuate the differences between the air of continent and ocean, and the slope facilitates the flow of the air—upward on the principle of a flue or downward by gravity. The best marked case is that of Southern Asia, where the summer monsoon is from the S. and brings rain, while the winter monsoon is from the N. and brings dry weather. There are Australian monsoons, though not so well marked, but the interchange between the Asiatic and Australian, combined with the trades, cause seasonal periodic winds over the East Indies. The other continents have their monsoons. The most distinct in the U. S. is that of Texas, extending at times up the Mississippi valley to the Canadian boundary. See Ferrel, *Popular Treatise on Winds* (1889), and the present writer, *The Texan Monsoons* (Bull. Phil. Soc. of Washington, xii., 293–308, 1894). Mark W. Harrington.

Monstrelet, mōn'stre-lā', Enguerrand, de: chronicler; b. at Cambrai, France, about 1390; was provost of his native city and bailiff of Wallaincourt, where he died July 20, 1453. He wrote a *Chronique*, narrating the history of France from 1400 (the date at which Froissart stops) to 1444. The latest edition is by L. Douet-d'Arcy (7 vols., Paris, 1857–63); English translation by Thomas Johnes (13 vols., London, 1810).

Monstrosity, in natural history: See Teratology.

Mont, Ment, Month, Menthu: the Egyptian god of war, who was especially worshiped in Hermonthis (Erment) and Thebes. He was variously represented as a hawk-headed deity, though he sometimes wore the head and horns of a bull which was sacred to him under the name of Bakh, the Bachis of the classics. He is also occasionally pictured with the head-dress peculiar to Amon. In later times he was identified with the sun-god Ra, as Mont-Ra. His name was used in inscriptions as a synonym of power ("strong as Mont"). In conjunction with the Semitic Baal, the combination stood for the highest ideal of might.

Charles R. Gillett.

Montagnais: See Algonquian Indians; also Athapascan Indians.

Montagnards, mōn'tăăn'yaar' [Fr., liter., mountaineers], or simply **The Mountain**: in the first French Revolution a name sometimes given to the ultra-democratic members of the National Convention, so called because they originally sat in the highest seats of the hall. The Girondists were, in distinction, called the Plain; and after their destruction the lower part of the house was called the Marsh (*Marais*), and was occupied by the undistinguished rabble of Jacobins, the leaders retaining the high seats.

Mon'tagu, Basil: law reformer and author; b. in London, Apr. 24, 1770; a natural son of the Earl of Sandwich by an actress, Miss Ray or Wray. He graduated at Cambridge 1790; was soon after called to the bar at Gray's Inn, and acquired a large and profitable practice in London, chiefly in bankruptcy cases. He was a member of the literary circle of which Coleridge was the chief ornament, and came near being carried away by the social theories of William Godwin. In 1806 he was appointed a commissioner of bankruptcy, and exerted himself successfully through a series of years to procure the reform of the law concerning bankruptcy, which was then highly objectionable. Under the new law he became accountant-general of bankruptcy, compelled the Bank of England to pay interest on deposits ordered by a court of bankruptcy, and distinguished himself by his advocacy of other reforms, especially the abolition of capital punishment for minor offenses. He was a voluminous author, having published forty volumes and left in MS. 100 more. His principal professional work was a *Digest of the Bankrupt Laws*, but he is best known as the careful editor of the *Works of Francis Bacon* (16 vols., 1825–34), of which the last volume contains a *Life of Bacon*. D. at Boulogne, France, Nov. 27, 1851.

Montagu, Edward Wortley: adventurer; son of Lady Mary Wortley Montagu; b. at Wharncliffe, Yorkshire, England, in Oct., 1713; was the first English child inoculated for smallpox; was placed at Westminster School, but ran away three times, making a voyage once as a cabin-boy to Spain; was elected in 1747 to Parliament, but had to resign on account of debt; went to Paris, where he was imprisoned on account of gambling transactions; was a Roman Catholic in Italy; traveled in Arabia and Egypt, and professed to be converted to Mohammedanism; and was returning to England when he died at Padua, Italy, May 2, 1776. He published some papers in *The Philosophical Transactions*, and a volume of *Reflections on the Rise and Fall of the Ancient Republics* (1759), of which the authorship was claimed by his tutor. He left an *Autobiography*, first published in 1869.

Montagu, Elizabeth Robinson: author; b. at York, England, Oct. 2, 1720; was married in 1742 to Edward Montagu, grandson of the fifth Earl of Sandwich, and cousin of Edward Wortley Montagu, the husband of Lady Mary, and being possessed of wealth, ambition, and some literary talent, became a celebrated leader of London society in the second half of the eighteenth century. She gave a famous annual dinner on May Day to the London chimney-sweeps, and her magnificent residence in Portland Square was the headquarters of the so-called Blue-stocking Club, and figures largely in the diaries of the period. Mrs. Montagu wrote three of the *Dialogues of the Dead* published in the 4th ed. of Lord Lyttelton's work bearing that title (1765), and an *Essay on the Writings and Genius of Shakspeare compared with the Greek and French Dramatic Poets* (1769), but is best known by her *Correspondence*, of which 4 vols. have been edited by her nephew. D. in London, Aug. 25, 1800. See her *Life*, by Dr. Doran, entitled *A Lady of the Last Century* (1872). Revised by H. A. Beers.

Montagu, Mary Wortley, Lady: b. at Thoresby, Notts, England, in 1690; a daughter of the Earl of Kingston; was second cousin on her mother's side to the novelist Fielding. Even in childhood she was a favorite in society on account of her wit and beauty. In 1712 she married Edward Wortley Montagu, without her father's consent. In 1716 she went to Constantinople with her husband, then ambassador to the Porte. In 1717 she made a successful trial of inoculation for smallpox upon her only son—a practice common in the East, but unknown before her time in Western Europe. Her successful introduction of smallpox inoculation into England was accomplished in spite of great opposition and personal abuse from all classes. After her return to England in 1718 followed a bitter quarrel with Pope, who had been her friend. In 1739 she left her husband, and resided chiefly in Italy. D. in England of cancer, Aug. 21, 1762. She is remembered chiefly for her brilliant *Letters*, written during her travels. Her great-grandson, Lord Wharncliffe, published a collected edition of her works with *Life* (3 vols., 1837; 3d ed. 1887).

Revised by H. A. Beers.

Montague: village; Muskegon co., Mich. (for location of county, see map of Michigan, ref. 7–H); on White Lake, which is here navigable, and the Chi. and West Mich. Railway; 5 miles E. of Lake Michigan. It is in an agricultural, fruit-growing, and lumbering region, and has regular steamboat communication with the principal ports on Lake Michigan and considerable commerce. Pop. (1880) 1,297; (1890) 1,623; (1900) 998.

Montague, Charles: See Halifax, Earl of.

Montaigne, mōn′tāñ′, Michel Eyquem, Seigneur de: essayist; b. near Bergerac, in Périgord, France, Feb. 28, 1533. He was educated with great care, first at home, where he learned Latin at the same time with French, then at Bordeaux. He was a precocious student, and at fifteen was studying law. In 1554 he took his seat as counselor in the Parliament of Bordeaux, where began his great friendship for Étienne de la Boétie. He had little taste for public affairs, and after his father's death resigned (1570) his office. In 1569 he had published a translation of the *Theologia naturalis* of Raimond Sebond, and in 1571 he edited the posthumous works of his friend la Boétie. In 1580 he issued the first two books of *Essais*, and in the same year set out on a series of travels in Northern France, Germany, Switzerland, and Italy. His interesting but not remarkable journal of this tour was published in 1774. While still in Italy (1581) he was chosen mayor of Bordeaux, and discharged the functions of that office with success, in difficult times of civil dissensions, till 1585, when, shortly before laying down his office, he exposed his character to serious imputations by fleeing from the city while the plague was raging there. In 1588 he published in Paris a fifth edition of the *Essais*, enlarged by the addition of a third book. In the following years he was somewhat obscurely connected with political events. D. Sept. 13, 1592. The *Essais* are familiar discourses with the reader, whom he takes completely into his confidence, about what he has done and seen, read and thought, set down in a sort of willful disorder, and as far as possible from a systematic philosophy. Living in a time of the most active ferment of ideas, when the Renaissance was struggling against the mediæval order of things, the Reformation against the Church, he saw that much is to be said on both sides of all questions, and gave up the task of finding an absolute and convincing decision in the clash of opinions and views. He gave it up with serene good humor, not feeling the need of such a decision with the intensity of minds like Pascal's, and in giving it up he did not feel obliged to relinquish his theological orthodoxy. So if the spirit that gives unity to the *Essais* is essentially skeptical, it is so without bitterness. The *Essais* are written in a rich, varied, and exceedingly personal style, capable of the utmost easy familiarity and of serious and sustained eloquence. By it Montaigne holds rank as one of the very greatest masters of French prose. He left two annotated copies of the *Essais*. Upon one, now lost, Mlle. de Gournay founded the edition of 1595; upon the other, now in the library of Bordeaux, was founded the edition of Naigeon in 1802. The classic edition is that of J. V. Le Clerc (4 vols., Paris, 1865). The edition of 1588 was republished by Motheau and Jouaust (Paris, 1873–80). Cf. A. Grün, *La vie publique de M. Montaigne* (Paris, 1855); G. Merlet, *Études littéraires sur les classiques français* (Paris, 1882).

A. G. Canfield.

Montalembert, mōn′tăă′lăăn′bār′, Charles Forbes de Tryon, Comte de: French publicist and statesman; b. in London, England, May 29, 1810; son of the Marquis Marc René de Montalembert. He entered public life young, showing an enthusiasm for the liberal neo-Catholic movement. He was in 1830 associated with Lamennais and Lacordaire in publishing the journal *L'Avenir*, but, like Lacordaire, after the papal condemnation of that journal, he recoiled and did not follow the radical evolution of Lamennais. In 1835 he entered the hereditary upper house, and developed great power as an orator in support of ecclesiastical measures, especially the right of Roman Catholics to establish schools of their own independent of the university. He still combined an ardent devotion to the Church with an enthusiasm for liberty and liberal ideas, and when the revolution of 1848 came he accepted an election to the Assembly, where he voted at first with the moderate republicans, but afterward joined the reactionary group. He did not accept the empire of Napoleon III., and was one of its most dangerous antagonists, remaining in the Chamber of Deputies till 1857. Failing of re-election then, he retired from public life, and devoted himself to literary work, but he remained an active influence in clerical circles, opposing persistently, though without success, the acceptance of the dogma of papal infallibility. D. in Paris, Mar. 13, 1870. His works comprise a *Vie de Sainte-Élisabeth d'Hongrie* (1836); *L'Avenir politique de l'Angleterre* (1855); *Pie IX. et Lord Palmerston* (1856); the pamphlets *Une nation en Deuil* and *l'Église libre dans l'État libre*; and his main work, *Études sur les Moines d'Occident depuis Saint-Bénoît jusqu'à Saint-Bernard* (6 vols., 1860–67). This is not so much a careful history as an eloquent plea in which the ardor of the defender of the Church dictates the choice and presentation of the materials. The qualities of the orator are more conspicuous in him than those of the writer. After his death appeared *Lettres à un ami de collège 1827–30* (1874). He himself prepared an edition of his *Œuvres complètes* (Paris, 1861–68). Cf. Craven, *Le Comte de Montalembert* (Paris, 1873).

A. G. Canfield.

Montalembert, Marc René, Marquis de: military engineer; b. at Angoulême, France, July 16, 1714; d. Mar. 29, 1800. Descended from a noble family, he entered the army at the age of eighteen, and served at the sieges of Kehl and Phillipsburg and in the war with Bohemia. Subsequently he engaged in the manufacture of cannon for the French navy. At the age of sixty-two he began to publish his great work, *La Fortification perpendiculaire, ou l'Art défensif supé-*

rieur à l'offensif. The use of the casemate in some of its forms goes back to Albert Dürer and San Micheli, in the early part of the sixteenth century, and it was resorted to by Vauban in his second and third systems, of which the tower-bastions are casemated throughout, but it was reserved for Montalembert, in the latter part of the eighteenth century, to give it an extraordinary development, and to make the casemate the essential element of a system of fortification. Notwithstanding that the French corps of engineers rejected the system in its intended application, and disclaimed, as an engineer, its author, it nevertheless constructed in 1786, for the defense of the harbor of Cherbourg, forts which are in reality almost copied from his designs. European nations followed the example.

Revised by JAMES MERCUR.

Montalván, JUAN PÉREZ, de, Doctor : dramatist and story-teller; b. in Madrid, Spain, in 1602; d. there, insane from over-work, June 25, 1638. He is one of the most interesting and important of the lesser literary figures of the Spanish "golden age." Educated at Alcalá, he obtained his doctor's degree in 1625, joined a fraternity of priests in Madrid, and became a notary in the Inquisition. All this, however, was merely for the sake of obtaining leisure to write. He became intimate with Lope de Vega, and a friend of almost all the great writers of his time, with the exception of Quevedo, who was his bitter enemy. His literary master was Lope de Vega, whom he loved and admired unreservedly, and whom he celebrated in his *Fama póstuma de Lope de Vega* (1636). He tried his hand at most of the *genres* practiced in his day, both in prose and verse. In 1624 he published *Las novelas ejemplares*, and in the same year, with the connivance of Lope de Vega, his *Orfeo*, in competition with the successful *Orfeo* of Jáuregui. In 1627 appeared his nominally pious work *Vida y purgatorio de San Patricio.* This was followed in 1632 by a collection of stories, anecdotes, and even plays, *El para-todos*, of a diverting kind. During all this time he had been producing constantly plays and so-called *autos*, of which he wrote in all about sixty. Far the best, and the only one that has held the stage down to the present day, is *Los Amantes de Teruel*, written in imitation of a similar piece by Tirso de Molina, but far surpassing it in dramatic effect. This theme has been one of the most popular in the history of the Spanish drama. Though Montalván has not the excellences of Calderón and Lope de Vega, and is often guilty of the worst excesses of the playwrights of his generation, he rarely produced a piece without great beauties. He prepared himself for publication two volumes of his plays, which appeared in 1638 and 1639 (reprinted in 1652). The best of them are to be found in vol. xlv. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1881). A. R. MARSH.

Montalvo, GARCÍA ORDOÑEZ, de: Spanish romancer; the author of the earliest existing version of the famous romance AMADIS OF GAUL (*q. v.*). Little is known of his life beyond the fact that he was governor of the city of Medina del Campo, and lived in the end of the fifteenth century. The question of the origin of his romance and of its relation to the supposed work of the Portuguese VASCO DE LOBEIRA (*q. v.*) is involved in great obscurity. After completing the *Amadis* proper, Montalvo wrote a lesser work on the deeds of Esplandian, son of Amadis and Oriana. Both are printed in vol. xi. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1874) with an *Introduction* by D. Pascual de Gayangos. A. R. MARSH.

Montana, mon-taa'na [Lat. (sc. *ci'vitas*, state), fem. of *monta'nus*, mountainous]: one of the U. S. of North America (Western group); the twenty-eighth State admitted into the Union.

Location and Area.—It lies between lat. 44° 6′ and 49° N. and lon. 104° and 116° W.; is bounded on the N. by the provinces of Alberta and Assiniboia, Canada, on the E. by the Dakotas, on the S. by Wyoming and Idaho, and on the W. by Idaho; average length E. to W., 470 miles; average breadth N. to S., 275 miles; area, 146,080 sq. miles (93,491,200 acres), of which 770 sq. miles are water surface.

Physical Features.—As its name indicates, it is a mountainous country, in which there are some fine valleys, and it has an abundance of timber, such as pine, spruce, cottonwood, and aspen. The streams are skirted with dense thickets, in which at the proper season there is found plenty of serviceberries, currants, and gooseberries. The Bitter Root range of mountains forms the southwest boundary; the main chain of the Rocky Mountains turns N. at the southwest corner, and forms between the two ranges a great basin, which constitutes one-fifth of the entire area of the State. About three-fifths of the State consists of rolling table-lands in the E., which are generally treeless and often ill-adapted to irrigation. The streams which traverse these table-lands, however, are generally lined with cottonwood, willow, and other similar trees. The principal rivers are the Gallatin, Jefferson, and Madison, here called the Three Forks, which unite and form the Missouri. Besides these are the Yellowstone, Musselshell, Milk, Teton, Sun, and Maria's rivers, etc. Flathead Lake is the only considerable lake. The Yellowstone National Park is partly within Montana.

State Seal of Montana.

Mineral Productions.—Gold has been found in every portion of the State. Silver ore, iron, and coal are also found. Lignite, copper, and petroleum are among the mineral products. The value of gold, silver, lead, and copper mined since 1862 has exceeded $320.000,000. Butte City is the great mining center, in which the annual product of silver and copper is valued at more than $20,000,000. Since 1888 the output of copper has exceeded that of any other State, and is now annually more than 200,000,000 lb. In 1899 the production of lead was more than 10,000 tons, placing Montana fifth among lead-producing States. In 1899 the gold product was valued at $4,760,100 (State rank, fifth); silver, at $20,810,990 (State rank, second); copper, 225,126,855 lb. (State rank, first); and coal, 1,496,451 short tons, value, $2,347,757. The copper product was 39·6 per cent. of the total product of the country, and almost all of it came from the small hills in the town of Butte. The most productive coal counties were Park, 147,154 tons, value $284,970; Cascade, 988,821 tons, value $1,523,932; Carbon, 272,396 tons, value $393,884; and Gallatin, 63,626 tons, value $102,712. There were 3 coking plants, with 303 ovens, which used 110,274 short tons of coal and produced 56,376 short tons of coke, value $356,190. A number of deposits of coal well-adapted to coke-making have been found near the entrance to the Yellowstone Park. Valuable sapphire mines have been opened on the right bank of the Missouri river, 12 miles N. E. of Helena, and there is an abundance of marble, common, green, variegated, and black, in the Sweet Grass Hills.

Soil and Productions.—The mountains of Montana are usually well covered with forests, but the trees are, if deciduous, almost exclusively willow, poplar, and cottonwood; if evergreen, pine, spruce, fir, cedar, and balsam. There is very little hardwood timber in the State. Grass and flowers of great beauty abound in the valleys. As a grazing country this will always maintain a high rank, the "bunch grass," so excellent for cattle, covering all the hillsides and plains. Indeed, many herds are turned out in the autumn to get their own living through the winter, and springtime finds them in good condition. Since 1885 much has been done to increase agriculture by means of irrigation. Along the foot-hills and between the great mountain ranges favorable opportunities occur, and wherever irrigation has been provided an abundant agriculture is the result.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	1,519	5,603	268·9
Total acreage of farms	405,683	1,964,197	384·2
Total value of farms, including buildings and fences	$3,234,504	$25,512,340	688·8

* Increase.

L. L. POATES, ENGR., N.Y.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	1,598	23,970 bush.	$14,142
Wheat	72,555	1,929,963 "	1,177,277
Oats	65,865	2,568,735 "	1,078,869
Barley	5,194	201,527 "	96,733
Potatoes	4,781	640,654 "	339,547
Hay	369,161	590,658 tons	5,138,725
Totals	519,154	.....	$7,845,293

On Jan. 1, 1900, the farm animals comprised 146,781 horses, value $3,491,193; 878 mules, value $35,509; 45,314 milch-cows, value $1,778,574; 914,494 oxen and other cattle, value $24,865,089; 3,884,179 sheep, value $11,017,474; and about 40,000 swine, value $375,000: total head, 5,031,646; total value, $37,562,839.

Climate.—The climate is milder than that of States farther E. in the same latitude, The annual mean temperature ranges from 44° to 48°. The climate is very dry. The annual rainfall at Fort Benton is but 12·17 inches, and it is nearly the same over most of the State.

Divisions.—For administrative purposes, Montana is divided (1901) into twenty-four counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION FOR 1900.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

* Reference for location of counties, see map of Montana.
† Formed since census of 1890.

Principal Cities and Towns.—Butte, 30,470; Great Falls, 14,930; Helena (capital), 10,770; Anaconda, 9,453; Missoula, 4,366; Bozeman, 3,419; Billings, 3,221: Livingston, 2,778; Walkerville, 2,621; Kalispel, 2,526; Red Lodge, 2,152.

Population and Races.—In 1870, 20,595; 1880, 39,159; 1890, 132,159 (native, 89,063; foreign, 43,096; male, 87,882; female, 44,277; white, 127,271; colored, 4,888, comprising 1,490 persons of African descent, 2,532 Chinese, 6 Japanese, and 860 civilized Indians); 1900, 243,329.

Finance.—The State has no debt, and generally has a large balance in its treasury. The assessed valuation in 1899 was $140,821,870.

Banking.—In 1900 there were 21 national banks with a capital of $2,305,000; surplus and profits, $1,198,860.70; and deposits, $13,360,264.52; 15 state banks, capital, $990,000; surplus and profits, $478,914; deposits, $6,066,057; and 6 private banks, capital, $271,000; surplus and profits, $110,314; and deposits, $3,509,883.

Means of Communication.—In 1899 the State board of equalization fixed the assessed value of all railway property in the State at $14,992,689, an increase in the year of $1,199,108. The Great Northern Railway has about 400 miles of roadbed in the State. There were twenty-nine railways in all, with an aggregate mileage of 2,988·39, the principal ones being the Northern Pacific and the Great Northern. The extension of the latter opened to settlement the Flathead country, and also tapped forests of cedar, fir, and pine that were previously almost inaccessible; it thus passes through a region whose agricultural resources are capable of sustaining thousands of families.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	94	102	25,149	$184,100
Methodist Episcopal	48	48	1,901	159,850
Presbyterian in the U. S. of A	24	24	1 232	85,000
Protestant Episcopal	30	26	1,104	165,450
Disciples of Christ	13	14	785	58,800
Baptist	14	14	683	89,000
Methodist Episcopal South	23	23	492	74,000
Congregational	7	7	345	38,800

Schools.—The act of Congress providing for the admission of Montana, North Dakota, South Dakota, and Washington guaranteed that on becoming a State Montana should receive the sixteenth and thirty-sixth sections of every township of the State, the proceeds from the sale of which should form a permanent school fund; that the State should also be entitled to 5 per cent. of the net proceeds received from all sales of public land retained by the U. S. within the State made subsequent to its admission, the sums so derived to be likewise a part of the permanent school fund; and that the State should receive a grant of 72 sections of unappropriated public lands, to create a fund for the support of a State university, 140,000 acres for agricultural colleges, 100,000 acres for a school of mines, 100,000 acres for State normal schools, and 50,000 acres for a deaf and dumb asylum. Under these provisions, the Legislature in 1893 passed acts establishing the State University at Missoula, the State Agricultural College at Bozeman, the State School of Mines at Butte City, the State Normal School at Dillon, the State Deaf and Dumb School at Boulder City, a State Reform School at Miles City, and a home for orphans, foundlings, and destitute children at Twin Bridges. At the same time the State board of education was authorized to select lands for the educational institutions. Public school statistics for 1898–99 showed, children of school age, 49,498; enrolled in public schools, 35,070; average daily attendance, 23,400. There were 656 schools and 1,086 teachers—201 men, and 885 women; the average monthly salary for men was $69.28; for women $48.61. The value of school property was $1,857,965; the school revenue (1897–98), $815,341; expenditure, $776,150.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Montana had 5 libraries, containing 21,139 bound volumes and 1,300 pamphlets. The libraries were classified as follows: General, 1; college, 1; law, 1; State, 1; and historical, 1. The Montana Historical Society was made a State institution in 1891.

Post-offices and Periodicals.—In Jan., 1901, there were 499 post-offices, of which 25 were presidential (2 first-class, 6 second-class, 17 third-class) and 474 fourth-class. There were 180 money-order offices, and 3 money-order stations. Of periodicals, there were 12 of daily, 2 tri-weekly, 2 semi-weekly, 74 weekly, 1 semi-monthly, and 4 of monthly publication; total, 95.

Charitable, Reformatory, and Penal Institutions.—On the admission of the State the former territorial penitentiary at Deer Lodge was turned over for a State prison, and a second one has been erected since at Billings. Pending the completion of the authorized State institutions, arrangements were made to maintain the insane at public expense by private individuals at Warm Springs, and a number of deaf and dumb, blind, and feeble-minded children, in appropriate institutions out of the State. A State board of charities and reform was created by the Legislature in 1893.

Political Organization.—The constitution permits aliens to own mines and mining property; proscribes polygamy; and prohibits trusts, contract labor in prisons and reformatories, and lotteries. The executive authority is vested in a Governor, Lieutenant-Governor, Secretary of State, attorney-general, State treasurer, State auditor, and superintendent of public instruction, all elected for four years. The Governor is given authority to veto separate items of appropriation bills. The legislative authority is vested in a Legislative Assembly, comprising (1901) a Senate of 24 members, elected for four years, and a House of Representatives of 70 members, elected for two years. The Legislature holds biennial sessions, limited to sixty days. It is prohibited from making appropriations for charitable, industrial, educational, or benevolent purposes to any person, corporation, or community not under the absolute control of the State, nor to any denominational

or sectarian institution or association. The Supreme Court has appellate jurisdiction only, with a supervisory control over all minor courts. It consists of three judges (who may be increased to five) elected by the people for six years. Judges of district courts, county attorneys, justices of the peace, and the clerk of the Supreme Court are also elected by the people. Citizens of the U. S., who have been residents of the State for one year, and of a county for thirty days next preceding an election, may vote, excepting U. S. soldiers, felons, and Indians. Women are eligible to hold the office of county superintendent of schools, or any school-district office, and have the right to vote at any school-district election. The tax rate for State purposes was limited to three mills, with the provision that when the value of the taxable property of the State reached $100,000,000 the rate should not exceed two and a half mills, and when the value reached $300,000,000 the rate should not exceed one mill and a half; but the rate may be increased by a majority vote of all those voting on the question at a general State election. The State capital was fixed temporarily at Helena. At the general election in 1892 votes were cast for a permanent capital as follows: Helena, 14,010; Anaconda, 10,183; Butte City, 7,752; Bozeman, 7,685; Great Falls, 5,045; Deer Lodge, 983; and Boulder, 295; and final choice between Helena and Anaconda was deferred to the general election of 1894, when Helena was chosen.

History.—Montana had had a few settlers, mostly trappers and hunters and some missionaries, for many years before its organization as a Territory, but its growth dates from the discovery of gold there in 1861. It was a part of Idaho Territory till May 26, 1864, when it was organized as a separate Territory. After the discovery of gold, people flocked in from all quarters. In the earlier days there was a very mixed population, among which were a number of noted robbers and desperadoes, who at one time seemed to have complete possession of the Territory. This state of things continued until the respectable portion of the community could endure it no longer, when they formed themselves into an organization known as the "Vigilantes," who administered the law without partiality or favor, and many a miscreant was hanged by them. It was once a favorite hunting-ground for hunters and trappers, and Fort Benton, on Missouri river, at the head of navigation, was a fur-trading post. Having adopted a State constitution the Territory was admitted to the Union as a State on Nov. 8, 1889. On Oct. 15, 1892, the surplus lands of the Crow Indian reservation, in Southern Montana, aggregating about 1,800,000 acres, were opened to settlement.

Montanel'li, GIUSEPPE: statesman and poet; b. at Fuccecchio, in Tuscany, in 1813; d. in 1862. He was educated at the University of Pisa, and in 1838 published a volume of poetry; from 1837–39 practiced successfully as an advocate; and in 1848 was appointed Professor of Civil and Commercial Law in the University of Pisa. Even before 1848 he had excited much attention by his proposed liberal reforms, by the political association known as Fratelli Italiani, and by the *Italia*, a journal edited by him at Pisa in 1847 with the motto "Riforma e Nazionalità." On the breaking out of the revolution in 1848 he volunteered, and distinguished himself by his valor. A report of his death at the battle of Curtatone became current, and he was universally lamented. Mazzini wrote a splendid eulogy upon him. He was, however, only severely wounded and a prisoner. On his return to Tuscany he became a member of the constitutional ministry, and on the flight of the grand duke in 1849 he was chosen triumvir with Guerrazzi and Mazzini. At this time he exerted himself for the union of Tuscany with Rome. While he was on a mission to Paris the restoration took place, and Montanelli remained an exile until 1859, during which time he published two volumes of memoirs, *Memorie sull' Italia e specialmente sulla Toscana dal 1814 al 1850* (Turin, 1853; French trans. by F. Arnaud, Paris, 1857). Among his poems are mentioned with praise *La Tentazione*, and a tragedy entitled *Camma*. In 1859 he declared himself for the autonomy of Tuscany, rather than for the unification of Italy. *La Nuova Europa*, a journal founded by him, was the special organ of his peculiar political ideas, and its publication ceased at his death. See E. Redi, *Ricordi biografici su G. Montanelli* (1883).

Revised by A. R. MARSH.

Mon'tanists: an early Christian sect, the followers of Montanus of Pepuza in Phrygia. He appears to have been a priest of Cybele, was converted about 150 A. D., and soon after began to fall into fits of ecstacy and to utter prophecies. He was joined by two women (Maximilla and Priscilla) of wealth and high social position, who deserted their husbands and became prophetesses. Expelled from the Church, he set up for himself, organizing a body of preachers to be supported by the voluntary contributions of his followers. He established a singular hierarchy, consisting of (1) a patriarch, residing at Pepuza, which was to be the metropolis of the millennial kingdom; (2) cenones, which have not been described; (3) bishops. Orthodox in respect to the cardinal doctrines, his teaching, in substance, was that the Mosaic and Christian dispensations having failed to save the world, a new revelation had been made through him and his two prophetesses. This revelation pertained not to doctrine, but to discipline. The points were—(1) fasting, at first two and afterward three annual fasts of a week, instead of one such fast; (2) forbidding second marriages; (3) refusing restoration to such as had been guilty of murder, adultery, or idolatry; (4) requiring the veiling of virgins in the assemblies of the Church. The novelty was not in the things themselves, which were already popular, but in *prescribing* them in obedience to what was claimed to be a new express revelation. The system was received at first with some favor at Rome. Irenæus of Gaul was tolerant toward it. Finally it was treated everywhere as a heresy. Its strongholds were in Asia Minor and Northern Africa; Tertullian was its ablest champion. Severe laws against the sect were enacted (*Cod. Just.*, 1 : 5 : 18–21) as late as 530 and 532 A. D. The original sources of information in regard to Montanism are, mainly, Eusebius, *Hist.*, vol. iii., 14–19; Epiphanius, *Hær.*, 48, 49; and 22 of the 37 *Treatises* of Tertullian. See *Montanism and the Primitive Church*, by John de Soyres (1878).

Montanus Arias: See ARIAS MONTANUS.

Montauban, mōn'tō'bään': capital of the government of Tarn-et-Garonne, France; on the Tarn, 31 miles N. of Toulouse (see map of France, ref. 8–E). It is an old but well-built town, founded in the twelfth century, and contains a still older cathedral. It has large manufactures of woolens and beet-root sugar, extensive dye-works and distilleries, and carries on a considerable trade in wine and grain. It was one of the Protestant strongholds in France, and has a flourishing Protestant theological school. Pop. (1891) 22,616; (1896) 29,470.

Montauk' Point: a high, fertile headland, the extreme eastern point of Long Island; a part of the township of East Hampton, Suffolk co., N. Y. It was the seat of the Montauk Indians, now extinct. It has a stone lighthouse with a flashing white light of the first order, 172 feet above the sea, and also a fog-trumpet; lat. 41° 4′ 13″ N., lon. 71° 51′ 6″ W.

Montauks: See ALGONQUIAN INDIANS.

Mont Blanc, mōn' blăän' [Fr. *white mountain*, from its perpetual snow]: one of the Pennine Alps, 15,750 feet high, and the highest mountain in Europe except Mt. Elbruz in the Caucasus. It is a long ellipse of granite and crystalline schists directed N. E. and S. W., and standing at the angle where France, Switzerland, and Italy meet, the principal peak being in France. It is covered with an ice cap so thick that a horizontal shaft driven in at 40 feet below the highest point to a distance of 75 feet with lateral drifts, did not

reach the rock. From this mass of ice extend numerous glaciers down the valleys, in some cases to an elevation of only 3,600 feet. The line of perpetual snow extends down to 8,600 feet. The drainage is into both the Rhône and Po. The ascent is dangerous and fatiguing, requiring two days, starting from Chamouni (elevation 3,445 feet) on the N., and spending the first night at Grands Mulets (11,335 feet). The first ascent was made by the guide Balmat in 1786. The second, in the following year, was by the celebrated physicist Saussure, who recorded the first physical observations ever made on high mountains. Mont Blanc has since been a notable field for scientific exploration, and in Sept., 1893, under the instigation of M. Janssen, an eminent French scientist, an observatory was erected on the mountain near the apex. It is devoted to meteorologic and astronomic work. MARK W. HARRINGTON.

Montcalm, mōñ'kaalm', LOUIS JOSEPH SAINT-VERAN, Marquis de: soldier; b. near Nîmes, France, in 1712. Descended from a noble family, he received a careful education, and at fourteen years of age entered the army, and was distinguished in Italy, Bohemia, and Germany, attaining the rank of colonel. In 1756 he was appointed to the chief command of the French troops in Canada, and three months after his arrival captured Fort Ontario (Oswego) and a year later Fort William Henry (Lake George); in July, 1758, he occupied Fort Ticonderoga, where he successfully repulsed a greatly superior British force under Abercrombie. To protect Quebec, threatened by the forces of Gen. Wolfe, Montcalm assembled the main body of his troops on the Montmorency, where, July 31, 1759, he repulsed Wolfe, who, retiring, secretly reached, Sept. 13, the heights of Abraham, in the rear of the army of Montcalm. With numbers nearly equal, Montcalm gave battle to the British, but, though displaying the utmost personal bravery, his troops gave way, and were entirely routed by a charge which followed. Wolfe fell rejoicing in his victory, while Montcalm, who had received a fatal wound, died the following day, exulting that he should not live to see the surrender of Quebec. A monument stands in Quebec to the memory of the two heroes.

Mont Cenis, mōñ'se-nee': a remarkable mountain pass of the Alps; on the boundary between the Italian province of Turin and the French department of Savoie, at the junction of the Graian and Cottian Alps. It forms a plateau 6,773 feet high, with a peak 11,451 feet high. In 1803–10 Napoleon I. laid an elegant and comfortable carriage-road over the plateau, connecting France with Italy. In 1867 a railway on the Fell system was carried over the pass, running for the most part by the side of the carriage-road. It never paid well, and was discontinued in 1871. The famous tunnel was begun in Aug., 1857, completed Dec. 25, 1870, and opened for traffic in Sept., 1871. It is 8 miles long, lacking only 30 yards. Its north end is 3,942 feet above the sea, its south end 4,380, and the middle about 15 feet higher than the south end. The cost was £3,000,000. Trains run through in about twenty minutes. See FRÉJUS, COL DE.

Montclair: township; Essex co., N. J. (for location of county, see map of New Jersey, ref. 2–D); on the Del., Lack. and W. and the N. Y. and Greenwood Lake railways; 5 miles N. by W. of Newark, the county-seat, 14 miles W. N. W. of New York city. It comprises a tract 5 miles long by 1½ miles wide, and has for its western boundary the First or Watchung Mountain. Its average elevation above tide-water is 301 feet; the part called "The Heights" has an altitude of 368 feet. The township has been built up chiefly by New York business men, and the residential parts are Montclair, Upper Montclair, and Montclair Heights, forming together a charming, healthful suburb. There are several churches, a military academy, a high school, completed in 1893 at a cost of $125,196, public schools, a library founded in 1868, a club-house opened in 1889, a State bank with capital of $50,000, and two weekly newspapers. Pop. (1880) 5,147; (1890) 8,656; (1900) 13,962.

Mont de Piété, mōñ'de-pi-ā'tā' [Fr., mistransl. of Ital. *Monte di Pietà*, liter., mount of pity or compassion (*pietà* meaning both piety and pity). Cf. Fr. *piété* and *pitié*]: an institution for the loaning of money at a low interest to the poor, pledges being taken for security. The earliest seems to have been that of Padua, founded in 1491 in opposition to the usurious practice of the Jews. The ancient Lombard houses and modern loan-funds are in principle the same. The *Monti di Pietà* at Rome are among the best managed in the world. The *Mont de Piété* may be regarded as a public system of pawnbrokerage. A similar system has prevailed in China for ages. See PAWNBROKING.

Mont-Dore-les-Bains, mōñ'dōr'lā-bāñ' (i. e. the Baths of Mont-Dore): an important health resort of the department of Puy-de-Dôme, France; 11 miles S. S. E. of Rochefort, on the head-waters of the Dordogne river. It is situated in a picturesque region among the mountains, 3,445 feet above sea-level. Here are cold, hot, mineral-water, mud, and vapor baths, the beneficial effects of which have been known since the time of the Romans, who resorted to the place. The population of the commune is about 1,400; the annual number of visitors 5,000. M. W. H.

Monte Carlo: See MONACO.

Monte Casino: See CASSINO.

Monte Cristo (the *Oglasa* of Pliny): an Italian island, between Corsica and Tuscany, 30 miles S. of Elba; rendered famous by Alexander Dumas's romance *The Count of Monte Cristo*. It is a conical rock of granite, 5 miles in circumference, 2,093 feet high; long uninhabited, but in 1874 made a penal colony. It has very little land capable of cultivation. M. W. H.

Montecu'culi, RAIMONDO, Count of: soldier; b. near Modena, Italy, in 1608; entered the Austrian army in 1627; distinguished himself in the Thirty Years' war, and afterward in the Polish war against the Swedes, and received in 1660 the command of the allied Austrian and French army in Transylvania, with which he defeated the Turks in the great battle of St. Gothard, on the Raab, Aug. 1, 1664. In the war between France and Holland he again commanded the Austrian army, and distinguished himself much in the campaigns between 1672 and 1676. In 1679 the emperor made him a prince of the empire, and the King of Naples gave him the duchy of Melfi. D. at Lintz, Oct. 16, 1681. He left a memoir on the Turkish war, written in Italian, and translated into Latin, German, and French, and several other writings, including sonnets.

Montefio're, Sir MOSES HAYIM, F. R. S.: philanthropist; b. at Leghorn, Italy, Oct. 24, 1784. At an early age he was taken to England by his parents. He rose to prominence as a successful merchant, and was made a broker on the London Stock Exchange. He was honored for his integrity and benevolence. In 1824 he retired from business, and devoted the remainder of an unusually long life to works of charity and to the amelioration of the condition of the Jews in all parts of the world. In 1835 he became president of the United Deputies of British Jews. In 1837 he was preferred to the office of sheriff of London and Middlesex, in which year he was knighted by the Queen. In 1846 a baronetcy was conferred upon him. His first visit to the East was made in 1827; his second in 1839 for the purpose of founding colonies for Jews. In 1840 he again visited the East, and at Damascus secured the release of the Jews who had been charged with the murder of a monk. In 1846 he pleaded before Emperor Nicholas at St. Petersburg in favor of his people; 1855 he brought assistance to those who were suffering from the famine in Syria; 1858 he traveled over Europe in the unsuccessful endeavor to secure the release of Edgar Mortara, who had been forcibly converted to Roman Catholicism. In 1863 he visited Constantinople, in 1864 Morocco, in 1866 Syria, in 1867 Bucharest, and in 1875 Jerusalem. In memory of his wife he founded at Ramsgate the Judith Montefiore College for the training of Jewish divines. D. at Ramsgate, July 28, 1885. See Judith Montefiore, *Private Journal of a Visit to Egypt and Palestine* (London, 1836); *Diaries of Sir Moses and Lady Montefiore* ed. by L. Loewe (London, 1890); Baley's *Modern Methuselah*; *Dictionary of National Biography*, ed. by Sidney Lee (xxxviii., p. 278). RICHARD GOTTHEIL.

Montcleo'ne di Cala'bria: town; in the province of Catanzaro, Southern Italy; situated on an eminence, 11 miles E. of Tropea (see map of Italy, ref. 9–G), and containing some fine buildings. This town occupies the site of the ancient *Hipponium* of Magna Græcia; was known under the Romans as *Vibo Valentia*, and took a prominent part in the Neapolitan wars of the Middle Ages. In 1783 it suffered fearfully from an earthquake which destroyed nearly the whole town, including the magnificent castle erected by Roger the Norman. Pop. about 9,700.

Montelu'po, BACCIO, da: sculptor and architect; b. at Montelupo, near Florence, in 1450; d. at Lucca in 1533. Among his early works are a Hercules for Francesco dei Medici, and a bronze statue of St. John the Evangelist for

the garden of Porta Santa Maria—one of the best statues ever produced in Florence. He carved many crucifixes in wood for churches all over Italy. One of these is at St. Mark's convent in Florence, another at Arezzo. At Lucca he built the Church of San Paolino. W. J. S.

Montemayor, mōn-tā-maă-yōr′, Jorge, de: poet; b. at Montemor, near Coimbra, Portugal, probably between 1510 and 1520; d. in a duel at Turin, Italy, in 1561. Originally a soldier, he became connected with the traveling chapel of Philip II., owing to his knowledge of music. He was thus enabled to visit several foreign countries, particularly the Netherlands and Italy. The work for which he is famous is the pastoral romance *Diana Enamorada*, written in Spanish, as were all his other works. It is modeled upon the *Arcadia* of Sannazaro, but contains much of the author's personal experience and regret for unrequited love. This was first published in an incomplete form at Valencia in 1558 or 1559, nor was it ever finished by its author. After his death, however, several persons undertook to go on with it. First, Alonso Pérez, a physician of Salamanca, carried it a little way, according to Montemayor's own plan, which had been communicated to him (1st ed. 1564, and often after that date with the original *Diana*). Next, Gaspar Gil Polo, a professor of Greek in Valencia, furnished another continuation, also never finished (1st ed. 1564). Finally, one Hieronymo de Texeda, a Spaniard residing in Paris, prepared still a third continuation, the dullest of all (Paris, 1627). The original romance became at once extremely popular, not only in Spain, but in other countries. Translations were made into Latin, French (six versions), German (two versions), Dutch, and English. The last, by Bartholomew Yong (London, 1598, folio), as the introduction shows, was made because of the interest felt in the work by the illustrious group to which Sir Philip Sidney belonged, though its publication was delayed nearly twenty years. Another sign of this interest is the fact that the *Diana* was the immediate model of Sidney's own *Arcadia*. Besides the *Diana*, Montemayor wrote a considerable amount of verse of various kinds—lyrics, ballads, elegies, pastoral and satiric poems. These are to be found in the *Cancionero de las obras de Jorge de Montemayor* (Antwerp, 1554, and often), and in the *Cancionero espiritual* (Antwerp, 1558). See G. Schönnherr, *Jorge de Montemayor, sein Leben und sein Schäferroman* (Halle, 1886). A. R. Marsh.

Montemorelos, formerly **Pilon**: a town of the state of Nuevo Leon, Mexico; 52 miles S. E. of Monterey; at the southeastern base of the Sierra de la Silla; about 2,000 feet above the sea (see map of Mexico, ref. 4–G). It is the center of a rich sugar-producing district. Pop. about 10,000. H. H. S.

Montenegro (in Servian *Czrnagora*, Black Mountain): an independent principality of Europe; situated between 41° 45′–43° 15′ N. lat. and 16° 15′–17° 35′ E. lon., bounded by Dalmatia, Herzegovina, and Albania. Its area, 3,506 sq. miles, was somewhat increased by the Congress of Berlin (1878) through the cession of territory on the Adriatic with the port Antivari, and later (1880) of another port—Dulcigno. The country is a mass of rugged and lofty mountains, with dense forests of oak, beech, poplar, fir, and sumach. The loftiest peak, Kutsch-Kom, is 9,250 feet high. There are no roads and few villages. The people are a sturdy race, possessing all the characteristics of half-barbarous mountaineers, occupied in a primitive way with agriculture, hunting, and fishing when not engaged in war. No real census has ever been taken, and there is no budget, hence estimates are only approximate. Pop. 220,000, of whom 4,000 are Roman Catholics, 4,000 Mussulmans, and 212,000 Orthodox Greeks. Though "Montenegro is a military camp," there is no standing army, but every Montenegrin between sixteen and fifty years of age owes military service, and the prince can in a few days put under arms 36,000 men (20,000 between twenty and forty in the first class). The revenue amounts to $300,000, derived from taxes on land and cattle, from government salt monopoly, and customs dues, which are 6 per cent., *ad valorem*; public debt, $500,000. The exports of cattle, sheep, goats, scodano (a dye-wood), insecticide powder, smoked meat, fish, cheese, skins, and wool amount to $1,000,000. The political history of Montenegro is one long, ferocious heroism. When Servia was conquered by Bayezid I., at the battle of Kossova (1389), many of the inhabitants took refuge in the mountains under the lead of Balsha, son-in-law of the slain Servian king Lazarus, and have since maintained their independence against the frequent and desperate attempts of the Ottomans to subdue them. The country has often been overrun by armies more numerous than the entire population, the inhabitants almost exterminated, and the capital, Cettigné, several times captured and burned (1623, 1714, 1785). Still they were generally victorious over these fierce invaders, and their independence was formally acknowledged by the sultan in 1878. Peter the Great made an intimate alliance with them in 1710, and they have often been assisted by Russians, whom they regard with peculiar affection. Russia pays them annually $17,000, not as a subsidy, but as indemnity for losses they sustained in 1813, when helping to expel the French from the Dalmatian coast. For more than 300 years their government was theocratic, the metropolitan (Vladika) of Cettigné exercising despotic authority; but it is now a hereditary absolute monarchy vested in the Petrovitch Niégosch family. The chief towns are: Cettigné, 1,200 inhabitants; Podgoritza, 4,000; Nikchitch, 3,000; Dulcigno, 2,000; Antivari, 1,500; Kolashine, 1,500; Niégosch, 1,200; Danilovgrad, 1,000. E. A. G.

Monte Nuovo: See the Appendix.

Montépin, mōn′tā′păn′, Xavier Aymon, de: novelist; b. at Apremont, Haute-Saône, France, Mar. 18, 1824. He dabbled a little in politics in 1848, founded the newspaper *Le Canard* (1848), contributed to the anti-revolutionary *Le Pamphlet* and *Le Lampion*, and published satirical pamphlets. He had already(1847) made his appearance as a novelist with *Les Chevaliers du lansquenet*, and after 1848 he abandoned politics for literature. He has produced novels with surprising rapidity. Each work, as a rule, has appeared in several volumes, and these number nearly 350 (1894). Besides these, he has composed, alone or with collaborators, more than twenty plays. He depends for his interest upon exciting incident and sensational situation.
A. G. Canfield.

Monterey: city (settled by the Mexicans, former State capital); Monterey co., Cal. (for location of county, see map of California, ref. 9–C); on Monterey Bay, and the S. Pac. and the Monterey and Fresno railways; 80 miles by sea from San Francisco, with which it is connected by a line of steamers. It has a capacious harbor, absolutely safe in any weather; has electric lights, 3 churches, large public-school building, 2 State banks with combined capital of $70,000, and 2 weekly newspapers. The famous old Mission Church, Colton Hall, where the State constitution was signed, and the old custom-house are still preserved, but nearly all the adobe houses of the early Spanish and Mexican inhabitants have been replaced by modern buildings. Pop. (1880) 1,396; (1890) 1,662; (1900) 1,748.
Editor of "New Era."

Monterey, mōn-tā-rā′ [Span., liter., Mt. King]: capital and most important town of the state of Nuevo Leon, Mexico; in a valley or small plain, partly surrounded by picturesque mountains of the Sierra Madre (see map of Mexico, ref. 4–G). It is on the Mexican National Railway (from Mexico to Laredo, Texas), and is connected by other lines with Tampico and Eagle Pass; a line to Matamoros is in course of construction (1894). The city covers a large area on the banks of the little river San Juan; the houses generally have only one story. The principal public buildings, cathedral, etc., face on two large squares. There is a large trade, especially with the U. S., and the town has considerable manufacturing establishments, including a large one for woolen goods, breweries, tan-yards, etc. The climate is dry and healthful, though warm in the summer months, and somewhat changeable; mean winter temperature, 55° F.; summer, 83°. A settlement was formed here probably as early as 1581; it was called Leon in 1584, when it became the capital of Nuevo Leon; and the present name was adopted in 1596. During the early part of the war with the U. S. the Mexicans, having been defeated by Taylor on the Rio Grande, concentrated their forces at Monterey; here they had nearly 10,000 men under Ampudia. Taylor advanced from Matamoros Aug. 5, 1846, with 6,650 men, and carried the greater part of the fortifications and city after a hot battle in the streets and houses during three days, Sept. 21–23. Ampudia then capitulated, and was allowed to march out with his force. Pop. (1892) 46,000. H. H. Smith.

Montero, mōn-tā′rō, Lizardo: naval officer and politician; b. in the province of Piura, Peru, May 27, 1832. He was involved in the rebellion of Vivanco 1856–57, and was banished until 1860; took a leading part in the defense of Callao against the Spanish fleet May 2, 1866; and commanded part of the land force against Pierola 1874. When the war with

Chili broke out he had attained the rank of admiral, but served again with the land forces, commanded the right wing at the battle of Tacna, and took part in the defense of Lima. After the fall of that city he was made vice-president in the provisional government, and President Calderon, having been imprisoned by the Chilians (Sept., 1881), Montero assumed the executive at Arequipa. The Chilians forced him to evacuate that place Oct. 29, 1883, and he retired to Bolivia, only returning after Caceres had been regularly elected president. Subsequently he was senator from Piura. H. H. Smith.

Mon'te Ro'sa: a mountain in the Alps, exceeded in elevation only by Mt. Blanc; on the boundary between the Swiss canton of Valais and the kingdom of Italy, at the junction between the Pennine and Lepontic Alps. It rises in nine peaks, the four central ones of which are more than 14,000 feet high, the highest, the Dufourspitze, having an altitude of 15,217 feet. It is rich in metals. Gold, copper, and iron mines are worked. The highest of these mines is situated at an elevation of 10,500 feet, in the region of perpetual snow. The Dufourspitze was ascended for the first time in 1855.

Montesano: town; capital of Chehalis co., Wash. (for location of county, see map of Washington, ref. 5–B); on the Chehalis river at the head of navigation, and on the N. Pac. Railroad; 50 miles S. by W. of Olympia. It is engaged in lumbering, salmon fishing and canning, stock-raising, dairying, and manufacturing, and has a national bank with capital of $50,000, an incorporated bank with capital of $75,000, a private bank, and two weekly newspapers. Pop. (1890) 1,632; (1900) 1,194. Editor of "Vidette."

Montesquieu, mōn'tes'ki-ö', Charles Louis de Secondat, Baron de: historian and political philosopher; b. Jan. 18, 1689, at the Château de la Brède, near Bordeaux, France, whence he derived the title he bore during his youth—Baron de la Brède. He was educated at the oratorian college of Juilly; studied law at Bordeaux; in 1714 became councilor of the *Parlement* of Bordeaux, and in 1716 president. The same year he entered the Academy of Bordeaux, and showed more taste for study than for business. Under the influence of Newton he turned to natural history and conceived the plan of a *Histoire physique de la terre ancienne et moderne* (1719). In 1721 he produced the *Lettres Persanes*, in which, under guise of letters written home by a Persian traveling in France, he satirized French society and institutions. In 1725 came the *Temple de Gnide*, an allegorical prose poem. He was chosen to the Academy the same year, but the king refused to sanction the choice on the plea that he did not live in Paris. In 1728 he was elected a second time, and took his seat. The next years were spent in travel in Germany, Austria, and Italy, and in observing the institutions and manners of those countries. Montesquieu went next to England, where he remained nearly two years, studying the methods of government. He returned to France in 1731, and applied himself seriously to historical study. The first fruits of this labor were the *Considérations sur les causes de la grandeur et de la décadence des Romains* (1734), in which he sought to discover the laws of political life through the very complete political experience of Rome. The *Dialogue de Sylla et d'Eucrate* (1745), an imaginative embodiment of Roman ideas in characters, is closely connected with it. All this, however, was preparatory to his great work, *L'Esprit des Lois* (1748). The scope of this work is indicated by its fuller title: On the spirit of laws, or the necessary relations between a country's laws and the nature of its government, its manners, climate, religion, commerce, etc. In spite of errors and inaccuracies and a want of orderly plan, it has been, by reason of its vast information and its fertility of general views, one of the most important books of modern times in its field, and established the method of historical treatment of political science. It was received with great enthusiasm, and ran through twenty-two editions in a year and a half. To the objections it called forth Montesquieu replied by the *Défense de l'Esprit des Lois* (1750). D. Feb. 10, 1755. Some minor writings were long kept from print by his family—*Deux opuscules de Montesquieu* and *Mélanges inédits de Montesquieu* (Paris, 1891–92). The best edition of his *Œuvres complètes* is by E. Laboulaye (7 vols., Paris, 1879). See A. Sorel, *Montesquieu* (Paris, 1887), and Political Science. A. G. Canfield.

Monteverde, Claudio: originator of the modern style of musical composition; b. at Cremona, Italy, in 1568; d. in Venice in 1643. Monteverde was the first to discover and employ the chord of the dominant seventh and its inversions, also the chord of the ninth and the principle of suspensions. Besides this he showed astonishing gifts in the composition of dramatic music. He composed many operas, and may be said to have originated truly dramatic music in contradistinction to the then all-prevailing contrapuntal style of the old ecclesiastical composers. In the orchestra he also made innovations and improvements. In 1608, at the performance of his *Orfeo*, he employed thirty-six instruments. In 1624 he introduced into a large cantata, among other novel effects, a *tremolo* for the stringed instruments as we now employ it to express agitation, rage, anger, etc. It is said that the appearance of this tremolo upon paper so astonished the performers of that day that at first they declined to attempt it. Dudley Buck.

Monteverde, Juan Domingo: soldier; b. in Teneriffe, Canary islands, about 1772. He served at first in the Spanish navy, attaining the grade of captain of frigate. Being stationed on the Venezuelan coast, he exchanged into the army, taking the rank of *mariscal de campo*. The revolt which had broken out at Caracas attained great headway until the disastrous earthquakes of Apr., 1812. Monteverde, taking advantage of the confusion, collected forces in the western provinces, advanced rapidly on Caracas, and, with very little fighting, compelled the submission of Miranda in August, occupying the capital soon after. He treated the conquered region with great severity, and, in violation of his own treaty, sent Miranda a prisoner to Spain. His excesses excited new revolts; he was driven from Caracas, repeatedly beaten by Bolivar, and finally shut up in Puerto Cabello, where he was deposed by his own officers Dec., 1813. In 1816 he returned to Spain, where he died in 1823. Herbert H. Smith.

Montevideo: village; capital of Chippewa co., Minn. (for location of county, see map of Minnesota, ref. 9–B); at the junction of the Chippewa and Minnesota rivers, and on the Chi., Mil. and St. P. Railway; 133 miles W. of Minneapolis. It was founded soon after the Sioux Indian outbreak in 1862, and is near the spot, now marked by an imposing monument erected by the State, where Little Crow surrendered a large body of hostiles and several hundred white prisoners. There are 7 churches, Windom Institute, State High School, graded schools, a State bank with capital of $30,000, 2 private banks, a monthly and 2 daily periodicals, 5 elevators, and 2 large flour-mills. It is in an agricultural, dairying, and stock-raising region. Pop. (1880) 862; (1890) 1,437; (1900) 2,146. Editor of "Leader."

Montevideo, Span. pron. mōn-tā-veĕ-dā'ō: capital and chief city and port of Uruguay; on a small bay of the northern shore of the Rio de la Plata, where the estuary begins to open out into the Atlantic; lat. (of the cathedral) 34° 54′ 33″, S. lon. 56° 12′ 18″ W. (see map of South America, ref. 8–E). The bay, which is about 2½ miles long and wide, forms the best harbor on the Plata; it is, however, open to winds from the S. E., and it will not admit vessels of over 15 feet draught; larger ships anchor in the open roadstead formed by the mouth of the estuary, where, during the winter months, they are exposed to the dangerous storms called pamperos. A conical hill, the Cerro, marks the southwestern side of the entrance to the bay, and is a conspicuous feature in the landscape. The city occupies a low ridge or headland with gently sloping sides: this gives it an excellent surface drainage during the frequent rains, and there is now a good system of under drainage. The water-supply is obtained from the river Santa Lucia, about 12 miles distant. The streets are wide and straight, crossing each other at right angles; the most important ones run along the top of the ridge, where also there is a series of fine public squares. The better class of houses in the city proper are commonly in the Italian style, three or four stories high; owing to the general taste for architecture and the free use of white marble in building, this is one of the handsomest cities of South America. Among the numerous fine public edifices may be mentioned the cathedral, municipal building, government palace, school of arts and sciences, and the Solis theater. Lines of tram-cars run to the outskirts—Paso Molino, La Union, etc.—where there are numerous charming suburban residences, surrounded by gardens and lawns. The Prado, about 3 miles from the city, is a handsome park, adorned with fountains, groves, and flower-gardens. Pocitos and Buceo, on the coast just E. of the city, are much frequented for bathing; and Victoria and Villa del Cerro, on the opposite side of the bay, contain

many slaughter-houses and establishments for curing hides, preparing jerked beef, etc. At Cerro there are three large dry docks. Montevideo absorbs a large portion of the commerce of Uruguay, and to some extent the trade in transit to the rivers Paraná and Paraguay; numerous regular lines of steamers connect it with Europe, North America, Brazil, the Argentine, and the Pacific coast. In 1891 the number of vessels which entered the port was 4,033, of which 1,092 were from foreign ports. In 1889 the value of the exports was about $17,415,000, of the imports $33,476,000. The most important exports are hides, jerked beef, and other bovine products, and wool. Railways connect the city with Santa Ana (Brazil), Minas, and Barra de Santa Lucia. The city, like Uruguay in general, has few important manufactures. It is the seat of a university, schools of medicine, art, etc., and many charitable institutions. Montevideo was founded in 1726, and during the colonial period was little more than a fort and settlement, dependent on Buenos Ayres. On Feb. 2, 1807, it was taken by a British expedition, but was soon abandoned. When Buenos Ayres declared its independence, in 1810, the Spanish forces intrenched themselves in Montevideo, whence they were not expelled until June, 1814. It became the capital of Uruguay in 1828, but at that time had only 9,000 inhabitants. Its commercial prosperity began in 1836, owing to the short-sighted policy of Rosas, which drove trade and immigration from Buenos Ayres and turned the current to this port; the tyranny of the dictator also drove many of the better class from Buenos Ayres to this place, and it became a center of opposition to him. From 1842 to 1851 Oribe, supported by Rosas, made constant efforts to take the city; this period is known as the "nine years' siege." Notwithstanding this and the burdens of subsequent civil wars, Montevideo has prospered steadily. Pop. (1892) officially given as 238,080; but this includes the department of Montevideo, which contains 256 sq. miles; the city proper probably has about 180,000, most of the rest being in Cerro, Victoria, Pocitos, Buceo, and other villages of the outskirts. See Mulhall, *Handbook of the River Plate* (1892); Childs, *Spanish-American Republics* (1891); Isodoro De-Maria, *Compendio de la historia de la República Oriental* (1874–75).

HERBERT H. SMITH.

Mon'tez, MARIE DOLORES ELIZA ROSANNA, Countess of Landsfeld, known as LOLA MONTEZ: adventuress; b. at Limerick, Ireland, in 1818; was the daughter of an ensign named Gilbert; was married in 1837 at Neath to a Capt. James, from whom she soon separated; appeared as a *danseuse* in Paris 1840; proceeded in 1846 to Munich, where she became mistress of King Louis and received the title of Countess of Landsfeld. She took an active part in politics, but was compelled to leave the country by the outbreaks of 1848; went to the U. S. in 1851; appeared for some years as an actress and lecturer, and published her *Autobiography* (1858), besides various other writings. D. at Astoria, L. I., Jan. 17, 1861. Revised by B. B. VALLENTINE.

Montezu'ma: town; capital of Poweshiek co., Ia. (for location of county, see map of Iowa, ref. 5–I); on the Ia. Cent. and the Burl., Cedar Rap. and N. railways; 24 miles N. of Oskaloosa, 56 miles E. of Des Moines. It is in a farming, dairying, and stock-raising region; has valuable coal deposits in its vicinity; and contains 4 churches, 2 public-school buildings, electric lights, a national bank with capital of $50,000, and 2 weekly newspapers. Pop. (1880) 921; (1890) 1,062; (1900) 1,210.

EDITOR OF "REPUBLICAN."

Montezuma [also written MOTECZUMA, MOCTEZUMA, MOTECHUZOMA, etc.; Aztec, *Motecuhzoma*, the sad or severe one]: the name of two war-chiefs or so-called "emperors" of ancient Mexico.—MONTEZUMA I., called ILHUICAMINA, was born about 1390, became chief in 1436, and, like most of the line, was a successful warrior; he is said to have been the first who carried his arms to the Gulf coast. D. about 1464. —MONTEZUMA II., surnamed XOCOYOTZIN, was born about 1476 (according to Bernal Diaz, in 1479), and is famous as the chief of Mexico at the time of the Spanish invasion. He was the son of Axayacatl, a former chief; was early noted as a warrior; and it would appear was also a priest. In 1503 he was chosen to succeed his uncle, Ahuizotl. At this time Tenochtitlan, or Mexico, was the most powerful city of the plateau, and its authority was in some sense recognized by most of the tribes as far as the Gulf to the E. and southward to the Isthmus of Tehuantepec. Montezuma had almost continuous wars with the Tlascalans, who had never been subdued; and he is said to have made an expedition far southward into Honduras. From these and other wars he brought back thousands of prisoners, who were sacrificed in the temples. In 1518 he heard that ships with white men (Grijalva's expedition) had appeared on the coast; and his uneasiness at the tidings was increased, it is said, because it had been foretold that descendants of the white god, Quetzalcoatl, would one day come and rule Mexico. When Cortés landed at Vera Cruz, Apr., 1519, Montezuma sent him gifts, but tried to dissuade him from coming to Tenochtitlan. Beyond this it does not appear that he ever attempted an armed resistance; and the only fighting done by the Spaniards in their march over the plateau was in the independent territory of Tlascala, and in Cholula, where they discovered, or thought they discovered, a conspiracy, and punished it by killing several hundred unarmed people. Since Cortés had insisted on coming, pretending that he was an ambassador from the King of Spain, Montezuma received him well, going out from the city to meet him, assigning him quarters in a public building, and sending rich presents to him and his officers (Nov. 8, 1519). The common people soon showed that they hated the strangers, and were impatient with the pusillanimous policy of their chief; Cortés, fearing an outbreak, boldly seized Montezuma in his own house, and confined him as a hostage in the Spanish quarters. Here he was, in the main, kindly treated, and nominally ruled as before, through his officers; on one occasion, when it was alleged that he was attempting resistance to his jailer's wishes, he was put in irons. The people at length rose in open revolt, and attacked the Spanish quarters. At the request of Cortés, Montezuma appeared on the wall and attempted to pacify them; but he was received with a shower of stones, and fell back wounded. Four days after he died, probably more of grief and shame than from the effects of his wounds, June 30, 1520. See Prescott, *Conquest of Mexico*; Bancroft, *History of the Pacific States: Mexico* (vol. i.); Bernal Diaz del Castillo, *Historia verdadera de la conquista de la Nueva España*.

HERBERT H. SMITH.

Montfaucon, mōn'fō'kōn', BERNARD, de: classical scholar; b. at Soulaye, in Languedoc, Jan. 17, 1655; served for some years in the army, but entered in 1675 the Benedictine congregation of Saint-Maur, devoting himself exclusively to classical studies, inspired by Amyot's famous French translation of Plutarch; traveled in Italy, and settled in 1701 in Paris, where he died Dec. 21, 1741. The first fruits of his extensive learning were new critical editions of several of the Greek Fathers, but his enduring fame rests upon the *Palæographia Græca* (1708), by which he became the founder of scientific palæography. He examined 11,630 MSS. with a view to determine chronological data from the character of the handwriting. Other works are *L'Antiquité expliquée et representée en figures* (French and Latin, 15 vols., 1719–24); *Bibliotheca bibliothecarum MSS. nova* (2 vols. fol., 1739), containing a list of the MSS. examined by him during a period of forty years; *Monuments de la monarchie française* (1729–33, in 5 vols. fol.). Cf. E. de Broglie, *La société de l'abbaye de Saint-Germain* (2 vols., 1891).

Revised by A. GUDEMAN.

Montferrat: formerly an independent duchy of Italy; bounded by Piedmont, Milan, and Genoa; now a part of the Italian province of Turin. From the time of Otto the Great it was governed by margraves or marquises, of whom several became famous as military chiefs, especially in the crusades. Conrad successfully defended Tyre against Saladin in the third crusade, and one of the leaders of the fourth was Bonifacе III. who after the establishment of the Latin Empire of the East (1204) became lord of Thessaly. Montferrat became a duchy in 1574. In 1631 a part of it was ceded to Savoy, which in 1703 secured the remainder.

Montfort, SIMON, de, Earl of Leicester: statesman; b. in France early in the thirteenth century, a son of Simon de Montfort, the vanquisher of the Albigenses. In 1231 his brother, the Count Amaury de Montfort, gave him the honor of Leicester, inherited from his maternal grandmother, an English lady; for this title Simon did homage to Henry III. in 1231, and in 1239 it was formally granted by the king after his marriage with the king's sister; was for many years employed as governor of Gascony, where he conducted many wars with advantage, and twice refused the French regency; in England, unlike most other French adventurers of that period, he took the part of the barons against the king in the wars of Henry III.'s reign; compelled the

king to sign the provisions of Oxford 1258, and in 1262 became the leader of the baronial party; dictated terms at the victory of Lewes 1264; summoned the Parliament of 1265, at which knights of the shire and representatives of the boroughs were admitted—the germ of the future House of Commons; became justiciary of England. Long the virtual master of the realm, he was attacked by Edward, Prince of Wales, at Evesham, and there defeated and slain Aug. 4, 1265.

Montfort, Simon, de, Count, subsequently Count of Toulouse: soldier; b. about 1150; took part in the fourth crusade; was appointed leader by the pope of the crusade against the Albigenses in 1208, and became famous for the unheard-of cruelty with which he suppressed this movement. In 1213 he took Toulouse from Count Raymond, but was afterward driven from the city, and when he returned to besiege it he was killed by a stone thrown from the wall June 25, 1218.

Montgolfier: See Aëronautics.

Montgomery: city (founded in 1817, incorporated in 1837, made State capital in 1847); capital of Alabama and of Montgomery County (for location of county, see map of Alabama, ref. 5–D); on the Alabama river, and the Ala. Mid., the Cent. of Ga., the Louis. and Nash., the Savannah, Amer. and Mont., and the W. of Ala. railways; 180 miles N. E. of Mobile, with which it has steamboat communication all the year. It is built on the bluffs of the river, and is in an agricultural, mineral, and yellow-pine and hard-wood timber region. It contains 35 churches, 7 large cotton-storage warehouses, 3 compresses, 4 ginneries, 8 public-school buildings, an orphanage, a home for widows, U. S. Government building, State Capitol (erected in 1851), 3 national banks with combined capital of $600,000, a State bank with capital of $100,000, and 2 daily, 5 weekly, 3 monthly, and 2 other periodicals. There are gas and electric light plants, electric street-railway, water and sewerage plants (the former supplied from artesian wells), and suburban parks at Riverside and Highland Hill. Extensive deposits of coal and iron are within easy reach by rail and water, and the city is connected with the heart of the timber region by a narrow-gauge railway. The river tonnage of freight averages 500,000 tons annually, and the aggregate business of the city exceeds $40,000,000 in value annually. Besides the industries connected with the cotton, coal, iron, and timber production, there are brick-yards, flour-mills, and carriage and wagon, ice, candy, fertilizer, cigar, soap, paper-box, vinegar, cracker, and other factories. Pop. (1890) 21,883; (1900) 30,346. Editor of "Advertiser."

Montgomery: village; Orange co., N. Y. (for location of county, see map of New York, ref. 7–J); on the Wallkill river, and the Erie and the Wallkill Val. railways; 12 miles W. of Newburg, 70 miles N. by W. of New York city. It is in an agricultural and dairying region, has 4 churches, public union school, and 2 weekly newspapers. Pop. (1890) 1,024; (1900) 973. Editor of "Standard."

Montgomery City: town; Montgomery co., Mo. (for location of county, see map of Missouri, ref. 4–I); on the Wabash Railroad; 84 miles W. of St. Louis. It contains 7 churches, high school, public school, free public library, electric lights, woolen, flour, tobacco, and box factories, 2 State banks, and 2 weekly newspapers. It is in a farming, dairying, and live-stock region, and has valuable quarries in its vicinity. Pop. (1890) 2,199; (1900) 2,026. Editor of "Standard."

Montgomery, Gabriel, Comte de: soldier; b. about 1530; was an officer in the Scotch Guard at Paris. In 1559 he was invited to joust against King Henry II. in the royal tournament, and accidentally drove a splinter of his lance into his antagonist's eye, causing a fatal wound. He then retired for a time to his estates, and afterward traveled in Italy and England. Having turned Protestant, he returned to France and took part in the Huguenot wars, winning distinction by his brave defense of Rouen, and by his successes in Languedoc and Béarn. In 1573 he made an attempt on La Rochelle, but without success. Then, gathering a considerable body of Huguenots, he began war in Normandy, but was captured in the Castle of Domfront and taken to Paris. Despite his captor's promise that his life should be spared he was executed by order of Catherine de Médicis, June 26, 1574.

Montgomery, James: poet; b. at Irvine, Ayrshire, Scotland, Nov. 4, 1771; was the son of a Moravian preacher; was educated at the Fulneck School, Yorkshire, and apprenticed to a grocer, but ran away in 1789, and in 1792 became clerk to Joseph Gales, a famous journalist of Sheffield. Montgomery then founded *The Sheffield Iris*, which he edited thirty-one years, 1794–1825. In 1835 he received a pension, and declined the professorship of Rhetoric at Edinburgh. D. at Sheffield, Apr. 30, 1854. His principal works are *Prison Amusements* (1797), written during an imprisonment for seditious libel; *The West Indies* (1809), an anti-slavery poem; *The World before the Flood* (1813); *Greenland* (1819); *Prose by a Poet, Lectures on Poetry and English Literature* (1830–31); *Original Hymns* (1853).

Montgomery, John Berrien: sailor; b. at Allentown, N. J., Nov. 17, 1794; entered the navy as midshipman 1812; was a midshipman on the flagship Niagara at Perry's victory on Lake Erie, Sept. 10, 1813, receiving a sword and the thanks of Congress; was with Decatur in the naval campaign against Algiers 1815; commanded the Portsmouth on the Pacific coast 1845–48, during which cruise he took possession of Lower California, occupied Guaymas, and blockaded Mazatlan for some months; was commissioned captain 1853; commanded the Pacific squadron 1860–61; made commodore July 16, 1862, and rear-admiral July 25, 1866; commanded the naval station at Sackett's Harbor 1867–69; retired 1869. D. at Carlisle, Pa., Mar. 25, 1873.

Montgomery, Richard: soldier; b. in Swords, near Feltrim, Ireland, Dec. 2, 1736. He was educated at Trinity College, Dublin; entered the English army at the age of eighteen; and in 1757 was ordered to Halifax. He served in various Canadian campaigns, and in 1762 had reached the rank of captain. He also fought in the campaigns against Martinique and Havana, and afterward spent some time in England, where he became intimate with Edmund Burke and Charles James Fox. In 1772 he sold his commission and purchased a farm at King's Bridge, now in New York city, and married Janet, daughter of Robert R. Livingston. In May, 1775, he was sent as a delegate to the First Provincial Congress in New York city, and in June was made brigadier-general in the Continental army. Through the illness of Gen. Schuyler the command of the campaign into Canada devolved upon him. After his successes at St. John, Chambly, and Montreal he was made major-general, Dec. 9. He was killed while leading the attack on Quebec, Dec. 31, 1775. In 1818 his body was removed to New York city and buried in St. Paul's Chapel.

Montgomeryshire: county of North Wales, comprising an area of 797 sq. miles. The surface is mountainous, and the soil, with exception of the valleys of the Severn, Wye, and Dee, not fertile. On the mountain-pastures many sheep are reared, and the county is the chief seat of the Welsh flannel manufacture. Pop. (1901) 54,892. Chief town, Montgomery.

Month [M. Eng. *month*, *moneth* < O. Eng. *mōnð*, *mōnað*: O. H. Germ. *mōnōd* (> Germ. *monat*): Icel. *mānuðr*: Goth. *mēnōþs*; cf. Moon]: a period of time roughly corresponding in length to one revolution of the moon around the earth. The length of a mean lunation is 29d. 12h. 44m. 2·8s. Months were at first therefore reckoned as alternately 29 and 30 days long, twelve lunar months falling short of the length of a year by about 11¼ days. The methods used by different peoples to obviate this disparity, together with the history of our own system, are discussed in the article Calendar (*q. v.*).

Montholon', Charles Tristan, de, Count: soldier; b. in Paris in 1782; entered the army in 1798; distinguished himself in the battle of Wagram 1809; was attached to the personal staff of Napoleon; followed him to St. Helena, and was appointed one of his executors. After 1830 he re-entered the French army; took part in the attempt of Prince Louis Napoleon at Boulogne, and was condemned to twenty years' imprisonment, but regained his liberty after the Revolution of 1848, and became a member of the Legislative Assembly. D. Aug. 24, 1853. In connection with Gen. Gourgaud he published *Mémoires pour servir à l'Histoire de France sous Napoléon, écrits à Sainte-Hélène, sous sa dictée* (8 vols., Paris, 1822–25; 2d ed. 1830); and in 1846 *Récits de ta Captivité de l'Empereur Napoléon à Sainte-Hélène.*

Mon'ti, Vincenzo: poet; b. at Alfonsine, near Ravenna, Italy, Feb. 19, 1754; d. in Milan, Oct. 13, 1828. Studied literature with the poet Onofrio Minzoni in Ferrara, and imitated Varano and Dante; at Rome obtained the position of secretary to Prince Luigi Bracchi, himself secretary of

Pope Pius VI. Inspired by the tragedies of Alfieri, Monti became a tragic poet, and wrote the tragedies *Aristodemo* (1785) and *Galeotto Manfredi*. Basseville, the representative of the French republic, having been assassinated at Rome, Monti, to please the papal court, wrote a poem entitled *Cantica in morte di Ugo Basville*, which gave him great celebrity. This poem was followed by two others, *La Musogonia* and *La Feroniade*, satiric attacks upon the French Revolution and the whole revolutionary movement. On the triumph of Bonaparte, however, Monti sought the protection of the rising genius, and obtained at Milan the post of secretary of the executive directory. Thence he was sent to Bologna as commissioner of the Cisalpine republic. After the Russo-Austrian invasion (1799) he fled to Paris, and there wrote a third tragedy, *Cajo Graccho*; and his *Mascheroniana*, a poem in three cantos, on the death of the mathematician Lorenzo Mascheroni. Returning to Italy after the battle of Marengo, he was appointed professor in the Brera at Milan, and of Italian rhetoric in the University of Pavia. In 1805 Napoleon named him historian of the kingdom of Italy. Then followed certain adulatory but unsuccessful poems—*Il Bardo della selva nera*, *La Spada di Federico*; afterward an indifferent translation of Persius, and an elegant translation of the *Iliad* of Homer. When Napoleon fell (1815), Monti was ready to compose a poem in honor of the Emperor of Austria, Francis I. In the last years of his life he prepared a voluminous *Proposta di alcune correzioni ed aggiunte da farsi al vocabolario della Crusca* (6 vols., Milan, 1817–24). Collected editions of his works appeared in Milan (6 vols., 1839, *seq.*), Florence (5 vols., 1847), Milan (1 vol., 1847). See Vicchi, *Vincenzo Monti, la lettere e la politica in Italia dal 1750 al 1830* (Rome, 1885, *seq.*); also B. Zumbini, *Sulle poesie di Vincenzo Monti* (Florence, 1886). Revised by A. R. Marsh.

Montiano y Luyando, Agustin, de: poet; b. in Valladolid, Spain, Mar. 1, 1697. Educated by an uncle in the island of Majorca, he wrote there a poem, *El robo de Dina*, and a drama, *La lira de Orfeo*, which gave him some repute. In 1727 he went to Madrid, where he had political employment of some importance, and became a member of all the academies, as well as director of the Academy of History. D. in Madrid, Nov. 1, 1764. He is chiefly known for his attempts to regulate and purify the Spanish drama, bringing it under the rules of the French playwrights, particularly Racine. For this purpose he composed two tragedies, *Virginia* (1750) and *Athaulpho* (1753), so rigidly regular as now to be scarcely readable. He had great repute in his day, both in and out of Spain. A. R. Marsh.

Monticello: town; capital of Drew co., Ark. (for location of county, see map of Arkansas, ref. 5–D); on the St. L., Iron Mt. and S. Railway; 85 miles S. by E. of Little Rock, the State capital, 35 miles W. of the Mississippi river. It contains saw and grist mills, and a weekly newspaper. Pop. (1880) 891; (1890) 1,285; (1900) 1,579.

Monticello: town; capital of Jefferson co., Fla. (for location of county, see map of Florida, ref. 2–G); on the Fla. Cent. and Pen. and the Savannah, Fla. and West. railways; 30 miles E. of Tallahassee, 142 miles W. by N. of Jacksonville. It is in a farming and fruit-growing region, and contains 6 churches, 2 public schools, several private schools, and 2 weekly newspapers. Pop. (1890) 1,218; (1900) 1,076.
Editor of "Constitution."

Monticello: city; capital of Piatt co., Ill. (for location of county, see map of Illinois, ref. 6–F); on the Sangamon river, and the Wabash and the Ill. Cent. railways; midway between Chicago and St. Louis. It is in a corn-growing and stock-raising region; contains 5 churches, 3 public-school buildings, water-works, electric lights, and 2 weekly and 2 monthly periodicals; and has steam flour-mill, steam elevator, foundry and machine-shops, planing-mill, harness, broom, and cigar factories, and patent fence and tile works. Pop. (1890) 1,643; (1900) 1,982. Editor of "Bulletin."

Monticello: town (laid out in 1835); capital of White co., Ind. (for location of county, see map of Indiana, ref. 4–C); on the Tippecanoe river, and the Louis., New Alb. and Chi., and the Pitts., Cin., Chi. and St. L. railways; 21 miles W. of Logansport, 25 miles N. of Lafayette. It has 4 churches, 2 public-school buildings, 2 weekly newspapers, electric lights, 3 flour-mills, canning-works, and a hub and spoke factory. The river furnishes excellent water-power. Pop. (1880) 1,193; (1890) 1,518; (1900) 2,107.
Editor of "Herald."

Monticello: city (settled in 1836); Jones co., Ia. (for location of county, see map of Iowa, ref. 4–K); on the Maquoketa river, and the Chi., Mil. and St. P. Railway; 36 miles S. W. of Dubuque, 216 miles W. of Chicago. It is the center of a large dairy region, has extensive creamery interests, manufactures feather dusters, feather trimming, and cigars, and contains 6 churches, high and grammar schools, water-works (supplied from an artesian well), and 2 weekly newspapers. Pop. (1880) 1,877; (1890) 1,938; (1900) 2,104. Editor of "Express."

Monticello: village (founded in 1804, made the county-seat in 1809); capital of Sullivan co., N. Y. (for location of county, see map of New York, ref. 7–I); on the Port Jervis, Mont. and N. Y. Railroad; 24 miles N. of Port Jervis, 40 miles W. by N. of Newburg. Its altitude of about 1,600 feet above sea-level gives it an invigorating, dry atmosphere, and makes it a charming health and pleasure resort. It is in a lumbering region, and has a tannery in which fancy leather for bookbinding and other purposes in the arts is manufactured, an academy, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Roman Catholic churches, and two weekly newspapers. Pop. (1880) 941; (1890) 1,016; (1900) 1,160.
Editor of "Republican-Watchman."

Montmorency, Fr. pron. mōn′mō′raăn′see′: the surname of an ancient and illustrious French family, traced back as far as 950 to Bouchard, Sire de Montmorency, a great French feudatory, nephew of Edred, King of England. The Montmorencies were long known as the premier barons of France, and among those of this name were six grand constables, twelve marshals, four admirals, many cardinals, generals, grand chamberlains, and other high magnates. Belgium and Luxemburg have still several princely and ducal lines of this family. Count Horn and Marshal Luxembourg were both Montmorencies.

Montmorency, Anne, de, First Duke: soldier; b. at Chantilly, Mar. 15, 1492; was one of the leading generals in the wars of Francis I.; gained renown for his gallantry at Marignano and Mézières, and was captured with Francis at Pavia in 1525. On the renewal of the war with Charles V. he commanded with such success that he was appointed by Francis constable of France. In the war with Spain he was defeated and captured at St.-Quentin (1557). During the first Huguenot wars he commanded the royal army. He was taken prisoner at the battle of Dreux (1562), but was soon released. In 1563 he drove the English from Havre, and fought with Condé at Saint-Denis. He was fatally wounded in the latter engagement, and died on the following day, Nov. 11, 1567.—Henry, fourth Duc de Montmoreney, a grandson of the preceding; b. at Chantilly, Apr. 30, 1595; godson of Henry IV., when sixteen years old became admiral of France and Viceroy of Canada. He served with distinction in Italy and against the Huguenots; took part in the rebellion of Gaston of Orleans, and was executed by order of Richelieu at Toulouse Oct. 30, 1632.

Montmorency, Falls of: a beautiful cascade in the Montmorency river, 8 miles N. E. of Quebec. The river rises in Snow Lake, Montmorency County, and flows S. for more than 30 miles, emptying into the St. Lawrence, after being joined by Des Neiges river. About a mile above the precipice of 250 feet, over which the waters take their final leap, are the natural steps, formed by the action of the water on the rock. At the base of the steps or terraces is a narrow, water-worn channel through which the stream rushes as in a mill-race over cascades and through seething pools. Between the falls and the natural steps the river is crossed by a wooden bridge built since the destruction of the beautiful suspension bridge that once spanned the cataract. Montmorency is a favorite resort for visitors to Quebec. In summer the scene is very impressive from the Duke of Kent's lodge, or from the steep stairway on the eastern side. In the winter the freezing spray forms a cone which attains a considerable height, and down this tobogganers slide with great velocity. The road to the falls passes through the straggling village of Beaufort with an asylum and numerous picturesque residences. Beaufort was the headquarters of Montcalm in 1759 when he prevented Wolfe from landing at Montmorency Falls. A railway connects the falls with Quebec. J. M. Harper.

Montpelier: town; Bear Lake co., Ida. (for location of county, see map of Idaho, ref. 11–F); on the Union Pac. Railway; 145 miles N. W. of Green river. It is in an agri-

cultural, dairying, lumbering, and mining region. Pop. (1890) 1,174; (1900) 1,444.

Montpelier: city; capital of the State of Vermont and of Washington County (for location of county, see map of Vermont, ref. 4–C); on the Winooski or Onion river, here crossed by a stone bridge, and on the Mont. and Wells River and the Cent. Vt. railways; 40 miles S. E. of Burlington, 205 miles N. N. W. of Boston. It is in an agricultural and granite region, is the commercial center of a large territory, and has an extensive trade. It contains 6 churches, the Vermont Methodist Seminary (chartered in 1833), the Washington County Grammar and two Montpelier Union Schools, electric-light, gas, and water plants, 7 libraries containing nearly 100,000 volumes, an educational, 3 weekly, and 2 monthly periodicals, and 2 national banks with a combined capital of $400,000, and two savings-banks and a trust company, with capital of $150,000, two fire and one life insurance company, the assets of the latter being

State Capitol, Montpelier, Vt..

nearly $20,000,000. The town was made the State capital in 1805, and contains a Capitol built of granite, with a frontage of 177 feet and a dome and cupola 56 feet high, surmounted by a statue of Agriculture, 120 feet above the ground. The principal industry is the quarrying of the celebrated Barre granite; other industries are the manufacture of sawmill, candy-making, and other machinery, leather, organ and piano springs, and clothes-wringers and washing-machines. Pop. (1880) 3,219; (1890) 4,160; (1901) 7,157.

EDITOR OF "THE ARGUS."

Montpellier, mōn'pel'i-ā': capital of the department of Hérault, France; on the Lez; 6 miles N. of the Mediterranean and 76 miles W. N. W. of Marseilles (see map of France, ref. 8-G). Its promenades afford the most splendid views of the Mediterranean, the Pyrenees, and the Alps; and as its climate is remarkably mild and salubrious, its vicinity is covered with villas and cottages. Remarkable among its buildings are the cathedral and the aqueduct, and among its institutions its medical school, founded in the Middle Ages by Arabian physicians and in 1289 incorporated with its schools of law and arts as a university; a botanical garden, the first established in France, and many excellent collections, are connected with the school. Montpellier has large distilleries and manufactures of woolens and cottons, and it carries on an important trade in wine, olive oil, fruits, and grain. Pop. (1896) 73,931.

Montpensier, mōn'paŋ'si-ā', ANNE MARIE LOUISE D'ORLÉANS, Duchesse de (better known by her courtesy title of Grande Mademoiselle); niece of Louis XIII.; b. in Paris, May 29, 1627. Being of royal blood and having enormous wealth, she was encouraged to look forward to the French throne through a marriage with Louis XIV., but was disappointed in this and in other plans for a brilliant match, and, attributing her misfortunes to Mazarin, favored the rebellious movement known as the Fronde. In the ensuing war she played a bold and masculine part. In 1652, at the time of the fighting in the city, she held the Bastile and saved her defeated party by opening the gates and ordering the cannon to be directed against the royalists; and during the riots that followed she occupied the Hôtel de Ville and tried to mediate between the combatants. After this she was for some time in disgrace, but returned to the court in 1657, apparently restored to favor. About this time she fell in love with LAUZUN (*q. v.*), and in 1670 she sought the royal permission to marry him. The king's consent was at first given and then withdrawn at the instance of other members of the royal family. Lauzun passed ten years in prison, but after his release in 1681 Mademoiselle and he were secretly married. The union was unhappy and they soon separated, after which she devoted herself to religious duties and to the completion of her *Mémoires*. D. Apr. 9, 1693. The *Mémoires* were first published at Amsterdam in 1729; edited and republished by M. Chéruel in 1858. See Voltaire's *Siècle de Louis XIV.*

F. M. COLBY.

Montpensier, ANTOINE MARIE PHILIPPE LOUIS D'ORLÉANS, Duke of: the fifth and youngest son of Louis Philippe, King of the French; b. at Neuilly, July 31, 1824; was educated at the Collège Henri IV., and in 1842 was appointed *sous-lieutenant* of artillery; took part in several campaigns in Africa, won the grand cross of the Legion of Honor, and rose to the rank of brigadier-general in 1846. At this period the negotiations took place by which the duke was betrothed to the sister of the Queen of Spain. These alliances and the famous "Spanish marriages" produced a great sensation in France and dissatisfaction elsewhere, especially in England. After his marriage, Oct. 10, 1846, he took up his residence at the palace of the Tuileries, whence he was driven in 1848 by the revolution which dethroned the king. He finally fixed his residence, with the duchess, in the palace of San Telmo at Seville. Besides honorary appointments, he was made by Queen Isabella, in 1858, captain-general of the Spanish army, and in 1859 she conceded to him the honors due to "infants" of Spain. This cordiality was disturbed by political troubles accumulating about the queen's government, and by his alleged ambition to succeed to the Spanish throne. After the dethronement of the queen (Sept., 1868) his claims were pressed by his friends, but he was not successful. The most marked event of this period is his quarrel with his cousin, who spoke of him in bitter and insulting terms. A duel ensued and Montpensier killed his adversary, Duc Henrique. The duke and his family lived for some years in Paris. D. in Andalusia, Feb. 4, 1890.

Montreal [literally, Mount Royal]: city; province of Quebec, Canada; ranking first in the Dominion in population, wealth, commercial importance, and political influence (see map of Province of Quebec, ref. 5–B). It occupies a commanding position at the highest point of ocean navigation, and the beginning of a vast system of railways and canals that ramifies throughout Canada. The city has grown up along the southeast side of an island formed by the junction of the Ottawa river with the St. Lawrence, the older portion lying upon the slope of a hill, known as The Mountain, whose crest has been reserved for a public park, the newer parts of the city spreading out at the east and west ends upon more level ground. The general direction is northeast by southwest, and with the broad river in front and the richly wooded Mountain behind, Montreal presents a most picturesque and pleasing appearance from any point of view.

Area and General Plan.—The length of the city is about 6 miles, and the breadth at its widest part over 2 miles. The main avenues run parallel with the river, and the cross streets at right angles to it. Upon the whole, the street plan is regular, although in the older wards there are many narrow, tortuous streets. The alley system is in use in the newer residence quarters. The business part of the city is closely built up with lofty and substantial warehouses and office buildings. In the residence quarter the streets are broad, well shaded with trees, and lined with handsome stone dwellings, brick and wood being very little used. There are many open squares scattered through the city, and the principal ones, such as Dominion Square, Victoria Square, Place Viger, and St. Louis Square, are adorned with ponds, fountains, and flowers. The Mountain Park comprises nearly 500 acres, and is beautifully laid out and carefully maintained.

Important Public Buildings.—The principal public buildings are the court-house and the city-hall, both large blocks of gray limestone; the Windsor and Place Viger Hotels, the former one of the world's most noted; the Bonsecours market; the exhibition buildings, where the provincial exhibition is held annually; the drill hall and armory, one of the largest in Canada; the Windsor Street, Place Viger, and Bonaventure railway stations; and the federal buildings, such as the custom-house, post-office, etc.

Institutions.—In institutions of all kinds Montreal is exceptionally rich. Within the bounds of the city are the grandest ecclesiastical edifices, the best-equipped and most largely attended university, the richest Catholic convents and monasteries, the finest public schools, the most perfectly appointed public hospitals, and the most costly and luxurious clubs in Canada. The chief church buildings are the new St. James's Cathedral (Roman Catholic), modeled after St. Peter's at Rome on a scale of one-half; Church of Notre Dame, in one of whose lofty twin-towers hangs the largest bell in America; St. James's (Methodist), the most splendid Protestant church in Canada; Christ Church Cathedral (Episcopal), a beautiful specimen of Gothic architecture; the Jesuit church, notable for its fine frescoes; and St. Paul's and Crescent churches, both Presbyterian. The public-school buildings are principally of the modern type, the new high-school building being the largest in the Dominion. There are five hospitals, the Royal Victoria, presented by Lord Mount-Stephen and Sir Donald Smith at a cost of several millions of dollars; the Montreal General, opened in 1822; the Hôtel Dieu, a large and useful Roman Catholic institution; the Notre Dame; and the Western Hospital. As an educational center Montreal takes high rank, the most important institution being McGill University, founded in 1813. The University of Bishops College has its medical department in Montreal, and there are many important French institutions, such as the branch of Laval, the Seminary of St. Sulpice, St. Mary's College, and the convent of Ville Marie. There is one free library, the Fraser Institute, with 40,000 volumes. Other good libraries are the Redpath of McGill University with 35,000 volumes, the Law Library with 15,000, the Mechanics' Institute with 12,000, and the Union Catholique with 20,000. The only museum of note is that attached to McGill University. In the galleries of the Art Association there is a choice collection of paintings.

Government, Finance, etc.—The municipal affairs are administered by a mayor and corporation elected by popular vote, the city being divided into wards, each represented by two or more aldermen. The annual revenue is about $3,049,000, and is usually exceeded by the expenditure, with the result that a debt exceeding $27,000,000 has been incurred. The total valuation of real estate liable to assessment is $152,000,000; the religious, school, and other property exempt from taxation is $36,300,000; and the rate of taxation $1.25 per $100.

Business Interests.—As a manufacturing center Montreal stands sixteenth on the list of American cities. In 1891 the number of establishments was 1,735; capital invested, $51,212,133; number of persons employed, 38,562; total wages paid, $13,078,546; and the value of products, $52,509,710. The principal products were sugar, cotton, flour, malt liquors, tobacco and cigars, and iron and steel goods. The city is the chief distributing point for the commerce of the Dominion. It contains the largest wholesale houses, the leading banks and other financial institutions, and the headquarters of the two great railway systems, the Canadian Pacific and the Grand Trunk. Situated at the head of ocean navigation in the summer season, and having Boston and Portland as winter ports when the St. Lawrence is closed, it holds the key to the commercial movement the year round. In 1900 the imports aggregated in value $68,550,993; the exports, $65,344,197; the customs dues paid, $9,136,377. The arrivals of seagoing vessels were 415, and during the year about 2,739 inland vessels, with aggregate tonnage of 731,596, were in the port. The first bank was established in 1817, and named after the city. It has a capital of $12,000,000 and a reserve fund of $6,000,000. In 1900 the total capital of the banks was $30,000,000, the deposits $121,191,306, the circulation $15,580,312, and the discounts $96,545,963.

History, Antiquities, etc.—When the first town was built upon the island can not be known. As early as 1535 Jacques Cartier found a strong settlement of Hochelaga or Beaver Indians, who were active traders, and whose influence extended far up the Ottawa and down to the Gulf of St. Lawrence; but when in 1603 Champlain visited the place, the Indian town had vanished and desolation prevailed. Eight years later, when he decided to establish an entrepôt for trade he chose the same location, and built Place Royale, the site of the present Custom-house Square. Until 1642 Place Royale continued to be merely a trading station, but on May 18 of that year the city was formally founded by Maisonneuve. The original purpose was mainly to Christianize the Indians therefrom, the Ottawa river furnishing ready passage to the Great Lakes among friendly savages. The first charter therefore prevented the company by whom the enterprise was carried out from engaging in the fur trade, but so favorable was the site for commercial purposes that Montreal shortly became an important center of traffic in spite of the endeavors of the authorities of Quebec to prevent it. In 1663 the company of Montreal got into financial difficulties, and transferred its possessions to the Sulpicians. Three years before that a young officer of the garrison, Adam Doulac, Sieur des Ormeaux, with a handful of companions had, by a most heroic sacrifice, saved Canada from the Iroquois, meeting their invading force at the Long Sault Rapids, and holding it at bay for five days until he and all his companions were slain, when the Indians withdrew disheartened by the stubborn defense. In 1689 the Iroquois fell upon Lachine, at the upper end of the island, and massacred 400 inhabitants. The early days of the city were full of warfare with the Indians, varied by more civilized but scarcely less bitter diplomatic strife between the religious and civil authorities at Montreal and Quebec. Notwithstanding many restrictions in favor of Quebec, Montreal outstripped her. The peltry-trade was her chief support, and this grew to immense proportions, until the glut of beaver-skins brought ruin upon many connected with the business, and it had to be reorganized upon a sounder basis. In 1741 the fortifications of the city, begun in 1717, were completed. They consisted of solid masonry with a deep ditch, and had thirteen bastions. Seven gates gave admittance within the walls. Nothing of these now remain, the growth of the city having long since compelled their demolition. It was to Montreal that Gov. de Vaudreuil retreated after Montcalm's defeat by Wolfe at Quebec, and there was signed the capitulation of New France. On Sept. 7, 1760, the entry of the British troops marked the beginning of a new era.

During the war between the North American colonies and Great Britain, in Nov., 1775, Maj.-Gen. Richard Montgomery, leader of a division of the Continental army, invaded Canada, and captured Montreal. He set out thence to join Arnold at Quebec, where their joint forces suffered defeat and Montgomery was slain. Since then, with the exception of the excitement connected with the rebellion of 1837, the history of Montreal has been that of ever-increasing growth and prosperity, varied by occasional incidents of note, such as the epidemic of Asiatic cholera in 1832, the epidemic of ship-fever in 1847, the burning of the Parliament building by a mob in 1847, the great fire of 1852, the opening of the Victoria bridge by the Prince of Wales in 1859, the great flood of 1861, the Orange riots of 1877, the smallpox riots of 1885, etc. The population of the city in 1891 was 216,650, an increase of 61,413 since 1881. Including the surrounding municipalities, which practically form parts of the city, the total population is now about 380,000. Two-thirds the inhabitants are French-Canadians, the other portion being principally English, Scotch, and Irish. PERCY ST. CLAIR HAMILTON.

Montreal d'Albino: See FRA MOREALE.

Montrose': town; in the county of Forfar, Scotland; on the South Esk (see map of Scotland, ref. 9–J). It has a good harbor, lined with wet and dry docks and handsome quays; its bleaching-works, flax-spinning mills, and manufactures of linens are important, and it carries on some ship-building and a considerable trade. Pop. (1891) 13,048.

Montrose': town; capital of Montrose co., Col. (for location of county, see map of Colorado, ref. 4–B): on the Denver and Rio Gr. Railroad; 353 miles S. W. of Denver. It is in a farming, fruit-growing, and stock-raising region, and has a bi-monthly and two weekly newspapers. Pop. (1880) not in census; (1890) 1,330; (1900) 1,217.

Montrose: borough; capital of Susquehanna co., Pa. (for location of county, see map of Pennsylvania, ref. 2–H): on the Del., Lack. and West. and the Montrose railways: 8 miles W. of Alfred Station, 165 miles N. by W. of Philadelphia. It is in an agricultural region, nearly 2,000 feet above sea-level, is a popular summer resort, and has three weekly newspapers. Pop. (1880) 1,722; (1890) 1,735; (1900) 1,827. EDITOR OF "DEMOCRAT."

Montrose, JAMES GRAHAM, First Marquis of; soldier; b. at the family estate of Montrose, Scotland, in 1612; was educated at the University of St. Andrews; traveled in Italy and France; returned home in 1637, and joined the Covenanters, as it is said, on account of the cold reception Charles I. had given him. After some successes against the royalists, Montrose was won over to the king's side in 1639. He was created a marquis, and in 1644 he gathered an army of about 5,000 men, partly Irish mercenaries and partly

Highlanders, who followed him from hatred of the Campbells. With this army he made a most successful campaign, defeated the Covenanters several times with great slaughter, and took several towns, which were given up to plunder and massacre; but on Sept. 13, 1645, he was defeated at Philiphaugh by David Lesley; in July, 1646, he capitulated at Middleton, and soon after left Scotland for the Continent. Having been authorized by Charles I., and afterward by Charles II., to raise a force and invade Scotland, he traveled from Austria to the Scandinavian kingdoms, busy in the king's interest. In Mar., 1650, he landed at the Orkneys with a small force, but having gone as far to the S. as the border of Ross-shire, his army was scattered, and he himself taken prisoner, condemned to death as a traitor against the Covenant, and hanged at Edinburgh, May 21, 1650.

Monts, mōn, Pierre du Guast, de, Sieur: explorer; b. in Saintonge, France, about 1560, of an Italian Catholic family; became a Protestant, and attached himself to the fortunes of Henry IV., by whom he was given a high post in the royal household. He had already made a voyage to Canada with Chauvin, when in 1603 the king appointed him director of the Canadian Company, to which he granted, under the name of Acadia, the region between lat. 40° and 46° N. De Monts fitted out a considerable expedition; took Samuel Champlain, Poutrincourt, Biencourt, and Pontgravé as his chief officers; sailed from Havre Mar. 7, 1604; explored the Bay of Fundy; discovered Annapolis harbor and the river St. John, which he ascended; visited the St. Lawrence, and returned to France in October, while his colony established itself at Port Royal (now Annapolis) under Poutrincourt. On his arrival at court de Monts found his monopoly ended; various other grants were made to different individuals, and he failed to obtain indemnification. He dispatched a vessel in command of Lescarbot to the relief of Poutrincourt Mar., 1606; dispatched Champlain and Pontgravé on a new voyage to the St. Lawrence 1607; sent them other vessels 1608, by the aid of which Quebec was founded. On the death of Henry, in 1610, de Monts lost favor at court. D. in Paris in 1611.

Montserrat, mont-ser-răt': an island of the British West Indies, forming part of the Leeward islands colony; crossed by lat. 16° 42′ N., lon. 62° 13′ W. Area, 32 sq. miles. Pop. (1891) 11,672. It is 34 miles N. W. of Guadeloupe and 29 miles S. E. of Nevis; between it and Nevis is the little island of Redonda. Like most of the Caribbean islands, Montserrat is mountainous and of volcanic origin. It has a crater, the Soufrière, which is now quiescent, though emitting fumes of sulphur. The highest peak is about 3,000 feet above sea-level. The principal products are sugar, rum, and tropical fruits; the latter, especially limes, are now exported in large quantities. The only town is Plymouth (pop. 1,475). Montserrat was first colonized by the English in 1632, but was held by the French 1664–68 and 1782–84. H. H. Smith.

Montt, Jorge: naval officer and politician; son of Manuel Montt, statesman; b. at Santiago, Chili, 1847. He was a captain in the navy when, in the latter part of 1890, the Chilian congress began its resistance to President Balmaceda. When (Jan. 6, 1891) the congressional leaders proclaimed a revolution, Montt was given provisional command of the naval and land forces. Soon after the death, by suicide, of Balmaceda (Sept. 19) Montt was proclaimed provisional president, and was regularly elected to the office Nov. 6, 1891, for a term of five years. H. H. S.

Montt, Manuel: statesman; b. at Petorca, Chili, Sept. 5, 1809. He was educated in the National Institute at Santiago, and for a time was a professor there, but was soon appointed to government offices; entered actively into politics, and became leader of the conservatives. In 1841 he was president of the Chamber of Deputies, Minister of Justice 1841–45, and of the Interior 1846–48; and in 1851 he was elected president of Chili, assuming office Sept. 1; by reelection in 1856 he retained the office until Sept. 1, 1861. During this period the country was, in the main, very prosperous, and many material improvements were instituted; but the extreme conservative policy of President Montt and his principal minister, Varas, caused great discontent among the liberals. Immediately after his inauguration in 1851 a formidable revolt broke out, and it was put down only after several months of hard fighting. In 1858 there were fresh disorders, culminating in a fierce civil war and several sanguinary battles in 1859; but in this case also the revolutionists were beaten, and many of the most prominent men in Chili were banished. President Montt turned over his office peacefully to his successor, Perez, and subsequently he was president of the Supreme Court. Montt and Varas were the founders of the extreme conservative party, now known in Chilian politics as the Montt-Varistas. D. at Santiago, Sept. 20, 1880. H. H. Smith.

Monument: a commemorative structure, as a building erected or a stone set up in memory of an important event or in honor of a famous man; by extension, any important building, perhaps in the sense that such a building commemorates the past. Monuments proper, that is, structures put up in memory of something or somebody, are of all sizes and kinds, from the small churchyard cross to the Great Pyramid. The last-named mass of stone is generally admitted to have served as a tomb at last if not at first, and the other pyramids of Egypt are tombs and nothing else. The great Sphinx, however, is a monument of a different kind, erected in honor of a divinity, or a system of worship and devotion. It is a human-headed lion, cut out of the living granite rock, and of gigantic size, and is probably the oldest monument of which any considerable remains exist.

Among the Greeks one very curious species of monuments existed—those which commemorated the triumphs of the *choregi*, or leaders and organizers of the Dionysiae musical festivals. A bronze tripod was commonly the prize at such a contest, and the winner would erect a pillar or a small edifice upon the top of which his prize would be displayed. The very beautiful circular building in Athens known as the Monument of Lysicrates was one of these *choragic* monuments. Greek tombal monuments are also of great interest. (For these and the great Roman structures made into fortresses in the Middle Ages, see Tombs.) The Roman monuments erected in honor of a great event or of a living man deserve special notice. See Arch for the best-known type of such monuments.

Columns.—The huge and very richly adorned columns of Trajan and of M. Aurelius at Rome, and the smaller and much less elaborate pillars set up in Alexandria in Diocletian's time, and in the Roman Forum in Phocais's time, are original examples of a style of monument which has prevailed over all the European world in modern times. The London monument of Fish Street Hill, in commemoration of the great fire of 1666; the Nelson column in Trafalgar Square; the Napoleon column of the Place Vendôme in Paris, and that in memory of the Revolution of 1830 in the Place de la Bastile; the Washington Monument in Baltimore, and the pillar of Alexander I. at St. Petersburg, are well-known instances of this form. Trajan's campaigns are sculptured in long panoramic display on the spiral band which adorns his shaft, and the galleries of his basilica may have afforded a better chance for the study of these than could be had by those standing on the pavement below; but the copies of this great original are without its advantages, and are generally devoid of anything worth looking at with care, the Antonine column of the second century and the Napoleonic one of the nineteenth century being cold readjustments of the great original plan. Obelisks, as the Roman world understood them, and as the modern world takes them over from Rome, are monuments of a sort very nearly akin to the columns. To the Egyptian builder an obelisk was not an independent erection; many obelisks were brought by the imperial officers to Rome, and from Rome one of these wandered on to Paris, where it stands in the Place de la Concorde. To a strict definition of the word monument these, in their new homes, hardly conform; they are now decorative objects, the adornments of public places, and little more.

The truly characteristic monument of modern times is the memorial chapel, the memorial hospital, the college hall, or the special library named after the man or the event commemorated. Such foundations as these, if they take on a decorative character in some part of the buildings which house them, are monuments in every sense of the word. They can not, however, replace altogether the purely decorative structure, the colossal statue like Schwanthaler's *Bavaria* at Munich and Bartholdi's *Liberty* in New York harbor, the equestrian group, the pedestal crowned by a portrait-statue, the emblematic or allegorical composition in sculpture. For mention of some of these works of art, see Sculpture. Russell Sturgis.

Mon'za: town; in the province of Milan, Italy; on the Lambro; about 10 miles N. N. E. of the city of Milan (see map of Italy, ref. 2–C). It is a favorite summer and autumn retreat, and the Crown Prince and Princess of Italy gener-

ally pass a part of each year at the royal palace, situated in a beautiful park. Monza, though for a time the royal residence of the great Theodoric, is best known as the capital of the old Lombard kings, and especially as the favored seat of the renowned Theodolinda, who adorned it with magnificent buildings. Very interesting memorials of this queen are still preserved in the cathedral; also the famous iron crown, so long used for the coronation of the Kings of Lombardy. The history of Monza is intimately connected with that of Milan. Pop. about 18,000.

Moody, Dwight Lyman: evangelist; b. in Northfield, Franklin co., Mass., Feb. 5, 1837; received a meager education; worked on a farm till he was seventeen, when he became clerk in a boot and shoe store in Boston; joined a Congregational church soon after, and in 1856 went to Chicago, where he engaged zealously in missionary work among the poor classes; in less than a year he built up a Sunday-school which numbered over 1,000 children. He was in the service of the Christian Commission during the civil war, and subsequently became city missionary of the Young Men's Christian Association of Chicago; a church was built for his converts, and he became its unordained pastor; in the Chicago fire of 1871 the church and Moody's house and furniture, which had been given him, were destroyed, but a new church was erected in its place. In 1873, accompanied by Ira D. Sankey, Moody went to Europe, and held religious revivals at Edinburgh, Glasgow, Dublin, London, and other cities of Great Britain; in 1875 they returned to the U. S., and held large meetings in various cities. Moody afterward continued his evangelistic labors in the U. S. and in Great Britain. He established four schools, three at his native town of Northfield, Mass., and one at Chicago. Two of the Northfield schools are academies fitting students for college, the third is a woman's training-school, while the Chicago institution is for biblical instruction. Among his published works are *Arrows and Anecdotes* (1877); *Heaven* (1880); *Secret Power* (1881); *The Way to God* (1884); *Bible Characters* (1888), etc., and several collections of sermons. D. Dec. 22, 1899.

Mooltan, India: See Multan.

Moon [M. Eng. *mone* < O. Eng. *mōna*: O. H. Germ. *māno* (> Germ. *mond*): Goth. *mēna* < Teuton. *mēna*: Lat. *men-sis*, month: Gr. *μήνη*, moon, *μήν*, month: Sanskr. *mās*, moon]: the satellite of the earth, bearing the same relation to it that the satellites of other planets do to their primaries. In size and mass, however, it differs much less from its primary than do any of the other satellites, its diameter being more than one-fourth that of the earth, and its mass nearly one-eightieth.

The following particulars relate to the size and motion of the moon:

Greatest distance from earth's center...	252,600 miles.
Least distance from earth's center.....	221,700 "
Least distance from earth's surface.....	217,740 "
Diameter of moon.....	2,161 "
Mean interval from one new moon to the next, called a lunation	29d. 12h. 44m. 2·8s.
Density (that of the earth = 1).....	0·605
Gravity at the surface (earth = 1).....	0·165

If the mean density of the moon were the same as that of the earth its mass would be in proportion to its volume, or about one-fiftieth. The difference in density does not necessarily prove that the moon is composed of materially different substances from the earth; it may arise from the fact that the pressure in the interior is much less than in the interior of the earth. The force of gravity at the moon's surface is about one-sixth that at the earth's surface. Thus an ordinary man would weigh but 25 or 30 lb., and could jump over a stile several yards high.

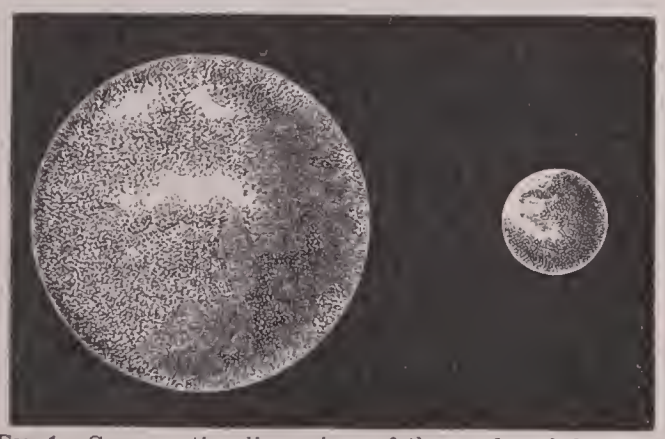

Fig. 1.—Comparative dimensions of the earth and the moon.

Phases of the Moon.—A careful study of the changes which the moon goes through in the course of a month shows that it is a dark globe, shining by the light of the sun, and revolving round the earth at a distance much less than that of the sun. When this globe first emerges from the sun's rays the hemisphere turned toward the earth is all in darkness, except a bright border on one side, which we see illuminated. This gives the form of a crescent, which one can easily reproduce by looking at a globe illuminated by a candle nearly on the opposite side of it. It will frequently be noticed, however, that when the moon is a crescent her whole globe is visible, shining with a faint, ashy light. This appearance, sometimes called "the old moon in the new moon's arms," is evidently due to the light reflected from the earth upon the dark hemisphere of the moon. When the moon, moving through one-fourth of a revolution from the sun, is in the first quarter, the hemisphere turned toward the earth is one-half illuminated and one-half dark. The globe then presents the familiar appearance of a semicircle. As it moves around into the position of full moon, or opposite the sun, the entire hemisphere turned toward us is illuminated. During the second half of the revolution the same phases are repeated in reverse order.

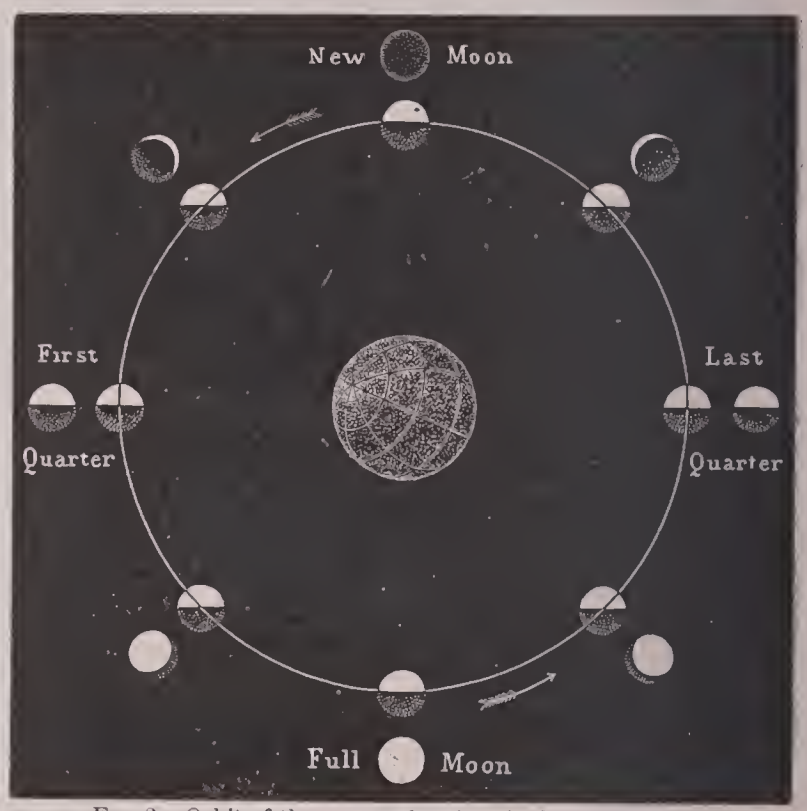

Fig. 2.—Orbit of the moon, showing the lunar phases.

Sidereal and Synodic Revolutions of the Moon.—When the moon, after passing a star, completes a revolution so as to come back to the same star, it is said to make a sidereal revolution. The time required for this is 27d. 7h. 43m. (See Acceleration.) If the sun were apparently fixed among the stars, this would also be the period from one new moon to another; but, owing to the earth's revolution around the sun, the latter appears to describe a complete revolution among the stars in the course of a year. Hence if we suppose the moon to begin a sidereal revolution at the moment when she is in conjunction with the sun, we shall find that after completing such a revolution the sun has moved away from that point about 27°. Therefore the moon must

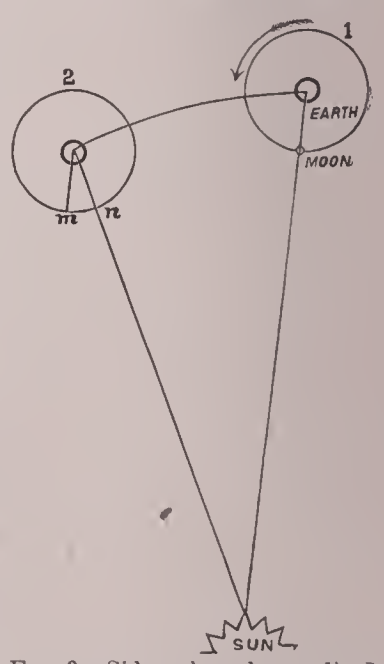

Fig. 3.—Sidereal and synodical revolutions of the moon.

overtake the sun (i. e. travel farther, the distance *m* to *n*, Fig. 3) before new moon can again occur. This requires two days and five hours, so that the synodic revolution, or the period between one new moon and the next, requires more than twenty-nine days and twelve hours.

Rotation of the Moon.—Long before the telescope was invented it was evident to careful observers that the moon always presented the same face to the earth. It therefore rotates on its axis in the same time that it revolves around the earth. It is often supposed that, presenting always the same face toward the earth, it can have no rotation at all, and a great deal has been written to explain the fallacy of this notion. The explanation turns upon what we should mean by saying the moon had no rotation. In scientific language a body is said to have no rotation when any line passing through its center and in a fixed position relative to its surface always points in the same direction. Now, as the moon revolves around the earth, the earth must appear from the moon in different directions from time to time, and seem to an observer on the moon to make a complete revolution around it in one month. Hence if the moon did not rotate at all it would appear to an observer on the earth to make one rotation on its axis, because as it moved around the earth he would see all sides of it in succession; but in order to turn the same face always toward the earth it must turn around on its axis exactly as fast as it revolves around the earth and in the same direction.

FIG. 4.—The full moon.

From this correspondence between the rotation and revolution of the moon, it follows that the latter is not a perfect globe, but is slightly elongated in the direction of the earth. Without such an elongation the correspondence of the two motions would not be kept up forever, because in the course of ages the moon moving sometimes a little faster and sometimes a little slower would present different faces toward the earth. The deviation from the spherical form is, however, so slight as to be unmeasurable with our instruments.

Libration of the Moon.—The rotation of the moon on its axis is nearly uniform, while in its motion around the earth it moves faster when near perigee than when near apogee. Its latitude also varies from time to time. In consequence of these inequalities the globe seems, to telescopic vision, to vibrate back and forth through a very small amount from time to time. This vibration is called the libration of the moon. In consequence of it about $\frac{57}{100}$ths of the moon's surface may be seen at one time or another. The remaining portions are forever hidden from human eyes.

Telescopic Appearance of the Moon.—Seen through a small telescope at the proper time the moon is the most beautiful and striking object in the heavens. To see it to the best advantage we must not choose the time of full moon, which people are apt to do, but rather the first quarter, or even two or three days before the first quarter, when the form of the illuminated portion is still a crescent. The moon presents the most beautiful appearance when viewed through a small telescope 3 or 4 inches in diameter, though to see the smallest details of the surface a large telescope is necessary. Under the most favorable circumstances the moon does not seem flat, as to the naked eye, but the globular form is very evident. The general effect is that of chased silver or gold. The delicacy with which the surface seems to be worked, when viewed in the way we have described, is exquisite; the highest art of the goldsmith could only imitate it. With higher telescopic powers features of a very remarkable character are brought out on the lunar surface. When Galileo first viewed this luminary through his small and imperfect telescope he is said to have considered that the moon had land and water, like our globe; but careful study shows that the surface is totally unlike that of our earth. No liquid is visible upon it. There is no evidence of any atmosphere; if one exists at all it is so rare as to be totally inappreciable. In consequence, there is no vegetation, no life, and, so far as we can observe, no change of any sort. We might describe the moon as a place where

FIG. 5.—Last quarter of the moon.

nothing ever happens. No sound ever breaks the eternal silence; every object, large and small, stays where it was placed long ages ago; and doubtless our remotest posterity will see the moon just as we see it to-day. The surface is indeed very rough, and the mountains are about as high as on our earth; but these lunar mountains are totally different in shape from our earthly ranges of hills. They have the appearance of extinct volcanic cones and walled plains, in the center of which a smaller cone can frequently be seen. The whole aspect suggests volcanic action at some former period, but nothing like an active volcano has ever been seen. With a telescope of low power small regions will seem to be smooth, but when we look through one of sufficiently high power, cavities, furrows, and lumps are visible almost everywhere. Long, deep rills, or clefts, are quite numerous; and perhaps the most extraordinary features, which can almost be seen with the naked eye, are long white streaks which extend from some of the prominent mountains through distances of several hundred miles.

Telescopic and Photographic Study of the Moon.—Though the moon is much the nearest of the heavenly bodies, yet, even on the moon, an object would have to be about 50 miles in diameter to be clearly visible to the naked eye. No minute details can therefore be seen except with a telescope. A telescope magnifying a hundred times would make visible an object half a mile in diameter, and higher magnifying powers would show yet smaller objects, but not in proportion to the power. When we use powers of several hundred times all the indistinctness caused by the air and the imperfections of the glass are magnified in the same degree, so that we at last reach a point beyond which no increase of power will help the vision. It may be questioned whether a power of more than 1,000 can be used with advantage in viewing the moon even with the great Lick telescope of California.

The photographing of the moon has in recent years been practiced with great success. The lunar photographs of Rutherfurd and Draper, of New York, were justly celebrated in their time. The fine air of the locality in which the Lick Observatory is situated and the splendid equipment of that institution have been utilized for photographing the face of our satellite on a scale and with a minuteness never before reached. It is proposed, with the aid of these photographs, to make a map of the moon showing the configuration of its surface with the utmost detail. S. NEWCOMB.

Moon Alphabet: See Blind, Education of the.

Mooney, James: ethnologist; b. at Richmond, Ind., of Irish parentage, in 1861; began the study of Indian ethnology as a boy of twelve, starting in an endeavor to make a geographic list of all the tribes of North and South America, and steadily prosecuted this purpose, which soon widened in scope. After leaving school he learned the printer's trade, and worked at it six years. In 1885 he went to Washington, where his work secured the recognition of the Bureau of Ethnology, his list of tribes, then numbering nearly 3,000, being taken as the basis of a *Dictionary of Tribal Synonyms*. Soon after this he began researches among the Cherokees. In the course of this investigation he discovered and secured the whole secret ritual of their priesthood, the most complete collection yet obtained from any tribe. Later he began collecting materials relating to the ethnology of the South Atlantic tribes. In 1890 he was commissioned to study the ghost-dance among the wild tribes in the West; soon after he was commissioned to work among the Kiowas, and made an extensive collection for the World's Columbian Exposition, together with an ethnologic study of the tribe. His principal publications are *Medical Mythology of Ireland* (1887); *Funeral Customs of Ireland* (1888); *Holiday Customs of Ireland* (1880, published in *Proceedings* of Am. Philos. Soc., Philadelphia); *Myths of the Cherokees*; *Cherokee Theory and Practice of Medicine* (in *Journal of American Folk-lore*); *Indian Tribes of the Potomac*; the *Cherokee Ball Play* (in *American Anthropologist*); *Sacred Formulas of the Cherokees* (in Seventh Report of Bureau of Ethnology); *The Siouan Tribes of the East* (in bulletin of the Bureau of Ethnology); *The Messiah Religion and the Ghost-dance* (in Fourteenth Report of the Bureau of Ethnology).

Moonstone: a variety of adularia, or transparent potash-feldspar (*orthoclase*); so called because when polished it presents an opalescent appearance due to internal chatoyant or pearly reflections. Varieties of *oligoclase* and *albite* (other species of feldspar) occasionally present a similar appearance. The finest moonstones come from the Kandy district in Ceylon, where many thousands are annually cut into gems and exported. G. F. K.

Moor'croft, William: traveler: b. in Lancashire, England, about 1770; studied surgery in Liverpool and Paris, and became one of the earliest veterinary surgeons in England. In 1808 he went to India as superintendent of the East India Company's stud in Bengal, and being of an adventurous disposition made two daring journeys to Balkh and Bokhara in Central Asia in the disguise of a Hindu pilgrim (1812 and 1819). He was one of the earliest explorers of the Himalayas and the lakes, rivers, and valleys of Chinese Tartary. In 1820–25 he visited Ladakh, Kashmir, Afghanistan, and Bokhara. With the government of Ladakh he concluded a commercial treaty which virtually opened the whole of Central Asia to English commerce. Of almost equal importance were his numerous geographical discoveries. On his return, he was seized at Andkhui, between Bokhara and Cabul, with malignant fever, and died Aug. 27, 1825. His papers were recovered by Alexander Burns, and his *Travels* were edited by Prof. H. H. Wilson in 1841.

Moore, Clara Jessup: See the Appendix.

Moore, Clement Clarke: scholar; son of Bishop Benjamin Moore; b. in New York, July 15, 1779; graduated at Columbia College in 1798; in 1821 became Professor of Biblical Learning in the Protestant Episcopal Seminary; afterward Professor of Hebrew and Greek, and then of Oriental and Greek Literature. He was the author of a *Hebrew and Greek Lexicon* (1809); a volume of poems (1844); *George Castriot, surnamed Scanderbeg, King of Albania* (1850); and of the well-known ballad called *The Visit from St. Nicholas*, beginning: "'Twas the night before Christmas, when all through the house." He also edited a collection of his father's sermons (1824, 2 vols.), and was a contributor to Philadelphia and New York newspapers. D. at Newport, R. I., July 10, 1863. Revised by H. A. Beers.

Moore, David Hastings, M. A., D. D.: minister and journalist; b. near Athens, O., Sept. 4, 1838; graduated at Ohio University in 1860; joined the Ohio conference in the same year; entered the Union army as a private in 1862, and was elected captain of Company A, Eighty-seventh Ohio Volunteer Infantry; on expiration of term became major and the lieutenant-colonel of the 125th Ohio Volunteer Infantry, serving until the fall of Atlanta; resumed the pastorate and served several churches in Ohio; was president of the Wesleyan Female College, Cincinnati, O., 1875–80; president of Colorado Seminary and first chancellor of the University of Denver 1880–89; became Professor of Political Economy in Colorado University in 1889; has been editor of *The Western Christian Advocate* since 1889.

Moore, Edward: dramatist; b. at Abingdon, Berkshire, England, Mar. 22, 1712; was the son of a dissenting minister, and was brought up as a linen-draper in London, but abandoned that business and engaged in literary pursuits. He published *Fables for the Female Sex* (1744); *The Trial of Selim*; the unsuccessful comedies of *The Foundling* (1748) and *Gil Blas* (1751); and the very successful tragedy *The Gamester* (1753; often reprinted). An edition of his *Poems, Fables, and Plays* was published in 1756, and his *Dramatic Works* appeared in 1788. He edited a paper called *The World*, in which he was assisted by Lords Lyttelton and Chesterfield, and other able writers. D. Feb. 28, 1757.

Moore, Harry Humphrey: See the Appendix.

Moore, Sir John, K. B.: soldier; son of John Moore, M. D.; b. in Glasgow, Scotland, Nov. 13, 1761; entered the army in 1776; served in the Mediterranean, in America, and the West Indies, and sat in Parliament for a time; was governor of St. Lucia 1796–97; served in Ireland 1798; was badly wounded in the Netherlands 1799; served in Egypt and became major-general and K. B. 1801: served afterward in Sweden (1802) as envoy and commander of the British contingent; took (Oct. 6, 1808) chief command of the British troops in the Peninsula, numbering 23,000, managing the campaign against Napoleon with consummate skill and boldness; but the failure of the Spanish to co-operate with him compelled him to fall back upon Corunna. He conducted the retreat with masterly skill. He was killed at the battle of Corunna by a cannon-shot Jan. 16, 1809. This was a very spirited battle, and both sides claimed the victory. The British at once took ship for England, and the town was evacuated. *The Burial of Sir John Moore*, by Rev. Charles Wolfe, has immortalized both its subject and its author.

Moore, John Bassett: See the Appendix.

Moore, Thomas: poet; b. in Dublin, Ireland, May 28, 1779, of Roman Catholic parents; was in youth distinguished for his skill in lyric poetry; studied at the Dublin University and at the Middle Temple, London. His first volume of poems, the *Anacreon* (1800), was a success; the *Poetical Works of Thomas Little* (1801) was vastly more popular, though disgraced by a vein of licentiousness which Moore lived to regret. He was in the civil service in the Bermudas 1803–04; made the tour of the U. S. and Canada; married in 1811 Bessy Dyke, an actress of admirable character. For many years his principal writings were political satires in the Whig interest, full of wit and of general interest in their own day, but of small value now. His subsequent works of permanent value are the *Irish Melodies* (10 parts, 1807–34); *Lalla Rookh* (1817); *Loves of the Angels* (1823); *Life of Sheridan* (1825); *The Epicurean*, a romance (1827); *Life of Byron* (1830); and the *History of Ireland* (1827–35). He excelled as a song-writer, and many of his songs set to favorite airs, such as *Araby's Daughter*, *Those Evening Bells*, *The Last Rose of Summer*, etc., are still popular. Moore had brilliant powers in conversation, and was a talented singer. D. Feb. 25, 1852.

Revised by H. A. Beers.

Moore, William Eves, D. D., LL. D.: clergyman; b. at Strasburg, Pa., Apr. 1, 1823; was educated at Yale College; studied theology privately with Dr. Lyman H. Atwater; has been pastor of the First Presbyterian church of West Chester, Pa., 1850–72, and since 1872 of the Second Presbyterian church, Columbus, O. He has been permanent clerk of the General Assembly since 1884, and was moderator at Saratoga in 1890. He has published *New Digest of the Acts and Deliverances of the General Assembly of the Presbyterian Church* (Philadelphia, 1861) and *The Presbyterian Digest* (Philadelphia, 1873; new ed. 1886).

Moore, Willis Luther: See the Appendix.

Moor-fowl, incorrectly called **Red Grouse**: a ptarmigan of the British islands (*Lagopus scoticus*), which is one of the most highly prized of British game-birds. It is not only shot extensively by sportsmen, but it is snared for market, and even bred in confinement for food. It is about 16 inches long, mostly of a red-brown color, and feathered to the toes.

Moorhead: city; capital of Clay co., Minn. (for location of county, see map of Minnesota, ref. 5-A); on the Red

River of the North, and the North. Pac. and the Great N. railways; opposite Fargo, N. D., 253 miles W. of Duluth. It is in an agricultural region, and contains Hope Academy (Lutheran), a high school, 2 national banks with combined capital of $110,000, and a daily and 2 weekly newspapers. Pop. (1880) not in census; (1890) 2,088; (1900) 3,730.

Moor-hen: a member of the rail family (*Rallidæ*) common in many parts of Europe, Asia, and Africa. Its scientific name is *Gallinula chloropus*. It is about a foot long, of a dark-slate color, with a conspicuous red frontal shield formed by an upward prolongation of the beak. The moor-hen swims well, and keeps time to the strokes of the feet with a nodding motion of the head. The nest is large, but usually hidden among the rushes, or placed at some distance from the edge of the water. The eggs are about ten in number. The moor-hen is extremely common on quiet rivers and small ponds in Great Britain. Allied species occur in temperate and warm regions throughout the world.

F. A. Lucas.

Moors [from Lat. *Mau'rus*, later *Mor'us*, a Moor (> Fr. *Maure*) = Gr. Μαῦρος, Mauritanian, apparently a special use of μαῦρος, dark]: the name generally given to the Mohammedan race who invaded the southern part of Spain in the early part of the eighth century A. D. All the leaders of this famous invasion were Arabs, but as their forces were largely recruited from the African population of the neighborhood, the old *Mauri* of *Mauritania*, the whole of the invaders were called by the popular name of Moors; so, too, in early English writers Mohammedans are constantly thus designated. The history of their invasion of Spain is the simplest possible, and needs not, to account for it, the poetical tales invented afterward. Food was scarce among the Berber tribes; much discord prevailed in the waning kingdom of the Visigoths; the Jews, cruelly oppressed by the Spanish rulers, as everywhere else, were for aiding any who might help them; above all, the Arab chiefs, who had swept the seaboard of Africa to the waters of the Atlantic, had warriors at their disposal hard to restrain under peaceful bonds, but ready to undergo any toils for the hope of further plunder. Hence the invasion of Spain was naturally on this wise: Musa, the Arab Viceroy of Western Africa, sent his freedman Tárik, A. D. 711, to survey its southern provinces, and in less than one year the whole of Andalusia, then the richest part of the Peninsula, had submitted to his arms, while he had himself left behind him for all time a sure record of his prowess, the ancient Calpe, which he had captured, being named from him Gebêl-al-Târik (the hill of Târik), now shortened into Gibraltar. In the course of the next year Musa himself came over, jealous of the fame of his lieutenant, and in the course of the next five-and-forty years all Spain, except the Asturias, submitted to the rule of successive warriors with the title of emirs, the deputies of the Viceroys of Africa. Many of these men (they were twenty-one in all) were able administrators, and revived agriculture and the arts, which had fallen into abeyance toward the close of the feeble sway of the Visigoths; while some of them carried their arms into France, and attempted, but in vain, to establish there a similar Arab kingdom. The fate of perhaps their greatest leader, Abd-er-Ahman, and the crushing victory over him in A. D. 732 by Charles Martel in the plains of Tours, are known to every student of history. In later days, though Arab hosts ravaged Carcassonne and Narbonne and burned Marseilles, they were never able to secure a permanent footing on French soil.

The subsequent history of the Moors in Spain is the history of certain dynasties they founded there, which maintained for more than seven centuries a strong or a weak sway over the whole or parts of that country, according as they were or were not supported by their own people, internal treachery in the end accomplishing what all the arms and valor of the Christians had failed to achieve. The first, indeed the only, dynasty which swayed the whole of Spain and Portugal, with the exception of the Asturias, was that of the Ommiade caliphs from A. D. 756 to A. D. 1036. This dynasty was founded by Abd-er-Ahman, who reigned thirty-four years. During his rule his capital, Cordova, was a center of learning—not for Arabs only, but for Christians. Many able rulers followed him, the most eminent being the second and the third of that name. Abd-er-Ahman II. was distinguished as a warrior of great prowess, which is shown by his recapture of Barcelona from the Franks (A. D. 827), his burning of Marseilles (A. D. 839), and his successful encounter with the first Scandinavian vikings who had reached Spanish coasts (A. D. 844–845). Abd-er-Ahman III., whose reign extended from A. D. 911 to 961, was probably, with the exceptions of Haroun-al-Raschid and Akbar of Delhi, the ablest ruler that has ever governed the followers of the Prophet. As a warrior he was pre-eminent, but as an administrator he was even greater. He was, too, the first of the Western rulers to adopt the title hitherto reserved for the Caliphs of Bagdad alone, that of "commander of the faithful," and to rule his own dominions without reference to the original seat of Islam. Many of the works he executed still attest his power and munificence—notably, the great mosque at Cordova, with many roads, canals, aqueducts, and bridges. Many colleges and schools were also founded by him or by his son, Al-Hakem II., who, more perhaps than he, was an enthusiastic lover of literature, the great library he formed at Cordova being unrivaled at that period. After the death of Al-Hakem (A. D. 976) the Ommiade power rapidly declined, chiefly from internal quarrels or from the ill-regulated ambition of individual princes. Indeed, on the dissolution of this family the Mohammedan power in Spain may be said to have been in a state of decay; and though from time to time men of vigor arose and for a while restored the sinking fortunes of Islam, the attacks of the Christians became more and more persistent, ending in the final capture of Granada by Ferdinand in 1492. After the taking of Granada, the Moors who desired to remain still in Spain were required to accept the outward forms of Christianity and to be baptized, and those who did so were called by the *Moros* (or adherents to the ancient faith of Islam) *Christianos Moriscos*, or *Moriscos* alone, in derision. The atrocious cruelty with which these poor people were treated after every solemn promise had been broken by the Catholic party is a grievous blot on the memory of Ferdinand and of his successors. The skill of the Moors in agriculture contributed greatly to the wealth of the country for many centuries.

Moo'ruk [native name]: a species of cassowary (*Casuarius bennetti*), differing from the cassowary of North Australia (*C. australis*) and related species in having the helmet-shaped crest of its head much less elevated and flattened behind, and the absence of cervical wattles. It is about 5 feet high. Compared with its nearest allies (*C. westermanni* and *C. picticollis*), it is distinguished by the blue color of the throat as well as the back of the neck. It is an inhabitant of the Australasian island of New Britain. It is very easily tamed, and is often kept in a domesticated state by the natives who rear the birds from the egg. Like the ostrich, it swallows stones, iron, and whatever else it can pick up. When hard pressed it kicks, giving a severe blow. Like the emu, it is often seized with an ebullition of joyousness, and then it dashes about as if half insane. See also Cassowary. Revised by F. A. Lucas.

Moose: See Elk.

Moosehead Lake: the source of the Kennebec river; a body of water lying in Somerset and Piscataquis cos., Me. It is 36 miles long, from 3 to 10 miles wide, and is surrounded by a picturesque forest region sparsely inhabited. It is a favorite resort for sportsmen and anglers. Its waters abound in fine trout and are navigated by steamers.

Moquats Indians: See Shoshonean Indians.

Moquegua, mō-kā'gwaă: a maritime department of Southern Peru, adjoining Chili, and bounded on the N. by Arequipa and Puno. It was separated from Arequipa in 1875, and previous to the war with Chili (1879–83) consisted of the three provinces of Moquegua, Arica, and Tacna, with an aggregate area of about 30,200 sq. miles, and a population of 60,460. By the treaty ratified Mar. 8, 1884, Arica and Tacna were to be held provisionally by Chili for ten years; at the end of that time the people of the provinces to determine whether they will belong to Chili or Peru, and the country to which they are annexed to pay $10,000,000 to the other. Up to the time of this writing (June, 1894) the question has not been settled. Thus dismembered, Moquegua consists of the single province of the same name, with an area of about 10,400 sq. miles, and a population of perhaps 40,000. The coast region for about 60 miles inland is arid desert; the eastern part, which is mountainous, con-

tains fertile valleys, noted for their rich vineyards. The principal exports are wine and brandy. Moquegua, the capital and chief town, is situated in the valley of the river Ilo, 65 miles by railway from its port of Ilo, and 4,500 feet above the sea. It was an Indian settlement before the Conquest. Moquegua has been repeatedly destroyed by earthquakes, the last time on Aug. 13, 1868. Owing to the excellence of its wines it has been called the Peruvian Bordeaux. Pop. about 5,000. H. H. Smith.

Moquelumnan or Mutsun Indians [*Moquelumnan* is from Moquelumne, a corruption of the Miwok word *Wa-kal-u-mi-toh*, the native name of a river in Calaveras co., Cal.]: a linguistic stock of North American Indians comprising two divisions—the Miwok (twenty-three tribes) and the Olamentke (twelve tribes). The original habitat of the former embraced the territory bounded by Cosumne river, Fresno river, the Sierra Nevada, and the San Joaquin, except a strip on the east bank of the last-named river. The Miwok territory was bounded on the S. by San Francisco Bay, on the W. by the Pacific Ocean from Golden Gate to a point below Bodega Head, thence by a line to the southwestern corner of the Yukian territory northeastward of Santa Rosa, and on the E. by the Copehan family.

Habits and Customs.—As recently as 1876 the Miwok were described as the largest body of Indians speaking the same language in California, but they were also held to be the lowest in culture. Their beliefs have been described as superstitious and degraded, their conceptions imbecile, and their legends obscene almost beyond belief. The Miwok tribes practiced cremation, but it was never universal. Their houses were very rude, those of the Miwok having been simply frameworks of poles and brush which in winter were covered with earth. In the mountains a cone-shaped summer lodge of puncheons was made. Acorns formed the principal food of these tribes, and were stored for winter use in granaries raised above the ground. It has been asserted that the Miwok ate every living creature indigenous to their territory, save the skunk.

With the Miwok, chiefship was hereditary except when the successor was not of sufficient commanding influence. As with most of the tribes of California, marriage among the Miwok tribes was practically by purchase. When twins were born one of the children was killed. Shamanistic rites were performed by both men and women, and scarification and sucking were the principal remedial agents. The acorn-dance as well as a number of other ceremonials, principally for feasting or amusement, were formerly celebrated by the Miwok. No puberty dance was celebrated, nor did they observe a dance for the dead, but an annual mourning, and sometimes a special mourning, was observed.

Population.—Comparatively few of the natives of the Miwok division of this stock survive, and these are scattered in the mountains.

F. W. Hodge.

Moraes, mō-raa′ās, Prudente; politician; b. at Itú, São Paulo, Brazil, about 1845. He studied law at São Paulo; was admitted to the bar in 1863, and in 1866 was elected to the provincial assembly. In 1870 he avowed republican principles, an action which at the time seemed to debar him from taking any further part in politics; but in 1879 he and two other republicans were elected to the São Paulo assembly, where their moderation and dignity did much to advance their cause. In 1885 he was elected to the national chamber of deputies, being, with two others from São Paulo, the first avowed republicans who ever entered that body. After the revolution (in which he had no personal part) Senhor Moraes was the first republican governor of São Paulo (1889–90), and immediately after was elected senator. In Feb., 1890, he was a presidential candidate, receiving 97 votes against 123 given to Fonseca. Subsequently he was president of the Brazilian senate. The presidential elections of Feb. 28, 1894, took place when the rebellion was at its height, and Moraes was elected by a large majority.

H. H. Smith.

Moraine′ [= Fr.; cf. Ital. *mora*, heap of stones, probably from Teutonic; cf. Germ. dial. (Bavar.) *mur*, broken stones, *débris*]: (1) a mass of stones and earth carried by a glacier; (2) a mass of stones and earth deposited by a glacier. See Drift, Geology, and Glaciers.

Moralities: See Miracle-plays and Dance of Death.

Moral Philosophy [*moral* is from Lat. *mora′lis*, relating to morals or manners, deriv. of *mos*, *mo′ris*, manner, custom, conduct, way of life]: the theory of the *value* of human conduct. Moral philosophy, or ethics, is a branch of the philosophic as distinct from the physical sciences. The latter investigate facts and relations in their objective character. They fulfill their end, therefore, when the facts are adequately described and their relations stated. The philosophical sciences—namely, æsthetics, logic, and ethics—deal with the investigation of value. They reach their end, not in a description of a given experience, but in an estimate of its worth as a part of the whole system of experience. The philosophical sciences are sometimes termed normative, in that they all recognize a norm or standard, as duty, truth, and the good. This, however, is a derivative mark, not the primary differentia. The norm is simply the basis employed in estimating value.

The Origin of Ethical Theory.—In primitive societies morality is identified with the customs of the community; and these customs, receiving religious sanction, are thus binding religiously as well as morally. This fact tends to retard the growth of any theory of conduct. Custom when consecrated by religion is the essence of conservatism. Free inquiry would imply both lack of loyalty to the community and disrespect to the gods. The chief offset to this extreme conservatism is found in the existence of the councils of the community, in which certain questions are discussed and decided on their own merits; but among every folk, except the Greek, this germ of free inquiry was checked by the assumption that the decision simply declared existing custom, or else (when the council was a priesthood) made known the immediate will of the gods. In Greece, the discussion of the means and ends relating to the welfare of the community took at an early period a wide range, and was freed from any slavish subserviency to the fixed habits of the past or to the divine will. A divine sanction was supposed to attach to the *themistes* (or judicial decisions), but this was rather in virtue of the wisdom displayed in them than because they were regarded as authoritative expressions of will. We find the early proverbs and maxims—the so-called gnomic morality—different from those of other peoples in putting importance upon certain habits of mind and states of character rather than upon the performance of certain outward acts. Such maxims as "Know thyself" and "In nothing excess" already contain in themselves the principle of a free as distinct from a customary morality. The development of democracy, with its popular judicial tribunals and its assemblies for the general discussion of political matters, was a further influence in promoting the growth of moral reflection. A premium was put on power to persuade and to move the citizens of a community in all matters of public policy. At the same time the Greek, with his strong community feeling, always referred the measures under discussion to the welfare of the state as a decisive criterion. Along with this development of a reflective standard and method of judgment went a continual increase in the exchange of culture between Greece proper and the Greek colonies in Asia Minor and Italy. The effect of this was to abstract the consideration of moral questions from their identification with local customs. If we add the vast expansion in art and science found in Athens, consequent upon the Persian wars, we have all the material for a growth of conscious ethical theory. The immediate stimulus to this came from the Greek dramatists on one side and from the teachings of the Sophists on the other. Amid the decay of older religious beliefs and customs, attending the expansion of life, the dramatists tried to uphold a morality based upon a purification of the older mythology. This tendency culminated in the assertion that the fundamental ethical relations are absolute, eternal, and controlling in all the affairs of life; meantime the Sophists were moving in quite a different direction.

The Influence of the Sophists.—In connection with the rise of the democracy and increase of intellectual intercourse, already mentioned, there grew up a well-defined class of persons who made it their business to instruct ambitious citizens in the community in whatever was best calculated to make the latter capaple of securing political influence. Protagoras, for example, affirmed that he "was able to give his pupils skill in both private and public affairs; that his pupils learned to order their own houses in the best manner, and became able to speak and act for the

best in affairs of the state." (Plato, *Protagoras*, 319.) The Sophists, in other words, professed to abstract questions of social welfare from the traditions and habits of any particular community, and to discuss them with reference to the welfare of the state at large. This generalization of the idea of the state and its welfare or good formed the basis at once of the art of politics and of the science of ethics. More than this, many of the Sophists made use of concepts derived from the philosophic theories of the time to attack all traditional morality and, at least indirectly, morality itself. There was, for example, a general agreement among them that, so far as the subjects or citizens of the community are concerned, moral rules are simply the expressed will of the stronger; that duty is simply the necessity of submitting to superior force; while, on the part of the rulers, or stronger, moral rules are simply expedients for securing personal advantage.

Influence of Socrates.—The work of Socrates may be described as an effort to use the positive side of the Sophistic teaching against the negative side, and in the interest of an intrinsic morality like that taught by the dramatists, but freed from its religious dependence. The question raised by the Sophists was whether morality exists by nature (φύσει) or by institution—that is, by sheer enactment (θέσει). Socrates endeavored to show that it exists by the very nature of man and the state; that there is a single and supreme good or end for the individual and the community, reference to this end fixing the value of all particular acts and habits. The basis of morality is therefore knowledge of this good. Except in so far as the agent knows the good and acts with reference to it, his conduct is purely haphazard. Socrates is therefore in agreement with the Sophists in attacking all morality that is merely customary. So far as morality is merely traditional, it may be regarded as based upon either arbitrary authority or considerations of private expediency. All such conduct therefore is more than non-moral; it is immoral. Socrates, at the same time that he founds reflective theory, is the creator of a new type of morality. He introduces, as the precondition of all other virtues, the virtue of insight into the good and the doing of acts because of their value with reference to this good. He differs from the Sophists, not in the emphasis put on the discussion of moral questions—in that respect he is himself a Sophist—but in his insistence upon the necessity of a standard and method for the discussion—a standard and method to be derived from an examination of the essential end and laws of conduct itself. Hence his generalization of the Delphic γνῶθι σεαυτόν as the fundamental principle of morals.

The Limits of the Socratic Ethics.—In contrast with both the customary and the Sophistic moral teaching, Socrates points to the practice of the artists and artisans. The latter know the ends at which they aim; they proceed from a definite model or pattern, and follow a method every step of which has definite reference to the end to be reached; moreover, in the use of their method, they observe continually rules of measure and proportion. In decided contrast with this is the practice, not only of the ordinary citizen, but of the politician, the poet who sets up as a moral teacher, and the Sophist as a professed teacher of virtue. No one of these has a fixed or universal aim, pattern, or rule of measurement. Socrates himself does not claim to have himself any knowledge of what this supreme controlling good is; he represents simply a demand that men do not claim to be moral, much less teachers of morals, until they can base their conduct upon assured insight into the good. His own attitude toward knowledge of the good is thus finally decidedly ironical. Meantime Socrates urged, not only by precept, but still more by his own practice, loyalty to the spirit of the community of which one is a member. The relation between loyalty to the community and insight into the good is nowhere developed by Socrates. We may assume that he *felt* the identity of the good as known by scientific insight, and the good as expressed in the laws of the community, but he nowhere affords any justification for the identification. These limitations fix the problem for his successors.

Influence of Plato.—Speaking roughly, we may say that Plato, following the fundamental Socratic principle of the identity of knowledge and virtue, had to accomplish two things—to work out more positively the content of the good, and to establish more in detail its connection with social organization. The first of these tasks he attempted to perform by bringing the problem of the nature of the good into closer connection with the problem of the objective structure of the universe. He united, that is to say, the ethical analysis of the end of man with the philosophical analysis of the nature of reality. Nature itself was interpreted teleologically; the good or end is the supreme law and unity of both being and knowing. The second problem he met by admitting that most men can never of themselves attain to insight into the good or to true moral action. It is necessary, therefore, to reconstruct the whole social fabric so that the knowledge of the good obtained by the philosophers or the wise shall be mediated to the rest of the community through the very structure of the social organization. His scheme of virtues and his idea of social organization stand, therefore, in direct relation to each other. The supreme or controlling class in a state must, by the moral necessity of the case, be those who comprehend the supreme good, and who can estimate the value of particular acts by reference to the supreme good as a standard. This class follows the good simply because they appreciate it; their virtue is wisdom. Of them it is true that knowledge and virtue are identical. The next class in the state is composed of those who, without ability in themselves to comprehend the good, can appreciate it sufficiently when made known by the ruling class to defend and maintain it at all hazards. Their virtue is courage, or knowledge of the good at one remove. The lowest class in the state is composed of those who neither know nor can *positively* assert, under the direction of others, the good, but who can, when restrained, devote their energies to supplying the material making possible its realization by others. This is the industrial class, whose virtue is control or temperance; that is, knowledge at two removes. Justice is the whole made one by wisdom. Plato further began the psychological analysis of conduct by transferring the constitution of the state over into the structure of the individual soul. The appetites and desires, on their more passive side, correspond to the industrial class, the impulses and active desires to the loyal citizen class; reason to the ruling class, and the balance of the powers to the just state.

Influence of Aristotle.—Aristotle tended to separate ethics from its close connection both with metaphysics and with political organization. Plato himself had been obliged to admit that his idea of the universal and absolute good was but a bare outline; that it represented an ideal to be filled up rather than an accomplished fact. Aristotle added that in any case the ethical problem must relate to a good practically realizable by man, and not to some transcendent good. In place, therefore, of a metaphysical analysis of the good, Aristotle substitutes a description of the moral excellence found in the best type of the citizen gentlemen, a type which Athens, with its centuries of disciplinary and refining influences, had reared up. His account of goodness and of the chief virtues describe the ideals and habits of the typical Athenian gentleman; his principle of the golden mean is the generalization of the artistic principle upon which the Athenian character, in its best estate, had formed itself. Aristotle thus put at the disposal of all later peoples the net product of Greek life on its strictly moral side. As regards the method of attaining virtuous character, Aristotle substituted for the Platonic ideal of direction through social organization (now no longer possible, even as a dream, because of the loss of Athenian independence) the ideal of habits formed through careful discipline and training. Personal education tends to become the instrument for doing what previously social life as a whole had done. This emphasis upon the personal training of the individual made necessary more attention to the nature of the individual agent. Aristotle's ethics are thus as decidedly psychological as Plato's are political. It must not be thought, however, that Aristotle completely severs ethics from politics. Education is still conceived as carried on by the state; the community is thus the chief ethical instrument, indirectly if not directly. Moreover, since the individual is by nature social, he can realize his full good only in relation to others; his good includes a life in a community. In this way the state is also one form of the ethical end, but Aristotle distinctly separates the practical and social virtues from the contemplative virtues, making the latter higher in type, and thus prepares the way for the later isolation of the individual, and the divorce of ethics from politics.

Further Greek Development.—The so-called one-sided Socratic schools, namely, the Cynic and the Cyrenaic, had already entered upon the individualistic development. With the growth of the Macedonian and Roman supremacies, the welfare and customs of the local community came to mean

less and less to the individual. He was thrown back upon himself for moral strength and consolation. It is customary to put the two later schools, the Stoic and Epicurean, corresponding to the two one-sided schools already spoken of, in marked opposition to each other, and even to regard the Stoic school as the embodiment of all that was manly and truly virtuous in the life of the times, while the Epicurean is regarded as given over to lax and selfish pleasure-seeking; but considered in relation to the place which they occupy in the development of ethical problems and methods, the agreement between these two schools is much more important than the differences. Both are concerned with the question of how the individual, in an environment which is becoming more and more indifferent to him, can realize satisfaction; both answer in terms of a personal detachment from all outward concern, and of an attainment of internal self-sufficiency; both make wisdom the chief means in reaching this end; both, in a word, deal with the problem of the true satisfaction of desire in a world where good is no longer mediated through social organization, but has to be attained through the individual himself. Both schools therefore continue the psychological analysis, working out, indeed, the whole problem of will in its relation to desire, reason, and pleasure. In both schools there is an equilibrium reached through a remarkable compromise between self-satisfaction and self-sacrifice. While the Stoic school represents, upon the whole, asceticism, it has strongly hedonistic factors in it. The wise man was freed from everything merely customary, and this gave rise, in extreme cases at least, to a shameless disregard of the ordinary conventions of life in the satisfaction of passions. Moreover, the very contempt which the Stoic displayed for pleasure was in itself largely hedonistic; he felt that the pleasures which he despised were of little account compared with the pleasure of knowing that he was independent of them. On the other hand, there is a marked ascetic factor in Epicurus. He emphasizes the necessity, in order to secure stable pleasures, of moderating and even surrendering the urgency of desire. On the social side, the Stoics introduced an abstract cosmopolitanism by the side of their self-sufficient individualism. They conceived of the whole universe—"nature," in their phrase—as a vast city of which gods and men are the citizens, and for which the immanent reason, the Logos, gives laws. They thus generalize the ethical analysis which Plato and Aristotle had made with reference to the Athenian community. To live according to nature was to assume the same kind of relation to the whole world that Plato had required of the citizen with reference to his own community. The Epicurean school was even more definitely hostile in its moral aims to actual political life than the Stoic; but it set up the ideal of a brotherhood of like-minded men whose bond was not formal law, but personal friendship and voluntary sympathies.

Influence of Christianity.—The introduction of Christianity tended rather to deepen the existing antithesis than wholly to shift the center of interest. Within Christianity itself there were two contending strains. One, in its emphasis upon individual salvation and the freedom of the will, tended to reduce to the lowest terms possible the social side of conduct. It regarded social life, from the family to the state, as having primary relation to man's appetites, in themselves evil; social institutions therefore were either to be got rid of or, since that was impossible for most men, to be endured as necessary evils. On the other hand, the conception of love as the supreme law of life, and of a kingdom of heaven as a supreme social institution having complete community of interests—harmony of man with man—made the social aspect of conduct more prominent than it ever had been before. In the early centuries these two factors exist side by side with almost no consciousness of their contradiction. The chief immediate result in ethical theory was to center all moral questions in the will, and to conceive of will as power of personal choice rather than as expression of either desire or wisdom. God's will was the source and sanction of all moral law; man's will the free source of either goodness or badness; and the eternal destiny of man was fixed by the relation assumed between the divine will on one side and the human on the other.

Roman Influence.—The Roman empire formed at once the scene upon which all the contending ideas and tendencies met, and the framework which held them together and gave them objective consistency. The Latin influence furnished no new ethical analysis. It supplied neither a new idea of the supreme good, nor a further demand for personal righteousness. What it did afford was a vast and coherent system of practical means for realizing the ideal elsewhere developed. The system of private rights which civilization owes to Roman genius made the individualism of the Greek morals and Christian religion more than a speculation of the philosopher and an inner state of the saint; it gave this individualism objective body. In the same way the unified system of law and executive power necessary to the centralization of the Roman empire afforded at once a symbol and an objective support for the otherwise vague aspirations toward a unified humanity current in Greek and Christian thought. The first five centuries of our era are an epoch of fusion and assimilation. The Greek ideas furnish the theoretical analysis of conduct; Christianity insists upon the infinite meaning of life, and both are interpreted, on the practical or working side, by means of the legal and administrative concepts of Rome.

Mediæval Ethical Theory.—The result of this fusion is the Catholic Church of the middle ages with its well defined structure both as a political institution and the maintainer of a dogmatic system of truth. Ethical theory as free examination of conduct ceased; but none the less the Catholic Church gathered up into itself the net product of previous culture, and made it a tremendous influence in the practical discipline of men, both in their inner consciousness and in their community life. The official ethics was dominated by the legal ideas inherited from the Roman empire. God was the absolute lawgiver and judge. Moral laws and the laws of physical nature were the expression of his will, almost his arbitrary commands. The moral life was a process of conforming to legal rules; moral discipline a scheme for paying, either directly or vicariously, the penalties incident to infraction of law. The idea of government was everywhere supreme. The complete subordination of science, art, and ordinary social life to the demands imposed by the transcendent God, resulted in making an organized dualism out of conduct. The supernatural is the all-important, but the present and actual is the natural, which therefore can not be ignored. Thus there are two organs of moral knowledge, wisdom, making known the natural law, and revelation, declaring the supernatural; two types of virtue, the natural and the theological; two instruments for realizing the law, the state, the secular expression of the divine will, the kingdom of nature, and the Church its sacred expression, the kingdom of grace.

The Beginnings of Modern Moral Philosophy.—The Renaissance, here as elsewhere, marks a body of thought working free from constriction and subordination, and beginning to assert itself on its own account. After two or three centuries of conflict we find free theory finally able to maintain itself. Moral philosophy is severed from its theological subjection. From, say, 1625 to 1785 there are two main currents of ethical thought, the continental and the English, flowing on in relative independence of each other. The continental is from the *De Jure Belli et Pacis* (1625) of Grotius to the ethical writings of Kant; the English from the *Leviathan* of Hobbes to the death of Adam Smith. The continental school grew up under the traditions of Roman law and administration. It was interested mainly in an analysis of law; its source, sanction and content, jurally considered. English thought grew in connection with the struggle for political and industrial freedom. Hence it took the individual agent as its focus of interest and discussed moral questions as they bore upon the individual's life.

Agreement and Difference of the English and the Continental Movements.—It is customary to contrast the English and the continental phases of moral philosophy, regarding the former as empirical and the latter as rationalistic; yet their identity in principle was far more important than their difference in method. The problem of both was fixed by their attitude to the dogmatic character of mediæval theory; both were seeking a free basis for morality; in finding this, both start from the nature of the individual in himself, carrying out the same tendency in ethics which the Protestant Reformation introduced into religion and Descartes into metaphysics. Both neglected the positive and historical element—a neglect lasting until after the French Revolution. Both had the same fundamental question to deal with, the relation of the individual to society. The chief difference was that the English movement conceives of this relation as the adjustment of self-interest and benevolence, while the continental deals with it as the relation between the inner morality of the individual and the outward order of the state; moreover, English thought deals

with the individual as a feeling and desiring being, while continental thought derives its conclusions from his rational nature.

The Continental Development.—Grotius (1583–1645) initiated ethical science on the Continent. With the break-up of the feudal system and of the political authority of the Catholic Church, together with the emergence of independent nationalities, it became necessary to find a new source for authority and law. Grotius was particularly concerned with the problem of the relations between the various European states. Obviously there was no political sovereignty to impose law, and yet if there was no law anarchy was a sure result. Grotius fell back upon the idea of a law of nature antecedent to and controlling positive law. This natural law might be defined both as the law of reason and as a fundamental social law. It sprang from the rational impulse in the nature of man to seek for permanent union with his fellows, and to identify his good with theirs. The law of nature or right is to do whatever tends to execute this impulse. To Leibnitz (1646–1716) we owe the idea of a distinct philosophy of morals. Puffendorf (1632–94) had distinguished between a *forum internum* and a *forum externum*. The former was the region of religion in which all moral duties were included, the latter the region of jurisprudence. Leibnitz pointed out that moral duties must have a sphere of their own, separate from theology on one side and from jurisprudence on the other. Thomasius (1655–1728) tried to find a common principle underlying the sciences of morals and of civil law. The fundamental nature of man is toward rational happiness; the primary law of nature is therefore to seek both inner and outer peace. Morals deal with the former law; jurisprudence with the latter. The duties of the latter are expressed negatively: do not injure others. Its law is the law of justice; its defining mark the coercive character of such duties. The moral law is positive: do unto others as one would be done by; its law the law of benevolence, and its defining trait the impossibility of using coercive force. Thomasius thus afforded a philosophical basis for the growing tendency toward confessional religious freedom. Wolff (1679–1754) contributed no materially new elements, but carried out the idea of the rational character of morality on the formal side, working out the scheme of duties and virtues into a regular system on the basis of the principles of logic.

The English Development.—Hobbes (1588–1679) did for English thought what Grotius did for continental. The characteristic of his moral philosophy is the peculiar union of a thoroughly egoistic psychology, with an assertion that the basis of all moral obligation is positive law issued by a sovereign. The individual left to himself aims always and only at his own pleasure, so much so as to bring every individual into conflict with every other. The institution of the state is necessary to set limits to this self-seeking; by its enactments, which bring order out of anarchy, it sets up the moral ideal and definite moral duties. This theory of the positive origin of moral law called out the first reaction —an assertion of the intrinsic character of ethical distinctions. (See Intuitionalism.) The intuitionalists asserted that one law directly made known was that of benevolence, or the duty of considering the common good as one's own, but neither More (1614–87), Cumberland (1632–1718), nor Clarke (1675–1729) showed how this principle of benevolence appealed to the individual. Indeed, so far as they dealt with the question of how benevolence could become a working motive for the individual, they tended to fall back on external rewards and punishment. In so far they not only left the psychological egoism of Hobbes unrefuted, but also implicitly asserted it. This deficiency Shaftesbury (1671–1713) attempted to make good by a new analysis of the individual's make-up, with a view to showing the active presence within him of disinterested impulses or social affections on the same level as his self-seeking tendencies. Butler (1692–1752) went a step further and denied that even the self-regarding impulses, so called, aim at pleasure, claiming that each is directed to its own appropriate object. Self-love he held to be a general principle arising from reflection, and subject therefore to reason, as determining in what it really consists and how it may truly be obtained. Hutcheson (1694–1747) applied the same idea to the analysis of the social impulses, distinguishing between the natural and turbulent impulses on one side, whether personal or social, and calm self-love and calm benevolence on the other. He thus attempts to give the ultimate moral value to the balance of the impulses as affected by reason, claiming that a reasonable self-love and a reasonable benevolence coincide. He also laid great stress on the disinterested character of the social affections. Since no one of these writers assumed that the moral good coincides absolutely with the benevolent impulses, the question of the object of approbation, or the good, came to be a distinct problem. Hutcheson intensified this problem by recognizing the opposition between the disposition or character from which acts proceed and the nature of the acts themselves. He distinguished between the formally good, whose criterion is in the character, and the materially good, whose criterion is in the results of acts, holding that the test of the goodness of an act is its tendency to promote the greatest happiness of the greatest number. He thus prepared the way for the later utilitarianism. Hume (1711–76) attempts to unite Hutcheson's account of the object of approbation with a psychological account of approbation considered as a state of mind. According to him, approbation is the state of pleasurable consciousness, arising through sympathy, when we contemplate any traits or acts which are agreeable or useful to others. Hume thus carries to its extreme the emphasis upon feeling latent in the earlier writers; that which is approved and the act of approbation are both states of feeling. Reason comes in only as enlightening the feelings. Adam Smith (1723–90) carries out still further the idea of sympathy. Hume had not attempted to differentiate moral approbation from the sympathetic pleasure arising at the contemplation of any enjoyment whatever. Smith undertook to supply this lack by holding that our moral sympathy is not with the mere experiences of others, but with the active impulses from which the experiences arise. Moreover, he substituted for the more or less haphazard sympathies of Hume's moral agent the sympathies which would arise in a spectator who was both impartial and enlightened. Our own conscience or self-judgment is simply the reflex of such an imaginary spectator. Hartley (1705–57) completed this psychological analysis by the fuller use of the idea of association. He practically eliminated the "reason" of the older moral writers by accounting for all complex facts as associations of pleasure and pain with simple sensations and appetites.

Transition to the Moral Philosophy of the Nineteenth Century.—The common tendency of more recent ethical thought, underlying all differences between the various schools, is fixed by the effort to deal more adequately with the social factors of morality. Kant (1724–1804), in Germany, and Bentham (1748–1842), in England, represent the transition from their respective sides. In Kant the contradiction in previous rationalistic ethics almost comes to consciousness. This contradiction lay in deriving the moral laws from reason, which is assumed to be universal and necessary, and yet in beginning with the individual and considering the state simply as a compact between individuals. Kant became aware of the necessity of explicitly asserting the universal character of the individual as to his rational nature, and he set it over against the particular side found in his appetites and feelings. Morality thus becomes the struggle of the rational universal will to give the law to conduct, as against the inducements of the sensuous appetite. These two selves, moreover, he tends to identify with the results of Rousseau's political analysis, according to which the individual is to be considered both as sovereign or legislator and as subject, or recipient, of law. The universal character of the law to be realized forces Kant to the verge of realizing the social nature of morality. Having, however, excluded all historical content as empirical, he can get no further than asserting that the moral law, since universal, demands equal regard to all personalities, and requires of each that he act so as to make possible the harmony of all—the kingdom of ends. Instead, therefore, of continuing the parallelism between the inner and the outer (that is, the moral, motive, and political structure) erected by Thomasius, he asserts the necessity of having the outward conditions of action so regulated as to enable the internal moral motive to be really executed. Thus the structure of the state and law, though not in themselves moral, must be made of such sort as will permit the realization of morality. It was, of course, impossible that this unstable equilibrium of the individual and society could be continued. Meanwhile Bentham, on his side, had been effecting a similar transformation in English ethics. On one side he asserted that the sole criterion of morality is found not in the disposition of the agent, but in the tendency of acts to affect the happiness and misery of all sentient creatures; he

condemned all other standards as capricious and subjective. On the other hand, he demanded that the whole legal structure and machinery, both legislative and judicial, be transformed so as, in the first place, to have equal regard to the welfare of all, and, in the second place, to induce the individual really to identify his own happiness with that of others. Thus the contradiction latent in the earlier English thought comes to consciousness. The more (from Shaftesbury down) the writers had insisted upon the benevolent character of the individual the more it was open to cynical observers like Mandeville to point out the discrepancy between the theory and the actual facts of political and economic life in England, where self-seeking seemed the rule. Bentham's utilitarianism may thus be considered an assertion that the previous utilitarian theory of the identity of private and public happiness can become a fact only when the legislative and judicial agencies of the state are brought into play to equalize conditions and furnish motives. Utilitarianism thus became the intellectual instrument of reform in the interest of the rising democratic spirit. Ethical theory was forced from the attitude of mere psychological analysis into a theory of the nature and methods of social well-being.

Recent Ethical Theory.—The movement in Germany subsequent to Kant consists in translating the abstract universal will of his theory into concrete social terms. The unified life of society was substituted for formal reason. The particular or sensuous self was transformed into a given individual within the social whole. The categorical imperative, that is, the consciousness of the legislative character of the rational self, was translated into the consciousness on the part of the individual of his place in the social organism, and of the duties devolving upon him because of this place. In Hegel (1770–1831) this tendency reached its culmination. In his philosophy the moral consciousness of the individual is but a phase in the process of social organization. In England Bentham was followed by James Mill (1773–1836), who, uniting the psychology of Hartley with the reforming utilitarian spirit of Bentham, became the center of the philosophical liberal school—a school which had an influence quite out of proportion to its actual numbers. The son of James Mill, John Stuart Mill (1806–73), came early in life under the influence of the disciples of Coleridge, who was introducing German transcendental philosophy into England according to his understanding of it. While the younger Mill remained at bottom a Benthamite, he modified utilitarianism in such ways as to meet the intuitionalism of the other school at least half way. He introduced the conception that the quality of pleasure is more important than its quantity, and that the highest quality is found in the satisfied conscience of the wise and virtuous man. He admitted an independent moral consciousness in the sense which the individual has of himself as a member of a community. He thus added to the external sanctions of Bentham a strictly internal sanction. He further deepened the social factor of morality, introduced by Bentham, by laying less emphasis upon the direct activity of political administration, and more upon the organic and continuous national life with its moral bent and religious attitude. This, as an educative force, he came to regard as the finally determining element in morals.

Recent Scientific Influence in Ethics.—As we have already seen, the democratic tendencies in social and industrial life resulted in attaching greater importance to the objective and social content of morality. This practical tendency has been re-enforced in the last half of the nineteenth century by the development of science. The historical method, worked out in Germany and applied first to law and language, became the ruling instrument of scientific investigation. The effect was to put in clear and definite light the dependence of the individual upon his social environment. This idea was generalized by Comte (1798–1857), who made it the basis of a religious doctrine as well as of a moral theory. The theory of evolution broadened and deepened the historical method by applying it to the entire past history of the world. The result in ethical theory has been the introduction of biological concepts, and the attaching of new importance to anthropological researches into the early customs of humanity. The last decades have witnessed an effort to rethink the previous results of ethical speculation in the light of the new scientific methods, and by the incorporation of the anthropological and sociological data thus attained. The result, curiously enough, has been that the moral philosophy of Germany has been rendered more empirical, while that of England has become more metaphysical. German ethics had reached by its rational analysis the necessity of building up ethics on a social basis. The groundwork was thus provided for the ready assimilation of the historical data. On the other hand, English thought, having been led by its psychological analysis of the individual to the necessity of recognizing the social relations of the individual, felt the need of philosophical concepts, which would enable it to emerge from its individualism, and assert the organic place of the individual in the social whole. These organic ideas it found prepared in the philosophical systems of Germany.

Bibliography.—There is one excellent brief history of moral philosophy in English—Sidgwick, *History of Ethics* (London and New York, 3d ed. 1892). The earlier writings by Mackintosh, *On the Progress of Ethical Philosophy during the Seventeenth and Eighteenth Centuries* (Edinburgh, 1872), Whewell, *History of Moral Science* (Edinburgh, 1863), and Maurice, *Moral and Metaphysical Philosophy* (London, 1861), are by no means antiquated, although their "tendency" has to be allowed for. Leslie Stephen, *English Thought in the Eighteenth Century* (London, 1876), should be consulted for that period. Martineau's and Bain's (see below) ethical writings have historical sketches. Bonar, *Philosophy and Economics in their Historical Relations* (London and New York, 1893), contains much valuable historical material. Lecky's *History of European Morals* (2 vols., New York, 1870), is a history of customs rather than theories, but should be consulted.

In German the historical literature is much more abundant. Among earlier writings Schleiermacher, *Grundlinien einer Kritik der bisherigen Sittenlehre* (Berlin, 1834); Stahl, *Philosophie des Rechts* (vol. i., 5th ed. Tübingen, 1878); Raumer, *Die geschichtliche Entwickelung der Begriffe von Staat, Recht und Politik* (Leipzig, 3d ed. 1861); Mohl, *Geschichte u. Literatur der Staatswissenschaften* (Erlangen, 1855–58). Among the best of the recent histories is Jodl, *Geschichte der Ethik* (Stuttgart, 1889), dealing, however, only briefly with earlier thought and colored by a distinct tendency. In addition, we have Ziegler, *Geschichte der Ethik* (2 vols., Strassburg, 1881–86: a third still to appear); Köstlin, *Geschichte der Ethik* (Tübingen, 1887; as yet incomplete). In French we have Janet, *Histoire de la Philosophie morale et politique* (2 vols., Paris, 1858).

Limits of space compel us to keep detailed references to the ethical thought of the nineteenth century. The most important literature is Bentham, *Principles of Morals and Legislation* (vol. i. of *Works*, Edinburgh, 1838; also a separate ed. London, 1879); Austin, *Jurisprudence* (2 vols., London, 1869); Mill, *Utilitarianism, Dissertations and Discussions* (vol. iii., Boston, 1865; also separate ed. Boston, 1887); Bain, *Moral Science* (New York, 1869) and *Emotions and Will* (London, 3d ed. 1888); Sidgwick, *Methods of Ethics* (4th ed. London and New York, 1890); Wilson and Fowler, *Principles of Morals* (2 vols., Oxford, 1886–87). The foregoing are all utilitarian, though the last two in particular attempt a reconciliation with intuitional factors. The chief English writers who have made use of the evolutionary idea are Darwin, *Descent of Man* (New York, 1871), chs. v. and vi.; Spencer, *Data of Ethics* (New York, 1882; embodied also in *Principles of Ethics*, 2 vols., New York, 1893); Stephen, *Science of Ethics* (London, 1882). Accounts and criticisms will be found in Sorley, *Ethics of Naturalism* (Edinburgh, 1885); Schurman, *Ethical Import of Darwinism* (New York, 1887) and *Kantian Ethics and the Ethics of Evolution* (London, 1881); Williams, *Evolutional Ethics* (New York, 1893). Martineau, *Types of Ethical Theory* (2 vols., Oxford, 1885), continues more than any other one writer the English ethical traditions of the eighteenth century. In Germany, Kant, *Werke* (vol. v., Leipzig, 1867, ed. Hartenstein: trans. by Abbott as *Kant's Theory of Ethics*, London, 1883): Hegel, *Philosophie des Rechts*, *Werke* (vol. viii., Berlin, 1833; account of it in Morris, *Hegel's Philosophy of State* (Chicago, 1887), and trans. of selected portions in Sterrett's *Ethics of Hegel*, Boston, 1893). Among recent writers Steinthal, *Allgemeine Ethik* (Berlin, 1885; Herbartian, upon the whole), von Ihering, *Der Zweck im Recht* (Leipzig, 1877), Wundt, *Ethik* (2d ed. Stuttgart, 1892), Paulsen, *System der Ethik* (2d ed. Berlin, 1894), should be mentioned. Höffding, *Ethik* (German trans. Leipzig, 1888), gives what is probably the best existent statement of a social utilitarianism. The introduction of German philosophic concepts into English ethics is represented by Bradley, *Ethical Studies* (London, 1876); Green, *Prolegomena to*

Ethics (Oxford, 1883; and vol. ii. of *Works*, London, 1890); Caird, *Social Philosophy of Comte* (2d ed. New York, 1893); *Critical Philosophy of Kant* (2 vols., Glasgow and New York, 1889). Alexander, *Moral Order and Progress* (London, 1889), and Ritchie, *Darwin and Hegel* (London, 1893), are attempts to unite this mode of thinking with evolutionary concepts. JOHN DEWEY.

Moran, EDWARD: marine and genre painter; b. at Bolton, England, Aug. 19, 1829. He was a pupil of M. de Paris in Bolton, of Hamilton and of Weber in Philadelphia, and of the Royal Academy, London; came to the U. S. in 1844; is an associate of the National Academy; member of the American Water-color Society and of the Pennsylvania Academy of Fine Arts. His *Foggy Morning—English Channel* is in the collection of Thomas B. Clarke, New York. Moran is well known as an etcher. D. in New York city, June 9, 1901. W. A. C.

Moran, THOMAS: landscape-painter; b. at Bolton, England, Jan. 12, 1837; a pupil of his brother, Edward Moran; came to the U. S. in 1844; has painted pictures of Rocky Mountain scenery and other American views. His *Chasm of the Colorado* is in the Capitol at Washington; he became a National Academician 1884, and is a member of the Pennsylvania Academy of Fine Arts. He is a skillful and able etcher. Studio in New York. W. A. C.

Moratin', LEANDRO FERNANDEZ, de: dramatist; son of Nicolas F. Moratin; b. in Madrid, Spain, Mar. 10, 1760; was carefully educated for literary pursuits, though for some time he was engaged in the jewelry trade; received prizes from the Academy of Madrid in 1782 and 1785; visited Paris in 1787, where he made the acquaintance of Goldoni, and brought in 1770 his first and best comedy on the stage, *El Viejo y la Niña*. It was his object to reform the Spanish theater, and he succeeded. Godoy, Duke of Alcudia, gave him a pension; he traveled extensively in France, England, Holland, and Germany, and his later dramas, which were received with great applause, evince, besides a natural talent of considerable vigor, a highly developed taste. King Joseph made him his librarian, but after the restoration of Ferdinand VII. he left Spain, lived mostly in Paris, and died there June 21, 1828. His excellent work, *Orígenes del Teatro Español*, written in Paris, reaches only to Lopez de Vega.

Moratin, NICOLAS FERNANDEZ, de: poet; b. in Madrid, Spain, July 20, 1737; was of an ancient Biscayan family; received a careful education; became a lawyer and Professor of Poetry in the Imperial College at Madrid; was the founder of the literary club which took its name from the coffee-house of San Sebastian, and with the countenance of the court and of the great nobles undertook, amid great opposition, the reformation of the Spanish theater by substituting for the religious dramas, or *autos sacramentales*, pieces more in accordance with modern taste, especially as represented by the French school. He had previously published a comedy, *La Petimetra* (1762), and a tragedy, *Lucrecia*, as specimens of the new dramatic school, but neither of them had been placed upon the stage. *Hormesinda*, represented in 1770, achieved success, and *Guzman el Bueno* (1777) was much admired for its classic verse. Moratin was also the author of *Diana*, a didactic poem (1763), and *Las Naves de Cortés destruidas* (1765), a narrative poem on the conquest of Mexico, considered by Ticknor to contain the noblest verse of its kind produced by any Spanish writer of the eighteenth century. All his pieces are characterized by purity and correctness of diction and harmony of versification. D. in Madrid, May 11, 1780.

Mora'via (Germ. *Mähren*): province of Austria; bounded W. by Bohemia, N. by Bohemia and Silesia, E. by Hungary and Silesia, and S. by Hungary and the duchy of Austria. Area, 8,583 sq. miles. Pop. (1890) 2,276,870, of whom 600,000 are Slavonians and the rest Germans. It is almost entirely encircled by mountains—W. by the Moravian, N. by the Sudetic, and E. by the Carpathian—whose branches and spurs intersect the province, with exception of the southern part, which forms an elevated plain. Generally, the surface slopes toward the S., traversed by the Morava (or March) and a number of minor streams, which all send their waters to the Danube. The more elevated portions of Moravia are not fertile, but yield coal, alum, graphite, saltpeter, and metals, especially iron, copper, and lead; the valleys and the southern plains are very fertile, affording excellent pasturage and producing grain, potatoes, flax, hemp, hops, wine, chestnuts, and various kinds of fine fruits. Cattle, fine horses and sheep, geese, fowls, and bees are reared, and extensive manufactures of cotton, linen, silk, and woolen fabrics are carried on. In the twelfth century Moravia was made a margravate and declared a fief of the Bohemian crown, to be held by the younger sons; in 1526, on the death of Louis II. at the battle of Mohacs, it fell to Austria, together with Bohemia, from which it was formally separated in 1849. Revised by W. B. SHAW.

Moravia: village (settled and named The Flats in 1789, name changed to present in 1813); Cayuga co., N. Y. (for location of county, see map of New York, ref. 4–F); on the Owasco inlet, and the Lehigh Val. Railroad; 18 miles S. E. of Auburn, the county-seat. It is the center of a large grain-growing and dairying region; has good water-power, electric lights, and improved system of waterworks; and contains 5 churches, union graded school, public library, 2 national banks, a monthly and 2 weekly periodicals, 2 foundries, flour-mills, cheese-factory, and barrel, broom, furniture, and window-screen factories. Pop. (1880) 1,540; (1890) 1,486; (1900) 1,442.
EDITOR OF "REPUBLICAN."

Moravian Brethren: See MORAVIAN CHURCH and BOHEMIAN BRETHREN.

Moravian Church, The: an ecclesiastical organization owing its distinctive name to the fact that in the fifteenth and sixteenth centuries Moravia constituted one of its principal seats, and because it was renewed in the eighteenth by refugees from that country. Its official name, however, is the Church of the United Brethren, or the Unitas Fratrum, and it originated not only in Moravia, but also in Bohemia. The blood of the martyr Huss (see HUSS, JOHN) was its seed. It was founded by some of his followers in 1457 on the barony of Lititz, in Bohemia, on the following three principles: The Bible is the only source of Christian doctrine; public worship is to be conducted in accordance with the teaching of the Scriptures and on the model of the apostolic Church; the Lord's Supper is to be received in faith, to be doctrinally defined in the language of the Bible, and every human explanation of that language is to be avoided. Its first ministers were priests of the Calixtine or national Church, from which the Brethren had seceded. In 1467, however, they introduced a ministry of their own, and secured the episcopacy from Bishop Stephen of the Austrian Waldenses. In spite of frequent persecutions at the hands both of the Roman Catholics and of the national Church, they increased in numbers and influence. At the beginning of Luther's Reformation (in 1517) they had about 200,000 members and over 400 parishes. In the course of time they established colleges and theological seminaries, set up several printing-presses, and translated the entire Bible from the original into the Bohemian tongue. This version has remained a standard to the present day. About 1549 they spread to Poland; and in 1557 the Unitas Fratrum was divided into three ecclesiastical provinces—the Bohemian, the Moravian, and the Polish—each governed by bishops of its own, but all united as one Church. Religious liberty having been proclaimed in Bohemia and Moravia in 1609, the Brethren became one of the legally acknowledged churches of these lands. In the early part of the Thirty Years' war, however, Ferdinand II. inaugurated the so-called Counter-Reformation, which crushed evangelical religion out of Bohemia and Moravia. Only a hidden seed of the Church of the Brethren remained. The majority of its members, together with the Lutherans and the Reformed, were driven into exile (1620). A new center was now established at Lissa in Poland, and many parishes of refugees were formed, but Lissa was destroyed in 1656, in a war between Poland and Sweden, and the remaining parishes were gradually absorbed by other Protestant bodies. For more than half a century the Unitas Fratrum ceased to exist as a visible organization. Its hidden seed in Bohemia and Moravia, however, remained, and its illustrious bishop, Amos Comenius, filled with a prophetical anticipation of its renewal, republished its history, confession, and discipline, commended the future Church of the Brethren to the care of the Church of England, and took steps to perpetuate its episcopacy. Hence, for a period of fifty years, clergymen of the Reformed Church were consecrated bishops of the Unitas Fratrum, that the succession might not die out. On June 17, 1722, a few descendants of the Brethren, who had fled from their native land to Saxony, began to build the town of Herrnhut on an estate of Count Zinzendorf, where an asylum had been provided for them. This town

soon became the rallying-place for the remnant of the Church, descendants of which, to the number of several hundred, immigrated thither from Bohemia and Moravia. They introduced their ancient discipline, handed down by Comenius, and in 1735 received their venerable episcopate at the hands of its two last survivors, Daniel Ernst Jablonsky and Christian Sitkovius. At the same time, however, many Christians from different parts of Germany joined them, so that the renewal of their Church involved a union of the German element of pietism with the Slavonic element which they represented. The result was a development different from that in Bohemia and Moravia. Count Zinzendorf himself became the leading bishop of the resuscitated Church, and he strove to build it up in such a way as not to interfere with the rights and privileges of the state Church, in the communion of which he had been born, and to which he was sincerely attached. In carrying out this principle he did not let the renewed Unitas Fratrum expand as other churches expand, but established on the continent of Europe, in Great Britain, and in America exclusively Moravian settlements, from which the follies and temptations of the world were excluded, and in which was fostered the highest type of spiritual life. In doing this he carried out Spener's favorite idea of *ecclesiolæ in ecclesia*. Fifteen exclusive settlements still exist in Germany and four in Great Britain. In such towns, until recently, Moravians only were allowed to hold real estate, and the Church controlled not only religious but also municipal, and to some extent industrial, affairs. This fundamental principle is now undergoing a change which will gradually lead to the abolition of the entire system of exclusivism. In the U. S. it has been given up, the last vestige of it disappearing in 1856. The American Moravian Church now stands on the same footing as the other Protestant denominations of the republic, is pursuing the same polity of extension, has largely increased its membership, and is flourishing in other respects. Even in the period in which exclusivism was fully developed throughout the Unitas Fratrum, it did not remain idle or stand aloof from work for the spread of the kingdom of God. On the contrary, while its peculiar system necessarily kept it small at home, it began a very extensive mission in heathen lands, a no less influential domestic mission on the continent of Europe, and a number of educational enterprises that have given it a name far and wide. In 1857 its constitution was remodeled. The Unitas Fratrum now consists of three provinces—the German, British, and American—which are independent in all provincial affairs, but form one organic whole in regard to the fundamental principles of doctrine, discipline, and ritual, as also in carrying on the foreign and the Bohemian missions. Hence there is a provincial and a general government. Each province has a provincial synod, which elects from time to time a board of bishops and other clergymen, styled the "Provincial Elders' Conference," to administer the government in the interval between synods. To this board is committed the power of appointing the ministers to their several parishes. Every ten or twelve years a General Synod of the whole Unitas Fratrum is convened at Herrnhut in Saxony. It consists of delegates from each province and from the foreign missions, and elects a board of twelve bishops and other clergymen, styled the "Unity's Elders' Conference," which oversees the whole Church and superintends the foreign and Bohemian missions. The doctrine of the Church is set forth in its Catechism, its Easter Morning Litany, and in the statutes drawn up by the General Synod, and comprises all those points which are held by Trinitarian Christians as essential to salvation. The distinguishing feature of Moravian theology is the prominence given to the person and work of Christ, and a marked characteristic of the Church generally is its catholicity. The ministry consists of bishops, presbyters, and deacons. The episcopal office is not provincial and not diocesan, but represents the whole Unitas Fratrum. A ritual is used which comprises a litany for Sunday morning—free prayer being allowed at other times—forms for baptism, the Lord's Supper, confirmation, etc., services for the festivals of the ecclesiastical year, and a particular litany for Easter morning. Love-feasts are held, in imitation of the primitive *agapæ*, preparatory to the Lord's Supper and on other occasions. The use of the lot, which at one time was universal, is now greatly restricted, and in the American province resorted to only when a minister receiving an appointment requests its use. Foot-washing, too, has been abandoned. The enterprises of the Church are the following: (1) *Boarding-schools* for young people not connected with it, educating annually about 2,500 pupils of both sexes. There are, besides, numerous parochial schools, a college, a missionary institute, and three theological seminaries. (2) *Foreign missions*, begun in 1732, since which time more than 2,200 missionaries have been sent out, comprising the following 16 "mission provinces"—namely, Greenland, Labrador, Indian country of North America, St. Thomas and St. John, St. Croix, Jamaica, Antigua, St. Kitts, Barbados, Tobago, Mosquito Coast, Surinam, South African western province, South African eastern province, Alaska, Trinidad, Demerara, East Africa, North Queensland, Australia, and Tibet. (3) *Bohemian missions*, begun in 1870 in the early seats of the Unitas Fratrum, and numbering four stations. (4) *Domestic mission* on the continent of Europe, called the *Diaspora*, having for its object the evangelization of the European state churches, without depriving them of their members, who are organized into "societies" within the Church, and carried on in Germany, Switzerland, Denmark, Norway, Sweden, Poland, Livonia, Esthonia, and other parts of Russia. The whole number in the three provinces of the Unitas Fratrum is about 33,400, of whom 19,497 belong to the American province; the whole number of communicants in the foreign missions is about 31,600; of baptized adults, 55,860; the number of foreign missionaries, 347. Besides these there are about 80,000 connected with the Diaspora mission. See *Moravian Manual* (Bethlehem, Pa.); also histories in German by Bost (1848, Eng. trans.), in English by Schweinitz (1885), J. Taylor Hamilton (1894); Seifferth, on their constitution; Thompson, on their missions (1883); and *Moravian Schools and Customs* (1889).

Revised by Robert de Schweinitz.

Moray: See Elginshire.

Moray Firth; an inlet of the German Ocean, on the northeast coast of Scotland, 16 miles wide at the entrance, and stretching inland for about 39 miles, to the mouth of the river Beauly.

Moray, James Stuart, Earl of: See Murray.

Morazan', Francisco: soldier and politician; b. at Tegucigalpa, Honduras, Oct., 1792. About 1827 Honduras and Salvador broke out in open revolt against the arbitrary and unconstitutional acts of Arce, president of Central America, and Morazan as a military leader quickly became the foremost man in Central America. He assisted in gaining Honduras for the liberals; then marched into Salvador and Guatemala, took the capital of the latter state (and of Central America) in Apr., 1829, at once assumed the executive, proceeded to restore the constitution, and called a congress. In 1830 he was duly elected president of Central America. In the main he governed with wisdom and liberality. The opposition of the reactionist and Church parties soon produced a succession of revolts, and though Morazan was re-elected in 1834 he could not maintain order. At the end of his second term no provision had been made for electing his successor, and the Central American Confederation was *ipso facto* dissolved. Supported by Salvador he made a vain attempt to preserve the union by force; but he was finally defeated by Carrera at Guatemala, Mar. 18, 1840, and forced to fly to Peru; thereafter each state acted independently. In Apr., 1842, Morazan landed in Costa Rica, and again proclaimed the confederation. Carillo, president of Costa Rica, was deposed, and Morazan assumed the presidency at San José; but in September he was driven out of the city by a counter-revolution, was captured soon after, and shot at San José, Sept. 15, 1842. He was undoubtedly one of the ablest and best men that Central America has ever produced.

Herbert H. Smith.

Morbidity [from Lat. *morbiditas*, from *morbus*, disease]: liability to or relative prevalence of disease as shown by the ratio of the number of days of sickness to total number of days lived, or of the number of sick persons at a given time to the total number of persons in the community.

Death-rates, even when derived from complete and accurate data, can furnish only incomplete and imperfect information with regard to the relative prevalence of disease in different communities, or as to the amount of time lost by sickness. Many forms of disease which make life more or less a burden, and which partially or entirely disable a person, seldom or never appear in the registers as causes of death, and rarely can we find any definite and certain relation between the number of cases of a disease, or the

amount of time lost by the sufferers, and the number of deaths reported as caused by that disease. The proportion of deaths to cases in such acute diseases as scarlet fever, measles, whooping-cough, yellow fever, etc., varies greatly in different epidemics, and such chronic affections as consumption, Bright's disease, valvular heart disease, etc., differ much in different individuals as to the number of days or weeks of inability to work which they produce. From the results of data obtained from the records of mutual benefit and sickness assurance societies, it is usually estimated that, during a term of years, for every case of death in a community there are two persons constantly sick, which implies that there is an average of two years' sickness to each death, so that if the mortality of a place were 18 per 1,000, the morbidity would be 36 per 1,000. This is a high estimate, unless the word "sickness" be taken as including slight functional disturbances as well as disabling diseases.

Our sources of information with regard to sick-rates are very limited as compared with those for death-rates. The most reliable are the records of the army and navy, of the police force in some cities, and of certain societies for mutual aid in case of sickness. The following table shows the number per 1,000 constantly sick in the British army from 1868 to 1877, from 1878 to 1887, in 1888 and in 1889:

STATIONS.	1868–77.	1878–87.	1888.	1889.
Troops at home and abroad	46·56	54·64	54·52	58·14
United Kingdom	39·66	45·84	44·45	41·48
Gibraltar	34·16	49·68	36·47	39·47
Malta	40·56	50·01	33·24	36·81
Cyprus	.....	69·30	54·72	56·53
Egypt	.....	75·78	64·58	60·45
Canada	29·80	38·98	34·72	28·55
Bermuda	32·92	34·71	34·60	24·09
West Indies	40·58	46·42	55·55	52·49
South Africa and St. Helena	46·80	52·01	58·53	52·64
Mauritius	51·42	88·58	52·67	86·43
Ceylon	50·08	61·93	64·18	66·80
China	.....	.....	.....	53·38
China and Straits Settlements	49·55	50·61	64·59	* 99·84
India	55·88	68·67	72·34	87·36

* Straits Settlements only.

In the U. S. army the average number constantly sick per 1,000 of mean strength is about 41 for the white and a little more for the colored troops. These figures relate only to adult males, and would indicate about 3 cases of constant sickness to every death, but no doubt many of the cases are comparatively slight. The average time lost by sickness for each man during the year is, in the U. S. army, from 14 to 15 days; in the Italian army, from 13 to 14 days; and in the British army, from 19 to 21 days.

With these may be compared the figures for the sickness among members of friendly societies in England, as given in Mr. Finlaison's second report, published in 1884. For males between 21 and 50 years of age—i. e. the usual ages of those in military service—the average number of days' sickness per annum was, for those engaged in general labor, 8 days; for those employed in light labor, 7 days; and for those employed on heavy labor, 9½ days. Taking all the male members of these friendly societies, it was found that during the period of life between the ages of 15 and 85, each man has about 5 years of sickness, but that during the age of labor, from 16 to 66, the average annual time of sickness is about 1½ weeks, and of this the amount of sickness during the first half of working life is almost exactly half that of the second. In the U. S. census taken June 1, 1880, it was found that for the total living population of 15 years old and upward the number sick varied in different parts of the country from 7·17 to 22·7 per 1,000 for males, and from 8·1 to 17·5 for females. It should be remembered, however, that at this time of the year there is the least amount of sickness. The amount of sickness increases after the age of 15 in a definite ratio. Thus by the census report for 1880 it appears that the proportion of sick to the 1,000 of population of different ages was as follows:

AGE.	Males.	Females.
15–25	6·9	6·8
25–35	8·6	9·7
35–45	12·2	11·5
45–55	16·8	14·4
55–65	25·5	20·4
65 and over	44·5	35·3

The mean sickness-rate for the whole population 15 years of age and upward was 12·75 per 1,000. It will be seen that morbidity follows the same general law as mortality in respect to sex and age, being greater among males at advanced ages.

In the report on the census of Tasmania for 1881 the following table is given showing the number of cases of disabling sickness and accidents found on a given day in each 1,000 of living population:

AGE PERIODS.	SICKNESS.		ACCIDENTS.	
	Tasmania.	Victoria.	Tasmania.	Victoria.
All ages	15·13	11·81	1·94	1·80
0–15 years	5·42	3·89	0·70	0·44
15–30 "	9·20	8·73	1·44	1·57
30–50 "	15·60	15·99	1·84	3·06
50–70 "	40·10	41·30	5·52	5·15
70 and over	96·27	111·48	9·08	6·62

The comparatively high sickness-rate in children in Tasmania was, in part at least, due to the fact that measles was prevailing throughout the colony at the time the census was taken.

The difference in morbidity in cities and in the country is shown in the following table, giving average annual sickness-rates in males in the Foresters' Friendly Society for the five years 1871–75, and in the Manchester Unity of Odd Fellows for the years 1866–70, as given in Neison's work, *The Rates of Mortality and Sickness, etc.* (London, 8vo, 1882):

AGES.	Foresters' Friendly Society, 1871–75.				Manchester Unity of Odd Fellows, 1866–70.			
	Number of persons.		Sickness per member per annum in weeks.		Number of persons.		Sickness per member per annum in weeks.

J. S. Billings.

Morbihan': department of France; a part of the old province of Bretagne, bordering S. on the Atlantic. Area, 2,625 sq. miles. The northern part is hilly, but the rest is low and level, forming large plains, in some places very fertile, in others occupied by heath or marshes. The islands along the coast are especially remarkable for their fertility. Horses, cattle, sheep, and bees are extensively reared; corn, hemp, flax, and apples are raised; cider, butter, and honey are the principal products. The fisheries are very important. Pop. (1896) 552,028. Principal towns, L'Orient and Vannes.

Mordants [plur. of *mordant* = Fr., liter., biting, pres. partic. of *mordre*, bite, etch]: substances used in dyeing and calico-printing to fix colors which have no affinity for the tissues; in gilding, any viscous or sticky matter employed in making gold-leaf adhere. Animal fibers, as silk and wool, generally attract coloring-matters; for them, therefore, mordants are less important, though they are often used, either to make the color more durable or to brighten or otherwise modify the tint. Few colors can, however, be made to adhere to vegetable fibers, cotton or linen, without the aid of a mordant. Colors which require mordants are called adjective; those which do not, substantive. Safflower is a substantive dye for cotton and linen; most other dyes are adjective for these fibers. The mordant has a positive affinity for both color and fiber, and binds the two together. The most important mordants are soluble salts of aluminium, iron, and tin. If cotton is immersed in a solution of acetate of aluminium, a basic acetate of aluminium will be fixed on the fibers so firmly as to resist removal by washing; if the cotton be now treated

with water and ground madder, the red coloring-matters of the madder, alizarin and purpurin, will unite with the acetate, and thus each fiber will become covered with the red madder lakes, or salts of alizarin and purpurin, together with the acetate of aluminium. If an iron salt be substituted for the acetate of aluminium, as acetate of iron, a similar result would follow the treatment with madder, exeept that, as the iron eompounds with alizarin and purpurin are purple, the cotton would be dyed of this eolor. Sometimes the mordant and color are applied simultaneously. Astringents, such as sumac, nutgalls, etc., are employed as mordants, and act by virtue of the tannic acid they contain. When mordants are printed on cotton cloth in stripes and figures, and the cloth thus mordanted is subjected to the action of the dyestuff, the color is fixed in similar stripes and figures, leaving the other portions of cloth white; this is calico. Sometimes the color is mixed with a salt of the mordant, and the two printed together ("topical printing"). On subjecting the cloth to the action of steam, the acid of the mordant, generally acetic, is expelled, and the base and color become fixed on the cloth.

The term *mordant* is sometimes applied to agents which act merely mechanically and cement the color to the fiber, as albumen, casein, etc., which are used for pigment colors, such as ultramarine, oxide of chromium, etc., and for aniline colors. The term is also applied to salts which furnish a part of the matter of which the color actually consists, as the iron salt in produeing Prussian blue or the lead salt in forming chrome yellow. In these colors there is no proper mordant, as the insoluble color is merely produced in the fiber by the combination of its component parts. This difference is more apparent than real, as the same is actually true when aluminium or iron is used with madder or with astringents. See CALICO-PRINTING and DYEING.

More, HANNAH: author; b. at Stapleton, Gloucestershire, England, Feb. 2, 1745; was educated at a seminary kept by her two elder sisters at Bristol, in whieh she afterward beeame a teacher; began writing poems, pastorals, romantic tales, and tragedies at an early age; made the acquaintance of Garrick, by whom her tragedies of *Percy* (1778) and *The Fatal Secret* were successfully produced at Covent Garden; obtained the warm friendship and admiration of Dr. Johnson, Burke, and the literary circle swayed by them; abandoned writing for the stage from religious scruples while in the height of suecess, and devoted her pen to the advancement of religion and education; settled at Wrington 1786; produced *Sacred Dramas* (1782), *Florio* (1786), *Thoughts on the Manners of the Great* (1788), and *Religion of the Fashionable World* (1791); established at Bath *The Cheap Repository* (1795), a monthly periodieal, in whieh she published a series of short moral stories, including the celebrated *Shepherd of Salisbury Plain*; acquired a competence by her writings and the management of her seminary; removed to Barley Wood, near Cheddart (1802), where she founded several charitable schools; published *Strictures on the Modern System of Female Education* (1799), which led to her being invited to draw up a programme for the education of Charlotte, the Princess of Wales; wrote in 1809 *Cœlebs in Search of a Wife*, her most popular book, followed by *Practical Piety* (1811), and numerous other works; settled at Clifton 1828; died in that place Sept. 7, 1833, leaving a fortune of £30,000, one-third of whieh was bequeathed for charitable purposes. A pleasing ineident in her later life was her affectionate interest in the boy Thomas Babington Macaulay, who resided a considerable time with her, and doubtless owed something of his extraordinary literary career to her watehful care. Her complete *Works* were published in eleven volumes (1830), and several of them are still frequently reprinted. See her *Memoirs*, by William Roberts (2 vols., 1838); the *Correspondence of Hannah More with Zachary Macaulay* (1860); and the *Life* by Miss Yonge (1888).

More, HENRY, F. R. S.: divine; b. in Grantham, Leicestershire, England, Oct. 12, 1614; was bred a Puritan; studied at Eton and Christ's College, Cambridge, where he took a fellowship (1639). D. at Cambridge, Sept. 1, 1687. He is remembered as a mystical philosopher and admirer of Plato and the Cabbalists; author of *Philosophical Poems* (1647); *Conjectura Cabbalistica* (1653); *The Mystery of Iniquity* (1664); *Divine Dialogues* (1668); *Enchiridion Ethicum* (1669); *Enchiridion Metaphysicum* (1671); and of a number of other works characterized by acuteness, great learning, and a thoroughly devout spirit.

More, Sir THOMAS: statesman and author; b. in London in 1478, son of Sir Thomas More, judge of the king's bench; studied Latin under Nicholas Hart; became at the age of fifteen a member of the family of Cardinal John Morton, Archbishop of Canterbury, for whom probably he acted as secretary or amanuensis in preparing *The Historie of the Pittiful Life and Unfortunate Death of King Edward V. and the Duke of York, his Brother, with the Troublesome and Tyrannical Government of the Usurpation of Richard III., and his Miserable End*, which has been called the first specimen of classical English prose; entered Canterbury College (now Christ Church), Oxford, where he learned Greek under Linacre; became an intimate friend of Erasmus; studied law at New Inn and Lincoln's Inn; lectured on jurisprudence at Furnival's Inn, and on St. Augustine's *De Civitate Dei* at St. Lawrence church; resided for some years in a Gray Friars monastery, partaking of the manual labors and spiritual exercises of the monks while pursuing classical studies and learning French and music; married Miss Jane Colt 1505; engaged in the practice of law; soon rose to great eminence; was elected to a magistracy of criminal causes and a member of Parliament for Middlesex; opposed the exactions of Henry VII. both before the courts and in Parliament, thereby incurring the wrath of that monarch, visited upon his father in the form of malicious prosecution, fine, and imprisonment. Soon after the accession of Henry VIII. Cardinal Wolsey was charged to secure for the crown the services of the brilliant young advocate, which he effected, not without difficulty, and More was successively made master of requests and confidential envoy to the Netherlands (1514 and 1515) to negotiate for the enlargement of commercial privileges. About this time he composed in Latin his most famous work, the *Utopia*, or account of an imaginary commonwealth in a distant island of the Atlantic, of which the manners, laws, and state of society were depicted as a model worthy of English imitation. This work, printed at Louvain, Antwerp, and Paris in 1516, and at Basel in 1518, was quickly translated into English, Dutch, French, and Italian, and excited universal admiration. More was made privy councilor and treasurer of the exchequer; was knighted 1521; was repeatedly sent by Wolsey on special commissions to France; became a favorite of the king through the wit and wisdom of his conversation; was chosen Speaker of the House of Commons 1523; made chancellor of the duchy of Lancaster 1525; accompanied Wolsey on his famous embassy to France 1527, and became Lord Chancellor 1529. The Reformation had then recently begun; Luther had violently assailed not only his cherished friend Erasmus, but his monarch, and More entered zealously into the lists, attacking the new doctrines upon their weakest points with inimitable learning and wit, as well as caustieity. More was by nature conservative; his religious convictions were of the strongest kind; his tendencies to asceticism were now reviving; it is not therefore surprising that he regarded the repression of heresy as a duty of paramount obligation, but the accusations of cruelty in the persecution of Protestants seem unfounded. However ready the chancellor might be to aid Henry VIII. as "defender of the faith," he could not be expected to acquiesce in the royal vagaries in dealing with the rights of Queen Catharine of Aragon, and his refusal to countenance the proceedings for divorce led to his retirement from the chancellorship in May, 1532. He thenceforth lived in seclusion at Chelsea; was one of the believers in the divine mission of Elizabeth Barton, the nun of Kent, and in Apr., 1534, was committed to the Tower for refusing to swear allegiance to the "act of succession," which excluded the daughter of Queen Catharine from the throne in favor of the offspring of Anne Boleyn; remained in prison above a year in free communication with relatives and friends; refused to take the oath of submission to the king in his newly assumed character of head of the Church, and all efforts by the council to change his resolution having proved fruitless, he was brought to trial before the high commission for constructive treason, condemned to death, and executed within the Tower, July 6, 1535. By the unanimous consent of historians, Sir Thomas More is considered one of the greatest minds and purest characters on record. One of his chief characteristics was his unconquerable pleasantry—a quality which did not desert him even upon the scaffold. His collected *Works*, Latin and English, were published at Louvain 1556–57; the best known, the *Utopia* and the Latin *Epigrams*, have often appeared separately. See biographies by his son-in-law, Roper, his great-grandson, Cresacre More, Cayley, Sir James Mackintosh, and Lord Campbell.

More'a: the ancient *Peloponnesus* (island of PELOPS, *q. v*)., the large southern peninsula of Greece, separated from the mainland by the Gulfs of Patras, Corinth, and Egina, and connected with it by the narrow Isthmus of Corinth. Area, estimated at 8,263 sq. miles. Pop. (1889) 813,954. It is an elevated table-land encircled with high mountains, often arid and unproductive on account of lack of water, but in many places intersected by very fertile valleys. The etymology of the name *Morea*, which in the early Middle Ages superseded the old name, Peloponnesus, is uncertain. Some derive it from *morus*, mulberry, because the outline of the country is like that of the leaf of the mulberry; others derive it from *more*, a Slavic word, signifying "sea," meaning by it the more maritime part of Greece. The latter seems the more probable, as the land was invaded in the eighth century by Slavic tribes, which settled and remained here, and gave many rivers and places new names of Slavic origin. The name is no longer in use. See Fallmerayer, *Geschichte der Halbinsel Morea* (Stuttgart, 1830–36).

Revised by J. R. S. STERRETT.

Moreale, Fra: See FRA MOREALE.

Moréas, mō'rā'aa', JEAN: poet, novelist, and romancer; b. at Athens, Greece, Apr. 15, 1856. His youth was passed mainly at Marseilles; then he traveled in Germany (studying for a time at Heidelberg), Switzerland, and Italy. In 1882 he went to Paris to live, and devoted himself to letters. In 1884 he published a volume of verses, *Les Syrtes*, which was received with acclamation by Mallarmé, Verlaine, and the other members of the group calling itself *Les Décadents*. Since then Moréas has been one of the leaders of the school. In 1886 appeared more verses, *Cantilènes*. The next year he wrote with Paul Adam the romance *Les Demoiselles*. Since that date still another volume of poems has appeared, *Iconostase*; also the impossible romance *La femme maigre*, and the fantastic story *Thé chez Miranda*.

A. R. MARSH.

Moreau, mō'rō', ADRIEN: genre-painter; b. at Troyes, France, Apr. 18, 1843; pupil of Pils; was awarded second-class medals at the Salon of 1876 and Paris Exposition of 1889; decoration of the Legion of Honor 1892. His works are notable for graceful drawing and spirited characterization. Studio in Paris. W. A. C.

Moreau, GUSTAVE: figure-painter; b. in Paris, Apr. 6, 1826; pupil of Picot; was awarded medals at the Salons of 1864, 1865, and 1869; second-class medal, Paris Exposition, 1878; was made an officer of the Legion of Honor 1883; member of the Institute 1889. His compositions are original in conception and of great variety and depth of color. *Orpheus* (1867) is in the Luxembourg Gallery, Paris. Studio in Paris. W. A. C.

Moreau, HÉGÉSIPPE: poet; b. in Paris, Apr. 9, 1810. His parents were very poor, and, after receiving a fair education in a charitable institution, he learned the printer's trade, but left it to become an usher in a school. For a time he lived a bohemian life in Paris in poverty and illness. Afterward he published at Provins a satirical periodical, *Diogène*, in which he gave vent to his bitterness against society. D. in wretchedness in a hospital Dec. 10, 1838. His reputation is due to his graceful short stories and the poems of the volume *Myosotis*, published shortly before his death, more noticeable for their decided promise than for much that they contained. A. G. CANFIELD.

Moreau, JACQUES JOSEPH, M. D.: alienist; b. at Montrésor, department Indre-et-Loire, France, in 1844; began his medical studies at Tours under Bretonneau, then went to the Paris school, graduating M. D. in 1830; was *interne* at Charenton under Esquirol until 1832; in that year traveled with a patient in the East; returned to Paris in 1840, and passed the competitive examination for attending physician to the insane asylums of Bicêtre and Salpêtrière. Among his important writings are *Du hachisch et de l'aliénation mentale* (Paris, 1845); *De l'étiologie de l'épilepsie* (Paris, 1854); *Traité pratique de la folie névropathique* (Paris, 1869). He was coeditor of the *Annales médico-psychologiques* from 1855 to 1862. D. June 26, 1884. S. T. ARMSTRONG.

Moreau, JEAN VICTOR: soldier; b. at Morlaix, in Bretagne, Aug. 11, 1763; studied first law, but in 1792 joined the army, and evinced under Pichegru such a military talent that in 1794 he was made a general of division. In 1796 he commanded the army of the Rhine and Moselle, and penetrated into the center of Bavaria, driving the Austrians under Archduke Charles before him; but after Jourdan's defeat at Würzburg (Sept. 3), he was compelled to retreat, and this retreat, while fighting a superior and victorious army, established his fame as one of the greatest living generals. Incidentally implicated in the conspiracy of Pichegru, he received no command for nearly two years; but in 1799 he commanded in Italy, and distinguished himself again. By those who wished to overthrow the Directory the dictatorship was offered him, but he declined the offer and gave his services to Napoleon. On Apr. 25, 1800, he crossed the Rhine at the head of an army of 100,000 men, and followed the campaign through Bavaria and Austria to the walls of Vienna, ending with the decisive victory at Hohenlinden, Dec. 3, which resulted in the Peace of Lunéville, Feb. 9, 1801; but from this moment a rivalry sprang up between him and Napoleon. He was arrested Feb. 15, 1804, as an accomplice of the conspiracy of Pichegru and Cadoudal against the life of the first consul, and although the proofs were insufficient, he was declared guilty June 10 and banished. He went to the U. S., and settled at Morrisville, Pa., but on the invitation of Alexander I. of Russia he returned to Europe in 1813, and was present at the emperor's side in the battle of Dresden, Aug. 27, 1813, when a cannon-ball fractured both his legs. He died Sept. 2, 1813, at Laun, in Bohemia.

Morehead City: city; Carteret co., N. C. (for location of county, see map of North Carolina, ref. 4–J); on Bogue Sound, and the Atlantic and N. C. Railroad; 5 miles W. by S. of Beaufort, 36 miles S. E. of Newbern. It is in an agricultural region, is connected with Beaufort by steam-ferry, and has regular steamship communication with New York city. Pop. (1880) 520; (1890) 1,064; (1900) 1,379.

Morel [also *moril*, from Fr. *morille*, from Dutch *morilje*: O. H. Germ. *morhila* > Mod. Germ. *morchel*, mushroom]: the name given to the members of the genus *Morchella*, belonging to the ascomycetous group of Fungi, and best known for their esculent qualities, being among those fungi which were first used as articles of food. The most widely known species of the genus is *Morchella esculenta*, which inhabits woody and bushy places, growing chiefly in the spring. The common morel is found in the U. S., as well as in most parts of Europe, but those in commerce come mostly from Germany.

Common morel, natural size.

Morelia, mō-rāl'yăă (originally VALLADOLID): capital and largest city of the state of Michoacan, Mexico; on the plateau; in lat. 19° 42′ N., lon. 100° 54′ W.; 6,370 feet above the sea (see map of Mexico, ref. 7–G). Like most Mexican towns it is very regularly laid out and has several large squares; the cathedral, one of the finest in the republic, faces the Plaza de lo-Mártires, where Matamoros was shot in 1814. The manufactures and export trade are unimportant. The climate is variable and, during the summer months, intestinal diseases and intermittent fevers are sometimes prevalent; these are owing to the flooding of low lands near the city. Water is supplied through a handsome arched aqueduct. Morelia was founded as Valladolid in 1541, and became the capital of Michoacan in 1582. In 1810–11 it was one of the principal centers of revolt. In 1863 the bishopric of Michoacan (Morelia) was raised to an archbishopric, with San Luis Potosí, Querétaro, Leon, and Zamora as suffragans. Pop. (1892) about 30,000. H. H. S.

More'los: a state of Mexico; surrounded by Mexico, Puebla, and Guerrero. It is the smallest Mexican state except Tlaxcala and Colima, having an area of 2,773 sq. miles. The surface is very irregular, rising in the N. to the snowy cone of Popocatepetl, and descending southward to warm valleys, where the greater part of the population is gathered. Sugar-cane is extensively cultivated in these valleys, and sugar and rum are the principal exports. Pop. (1895) 159,800. Capital, Cuernavaca. The largest town is Cuautla, with about 16,000 inhabitants. Morelos was separated from Mexico in 1869. H. H. S.

Morelos, or **Ciudad Morelos**: principal city of Morelos, Mexico. See CUAUTLA.

More'los y Pavon', JOSÉ MARIA: patriot; b. near Apatzingan, Michoacan, Mexico, Sept. 30, 1765. When thirty-

two years old he gained admission, as a poor student, to the college at Valladolid. In due time Morelos became a priest, receiving curacies near Valladolid, where he resided. In 1810 he joined the revolt which had been proclaimed by his old preceptor, Hidalgo (*q. v.*), and was sent to raise forces near Acapulco and Chilpancingo. After Hidalgo's defeat and death (1811) the patriots in the northern provinces were threatened with complete destruction. At this juncture Morelos formed a new center of resistance in the S. and saved the cause. He repeatedly defeated small Spanish forces, thus obtaining arms; and in November advanced on Puebla and Mexico. Gen. Porlier, who marched against him, was disastrously beaten (Jan. 22, 1812), and Morelos took up his position at Cuautla with about 3,000 men, subsequently increased to 5,550. The viceroy, in alarm, placed all his available forces under the command of Calleja, who on Feb. 19 attempted to take Cuautla by storm, but was repulsed. The siege of Cuautla, which followed, is one of the most famous episodes in the history of Mexico; it lasted for sixty-two days, and in the end Morelos escaped with a great part of his forces, after having inflicted incalculable injury on the royalists. During the succeeding two years he was a constant scourge to the Spaniards, moving rapidly from one region to another and winning repeated victories. In Oct., 1812, he took Orizaba, in November he stormed Oaxaca, and in Aug., 1813, he captured Acapulco after a long siege. Soon after he called a patriot congress at Chilpancingo, which made him captain-general, declared the abolition of slavery, and on Nov. 16, 1813, put forth a declaration of independence. Morelos now marched into Michoacan and attempted to take Valladolid, but was defeated by Iturbide (afterward emperor) Jan. 15, 1814. Thereafter the tide was against him. In Nov., 1815, he was captured, taken to Mexico, and, after being forced to do penance before the Inquisition, was shot near the city Dec. 22, 1815. H. H. S.

Morenci: village; Lenawee co., Mich. (for location of county, see map of Michigan, ref. 8–J); on the Lake Shore and Mich. S. Railway; 80 miles S. W. of Detroit. It is in an agricultural and dairying region; contains 7 Protestant churches, union schools, 2 banks, and a weekly newspaper, and has a creamery, cheese-factory, brick and tile yards, brick and tile machine-shops, and flour, saw, cider, and sorghum mills. Pop. (1890) 1,248; (1900) 1,334.

Editor of "Observer."

Moreno, Gabriel Garcia: See Garcia Moreno.

Moreno, Miguel: poet; flourished about 1650. Little is known of his life. He was a native of Villacastin (or Madrid, according to Montalbán, *Para todos*), a notary of the royal court, and secretary to Philip IV., who sent him on one occasion as a member of an important commission to the pope. The titles of various works have come down to us, among them a *Diálogo en defensa de damas*, and two novels—*La desdicha en la constancia* and *El curioso amante*. The only work we have, however, is a collection of epigrams, two hundred in number, which were published in Rome under the title *Flores de España* (1735), and are reprinted in vol. xlii. of Rivadeneyra's *Biblioteca de Autores Españoles* (2d ed. Madrid. 1875). A. R. Marsh.

Moreto y Cabaña, mō-rā'tō-ee-kaă-baan'yaă, Agustín: dramatist; b. in Madrid, Spain, Apr. 9, 1618. He began his studies at Alcalá in 1634, and received his licentiate Dec. 11, 1639. About 1640 he seems to have begun to produce plays upon the stage, and for a number of years he lived at Madrid in intimacy with Calderón, Vélez de Guevara, Rojas, Mira de Mescua, and other brilliant spirits of the time. Later, though exactly when is not known, he embraced the ecclesiastical career, and entered the household of the Cardinal-Archbishop of Toledo, who showed him much kindness and affection. When, in 1657, the prelate reorganized the brotherhood of San Pedro, associating with it the hospital of San Nicolás, he desired Moreto to superintend the business for him. Accordingly, in Dec., 1659, the latter entered the brotherhood, and much of the rest of his life was devoted to its affairs. The sincerity of his interest is proved by the fact that at his death he left all his property to the poor. D. in Toledo, Oct. 28, 1669. Moreto is one of the most important of the Spanish dramatists of the seventeenth century. Though at first he chiefly imitated the work of Lope de Vega, Calderón, and others of his great predecessors or contemporaries, he often did this with such success as to supersede his originals. As his talent matured itself, furthermore, he initiated a distinctly new movement in the drama. He first completely abandoned in certain of his pieces the romantic and fantastic elements of earlier comedy, and replaced them by the deeper interest of character and manners. In *El lindo Don Diego* he paints inimitably the contemporary fop, and *El desdén con el desdén* is one of the most perfect and delightful comedies in any modern language. The latter was imitated by Molière in his *Princesse d'Élide*, but with little success. We have 103 plays or dramatic pieces from his pen (nineteen of these, however, written in conjunction with others). There is, unfortunately, no complete and satisfactory edition of them. A volume entitled *Primera parte de las comedias de don Augustín Moreto y Cabaña* appeared in Madrid in 1654, and in 1676 three volumes with similar titles were published. Many plays, however, did not appear in these, and are to be found only separately, or in the collections of plays by various hands issued during the seventeenth century. The best modern edition, containing thirty-three pieces, is that of Luis Fernández Guerra y Orbe, with *Life*, in vol. xxxix. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1873). A. R. Marsh.

Moret'to, properly Alessandro Bonvicino: painter; b. at Brescia, Italy, in 1498; he studied under Ferramola. At the age of twenty-three he already was a distinguished painter, and worked with Romanino in the Corpus Christi chapel in San Giovanni Evangelista, where he first gave proof of his mastery of tone and color. His work can be best studied in Brescia and its neighborhood, but the Brera at Milan, S. Giorgio Maggiore at Verona, S. M. Maggiore at Trent, and S. M. della Pietà in Venice, and the chief European galleries possess fine examples of his work. His greatest pupil was Giambattista Moroni of Bergamo. D. at Brescia in 1555. W. J. S.

Morgan, Conway Lloyd: biologist and psychologist; b. in London, Feb. 6, 1852; was educated at the Royal Grammar School, Guildford, and the Royal School of Mines, London; was lecturer on Science at Rondebosch, South Africa, 1878–83; became teacher, professor, dean, and principal of University College, Bristol, England, in 1884. His principal works are *Animal Biology* (1887); *Animal Life and Intelligence* (1890); *An Introduction to Comparative Psychology* (1894). He is associate and medalist of the Royal School of Mines, correspondent of the Philadelphia Academy of Sciences, Murchison medalist, etc. J. M. B.

Morgan, Daniel: soldier; b. in Hunterdon co., N. J., 1736; removed to Virginia in early life, and in 1755 joined Braddock's expedition as a wagoner; received 500 lashes in 1756 for an alleged insult to a British officer. On the outbreak of the war for independence he raised a company of riflemen, with which he marched to Boston, and accompanied Arnold's expedition against Quebec, where, after a brave resistance, he was forced to surrender himself a prisoner; upon being exchanged he was appointed (Nov., 1776) colonel of a Virginia rifle regiment, which he commanded with great ability, and was conspicuous at Saratoga; promoted to be brigadier-general in 1780, he was attached to the Southern army, and Jan. 17, 1781, won the victory of Cowpens over Tarleton, successfully avoiding Cornwallis's subsequent pursuit and rejoining Gen. Greene. For this service Congress voted him a gold medal. In 1795, as major-general at the head of a large army, he was employed in suppressing the "whisky insurrection" in Pennsylvania; was a member of Congress 1795–99. D. July 6, 1802.

Morgan, Sir George O.: See the Appendix.

Morgan, George Washbourne: organist; b. at Gloucester, England, about 1821; at eight years of age he played the organ in the St. Nicholas church there; removed to the U. S. in 1853, and was organist successively of St. Thomas's church, Grace church (eighteen years), and St. Stephen's Roman Catholic church, all in New York, and the Brooklyn Tabernacle. He was a remarkable performer, and a wonderful sight-reader. His later years were spent in concert tours. D. at Tacoma, Wash., July 10, 1892. D. E. H.

Morgan, George Washington: soldier and ambassador; b. in Washington co., Pa., Sept. 20, 1820; fought in the Texan army for independence, attaining the rank of captain; was appointed cadet at the U. S. Military Academy in 1841, but without graduating settled in Mt. Vernon, O. (1843), and became a lawyer. In the war with Mexico he served a year as colonel of the Second Ohio Volunteers, and then as colonel Fifteenth U. S. Infantry, receiving the brevet of brigadier-general for Contreras and Churubusco, where he was severely wounded; was U. S. consul at Marseilles 1855–

58, in the latter year being appointed minister to Portugal. In the civil war he was appointed Nov., 1861, brigadier-general of volunteers. By reason of ill-health he resigned in June, 1863; was the unsuccessful Democratic candidate for Governor of Ohio in 1865; was elected M. C. in 1866 and 1870. D. at Fort Monroe, Va., July 27, 1893.

Morgan, Sir Henry John: buccaneer; b. in Wales about 1637; shipped as a sailor to Barbados; went thence to Jamaica; joined a band of buccaneers, of which he soon became the leader, and ultimately became possessed of a formidable fleet, with which he repeatedly captured important seaports and ravaged whole districts of the Spanish Main. Morgan's earliest exploits were on the coasts of Campeche, where he made many prizes. He then combined his forces with those of an older corsair named Manswelt or Mansfield, and the two adventurers advanced upon Cartagena, which they would have taken had not a quarrel between the English and French buccaneers broken out, in consequence of which they returned to Santa Catalina. Upon Mansfield's death Morgan became his heir and successor, and thenceforth meditated bolder enterprises. With a well-equipped fleet of twelve vessels he ravaged Los Cayos and the south coast of Cuba; marched inland; took and ravaged Puerto Principe after a formal battle; took Puerto Bello in New Granada 1668, carrying by assault its three fortresses. The city was evacuated only on payment of a heavy ransom by the governor of Panama. In the following year he assembled all the "brothers of the coast" (*hermanos de la costa*) for a raid upon Panama; made rendezvous at Cape Tiburon, Santo Domingo, Dec. 16, 1670, with thirty-seven vessels and 2,200 men; captured the island of Santa Catalina a second time, and took and destroyed the fort of San Lorenzo at the mouth of the Chagres river. The buccaneers then ascended the Chagres river in canoes with 1,300 men; had to fight with concealed Indians, but succeeded in crossing the isthmus, and appeared before Panama Jan. 26, 1671. The city was defended by four regiments of the line, besides 2,800 armed citizens and 2,000 savage Indians, but this considerable force was totally routed and the city taken, sacked, and burned. After a residence of a month at Panama the buccaneers returned to Jamaica with a booty of over $2,000,000. Morgan then returned to civilized life, was knighted by Charles II.; became commissary of the admiralty; published at London his *Voyage to Panama* (1683), and spent the last twenty years of his life in opulence in Jamaica, where he died in 1690. See J. C. Hutcheson, *Sir Henry Morgan* (1890), and Howard Pyle, *The Buccaneers and Marauders of America* (1891).

Morgan, James Appleton: See the Appendix.

Morgan, John Hunt: soldier; b. at Huntsville, Ala., June 1, 1826; served in a cavalry regiment in the Mexican war; became a manufacturer of bagging at Lexington, Ky., where in Sept., 1861, he organized the Lexington Rifles, with whom he joined Gen. Buckner in the Confederate service; commanded a squadron of cavalry at Shiloh, and soon afterward began a series of raids through the portions of Kentucky held by the Union forces, destroying railways, bridges, and supplies, and gaining a wide celebrity. In 1862 he was appointed major-general. In 1863 he crossed the Ohio river on a bold raid, but was captured with most of his command, and was confined in the Ohio penitentiary. He succeeded in escaping, and again undertook a raid in Tennessee, but was surprised during the night by Federal cavalry near Greenville, and killed, Sept. 4, 1864.

Morgan, John Pierpont: See the Appendix.

Morgan, John Tyler: Senator; b. at Athens, Tenn., June 20, 1824; moved to Alabama; received an academic education; was admitted to the bar 1845; served in the Confederate army; was raised to the rank of brigadier-general; was a presidential elector in 1876; was elected to U. S. Senate as a Democrat Mar. 5, 1877; re-elected 1882 and 1888; was appointed with Justice John M. Harlan arbitrator for the U. S. in the Bering Sea controversy with Great Britain.

Morgan, Lewis Henry: See the Appendix.

Morgan, Morris Hicky, Ph. D.: classical scholar; b. at Providence, R. I., Feb. 8, 1859; graduated A. B. at Harvard 1881; was head tutor at St. Mark's School, Southborough, Mass., 1881–84; Ph. D., Harvard, 1887; since 1887 instructor and Assistant Professor of Greek and Latin at Harvard; author of *De ignis eliciendi modis apud antiquos*, Diss. Inaugur. (1887); *Dictionary to Xenophon's Anabasis* (with J. W. White), 1892; *The Art of Horsemanship by Xenophon: Translated with Essays and Notes* (1893). B. I. W.

Morgan, Sydney Owenson, Lady: novelist; b. in Dublin, Ireland, about 1780; was the daughter of an actor, who anglicized his name from McOwen, and was said to possess some literary ability. She published in 1797 a volume of poems, and afterward wrote two novels, which met with little success. In 1806 her novel, *The Wild Irish Girl, a National Tale*, gained her a sudden popularity. This work introduced her into aristocratic English circles, and in 1812 she married Sir Thomas Charles Morgan, a distinguished physician. She continued for many years to write novels, songs, comic operas, biographies, and works of travel. Among her more popular novels were *Florence Macarthy* (1816); *The O'Briens and the O'Flahertys* (1827); and *The Princess* (1835). In other departments her most celebrated works were probably the *Life and Times of Salvator Rosa* (1823) and *Woman and her Master* (1840). Lady Morgan was long a leader in London literary society, where she gained warm friends and had no lack of bitter enemies. In the last year of her life she published *Passages from my Autobiography* (1858). D. in London, Apr. 13, 1859. An edition of her works was edited by herself in 1855–56. She is said to have gained £25,000 by her writings, in addition to a pension of £300 conferred upon her by the ministry of Lord Grey. See *Lady Morgan, her Career, Literary and Personal, with a Glimpse of her Friends and a Word to her Calumniators* (1860), by W. J. Fitzpatrick, and her *Memoirs*, edited by Hepworth Dixon (2 vols., 1862).

Revised by H. A. Beers.

Morganatic or **Left-handed Marriage** [*morganatic* is from Late Lat. *morganatica*, a morning gift, a kind of dowry given on the morning before or after the marriage, deriv. of O. H. Germ. *morgan*, morning]: a marriage between a man of noble birth and a woman of inferior station or rank, by the terms of which neither the woman nor her children have any right to the titles, arms, or dignity of the husband, nor any right to succeed to his estate except as provided by contract. These restrictions affect only the rank and property rights of the parties concerned, and do not affect the validity of the marriage, which in general is regularly celebrated, and the children of such a marriage are legitimate. Morganatic marriages are still common among the nobility of the Germanic states of Europe, but the morganatic wife is now the sole wife, and not, as was formerly frequently the case, a second wife taken over and above another wife of equal rank with the husband. In the Middle Ages it was unlawful among the German nations for a man and woman of different rank to intermarry, and severe penalties were attached to the act, the woman being liable in some cases to the death penalty. These penalties were later moderated, and the woman and the children, if any, were excluded from their rights to the rank and estate of the husband and father, the children taking the rank of the mother. These restrictions are now, however, done away with, except as to the reigning families and the highest nobility. The term left-handed marriage arose from the old custom that the children of such a marriage should follow on the inferior, that is, the left, hand. See *Chambers's Journal* (Edinburgh), vol. xxxvii., p. 1; Shelford *On Marriage and Divorce*; Zöpfl, *Ueber Missheiraten in den regierenden Fürstenhäusern* (Stuttgart, 1853); and Schulze, *Die Hausgesetze der regierenden deutschen Fürstenhäuser* (3 vols., Jena, 1862–83).

F. Sturges Allen.

Morgan (formerly Brashear) City: city; St. Mary's parish, La. (for location of parish, see map of Louisiana, ref. 11–D); on the Atchafalaya river, and the S. Pacific Railroad; 80 miles W. by S. of New Orleans. It has a good harbor and regular steamship communication with Texan, Cuban, and Mexican ports; is the central sugar dépôt of Southern Louisiana, surrounded by a strictly sugar-cane country; and has large oyster, fish, vegetable, and moss interests. Pop. (1880) 2,015; (1890) 2,291; (1900) 2,332.

Editor of "Review."

Morganfield: town (founded in 1811); capital of Union co., Ky. (for location of county, see map of Kentucky, ref. 3–D); on the Ohio Val. Railway; 5 miles S. of the Ohio river, 35 miles S. W. of Evansville, Ind. It is in an agricultural region, and contains five churches, graded public school, and a weekly newspaper. Pop. (1880) 744; (1890) 1,094; (1900) 2,046. Editor of "Sun."

Morganton: town; capital of Burke co., N. C. (for location of county, see map of North Carolina, ref. 3–D); on the Catawba river, and the Richmond and Danville Railroad; 55 miles W. of Statesville, 64 miles N. W. of Charlotte. It

is in an agricultural and mineral region, and has gold veins and a weekly newspaper. Pop. (1890) 1,557; (1900) 1,938.

Morgantown: town (incorporated in 1785); capital of Monongalia co., W. Va. (for location of county, see map of West Virginia, ref. 5–I); on the Monongahela river at the head of the slackwater improvement, and on the Balt. and Ohio Railroad; 106 miles S. of Pittsburg, Pa., with which it has regular steamboat communication. It is in an agricultural, stock-raising, and natural-gas region; is the seat of the West Virginia University (non-sectarian, chartered 1867), which in 1890 had 16 professors and instructors, 208 students, 6,000 volumes in the library, and $15,000 invested in scientific apparatus, $150,000 in grounds and buildings, and $108,000 in productive funds; and has water-works, electric lights, and a semi-monthly and two weekly periodicals. Pop. (1880) 745; (1890) 1,011; (1900) 1,895.

EDITOR OF "POST."

Morgar'ten: a mountain pass in the canton of Zug, Switzerland, between Morgarten Hills and Lake Egeri. On Dec. 6, 1315, the Swiss won here their first victory over the Austrians, though numbering only 1,400, while the Austrian army consisted of nearly 15,000 men. Services are performed on the anniversary of the battle in a chapel erected at the foot of the hill.

Mor'ghen, RAPHAEL SANZIO: engraver; b. in Florence, Italy, June 19, 1758. His father, an engraver, gave him early instruction in his art, and sent him to the school of Volpato in Rome. Volpato gave him his daughter in marriage, took him into partnership, and shared with him the labor of executing the plate of Raphael's *Parnassus* in the Stanze of the Vatican. The dedication of the plate of Raphael's *Transfiguration* to Napoleon in 1812 obtained for him honors and preferment. From Louis XVIII. he received the decoration of the Legion of Honor and the cordon of St. Michael. D. in Florence, Apr. 8, 1833. The entire work of Morghen is estimated to comprise 254 pieces, eighteen of which are from Raphael; seventy-three are portraits. The most celebrated plates are *The Last Supper*, after Leonardo da Vinci; the *Madonna del Sacco*, after Andrea del Sarto; the *Madonna della Seggiola* and *The Transfiguration*, after Raphael; the *Aurora* and *St. John in the Wilderness*, after Guido Reni; and portraits of Dante, Boccaccio, Petrarch, Ariosto, Tasso, Leonardo da Vinci, Raphael, and Francesco Monçada. Palmerini, the pupil of Morghen, published in 1824 a *Life* and portrait of his master, with a catalogue of his works.

Revised by RUSSELL STURGIS.

Mori, mō'rĕē, ARINORI, Viscount: scholar and statesman; b. in the province of Satsuma, Japan, in 1848. Being a gentleman's son, he had every advantage of education, and studied abroad 1866–68. Appointed to a legal post soon after, he early associated himself with educational matters as a commissioner of schools, and this predilection continued to develop itself. When *chargé d'affaires* in Washington he arranged the postal convention with the U. S. He afterward served as minister plenipotentiary at Peking and London, and in the latter city was intimate with Spencer, Huxley, and other advanced thinkers. He returned to Japan with distinct educational views, and was given the portfolio of education in 1885, which he held until his death, on the day of the proclamation of the constitution, Feb. 11, 1889. He had been guilty of some negligence or breach of etiquette in visiting the sacred shrines at Ise, and a Shinto fanatic, Nishino Buntaro, working himself up to frenzy, stabbed the viscount in his own house. J. M. DIXON.

Mori'ah [the feminine of *Moreh*]: a district in Palestine, on one of whose mountains Abraham attempted the sacrifice of Isaac (Gen. xxii. 2) and Solomon afterward built the temple (2 Chron. iii. 1). This identity was affirmed by Josephus (*Antiq.*, i. 13, 2) and is accepted by a majority of the best scholars. See also JERUSALEM.

Mo'rier, JAMES: traveler and author; b. in England in 1780, was a nephew of William Waldegrave, Lord Radstock; early entered the diplomatic service; was private secretary of Lord Elgin in his embassy to Constantinople; accompanied the grand vizier in the campaign in Egypt against the French. Having acquired an intimate knowledge of several Oriental languages he spent many years as secretary of legation or as *chargé d'affaires* in Persia; published *A Journey through Persia, Armenia, and Asia Minor to Constantinople in the Years 1808 and 1809* (London, 4to, 1812), *A Second Journey through Persia, etc., between the Years 1810 and 1816, with a Journal of the Voyage by the Brazils and Bombay to the Persian Gulf* (1818), and attained great celebrity through his romances describing Persian manners and customs—*The Adventures of Hajji-Baba of Ispahan* (5 vols., 1824–28), which was followed by three others upon the same theme—*Zohrab the Hostage* (3 vols., 1832), *Ayesha, the Maid of Kars* (3 vols., 1834), and *Mirza* (3 vols., 1841). D. at Brighton, Mar. 23, 1849.

Mö'rike, EDUARD: poet; b. at Ludwigsburg, Würtemberg, Sept. 8, 1804; studied theology at Tübingen; was active as a minister for a number of years, but retired on account of ill-health, and was in 1851 appointed Professor of Literature at a girls' school in Stuttgart. Here he taught successfully until 1866, when he again retired. He died June 4, 1875. Mörike, who in his early youth was deeply influenced by the Romanticists, but kept himself free from their extravagances owing to his classical training, may justly be called the greatest German lyrist after Goethe. Like the latter, he understood how to transform life into poetry, and how to remain a naïve poet in Schiller's sense despite the influences of abstract modern thought. In his *Gedichte* (1838) he gives expression to the deepest and most tender emotions of the human heart, reminding us by the melody of his rhythms, his graceful humor, and his classic repose, of the best productions of German popular poetry as well as of the Greek lyrics. Mörike's prose writings also bear a classic stamp. His famous novel *Maler Nolten* (1832) can in many respects be compared with Goethe's *Wilhelm Meister*, and some of his smaller stories, like *Mozart auf der Reise nach Prag* and others, are masterpieces of their kind. His translations of Anacreon and Theocritus also deserve high praise. See his *Gesammelte Schriften* (Stuttgart, 1890); Fr. Th. Vischer, *Kritische Gänge* (1844, vol. ii.); Friedrich Notter, *Eduard Mörike* (1875); Julius Klaiber, *Eduard Mörike* (1876). JULIUS GOEBEL.

Morillo, mō-reel'yō, PABLO: soldier; b. at Fuente de Malva, Spain, 1777. He was a sergeant at the battle of Trafalgar, and during the French invasion (1808–09) was a noted guerrilla chief in Murcia. In 1809 he joined the regular army, and in 1814 was made general of division and given command of 10,600 men (subsequently re-enforced) to put down the rebellion in the northern part of South America. He occupied the coast provinces of Venezuela almost without opposition (Apr.–May, 1815), and in August appeared before Cartagena, which was only taken in December, after hundreds of the inhabitants had died of famine; Morillo himself lost 3,000 men, mainly by disease. In May, 1816, he entered Bogotá, and within a few weeks hardly a patriot soldier was left in New Granada. Morillo used his victory with merciless severity, and several hundred persons were executed, including many of the foremost citizens. For his successes he was created Count of Cartagena, with the title of Pacificator. Meanwhile the patriots had organized new forces in Venezuela, and he marched into that country, leaving part of his forces at Bogotá. After Bolivar's victory over these Morillo was confined to Venezuela; in Nov., 1820, he was forced to sign an armistice, and soon after he was relieved at his own request. He subsequently held several high commands in Spain, and was created Marquis of Fuentes; but his vacillations during the contest between Ferdinand VII. and the Cortes ended in his disgrace in 1823, and he retired to France, settling at Rochefort. In 1826 he published an account of his American campaigns. D. at Rochefort, July 27, 1838.

Morine, ALFRED BISHOP: See the Appendix.

Morisonianism: See EVANGELICAL UNION.

Morlaix, mōr'lā': town; in the department of Finisterre, France; at the confluence of the Jarleau and Kerlent; 6½ miles distant from the sea (see map of France, ref. 3–B). Its harbor has 13 feet of water at ordinary and 23 feet at spring tides. The railway from Paris to Brest is here carried across the river on a viaduct 934 feet long and 207 feet high. Morlaix has some manufactures of tobacco and paper, and considerable coasting trade. Pop. about 14,860.

Morley, HENRY: biographer and literary historian; b. in London, Sept. 15, 1822; was educated at King's College, London; practiced medicine 1844–48; was two years a successful instructor; became in 1851 a London journalist, and afterward edited *The Examiner*; was lecturer on English literature at King's College, London, 1857–65; and from 1865 to 1889 was Professor of English Language and Literature at University College, London; then became emeritus

professor; was examiner in English language, literature, and history, at the University of London, 1870–75 and 1878–83; from 1878 to 1889 held the same professorship at Queen's College, London; and from 1882 to 1889 was principal of University Hall, London. D. in Carisbrooke, Isle of Wight, May 14, 1894. He was the author of *How to Make Home Unhealthy* (1850); *Defense of Ignorance* (1851); *Lives* of Palissy, Cardan, Cornelius Agrippa, Marot, etc.; *English Writers before Chaucer* (2 vols., 1864–67), revised and continued as *English Writers* (8 vols., 1887–93); *Tables of English Literature* (1868); *A First Sketch of English Literature* (1873); *English Literature in the Reign of Victoria* (1881); and has edited many important series, such as The Library of English Literature (1881, vols. i.–v.); Morley's Universal Library (begun in 1884); Cassell's National Library (begun in 1886), etc. Revised by H. A. Beers.

Morley, John: author and statesman; b. at Blackburn, Lancashire, England, Dec. 24, 1838; educated at Cheltenham and Lincoln College, Oxford, graduating in 1859. He was admitted to the bar in 1873; was editor for some years of *The Literary Gazette*, of *The Fortnightly Review* from 1867 to 1882, of *The Pall Mall Gazette* from 1880 to 1883, and of *Macmillan's Magazine* from 1883 to 1885. He is the editor of the valuable biographies known as the English Men of Letters Series, and is the author of many noteworthy critical and biographical studies, including *Edmund Burke* (1867), *Critical Miscellanies* (1871–77), *Voltaire* (1872), *On Compromise* (1874), *Rousseau* (1876), *Diderot and the Encyclopædists* (1878), *Cobden* (1881), *Emerson* (1884), and *Walpole* (1889). An edition of his *Works* was published in 1886–88 (10 vols.). In 1883 he became member of Parliament for a division of Newcastle-on-Tyne, but was defeated in the general elections of 1895. He is an advanced Liberal in politics, an advocate of Home Rule, and was Chief Secretary for Ireland in Gladstone's cabinet in 1886 and again in 1892–95.

Morley, Samuel: philanthropist; b. in Well Street, Hackney, London, Oct. 15, 1809; increased his inherited wealth as a manufacturer of hosiery; took prominent place in his religious denomination, the Congregational, but refused to hold the office of deacon; was a leader in the "blue-ribbon" or total abstinence movement; sat in Parliament as member for Bristol from 1868 to 1885, when he retired in broken health, after declining a peerage. He was a munificent patron of philanthropic, religious, and political enterprises, and left an enormous fortune. D. at his house, Hall Place, near Tonbridge, Sept. 5, 1886. See his *Life*, by Edwin Hodder (London, 1889).

Morley, Thomas: composer; b. in England about 1545; was a pupil in music of William Birde; studied at Oxford; imitated the Italian style; was a skillful performer and a prolific composer of anthems, church services, ballets, canzonets, and madrigals. He published four books of *Madrigals* (1594–1601); *A Plaine and Easie Introduction to Practicall Musicke* (1597); and *The Triumphs of Oriana* (1601), an extraordinary performance, being a collection of twenty-four madrigals in honor of Queen Elizabeth (Oriana) by as many English verse-writers, set to music by "Thomas Morley, Bach. of Musicke and Gentleman of Her Majesty's honorable Chapell." One of the verse-writers was John Milton, father of the celebrated poet. Morley died in London in 1604.

Mormon, Book of: See Mormons and Smith, Joseph.

Mormons, or, as they call themselves, the Church of Jesus Christ of Latter-day Saints: a religious sect founded by Joseph Smith, Jr., at Fayette, Seneca co., N. Y., Apr. 6, 1830, since 1847 having its center and chief seat in Utah. The membership in 1900 was about 375,000, including 20,000 living in other countries than the U. S. The Mormons are Christians, their articles of faith declaring belief in God, the Eternal Father, and his Son, Jesus Christ, and in the Holy Ghost; that men will be punished for their own sins, and not for Adam's transgression; that through the atonement of Christ mankind may be saved by obedience to the laws and ordinances of the Gospel, those ordinances being: First. Faith in the Lord Jesus Christ. Second. Repentance. Third. Baptism for the remission of sins. Fourth. Laying on of hands for the gift of the Holy Ghost. They also believe that a man must be called of God to preach the Gospel; in a Church organization comprising apostles, prophets, pastors, teachers, evangelists, etc.; in the gifts of tongues, prophesy, revelation, visions, healing, etc.; in the Bible as the word of God, "as far as it is translated correctly," and in the *Book of Mormon* as the further word of God; in the literal gathering of Israel and the restoration of the Ten Tribes; in the building of Zion on the American continent; and in the coming of Christ to reign in person. The Church organization is a theocracy, pure and simple, the officers forming a complete priesthood. The supreme authority is vested in the First Presidency, comprising the president, who is also designated prophet, seer, and revelator, and two counselors, all being chosen by the body of the Church. Then follow the apostles, of whom there are twelve; the patriarch, seventies, high priests, elders, bishops, priests, teachers, and deacons. A distinguishing characteristic is belief in continuous divine revelation, and all are entitled to such revelation, but only the communications from the Lord which come through the prophet-president are authoritative and necessarily binding on the Church. The first president was Joseph Smith, Jr.; his counselors, the three comprising the original First Presidency, were Sidney Rigdon and Frederick G. Williams. The first patriarch was Joseph Smith, Sr., father of the founder of the Church. Joseph Smith's successors have been Brigham Young, chosen in 1847, at Kanesville, Ia., now Council Bluffs; John Taylor, elected in 1880; and Wilford Woodruff, who was chosen in 1887. The authority of the president extends to temporal as well as spiritual affairs, although the exercise of mandatory power by the priesthood in temporal matters has been falling into disuse.

With the *Book of Mormon* and present revelation as a basis Joseph Smith began to preach a new religion, and in a little time succeeded in gathering a small congregation, but he soon incurred the enmity and aroused the active hostility of his neighbors in New York, and at the beginning of 1831, less than a year from the date of the organization of the Church, he led his followers westward, settling at Kirtland, O. There the sect increased in numbers and wealth through the efforts of missionaries who were sent out by the prophet. A temple was built and the city flourished, but the animosity of the people of the neighborhood had been aroused, and seven years later the Mormons found it necessary to flee. Headquarters were next set up at Far West, Mo., and at that point the great majority of the saints rallied; but their sojourn was brief. The hatred which it seemed to be their fate to excite became so intense in Missouri that open war between them and the people resulted. The Mormons were forced by superior numbers to retire from the State, which they did in 1838, settling near Commerce, Ill., where they built the city of Nauvoo, and at once became an important factor in the commercial and political affairs of the State. An extraordinary charter was granted to the city, which made the corporation almost independent of the State government, and gave to Smith civil and military authority within the city very nearly equal to the religious power which he exercised over his people. Nauvoo flourished wonderfully and the Church gained in membership, proselytes gathering from New England and the Middle States and from Europe, many missionaries having been sent to foreign lands. Here, however, the popular enmity was as keen or even more bitter than it had been elsewhere. Dissensions also arose within the ranks of the saints themselves. There was a clashing of authority between the State and the city. Finally, in 1844, an ambitious but discontented member of the Church, backed by a considerable following, issued a newspaper at Nauvoo, vigorously assailing the prophet and threatening to expose some of his alleged immoralities and misdeeds. The printing-office was at once destroyed by Smith, for whose arrest a warrant was issued at the instance of the editor. The warrant was issued by a justice of Carthage, a neighboring town, but Smith refused to submit to arrest. He went before a friendly justice at Nauvoo, who discharged him. The Carthage justice issued another warrant, in which the prophet was charged with treason against the State, but Smith again refused to obey the writ, claiming the right to give bond to the Nauvoo justice to stand trial. The militia was summoned to make the arrest, and the Mormons armed to resist the attack. Civil war was imminent; indeed, there had been engagements between the saints and the militia, when by personal intercession the Governor of the State induced Smith to surrender and go to Carthage. This was on June 26, 1844. On the following day a mob gathered from the surrounding country, attacked the jail, and, overpowering the guard, killed Smith and his brother Hyrum, and wounded others of the prophet's party who had accompanied him to prison. It was thought that the death of Smith would put an end to the society, but the

Church continued to grow rapidly. Brigham Young, an organizer and leader and a man actuated by ambition, had joined the Church in 1832, and by reason of his earnestness in the work and his devotion to the prophet had risen in the organization until at the time of the assassination of Smith he was at the head of the quorum of apostles. He at once assumed the leadership, a position which his strong character and his place in the affections of the people enabled him to maintain, although the claim was disputed by some who declined to accept his rulership. Young immediately planned another removal, and the following year there was a general emigration from Nauvoo, temporary headquarters being set up at Council Bluffs, Ia. In the spring of 1847 Brigham Young, with a company of 143, again turned his back on the advancing civilization, and went in search of a new abiding-place. After months of traveling, much of the distance traversed being through an unexplored wilderness, the party, on July 24, 1847, arrived in the Salt Lake valley, which Young proclaimed the sought-for land. Salt Lake City was founded, and Young returned to the Missouri river to direct the movement of the people to the new home. Since then the headquarters and the gathering-place of the saints, their Zion, has been Utah. That is the "center stake," as they term it, but by direction of the leaders Mormons have gone into the surrounding States, and they now form a considerable percentage of the population of Idaho, Wyoming, Colorado, Arizona, and Nevada, while they have large colonies in Old Mexico. The Church seems to be increasing in membership, though the growth is by no means so rapid as it was in its earlier days. The missionary service is extensive, hundreds of elders being kept constantly in the field, and missions are maintained in various countries of Europe, in Asia, in Australia, and the Pacific islands. The British isles and Scandinavia furnish most of the converts.

The distinctive characteristic which has given the Mormons notoriety and trouble is polygamy. A plurality of wives is not merely allowed, but is held to be a means of grace, the number of a man's wives and children increasing his honor and glory in the world to come. The practice of polygamy was denied by the Mormons in early days, and the alleged divine revelation permitting or commanding it was not openly published, nor was the principle publicly preached until the saints were settled in Utah; but it has been proven that Smith had several wives, as did a number of the leading Mormons of his time. Of late years it has been maintained that the revelation sanctioning polygamy was received by the prophet as early as 1831, and was withheld from the body of the Church and from the world, although trusted ones were advised of it and permitted to practice the doctrine. Since 1852 polygamy has been publicly preached and practieed, and while a plurality of wives was not essential to a man's good standing in the Church, the leading men generally were polygamists and were favored over the monogamists. As early as 1862 the Federal Government undertook to stamp out the practice, a law forbidding it being enacted in that year. The efforts to enforce the statute, however, were weak and spasmodic, and the Mormons paid little or no respect to the law. In 1882 Congress put a more severe statute into the books, and two years later determined efforts to enforce it were made, the Mormons resisting through the courts until they could oppose no longer, the constitutionality of the law being established by the opinion of the Supreme Court of the U. S. Scores of polygamists fled or went into hiding while hundreds, without effort at resistance, accepted the situation, pleaded guilty to violation of the law, and went to prison. More than 1,100 men were convicted and sent to the penitentiary, the usual term of imprisonment being six months and the fine $300. In 1887 another law was enacted by Congress, which disincorporated the Mormon Church and confiscated its immense property in excess of $50,000. The Emigration Company, an extensive transportation association which managed the immigration business of the Church, was also disincorporated, and its resources were taken possession of by the Government. The Mormons resisted this law also without success. After hundreds had endured imprisonment and millions of dollars had been spent in payment of fines, feeing lawyers, and so on, and the vast property holdings of the Church had been lost, finally, in Sept., 1890, President Woodruff issued a pronunciamento against polygamous marriages. His action was approved by the body of the Church in general conference in the following October, and since that time there has been no evidence of a plural marriage sanctioned by the Church. There have been a few convictions of parties for living with several wives to whom they were married previous to the proclamation of the president, but it may be said with confidence that whereas the celestial marriage revelation is still in the books and its divinity is believed by the faithful, actual polygamy is an institution of the past.

The *Book of Mormon*, above referred to, which is esteemed by the saints a divine work, is merely what purports to be the historical account of the occupation of the American continent. In brief, the story is that after the destruction of Babel and the confusion of tongues America was settled by one of the peoples. Afterward, in the sixth century B. C., Lehi and his sons went to South America, and from them were descended the Indians. It is also related that after the Resurrection Christ went to America and preached to the people. At the final destruction of the civilized people, after a series of bloody wars, God commanded the prophet Mormon to record the events that had taken place and secrete the record. Mormon obeyed, and it was the claim of Joseph Smith, firmly believed by the saints, that an angel pointed out to Smith the spot on a hill near Palmyra, N. Y., where golden plates bearing Mormon's record were hidden. The characters on the plates were said to be "Reformed Egyptian." With them was found the "Urim and Thummim," by which the prophet was enabled to translate. The book was first published in 1830, and with it the certificates of three men that the angel had exhibited the golden plates to them, also the testimony of eight other men to whom Smith had exhibited the plates. The *Book of Mormon* is not a doctrinal work, as so many believe, but merely a narrative or record. The Mormon doctrines not contained in the Bible are stated in purported divine revelations, and these are contained in a volume entitled *Doctrine and Covenants*, many editions of which have been published. There has been very little revelation of late years, though the right and privilege to receive communications and instructions direct from the Almighty still exist. BYRON GROO.

Morning-glory Family: the *Convolvulaceæ*, a group of dicotyledonous plants, mostly twining or trailing herbs, with alternate leaves, gamopetalous flowers, and a superior two or three celled ovary. The 870 species are distributed widely throughout the globe, about 100 being natives of the U. S. Many species are favorite ornamental plants, as the morning-glories (species of *Ipomœa*), bindweeds (species of *Convolvulus*), *Evolvulus*, etc. The sweet potato (*Ipomœa batatas*), originally of India, has long been cultivated in warm and temperate climates for its nutritious roots. The parasitic dodders number about eighty species of the genus *Cuscuta*. They are to be regarded as morning-glories which have become degraded through parasitism.

CHARLES E. BESSEY.

Morny, mōr'nee', CHARLES AUGUSTE LOUIS JOSEPH, Duke de: soldier and politician; b. in Paris, Oct. 23, 1811; son of Queen Hortense of Holland and Count de Flahault, and consequently a half-brother of Napoleon III. His birth was kept a secret, however, and he was adopted by a Count de Morny, a resident of Mauritius, and educated by his paternal grandmother, Madame de Souza. He entered the army, fought with distinction in Algeria, and was made a chevalier of the Legion of Honor. Queen Hortense having died in 1837 and left him an annuity of 40,000 francs, he abandoned his military career, returned to Paris, and divided his time and energy equally between dissipation and financial speculation. As Minister of the Interior he was the executor, and probably also the instigator, of the *coup d'état*; and though he soon retired from the cabinet and contented himself with the chair of president of the *corps législatif*, he continued to exercise a considerable influence on the emperor. He was, indeed, next to the Empress Eugénie, the most characteristic figure of the second empire. D. Mar. 10, 1865.

Moro, or **Moor**, ANTHONY: painter; b. in Utrecht in 1510. He was a pupil of John van Schorel; also studied in Italy and gained a reputation as a portrait-painter. Charles V. appointed him court painter in 1552. The emperor sent him to Portugal to paint portraits of King John and his family, for which he was splendidly remunerated. He was then sent to England to paint the portrait of Queen Mary, the bride of Philip II., for which he received a gold chain and a yearly pension of £100 sterling, besides being knighted on his return to Spain. Notwithstanding the great favor shown him by Charles V. and Philip II. he had to fly from Spain for fear of imprisonment on account of a breach of

court etiquette. He received permission of the emperor to go to Brussels, and remained there. The Duke of Alva took him under his protection, showed him great favor, ordered portraits of his mistresses in the style of Titian, and conferred on him and all his family pensions, appointments, and canons' places. Besides portraits, Moro painted historical subjects. D. in Antwerp in 1568. His chief works are a *Resurrection*, now in London, and a *St. Peter and St. Paul*, which belonged to the Prince of Conti. The Louvre possesses three of his finest portraits. W. J. Stillman.

Moroc'co: sultanate of Northwestern Africa; situated between lats. 27° and 36° N., lons. 1° and 11° 50′ W., bounded by Algeria, the Mediterranean, the Strait of Gibraltar, the Atlantic, and Sahara. The area is estimated at about 219,000 sq. miles. The coast along the Atlantic is generally low, flat, sandy, very dangerous to navigate, and affords only a few harbors—El-Araish, Rabat, Casablanca, Mazagan, Safi, and Mogador; of these the best and most important are Mazagan and Casablanca. The coast from the Strait of Gibraltar eastward along the Mediterranean is high, bold, and rocky. The principal harbors here are Tangier, on the Strait of Gibraltar, and Tetuan. Spain owns Ceuta and several other points on this coast. A beautiful and very fertile plain, containing all the large cities, Morocco, Fez, etc., extends between the coast range and the Atlas Mountains, which in several parallel lines traverse the country from N. E. to S. W. None of the peaks of the Atlas reaches the line of perpetual snow; Miltzin, the highest point, 30 miles S. E. of the city of Morocco, rises to a height of 11,500 feet, but is often entirely free from snow. A number of rivers originate in the Atlas—the Draa, Sus, and several smaller rivers flowing to the Atlantic and the Muluia to the Mediterranean—but none of them is navigable. They are generally rapid and even turbulent in the spring, but often disappear altogether during the summer. The climate in the plain is delightful, tempered by cool breezes from the Atlas, which keep off the scorching winds from Sahara; in the wet season, from November to March, showers are frequent. In the mountains and on the southern slope extreme heat and cold alternate, and the changes are often very sudden. Excellent marbles of different kinds are found; gold, silver, copper, tin, nickel, rock-salt, and sulphur occur; iron is abundant and of good quality, and traces of ancient mines, probably worked by the Carthaginians, are met with in several places. The luxuriant forests which clothe the mountains contain oak, cedar of Lebanon, pine, and many kinds of valuable timber-trees. In the valleys and the plain all the cereals, fruits, and vegetables of the warm and temperate zones can be cultivated—wheat, maize, rice, sugar, cotton, tobacco, grapes, oranges, figs, almonds, dates, beans, peas, saffron, etc., but agriculture is generally in a very backward state, and the country sometimes does not produce sufficient wheat for its own demand. Large herds of cattle, horses of a small but spirited breed, goats whose skins furnish the famous morocco leather, and camels, are reared, but exportation is forbidden. The lion and panther are frequent in the forests, the hyæna, jackal, and wild boar in the plain, the gazelle and the ostrich in the regions bordering on Sahara; serpents, scorpions, lizards, and insects abound. Manufactures of fine woolens and silks are carried on at Fez, one of the capitals, and of bricks and silver-ware in other places; the fez, a well-known red cloth cap, takes its name from this city and is exported in large quantities to all Mohammedan countries. The only branch of industry extensively developed is that of leather. The commerce is inconsiderable; the traffic with the southern and eastern countries is carried on by caravans. The inhabitants, estimated at 5,000,000, are Berbers (generally agriculturists), Arabs (nomadic Bedouins), Moors, Jews, and Negroes. The Government has very indifferent control over the mountain tribes, particularly those among the Er-Rif Mountains in the N., who are chiefly Berbers. Nothing but good government is needed to make Morocco one of the most flourishing parts of Africa. The languages spoken are dialects more or less corrupted of the Berber, Arabic, Spanish, and Negro tongues from the interior of Africa. The reigning religion is Islam. In ancient times the country formed part of Mauritania (*q. v.*); in the seventh century it was conquered by the Arabs, whose religion and customs the Moors adopted. In 787 the kingdom of Fez was founded; in 1058 that of Morocco. In 1648 the present dynasty ascended the throne. In 1814 slavery of Christians was prohibited, and in 1817 piracy was suppressed. Revised by Cyrus C. Adams.

Morocco: one of the capitals of the sultanate of Morocco; situated in a plain at the foot of the Atlas, 1,500 feet above the level of the sea (see map of Africa, ref. 2–B). It is surrounded by a wall 23 feet high, 7½ miles in circuit, pierced by seven gates, and flanked with numerous towers, but now generally in a dilapidated condition. The city was founded in 1072, and was in the thirteenth and fourteenth centuries a famous seat of learning, to which the Moors of Spain sent their children to be educated, and is said to have contained 100,000 houses and 700,000 inhabitants. It contains still many large mosques and a magnificent palace, otherwise its splendor has decayed. Of its manufactures, that of red and yellow morocco is famous; its commerce is chiefly carried on by the Jews, who number about 6,000, but live in an abject condition. The climate is fine, and the city is well watered, but its streets are very dirty and crooked, and the sultan and court spend little time there. Pop. estimated at 50,000. Revised by C. C. Adams.

Morocco Leather: the name originally given to leather made from goatskins tanned with sumach, but now applied also to the inferior sort (roan) made from sheepskins. The name appears to be derived from the superior excellence of the leather formerly obtained from Morocco. The goatskins are steeped in water to remove the hair, and are then scraped clean and smooth on the fleshy side, and placed in milk of lime. From the lime-pits they are drawn out from time to time, laid to drain, and then steeped afresh. When the hair has become thoroughly loose, it is scraped off with a double-handled steel knife. After a few more days' steeping it is scraped on the flesh side until it is smooth and even. The skins are then placed in a liquid made from the dung of pigeons and hens. This done, they are sewn up in a bag-shape, the grain being outside. A small orifice is left, and in this a funnel is inserted and a strong infusion of sumach is poured in. A number of the skins thus filled are rolled about in a large tub containing a weaker solution of sumach. The object of this motion is to accelerate the action of the liquid contained in the skins, as well as to subject all portions of them to the equal action of the bath. They are then heaped upon a wooden rack, and pressure brought to bear until the sumach penetrates the pores and brings the tannin into the closest relationship with the fibers. The tanning is completed by a repetition of the process described, which can all be accomplished in one day. The bags are unsewn, scraped, and hung up in the drying-loft. When again wetted and smoothed with a rubbing instrument they are ready for dyeing, being sewn together at the edges, as only one side has to be colored. The mordant used is a solution of tin or alum-water. The dye used is chiefly cochineal; boiled with alum, it forms a red liquid which is filtered through linen into a cask. The skins undergo immersions in this dye. They are then rinsed and tanned with sumach, and afterward fulled with beetles, polished, and dried. Variations in color are obtained by the use of other dyestuffs. The final operation is that of currying. The process varies according to the purpose for which the skins are intended.

Enamel oilcloth, made to look like morocco leather, is now extensively used. Morocco leather is considered to be the best material for bookbinding, and the estimation in which it is held has led to extensive counterfeiting, inferior sheepskins being dressed and dyed to resemble it as much as possible. The preparation of imitation morocco from sheepskins does not vary greatly from that used for the genuine article. The color of the leather is not always given by dyeing, as almost any hue can be obtained by topical application. Aniline dyes have been used, but are said not to be durable.

Morone, mō-rō′nā, Giovanni Battista: painter; b. at Albino, near Bergamo, about 1510; was a pupil of Moretto of Brescia, whose manner he strictly adhered to in his fine pictures in several churches of Bergamo and the neighboring country. Morone was famous for his portraits. Titian was in the habit of advising gentlemen going to Bergamo to be painted by Morone. Examples of his work are in all the principal national European collections. D. Feb. 5, 1578. W. J. S.

Morot, mō′rō′, Aimé Nicholas: historical and genre painter; b. at Nancy, France, June 16, 1850. He studied under Cabanel; was awarded the Grand Prix de Rome 1873; medals at the Salons of 1876, 1877, and 1879; medals of Honor at the Salon of 1880 and Paris Exposition of 1889; decoration of the Legion of Honor 1883. His pictures are

marked by admirable qualities in drawing and color. Among his principal works are *The Good Samaritan* (1880), which is in the Luxembourg Gallery, Paris; *Toro Colante* (1885); and *Reichshofen—Charge of the Eighth and Ninth Cuirassiers.* Studio in Paris. W. A. Coffin.

Mor'pheus [= Gr. *μορφεύς*, liter., fashioner]: the god of sleep, son of Somnus. The name is first found in Ovid (*Met.* xi., 634, 647).

Morphia: See Opium.

Morphol'ogy, Animal [*morphology* is from Gr. *μορφή*, form + *λόγος*, reason, discourse]: that branch of zoölogy which treats of the general form and organization of animals, and the principles involved in their structures. It relates to the nature and origin of structures and organs, but has no reference to the uses or functions of parts. It thus contrasts with animal physiology, which treats of adaptation to surroundings in the organism as a whole, and of the use and functions of the diverse parts. To trace the unity of organization in the widely diverse forms of the animal kingdom, and the essential similarity in their mode of evolution, are the principal problems within the province of morphology.

Characteristics and Method.—The science thus distinguished is of comparatively late development, as the tendency of the human mind is to determine organs and parts from their uses, rather than from their intimate structure. In ordinary language, as well as in the earlier stages of science, the organs of less-known animals are named from their correspondence in function with those of man. Thus the fore limb of a dog is called a leg, though its real correspondence in structure, or homology, is with the arm of man, not with the hinder limb or leg. The fore limb of a bird, corresponding part for part with the arm of man, is called a wing, and the fore limb of a fish a fin. Yet the same word wing is used for the flying apparatus of the insect, although the wing of the insect has structurally nothing in common with the wing of the bird. In the same way the words gills, lungs, jaws, etc., are applied to organs with analogous functions, regardless of the way in which they are formed, and regardless of their method of evolution.

The discovery of the truth in such matters is the function of morphology. It is the science that treats of homologies, and its progress has been in direct opposition to our prepossessions. Its growth has been so gradual that it is difficult to assign the proper meed of praise to those who have contributed to the progress. Cuvier's recognition of the four branches of the animal kingdom (Radiates, Mollusks, Articulates, and Vertebrates) limited the search for homologies in each group to members of the same branch or sub-kingdom. Von Baer at nearly the same time recognized still more distinctly the principles of morphology and the limitations of homologies. The transcendental philosophy of Geoffroy Saint-Hilaire, Goethe, Oken, and others, though barren in results in other fields, and even misleading to a great extent, was of some use in the diffusion of morphological ideas. Morphology and physiology were, however, in spite of the growth of science, long confused together, and the latter employed at the expense of the former in morphological questions.

A principal object of morphology is the discovery and correct appreciation of the fundamental nature and correspondence of the respective regions and organs in different animals. Comparative anatomy (i. e. the structure of the adult animal), comparative embryology in its utmost details (i. e. the anatomy of the fœtus or young in its several stages of youth), and histology, are all invoked for the solution of the questions involved in this search. Physiology is rarely of value as a guide in such investigations. The student must be ever on his guard against being influenced by apparent similarity of functions, or superficial similarities of parts which are subservient to a common purpose. The natural prepossessions with which all must to a greater or less degree start in the consideration of natural history must be also kept in check. Modifications and deviations are so innumerable, and parts that are insignificant in some become of such overshadowing importance in others, and *vice versa*, that extreme caution is necessary in making comparisons and deciding on the correspondence or homologies of parts.

Subdivisions and Definitions.—Morphological problems admit of being grouped according to the aim in view by the investigator, and the various problems which fall within this domain have been classified primarily under (1) anatomy (which again has been divided into tectology and promorphology), and (2) morphogeny (including ontogeny or embryology and phylogeny, which is based chiefly on palæontology). Such are the divisions advocated in an extensive work on morphology by Haeckel (*Generelle Morphologie der Organismen*), who defines them as follows: *Anatomy* is morphology in the narrowest sense, and treats of the entire structure of the organism. *Tectology* (or the doctrine of structure) is that science which treats of the composition of the organism from organic elements or entities of different degrees. *Promorphology* (or the doctrine of fundamental form—*Grundformenlehre*) is that science which treats of the superficial form of organic individuals, or their stereometric fundamental form. *Morphogeny*, or developmental history, is the general science of the developing form of the organism. *Ontogeny* (or embryology) is the developmental history of the organic individuals (*onta*). *Phylogeny* (or palæontology) is the developmental history of organic stems or genealogical stocks (*phyla*).

The necessity for exact expression has also given rise to a number of terms of which only those most generally used need be referred to. *Homological* parts are those which agree in structural relations, however much they may differ in functions, and presumably are modified from corresponding primitive elements. Thus the arms of man, the fore limbs of quadrupeds, the wings of birds, and the pectoral fins of fishes (and of whales) are homologues of each other; so are also the lungs of the air-breathing vertebrates and the swim-bladders of fishes. *Analogous* parts are those which agree in function, however much they may differ in structure, and may be (but not necessarily) modified from entirely different primitive elements. Thus the wings of birds and of insects are analogues (but not homologues) of each other. Of course those organs which are homologous in detail, such as the wings of different flying birds, are also analogous. *Metameric* or *serially homological* parts are those which agree in general characters and relations, and are developed in an analogous manner, but not from the identically corresponding elements. Thus the fore and hind limbs are the serial homologues of each other, as are also the different vertebræ in the same individual.

Examples.—The branch of vertebrates being that whose representatives are best understood, as well as most familiar to the educated, the application of morphological principles will be best illustrated in their case. This may be done by first taking two extremes of the class craniata, and then endeavoring to ascertain the meaning and relations of the members by the intercalation of intermediate types.

On the one hand, as the highest expression of the animal kingdom, we have man. Man is a vertebrate, erect in stature, with two limbs developed as legs and two as arms; breathing air through the medium of lungs; with a highly developed brain divided into cerebrum and cerebellum, and with a definite number of nerves connecting with certain organs and parts; a bony skeleton divided into well-marked regions —the skull, for example (in which are to be distinguished the brain-case, the lower jaw directly articulated with the former, several small ear-bones, and the hyoid apparatus), the limbs, etc. On an examination of the abdomino-thoracic cavity we find, besides an intestinal canal, a pair of lungs connecting directly with the oral cavity; a quadrilocular heart; a distinctly differentiated liver; kidneys for the secretion of urine; and highly specialized organs of generation (in the female, in connection with the ovaries, a uterus, in which the young are for some time borne, and in the male, in connection with the testicles, certain other very complicated parts).

On the other hand, by far the lowest of the craniata stands the Lancelet (*Branchiostoma lanceolata*). Although a vertebrate, inasmuch as it has a nervous chord incased in a sheath and separated by a vertebral axis from the abdominal cavity, it is without a distinct head, and has rather the aspect of a worm than of a vertebrate; the body is horizontal, and pointed at both ends; entirely destitute of limbs, as well as scapular and pelvic arches; breathes air through the medium of water; has no distinctly differentiated brain (the several regions in the higher forms not being represented as distinct elements), and the skeleton is represented by a simple notochord or persistent cartilaginous axis, which ends in a point forward, no skull being developed; the viscera are also few in number; the intestinal canal has a large perforated pharynx, and thence runs straight and without lateral curvature backward; there are no lungs or air-bladder; the heart is tubular, and not divided into partitions;

the liver is a diverticulum of the intestinal canal; the kidneys are extremely rudimentary, and the organs of generation very simple, and scarcely differing superficially in the two sexes.

Such are the extremes exhibited by the members of a universally accepted branch. If we compare these two extremes together, it is at first impossible to perceive any resemblance in whole, or even to recognize the similar or homologous parts in each. The statement so often made in popular works that all the representatives of a single branch or sub-kingdom are built upon the same pattern, and that the corresponding parts are reproduced in all, is most evidently falsified by a comparative examination of the animals in question. It would be indeed absolutely impossible to obtain an adequate conception of the correspondence of these two forms were it not that numerous intermediate types exist which enable us, by successive steps, to trace the development of the various organs and parts. The examination of these intermediate forms in their adult as well as in their embryonic condition shows us that not even the rudiments of several parts exist as such in the inferior type. It becomes evident in the course of our examination that the limbs are the development of buds which spring from the side, and these are first developed in selachians (sharks, rays, etc.). The brain becomes gradually developed and differentiated into regions, which finally become subordinate to a central mass (the cerebrum) as we ascend the animal scale, and in the lowest form the nerves alone are present to remind us of the relations of the simple brain—if so it may be called—to the specialized organ of the higher forms. The notochord in *Branchiostoma* does not represent even potentially the skeleton of the higher vertebrates, inasmuch as in them it is the result not only of development and ossification of that notochord, but also of the union therewith of elements which have originated independently of the axial skeleton: e. g. the skull in the higher forms is composed of cartilage bones (bones formed in the cartilage), as well as membrane bones, and, in part at least, the latter are the homologues of dermal plates in the sturgeon and some other fishes. The lungs in the higher forms can be readily connected by regular gradations with the single air-bladder of fishes; and the relations which that has in the generalized or lower fishes, as well as its absence in the selachians, marsipobranchiates, and *Branchiostoma* shows that it was primitively a simple diverticulum of the alimentary canal, and consequently only potentially represented by the undifferentiated surface of the intestinal canal in *Branchiostoma*. In that form, likewise, the liver, so distinct in the higher forms, is represented by merely a diverticulum of the intestinal canal, but already specialized, so as to be actually comparable with the liver.

Causes of Morphological Correspondence.—The "reason why" of the coincidences thus indicated will naturally be called for. The older naturalists assumed that they were in accordance with a "plan" instituted by the Creator in the beginning, and that the representatives of the several great branches or sub-kingdoms of the animal kingdom were constructed after an ideal pattern common and peculiar to the various members of each branch. This, however, was only another way of expressing the fact that the animals of the respective groups agree in structure. If a "plan" had been predetermined upon, and "patterns" selected for the construction of animals, any deviation therefrom would indicate subjection to a higher power and failure in ability to carry into execution the original plan. If, therefore, the plan would be evidence of prescience, the failure of execution would prove impotence in ratio to the failure. Now, as already pointed out, every type is deviated from, and innumerable exceptions interfere with every extensive generalization respecting community of structure. The idea of plan, therefore, not only fails to give any explanation for morphological correspondences, but in its actual application and failures is really in antagonism to the conception of divine creative power. The consideration of morphological problems has resulted in a general adoption of the theory that the correspondences in question are the results of generic development from the most generalized common stocks, that homology is in all cases the expression of blood relationship. This theory, at first a "working hypothesis," is now universally accepted by students of morphology, because all contrary hypotheses have long since ceased to work. For further discussion of this subject, see ANATOMY, COMPARATIVE; BIOLOGY, SKELETON, ZOÖLOGY, etc.

THEODORE GILL. Abridged by D. S. JORDAN.

Morphology, Vegetable: the comparative anatomy of plants, including a discussion of the structure, transformations, and homologies of their cells, tissues, and external parts. It has often been restricted in botanical text-books to the external parts of the higher plants, but in modern biological botany it has the scope here given.

Morphology may well begin with the cell, whose identity is recognized whatever changes of form and function it undergoes. Whether its wall be thin or thick, uniform or elaborately marked; whether it be spherical or elongated into a mere thread; whether it be simple or branched, its identity is not lost. Modern botany recognizes the fact that every cell is an organism which lives, grows, and becomes modified not only by its growth, but by external influences also. See HISTOLOGY (*Vegetable*).

In like manner the tissues and groups of tissues are recognized as special modifications of masses of originally similar cells. We may thus study the comparative anatomy of the boundary tissue (epidermis), or of the skeletal tissues (fibro-vascular bundles), or of the mass of cells constituting the bulk of any organ (fundamental tissues).

In the study of the external organs of plants many homologies may be recognized. Thus botanists now are able to reduce all the organs of plants to five categories, viz., thallomes, phyllomes, caulomes, rhizomes, and trichomes.

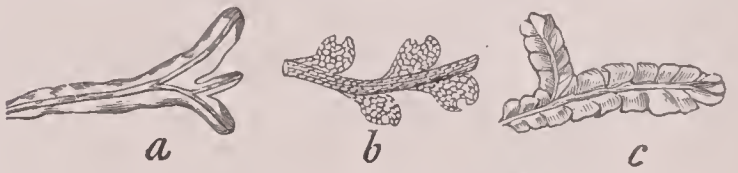

FIG. 1.—Transition from thallome to shoot: *a*, *Metzgeria*; *b*, *Cephalozia*; *c*, *Fossombronia* (all magnified).

The *Thallome* is primitively a row of cells, as in the confervas, but it soon becomes several or many celled in cross-section (as in *Enteromorpha*), or a flattened mass of one or more layers of cells (as in *Ulva* and some liverworts, Fig. 1, *a*). From this condition the passage is easy to the lobed form, with an axial portion somewhat differentiated (Fig. 1, *b*), and finally to the leafy shoot (Fig. 1, *c*).

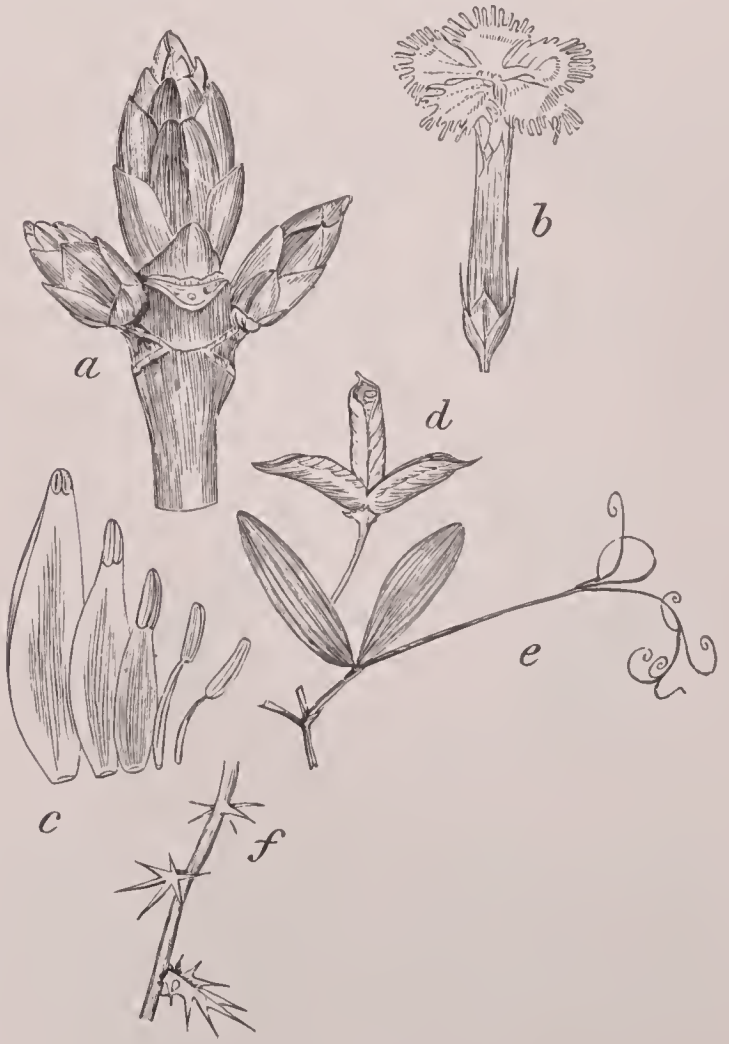

FIG. 2.—Some phyllome forms.

The *Phyllome* is always a lateral member upon an axis (caulome), and in its simplest form is derived from a lobe of the thallome. It is therefore primitively a flat struc-

ture, which is its usual form in the *green leaf*, very properly taken as the type of the phyllome. *Bracts* are underdevelopments of leaves, although still green; *scales* are not only underdevelopments, but their cell-walls have become firmer (Fig. 2, *a*); the outer *floral envelopes* (sepals) are usually similar to bracts, while the inner (petals) usually have a more delicate tissue, which is rarely green (Fig. 2, *b*); *stamens* have a petal-like tissue, usually little expanded, bearing pollen-sacs (Fig. 2, *c*); *carpels* bear ovules, around which they fold, making the ovary, or ovule cavity (Fig. 2, *d*). In *leaf-tendrils* and *leaf-spines* the framework grows much more than the parenchyma (Fig. 2, *e*, *f*).

The *Caulome* is the axial portion of the plant upon which the phyllomes are borne. The caulome with its phyllomes is the "shoot," and this is morphologically equivalent to the thallome. The typical caulome is the *stem*, which bears ordinary leaves. Other forms are *runners*, which are bract-bearing, slender, weak, and trailing (Fig. 3, *a*); *root-stocks*, more or less slender, bearing bracts or scales, and growing underground (Fig. 3, *b*); *tubers*, short and thickened, bearing scales, and growing underground (Fig. 3, *c*); *corms*, short and thickened, leaf-bearing, and subterranean (Fig. 3, *d*); *bulb-axes*, short and conical, leaf-bearing, and subterranean (Fig. 3, *e*); *flower-axes*, short and conical, bearing bracts, perianth, stamens, and pistils, and aërial (Fig. 3, *f*); *tendrils*, aërial, slender, flexible, nearly destitute of phyllomes (Fig. 3, *g*); *thorns*, aërial, conical, rigid, pointed, and nearly destitute of phyllomes (Fig. 3, *h*, *k*).

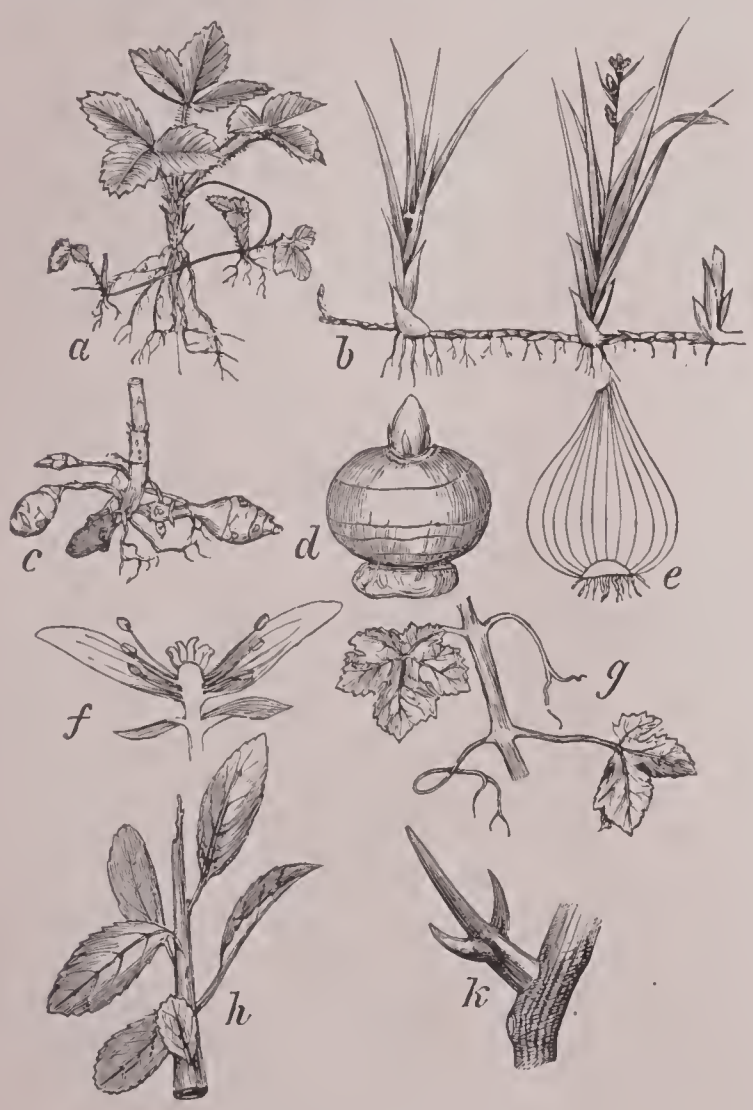

FIG. 3.—Caulome forms.

The *Rhizome** is the naked axial portion of the plant, which is terminated by a "root-cap." The *subterranean roots* of ordinary plants are typical. Common modifications of these are the *fleshy roots* of many plants. *Aërial roots* grow in the air, and often have their epidermis peculiarly thickened, as in the epiphytic orchids. The *roots of parasites* are peculiarly modified to enable them to penetrate their hosts.

The *Trichome* is a surface appendage, consisting of one or more cells usually arranged in a row, sometimes in a mass. The typical form is seen in the common *hairs* of many plants, especially those on the leaves and stems. (See HAIRS.) *Bristles* consisting of a single cell, or a row of cells, hardened and pointed at the apex; *prickles*, still stronger, and usually with a mass of cells below; *scales* (scurf) in which the terminal cell gives rise by fission to a flat, dry plate of cells; *glands* in which one or more of the cells, usually terminal, secretes a gummy, waxy, or other substance, are common examples of other trichome forms. In the *root-hairs* the single elongated cell (or in the moss-worts the row of cells) is an organ of absorption. The *spore-cases* of the FERNWORTS (*q. v.*) are trichome structures, therefore the *ovules* of flowering plants must be regarded as having the same morphological significance. See BOTANY, HAIRS, HISTOLOGY (*Vegetable*), and LEAF. CHARLES E. BESSEY.

* The prevailing use of this word for a root-stock is indefensible. The root-stock is not a root but a stem, and should not bear a name which is absolutely false, though sanctioned by long usage. It is time that this ancient error was abandoned and the term restored to its proper application.

Morphy, PAUL CHARLES: See the Appendix.

Morrill, JUSTIN SMITH: Senator; b. at Strafford, Vt., Apr. 14, 1810; engaged in mercantile business, and in 1848 became a farmer; was M. C. from Vermont 1855–67; chairman of committee of ways and means and author of the Morrill tariff of 1861; was U. S. Senator 1867–73, and was re-elected in 1872, 1878, 1884, 1890, and 1896. His term of consecutive service in Congress exceeded that of any of his colleagues. He wrote *Self-consciousness of Noted Persons* (1886). D. in Washington, D. C., Dec. 28, 1898.

Morrill, LOT MYRICK, LL. D.: legislator; b. at Belgrade, Me., May 3, 1813; was educated at Waterville College (now Colby University); became a lawyer in 1839, and removed to Augusta, Me.; entered the Legislature in 1854; was president of State Senate 1856; Governor of Maine 1858–60; U. S. Senator 1861–76; and was Secretary of the Treasury June 21, 1876–Mar., 1877; declined a foreign mission in 1877; was collector of Portland, Me., from Mar., 1877, till his death at Augusta, Jan. 10, 1883.

Morrilton: city (founded in 1880); capital of Conway co., Ark. (for location of county, see map of Arkansas, ref. 3–C); on the Arkansas river, and the St. L., Iron Mt. and S. Railway; 50 miles N. W. of Little Rock. It has cotton and grist mills, manufactories of lumber, glass, and furniture, and a monthly and two weekly newspapers. Pop. (1890) 1,644; (1900) 1,707. EDITOR OF "PILOT."

Morris: city; capital of Grundy co., Ill. (for location of county, see map of Illinois, ref. 3–F); on the Illinois river, the Illinois and Michigan Canal, and the Chi., Rock Is. and Pac. Railroad; 21 miles W. S. W. of Joliet, 61 miles S. W. of Chicago. It is one of the largest grain-markets in the West, and has extensive mines of bituminous coal in operation. There are manufactories of iron novelties, builders' hardware, paper car-wheels, tanned leather, brick and tile, oat-meal, and plows; and a Normal and Scientific School, 2 national banks with combined capital of $125,000, and 2 daily and 3 weekly newspapers. Pop. (1880) 3,486; (1890) 3,653; (1900) 4,273. EDITOR OF "HERALD."

Morris: village; capital of Stevens co., Minn. (for location of county, see map of Minnesota, ref. 8–B); near the Pomme de Terre river, which affords excellent power for manufacturing, and on the Great N. and the N. Pac. railways; 159 miles N. W. of St. Paul, 180 miles S. W. of Duluth. It is in a stock-raising and grain-growing region, and has a number of picturesque lakes in its vicinity affording good fishing. There are 6 churches, a State high school, 2 public-school buildings, 4 large grain elevators, and 2 weekly newspapers. Pop. (1880) 743; (1890) 1,266; (1900) 1,934. EDITOR OF "SUN."

Morris, ALEXANDER, D. C. L.: statesman; b. at Perth, Ontario, Canada, Mar. 17, 1826; was educated at the University of Glasgow and McGill College, and admitted to the bar in 1851. He sat for South Lanark in the Parliament of Canada 1861–72; for East Toronto in the Legislative Assembly of Ontario 1878–86; was Minister of Internal Revenue 1869–72; chief justice of the court of queen's bench of Manitoba 1872, and Lieutenant-Governor of Manitoba and Northwest Territories 1872–77. As commissioner of Indian affairs for Manitoba and Northwest Territories, he negotiated treaties with Saulteaux and Cree tribes of Indians 1873–74; acted as a commissioner for treaties with the Indians of Lake Winnipeg region in 1875, and with the Plain Crees at Forts Carlton and Pitt in 1876; and was appointed (1876) a commissioner to investigate conflicting claims to lands in Manitoba. Both as a speaker and writer he contributed much toward the adoption of the policy of confederation of the

provinces. He wrote *Treaties of Canada with Indians* (1880), and *Nova Britannica* (1884). D. at Toronto, 1890.
NEIL MACDONALD.

Morris, CLARA: actress; b. at Cleveland, O., about 1846. She received the first elements of dramatic education as a member of the ballet corps at the Academy of Music in her native city. In 1869 she played juvenile parts at Wood's theater in Cincinnati, and was afterward leading lady there. She then went to New York, and appeared at the old Fifth Avenue theater, where she excited admiration by her impersonation of Annie Sylvester in *Man and Wife*. Her success was still greater in *Divorce*, *Article 47*, *The Geneva Cross*, *Alixe*, *Camille*, and *Miss Multon*. In 1873 she made a tour through the western part of the U. S., and in 1880 fulfilled an engagement in San Francisco. For about ten years she was compelled frequently to retire temporarily from the stage through ill-health. She regained her strength, and has traveled with her own company on the Pacific coast and in the Northwest with great success. In the spring of 1894 she played an engagement in New York. Her present repertory is limited to a few plays, including *Camille*, *Renée*, and *Miss Multon*. Her forte is the emotional rather than the passionate, especially sorrow, grief, and suffering. She married F. C. Harriot in 1874, and published her memoirs in 1901. Revised by B. B. VALLENTINE.

Morris, EDWIN DAFYDD, D. D., LL. D.: minister; b. at Utica, N. Y., Oct. 31, 1825; graduated at Yale College in 1849 and at Auburn Theological Seminary in 1852; was pastor of the Second Presbyterian church, Auburn, N. Y., 1852–55; of the Second Presbyterian church, Columbus, O., 1855–67; was Professor of Church History 1867–74; and has been Professor of Theology in Lane Theological Seminary since 1874. He was moderator of the General Assembly at Cleveland in 1875; delegate to the councils of Reformed Churches (Pan-Presbyterian) in Edinburgh 1877, Philadelphia 1880, and Belfast 1884; and is (1894) a member of the committee on the revision of the Confession of Faith. He has contributed articles to various reviews, and has published *Outlines of Christian Doctrine* (Cincinnati, 1880; for use in his classes); *Ecclesiology* (New York, 1884); *Salvation after Death* (1887); *A Defense of Lane Seminary* (1893); and has edited *Scripture Readings* (1886). C. K. HOYT.

Morris, GEORGE POPE: journalist and song-writer; b. in Philadelphia, Oct. 10, 1802; removed in early life to New York, where he soon began to write for the press; published the New York *Mirror*, in connection with Samuel Woodworth, 1823–42; was the associate of N. P. Willis in publishing *The New Mirror* (1843), *The Evening Mirror*, assisted by N. P. Willis and Hiram Fuller (1844), *The National Press* (1845–46), and, assisted by N. P. Willis, *The Home Journal* (1846–64). Morris wrote a number of popular songs, including *Woodman, Spare that Tree*, *My Mother's Bible*, *We were Boys Together*, and *Near the Lake where Droops the Willow*. A complete edition of his *Poems* appeared in 1860. D. in New York, July 6, 1864.
Revised by H. A. BEERS.

Morris, GEORGE SYLVESTER: philosophical writer; b. at Norwich, Vt., Nov. 15, 1840; graduated with highest honors at Dartmouth College 1861; served in the Union army during the civil war; was tutor at Dartmouth 1863–64; studied theology and spent several years in Germany, chiefly in philosophical studies; translated Ueberweg's *History of Philosophy*, with additions (1871), and became Professor of Modern Languages and Literature in the University of Michigan 1870; resigned this position in Feb., 1880, and in the following year was appointed Professor of Logic, Ethics, and the History of Philosophy in the same institution; from 1878 to 1885 was lecturer on Ethics and the History of Philosophy in the Johns Hopkins University, Baltimore, Md. He wrote on philosophical topics in various reviews and in the *Transactions* of the Victoria Institute, London, and was the author of the following works: *British Thought and Thinkers* (Chicago, 1880); edited Grigg's *Philosophical Classics* (German), for which he wrote two works; *Kant's Critique of Pure Reason: a Critical Exposition* (Chicago, 1882); *Philosophy and Christianity*, being the Ely Lectures for 1883 (New York, 1883); and *Hegel's Philosophy of the State and of History* (Chicago, 1887). D. at Ann Arbor, Mich., Mar. 23, 1889. Revised by W. T. HARRIS.

Morris, GOUVERNEUR: lawyer and statesman; b. at Morrisania, N. Y. (now in New York city), Jan. 31, 1752; was of a wealthy family which produced many distinguished public men of New York; graduated at King's (now Columbia) College, N. Y., 1768; was admitted to the bar in 1771; was in the provincial congress of New York 1775; assisted in drafting the State constitution 1776; was in the Continental Congress 1777–80; became in 1781 assistant superintendent of finance and afterward was Robert Morris's partner in mercantile business; was one of the committee which drafted the Federal Constitution 1787; was engaged in business in France 1788–91; U. S. agent in London 1791; minister to France 1792–94; was U. S. Senator 1800–03, displaying remarkable ability and eloquence; was one of the fathers of the New York canal system, and president of the canal commission 1810–16; author of numerous essays, etc. D. at Morrisania, N. Y., Nov. 6, 1816. See Sparks, *Memoirs of Gouverneur Morris, with Selections from his Papers and Correspondence* (3 vols., Boston, 1832); Roosevelt, *The Diary and Letters of Gouverneur Morris* (1888): Annie Cary Morris, *The Diary and Letters of Gouverneur Morris* (2 vols., 1889).—His elder brother LEWIS (b. 1726, d. Jan. 22, 1798) was one of the signers of the Declaration of Independence.

Morris, JOHN GOTTLIEB, D. D., LL. D.: clergyman and author; b. at York, Pa., Nov. 14, 1803; graduated at Dickinson College, Carlisle, 1823; studied theology at Princeton, N. J., and Gettysburg, Pa., having been a member of the first class in the latter seminary; founded the first English Lutheran church in Baltimore, Md., and was its pastor 1826–59, and after intervals was pastor of Luther chapel in the same city, and at Lutherville, Md. He was the first librarian of the Peabody Institute in Baltimore, and upon him chiefly devolved the selection of the beginning of the large and valuable library, as well as its thorough organization. From his entrance into the ministry he was prominent in all movements connected with the Americanized portions of the Lutheran Church. He was a member of the first board of trustees of Pennsylvania College in 1832, and delivered annually a course of lectures on the connection between science and revelation, and on elocution in the Theological Seminary of that institution. He was the founder and in 1831–32 the first editor of *The Lutheran Observer*, and a constant contributor to the weekly church papers. He also wrote frequently for *The Evangelical* and *The Quarterly Reviews* (Gettysburg). He was the author of a number of volumes, especially *Popular Exposition of the Gospels* (1840); *Life of John Arndt* (1853); *Blind Girl of Wittenberg* (1856); *To Rome and Back Again* (1856); *Quaint Sayings and Doings concerning Luther* (1859); *Bibliotheca Lutherana* (1876); *Fifty Years in the Lutheran Ministry* (1878); translation of *Koestlin's Life of Luther* (1883); *Lives of C. A. G., T.*, and *C. A. Stork* (1886). In 1893 he organized the Academy of Lutheran Church History, and presided at its first sessions in Philadelphia in Mar., 1894. Dr. Morris also gave especial attention to entomology, and wrote two volumes on the *Lepidoptera of North America*, published by the Smithsonian Institution (1860–61). He was a contributor to *Silliman's Journal*, and a member from the beginning of the American Association for the Advancement of Science, and was the president of the Maryland Historical Society. D. in Lutherville, Md., Oct. 10, 1895. HENRY E. JACOBS.

Morris, LEWIS: poet; b. at Carmarthen, Wales, in 1834. He was educated at Jesus College, Oxford, and graduated in 1855. He was admitted to the bar in 1861, and practiced law till 1881. In 1877 he was elected honorary fellow of Jesus College and secretary of University College, Wales. He is a resident of Carmarthenshire and a justice of the peace for that county. He has published *Songs of Two Worlds* (1871; second series 1874; third series 1875); *The Epic of Hades* (1876); *Gwen: a Drama* (1879); *The Ode of Life* (1880); *Songs Unsung* (1883); *Gycia: a Tragedy* (1886); *Songs of Britain* (1887); *A Vision of Saints* (1890). H. A. BEERS.

Morris, MICHAEL: See the Appendix.

Morris, RICHARD, LL. D.: philologist; b. at Bermondsey, London, England, Sept. 8, 1833; was educated at St. John's College, Battersea; was appointed lecturer on the English Language and Literature in King's College School in Apr., 1869; was ordained curate of Christ Church, Camberwell, 1871; was elected head master of the Royal Masonic Institution for boys in 1875. Dr. Morris has been for many years one of the most efficient members of the Chaucer, the Early English Text, and the Philological Societies, and was chosen president of the latter in 1874. He published *The Etymology of Local Names* (1857); *Specimens of Early English* (1867); *Historical Outlines of English Accidence*

(1872); *Elementary Lessons in Historical English Grammar* (1874); *Primer of English Grammar* (1875); *Report on Pāli Literature* (1880); *Folk-tales of India* (1884–85), and other volumes. He has edited for the publishing societies numerous early texts, among which are *Early English Alliterative Poems* (1865); *Chaucer's Poetical Works* (1866); *Selections from Chaucer's Canterbury Tales* (1867); *Old English Homilies* (1867–73); *Spenser's Works* (1869); *Legends of the Holy Rood* (1871); *Cursor Mundi* (1874–75). D. May 12, 1894. Revised by H. A. Beers.

Morris, Robert: financier; b. Jan. 31, 1734. A native of England, he was taken by his father to North America in 1747, and after serving in the counting-house of Charles Willing in Philadelphia until 1754, formed a partnership with that gentleman's son, which continued with great success until 1793. Morris strongly opposed the Stamp Act, and against his business interests signed the non-importation agreement of 1765. In 1776 he was a delegate to the Continental Congress, and voted against the Declaration of Independence, but signed that paper on its adoption, and was twice re-elected to Congress. Throughout the war the services of Mr. Morris in aiding the Government in its financial difficulties were of incalculable value; he freely pledged his personal credit for supplies for the army, at one time to the amount of $1,400,000, without which the campaign of 1781 would have been almost impossible; he also established the Bank of North America, in 1781 was appointed superintendent of finance, and held the post until 1784, continuing to employ his personal credit to facilitate the needs of his department. Subsequently he was a member of the Pennsylvania Legislature, of the convention which framed the Federal Constitution, and from 1789 to 1795 was U. S. Senator, declining in the meantime the proffered post of Secretary of the Treasury, and suggesting the name of Alexander Hamilton for that office. After engaging in the China trade, he in his later years became involved in land speculations which resulted ruinously, and three years and a half were passed in confinement for debt. D. in Philadelphia, May 8, 1806. See Prof. W. G. Sumner, *Financier and Finances of the American Revolution* (New York, 1891); also, by same author, *Robert Morris* in Makers of America Series (New York, 1892).

Morris, William: poet and artist; b. at Walthamstow, near London, England, in 1834; was educated at the Forest School, Walthamstow, at Marlborough, and at Exeter College, Oxford; studied painting, but in 1863 devoted himself to the designing and manufacture of artistic household furniture, wall-paper, stained glass, and other decorations. In 1858 he published a small volume entitled *The Defense of Guinevere, and Other Poems*, and in 1867 *The Life and Death of Jason*, a narrative poem. His principal work, *The Earthly Paradise*, consisting of legendary and romantic tales in verse, appeared in four parts in 1868–71; *Love is Enough; or, the Freeing of Pharamond*, a morality, appeared in 1873; *The Æneid of Virgil*, translated into English verse (1876); and *The Story of Sigurd the Volsung and the Fall of the Niblungs*, a poem (1877). In collaboration with Erick Magnusson he has translated from the Icelandic *The Story of Grettir the Strong* (1869); *The Story of the Volsungs and the Niblungs* (1870); *Three Northern Love Stories* (1875); in 1887 appeared a prose translation of the *Odyssey*; in 1889 *The House of the Wolfings*; and in 1890 *The Roots of the Mountains*. In 1890 he began to publish English versions of the *Sagas*. In 1882 he published *Hopes and Fears for Art*, five lectures delivered during the five preceding years in London, Birmingham, and Nottingham. He later became a leading spirit in the Socialist League and a contributor to *The Commonweal*. A volume of socialist lectures, *Signs of Change*, appeared in 1888. D. in London, Oct. 3, 1896. Revised by H. A. Beers.

Morris, William Walton: soldier; b. at Ballston Springs, N. Y., Aug. 31, 1801; graduated at West Point 1820; promoted second lieutenant Sixth Infantry; transferred to the artillery 1824; served against the Arickaree Indians 1823; was major of mounted Creek volunteers in the Seminole war 1836–37; was breveted for gallant conduct, and during nine years' garrison duty (1837–46) gained a brilliant reputation as a military lawyer; was attached to the judge-advocate's department of Gen. Taylor's army on the Rio Grande 1846; was actively engaged in the battles of Palo Alto and Resaca de la Palma; was made prefect of police and alcalde of Tampico on the occupation of that port, and of Puebla 1847–48; in garrison New York harbor 1850–56; in Florida 1856–57; on frontier duty in Kansas 1857–58; and in Minnesota 1859–61. He was in command at Fort McHenry, Baltimore, 1860–61, where he promptly brought his guns to bear on the rioters in the memorable affray of Apr. 19, 1861. He was promoted to a lieutenant-colonelcy May 14, 1861, and shortly afterward refused to answer a writ of *habeas corpus* granted by a Maryland judge, on the ground that it had become invalid by the outbreak of hostilities. He was made full colonel of the Second Artillery Nov. 1 of the same year, brevet brigadier-general in the regular army June 9, 1862, and brevet major-general Dec. 10, 1865. He remained in command of Fort McHenry throughout the war, and died there Dec. 11, 1865. Revised by James Mercur.

Morrisburg: port of entry of Dundas County, Ontario, Canada; on the St. Lawrence, at the foot of the Rapide du Plat Canal, and on the Grand Trunk Railway; 92 miles above Montreal and opposite the village of Waddington, N. Y. (see map of Ontario, ref. 2–I). It has fine water-power, well improved, and does a large shipping business. Pop. (1891) 1,859.

Morris Dance [probably *Moorish* dance]: a rude dance common in England in the Middle Ages, and even now occasionally performed in the rural districts. The dragon or hobby-horse, Robin Hood, Maid Marian, and other fantastic characters often bore a part in it. It was generally performed by young men gaudily decorated with colored ribbons and using bells, castanets, swords, etc.

Morris Island: a low, narrow sand-island on the south side of the entrance into Charleston harbor, South Carolina, a little more than 3½ miles long, lying broadside to the ocean. Soon after the outbreak of the civil war (1861) the Confederates erected Fort Wagner and several batteries on Morris island as part of the exterior line of defenses for Charleston. The south end of the island was captured by an assault made from small boats by Union forces, July 10, 1863, and two unsuccessful assaults upon Fort Wagner, located near the north end of the island, followed July 11 and 18, the object being to get within effective breaching distance of Fort Sumter, occupying an interior line about 2,700 yards distant from Fort Wagner. After the assault of the 18th, it was determined to reduce Fort Wagner by a regular siege and this was prosecuted vigorously, a fourth parallel being established Aug. 21 at an average of 300 yards from Fort Wagner. On the 26th a sand-ridge about 100 yards in advance of the fourth parallel and 200 yards from Fort Wagner was carried by assault, and the fifth parallel established thereon. Between this parallel and the fort the island narrowed to about 30 yards in width and 2 feet in depth above high water. The navy occupied the main channel abreast the island, and co-operated in keeping down the fire from the fort. The trenches were pushed forward by the evening of Sept. 6 to the outer edge of the ditch on the side next the sea, completely masking the enemy's guns, and orders were given to carry the place by assault on the following morning. During the night the enemy evacuated the fort, and Morris island came into possession of the Union forces. See Bombardment.

Morrison: city (founded in 1855); capital of Whiteside co., Ill. (for location of county, see map of Illinois, ref. 2–D); on the Chi. and N. W. Railway; 124 miles W. of Chicago. It is in an agricultural, dairying, and stock-raising region; contains 6 churches, a large graded school, public library and museum, a national bank with capital of $100,000, a private bank, and 2 weekly newspapers; and has water-works supplying natural-spring water, thorough sewerage, electric-light plant, and several manufactories. Pop. (1880) 1,981; (1890) 2,088; (1900) 2,308.

Editor of "Sentinel."

Morrison, Robert, D. D., F. R. S.: first Protestant missionary to China; b. at Morpeth, Northumberland, England, of Scottish parentage, Jan. 5, 1782; had but an elementary education, but in 1803 succeeded in gaining admittance to the Independent Academy at Hoxton; in 1804 entered the mission college of Gosport; in 1807 was sent by the London Missionary Society to Canton, and in 1808 was appointed translator to the East India Company's factory there. While in that position he published a Chinese grammar and translated the Bible into Chinese, the New Testament appearing in 1814 and the Old, executed with the collaboration of Milne, in 1818. He next founded, at Malacca, an Anglo-Chinese college, which in 1845 was removed to Hongkong. In 1823–26 he visited England, where he created a great in-

terest for the Protestant mission in China. Immediately after his return to Canton, in 1827, he entered upon new literary undertakings in behalf of the mission. His greatest literary work is his Chinese dictionary (5 vols.), printed at the expense of the East Indian Company in Macao (1815–23), a work of great industry and scholarship, though now superseded by later works of the same kind. He died in Canton, Aug. 1, 1834. His *Memoirs*, compiled by his widow with critical notices of his Chinese works by Samuel Kidd, appeared in London (1839, 2 vols.). See his *Life*, by S. Wells Williams in the *Lives of the Leaders of the Church Universal* (Philadelphia, 1879, pp. 819–837); also W. T. Townsend's *Robert Morrison* (Chicago and New York, 1888).

Morrison, William Rails: legislator; b. in Monroe co., Ill., Sept. 14, 1825; was educated in the common schools and at McKendree College, Illinois; was admitted to the bar; was clerk of the circuit court; was four terms member and one term Speaker of Illinois House of Representatives; member of Congress 1863–65 and 1873–87. He was the leader of the tariff-reform Democrats in Congress, and was appointed an interstate commerce commissioner by President Cleveland Mar. 22, 1887.

Morristown: city; capital of Morris co., N. J. (for location of county, see map of New Jersey, ref. 2–D); on the Del., Lack. and West. Railroad; 30 miles W. of New York city. It is one of the oldest places in the State; was twice the headquarters of the American army during the Revolutionary war, and has a memorial monument on the site of Fort Nonsense, which Washington had built on top of one of the surrounding hills. The building occupied by Washington as his headquarters in 1780 was built in 1772, was purchased by the Washington Association of New Jersey in 1873, and contains priceless relics of Revolutionary days. The city is in the great Morris County peach and rose belt, has an elevation of nearly 700 feet above sea-level, and is the home of many New York business men. At Morris Plains, 4 miles from the city, is the New Jersey State Lunatic Asylum, the largest institution of its kind in the U. S. when completed, which cost $2,500,000, and has accommodations for 1,000 patients. The city has 11 churches, Young Men's Christian Association building, Young Men's Catholic Association building, 2 graded public schools, 2 parochial schools, St. Elizabeth's convent, 2 seminaries for young ladies, a classical school for boys, public library with over 10,000 volumes and lyceum hall, 2 hospitals (founded by Mrs. Brookfield and the Very Rev. Dean Flynn), 2 national banks with combined capital of $300,000, a savings-bank, a public park containing a soldiers' monument, and a monthly and 4 weekly periodicals. Pop. (1880) 5,418; (1890) 8,156; (1900) 11,267.

Editor of "Evening Express."

Morristown: town; capital of Hamblen co., Tenn. (for location of county, see map of Tennessee, ref. 6–J); near the Holston river, and on the East Tenn., Va. and Ga. and the Mor. and Cumber. Gap railways; 42 miles N. E. of Knoxville. It is in an agricultural and mineral region; has extensive quarries of variegated marble, flour-mills, stove-foundry, sash and blind and wagon factories, and 3 periodicals. Pop. (1880) 1,350; (1890) 1,999; (1900) 2,973.

Morse, Edward Sylvester, Ph. D.: biologist; b. in Portland, Me., June 18, 1838; was educated in Lawrence Scientific School, Cambridge, Mass.; from 1866 to 1871 he lived in Salem, Mass., where he aided in founding the Peabody Academy of Sciences, of which he has been curator since 1881, and in establishing *The American Naturalist*, of which he became an editor; was Professor of Comparative Anatomy and Zoölogy in Bowdoin College, Maine, 1871–74; Professor of Zoölogy in the Imperial University of Tokio, Japan, 1877–79; president of American Association for Advancement of Science 1885–87. He is the author of *Terrestrial Pulmonifera of Maine* (1864); *Early Stages of Terebratulina* (1870); *Embryology of Terebratulina* (1872); *Tarsus and Carpus of Birds* (1872); *Systematic Position of the Brachiopods* (1873); *First Book in Zoölogy* (1875; trans. into German and Japanese); *Shell-mounds of Omori* (1879); *Early Race of Man in Japan* (1879); *Ascending Process of the Astragalus in Birds* (1880); *Ancient and Modern Methods of Arrow Release* (1885); *Japanese Homes and their Surroundings* (1886); *On the Older Forms of Terra-cotta Roofing Tiles* (1892).

C. H. Thurber.

Morse, Richard Carey: general secretary of the American international committee of Young Men's Christian Associations; b. in New York city, Sept. 19, 1841; graduated at Yale College in 1861; studied at Princeton and Union Theological Seminaries; was connected editorially with *The New York Observer*, of which his father, Rev. R. C. Morse, had been a founder, until 1869, when he was called to the editorship of *The Association Monthly*, one of the early periodicals published by the international committee. Two years later he was elected to the general secretaryship of the international committee. The Christian Associations were few in number at that time, and most of them were very weak. The wonderful growth of the work in North America since then has been largely due to his efforts. He was for years the U. S. representative upon the world's committee.

Morse, Samuel Finley Breese, LL. D.: inventor, painter, and author; b. in Charlestown, Mass., Apr. 27, 1791; was the son of a clergyman; was educated at Yale College, taking his bachelor's degree in 1810. He decided to become a painter, and went to London in 1811 with Washington Allston to study in the Royal Academy under Benjamin West. In 1813 he received the gold medal for his first effort in sculpture, *The Dying Hercules*. Returning to the U. S. in 1815, he followed his profession, at the same time prosecuting his scientific studies, for which he had great fondness. He was one of the founders of the National Academy of Design in New York, and was its annually elected president for many years. He was one of the first professors of the University of the City of New York, filling the chair of Fine Arts. In 1835, in his rooms in the university, he set up his rude telegraphic apparatus, but it was not till 1844 that he was enabled to bring his invention fully before the world. By the aid of the Government he established a telegraphic line between Washington and Baltimore, a distance of 40 miles. Over this line, on May 24, 1844, from the rooms of the U. S. Supreme Court, a message was sent to Baltimore, instantaneously received, and immediately returned. From this moment the triumph of Prof. Morse was complete. He became a member of many learned societies in Europe and the U. S., and the recipient of the most flattering foreign distinctions, and at a congress of representatives of ten of the governments of Europe, specially convened for the purpose in Paris in 1858, at the suggestion of the Emperor Napoleon, it was unanimously decided that the sum of 400,000 francs should be presented to him. He wrote controversial pamphlets, poems, and magazine articles, and published *Foreign Conspiracies against the Liberties of the United States* (1835) and a few other works. D. in New York city, Apr. 2, 1872. See his *Life*, by Samuel Irenæus Prime (New York, 1875). Revised by Russell Sturgis.

Morse, Sidney Edwards: journalist; brother of Samuel F. B. Morse; b. at Charlestown, Mass., Feb. 7, 1794; graduated at Yale College in 1811; wrote for *The Columbian Sentinel* 1812–13; studied law in Judge Reeves's school at Litchfield, Conn.; established in 1815 *The Boston Recorder*, the first religious newspaper in the U. S.; was associated with his brother in inventing and patenting the flexible piston-pump 1817; published a school geography 1820, and a larger geographical treatise 1822; founded in May, 1823, with his younger brother, Richard C. Morse, *The New York Observer*, the first religious newspaper, and now the oldest weekly newspaper in New York; invented with Henry A. Munson the cerographic method of printing maps in 1839; brought out the *North American Atlas*, the *Universal Atlas*, and a new school geography, of which 100,000 copies were sold; remained senior editor of *The Observer* until 1858; spent his later years in inventing and improving a "bathometer" for deep-sea soundings. D. in New York, Dec. 24, 1871.

Morse: See Walrus.

Morselli, Enrico Agostino, M. D.: alienist; b. at Modena, Italy, July 17, 1852; graduated M. D. at the University of Modena in 1874; studied psychiatry under Livi in Reggio and anthropology under Mantegazza in Florence; subsequently became physician in charge of the Turin Insane Asylum, and Professor of Psychiatry in the medical school in that city. He was coeditor of the *Rivista sperimentale di freniatria e di medicina legale* in 1875, and of the *Archivo di psichiatria, antropologia criminale e scienze penali* in 1885. He is the author of a number of medico-legal and neurological papers. Among his published works are *Critica e riforma del metodo in antropologia* (Rome, 1880); *Suicide: an Essay on Comparative Moral Statistics* (New York, 1882); *Manuale di semejotica delle malattie mentali* (Milan, 1885); *Il magnetismo animale* (Turin, 1886).

S. T. Armstrong.

Mortality [Lat. *morta'litas*, from *morta'lis*]: liability or tendency to death; as commonly used, the ratio of deaths to population during a year, stated as being a certain number—such as 16 or 20—per 1,000, by which is meant that out of each thousand of the mean or average population of the place during the year, 16 or 20 died during the year. This ratio is also called the death-rate. For methods of ascertaining the mortality of particular localities or groups of men, and the conclusions to be drawn from comparisons of such mortalities, see LIFE-INSURANCE, VITAL STATISTICS, and LONGEVITY. In medical and hospital statistics, mortality is used to signify the ratio between the number of cases of a particular disease and the number of deaths occurring in those cases. For example, the mortality of Asiatic cholera is said to be about 50 per cent. of the cases; of yellow fever, from 15 to 50 per cent. in different epidemics; of typhoid fever, from 10 to 20 per cent.; of smallpox in unprotected persons, from 25 to 30 per cent.; of scarlet fever, from 5 to 20 per cent. in different epidemics; of diphtheria, from 10 to 25 per cent.; of pneumonia, 25 per cent.; and of women in childbirth, from 0·2 to 0·6 per cent., meaning always percentage of the number of cases observed.

J. S. BILLINGS.

Mortars [so called from resemblance to a mortar in which substances are pounded with a pestle]: short cannon for throwing shells, usually fired at angles from 35° to 45° elevation, called "vertical fire," in contradistinction to the fire of long cannon, usually made at low angles. Mortars are believed to have been the first guns used, and, though changed from age to age frequently in form of chamber, size, and projectile, in all ages they have been found too useful in their special way to be given up, or, until very recently, to be essentially altered. The "Coehorn" mortar—so called from the famous Dutch engineer, Gen. Coehorn, who first proposed them in 1674—is to-day in use, of the pattern and for the service then suggested. Monster mortars have been constructed from time to time, in the hope of producing immense destruction in bombardments with single shells each containing a large quantity of powder. (See BOMBARDMENT.) The monster mortar made by Mallet for the British Government, weighing 114,000 lb., with a bore of 36 inches and a shell of 2,912 lb., failed to be of any service; 13-inch seacoast mortars and 8-inch and 10-inch siege mortars are calibers still in use in the U. S. and some other countries. These are smooth-bores firing spherical projectiles. Recently, however, great improvements have been made in mortars by lengthening them and rifling the bore, until they are really more properly *rifled howitzers* than *mortars*. They are designed, however, for "vertical fire," are accurate, and have long range, are made of all calibers up to 12 inches or larger, fire elongated projectiles with any desired velocity up to 1,000 feet or more. The projectiles are loaded with large charges of gunpowder or high explosives, and are capable of producing very destructive effects. The mortars of 12-inch caliber have been introduced largely in the proposed armaments of the U. S. seacoast defenses.

Revised by JAMES MERCUR.

Mortar-vessels: vessels strongly built for the purpose of carrying mortars for bombardment. The bomb-ketch was of this class, but is now disused. Sometimes steam-vessels are employed. In the civil war in the U. S. a class of wide, light-draught schooners, carrying each a 15-inch mortar and a 32-lb. rifle gun, were used upon the lower Mississippi river. Against Island No. 10 mortar-vessels of another class were used. See BOMBARDMENT.

Morte d'Arthur: See MALORY, Sir THOMAS.

Mortgage [(adapted to Fr. *mortgage*) from O. Fr. *morgage*, liter., dead pledge; *mort*, dead + *gage*, pledge]: a term used in law. It will be considered under two principal divisions: I. Mortgages of land; II. Mortgages of chattels.

I. A mortgage of land is, when regular in its form, a conveyance of land for the purpose of securing the payment of a debt or the performance of an act at a specified time, with a condition that if the payment is made or the act performed at the time and in the mode prescribed, the conveyance shall be void. On the other hand, if payment, etc., is not made, the conveyance, strictly speaking, becomes absolute in the mortgagee. By the rules of the common law the enforcement of the condition was rigorous if redemption was not made on the stipulated day, no matter how insignificant the debt might be, or how great might be the value of the mortgaged estate. Furthermore, notwithstanding the fact that the mortgagee had acquired an absolute title to the property by the failure of the mortgagor to pay the debt on the day named, the debt still remained unpaid, and an action could be brought to recover the same at law. This was a necessary result of treating the mortgage, not as a security for a debt, but as a conveyance of property, title to which the grantor might reacquire by performing a stated condition. It was not until the courts of equity gained a strong foothold that any modification of the severity of this doctrine took place. The right of redemption has now become positively settled, and is regarded to be inherent in the very nature of a mortgage. The present theory in a court of equity is that a mortgage is a mere security for a debt, and that, accordingly, any attempt on the part of the creditor to obtain more than his debt and interest from the land is in the nature of a penalty, against the effect of which the court will relieve on payment of the amount actually due. On this theory the debt is the principal thing, and the land accessory. When the debt is transferred the assignee thereof is equitably entitled to the benefit of the mortgage, even without special mention; so when the debt is paid the mortgage is really extinguished, though it may in form continue. A mortgage as thus explained, being regular in point of form, has all the requisites of a deed or conveyance of land. It is signed, sealed, and delivered. There is a clause of defeasance in the deed, or if separate it is executed with due formality. The effect of the "defeasance clause" is to declare that if the debt is punctually paid or the act performed the deed is void.

There usually accompanies a legal mortgage a bond or promissory note, or other promise to pay the debt. This is advantageous to the creditor, since, if the land does not yield enough to pay the debt, he has a further remedy upon the bond or note or promise for the deficiency. Where there is no such promise the mortgagee is confined in his remedies on the mortgage. It is not material which form the contract assumes. Where no negotiable note is given, the mortgage, both in the hands of the mortgagee and assignee, is subject to all the defenses which are applicable to the debt, so that if the debt can not be collected by reason of fraud or duress or want of consideration, the mortgage can not be enforced. On the other hand, if it accompanies a negotiable note which is not yet due, it is held to be the rule in a number of States that a transfer before maturity, which would preclude a defense to the note, will have a like effect upon the mortgage. It is a cardinal rule that no agreement between the parties can take away or restrict the right of redemption. Such an agreement is regarded as a "penalty," and is accordingly inoperative. This rule does not preclude an agreement that on default of payment of interest for a specified time the entire mortgage, though not yet mature, shall become due. Such a stipulation enters into the contract, and does not curtail the right of redemption. So an agreement made after the execution of the mortgage for a new and sufficient consideration that the mortgagor shall convey his interest to the mortgagee is valid, if not under the special circumstances of the case unfair and oppressive. It is necessary to distinguish carefully between a mortgage and a conditional sale. In the one, there is an inherent right to redeem; in the other, there is not. By a conditional sale is meant a transfer of land upon a condition that on the happening of a specified event the vendor shall have the right of repurchase. There is no relation of debtor and creditor in this case, and the former owner must comply with the contract.

It is quite common to insert in a mortgage a power of sale enabling the mortgagee to sell in case of default of payment, and thus obtain the amount of his claim. This is deemed to be a valid power. It does not resemble an ordinary power of attorney, which is revocable in its nature. The power is irrevocable, being in legal phraseology "coupled with an interest"—that is, the mortgagee, having an interest in the property, has the power conceded to him as connected with his interest in order to make it more completely available. Should he transfer or assign his mortgage, the power would accompany it. When the mortgage is paid the power is extinguished. A mortgagee, though having such a power of sale, is not obliged to resort to it. He may "foreclose" in the manner hereafter explained, so that the remedies become cumulative. If on the sale a surplus is received, it belongs to the mortgagor, or if he is then dead, it passes to his heirs as the proceeds of real estate. This power is of an important nature, and liable to abuse. To guard against oppression it is regulated in a number of the States by statute, prescribing the mode of giving notice of

the foreclosure to the mortgagor and to incumbrancers, as well as of conducting the sale and giving title to a purchaser. It is not necessary that a mortgage should be given directly to a creditor. It may be executed to some person in trust for him. This is a very common case in mortgages of railway property. A single mortgage is given to a trustee to secure a number of bonds. The mortgagee is thus a trustee, and the bondholders are *cestui que trustent* or beneficiaries. As between the trustee and the debtor all the ordinary relations of mortgagor and mortgagee would attach.

Reference will now be made to the rights acquired by a mortgagee. In a common law court he is deemed to be an owner of the land by a defeasible title until the mortgage is due. After it has matured his title is absolute, subject of course to the interference of a court of equity. Confining the attention for the moment to the courts of law, it may be affirmed that, as a strict rule, the mortgagee may exercise the ordinary rights of ownership. He may, in the absence of statutes to the contrary, eject the mortgagor and take possession of the estate. He may notify a lessee whose estate has been acquired before his own to pay rent to him. So he may convey his interest to another termed an assignee, who will stand in his position and possess his rights.

A court of equity, however, will impose an equitable obligation upon the mortgagee while thus exercising his legal right. For example, if he should be in possession of the land, then called a "mortgagee in possession," he could not, as an absolute owner might do, wilfully allow the property to lie idle. He would be required to act with ordinary diligence and prudence. Should he collect any rent, it would be applied on the mortgage. After his entire claim, including interest, is paid, he is a mere trustee for the mortgagor and others interested in the land.

The theory on which the court of equity in framing its rules proceeds is that the relation of debtor and creditor exists, and that the claim upon the land is a mere security. The mortgage partakes of the nature of that which it is given to secure. When the opposing views in the two courts come in conflict, the equity doctrine modifies that which prevails in law.

From what has been said, it may readily be inferred that the rules concerning mortgages are complex and difficult of comprehension in all their branches to any but professional men. The decisions of the courts on a cursory examination seem strangely conflicting when they may in fact be harmonized by considering that the subject is being regarded either from the law or equity point of view. Thus it will be found to be stated on the one hand that the mortgage is a conveyance; that the title has passed to the mortgagee, and on his death descends to his heirs; and that he can only assign it by an instrument in the nature of a conveyance. On the other hand, it is affirmed with equal positiveness in another set of decisions (equity) that the mortgage is a mere attendant upon the debt; that the assignment of it carries the mortgage with it, even without special mention, as an incident; that the debt and mortgage both belong, in case of the mortgagee's death, not to the heirs, but to the personal representatives (executors or administrators). To reconcile these views it has only to be supposed that the equity theory fastens a trust upon him who would be deemed owner in a court of law. For example, a sale by a mortgagee to an assignee, though in the form of a conveyance, is accepted by him as qualified by the rights of the mortgagor. So if a mortgagee dies, his heir, if he takes the title, holds it in trust for the executors, etc. In some of the States this double view has almost disappeared, and the equity rule has become so predominant as substantially to displace that of the common law. Such is the case in New York and California, and some other States. These States would hold that, for nearly all purposes, the mortgagor was owner, and the mortgagee had only a lien for his debt. The only way that he could acquire any more than this would be by foreclosure.

Something further should be said in respect to assignment. In the ordinary case of an assignment of a non-negotiable debt secured by mortgage the rule of equity is that the assignee must abide by the position of the one of whom he buys. If he for any reason can not enforce the claim, the assignee can not. It is therefore a usual and wise course before purchasing to inquire of the mortgagor whether he has any defenses to the claim. If he states that he has not, and the assignee purchases on the faith of the statement, the mortgagor will be estopped from denying its truth. It is judicious, though not necessary, to take the statement in writing. After the assignment notice should be given to the mortgagor, otherwise he will be allowed any payment which he may have made to the mortgagee in ignorance of the assignment. There are certain cases in which a person can compel an owner of a mortgage to make an assignment to him. An illustration is found in the case of a first mortgagee being about to foreclose, and a second desiring to take an assignment of the prior claim, in order to protect his right.

Without further treatment of the rights of the mortgagee, reference may now be made to the estate of the mortgagor. In this respect legal opinions are not so divergent. It is now agreed that for most purposes the mortgagor is the owner. Thus when a mortgagor dies his estate descends to his heirs, and his widow has dower. He can only part with his residuary interest by a regular conveyance. So the State treats him as owner in laying taxes and in taking possession of the land under the doctrines of eminent domain. A mortgagor may carve out of his estate other mortgages, which will have priority (in the absence of statutes requiring registration) in the order of their execution.

The right of redemption in the law of mortgages is of high consequence, and distinguishes the transaction from an absolute sale. Not only the mortgagor, but every one deriving an interest from him subsequent to the mortgage, may "redeem" or, in other words, may pay the debt and the interest, and thus be relieved from the mortgage. Among those who have a right to redeem may be mentioned, by way of illustration, subsequent mortgagees and judgment creditors, heirs, tenants by the curtesy and in dower, lessees, and persons having incorporal interests, such as easements. One who redeems must take up the entire mortgage. This rule will be applied to an owner of a fractional interest in the equity of redemption, who may then enforce against the owner of other interests such portion of his claim as is equitable and just. The right to redeem can be barred by the proceeding termed a "foreclosure," to be hereafter explained. So the right to redeem may be lost where the mortgagee is in possession by a neglect to call him to account for a considerable period of time. This time is sometimes fixed by statute, as, for instance, in New York at twenty years. Still, even then, should the mortgagee by some appropriate act recognize the existence of the mortgage—as if, for example, he should begin an action to foreclose the mortgage—the right to redeem will remain.

Notice should be taken of the grounds on which a mortgage may be treated as void or voidable, or, if originally valid, of the manner in which it may lose its force and effect. A mortgage is void or voidable for any of the reasons which make contracts in general invalid, such as for want of consideration, duress, fraud, illegality, or the like. It is a frequent practice in these cases for the mortgagor or other person standing in his place to begin an action to set aside the mortgage. Mortgages having once been valid may become inoperative by reason of a material or fraudulent alteration made by the creditor, or by merger or extinguishment, by release or other discharge, or by payment or by tender. Payment of the debt has the effect of extinguishing the mortgage. No reconveyance to the mortgagor is in general necessary. In order to remove from the registry all appearance of a claim upon the land, a written statement in a form prescribed by law, setting forth the fact of payment, is taken from the mortgagee. This is also registered. Such statement may be exacted by a court of equity, should a mortgagee decline to give it. The tender of the amount of the debt upon the prescribed day, though unaccepted, destroys the lien of the mortgage, though it does not discharge the debt. Some of the States give the same effect to an unaccepted tender made after the mortgage has become due. Lapse of time, according to the ordinary rules of law, may lead to a presumption of payment, which may, however, be rebutted. Sometimes there is a positive bar to any claim by force of the Statute of Limitations. (See LIMITATION OF ACTIONS.) The debt may in some instances be barred by this statute when the mortgage is not, as where different periods of time limit the right to proceed upon the debt and the mortgage respectively. While the debt continues no change in its form is fatal to the mortgage. Thus if a new note is given in the place of an old one, or the time of payment is extended, the debt remaining unchanged, the mortgage is still in force.

On the death of a mortgagor an important question frequently arises as to the fund from which satisfaction of the mortgage is to be made, or, in other words, whether pay-

ment is to be made from the real or personal estate. The general rule is that it must be made from the personal property rather than from the real estate. As the real estate, by the rules of the common law, passes to the heirs, and the personal property to the executors or administrators, the latter are accordingly primarily liable to pay the debt. A result of this rule is that the heirs become "sureties" for the executors, and if they are made to pay are allowed to proceed against the personal property. This rule has been changed by statute in England and in a number of the U. S., and the burden of paying the mortgage cast primarily upon the heirs. Under these statutes the executors become sureties for the heirs. The rule may be affected by evidence of the intent of the mortgagor that the burden of the debt shall be cast on either the one or the other portion of his estate. It has no application to the case of one who did not himself borrow the money, but acquired the estate subject to the mortgage, for in that instance his successor takes the property with its burdens.

Questions frequently arise as to the apportionment of the burden of the mortgage among different owners. It is a general rule that where a number of owners of land affected by a single mortgage stand in the same position as to rights, they must bear the burden equally. Accordingly, if one is called upon to pay the whole, he has a right to enforce a proportionate part of the mortgage against the owners of the remaining lots. This case may be illustrated in this wise: Suppose that there is a mortgage upon a farm which is subsequently divided into village lots and sold in such a way to purchasers that one is entitled to no preference over another. In this case every purchaser should pay a proportional part of the mortgage. This would be plain if the lots were sold to different persons contemporaneously. If, on the other hand, they had been sold successively to purchasers paying the full price, the earliest purchasers, according to the present prevailing opinion, have a superior right or "equity" to the later ones. The lots last sold would be primarily liable to pay the mortgage. If a foreclosure should take place and a sale be had to satisfy the mortgage, the lots would be sold in the "inverse order of alienation," i. e. the lots sold last by the mortgagor would be sold first on the foreclosure to pay the mortgage. The result would be that as soon as enough had been realized to pay the mortgage, further sales would not take place, and the lots first sold by the owner would accordingly be altogether relieved. These principles would not be recognized in case the earlier purchaser bought subject to a portion of the mortgage or assumed its payment. In that case he would be obliged to bear the burden that he had taken upon himself.

It is proper to state more comprehensively the general effect of a purchase of land subject to a mortgage. There are several forms of expression used in conveyances which must be carefully distinguished. Thus one may buy "subject to the mortgage," or he may "assume its payment." In the first case he is not personally chargeable. The land may be taken, but he is not required to pay from his own means. On the other hand, if he "assumes the payment" he becomes personally liable. The importance of the distinction may be seen from the following supposition: If one had bought "subject to a mortgage," and the land had diminished in worth so that its value was greatly inadequate to satisfy the debt, the land would be relinquished, but no further charge upon the purchaser could be made; if he had "assumed the mortgage," he would be personally responsible for the deficiency. These rules will be applied if the clauses referred to are in the purchaser's deed, even though he does not attach his signature to it. He can not take title under the instrument without accepting all its provisions.

Whenever a person holding the position of a surety is made to pay a mortgage, he is entitled to stand in the mortgagee's place and enforce the mortgage for his own benefit. This is known as the doctrine of subrogation. See SUBROGATION.

It remains to refer to the matter of foreclosure. The effect of the court of equity taking jurisdiction to allow a mortgagor in default to redeem the land, was to allow the mortgagee to file a bill in equity for the purpose of having the time fixed within which the mortgagor should exercise his right to redeem. Originally the only object in filing the bill of foreclosure was to fix a time within which the mortgagor must pay the debt or lose the property. This was called a bill of strict foreclosure. The object of the foreclosure suit is usually to obtain a decree that the property be sold, and the proceeds applied in payment of the debt. The surplus, if any, goes to the mortgagor. The mortgagee begins his proceedings by making parties to it all who have a right to redeem. If they are omitted, the proceedings are ineffectual as far as they are concerned. The creditor may at his option refrain from a foreclosure, and may collect his debt by an ordinary action. In some of the States he is allowed by statute in a single action to foreclose his mortgage and to have a judgment for any deficiency. The subject is largely regulated by statute, and is a matter of detail which must be examined in the books of practice in the respective States. After foreclosure the title vests absolutely in the mortgagor or purchaser, as the case may be. There may also be a foreclosure under a power of sale. There are also special statutory modes adopted in some of the States. For further information on the general subject, see Jones *On Mortgages*, Fisher *On Mortgages*, Washburn *On Real Property*, Kent's *Commentaries*, title *Mortgages*.

A mortgage, as heretofore explained in this article, has all the requisites of a deed or conveyance of land. It is signed, sealed, and delivered; there is a clause of defeasance in the deed, or, if separate, it is executed with due formality. The effect of the defeasance clause is to declare that if the debt is not punctually paid, or the act performed, the deed is to be void. While every mortgage is in form a conveyance of property, it is evident that where property is conveyed by a deed absolute on its face, with an oral understanding between the parties that the grantee is to hold the land only as security for the payment of the debt, the deed can not be treated at law as a mortgage. A court of equity, however, in such a case will confer upon the creditor the same rights and impose upon the grantee the same obligations that would have been created had the mortgage in fact been executed. Hence it is often said that a deed absolute on its face, if in fact intended only as security of the payment of a debt, is considered in a court of equity a mortgage. A court of equity will in certain cases where a mortgage has not been created by the parties recognize an equitable right in a creditor to treat land as security for the payment of his debt. Thus in England it is held that an equitable mortgage can be created by the mere deposit of title deeds. The theory upon which this doctrine is established is that the deposit of the title deeds is evidence of an agreement on the part of the person depositing them that the land shall stand as security for the payment of the debt, and that he will execute a mortgage thereof. The equitable mortgagee is therefore in such a case entitled either to ask that the land be sold, and the proceeds thereof applied in extinguishment of the debt, or that the equitable mortgagor execute a legal mortgage thereof. This doctrine is inconsistent with the statutes of frauds, and has been adopted only to a very limited extent in the U. S. (Jones *On Mortgages*, 4th ed., § 185.) The lien which a court of equity gives an unpaid vendor of land to secure the payment of the purchase money is another instance of a so-called equitable mortgage. This doctrine rests not upon the contract or agreement of the parties, but upon the broad principle that it would be unjust if the vendor were not allowed to look to the land as security for the purchase money.

II. CHATTEL MORTGAGES.—This subject has assumed much importance in modern times, though it received scarcely any attention in the earlier law-books. A mortgage of personal property is in law a conditional sale. It differs from a pawn or pledge in the fact that the latter is a bailment (see BAILMENT), the ownership remaining still in the bailor. If the debt is not paid on the appointed day, the title to the mortgaged chattel becomes, in the view of a court of law, absolute in the mortgagee. Still, even in that case a court of equity may interfere and enforce in favor of the mortgagor an "equity of redemption."

There is considerable danger that chattel mortgages may be resorted to by unscrupulous debtors as a mere pretext, and with a view to withdraw their property from the reach of their creditors. Such an act of withdrawal would be regarded as a fraud upon the creditors, and might, at their instance, be declared void. To insure publicity in this class of cases, it is provided by legislation in a number of States that the mortgage, when there is no change of possession, shall be filed in some public office. A failure to comply with this regulation would usually make the transaction void as to creditors and as to purchasers in good faith from the mortgagor, though the mortgage would still be binding as to the original parties and as to purchasers with notice of all the facts. It is in some instances further provided that

if the debt secured by the mortgage duly filed is not paid within a brief period (e. g. a year), there shall be a public declaration, filed by the mortgagee in the same office, of the continuance of the indebtedness. A non-compliance with this regulation is visited with similar penalties.

If the mortgage be valid, and be not paid at the appointed day, the remedy of the mortgagee to cut off the right of redemption is to foreclose by an action in equity. So he may sell under a power of sale, giving due notice to the debtor of the time and place of sale, and holding himself accountable to the mortgagor for any surplus realized above the amount of his claim. The subject may be further pursued in the works on mortgages already referred to, and in the statutes of the respective States, and in the reports.

Revised by WILLIAM A. KEENER.

EUROPEAN LAW.—*Historically*, the law of pledge or mortgage has regularly developed in one of two ways: 1. The earliest form, especially applicable to chattels, is the pledge *with possession* (Lat. *pignus*, Old German, *wette*, Mediæval Lat. *vadium*, French, *gage*). The pledgee has the right to keep the pledge until the debt is paid; by agreement he may also have the right of selling the pledge if the debt is not paid at the proper time. When this form of pledge is extended to realty, the right of using the property, of enjoying its yield or income (*fructus*), is regularly accorded to the pledgee: so in the Græco-Roman *antichresis*, and the Old German *Sate* or *Satzung*. In the Greek law it came to be recognized that the rights of a pledgee (right to possess, right to sell) might be created by contract without delivery of possession, and the Romans borrowed from the Greeks both the institution and the name (*hypotheca*). 2. A second and very early form of pledge or mortgage, which is especially applicable to realty, appears as soon as methods are devised for conveying title or ownership *without possession*. Debts are then secured, as in the English law, by conveying to the creditor full ownership of a piece of land or other property, with an agreement for a reconveyance whenever the debt shall have been paid. The older Roman law had such a form of mortgage in the *fiducia*; but this was afterward discarded in favor of the *hypotheca*, and in the later Roman law *pignus* and *hypotheca* were practically identical. Among the Teutonic peoples, in the Middle Ages, two methods of conveying title without delivering possession were gradually worked out—(*a*) by delivery of a deed, with a purely symbolical (i. e. fictitious) investiture; and (*b*) investiture in court, at the close of a real or fictitious law-suit. Both methods were employed to furnish security for the payment of debts. The delivery of a deed or "book" of land was a common method of establishing mortgage in Saxon England. In the Frankish empire judicial conveyance was usually employed to create the rights of ownership and of mortgage. A notice of the transaction was regularly entered in the records of the court. As early as the thirteenth century special registers of conveyances and mortgages were kept in some of the German cities. The reception of the Roman law, toward the close of the Middle Ages, brought two antagonistic systems face to face. Teutonic custom recognized no mortgage of realty without judicial registration, no pledge of personalty without possession (*Faustpfand*, *nantissement*). The Roman law recognized secret contractual mortgages of realty and personalty alike. In Teutonic custom all mortgages and liens were special; the Roman law recognized general mortgages and liens. In the main, the Teutonic rules held their own in Germany and in Northern France, and in modern European legislation they have more than held their own.

Modern legislation tends to require *publicity* of conveyances and mortgages, and *specialty* of mortgages and liens. As regards realty, secret (unregistered) mortgages either affect the parties only or are wholly ineffective. General mortgages and liens are abolished or are limited in their operation by requiring them to be imposed by registration on special pieces of property. The most advanced legislation, in these respects, is to be found in the states of the German empire, especially in Prussia. Out of the mediæval city registers have grown the modern German land-books (*Grundbücher*). They are judicial records, kept by the ordinary court of first instance in each judicial district, and they are arranged on the "lot system," i. e. a special page is devoted to each city lot or country field. (See RECORDING, etc.) These land-books enjoy *publica fides*, i. e., he who obtains an entry of conveyance or of mortgage from the person registered as owner, or an assignment of mortgage from the registered mortgagee, is protected against all claims and defenses which do not appear on the register.

Other European countries have registers of conveyances and mortgages, but they are usually kept like the registers used in the U. S., with no attempt to separate the entries affecting special pieces of property, and the registration of a mortgage simply gives it priority over earlier unregistered mortgages. Where registers are kept in this fashion no attempt is made to give them *publica fides* in the German sense.

As regards movable property, the tendency of European legislation is to require the transfer of the things mortgaged into the hands of the mortgagee and to refuse recognition to the chattel mortgage without possession. This is the system of the *Code Napoléon* and of European commercial codes generally.

LITERATURE.—Gide, *Le Régime Hypothécaire en Prusse* (Paris, 1873); Achilles, *Grundeigenthum und Hypothekenrecht* (Berlin, 1881). MUNROE SMITH.

Mortier, mōr'ti-ā', ÉDOUARD ADOLPHE CASIMIR JOSEPHE: soldier; b. at Cateau-Cambrésis, in the department of Nord, France, Feb. 13, 1768; received a mercantile education, but entered the army in 1791; was made a general of division in 1799, and marshal in 1805; fought with distinction in Germany, Spain, and Russia; was made Duke of Treviso after the battle of Friedland 1808, and a peer of France during the first Restoration; accompanied Louis XVIII. across the frontier, but returned to Napoleon during the Hundred Days; was commander-in-chief of the Fifteenth Military Division after the second Restoration; went as ambassador to St. Petersburg in 1832; took charge of the ministry of War for a short time in 1834, and was killed by Fieschi's infernal machine on the Boulevard du Temple, Paris, July 28, 1835.

Mortification: See GANGRENE.

Mortimer, ROGER: Earl of March, Baron of Wigmore; b. on the Welsh frontier about 1287; was knighted, and served under Edward I. in the Scottish war 1306–07; was employed in high offices under Edward II. in Scotland and France; joined the Earl of Lancaster in his rebellion against the king's favorites 1320; was captured at the battle of Boroughbridge 1322, and imprisoned in the Tower; escaped to France by the connivance of Queen Isabella; entered the service of King Charles IV. of France, then at war with England; met Isabella at her brother's court at Paris 1325; plotted with her against her husband; obtained possession of the young Prince Edward, heir to the throne; landed with Isabella at Orwell, Sept. 24, 1326; was joined by the great nobles; deposed Edward II. Jan., 1327; proclaimed the young prince as king (Edward III.); ruled the kingdom in his name; was created Earl of March; murdered the deposed king at Berkeley Castle Sept. 21, 1327; offended the people, the nobles, and the king by his cruelty and arrogance; was seized by the king and Lord Montacute at Nottingham Castle; attainted by a new Parliament called at Westminster, and was hanged at Tyburn, Nov. 29, 1330. His attainder was reversed as illegal in 1354, and the title and estates restored to his grandson, who by alliance with the royal family was ancestor of the Tudor and all later sovereigns of England.

Mort'main [from O. Fr. *mortemain*; *mort*, fem. *morte*, dead + *main*, hand. Cf. Fr. *main morte*]: the perpetual tenure of land by corporations. More commonly, however, the term is used to designate the holding of land by the Church, by religious corporations and pious foundations. The expression *manus mortua*, which occurs in public documents as early as the middle of the ninth century, is probably derived from the fact that persons who became members of religious corporations and ecclesiastical communities were civilly dead—that is, were regarded in the law as dead, so that property held by them was, as it were, in dead hands. The amount of the lands which during the Middle Ages and the centuries immediately succeeding passed into the hands of ecclesiastical proprietors, of churches, cathedrals, chapters, abbeys, convents, and every other species of religious corporation, and which were thus in mortmain, throughout all the countries of Europe was enormous. The influence of the Church was constantly exerted to procure additional gifts from the laity, and its policy permitted no alienation of what had once been obtained. This policy tended more and more to bring about a condition of affairs which was wholly incompatible with the welfare of the state and of society. The feudal system was a vast pyramidal organization of society, supported in every part, on its political as well as its social and economic sides, by

the feudal tenure of lands. This was a qualified and precarious land ownership, in which every man was the tenant of a superior owner or lord; a tenure based on an inflexible obligation to render military or other service to such lord, so qualified that it could be continued in the tenant and his heirs only at the cost of many burdensome exactions, and so precarious that any one of several causes might bring it to an end and throw the estate back into the hands of the lord. It was out of the precarious and incidental features of this tenure—the successions upon the death of tenants, the wardships and marriages of tenants' children, the escheats upon the failure of heirs—that the feudal state drew most of its nourishment. It was with this condition of things that the Church, by her policy above described, found herself at war. In consequence of the perpetuity of the ecclesiastical organizations, the tenacity with which they clung to all lands that came into their grasp, and their guaranteed freedom from ordinary feudal exactions, they withdrew, so far as the state was concerned, so much land from productive to non-productive uses—in other words, from living to dead hands—that they constituted a serious menace to the safety of the state. It was from sound considerations of policy, therefore, that the governments of Europe at an early day resorted to repressive measures against mortmain. The first of these measures subsequent to the overthrow of the Western Roman empire was an edict of the Emperor Frederick Barbarossa, who in 1158 prohibited the transfer of fiefs to the Church without the consent of the superior lord, and the same was subsequently enacted by Louis IX.

English legislation against mortmain begins with *Magna Charta* (A. D. 1217), and continues down to the fifty-second year of Victoria (1888). The provision in *Magna Charta* (cxliii.) went no further than to forbid the giving of lands to a religious house to be taken back again by the donor as tenant of the corporation; but it was construed by the courts as an absolute prohibition against the granting of lands to religious houses. The law must have speedily fallen into disuse, however, for the complaints against the practice of mortmain are almost continuous from the era of the Venerable Bede, in the eighth century, down to the statute *de viris religiosis*, "the statute of mortmain" *par eminence*, in 1279. (7 Edw. I., stat. ii., c. 13.) The preamble to this act recites the fact that notwithstanding the prohibition of Magna Charta, religious men continue to acquire the fee of lands, "whereby the services that are due of such fees, and which at the beginning were provided for defense of the realm, are wrongfully withdrawn, and the chief lords do lose their escheats of the same," and it is thereupon ordained that no alienation of lands by or to "any person, religious or other," "whereby such lands or tenements may anywise come into mortmain," should be valid. The act provided for its own observance by ordaining further that the lands so attempted to be conveyed should be forfeited to the next chief lord of the fee or to the crown.

Although this statute applied to all corporations, whether religious or secular, it was the ecclesiastical establishments that were most affected by it, and the next 100 years were occupied with the strenuous but futile struggle of the Church to evade or destroy the legislation against mortmain. This conflict was in part a diplomatic struggle between Rome and Westminster, but the real contestants were the lawyers on the part of the Church and the Parliament on behalf of the crown and the territorial lords. The fictitious suit known as a *recovery*, the practice of conveying lands to certain persons to hold to the *use* of others, were among the devices originated and carried into effect by the ingenuity of the lawyers in order to evade the Mortmain Act. They were so far successful that Parliament was compelled to meet each legal device with new and more radical legislation. The practice of conveying lands to be held in mortmain by "suffering a recovery," as it was technically known, was swept away by the second statute of Westminster (13 Edw. I., c. 32, A. D. 1285), and the similar abuse of the doctrine of *uses* by an act passed in 1391 (15 Ric. II., c. 5). Neither of these acts infringed upon the new modes of conveying lands by recovery or by use, except to render them invalid for the purpose of conveying lands to be held in mortmain. As will be noticed, the mortmain acts applied only to alienations *inter vivos*, there being at common law no right to devise lands by will, and the Statute of Wills (32 Hen. VIII., c. 1, A. D. 1540), which first made it possible to dispose of lands by will, expressly excluded corporations from its benefits. The subsequent history of the law of mortmain can be briefly stated. The principles of the legislation which has been sketched above, as well as the laws themselves, have kept their place in English jurisprudence. A few changes have nevertheless been made. By a series of judicial interpretations the power of *devising* lands to corporations for *charitable uses* was established and the object of the mortmain acts to that extent frustrated, but it was still held that the corporation must have the license of the crown to hold the lands, and by recent legislation the power to make any gift of lands to charity *by will*, whether to a corporation or not, has been wholly taken away, though there are a few exceptions in favor of gifts to the two universities and for certain educational and other public purposes. Cf. 9 Geo. II., c. 36; 51 and 52 Vic., c. 42.

There are, strictly speaking, no general laws against mortmain in the U. S., except in Pennsylvania. The absence of the feudal *régime*, for whose protection such laws were rendered necessary in Europe, and still more, perhaps, the lack of any causes of irritation—owing to the comparative poverty of religious corporations and the cheapness and abundance of land in the Western World—sufficiently account for the dearth of such legislation in the U. S. There are not wanting signs, however, that this indifference to corporate and especially to ecclesiastical ownership of land may not be the permanent attitude. The growing wealth of the churches and the increasing value of landed property may, before many years, require some readjustment of the relations of corporations to the state and society. The symptoms of such a tendency are already observable in the growing sentiment in favor of the taxation of Church property for the support of the state, as well as in the general disposition to limit the amount of property which even charitable corporations, as the higher institutions of learning, may hold.

Corporations are legal persons, and at common law, unrestrained by statutes of mortmain, have the same capacity to take and hold lands that natural persons have. In the U. S., as in England, they are usually prohibited from acquiring or holding more land than is necessary for the purposes of their incorporation. Ordinary or business corporations can not take land by devise; charitable corporations, however, are usually allowed to take it both by deed and by will. In a few of the States there are statutes restricting the creation of charitable uses by will, somewhat resembling the English statute of 9 Geo. II. Thus it is provided in New York that no testator leaving a wife, child, or parent shall devise or bequeath to a charitable institution or association more than one-half of his property, deducting his debts; but this is not, properly speaking, a statute of mortmain, not being aimed at the ownership of lands by corporations as such, but being a paternal limitation on the power of devise in favor of the natural objects of a testator's bounty. See Shelford *On Mortmain*; Digby's *History of the Law of Real Property*; Leake's *Digest of the Law of Land*.

GEORGE W. KIRCHWEY.

Morton, HENRY, Ph. D.: physicist; b. in New York city, Dec. 11, 1836; graduated at the University of Pennsylvania 1857, and then studied law in Philadelphia for nearly two years, and during that time lectured on chemistry and physics at the Episcopal Academy, originating the scientific course in the curriculum of that institution, and filling a chair created for him, when his growing predilection for physical and for chemical science induced him to give them his entire attention. In 1863 he was elected Professor of Chemistry at Philadelphia Dental College; in 1864 became resident secretary of the Franklin Institute of Pennsylvania, and in April of that year began the delivery in the Academy of Music of Philadelphia of a course of sixteen lectures on light, which excited great attention both in the U. S. and in Europe, on account of the originality and brilliancy of their experimental illustrations. (See *Les Mondes*, vols. xviii., *seq.*) These lectures were the first of their kind. In 1867 Prof. Morton became editor of the *Journal* of the Franklin Institute, and during the academic year 1867–68 filled temporarily the chair of Chemistry and Natural Philosophy in the University of Pennsylvania. In 1869 he organized the photographic parties sent to observe the solar eclipse of Aug. 7, under the auspices of *The Nautical Almanac* office. In 1869 he was elected Professor of Chemistry in the University of Pennsylvania, and in 1870 was appointed president of the Stevens Institute of Technology at Hoboken, N. J., then just founded. President Morton has published a number of papers in scientific

journals. Among them may be noted those *On the Giffard Injector*, *On the Bright Line beyond the Moon's Edge in Partial Phase-eclipse Photographs*, *On the Fluorescent Relations of Anthracene and Chrysogen*, *On the Fluorescent Relations of Some Solid Hydrocarbons found in Petroleum Distillates*, *On the Fluorescent Relations of Pyrene and Chrysene*, *On Thallene, a Solid Hydrocarbon produced in the Destructive Distillation of Heavy Petroleum Oils*, *On the Basic Salts of Uranium*, *On the Fluorescent and Absorption Spectra of Uranium Salts*, the latter comprising seven papers prepared in conjunction with Dr. H. C. Bolton (*Chemical News*, vol. xxviii., 1873; *Moniteur Scientifique*, vols. xv. and xvi.). COLEMAN SELLERS.

Morton, JAMES DOUGLAS, Fourth Earl of: regent of Scotland; b. at Dalkeith about 1530; was a younger son of the family of Angus, and succeeded to the earldom and estates of Morton in right of his wife 1553. He became a lord of the Congregation 1557, and Lord High Chancellor 1563. He took a leading part in the murder of Rizzio 1566; escaped to England, but was soon pardoned and returned. He joined the confederacy of the nobles against Mary and Bothwell, discovered the Casket Letters, and led the van in the battle of Langside, where the forces of the queen were routed. He was elected regent in Nov., 1572, but his policy raised up enemies on all sides. In 1577 he resigned and retired to Lochleven Castle, and though he recovered his authority soon afterward, was overthrown by the influence of the new royal favorites, Esme and James Stewart; tried and convicted of participation in the murder of Darnley, and executed in Edinburgh, June 3, 1581.

Morton, JAMES ST. CLAIR: military engineer; b. in Philadelphia in 1829; graduated at the U. S. Military Academy in 1851; rose to be major of engineers in July, 1863. After various services he became engineer in charge of the Potomac aqueduct; led the Chiriqui expedition, Central America, in 1860; on his return resumed charge of the Potomac waterworks, and subsequently superintended the fortifications on the Tortugas; in May, 1862, reported to Gen. Buell as chief engineer of the Army of the Ohio; in Oct., 1862, was chief engineer of the Army of the Cumberland; commanded the pioneer bridge-brigade of that army, and became brigadier-general of volunteers, dating from Nov. 29, 1862; constructed the intrenchments about Murfreesboro; took part in the capture of Chattanooga, and superintended the engineering operations at Chattanooga under Gen. Rosecrans; in the Richmond campaign of 1864 served as chief engineer of the Ninth Army-corps, and was killed at the assault of Petersburg, Va., June 17, 1864. He wrote *A Memoir on American Fortifications*, etc.

Morton, JOHN: cardinal and Archbishop of Canterbury; b. at Bere, Dorsetshire, England, about 1420; educated at Cerne Abbey and Baliol College, Oxford; became prineipal of Peckwater Inn, now Christ Church; was present at the battle of Towton, and escaped with Queen Margaret to Flanders; attainted of high treason 1461; pardoned and attainder reversed 1471; made master of the rolls 1472; Archdeacon of Winchester 1474; appointed by Edward IV. ambassador to the Emperor of Germany and the King of France; Bishop of Ely and Lord Chancellor 1478; imprisoned by Richard III. 1483, but escaped to the Earl of Richmond in Flanders; was made privy councilor by Henry VII. 1485, Lord Chancellor 1486, and Archbishop of Canterbury in July of the same year; was made cardinal by Pope Alexander VI. 1493. D. at Knoll, Kent, Sept. 15, 1500.

Morton, LEVI PARSONS, LL. D.: Vice-President of the U. S.; b. in Shoreham, Vt., May 16, 1824; in 1840 engaged in mercantile business at Hanover, N. H., in 1848 in Boston, Mass., and in 1854 in New York, where he became a banker in 1863; was Republican M. C. from New York 1879–81; U. S. minister to France 1881–85; candidate for U. S. Senator from New York in 1885 and 1887, but was not elected. He was elected Vice-President of the U. S. by the Republicans Nov. 6, 1888, and Governor of New York, Nov. 6, 1894.

Morton, NATHANIEL: historian; son of George Morton, an early emigrant to Plymouth, Mass., and author of *Mourt's Relation*, an account of the founding of Plymouth colony; b. at Leyden, Holland, in 1613; was taken by his parents to Plymouth, Mass., on the Ann, in 1623; after his father's death was taken into the family of Gov. Bradford, whose wife was his mother's sister; early became assistant to his uncle in the management of public affairs, and by annual popular election was secretary of the colony from Dec. 7, 1647, until his death at Plymouth, June 29, 1685. In 1669 he published at Cambridge the first regular history of the colony, under the title *New England's Memoriall, or a Brief Relation of the most Memorable and Remarkable Passages of the Providence of God manifested to the Planters of New England*. Other editions were printed in London (1669), Boston (1721, with supplement by Josiah Cotton), Newport (1772), Plymouth (1825), Boston (1826, with valuable notes by Judge John Davis), and Boston (1855, with notes). The work was compiled at the request of the commissioners of the four united colonies, was chiefly based upon MS. of Gov. Bradford, was attested as correct by the most eminent survivors of the earlier generation, and until the recovery of Bradford's own history (1855) was the chief early authority for the history of Plymouth colony. Morton also wrote a synopsis of the Church history of Plymouth (1680, published by Young in his *Chronicles of Plymouth*, 1841), etc.

Morton, OLIVER PERRY: See the Appendix.

Morton, THOMAS: adventurer; b. in England about 1575; was a lawyer at Clifford's Inn, London; was leader of the colony sent by Weston to settle in Massachusetts June, 1622; went back to England; returned with Capt. Wollaston in 1625; settled at Mt. Wollaston, now Braintree, where on May Day, 1626, he presided over a scene of merriment very obnoxious to Puritan ideas, setting up a May-pole and naming the spot Ma-re Mount or Merry Mount. The people of Plymouth, hearing of these proceedings, came in force two years later, headed by Capt. Miles Standish, cut down the pole, carried Morton away, and sent him back to England. He returned to Massachusetts in 1629, but was again seized and transported, and his house torn down 1630. He published a satirical work, *The New English Canaan* (Amsterdam, 1637); went again to Massachusetts 1643; was imprisoned a year for his "scandalous book"; removed to what is now Maine. D. about 1646. See John L. Motley's novels, *Morton's Hope* (1839) and *Merry Mount* (1849); also Hawthorne's story, *Merry Mount*.

Morton, W. T. G.: See the Appendix.

Mortuary: a building for the temporary care of dead human bodies; a dead-house. The chief purposes of a public mortuary are to relieve poor people from the necessity of eating and sleeping in the same room with a corpse during the interval between death and burial, to isolate and properly to treat the bodies of those who have died of contagious and infectious diseases so as to prevent them from being the means of the spread of such diseases, and to provide for the care and identification of the unknown dead and of those bodies which require judicial investigation. Such institutions were first established in Austria in 1771, and by Hufeland in Weimar in 1791; they were also proposed by Thiery in his *La vie de l'homme respectée et défendue dans ses derniers momens* (Paris, 1787), were built in Berlin in 1797, in Munich in 1818, and since then have been erected in most of the large cities of Europe. One of the original arguments for their construction was that they would prevent the danger of premature interment, a danger which was then supposed to be much greater than it is now believed to be.

In Europe, as a rule, mortuaries are placed either in or near cemeteries, but such a location greatly interferes with their utility as a means of helping the poor, since they are too far from their habitations. To induce those for whose benefit they are especially designed to make use of them they should be near at hand, and in a large city they should not be with the morgue, although in cities having less than 100,000 inhabitants the two may be combined. As a specimen of a large mortuary and morgue combined one of the best is that of Berlin, of which a description, with illustrations, is given by Dr. Liman in the *Vierteljahrsschrift für gerichtl. Med. und öffentl. Sanitätswesen*, n. f. xliv. (Berlin, 1886), p. 170. It is easy to manage such buildings and the bodies received in them in such a way that there will be no possible risk of infection or offense from them, even when located amid crowded dwellings. J. S. BILLINGS.

Morula: a stage in the development of many animals, when the egg in its segmentation has become converted into a solid mass of cells, presenting an appearance much like that of a mulberry (Lat. *morum*), whence the name. See EMBRYOLOGY.

Morungen, mō-roong'en, HEINRICH, von: minnesinger; probably born at the castle Morungen, near Sangerhausen, Germany, during the latter part of the twelfth century. He is mentioned as Henricus de Morungen, *miles emeritus*, during the years 1213–21, in a document by Margrave Dietrich

IV. of Misnia, who at one time also had friendly relations with Walther von der Vogelweide. The fact that Heinrich very probably participated with Dietrich IV. in the crusade of 1297 may have given rise to the legendary story which forms the basis of the later popular song, *Vom edelen Moringer*. As a minnesinger Heinrich von Morungen ranks among the very best poets living previous to Walther. Though he imitated the troubadours, his poetry is characterized by a marked originality. See Ferdinand Michel, *Heinrich von Morungen und die Troubadours* (1880); E. Gottschau, *Ueber Heinrich von Morungen* (1880); F. Vogt, *Der edele Moringer, Paul u. Braunes Beiträge*, vol. xii., 431–453.

JULIUS GOEBEL.

Mosaic [from Mediæv. Lat. *mosa'icum*, for **musaicum* = Mediæv. Gr. μουσαϊκόν, mosaic (liter., neutr. of μουσαϊκός, pertaining to the Muses, deriv. of μοῦσα, Muse), for anc. Gr. μουσεῖον, mosaic, deriv. of μοῦσα, a Muse]: the art by which ornamental patterns, and even elaborate pictures, are made up of small pieces of different colors; or, in its simplest form, the art of making pavements and the like of hard material in small pieces, which surfaces, even if not varied in color, have a decorative appearance caused by the play of light on the different *tesseræ*. The word is used in a more general sense for any artistic composition made up of different pieces of material fitted together, as some ornamental windows are said to be *mosaics* of stained glass, and even mosaics of wood are sometimes spoken of. In a stricter sense the term is confined to what is made up of hard substances, generally stones or glass. Inlay differs from mosaic in that for inlaying smaller pieces are let into the surface of a large piece; but a patch of mosaic may be inlayed in a larger solid surface, as was often the case in both ancient and mediæval work. The mosaics of ancient Greece were rather of this character, so far as is known to us. Pieces of blue glass were inserted in marble or in metal frames. In like manner the work of the COSMATI (*q. v.*) was commonly delicate mosaics of glass inserted in bands and circles, and in surfaces of white marble; an inlaying of mosaic. The cutting of sunken patterns in marble or stone in *intaglio*, and the filling of these sunken parts with some colored substance, as is often practiced, is rather inlaying than mosaic.

Roman floors were commonly in mosaic of white or light-gray marble made up of tesseræ about an inch square or smaller; the borders and other ornamental parts made by the use of dark-colored tesseræ of the same size. Large fragments of such work may be seen in the baths of Caracalla in Rome. The tesseræ are fitted together very roughly, with no attempt to make invisible joints; indeed, they are ranged in curves, etc., so as to produce certain effects of light and shade by means of the darker joints themselves, so that these joints are much wider in one place than in another. In this way large rough figures and scrolls, leafage, and the like are produced. Many mosaic floors have been found in Pompeii. On the other hand, elaborate pictures exist, many of which are in the museum at Naples, and also a very refined sort of mosaic decoration was used for walls and piers, the whole surface being covered with this material, and a very rich color-effect is thus produced. A fountain in a large niche exists in the Naples museum, where the whole concave surface of the niche and the semi-dome at its top are covered with mosaic of very small tesseræ. On each side of this stands a column, and the convex surfaces of these are as rich as the surface of the niche. There are in the same gallery bas-reliefs of figures the whole surface of which—background and reliefs alike—are covered with mosaic.

When the early Christian churches were in building, as in the sixth and seventh centuries, the arts of antiquity were in complete decay. Sculpture was not to be had; even the barbarous art of the fifth century had disappeared. Of the painting of the time we can judge by miniatures in manuscripts, and by the designs of the mosaics themselves. It is evident that all the higher skill and ability had gone, and that what was left was the natural instinct of decoration common to half-civilized people, together with a disposition to study the great works of the past which were then numerous in spite of war and ravage, and a certain tradition of great design which would influence their decoration and keep it from the triviality often seen in the work of barbarous people, even when artistic in disposition. Mosaic lent itself easily to the requirements of the time. The artists could not draw the figure, but they could compose groups of draped personages, the head and arms only showing, and the rest of each figure shrouded in ample robes, the patterns of the stuffs most effective in their contrasting colors. The Christian emblems, too—lambs, crosses, banners bearing the sacred monogram, and the like—were perfect material for mosaic. In this way the interiors of Santa Sophia at Constantinople and of the other churches of the empire, by hundreds, including those of Ravenna, which still remain to us in almost perfect condition, were decorated in the richest manner; but the material, instead of stone or marble, was generally glass. The art, once well established in the Eastern provinces and in Sicily, spread to Italy with the earliest building there of churches of any importance, and the great basilicas were adorned within, and even to a certain extent without, by means of this splendid and inexpensive material. St. Mark's church at Venice and the churches at Palermo and Monreale in Sicily are more completely decorated in this way than others, but many churches in Ravenna and in Rome, as well as in other towns, retain large mosaics of great beauty.

What is called *Florentine mosaic* is an inlay of very hard stones in a background usually of white or of black marble. It is so far a true mosaic that the different pieces of beautiful jasper, lapis-lazuli, and the like, are fitted close together, no background showing between. Some specimens of this art have some parts in relief; thus a cherry will be indicated by a piece of translucent and brilliant red stone raised in a half ball above the general surface. The term *pietra dura* (hard stone) is commonly used in Italy for such work. It is sometimes used on a very large scale; thus the whole sacristy of the Church of San Lorenzo in Florence is lined with *pietra dura* of the most brilliant sort, and although parts of this are in rather large slabs of the precious material, other parts are covered with a mosaic of small pieces.

What is called *Roman mosaic* is made of very thin glass rods of many colors, which are manufactured for the purpose. By these very elaborate pictures may be made; views of St. Peter's, etc., are common even in the U. S., but these are generally almost valueless as works of art.

RUSSELL STURGIS.

Mosaic Gold: See ORMOLU.

Mosasau'ria [Mod. Lat., named from *Mosasau'rus*, one of the genera; Lat. *Mo'sa*, the river Meuse + Gr. σαῦρος, lizard]: a group of extinct reptiles, remains of which were first discovered in 1780 in the upper chalk of St. Pietersberg, near Maestricht, in Holland, on the Meuse river. The first known species was called *Mosasaurus hofmanni*. A few other species have been found in the Cretaceous of England and Europe, but their remains are much more abundant in the deposits of that age in North America, and among these several genera have been recognized. They agree in having an elongated and serpent-like body. The jaws were powerful and well armed with sharp conical teeth, which were ankylosed by their bases with the jaws, and occurred also on the roof of the mouth. The two rami of the lower jaw were united at the extremity only by cartilage, as in the serpents, and a further provision for the wide distension of the mouth was afforded by a joint in the side of the lower jaw at the base of the splenial element. The other bones of the skull had much resemblance to those of existing lizards. (In the genus *Mosasaurus* the cranium is 5 feet in length.) The vertebræ were concave in front and convex behind. Those of the neck were few. The limbs were in the form of paddles with five digits, each having from four to six phalanges. The families now known are the *Mosasauridæ* and the *Edestosauridæ*. In the former the zygosphenal articulation of the vertebræ was wanting; in the latter it was well developed, as in modern snakes and iguanas. The best-known genera of the first family are the following: *Mosasaurus*, *Liodon*, *Baptosaurus*, *Holosaurus*, *Lestosaurus*, and *Tylosaurus*. More than fifty species of Mosasauria have been found in the Cretaceous strata of North America. About fifteen of these are from New Jersey, half a dozen from the Gulf deposits, and the remainder from Kansas and other parts of the West. *Mosasaurus princeps*, from New Jersey, probably was 75 feet in length, and *Tylosaurus dyspelor*, from Kansas, scarcely less gigantic.

O. C. MARSH.

Mosasau'ridæ: a family of reptiles. See MOSASAURIA.

Mosby, JOHN SINGLETON: See the Appendix.

Moscheles', IGNAZ: pianist and composer; b. at Prague, May 30, 1794. His father was a Jewish banker. He studied first with F. D. Weber, director of the conservatory, after-

ward with Albrechtsberger and Salieri; went to Paris in 1820, but in the following year repaired to London, where he remained twenty-five years. In 1846, after a period of professional travel in France and Germany, he established himself in Leipzig; was made director of the conservatory there, and exerted great influence on the musical education and taste of his time. Thalberg and Mendelssohn were his pupils, the only two who by general admission surpassed their master. Previous to them Moscheles ranked with the most eminent, even with Hummel and Kalkbrenner. Moscheles was a composer of sonatas, concertos, fantasias, variations, and studies for the piano. Some of these have a permanent value. His translation from the German of Schindler's *Life of Beethoven* is well known. D. in Leipzig, Mar. 10, 1870. See *Aus Moscheles Leben* (1872) and *Briefwechsel mit Mendelssohn-Bartholdy* (1888).

Moschus (Gr. Μόσχος) **of Syracuse**: Greek idyllic poet; flourished about 150 B.C. His *Lament for Bion* (Ἐπιτάφιος Βίωνος) has been utilized by Shelley in his *Adonais*. Noteworthy also are his *Rape of Europa* and his *Runaway Cupid* (Ἔρως δραπέτης). Often edited with Theocritus and Bion (*qq. v.*), and translated with the same by Andrew Lang (1889).

Mosco'so, or **Mosco'so de Alvarado**, Luis: soldier; b. at Badajoz, Spain, about 1505. In 1529 he went to Guatemala with his kinsman, Pedro de Alvarado, passed with him to Peru in 1534, and remained there for two years, serving under Pizarro. Returning to Spain, he joined the expedition of Hernando de Soto to Florida in 1538; on de Soto's death, May 21, 1542, succeeded him in command and descended the Mississippi in July, 1543, finally reaching Mexico with the remnants of the expedition. D. in Peru in 1560. H. H. S.

Mos'cow: government of Central Russia, watered by the rivers Moskva and Kliazma. Area, 12,859 sq. miles. Its surface is an almost level plain, consisting of a claycy or sandy soil, not very fertile. The government is the most flourishing manufacturing part of Russia. Whole villages are often engaged each in the manufacture of one single article—cloth, silk brocade, paper, pins, glass, mirrors, etc. —and the manufacture of many articles is carried to a high degree of elaboration. Limestone and marble are quarried and extensively used for building purposes, and the government is rich in coal. Pop. (1897) 2,433,356.

Moscow: the former capital of the Russian empire, a great manufacturing and commercial center, and now the second imperial residence; in lat. 55° 45′ N., lon. 37° 33′ E., 400 miles by railway S. E. of St. Petersburg (see map of Russia, ref. 7–E). It is situated in a hilly, fertile, well-cultivated, and beautiful district on the navigable river Moskva, and presents, when seen from the Sparrow Hills on its southern outskirts, a most picturesque appearance, spires and domes in old Byzantine style rising beside palaces and public buildings in the modern French and Italian. Its circumference is 23 miles, and it consists of five different parts: 1. Kremlin, the central part of the city, occupying a hill on the northern bank of the Moskva, is surrounded by heavy stone walls. It contains the palaces of the czar, the patriarch, and the holy synod, the arsenal, the treasury, and other public buildings, the Cathedral of the Assumption, in which the czars are crowned, built in the fourteenth century, and gorgeously decorated; the Cathedral of St. Michael, in which the czars before Peter the Great are buried; the tower of Ivan Veliki, 270 feet high, surmounted by a gilded dome 37 feet high, and containing thirty-two bells; the Kolokol, the largest bell in the world, weighing 448,000 lb., placed on a pedestal close by, etc. 2. Kitaigorod, or the "Chinese city," to the E. of the Kremlin, also surrounded by a wall with towers and gates, is the seat of the trade of the city. Here is the Petrovskoi cathedral, properly consisting of twenty-one chapels joined together. 3. Beloigorod, or the "white city," because it is surrounded by a wall of whitish stone, encircles the Kremlin and Kitaigorod on three sides. Here are the palaces of the governor and the nobility, the university, several immense monasteries, the foundling hospital, the theaters, the post-office, and other government houses, and the famous drill-house, 560 feet long and 158 feet wide. 4. Zemlianoigorod, or the "earthen city," because it was formerly surrounded by an earthen wall, which now has been transformed into promenades. 5. The Slobodi, or suburbs, eight in number; in these splendid mansions and magnificent monasteries, schools, hospitals, etc., surrounded with large and beautiful gardens, alternate with clusters of shanties, and with manufacturing establishments. Among the 400 places of worship which the city contains there are chapels for the Roman Catholics, Lutherans, and other Christian denominations, also synagogues and even mosques. The university, attended by 3,400 students, was founded in 1755, and enjoys a high reputation. Connected with it are a library of 250,000 volumes, a printing establishment, a zoölogical and mineralogical museum, a botanical garden, an observatory, an anatomical theater, and several scientific associations of high standing. Besides general schools of different grades the city also contains special educational institutions—ecclesiastical seminaries, military schools, an academy of art, commercial and industrial schools—and numerous benevolent institutions. It has water communication with the Baltic, the Black, the White, and the Caspian Seas, and it is connected with St. Petersburg, Nijnii-Novgorod, Taganrog, and Warsaw by rail. It carries on an immense trade in tea, grain, cotton, timber, furs, tallow, metals, and its own productions. The opening of the port of St. Petersburg had a bad effect on the commerce of Moscow, but since that time both the trade with Asia and the inland trade of the city have increased immensely. It also rivals St. Petersburg as the first manufacturing place in Russia, and its factories of cotton, wool, silk, tobacco, paper, chemicals, leather, pottery, watches, silver, and other metals are very extensive. Its book-trade exceeds that of any other city in Russia.

Moscow was founded in the twelfth century, and in the fourteenth it became the capital of the rising empire and the residence of the Grand Duke of Moscow. In 1712 Peter the Great transferred the capital to St. Petersburg, but Moscow, being a sacred city, continued to stand as the first city in the estimation of the Russian nation. It was the winter residence of the Russian nobility, and by its commerce and industry it grew rich. In 1812 it had 9,158 houses and 252,609 inhabitants. Napoleon, however, when he entered it, Sept. 15, 1812, found hardly 12,000 people in the city; the rest had fled. From Sept. 14 to 21 a conflagration raged, started by the inhabitants themselves, and the impossibility of wintering in a ruined city, together with lack of supplies and the liability to being continually attacked by Cossacks, compelled Napoleon to abandon the city. Only 2,626 houses were left standing after the conflagration. Nevertheless, the city was soon rebuilt. It had 166,515 inhabitants in 1816, 348,562 in 1838, 611,970 in 1871, and 988,610 in 1897.

Moscow: town; capital of Latah co., Ida. (for location of county, see map of Idaho, ref. 5–A); on the N. Pac. and the Union Pac. railways, near the Washington boundary-line, 94 miles S. by E. of Spokane, Wash. It is in a milling, mining, stock-raising, and agricultural region; is the seat of the State University, established by act of the territorial Legislature in 1889, contains a business college, 2 public-school buildings, 2 national banks with combined capital of $175,000, 2 State banks with capital of $125,000, and a daily and 3 weekly newspapers; and has a large lumber-trade and several manufactories. Pop. precinct (1890) 2,861; town (1900) 2,484. Editor of "Mirror."

Moseley, mōz'lĕy, Henry, D. D., F. R. S.: educator and scientist; b. in England about 1802; graduated at St. John's College, Cambridge, with high honors 1826; took orders in the Church of England 1828; was Professor of Natural Philosophy and Astronomy at King's College, London, 1831–45; was a distinguished champion of popular education, and one of the first inspectors of schools appointed by government; author of *Mechanical Principles of Engineering and Architecture* (1842), which is a text-book at West Point, *Lectures on Astronomy* (1847), and of several other works; became canon of Bristol 1853; chaplain to the Queen 1855. D. at Olveston, Jan. 20, 1872.

Moselle, mō'zel': river of France; rises in the Vosges at an elevation of 2,260 feet, and flows with a tortuous course of 330 miles through France, Belgium, Luxemburg, and Rhenish Prussia, where it joins the Rhine at Coblentz. Its broad valley is covered with vines, celebrated for the light wine they yield.

Mosen, mō'zen, Julius: poet and dramatist; b. at Marienev, Saxony, July 8, 1803; studied jurisprudence at Jena and Leipzig; practiced law at Dresden, and was in 1844 appointed official playwright at the court theater of Oldenburg. D. in Oldenburg, Oct. 10, 1867. Mosen's best-known poetical production is his *Ahasver* (1838), an epic poem of great philosophical conceptions, treating the popular legend of the Wandering Jew. The philosophical nature of his poetry can also be seen from his historic dramas, *Die*

Bräute von Florenz, *Der Sohn des Fürsten*, *Kaiser Otto III.*, *Heinrich der Finkler*, *Cola Rienzi*, *Herzog Bernhard von Weimar*, in which the characters are made the representatives of the poet's abstract thought in order to illustrate his conceptions concerning the philosophy of history. Mosen's *Gedichte* (1836) shows less of this philosophical turn. JULIUS GOEBEL.

Mosenthal, mō'zen-tăl, JOSEPH: organist, violinist, and conductor; b. at Hesse-Cassel, Germany, in 1834; removed to New York in 1853, and there remained until his death. He had studied music under his father, and the violin under Spohr. On arriving in New York he began playing and teaching, and in 1860 became organist of Calvary church, remaining there until 1887. During that time he composed much sacred music, mostly for the choir of that church. He conducted the Mendelssohn Glee Club continuously from 1867, and before that he conducted the Tentonia Society and the New York Vocal Society. D. in New York, Jan. 6, 1896.

Mosenthal, SALOMON HERMANN: dramatist; b. Jan. 14, 1821, of Jewish parentage, at Cassel, in the Prussian province of Hesse; studied at the technical school of Carlsruhe and later at the University of Marburg, and received in 1851 a position under the Austrian Government at Vienna. Of his many highly successful dramas, two—*Deborah* (1850) and *Sonnenwendhof* (1857)—have been translated into the English, Danish, Hungarian, and Italian languages. His dramas *Die deutschen Komödianten* (1863), *Der Schulz von Altenbüren* (1868), *Maryna* (1871), and his tragedies *Düweke* (1860) and *Pietra* (1865) have also proved successful on the stage. D. in Vienna, Feb. 18, 1877. Revised by J. GOEBEL.

Moser, mō'zer, GUSTAV, von: dramatist; b. at Spandau, Germany, May 11, 1825; received a military education in Berlin; served as an officer in the Prussian army, but retired in 1856. In the solitude of his country life he conceived the idea of writing for the theater, and was at once very successful with a number of smaller farces. He established his fame as one of the brightest and wittiest writers of German comedies by the piece *Das Stiftungsfest* (1872), which is still played on many German stages. This comedy was followed by many others, the best known of which are *Der Elefant* (1873); *Ultimo* (1873); *Der Bibliothekar* (The Private Secretary, 1878); *Der Veilchenfresser* (1876); *Krieg im Frieden* (1880). The last two pieces were taken from German military life, and Moser's example has since been followed by other dramatists. A number of Moser's comedies and farces have been translated into English and successfully played. JULIUS GOEBEL.

Möser, mö'zer, JUSTUS: historian; b. at Osnabrück, Germany, Dec. 14, 1720; studied jurisprudence at Jena and Göttingen, and also paid great attention to the study of the modern languages and their literatures; occupied several very important positions in the government of his native country. D. Jan. 8, 1794. Möser, who was an ardent German patriot, may be called the father of modern German historiography. While history had thus far consisted only of a dry nomenclature of dynasties and wars, Möser claimed that the true historian should direct his attention chiefly to the changing conditions of the people, their laws, customs, and habits. He himself gave an example of such historical writing in his celebrated *Osnabrückische Geschichte* (1768), in which he also urged a more careful study of German antiquity. His *Patriotische Phantasien* (1774), a collection of essays on various practical topics, exerted a great influence on his nation. See *Sämmtliche Werke* (Berlin, 1842–43); Kreissig, *Justus Möser* (1857). JULIUS GOEBEL.

Moses [= Lat. = Gr. Μωσῆς, from Heb. *Mōsheh*, either derived from or adapted in form to *māshāh*, draw out (sc. of the water. Cf. Exod. ii. 10)]: lawgiver of the ancient Jewish people. The history of Moses is principally found in the Bible, but there are several other sources. There is an Egyptian tradition (Manetho), a Jewish tradition (Midrash), Philo, and Josephus, and a Mussulman tradition in the Koran. The tradition, however, contains comparatively very little which is not simple elaboration and exaggeration of the account given in the Pentateuch, and it has generally a legendary character. The name of Moses is one of the greatest in history. He organized the Hebrew people; he formed the Hebrew character; and the influence which the Hebrew nation has exercised on the civilization of mankind, by being through many centuries the bearer of the monotheistic idea, can hardly be overestimated. According to Ex. ii. 10, Moses was adopted by the king's daughter, and according to Acts vii. 22 he was initiated in all the secret wisdom of the Egyptian priesthood; but the Bible tells nothing of his youth from his adoption by the princess to the day when he slew an Egyptian overseer for his barbarous treatment of a Jewish man. He had then to flee from Egypt, and lived for many years in Midian with Jethro the priest, whose daughter he married and whose flocks he tended. Having been called to free his brethren from the oppression in which they lived, he returned to Egypt, but at first he was received by his countrymen with suspicion and by the Egyptians with contempt. Nevertheless, he succeeded in his mission, leading the Jews across the Red Sea into the desert. The first part of the task was thus accomplished: the remainder, however, proved still more difficult. Following the statements made in the Bible, rather than the traditional interpretations of the Bible, we find that the Israelites left Egypt a circumcised people, fairly well organized, with a good degree of civilization and a body of civil and religious institutions, but lacking in the sterner virtues. In the wilderness Moses improved their organization, and by divine revelation gave them a new body of institutions, into which, however, their previous usages were largely incorporated. For more than thirty-seven years they were "shepherds in the wilderness" (Num. xiv. 33). They were miraculously cared for to the extent to which God saw this to be necessary, but not to the extent of relieving them from effort, and not so as to free them from the discipline of the hard life of the desert. They came together again the fortieth year after they left Egypt, an uncircumcised people (Josh. v. 2–9), their civilization largely lost, paying less regard than they should to the legislation which Moses had provided for them (Deut. xii. 8; Amos v. 25, etc.), yet trained in the virtues in which they had been lacking, and thus, on the whole, fitted for the career that lay before them. According to the biblical narrative (in the Pentateuch and the book of Acts), Moses was forty years old when he fled into Arabia, eighty when he led the march to Sinai, and 120 when he died on Mt. Nebo. See Warburton's *Divine Legation of Moses* (1737, 1741, 1788); Spencer, *De Legibus Hebræorum Ritualibus* (1685); Witsius, *Egyptiaca* (1683); Michaelis, *Mosaisches Recht* (1770–75); and Saalschütz, *Mosaisches Recht* (1846, 1848). For the more recent literature concerning the times, the legislation, and the writings of Moses, see HEXATEUCH.

Revised by W. J. BEECHER.

Mos'heim, JOHANN LORENZ, von: theologian; b. at Lubeck, Germany, Oct. 9, 1694; was theological professor at Helmstädt 1723–47; became in 1747 professor at Göttingen and chancellor of the university. D. in Göttingen, Sept. 9, 1755. An able preacher and historian, his works are of great permanent value. The chief are *Institutiones Historiæ Ecclesiasticæ* (1726–39) and *De rebus Christianorum ante Constantinum* (1753), the former translated into English by Maclaine (London, 1765–68), later by James Murdock (New York, 1832; best ed. by W. Stubbs, London, 1863, 2 vols.). The latter was also translated by James Murdock, *Commentaries* (2 vols., New York, 1832). His theological standpoint occupies the middle between the two extremes, pietism and deism.

Moskwa, Battle of the: See BORODINO.

Moslem: See MOHAMMED and MOHAMMEDANISM.

Mosler, HENRY: See the Appendix.

Mosque [from Fr. *mosquée*, from Span. *mezquita*, from Arab. *masjid*, deriv. of *sajada*, bow, adore]: a Mussulman sanctuary; generally a square or rectangular building, surmounted by a dome. The most essential feature is the mihrab, an indentation in the wall or a marble slab or other object, which indicates the direction of the KAABA (*q. v.*), toward which prayer must be addressed. The mosque generally contains a high, narrow pulpit with a sharp-pointed cone above. Lamps, arabesques, and passages from the Koran form the customary ornaments, no pictures whatsoever of human beings or animals being allowed. None may enter save with unshod feet. The two sexes do not worship together, and a few mosques are reserved to women. Outside at the southeast corner is generally the lance-like minaret or tower, surrounded by an open gallery whence the muezzin calls to prayer. The school of the village or quarter is usually attached to the mosque. Endless variety of architecture and decoration characterizes the larger edifices. These have from two to seven minarets, are preceded by open courts with galleries and colonnades, and have hospi-

tals, almshouses, soup-kitchens, libraries, colleges, and theological seminaries in connection. The first mosque was erected at Medina by Mohammed in 622. E. A. G.

Mosquera, mos-kā′răă, Ruy Garcia: explorer and colonist; b. in Spain in 1501; accompanied Sebastian Cabot in his voyage in the Spanish service to the Rio de la Plata 1526; discovered Paraguay, from which he brought specimens of silver; was left by Cabot in charge of the colony of Espiritu Santo; narrowly escaped massacre by the Indians; established himself at Cape Santa Maria on the coast of Brazil, and subsequently on the island of Santa Catalina, after defeating the Portuguese, and in 1535 joined Pedro de Mendoza in founding Buenos Ayres, where he died about 1555. The influential family of Mosquera in Colombia, which during the nineteenth century has furnished several presidents, generals, ministers, and bishops, is said to trace its descent from the navigator.

Mosquera, Tomás Cipriano: soldier and politician; b. at Popayan, New Granada (the present Colombia), Sept. 20, 1798. He joined the patriot army when a lad, fought in Colombia and Peru, and was private secretary and chief of staff with Bolivar. Subsequently he held diplomatic and cabinet positions, was senator, and attained the rank of general. He was president of New Granada 1845–49, and during this term a large part of the internal debt was paid, restrictions on commerce were removed, and immigration was encouraged. In 1859 he headed the federalist-democratic revolt, assumed the executive in July, 1861, and called a constituent assembly, which adopted a federal constitution, changed the name of the country to United States of Colombia, and made him dictator. Meanwhile the opposition party was victorious in the west, and formed an alliance with Ecuador; civil war continued until 1862, when the opposition president, Canal, came to terms with Mosquera. The latter resigned his dictatorship to a new convention, which limited the presidential term to two years. Under this constitution Mosquera was president 1863–64, and was elected for the term beginning 1866; but having forcibly adjourned congress and arrested many of its members, he was deposed and banished for two years (May, 1867). Subsequently he was governor of Cauca and a member of congress. Mosquera was an author of considerable repute, his works including a *Vida de Bolivar* and a treatise on the geography of New Granada. D. at Coconuco, Oct. 7, 1878. Herbert H. Smith.

Mosquitia, mōs-kĕĕ-tee′ăă, or the **Mosquito Coast**: an ill-defined region on the eastern or Caribbean coast of Central America, between Cape Gracias á Dios and the river San Juan. The so-called Mosquito Indians, from which it takes its name, are a race of mixed African and Indian blood, probably derived from the union of Cimarrones, or fugitive slaves, with native women. (See Indians of Central America.) They first appear in history in the latter part of the seventeenth century as complete savages, subject to hereditary chiefs or "kings," and able, according to reports, to bring 40,000 warriors into the field. About 1660 the English had a permanent settlement, and subsequently they established a protectorate over the coast. Spain repeatedly interfered and tried to occupy it, and later Nicaragua and Honduras both claimed the territory. By the Clayton-Bulwer treaty, signed at Washington Apr. 19, 1850, Great Britain resigned all claims to the Mosquito Coast, and in 1860 by treaties with Nicaragua, Honduras, and Guatemala, she recognized the sovereignty of Nicaragua over it. The latter country agreed to maintain a permanent reserve for the Indians, who should have the right of self-government, while acknowledging allegiance to the republic. The same treaty forbids Nicaragua to interfere with the commerce of the Indians, and this clause has led to fresh disputes, owing to the attempts of Nicaragua to maintain customs officers at Bluefields. The question of her right to do so was submitted to the adjudication of the Emperor of Austria, who, in 1880, decided that no such right existed.

The name Mosquitia is now generally restricted to the reserve which, in a limited sense, forms a part of Nicaragua. It is a strip on the coast between lats. 11° 30′ and 14° 10′ N., extending inland to lon. 84° 15′ W., with an area of about 7,000 sq. miles. The surface is generally low, largely covered with forest, and very fertile. The interior is little known, but it is crossed by many rivers, the largest of which is the Bluefields river, at whose mouth is the only town of importance, Bluefields, or Blewfields, on a bay or lagoon of the same name. The Mosquitos proper probably do not number more than 10,000, and they are hardly advanced from their former savage condition. They obey their own "king," whose "capital" is on Pearl Cay Lagoon N. of Bluefields. There is a considerable trade in cabinet woods and bananas, and this is largely in the hands of citizens of the U. S. See "Samuel A. Bard" (E. G. Squier), *Waikna: Adventures on the Mosquito Shore* (1856 and 1891).

H. H. Smith.

Mosquito [= Span., dimin. of *mosca*: Ital. *mosca*: Fr. *mouche*, fly < Lat. *mus′ca*]: a name given to many biting and blood-sucking dipterous insects, mostly of the family *Culicidæ*, and of the genera *Culex*, *Anopheles*, *Corethra*. The female insects alone bite, or rather thrust into the flesh their awl-like bristles, massed together into a tube, through which they draw the blood. The distress these insects occasion is very great, not only in hot countries, but in some cold ones, like Lapland and Labrador. The use of mosquito-netting, the kindling of dense smoky fires, and the application of tar, pennyroyal oil, or decoction of feverfew to the skin—all have some effect in protecting the person from their attacks. The female deposits her eggs on the surface of the water, and the larvæ constitute an important part of the food of fishes. See Gnat. Revised by F. A. Lucas.

Mosquito Coast and **Mosquito Reservation**: See Mosquitia.

Moss-agate: See Chalcedony.

Mossbunker: See Menhaden.

Mosses [plur. of *moss* < M. Eng. *mos*: O. H. Germ. *mos* > Mod. Germ. *moos*; cf. Lat. *mus′cus*, moss]: See Mossworts.

Mosso, Angelo: physiologist; b. in Turin, Italy, May 31, 1846; studied medicine in Turin, devoting himself especially to physiology under the direction of Moleschott, and continued his studies in Florence and Leipzig. In 1876 he became Professor of Pharmacology in Turin, and three years later succeeded Moleschott as Professor of Physiology. He has won distinction by his original methods of investigation of the physiology of man, and by his ingenious mechanical devices for recording physical change resulting from physical and mental activity. In 1882 he founded the *Archives italiennes de biologie*, in which many of his works have appeared. He has published also *Die Diagnostik des Pulses* (1879); *Ueber den Kreislauf des Blutes im menschlichen Gehirne* (1881); *Die Furcht* (1889); *Die Ermüdung* (1892); *Die physische Erziehung der Jugend* (1894).

Mossworts: the plants constituting the great branch of the vegetable kingdom otherwise called the Bryophytes (*Bryophyta*), including the plants familiarly known as the liverworts and mosses. They are related to the Fernworts (*q. v.*) on the one hand, and the higher Carpophytes, especially the Stoneworts (*q. v.*), on the other. They agree with the fernworts in the structure of their sexual organs and a marked alternation of generations. The first generation—i. e. the one developed from the spore—bears the sexual organs; after fertilization a structure is produced, the second generation or sporophyte, which bears spores. From these spores the sexual generation is again produced.

The mossworts, like the fernworts, are all chlorophyll-bearing plants, none being parasitic or saprophytic. They are plants of rather small size, rarely exceeding 10 or 20 cm. (4 to 8 inches) in height, and often measuring no more than a millimeter ($\frac{1}{25}$ inch). They usually inhabit moist places, and a few are aquatic. While the plant-body often exhibits a complete differentiation of leaf and stem, no true roots are ever developed, their place being filled by root-hairs consisting of long cells or rows of cells.

Their sexual organs are antherids and archegones. The former are club-shaped bodies, consisting of a boundary layer of cells inclosing a considerable number of thin-walled cells. At maturity the latter are extruded from the antherid, when the protoplasm of each cell arranges itself into a more or less coiled, motile filament, the antherozoid, which escapes by the rupture of the cell-wall (Fig. 3, *e*). The archegones are flask-shaped structures (Fig. 9, *b*), consisting of one or two layers of boundary cells inclosing, at maturity, a single cell—the germ-cell, egg-cell, or oösphere. The neck of the mature archegone is narrow, elongated, and open at the top. Fertilization takes place by the antherozoids swimming to the summit of the archegone, and working their way down the narrow channel in its neck to the egg-cell with which one fuses. Of course this must take place in water, which may be abundantly supplied by a rain or heavy dew.

As a result of fertilization the egg-cell soon undergoes successive divisions, giving rise to a spherical or more commonly an elongated body (the sporophyte), the upper portion of which is usually somewhat enlarged into a spore-case (Figs. 5, 7, 10, 11). The spores are developed from certain internal cells, occupying definite positions, each mother-cell dividing into four daughter-cells, which become the spores by the formation of thick cell walls. In germination the spore grows out into an elongated green tube, which soon becomes divided into cylindrical cells (constituting the "protonema"), and from this the sexual plant develops sooner or later (Fig. 6).

Mossworts are often reproduced non-sexually by means of brood-cells or masses of cells, which are spontaneously separated from the plant-body. These are analogous to the conidia of many lower plants, but unfortunately in most books they have been called buds (or gemmæ), which they certainly are not.

In one of the common liverworts (*Marchantia polymorpha*) small cups form on the upper surface of the thallus (Fig. 1, *a*), and in these hairs appear which gradually enlarge by subdivision, finally forming a many-celled brood mass (Fig. 1, *b*), each of which breaks away below and falls to the earth, where it soon grows into a new thallus. Similar brood-cells occur singly in the axils of the leaves of some mosses. In some higher liverworts single brood-cells are detached from the margins of the leaves.

FIG. 1.—*a*, a small plant of *Marchantia polymorpha* with four brood-cups (natural size); *b*, brood masses in several stages of growth magnified.

The tissues of mossworts are mostly parenchymatous; still they show the beginnings of a differentiation into several kinds (Fig. 8, *b*, *c*, *d*), and there is often a rudimentary fibro-vascular bundle in the center of the stem and the midrib of the leaf.

The mossworts are usually divided into two classes, the Liverworts (*Hepaticæ*) and the Mosses (*Musci*).

THE LIVERWORTS.

The plant-body is a thallus, or a filiform stem with two (or three) rows of leaves, and is always prostrate, with two distinct and well-marked surfaces, an upper or dorsal and a lower or ventral, the latter bearing the root-hairs (rhizoids) by which it is attached to the ground.

There are three orders of liverworts, including about 3,000 species, as follows:

Marchantiaceæ, the liverworts proper; thallose, dichotomously branched, terrestrial (rarely aquatic) plants; spore-case globose, without a columella, indehiscent, or dehiscent (into four or more lobes, or rarely by a separable lid). The common crystalwort of the U. S. (*Riccia natans*, Fig. 2) is one of the simplest representatives of the order. Its spore-case is indehiscent, has no elaters, and is immersed in the upper surface of the thallus. *Marchantia polymorpha* (Figs. 1, 3, *c d e*, and 4), which is very common in nearly all regions of the earth, is one of the highest types of the order. Its spore-case splits into several revolute lobes, has elaters, and is borne on a specialized branch of the thallus.

FIG. 2.—*Riccia natans* (natural size).

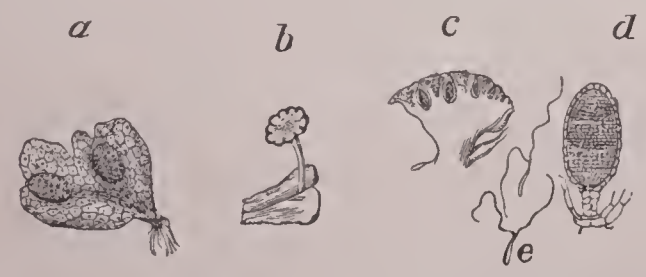

FIG. 3.—*a b*, antheridial branches; *c*, section of same; *d*, antherid; *e*, antherozoid (*d* and *e* highly magnified).

The many genera are separable into several families—e. g. (1) *Ricciæ*, represented in the U. S. by three genera, *Riccia*, *Thallocarpus*, and *Sphærocarpus*, and about twenty-five species; (2) *Targonieæ*, a small family represented in the U. S. by a single Californian species; (3) *Marchantieæ*, of which *Marchantia*, *Conocephalus* (Fig. 3, *a*), *Fimbriaria* (Fig. 4), and *Lunularia* are common genera in the U. S., the last named occurring on flowerpots in greenhouses to which it has been introduced from Europe.

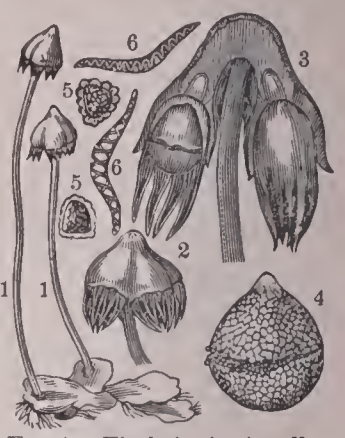

FIG. 4.—*Fimbriaria tenella*: 1, 2, 3, plants, with antheridial branches; 4, spore-case; 5, spores; 6, elaters.

Anthocerotaceæ, the horned liverworts; thallose, irregularly branched terrestrial plants, spore-case cylindrical, with a columella and elaters, and splitting at maturity into two longitudinal valves. The single family, *Anthoceroteæ*, is represented in the U. S. by a dozen or more species of *Anthoceros* (Fig. 5, *a*) and *Notothylas*.

Jungermanniaceæ, the scale-mosses; leafy-stemmed plants, with two-ranked leaves, spore-case stalked, globose, without columella, dehiscing into four lobes, and containing elaters. Scale-mosses grow on the bark of trees, on rocks, or on the ground. The species (2,000 or more) are usually distributed among about a dozen families. In the U. S. 171 species have been enumerated belonging to the genera *Aneura*, *Metzgeria*, *Frullania*, *Lejeunia*, *Madotheca*, *Radula* (Fig. 5, *b*), *Jungermannia*, etc.

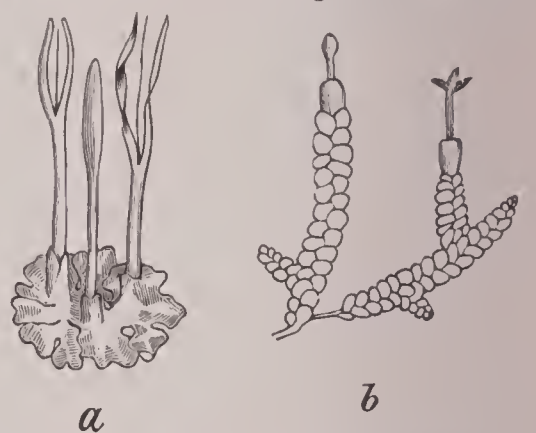

FIG. 5.—*a*, *Anthoceros lævis*; *b*, *Radula complanata*.

THE MOSSES.

The plant-body is always a leafy stem, which is usually erect, producing root-hairs below; the leaves, which are mostly sessile and several ranked, are usually composed of a single layer of cells, often traversed by a midrib.

In the mosses the protonema is usually much larger than in the liverworts. Here it is a mass of green branching threads (Fig. 6, *a*), from which eventually the leafy plant (sexual generation) is produced (Fig. 6, *b*).

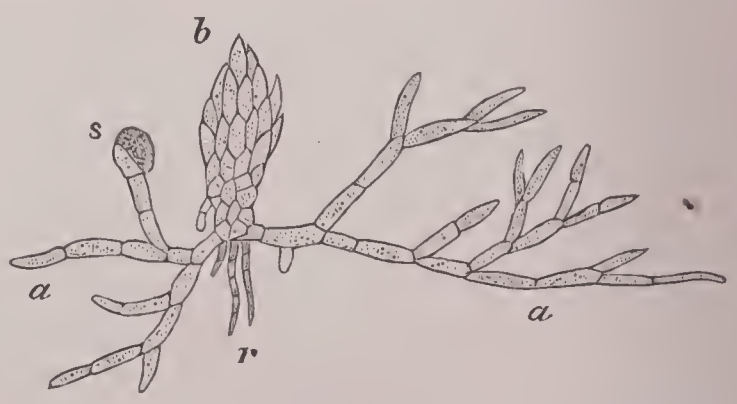

FIG. 6.—*a*, Protonema of a moss, growing from the spore *s*, and producing a leafy stem, *b*, and root-hairs, *r*.

About 4,500 species are known, arranged in four orders, as follows:

Andreæaceæ, the black mosses; small plants, usually of a dark color, with thickish, several-ranked leaves, composed of similar cells; sexual organs terminal; antherids several, oblong, stalked; archegones several, each developing into a thin, persistent calyptra, and producing a spore-case which is destitute of stomates, and dehisces longitudinally into four valves. Before maturity the spore-case is raised upon a short stalk developed at the summit of the leafy stem. The family, *Andreææ*, contains the only genus, *Andreæa* (Fig. 7, *a*), and sixteen species, three of which occur on wet rocks in North America.

Sphagnaceæ, the peat-mosses; large, soft, and usually pale-colored mosses, inhabiting bogs and swamps. Leaves five-ranked, and composed of dissimilar cells, (1) narrow chlorophyll-bearing cells, and (2) large, perforated cells lying between the former, and often containing water. Antherids globose, stalked, solitary at the sides of the leaves of special branches; archegones terminal on special branches, soon ruptured above by the growing spore-case, which has stomates on its surface, and dehisces horizontally by a lid, leaving a naked mouth (Fig. 7, *b*). Before maturity the spore-

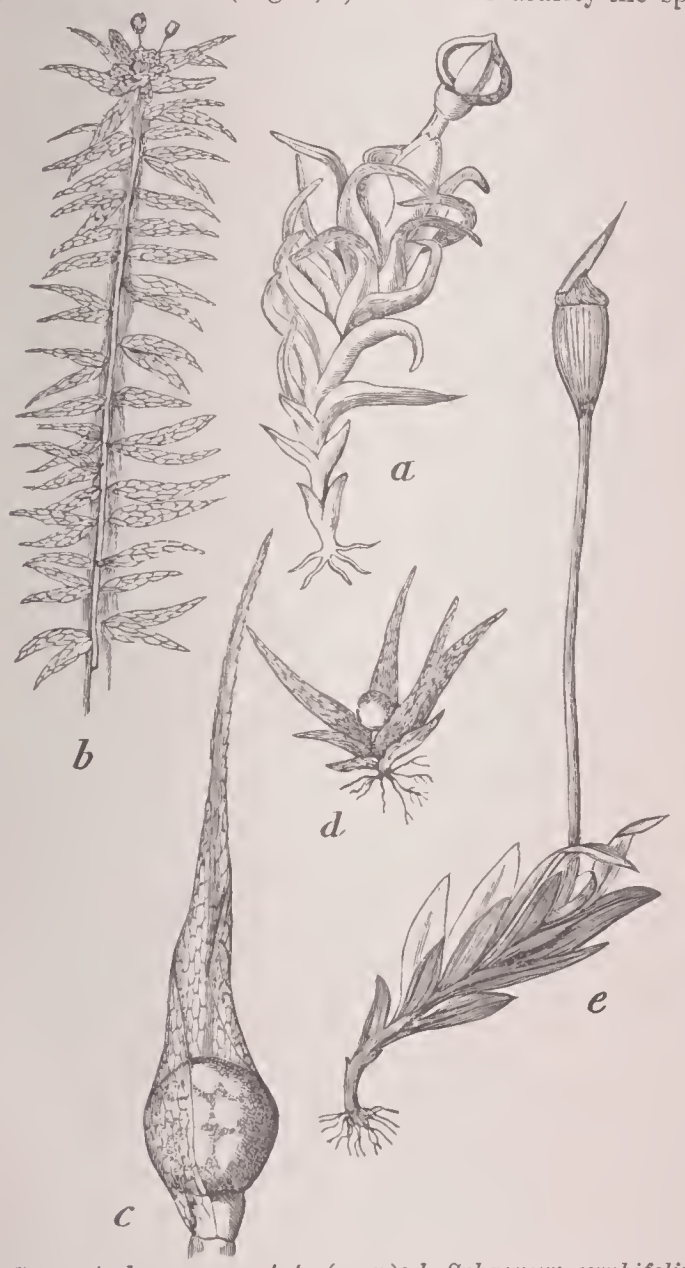

Fig. 7.—*a*, *Andreæa angustata* (mag.); *b*, *Sphagnum cymbifolium*; *c*, spore-case of *Archidium phascoides* (mag.); *d*, *Nanomitrium tenerum* (mag.); *e*, *Fissidens minutulus* (mag.).

case is raised upon a short stalk developed at the summit of the leafy stem.

There is but one family, *Sphagnaceæ*, and this contains but one genus, *Sphagnum*, of about sixty species, nearly half of which occur in North America. *S. cymbifolium* (Fig. 7, *b*) and several other species are used by florists for packing in the transportation of living plants, inasmuch as they retain moisture for a long time.

Archidiaceæ, minute plants, with branching and prostrate stems, and leaves composed of a single layer of similar cells, and a midrib of elongated thicker-walled cells; sexual organs terminal, antherids club-shaped, archegones several, each rupturing as the spore-case develops; spore-case globose, sessile, containing a few large spores and no columella, indehiscent. The single genus, *Archidium* (Fig. 7, *c*), represents the family *Archidieæ*. The species are few, five only occurring in the U. S.

Bryaceæ, the true mosses; usually of larger size with simple or branching stems, and leaves composed of a single layer of similar cells, and commonly with a midrib of elongated cells; sexual organs terminal or lateral, antherids club-shaped, archegones usually several, each developing into a persistent calyptra, and producing a stalked spore-case, which contains a columella, has stomates on its surface, and usually dehisces horizontally by a lid, the mouth being naked or provided with teeth (Fig. 7, *d e*).

In this order are found fully nine-tenths of the mosses (about 4,000 species). They vary greatly in complexity of structure and development of the plant-body, from the tiny *Ephemerum* to the large and stocky *Polytrichum*, or the

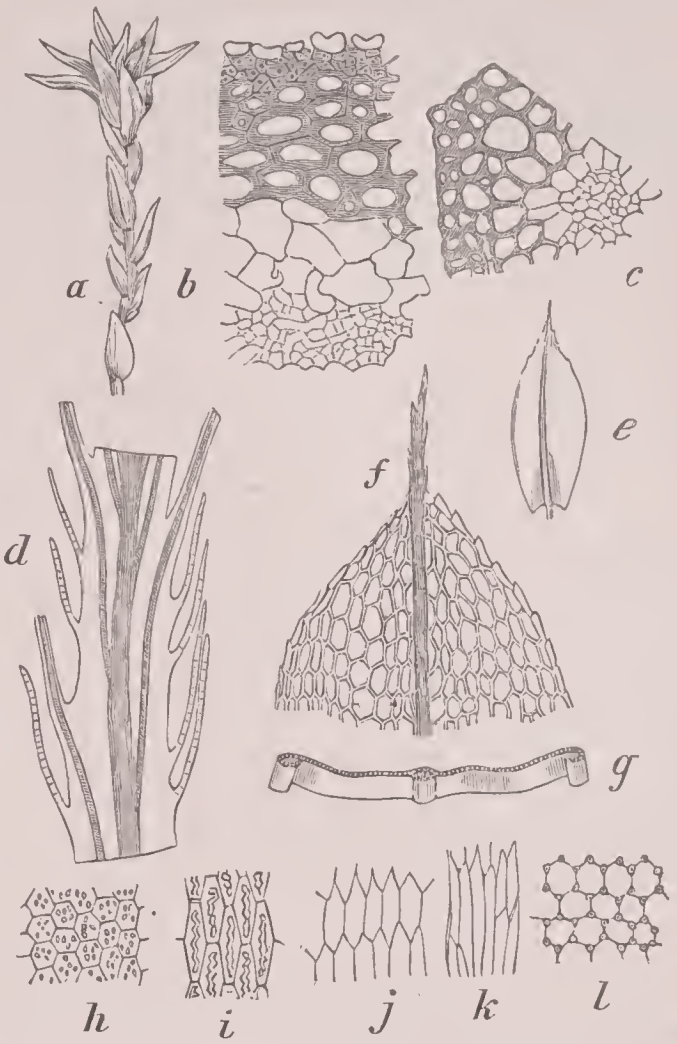

Fig. 8.—*a*, typical moss plant; *b c*, partial cross-sections of stems; *d*, longitudinal section of stem, showing the rudimentary fibro-vascular bundles; *e*, leaf; *f*, portion of leaf showing areolation; *g*, leaf section; *h* to *l*, forms of areolation (all except *a* magnified).

feathery-branched *Hypnum*. In some cases there are strings of elongated cells, which traverse not only the leaves (Fig. 8, *e f g*), but also extend downward into the stem (Fig. 8, *d*). These are rudimentary fibro-vascular bundles. The stems of some species, when cut in cross-section, show a good deal of differentiation of their tissues (Fig. 8, *b c*). The cells of the leaves vary much in the different genera, and these differences are commonly used in the generic and specific descriptions. A few of the characteristic shapes (areolations) are given in Fig. 8, *h* to *l*.

In many cases the sexual organs are collected at the summit of the stem, and surrounded by a whorl of leaves, somewhat resembling a flower (Fig. 9). In some cases the antherids (*a*) and the archegones (*b*) are in the same "flower" (hermaphrodite), while in others they are separated, but on the same plant (monœcious), or on different plants (diœcious).

Fig. 9.—A moss plant in "flower": *a*, antherids and hairs (paraphyses); *b*, archegones and paraphyses (magnified).

The spore-case is usually long stalked, and as it grows carries up the calyptra (Fig. 10, *a*). When young the spore-case is composed of uniform parenchymatous tissue; but an inner cylindrical portion separates partially from the rest (Fig. 10, *e*), and in this is the circular spore-bearing layer (darker in the figure), each cell of which produces four spores by subdivision. The remaining central tissue constitutes the columella.

The teeth which line the mouth of the opened spore-case are formed by the splitting of certain thick-walled cells. Each tooth is thus composed of the fragments of many

cells, whose horizontal walls constitute its transverse bars (Fig. 11, *b d*). In some mosses there is a single row of

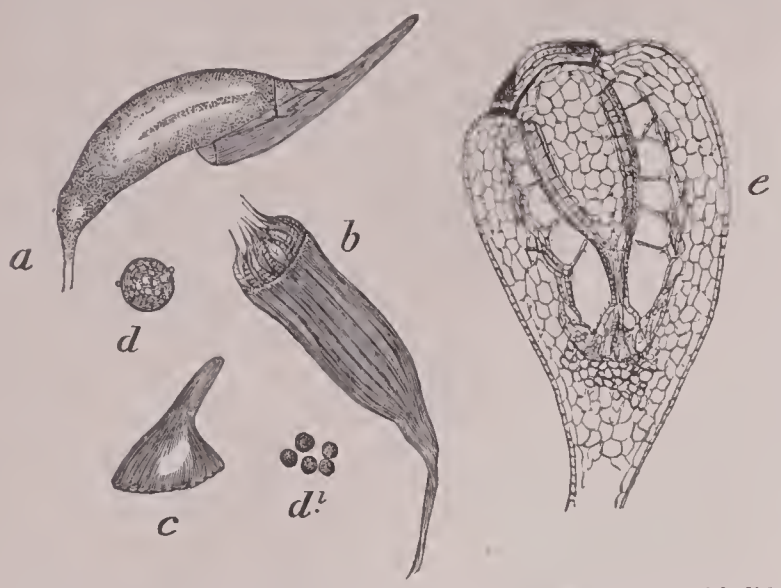

Fig. 10.—*a*, ripe spore-case with its calyptra ; *b*, the same with lid removed ; *c*, lid ; *d d*, spores ; *e*, young spore-case in longitudinal section (all magnified).

teeth (Fig. 11, *a b*), while in others there are two (*c d*). The usual number in each row is sixteen, but it may be four, eight, sixteen, thirty-two, or sixty-four.

There are many families of the true mosses, arranged under two sub-orders, as follows :

1. *Spore-case indehiscent*, Cleistocarpæ.—Here are grouped several families of small mosses, including the genera *Ephemerum*, *Nanomitrium* (Fig. 7, *d*), *Phascum*, etc., often associated with the plants of the preceding order on account of their simple structure.

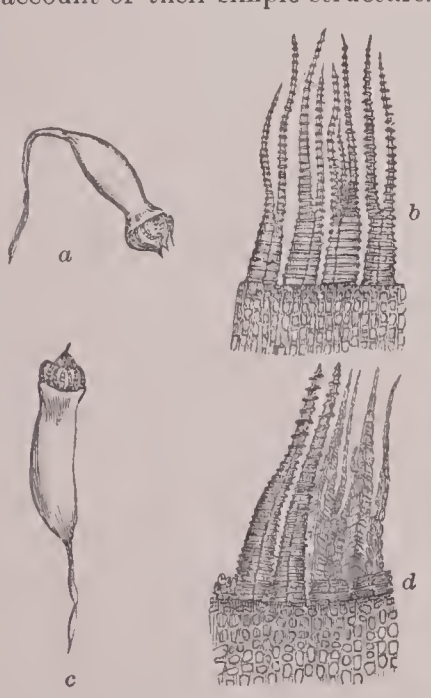

Fig. 11.—*a*, spore-case of *Fissidens* ; *b*, teeth of same ; *c*, spore-case of *Hypnum* ; *d*, teeth of same (all magnified).

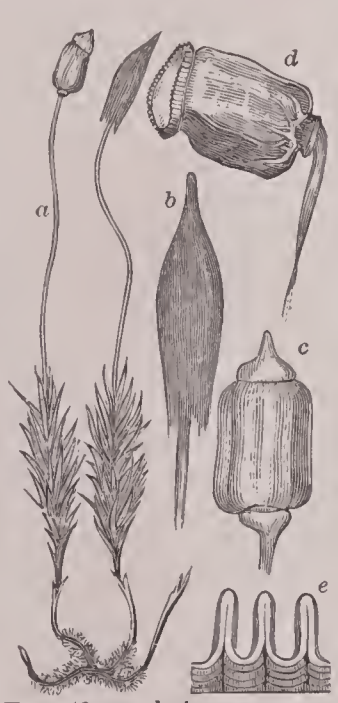

Fig. 12.—*a*, hair-cap moss (*Polytrichum*) ; *b*, spore-case covered with calyptra ; *c*, spore-case ; *d*, same with lid off ; *e*, teeth of spore-case (all except *a* magnified).

2. *Spore-case dehiscent by a lid*, Stegocarpæ.—This sub-order is again divided into two groups, according as the spore-case is terminal or lateral. The prominent genera in the first (*Acrocarpæ*) are *Grimmia*, *Bartramia*, *Fissidens* (Figs. 7, *e*, and 11, *a b*), *Ceratodon*, *Dicranum*, *Polytrichum* (Fig. 12), *Orthotrichum*, *Funaria*, *Bryum*, *Mnium*, and *Timmia*. In the second (*Pleurocarpæ*) the principal genera are *Leskea*, *Cylindrothecium*, *Climacium*, and *Hypnum* (Fig. 11, *c d*).

Charles E. Bessey.

Mostaganem' : town ; in the province of Oran, Algeria ; carries on an important trade with the interior. Its harbor is shallow. It has manufactures of woolen fabrics, leather, pottery, and jewelry. Pop. (1891) 14,374.

Mostar' : capital of Herzegovina, Austro-Hungarian empire ; on the Narenta, which is here crossed by a celebrated Roman bridge consisting of one arch of 95 feet (hence its name, *Most Star*, Old Bridge). It is situated 35 miles from the mouth of the river and 40 miles S. W. of Serajevo (see map of Austria-Hungary, ref. 10–F). It manufactures knife and sword blades and fine silks, and the vicinity produces an excellent wine. Pop. about 12,600.

Most Favored Nation Clause : See the Appendix.

Mosul : chief town of the vilayet of Mosul, Asiatic Turkey ; on the right bank of the Tigris, opposite Nineveh (see map of Turkey, ref. 6–J). Formerly a prosperous manufacturing city, its fine cotton fabrics, called muslins, were exported to Europe. Now its manufactures have almost ceased, its bazaars are filled with European goods and even its transit trade has largely diminished, as Kurdish tribes render the neighborhood insecure. Though the soil in the region is fertile, hardly anything is produced save wheat, barley, and some cotton and rice. Near the city are oil and mineral springs. Pop. 57,000, four-fifths Mussulmans.

Moszkowski, Moritz : See the Appendix.

Motasalis, Motazalites, or **Kadarija** [*motasalis* or *motazalites* mean literally sectaries, being from an Arabic word meaning to separate ; *kadarija* means literally free-will men] : a Mussulman heretical sect ; founded shortly after the prophet's death by the Doctors Mohabbed-al-Djohani, Djilan, and Yunis. Abu-Hadifah-Wasil was their chief leader. They taught that God's essence and attributes were inseparable ; that the Koran was created and not eternal, faith inalienable, and that God's providence was only most general and left man absolutely free. Rationalistic and philosophical, they controlled for a time the seminaries of Bassorah and Bagdad, and were favored by many Abasside princes. Innumerable sects and divisions of sects have sprung from them. E. A. Grosvenor.

Moth [M. Eng. *mothe* < O. Eng. *moððe* : Germ. *motte*] : a nocturnal insect of the order *Lepidoptera*. Moths are distinguished from butterflies and sphinges (or hawk-moths) by the antennæ, which are mostly filiform or pectinate in moths, knobbed in butterflies, and enlarged in the middle in the sphinges. Moths are mostly, but not always, nocturnal ; sphinges mostly crepuscular (flying by twilight) ; and butterflies diurnal. Among the best-known moths are the silkworm moths (*Bombyx mori*) and the clothes-moths (*Tinea flavifrontella*, *T. tapetzella*, or carpet-moth, etc.). Their larvæ attack woolens, furs, feathers, etc., and more rarely cotton goods. Goods which are exposed to their ravages should be carefully shaken and inspected about the first of June. Powdered black pepper should be strewed under the edges of carpets. Spirits of turpentine, snuff, tobacco, camphor, cedar chips, corrosive sublimate, benzine, and carbolic acid are among the agents which are useful in checking their ravages. See Entomology and Lepidoptera ; also Gall Insects.

Moth, mōt, Matthias : statesman and lexicographer ; b. in Odense, Denmark, about 1642 ; was ennobled 1679 ; made chancellor in 1684 ; was removed 1699 on the death of his patron, Christian V. In 1680 he began the compilation of a Danish dictionary, in which, by reason of his position, he was able to obtain the co-operation of scholars from all parts of the kingdom ; only two specimen sheets were printed together with the plan in 1697. After his death the collection, consisting of sixty folio volumes, was sold to the king, and later was transferred to the Royal Library. In his orthography Moth anticipated many of the reforms instituted by Rask. He died in 1719. See C. Molbech, *Historisk Udsigt over de danske Ordbogs-Arbeider i det 17 og 18 Aarhundrede* (Copenhagen, 1827), and *A Bibliography of Danish and Swedish Dictionaries*, etc. (Baltimore, 1890), by the author of this article. D. K. Dodge.

Mother Carey's Chicken, or **Stormy Petrel**: a name applied to various little petrels belonging to the genera *Procellaria*, *Cymodroma*, *Oceanodroma*, etc., which to the untrained eye look much alike, but more properly restricted to *Procellaria pelagica*, a bird about 6 inches long and 14 in spread of wing. The color is brownish black above, a little browner below, and there is a conspicuous white patch on the rump. This petrel is common in parts of the North Atlantic, but is the rarest of the little petrels found along the eastern coast of the U. S. It can be readily distinguished among them by its square tail, short legs, and entirely black feet. It nests in crannies among rocks, and lays a single white egg with a few faint markings around the larger end. The bird has a rank, musty odor, and when captured, besides biting and scratching, defends itself by ejecting from its mouth an ill-smelling, oily fluid, the partly digested contents of its stomach. The superstitious dread in which this bird is said to be held has been greatly exaggerated. It is doubtful if it ever was regarded as the harbinger of a storm, because in some localities it is, at proper seasons, always common, and it is most noticeable during a gale because, being then prevented from readily obtaining its customary food, it hovers about ships in search of scraps of food. See also PETREL.

F. A. LUCAS.

Mother-of-pearl: a substance chiefly afforded by the shells of the pearl-oyster (*Meleagrina margaritifera*), which also yields the greater part of the pearls of commeree. The shells are obtained in the Gulf of California, at Panama, Cubagua, Ceylon, Madagascar, Swan river, Manilla, the Society islands, etc. Those from Manilla are the best; they are of the black-lipped variety. The Society islands furnish the silver-lipped sort, and Panama the "bullock shells." The genera *Haliotis*, *Turbo*, etc., also furnish some mother-of-pearl. It is principally used in knife-handles, shirt-buttons, for inlaying, etc.

Moths: See MOTH.

Motion [viâ O. Fr. from Lat. *mo'tio*, a moving, deriv. of *move're*, to move]: change of position or place of a point or of a body, the successive positions of the point or body forming its path or trajectory.

There can be no definite conception of the motion of a point or body without reference of its positions to some other point or body in relation to which the motion is estimated. On the earth's surface we are accustomed to refer nearly all ordinary phenomena of motion to some point which is fixed on the earth. The motion of a person walking is unconsciously referred to the points on the ground over which he passes; the motion of a projectile is referred to the point at which it receives the impulse which produces its motion; and the conception of the motion of the solar system is possible only by referring it to some point or direction in space toward which the system as a whole is supposed to move. The fundamental idea, therefore, of a simple movement is that it is relative—i. e. it must have reference to some point and some direction which may be supposed fixed. The study of the principles of motion unconnected with the forces which produce it constitutes a branch of the science of dynamics to which the name *kinematics* (from Gr. κίνημα, movement, from κινεῖν, move) has been given.

Velocity is a term which has reference to the *rate* of motion of a point or body. It is employed to denote a definite measure of the rate of motion according to some particular unit of measure. The three simple units of measure by which natural phenomena are investigated are the unit of force, the unit of time, and the unit of distance or space. The two latter are employed in the determination of velocity; and from these two the measure of velocity may be obtained—viz., the space measured in units of space, passed over by a body in a unit of time. If a second be taken as the unit of time, the velocity will be the space passed over by a point or body in one second. In this manner all velocities may be compared by their measures in the same units; assuming the same interval of time for the unit of time, the velocities of bodies in motion may be compared definitely by the spaces passed over in this unit of time.

If the path or trajectory of a point is known, and its velocity given, the elements of its motion are thus completely determined. The motion is said to be *uniform* when equal portions of the path are passed over in equal times. It is *varied* when unequal portions of the path are described in equal times. It is *uniformly varied* when the successive changes of velocity, increasing or diminishing, take place by equal increments or decrements in the same time. The laws of motion require, therefore, not only that the path shall be known, but that the velocity at each point of its path, or the law by which the velocity changes, shall be known. In uniform movement this law is expressed algebraically by the expression $s = v\,t$, in which s is the space moved through, v the constant velocity, and t the time, in seconds, during which motion has taken place from the initial point. In varied motion the velocity is continually changing, either uniformly or otherwise; and to determine the velocity of a point at any position of its path it is necessary to know the law of change. If the velocity increase or diminish at a uniform rate, the velocity at any instant t, measured from the instant at which the velocity was v_1, will be $v = v_1 + a\,t$, in which a is a constant denoting the rate of variation of the velocity called the acceleration, and the space described will be represented by

$$s = v_1 t + \frac{a\,t^2}{2}.$$

If the velocity is neither constant nor uniformly varying, its rate of variation and the relation between the space and time may still be found by the methods of the integral calculus.

A point is said to have a motion of *translation* with reference to another point when the line joining the two points is altered in length. It is said to have a motion of *rotation* in reference to another point when the line joining the two points changes its direction. A point moving in a circular path has a motion of rotation with reference to the center of motion, but no motion of translation in reference to this center; and a point the trajectory of which is a straight line has a simple motion of translation with reference to all points in that straight line. The measure of angular movement involves the unit of time and the angle through which the body turns in a unit of time. This angle is usually estimated by the length of the circular arc passed over by a point at the distance unity from the axis, and this length is called the *angular velocity*. It results from this mode of measuring angular movement that if a represent the angular velocity, then the actual velocity of a point in the body at the distance r from the axis, in the direction of the tangent to its path, will be equal to the angular velocity multiplied by the distance from the center of motion, or $v = a\,r$. For practical purposes, especially in the study of machines, it is often convenient to express the angular velocity in terms of the number of turns per second of the body about its axis. If N be the number of turns per second—by which it is implied that N may be a fraction or a whole number—then $a = 2\pi N$, and $v = 2\pi N\,r$ will be the actual velocity of a point at the distance r from the axis in the direction of the tangent, π being the ratio of the circumference to the diameter.

Starting thus with the general proposition that all motion is relative, the motion of one point with reference to another is usually composed of two elements—one a change of distance and another a change of angular position. If a change of distance along a given direction only takes place, the motion of either point referred to the other is a movement of translation; if a change of angle only takes place, the movement is one of simple rotation; and if both these changes occur simultaneously the movement is a motion of translation and rotation combined. A rigid body is said to have a motion of translation when all points of the body describe parallel lines, and a motion of rotation when any line of the body changes its direction.

Relative and Comparative Motions of Points.—Two points moving in the same straight line have a *relative* motion equal to the sum or difference of their motions in reference to a third point in the same line. If the points move in the same direction their relative motion will be the difference, and if in opposite directions the sum of their motions in reference to the third point. If the points move with the same velocity the distance between them will remain invariable when they move in the same direction, and will continually increase if they move in opposite directions. When two points rotate about a third, the three points lying in the same plane, if the two revolving points are rigidly connected their angular motions and velocities will be the same; their *comparative* motions will differ only in their tangential velocities, which depend on their distances from the center of rotation. Their *relative* motions will, however, be found to consist of a rotation about each other with the same angular velocity with which they revolve about the common central point. If two points connected together by an invariable line revolve about different centers, their relative and comparative motions may be found by the application

of a theorem which forms the basis of nearly the whole theory of combination in mechanism—viz.: If two points are so connected that their distance apart remains invariable, the components of their velocities along the straight line joining them must be equal.

Composition of Translations.—If a point move over one side of a parallelogram, and then over the next adjacent side, the effect will be the same as if it had moved along the diagonal—i. e. its relative motion with reference to the starting-point will be the same. The two motions along the sides are called the components, and the diagonal motion the resultant motion. It follows from this that any motion of translation in a plane may be resolved into two components in any two given directions in that plane by constructing a parallelogram of which the diagonal is the original motion, the sides having the given direction. More generally any motion of translation can be resolved into three components in three given non-coplanar directions by constructing a parallelopiped of which the diagonal is the original motion, the edges having the given directions. In the same manner the velocity of a point in a given direction may be resolved into three component velocities having given directions. If the components are at right angles to each other, the parallelopiped will be rectangular.

Resolution and Composition of Rotations.—The rotation of a rigid body about a given axis is equivalent to the resultant of two component rotations about two axes parallel to the given axis and in the same plane, the angular velocities of each of the three rotations being proportional to the distance between the other two axes. It follows from this that if two wheels revolving about their centers remain in contact with each other, the point of contact being in the line joining the centers, the angular velocities of the wheels will be inversely proportional to their radii. This proposition forms the basis of the construction of spur-gearing. This kind of gearing illustrates the composition and resolution of parallel rotations. If one wheel be fixed and the other roll around it, the motion of any point in the rolling wheel about the instantaneous axis or pitch-point may be regarded as compounded of the rotation about the axis of the rolling wheel and the rotation of the axis of the rolling wheel about the axis of the fixed wheel.

Rotations may be resolved and compounded in another manner. A rotation about a given axis may be regarded as equivalent to two rotations about two axes which intersect the given axis at the same point, the angular velocities about each of the three axes being proportional to the sine of the angle between the other two. This proposition is the basis of construction of bevel wheels. If one cone roll upon another having the same vertex, the surfaces of the two cones being constantly in contact along a line, any point in the rolling cone may be regarded as having a rotation about its own axis combined with a rotation of this axis about the axis of the fixed cone; or as having a simple rotation about the line of contact as an instantaneous axis. To find the diameters of two beveled wheels which shall revolve with given angular velocities about two intersecting axes, it is only necessary to draw two lines intersecting each other and making the required angle between the axes. If, then, from the point of intersection distances be laid off proportional to the angular velocities of the wheels respectively, the diagonal of a parallelogram constructed on these lines will represent the line of contact of two rolling cones. Such a construction may be called the parallelogram of rotations. This parallelogram determines the relative diameters of the bevel wheels.

Helical or screw-like motion may be regarded as either compounded of a rotation about an axis and a translation in the direction of that axis, or it may be considered as compounded of two rotations about two axes lying in different planes. The latter proposition is illustrated by the rolling of one hyperboloid upon another, their surfaces being in contact along the right-lined element which constitutes the instantaneous axis of the rolling hyperboloid. Such hyperboloids form the basis for the construction of skew-bevel wheels.

It follows from the principles of the composition of motions that the most complex motion of a rigid body may be regarded as equivalent at each instant to a rotation about an instantaneous axis, and a translation along that axis combined, each point of the body describing a helical path.

The combination of two motions of translation transverse to each other gives rise usually to curved trajectories. If one be a reciprocating motion of small amplitude, and the other a continuous motion, the curve takes an undulating or wave-like form. Harmonic motion is a reciprocating motion in a straight line, in which the velocity at every instant is equal to the component parallel to the straight line of another point which moves uniformly in a circle, the amplitude of the reciprocating motion being equal to the diameter of the circle. The motion of the piston of the steam-engine would be exactly harmonic if the connecting-rod were infinite in length. The motion is approximately harmonic in ordinary cases of piston-and-crank motion.

The motions of one curve rolling on another curve, or one body rolling on another body, present particular cases of the general proposition of the movement of rigid bodies, which are not only often observed, but which form the bases of useful applications. The case of a wheel rolling on another wheel has been referred to. In this case any point of the circumference of the rolling wheel rotates about the point of contact and describes a continuous curve called an epicycloid. A cylinder rolling on a plane furnishes an example in which a rotation is combined with a translation of the rotating body, the resultant motion of any point in the cylinder being a rotation about an instantaneous axis, which is the line of contact of the cylinder and plane. Any point of the cylinder describes a curve called a trochoid, and a point in the surface of the cylinder a curve called a cycloid. The crank-pin of a locomotive wheel describes a trochoid, and a point in the circumference of the wheel a cycloid, as the engine moves along the track. A point in a plane rolling on a cylinder, or a point in a string unwound from a wheel, describes an involute of the circle from which it is unwrapped.

The motion of the piston of a locomotive engine furnishes an interesting example of comparative and relative motions of translation. In the forward motion it acts as the moving surface which gives rotation through the crank to the wheel and in the backward motion as a point of resistance, the cylinder being pushed away from the piston; considered relatively to each other, the piston and cylinder have precisely the same motions as they would have if the locomotive were suspended from the earth. Considered with reference to the earth, the cylinder has a continuous uniform motion in a straight line, while the piston, at one point of each revolution, comes partially to a state of rest with reference to the earth. It would come to rest if the crank-pin were in the circumference of the driving-wheel. When a body is spoken of as being at rest, it is understood only as being at rest relatively to other points, there being no point of absolute rest in the universe.

It will have become apparent from this discussion of the principles of motion that the actual path of a material point in space may be the result of a complicated series of motions. Leaving out of consideration the infinitesimal motions of vibration which the molecules of bodies have, and which constitute the cause or phenomena of heat, a particle may have a resultant motion which is compounded of an almost unlimited number of separate motions. Take, for instance, a point in a projectile: it usually has a motion of rotation about an axis within the body of the projectile; it has a parabolic motion with reference to the earth, while it partakes of the motion of the earth around the sun. It is thus made evident that in discussing motion it must usually be restricted to certain relative conditions which constitute the particular points of any investigation.

Revised by R. A. Roberts.

Motion in Animals and Plants: the movements observed in living matter. They may be divided into two categories—invisible and visible. The former are such as occur in the vibrations of atoms, being manifested in heat, light, electricity, and chemical changes. Visible movements are of great variety, many being obvious to the naked eye, while others demand the aid of the microscope. Some, such as growth, are so slow as to be inappreciable except by prolonged observation, but most of them are readily discernible.

In low organisms motion is not only seen in the individual as a whole, but in separate parts. Thus the amœba while in the active state continues to undergo alterations in its outlines by throwing out foot-like prolongations here and there, and from time to time retracting them. The interior semi-liquid protoplasm can be seen to possess a circulatory movement, and if vacuoles are present they may be noticed to contract and dilate. The vorticella has a contractile stem, by means of which the organism is raised or lowered, also a contractile vacuole, besides movable cilia at its mouth.

The paramecium, spirostomum, and the embryo of porifera have cilia which they move with a rapid lashing motion. The volvox and certain rotifera possess cilia or ciliated tentacula which they employ as propulsive organs, while the flagellata propel themselves by their flagella. The volvox, which is in the form of a spherical combination of cells, and is one of the lowest organisms of plant life, is able to execute remarkable movements by means of its cilia—it sometimes rolls over and over like a ball, or around in a circle, or in various indefinite directions, or revolves as though it were on a pivot. The common starfish moves from place to place by means of ambulacral feet. The ophiura, one of the starfish, propels itself in a curious manner by raising itself upon its legs and throwing its body forward, progressing by a series of leaps. The astropectin, another of the starfish, has flexible, hollow legs which the animal draws forward and then fills with fluid, making them rigid, thus raising the body as though on stilts. This straightening of the legs draws the body forward, and as soon as the legs are perpendicular the fluid is suddenly withdrawn, the legs collapse, and the body falls. By a succession of such operations the organism moves from place to place. In centipedes and millipedes the motions of the legs are well defined. The movements of spiders and insects are also sufficiently well known as to need no special comment. In certain mollusks locomotion is accomplished by protoplasmic prolongations which serve as feet as well as for burrowing. Cephalopods swim by means of tentacula. Crustacea use their antennæ as a means of locomotion, and they are able to burrow by means of the conjoined actions of their antennæ and the movements of flexion and extension of their bodies.

In vertebrates motion is developed to a much greater degree. Illustrations are found in the various methods of locomotion, as in swimming, flying, trotting, running, walking, etc., and in the many movements exhibited by various parts of the organism. For instance, in man besides the peculiar combinations of movements which are observed in his methods of locomotion, are those involved in facial expression, gesture, speech, mastication, and deglutition, also movements of the eyeballs, heart, intestines, vessel-walls, blood and lymph, cilia lining the air-passages and Fallopian tubes, white corpuscles, etc. See GAITS and MECHANICS, ANIMAL.

In plants motion is observed in cells and in various organs. Thus in cells the soft protoplasm is sometimes seen to rotate within the cell-wall, as in the leaves of the *Vallisneria spiralis*, while the nucleus is continually undergoing a change of form as it moves from place to place. In the cells of other plants the protoplasm sends prolongations to various parts of the interior, which are after a time withdrawn only to be sent out in other directions. Vacuoles in plant-cells contract and dilate, thus causing a circulation of the cell contents. In the sap-tubes or vessels, ascending and descending currents of sap are observed.

The movements of certain organs are well observed in many species, and in some instances are truly remarkable. The leaves of several species of sorrel move up and down with alterations of light and temperature. The lateral leaflets of the sensitive-plant close in pairs when touched, and if the irritation is strong enough the petiole bends downward and all of its leaflets close. The leaves of the Venus fly-trap (*Dionea muscipula*) and of the so-called aquatic *Dioneæ* (*Aldrovanda vesiculosa*) are constituted of lateral halves which are so connected at the midrib as to permit of their opening and closing like a hinge. In the passive state the leaves are partially open, but should an insect alight within the blades, the sides come together and the victim is imprisoned. The telegraph-plant (*Desmodium gyrans*) rotates the lateral leaflets and jerks them up and down under favorable conditions as often as two or three times a second. The tentacles or filaments of the leaf of the common sundew (*Drosera rotundifolia*) double upon an insect that falls upon the disk or touches them: one after another of the tentacles bends over the prey, rendering escape impossible. Should the victim be caught by the tentacles at the margin of the leaf it will gradually be worked toward the center by the successive movements of the tentacles. So exquisitely sensitive are these filaments that a slighter stimulus will cause them to bend than can be appreciated by the most sensitive nerves of man. The petals of some flowers, as the portulaca, close in the evening and open in the morning; other flowers open in the evening and close in the morning. The leaves of certain plants are similarly affected by light. Thus very strong light causes the leaflets of the sensitive-plant to close, and it arrests the movements of the leaflets of the telegraph-plant; the prolonged absence of light destroys the irritability of the sensitive-plant. The stamens of the *Berberideæ*, *Cynareæ*, etc., are mobile, and when touched bend upon the stigma.

EDWARD T. REICHERT.

Motive: that which occasions or tends to bring about a voluntary movement, such as a consideration, inducement, end, etc. The word is used most generally by psychologists to denote *any influence whatever which tends to bring about voluntary action on the part of a normal person.* Motives fall into two great classes, according as they represent pictured objects of pursuit on one hand, or the subconscious, organic, habitual, or purely affective springs of action on the other, whose main influence is the coloring they give to consciousness as a whole. The former class of motives are *ends*, the latter *affects*. No sharp line can be drawn between them, for they pass constantly into one another. Yet in consciousness the line is both plain and important; for it is only "ends" which are available as distinct lines of direction for volition, in definite cases of choice.

Affects.—All states of feeling whatever tend to discharge themselves in action through the muscles. We feel the force, the motive worth, of a suggestion, a pain, an impulse. An idea simply as an idea—if such could be realized—might not react in movement; but the simple presence of an idea in consciousness itself gives feeling, and only in so far as it affects us does it move us to action.

We may accordingly apply the term *affects* to all involuntary stimuli to movement. When I am affected I am moved through my own inner state of sensibility. And such affects figure directly in the voluntary consciousness, standing in contrast with another great class of stimulations, which together with them constitute *motives*.

All the influences, therefore, which do their work upon us unconsciously are to be taken into account as real motives. The general law that sense-modifications tend to pass off in motor reactions bears right up into the voluntary sphere. *Suggestion* which produces involuntary movement tends to produce voluntary; so of *pleasure and pain*, *emotion*, *impulse*. The psychology which separates volition from reaction so sharply as to deny any influence upon the will to other stimuli than pictured ideas is false. The conditions back of an act of choice are never limited to the alternatives between which the choice is made. There is beneath it all a dumb, unexpressed mass of affects—organic, partially felt tendencies outward, which give coloring to the whole process. A decision made at night is reversed in the morning, when no new information has been received. A trifling physical accident will distort vision, arouse emotion, and reverse decision. This fact, that our most abstract acts of volition are strongly influenced by subconscious affective influences, is only beginning to have due recognition in psychology.

Ends.—The other class of motives may be called ends; which are actual considerations in consciousness which we weigh and measure, as in reaching a decision. Technically they are called *presentations*, since they are mental images which consciousness *presents* to itself as worth preserving. The attitude of the mind toward such ends is *desire*. (See WILL.) With these two kinds of motives distinguished, we may consider how these motives behave in reference to our voluntary action.

Law of Motives.—Volition always involves some measure of division in consciousness—some measure of confusion due to unadjusted claims. The various classes of claims which are to be adjusted in an act have been pointed out. They are the springs of action or *motives*, any affecting tendencies whatever that represent active conditions of consciousness. My whole personality is an expressive thing: its expressive side is as real and elementary as its receptive side. Consequently, at every moment the man is expressing himself somehow, and what he is expressing is the outcome of all the elements in him which seek expression.

Further, the whole of the present possibilities of the man are summed up in these tendencies outward; they represent his entire self at the moment that he acts, i. e. his make-up as the present conditions of his environment are suited to call it out. Given conditions which favor the expression of a number of his motives at once, and they all clamor for exclusive recognition. For example, a brakeman's hand is freezing to the iron; intense pain, a physical spring of action, prompts him to desert his brake; but he quickly calculates the chances of collision, or an open bridge: intellec-

tual motive urging him to remain faithfully at his post; and with this last there comes the picturing of wounded passengers, the cries of those in danger—a new emotional motive, which brings with it a warm flood of sympathy, leading to a quick and easy decision on the side of duty. The decision is the man's decision; it expresses the nature of this man and no other; and it is the outgoing of his nature in a line which the particular circumstances open to him. Accordingly, we may say, first, that *all volition results from a more or less complex aggregation of motives*; and, second, that *this aggregation of motives exhausts the possible alternatives of present action.* It is impossible that any one of these motives should act alone, for a man is never free from his body, on one side, or his higher ideals, on another side, or his emotional life, on a third. They are all present always in normal life.

The second position shows us that any doctrine according to which a man can transcend his motives, hold aloof from them, despise and reject them, simply asks us to chase a firefly. If you remove a man's motives you remove the man; for what is the man but body and mind? The whole content of volition disappears. To will at all a something must be willed, but this something is a pictured something, bearing some relation to myself. The reason I will it is because it moves me—is my motive. Let me picture never so strongly the fabulous—the utterly uninteresting and indifferent—and will in reference to it is impossible. I can never make new motives, nor will a thing that does not for some reason find a responsive echo in my breast.

Nature of Motives.—It is also plain that a motive is nothing in itself. It is only a name for a partial expression of the nature of an agent. Consequently, motives can in no sense be considered as forces which expend their energies upon the will, or which fight each other. These conceptions of the old psychology are nothing short of myths—myths which have "darkened counsel without wisdom" long enough. Apart from the motives, there is no will to fight against, and as to struggling with each other—that would mean either that each of the motives had a will of its own, or that there was no common life whose full realization is the best satisfaction of them all. Here is a developing principle—call it what we may—whose different life-furthering adaptations represent a hierarchy of worths. One worth is chosen. If it be the best the others are also furthered with it by their very denial; if it be lower than the best it suffers with the others through its gratification; both because, as elements of a common life, all are involved in the gratification of each. How, then, can they be conceived as separate entities contending in a theater which is cold stone to all of them? Rather they are all vital elements in the functional synthesis of a living consciousness.

Affects as Motives.—Among motives two great classes have been distinguished, affects and ends. The former are immediate influences upon the will, unpictured, unreckoned, unavoidable. The latter are reflective motives, pictured, estimated, subject to conscious selection or rejection. Now it is plain that these two classes of motives stand on very different planes in the mental life as regards their volitional worth. If all volition is in view of an end, then it is only by strengthening the influence of particular ends that affects enter. If I grow greatly excited, for example, over a particular choice, my excitement colors my choice only in so far as it presses home upon me one alternative of my choice. My physical health alters my opinions and reactions, not by supplying me a new end, but by brightening a consideration here, dulling another there, rendering the attention sluggish, and so limiting the range of my consideration, or stimulating it greatly, and so pitching the entire intellectual play at a higher key. What actual volition is concerned with, therefore, is ends and ends only.

Play of Motives.—How, then, does an end pass into a volition—how does it get the fiat which makes it an act? Careful questioning of consciousness leads us to see that the picturing of ends is in no respect different from the picturing of anything else. It is an ordinary act of Apperception (*q. v.*), by which new elements of conscious content are taken up in an integration with the old established complex of ideas. The new end gets in only as far as it is adjusted and harmonized with old ends; the old ends themselves, a single integrated group, take on a new complexion from the new element of experience thus absorbed. The attention moves throughout the series of elements, grasping, relating, retaining, selecting, and with the integration which it effects, swells and fills consciousness—that is volition. Just as soon as the elements of the end-complex cease to act as partial influences, causing the movements of attention by their own vividness, and the attention gets its hold upon its integrated content as a grand related *situation*, the fiat of choice goes forth.

For example, I have been accustomed, after careful thought, to pursue a given line of business policy. It is the outcome of all my thinking, feeling, and past action—an integration, a motor situation, which exhausts my motives and represents my present volitional attitude. A friend gives me new information; it gets an entrance by its own intrinsic hold upon my attention; it becomes an element in the situation; every other element gets a new adjustment; and when I make up my mind again, get control of the situation through relative stability in the apperceptive outcome—then I am at once in action—my fiat is given.

No one motive has brought about this result. I do not adopt one and utterly deny others. I adopt the situation in which all have entered and to which they have given each its own significance. It is true that the exigencies of conduct narrow me down to a very small number of expressions. I must either go to the opera or stay away. But neither alternative represents my true mind. I decide to go, *provided*; to stay away, *if*; and whichever I do it is with the clear consciousness that I am not realizing my ideal volitional situation in the premises. Instead of indulging one of my motives I am acting on a compromise, which really satisfies none.

The apperception of motives therefore differs from general apperception only in its explicit reference to action. This reference is present in all apperception; no state of consciousness lacks it; but when I have action in view the moving quality of the elements of my synthesis is more felt. Generally, my decision is simply consent—the passage of "the adopting act." I consent to a thing when I give it my sanction. This is volition; but not as full a volition as the volition of conduct. When I know that my own fate is involved, that it is I who must act, there is a fullness of emotional warmth and reality that gives new coloring to the motives involved, and perhaps radically alters the outcome.

Controlling Motive.—The controlling motive, consequently, is the motive which wins the choice; but it is very difficult to find anything that it controls. It does not exist at all after choice, for the outcome of choice is a new end in which all the motives have entered. So it does not control conduct, which is merely expression. For the same reason it does not control the volition itself. Every one of the motives is controlling in the same sense, i. e. of entering essentially in the result. The only advantage it has over other motives is that it becomes the final channel of expression in conduct, an advantage denied to them. In this sense it controls the other motives, but only in this sense. See Psychology, Volition, and Will.

J. Mark Baldwin.

Motley, John Lothrop, LL. D., D. C. L.: historian; b. at Dorchester, Mass., Apr. 15, 1814; graduated at Harvard in 1831; studied at Göttingen and Berlin; was a fellow student with Bismarck; was admitted to the bar in 1836; became in 1841 secretary of the legation at St. Petersburg; U. S. minister to Austria 1861–66; to England 1869–70. After long and exhaustive researches and manifold preparations he published in London in 1856 *The Rise of the Dutch Republic* (3 vols.), which immediately attracted great attention, and has been translated into German, French, Dutch, and Danish. *The History of the United Netherlands* followed (4 vols., 1861–68), and the *Life of John van Barneveld* in 1874, with equal success. His pictures of characters, events, and social states are complete and vivid, and breathe in general a spirit of justice and truth. D. near Dorchester, England, May 29, 1877. See a *Memoir*, by Oliver Wendell Holmes (1878), and *Correspondence*, edited by George William Curtis (2 vols., 1889).

Motoori, mo-tō'rĕĕ, Morinaga: Japanese scholar and author; b. at Matsuzaka in Ise, Japan, in 1730; the father of modern Japanese literature, whose constant aim was to rescue it from a too slavish adherence to Chinese traditions. He wrote on politics in the *Tamakushize*, on history in the *Manyoshu*, *Kokinshu*, and *Genji Monogatari*, on archæology and the history of religious traditions in the *Kojikiden*; and is pre-eminent among Japanese writers for the elegance and perspicuity of his style. He prepared the way more than any other man for the restoration in 1868 of the

emperor to his ancestral rights, and was later elevated to a place in the national panthcon. D. in 1801. J. M. Dixon.

Motor Carriages: See the Appendix.

Mott, Lucretia: See the Appendix.

Mott, Valentine, M. D., LL. D.: surgeon; b. at Glen Cove, L. I., Aug. 20, 1785; graduated M. D., Columbia College, New York, 1806; studied three years in London and Edinburgh; was Professor of Surgery in Columbia College 1809–26, in Rutgers Medical College 1826–30, in College of Physicians and Surgeons, New York, 1830–40, and in University Medical College, New York, 1840–60. He was a very successful surgical operator; was the inventor of valuable surgical implements; had wide fame as an *accoucheur*; was a brilliant and able lecturer; published a translation of Velpeau's *Operative Surgery*, with large additions; a volume of travels in the East (1842), a volume of published clinical lectures (1860), and many papers and addresses. He was the recipient of many foreign distinctions and a member of numerous learned societies. D. in New York, Apr. 26, 1865.

Motto [Ital. *motto*, saying, adage, from Fr. *mot*, word: Provenç. *motz*: Catal. *mot* < Lat. **muttum*, a sound, deriv. of *muttire*, to utter a sound]: a word, phrase, or sentence, used as a declaration of faith or allegiance, as a war-cry in the Middle Ages, as a part of the achievement of arms (see Heraldry), or merely as a kind of badge, sometimes inherited. Those mottoes which were originally war-cries are necessarily very brief; most war-cries indeed are not strictly mottoes, but were names, as of saints (*Saint George!* or *Notre Dame!*) or of the estates or castle of the leader (*Sancy!* or *Bury!*), or of some ancestor, or perhaps some lady. Mottoes of significance including several words or a sentence were naturally developed with the progress of heraldic bearings and heraldic display. While some mottoes originated as a remark or boast appropriate to special occasion (e. g. those emblazoned on the arms of Great Britain: *Honi soit qui mal y pense*—May he be shamed who thinks evil of it; and *Dieu et mon Droit*—God and my right—the utterance of Richard I. at the battle of Gisors), most mottoes have been chosen deliberately for their meaning and euphony; such obvious phrases as *Semper idem* (Always the same) and *Esse quam videri* (To be rather than to seem) have been taken by many persons.

The Italian and French nobles of the fifteenth and sixteenth centuries had the habit of adopting elaborate emblematic devices with sometimes more mottoes than one. Perhaps the briefest of them all was that of Pope Leo X., *Suave*—that is, sweet, or agreeable, or easy; or perhaps as an adverb, gently. The mottoes of nations in Europe are generally those of their reigning families, or of their chief honorary orders, but cities and towns all through the Middle Ages had mottoes of their own; and from this custom have come the mottoes of the States of the American Union. Virginia has *Sic Semper Tyrannis* (So [let it be] always to tyrants), in allusion to the dagger in the escutcheon; New York has *Excelsior*; and the Union itself the admirably chosen words *E Pluribus Unum*. Russell Sturgis.

Mouflon: an animal of the genus *Ovis*, found in Southern Europe, and closely related to the common sheep, with which it breeds, and to the big-horn. Its fleece is not woolly.

Moukden: See Mukden.

Mould: See Mucoraceæ and Water Moulds.

Moulding [deriv. of *mould*, *mold*, from O. Fr. *moler* > Fr. *mouler*: Span. *moldar*: Ital. *modulare* < Lat. *modula'ri*, measure, deriv. of *mo'dulus*, *modus*, measure]: the art of forming a cavity conformably to a plan, pattern, or model, in mould, sand, or other suitable material, in which to pour molten metal or other liquid capable of solidifying therein.

The art of moulding has come down to us from a very remote period; we find evidences of its practice by the most ancient nations, in articles found among the ruins of temples, palaces, fortresses, and cities. Whatever the source of the technology of the art, we in our day can show nothing superior, either in design or execution, to the work of men whose names and methods are lost. The materials used and the methods employed in the art at present can alone claim our attention.

Preliminary Preparations.—These involve a most careful study, by the artist or engineer responsible for the work, of the character, general plan, and the subordinate details of its design; the selection of proper materials for the pattern or model, and its construction with especial reference to accuracy and the number of copies to be made from it. If but few copies are required, the pattern is usually made of wood, plaster-of-Paris, or some other cheap, perishable material; if the pattern is to be used frequently, it should be made of metal. In moulding directly from natural objects, of course, no other pattern is required, and by the peculiar process employed the object copied can be used but once.

The Material of which the Mould is to be made.—This should allow the passage of air and such gases as are generated when the mould is filled with melted metal, but it must also be sufficiently compact to resist the pressure of the liquid metal and the high temperature at which it enters the mould, and it must separate from the casting with ease, leaving a clean, smooth surface.

Suitable frames, called "flasks," must be provided for holding the material of the mould, and ovens for drying certain kinds of moulds erected. Proper hand-tools must also be furnished the workmen or moulders, and cranes or other machinery for lifting and moving heavy moulds and castings.

Making the Patterns.—The patterns used in the art of moulding are in form exact representations of the articles to be cast in the moulds made from them, but in size they usually exceed the finished article by an amount represented by the "shrinkage" of the metal in passing from a liquid to a cold, solid condition. The amount of this allowance for shrinkage is determined from the well-known behavior of the various metals A common allowance for the metals more generally used is as follows:

Cast iron	$\frac{1}{8}$ inch per foot.
Gun metal (copper and tin)	$\frac{1}{6}$ " "
Copper	$\frac{1}{5}$ " "
Lead	$\frac{5}{16}$ " "
Zinc	$\frac{1}{4}$ " "
Tin	$\frac{1}{12}$ " "
Bismuth	$\frac{5}{32}$ " "

Patterns are usually made of wood, which must be thoroughly dry and free from imperfections. Pine is the kind more generally used, but cherry and mahogany are often employed for small objects. Wood patterns when finished are coated with shell-lac varnish, to prevent the absorption of moisture from the damp materials of the mould; but when a pattern is to be used often, it is preferable to make it of metal. Brass and cast iron are used for this purpose.

Patterns are frequently made in two or more parts to facilitate moulding, and for the casting of gear-wheels it is a growing practice to make a small segment of the rim for a pattern of that part; this is attached to a very exact apparatus for placing it, which enables the moulder to make it subserve the purpose of a complete pattern of the rim.

Models for statuary are commonly built up by the artist in clay, from which a plaster cast is made, and from this the mould.

Kinds of Moulding.—These are three in number, viz., green-sand, dry-sand, and loam-moulding. In the first there is employed a "moulding-sand" composed chiefly of silica with a small admixture of alumina, which is always used in a moist or "green" condition, in wooden boxes or flasks. In the second method the moulding-sand is used in iron flasks, and before the mould is considered finished it is thoroughly dried, hence the term "dry-sand moulding."

In loam-moulding the sand employed has more alumina associated with it, and usually has mixed with it a quantity of horse-dung to increase its adhesiveness and porosity; this moulding composition is called "loam," whence the term loam-moulding. The loam is always manipulated in a moist or even wet state, but is thoroughly dried before the metal is run into the mould made in it. In loam-moulding patterns are rarely employed save for certain ornamental parts and for projecting "ears" or "lugs"; the most of the work being done with sweeps, straight-edges, and other tools.

Flasks.—The flasks or boxes used for holding the sand of the mould are usually rectangular frames of wood or metal, without top or bottom, having in their interior a number of cross-bars or traverses, to assist in sustaining the sand. Flasks are commonly made in two parts, the upper of which is called "the cope" and the lower "the drag." The cope is prevented from lateral displacement by dowel pins on its lower side, which enter corresponding holes in the top of the drag.

Wood is generally used for flasks that are employed for green-sand moulding, and iron flasks are always used for dry-sand work. Sometimes iron flasks are also used for small

work that is moulded in green sand. "Snap-flasks" are a special variety only used for very small work; in these there are no traverses, and both the cope and drag are hinged at one corner, and have a latch at the opposite angle; this arrangement permits the detachment and removal of the flask from the mould after it is finished, and thus it can be used for any number of moulds.

Cores.—These are made of a somewhat coarse sand, whose cohesion is augmented by mixing it with stale beer, yeast, molasses and water, or similar adhesive matter. Cores are made in a great variety of shapes, and are used in moulding to make holes and hollows in the casting wherever required; for this purpose the cores are put into the mould in their proper places, and the metal flows around them.

Making a Mould.—The simplest way of making a mould is to hammer a pattern into the sand floor of the foundry until its top is level with the surface of the floor; the pattern is then removed and metal is run into the cavity left. This is called open sand-moulding, and is only used for the coarsest variety of work, such as pig iron and the various rough plates, "glands," etc., used in foundries.

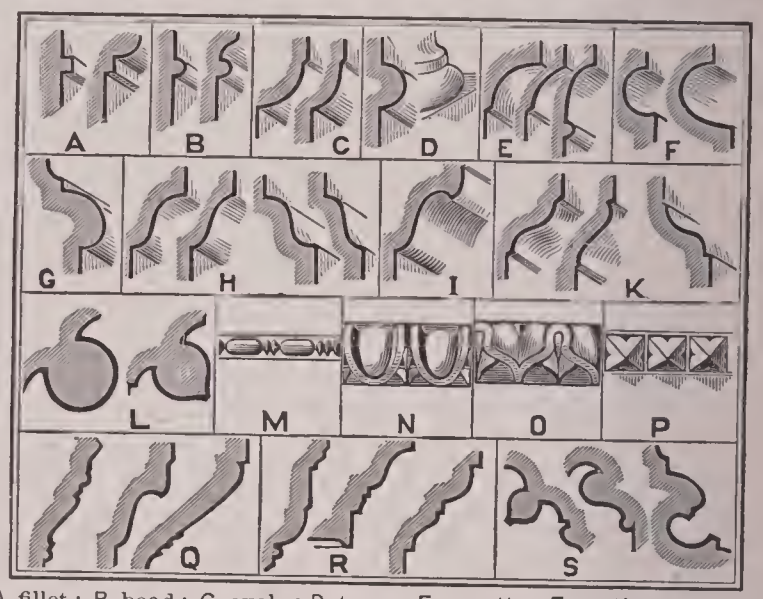
In ordinary green-sand moulding a board, called the follow-board, is first placed upon the floor; upon it with its top side down is placed the drag. Half of the pattern of the article to be cast is placed within the drag upon the follow-board; green sand is then sifted upon the pattern until it is thoroughly covered; the drag is then shoveled heaping full of unsifted sand, which is then thoroughly compressed by the use of a tool called a rammer; the surplus sand is then removed by a straight-edge or "strickle," so that none projects above the sides of the drag, which is then turned over; the surface of the sand that is then uppermost is smoothed with a trowel or "slicker," and dry "parting-sand" is dusted over it evenly, any of the sand which falls upon the upper surface of the pattern being blown off with hand-bellows. The other half of the pattern is now placed upon that in the sand, and the cope of the flask is placed upon the drag. A "gate-pin" (a tapering pin of wood, large end up) is placed in position on the sand in the drag, and sand is sifted into the cope until the pattern is entirely covered, when sand is shoveled in, rammed, and strickled off, as in the case of the drag. The gate-pin is now withdrawn and the upper end of the gate (also called "git") is enlarged and given a trumpet-mouth shape; then the cope is lifted and turned over to one side of the drag, carrying the upper half of the pattern with it. A "rapping-pin" is now inserted in that portion of the pattern which remains in the drag, and gently rapped with a hammer in every direction to loosen the pattern, which is gently lifted out by the rapping-pin. A runner is then cut from the mould to the gate, and if the casting is required to be very smooth a facing material is applied to the surface of the mould and carefully smoothed down. All imperfections are corrected in the lower half of the mould, and when the upper half has had its pattern removed, and been "faced" and "mended up," the cope is again lifted, turned, and placed carefully upon the drag, which is now locked to the cope by hooks, glands, or any other way that will prevent its "rising" when the metal is poured in the mould. Care must be taken before the patterns are removed to make a number of vent-holes with a vent-wire in order to liberate the air and gases that tend to accumulate in the upper part of the mould when the liquid metal is run in. The mould having been finished, it is in due time "poured," and as soon as the metal is sufficiently solidified to bear handling without injury the flask is opened and the sand and casting removed, the gates and runners are broken off, and the article cast is cleaned.

W. F. Durfee.

Mouldings: ornaments in architecture and decoration, consisting of narrow raisings or lowerings of the surface. The new surface, that is, the surface of the moulding, may be plane, or of a simple or elaborate curvature. A moulding has generally the same profile or section from one end to the other; it is supposed to be produced by moving the profile at right angles to its plane, either in a right line or along a curved path; mouldings in plaster and other plastic material are made in this way.

In many architectural styles mouldings constitute one of the most important elements in design, serving by their multiplied alternations of light, shade, and shadow in parallel lines to frame and accentuate the main divisions of a composition, and to impart animation and variety to its whole aspect. They occur most frequently grouped in string-courses separating the successive stages of the design; in the bases and capitals of columns, and in entablatures and cornices, to support and to crown its various features; in arch-mouldings, to break up the depth of heavy arches into pleasing successions of convex and hollow surfaces, whose concentric lights and shades repeat the form of the arch, and mediate like a penumbra between the bright wall and the deep shadow of the arch; in archivolts, to frame arch-openings with delicate concentric lines of shadow; and in frames, to decorate the outlines of decorative or constructive panels.

The essential consideration in designing mouldings is the profile; for although this is not seen, and although a pretty profile may not give an effective moulding, yet upon this depends the whole character of the moulding and of its effect in the composition. The profile is usually a curve, simple or compound; the nature of its curvature and the way in which various curves are combined in groups and alternated with angular and plane surfaces determining widely diverse effects by graduated transitions or abrupt contrasts of light and shade, and by the ranging succession of wide and narrow bands or lines of shadow. The type profiles of the commoner mouldings are shown and named in the annexed diagram.



A, fillet; B, bead; C, ovolo; D, torus; E, cavetto; F, scotia, or gorge; G, thumb-moulding; H, cyma recta; I, beak-moulding; K, cyma reversa, or ogee; L, boultel, plain and filleted; M N O P, decorated mouldings; Q, Greek profiles; R, Roman profiles; S, mediæval (Gothic) profiles.

In the art of profiling mouldings the ancient Greeks were absolute masters, and the combination of delicacy and strength in the subtle and elusive curves of Greek mouldings has never been equaled. This delicacy was not lost in the decorations with which they were often enriched; whether these were painted, as in the earlier and Doric buildings, or deeply carved, as in the later and Ionic mouldings. The decorative forms used seem to have originated in Egyptian lotus-borders, but were treated so as to reproduce in symmetrical repeated patterns the profile of the moulding itself, and thus developed into the egg-and-dart, water-leaf, or heart-leaf, and anthemion ornaments which the Romans still further elaborated and enriched, not without sacrificing the purity and delicacy of the original Greek profiles. (See Architecture.) The Gothic mouldings were far more complex than the Classic, with multiplied deep hollows, sharp, angular fellets, and salient rounds or boultels. They were almost invariably cut into the masonry, reducing its mass, instead of projecting from it like the Classic. The earlier or Romanesque mouldings were large and simple in profile, but often richly carved with zigzags, billets, or surface-patterns. These disappeared with the advent of the pointed arch; in the true Gothic or pointed styles only the hollows were decorated, and these with pyramid-flowers or dogteeth at first, later with ball-flowers, naturalistic or conventional foliage, and finally running vines realistically carved. The Renaissance revived the Roman profiles and ornaments, and modern architecture has mainly continued in its use. The importance of carefully studying the profiles of all mouldings is best understood perhaps by the French, whose care in this respect accounts largely for the air of refinement which seems to characterize in a greater degree the average modern French building as compared with the average modern English, German, or American building. TURE, ORDERS OF ARCHITECTURE, and RENAISSANCE ARCHITECTURE; also Perrot and Chipiez, *History of Art in Antiquity*; Viollet-le-Duc, *Dictionnaire Raisonné*, under *Profil*; Paley, *Gothic Mouldings*; Parker, *Glossary*; Rosengarten, *Handbook of Styles in Architecture*. A. D. F. HAMLIN.

Moulds: See MUCORACEÆ and WATER MOULDS.

Moulins, moo'lăn': capital of the department of Allier, France; on the Allier, here crossed by one of the finest bridges in France; 124 miles N. W. of Lyons (see map of France, ref. 5–F). It is a beautifully situated and handsomely built town, with a fine cathedral, large cavalry barracks, and important manufactures of cottons and cutlery. Pop. (1896) 22,215.

Moulins: wide-mouthed, funnel-shaped crevasses formed in melting GLACIERS (*q. v.*).

Moulting, or **Exuviation** [*moult* is from M. Eng. *mouten*, from Lat. *muta're*, change, whence Eng. *mew*, moult; *exuviation* is from Lat. *exu'viæ*, anything taken or stripped off, the shed skin of animals, deriv. of *exu'ere*, take out or off]: the periodical casting off of shell, skin, horns, feathers, or other parts of the integument, such as takes place once a year or oftener (in some animals once every few days) among serpents, batrachians, spiders, insect-larvæ, etc. Birds in many cases shed their feathers annually, and many quadrupeds also shed their coat of hair nearly all at once. Deer mostly renew their horns completely every year. In man exuviation is a continual process; and this is the case with many of the lower animals. See FEATHERS and ENTOMOLOGY.

Moulton, mōl'tŭn, ELLEN LOUISE CHANDLER: poet and story-writer; b. in Pomfret, Conn., Apr. 5, 1835; married in 1855 William A. Moulton, a publisher of Boston: has published many contributions to periodical literature: author of *This, That, and the Other* (1854); *Juno Clifford* (1855); *My Third Book* (1859); *Bedtime Stories* (1873, 1875, 1880); *Swallow Flights* (1878); *In the Garden of Dreams* (1890); *Some Women's Hearts* (1888); and other works.

Moulton, RICHARD GREEN: See the Appendix.

Moultrie, WILLIAM: soldier and patriot; b. in South Carolina in 1731; commanded a company against the Cherokees 1761; was in 1775 appointed colonel of the Second South Carolina Regiment, and in that year represented St. Helena parish in the provincial congress. In June, 1776, while engaged in constructing a rude defensive work of palmetto logs on Sullivan's island, Charleston harbor, he was attacked by a British fleet (June 28) under Sir Peter Parker; an engagement of nearly ten hours ensued, resulting in victory for the little fort, which has since borne the name of its gallant defender. In September he was made a brigadier-general, and in Feb., 1779, defeated the British near Beaufort. In May he successfully resisted Prevost's advance upon Charleston, which place he was able to hold until the arrival of Lincoln; but in 1780, upon the surrender of the place, he was made prisoner and held for nearly two years, refusing repeated offers of bribery to desert the cause of his country. After his exchange (Feb., 1782) he was made (Oct. 15) a major-general; was Governor of South Carolina 1785, and again 1794–96. Author of *Memoirs of the Revolution* (2 vols., 1802). D. at Charleston, S. C., Sept. 27, 1805.

Mound-builder: a species of bird. See MEGAPODIDÆ and NESTS OF BIRDS.

Mound-builders: in American archæology, the name applied to the constructors of an extensive series of ancient remains, of uncertain date, scattered over the upper Mississippi and Ohio river valleys. These remains vary greatly in size and character, and evidently were erected by different peoples widely apart in time, but approximating each other in the general level of their culture. The mounds or tumuli are of earth or earth mingled with stones, and are of two general classes, the one with a circular base and conical in shape, the other with a rectangular base and a superstructure in the form of a truncated and terraced pyramid. The former are generally found to contain human remains, and are therefore held to have been barrows or sepulchral monuments raised over the distinguished dead, or, in some instances, serving as the communal place of interment for a gens or clan. The truncated pyramids, with their flat surfaces, were evidently the sites for buildings, such as temples or council-houses, which being constructed of perishable material have disappeared. Many of the mounds are small in size, scarcely visible above the general level of the soil, while others reach extraordinary proportions. One at Grave Creek, W. Va., is 70 feet high and 900 feet in circumference; a rectangular, truncated mound at Marietta, O., is 188 feet long, 132 feet wide, but only 10 feet high; one at Cahokia, Ill., is 97 feet high, rising from a base in the form of a parallelogram, with sides measuring 700 and 500 feet respectively. They are most numerous in Southern Ohio and Southern Illinois. According to a careful estimate there are more than 10,000 in the former State alone. Many of them are connected with extensive artificial embankments and earthworks, inclosing large areas in lines representing accurately geometrical figures, usually the square and the circle. One of these, in Ross co., O., incloses 140 acres; while that known as Fort Ancient, on the Little Miami river, extends in the whole circuit of its embankments about 4 miles. Nearly 1,500 of such inclosures have been enumerated in the State of Ohio, and over 100 in Ross County, which seems to have been one of the centers of population of this ancient people.

Another class of mounds occasionally found in Ohio but much more abundant in Wisconsin are those known as animal or effigy mounds. These are of slight elevation, at most 3 or 4 feet, and represent in outline the figure of some animal in gigantic size, often several hundred feet in length. Usually the subject chosen is a bird or familiar mammal. Figures of men are rare; instances of extinct or unknown animal forms, such as those of monkeys, elephants, the mastodon, etc., have been alleged in various quarters, but closer examination has proved the resemblance to be delusive. Several remarkable examples of such mounds are found in Ohio, as the Great Serpent mound in Adams County and the so-called Alligator (probably an opossum) in Licking County. From these examples it is surmised that the builders of the Wisconsin mounds may have been connected with the constructors of the Ohio works. It is generally supposed that the object of these effigy mounds was to represent the "totemic animal" or mythical ancestor of the gens or tribe.

Many hundreds of the mounds have been carefully opened and their contents studied. They indicate a degree of civilization higher, indeed, than that of the native Indians, who occupied the locality when it was first visited by the whites, but not in advance of what was found in many portions of the area of the U. S., and generically strictly within the limits familiar to the red race. Although the mound-builders were familiar with the use of copper for ornaments and tools, they hammered it from the native ore, and knew nothing of smelting or casting. They were wholly within the "polished stone age," and their weapons and implements were mainly of chert, quartz, slate, and bone. They were somewhat skillful in carving pipes from the softer stones, and evidently were agricultural, cultivating tobacco, maize, and some other food-plants. Their pottery was superior to that of the nations N. or E. of them, but much below that of Mexico; the most artistic examples are certain small figurines representing animal and human forms, which have been found broken and thrown upon funeral pyres under the sepulchral mounds. It is evident that they had extensive commercial intercourse in various directions. Besides copper, which came from the shores of Lake Superior, the mounds have yielded abundance of mica, brought from the mountains of North Carolina, pearls from the Tennessee river, shells from the Gulf coast, and obsidian from the region now comprising Yellowstone Park.

The period when the mound-builders flourished has been differently estimated; but there is a growing tendency to reject the assumption of a very great antiquity. There is no good reason for assigning any of the remains in the Ohio valley an age antecedent to the Christian era; and the final destruction of their towns may well have been but a few generations before the discovery of the continent by Columbus. Faint traditions of this event were still retained by tribes who occupied the region at the advent of the whites. Indeed, some plausible attempts have been made to identify their descendants with certain existing tribes. It is now fully recognized that the culture of these ancient peoples was strictly "Indian" in character; and in a number of prominent traits it bore a striking likeness to that discovered by de Soto and the early French explorers on the lower Mississippi, and in the area of the Gulf States. Not only did the modern tribes resident there erect mounds of similar size and character to those in the Ohio valley, but many minor details of art and ornament are identical. There is therefore no occasion to go beyond the ancestors or relatives of these southern tribes to explain the mystery of the mound-builders.

Authorities.—*Reports of the Peabody Museum* (Cambridge); Cyrus Thomas, *Mound Exploration for the Bureau of Ethnology*; W. K. Moorehead, *Primitive Man in Ohio* (New York, 1892); J. P. Maclean, *The Mound-builders* (Cincinnati). D. G. Brinton.

Mound City: city; capital of Pulaski co., Ill. (for location of county, see map of Illinois, ref. 12–E); on the Ohio river, and the Cleve., Cin., Chi. and St. L. Railway; 7 miles N. of Cairo. The principal industries are lumbering, manufacturing, and ship-building. It contains one of the U. S. national cemeteries. Pop. precinct (1880) 2,222; (1890) 1,965; city (1900) 2,705.

Mound City: city; Holt co., Mo. (for location of county, see map of Missouri, ref. 2–C); on the Chi., Burl. and Quincy Railroad; 45 miles N. by W. of St. Joseph. It is in an agricultural and stock-raising region; has considerable canning interests; and contains 5 churches, 2 public-school buildings, 3 hotels, and 2 weekly newspapers. Pop. (1880) 678; (1890) 1,193; (1900) 1,681. Editor of "News."

Moundsville: city (formerly Grave Creek, renamed from large mound in vicinity); capital of Marshall co., W. Va. (for location of county, see map of West Virginia, ref. 4–G); on the Ohio river, and the Balt. and O. and the Ohio River railways; 12 miles S. of Wheeling. It is in a coal-mining and farming region; has water-works, electric lights, electric railway, cotton and woolen mills, glass, mineral wool, and shoe factories, brick-works, and several sawmills and coal-banks; and contains the State penitentiary, a State bank with capital of $35,000, and two weekly newspapers. The work of the mound-builders here consists of a conical structure, about 70 feet high and 900 feet in circumference at the base. A shaft sunk from the apex to the base in 1838 disclosed two sepulchral chambers, formed of logs and covered with stones, containing human skeletons. Pop. (1880) 1,774; (1890) 2,688; (1900) 5,362.
Editor of "Herald."

Mountain: a prominence of the earth's surface, having considerable magnitude and steep slopes. Plateaus are distinguished from mountains by their broader tops or gentler slopes. Hills are distinguished by their less magnitude; but there is no fixed limit, and classification is influenced by the general scale of the surrounding features. An eminence which in a district of great mountains would be called a hill might rank as a mountain if surrounded by broad lowlands.

A long mountain is called a range, ridge, or sierra, and is said to trend in the direction of its length. A group of ranges usually exhibit parallelism of trend, and if it is itself long is called a chain or cordillera.

Parts of Mountains.—A ridge diverging from the main ridge or mass of a mountain is called a spur. Acute lines of water-parting are called crests. Peaks are exceptionally high points of crests; saddles or cols, exceptionally low points. Cols traversed by routes of travel, or available for such routes are called passes. The title mount is often prefixed to the specific name of a peak or isolated mountain; and knob, following the specific name, is sometimes used in the same sense. Acute peaks are called pinnacles or needles. Hollows or depressions on the slopes of mountains are called valleys if their bottoms are broad, gorges if they have narrow bottoms between steep walls. In the Western U. S. gorge is replaced by cañon; in the Catskill district of New York by clove. In the Rocky Mountains large mountain valleys are called parks; in the Southern Appalachians small mountain valleys are known as coves. Steeply walled amphitheaters, often found near the crests of ranges, are called cirques.

Origin of Mountains.—The processes of mountain-making may be summarized under three heads: uplift, eruption, and sculpture. From time to time, now in one place and now in another, portions of the earth's crust are lifted high above the general level. If the rising tract is broad it becomes a plateau; if narrow it becomes a mountain. So, too, in various places and from time to time lavas issue from cracks in the earth, and spreading over the surface are congealed. Many such lava-flows issuing at one place build up a mountain. The whole surface of the land is subject to erosive action by rain, streams, frost, and other agencies, and the final tendency of this action is to wear away the continents and deposit the material in the ocean; but its immediate tendency is to carve hollows in the higher parts and on the steeper slopes of the land. The mountains made by uplift and eruption are thus sculptured into new shapes, often very different from the original: and plateaus are sometimes so profoundly furrowed that the parts remaining between the hollows are properly called mountains. It will be noted that uplift and eruption are initiative, while sculpture is a modifying process. Though they co-operate in the production of mountains, their co-operation is antagonistic, and the form of each mountain represents a transitory phase of the conflict between constructive and destructive forces. Uplift and eruption do their work slowly, and their product is subject to degradation from the very start.

Types of Uplift.—In some cases the rocks composing an uplifted mass are massive or are of complicated structure, and it may then be difficult to determine the character of the uplift; but when the original structure is simple, and especially when the original rocks are undisturbed sediments, the new structure given to the rocks exhibits the nature of the disturbance. In a number of well-studied mountain chains the rocks are arranged in a series of parallel folds or wrinkles. The folds, though long, are shorter

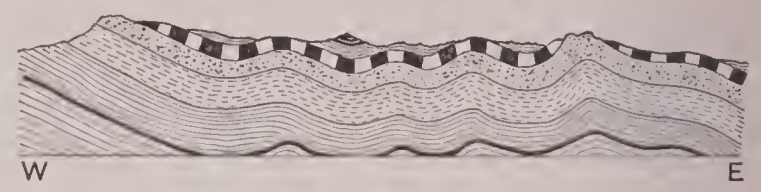

Fig. 1.—Section of Appalachian folds in Virginia (after Rogers).

than the chain, and lap past each other like wind-waves on a lake. Associated with them are faults of the type called thrust faults (Fig. 2). Both folds and faults show that in

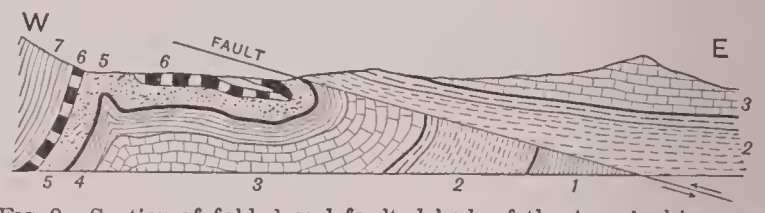

Fig. 2.—Section of folded and faulted beds of the Appalachian systems in Eastern Tennessee (after Campbell). Arrows show the directions of motion along the fault plane. Formation 2, originally underlying 3, and overlying 1, is by the dislocation made to rest on the broken ends of 1, 2, 3, and 4.

the process of wrinkling the rocks have been made to occupy much less space laterally, and it is hence inferred that the wrinkles were produced by forces acting horizontally, or in directions tangential to the earth's surface. To account for such forces various theories have been propounded, the one that has found most favor appealing to the shrinkage of the earth by cooling. The interior of the earth is intensely hot (see Earth and Refrigeration of the Earth), and there is a continual flow of heat by conduction to the surface, whence it is radiated to space; but the outer part, having acquired a low temperature long ago, does not become cooler. Consequently, there is a progressive shrinkage of the nucleus, but not of the crust, and the adjustment of the crust to the shrinking nucleus produces tangential stresses. The folded structure is characteristic of the Appalachian Mountains and the Coast Ranges of the U. S., and of the Jura Mountains of Europe; it is appropriately called the *Appalachian structure*.

In an important variety of fold-structure the folds are pressed closely together, are symmetrically arranged on opposite sides of an axis, and are overturned in such way that the strata dip toward the axis from both sides (Fig. 3).

Fig. 3.—Section illustrating the fan-structure of the Alps (after Geikie). The numbers indicate different formations in the order of their original superposition, No. 1 being the lowest.

This type, which is not well illustrated in the U. S., has been best studied in the Alps, and is called the *Alpine* or *fan-structure*.

In an independent type, known as the *Basin Range structure*, there seems to have been no horizontal compression, but only vertical movement. Sometimes the rocks are arched, but more frequently they are divided by vertical fractures into blocks of mountain size, and these are un-

equally lifted, or some go up and others down (Fig. 4). Frequently a number of great blocks are separately tilted, their lifted edges making mountains and their fallen edges valleys (Fig. 5). This structure, for which no satisfactory explana-

FIG. 4.—Ideal section, illustrating Great Basin structure (after Russell).

tion has been offered, characterizes many mountain ranges in Nevada, Utah, Arizona, and New Mexico.

Intermediate between the Basin Range structure and what has been called plateau structure is the *Uinta structure*, in which a crustal block somewhat broader than an ordinary mountain range is lifted bodily above adjacent tracts and is

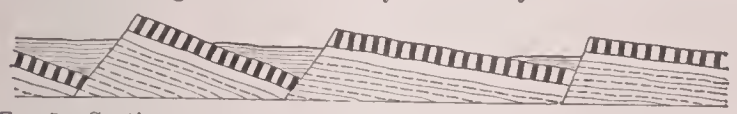

FIG. 5.—Section across mountains and valleys in Southeastern Oregon (after Russell).

itself gently arched. Of this type are the Uinta Mountains of Utah and the Black Hills of Dakota.

Types of Eruption.—Those eruptions which produce mountains may be classified as superficial and subterranean. *Superficial* eruptions build up mountains of conical form with craters at top, lavas of one type producing cones of gentle slope, as in the Sandwich islands, lavas of another type making steep cones like Vesuvius. Some volcanic cones are solitary, others are grouped together, and sometimes the grouping is linear. In the Western U. S. there are many volcanic mountains, among which Rainier, Hood, St. Helena, Adams, Shasta, and Taylor are distinguished by their great size. The Cascade Range is a broad upland constituted chiefly of confluent volcanoes. See VOLCANO.

Eruptions that may be called subterranean never reach the surface, but stop at lower levels, forming bubble-like cysts called laccolites. In making space for themselves they lift the superjacent rocks, and thus produce mountains at the surface. Structurally such mountains are domes with hard nuclei; and they are often grouped together after the manner of volcanoes. In the Western U. S. the Henry, Navajo, Abajo, La Sal, Elk, Spanish, and Huerfano Mountains are of this type.

Mountain-making by Sculpture.—When a continental area is exempt for a long time from uplift and eruption it becomes a plain. Its mountains are worn down to low hills, its valleys are made flat, and its extent is enlarged by the building of low deltas on its coasts. The whole surface is brought so nearly to the level of the sea that the streams are sluggish and nearly cease their work of degradation. The form of the surface is practically independent of the geologic structure, which may be simple or complex. If such a plain, or part of it, be uplifted, the resulting plateau is at once subjected to active but unequal erosion. All about its margin, and eventually through its whole extent, streams have steep descent and deepen their channels rapidly; the general surface between streams suffers relatively little wear; and the plateau is thus converted into a rugged tract of steep-sided mountains and valleys. If the rock is homogeneous, the positions and trends of the mountains are determined by the streams, and each mountain is usually a congeries of spurs. If the rock is varied in texture, the courses of streams are modified through the inequality of the resistances offered by the different rocks to erosion, and a topography results in which valleys follow the outcrops of rocks easily eroded, and the great masses of resistant rock survive as mountains. This is finely illustrated in the Appalachian chain. After the rock-sheets of that range had been crowded into folds there was a long period of stability during which the parts of folds lying above sea-level were almost completely removed, hills surviving only where resistant rocks were massed together. Then the folded belt was gradually lifted into a broad, flattish arch several thousand feet high, and the streams were stimulated to a great work of sculpture. From the arch-like plateau they have carved the existing mountains, the plan of the mountain-ridges being determined almost wholly by the arrangement of the more durable formations. This arrangement was itself determined primarily by the folds and faults of the earlier uplift, and secondarily by the level at which the folds were truncated. Many of the structural features of the chain are thus forcibly expressed in its topography, although the axes of mountain-ridges do not ordinarily coincide with the axes of folds.

FIG. 6.—Map of Appalachian ridges in Eastern Central Pennsylvania (after Lesley). The ridges coincide with the outcrops of hard beds which were involved with soft beds in great folds.

A number of the eruptive rocks are able to withstand erosive attack with peculiar success, and this quality enables sculpture to develop mountains when eruption is combined with regional uplift. A small volcano, itself only a hill, may by the hardness of its rock protect and preserve softer rocks beneath it while the surrounding plateau is profoundly degraded, and thus determine the existence of a mountain. Of this character are the Uinkaret and San Francisco Mountains of Arizona. In similar fashion thick, level layers of lava sometimes cause flat-topped mountains, such as the Raton of Colorado, the Thousand Lake of Utah, and Table Mountain of California.

Lavas that were originally congealed beneath the surface, or that were afterward buried deeply by sediments, often occasion mountains as a result of subsequent regional uplift and degradation. To this class belong the Henry and other laccolitic mountains already mentioned, the Watchung of New Jersey, and the various mountains of the Connecticut valley.

Origin of Mountain Details.—Excepting volcanoes in process of construction, mountains owe to sculpture their details of form. The storm-water that flows down the sides of a mountain follows everywhere the lines of steepest slope. These lines converge so that the water is gradually gathered into a small number of large streams which issue from the base. The streams are the carriers of the eroded rock, and are themselves agents of erosion, excavating the gorges in which they flow. The spurs between them are not minor units of uplift or eruption, but are residual parts of the general mass which survive because not on stream lines. The placing of stream lines is therefore a matter of importance. Sometimes a large stream crossing a rising mountain mass holds its course despite the uplift, degrading its channel as rapidly as the bottom rises; but small streams are deviated by the uplift and turned down the newly created slopes. Similarly, when the streams of a rising plateau discover a resistant rock mass, the largest persist and file the mass in two, but the smaller are eventually drawn off in other directions by streams traversing soft rock, and their places are taken by streams running from hard rock toward soft. Each stream tends to enlarge its valley at the head and sides, and along the divides there is a contest for territory. In this contest large streams have advantage over small, streams at low level over streams at high level, and streams on soft rock over streams on hard rock. There results a tendency toward the rapid segregation of mountain drainage into a few main streams whose lower courses are of high stability, while their upper courses respond freely to the local conditions of rock texture, which usually vary with the progressive degradation of the mass. The high grades of mountain torrents enable them to lower their channels

rapidly; the intervening spurs, being comparatively exempt from such action, lag behind until their slopes become so steep that blocks loosened by frost can be rolled down by gravity. It is for this reason that the valleys of mountain streams are gorges and the crests of mountain spurs are sharp.

Where glaciers gather about mountain summits and flow down their sides the laws of sculpture are different. There are still crests, troughs, and spurs, but they have other forms. The troughs, instead of resembling the letter V in cross profile, simulate U, and they head in cirques with nearly vertical sides. The cirques are gradually eaten backward, and where two meet on opposite sides of a crest the crest is first reduced to a narrow row of pinnacles (the *arrête* of the French), and finally converted into a low col. These forms are specially illustrated in the Sierra Nevada, which formerly nourished a great system of glaciers. Where a continental glacier flows over a mountain it wears away the sharper angles, substituting a system of curved contours, as illustrated in the mountains of New England. See GLACIERS.

The results of prolonged ice-sculpture are not known. The only glaciated regions now bare of ice, so that their topographic details can be studied, were occupied but briefly by ice, and had been previously sculptured by water, and the ice-formed features consequently appear as modifications of water-formed features. See PLEISTOCENE PERIOD.

Zones of Climate and Life.—The development of glaciers about the summits of some mountains is but one of a large group of characters linked to the dependence of climate on altitude. The upper layers of air are cooler than the lower, the general rate of change being 1° F. for each 300 feet. The precipitation of moisture on mountain-slopes increases upward, except at great altitudes, and the ratio of snow to rain increases upward. With changes in temperature and precipitation go changes in vegetation, so that mountains are begirt with approximately horizontal floral zones, each differing from the next in most of its species. Above all the plant zones the highest peaks are barren. Animals of all kinds are directly or indirectly dependent on plants for food, and faunal zones in general coincide with floral. In regions of great general moisture the barren zone is chiefly occupied with perennial snow, whence ice-streams, following valleys, invade the higher life zones; in arid regions the barren ground may have no perennial snow. The height of the various zones above sea-level is affected by many local conditions, but chiefly by latitude, all zones descending from the tropics toward the poles, and the barren zone finally reaching the sea.

Thus the scenery of mountains, though indebted primarily to the vital throes of the inner earth and the destructive energies of water and ice, owes much of its beauty to the gentler offices of sun and shower, which clothe it with a varied mantle of verdure. Certain elements of topographic form also must be credited to life, for where the air is both warm and moist the resulting rank vegetation generates reagents that decompose rocks, and at the same time impedes the work of running water, and these influences conspire to give smoother and rounder contours to spurs and crests.

Oceanic Mountains.—The name mountain is ordinarily applied only to prominences of the land, but a broader meaning is sometimes given. Many islands are but the peaks or crests of mountains that stand on the ocean floor, and other oceanic mountains are known only from soundings. Knowledge of the configuration of the ocean-bed is only fragmentary, and if complete would doubtless confirm our present impression of a general smoothness as compared with the land; but it can scarcely be doubted that elaborate survey would discover a great number of mountains resembling those of the land except as to details of sculpture. Half-submerged mountain chains are well illustrated by the Alaskan and West Indian archipelagoes.

REFERENCES.—For accounts of individual mountains the reader should consult articles under their several names; the great mountain systems of the earth are outlined in the articles on the several continents, those of the Western U. S. in the article ROCKY MOUNTAINS. The processes of mountain sculpture are treated under GEOLOGY and GLACIERS, those of eruption under VOLCANOES.

On the origin and classification of mountains, see Dutton, *Greater Problems of Physical Geology* (Phil. Soc. Wash. Bull., vol. xi., 1889); Fisher, *Physics of the Earth's Crust* (1889); Green's *Physical Geology* (1882); Heim, *Mechanismus der Gebirgsbildung* (1880); Le Conte, *Theory of the Origin of Mountain Ranges* (*Journal of Geology*, vol. i., 1893); Powell, *Geology of the Uinta Mountains* (1876); Reade, *Origin of Mountain Ranges* (1886); Suess, *Das Antlitz der Erde* (1888).

On the sculpture of mountains, see Davis, *Rivers and Valleys of Pennsylvania* (*Nat. Geographic Mag.*, vol. i., 1889); Geikie, *Scenery of Scotland* (2d ed., 1887); Gilbert, *Geology of the Henry Mountains* (1877); Hayes and Campbell, *Geomorphology of the Southern Appalachians* (*Nat. Geographic Mag.*, vol. vi., 1894). G. K. GILBERT.

Mountain-ash. or **Rowan-tree**: popular names of small trees, often seen in cultivation, belonging to the order *Rosaceæ*, sub-order *Pomaceæ*. They are *Pyrus aucuparia* of Europe, and *P. americana* and *P. sambucifolia* of North America. They have pinnate leaves, and in autumn clusters of small acid bright-red fruit. The European tree is most common in cultivation. The wood of all is hard and suitable for turnery. The peasantry of nearly all nations of Europe ascribe supernatural qualities to the wood of the rowan-tree, which is used for divining-rods and the like.

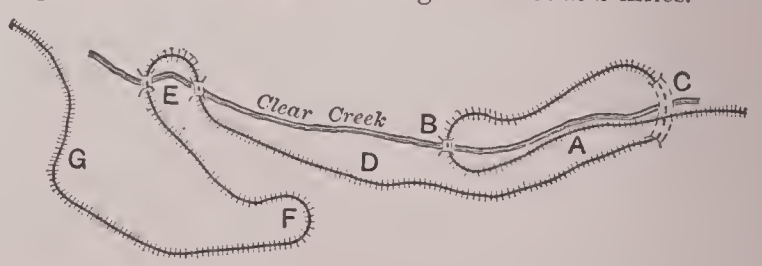
Mountain Limestone: a geologic formation of Carboniferous age, occurring in Great Britain. It is metalliferous, lead being the most important ore. Fluor-spar, a little petroleum, a few small coal-seams, quarries of building-stone, and some iron and copper ore are among its economic resources. The name has also been applied to Carboniferous limestones in the U. S., but is no longer so used. G. K. G.

Mountain-lion: a common name in the western parts of the U. S. for the PUMA (*q. v.*).

Mountain Meadow Massacre: See UTAH.

Mountain Railways: railways with steep gradients where cables or rack-rails are used to facilitate the ascent, or lines passing over mountains with unusual grades and curves, or narrow-gauge railways in mountainous countries. The first class, using cable and rack systems, will be found described in detail in INCLINED PLANE.

Mountain railways not using the special devices of the first class rarely have grades greater than 4 per cent. (211·2 feet rise per mile), and in order to make the ascent the horizontal distance is increased by forming spirals or zigzags, and often the line crosses itself at different elevations, while tunnels and viaducts are of frequent occurrence. The method of spirals and zigzags is illustrated (see figure) by a portion of the track of the Union Pacific Railway near Georgetown, Col. At A the track is on a grade of 3 per cent., but to pass directly to D would require a very heavy gradient of 10 per cent. or more, which a locomotive could not ascend, and accordingly the line was turned backward at B across the creek, and a spiral A B C D formed. At C the line crosses the creek again by a viaduct 90 feet above the water, and 75 feet above its own track. From D to G is seen an example of the zigzag method of gaining distance, requiring very sharp curves at E and F, and the grade being nearly 3 per cent. throughout. The total length of the line shown in the figure is about 2 miles.



The spiral shown above is of the class called a bridge spiral, in which the line swings around a valley and the upper end of the spiral is carried over the lower by a bridge or viaduct. Another class is the tunnel spiral, in which the line swings around a central hill and the lower end of the spiral crosses under the upper by a tunnel. The St. Gothard Railway has tunnel spirals on both the Swiss and Italian sides of the Alps.

Switchbacks have been used in a few cases instead of zigzags; in this case the line, after making an ascent, is turned back tangentially to itself without a curve, so that the train stops, and is run backward until the next switchback is reached. These are generally arranged in pairs, with the distance between the switchbacks as short as possible.

An additional locomotive or a pusher is frequently used on grades greater than 2 per cent. (105·6 feet per mile) for heavy trains, although a light train of one or two cars can easily be drawn by a single locomotive on much heavier grades. In some cases temporary grades of 10 per cent. have been operated, as on the Baltimore and Ohio Railroad in 1852.

Heavy grades for long distances are, as a rule, avoided, but an instance of such is the railway from Vera Cruz to the city of Mexico, which has an unbroken 2 per cent. grade for a distance of 72·6 miles. The Southern Pacific Railway has an average 2 per cent. grade (maximum, 2·2) for a distance of 25·4 miles. The Denver and Rio Grande Railroad has an average grade of 3 per cent. (maximum, 4·0) for a distance of 25 miles.

Mountain railways are charaeterized also by a large amount of curvature and many sharp curves. The number of degrees of curvature per mile generally increases with the number and height of the mountain ranges. The average curvature for a prairie State like Illinois is about 9° per mile, and for Pennsylvania about 80° per mile, while for some roads in Colorado it is more than 300° per mile.

The sharpness of a curve is inversely as its radius or directly as the degree of the curve, the latter being the angle subtended at the center by a chord of the circle 100 feet in length. Ordinary railway lines avoid curves greater than 5° (1,146 feet radius), but in making mountain ascents much sharper ones are necessary. The curve on the Lehigh Valley Railroad, Mauch Chunk, Pa., is nearly 14° (410 feet radius). The curves at E and F in the above sketch are 28° and 30° degrees respectively (207 and 193 feet radii). Such sharp curves make riding very uncomfortable to passengers unless the velocity is slow, while the increased resistance causes a greater fuel consumption and rapid wear of the rails.

Mountain railways are subject to accidents from both land and snow slides, and the prevention of these is an important part of the work of construction and maintenance. Retaining walls are built to secure the stability of slopes, and snow-sheds are erected to prevent snow from drifting or sliding into cuts. The avalanche-sheds of the mountain division of the Northern Pacific Railway are formed of solid rock-filled crib-work upon the upper slope and strongly braced frame-work on the lower, and their cost varies from $40 to $70 per linear foot. To protect these sheds from fire a water-supply is provided, and pipe-lines are laid to tanks erected at suitable intervals. Over $3,000,000 have been spent on this railway for the single item of protection from snow.

Narrow-gauge railways are frequently built in mountain regions, particularly for local traffic. These have the advantage that sharper curves and heavier grades may be used than with the standard gauge, thus lessening the cost of construction, while the cost of rolling stock is also smaller. The gauges most frequently used for this class of railways are 3 feet and 3½ feet, although short lines with a gauge as low as 2 feet have been built. The advantages of a narrow-gauge railway disappear when connection is made with those of the standard gauge, as freight has then to be transferred from one car to another, and thus delay and additional expense are incurred. For this reason narrow-gauge railways are often, after a few years, changed to the standard gauge of 4 ft. 8½ in. Many are found in Colorado, and among those may be mentioned the Calumet Mine branch of the Denver and Rio Grande Railroad, which surmounts a vertical height of 2,700 feet in 7 miles, having 8 per cent. grades for a large part of the distance. See Wellington's *Economic Theory of Railway Location* (New York, 1887); also on allied subjects, the articles Gauge of Railways, Inclined Plane, Railways, and Tunnels.

Mansfield Merriman.

Mount Airy: town; Surrey co., N. C. (for location of county, see map of North Carolina, ref. 2–E); on the Ararat river, and the Cape Fear and Yadkin Val. Railway; 151 miles N. W. of Raleigh. It contains granite quarries, mineral springs, flour and planing mills, cotton and tobacco factories, shoe-factory, and a weekly newspaper. Pop. (1880) 519; (1890) 1,768; (1900) 2,680.

Mount Ayr: town; capital of Ringgold co., Ia. (for location of county, see map of Iowa, ref. 7–F); on the Chi., Burl. and Quincy Railroad; 90 miles S. of Des Moines. It is in an agricultural and stock-raising region, the blue-grass belt of Southern Iowa; contains 5 churches, public school with 8 departments, 2 banks, and 3 weekly newspapers, and has fencing, pump, and cigar factories. Pop. (1880) 1,275; (1890) 1,265; (1900) 1,729.

Editor of "Journal."

Mount Calvary: See Calvary, Mount.

Mount Carmel, Palestine: See Carmel, Mount.

Mount Carmel: city; capital of Wabash co., Ill. (for location of county, see map of Illinois, ref. 9–G); on the Wabash River, and the Cleve., Cin., Chi. and St. L., and the Louis., Evans. and St. L. railways; 24 miles S. W. of Vincennes, Ind., 132 miles N. E. of Cairo. It derives good water-power from the river, and has a number of saw and flour mills and other manufactories, and two weekly newspapers. Pop. (1880) 2,047; (1890) 3,376; (1900) 4,311.

Mount Carmel: borough; Northumberland co., Pa. (for location of county, see map of Pennsylvania, ref. 4–G); on the Lehigh Val., the N. Cent., and the Phila. and Read. railways; 28 miles E. by S. of Sunbury, the county-seat. It has a number of anthracite coal mines, a national bank with capital of $50,000, and a daily and three weekly newspapers. Pop. (1880) 2,378; (1890) 8,254; (1900) 13,179.

Mount Carroll: city (founded in 1843); capital of Carroll co., Ill. (for location of county, see map of Illinois, ref. 2–D); on the Chi., Mil. and St. P. Railway; 128 miles W. of Chicago. It has 5 churches, 3 public schools, female seminary, 2 libraries (Seminary and Public School), and a weekly and 2 semi-weekly newspapers. The principal industries are farming, mining, and stock-raising. Pop. (1890) 1,836; (1900) 1,965.

Editor of "Mirror."

Mount Clemens: city; capital of Macomb co., Mich. (for location of county, see map of Michigan, ref. 7–K); on the Clinton river at the head of navigation, and on the Gr. Trunk Railway; 22 miles N. E. of Detroit. It is noted for its mineral and magnetic waters, said to have remarkable curative properties, which make the city a resort for hundreds of invalids annually. It contains an iron furnace, union school, public library, lumber manufactories, several hotels and boarding-houses, and two weekly newspapers. Pop. (1880) 3,057; (1890) 4,748; (1900) 6,576.

Mount Desert Island: a mountainous island of the Atlantic in Hancock co., Me., 14 miles long and 7 wide. Soame's Sound divides it nearly in two. Bar Harbor, Northeast and Southwest Harbors, Asticou, Soamesville, Seal Harbor, Seal Cove, and East Eden are among the villages. It abounds in beautiful lakes. The highest point is Green Mountain, 1,535 feet high. The island is a favorite place of summer resort. The French settled Mt. Desert in 1608, but in 1616 were driven out by the British, who settled it in 1761. Pop. (1890) 8,195; (1900) 7,907.

Mount Erebus: See Erebus, Mount.

Mount Forest: a village of Wellington co., Ontario; junction of the Grand Trunk and Canadian Pacific railways; 84 and 87 miles respectively W. N. W. of Toronto; on the south branch of the Saugeen river, a tributary of Lake Huron (see map of Ontario, ref. 4–C). It has good water-power, an iron-foundry, and other industries. Pop. (1891) 2,214.

M. W. H.

Mount Gilead: village (established as a stage station in 1845); capital of Morrow co., O. (for location of county, see map of Ohio, ref. 4–F); on the Olentangy river, and the Ohio Cent. and the Cleve., Cin., Chi. and St. L. railways; 45 miles N. of Columbus. It is in a rich farming region; manufactures machinery, carriages, and cider-presses; and has 5 churches, large public-school building, and 2 weekly newspapers. Pop. (1880) 1,216; (1890) 1,329; (1900) 1,528.

Editor of "Morrow County Sentinel."

Mount Holyoke College: an educational institution for women: situated at South Hadley, Hampshire co., Mass.; 4 miles from Holyoke, near the Connecticut river. It is the outgrowth of Mt. Holyoke Seminary, founded by Mary Lyon in 1836, and opened Nov. 8, 1837. In 1888 its charter was enlarged, and its name was changed to Mt. Holyoke Seminary and College. On Jan. 31, 1893, a full college curriculum was adopted, the charter was amended, the name was changed to Mt. Holyoke College, and the institution was given power to grant any degrees conferred by any college in the State. The campus contains a lake, park, tennis-courts, and botanic garden. Three courses of study lead respectively to the degrees B. A., B. S., B. L. The library contains 19,000 volumes. The main college building (destroyed by fire in 1896, and immediately replaced), 6 dormitories and library, gymnasium, observatory, physical and chemical

laboratory building, and Lyman Williston Hall comprise the college buildings. There are (1900) fifty professors and instructors, and 550 students. HENRIETTA E. HOOKER.

Mount Joy: borough; Lancaster co., Pa.; on the Penn. Railroad; 12 miles W. of Lancaster, the county-seat, 24 miles E. of Harrisburg (see map of Pennsylvania, ref. 6–H). It has a roller flour-mill, iron-foundry, woolen-mill, furniture and carriage factories, and agricultural-implement works; a seminary, soldiers' orphans' home, and two weekly newspapers. Pop. (1880) 2,058; (1890) 1,848; (1900) 2,018.

Mount Meru: See MERU.

Mount Morris: village; Livingston co., N. Y.; on the Dansville and Mt. Morris, the Del., Lack. and W., the N. Y., Lake E. and W., and the W. N. Y. and Pa. railways; 30 miles S. of Rochester, 60 miles E. of Buffalo (see map of New York, ref. 5–D). It has 5 churches, union school and academy, iron-furnace, sawmill, machine-shops, salt-works, 3 flour-mills, 2 cigar-factories, 2 broom-factories, and a monthly and 2 weekly periodicals. The Shaker property, purchased by the State for the establishment of the Craig colony for epileptics, is 4 miles S. of the village, and the site of the proposed Genesee river water-storage dam is a mile W. Pop. (1880) 1,899; (1890) 2,286; (1900) 2,410.

Mount Olivet: See OLIVES, MOUNT OF.

Mount Pleasant: city; capital of Henry co., Ia. (for location of county, see map of Iowa, ref. 7–J); on the Chi., Burl. and Quincy Railroad; 28 miles W. N. W. of Burlington, 47 miles E. of Ottumwa. It contains 17 churches, 5 public-school buildings, 2 national banks with combined capital of $200,000, a savings-bank with capital of $24,000, and a daily, monthly, and 4 weekly newspapers. It is the seat of the Iowa Wesleyan University (chartered in 1855), German College (Methodist Episcopal, chartered in 1873), and the Iowa Hospital for the Insane. There are water-works, gas and electric light plants, flour-mills, carriage and wagon factories, and farming-implement works. Pop. (1880) 4,410; (1890) 3,997; (1900) 4,109. EDITOR OF "NEWS."

Mount Pleasant: city; capital of Isabella co., Mich. (for location of county, see map of Michigan, ref. 6–I); on the Chippewa river, and the Flint and Pere Marq. and the Toledo, Ann Arb. and N. Mich. railways; 46 miles W. of Bay City. It is in an agricultural region, and has a high school, the Central Michigan Normal School, an Indian Industrial School, 7 churches, 2 State banks with combined capital of $100,000, a national bank with capital of $50,000, a private bank, and three weekly newspapers. There are electric lights, flour, grist, and saw mills, sash, door, and basket factories, foundries, and a considerable lumber-trade. Pop. (1880) 1,115; (1890) 2,701; (1900) 3,662.
EDITOR OF "DEMOCRAT."

Mount Pleasant: borough; Westmoreland co., Pa. (for location of county, see map of Pennsylvania, ref. 5–B); on the Balt. and O. and the Penn. railways; 12 miles N. of Connellsville, 32 miles S. E. of Pittsburg. It is in a coal-mining, coke-making, and limestone-quarrying region; is the seat of the Western Pennsylvania Classical and Scientific Institute (Baptist, chartered in 1871); and has three national banks with combined capital of $200,000, a private bank, and a weekly newspaper. Pop. (1880) 1,197; (1890) 3,652; (1900) 4,745.

Mount Pleasant: town; capital of Berkeley co., S. C. (for location of county, see map of South Carolina, ref. 6–F); on Charleston Harbor, opposite Charleston. It is in an agricultural region, and has a weekly newspaper. Pop. (1880) 783; (1890) 1,138; (1900) 2,252.

Mount Pulaski: village; Logan co., Ill. (for location of county, see map of Illinois, ref. 6–E); on the Ill. Cent. and the Peoria, Decatur and Evans. railways; 21 miles N. W. of Decatur, 24 miles N. E. of Springfield. It is in a coal-mining and stock-raising region, ships large quantities of grain, and has several flour-mills and elevators, and a weekly newspaper. Pop. (1880) 1,125; (1890) 1,357; (1900) 1,643.

Mount-Stephen, GEORGE STEPHEN, Baron: capitalist; b. in Dufftown, Banffshire, Scotland, Feb. 5, 1829; removed to Canada in 1850, and, engaging in business as a merchant in Montreal, amassed great wealth. He became president of the Bank of Montreal in 1876, president of the Manitoba and Minneapolis Railway in 1878, and president of the Canadian Pacific Railway in 1881, an office which he held for seven years until his resignation. In 1887 he and his cousin, Sir Donald Smith, gave $1,250,000 to found the Victoria Hospital at Montreal, which was completed in 1893. In 1886 he was created a baronet for his services in connection with the Canadian Pacific Railway, and in 1891 was raised to the peerage under the title of Baron Mount-Stephen. Some time afterward he took his seat in the House of Lords. NEIL MACDONALD.

Mount Sterling: town; capital of Brown co., Ill. (for location of county, see map of Illinois, ref. 6–B); on the Wabash Railroad; midway between Quincy and Jacksonville. It is in a rich farming country; has extensive deposits of coal and brick-clay; contains 6 churches, large public school, 2 Roman Catholic schools, electric lights, water-works, and 3 weekly newspapers; and manufactures wagons, brick and tile, and earthenware. Pop. (1880) 1,445; (1890) 1,665; (1900) 1,960.
EDITOR OF "DEMOCRAT-MESSAGE."

Mount Sterling: city (founded in 1793); capital of Montgomery co., Ky. (for location of county, see map of Kentucky, ref. 3–I); on the Ches. and O. and the Ky. and S. Atlantic railways; 120 miles E. of Louisville. It contains 7 churches for white people and 2 for colored, a public, a military, and 7 private schools for white children and 2 for colored, a public library, and 2 semi-weekly and 2 weekly newspapers. The city is known through the State as "the Gate City to the Mountains," and has large trade interests. Pop. (1880) 2,087; (1890) 3,629; (1900) 3,561.
EDITOR OF "JOURNAL."

Mount Terror: See EREBUS, MOUNT.

Mount Vernon: city; capital of Jefferson co., Ill. (for location of county, see map of Illinois, ref. 9–E); on the Louis. and Nash., the Jack. S. E., the Louis., Evans. and St. L., and the Wabash, Chest. and West. railways; 76 miles E. of St. Louis, Mo. It contains 8 churches and 2 daily and 3 weekly newspapers, and is principally engaged in farming and manufacturing. Pop. (1880) 2,324; (1890) 3,233; (1900) 5,216. EDITOR OF "NEWS."

Mount Vernon: city; capital of Posey co., Ind. (for location of county, see map of Indiana, ref. 11–B); on the Ohio river, and the Louis. and Nash. and the Evans. and Terre Haute railways; 18 miles W. of Evansville. It has flour, saw, and planing mills, large commerce by rail and river, a national bank with capital of $100,000, a private bank, County and Mechanics' Library (founded in 1850), and a daily, a monthly, and three weekly newspapers. Pop. (1880) 3,730; (1890) 4,705; (1900) 5,132.

Mount Vernon: town; Linn co., Ia. (for location of county, see map of Iowa, ref. 4–J); on the Chi. and N. W. Railway; 16 miles E. of Cedar Rapids. It is in an agricultural region; is the seat of Cornell College (Methodist Episcopal); and has 2 libraries (Cornell College and Adelphian Society) containing over 12,000 volumes, and 3 weekly newspapers. Pop. (1880) 977; (1890) 1,259; (1900) 1,629.

Mount Vernon: city; incorporated as a village in 1853 and as a city in 1892; Westchester co., N. Y. (for location of county, see map of New York, ref. 8–J); on the Bronx river, and the N. Y., N. H. and H. and the N. Y. C. and H. R. railways; 13 miles N. of New York. It includes the former village of Mt. Vernon, the suburb of Chester Hill, and a part of the town of Eastchester, and has an area of about 1 sq. mile. Some parts of it are about 200 feet above tide water, and command an extensive view of Long Island Sound. There are 12 churches, 5 public and 4 private schools, Y. M. C. A. building, an opera-house, 4 libraries (Union School and School Districts 2, 4, 5) containing nearly 10,000 volumes, 2 State banks with combined capital of $75,000, a savings-bank, and a daily, 6 weekly, and 2 monthly periodicals. Pop. (1880) 1,857; (1890) 10,830; (1900) 20,346.

Mount Vernon: city; capital of Knox co., O. (for location of county, see map of Ohio, ref. 4–F); on the Kokosing river, and the Balt. and O. and the Cleve., Akron and Col. railways; 45 miles N. E. of Columbus. It contains 9 churches, 8 school buildings, and a semi-weekly and 2 weekly newspapers; and has locomotive and machine works, flour-mills, and bent-wood, carriage and wagon, and furniture factories. Mt. Vernon Academy (Seventh-day Adventist) is a mile N. E. of the city, and Kenyon College (Protestant Episcopal) is 5 miles E. Pop. (1880) 5,249; (1890) 6,027; (1900) 6,663. EDITOR OF "REPUBLICAN."

Mount Vernon: magisterial district; Fairfax co., Va. (for location of county, see map of Virginia, ref. 4–H); on the Potomac river, and the Wash., Alex. and Mt. V. Electric Railway; 15 miles below Washington, D. C. It contains the home and tomb of George Washington, purchased with 200 acres of land in 1858 by the Ladies' Mt. Vernon Association for $200,000, and since preserved with great care by the association, which is a national organization with State representatives. The mansion contains many relics of the Washington family, and the spot is visited annually by thousands. Pop. of district (1890) 2,673; (1900) 3,033.

Mount Vernon Ladies' Association: See the Appendix.

Mourning: the official or conventional expression of grief. It has varied much at different times and in different countries. The Hebrews tore the garments, cut the hair and beard, strewed ashes on the head, went bareheaded and barefooted, and lay down on the ground weeping and smiting the breast; the period of mourning was seven days, but for Moses and Aaron they mourned thirty days. The Greeks cut off the hair, put on a coarse, black garment, retired into seclusion, and wailed. When a great general died the whole army cut off their hair and the manes of their horses. The period of mourning was in Athens thirty days, but in Sparta only ten. With the Romans the mourning was mostly done by the women; the men wore black clothes, but only for a few days. Public mournings often occurred in the days of the republic on the occasion of some public calamity or on the death of some great man; during the empire, on the death of an emperor. Then all business stopped; the temples, the forum, the schools, and the baths were closed. The mourning color was black under the republic, but during the empire white became the mourning color for women. The mourning rites among barbarians and half savages are often horrible, frequently involving serious mutilations. Among civilized nations the mourning customs have become very similar in modern times, and consist mostly in retirement within the house and avoidance of what is bright and noisy. In Europe and America the mourning color is black; in Turkey, violet; in China, white; in Egypt, yellow.

Mousa-ben-Noseir: Arab general. He was appointed by the Caliph Walid I. his lieutenant in Northern Africa, where by his justice he won the devoted affection of the recently converted Berbers or Moors. The proposals of Count Julian, who offered to betray Spain to the Mussulmans, determined him to undertake the conquest of that country. First he dispatched Tarik the Moor with a small army. Tarik was joined by Count Julian, and overthrew the Goths at the decisive battle of Xeres (911), their king, Roderic, being drowned in the Guadalquivir. Mousa crossed the strait and rapidly completed the subjugation of Spain. Then he reorganized the country, and by wise and kindly laws gave it peace and prosperity. He was preparing for the conquest of Gaul, but his virtues and successes aroused the suspicion of the jealous caliph, and he was summoned in disgrace to Damascus for trial. Making a triumphal entrance into that city with immense spoils and thousands of captives, he was still more suspected, and was condemned by the new caliph, Suleïman I., to payment of an enormous fine and was publicly flogged (715). His two sons were massacred. Then in contempt he was allowed to withdraw to Mecca, where he soon after died of grief and old age (716). E. A. G.

Mouse, plur. **Mice** [M. Eng. *mous* < O. Eng. *mūs* (plur. *mȳs*): O. H. Germ. *mūs* > Germ. *maus*. Cf. Sanskr. *mūṣ-*: Gr. *μῦς*: Lat. *mūs*, mouse]: the common name of the house mouse (*Mus musculus*), popularly applied to many species of small rodents, chiefly of the family *Muridæ*, although a few belong to related families. Such are the jumping mice (*Zapus*) of the family *Zapodidæ* (see DEER-MOUSE), the pocket mice (*Perognathus*), belonging to the *Dipodidæ*, and the dormice (*Myoxus*), forming the family *Myoxidæ*. The field mice, or voles, belong to the genus *Arvicola*, which includes many species and has representatives in both the Old and New Worlds. The white-footed or deer mice belong to the genus *Hesperomys*, which is exclusively American.

The house mouse is a native of the Old World, but, like the rat, has been unintentionally introduced by man throughout nearly the whole world, and thrives in his habitations from the arctic to the torrid zone, its amazing fecundity enabling it to hold out against numerous enemies, including its larger relative, the rat. Under favorable conditions the house mouse becomes semi-wild, and does much damage to stored grain.

The various small mice, particularly those of the genus *Arvicola*, inflict great damage by destroying growing or standing crops, and there have been such plagues of voles in Thessaly and Scotland that inoculation with the virus of a contagious disease was resorted to in order to destroy them, but with only partial success. F. A. L.

Moussy, JEAN ANTOINE VICTOR MARTIN, de: See MARTIN DE MOUSSY.

Mouth, Diseases of the: The mouth is subjected to so many irritations that it seems remarkable to find any mouths in a healthy condition. On account of the arrangement of the coating, however, it requires either a great irritation, or, on the other hand, diminished resistance, or both, before disease develops in the mouth. From the aspect of causation, it is convenient to make the division of the diseases according to the kind of change found in the mouth. We therefore have the inflammations, which induce by far the greatest number of diseases found in the mouth, and such other changes as will have to be described. Irritations may be of various kinds, either mechanical, chemical, thermal, or in the form of lower forms of life. Again, the point of view must not be lost sight of that the mouth has the property of secretion; i. e. certain substances are eliminated from the system by its glands, and these substances may give rise to sufficient irritation to cause inflammation. An inflammation of the mouth is called *stomatitis*, and of this there are the following varieties: *Catarrhalis*, *ulcerosa*, *hyphomycetica*, *aphthosa*, *crouposa*, *diphtheritica*, *syphilitica*, and *gangrenosa*.

Stomatitis catarrhalis is found as the results of uncleanliness; of irritation, too hot food, too acrid; acids, alkalies; in the presence of some of the exanthemata, i. e. measles, scarlet fever; with fevers in general. It is claimed, and it seems justly, that nearly all the forms of *stomatitis* are either preceded or accompanied by this form. Its symptoms are those of nearly all other forms—more or less pain, general constitutional reaction; but it is marked by redness, more or less swelling of the mouth, and, in some bad cases, hæmorrhage.

Stomatitis ulcerosa is found in scorbutic children, in lead and mercury poisoning, and frequently in those in which it seems impossible to determine the cause. It is characterized by the formation of an ulcerative band at the gums where they come in contact with the teeth. It never develops in toothless children. The ulcerative process, called a necrobiosis, a molecular death, is characteristic for the disease. With this we have a great amount of salivation and always very fetid saliva. The diseased process is no respecter of tissues, in that it loosens the teeth, and frequently attacks the bones of the jaws. Sometimes it runs into the form called *stomatitis gangrenosa*, and then becomes fatal; even without this termination stomatitis ulcerosa is always to be looked upon as a serious disease.

Stomatitis hyphomycetica, better known as thrush, is produced by one of the hyphomycetes which, for convenience, has been called the *saccharomyces albicans*. It is a disease which occurs most frequently in infants, and in adults who have been reduced by previous illness—consumption, typhoid fever, etc. It is characterized by the appearance of membranous spots, white or grayish white, deposited within the membrane of the mouth, but always in its outer layer. These membranes are made up of the fungus and parts of the mucous membrane, especially epithelial cells; they are detached with some difficulty, and sometimes there is left a bleeding spot where they are detached. The disease has frequently been mistaken for diphtheria of the mouth, but careful examination makes this error impossible. As a rule, the disease is amenable to treatment, and is only to be looked upon as a grave omen when implanted upon a general process already grave.

Stomatitis aphthosa is characterized by the appearance of small blisters in the mouth (aphthæ). Their eruption is preceded by more or less constitutional disturbances, and practically they represent that form of skin trouble known as herpes, except that they appear upon the mucous membrane. There is but one positively determined cause, that of the manifestation of the foot-and-mouth disease of cattle in man. As this is of very rare occurrence in the U. S., and as aphthæ are common, it is natural to suppose that there are many other poisons which may produce this disease. As a matter of fact, we do see it frequently in pneumonic and other fevers, and very commonly in disturbances of the gastro-intestinal tract, so that it seems as if this disease might be produced by a number of poisons acting either

directly upon the mucous membrane or indirectly through the nervous system, as is the case in herpes. In and of itself *stomatitis aphthosa* is not a dangerous affection, but may become so as the result of secondary infection of the abrasions which are left when the blister breaks. Of *stomatitis crouposa*, *diphtheritica*, and *syphilitica* little need be said in this place. They are all local manifestations of a disease graver than is expressed by the term stomatitis. See Croup, Diphtheria, and Syphilis.

Stomatitis gangrenosa is by far the most serious form of inflammation of the mouth, in that it usually ends fatally. It is found only in subjects very much debilitated by previous illness, and manifests itself by a gangrenous spot upon the cheek, which grows so as to perforate the cheek, and finally may include the whole of the face, the neck, attacking the bones and leaving a cavity, black and fetid, giving to the patient a most horrible appearance. The odor from this process is so penetrating that it may pervade the whole house. Fortunately, this disease is not frequently met with in private practice, but is most commonly seen in hospitals. It seems the great chance of saving these patients lies in early interference—the gangrenous tissue must be removed, best by the actual cautery (white heat), then by chemicals. In latter years more cures have been reported by means of this active interference than ever before.

In regard to the general treatment of *stomatitis* it may be said that surgical cleanliness is the principle that underlies successful treatment. We have many remedies which are especially valuable as applications to the mouth—chlorate of potassium, permanganate of potassium, nitrate of silver, salicylic acid, etc.; but their application alone will be of little avail unless done intelligently. On the whole, these forms of disease are very amenable to treatment, but they ought not to be overlooked on account of their apparent harmlessness, as, as in the case of *stomatitis ulcerosa*, they may be followed by grave and dangerous consequences if not properly treated.

For other diseases connected with the mouth, see Tongue, Mumps, etc. F. Forchheimer.

Movable Feasts: See Easter.

Movers, Franz Karl: theologian; b. in Koesfeld, Westphalia, July 17, 1806; studied theology and the Oriental languages at Münster 1825–29; was pastor of Berkum 1833–39, and then Professor of Theology in the Roman Catholic faculty at the University of Breslau, where he died, Sept. 28, 1856. His principal work is *Die Phönizier* (4 vols., 1840–56).

Mowat, Sir Oliver, LL. D., G. C. M. G.; statesman; b. in Kingston, Ontario, Canada, July 22, 1820; was called to the bar in 1841, and appointed a queen's counsel in 1856. He was a commissioner for consolidating the public general statutes for Canada and Upper Canada, respectively, in 1856; a member of the Quebec union conference 1864; president of the Evangelical Alliance of Ontario 1867–89, and has been president of the Canadian Institute, Toronto. He represented South Ontario in Canada Assembly 1857–64; North Oxford in Ontario Parliament since 1872; was Provincial Secretary in Brown-Dorion government in Aug., 1858; Postmaster-General in Sandfield Macdonald-Dorion government 1863–64, and the latter year was appointed Vice-Chancellor of Upper Canada, an office he resigned Oct. 25, 1872, on being called upon to form a new administration for Ontario. He was Premier and Attorney-General of Ontario from Oct., 1872, to July, 1896, when he became Minister of Justice of the Dominion in Sir Wilfrid Laurier's cabinet. He was appointed Lieutenant-Governor of Ontario Nov. 18, 1897. He was knighted in 1892.

Mowatt, Anna Cora: author; b. in Bordeaux, France, in 1819; daughter of Samuel Gouverneur Ogden, a New York merchant; married to James Mowatt, a lawyer, when she was only sixteen years old; published in 1836 her first work, a poetical romance entitled *Pelayo, or the Cavern of Covadonga*, using the pen-name "Isabel," and in 1837 a satirical answer to some adverse criticisms, under the title *Reviewers Reviewed*. During a sojourn in Europe because of ill health, she wrote *Gulzara, the Persian Slave*, a play, published in 1840. She began in Boston, Oct. 28, 1841, a series of dramatic readings, continued in Providence and New York, but discontinued them and returned to literary work, writing magazine stories, which she signed "Helen Berkley." She also wrote *Fashion*, a comedy, produced with success at the Park theater, New York, in March, 1845, and in June, 1845, she appeared at that theater as Pauline, in *The Lady of Lyons*, afterward acting in several other cities in the U. S. and in England. In 1847 she wrote another play, *Armand, or the Peer and the Peasant*. Her last appearance on the stage was at Niblo's Garden, New York, June 3, 1854. Her husband had died in 1851, and in 1854 she was married to William F. Ritchie, of Richmond, Va. Her chief writings, besides those mentioned above, are *The Fortune-Hunter* (1842); *Evelyn, or a Heart Unmasked* (1845); *The Autobiography of an Actress* (1854); *Mimic Life, or Before and Behind the Curtain* (1855); *Twin Roses* (1857); *Fairy Fingers* (1865); *The Mute Singer* (1866); *The Clergyman's Wife, and other Sketches* (1867). D. near London, England, July 28, 1870.

Mowbray, Henry Siddons: figure-painter; b. in Alexandria, Egypt, of English parents, in 1858; was taken to the U. S. when a child and lived in North Adams, Mass. Received an appointment to the U. S. Military Academy, but spent only one year there and went to Paris in 1878, where he became a pupil of Bonnat; studied and painted in Paris until 1885, when he settled in New York; became a member of the Society of American Artists 1886; National Academician 1892; was awarded the Clark prize at the National Academy, New York, 1888. He is a strong and graceful draughtsman and a brilliant colorist; well known as an illustrator. Studio in New York. W. A. C.

Mowing-machines: See Reaping-machines.

Moxa [from Japanese *mokusa*]: name applied to a form of the actual cautery whose use was derived from the Japanese and Chinese through the Portuguese. The down from the leaves of *Artemisia moxa*, the pith of the sunflower, cotton or lint soaked in solution of saltpeter and then dried, a pledget of spider's web, or a lump of madou is rolled into a little cone and placed upon the part which it is desired to cauterize. It is then set on fire and held in place by a hairpin or an instrument called a porte-moxa. The neighboring parts are surrounded by wet lint. There is no advantage over the hot iron in this method, and it is more painful. It is rarely employed. Revised by William Pepper.

Moyabam'ba, or **Moyobam'ba**: a town of Peru; capital of the department of Loreto; on the river Mayo or Moyabamba, a branch of the Huallaga; 423 miles N. of Lima and 2,840 feet above the sea. It is little more than a large village, the houses being scattered over a wide area and generally thatched with palm-leaves. Most of the inhabitants are Indians, and the only industry of importance is the manufacture of jipijapa or Panama hats. Moyabamba has some trade with Brazil by way of the Huallaga and Amazon; the chief obstacle to greatly increased commerce is the lack of good roads over the Andes. Pop. (1889) estimated, 9,500. H. H. S.

Mo'ya y Contra'ras, Pedro, de: prelate and administrator; b. in the diocese of Cordova, Spain, about 1520. He graduated as doctor of canon law at Salamanca, was Inquisitor in Murcia, and in 1571 was sent to Mexico to establish the Inquisition there. In Dec., 1574, he was consecrated Archbishop of Mexico, and after the death of the Count of Coruña he was acting viceroy Sept. 25, 1584, to Oct. 17, 1585. In 1591 he resigned the archbishopric and went to Spain, where in Jan., 1591, he became president of the Council of the Indies. D. in Madrid, Dec., 1591. H. H. S.

Moylan, Gen. Stephen: b. in Ireland in 1734; settled in Philadelphia, Pa., some years before the Revolution; presented himself to Gen. Washington at Cambridge, Mass., as a volunteer, and, being a gentleman of good education and address, was appointed aide-de-camp Mar. 5, 1776, commissary-general June 5; commanded the Fourth Light Dragoons in 1777; participated in Greene's Southern campaign in 1781; was appointed brevet brigadier-general Nov. 3, 1783; became a farmer at Goshen; was register and recorder of Chester County 1792–93; for several years commissioner of law for the district of Pennsylvania, and vice-president of the Society of the Cincinnati in 1800, and developed a great and beneficial activity in public life. D. in Philadelphia, Apr. 11, 1811.

Moyse, Hyacinthe: soldier; b. in Hericourt, Santo Domingo, in 1769; a Negro slave, nephew of Toussaint Louverture (*q. v.*). He was among the first of those who rebelled in 1790, and displayed great courage, soon becoming a leader. On Mar. 28, 1792, he compelled the commander at La Croix du Bouquet, Breton de la Villaudrie, to retreat to Port au Prince, and incited a general revolt in the western and southern counties. He was preparing to march against Port au Prince when the governor, Blanchelande,

induced many of the insurgent chiefs to disband their followers by promising them enfranchisement. Moyse joined the forces of Jean François, was placed in command of the Negroes of the county of Du Doudon, and remained active in the rebellion for several years. In 1793 he learned to read and write. He joined Toussaint Louverture in 1794, and fought for the French cause against the English, whom he finally drove from the island in 1798. He commanded the right wing of Toussaint's army in the invasion of the Spanish part of Santo Domingo, and defeated the Spanish on the banks of the river Nissa, entering Santo Domingo with Toussaint Jan. 2, 1801. Toussaint sent him as general inspector of agriculture to the northern part of Hayti, and before long Moyse again joined Jean François in rebellion against Toussaint, who ordered his arrest and condemned him to death without a trial. He and twenty-three of his followers were executed in Port au Prince, Dec. 25, 1801.

Mozambique, mō-zăm-beek' : a Portuguese province on the east coast of Africa, extending from Cape Delgado to the mouth of the Zambesi river, the coast regions farther S., formerly a part of Mozambique, now constituting the province of Lorenço Marques. These two provinces were constituted (1891) the state of East Africa, each province having its own capital, and the governor of the state residing in each alternately. The British possessions form the western frontier. The chief towns are Mozambique and Quilimane. Each settlement on the coast has its own local government. The coast land is low, with a rich, humid soil and a hot, moist climate, which make it extremely fertile. Large harvests of rice, maize, millet, and all varieties of tropical fruits are gathered. Hippopotami, elephants, lions, crocodiles, and flamingoes abound. On the islands and shoals with which the coast is fringed turtles are caught in great numbers, and pearl-fishing is very remunerative; tortoise-shell is a staple article of export. Revised by C. C. Adams.

Mozambique: capital of the Portuguese province of Mozambique; in lat. 15° 2′ S.; on a small coral island near the mouth of a bay 6 miles long and 5 miles wide (see map of Africa, ref. 7–G). It is defended by three forts, has a good harbor, and some trade in rice, gum, gold-dust, ebony, tortoise-shell, and timber. The streets are very narrow, and the houses are all whitewashed. Pop. about 8,000, of whom about 7,000 are slaves, and the rest Arabs, Indian merchants, and Portuguese.

Mozambique Channel: the strait between the east coast of Africa and the island of Madagascar. It is about 1,000 miles in length, with a breadth of between 500 and 600 miles at its entrances, and of nearly 300 miles in the middle. The Comoro islands are at its northern outlet.

Mozarab'ic Liturgy [*mozarab'ic*, deriv. of *mozarab*, from Span. *mozarabe*, from Arab. *mosta'rib*, deriv. of *te'arrab*, become an Arab, deriv. of *arab*, Arab]: the liturgy of the Christian subjects of the Saracens in Spain, called *Mozarabes*, Arabs by adoption. Ephesine in its type, if not in its origin, and not called Mozarabic till after the Mohammedan conquest in the eighth century, it is, in its groundwork at least, coeval with the introduction of Christianity into Spain. At Braga, in 538, it was set aside for the Roman liturgy, but restored at Toledo in 589; and at the Fourth Council of Toledo in 633, after some improvements by Leander of Seville (d. 595) and Isidore of Seville (d. 636), the use of it was extended to all Spain. Further improvements were introduced by Ildefonso of Toledo (d. 667), but in the eleventh century (in Aragon 1071, and in Castile 1074) it gave place, by royal authority, to the Roman liturgy. Through the influence and example of Cardinal Ximenes (1436–1517) the use of it was revived in Toledo (after 1502), in Salamanca (1517), and in Valladolid (1567). By the concordat of 1842 provision was made for its continuance at Toledo, but nowhere else. It has been pronounced "the richest, the fullest, the most varied of all known liturgies." It bears great resemblance to the Gallican liturgy, and is noted for its use of Scripture. It has been edited by Leslie (1755), Lorenzana (1774), and Arevalus (1804). See Migne's *Latin Patrology* (vols. lxxxv., lxxxvi., 1850) and John Mason Neale's *Eastern Church, General Introduction* (1850), and *Liturgiology and Church History* (2d ed. 1867).

Revised by S. M. Jackson.

Mozart, Germ. pron. mō'tsaărt, Leopold: the father of Wolfgang Amadeus Mozart; b. Nov. 14, 1719; was himself a voluminous composer, and was kapellmeister to the Archbishop of Salzburg. He deserves remembrance for two reasons: First, for having excellently conducted the early education of the son who was to become one of the greatest composers of all time. Second, for his own great *Violin School* (Augsburg, 1756), which may be termed the first theoretical and practical method for that instrument ever published. It passed through numerous editions in various languages, and was for a long time the only work of its kind. D. at Salzburg, May 28, 1787. Dudley Buck.

Mozart, Wolfgang Amadeus, sometimes called Jean Chrysostome Theophile Sigismund: pianist and composer; b. at the city of Salzburg, Germany, Jan. 27, 1756. At four years of age he played the violin with astonishing ease and expression, and composed minuets and simple pieces. When the boy was six years of age his father, Leopold Mozart, visited Munich and Vienna with his son and daughter, Marianne, whose performances excited great admiration. In 1763 Leopold made a second tour with the children, visiting the most important cities of Europe, and although only eight years of age Wolfgang composed most of the symphonies which were played at the concerts. The family visited England in 1764 and remained until late in 1766, when Wolfgang returned home to study composition under his father for a few months. The works of Handel, which he brought from London, and those of Bach became his classical models. He studied also some of the best Italian masters, getting from them his marvelous skill in making each of his vocal parts melodious and graceful even in the most constrained harmonic situations. In 1767 Leopold and the children went to Vienna, and remained there more than a year, hoping to improve their fortunes, but they reaped only loss and disappointment, owing chiefly to the jealousy of the Italian court musicians, and gladly left Austria for Italy. While in Rome Wolfgang wrote from memory, after hearing it but once, the Easter music performed in the Sistine chapel. At Milan an opera by young Mozart, *Mitridate*, was brought on the stage and repeated twenty times. The whole tour was a success, and on his return he was appointed court organist to the Archbishop of Salzburg. From 1777 to 1779 he resided in Paris. In 1780 he was called to Munich by Prince Charles Theodore of Bavaria to write the opera *Idomeneo*. In this entirely new creation Mozart laid the corner-stone of dramatic composition—a service which the most eminent of his successors fully acknowledge. Its originality and beauty became at once the delight of his audience, and earned him even more than his usual praises. The Archbishop of Salzburg at once had Mozart return with his honors from Munich, and in 1781 move with him to Vienna as a member of his household, but treated him as a menial. After a fruitless remonstrance Mozart resigned, and gave lessons for a living in Vienna, which thereafter was his home. In 1782 he married Constance Weber, a pianist, whose care and love were his greatest help and happiness. Joseph II., fond of Italian music and of his Italian masters, the enemies of Mozart, was slow in granting him any privileges. Finally, *Die Entführung aus dem Serail* was ordered, and paid for with fifty ducats. The originality of this work at first hid its beauties from the people of Vienna, but the opera made a deep impression on the musicians there and on all classes in other parts of Europe. The emperor gave Mozart the office of composer to the court and a salary of 800 florins, but with astonishing indifference made his office a sinecure. To sustain his family Mozart was obliged to give lessons, write waltzes and contredanses for balls, and give concerts in neighboring cities. It was not till his twenty-eighth year (1784) that these ephemeral labors were followed by uninterrupted industry in composition. The opportunity which wealth and royalty refused to give came unsought in the libretto of *Il Nozze di Figaro*, written for Mozart by the poor poet Da Ponte in 1786. This opera, finished in six weeks, had great success throughout Europe. Many offers came to him then from various courts, but Mozart was fond of Vienna, and even of his indifferent emperor. The people of Prague asked for an opera, and *Don Giovanni* was written for them in 1787. In 1788 Mozart began to feel depressed by his disease of the lungs and the nerves. A mysterious messenger (commissioned by Count Walsegg) came to him and engaged him to write a *Requiem*, refusing any information as to its destination. This mystery, some presentiment, and his melancholy fancies gave him the opinion that he was writing his own funeral service. In the single year of 1791 Mozart wrote *Die Zauberflöte*, *La Clemenza di Tito*, and the *Requiem*. He died Dec. 1 the same year, and was buried in St. Mark's churchyard, but the situation of his grave is unknown.

Mozart is considered the greatest composer of the world from the combined versatility and power of his genius. In every kind of composition he produced works of greatest excellence. He was the best pianist of his time in Germany. His execution was precise, elegant, fervid, and delicate in expression. He wrote 626 published works, and 294 compositions either unfinished or unpublished. *Don Giovanni*, *Il Nozze di Figaro*, *Die Zauberflöte*, the *Requiem*, the symphony in G minor, the quartets Nos. 10 and 18, are but a few of his great productions. See the *Life* by Jahn (1856–59; 2d ed. 1867; Eng. trans. 1882); that in English by Holmes (1845; 2d ed. 1878); and that by Fiseher (1888). His *Correspondence* was edited by Nohl (2d ed. 1877).

Revised by DUDLEY BUCK.

Moz'ley, JAMES BOWLING, D. D.: theologian; b. at Gainsborough, Lincolnshire, England, Sept. 15, 1813; graduated at Oriel College, Oxford, 1834; beeame a fellow of Magdalen 1840, vicar of Shoreham 1856, canon of Woreester 1869, Regius Professor of Divinity, Oxford, 1871; author of a work on *Predestination* (1855); works on *Baptismal Regeneration* (1856–62); *Eight Bampton Lectures on Miracles* (1865); *Ruling Ideas in Early Ages* (1877); *Essays* (1878); and other theological works. D. at Shoreham, Jan. 4, 1878.

Mucilage [= Fr., from Lat. *mucilago*, a mouldy, musty juice, deriv. of *mu'cus*, mueus, slime, and *muce're*, be mouldy or musty]: a name applied in the arts to solutions of vegetable gums (see GUM) in water, or to other soluble preparations possessing adhesive qualities. The best mueilage is prepared by dissolving gum arabic in water in closed copper boilers surrounded by steam-jaekets, the temperature of the water being raised to and kept at the boiling-point by superheated steam until the solution is effeeted, the proeess being hastened and facilitated by brass agitators run by maehinery. The hot solution is drawn off, filtered under pressure through cloth, to remove the dirt and other foreign matter contained in the gum; oil of eloves or some other suitable antiseptic is added to prevent fermentation and the growth of mould, whieh impair the adhesive properties of mueilage, and the solution is allowed to stand for some time until such impurities as were not removed on the cloth filter have settled out, when it is bottled.

One of the most eommon substitutes for gum arabic is DEXTRIN (*q. v.*). The objectionable brown color of its solution can be removed by filtering through animal eharcoal, but its adhesive properties, as indicated by its viseosity, are only equal to those of a third-rate gum arabic. It is used to form the adhesive surfaee of postage-stamps, labels, and envelopes. Fish-glue (see GLUE) is also much used on labels, and dilute solutions of this material are widely sold as mueilage, and are, exeept for the eharacteristic and disagreeable odor and taste, a satisfactory substitute for the gum-arabic mucilage. Other gums are also largely imported for the uses to which gum arabic was almost exclusively used. Of these the principal ones are the other African gums from Senegal and the Cape, and the Ghatti gums from India.

Dextrin is somewhat hygroscopic, more so than gum arabie or gum Ghatti, whieh explains the tendency of postage-stamps to stiek together in damp weather. H. B. HODGES.

Mucora'ceæ [Mod. Lat., from Lat. *mucor*, mould, mustiness, deriv. of *muce're*, be musty]: a family of fungi, popularly known as Moulds or Blaek Moulds, in which the oöspores are solitary and produeed by a proeess of conjugation, and whose eonidia are produeed in sacs eontaining one to many spores. The species of this order are very widely distributed, and among them are many fungi known as common moulds. They frequent articles of food, excrement of animals, and, in short, are found on nearly all decaying animal and vegetable matter. One species, *Phycomyces nitens*, grows on oily substances, an unusual habitat of fungi. As a rule, the members of this order are quite small, although *P. nitens* has been known to attain the height of a foot. The myeelium, which is often found in large masses in some of the commoner moulds of this group, frequently presents a shiny appearance, whenee the common German word for plants of this order, *Schimmel*, glitter, is derived.

Inasmuch as the species of this family conform tolerably closely to the type, we may select *Mucor mucedo*, a common mould growing on dung and other substances, as an illustration of the whole order. *M. mucedo* has occupied the attention of many botanists, but the most eomplete account of its development was given by Dr. Osear Brefeld in a work entitled *Botanische Untersuchungen über Schimmelpilze*, part i., published in 1872. In this publication there appeared for the first time an account of the oöspores, as well as the conidial spores of the plant in question. If fresh horse-dung be plaeed in a moist plaee, it will soon be covered by a coating of white glistening fibers, whieh are the hyphæ or mycelial threads of *M. mucedo*. They soon eover the surface of the dung with a cotton-wool-like mass, more or less dense according to the moisture and amount of nitrogenous matter in the dung, from whieh mass projeets eertain threads, whose tips, at first white, afterward blaek, are the eonidia or asexual fruit, eonsisting of saes containing a large number of spores. The threads, whieh grow upward to bear the spore-sacs, exhibit in *M. mucedo* a marked tendeney to turn toward the light. In *Rhizopus nigricans*, the eommon bread-mould, a nearly related species, the stalks of the spore-cases, on the eontrary, seem to be indifferent to the aetion of light. A mieroscopie examination of the hyphæ or threads composing the mycelium shows that, as in most fungi, they branch in all directions, and are occasionally divided by eross-partitions. The contents are colorless or slightly tinged with brown or gray, and the cell-wall, although, aecording to de Bary, it sometimes shows the blue color given by cellulose on the application of iodine and sulphurie acid, often fails to give that color. If submerged, the hyphæ live, at least for a eertain length of time, but undergo certain changes; the eross-partitions become more numerous, and the cell-walls sometimes bulge a little. It has been sometimes supposed that yeast-cells were nothing but the altered myeelium of submerged plants of *M. mucedo*. This view is not generally aecepted, and it must be admitted that we have no proof that yeast-cells either come from *Mucor* or are ehanged into it. When, however, the mycelium of *M. mucedo* is kept quite moist, it undergoes a modifieation, and we have the produetion of what are known as chlamydospores (Fig. 1). These are formed in the following way: The eross-partitions inerease in number, and some of the eells thus formed swell until they become nearly spherical. The protoplasmic contents of the eells then roll themselves up into round masses resembling spores, whieh afterward are capable of germinating. The filaments, or hyphæ, which rise above the common mass of myeelium to bear the conidia, are generally from an eighth to half an inch high, but under exceptionally favorable circumstanees may be as high as 6 inches. The ends of the hyphæ swell into a globular-shaped sae shown in Fig. 2. The contents of the sac are at first eontinuous with those of the rest of the filament, but are afterward eut off by a partition, which is not flat, like the cross-partitions found in the ordinary myceli-

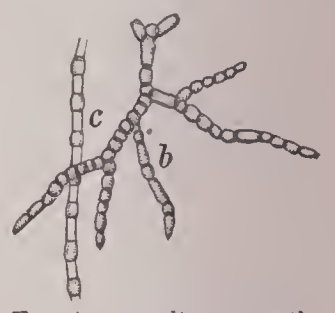

FIG. 1.—*c*, culture-growth; *b*, chlamydospores. (Magnified.)

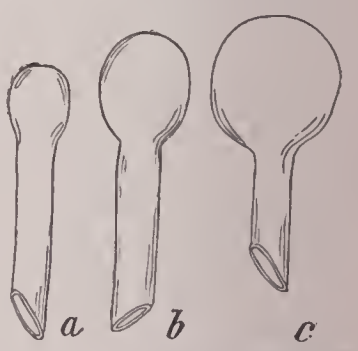

FIG. 2.—Successive stages of spore-sacs. (Magnified.)

um, but arehed, as shown in section in Fig. 3. The expanded tip of the mycelium, which projects into the spore-sac, is known as the *columella*. In *M. mucedo* (Figs. 2, 3) it is very prominent. In most of the Mucoraceæ it is smaller, and in a few cases is entirely wanting. In the sporangium or spore-sac the spores are formed by free-cell formation. In *M. mucedo* they are very numerous and of an oval shape, 0·0066–0·0099 mm. long and 0·0033–0·0040 mm. broad. Their color is grayish brown, and when seen in mass they often appear black. The external wall of the sporangium is composed of two layers, the outer of which is beset with short hairs. Within the sporangium is an expansible elastic substance, whose presence can be demonstrated before the spores are ripe by bursting open the outer wall, when the elastic substanee projeets as a globular mass, in which the young spores are imbedded. When ripe the spores are discharged with some violenee by means of the sudden swelling of the elastic substance; the whole outer wall breaks away and disappears, except a small portion which remains, forming a rim about the base. This is some-

FIG. 3.

times so small that it can be seen only on close examination, and at first sight it appears as though the columella which remains were the young state of a sporangium. In *Rhizopus*

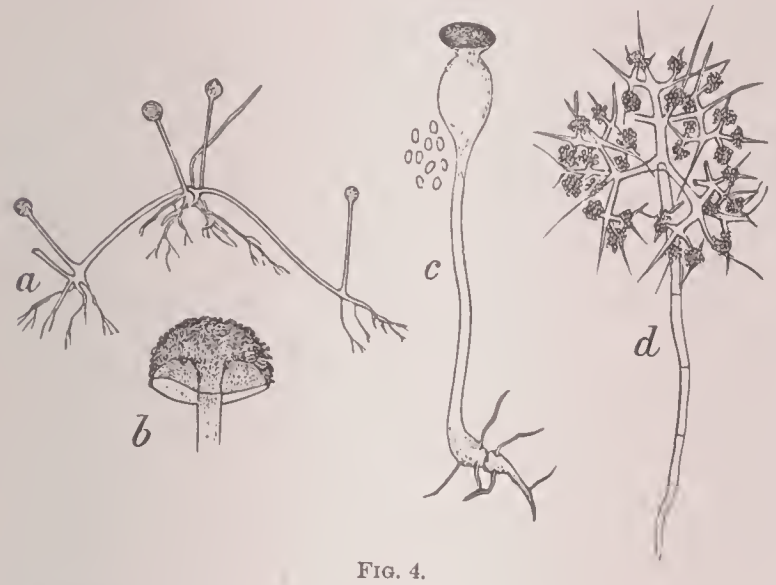

FIG. 4.

nigricans (bread-mould) it happens that not only is the outer wall of the sporangium destroyed, but the very large columella splits and collapses, falling back over the fruit-stalk like an umbrella or small toadstool, as in Fig. 4 *b*. The spores are often projected to a considerable distance, as may be shown by placing a piece of white paper 2 or 3 inches from a mass of *Mucor*, when it will soon be covered with black spots, which are the discharged spores. The spores placed on a moist surface swell to two, three, or even a greater number of times their original dimensions, but do not clearly show a division of their wall into two layers. Their germination takes place by the growth of one or more tubes, which soon assume all the appearance of the mycelium of *M. mucedo*, and in a short time, usually only a few hours, reproduce the conidia of the species.

When *M. mucedo* is cultivated on a decoction of horse-dung it bears only conidia. When growing spontaneously on horse-dung it frequently produces oöspores as well. On breaking the dung open they are seen by the naked eye,

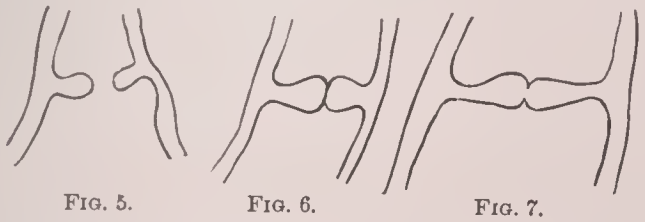

FIG. 5. FIG. 6. FIG. 7.

looking like small round black bodies just below the surface of the dung. Their size varies from 0·0099–0·2145 mm., according to Brefeld's measurements. Examined with a rather lower power of the microscope they are found to have two coats, the outer of which is black, opaque, and brittle, and roughened with irregular protuberances. On breaking open the outer coat, it is seen to be lined with a more delicate membrane, which fits into the inequalities of the outer layer. The inner coat is continuous; the outer is perforated by two circular openings diametrically opposite. This is where the suspensors were attached, as we shall see presently. The oöspores are produced in the following manner: Two hyphæ which are lying near each other send out lateral shoots, as shown in Fig. 5, which increase in size, gradually approaching each other until they meet, as in Fig. 6. The two parts in contact are next cut off by partitions from the hyphæ from which they respectively arose, as in Fig. 7. Finally, the cell-wall at the point of contact is absorbed, and the protoplasmic contents of the two cells unite into a globular mass, which afterward becomes enveloped in a coating of cellulose and grows into a spore (Fig. 8), such as has already been described. In Fig. 8, *a a* are called the suspensors. The oöspore remains attached for some time to the mycelium, but is finally set free; generally, however, a small part of the suspensors remains attached. The oöspore

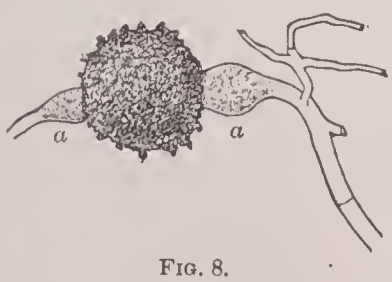

FIG. 8.

germinates in the following manner: The thick outer coat opens, and from the contents of the spore there grows out a germinal tube, which soon assumes all the marks of the ordinary Mucor mycelium. This mycelium, arising directly from the oöspore, produces conidia, and sometimes almost immediately, as is illustrated in Fig. 9. No case has as yet been observed in which the mycelium from the oöspore of *M. mucedo* has produced another oöspore directly, without first having borne conidia. The oöspores of the Mucoraceæ are called by de Bary *zygospores*, from their being produced by conjugation.

FIG. 9.

The method of production of the oöspores just described in *M. mucedo* prevails throughout the family. The process, it will readily be seen, is similar to what is known as conjugation in certain Algæ, as the Desmidiaceæ and Zygnemaceæ. The process consists in the direct union of the contents of two different cells, which resemble one another so closely that we can not with propriety call one male and the other female. In the Desmidiaceæ it is the contents of two unicellular bodies which unite; in the Zygnemaceæ the contents of two cells which are in different filaments. In one genus of the latter family, *Sirogonium*, we find a single filament, which bends upon itself, and the conjugation takes place between two cells of the same filament. In the Mucoraceæ we have a conjugation between parts of different threads, but these threads may have both arisen from the germination of the same spore, so that the conjugation in this order is not necessarily between two different individuals, which must always be the case with Desmids. In those species of *Mucor* where there is a large amount of mycelium we do not know whether the mass has arisen from one or many spores; and when conjugation takes place in such cases it may have been between threads arising from different spores. Cultures of single spores have, however, been made, from which it is known that threads of the same individual may conjugate. This is shown particularly clearly in *Sporodinia grandis*, common mould on toadstools, where the mycelium from a single spore is easily traced. It has been remarked that the two conjugating cells closely resemble one another. In *Chætocladium*, however, one of the cells is uniformly larger and of a slightly different shape from the other, but even in this case there is no distinction of antheridium and oögonium. The oöspores of the different species and genera of Mucoraceæ vary in shape, size, and markings, but a detailed account would be out of place. The most striking form is *Phycomyces nitens*, whose oöspores are surrounded by a ring of branching processes.

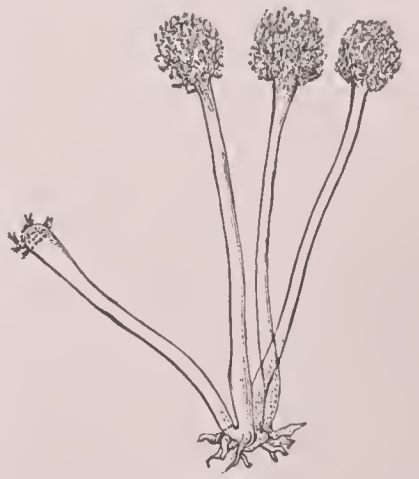

FIG. 10.

The older writers had no knowledge of the mode of production of the oöspores of this group, and the only form of fruit which they regarded in their classification of this order was the asexual or conidial form; and they considered the conidial sporangia to resemble the asci of the Perisporiaceæ. Modern research has shown that this is not the case; for, while the former are produced without the intervention of any sexual action, the latter are the result of a peculiar process of fertilization. By continental writers the *Mucoraceæ* are considered one of the lowest families of Fungi, and are placed just below the *Peronosporaceæ*.

The principal genera of the family are *Mucor* (Figs. 2, 3, 8, 9), *Phycomyces*, *Circinella*, *Spinellus*, *Sporodinia*, *Rhizopus* (Fig. 4, *a b*), *Helicostylum*, *Thamnidium*, *Chætostylum*, *Chætocladium* (Fig. 4, *d*), *Mortierella*, *Piptocephalis*, *Syncephalis* (Fig. 10), and *Pilobolus* (Fig. 4, *c*). W. G. FARLOW.

Mucous Membrane [*mucous* is from Lat. *mu'cus*, mucus]: the lining membrane of the alimentary, respiratory, and genito-urinary tracts. Anatomically, it consists of the mucous membrane proper and the sub-mucous tissues. The first is composed of the secretory tubules, follicles, and glands, situated upon a basement or limitary membrane;

the second consists of connective or "arcolar" tissue with some elastic fibers, and contains the capillary blood-vessels and nerve-filaments by which the secretory surface is nourished and vitalized. The functions of mucous surfaces differ very greatly with the situation. In the nose, for example, the function is merely the heating and warming of the air of respiration; in the œsophagus and lower urinary tract the mucous surface acts merely as a protective surface, offering no obstacle to the ready passage of the substances normal to the parts in question. In the stomach, intestines, and in certain other situations the mucous membrane secretes complex substances of the greatest importance in physiological processes, and by its corrugated structure, numerous reduplications, and villous processes it affords an extensive surface for the great functional processes of nutritive absorption and the elimination of effete excretory products. It is the common property of all mucous membranes to secrete a viscid liquid called mucus, which acts as a lubricant and protective. It consists of a viscid fluid part, containing mucin and cellular constituents derived from the mucous surface. Its free surface is lined with epithelial cells of various shapes, according to the function of the part, whether merely protective or whether secretive. These epithelia are constantly exfoliated, and as constantly reproduced by young cells formed by proliferation in the cellular structures beneath. The secreted matter called mucus contains a limited number of mucous corpuscles, which are cast-off epithelia or escaped products of rapid cell-formation, but the homogeneous fluid portion is the peculiar secretion of the mucous follicles. It is clear, colorless, has nearly a semi-solid consistency, and consists of water, mucin, and salts, especially chloride of sodium. When rich in corpuscles and mucin, mucus is viscid and tenacious. It is thin and watery when salines are chiefly present, and often a rapid serous flow is scarcely more than transuded blood-serum. The mucous membrane is also the seat of glands of special function, as those producing the saliva, the gastric and intestinal digestive juices. Inflammation of mucous surfaces is called *catarrh*, and is nearly always attended with increased secretion of mucus. Catarrh of mucous surfaces has many causes. When the skin is chilled, or its circulation is sluggish by reason of uncleanliness or neglect of exercise, blood is determined to the internal parts. Rapid circulation of the blood and the elevated temperature of the body produce catarrhs in most acute inflammatory or febrile disorders. When large organs, as the lungs or liver, are diseased, the obstruction they offer to the circulation favors congestion of the extensive mucous surfaces of the stomach and intestines, and catarrhs result. They are greatly congested when the heart is incapable of maintaining proper circulation. Direct irritation more often causes catarrhs, as dust in the bronchi, or errors in diet producing the catarrhs of gastric and intestinal indigestion. Revised by WILLIAM PEPPER.

Mucuna: See COWHAGE.

Mucus: See MUCOUS MEMBRANE.

Mudfish: a book-name for the African *Protopterus annecteus* (see DIPNOI) and for the bowfin, or dog-fish (*Amia calva*) of the Great Lakes of the U. S.

Mudge, ENOCH: preacher; b. in Lynn, Mass., June 21, 1776; joined the New England conference in 1793. He traveled and preached through most of Massachusetts, Rhode Island, Connecticut, and Maine. He was prominent in founding Methodism in Maine, which was then a province and a wilderness, and endured severe and romantic trials. He was twice elected to the Legislature of Massachusetts. The latter years of his life were spent in New Bedford, Mass., as chaplain to its mariners' chapel. He published a volume of excellent *Sermons for Mariners* and many poetical pieces of some merit. D. at Lynn, Mass., Apr. 2, 1850.

Mud-hen: See GALLINÆ.

Mud-puppy, or **Water-dog** (*Necturus maculatus*): a batrachian of the order *Amphipneusta*, found in the fresh waters of the eastern parts of the U. S., especially abundant in the Great Lake system. It has the head and mouth large; the upper jaw and palate thickly set with small sharp teeth; a short neck, with three branchial tufts on each side; tail compressed laterally, and fringed with a delicate membrane; four limbs, each having four toes without nails; small eyes, without lids; thick and fleshy lips; a large tongue, immovable except at the tip and edges; small nostrils; and a smooth skin. It has rudimentary lungs, and is able to support life out of water for several hours. Its color is brown, and it is marked by numerous blackish spots of various sizes. It reaches a length of about a foot. The name *Menobranchus* is a synonym of *Necturus*. The name mud-puppy is sometimes applied to a similar salamander, the HELLBENDER (*q. v.*). This batrachian is found chiefly in the head-waters of the Ohio and Tennessee rivers, not in the Great Lakes, and is larger and duller in color than the true mud-puppy; but the most striking difference is in the absence of gills in the hellbender, a round opening or spiracle occupying their place. Both animals are absolutely harmless.

Revised by D. S. JORDAN.

Muez'zin [Arab., also *muazzin*, deriv. of *'azzana*, inform (cf. *'azan*, the call to prayer), deriv. of *'azana*, hear]: the Mussulman official who chants the ezann or call to prayer five times every twenty-four hours from the minaret or some prominent part of a mosque. While chanting he stands erect, a finger in each ear, his face turned toward Mecca. He is expected to possess great strength and melodiousness of voice; if blind, so much the better, as he will not see into neighboring houses and gardens. Mohammed was unwilling to use bells or trumpets in calling the faithful to worship, as these were employed by the Christians and Jews, so he chose the human voice. The ezann is in the following words: "God most high! [four times]. I attest there is no God but God; I attest that Mohammed is the prophet of God; come to prayer; come to the temple of salvation [twice]. There is no God but God." To the morning ezann the words "prayer is better than sleep" are added after "temple of salvation." E. A. GROSVENOR.

Müffling, FRIEDRICH FERDINAND KARL WEISS, Freiherr von: general; b. in Halle, Westphalia, June 12, 1775; entered the Fusiliers while a mere lad, and was with them in the campaign against France 1792–94. In 1806 he entered the service of the Duke of Weimar, and after the battle of Jena joined Blücher and was appointed to conclude the capitulation of Rattkau. Two years later, as member of the so-called secret council, he entered the service of the Duke of Weimar, but in 1813 he re-entered the Prussian army and was assigned to Blücher's staff. He was repeatedly promoted, and after the first Peace of Paris was made chief of the general staff of the army stationed at the Rhine. In 1815 he was assigned to the British army under Wellington, and after the second surrender of Paris was made governor of the city. Five years later he became chief of the general staff of the Prussian army, and in 1832 was appointed general of the Seventh Army-corps. He retired in 1847 with the title of general field-marshal. D. in Erfurt, Jan. 16, 1851.

Muf'ti [= Arab. *muftī*, expounder], or **Sheikh-ul-Islam** [Arab., lord of the faith (liter., of the submission, which takes in Islam the place of faith in Christianity)]: the highest Ottoman ecclesiastical functionary, representative of the sultan in religious affairs, as is the grand vizier in temporal matters. His chief duty is to expound Mussulman religion and law. Though appointed and removable like any officer of state, he while in power exercises a peculiar and anomalous influence upon the throne. No Ottoman sultan was ever deposed until after the mufti had issued a *fetva* (official opinion) against him; such a fetva once issued, it would be very difficult if not impossible for the sovereign to retain his place. The title mufti is often applied to jurisconsults attached to general or local Ottoman government councils. E. A. GROSVENOR.

Müg'ge, THEODOR: author; b. in Berlin, Nov. 8, 1806; became a soldier, determined to go to South America and fight under Bolivar, but the war was over when he reached London: returned to Berlin; studied natural sciences, history, and philosophy for some time; devoted himself finally to literature. D. in Berlin, Feb. 18, 1861. Of his political writings, *France and the Bourbons* (1830), *England and the Reform* (1831), and *The Censure in Prussia* (1845), attracted much attention. The best of his traveling sketches are *Die Schweitz* (1847; Eng. trans. by Mrs. Percy Sinnet, London, 1848) and *Nordisches Bilderbuch* (1856); of his romances, *Toussaint* (1840) and *Afraja* (1854; Eng. trans. by E. J. Morris, Philadelphia, 1854). His works were published at Berlin in 33 vols. (1862–67). Revised by J. GOEBEL.

Mühl'bach, LOUISE (pseudonym of **Klara Mundt**): novelist; b. at Neubrandenburg, Germany, Jan. 2, 1814; married Theodor Mundt 1839; died Sept. 26, 1873. She was the author of numerous novels, mostly historical, which, on account of their sensational contents, were for a long time

devoured by the patrons of the German circulating libraries. The fecundity of her imagination is illustrated by the fact that in one year she was able to furnish a dozen volumes to these libraries. As a consequence, her stories lack entirely artistic finish, though some of them show considerable descriptive talent. JULIUS GOEBEL.

Mühlberg, mül'bārch: town; in the province of Saxony; on the Elbe; 36 miles S. E. of Wittenberg (see map of German Empire, ref. 4–G). It is famous on account of the battle fought here on Apr. 24, 1547, in which the army of the allied Protestant princes under Johann Friedrich was totally defeated by the imperial army, and which changed entirely the course of the Reformation. Pop. (1890) 3,443.

Muhlenberg, FREDERICK AUGUSTUS: first Speaker of the House of Representatives of the U. S.; son of Henry Melchior Muhlenberg; b. at Trappe, Montgomery co., Pa., June 2, 1750; was a grandson of the distinguished Indian agent, Conrad Weiser; was educated in the University of Halle, Germany; was ordained in 1770, and began his pastorate in Lebanon co., Pa.; was pastor of Christ's church (German Lutheran), New York, from 1773 until the British occupancy of the city in 1776 determined his removal, and he became his father's assistant in Montgomery co., Pa. In 1777 he became pastor at New Hanover, Oley, and Goschenhoppen, all in the same county, serving also for a time at Reading, Pa. He became a member of the Continental Congress in 1779, and in 1780 a member of the General Assembly of Pennsylvania, of which he was Speaker 1781–82; was delegate to the Pennsylvania convention to ratify the Federal Constitution in 1787, and was chosen its president; was a member of the 1st, 2d, 3d, and 4th Congresses, and Speaker of the 1st and 3d; receiver-general of Pennsylvania 1800. D. at Lancaster, Pa., June 4, 1801. After retiring from the ministry Mr. Muhlenberg was an active lay member of the Lutheran Church, and bore a very important part in the revision of the constitution of the Ministerium of Pennsylvania in 1792. H. E. JACOBS.

Muhlenberg, HEINRICH MELCHIOR, D. D.: the organizer of the Lutheran Church in America; b. at Eimbeck, Hanover, Sept. 6, 1711; studied at Göttingen, where, as a student, he founded an orphan-house, still in existence; was teacher in the orphan-house at Halle 1738–39; pastor in Grosshennersdorf, Saxony, 1739–42. The Lutheran congregations in Philadelphia, New Hanover, and Trappe having applied to the Lutheran pastors in London and the professors in Halle for a pastor, Muhlenberg responded to the call in 1742, and, on his arrival in Philadelphia, Nov. 25, began a career of unwearied activity extending throughout all the German settlements on the Atlantic coast from Nova Scotia to Georgia. He not only gathered the scattered people into congregations and saw that they were provided with pastors, but gave the congregations the organized form they have maintained; founded in 1748 the first synod (the Ministerium of Pennsylvania) and provided it with a constitution, and prepared the first liturgy and in a large measure the first hymn-book. The congregations of the General Synod and United Synod of the South, most of the congregations of the General Council and of the Joint Synod of Ohio, with many of those in the Synodical Conference, are the direct outgrowth of his labors. Dr. Muhlenberg laid the foundations of the Lutheran Church of America upon a confessional basis embracing all the symbolical books, to which he unwaveringly held, although cultivating friendly and even cordial relations with the representatives of the Episcopal, Presbyterian, and German Reformed Churches. He advocated the early introduction of the English language into the German churches, and set the example by preaching, while pastor in New York, every Sunday in three languages —German, Dutch, and English. The form of church government which he sought to introduce provided for the systematic oversight of pastors and congregations through an adaptation of the Lutheran episcopal system to the synodical organization. The liturgical service which he prepared in 1748 is essentially the same as the Common Service, now agreed upon by all English-speaking Lutheran bodies in the U. S. D. at Trappe, Pa., Oct. 7, 1787. See Mann, *Life and Times of Henry Melchior Muhlenberg* (Philadelphia, 1887). H. E. JACOBS.

Muhlenberg, JOHN PETER GABRIEL: clergyman, soldier, and legislator; b. at Trappe, Pa., Oct. 1, 1746; a son of Dr. Heinrich M. Muhlenberg; was educated in Halle, but ran away from college and enlisted in the dragoons; became in 1772 minister of a Lutheran church at Woodstock, Va.; was much in public life, and soon after the outbreak of the Revolution threw off his gown in the pulpit, displaying a military uniform, read his commission as colonel, and ordered the drums to beat for recruits; served with great distinction at Charleston, Brandywine, Germantown, Monmouth, Stony Point, and Yorktown; became a brigadier-general in 1777, and afterward a major-general; was vice-president of Pennsylvania 1785; member of Congress 1789–91, 1793–95, and 1799–1801; U. S. Senator 1801–02; became in 1802 U. S. supervisor of revenue for Pennsylvania, and in 1803 collector of the port of Philadelphia. D. near Philadelphia, Oct. 1, 1807. See the *Life* by Henry A. Muhlenberg (Philadelphia, 1849).

Muhlenberg, WILLIAM AUGUSTUS, S. T. D.: clergyman and hymn-writer; great-grandson of Heinrich Melchior Muhlenberg; b. in Philadelphia, Sept. 16, 1796; graduated at the University of Pennsylvania in 1814, and entered the Episcopal ministry in 1817. From 1817 to 1821 he was assistant rector of Christ church in Philadelphia under Bishop White. From 1821 to 1828 he was rector of St. James's church in Lancaster, Pa. From 1828 to 1846 he was at the head of a school, afterward called St. Paul's College, founded by him at Flushing, L. I. From 1846 to 1858 he was rector of the Church of the Holy Communion, erected by his sister, corner of Sixth Avenue and Twentieth Street, New York. In 1852 he organized the first Protestant sisterhood in the U. S.; he also promoted the establishment of a Christian settlement, called St. Johnland, on Long Island. In 1858 he became the first superintendent and pastor of St. Luke's Hospital, which owes its existence to him. He published *Church Poetry* (1823); *Music of the Church* (1852); *People's Psalter* (1858); *Evangelical Catholic Papers* (2 vols., 1875–77); and other works. He distinguished himself both as a philanthropist and a promoter of Christian union, but will be longest remembered as the author of the hymns *I would not Live Alway* (1823; revised in 1865); *Like Noah's Weary Dove* (1826); and *Saviour, who thy Flock art Feeding* (1826). D. in New York, Apr. 8, 1877.

Muhlenberg College: an institution at Allentown, Pa., founded in 1867, and named in honor of Heinrich Melchior Muhlenberg, the patriarch of the Lutheran Church in America. Its curriculum of studies embraces all the branches given in the best colleges for the degree of A. B., German being a required study throughout the four years' course. About 50 per cent. of its graduates prepare for the Lutheran ministry. The institution is endowed ($155,000), and has a valuable property in the best part of the city. The number of the faculty is 12, exclusive of lecturers; students, 157; alumni, 481; books in library, 10,000. It possesses the usual apparatus and cabinets, together with a laboratory for scientific work. It has had three presidents; Rev. T. L. Seip, D. D., the present president, was inaugurated in 1886. T. L. SEIP.

Mühlhausen: town of Prussia; province of Saxony; on the Unstrut; 25 miles by rail N. N. W. of Gotha (see map of German Empire, ref. 5–E). It has large manufactures of woolen and cotton goods, furniture, hosiery, leather, sewing-machines, etc. It is surrounded by walls, and originally was a free city of the empire. In the Peasants' war of 1525 it was the headquarters of Thomas Münzer, and also the scene of his execution. Pop. (1890) 27,538.

Muir, myur, JOHN, D. C. L.: Orientalist; b. in Glasgow, Scotland, Feb. 5, 1810; was educated at Glasgow University and at the East India College at Haileybury; proceeded to Bengal as a writer in the civil service 1828; filled several important posts in the revenue and judicial departments; made a profound study of Indian languages, history, and antiquities; wrote some religious tracts, in Sanskrit verse, and, after retiring from the service in 1853, devoted his time and his fortune to the promotion of Oriental studies, especially such as have a religious bearing. In 1862 he endowed with £5,000 a chair of Sanskrit and Comparative Philology in the University of Edinburgh. Besides various contributions to the *Transactions* of the Asiatic societies and other learned associations, Dr. Muir published five volumes of *Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions* (1858–70; 2d ed. 1868–73)—a work of the utmost value to the students of Indian antiquities, mythology, and literature, particularly of the Vedic age. Noticeable among his other works are *A Sketch of the Argument for Christianity against Hinduism* (Calcutta, 1839); *Examinations of Religions* (Calcutta, 1852–54); *Remarks on the Conduct of Missionary Operations in Northern India* (Cape Town,

1853). He was also the author of *Metrical Translations from the Sanskrit*, many essays in *The Journal of the Royal Asiatic Society*, and an anonymous work on *Inspiration*. D. in Edinburgh, Mar. 7, 1882.—Dr. Muir's brother, Sir William Muir, b. in 1819, rose to high rank in India, and on his return to England sat in the Council of India 1876–85, and was then chosen principal of the University of Edinburgh. He is author of a valuable *Life of Mahomet* (4 vols., 1858–61); *Extracts from the Corân* (1880); and other works.

Muir, John: See Appendix.

Muir, Mackenzie M.: See the Appendix.

Muk'den, or **Mouk'den**: city; capital of Manchuria, and chief city of the province of Shingking. *Mukden* is the Manchu name, and means prosperity. The city, whose walls have a circuit of 3 miles, and are pierced by nine gates, stands in a comparatively treeless plain, watered by the Hwŭn, a west-flowing affluent of the Liao river; about 430 miles N. E. of Peking and 80 N. of Ying-tse (Niuchwang), its port; lat. 41° 50′ 30″ N., lon. 123° 37′ E. (see map of China, ref. 2–L). It is modeled after Peking, and contains several palaces and official buildings erected about the year 1625, when Nurhachu made it his capital. The suburbs, where most of the business is transacted, are inclosed by another wall, 11 miles in circuit. About 3 miles to the E. is the tomb of Nurhachu. The tombs of most of the Manchu rulers, however, are at Yung-ling and Foo-ling, in the vicinity of the small palisaded city of Hingking, the original home of the Manchus. Pop. of Mukden about 180,000.

R. Lilley.

Mulberry [M. Eng. *moolbery*, *murberie*, whose first part is from Lat. *mo'rum*, mulberry. Cf. Germ. *maulbeere*; also from Lat., and like the Eng. with dissimilation of *l* to *r* before the following *r*]: a name of trees and fruits of the genus *Morus*, now generally referred to the *Urticaceæ* or Elm family. The genus comprises a few species of Asiatic and North American trees, mostly of small size and short trunk. The leaves are mostly large and ovate, alternate upon the stem, and are variously toothed and lobed, although not compound. A remarkable feature of mulberry foliage is its variability, leaves upon the same tree often differing widely in shape. The flowers are borne in axillary catkin-like short spikes, and they are small and greenish and unisexual. The sexes are borne upon different plants in some cases and upon different catkins on the same plant (monœcious) in others. The fruit itself is a very small, ovate achenium, which is ordinarily called a seed, while the fleshy and edible portion is the succulent enlarged calyx. The mass of thickened flowers comprising the spike is the so-called fruit of the mulberry.

The mulberry is chiefly known through its use as a food-plant for the silkworm. For this purpose it has been grown from the earliest times, particularly in China. Probably there is no single plant which enjoys such a voluminous literature as this white or silk-yielding mulberry, and there are few plants, perhaps, more variable or more confusing to systematic botanists. In the U. S., however, the mulberry is chiefly known as a fruit-bearing tree, and even in this capacity it is nowhere largely grown. The fruit resembles a blackberry in form and size, although more slender, and the flavor is sweet and in some varieties slightly vinous. It has never found its way into the market as a salable commodity, and there are no commercial preparations of it. It is worthy and capable of more extended use, however. The fruit varies from a half to 2 or even nearly 3 inches in length, and in color from amber white to violet, purple, and black. Although the two commonest species of mulberry are known as the white and the black, the color of the fruit does not afford characteristic differences between them. Mulberries begin to ripen early in summer, and some species or varieties mature their fruits successively through two or three months, a circumstance which adapts them to dessert use, but greatly lessens their adaptability for marketing. The fruits fall as they ripen, and the trees are therefore usually grown in sod, that the fruit may not be soiled. In Europe cresses or other quick-growing small plants are sometimes sown under the trees in order to catch the dropping fruits. Birds, poultry, and swine are very fond of mulberries, and in the southern parts of the U. S. certain varieties are planted for the express purpose of affording food to fattening hogs, for which the fruit is said to be well adapted. There are several kinds of mulberries grown for their ornamental foliage or curious habit. The Russian mulberry, a form of the white mulberry, is also planted for hedges, and mulberry timber is considered to be good for uses which require a light, strong, and durable wood.

At various times during the eighteenth century attempts were made to rear the silkworm in North America (see Silk), and the mulberry was grown to feed it. About 1830 a new species, called *Morus multicaulis*, was introduced into the U. S. from France, a fever of speculation set in, and millions of trees were planted. As a result, the market was overstocked, climate and disease affected the trees, nurserymen lost their fortunes, and in 1839 the bubble burst. *Morus multicaulis* is no longer grown, unless for stocks upon which to graft other kinds. The fruit-bearing mulberries of the U. S. have been referred to *Morus nigra*, but they really belong to *M. alba* and to the native *M. rubra*, while the true black mulberry is grown only in the Southern States and on the Pacific slope. The fruit-bearing mulberries of the U. S. therefore are essentially different in type from those of other countries. Apparently the first-named variety of mulberry originating upon American soil was the Johnson, springing from the native red mulberry, *M. rubra*. The Hicks and Stubbs mulberries also belong to this species, and these two varieties are much prized in the South, especially for swine. The best mulberry for the North is probably the New American, a variety of *Morus alba*, although it is commonly, but erroneously, sold under the name of Downing. The Russian mulberry is the *Morus tatarica* of Linnæus,

Mulberry.

but botanists now agree in referring it to *M. alba*, of which it is a hardy descendant. Two or three fruit-bearing varieties have sprung from this Russian stock, but they have not gained prominence. The *Nervosa* mulberry, grown in gardens for its curious narrow and jagged ribbed leaves, is a monstrous form of *M. alba*. The chief groups of mulberries now grown in North America may be divided as follows: 1. The white mulberry group. The white mulberry is supposed to be a native of China. It is nearly or quite as hardy as the plum-tree when well established. 2. The *Multicaulis* group. *Morus latifolia*, Poiret. (*M. multicaulis*, Perrottet. *M. alba* var. *multicaulis* of Loudon.) 3. The Japanese group. *Morus japonica*, Audibert. (*M. alba* var. *stylosa*, Bureau.) The fruit is short-oblong and red. 4. The black mulberry group. *Morus nigra*, Linn. The black mulberry is a native of Asia, probably of Persia and adjacent regions. It is not hardy, except in protected places, in New England and New York. 5. The red or native mulberry group. *Morus rubra*, Linn. The native mulberry is generally distributed from Western New England to Nebraska and southward to the Gulf. It is more abundant and attains a larger size in the South.

L. H. Bailey.

Mulcaster, Richard: schoolmaster; b. about 1530; educated at Eton, Cambridge, and Oxford; became in 1561 first head master of Merchant Taylors' School, in which position he remained until 1586. Some years later he was head master of St. Paul's School, where he labored for twelve years. In 1598 he was appointed by the queen rector of Stanford Rivers, in Essex, but began to live there

only in 1608. He died in 1611. In Merchant Taylors' School Edmund Spenser was one of his pupils, and among the others were nine who in later years aided in making a translation of the Bible (King James Version). His reputation has recently been increased through the attention attracted to his two works, *Positions for the Training up of Children, either for Skill in their Booke or Health in their Bodie* (1581), and *Elementarie*, or first steps in education (1582). The former has been reprinted with excellent notes by R. H. Quick. In the *Positions* Mulcaster outlines an excellent course of training for body and mind that is in accord at many, if not most, points with the best thought of our day. The *Elementarie* is in the main a vigorous plea for the use and study of English. He especially defends the use of English by the learned, and writes his own book in the vernacular to show his faith. He also had advanced views on the education of women. See reprint of *Positions*, edited by R. H. Quick; Williams, *History of Modern Education*; Quick, *Educational Reformers*. C. H. Thurber.

Mulder, Gerardus Johannes: chemist; b. at Utrecht, Holland, Dec. 27, 1802; studied medicine; practiced in 1825 at Amsterdam; lectured in 1827 at Rotterdam on botany and chemistry, and became in 1840 Professor of Chemistry at the University of Utrecht. His *Chemistry of Vegetable and Animal Physiology* (translated into German by Kolbe in 1844, and into English by J. T. W. Johnston in 1849) occasioned a hot controversy with Liebig concerning the existence of Protein (*q. v.*) as an independent compound. His *Chemistry of Wine* was translated into English by H. Bence Jones (1857). He also wrote the *Chemistry of Beer*, *De Voeding in Nederland*, *De Voeding van den Neger in Suriname*, *Chemical Researches*, etc., all translated into German, some into French. D. at Utrecht, Apr., 1880.

Revised by Ira Remsen.

Mule [viâ O. Fr. from Lat. *mu'lus*, mule (*mu'ta*, she-mule), whence O. Eng. *mūl*, mule]: a name in its widest sense synonymous with hybrid, but more commonly denoting the offspring of the male domestic ass and the mare; the corresponding offspring of the male horse and female ass is the jennet or Hinny (*q. v.*). The mule is more difficult to breed than the horse and matures more slowly, but its working life is longer and it is less liable to disease. The male is sterile, and although the female sometimes can be impregnated by the horse or ass, she rarely brings forth offspring alive. The mule is a hardy, strong, sure-footed, serviceable animal, peculiarly adapted to hard work in hot weather, and to use on steep and rough roads. Mules were much employed by the ancient Romans, and are now used in nearly all parts of the world, especially in North and South America, Spain, Southern France, Italy, and the East. In Spain, Spanish America, and parts of Africa and the East mules are highly prized as saddle animals. For military transport purposes they are decidedly superior to horses and much more used. In the U. S., Washington was instrumental in introducing the use of mules on Southern plantations, and at present they occur most extensively in the South. The total number in the U. S. in 1894 was 2,352,231, valued at $146,232,811. Very nearly half of these were possessed by the States of Missouri, Texas, Tennessee, Georgia, Mississippi, and Kentucky, named in order of numbers.

Mule-deer: See Deer.

Mulford, Elisha, LL. D.: philosophical writer; b. at Montrose, in Susquehanna co., Pa., Nov. 19, 1833; graduated at Yale College in 1855; his education in law, theology, and philosophy was continued at the Union Theological School, at Andover, and at Halle and Heidelberg, Germany. He held various charges, but after 1881 made his home in Cambridge, Mass. In 1870 he published *The Nation*, a profound treatise on the philosophy of the state; in 1880 *The Republic of God*, a similar work on the philosophy of religion. He lectured on the philosophy of law at Columbia Law School, and on theology and philosophy at Cambridge Theological (Episcopal) School. D. at Cambridge, Mass., Dec. 9, 1885.

Mulgrave, Constantine John Phipps, Baron: explorer and politician; b. in England, May 30, 1734; entered the navy at an early age; became post-captain 1765: commanded an exploring expedition in search of a northwest passage 1773; reached lat. 80° 48′ N., whence an impenetrable field of ice stretched northward; published *A Journal of a Voyage toward the North Pole* (1774); succeeded to the title 1775; was commissioner of the admiralty under Lord North's administration, and an ardent politician; was raised to the English peerage in 1784, and died Oct. 10, 1792.

Mulhall, Michael G.: statistician; b. in Dublin, Ireland, in 1836; was educated at the Irish College, Rome; removed to South America and founded the Buenos Ayres *Standard* 1861; contributed to *The Contemporary Review*. Is the author of *Handbook of the River Plata* (5th ed. 1885; trans. in Spanish); *The Progress of the World* (1880); *Dictionary of Statistics* (1891).

Mülhausen, mül-how'zen (in Fr. *Mulhouse*): town and railway center of Germany; province of Alsace-Lorraine; on the Ill, which divides it into the old and the new city; 61 miles S. S. W. of Strassburg (see map of German Empire, ref. 7–D). The old town is rather indifferently built, the new town is very elegant; there is, besides, a workingmen's quarter of 1,000 well-built houses. Mülhausen has manufactures of cotton (525,000 spindles), woolens, linens, muslins, watered silks, chemicals, printing and dye works, etc., and is one of the most flourishing manufacturing towns of Germany. The town and its territory originally belonged to the Swiss confederation, but in 1798 it was incorporated with France, and by the Treaty of Frankfort, 1871, it was ceded to Germany. Since that time it has increased very rapidly, principally by immigration from Germany. Pop. (1895) 82,986.

Mülheim-am-Rhein, mül'hīm-aam-rīn': town of Prussia, Rhine province; on the right bank of the Rhine; 3 miles above Cologne; has large manufactures of velvet, silk, and thread (see map of German Empire, ref. 4–C). Its prosperity dates back to the beginning of the seventeenth century, and was due to the settlement there of a number of Protestant emigrants from Cologne. Pop. (1890) 30,996.

Mulheim-an-der-Ruhr, -dār-roor': town of Prussia, Rhine province; on the Ruhr; 16 miles N. of Düsseldorf; has extensive manufactures of iron and leather, and a trade in coal and iron from the mines in the vicinity (see map of German Empire, ref. 4–C). The Ruhr becomes navigable here, and a large number of vessels for the navigation of that river and the Rhine are built. The trade of the town is principally with Holland. Pop. (1890) 27,903.

Mull: one of the Inner Hebrides; off the west coast of Scotland. It is 30 miles long and 25 miles broad, high, rugged, but fertile, though not fit for agriculture on account of climate; cattle and sheep are reared. Pop. about 7,000.

Mullein, mŭl'lin [M. Eng. *moleyn* < O. Eng. *molegn*]: the common name of a plant of the family *Scrophulariaceæ* or figworts (*Verbascum thapsus*), belonging to a widely distributed genus which includes more than eighty varieties. The common mullein of the U. S. is biennial, attaining a height of from 4 to 6 feet, with oblong-acute leaves 8 or 10 inches long, covered with a soft wool-like pubescence. It is found in Europe and Asia, whence it was introduced into North America, where it is a troublesome weed.

Muller, mü'lār', Charles Louis: historical and portrait painter; b. in Paris, Dec. 22, 1815; d. there Jan. 10, 1892. He was a pupil of Baron Gros and of Léon Cogniet; was awarded medals at the Salons of 1838 and 1846; first-class medal, Paris Exposition, 1855; became an officer of the Legion of Honor 1859; member of the Institute 1864. He is best known by his celebrated *Rott-calt of the Last Victims of the Reign of Terror*, formerly in the Luxembourg Gallery, Paris. His *Chartotte Corday in Prison* (1875) is in the Corcoran Gallery, Washington. W. A. C.

Müller, mü'ler, Eduard Friedrich Hermann Lucian: Latinist; b. at Merseburg, Germany, Mar. 17, 1836; studied in Berlin, and in 1867 became privat docent in Bonn; since 1870 has been Professor of Roman Literature at the Philological Historical Institute of St. Petersburg. His works display great learning and high critical talent, but are vitiated by virulent invective against eminent scholars who do not hold his views. With the exception of a very unsatisfactory *History of Ctassical Philology in the Netherlands* (1869), his work has been confined chiefly to Old Latin poetry. His masterpiece is the *De re metrica præter Plautum et Terentium* (1861), the most exhaustive and best treatment of the subject we possess. Besides this, Müller has edited *Lucitius* (1872); a literary monograph on this poet's *Life and Works* (1876); *Phædrus* (1877); *Catuttus, Tibullus, and Propertius*; a German commentary to Horace's *Satires and Epistles* (2 vols., 1892–93); *Nonius* (2 vols., 1892); monographs on *Ennius* and *Horace*, etc.

Alfred Gudeman.

Müller, Baron Ferdinand, von, M. D., F. R. S.: botanist; b. at Rostock, Germany, June 30, 1825; was educated at Kiel; investigated the botany of Schleswig and Holstein; emigrated to Australia 1847; made extensive botanical explorations in South Australia at his own expense 1848–52; was then made government botanist for the colony of Victoria; explored many mountain ranges previously unknown 1852–55; was naturalist to Gregory's exploring expedition 1855–56; was director of the botanical garden at Melbourne 1857–73; published *Fragmenta Phytographiæ Australiæ* (10 vols., London, 1862–77); *Plants of Victoria* (2 vols., Melbourne, 1860–65), *Flora Australiensis* (7 vols.), and other works. He was ennobled by the King of Würtemberg in 1870. D. at Melbourne, Oct. 9, 1896.

Müller, Frederick Max, Ph. D., knight of the *Ordre pour le mérite*: philologist; b. at Dessau, Germany, Dec. 6, 1823; studied at Leipzig, Berlin, and Paris; since 1854 has been Professor of Comparative Philology in the University of Oxford, England; is foreign member of the French Institute. He has a high reputation as a popular interpreter of the most recondite subjects of learning. Among his most important works may be mentioned *Rig-Veda Saṃhitā* (6 vols., 1849–73; 2d ed. 4 vols., 1889–92); *Rig-Veda Saṃhitā, Translated and Explained* (vol. i., 1869); 2d ed. *Sacred Books of the East* (1892); *Rig-Veda Prātiśākhya, das älteste Lehrbuch der vedischen Phonetik* (1869); *Hitopadeśa, in das Deutsche übersetst* (1844); *Hitopadeśa, Text with Interlinear Transliteration, Gramm. Analysis, and English Translation* (1866); *Meghadūta, dem Kālidāsa nachgedichtet* (1847); *Upanishads, Translated from the Sanskr., Sacred Books of the East* (vols. i. and xv., 1879, 1884); *Dhammapada, Translated from Pāli, Sacred Books of the East* (vol. x., 1881); *Buddhist Texts from Japan* (1881–85); *History of Ancient Sanskrit Literature* (2d ed. 1859); *Sanskrit Grammar for Beginners* (2d ed. 1870); *India, What can it Teach Us?* (1883; new ed. 1892); *Kant's Critique of Pure Reason, Translated* (1881); *Introduction to the Science of Religion* (1870; last ed. 1882); *On the Origin and Growth of Religion*, Hibbert Lectures (1878; new ed. 1882); *Chips from a German Workshop* (4 vols., 1867–75); *Selected Essays on Language, Mythology, and Religion* (2 vols., 1881); *Biographical Essays* (1884); *Lectures on the Science of Language* (1861–63; rewritten 1891); *The Science of Thought* (1887); *Biographies of Words and Home of the Aryas* (1888); *Gifford Lectures*, i. *Natural Religion* (1890), ii. *Physical Religion* (1891); *Anthropological Religion* (1892). D. Oct. 28, 1900. Benj. Ide Wheeler.

Müller, Friedrich (*Maler Müller*): poet; b. at Kreuznach, Germany, Jan. 13, 1749; studied art, and attracted by his talent the attention of influential persons. Aided by these, and especially by Goethe, he was enabled to go to Rome in 1778. His paintings did not, however, meet with success; he lost his interest in his art and supported himself finally as a guide and second-hand bookseller in Rome, where he died Apr. 23, 1825. As a poet and writer Müller is to be classed among the members of the Storm and Stress school. He has been called the romanticist among these writers on account of his love for the Middle Ages. He gained his first reputation as a writer by his *Idyllen* (1775), but his talent was more of a dramatic nature. Of the many dramas which he planned, he finished but a few, and among these *Golo und Genoveva* is his best work. He also wrote a *Faust*, but the published fragments of this drama give sufficient evidence that Müller was not equal to a theme of the proportions of the Faust legend. See B. Seuffert, *Maler Müller* (1877); A. Sauer in vol. lxxxi. of *Kürschners Nationalliteratur*. Julius Goebel.

Müller, Friedrich, Ph. D.: philologist; b. at Jemnik, in Bohemia, Mar. 5, 1834; studied at Vienna; since 1869 has been Professor of Comparative Philology at Vienna; is a member of the Imperial Academy of Vienna; author of a great number of most important ethnographical and linguistic treatises, among which are *Grundriss der Sprachwissenschaft* (7 vols., 1876–88); *Allgemeine Ethnographie* (1873; 2d ed. 1879); *Reise der österr. Fregatta Novara um die Erde: linguistischer Theil* (1867), *ethnographischer Theil* (1868); various treatises on Pāli, Zend, Modern Persian, Afghan, Kurd, Ossetan, Armenian, the African, and American languages in the *Mittheilungen der anthropologischen Gesellschaft in Wien*: editor of the *Wiener Zeitschrift für die Kunde des Morgenlandes*, and author of numerous articles therein, as well as in the journals *Ausland* and *Globus*. Benj. Ide Wheeler.

Müller, Georg Elias, Ph. D.: psychologist; b. in Grimma, Saxony, 1850; educated at Grimma, Leipzig, Berlin, and Göttingen; assistant professor in the University of Czernowitz in 1880; Professor of Philosophy at Göttingen in 1881. His principal works are *Zur Theorie der sinnlichen Aufmerksamkeit* (1873); *Zur Grundlegung der Psychophysik* (1878); *Ueber die Maasbestimmungen des Ortssinnes der Haut* (1879); *Theorie der Muskelcontraction* (with Dr. Fr. Schumann, vol. i., 1891); *Ueber die psychologischen Grundlagen der Vergleichung gehobener Gewichte* (1889); *Experimentelle Beiträge zur Untersuchung des Gedächtnisses* (1893). J. M. B.

Müller, Georg Friedrich: See the Appendix.

Müller, Johannes, von: historian; b. at Schaffhausen, Switzerland, Jan. 3, 1752; studied theology and history at Göttingen; devoted himself to the preparation of a *History of Switzerland*, of which the first volume appeared at Berne in 1780; was Professor of Statistics at Cassel 1781–83, but retired and lived at Geneva till 1786. In this year he was appointed court councilor and librarian at Mentz, and when the city was taken by the French in 1791 he repaired to Vienna, where he stayed till 1804, and was treated with much courtesy, but he was forbidden to continue his Swiss history. In 1804 he went to Berlin; was appointed historiographer to the King of Prussia, and received permission to use the Prussian archives for a history of Frederick II. Nevertheless, after the battle of Jena and the occupation of Berlin by the French, Napoleon succeeded in winning him over to his side, and in 1808 he accepted a position as minister of state to the King of Westphalia. This act, and the pronounced manner in which he extolled Napoleon, excited great indignation in Germany, and other circumstances, pecuniary embarrassments, political disappointments, etc., were added, making his last days melancholy. D. at Cassel, May 29, 1809. Besides his great works, the *History of Switzerland* and *Twenty-four Books of Universal History*, he wrote a number of monographs and pamphlets rich in ideas and elegant in style.

Müller, Johannes: physiologist; b. at Coblentz, Germany, July 14, 1801, in humble circumstances; began to prepare himself for the Roman Catholic Church, but abandoned in 1819 his theological studies, and devoted himself exclusively to medicine; took his degree in 1822, and became Professor of Physiology and Anatomy in 1826 at Bonn, and in 1833 at Berlin, where he died Apr. 28, 1858. As the founder of the physico-chemical school of physiology he enjoyed the fame of being one of the greatest physiologists of his age, and his publications brought new facts and new ideas to every point of his science. His principal works are *Elements of Physiology* (1833; translated by Dr. W. Baly, 2 vols., London, 1837–42); *De Respiratione Fœtus* (1823, his first publication); *De Glandularum Secernentium Structura* (1830); *Vergleichende Anatomie der Myxinoiden* (1835–45, etc.). J. M. B.

Müller, Johann Friedrich Wilhelm: engraver; son of Johann Gotthard Müller; b. at Stuttgart, 1782; d. at Pirna, Saxony, May 3, 1816; was educated partly by his father, partly in Paris; became an equally celebrated engraver, and was professor at the academy in Dresden. His engraving after the statue *La Jeunesse* attracted great attention by the manner in which he undertook to imitate marble, but his most celebrated works are the engraving of the *Madonna di S. Sisto*, by Raphael, and the portraits of Jacobi and Schiller, after the busts by Dannecker.

Müller, Johann Gotthard, von: engraver; b. at Bernhausen, near Stuttgart, Germany, May 4, 1747; received his first artistic education at the school of art in Stuttgart; went in 1770, with the support of Duke Charles, to Paris, where he studied engraving under Wille, and was appointed professor in 1776 at the academy of art at Stuttgart, where he exercised a great influence, and had many pupils. D. Mar. 14, 1830. Among the most celebrated engravings by him are *The Battle of Bunker Hill*, by Trumbull; *St. Cecilia*, after Domenichino; *St. Catharine*, after Leonardo da Vinci; and the portraits of Louis XVI., Dalberg, and Jerome Bonaparte.

Müller, Karl Otfried: Greek scholar and archæologist; b. in Brieg, Silesia, Aug. 28, 1797; studied in Breslau and under Boeckh in Berlin. At the early age of twenty-two, he was appointed professor extraordinary at Göttingen, professor ordinary in 1823. In Sept., 1839, he undertook what was to prove a fatal journey to Greece, for he died Aug. 1, 1840 of a fever which he contracted at Delphi, while copying in-

scriptions. Müller may be said to have permanently established the study of archæology inaugurated by Winkelmann. Many problems which it was reserved for later scholars to solve were first suggested by him. His best known works are *Orchomenos und die Minyer* (1820); *Die Dorier* (2 vols., 1824); *Die Etrusker* (2 vols., 2d ed. by W. Deeke, 1877); *Prolegomena zu einer wissenschaftlichen Mythologie* (1825); *Handbuch der Archaeologie der Kunst* (1848; 3d ed. by F. G. Welcker); *Aeschylus's Eumeniden*, Greek and German, with exhaustive essays on scenic antiquities, still of interest, because of the polemical introduction which gave rise to the famous quarrel with G. Hermann; *Varro de lingua Latina* (1833); *Festus* (1839), until recently (1891) the standard edition of this work; and finally the *History of Greek Literature* to the time of Alexander (2 vols., 1841; 3d vol. added by E. Heitz, the Hellenistic period by I. W. Donaldson; fourth edition in German 1883), still one of the best works on the subject, both in style and treatment. Cf. K. Hillebrand, in the French translation of Müller's *Varro*, pp. xvii.–ccclxxx.; *Briefwechsel zwischen August Boeckh und O. M.* (1883, pp. 442); Bursian, *Geschichte der classischen Philologie in Deutschland*, pp. 1007–1028. ALFRED GUDEMAN.

Müller, WILHELM: poet; b. at Dessau, Germany, Oct. 7, 1794; studied philology and history at Berlin; fought as a volunteer in the wars of liberation against Napoleon; went to Rome in 1817, where he stayed for nearly two years, and was in 1819 appointed Professor at the Gymnasium of Dessau, and librarian of the duke's library at the same place. D. Sept. 30, 1827. There are few German poets who have succeeded in reproducing the spirit of the Volkslied with such naïve originality as Müller did in his graceful, melodious *Gedichte eines Waldhornisten* (1821), *Lieder des Lebens und der Liebe* (1824), *Lyrische Reisen* (1827). Many of these which were set to music by the greatest German composers like Schubert have again become popular songs; besides, they exerted a great influence on Heine's lyrics, according to the latter's own confession; but Müller was also capable of vigorous political pathos, as is shown by his excellent *Griechenlieder*, which he sang in defense of the liberation of Greece. Müller's complete works were published by G. Schwab, 1830. His *Gedichte* were edited with an excellent introduction and notes by his son, Max Müller (Leipzig, 1868). JULIUS GOEBEL.

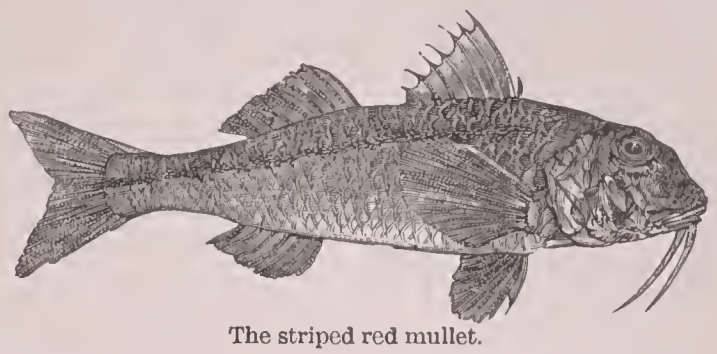
Müller, WOLFGANG: poet; b. at Königswinter, Prussia, Mar. 5, 1816; studied medicine at Bonn and Berlin; lived at Düsseldorf, Cologne, and Wiesbaden. D. June 29, 1873. He was the author of several charming epic poems, e. g., *Die Maikönigin* (1852); *Prinz Minnewein* (1854); *Der Rattenfänger von St. Goar* (1854); *Johann von Werth* (1858), etc. Much of his poetry is based on the legends of the romantic Rhine valley, as may be seen from his collections *Dichtungen eines rheinischen Poeten* (4 vols., 1871–74) and *Erzählungen eines rheinischen Chronisten* (2 vols., 1860–61). He was less successful as a dramatist, though some of his smaller pieces, like *Sie hat ihr Herz entdeckt*, still charm us with their exquisite simplicity. JULIUS GOEBEL.

Muller's Glass: See HYALITE.

Mullet [from O. Fr. *mulet*, dimin. of *mulle* < Lat. *mullus*, red mullet]: a name common to the fishes of the family *Mugilidæ* (group Percesoces), and often extended to the

The gray mullet.

very different family *Mullidæ* or surmullets and to other fishes. Of the true mullets of the American Atlantic and Gulf waters, the striped mullet (*Mugil cephalus*) and the white mullet (*M. curema*) are small but esteemed food-fishes. The waters of the Old World abound in true mullets of many species. They often ascend rivers, and can be naturalized in fresh water. They are caught and cured extensively in Europe. The gray mullet (*M. capito*) is one of the best. The *Mullidæ* or surmullets are popularly called mullets, red mullets, etc. Of the typical genus, *Mullus*, there are several valuable marine food-fishes. *Mullus surmuletus* of Europe is the finest. The red mullet of the Gulf of Mexico (*Upeneus maculatus*) is an abundant fish, caught



The striped red mullet.

extensively for table use, but its flesh is not excellent. See FISHERIES.

Mullion: in architecture, a vertical bar or slender pillar dividing a window into two or more parts. In Gothic tracery the earliest mullions seem to have been slender columns, sometimes single and sometimes clustered. In the Geometric, Decorated, or Rayormant period (fourteenth century) these columnar mullions were of extraordinary slenderness and height; they soon, however, gave way to bar-mullions, mere slender bars molded to the profiles of the moldings of the arched heads of each division or light of the window. In the enormous windows of the English Perpendicular period the mullions were intersected by frequent horizontal bars or *transoms*. Long after mullioned windows had been given up in France, under the influence of the Renaissance, we find in the Elizabethan mansions of England vast square windows of many lights divided by simple vertical mullions with one or more transoms in the upper portion. The early Renaissance in Florence, Bologna, Venice, and Milan also shows examples of arched windows divided into two subordinate arched lights by a central colonnette of Corinthian type. Mullions of stone or wood are commonly used in large windows of modern buildings. See ARCHITECTURE. A. D. F. HAMLIN.

Müll'ner, AMADEUS GOTTFRIED ADOLF: dramatist; b. at Langendorf, Prussian Saxony, Oct. 18, 1774; studied law at Leipzig, and practiced from 1798 as an advocate at Weissenfels, where he died June 11, 1829. He wrote on juridical subjects, novels, dramas, and critical essays, and became famous as the author of the two tragedies *Februar 29* (1812) and *Die Schuld* (1816), both of which are notorious samples of the so-called *Schicksalstragödie*, a literary aberration at the beginning of the nineteenth century. In imitation of the misapprehended Greek tragedy, the writers of the *Schicksalstragödien* introduced "fate" (*Schicksal*) into their plot as an invisible power which arbitrarily determined the destiny of the characters of the play. The absurdity of this undertaking was effectually ridiculed by Platen in his classic parody *Die verhängnissvolle Gabel*.

Mulock, DINAH MARIA: See CRAIK.

Mulock, WILLIAM: See the Appendix.

Mulready, WILLIAM: landscape and genre painter; b. at Ennis, County Clare, Ireland, Apr. 30, 1786. He studied at the Royal Academy, London, where he first exhibited in 1803; was elected a Royal Academician 1816. His illustrations for *The Vicar of Wakefield* are among the best things of their kind in British art, and he painted several pictures from the same subjects. *Snow Scene* and *Seashore Scene* are in the National Gallery, London; *The Bathers* is in the National Gallery, Edinburgh. D. in London, July 7, 1863. W. A. C.

Multan': town of British India; in the Punjaub (see map of N. India, ref. 4–B). It is interesting on account of the surrounding ruins; is of much commercial and manufacturing importance; and its magnificent Hindu temple and the graves of two Mohammedan saints draw many pilgrims from all parts of India. Pop. (1891) 74,510. C. C. A.

Multiple Point [*multiple* is from Lat. *mul'tiplex*, manifold, many-fold; *mul'tus*, many + *-plex*, -fold. Cf. *plica're*, to fold]: a point at which a curve intersects itself. If the curve passes twice through the same point it is a *double* point; if *three* times, a *triple* point; and so on. It is a characteristic property of a multiple point that the first differential coefficient of the ordinate at that point has as many values as the number of times that the curve passes through the point. Thus the curve whose equation is $x^4+2ax^2y-ay^3=0$ has a triple point at the origin, at which point the first differential

coefficient of the ordinate has the three values, 0, $+\sqrt{2}$, and $-\sqrt{2}$. It may happen that two or more branches of a curve are tangent to each other at some point; this point is a species of multiple point, at which the corresponding differential coefficient of the ordinate has two or more equal values.

Multiple Proportion, Law of: See CHEMISTRY.

Multituberculata: an order of mammalia, appearing in the Triassic period and becoming extinct in the Eocene. They are characterized by having the incisor teeth much enlarged, and the molars with tubercular grinding surfaces and distinct roots. It is supposed by Cope that they were closely allied to the strange order of *Monotremata*, represented to-day by the duckbill and the spiny ant-eaters of Australasia.

Mum'mius: a Latin writer of the early empire who wrote *fabulæ Atellanæ*. Only a few fragments are extant. See Ribbeck, *Com. Rom. Frag.*, p. 273.

Mummius, LUCIUS, surnamed ACHAÏCUS: the conqueror of Greece and the destroyer of Corinth; was prætor in 154 B. C., and became consul in 146. The Achæan League was just running its mad course of wild, hazardous policy under the leadership of Critolaus and Diæus. Metellus had defeated the league several times, but had not been able to suppress it completely; perhaps he did not wish to suppress it. At the moment of Mummius's arrival in Greece the league had gathered an army on the isthmus of Corinth, but it proved very easy for Mummius to defeat and disperse it, and after the victory he entered Corinth, bent upon establishing an example which should deter other Greek cities from attempting resistance to the Roman supremacy. Many of the inhabitants had fled; the rest were either massacred or sold as slaves. The city was then pillaged and burned. Its enormous treasures of art and luxury were either sold to the King of Pergamos, carried to Rome, or ruined.

Mummy [from O. Fr. *mumie* (> Fr. *momie*), from Pers. and Arab. *mūmiyā*, mummy, deriv. of *mūm*, wax (used in embalming)]: an embalmed human or animal body, preserved dry, in semblance of its original shape, by artificial means. The Egyptian name was *sāḥu*. Mummying has been practiced by various peoples for a variety of reasons, mainly religious. The art was most developed in Egypt, where it had distinct connection with the very ancient belief in a future revivification of the body, a belief of whose existence we have monumental proof from the second dynasty, and one which took its rise in the conception of the nightly journey of Ra, the sun-god, in the nether world, and from the Osiris myth. At death the soul and body are separated, and, according to Egyptian belief, in order to the continued existence of the soul in its separate state and to its reconnection with the body, the latter must be preserved as nearly intact as possible (see KA), the idea apparently being that the bodily organs continued of service to the dead in the journey through Amenti, the region of the departed. Hence came the care bestowed upon the mummy and the provision against harm by placing it in hidden pits, pyramids, and other tombs. (See MASTABA.) The antiquity of the process is great (bodies impregnated with pitch having been preserved from the earliest dynasties), but its source is unknown. It is disputed whether it is Egyptian in its origin or whether it was brought from Asia by the original invaders, who are supposed to have come in by way of the Wadi Hammamat from Southern Arabia. In the earliest native burials the bodies were not mummified, and were placed in a sitting posture or in a contracted lying position. It is thought that these distinctions in mode correspond to a difference in race. (Cf. Petrie, *Medum*, p. 21.) What is known of the process is derived from observation and from the accounts of Herodotus (ii., 85), Diodorus (i., 91), and others. In the main these sources confirm each other.

Egyptian mummying was performed with more or less elaborateness, according to the wealth and position of the deceased. Diodorus speaks of three methods, which varied in price; the most expensive costing about $1,250, the second about $300, while the last was very cheap. Every particular in the process was accompanied with ceremonials, symbolic acts, or recitations, more or less elaborate according to the wealth or poverty of the dead. Many papyri are more or less devoted to these details. When mummification was completed the body was delivered to the friends, placed in its human-shaped coverings, cartonnages or sarcophagus, and transported to the west side of the Nile where, as a rule, the necropolis was located. The dead, meantime, had become an Osiris, received an Osiris-name, and had begun the career of the departed Egyptian. Cf. Maspero, *Études de mythologie et d'archéologie égyptiennes* (Paris, 1893, i., p. 283 ff.) See EMBALMING and RITUAL OF THE DEAD.

The literature of the subject is quite large, though scattered, but the best book on the entire subject is that of E. A. Wallis Budge of the British Museum, *The Mummy* (Cambridge, 1893). CHARLES R. GILLETT.

Mumps [probably derived from verb *to mump*, to mumble, be sulky, in allusion to the appearance of the patient; cf. *mumpish* and *mumps* in sense of the sulks. An Eng. dialectal word *mump*, lump, protuberance, may, however, also have aided in determining the use of the term]: an infectious and contagious disease, belonging to the same general class as measles, scarlatina, whooping-cough, etc., and characterized by an acute inflammation with enlargement of the parotid gland. In some localities, especially those with a moist and cold climate, it is very frequently seen (endemic). Children from seven to fourteen years of age, principally males, are most liable; adults, however, are not exempt. Its period of incubation, or preparatory development, lasts from one to three weeks; its chief symptoms are moderate fever; pain on pressure over the affected gland, in front of and below the ear, most frequently the left, sometimes the right and occasionally both sides; considerable swelling of that region and the whole cheek and chin; difficulty in mastication, deglutition, and respiration is in proportion to the amount of swelling; change of voice; fullness of the head and dizziness. In some cases the spleen and numerous other glands are also enlarged. In males the testicles and seminal glands, in females the ovaries and breasts, may also swell, and catarrh of the mucous membranes of the eyelids, nose, and mouth, is frequent. The duration of the disease is from a few days to a week. The swelling will gradually subside; in some cases, however, the gland may remain large and hard, and in a few an abscess will form. The treatment is simple, but should be under the guidance of a physician. It consists of regulation of diet—less meat, more milk, gruels, fruit, etc.; vegetable acids (lemonade), or dilute hydrochloric acid, ten to fifteen drops in a tumblerful of water as a beverage; mild purgatives, such as Rochelle salts, Seidlitz powder, or cream of tartar. Locally, it is best to use cold applications, reserving warm water or poultices for those cases in which an abscess is forming. Internal medication can generally be restricted to a mild antipyretic when indicated by excessive fever, and the iodides, should induration remain. In case of abscess, incision, free drainage, and antiseptic treatment are indicated. A. JACOBI and F. E. SONDERN.

Munch, PETER ANDREAS: historian; b. at Christiania, Norway, Dec. 15, 1810; studied law at the university of his native city, but at the same time gave a great deal of his time to the study of history and of Old Norse language and antiquities, a study he had begun while at school. Munch was, together with Rudolf Keyser, the founder of what is called the modern Norwegian historical school, and his historical writings are alike distinguished by critical acumen, thorough learning, and ingenious combination. Munch was in 1837 appointed an associate professor, and in 1841 Professor of History at the University of Christiania. He made several voyages abroad in order to study foreign archives and libraries, and from 1858 to 1861 lived in Rome, studying the papal archives, to which he gained an access that rarely has been granted to non-Catholics. His principal work is *Det norske Folks Historie* (History of the Norwegian People, in 8 vols., Christiania, 1852–63), treating of Norwegian history until the Calmar Union. Munch published a great many works of a linguistic nature (Old Norse Grammar, *Det Oldnorske Sprogs Grammatik*, by P. A. Munch and C. R. Unger, 1847; *Forn-Svenskans och Forn-norskans Språkbygnad*, Stockholm, 1849; *Det Gothiske Sprogs Formlære* 1848), and on historic and mythologic subjects (*Nordmændenes ældste Gude- og Helte-sagn*, 1854; new edition 1880). He also translated and edited several Old Norse sagas, including Snorri Sturluson's *Heimskringla* and *Odd*, the monk's *Saga of Olaf Trygvason*, and with C. R. Unger the *Saga of St. Olaf*, *Chronicon Regum Manniae*, *Speculum Regale* (1848), and the *Elder Edda* (1847). A complete collection of Munch's essays (*Samle de Afhandlinger*, 4 vols., Christiania, 1873–76), was edited by Dr. Gustav Storm. D. in Rome, May 25, 1863. P. GROTH.

Munch, Peter Andreas: poet; b. at Christiania, Norway, Oct. 19, 1811; studied law at the University of Christiania without finishing his course; was editor of a newspaper, *Den Constitutionelle* (1841–46); was in 1850 made assistant librarian of the university library, and in 1860 given a position as extraordinary lecturer in the university without obligation of lecturing. After 1860 he spent most of his time abroad, and from 1866 he had his residence in Copenhagen. Among his numerous writings may be mentioned *Sorg og Trøst* (Grief and Consolation, a collection of poems, 1852; 7th ed. 1891); *Salomon de Caus*, a lyric drama (1854; translated by John Chapman, London, 1855); *En Aften paa Giske*, an historical drama (1855); *Lord William Russell*, a tragedy (1857; translated by John Heyliger Burt, London, 1862, under the title *William and Rachel Russell*); *Kongedatterens Brudefart* (The Princess's Bridal Journey, twelve romanzas, 1861; 3d ed., illustrated, 1878); *Pigen fra Norge* (The Maid of Norway, a romance, 1861; translated by Mrs. Robert Birkbeck, London, 1877); *Jesu Billede* (The Picture of Jesus, a cycle of poems after a Roman legend, 1865; 6th ed. 1885). Munch translated into Norwegian several of Tennyson's poems, among them *Enoch Arden* (1866), and Walter Scott's *The Lady of the Lake* (1871). His romance *Brudefærden i Hardanger* (The Bridal Procession in Hardanger), after the famous picture by A. Tidemand and H. Gude, and with music by Halfdan Kjerulf, is one of the most popular of Norwegian songs. D. at Copenhagen, June 27, 1884. P. Groth.

Münchau'sen, Hieronymus Karl Friedrich, Baron von: romancer; b. of noble family at Bodenwerder, Hanover, in 1720; served in the Russian cavalry against the Turks 1737–39; died at Bodenwerder in 1797. The baron was throughout life accustomed to entertain his friends (in a singularly modest way and with an air of truthfulness) with wonderful tales of his exploits in the wars, and had the reputation of being the greatest liar in Germany. The first published collection of his stories appeared in English, and was written by Rudolph Erich Raspe, a German exile, and published in 1785 in Oxford under the title *Baron Munchhausen's Narrative of his Marvelous Travels and Campaigns in Russia.* This collection was translated into German in the following year by G. A. Bürger, the famous German poet, and with many additions has since then been printed very often as one of the most popular books. See introduction to the reprint by E. Griesebach (Stuttgart, 1890), and Carl Müller-Fraureuth, *Die deutschen Lügendichtungen bis auf Münchhausen* (Halle, 1881). Revised by Julius Goebel.

Münch-Bellinghausen, Eligius Franz Joseph, Baron von: dramatist; b. at Cracow, Apr. 2, 1806; studied law, and held different government offices in Vienna at the imperial library, the Burgtheater, etc. He is best known in German literature by his pseudonym of *Friedrich Halm.* In 1834 his first drama, *Griseldis*, was performed at the Burgtheater, and had a great success. Then followed in 1836 *The Adept*, in 1837 *Camoens*, in 1838 *Imelda Lambertazzi*, in 1843 *Der Sohn der Wildniss* (Ingomar), in 1844 *Sampiero*, in 1847 *Maria de Molina*, in 1854 *The Gladiator from Ravenna*, etc. The last-mentioned drama is his best work; his subsequent ones are rather weak. As a dramatist, he belongs to the school of Schiller. He was famous in his time, and several of his pieces have been translated into English. He treated extraordinary psychological problems in his dramas, and by using strong contrasts in the characters and situations produced powerful effects. He also wrote some lyrical poems of inferior quality. His collected works were published at Vienna in 8 vols. (1857–64). D. in Vienna, May 22, 1871. Revised by J. Goebel.

Muncie: city; capital of Delaware co., Ind. (for location of county, see map of Indiana, ref. 5–F); on the White river, and the Lake Erie and W., the Cleve., Cin., Chi. and St. L., and the Ft. W., Cin. and Louis. railways; 54 miles E. of Indianapolis, 110 miles N. W. of Cincinnati. It is in an agricultural region, and has important manufactures, including glass, nails, iron, steel, handles, pulp, and paper. It is also in the center of the great Indiana natural-gas belt, which gives the factories free fuel. There are electric lights, electric street-railway, public library (founded 1874) which contains over 10,000 volumes, 3 national banks with combined capital of $250,000, and 3 daily and 4 weekly newspapers. Pop. (1880) 5,219; (1890) 11,345; (1900) 20,942. Editor of "Morning News."

Muncy: borough; Lycoming co., Pa. (for location of county, see map of Pennsylvania, ref. 3–F); on the Susquehanna river, and the Phila. and Reading and the Penn. railways; 14 miles E. by S. of Williamsport. It is in an agricultural and lumbering region, and has flour, saw, and planing mills, French burr feed-mill factory, large woolen-mill, foundry, and machine-shops. Pop. (1880) 1,174; (1890) 1,295; (1900) 1,934.
Editor of "Luminary and Lycoming Co. Advertiser."

Mundé, Paul Fortunatus, M. D.: gynæcologist; b. at Dresden, Saxony, Sept. 7, 1846; was taken to the U. S. in 1849. He studied medicine at Yale and Harvard Medical Colleges, graduating M. D. from the latter in 1866; served as volunteer assistant surgeon in the war between Prussia and Austria in 1866; from 1867 to 1870 was resident physician in the Würzburg Maternity Hospital and assistant to Scanzoni; in 1870 was surgeon in the Bavarian army during the Franco-German war; settled in New York in 1872; is Professor of Gynæcology, New York Polyclinic, gynæcologist to several New York hospitals, and a fellow of numerous societies. He was editor of *The American Journal of Obstetrics* 1874–92. Among his writings are *Minor Surgical Gynæcology* (New York, 1880). He edited the sixth edition of Thomas's work on *Diseases of Women.*

Mundella, Anthony John, M. P.: British statesman; b. 1825 of Italian ancestry; engaged in business in Nottingham; was sheriff of Nottingham 1852; organized the first courts of arbitration for the settlement of trade disputes 1859; entered Parliament as a Liberal 1868; was vice-president of the council on education and charity commissioner 1880–85; president of the Board of Trade in the Gladstone ministry 1886 and again in 1892; resigned in 1894 under Lord Rosebery. D. in London, July 21, 1897. C. H. T.

Mundy, Johnson M.: See the Appendix.

Munger, Theodore Thornton, D. D.: clergyman and author; b. in Bainbridge, N. Y., Mar. 5, 1830; graduated at Yale College in 1851, and from the Yale Theological School in 1855; was pastor of Congregational churches at Dorchester, Mass., 1856–60, Haverhill 1862–70, and Lawrence 1871–75; was in San José, Cal., where he established a Congregational church, 1875–76; was pastor at North Adams, Mass., from 1877 to 1885, when he became pastor of the United Society (Congregational), New Haven, Conn. He has published *On the Threshold* (1884), which has been issued in numerous editions; *Lamps and Paths* (1885); *The Freedom of Faith* (1883); *The Appeal to Life* (1887); and numerous literary and theological essays in reviews and magazines. George P. Fisher.

Mun'go (Saint), or **Kentigern**: one of the three earliest missionaries who introduced Christianity into Scotland. While his associates, St. Columba and St. Ninian, devoted themselves respectively to the tribes of the south, west, and north, Mungo was the apostle of the Welsh or British races inhabiting the districts between the Clyde and the northern boundaries of Cumberland. The son of a British prince, he was born at Culross, on the Forth, about 518, and died at a monastery he had founded on the site of the cathedral of the modern Glasgow, Jan. 13, 603. Many miracles were ascribed to him, and numerous fabulous biographies are preserved. See Forbes, *Historians of Scotland*, vol. v.
Revised by S. M. Jackson.

Mungoos [the native name; variously written mongoos, mongoose, or mungoose]: a carnivorous mammal of India (*Herpestes griseus*) belonging to the family *Viverridæ*, and related to the African Ichneumon (*q. v.*). It is about the size of a cat, but is lower and longer bodied. The tail is long, hair harsh, of a gray color, with blackish markings. In India the mungoos is domesticated, and kept about houses to free them of rats, and, above all, to kill venomous serpents. It is popularly believed to eat some plant which renders it poison-proof, but really owes its immunity to its quickness. F. A. Lucas.

Mŭng-Tse, or **Mêng-Tse**: See Mencius.

Mu'nich (Germ. *München*): capital of Bavaria; on the Isar, here crossed by three bridges; 1,868 feet above the sea, at the southern extremity of an extensive plain (see map of German Empire, ref. 7–F). The city proper is situated on the left bank of the Isar; only some suburbs extend along the right bank. In architectural respects it is the most beautiful and interesting city in Germany, and one of the richest in sculptures and paintings. Nearly in the center of the city, on the Max Joseph Place, which contains the bronze statue of King Max (1825) by Rauch, is the royal palace, consisting of three parts—the king's house, the ban-

queting-house, and the old residence. The king's house was built by Klenze 1826–35, and is an imitation of the Palazzo Pitti in Florence. Its interior is very rich in marbles and frescoes, among which are the celebrated Nibelungen frescoes by Schnorr. The banqueting-house was built 1832–42 in Renaissance style, and has a large balcony resting on ten Ionic columns. The old residence was built at different periods, and contains many beautiful bronze statues. The palace is connected by a winter garden with the theater, which has seats for 2,500 persons. On the other side of the palace is the royal garden, surrounded on two sides by arcades, which are connected with the banqueting-house. On the southern side of the Max Joseph Place stands the post-office, in Florentine style. The so-called generals' hall, an imitation of the Loggia dei Lanzi in Florence, was built in 1844. From this building begins the Ludwig Street, running northward, terminating at the Siegesthor (Gate of Victory). On it are the Odeon, built in 1828; the palaces of the Duke of Leuchtenberg and of Duke Max; the ministry of war; the library, built 1832–43 in Florentine style, and containing 950,000 volumes and 25,000 MSS.; the university, with 3,292 students in 1892, the seminary, and the Max Joseph School, which three buildings, built in 1840, form a large square. The Siegesthor, an imitation of the triumphal arch of Constantine at Rome, was finished in 1856. Starting from the royal palace to the N. W., and passing by the Theatiner church, built 1661–75 in Italian rococo style, one reaches the Wittelsbacher Place. It contains the equestrian statue of the Elector Maximilian I. by Thorwaldsen, and the Wittelsbacher palace (finished 1850), in mediæval style, with pointed arches. At the end of the Brienner Street is the Propylæum, built in imitation of the Propylæum of Athens, with reliefs by Schwanthaler. On this side of the gate is the Kunstausstellungsgebäude; to the right, the celebrated Glyptothek, built 1816–30 in Ionic style, with a portico resting on twelve columns, and a magnificent tympanum; the building contains twelve rooms filled with marbles, chiefly antique. Near by are an establishment for painting on glass and the famous Pinakothek. The old Pinakothek, built 1826–36, in Renaissance style, is 520 feet long, and contains 1,300 pictures, arranged in thirty-two rooms. The ground floor is occupied by a collection of engravings, containing about 300,000 pieces, a collection of drawings, numbering about 9,000, and a collection of Grecian and Etruscan vases. To the W. of this building is the Polytechnicum, a structure in rich Renaissance style, and to the E. the new Pinakothek, built 1846–53, which contains pictures by modern artists. Other noteworthy buildings are the bronze-foundry, with a collection of models and an exposition-room; the Schwanthaler Museum, containing nearly all the plaster models by this artist; the Academy of Science and Art, with an immense collection of fossils, a collection of minerals, of coins, of physical and optical instruments, etc. To the S. W. of the city, near the Karl Gate, stands the Hall of Fame, built in the form of a horseshoe, with forty-eight Doric columns, and finished in 1853 after a plan by Klenze. It contains the busts of eighty renowned Bavarians. In front of the buildings stands a colossal figure of Bavaria, 66 feet high, modeled by Schwanthaler. A beautiful view toward the Alps can be had from the interior of the head.

The principal churches are the Frauenkirche, Gothic in style, built in the fifteenth century, the metropolitan church of the Archbishop of München-Freysing; St. Michael's Hofkirche, built in the latter part of the sixteenth century, in Roman Renaissance style; the Auerkirche, built 1831–39 in Gothic style, with beautifully painted windows; the Basilica des heiligen Bonifacius, an excellent imitation of the old Italian basilica, finished in 1850, with sixty-six columns, beautiful frescoes, and thirty-four medallion portraits of popes. Here is the tomb of Ludwig I. (Ludwigskirche), built 1829–43, by Gärtner in the Italian round-arch style. Over the portal stand Christ and the apostles by Schwanthaler; the interior contains beautiful frescoes by Cornelius and his disciples. The Allerheiligenkirche or Neu Hofkapelle, E. of the royal palace, was built in 1837 in Byzantine style, and is a very elegant though small structure. The Protestantische Kirche was built 1827–32.

The city is generally well laid out, and has broad streets and many large public squares. It has grown rapidly: in 1801 it had but 40,000 inhabitants. The Academy of Fine Arts, comprising three divisions—architecture, sculpture, and painting—and under the leadership of able men, attracts steadily a great number of students. The same is the case with the Conservatory of Music. The city occupies also a high rank in science. There are many scientific associations, good educational and numerous benevolent institutions. The manufacturing industry includes the bronze-foundries, the porcelain-manufactures at Nymphenburg, the glass-painting establishments, all founded by the Government; also the optical institute founded by Fraunhofer, and manufactures of mathematical instruments, machinery, fire-arms, cotton, and silver. The breweries are very extensive. Grain is the principal article of commerce.

The city first appears in history in the twelfth century; in 1254 it was fortified, and from Emperor Ludwig of Bavaria it received many privileges. In 1632 Gustavus Adolphus of Sweden entered it victoriously. The Elector Karl Theodor improved the fortifications at the end of the eighteenth century. In 1800 it was captured by the French. In 1814 King Maximilian I. began the rebuilding and beautifying, which were continued by Ludwig I. and Maximilian II. The population in 1890 was 349,024; in (1900) 499,959.

Municipal Assessments: See the Appendix.

Municipal Corporations [*municipal* from Lat. *municipa'lis*, deriv. of *munici'pium*, a town having free local government and Roman citizenship]: corporations formed from the members of a city, town, or other community for purposes of local self-government. Public corporations, that is corporations formed for governmental or political purposes, may be divided into *quasi* municipal corporations and municipal corporations proper. The distinction between the two is important, inasmuch as the duties and powers of the latter are much broader than those of the former. Among the *quasi* municipal corporations are embraced such local governmental bodies as counties, towns, and school districts—bodies with extremely narrow powers, and formed generally for the purpose of administering in the localities affairs of general concern and importance. Among municipal corporations are embraced cities and villages which are formed primarily and almost exclusively for the purpose of administering the affairs affecting the particular districts in which such corporations are found. While almost all governmental districts possessing in any important degree the privileges of local self-government are at the same time municipal corporations, it is to be borne in mind that the incorporation of a place is, or at least was, not originally necessary in order that it possess rights of local self-government. Thus the English boroughs at a very early time received charters which assured to them certain governmental privileges, but they were not incorporated until about the middle of the fifteenth century. The first charter of incorporation in England is said to be that given to Kingston-upon-Hull, granted in 1429. From that time on charters of incorporation were granted with great freedom until most of the boroughs of any size became at the same time municipal corporations. The other divisions of the country, such as the counties and the parishes, did not become corporations until very much later. Indeed, the counties of England did not become incorporated until the passage of the Local Government Act of 1888. When municipal boroughs were first incorporated it was not the locality nor the inhabitants that formed the corporations thus created, but the most important individuals, generally members of the governmental body of the borough, i. e. the council, though sometimes the freemen were included. This idea has, with the more democratic character of municipal government, been abandoned, until now, in both the United Kingdom and the U. S., the corporation formed by the grant to a municipal borough or city of a charter of incorporation is not to be found in the officers or a narrow body of freemen, but in all the inhabitants residing within the municipal district.

While the original purpose of granting to municipal boroughs charters of incorporation was to enable them to act as subjects of private law, and thus to hold property and be capable of enforcing obligations contracted with them and of being forced by the courts to fulfill obligations which they had contracted, still most of the important municipal boroughs which were thus incorporated were at the same time governmental agencies as well. For example, the councils of almost all of the important municipal boroughs had under their direction and control the local police force. Further, in almost all cases a commission of the peace was issued to the individuals composing the council, who acted thus also as justices of the peace. The larger cities had also a special court of quarter sessions. In this way the more important municipal boroughs were

agents of the central government both for the purpose of the administration of justice and for the purpose of the administration of the police force. On account, however, of the degeneration of the boroughs and of their prostitution for purposes of central politics, which began during the period of the Stuarts in the interest of the king, and was continued after the revolution of 1688 in the interest of the great political parties from that time on controlled by the nobility, it was felt to be inexpedient to confer upon the municipal organization any of the other administrative duties which the Government had to assume as a result of the development of the kingdom. Thus when the suppression of the monasteries made necessary a system of administering poor relief, this branch of administration was conferred upon the parish organization which extended through the urban as well as through the rural districts. Later on also, when the administration of education became a governmental matter, and the municipal borough was made the urban school district, a school board was provided separate and apart from the municipal organization proper for the purpose of attending to the schools. In the same way when it became necessary to light and pave the streets, these matters were put into the hands either of the parishes or of special commissions or trusts formed by special acts of Parliament and not a part of the borough organization. The result is that the English borough was at the time of the formation of municipalities in the U. S., and is even at present, an organization mainly for the satisfaction of local needs, with very few functions of general government to discharge.

Naturally this was the conception of the sphere of activity of municipalities in the U. S. at the time municipalities began to develop; but as a result of their better organization in the U. S. during the colonial period they very soon came to be regarded not merely as organizations for the satisfaction of local needs, but also as important agents of the central government. While during the very early colonial period municipalities were considered to be so much private in character as not to be capable of possessing the power of taxation, with the development of their capacity as agents of central government the power of taxation—a distinctively public power—was granted them in order to enable them to discharge their public functions. Not only has this power been very generally granted to the cities, but the city itself, when of large size, is often made the agent of the State administration for the assessment and collection of central taxes; and in many other cases the city officers attend to certain matters of general interest, and the expense of a long series of matters which may not be attended to directly by city officials has devolved upon the city. In the U. S. in most of the large cities municipal officers, either elected by the people of the city or appointed by the municipal authorities, are intrusted with the care of the public health, the schools, and the support of the poor, attend to police and election matters, and have a series of duties to perform relative to the administration of judicial affairs. This gradual development of the city from an organization for the satisfaction of purely local needs into an agent of the central State government has resulted in an assertion by the latter of very much greater powers of control over the city than were exercised over the English borough. This control has been extended not only to those matters where the city acts as an agent of central government, but also to matters of purely local concern. Cities in the U. S. have as a result largely lost the power of regulating their own purely municipal affairs. As no city may exercise any power which the Legislature has not granted to it, and as the Legislature in the U. S. has generally been very niggardly in its grants of power to cities, every city which does not find a power that it desires to exercise contained in the charter or laws regulating its government is obliged to apply to the Legislature for a special grant of power. The result has been a continual interference by the legislatures of the States with the affairs of cities, an interference which has had so much of evil result that a majority of the States of the Union have prohibited the Legislature from interfering by such special act with the affairs of municipal corporations. It must be confessed, however, that the courts have felt obliged, on account of the difficulty of regulating at one time and by general law all the matters in which a city should exercise power, to allow the Legislature considerable freedom of interference in local concerns, notwithstanding the constitutional provisions mentioned.

At the same time that the position of the city has been changing there has been a corresponding change in the organization of city government. The original governing body of the municipal borough in both England and the U. S. was the council, in which all powers were centered. As a result, no doubt, of the more important functions which have been conferred by law upon municipal corporations in the U. S., there has been felt a need of more clearly defining the responsibility for the administration of city government, and the council has been split up. The judicial functions have generally been assumed by State officers, namely, the judges of the courts, the justices of the peace, and police magistrates. The executive functions have been conferred upon the mayor, who has been separated from and made independent of the council, and by executive officers who have been provided by statute; and the functions of deliberation have been retained by what was left of the council. This separation of functions began in the latter part of the eighteenth century or the beginning of the nineteenth. The modern tendency has been to increase more and more the powers of the mayor, conferring upon him almost all powers of appointment and removal. This is particularly true of the large municipal corporations of the U. S.

This increasingly public character of municipal corporations has had an influence not only upon its public legal, but also upon its private legal relations. Inasmuch as the private legal relations into which a municipal corporation enters result for the most part either in the formation of contracts or in the commission of torts, we may consider its private legal capacity under the two headings of contracts and torts. So far as contracts are concerned, all that need be said is that, like all corporations, municipal corporations may enter into only those contracts which their charters or the laws by which they are governed permit them to enter, and they must form such contracts only in the way in which the law has permitted them to act, and any excess of powers or deviation from the methods provided by law will result in their contracts being void and of no effect. When we come to consider the law of torts relative to municipal corporations, too much emphasis can not be laid upon the dual position which these bodies occupy. In so far as they may be regarded as organizations for the satisfaction of purely local and municipal needs, they are assimilated to private corporations, and their negligence in the performance of their duties, or their non-observance of the rights of others in the exercise of these duties, will result in a legal liability of much the same character as results in a similar case from the action of private individuals or private corporations; for whatever may have been the original rule—and there is some dispute as to this—as to their liability for torts, no rule of law is better settled than that the municipal corporation is liable for all damages caused by the negligent performance of these private and purely local or municipal duties. When, however, we come to consider the municipality as a governmental agent, the position which the government occupies in this respect must be borne in mind. The law has always been reluctant to recognize any liability on the part of the government for torts committed by its officers. This has been due to motives of public policy, to the fear that the action of the government would be paralyzed were it to be responsible for all incidental damages which might result from an exercise of its purely governmental and sovereign powers. The same rule has been applied to municipal corporations in that they are exempt from all liability for negligence in the performance of their governmental duties. The tendency is, however, to recognize a liability for the mismanagement of their property, whether such property is employed in the performance of a public or a private duty; this tendency has not been so marked as to justify the statement of the rule that in so far as they manage property they are not exempt from liability for negligence; but it will undoubtedly be the means by which the liability of municipal corporations will be extended in the future.

FRANK J. GOODNOW.

Municipal Government: the government of cities and towns. The rise of modern industry, with its use of steam and electricity, its development of the factory system in place of old-time handicrafts and household industries, and its adoption of such agents of expanding commerce as the railway and the steamship, has not only given an enormous stimulus to the growth of population, but has also tended to mass population in towns and cities. While agricultural production has vastly increased, the increase is due to the opening up of new areas rather than to any increase in the

density of the farming population, and in the thoroughness and intensity of manual labor as applied to the soil. In fact, the invention and use of labor-saving machinery in the operations of agriculture have, especially in the U. S., materially lessened the number of people who can advantageously be employed in the tillage of a given area. The consequence has been, as shown by successive national and State census reports, a steady falling off in the population of strictly rural communities, this decline being exhibited since 1875 in Iowa and Minnesota, as well as in States E. of the Mississippi river. In Scotland, England, France, and Germany, the strictly rural population has been either declining or at an absolute standstill for several decades. In Scotland and France a sharp decline has been visible, while an apparent slight gain in England and Germany has in fact been due to the encroachment of industrial and urban conditions upon the village life of farming districts, rather than to any increase in the number of people living a distinctly rural life. The growth of U. S. cities has been at an enormous rate of increase; but the growth of English, Scotch, and German cities has been at a pace almost as great. It may simply be said that about three-fourths of the people of England and Scotland are now living under the conditions that belong to urban life, and that in the older parts of the U. S. the town dwellers outnumber the country dwellers. The urban impulse is comparatively new in Germany, but is at the same time very strong. The French people are less mobile, yet their great towns are growing with considerable rapidity, while the national population as a whole is barely maintaining its volume.

When the modern urban movement began to exhibit strong tendencies in Great Britain, the old traditional town life was very simple. The functions of the municipal corporations described in MUNICIPAL CORPORATIONS (*q. v.*) were not very numerous, and did not require the expenditure of large sums of money; but the rise of modern industrial towns made necessary a wholly new *régime* of municipal life. It was discovered that the comfort and happiness of a rapidly increasing proportion of the population demanded the exercise of a new series of public functions. It was not enough that the police departments and local courts of justice—performing the negative function of preserving order and punishing misdemeanors—should be strengthened, but it became necessary to meet with the assumption of positive municipal functions the supply of various common necessities. There poured into the manufacturing towns a great access of population from villages and country districts, and these factory-workers were huddled into crowded and ill-constructed tenements under conditions that were deleterious and demoralizing in every respect. Much space would be required to describe the recurring epidemics and the varied evils consequent upon the aggregation of town populations without what we now term municipal improvements. The first great step in England toward the adaptation of municipal life to the needs of growing communities was taken in the reform of the organization of the town or borough corporations. These had, for the most part, fallen into the hands of self-perpetuating groups of men who exercised under mediæval charters the proscriptive and traditional authority of the municipal government. By the reform acts which were passed in 1833 for Scotch cities, in 1835 for English, and in 1840 for Irish, these old corporations were reconstructed, and municipal government was placed in the hands of the householders. The poorest class was excluded, but subsequent laws have removed disqualifications until every family now has its vote. Authority is exercised by a common council, which is nothing more nor less than a large committee of the voting population. The organization of the English municipal corporation is very simple. The electors have only to choose councilors, one each year from each ward, the most usual number of wards in the larger towns being sixteen. The term is three years, and one-third therefore of the council retires annually. The council elects the mayor, usually from its own number. It also adds to its body a number of so-called aldermen, equal to one-third of the elected councilors. The aldermen, in fact, are usually appointed from the councilors who have served longest, and their selection leaves vacancies to be filled by special ward elections. All the working departments of the municipal administration are manned by expert chiefs appointed by the council, holding their places upon a tenure that is practically permanent. The council through its standing committees supervises the various branches of the city government. The mayor is merely the council's presiding officer and most important member. He is elected for a single year and has no appointing power or special authority, all control of municipal affairs being vested in the council. The town-clerk, who is the legal representative and the archive keeper, is the most indispensable functionary of an English municipality. Like the other officials, he is an appointee of the council. Some differences in nomenclature distinguish municipal government in Scotland, but in all essential matters it is the same as the English system. As civilization has advanced and science has led the way, these simple representative city governments of England and Scotland have enormously increased their activities in behalf of the common wants of the population. They have spent great sums upon the introduction of adequate municipal water-supplies, and have in many instances established municipal gas and electric works which not only furnish ample and cheap illumination of streets and public places, but also furnish light to private consumers at reasonable prices. They have constructed great drainage and sewer systems, with which the plumbing of all houses is obliged to connect. They have established public abattoirs and suppressed private slaughter-houses, have erected produce-markets, and brought all food-supplies under strict municipal sanitary inspection. They have entered upon great projects for the demolition of unsanitary tenement-houses, have adopted stringent regulations guarding against further imperfect building, and have devised methods of sanitary visitation for the prompt suppression of nuisances of every class, and for the immediate isolation, in great municipal epidemic hospitals, of cases of infectious diseases. Through these and kindred measures they have greatly lowered the death-rate, and have reduced to small proportions the ravages of those diseases that are spread by infection and that are amenable to sanitary control. Great reforms for the convenience of traffic and for the better admission of air and light have been made by the reconstruction of street systems and by the retention of open spaces. Commendable activity has also been shown in the acquisition of parks and public pleasure-grounds. The health and comfort of the people have been promoted in many of these places by the establishment of public baths, while in several of them there are public laundries and wash-houses patronized by the housewives in the tenement districts. Public libraries and reading-rooms under municipal auspices have become frequent, as also have public halls and assembly-rooms. In many of the English and Scotch cities the street-railways have been constructed and are owned by the municipality itself, although it is the common practice to lease them to a private company for operation. The great city of Glasgow has now assumed the direct operation of its street-railways, and several of the smaller English cities have entered upon the same policy. The metropolis of London, under the Local Government Act of 1888, became an administrative county governed by an elected council of citizens; and since that time it has entered upon a policy for the promotion of the welfare of its great population that is similar in scope to that described as common to the industrial and manufacturing cities, such as Birmingham, Manchester, Glasgow, Sheffield, Leeds, and scores of other places.

Municipal government in France under existing forms is the outgrowth of the French Revolution. The laws of France—as also those of Italy and Belgium, which are historically and practically modeled upon the French system—have grown out of the great reforms instituted as a result of the French Revolution. All France is divided into communes. The principle of communal government is the same for the smallest country township as for the largest cities. Except as the general Government through the Department of the Interior exercises some discretionary power and takes occasional steps of interference, the communes are little republics. Universal manhood suffrage prevails, and the voters of each commune elect from time to time a certain number of members of the communal or municipal council. The size of the council varies according to the population of the commune, a sliding scale having been established in the general code for the government of communes and municipalities. The municipal or communal council appoints the mayor from its own number, and the mayor in turn selects a certain number of councilors to be his coadjutors and to act as a standing executive committee. The mayor and this committee are known as the *corps législatif*. Each member of the standing committee is given the supervision of some department of the municipal administration, and acts in the capacity of the chairman of a committee having charge,

let us say, of water-supply, or police, or some other branch of the local administration. The *corps législatif* holds frequent sessions, and the whole business of administering the affairs of the municipality comes under the direction of the mayor. The full council meets less frequently, but goes very exhaustively into reports from the mayor and executive corps, makes all the by-laws and regulations for the government of the commune or municipality, passes upon the levy of local taxes, and votes in detail the amounts to be expended for various purposes. This plan of municipal government, with some differences of detail, may be said to belong to all the Latin countries of Europe. It works effectively, and has shown its capability of bearing an unlimited expansion of local functions and undertakings. Thus of late years in Italy enormous physical reconstructions and public works of supply and improvement have been undertaken, and faithfully and ably carried out by the municipal councils, with their *sindaco*, as the mayor is called, and their group of experienced members selected as the executive corps.

In Germany municipal government as a sort of community-housekeeping has developed in many respects a higher state of perfection than anywhere else. The structure of municipal government in Prussia grows out of the general system of administration that dates from the reforms of Stein and Hardenburg early in the nineteenth century. Circumstances that were dominant at that time made it possible for property interests to retain a degree of special representation in government that English and French political reforms would not admit. The franchise, both for national and for local and municipal purposes, was based upon a three-class system which made taxation the measure of representation. The handful of men who stood highest on the tax-roll and paid one-third of the taxes were allowed to exercise as much authority at the polls as the great mass of workingmen whose names stood at the other end of the tax list, and who, in the aggregate, also paid one-third of the direct taxes. A middle class, paying the second third of the total sum raised by direct taxation, also exercised a like share of political authority. This system was not respected in the establishment of the present German empire, and simple manhood suffrage is the basis of the electorate that is represented in the imperial Reichstag; but in the government of Prussia and of Prussian municipalities the three-class system still prevails. It also exists in some other parts of Germany, though not in all. The body in which the authority of municipal government is reposed is the *Gemeinderath*, or common council. It is elected by the body of electors, or *Wahlmänner*, of which the three classes of voters have each selected one-third. The common council in a German town is elected for six years, one-third of the membership retiring every two years. The executive work is performed by a burgomaster, or mayor, and the body of department chiefs, known as the magistrates. The mayor is selected by the common council, and so are the high department chiefs, or magistrates, and these functionaries, the mayor included, have what is practically a life tenure upon their positions. In some cases they are appointed expressly for life or good behavior, while in other cases they have twelve-year terms with the practical assurance of reappointment. They are selected for expert knowledge, and administrative experience and ability. They constitute, with the burgomaster, what is known as the *Magistratsrath*, and they hold frequent conferences together upon some such plan as that already described in the account of the executive corps of the municipalities of Latin countries. Some of the magistrates are highly salaried, while another element of the body is composed of distinguished citizens who serve without pay, and who regard the office as an honor and the opportunity to serve their fellow citizens an agreeable public duty. This body often includes men who have been brought from other cities on account of their special ability, and the burgomaster himself is frequently selected on the strength of the good service he has rendered in a like capacity to some smaller city. The law department, the treasury department, the public-health department, and the educational department, also those of water-supply, gas-supply, streets and paving, architecture and building, care of the poor, property assessment, and various others, are all presided over by some member of the executive magistracy selected on account of his special attainments and qualifications. The minor positions in the official service of a German city are filled under rules and regulations which give protection against arbitrary removal, and it is easy for the cities to secure an abundant supply of expert and highly trained civil servants.

The German cities are run upon excellent business principles, and it is considered their function to undertake anything that will promote the wellbeing of the community, provided the undertaking will not involve a heavy burden of taxation without affording any compensatory relief. Thus magnificent water-supplies are the rule in German cities, but they are managed in such a way that while furnishing the citizens with good water at moderate charge the works are made to pay the expenses of management, all interest charges upon the cost of the plant, an ample fund for maintenance and for the accumulation of a sinking fund to meet bonded indebtedness as it falls due, and finally to pay over a clean profit into the city treasury to lighten the tax-rate. The gas-supply in Germany in like manner is, as a rule, provided by the municipal authorities as a profitable undertaking. Many of the German cities are establishing electric-light plants on similar business principles. Great markets and abattoirs are the rule in these German cities, and they are made self-supporting. The German towns have awakened greatly to the necessity of sanitary reforms in every direction, and they have applied scientific knowledge to the problems of the public health with a thoroughness nowhere else equaled. All great German towns maintain well-equipped chemical and bacteriological laboratories, which are constantly testing the character of the water-supply, and examining food that is offered for the consumption of the masses. Street-paving and public works of various kinds are prosecuted with a thoroughness that has given great reputation to German municipal administration. The street-cleansing service also excites the admiration of American visitors. It is the universal policy to maintain municipal savings-banks and pawnshops, so conducted as greatly to encourage thrift and to lessen the hardship of sudden misfortune. In nothing is German municipal administration more successful than in its system for the relief of the poor and the distribution of public charity. Under the executive magistrate who has oversight of that department there is a large central committee, upon which members of the council and non-official citizens are asked to serve. There is a subdivision of the city into main districts, and then into minute ones for the organization of relief. Small districts contain perhaps two or three hundred families each, sometimes including not more than two or three large tenement-buildings. For each of these districts a visitor is selected, whose responsible and upright character has commended him to the attention of the central authorities. Every citizen thus appointed is expected to serve. It is considered an honor and a serious public duty, and refusal to accept without good excuse would involve penalties under the law. The visitor becomes the good angel of his little district, knows all the families, and can not well be imposed upon. The families in turn know to whom they must first appeal in case of need. The visitor has at his call a physician, whose duty it is to render prompt medical relief. Each visitor must make frequent and regular report of every case of need that arises in his neighborhood, and every case of duplication or fraud is thus easily traced and exposed. The German municipalities are, either on their own account or as agents of the general Government, entering upon the policy of insuring workingmen against illness, accident, and the peril of an impoverished old age. These communities have shown themselves by far the most enlightened in the world in their methods of dealing with poverty, and have succeeded as no other modern communities have done in reducing city life to a system in which each individual and each family has its place as in a great household. The direct application of municipal energy to the task of providing a kind of education for children which would at once fit them for life under existing conditions, and enable them to enter advantageously into the industrial life of their own particular community, has been carried further in the German cities than anywhere else, with the possible exception of Paris. Not only is ordinary elementary education universal and compulsory, but the cities provide much manual, trade, and commercial instruction, and, through the universally established system of gymnastic drill, make provision for physical development.

The typical modern city is not to be sought in Western Europe or America alone, but may be studied to excellent advantage in the two capitals of the Austrian-Hungarian empire, Vienna and Budapest. These splendid cities have established admirable systems of municipal government, under which they have been marvelously reconstructed,

transformed, and adorned, and under which also the health and comfort of the population has been cared for no less than the externalities of fine architecture, broad boulevards, and ornate pleasure-grounds. The most recent tendency of large cities in all countries is that of a decline of population in their central wards and districts, and a vast development of less densely housed population in the suburbs. This new disposition to a readjustment of urban populations over a greater area is due principally to the rapid increase of transit facilities, by which for a small price a great host of people may be carried from business at the core of a town to homes on the circumference. Thus the multiplication of workingmen's low-fare trains and other facilities in London is fast depopulating the inner city; and a little area of 1 sq. mile, in whose busy streets and shops 1,000,000 people are engaged during the working hours, now shelters less than 50,000 at night. Of London, Paris, Berlin, Vienna, New York, and perhaps also of Philadelphia and Chicago, it may be said in a general way that there is a central population of approximately 1,000,000 people which for a considerable period of years has remained practically stationary, and which is now tending to a slight decline. All further growth of population attributed to these cities belongs to the portions lying beyond the inner wards which contain the one-million nucleus. If a still smaller nucleus of 200,000 or 300,000 is sought, one discovers that the enormous central districts show substantial declines. Thus the question of the disappearance of the slums is, under natural and healthful circumstances of evolution, tending to settle itself. Some intelligent and vigorous effort to assist these natural and wholesome tendencies can, however, greatly quicken the results that are desired. In Great Britain municipal governments, under a series of so-called "workingmen's dwellings acts" and "housing-of-the-people acts," are condemning and destroying the most objectionable tenement rookeries, and providing here and there in the crowded districts for small parks, playgrounds, and open spaces. They are also perceiving that prevention is better than cure, and that stringent regulation of new buildings may in the course of one or two generations result in a vastly improved housing for the population of an entire great city.

In the U. S. the problem of adjusting town conditions to the convenience and welfare of large masses of population has come into prominence more recently than in Europe, because in the U. S. the life of the farming districts and of country towns has until lately been the characteristic and prevailing system. The development of large towns since the civil war has led to much scandal in municipal administration and has brought some reproach upon the institutions of the country. It may be said for the large cities and towns of the U. S. that they have shown enterprise in the management of certain departments, such as the water-supply, the fire-extinguishing service, the provision of common schools, the creation of parks, and, in many cases at least, the establishment of public libraries. The chief difficulty of municipal government has grown out of a lack of adaptation of the municipal framework to the accumulation of business which modern civilization makes incumbent upon the ruling authorities of a large town. A hopeful period of reform has been entered upon, and simplicity and unity begin to take the place of an antiquated system of disconnected boards, commissionerships, trusteeships, separately elected mayors, and aldermanic groups, or common councils stripped of adequate authority, and therefore unable to command the membership of the best-qualified citizens. In the U. S. the policy has been to confer street-railway franchises and gas and electric franchises upon private companies, and the negotiations between these companies and the municipal bodies having power to grant franchises has been a constant source of scandal and corruption. The frequent interference of State Legislatures in the affairs of the cities has also made impossible any stability of municipal methods or any proper development of local responsibility. The municipal-reform movement has been based more than anything else upon the principle of local home rule for municipalities, in order that the people who pay the costs, bear the ills, and enjoy the advantages of any given municipal administration may exercise authority under a charter which shall not limit them unduly, and which shall guarantee them against outside intervention in matters of detail. The taxes collected for the maintenance of municipal government and local institutions in all civilized countries have lately grown to formidable proportions; and in the U. S. as well as in some European countries they constitute very much more than half of all the taxation levied for all purposes upon the taxpayer; but the citizen receives in return a series of services which are as essential to his health, comfort, and happiness as are the necessities of life which he procures through his private expenditures. Municipal indebtedness everywhere tends to assume large dimensions; but most of it has resulted from a tangible and commendable investment in public works which, either directly or indirectly, give ample pecuniary return. The fear, therefore, lest the rapid growth of modern municipal expenditure and the formidable development of municipal indebtedness may be leading on to disaster, or even bankruptcy, is not well founded. All municipal improvements essential to the health and general well-being of the community are to be considered as a co-operative investment which must result advantageously.

ALBERT SHAW.

Municipality: See the Appendix.

Municipal Law of England and the U. S. The municipal or national law of England has assumed its present form after a practically uninterrupted development of fourteen centuries. Although it has been largely influenced by Roman law, civil and canon, it is essentially, in its character as in its origin, a Teutonic system. Carried by English colonists to all quarters of the globe, it divides with Roman law the rule of the modern civilized world.

Anglo-Saxon Law.—During the first five centuries of the Christian era Britain was governed by Roman imperial law; but this law, like the rest of Roman civilization, was swept away by the heathen hordes from the coast of the North Sea, who invaded and conquered the island. English law began as "a slip of German law planted in England" (Maitland). It consisted at first of numerous bodies of tribal custom, varying in details, similar in essentials. The so-called "laws" or "dooms" issued by Kentish, Wessex, and English kings and their *witan* from the seventh to the eleventh century, and even those published by the Danish conqueror Canute, are simply statements of Anglo-Saxon custom. Like the contemporaneous "folk-laws" of continental Germany, these dooms consist mainly of provisions for the punishment of breaches of the peace and tariffs of penalties for private wrongs. After the conversion of the English to Christianity the Church exercised a certain humanizing influence upon the law—an influence which was more considerable in the eighth and ninth centuries than in the tenth and eleventh. The Church also introduced its own law of marriage, and familiarized the English with the use of deeds and testaments; but even in these matters its innovations were adapted to the national ideas and customs.

Norman Law.—The system of law which Rolf and his Norse followers found in Northern France when they conquered and colonized that region, the system which they accepted and perpetuated in their duchy of Normandy, and which William the Conqueror and his men carried with them to England, was also a transplanted slip of German law, viz., the law of the Franks; but through the legislative reforms of the Frankish kings and emperors, and in the practice of the Frankish courts, the law of the Franks had reached a higher stage of development than the closely related law of Saxon England. The Norman conquest of England brought these two systems face to face. The English, as the Conqueror had promised them, lived by their own law; the Normans by Norman law; the relations between the two races were ordered by special provisions. These special provisions, of course, were framed in a Norman spirit; and it was equally a matter of course that the Anglo-Saxon law, where it was still applicable, suffered at the hands of the unsympathetic Norman officials who had to apply it; but the fact that the Anglo-Saxon law was gradually superseded by the Norman was not due solely or even mainly to the conditions of competition, but to the technical superiority of the Norman system. English resistance to this process produced in the eleventh and twelfth centuries numerous compilations of Anglo-Saxon laws, falsely ascribed to Saxon or Norman rulers (e. g. the so-called laws of Edward the Confessor, of William the Conqueror, of Henry I.), but the infiltration of Norman ideas in these very compilations shows the hopelessness of the struggle. In the fusion of the two systems which accompanied the fusion of the two races, in the development of a common law for all Englishmen, the Norman law was by far the more important constituent. The language of the laws and of the reports, from the time of the Plantagenets to that of the Tudors, was Norman-French.

The Common Law.—The fusion of Saxon and Norman law was not accomplished by the development of a new popular custom—a new English folk-law. It was effected partly by legislation (royal charters, provisions, assizes, statutes), mainly by judicial decisions. The Norman conquest had given England a more strongly centralized government than existed anywhere upon the Continent before the fifteenth century. At a period when the administration of secular justice upon the Continent had fallen into the hands of the feudal seigneurs and the free cities, the king's writs ran throughout England; controversies were tried by royal justices in the county and circuit courts; and appeals lay to the central courts of exchequer, king's bench, and common pleas. These conditions alone would have insured a rapid development of national English law, but the process was hastened by the centralization of legislative power in the crown and the Parliament. When the imperial Roman law, revived in Italy, spread over Europe in the twelfth and following centuries, the English common law was sufficiently developed to avert any such "reception" of the lawbooks of Justinian as took place upon the Continent. Such influence as they exerted was indirect, and was limited to special departments of the law. The Lombard jurist Vacarius read Roman law at Oxford in the twelfth century, and one of the first important treatises upon English law, that of Bracton (properly Bratton, *circa* 1259), was strongly colored by Roman ideas; but even Bracton drew upon the Roman jurisprudence for his definitions, his classification, and his terminology rather than upon the Roman law for his rules; and in the later mediæval writers (Britton, Forteseue, Littleton, etc.) Roman influences are far less perceptible. In the thirteenth and following centuries it was not the universities that trained the lawyers, but the Inns of Court. It is true that one very important part of the English common law, the law of contracts, seems to exhibit numerous Roman grafts; but it may well be queried whether this fact is due to a direct acceptance of Roman rules or to their indirect transmission through the customs of European merchants. See MERCANTILE LAW.

The most important foreign influence, as in the Anglo-Saxon period, was that of the Church. From the Conqueror the ecclesiastical courts obtained an independent jurisdiction, which they sedulously strove to widen. Their encroachments were checked by many statutes (provisions of Clarendon, statutes of *præmunire*, etc.), and their subjection to the royal authority was repeatedly emphasized; but their jurisdiction over MARRIAGE (*q. v.*) and family law in general, and over the administration of estates, was never seriously questioned, and these branches of the English law are mainly the creation of the ecclesiastical courts.

It should be added that throughout the Middle Ages churchmen were frequently employed as judges in the secular courts (Bracton, for example, was an ecclesiastic as well as a justice of eyre and of assize), and that the chancellors, from Becket to Wolsey, were regularly ecclesiastics.

Equity.—Toward the close of the Middle Ages judicial law-making assumed a peculiarly bold and open form in the decisions of the court of chancery. The chancellors exercised the right of supplementing and even of overriding the common law by virtue of the equitable powers which all Teutonic peoples seem to have regarded as inherent in the crown—or which, if a wider generalization may be risked, all Aryan nations appear to have regarded as inherent in supreme political authority. (Cf. ROMAN LAW, *jus honorarium.*) In England these powers seem to have been little needed while the common law was in active development, and while new writs were constantly appearing to meet new exigencies; it was only when the common law had become relatively rigid that equity became an imporant agency in the development of the law. Some of the earliest traces of a special jurisdiction exercised by the court of chancery are found in the reign of Richard II.; under the Tudors the development of equity was very rapid; since the eighteenth century the courts of equity, both in England and the U. S., have practically confined themselves to administering the law established by previous decisions. The net result of the whole process has been to create "a kind of secondary common law" (Kent), which in our day has been substantially merged in the general body of the judge-made law. See EQUITY.

Blackstone.—The English law, common and statutory, as it existed toward the close of the eighteenth century, has been so set forth by Blackstone that his work has become a legal classic. The faults of his work are mainly due to the circumstances under which it was done, namely: That at the time when it was written the historical study of law was in its infancy; the analysis of legal institutions was crude and imperfect; and a thoroughly logical arrangement of the law was a problem that interested very few persons on the continent of Europe and nobody in England. A foreign scholar who is far more competent than most of Blackstone's critics to appreciate that writer's shortcomings, Heinrich Brunner, of Berlin, has justly said that "no other system of modern law has been presented in so complete and well-rounded a form as the English law in the *Commentaries* of Blackstone."

United States.—The English colonists brought with them to America the English law, common and statutory. After the Declaration of Independence it was expressly resolved in some of the States that this law was still in force. It was as unnecessary to pass such resolutions as to decree the continued employment of the English language. Except in those portions of the U. S. where the colonists and their institutions were French or Spanish, the English law, as it existed at the period of independence, is still the basis of law.

The colonists also brought with them those methods of developing the law which had been recognized and employed in England, viz., statutes and judicial decisions. In consequence, however, of the adoption of written constitutions which are not enacted by the ordinary legislative bodies, and by reason of the division of powers, legislative and judicial, which is incidental to the federal form of government, the sources from which law proceeds are more numerous in the U. S. than in England. *Written law* is made (1) by amendment of the Federal Constitution; (2) by acts of Congress and treaties; (3) by amendment of the several State constitutions; (4) by acts of the several State legislatures. *Unwritten law* (see LAW) is made (1) by the Federal judiciary and (2) by the several State judiciaries. As regards subsidiary or delegated law-making power (ordinance, etc.), see LAW.

The extent to which the common law, i. e. the judge-made law, is still in force in Great Britain and its colonies and in the U. S.—the extent, therefore, to which the *development* of the law is still in the hands of the judiciary—constitutes a striking difference between these countries and the countries of the Roman law. In the states of continental Europe and of Central and South America the entire law is ordinarily reduced by codification to statutory form; or at least the attempt is made to bring the whole law into such form; and the law-making power of the judiciary is limited to the interpretation of the written law and the filling of "open places." In Great Britain and in the U. S. considerable portions of the law have been reduced to statutory form, and even to the form of codes; but the great body of private law, especially the law of personal property and of contracts, still rests upon judicial custom or "precedent," and is developed not by legislation, but by the decisions of the courts.

LITERATURE.—Upon the history of English law as a whole no satisfactory work exists. The best is still Reeves's *History of the English Law* (3d ed. 1814; later editions by Finlason to be avoided). For literature of special historical investigations, see Brunner, *Quellen des Englischen Rechts*, in Holtzendorff's *Rechtsencyclopädie* (5th ed. Leipzig, 1890; English translation of Brunner's article from the 4th ed. by Hastie, Edinburgh, 1888), and Maitland, *Materials for English History*, in *Political Science Quarterly*, iv., 496, 628. For modern English law, see Stephen, *New Commentaries* (7th ed. London, 1874). For American law, see Kent, *Commentaries* (12th ed. by O. W. Holmes, Jr., Boston, 1873). A brief but very suggestive work is that of O. W. Holmes, Jr., *The Common Law* (Boston, 1881). On the question of judge-made law *vs.* statute, see Carter, *Codification of our Common Law* (New York, 1884), and Dillon and Munroe Smith in *Political Science Quarterly*, ii., 9, 105; iii., 136.

MUNROE SMITH.

Municipio Neutro (Brazil): See RIO DE JANEIRO.

Munjeet', or **East Indian Madder** [*munjeet* is from Hind. *manjit*, a drug used for dyeing red]: a plant (*Rubia cordifolia*) extensively cultivated in India, its root being used as a dyestuff for producing colors similar to those of common madder. It was formerly supposed to contain the same coloring-matters as madder, alizarin, and purpurin. Dr. Stenhouse (*Proc. Roy. Soc.*, xii., 633; xiii., 86, 145) has shown that it contains purpurin, but no alizarin. The substance supposed to be alizarin he has shown to be a distinct body, *munjistine*, having properties very similar to those of alizarin.

Munk, Hermann, M. D.: neurologist; b. in Posen, Prussia, Feb. 3, 1839; was educated at Posen, and Berlin and Göttingen Universities; became successively a physician (1860), docent in the University of Berlin (1862), assistant professor (1869), professor and director of the physiological laboratory in the Veterinary High School (1876). He is a member of the Royal Academy of Sciences in Berlin. He belongs to the school of physiologists known by the names of Müller, Dubois-Reymond, and Virchow. His principal works on physiology and physiological psychology are *Untersuchungen über das Wesen der Nerven-Erregung* (vol. i., Leipzig, 1868); *Die elektrischen u. Bewegungs-Erscheinungen am Blatte der Dionaea muscipula* (Leipzig, 1876); *Ueber die Functionen der Grosshirnrinde: Gesammelte Mittheilungen* (Berlin, 1881; 2d ed. 1890); numerous memoirs in *Zeitschr. für wissensch. Zoologie* (vol. ix.), *Arch. f. Anat. u. Physiol.* 1860–94), *Sitzungsber. d. Berliner Akademie d. Wiss.* (1880–94), etc. J. M. Baldwin.

Munk, Salomon: Orientalist; b. at Glogau, Silesia, May 14, 1805, of Jewish parentage; studied at Berlin (1820), at Bonn, and at Paris (1828); was appointed assistant in the department of Oriental MSS. in the National Library of Paris (1835); traveled in Egypt and Syria with Montefiore and Cremieux (1840), where he assisted in founding schools for Israelites; and was made Professor of Hebrew, Chaldee, and Syriac at the Collège de France (1865), though in 1852 he had become quite blind. In 1860 he was elected a member of the Académie des Inscriptions et Belles-Lettres, and a little later a member of the Consistoire Central Israélite. D. Feb. 6, 1867. His greatest work was the edition of the Arabic text, with French translation, of Moses ben Maimon's Guide of the Perplexed, *Le Guide des Égarés* (3 vols., Paris, 1856–66). He also wrote *Reflexions sur le culte des anciens Hébreux* (Paris, 1833); *Notice sur Rabbi Saadia Gaon* (Paris, 1838); *Palestine* (1845); *Philosophie chez les Juifs* (1848); *Notice sur Abou'l Walid Merwan* (1851; crowned by the Academy); *Mélanges de philosophie juive et arabe* (1857–59); *Commentaire de Rabbi Tan'houm de Jérusalem sur le livre de Habakkouk* (1843). He also wrote articles in the *Encyclopédie pittoresque*, *Dictionnaire des Sciences philosophiques*, and the *Dictionnaire de la conversation*.

Richard Gottheil.

Munkacsy, moon-kaat'sĕe, Mihaly: historical and genre painter; b. at Munkacs, Hungary, Oct. 10, 1846. His real name was Michael Lieb, and he was a carpenter's apprentice before he began the study of art. He studied at the Vienna Academy and under Franz Adam in Munich; went to Düsseldorf in 1867 and painted there *The Last Day of a Man Condemned to Death*, which at once brought him into notice. In 1872 he established himself in Paris and painted pictures of life in that capital. With his picture of *Milton Dictating Paradise Lost to his Daughters* (in the Lenox Library, New York) he entered on a new field, and this work and others exhibited by him at the Paris Exposition of 1878 attracted much attention. *Christ before Pilate* and *Christ on Calvary* are two large compositions which have been exhibited in all the large cities of the U. S. He visited the U. S. in 1886 and painted several portraits in New York.

Munn, George F.: See the Appendix.

Muñoz, Juan Bautista: historian; b. near Valencia, Spain, 1745. He graduated at the University of Valencia, devoted himself to historical studies, and in 1779 was commissioned historiographer of the Indies, with special orders from the king to write the history of America. Only the first volume of his *Historia del Nuevo Mundo* was published (Madrid, 1793); this brings the narrative down to 1500, and is a work of the highest value. D. in Madrid in 1799. His manuscripts were scattered, but most of them are now in the Academy of History at Madrid. H. H. S.

Munro', Hugh Andrew Johnstone, D. C. L.: classical scholar; b. at Elgin, Scotland, Oct. 14, 1819; educated at Trinity College, Cambridge, where he became a fellow 1843; published an edition of *Lucretius* (4th ed. 1885), one of the standard works of English scholarship; of *Horace* (1869); *Elucidations of Catullus* (1878); and articles in philological journals. He also wrote Greek and Latin verse. D. Mar. 30, 1885. Dr. Munro was the first university professor of Latin, from 1869 to 1872, when he resigned.

Munroe, Charles Edward: See the Appendix.

Munroe, Charles Kirk: See the Appendix.

Munster: the largest of the four provinces of Ireland; bounded N. and E. by Connaught and Leinster, and S. and W. by the Atlantic. Area, 9,481 sq. miles. Pop. (1891) 1,168,994. The province is divided into the counties of Cork, Clare, Kerry, Limerick, Tipperary, and Waterford.

Münster: capital of the province of Westphalia, Prussia; on the Aa; 101 miles by rail N. by E. of Cologne (see map of German Empire, ref. 3–D). It is an old but well-built and picturesque town, surrounded with beautiful promenades (its old fortifications), and containing many open places planted with trees and lined with elegant houses. The most remarkable among its buildings are the cathedral (built 1225–61), and the town-hall, in which the Peace of Westphalia was signed in 1648. From the twelfth to the eighteenth century Münster was the capital of an independent principality of the German empire. In 1719 it was merged into the archbishopric of Cologne, and in 1814 it was given to Prussia by the Congress of Vienna, together with most of its territory. It has many good educational institutions, printing establishments, dye-works, and manufactures of leather, woolen, cotton, and silk fabrics, paper, and sugar, and it carries on a considerable trade in its own manufactures and the products of the surrounding district. Pop. (1895) 57,135.

Münsterberg, Hugo, Ph. D., M. D.: psychologist; b. at Dantzic, Germany, June 1, 1863; studied at Dantzic, Geneva, Leipzig, and Heidelberg. From 1887 to 1891 was instructor and 1891–92 Assistant Professor of Psychology in the University of Freiburg in Baden, Germany; in 1892 became Professor of Experimental Psychology, Harvard University, Cambridge, Mass. His principal works are *Die Willenshandlung* (Freiburg, 1888); *Gedankenübertragung* (1889); *Der Ursprung der Sittlichkeit* (1889); *Beiträge zur experimentellen Psychologie* (1889–93); *Aufgaben und Methoden der Psychologie* (1891); and many psychological and philosophical articles in *Psychological Review*, *Reallexikon der medicin. Propädeutik*, *Zeitschrift für Psychologie*, etc.

J. M. Baldwin.

Muntaner', Ramon: chronicler; b. at Peralada, Catalonia, in 1265; d. in 1336; the most important authority on the early history of his country, as well as one of the most valuable of mediæval annalists. After having filled many positions of trust under his sovereign, and participated in the remarkable Catalan expedition to Rumelia and Greece, Muntaner retired to Xilvella, near Valencia, and at the age of sixty years began the composition of his chronicle. His narrative covers the period between the "miraculous" birth of King Jaume, Jacme, or Jayme, I., the founder of the Catalan nationality, in 1208, and the coronation of King Alphonso in 1328. Muntaner's chronicle was first printed at Barcelona in 1558 under the title *Chronica o Descripcio dels fets e hazanyes del inclyt Rey Don Jaume, primer Rey d'Arago, de Mallorques e de Muntpesller; feta per lo magnifich en Ramon Muntaner*. A reprint of this edition appeared at Barcelona in 1562. Lanz gave an edition of the text in the publications of the Stuttgart *Literarischer Verein* in 1844, and Bofarull has published at Barcelona the text with a Castilian version (1860). There is a good French translation by Buchon in the *Chroniques étrangères relatives aux Expéditions françaises pendant le XIII^e Siècle* (Paris, 1841); a German by Lanz (2 vols. 8vo, Leipzig, 1842); and an Italian by F. Moisé—*Due cronache catalane, etc.* (2 vols., Florence, 1843–44). See also G. Finlay, *Mediæval Greece and Trebizond* (London, 1851). Revised by A. R. Marsh.

Mün'ter, Friedrik Christian Carl Henrik: theologian and author; b. at Gotha, in the duchy of Saxe-Coburg, Oct. 14, 1761; studied theology and archæology at Copenhagen and Göttingen; traveled for three years in Italy on a stipend from the Danish Government; was appointed Professor in Theology at the University of Copenhagen in 1790, and Bishop of Sealand in 1808. D. at Copenhagen, Apr. 9, 1830. He published the Coptic translation of the book of Daniel (1786), the statute-book of the Templars (1794), a manual on early Christian doctrinal history (1801–04), valuable works on the introduction of Christianity into Denmark (1823–32), and of the Reformation (1802), a very learned disquisition on the religion of the Carthaginians (1823), and a work describing the symbols and artistic representations employed by Christians in the first century (1825).—His father, Balthasar Münter (b. at Lubeck, Mar. 24, 1735; d. in Copenhagen, Oct. 5, 1793), was minister of the German congregation at Copenhagen, and wrote in German *A Faithful Narrative of the Conversion and Death of Count Struensee* (trans. into English by Rev. G. F. A. Wendeborn, London, 1773; 3d ed. 1826).

Revised by S. M. Jackson.

Muntjak: the Javanese name adopted as the common name of a few species of small deer found in Southern and Eastern Asia and some of the neighboring islands. They are characterized by the great length of the pedicels, or processes of the frontal bones, supporting the antlers. The pedicels are continued forward on the skull as prominent, converging ridges; the antlers, which are short, turn inward at the tip, and have but a single brow-prong. The little side hoofs so well developed in other deer are small, and represented by the lower portion only. These little deer stand only about 2 feet high at the shoulder. The most common species, *Cervulus aureus*, often called barking-deer, occurs in British India, Burma, Ceylon, Java, Sumatra, etc. *Cervulus reevesii* is found in China. F. A. L.

Muntz: See Brass.

Munychia, myu-nik'i-a (in Gr. *Μουνυχία*): the name of one of the harbors of Athens, and also of a hill lying between the harbors Zea and Munychia. On the hill there was a temple of Artemis Munychia, in whose honor a festival (also called *Munychia*), in commemoration of the battle of Salamis, was held. The hill was the scene of the battle between the patriots under Thrasybulus and the Thirty Tyrants (404 B. C.). In 322 B. C. the hill served as a fortress for the Macedonian garrison of occupation. J. R. S. S.

Mün'zer, Thomas: Reformer; b. at Stolberg, in the Harz Mountains, about 1490; studied at Leipzig, and became preacher at Zwickau, in Saxony, in 1520, and in 1523 at Allstedt, in Thuringia. At first he worked in unison with the Reformers, though his preaching was always strangely mixed up with mystical and fantastical ideas, but afterward he turned, according to his own "inner light," against the "halfness" of Luther and Melanchthon, and demanded a radical reform of Church and state, which led to uproar and confusion. He entertained peculiar ideas of infant baptism, similar to those of the Anabaptists, with whom, however, he had no direct connection. His most characteristic views were a belief in continuous divine revelation through dreams and visions, and in the community of property, and he promulgated them in speech and writings with a somewhat coarse but often impressive eloquence. Expelled from Allstedt by the Government, he went to Nuremberg, and next to Schaffhausen, but returned soon to Thuringia, and settled at Mühlhausen. Here he succeeded in overthrowing the city council and appointing another which was entirely under his control; and when in 1525 the Peasants' war broke out in Southern Germany, he instigated the whole population in and around Mühlhausen and Langensalza to rise in revolt. Murder and plunder ensued, but on May 15, 1525, the peasants were totally routed at Frankenhausen after a long battle. Münzer was taken prisoner, put to the torture, and beheaded at Mühlhausen a few days afterward. His *Life* was written by Melanchthon (Hagenau, 1525), G. T. Strobel (Nuremberg, 1795), J. C. Seidemann (Dresden and Leipzig, 1842), and Heinrich Leo (Berlin, 1856). Revised by S. M. Jackson.

Mur: a river of Austria. It rises in the Mureck Mountains in the district of Salzburg, enters into Styria, where it becomes navigable at Judenburg, and passes by Gratz, flows through Hungary into Croatia, and joins the Drave at Legrad, after a course of 230 miles. It receives about 100 affluents, among which are the Kainach, Lasznitz, Sulm, Pöls, and Mürz, but none is navigable.

Murad: the name of five Ottoman sultans. Murad I. Ghazi the Victorious (1360–89), b. in 1326; son of Sultan Orkhan Ghazi; captured Adrianople in 1360, and in 1365 made it the Ottoman capital; subdued a large part of Asia Minor; captured Thessalonica in 1386, and crushed Servia at the battle of Kossovo (1389), where he was slain. Tireless and able in war and council, pious, frugal, and just, he is one of the most illustrious Ottoman sovereigns.—Murad II. (1421–51), b. in 1403; son of Mohammed I.; conquered Phrygia and Karamania, subjected the Peloponnesus to tribute, and consolidated the empire; but he was unsuccessful at the siege of Constantinople (1422) and of Belgrade (1439), and could not conquer the Albanian Scanderbeg or the Hungarian Huniadi. He loved his people, encouraged learned men, and built many mosques and colleges. Though twice abdicating in favor of his son Mohammed, he was each time soon afterward forced by his subjects to reascend the throne.—Murad III. (1574–95), b. in 1546, was a son of Selim II.; had his five brothers bowstrung on the day of his accession. He conquered Georgia (1578), and carried on a successful war against Persia (1577–90). Though brave, he was avaricious, uxorious, sanguinary, and feeble-minded, and the empire declined under his reign. He had 129 children.—Murad IV. Ghazi (1623–40), b. in 1611; son of Achmet I.; captured Bagdad in 1638, reduced the Druses, cowed the janissaries, and introduced a few reforms. He possessed ability, but was violent, revengeful, and unjust, and injured rather than benefited the empire.—Murad V. (May 29–Aug. 31, 1876), b. in 1840, was a son of Sultan Abd-ul Medjid. On the dethronement of his uncle Abd-ul Aziz, he succeeded, according to Ottoman custom, as the eldest member of the dynasty. Well educated, affable, and kindly, his accession gave rise to high hopes, but excitement, caused by the violent death of Abd-ul Aziz and by the assassination of some of his own ministers, brought on insanity, and he was deposed. His brother Abd-ul Hamid II., present sultan (1897), reluctantly succeeded.

E. A. Grosvenor.

Muræ'na [= Lat. = Gr. *μύραινα*, a sea-eel]: the typical genus of the moray family of fishes (*Muræniдæ*). It includes the *Muræna helena*, the famous muræna of the ancients, a European salt-water eel. Its flesh is white and good, and it was artificially bred by the ancient Romans, who prized it extremely. Other species of *Muræna* occur in tropical America.

Muræ'nidæ [Mod. Lat., from *Muræna*, the typical genus]: a family of fishes of the order *Apodes*, typified by the celebrated Muræna (*q. v.*) of the ancients. The body is elongated, as in the common eel; the scales absent; the head moderate; the opercular bones generally rudimentary and in part wanting; the mouth with the cleft moderately developed, or very large and extending far backward laterally; the intermaxillaries are rudimentary; the teeth well developed; the branchial apertures developed externally as lateral holes; the dorsal and anal fins variable, sometimes being well developed and sometimes nearly absent; the pectoral fins also either present or absent. The skull exhibits a number of well-marked characters, as shown by Cope; the parietals are largely in contact; the ethmoid very wide; the symplectic, maxillary, pterygoid, basal, branchihyal, and superior and inferior pharyngeal bones all wanting, except the fourth superior pharyngeal; this is jaw-like, and supported by a strong superior branchihyal; other superior branchihyals wanting or cartilaginous. The color is formed by the articulation of the lighter hues inclosing darker interspaces, sometimes by blue cross-bands, sometimes by white ocelli, and sometimes the coloration is uniform. The species are very numerous, chiefly in the tropical seas. Most of these fishes are voracious and some even ferocious. They are known to English-speaking fishermen as morays, a word derived from *Muræna*. Revised by D. S. Jordan.

Mural Circle [*mural* is from Lat. *mura'lis*, deriv. of *mu'rus*, wall]: an astronomical instrument consisting of a large graduated circle, to which is attached a telescope moving only in the plane of the meridian, and supported on the perpendicular face of a wall. It was used for the determination of the declinations of the heavenly bodies, but is now superseded by the meridian circle, which has the advantage of allowing both right ascension and declination to be determined at the same time.

Murat, Fr. pron. mü'raa', Joachim: soldier; b. at La Bastide Fortunière, in the department of Lot, France, Mar. 25, 1771; the son of an innkeeper; was educated at Cahors and Toulouse, where he prepared himself for the Church. Dismissed from the seminary, he entered a regiment of chasseurs, and, cashiered in the regiment, lived for some time as waiter in a *café* in Paris. On the establishment of the constitutional guard of Louis XVI. he became a member of that body of troops, and was afterward transferred to a regiment of cavalry. He was aide-de-camp to Napoleon in 1795; accompanied him to Egypt in 1798; was made general of division in 1799; married in 1800 Caroline, a sister of the First Consul, and was made marshal of France, imperial prince, and grand admiral in 1804. In most of Napoleon's great battles, Austerlitz, Jena, Eylau, Friedland, he took a distinguished part, and the emperor loaded him with honors. In 1805 he was made Grand Duke of Berg, and in 1808 King of Naples under the name of Joachim I. Napoleon. Murat wished to govern his kingdom independently of France, but every attempt in this direction Napoleon frustrated with indignation. After the battle of Leipzig, Murat hastened to Italy and opened negotiations with Great Britain and Austria, which powers guaranteed him, by a treaty

on Jan. 11, 1814, the possession of his throne on the condition of his joining the allies against Napoleon. He marched against Prince Eugene, Viceroy of Italy, but when he heard that the Bourbons insisted violently at the Congress of Vienna on his expulsion, he stopped, and when Napoleon returned from Elba he at once declared war against Austria (Mar. 31, 1815). Defeated Apr. 12 at Ferrara, and May 2 at Tolentino, he fled to France, where, however, Napoleon refused to receive him. He lived in the vicinity of Toulon, but after the battle of Waterloo he was compelled to leave France. With a few adherents he made a fantastic attempt to invade Naples, but was caught near Pizzo, tried before a court martial, and shot Oct. 13, 1815.

Murato'ri, Ludovico Antonio: historian; b. at Vignola, in the duchy of Modena, Oct. 21, 1672; studied theology and history at the University of Modena; took holy orders; became keeper of the Ambrosian Library at Milan in 1694, and of the d'Este Library and the ducal archives at Modena in 1700, and died Jan. 23, 1750. His contributions to the history of Italy are very valuable: *Rerum Italicarum Scriptores* (25 vols., Milan, 1723–51); *Antiquitates Italicæ Medii Ævi* (6 vols., 1738–42); *Annali d'Italia* (12 vols., 1744–49).

Muravieff: name of a family eminent in Russian literary, military, and political history, prominent during the reign of Ivan III. (1462–1505), who granted them large tracts of land, and especially noteworthy in the eighteenth and nineteenth centuries. (1) Muravieff, Michael: poet and diplomat; b. 1757; tutor of the grandchildren of Catherine II., who made him a senator, state secretary, and curator of the University of Moscow. D. 1807. His scattered literary works were collected and published at St. Petersburg in 1820, the chief being *The Inhabitants of the Suburbs, Dialogues of the Dead*, and *Essay on Literature and Morals.* —(2) Muravieff, Nicolas: mathematician; published the first algebra in Russian (1752); made lieutenant-general and governor of Livonia by Catherine II.; d. 1770.—(3) Muravieff, Nicolas Nicolaïevitch: general; son of preceding; b. 1768; played a brilliant part in the Russo-French wars of 1812–15; then devoted himself to a school, afterward imperial, which he had founded for Russian staff officers and to development of national agriculture. D. 1840. He left five sons, all of whom became distinguished.—(4) Muravieff, Alexander: general; oldest son of preceding; b. 1792; d. 1864; took part in conspiracy of 1825, on account of which he was exiled to Siberia, but was pardoned for his father's sake and recalled; served with distinction in the Crimean war; was appointed governor of Nijni Novgorod in 1856.—(5) Muravieff Karski, Nicolas: general; son of (3); b. 1793; fought in Russian campaigns of 1812–15; chief of staff during war with Persia (1827); general in Russo-Turkish war (1828–29); commanded the right wing at the capture of Warsaw (1831); commanded the army of assistance which disembarked in the Bosphorus (1833); was disgraced in 1838, but during the Crimean war commanded the army of the Caucasus and captured Kars (1855), for which exploit he received the title *Karski* and was made a prince. Though he fought in over fifty pitched battles he was never wounded. D. 1856.—(6) Muravieff, Michael: general and mathematician; son of (3); b. 1796; fought in campaigns of 1812–15; governor of Grodno (1830), where he crushed insubordination with severity; vigorously opposed emancipation of the serfs; put down the students' rebellion (1861) and the Polish insurrection (1863); was president of the Russian Geographical Society, and did much for Russian agriculture. D. 1866.—(7) Muravieff Amurski, Nicolas Nicolaïevitch: general; son of (3); b. 1810; served in the Caucasus; governor-general of Eastern Siberia (1847), and conquered the territory on the Amur for Russia (1858), whence he gained the title of *Amurski*; negotiated a treaty with Japan very favorable to Russian interests. D. 1881.—(8) Muravieff, Andrew: traveler and author (1798–1874); son of (3); a versatile and very popular writer; composed many works in German and Russian on history, religion, and his travels. The chief are *Pilgrimage to the Russian Holy Places* (1832); *Dante*, a drama (1841); *History of the First Four Centuries of Christianity* (1842); *History of Jerusalem* (1844); *History of the Russian Church* (1845); *Souvenirs of Rome* (1846); *Description of Georgia and Armenia* (1848); *Souvenirs of the East* (1851); *Impressions of the Ukraine and Sebastopol* (1859).—(9) Muravieff-Apostol, Ivan: author; b. 1769; ambassador to Saxony and Spain; versed in ancient and modern languages; translated many works into Russian. D. 1851. His best-known original production is archæological, *A Journey in the Crimea.* His three sons took part in the insurrection of 1825; the eldest, Sergius Ivanovitch Muravieff-Apostol, the chief of the conspiracy, was hanged; the second died of his wounds; and the third was exiled for twenty years to Siberia.

E. A. Grosvenor.

Murchison, Sir Roderick Impey, K. C. B., F. R. S., D. C. L., LL. D.: geologist; b. at Tarradale, Ross, Scotland, Feb. 19, 1792; studied at the military college, Marlow, and the University of Edinburgh; was an officer in the army 1807–15, serving in the Peninsula and Sicily; was the associate of Davy; became in 1825 a fellow of the Geological Society, and in 1826 F. R. S.; aided Sedgwick and Lyell in British and continental geological studies; was one of the founders of the Royal Geographical Society, and often its president; traveled extensively in Russia, Scandinavia, etc.; was knighted 1846, made K. C. B. 1863, baronet 1866; became in 1855 director-general of the geological survey of the United Kingdom. D. in London, Oct. 22, 1871. Among his leading works are the *Silurian System* (1839), enlarged to *Siluria* (1854), *Geology of Russia and the Ural* (1845), and *Geological Atlas of Europe* (1856). He was the recipient of numerous honors and distinctions, British and foreign. See *Memoir of Sir Roderick Murchison*, by Archibald Geikie (2 vols., London, 1874).

Mur'cia: province of Spain, part of the old province of the same name, which in 1833 was divided into the present provinces of Murcia and Albacete. Area, 4,478 sq. miles. The surface is mountainous, forming elevated plateaus and large, deep valleys. Where water is abundant the soil is exceedingly fertile, producing wine, oil, silk, hemp, and all kinds of fruits, but in places where water is deficient the country is nearly a desert. Mineral springs abound; copper, lead, iron, and salt are found. Pop. (1887) 491,436. Capital, Murcia.

Murcia: capital of the province of Murcia, Spain; on the left bank of the Segura; 50 miles N. by W. of Cartagena (see map of Spain, ref. 18–H). It is irregularly built, but its streets are clean and its houses substantial, often elegant. Its cathedral has a high tower, from the top of which there is a magnificent view of the surrounding valley, the *huérta*, the river which waters it, and the lofty mountains which inclose it. Murcia has good educational institutions, manufactures of silk, linen, mats, cordage, saltpeter, powder, glass, and musical instruments, and an extensive trade in the products of its fertile *huérta.* Pop. (1887) 98,538.

Murder [M. Eng. *morder, morther* < O. Eng. *morðor*, deriv. of *morð*, murder: Germ. *mord*, Goth. *maúrþr*; cf. Sanskr. *mṛta*, death; Gr. *βροτός* (for *μροτός*), mortal: Lat. *mors, mortis*, death]: the unlawful killing of a person with malice aforethought; or, as defined by Lord Coke, the unlawful killing by a person of sound mind and discretion of any reasonable creature in being and under the king's peace, with malice aforethought, either express or implied. This crime is punishable, almost without exception, in all countries with the death penalty; and when committed on one's self involved at the common law the forfeiture of the decedent's goods and chattels and ignominy to the dead body. (See Capital Punishment and Suicide.) By examining the separate elements of the latter definition, it will appear that to constitute the crime of murder the act of *killing* must have been by a person of sound memory and discretion—that is, by a person who is neither insane nor of such an age as to be incapable, either absolutely or by legal presumption, of the intent which is necessary to the commission of the crime. (See Insanity and Infant.) The killing must also be unlawful—that is, neither excusable nor justifiable. See Homicide.

The *person killed* must be a reasonable creature in being —that is, a living person fully born. At the common law, therefore, the killing of an unborn child was not murder, although if the child were fully born alive and then died from the effects of acts committed upon it before birth, this constituted murder. (See Infanticide and Abortion.) It was also a rule of the common law, which is still valid, that the death of the person must occur within a year and a day of the time of the wrongful act or injury which is the alleged cause of death, the day upon which the act is committed being included in the reckoning.

The expression "under the king's peace," or, as it is commonly expressed in the U. S., "under the peace of the State," excludes from being regarded as murder the killing of an

alien enemy engaged in actual hostilities: but the killing of an alien enemy otherwise constitutes murder.

The word malice in law has not only its ordinary signification of a mischievous or wicked intention, but also an artificial one denoting the malicious or wicked intention which by fiction of law is presumed to exist when a person does a wrongful act without just cause or excuse. (See MALICE.) *Malice aforethought*, as used in the above definition, is a phrase of rather indefinite meaning, which comes down from the old statutes of mayhem and those distinguishing murder from MANSLAUGHTER (*q. v.*). It is the same in meaning as the phrase "malice prepensed," which also occurs in the older books, in one of which it is said that "He that doeth a cruel act voluntarily doeth it of malice prepensed." The word aforethought has no great significance in the meaning of the phrase, and in the language of many opinions of judges and other law writings the phrase seems to be little distinguished from malice alone; but in the better usage malice aforethought implies a greater degree of wickedness or malevolence than malice alone.

The distinction between *express* and *implied* malice is an artificial one (malice in all cases being implied from the circumstances), and refers to the methods of proving its existence as a fact in any given case. Malice is said to be express in those cases in which the wrongful intention is inferred as an ordinary deduction of fact—that is, through processes of reasoning unaided by any legal presumptions from the evidence which is given for the very purpose of establishing its existence, such as lying in wait, former threats, old grudges, studied preparations, etc. Where the wrongful intention is inferred as a legal presumption and not as an actual fact, as where the law conclusively presumes malice from the existence of certain other facts, it is called implied malice. Thus malice is implied as a conclusive presumption of law from the killing of a person by one engaged in the commission of a felony. Whether malice is presumed from the mere fact of killing alone is disputed; but the better opinion is that it will not be presumed without some circumstance connected with the killing which raises a presumption of malice, although a killing could hardly be proved without showing circumstances which would raise or rebut such a presumption. The point therefore seldom or never has any bearing upon the real facts of any actual case, but it is nevertheless frequently raised by counsel and incorporated in the charge of the judge to the jury. In addition to those cases where there is a preconceived design to kill the very person whose life was taken and where the act was not excusable or justifiable, which are plainly murder, the malicious intent is presumed where a person is engaged in the willful commission of an act which shows him to be an enemy to mankind in general, as if he should deliberately fire a loaded gun into a crowd, although he might not design to take the life of any particular individual; also when engaged in the commission of, or the attempt to commit, a felony, or in the willful commission of an act dangerous and adapted to kill, or in the willful neglect of a legal duty of a nature adapted to kill, or in any other unlawful act of a similar nature.

It was a general doctrine of the common law that if the killing was done under great and immediate provocation, upon the spur of the moment, while the passions were inflamed, the crime was reduced to manslaughter; but no matter how great the antecedent provocation, after an interval had elapsed sufficient for the passions to cool and the reason to return, the homicide would then be murder.

Statutory Changes.—It will be seen from the foregoing that the common law included under the head of murder, and punished with the same penalty, many acts of a different degree of moral culpability. Thus a person committing an act which was intended to produce great bodily harm, but distinctly not intended to kill, was punished the same as a person who deliberately took life. Statutory changes, however, have aimed to remedy this vice of the common law, and have divided murder into two or, in some cases, three classes, leaving unchanged the common-law distinction between murder and manslaughter. The particulars of the statutes are various, and the language employed differs in the different States; but in general they class under the head of murder in the first degree those cases where there is a specific intent to kill; where the killing is done in the commission of arson, burglary, robbery, or rape; in many of the States, where it is committed by poison or by lying in wait; and in some States (as in New York) when committed "by an act imminently dangerous to others, and evincing a depraved mind, regardless of human life, although without any premeditated design to effect the death of any individual." There is no U. S. statute dividing murder into degrees, and consequently the Federal courts make no distinction, but follow the common law. See Wharton's *Law of Homicide*; Bishop's *New Commentaries on the Criminal Law*.

F. STURGES ALLEN.

Mure, Col. WILLIAM: classical scholar; b. at Caldwell, Ayrshire, Scotland, July 9, 1799; was educated at Westminster School and at the University of Edinburgh, and subsequently studied several years in Germany. He wrote articles for *The Edinburgh Review* upon the literature of modern languages, which were characterized as brilliant by Moore and Jeffrey; published *Brief Remarks on the Chronology of the Egyptian Dynasties* (1829); *A Dissertation upon the Calendar of the Zodiac of Ancient Egypt* (1832); traveled in Greece and the Ionian islands in 1838, publishing the *Journal* of his tour in 1842; and after many years of research issued his *Critical History of the Language and Literature of Ancient Greece* (5 vols., 1850–57), which was never finished, but of which the several portions upon the epic and lyric poets and the historians may be regarded as separate works. He also edited *The Caldwell Papers* (3 vols.) for the Maitland Club. Col. Mure was an able literary critic, best known as a strenuous defender of the unity of the *Iliad* and *Odyssey*, and the identity of their authorship in the person of Homer. He sat in Parliament for Renfrewshire 1846–55, and was lord rector of the University of Glasgow 1847–48. D. in London, Apr. 1, 1860.

Revised by BENJ. IDE WHEELER.

Muret, mü′rā′, MARC ANTOINE, de, often called MURETUS: humanist; b. at Muret, near Limoges, France, Apr. 12, 1526. He was an ardent and precocious student of classical letters, and taught with success at Poitiers, Bordeaux, Paris, and Toulouse. At the age of eighteen he wrote in Latin the school tragedy *Julius Cæsar*; he was connected with the French men of letters of the Pléiade, and furnished a commentary for Ronsard's *Amours de Cassandre* (in the 2d ed., 1553). Charges pressed against him by enemies drove him from France to Italy, where he studied law at Venice and Padua, and gained great reputation by his lectures in Rome, where he received employment in the service of Cardinal d'Este. He was ordained priest in 1576. D. in Rome, June 4, 1585. Besides his writings in Latin, *Orationes*, *Observationum juris liber singularis*, etc., he prepared editions of many Latin writers, and his *Variæ Lectiones* are still valuable, but he was especially famous for his Latin style. Editions of his works appeared at Verona (5 vols., 1723–30), Leyden (4 vols., 1789), Leipzig (3 vols., 1834–41). On his *Life*, see vol. iv., pp. 518–582, in Ruhnken's edition of his works, and the monograph of C. Dejob, *M. A. Muretus* (Paris, 1881), and Mark Pattison's essays, i., pp. 124–132.

A. G. CANFIELD.

Mu′rex [Mod. Lat., from Lat. *mu′rex*, the purple-fish, driv. of *mūs*, sea-mussel, like Gr. *μύαξ*, purple-fish from *μῦς*, mussel]: name of a large genus of gasteropod mollusks of the family *Muricidæ*. There are some 180 living species, and nearly as many fossil ones, found in the Eocene and later deposits. The living species are worldwide in distribution. *M. brandaris*, *trunculus*, and others furnished a part of the Tyrian purple dye of the ancients. The animals are all predatory; many of the shells assume singular forms. One of the most remarkable is the thorny woodcock or Venus's comb of collectors (*M. tribulus*), from the Spice islands. *M. regius* of the Pacific coast of tropical America is splendidly colored. See MURICIDÆ.

Murex′ide [from Lat. *mu′rex*, the purple-fish, purple], or **Purpurate** [from Lat. *pur′pura*, purple] **of Ammo′nium**: a substance formed by the action of ammonia on alloxantin, and by other reactions. It crystallizes in four-sided prisms, which are garnet-colored by transmitted and rich gold-green by reflected light. In water it forms a splendid purple solution. With mercuric salts it produces fine red and purple colors on silk, wool, cotton, and leather, and with zinc salts orange and yellow colors. These colors are very bright and resist the action of light; they are, however, very sensitive to sulphurous acid, which rapidly discolors them, so that they can not be used in cities where coal-gas is employed. At one time murexide, made from the uric acid of guano, was extensively used for dyeing and calico-printing. It was driven out by the aniline colors. See DYESTUFFS. See *Report on Murexide Dyeing*, by E. Kopp (*Rep. Chim. app.*, i., 79), and Hofmann's *Report* (1862,

p. 118); also *Jahresbericht* (1857, 649; 1858, 671; 1859, 752), and Wagner's *Jahresb.* for the same years.

Revised by Ira Remsen.

Murfree, Mary Noailles: novelist; b. near Murfreesboro, Tenn., about 1850. Her short stories and novels, written under the pseudonym *Charles Egbert Craddock*, are impressive and highly dramatic studies of life among the Tennessee Mountains. They include *In the Tennessee Mountains* (1884); *The Prophet of the Great Smoky Mountains* (1885); *The Despot of Broomsedge Cove* (1888); *In the Stranger People's Country* (1891); *His Vanished Star* (1894). H. A. B.

Murfreesboro: city (founded about 1800, State capital in 1817–27); capital of Rutherford co., Tenn. (for location of county, see map of Tennessee, ref. 6–F); near Stone river, on the Nash., Chat. and St. L. Railway; 32 miles S. E. of Nashville, 119 miles N. W. of Chattanooga. It is in an agricultural, cotton, and fruit-growing region, and has an historical value from the fact that engagements occurred here between the Union forces under Gen. Rosecrans and the Confederates under Gen. Bragg, on Dec. 31, 1862, and Jan. 2, 1863, the actions forming what is known as the battle of Murfreesboro or Stone river. The city is the seat of Soule Female College (Baptist, founded 1841), and has 6 churches, a national soldiers' cemetery, 2 national banks with combined capital of $175,000, and 3 weekly newspapers. Pop. (1880) 3,800; (1890) 3,739; (1900) 3,999. Editor of "Free Press."

Murfreesboro, Battle of: one of the most fiercely contested battles of the civil war in the U. S.; fought Dec. 31, 1862, and Jan. 2, 1863, between the Union forces under Gen. Rosecrans and the Confederates under Gen. Bragg. It is also known as the battle of Stone River.

Gen. Rosecrans moving out from Nashville Dec. 26, 1862, forced back Bragg's outposts, and on the 29th found his army in position about 2 miles in front of Murfreesboro, Tenn., facing nearly N. W., its right under Breckinridge resting on Stone river, its center under Polk and its left under Hardee. Rosecrans drew up his army in front of the Confederates, McCook on the right, Thomas in the center, and Crittenden on the left, resting on Stone river. The left of each army extended beyond the right of the other. The plans of battle adopted by Rosecrans and Bragg were nearly identical.

In the morning of Dec. 31 each advanced his left wing with a view to turning and driving in the enemy's right. Hardee being but a short distance from McCook, his attack made at daylight struck first, and being pushed with great vigor the Union right was slowly rolled back, until at the close of the first day Rosecrans's army was concentrated, its right and center along the Nashville Pike on a short line nearly at right angles to its original position, and its left curved back and resting on Stone river. No serious fighting occurred on Jan. 1. The lines were rectified and Rosecrans extended his left, placing one division under Col. Beatty on the east bank of the river in a position to enfilade a part of Bragg's line, making it necessary for Bragg to dislodge this division or abandon his line.

On Jan. 2 Breckinridge, by Bragg's order, assaulted Beatty's division, and by the force of his attack at first forced it back. The Union left in falling back, however, exposed the Confederates to a crushing artillery fire, by which they were stopped, and a vigorous countercharge drove them back to their original position.

No further attacks were made, and on the night of Jan. 3 Bragg withdrew to the Elk river. The Union force engaged was 43,400 men; its losses, 1,730 killed, 7,802 wounded, and 3,717 missing; total, 13,249, or 31 per cent. The Confederate force was 37,800; its losses, 1,294 killed, 7,945 wounded, and 1,027 missing; total, 10,266, or 28 per cent.

James Mercur.

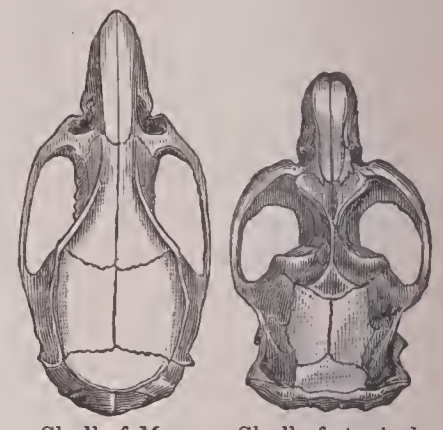
Murger, mür′zhā′, Henri: novelist; b. in Paris, Mar. 24, 1822; the son of a concierge and tailor. At the age of fifteen he was put into a notary's office, but found it uncongenial. The following year he became secretary to Count Leo Tolstoï. This position gave him independence and leisure to devote himself to writing. Little is known about his career during the next ten years. Probably he was leading the irregular and dissipated life of that artistic and literary Bohemia which he described so vividly in his best-known work, *Scènes de la vie de Bohème* (1848), of which he himself is thought to be the hero. In it the life of the Latin Quarter, with its mixture of gayety and wretchedness, youthful spirits and corruption, is reproduced with a realism that is relieved by touches of poetic feeling. Murger made himself the special painter of this life, and it furnished him most of the materials for his other novels, none of which equals the *Vie de Bohème*. D. in an asylum for the insane near Paris, Jan. 28, 1861. Among his other works are *Claude et Marianne* (1851); *Scènes de la vie de jeunesse* (1851); *Le dernier rendez-vous* (1852); *Le pays latin* (1852); *Adeline Protat* (1853); *Les buveurs d'eau* (1854). His poems were collected in one volume, *Les Nuits d'Hiver*.

A. G. Canfield.

Muriatic Acid: See Hydrochloric Acid.

Muric′idæ, or **Muric′inæ** [Mod. Lat., named from *Murex*, the typical genus]: a family of gasteropod molluscs, order *Rhachiglossa*, occurring mostly in the warmer seas. The shell has an anterior canal, and is ornamented by two or more series of thickenings (varices). The genera and species are numerous. One species is said to have been the source of the celebrated Tyrian purple. All the species are carnivorous. J. S. K.

Mu′ridæ [Mod. Lat., named from *Mus*, the typical genus = Lat. *mus*, *mu′ris*, mouse. See Mouse]: a large family of the rodent order and simplicidentate sub-order. The skull is well developed; the infraorbital foramen large, generally pyriform and contracted into a slit below (which is typically bounded externally by a plate of bone arising from the supramaxillary), and with a portion for the masseter muscle as well as for the infraorbital nerve; the lower jaw with the coronoid and condyloid processes in nearly the same vertical plane with each other and with the descending ramus, the last more or less twisted; molar teeth generally $\frac{3}{3}$ (rarely $\frac{4}{3}$ or $\frac{2}{2}$) $\times 2$; the hind legs are but moderately developed, and the animals normally progress by a running gait approaching to leaping; the tibia and fibula are united below; the metatarsal bones separate from each other; a cæcum is present. This family is by far the most extensive of the order, and contains more than 500 species, representing about fifty genera, which have been distributed among six sub-families—viz., *Murinæ*, to which the *Spalacinæ* and *Georhychinæ* are adjuncts, and *Arvicolinæ*, with which the *Siphneinæ* and *Ellobiinæ* are nearly connected. See Lemming, Mouse, Muskrat, and Rat. Revised by F. A. Lucas.



Skull of *Mus tectorum*. Skull of *Arvicola xanthognathus*.

Murillo. moo-reel′yō, Bartolomé Esteban: painter; b. at Seville, Spain, in 1613. The first instruction he received was from his cousin, Giovanni del Castillo. In order to earn his living he painted church banners and pictures for exportation to South America, and acquired great rapidity and facility of execution. After studying under Van Dyck and Pedro de Moya he visited Madrid, where his talent was recognized by Velasquez, who got him work at the Escurial, thus procuring him the means of remaining in that city, where he made numerous copies from Titian, Rubens, and Van Dyck. On his return to Seville in 1645 his work created a great sensation. He painted some large pictures for the convent of St. Francis, in which he showed himself to be a remarkable colorist; after these he painted *The Death of Santa Clara*, and *San Giovanni Giving Alms*. His fortune was made at last, and he had innumerable commissions. His most perfect works were produced at the age of thirty-five, and acquired for him the reputation of being the foremost of Spanish colorists. Among these are *St. Leander and St. Isidore*, and *St. Anthony of Padua*; also the pictures to adorn the Church of Santa Maria la Blanca, which are now in Paris. In 1667 and 1668 he directed the works in the cathedral, and painted an *Immaculate Conception* in one of its cupolas. The epoch of Murillo's greatest success was from 1670 to 1680, when, besides other works, he produced for the Capuchin church in Seville twenty-three pictures, which were sent to South America later. In 1687 he went to Cadiz to paint in the Capuchin church an altarpiece, *The Marriage of St. Catherine*, and while occupied on this picture he fell from the scaffolding. He returned to Seville,

but died from the effects of the injury Apr. 3, 1682. See Minor, *Murillo* (London, 1882), and Curtis, *Velasquez* and *Murillo* (1883). W. J. Stillman.

Murner, Thomas: clergyman and satirist; b., according to tradition, at Strassburg, Dec. 24, 1475; was educated in the school of the Franciscans, and ordained in 1494; studied theology at Paris and law at Freiburg in 1499. In 1506 he was made poet laureate by the Emperor Maximilian; taught logic at Cracow; became doctor of divinity, and led a roaming life, preaching in many cities and drawing large crowds by his witty sermons. Being an opponent of Luther, he was invited to come to England by Henry VIII., but he soon returned to Strassburg, where, in the meantime, the Reformation had been introduced. He fled to Switzerland and preached for a time at Lucerne, but was forced to flee again, and went to Heidelberg. Finally he received a small parish at Oberehenheim, Alsace, where he died about 1536. Murner was the greatest satirist of the sixteenth century, far more original and witty than Sebastian Brant, whom he followed in his earlier productions. His principal works are *Der Schelmen Zunft* (1512); *Die Narrenbeschwörung* (1512); and *Die Geuchmat* (1519), in which he mercilessly and with great power of language ridicules the follies of his contemporaries. Though he did not spare the clergy with his attacks, he was nevertheless opposed to the Reformation as an unjustified innovation of the individual Luther. He answered the numerous libels which, on this account, were heaped upon him by the Lutherans in the best and most stinging of his satires, *Von dem grossen lutherischen Narren* (1522). The hatred of his religious opponents has followed Murner up to modern times, blackening and defaming his character, and not until recently has history begun to do justice to this extraordinary man. See Lappenberg, *Murners Ulenspiegel* (1854); K. Goedeke, *Murners Narrenbeschwörung* (1879); G. Balke in Kürschner's *Deutsche Nationalliteratur* (vol. xvii.); Kawerau, *Thomas Murner und die Kirche des Mittlelalters* (1890); M. Spanier in Paul and Braune's *Beiträgen* (xviii., 1–72). Julius Goebel.

Murphy, James Gracey, LL. D., D. D.: clergyman and author; b. in the parish of Comber, County Down, Ireland, Jan. 12, 1808; was educated in the Royal Academical Institution at Belfast and Trinity College, Dublin, where he spent three years as sizar and three as scholar; was minister at Ballyshannon 1836–41; classical head master in the Belfast Academical Institution 1841–47; Professor of Hebrew in the Assembly's Theological College at Belfast from 1847 till he retired at his own request in 1888. He has published *A Latin Grammar* (London, 1847); *A Hebrew Grammar* (1857); *Nineteen Impossibilities in Colenso's Pentateuch* (Belfast, 1863); *The Human Mind* (Belfast, 1873); *Commentaries on Genesis* (Edinburgh, 1864; Andover, 1866); *Exodus* (Edinburgh, 1866; Andover, 1868); *Leviticus* (Andover, 1872); *Psalms* (Edinburgh, 1875); *Revelation* (London, 1882); *Chronicles* (Edinburgh); *Daniel* (London, 1884); and *Sacrifice in Scripture* (London, 1889).
C. K. Hoyt.

Murphy, John Francis: landscape-painter; b. at Oswego, N. Y., in 1853; was elected member of the Society of American Artists in 1883; National Academician 1887; member of the American Water-color Society; was awarded the Webb prize at the Society of American Artists in 1887; second Hallgarten prize, National Academy, 1885. His pictures are notable for harmonious color schemes. Studio in New York. W. A. C.

Murphysboro: city; capital of Jackson co., Ill. (for location of county, see map of Illinois, ref. 10–D); on the Big Muddy river, and the Chi. and Tex., the Mobile and O., and the St. L., Alton and Terre H. railways; 6 miles W. of Carbondale, 90 miles S. E. of St. Louis. It is in an agricultural and coal-mining region; contains 8 churches, 2 public-school buildings with 23 departments, including a high school, 2 national banks with combined capital of $100,000, and 2 daily and 2 weekly newspapers; and has manufactories of flour, lumber, fire-brick, ice, mineral waters, and cigars. Pop. (1880) 2,196; (1890) 3,880; (1900) 6,463.
Editor of "Era."

Murray, Alexander, D. D.: Semitic scholar; b. at Dunkitterick, Kirkcudbrightshire, Scotland, Oct. 22, 1775, the son of a shepherd. He displayed from childhood extraordinary proficiency in the acquisition of languages, and was enabled to enter the University of Edinburgh at the age of nineteen. He took orders in the Church of Scotland, and after serving in several parishes was elected in 1812 Professor of Oriental Literature at the University of Edinburgh. His knowledge of Semitic languages procured from the widow of James Bruce a commission to classify the extensive collection of manuscripts formed by that traveler, and also to bring out a second thoroughly revised and annotated edition of Bruce's *Travels in Abyssinia*, which appeared in 1807 (7 vols.), accompanied by a *Life* of the author. In 1812 he published *Outlines of Oriental Philology, comprehending the Grammatical Principles of the Hebrew, Syriac, Chaldee, Arabic, and Abyssinian Languages*, a manual intended for the use of his students. D. at Edinburgh, Apr. 15, 1813. He left in MS. a *History of the European Languages, or Researches into the Affinities of the Teutonic, Greek, Celtic, Sclavonic, and Indian Nations*, published at Edinburgh in 1823 (2 vols).

Murray, David, Ph. D., LL. D.: educator; b. at Delhi, N. Y., Oct. 15, 1829; graduated at Union College in 1852; was successively a professor and principal of the Albany Academy from 1853 to 1863, and from 1863 to 1873 Professor of Mathematics and Physics in Rutgers College. In 1873 he entered the service of the Japanese Government as foreign adviser to the department of education. He is the author of a *Manual of Land Surveying* (New York, 1872), a contributor to Mori's *Education in Japan* (New York, 1872), and the editor of an *Outline History of Japanese Education* (New York, 1876) and *The Story of Japan* (New York, 1894). He returned from Japan in 1878, became secretary of the board of regents of the University of the State of New York, and resigned in 1888.

Murray, George Henry: See the Appendix.

Murray, Sir Herbert H.: See the Appendix.

Murray, Hugh: geographer; b. at North Berwick, Scotland, in 1779; became at an early age a clerk in the excise office at Edinburgh, and devoted his leisure to literature, especially to geography. He edited *The Scots' Magazine*, contributed to *The Edinburgh Gazetteer* and the *Transactions* of the learned societies, and wrote for the Edinburgh Cabinet Library seven volumes of *History of Discoveries and Travels*—namely, *Africa* (2 vols., 1817), *Asia* (3 vols., 1820), and *North America* (2 vols., 1829): and ten volumes of descriptive geography—namely, *British India* (3 vols.), *China* (3 vols.), *United States of America* (3 vols.), and *Marco Polo's Travels* (1 vol., 1839). His principal work was the *Encyclopædia of Geography* (1834). D. in London, Mar. 4, 1846.

Murray, James A. H., LL. D.: lexicographer; b. at Denholm, Roxburghshire, Scotland, in 1837; taught school for some time in Hawick; was foreign correspondent in the Oriental Bank, London; graduated at London University, and while senior assistant master of Mill Hill School became in 1879 president of the Philological Society and editor of the *New English Dictionary* (see Dictionary); the presidency he again held in 1880. He is thoroughly familiar with most European and many Oriental languages, and became widely known as a philologist through his *Dialect of the Southern Counties of Scotland* (in *Trans. Lond. Philol. Soc. 1870–72*, London, 1873). For the Early English Text Society he edited the minor poems of Sir David Lyndesay (1871); *The Complaynt of Scotlande* (1872); and *The Romance and Prophecies of Thomas of Erceldoune* (1875). In 1884 he was honored with an annual civil-list pension of £270.

Murray, James Clarke: philosophical writer; b. in Paisley, Scotland, Mar. 19, 1836; was educated at Glasgow and Edinburgh Universities, and spent some time at Göttingen and Heidelberg. In 1862 he was appointed Professor of Mental and Moral Philosophy in Queen's University, Kingston, Canada, and since 1872 he has held the same chair in McGill University. He has published *An Outline of Sir William Hamilton's Philosophy* (Boston, 1870); *The Ballads and Songs of Scotland* (London, 1874); *Memoir of David Murray* (Paisley, 1881); *Handbook of Psychology* (London, 1885); *An Introduction to Ethics* (Boston, 1891).
Neil Macdonald.

Murray, or **Moray**, James Stuart, Earl of, known in Scotch history as the "good regent": b. about 1533; was a natural son of James V. by Lady Margaret Erskine, who afterward married Sir Robert Douglas of Lochleven; was made by his father commendator of the priory of St. Andrews in 1538, and subsequently acquired the priory of Pittenweem and that of Maçon in France, with a dispensa-

tion to hold three benefices, and took in 1544 an oath of fealty to Pope Paul III. In 1547 he accompanied his half-sister Mary (afterward Queen of Scots) to France, and in the following year repelled a descent of Lord Clinton upon the island of St. Monan, on the coast of Fifeshire. In 1556 he joined the Scottish Reformers, and soon assumed the political leadership of the Protestant party. He was one of the Scottish commissioners to witness Mary's marriage to the Dauphin of France (1558); was appointed member of the council for civil affairs Dec., 1559, and one of the lords of the articles June, 1560; was sent as envoy to France Apr., 1561, to invite Mary to return to Scotland as queen, and on her arrival in August became her prime minister and chief adviser, protecting the Protestants in the enjoyment of their religious privileges, while he insisted upon the queen's right to worship according to her Catholic antecedents. In Feb., 1562, he was created Earl of Mar, and soon afterward married Lady Agnes Keith, daughter of the earl marischal, but in the same year resigned the title of Mar in favor of his uncle, Lord Erskine, who claimed it by right, and received in its stead the earldom of Murray; defeated the rebel Earl of Huntly at Corrichie, and governed Scotland with prudence, though incurring the displeasure of Knox and the extreme Protestants by his studied neutrality in the religious conflict then beginning. In 1565 he took up arms to prevent Mary's marriage with Darnley, but was defeated and escaped into England. He was recalled in 1566, and arrived at Edinburgh the day after the assassination of Rizzio, to which he was supposed to have been accessory, as also to the murder of Darnley in the following year, though his complicity in the latter crime is much less certain. He left Edinburgh the day before that event, and proceeded to France, also visiting Queen Elizabeth in England; returned to Scotland and induced Mary to abdicate July 22. He was proclaimed regent Aug. 22; defeated his sister's forces at Langside May 13, 1568, and firmly established his authority; at the trial of Mary at York for the murder of Darnley, gave his testimony against her, and produced as evidence the famous "casket letters," the authenticity of which has ever since been warmly debated. Murray ruled with skill and success until he was assassinated in the streets of Linlithgow by James Hamilton of Bothwellhaugh, Jan. 21, 1570.

Murray, John: publisher; b. in London, Nov. 27, 1778; son of a Scotchman named John McMurray (b. in Edinburgh, 1745; d. in London, Nov. 16, 1793), who founded a prosperous bookselling shop in London. Succeeding at the age of fifteen to his father's business, young Murray ultimately became the friend and liberal patron of a famous circle of literary men, most of whose works he published. Among them were Byron, Moore, Campbell, Crabbe, Irving, and Gifford, the latter of whom edited for many years Murray's *Quarterly Review*, founded in 1809 as a Tory organ in opposition to *The Edinburgh Review*. In 1812 Murray removed his business from Fleet Street to Albemarle Street, where it still remains. D. in London, June 27, 1843.—His son, bearing the same name, b. in 1808, and educated at the University of Edinburgh, edited a series entitled the *Home and Colonial Library*, personally superintended the preparation of the well-known *Murray's Handbooks of Travel*, and brought out, among others, the works of Hallam, Grote, Milman, Layard, Wilkinson, Rawlinson, William Smith, Lyell, Murchison, Livingstone, and Darwin. In 1869 he established *The Academy*, a scholarly literary and critical weekly paper. Revised by H. A. Beers.

Murray, John: naturalist; b. in Coburg, Ontario, 1849, of Scotch ancestry. His early education was received at Coburg, and at sixteen he was sent to the University of Edinburgh, where he took honors in natural and physical sciences, doing much of his work in the physical laboratory under Prof. Tait. In 1867 he began the marine investigations with which his name is so intimately connected. In that year he went on an expedition to Spitzbergen and Greenland, and in 1872 was appointed one of the naturalists of the Challenger Expedition (*q. v.*). On the return of the expedition he was appointed by the British Government as first assistant under Sir Wyville Thomson on the staff to prepare the final report on the scientific results of the expedition. On the death of Thomson he became director of the staff, and under his editorship fifty fully illustrated volumes have been issued. Of these he prepared the volume of the summary of results, and was joint author of the volumes on deep-sea deposits and the narrative of the cruise. In 1880–82 he had charge of the scientific work on the deep-sea expeditions of the Knight Errant and Triton in the North Atlantic. He is the author of numerous scientific papers, largely upon physical geography and oceanography, and is a member of numerous learned societies. He received the degrees of LL. D. from Edinburgh, D. Sc. from Cambridge, and Ph. D. from Jena. He resides at present in Edinburgh. J. S. Kingsley.

Murray, Lindley: grammarian; b. in Swatara, near Lancaster, Pa., Apr. 22, 1745; removed in 1753 to New York with his father, a Quaker merchant; was admitted to the bar in 1776; became a successful merchant of New York, and in 1784 retired from business; settled in Holdgate, near York, England, and devoted himself to literary pursuits; best known by his *English Grammar* (1795), which was for many years regarded as the best authority on the subject, and had a prodigious currency, particularly in Great Britain; published also an *English Reader*, a spelling-book, and other educational works, an *Autobiography*, and some religious works. D. in Holdgate, Feb. 16, 1826.

Murray, William: See Mansfield, Earl of.

Murray, William H. H.: See the Appendix.

Murray, William Vans: lawyer and statesman; b. in Maryland in 1762; received a classical education; went to London after the peace of 1783, and studied law in the Temple for three years; was elected a member of the Maryland Legislature on his return, and sat in Congress 1791–97; took a very prominent part in the early legislation of the U. S., and had few superiors in erudition, eloquence, wit, judgment, or skill in debate. He was appointed by Washington minister to the Netherlands in 1797, and became envoy to France in 1799, where the convention signed at Paris Sept. 30, 1800, which put an end to the serious difficulties between the U. S. and France, was mainly his work. He returned to his post at The Hague, where he remained until Dec., 1801. D. at Cambridge, Md., Dec. 11, 1803. He was the author of a treatise on *The Constitutions and Laws of the United States.*

Murray Bay [named from Gen. Murray, governor of Quebec in 1759], or **Malbaie**: a watering-place on the north shore of the St. Lawrence, in Charlevoix County, Province of Quebec; about 90 miles E. of city of Quebec (see map of Quebec Province, ref. 3–F). The bay on which the village is built is the estuary of the Murray river, which drains the region of a thousand lakelets. The scenery around the village is very picturesque, with frowning hills behind and beetling cliffs in front. Though the water of the bay continues cold during the greater part of the summer, the sea-bathing is one of the attractions of the place. The population of the parish is 3,500. There are two churches, and the river affords very good motive-power for a number of saw-mills. The place is reached from Quebec by steamer. J. M. Harper.

Murray River: the principal river of Australia; rises on the western slope of the Australian Alps, and falls into Encounter Bay in lat. 35° 26′ S., after a tortuous course of 1,200 miles. Its mouth is too shallow to be entered by large vessels, but the lower portion is navigable. The chief tributaries are the Murrumbidgee and the Darling, both on the N. The latter is longer than the entire Murray, but it is a desert river with little water, except after severe local storms. The entire basin of the Murray (including the Darling) is about 240,000 sq. miles.

Murree: a town and sanitarium of the Punjaub; 30 miles N. E. of Rawal Pindi; on the upper slopes of Murree Mountain; from 6,200 to 6,500 feet above sea-level (see map of N. India, ref. 3–C). It is in summer the seat of the government, and is connected with Rawal Pindi by a good wagon road. The temperature ranges from 17° F. to 99° F., but the place is cool even during the summer, averaging about 65° F. It has several large hotels, a school for the education of the children of European soldiers, and a brass-foundry, and is the center of a large business. Pop. 2,500; in summer, 12,000 to 14,000. M. W. H.

Murshedabad′: town of British India, in Bengal; on the Bhagirathi river (see map of N. India, ref. 7–I). It was formerly the capital of Bengal, and is a large and straggling town, extending along the river for a distance of nearly 8 miles. With exception of the palace and some mosques, it is meanly built, its houses being mostly mud huts. It is situated on the main road between Calcutta and the Northwest Provinces, and has an important trade. Pop. (1881) 39,231. Revised by C. C. Adams.

Musæ'us (in Gr. Μυσαῖος): 1. A singer, seer, and priest who flourished in the times before Homer. He was a pupil or son of Orpheus (*q. v.*), and introduced hymns and other sacred poetry into Attica. His poems were collected by Onomacritus, who forged many of them. 2. A grammarian who imitated Nonnus (*q. v.*), and wrote an epic poem on the story of Hero and Leander, edited by Passow (Leipzig, 1810) and by Dilthey (Bonn, 1874). See also Schwabe, *De Musæo Nonni imitatore* (Tübingen, 1876). 3. An epic poet of Ephesus, lived in Alexandrian times, and wrote a *Perseïs* and poems in honor of Eumenes and Attalus. See Düntzer, *Fragmente der epischen Poesie* (Cologne, 1840).

J. R. S. Sterrett.

Musä'us, Johann Karl August: author; b. at Jena, Mar. 29, 1735; studied divinity; became in 1763 governor of the court pages at Weimar, and in 1770 became a professor in the gymnasium. D. at Weimar, Oct. 28, 1787. He is remembered as the author of *Volksmärchen der Deutschen* (1782), a collection of pleasing tales, for a long time very popular. He wrote also *Grandison der Zweite* (1760); *Physiognomische Reisen* (1778–89), against Lavater; *Freund Heins Erscheinungen* (1785); and *Straussfedern* (1787–97), which show the influence of Wieland. See *Life* by Müller (1867).

Revised by Julius Goebel.

Musca: See Fly.

Muscadine [from Fr. *muscadin*, musk-lozenge; from Late Lat. *mus'cus*, musk, whence Eng. *musk*]: name applied to a species of grape (*Vitis rotundifolia*), indigenous to the southern parts of the U. S. It is also popularly called bullace or bullitt grape, and fox-grape. The white scuppernong grape, which is one of its varieties, is much esteemed.

Mus'cæ Volitan'tes [Lat., liter., flitting flies]: a name given to the black, or more rarely very bright, floating objects which sometimes seem to appear before the eyes. If fixed and permanent black spots appear, moving with one or both of the eyes, there is reason to suspect organic disease of the eye, and an expert oculist should be consulted. If the spots fall or swarm upward, it is believed that they are caused by small and unimportant opacities floating in the humors of the eyes.

Muscat, or **Mascat**: an imamate in Arabia with indefinite boundaries; one of the eight divisions of Oman, lying S. W. of the Gulf of Oman and included between 22° and 27° N. lat. and 53° and 58° E. lon. This has been its general outline since 1856. It comprises also a narrow strip of land along the shores of Laristan and Moghestan. The coast-line, sometimes low, presents generally a succession of high precipitous rocks. Between and behind these cliffs, as well as far inland, are frequent patches of land which artificial irrigation renders marvelously fertile. Cotton, rice, maize, coffee, and tropical fruits of every sort are produced in abundance. There are no rivers but many springs. The climate is exceedingly unhealthful for Europeans, a dry, burning heat continuing for long periods night and day. The imam is the merchant-in-chief, practically controlling all the business relations of his subjects, which he regulates in accordance with his own interests. No reliable estimate of the population or extent of the imamate has ever been made.

E. A. Grosvenor.

Muscat, or **Maskat**: capital of Oman, an independent state of Southeastern Arabia; in a fertile plain in lat. 23° 38′ N., lon. 58° 40′ E., surrounded by gardens and plantations of date-palms, on the border of an inlet of the ocean which forms a spacious and safe harbor (see map of Persia and Arabia, ref. 7–J). The city is fortified, but rather poorly built. Its inhabitants consist of Arabs, Hindus, Negroes, and Jews, and carry on a very important trade in coffee, pearls, salt fish, dyestuffs, and other Persian and Arabian goods. The population is variously given at from 20,000 to 60,000. See Muscat in the Appendix.

Muscatine: city (settled under the name of Bloomington in 1836, incorporated as a city in 1853); capital of Muscatine co., Ia. (for location of county, see map of Iowa, ref. 6–K); on the great bend of the Mississippi river, and the Cin., Rock Is. and Pac., and the Burl., Cedar Rap. and N. railways; 30 miles W. of Davenport, 203 miles W. of Chicago. It contains 17 churches, 9 public-school buildings, 2 commercial colleges, several parochial schools, Commercial Club building, Young Men's Christian Association building, a national bank with capital of $50,000, a savings-bank with capital of $60,000, 2 private banks, and 2 daily and 5 weekly newspapers. The manufactories include large sawmills, sash, door, and blind factories, iron-rolling mill, oat-meal mill, large box-factory, plumbing-supply factory, woven-wire picket-fence factory, brick and tile works, iron-foundries, marble-works, cigar-factories, pearl-button works, machine-shops, potteries, carriage, wagon, and harness factories, and large pickling-works. The natural slope of the ground affords excellent drainage, the streets are lighted by gas and electricity, the river is here crossed by a wagon bridge, and the city has electric railways. Pop. (1880) 8,295; (1890) 11,454; (1900) 14,073.

Manager of "Journal."

Musch'elkalk [= Germ.; *muschel*, shell + *kalk*, lime]: in Germany, a great limestone, belonging in the middle of the Triassic period, and resting, typically, upon the Bunter sandstone, and covered by the Keuper or red marl beds. It is named for its abundant fossils, and supplies lime, marl, rock-salt, gypsum, and building-stone.

Musci: plural of *Muscus*, a class of plants. See Mosswort.

Muscle [O. Eng. *muscle*, from Lat. *mus'culus*, muscle, mussel, liter., dimin. of *mus*, mouse, which some muscles resemble in form]: the tissue through the direct agency of which the various movements of animals are effected. Very early in embryonic life a part of the great mesodermic layer differentiates into elongated elements distinguished by the possession of contractility in limited and definite directions; these elements form the muscular tissue, whose minute structure is described in detail in Histology (*q. v.*). In man and the higher animals muscular tissue is separated into two varieties, *voluntary* and *involuntary*, according to its control by the will or independence of action: the voluntary muscle constitutes the great masses of sarcous substance or "flesh" of animals by which the various movements are carried out at will; the involuntary muscle, on the contrary, forms the walls of the hollow organs, as the stomach, intestines, blood-vessels, etc., whose contractions are beyond the control of volition. The number of individual contracting bands or "muscles" increases with the subdivision of labor and the specialization of action in the higher types, in man over two hundred distinct muscles being recognized. The close association of these organs with the skeleton separates them into the corresponding groups of the muscles of the *axis* and those of the *extremities*, many of the latter group passing from the more fixed points of the axial skeleton to the upper parts of the freely moving limbs. The more rigid point of attachment of a muscle is spoken of as its *origin* in contrast to its *insertion* or attachment to the part moved; in many cases, however, the position of greatest fixation varies from time to time with the particular action to be secured. Muscular tissue is attached to other parts by means of dense white fibrous tissue, usually in the form of *tendons* or of aponeurotic expansions; in early life the tendons are relatively small and exceedingly pliant, as evinced by the greater suppleness and agility of youth as contrasted with the increasing rigidity of age due to the invasion of the muscular tissue by the encroaching tendinous structures. See Histology.

G. A. Piersol.

Muscle-reading, or so-called **Mind-reading**: the apparent detection of the thoughts of another from simple muscular contact with him. This phenomenon, under the phrase mind-reading, has given rise to much mystification of audiences and many extravagant claims to powers of clairvoyance, etc. It has now been shown by a number of well-planned experiments that it is impossible to think intently of directions, figures, etc., without making very slight muscular movements, or twitchings, or tensions in the direction or around the figures thought of. The muscular system reflects in a very remarkable way the course of thought through all its concrete imagery. It is therefore possible that certain persons, of delicacy of touch and with training, should be able by simple contact to interpret these slight movements of the hand-muscles of another, and so to seem to divine his thoughts directly. The most interesting experiments, apart from those on hypnotic subjects, were reported by Prof. Joseph Jastrow. (See articles on *Involuntary Movements*, *Popular Science Monthly*, Apr., Sept., 1892.) The performances of many well-known operators can probably be explained in this way—i. e. Cumberland, Bishop, Randall Brown, etc. On the claims to mind-reading in which the influence of muscular movement is not so evident, see Telepathy.

J. Mark Baldwin.

Muscle-sense: the sense which reports feelings of the activity of the muscles of the body as concerned in movement. It is in its development the earliest of the senses. As to the existence of such a class of sensations as seen in lifting, pushing, straining, and in the weariness that follows muscular exertion, there is no doubt. Beaunis finds that a singer retains control over the vocal chords after their sensitiveness to touch has been destroyed by cocaine. Clinical cases show the same for the limbs. This indicates that the skin is not the exclusive organ of muscular sensations. Further than this the muscular sensations have characteristics peculiar to themselves.

First, there seems to be a consciousness of the state of the motor apparatus as a whole, as capable or incapable of the movement in question. It is felt in the system as a disposition or indisposition for action. Considered as a state of readiness or the contrary, it may be called feeling of *motor potential.* It seems to be plain in the different consciousness we have of the power of the right and left arms respectively.

Fatigue is another general sensation classed here. It takes on a peculiar character according as the fatiguing movement is voluntary or mechanical; at least voluntary movement is more fatiguing than mechanical movements. No doubt in the case of voluntary movement more nervous energy is employed; and it seems equally clear that in the case of voluntary movement the higher nervous centers are more taxed. Mosso and Waller have shown that there is both nervous and muscular fatigue. Simple intellectual work exhausts the muscles as well as the brain.

Combined with touch, the muscular sense affords us knowledge of extension and force, and contributes important elements to our consciousness of self and the world. Sensations of contact, repeated on successive portions of the skin or by the same portion on different parts of the object, present data for the projection of a flat surface. It is by pressure added to these sensations that we come to apprehend depth. It is sufficient to remark this here. Spencer, speaking of the sensation of resistance as involving that of effort, says: "This sensation is at the bottom of our conception of the material universe, for extension is (as apprehended) only a combination of resistances; movement is the generalization of a certain order of resistances; and resistance is also the substance of force." For the general bearings of the muscular consciousness and its place in psychological theory, see PSYCHOLOGY and WILL.

Kinæsthetic sensations are sensations arising directly from the movements or positions of the members of the body as reported by the afferent or sensor nerves. See SENSATIONS.

Besides the particular and more or less clearly localized feelings (such as those due to passage through the air, stretching of the skin, etc.), there seems to be a sense of whereness or *massive locality* of the limb, as a whole, in reference to the body.

Kinæsthetic Sensations as Immediate or Remote.—The sensations of movement heretofore described have their stimuli in the organ itself which makes the movement. Such feelings are *immediate.* On the contrary, such movements may themselves serve to stimulate one or other of the special senses, giving a new class of sensations which report the movement. Such movement reporting sensations from other senses are *remote* kinæsthetic. For example, when I move my arm with my eyes shut and in the presence of noises which prevent my hearing the rustle of my clothing, etc., my sensations of movement are immediate. I now open my eyes and see the arm move and listen attentively and hear it; the optical and auditory sensations now added to my consciousness are remote kinæsthetic feelings. It is important to note that our feelings of movement are perhaps never free from these contributions from remote sources. They almost always enter in a complete statement of the case. See James, *Principles of Psychology* (New York, 1890, pp. 488 ff., vol. ii.).

The nervous arrangement which underlies this confluence of immediate and remote sensations is an illustration of the dynamic unity of the brain as a whole. The activity of one center stimulates the other directly, and both discharge into the motor course with which one is immediately and the other remotely connected, as is clearly illustrated by cases in which patients are unable to move their limbs as long as their eyes are closed, but can do so when they see their limbs. This means that the direct channel into the limb center is blocked, but the indirect channel through the visual center is still open. (See INNERVATION.) On the other hand, instead of re-enforcing a discharge, a remote sensation or memory may inhibit it altogether, as where our sense of the great distance of a desired object obtained through the eyes leads us to give up altogether the effort to reach it.

Furthermore, what is true of sensations in general as regards their possible reproduction or memory is true of these states of the sensibility. From the nervous point of view, any form of stimulus which excites the kinæsthetic center or centers may bring up images of movement, and may, through these images, serve to start a brain process which issues in a series of real movements. What we may call the motor or stimulus value of these sensations is accordingly preserved in a weaker degree in the motor or stimulus value of their memories, both immediate and remote. For literary references, see PSYCHOLOGY. J. MARK BALDWIN.

Muscogees: See MUSKHOGEAN INDIANS.

Mus'covite [named from *Muscovy*, the ancient name of Russia]: the most common species of mica, otherwise known as common or potash mica. Muscovite occurs crystallized in hexagonal prisms, belonging to the orthorhombic system; also in scales and plates, which are sometimes aggregated into stellate and plumose groups. It is remarkable for its eminent cleavage parallel to the base of the prism, the thin folia being separated easily by the thumb-nail. Its hardness on the cleavage planes is from 2 to 2·5, and its specific gravity from 2·75 to 3·1; its luster varies from pearly to metallic, and its color from white to gray, pale green, greenish yellow, and brown. It is remarkably elastic. In composition muscovite is a silicate of alumina, potash, and iron (silica, 43 to 50 per cent.; alumina, 31 to 39 per cent.; potash, 5 to 12 per cent.; ferric oxide, 1 to 8 per cent.). The name muscovite (or, as it was formerly called, Muscovy glass) is in allusion to its use in Russia as a substitute for glass in windows. In the U. S. it is largely used, under the misnomer of "isinglass," for the same purpose in stoves. It is one of the more abundant minerals, occurring in plutonic and metamorphic rocks, and also in broken flakes in many unaltered sandstones and clays, which are hence described as "micaceous." See MICAS.

Muscovy Duck: a South American duck (*Cairina moschata*) about 2 feet in length, and, in its wild state, of a black color with blue and green reflections. The species has been extensively domesticated, and its name is a perversion of musk-duck, applied to the bird on account of its peculiar odor. F. A. L.

Muses [plur. of *Muse*, viâ Fr. from Lat. *Mu'sa* = Gr. Μοῦσα, Muse, usually in plur. Μοῦσαι, Muses]: in Greek mythology, the daughters of Zeus and Mnemosyne (Memory). They were fountain nymphs, who were worshiped in the groves and grottoes, and at the fountains of Olympus and Helicon, whose waters were thought to inspire song. From fountain nymphs they were exalted to the rank of goddesses of song, to whom poets prayed for inspiration. Later on they are the patrons of the different kinds of poetry and of the arts and sciences. So Calliope, she of the beautiful voice, is the muse of epic poetry; Clio, she who makes famous, the muse of history; Euterpe, she who makes glad, the muse of lyric poetry; Melpomene, she who sings, the muse of tragedy; Terpsichore, she who rejoices in the dance, the muse of the dance; Erato, the lovely one, the muse of erotic poetry; Polyhymnia, or Polymnia, the rich in hymns, the muse of sacred song; Urania, the heavenly one, the muse of astronomy; Thalia, the blooming one, the muse of comedy and idyllic poetry. In art Calliope is represented with a tablet and stilus in her hand, Clio with a scroll, Euterpe with a double flute, Melpomene with a tragic mask in her hand and a chaplet of ivy on her head, Terpsichore with a lyre and plectrum, Erato with a stringed instrument, Urania with a globe, and Thalia with a comic mask and shepherd's crook in her hands and a chaplet of ivy on her head. Polyhymnia has no distinguishing attributes, though she is easily recognized by her ample dress, and grave and thoughtful demeanor. Even after the Muses had become goddesses of song, it was not forgotten that they were originally fountain nymphs, and so their sanctuaries were situated at fountains. Fountains in which the Muses took especial delight were the Castalia, at the foot of Mt. Parnassus at Delphi, and the Aganippe and Hippocrene on Mt. Helicon. Epithets taken from the various seats of their cult were applied to them—e. g. Pierian, Castalian, and many others. Apollo was the leader of the Muses (*Musagetes*). By reason of their connection with dramatic poetry

they were especially near to Dionysus, whose nurses and companions they were. J. R. S. STERRETT.

Muse'um [= Lat. = Gr. Μουσεῖον, temple dedicated to the Muses, hence a place for study, literature, art, etc.; liter., neut. of μουσεῖος, pertaining to the Muses, deriv. of Μοῦσαι, Muses]: an institution for the preservation of works of art, antiquities, and objects of natural history, and for their utilization in research, and in the culture and enlightenment of the people. Originally, museums were places sacred to the Muses, such as the groves of Parnassus and Helicon; later, temples in various parts of Greece were known by this name; and still later the meaning of the word changed, and it was applied to a place of study or a school. Athenæus in the second century spoke of Athens as "the museum of Greece." The Museum of Alexandria, founded by the Ptolemys, B. C. 296, was a portion of the palace at Alexandria, which was set apart for the study of the sciences, and contained the great Alexandrian library; this was really a great university, the abiding-place of men of science and letters, who were divided into many companies or colleges, for the support of each of which a large revenue was allotted. After the burning of the Alexandrian Museum, the term museum, as applied to a great public institution, dropped out of use until the seventeenth century. The disappearance of the word is an indication of the fact that the idea for which it stood had also fallen into disfavor. It was not until the modern arts and sciences had been born, and a distinct literary and scientific class had been developed, that it was possible for the modern museum to come into existence, although there had always been collections of works of art and objects of natural history in many parts of the world.

The idea of a great national museum of science and art of the modern type was first outlined by Bacon in his *New Atlantis*, and the British Museum, founded in London in 1753, containing collections of books and manuscripts, as well as works of art and nature, was in some degree a realization of that plan. This institution is, at least to English-speaking people, the most important in the world bearing the name of museum, partly because of its magnificent library, and also from its unrivaled archæological collections—Egyptian, Assyrian, Oriental, Greek, Roman—prehistoric and mediæval; its coins, its manuscripts, and its prints. The equally important natural history departments were removed in 1883 from Bloomsbury, where the parent institution still stands, to new quarters near the Art Museum in South Kensington, and placed under the control of a director, who is practically independent of the executive officer of the British Museum, its principal librarian. In modern usage the museum is always separated from the library.

Museums may be classified in two ways—(1) by the character of their contents, or (2) by the object for which they were founded. Under the first head they may be grouped as follows: (1) Museums of art; (2) historical museums; (3) anthropological museums; (4) natural history museums; (5) technological museums; (6) commercial museums. Under the second category they may be classed as (1) national museums, these being often in groups rather than combined in one; (2) local, provincial, or city museums; (3) college museums; (4) professional or class museums. The museum of art is the depository for the most precious material products of man's creative genius—paintings, sculptures, architecture (so far as it can be shown by models, drawings, and structural fragments), and specimens of the illustrative arts, such as engravings, and illustrations of the application of decorative uses. Perhaps the oldest museum of art, and one which is still among the most important, is that founded by Cosmo de' Medici in Florence at the beginning of the sixteenth century. It is preserved in the Uffizi Gallery, and is connected by a bridge across the Arno with a similar collection, of more recent origin but under the same administration, known as the Pitti Gallery, which is especially rich in paintings of the Italian schools.

Every city in Italy has its art museum. The Vatican Gallery in Rome is one of the most celebrated, including most important collections in painting and antique sculpture, besides numerous other departments; while the Capitoline Museum and the Lateran Museum contain treasures of the greatest importance. The Museo Borbonico at Naples is rich in similar collections, and includes also most important archæological material from Herculaneum and Pompeii, from excavations of Etruscan cities and from Egypt. The Gallery of Bologna; the Academy of Fine Arts at Venice, with its works by Titian, Tintoretto, and Veronese; the Brera and the Ambrosian Galleries in Milan; the museums of Turin, Modena, Padua, Ferrara, Brescia, and Perugia are remarkable, as well as that at Parma, particularly rich in the works of Correggio; and the Academy of Fine Arts at Siena, devoted to the work of the early Tuscan artists.

The art museums of France are next in importance to those of Italy. The Louvre, founded in 1793, is one of the richest in the world as regards not only painting and sculpture, but all other subjects which fall within the limits of a museum of art, and is supplemented by the Luxembourg Museum, containing the masterpieces of living artists, the Museum of the School of Fine Arts, and the Musée des Thermes, or Cluny Museum, devoted to the decorative arts of the Middle Ages. Every considerable city in France has its own collections, those of Lyons, Dijon, Bordeaux, and Toulouse being among the most important.

In Germany, those of Berlin—the Old Museum and the New Museum—those at Munich—the Pinakothek and the Glyptothek—and that of the Zwinger in Dresden, the resting-place of the Sistine Madonna, are the richest, while those of Cologne, Frankfort-on-the-Main, Darmstadt, Ratisbon, Weimar, and Breslau also deserve special mention. In Austria-Hungary, the Belvidere Museum at Vienna is one of the highest rank; in Russia, the Hermitage Museum at St. Petersburg; in Spain, the Prado at Madrid; in Belgium, those of Antwerp and Brussels; and in Holland, those of Rotterdam and The Hague.

The National Gallery in London has an excellent collection of paintings of all schools. The South Kensington Museum, near London, is connected with the department of science and art, and is especially rich in material for instruction in all the arts of design; and there are collections in most of the cities of the United Kingdom.

In the U. S., the Museum of Fine Arts in Boston, the Metropolitan Museum of Art in New York, the Museum of Fine Arts in Cincinnati, the Corcoran Art Gallery in Washington, the Museum of Fine Arts in St. Louis, the Academy of Fine Arts in Philadelphia, the Art Institute of Chicago, and the Walters collection in Baltimore are the most important. The museums in the U. S., however, are far from rich in materials illustrating the earlier periods in the history of painting and sculpture.

The museums and galleries just enumerated should be regarded only as types. So many hundreds of important museums, public and private, exist, that it is impossible even to mention them by name. Besides these general collections, there are special museums devoted to the work of single masters, such as the Thorwaldsen Museum in Copenhagen, and the one at Brussels containing only the works of the eccentric painter Wiertz, the Donatello Museum in the Bargello at Florence, and the Michelangelo collections in its Academy of Fine Arts and in the Casa Buonarrotti.

Museums of history are intended to preserve objects associated with the events in the history of nations or races, or illustrating their condition at different periods in their national life. Every museum of art and every archæological museum is also a museum of history, by reason of its wealth of portraits of historical personages, pictures of historical events, and the delineations of customs, costumes, architecture, and race characteristics. Historical museums are manifold in character, and of necessity local in interest. Some relate to the histories of provinces and cities. One of the oldest and best of these is the Märkisch Provinzial Museum in Berlin. Conspicuous among these also are the Museum of the City of Paris in the Hôtel Carnavalet, and the museums of the cities of Brussels and Antwerp. Some historical museums relate to a dynasty, as the Museum of the Hohenzollerns in Berlin. The cathedrals of Southern Europe and St. Paul's in London are in some degree national or civic museums. There are special museums, either devoted to single men—like the Galileo and the Dante and Buonarrotti Museums in Florence, or the Goethe Museum in Weimar and the Beethoven Museum at Bonn; to the great men of the nation, as the National Portrait Gallery of Great Britain, the German Valhalla at Ratisbon, and so forth; or to great men of a special profession, such as the Gallery of Artists in the Pitti Museum of Florence, consisting of portraits of all the great artists of the world, painted by themselves. In this class would come also collections of autographs and manuscripts, like the Dyce-Forster collection at South Kensington, and collections of personal relics. Among historical museums should also be mentioned those representing the earliest history of a race or country, such as the

magnificent Musée Gallo-Romain at St.-Germain, near Paris, devoted to the history of France up to the end of the Roman occupation; the Romano-German Museum at Mentz, and the Etruscan Museums at Florence, Bologna, and elsewhere in Italy; the Ghizeh Museum near Cairo, Egypt (formerly the Boulak Museum); the museums at Constantinople, the Acropolis Museum at Athens, and many others. Such institutions as the Bavarian National Museum at Nuremberg and the National Museum in Munich have to do with the later periods of national history, and there are throughout Europe numerous collections of armor, furniture, costumes, and architectural and other objects, illustrating the life and arts of the Middle Ages and the later periods, which are even more significant from the standpoint of the historian than from that of the artist. Important among these is the Royal Irish Academy at Dublin.

Museums of anthropology and ethnology include such objects as illustrate the natural history of man, his classification into races and tribes, his geographical distribution, past and present; the origin, history, and methods of his arts, industries, customs, and languages, particularly among primitive and semi-civilized peoples. Museums of anthropology and history meet on common ground in the field of archæology. In practice, historic archæology is usually assigned to the latter and prehistoric archæology to the former, since prehistoric material may be studied to the best advantage by the use of the natural history methods which have been adopted by anthropologists, but not as yet by students of history. Ethnographic museums were proposed by the French geographer Jomard, and the idea was first carried into effect about 1840 in the establishment of the Danish Ethnographical Museum. In Germany the best are in Berlin, Dresden, Munich, and Leipzig. Austria has in Vienna two for ethnography, the Court and the Oriental Museums. Holland has the National Ethnographic Museum in Leyden, and smaller collections in Amsterdam, Rotterdam, and at The Hague. France has the Trocadéro; Italy the important prehistoric and ethnographic museums in Rome and Florence. The Philippine collections in the Museo de Ultramar in Madrid and the Hawaiian collections in the Bernice Pauahi Bishop Museum at Honolulu are important. In England less attention has been given to this subject than elsewhere in Europe, the Christy collection in the British Museum being the only important one specially devoted to ethnography, except the Blackmore Museum at Salisbury. In the U. S. the principal establishments arranged on the ethnographic plan are the Peabody Museum of Archæology in Cambridge, and the collections in the Peabody Academy of Sciences at Salem and the American Museum of Natural History in New York. The vast ethnological collections in the National Museum in Washington are classified on a double system, in one of its features corresponding to that of the European, in the other, like the famous Pitt Rivers collection at Oxford, arranged to show the evolution of culture and civilization without regard to race. This broader plan admits much material excluded by the advocates of ethnographic museums, who devote their attention almost exclusively to the primitive or non-European peoples.

In close relation to the ethnographic museums are those which are devoted to some special field of general thought and interest. Most remarkable among these is the Musée Guimet, founded in Lyons in 1878 and removed to Paris in 1886, which is intended to illustrate the history of religious ceremonials among all races of men, a field also occupied by one department of the National Museum in Washington. Other good examples of this class are some of those in Paris, such as the Musée de Marine, which shows not only the development of the naval and merchant marine of the country, but also, by trophies and other historical souvenirs, the history of the naval battles of the nation. The Musée d'Artillerie does for war, but less thoroughly, what the Marine Museum does in its own department, and there are similar museums in other countries. Of musical museums, perhaps the most important is the Musée Instrumental, founded by Clapisson, attached to the Conservatory of Music in Paris, that in Brussels, and that in the National Museum in Washington. There is a magnificent collection of musical instruments at South Kensington, but its contents are selected with reference to their suggestiveness in decorative art. There is a Theatrical Museum at the Académie Française in Paris, a Museum of Journalism at Antwerp, and Museums of Pedagogy in Paris and St. Petersburg. These are professional rather than scientific or educational, as are perhaps also the Museum of Practical Fish-culture at South Kensington and the Museums of Hygiene in London and Washington. The Psychological Museum founded by Mantegazza in Florence in 1886 is the only one of its kind.

The value of archæological collections, both historic and prehistoric, has long been understood. The museums of London, Paris, Berlin, Copenhagen, and Rome need no comment. In the Peabody Museum in Cambridge, the Metropolitan Museum in New York, and the National Museum in Washington are immense collections of the remains of man in America in the pre-Columbian period, collections which are yearly growing in significance as they are made the subject of investigation, and there is an immense amount of material of this kind in the hands of other institutions and of private collectors in the U. S.

Museums of natural history contain those objects which illustrate the phenomena of nature in animals, minerals, and plants, and whatever illustrates their origin, growth, functions, structure, and geographical distribution, in the present and in the past. Museums of natural history and anthropology meet on common ground in man. In practice the former usually illustrates the relations of man to other animals; the latter, man in his relations to other men. Every great nation has its museum of nature. Probably the natural history department of the British Museum is the most extensive, with its three great divisions—zoölogical, botanical, and geological. The Musée d'Histoire Naturelle, in the Garden of Plants in Paris, founded in 1795, with its galleries of anatomy, anthropology, zoölogy, botany, mineralogy, and geology, is one of the most extensive, but far less potent in science now than in the days of Cuvier. In Washington there is the National Museum, with its great anthropological, zoölogical, botanical, mineralogical, and geological collections, administered under one organization, together with a large additional department of arts and industries or technology. The American Museum of Natural History in New York, the Museum of the Academy of Natural Sciences in Philadelphia, the Boston Society of Natural History, the California Academy of Sciences, the Peabody Museum of Yale College, the E. M. Museum of Princeton University, the Museum of Archæology and Palæontology of the University of Pennsylvania, and the Milwaukee Public Museum are also important.

Passing to specialized natural history collections, perhaps the most noteworthy are those devoted to zoölogy, and chief among them is that at Harvard University, known as the Museum of Comparative Zoölogy, which was founded by Agassiz "to illustrate the history of creation as far as the present state of knowledge reveals that history," and was in 1887 pronounced by the English naturalist Alfred Russell Wallace "to be far in advance of similar institutions in Europe as an educational institution, whether as regards the general public, the private student, or the specialist." Next to Cambridge, after the zoölogical sections of the museums of London and Paris, stand the collections in the Imperial Cabinet in Vienna, and those of the zoölogical museums in Berlin, Leyden, Copenhagen, and Christiania, and the museums of Brussels, Florence, and La Plata, so rich in palæontological materials. The university museums at Oxford and Cambridge and the Liverpool museums are also noteworthy.

Among botanical museums, that in the Royal Gardens at Kew, near London, is pre-eminent, with its colossal herbarium containing the finest collection in the world, and its special museum of economic botany, founded in 1847, both standing in the midst of a collection of living plants. There is also in Berlin the Royal Botanical Museum, founded in 1818 as the Royal Herbarium; in St. Petersburg, the Herbaria of the Imperial Botanical Garden. The Natural Herbarium in Washington is the property of the Smithsonian Institute and of the Department of Agriculture.

Among the geological and mineralogical collections the mineral cabinet in Vienna, arranged in the imperial castle, is among the first. The Museum of Practical Geology in London, which is attached to the Geological Survey of the United Kingdom, was founded in 1837 to exhibit the collections of the survey, in order to show the applications of geology to the useful purposes of life. The department of economic geology in the Field Columbian Museum in Chicago, an outgrowth of the department of mines in the exhibition of 1893, is one of its most striking features.

Of museums of anatomy there are thirty of considerable magnitude, all of which have grown up in connection with schools of medicine and surgery, except the magnificent

Army Medical Museum in Washington. The Medical Museum of the Royal College of Surgeons in London is probably first in importance.

Museums of technology, or industrial museums, are devoted to the industrial arts and to manufactures, and exhibit (1) materials and their sources; (2) tools and machinery; (3) methods and processes; (4) products and results. In this group would be included museums of agriculture, as that of the U. S. Department of Agriculture in Washington; of mining, such as the Museum of Practical Geology in London, in part, and the Museum of the School of Mines in Paris; and of fisheries, such as the Museum of Practical Fish-culture in South Kensington, and the fisheries section of the National Museum in Washington, which formed so important a feature of the International Fisheries Exhibition in Berlin in 1880 and in London in 1883; museums of textiles, such as the museums of tapestries in Florence, that in the Escorial in Spain, and that at the Gobelin establishment near Paris; of the ceramic industries, such as the Sèvres Museum in Paris, and indeed such collections are usually included in museums of decorative art, one of which may be found in every great city; museums of transportation, by far the most important of which is the Railway Museum now (1894) being formed in connection with the Field Columbian Museum in Chicago, which has also important collections in other technological fields. A collection of waste products and undeveloped substances usually forms a part of the technological museums; and there are special museums of animal products, such as that at the Bethnal Green Museum in London, and of vegetable products, such as the Museum of Economic Botany at Kew, near London.

Commercial museums exhibit salable articles of all kinds, with illustrations of markets, means of commercial distribution, prices, and commercial demand and supply. One of the best of these is the Musée de Melle at Ghent. Commercial museums are especially useful in great centers of manufacture and trade, especially when coupled with an efficient service of foreign correspondents. Such museums may be properly connected with a technological museum, although its methods are likely to be more akin to the exhibition, exposition, or fair, involving a frequent renewal of exhibits in connection with commercial changes, and also certain features of competition and advertising display on the part of private exhibitors.

The principal types of museums have been referred to in connection with a classification based on their contents. It is therefore unnecessary to review them under the second form of classification proposed at the beginning of this article. It should be said, however, that every great national capital has a single museum, or a group of them, supported by the national government, and intimately connected with national educational enterprises.

In Italy, while there are national museums in Rome and Florence, the whole country is under the control of a Government commission charged with the preservation of the treasures of history and art. The treasures of every church and monastery are under public control, and many of these and other public edifices have been declared public monuments. The tract in which the Forum at Rome is situated has been constituted an outdoor museum, under the name of the Passagiata Archeologica.

In the U. S. the National Museum at Washington, established as a part of the Smithsonian Institute in 1846, is charged with the care of all the collections of the Government. There are also, however, the Army Medical Museum, the Naval Museum of Hygiene, and the Corcoran Gallery of Art, the latter under the control of a private corporation.

The modern museum is the latest of the great agencies which have been developed for the increase and diffusion of knowledge, and in this capacity it stands by the side of the university, the learned society, and the public library. The museum is even more closely in touch with the masses than the university or the learned society, and quite as much so as the public library, while, even more than the library, it is a recent outgrowth of modern tendency of thought. It is maintained by many that the degree of civilization to which any nation, city, or province, has attained is best shown by the character of its public museums and the liberality with which they are maintained. GEORGE BROWN GOODE.

Mushroom-poisoning: See TOXICOLOGY.

Mushrooms [(by folk-etymology from *mush* and *room*) from O. Fr. *mouscheron* > Fr. *mousseron*; cf. *mousse*, moss]: popular name of edible Fungi of the order *Hymenomyceteæ*, especially species of the genus *Agaricus*. (See FOOD.) In the U. S. the name toadstool is applied to nearly every kind of parasol-shaped mushroom, the common belief being that they are poisonous.

The common mushroom, *Agaricus campestris*, is a species of the *Agaricaceæ*, the first family of the *Hymenomyceteæ* (see FUNGUS), growing almost everywhere. It is the famous *champignon* of the French, *pratiola* of the Italians, and was known to the ancients by upward of a score of synonyms. The fleshy pileus is white in the young state, becoming of a yellowish brown when mature. It usually grows in clusters and never attains a great size. The ring is present and conspicuous. Though subject to many variations, it is easily recognized by its fleshy pileus, solid stipe, and pink-colored gills, often becoming purple with age. It is the most generally eaten of esculent fungi. This mushroom is used to a great extent as an article of food in France, and especially in Paris, around which it is largely cultivated; old deserted mining-caves have been appropriated for the purpose, and many miles of mushroom-beds are reached by the aid of ladders and lanterns. It is usually found in the wild state scattered over a rich meadow or pasture in early morning after a warm shower in the night. The mushroom is only one of over 1,000 well-defined species of the genus *Agaricus*, at least one-fourth of which are not only harmless, but well worthy the time and care of the market-gardener. Closely related to *A. campestris* is *A. arvensis*, popularly called "meadow-mushroom," from its place of growth. It is larger than *A. campestris*, stronger in flavor, and less esteemed. From its size and coarseness it has in England received the name of "horse-mushroom." Specimens are mentioned weighing 14 lb. The "nail fungus," *A. esculentus*, is the smallest species used for food. The pileus does not exceed an inch in diameter, and is flat and clay colored. It is found in fir woods, and is used largely in Vienna as a flavor for sauces under the name of *Nagelschwamm*. One of the most poisonous species of the genus is the "fly agaric," *A. muscarius*, so named because the fungus is often steeped and the solution used for the destruction of the house-fly. The pileus is raised upon a long stipe, reaching a diameter of 4 to 6 inches, having its bright red surface studded with large white protuberances. Very closely allied to the fly agaric is *A. cæsareus*, though not poisonous and very excellent for food. It can always be distinguished by its yellow gills, while *A. muscarius* has them of a pure dead white. The genus *Coprinus* differs from *Agaricus* mainly in the deliquescent character of the gills. *C. comatus* is the leading esculent species, and commands attention by its singular and graceful form. The whole surface is delicate and silky, the cap tinged with brown at the top and grayish at the base, soon becoming covered with scales. The gills are very close together, and pass in color from pink to brown. These plants should always be gathered before they begin to deliquesce. In the genus *Cortinarius* the veil is composed of arachnoid threads and the spores are rusty. The edible species are few in number. In *Hygrophorus* the main feature is the waxy character of the hymenium. There are three species of culinary importance, the best being the small pure white *H. virgineus*. It is common, and, like the brown *H. pratensis*, is found in open pastures. The members of the genus *Lactarius* are distinguished by the milky juice which exudes from them when bruised. *L. deliciosus* has the orange-colored pileus marked with zones of a darker color. The milk is at first yellow, soon turning green. This species deserves its name *deliciosus*, and is sought for and highly prized by all lovers of edible Fungi. *Russula emetica*, as its name would indicate, acts as an emetic to most persons, though a few can eat it with impunity. It may be distinguished by its rosy pileus, brittle gills, and white stipe dotted with red spots. The genus *Cantharallus* has thick branched gills, with edges blunt and roundish. *C. cibarius* is the beautiful little yellow chanterelle so highly esteemed by the French. It is easily distinguished by its bright golden-yellow color, and odor much resembling ripe apricots. In *Marasmius* the species are characterized by having a dry hymenium, folds thick and tough and acute at the edge. The species are generally quite small. *M. oreades*, from its peculiarity of growing in circles, and the early superstitious belief that these rings had some connection with elfs and goblins, has long been known as the "fairy-ring fungus." These rings are now known to be formed by the spreading out in all directions of a cluster of these

plants, the result of the exhaustion of the nourishment directly beneath. It is a very small and common species, and has gained a good reputation among mushroom-eaters as furnishing a delicate dish.

In the second family of the *Hymenomyceteæ*, *Polyporaceæ*, the gills of the *Agaricaceæ* are replaced by *pores* or tubes. The genus *Boletus* has the pores easily separated, and furnishes a number of esculent species, of which *B. edulis* is the most important. The pileus is smooth and brown, with the tubes at first yellow, becoming green by age. The reticulation of the stem is one of the leading characteristics of the species. It is an inhabitant of the woods. Some prefer to this the *B. æstivalis*, which is an early summer species. *B. luridus* is sometimes eaten without harm, but should not rank among esculent species. It has a pileus 3 to 6 inches broad, and varying in color from a brick-red to brown. The flesh is at first yellow, changing to blue. In the genus *Polyporus* the pores are not easily separated, and many of them are without stems. A few species are of worth as articles of diet. *P. giganteus* and *P. intybaceous* are of very large size, a single specimen sometimes weighing 40 lb. They both, like many other species of the genus, grow upon the trunks of trees. In gathering them for food it is best to select the younger specimens, and use only the inner portion. *P. fomentarius* is touch-wood or "punk," and grows to a great extent on the trunks of dead and decaying trees. The property of its being luminous in the dark has long been known. Amadou or German tinder is a commercial product from this and several other species of *Polyporus*. It consists of slices of the plant beaten out in thin strips and saturated with a solution of nitrate of potash. It is used as a rapid and easy means of starting a fire. The last genus of *Polyporaceæ* is *Fistulina*, characterized by having the hymenium inferior and a papillated surface when young, which changes into tubes bearing the spores. *F. hepatica*, so named from its resemblance to the liver, is fleshy and juicy, and very appropriately bears the common name of beefsteak fungus. It assumes a great variety of forms, from that of a strawberry to that of a tongue. When cut it resembles a beet-root. It grows upon trunks of trees throughout the summer, and is eagerly sought for.

The third family of the *Hymenomyceteæ* is termed *Hydnaceæ*, in which the leading characteristic is the numerous projecting spines or teeth, over the surface of which the hymenium is spread. The most common edible species is *Hydnum repandum*, found in woods and shady places. The pileus is fleshy, regular, and red, lobed, or undulated, spines pale-yellow, stem 2 inches long. When raw it has a peppery taste and the odor of horseradish. Less common, *H. coralloides* in its young state much resembles a cauliflower, because of its peculiar branching. It is a tree-inhabiting plant, and is esculent. *H. caput-medusæ*, as its name would suggest, has the branching top of the one just mentioned. Among others used for food are *H. subsquamosum* and *H. rufescens*. The members of the family *Clavariaceæ* are easily recognized by being club-shaped, fleshy, and branching. Among these are found a number of edible species. The most beautiful colored species is *Clavaria amethystina*. It is of a fine violet color, and is seldom found in large quantities. Dr. Curtis enumerates thirteen species of *Clavaria* eaten in Carolina, but they are generally little known. In the family *Tremellaceæ*, or the gelatinous Fungi, only one species has received much attention as an article of food—viz., the curious "Jew's ear," *Hirneola auricula-judæ*. It gets its name from its strong resemblance to the human ear. This species is collected in large quantities in Tahiti and shipped in a dried state to China, where it is used for soap.

There are no simple rules that may be taken as infallible guides for distinguishing esculent from poisonous species. The following rules are only of a general character, having some exceptions: (1) *Avoid bright colors* (this would throw out the highly prized chanterelle of the French and several other species); (2) *avoid those that change color when cut or broken*; (3) *avoid those with a milky juice* (*Lactarius deliciosus* has a milky juice, and is still delicious); (4) those that *deliquesce should be avoided*—the *Coprinus comatus* is a grand exception to this rule. The safest of all rules is, never to use a fungus about which there is any doubt; this will require a thorough acquaintance with at least a few of the edible species, which will take no more time than to become familiar with the same number of shrubs or trees. Care should also be exercised to gather only the fresh plants, and they should not be allowed to remain a long time before being eaten. Climate and the seasons seem to exert an influence over fungi as regards their edible qualities. A much larger per cent. of the spring species are edible than those of autumn.

Most fungi require for their best development a moist atmosphere, with the exclusion of bright sunlight. The common and most successful method of cultivating the mushroom and edible toadstools is to mix fresh horsedung with loam in such proportions as to prevent too violent fermentation, when it is put in long narrow beds of a foot or 18 inches in height in the center, into which the mycelium or spawn is placed, and the whole coated over with a layer of loam. These beds are usually protected from the light and drying influences of the sun by low sheds, having the roofs thatched to prevent too rapid evaporation of moisture. A covering of hay or straw is often placed directly upon the beds.

William G. Farlow.
Revised by Charles E. Bessey.

Music [viâ O. Fr. from Lat. *mu'sica* = Gr. *μουσική* (sc. *τέχνη*), any art over which the Muses presided, especially lyric poetry set to music, lit. fem. of *μουσικός*, pertaining to the Muses, deriv. of *Μοῦσαι*, Muses]: a succession of combination of sounds arranged with such connection and mutual relation as to express to the ear some distinct form or train of thought, and awaken certain corresponding emotions. Sounds when thus regulated affect the mind through the *ear*, as painting and sculpture under similar conditions affect it through the *eye*. The latter, however, deal with tangible objects, or with ideas formed from material types and their attributes, while the agency of music is limited to certain relations existing between sounds, variously ordered and combined, and the inward springs of emotion. In all time past, and even among the rudest tribes and nations, we find traces of effort to make both the eye and the ear subservient to the stirring up of pleasurable or other feelings. (See Ethnology.) To some such impulse it is most natural to refer not only the production of the rough drawings, chiselings, and carvings often found among tribes and nations of barbarians, but also the varied and persevering attempts of the same untutored races to find gratification for the ear amid the din and clang of their imperfect musical instruments. The results in both cases could not be otherwise than strange in their conception and often marvelous in their ugliness. From this state of primitive rudeness the progress of the finer arts to higher stages of cultivation was not equally rapid. All historical records, and the still existing monuments and relics of antiquity, bear evidence that architecture, painting, and sculpture gradually rose to perfection, while music still remained a subject of dark and confused speculation. For long ages, and even through the most brilliant periods of ancient civilization and intellectual splendor, it was the fate of music to be an enigma defying all solution; and we read of no master-minds springing up to reveal its long-hidden beauties or to discover and systematize its real principles till near the close of the Middle Ages. The music of the present day, both as a science and an art, is therefore a growth of the last three or four centuries; and (with a rapidity equaled only by the rise and advance of Gothic architecture) it has already reached so high a stage of development as seemingly to leave little room for further discovery, either in its scientific or practical and mechanical departments.

In the present article it is purposed to give in a simple manner a general view or outline of the musical system as now ordinarily understood and received; and as it is presumed that the reader already possesses some elementary knowledge of music, it will be the less necessary to enter into details on Notation, Scale, Mode, and other preliminary matters, concerning which full information will be found under their respective heads in the present work.

Sounds may conveniently be regarded as either musical or unmusical. This distinction is irrespective of their several qualities as loud or soft, harsh or smooth, etc.; for certain sounds which are essentially musical may nevertheless be painful to the ear, while, on the contrary, others which are strictly *un*musical may have no such unpleasant effect. The radical peculiarity or mark of a musical sound is that it possesses a definite *pitch* (or intelligible grade of acuteness), arising from the number, equality, and permanence of the vibrations given forth by the body from which the sound proceeds. The pitch (i. e. the degree of acuteness or gravity) of any such sound is dependent on the rapidity of the vibrations excited by the sonorous body. It is estimated that a string or the column of air in a pipe giving the sound represented by C C C C will make 32 vibrations in a second of time; for the octave above—viz., C C C—the vibrations will be 64, or double the original number; for C C the vibrations are quadrupled in rapidity, being 128 in a second; and so on for the still higher octaves. These various octave sounds differ from each other only in their relative acuteness, just as the letters A, a, a differ only in point of size. The intermediate sounds passed over in rising from one C to another have also their proportionate rates of vibration; and when theoretically considered such intermediate sounds may be almost infinite in number; but for practical purposes the system of music is founded on a select number of these possible musical sounds, forming a scale or series; and it is found, both by experiment and by a certain demand of the human ear, that the degrees or intervals thus selected must follow each other in a certain order, number, and inequality of distance to fit them for musical use. These intervals, counting upward from a root or starting-point, are known as the second, third, fourth, fifth, sixth, and seventh, and they are commonly ascertained by dividing a sounding-string into one-half, one-third, one-fourth, etc., of its length, thus gaining all the sounds necessary for the filling up of the octave. (In the article Monochord this process is described.) The notes or sounds thus obtained are named after the first seven letters of the alphabet, the letters being repeated for each successive octave. In Ex. 1 an octave of this scale (called the *diatonic* scale) is represented according to the order in which the large and small intervals stand to each other:

Ex. 1.

1	2	3	4	5	6	7	8
C	D	E	F	G	A	B	C

Here it will be seen that in the compass of the octave there are five *whole* degrees or "tones," and two *half* degrees or "semitones," and that in a series beginning on C these two semitones fall between the third and fourth and the seventh and eighth degrees. It will also be noticed that in the space from the first to the third degree two whole tones are comprised, making a "major" or greater third. All music written on a scale thus constructed is said to be in the *major mode*; and no similar scale can be formed from the notes in their common order by beginning elsewhere than on C, except by modifying them by means of flats or sharps. This modification is for the purpose of rendering their tonal succession ever similar, thus complying with the law which demands a semitone (or half step) only between the third and fourth and seventh and eighth degrees, in case of the major scale from whatever degree the scale may begin. Another series of notes equally well fitted for the expression of musical ideas may be obtained by beginning on A instead of C. In this the positions of the tones and semitones are widely different, as shown in Ex. 2:

Ex. 2.

1	2	3	4	5	6	7	8
A	B	C	D	E	F	G	A

Here the semitones are from the second to the third and from the fifth to the sixth. This kind of scale constitutes the *minor mode*, and in the natural order of the notes it can begin only on A. The minor mode is less perfect than the major, as the whole tone between the seventh and eighth in the *ascending* scale is unsatisfactory to the ear, and needs to be raised one semitone higher; but in doing this it sometimes becomes necessary to elevate the sixth also. This scale also serves as a standard formula, and modified by the same means (sharps and flats) determines the order of tones and semitones adopted in modern tonality for all *minor* scales. This subject of the modes, with special reference to these peculiarities of the minor, is illustrated in the article Mode.

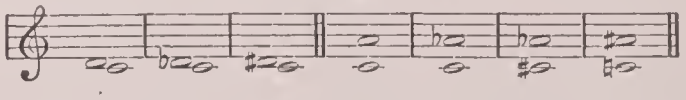
Thus far we have noticed only the *diatonic* scale, which consists of a mixture of tones and semitones in the order described; but as each whole tone in this scale admits of division into two semitones, we obtain by such a division another form of scale (called the *chromatic*), consisting of a complete series of twelve semitonic intervals in the compass of the octave. The chromatic scale may be variously written, either by the use of flats or sharps. These two scales (the diatonic and chromatic) furnish all the material from which modern music is constructed. However varied, discursive, or even capricious a composition may be, either in melody or harmony, all its tonal degrees are derived from the simple elements of one or other of these scales. It remains here to be noted that before the rise of the modern system of music several other "modes," different from the major and minor, were in common use. The ancient Greeks recognized three genera of scales and intervals—viz., the diatonic, the chromatic, and the enharmonic, the last consisting of quarter tones. Of these genera, however, the diatonic alone appears to have formed the basis of all the music in actual use, or which was capable of being conceived and performed with any approach to accuracy of intonation. For a more extended view of the formation and characteristics of the ancient scales, the reader is referred to the article Mode (*Ecclesiastical Modes*).

The term "interval" is used to denote the distance of one sound or note from another as reckoned by the degrees of the diatonic scale. Counting upward from any given degree, the intervals and their names are as represented in Ex. 3:

Ex. 3. 1st. 2d. 3d. 4th. 5th. 6th. 7th. 8th.

Simple intervals are those which lie within the compass of one octave, as those in the example. *Compound* intervals are those which reach beyond the limits of an octave, as the ninth, tenth, eleventh, etc. On the diatonic-chromatic scale the interval of a semitone admits of the distinction of major or diatonic, and minor or chromatic. The *major* semitone is that which involves two different degrees of the scale, as B, C or E, F; but the *minor* semitone has both of its terms on the same degree, as C, C♯, or B, B♭. Each of the other intervals may be various in the number of tones and semitones comprised in it. Thus a second may be either major, minor, or augmented, and a sixth may be similarly varied, and also diminished, though the notes representing them remain on the same degrees. These differences are created by the elevation or depression of the terms of those intervals by the occurrence of sharps or flats. In illustration of this see at *a* in Ex. 4 the major, minor, and augmented second; and at *b*, the major, minor, diminished, and augmented sixth:

Ex. 4.—*a* *b*
Maj. Min. Aug. Maj. Min. Dim. Aug.



On examining the *contents* of these several intervals it will be found that the minor is one semitone less than the major, the diminished one semitone less than the minor, and the augmented one semitone greater than the major; in other words, the major sixth contains nine semitones, the minor contains eight, the diminished only seven, and the augmented ten. Though all the intervals may thus be subject to modification, and may be viewed in several aspects, yet the unison, octave, fifth (and the fourth as the inversion or complement of the fifth) are those alone which are called "perfect," because they are producible on the scale in only one form, as C C, D D, etc., or C — G, D — A, etc. The only exception is the imperfect fifth, B — F, which, however, is treated as perfect in the progressions of the *minor* scale, as will be seen hereafter. In the article Interval (*q. v.*), at Ex. 3, all the intervals of the octave (including also the ninth), as now in use, with their several names, are given in their proper order and relations.

Certain names are also given to the intervals within the

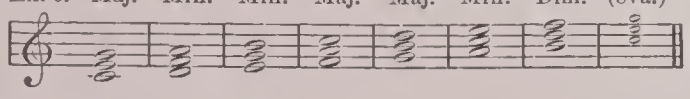
octave, to indicate their relations to the root, prime, or keynote. Thus the keynote itself is called the *tonic*; the fifth above is the *dominant*; and the third midway between these is the *mediant*. Similarly, the fifth below the tonic is the *subdominant*, and the third between it and the tonic is the *submediant*; the note immediately above the tonic is called the *super-tonic*, and the interval directly below the tonic is the *sub-tonic* or *leading note*. Intervals are also classified as consonant and dissonant, fundamental and inverted, etc.; these distinctions will also be found explained in the article Interval.

The intervals just enumerated are the elements of all musical compositions. When arranged in a continuous series of single sounds, selected and properly linked together, the composition so made is called a *melody*, and the union of two or more melodies in simultaneous utterance is called *harmony*. The subject of Melody the reader will find already discussed in this work under its appropriate head, and attention will now be given to that far more intricate and extensive branch of the science which relates to *harmony*. The great primal maxim which forms the basis of the modern structure of harmony is thus expressed by an able writer of the German school: "All musical harmony arises from *two chords*, called the *fundamental concord* and the *fundamental discord*, and from the different uses that can be made of them by *inversion*, *suspension*, *anticipation*, and *transition*. All musical harmony, even the most complicated, if only regular, is reducible to the said *two chords*, the fundamental note of which is called the *fundamental bass*." These two chords are the *triad* and the *chord of the seventh*, of each of which there are several varieties. Any of these chords may be used in a complete or an incomplete form; i. e. with *all* their terms or intervals expressed, or with one or more omitted. The *triad*, which we are now to consider, is the first and simplest of the two fundamental chords. It consists of a bass, with its third and fifth, and may be major, minor, or diminished; the first having a major third, the second a minor third, and the last a minor third with a diminished fifth. These three triads are shown in Ex. 5:

Ex. 5. Major. Minor. Diminished.

A triad may be built on each of the natural degrees of the scale; and on experiment it will be seen that three of these triads are major, three are minor, and the remaining one is the diminished triad. See Ex. 6.

Ex. 6.—Maj. Min. Min. Maj. Maj. Min. Dim. (8va.)

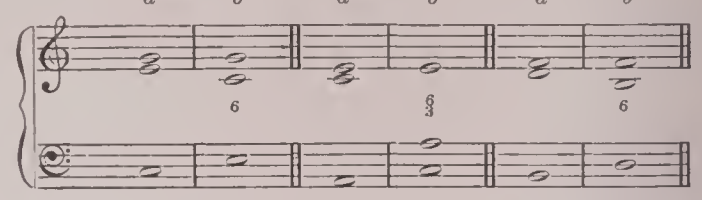


In this normal or original form of the triad the lowest note or term is the root or "fundamental bass"; and so long as this lowest term remains unchanged it is a matter of indifference whether the other terms (the third and fifth) stand in close or dispersed relation to it. One or more of the intervals of a triad may also be *doubled* (either on the unison or the octave), or in certain cases one of the terms may be omitted. Thus, in Ex. 7, the octave of the root is omitted and the third doubled; at *b* the octave is omitted and the fifth doubled; at *c* the fifth is omitted and the third doubled; and at *d* the fifth is omitted and the octave doubled:

Ex. 7. *a* *b* *c* *d*

It is not to be understood that in composition all these forms are equally good; and they are here adduced merely to show what changes may take place among the *upper* intervals of the triad while the fundamental bass remains the same. When the root or fundamental bass is no longer the *lowest* term of a chord, but one of the higher terms is substituted for it, the chord is said to be *inverted*; and there can be as many inversions of a chord as there are intervals to change places with the bass. As a triad consists of two such intervals besides the root—viz., a third and a fifth—it follows that it is capable of two inversions. (See Inversion.) The first inversion of the major, minor, and diminished triads (in which the original third becomes the bass) may be seen at *b*, *b*, *b* in Ex. 8, with their respective fundamental forms prefixed at *a*, *a*, *a*:

Ex. 8. Major. Minor. Diminished.
a *b* *a* *b* *a* *b*



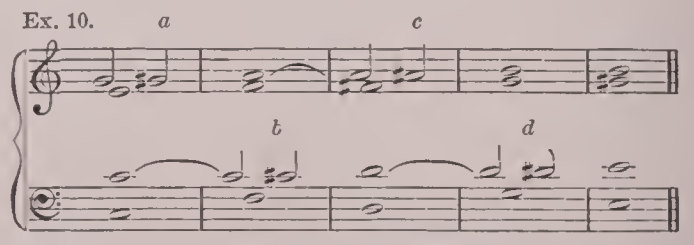
As the triad originally consisted of a bass, third, and fifth, it assumes in this inversion the form of a bass, third, and sixth. Hence it is represented by the figures $\frac{6}{3}$ or 6. In the second inversion, the original fifth becomes the bass, while the former third makes the interval of a sixth, and the octave of the fundamental stands between them as a fourth, as in Ex. 9, at *b*, *b*, *b*:

Ex. 9. Major. Minor. Diminished.
a *b* *a* *b* *a* *b*

The triad thus inverted is indicated by the figures $\frac{6}{4}$. Inversions are not to be confounded, as we have said, with mere "changes of position" among the *upper* parts of a chord. These changes, however various, do not affect the real nature and quality of a chord, or its standing in relation to its fundamental bass; but an *inversion* involves a radical change of that relation, and is productive of new and often far richer effects than those ordinarily attending the uninverted chord. Hence the large number of inverted chords in all compositions which rise above the rank of the simple choral or the plain ecclesiastical chant. Inverted *triads* have also a property—somewhat analogous to that of the chord of the seventh—of suggesting to the mind an idea of *progress* or continuance; and this oftentimes with such definiteness as to lead the hearer to anticipate, in a measure, the course of the ensuing progression, and to keep his thoughts in a sort of protracted suspense till the harmony brings the ear into repose on some expected turn or cadence. Impressions of this kind are not usually excited by triads in their original form, as each *such* triad has in itself a certain element of finality or conclusiveness, which either disappears or is not sensibly felt when the chord is inverted.

Besides the three *fundamental* triads, there are several others. Among these is the *augmented* triad, which has a major third and an augmented fifth. In modern works the augmented fifth is also frequently found in conjunction with the *minor* third. This augmentation is effected by an accidental sharp or its equivalent; and therefore, as *this* term of the chord is foreign to the diatonic scale, the real origin and nature of the augmented triad admit of a ready explanation as a passing note of greater or lesser duration. See Ex. 10, at *a*, *b*, *c*, *d*.

Ex. 10. *a* *c* *b* *d*



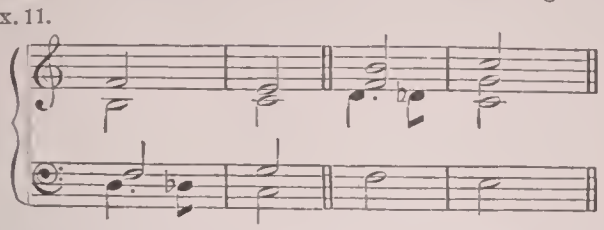
In this triad the elevated fifth becomes a "leading note" to the succeeding chord, and therefore always *ascends*, as in the example. See Note.

The same explanation will apply to the contrary process of depressing or flattening the third of the triad, as in Ex. 11.

From this review of the triad we now proceed to the *chord of the seventh*. This is formed by adding a third to

the triad, thus making it a chord of four parts or terms—viz., a bass, third, fifth, and seventh. As each degree of the

Ex. 11.



diatonic scale may be the basis of a triad (see Ex. 6), so by the addition of a third to each triad we obtain an equal number of chords of the seventh, as will appear from Ex. 12.

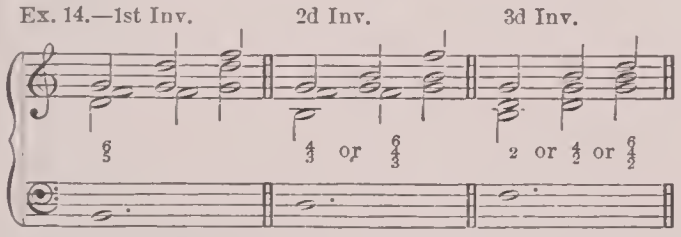
Ex. 12.

As all these are composed of major and minor thirds variously combined—several of them also being identical in structure—we may classify them thus: (1) That with a major triad and minor seventh—viz., G; (2) those with a minor triad and minor seventh—viz., D, E, and A; (3) that with a diminished triad and minor seventh—viz., B; and (4) those with a major triad and major seventh—viz., C and F. From the ordinary degrees of the scale we have thus four different forms of this chord, which for convenience may be referred to as the sevenths on G, A, B, and C. These four kinds of sevenths are called *fundamental*, but the most important is that founded on the dominant of the key or tonic, as it is not only the most pleasing to the ear, but also the chief agency in the formation of cadences and in digressions from one key to another. All the fundamental sevenths are, for the most part, subject to the same rules and are capable of the same inversions, which are three in number. (The *diminished* seventh has not here been mentioned, as from its very peculiar form and character it is reserved for treatment elsewhere.) In the three *inversions* of the chord of the seventh, the third, fifth, and seventh become successively the bass, and the other parts (including the octave of the root) will stand to the new bass in the order (1) of a third, fifth, and sixth; (2) a third, fourth, and sixth; and (3) a second, fourth, and sixth, as in Ex. 13, where *a* is the fundamental position of the chord, *b* the first inversion, *c* the second, and *d* the third:

Ex. 13.

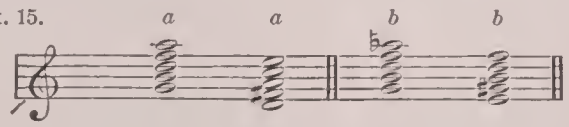
When represented by figures, the first inversion is known as the "chord of the sixth and fifth"; the second, the "chord of the fourth and third"; and the third, the "chord of the second"; these names being derived from the new positions assumed by the intervals of the chord under its several inversions. (See FIGURED BASS.) The above example is given in "close" harmony to show more clearly the nature of the changes made by inversion; but in each inversion the upper parts may be "dispersed," or taken at greater distances from the bass, without in any way affecting the nature of the inversion itself. See Ex. 14.

Ex. 14.—1st Inv. 2d Inv. 3d Inv.



Besides the triads and the chords of the seventh there are three other combinations yet to be noticed, on account of their frequent occurrence and the different theories adopted for their explanation. These are the chords of the ninth, eleventh, and thirteenth. The chord of the ninth differs

Ex. 15.



from the seventh by the addition of a third above. The ninth itself may be either major, as at *a*, *a* in Ex. 15, or minor, as at *b*, *b*.

Like the triads and chords of the seventh, the chord of the ninth may be inverted, but several of its inversions are harsh, except in rapid movements, and are therefore little used. Ordinarily, one (or more) of the middle intervals is omitted, and the effect of the chord is generally more pleasing when thus incomplete. The "chord of the *eleventh*" exceeds the ninth by the addition of another third, and the "chord of the *thirteenth*" extends beyond the eleventh by the addition of still another third. Respecting the origin of these three chords there are various theories, of which the two principal ones only will be here noticed: first, that supported by Rameau, under which they are called "chords by *supposition*," or chords formed by *supposing* one, two, or three thirds to be added *below* a chord of the seventh. For example, by supposing a third to be placed below such a chord, the *ninth* is formed; by adding to this another third, we obtain the *eleventh*; and by yet another, the chord of the *thirteenth*. This process is exhibited in Ex. 16, where the thirds which are thus supposed are marked by black dots:

Ex. 16. 7th. 9th. 11th. 13th.

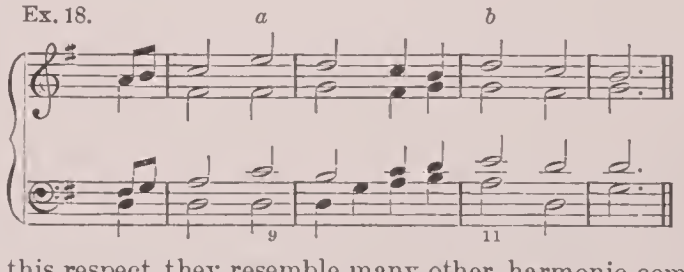
To this system it is objected (1) that there is no apparent reason why those thirds should be supposed at all; (2) that such a theory ignores the natural bearings of the *sound* of the chords in question, and their possible relation to other sounds into which they may be resolved, and offers instead of this a mere mathematical calculation. On the other theory, that of Kirnberger, these chords are not considered as fundamental, but having their origin in *suspensions*; and when so regarded their explanation is rendered both easy and satisfactory.

To illustrate Kirnberger's theory as briefly as possible, we give at *a* in Ex. 17 the ninth as suspension of the octave; at *b* the eleventh as suspension of the tenth; and at *c* the thirteenth as suspension of the twelfth; the dots are merely explanatory:

Ex. 17. *a* *b* *c*

It is to be observed, however, that though these chords have thus their *origin* in suspensions, yet they often occur independently—i. e. unconnected with actual or apparent suspensions. See Ex. 18, at *a* and *b*.

Ex. 18. *a* *b*



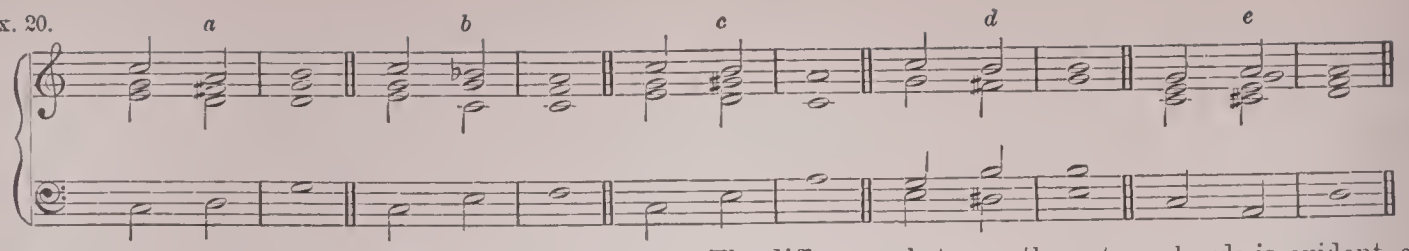
In this respect they resemble many other harmonic combinations, which are traceable only to the numerous forms generated by anticipations, transitions, etc.

The *progressions* of the fundamental triads and chords of the seventh are next to be noted. "Progression" is the movement from one chord to another more or less related to it. We shall first consider the ordinary progressions of the *triads*. From a major triad (that of C, for example) we may proceed to the triads and inversions of the dominant (G), the subdominant (F), the relative minor (A), the mediant (E), and the super-tonic (D), these being the most nearly related triads to that of C. See Ex. 19.

Ex. 19. C—G. C—F. C—A. C—E. C—D.

Also to the *leading chords* of these related triads, with or without the seventh, as at *a*, *b*, *c*, etc., in Ex. 20:

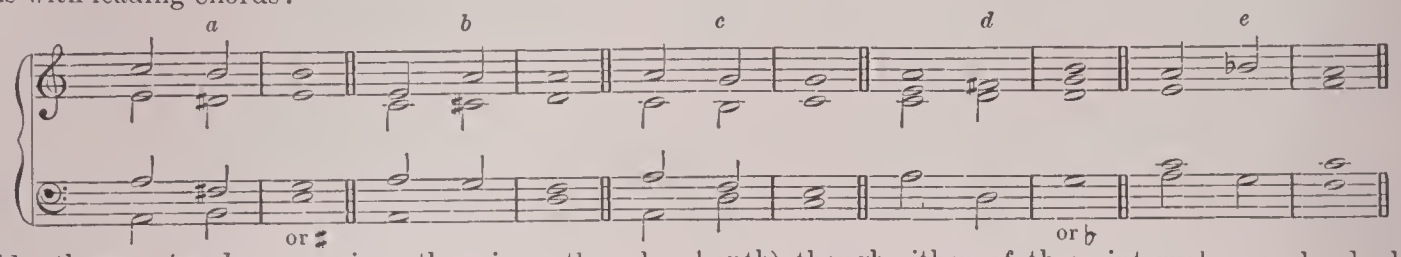
Ex. 20.



From a *minor* triad we may proceed in like manner, the *order* of the related keys being slightly different. See Ex. 21.

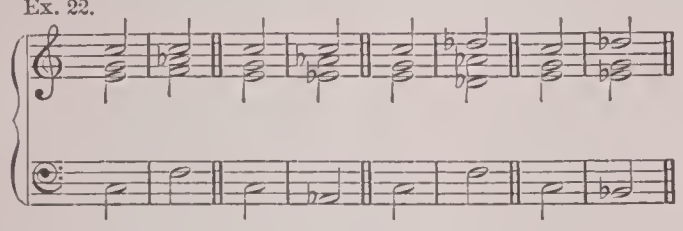
Ex. 21.

Or thus with leading chords:



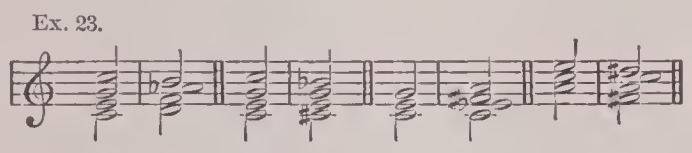
Besides these *natural* progressions, there is another class called the *abrupt*, in which the triad proceeds to chords more or less unrelated or remote. These progressions generally imply the omission of some intermediate chord; and sometimes the first chord is assumed to be not the tonic, but the dominant of its scale. See Ex. 22.

Ex. 22.



From a triad, either major or minor, we may proceed directly to any chord of the diminished seventh or its inversions, as in Ex. 23:

Ex. 23.



The progressions of the *diminished* (or imperfect) *triad* are peculiar, and require special notice, as the resemblance of that chord to an incomplete chord of the seventh often leads to mistakes. This triad consists of a bass, with a minor third and imperfect fifth. It has its place or seat on the second degree of the minor scale and the seventh of the major. The base or root is therefore the leading note in the major scale, and a triad so placed consists of precisely the same notes or intervals as the first inversion of the seventh on the dominant with the root omitted. Hence such a chord is ambiguous, and its real nature can only be determined by its connection and the harmony immediately following it. This will be apparent from Ex. 24, where the notes at *a* and *c*, though the same, are shown by their progressions at *b* and *d* to be essentially different chords, the first being an incomplete inversion of the seventh, and the other the real diminished triad.

Ex. 24.

The difference between these two chords is evident, as the bass and fifth at *a* in the example can not be doubled (the one being the leading note and the other the essential seventh), though either of these intervals may be doubled in the case of the diminished triad, as shown at *e* and *f*. The diminished triad is simply the supertonic harmony in the *minor* scale, and its treatment is in most respects similar to that of the supertonic of the *major* scale.

In the progressions of the *chord of the seventh* and all dissonances two points are to be noted—viz., *preparation* and *resolution*. Any such dissonance is said to be "prepared" when it has been heard as a consonance in the same part or voice in the *preceding* measure. Thus in Ex. 25 the first F in the alto is a concord followed by the same F as a discord of G. The two Fs in the bass are respectively F the third of D and F the discord of G. In the strict style of composition this rule was held to be obligatory, except in a very few cases, but in the free style numerous instances of unprepared dissonances occur in the writings of the best composers. Like several other rules which have been modified or abrogated under the advances of modern harmony, that of preparation has lost much of its stringency, and is frequently overlooked in cases where it can add nothing to the clearness or compactness of the harmony. Such instances of unprepared sevenths as the following (Ex. 26) are frequent, and are approved by Albrechtsberger and other theorists:

Ex. 25.

Ex. 26.

In the *resolution* of the chord of the seventh the general rule is that the third (from the root) moves one degree upward, and the seventh one degree downward, the fifth being unlimited. The fundamental bass also usually rises a fourth or descends a fifth. See Ex. 27.

Ex. 27.

The resolution does not always take place on the very next note, but may be delayed by the intervention of several notes and even by extraneous harmonies. Compare *a* and *b* in Ex. 28.

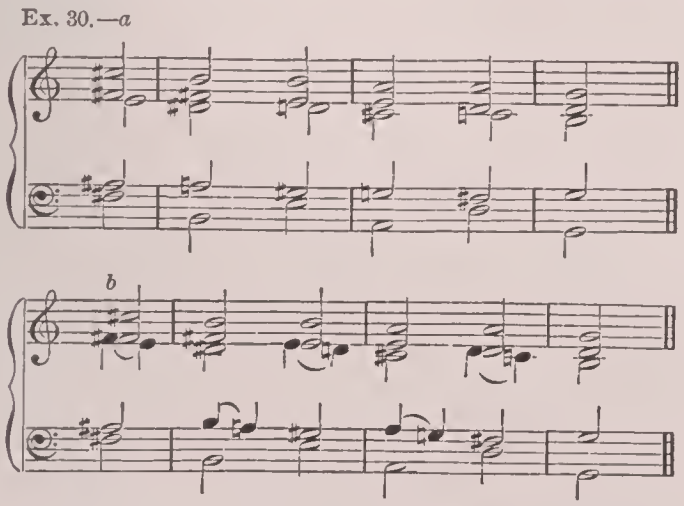
Ex. 28.

It is not necessary that the resolution of the chord should always occur in the *same part* which makes the dissonance, for any part may move from its own to another term of the chord by an exchange of place with some other part; but in all cases the resolution must finally take place. Thus in Example 29, at *a*, the third (or leading note) is in the bass, and the fifth is in the treble; but at *b* these two parts make an exchange of notes, and the resolution proceeds accordingly. At *c* the seventh in the treble part is transferred to the alto at *d*, and the treble takes the leading note, which before was in the tenor:

Ex. 29.

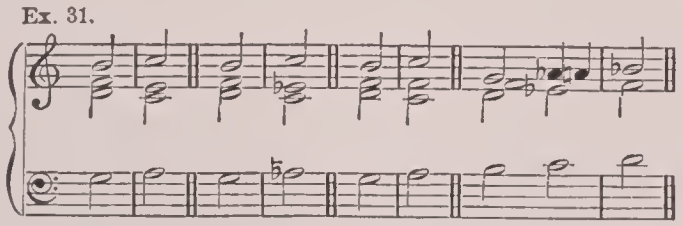
A seventh, instead of resolving into the perfect triad, may be succeeded by another seventh, and this also by another, thus forming a train ending with the usual resolution, as at *a* in Ex. 30. Theorists explain this kind of progression by supposing that the ear perceives a transient resolution after each seventh, which immediately passes into the next dissonance. This is shown by the crotchets at *b* in the example (Ex. 30), which make each chord first a triad and then a seventh:

Ex. 30.—*a*



On the same theory of the skipping or omission of some intermediate note numerous other progressions of the seventh are to be explained. Several of these are given in Ex. 31:

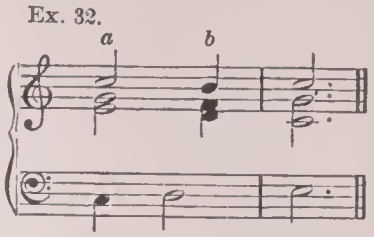
Ex. 31.



That the sevenths may proceed at once, like the triads, to any chord of the diminished seventh, will need no demonstration.

To the chords already described must be added those accidental combinations called *anticipations* and *suspensions*. An "anticipation" is the premature advance of one of the terms of a chord by which it intrudes (as it were) upon the next chord. An instance of this may be seen at *a* in Ex. 32, where the second note of the bass, by moving one crotchet too soon, comes in collision with the triad of C in the upper parts, and *anticipates* the harmony at *b* to which it properly belongs.

Ex. 32.



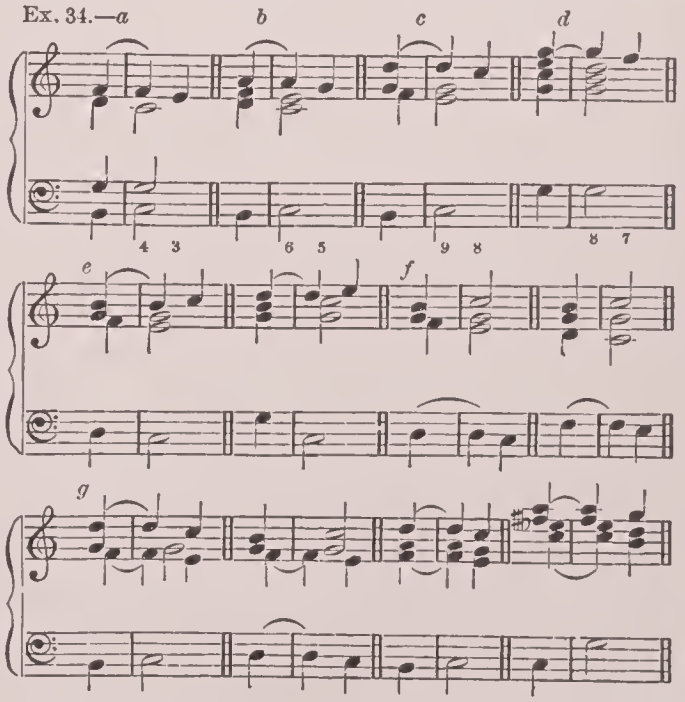
In Ex. 33, at *a* and *b*, the upper parts make anticipations by moving one quaver in advance of the bass; and at *c* and *d* the bass moves in a similar manner in advance of the upper parts:

Ex. 33.

Anticipations are for the most part discordant, since they bring a foreign element into the harmony; in some cases, however, they contribute to the smoothness and elegance of a movement.

Suspensions are the reverse of anticipations. They occur "when one or more notes of a *preceding* chord are carried into a *succeeding* one to which they do not belong." Any one of the intervals of a triad or chord of the seventh (or two or more together) may be suspended. These suspensions are always on the accented part of a bar or note, and are resolved on the unaccented. A note may be suspended either from above or below. Illustrations are given in Ex. 34, where at *a* the third in the upper part is suspended from above by the fourth; at *b* the fifth is suspended by the sixth; at *c*, the octave by the ninth; and at *d*, the seventh by the octave. At *e* the suspensions are from below, and at *f* they occur in the bass. Instances of double, triple, and quadruple suspensions are added at *g*:

Ex. 34.—*a* *b* *c* *d*



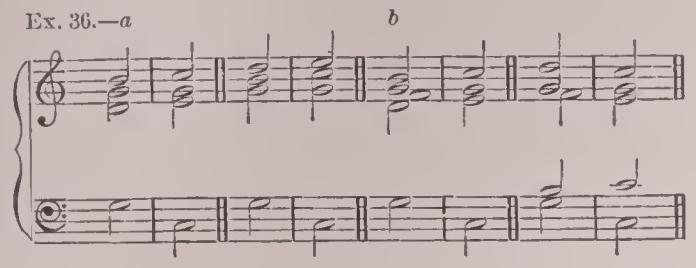
Suspensions are not always resolved on their own proper triads, but another fundamental harmony is substituted, as in Ex. 35, at *a*, *b*, and *c*:

Ex. 35.

Cadences are terminations, closes, or boundaries of musical ideas. In their simple or radical form they consist of a leading chord and a major or minor triad. Cadences are perfect, imperfect, deceptive, and extended; also medial or final. The *perfect* cadence consists either of the triads of

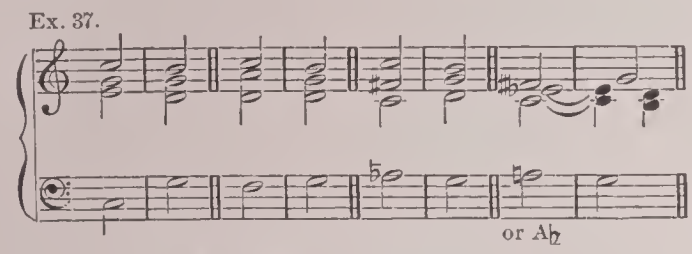
the dominant and tonic, or of the principal seventh and the triad of the tonic. See both forms illustrated at *a* and *b* in Example 36.

Ex. 36.—*a* *b*



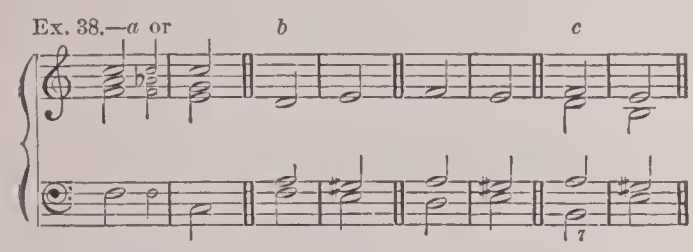
Almost all compositions end with this cadence, as its effect on the ear is final and satisfactory. It admits of numerous inversions (which will be understood without illustration by examples); but as these inversions are not conclusive, they are seldom used as terminations where there are more than two parts or voices. The *half* or *imperfect* cadence has various forms, all ending not with the tonic but the dominant harmony, and it is suitable only for such closes as are not final. See several forms of the half-cadence in Ex. 37.

Ex. 37.



The first of the two cadences which are shown in Ex. 38 is variously known as the plagal or the ecclesiastical; the second (at *b*), called the "Phrygian," is merely an incomplete form of the ordinary minor progression at *c*, with the fundamental note omitted:

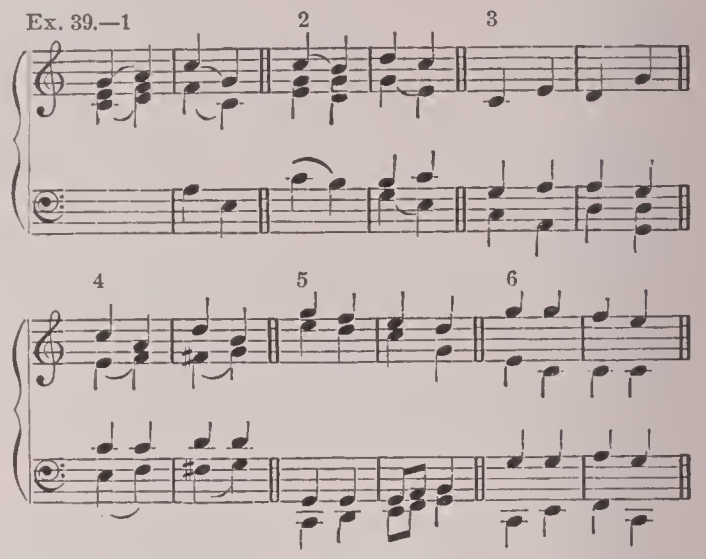
Ex. 38.—*a* or *b* *c*



Deceptive cadences are those in which the leading chord is not followed by that which it naturally suggests, but by another which is more or less foreign to the ear. See Ex. 31, in which each progression is essentially a cadence of this kind.

After this general view of chords and their inversions, suspensions and cadences, we come to their use and treatment in composition, concerning which we here refer the reader to some introductory and historical remarks in the article Harmony. Preliminary to all study of the use of chords is that of their *duration*, and the mode by which the time of any series of musical sounds is regulated and expressed. On this subject, however, some elementary details have been offered in the article Measure, and a more particular exposition will be found under the head of Time. On the kindred subject of Rhythm also, of which only a brief notice could here be taken for want of room, a more extended treatment is given under its proper caption. *Counterpoint*, or the harmonizing of a given melody, is the setting of note against note, formerly written in points. *Simple* counterpoint comprises all those compositions, whether plain or florid, in which the parts are not invertible, but fixed. In *double* counterpoint the parts are so constructed by special rules that two or more of them may be inverted, the higher part changing place with the lower. (See the latter part of the article Inversion.) In simple counterpoint the following general rules are to be observed: (1) Two perfect *fifths* in direct motion and succession, and in the same parts, are usually of bad effect, and should be avoided. (2) Two or more successive *octaves* in the same parts are inadmissible, except in special cases where it is desirable to strengthen the bass or make some idea particularly prominent. (3) As the third is the only discriminating term or element in triads by which we know whether they are major or minor, it should rarely be omitted. (4) Where two or more successive chords contain doubled intervals, care should be taken not to double the *third* when it is leading note to the next chord, as the result would be consecutive octaves. (5) The two higher and two lower parts in a composition should not be placed at an excessive or disproportionate distance from each other. (6) The same rule applies to passages in dispersed harmony, as the effect is thin and unsatisfactory when the parts are widely separated. Instances of violation of these rules are severally given in Ex. 39:

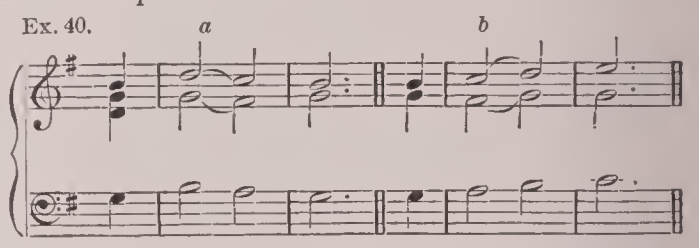
Ex. 39.—1 2 3



4 5 6

The rule respecting consecutive fifths is not violated when the first fifth is perfect and the second imperfect, as at *a* in Ex. 40. In modern music the contrary order frequently occurs, in which the imperfect fifth precedes the perfect, as at *b* in the example:

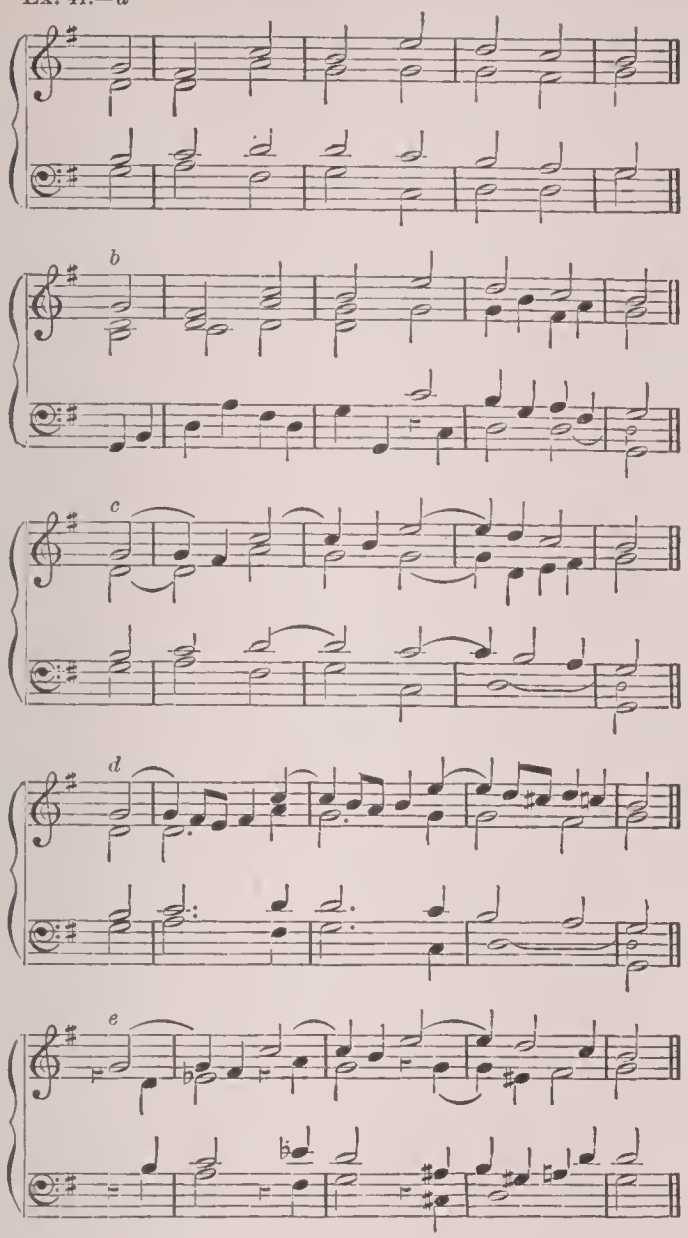
Ex. 40. *a* *b*



Successive fifths are not prohibited when the parts are in *contrary* motion, provided that the texture of the harmony is so woven as not to render them too prominent. In free composition the rule of the fifth is so far modified as to admit of numerous exceptions.

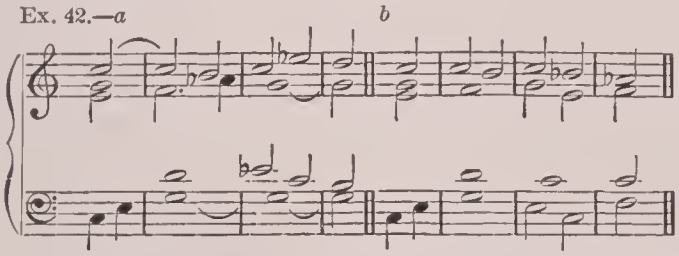
In two-part exercises every triad and chord of the seventh must necessarily be incomplete through the omission of one or more of their intervals or terms. In triads the third (or its inversion, the sixth) should be most frequently used, the fifth less freely, and the octave and unison only occasionally. When there are three parts each *triad*, as a general rule, should be complete; and of the *seventh*, the omitted interval may be the fifth, or less frequently the third or the root. In four parts each chord may appear complete in all its intervals. In triads one term will necessarily be *doubled*, either in the unison or the octave, and one of the terms may even be tripled or omitted, as shown already in Ex. 10 and its context. The third and seventh in the chord of the seventh, being its characteristic intervals, should not be doubled unless in exercises of five, six, or more parts, but the doublings should occur on the fundamental bass or the fifth. In harmonizing a plain theme in four parts each part should as much as possible have its own distinct quality, and more or less of a melodious progression. The simplest practical exercises are those having notes of equal length, confined to a single key, and consisting chiefly of triads and the principal chord of the seventh, with their inversions. A short theme thus treated is given at *a* in Example 41. (The example is merely elementary, for from such plain forms "simple counterpoint" extends to an area of almost unlimited expansion, freedom, and variety, including compositions which are oftentimes far more complex and ornate than ordinary exercises in *double counterpoint*.) The first step in the elaboration of the theme in the example given at *a* is shown at *b*, by the introduction of two notes against one; at *c* and *d* a further advance is made by suspensions of chords and other devices; and at *e* the theme receives additional ornament from chromatic harmony, syncopations, and variations of the time and movement of the parts:

Ex. 41.—*a*



Though a piece of some length may be written in a single key, yet digressions into other keys, near or remote, are ordinarily essential to the beauty and interest of a composition. This passing from one key to another constitutes *modulation*; and it is generally effected by the introduction of the leading note or the minor seventh of the new key, the former generally requiring an accidental ♮, ♯, or ×, and the latter a ♮, ♭, or ♭♭. Instances of such changes of key or mode may be seen in Exs. 20 and 21. More strictly, however, a modulation occurs only when a regular cadence in some new key is made *at the close* of a phrase or period. Modulation is of three kinds—viz., *natural*, *abrupt*, and *enharmonic*. The first of these is illustrated in Ex. 41, and has already been considered in the article Modulation, which the reader should here consult. *Abrupt* modulations are so called because they proceed to foreign or unrelated keys or modes, and not on account of anything rough or strange in their effect. The simplest kind of abrupt modulation is

Ex. 42.—*a* *b*



that consisting of a mere change of *mode*, as from major to minor, or *vice versa*, while the keynote remains the same. In Ex. 42, at *a*, see a modulation from C major to C minor, and at *b* a change from C major to F minor, where both mode and key are relinquished. The latter modulation will be found on analysis to consist essentially of the triads of C major and F minor, the first and last notes; and the progression is one which furnishes the key to many developments both curious and important in abrupt modulation. Some of these we shall briefly notice. For instance, the C major triad is the dominant chord to the F minor triad, the bass rising a fourth. From the latter triad we may then proceed by ordinary rule to the major triad of D♭, as at *a* in Ex. 43; which triad being treated as a dominant chord (like the former C) is followed at *b* by the minor triad of its fourth—viz., G♭ minor (otherwise F♯ minor); and by *repeating* this process continually we may proceed through the whole circle of the keys, as partly shown in the example:

Ex. 43. *a* *b* or

The progression from the second chord (F minor) may also be to the major triad of B♭, the bass descending a perfect fifth, as at *a* in Ex. 44, on which another chain of harmonies may be formed, thus:

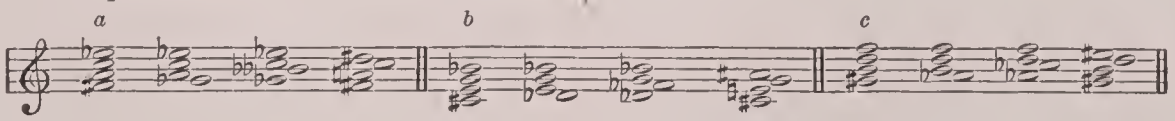
Ex. 44.

From these suggestions the student will be able to construct many other circular progressions or chains of cadences. In some cases the modulation seems to imply the omission of an intermediate note, instances of which are given in Ex. 22. In this class may be placed the very abrupt but useful progression at *a* in Ex. 45, where the upper note of the tonic harmony (octave of the root) is taken as a *new leading note* (with or without the seventh), and resolved in the usual manner. Of course, the process may be repeated indefinitely, as in the former examples:

Ex. 45. *a* or

Modulation by *enharmonic changes* is chiefly effected by means of the chord of the diminished seventh. This chord consists of three minor thirds, i. e. a minor third, an imperfect fifth, and a diminished seventh. And as a minor third contains only three semitones, it follows that only three different diminished sevenths are possible, for, after building the chord on three successive grades of the chromatic scale, a fourth grade would produce simply a replication or inversion of the first. The peculiarity of this chord lies in a certain mysterious, dreamy, and equivocal quality which for the time is so entrancing as to involve all sense of key and mode in a sort of bewildering obscurity. Hence the use of this chord in rendering digressions into remote keys is both easy and graceful. Its enharmonic quality arises from the circumstance that each of its elements may be regarded and treated as two entirely different notes in intervals—viz., as sharp of the note below, or flat of the note above, or in both cases as natural instead of sharp or flat. Consequently, each of the three diminished sevenths may be written in four or more different ways, according to the key or scale to which they belong. This will be evident on an inspection of Ex. 46, where four various forms of each seventh are given at *a*, *b*, and *c* respectively.

Ex. 46. *a* *b* *c*



Two other points also are to be observed: 1st, that each of these forms contains a *leading note* into some particular key; and 2d, that any such form may become the principal (or dominant) *seventh of that key* by dropping another of its terms a semitone lower. (In illustration of this see Ex. 47,

Ex. 47.—*a* *b* *c*

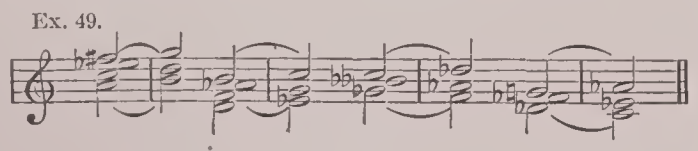
which is an exercise on the first of the above sevenths, with the parts distributed.) At *a* the lower term (F♯) is the leading note, and by dropping the E♭ of the alto to D the chord becomes at once an inversion of the ordinary seventh on D, and resolves into the key of G (either major or minor). At *b* the alto, now written D♯, is the leading note, and the tenor being lowered a semitone, we have an inversion of the minor seventh on B, which resolves into the key of E. At *c* the upper part is leading note, and the F♯ of the bass (now become G♭ by enharmonic change) descends a semitone, forming the minor seventh on F, which resolves into the triad of B♭:

Ex. 48. En. ch. En. ch.

By this simple process we may readily pass from any key to any other (major or minor) without going through a tedious succession of intermediate chords or annoying the ear by a sudden plunge into a foreign scale. To become familiar with this species of modulation it is necessary to keep in mind the distinction between F♯ and G♭, C♯ and D♭, F and E♯, etc., as these two names or forms of expression indicate relations to two different keys. The actual *sound*, however, remains the same, and is in most cases equivocal till the progression decides its character. If, then, we wish to proceed from C major, for instance, to some other key, we select that particular diminished seventh which contains the *leading note* of such other key; and this will form the link connecting the two keys. Suppose the new key to be D♭ major or E♭ minor: of these, the leading notes will of course be C and D, and we accordingly select the diminished sevenths in which they are found. By interposing these between the tonic harmony of C and that of the new keys, the modulation is effected at once, because the middle term in each case is on one side related to C, and on the other (by enharmonic change) to D♭ or E♭. See Ex. 52.

Though in the examples which have been already given one of the intervals of the diminished seventh is dropped a semitone in order to make the ordinary minor seventh of the new key, yet this change is not really necessary, as this chord often proceeds *directly* to its resolution, as is shown in Ex. 49:

Ex. 49.



Frequently, also, two or more diminished sevenths occur in immediate succession before the modulation is effected. For a somewhat full treatment of other points more or less pertaining to the subject of simple counterpoint, see the articles Imitative Music, Mode, Scale, Sequence, and Transposition.

Double counterpoint is that species of composition in which the parts or voices are susceptible of *inversion*, the higher part thus becoming the lower, and *vice versa*. Of such species of composition there are several varieties—viz., counterpoint of the *octave*, when one of the parts is moved an octave higher or lower than its original place, while the other part retains its position; and counterpoint of the *tenth*, of the *twelfth*, etc., in which the inversion takes place at those distances respectively. Each of these varieties of counterpoint has special rules by which it is governed in addition to those governing "simple" counterpoint. The intervals of the original composition thus become different by reason of the inversion of the parts. For instance, in "counterpoint of the *octave*" the octave becomes a unison, the second a seventh, the third a sixth, etc., as shown in the following scheme:

Original, 8 7 6 5 4 3 2 1.
Inversion, 1 2 3 4 5 6 7 8.

This will also be evident on observing the notes and figures in Ex. 50, where the lower part becomes the higher by inversion:

Ex. 50.—*Original.*

Inversion.

In counterpoint of the *octave* no greater interval than an octave is admissible between the two parts, as every note that exceeds an octave will remain uninverted. This fault will be noticed at *a* and *b* in Ex. 51, where two notes are unchanged in the inversion because they violate the rule. Two perfect fourths in succession are to be avoided, because in the inversion they become two fifths; but two fourths, of which the last is augmented, may be admitted. The two parts should also be various in quality of notes for the sake of distinction. By observing these rules many new and striking effects may be produced from a subject apparently insignificant. To illustrate this very

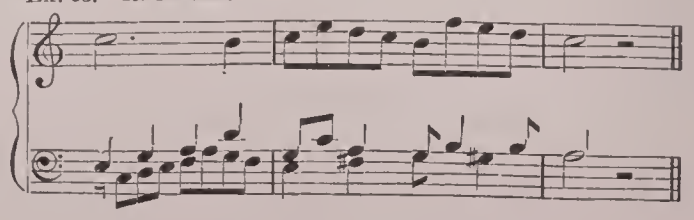
Ex. 51.—*Original.* *Inversion.*

briefly we shall take the following simple theme, and treat it in counterpoint of the octave. In Ex. 52 see the theme at *a*, with an under part in small notes; at *b* is the first inversion, in which the lower part is moved an octave *upward*, thereby becoming the higher; at *c* and *d* are two other inversions, though the first is the only *real* one:

Ex. 52.—*a*

In the latter case, however, the effect is thin and unpleasant, owing to the great distance between the parts. And this very fault suggests another feature—viz., the introduction of a *third* part to fill up the vacant space; which new part we have inserted in small notes. This middle part is also constructed in such a manner as to be capable of inversion like the other parts, and thus several new and beautiful changes may be produced by carrying out the inversions. These inversions are five in number, of which we give the first entire, and the others with only a few notes to indicate the positions which the several parts will assume. See Ex. 53.

Ex. 53.—*1st Inversion.*



To afford room for inner parts the inverted part may be set at the distance of *two* octaves, as in the above example and also in the next following.—To a two-part counterpoint of the octave two other parts, consisting *entirely of thirds*, may be added by observing the following rules: (1) The original parts should always proceed by contrary or oblique motion; (2) only thirds, sixths, and octaves should be used on the essential or strong parts of the harmony; (3) if a leading note occurs in the lower part, and its third above in the higher, the latter must be resolved downward. We may then form two new parts by writing thirds *above* all the notes of the original parts, as in Ex. 54, where the added parts are given in small notes:

Ex. 54.

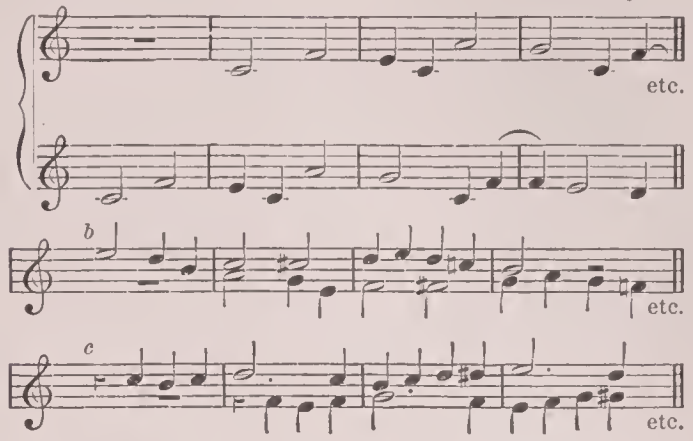
The rules for the other counterpoints are in like manner deduced, for the most part, from a comparison of the intervals in the composition before and after inversion. Thus, in counterpoint of the *tenth*, as thirds, fourths, sixths, and tenths become by inversion octaves, sevenths, fifths, and unisons, two of them in succession are not allowable, except in certain cases when such sevenths or fifths are not of the same quality. In counterpoint of the *twelfth*, successive fourths and sixths are forbidden except under similar limitations, as they produce ninths and sevenths in the inversion. To all these counterpoints two middle parts may be added, either as "free" or as parts capable of inversion; and when a composition has four parts of the latter construction, it may be inverted *twenty-three times* by merely arranging the four parts in correspondence with the changes which can be made with the numbers 1, 2, 3, 4—viz., 1, 3, 2, 4—2, 1, 3, 4, etc. Double counterpoint thus throws open a rich field of ideas which would never occur to a composer whose studies had been confined to the simpler departments of harmony.

The subject of FUGUE, which comes next in order, has already received attention under its own proper head, and we shall close the present article with a few lines on the nature and structure of *canon*. A canon is a composition in which the several parts are substantially one and the same train of notes, one part beginning, and the others falling in successively at prescribed distances, as in Ex. 55.

Ex. 55.

The parts thus formed by mere imitation of the first may be exact repetitions in unison, or less exact by answering in the second, third, fifth, etc., of the original; but in all cases the answer should conform to the theme in motion and in length of notes. "The truest, easiest, and at the same time, strictest canons," says Albrechtsberger, "are those in the unison and in the octave; for only on these intervals can the answers correspond exactly as to all the half and whole tones, although those on the fifth and fourth may be made to correspond sufficiently well." In Ex. 56 see the openings

Ex. 56.—*a* *Kirnberger.*



of three two-part canons, in which at *a* the answer is in the unison, and *b* in the third below, and at *c* in the fifth below: Canons are said to be *finite* when provided with a proper termination or ordinary ending. On the contrary, an *infinite* canon is one in which there is no such conclusion, but a constant circular repetition, which is usually terminated by a signal agreed upon by the performers.

Among the multitude of works on musical science, embracing both the strict and free schools, the following may here be mentioned, all of which are accessible in the English language: Albrechtsberger, *Harmony, Counterpoint, and Fugue* (London and New York); the same by Cherubini; E. F. Richter, *Harmony, Counterpoint, and Fugue* (3 vols., sold separately); B. Jadasson, *Harmony and Counterpoint* (New York); Weitzman, *Theory of Harmony*, etc., edited by E. M. Bowman (New York). In matters of musical history, W. S. B. Mathews, *Popular History of Music* (Chicago); Sir George Grove, *Dictionary of Music and Musicians* (London and New York). In musical "form," Büssler's *Treatise*, translated and adapted by J. H. Cornell; W. S. B. Mathews, *Elements of Musical Form* (New York). In orchestration, Berlioz's *Treatise* (London); E. Prout, *Instrumentation* (London); Oscar Coon, *Harmony and Instrumentation* (New York), the last almost unique in matters concerning arrangements and scoring for small orchestras and brass bands. Revised by DUDLEY BUCK.

Musin, OVIDE: See the Appendix.

Musk [from O. Fr. *musc* < Lat. *mus'cus*, from Gr. *μόσχος*, from Pers. *musk*. Cf. Arab. *mushk*, musk]: a concrete, strong-smelling, brownish, inflammable substance extensively employed in medicine and in perfumery. It is obtained from the preputial sac of the MUSK-DEER (*q. v.*), and is brought to market from China, Russia, and Calcutta; the musk of the warmer regions is by far the best. On killing the animal, the musk-bag is carefully removed, so as to defend its precious contents from exposure to the air. When recently taken the musk is of so powerful an odor as to cause headache to those who inhale its overpowering fragranee. The affluence of perfume in musk is almost incredible, being apparently undiminished by lapse of time. The price of musk is very high, and it is in consequence excessively adulterated. Some similarly smelling animal products (as the perfume of the desman, etc.) are sold for it. The volatile oils of some plants, such as *Malva moschata* (*Malvaceæ*) and *Mimulus moschatus* (*Scrophulariaceæ*), are found to possess its odor and its medicinal qualities, which are strongly antispasmodic and stimulant. Artificial musk is obtained by treating rectified oil of amber with strong nitric acid. It is superior to much of the musk of commerce, but not equal to the genuine article. It has a limited use in medicine. The drug sambul or sumbul is also a fair musk substitute. Revised by H. A. HARE.

Musk-deer: a small deer (*Moschus moschiferus*) inhabiting the highlands of Central and Eastern Asia, and rarely found in summer below an elevation of 8,000 feet. The musk-deer is about 20 inches high at the shoulder, of a grayish brown, sometimes of a reddish tinge, sometimes mottled with lighter blotches. The hair is long and coarse. Antlers are lacking, but the male has a pair of long canine teeth in the upper jaw. This species is remarkable for the great development of the small side-hoofs, and differs from all other deer in having a gall-bladder. It is an aberrant member of the family *Cervidæ*, and is only distantly related to the little

chevrotains; for these, although often called pygmy musk-deer, belong to another family, the *Tragulidæ*. The flesh is esteemed, though that of the male is very rank and musky.

The musk-deer.

On account of the value of the musk, the animal, which furnishes the precious substance, is subjected to great persecution on the part of hunters, who annually destroy great numbers.

F. A. Lucas.

Muskegon: city (incorporated as a village in 1861, chartered as a city in 1870); capital of Muskegon co., Mich. (for location of county, see map of Michigan, ref. 6–H); on the Muskegon river, and the Chi. and W. Mich., the Gr. Rap. and Ind., and the Toledo, Sag. and Musk. railways; 38 miles N. W. of Grand Rapids, 120 miles by water N. E. of Chicago. The river here enlarges to a width of about 2 miles, and is locally known as Muskegon Lake. It has a water frontage of about 12 miles. The harbor, almost entirely landlocked and open all the year, is one of the best on Lake Michigan, and has regular steamboat communication with all the principal lake ports. The city has an area of about 12 sq. miles, of which 5 are water surface; is lighted with gas and electricity, and has a water plant on the Holly system, completed in 1891, and taking its supply from Lake Michigan; well-paved streets, and an improved sewerage plant. There are 24 churches, 17 public-school buildings, a central school, a high school, 6 kindergarten cottages, and 5 parochial schools, Hackley Public Library (founded in 1888) with over 20,000 volumes; soldiers' monument; public fountain; public park; a park of 58 acres between Lake Michigan and Muskegon Lake, on the west side of the city; 4 national banks with combined capital of $400,000, a State bank with capital of $50,000, and 2 daily and 2 weekly newspapers. The city has been noted for many years for the variety and extent of its manufactures, and particularly for its great lumber interests. The census returns of 1890 showed that 310 manufacturing establishments (representing 53 industries) reported. These had a combined capital of $11,443,967; employed 4,956 persons; paid $2,151,820 for wages and $5,540,042 for materials; and had products valued at $9,464,105. The principal industry, according to the amount of capital employed, was the manufacture of lumber and other mill products from logs or bolts, which had 29 establishments; employed $9,091,979 capital and 2,532 persons; paid $1,022,073 for wages and $3,257,473 for materials; and had products valued at $5,326,058. Next was the manufacture of planing-mill products, which had 9 establishments; employed $345,597 capital and 415 persons; paid $167,283 for wages and $382,694 for materials; and had products valued at $602,541. Then followed the manufacture of foundry and machine-shop products and of furniture. The aggregate shipments by water of lumber products in 1890 were 355,515,000 feet of lumber, 90,808,000 shingles, and 22,670,000 lath. In 1890–94 there were 12 new and large manufactories established in the city, and in the latter year the industrial establishments included iron and steel works, iron-works, boiler-works, about 20 saw and planing mills, furniture-factory, flour-mill, brewery, marble and granite works, and chemical-engine, revolving bookcase, patent earth-closet, library supplies, invalid-chair, portable-desk, army-cot, and brick and tile factories. Pop. (1880) 11,262; (1890) 22,702; (1900) 20,818.

Muskhogean (mŭsk-hō'-gĕe-ān) **Indians** [*Muskhogean* is from Algonquian for swamplanders, swamp-dwellers]: a linguistic stock composed of tribes formerly occupying almost the whole of Mississippi and Alabama and large portions of Georgia, Florida, and South Carolina; now the majority are settled in the Indian Territory. Various names have been proposed to designate this family: Choctaw-Muskoki, Muskhogie, Choktah, Tschahta, Mobilians, and others; but the Indian name of its most powerful and central portion, the Creek, is now adopted.

The tribes formed confederacies, but the political power exercised by these was not always coincident with their territorial extent, and only the Creek and Chikasa confederacy has ever been of decisive influence upon the destinies of the southern Indians. A subdivision of the various tribes of Muskhogean affiliation can be attempted upon a linguistic basis only. The following classification embodies present knowledge:

I. First branch, or Maskoki, comprises the Creek Indians, also called Maskoki, isti Maskoki, or Maskokalgi. They are subdivided into Upper Creek, on the Coosa and Tallapoosa rivers, and Lower Creek, on the Chattahoochee river and E. from there; they comprised also the Creek part of the Seminole and of the Yamasi.

II. Second branch, or Hitchiti towns. This southeastern division comprised towns on the lower Chattahoochee river speaking the Hitchiti dialect; also that portion of the Yamasi and Seminole Indians who had politically separated from the towns just mentioned.

III. Third or Apalache branch; historically known to have lived about St. Mark's river, Florida.

IV. Fourth or Alibamu branch; embraced the Alibamu and Koassati villages on Alabama river, in the vicinity of the present capital, Montgomery.

V. Fifth, Western or Choctaw branch. The Choctaw, living in Central and Southern Mississippi, were the principal people of this division. It branched off into the Chikasa, Choktchúma, and Mugulásha; and some other tribes on the Mississippi river were probably of Choctaw affinity.

Tribes of the Muskhogean Indians.—In the following alphabetic list of the principal tribes the topographic locations given are mostly those of their historic seats E. of the Mississippi river, in which they remained until 1830 to 1840. The larger portion of these tribes still exist in the Indian Territory, preserving the same names, and this may be said more especially of the Creek Indians.

Ábika or Apihka: a very ancient Upper Creek town on Coosa river. It was probably identical with the historical Kusa. Abikudshi, or Little Abika, is a colony of it.—Acolapissa, *Spies, Guardians*: a generic term for a class of Choctaw Indians on the Gulf coast. They are said to have inhabited seven villages.—Alibamu or Albámu: a people with a special dialect, settled in four villages W. of Montgomery, Ala. They live now scattered through the Creek Nation, one town being on the North Fork of the Canadian. There is a settlement of about 100 Alibamu in Polk co., Eastern Texas.—Apalachi: a town and "province" N. of St. Mark's Bay, Florida, the inhabitants of which spoke a Muskhogean dialect of their own. After being subjugated by the Spaniards about 1638, a portion of them removed in 1705 to Mobile Bay, and subsequently went to Louisiana.—Apalachucla: a Hitchiti town on lower Chattahoochee river, and a large center of population; it was called also Tálwa thláko, *Great town*. Under this name is a village in the Indian Territory.—Atasi, *War-club*: an Upper Creek town formerly on lower Tallapoosa river.—Attapulgas, *Dogwood thicket*: a Seminole settlement of Northern Florida.—Bayogoula, *White oak people*: a Choctaw tribe on the western bank of the Mississippi.

Chikasa or Chickasaw Indians: originally inhabiting seven palisaded towns in Pontotoc County, on a table-land in Northern Mississippi. They were a warrior tribe of political importance, stood at the head of a confederacy dwelling along Yazoo and Mississippi rivers, and were the constant antagonists of their congeners, the Choctaw, and of the French colonists. Their dialect differs considerably from the Choctaw lexically, but for oratorical purposes they make use of Choctaw.

Chikasawhay Indians, *Eaters of the bog-potato* (ahi): once on an affluent of Pascagoula river; also known as Ahi-pat

o'kla, the Choctaw term for *potato-eating people*.—Chiaha, *Where others live*: a Lower Creek town on Chattahoochee river; its language and that of its colony, Chiahudshi, is the Hitchiti dialect, though the name of the town itself is Cherokee.

Choctaw, more properly Cha'hta, of Central and Southern Mississippi. Many of them resided on table-lands of the interior, being more agricultural than warlike in character. A nickname of theirs is "Tubbies," apparently taken from their stout or tub-like exterior, but in fact recalling the frequent ending of their war-titles, abi, *killer*. Many Choctaw settled in Louisiana during the eighteenth and nineteenth centuries. Some of the principal subdivisions of the people were the Sixtowns, the Long House, Cusha, Boguechito, Heyowani, and Chikasawhay.

Choktchúma, *Red crabs*: a Choctaw tribe settled on the Yazoo river; mentioned as early as 1540 as Saquechuma, *a walled town*.

Creek Indians, the most centralized, warlike, and politically powerful of the southern tribes, lived in compactly built villages along the fertile bottom-lands of the Coosa, Tallapoosa, Chattahoochee, and Flint rivers. They advanced from the Northwest to Georgia and Florida, subjugating the populations they encountered. Their settlements were divided into two parties: the red towns, also called war or kipáya towns, and the white or peace towns, tálua míkagi, conservative communities. These were governed by civil magistrates, whereas the red towns were controlled by the warriors only, and both parties appear to have been equally strong in numbers. Among the ancient Creeks two forms of speech prevailed: the archaic or female language, now in use among old people only, and the modern or male language; they differ chiefly in verbal endings, not in lexic elements. Historically, the Creek, or parts of their nation, were known as Conshac (*reed-knives*), Coosa, Tallapoosa, Kawita, and Osotchi. The present appellation, "Maskoki," appears to be of comparatively late origin. Among the peoples incorporated into the Maskoki confederacy were the Yuchi, the Natchez, the Alibamu, and the Koassati, some Shawanos, the Nukfalalgi of Southern Georgia, and some Cherokee and Yamasi. The Táskigi and the Tukabatchi are said to have formerly spoken an alien language.

Heyowáni, abbreviated to Towáni: a Choctaw or Cha'hta town on Pascagoula river, once strongly fortified. After their removal to the West, these Indians had a village at Lamourie Bridge, Rapids parish, La.—Hickory Ground, or Odshiapófa: a Creek town on Coosa river, a mile below the falls.—Hillabi: an Upper Creek town between the Coosa and the Tallapoosa rivers.—Huthli-Wahli, *Sharing-out war*: an Upper Creek town on Tallapoosa river.—Huma, or Ouma, *The red ones*: a tribe once settled on the western bank of the Mississippi river, about 20 miles above the Red river junction. Probably of Cha'hta lineage.—Ka-iläi'dshi: an Upper Creek town in the "central" district, between the Coosa and Tallapoosa rivers, Alabama.—Kasi'hta, often spelled Cussetaw: a Lower Creek town on Chattahoochee river. This white town was considered to be, with Kawita, the oldest of the Creek towns on Chattahoochee river.—Kawita, often spelled Coweta, and Kawita Tallahassi: two Lower Creek towns on Chattahoochee river, the latter being a "capital" of the people in the earlier periods. Both were red towns, ruled by the warrior class.—Koassáti, or Coushatta: a tribe once settled near the confluence of the Coosa with the Tallapoosa river. Two townships in the Creek nation are now inhabited by them; about twenty-five live at Shepherd, San Jacinto co., Texas. They speak a dialect approximating nearest to Alibamu.—Muklasa: a Creek town on the southern shore of the lower Tallapoosa river, speaking Alibamu.—Oipat ókla, *Smaller people*: an ancient territorial division of the Cha'hta people, embodying the Cusha and other districts; called so to distinguish it from the Ukla falaya, *Long people*, whose villages extended along a considerable space in the shape of a square.—Okfuski, or Akfaski, *Confluence tongue*: a Creek town built on both sides of Tallapoosa river. It gave origin to seven branch villages.—Okóni: a Hitchiti-speaking town on Okoni river, Georgia, from which the Hitchiti towns claimed descent; abandoned about 1710. Okoni is also the name of a town on Chattahoochee river settled by immigration from the Okoni above.—Sáwokli, *Raccoon town*: a very ancient town of the Hitchiti connection on lower Chattahoochee river, Near by was a colony or branch of it, Sawokli-ū'dshi, *Little raccoon town*.

Seminole Indians of Florida and Georgia: chiefly known in history for the heroic struggle they underwent to oppose the cession of their territory and their removal to the West (1835–42). After the end of this struggle about 400 of these Indians remained in the south of the peninsula. The majority are in the Indian Territory, on a separate tract, and in 1890 numbered 2,539 persons. The tribal name is Creek, and means *separatists*, seceders from the main body of the Upper and especially the Lower Creeks; the proper Indian form is isti isimanóle, or isti Simanólalgi. The Seminoles appear as a distinct political body about 1750, and many authors used the name as synonymous with Lower Creeks. Creek immigrants and invaders, however, are mentioned on the coasts of the peninsula long before that date. The Hitchiti portion of this national conglomerate had a political center in Mikasuki, Northern Florida, and, together with the Creek ingredient, possessed an unenviable reputation among the other Creeks.

Sixtowns, English Towns, or Ukla hánnali: a Cha'hta territorial division still kept up in the Choctaw nation, Indian Territory. Their numbers were subsequently increased. They were located in Smith and Jasper cos., Miss., and were called as follows: Chinokabi, Okatallia, Kilis-tamaha, Talla town, Nashoweya, Bishkon.—Taski'gi, *Jumpers*: a Creek town formerly at the junction of Coosa and Tallapoosa rivers. A town named Tuskegee is now built E. from there.—Tukabátchi, below the falls of Tallapoosa river; the largest town of the Upper and Lower Creeks, and a capital of theirs as late as the end of the eighteenth century.—Wewoka, *Roaring waters*: an Upper Creek town E. of Coosa river.—Witumka, *Rumbling waters*: a town at the Cascade Falls of Coosa river, whose dialect was that of Koassati.—Yamacraw, the misspelled Hitchiti form of the name Yámasi: a small Lower Creek settlement on Savannah river, 4 miles above the city of Savannah. This fragment of a tribe is mainly known to us through its chief, Tomochichi (d. 1739); its name should be spelled Yamathla, or Yamathli.

Yámasi Indians, or Yamasalgi, *The peaceables*: a body of Indians, mostly of Creek descent, who early in the eighteenth century dwelt on both sides of the Savannah river. At first they sided with the English colonists, then passed over to the Spanish side, and finally were annihilated by Creek war-parties after they had retired into Florida. They may be regarded as the early precursors of the Seminoles.

General Characteristics.—The Muskhogean family is so extensive that it is difficult to give any somatological characteristics which will apply to all of its population. Prognathism is not frequent among them, and their complexion is rather dark cinnamon, with the southern olive tinge. Their general intelligence renders them highly susceptible to civilizing influences. All the tribes were well advanced in agriculture, which rendered them relatively independent of the uncertainties of the chase. The members of the two main branches of the stock, the Creek and the Choctaw, differ in stature, the latter being thick-set and heavy, while the former, with the Hitchiti, are more lithe and tall.

The Muskhogeans had extensive systems of totemic clans, which were organized into tribes. Each tribe occupied a distinct village. The clans of every village were organized into two groups, symbolized by the colors white and red. From the white clans the councilors and civil chiefs were selected, while the warriors came from the red clans. Between many of the tribes a reciprocal promotion existed; that is, the white clans, gathered in council, selected the chiefs of the red clan, while the red clans in council selected the chiefs of the white clan. They used the *Ilex cassine* for the preparation of the black drink, erected artificial mounds, in the earlier periods worshiped the sun, and believed in a deity sometimes called the "holder of life." Their fire-worship was connected with their adoration of the sun, and they had many animal-gods. The children belong to the clan of the mother, an antique custom which must have prevailed throughout the Gulf territories. The Muskhogean, as well as other eastern tribes, had town-squares, where an annual festival called a fast (púskita in Creek) was celebrated. No instances of cannibalism are recorded, but scalping was a common custom. Artificial flattening of the foreheads prevailed in the western tribes, other deformations of the skull among the eastern tribes. The reinterment of bodies, after the bones were cleaned from the adhering muscles and ligaments several months after death, is recorded, more especially for the western tribes of the stock.

History.—Historical knowledge of the Muskhogean tribes for the first two centuries after the Columbian discovery is

exceedingly meager. In the sixteenth century three Spanish expeditions passed through the territories held by their tribes—Hernando de Soto, 1539; Tristan de Luna, 1559; and Juan del Pardo, 1567. From their reports it appears that the majority of these tribes were then inhabiting the same tracts and spoke the same dialects as they did about the year 1800.

During the seventeenth century the Spanish colonists had several contests with the Creeks on Tallapoosa river and with the Alabama Indians, as may be gathered from Barcia's *Ensayo cronológico*, and the Apalachia Indians of St. Mark's river, Florida, were subjugated by the Spaniards about the middle of the century. French colonists settled near the mouth of the Mississippi river and English pioneers on the shores of the Atlantic. The French could never overcome the hostile feelings of the Chikasa and their confederates, and in several wars waged against them the Chikasa experienced severe losses, until they were obliged to cede their territories to Great Britain by the peace of 1763. Oglethorpe was the first to conclude treaties with the inland Creek, and the British henceforth established trading-posts in their country. The war against the Cherokee and attacks of some turbulent bands of Creek Indians alternated with intertribal quarrels. The great rebellion of the Creek Indians (1812–14) was instigated by the British and by Tecumseh, their Indian emissary, to imperil the U. S. by an attack from the southern side; but the Creek were reduced by a series of defeats, and after the annihilation of their warriors at the Horseshoe Bend of the Tallapoosa (Mar., 1814) they made peace on the condition of ceding much valuable territory. The urgent pressure of the white population finally caused the removal of all the southern tribes to what is now called Indian Territory. The Cherokee began to emigrate thither in 1819, and were followed by the Seminole and Creek (1836–40), and by the Choctaw and Chikasa (1840–44). Peace being secured to them, they have since acquired a considerable degree of wealth and mental culture.

Population.—According to the census of 1890, the number of pure-blood Indians in the Territory is as follows: Choctaw, 9,996; Chikasa, 3,464; Creek, 9,291; Seminole, 2,539.

Authorities.—Adair, *The History of the American Indians* (London, 1775); Romans, *A Concise Natural History of East and West Florida* (New York, 1775 and 1776); Jefferys, *History of the French Dominions in America* (London, 1760 and 1761); Bartram, *Travels through North and South Carolina, Georgia, etc.* (Philadelphia, 1791); Lawson, *The History of Carolina* (Raleigh, 1860); Le Page du Pratz, *Histoire de la Louisiane* (3 vols., Paris, 1758); Hawkins, *A Sketch of the Creek Country in 1798 and '99* (Savannah, 1848); Milfort, *Mémoire ou Coup d'œil Rapide sur mes Différens Voyages et mon Séjour dans la Nation Crëek* (Paris, 1802); Margry, *Découvertes et Établissements des Français dans l'Amérique Septentrionale* (6 vols., Paris, 1880, etc.); Claiborne, *History of Mississippi*, vol. i. (1881). See Indians of North America.

J. W. Powell.

Muskingum: the longest river wholly in Ohio; formed at Coshocton by the confluence of the Tuscarawas and the Walhonding rivers. Thence it flows generally S. E., 112 miles to the Ohio at Marietta. Zanesville is on its banks. The river is navigable by slackwater improvements 90 miles to Dresden, which is 130 feet higher than its mouth. Its valley is fertile and beautiful.

Muskmelon: See Melon.

Musko'ka: a lake, river, and county of Ontario, Canada; on the eastern side of Georgian Bay; but the name is loosely applied to the entire district from Severn river to Lake Nipissing, and northeastward to the Ottawa river. Thus defined it is about half as large as Maine, a tangle of forests, rivers, and lakes (of which last there are said to be 800 of considerable size). It was long practically uninhabited, but is now crossed by railways and dotted by summer hotels. The waters of the lake are deep, clear, and cool, and swarm with fish.

M. W. H.

Musk-ox: the sole member (*Ovibos moschatus*) of a peculiar sub-family (*Oviboviнæ*) of the ox family (*Bovidæ*); so named from the musky flavor of the bulls and old cows. It is about the size of a small heifer. The horns, which suggest on a small scale those of the African buffalo, are large at the base, in old males almost meeting on the forehead; they curve at first downward and outward, then upward and slightly forward. The body is heavy and legs short, but the coat of very long, thick, dark-brown hair makes the animal look still heavier. There is an undercoat of thick woolly fur, shed in summer. The musk-ox feeds on grass, lichens, and the twigs of pine and willow. This animal is at present confined to the extreme northern parts of the North American continent, where it ranges over the barren grounds to the N. of lat. 60°, roaming in summer to the islands within the Arctic Circle. During the glacial period its range must have been far more extensive, as its bones have been found in drift-gravel in the valley of the Avon at Bath, and elsewhere in England; while the remains of allied species, termed *Bootherium* by Leidy, have been found in the U. S.

Musk-ox.

Revised by F. A. Lucas.

Muskrat: a name applied in different countries to several rat-like mammals distinguished by musky exhalations. (1) In North America it is conferred on the *Fiber zibethicus* (by some called also *musquash*), a rodent of the family *Muridæ*, and the group which contains the field-mice. It is larger than most of the family, being some 15 inches in length, with a tail of 10 inches. It is aquatic, sometimes building houses like those of the beaver, and oftener burrowing in river-banks. It is abundant in many parts of North America. Its fur (the "river sable" of commerce) is extensively sold in Europe. The creature has a strong smell of musk. (2) In India the name is given to the *Crocidura myosurus*, a large rat-like shrew, which possesses and communicates to whatever it touches an intolerable and nearly indelible musk-like smell. (3) It is also applied to the European *Myogale moschata*, or desman, a representative of the family of *Talpidæ* or moles.

Musk-wood: the wood of *Guarea grandiflora* and *G. swartzii*, meliaceous trees of the West Indies, whose wood is finely redolent of musk. The name is also given to *Olearia argophylla*, a composite-flowered shrub of Tasmania, sometimes cultivated.

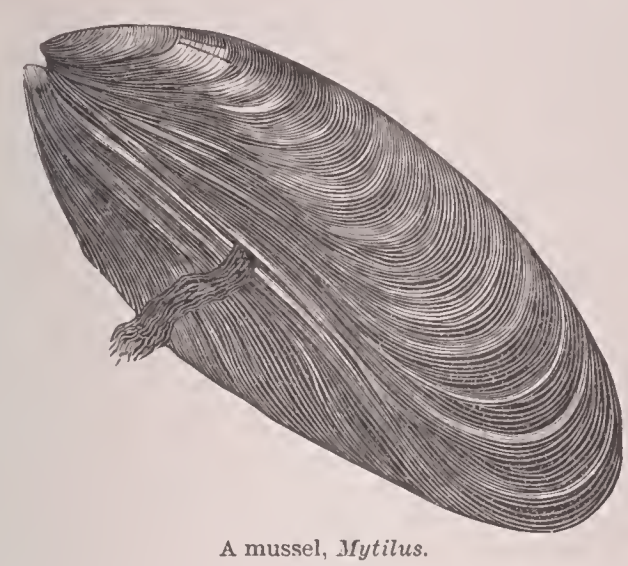
Muspratt, James Sheridan, Ph. D., M. D., F. R. S. E.: chemist; b. in Dublin, Mar. 8, 1821; was educated in Liverpool, where his father established a large manufactory of chemicals; traveled in Germany and France; studied chemistry at Andersonian University, Glasgow, in the laboratory of Prof. Graham, whom he afterward accompanied to London; became when sixteen years old chemist for a large manufactory of chemicals in Manchester; tried mercantile life in the U. S. without success; studied chemistry under Liebig 1843–45, graduating as Ph. D. at Giessen; made numerous discoveries, chiefly in organic chemistry, especially concerning the remarkable bodies produced from the sulphocyanides of ethyl and methyl; founded the Liverpool College of Chemistry, and became a professor there. Among his works are a valuable translation of Plattner on the blowpipe (1844); *Outlines of Qualitative Analysis* (1849); and a *Dictionary of Chemistry* (1854, *seq.*), which found a wide circulation in both England and the U. S., and was translated into German and French. D. at West Derby, England, Feb. 3, 1871.

Musquash: See Muskrat.

Mussafia, Adolf: philologist; b. at Spalato, Dalmatia, Jan. 15, 1834; studied at first medicine and then philology at Vienna, where he is Professor of Romance Philology at the university and member of the Academy of Sciences. He is one of the eminent scholars of the time in the Romance languages, particularly in text-criticism, old Italian dialects, and mediæval legends, and has contributed many articles and reviews to German, French, and Italian linguistic periodicals, many of his most valuable papers appearing in the publications of the Vienna Academy. Among his writings are *Italienische Sprachlehre* (1860); *Altfranzösische Gedichte aus venezianischen Handschriften* (1864); *Monumenti antichi di dialetti italiani* (1864); *Darstellung der altmailändischen Mundart* (1868); *Darstellung der romagnolischen Mundart* (1871); *Beitrag zur Kunde der norditalienischen Mundarten im XV. Jahrhundert* (1873); *Die catalanische metrische Version der sieben weisen Meister* (1876); *Studien zu den mittelalterlichen Marienlegenden* (i., 1886; ii., 1887; iii., 1889); *Zur Christophlegende* (i., 1893, etc.).

E. S. Sheldon.

Mussel [for etymology, see Muscle]: a name often popularly applied to many species of bivalve molluscs, but more properly restricted to the members of the family *Mytilidæ*, and with the qualification fresh-water mussel to the Unioni-



A mussel, *Mytilus*.

dæ (*q. v.*). The marine mussels have an elongated shell closed by a single muscle, and they have the ability to anchor themselves to any solid support by a cable of silken threads (byssus, shown in cut). Most of the species live in shallow water, and the common mussel (*Mytilus edulis*), common to the colder waters of Europe and America, is often eaten in the Old World. The severe sickness which sometimes follows its use may be the reason for its neglect in America. The fresh-water mussels are much different in structure, and are useless as a food-supply for man.

J. S. Kingsley.

Musset, mü'sā', Louis Charles Alfred, de: poet; b. in Paris, Dec. 11, 1810; son of M. de Musset-Pathay, editor of an esteemed edition of J. J. Rousseau. He was educated at the Collège Henri IV., and maintained a high level of merit. His father then wished him to study law, but he had a great repugnance for the routine of business, shared the romantic excitement that was then reaching its height in the world of letters and art, and was consumed by a vague literary ambition. He made a pretense of studying law and then tried medicine, but found both repellent, and for two or three years did little but frequent the romantic *cénacle*. In 1829 he became for a short time a clerk in a business house. In the beginning of 1830 he published his first volume of poems, *Contes d'Espagne et d'Italie*, which, with many features of romanticism, showed yet an independent personality. His independence became clearer in the next poems, forming the volume *Un spectacle dans un fauteuil* (1832). In 1833 he made the acquaintance of George Sand, and the liaison that followed, passing through the tempestuous passion of their journey to Italy (1834) and ending with a series of violent quarrels and reconciliations (1834–35), was the profoundest experience of his life, and left its traces on most of his works. The series of the Nights, his masterpieces—*Nuit de mai* (1835), *Nuit de décembre* (1835), *Nuit d'août* (1836), *Nuit d'octobre* (1837)—flowed directly from it, and the latter part of the prose story *Confessions d'un enfant du siècle* (1836) is the narrative of it. A first trial of the stage with the comedy *La nuit vénitienne* (1830) was a failure, and he ceased to write for representation; but he continued to use the dramatic form, and, free from all concern for the demands of popular taste, produced the historical tragedy *Lorenzaccio* (1834), and a series of slight but original *Comédies et Proverbes*, dialogues full of airy fancy and sprightly and delicate wit, with love for their constant theme: *Les caprices de Marianne* (1833); *Fantasio* (1834); *On ne badine pas avec l'amour* (1834); *Le chandelier* (1835); *La quenouille de Barbarine* (1835); *Il ne faut jurer de rien* (1836); *Un caprice* (1837); *Il faut qu'une porte soit ouverte ou fermée* (1845). He also wrote a few short stories of fresh and simple sentiment; the better known are *Frédéric et Bernerette* (1838); *Margot* (1838); *Croisilles* (1839); *Emmeline* (1842); *L'histoire d'un merle blanc* (1842); *Mimi Pinson* (1843); *Le secret de Javotte* (1844). In 1838 he was appointed librarian of the Department of the Interior. He lost this position some years later, and in 1855 was appointed librarian of the Department of Public Instruction. After 1840 he wrote very little. His course of life had wrecked his health, and he aggravated his condition by the use of stimulants. He was elected a member of the Academy in 1852. D. May 2, 1857. As a poet his power is essentially lyric. His range is narrow, but within it his power is such that he is ranked with Hugo and Lamartine as one of the first three French poets of the nineteenth century. See his *Biographie* by Paul de Musset (Paris, 1877; Eng. trans. by Miss H. W. Preston, Boston, 1887); Arvède Barine, *Alfred de Musset* (Paris, 1893). A. G. Canfield.

Mustang: a name applied to the small wild horses of Texas and to the ponies of the Indian tribes of the southwest of the U. S., which are of one and the same stock, descended from horses of Spanish importation. They associate in large troops, are caught for use by the reata or lasso, and are easily broken to the saddle, though it is often done in a very imperfect fashion. They are hardy and spirited, but often very fractious unless carefully handled.

Mustapha: name of four Ottoman sultans. Mustapha I. (1617, 1622–23), b. 1591; son of Mohammed III.; was an imbecile, twice deposed; d. 1623.—Mustapha II. (1695–1703), b. 1664; son of Mohammed IV., was an able, just, and kindly prince; under him was signed the disastrous treaty of Carlovitz, which sanctioned the first dismemberment of the Ottoman empire. D. 1704, one year after deposition.—Mustapha III. (1757–74), b. 1717; son of Achmet III., though intelligent and animated by high purposes, could neither carry out internal reforms nor retard the decline of the empire. D. 1774.—Mustapha IV. (1807–08), b. 1779, succeeded Selim III. An opponent of reform, he owed his promotion to the Janissaries, and was deposed and strangled the following year. E. A. Grosvenor.

Mustard [from O. Fr. *moustarde* > Fr. *moutarde*: Ital. *mostarda*, from Lat. *mus'tum*, must, unfermented grape-juice, with which mustard was mixed in preparing it for use]: the seed of a number of annual plants of the genus *Brassica* (formerly classed as Sinapis) in the natural order *Cruciferæ*. Black mustard is the seed of *Brassica nigra*, and white that of *B. alba*, native in all parts of Europe, and cultivated in gardens in the U. S. Black-mustard seeds are small, globular, of a deep-brown color externally and yellow within. The white are larger, and of a light color externally. Flour of mustard consists of a mixture of the two kinds of seeds, ground and sifted. As sold, it is generally adulterated with wheat flour and turmeric. Such adulteration is infallibly betrayed by the presence of starch-grains, which are absent in pure mustard. Mustard flour is a popular condiment, and was known to the ancients. It has also medicinal uses. The moistened flour applied to the skin is a powerful irritant and vesicant, and is much used as a counter-irritant to relieve internal pains and spasms. A tablespoonful diffused in a tumbler of water and swallowed acts as a prompt non-nauseating emetic, often convenient in cases of poisoning.

Mustard Family: a group of mostly herbaceous dicotyledons (*Cruciferæ*), with choripetalous, cross-shaped flowers having usually six stamens and a single superior bicarpellary ovary. About 1,500 species are known, mostly natives of the temperate regions of the globe. Most of the species possess a pungent juice, and indeed the members of this family may be recognized commonly by their mustard-like pungency. Among the well-known genera are *Brassica* (containing cabbage, turnip, and mustard), *Raphanus* (radish), *Cheiranthus* (wall-flower), *Hesperis* (rocket), *Iberis*, *Alyssum*, etc. Mustard, shepherd's-purse, peppergrass, and false flax are troublesome weeds. C. E. B.

Mustard Oil: a substance distilled from the ripe seeds of the black mustard (*Brassica nigra*) after the fixed oil has been expressed. It is not contained in the dry seed, but is formed after the addition of water. A soluble ferment, called myrosin, is contained in the seed together with a glucoside, myronate of potassium. When the ferment is dissolved in water it acts upon the glucoside, and decomposes it into glucose, mustard oil, and acid potassium sulphate, as represented in the equation:

$$\underset{\text{Potassium myronate.}}{KC_{10}H_{18}NS_2O_{10}} = \underset{\text{Glucose.}}{C_6H_{12}O_6} + \underset{\text{Mustard oil.}}{C_3H_5CNS} + KHSO_4.$$

The oil is extremely pungent, and when applied to the skin it produces a blister. Chemically, mustard oil is known as allyl isothiocyanate, and is a member of a class of substances several of which have been prepared by artificial methods and have properties similar to those of ordinary mustard oil. This also has been made artificially. Ira Remsen.

Mustel'idæ [Mod. Lat., named from *Muste'la*, the typical genus, from Lat. *mūstē'la*, weasel, a dimin. of *mus*; cf. O. Fr. *musteile*]: name of a family of mammals of the order *Feræ* or *Carnivora*, comprising many species, such as the weasels, skunks, badgers, otters, etc. The form is very variable according to the genus, in some, such as the small weasels, the trunk being very much elongated, and in others, such as the gluttons and badgers, being comparatively concentrated and robust; the teeth are adapted to a purely carnivorous diet, the molars of the upper jaw and the last premolar of the upper jaw being typically sectorial, or adapted for cutting. The true molars are reduced in number to one above and two (or, as in *Mellivora*, one) below. The skull exhibits many characters in common; the paroccipital process is closely applied to the auditory bulla; the mastoid process prominent, and projecting outward or backward behind the external auditory meatus; the carotid canal is distinct, and more or less in advance of the foramen lacerum posticum; the condyloid foramen is distinct from the latter; the glenoid foramen is generally well defined; the intestinal canal has no cæcum; the prostate gland is not salient, being contained in the thickened walls of the urethra; Cowper's glands are not developed; the os penis is large. The family in most of the characters thus referred to exhibits decided affinity with the bears, raccoons, and allied forms, and not at all with the cats and dogs, agreeing with the last simply in adaptation for carnivorous diet. It contains numerous species, which have been distributed among eight sub-families—viz., (1) *Mustelinæ*, including the genera *Mustela*—i. e. the large weasels; *Putorius*—i. e. the small weasels; *Gulictus*—i. e. the weasels of tropical America; and *Gulo*—i. e. the gluttons or carcajou; (2) *Melinæ*, with the genera *Meles* and *Arctonyx*, or Old World badgers; *Mydous*, or African teledu, and Taxidæ, or American badgers; (3) *Mellivorinæ*, with its single genus, *Mellivora*—i. e. the African and Indian ratels or honey-badgers; (4) *Mephitinæ*, or the American skunks, including the genera *Mephitis*, *Conepatus*, and *Spilogale*; (5) *Ictonychinæ*, with the South African genus *Ictonyx* or *Zorilla*; (6) *Helictidinæ*, with the Asiatic genus *Helictis*; (7) *Lutrinæ*, with the various genera of fresh-water otters of all parts of the world; and (8) *Enhydrinæ*, with the genus *Enhydris*, or the sea-otters of the North Pacific.

Mut: an Egyptian goddess; the second member of the Theban triad (Amon, Mut, and Khonsu), and wife of Amon. She symbolized Nature as the mother of all things. She is represented as a woman with a vulture head-dress, the uräus, and the double crown of Egypt, and with the life-sign in her right hand. C. R. G.

Mutata: See IMMUTATA.

Mutation: See UMLAUT.

Mutes [from Lat. *muta* plur., translation of Gr. ἄφωνα, sc. γράμματα, toneless; ἀ-, not + φωνή, tone. The Greek grammarians commonly divided the letters into φωνήεντα, vowels, and σύμφωνα, consonants, and the latter into ἡμίφωνα, half-toned (ζ, ξ, ψ, λ, μ, ν, ρ, σ), and ἄφωνα, toneless (β, γ, δ, κ, π, τ, θ, φ, χ)]: a traditional term of phonetics, for which modern science generally substitutes the term explosives or stops (Germ. *Verschlusslaute* or *Explosivlaute*). These sounds are the result of a check upon the breath or the breaking of a check. The commonest illustrations are *k*, *g*, *t*, *d*, *p*, *b*. See PHONETICS. BENJ. IDE WHEELER.

Mutsu Hito, moot'soō sh'tō: the reigning Mikado or Emperor of Japan; b. Nov. 3, 1852; ascended the throne Feb. 3, 1867. His administration is notable for the great reforms that have been introduced and the remarkable development of the empire. The official designation of his reign-period is Mei-ji (pronounced mā'jee').

Mutton-bird: a popular name, used in Australia and New Zealand, for the large petrels of the genus *Œstrelata*, particularly for *Œstrelata lessoni*.

Mut'tra: town of British India, in the Northwestern Provinces; on the banks of the Jumna (see map of N. India, ref. 5–E). It is built on high and hilly ground, with magnificent flights of steps, adorned with temples, leading down to the river, which is kept sacred by the Hindus, and annually attracts vast numbers of pilgrims. The enormous riches which the town formerly contained have been carried away by various conquerors, its fortifications have fallen into ruins, and nothing is left but the narrow, dirty streets, which swarm with so-called sacred apes, parrots, peacocks, and bulls. Pop. (1891) 61,195.

Mužáková, moōzh'ăăk-ov'ă, JOHANNA: Bohemian novelist, better known by her pseudonym SVĚTLÁ (*q. v.*).

Myc'ale [= Lat. = Gr. Μυκάλη]: the modern *Samsum*; the westernmost branch of Mt. Mesogis, in Lydia, Asia Minor, terminating in the promontory called Trogylium (now Cape Santa Maria). In the narrow channel between this promontory and the island of Samos the Persian fleet was defeated and destroyed by the Greeks in 479 B. C. It is probable that at the time of the battle there was a town—Mycale or Mycallessus—at the foot of the promontory, but no certain account of it is extant.

Myce'næ, or **Myce'ne** [= Lat. = Gr. Μυκῆναι, or Μυκήνη]: one of the oldest cities of Greece; situated on a rocky eminence in the plain of Argos, in the Peloponnesus. It was the residence of the Pelopidæ, and at the time of Agamemnon it was the principal city of Greece. In 468 B. C. it was totally destroyed, and it was never rebuilt, but the remains of it, the cyclopean walls, the gate of lions, and the treasury of Atreus, are among the grandest and most interesting antiquities in Greece. The ruins are near the little village of *Charvati*, 5 miles N. E. of Argos. The excavations of Schliemann in 1876 and of the Greek Archæological Society from 1886 to 1888 have added much to our knowledge of the importance of Mycenæ, for they brought vast treasures to light, and have opened up an entirely new chapter in the history of early art. See Schuchhardt, *Schliemann's Excavations* (London, 1891); Brunn, *Griechische Kunstgeschichte* (Munich, 1893); Overbeck, *Geschichte der Griechischen Plastik* (Leipzig, 1893); Collignon, *Histoire de la Sculpture Grecque* (Paris, 1892); Perrot and Chipiez, *Histoire de l'Art dans l'Antiquité, La Grèce Primitive, l'Art Mycénien* (Paris, 1893). See also Milchhoefer, *Die Anfänge der Kunst in Griechenland* (Leipzig, 1883); Loeschcke and Furtwaengler, *Mykenische Vasen* (Berlin, 1886); Steffen, *Karten von Mykenae* (Berlin, 1884). J. R. S. STERRETT.

Mycerinos (Egypt. *Menkara*): the Mechirinos of Diodorus; the sixth king of the fourth Egyptian dynasty; builder of the third largest pyramid at the S. W. of Gizeh. In 1837 Col. Vyse found his stone sarcophagus intact and also some pieces of the wooden coffin in his pyramid. The former was lost at sea off Gibraltar. The inscriptions of the latter show a definite form of the Egyptian belief in a future existence. His reputation for piety was enduring, and the thirtieth and sixty-fourth chapters of the RITUAL OF THE DEAD (*q. v.*) were said to have been discovered during his reign, being then already old. CHARLES R. GILLETT.

Mycetozoa: See SLIME MOULDS.

Mycoderm: See FERMENTATION.

Myeli'tis [Mod. Lat. *my'elon*, spinal marrow, spinal cord (from Gr. μυελόν, earlier μυελός, marrow) + suffix *-itis*, denoting a disease of the part to whose name it is added]: a common nervous disease. Formerly the term was applied also to diseases which are allied but now easily distinguishable from it in life and *post mortem*. Myelitis may affect limited or extensive portions of the cord, and we speak of localized and diffuse or disseminated myelitis. The gray matter of the cord alone may be involved (central myelitis), or only the cortical white substance may be affected. An interesting form is that in which a transverse section of the cord, of limited extent, upward and downward, is inflamed in consequence of angulation of the spinal column or pressure from some other cause. This is known as transverse myelitis.

The causes of myelitis are varied. Sometimes it results from exposure to cold or from over-exertion. At other times it seems to result from infectious diseases, from injury, or from intemperance. The appearance of the spinal cord varies widely in myelitis, in accordance with the rapidity of development. In very acute cases and in those in which the disease results from pressure on some part of the cord, the affected area is softened and pulpy. When the process is more gradual, reparative changes take place at the same time as degeneration, and the cord may be gray and tough. Microscopically, the nerve-fibers of the cord are found in a state of greater or less degeneration, and there is an evident attempt at repair by new growth of fibrous tissue, as in destructive diseases of other organs.

The symptoms manifested in myelitis vary somewhat with its rapidity of development and with the distribution of the inflammation. Generally mild disturbances of sensation are the initial indications of spinal irritation. Among these

sensory symptoms are such as the feeling of ants crawling over the skin, numbness of the feet, a woolly feeling in the skin, pricking sensations, heat, cold, and the like. Soon after this, or coincidently, power fails in the legs and tends to grow worse. Paralysis of the legs is known as paraplegia, and in the great majority of cases is due to myelitis. In exceptional instances the disease in the cord rises so high that the arms may be involved in the palsy, but more generally death takes place when the upper part of the spinal cord is diseased, before the distribution of the paralysis is defined. As the disease advances, some wasting of the legs is noted; sensation, in place of perversion, becomes benumbed, and there may be complete loss of feeling in the skin of the legs and body to the level of the disease. Finally, bed-sores are apt to develop, and serious disease of the urinary bladder and kidneys may result from inability to void the urine properly.

Myelitis is always a serious disease, very acute cases tending to early fatal termination, and only in its milder forms is treatment of much value in a curative sense. Much may be done to prevent unpleasant or dangerous complications, but complete recovery is rare even in mild cases. Absolute physical and mental rest may do much in the early stages to limit the disease. Careful diet and cleanliness are essential, especially the latter. Strict attention should be paid to the bed and to bathing the patient's back to prevent bedsores. Certain remedies, like ergot, may have value at the onset of the disease; and after it has become established, cool bathing, the use of electricity to the limbs, strychnia, and nitrate of silver are recommended. WILLIAM PEPPER.

Myer, ALBERT JAMES: See the Appendix.

Myer, ISAAC: See the Appendix.

Myers, FREDERIC WILLIAM HENRY: author; b. at Keswick, England, Feb. 6, 1843; was educated at Cheltenham College and Trinity College, Cambridge; was fellow of Trinity and classical lecturer 1865–68; published *St. Paul* (poem, 1867); *The Renewal of Youth, and other Poems* (1882); *Essays, Modern and Classical* (1883); *Science and a Future Life, with other Essays* (1893). He was collaborator in *Proceedings of the Society for Psychical Research* (1882 onward) and in *Phantoms of the Living* (1886).

Myliobat'idæ [Mod. Lat., named from *Mylio'batis*, the typical genus, liter., the millstone skate; Gr. *μυλίας*, millstone (deriv. of *μύλη*, mill) + *βατίς*, a flat fish, named from having teeth adapted for grinding]: a family of the class of selachians and order *Raiæ*, or rays; rather to be called *Aëtobatidæ*, as *Aëtobatis* is an older name for the genus often called *Myliobatis*. The disk formed by the union of the pectoral fins with the body is very broad, by reason of the lateral extension of the latter, and the tail is very long and attenuated; the dorsal fin is developed near its root, and behind it is one or a pair of spines serrated at their lateral edges; the pectoral fins are atrophied at the sides of the head, but at the extremity of the snout are developed as a pair of detached cephalic fins; the skin is smooth and destitute of spines; the head quite deep; the mouth inferior and transverse; the teeth have flat grinding surfaces, and are quadrangular or hexangular, and in one or several interlocking longitudinal rows. The family is divisible into two sub-families, the one with a median row of teeth, besides several lateral rows, which alternate and interlock with the adjoining ones, the other, with the teeth broad and in a single row, answering to the median row in the former. Several species are found on the coast of the U. S. On the eastern coast the *Rhinoptera bonasus* is sometimes called clam-cracker, sting-ray, and cow-nose ray: the *Aëtobatis fremenvillei*, sharp-nosed ray; and the *A. aquila* is in England known as eagle-ray. Revised by D. S. JORDAN.

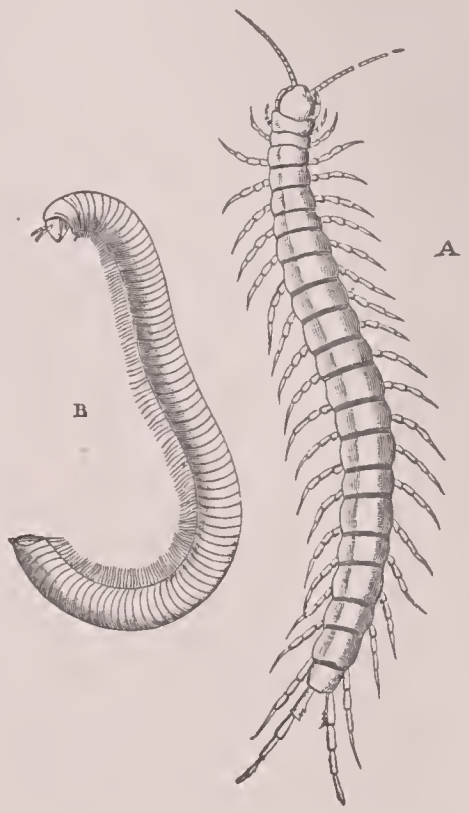
Mylit'ta (Gr. *Μύλιττα*): a goddess worshiped in Babylon, Assyria, and Persia; corresponding in some respects to the Greek Aphrodite Urania. She was the great cosmic principle, the great mother, who produced all life in conjunction with Bel (or Baal), her male counterpart. She was worshiped under a variety of names in Asia, and in Greece she was known now as Cybele and now as the Artemis (Diana) of Ephesus. J. R. S. STERRETT.

Myocardi'tis: See HEART DISEASE.

Myograph: See RECORDING APPARATUS, PSYCHOLOGICAL, in the Appendix.

Myo'pia: short-sightedness due to excessive convexity of the cornea or to convergence of the visual axes of the eyes. The defect is remedied by concave glasses.

Myriap'oda [Gr. *μύριοι*, ten thousand + *πούς, ποδός*, foot]: a class of elongated animals with homonomously segmented bodies. Popularly they are known as centipedes, millipedes, galley-worms, and army-worms. In structure they show considerable similarity to the so-called Protracheata (*Peripatus*) and some of the annelid worms on the one hand, and to the Hexapoda (see ENTOMOLOGY) on the other. At one time they were classed with the Hexapoda under the term *Insecta*, or its equivalent *Antennata*, and at another as forming a distinct class by themselves. More recent studies have shown that half (Chilopoda) of the group have undoubted Hexapodan affinities, while the other half (Diplopoda) must stand by itself, as having no connection with the Hexapodan phylum. Heretofore the two groups have been kept together chiefly on account of the common character of a multisegmented and many-legged body. This, however, is overbalanced by the decided differences in the structure of the mouth-parts and in the position of the sexual organs, which can not be explained except by supposing an independent origin for the two groups. All previous endeavors to derive one group from the other have been based on an ignorance of the value of these differences, and on an exaggerated value of unimportant similarities or on those now readily explained without supposing the existence of a genetic relationship.



Myriapods: A, *Scolopendra* (Chilopod); B, *Iulus* (Diplopod).

In both groups the number of legs varies greatly. Thus among the Diplopoda *Pauropus* has 9 pairs, *Polyxenus* 15, the *Polydesmidæ* have 28 to 31, and the *Polyzonidæ* from 56 to 196 or more. Among the Chilopoda the number varies from 15 in the *Scutigeridæ* and *Lithobiidæ* to 21 and 23 in *Scolopendridæ* and to as many as 170 and more in one of the *Geophilidæ*. It is to be noted that only in the forms with comparatively few legs is the number constant for the species. In one of the common species of *Geophilus* (*G. bipuncticeps*) adults may be found with from 61 to 67 pairs of legs. There is a body segment for every pair of legs, although in the Diplopoda the upper half of the segment has become so modified that there are apparently two pairs of legs to a segment. Hence the name Diplopoda. In each ring either the dorsal portions of two segments have grown together, or one has covered two segments. Then this has grown downward, crowding the bases of the legs together until, in many instances, there is scarcely any sternal space between them. This explanation of the anomalous double-footed condition is based upon a comparison with the fused segments in certain Crustacea, and upon the development of the young Diplopod.

In the number and character of the mouth-parts real differences occur. While the number of oral appendages in the Chilopoda is three, which bear comparison with those of Hexapods (see ENTOMOLOGY), in the Diplopoda there are only two pairs, a pair of mandibles and a large plate-like lower lip (gnathochilarium), which, according to the embryological studies of Metschnikoff and others, is developed from a pair of primitive appendages. In the Chilopoda the first pair of legs become very much enlarged, and lie beneath the head as a pair of prehensorial jaws. In the terminal joint of these is a poison gland, which opens by a small pore near the tip of the terminal joint.

The internal anatomy in both groups is primitive in general character. The alimentary canal runs straight through the body without or with but slight differentiation

into regions such as are readily observed in the Hexapoda. The Malpighian tubules are two in number in all excepting the one genus *Scutigera*, in which there are four. The nervous system consists of a long chain of ganglia, one to each pair of legs, and a sub- and a supra-œsophageal ganglion. In the Diplopoda the two strands composing the chain are completely fused, and the ganglionic swellings are very slight. The respiratory system in the Chilopoda may be very complex from the interlacing and anastomosing of the tracheal branches. In the Diplopoda no such branching occurs; the tracheæ arise from the spiracles near the base of the leg and run into the body as simple tubes. To this *Glomeris* offers the only exception, but even here the branching is very simple. Though apparently ventral in the Diplopoda, the spiracles in both groups are on the side of the body, excepting in the genus *Scutigera*, where there is a row of spiracles in the median dorsal line. In this genus the internal structure also of the respiratory apparatus differs from that of the others. The spiracle opens into a small chamber from which radiate small tracheæ branching dichotomously and ending bluntly in the tissue surrounding the heart. There are seven of these organs, each situated on the posterior margin of a dorsal shield. In other forms of the Chilopod group the spiracles may be on every segment except the last two, as in the *Geophilidæ*, or on approximately every other one. Thus in the *Scolopendridæ* and the genus *Lithobius* they are found on segments 3, 5, 8, 10, 12, etc., while in the genus *Henicops* the arrangement is the same, with the addition of a pair on the first segment. The reproductive system of the Diplopoda is in marked contrast with that of the Chilopoda. In the latter the ovaries and testes lie above the intestine. The two oviducts pass along the sides of the intestine, unite under it, and open by a single opening in the penultimate segment. In the Diplopoda the genital glands lie underneath the intestine, and open by two short ducts in the third body segment or between the second and third pairs of legs. In both groups so-called salivary glands occur. In the Chilopoda these are short and racemose; in the Diplopoda they consist of two pairs of elongated simple tubes. These are so fused together as to appear like two elongated threads, one on either side of the intestine, comparable to the spinning glands of Lepidopterous larvæ, or to the slime-glands of *Peripatus*. Protective dermal or repugnatorial glands occur in both groups. On the majority of the rings in the Diplopoda there is a pair of repugnatorial pores, secreting a fluid with the odor of crushed almonds, due to the presence of hydrocyanic acid. In the *Geophilidæ* numerous pores are gathered into areas on each sternum. Besides these small pores there may be large ones on the coxæ of the penultimate segment, or on the anal segment. In the *Lithobiidæ* they occur on the under side of the coxæ of the last four pairs of legs. In some cases, as in one of the *Polydesmidæ* and several of the *Geophilidæ*, the animals are phosphorescent. In the former family the phosphorescence is plainly due to the action of the repugnatorial glands, but in the *Geophilidæ* observers differ as to whether it is produced by the ventral pores or in the intestinal region. Sensory organs are more or less developed. The eyes, where present, consist of simple ocelli, in numbers ranging from a single pair in one of the *Lithobiidæ* to very many in *Scutigera*. In *Scutigera* the ocelli are so numerous as to form a compound eye, comparable with that of Hexapods. The *Polydesmidæ* and some others among the Diplopoda, and the *Geophilidæ* and some of the *Scolopendridæ* among the Chilopoda, are without eyes. At the end of the terminal joint of the antenna of Diplopods are several two-jointed processes that are undoubtedly tactile in function, and may also be used as organs of smell. In *Sphærotherium*, of the same group, a stridulating apparatus occurs. This argues the presence of auditory organs.

The eggs of the animals are laid in the ground, usually in nests. In the case of *Lithobius* they are laid singly. Sometimes the eggs and newly hatched young are guarded by the mother, as was observed with *Geophilus ferruginosus* by Fabre and others, and with *Scolopocryptops* by Wood. *Scolopendra* is said to be ovoviviparous. The eggs undergo total segmentation, and during development show similarities to the eggs of *Peripatus* and to those of Hexapoda. Very much yet remains to be learned in regard to the early stages of growth. The Diplopod young escapes from the egg with few body segments and only three pairs of legs, a fact that has been regarded as proving their affinities with the Hexapoda, and as showing them to be the antecedents of the Chilopoda. The larva undergoes a series of moultings, more segments and more legs being added with each moult until the adult condition is reached. Among the Chilopoda there are two distinct divisions to be noted. In one, the *Epimorpha*, the young hatch from the egg with the adult number of segments and legs, while in the other, the *Anormorpha*, the young have at first only seven pairs of completely developed legs and three pairs of leg buds. With successive moultings new segments and new legs are added until the adult number of fifteen is reached.

The distribution of the Myriapoda is worldwide, a fact that indicates an early origin. The Chilopoda are not, however, found earlier than the Tertiary period, unless the Protosygnatha of Scudder be admitted as a primitive Chilopod, which is extremely doubtful. On the other hand, the Archipolypoda, apparently the precursors of the Diplopods, are found as far back as Devonian times. Of the Protosygnatha, the only form, *Paleocampa anthrax*, found by Meek and Morthen in the carboniferous formation at Mason Creek, Illinois, has ten body segments and two rows of spreading fascicles of needle-like spines. These give it the appearance of a caterpillar, and as such it has been described. If it is at all related to the Myriapods, it is more likely to *Polyxenus* of the Diplopoda than to any of the Chilopoda. Concerning the relationships of the Archipolypoda there is less doubt. The *Euphorberidæ*, occurring in the same beds as *Paleocampa*, are peculiar from the large spines on the back and sides, and for certain openings occurring in each segment between the bases of the legs. The former occur in some of the Diplopoda, but the meaning of the latter is an unsolved problem. Chief among works on Myriapoda are Latzel's *Die Myriapoden der Oesterreichisch-Ungarischen Monarchie*, containing a full bibliography, and the embryological works of Metschnikoff, Sograff, and Heatheote. For American forms, see Bollman's *Myriapods of America* (1893). F. C. Kenyon.

Myris'tica, or **Nutmeg**: the kernel of the seed of a tree about 30 feet in height, closely resembling the orange-tree; a native of the Banda islands and some neighboring islands. Its scientific name is *Myristica fragrans*. It does not flower until the eighth or ninth year, but after this time it bears flowers and fruit together constantly, and continues to do so for many years. In order to insure early fruitfulness a branch of the female tree is grafted into all the young plants when about two years old. Sometimes as much as three crops are gathered annually. Mace is the inside covering of the nutmeg. Upward of 1,500,000 lb. of nutmegs are imported into the U. S. yearly. Nutmeg is used in medicine as a nervous sedative, and mace is sometimes employed as its substitute. H. A. Hare.

Myrmeleon: See Ant-lion.

Myrmid'ones (in Gr. Μυρμιδόνες): the followers of Achilles in the campaign against Troy. They came originally from Ægina, and received their name from μύρμηκες, ants, because Zeus, at the request of Æaeus during a plague, changed all the ants of the island into men, and thus peopled it. Peleus led them into Thessaly, where they settled.

Myrob'alan [viâ Fr. from Lat. *myroba'lanum*, from Gr. μυροβάλανος; μύρον, unguent, fragrant juice + βάλανος, acorn]: a drug formerly much used in medicine as an astringent, and now used by tanners, dyers, and ink-makers for the tannic acid it contains. Myrobalans, sometimes called white galls, are the fruit of East Indian trees (*Terminalia bellirica* and *T. chebula*, of the order *Combretaceæ*), of a euphorbiaceous plant (*Phyllanthus emblica*), and of other trees of tropical regions.

My'ron (in Gr. Μύρων): a sculptor; b. at Eleutheræ, in Attica, who flourished about 460 B. C. He was a pupil of Ageladas, as were Phidias and Polyclitus. He worked almost exclusively in bronze, in which he cast a great number of statues both of gods, men, and animals. Among his statues of gods his Hecate (in wood), two Apollos, a Dionysus, a group consisting of Zeus, Athene, and Heracles, and a group of Athene and Marsyas were celebrated. Several imitations of the last group are known—on Athenian coins, on an Attic vase now in Berlin, and on a marble relief now in Athens. An admirable copy in marble of the Marsyas of this group is now in the Lateran Museum in Rome. (See von Sybel, *Athene und Marsyas* (Marburg, 1879); Hirschfeld, *Athene und Marsyas* (Berlin, 1872).) Of his statues of mortals that of the runner *Ladas* and the *Discobolos* were most celebrated. The best account of Myron and his works is found in Collignon's, *Histoire de la Sculpture Grecque* (Paris, 1892). J. R. S. S.

Myrosin: See Fermentation.

Myrrh [readapted to Latin orthography < O. Eng. *myrra*, from Lat. *myr'rha* = Gr. *μύρρα*, from Arab. *murr*, myrrh, liter.. bitter]: the concrete juice of one or more trees, among them a small tree (*Commiphora myrrha*) growing in Arabia. Myrrh is exported from the East Indies in the form of reddish-brown, brittle, resinous lumps, of a fragrant odor and bitter, aromatic taste. Its principal constituents are a gum and a resin. (See Gum Resins.) Myrrh has been known from the earliest ages, being used as a constituent of incenses, perfumes, and salves. Taken internally, myrrh resembles other aerid resinous substances in tending to correct a feeble, relaxed condition of the mucous membranes, and in small doses promotes digestion and quickens the action of the heart. It is very little used as an internal medicine in the U. S. Locally, an emulsion of myrrh makes an agreeable mouth-wash for spongy gums and sore throat and dressing for indolent ulcers. Edward Curtis.

Myrta'ceæ [Mod. Lat., named from *Myr'tus*, the typical genus = Lat. *myr'tus* = Gr. *μύρτος*, from Pers. *mūrd*, myrtle. Cf. Myrrh]: an important natural family of dicotyledonous trees and shrubs, of tropical and warm temperate regions, with the entire leaves dotted with pellucid glands, containing an aromatic oil, no stipules, mostly numerous stamens, and an inferior compound ovary surmounted by a single style. Nine species, belonging to the genera *Calyptranthes*, *Eugenia*, and *Psidium* occur in the extreme Southern U. S. A peculiar portion of the family, embracing a majority of the species, is Australian, conspicuous among which is the genus Eucalyptus (*q. v.*). Within the tropics the fleshy or berry-fruited genera prevail. The family is important for its useful products, such as Cloves and Allspice, Guavas and Eugenia, Cajuput Oil, and Brazil-nuts (*qq. v.*). Besides the common myrtle, callistemous and several Australian shrubs and small trees are cultivated for ornament.

Myrtle [from O. Fr. *mirtil*, dimin. of *myrte* < Lat. *myr'tus*, myrtle. See Myrtaceæ]: popular name of trees and shrubs, mostly tropical and evergreen, belonging to the genus *Myrtus*. None are indigenous to North America. The common European myrtle (*Myrtus communis*) is a fine aromatic shrub whose berries yield a pleasant cordial. The leaves produce an aromatic oil, and water distilled with the flowers is the agreeable perfume known in France as *eau d'ange*. Several tropical species are cultivated. The name is popularly but incorrectly extended to other evergreen shrubs. For Dutch myrtle, see Gale.

Mys'ia (in Gr. Μυσία): a province of Asia Minor, bordering N. on the Hellespont and Propontis, W. on the Ægean Sea, S. by Lydia, E. by Phrygia and Bithynia. It was subdivided into five territories—Lesser Mysia, Greater Mysia, Troas, Æolis, and Teuthrania. Among its mountains was Ida; among its rivers, the Scamander, Simois, and Granicus; among its cities Troy. J. R. S. S.

Mysore, mī-sōr': an independent state of India under British protectorate; between lat. 11° 35′ and 15° N., and between lon. 74° 45′ and 78° 45′ E.; bounded on all sides by the territory of the Presidency of Madras. Area, 30,886 sq. miles. Pop. (1901) 5,538,482. It is an elevated table-land, rich in gold mines and salt, and producing, besides the common Indian grains, pepper, cardamoms, cinnamon, and coffee; water is often very scarce, and the country is infested with tigers and leopards. The reigning family is Hindu.

Mysore: the capital of the principality of Mysore; in lat. 12° 19′ N. and lon. 76° 42′ E.; at an elevation of 2,330 feet above the sea; 10 miles S. W. of Seringapatam, the former capital (see map of S. India, ref. 6–D). It is fortified, and contains the palace of the rajah and the residence of the British governor. Its splendid aqueduct has now fallen into ruins, and great trouble is often caused by lack of drinking-water. Carpets are manufactured here. Pop. (1891) 74,048.

Mysteries (in Gr. Μυστήρια): the secret worships of various gods, to which one might be admitted only after having passed certain purifying initiatory trials or degrees that varied in number in different Mysteries. In addition to what was universally known about any god, there were also certain secret facts and tenets of such a character that they might be divulged to the initiated alone. The character of these tenets varied according to the god honored in the Mysteries, but they can only be guessed at, inasmuch as everything connected with the Mysteries was kept secret. A clew to the general character of Mysteries is given by Plato (*Rep.* 2,378), who tells us that whatever is vicious, immoral, or disgraceful in the stories about the gods ought either to be buried in silence or else be told only in Mysteries, from which the mob must be excluded by making the sacrifice of a huge and unprocurable victim the condition of initiation. The Mysteries had their origin in the worship of the powers of nature, as seen in the contrasts of spring and winter, seed-time and harvest, the budding of new life from the rotting of the seed. Life springing from death in nature were contrasts in which the devout saw a bit of the history of the human soul. The myth of Persephone embodied the principle of life succeeding death, so that Mysteries were naturally held in honor of Demeter and her daughter. Just as new life sprang from the death of the seed, so new life must also spring from the death of the human body, and hence the doctrines of the immortality of the soul and of retribution after death were added at an early time to the doctrines taught in the Mysteries. Mysteries were held in honor of Demeter and Persephone at Eleusis, of the Cabiri in Samothrace, of Zeus in Crete, and at many places in honor of Dionysus, Cybele, Hecate, Aphrodite, Mithras, Orpheus, Isis, Zagreus, and Sabazius. Specialized information will be found under Eleusinia. See also Stengel, *Griechische Kultusalterthümer* (Munich, 1890); Strube, *Studien über den Bilderkreis von Eleusis* (Leipzig, 1872); Förster, *Der Raub und die Rückkehr der Persephone* (Stuttgart, 1874); Haggenmacher, *Die Eleusinischen Mysterien* (Basel, 1880); Nebe, *De mysteriorum Eleusiniorum tempore* (Halle, 1886); Rubensohn, *Die Mysterienheiligthümer in Eleusis und Samothrake* (Berlin, 1892); Gardner's article *Eleusis and the Mysteries* in his *New Chapters in Greek History* (London, 1892).

J. R. S. Sterrett.

Mysteries: See Miracle-plays.

Mysticism [from Gr. *μυστικός*, secret, mystic, deriv. of *μύστης*, one initiated, deriv. of *μύειν*, close (the lips or eyes); cf. *μυστήριον*, secret rite, mystery]: a term covering different notions (1) in ceremonial worship, (2) in religion, and (3) in philosophy.

(1) In worship, mysticism denotes the performance of certain rites or mysteries symbolizing and, at the same time, tending to establish certain ineffable relations between God (or the gods) and man. It is common to nearly all forms of worship save the most spiritual, is closely connected with theurgy and Magic (*q. v.*), and frequently produces enthusiasm or Ecstasy (*q. v.*) in the worshiper. In Greece, this mysticism, which is later than Homer, was confined, for the most part, to the worship of the gods of the earth and the underworld (*θεοὶ χθόνιοι*). Consult Iamblichus, *De Mysteriis*; Lobeck, *Aglaophamus*; Seemann, *Die Götter und Heroen der Griechen*, pp. 425, *sqq.*; Hatch, *Hibbert Lectures for 1888*, lect. x.; Robertson Smith, *Religion of the Semites*, lect. x.; Lenormant, *Chaldæan Magic* (London, 1877).

(2) Religious mysticism grows out *of* the enthusiastic or ecstatic element in ceremonial worship, and occurs in many religions. It is an attempt to enter into direct communion or union with the divine through (*a*) some abnormal psychical condition or (*b*) some faculty of the mind other than reason. It therefore assumes many different forms.

(*a*) The requisite abnormal condition may be produced by various causes, by drugs (homa-juice, hashish, wine, etc.), self-hypnotism, asceticism, mental alienation, hysteria, obsession, (?) etc. To such causes as these we must attribute the frenzy of the Corybantes and Bacchanals, the "inspiration" of the Pythia (*q. v.*) and oracle-givers generally, the dreams of the Sufis (*q. v.*), the performances of magians, dervishes, and yogis, very many of the phenomena of mediæval Christian and Moslem mysticism and modern Spiritualism, etc. Upon all these light is being thrown by psychiatry and psychical research. Consult Cicero, *De Divinatione*; Myers, *Greek Oracles* in *Hellenica*; Baumgart, *Ælius Aristides*; Görres, *Christliche Mystik* (5 vols.); Gobineau, *Les Religions et les Philosophies de l'Asie Centrale*, chap. iv.; Fitzgerald, *The Rubáiyát of Omar Khayyám*; Preger, *Die deutsche Mystik*, vol. i., pp. 13–141.

(*b*) The faculties, other than the reason, by which men have sought to come into possession of the divine are (*α*) feeling, (*β*) the supernatural sense. (*α*) Some persons, like Max Müller (*Lectures on the Origin and Growth of Religion*. p. 37), hold that we actually feel the Infinite with our bodily senses; but generally the theopathic sense is held to be a kind of emotion, *volupté*, or passive love (*Minne*), imparting blessedness (supposed to be a consciousness of God), but no definite conception. This mysticism, which usually

leads to QUIETISM (*q.v.*), belongs almost exclusively to Christianity and to monasticism. It seems to have originated in the allegorical interpretation of the Song of Solomon, begun by the Jewish doctors, and continued among Christians from the days of Origen onward. Indeed, Origen may be called the founder of this species of mysticism (see Bigg, *The Christian Platonists of Alexandria*, p. 188, *seq.*), which appears in every age of the Church after him, assuming sometimes revolting forms, sometimes, when combined with the higher mysticism, forms of great purity and beauty, as, e. g., in Bernard of Clairvaux's eighty-six sermons on the Song of Solomon. It forms a large element in the mysticism not only of Bernard, but also of all the greater mystics—e. g. Francis of Assisi, Hugo and Richard of St. Victor, Joachim of Floris, Eckhart, Suso, Thomas Aquinas, Bonaventura, Dante, de Gerson, Catherine of Siena, Thomas a Kempis, Angelus Silesius, Molinos, Fénelon, Madame Guyon, etc. Consult the works of these, also of Preger and Görres, *ut sup.*) The forms of mysticism thus far named may all be regarded as more or less material, morbid, and false. We now approach the spiritual, healthy, and true form, that which has its origin in the supernatural sense. (*β*) It is difficult to define this sense otherwise than by saying that it is the faculty which relates us to the spiritual world, as our bodily senses relate us to the material world, and enables us to recognize God as the Father of Spirits. It has been called by many other names, e. g. inspiration (Job xxxii. 8), Word of God, Word (first by Heraclitus), faith (first by Parmenides), synderesis (*συντήρησις*, first by Jerome, in commenting on Ezekiel i.), spiritual sense, theory (Aristotle, *Metaph.*, xi., 7), practical reason (Kant), wisdom (Tennyson, *In Memoriam*, cxiv.; cf. xcv.), etc. It is, as it were, the convergence and apex (*apex mentis*, Bonaventura) of all the faculties of the soul, including perception, will, love, or, in Paul's language, faith, hope, love. When strongly marked, it makes the prophet or the religious genius, and all such are necessarily mystics—Zoroaster, Moses and the Hebrew *nebi'im*, Jesus (supremely), Mohammed (slightly—the Buddha not at all), Heraclitus, Æschylus, Socrates (with his *dæmon*), the Christian apostles, several of the Neo-Platonists, Christian and heathen, Augustine, the great mystics of the Middle Age (see under *a*), Luther, and many more. Indeed all persons for whom religion is a matter of personal experience, something more than an ethical code, an historical belief, or a system of observances, are mystics. Mysticism of this kind is the very essence of religion, the spring of all healthy, rational, human energy. Consult the *Gâthas* of Zoroaster, in *Sacred Books of the East*, vol. xxxi.; the Bible, the Fathers of the Church; Lane-Poole, *The Speeches and Table-talk of Mohammed*; the works named under (*a*); Spicker, *Die Ursachen des Verfalls der Philosophie in alter und neuer Zeit*; Brother Azarias, *The Culture of the Spiritual Sense*, in *Phases of Thought and Criticism*; Vaughan, *Hours with the Mystics*; Rosmini, *Antropologia Soprannaturale* and *Teosofia*; Gioberti, *Teorica del Soprannaturale.*

(3) Philosophic mysticism seeks either (*a*) to grasp the divine by means of the reason (dialectic), or else (*b*) to draw out in terms of the reason the data of the faculty by which it is grasped. The former is pantheistic or panlogistic, the latter theistic. (*a*) Pantheistic mysticism, proceeding by abstraction, reaches at last the universal predicate, Being, which it then assumes to be the real ground of the universe, God, and, reversing the process of abstraction, tries to deduce the universe from him. It involves a complete confusion of the ideal with the real, of human thinking with the process of existence, and always finds its goal in darkness, self-annihilation, *nirvana.* Since abstract Being is equal to naught, and as *ex nihilo nihil fit*, no other logical result is possible. Of this sort is all Brahmanic, Buddhistic, Neo-Platonic, Moslem, Jewish, and much Christian mysticism. It finds its classical expression in the philosophy of Hegel, which is rightly called Panlogism. In the western world, this kind of mysticism seems to owe its origin to Parmenides, who identified being and thinking (*τὸ γὰρ αὐτὸ νοεῖν ἐστίν τε καὶ εἶναι*), and placed being in a transcendental world. He was followed by Plato, whose whole doctrine of ideas is a species of intellectual mysticism, from which even Aristotle is not altogether free. (See *Metaph., ut sup.*) The germs sown by these thinkers developed, under the influence of Oriental religions (Mazdeism, Judaism, etc.), into the mysticism which we find in Philonism and Neo-Pythagoreanism, and, partly under the influence of Christianity, into Neo-Platonism and the Gnosticism of Clement and Origen, the former of whom has some claim to be considered the originator of Neo-Platonism. (See Bigg, *Christian Platonists of Alexandria*, p. 64.) A later union of Christianity with Neo-Platonism gave birth to the works erroneously attributed to Dionysius Areopagita, the convert of Paul. These works were written by a Neo-Platonic Christian about A. D. 400, and became known to the Latin Church through the translation of Scotus Erigena in the ninth century. They completed the union of Hellenism with Christianity, and furnished the type of mediæval theology and piety. From that time pure pantheistic mysticism ceased, until it was revived in the systems of Bruno, Spinoza, and Hegel. (Consult Brahmanic *Upanishads* and Buddhistic *Suttas*, in *Sacred Books of the East*; Mohini, translation of *Bhagavad-Gîta*; Max Müller, *History of Sanskrit Literature*, chap. ii.; Dieterici, *Philosophie der Araber*, vol. i., pp. 164, *sqq.*; Syed Ameer-Ali, *Life and Teachings of Mohammed*, chap. xix.; the *Cabbala*; the fragments of Parmenides, in *Journal of Spec. Phil.*, vol. iv.; the *Republic* and *Timæus* of Plato; Aristotle, *Metaph.*, book xi., in *Jour. of Spec. Phil.*, vol. xxii.; the works of Clement of Alexandria, Origen, Plotinus, Porphyry, Iamblichus, Proclus, Dionysius Areopagita; Westcott, *Religious Thought of the West*, pp. 142, 194, *sqq.*; Bruno's philosophic works; Spinoza, *Ethica*; Hegel, *Logik*, *Naturphilosophie*, *Philosophie des Geistes.* Cf. Frothingham, *Stephen Bar Sudaili, the Syrian Mystic, and the Book of Hierotheos* (Leyden, 1886); *Der Neoplatonismus*, in Harnack, *D. G.*, i., 719, *seq.*). (*b*) Theistic philosophic mysticism is almost peculiar to Christianity, and dates from (the pseudo-) Dionysius (see above) and Augustine. It was in part due to the same cause as monasticism, and is closely connected with it. That cause was the secularization of the Church, which forced the more profoundly religious and reflective spirits to withdraw from the practical world and seek satisfaction in speculation. The monks were a church within the Church. The speculations of Dionysius and Augustine, continued through Maximus Confessor, Joannes Damascenus, Scotus Erigena, and others, finally celebrated a glorious resurrection in Bernard of Clairvaux. Bernard is the perfect type of the theistic mystic—God-intoxicated, yet keenly alive to the personality of God; practical in the best sense, yet living above the world. In him catholic piety ("Mysticism is catholic piety, in so far as this is not obedience to the Church," Harnack, *Dogmengesch.*, iii., 375) reached its highest expression, imparting a freedom which makes him interpret the records of revelation and the dogmas of the Church in terms of his own supernatural consciousness, and a power which enables him to dictate even to the head of the Church (see his *De Consideratione*); but he had no followers, except, perhaps, Dante—who knew so well the exceptional character of his mysticism as to place him in heaven, far above all other mystics, and make him his own last guide—and Savonarola. The mysticism of those who usually count as his successors, Richard and Hugo of St. Victor, Albertus Magnus, Thomas Aquinas, and Bonaventura, is, in reality, different, inasmuch as it subordinates the personal consciousness to the letter of Scripture and dogma. Their mysticism is co-ordinated with SCHOLASTICISM (*q. v.*), which in its earlier shapes rests upon Platonism and Neo-Platonism (pseudo-Dionysius), in its later upon Aristotelianism. It constantly tends, therefore, to abstract formalism and pantheism in thought, and slavery, not sonship, in practice. Its highest aim is the "superlucent darkness" of Dionysius. Indeed it was hard for mysticism to maintain itself on the height to which it rose in Bernard. Being composed of three elements, intelligence, love, will, it required that these should be completely and harmoniously blended in the "spark of synderesis" which unites man to God. And this can happen but rarely. Intellect in excess leads to pantheism, Neo-Platonism, and panlogism; love in excess, to QUIETISM (*q. v.*) and morbid sentimental pietism; will in excess, to antinomianism and contempt for morality. All these excesses are to be met with in the mysticism of the Middle Ages. German mysticism, in hysterical and theopathic forms, began in the twelfth century, and was professed mostly by nuns. (See Preger, bk. i.) The higher orthodox mysticism was inculcated by Albertus Magnus (see Bach, *Des Alb. Mag. Verhältniss zu der Erkenntnisslehre der Griechen, Lateiner, Araber und Juden*, pp. 182–212), who was followed by David of Augsburg, Berthold of Regensburg, and Dietrich of Freiburg; but the founder of what is known specifically as "Deutsche Mystik" was Meister Eckhart (see ECKHART, MEISTER), whose system, as

might be expected, was a compound of theopathy and THEOSOPHY (*q. v.*). It is, to a large extent, a return to Neo-Platonism, but contains a dialectic element due to Aristotle, and a love element (*Minne*) due to Bernard and the German temperament. It comes, in its results, very close to Buddhism (see Neumann, *Die innere Verwandtschaft buddhistischer und christlicher Lehren. Zwei buddh. Suttas und ein Tractat Meister Eckharts*, 1891), and is distinctly pantheistic; also in principle, though not in intention, anti-catholic. It endeavors, by a dialectic process, to penetrate the nature of God, One and Three, and through a process of love to bring the individual soul into union with him; but the dialectic reaches only an abstraction, and the love, being pathological, is destitute of moral force. The immediate knowledge of God which Eckhart claimed for the individual soul through its spark of synderesis (*Fünkchen*) formed the fundamental principle of the Protestant Reformation; and this was recognized by Luther, whose fondness for Tauler and the "Deutsche Theologie" is well known. There is a sense in which it may be said that the Reformation grew out of mysticism. The speculative mysticism originating with Eckhart may be called High German mysticism. Of somewhat later date is the Low German practical mysticism, whose founder was Johannes Ruysbroek. His pupil, Geert de Groot, was the founder of the society known as the Brothers of Common Life, whose most famous members were Thomas a Kempis, author of the *Imitation of Christ*, and Nicholas of Kues, one of the greatest of speculative mystics. (See Kettlewell, *Thomas a Kempis and the Brothers of Common Life.*) Contemporary with the later German mystics were de Gerson in France, and Catherine of Siena, and Savonarola (burned 1498) in Italy. After the Reformation there were two classes of mystics, one protestant, resting on the Gospel, the other, catholic, resting upon dogma. To the former belonged Luther, Casper Schwenckfeld, Sebastian Franck, Valentine Weigel, and Jacob Böhme; to the latter, Philip Neri, Sta. Theresa, Loyola, Francis of Sales, John of the Cross, Paracelsus, Campanella, and Giordano Bruno, in the last three of whom the modern scientific element predominated. Since the date of Bruno's death (1600), though there have been many noble Christian mystics—Angelus Silesius, Poiret, Malebranche, Madame Guyon, Fénelon, Cardinal Gerdil, Jacobi, Schleiermacher, Klopstock, Novalis, Gioberti, Thomas Taylor, Jones Very, etc.—there has hardly been any new movement except that initiated by SWEDENBORG (*q. v.*). Orthodox mysticism found a wonderful example and systematizer in Rosmini (1797–1855), who may be called the last of the Christian mystics. A return to purely intellectual mysticism, divorced from religion, was made by Spinoza from Judaism, by Giordano Bruno from Catholicism, by Hegel from Protestantism. Along with the last ought perhaps to be named Schelling, Krause, and Baader. Consult the works of the mystics above named, especially Bonaventura's *Itinerarium Mentis in Deum*, translated in *Jour. of Spec. Phil.*, vol. xxi.; also Thomas a Vallgornera, *Mystica Theologia Divi Thomæ*, 2 vols.; Pfeiffer, *Die deutschen Mystiker des XIV^ten^ Jahrhunderts*; F. Juvenalis, *Solis Intelligentiæ Lumen Indeficiens seu Immediatum, Dei et Entis Summi Internum Magisterium* (ed. F. d'Envieu, Paris, 1878); Stöckl, *Philosophie des Mittelalters*; Erdmann's and Ueberweg's histories of philosophy (the latter contains an excellent bibliography); Harnack, *Dogmengeschichte*; Müller, *Kirchengeschichte*; Schaff, *History of the Christian Church*, and the literature there cited; Storrs, *Bernard of Clairvaux*. THOMAS DAVIDSON.

Mytho: See COCHIN-CHINA (*French*).

Mythology [Gr. *μῦθος*, word, story, legend + *λόγος*, discourse, reason]: the science dealing with that body of poetic and quasi-scientific tradition which gathers about the religious belief of a race; or, the body of myths themselves. The notion of mythology should be sharply distinguished from the notion of religion; and the myth, though it must be connected with religion, should be distinguished from the cult or round of ceremonies employed in actual worship. We distinguish between the worship of a god and the story of a god. Nor, again, should we confound the myth with the creed or religious philosophy of a primitive race, although the myth may often embody the result of such speculation. A race which has reasoned out no creed, no rude system of religious belief, may nevertheless have myths, as it may have a cult. The cult is a matter of daily habit, a round of ceremonies to insure certain benefits or avert certain evils; the creed is primitive thought; but a myth is the offspring of observation and unconscious fancy. Primarily, it attributes will and passion to the objects and processes of nature; yet this statement, correct so far as it goes, does not give a complete definition of the myth, but leaves out of account certain other factors with which we shall presently reckon.

History of the Science.—Myths have been found in every part of the world, and the study of them upon a historical and philological basis has resulted in the science of comparative mythology; but while this is a modern affair, attempts to explain the myths are as old as history. Even while they were current articles of faith, the rationalist began to oppose the believer. Criticism of this type fell into two classes. On the one hand, myths were explained by men like Anaxagoras and Heraclitus as allegory, as symbolical of some fact or truth. On the other hand, Euhemerus (about 316 B. C.) declared that a myth was nothing more than a fact covered with parasitic growth of supernatural fancies—that, e. g. Demeter was simply a woman who had introduced the art of baking bread. This interpretation of myths was a favorite among the early Christian writers, and finds a modern champion in Herbert Spencer (*Principles of Sociology*), who regards the myth as corrupted tradition of a dead and deified ancestor, complicated by the confusion of metaphorical statement. The opposite line of theory, which treats the myth as allegory and symbol, reached its ultimate absurdity in Bacon's *Wisdom of the Ancients*, where sundry classical myths are interpreted as bearing within them the most subtle lessons of morality and statecraft.

To treat myths as symbol and allegory, or as distorted fact, was the general drift of criticism down to modern times, when the rise of two great sciences, comparative philology and anthropology, developed two corresponding theories of the myth. The enormous gains made for our knowledge of the past by the comparison of related languages led certain scholars, notably Prof. Max Müller, to base the study of myths upon the study of words, particularly the names of gods and heroes. As the scholar had followed a group of related words to a supposed primitive Aryan word, so he resolved a group of related myths into a primitive Aryan myth. Although this method was foreshadowed by Jacob Grimm, it could be realized only by a student of Oriental languages; and Max Müller must be reckoned as founder of the science. His particular school came to regard the bulk of Aryan myths as sun-myths, while German advocates of the same general theory preferred the storm-cloud; but all of them were agreed in regard to the primitive Aryan myth, and in regard to the philological method of research. As to the origin of a myth, they taught that the literal words in which man spoke of natural processes were abstracted from these processes, were confounded with other words, and so came to represent divinities; hence the myth of a god and a deed, from the original statement about a natural object and a process (*Disease of Language*). "Mythology," says Müller, "is only a dialect, an ancient form of language."

To study words, then, seemed and seems to these critics the proper key of mythology. On the other hand, anthropologists regard a myth as no chance of speech, but as inevitable product of the human mind in certain stages of culture, and explain it by analysis of the physical and social environment. Edward B. Tylor has given an admirable summary of this doctrine in the chapters on mythology and on animism in his *Primitive Culture*; while Andrew Lang has brought the myth into closer relations to customs and folk-lore generally.

General Principles.—While we accept as prime factor in the myth that instinct of primitive man to see will and passion behind the processes of nature, just as will and passion are behind human deeds, it is necessary to note certain restrictions upon this doctrine. First, we must admit with Mannhardt the influence "of poetical and literary production as an essential factor in the formation of mythology." From this consideration, again, we derive another—the need of a stricter chronology. In 1861 W. Schwartz called attention to the distinction between the origin and the development of a myth, and showed that a rude and brutal race will make a rude and brutal myth. Prof. E. H. Meyer places, therefore, "a pandemonium before the pantheon"—first demons, a horde of petty spirits of the dead, mere ancestor-worship; then gods and a system of gods. Thirdly, we must allow extensive distribution

and borrowing of myths from race to race, a fact which spoils many a pretty theory of the older comparative mythologists. Fourthly, we admit as a factor in early myths not merely unbridled fancy, but unbridled curiosity as well, the rude scientific instinct which seeks to account for a strange fact or even a strange name. (See Tylor, *Early History of Mankind*, chap. xi.) We can, however, allow little weight to Scherer's claim for "entertainment" as the main factor in myth-making. Fear had more to do with the early myths than any phase of pleasure. Finally, we must admit that the world within, the realm of dreams and visions, had almost as great an influence on the making of myths as the world without. The nightly visitant, combined with ancestor-worship, could give rise to a demonic myth; and the feigned wanderings of the dreamer himself, not to speak of the connection easily made between mysterious beasts, such as the snake that glided suddenly from the neighborhood of a sleeping man, and the independent spirit, could also produce a plenty of such rude myths as we still meet in folk-lore—e. g. the common story of the soul leaving its body in shape of snake or mouse. Nevertheless, while the tendency of modern criticism to divest myths of their old majestic character, to bid us look if we would study origins, not at the stately figures of Olympus, but at the "cruel, puerile, and obscene" stories of the primitive savage, has both critical sanity and historic truth, the process can easily go too far. It goes too far when it concedes to primitive man an interest in the world within and denies him an interest in the world without. The sense of a vague personality in storm and fire he surely knew. The beauty of sunset, of sparkling ocean, was of little interest to him; but the thunderbolt ("*it* thunders," we still say), the whirlwind, whatever natural process came with overwhelming terror into his life, must have had personality for him, a cult of fear and sacrifice, and a myth.

It seems best to divide myths into those of the savage and those of semi-civilized races, the lower and the higher mythology, remembering that traces of the former will always be found in the latter. In savage myths little distinction is made between subjective and objective impressions; hence the strange medley of man, beast, and inorganic nature, all thrown together on one plane of mythic fancy. In the developed myth subjective impressions count for little; there is system, with a certain air of probability, and the ordering touch of literary instinct. Indeed, many a so-called myth is simply a bit of primitive science, a desire to give rational answers to curiosity.

Savage Myths.—Along with the fantastic, monstrous, and brutal stories of the savage we find distinct traces of element-myths. Evidence is at hand that even rudest tribes have doubted the stars were fire, and have regarded them as personal agents. Certain Africans were sure that the wind was a man, or at the least a bird. What we do not find, however, in this stage of culture is any system of myths, any cosmogony, that goes beyond an individual story. What has passed for such a system often turns out to be a missionary's account of creation translated into terms of savage thought; while the genuine myth goes no further than a makeshift, like the tortoise which holds the world upon its back—a myth found in North America as well as in India—or like the countless tales of sun and moon, eclipse, tempest, and earthquake. Moreover, the myth embodied primitive history, and supported that claim for divinity with which a race regarded its founder. Hence the heromyth, the story of the great head of the race, as culmination of the system of ancestor-worship; hence, too, the allied myth of the culture-hero, the being who brought the race its arts of life, its primitive civilization. It is not only a Cadmus who plays this part; our native myth is full of such characters. (Brinton, *American Hero-myths*, Philadelphia, 1882.) Finally, among the lower myths, though not necessarily savage, are the tales of serviceable household spirits, familiar demons, and all other survivals from the days of ancestor-worship.

Higher Myths.—Here, to use Meyer's phrase, we have the pantheon developed out of the pandemonium. Dignity succeeds silliness; system takes the place of confusion; and such brutal or absurd elements as tradition has preserved are veiled, or belittled, or even explained away. Stories of the gods reveal only by implication the elements with which these had been identified—Zeus for the sky, or Apollo for the sun. Such myths belong distinctly to the realm of poetry, sacred, to be sure, but none the less poetry. They tend more and more to the personal, the romantic, the literary. They combine with heroic legend to form the great epics, and stand in the forefront of every national poetry. Ethical conceptions cross and sometimes control the old traditions of wayward and inexplicable power in the divinity in question. Compare, for example, a Vedic hymn with a Vedic myth. At worst, the old brutalities are transformed into romance, just as love and war are used to disguise brutality and lust. Cycles of myths are told of one god or hero. In the old Persian religion we note a distinct superiority of the ethical and philosophical over the mythical; in Hellenic myths, again, poetical rather than ethical considerations have conquered. The elements of these different myths have been mingled and confused to a degree that makes the "interpretation" of them so supremely difficult, or so supremely easy. Besides the perplexing question of borrowing and distribution, we are everywhere confronted by the difficulty of sundering the myth-maker from the poet pure and simple. If we once drop the clew of religion, the test of belief by definite worshipers in the god in question, and belief to a reasonable extent in the myth itself, we are not only lost in the maze of poetry, and must accept the *Faerie Queene* or even Burns's *John Barleycorn* as a part of mythology, but we have no criterion for separating the myth from the heroic legend. Though the cord which bound the myth to some sort of religious worship may have been both long and loose, there must have been such a cord, or we are not dealing with a myth.

Bibliography.—Of the countless works on mythology, general and special, we note: K. O. Müller, *Prolegomena zu einer wissenschaftlichen Mythologie* (1825), the first really scientific treatise on the subject; Max Müller, *Oxford Essays* (1856); A. Kuhn, *Die Herabkunft des Feuers*, etc. (1859); M. Bréal, *Mélanges de Mythologie et de Linguistique* (Paris, 1877), especially essay on *Hercule et Cacus*, originally published 1863; Tylor, *Primitive Culture*, chapters on *Mythology* and *Animism*, probably the best modern treatment of the subject; Andrew Lang, article *Mythology* in the *Encyclopædia Britannica*, *Custom and Myth*, and *Myth, Ritual, and Religion*; E. H. Meyer, *Indogermanische Mythen* (2 vols., 1883–87); H. Spencer, *Principles of Sociology*. These represent each a definite school; for general summaries regarding the science may be noted: O. Pfleiderer, *Religionsphilosophie auf geschichtlicher Grundlage* (Berlin, 1878); Otto Gruppe, *Die Griechischen Culte und Mythen in ihren Beziehungen zu den Orientalischen Religionen* (vol. i., Leipzig, 1887); and Chantepie de la Saussaye, *Lehrbuch der Religionsgeschichte* (2 vols., Freiburg, 1887–89).

Francis B. Gummere.

Mytile'ne (in Gr. Μυτιλήνη): the most important city of Lesbos, situated on the eastern side of the island (see map of Greece, ref. 15–M). It was celebrated in antiquity as a seat of literature and art, being the birthplace of the poets Alcæus and Sappho, the historians Hellanicus, Chares, and Theophanes, the statesman Pittacus, the philosopher Cratippus, the rhetoricians Lesbonax, Polemo, and Diophanes. The city played an important *rôle* in every period of Greek history. It is still the chief city of Lesbos. See Conze, *Reise auf der Insel Lesbos* (Hanover, 1865); Archontopoulos, Λέσβος (Canea, 1866); Koldewey, *Die antiken Baureste der Insel Lesbos* (Berlin, 1890); Cichorius, *Rom und Mytilene* (Leipzig, 1888). The name is also applied to the island. See Lesbos.

J. R. S. Sterrett.

Mytil'idæ: See Mussel.

Myxomyce'tes and **Mycetozo'a**: See Slime-moulds.

Myzos'toma [Mod. Lat., from Gr. μύζειν, suck + στόμα, mouth]: name of a genus of peculiar parasitic animals of uncertain affinities. Myzostoma has a disk-like body, about a sixth of an inch in length, around the margin of which are a number of warts or longer processes, while on the under surface there are five pairs of hooked feet, and in front a tubular protrusible proboscis. About seventy species are known, all marine, and all living upon crinoids. By some they are regarded as having affinities with the parasitic mites, while others, with more reason, place them among the worms (Chætopoda). The species are described by von Graff in part xxvii. of the zoölogy of the Challenger expedition. The best account of the structure is by Nansen (Bergen, 1887).

J. S. Kingsley.

N

: the fourteenth letter of the English alphabet.

Form.—Its form is derived through the Roman alphabet from the Greek Ν, Ϻ, or Ϻ, corresponding to the Phœnician or Canaanitic 𐤍.

Name.—The English name *en* represents the Latin name *en*, which was a substitute for the Greek name *nū*, after the manner of *em*, *el*, *er*, *es*, instead of *mū*, *lambda*, *rhō*, *sigma*. The Greek name *nū* represents the Phœnician *nūn*, fish, probably suggested by the form of the letter, possibly also by the proximity in the alphabetical series of *mēm*, water, provided the arrangement itself is not due to the signification of the names rather than the sounds of the letters.

Sound.—Its sound is a dental or alveolar nasal. The passage of air through the mouth is checked by pressing the forward rim of the tongue against the roots of the upper teeth or against the teeth themselves (in English the former), and voiced breath passes out through the nasal cavity opened by depressing the soft palate. The sound of *n* is differentiated from that of the other nasals, *m*, *ng*, solely by the different shape and size of the oral resonance-chamber. In the case of *m*, this is formed by closure of the lips, in that of *ng* by contact of the body or back of the tongue with the palate. The sound of *n* is to that of *d* as *m* is to *b* or *ng* is to *g*. It may serve as a vowel, as in *maiden*, *forgotten*, *even*, where the preceding unaccented vowel has been silenced. The letter is silent after *m* in the same syllable, as in *hymn*, *autumn*, *solemn*, also after *l* in *kiln*. After an accented vowel before a guttural it has generally the sound of the guttural (palatal) nasal *ng*, as in *longer*, *anger*, *uncle*, *congress*, *conquer*, *ink*, *thank*, *anxious*; but when coupled with *g* in the same syllable it unites with it to express the guttural nasal, and *g* has no separate sound; thus *song*, *singer*, *tongue*, *wing*, with which contrast *lon-ger*, *fin-ger*.

Source.—The sound has in general been faithfully preserved as representative of Teutonic and Indo-European *n* in the native Teutonic element, and of Latin *n* in the Romance element; cf. *night*: Goth. *nahts*: Lat. *nox*: Skr. *nákti-*; *chin*: Goth. *kinnus*: Gr. *γένυς*; *reign* < M. Eng. *regne* from Lat. *regnum*. Teuton. *n* is lost in O. Eng. before *s* and *þ*; cf. Eng. *goose* < O. Eng. *gōs*: Germ. *gans*; Eng. *tooth*: Germ. *zahn*; Eng. *other*: Germ. *ander*; Eng. *mouth*: Germ. *mund*.

Value as Symbol.—N = (in chemistry) nitrogen; also, noon, north, Norse; as a mediæval numeral, a symbol for 90. Na = Sodium (*Natrium*). See Abbreviations.

Benj. Ide Wheeler.

Nablus′, Nabulus, or **Napolose**: town of Palestine; the ancient Shechem or Sychem, capital of Samaria, probably the same as the Sychar of the New Testament (see map of Palestine, ref. 8–D). The city, which had fallen into decay, was rebuilt by Vespasian and called Neapolis, whence the name Nablus is derived. It is 32 miles N. of Jerusalem, on the watershed of a narrow valley, not more than 600 feet wide, between Gerizim and Ebal. This was Abraham's first camping-ground in the country. Here Joseph was buried, and here Joshua delivered his last address to the Israelites. It was one of the cities of refuge. Its situation is marvelously beautiful. There is no greener or more fertile spot in Palestine. It carries on a lucrative trade in cotton and oil, and manufactures coarse cloth and soap, sending large quantities of the latter to Egypt and the East. Among its 9,000 inhabitants are a few Jews, Samaritans, and Christians, but the majority are Mussulmans. At the eastern end of the valley, 1½ miles distant, is Jacob's well.

E. A. Grosvenor.

Nabob [from Hind. *nawāb*, from Arab. *nawāb*, formal plur. of *nāīb*, vicegerent, governor]: under the Moguls in India, a viceroy or governor of a province. The title afterward came to indicate merely high rank without office. In process of time many of the nabobs became virtually independent monarchs. It was the mutual jealousy of the nabobs that made India the comparatively easy prize of British adventurers.

Nabonas′sar, Era of: an era employed in the Chaldæan and Alexandrian Greek chronology. By Berosus it was reckoned from the accession of King Nabonassar to the Babylonian throne, which took place Feb. 26, 747 B. C., as shown by astronomical records.

Nachees: See Siouan Indians.

Nachtigal, naa*ḥ*′ti-gāal, Gustav: physician and explorer; b. at Eichstedt, Prussian Saxony, Feb. 23, 1834; studied medicine at Berlin, and practiced for some time at Cologne; entered the service of the Bey of Tunis in 1863, and went in 1869 to Kuka to convey presents from the King of Prussia to Sheikh Omar of Bornu. On Feb. 18, 1869, he started from Tripoli, and reached on Mar. 27 Murzuk, where he stopped till Apr. 18, 1870, exploring the country of the Tibbus in the meantime, and arrived at Kuka July 6. He returned by Waday and Darfur, and reached Cairo in Nov., 1874, having explored the countries belonging to Baghirmi. The results of his explorations he communicated in 1874 in Petermann's *Mittheilungen* and the London *Geographical Magazine*. In 1879 he published *Sahara and the Soudan: Results of Six Years' Wanderings in Africa*, and in 1882 he was appointed German consul at Tunis. In 1884 he was sent to the west coast of Africa charged with effecting the annexation to Germany of the Cameroons, Lüderitzland, and other territory. D. on shipboard on his return to Germany, Apr. 19, 1885. Revised by M. W. Harrington.

Nacogdoches, năk-ō-dō′chez: city; capital of Nacogdoches co., Tex. (for location of county, see map of Texas, ref. 3–J); on the Houston, E. and W. Tex. Railway; 53 miles N. E. of Crockett. It is in an agricultural and cotton-growing region, contains 8 churches, 5 secret-society lodges, a college, a national bank with capital of $50,000, a private bank, and 3 weekly newspapers, and has several manufactories and over 100 business concerns. Pop. (1880) 333; (1890) 1,138; (1900) 1,827.

Editor of "Star-News."

Nadal, Ehrman Syme: author; b. at Lewisburg, W. Va., Feb. 13, 1843; graduated at Yale in 1864; was secretary of legation at London in 1870–71, and again from 1877–84; has lectured, engaged in journalism, and written for the magazines. Among his books are *Impressions of London Social Life* (London, 1875); *Essays at Home and Elsewhere* (1882); and *Zweiback, or Notes of a Professional Exile* (1887).

H. A. B.

Nadaud, năă′dō′, Gustave: song-writer; b. at Roubaix, France, Feb. 20, 1820. After completing his studies at the Collège Rollin at Paris (1834–38), he found employment in a business-house at Roubaix. In 1840 he removed with his parents to Paris, and embarked in business as a cloth-merchant. The success of some songs which he had composed, set to music, and sung for the entertainment of friends led him in 1849 to give up his business for song-writing, and in that year he published a small collection which was greatly enlarged in successive editions (1852–62–70, etc.). At first his songs celebrated conventional subjects, but afterward entered the field of political satire or became the vehicle of a gay and easy-going conception of life. D. Apr. 28, 1893. His works comprise also the words and music of several parlor operettas, collected in two volumes: *Opérettes* (7th ed. 1867) and *Théâtre de fantaisie* (1879); a novel, *Une Idylle* (1861); *Solfège poétique et musical* (1886); *Miettes poétiques* (1888); *Nouvelles chansons à dire ou à chanter* (1889). His most famous poem is "Carcassonne," many times translated.

Na′dir Shah, or **Kuli Khan**: Shah of Persia; b. near Kelat, in the province of Khorassan, Persia, in 1688; became while still a young man the leader of a gang of robbers, by whose aid he captured and held several towns and fortified places in Khorassan; espoused the cause of Tamasp, the legitimate ruler of Persia, against the Afghan invaders; was appointed commander-in-chief of Tamasp in 1727; defeated the Afghans repeatedly, and succeeded finally in driving them entirely out of the country in 1730. Tamasp now made him governor of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, and he assumed

the name of Tamasp Kuli (Tamasp's slave), to which the shah added the title of khan. In 1731 he fought against the Turks and defeated them, and when in 1732, during his absence on a campaign against the Afghans, Tamasp was defeated by the Turks and concluded a dishonorable peace with them, ceding several provinces, Kuli Khan deposed him, and raised his son, Abbas III., a child, to the throne. The war with the Turks was renewed and carried on with great success, and when Abbas III. died in 1736 Kuli Khan was crowned Shah of Persia under the name of Nadir Shah. His reign was very brilliant in military undertakings, especially his expedition into Hindustan. He defeated the Great Mogul, captured Delhi, and carried away to Persia an enormous booty. He restored to Persia her old boundaries from the time of the Sassanides, but in course of time he became greedy, suspicious, and a merciless tyrant; whole cities were put to the sword. He was assassinated June 20, 1747. His *Life* was written in Persian by Mirza Mohammed Mahadi Khan, and translated into French by Sir William Jones (1770). See H. Maynard, *Nadir Shah* (1885).

Næ'vius, Gnæus: author; b. in Campania about 264 B. C.; served in the first Punic war, and became famous as a writer of comedies and tragedies. He belonged to the plebeian party, attacked the nobility with great virulence, was driven into exile, and died in Utica, Africa, about 199 B. C. A few short fragments of his epic poem (in Saturnians) on the Punic war, and of his dramas, are still extant, and were collected by Klussmann (Jena, 1843). See also the fragments of the *Bellum Pœnicum* in L. Müller's edition of Ennius, pp. 157–170 (St. Petersburg, 1884), and for the dramatic fragments L. Müller's *Liv. Andronici et Cn. Nævi fabularum reliquiæ* (Berlin, 1885), or O. Ribbeck, *Scænicæ Rom. Poesis Frag.* (Leipzig, 1871). M. Warren.

Næ'vus [Lat.], or **Birthmark**: a discolored spot (also called *mother's mark* and *port-wine stain*) on the skin of a human being, usually characterized by the presence of numerous enlarged blood-vessels (more especially venous), and popularly believed to be the result of some ungratified longing on the part of the mother during gestation. Some nævi disappear spontaneously; others remain unchanged; still others grow rapidly, and sometimes inflame and slough. They may be treated by cold and pressure, by vaccination of the spot, by cautery, by excision, by ligation, or by other obliterative methods. Small nævi have been treated successfully by electrolysis. Revised by William Pepper.

Nagasaki, nă̆a-gă̆a-saa'kĕĕ: a city and important seaport in the S. W. of Japan, on the island of Kiushiu, for a long time the only Japanese port of entry for foreign vessels; situated along the eastern shore of one of the finest landlocked harbors in the world (see map of Japan, ref. 7–A). After Japan was closed to foreign intercourse in 1637, when the Spaniards and Portuguese were finally expelled, the Dutch and the Chinese were still allowed to carry on trade under severe restrictions, the small, flat, artificial island of Deshima, at the head of the harbor, being set apart for the Dutch factory; only one European ship arrived yearly from Batavia. The present foreign settlement has a water frontage of 700–800 yards; foreign population (exclusive of Asiatics), 332. Across the bay is a handsomely equipped imperial dockyard. Most of the foreign trade of Nagasaki has been transferred to Kobe, but the mines of Takashima still make it an important coaling station. The town is noted for its tortoise-shell bric-à-brac, and for its Imari and Arita porcelain. The most important articles of export, next to coal, are dried fish, rice and other grains, camphor; of import, sugar, raw cotton, rails and machinery, kerosene oil. The total entries for 1892 amounted to 733 vessels, aggregating 897,274 tons. Pop. 31,380. J. M. Dixon.

Nagel, naa'gel, Albrecht Eduard, M. D.: ophthalmologist; b. at Dantzic, Germany, June 14, 1833; was educated in his native city, but studied medicine at Königsberg and Berlin; began practice at Dantzic in 1856; became privat docent at Tübingen in 1864; extraordinary professor in 1867; ordinary professor of ophthalmology in 1874. His principal works are *Das Sehen mit zwei Augen* (Leipzig, (1861); *Refractions- und Accommodations-Anomalien des Auges* (Tübingen, 1866); *Behandlung der Amaurosen und Amblyopien mit Strychnin* (1871); *Die Anomalien der Refraction und Accommodation des Auges* (1880); *Die Vorbildung zum medicinischen Studium* (1890). He has also written much for scientific periodicals; since 1870 has edited and contributed to the *Jahresbericht über die Leistungen und Fortschritte im Gebiete der Ophthalmologie*; and since 1880 has edited the *Mittheilungen aus der ophthalmiatrischen Klinik in Tübingen.*

Nägelsbach, nā'gels-bă̆ă̆kh, Karl Friedrich: classical scholar; b. near Nuremberg, Mar. 28, 1806; became professor in the University of Erlangen in 1842; d. Apr. 21, 1859. He is famous as the author of the *Lateinische Stilistik für Deutsche* (1846; 8th ed. by Iwan Müller, 1890). Other works are *Die homerische Theologie in ihrem Zusammenhang dargestellt* (1861; 2d ed. by G. Autenrieth); *Die nachhomerische Theologie des griechischen Volksglaubens bis auf Alexander* (1857); *Æschylus's Agamemnon*, with introduction, translation, and commentary, ed. by Fr. List, 1863. Cf. L. Doederlein, *Oeffentliche Reden* (1860), pp. 239 ff. A. G.

Nagoya, naang'ō-yă̆a: city of central Japan; situated close to the bay of Owari, on the main route and railway between the two capitals (see map of Japan, ref. 6–D). It was formerly the seat of the powerful daimios of Owari, who were closely allied to the Tokugawa ruling house, and whose magnificent castle, now used as a military station, still remains intact. Nagoya is the capital of the prefecture of Aichi. The town and district are celebrated for the manufacture of fans, cloisonné ware, porcelain of the "egg-shell," "frosted," and other delicate varieties, and silks. The people are devoted Buddhists, and the local temples are fine. Pop. (1892) 179,174. J. M. Dixon.

Nagpur', or **Nagpore**: town of British India; capital of the province of Berar or Nagpur; situated in lat. 21° 9′ N., lon. 79° 11′ E., 430 miles E. N. E. of Bombay, with which it is connected by railway (see map of S. India, ref. 2–E). It is 7 miles in circumference and consists mostly of mud huts. The ground on which it stands is swampy and unhealthful. Its manufactures of cotton cloths, coarse and fine chintzes, woolens, silks, and brocades are important. In 1740 it became the seat of an independent Mahratta prince; in 1853 it was incorporated with the British dominions. Pop. (1891) 117,014.

Naharro, Bartolomé de Torres: poet; b. toward the end of the fifteenth century at Torres, near Badajoz, Spain. After being a captive in Algiers, he visited Rome (after 1513) for the purpose of obtaining the favor of Pope Leo X. Obliged to leave Rome, owing to a satire on the vices of the papal court, he lived for a time at Naples, under the protection of Fabricio Colonna. He is said to have died in poverty. His works were first published by himself at Naples (1517) under the title *Propaladia*, and dedicated to Ferrante d'Avalos, husband of the famous Vittoria Colonna. They consist of satires, epistles, ballads, and particularly eight plays, called by the author *Comedias*. These latter were the first attempt in Spanish to adopt something of the form and manner of the classical and the Italian drama. Though fluent and amusing, they are often extremely coarse and never remarkably interesting. The openness of the attacks on the clergy in them led the Inquisition to prohibit them, and the later editions were expurgated. The first Spanish edition appeared at Seville in 1520, and was followed by many others, both there and elsewhere. Four of the comedies are printed in Böhl von Faber's *Teatro Español* (Hamburg, 1832). In spite of his roughness, Naharro was much admired and imitated in Spain during the sixteenth century. A. R. Marsh.

Nahr-el-Asi: See Orontes.

Nahr-el-Mukatta: See Kishon.

Nahuatl Antiquities: See Central American Antiquities.

Na'hum [= Heb. *Nahūm*, liter., consolation]: one of the twelve minor prophets. He is called an Elkoshite, but no place called Elkosh is now known. Jerome identified it with a town of Galilee; Ewald and others with *Alkush*, on the east bank of the Tigris, about 2 miles N. of Mosul, where "Nahum's tomb" is still shown, but Layard pronounces the structure to be comparatively modern; and there is no notice of Nahum in connection with this place earlier than the sixteenth century. Nahum prophesies after Sennacherib's invasion (700 B. C.) and before the destruction of Nineveh (625 B. C., Rawlinson, or 606, Oppert and Lenormant). His Hebrew is of the most classical style.

Na'iades: the Lamarckian name for the fresh-water mussels forming the family of the Unionidæ (*q. v.*).

Naiads [from Lat. *Nai'ades* = Gr. Ναϊάδες, Naiads]: the nymphs of fountains, streams, and lakes, as distinguished from the Oceanids and the Nereids. Their special appella-

tions vary according to circumstances, *Crenææ*, *Potamēides*, *Limnades*, etc. See Nymphs.

Nails [O. Eng. *nægel* : O. H. Germ. *nagal* > Mod. Germ. *nagel*, nail (in both senses); Gr. ὄνυξ, claw, hoof, nail : Lat. *unguis* : Sanskr. *nakhá-*]: the plates of horny epidermis which in man grow upon the dorsal aspect of the distal phalanges of fingers and toes. They are the homologues of the hoofs and claws of the lower animals. They consist each of a free extremity, of which both sides are exposed; of a body, having one side exposed; and of a matrix or root, of which both sides are concealed in the skin. At the base of the nail appears a crescent-shaped patch of lighter color than the rest, called lunula or albedo. As the result of sickness small spots of whitish color are formed at the root of the nail, and by observing their progress in the growth toward the tip it may often be estimated how long before the observation an illness occurred. After fractures and some nervous diseases the nails cease to grow temporarily.

Nails: slender pins or pieces of metal, usually tapering and having a head, used for fastening pieces of wood or metal together, or, when driven into any material, for hanging articles on. Nails are classified by the U. S. Patent-office as cut, wrought, horseshoe, shoe, barbed, composition, button, carpet, coffin, sheathing, galvanized, harness, leather-work, picture, siding, slating, trunk, upholstery, weather-tiling, and screw-nails. Of these, the cut, wrought, and horseshoe nails are by far the most important. In the beginning of the nineteenth century nails were ordinarily manufactured by hand-forging, usually by women and children, the degradation of the nailmakers forming one of the saddest phases of English industrial life. The application of machinery to the fabrication of all the more important varieties of nails originated and developed chiefly in the U. S. This was a natural result of the universal use of wood for buildings, fences, etc. The first cut nails are said to have been made in New England late in the eighteenth century by cutting the blanks from a piece of sheet metal and heading them with a hand-hammer while held in a vise. In 1810 a machine invented in the U. S. cut nails at the rate of 100 per minute. The rough surface of a cut nail where no clinching is required adds about 20 per cent. to the holding power. For uses requiring clinching a tapering hand-forged nail, termed the "German wrought," was used until about 1860, when manufacturers began to anneal common cut nails, giving them a bending quality; and these soon practically drove the others from the market. The importance attached to nail manufacture in the U. S. may be inferred from the fact that previous to 1874 upward of 300 patents were issued for improvements in making cut and forged nails, of which twenty-three were granted before the beginning of the nineteenth century. These embraced the germinal ideas of the present machinery for *cutting* nails, while an earlier English patent, that of William Finch, of Staffordshire, comprised the use of tilt-hammers, the rapid and forcible striking of which enabled several nails to be made from the rod with one heat, whereas by hand the rod required to be reheated previous to the forging of each nail.

In the manufacture of cut nails the iron or steel, as the case may be, is first rolled into plates having a thickness corresponding to that of the nail to be made, measured from one flat side to the other, and a width somewhat greater than the length of the finished nail. When the nails are to be annealed for clinching, the length of the plate is transverse to the grain of the iron, in order that the grain may be lengthwise of the finished nail to insure greater flexibility in clinching. The plate is then placed in a feeding device, which moves it forward to dies or cutters, which cut a tapering blank from the end of the plate. This blank is then gripped by holding-jaws, which clamp it firmly while a punch or header abuts against the widest end of the blank and upsets a sufficient portion of the metal to form the head. In order to secure the tapering form of the blank without waste of material, the plate is turned laterally, so that its end is at a slight angle to the cutting devices or dies, first in one direction and then in the other, the head of each alternate nail being formed at that lateral edge of the plate opposite that at which the head of the previous nail was made. In some cases the same result has been secured by giving the lateral movement to the cutting dies while the plate is made to travel in a straight line. In one machine the plate is made of a width sufficient to permit blanks for a number of nails to be cut simultaneously from its end. In this apparatus rotating cutting dies, instead of vibrating or reciprocating ones, are used to sever the blanks from the plate, and the nails by this machine are made with chisel-shaped points.

In the manufacture of horseshoe nails, the nail-rod, heated at one end for about a foot in length, has its free or outer end steadied by the hand of an attendant, but is gripped near its inner end by an intermittent feeding-device which feeds it inward to the hammering mechanism. This latter comprises a fixed anvil, the face of which corresponds to the contour of one of the flat sides of the nail, and which has at one edge a fixed die arranged vertically at right angles to its face, and corresponding in its form to one of the curved lateral edges of the nail. At the opposite side of the anvil is a moving die having a face the same shape as that of the anvil, but attached to one end of a rocking lever, the opposite arm of which is connected by a universal joint, a rod, and strap with an eccentric on a rock-shaft provided transversely above the parts just noticed. On this shaft, immediately over the anvil, is a disk upon the periphery of which is arranged a roller, which serves the purposes of a striker. As the nail-rod is fed inward, with its heated extremity upon the anvil, the rotation of the striker impinges longitudinally upon the heated end of the rod, striking a "drawing" blow, which of course elongates the metal. As soon as the striker, carried away by the continued rotation of the disk, has been brought out of contact with the metal, the moving die moves inward, compressing the flattened part to bring its lateral surfaces to the shape required in the edges of the nail. This done, the striker strikes again, to be followed by another action of the dies, until after sixteen blows of the striker the nail is complete so far as the hammering is concerned; but the process of shaping does not end here. The "point" of the nail at this stage is an eighth of an inch wide, and is rough and jagged. The nail is, moreover, three-fourths of an inch longer than when finished. To complete the work, a little device, termed a "poker," bends the point or tip sidewise until one edge intercepts (at a proper place along the length) an imaginary line drawn axially through the nail. This done, a cutter at the opposite side traverses a path corresponding to the curvature just given by the bending to the edge just previously referred to, and cuts off the surplus metal from the tip. A slight retrograde motion of the rod permits a suitable cutting device to sever the finished nail therefrom.

The wire nail consists essentially of a cylindrical piece of wire of suitable length, with one end properly sharpened and the other upset to form a head. A good wire nail has great holding-power. A succession of new machines and mechanical operations tends constantly to increase the output and improve the quality of this variety of nails. In the production of cut nails steel has, in a measure, taken the place of iron. This is due to the cheapening of a suitable quality of steel, and to its greater strength and toughness. Notwithstanding the long period during which the machine-manufacture of cut nails has been carried on, improvements and changes in machinery are constantly made.

Of the minor varieties of nails may be mentioned garden nails, made of cast iron and frequently toughened by annealing; screw-nails, made with flat shanks, to which a spiral twist, from a half to a full turn, is given; and barbed nails, notched or provided with notches or with spurs to increase their hold on the wood. Shoe-nails are headless tapering nails cut, the smaller sizes, from sheet zinc, the larger from iron. Ornamental nails, such as are used for pictures, coffins, etc., are made with wrought shanks and porcelain or stamped sheet-metal heads, the latter attached by being screwed upon the shanks or by soldering with soft metal.

James A. Whitney.

Nain [= Gr. Ναΐν = Heb. *Nā'ĭn*, liter., pasture]: a poor little village in Galilee, 6 miles S. E. of Nazareth, mentioned only in the New Testament (Luke vii.) as the place where our Lord raised the widow's son from the dead (see map of Palestine, ref. 6–D). It was then a walled town, with a cemetery some ten minutes' walk to the E. It is beautifully situated, and now contains a few mud and stone houses occupied by Moslems.

Nain: mission station of the Moravian Brothers, on the east coast of Labrador, in lat. 56° 30′ N.; politically a part of Newfoundland. The climate is severe: the mean temperature for summer is 48° F.; for winter, −7° F.; for the year, 25° F. Pop. about 300, consisting of Christianized Esquimaux.

M. W. H.

Nairne, Lady Carolina Oliphant, Baroness: poet; b. at Gask, Perthshire, Scotland, July 16, 1766; was called in her youth the Flower of Strathcarn, from her great beauty; married in 1806 Capt. W. Murray Nairne, afterward Lord Nairne; belonged to a prominent Jacobite family; wrote *The Laird o' Cockpen*, *The Land o' the Leal*, and other popular Scotch ballads, the authorship of which was kept secret until shortly before her death, which occurred at Gask, Oct. 27, 1845. See her *Memoir and Complete Lyrical Compositions*, by Charles Rogers (1869).

Nairnshire: county of Scotland; bordering on the Moray Firth, Elginshire, and Inverness-shire. Area, 169 sq. miles. The surface generally ascends from a fertile and well-wooded tract near the coast, until at Carn Glas, on the southern boundary, it attains 2,162 feet. Most of the ground is covered with forest, and less than a fifth of the entire area is under cultivation. more attention being paid to stock than crops. Pop. (1901) 9,291. Capital, Nairn, at the mouth of the river Nairn, with a good harbor, protected by a breakwater. Pop. (1891) 4,651, chiefly engaged in herring-fishing. Near by is the village of Cawdor, with the castle of the same name, in which, according to tradition, Macbeth murdered Duncan; the present building, however, is not older than the fifteenth century.

Najac, Émile, Comte de: dramatic writer; b. at Lorient, Morbihan, France, Dec. 14, 1828. After studying law he obtained a post in the ministry of the Interior, but later gave this up for a purely literary career. For a whole generation he has produced, alone and in collaboration with others, a stream of comedies, farces, operettas, etc. Among these may be mentioned *La poule et ses poussins* (1861); *Les oiseaux en cage* (1863); *La dernière poupée* (1875); *Théâtre des gens du monde* (1872); *Madame est servie* (1874); with Scribe, *La fille de trente ans* (1859); with Sardou, the comic opera *Les noces de Fernande* (music by Deffès, 1878); and the comedy *Divorçons* (1880). A. R. M.

Nakhimov, năăk-hee'mov, Akim Nikolaevich: satirical poet; b. in 1782, on his father's estate in the government of Kharkov, Russia; was educated in Moscow, and at the University of Kharkov; but during the latter part of his life remained most of the time at his home in the country. In his leisure moments he wrote poems, of which the best known is his *Satirical Elegy* (1809), called forth by a new law on the education of officials. D. in 1815. The seventh edition of his complete works appeared in 1852, in the collection of Smirdin. A. C. C.

Nakhitchevan': town of European Russia; on the Don, 30 miles from its mouth; founded in 1780 by an Armenian colony (see map of Russia, ref. 10–E). It is the seat of the Armenian Patriarch of Russia; has some manufactures of cotton and silk, and an extensive trade. Pop. (1889) 17,347.

Nakoo: See Gavial.

Namaland, Great, or **Namaqualand**: the southern part of the German possessions in Southwest Africa; bounded N. by Damaraland, E. by the Kalihari Desert and British Bechuanaland, S. by Cape Colony, and W. by the Atlantic. It is the chief home of the remnant of the uncivilized portion of the Nama or Hottentot people, and forms the southern extremity of the semi-arid lands of Southwest Africa. The characteristic features are sandy, undulating plains, hills, and mountains dividing the coast lands from the depression of the Kalihari, bitter salt springs, dry river-beds, and a few long, narrow, verdant valleys, where the missionary and chief native settlements are found. The region is less valuable in its prospects of mining and agricultural development than the German possessions adjoining it on the north. C. C. Adams.

Namangan: a town and fortress of Ferghana, Russian Turkestan; on the upper Syr-Daria; lat. 41° N., lon. 71° 40′ E.; 50 miles N. E. of Khokan. It is the chief commercial city of the upper valley of the river, and transacts a large business in sheep, wool, hides, yarn, and fruit. Rafts are extensively used to convey the merchandise down the river. Pop. (1897) 61,906. M. W. H.

Namaquas: See Hottentots.

Namatia'nus, Rutilius Claudius: a Latin poet of the fifth century, who wrote in elegiac verse an account of his return from Rome to Gaul (*de reditu suo*) in two books (of which nearly the whole of the second is lost), interesting for the description of places and the personal allusions, and very correct in form. The writer was a Stoic, and despised both the Christians and the Jews. See edition of L. Mueller (Leipzig, 1870) and Baehrens, *Poet. Lat. Minores*, vol. v., pp. 4–30 (Leipzig, 1883). M. Warren.

Namaycush, or **Mackinaw Trout**: one of the largest of the fresh-water *Salmonidæ*. Its scientific name is *Salvelinus* or *Cristivomer namaycush*. It inhabits the upper lakes of the St. Lawrence basin and the lakes westward to British Columbia and Alaska. It is caught with the spear mostly. Specimens of 120 lb. weight are reported, but it does not often exceed 50. The flesh is good, but not of first quality. It is also called longe, togue, and Great Lake trout.

Namdinh: city of Tonquin, Indo-China; 50 miles S. E. of Hanoi, 3 miles from the Song-koi or Red river, and 20 miles from the coast; lat. 20° 25′ N., lon. 106° 8′ E. It is the residence of a French political agent, a center for the Annamite French consular service, and contains magazines of military stores. It is a center of a rich portion of the Song-koi delta, and has an active commerce in rice, cotton, silk, indigo, salt, and wood-carvings. The exports go chiefly to the southern provinces of China. Pop. 50,000.

Name [O. Eng. *nama*: O. H. Germ. *namo* (> Mod. Germ. *name*): Goth. *namō*; cf. Sanskr. *nāman-*: Gr. *ὄνομα*: Lat. *nomen*, name]: the word or words by which a person, place, or thing, or a family or class of persons or things is designated. Among savages, with whom general social relations and history are in an undeveloped condition, a single appellation derived from some association is enough for the name of a person. He who kills a wolf under striking circumstances is called Wolf, and the man who dreams of an eagle is named Eagle. Among certain tribes in North America the animal-spirit peculiar to each Indian is the first creature which appears to him in a dream after fasting and seclusion, and this, his *totem*, gives him a name. The first distinction recognized is that of proper and common names, or that of the individual as distinguished from the family and tribe. As there is something reserved and sacred often attached to the former, there was often a mystery associated with it; and, as Schoolcraft observes, "An Indian will tell his specific name with great reluctance, but his generic or family name he will declare with pride."

Scripture Names.—The early Hebrews gave an infant a name as soon as it was born, from some striking accident relative to it. It thus became commemorative of the history of the family. When Eve bore her first son she said, "I have *gotten* a man from the Lord," whence he was called Cain, meaning "gotten" or acquired. Noah signifies "comfort" (Gen. v. 29). The vigor and intelligence shown in our Scripture names were remarkable. They greatly influenced Hebrew literature, and are the finest of antiquity. Those of the women were derived from character and circumstance: e. g. Adah or Ada, "ornament"; Leah, "weary"; Deborah, "a bee." The names of the patriarchs generally had a mystical meaning. Elijah and Joel are composed of two names of God; Josaphat and Saphatias indicate the judgment of God; Johanan or John of Hanania, his mercy; Nathaniel, Elnathan, Jonathan, and Nathania, all mean "the gift of God," as *Devadatta* was Sanskrit, and as *Theodore*, Greek.

Arabia and Turkey.—Among the Arabs and Turks names are few and simple. As Mohammed said, "Give your sons the names of prophets," the result has been an interminable repetition of Mohammed, Mahmud, Hamet, or Achmet; of Ibrahim (Abraham), Moussa (Moses), Suleiman (Solomon), Dauoud (David), and Aïssa (Jesus). Then come the names of their heroes, such as Osman, Ali, Omar. In a third category are the names beginning with Abd, a "servant," as Abd-el-Kader, "servant of the All-Powerful," Abd-Allah, "servant of God." To these follow names ending in *din*, "religion," as Salah-ed-Din (Saladin), "restorer of religion." Some names consist of these elements composed, as Hamet-el-Abd, "Mohammed the servant," and others are merely adjectives, as Saïd, "happy or fortunate," Hassan, "handsome," Hussein, "powerful," Reshid, "just judge," Mustapha, "elected of God." To indicate men more accurately, surnames are often added—e. g. El Kebir, "the great"; words of relationship—e. g. Abu or Bu, "father," Abu-Nebas, "the father of the race." Among the feminine names are Lulu, a "pearl," Zarifa, "beauty." Girls are also called after the wives or female relatives of the Prophet. Men sometimes take as surnames appellations relating to their country, birthplace, origin, family, sect, trade, or occupation.

Greece.—The Greeks in the time of Aristotle gave a child its name on the seventh day after birth. It was afterward

given on the tenth day. It was derived from some quality, such as piety, a great event, a striking personal quality, a happy presage; from some virtue or physical advantage, from friendship, or by chance. The grandson took his name from his grandfather or the nephew from his uncle, and to prevent confusion another name, such as the father's, was added, or else one derived from the calling of the bearer, from his birthplace, or a nickname. The father's name was, with a slight change, also given to one child, e. g. Chryseis, "daughter of Chryses." In later times names of people were taken from the gods, e. g. Apollodorus, "gift of Apollo." Though denied by many writers, it is evident that something like a generic name was applied to many families: e. g. the Heraclidæ, the Cecropidæ, the Atridæ, the Alcmeonidæ. Many of the Greek names were very beautiful—e. g. Aphrodite, "foam of the sea"; Artemas (m.), "perfect," Artemisia (f.), "perfect"; Diana, "bright as day": Diomede, "dear to Jupiter"; Zenobia (f.), "life," from Zeno, the lord of life; Spiridion, "breath of the gods"; Isidore (m.), Isidora (f.), "gift of Isis"; Heliodorus, "gift of the sun"; Zeno, "life" (the lord of); Zoë, "life"; Amaranth, "unfading flower."

Rome.—The Romans, like ourselves, had a family name, called the *nomen gentilitium*, generally ending in *ius*, *eius*, or *aius*. This, derived from the gens, "clan or tribe," was the *nomen* or name proper. As the clan was divided into families, there was also the hereditary *cognomen*, while the *prænomen* distinguished the individual. Sometimes, by way of further distinction, a second cognomen, called the *agnomen*, was borne. This was often an honorable title derived from some great exploit. The *prænomina* or "Christian names," so to speak, were not more than thirty in number, whence the constant repetition of Marcus, Decimus, Florus, Gaius, etc. Romans often took their names from their order of birth, as Primus, Secundus, Tertius ("first," "second," "third"), and cognomens were derived from the months in which they were born or from some personal peculiarity; from being a twin or a posthumous child; from a city, river, or country. The daughter's name was the feminine form of that of the father—e. g. Julia from Julius, Octavia from Octavius. To distinguish the individual, she also received another name grown hereditary in the family, as Julia *Agrippina*; but the surname was often fanciful, as *Felicula*, "little cat" or "puss." Nicknames were common. After marriage a Roman lady bore the name of her husband in feminine form, whence it was usual to say at marriage, "Where you are Gaius, I will be Gaia." Many Roman names were from Etruscan or other old Italian sources; some were from the most trifling or undignified personal peculiarities or occupations. With the Northern invaders came chiefs proud of their own ancient Gothic names and families; that of Theodoric gloried in the recollection of Amal, whence Amalaric, Amalafride, Amalaberg. With Christianity came names from the Bible, but the old heathen family appellations "died hard." St. John Chrysostom in the fourth century complained of this obstinacy, as did St. Gregory in the sixth century. Such were the names Wolf, and those founded on Ans or As, indicative of a god; e. g. Anselm, Esmond, Oscar or Elf, Hildebrand, "war-sword," Bertha, "the bright goddess" (Albert, Bertram), Gertrudis, etc. All of these were sources of pride, owing to age and associations.

English Names.—The entire history of Indo-European names is that of a growth from a condition like that of the Arab and Indian to the one now prevalent among us. Those of the Anglo-Saxons were imposed, says Sharon Turner, as with us, in their infancy, by their parents. They were frequently compound words, rather expressive of caprice than of appropriate meaning. The following are specimens: Æthelwulf, "the noble wolf"; Æthel or Ethel, Adel, and Adeline, meaning "noble"; Bertwulf or Bertolf, "illustrious wolf"; Eadwulf, "the prosperous wolf"; Æthelwyn, "noble joy"; Eadric, "happy and rich"; Ælfred, an "elf (i. e. shrewd) in council"; Sigeric, "victorious and rich"; Æthelred, "noble in speech" (German, *Rede*); Eadmund or Edmund, "prosperous patron"; Eadwin, "prosperous in battle"; Dunstan, "mountain-stone"; Ethelbald, "noble and bold"; Eadward, "prosperous guardian"; Ethelstan, "noble rock" (or stone); Ethelbert, "noble and illustrious." These names partially remain to-day. Many Anglo-Saxon names were wild and strange; e. g. Beanhelm, "helmet of the nobles"; Eardwulf, "wolf of the earth or province"; Werburg, "hedge of the city"; Sigfred, "peace of victory"; Beonheat, "the soaring bee"; Beagstan, "bracelet stone"; Wulfheah (wolf-high), "tall wolf"; Beornoth, "noble's oath"; Wine, "the dear one," which often forms a part of many names; Sæfreth, "freedom of the sea"; Ceolmund, "protecting ship." Female names were not less fanciful. Thus Dudda, meaning the "family stem," was a father who had three daughters—Deorwyn, "dear to man" or "dear love," Deorswythe, "very dear," and Golde, "golden." A father, Æthelwyn ("noble joy"), had four sons—Æthelwold, "noble governor," Alfwold, "ruling elf," Athelsin, "always noble," and Æthelwyn. It is not settled whether the Anglo-Saxons always used surnames. Many certainly had appellations added to their original names. Thus there was Wulfsic se blaca, or "the pole," and Thurceles hwitan, or "the white." These were, however, among the Saxons, as for many centuries later in England, derived from many causes, as from the place of residence—e. g. Ælfric at Bertune; or from the father, as Elfgare Ælfan suna, "Elfgare, son of Ælfan," or, more shortly, Wulfrig Madding, Badenoth Beotting. Office, trade, or possession often bestowed a name, as Leofwine ealdorman ("alderman"), Sweigen scyldwirtha ("the shield-bearer"), Ægelifrig munuc ("monk"). In the course of time, though very rarely among the Anglo-Saxons, these became family names, and as such still exist. Among women's names are Ethelswytha, "very noble"; Selethrytha, "a good threatener" (Anglo-Saxon ladies appear to have excelled as scolds); Editha, "the blessed gift"; Elfhilda, "elf of battle"; Beage, "bracelet"; Ethelfritha, "noble and powerful"; Adeleva, "noble wife"; Heaburga, "high tower" (a tall lady); Adelfleda, "noble pregnancy"; Elfgiva, "elf favor"; Edgiva, "happy gift"; Ethelgiva, "noble gift"; Wynfreda, Winifrede, "peace of man"; Ethelhilda, "noble war-goddess"; Elfthrythe, "threatening as an elf." Saxon is the stock on which the English and American names of the present day are formed. Next to these come the Norman, but it must be remembered that both were in a great degree founded on a common Teutonic origin. Though the Anglo-Saxons very rarely employed a regular system of family nomenclature similar to our own, they attempted to show relationship by the use of similar personal names. Thus in one family we find Wigmund, Wig-helm, Wig-laf, Wih- (or Wig-) stan, and the nineteen descendants of Alfred had their names beginning with *Ead* ("prosperous"). The termination *-ing*, as in Brening, Dering, Whiting, means a descendant, or "born of." Surnames were not common before the eleventh century, though they were used, hereditarily, occasionally both by lords and common men. Among the oldest of these family names were the names Liniet (Linney), Grimkelson, Dubbe, Tuk (or Tuckey), Pineebek, and Gamelson. The ingress of the Normans introduced the use of Scripture names. During three centuries after the Conquest people of rank began to assume first some surname of place or characteristic, and then one of family. The younger branches of a family often laid aside the father's name and took one from the place where they lived, and thus (in Cheshire) in three descents as many surnames are found in the same family. Several brothers often assume different surnames. Hence it is difficult to trace the pedigree of any family beyond the thirteenth century. The roll of Battle Abbey, containing the names of those who fought at the Conquest, gives the cream of the Norman aristocracy, so that a biographer of Chaucer declared that all names to be found in it ennobled their descendants. (For different versions of this roll, see Lower. *Patronymica Britannica.*) The Normans introduced the title *de* ("of" or "from") as indicating the names of their estates; e. g. Le Sire de Vitry, Paennel du Monstier-Hubert. The mingling of Norman with English names soon formed a sad chaos, many callings, places, and nicknames being translated into French and thence Anglicized, while the confusion was worse confounded by the Latinization of others. *At*, meaning the same as *de*, or indicating residence, enters into many English names; e. g. Athill, Atwood. In Norman names many old Norse words became French. Thus *ey* or *ö*, "island," became *eu* (Cantaleu); *flôt*, a river, *fleur* (e. g. Harfleur); *bo* or *by*, an "island," *bœuf* (Paimbœuf); *garth* became *gard* (Epegard), etc.

Celtic names were originally formed on the same principles as the Saxon, the affix *Mac*, denoting "son," being usually assumed in Scotland, as was *O'* ("grandson") among the Irish, and *Ap* with the Welsh. The head of a clan in Scotland is spoken of as *The*—e. g. The Macgregor—and he is addressed by the name alone, without an article.

The entire clan usually bore the chief's name. Among Celtic names are Angus, "firm"; Fingal, "strongest of the strong"; Brian, "chief"; Fergus, "strong arm or man"; Arthur, "a bear"; Griffith, "a dragon"; Hugh, "mighty, indomitable"; Murdoch, "great chief"; Owen (John), "a lamb"; Dugald, "black-haired"; Rowena, "the white-necked" (?); Brenna, Brenda, "raven-haired"; Cordelia, "token of the flowing"; Morgiana, "lady of the sea."

There are in Great Britain nearly 50,000 surnames, derived from every conceivable source, such as animals, offices, saints, traders' signs, virtues, and even from oaths and salutations, such as Bigot, from "by God"; Pardoe, from "par Dieu"; Godsall, from "God's soul"; Olyfader, from "Holy Father"; and Belcher, from "*belchère*." The commonest name is Smith; the next in order Jones, Taylor, Williams, Brown, Davies, Thomas, Robinson. Of the second class as to number are Baker, Clark, Cooper, Davis, Edwards, Evans, Green, Hall, Harris, Harrison, and others, in apparently the same proportion as in America.

In Wales there are districts in which family surnames are not yet known, and there are places all over Great Britain in which nicknames or sobriquets like those of the Middle Ages are in general use. It has been frequently asserted that French names introduced at the Conquest may be known by such prefixes as *de*, *du*, *des*, *de la*, *saint*, or by the suffixes *font*, *ers*, *faut*, *beau*, *age*, *mont*, *ard*, *aux-bois*, *ly*, *eux*, *et*, *val*, *court*, *lay*, *fort*, *ot*, *champ*, and *ville*; but this is far from being the case, since very soon after the Conquest these terms came into such general use as to make distinctions almost impossible. The Norman term *fitz* is commonly believed to signify illegitimate descent, but this was by no means invariably the case, the word itself meaning simply *fils*, or "son."

In many European countries the husband adds his wife's name to his own, and in Spain, if the mother is of better family than the father, the children take her family appellation. In inheriting Scotch estates it is a very common condition that a certain name shall be taken with the property.

Ancient Egypt.—Among the ancient Egyptians the king ordinarily had two names—one a prænomen or solar title, assumed at coronation (as Men-Cheper-Rā, the prænomen of Thotmes III., or Cheper-Ka-Rā, that of Usertasen I. of the twelfth dynasty), and a family name. In writing these were included in ovals or cartouches. Individuals had often two names, but the Egyptians generally used only one. Egyptian proper names, however, present great variety of structure, some being apparently very simple and not always possessed of particular significance, while others present more or less complete sentences. The latter usually have a divine name as a component part, and are capable of a more or less exact translation.

China and Korea.—The Chinese have at least two names: one a "sing" or family name, which is invariably placed first in both speech and writing, and a "ming" or personal or given name, corresponding to the Christian name of Western nations. There were originally only 100 family names, but now there are 438, of which thirty are dissyllabic, as Sze-ma, Ow-yang, etc. The others are all monosyllabic. The little book called *Peh-Kia-Sing*, or Hundred Family Names, which contains lists of these characters, is the most popular book in China, and as it covers nearly every sound in the language it affords to the unlearned a convenient list of phonetics for correspondence and account-keeping. These names are usually the names of common objects such as *Lung*, "dragon"; *Lang*, "wolf"; *Ma*, "hemp"; *Li* (pronounced lee), "a plum"; *Lin*, "forest"; *Liu*, "willow"; *Ts'ŭn*, "inch"; *Hwang*, "yellow"; *Luy*, "thunder"; *Wang*, "prince." The surnames Li, Wang, and Chang are as common in China as Smith, Brown, and Jones are among English-speaking peoples. Persons having the same surname can not intermarry.

The *ming*, or given name, is usually in two syllables, and invariably follows the sing or surname, as Li Hung-chang (the famous viceroy and grand secretary), Tsêng Kwo-fan. It is therefore improper to speak of Mr. Ch'ang or of Mr. Hung-chang; Mr. Li and Mr. Tsêng are correct. The surname never varies, but the ming may. At birth a boy receives a "milk-name"; when he goes to school he receives a "book-name"; when he marries he takes a "great name"; when he takes his degree or enters upon office he assumes an "official name"; while in the ancestral temple he is known by his posthumous name. When a woman marries she assumes her husband's surname, and retains her own surname as her given name. All Buddhist monks are surnamed Shih (the first syllable of Shih-kia- or Sakya-muni); hence no one ever asks a Buddhist his sing or surname. The dissyllabic names which are often seen over the doors of Chinese business houses are simply the "style" adopted by the individual or firm doing business there, and not the names of individuals.

Emperors are never known or spoken of by their own names. On the accession to the throne a *nien-hao*, or year-name, is chosen, and this designates not the ruler, but his reign-period. K'ang-hi is thus not the name of the second emperor of the Manchu dynasty, but merely the style of his reign. The eighth emperor of the present dynasty was named Mien Tsai, and his reign-period Tung-Chi. The present reign-period, which began with 1875, is called Kwang-sü, or "Glorious Succession." In history emperors are known by their posthumous or temple names.

Korean usage is the same as that of China.

Japan.—Japanese surnames are of two kinds: (1) the *Kabane*, or clan name (e. g. Minamoto, Fujiwara, etc.), and (2) the *uji*, or family name, originally names of localities, e. g. Takahashi, "High-bridge"; Yamamoto, "Mountain-foot"; Matsumura, "Pine-tree-village"; Nagasaki, "Long-point." Given (or "Christian") names are also of two kinds: (1) common name, usually ending in -tarō for the eldest son, -jirō for the second, -saburō for the third, and so on; (2) the true name, which until recent times was used only on solemn occasions. As in China, the family name invariably precedes the given name, e. g. Nagasaki Gentarō. As in China, the mikados are known in history by their posthumous or temple names. The personal name of the present emperor is *Mutsu-hito*, "Benevolent Man," and his reign-period is *Mei-Chi*, "Enlightened Rule." Women are generally named after some flower or other natural object, preceded by O, "honorable," as O Hana, "Flower"; O Take, "Bamboo"; O Kiku, "Chrysanthemum"; O Haru, "Spring."

Place-names.—The study of the names of places is hardly less important than that of persons. From the earliest times men have retained the names of towns, hills, or rivers given by earlier races, so that it often happens, as in the case of the Picts, that all that is known of their language and origin is embraced in these terms. Again, in migrating to other lands the old place-names have always been transferred to new localities, in illustration of which the reader may consult *India in Greece, or Truth in Mythology*, by Edward Pococke (1852), a work in which the author has endeavored to prove that Aryan-Indian names were taken to the West. In like manner the Celt, the Saxon, the Pict, Romans, and Normans left their language in such words as *tam*, *tav*, or *clwyd*, meaning "river or water," whence the Thames, Tavy, and Clyde (Celt.); in *burg*, "a hill," and *bricg*, "bridge" (Saxon); in *Penval*, "the head of the wall" (Pictish); in *castrum*, "a camp," whence *-caster* (Roman). In *The Norman People* (London, 1874) it is shown that 124 common English names of places are also to be found in Scandinavia, and in such a way that they evidently originated there. See Steenstrup, *History of the Normans*, especially part iii.

Among the many books on the subject of names the reader may refer with advantage to *The History of Christian Names*, by Miss Yonge; also, *English Surnames*, by Beardsley (2d ed. 1875); and *Names and their Meaning*, by Leopold Wagner (1892). For (East) Indian names, see *Journal of the Royal Asiatic Society* (Jan., 1889, p. 159).

Revised by R. Lilley.

Names, Law of: For centuries the common law has assumed, if it has not required, the full legal name of a natural person to consist of a Christian or given name and of a surname or patronymic. A middle name or initial is generally deemed no part of the legal name, and hence unimportant. According to the older authorities a total mistake in the Christian name was fatal to all legal instruments, whether pleadings, grants, or obligations; "and the reason is, because it is repugnant to the rules of the Christian religion that there should be a Christian without a name of baptism, or that such person should have two Christian names, since our Church allows no rebaptizing. The mistake of the surname does not vitiate, because there is no repugnancy that a person should have different surnames." (Bacon's *Abridgment*; title, *Misnomer and Addition*, B.) The first of the above rules is no longer law. It is now well settled, both in Britain and in the U. S., that a person can change any part or the whole of his name with-

out penalty or punishment of any kind, unless the change is resorted to for the purpose of defrauding another. If he enters into a contract in a particular name he may be sued in that name, whatever his true name may be. So if he makes or receives a grant in an assumed name, his identity may be established by extrinsic evidence; and his marriage under an assumed name is valid. If negotiable paper is made payable to a person by a mistaken name, he may indorse it in such name, and thereby pass title and bind himself as indorser. "All that the law looks at is the identity of the individual, and when that is clearly established the act will be binding upon him and others." (*Petition of John Snook*, 2 Hilton's *Reports*; N. Y. Common Pleas 566.) Upon marriage the legal surname of the wife becomes that of her husband; yet she may continue to employ her maiden name in business transactions without subjecting herself to moral or legal censure. (*Bell* vs. *Sun Printing Co.*, 42 N. Y. Superior Court Reports 567.) The legal right to name a child is in the father. His promise to give the child a particular name has been held a valuable consideration for a note of the promiser. *Wolford* vs. *Powers*, 85 Ind. 294.

An act of Parliament changing a person's name is permissive and not compulsory; he may retain his original name. In many of the U. S. the constitutions forbid local or special laws changing the names of persons, and provision is made for the alteration of names by a judicial proceeding. (Stimson's *American Statute Law*, §§ 395, 432.) Statutes have been enacted authorizing the use of a deceased person's name by his successors in business, upon their acquiring the right to use it from his personal representatives, and filing and publishing the required certificate. (See N. Y. Laws of 1880, ch. 561, and Laws of 1881, ch. 389.) English common law does not secure to an individual such a right of property in his name or in the name of his real estate as to enable him to prevent the assumption of such name by another, unless the name thus assumed has become a TRADE-MARK (*q. v.*) or business name, and is employed to deceive the public or to defraud the person who made it valuable. See McAdam on *Individual, Corporate, and Firm Names* (New York, 1894). F. M. BURDICK.

Namur, Fr. pron. naă'mür': province of Belgium, on the French frontier; intersected by the Meuse. Area, 1,414 sq. miles. It consists of large, densely wooded hills, offshoots of the Ardennes, and rich in coal, iron, copper, lead, sulphur, alum, marble, and slate; and beautiful and exceedingly fertile valleys, yielding fine pastures and large crops of wheat, oats, hops, and flax. Besides agriculture and mining, a large manufacturing business is carried on, especially in paper, hardware, and cutlery. Pop. (1891) 336,543, mostly French-speaking Walloons.

Namur: capital of the province of Namur, Belgium; at the confluence of the Sambre and the Meuse; 35 miles by rail S. E. of Brussels (see map of Holland and Belgium, ref. 11–F). It has an elegant cathedral and many good educational institutions, large breweries, and celebrated manufactures of cutlery and leather. It was formerly a very strong fortress; was taken by Louis XIV. in 1692, and retaken by William III. in 1695. Joseph II. demolished the fortifications, and, although they were restored in 1817 during the union with the Netherlands, they were demolished again in 1866, with the exception of the citadel. Pop. (1891) 30,674.

Nanaimo, naă-nī'mō: port and town of Vancouver island, British Columbia; situated on the east coast, 60 miles N. N. W. of Victoria. It is a station on the railway from Victoria to Menzies Bay; and has a good harbor, although closed by ice in winter. Excellent coal is obtained in the immediate neighborhood and at Departure Bay, 3 miles north. Pop. about 3,000. M. W. H.

Nanaimos: See SALISHAN INDIANS.

Nanak: See SIKHS.

Nana Sahib, naa'naă-saa'hib (the title of *Dhundu Punt* or *Panth*): a leader of the Sepoy mutiny; b. about 1820; was adopted by Bajee Rao, Peishwa of Poona, and became his heir, but was not regarded as such by the British Government, which refused to continue the pension paid to his adopted father. Though embittered by this the Nana continued outwardly friendly to the British and won their confidence, but on the outbreak of the mutiny turned traitor and placing himself at the head of a body of rebels attacked Cawnpore. The British surrendered on condition that they should be sent down the Ganges to a place of safety, but they had hardly embarked when they were fired upon from the shore and almost all the men on board were killed. The women and children were taken to Cawnpore, and on the day before the arrival of Havelock to their aid were butchered by order of the Nana and their bodies thrown into a well. Notwithstanding the repeated efforts of the British to capture the author of the crime, he never fell into their hands though several times defeated by them in battle. Of his subsequent career nothing is known. F. M. COLBY.

Nancy, naăn'see': capital of the department of Meurthe-et-Moselle, France; on the left bank of the Meurthe; 220 miles by rail E. of Paris (see map of France, ref. 3–H). It is beautifully situated at the foot of a range of wooded and vine-clad hills. Besides its suburbs, it consists of the old and the new town, the latter with many broad and straight streets lined with magnificent houses. and many public squares adorned with fountains and gardens. It owes much of its beauty to Stanislaus Leczinsky, ex-King of Poland, who resided here from 1735 to 1766, and whose statue is in the Place Royale. It is the seat of a bishopric, and has a university, a celebrated school of medicine and pharmacy, a lyceum, a library of 40,000 volumes, several scientific societies, and many other excellent educational institutions, and large museums and collections both for scientific and artistic purposes. It is an important center for research in the field of hypnotism. It has manufactures of cotton and woolen goods, hosiery, hats, and brass, and its embroideries in all kinds of stuffs are celebrated. It was the capital of the former duchy of Lorraine, and in its immediate vicinity was fought the battle between Charles the Bold of Burgundy and René II. of Lorraine, in which the former was defeated and killed Jan. 5, 1477. At the death of Stanislaus, who held the country after the Peace of Vienna in 1735, Nancy was incorporated with France (1766). It has grown much in importance since the German annexation of Alsace-Lorraine. Pop. (1891) 87,-110; (1896) 96,306. Revised by S. A. TORRANCE.

Nan'du, or **American Ostrich**: the South American ostrich, or Rhea. See RHEIDÆ.

Nan'ek: founder of the important modern sect of the Sikhs of the Punjaub; b. at Talwendy, near Lahore, in 1469; son of Kalu of the Kshatriya caste; showed an early tendency to mysticism; associated with the fakirs; studied the religious books both of the Brahmans and of the Mohammedans; distributed his property to the poor; visited Mecca and Medina, and wandered through India in quest of a "vision of truth," which he ultimately attained, and thenceforth propagated a new religion with great success, being presented to the Emperor Baber in 1527. Nanek taught the unity of God, insisted upon faith in God and love to man, rejected monasticism, and instituted a very simple form of worship, which has since been considerably overlaid by the innovations of his successors. The object of Nanek was a reconciliation of Buddhism with Mohammedanism, and he embodied his doctrine in a book entitled *Adi Granth*, now the Bible of the Sikhs. D. at Kirtipur, on the banks of the Ravi river, in 1539. His tomb has been swept away by the river, but the locality is still a place of pilgrimage.

Nankeen' [named from *Nanking* in China, the original place of manufacture]: a durable cotton cloth of a buff-yellow color. It is made in Asia from a variety of cotton whose fiber is of this color (the *Gossypium herbaceum*). Artificially colored nankeens are made from ordinary cotton, and have nearly superseded the real article.

Nanking, or (less correctly) **Nankin** (literally, southern capital): the name by which *Kiang-ning-foo*, capital of the province of Kiang-su, is popularly known in China and among foreigners. It is situated on the south bank of the Yang-tse, 194 geographical miles W. of Shanghai, and 44 above the river-port of Chin-kiang; lat. 32° 2′ N., lon. 118° 49′ E. (see map of China, ref. 5–K). Its walls, which are 30 feet thick at the base and 70 feet high in some places, have a circuit of about 20 miles. The inclosed area, however, contains many open spaces and much waste ground. The inhabited part lies toward the west side, and is 3 miles from the river. The site is very unhealthful for Europeans, and even for natives of other parts of the empire. It is the seat of the viceroy or governor-general of the group of provinces known as Kiang-nan, and was formerly a city of much magnificence and importance. It was one of the chief literary centers, and was noted (as it still is to some extent) for its manufactures of satin, crape, nankeen, paper, porcelain, and

artificial flowers. It is now the seat of an arsenal conducted, under foreign superintendence, on the most advanced scientific principles.

The present city dates from the year 1368, when Chû-yuen-chang, a temple servant, at the head of a native army overturned the Mongol dynasty, whose capital was at Peking (the northern capital), and founded the Ming dynasty, which was in turn superseded in 1643 by the Manchus. He made it his capital (hence the name southern capital). Here outside the south gate stood the famous Porcelain Tower, or pagoda, which the third emperor of the Ming dynasty erected in honor of his mother in 1413, two years after the removal of the capital to Peking. It was 261 feet high, octagonal in ground plan, and consisted of nine stories, each provided with a gallery and a projecting roof, from the corners of which bells were suspended. Its outer walls were encased with white porcelain tiles. On Mar. 19, 1859, the city was taken by the Tai-pings, and was held by them until July 19, 1864, when it was captured by Gen. Gordon, and the rebellion came to an end. During their occupancy the palaces and other public buildings erected in the early days of the Ming dynasty, including the Porcelain Tower, were completely destroyed. The arsenal now stands on the site of this tower, and was partly built with its bricks.

At Nanking, Aug. 29, 1842, Great Britain concluded the treaty which opened five ports to foreign residence and trade. In the treaty concluded by the French in 1858 Nanking is mentioned as a treaty-port, but it has never been opened. Population probably less than 250,000. R. Lilley.

Nan'sen, Fridjof, Ph. D.: Arctic explorer; b. near Christiania, Norway, Oct. 10, 1861; entered the University of Christiania 1880; left in 1882 for an expedition in a sealing-ship to Arctic latitudes; was appointed on his return in 1882 curator in the Natural History Museum at Bergen; started May, 1888, on his celebrated journey to Greenland, in which he crossed the continent, returning May, 1889; became curator of the Museum of Comparative Anatomy at the University of Christiania; is the author of *The First Crossing of Greenland*, *Eskimo Life*, and numerous scientific papers. The Norwegian Storthing having voted 200,000 kroners for a new expedition to the north pole under Nansen's direction, he set out from Christiania June 24, 1893, in a specially constructed vessel of 170 tons, the Fram (Forward), manned with a dozen men and equipped with provisions and fuel for five years. His plan was to utilize the current which he believed sweeps from Bering Strait and the vicinity of the New Siberian Islands (*q. v.*) across the pole toward Greenland. By Sept. 22 he was shut in by the ice and began his northward drift. On Mar. 14, 1895, when in lat. 83° 59′, he with Lieut. Johansen left the ship and proceeded toward the pole with dog-sledges. On Apr. 8, when in lat. 86° 14′ N. and lon. 95° E. (2° 50′ nearer the pole than any previous explorer), they discovered that the ice-pack on which they were traveling was slowly drifting southward, and determined to make for Franz Josef Land, which they reached Aug. 26; spent the winter there (lat. 81° 13′ N.), living on bear and walrus, and in the spring of 1896 set out to reach Spitzbergen over the ice. On the way they fell in with members of the Jackson-Harmsworth expedition, and in August returned to Norway in their supply vessel, the Windward. On Aug. 21 the Fram also arrived safe and sound at Hammerfest (*q. v.*), and reported that, continuing to drift with the ice, she reached lat. 85° 57′ on Nov. 15, 1895, and found open water in lat. 83° 14′ N. and lon. 14° E. No land had been sighted N. of 82°. In 1897 Nansen made a lecturing tour in Great Britain. See *Fridtiof Nansen* (1896) and his *Farthest North* (1897). R. Lilley.

Nantel, Guillaume Alphonse: See the Appendix.

Nantes (Fr. pron. nänt; anc. *Condivin'cum*, or *Namne'tes*): city of France; capital of the department of Loire-Inférieure: situated on the right bank of the Loire, 35 miles from its mouth, at the influx of the Erdre and the Sèvre-Nantaise; 248 miles by rail S. W. of Paris (see map of France, ref. 5–C). The quays, boulevards, and promenades along the Erdre are elegant, and the city is regular and handsome. The most remarkable architectural monuments are the cathedral, built in the fifteenth century, with its towers hardly rising above the roof, containing the splendid monuments of Queen Anne, of Francis II., the last Duke of Bretagne, and his wife, Margaret of Foix; the castle, begun in 938, in which Henry IV. signed the Edict of Nantes (*q. v.*) Apr. 13, 1598, and in which many of the French kings resided temporarily; the bourse, a modern building, and one of the finest of its kind in France; and the post-office, built in 1884. The city has a lyceum, a school of navigation, several commercial and industrial schools, a library of 50,000 volumes, a botanical garden, a museum of antiquities, and an art-gallery. The principal branch of the industry of Nantes is ship-building and the production of all articles necessary to the outfit of a vessel—anchors, cables, cordage, sailcloth, biscuits, preserved meat, etc. The city itself possessed in 1889 330 ships, of 54,500 tons burden; the total shipping for the year amounted to 296,000 tons; the value of imports was $10,000,000 and of exports $2,750,000. Sugar-refining and the manufacture of linen and cotton fabrics, calicoes, flannels, musical, mathematical, and optical instruments, chemicals, leather, brandy, etc., are also extensively carried on. The harbor, formed by an arm of the Loire, can accommodate 200 vessels, and a ship-canal constructed in 1891 between Nantes and St.-Nazaire has made it possible for large vessels, which were formerly compelled to load and unload at the mouth of the river, to reach the harbor. Pop. (1891) 122,750; (1896) 123,902.

Nanticoke: borough; Luzerne co., Pa. (for location of county, see map of Pennsylvania, ref. 3–H); on the Susquehanna river, and the Cent. of N. J., the Penn., and the Del. Lack. and W. railways; 8 miles S. W. of Wilkesbarre, the county-seat. It contains a planing-mill, drill-factory, several coal mines, and 2 daily and 2 weekly newspapers. West Nanticoke is in Plymouth township, on the opposite side of the river, and has large coal-mining interests. Pop. of Nanticoke (1890) 10,044; (1900) 12,116. Editor of "News."

Nanticokes: See Algonquian Indians.

Nantucket: town; capital of Nantucket co., Mass. (for location, see map of Massachusetts, ref. 6–J); on Nantucket island, and the Nantucket Railroad; 28 miles S. of the Cape Cod peninsula. It is a noted summer resort; has steamboat connection with New Bedford (53 miles N. W. by water), Wood's Hole, and Martha's Vineyard; and contains a national bank with capital of $100,000, a savings-bank with deposits of over $453,000, 2 libraries (Admiral Sir Isaac Coffin's Lancasterian School, founded 1827, and the Athenæum, founded 1836) containing over 10,000 volumes, and 2 weekly newspapers. The town formerly had large whale-fishery interests, but is now principally engaged in the cod-fishery and the coasting trade. Pop. (1880) 3,727; (1890) 3,268; (1900) 3,006. Editor of "Inquirer and Mirror."

Nantucket Island: an island in the Atlantic Ocean: about 30 miles S. of Barnstable co., Mass. With the small islands of Tucanuck, Muskeset, and the Gravel islands it forms the county of Nantucket, which has an area of about 60 sq. miles. Nantucket island is of a triangular shape, about 15 miles long, and from 3 to 4 miles wide. The soil is sandy. Pop. (1890) 3,268; (1900) 3,006.

Napa, naa'pa: city; capital of Napa co., Cal. (for location of county, see map of California, ref. 6–C); at the head of tide-water on the Napa river, and on the S. Pac. Railroad; 46 miles N. E. of San Francisco, 65 miles S. W. of Sacramento. It is in an agricultural, horticultural, and wine-growing region, in a valley noted for its beautiful scenery and equable climate. It contains 4 public and 2 private schools, Oak Mound School (non-sectarian, opened 1872), Napa College (Methodist Episcopal, opened 1886), 2 libraries (free public, founded 1885, and Napa College) containing over 9,000 volumes, 2 State banks with combined capital of $500,000, a private bank, and 3 daily and 3 weekly newspapers. The State asylum for the insane, completed in 1875 at a cost of over $1,000,000, is located here. The manufactures include cream of tartar, wine, planing-mill products, tanned leather, and gloves. Pop. (1880) 3,731; (1890) 4,395; (1900) 4,036. Editor of "Register."

Napata: the capital of the Ethiopian kingdom which grew to power between 900 and 700 B. C. It was located at the present Gebel Barkal (18° 30′ N. lat.), somewhat below the fourth cataract of the Nile. The region was conquered by the Egyptians of the twelfth dynasty and was long governed as a province. During the Hyksos period its history is unknown, but under the eighteenth dynasty it was again conquered, and a temple to Amon-Ra was erected at Napata by Amenophis III. Intimate relations with Egypt continued through the Ramesside period. Somewhat later Napata became the capital of an "orthodox" priestly Egyptian kingdom, possibly founded by the successors of Her-Hor (*q. v.*) when the Libyans gained the rule in Egypt under the twenty-second dynasty (about 930 B. C.). Subsequently the

relative strength of Egypt and the kingdom of Napata gradually changed, and 200 years later Pianchi made a warlike incursion into Egypt, conquering the whole land, and establishing the Ethiopian dynasty. After the Greek period the history of Napata is not clear, its monuments being largely in a hieroglyphic character which has defied successful decipherment. It continued, however, down to the Roman times, with a change of the capital to Meroë (*q. v.*) C. R. Gillett.

Naperville: city; Du Page co., Ill. (for location, see map of Illinois, ref. 2–G); on the Du Page river, and the Chi., Burl. and Quincy Railroad; 9 miles E. of Aurora, 30 miles W. S. W. of Chicago. It is the seat of Northwestern College, for both sexes (Evangelical Association, opened in 1861), which in 1890–91 had 21 professors and instructors and 280 students. The principal industries are agriculture, stone-quarrying, and manufacturing. There are a national bank with capital of $50,000, two private banks, and a weekly and a monthly periodical. Pop. (1890) 2,216; (1900) 2,629.

Naphtali [= Heb. *Naphtālī*, liter., my wrestling]: the sixth son of Jacob, by Bilhah, the handmaid of Rachel. The tribe of Naphtali numbered 53,400 fighting men before Sinai, and 45,400 at the entrance into the promised country. It was settled in Northern Galilee from the foot of Anti-Lebanon to Lake Genesareth; Kedesh was its principal town.

Naphtha [= Lat. = Gr. *νάφθα*, from Arab. *nafth*]: a name applied to certain natural and artificial volatile fluids with little or no color.

In Persia the word was used to designate the most volatile forms of liquid bitumen that are intermediate between petroleum and natural gas. As the use of the word extended into Europe, where the substances to which it was first applied were unknown, it was used to designate petroleums—hence we have "the naphtha of Amiano" and Rangoon naphtha, the latter of which was nearly maltha in consistence. When wood was distilled for the production of pyroligneous acid, the volatile liquid that first passed over, and from which by refining methylic alcohol is obtained, was called wood-naphtha. When coal-tar was distilled, the volatile liquid that first passed over, from which benzole and its homologues are derived, was called coal-tar naphtha. Still later, when American petroleum was distilled, the volatile liquid that first passed over, that was not suitable for illuminating oil, was called naphtha, and later petroleum-naphtha. This crude naphtha was later redistilled and the distillate subdivided into A, B, and C naphthas, having different specific gravities, and used for different purposes. At the present time the word has very little use without some qualifying phrase to give it definition. See Bitumen, Petroleum, Methyl Alcohol, and Hydrocarbons. S. F. Peckham.

Naphtha Gas: See Petroleum.

Naphthalene [*naphtha* + *al*(*cohol*) + suffix *-ene*]: a hydrocarbon found among the products of the destructive distillation of bituminous coal. (See Gas-lighting and Hydrocarbons.) It occurs in Rangoon petroleum and the tar of shale oil. It is formed by passing the vapors of several other hydrocarbons through a red-hot tube, as toluene (C_7H_8), xylene (C_8H_{10}), cumene (C_9H_{12}), or mixtures of ethylene (C_2H_4) with benzene (C_6H_6), cinnamene (C_8H_8), anthracene ($C_{14}H_{10}$), or chrysene ($C_{18}H_{12}$). Alcohol and ether vapor, and even ethylene and vapors of acetic acid, petroleum, essential oils, etc., yield some naphthalene when passed through red-hot tubes. Soot and lampblack contain naphthalene.

Preparation.—Naphthalene is found in the tar formed from coal in the manufacture of gas and coke. It is found in that fraction of the tar that boils between 180° and 250° C. (350° and 480° F.), that is principally in the so-called "carbolic oil." From this it is separated by filtering and pressing between hollow plates heated by steam (hot-pressing). The product obtained in this way is treated with caustic soda for the purpose of extracting phenols; then it is washed with dilute sulphuric acid at about 100° C. (212° F.). During this stage a small quantity of finely ground black oxide of manganese is added to the vessel for the purpose of removing the color. The purified hydrocarbon is washed several times with hot water, then with dilute alkali, again with hot water, and then sublimed or distilled.

Properties.—Naphthalene appears in brilliant white, scaly crystals, very friable, strongly and unpleasantly odorous. The disagreeable odor is said by Ballò to be due to leucoline oil, which can be separated by boiling it with strong sulphuric acid and precipitating the resulting brown solution with ammonia. In medicine naphthalene has been employed for antiseptic and disinfectant purposes both internally and externally. Its specific gravity is 1·152. It melts at 174·5° F. (79·2° C.), and boils at 424·5° F. (218° C.). It sublimes at low temperatures and evaporates in the air. It is insoluble in cold, and almost insoluble in boiling water, but dissolves readily in alcohol, ether, fatty and essential oils, and most oils (naphthas) obtained by destructive distillation, in acetic and oxalic acids. The composition of naphthalene is represented by the formula $C_{10}H_8$ (see Hydrocarbons), and, so far as its chemical nature is concerned, it is regarded as related to benzene, C_6H_6. A very ingenious suggestion as to the relation between these hydrocarbons was first made by Erlenmeyer, and afterward shown by Gräbe to be in accordance with a large number of facts. It has long been used as a satisfactory working hypothesis, and much of our knowledge of this hydrocarbon and its derivatives is due to attempts made to test the hypothesis.

Naphthalene is a stable substance, as is clearly shown by its formation under the influence of high heat. It undergoes change under the influence of active reagents, and yields a great variety of derivatives, many of which have come into use on a large scale, especially in the manufacture of colors.—*Oxidizing agents*, as, for example, nitric acid, *potassium permanganate* (see Manganese), etc., convert it into Phthalic Acid (*q. v.*), or into α- naphthaquinone.—*Chlorine* forms addition products and substitution products.—*Nitric acid* forms several nitro-products, viz., one mono-nitronaphthalene, $C_{10}H_7.NO_2$; two dinitro-products, $C_{10}H_6(NO_2)_2$; three trinitro-products, $C_{10}H_5(NO_2)_3$; and two tetranitro-products, $C_{10}H_4(NO_2)_4$.—*Sulphuric acid* yields sulphonic acids, as follows: two mono-naphthalene sulphonic acids, $C_{10}H_7.SO_3H$; four disulphonic acids, $C_{10}H_6(SO_3H)_2$; two trisulphonic acids, $C_{10}H_5(SO_3H)_3$; one tetrasulphonic acid, $C_{10}H_4(SO_3H)_4$.—Among the most important derivatives of naphthalene are the *sulphonic acids*; the *nitro-naphthalenes*; α- and β- *naphthylamine*, $C_{10}H_7.NH_2$, made by reducing the corresponding nitro-naphthalenes; α- and β- *naphthol*, $C_{10}H_7.OH$, which bear to naphthalene the same relation that carbolic acid or phenol bears to benzene; *naphthionic acid*, $C_{10}H_6.NH_2.SO_3H$, or the sulphonic acid of naphthylamine. The naphthols and naphthionic acid are used in the preparation of azo-dyes.

Some years since Roussin prepared a substance which he supposed to be artificial alizarin, the most important coloring-matter of madder. Alizarin was at that time supposed to be a derivative of naphthalene, as both yield phthalic acid. Roussin's product was not alizarin, and has not proved to possess any value as a dye. It is called naphthazarin, and is dioxynaphtho-quinone ($C_{10}H_4O_2(OH)_2$).

Naphthalene Colors.—Many of the derivatives of naphthalene exhibit beautiful and intense colors, but a few only have been found available as dyes. (1) Martius yellow, Manchester yellow, *jaune d'or*, is the ammonium calcium or sodium salt of dinitro-naphthol. It imparts to wool and silk, without the aid of a mordant, yellow hues from lemon-yellow to golden-yellow, which are gradually volatilized by steaming. Picric acid imparts similar tints, but it is volatilized by steam. Martius yellow is not only used for dyeing yellow, but also to modify the hue of aniline red. (2) Naphthol yellow S., acid yellow S., is the calcium, sodium, or ammonium salt of dinitro-α-naphthol-sulphonic acid. It is prepared by treating α-naphthol with sulphuric acid and afterward with nitric acid. The acid and its salts dye like Martius yellow. Unlike the latter, they are not volatile in the process of steaming. (3) Magdala red, naphthalene red, naphthylamine red, roseonaphthalene, is made, according to O. N. Witt, by melting together hydrochlorate of naphthylene-diamine, α-naphthylamine, and amidoazonaphthalene. It has the composition $C_{30}H_{21}N_4Cl$, and belongs to the class of dyes known as safronines. The product appears in commerce as a dark-brown, somewhat crystalline powder, which is the chloride of the base. In tinctorial power it equals aniline red, while it surpasses it in being a very fast color. It can be readily distinguished from aniline red by the following reaction: On pouring a few drops of its concentrated solution into a cylindrical vessel filled with alcohol, a liquid is formed perfectly transparent, with light rose-color by transmitted light, but exhibiting in reflected light a strong and peculiar fluorescence, giving an appearance of opacity, as if a precipitate were being formed, and diffusing itself through the liquid in

clouds of fiery-red color. (4) Naphthylamine violets and blues are produced by the same reactions employed in converting aniline red into violets and blues (see ANILINE COLORS); i. e. replacing in magdala red one, two, or three atoms of hydrogen by methyl, ethyl, phenyl, etc. They may also be produced by treating naphthylamine with mercuric nitrate (*Wilder*); by substituting the radical naphthyl ($C_{10}H_7$) for hydrogen in aniline and toluidine (*J. Wolff*); from rosaniline and mono-bromnaphthalene, and from rosaniline and naphthylamine (*M. Ballô*). Blumer-Zweifel (*Dingl. polyt. J.*, cxcvi., 66) produces naphthylamine violet directly on the fiber by printing linen or cotton stuffs with a solution containing in a liter of suitable thickening material 30 grammes of naphthylamine hydrochloride and 15 grammes of cupric chloride solution of 15° B. For dyeing the thickening material is omitted, and the cupric chloride is reduced by a fourth. By increasing or diminishing the quantity of naphthylamine salt the color may be made darker or lighter. The printed or dyed stuffs are left for two or three days in the oxidizing chamber at a temperature of 77° F. (25° C.), and the colors fixed by washing with soap-water. Alkaline baths render the color reddish, acid baths make it bluish. A. Kielmayer (*Dingl. polyt. J.*, cxcvi., 67) has given a similar process, using chlorate of potassium instead of cupric chloride. (5) Chloronaphthalic or chlor-oxynaphthalic acid ($C_{10}H_5ClO_3$). When naphthalene is heated with chlorate of potassium and hydrochloric acid, a mixture of chloro-naphthalene and bichloro-naphthalene is obtained. By heating these with nitric acid a mixture of phthalic acid and chloride of chlor-oxynaphthyl is produced. The latter compound, on being heated with an alkali, is converted into the new acid. In a free state the chlor-oxy-naphthalic acid is yellow; it forms beautifully colored salts with baryta, zinc, and copper. It dyes wool scarlet without a mordant, but scarcely produces any change on cotton mordanted with alumina or iron. This acid almost rivals turmeric and litmus in its sensibility to alkalies. Paper stained with a very dilute alcoholic solution assumes a red color in ammoniacal vapors.

LITERATURE.—T. E. Thorpe, *Dictionary of Applied Chemistry* (1891); Wagner's *Technology* and *Jahresbericht*; *Jahresbericht der Chemie*; Th. Chateau, *Couleurs d'Aniline, d'Acide phénique, et de Naphthaline* (Paris, 1868); M. Ballò, *Das Naphthalin und seine Derivate* (Brunswick, 1870); Dr. P. A. Revised by IRA REMSEN.

Naphthol and **Naphthylamine**: See NAPHTHALENE.

Na'pier, Sir CHARLES, K. C. B.: admiral: son of Capt. Charles Napier, R. N.; b. at Merchiston Hall, Stirlingshire, Scotland, Mar. 6, 1786; entered the navy at the age of thirteen; was made commander in 1807; distinguished himself in the West Indies; served as a volunteer in the British army in Portugal; became commander of the Thames (32 guns) in 1811, and inflicted great damage upon the French in the Mediterranean; was engaged in the British naval operations in the Potomac and against Baltimore in 1814; settled in Paris after the peace, and lost his money in a steamboat speculation; was placed on naval duty on the coast of Portugal in 1829; accepted from Dom Pedro in 1833 the command of the squadron of the young queen; inflicted upon the fleet of Dom Miguel a decisive defeat off Cape St. Vincent July 5, for which he was made Viscount St. Vincent in the Portuguese nobility and admiral-in-chief of the Portuguese navy. In 1836 he resumed service in the British navy; was engaged as commodore on the coast of Syria in 1840, when he stormed Sidon with a land force, captured Acre, blockaded Alexandria, and concluded a convention with Mehemet Ali, for which services he was knighted. He sat in Parliament 1842–46; commanded the Channel fleet 1846–48; made vice-admiral May, 1853; commander of the Baltic fleet in the war with Russia 1854, and captured Bomarsund, but his refusal to attack Cronstadt provoked unfavorable comment, and he thereafter held no active command. He was made admiral of the blue 1858, and sat in Parliament for Southwark from 1855 till his death, which occurred at Merchiston Hall, Hampshire, England, Nov. 6, 1860. He wrote *An Account of the War in Portugal* (1836) and *The War in Syria* (1842), and furnished materials for a *History of the Baltic Campaign* (1857). See his *Life and Correspondence*, by Maj.-Gen. E. Napier, 1862.

Revised by B. B. HOLMES.

Napier, Sir CHARLES JAMES, G. C. B.: soldier; b. at Westminster, London, Aug. 10, 1782; received a commission in the army when twelve years of age; fought in the Irish rebellion; was wounded and left for dead in the battle of Corunna (Jan. 16, 1809); engaged in literary work in England; returned to the Peninsula as a volunteer and obtained a regular command in 1811; engaged in expeditions against the coast of the U. S. 1813; governor and military resident of Cephalonia 1822–30; conquered Sind in a series of battles, and showed great ability as governor of the conquered province 1842–47; resided in England 1847-49, when he was again sent to India as commander-in-chief, but found the Sikhs already beaten, and returned to England the next year. D. near Portsmouth, Aug. 29, 1853. He was of an imperious disposition, and often quarreled with those of greater authority; but he was loved by his soldiers and was the object of much hero-worship. He is the author of *Lights and Shadows of Military Life* (1840); *Indian Misgovernment and Lord Dalhousie* (1853).

Napier, JOHN, Laird of Merchiston: mathematician; b. at Merchiston Castle, near Edinburgh, Scotland, in 1550; studied at the University of St. Andrews; spent several years in travels in France, Spain, and Italy, and on his return entered upon a life of studious leisure. He first became known as an author by his *Plain Discovery of the Whole Revelation of St. John* (1593), giving in the dedication some wholesome advice to King James upon the reform of his "house, family, and court." About this time he was engaged in researches into the construction of warlike machines, and a letter to Anthony Bacon, dated in 1596, describes his invention of a mirror to set fire to ships by reflecting the rays of the sun, and of an instrument for scattering shot over a wide area; but these inventions seem never to have been tested or even perfected. In 1614 he published his great discovery of logarithms in a work entitled *Mirifici Logarithmorum Canonis Descriptio*, which, according to Kepler, he had indicated as early as 1594 in a letter to Tycho Brahe. In 1617 he published *Rabdologiæ, seu Numerationis per Virgulas Libri duo*, describing the invention known as NAPIER'S BONES (*q. v.*). He died at Merchiston, Apr. 4, 1617. His son Robert published, 1619, a posthumous work, *Mirifici Logarithmorum Canonis Constructio*, explaining the method of constructing tables of logarithms. Archibald, his eldest son, was created Lord Napier in 1627, and was ancestor of several of the Napiers of military and naval celebrity in modern times. Biographies of Napier were published by the Earl of Buchan (1787) and by Mark Napier (1834).

Napier, MACVEY: lawyer and author; b. in Stirlingshire, Scotland, Apr. 12, 1776; studied law; became writer to the signet 1799; published in 1817 an essay on the *Philosophical Writings of Lord Bacon*; edited the *Supplement* to the *Encyclopædia Britannica* (6 vols., Edinburgh, 1815–24); was appointed Professor of Conveyancing in the University of Edinburgh 1825; edited *The Edinburgh Review* for seventeen years (1829–46); superintended the seventh edition of the *Encyclopædia Britannica* (1830–42). D. at Edinburgh, Feb. 11, 1847. A posthumous work by Prof. Napier, *Lord Bacon and Sir Walter Raleigh*, appeared in 1853.

Napier, Sir WILLIAM FRANCIS PATRICK, K. C. B.: soldier and author; b. at Castletown, Kildare, Ireland, Dec. 17, 1785; brother of Sir Charles James and Col. George, and cousin of Admiral Sir Charles Napier, who together constituted a remarkable assemblage of military, naval, and literary talent, all being descendants of the Laird of Merchiston, the inventor of logarithms. Sir William entered the army in 1800; became captain 1804; served at the siege of Copenhagen 1807; in 1808 accompanied Sir John Moore to Portugal, and was actively engaged in the Peninsular campaign 1810–14; became major 1811, and lieutenant-colonel 1813, and wrote a *History of the War in the Peninsula and in the South of France from 1807 to 1814* (6 vols., 1828–40), admitted to be one of the most remarkable military histories of modern times. This history called forth a large number of replies and criticisms from officers alluded to in the text and the later editions contain replies printed under the title *Justificatory Pieces*. Napier was made colonel in 1830, major-general 1841, lieutenant-governor of Guernsey 1842, knighted 1848, and made lieutenant-general 1851. He devoted his later years to the illustration of his brother's exploits in the East, publishing *The Conquest of Scinde* (1845),

Administration of Scinde (1851), and *The Life of Sir Charles Napier* (1857); he also issued in 1855 *English Battles and Sieges in the Peninsula*, consisting of passages from his larger history, revised and sometimes rewritten. D. at Seinde House, Clapham, Feb. 12, 1860.

Napierian Logarithms: See LOGARITHMS.

Napier of Magdala, ROBERT CORNELIS NAPIER, Baron: soldier; b. in Ceylon, Dec. 6, 1810; son of Major C. F. Napier, of the Royal Artillery; was educated at the Military College at Addiscombe, and entered the Royal Engineers as second lieutenant in 1826; served throughout the Sutlej campaign of 1845–46, as chief engineer in the battles of Moodkee and Ferozeshah (severely wounded), and as brigade major of engineers at the battle of Sobraon; served in the Punjaub campaign of 1848–49; was chief engineer and wounded during the siege of Mooltan 1849; commanding engineer of the right wing at the battle of Gujerat and pursuit of the Sikh army; actively engaged throughout the Indian mutiny campaigns; chief of staff to Outram in 1857, and distinguished in the actions leading to the first relief of Lucknow and subsequent operations; brigadier and chief engineer at siege and capture of Lucknow; commanded a brigade at the capture of Gwalior, reducing the fort of Powrie Aug., 1858; commanded a division in the China expeditionary force, and was distinguished throughout the campaign resulting in the surrender of Peking, and promoted to be major-general; appointed lieutenant-general in 1867, and commanded the Abyssinian expedition resulting in the capture of Magdala and the release of the British prisoners. On Napier's return to England, in July, 1868, he was raised to the peerage under the title of Baron of Magdala, and received an annual pension of £2,000. (See ABYSSINIA and MAGDALA.) He was also nominated a G. C. B., having previously been made C. B. and K. C. B. for his services during the Indian mutiny. He was governor and commander-in-chief of India 1870–76; governor of Gibraltar 1876–82. D. in London, Jan. 14, 1890.

Napier's Bones (or **Rods**): a set of tablets of bone, horn, ivory, or other material, invented by the mathematician Napier for facilitating multiplication and division. They are of no practical use, and are only interesting as a mathematical curiosity.

Naples [= Fr., from Ital. *Na'poli* < Lat. *Nea'polis* = Gr. Νεάπολις, liter., New Town; νέος, new + πόλις, city]: city of Italy; capital of the province of Campania, and formerly of the kingdom of the Two Sicilies; on the Bay of Naples; in lat. 40° 50′ N., lon. 14° 16′ E.; 161 miles by rail S. E. of Rome (see map of Italy, ref. 7–F). It is magnificently situated, rising like an amphitheater from the shore, and has an almost perfect climate. The city is dominated on the W. by the Castle of St. Elmo, once of immense strength, which crowns the hill of St. Erasmo or St. Ermo; on the seaside are the fortresses of Castel Nuovo, often compared to the Tower of London, and adorned with a triumphal arch in honor of Alfonso of Aragon (1442); the Castel dell' Ovo, with its mediæval traditions about Vergil, but which was probably built by the Norman William I. (1150); also many batteries.

Means of Communication, Streets, etc.—There is regular steam communication by water between Naples and all the principal Mediterranean ports, and railways connect it with Central and Northern Italy; the city itself is intersected by tramways and omnibus lines. It is divided into the Old, or eastern, and the New, or western, towns by the ridge extending from the palace of Capodimonte to the sea, thus dividing the city into a kind of double crescent. The modern streets are broad and well paved, while the older thoroughfares, lined by houses of great height, are, the Via Roma excepted, extremely narrow, and sometimes very steep and crooked, and the glimpses caught of them in driving through the wider avenues are strikingly picturesque. Among the principal streets are the Via Roma (formerly called the Toledo), a grand street intersecting the old town; the Chiaja, or Riviera di Chiàja, which, passing the charming gardens of the Villa Nazionale on the left and a row of fine buildings on the right, winds for several miles along the curving, undulating western shore of the bay, and is the fashionable promenade of the city; the Vittorio Emmanuele, which skirts and crosses the higher portions of the town, commanding views of surpassing loveliness; the Corso Garibaldi, and the Via del Duomo. The lower part of the Via Roma formerly offered to the visitor the most animated pictures of Neapolitan habits, where the whole domestic life of the poorer classes might be studied in the open air, but all this has greatly changed since the unification of Italy and the consequent reduction of the *lazzaroni*. The public squares, called *larghi*, are irregular, and, though flanked by showy edifices and decorated with fountains, are not generally attractive. In the Villa Nazionale stand the aquarium and exhibition-rooms of the famous Zoölogical Station, established here in 1870–75 by Dr. Anton Dohrn, of Jena.

Churches and Public Institutions.—The churches number 350, some very quaint and curious in their construction, and have more archæological interest than architectural merit. In the sacristy of the Cathedral of San Gennaro is the almost priceless treasury of the saint; here also are the *ampolle* or small phials said to contain the blood of St. Gennaro, which is believed to liquefy twice every year. Among other prominent churches are the Incoronata, founded by Joanna I., with damaged frescoes attributed to Giotto; Sta. Chiara, with fine frescoes and curious old monuments; San Domenico Maggiore, very rich; the Church of the Gerolomini, one of the finest in the city; San Francesco di Paola, which has a cupola of great size and boldness of execution. Of the six large theaters, San Carlo is the largest and most elegant. The National Museum, formerly known as the Museo Borbonico, is one of the most extensive and most interesting in the world; among its treasures are a great number of objects found in Pompeii and its neighborhood. The National or Farnese Library contains over 250,000 volumes, besides 8,000 manuscripts on parchment and paper, and 1,800 from Herculaneum on papyrus; the Brancacciana has over 100,000 volumes; and 150,000 volumes belong to the library of the university, which was founded in 1224, and is attended by 3,500 students. Outside of the Capuan gate is the cemetery of the non-Catholics, remarkable for the simplicity and elegance of the monuments. The old Campo Santo, the cemetery of the victims of the cholera, and the new Campo Santo, are on the road to the Poggio Reale. Among the many objects of interest in the immediate vicinity of Naples is the grotto of Posilipo, the work of Lucullus or of Agrippa. This is a gallery cut through the rocky promontory of Posilipo, about 1,850 feet long, 17 or 18 in width, and at the extremities above 50 feet in height, though much lower toward the center. Just over the east entrance is the reputed tomb of Vergil.

Industry, Trade, etc.—Naples has, to a small extent, manufactures of woolen, silk, and linen fabrics, leather, gloves, coral ornaments, tapestry, porcelain, chemicals, machinery, carriages, and maccaroni, and is the site of a government ordnance-foundry. Its trade is large, however; some 3,700 ships of 1,700,000 tons burden enter the port annually. The principal exports are wine, olive oil, almonds, sulphur, hemp, and flax; the chief imports, grain, cottons, woolens, and earthenware. The fisheries also are important.

History.—Naples is said to have been founded as an offshoot of the still older town, *Parthenope* or *Palæopolis*, the site of which was probably Posilipo. Both towns were Greek colonies, and Greek continued to be spoken until the second century of the Christian era. The ancient city first appears in history as an ally of Rome against the Samnites. It continued faithful to the Romans in their wars with Hannibal, and eventually became the favorite resort of the Roman aristocracy, the ruins of whose splendid villas still meet the eye in every direction. After suffering much from the barbarians, it was besieged (537) by Belisarius, who, entering the town through an aqueduct, gave it up to his soldiers. Totila, who took it afterward, treated it more humanely. Later it became the capital of a dukedom, gradually extending over the neighboring towns and islands, and had fierce conflicts with that of Benevento. In 1037 the city fell into the hands of the Normans under Ruggiero, and was well governed by him and his successors as a part of their kingdom. The Suabian dynasty followed in 1194, but in 1268, at the instigation of the pope, Conradine, the last of his house, was taken prisoner and beheaded by Charles of Anjou, on whom the pope had bestowed the kingdom of Naples. Charles beautified the city and made it his capital. The weakness of Joanna I. and the assassination of her husband brought upon Naples the vengeance of his brother, Louis of Hungary, and for a century the greatest disorder and misery prevailed. In 1442 Alfonso of Aragon besieged the city and entered it through an aqueduct, as Belisarius had done before him. In 1495 Naples joyfully opened her gates to Charles VIII. of France, who, however, was soon forced to share his prize with Spain. Francis I. vainly endeavored to recover it from his rival,

Charles V. In the siege of 1528 both besieged and besiegers suffered cruelly from plague and famine. Under the government of the Spanish viceroys Naples presented a scene of disorder and squalor, while churches were multiplied and convents occupied the most beautiful and healthful positions in the city. Strong efforts were made by the best citizens and the purest ecclesiastics to introduce the Reformed religion, and a popular tumult in 1547 forced Charles V. to annul the order for the establishment of the Inquisition; but religious persecution under other forms and the most intolerable despotism finally brought about (1647) the famous insurrection of MASANIELLO (*q. v.*). Not long after a terrible plague appeared, during which 30,000 persons perished in six months. In 1701 the nobility attempted to overthrow the existing government and place an archduke of Austria at its head. During the wars of the French Revolution, Naples was several times taken, lost, and retaken by the French. In 1815 the Bourbons were once more restored; the citizens endeavored to obtain reforms, but were sternly repressed until 1860, when, on Sept. 7, Garibaldi entered the city, and the people, being called upon to decide their own destiny, voted for the annexation of Naples to the constitutional kingdom of Victor Emmanuel II. Since then marked changes for the better have taken place, and the material wealth of the city has increased. Its sanitary condition has been greatly improved by a system of drainage that carries the sewage to a distance, by the pure water-supply opened in 1885, and by the removal of unsanitary dwellings begun in 1889. Pop. (1882) 463,172; (1893) 532,500. Revised by S. A. TORRANCE.

Naples, Bay or **Gulf of** (anc. *Sinus Puteolanus*): a portion of the Mediterranean, on the southwest coast of Italy, running inland about 10 miles between Cape Miseno and Cape Campanella, 20 miles distant from each other. Its shores have a worldwide reputation for beauty of scenery and charm of climate.

Naples, Kingdom of: one of the old political divisions of Italy. See ITALY and SICILY.

Napo, naa'pō: a northern branch of the upper Amazon, in Ecuador; rising on the east slope of the Andes, S. E. of Quito, flowing S. E. by E., and joining the Amazon near lon. 72° 45′ W.; length, by the principal windings, nearly 800 miles; navigable for small steamers about 500 miles. The upper portion is obstructed by rapids, which are passed by canoes as far as the village of Napo; thence a rough trail leads over the mountains, by way of Archidona and Papallacta to Quito, forming almost the only route from the Ecuadorian plateau to the Amazon. The river flows through a vast, forest-covered plain, which is thinly inhabited by a few Indian tribes; a dozen miserable villages on the banks are the only marks of civilization. The Napo region is rich in gold, but it is collected only in small quantities by hand-washing. Sarsaparilla, a little rubber, etc., are obtained along the banks. The principal tributaries are the Curaray, Aguarico, and Coca. Peru claims the lower Napo, and the entire northern shore is in territory claimed by Colombia. See Orton, *The Andes and the Amazon* (1876); Simson, *Travels in the Wilds of Ecuador* (1886). H. H. S.

Napoleon: village; capital of Henry co., O. (for location of county, see map of Ohio, ref. 2–D); on the Maumee river, the Miami and Erie Canal, and the Wabash Railroad; 35 miles S. W. of Toledo. It is in an agricultural region, and contains two large flour-mills, elevators, several manufactories, water-works, electric lights, 2 private banks, and 4 weekly newspapers. Pop. (1880) 3,032; (1890) 2,764; (1900) 3,639. EDITOR OF "DEMOCRATIC NORTHWEST."

Napoleon I.: soldier, statesman, and Emperor of the French. The place of his birth was Ajaccio, in the island of Corsica, but the date is uncertain. The one commonly accepted is Aug. 15, 1769, but the Corsican record shows that his mother bore a son Jan. 7, 1768, who was baptized by the name Nabulione. If the earlier date is the true one, the motive for announcing the other was doubtless the fact that when, in Apr., 1779, he was admitted to the military school at Brienne he would have been excluded as more than ten years of age if Jan., 1768, had been given as the time of his birth. His father, Carlo Buonaparte, was descended from an Italian family of rank, which had migrated to Corsica in 1529. When he was eighteen, Carlo Buonaparte married Letitia Romolino, a Corsican young lady not fifteen years of age. The children of this marriage were thirteen in number, of whom eight grew to maturity, Napoleon being the eldest or the second. The mother had beauty and sagacity, but neither position nor wealth. The father, though noble in rank, was poor and indolent. Two characteristics of Napoleon's childhood are specially worthy of note. He grew up in poverty, though among luxurious noblemen. The condition of the country was one of uninterrupted turbulence and violence. France had purchased the equivocal rights of Genoa to the island in 1768 and had attempted to enforce them by a vigorous and cruel system of suppression. The Bonaparte family took the French or unpopular side. Up to 1795 Napoleon's interests were in Corsica, where he doubtless intended to pass his life. In the course of five years at the military school at Brienne he mingled very little with his fellow pupils. One authority says his life was that of a "hermit"; it is certain that he was solitary and unhappy. In 1784 he went from Brienne to a military school in Paris, and a year later received the rank of lieutenant in a regiment at Valence. During the next few years his regiment was moved from place to place, and on account of ill-health he frequently had long vacations, which he passed in Corsica. During this period he showed no unusual talent, though he had skill in mathematics, and was fond of military history. His writings at this time gave no promise of an exceptional future, though they indicated that kind of fierce impatience which was characteristic of his later years. Thoroughly alive to the interests of Corsica, his youth was familiar with a country in a constant state of turbulent disorder. At this period his allegiance wavered from one side to the other. In 1792, having obtained a limited command, he made an unsuccessful attempt at a *coup d'état*, but when pursued he escaped to France, thus probably saving himself from being shot by court martial. A little later the whole family, pursued by the fury of the Corsicans, fled from the island and subjected themselves to the risk of landing in France in the very midst of the Revolution. Thus ended the Corsican period of his life. His education, if not exclusively military, had been chiefly military in the very worst sense of the term; for from infancy he had been constantly familiar with deeds of violence.

Soon after Bonaparte's return to France his character and ability revealed themselves. Rising rapidly in the service, he impressed all who came in contact with him with a sense of his irresistible force of will. When he was first appointed to a command, Auguereau, a proud but heroic old soldier, ridiculed his insignificant figure and his youth (according to de Méneval he was only about 5 ft. 2 in. in height), but after an interview with the little general Auguereau confessed that he had been frightened and overawed at the first glance. Gen. Vandamme, one of the most energetic and brutal of the revolutionary soldiers, said to Marshal d'Ornano: "I, who fear neither God nor devil, when I approach him, tremble like a child. He could make me dash through the eye of a needle into the fire." United with these characteristics was a remarkable power of work and concentration. Roederer, during the early part of Napoleon's French career, wrote of him: "What characterizes him above all other men is the force, flexibility, and constancy of his attention. He can work eighteen hours at a stretch, on one or on several subjects. I never saw him tired." Pelet wrote a little later: "Often he keeps the counselors of state from nine o'clock in the morning until five in the evening, with fifteen minutes' intermission, and seems no more fatigued at the close of the session than at the beginning." Such powers were not long in producing an effect. Immediately after his return from Corsica Napoleon allied himself with the younger Robespierre and the Terrorists. In 1793 he was given command of a battalion of artillery, and so distinguished himself in planning the expulsion of the British from Toulon that he was at once named general of brigade. In the summer of 1794 he saw little military service, but was active in his political plans, and, according to Marmont, "acquired an ascendency over the representatives which it is impossible to describe." After the fall of Robespierre (July 28, 1794) Bonaparte was arrested and imprisoned, but was not sent to Paris, as the record quaintly says, "on the ground of the possible utility of the military and local knowledge of the said Bonaparte." Gen. Marmont says he "moved heaven and earth" to effect his escape from prison. He finally succeeded. In 1795 he showed a restless activity, though he seemed to act now on one side and now on the other. On Oct. 4 he received the command of the garrison, and on the following day showed himself master of the city by sweeping the streets with grapeshot and driving the Terrorists into seclusion. He thus practically

brought the Revolution to an end. In Mar., 1796, he married Josephine de Beauharnais, a widow whose first husband had perished on the guillotine. Josephine had sweetness of disposition, and the favor with which she was regarded in Parisian society was of advantage to her husband. The marriage register declares that Bonaparte was born in 1768, instead of 1769, and Josephine in 1767, instead of 1763, the true date of her birth. Bonaparte's European career was now to begin.

The First Italian Period.—The coalition which had been formed against France in 1793 was broken up by the revolt in Poland, and the consequent withdrawal of the Prussian troops from the west. France in 1794 regained all she had lost, expelled the Austrians from Belgium and the Stadtholder from Holland, set up her boundary on the Rhine, and pushed her armies into Germany. This act of conquest led to the coalition of Russia, Austria, and Great Britain in 1795. The Austrian generals Wurmser and Clerfait forced the French armies back out of Germany and drove them across the Rhine. Bonaparte saw that the most formidable enemy of France was Austria, and that the most vulnerable point of attack was the Austrian territory in Italy. He urged his views on the members of the Directory with so much cogency that an Italian campaign was determined upon, and he himself was placed in command. His personal characteristics showed themselves instantly. Though the ostensible purpose of the war was to free Italy from Austria, Bonaparte issued a proclamation to the soldiers in which he said: "Soldiers, you are naked and ill-fed; I will lead you into the most fruitful plains in the world. Rich granaries, great provinces will be in your power. There you will find honor and fame and wealth." This order was issued Mar. 27, 1796, eighteen days after his marriage. The course hinted at in the proclamation was carried out. The commander not only made the war support itself, but he levied enormous sums upon the provinces and cities, with which he filled the military chest and made his commanders rich. Marmont relates that Bonaparte at one time caused a large sum to pass through his hands, and that when he rendered a detailed account of the same the commander ridiculed him for not keeping it for himself. From the pope he extorted 15,000,000 francs. In this way he bound his officers and soldiers to him and overawed his enemies. His plan of campaign was essentially the same that he attempted nearly twenty years later at Waterloo. He separated the Austrian army from the Sardinian, and then defeated them both in turn. In less than a month he fought five important battles, and was in complete possession of the western part of Northern Italy. Turning to the E., he met greater difficulties, but he showed even greater ability and resources, and his success was not less marked. Wurmser had come to the rescue from N. of the Alps with a new army of 50,000 men, and Bonaparte came near being overwhelmed and ruined at Arcola. The Austrians were defeated at Rivoli Jan. 14, 1797, and a whole *corps d'armée* capitulated at Roverbella Jan. 16. These successes raised the reputation of Bonaparte above all the other French generals and made him from that time practically independent. He determined to strike at the heart of Austria from Mantua as a basis, but he was now to meet with a new enemy. The Austrian general, the Archduke Charles, who had succeeded Clerfait in the campaign against Jourdan and Moreau in Southern Germany, had beaten the French at Würzburg and driven them back across the Rhine. He was now ordered to return to the defense of Austria against Bonaparte. No important successes were achieved by the French, and Mar. 31 Bonaparte proposed to the archduke an armistice of six days. The result was what are known as the Preliminaries of Leoben, which were the basis of the Treaty of Campo Formio, signed in Oct., 1797. The unscrupulous way in which Bonaparte had even now begun to deal was shown in the treatment of Venice. This republic, which had maintained its neutrality though overrun by the French army, was now ceded to Austria in return for Belgium and the Rhenish frontier, though France had no right to cede Venice, and Austria had no right to cede those portions of the left bank of the Rhine, over which she had no control. By the same treaty a Cisalpine republic was set up under the protection of France. On the whole, the treaty was decidedly favorable to Austria, for she gained the territory of Venice as far as the Adige in return for a number of straggling provinces over which she had at best only partial control. The most important result of the campaign was the great fact that it revealed Bonaparte to the army, to France, and to the world. It was also of importance that he had given the republican Venice to imperial Austria; for by so doing he had thrown an apple of discord among the old powers of Europe.

The Egyptian Campaign.—The revolution of the 18th Fructidor (Sept. 4, 1797), led by Augereau, overthrew the republican constitution which had been definitely established in 1795, and substituted for it the government of the army. The elections had shown that the country favored a policy of peace, and consequently the element in favor of peace in the legislature was on the point of gaining control. Augereau, who was then one of Bonaparte's generals of division, surrounded the legislative body with a force of 12,000 men, and arrested the most obnoxious representatives. The elections in forty-eight of the departments were annulled, and a large number were proscribed and transported to die in the penal colony at Cayenne. Henceforth during the ascendency of Bonaparte France was to be ruled by the sword. Soon after congratulating the armies on the fall of "the enemies of the soldier, and especially the army of Italy," Bonaparte left Italy for Paris. His speech on the occasion of his reception by the Directory indicates that he was at the time uncertain what course to pursue. The Directory probably saw the necessity of giving him employment, and he was made "general-in-chief of the army of England"; but the affairs of continental Europe did not offer him a favorable opportunity for direct action against England. He had no faith in the permanency of the present form of government, and while the Directory was demonstrating its weakness an opportunity offered itself for showing his powers in another field. For some months he had talked of an Eastern policy which should unite France with Russia in taking possession of Turkey, for the purpose of weakening Great Britain. It was this thought which now gave shape to his action. France had not yet abandoned all its claims in India. He decided to attack Egypt, and then swing around upon Turkey from the East after he had taken possession of Palestine. It is significant, however, that at this very time the flames of war were bursting out in all parts of Europe. In the early spring of 1798 the Swiss constitution was overthrown, the French seized a treasure of 40,000,000 francs at Bern, the treasury of the aged pope was plundered, and the pope himself was carried into captivity; but these excesses, although they led to the new coalition against France, did not change Bonaparte's determination. He was not only willing that in the condition of affairs then existing France should carry on the war without him, but he was willing to take with him to Africa the flower of the French army and the most promising of the generals. With Murat, Berthier, Desaix, Kléber, Lannes, and Marmont he set out in command of 30,000 men on May 19, 1798. Stopping to take Malta, which capitulated June 12, he was ready to begin the Egyptian campaign early in July. The Egyptians were easily beaten. At the battle of the Pyramids the Mamelukes lost 2,000, and the French only twenty or thirty. Bonaparte, however, was thrown immediately into the greatest embarrassment by the complete destruction of his fleet by Nelson only a week after his arrival in Cairo. His grand design was ruined by this misfortune. While France was at war with nearly all Europe its best generals and an excellent army were imprisoned in another continent. From July until the following February Bonaparte and his army remained in comparative inactivity near Cairo. Meanwhile the Turks were gathering a force in Syria. He determined to anticipate their attack by advancing against them with 12,000 men. He entered Syria, and took Jaffa Mar. 3 by assault. More than 2,000 prisoners were taken. Unwilling to feed or to guard them, he ordered them to be taken to the seashore and shot. The order was carried out, every precaution having been taken to prevent any from escaping. At St. Jean d'Acre the fortress was furnished with supplies by the British from the sea. After vain attempts for two months to reduce the city, he was obliged to retire. He wrote to the Directory that he abstained from entering the city on account of the plague which he had heard was ravaging it. He afterward declared that the "grain of sand" which obstructed his way at Acre "changed the destiny of the world." At Mt. Tabor, and later in the Bay of Aboukir, some advantages were gained, but nothing could relieve the general character of the disaster. There was now nothing to show for the loss to France of some 6,000 soldiers and several distinguished generals at a very critical period. On Aug. 22 Bonaparte transferred the command of the expedition to Kléber, and, taking with him all

the other generals of distinction, set sail in two frigates for France. After a tortuous voyage and many delays he landed at Fréjus Oct. 9, 1799. Kléber was soon murdered, and Egypt and Malta passed into the hands of the British.

The Coup d'État of the 18th Brumaire.—During Bonaparte's stay in Egypt France had been threatened with overwhelming disaster; but the affairs of the allies had been mismanaged, and the affairs of France, on the whole, had been conducted with ability and skill. The Duke of York, in command of the British forces in the Netherlands, had conducted an unsuccessful campaign, and the Archduke Charles had gone to his assistance without result. The attack of the Russians, under Suvaroff and Korsakoff, had been successfully repelled by Masséna near Zurich, and Italy, though threatened, had not been lost. It would be too much to hope that this favorable condition could long be continued unless the coalition could be broken or the power of France strengthened. The return of Bonaparte therefore was most opportune. He was everywhere met with universal acclaim. The finances were in disorder, and the forces of the Government were not united. Bonaparte saw at once that affairs were ripe for a change. He had no difficulty in bringing the members of the Directory to his way of thinking. They caused reports to be spread that the legislative bodies were in danger of attack in the city, and by this means induced them to adjourn to St.-Cloud. Here the task of overthrowing the Government was not difficult. On the 18th Brumaire (Nov. 9, 1799), just one month after Bonaparte landed in France, the *coup d'état* took place which swept away the constitution of the year III. and placed Bonaparte in power. The legislative halls were cleared by the soldiery, and Sieyès drew from his pocket a new constitution, that known in the republican calendar as the Constitution of the year VIII. When modified by Bonaparte the new instrument of government practically put all power into the hands of three consuls. Sieyès had, no doubt, in planning the constitution made, as he supposed, ample provisions for himself; but Bonaparte as First Consul would brook no rival. He afterward boasted that he had pacified Sieyès with an ample bribe at the expense of the state. Sieyès and Ducos resigned as consuls, and Bonaparte put two unimportant officials in their places.

The Second Italian Campaign.—During all this period war was going on, and the enemies were on the borders of the country. Scarcely had he been installed as Consul when he made overtures of peace to Great Britain and Austria. It is not singular that these were rejected, for, after the events of 1799, the allies must have been confident of ultimate success. The new Government therefore was obliged to renew the war against Great Britain, Russia, and Austria. The condition, however, was not so bad as it seemed; for Russia, attributing the defeat of Suvaroff to Austrian jealousy, refused further aid to the coalition, and Great Britain, after the failure of York in the Netherlands, was not in condition to take an active part. The only enemy of importance therefore was Austria; but at that very moment Austria was in possession of Southern Germany and of a large part of Northern Italy, with powerful armies in the field. Bonaparte availed himself of all the new enthusiasm to re-enforce the army and put it in order. His plan of action was soon determined upon. In Italy the Austrian general Melas was advancing toward the W. with an army of 120,000 men, while Masséna was trying to keep him at bay with an army of 40,000. North of the Alps Moreau was in command of about 130,000 men, as opposed to 120,000 under the command of the Austrian general Kray. The plan of campaign now entered upon is generally considered one of the most brilliant ever designed by Napoleon. He directed Moreau to advance to Schaffhausen, in the eastern part of Switzerland, to cut off Kray, and then to send a part of his army across the St. Gothard Pass to co-operate with the French army in Italy. Masséna was to fall back to Western Italy, and Napoleon himself was to advance across the middle Alps. Thus the Austrians would be caught either between Napoleon and Masséna, or between Napoleon and Moreau. Napoleon's part of the campaign was conducted with the greatest secrecy. Masséna (in the early spring of 1800) was driven to the W., and finally shut up in Genoa, where he distinguished himself by a defense that made his name memorable. Moreau, though not venturing to march on Schaffhausen, drove Kray back to the Danube at Ulm, and sent the promised contingent across the Alps. The success of Napoleon's movement depended upon its secrecy. Troops were collected in Southern France in such a way as to bewilder the enemy. Rapidly during the second week in May they converged upon the Swiss frontier, and Napoleon placed himself at their head. A part of the troops advanced by Mont Cenis; but the main army, under Napoleon himself, crossed by the Great St. Bernard. So secretly had the movements been conducted, and so swift was the execution, that Napoleon reached Milan on June 2. The corps sent by Moreau across the St. Gothard, finding that the Austrians had advanced to the W., followed on and united with Napoleon immediately after his arrival in Milan. The approach of a French force by Mont Cenis had deceived Melas and thrown him off his guard. Meanwhile Napoleon, learning that Masséna had been obliged to surrender Genoa, feared that Melas would try to escape by the seaboard. He therefore determined to advance at any risk. Going through the Stradella Pass of the Apennines he came into the vicinity of the enemy in the great plain of Marengo. His army was inferior in numbers, and still more inferior in artillery and cavalry. The Austrian commander saw his advantage, and advanced to a furious attack on the morning of June 14. The battle raged with varying fortunes, but near the end of the day the Austrians were everywhere successful, and Melas retired from the field believing that the battle was won. At that moment, however, Desaix arrived with his division, and, heading a furious charge of the heavy cavalry, turned the tide, and changed the disaster into a complete victory. Desaix was killed in the hour of triumph, but the line of Melas's retreat was closed, and the Austrians had no choice but to make terms. Later in the year Moreau overwhelmed the Austrians at Hohenlinden, and was about to march upon Vienna when overtures of peace were made. The Peace of Lunéville (Feb., 1801) confirmed the provisions of Campo Formio in regard to the French frontier along the Rhine, but it was far more disastrous to Austrian interests in Italy. The power of Austria in the Italian peninsula was practically destroyed, and the ascendency of France became complete. Napoleon then turned his attention toward Great Britain. He succeeded in establishing a firm alliance with Russia; but at the critical moment the death of the czar and the victory of Nelson at Copenhagen destroyed his prospects. Negotiations were opened for peace. After months of discussion the Treaty of Amiens was signed in Mar., 1802. Unfortunately the treaty left many important questions unsettled. Great Britain agreed to give back Malta to the Knights of St. John under the protectorate of a great European power, but the conditions were obscure, and contained the seeds of future discord. Great Britain consented to the French status N. of the Alps, but refused to acknowledge the republics in Italy, which were in fact the dependent vassals of France. These refusals and ambiguities made the peace hardly more than a truce. The war, however, had won for Napoleon the respect of Europe, and had confirmed his power over all opponents in France. The success of the war was crowned by an overwhelming majority of the senate and the people creating him First Consul for life.

Napoleonic Reforms during the Consulate.—The years 1802–03 were devoted very largely to that reorganization of the government in which Bonaparte showed his extraordinary power quite as much as he had done in the fields of war. It is true that the Revolution had left the government in chaos, and consequently he was not embarrassed by the resisting power of precedents; but even after every possible allowance is made it will have to be admitted that the years of the First Consulate were remarkable for the number, the far-reaching importance, and the permanence of the changes brought about. The revolution of the 18th Brumaire met with popular favor, and Bonaparte at once as First Consul took the whole system of administrative and executive government into his own hands. In this new position he showed a faculty for organization perhaps never before equaled. His power of calculation, his force of insight, his tireless industry, his stupendous capacity for mastering details, and, above all, his ability at any moment to co-ordinate all these resources and bring them into their place in accomplishing any object he had in view, form one of the most impressive facts in the history of the human race. In a few weeks he reorganized the financial system of the Government, and rapidly brought order out of the chaos of practical bankruptcy. By a wise combination of energy and clemency he altered the chronic rebellion of La Vendée into enthusiastic loyalty. Though in the East he had avowed the Mohammedan faith, he now stopped the persecution of the nonjuring priests, ordered a solemn funeral for Pius VI., threw open the church doors in all parts of France, re-

stored Sunday as a sacred day of rest, and relieved the priests and bishops from the offensive "oath to the state." In less than a year he had secured the support in place of the enmity of the Church, and within the same period he had exterminated the most important of his opponents. Some of the reforms had to do not only with the principles of the Revolution, but with the very foundations of government. The old Bourbon method had been one which centralized all power in the thirty intendants, who were directly accountable to the king. The Revolution had swept away this method and set up a system which Burke characterized as "forty thousand republics." Napoleon reverted to the old method with an improvement. At the head of every department he placed an officer under whom there was a hierarchy of prefects, sub-prefects, and mayors, each dependent upon the person above him, and thus all dependent on the First Consul. The powers of local self-government, though not effaced, were greatly curtailed and controlled. This system, as Napoleon himself said, placed the First Consul in every department of France. His next step was a reform of a similar nature in the courts of justice. The Revolution had swept away the cumbrous Bourbon system and substituted for it an elective judiciary which had resulted in some of the wildest excesses of discord and injustice. Napoleon restored the appointment of judges and made them independent of popular clamor. While strengthening the courts of initiative he provided courts of appeal, by means of which justice was made prompt as well as effective. He also resumed and pushed forward the work begun by the National Assembly of collecting and fusing the laws and usages of the nation into an organic code. This work, like that of Justinian, was intrusted to a body of eminent jurists. The *Code Civil* was published in 1801, but the *Code de Commerce*, the *Code Pénal*, and the *Code d'Instruction Criminelle* occupied the commissioners till near the close of Napoleon's career. What is known as the *Code Napoléon*, which was made up of these four parts, at once took rank as one of the foremost legal productions of history; and its permanence in France has already more than justified the declaration of Napoleon himself that his code would outlive his victories. In his efforts to improve the system of education he was less fortunate. Under the Revolution the National Assembly had decreed that every commune should support a primary school, but from time immemorial the schools had been in the hands of the priests; and, as the revolutionary Government was in no condition to enforce its decrees, the weakening of the clergy had weakened the schools. Napoleon did not provide for supporting primary schools by taxation, and therefore his efforts in their behalf were only slightly successful. For the higher schools he did more; but his method abundantly shows that he had no adequate understanding of the elements of educational success. He endowed a few secondary schools, and some years later he concentrated the whole system for a nation of 30,000,000 of people in the single university at Paris which was made immediately dependent on the central Government. Another element of prodigious power in this work of centralization was the re-establishment in France of the ecclesiastical hierarchy. The National Assembly had swept away this great corporation by the confiscation of its lands and by requiring an elective clergy which should acknowledge supreme allegiance to the state. Under this *régime* the Church had assumed an attitude of active or sullen hostility to the Government. Napoleon now restored the Church in all the most essential of its powers and sealed its restoration by the Concordat which is the basis of all ecclesiastical law in France down to the present day. The Church, however, had been shorn of its endowments, and was made, therefore, strictly dependent on the Government. This action was an element of great power in consolidating and harmonizing the masses of the nation. It severed the Church from the Bourbons and attached it to Napoleon, who depended upon the peasantry for his army. A similar influence, though in another field, was the system of honorary rewards and dignities. He established the Legion of Honor, a national order of merit thrown open to pre-eminent success in every walk of life. It encouraged excellence in all ranks and callings, and was so successful that institutions of the same kind have been established by nearly all the governments in Europe. In Feb., 1800, a general law regulating the organization of local government was enacted, and at about the same date the financial system was concentrated in the newly established Bank of France. While these several reforms greatly tended to establish and consolidate the dictatorship, they conserved harmony and good order, and for the most part retained a permanent place in French government even after the fall of Napoleon. They were not enacted, however, without opposition. The old Revolutionists strenuously opposed the Concordat, and the ardent republicans saw in the general movement a complete overthrow of the revolutionary system. In Dec., 1800, the explosion of a bomb aimed at the Consul's carriage called for decisive action. Napoleon acted with characteristic energy. A hundred and thirty conspicuous opponents were seized, and without trial sent to the penal colony at Cayenne. Moreau, the hero of Hohenlinden, was condemned to imprisonment for two years, but was allowed to escape to America. Pichegru, found strangled in his bed, was either murdered or permitted to commit suicide. Thus the republicans were outdone, and opposition was annihilated. The supremacy of Napoleon was crowned by the declaration that the Senate was henceforth to have constituent powers, thus doing away with the legislative body, and enabling the Senate to make any change in the constitution that might be called for by its master. An open road was thus constructed to an imperial monarchy far more concentrated than was the monarchy swept away by the Revolution.

Causes of the Renewal of War.—In the management of foreign affairs Napoleon was less fortunate. It is now easy to see that he should have avoided vexing and alarming the states of Europe, but he chose the opposite course. He annexed Piedmont to France, made himself president of the Italian republic, and the remainder of Northern Italy a subject province. He reduced the Batavian republic to a dependency, and placed Switzerland under French control by the occupation of Bern. He made the lesser German states his dependencies by his interpretation of the Treaty of Lunéville, and he showed unwonted activity in all the ports and dockyards of France. A report of Sebastiani on the condition of Egypt seemed to take it for granted that the British were to be driven from the country by a new French occupation. The *Moniteur*, the organ of the state, was filled with boastful assertions of French power, and emissaries were dispatched to the British ports to observe and report on their condition and strength. This unwonted activity created general unrest throughout Europe, but it was especially irritating to Great Britain, where public opinion was beginning to oppose the peace policy of the Government. The dispute over the island of Malta was the occasion of the outbreak. Great Britain, in accordance with the Treaty of Amiens, had invited Russia, and a grand-master chosen by the pope, to assume the protectorate of the island, but both had declined. France had been at least lukewarm in suggesting expedients of settlement. Delay and the prodigious increase of French power had, as the British claimed, changed the situation. When the French envoy now referred to the condition at Malta, Lord Hawkesbury, the British foreign minister, hinted that Great Britain might have to take precautions, the state of the Continent had so greatly changed. Napoleon replied by a peremptory demand for the immediate evacuation of the island. While negotiations were pending the *Moniteur* published the report of Sebastiani, the French officer sent to examine the condition of Egypt, which, among other irritating statements, declared that "the country could be recaptured by 6,000 Frenchmen." This was immediately followed by a message of Napoleon to the legislative bodies, saying that Great Britain by herself was unable to cope with France. This was regarded as a direct challenge by all classes in Great Britain, and caused an instantaneous explosion of wrath. Public opinion in Great Britain was greatly aggravated by the absurd demand of Napoleon that the public prints which caricatured him should be suppressed. All attempts to negotiate were unsuccessful, for each refused to accept the terms of the other. Negotiations continued for some months, during which both sides carried on the most active preparations for war. Great Britain finally instructed her ambassador to propose that she should retain Malta for ten years; that the new Italian states should be recognized by her; that French troops should be withdrawn from Holland and Switzerland; and that, if these terms should not be acceded to in seven days, the British ambassador should demand his passports. The French refused the terms offered, whereupon Lord Whitworth demanded and received his passports on May 12, 1803. It is of importance to note that on May 2 of the same year Napoleon, notwithstanding the violent opposition of Talleyrand and of his brothers Lucien and Joseph, sold the territory of Louisiana to the U. S. for the sum of 60,000,000

francs. This transaction, of such immeasurable importance to the U. S., was proposed and pushed through by Napoleon purely for financial reasons. The money received was all devoted to the armament for the invasion of England. The flames of war at once sprang up and soon the whole European world was involved in the conflagration.

The Renewal of War.—Napoleon's first plan contemplated the invasion of England, and preparations were made on a stupendous scale. What he planned will always remain a monument of his comprehensive genius and of his extraordinary gifts in arranging even the minutest details. From the Scheldt to the Garonne along the banks of the rivers vessels were constructed for the purpose of converging at the right moment upon a single point with an army of 160,000 men. The number of vessels so prepared reached the vast number of 2,300, and these were manned by more than 15,000 seamen and 3,000 guns. Before the end of 1804 the shores around Boulogne were skirted with armed vessels ready to put to sea. Meanwhile four great military camps had been formed and the army put into condition for the descent. In Great Britain more than 200,000 men were put under arms, and made ready to repel the attack; but while these preparations were going on, evidences began to abound in France of plots against the life of the First Consul. These had their inspiration partly in the interest of the Bourbons, and partly in the disaffections of the republicans. It was discovered that meetings of the conspirators were frequently held in Paris and Strassburg. The report of a French spy declared that meetings of some of the *émigrés* had been held at the house of the Duc d'Enghien at Ettenheim, in Baden. Napoleon determined to terrify the Bourbon faction by a decisive act. Though Baden was a neutral state, he ordered a body of armed men to enter the territory, seize the duke, and bring him to Paris a close prisoner. The papers that were taken showed no evidence confirming the charges. He was then charged with having been an *émigré*, and with having been opposed in sympathy to the consular government. There could be no answer to such a charge. The duke was taken in the night before a military tribunal selected for the purpose, was given no opportunity for being heard in defense, and before morning was shot. In his last will Napoleon declared that he caused the duke to be "arrested, condemned, and shot because it was necessary for the security, the honor, and the interests of the French people." That the act would excite all the crowned heads of Europe to a new coalition against him does not seem to have entered Napoleon's mind. The event created a profound sensation. Signs of opposition began to show themselves in all parts of Europe. The friends of Napoleon soon saw that prudence required the consolidation of his authority in every possible way. The Tribune and the Senate proposed that he receive the name as well as the power of emperor. The proposal met with the general and enthusiastic favor of the people as well as of the legislative bodies, and the First Consul was crowned as emperor at Notre Dame, Dec. 2, 1804. A little later the emperor visited Italy to be crowned King of Lombardy, and in the course of a few months he made it evident to all of the European powers that he was henceforth to regard the smaller states of Italy and Germany simply as parts of his empire. He either made the political blunder of supposing that this course would not lead to a general coalition against him, or the miscalculation of believing that he could carry on successfully at the same time an invasion of England and a war against continental Europe.

The Austerlitz Campaign.—It was, no doubt, on account of the gathering clouds that on Jan. 2, 1805, Napoleon wrote to the King of Great Britain making overtures of peace. To this letter the Government of Great Britain, now again under the energetic guidance of Pitt, replied that that power could not enter upon any definite negotiations for peace without consulting her continental allies. This answer gave an unmistakable intimation of a new coalition. In the following April a treaty was signed between Great Britain and Russia, and a little later the league was joined by Austria. Prussia, induced by promise of Hanover, was kept neutral. Up to this time preparations for the menaced invasion of England had been unabated. Nelson, with his British fleet, manœuvered so successfully that Villeneuve, with the combined fleets of France and Spain, did not venture to approach for the protection of the transports intended for invasion. In the presence of the British fleet an attempt to cross into England would have been madness. As soon, therefore, as the hostility of Austria was openly declared, Napoleon obscured the failure of his plan of invasion by announcing that the operations of the "Army of England" were to be transferred to Germany. Early in September the camp at Boulogne was rapidly broken up, and the army was turned toward the Rhine. The Austrians, 80,000 strong, under Gen. Mack, about the same time advanced as far as Munich, with the intention of pushing on into France. Napoleon stationed himself at Strassburg, and ordered the larger part of his army around by the north through the neutral territory of Hanover. By a series of brilliant manœuvers he threw his troops between the Austrian army and Vienna. Mack, taken by surprise, was driven into Ulm and forced to capitulate with his army on Oct. 20. On Nov. 13 Napoleon entered Vienna, and established his headquarters in the imperial palace. His situation, however, was apparently by no means free from danger. The violation of Prussian territory had driven Prussia into the coalition, though too late for active service. The Austrian Archdukes Charles and John had collected a force of 90,000 men in Hungary, and a powerful Austro-Russian force was advancing from Moravia. Napoleon very naturally decided to deliver a decisive blow before these armies could be united, and for this purpose he crossed the Danube on Nov. 22 and marched upon Brünn. A series of masterly manœuvers, all executed with astonishing celerity and accuracy, brought the French into a favorable position at Austerlitz. In the battle that followed on Dec. 2 the Austro-Russian force was overwhelmingly defeated. The Emperors of Russia and Austria, compelled to witness the destruction of their splendid legions, saved themselves by flight. An armistice was immediately signed, and this was followed, Dec. 26, by the Peace of Presburg, by which Austria gave her Venetian territory to the kingdom of Italy, her Tyrolese territory to Bavaria, and her Suabian territory to Würtemberg and Baden.

Though Napoleon's Austrian campaign had everywhere been triumphantly successful, his project of invading Great Britain had been thwarted by the annihilation of his fleet at the battle of TRAFALGAR (*q. v.*). On the very day after the capitulation of Mack at Ulm, Lord Nelson, having hurried south as soon as Napoleon started for Austria, had met the combined French and Spanish fleets under Admiral Villeneuve, and of thirty-three line-of-battle ships twenty-four were either captured or sunk, in one of the most memorable naval battles in history. The emperor, therefore, abandoning all present thought of invading England, was able to turn his attention to the consolidation of his power on the Continent. The death of Pitt on Jan. 23, 1806, and the succession of Fox as Foreign Minister, gave temporary promise of peace; but even Fox would not consent to the demands of the emperor, and all hopes of an accommodation were thus brought to an end. For the consolidation of his power he now declared the throne of Naples vacant, and placed upon it his brother Joseph; he created his brother Louis King of Holland, and his brother Jerome King of Westphalia; he raised Bavaria and Würtemberg to the dignity of kingdoms; he consolidated the smaller German governments on the right bank of the Rhine into a confederation under the suzerainty of himself; he raised the subordinate members of his family by marriage to positions of dignity and influence; and the most successful of his generals he elevated to the highest nobility.

The Jena Campaign.—Peace was by no means established. In the summer of 1806 the Government of Prussia discovered that Napoleon was negotiating to restore Hanover to Great Britain, although he had promised that electorate to Prussia as the price of her neutrality. His violation of Prussian territory when advancing to the rear of Mack had given emphasis to Prussian distrust. The current of public opinion, greatly swollen by the letters of Queen Louise and the advocacy of Stein, had finally become irresistible. Prussia had joined in firm alliance with Russia; and the czar in August refused to ratify the treaty with France which had been signed by his representative in Paris. If Napoleon had sincerely desired peace it would have been easy to satisfy Prussia; but he decided to pursue another course, and to act as he had done in the case of Italy and Austria. The French had not yet evacuated Germany since the Austerlitz campaign. The Prussian army was mobilized, but before it could be brought into fighting condition Napoleon struck in upon the rear of his enemy, as he had done at Marengo and at Ulm. The battles of Jena and Auerstädt, Oct. 14, 1806, crushed the Prussian army and gave the conqueror Berlin as the capitulation at Ulm had given him Vienna. As Napoleon advanced toward the east the fortresses established by Frederick the Great capitulated one after another

almost without resistance. The French army was led on to the Vistula, where the terrible battle of Eylau, Feb. 8, 1807, left 12,000 Frenchmen and 15,000 Russians on the field. For the first time Napoleon had fought a great battle in which he was only partially victorious; but his weakened and shattered forces were recruited and manœuvered with characteristic skill, and on June 14, the anniversary of Marengo, at the battle of Friedland the cause of the allies suffered an overwhelming defeat. The Treaty of Tilsit, which was signed in July, 1807, deprived Prussia of nearly half her inhabitants and her territory, and reduced the army to 42,000 men. In this treaty Napoleon overreached his goal, for it was the severity of these terms that made the people of Prussia the most inveterate foes of the conqueror from this time until the final downfall in 1815.

Napoleon now had time to complete the rewards of his most efficient supporters. He had already made Berthier the Prince of Neuchâtel, Bernadotte the Prince of Ponteeorvo, and Talleyrand the Prince of Benevento; he now created four additional hereditary princes and thirty-one hereditary dukes. Of these new potentates, one (Berthier) received more than 1,250,000 francs a year, another (Davoust) more than 750,000 francs, nine others more than 250,000 franes each, and twenty-three others more than 100,000 francs each. Thus it was that loyalty was secured and power consolidated.

Though the invasion of England had been abandoned, Napoleon sought in the course of this campaign to strike an effective blow at British power and influenee by another method. The right to prevent a neutral from trading with an enemy by means of a blockade is conceded by international law; but the blockade must be a real one. It was impossible for Napoleon to blockade British ports; but notwithstanding this fact, he did not hesitate to proclaim by what is known as the Berlin Decree of 1806 that the harbors of neutrals were closed against British ships under penalty of war with Franee, and the confiscation of ships and goods. It was a defiant manifesto, designed to create what he called a "continental system," and to leave Great Britain in commercial isolation. The effort was not successful; for while it exasperated Great Britain into retaliation, it failed to bind the continental nations together.

The Spanish Campaign.—Having remodeled the states on the Rhine at his pleasure and placed members of his own family in power, he now turned his attention to Portugal and Spain with a similar purpose. Portugal defied the Berlin decree by keeping her ports open to British commerce; and Spain was embroiled with domestic diffieulties which afforded an opportunity for interference. In Oet., 1807, two conventions at Fontainebleau provided for the partition of Portugal; for the giving of Brazil to Spain; for giving the King of Spain the title of emperor; and for providing a French army to resist any intervention of Great Britain. On Nov. 30, Marshal Junot arrived with an army in Portugal, and a little later a Freneh force of 80,000 men took possession of a number of fortresses in Spain. The Spanish people, it is true, were indignant at the weakness of the king and the dissoluteness of the queen, but the heir-apparent, Ferdinand, was a favorite, and the popular movement was designed to overthrow the king and place the prinee on the throne. While Napoleon was supposed to support this movement he was welcome; but he soon disclosed another purpose. His course was perhaps the most unfortunate one adopted by him in the whole of his career. Spain for fifteen years had been perfectly subservient to revolutionary France and to Napoleon, and it would not have been difficult by a more moderate policy to have insured peaee and have placed Spain under permanent obligation. Napoleon, however, arranged for a meeting with King Charles IV. and his son Ferdinand, and at the end of a stormy interview extorted from both an abdication. The event was followed by an outburst of indignation in all parts of the country, and an uprising that has seldom had a parallel in history. Napoleon offered the throne to his brother Louis, who, seeing the difficulties, refused it. He then gave it to his brother Joseph. So general and fervid was the opposition that before the summer was over the emperor was obliged to invade the country in person with an army of 180,000 men. Junot was defeated by the British in Portugal, and Spain was everywhere open to communications with Great Britain. The result was not only a determined insurrection by a nation of 11,000,000 of people, but an insurrection everywhere supported by the power and resources of Great Britain. Napoleon may have believed that he could regenerate and improve the bad government of Spain, but he committed the blunder of misjudging human nature, and nothing ean excuse the perfidy of invading the country with an armed force for the ostensible purpose of settling a domestic difficulty, and then demanding an abdication of the king and of the heir-apparent in order that he might impose his own government upon a confiding people. There could be only one result. The Peninsular war, led on the part of the British by Sir John Moore and Sir Arthur Wellesley, and on the part of the French by Napoleon himself and such marshals as Soult, Ney, Lannes, Masséna, and Bessières, continued to drain the resources of Franee until the last of the French were driven across the Pyrenees in 1814.

The Wagram Campaign.—As soon as the magnitude of the Spanish war revealed itself, unmistakable signs of difficulty appeared in the East. Napoleon led his army into Spain and advanced as far as Madrid, where he reinstated Joseph, who had been obliged to flee for his life; but no sooner had he begun the active work of the campaign against Sir John Moore than he was obliged to leave Spanish affairs in the hands of his marshals in order that he might devote himself to the rising discontents in Germany. By appointment he met the czar at Erfurt and completed the negotiations for an alliance that had been secretly begun at Tilsit. The most serions source of difficulty, however, was in Austria. That Government had so far recovered from the Austerlitz disaster as to be able to put an army of nearly 400,000 men into the field. Affairs in Italy were in such condition that nearly all the Austrian troops could be used N. of the Alps. The course of Austria was inspired by the insurrection of Hofer in the Tyrol, the occupation of the French in Spain, the rising hatred of Napoleon in Germany, and especially by the policy of France now revealed of extending the power of Russia in the south. War was begun in Apr., 1809. Napoleon was compelled to fill the ranks of his army with conscripts from France and from the confederation of the Rhine. He entreated the czar to send a re-enforcement from Poland to the Galician frontier, but his request was only partially and tardily complied with. The Archduke Charles, now in supreme command of the Austrian forces, advanced with an army of 150,000 men across the Inn and the Isar. The Freneh army was widely scattered, Davoust being at Ratisbon, Masséna at Ulm, and Oudinot at Augsburg. In the face of a powerful and enterprising enemy it would have seemed impossible to bring them together. The movements whieh now extricated the French from their positions constitute one of the most remarkable of Napoleon's military exploits. With an army greatly inferior in point of numbers and experience, Napoleon not only reseued his forces from a perilous position, but defeated the enemy in the decisive battles of Abensberg and Eckmühl, and drove him across the Danube. The French entered Vienna on May 13; but the army of the Arehduke Charles was still far superior to that of Napoleon. The campaign that ensued was one of the most interesting in all the Napoleonic period. Impatient to crush the enemy by another Austerlitz, the conqueror crossed the Danube into the great plain of the Marehfield, a little N. E. of Vienna. The arehduke attacked with fury on May 21 and 22 at Aspern and Esling, and finally drove the French back to a precarious position on the island of Lobau. Here the superhuman energy and resources of Napoleon were shown as nowhere else in all his career. His army was huddled in upon an island, the bridges of which were either broken down or in command of a vietorious foe; but instead of asking for terms or weakening his efforts, he kept up an attitude of the most vigorous and aggressive defiance. On the night of July 4, under cover of a false attack and a furious cannonade, he threw six bridges across the river, and marehed 100,000 men to the left bank. In the course of the 5th the Arehduke Charles, baffled and almost paralyzed, brought his forces into line for battle. The armies were the largest that had ever confronted eaeh other in modern warfare. Napoleon had received re-enforeements until he now had 160,000 men and 600 cannon, while the army of the archduke consisted of about the same number of cannon and nearly as many men. In the battle of Wagram the French were victorious, but as the Austrians began their retreat the advance guard of the long-expected army of the Archduke John came in sight. Had he been a few hours earlier the end of the battle might have been like that of Waterloo. An armistice was agreed to at Znaim on July 11, and the Treaty of Schönbrunn was signed Oet. 14. By this act the humiliation of Austria was made nearly as complete as was that of Prussia by the Treaty of Tilsit. More than that, the

terms of the treaty, by raising the Polish question, set at nought the agreements that had been made with the czar at Tilsit and Erfurt. The great signifieanee of the treaty was the fact that Russia was eonverted by it into an enemy, and the Russian war began to loom up as soon as the Austrian war was brought to a elose. The alienation was soon converted into something like bitterness by the divorce of Josephine and the subsequent marriage of the emperor. The emperor's poliey of an hereditary empire required that provision should be made for a succession to the imperial throne. To this end Napoleon had for some time contemplated a divorce. On his return to Paris after the treaty of Sehönbrunn, he determined to earry out this poliey without delay. He first asked the ezar for the hand of his sister, but a little later withdrew the offer and eontraeted with the Emperor of Austria for the Arehduehess Maria Louise. By this marriage, Austria, after being weakened and humiliated, was practieally adopted as a dependent state.

The Russian Invasion.—The emperor now had leisure and opportunity for the further development of the plans he had adopted in 1806. With this end in view he entered upon a eommereial policy whieh sought at once to insure the independence of continental Europe and the destruetion of British supremaey. Perhaps the latter was the eause of the former; but whether his British poliey was the parent or the ehild of his poliey on the Continent, he found he eould not secure continental independence without elosing additional ports by means of additional annexations. He annexed Holland and eut it up into nine Freneh provinees. He rounded out his interior frontier by annexing the kingdom of Westphalia with all the territory added from Prussia after Tilsit. He extended the northern maritime border so far as to inelude Oldenburg, whieh was then under the protectorate of Russia. These events, taking plaee in 1809, 1810, and 1811, eonvineed Russia that there was no possibility of peaee except by erushing the power of Napoleon, or by an acknowledgment of a Napoleonic suzerainty over the whole of Western Europe. Great Britain had taken that position early in the century. The Austrian marriage, the birth of a Napoleonic heir (May 11, 1811), the looseness with which Napoleon had interpreted the obligations he had entered into with the ezar at Tilsit, the seizing of the northern provinces—these were enough to eomplete the evidenee, and so taken together were the eause of the war with Russia. Napoleon now had Austria and Germany under his eontrol, and entered into the war with the assistanee of their troops. Sweden, though now ruled by Bernadotte, formed an alliance with Russia. The great eontest therefore brought together Great Britain, Sweden, and Russia on the one side, France, Austria, and the rest of Germany on the other. Great Britain at war with the U. S., and still in the thiek of the contest on the Spanish Peninsula, could take no prominent part in the great struggle now about to begin. Napoleon, with the help of his allies, was able to begin the invasion with an army of more than 600,000 men.

The general plan of the eampaign was like all the eampaigns of Napoleon in its aggressive features, but it was fatally defeetive in its failing to take into aeeount the eondition of the invaded eountry, and the spirit of the invaded people. From the very first the ezar refused to negotiate for peace so long as the Freneh were upon Russian soil. Eylau and Friedland, not to speak of Kesseldorf and Kunersdorf, had abundantly shown that Russian soldiers were among the most formidable and persistent fighters of Europe. It is one of the most singular faets in the career of Napoleon that he did not pereeive the elements of the situation, but regarded Russia as he had regarded Italy, Austria, and Germany. His reeent experience in Spain should have taught him that the enemy would only have to fall baek in order to lure him on to eertain destruetion, as Peter the Great had lured on the conquering armies of Charles XII. The failure of Napoleon's Russian eampaign is often attributed to the unwonted severity of the winter, but if the winter had been no more severe than usual, the result must have been substantially the same. The number returning would have been somewhat greater, but the failure of the expedition would have been seareely less.

Napoleon advaneed aeross the Niemen on June 24, 1812. That he was so late in beginning the campaign, and that he did not leave Vilna until July 16, shows either that he had no adequate understanding of what was before him, or that mueh of his old energy was already gone. The forees of the enemy were divided into three armies, neither of whieh eould be brought to a deeisive engagement. Bad roads and huge baggage-trains delayed the advance. The French pushed forward with the main line between the rivers Dwina and the Dnieper, evidently intending to strike at Moscow. Napoleon's method of making war support itself told rapidly upon Russian patience, and the elamors for a battle at length became irresistible. The ezar, in answer to the demands for a vigorous resistanee, plaeed Kutusoff in eommand of the entire Russian force, a faet that indicated a ehange of poliey. The battle of Borodino, one of the most sanguinary of modern times, followed on Sept. 7, and left about 80,000 men on the field. The French were vietorious; but they did not press their advantage, and relatively they were no stronger than before. On the 14th they entered Moscow, but were surprised to find it praetically deserted. The next night fires broke out in all parts of the city. These, begun by the governor of Moseow before the evacuation, had probably been kept up by Russians, partly in the interests of patriotism and partly in the interests of plunder. Napoleon was obliged to evacuate the Kremlin almost immediately after occupying it. What was next to be done? Would the ezar negotiate for peaee? The pressure upon him by faint-hearted eouneilors was very great; but Stein, a representative of Germany, and Jaekson, a representative of Great Britain, urged the opposite course with so mueh cogeney that the ezar stood firm. Napoleon hesitated six weeks before leaving Moscow. After blowing up the Kremlin he abandoned the old capital Oet. 20. Reeruits for the Russian army were eoming in from every quarter, while the foree of Napoleon was eonstantly growing weaker. He turned southward in the hope of rieher fields, but he could not bring the enemy to a deeisive battle, and was obliged to return to the north. He reaehed Smolensk on Nov. 9. Winter eame on with unusual severity to eomplete the work already far advaneed. The sufferings of the retreat form one of the most melaneholy pages of history. As in Egypt and in Spain, Napoleon left the defeated army in the hands of subordinates and returned to Franee. Passing through Poland and Germany in disguise he reaehed Paris in the early part of Deeember. After unparalleled sufferings, a remnant of the army tottered into Vilna on the evening of the 6th of the same month. It is estimated that by battle, by disease, by starvation, and by frost, half a million men had perished.

The Leipzig Campaign.—The disasters of the Russian campaign seemed to precipitate the distrust and diseontent that were now everywhere prevalent. Even in France the old fervor for the emperor was gone. The eonseriptions had drained the eountry of able-bodied men, and the levies for the great Russian movement had met with so much opposition that young men were willing to maim themselves in order to be exempt from the service. Napoleon's departure for the war evoked no enthusiasm, and his return was met with ominous indifferenee. Still his genius was able to prevent any general uprising in Franee. In Germany the situation was far different. Though Prussia and Austria, as well as the eonfederation of the Rhine, had been drawn into the Russian expedition, they had fought without zeal, and were probably not dissatisfied with the result. The Prussian contingent in the north and the Austrian in the south had not shared the fate of the Freneh. The signal for a general revolt was the course of Prussia. Field-Marshal York, eommanding a Prussian wing of the invading army, and seeing that the tide had turned, abandoned the eause of the Freneh, and put himself at the head of the opposition to Napoleon. The movement was eontagious and soon amounted to a popular uprising throughout Prussia. It was now found how effeetually the Napoleonie requirement that the army should be kept down to 42,000 men had been avoided. By terms of short serviee and rigorous drill nearly all the young men in the eountry had passed into and out of the army, and had reeeived a good military training in the course of the six years that had elapsed since the Peaee of Tilsit. In a few months the Prussian army amounted to some 250,000 men. In Austria the movement was slower, owing to the bond that had been established by the marriage and the birth of an heir; but Napoleon twiee refused definite offers by Austria, looking toward the establishment of peaee on a basis that would have seeured Freneh retention of a large part of the conquered territory. The result of these refusals was that Austria joined the new eoalition with Prussia and Russia. The eampaigns that followed in 1813 were intrieate, and for a long time without decisive results. It was the general poliey of the allies, inspired by Seharnhorst, the organizing military genius of

Prussia, to avoid general engagements, except when they could be fought with manifest advantage. The battles of Lützen, Bantzen, and Dresden gave Napoleon some advantage, but were not followed up with energy, and were by no means decisive. Blücher met and routed Ney at the Katzbach. Napoleon formed a grand design of holding Schwartzenberg and the Austrians in check with the corps of Murat in the south, while he advanced rapidly upon his allies in the north, and, after defeating them, returning and crushing the Austrians; but the design could not be carried out because of the inherent weakness of the situation. At the decisive moment Bavaria threw off her allegiance to Napoleon and joined the allies, Westphalia repudiated Jerome, and the confederation of the Rhine showed such unmistakable signs of disloyalty as to threaten the emperor's communications with France. For these many reasons the plan had to be abandoned. Murat was unable to keep Schwartzenberg in check, and Blücher, followed by Bernadotte, vigorously pressed back the forces from the north. The allies rapidly concentrated about Leipzig, and Napoleon was compelled either to fight a great battle or to withdraw. He decided to risk a general engagement. His force at Leipzig was about 160,000 men, while that of the allies, Austrians, Bavarians, Russians, Prussians, and Swedes exceeded 300,000. The allies began the attack on the morning of Oct. 16, and the battle continued until the 19th. The defeat was so disastrous to Napoleon that he was able to rescue only about 60,000 men from the wreck of his army. The garrisons on the Elbe, the Oder, and the Vistula were left unsupported and surrounded by enemies, so that the total loss to the French could hardly have been much less than 175,000.

The Invasion of France.—After the disastrous battle of Leipzig Napoleon slowly made his way back to the Rhine, while his flanks and rear were constantly harassed by the forces of Blücher and Schwartzenberg. Austria attempted to negotiate for a permanent peace on the basis of the "natural boundaries," i. e. the Alps, the Pyrenees, and the Rhine; but Napoleon was unwilling to abandon Germany, and so lost the last chance of saving Holland, Belgium, Cologne, Mentz, and Manheim. In the westward movement that followed, Blücher crossed the Rhine at Manheim with about 80,000 men, and Schwartzenberg at Basel with no less than 160,000. The defensive campaign now fought by Napoleon gave abundant evidence that his masterly strategic ability was in no way diminished. Wellington, who was one of the most discriminating of military critics, characterized it as "very brilliant, probably the ablest of all his performances." In a general way his policy may be described as a determination to prevent the two invading armies from uniting, and by keeping between the two, striking out to the right and left as there might be opportunity. The forces of the French probably did not exceed one-third the numbers of the allies. At La Rothière Napoleon was defeated, and his cause now seemed hopeless. Blücher pushed on with characteristic energy, Schwartzenberg with characteristic caution. With almost unprecedented force and skill the mighty Frenchman threw his army upon the advancing forces of Prussia, and not far from Troyes defeated them three times in succession, between Feb. 10 and 14. He then turned upon the hosts of Schwartzenberg, which were advancing along the Seine on the way to Paris, and defeated them at Nangis and Montereau after a series of movements which showed extraordinary skill. An armistice followed in the closing days of February, but the enemies could not agree upon terms of peace. The allies had discovered that Napoleon was now supported with no enthusiasm by the French, and they therefore demanded that the boundaries should be established on the basis of the France of Louis XVI. The emperor scornfully refused to consider these terms, and the war accordingly was renewed. Blücher had recovered and united with the Austrian force on the Seine. Napoleon fought two disastrous battles at Craonne and Laon, in which he lost nearly a fourth of his army. He now adopted a course which could hardly have been the result of anything but desperation—he threw himself in the rear of the enemy and called for re-enforcements from the troops shut up in the fortresses along the Rhine. This movement left the way to Paris open for the allies. Having already discovered a formidable conspiracy in the city, led by Talleyrand, to repudiate Napoleon, they did not hesitate to march directly upon the capital. Marmont and Mortier made an honorable but fruitless defense, and on Mar. 29 the united armies reached the heights of Montmartre. The capitulation was signed on the evening of the same day. Meanwhile Napoleon, finding no forces to meet him in his eastward movement, and fearing that the allies were marching upon Paris, turned westward once more and reached a village near Fontainebleau before, on the evening of the 30th, he heard the terrible news that the capital was in the hands of the enemy. He sent an embassy at once to treat for peace, but the allies were in no haste. Strange scenes in Paris met the eyes of the envoys. A revolution was everywhere going on for the purpose of overthrowing Napoleon and reinstating the Bourbons. Talleyrand assured the allies that public opinion was ready for a complete repudiation of Napoleonic authority. The czar, smarting still under the remembrances of 1812, was in condition to dictate the policy; and answer was finally returned that the allies would not treat with Napoleon or with any one of his name. The emperor had gathered about him at Fontainebleau an army of 80,000 men, and now prepared to renew the attack; but the extent to which the poison of discontent and distrust had permeated all branches of the service, as well as of the Government, was now revealed. While Marmont himself was treating with the allies as an envoy of Napoleon, his corps, 20,000 strong, deserted the standard of the emperor and passed over to the enemy. Even worse than this, the Senate, which ever since 1804 had been his subservient tool, now proclaimed that Napoleon had forfeited his crown. The populace tore down the emperor's statue from the column of Austerlitz, and evidences of his name were rapidly effaced. Seeing that the contest could not longer be carried on without civil war, the emperor signed an unconditional abdication on Apr. 6, 1814. The evidences of defection on the part of the officers he had raised to power tormented him with the impression that he was forsaken and execrated by mankind. In a moment of anguish he swallowed poison, but the dose did not prove fatal. The allies decided to place the Comte de Provence on the throne as Louis XVIII., and to banish Napoleon to the island of Elba. Bidding a touching and memorable farewell to the soldiers of his guard at Fontainebleau, he was soon on his way to the little island in the Mediterranean. As he passed through the towns that had been made desolate by the commercial destruction of his continental system, he was denounced as a monster of crime, and the cause of all the sufferings of the French people. At Avignon the crowd attacked the carriages and wanted to throw him into the Rhône. He was obliged to disguise himself, and more than once his life seemed to be in extreme danger.

The Waterloo Campaign.—Scarcely had Napoleon landed on the island of his exile when new troubles broke out in France. Louis XVIII., and those he called about him, not only re-established many of the most offensive features of the old Bourbon government, but unsettled domestic affairs, played havoc with the positions of public men, and threw the titles of estates into dire confusion. These changes, so sudden and intolerable, were enough in themselves to suggest a new revolution. Meantime the old soldiers, who had been left in the garrisons or as prisoners in Germany, probably 300,000 in number, came streaming back into France with their enthusiasm for their chief unabated. The congress at Vienna, called to settle all disputed questions arising from the new conditions, added to the discontents. Meeting in September, the plenipotentiaries passed the whole of the winter without completing their work, but as the months passed on it became apparent that France would in the end be humiliated and the great powers would be greatly enriched. In all these facts Napoleon saw what he thought to be an opportunity to revive the old loyalty to himself. He formed the desperate resolution to abandon Elba and place himself at the head of the malcontents. Setting sail with about 1,100 soldiers on Feb. 25, 1815, he landed Mar. 1 near Cannes. He had not misjudged the feelings of the old soldiery, for he was at once, wherever he appeared, hailed with acclamations of joy. On Mar. 13, at Lyons, he issued an imperial decree dissolving the chambers established by Louis XVIII. and summoning an extraordinary meeting in the Field of May. On Mar. 19 the king left Paris; on the 20th the emperor arrived. Although the people generally maintained a sullen silence, the soldiers were enthusiastic. Many of the old commanders flocked to his side, and he soon had an army of more than 100,000 men; but, as so often before, he had not estimated the powers of his enemies aright. On Mar. 13 the news of his landing in France reached the representatives of the powers at Vienna. They at once forgot their differences and proclaimed

him "an enemy and disturber of the peace of the world." On the 25th the new coalition was signed, and the troops everywhere marching toward home, were ordered to halt and fall into line for the coming campaign. The allies put at once 700,000 men into the field, and the reserves at their disposal were probably twice as many more. Napoleon early in June commanded about 200,000. When the campaign began, on June 12, the emperor's force numbered 122,401. The allies consisted of Great Britain, Prussia, Russia, and Austria, besides the subordinate states of Germany, and it is evident that, whatever the result of the first great battle, the complete overthrow of the emperor could not now long be postponed. Napoleon advanced with characteristic rapidity. His plan was to strike in between his enemies, as he had so often successfully done before, and defeat them individually before they could unite. The army under Wellington, consisting of British, Hollanders, Belgians, and Germans, numbered 105,950 and was stationed at Brussels. The Prussian army of Blücher, numbering more than 116,000 well-disciplined troops, was approaching from the E. to join his British ally. Napoleon's purpose was to prevent their union and to defeat first the one and then the other. On June 16 the French and Prussians fought at Ligny, but the Prussians, though defeated, were able to withdraw from the field in good order. Napoleon now made the mistake of supposing that Blücher withdrew to the E. by way of Namur, while in fact he took the road N. leading to Wavre, a village about 8 miles E. of Waterloo. Marshal Grouchy, with a strong French force of about 33,000 men, was ordered to pursue Blücher and prevent his junction with Wellington. Grouchy naturally took the Namur road instead of that to Wavre. The mistake at Ligny led to another that was still more important. After the battle of Ligny, Napoleon's army, only about 15 or 18 miles from that of Wellington, if the old-time energy had been shown, could have overtaken Wellington by Genappe and Nivelles in time to fight the battle on the 17th. The night of the 16th Napoleon passed at Fleurus, a village about 3 miles S. of Ligny, though the left of his army, under Ney, was at Quatre Bras. The delays that now occurred have baffled many of the critics, but the most recent investigations have shown that Napoleon was so overcome with fatigue and illness on the evening of the 16th that he went to bed immediately after the battle, and did not allow himself to be disturbed till late on the morning of the 17th. He reached Ligny about noon, where he heard that Blücher had moved toward the N. Going to Quatre Bras early in the afternoon, he learned that Wellington had fallen back to the high ground S. of Waterloo. Furious rains retarded the movement of the army, but before dark the heads of the emperor's columns reached the hills in front of La Belle Alliance, less than 2 miles S. of Wellington's line. If, in the course of the night, the army had moved forward so as to begin the attack at daybreak, the result might have been different, but, notwithstanding the fact that Napoleon knew of Blücher's movement, the French army was so slow in coming into line that it was noon of the 18th before the battle began. The delay is not very satisfactorily explained by Napoleon's over-confidence in his own destiny and his underestimate of the power of his foes; and it can not properly be attributed to the rain, since the defeated army of Blücher was able to advance a much greater distance over inferior roads. It is evident that the Napoleon of Waterloo was not the Napoleon of Marengo or Austerlitz. When the attack began the French columns were thrown against the British squares with the fury of desperation. Attacks were repeated on the British right, on the left, and on the center. About four o'clock the imperial forces captured the important strategic point at La Haye Sainte. A gap was now opened in the British lines, and Napoleon followed up the advantage by an attack of the guard; but the head of the Prussian columns, under Bülow, had already reached the field, and at this moment Blücher's veterans came on as an irresistible re-enforcement. The Prussian force charged upon the French right with impetuosity. The French forces were thrown into some confusion, when Wellington ordered a general charge along the whole line. This movement not only decided the day, but drove the imperial army from the field. The pursuit was followed up with so much energy by the victors that the French army was shattered in pieces, and the fragments were sent flying in all directions toward the frontier. Napoleon himself hastened to Paris to make an appeal to the chambers, and, if possible, to repair the crushing disaster. His appeal fell on insensible ears. There was nothing left for him but abdication.

Final Abdication, Banishment, and Death.—He proclaimed his son Napoleon II., but, notwithstanding this fact, the chambers set up a provisional government. The allies, under the impetuous counsels of Blücher, pressed on to Paris. Napoleon saw that he could do nothing to resist the current, and, accordingly, he decided to embark for America; but on reaching La Rochelle he found the harbor thoroughly guarded by British cruisers, and so changed his purpose. On July 15 he placed himself under the flag of Great Britain, and was received on board the Bellerophon with high honors. At the same time he wrote a letter to the prince regent declaring that he "committed himself to the protection of the laws of the most powerful, the most persevering, and the most generous of his foes"; but the coalition had learned a lesson at Elba. In a few days the British Government decided upon its course. The dignified protest of the emperor was disregarded, and early in August the great exile was on his way to the rocky island of St. Helena, in the Southern Atlantic, where, after six years of mental and physical distress, he died, May 5, 1821, after much suffering, from an ulcer in the stomach. In his last will he distributed his fortune with munificent forethought, and expressed his desire that his remains might "repose on the banks of the Seine amid the people whom he had loved so well." This wish was respected by the British Government, but the remains were not removed until 1840. In that year the "solitary tomb under the willow-tree was opened, the winding sheet was rolled back with pious care, and the features of the hero were exposed to the view of the spectators. So perfectly had the body been embalmed that the features were undecayed, the countenance serene, even a smile on the lips, and his dress the same, since immortalized in statuary, as when he stood on the fields of Austerlitz and Jena." The remains of the mighty dead reached Paris early in December, and on the 15th, followed by a procession of 600,000 people, were deposited in their final resting-place under the dome of the Church of the Invalides on the banks of the Seine.

General Estimate of his Career.—Taken all in all, Napoleon was by far the greatest of the modern masters in the art of war. In those military combinations which are known as strategy he has never had an equal, and he was so consummate a master of details that he could often predict to a day or an hour the time when a remote result would be accomplished. By a kind of inspiration or intuition he was able to detect the weakest point in the policy of the enemy, and he had unrivaled skill in throwing himself between the opposing forces and beating them in detached parts. The boldness and swiftness of his movements often stunned and almost paralyzed his foes. If he met with reverses, he was often able to conceal them by some achievement that seemed to cover everything with a blaze of glory. By means of his bulletins and reports he kept an impression of his invincible power in the minds and imaginations of the people, and it long seemed to many of the thoughtful minds of Europe that his imperial system would be permanently established. Stupendous as were his successes, a careful analysis of his career will show that his failures were still greater. It is not probable that at the beginning of his career he had any clearly defined policy in view. He was, in a very exceptional sense, a product of revolution, and yet he was so far from having sympathy with revolutionary ideas that he reinstated many of the most offensive features that the revolution had overthrown. When he came into the revolutionary current and sought to control it, he saw that the most effective way to wield all the forces of France was to unite them against the traditionary foe of the nation. During the eighteenth century France had been almost constantly at war with Great Britain. The result had been humiliating to the French in the extreme. William III. and Marlborough had beaten the French on the Continent; and the statesmanship of Chatham had accomplished the stupendous result of driving the French out of America and out of India. A general hatred of the British was as dominant a factor in French life from 1775 to 1800 as was hatred of the Germans during the generation following 1870. Connected with this hatred was a natural desire to recover what had been lost. When Napoleon came upon the scene, France and Great Britain were at war. Napoleon found in this fact the greatest of opportunities. His Egyptian campaign was designed primarily as a blow at British power in the East, and its design, as well as its failure, was made all the more conspicuous

when he sent Sebastiani to explore the country with a view to a new attack. The refusal of Great Britain to give up Malta in consequence of these new revelations led, as we have seen, to a renewal of the war with the same purpose in view. The colossal preparations for the invasion of England followed; but Pitt succeeded in forming a continental coalition, and France was now obliged to fight not only Great Britain but Austria and Russia as well. As the French fleet had been unable to keep Nelson from guarding the Channel, Napoleon saw that the chances of a successful invasion were daily becoming less and less, and accordingly he changed his purpose and determined to strike the British allies instead of Great Britain herself. Ulm and Austerlitz concealed the defeat at Boulogne, as Marengo had concealed the defeat in Egypt. The war with Prussia, which began with Jena and ended with Friedland and Tilsit, humiliated the people of Frederick the Great, and by so doing prepared the way for the Nemesis of Leipzig and Waterloo; but even the tumults of this great war did not turn Napoleon for an instant from the line of his great purpose. The annihilation of the French navy at Trafalgar showed the great conqueror the utter futility of renewing the project of invasion; but the Berlin decree was aimed at the same result. By destroying commercial relations with continental markets he believed that Great Britain could be subdued; but in order to accomplish this purpose he must close all the ports of Europe. The Spanish Peninsula and the Russian Baltic ports were still open. The Spanish war was brought on by sending his brother to Madrid and Junot to Portugal for the purpose of completing the blockade in the Peninsula; and he brought on the Russian war, with all its horrors, by insisting upon a closing of the ports of Oldenburg. The failures of the Spanish and the Russian wars, among the most stupendous in history, were but the crowning failure of his policy in regard to Great Britain. Even this was not all. The failure of Napoleon in regard to France was no less complete. It is true that during the consulate and early empire he wrought important reforms that have been permanent; but it may well be doubted whether the most of these reforms were not the natural fruit of the Revolution. In making up our judgment it must not be forgotten that a great national upheaval or disaster, followed by a restoration, is always a period of great reform. Greece after the Persian invasions, Great Britain after the overthrow of the Stuarts, Prussia after Tilsit, even France after Sedan, give us intimations of what was the natural sequence of the Revolution of 1789; but whatever opinion may ultimately come to prevail in regard to the administrative reforms of the Napoleonic period, it will have to be admitted that what he fondly called his continental policy was a complete failure. In Italy, in Spain, in Switzerland, and in Germany his work perished with his overthrow. He found France in the peaceful and unquestioned possession of Belgium and the left bank of the Rhine, and he left it shorn of much of the richest and most populous portion of the realm. It was as the fruit of his policy that Cologne, Bonn, Coblentz, Mentz, and all the rich intervening territory which for twenty years had belonged to France, became permanently a part of Germany. It was not alone or even chiefly in losses of a material nature that the baneful influence of Napoleon's career left its impression on France. Far more damaging was the fact that it gave to the people those erroneous beliefs, unwholesome sentiments, and false ideals in which were bound up all the misfortunes of the second empire and the war of 1870.

AUTHORITIES.—Our knowledge of Napoleon was greatly modified by the publication, under the authority of the second empire, of the *Correspondance de l'Empereur Napoléon I.*, in thirty-two volumes 4to. Unfortunately, however, the published portion of the correspondence is by no means complete. The editors were under instructions to give to the public only "what the emperor himself would have given to the public had he survived himself." Of the entire correspondence in the French archives, numbering about 80,000 letters, only about 30,000 are included in the published collection; but the published letters have thrown new light on almost every important event of Napoleon's life. The most important of the systematic works that have received the benefit of these letters and dispatches are: Lanfrey, *History of Napoleon I.* (4 vols.); Jung, *Bonaparte et son Temps* (3 vols.); Taine, *Modern Régime*; Seeley, *Short History of Napoleon the First*; Morris, *Napoleon, Warrior and Ruler*; Ropes, *The First Napoleon*; Ropes, *Waterloo*; Gardner, *Quatre Bras, Ligny, and Waterloo*; Browning, *England and Napoleon in 1803*. Of the more elaborate standard works published before the *Correspondance*, Thiers, *Consulate and Empire* (20 vols.); Jomini, *Political and Military Life of Napoleon I.* (4 vols.); and Alison, *History of Europe from 1789 to 1815* (14 vols.), are the most important. Of the almost countless *Mémoires* the most worthy of note, as throwing important light on the period by personal observers, are those of d'Abrantès, Rémusat, Talleyrand, Metternich, Marbot, Pasquier, Montholon, Gourgaud, Bourrienne, de Méneval, Las Casas, O'Meara, Marmont, Masséna, Sachet, de Ségur, and Miot de Melito.

C. K. ADAMS.

Napoleon II., FRANCIS JOSEPH CHARLES: the only child of Napoleon I. by Marie Louise of Austria; b. in the Tuileries, Mar. 20, 1811, and baptized June 9 as King of Rome. After the defeat at Waterloo, Napoleon I. abdicated in favor of his son, and proclaimed him Emperor of the French (June 22, 1815) under the title of Napoleon II., but the allied powers paid no attention to this proclamation. He was educated in Vienna, where he was known as the Duke of Reichstadt, from a small estate in Bohemia. He was instructed in military science, and in 1830 was raised to the rank of major. In Apr., 1832, he was suddenly seized with consumption, and died at Schönbrunn, July 22, 1832. As Napoleon III. ascended the French throne, the Duke of Reichstadt is reckoned among the French sovereigns by the Bonapartists and known as Napoleon II., though he never occupied the throne.

Napoleon III., CHARLES LOUIS: Emperor of the French; the youngest son of Louis Bonaparte, King of Holland, and Hortense Beauharnais, the stepdaughter of Napoleon I.; b. in Paris, Apr., 20, 1808. The parents lived separately, the children with the mother. After the fall of Napoleon I., Queen Hortense repaired in 1816 to Arenenberg in Thurgau, and Louis attended for eight years the gymnasium of Augsburg, and after 1824 for some time the military school of Thun. On the dethronement of the Bourbons by the revolution of 1830 he took an active part in public affairs. He joined in the unsuccessful revolt of the Italians against the papal rule in Romagna and afterward returned to France, but the law exiling the Bonapartes was still in force and he was obliged to leave the country. After the death of his elder brother in 1831, and of the Duke of Reichstadt in 1832, he became the heir of the house of Bonaparte. A sort of conspiracy in Strassburg proclaimed him emperor Oct. 30, 1836, but only for two hours. He was arrested and sent to the U. S. without trial. He returned to Switzerland in 1837, just before the death of his mother, and spent the next two years in London, where he was generally liked, though he inspired no great respect for his abilities. On Aug. 6, 1840, he landed at Boulogne with fifty men and conquered the toll-gates. This time, however, he was sentenced to imprisonment for life, and he remained in the citadel of Ham till May 25, 1846, when he succeeded in making his escape. He bore his imprisonment with courage, spending much of the time in writing papers on political questions. His pamphlets *Réveries Politiques* (1832) and *Des Idées napoléoniennes* (1839) had already appeared, and while at Ham he published *De l'Extinction du Paupérisme* (1844). After his escape he again went to London, where he lived till 1848, when the February revolution in Paris brought his name into prominence. He was elected to the Assembly from Paris and from three departments. On Sept. 26 he took his seat, and on Dec. 20 was elected president of the French republic by a majority of over 5,000,000. Soon, however, a quarrel arose between him and the Assembly, the latter suspecting him of an intention of overthrowing the constitution, while he in turn maintained that the Assembly opposed all his plans for promoting the welfare of the people. The trouble finally culminated in his masterly but unscrupulous seizure of power by the *coup d'état* of Dec. 2, 1851. On that day Paris found its walls placarded with proclamations to the effect that the president had discharged the Assembly, charging it with being the "hotbed of sedition," and appealing to the people in support of the course he had taken. All civil and military officers likely to oppose his scheme were then arrested, the army, which was hostile to the Parisian populace, was skillfully disposed in the streets, and finally the brutal and needless massacre of the crowds on the boulevards on Dec. 4 completed the work of overawing the city. Reports that Paris enthusiastically approved the president's course were dispatched to the provinces, and on Dec. 20–21 the people of France were called upon to vote on the questions as to

whether or not the course of the president should be sustained, and whether he should be authorized to draw up a new constitution and to retain the presidential chair for ten years. A negative answer would have meant temporary anarchy, and the result of the vote was an almost unanimous acceptance of the proposals submitted, the dissenting minority numbering only 640,000 out of a total of 8,000,000 votes. From this time on he possessed in effect arbitrary power, and on Dec. 2, 1852, was proclaimed emperor, a second plebiscite having resulted in a still larger majority in his favor than the first. On Jan. 30, 1853, he married Eugénie de Montijo, and Mar. 16, 1856, she bore him the Prince Imperial, who died June 1, 1879. For the first ten years of his reign he was a conspicuous and at times a brilliant figure among European sovereigns. The Crimean war (1854–56), which was only a half success, immensely expensive, and small in its results, nevertheless added to the military reputation of France, and the Italian war (1859), although disappointing to the Italians on account of their failure to secure Venice, made him immensely popular. The Mexican war (1862–63) was showy enough, in that it gave him a crown to dispose of, but after Maximilian's overthrow and death people began to view the emperor's policy with some suspicion, and although he entertained Europe well enough by the opening of the Suez Canal, the World's Exposition, the rebuilding of Paris, by congresses and visits, France began to lose something of her prestige in foreign relations. Both in the Danish war of 1864 and in the war of 1866 Napoleon's policy betrayed weakness and inconsistency, and its results were humiliating and disappointing to France. One of the chief motives for the fatal war with Germany in 1870 was the desire to strengthen the empire by an access of military glory. Napoleon, who was then slowly dying of an incurable disease, seems to have been the victim of gross misrepresentations as to the resources of France and her readiness for war. During the contest he was misled by his advisers and urged on to rash measures by the dread of a popular uprising against his government. He was made prisoner with his entire army at Sedan, Sept. 2, 1870, and sent to the castle of Wilhelmshöhe, near Cassel, whence he afterward removed to England. D. at Chiselhurst, in England, Jan. 9, 1873. Among Napoleon's other writings are *Histoire du Jules César* (1865–66); miscellaneous works published under the title *Œuvres de Napoléon III.* (1854–69); and a collection of posthumous works, *Œuvres posthumes* (1873). See Delord, *Histoire du second empire* (1869–75); Gottschall, *Napoleon III., Eine biographische Studie* (1871); von Sybel, *Napoleon III.* (1873); Jerrold, *The Life of Napoleon III.* (1877); Hugo, *Histoire d'un Crime* (1877); Simson, *Die Beziehungen Napoleons III. zu Preussen und Deutschland* (1882); C. E. de Maupas, *Story of the Coup d'État* (Eng. trans. 1884); memoirs of the Duke of Coburg; Fyffe, *Modern Europe* (1890); and Murdock, *Reconstruction of Europe* (1891). F. M. Colby.

Napoleon, Prince Napoleon Joseph Charles Paul Bonaparte: See Bonaparte, N. J. C. P.

Napoleon IV., Prince Louis Napoleon: the name given by the Bonapartists to the only child of Napoleon III. and the Empress Eugénie, though he never ascended the throne. He was born Mar. 16, 1856, and was educated in the Tuileries; but when, on Sept. 4, 1870, the people of Paris, after the battle of Sedan and the downfall of Napoleon III., proclaimed the republic, he escaped with his mother to England. He received a military education at the Royal Military Academy at Woolwich. During the war against the Zulus, in South Africa, he volunteered his services, and was killed June 1, 1879.

Napoleona: a genus of two species of small trees, of the Myrtle family, natives of tropical Africa. The large flowers are crimson and orange in color, and of great beauty of form. These plants are now grown in conservatories, sometimes under the old name of *Belvisia*.

Nappe [= Fr. sheet, cloth < Late Lat. *nappa*, variant of Lat. *mappa*, cloth, table-cloth]: in mathematics, one sheet of a surface. Thus if an hyperbola is revolved about its conjugate axis, it will generate a surface which is everywhere continuous; this surface is an hyperboloid of *one* nappe; if the curve is revolved about its transverse axis, it will generate a surface composed of two parts or sheets; this surface is called an hyperboloid or *two* nappes.

Naquet, năă'kā', Alfred Joseph: chemist and politician; b. at Carpentras, in the department of Vaucluse, France, Oct. 6, 1834; studied medicine at Paris, and was appointed professor at the medical school in 1863. His principal scientific works are *Principes de Chimie fondés sur les Théories Modernes* (1865); *De l'Atomicité* (1868); *Précis de Chimie légale* (1872). He was one of the organizers of the congress of Geneva, and his speeches on this occasion cost him fifteen months' imprisonment, besides a fine. For his *Religion, Propriété, Famille* (1869) he was also punished by imprisonment and a fine. In 1873 he published *La République radicale*, but his journal (*La République*, 1876) was not successful. He was prominent as a senator, radical politician, and Boulangist, 1882–90.

Nara: an ancient town of Japan; situated in the northern part of the province of Yamato, about 27 miles S. by E. of Kioto (see map of Japan, ref. 6–C). The name is said to be derived from *nara*, a species of oak no longer common in the neighborhood. For seven reigns (709–784 A. D.) Nara was the imperial seat, and retains, in its wonderful old temples, relics of its past glory. In a pagoda, 156 feet high, is contained the largest image of the Great Buddha in the empire. It is 53 feet in height, and is ascribed to a Chinese founder of the eighth century. Some of the finest specimens of wood-carving in Japan are to be found in the various temples and shrines, as well as collections of invaluable antiques. Modern Nara is noted for its cutlery, sold mostly to pilgrims as souvenirs, and for its park, where is kept a herd of tame sacred deer. Pop. 21,000. J. M. Dixon.

Naraka [Sanskr.]: in Brahmanism and the religious systems developed from it, the place to which the wicked are consigned for punishment; hell. Manu enumerates twenty-one such places, and describes with great elaborateness the varied punishments meted out for different crimes. According to the Buddhist system there are eight large hot hells, eight large cold hells, eight large hells of utter darkness, and ten large cold hells on the edge of the universe. Each of these has innumerable smaller hells attached to it. The eight large hot hells are situated in tiers beneath Jambudwipa (*q. v.*); each has four gates, and outside each gate are four other hells, making 136 hot hells in all. The lowest of the eight large hot hells is called Avichi, or the hell of unintermitted suffering. To it are consigned all those who disobey parents, or who speak ill of Buddha or his law.

The eight large cold hells are situated beneath the double range of iron mountains which form the periphery of the universe. The eight hells of utter darkness are situated between these two ranges, and are called "living" or "vivifying" hells, because if a being dies in one he is immediately reborn in another, where he continues 500 years, and is then reborn in a third, and so on until his sins have been expiated, when he is again born on earth in some one of the remaining five gatis. (See Gati.) Attached to each of the cold hells on the edge of the universe are 100,000,000 smaller hells, while besides all this there are 84,000 other hells situated on mountains, in deserts, on the water, etc.

All these hells are in charge of Yama (*q. v.*), the judge of the dead, who, with the assistance of eighteen officers and an army of demons, determines the kind, degree, and duration of torture to which each male culprit must be subjected. His sister performs the same duties in regard to female culprits. See Buddhism. R. Lilley.

Narbada: See Nerbudda.

Narbonne, năr'bŏn' (anc. *Narbo Martius*): town; in the department of Aude, France; on a branch of the Canal du Midi; 8 miles from the Mediterranean (see map of France, ref. 9–F). It is an old town, and was known to the Greeks 500 B. C. In 118 B. C. it was colonized by the Romans, and in the times of the emperors it became a magnificent city, the capital of Gallia Narbonensis, adorned with temples, triumphal arches, and amphitheaters, and famous for the salubrity of its air. Three emperors, Carus (282–283) and his two sons, Carinus and Numerianus (283–284), were born here. In 719 the Saracens took and burned it; in 859 the Northmen plundered it; yet in the twelfth and thirteenth centuries it was a city with 40,000 inhabitants and extensive commercial connections; in 1271 it began building its magnificent Gothic cathedral, which was never finished. The town sank suddenly. All its splendor has now shrunk into a collection of antiquities. Even its pure air has been spoiled by poisonous gases from swamps in the vicinity. Its only celebrity at present is due to its honey, which is the best in France. Pop. (1896) 27,824.

Narcissus [= Lat. = Gr. *νάρκισσος*, perhaps deriv. of *νάρκη*, numbness, torpor. Cf. Narcotics]: name of a genus of bulbous plants of the family *Amaryllidaceæ*, natives of the

Old World. The genus includes the garden and greenhouse plants called jonquil, narcissus, daffodil, and polyanthus, cultivated for ornament. They mostly have handsome flowers, appearing in spring, and many are very fragrant. See DAFFODIL.

Narcis'sus [= Lat. = Gr. *Νάρκισσος*, personification of *νάρκισσος*, narcissus]: the beautiful son of the Bœotian river-god Cephisus and the nymph Liriope. The nymph ECHO (*q. v.*) loved him, but he repulsed her, and was punished by falling in love with his own image as reflected in a fountain, so that not attaining the beloved image he pined away and died. When the Naiads came to bury his body, they found only a flower—the narcissus. The myth is thought to have had its origin in the Bœotian pæderasty, having been invented to frighten unresponsive boys. J. R. S. S.

Narcotics [from Gr. *ναρκωτικός*, benumbing, deriv. of *ναρκοῦν*, benumb, deriv. of *νάρκη*, numbness]: in medicine, such drugs as have the power of stupefying the cerebral faculties, or inducing sleep, or deadening ordinary sensibility. No exact division of narcotics can be made, but such drugs as opium, belladonna, stramonium, henbane, Indian hemp, chloral, and the ethers are those to which the term is commonly applied.

Narcotine: See OPIUM.

Nard: See SPIKENARD.

Nares, nārz, Sir GEORGE STRONG, K. C. B., F. R. S.: navigator; b. at Danestown, Scotland, in 1831; was educated at the Royal Naval College, Greenwich; engaged in the Arctic expedition 1852–54, and was in 1875 at the head of the expedition sent out in search of the north pole, commanding the Alert, which reached lat. 82° 37′ N. He afterward made a survey of the South Pacific in the same ship. He published *The Naval Cadet's Guide* (1860; reprinted in 1862 under the name of *Seamanship*; 4th ed. 1868); *Reports on Ocean Soundings and Temperature* (in the Challenger; 6 parts, 1874–75); *The Official Report of the Arctic Expedition* (1876); *Narrative of a Voyage to the Polar Sea in 1875–76* (2 vols., 1878). In the period between his first and his second Arctic expeditions he was mostly employed in explorations of the southern polar seas and the coasts of China, being in command of H. M. S. Challenger 1872–74.

Nares, ROBERT, F. R. S.: clergyman and author; b. at York, England, June 9, 1753; was educated at Christ Church, Oxford; took orders in the Church of England 1778; became rector of Sharnford, Leicestershire; preacher at Lincoln's Inn 1788; assistant librarian at the British Museum 1795–1807; canon of Lichfield 1799; archdeacon of Stafford 1800; prebendary of Lincoln and rector of All Hallows, London. With Mr. Beloe he founded and edited *The British Critic* 1793–97; was a contributor to *The Classical Journal*; was vice-president of the Royal Society 1823; published several volumes of sermons and theology, and was author of *Elements of Orthoëpy* (2d ed. London, 1794), and a valuable *Glossary, or a Collection of Words, Phrases, Names, and Allusions, etc., which have been thought to require illustration in the Works of English Authors* (1822; new ed. by J. O. Halliwell and Thomas Wright, 2 vols., 1859; new ed. 1888). D. in London, Mar. 23, 1829.

Nariño, nāă-reen'yō, ANTONIO: patriot; b. at Bogotá, New Granada, 1765. He had only the limited education afforded by a college in his native city, but he acquired some fame as an author and orator, and held responsible positions under the viceroys. About 1793 he translated and secretly printed a French work advocating republican principles. Subsequently, fearing the authorities, he burned all the copies, but one of them had been seen by a royalist officer, and Nariño, after a tedious trial, was condemned to ten years' penal servitude, and sent a prisoner to Spain (1795). He escaped, and in 1797 returned to New Granada, but was again arrested, and was only released by the revolution of 1810. He at once joined the patriots, and was made president (1811), and subsequently dictator of Cundinamarca, which embraced the city of Bogotá. Nariño was the leader of the centralist republicans, and Cundinamarca refused to join the New Granadan confederation; civil war broke out, and Nariño defeated the federalists, who attacked Bogotá, Jan. 9, 1813. Soon after he resigned his dictatorship and marched to the south against the royalist forces; at first successful, he was defeated at Pasto in May, 1814, captured and sent to Spain, where he remained a prisoner until 1820. Returning, he was senator and vice-president of Colombia in 1822. D. at Villa de Leiva, Dec. 13, 1823.

HERBERT H. SMITH.

Naro, naa'rō: town; in the province of Girgenti, Sicily; about 15 miles from the town of Girgenti (see map of Italy, ref. 10–F). It is well built, and contains some fine churches and an old feudal castle with four towers. In the neighborhood are remains of ancient aqueducts, grottoes, and sepulchers. There are also productive sulphur mines in the vicinity. Naro is said to have been built by the Saracens on the ruins of the ancient *Motyum*. Tasso in his *Gerusalemme Liberata* calls it *Naja*. Pop. about 10,400.

Narragansets: See ALGONQUIAN INDIANS.

Narragansett Bay: an inlet of the Atlantic, extending 28 miles into the State of Rhode Island. It is deep and well sheltered from the sea, receives the estuaries of the Providence and Taunton rivers, and contains the islands of Aquidneck (or Rhode Island proper), Conanicut, Prudence, and other smaller ones. It has valuable fisheries.

Nar'ses: soldier and administrator; b. in the latter part of the fifth century; was a eunuch and a slave in the palace of the Byzantine emperors. His talents attracted the attention of Justinian, who made him keeper of the privy purse and a member of the council. In 538 he went to Italy as commander of a force sent either to re-enforce or to watch Belisarius, but he was recalled in 539. Nevertheless, after the death of Belisarius, he was made commander-in-chief in Italy in 552, and his success as a general was most brilliant. Near Tadini he defeated the Gothic king Totila, who was killed in the battle. He then conquered Rome; defeated Teias. Totila's successor, on the banks of the Sarna, and completely crushed the power of the Goths in Italy. Justinian made him governor of Italy, with the title of exarch. He fixed his residence at Ravenna, and governed the country with much severity, but also with much wisdom. After the death of Justinian and the accession of Justin II., he was ignominiously deprived of his office in 565, and died in retirement at Rome about 573. It is said that the invasion of the Lombards, which took place shortly before his death, was an intrigue by him to get revenge on the court of Constantinople.

Narthex: See GUM RESINS.

Narthex [Gr. *νάρθηξ*, name of a hollow-stemmed plant, the giant fennel; a casket, case. From this latter signification came in eccles. Gr. the application to a part of a church]: a vestibule or inclosed porch extending across the whole front of a church. In the early Christian and Byzantine churches it was commonly vaulted, and entered from the *atrium* or forecourt by a number of doors corresponding with those leading into the church proper. The unbaptized and heretics were not allowed to pass beyond the narthex into the church. Like most of the arrangements of the Christian basilica the narthex appears to have been imitated from the Roman secular basilicas, as may be seen in the ruins of the basilica of Maxentius at Rome. The most magnificent examples of the narthex are those of Santa Sofia at Constantinople, now a mosque, but formerly a Christian church, built in 538 A. D., and St. Peter's at Rome, built by Maderna in 1625. The term is also applied to porches less wide than the whole front, and also to those still larger than the front would allow, as in the case of St. Mark's church at Venice, where the narthex is carried along the north flank as far as the transept. This use of the term is limited to the Byzantine or Romanesque styles.

A. D. F. HAMLIN.

Narvaez, nāăr-vaa'eth, PÁNFILO, de: soldier; b. at Valladolid, Spain, about 1478. He went to Santo Domingo, probably in 1502, and from 1512 was the principal lieutenant of Velasquez in the conquest of Cuba, where he settled. Cortés, who had been sent by Velasquez to conquer Mexico, threw off his authority there, and Narvaez was sent to supersede and imprison him as a rebel. He sailed with a powerful armament, and in Apr., 1520, landed at Vera Cruz with 900 men; but on May 28 he was defeated and captured by Cortés at Cempoala, losing an eye in the engagement; his soldiers were incorporated in the army of Cortés and took part in the siege of Mexico. Narvaez was well treated, and was soon released. He went to Spain, and in 1526 obtained a grant to conquer Florida, of which he was made governor. In Mar., 1528, he sailed from Cuba with five vessels and 400 men; landed probably at Apalache Bay, and marched inland; but after losing half his men in

encounters with the Indians was obliged to return. Unable to find his ships he built boats, in which he made his way westward along the coast, nearly to the mouth of the Mississippi; there he and nearly all his men perished in a storm. The four survivors reached Mexico after years of wandering. HERBERT H. SMITH.

Narvaez, RAMON MARIA, Duke of Valencia: statesman; b. at Loja, Spain, Aug. 4, 1800; entered the army in youth, and in the first Carlist war attained the position of captain-general of Old Castile. He took part in an attempted revolution against Espartero in 1839, and had to take refuge in France, where he plotted with the ex-queen, Maria Christina. In her interest he placed himself at the head of an expedition with which he penetrated to Madrid in 1843 and overthrew the government of Espartero. In the following year he became Prime Minister; was created field-marshal, Count of Cañadas Altas, and Duke of Valencia, and effected the formation of a new constitution (1845), suppressing all his opponents with rigor. In 1846 he quarreled with the ex-queen, resigned his post, and went as ambassador to France; resumed power in 1847, but soon lost it again for the same reason as before. In 1849 he was again at the head of the government during the diplomatic quarrel with Great Britain which culminated in the withdrawal of the British ambassador, Sir Henry Bulwer. In 1851 he went as ambassador to Vienna; became again Prime Minister in 1856; repressed several revolutionary outbreaks, and took stringent measures against the press; was overthrown Nov., 1857; was again Prime Minister from Sept., 1864, to June, 1865, and from July, 1866, until his death, at Madrid, Apr. 23, 1868.

Narwhal [from Swed. and Dan. *narhval*; the latter element is akin to Eng. *whale*], or **Sea-unicorn**: a cetacean (*Monodon monoceros*) belonging to the family of the *Delphinidæ*, or dolphins. It is most nearly related to the white whale (*Delphinapterus catodon*), and forms with it the subfamily *Delphinapterinæ*. Belonging to an order in which many of the members never develop teeth at all, it is supplied with a tooth altogether out of proportion to its size; and this tusk is moreover developed in utter contravention of the rules of bilateral symmetry, which in every other known case among vertebrates govern the production of the teeth. In both sexes the lower jaw is edentulous; in the male the upper jaw is provided, on the left side, with a tusk from 6 to 8 feet long, straight, spirally grooved externally, and hollowed within into a persistent pulp-cavity. On the right side the corresponding tooth generally remains hidden, smooth, and solid, within the jaw, but sometimes is produced symmetrically with the other. These teeth are generally described as incisors, but erroneously, as the alveoli are situated at the junction of the intermaxillary and maxillary bones, and, according to Mivart, are even "embedded entirely in the maxilla." In addition to these, there are two small rudimentary molars concealed in the upper jaw. The female, although as a rule without apparent teeth, has the incipient tusks concealed in the jaw; one of these is, however, said to be sometimes developed as in the male. The narwhal in form of body resembles the porpoises; its mouth is small, and its single spiracle or blowhole is situated on the top of the head. Its flippers or "fins" are small, and it has no dorsal fin. It attains to a length of from 10 to 15 feet, exclusive of the tusk, and in color is whitish, marbled with brown. The single species inhabits the Arctic seas, where it lives largely on cuttlefishes, and in its turn serves an important purpose in the domestic economy of the Eskimos, yielding them a large supply of oil, etc., and an ivory of considerable commercial value. It has become somewhat rare. Revised by F. A. LUCAS.

Nasalization: the adding of nasal resonance to a sound or sounds. Thus in French the adding of nasal resonance to the vowel *e* of *perte*, *mer* yields the nasalized vowel of *fin*, *plaindre*, *bien*; to the *ö* of *peur*, *peuple* yields the vowel of *un*, *parfum*; to the *o* of *mort*, *porte* yields the vowel of *rond*, *nom*; to the *a of lâche* yields the vowel of *an*, *dent*, *temps*. The physiological process of nasalization consists in dropping the soft palate toward the base of the tongue and opening the passage into the nasal cavity. This has the effect in the sounding of a vowel of adding a second resonance chamber, which conditions not only the color of the sound, but the natural or inherent pitch of the vowel. This pitch is lower than in the corresponding pure vowels. The "nasal twang," widely characteristic of American English, consists in a partial nasalizing of the entire current of speech-breath. The nasal valve is left partly open, so that the nasal cavity participates to some extent in yielding the characteristic resonance of all the voiced sounds. An excellent test of the extent of nasalization may be made by holding a lighted candle before the nostrils and shielding the flame from the breath emitted at the mouth. The flickering of the flame will then indicate the presence of nasalized breath. See PHONETICS. BENJ. IDE WHEELER.

Nasals: a class of speech-sounds characterized by the opening of the nasal passages. The term in its narrower use applies to the common sounds of *n*, *m*, *ng*, the dental, labial, and palatal nasals respectively. These are formed by making with the tongue or lips the closures for *d*, *b*, or *g* respectively, and deflecting the voiced breath through the nasal passages. The sounds are used both as consonants (non-syllabic) and as vowels (syllabic). They appear as nasal vowels, e. g. in *written* (pronounced *ri'tn̩*), *sicken* (pronounced *si'kn̩*). The nasal vowels differ from the nasalized vowels in that the latter leave the oral cavity open. See NASALIZATION. BENJ. IDE WHEELER.

Nascent State [*nascent* is from Lat. *nas'cens*, *nascen'tis*, pres. partic. of *nas'ci*, be born]: in chemistry, a state in which, at the instant of evolution from previous combination, some substances manifest tendencies to combine directly with, and even to decompose, bodies upon which in ordinary circumstances they are inactive. The most familiar and the most remarkable examples of this class of phenomena are exhibited by the element HYDROGEN (*q. v.*). When evolving from combination in a diluted acid by means of a soluble metal, it is endowed with affinities so intensified that it will not only combine with other elements that may be present, such as sulphur, phosphorus, arsenic, carbon, etc., but will in many cases decompose oxides or other compounds of these elements, combining with and carrying off the latter in gaseous or volatile forms. Thus when common iron, which contains carbon, is dissolved in a diluted acid, hydrocarbon gases and vapors of an interesting kind are found mixed with the hydrogen gas, giving it a peculiar disagreeable odor, *pure* hydrogen being odorless. According to the prevailing views, the explanation of the phenomena of the nascent state is not difficult. There is good evidence in favor of the idea that hydrogen gas, or free hydrogen, consists of molecules which, in turn, consist of atoms. Free hydrogen is a compound of atoms of hydrogen. In order that this may act upon other things, it is necessary that the atoms be separated from each other, or the molecules of hydrogen must be decomposed. Therefore, free hydrogen does not act readily. When, however, the element is set free, it is in the condition of atoms which are free to act upon whatever they may come in contact with. If they find nothing else with which they can combine, they combine with each other in pairs, thus forming the comparatively inert free hydrogen.

Revised by IRA REMSEN.

Naseby, nāz'bi: village; in the county of Northampton, England; famous for the battle in which Fairfax utterly defeated Charles I. On the morning of June 14, 1645, the two armies stood arrayed opposite each other—the royal commanded by the king himself, with Prince Rupert on his right wing and Sir Marmaduke Langdale on his left, and the Parliamentary commanded by Fairfax, with Cromwell on his right wing and Ireton on his left. The Parliamentary forces numbered nearly 14,000 men, while Charles had barely 7,500. The attack was made by the royal forces, and Prince Rupert succeeded in overwhelming Ireton and put his corps to flight. On the other side Cromwell routed Langdale, but, while Prince Rupert left the general battle in order to pursue Ireton, Cromwell wheeled round and attacked the royal center in the rear. Of the Parliamentary army there were only about 1,000 killed, while of the royal army there were about 800 killed and about 4,500 were made prisoners.

Nash, JOHN: architect; b. in London, England, in 1752; obtained in 1797 a patent for improvements in the construction of the arches and piers of bridges; was much employed in designing mansions for the nobility and gentry. In 1815 he was taken into the Government service, and for many years thereafter was engaged in laying out streets and building public edifices in London. Part of Regent Street, the terraces of Regent's Park, Haymarket theater, and Buckingham Palace show the character of his work. D. at East Cowes Castle, May 13, 1835.

Nash, RICHARD, known as BEAU NASH: leader of fashion; b. at Swansea, Wales, Oct. 18, 1674; studied at Oxford, but

was expelled about 1690; held for some time a commission in the army, and began the study of law at the Temple; became famous as a diner-out, a gamester, and leader of fashionable dissipation, and in 1704 undertook the management of the balls at Bath, then the most celebrated watering-place in England. For fifty years he was master of ceremonies, acquiring a wide notoriety for his strictness in enforcing decorum in the midst of gayety and dissipation, and was popularly called "the king of Bath." He made his living chiefly by gaming, and was noted for generosity. In his old age he fell into neglect and often suffered from privation. D. at Bath, Feb. 3, 1761. His *Life* was written by Goldsmith (published anonymously, 1762).

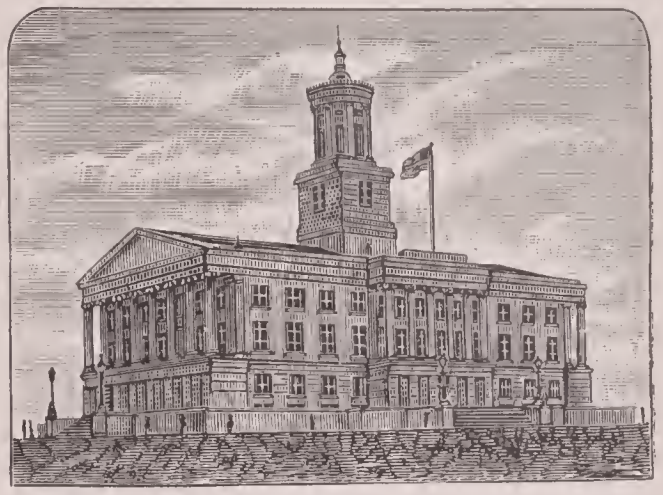
Nash, Stephen Payne: See the Appendix.

Nash, Thomas: author; b. at Lowestoft, Suffolk, England, in 1567; graduated at Cambridge in 1584; settled in London in 1589; attacked the Nonconformists in several pamphlets written in grotesque style; wrote a number of unimportant dramas. He lived in extreme poverty. Among the most interesting of his lampoons and miscellaneous pamphlets are *Pierce Penniless, his Supplication to the Devil* (1592); *The Terrors of the Night* (1594); and *Have with you to Saffron Walden* (1596). D. in London probably in 1601. See his *Complete Works*, edited by Grosart (6 vols., London, 1883–84). Revised by H. A. Beers.

Nashua: city (incorporated as a city in 1853); one of the capitals of Hillsboro co., N. H. (for location of county, see map of New Hampshire, ref. 10–E); on the Nashua river, near its junction with the Merrimack, and on the Concord and Montreal and the Boston and Maine railways; 35 miles S. of Concord, 40 miles N. W. of Boston. Since 1826 it has been noted for its manufactures, for the promotion of which a superior water-power was obtained from the rivers by means of a connecting canal 3 miles long, 60 feet wide, and 8 feet deep, with a head and fall of 36 feet. The principal manufactures are cotton goods, sheetings, embroidery, iron and steel, foundry products, furniture, edge tools, paper, and locks. The city has a public library (founded 1867) with over 10,000 volumes, 3 national banks with combined capital of $370,000, 2 savings-banks with combined deposits of nearly $3,500,000, a banking company with deposits of over $1,075,000, and 2 daily and 2 weekly newspapers. The assessed valuation in 1893 was $12,502,142, and the net debt on Jan. 1, 1894, was $563,160. Pop. (1880) 13,397; (1890) 19,311; (1900) 23,898. Editor of "Telegraph."

Nashville: city; capital of Washington co., Ill. (for location of county, see map of Illinois, ref. 9–D); on the Centralia and Chester and the Louis. and Nash. railways; 50 miles E. by S. of St. Louis, 120 miles S. of Springfield. It is in an agricultural and coal-mining region, and has 8 churches, high school, public school, 3 flour-mills, 2 coal mines, a State bank with capital of $25,000, and a daily and 4 weekly newspapers. Pop. (1880) 2,222; (1890) 2,084; (1900) 2,184. Editor of "Democrat."

Nashville: city; capital of the State of Tennessee and of Davidson County (for location, see map of Tennessee, ref. 6–E); on the Cumberland river, 200 miles from its mouth, and on the Louisville and Nashville and the Nash., Chat. and St. L. railways; 233 miles E. N. E. of Memphis. The city rests on a rocky foundation, the river bluffs rising to a height of 80 feet above low water. It is noted for its educational institutions, commerce, and manufactures. A new charter granted in 1883 vested its government in a mayor, a salaried board of public works, and a common council. The city contains Vanderbilt University, Peabody Normal School, Montgomery Bell Academy, University of Nashville, University of Tennessee, St. Cecilia Academy, Boscobel Female College, Ward's Seminary for Young Ladies, Belmont College for Young Ladies, Tennessee Industrial School, and 4 business colleges; also 5 schools and colleges for colored people: Central Tennessee College, Fisk University (founded in 1866), Roger Williams University, Meharry Medical College, Walden University. In the school year 1900 there were 29,211 children of school age, of whom 12,142 were enrolled in the public schools and 1,350 in private and parochial schools. There were 18 public-school buildings, 164 regular teachers, and public-school property valued at $350,000. The libraries in the educational institutions contained over 35,000 volumes, and 4 other libraries, including the State Library, had together over 40,000 volumes. The city also contains the State School for the Blind (established 1844), and the headquarters of the Tennessee Historical Society, the Tennessee Confederate Memorial and Historical Association, and of the Engineering Association of the South. There are about 150 churches. The Chamber of Commerce reported commercial receipts in the year ending Aug. 31, 1900, valued at $20,000,000. These included 6,079,000 bush. of wheat, 2,612,500 bush. of corn, 6,729,069 lb. of bacon, 38,310 bales of cotton, 2,357,000 lb. of bulk meats, 118,792 cases of boots and shoes, and 2,732,350



State Capitol, Nashville, Tenn.

bush. of oats. The census returns of 1900 showed that 494 manufacturing establishments (representing 85 industries) reported. These had a combined capital of $9,166,626, employed 7,434 persons, paid $3,318,961 for wages and $7,727,010 for materials, and had products valued at $13,673,730. The principal industry according to amount of capital employed was the manufacture of lumber products, which had 22 establishments and $1,587,626 capital, employed 1,524 persons, and had products valued at $2,217,420. In 1900 there were 3 national banks and 7 State banks with aggregate capital of $3,000,000; 2 daily, 24 weekly, 21 monthly, 5 semi-monthly, 2 bi-monthly, 1 German, 2 Spanish, and 5 other periodicals; and a debt (including a water debt of $1,497,000) of $3,339,600. The assessed valuations in 1900 aggregated $37,268,215. Pop. (1880) 43,350; (1890) 76,168; (1900) 80,865. Secretary of Chamber of Commerce.

Nashville, Battle of: a battle of the civil war in the U. S.; fought Dec. 15 and 16, 1864, between the Union forces under Gen. G. H. Thomas and the Confederates under Gen. J. B. Hood. After the battle of Franklin (see Franklin, Battle of) Gen. Thomas concentrated his forces at Nashville, Tenn., which was well fortified with field works extending along the crests of the low hills, surrounding the city on the S., with both flanks resting on the Cumberland river. Gen. Hood took up a position in his front Dec. 2–4. Thomas's army, although equal to or greater than Hood's in numbers, needed a few days for organization, and was without horses for the cavalry. He delayed making an attack upon Hood until he felt himself fully prepared to secure the best results. His army was ready to attack on Dec. 8, but was prevented by a sleet-storm which covered the country with ice and made a movement impossible up to the 15th. The impatience of the Secretary of War and of Gen. Grant at this delay was so great that on the 9th Grant issued an order directing Thomas to turn over his command to Schofield; but this order was revoked before it reached him. On the 13th Gen. Logan was sent to supersede Thomas, but stopped at Louisville upon learning the result of the battle which had taken place.

On the morning of Dec. 15 Thomas moved out. Making a demonstration on his left, he extended his right, turned Hood's left, carried his lines from left to right, and drove him back to a new position about 2 miles to his rear. On the 16th Thomas again attacked. He was held in check by Hood's right on Overton's Hill, but by turning his left he swept him from his new line and drove him from the field routed and in disorder. The well-equipped cavalry prepared for this contingency now led the pursuit, closely followed by the infantry. The pursuit was pushed vigorously to the Tennessee river, which the Confederates crossed at Decatur on Dec. 27; from here they fell back to Tupelo, Miss., where what remained of the army was broken up and the parts sent to different fields. The total Union loss was 3,057, of whom less than 400 were killed. The Confederate loss in killed and wounded was never accurately deter-

mined, but probably did not differ materially from that of the Union army. There were captured on the field about 4,500 prisoners, including four generals, besides 54 guns and numerous small arms. During the retreat a large number of prisoners were captured and deserters received. During the campaign of November and December over 15,000 prisoners and deserters, 72 cannon, and 3,000 small-arms were taken. See Cox, *Battles of Franklin and Nashville*, Scribner's War Series, and *Battles and Leaders of the Civil War*.

JAMES MERCUR.

Nashville, University of: an institution founded in 1785, fifteen years before the State of Tennessee was admitted into the Union, and chartered by the Legislature of North Carolina as Davidson Academy. The Legislature gave it 240 acres of land, now included in the city of Nashville. In 1806 the academy became Cumberland College, which in 1826 was organized as the University of Nashville. In 1850 the university was closed on account of the scourge of cholera; in 1855 the literary department was reorganized as a military school with Col. Bushrod R. Johnson as superintendent; in 1861 the teachers and students went to the war; after the close of the war the institution again became a military school under the direction of Gen. E. Kirby Smith; in 1875 the Peabody board and the trustees of the University of Nashville united in forming a college for the training of Southern teachers. Eben S. Stearns, LL. D., was elected president and chancellor; at his death in 1887 he was succeeded by William H. Payne, LL. D. The buildings are situated on an elevated campus of 16 acres, a mile from the public square. The Peabody board has established 184 scholarships, each worth $100 a year, and each student's railway fare is paid from his home to Nashville and back. The medical department was organized in 1850; the number of students annually in attendance varies from 300 to 400. The total number of students in the general departments exceeds 1,200. W. H. PAYNE.

Na'smyth, JAMES: mechanical engineer and astronomer; b. in Edinburgh, Aug. 19, 1808; the son of an artist; was educated at the School of Arts and the Edinburgh University; removed to London, and in 1834 to Manchester, where he became a successful machine constructor and inventor. The steam-hammer, steam pile-driver, and improved forms of ordnance are among his inventions. He also acquired fame as a practical astronomer, giving special attention to selenography, in which he employed telescopes and other instruments of his own construction. He published *Remarks on Tools and Machinery*, in Baker's *Elements of Mechanism* (1858), and *The Moon considered as a Planet, a World, and a Satellite* (1874). D. in London, May 7, 1890. See *Life*, by Smiles (1883). Revised by R. H. THURSTON.

Nâsr-ed-dîn, officially called CHAH EN CHAR (King of Kings): Shah of Persia; b. July, 1831; eldest son of the monarch Mehemet (or Muhammad) Shah, by Queen Velliat of the Kadiar tribe, and grandson of Abbas Mirza; succeeded to the throne Sept. 10, 1848; suppressed several revolts of the nomadic tribes; maintained neutrality during the Crimean war, at the close of which he signed a treaty with Russia; waged a nominal war against Great Britain in 1856, which was terminated by the Treaty of Paris 1857; gave his support to the passage of the Anglo-Indian telegraph through his dominions 1866; visited the principal countries of Europe 1873, and wrote an amusing diary, which was translated by J. W. Redhouse. The shah's desire to introduce reforms and material improvements into his kingdom actuated this visit, and was exemplified by the fact that he had learned French and Turkish in order to familiarize himself with the history and condition of European countries. He also visited Russia in 1878. Assassinated at Teheran, May 1, 1896.

Nas'sau: a part of the province of Hesse-Nassau, Prussia. Before 1866 it was an independent duchy of Germany, with an area of 1,800 sq. miles, and a population of (1864) 468,311 inhabitants. The country, extending along the Rhine, the Main, and the Lahn, and traversed S. by the Taunus and N. by the Westerwald, is beautiful and rich. The mountains are covered with extensive forests abounding in game, and contain iron, lead, copper, coal, marble, and building-stone. The valleys produce wheat, tobacco, flax, and fruit of superior quality, and grapes from which are made the choicest Rhenish wines, such as Johannisberger, Hochheimer, Rüdesheimer, and Marcobrunner. The mineral springs of Nassau are famous; the watering-places which are built around them, such as Wiesbaden, Ems, and Selters, are visited by people from all parts. In the thirteenth century the ruling family split into two branches, called after the brothers Walram and Otho. The younger branch, the Othonic, became the reigning family in the Netherlands, while the Walram line obtained the title of Dukes of Nassau by the formation of the Rhenish confederacy in 1806, and their troops fought under Napoleon against Prussia and Austria in Spain and Russia. The duke, however, was shrewd enough to abandon Napoleon at the right moment, and in reward he received a considerable augmentation of his territory by the Congress of Vienna. In 1815 he granted a constitution; but when, in 1818, the constitution came into operation and the house of representatives demanded an account of revenue and expenditure, the duke employed force to silence the representatives. When the revolution of 1848 came, the duke was obliged to grant a more liberal constitution, but soon adopted a reactionary policy. In 1866, when the war between Prussia and Austria broke out, he openly supported the latter; hence was forced to flee before the Prussians, who overran the duchy, and on Oct. 3 Nassau was incorporated with Prussia.

Nassau: town of the island of New Providence, and capital of the BAHAMA ISLANDS (*q. v.*). It has a good harbor, is fortified and well built, and is celebrated for its salubrious climate. Pop. about 11,000.

Nassau, ADOLPHUS WILLIAM CHARLES AUGUSTUS FREDERICK, Duke of: b. July 24, 1817; assumed the sovereignty of Nassau, Aug. 20, 1839. His state was joined to Prussia in 1866, and he received over 15,000,000 gulden as indemnification. On the death of the King of the Netherlands, Nov. 23, 1890, he became Grand Duke of LUXEMBURG (*q. v.*).

Nassau, JOAN MAURITZ, van, Count of Nassau-Siegen (commonly called Mauritz or Maurice of Nassau): general and administrator; b. near Delft, Holland, June 17, 1604. He early fought against the Spaniards and particularly distinguished himself at the siege of Breda, 1625. From Jan., 1637, to May, 1644, he was governor-general of the Dutch possessions in Brazil, and this period was the most prosperous in the history of the colony. Nassau was repulsed in an attack on Bahia 1638; but he gained a brilliant victory over the Spanish and Portuguese fleet Jan., 1640, and was able to send expeditions against the Portuguese in Africa and the Spanish on the Rio de la Plata. After his return he was lieutenant-general of cavalry, and from 1647 governor of Cleves; in 1652 he was made a prince of the German empire. As commander of the Netherlands army in 1665 he repulsed the invading army of the Bishop of Münster. He defended the frontier in 1672, and was prominent in the campaign of 1674 in the Spanish Netherlands. D. at Cleves, Dec. 20, 1679. HERBERT H. SMITH.

Nast, THOMAS: illustrator; b. at Landau, Bavarian Palatinate, Sept. 27, 1840; went with his father to the U. S. in 1846; received art instruction under Theodor Kaufmann; began when fifteen years old to furnish illustrations for papers; was in Europe 1860–61, and during the civil war began a long series of powerful and effective political caricatures, many of which appeared in *Harper's Weekly*. He has edited *Nast's Illustrated Almanac* and *Nast's Weekly*, and has given many public lectures, illustrated with pictures drawn in the presence of the audience. In 1894 he went to London to undertake an important task in connection with *The Pall Mall Magazine*. Revised by RUSSELL STURGIS.

Nastur'tium [= Lat.; *na'sus*, nose + *torque're*, *tor'tum*, twist. Named from the wry face caused by its pungent taste]: name of a genus of cruciferous herbs, mostly aquatic, containing many species, among which are water-cress and horseradish. (See CRESSES.) Popularly, the name nasturtium is given to *Tropæolum majus*, a fine, showy, climbing herb, a native of Peru, often seen in gardens. Its flowers are used in salads, and its pungent buds and fruit are pickled and incorrectly called capers.

Natal': a British colony on the southeast coast of Africa, extending along the Indian Ocean from lat. 28° to 31° S. Area about 20,460 sq. miles. Pop. (1891) 46,788 Europeans, 41,142 Indian coolies, and 455,983 Kaffirs, a total of 543,913. Natal is a temperate, healthful, and undulating but not mountainous region, more productive than the neighboring Cape Colony, on account of the greater rainfall. It is attractive to European colonists, who have doubled in number since 1879, while the foreign trade has doubled in the same time. The chief products are sugar, wool, hides, cotton, and ostrich-feathers. The large coal-fields now developing are becoming

of great advantage to the colony. Railway lines owned by the Government connect the port of Durban with Pietermaritzburg, the capital, and the frontier of the South African Republic. The capital is a handsome town, noted for the beauty of its churches, residences, and gardens.

C. C. Adams.

Natal, often called **Rio Grande do Norte**: capital and principal town of the state of Rio Grande do Norte, Brazil; on the Potengi or Rio Grande, 2 miles above its mouth. The river is navigable to this point and for some miles farther, but the bar does not admit vessels of over 13 feet draught. The town is on low land and has a picturesque appearance, owing to the cocoanut-groves around it; but the climate is hot, and yellow fever is a frequent visitant. Natal was founded in 1559, and was held by the Dutch from 1635 to 1654. Pop. about 9,000. H. H. S.

Natalie, Queen of Servia: See Milan I.

Natato'res [Lat., plur. of *nata'tor*, swimmer, deriv. of *nata're*, swim]: the name for an artificial combination of birds, agreeing only—and but partially even in this respect—in being adapted for swimming. It was formerly regarded as an order or sub-class, but is now discarded.

Natchesan Indians: a name applied to two tribes of North American Indians, called Natchez and Taensa. I. *Natchez.*—Of this tribe Commander P. Lemoyne d'Iberville, in 1699, mentions nine villages which were contiguous and constituted one town only. Probably there were more of them, and apparently only a part spoke the Natchez language. They were situated on or around St. Catharine creek, near Natchez City, Miss. This Natchesan confederacy was controlled by a head chief who belonged to the ruling family of the *suns*, and wielded a more centralized power than the chiefs of other Mississippian tribes. His confederacy formed a part of the larger league of the Chicasa and Yazoo river villages. The Natchez people had three serious conflicts with the colonial French troops, the last of which (in 1730) brought on their dispersion and decimation. At that time the population of the confederacy probably reached 1,200. Scattered remnants of the tribe still linger among the Creeks and Cherokees.

II. *Taensa.*—The Taensa people, who lived on the west side of the Mississippi river, above the Natchez, are now, on the strength of two passages in de Montigny's and Gravier's letters (about 1700), classed with the Natchesan family. These people were in 1714 settled on Mobile Bay, and about the year 1764 removed W. of the Mississippi river. Both the Taensas and the Natchez had a house of worship where the perpetual fire was kept.

See Margry, *Découvertes* (Paris, 1880), iv., 179, and *passim.*

A. S. Gatschet.

Natchez: city (settled by the French 1716, settlers massacred by Indians 1729, occupied by the English 1763–79 and by the Spanish 1779–98, made capital of the Territory of Mississippi 1798, became a city 1803); capital of Adams co., Miss. (for location, see map of Mississippi, ref. 8–E); on the Mississippi river, and the New Orleans and N. W. and the Yazoo and Miss. Val. railways; 100 miles S. W. of Jackson, 280 miles N. W. of New Orleans. The business part of the city is a narrow stretch of river bank, and the larger part, occupied by public buildings and residences, is the summit of a bluff 150 feet above the river. The entire brow of the bluff in the city limits has been converted into a public park. Its location on the river gives the city a large commercial importance. It handles 50,000 bales of cotton annually, and has steam saw, planing, grist, and cotton mills, cottonseed-oil factory, steam-ginneries, ice-factory, and other manufactories. There are a national bank with capital of $100,000, a State bank with capital of $50,000, and incorporated and private banks, and a monthly, 2 daily, and 3 weekly periodicals. The assessed valuation in 1893 was $4,197,062, and the net debt on Feb. 1, 1894, was $347,463. Pop. (1880) 7,058; (1890) 10,101; (1900) 12,210.

Editor of "Democrat."

Natchitoches: See Caddoan Indians.

Natchitoches: town (founded by the Spaniards in 1713); capital of Natchitoches parish, La. (for location of parish, see map of Louisiana, ref. 8–B); on the Cane river, and the Natchitoches Railroad; 95 miles S. of Shreveport, 450 miles N. of New Orleans. It is in the Red river valley, in a fertile region yielding large crops of cotton, corn, sugar-cane, and all kinds of vegetables. The surrounding country contains large tracts of Bermuda grass, on which cattle-raising is carried on extensively. The town is the seat of the State Normal School; has seven churches, a cathedral, Convent of the Divine Providence, U. S. land-office, free iron drawbridge across the river, a State bank with capital of $10,000, and two weekly newspapers; and contains an oil-mill, ice-factory, and other manufactories. Pop. (1880) 2,785; (1890) 1,820; (1900) 2,388. Editor of "Enterprise."

Natic'idæ [Mod. Lat., named from *Na'tica*, the typical genus, from Mediæv. Lat. *na'tica*, buttock, deriv. of Lat. *na'tes*, buttocks]: a family of Gasteropod molluscs with globular shells containing numerous species, occurring in the shallow seas and on the shores of the ocean in all parts of the world. The naticas, or sea-snails, have a very large fleshy foot; the shell has the aperture rounded in front and pointed behind. These animals are very voracious, feeding upon other molluscs, which they kill by rasping holes in the shell with their lingual ribbon. (See Gasteropoda.) The members of one species lay their eggs in those curved bands known to people on the shore as sand-saucers. J. S. K.

Natick: town (settled by John Eliot 1651, church of Christian Indians established 1660, town incorporated 1781); Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); on the Charles river, and the Boston and Albany Railroad; 17 miles S. W. of Boston. The town contains several villages and business centers, water, gas, and electric light plants, Morse Institute with library of over 16,000 volumes, national bank with capital of $100,000, savings-bank with deposits of nearly $1,200,000, a monument to the memory of John Eliot, and three weekly newspapers. The principal manufactures are boots and shoes, woodenware, clothing, rubber goods, chairs, and baseballs. A portion of Cochituate Lake, from which Boston derives a part of its water-supply, is within the town limits on the N. Pop. (1880) 8,479; (1890) 9,118; (1900) 9,488. Editor of "Bulletin."

National or Constituent Assembly, The: a convention of delegates of the French people, constituted as a national assembly June 17, 1789. See France, History of.

National Banks: See Bank.

National Convention, The: an assembly of deputies of the French people. See France, History of.

National Debt: See Debt, Public.

National Educational Association: See the Appendix.

National Guard [trans. of Fr. *garde nationale*]: a kind of militia in France, mostly recruited from the bourgeois class, and representing the burgher interests. In some of the French towns the national guards had long been known, but they were first organized in Paris in 1789 by the revolutionary Committee of Safety. There were 48,000 in Paris, and in 1790 a paper organization of 4,000,000 in France, and the whole were under La Fayette and carried the tricolor flag. Frequent changes in organization were made. In 1795 they were defeated and broken up by Napoleon, were reorganized by him in 1814, dissolved by Charles X. in 1827, were again reorganized in 1830, and again in 1831. They fell away from Louis Philippe in 1848, were remodeled in 1851, dissolved and reorganized in 1855, served against the Germans in the war of 1870–71, and in the latter year a part of them took a share in the Communist struggle, after which they ceased to exist. In some other European countries and in some of the U. S. there are militia organizations called national guards. See Militia.

National Humane Alliance: See the Appendix.

Nationalism: a theory of social reconstruction through the nationalization of the entire system of production and distribution. It demands the extension of the functions of government to include the control of all economic operations, and all personal services now rendered for profit or hire. In the U. S. in 1888 it was taken as the basis for a party organization by readers of *Looking Backward*, a work portraying an ideal state framed in accordance with the above theory. Approving of the economic system there pictured, and believing it attainable, they organized so-called nationalist clubs, and began the work of propagandism. It is proposed that the economic government of nations, now conducted by irresponsible private persons for their personal ends, shall be assimilated in the method and purpose of its administration to the so-called political government, and that just as under the latter all citizens not willfully evading their duties to the state have equal claims to the benefits and services afforded by the government, without regard to the extent to which they have contributed, whether by tax or

personal service to its support, so they should share equally in the benefits resulting from collective action in economic matters, notwithstanding unavoidable inequality in their contributions of service.

In order to protect the people in their equality the democratic polity gives to all citizens, whatever their inequalities in intelligence, character, or possessions, an equal voice in law-making. Nationalists propose the strict application of these fundamental principles of democracy to the organization of the economic system of nations. According to their plan all economic operations shall be carried on by the people under a uniform law of service, but, while this law will be equal for all, it is expected that the nature of the services rendered will vary as widely as do the amounts of tax and military service under the present system. Efforts will be made to prevent and punish willful evasion of duty, but no account will be made of the difference in the value of the services rendered in distributing the resulting total product among the citizens. It appears obvious to the adherents of nationalism that it is merely the strictly logical evolution of democracy, and that, unless a reversion to personal or clan government shall check the progress of democracy, nationalism must inevitably in the near future furnish the solution of the industrial and social problem. It should be understood that while the nationalist movement originated with admirers of the economic system depicted in *Looking Backward*, it by no means follows that the various details and devices introduced in that book in depicting the systems in operation form any necessary part of the plan of nationalism, which is, on the contrary, confined to general principles, leaving details to be filled out as occasion arises. Nationalists agree in deprecating the use of violent methods to bring about the desired reorganization, but favor a gradual and peaceable evolution, advocating as first steps toward nationalism all measures looking toward the assumption by municipality, States, and the nation of the ownership and operation of all forms of business, discharging quasi-public functions, such as lighting and water-works, milk-supply, tramway system, telegraphs, railways, etc., and wherever any sort of business has become an oppressive trust monopoly they would have the State or the nation take such business into its own hands. The growth in popularity of nationalistic ideas in the U. S. since the inception of the movement in 1888 has been notable. The idea of assumption by municipalities of all sorts of quasi-public functions, such as lighting, water-works, and local transit, has found great favor, and is being widely adopted. In general politics a national party under the name of the People's Party (*q. v.*) has adopted for its platform nearly the entire immediate programme of nationalism, including nationalization of the telegraphs, telephones, railways, and money system, and secured 1,000,000 votes in the presidential election of 1892 for a ticket representing these ideas. The nationalist movement, while represented by organization and publications in all parts of the Union, has at present the most general popular backing in the States between the Mississippi and the Pacific.

Edward Bellamy.

National Museum of the United States: an institution, located in Washington, D. C., which dates its existence from Aug. 10, 1846, when the act of Congress establishing the Smithsonian Institution was formally approved, and all Government collections assigned to its charge. The use of the present name, however, did not begin until much later, and was first legally sanctioned in the act providing for the erection of a building to contain the material received at the close of the Centennial Exhibition of 1876.

The germ of the museum is to be found in a collection of minerals, containing about 10,000 specimens, which formed a portion of Smithson's bequest to the U. S., and was, so far as can be ascertained, the first scientific cabinet owned by the Government. This collection was lost in the fire of 1865, which destroyed a portion of the Smithsonian Institution.

The idea of a national museum was first prominently brought forward by the National Institution for the Promotion of Science, a scientific society organized in Washington, May 15, 1840, whose objects were, among others, "to promote science and the useful arts, and to establish a national museum of natural history." This institution, which was for many years the official custodian of the Government collections, made an earnest and nearly successful attempt to secure both the management of the Smithson fund and the care of all collections belonging to the U. S., and the failure of the effort was the death-blow to the association.*

The Government collections, consisting mainly of the objects collected by the Wilkes exploring expedition, were transferred to the Smithsonian building in 1857, the regents of that institution having accepted the trust on the condition that Congress should provide the funds necessary for their preservation. Prior to that date material had been received but not displayed, and up to 1876 the exhibition of specimens for the benefit of the public may be said to have been considered as of secondary importance, as well as largely precluded by lack of funds for their proper preparation. At the close of the Centennial Exhibition of 1876 the Smithsonian Institution came into the possession of the collections prepared to illustrate the animal and mineral resources, the fisheries, and the ethnology of the native races of the U. S., and in addition a large amount of material was presented by the governments of thirty foreign nations.

As these objects could by no possibility be displayed in the Smithsonian building, the bulk of them were placed in storage, and Congress was asked for funds for the erection of a museum building. After a delay of two years Congress on Mar. 3, 1879, passed a bill appropriating $250,000 for the construction of a building 300 feet square. On Apr. 14 of the same year ground was broken for its erection, and with the beginning of 1882 the work of installation was actively begun. The structure, which is of brick, has small architectural pretensions, but is well adapted for exhibition purposes, the sixteen halls into which it is divided affording on one floor 80,000 sq. feet of space. The main portion of the building is only a single story in height, but at each corner and on either side are towers three stories high, used for laboratories and offices. Owing to the fact that there is neither basement nor attic, the only space available for the storage of duplicate specimens is in the lower part of the exhibition cases, and the rapid growth of the collections has caused this defect to be severely felt.

The formal organization of the museum staff was in 1881, when the various departments were first defined and their curators appointed. Other departments have from time to time been established, until there are thirty-three departments, and a scientific staff of forty-one, including, however, a number of honorary curators who receive no salary.

By act of Congress the regents of the Smithsonian Institution are charged with the duty of preserving and utilizing all objects of art, all objects of foreign and curious research (i. e. ethnological collections), all geological and mineralogical specimens belonging, or hereafter to belong, to the U. S. The National Museum is thus the museum of the Smithsonian Institution, and its officers are appointed by the secretary of that institution. A practical distinction lies in the fact that the money for the maintenance of the museum is annually appropriated by Congress, while the operations of the Smithsonian are carried on by the fund bequeathed by Smithson.

By virtue of the provisions above noted the museum has been greatly enriched by various Government explorations and surveys, and especially by the material gathered during the investigations of the U. S. Fish Commission. Aside from specimens thus obtained the collections are increased by exchanges, by gifts, and to a limited extent by purchase, a privilege that has been granted comparatively recently, the earlier appropriations being simply for the "preservation of collections."

The museum is naturally richest in material relating to North America, particularly so in specimens illustrating the arts and occupations of the Indians, to which the Catlin paintings form an interesting supplement. In zoölogy the series of deep-sea fishes and invertebrates is very extensive, the collections of shells is one of the finest in the world, and the mammals and birds of North America are represented by large series. The departments of metallurgy and geology contain material exhibiting the mineral resources of the U. S., and many illustrations of the phenomena of physical geology. The fisheries of the U. S., and to a considerable extent those of other countries, are well shown by means of apparatus, models of vessels, and illustrations of modes of capture, and the section of animal products contains many examples of the direct and indirect ways in which animals are of use to man. The historical collections

* For a full account of the steps leading to the founding of the National Museum, see the article by Dr. G. Brown Goode on *The Genesis of the United States National Museum* in the *Report of the United States National Museum for 1891*, pp. 273–880.

include personal relics of such well-known men as Washington, Jefferson, and Grant. The collection of musical instruments is good, and the section of graphic arts gives a comprehensive history of the art of illustrating.

In 1882 the number of specimens in all departments was estimated at about 200,000; in 1893 the total was, approximately, 3,277,000. While the exhibition series is very extensive, containing the best specimens in their respective groups, or those of the highest educational value, the great proportion of this material is in the study series to which especial attention has been paid.

The chief publications of the museum consist of papers issued at intervals, corresponding to the bulletins of other institutions, and longer or monographic papers, of the nature of memoirs and issued as bulletins. Fifty of the bulletins have been published and 1,170 of the shorter papers, the latter forming twenty-one volumes of the *Proceedings* of the U. S. National Museum. The museum also publishes an *Annual Report* containing, in addition to the reports of the assistant secretary and the curators on the condition and progress of the various departments, papers of general interest, and often of considerable length, descriptive or illustrative of the collections. Articles by museum officers or based on its collections are also printed in the Smithsonian publications or in those of other Government departments.

The work of the museum, by the accumulation and study of specimens, their exhibition, and by the publication of papers, is thus threefold, and its aim is to be in every particular an educational museum in the broadest sense of the term.

Every aid is given to students, and, in addition, a large amount of work is done in reporting on material submitted to the museum for identification or other information. The building is open to the public every day but Sunday.

FREDERIC A. LUCAS.

Nativism (in philosophy): the doctrine that the mind has certain kinds of knowledge, or principles of organization of its experience, native to itself or inborn. It is opposed to empiricism, which holds that knowledge is derived exclusively from experience. Other terms for nativism are *apriorism* and INTUITIONALISM (*q. v.*). J. M. B.

Natolia: See ANATOLIA.

Na'trolite [Eng. *natron*, soda (viâ Fr. and Span. from Arab. *natrūn*, *nitrūn*, whence Eng. *niter*) + Gr. λίθος, stone]: a mineral belonging to the zeolitic section of hydrous silicates, and essentially a silicate of aluminium and sodium, with 9·5 per cent. of water. It occurs generally in slender crystals assignable to the trimetric system, also frequently in radiated fibrous masses. It is met with most commonly in volcanic rocks, but occasionally also in granite and gneiss. Bergen Hill, N. J., Copper Falls, Lake Superior, Mich., and localities in Nova Scotia have yielded fine specimens.

Natron: See SODIUM.

Natu'na Islands: a group of islands situated in the China Sea, between Borneo and the peninsula of Malacca, belonging to the Dutch. Area, 664 sq. miles. Pop. 7,500. They are high and mountainous, and produce rice, maize, sago, and cocoanuts. Fishing is the chief occupation of the inhabitants.

Natural: a term used in music. The regular notes of the scale when unaffected by sharps or flats (as in the key of C major) are said to be *natural*, or in their original and ordinary condition; and when any note has been modified by the use of a ♯ or ♭ (whether placed at the clef or occurring as an accidental), such alteration may be revoked by prefixing to the note the sign ♮. This sign is called a "natural," because it restores to the altered note its original character. The natural is also of service in cases where a change of key takes place, as at the opening of a second or third movement, where such sharps or flats in the signature as are no longer needed are revoked by the substitution of as many naturals. Double sharps and double flats are restored to simple sharps and flats by the signs ♮♯ and ♮♭.

Revised by DUDLEY BUCK.

Natural Bridge: an arch of great size and beauty, carved or eroded in the horizontal strata of Cambro-Silurian magnesian limestone (Knox dolomite) in Rockbridge co., Va. The bridge is a small remnant of the roof of a former cavern, now for the greater part opened into a gorge, through which Cedar creek flows to James river. The gorge widens, and is clothed with trees above and below the bridge; under the arch the walls are bare and vertical, about 50 feet apart. The arch has a thickness of 44 feet and a span of from 45 to 60 feet. The crown of the arch is almost 200 feet above the creek, while the top of the bridge is 236 feet above the water. A public road leads across the bridge, the width of the top being about 30 feet.

W. M. DAVIS.

Natural Gas: a form of bitumen that under natural conditions exists as a gas. Before its true relations had been discovered it was familiar to the inhabitants of certain localities as escaping from springs and crevices in rocks, producing the phenomena of burning springs and fire-wells, and furnishing the fuel for the perpetual fires of Baku and other shrines of the Fire Worshipers.

History.—Travelers overland to Persia and India, from the time of Marco Polo in the fourteenth century to the first half of the nineteenth century, describe the burning springs of Asia Minor and the fires of Baku. Abbé Huc, in his *Travels in China*, describes the fire-wells and the method of drilling them. The gas from these wells was used in China for boiling brine and in domestic heating. Natural gas was also used in the fire-temples of Tibet and Northern India.

In the U. S. the burning springs that were common in the valleys of the western slopes of the Appalachian chain, from the St. Lawrence river to Alabama, early attracted attention. In the valley of the upper Cumberland, in Southern Kentucky, accumulations of gas beneath the thin horizontal strata of that region sometimes gained sufficient force to tear up a mass of earth and stone with explosive violence, thus producing what are locally called "gas volcanoes."

The earliest attempt to utilize the gas was made at Fredonia, N. Y. The gas was first used in 1824 from wells dug into the rock strata that underlaid the town, but later wells were drilled. At about this period, as borings for brine were made in the valleys of the streams that drain the western slopes of the Alleghanies, gas was often encountered, and was frequently utilized as fuel to evaporate the brine. This was particularly true of the valleys of the Kanawha and Muskingum rivers.

As the development of the petroleum-fields increased, the vast accumulations of natural gas that often accompanied the petroleum were utilized for fuel.

The immense number of test-wells that were drilled for petroleum during 1865 and 1866 throughout the valleys of the Mississippi and its tributaries led to the discovery in many localities of deposits of natural gas outside the limits of any productive petroleum-field. Yet for many years few attempts were made to utilize the gas. Among these the Neff Wells near Gambier, Knox co., O., may be mentioned. In drilling the first of these wells water was encountered in large quantities at a depth of 66 feet. At a depth of 600 feet gas was struck under great pressure. The boring throughout its whole length became alternately filled and discharged. The enormous volume of water thrown out—perhaps 10,000 barrels per day—kept the derrick soaked so thoroughly that at night the gas could be fired, when a struggle between the burning gas and water followed. Another similar phenomenon was witnessed in a well at Kane, Pa., on the Philadelphia and Erie Railroad. This well was drilled 2,000 feet deep, but as no oil was obtained the casing was withdrawn and the well abandoned. Then the struggle between the gas and water began. The stratum from which the gas issued was encountered at about 1,400 feet. The fresh water flowed into the well on top of the gas until the pressure of the confined gas became greater than the weight of the superincumbent water, when the water was forced out of the well to a great height, producing all of the phenomena of a geyser.

Gradually the great value of the escaping gas for fuel began to be appreciated. In several instances the gas was used to generate power without being burned, the pressure of the escaping gas alone being sufficient to operate an engine, as if the gas were steam. More frequently the gas escaping from one well was used as fuel under the boilers in drilling an adjoining well. The gas was also gradually introduced into the towns that were adjacent to oil territory. By 1880, besides Fredonia, N. Y., natural gas was being used notably in Rochester, Sheffield, Erie, and Bradford, in Pennsylvania; Painesville, East Liverpool, and Gambier, in Ohio; and in New Cumberland, W. Va.

The town of Findlay, O., was settled in 1836. In 1838 one of the settlers dug a well which yielded sulphurous water and inflammable gas. By a rude contrivance the gas was

carried into the house, and then used for domestic heating. The extended use of natural gas in the so-called oil region of the Ohio valley led in 1884 to the formation, in Findlay, of a company to drill for gas. The successful drilling of the first well at Findlay was immediately followed by others, until in Jan., 1886, the famous Karg well was drilled to a depth of 1,144 feet in twenty-four days. It is estimated to have yielded from a 4-inch pipe 12,080,000 cubic feet daily. The total gas-production in Findlay soon amounted to 25,000,000 cubic feet daily, numerous manufactories were established, and the place increased rapidly in population. Other towns throughout Ohio, Indiana, and Illinois had the same experience. The gas was carried into Chicago, Detroit, and other cities more than 100 miles distant from the wells through pipes that had scarcely been laid before the decreased pressure and volume of the gas necessitated the substitution of pumps for the natural pressure of the gas. Natural gas as a fuel has become an important factor in the commercial and industrial world of the central U. S., but it is generally conceded that an artificial substitute must soon take its place in the progress of civilization.

Geographical Distribution.—Natural gas is very generally distributed. It is particularly abundant in those regions that furnish petroleum and other forms of bitumen, but it is also found in other regions where metamorphic or volcanic action has not disturbed the crust of the earth. In the U. S. the most eastern point that has furnished it is Dutchess co., N. Y., on the east side of the Hudson river. The points, however, E. of the Alleghany Mountains at which it has been observed are few, if any, S. of the State of New York. It has been reported from nearly every county in New York State except the Adirondack region, but it is in the region tributary to the city of Buffalo that large and remunerative quantities have been obtained. Throughout the entire oil region of Western Pennsylvania, and extending into Armstrong and Westmoreland Counties to the E., enormous quantities of natural gas have been supplied, particularly to the city of Pittsburg. West Virginia and Eastern Kentucky have long furnished gas, while nearly the whole State of Ohio, Northern and Central Indiana, and Central Illinois have been prolific fields, in many instances furnishing enormous quantities for many years. Outside this territory, lying in the northern Mississippi basin, there is scarcely a section of country to the W. and S. of large extent that has not yielded natural gas, but rarely in quantities of economic importance.

On the Pacific slope natural gas occurs throughout nearly the entire State of California. It accompanies petroleum in the counties of Los Angeles and Ventura. A large part of the fuel consumed in the city of Stockton is supplied from wells. A large area around Sacramento yields natural gas in quantities sufficient to make it an important factor in the fuel-supply of that region.

Outside the U. S. the peninsula of Ontario, in Canada, has yielded natural gas in quantities locally valuable. In South America and the Eastern continent, with the exception of China, natural gas has never been developed by artesian borings, and the extent to which it exists is unknown.

The Chemistry of Natural Gas.—The natural gas which is the subject of this article should be distinguished from natural gas which occurs in volcanic regions and is the product of volcanic action. In a general way the first may be distinguished as a combustible gas, the second as consisting of the products of combustion.

The following results of analyses will, by comparison with those that are given of combustible gases, illustrate more clearly the generic differences between the two classes of gases. Nos. I. and II. are analyses of the gases rising through the Lago di Nafta in the Val del Bove of Etna. No. III. is an analysis of the gases evolved from fumaroles on the island of St. Paul.

CONSTITUENTS.	I.	II.	III.
CO_2	94·23	84·58	14·24
CH_4	1·82	2·42	.....
O	0·28	4·52	17·01
N	3·79	1·89	68·75
H_2S	....	6·17	.....

No combustible gases are evolved by the Caldeira de Fumas, San Miguel, Azores, which differs in this respect from the geysers of Iceland and the Suffioni of Tuscany, both of which invariably yield hydrogen and marsh-gas (CH_4), mingled with various incombustible gases. The gases evolved from solfataras contain CO_2, H_2S, O, and N. The Great Solfatara yields steam, hydrogen sulphide (H_2S), carbonic acid (CO_2), oxygen, and nitrogen.

The composition of the combustible natural gas of Pennsylvania, etc., is found to vary not only in different wells, but in the same wells on different days.

The following analyses were made on four different days in four months of gas from Westmoreland co., Pa., used at the Cambria iron-works:

CONSTITUENTS.	1.	2.	3.	4.
Marsh-gas, CH_4	67·00	49·58	57·85	75·16
Hydrogen	22·00	35·92	9·46	14·45
Ethyl hydride, C_2H_6	5·00	12·30	5·20	4·80
Ethylene, C_2H_4	1·00	0·60	0·80	0·60
Oxygen	0·80	0·40	2·10	1·20
Carbonic oxide, CO	0·60	0·40	1·00	0·30
Carbonic acid, CO_2	0·60	0·40	....	0·30
Nitrogen	3·00	....	23·41	2·89

Analysis of the Fredonia gas shows it to be a mixture of marsh-gas (CH_4) and ethyl hydride (C_2H_6), with a small quantity of carbonic acid and nitrogen. Analysis of the gas from two burning springs in West Virginia showed it to consist almost exclusively of marsh-gas, with a small quantity of carbonic acid and nitrogen, and traces of carbonic oxide and oxygen.

In the following table is shown the composition of the gas of five wells in the oil regions of Pennsylvania, and immediately following that is a table showing the composition of the gas from seven wells in Northwestern Ohio and Central Indiana, all of which yielded gas from the Trenton limestone:

ANALYSES OF GAS FROM WELLS IN THE OIL REGIONS OF PENNSYLVANIA.

Kokomo, Ind	0·30	1·42	94·16	0·30	0·55	0·29	2·80	0·18
Marion, Ind	0·55	1·20	93·58	0·15	0·60	0·30	3·42	0·20

A comparison of these several tables shows that marsh-gas is the principal constituent of all of these gases; at the same time it will also be observed that, while a marked variation is found in the gases from Pennsylvania, a very remarkable uniformity prevails in the Trenton limestone gas from wells scattered over a very wide area. This is due to the fact that the gas of Pennsylvania is uniformly associated with petroleum in greater or less quantity, and it therefore is nearly impossible to secure it free from the lighter products of petroleum that under varying conditions of temperature and pressure assume the liquid or gaseous form and mutually dissolve each other.

The presence of hydrogen sulphide in the gas from the Trenton limestone is characteristic of the bitumens issuing from that formation.

As related to the constituents of the petroleums issuing from the older rocks of the northern Mississippi basin, natural gas is composed to the extent of more than 90 per cent. of the initial member of the marsh-gas or paraffin series of hydrocarbons, of which those petroleums are largely composed. Some varieties also contain olefiant gas, which is the initial member of the ethylene series, a series of hydrocarbons also found in small quantity in Pennsylvania and other petroleums. As the production of oils similar to petroleum by artificial means is always accompanied by the formation of varying quantities of marsh-gas and olefiant gas, it is not surprising that similar operations in nature should result in similar products. So also the natural products of combustion are similar to the gases issuing from fumaroles and other forms of volcanic action. See HYDROCARBONS.

Drilling of Wells and Distribution of Gas.—The method of drilling wells for natural gas is precisely like that employed in the drilling of petroleum-wells. (See WELL-DRILLING.) The distribution of the gas is conducted in a manner precisely similar to that of distributing ordinary illuminating gas.

Uses of Natural Gas.—With the exception of the Neff wells near Gambier, O., and a few others, natural gas is used exclusively for fuel. The gas of the Neff wells was used for the production of lampblack soon after they were drilled. The black is obtained from the imperfect combustion of the gas, by which a large part of the carbon is deposited in a dense form of lampblack of excellent quality, known as diamond black.

Natural gas is the most valuable form of fuel known. Theoretically, 1 lb. of Pittsburg coal is equal to 18·33 cubic feet of Pittsburg gas; but experimentally 7·5 feet of gas is equal to 1 lb. of coal. Findlay gas has been proved to be somewhat better. At the height of the use of natural gas in Pittsburg, 28,000 domestic services and 900 manufacturers' services supplied the city. These used between 400,000,000 and 500,000,000 feet per day, displacing 8,500,000 tons of coal per year. It has been found excellent for the manufacture of iron, steel, and glass, for burning fire and other brick and pottery, and for the generation of steam.

See BITUMEN, HYDROCARBONS, PETROLEUM, and ILLUMINATING GAS.

S. F. PECKHAM.

Natural History: a term used in different senses at different times and by different persons. (1) Formerly it was extended to embrace the consideration of all the objects, as well as the phenomena, of nature, and hence, in addition to mineralogy, zoölogy, and botany, embraced chemistry, physics, and astronomy; and protests were made by physicists at the attempt to restrict the term to its present more generally accepted sense. (2) It is now, however, limited to the history of the natural objects known under the names of minerals, plants, and animals in their normal conditions. (3) There is also a tendency to still further restrict it to zoölogy, for which it is frequently used in conversation, and occasionally in popular literature, as an interchangeable term. This last usage, however, is not sanctioned by good authority or by the necessities of the case, the word zoölogy being all-sufficient, and the common name being necessary for that branch whose objects of study belong to the three kingdoms in question. The objects taken cognizance of by natural history fall naturally into two great groups: (1) the *mineral empire* or *mineral kingdom*, considered under the head of MINERALOGY; and (2) the *organic empire*, discussed under the term BIOLOGY. Biology is itself subdivided into (*a*) botany, which treats of the vegetable kingdom, and (*b*) zoölogy, which has for its domain the animal kingdom. Nothing can be predicated respecting characters common to all the bodies which belong to the several kingdoms indicated which does not more properly pertain to the science of somatology, which falls within the sphere of the physicist; and there is little in common even as to methods of study or terminology.

Naturalization: an act or process performed by an alien when he transfers his allegiance from the country of his origin and from his sovereign to another country and sovereign. His original allegiance remains until replaced by the new. There may be *partial* or qualified naturalization, which does not make aliens completely equal in all respects to native-born citizens or subjects; thus by the Constitution of the U. S. (Art. II., Sect. 2, § 5) no naturalized citizen can become President of the U. S., and for some time in England no such person could be a member of the privy council or of either house of Parliament. Complete naturalization gives all the rights and imposes all the obligations of a native-born citizen. Most states give privileges of naturalization, but there is great difference in regard to the conditions. Hence a conflict of laws may arise with respect to the same individual on his return to his original country. The English doctrine for a long time was that allegiance to the crown was perpetual and indissoluble. Hence an Englishman naturalized by the law of the U. S. was held to be still a British subject, and many such were in the early part of the nineteenth century taken on the high seas out of U. S. vessels, on the ground of owing military duty to the crown, and were impressed into the English naval service. If the allegiance were indissoluble, *jure gentium*, it would not follow that this procedure of taking these persons out of neutral vessels was authorized, since it was an attempt to enforce a municipal law of one state within the jurisdiction of another; at present this claim must be abandoned as far as the U. S. are concerned, owing to the new position in regard to naturalization which treaty has imposed on Great Britain, and in regard to taking persons out of neutral vessels on the high seas, which that Government took in the case of the Trent.

Naturalization involves all rights of person and property, including generally that of holding real estate, but does not extinguish claims which were in force at the time the person concerned altered his allegiance. Thus numbers of young men have left different parts of Germany to escape from the military duty required for a certain time of all able-bodied males. The fact of passing through the forms of allegiance according to the laws of the U. S. would not protect such persons from the operation of laws to avoid which they removed from their native country.

How far the incomplete process of naturalization is to have effect in entitling a person to protection is a matter of doubt, since it depends on the person himself whether he will complete the act according to his expressed intention. The case of Koszta, who was seized in a Turkish port at the instigation of the Austrian consul-general, next was put into the hands of the French consul-general in consequence of the threat of force made by a captain of a U. S. vessel then in the port, and finally set free so as to go to the U. S., is in point. This was in 1854.

Treaties of the U. S. with German powers and with Great Britain have so defined the claims of the original and the adopted country as to prevent conflict of laws as far as possible. In the treaty with the North German confederation, and in that with Bavaria made in 1868, five years of uninterrupted residence with formal naturalization constitutes citizenship on both sides. The mere declaration to become a citizen is of no effect. Residence is understood, as the Bavarian treaty expresses it, in the *jural* sense, so that it is not interrupted by a transient absence. A person returning to his former residence is not protected by his naturalization from responsibility for crimes committed before his emigration; and such a person residing more than two years in his original country is held to have renounced his naturalization. In the Bavarian treaty it is agreed that the treaty shall not affect a provision of the military law by which Bavarians, emigrating before the end of the prescribed military service, can not on their return be admitted to permanent residence in the land until they shall have become thirty-two years old; but it is understood that if a certificate of emigration has been granted liability to military service shall be wiped out by naturalization. Such treaties were made with Baden, Bavaria, Belgium, Hesse, Mexico, the North German Union and Würtemberg in 1868; with Sweden and Norway in 1869; with Austria and Great

Britain in 1870; with Denmark in 1872. It should be added that in the treaties with Austria and Baden evasion of military service, when the emigrant actually was in the ranks or had been drawn, was not to be pardoned though naturalization followed. This was expressly stated in these treaties, but the same rule would probably hold good in the other treaties, desertion being a crime. The convention with Great Britain provides that the subjects or citizens of either nation, naturalized according to the laws of the other, shall be held to be for all purposes subjects or citizens of the other; that they may again exchange their nationality on terms to be agreed upon within a certain time after the date of the convention; and that on renewing their residence in either country they may be readmitted to the character and privileges of a citizen or subject, and not be claimed by either country on account of the previous naturalization. In 1868 the U. S. gave up the claim to indelible allegiance.

Revised by T. S. Woolsey.

Laws Governing Naturalization in the United States and Great Britain.—At the common law a foreigner or temporary resident in a country is bound to yield a local or temporary allegiance to the state and obey its laws, and is entitled to protection by its government, and redress for his injuries in its tribunals. This allegiance, however, is to be distinguished from the allegiance which is due from a citizen to the state; and the right to protection and redress does not include many of the rights which belong to a citizen to acquire and dispose of property, to exercise political franchises, etc. See the articles on Alien, Allegiance, and Citizen.

Before the formation of the U. S. the American colonies of Great Britain each exercised the prerogative of adopting naturalization laws, and the laws passed mainly aimed to promote immigration; but the Constitution of the U. S. provides that "Congress shall have power to establish an uniform rule of naturalization." This power vested in Congress by the Constitution is held to be exclusive; and in the exercise of it various statutes have been passed prescribing the qualifications and formalities requisite for an alien to become naturalized. This exclusive authority, however, does not deprive the States of the right to regulate by statute the abilities and disabilities of aliens in regard to the acquisition and transfer of property, nor does it prohibit them from investing aliens with the privileges of State citizenship, such as the right to vote in State elections, hold State offices, etc. (See Citizen.) The Federal naturalization laws are very liberal, and in nearly all respects naturalized citizens are placed on the same footing as those who are native-born. The Constitution provides that no naturalized citizen shall be eligible to the office of President or Vice-President, and that no person shall be elected to the U. S. Senate who shall not have been a citizen for nine years, or to the House of Representatives unless he shall have been a citizen for seven years.

In substance, the naturalization laws of the U. S. at present provide that to become naturalized the alien must declare on oath before a circuit or district court of the U. S., or a district or Supreme Court of the Territories, or a court of record of any of the States having common-law jurisdiction and a seal and a clerk, two years at least prior to his admission, that it is *bona fide* his intention to become a citizen of the U. S., and to renounce forever all allegiance and fidelity to any foreign prince, state, or sovereignty of which the alien may be at the time a citizen or subject. His full admission to citizenship can not, however, take place until he has resided within the U. S. for the continued term of five years next preceding his admission, and one year at least within the State or Territory where the court is held to which he makes application. At the time of this application to be admitted he must declare on oath before some one of the courts above mentioned that he will support the Constitution of the U. S., and that he absolutely and entirely renounces and abjures all allegiance to every foreign power, and particularly to that state of which he was before a citizen. These proceedings must be recorded by the clerk of the court. It must be made to appear to the satisfaction of the court admitting the alien to naturalization that he has duly fulfilled the prescribed qualifications in regard to the term and place of residence, and that during that time he has behaved as a man of good moral character, is attached to the principles of the Constitution of the U. S., and is well disposed to the good order and happiness of the same. If the alien has borne any hereditary title or been of any of the orders of nobility in the kingdom or state from which he came, he must also make an express renunciation of his title or order of nobility; and this renunciation must be recorded in the court.

If the alien is a minor the rules in regard to his admission of citizenship are somewhat different. If he has resided in the U. S. three years next preceding his twenty-first birthday, and five years (including the three of minority) before making his application to be naturalized, the residence being continuous, he is not required to make the preliminary declaration above described of intention to become a citizen; but he must make the same declaration at the time of his admission as is required of other applicants; and must further declare on oath, and prove to the satisfaction of the court, that for two years next preceding it has been his *bona fide* intention to become a citizen, and must in all other respects comply with the naturalization laws. The minor children of alien parents who are naturalized become thereby citizens themselves, without any application on their own part being necessary if they are then dwelling in the U. S.

If a husband dies before he is actually naturalized but after he has taken the preliminary oath of intention to become a citizen, his widow and children are declared to be citizens, and are entitled to all rights and privileges as such upon taking the oath prescribed by law. There are also special statutory provisions in regard to the naturalization of aliens who have served in the U. S. army, and of foreign seamen. The general provisions of the naturalization laws apply to aliens of African nativity and to persons of African descent. Under the laws as they now (1894) stand Chinese and Japanese can not become naturalized.

Aliens who are citizens or subjects or denizens of a country with which the U. S. is at war at the time of their application can not be naturalized until the restoration of peace.

In Great Britain no general naturalization law was enacted until the year 1844. Before that time naturalization could be effected only by special act of Parliament, but it had been provided by statute that an alien naturalized in this mode should still remain under important disabilities; he was still incapable of being a member of the privy council or of Parliament, or of holding a civil or military office, or receiving grants of land from the crown. A practice, however, has existed from an early period for the king to grant letters of denization to aliens, which have the effect of removing an alien's disqualifications to a limited extent. A denizen is described as occupying a kind of middle state between an alien and a natural-born subject, having, as it were, an intermediate legal status. Thus he may take lands by purchase or devise, though an alien can not; but he can not take by inheritance. A denizen, moreover, can not belong to the privy council or Parliament or hold any public office of trust. A comprehensive statute in regard to the naturalization of aliens was enacted in 1870 (33 Vict., ch. 14), and this with slight changes or additions is the law at present in force. By this it is provided that an alien who has resided in the United Kingdom, or has been in the service of the crown, for a term of not less than five years, and intends, when naturalized, to continue either his residence or his service, may apply to one of her Majesty's principal secretaries of state for a certificate of naturalization. The applicant must present such evidence of residence or service and intention to reside or serve as the Secretary of State may require, and the Secretary may then, in the exercise of his own discretion, with or without assigning a reason, give or withhold a certificate as he thinks most conducive to the public good, and no appeal lies from his decision; but such certificate will not take effect until the applicant has taken the oath of allegiance. An alien to whom a certificate of naturalization is granted is entitled in the United Kingdom to all political and other rights, powers, and privileges, and is subject to all obligations, to which a natural-born British subject is entitled or subject, with this qualification, that he shall not, when within the foreign state of which he was previously a subject, be deemed to be a British subject unless he has ceased to be a subject of that state in pursuance of the laws thereof or pursuant to treaty provisions.

For a fuller treatment of the whole subject, and the particulars of statutory provisions, see the works of Cockburn and Howell on *Nationality*; the works of Scott, Cutler, Bidoulae, and Boese on *Naturalization*; Hansard on *Aliens and Naturalization*; and the works of Woolsey and Wheaton on *International Law*.

F. Sturges Allen.

Natural Law: See the Appendix.

Natural Philosophy: that branch of physical science which deals with properties of bodies that are unaccompanied by essential changes of the bodies themselves. See MECHANICS.

Natural Selection: See EVOLUTION.

Natural Theology: a science treating of the existence and character of God as these may be known from reason and nature. It investigates the evidences of his being and seeks to determine his attributes and relations to the world. The conclusions thus reached and scientifically established form what is rightly termed rational theism, or the doctrine of God as ascertainable apart from supernatural revelation.

The primary idea upon which it proceeds is that, if there be a God as the Creator or First Cause of the universe, his existence and character must be found impressed upon it and discoverable from it. The author of a work is revealed in the work he has done. The world is viewed as a visible expression of the being and thought, if there be any, of its source. One of the primary conceptions of science is that nature holds and presents in its constitution and order some record of its origin, legible to the reason of those who honestly study it. Natural theology therefore seeks to examine this record, take its testimony, and thus, if possible, ascend through nature up to nature's God.

History.—Efforts to construct a natural theology appear very early. The most ancient literatures of the nations present many of its truths or conclusions in more or less systematized form. The *Vedas* of the Hindus, the *Zend-Avesta* of the Persians, the *Book of the Dead* and other writings of the ancient Egyptians, contain illustrations of the earliest recorded efforts of the human mind toward a knowledge of Deity. Socrates and Plato among the Greeks, and Cicero and Seneca among the Romans, made earnest and to some degree successful efforts to give rational account of men's spontaneous faith in the divine existence. In all ages of the Christian Church theologians have claimed that the works of nature exhibit the being, power, wisdom, and goodness of their author, and that revelation presupposes and recognizes this truth. The *Theologia Naturalis sive Liber Creaturarum* of the Spanish physician Raymund de Sabunde, in the early part of the fifteenth century, however, seems to have been the first attempt to construct a distinctively natural theology. During the seventeenth century natural theology made considerable progress, rose to increased prominence in the eighteenth, and reached a golden period in the early part of the nineteenth century through the celebrated Bridgewater Treatises and other able works. The subject has continued to hold a place of undiminished interest amid the surpassing philosophical and scientific progress with which the nineteenth century closes.

Its Fundamental Postulates.—In its reasoning it assumes as valid the so-called intuitional or *a priori* truths, especially the law of causation, which demands an adequate cause for every event. In this, however, it does only what all true science does. Whatever psychological explanation may be given of these truths or beliefs, it is undeniable that their authority is supreme and invincible in the practical thinking and reasoning of the race, and that neither science nor philosophy can impeach their validity without suicide.

Great variety has marked the theistic evidences from the numerous sources whence they are drawn. Since the proper proofs of the divine existence must be regarded as including all the phenomena of the whole world of matter and mind open to our study and interpretation, these evidences must be literally countless and inexhaustible. They are impressively cumulative, as the immeasurable realm of nature, life, and history is more and more explored. They appear in thousands of different ways to different minds. If it is fair to assume a single evidence, there are many evidences. If there is one, there are innumerable points of light revealing the divine. Natural theology therefore rests its conclusions not simply on one or several formal proofs, but upon the aggregate testimony of the whole cosmical system and all its particulars, upon the force and consilience of the indications in nature, thought, and history as they are found running up and compacting their varied logic in one common demand.

Forms of Argument.—Different methods of viewing nature's testimony, as well as difference as to the parts considered, have given the theistic reasoning a number of leading characteristic forms. These stand simply for generic methods of shaping our view of nature's witness to the real existence and attributes of the Being for whom the idea of God stands in the human mind. Sometimes the method is *a priori*, proceeding directly from ideas which are held to be necessary in the mind's own insight and consciousness. Sometimes it is *a posteriori*, as necessary inference or logical conclusion from observed facts. Commonly the reasoning is found to unite the two methods. Sometimes the argument is based upon the existence and phenomena of mind; sometimes upon the facts of physical organization and life; sometimes on the order and glory of the heavenly bodies; sometimes on the structure and adaptation evident in the chemical elements and material atoms. Besides some forms of presumptive proof, such as the universality of the idea of God in the human mind, so normal as to force itself in some form or other into the belief of all ages and tribes; the religious instinct of the race, showing a natural and profound adjustment of the human constitution to worship; the benign influence of belief in God, quickening the sense of duty and responsibility, in which personal and social life reaches its best and happiest order; and the fact that all the phenomena of the world are best explained on the assumption of the existence of God, the theistic arguments, though wrought out in greatly diversified ways, have for the most part fallen under the following types:

1. The *ontological* argument. The germs of this were involved in Plato's "ideas," but it was first formulated by Anselm in the eleventh century. From the existence in the human mind of the idea of a most perfect being it concluded that the most perfect being exists—because real existence is a necessary part of the idea of the most perfect being. Descartes, Bishop Butler, Leibnitz, Cousin, Samuel Clark, and many other eminent writers have used this method of argument; but, standing alone, it has often been shown to be unsound, in confounding real objective existence with the simple idea of it in the mind. Its only force rests on the *necessity* of the idea in human thought. The universality of the idea proves it to be spontaneous and necessary in the action of mind in the presence of nature. Our knowledge of actual being compels us to believe in self-existent or unoriginated being. Thus God becomes the ultimate necessity in human thought. This method of reasoning, however, besides being too metaphysical for general apprehension, fails to exclude pantheistic conceptions or make clear the distinction between God and the universe itself.

2. The *cosmological* or, more exactly, *ætiological* argument. This reasons from the existence of the world as contingent and dependent, to the existence of God as the necessary unconditioned self-existent cause. That the world has had a beginning is indisputable, and science is busy only with the question *how* it came to be. In all its parts, and as a whole, nature is found to be finite and conditioned. In searching for the cause of it all, the inexorable demand of the law of causation can never be satisfied till a cause is reached that is not itself an effect, a first cause, a self-existent, absolute cause. This draws the line clearly between self-existent being and all originated and dependent being. Modern research and progress have not discredited, but rather, if possible, strengthened, the force of this argument, for they have left no place for the anciently asserted notion that the world itself may be regarded as eternal, and, despite former metaphysical questionings, they have recognized with the most absolute confidence the validity and universality of the law of causation for the real system of the world.

3. The *teleological* argument. This seems to have been the earliest form of theistic reasoning, and still remains the most prominent and impressive. It is usually known as the proof from design or "final cause." Its peculiarity is that while based, as is the cosmological, on the principle of causation, it considers specifically the marks of order and purpose everywhere in nature. Teleology, or clear adjustment of structure to predetermined ends, is so omnipresent a reality in the world that we are never out of sight of it. It seems to be coextensive with the highest law of the universe. The world appears to be a thought with purpose or intent shining all through it, from its primary adapted atoms acting like "manufactured articles" up through all the aggregations in which atoms are built into a cosmos. The correlate to all this is a Thinker, as the creator of the world. The excellence of this argument is that its conclusion leads directly and necessarily to the intelligence and personality of the self-existent First Cause. This argument, together with the cosmological, has been assailed by severe criticism in

some modern philosophies and forms of speculative science. The chief philosophical objection, apart from that which has sought to vacate the law of causation itself as but a "form of thought," has been the claim that the world, being only finite, can not demand the infinite as its cause. This is conceded; but the value of the argument remains practically the same; for all that is sought from this form of proof is the existence of a personal creator of the actual universe. This is enough; but the main objection has come from a form of speculative science in connection with the hypothesis of evolution. This is thought by some to show how the universe of structure and organism has been immanently evolved from primordial matter without intelligent purpose. The answer to this, believed to be amply sufficient, is that any atheistic hypothesis of evolution must resolve itself into the incredibility of "chance," and especially that the great majority of evolutionists themselves maintain that evolution, being not a *cause*, but only a *mode*, does not set aside teleology, but enlarges its scope and range. Numerous discussions, especially the masterly work on *Final Causes*, by Paul Janet, have thoroughly vindicated the high place of this form of proof.

4. The *moral* argument, drawn from the facts of conscience and ethical law in the world. It is shaped in different ways, according as it reasons directly from the existence of conscience or from the course of history, with their realities of moral law and necessary presuppositions of a moral law-giver. In the ethical capacities and obligations human nature reaches its highest ascent. As the cosmical system thus culminates in ethical law, its author must be a moral governor. To this argument evolutionism suggests the objection that what is reputed to be ethical law is but the race's experiences of utility transformed into judgments of approval and incorporated as mental instincts by hereditary descent, but this objection fails by disregarding the fact of an irreducible distinction between the judgments of utility and those of right or righteousness.

Divine Attributes.—Natural theology claims that the evidences of the divine existence necessarily fix some fundamental conceptions of the divine nature and attributes. Over against the negations of agnosticism it claims to be able to know not only that God is, but to some degree *what* he is. Reflected from the realities which prove his being, we learn some of the perfections which belong to him and by which he is indeed God. Hence natural theology affirms of him self-existence, as the absolute First Cause; eternity, as necessarily involved in self-existence; personality, as the logical presupposition for the cosmic order and design; unity, as the one and only ground of the universe; omniscience, omnipresence, omnipotence, infinite wisdom, perfections reflected from the immensity of nature; holiness or righteousness, necessarily presupposed from the moral constitution of man and the world; and goodness, evident from the general arrangement of nature's structures for creature enjoyment.

God's Relation to the World.—This also is in a measure reflected from the evidences of his being; but it presents many profound and difficult problems which at once challenge thought and baffle satisfactory solution. Yet as the Cause of the world God is necessarily apprehended as before and above it, in a divine transcendence. As nature, however, exhibits the divine causation as working everywhere within it, the divine immanence is equally certified. He is in the world, but not a part of it. There are thus excluded both a pantheistic identification of God with nature, and a deistical separation or withdrawal from it. The world is God's world, and must have its purpose and plan in the divine counsel; but here natural theology joins on to supernatural revelation, which gives the fuller needed knowledge both of the divine attributes and of God's relation and purposes with respect to nature and man.

LITERATURE.—Besides the older discussions by Clarke, Newton, Derham, Nieuwentyt, Paley, and the Bridgewater Treatises, the chief later works are Tulloch's *Theism* (New York, 1855); Thompson's *Christian Theism* (London, 1855); Buchanan's *Modern Atheism* (Boston, 1867); Mahan's *Science of Natural Theology* (Boston, 1867); Chadbourne's *Natural Theology* (Boston, 1867); Jackson's *Philosophy of Natural Theology* (New York, 1875); Cocker's *Theistic Conception of the World* (New York, 1875); J. P. Cooke's *Religion and Chemistry* (Boston, 1864); Fairbairn's *Studies in the Philosophy of Religion and History* (New York, 1876); Flint's *Theism* (Edinburgh, 1878); Flint's *Anti-Theistic Theories* (Edinburgh, 1879); Janet's *Final Causes* (trans. from French, Edinburgh, 1878); Diman's *Theistic Argument* (Boston, 1881); Bowne's *Studies in Theism* (New York, 1879); Harris's *Philosophical Basis of Theism* (Boston, 1883); Fisher's *Grounds of Theistic and Christian Belief* (New York, 1883), *Natural Theology* (1893); Valentine's *Natural Theology or Rational Theism* (Boston, 1890); Bowne's *Philosophy of Theism* (New York, 1887). M. VALENTINE.

Nature-study: See the Appendix.

Nauck, nowk, AUGUST: scholar; b. in Auerstädt, near Merseburg, Germany, Sept. 18, 1822; was educated in the gymnasium of Schulpforta and at Halle. After teaching at various gymnasia in Berlin, he was called in 1856 as member extraordinary of the Imperial Academy of Sciences to St. Petersburg, where he remained until his death Aug. 3, 1892. Nauck was one of the greatest text-critics of modern times. Of his many works, exclusively confined to Greek, the following are the most famous: *Aristophanis Byzantii fragmenta* (1848); Euripides with the fragments (3d ed. 1877); *Tragicorum Græcorum fragmenta*, his masterpiece, and the standard work on the subject (2d ed. 1889, with *Tragicæ dictionis index*, 1892): Sophocles with German notes, first edited by Schneidewin (text ed. 1867); Homer's *Odyssey* (1874) and *Iliad* (1877); *Iamblichus de vita Pythagorica* (1884); *Porphyrii Opuscula selecta* (2d ed. 1886). Cf. Th. Zielinski, *August Nauck* (Berlin, 1894), where a complete list of his writings, 121 in all, is given.

ALFRED GUDEMAN.

Naucratis, or **Naukratis**: a garrison city established by PSAMMETICHUS I. (*q. v.*) about 665 B. C., for his Ionian and Carian mercenaries. It was located at what is now called Tell Nebireh, on a canal W. of the Rosetta branch of the Nile, near Sais, the capital of the twenty-sixth dynasty, and close to the Libyan frontier (30° 50′ N. lat., 30° 30′ E. of Greenwich). Its site was discovered by W. M. Flinders Petrie in 1883, and explored by him in 1885–86. Its origin was entirely Greek. The subsequent history of the Persian, Ptolemaic, and Roman periods of the city is in doubt, on account of the excavations made by natives, which uncovered the Greek antiquities but destroyed all later accretions. A factory for making Greek imitations of Egyptian scarabs was found by Petrie, with remains dating down to Apries (Hophra), but none from the reign of Amasis. This dates the original town quite exactly, but the discoveries at Daphnæ (see TAHPANHES) serve to determine the time more closely still. The pottery found at Naucratis was clearly Greek, and apparently formed of Greek clay; in style it was quite distinct from that of Daphnæ. Naucratis contained a number of large buildings—a temple to Hera, another to Aphrodite, a small one to the Dioscuri, the Panhellenion, the largest of all and the Greek religious center of Egypt, and, oldest of all, a temple to the Milesian Apollo, in the center of the town. The whole was originally fortified. The discovery of Naucratis was important, not only in itself, but in its results, since it threw light upon the earliest intercourse between Egypt and Greece, and also upon the history of the Greek alphabet, the Naucratian specimens of Greek caligraphy being among the oldest known. After the time of Amasis and the destruction of Daphnæ the place was the only one where trade with Greece was allowed. See Herodotus, ii., 178; Strabo, xvii., i., 18, 23, 33; Petrie, *Ten Years' Digging in Egypt*: and Edwards, *Pharaohs, Fellas, and Explorers*. CHARLES R. GILLETT.

Naugatuck: borough (incorporated in 1893, made coterminous with the town in 1895); New Haven co., Conn.; on the Naugatuck river, and on the Naugatuck Division of the N. Y., N. H. and Hart. Railroad; 5 miles S. of Waterbury (for location, see map of Connecticut, ref. 10–F). Its manufactures include rubber and woolen goods, malleable iron, paper boxes, pins, buttons, belt-lacing, and electro-plated ware; and it has a public library (3,600 vols.), a public-school building (both the gift of a citizen), a national bank with capital of $100,000, a savings-bank, and three weekly newspapers. Pop. (1880) 4,274; (1890) 6,218; (1900) 10,541.

T. F. KANE, SUPERINTENDENT OF SCHOOLS.

Nau'plia: town of Greece, in the Peloponnesus; on a rocky peninsula in the Argolic Gulf (see map of Greece, ref. 17–K). Of small importance in the classic period, it was entirely deserted at the time of Pausanias (174 A. D.), but became prominent during the Middle Ages. The Ottomans and Venetians long disputed its possession; it was held by the former from 1715 to 1825, when it was captured by the Greeks, who made it the seat of their government from 1829 to 1834. Its deep harbor, well sheltered from the winds, is

protected by the citadels of Palamedes and Itskale, the former 720 feet above the town, and the latter built on the site of the ancient acropolis. From a military standpoint Nauplia is the most important town in the kingdom, and the Greeks call it the Gibraltar of Greece. Pop. (1889) 5,459.

E. A. GROSVENOR.

Nauplius [Lat., a kind of shellfish, from Gr. *ναῦς*, ship + *πλεῖν*, to sail]: a name given to the young of a certain crustacean under the impression that it was adult, and now used as a term for a particular stage in the development of these forms. A nauplius has an unsegmented body, a single median eye, and three pairs of appendages. Of these the anterior pair is simple and sensory, the two remaining pairs are two-branched and serve as swimming organs, while their basal joints, on either side of the mouth, are used for the comminution of food. A nauplius stage occurs in the history of most ENTOMOSTRACA (*q. v.*), but it is rare in the development of other Crustacea. From the wide distribution of the stage it was formerly regarded as indicating that the Crustacea had descended from a naupliiform ancestor, but many zoölogists no longer regard it as having any phylogenetic significance. See CRUSTACEA. J. S. KINGSLEY.

Nausea [= Lat., from Gr. *ναυσία*, sea-sickness]: the sense of impending vomiting. It is a symptom of many diseases, and occurs as a result of irritation of some part of the alimentary canal or of the nervous centers which preside over its functions. In some cases nausea passes on to vomiting, in others it goes no further than to produce a feeling that vomiting might occur if the conditions provoking nausea were to continue. Vomiting may occur without nausea. The exciting causes of nausea are very numerous. It may be provoked by certain drugs known as emetics, such as ipecacuanha, tartar emetic, apomorphia, sulphate of zinc, sulphate of copper, and alum; while lukewarm water, with or without the addition of ground mustard seeds, and tobacco are familiar excitants of vomiting. Nausea is also often observed after the administration of morphia and after prolonged debauches. Nausea may be provoked by mechanical irritation of various parts of the alimentary canal, as, for instance, tickling the fauces. Overloading the stomach is a well-known cause of nausea and vomiting, and another—equally known to medical men—is the irritation caused by the compression of a loop of intestine which sometimes takes place in hernia or in a form of entanglement of the bowels within the abdominal cavity. Nausea may be caused by blows upon the head, the abdomen, the testicles or the ovaries, and it is a symptom of various disorders or diseases of the stomach and intestines, the brain, and the kidneys. Nausea and vomiting are induced by many poisons, and often occur in the early months of pregnancy, sometimes being in the latter case of a most intractable character. Nausea occurs in surgical shock, in fainting, and after the administration of ether. A peculiar form of nausea with vomiting is seen in some cases of consumption and in a disease of the ear called Menière's disease or labyrinthine vertigo, and in hysteria. In many fevers—especially in children—nausea is an early symptom, and vomiting occurs almost invariably in whooping-cough, although there is usually little nausea (in the strict sense of the term) in connection with the vomiting. In addition to these causes of nausea may be mentioned the mental impression made by disgusting sights or odors, terrifying circumstances, and the fact that individual peculiarities (idiosyncrasies) make certain persons prone to nausea from causes which do not similarly affect most persons.

Nausea is often a salutary condition, either as a warning of some impending danger or as an indication of the presence of some insidious disease; it is also the customary forerunner of vomiting, which itself is very often a most salutary process.

For the elaboration of these ideas and much that ought to be understood in connection with nausea and vomiting conjoined, see the article on VOMITING. CHARLES W. DULLES.

Nautch (nawch) **Girls**: See BAYADERE.

Nautical Almanac: See EPHEMERIS.

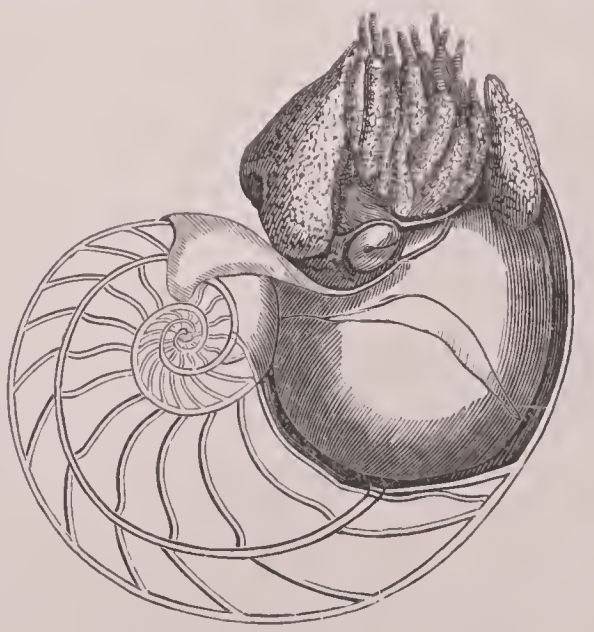
Nautical Schools: schools principally for the purpose of training boys for the merchant marine. They were of early origin, and were maintained with more or less success by the various nations engaged at different times in the struggle for commercial supremacy. In Great Britain there are a number of vessels upon which schools are maintained, some reformatory, others industrial in their nature, but all for the purpose of educating as sailors a class which otherwise would be unprovided for. In addition, there are two school-ships upon which boys are trained with a view to becoming officers in the merchant service.

By act of Congress, June 20, 1874, the Secretary of the U. S. Navy was authorized, for the purpose of promoting nautical education, to furnish, upon application of a Governor of a State, a suitable naval vessel, with her apparel, charts, books and instruments of navigation, to be used for the benefit of any nautical school established at New York, Boston, Philadelphia, Baltimore, Norfolk, San Francisco, (Wilmington, Charleston, Savannah, Mobile, New Orleans, Baton Rouge, Galveston, and in Narragansett Bay, added later), upon condition that there shall be maintained a school for the instruction of youths in navigation, seamanship, marine enginery, and all matters pertaining to the construction, equipment, and sailing of vessels, or any particular branch thereof. The President was authorized at the same time to detail proper officers of the navy that could be spared as superintendents or instructors.

By virtue of this act old wooden sailing vessels were assigned as follows: St. Mary's to New York in 1874; Jamestown to San Francisco in 1876; Saratoga to Philadelphia in 1889; and the steam-sloop Enterprise to Boston in 1892. While the nautical school in San Francisco lasted but a short time, that in New York has been maintained ever since its inception, and has served as a model for the others. Application for admission to it must be made in writing to the board of education of New York city, which controls the school, or in person on board the St. Mary's. The qualifications of candidates are as follows: Age between sixteen and twenty years; average size, sound constitution, and freedom from physical defects; inclination for seafaring life; and knowledge of reading, writing, spelling, and arithmetic. Candidates admitted are required to furnish their outfits and to deposit $30 to cover cost of uniform; the latter amount is forfeited should the lad desert or be withdrawn or expelled. The St. Mary's passes nine months of the year at sea, during which instruction is given in seamanship and navigation; the course lasts two years, and at its conclusion the proficiency attained is determined by examination.

According to the Postal Subsidy Act of Mar. 3, 1890, all subsidized ships must draw their apprentices from the nautical schools. C. BELKNAP.

Nautil'idæ [Mod. Lat., named from *Nau'tilus*, the typical genus, from Lat. *nau'tilus* = Gr. *ναυτίλος*, nautilus, liter., sailor, deriv. of *ναύτης*, sailor, deriv. of *ναῦς*, ship]: the only existing family of the once numerous group of Tetrabranchiate Cephalopods. (See MOLLUSCA.) The animal differs from that of other Cephalopods (squids and cuttlefish) by having numerous tentacles, an eye formed on the type of the pin-hole camera (i. e. without a lens), four gills, and a chambered shell. This shell is well known. It is coiled in



Section of a nautilus, showing its interior.

a flat spiral, and the interior is divided by partitions into numerous chambers, which are connected with each other by a tubular structure, the siphuncle. The animal occupies the large outer chamber. The only existing genus is *Nautilus*, and of the habits of this almost nothing is known, for while the shells—familiar as the "pearly nautilus"—are

common, the animals are among the greatest rarities. These animals feed on small crabs. Fossil forms belonging to this family are numerous, over 2,000 species being described; only six living species are known. J. S. Kingsley.

Nauvoo: city (founded by Mormons in 1840, subsequently occupied by a company of French Icarians, now settled principally by Germans); Hancock co., Ill. (for location of county, see map of Illinois, ref. 5–B); on the Mississippi river, at the head of the lower rapids; 8 miles S. of Fort Madison, Ia., 12 miles N. of Keokuk. The nearest railway station is that of the Chi., Burl. and Quincy, at Montrose, Ia., directly opposite, which is reached in summer by ferry and in winter on the ice. The city contains 5 churches, high school, 3 district schools, St. Mary's Academy for girls, a State bank with capital of $25,000, and 2 weekly newspapers. The prineipal business is agriculture and horticulture. About 100,000 gal. of wine are made annually, and from fifty to eighty carloads of table-grapes and twenty of strawberries are shipped each season. For events during the Mormon occupation, see Mormons. Pop. (1880) 1,402; (1890) 1,208; (1900) 1,321. Editor of "Independent."

Navajos: See Athapascan Indians.

Naval Academies: schools especially devoted to the training of officers for the naval service.

France.—Speeial instruction in the art of war originated in France, but it was carried on with no well-defined policy until 1810, when two schools for the navy were established, one at Brest, the other at Toulon. In 1816 they were united at Angoulême, and in 1827 the school was removed to Brest, where it has since remained. The naval school is on board the Borda, an old ship of the line, anchored in Brest roads; at its head is a captain, assisted by a commander, and a staff of 8 lieutenants, 12 professors, and 1 principal mechanician (engineer) as instructors. About 45 candidates are admitted annually. Admission is gained to the school by public competitive examinations held annually in various parts of the country. The qualifieations, in addition to a good bodily constitution and an age between fourteen and seventeen years, comprise a knowledge of history, geography, French, English, Latin, drawing, physics, chemistry, arithmetic, algebra, geometry, plane trigonometry, and analytical and descriptive geometry. The course of instruction embraces literature, history, geography, English, drawing, physics, chemistry, astronomy, analytical and mechanical science, naval architecture, and the theory and practice of seamanship, gunnery, steam-engineering, and small-arms. These are supplemented by praetical exercises and drills of various kinds, and by an annual practice cruise of two months. The discipline maintained is severe and the students, from whom over ten hours' daily work, Sundays included, is expected, are subjected to constant surveillance. With certain exceptions, the pupils are required to pay 700 franes yearly for subsistence, and 1,000 francs for outfit. After two years at the school those found qualified at the annual examination are transferred, with about four graduates yearly from the Polytechnic School at Paris, to the Flore, a screw steamer, eighteen guns, for the final practice eruise of ten months, after which, upon passing an examination in professional subjects, they become eligible for active service as midshipmen.

The school of naval architeeture, founded in Paris in 1765, and after several changes finally established at Cherbourg in 1872, is under the management of the naval construetors, the corps which designs and supervises the construction of ships and engines for the navy. At the head of the sehool is a director of naval construction, who gives instruetion, assisted by two naval constructors and two civil professors. The course of instruction covers two years, and ineludes the following subjeets: Ship-building, strength of materials, naval architecture, free-hand, mechanical, and ship and engine plan-drawing, workshop technology, steam-engine, thermodynamics, naval ordnance, compass deviation and compensation, aecounts, and English. Graduates of the Polytechnic School to the number of four annually are assigned to this school, where they receive theoretieal instruetion for eight months of the year, and practical illustration for the remaining four months in the dockyard at Cherbourg (first year) and in the national engine works at Indret (second year). Those found qualified at the end of the course are appointed assistant naval constructors. Private students having the necessary qualifications are admitted to this school by permission of the Ministry of Marine, and upon the conclusion of the course are given diplomas stating the work done and the proficiency attained.

The gunnery school for officers is on board the Souverain, twenty-five guns, at Toulon; in special cases the course is two years. At Lorient there is an artillery school for the instruction of officers of the marine artillery exclusively, and at the same place a number of officers are annually trained at small-arms. A torpedo-school was established at Boyardville, Isle of Oleron, in 1869, and transferred in 1886 to Toulon. Lately it has become the school of submarine defense, that of torpedoes having been separated and placed on board the Algesiras at Hyères. The course is five months, but those who show special aptitude receive a supplementary course of four months; the instruction is both theoretical and practical. Special schools are also maintained at the various naval ports for the training of officers of the medical and commissariat staff, the course lasting in both classes two years. In France, engineer officers of the navy are selected from mechanicians.

Great Britain.—The system is complex, and the changes made since the foundation of the Royal Naval Academy at Portsmouth in 1729 have been many; they have resulted in the formation of two schools, one for the training of naval cadets, the other for the education of officers of higher rank. The training-school for cadets, established in 1857, at first at Portsmouth, but now on board the Britannia, at Dartmouth, is in charge of a captain, assisted by 9 officers, 9 naval instructors, 2 French, 1 Latin and 2 drawing masters, and 6 warrant officers. About 40 cadets are appointed to the school semi-annually by the admiralty, the qualifications for admission being, in addition to a sound physique and an age between thirteen and fourteen and a half, knowledge of elementary mathematics, English, French, Latin, and Scripture history. The cadets are required to pay for their outfit, clothing, materials used, and also a fee of £70 yearly (in some cases reduced to £40), but receive their subsistence and a small weekly allowance for pocket-money. The course of study embraces arithmetic, algebra, geometry, plane and spherical trigonometry, astronomy, navigation, dictation and composition, physics, and French, and lasts two years; the cadets are then sent to sea, and after a year's serviee become ensigns. After five years' sea-service, and after attaining the age of nineteen, the ensign is examined, wherever he may be, in seamanship, and upon passing receives an appointment as acting sub-lieutenant. He then returns to England for instruction and examination in navigation and gunnery, and if successful is commissioned sub-lieutenant.

The Royal Naval College was re-established in 1873 at Greenwich, to provide for the education of officers of all ranks above midshipmen in theoretical and scientific study bearing upon their profession. At its head is a flag-officer, assisted by a captain, a civilian director of studies, and a corps of thirty-one professors and instructors. Courses of study (compulsory) are provided for acting sub-lieutenants, gunnery and torpedo lieutenants, naval construction students, acting assistant and assistant engineers, probationary lieutenants of the marine artillery, naval instructors, and (voluntary) for other officers on half-pay, and private students. The courses vary in length from six months for acting assistant engineers and sub-lieutenants to three sessions of nine months each for construction students and assistant engineers.

The gunnery-school is on board the Excellent at Portsmouth; the course for gunnery lieutenants is six months, for acting sub-lieutenants, marine artillery, and other officers, three months. The torpedo-school is on board the Vernon, also at Portsmouth; the course lasts nine months.

United States.—The U. S. Naval Aeademy was founded in 1845 by George Bancroft, Secretary of the Navy during the administration of President Polk. For several years prior to this there was a school at the Naval Asylum in Philadelphia, where the midshipmen prepared themselves for examination for promotion. The Naval School, as it was at first called, was formally opened Oct. 10, 1845, in Fort Severn, at Annapolis, Md., which had been transferred by the War to the Navy Department for the purpose. The course was fixed at five years, of which the first and last only were to be passed at the school, and the intervening three at sea. The first midshipmen that received a course of instruction and graduated from the school were those who entered the serviee in 1840. In 1850 the school was reorganized; the name was changed to the U. S. Naval Academy; the course was increased to seven years, the first and last two years to be passed at the school, the intervening three at sea; the number of instructors was increased, and separate departments of instruction established; a vessel

was provided, and annual practice cruises instituted; and provision was made for an annual board of visitors to inspect and report upon the condition of the school to the Secretary of the Navy. In 1851 the requirement of sea-service was abolished, leaving the course four consecutive years of study.

At the outbreak of the civil war in 1861 the Naval Academy was removed to Newport, R. I., where it remained until the summer of 1865, when it was re-established at Annapolis. In 1870 the title of cadet-midshipman was substituted for that of midshipman, and three years later the course was increased by the addition of two years' sea service in cruising vessels, at the expiration of which the cadet-midshipman returned to the Naval Academy for examination in professional subjects prior to final graduation. In 1866 the education of engineer officers was begun at the Naval Academy by the admission of a class of acting third assistant engineers, who pursued a special course of instruction for two years. Later cadet-engineers were admitted annually until 1882, when it was provided by act of Congress that naval cadets should be appointed in place of cadet-midshipmen and engineers, and that from those who successfully completed the six years' course appointments should thereafter be made to fill the vacancies in the lower grades of the line and of the engineer and marine corps, and that those for whom no vacancy existed should be discharged with a year's pay. By act of Congress, Mar. 2, 1889, it is provided that the academic board shall, prior to the beginning of each academic year, separate the first (highest) class of naval cadets into two divisions in the proportion which the aggregate number of vacancies that have occurred during the preceding fiscal year in the lowest grades of commissioned officers of the line and of the marine corps shall bear to those which have occurred in the engineer corps, and that the cadets so assigned shall thereafter pursue separate courses of study: those in the line and marine division, one arranged to fit them for service in the line of the navy; those in the engineer division, one to fit them for service as naval engineers. It is further provided that all vacancies in the line and in the marine and engineer corps shall be filled by appointments from final graduates at the end of the six years' course, in order of merit, the assignments to be made by the Secretary of the Navy upon recommendation of the academic board.

At the head of the Naval Academy is the superintendent, a naval officer of high rank, who is assisted by the commandant of cadets, and by the academic board, which is composed, in addition to the foregoing, of the heads of the different departments of study, who are, with one exception, naval officers. One naval cadet is allowed for each member and delegate of the House of Representatives, and, by appointment of the President, one for the District of Columbia, and ten for the country at large. Should a member of Congress fail to fill the vacancy that may exist in the cadetship for his district by July 1, the Secretary of the Navy is authorized to do so. In the regular sequence of affairs vacancies occur therefore in cadetships once in six years. The examinations for admission are held at Annapolis in May and September; the requirements, in addition to robust constitution, freedom from physical defects, and an age between fifteen and twenty years, are a knowledge of spelling, grammar, geography, history of the U. S., arithmetic, and algebra as far as equations of the first degree. If admitted, cadets are required to sign an engagement to serve in the navy for eight years, unless sooner discharged, and to make a deposit of $200 to cover the cost of outfit; the expenses of travel from their homes to Annapolis are refunded to them, and they receive $500 a year, but are required to pay for their subsistence, clothing, and other expenses.

For the first three years all the cadets pursue the same course of study, which includes English studies, history, French, Spanish, or German, algebra, geometry (including descriptive and analytical), trigonometry, calculus, mechanics, astronomy, physics, chemistry, mechanical drawing, and seamanship. During the fourth year the course of study is the same for both divisions of the class in naval construction, method of least squares, applied mechanics, electricity, and hygiene, but while the cadets of the line division pursue a course in seamanship, ordnance, gunnery, infantry tactics, navigation, surveying, compass deviation, and international law, those of the engineer division receive a separate course of instruction in marine boilers and engines, and in designing machinery. The academic year begins Oct. 1 and ends May 31, and is divided into two terms; the system of instruction is by means of daily recitations (oral), and by monthly, semi-annual, and annual examinations (written); those found physically or mentally disqualified at the half-yearly examinations are dropped; the instructors are almost exclusively naval officers. The course of study is supplemented by a very thorough system of practical exercises in seamanship, signals, management of boats under oars and sail, and of steam-launches, in infantry, howitzer, and great-gun drill, in ordnance, gunnery, and torpedoes, in marksmanship with revolvers, rifles, and rapid-fire guns, in navigation, surveying, and compass deviation, in machine-shop work and in running engines, and in athletics, including fencing with small and broad swords, bayonet exercise, boxing, swimming, and dancing. The departments of study are amply illustrated by models and apparatus of all kinds; the observatory contains a large collection of instruments, including an equatorial teleseope; the library contains 32,000 volumes. The Monongahela, a wooden sailing vessel, and the Bancroft, a steel barkentine-rigged vessel, 838 tons displacement, with triple-expansion engines, and twin screws, carrying an armament of four 4-inch rapid-fire guns, and seven guns of smaller calibers, with tubes for both Howell and Whitehead torpedoes, are stationed at the Naval Academy for purposes of instruction in sail and spar drill, and in great-gun, torpedo, and other exercises, and for use in making the summer practice cruises.

Immediately after the annual examination the cadets of the graduating class are ordered to cruising vessels for the two years' service prior to final examination; the first and third classes, with the candidates that have been admitted, are embarked on board the practice-vessels for the annual cruise of three months; the second class remains at the academy for practical instruction in the machine-shop for a month, and then joins the others on the cruise. All the cadets, except those of the fourth class, are granted leave to visit their homes in September.

The limits of this article do not permit description of other systems of naval education; in general, it may be said that all nations making any pretensions to naval power provide for the training of naval officers; the methods pursued resemble more or less closely those already described above.

Naval Architecture: See Ship-building.

Naval Signals: the means of transmitting intelligence at sea by the agency of sight or hearing. The code of day and night signals used in the U. S. navy is contained in two volumes—the *General Signal-book* and the *Fleet Drill-book*. The first contains about 7,000 words and sentences arranged alphabetically and regularly numbered. Resort is had also to a vocabulary of some 10,000 conversational words, to which is added an alphabet and a geographical list of nearly 11,000 places, each letter and word having its appropriate number. The *Fleet Drill-book* relates to the tactical formations of a fleet or squadron. Now, every vessel in the navy having a set of these books, it is only necessary, in order to signal a message from one ship to another, to indicate the volume and the number in that volume corresponding to the required words or sentences. To do this there are nine rectangular signal-flags representing the digits, one to stand for zero or ten, and three triangular pennants called *repeaters*, wherewith to make duplicate numbers. The sentence, for example, "Anchor in the order of steaming" may stand opposite No. 112 in the signal-book. To make this we first bend on signal-flag No. 1, next the first repeater, and lastly No. 2. Had the signal been No. 122, we should first bend on signal-flag No. 1, then No. 2, and lastly the second repeater, because the second number in the hoist is to be repeated; and so on. The lowest flag in the hoist represents the units. Besides the above-named flags there are the cornet, the danger-signal, the guide-flag, the annulling flag, the telegraph flag, the dispatch, quarantine, and convoy flags; also the answering pennant, the preparatory, interrogatory, numeral, geographical, and position pennants, their names suggesting their uses, save the cornet, which indicates a vessel's number in one case, and serves as a recall in another. Flags of various colors are available as signals only for a distance but little over 3 miles. Beyond that long-distance signals are used, such as the semaphore, the collapsing drum, or the use of cones, balls, and squares—in which the shape takes the place of color. *Night-signals* are made according to the system of Lieut. E. W. Very, U. S. navy, by which fire-balls

or stars are shot to a height of about 400 feet. Only two colors are used, red and green, with which any desired signal may be made, a rocket being used to indicate a ship's number and as a signal of execution. Electric lights are now used for distant night signaling. The search-light may be used for signaling a ship below the horizon, by reflecting the light on a cloud. Signals have been exchanged in this manner between two ships 60 miles apart. *Fog-signals* are made by firing guns, blowing horns, the steam-whistle, and by sounding the ship's bell. The long and short blasts of the steam-whistle, by representing the two elements of the army code, furnish the means of signaling in thick weather.

The army code, as it is generally called, invented by Gen. A. J. Myer, U. S. army, is used, with certain modifications, as a part of the naval signal system. By this method the signalman spells each word of the message, shortening the process by abbreviations. The letters of the alphabet are represented by signs, each sign and its corresponding letter having an arbitrary number assigned to it. A, for example, may be represented by 22, B by 2112, C by 121, etc. The usual manner of making these numbers is by a flag attached to a staff and waved by the signalman. At night the staff is surmounted by a torch. The signalman, facing the point of communication, and holding the staff in a vertical position to his front center, dips his flag to the right to represent 1, to the left for 2, and to his front for 3, each dip describing the quadrant of a circle. Nos. 1 and 2 are made in a vertical plane at right angles to the line of communication; No. 3 in a vertical plane in that line. All the letters of the alphabet are made up of combinations of 1 and 2, No. 3 being used to mark the end of a word, and when repeated the end of a sentence or message. Two practiced signalmen can communicate freely by this method, transmitting with accuracy and expedition long messages. Its great advantage consists in not requiring a signal-book. See SIGNAL-SERVICE.

The international code of signals furnishes a species of universal language to the entire maritime world. One system of flags having been adopted by all nations, and each one having a signal-book common to all, printed in its own language, it is plain that on the meeting of two ships at sea signals may be made and understood whatever their respective nationalities. A full explanation of the system may be found in the preface of *International Code*, together with a description of distance signals, semaphore, boat, and weather signals. S. B. LUCE.

Naval Tactics: See TACTICS.

Navarino, năă-vă-ree'nō (anc. *Pylos*): town of Greece; in the Peloponnesus, on the Bay of Navarino; situated on a rocky promontory, with a strong citadel (see map of Greece, ref. 18–J). Pop. (1889) 2,128. In the harbor the Turco-Egyptian fleet was destroyed by the allied British, French, and Russian fleets Oct. 21, 1827. The former consisted of 120 vessels of all sorts, carrying 2,240 cannon; the latter of only 26 vessels, with 1,324 cannon. The Turco-Egyptians lost 3 ships of the line, 16 frigates, 26 corvettes, 12 brigs, and 5 fire-ships, and 6,000 men killed. The allies lost one gunboat, 140 men killed, and 300 wounded. See MEHEMET ALI PASHA. E. A. GROSVENOR.

Navarre (Span. *Navarra*): a province of Northern Spain; between the Pyrenees and the Ebro. Area, 6,046 sq. miles. Pop. (1887) 304,122. The whole country is mountainous, traversed by branches of the Pyrenees, whose tops generally are bare, while their sides are covered with forests of beech-trees or afford excellent pastures where numerous cattle and sheep are reared. The mountains, which contain much iron and salt, inclose many beautiful and fertile valleys, such as that of Roncesvalles and Roncal, which produce wheat, olive oil, figs, grapes, chestnuts, and many varieties of fruits. The inhabitants are an almost pure Basque race, speaking the Basque language to a considerable extent (see BASQUES), and very jealous of their old customs and privileges; they are hardy, industrious, and hospitable. Besides agriculture, cattle-breeding, and manufactures of iron, glass, paper, and soap, they are much engaged in hunting and in smuggling. The old kingdom of Navarre (which originally included also what is now the French department of Basses-Pyrénées) successfully resisted the invasions of the Saracens, and remained independent until Ferdinand and Isabella conquered it in 1512 and annexed it to Aragon; it preserved many peculiar privileges, however, which were not finally abolished until 1876.

Navarrete, năă-vaăr-rā'tā, FRANCISCO MANUEL, de: poet; b. at Zamora, diocese of Michoacan, Mexico, July 16, 1768. On the completion of his studies at Zamora he went into business in the city of Mexico, but felt a strong call to the religious career, and about 1787 became a Franciscan. He obtained much fame as a preacher, and on account of his scholarship was made Professor of Latin in the college of Valladolid. His first poems were published in the *Diario de Méjico* in 1805, and before his death he had composed a considerable quantity of verses, some of them upon religious themes, but others modeled upon the works of his beloved Latin poets. He died July 19, 1809, in the monastery of Tlalpujahua, after trying, it is said, to burn all he had written; but his brother was able to gather a considerable body of poems and to issue them under the title *Entretenimientos poéticos del P. Navarrete* (Mexico, 1823; Paris, 1835). A. R. MARSH.

Navarrete, MARTIN FERNANDEZ, de: naval officer and historian; b. at Avalos, Logroño, Spain, Nov. 8, 1765. He entered the navy in 1781 and took part in the attack on Gibraltar Sept., 1782; in 1789 he had attained the rank of lieutenant, and was already known as a promising author. He then received orders to collect documents relating to the Spanish navy, and for this purpose he examined all the principal archives and libraries of Spain. Returning to active service in 1792, he served against the French; in 1796 he was attached to the Department of Marine, holding important positions in it until 1807, when he resigned rather than recognize Joseph Bonaparte. After the restoration he was again given office, and for many years he was one of the highest authorities on naval affairs. From 1823 he was director of the hydrographic office, and from 1824 director of the Madrid Academy of History, which owed its fame largely to his exertions. In later life he was several times senator. His best-known work is the collection of annotated documents entitled *Colección de los viajes y descubrimientos que hicieron por mar los Españoles desde fines del siglo XV.*, etc. (7 vols., 1825–65). He also wrote *Vida de Cervantes*, published by the Academy with its edition of *Don Quixote* (1820); *Biblioteca marítima española* (posthumous, 1851), etc. He edited the first four volumes of the great collection of documents relating to the history of Spain. D. at Madrid, Oct. 8, 1844. HERBERT H. SMITH.

Navasota: city; Grimes co., Tex. (for location, see map of Texas, ref. 4–I); at the confluence of the Brazos and the Navasota rivers, and on the Houston and Texas and the Gulf, Colorado and Santa Fé railways; 70 miles N. of Houston. It is in an agricultural and cotton-growing region, and is principally engaged in milling and several branches of the cotton industry. It contains a national bank, a private bank, and three weekly newspapers. Pop. (1880) 1,611; (1890) 2,997; (1900) 3,857.

Nave [viâ O. Fr. from Lat. *navis*, ship, Mediæv. Lat., body of a church > Mod. Fr. *nef*, Ital. *nave*]: in architecture, a term used to designate in general the principal hall of a church as distinguished from the choir, transepts, chapels, or side aisles. It is also sometimes applied in secular architecture to large and imposing halls of more than usual length and loftiness, which resemble in form and proportion the nave of a church. The typical arrangement of the nave and side aisles in Christian architecture was derived from the Roman secular basilicas. These were halls with nave, side aisles, a species of transept, and an apse or tribune. The naves, separated from the aisles by arcades or colonnades, were lighted by clerestory windows and covered with wooden roofs, sometimes with open trusses, sometimes with richly paneled or coffered ceilings. In a cruciform church the nave extends from the front to the transepts, and is commonly flanked by single or double side aisles on either hand. There are, however, many parish churches in England having a double nave, i. e. two nearly or quite equal naves side by side, without side aisles. In Southern Europe especially, though not exclusively, there are also many churches having a nave flanked by chapels without intervening side aisles, as in the cathedral at Alby in France, the cathedral at Gerona in Spain, and in a number of Italian churches of the Renaissance. In churches with a nave and aisles the former is separated from the latter either by columns, as in the early Christian basilicas of Rome and the East and their mediæval copies in Italy, or by piers, square, polygonal, or clustered, as is the case in all Romanesque, Lombard, Norman, and Gothic churches, and generally in those of the Renaissance. The piers or columns sustain arches called *pier-arches*, upon

which are built the upper side walls of the nave, which rise above the side-aisle vaulting and roofs, and are piereed with windows; the wall thus pierced is called the *clerestory*. Above it is the ceiling or vault of the nave. In most mediæval churches of importance in France, England and Western Europe generally the broad band of wall between the pier arches and clerestory windows, corresponding to the "lean-to" roofs over the side-aisle vaulting, is piereed with arches forming a *triforium* or gallery; but many German churches, and a few elsewhere, have the side aisles nearly or quite as high as the nave, all the light being received from windows in the side walls. Another type of basilica nave that was destined to profoundly influence Christian architecture was evolved in the basilica of Maxentius and Constantine, where the tepidarium halls of the greater thermæ were imitated with their huge groined vaults in three compartments spanning the great hall, while the three compartments or bathing recesses on either side were converted into side aisles by piereing arches through the wing walls or buttresses separating these recesses. These wing walls, continued above the vaulted roofs of the side aisles, formed buttresses to withstand the lateral thrust of the nave-vaulting. This Constantinian type of nave, with the substitution of domical for groined vaulting, became the prototype of Byzantine structures like Aya Sofia ("St. Sophia" so called) in Constantinople. It had the advantage of greater loftiness as compared with the earlier types, and of being thoroughly fireproof. It solved in one way the problem of the vaulted nave with side aisles which the architects of the Middle Ages afterward sought for 300 years to solve in another way. Gothic architecture is indeed the outcome of long-continued experiments in the adaptation of vaulting to the typical basilica plan of pagan and early Christian Rome. (See ARCHITECTURE.) In this effort to vault with masonry the nave as well as the aisles of the original basilica type by methods which reached their culmination in the splendid cathedrals of the thirteenth and fourteenth centuries—like Salisbury, Amiens, Strassburg, and Cologne—the nave took on an entirely new form. In place of the monolithic columns which formerly separated it from the aisles, heavy piers—square or round in the earlier examples, but in the later ones resembling clusters of shafts about a central core—sustained the greatly thickened clerestory walls by means of heavy arches richly moulded, some of the shafts being carried up to receive the spring of the ribs of the groined vaulting. The width of the nave was considerably reduced owing to the difficulty of constructing vaults of large span, while the span of the pier-arches was increased, the number of bays in the nave being correspondingly reduced. As the complexity, refinement, and perfection of the construction advanced, the piers were made lighter and loftier; each vaulting-rib was given its own shaft, carried clear to the ground; the arches, at first round, became pointed; the clerestory was made higher and its wall-surface treated as a mere screen between the vaulting and the supporting shafts; the clerestory windows were made of enormous size, and filled with magnificent stained glass held by elaborate geometric or "flowing" tracéries in stone; the triforium was made a wholly subordinate but ornate feature between the clerestory and the pier-arches; and in England, and to some extent in Germany, the vaulting itself was made highly decorative by the rich patterns of a complex system of vaulting-ribs. In Italy, however, the Gothic system was never comprehended, and the broad divisions and ample scale of parts of the old Roman vaulted halls seem to have prevailed in such naves as that of the Duomo at Florence, where there are only five bays of nearly 55 span each, against an average span of 18 to 25 feet for the 7 to 12 bays of French and English Gothic naves. The English naves are lower than the French, 70 to 80 feet to the crown of the vault being a common height, against 100 to 150 feet for the French; but the vistas of English naves are, on the other hand, enhanced by the almost excessive length of the choirs beyond.

In the Renaissance period Italy took the lead in the building of imposing churches; the dome at the crossing of the nave and transepts became the central and culminating feature of the design, and this arrangement was imitated in most of the large Renaissance churches of England, France, and Germany, as at St. Paul's (London), the Panthéon (Paris), and many others. Of the Italian churches St. Peter's is the archetype; its stupendous nave, 330 feet long to the opening of the dome, is 87 feet wide and 153 feet high. In this, as in most of the Italian churches of the Renaissance, the vault is a barrel-vault with penetrations, richly adorned by paneling executed in stucco and gilded. The arrangement of piers, invariably treated with one or another of the classic orders, varies greatly, with corresponding variety in the architectural effect of the nave. Stucco enrichments, inlays of precious marble, and sumptuous pictorial decorations in fresco on the vaults and spandrels contribute to these effects. See articles *Architecture* and *Cathédrale* in Viollet le Duc's *Dictionnaire Raisonné*; Mrs. Van Rensselaer's *English Cathedrals*; Parker's *Gothic Architecture*; Lübke's *Mediæval Architecture*; Prof. Moore's *Development of Gothic Architecture*; Fergusson's *History of Architecture* and *History of Modern Architecture*; also ARCHITECTURE and RENAISSANCE ARCHITECTURE. A. D. F. HAMLIN.

Na'vesink (or **Neversink**) **Highlands**: a range of hills on the south side of Sandy Hook Bay, in Monmouth co., N. J. They are important landmarks to ships approaching New York. The highest point, Mt. Mitchell, is 282 feet high. Two first-class lighthouses, 53 feet high, stand 100 feet apart on ground 195 feet high. The southeasternmost tower is in lat. 40° 23′ 43″ N., lon. 73° 58′ 49″ W. Both show fixed white lights.

Navicular Disease: See FARRIERY.

Navigation [from Lat. *naviga'tio*, a sailing, deriv. of *naviga're*, sail; *na'vis*, ship + *a'gere*, lead, drive, conduct]: the art of conducting a ship from port to port and across the ocean with safety and dispatch, and, more particularly, of determining her position from time to time on the face of the globe by observations of the heavenly bodies.

The inhabitants of ancient Sidon were the pioneers in this branch of knowledge. Neglecting the history of its development, this article gives a brief description of the practical navigation of a ship in making a voyage. The reader is referred, for a complete understanding of the subject, to Coffin's *Navigation and Nautical Astronomy* and to Bowditch's *Navigator*.

Before proceeding to sea, the ship should be furnished with charts of the ocean to be traversed; a sextant or octant, a compass fitted with attachments for observing azimuths; a nautical almanac for the current year; a chronometer running on mean time whose error for a given meridian (generally that of Greenwich, England) and daily rate of error are known; a standard work on practical navigation; a lead-line properly marked for taking soundings; and a log-line for measuring the ship's speed. When the cargo is stowed and the vessel otherwise ready for sea the local deviation of her compass should be determined. In iron or steel-built ships the local deviation, due to the magnetism of the ship, is usually very great, and renders the compass unreliable. When this is found to be the case, the compass is adjusted by placing near it other magnets which neutralize the ship's magnetism. These are generally horizontal magnets, acting in the direction of the ship's magnetic force; a vertical magnet directly under the center of the needle; vertical soft iron bars, called Flinders bars, with one end on the level of the compass needle; and two hollow spheres of soft iron, placed on a line through the center of the compass, with their centers in the plane of the needle, and at equal distances from the compass. Full directions for determining the deviation and for the adjustment of the compass will be found in the *Admiralty Manual of Compass Deviation*.

As the ship stands out to sea a *departure* is taken. This is finding the ship's latitude and longitude from the chart by the bearing and distance of one landmark, or from the bearing of two or more marks whose positions are laid down on it. As soon as this departure is taken the *course is shaped* for the port to which the ship is bound, due regard being had for the winds, currents, and dangers to navigation to be encountered by the way, and from this time on the courses steered, the speed of the ship, etc., are duly noted in the log-book. Suppose the ship sails at night. At or about 8 A. M., or, better still, when the sun bears most nearly true E., and yet has sufficient altitude to avoid the irregular refraction near the horizon, its *altitude* (angular distance above the sea horizon) is measured with the sextant, and the instant of observation is noted by the chronometer. With the latitude and longitude of the ship at the time of taking the departure, with the courses and distances sailed, the former corrected for variation, leeway, and deviation to the time of the observation, we compute by trigonometry the latitude and longitude, or the position by *dead reckoning*. From the altitude of the sun observed (corrected, as all altitudes of the sun taken at sea have to be, for semi-diameter, parallax, dip, refraction, and the index error of the sextant), we

have the true altitude of the sun's center as seen from the center of the earth; from *The Nautical Almanac* we obtain the sun's declination for the instant of the observation; and by the dead reckoning we have the approximate latitude, data giving the three sides of the astronomical triangle; and from this we compute one of its angles, the hour-angle of the sun, the local apparent time, which is converted into mean time by the application of the equation of time taken from the almanac; the difference between the local mean and the chronometer times gives the longitude by observation. When taking the sun's altitude its bearing by compass and the ship's heading by compass should be noted. With the same data as above the sun's true bearing can be computed, and by comparing its true and compass bearings the errors of that compass on that heading of the ship are obtained.

Near noon the observer again begins to observe the sun, and continues to do so as long as the altitude increases, noting the sextant reading at the greatest altitude attained. The sun is said *to dip* when the altitude begins to decrease. The greatest altitude is assumed to be that when on the meridian, which is correct within small limits. By combining the sun's meridian altitude with its declination we obtain the declination of the zenith, which is the latitude of the position. The ship's run worked from the place of departure gives the *latitude and longitude by dead reckoning*; from the longitude by the A. M. observation corrected for the ship's run to noon we have the *longitude by observation*, and from the meridian altitude the *latitude by observation*. Any difference between the ship's position by observation and dead reckoning is ascribed to *current*, and its set and amount are the bearing and distance of the position by observation from that by dead reckoning. From the noon position by observation the reckoning begins as from the place of departure. In the afternoon, when the sun bears most nearly W., the observations for longitude and variation are repeated, and the above observations continue daily throughout the voyage.

The sun, however, may be obscured by clouds at the time of its crossing the meridian, and then it becomes necessary to resort to some other method than the one above given for finding the latitude. Appropriate formulas have been deduced for this by considering in the astronomical triangle the coaltitude, codeclination, and the hour-angle. This last, at sea, is always somewhat in doubt, but small errors in the hour-angle, when the angle itself is small, produce but slight errors in the latitude; under most circumstances good latitude results can be obtained from observations taken within one hour of the transit over the meridian. Observations of other heavenly bodies, as well as those of the sun, may be used for determining the latitude, longitude, and error of the compass. They are less resorted to, however, because of the difficulty of clearly seeing the horizon at night, this obscurity throwing some doubt upon the accuracy of all altitudes measured after dark at sea.

The position at sea can also be found by a method introduced to the nautical world by Capt. Thomas H. Sumner in 1843, and known as Sumner's method. If an altitude of the sun or other heavenly body be measured, and the Greenwich time noted, we can with its hour-angle and declination plot its position on a terrestrial globe. With this as a center and the coaltitude (zenith distance) as the radius, draw a circle; the observer was at the instant of observation somewhere on this circle. After the lapse of sufficient time repeat the above, and the observer, who is supposed to be stationary, will be found on a second circle. As he is thus on two circles he must be at one of their intersections. In practice the observations are so timed that the interseetions are far apart, and the observer has no difficulty in knowing at which one he is. It is not essential that he remain stationary between the observations, as by appropriate reductions any change may be allowed for. In practiee the plotting is made upon a chart, and only a small part of the circumference coming within the belt in which the ship is known to be is laid down, and that by points computed from eaeh observation. The line joining the points calculated from one observation is called the *line of position*. The intersection of the lines obtained from the two observations gives the ship's position. The bearing of the heavenly body is always at right angles to the line of position, and the method gives the best results when the azimuth at the time of the second observation differs from that at the first by about 90°. The line of position is of much use in finding the bearing of the port in approaching land. For instanee, suppose we have determined a single line and laid it down on the chart and find that it cuts the land, say, 20 miles to the N. of the port to which we are bound. If we sail due S. for 20 miles and draw a line parallel to the first line, the ship is somewhere on this second one. As the new line passes through the port the course to the port is known, though not the distance; and by keeping a good lookout for the land and getting casts of the lead, the ship can sail on her way with confidence.

If, on a long voyage, the ship passes within sight of any known land, the longitude given by the land and that by observation should be compared as a check upon the running of the chronometer. The chronometer can also be cheeked by an observation called a *lunar*. The almanac gives for every three hours of Greenwich mean time the moon's angular distances (as seen from the center of the earth), from the sun, planets, and certain stars. Carefully measure with the sextant the distance between the moon and one of these heavenly bodies, and note the time by the chronometer. The angle measured can be reduced to what it would have been had the observation been made at the earth's center. By comparing our reduced angle with the almanac angle of the same magnitude for the body observed we obtain the Greenwieh mean time, which, compared with our noted time, gives the error of the chronometer.

The winds and currents of the ocean have a material influence upon the speed of ocean voyages, even with modern steamers; with sailing vessels they are most important, and are truly said to control the mariner in his course, and to know how to steer his ship on this or that voyage so as always to make the most of them is the perfection of navigation. The voluminous works of Horsburgh, Findlay, Kerhallet, and Maury contain full information as to the winds and currents. For many years Maury accumulated the logbooks from many ships in every part of the world, and tabulated and plotted the winds and currents they had encountered. The information thus collected has been graphically represented by the British Board of Trade, and conveys at a glance most complete information as to the winds and currents of the ocean highways. The approaches to the ports and the appearance of the land in their vicinity are described in local *Sailing Directions*, which are very complete for all parts of the globe, and are the guides for entering port and anchoring.

A. H. McCormick.

Navigation, Freedom of: the right to navigate freely the waters of seas or rivers. While the jurisdiction over the sea, near the land, and within bays and gulfs inclosed within not very remote headlands, is conceded to the territorial sovereign, it is admitted now on all hands that the open or high sea is common to all nations. Yet this rule has not always been conceded. Thus Portugal claimed the exclusive use of the African seas, together with the empire of Guinea, under a bull of Pope Nicholas V., given out in 1454. The pope's claim to do this seems to have been connected with his being the vicar of Christ, to whom the heathen were given "as an inheritance and the uttermost parts of the earth as his possession." The bulls of Alexander VI., issued in 1493, soon after Columbus had discovered America, carried out this assignment of parts of the world still further. One of them granted to Spain the lands lying W. of a meridian drawn 100 leagues W. of the Azores, and another divided the occupation of the seas between Spain and Portugal. It was to attack such pretensions, with others, that Grotius wrote his *Mare Liberum* in 1609. Other nations, especially Protestant ones, paid no regard to these grants, but the English in the seventeenth century claimed property in the narrow channels adjoining Great Britain, and on that account demanded that especial respect should be paid to their flag. This brought on war with Holland. In the peace of 1674 it was stipulated that even fleets should furl the flag and lower the topsails in honor of any English vessel of war between Cape Staten in Norway and Cape Finisterre in North Spain—quite beyond the claim of jurisdiction. Russia at a much later date claimed exclusive jurisdiction over the Pacific, N. of the 51st degree of latitude, on the ground that its territory, and no other, bordered on the ocean beyond that line; but this claim was abandoned in treaties made with the U. S. in 1824 and with Great Britain in 1825. All such claims may be considered as being now mere matters of history.

The free navigation of rivers forms another branch of this topic. Where a navigable stream flows through several countries and into the sea, by strict law exclusive rights of navigation of its lower waters and access to the ocean are

possessed only by the state within whose territory its mouth lies. Thus at the close of the eighteenth century the Spanish colony of Louisiana could impose its own conditions upon traffic on the Mississippi river between the Ohio valley and the Gulf of Mexico. In vain it was attempted to establish free navigation of the whole river as a natural right. Failing this, as necessity grew and liberal ideas also, partly through negotiation, partly through force, most of the great navigable rivers of the world have been made free to the world's commerce. By the Louisiana purchase the U. S. acquired the entire Mississippi. The Rhine and the Scheldt were opened at the Congress of Vienna in 1815; their free navigation was reaffirmed in 1831. In 1835 the Douro was opened to the common use of both Spain and Portugal. By various decrees and treaties between 1853 and 1859 the navigation of the Rio de la Plata system was declared free. The Treaty of Paris in 1856 opened the Danube. The Emperor of Brazil made the Amazon free by imperial decree in 1866. In 1854 the common right to navigate the St. Lawrence was arranged. This treaty expired in 1866, but the free mutual use forever of the St. Lawrence river, its canals, and Lake Michigan was again provided for by the Treaty of Washington in 1871, subject, however, to certain conditions and rights of regulation "on terms of equality." In 1871 also the navigable Alaskan rivers were opened to the free use of both Great Britain and the U. S. The treaty of 1846, which secured the Oregon country for the U. S., stipulated for the free navigation of the Columbia by the Hudson Bay Company and its trade. Lastly, at the Congo conference in Berlin, 1884–85, the free navigation of the Congo and the Niger was declared, subject to the regulations of an international commission. Thus in this direction little more remains to be asked for. These various decrees and treaties all prove that the free navigation of rivers has been granted as a concession, not secured as a right.

Navigation Laws: See International Law.

Navigator's Islands: a group of volcanic islands in Polynesia, now usually called Samoa (*q. v.*)

Navy [from O. Fr. *navie*, navy < Late Lat. *na'via*, ships, neut. plur. for Lat. *naves*, fem. plur. of *na'vis*, ship]: a fleet or assemblage of ships or vessels; specifically, the whole of the war vessels of a nation; the war marine of a state. Navies have grown out of either military necessities or the requirements of an ocean commerce obstructed by pirates. Trade and navigation may be said to be the parents of navies, those countries most largely interested in the former generally boasting of the most powerful fleets. While foreign trade produces wealth, and at the same time trains a class of men to the hardships of the sea, it requires protection and assistance in return. This is rendered by the military marine, whose service is largely recruited from the commercial. The Carthaginians, descended from the Phœnicians, were the most successful navigators of their day, their powerful navy being the natural offspring of an extensive ocean trade. The Romans, on the other hand, were not a commercial people. Their navy was forced into existence as an implement necessary in the great game of war, but it always occupied a minor position in comparison with their land forces. The military value of a navy was demonstrated in the earliest pages of its history. We may cite the first Persian invasion of Greece as the earliest case in point. Defeated at Marathon, the Persians hastily took to their ships, and threatened Athens. Having no navy to oppose them, it was only by the rapid march of Miltiades that the barbarians were prevented from landing again. The facility with which the Persians transported a large army to a great distance by means of their fleet; the advantage they enjoyed of striking the coasts of Greece at any particular point, and of afterward transferring the field of operations to other parts, imposing exhaustive marches on their enemies, taught the Greeks the necessity of a floating force. The Athenians were among the first known to authentic history to maintain a navy respectable in its character and distinguished for its organization, its discipline, and its efficiency. By a skillful use of this arm during the Peloponnesian war they were enabled to hold certain strategic points, giving them great advantage over their enemies, as Sestos, by which they kept control of the Hellespont and the corn-trade of the Euxine.

A navy proportioned to the commercial tonnage of a country and the extent of its shore-line is the best and least expensive protection to the coasts and commerce of that country. Since an efficient naval force (unlike an army) can not be improvised, every maritime state has found it necessary to maintain a permanent navy; and such navies have seldom lent themselves to the subversion of the political organization of the state. Besides the ordinary duties of policing the seas to keep down piracy and of affording a moral support to ministers at foreign courts and merchants in foreign trade, navies are constantly engaged in the fields of science, and have contributed generously to the common stock of knowledge and the advancement in civilization.

From these general views the reader may understand how and why navies have come into existence. To render it clearer, many examples might be drawn from modern history, but we may cite the origin of the U. S. navy alone as a fair illustration. In Sept., 1775, the British troops, closely invested in Boston, could receive supplies only by water. To intercept these, Gen. Washington, by virtue of his commission as commander-in-chief of all the Continental forces, detailed certain of his officers and men familiar with nautical pursuits to operate afloat in small armed cruisers. Vessels were purchased, fitted out, armed, and manned by the seamen of New England, and cruised in Massachusetts Bay with such success that, while depriving the enemy of necessary supplies, their prizes furnished the colonial army with such materials of war as alone rendered the successful prosecution of hostilities possible. The measures adopted by Washington being confirmed by Congress, other vessels were soon added to the list by legislative authority, prize-laws enacted, and a navy gradually formed. The country was so exhausted by the struggle that on the termination of the Revolutionary war the navy for a time passed out of existence. Its re-establishment under the present constitution furnishes another illustration. The commerce of the republic spread to every sea, but the new flag was treated with little respect by either civilized or uncivilized states: the former disregarded its neutral rights, the latter did not hesitate to offer it insult. The U. S. was bound therefore, in the interests of peace and civilization, to create a navy. Peace with Algiers put an end for a time to naval preparations, when statesmen were again admonished of the necessity of an armed force on the ocean by the depredations of French cruisers; but as hostilities with France were of short duration and never fully recognized, the first notable service of the young navy was to fulfill the mission for which it was primarily created by putting down the Barbary powers, who had been plundering U. S. merchantmen and imprisoning U. S. citizens. The successful prosecution of the war with Tripoli, by which the dey was compelled to recognize the laws of nations, redounded greatly to the credit of the navy. The war of 1812 with Great Britain was the next in which the navy was called to take a prominent part. Although the U. S. had nothing on the ocean that could contend against the powerful fleets of Great Britain, yet the few single engagements that were fought developed so much professional skill on the part of the officers, such fine qualities on the part of the seamen, that the republic soon saw itself possessed of all the elements for one of the finest navies in the world. On the lakes, where the forces of the two countries were more nearly equal, this was still more manifest, for the results of the victories gained on Erie and Champlain were immediate and important, the British themselves admitting that they lost there all but their honor. During the Mexican war and the civil war the field of operations of the navy was confined to blockading and to service on shore, there being no sea-going ships on either occasion to contend with.

The single fights of isolated cruisers, however heroic, rarely have any effect upon the ultimate results of a war. The real fighting strength of a navy is measured by its line of battle, and the U. S. has never had ships in sufficient number and of requisite military value to form a line of battle; so that in reality its strength as a naval power has never been tested.

Among the notable scientific undertakings of the navy of the U. S. may be mentioned the U. S. Exploring Expedition and that to Japan, the interoceanic canal surveys, Arctic voyages, and those for deep-sea soundings, the Pacific explorations for hidden dangers, and the distant voyage of the Swatara (which, like that of Capt. Cook to Otaheite in 1769, was undertaken for the purpose of observing the transit of Venus), and besides these the War College, the Naval Observatory, the Coast Survey, Hydrographic Office, torpedo station, and Naval Academy are all contributing to scientific research and the common stock of useful information.

Organization of the U. S. Navy.—The Constitution of the U. S. imposes on Congress the duty of providing and maintaining a navy, and of making rules for the government and regulation of the naval forces. It declares the President to be commander-in-chief of the army and navy, and requires him to commission all officers of the U. S. Such commissions continue in force only during the pleasure of the President of the U. S. for the time being. The Secretary of the Navy presides over the Navy Department, and is the duly constituted adviser of the President on all questions relating to naval affairs. In his former duties he is assisted by an assistant secretary and the chiefs of eight bureaus, as follows: Equipment, yards and docks, navigation, ordnance, medicine and surgery, supplies and accounts, steam-engineering, and construction and repairs. The chiefs of bureaus are appointed by the President, with the sanction of the Senate, for a term of four years, and while so acting have the relative rank of commodore, unless already holding a higher grade. The law declares that the orders of the chiefs of bureaus shall be considered as emanating from the Secretary of the Navy, "and shall have full force and effect as such." The active list of the line officers is divided into eleven grades, the number in each grade being limited by the act of Aug. 5, 1882, as given below. The relative rank between officers of the navy and army on the active or retired list is as follows:

The admiral of the navy	to rank with	general of the army.			
The vice-admiral	"	"	lieutenant-general	of the	army.
6 rear-admirals	"	"	major-generals	"	"
10 commodores	"	"	brigadier-generals	"	"
45 captains	"	"	colonels	"	"
85 commanders	"	"	lieutenant-colonels	"	"
74 lieutenant-commanders	"	"	majors	"	"
250 lieutenants	"	"	captains	"	"
75 lieutenants (jr. grade)	"	"	first lieutenants	"	"
Ensigns	"	"	second lieutenants	"	"

The offices of admiral and vice-admiral expired on the death of Admiral D. D. Porter and of Vice-Admiral S. C. Rowan.

All staff officers are appointed by the President, with the sanction of the Senate. By act of Aug. 5, 1882, the active list of the medical corps consists of 15 medical directors, 15 medical inspectors, 50 surgeons, and 90 assistant surgeons, with the relative rank respectively of captain, commander, lieutenant-commander or lieutenant, and of lieutenant (junior grade) or ensign. The pay corps consists of 13 pay-directors, 13 pay-inspectors, 40 paymasters, 20 passed assistant paymasters, and 10 assistant paymasters, having a like relative rank; and the engineer corps of 10 chief engineers having the relative rank of captain, 15 of commander and 45 that of lieutenant-commander, 60 passed assistant engineers, and 40 assistant engineers. The law authorizes the appointment of 24 chaplains, who are permitted to conduct public worship according to the manner and forms of the Church of which they are members. The law also authorizes the appointment of 12 professors of mathematics, and as many naval constructors as the service may require. The foregoing officers are commissioned. The President is authorized to appoint for vessels in actual service as many boatswains, gunners, sailmakers, and carpenters as may, in his opinion, be proper. These are called warrant officers. All officers not entitled to hold commissions or warrants, except secretaries and clerks, are called petty officers. The number of enlisted persons in the navy, including seamen, ordinary seamen, landsmen, mechanics, firemen, coal-heavers, apprentices, and boys, is limited by act of Mar. 3, 1893, to 9,000.

The pay of all officers of the navy is fixed by law, and may be seen by reference to the *Navy Register* issued for the year. The pay allowed to petty officers (excepting mates), and the pay and bounty upon enlistment of seamen and others of inferior rating, are left by Congress to the President, with the sole proviso that the total amount of pay for officers and seamen shall not exceed the amount appropriated for that purpose. By the act of Aug. 5, 1882, vacancies in the lower grades of the line, Engineer Corps, and Marine Corps are to be filled from the graduates of the Naval Academy. The Marine Corps forms part of the naval organization.

Naval discipline is maintained by the code embraced in the "act for the better government of the navy of the U. S.," commonly known as the "Articles of War." By navy regulation of Dec. 26, 1891, the ships of the navy of the U. S. are classed as follows:

Ships of 5,000 tons displacement and above are classed as *first rates*; those of and above 3,000, but below 5,000 tons displacement, as *second rates*; those of 1,000 and above, but below 3,000 tons displacement, as *third rates*; and all those of less than 1,000 tons displacement, as *fourth rates*.

Vessels are named by the Secretary of the Navy, under direction of the President, as follows: First rates after the States of the Union, second rates after cities, third rates after important events, or names connected with the naval history of the U. S., fourth rates after lakes and rivers of U. S. Vessels of special class to be named appropriately to the service for which they are designed. The number of cruising vessels (which are built of steel) has been fixed at seventy.

The act of Apr. 21, 1806, authorizes the President to keep as many ships in commission during peace as he thinks proper, but Congress practically limits the number by the amount annually appropriated for the maintenance of the navy.

The following table shows the area, docks, etc., of the navy-yards and stations of the U. S.:

NAVY-YARDS AND STATIONS.	Acres.	Dry docks.	Floating docks.	Ship houses.	Slips.
Portsmouth, N. H.	164	.....	1 balance.	3	3
Boston, Mass.	87½	1 granite.	.....	4	6
New London, Conn.	86				
Brooklyn, N. Y.	161 6/10	1 granite. 1 timber.	.....	1	4
League island, Pa.	922½	1 timber.			
Washington, D. C.	42	.....	.....	1	4
Norfolk, Va.	82½	1 granite. 1 timber.	.....	..	5
Port Royal, S. C.	41	1 building.			
Pensacola, Fla.	83¼	.....	1 sectional (in part only).	..	1
New Orleans, La.	22	1 appropriated for.			
Key West, Fla.	2½	.....	1 stern dock.		
Mare island, Cal.	900	1 granite.	1 sectional.	..	1
Puget Sound, Wash.	192¼	1 appropriated for.			
Sackett's Harbor, N. Y.	3½				
Coaster's Harbor island, Newport, R. I.	90				
Naval Home, Philadelphia, Pa.	24 6/10				

Shore Stations.—Naval apprentice station, Naval War College, and naval torpedo station at Newport, R. I.; Naval Academy at Annapolis, Md.; Naval Observatory at Washington, D. C.

S. B. LUCE.

Navy Department: that department of a government to which is intrusted the control and administration of its navy. The official designation for this department varies in different countries. That of Great Britain is called the Board of Admiralty, constituted by the lords commissioners for discharging the office of lord high admiral, a controller of the navy, and an expert civilian. Of these the first lord has supreme authority, and is a member of the cabinet.

That of the U. S. is officially denominated the Department of the Navy, and its head or chief is a civil officer, called the Secretary of the Navy, who receives his appointment from the President, by and with the advice and consent of the Senate, and is a member of the President's cabinet. His salary is $8,000 per annum, without allowances of any description. As the President is, under the Constitution, the commander-in-chief of the army and navy of the U. S., the Secretary of the Navy is in reality his representative in the Navy Department. With the exception of cases in which independent powers are specially invested in him by law, his acts are regarded as having the direction and sanction of the President, and have full force and effect as such. Prior to the establishment of the Navy Department the administration of naval and maritime affairs was intrusted to committees, agents, and boards appointed under resolutions and acts of the Continental or the Federal Congress, and for nearly ten years (1789–98) to the Secretary of War. The establishment of a separate Navy Department was due to the increase in the size and importance of the navy, which took place partly as a result of the naval contests with Great Britain, and partly from the necessity of affording a reasonable degree of protection to the maritime interests of the nation.

By the act of Apr. 30, 1798, it was organized as a separate department, to be denominated the Department of the Navy, the chief thereof to be called the Secretary of the Navy, whose duty it should be to execute such orders as he should receive from the President of the U. S. relative to the procurement of naval stores and materials, and the construction,

armament, and equipment of vessels of war, as well as to other matters connected with the naval establishment of the U. S. It is from this act, through the President, that the general powers of the Secretary of the Navy are derived. Subsequent acts have provided for the method of discharging the ministerial duties of the Secretary of the Navy, and under the present law the department is organized in bureaus. See NAVY (*Organization of the U. S. Navy*).

June 8, 1880, an act was passed authorizing the appointment of a judge-advocate-general of the navy, by and with the advice and consent of the Senate, from officers of the Marine Corps or the navy. The judge-advocate-general has charge, especially, of matters relating to courts martial, and assists the secretary in various ways and in other matters coming before the department; he is to a great extent his law-officer. If appointed from the Marine Corps, he has the rank and allowances of a colonel; if from the navy, that of captain.

The duties of the office of the Secretary of the Navy are performed under his immediate supervision. By act of Congress approved July 1, 1890, the office of Assistant Secretary of the Navy (once before created and abolished) was revived. The assistant secretary is appointed by the President, by and with the advice and consent of the Senate, and (under the clause in the legislative appropriation act approved Mar. 3, 1891) performs "such duties as may be prescribed by the Secretary of the Navy, or required by law." He is, by virtue of Section 178 of the Revised Statutes, Acting Secretary of the Navy during the absence of the secretary. There is attached to the office a chief clerk of the department. The chief clerk has the care and custody of the files and records of the office, and the supervision of the duties of the other clerks and the subordinate employees thereto attached. An office of naval intelligence, the head of which is an officer of the navy, designated chief intelligence officer, is attached to the secretary's office; also an office of naval war records, combined with the library, in charge of an officer of the navy, who is designated superintendent of naval war records.

Revised by S. B. LUCE.

Nax'os (in Gr. Νάξος): the largest and most fertile of the Cyclades islands; 20 miles in length and 14 in breadth. It was celebrated for its wine, and therefore was one of the chief seats of the worship of Dionysus. This fact is embodied in the myth of ARIADNE (*q. v.*), whom Dionysus found here after her abandonment by THESEUS (*q. v.*). For this reason the ancients thought that it had been colonized by Thracians, but in the earliest known times it was inhabited by Carians, who were driven out by Ionians and Cretans. Its shape is somewhat round, and hence in poetry it was called *Strongyle*. The island flourished most under Lygdamis the tyrant, who was put into power by Pisistratus. It was devastated by the Persians in 490 B. C. Four Naxian ships fought at Salamis on the side of the Persians. It then became a member of the Athenian confederacy, but was crushed by Athens in 466 B. C. and was colonized by Athenian citizens in 453 B. C. Chabrias gained a victory over the Spartans at Naxos in 376, and forced the island once more to join the Athenians. The island was then owned in turn by Macedonia and Egypt, and was given by Antony to Rhodes. Henceforth the island played an insignificant *rôle* until it was conquered by the Venetians in 1206 A. D., when it became the capital of a duchy and the center of Venetian power in the Ægean. It fell to the Turks in 1579, but now belongs to Greece. A range of mountains of white marble, similar to that of Paros, runs through the island. It is high, but contains many beautiful, well-watered, and fertile valleys, which produce wheat, wine, figs, and olives in abundance and of superior quality. See Gruter, *De Naxo insula* (Halle, 1833); Engel, *Quæstiones Naxiæ* (Göttingen, 1835); Dugit, *De insula Naxo* (Paris, 1867); Tozer, *Islands of the Ægean* (Oxford, 1890).

J. R. S. STERRETT.

Nazareans: See MANDÆANS.

Nazarene [from Lat. *Nazare'nus* = Gr. Ναζαρηνός, deriv. of Ναζαρέτ, Nazareth]: a term employed in several significations in the New Testament and in ecclesiastical history. As first used (Matt. ii. 23) it is applied to Christ's residence at Nazareth as the fulfillment of a prophecy that "he shall be called a Nazarene"; but as no such passage occurs textually in the Old Testament, the term has been referred to the Nazarites; or to *Netser*, "the Branch" (Isa. xi. 1): or, rather, it expresses reproach, Nazareth being a proverbially contemptible place (John i. 46).

Nazareth [= Lat. = Gr. Ναζαρέθ, Ναζαρέτ, from Heb. *Nazareth*]: a village of Palestine; in the ancient district of Galilee; 70 miles N. of Jerusalem; in the modern eyalet of Beyrout; celebrated as the place of the Annunciation and the abode of Christ during most of his life (see map of Palestine, ref. 6–D). The Roman Catholics have erected a church on the spot where the angel came to Mary to announce the birth of the Saviour, and the Greeks a church on another spot where the event took place, according to their belief. Chapels have also been built over Joseph's workshop and over Christ's table where he used to eat with his disciples. The village is in a little valley about a mile long and a quarter of a mile wide, just N. of the Plain of Esdraelon. From the hill overlooking the village is obtained one of the finest prospects in Palestine. The population in 1891 was about 7,500, and the Christian part of it is steadily increasing. Besides Mohammedans (about 2,000), there are Orthodox Greeks, Roman Catholics, Roman Catholic Greeks, Maronites, and a few Protestants.

Nazareth: borough (established 1740 by George Whitefield as the site for a school for Negroes, site soon abandoned and purchased by Count Zinzendorf, who established a settlement for Moravians in 1743, incorporated 1858); Northampton co., Pa. (for location, see map of Pennsylvania, ref. 4–J); on the Bangor and Portland Railway; 7 miles N. W. of Easton, 60 miles N. of Philadelphia. It contains the Whitefield House, erected in 1740, now belonging to the Moravian Historical Society, and having a valuable library and collection of Moravian antiquities; Nazareth Hall, the Moravian military boarding-school for boys, founded in 1785; four churches; graded public schools; board of trade, organized in 1877; fair grounds of the Northampton County Agricultural Society; manufactories of seamless underwear and hosiery, agricultural implements, paper boxes, and guitars; and a weekly newspaper. The borough has become noted as a quiet summer resort, and has many attractions for tourists. Pop. (1880) 984; (1890) 1,318; (1900) 2,304.

EDITOR OF "ITEM."

Nazarite [from Gr. Ναζαρίτης, from Heb. *nāzar*, separate one's self, vow, abstain]: among the ancient Hebrews, an ascetic of either sex who had taken a vow to abstain from wine, strong drink, including date and palm wine, and everything that is made of the vine, to let the hair grow, and to touch no dead body. Nazaritism is older than the time of Moses (Num. vi. 2). The vow might be either for a specified time or for life. Samson and Samuel were Nazarites for life, and so was John the Baptist.

Neagh, Lough, loch'nā': a lake in the province of Ulster, Ireland; 17 miles long, 10 miles broad. Area, 153 sq. miles. It receives from the S. the upper Bann and the Blackwater, and communicates on the N. with the Atlantic by the lower Bann. The shores are marshy, and in its vicinity is found much carbonized wood. Tradition says that the lake was made by an inundation in comparatively recent times. Thomas Moore praised the lake, but it is now unattractive.

Revised by M. W. HARRINGTON.

Neal, neel, DANIEL: historian; b. in London, England, Dec. 14, 1678; studied at the Universities of Utrecht and Leyden; became a Dissenting minister in London 1703; preached at Lorimer's Hall 1706–07, and to a congregation in Jewin Street from 1707 until his death, which occurred at Bath, Apr. 4, 1743. Besides minor writings he published a *History of New England* (2 vols., 1720) and a *History of the Puritans* (4 vols., 1732–38). The latter work was reprinted in 1754, 1759, 1793–97 (with *Memoir* by Joshua Toulmin), 1822, and 1837, and an edition, revised, corrected, and enlarged, was issued by Rev. J. O. Choules (New York, 2 vols., 1844). Many replies to Neal appeared, the chief being by Bishop Isaac Madox and Dr. Zachary Gray, and Neal published several rejoinders. The *History*, although not free from a Puritan bias, is an instructive work.

Revised by G. P. FISHER.

Neal, JOHN: author; b. at Portland, Me., Aug. 25, 1793; was brought up in the Society of Friends, but left it when twenty-five years old; became a shop-boy at twelve; was admitted to the Maryland bar in 1819, having previously followed various occupations; was in Europe, most of the time the associate of Bentham, 1824–27, and a correspondent of *Blackwood*; returned to Portland and established *The Yankee* in 1828, and was engaged as editor, lecturer, lawyer, poet, novelist, and teacher of gymnastics. Among his works are *Keep Cool*, a novel (1817); *The Battle of Niagara*; *Goldau and Other Poems* (1818); *Otho*, a tragedy (1819); *Brother Jonathan* (1825); *Rachel Dyer* (1828); *Bentham's*

Morals and Legislation (1830); *The Down-easters* (1833); *True Womanhood* (1859); *Wandering Recollections of a Somewhat Busy Life* (1870); and a very large number of other works. D. at Portland, June 21, 1876.

Revised by H. A. Beers.

Neale, John Mason: theologian and hymn-writer; b. in London, England, Jan. 24, 1818; was educated at Trinity College, Cambridge, and graduated 1840; took orders in the Church of England 1842; was made incumbent of Crawley in Sussex, and warden of Sackville College, East Grinstead, May, 1846. He became one of the literary champions of the High Church party, and was the founder of the sisterhood of St. Margaret 1856; obtained the Seatonian prize at Cambridge for an English sacred poem on nine occasions between 1845 and 1861. He published nearly seventy volumes, chiefly upon theological and ecclesiastical subjects, of which the best known were *The History of the Holy Eastern Church, the Patriarchate of Alexandria* (4 vols., London, 1847–51); *Mediæval Preachers* (1857); *History of the so-called Jansenist Church of Holland* (1858); *Essays on Liturgiology and Church History* (1863); *Mediæval Hymns from the Latin* (1851): and *Hymns of the Eastern Church* (1863). He also published an edition of Bunyan's *Pilgrim's Progress* (1853) for the use of children of the Anglican Church, and his notes to that work gave rise to much controversy. He wrote the popular hymns on the New Jerusalem (*Jerusalem the Golden*, etc.) on the basis of the original, besides a great number of other hymns, partly original, partly translated; *Hymns for the Sick* (1843); *Hymns for Children* (1842–46, 3 series); *Rhythm of Bernard de Morlaix* (1858). D. at East Grinstead, Aug. 6, 1866.

Revised by S. M. Jackson.

Neander, nā-aan'der, Johann August Wilhelm; ecclesiastical historian, whose real name was David Mendel; b. at Göttingen, Jan. 17, 1789, of Jewish parents and in humble circumstances; was educated in Hamburg, where he frequented the Johanneum; embraced Christianity in 1806, when he changed his name; studied theology at Jena and Göttingen, and was appointed professor extraordinary at Heidelberg 1812, and Ordinary Professor of Church History at the University of Berlin 1813, where he died July 14, 1850. With immense learning and decided genius he joined great simplicity of character, earnestness, and enthusiasm. By his works he rightfully won the title of the "father of Church history." The old conception of history as a mere concatenation of individual exertions he abandoned, and represented the history of the Christian Church as a general process by which a divine force works its way into the life of the human race. By this idea, first developed by Hegel and afterward manifoldly elaborated by the romantic school, Neander remodeled or regenerated the science of Church history; and he was prominent in that circle of theologians whose center was Schleiermacher, and which, in the earlier part of this century, awakened the educated classes of the German nation from their rationalistic indifference and led them back to Christianity, without throwing them into the arms of Romanism, as the romantic school did. As a writer of history he lacks dramatic power, and his style is heavy. His principal work is his *General History of the Christian Religion and Church*, from the close of the apostolic age to the Council of Basel in 1431 (6 vols., in 11 parts, 1825–52), translated into English by Prof. Joseph Torrey; but several of his monographs, on Julian the Apostate (1812), St. Bernard (1813), Gnosticism (1818), St. Chrysostom (1821), *Memorials of Christian Life in Early and Middle Ages* (translated into English by Ryland, London, 1852), are models of that kind of composition. He also wrote *History of the Planting and Training of the Christian Church by the Apostles* (translated by Ryland, Edinburgh, 1842, 2 vols.; revised by E. G. Robinson, New York, 1864) and *The Life of Jesus Christ* (translated by John McClintock, New York, 1848), in refutation of Strauss, etc. A complete edition of his *Works* appeared at Gotha in 13 vols. (1862–66). His library was purchased after his death for the Baptist theological seminary of Rochester, N. Y. See his *Life*, by A. Wiegand (Erfurt, 1890). Revised by S. M. Jackson.

Nearchus, nē-aar'kŭs: one of the generals of Alexander the Great; commanded the fleet during the Indian expedition, and conducted it at the end of the campaign from the mouth of the Indus, through the Persian Gulf, to the mouth of the Tigris. Of his voyage he wrote an account, Παράπλους, of which the substance is in Arrian's *Indica*, and shows the trustworthiness of the author.

Neat-work: See Foundation.

Neb-neb: name given to the dry pods of a species of acacia, especially *A. arabia*, a native of the East and of Senegal. These pods contain much tannic acid, and are used by tanners in Egypt and in some other countries. They have also been used in dyeing.

Ne'bo [Heb. *Nebō*, the planet Mercury, worshiped by the Chaldeans and Assyrians as a god: Assyr. *Nabu*: Accadian, *Nabin*]: one of the principal divinities of the Babylonian pantheon, generally identified with the Egyptian Thoth and the Greek Hermes. His greatest temple was at Borsippa (Birs-Nimrud).

Nebo [Heb. *Nebō*, appar. named from being a seat of the worship of the god Nebo (*q. v.*)]: a mountain of Eastern Palestine, "over against Jericho" (Deut. xxxii. 49), identified, in 1875, by Prof. John A. Paine, of the American Palestine Exploration Society, with *Jebel Nebba*, 5 miles S. W. of Heshbon. It is 2,685 feet high. There was also a city of the same name (Num. xxxii. 3) in the immediate neighborhood.

Nebraska [from Indian, liter., shallow water, or Water Valley]: one of the U. S. of North America (North Central group); twenty-fourth in order of admission into the Union; popularly known as the "Blackwater State."

Seal of Nebraska.

Location and Area.—It lies between 40° and 43° N. lat., and 95° 23′ and 104° W. lon.; South Dakota lies N., the Missouri river separates it from Iowa and Missouri on the E., Kansas and Colorado lie S., and Colorado and Wyoming W.; extreme length E. to W. 420 miles, N. to S. 208 miles. Area, 76,840 sq. miles (49,177,600 acres).

Physical Features.—Nebraska is one of the prairie States, with gently rolling surface in the E., which breaks into a few hills in the extreme W. The general slope of the surface is toward the southeast corner, which is about 875 feet above the level of the Gulf of Mexico. From here the ascent is very gradual both to the N., up the Missouri, and to the W., toward the foot-hills of the Rocky Mountains. In the northeast corner the elevation is 1,140 feet; in the N.W., at Mansfield, it is 3,628 feet; and at the southwest corner 3,258 feet. The general elevation along the entire western boundary exceeds 4,000 feet. The highest point in the State is Scott's Bluff, situated a little to the S. of the point where the North Fork of the Platte enters the State. Its elevation is over 6,000 feet. The gentle inclination of the surface allows water to flow off slowly, so that rivers are generally wide and shallow. Nebraska ranks second in the area of its rivers and small streams (630 sq. miles). The forks of the Platte river, rising in Colorado and flowing through Colorado and Wyoming, unite in Western Nebraska and run the full length of the State, turning a third of it into a fertile valley. The North Platte river from its source to its mouth at the Missouri has an estimated length of more than 1,400 miles, making it the seventh river in length in the U. S. The Niobrara river flows through the northern portion of the State, flowing into the Missouri. The extreme S. E. is drained by the Missouri directly, but the S. and S. W. are drained by the Republican, a tributary of the Kansas. The rich black soil, in a past age the bottom of a great fresh-water lake, washes into the streams and renders them very dark colored. Along with the deposits of limestone, sandstone, and shale, in the southeast counties are light veins of coal. These are not productive enough for more than local use. Rocks of the Permian age appear only in and near Gage County, in the S. E. The rocks of the Dakota group are found within an area extending from the upper half of the eastern border to the Kansas line, through Saunders, Lancaster, Saline, and Jefferson Counties. The "rotten limestone" and "chalk rock" of the Colorado group

NEBRASKA

0 10 20 30 40 50
County Towns ⊙

Longitude West from Greenwich

are seen within a strip of country extending N. and S. next W. of the Dakota group, with an average width of 80 miles. The remaining surface, excepting a small showing of the Colorado group at the re-entrant angle of the boundary, is the area of the lake deposits. The western central part of the State is an unusually fertile country. The bad lands, or "mauvaises terres," cut into deep gulches by the tributaries of the White and Big Cheyenne rivers, are not absolutely worthless as was once supposed. Vegetable life has not obtained a foothold except in a few places, but where it has, grasses and other plants grow in abundance. The State geologist has pronounced the marl of this region to be as fine soil as the State can show.

Soil and Productions.—Nebraska is pre-eminently an agricultural State. As a mineral-producing State it ranks almost last. The output of 1889 (census of 1890) was valued at $257,019. A small part of this was the value of 1,400 tons of coal mined in Richardson County for local use. The rest was for limestone, which is quarried extensively and used in all kinds of masonry. Comparatively little is used in the manufacture of lime. A soil of unusual richness covers the State to an average depth of about 200 feet. S. of the Platte it seems to be one uniform stretch of loess formation. Covering two or three tiers of counties along the entire eastern border, much glacial drift is found, and at the very S. E. some rock soil. N. of the Platte, beginning at about the 99th meridian, there is sand, which increases to the W. The center of this region is Grant, Thomas, and Hooker Counties. The subsoils are as rich as the black soil, and raise a full crop the first year after being turned up. All that ever causes a failure of crops is lack of sufficient water. Comparatively little fertilizing is done because the soil yields abundantly without. All crops that are adapted to this latitude are grown in Nebraska.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	63,387	113,608	79·2
Total acreage of farms	9,944,826	21,593,444	117·1
Value of farms, including buildings and fences	$105,932,541	$402,358,913	279·8

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	8,093,464	210,430,064 bush.	$65,233,320
Wheat	2,066,825	24,801,900 "	13,145,007
Oats	1,732,962	37,778,572 "	9,066,857
Rye	61,073	867,237 "	346,895
Barley	33,374	587,382 "	193,836
Buckwheat	5,155	82,480 "	52,787
Potatoes	146,431	9,664,446 "	4,735,579
Hay	1,912,673	2,639,489 tons	13,593,368
Totals	14,051,957	.....	$106,367,649

On Jan. 1, 1900, the farm animals comprised 658,807 horses, value $28,120,512; 43,876 mules, value $2,384,667; 685,338 milch cows, value $24,329,499; 1,521,454 oxen and other cattle, value $46,220,249; 322,057 sheep, value $1,090,807; and about 2,000,000 swine, value $15,000,000; total head, 5,231,532; total value, $117,145,734.

Mention should be made of the introduction and rapidly increasing production of alfalfa as a forage plant, and of the success of nurseries and seed farms, of which there were nearly 15,000 acres in 1890. Many millions of trees have been planted in the State since Arbor Day originated.

Flora.—The State is the meeting-ground for the floras of the Rocky Mountains and the Mississippi valley. In all, more than 2,700 species of vegetable life have been catalogued. Grasses are especially abundant, and about 150 native species have been found. The Compositæ and the Leguminosæ are also numerously represented. There are 140 species of woody plants, of which sixty-two are trees. Among the most useful of these are yellow pine, red cedar, seventeen species of oak, seven members of the walnut family, a dozen of the willow, the white and the red elm, red mulberry, plane-tree, papaw, basswood, two species of maple, and the box-elder.

Fauna.—The large mammals are almost extinct. The bison does not occur wild. Elk, deer, and antelope are very rare. In the western part of the State there are many of the smaller animals, such as wild-cats, wolves, coyotes, and foxes. Twenty-three species of reptiles are found, none poisonous except three species of rattlesnake. About 400 species of birds are found, including the migratory ones. Owing to the position of Nebraska, midway between the N. and the S. and between the E. and the W., the number of insects is very large. Of the *Orthoptera*, 275 species are found, and other orders, so far as they have been studied, appear in correspondingly large numbers.

Climate.—The mean annual temperature varies from 46·8° to 51·4°. The southeast part of the State has both higher temperature and greater rainfall than the other portions. The facts of greatest value to agricultural interests are that there are many consecutive days in the spring and summer with temperature above 50°, and that a large portion of the annual rainfall occurs during the months when crops are growing. The rainfall for the whole State is not quite so large as for the States immediately E., but the fall is better distributed according to the needs of the crops. The following tables show the temperature and rainfall for the year 1892:

MONTHS.	TEMPERATURE. Mean temperature for State.	S. E.	Cent.	West.	Max.	Min.	PRECIPITATION. State.	S. E	Cent.	West.
January	18·8°	19·6°	17·8°	21·4°	72°	−42°	0·86	0·75	1·02	1·06

* Reference for location of counties, see map of Nebraska.

N. B.—Arthur County is now part of McPherson County; Thurston County was formerly Blackbird County; Boyd County was organized in 1891 from part of South Dakota.

Principal Cities and Towns, with Population for 1900.—Omaha, 102,555; Lincoln, 40,169; South Omaha, 26,001; Beatrice, 7,875; Grand Island, 7,554; Nebraska City, 7,380; Fremont, 7,241; Hastings, 7,188; Kearney, 5,634.

Population and Races.—1860, 28,841; 1870, 122,993; 1880, 452,402; 1890, 1,058,910 (native, 856,368; foreigners, 202,542; males, 572,824; females, 486,086; white, 1,046,888; colored, 12,022, of whom 8,913 were of African descent, 214 Chinese, 2 Japanese, and 2,893 civilized Indians).

Industries and Business Interests.—Nebraska has not yet taken rank as a manufacturing State, but a good beginning has been made. In 1890 there were reported 3,014 manufacturing establishments, which had $37,569,508 capital, employed 23,876 persons, paid $12,984,571 for wages and $67,334,532 for materials, and had products valued at $93,037,794. The most important industries were smelting at Omaha; pork-packing at Omaha, Lincoln, and Nebraska City; distilling and brewing at Omaha and Nebraska City; limestone-quarrying and the manufacture of beet sugar at Norfolk and Grand Island; linseed oil at Omaha: cotton goods at Kearney; and flour and starch at Nebraska City. The Chicago, Burlington and Quincy Railroad has car-shops near Lincoln, and the Union Pacific at Omaha. In 1892 there were ninety-eight creameries in the State, which yielded butter to the value of $10,000,000.

Valuations.—The assessed valuations in 1899 aggregated $169,105,905, and the total levy was $1,286,792. On Nov. 30, 1898, the floating debt was $1,571,686.61, and the bonded debt $153,267.35; in 1900 the floating debt was $1,774,588.92, and the bonded debt $55,000. The receipts for the year ending Nov. 30, 1900, were $2,650,324.78, the disbursements $2,660,737.87. The balance at the beginning of the year was $624,523.43, at the end $614,110.34.

Banking.—On Sept. 5, 1900, there were 110 national banks with combined capital of $9,965,000, surplus and profits of $2,379,105, and deposits of $32,916,566; and 405 State banks with combined capital of $7,005,450, surplus and profits of $2,104,794, and deposits of $25,256,035.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 1,070 post-offices, of which 114 were presidential (3 first-class, 11 second-class, 100 third-class) and 956 fourth-class. 601 money-order offices, and 3 money-order stations. There were 28 daily, 1 tri-weekly, 12 semi-weekly, 523 weekly, 2 semi-monthly, and 42 monthly periodicals; total, 608.

Libraries.—In 1892 there were 31 libraries of 1,000 volumes and over, which contained 150,668 bound volumes and 13,197 pamphlets. They were classified as follows: General, 6; school, 8; college, 5; college society, 1; law, 1; public institution, 2; State, 1; Y. M. C. A., 1; social, 3; historical, 1; not reported, 2.

Means of Communication.—The following is the mileage of the railways in Nebraska, given by the board of transportation in Mar., 1894: Chicago, Burlington, and Quincy ("B. and M."), 2,253·07; Chicago, St. Paul, Minneapolis, and Omaha, 261·85; Fremont, Elkhorn, and Missouri Valley, 985·19; Sioux City and Pacific, 26·95; Chicago, Rock Island, and Pacific, 248·33; Missouri Pacific, 279·46; Pacific R. R. in Nebraska, 71·22; Union Pacific, 467·48; Omaha and Republican Valley, 414·44; St. Joseph and Grand Island, 112·53; Kearney and Black Hills, 65·72; Kansas City, Wyandotte and Northwestern, 20·10; Nebraska and Western (Pacific Short Line), 129·16: total, 5,529·22. Total in 1899, 5,574·28.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	213	220	51,503	$1,179,160
Methodist Episcopal	649	680	41,086	1,242,200
Lutheran, Synodical Conference	135	93	12,339	168,570
Presb. in the U. S. of America	228	187	12,159	576,210
Baptist	230	234	11,917	514,710
Congregational	172	144	10,145	640,204
Disciples of Christ	100	84	7,715	269,375
Lutheran, General Council	88	83	7,204	206,001
United Brethren in Christ	147	140	5,673	84,950
Lutheran, General Synod	73	73	3,731	330,420
Evangelical Association	81	84	3,458	86,100

Schools.—The system of public education is very complete. From the district schools and city grades, through the high schools to the university, the system is a unity. In addition there are a State normal school, schools for the blind, deaf and dumb, refractory youth and feeble-minded youth, and an efficient system of teachers' institutes and university extension. The management of the State University is vested in a board of regents, two members being elected biennially for the term of six years. The normal school is under the direction of a board of seven members, including the State superintendent of public instruction and the State treasurer.

In the school year 1898–99 there were 372,764 children of school age, of whom 277,765 were enrolled in the public schools, with an average daily attendance of 169,424. There were 6,710 schools; 9,192 teachers—2,038 men, and 7,154 women. The average monthly salaries were, men $45.05, women $36.56. The total value of school property was $9,215,220; revenue for school purposes, $3,737,950; expenditure, $3,815,593.

Charitable, Reformatory, and Penal Institutions.—These comprise the State School for Feeble-minded Youth, at Beatrice; School for the Deaf and Dumb, at Omaha; School for the Blind, at Nebraska City; Industrial School for Boys, at Kearney; Industrial School for Girls, at Geneva; Home for Fallen Women, at Milford; State lunatic asylums, at Lincoln, Norfolk and Hastings; Home for the Friendless, at Lincoln; Sailors' and Soldiers' Home, at Grand Island; and the State Penitentiary, at Lincoln.

Political Organization.—There are few unusual features in the constitution of the State. The State officers are Governor, secretary, auditor, treasurer, attorney-general, Lieutenant-Governor, superintendent of public instruction, and commissioner of public lands and buildings, each elected by the State at large for two years. The clerk of the Supreme Court is the State librarian. Much of the executive work is done by boards, chief among which are those for public lands and buildings, equalization, transportation, school lands and buildings, health and State printing. The Legislature consisted in 1894 of 33 Senators, elected from 30 districts, and 100 Representatives from 67 districts, each for a term of two years. Sessions are held biennially, beginning on the first Tuesday in January of odd-numbered years, and are limited to 60 days. A three-fifth vote passes a bill over the Governor's veto. The judicial department consists of a Supreme Court of three members, district courts in 15 districts, county courts, justices' courts, and in cities police courts.

History.—A Spaniard named Coronado came up from Mexico as far as the south part of Nebraska as early as 1541. Father Marquette mapped out the Platte and Missouri in 1673. Dutisne, a Frenchman, came into the plains W. of the Missouri in 1719. Twenty years later the Mallet brothers explored the Platte country. The fur-trading periods, in the latter part of which the Nebraska country served as trading-ground, may be divided as follows: French, 1634–1763; British, 1763–1816; American, 1816–34. In 1810 the American Fur Company located a trading-post at Bellevue, on the high bluffs just N. of the mouth of the Platte river. Lewis and Clarke's expedition had passed up the west bank of the Missouri river in 1804, and other expeditions followed, viz., Major Long, 1819; W. H. Ashley, 1822; Rev. Samuel Parker, 1835; and Gen. Frémont, 1842. The U. S. Government established old Fort Atkinson, afterward called Fort Calhoun, in 1820. It was abandoned in 1828. Missionaries to the Indians began to penetrate the region W. of the Missouri river very early. One of the earliest was Moses Merrill, who preached to the Otoes from 1833 to 1840. The Mormons removed from Illinois in 1846, and their "winter quarters," a few miles N. of where Omaha now is, are said to have contained at one time 15,000 people. Nearly all of them shortly made their way beyond the mountains to Salt Lake City. The next great movement of population to the West, that of the gold-hunters, beginning in 1849, gave to the west bank of the Missouri its first towns, and Nebraska City and Plattsmouth had become towns of some size when the lands were formally thrown open to settlers. The first organization of the country by the famous Kansas-Nebraska Bill in 1854 made one Territory of all the region between parallel 40°, the summit of the Rocky Mountains, the Canada line, and the Missouri river. From 1803 to 1854 the tract was nothing in fact but Indian country, known on the statute-books as Louisiana Territory (1805), or the Territory of Missouri (1812). The Territorial form of government lasted from 1854 to 1867, during which the capital was at Omaha, and settlements grew westward from the Missouri slowly. With statehood in 1867 came also the Union Pacific Railway, and a change of the capital to Lincoln, where it has since remained. With the exception of the controversy over one of the electoral votes at the time of the presidential election of 1876, there have been few important events in the recent history of the State.

GOVERNORS OF NEBRASKA.

Territorial.

Francis Burt	1854
T. B. Cuming (acting)	1854–55
Mark W. Izard	1855–58
Wm. A. Richardson	1858

S., bulletins and three volumes for 1890; J. A. Barrett, *History and Government of Nebraska* (Lincoln, 1891); Johnson, *History of Nebraska*; *Nebraska State Gazetteer* for 1893.

JAY AMOS BARRETT.

Nebraska City: city; capital of Otoe co., Neb. (for location of county, see map of Nebraska, ref. 11–H); on the Missouri river, and the Burlington and the Mo. Pac. railways; 44 miles S. of Omaha, 57 miles E. of Lincoln; elevation above sea-level, 907 to 972 feet. The river here has two arms, which are crossed by a pontoon bridge that cost $18,000, and by a steel railway bridge that cost $1,000,000. The city contains 17 churches, a high school, 10 public-school buildings, the State School for the Blind, Roman Catholic convent, U. S. Government building, public library, hospital, 3 national banks with combined capital of $200,000, a State bank with a capital of $50,000, and a monthly, 4 daily, and 5 weekly periodicals. The industrial establishments include two large pork-packing plants, extensive stock-yards, cologne spirits and alcohol distillery, flour and starch mills, vitrified brick-works, several breweries, foundries, and machine-shops, creamery, canning-works, boiler-shops, marble-yards, plow and wagon factories, lumber-yards, and planing-mills. The city is in the center of a rich corn and fruit belt, and has adequate sewerage, gas, electric-light, water, fire department, and street-railway services. Pop. (1880) 4,183; (1890) 11,941; (1900) 7,380.

EDITOR OF "NEWS."

Nebuchadnez'zar [from Heb. *n'būkhad netstsar*, appar. the prince of the god Nebu or Mercury; but the form in Jer. xlix. 28 (Nebuchadrezzar) agrees more nearly with that found on the cuneiform monuments, *Nabu-kudurri-uṣur*, Nebo, defend the crown]: the greatest of the Kings of Babylon, son and successor of Nabopolassar, the founder of the empire; was of marriageable age at the time of his father's revolt against Assyria (B. C. 625), at which time Amuhia, daughter of the Median king, was betrothed to him; is supposed to have commanded the Babylonian auxiliaries in Cyaxares's war against Lydia, and to have brought the hostilities to a close by his mediation on the occasion of the famous eclipse foretold by Thales, B. C. 610; regained Carchemish on the Euphrates from the Egyptian king 605; subjugated Syria and Palestine, carrying the principal Jews into captivity in the same year; succeeded to the throne 604; besieged Tyre 598; completed the reduction of Judæa 586; destroyed Tyre after a siege of thirteen years 585; invaded and ravaged Egypt some years later; rebuilt in a splendid manner all the cities of Upper Babylonia; constructed vast temples, aqueducts, and palaces, the ruins of which still testify to their grandeur. He was, indeed, the most successful and the most powerful monarch who sat on the throne of Babylon. Of his insanity and the events preceding it we have no other account than from the book of Daniel, though numerous inscriptions tell us about his occupations at home. D. about 561. See Rawlinson's *Five Great Monarchies*; also the book of Daniel.

Nebulæ [= Lat., plur. of *neb'ula*, cloud; cf. Gr. *νεφέλη*, cloud : Sanskr. *nábhas-* : O. H. Germ. *nebul*] : a class of celestial objects characterized by a certain cloudy aspect resembling the light of the Milky Way or the Magellanic clouds, or in numerous cases the diffused light of a comet's tail. By means of powerful telescopes many bodies having this nebulous appearance can be shown to be merely clusters of apparently faint stars, but it does not seem at present improper to treat of clusters and nebulæ under one general name—nebulæ. The nebulæ are distinguished from the fixed stars by their apparent diameter, since the latter bodies appear, even under the greatest magnifying powers, without sensible magnitude. They are, on the other hand, distinguished from the planetary and cometary disks, not only by their peculiar luster, but by their immobility, since, as yet, a proper motion has not been demonstrated for any nebula except the trifid (*G. C.* 4355), although changes are known to have occurred within the body of one nebula and perhaps others. (See Holden in Silliman's *Am. Jour.*, May, 1876.) On account, therefore, of their fixity, it has always been considered that the nebulæ belong to the regions of space very far removed from our solar system. Knowledge of these celestial bodies has been peculiarly dependent upon the successful construction of large telescopes, and is therefore almost exclusively the result of the labors of modern astronomers, beginning with Sir William Herschel.

The term "cloudy stars" is first found in the catalogue of Ptolemy, but each of the five objects so named by him is now known to be a coarse cluster of stars, easily resolvable into its elements by feeble telescopes. The Arabian astronomer Sufi in the middle of the tenth century makes mention of the Magellanic clouds and of the Andromeda nebula. The first recorded telescopic observation of a true nebula is by Simon Marius, who in 1612 had appropriately described the great nebula in Andromeda as appearing to the naked eye like the flame of a candle seen through a semi-transparent sheet of horn. In 1656 Huyghens recorded the discovery of a similar nebulous body in Orion, which had been discovered without the use of a telescope by Cysat in 1619. The largest general collection of nebulæ previous to the time of Sir William Herschel was that published by Messier, whose first catalogue (1771) contained 45 nebulæ and clusters; while his second and third catalogues (*Conn. des Temps*, 1783 and 1784), contained 103. Sir William Herschel discovered several thousand new nebulæ and clusters, the places of which, with appropriate descriptions, were communicated by him to the Royal Society of London in three successive memoirs—in 1786, 1,000 new nebulæ and clusters; in 1789, 1,000 additional nebulæ and clusters; and in 1802, a third catalogue of 500 of these bodies. The next great work

is due to Sir John F. W. Herschel, son of Sir William, who in 1825 to 1830, with a 20-foot reflector, revised a portion of the work of his father in the northern hemisphere, compiling a catalogue of 2,306 nebulæ, of which 500 were new.

FIG. 1.—The nebula in Orion (*G. P. Bond*).

He then transported his teleseope and other apparatus in 1833 to the Cape of Good Hope, and devoted the years 1834 to 1838 inclusive to a "teleseopic survey of the whole surfaee of the heavens." Of the seven portions into which this great work was divided, the first, on the nebulæ of the southern heavens, contained a catalogue of 2,049 nebulæ, of which about 500 were new. Some of the nebulæ in the southern hemisphere observed by Sir John Herschel had also been catalogued by Dunlop, who in 1828 had presented to the Royal Society a catalogue (full of errors, however) of 629 nebulæ and clusters observed at Paramatta.

Equally brilliant were the labors of William Parsons, Earl of Rosse, who applied reflecting telescopes of 3 and 6 feet diameter and 30 and 53 feet focal length to the study of the nebulæ, and who directed his efforts rather to the minute study of interesting objects than to the discovery of new ones. Besides several earlier smaller papers, he communicated in the *Philosophical Transactions* for 1844 and 1850 the results of his examinations of several of the nebulæ observed by Sir John Herschel, and in this paper, among other interesting phenomena, announced the existence of spiral nebulæ. Further observations were published by him in 1860 and 1861. The astronomical labors of the Earl of Rosse have been worthily continued by his eldest son. Equally effective were the labors of Lassell, who by the establishment of a magnificent reflector of 4 feet aperture at Malta eontributed greatly to this branch of astronomy. The *Memoirs of the Royal Astronomical Society*, vols. xviii., xxxvi., contain his work on this subject, as well as that of his assistant Mr. Marth, who discovered about 600 new nebulæ. The great reflectors at Melbourne, Australia, and at Paris and Toulouse, France, are also devoted to the study of nebulæ.

While the British observers of nebulæ have preferred the use of large reflectors, those of other nations have been slow to adopt them; the most important observations made by others in whieh reflectors have been used, at least so far as yet published, are contained in the memoir of E. P. Mason, of New Haven, Conn., printed in the seventh volume of the *Transactions of the American Philosophical Society*.

The most eomprehensive list of nebulæ and clusters that has as yet been published is the General Catalogue of Sir John Herschel in the *Philosophical Transactions* of 1864, in which work he has combined in one catalogue all the observed positions of nebulæ accessible to him in 1863, to the number of 5,079, whieh by a comprehensive system of references and synonyms enables one to recognize by whom a given nebula was first observed, and what is its general appearance. Since the publication of this catalogue a great number of additional nebulæ have been observed, which are, however, so faint as to be visible only in the most powerful telescopes. Herschel classified both nebulæ and clusters into orders, defined by their actual shapes. Thus we have first, eireular; second, elliptic: third, annular; fourth, long or ray-like; fifth, spiral; and sixth, very irregular nebulæ.

FIG. 2.—The spiral nebula 51 M Canum Venaticorum (*Earl of Rosse*).

Evidences are at hand of slight variations in brightness, size, and form of a few nebulæ. The frequent occurrence of double nebulæ suggests the classification of these objects in this regard, and we find in the General Catalogue of Sir John Herschel, out of 5,079 objects, of which 4,050 are unresolved or true nebulæ, 229 double nebulæ, 49 triple, 30 quadruple, and 11 more or less complex multiple nebulæ. D'Arrest remarks that among nebulæ the double and probably binary nebulæ occur more frequently than do similar stellar combinations in comparison with the total number of fixed stars.

The application of spectrum analysis to these bodies affords another system of classifieation. This difficult branch of observational astronomy we owe to William Huggins, F. R. S., of London, who in Aug., 1864, first turned his delicate spectroscope and moderately powerful refracting telescope upon the planetary nebulæ. Secchi, d'Arrest, and, to a less extent, a few others, but especially Brediehin of Moscow and the younger John Herschel, have also contributed to our knowledge of this subjeet. It is apparent from the observations of these spectroseopists that among the nebulæ there are some whose spectra have the characteristics belonging to the spectra of gases, and this almost entirely irrespective of the apparent resolvability or stellar nature of the nebulous mass. Other nebulæ have the equally characteristie spectra peculiar to glowing solids. In a third and numerous class of nebulæ we place all those whose spectra combine the characteristies of both the preceding classes. The relative motions of the earth and some nebulæ are also indicated by Huggins's later observations. Photography has also been applied with success to the study of nebulæ, and has revealed peculiarities which were not otherwise observed. Foremost in this branch of research is Isaac Roberts, F. R. S.

FIG. 3.—The annular nebula 57 M Lyræ (*Earl of Rosse*).

The consideration of the imperceptible gradation that exists as we pass from the faintest, most diffuse, and most irregular, by insensible gradations, down to the well-defined, brightest, and smallest of the planetary nebulæ, led Sir William Herschel to imagine, most naturally, that the fixed stars, our sun, and the planets of our solar system were but the results of the systematic operations of evolution by means of which inhabitable worlds endowed with warmth, light, and life were brought forth out of primitive and gaseous matter; and, however much of hypothesis may be inherent in such a sys-

tem as this, or however little ground there may have been for belief in the nebular hypothesis as first advanced by Herschel, and subsequently elaborated by Laplace, there

Fig. 4.—The great nebula in Andromeda (*G. P. Bond*).

would seem at the present day to be no reason to reject all of its propositions. See Nebular Hypothesis.

Cleveland Abbe.

Nebular Hypothesis: the modern theory of the formation of stars and planets. The idea that the earth was, in some way, formed or created by the collection and arrangement of matter originally in a chaotic state seems to have been a part of the heritage of our race, being familiar even in prehistoric times. The first verse of the book of Genesis may be cited as an indication of this; but it was impossible to form any scientific basis for such a theory until after the discovery of universal gravitation. Perhaps Swedenborg has as good a right as any other to be regarded as first to suggest the modern theory. The accord of his work with recent ideas, however, was more in his description of the succession of the phenomena than in his reference to the theory of gravitation, for although Sir Isaac Newton published his *Principia* before Swedenborg wrote, it does not appear that gravitation played a prominent part in the speculations of the latter.

The German philosopher Kant is very generally regarded as the actual founder of the nebular hypothesis, because he reached it both inductively, by a study of the structure of the solar system, and deductively, by showing how gravitation could have resulted in the formation of the system from nebulous matter. He was the first to show that the hypothesis explains the fact that the orbits of the planets and satellites are all very nearly in the same plane, and that the revolutions both around the sun and on their axes are all in the same direction. We now know that this is not true of the satellites of Uranus and Neptune, but Kant was not acquainted with those bodies. To explain this common direction of motion, Kant assumes that all the materials out of which the bodies of our solar system were formed were, in the beginning of things, resolved into their original elements, and filled all that region of the universe in which these bodies now move. Kant, however, was too little acquainted with the laws of mechanics to show clearly how this condensation of the original matter would have resulted in the planets performing revolutions both around the central body and on their own axes. He did not confine himself to the solar system, but pointed out that the whole galaxy seemed to be a system somewhat of the same kind, thus assigning to the hypothesis the widest possible scope.

Herschel reached the same conclusions in an entirely different way, by his telescopic examinations of the nebulæ. He found that no sharp line could be drawn between the nebulæ properly so called, which seemed to be composed wholly of glowing vapor, and clusters of stars. These two classes of bodies seemed to shade into each other by insensible gradations. He therefore conceived that the stars are formed by the actual condensation of nebulæ.

The author to whom the hypothesis has been most frequently referred is Laplace, the fact that he was anticipated by Kant having been very generally overlooked. Like Kant, he concluded that the remarkable uniformity in the directions of the rotation of the planets could not have been the result of chance. He had the great advantage over Kant of being a master of the mathematical theory of the rotation of bodies, and therefore better qualified than his predecessor to show how such rotations might originate. He begins, however, not with an assumed uniform nebulous mass, as Kant and others did, but with the sun itself, surrounded by a fiery atmosphere, which extended beyond the present limits of the solar system. This atmosphere consisted of the elements which now form the planets and satellites; and he showed how, by its gradual cooling and condensation, combined with a slow axial rotation, successive rings would be formed which would themselves gradually condense into planets and satellites. The zone of asteroids between Mars and Jupiter is explained by supposing that, owing to the general uniformity of the particular ring which formed these bodies, it did not condense around a single nucleus, but contracted into a great number of small bodies.

Since then the most eminent writer on the subject is Herbert Spencer, who has made the hypothesis a part of his general theory of evolution, and shown how the process by which nebulous matter condensed into planets was analogous to that which is seen in the generation and growth of animals, and in the whole tendency of progressive natural changes.

The most interesting question suggested by the hypothesis is as to what extent it can be considered as proved. The most we can say is that a number of natural phenomena point to it, or are explained by it, but that no one of them can be considered as actually proving it. It must, however, be admitted that if we are to explain the origin of the solar system otherwise than by the arbitrary fiat of the Creator, this is the only explanation that can be offered. It explains the fact that the Earth (*q. v.*) is an intensely hot body, only the surface of which has cooled off. It explains also the origin of the sun's supply of heat, and shows why our central luminary did not, like the earth, cease to give off heat ages ago. See Energy.

S. Newcomb.

Nece'dah: village; Juneau co., Wis. (for location of county, see map of Wisconsin, ref. 6–D); on the Yellow river, and the Chi., Mil. and St. P. and the Chi. and N. W. railways; 19 miles N. of Manston, the county-seat, and 147 miles N. W. of Milwaukee. It is built up around a high bluff, in an agricultural and lumber region; contains four churches, public, high, and graded schools, and a weekly newspaper; and is engaged in general farming, cranberry cultivation, milling, and the manufacture of pine and hardwood lumber. Pop. (1880) 1,475; (1890) 1,708; (1900) 1,209.

Editor of "Republican."

Necessity [viâ O. Fr. from Lat. *neces'sitas*, deriv. of *neces'se*, necessary, unavoidable]: in philosophy, the name of a doctrine which treats of the essential relation which a being has toward another. It has importance theologically, morally, and scientifically. On it hinge the questions of God, freedom, and immortality, their solutions being determined affirmatively or negatively according to the type of necessity which is assumed as predominant in the universe. Three kinds or species of necessity may be enumerated as including the manifold distinctions under this head: (*a*) *Physical or causal necessity*, whereby a somewhat is subject to external constraint, determined to be what it is by another outside it. This necessity is founded on causation, and is known also under such designations as fate (*εἱμαρμένη* of the Stoics), destiny (*necessitas consequentis* of the Schoolmen), natural selection (as understood by the ancient Epicureans and atomists; the Darwinian meaning of this term implies various degrees of self-activity and reaction against the environment, and thus suggests freedom rather than necessity); and such epithets as material, natural, blind, brute are given to it. (*b*) *Logical or substantial necessity*, called also ideal or formal, absolute, "metaphysical or mathematical" (Leibnitz), *necessitas consequentiæ* (Schoolmen), is variously defined as "that which can not but be in the nature of things"; "connection between parts of mental or verbal propositions"; "that the opposite of which implies contradiction." This form of necessity is founded on substantiality, "the connec-

tion of existence and essence," and is first a subjective necessity, the opposite of which is inconceivable, and, secondly, the condition also of objective reality. It is exemplified in "necessary truths" or "necessary ideas," the contrary of which can not be conceived. (*c*) *Moral or teleological necessity* is defined as "connection of end and means," "moral obligation or conscience," "that of motives," "that of rational determination or freedom." It is called in its various phases "categorical imperative" (Kant), "hypothetical necessity" (applied by Leibnitz to the divine predetermination), "overruling Providence" (*πρόνοια* of the Stoics). It is founded on Final Cause, and embraces phases of manifestation within the consciousness of man, as well as those based upon the divine will; hence the wide differences in the above definitions and epithets. Logical necessity, as the distinctive characteristic of *a priori* truth, was first enunciated by Leibnitz (*Nouveaux Essais*), and afterward made the basis of the critical system by Kant. In his *Critic of Pure Reason* Kant places the category of Necessity after those of Possibility and Reality, as forming their identity. A reality which has unrealized possibilities is contingent (this is Kant's thought), while a reality that has realized all of its possibilities is a necessary being, and can not be otherwise, having no other possibilities; this makes the sphere of reality coextensive with the sphere of possibility. They who set up physical or material necessity as the highest principle, if consistent, make God to be a blind force, mind to be an emanation from matter, and deny freedom and immortality. They who make moral or teleological necessity the first principle hold God to be personal, and interpret nature and history as stages in the realization of free, personal beings. Logical necessity is held to be identical with God's moral necessity by some. Psychologically, the perception of necessity marks the entrance into the stage of reflection. Sense-perception perceives no necessity; to it all is contingent. Each individual is to it independent and valid by itself. Without transcending experience one can not perceive necessity (although this is denied by Occam, the great nominalist). Reflection throughout all its stages is dominated by the idea of necessity. Each thing is dependent upon others —upon all others. In this principle are contained antinomies or unavoidable contradictions which it is the object of philosophy to solve. The process of their evolution and solution is called *dialectic*. By it the subsidiary character of physical necessity may be shown. It proves to be only a phase in the process of moral or teleological necessity, which is implied in free will. The following is an outline of the dialectic statement of the attitudes successively assumed by consciousness toward necessity: (*a*) All things are necessitated; each is necessitated by the totality of conditions; hence whatever is, must be as it is, and under the conditions can not be otherwise. (This is the standpoint of complete fatalism; its incompleteness and inadequateness is seen when applied to explain change.) (*b*) Things change—something new begins and something old ceases; according to the principle of necessity, the new must be necessitated by the totality of conditions, just as the old was. If the same totality of conditions necessitates both states (the new and the old), it follows that it is adapted to both, and hence indifferent to each; it allows one to pass into the other, and therefore does not absolutely condition or constrain either. Hence there must be two totalities of conditions, or indeed a new one for every change in the world, for the totality of conditions includes the reality of each thing, and therefore changes whenever anything changes. (*c*) Since every change involves change in the totality of conditions according to the principle of necessity, and inasmuch as all external necessity is included within the totality of conditions, it follows that this totality is its own internal necessity, moves or changes itself, originates its own action, is *causa sui*, spontaneity, freedom. The presupposition lying behind any form of physical necessity is therefore self-determination, which is discovered to be moral necessity (divine or in God) when carefully considered. WILLIAM T. HARRIS.

Necho, or **Neco** (Egypt. *Nekau*): the second king of the twenty-sixth Egyptian dynasty: son and successor of Psammetichos I. He ruled from 610 to 594 B. C. Herodotus (ii., 158; iv., 42) relates his attempt to join the Nile with the Red Sea by a canal through the Wadi Tumilat, which apparently followed the line of a previous waterway, natural or artificial, that existed under Seti I. and Ramses II., and coincided generally with the fresh-water canal used during the construction of the Suez Canal. Herodotus (iv., 42) also tells of the first circumnavigation of Africa during the reign of Necho. Necho continued the internal policy of his father by encouraging Greek colonization and trade. Taking advantage of political complications in the East, he attempted to restore Egyptian power in Asia, and in 608 B. C. he marched through Palestine to Megiddo, where he met the army of Josiah, King of Judah (2 Chron. xxxv. 21–24). He also intervened in the political affairs of the Hebrews (2 Chron. xxxvi. 1–4). With the rise of Babylonian power he saw his sway in Asia threatened and marched to Carchemish, where he met Nebuchadnezzar in 604, and was routed. In spite of subsequent appeals for aid from the Hebrews, he remained in Egypt during the rest of his reign, and there he died in 594 B. C. The threatened invasion of Nebuchadnezzar was deferred till the reign of Hophra (Apries), in 567 B. C. CHARLES R. GILLETT.

Neckar: a river of Germany; rising in the Schwarzwald Mountains, on the frontier of Würtemberg and Baden. It flows with a tortuous course of 210 miles through a beautiful tract of land between low, vineclad hills, and joins the Rhine at Mannheim. It receives from the left the Enz and from the right the Jaxt, but it is shallow and difficult of navigation. Its basin contains 4,980 sq. miles.

Necker, JACQUES: French statesman; b. at Geneva, Sept. 30, 1732; went in 1747 to Paris as a clerk in a banking-house; established afterward a business of his own, and accumulated a great fortune during the Seven Years' war. In 1764 he married Suzanne Churchod, by whom he had one daughter, afterward the celebrated Mme. de Staël. Encouraged by his wife to mark out for himself a public career, he retired from his business, secured the position of syndic or director in the French East India Company, and subsequently became the diplomatic representative of Geneva in Paris. He acquired great authority in financial matters by his *Éloge* on Colbert and *Essai sur la Législation et le Commerce des Grains*, the latter work being an attack on the economic policy of the far abler Turgot. After the removal of Turgot in 1776 Necker was called to take part in the administration of the finances, and after the short administration of Clugny he was appointed director-general of the finances in 1777. Under his direction the financial condition was in some respects greatly improved. The administration was systematized; taxation became more equitable and public confidence was restored, though his persistent borrowing added greatly to the national debt. His wife, in the meanwhile, made his home the rendezvous of the political and literary celebrities of the time, and rivaled the famous Mme. Geoffrin as the mistress of a salon. A certain vanity in his bearing, however, made him disliked by the courtiers; he lost the favor of the queen by thwarting her wishes, and after the publication of his *Compte Rendu au Roi sur les Finances de l'État* in 1781, revealing the condition of the treasury, he was suddenly dismissed. He returned to Geneva, and bought Coppet, an estate in its vicinity, where he resided for several years, and wrote his *Administration des Finances*, which was published in 1784. He returned to Paris in 1787, but was soon banished for an attack which he published on the financial policy of Calonne. Meanwhile the administration of Fleury, Calonne, and Loménie de Brienne had brought financial matters in France to a crisis, and in Sept., 1788, Necker was recalled and made comptroller-general and Minister of State. He was regarded as the savior of France, and when the king once more dismissed him, on July 11, 1789, because he declined to participate in a royal measure by which the constitution of the third estate as a national assembly was to be annihilated, Paris rose in insurrection, and he returned to his office in triumph after a brief absence. He was, however, a good banker rather than a great financier, and as a statesman he was wholly unequal to the task set before him. In the National Assembly he was completely outshone, not only in political but even in financial questions, by Mirabeau and others, and when he resigned (Sept. 4, 1790) he had entirely lost not only his popularity as a hero of freedom, but also the respect he enjoyed as a financial authority. He lived afterward at Coppet, and died there Apr. 9, 1804. His *Œuvres Complètes* were published in Paris in 1822 (revised ed. 1833). See Mme. de Staël-Holstein, *La Vie privée de M. Necker*, and Auguste de Staël-Holstein, *Notice sur la Vie de M. Necker* in his edition of the collected writings in 1833. See also d'Haussonville, *Le Salon de Mme. Necker* (1882).

Necker de Saussure, ADRIENNE A.: See the Appendix.

Necromancy: See MAGIC.

Necro'sis [Mod. Lat., from Gr. *νέκρωσις*, a making dead, deriv. of *νεκροῦν*, make dead, mortify, deriv. of *νεκρός*, corpse]: the death of a large piece of bone or of a whole bone in the living subject, as distinguished from *caries*, the ulceration or molecular death of bone. Necrosis may result from injury, from periostitis, from phosphorus-poisoning, and from syphilis. It may be superficial, central, or total. Necrosis almost always calls for surgical interference for its complete cure. The dead bone finally separates as a *sequestrum* from the living bone, and until it is quite detached it is worse than useless to attempt to operate. The sequestrum is usually inclosed in a case of new bone, which must be cut through before the removal can take place. If the patient be young and otherwise healthy, the removal of the sequestrum is usually followed by recovery. In all cases a generous diet, with appropriate tonic treatment, is called for.

The term necrosis is also used to designate a variety of destructive diseases of the soft parts, of which caseation and gangrene are typical examples.

Nectanebo I. (Egypt. *Necht-Hor-Heb*): the first king of the thirtieth Egyptian dynasty, reigning from 386 to 368 B. C. In spite of the Persian wars he left his name on many monuments and buildings. The extant evidence points to this as a brilliant season in Egyptian history. Greek influence was felt in all departments of life, and the warlike operations of the period were carried on largely by the aid of Greek mercenaries. Early in his reign he assisted the King of Cyprus against the Persians under Artaxerxes II., but upon the failure of the allied arms he was compelled to defend himself against a Persian invasion which was only checked when high Nile flooded the whole country. The conflict was continued under Teos, or Tachos, his successor, and also during the reign of NECTANEBO II. (361–349 B. C.), the last native King of Egypt. Ochus, the Persian king, marched to Pelusium and thence to Memphis after having defeated the allied forces of Cyprus, Phœnicia, and Egypt. Seeing the futility of further resistance, Nectanebo II. gathered what valuables he could and fled, probably to Ethiopia, some say to Macedon. From his reign we possess evidences of the working of the mines of Hammamat and of considerable architectural activity. The Persian rule, which succeeded, gave place (332 B. C.) to that of Alexander the Great. C. R. G.

Nectarine [from Old Fr. *nectarin*]: a tree and its fruit, differing from the peach, from which it is derived, mainly in having a smooth skin instead of a downy one. There are numerous sub-varieties, of which some are freestones. The nectarine is much grown in California, and can be grown wherever the peach thrives. Nectarines have sprung from the peach by bud-variation and from seeds. L. H. B.

Nectariniidæ: See SUN-BIRD.

Nedjed: an Arabic word signifying elevated land or plateau. The Arabs use the term in connection with other names, as Nedjed-el-Hedjaz, or Nedjed-el-Oman. By European writers the term is specially applied to the vast, vague interior territory of Northern and Central Arabia. No reliable description of this region exists, but Palgrave's various works concerning it are of interest. E. A. G.

Needle-gun [transl. of Germ. *zündnadelgewehr*; *zünden*, to light, fire + *nadel*, needle + *gewehr*, gun]: a form of breech-loading small arms designed for military use, and for a long time the regulation weapon of the German infantry. It is the invention of Nicolaus Dreyse, and was extensively manufactured at Sömmerda, Prussia, his native town. Its efficiency was demonstrated in the war of 1866 between Prussia and Austria. As in the chassepot, the cartridge is exploded by means of a needle thrust into the detonating mass along the bore of the piece. See SMALL ARMS.

Needles and Needle-making [*needle* is from M. Eng. *nedle* < O. Eng. *nœdl*: O. H. Germ. *nādal* (> Mod. Germ. *nadel*). Cf. Germ. *nähen*, sew < O. H. Germ. *nājan*]: I. NEEDLES.—A needle is an instrument used by hand or in machinery for the purpose of carrying the thread in sewing or the making of hosiery. The principal kinds are: (1) The sewing-needle used by hand, which is a small piece of steel wire pointed at one end and pierced at the other so as to receive the thread. (2) Needles used by hand in knitting, crocheting, etc. The former are straight, slender rods with rounded ends, while the latter have a hook at one end. (3) Needles used in knitting-machines and sewing-machines; they are of a considerable variety of forms. Historically, the needle in its earliest form was doubtless a strong thorn or a sharp splinter of bone, wood, or stone, with which the skins intended to be joined were perforated along their edges, these being afterward laced together by hand. The next step was to make an eye in the splinter, so that one operation should pierce the material and carry the thread through it; and by degrees needles came to be smoothed and finished with much neatness, as is shown by excellent prehistoric specimens to be seen in the British Museum. Many bronze needles have been found, varying in length from 1 to 8 inches, the longest having probably been used for hairpins; those discovered in Egyptian tombs are invariably coarse, though Wilkinson (*Ancient Egyptians*, iii., 384) assures us that finer kinds must have existed.

Judging by the delicate embroidery handed down to us, all through the Middle Ages fine needles must have been used. We read of their manufacture at Nuremberg during the fourteenth century. They were introduced into England under Queen Elizabeth, and the manufacture seems to have flourished, for about 1597 the "Pinners and Needlers" petitioned against the importation of foreign pins and needles. Knitting-needles were first used in the fifteenth century; and about the middle of the nineteenth century the peculiar kind of needles used in machinery were first made.

Knitting and Crochet Needles.—Knitting-needles, for use by hand in pairs or sets of four or five, are made of steel, ivory, bone, or wood; they are of various lengths, and of cylindrical shape with rounded ends. They are of such simple construction and so well known that they need no further description. Much skill has been displayed in the production of hooked needles for crocheting, and much ingeniously constructed machinery and many special appliances have been employed for the purpose. The hand-used needles, however, do not possess the greatest interest in comparison with those used in automatic machines, by which knit goods are produced.

Needles Used in Machinery.—These are chiefly employed in knitting and sewing-machines. (1) *Spring and Latch Needles.*—Spring needles of steel for hosiery or stockinet work are made by reducing the working end on a taper to an approximate point and bending the reduced portion over upon itself so as to form an open loop, a groove having been previously made so as to come opposite the point. In the operation of this needle the point stands out at the proper time for the yarn to be taken, which is to be carried through the loop to form the stitch. As the forward motion continues, the point is depressed into the groove by coming in contact with mechanism arranged for the purpose, and thus the passage through the loop without catching is insured.

FIG. 1.—Latch needle.

In the latch needles, instead of the spring barb, there is a short rigid hook, formed by tapering the working end nearly to a point and bending in combination with the latch. The latter is contained in a groove milled in the body of the needle and pivoted upon a rivet which passes through the walls of the groove. The latch, the walls between which it is riveted, and the diameter of the rivet are each only about one-hundredth part of an inch in thickness, so that extreme delicacy is required in the manufacture of these needles. The latch must work with the utmost freedom, resting at each stitch with its point toward the hooked end and the opposite or shank end alternately. Its office is to prevent the yarn from being caught under the hook except at the proper times, thus aiding in forming and casting off the stitch.

(2) *Sewing-machine Needles.*—Of these there is such variety as to preclude the possibility in limited space of describing each in detail, but broadly they may be described as having either an eye, hook, or barb, at the pointed end, and are used with a single thread in making a single loop-stitch both with eye and with barb. The needle best known to the public is the one with the eye at the pointed end, with a long groove on one side and a short groove on the opposite side. It is used in connection with a shuttle, or other device, for carrying a second thread which is passed through a loop of the thread in the needle, thus forming the double-lock stitch. The grooves are of importance in protecting the thread from wearing or being cut off in passing through the fabric operated upon.

Besides the ordinary needles for use on cloth are the wax-thread needles for use on leather, including many shapes for the different machines. These needles, in place of having an eye, are formed with hooks by which the thread is pulled through a hole made by an awl, or by the needle itself in some cases. They are used for difficult leather-work once considered impossible of accomplishment by machinery. Among these is the needle used in the Goodyear welting-machine. It is a segment of a circle in shape. (See Fig. 3.) It puts welts upon boots and shoes with a rapidity and accuracy unapproachable by handwork.

Fig. 2.—Sewing-machine needle.

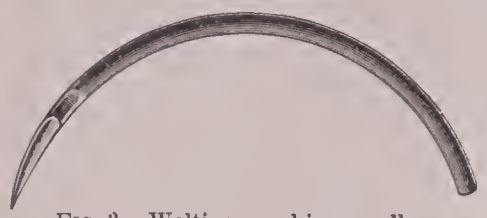

Fig. 3.—Welting-machine needle.

II. Needle-making: (1) *The Sewing-needle.*—The manufacturer buys his wire in large bundles, each containing several coils. The coils are first cut into two-needle lengths by a guillotine shearing-machine. The cut wires, technically called *blanks*, having been taken from a round coil, are slightly bent; the next process, therefore, is to straighten them. The blanks are inclosed in two strong iron rings (Fig. 4), then heated red in a furnace, and allowed to cool gradually. When cool they are removed to an iron plate and rubbed backward and forward with an instrument called a *smooth file*, consisting either of one broad curved bar which is introduced between the two rings or of three narrow bars joined at the ends, into the intervals of which the rings fit (Fig. 5). The blanks are next pointed at both ends, which was formerly done by hand on a grindstone. The blanks are withdrawn, one following another, from a hopper, by a pulley revolving at right angles to the grindstone, and are held to the face of the pulley by an India-rubber band. Between the pulley and the grindstone the blanks revolve on their axes and become pointed at one end, and the process is repeated for the other end. The wire blanks are next fed automatically into a belt-driven machine, in which a punch and dies form the prints for the eyes. Then oval holes are punched through the two prints of each blank by a vertical belt-driven punching-machine (Fig. 6). The needles are now strung or "spitted" upon two fine wires (Fig. 7), the "burrs" or projections caused by stamping are filed off, and the double needles are divided between the eyes by being gently bent to and fro. Each row, still strung on its wire, is grasped by the points in a sort of vise (Fig. 8), and the heads are laid upon a raised plate of metal and filed into shape. Now begin the tempering processes. The needles are heated red in a furnace, then cooled suddenly in cod oil, and so rendered excessively brittle. They are next tempered by exposure to slow heat, during which they are stirred about with a shovel until a blue oxide forms on them, when they are removed and allowed to cool gradually. Each one is next examined by being rolled with the finger on a smooth steel slab, and any that do not roll truly are weeded out. In parcels of about 50,000 they are next washed and scoured with soap, to remove any of the oil which adheres. The eyes are then blued and polished. According to one method the polishing is done by threading the eyes loosely on wires carried by standards fixed to a tray which moves quickly with an alternating motion in a horizontal plane. In about an hour, with the use of a little emery and oil, the swinging of the needles on the wire smooths their eyes so that they may not cut the thread; but the eyes of the best needles are hand-polished with fine emery on flax threads. The heads are next ground and the points set by hand on a revolving stone of fine grain. The shanks are then polished by machinery. The needles, in rows one deep, are fed longitudinally between transverse leather-covered rollers with holding rollers above them. Besides revolving on their axes the rollers have a lateral alternating motion, thus giving a high polish to the needles.

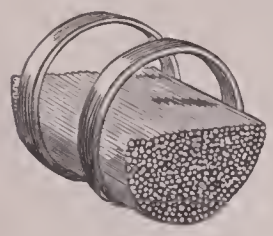

Fig. 4.

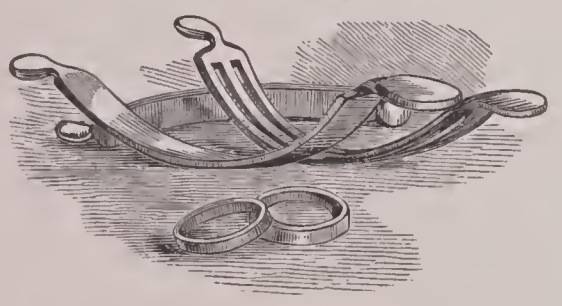

Fig. 5.

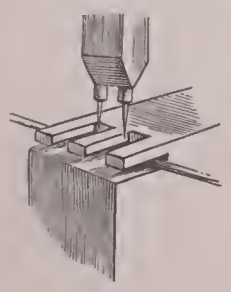

Fig. 6.

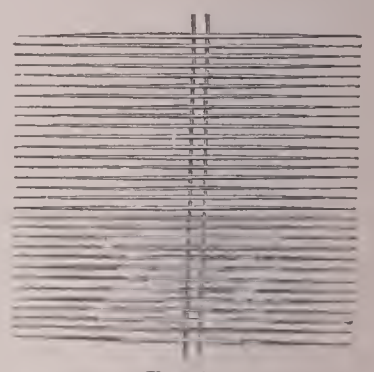

Fig. 7.

The older method of polishing needles is to put several thousands of them, first along with sand and emery-powder, and afterward with oil and putty-powder, in canvas bundles wound round with cords. A number of these then are put in a kind of mangle and rolled backward and forward for at least fifty hours. It is now necessary that the needles should be laid with their heads one way. A gun-metal disk revolving in a vertical plane takes up each needle by a groove in its circumference, and drops it on an inclined glass plate. Owing to their shape the needles describe an arc in falling, so that those with their heads in one direction go to the right, and the others to the left. As the finished needles differ slightly in their lengths, those of one size require to be separated from the others by the sorting process, in which gauges are used. Finally the needles are papered, either by being spitted on cloth pasted to paper or by being made up in packets. There are many sorts and sizes, including large needles used in sail-making, and special kinds employed for upholstery, surgical purposes, etc.

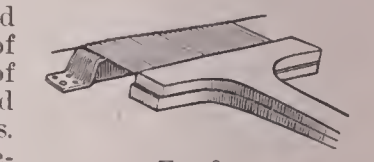

Fig. 8.

(2) *The Sewing-machine Needle.*—To reduce the blade from the size of the shank to the required size, and at the same time to put in the grooves, the wire was formerly stamped between dies. This threw out the superabundant material at each side as a flash or fin. These fins at the very first were cut off by hand-shears; later, with a die and punch in a press; then the needles were rounded up and pointed by filing. As the demand for sewing-machine needles gradually ran up into millions, step by step the methods changed. Stamping gave way to rolling, grinding, turning, and milling, until a machine was invented by O. L. Hopson and H. P. Brooks, and improved by E. J. Manville. It swages down the wire from the original size so as to produce any size of blade required, and as the reduction is made by compression, it effects a saving of material. The length being increased by the swaging process, in some cases there is a saving of half the material over the old methods.

The blades are cylindrical and true to the intended size to a degree hitherto unknown. Simultaneously there have been improvements in the methods of grooving. Automatic groovers have come into use, which clamp and hold the needle, start in with the short grooves and withdraw the cutter at the proper time, after having proceeded the right distance, while the cutter on the opposite side goes on until the long groove is completed. Machines also for pointing, polishing the eyes, etc., have been devised to perform automatically what was formerly done by hand.

S. W. Goodyear.

Needles, The: a cluster of rocks on the west extremity of the Isle of Wight, which take their name from their pyramidal shape. Five in number, they are composed of chalk, dotted with thin strata of flint. The violent wave-action here is constantly changing the form of these rocks, only three of which now rise to any considerable height above the water. The Needles Light is situated on the outer part of the farthest of these celebrated rocks, which was previously leveled nearly to the water's edge to receive it. The name is applied by British navigators to many similar structures elsewhere. Revised by M. W. Harrington.

Nee'nah: city (founded in 1836 as a Government post); Winnebago co., Wis. (for location of county, see map of Wisconsin, ref. 5–E); on the Fox river, at the outlet of Lake Winnebago, and on the Chi. and N. W., the Chi., Mil. and St. P., and the Wis. Cent. railways; 14 miles N. of Oshkosh, the county-seat. It contains 15 churches, 5 schoolhouses, a commercial college, 3 public parks, 2 national banks with combined capital of $140,000, manufactories of paper, flour, and stoves, and 2 daily and 4 weekly newspapers. The city has abundant water-power, and has become a popular summer resort. Pop. (1880) 4,202; (1890) 5,083; (1900) 5,954. EDITOR OF "TIMES."

Neesima, nee'shĕ-maă, JOSEPH HARDY: preacher and educator; b. in Tokio, Japan, in the year 1843. Anxious for a foreign education, he obtained a passage in a U. S. brig, and finally landed at Boston, where he found a patron in the gentleman whose name he assumed. An academic course at Andover and Amherst was followed by a theological course at Andover. He attached himself in 1872 as secretary to Viscount Tanaka, commissioner of education, then at Washington, with whom he visited Europe. Neesima's name is inseparably associated with the founding of the Dōshisha College at Kioto, of which he became president. D. Jan. 23, 1890. He was held in high esteem by all classes of his countrymen. See his *Life and Letters*, edited by Arthur S. Hardy (Boston, 1892). J. M. DIXON.

Nees von Esenbeck, nās'vŏn-ā'zen-bek, CHRISTIAN GOTTFRIED DANIEL: botanist; b. at Reichenberg, Westphalia, Feb. 14, 1776; studied medicine at Jena, and was Professor of Botany at Erlangen 1818–30, and at Breslau 1830–52. His principal works are *Das System der Pilze und Schwämme* (1816); *Systema Laurinarum* (1836); *Agrostologia Brasiliensis* (1829); *Die Entwickelung der Pflanzensubstanz* (1819); *Die Naturphilosophie* (1841). D. at Breslau, Mar. 16, 1858. Revised by CHARLES E. BESSEY.

Ne Ex'eat Reg'no [Lat., let him not go out of the kingdom], **Writ of**: a writ used at present only in legal proceedings to restrain a person from departing from the jurisdiction of the court. The exact date when, and the circumstances under which, this writ was first issued are involved in obscurity, but it is known that according to the rules of early English law the king by virtue of his prerogative might issue a writ prohibiting a subject from going abroad without license; but it has been thought that this was not a rule of the common law. A section of King John's Great Charter allowed subjects to depart from the kingdom at their pleasure. In later charters this provision was not found, and it came to be understood as law that a subject did not possess the right of leaving the realm without the king's license, and writs could be issued to enforce the law. This rule of law has become practically obsolete, subjects being allowed freely to leave the kingdom except in time of war and public danger.

At the present time the writ of *ne exeat* is used simply as a judicial proceeding in the ordinary administration of justice. It is issued by a court of chancery (or equity) to prevent a party to a suit from withdrawing from the jurisdiction of the court, and thus rendering its decree ineffectual. The substance of the matter is that the defendant becomes liable to give bail or security that he will not withdraw himself from the power of the court to compel him by its process to abide its order, in default of which he will be imprisoned. It can only be resorted to for the purpose of enforcing equitable demands, except in the case of alimony and of an action for an account. Alimony in the case of a partial divorce was granted in England by the ecclesiastical court, which had no power of exacting bail, and the courts of equity, to prevent a failure of justice in such a case, aided the plaintiff by means of this writ. In the case of mutual account the court of equity has concurrent jurisdiction with the courts of law, and is thus, having jurisdiction, not debarred from issuing the *ne exeat*, though a court of law also has power over the case. It should be added that the claim must be pecuniary in its nature, and so far mature that present payment or performance can be rightly demanded. All that is necessary to give the court jurisdiction is the presence of the defendant, whether citizen or alien.

In the U. S. the equity courts of the respective States assume the same power over this subject that is exercised by the English courts of chancery, except where their inherent authority has been taken away by statute, or where the writ has been expressly abolished, as in the State of New York. Where this remedy exists it may be granted in the form of an order as well as of a writ. For further details, see Beames's *Brief View of the Writ of Ne Exeat Regno* (London, 1812); the works of Daniell and Barbour on *Chancery Practice*; and Story's *Equity Jurisprudence*.

Revised by F. STURGES ALLEN.

Negative Quantity: a quantity taken in a sense opposite to that which we have agreed to call *positive*. The terms *positive* and *negative* are correlative; if we agree to consider a quantity taken in any sense as positive, it will be negative when taken in a contrary sense. Thus if we agree to call distance estimated to the right of some point *positive*, then distance estimated to the left of that point will be *negative*. See IMAGINARY QUANTITIES.

Negau'nee: city (founded in 1865); Marquette co., Mich. (for location of county, see map of Michigan, ref. 2–F); on the Chi. and N. W., and the Duluth, S. Sh. and Atlantic railways; 12 miles W. of Marquette. It is on Iron Mountain, at an elevation of 900 feet above the level of Lake Superior, and is principally engaged in iron-mining and lumbering. There are 5 churches, graded and convent schools, a national bank with capital of $50,000, and a weekly newspaper. Pop. (1880) 3,931; (1890) 6,078; (1900) 6,935.

EDITOR OF "IRON HERALD."

Negligence [from O. Fr. < Lat. *negligen'tia*, deriv. of *negli'gere*, neglect; *neg-*, not + *le'gere*, gather]: as a legal cause of action, has been defined to consist "in the neglect of the use of ordinary care or skill toward a person to whom the defendant owes the duty of observing ordinary care and skill, by which neglect the plaintiff, without contributory negligence on his part, has suffered injury to his person or property." (Brett, Master of Rolls, in *Heaven* vs. *Pender*, 11 Queen's Bench Division 503.) The elements of the wrong, it will be observed, are (1) a legal duty to use care; (2) the neglect to perform such duty; (3) legal damage caused by such neglect to the person to whom the duty was owed.

(1) *Legal Duty.*—In order that negligence amount to a tort, the duty which has been neglected must be other than a contract duty, although it may arise out of contract. A person who negligently fails to pay his promissory note at maturity, and thereby causes the payee to lose a profitable bargain which he could have obtained had the money been paid, is liable for the breach of his contract, but not to an action in tort for negligence. A common carrier, however, who contracts to transport goods safely, and who negligently injures them, may be sued by the shipper, either in tort or for the breach of contract. In such a case "the contract creates a relation, out of which relation springs a duty independent of the mere contract obligation."

Extent of Duty.—A person's conduct may be very careless on a particular occasion, without subjecting him to an action for negligence on behalf of one damaged by such carelessness. Whether his carelessness is actionable negligence will depend upon whether he was under a duty to the injured party to exercise care. A farmer leaves maple-sirup in uncovered buckets in an open shed. His neighbor's cow wanders from her owner's premises into the shed, and dies from drinking the sirup. He is not liable in damages to the neighbor, for he was under no duty to guard trespassing cattle against a harmful beverage; but had he given his neighbor the legal right to turn the cow into the lot surrounding this shed he would have incurred a duty toward the neighbor to make the place reasonably safe, and his carelessness in dealing with the sirup would have been actionable negligence. (*Bush* vs. *Brainard*, 1 Cowen (New York) 78.) A trespasser who suffers damage from the mere carelessness of another has no cause of action in negligence, because the other is under no duty to exercise care toward such an one. The only duty is to refrain from willful or wanton misconduct toward him.

The duty to exercise care is at times very broad in its sweep, extending to those with whom the subject of the duty has no contract or personal relation; while at other times it is confined within narrow limits. One who deals in dangerous instruments or poisonous substances, or explosives, is bound to use reasonable exertions to prevent their doing harm to others. This obligation is not confined to his customers, but extends to strangers whose use of these articles is the natural and probable consequence of his parting with them. Hence a wholesale druggist who sends out the extract of belladonna carelessly labeled as the extract of dandelion is liable in damages to one who takes it as a medicine, though the injured party buys it from a

dealer who bought it from a purchaser of the wholesale druggist. (*Thomas* vs. *Winchester*, 6 New York 397.) So a tradesman who sells gunpowder to a young child is liable to third persons who are injured by the child's use of it. The tradesman's duty was not confined to his purchaser, but extended to all who, he reasonably might have contemplated, would suffer from his carelessness. The same doctrine has been applied by some courts to the manufacturer of chattels, who carelessly sends them into the trade with defects which render them dangerous to their users. (*Schubert* vs. *Clark Co.*, 49 Minn. 331.) Other courts have refused to apply it in such cases, declaring that "if a contractor who erects a house, who builds a bridge, or performs any other work; a manufacturer who constructs a boiler, a piece of machinery, or a steamship, owes a duty to the whole world that his work, or his machine, or his steamship, shall contain no hidden defect, it is difficult to measure the extent of his responsibility, and no prudent man would engage in such occupations upon such conditions." These courts confine the duty of the contractor or the manufacturer to the parties with whom he deals. *Curtin* vs. *Somerset*, 140 Penn. 70; *Heizer* vs. *Kingsland, etc., Co.*, 110 Mo. 605.

Degrees of Care.—After it has been determined that a particular person was under a duty to exercise care toward another, it becomes important to inquire what amount of care was incumbent upon him. Upon this topic various theories have been maintained. One is that the law recognizes three degrees of care: Great care, or that which is usually bestowed upon the matter in hand by the most competent and prudent class of persons. Ordinary care, or that which is usually bestowed upon the matter in hand by the average person. Slight care, or that which is usually bestowed by persons of average prudence, having no special knowledge of or experience in such matters. (Shearman and Redfield on *Negligence*, 4th ed., § 47.) According to another theory there are but two degrees of care—that required of one who is not and does not profess to be a good man of business, or an expert in the affairs under consideration, and that required of one who is or professes to be such an expert. (See Wharton on *Negligence*, bk. i., chap. ii.) A third theory, and the one generally accepted at present, recognizes but one legal standard of care for all cases, and that is the care usually exercised by the ordinarily prudent person in like circumstances. Whether an oculist has been negligent in operating upon an eye and whether a carrier has been negligent in transporting a barrel of apples are to be determined by the application of the same test. Each has failed to use ordinary care, and hence has been negligent if he has fallen below the standard of reasonable skill and attention which the ordinary man of his class would exercise in dealing with the like matter in like circumstances. According to this theory the legal standard of care remains constant; but the amount of care which that standard requires in a given case varies with its facts.

Amount of Care.—The manner in which this varies with the circumstances surrounding the one who is bound to use due care is well illustrated by the case of the occupier of land or buildings. We have seen that he is under no duty of care toward a trespasser. His only obligation is to refrain from inflicting willful or wanton injury upon such wrongdoer. Toward licensees (see LICENSES), including guests who are enjoying gratuitous hospitality, his duty does not extend beyond warning them of any secret danger, known to himself, but not reasonably apparent to them. Indeed, one who for his own benefit uses the property of another under a bare permission must take it, as a rule, with all its faults. All that he has a right to expect is that the owner will use reasonable care not to subject him to new perils without notice. In case the occupier of land or buildings invites others to enter or use them in connection with his business, his duty is "to make the place as little dangerous as such a place could reasonably be, having regard to the contrivances necessarily used in carrying on the business." (*Indermaur* vs. *Dames*, Law Reports, 1 Common Pleas 274.) If the property abuts on a highway, the risk of harm from its defective condition or its improper use is very great; consequently the owner is bound to use an amount of care and skill to protect passers-by from injury which is commensurate with the danger. If he is constructing a building on the line of a city street, he is bound to know that materials will probably fall and injure passers-by unless special safeguards are provided. His failure to take such precautions may well amount to a want of reasonable care—"an omission to do something which a reasonable man, guided upon those considerations which ordinarily regulate the conduct of human affairs, would do." (*Jager* vs. *Adams*, 123 Mass. 26.) Similar considerations determine what is reasonable care on the part of passenger-carriers. A railway company, to be free from negligence, must inspect its road-bed and rolling stock more frequently and thoroughly than a stage-coach proprietor is bound to do.

Duty to Insure Safety.—In some cases the English common law requires one who brings upon his land that which exposes his neighbor to extraordinary risk "to insure his neighbor against any consequent harm, not due to some cause beyond human foresight and control." Thus the owner of animals is bound to keep them on his own land at his peril. If they escape and trespass upon a neighbor's land, the owner is liable for the natural consequences of that trespass, without regard to the care he has taken to keep them at home. So the keeper of a mischievous animal, having knowledge of its propensities, is bound to keep it securely. He does not perform his duty by using reasonable care to prevent its doing harm. Again, one who starts a fire on his premises for any purpose is bound to keep it there at his peril. The same doctrine has been applied by the English courts to one who constructs a reservoir on his land. In the leading case on this subject, decided in 1868 (*Rylands* vs. *Fletcher*, Law Reports, 3 House of Lords 330), it was declared that "the true rule of law is that the person who for his own purposes brings on his land and collects and keeps there anything not naturally there, and likely to do mischief if it escapes, must keep it in at his peril; and if he does not do so, is *prima facie* answerable for all the damage which is the natural consequence of its escape. He can excuse himself by showing that the escape was owing to the plaintiff's default; or perhaps that the escape was the consequence of *vis major*, or the act of God." Later cases have recognized exceptions, where the escape was caused by the act of a stranger; where the source of danger was maintained for the common benefit of the plaintiff and the defendant; and where its existence was authorized by law.

The doctrine of *Rylands* vs. *Fletcher* has been adopted without qualification in some of the U. S. (see *Baltimore, etc., Co.* vs. *Ranstead*, 28 Atlantic Reporter 273, Md. Court of Appeals, 1894), but in most jurisdictions it has been repudiated (*Marshall* vs. *Welwood*, 38 New Jersey Law 339), and the liability of one who constructs a reservoir on his land, or brings upon it a steam-boiler, or kindles a fire, is confined to damages caused by his failure to exercise reasonable care; that is, a care proportioned to the manifest risk to which his use of his land exposes his neighbor. Even in the case of trespassing animals the common-law doctrine has been greatly modified by statute in the various States, or has been declared by the courts inapplicable to the conditions and habits of the people. *Morris* vs. *Fraker*, 5 Colorado 425.

(2) *Breach of Duty.*—In an action for negligence the plaintiff must show not only that the defendant owes to him the duty of exercising reasonable care, but also that the duty has been violated. A person driving along a street must use reasonable care in selecting and controlling his horse. If, however, the animal becomes unmanageable through no fault of the driver, and runs away and injures the person or property of another, the latter has no cause of action for damages against the former. The harm results not from the driver's negligence, but from inevitable accident. Whether a person has failed to use reasonable care in a particular case is generally a question of fact for the jury. At times a positive duty is laid upon him by contract, by statute, or otherwise. Here the only question will be whether he has done the act required, or has abstained from that which was prohibited. Accordingly, if a statute or ordinance forbids the suspension of signs over a street, or of awnings over a sidewalk, or requires boats moving at night to display head-lights, or the owners of buildings having elevator-wells to protect them by rails, a person who inadvertently violates any of these provisions fails to use due diligence. Such positive requirements represent the minimum of reasonable care, but as a rule the question of reasonable care is one of fact. This does not mean that the court is bound to submit every action for negligence to the jury. On the other hand, it may dispose finally of the whole case wherever the only inference that can fairly be drawn by reasonable men from all the evidence is that there was no negligence. The respective functions of the court and jury have been stated briefly as follows: "The judge has to say whether any facts have been established by evi-

dence from which negligence may be reasonably inferred; the jurors have to say whether from those facts, when submitted to them, negligence ought to be inferred. It is a question of law for the judge whether there is evidence which, if it is believed, and the counter evidence, if any, not believed, would establish the facts in controversy. It is for the jury to say whether and how far the evidence is to be believed."

The common law does not presume negligence, but requires the one who bases a claim upon it to establish its existence by a fair preponderance of proof. He is not bound to prove it beyond a reasonable doubt, and he makes out a *prima facie* case by showing that the harm done was such as would not have occurred in the ordinary course of things had the defendant used reasonable care. Where one is injured by a building falling into the street without apparent cause, or by a barrel rolling out of a warehouse window to the sidewalk, or by a railway train jumping the track, or by a bridge breaking under an ordinary load, the very circumstances of the injury raise the presumption of negligence, and require an explanation from the defendant. This doctrine has been extended by statute in England and in some of the U. S., so that in certain cases, chiefly those of damages resulting from the operation of railways, proof of injury sustained by the plaintiff makes out a *prima facie* case, which the defendant is required to overcome.

(3) *Damage Caused by the Defendant.*—A breach of duty to use care must cause legal damage to the object of that duty in order to amount to actionable negligence. Whether physical suffering consequent upon a nervous shock caused by another's negligence constitutes legal damage is a subject of judicial disagreement. It was carefully considered by the Privy Council in *Victorian Railways Commissioners* vs. *Coultas* (13 Appeal Cases 222), and the conclusion was reached that no English decision treated such an injury as legal damage. It was thought unwise to extend the liability for negligence to this class of cases, because of the great difficulty that would ensue in determining whether the alleged injuries had been caused by the negligent act, and of the wide field that would be opened to imaginary claims. The same view has been taken by courts in the U. S. (See *Ewing* vs. *Pittsburg Railway Co.*, 147 Penn. 40.) On the other hand, it has been held that if the fright or nervous shock produced by defendant's negligence causes the victim's person to collide with some object, or even causes nervous convulsions and illness, the defendant is liable. (*Purcell* vs. *St. Paul Railway Co.*, 48 Minn. 134.) In some jurisdictions mental suffering, although neither an incident nor a producer of physical injury, has been adjudged to constitute legal damage; as when a child has been prevented from attending his parent's funeral by the negligence of a telegraph company in transmitting a message. The weight of authority, however, is against this view. See *Kester* vs. *Western Union Co.*, 55 Federal Reporter 603.

Not only must the defendant's negligence sustain the relation of cause to plaintiff's harm, but it must be the proximate cause. Between the negligence complained of and the injury there must be an unbroken connection. If a new and independent cause intervenes, this and not the remote cause bears the whole legal responsibility for the harm. "The rule is difficult of application; but it is generally held that, in order to warrant finding that negligence or an act not amounting to wanton wrong is the proximate cause of an injury, it must appear that the injury was the natural and probable consequence of the negligence or wrongful act, and that it ought to have been foreseen in the light of the attending circumstances." In applying this rule it has been held that the proximate cause of the loss of goods, which had been negligently delayed by a common carrier, and destroyed by an extraordinary freshet while thus delayed, was the flood, and not the negligence. (*Railroad Co.* vs. *Reeves*, 10 Wallace (U. S.) 176.) Consistently with this holding, it has been decided that the negligence of the State in permitting a bridge to remain in an unsafe condition was the proximate cause of the death by drowning of a father, who plunged into the canal to save his child upon the latter's falling into the water by reason of the defect in the bridge. (*Gibney* vs. *State*, 137 N. Y. 1.) In the former case the destruction of the property by the flood was not the natural and probable consequence of the carrier's delay. In the latter case the father's desperate efforts to save his child were the natural and probable result of the danger to which the defendant's negligence had subjected him.

Concurring Causes.—It is not necessary that the defendant's misconduct be the sole cause of plaintiff's damage. One who is injured by a collision of the trains of two railway companies can maintain an action against either, or both, if both are in fault. If but one was negligent, he must look to that one for redress. Even though it be shown that defendant was negligent at the time of the harm, if such fault was simply a condition of the injury, while its immediate cause was the independent wrongful act of a third person, the latter will be treated as solely responsible therefor. If, however, such act by a stranger might have been foreseen as a reasonably probable result of defendant's negligence, it will not relieve him from liability.

Contributory Negligence.—If one of the concurring causes of plaintiff's injury is his own lack of proper care, he can not recover, although but for defendant's negligence the harm would not have happened. However, it is to be remembered that plaintiff's want of care must be a cause of the injury, in order to defeat his recovery. If it is a condition only, it will have no such result. This is illustrated by a case where the plaintiff was put to work on a platform surrounding the defendant's building, and was warned not to go on a certain part which was not railed, because of the danger of slipping on the ice and falling off. While on the forbidden part he was knocked to the ground by bricks falling from the building by reason of defendant's negligence, and concerning which he had not been warned. It was held that plaintiff's going upon the slippery part of the platform was not the proximate cause of his injury. By passing to that part he took the risk of dangers pointed out, but not the risk of different perils to which he was subjected by defendant's negligence. (*Southwick* vs. *Hall*, 59 Conn. 261.) Moreover, the plaintiff may have been negligent with respect to the very source of the injury, and yet if the defendant might have avoided inflicting the harm by exercising reasonable care, after the occurrence of plaintiff's negligence, the defendant is liable. While in one sense the carelessness of the plaintiff contributed to the harm, it was not its proximate cause. Hence one who recklessly drove against a donkey, which had been carelessly turned into the highway by its owner with its forefeet fettered, was held liable for the injury. It is the duty of one who has been harmed by the negligence of another to use reasonable efforts to make the damage as small as possible. If he has sustained a personal injury, he is bound to take proper care of himself, and this may include suitable medical treatment. When, however, he uses proper care in selecting a physician, and the latter aggravates the injury by unskillfulness, the original wrongdoer is liable for the increased damages. They are an incident, a natural and probable consequence, of the defendant's wrongful act. *Pullman Palace Car Co.* vs. *Bluhm*, 109 Ill. 20.

A person is not chargeable with contributory negligence who acts without deliberation, and as the event discloses, unwisely, in the attempt to extricate himself from a peril brought upon him by another's fault. In such a case the defendant must show that the plaintiff's conduct was unreasonable under the circumstances, and reckless. Nor is it contributory negligence for one, in the discharge of duty, to remain in a situation made dangerous by the negligence of another. An engineer who remains at his post in the attempt to save his train from disaster is an example. So a person who, without recklessness, exposes himself to danger to save a human life imperiled by another's negligence, and is injured, may recover damages. *Pennsylvania Co.* vs. *Langendorff*, 48 Ohio 316.

While contributory negligence is a bar to the plaintiff's action for damages at common law, it is not in ADMIRALTY (*q. v.*), although his willful, gross, or inexcusable fault will defeat him. If both parties are negligent the damages are divided between them, though not always equally. (*The Max Morris*, 137 U. S. 1.) As this doctrine applies to all maritime torts, a person injured by the negligence of another will often find it to his advantage to bring his suit in admiralty rather than in a common-law court.

Imputed Negligence.—The fault of one may be imputable to another when the former occupies the relation of servant to the latter. (See MASTER AND SERVANT.) In some jurisdictions this rule has been extended so as to charge a passenger with the negligence of his carrier, and a child with the negligence of his parent or guardian. The leading case in support of the first view is *Thorogood* vs. *Bryan* (8 Common Bench Reports 115), which held that a passenger in an omnibus was to be considered so far identified with the owner that negligence on the part of the owner or his serv-

ant was to be deemed the negligence of the passenger. The case has been overruled in England (*The Bernina*, 13 Appeal Cases 1), and is generally repudiated in the U. S. (*Little* vs. *Hackett*, 116 U. S. 366.) Its doctrine is clearly unsound. Neither the owner nor his servant is under the control of the passenger. If the carrier's negligence is imputable to the passenger so as to defeat his recovery against a negligent third person, it ought to be imputable to him, so as to render him liable to a third person injured by the carrier's negligence. Equally unsound is the doctrine that a parent's negligence is imputable to his infant child. The legal right and duty of the parent to protect the child exist for the infant's benefit, not for his detriment. It is true that the parent's negligence may be the proximate cause of the child's injury in a particular case, and the third party's negligence only the remote cause. When such are the facts, the parent and not the third party is responsible; but if their negligent acts concur to produce the harm, there is no reason why the parent's misconduct should protect the third party from liability to the infant. *Newman* vs. *Phillipsburg Co.*, 52 N. J. Law 446.

Death by Negligence.—At the common law, if an injury occasioned by negligence caused death, no civil action could be maintained. It is plain that no action could be brought in the name of the person killed. Other persons, it is said, are not pecuniarily damaged, as they could only claim compensation on the ground of loss of service, and the *relation* of master and servant, whether expressly created or implied from that of husband and wife or parent and child, is at an end. This defect in the law was remedied in England by "Lord Campbell's act" (9 and 10 Vict., c. 93; see also 27 and 28 Vict., c. 95), the provisions of which have been substantially re-enacted in most of the U. S. The substance of the statute is that the action is to be brought by the executor or administrator of the person killed, for the benefit of the husband or wife or next of kin. The amount to be recovered depends upon the pecuniary damages sustained, and is generally limited to a specified amount. It has been held both in England and the U. S. that the rule upon this subject in admiralty is the same as at common law. (*The Harrisburg*, 119 U. S. 199.) In Scotland the surviving lawful children or parents, husband or wife of the deceased, "acquire a claim in their own right to damages and *solatium*, founded partly on the nearness of relationship, partly on the existence during life of a natural obligation of aliment." *Bell's Principles*, § 2030, 9th ed.

Criminal Negligence.—Where a particular intent is necessary to constitute a crime, as in larceny or perjury, it can not be committed by mere carelessness. Negligence, however, may satisfy the requirements of the law for a general criminal intent, where a person, being under a public or private duty, neglects to perform it, and thus causes an injury to society or to particular persons. Though there is no positive intent to do wrong, there is culpability in the failure to discharge the duty. Thus a public officer, being under a public duty to keep a prisoner safely, is criminally liable if he by neglect permit him to escape. Statutes sometimes declare that official neglect in specified cases shall constitute a crime of a particular grade. The same general rule would be applied to a violation of a private obligation causing a wrong to society. Thus a neglect to scour the bed of a river, whereby adjoining lands are overflowed, may constitute a public nuisance. It is a well-known rule in the law of HOMICIDE (*q. v.*) that an act of neglect causing death may amount to the crime of MANSLAUGHTER (*q. v.*), while a positive intent to kill will constitute MURDER (*q. v.*). In case of criminal homicide by negligence, contributory negligence on the part of the deceased is no defense. The plaintiff in criminal prosecutions is the State, not the injured party nor any one in privity with him. In addition to the authorities cited above, see Bevans's *Principles of the Laws of Negligence* (London, 1889); Pollock on *Torts*; Bishop's *New Criminal Law* (Chicago, 1892). FRANCIS M. BURDICK.

Negotiable Instruments: written contracts which are transferable by indorsement or delivery, so that the transferee can enforce them in his own name, and free from any equities against prior holders, provided he takes them before maturity, for value and without notice. In these respects they differ from an ordinary chose in action. An assignee of such a claim can not maintain a suit upon it in his own name at common law; the assignment does not bind the debtor until notice thereof is given to him, and the assignee gets no better title than that of his assignor. (See ASSIGNMENT.) If negotiable paper is payable to order, it is regularly transferable by indorsement—that is, by the payee's writing and signing on the back of the instrument a direction for its payment to his transferee, followed by delivery. If it is payable to bearer, it is transferable by delivery only. Even if the paper is payable to order, its transfer by the payee, without indorsement, will pass all his interest in it, and will give the transferee the right to compel an indorsement. By statute, in many of the U. S., he can maintain a suit in his own name on the paper, although only an assignee. In such case, however, even when a purchaser without notice, he gets no better title, until he obtains an indorsement, than his transferrer had; so that if the paper becomes due, or he has notice of equities before the indorsement, he will be subject to all the defenses that existed against his transferrer.

Defenses.—These are of two kinds: (1) legal or real, and (2) equitable or personal. The first class is sometimes called legal defenses, because they rest on fixed legal rules, and exclude all consideration of equities between the parties. They are also termed real defenses, because they attach to the *res*—the instrument—and are thus available against any holder, without regard to his merits or demerits. This class includes the defense that the instrument never had an inception, as when a bill or note fully executed by the defendant is stolen from him before delivery, or when it is obtained from him by an imposition as to the contract he is making; it includes defenses based upon the incapacity to make a binding contract, as in the case of an infant or an insane person; those based on illegality, which by statute renders the instrument absolutely void, as usurious bills and notes in some of the U. S.; and those based on the extinguishment of the contract, by alteration or cancelation. The second class has received the appellation of equitable, because its basis is the equities between the parties. It is also called personal, from the fact that a defense of this class is available only against the party whose conduct renders it inequitable for him to recover, or against one in privity with such person. It includes the case of negotiable paper obtained by ordinary fraud, or by duress, or for which there was no consideration, or which was illegal but not declared void by statute, or which has been paid or discharged but not taken up. This class is not available against a *bona-fide* holder—that is one taking the paper before due, for value and without notice of defects.

Forms of Negotiable Instruments.—Negotiable paper ordinarily takes the form of a BILL OF EXCHANGE (*q. v.*), a CHECK (*q. v.*), or a PROMISSORY NOTE (*q. v.*), but is not limited to these. Commercial usage is constantly evolving new forms, many of which have received judicial sanction, and thus have been added to the list of negotiable instruments. The earliest kind of negotiable paper recognized by the English courts was the foreign bill of exchange, that is a bill between an English and a foreign merchant. During the latter part of the seventeenth century, domestic or inland bills between traders gained recognition, followed very soon by inland bills between non-traders. Next came promissory notes, which, after receiving the sanction of several judicial decisions, were held non-negotiable by Lord Holt, only to be declared by act of Parliament "to have the same effect as inland bills of exchange." (3 and 4 Anne, ch. 9, 1704.) Then followed goldsmiths' or bankers' notes, checks, exchequer bills, bonds of corporations, whether public or private, and government scrip. (*Goodwin* vs. *Roberts*, Law Reports, 10 Exchequer 337; 1 Appeal Cases 476.) It is not necessary that the instrument contain an order or a promise to pay money. In the case just referred to, the writing, called government scrip, bound the Russian Government to deliver a bond in exchange for the scrip; and yet the court held that "the usage of the money-market has solved the question whether scrip should be considered security for and the representative of money by treating it as such."

A promissory note of an individual or of a corporation under seal is held generally non-negotiable, because of the radical differences at common law between an ordinary contract and a BOND (*q. v.*) Corporate bonds, however, are treated in almost every jurisdiction as negotiable, if, containing words of negotiability, they are issued as marketable securities, and are regarded by the mercantile community as such. The Supreme Court of the U. S. has declared: "There is nothing immoral or contrary to good policy in making them negotiable, if the necessities of commerce require that they should be so. A mere technical dogma of the courts or the common law can not prohibit the commercial

world from inventing or using any species of security not known in the last century. Usages of trade and commerce are acknowledged by courts as parts of the common law, although they may have been unknown to Bracton or Blackstone; and this malleability to suit the necessities and usages of the mercantile world is one of the most valuable characteristics of the common law." (*Mercer County* vs. *Hackett*, 1 Wallace 83.) In a number of the U. S. the common-law rule as to the negotiability of instruments under seal has been abrogated, and the English Bills of Exchange Act of 1882 (§ 91) authorizes corporations to issue negotiable paper under corporate seal.

Some forms of debentures, dividend warrants, certificates of stock, and receiver's certificates have been declared by the courts non-negotiable. See BILL OF LADING, LETTERS OF CREDIT, and WAREHOUSE RECEIPTS. See Daniels, *Negotiable Instruments* (New York, 1891); Chalmer, *Bills of Exchange* (London, 1891). FRANCIS M. BURDICK.

Negri, ADA: poet; b. in 1871 of peasant parents at Lodi, in Lombardy, Italy. Her youth was spent in extreme poverty, and when she was eighteen she became a teacher in the communal school of the remote hamlet of Matta-Visconti. Here she began to write verses, which for some time appeared, almost unnoticed, in the columns of the *Illustrazione Popolare* and the *Corriere della Sera* of Milan. In 1892 these were collected in a volume entitled *Fatalità*, which at once attracted general interest in Italy. They are verses of poverty, toil, regret for the hard conditions of the life of the poor, passionate longing for a state of society in which such things shall be impossible. They brought upon their young author charges of revolt, socialism, and anarchism, but they also secured recognition for her remarkable talents. She was given a money prize that is awarded to Italian women who distinguish themselves in literature, and she was also transferred from her lonely post to the normal school for women at Milan, where she taught Italian literature. A. R. MARSH.

Negri, nā′grĕ, PAOLO: obstetrician; b. in Verona, Italy, Dec. 28, 1853; educated at the University of Padua; assistant in the Milan School of Obstetrics 1879–82; professor and director of the School of Obstetrics in Novara 1882–86, and since 1886 has held the same position in the School of Obstetrics in Venice. Among his many published works are *Intorno al parto per il fronte* (Milan, 1882); *Studj e ricerche di Ostetricia* (1885); *Di una gravidanza extrauterina* (Venice, 1880); *Sulla idrocefalia ripetuta del feto* (1890); *Cinquanta laparotomie* (1892).

Negrillos, Negritos [Span. dimins. of *ne'gro*, black, a Negro], **Arafuras, Alfooroos**: names given to the various black or Negro-resembling peoples of the Pacific area. Some of the hill-men of Farther India, and possibly the Andaman islanders, are of this stock. The wild men of the Philippines are the typical Negrillos. They have woolly hair, longer and less crisped than the Negroes. The hair of some tribes grows in patches, like that of some South Africans. The features of most are of a decidedly African cast, but their languages are clearly not African. The skin is sometimes perfectly black. It seems generally but not universally admitted that the straight hair and less uniform features of the black Australian natives, with their peculiarities of language, separate them from the true Negrillo stock. The whole race are referred by Latham to the "Oceanic Mongolidæ." Their languages seem to have some verbal roots in common with the Malays. (See ARAFURA.) See Wallace, *Malay Archipelago; Asiat. Researches* (iv., 393; x., 218).

Negri-Sembilan (i. e. the nine states): a confederation of six small states in the S. W. of the Malay Peninsula, now under British protection. There were originally nine, but by political vicissitudes they were reduced to six. See MALAY PENINSULA and STRAITS SETTLEMENT. M. W. H.

Negro [from Portug. or Span. *negro*, black: Fr. *noir*: Ital. *nero* < Lat. *niger*, black]: a term employed in ethnology to designate one of the five races or varieties of the human species. As synonyms, African, Aust-African, and Melanic have been used by writers.

Location.—The purest types of the Negro or black race are found in Africa, S. of the Sahara Desert, and especially in the Sudan (in Arabic, *Beled es Sudan*, Land of the Blacks); but numerous tribes, as dark in color as the blackest Africans, reside in India and the islands of Melanesia, where they are believed to be the descendants of the earliest human inhabitants. These, however, differ in other physical traits from the African Negro, and for that reason are called *Negritic*. The eastern portions of Africa are peopled by tribes usually very dark in color, but with features and hair of intermediate racial character, and they are therefore known as *Negroids*; while in the center of the continent a number of small-sized, dark-colored tribes are grouped together as *Negrillos*, a Spanish word meaning small Negroes.

Physical Traits.—There are no physical traits strictly peculiar to the African Negro, but he presents in a larger degree than any other race a series of characteristics which are incomplete, arrested, or fetal in their origin. The skull is usually long (dolichocephalic), its bones thick, and its sutures ossified in comparatively early life. The face is prognathic—that is, the lower jaw-bone and often the alveolar processes of the upper jaw protrude; the chin is not prominent; the teeth are usually strong and regular, and have the third molar, or wisdom tooth, better developed than in the white race. The nose is flat and wide, the lips thick and everted. The pelvis is narrowed—that is, its antero-posterior diameter is greater in proportion to its transverse than in other races. In the long bones, the femur and the humerus are unusually long, and the latter is less twisted upon its axis than in other varieties. The convolutions of the brain are simpler, and its average weight a few ounces less than in persons of the same height in the white race. A further comparison shows in the Negro a larger liver and proportionately smaller lungs; the muscular strength is about the same, but the muscles of the calf of the leg are less developed. The sole of the foot is flatter, the heel-bone (os calcis) projects farther backward, and the articulation of the great toe is more oblique, bringing it more into opposition to the remaining toes, and thus conferring upon it a higher prehensile power. The skin is soft to the touch, slightly cooler, and furnished with numerous odoriferous glands which exhale the well-marked and peculiar odor belonging to the race. The color of the skin is rarely completely black. Usually it is a more or less dark brown, and this is true of some of the purest Sudanese types. The eyes are black or dark brown. The hair is dark and frizzly or woolly, sometimes to such an extent that it will felt like the wool of a sheep, a peculiarity rarely or never found in other branches of the species. This depends upon the unusual narrowness of its transverse section. It is generally distributed equally over the head, but sometimes grows in isolated patches or bunches (lophocomic). The beard is generally deficient, but by no means always, and the distribution of hair on the surface of the body is ordinarily less than in the white, but greater than in the Asiatic races. To some of these peculiarities, especially to those relating to his viscera, we may attribute the general immunity of the Negro from certain diseases, as yellow and miasmatic fever, hepatitis, dysentery, and calculus, and his unusual liability to others, as pneumonia and phthisis.

Intellectual Traits.—In no part of its extensive territory does the Negro race appear to have developed an independent culture beyond the stage of barbarism. Wherever in Africa we find traces of such, we also discover relics which assign it unquestionably to some branch of the Semitic or Hamitic stocks, who from the dawn of history have occupied large portions of the African continent, and extended their influence by war and commerce throughout it. Where such influence did not exist the native Negroes lived in savagery. They developed no important food-plant, they domesticated no animal for draft or burden, they constructed no walls of stone. Many of their tribes are agricultural, but the plants which they principally cultivate—the sorghum, millet, rice, yams, manioc, and tobacco—were all introduced from Asia, Europe, or America. Other tribes are pastoral, but their cattle and sheep are descended from the ancient stocks domesticated by the Egyptians; their horses are from the same source; and the ass, indigenous to Africa, appears to have been tamed first by the Semites. The towers and walls of cut stones discovered in Southeastern Africa—the "Great Zimbabwe"—like the more modern brick-built cities of the Sudan, were constructed under the direction of Semitic and Hamitic invaders. The knowledge of smelting and forcing iron is of ancient date throughout Africa, but a long acquaintance with this most useful metal has helped the Negro little toward civilization. Many tribes are skilled in weaving, in pottery, in dyeing, and in the preparation of salt and soap. As a rule, they are fond of music, and the invention of some simple instruments, as the mandolin and marimba, is attributed to them. Their governments are generally the crudest despotisms, and slavery

has been everywhere prevalent. Woman generally, though not invariably, is little more than a slave, and polygamy is universal. Cannibalism in its most abhorrent forms is still prevalent. Their religions are generally fetichisms, inculcating childish superstitions and cruel rites. During the nineteenth century, however, Mohammedanism has made rapid strides in Central Africa, and has exercised a beneficial effect on the native morals.

Divisions.—1. True Negroes. Tribes of the true Negro type are rarely found in Africa outside of the area bounded on the N. by the tropic of Cancer and on the S. by the equator, and lying between the head-waters of the Nile and the Atlantic Ocean. Within this territory we have in the Central Sudan the important Negro monarchies of Bornu, Bagirmi, and Wadai, the two former located in the fruitful depression which surrounds Lake Tchad. Farther to the W., in the basin of the Niger, are numerous kingdoms and some cities of magnitude, as Sansandig, with 30,000 inhabitants, and the better known Timbuctoo, with about 20,000. In Senegambia are the Mandingoes and Wolofs, the latter especially presenting a very pure instance of the Negro type. On and near the coast of Guinea are the petty kingdoms of Ashantee, Dahomey, and Fanti, which were long the purveyors of the slave-trade to America. 2. The Negroids. Most of the African continent S. of the equator and its eastern shores were and are yet largely peopled by tribes of dark hue, but lacking some of the most prominent traits of the true Negro. In color they are a deep brown, the hair is crisp but not woolly, the nose is straight rather than flat, the features assimilate closer to the European type, and the peculiar odor of the Negro is absent, or but slightly noticeable. In these Negroids we recognize the products of an intermixture of blood between true Negroes and members of the Semitic and Hamitic stocks, an intermixture which has been going on for 10,000 years or more. In the North it has formed the Nubian group, in the South the Bantus. The former embraces the Nubas proper, the Nyam Nyams, the Monbuttus, and many tribes of less note. Their occupations are pastoral and agricultural, but as a rule they are in the condition of savagery, and some of them are notorious cannibals. The Bantu group occupies the whole of Africa S. of the equator, except the territory of the Bushmen and Hottentots. It includes the Suahelis and Kaffirs on the east coast, the Sakalavas of Madagascar, the Zulus, the Bechuanas, and the numerous tribes of the Congo basin and east coast. They are generally pastoral and agricultural, and slightly higher in the scale of development than the Sudanese Negroes. 3. The Negrillos. These are the African pygmies, a curious little people, averaging in the adult males about 4½ feet high. Their color is brown, the face prognathic, chin retreating, lips protruding, ears large, nose flat, hair woolly and well distributed over the body, which exhales a strong and offensive odor. They have no settled abodes, do not cultivate the soil nor domesticate animals, and depend on hunting and fishing for a livelihood. They are unerring marksmen, and use poisoned arrows. By many writers the Bushmen and Hottentots of South Africa are believed to be a branch of these Negrillos.

Negroes in America.—The deportation of Negroes from Africa to become slaves in America began early in the sixteenth century, and was continued to such an extent and for so long a time that it is estimated that at present there are on the American continent over 20,000,000 persons of Negro ancestry, about one-third the number being within the area of the U. S. The slaves were chiefly derived from three sources—the coast tribes about the Gulf of Guinea, captives obtained by these from the Mandingoes and other nations of the interior, and from the Bantu tribes of the Congo basin and S. of it. The languages of these mixed masses were soon lost, and English, Spanish, or Portuguese adopted by them. In spite of the rigors to which they were often subjected, the rate of their increase was high and in some instances remarkable, as in the slave population of the U. S. during the twenty years before the civil war, when it far surpassed that of the whites. Where opportunities of education have been afforded them they have often shown considerable capacity for learning, and in some instances Negroes of pure blood have obtained creditable positions in the learned professions. Naturally, there has been in all parts a frequent intermixture of blood, almost invariably between white men and Negro women. This has led to crossings, which have been legally defined into as many as sixteen degrees—mulattoes, quadroons, octoroons, etc. The higher the percentage of white blood the more intelligent as a rule is the individual; but often this intelligence is accompanied by perversity and indolence, and a feeble physical constitution. Crossings with the American Indian have also been frequent, especially in Spanish countries. These are said to develop a physically powerful variety, combining the best qualities of both the parent races. In Brazil they are known as Cafusos.

D. G. Brinton.

Negropont: See Eubœa.

Negro, Rio: See Rio Negro.

Negros (in Span. *Isla de Negros*, or Negro island): one of the larger of the Philippine islands; near the center of the group, in lat. 10° N., lon. 123° E.; somewhat rectangular in form, 140 miles long by 40 broad; area, 4,700 sq. miles. It has two or three active volcanoes and many extinct ones. The streams are little else than mountain torrents; the interior is heavily wooded. It was discovered by Goyti in 1565, who gave it the name of Negro island because of the number of negritos seen by him, but in 1848 Arenas found only 3,475. The most of the inhabitants are Visaya Malays, now generally professing Christianity. Pop. about 250,000.

M. W. H.

Negruzzi, nā-groot'sĕe, Constantin: poet; b. in Jassy, Roumania, about 1809; was taken to Bessarabia by his father in 1821 on the outbreak of the Greek revolt under Ypsilanti, and became acquainted with the poet Pushkin. His writings include translations into Roumanian from Pushkin and Victor Hugo, an historical poem, *Aprode Purice*, and lyric poems published under the title *Sins of Youth*. His works were published in 1873. D. Aug. 25, 1868.

E. S. S.

Negruzzi, Iacob: poet; son of Constantin Negruzzi; b. at Jassy, Jan. 11, 1843; was in Berlin 1852–63, afterward becoming professor at Jassy, and in 1880 at Bucharest. In 1867 he established the useful literary periodical *Convorbiri literare*, of which he has since been the editor, and in which his verses were first printed. He is a member of the Roumanian Academy. He has published *Poesiĭ* (1872); the idyl *Miron şi Florica*; the novel *Mihaiu Vereanu*: *Copiĭ după natura* (Copies from Nature); comedies, satirical verse, translations from Schiller, etc.

E. S. Sheldon.

Nehemi'ah [from Heb. *Nehemyāh*, liter., whom Jehovah comforts]: the latest of the Jewish leaders in the return from the Babylonian exile. Nehemiah's first administration seems to have extended from 445 to 433 B. C., and his second began after an unknown but not very long interval (Neh. xiii. 6–7). Probably he was a very young man in B. C. 445, and probably in his second administration at Jerusalem he lived to be a very old man. Josephus says: "He came to a great age, and then died" (*Ant.* xi. vi. 8). According to Neh. xii. 26, 23, cf. 2 Mac. i. 23, his "days" extended "to the days of Johanan the son of Eliashib," who became high priest between 380 and 370 B. C., or earlier.

The works attributed to Nehemiah are the fortifying and peopling of Jerusalem, the suppressing of extortion, and the carrying into permanent effect of the reforms that had been previously attempted by Ezra. These reforms mainly consisted in the enforcement of the laws of Moses, the establishment of the temple-worship on a creditable basis, and the breaking up of intermarriages between the Jews and people of other races. Later traditions assign to him two other important works, the collection of a library (2 Mac. ii. 13), and the completion of the books of Chronicles, and thus of the Old Testament (Baba Batra fol. 14, a; cf. 2 Mac. ii. 9–13, where 1 Chronicles is cited, apparently, under the title *The Memoirs according to Nehemiah*).

Willis J. Beecher.

Nehemiah, The Book of: one of the canonical books of the Old Testament. It has a title, and by its very form must always have been a separate piece of composition; but Ezra and Nehemiah are counted as one book in the scheme which groups the Old Testament writings into twenty-two books. It is now commonly said that the book was written by some later scribe, in part from memoirs made by Nehemiah. In proof of this, it is alleged, first, that the book mentions events later than Nehemiah's time; and, second, that it is in a confused state, the different parts speaking of Nehemiah sometimes in the first person singular, sometimes in the first person plural, and sometimes in the third person; but no one can prove that the book mentions any event later than the early part of the pontificate of Johanan (xii. 23), when Nehemiah was still living (xii. 26, 2 Mac. i, 23); for Jaddua (xii. 22, 10) may have been registered in his father's lifetime, and the Darius of the same verse, "upon"

whose reign the registration was begun, is most naturally Darius Nothus; and, further, the book, supposing it to have been written by Nehemiah in his old age, is capable of an analysis in which the alleged confusion of the pronouns vanishes.

On this hypothesis, it consists of two parts: first, an account of the first months of Nehemiah's first administration, with supplementary notes (i. 1–xii. 26); and, second, an account of certain events in Nehemiah's second administration (xii. 27–xiii.). The second of these two parts is simply a narrative by Nehemiah, in which he speaks of himself in the first person singular, except in xii. 47, where he uses, officially, the third person. The main portion of the first of the two parts is likewise a narrative written by Nehemiah in the first person (i. 1–vii. 5). In vii. 6–viii. 1 it incorporates matter quoted from Ezra ii. 1–iii. 1. Then follows an official account of the great convocation (viii.–x.). The first sentence of the official account blends curiously with the closing sentence of the passage quoted from Ezra. Then Nehemiah takes up his narrative (xi. 1–2), at the point where he left it in vii. 4, but continues it for these two verses only. He then finishes what he has to say touching his first administration by appending to it the long genealogical note—(xi. 3–xii. 26), which is in part a duplicate of 1 Chron. ix. 2, *seq.*, and covers a period of six generations, from the grandfather to the great-grandson of Eliashib, who was high priest when Nehemiah's first administration closed. With the facts thus accounted for, we must hold Nehemiah to be the author of the book, and not merely of some of its materials. WILLIS J. BEECHER.

Neher, BERNHARD, von: painter; b. at Biberach, Würtemberg, Germany, Jan. 16, 1806; received his first instruction in painting from his father, and finished his studies in the academies of Stuttgart and Munich and in Rome. The first great work he executed after his return to Munich was the immense fresco on the Isarthor representing the entrance of the Emperor Louis the Bavarian into Munich. In 1841 he went to Weimar, where he decorated the Goethe and Schiller galleries with frescoes. In 1844 he was made director of the art-school in Leipzig, and in 1854 of that in Stuttgart. Besides historical subjects, he painted several of a religious nature. D. at Stuttgart, Jan. 17, 1886.

Neidhart von Reuenthal: a Bavarian knight and poet who lived during the first half of the thirteenth century. He took part in the crusade of Duke Leopold of Austria (1217–19), previous to which he had already gained the reputation of a poet, according to the testimony of Wolfram von Eschenbach. For unknown reasons he incurred the enmity of Duke Ludwig of Bavaria and lost his fief in Bavaria. He turned to Austria and was given a house at Melk by Duke Frederic. No further historical traces of him are found after the year 1236. Although Neidhart is classed with the minnesingers in mediæval manuscripts, he can not properly be placed among those poets. His poems may be divided into *Sommerlieder* (*Reigen*), and *Winterlieder* (*Tanzlieder*). While the former were presumably composed for the amusement of the villagers, the latter, which are mostly satirical in contents and ridicule the bragging peasants, were chiefly delivered before the court circles, who seem to have enjoyed their boorish caricatures. In many of Neidhart's poems, especially in the *Sommerlieder*, we notice traces of old popular songs, which he with great skill and excellent effect adapted to his artistic purposes. He found a great many imitators, but most of their imitations are coarse, and lack Neidhart's gracefulness and humor. The fact that Neidhart during the following two centuries became a legendary hero in the popular songs is sufficient proof of the impression he made on his contemporaries. See *Neidhart von Reuenthal*, edited by M. Haupt, 1858, and by Fr. Keinz, 1889; R. M. Meyer, *Chronologie der Gedichte Neidharts von Reuenthal* (1883); Bielschowsky, *Gesch. der d. Dorfpoesie im 13. Jahrh.* (1891); *Die Neidhart-Legende*, *Zeitschrift f. deutsches Alterthum* (31, 64). J. GOEBEL.

Neilgher'ry (or **Nilgiri**) **Hills**: an almost isolated group of mountains in Southern Hindustan, between lat. 11° 10′ and 11° 38′ N., and between lon. 76° 30′ and 77° 10′, and covering an area of 700 sq. miles. They consist of granite, covered with a layer of rich black soil 10 feet deep, and rise in the highest peak, Dodabetta, to the height of 8,760 feet. Their sides are covered with impenetrable jungles of tropical forests, hot, unhealthful, and swarming with wild animals; but at an elevation of about 5,000 feet they form a table-land remarkable for its healthful climate, and on this account much frequented by Europeans. The native population comprises, besides the Badahars and other Hindu tribes, the Todas, who differ much from all other races in India, being tall and well formed, with strongly marked Semitic features.

Neill, EDWARD DUFFIELD, D.D.: author; b. in Philadelphia, Pa., Aug. 9, 1823; educated at the University of Pennsylvania, Amherst College, and Andover Theological Seminary; was a Presbyterian minister in St. Paul, Minn., 1849–60; chancellor of the University of Minnesota 1858–61; chaplain of the First Minnesota Regiment and hospital chaplain 1861–64; private secretary to President Johnson 1865–69; consul to Dublin 1869–70; president of Macalester College, Minneapolis, 1873–84; Professor of History and Literature there from 1884; and pastor of the Reformed Episcopal church of St. Paul 1884–89. D. there Sept. 26, 1893. Author of *Annals of the Minnesota Historical Society* (1856); *History of Minnesota* (Philadelphia, 1858); *Terra Mariæ, or Threads of Maryland Colonial History* (1867); *The Fairfaxes of England and America* (1868); *History of the Virginia Company* (Albany, 1869); *English Colonization of America during the Seventeenth Century* (London, 1871); *Founders of Maryland* (Albany, 1876); *Virginia Vetusta* (1885); *Virginia Carolorum* (1886); and *Concise History of Minnesota* (Minneapolis, 1887).

Neillsville: city; capital of Clark co., Wis. (for location of county, see map of Wisconsin, ref. 4-C); on the Black river, and the Chi., St. P., Minn. and Omaha Railway; 60 miles N. E. of La Crosse. It is in an agricultural, dairying, and stock-raising region, with considerable tracts of heavy timber; contains 6 churches, high, ward, and Roman Catholic and Lutheran parochial schools, 2 State banks with combined capital of $50,000, and 3 weekly newspapers; and has manufactories of furniture, staves, spokes, wagons, flour, and lumber. Pop. (1880) 1,050; (1890) 1,936; (1900) 2,104.
EDITOR OF "TIMES."

Neilson, LILIAN ADELAIDE: actress; b. near Saragossa, Spain, Mar. 3, 1850; went to England when a child and appeared in Margate as Julia in *The Hunchback* in 1865. In July of the same year she played the part of Juliet at the Royalty theater, London, and from this time appeared in various parts with considerable success, but did not arouse much enthusiasm till 1870–71, when her *Amy Robsart* brought her into high favor with the public. She was equally successful in the U. S., where she made a tour in 1872, appearing at Booth's theater in New York as Juliet and elsewhere as Beatrice, Lady Teazle, and her other favorite characters. She was again in the U. S. in 1877 and in 1879, and at each time was received with enthusiasm. In 1872 she married a Mr. Philip Lee, from whom she was divorced in 1877. D. in Paris, Aug. 15, 1880.

Neiva, nā'ee-vă'a: a city of the department of Tolima, Colombia; on the right bank of the river Magdalena, above the junction of the Neiva. This point is the head of navigation for light craft, and is sometimes attained by steamers during exceptional floods; much of the commerce of Popayan and the southern departments passes through it. The district is noted for its cacao, and has an active trade in cattle. Formerly large quantities of cinchona were obtained in the neighboring mountains, but most of the trees have been destroyed. Neiva was founded in 1550 at the mouth of the river of that name; after it had been destroyed by Indians it was rebuilt on its present site. It was the capital of Tolima until about 1888. Pop. 9,000; with the district (1892) 15,000. HERBERT H. SMITH.

Nekra'sov, NIKOLAĬ ALEKSEEVICH: poet; son of an army officer; b. in a village in Podolia, Russia, Nov. 22, 1822. At sixteen he was sent to St. Petersburg to enter a military academy, but gave it up for the university and a literary career. In 1840 appeared a volume of verses. Five years later he wrote the first of his celebrated poems. In 1847, with A. P. Panaev, he founded the *Sovremennik* (Contemporary), which he conducted until it was suppressed in 1866. To it almost all the great Russian writers of the day contributed. In 1868 he became editor of the *Otechestvennyĭa Zapiski* (National Annals), which continued the success of his former journal. D. Dec. 27, 1877. Nekrasov belongs to the realistic school. Whether he describes the daily round of the peasant's existence or the dark sides of St. Petersburg, or whether he reveals his own experiences and sentiments, his tone is one of melancholy. Frequently, as in *A Moral Man* (English trans., *Cornhill Magazine*, Mar., 1863),

he lashes the upper classes with savage irony. The form of his verse is at times far from perfect, but the substance often glows with intense feeling and wonderful descriptive power. His two longest poems are *Moroz Krasnyĭ Nos* (Red-nosed Frost; anon. trans., 2d ed., Boston, 1877), perhaps his masterpiece, and *Komu khorosho zhit v Rossiĭ* (To Whom is Life good in Russia?), which he did not live to finish. There have been several editions of his works (5th complete ed. St. Petersburg, 1890). A few of his pieces have been rendered into English, with scant success in *Russian Lyrics in English Verse*, by C. T. Wilson (1887); rather better in *Rhymes from the Russian*, by J. Pollen (1891). See the chapter on Nekrasov in *Studies in Russian Literature*, C. E. Turner (1882); also an article in the *Revue des Deux Mondes* for Dec. 15, 1858, by M. H. Delaveau, and one in *Regards Historiques et Littéraires*, by F. M. de Vogüé, originally prefixed to the French translations of Nekrasov's works.

A. C. Coolidge.

Nélaton, nā′lăă′tōn′, Auguste: surgeon; b. in Paris, France, June 18, 1807; graduated M. D. from the Paris school in 1836; became Associate Professor of Clinical Surgery in 1839 and professor in 1851; became a fellow of the Academy of Medicine in 1863, a member of the Institute in 1867, and a Senator of the empire in 1868; invented a new method of extracting calculi from the bladder, which he applied with great success. D. Sept. 21, 1873. He wrote *Éléments de Pathologie chirurgicale* (5 vols., 1844–60; 2d ed., 6 vols., 1868–85). Revised by S. T. Armstrong.

Neligh: city; capital of Antelope co., Neb. (for location, see map of Nebraska, ref. 9–F); on the Elkhorn river, and the Fremont, Elkhorn and Mo. Valley Railroad; 33 miles W. by N. of Norfolk, 160 miles N. W. of Omaha. It is the seat of Gates College (Congregational, chartered in 1881), and contains a national bank with capital of $50,000, a State bank with capital of $30,000, and four weekly newspapers. Pop. (1880) 326; (1890) 1,209; (1900) 1,135.

Nellore, nĕl-lor′: town of British India, Presidency of Madras; capital of the district of Nellore; on the Panar, near its mouth, in lat. 14° 27′ N. (see map of Southern India, ref. 5–E). It is ill built, but is clean, airy, and healthful. Pop. about 30,000.

Nelson: province of New Zealand. Area, 10,269 sq. miles. Pop. (1891) 34,770. The capital, Nelson, on the northern extremity of Middle island, at the head of Blind Bay, has a good harbor. It is well built, and its surroundings are very fertile and beautiful; pop. (1896) 6,659.

Nelson, David, M. D.: clergyman; b. near Jonesboro, Tenn., Sept. 24, 1793; graduated from Washington College, Virginia; studied medicine in Danville, Ky., and in Philadelphia; was surgeon with a Kentucky regiment in the war of 1812; and after the war was a physician in Jonesboro. In early life he professed Christianity, but relapsed into infidelity; becoming convinced anew of the truth of Christianity, he left a lucrative practice to enter the Presbyterian ministry, and was licensed in 1825. For nearly three years he preached in Tennessee, and was connected with *The Calvinistic Magazine*, published at Rogersville. In 1828 he succeeded his brother in the Presbyterian church at Danville, Ky.; in 1830 removed to Missouri, established Marion College, 12 miles from Palmyra, and was made president; in 1836, being forced by his zeal for emancipation to flee from Missouri, he removed to the vicinity of Quincy, Ill., and established there an institution for the education of young men. D. in Oakland, Ill., Oct. 17, 1844. In addition to articles for the press and the hymn *My Days are gliding swiftly by*, he published the widely used and formerly much admired *Cause and Cure of Infidelity* (New York, 1836; republished in London and elsewhere). C. K. Hoyt.

Nelson, Henry Addison, D. D.: professor and editor; b. at Amherst, Mass., Oct. 31, 1820; was educated at Hamilton College (1840) and Auburn Theological Seminary (1846); was a teacher in Eaton and in Homer, N. Y., 1840–43; pastor of the First Presbyterian church of Auburn, N. Y., 1846–56; of the First Presbyterian church of St. Louis 1856–68; Professor of Systematic and Pastoral Theology in Lane Seminary 1868–74; pastor of the First Presbyterian church of Geneva, N. Y., 1874–85; and since 1886 he has been the editor of *The Church at Home and Abroad*. In 1867 he was moderator of the General Assembly at Rochester, N. Y. He has published *Seeing Jesus* (1869); *Sin and Salvation* (1881); and *Home Whispers* (Philadelphia), besides contributing to religious papers. C. K. Hoyt.

Nelson, Horatio: Viscount Nelson of the Nile, Duke of Bronté; b. at Burnham Thorpe, Norfolk, England, Sept. 29, 1758; the fourth son of Rev. Edmund Nelson, rector of the parish. He attended school at Norwich and at North Walsham; obtained at the age of twelve an appointment as midshipman; accompanied Capt. Phipps's Arctic expedition 1773; served in the East Indies 1775–76; became lieutenant Apr. 8, 1777, and post-captain in 1779; was given command of a man-of-war, with which he proceeded to San Juan del Norte, Nicaragua; took Fort San Carlos in the San Juan river; cruised in the North Sea 1781–82; served again in the West Indies 1782–87, where he gained much ill-will by his vigorous attempts to prevent smuggling between the U. S. and the British colonies. On the recommendation of Lord Hood he was made captain of the Agamemnon in 1793, and was dispatched to the Mediterranean; commanded a small squadron on the coast of Corsica which co-operated with Paoli, and took Bastia May, 1794; aided in the siege of Calvi, where he lost an eye; participated in Admiral Hotham's victory over the French squadron Mar. 15, 1795; took the island of Elba; blockaded Leghorn Apr. to Oct., 1795; was made commodore 1796; distinguished himself under Admiral Jervis in the naval victory over the Spanish fleet off Cape St. Vincent Feb. 14, 1797; was appointed rear-admiral Apr., 1797; took part in the blockade and attempted bombardment of Cadiz May to July, and in the unsuccessful attack upon Santa Cruz, Teneriffe, July, 1797, where he lost his right arm; was made a Knight of the Bath and received a pension of £1,000. In May, 1798, he took command of the Mediterranean squadron off Toulon; followed Napoleon's expedition to Egypt and destroyed the French fleet at the Bay of Aboukir (generally called the battle of the Nile), being wounded in the engagement, Aug. 1, 1798, for which victory he was made Baron Nelson of the Nile, and received an additional pension of £2,000; proceeded to Naples in September; occupied Leghorn in November; aided the Government of Naples in resisting the French invasion and in recovering the capital after it had been taken, but stained his reputation by violating the capitulation concluded June 23, 1799, and hanging Caraccioli, the insurgent admiral; was made Duke of Bronté (Sicily) by the King of Naples; aided in the siege of Malta; returned to England in company with Sir William and Lady Hamilton Nov., 1800; was received with unbounded popular enthusiasm. He was made vice-admiral Jan., 1801; was second in command of the Baltic fleet in the naval battle of Copenhagen, Apr. 2, for which he was made viscount; took command of the squadron for the defense of England against the contemplated French invasion in July; attacked the French flotilla off Boulogne, Aug. 15; resided with the Hamiltons at their seat in Merton, Surrey, during the Peace of Amiens, 1802–03; was appointed commander of the Mediterranean fleet on the resumption of hostilities May, 1803; blockaded Toulon; unsuccessfully pursued a French fleet to the West Indies May, 1805; returned to England in July; again took command of the Mediterranean fleet, and inflicted a total defeat on the combined French and Spanish squadrons off Cape Trafalgar, losing his life in the engagement, Oct. 21, 1805. Lord Nelson was buried with much pomp in St. Paul's Cathedral, Jan. 8, 1806. He had learned his tactics from Napoleon, "plunging headlong into the enemy's fleet, and doubling upon a part of their line, in the same manner as Napoleon practiced in battles on land." See *Life*, by Southey (2 vols., 1828); his *Letters and Dispatches*, edited by Sir N. Harris Nicolas (7 vols., 1844–46); E. de Forgues, *Histoire de Nelson* (1860); *Lady Hamilton and Lord Nelson* (2 vols., 1888); and *The Queen of Naples and Lord Nelson* (2 vols., 1889), by J. C. Jeaffreson.

Nelson, Samuel, LL. D.: jurist; b. at Hebron, N. Y., Nov. 10, 1792; graduated at Middlebury College in 1813; was admitted to the bar in 1817; became a successful lawyer of Cortland co., N. Y.; judge of the circuit court 1823–31, of the State Supreme Court 1831–37, its chief justice 1837–45; in 1845 was appointed a judge of the U. S. Supreme Court, from which he retired in 1872; was a member of the joint high commission to settle the Alabama claims 1871. D. at Cooperstown, N. Y., Dec. 13, 1873.

Nelson, Thomas: Governor of Virginia; b. in York co., Va., Dec. 26, 1738; was educated at Trinity College, Cambridge, and before his return, when just twenty-one, was chosen to the house of burgesses of Virginia; was a member of the Williamsburg convention 1774, of the convention of

1775, and of the Virginia constitutional convention of 1776; was in Congress 1776–77 and 1779; signed the Declaration of Independence; served as colonel, and afterward as a general officer, in the army; was Governor of Virginia in 1781; expended his great fortune for the cause of liberty, and at the siege of Yorktown directed the artillery to play upon his own mansion, the supposed headquarters of Cornwallis. D. in Hanover co., Va., Jan. 4, 1789.

Nelson, Thomas L.: See the Appendix.

Nelson River, Canada: See Saskatchewan River.

Nelsonville: See Cowansville, Quebec, Canada.

Nelsonville: village; Athens co., O. (for location, see map of Ohio, ref. 7–G); on the Col., Hock. Valley and Toledo Railway; 14 miles N. W. of Athens, 62 miles S. E. of Columbus. It is in the great coal-belt of Ohio, and is principally engaged in coal-mining and shipping. It has 2 private banks and 3 weekly newspapers. Pop. (1880) 3,095; (1890) 4,558; (1900) 5,421.

Nelum'bo (the Ceylonese name): a genus of water-lilies (*Nymphæaceæ*), containing only two or three species. The *Nelumbo speciosa* (the Egyptian bean, lotus of Tibet and India) furnishes in China and the East much food. Its seeds, roots, and stalks are cooked, and are very palatable, abounding in starch. This plant is nearly or quite extinct in Egypt, where it was once worshiped. The *N. lutea* of the U. S. has pale-yellow flowers (those of the *N. speciosa* generally are rose colored). Its roots and seeds (water-chinquapins) are edible. It grows in shallow waters of the Western and Southern States, but is rare in the Middle States.

Nelumbo lutea.

Revised by Charles E. Bessey.

Nematel'mia: same as Nemathelminthes (*q. v.*).

Nemathelmin'thes [from Gr. *νῆμα*, thread + *ἕλμινς*, parasitic worm]: a large group of "worms," most of which are parasitic, and which from their cylindrical shape receive their systematic name as well as the common terms of "roundworms" and "threadworms." They may be recognized by their cylindrical, unjointed bodies. Externally they are covered by a thick cuticle, and no traces of appendages can be found. The peculiarities of internal structure can best be mentioned by treating the two groups of round worms separately.

In the first, the Acanthocephali (spine-headed worms), there is no digestive tract, nourishment being absorbed through the skin. The body ends anteriorly with a "proboscis" covered with spines, by means of which the parasite anchors itself to the walls of the intestines of its host. The sexes are separate, and the eggs, passing out, require to be eaten by some arthropod before beginning their development. In the bodies of these new hosts they partially develop, but not until they are again eaten by some fish, bird, or mammal do they complete their history. The order contains but a single genus, *Echinorhynchus*, the adults of which occur only in fishes, birds, and mammals. The pig is quite frequently infested with these parasites, and recent investigations have shown that the intermediate hosts in this instance are the larvæ of "June bugs" and similar beetles. The eggs are passed with the droppings of the pigs to the ground, they are eaten by the larvæ, and these latter are devoured by the pig as he roots them from the ground.

The second order, Nematoda or Nematoidea (nematode worms), contains those more numerous forms in which the alimentary canal is present, while the proboscis never occurs. In most the sexes are separate, and frequently the male differs in appearance (especially in size) from the female of the same species. A few forms occur either in the water or in moist earth, but most are parasitic, and some attain great importance (e. g. Trichina, *q. v.*), from the serious results which follow their invasion of the animal. Space will permit the mention of but few forms. *Tylenchus* injures wheat by boring into the kernel, while the species of *Heterodera* live in turnips and other root crops. *Anguillula* furnishes the "vinegar eels," those small worms which occasionally occur in vinegar or stale paste, and which are introduced with the wort. Most of the species of *Fitaria* are injurious to various vertebrates, one, *Filaria medinensis*, being the much-dreaded Guinea-worm (*q. v.*) of the tropics. *Dochmius duodenatis*, occurring in the warmer regions of the Old World, has recently appeared in Brazil. This form lives in the duodenum of man, and, sucking the blood, causes the disease known as Egyptian chlorosis, which sometimes results in death. To the genus *Ascaris* belongs the larger roundworm, *Ascaris lumbricoides*, which reaches a length of a foot or more, being the worm most often affecting children. Allied to this is the much smaller *Oxyuris vermicularis*, or "pinworm," which lives in the rectal region of children, causing an intolerable itching.

Differing considerably from the ordinary nematodes are the hairworms (*Gordiaceæ*), which are frequently regarded as horse hairs turned into worms by soaking in water. In these the body is long and thread-like, and in the adult either the mouth (*Gordius*) or the vent (*Mermis*) is lost. There are yet many unsolved points in the history of these forms. *Gordius* lays its eggs in the water, and from these there hatches out a short larva with spiny proboscis which lives in the body of aquatic insects. When these are eaten by other insects the metamorphosis takes place, and after feeding for a while on the new host the worm bores its way out and lays its eggs. In *Mermis* the history is much the same, except that the eggs are laid in moist earth, and the forms infested by it are moths, crickets, grasshoppers, and beetles.

The principal papers on round worms are European in origin. Among these may be mentioned Diesing, *Systema Helminthum* (Vienna, 1850–51); Leuckart, *Die menschlichen Parasiten* (Leipzig, 1876); Villot, *Monographie des Dragonneaux* (*Gordius*) (Paris, 1874). J. S. Kingsley.

Nematisti'idæ [Mod. Lat., named from *Nematis'tius*, the typical genus; Gr. *νῆμα*, *νήματος*, thread + *ἱστίον*, web, sail]: a family of teleocephalous fishes, related to the mackerels and dolphins. The family is represented by a single species, *Nematistius pectoralis*, an inhabitant of the Pacific coast of Mexico. It is especially distinguished as the type of a family by the composition of the ventral, as well as structure of the other fins.

Nemato'da, or **Nem'atodes**: See Nemathelminthes.

Nematog'nathi [Mod. Lat.; Gr. *νῆμα*, *νήματος*, seam, thread + *γνάθος*, jaw]: the "catfishes," an order of teleost fishes distinguished by many peculiarities of the skeleton and brain. The skull has a nearly rectilinear dorsal outline, there being no anterior geniculation; the supra-occipital is confluent with the parietals; the pterotic bone is simple; no symplectic bone is differential; the intermaxillary bones are attached to the inferior surface of the ethmoid; the supra-maxillaries are styliform, articulated at their bases, and inclosed in filamentous extensions of the skin, developed as the supramaxillary barbels; the suboperculum is wanting; in the branchial apparatus (according to Cope) the third superior pharyngeal bone is wanting or small, and resting on the fourth, the second directed backward; one or two pairs of basibranchihyals and two pairs of branchihyals are developed; the branchiæ are pectinated; in the scapular arch the coracoid elements are soldered with the proscapula (clavicle of some), and the mesocoracoid is represented by a bridge-like arch; "interclaves" are developed; the post-temporal (supra-scapula of some) is co-ossified with the skull; no postero-temporal or supra-clavicle is represented; the four anterior vertebræ are greatly modified and more or less perfectly coalesced; the brain has an immense cerebellum, which extends forward over the optic lobes; the optic lobes are quite peculiar in their thalami; the heart has no bulbus arteriosus; the air-bladder connects by a duct with the roof of the œsophagus. These and other characters unite to distinguish the catfishes and related forms from all other types as an independent order. The

order is represented by numerous species, most of which are found in the fresh waters of almost all warm and temperate countries, but some are also marine. Although, apparently, in many respects, an ancient type, no forms that can be certainly referred to it have been found in the older rocks. The order has been differentiated into the families: (1) *Trichomycteridæ*, (2) *Siluridæ*, (3) *Chacidæ*, (4) *Plotosidæ*, (5) *Clariidæ*, (6) *Callichthyidæ*, (7) *Argiidæ*, (8) *Loricariidæ*, (9) *Lisoridæ*, (10) *Hypophthalmidæ*, (11) *Aspredinidæ*. Of these, the first ten have a well-developed operculum, while in the eleventh the operculum is wanting. The first, sixth, seventh, eighth, tenth, and eleventh families are peculiar to South America; the third, fourth, fifth, and ninth are peculiar to the fresh waters or seas of the tropical parts of the eastern hemisphere; and the second is cosmopolitan. All the North American species belong to the SILURIDÆ (*q. v.*).

THEODORE GILL.

Nematoi'dea: See NEMATELMINTHES.

Němcová, nyem'tsō-vâă, BOŽENA: novelist; b. at Vienna, Feb. 4, 1820; was educated at Skaliee; married an official at Kostelee in 1837, and in 1842 settled in Prague. At Kostelec she wrote two stories, *Chudí lidé* (Some Poor People) and *Dobrý člověk* (A Good Man); her first poems appeared in 1843, in the *Květy*. In 1845 she removed to Taus, an ancient Bohemian town, where she wrote her sketches, *Obrazy z okolí Domažlického*, and novels *Karla* (Charlotte) and *Pohorská vesnice* (The Village in the Mountains, Prague, 1856), two pictures of Bohemian country life. *Národní báchorky a pověsti*, a collection of Bohemian folk-tales, was published at Prague 1845–46. It was followed by her masterpieee, *Babička* (The Grandmother, Prague, 1855), a novel of Bohemian country life, since translated into many languages (English by Frances Gregor, Chicago, 1891). She visited Northern Hungary several times, gathering material for her new works: *Slovenské pohádky a pověsti* (Slovák Folk-tales, Prague, 1858), *Uherské město* (A Hungarian City), etc. D. Jan. 21, 1862, at Litomyšl. Her collected works, *Sebrané spisy*, were published in 8 vols. at Prague and Litomyšl in 1862–63.

J. J. KRÁL.

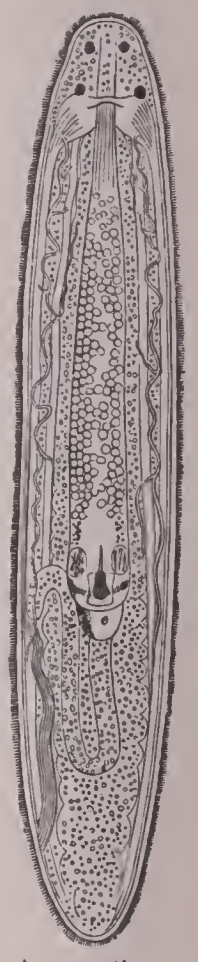
Ne'mea: a valley situated in Argolis, Greece, between the cities of Phlius and Cleonæ, and celebrated in Grecian story as the site where Argos was slain by Mercury, and where the Nemean lion was overcome by Hercules. Nemea owes its later celebrity entirely to the renown of the games held there. It was merely a stretch of pasture-land, measuring about 4 miles by 1, and hemmed in by Mts. Trikaranos, Apesas, and Tretos. On Mt. Apesas Perseus, King of Argos, had sacrificed to Zeus; on Mt. Tretos the cave of the Nemean lion was anciently shown, with its double issue, a feature common to many grottoes now visible on Mt. Tretos. There remain at Nemea three remarkably slender Doric columns and a heap of ruins of the Doric temple of Nemean Zeus, under whose patronage the biennial games were conducted. The structure, to judge by its style, was erected only in the third century B. C., and was early destroyed, presumably by an earthquake. Nemea is now a way station 20 miles distant from Corinth on the Nauplia division of the Peloponnesian Railway, but continues uninhabited. Compare Leake, *Travels in the Morea*, iii., pp. 326–336; Curtius, *Peloponnesos*, ii., pp. 505–510; Baedeker's *Greece*, p. 357.

ALFRED EMERSON.

Ne'mean Games: the third of the Panhellenic or national athletic and musical festivals of ancient Greece, celebrated biennially at Nemea in Argolis. Like other similar Grecian celebrations, they originated as a funeral festival, established in prehistoric times in honor of Opheltas or Archemorus. The death of this young prince, witnessed by the leaders of the Argive expedition against Thebes, and his funeral pomp celebrated by them with games of physical prowess, after the fashion of heroic times, presaged the failure of their expedition. The historic games occurred, alternately in spring and autumn, in the second and fourth year of each Olympiad. The first Nemead was an autumn festival coincident with the fifty-first Olympiad (575 B. C.). The greatest popularity of the Nemean games was from about 500 to 350 B. C. The contests were athletic, equestrian (horse-races), and musical. Probably there was little difference between the athletic system of Nemea and that of Olympia. The only contests recorded, however, are the foot-race or stadion (200 yards dash), wrestling, pentathlon, and pankration (see GRECIAN GAMES), in each case for men and boys; the double course, the long run, and the race in armor also occurred, to which the famous adventure of Kreugas and Damoxenus at Nemea adds the boxing-match. Damoxenus having intentionally killed his adversary, the judges awarded the victor's wreath to the dead body of Kreugas, amid loud acclamations. Among the winners in chariot-races was Alcibiades of Athens, who allowed himself to be painted seated in the lap of the nymph Nemea. Among the musical contests was one for flute-players. The prize in every case was a wreath of wild celery, on a bed of which plant Archemorus had expired. The twelve judges wore gray robes in sign of mourning for Archemorus. Participants in the games and official embassies enjoyed safe conduct during the sacred month. The conduct and protection of the games lay at first with Cleonæ, after 573 B. C. with Argos. This city refused even to recognize games held at Nemea under the auspices of Cleonæ and the Archæan League, when the fortune of war compelled the Argives to hold their own at Argos. On this occasion Aratus, the Arehæan general, sold the contestants in the Argive celebration into slavery, a good illustration of the real necessity for the sacred truce. In Græco-Roman times the Nemean games were regularly held at Argos, and imitations of them, also called Nemean, were instituted elsewhere. It is not known when the festival was abolished. The stadion and theater used in the games are still recognizable. Compare J. H. Krause, *Pythien, Nemeen. und Isthmien.* pp. 119–132, and in Pauly's *Realencyclopädie des klassischen Alterthums* (Stuttgart, 1848), under *Nemeen.*

ALFRED EMERSON.

Nemer'tines [Gr. Νημερτής, a nereid]: a group of low worms, almost exclusively marine, in which the usually flattened elongate body is without a body-cavity, the mouth is near the anterior end, and the usually sacculated intestine terminates in a posterior vent. In front, above the mouth, is a slit-like opening from which an extremely extensile proboscis can be protruded. This is the means by which the worm obtains its food, the proboscis coiling around the prey. The larger forms live in the mud of the shores, the smaller ones swim freely. It is difficult to say what the size of a large nemertean is, one of the species of the U. S., *Cerebratulus ingens*, measuring about a foot in length in its contracted condition, but yet being able to extend to a dozen feet or more. In some cases the nemertine development is direct, but in others a peculiar larval stage is introduced, inside of which the worm is gradually formed, and from which it later escapes, leaving the old skin. The nemertines are subdivided into four orders; in the first, the *Hoplonemertini*, the proboscis bears a couple of spines. In the others these spines are lacking. The *Schizonemertini* have a pair of grooves on the sides of the head which are doubtless sensory (? olfactory) in function. In the *Palæonemertini* these grooves are lacking. The last group, the *Malacobdellini* differ from all the rest in having a sucker on the posterior end of the body, and the members live in the gill cavities of certain clams. The presence of this sucker led to their being formerly regarded as leeches.



A nemertine.

The literature of the group is small. The various papers of Hubrecht stand first. M'Intosh (Ray Society) has described the British species, while Verrill has catalogued those of New England.

J. S. KINGSLEY.

Nemesia'nus, MARCUS AURELIUS OLYMPIUS: a Latin poet; b. at Carthage in the middle of the third century of our era; flourished at the court of the Emperor Carus, and wrote didactic poems on hunting, fishing, etc. We possess only the first 325 verses of the *Cynegetica* and four eclogues (*Bucolica*), whose author was for a long time identified with Calpurnius. These eclogues are full of reminiscences of Vergil, Ovid, and other poets, and are less correct in form than the seven eclogues of Calpurnius. See Baehrens, *Poet. Lat. Minores*, iii., pp. 174–202 (Leipzig, 1881); H. Schenkl, *Calpurnii et Nemesiani Bucolica* (Leipzig. 1885; also with introduction, commentary, and appendix by C. Keene, London, 1887).

M. WARREN.

Nem'esis [= Lat. = Gr. Νέμεσις, personification of *νέμεσις*, righteous anger, anger rightly allotted, orig. an allotment, deriv. of *νέμειν*, distribute, allot]: originally the abstract idea of strict divine retribution, in which sense alone Homer uses the word. In Hesiod she is a goddess, the daughter of Night (*Theog.* 223), and sister of Fraud, Love, Old Age, and Strife. Properly speaking, Nemesis deals out to men, according to their deserts, good or ill fortune. She takes cognizance only of man's past deeds, while the FATES (*q. v.*) are appointed to man before his birth, and spin his fate without reference to his merit or demerit. In the classical period, however, Nemesis has become a goddess who deals out mostly ill-fortune; she avenges pride and chastises the wicked; she brings low the very fortunate and restores to him his proper measure of felicity. She therefore is the goddess who watches over *measure* in the abstract, the *just measure*. In art she is represented as a maiden holding her right fore-arms in front of her breast, so that the fore-arms from elbows to finger-tips gave the just measure of the *ell*. The *bridle* in her left indicates that she keeps man within the just measure of fortune. The Temple of Nemesis at Rhamnus gained importance after the Persian wars. The Persians, the story goes, brought with them to Marathon a block of Parian marble, in order to erect a trophy worthy of their victory, but after their defeat at Marathon carved from the block a colossal statue of Nemesis, which was placed in the temple at Rhamnus. By some the statue was ascribed to Agoraeritus, a pupil of Phidias. What is supposed to be the head of this statue is now in the British Museum. See Posnansky, *Nemesis und Adrasteia*, p. 92 ff.; Rossbach, *Zur Nemesis des Agorakritos* in *Athen. Mittheil.*, xv., p. 64 ff.; Brunn, *Griechische Künstler* (Brunswick, 1853), i., p. 240 ff.; see also the article *Nemesis* in Baumeister's *Denkmäler*. J. R. S. STERRETT.

Nemichthy'idæ [Mod. Lat., named from *Nemichthys*, the generic name; Gr. *νῆμα*, thread + *ἰχθύς*, fish]: a family of fishes of the order *Apodes* or eels, distinguished by its thread-like body and snipe-like bill. The body is extremely elongated and band-like, with the tail tapering into a point, and the anus not far behind the throat, the abdominal cavity, however, extending much farther back; the head is very much elongated, and the jaws extended into a long and slender bill. Several species are known, most of them inhabiting great depths in the ocean.

Nemours, *ne-moor'*, LOUIS CHARLES PHILIPPE RAPHAEL D'ORLÉANS, Duc de: second son of King Louis Philippe; b. in Paris, Oct. 25, 1814. He served with his elder brother at the siege of Antwerp, and in 1836 and 1837 in the two expeditions against Constantine, in Algeria, in the latter of which he commanded one of the three brigades upon which fell the heaviest part of the short but bloody siege; commanding also the rear-guard on the return march, during which great ravages were made in the ranks by the cholera, the prince endeared himself to his soldiers by his self-exposure and devotion to the sick. His marriage the year after with a princess of Saxe-Coburg became the cause of the deposition of the Soult ministry, one of the earlier ominous signs of incipient discontent with the reigning family. On the abdication of the king he assumed command of the troops then in the court of the palace of the Tuileries, and protected the widowed Duchess of Orleans and her children. After the fruitless and hazardous appeal by her personal presence in the Chamber of Deputies, he took measures for the safe withdrawal from France of herself and all the members of the royal family, after which he succeeded himself in reaching England. His life of exile in England was passed in great seclusion, and was marked by devotion, during the continuance of their lives, to the ex-king and queen. After the abrogation of the decree of exile he was restored (as likewise the Duc d'Aumale) to his former rank of *général de division* in the French army, but his name was removed from the army list in June, 1886, according to the law excluding from military service the members of once reigning families in France. D. June 25, 1896.

Nencioni, ENRICO: poet and critic; b. in Florence, Italy, in 1840. He was educated in his native place, and early became a member of the group of young men of letters known as *gli amici pedanti*, to which Chiarini, Cavaciocchi, and Targioni-Tozzetti also belonged. He engaged in private teaching at first, but in 1869 he began to write critical articles for Bargoni's *Italia Nuova*. In 1878 his first volume of poems, *Poesie*, appeared, and this has been followed by *Medaglioni* (Rome, 1885). As a poet he shows everywhere the influence of Carducci and his school. The volume of his verse, however, is small compared with that of the critical articles he has contributed to the Italian literary periodicals. Well acquainted with English and French literature, as well as Italian, he has served as an interpreter of the chief modern poets of all three nations to his countrymen. Owing to his literary successes, he has been given a professorship in the Istituto Normale Femminile at Florence. A. R. MARSH.

Nen'nius: the supposed author of the *Historia Britonum* or *Eulogium Britanniæ*, a Latin history of Britain from the arrival of Brutus the Trojan, grandson of Æneas, to A. D. 655. According to several passages of this work, the writer was a monk of Bangor, Wales, but no particulars of his career are known, and it is even disputed whether he belonged to the seventh or the ninth century. Dr. Guest (1849) assigns the work which bears the name of Nennius to the eighth century, but supposes the preface to have been written in the ninth or tenth century. The best edition of the text is that edited for the English Historical Society by Rev. Joseph Stevenson (1838). Bohn's Antiquarian Library (1848) contains a translation by Gunn. See *Monumenta Historica Britannica* (1848) and *L'Historia Britonum*, by de la Borderie (Paris, 1883).

Ne'ocene Period [*neocene* is from Gr. *νέος*, young + *καινός*, new]: the division of geologic time following the Eocene period and preceding the Pleistocene; the middle part of the Cenozoic era. The animals and plants of this period include those regarded as the immediate ancestors of existing species, and to a considerable extent are identical with living forms. The greatest differences are found in the vertebrates, especially in the mammals. The strata, as compared with those of other periods, are characterized by the abundance of lacustrine beds.

In the U. S. Neocene rocks occupy a broad belt along the Atlantic and Gulf coasts from New Jersey to the Rio Grande, covering nearly the whole of Florida and Mississippi, approximately half of Delaware, Maryland, South Carolina, Georgia, Alabama, and Louisiana, and smaller portions of Virginia, North Carolina, Tennessee, Arkansas, and Texas. These beds are marine, as is also a fringe of deposits along the coasts of Washington, Northern Oregon, and Southern California. Fresh-water strata, recording the existence of Neocene lakes, cover the Llano Estacado of Texas and New Mexico, broad districts of the great plains in Oklahoma, Kansas, Nebraska, Colorado, and Wyoming, and smaller areas in Utah, Nevada, Montana, Idaho, and Oregon. The beds include many valuable deposits of marl and phosphates. See GEOLOGY and CENOZOIC, and consult *Bulletin No. 84* of the U. S. Geological Survey, by Dall and Harris. G. K. GILBERT.

Neo-Darwinians: See EVOLUTION.

Neodesha, *nĕe-ō-de-shaa'*: city (founded in 1869); Wilson co., Kan. (for location of county, see map of Kansas, ref. 7–1); at the junction of Fall and Verdigris rivers, and on the St. L. and San Fran. and the Mo. Pac. railways; 14 miles N. of Independence. It has 5 churches, high and graded schools, public hall owned by the city, natural-gas and petroleum wells, railway repair-shops, and 2 weekly newspapers. It is in a fertile agricultural region, has exceptional water-power, and is principally engaged in general farming, stock-raising, and milling. Pop. (1880) 924; (1890) 1,528; (1900) 1,772. EDITOR OF "REGISTER."

Neodymium: See DIDYMIUM.

Neo-grammarians: a translation of the German term *Junggrammatiker*, first applied by Friedrich Zarncke to the new school of comparative philologists which arose in Leipzig about 1877–78, and was distinguished by its enunciation of a stricter method of historical tests in linguistic research. This method recognized two leading principles: (1) That the laws of sound operate uniformly, i. e. with like results in like conditioned materials; (2) that the apparent exceptions to the laws of sound are to be explained by the operation of the psychological principle of analogy. The completest statement of these principles may be found in Osthoff-Brugmann, *Morphologische Untersuchungen*, vol. i., introd. (1878), and in Paul, *Principien der Sprachgeschichte* (1st ed. 1880; 2d ed. 1886).
BENJ. IDE WHEELER.

Neo-Lamarckianism: a term introduced for that school of evolutionists, especially strong in the U. S., which believes with Lamarck that use and disuse are important fac-

tors in the development of new organs, but which differs from Lamarck in admitting that natural selection may also be an efficient element in variation. For the principles involved, see EVOLUTION and HEREDITY. J. S. K.

Neon: See the Appendix.

Neo-Pla'tonism: in the more limited sense of the word a philosophical school which originated in Alexandria in the third century after Christ, was professedly founded on the doctrines of Plato, but, as has been shown by Hegel, is more indebted to the ideas of Aristotle than to Plato, and denotes the last attempt of the speculative spirit of the Greek civilization to establish a scientific basis for its development. The school was founded by Ammonius Saccas (175–241 A. D.), further developed by Plotinus (205–270), and continued by Porphyrius (233–305), Iamblichus, Proclus (412–485), and others. In a wider sense, the name is applied to the whole speculative tendency which grew up in Alexandria from the amalgamation of Greek philosophy, Oriental theosophy, and Jewish and Christian theology, and of which the above-mentioned philosophical school is only one individual manifestation, while it produced most remarkable intellectual characters in the most different fields of speculation. Thus Philo Judæus (42 A. D.), Clemens Alexandrinus (220), Origen (185–254), and the Gnostics are severally representatives of systems akin to the Neo-Platonic form of speculation. In the celebrated commentary of Alexander of Aphrodisias on Aristotle's psychology there are to be found many of the leading ideas which form the foundation of Neo-Platonism. For the general character of this tendency and the special ideas of the school, see PHILOSOPHY and the special articles PLOTINUS, PROCLUS, etc.

Revised by W. T. HARRIS.

Neo'sho: city (incorporated in 1846, seat of the Legislature which adopted the ordinance of secession in 1861); capital of Newton co., Mo. (for location of county, see map of Missouri, ref. 7–D); on the St. L. and San Fran. and the Kan. City, Pitts. and Gulf railways; 73 miles S. W. of Springfield, 315 miles S. W. of St. Louis. It is in a lead-mining and agricultural region, has a number of valuable mineral springs, and is principally engaged in lead-mining and manufacturing. It is the seat of Scarritt Collegiate Institute (Methodist Episcopal South, chartered 1888), and has a U. S. Fish Commission station, with extensive building and grounds. There are 12 churches, a State bank with capital of $40,000, a private bank, and 3 weekly newspapers. Pop. (1880) 1,631; (1890) 2,198; (1900) 2,725.

EDITOR OF "TIMES."

Neosho River: a stream which rises in Morris co., Kan., flows generally S. S. E., enters the Indian Territory, and joins the Arkansas near Fort Gibson. It is some 300 miles long. Its chief tributary, the Cottonwood, is much larger and longer than the Neosho above the junction.

Neotropical Region: See AMERICA, SOUTH.

Nepal, Nepaul, or Nipal: an independent state of Hindustan, situated between Tibet and British India, and between lon. 80° 6′ and 88° 14′ E. Area, 54,000 sq. miles. Pop. estimated at 2,000,000. The southern part of the country consists of a belt of low land covered with tropical forests, which yield many sorts of valuable timber; the climate is hot, and utterly unhealthful, and wild animals, such as elephants, tigers, and leopards, abound. From this low land the ground gradually rises, first into hills, where rice, maize, millet, sugar, indigo, and coffee are cultivated, mostly on artificial terraces along the hill-sides; then into mountains, in whose elevated valleys wheat, oranges, walnuts, grapes, and other kinds of fruits are grown; and then into alps, among which are the highest peaks of the Himalaya—as, for instance, Mt. Everest—on whose pastures large herds of cattle, sheep, and goats are reared. Iron, copper, lead, tin, zinc, and salt have been found and are mined; cotton cloths and earthenware are manufactured; timber, hides, ivory, fruits, sheep, cattle, and elephants are exported. The inhabitants consist of several tribes, of which the Gurkhas, who are of Rajput descent and faith, form the warrior caste and hold the government, while the Newars, who are of Tibetan origin and are Buddhists, make the artisans of the country. Between the various tribes there exists a great difference, not only in character and religion, but even in language; they all have succumbed to the conquering tribe of the Gurkhas, which invaded the country in the latter half of the eighteenth century. The government is a military oligarchy, with a titular sovereign, who is a mere figurehead, the real power being in the hands of a prime minister, called the mayor of the palace. Capital, KHATMANDU (*q. v.*).

Revised by M. W. HARRINGTON.

Nepen'thes [Mod. Lat., from Gr. *νηπενθής*, banishing pain or sorrow; *νη-*, not + *πένθος*, suffering, sorrow]: a remarkable genus of pitcher-plants (the sole type of a peculiar family, *Nepenthaceæ*) of over thirty species, all natives of the southern tropical region of which the Indian Archipelago is the center, ranging from Madagascar to New Caledonia. They are all woody climbers, with apetalous and inconspicuous dicœcious flowers. Their peculiarity is in the leaves; these are rather long and narrow, traversed by a very strong midrib, which is prolonged into a tendril serving for climbing, the apex of this developed into a tubular or oblong pitcher, closed with a hinged lid. Until the pitcher is full grown the lid closes the orifice. A watery liquid, having a slight acid reaction, is secreted in the pitcher in small quantities. At maturity the lid opens, and remains so, more or less elevated on its hinge: the watery secretion still continues, especially if animal matter is introduced, but it may now escape by evaporation. About the rim of the pitcher a sweet secretion forms under favorable circumstances, which is attractive to insects; and dead insects are generally found in the pitcher. The researches of Dr. Hooker go far to prove that the liquid within possesses digestive properties, and that its powers of dissolving animal matter are augmented by a peculiar secretion which is only poured out in quantity when insects or other animal substances are introduced. *Nepenthes distillatoria* of Ceylon was the earliest known species, and together with *N. phyllamphora* and *N. ampullaria* of the Archipelago has been long known in cultivation. Some species found in Borneo have pitchers a foot or two in length.

Portion of a plant of *Nepenthes distillatoria* (much reduced).

Revised by CHARLES E. BESSEY.

Ne'pheline [from Gr. *νεφέλη*, mist, cloud]: a silicate of alumina, soda, and potash, crystallizing in the hexagonal system and allied to the feldspars. It occurs in volcanic rocks; in some instances so completely taking the place of feldspar as to form a nepheline rock. *Davyne* and *elæolite* are varieties of nepheline.

Nephi: city; capital of Juab co., Utah (for location, see map of Utah, ref. 5–L); on the Union Pac. and the San Pete Valley railways; 90 miles S. of Salt Lake City. It is in an agricultural, sheep-raising, gypsum, marble, and salt region, and has a national bank with capital of $50,000, an incorporated bank with capital of $50,000, and a weekly newspaper. Pop. (1880) 1,797; (1890) 2,034; (1900) 2,208.

Nephrid'ia [from dimin. of Gr. *νεφρός*, kidney]: a term introduced by Lankester for those excretory organs which can be reduced to the type of ciliated funnels connecting the body-cavity (cœlom) with the exterior. To this category belong the excretory organs of most worms, molluscs, crustacea, and vertebrates. The excretory organs of insects are entirely different.

Neph'rite [from Gr. *νεφρός*, kidney. Named from being formerly worn as a remedy for kidney diseases]: See JADE.

Nephritis: See BRIGHT'S DISEASE.

Nephthys [Egypt. *Neb-ḥat*, mistress of the house]: an Egyptian goddess, daughter of Seb and Nut (sky) and sister of Osiris, Isis, and Set. She is usually represented as the wife of Set, but also as the mother, by Osiris, of Anubis, the jackal-headed god of the dead. She appears principally as the companion of Isis, with whom she is represented as mourning the dead, being painted on burial-chests at the head of the chest, with wings extended for the protection of the departed. When represented alone, she appears with the signs ("house" and "bowl") which express her name ideographically. CHARLES R. GILLETT.

Nepigon [from Cree *Aminipigon*, deep, clear lake]: a large lake in the Thunder Bay district of Ontario, Canada,

30 or 40 miles N. of Lake Superior, with which it is connected by Nepigon river, emptying into Nepigon Bay of Lake Superior. It measures about 70 miles N. and S. by 50 E. and W., is thickly studded with islands and has deeply indented shores. It is a much-praised region for summer hunting and especially fishing. The January mean temperature is about 7° F., or that of Godthaab in Greenland. In July the mean temperature is that of San Francisco. The region about the lake appears to be as favorable for agriculture as Manitoba or Quebec. M. W. H.

Ne'pomuk, JOHN: a saint of the Roman Catholic Church and the patron saint of Bohemia; b. at Pomuk, Bohemia, about 1330; studied at the University of Prague; became rector of the Church of St. Gall in that city, and was appointed court preacher to the Emperor Wenceslas in 1378. In this position he opposed and reproved with undaunted courage the suspiciousness and cruelty of Wenceslas, who had demanded that John should reveal to him the secret confessions of his wife, the Empress Sophia, daughter of Albert, Duke of Bavaria. On John's refusal, he was imprisoned, cruelly tortured, bound hand and foot, and cast into the Moldau in 1393. His body was found and buried; many miracles were wrought at his grave; legends gathered around his name, and on Mar. 19, 1729, he was canonized by Pope Benedict XIII. The Cathedral of Prague contains a magnificent monument of marble and silver to his honor. His festival is held on May 16. See Abel, *Die Legende des heiligen Nepomuk* (1855); Frind, *Der geschichtliche Johann von Nepomuk* (1861); and *Der heilige Johann von Nepomuk* (1879).

Ne'pos, CORNELIUS: a Roman historian from Upper Italy, of whose life nothing is known but that he was a friend of Atticus, Cicero, and Catullus, and that he lived between 99 and 24 B. C.; wrote various works, all of which have been lost with the exception of parts of his *De Viris Illustribus*, which originally contained at least sixteen books. The extant lives of Cato and Atticus were from the book *De latinis historicis*. The work *De excellentibus ducibus exterarum gentium*, now commonly used as a school-book, and generally ascribed to Cornelius Nepos, was first printed in 1471 under the name of Æmilius Probus, an obscure writer of the fourth century, but in a new edition of 1569 Dionysius Lambinus claimed the authorship of the book for Cornelius Nepos, and identified it as a part of his lost *De Viris Illustribus*, chiefly on the ground that the purity of the language and the simplicity of the style would be impossible with a writer of the fourth century; and this opinion, modified by various hypotheses, has been generally accepted, although Unger (*Der sogenannte Cornelius Nepos*, Munich, 1881) attributes it to Hyginus. Editions and translations are very numerous. Among the most useful editions are those of Van Staveren, revised by Bardili (2 vols., Stuttgart, 1820), of Bremi (Zurich, 1827), of Siebelis (11th ed. 1885), and of Nipperdey (9th ed. 1885), and a larger edition revised by Lupus (Berlin, 1879). Revised by M. WARREN.

Neptune [from Lat. *Neptu'nus*]: in Roman mythology, the god of the sea. In sharp contrast to the seafaring Greeks, the Romans reveal by their mythology and language very little early familiarity with the sea. Words pertaining to the sea or seafaring are for the most part borrowed from the Greek, and a native sea-god independent of the Greek Poseidon can hardly be said to have existed. The name Neptune was common to Etruscans and Romans, and perhaps originally indicated a god of all water or moisture. There is practically nothing left, however, to indicate the attributes and character of this original god, for at an early date he is completely identified with the Greek sea-god Poseidon. Only one early temple to Neptune is reported. It was located near the Circus Flaminius, and contained a famous marine group by Scopas, representing Neptune and his train. After the defeat of Sextus Pompey and the victory at Actium, the worship of Neptune was revived, and Agrippa erected in his honor the great temple in the Campus Martius, called either by the Greek name, the Poseidonium, or the Basilica Neptuni. G. L. HENDRICKSON.

Neptune [named from *Neptune*, a Roman deity]: the outermost planet of the solar system. Its discovery is justly regarded as the most remarkable astronomical achievement of the nineteenth century. Up to about the beginning of the century it was found that the motions of all the planets could be perfectly accounted for by the attraction of the sun and their mutual attraction on each other; but when, about 1820, Bouvard proceeded to construct tables of Uranus, then the outermost known planet, an apparent exception presented itself, and the observations could not be reconciled with the motions computed from the attraction of the sun, Jupiter, and Saturn. Although Uranus was discovered by Sir William Herschel in 1781, it was afterward found that a number of astronomers had actually seen it and observed its position before that time, supposing it to be a fixed star. One of these observations was by Flamsteed as far back as 1695. Bouvard, finding that he could reconcile the observations made after 1781 with the theory, omitted the older ones entirely, leaving it to the future to find why they could not be so reconciled; but it was soon found that the planet began to deviate from the tables far more rapidly than could be accounted for by the necessary uncertainty of the data on which the tables were founded. The cause of this deviation was the subject of consideration among astronomers, and it seems to have occurred to several that it might be due to the action of an unknown planet beyond Uranus; but the problem of finding this planet was one which for some time no one ventured to attack. In 1840, however, the deviations had become so wide, amounting to two minutes of arc, that they attracted more attention than before, and three astronomers took up the problem of tracing them to their cause. The first of these was the illustrious Bessel, of Königsberg, who began work about 1840 by making a critical examination of the correctness of Bouvard's computations, and setting one of his assistants, Fleming, at the work of making a careful reduction of the Greenwich, Paris, and Königsberg observations. The death of Fleming and the ill-health of Bessel prevented the work from being carried further.

John C. Adams was then a student at Cambridge. In the summer of 1841 he became acquainted with the state of this question by reading a report of Mr. Airy. It occurred to him that it ought to be within the power of mathematics to calculate the position and movements of the disturbing planet from the observed deviations of Uranus, and he determined to attack the problem as soon as his studies would permit. In the autumn of 1845 he had so far advanced as to have computed an approximate orbit of the hypothetical planet, and about the end of October of that year he communicated the position of the planet to Prof. Airy, within a degree and a half of the real position of Neptune. Had an expert astronomer pointed a telescope of 6 inches aperture in the direction indicated by Adams, and swept for the planet, he must have recognized it by its disk after a few minutes' examination; but Prof. Airy had so little confidence in the prediction that he did not take the trouble to look for the object.

In the meantime a third person entered the field. This was Urbain J. Leverrier, then a young man of little over thirty, who had proved his mathematical ability by a very important paper on the secular variations of the orbits of the planets. In June, 1846, he presented to the Paris Academy of Sciences a paper in which he assigned an approximate position of the planet, agreeing very nearly with that already found by Adams. When Airy heard of this he began to consider the planet worth looking for, and at his suggestion Prof. Challis, director of the Cambridge Observatory, began a search. Instead, however, of trying to recognize the planet by its disk, he began the work of preparing an extensive catalogue of the stars in a space of several degrees each side of the computed place of the planet, which would necessarily occupy a considerable time. Meanwhile Leverrier was engaged in determining more accurate elements, which he communicated to the Academy about the end of August. Being now entirely confident that the planet must be very near the assigned place, he wrote to Dr. Galle, of Berlin, requesting him to search for it. Galle received the letter on Sept. 23, 1846, and the same evening went to the telescope, and proceeded to compare the stars in the neighborhood of the assigned place with a star-chart of that region which had just been finished. He soon found a star of the seventh or eighth magnitude which was not on the chart, within a degree of the position sent by Leverrier. As it presented a sensible disk, there could be no reasonable doubt that it was the object sought; but, desirous of proceeding with caution, he waited till the following night, when he found that it had actually changed its position among the stars. There was no longer any doubt of the reality of the discovery. After considerable discussion astronomers in general agreed upon the name Neptune for the newly discovered planet.

Subsequent investigations of the motions of Neptune

have been made mostly by astronomers of the U.S. The first one in the field was Sears C. Walker, then astronomer at the Naval Observatory, Washington. He computed an accurate orbit of the planet from all accessible observations, and then proceeded to inquire whether it had not been observed as a star at some former time, as Uranus had been. Computing the place of the planet for those previous years in which its path was known to have been swept over by observers of catalogues of stars, he found that on May 10, 1795, Lalande had observed a star almost exactly on the path of Neptune, which was now missing from the heavens, and which must have been the planet. When the news of this discovery reached Europe, search was made among the original manuscripts of Lalande, and it was found that the planet had also been observed on May 8, but finding the two observations discordant, owing to the motion of the planet during the interval, he had rejected his first observation entirely. He thus missed the great discovery by not investigating the cause of the discordance between his observations. These observations have been very valuable in fixing the orbit of the planet. Neptune moves in an orbit nearly circular, having an eccentricity of only 0·00872; yet on account of the great dimensions of this orbit, the absolute eccentricity in miles exceeds 25,000,000, and the difference of its distances from the sun in aphelion and perihelion is more than 50,000,000. The inclination of the orbit to the ecliptic is 1° 47′, and its mean radius about 2,746,000,000 miles. The period of revolution of the planet is about 164⅔ years, and its diameter about 37,000 miles. Its bulk is therefore more than 100 times that of the earth, but its density is so much less (one-sixth) that it has only about 17 times as great a mass.

Neptune has a single satellite, discovered in 1847 by Lassell, of Liverpool. Its period is 5d. 21h. 2m. 44s., and its mean distance from the planet about 230,000 miles.

S. Newcomb.

Nerbudda: a river of Central India, and next to the Indus the largest river of India, emptying on the west coast. It rises in lat. 22° 40′ N. and lon. 81° 52′ E., crosses the peninsula with a course of 620 miles, flowing a little S. of W., and falls into the Bay of Cambay, forming a large estuary. It is narrow and deep, but serves as a commercial highway only for the last 90 miles of its course, on account of its rapid current and numerous waterfalls. C. C. A.

Ne′reids [from Gr. Νηρηΐδες, plur. of Νηρεΐς, a Nereid, liter., daughter of Nereus; Νηρεύς, a sea-god + femin. patronymic ending *-ις*, *-ίδος*, descended from]: the fifty daughters of the sea-god Nereus by Doris, his wife. They were genuine Greek goddesses, who lived in the depths of the sea in a grotto resplendent with gold and silver. They were friendly to mariners and often acted as pilots, notably to the Argonauts and the Greek expedition against Troy. They were represented in art as beautiful and youthful maidens, sometimes clothed and sometimes nude. They disported themselves on the waves of the sea along with various sea-monsters, and are often depicted riding on the backs of dolphins or seated in a chariot drawn by Tritons (*q. v.*). Among the most distinguished of the Nereids were Amphitrite, Thetis (the mother of Achilles), and Galatea. See the article *Nereïden* in Baumeister's *Denkmäler*.

J. R. S. Sterrett.

Nereids: See Sea-mouse.

Neri, nā′rĕē, Filippo, dei, known in English as St. Philip Neri: saint; b. at Florence, Italy, in July, 1515; was adopted by a wealthy uncle as his heir; secretly went to Rome to study theology and canon law; distributed his property to the poor 1538; devoted himself to the care of pilgrims and the destitute sufferers in hospitals, and in that work was associated with Ignatius Loyola; took holy orders 1551, and founded the order of Priests of the Oratory, approved by Gregory XIII. in 1575. D. at Rome, May 26, 1595; was canonized in 1622. See Oratory, Congregation of the, and Faber's *Spirit and Genius of St. Philip Neri* (1850).

Nerit′idæ [Mod. Lat., name from *Ne′rita*, the typical genus, from Lat. *ne′rita* = Gr. νηρείτης, sea-mussel, periwinkle, deriv. of Νηρεύς, a sea-god]: a family of Azygobranch mollusks (see Gasteropoda) containing some 200 species, characterized by having a solid semi-globose shell with a straight columellar lip, which may bear a prominent tooth near its middle. In one species (*Nerita peloronta*) the columella at the base of this tooth has a red blotch, whence the name, which signifies "bleeding tooth." The aperture is closed by a calcareous operculum, which locks into the columella. Most of the species are marine, but some extend into brackish and others into fresh water.

Ne′ro, Lucius Domitius (after his adoption by the Emperor Claudius called Nero Claudius Cæsar Drusus Germanicus): Roman emperor from 54 to 68 A. D.; the son of Cn. Domitius Ahenobarbus and the younger Agrippina, daughter of Germanicus; b. at Antium in 37 A. D. After the marriage of his mother to the Emperor Claudius (49 A. D.) he was adopted by the latter, and a few years later married the emperor's daughter Octavia. As early as his fourteenth year, on the assumption of the toga of manhood, the intrigues of his mother had caused his succession to the imperial dignity to seem assured, in spite of the fact that the emperor had a natural son of great promise, the young Britannicus. In 54 A. D. Claudius died (poisoned, our authorities agree, by Agrippina, in order to insure and hasten her son's succession), and, the claims of Britannicus being ignored, Nero was saluted as emperor first by the prætorian guard and then by the senate. At this time Nero was only seventeen years of age and still under the influence of his tutors, Burrus and the philosopher Seneca, who, during the first years of his reign, practically ruled the empire. The high hopes which had been raised by belief in the ability and noble nature of Nero were not at first disappointed, so long as the influence of Seneca kept the baser qualities of his nature in check; but the jealousy of Agrippina, who saw her influence over her son waning, gave the first impulse to the unparalleled series of crimes which make up the chief history of Nero's reign. His first victim was Britannicus, the son of Claudius, for whom Agrippina had threatened to secure the imperial throne in his stead. In 59 A. D. he caused the death of his mother, and from this time on he abandoned himself to a career of the wildest and most enormous profligacy and crime. Indeed, the record of the remaining years of his life is little more than a tedious enumeration of the victims of his fear and hate. The conflagration in 64 A. D., which swept away the greater part of the city, was attributed to Nero in his own time, and practically all authorities after Tacitus charge him with it; but Tacitus reports the rumor without giving it credence, and its truth may well be questioned. To avert suspicion from himself the deed was charged to the Jews and Christians of Rome, and some of the latter perished for it as the first victims of Roman persecution. The city was rebuilt by Nero in a more durable and better manner, with wider streets and more adequate precautions against fire. The chief feature of the reconstruction was the magnificent palace called "the golden house," which stretched over a vast area of the best portion of the city, from the Palatine across the intervening valley to the Esquiline. (See Middleton, *Remains of Ancient Rome*, London, 1892, vol. ii., pp. 145–153.) In the following year a conspiracy against the life of Nero was disclosed, and the leaders of it, as well as many innocent persons on whom suspicion fell, were punished. Among the latter was his former tutor and friend, the philosopher Seneca, whom he ordered to die. Nero possessed accomplishments as a singer, actor, and athlete of no common kind, and was fond of displaying himself. In the year 64 he appeared thus in public at Naples, and two years later he journeyed through Greece, where he found a more appreciative audience, taking part in the contests of the Greek festivals. On his return to Italy early in 68 he tarried long in Naples, and was finally recalled to Rome by the news of the revolt of Gaul under Julius Vindex. This movement was joined by Spain under the leadership of Galba, who had been saluted as emperor by his soldiers. Virginius, the governor of Upper Germany, lent his support to the insurrection, and the senate proclaimed Nero a public enemy and condemned him to death. At this Nero fled for refuge to the villa of a faithful freedman, but, as he was being overtaken by his pursuers, put an end to his own life. See H. Schiller, *Geschichte des röm. Kaiserreichs unter der Regierung des Nero* (Berlin, 1872).

G. L. Hendrickson.

Nero: See Claudius.

Nertchinsk: town of Eastern Siberia, province of Transbaikalia; 527 miles E. of Irkutsk, on the basin of the Amur; on the Nertcha river, 3 miles from its confluence with the Shilka. The town was founded in 1654. It was removed from the Shilka in 1812 to avoid the frequent inundations of this river, but in 1840 it was seriously injured by floods from the Nertcha. The country around abounds in good pasturage and in rich ores of many minerals, including gold,

silver, and precious stones. The richest mineral district lies between the Shilka and the Argun, and embraces 3,250 sq. miles belonging to the czar. Pop. 3,000. M. W. H.

Neruda, ner'ŏŏ-daă, Jan: poet and novelist; b. at Prague, Bohemia, July 10, 1834: studied law and modern languages at the University of Prague, adopted a literary career, and edited various journals: *Obrazy života* (Pictures of Life, 1859–60); *Rodinná kronika* (The Family Chroniele, 1863–64); *Květy* (Blossoms, 1865–66). In 1865 he became the regular feuilletonist to the *Národní Listy* (National Gazette), a position which he held until his death Aug. 22, 1891. Neruda must be considered the head of the new romantic school of poetry in Bohemia, which originated in the fifties in opposition to the old "national" school. In the production of short, witty discourses on timely topics he has no equal among Slavonic writers. He disseminated free thought, and was therefore calumniated by the priests. His first poems appeared in the *Lumír* (1854) and the almanac *Máj* (May, 1858). He published: poems, *Hřbitovní kvítí* (Flowers from the Churchyard, Prague, 1858), reflections on contemporary life; *Knihy veršů* (Books of Verse, 1868), epic, lyric, and occasional; *Písně kosmické* (Cosmic Songs, 1878), songs of the universe, highly praised by German critics; *Ballady a romance* (1883); *Prosté motivy* (Simple Motives, 1884); *Zpěvy páteční* (Friday Songs, left in manuscript), patriotic lyrics. Dramas: *Francesca di Rimini* (1860), a tragedy, and comedies *Prodaná láska* (The Sold Love, 1879) and three others. Novels, stories, and sketches: *Arabesky* (1864; 2d ed. 1880); *Různí lidé* (Various People, 1871); *Obrazy z ciziny* (Sketches from Foreign Lands, 1872); *Feuilletony* (1876, *et seq.*); *Malostranské povídky* (Little Side Stories, 1878, 1883), stories of Prague life, his masterpieee. His collected works, edited by Ignát Herrmann, were published at Prague (1892–94). J. J. Král.

Ner'va, Marcus Cocceius: Roman emperor from 96 to 98 A. D. As a member of the senate he had won a good name for prudence and integrity, and after the murder of Domitian he was declared emperor. Though not an administrator of great ability or force, he reformed many of the worst abuses of Domitian's rule, and sueeeeded in a measure in "blending things onee irreconcilable, sovereignty and freedom" (*Tacitus*). Feeling, however, that he was not strong enough alone to withstand the hostility of Domitian's former instrument of servitude, the prætorian guard, he adopted and associated with himself Trajan, then eommander of the army on the Rhine. After three months of joint rule Nerva died suddenly (at the age of sixty-six) and was succeeded by Trajan. G. L. Hendrickson.

Nerval, Gérard de: See Gérard de Nerval.

Nerves [plur. of *nerve*, viâ O. Fr. from Lat. *ner'vus*, sinew, tendon, fiber, nerve, akin to Gr. *νεῦρον*, sinew, nerve]: the cords of communication between the eentral nervous system and the peripheral parts—the skin, internal surfaees, museular apparatus, organs of speeial sense. These cords vary in diameter from a microseopic dimension to 10 millimeters, their lengths also vary widely, from a few lines to 2 feet and more. Every nerve, whether mieroscopic or larger in size, is a eompound structure made up of nervous and connective tissue. For the struetural details, see Histology (*Nerves and Nerve-centers*). The functions of nerves are general and special. As general functions or properties are recognized—(1) eonductibility, (2) excitability. By the former, sensory impressions are conveyed from peripheral parts through nerve-fibers centripetally to the nervous centers; the spinal cord and brain are thus affeeted by the external world. Again, conduetion takes plaee in a eentrifugal direction, motor excitations being sent from the nervous centers to peripheral apparatus; the aetivity of the organism is made externally manifest. Exeitability is the property whieh nerves have of reacting to impressions independently of the nervous eenters—a property whieh, after section of a nerve, survives for about three days in the distal portion. The special functions of nerves are treated of under other headings. (See Sensation, Eye, Ear, Taste, etc.) A very important function of certain nerve-fibers is that relating to nutrition. It is known that when eertain fibers of a nerve are cut atrophy and degeneration take plaee in the parts supplied by this nerve. These fibers, known as *trophic fibers*, are probably present in most nerves, but especially in certain ones. Another highly important set of nerves are those whieh govern the blood-vessels and regulate their state of contraction or distention. In this way these nerves are also closely concerned with nutrition. Nerves are liable to various diseases, such as inflammation (neuritis), or tumors (neuroma), and often reeeive injuries. See Histology. Revised by William Pepper.

Ner'vii: an aneient Belgie race, probably of Germanic or Dutch stock, who desperately opposed Cæsar in several bloody wars (57–52 B. C.). Their chief towns were *Bagacum* (Bavay) and *Camaracum* (Cambray).

Nervous Diseases: affections of the nervous system—that is, of the brain, spinal cord, or external nerves. They may be either functional or organie. By functional nervous diseases are meant such as present no anatomical alteration of nerve structure to the naked eye or to other means of examination at our command. Though this group has been materially lessened in number by the more accurate methods of study recently acquired, there is reason to believe that there will always be left a certain number in which the disorder of nerve action is possibly rather of a chemieal than of a structural origin. Whether this be true or not, for the present there are certain nervous diseases in which structural changes are not discoverable. These are often spoken of as *neuroses*. Many vague eonditions are included in this group, and in the course of many organie diseases of other parts of the body nervous disorders of a functional, probably often toxic, nature are developed. The term *nervousness* is applied loosely to many distinct conditions; bnt there is a form of unstable nervous equilibrium which has occupied much attention of late, and whieh is variously known as nervous exhaustion, nervous break-down, and neurasthenia. This disorder assumes many forms, aeeording to the part of the nervous system involved and the causes at work. It is of immense importance to reeognize it as a distinct affection as well as its influenee in furthering other and organic diseases. Overwork, excesses, and disease are at the bottom of this, which is really a condition of wasted nerve foree. Epilepsy, hysteria, certain forms of insanity, and neuralgia are among the more serious nerve disorders of the functional kind. In all of them heredity plays a part—not necessarily in every case, but in many. The vices as well as the diseases of the aneestor are visited upon the offspring: the child of a drunken father may be an epileptic; the ehild of an epileptic insane. Alternately, from generation to generation, one and another funetional nervous disease erops out in families with this neuropathic taint, slight exciting causes sufficing to upset the originally weak nervous organization. On the other hand, the most stable nervous system may suecumb to unusual and improper strains.

The organic affections of the nervous system may be classified, as are the diseases of other organs, by the nature of the struetural changes. These may be anæmia, congestion, inflammation, degenerative changes, malignant growths, and the like, as elsewhere. An ideal system of elassification would take these changes alone into consideration. Unfortunately, however, the knowledge of the physiology and pathology of the nervous system has not yet reached the point where this is possible. We are constrained to consider nervous diseases from the clinieal standpoint, grouping together diseases whose external manifestations or symptoms are the same when in reality their essential nature is probably widely different. Thus we recognize St. Vitus's danee by certain symptoms, yet it is probable that this is not essentially a disease, but a form of expression of various diseases, just as dropsy may result from heart disease or disease of the kidneys. The individual diseases of the nervous system are considered under the names of the diseases themselves. William Pepper.

Nervous System: See Histology, Nerves, and Anatomy, Comparative.

Nes'selrode, Karl Robert, Count von: Russian diplomatist; b. at Lisbon, Dec. 14, 1780, where his father was Russian ambassador; entered very early on a diplomatic career; gained the confidence of the Emperor Alexander; was made Minister of Foreign Affairs in 1812, and took a prominent part in all the important negotiations with France and the allies at the close of the Napoleonie wars. He represented Russia at the Congress of Vienna, and afterward at the congresses of the Holy Allianee, usually favoring a peaceful and moderate policy. At Aix-la-Chapelle in 1818 he showed great zeal in the interest of Franee, urging that the occupation of that country by the allies should cease. For this he was rewarded by the Freneh Government, whieh added enormously to his wealth. He became vice-chancellor of the empire in 1829, chancellor in 1844,

and governed the relations of Russia with foreign powers to 1856, when, after signing the Peace of Paris, he retired into private life, and died at St. Petersburg, Mar. 23, 1862. His relation to Alexander I. and Nicholas depended partly upon hypocrisy; he had a great talent for concealing his own superiority and making others embrace his ideas, in the belief that they themselves had produced them. His *Autobiography*, written in French, and somewhat disappointing as to its contents, was published after his death.

Nessler, Victor: opera-composer; b. in Alsace, Jan. 28, 1841; was a pupil of Theophil Stern at Strassburg; studied theology, but gave it up for music; conducted several singing societies in Leipzig, and also at the theater from 1870 to 1879. He lives at Strassburg. His operas are popular, and include *Dornröschens Brautfahrt* (1867); *Irmingard* (1876); *Der Rattenfänger von Hameln* (1879); *Der Wilde Jäger* (1881); *Der Trompeter von Säckingen* (1884). He has also composed several operettas, cantatas, etc. D. E. H.

Ness, Loch: a lake in the county of Inverness, Scotland; in the valley of Glenmore; 23 miles long and 1½ miles broad. It communicates with the Moray Firth by the river Ness.

Nestor, The Chronicle of: nearly, if not quite, the oldest chronicle we possess of the early history of Russia. It is supposed, on no very good evidence, to have been written, or at least compiled, by a monk named Nestor, who was born at Kiev in 1066 and died in 1113. However that may be, it is a document of the greatest importance for our knowledge of the time it describes. Although it has the faults of other mediæval histories, with little pretense to literary merit or critical insight, the wide knowledge of the chronicler and the general trustworthiness of his facts put the work above most others of its class. It begins with the creation, and comes down to the year 1113, describing many events that occurred during the lifetime of the writer or were related to him by older eyewitnesses. The language is one of transition from the old Church Slavonic to Old Russian. The most ancient manuscript extant, the so-called Laurentian (*Lavrentinskiĭ Spisok*, facsimile, St. Petersburg, 1870), dates from 1377, and was not known to the editors of the first printed text (1767). A revised edition was published at Vienna in 1860. The chronicle has been translated into Bohemian, Polish, German, and French. The last French version is by L. Leger (1884). See the works of Schlözer (5 vols., Göttingen, 1802–09), Miklosich (1855), Sukholimov, and others. Nestor also left a story of the lives of certain saints, called the *Paterikon*. A. C. Coolidge.

Nestor [= Lat. = Gr. Νέστωρ]: son of Neleus and Chloris and King of Pylus in Messenia. When Heracles captured Pylus and slew all the other sons of Neleus, Nestor escaped death because he was absent at Gerenia. For this reason he bears the epithet of *Gerenian* in Homer. In his youth he fought against the Epeans of Elis, against the Arcadians, and on the side of the Lapithæ against the Centaurs. He also took part in the Calydonian boar-hunt, and in the Argonautic expedition. When, as an old man, he was ruling over the third generation of his subjects, it became necessary for him to join the expedition against Troy because his son Antilochus had been a suitor of Helen. At Troy he was one of the foremost of the heroes both in the council and the fray, being distinguished for his wisdom, justice, and eloquence. After the Trojan war he resumed the reins of government at Pylus, where Telemachus, when on his way to Sparta, found him enjoying a peaceful and happy old age. His house at Pylus was shown as late as the time of Pausanias. His name is still applied to the oldest and wisest councilor of a class—e. g. the Nestor of Philologians. J. R. S. Sterrett.

Nesto'rians: a portion of the Oriental Church, adherents of Nestorianism (dioprosopysm, two-person-ism), a Christological theory which takes its name from Nestorius, who was not its first nor ablest, but became its most renowned, representative. I. Nestorius was a native of Germanicia in Syria, became a pupil of Theodorus of Mopsuestia (393–428), and from him received the views characteristic of the school of Antioch with which his own name was to be identified. First a monk, then a presbyter in Antioch, his ascetic piety and gifts as a preacher caused him to be chosen Patriarch of Constantinople, the great calamity of his life (428–431). Like no few of the great heresiarchs, he began as a zealot of orthodoxy and as a persecutor of hereties. The new patriarch and his presbyter, Anastasius, whom he had brought with him, heard in Constantinople on every hand the darling phrase of the school of Alexandria, "Mary, mother of God"—a phrase which, except with explanations and limitations which totally changed its meaning, the extreme wing of the school of Antioch would not tolerate. The presbyter (428) assailed this phrase and the theology it represented. Proclus, the unsuccessful rival of Nestorius for the patriarchate, eagerly caught at the opportunity of assailing Nestorius through his presbyter. Nestorius stood by Anastasius. Dorotheus, the court bishop, pronounced an anathema against those who should style Mary the mother of God. At the festival of the Annunciation (429) Nestorius and Proclus preached in the same church against each other. The monks and people rose in fury, renounced fellowship with the patriarch ("We have an emperor, but no bishop," they said), and treated him with such insolence that in his anger he had the monks scourged, and at a local synod convened in 429 anathematized his opponents as Manichæans.

II. There entered now into the conflict the most formidable foe encountered by Nestorius. This was Cyril, Bishop of Alexandria (412–444). His theology was antagonistic to that of Antioch, and his see was the rival of Constantinople. Nestorius afforded him the opening for dealing one decisive blow against both the objects of his dislike. It was a contest between a great theologian and a shallow popular orator, between a sagacious, unscrupulous man of the world and a monk whose excellences and defects showed the traces of the passiveness and the narrowness of the cloister. Worst of all for Nestorius, there was a statement, necessarily crude in certain aspects, yet in the main strong and sharply defined, of the logical result of the dominant movement of the mind of the Church for ages, over against a set of clumsy propositions, which never touch the real question in discussion, but persistently misstate it, and whose precise force in various respects is an object of dispute to this hour. Cyril charged Nestorius with making two persons, of two natures, and thus denying the proper personal deity of Christ, making him in one person God, in another person man, and not, as he was in truth, in one person, the God-man, so that every act and every passion was personal, though it were according to one or the other nature. Nestorius was charged with teaching a moral, ideal, voluntary *connection* (συνάφεια) of two persons, instead of the natural, real, and inseparable *union* (ἕνωσις) of two natures into one person. At the synod of Alexandria (430) Cyril issued twelve anathemas, to which Nestorius replied in the same form.

III. The third Œcumenical Council was convened by the desire of both parties at Ephesus (431). The Emperor Theodosius II., who called it, was friendly to Nestorius. After a delay of fifteen days, in consequence of the involuntary detention of John and the other Syrian bishops, the council proceeded in their absence, in a very hurried way, to condemn and depose Nestorius and fifty bishops who sympathized with him. It acknowledged the anathemas of Cyril as the true doctrine of the Church. The delayed bishops held a separate council, and made decisions reversing all that had been done by the other. Nestorius voluntarily retired to his old cloister. The emperor attempted to unite the parties at the Council of Chalcedon (432), but without success. The deposition of Cyril, Memnon, and Nestorius had been pronounced in form by the emperor, but only in the case of Nestorius did it take effect. The overthrow of Nestorius made it safe for Cyril to accept the advances of the emperor toward a settlement of the controversy. A formula was prepared by Theodoret (433) which confessed that there is, without confusion, such a union of the two natures in the one Christ as to justify the language that Mary is the mother of God. This was signed by Cyril on the one side, and on the other side John of Antioch concurred in the anathema pronounced on Nestorius. Many of the earnest men on both sides, but especially those of the school of Antioch, were dissatisfied with the compromise. The emperor urged it. Theodoret yielded on condition that he should not be required to sign the condemnation of Nestorius. Meletius and Alexander continued their resistance, and were deposed. Nestorius had now lost all favor with the emperor. Even the poor shelter of the cloister was denied him, and he was hunted from one place of exile to another until his death.

IV. The Nestorian party did not, however, become extinct. Their school at Edessa, a daughter of the school at Antioch, trained men for the priesthood of the Church in

Persia. Ibas, Bishop of Edessa (436–457), was one of its great names. Thomas Barsumas, Bishop of Nisibis (435–489), labored to secure a permanent place for Nestorianism in Persia. He established a patriarchate in Seleucia, and when the school at Edessa was destroyed by order of Zeno (489) he founded a school at Nisibis. It was the policy of the Persian kings to foster the division between their own Christian subjects and the Christians of the Roman empire. The Nestorians established a distinct church government, and called themselves not Nestorians—which was the title by which their enemies stigmatized them—but Chaldee Christians, with reference to their earlier home and the language which they employed in their church service. At the Council of Seleucia-Ctesiphon (498–99), a statement of their doctrine and of its divergency from what claimed to be orthodox was made, and the Church of Persia was formally separated, making its doctrinal basis the assertion that Christ consists of two substances. two natures, and of two persons or hypostases, in one "partsupo" of filiation, the natures continuing to subsist unchanged, and the persons also. The term "partsupo" (parsopa) has been the subject of a good deal of dispute, as more than any other determining the orthodoxy or heterodoxy of the Nestorians. There is no reason to doubt that it is formed from the Greek *πρόσωπον*. The Peshitto-Syriac uses it to render that word in its sense of face, appearance, outward appearance, manifestation of presence, person (in the popular sense), and in the Nestorian usage it often corresponds with Asseman's definition of it, "nature manifested to the senses;" but in connection with "filiation" it seems to correspond very nearly with what is called "hypostatical relation," and would mean that though there are two persons in Christ, there are not two sonships; but that the human derivative sonship coincides so far with the divine essential Sonship as to stand in the unity of the *relation* of the Son, though not in the unity of his *person*—in unity of the partsupo, but not in unity of the qitomo (chauma-hypostasis). The metaphysical difficulty running through the entire Christological controversies of the ancient Church connected itself with the identification or distinction of the ideas of nature and person. Nestorianism affirmed the concrete identity of the two. (See Christology, Monophysites, and Monothelites.) See Weismann, *H. N. J. I.*, 632; Schröckh, *K. G.*, xviii., 311; Badger, *Nestorians and their Rituals* (1852), ii., ch. vi.

V. In the sixth century Nestorianism spread into Egypt and Arabia, into India, and in the eighth in China. At the beginning of the eleventh century there were Nestorians in Tartary. (See Prester John.) The Nestorian patriarch Zesuzabes entered into a formal compact first with Mohammed, and subsequently with Omar. During the Arabian domination the high places of state were open to them. In the tenth century they were oppressed, and from that time there has been a decline in their intellectual and theological activity.

VI. The Nestorians remained under one ecclesiastical head until the sixteenth century. In the thirteenth Innocent IV. and Nicholas IV. had made attempts, which were not successful, to bring about a union of the Nestorians with the see of Rome. The influence of Rome, however, was sufficient to divide them in the choice of their iazelich (the catholic—their name for their patriarch) in 1551. One party favored Sulakas, who, under the name of John, had been consecrated by Julius III. The others adhered to Simeon Barmas. The partisans of John went over to the Church of Rome, and form the United Nestorians, or, as they are frequently named, giving them the title of the ancient undivided body, Chaldee Christians. They number about 90,000 souls, acknowledge the primacy of the pope and the seven sacraments, and observe the ritual of the Greek Church. Their patriarch has his see at Diarbekîr. The non-united Nestorians acknowledge three sacraments only—baptism, the Lord's Supper (in both kinds and without solitary masses), and ordination. They have been styled for these and other reasons "the Protestants of the East." They have no pictures or images. Their clergy are allowed to marry. They have a population of about 70,000. The internal energy which once marked the Nestorian churches has almost vanished. The Nestorians of India are called the Christians of St. Thomas, or Syrian Christians. Those on the coast were brought into nominal union with the see of Rome in 1599. These have nearly 100 churches, a population of about 150,000, and a theological seminary at Pulingunna. The Christians of St. Thomas in the interior declined the union with the pope, and when a renewed effort was made in 1653 to bring them into it they fled to the Ghauts, and placed themselves under the protection of the rajah. They have between sixty and seventy churches, and number about 70,000. The Nestorian monks and nuns observe the rule of St. Anthony. Their center is the cloister of Hormoz. Their vows are not strict. It is possible to be freed from them and to marry. In addition to their religious duties, the monks occupy themselves with manual labor; lay sisters provide their support. Some of the cloisters have the monks and nuns in separate cells, under one roof. Flesh, butter, and milk are forbidden. The costume of the brethren and sisters consists of a black upper robe and skirt. The brethren wear a blue turban, the sisters a black veil.

VII. Missionaries from the U. S. have labored among the Nestorians in Turkey and Persia. The most distinguished has been Rev. Dr. Justin Perkins, who began work in 1834. The Kurds and Turks waged a war of extermination against the Nestorians of the mountains in 1843, and as a result the Protestant missions were swept away in 1846. Mission efforts have since been renewed with success.

Nests of Birds [O. Eng. *nest*: Germ. *nest* < Teut. *nest-* < Indo-Eur. *nisdos* > Sanskr. *nīḍa-*: Lat. *nīdus*]: While nest-building species are found among all classes of animals, there is no other group whose members so universally construct nests and are such adepts at the art as birds. There are, however, many species which build no nest whatever. Some, like the murre (*Uria*) and razorbill (*Alca torda*), deposit their eggs on the rocky shelves of sea-washed cliffs; others, like some goatsuckers, lay their eggs directly on the ground; others occupy deserted nests or those from which they have driven away the rightful owners; while a few, including the European cuckoo and the cowbird (*Molothrus*) of the U. S., drop their eggs in the nests of other birds, and leave their young to the care of these adopted parents.

While the ends attained by building a nest are various, it may be said that primarily the object is to furnish a safe receptacle for eggs and young, a place where the former can be kept together in small compass, so that they can be readily covered by the parent, and where the latter will be measurably secure from accident until old enough to shift for themselves. Protection from enemies, either by concealment or inaccessible location, protection from the weather, and retention of heat are also among the advantages of a nest.

Attempts, more or less fanciful, have been made to group birds according to the structure or location of their nests, but such artificial systems have failed; birds nearly related often differ in their mode of nidification, while even one and the same species may, under varying conditions, alter the manner of building its nest.

In spite of these variations we may, however, keeping in mind that the division is largely artificial, divide birds roughly into two groups—tree-builders and ground-builders.*

The "ground-building birds," including all that occupy its surface or penetrate within it, and those that resort to high cliffs and to remote islands, comprise not far from one-half of all the species, including all the diving birds, nearly all the swimmers, and a large proportion of the shore-birds and waders. The ground-breeding birds that build within the earth are separated into a group by themselves, known as "miners." The latter include both those which dig out their own burrow and those that make use of natural cavities or of holes made by other animals. Prominent among the true "miners" is the common bank-swallow (*Clivicola riparia*). This familiar species, abundant in both the old and the new hemispheres, is found in large colonies, and excavates its burrow on the steep face of a sandbank or a gravel-bed. Its hole is usually not more than 2½ or 3 feet in depth, yet where its excavation has been dug through a bed of coarse gravel the channel has been known to be 9 or 10 feet deep; but this apparently inconsistent action is ac-

* The terms used in this article are those used by Prof. Rennie in his work on *The Architecture of Birds*.

counted for by the supposition that the swallow digs on until it finds a locality sufficiently safe for its nest, which is not the case where the gravel is large and coarse, and liable to fall down upon and break the eggs. Where the firmness of the sand permits, these holes are as circular as if planned with a pair of compasses. The galleries are usually more or less tortuous, and are at their termination enlarged into a chamber in which is placed a loose but soft and warm nest. The kingfisher (*Ceryle alcyon*), another typical miner, mines a long tortuous gallery about 5 feet in length, which is sometimes wholly in one direction, but usually turns at a right angle, to the left or right, when at the depth of 3 feet; at the end of the gallery it excavates a small chamber, in which it deposits its eggs on the bare earth. Occasionally, if the earth is damp, it makes a small floor of miscellaneous materials. The European kingfisher (*Alcedo ispida*) very commonly makes a nest of fish-bones, which, being indigestible, are rejected in good-sized pellets. The common fork-tailed petrel (*Thalassidroma leachii*) of the coast of the U. S. is a very interesting "miner" of peculiar habits. It digs a winding and sometimes intricately tortuous burrow, often of great length, at last causing its channel to descend and to double directly under its first gallery, and makes a large chamber at its terminus, which frequently is directly under the opening, though separated from it by the intervening floor of earth. It makes no nest, but lays its single egg on the bare soil.

The burrowing owl of North and South America (*Speotyto cunicularia*), though able to dig for itself when necessity compels, is usually a parasitic miner. There are two or three races, but their habits are identical. The northern sub-species is found W. of the Missouri valley from California to Mexico. It lives in communities, and is often very abundant. It takes possession of the burrows of several species of small quadrupeds where these offer, chiefly occupying those of the prairie-dog. The story that owl and prairie-dog dwell harmoniously together is a myth, the truth being that a large portion of the food of the owl is formed of young prairie-dogs, even the adults sometimes falling victims. In Texas it dwells in deserted rat-holes, and in Northern California in the burrows made by two large species of ground-squirrel. In South America, wherever the viscacha is found, this owl makes use of its burrows. In the Banda Oriental, according to Darwin, it depends upon its own labor, and excavates its own burrow on any level spot of sandy soil.

Another marked group of birds which occupy the ground are those which usually construct no nest. In this may be included birds of very different forms and habits. The whippoorwill (*Antrostomus vociferus*) and all the kindred genera, so far as is known, deposit their eggs on dry beds of leaves in the dark recesses of the forests; the more common nighthawk usually leaves its eggs, that resemble pebble-stones, on the bare rock, to which in color they are closely assimilated. In the vicinity of cities it sometimes deposits its eggs on the flat roofs of stores and dwellings. The loon (*Colymbus torquatus*) chooses a receptacle for its egg on the edges of islands in fresh-water lakes, so near the water that if disturbed it can plunge from its nest directly into and under it. Other divers, as the auks and the guillemots, nest in communities, using the bare surface of rocky cliffs or crevices in the rocks, but make no nest. The peculiar, pear-shaped egg of these birds has a direct relation to the places on which it is deposited, since, by virtue of its peg-top form, the egg when disturbed rolls about in a circle instead of rolling off the rock. The gannet, which also breeds on rocky ledges and lays an elliptical egg, builds just enough of a nest to keep the egg in place. A few of the *Alcidæ*, like the puffins, burrow into the ground in sandy places to shelter themselves and their eggs from birds of prey and gulls. The penguins breed in great colonies on low rocky or sandy islets, constructing a slight nest of pebbles, barnacles, seaweed, bits of wood, or almost anything that may offer. The gulls and terns nest on the ground, but differ in regard to nest, some building an elaborate one, and others having hardly more than a hollow in the bare sand. Nearly all the waders make their nests on the ground, and all or nearly all of these are usually a mere depression. They are usually situated near marshy grounds or water, though the plovers and a few other kinds prefer higher and dry situations. The grebes construct the foundation of their nests of fresh aquatic plants, which they obtain by diving, and finish with dead weeds, building quite a bulky structure. The nest is placed in marshes, sometimes on a mass of plants growing so low in the water that the nest is floated off by a flood. This has caused the impression that they purposely build floating nests, but this is not the fact. With very few exceptions nearly all the North American sparrows breed on the ground. All the species of the several genera of *Ammodromus*, *Junco*, *Plectrophanes*, *Zonotrichia*, *Melospiza*, etc., with only individual exceptions, nest on the ground, as also do nearly all the titlarks, true larks, buntings, and similar forms, the world over. The common house-sparrow and all its congeners nest in various manners, but not on the ground. Some species exhibit the singular peculiarity of always nesting on the ground in certain localities, and in other regions as invariably building in bushes or trees high above it. Thus the prairie lark-finch in Illinois and Wisconsin always nests on the ground. On the Pacific coast the same species usually nests in trees. The same is noticed in the black-throated bunting, which in the E. of the U. S. nests on the ground, but in the Mississippi valley usually a few feet above it. All the *Spizellæ*, with one marked exception, nest in trees or bushes. *S. monticola*, although known as the tree-sparrow, nests in bushes or on the ground.

Fig. 1.—Tree-sparrow (*Spizella monticola*).

A few of the slender-billed oscines always build on the ground, but some nest indifferently on the ground or in different situations. The common brown thrush of North America (*Harporhynchus rufus*) is a remarkable instance of this, in some localities usually nesting upon the ground, and in other districts always above it. The gray-cheeked thrush (*Turdus aliciæ*) nests sometimes on the ground, but occasionally in more or less elevated situations. The robin redbreast (*Erithacus rubecula*) of Europe nests naturally on the ground, but there are many instances recorded of striking deviations from these selections.

Among the American thrushes, *Turdus fuscescens*, *T. pallasi*, *Cinclus mexicanus* always nest on the ground. All the species of the genera *Myiodioctes*, *Oporornis*, *Seiurus*, *Mniotilta*, *Geothlypis*, *Helmintherus*, and *Helminthophaga*, except *H. luciæ*, build with rare exceptions on the ground. The large group of *Dendroicæ*, except *D. palmarum*, nest in elevated situations so far as is known. Many ground-building birds resort to ingenious means of concealment. The common quail, the meadow-lark, and other species sink their nests by the side of a high tussock of grass, and form an archway over the nest with the natural growth. The common snow-bird and the savanna-sparrow often build their nests on the steep side of an excavation under a projecting sod. The song-sparrow and the grass-finch often construct a covered approach to the nest, which is hidden in high grass or by bushes. The Canada fly-catcher, so far as is known, always selects a large tussock of grass in the midst of boggy and almost impassable ground.

The sea-ducks, swans, geese, the gulls, terns, albatrosses—in short, the marine birds in general—resort to the ground to construct their nests. A very few build in trees, either exceptionally as individuals or as species, and in the former class may be mentioned the North American herring-gull (*Larus argentatus smithsonianus*), which sometimes resorts to trees in localities where its nest on the ground has been repeatedly plundered. Wood-ducks of all kinds, and several of those that frequent lakes and rivers, nest in hollow trees. A few, like the dusky duck, nest indifferently on trees or on the ground, usually selecting the latter. Several kinds of sea-ducks are noted for adding to their nests a warm lining of the softest down plucked from their own breast. This is done by the long-tailed duck, by the smew, by the king-duck, the Pacific eider (*Somateria V.-nigra*), and by the common eider. Of these, however, the smew always nests in hollow trees. Owing to the commercial value and importance of its down, the eider (*Somateria mollissima*) is cherished and protected in Iceland and on the northwestern coast of Europe. It usually constructs in the first place a rough platform nest of various marine plants, both sexes working in concert, piling up a rude foundation of drift. Over this rough mattress the female spreads a bed of the finest down, freely taken from her own breast.

Sometimes two females make use of the same nest, each contributing a supply of down and five eggs. Birds of very different species sometimes make a common use of the same nest.

Very many shore-birds, waders, etc., and also birds which nest on the ground in swampy places, construct large and elaborate nests of reeds, rushes, and other water-plants in a moist and decaying state, chosen because of their pliable condition, and not because a moist nest is desired. On the contrary, notwithstanding the prevalent error, these nests are not used until they are dry, and are abandoned when, owing to rains or floods, they become so damp that they can no longer be occupied. Such nests as those of the willet and the bitterns are of this description. Very many of the land-birds of the U. S., as the song-thrush, the robin, etc., use moist materials in building their nest, but occupy it only when it has become dry. The robin (*M. migratoria*) works from preference in rainy weather. All or nearly all the *Gallinæ* occupy nests on the ground, some making a rude nest, others only using a hollow in the earth. The wild-turkey uses great precaution to conceal her nest alike from birds of prey and prowling animals, and from her own mate, hostile to his own progeny. When forced to leave them in search of food, she covers her eggs with leaves, and if approached when on the nest the mother will die sooner than leave her charge.

By far the most remarkable group of ground-nesting birds are the "mound-builders" of Australia and the eastern archipelagoes of Asia, known as the brush-turkey in Australia. All the species of this group belong to the family MEGAPODIDÆ (*q. v.*), and are all somewhat remarkable for the manner in which the hatching of their eggs is effected. The *Talegalla lathami* when about to deposit her eggs collects a large heap of decaying vegetable matter as their depository, and trusts entirely to the heat engendered by the process of decomposition for the development of her offspring. The *Megapodius tumulus* constructs large mounds of earth, varying from 20 to 60 feet in circumference and from 5 to 15 feet in height. In these the eggs are carefully buried to the depth of 6 feet. Of the other species of this singular family, some merely deposit their eggs in holes excavated on the seashore to the depth of 3 feet, but nearly all the members of this family are more unequivocally mound-builders.

Several species belonging to different genera have been grouped together in some systems as "masons," so called because they knead together, in the manner of the house-builder, a rude mortar of tempered earth or clay. It is not a well-marked group, and all its members might claim a place in other connections. The cliff-swallow (*Petrochelidon lunifrons*) of North America is a typical "mason," building a remarkably symmetrical nest of plastic earth or clay by the united efforts of several working in concert where they are in societies, sometimes by only the solitary pair. The normal shape of the nest is that of an inverted retort, the larger portion being attached to the cliff or side of a building. It is arched over at the top, and extends down in front in a covered passageway open at the bottom. In the wild state on the sides of high cliffs the nest is an elaborate and ingenious structure, sheltering its inmates from the weather and from their enemies. Under the shelter of man all this protection is not needed, and under the eaves of barns and other buildings these birds build a simpler and equally safe nest, but always of kneaded earth. The barn-swallow of

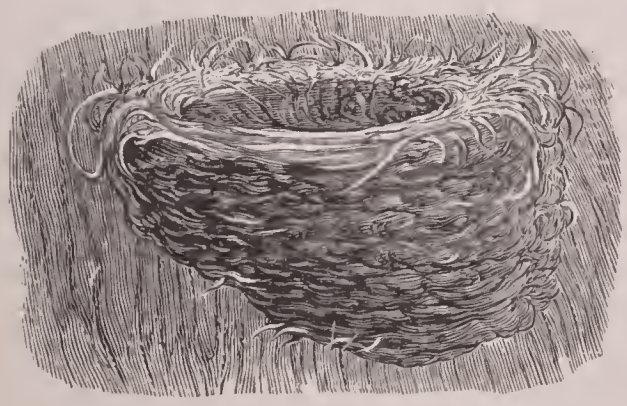

FIG. 2.—Barn-swallow (*Chelidon erythrogaster*).

North America, the house-swallow of Europe, and several other species of *Hirundines* are also true masons. The barn-swallow (*Chelidon erythrogaster*), which once nested only in caves or under overhanging cliffs, now attaches its elaborately wrought nest to the sides of rafters in barns, under the protection of their roofs, and even to the porches of dwellings. These are made of the finest mason-work, and put together in the most artistic manner, piece by piece, with an order and a regularity quite curious. Attached to the nest there is often an equally elaborate extra platform designed for the use of the mate, on which it can sit when not collecting food, and where, when the young no longer require the cover of a parent, the latter may stay and keep them company.

The term carpenters is applied to the members of a small but noteworthy group of birds, from the fact that with their chisel-like bills they hew for themselves holes in the trunks or limbs of trees. At the bottom of these holes, which may be more than 3 feet in depth, the eggs are laid without other nest than the few fine chips which have been left. The woodpeckers are typical carpenters, and conspicuous among them is the great ivory-billed woodpecker of the Southern U. S., a species now become very rare. This bird digs into some of the largest and hardest trees of the forests, being particularly partial to the cypress, and a pair have been known to cut into the living wood to a depth of 5 feet. The wrynecks (*Iunx*), the nuthatches, and some of the titmice are carpenters on a smaller scale.

Among birds which breed in holes of trees, but do not excavate these dwellings themselves, are the blue-bird, the tree-swallow, some of the titmice, owls, parrots (with one exception), and the great hornbills of the Old World.

Certain classes of birds build what are styled "platform nests." These are found among only a few families, and their character varies very essentially, some being remarkably large structures, others being of a frail description. Of the one kind are the huge platform structures of eagles; of the other, the slight nests of the doves and the American cuckoos. All or nearly all the eagles are true platform-builders, the only exceptions being those that use cliffs as substitutes for platforms and add little to their natural advantages. Others, like the white-headed eagle of the U. S., when they build in trees, construct large and massive structures of 5 or 6 cubic feet, and almost as solid as the natural rock platform of the golden eagle. In striking contrast with these are the slight nests of nearly all the *Columbidæ*, the cuckoos, etc. These are platforms of the frailest description, made of a few sticks loosely laid together, and as loosely crossed with other sticks, the whole rudely made and apparently not strong enough to hold together and preserve the egg from falling to the ground. An example is the nest of the Carolina dove. More substantial than these are the platform nests of nearly all the species of true herons, but not equal to those of birds of prey in size or strength, though like them having no cavity or depression in the center. The herons known as bitterns, however, are exceptional, and usually nest on the ground.

FIG. 3.—Carolina dove (*Zenaidura macroura*).

A large group of nest-makers are classed together by Prof. Rennie as "basket-makers." It is not very well marked, and its members are not always distinguishable from other

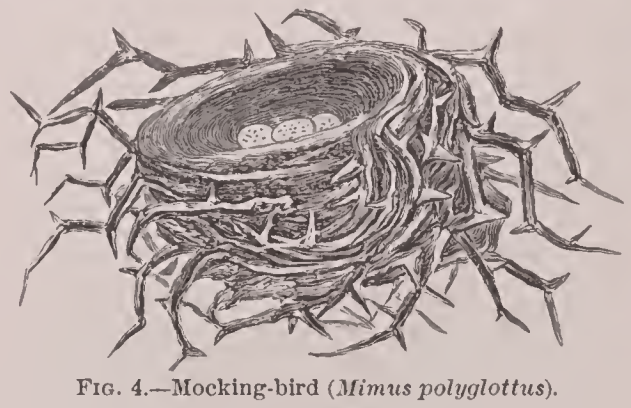

FIG. 4.—Mocking-bird (*Mimus polyglottus*).

groups known as "weavers," "tailors," and "felt-makers," but it is designed to include birds which, like the common mocking-bird of the U. S., the cedar-bird, the Bohemian chatterer, the European bullfinch, and others, construct a rude basketwork of sticks, resembling the common baskets of osier. In these are placed more carefully woven nests of

softer materials. Some of these are mere open baskets placed on a flat limb; others are interwoven with the smaller twigs of a branch. The mocking-bird builds as an outer framework for its nest a strong barricade of brambles and thorns, and places within this rude basket an elaborately woven structure made of the finest roots. The common bullfinch (*Pyrrhula vulgaris*) of Europe builds a typical open basket placed on a platform of her own rearing of birch-twigs, or on a flat branch of a spruce-tree she weaves a loose basket of flexible, fibrous roots. The yellow-headed blackbird (*Xanthocephalus xanthocephalus*) exhibits great ingenuity, variety, and skill in the construction of elaborate basket-like structures. The *Turdus bicolor* of Southern Africa unite in communities to build a huge basket-like structure, with numerous cells or apartments for the nests of different pairs. These are like an aggregation of smaller baskets, each a separate nest with a tubular gallery leading into it from the outer side. The number of these cells varies from six to twenty, and over all is woven an inverted basket for a roof, wrought of twigs. We include among basket-makers the remarkable nest of the Mexican fly-catcher (*Pitangus derbianus*), more striking for the use made of it by other and smaller species than for its own peculiarity of structure and disproportionate size. This bird, not larger than the king-bird, builds a structure sometimes 3 or 4 feet in length and about 2 in breadth. The cavity is on the side. The structure is loosely made of coarse materials, twigs, dried plants, leaves, etc. In its chinks and cavities smaller

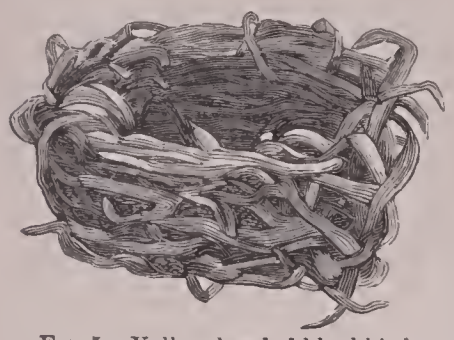

FIG. 5.—Yellow-headed blackbird (*Xanthocephalus xanthocephalus*).

FIG. 6.—Magpie (*Pica caudata*).

birds seek shelter, and are permitted to build their own nests in peace and safety, the warlike proprietor of the whole keeping all birds of prey at a distance. The magpies, both of Europe and America, build a curious basket barricade around their nest, evidently as shelter against birds of prey.

The "weaving" birds construct nests, for the most part, somewhat pensile, but of very various styles and shapes. Among the most familiar of these may be mentioned the orchard oriole and the Baltimore oriole of Eastern North America, and Bullock's oriole of the Pacific coast. All the orioles are first-class weavers, and their nests partake somewhat of the peculiarities of the basket-makers and the so-called tailor-birds, and are all conspicuous for the wonderful skill with which they are wrought, their beauty of design, and the strength with which the materials are intricately woven together. The vireos, of which there are in North America sixteen different species, all, so far as we know, construct a curious pensile nest, hemispherical in shape and peculiar to the genus. Simpler in design than the nests of the *Icteri*, they are still structures of remarkable beauty and ingenuity. They are wrought into the shape

FIG. 7.—Solitary vireo (*Vireo solitarius*).

of a deep cup, and are usually suspended from the fork of two twigs, around and over which the upper margin of the nest forms a continuous covering. Working down from this fold, the materials are neatly woven into a hemisphere truncated at the top. The pensile grosbeak of Africa (*Ploceus oryx*) suspends a very curious basket, woven of straw and reeds, from the end of a branch, usually over a stream of water. This is in shape like an oblong bag, with the entrance from below. Within and on one side of this is the real nest. These birds build in communities; Pringle, the African traveler, mentions seeing twenty together. Their obvious design is to secure the offspring from the dangers of the weather and from various enemies. The entrance, always from below, is through a cylindrical gallery 15 inches in length, that hangs from the spherical nest like the tube of a chemist's retort. The bottle-nest sparrows of India have nests constructed with equal ingenuity. These are made pendent to branches of trees by small loops, and are formed of a peculiar kind of long grass woven together in the shape of a bottle. These swing from the ends of long flexible branches, and effectually secure their inmates from harm. Their entrance is from below. Besides this curiously pensile nest, the male bird also constructs an elaborate covered roost, which is wrought of the same kind of grass. This is a bottle-shaped basket, having a thatched roof, which covers a perch open at the bottom and is suspended from the small end or neck of the bottle. This roost is occupied by the male, and hangs by the side of the real nest, in which are his mate and family. The object is protection from sun and rain, and from various kinds of enemies. Another remarkable species of the weaving grosbeaks (*Loxia socia* of Linnæus) greatly excel the remainder

FIG. 8.—Bottle-sparrow (*Ploceus bengalensis*).

of the family, at least in the extent of their workmanship. They build an enormous structure, in shape resembling an open umbrella, wrought, in the manner of a thatched roof,

FIG. 9.—Social weaver (*Ploceus socius*).

of Bushman's grass without any intermixture, and so completely woven as to be impervious to rain. Under the shelter of this canopy each pair builds its own particular nest, placed under the eaves. Each nest is 3 or 4 inches in diameter; they are all in contact with one another around the eaves, and each nest has its own individual aperture forming the entrance.

The tailor-bird of India, which enjoys a somewhat exaggerated reputation for ingenuity and skill, owing to accounts now believed to be more fanciful than real, is at least known to bend over one end of a leaf and to sew it securely to the stem-end, and to place its tiny nest in the hollow thus created. The parula warbler (*Compsothlypis americana*) constructs its nest of the long gray lichens of the northern forests of the U. S., gathering up and fastening together in a loop the long hanging branches of this

FIG. 10.—Yellow-throated warbler (*Dendroica dominica*).

moss to make its nest, often using no other material, and in this manner creating a beautiful structure, the entrance to the cavity being usually on one side. Even more strikingly beautiful is the nest of the yellow-throated warbler of the southern parts of the U. S. (*Dendroica dominica*), of which the cut presents a remarkable illustration. Here the long pendent moss of the swamps is carried up and fastened in loops; mosses 3 feet in length are fastened together into a woven bag of half the original length. In the center of this curious structure, the natural appearance of which is unchanged, is hidden the tiny nest wrought of the softest vegetable down.

FIG. 11.—Chaffinch (*Fringilla cœlebs*).

Another interesting group, styled by Prof. Rennie the "felt-makers," is distinguished not so much by the architectural peculiarities of the nests as by the remarkable changes made in the character of the materials used. These are included in only a few families, but the latter are individually very numerous. The group includes two kinds, the true felt-makers, who make a composite felt, and those that use only a single material. There is, however, very little difference in the appearance of the product, and many species indifferently use a single or a composite felting. The finches of both the Old and the New World are typical felt-makers. Of these the canary, the several goldfinches, and the chaffinches may be mentioned as examples. Fine wool, of either vegetable or animal origin, serves as the base of this felting, and with this various other substances, such as mosses, lichens, spiders' webs, bits of cotton, bark, etc., are intermingled, and with wonderful exactness felted and compacted together into a texture apparently homogeneous and uniform. With some, these felted nests are wholly composed of this single material, as in the nests of various humming-birds, where, besides an external covering of lichens, a means of concealment rather than an essential part of the nest, the whole is made of this one material. In the nests of the finches there is always an external framework, filled out and lined with felting. In these greater strength is given to the fabric by binding the whole with strong wiry grasses, fibrous roots, etc., and especially by binding the nest firmly into the fork by twining among the twigs bands of strong felting. The nest of the goldfinch (*Spinus tristis*) of the U. S. is a striking illustration. All the *Polioptilæ* of North America and the

FIG. 12.—Goldfinch (*Spinus tristis*).

FIG. 13.—Black-tailed gnatcatcher (*Polioptila californica*).

West Indies are superior felt-makers. Their nests are large for the birds, remarkably deep, and have thick soft walls made of downy materials, but abundantly strong for the oc-

cupants, which are among the smallest American species. The nests are models of architectural beauty and ingenuity of design. They are deep and purse-like in shape, not pensile, but interwoven with small upright twigs, and usually are placed near the tree-top, swaying with every breeze, the depth of the cavity and the small diameter at the opening preventing the eggs from rolling out. The black-capped species of St. Lucas (*Polioptila californica*) uses the living tendrils of a wild vine as the framework of its nest, which is interwoven with the vine so intricately as to be rendered inseparable.

Prof. Rennie recognizes as a distinct group what he calls "dome-builders," but nearly all might easily be ranged in one of the other groups. They consist of a great number of species and belong to a variety of families, and either occasionally or uniformly construct covered nests entered by holes in their sides. With many species the domed cover of their nest is not a uniform feature. The Carolina wren at times builds a domed nest, and quite as frequently constructs one open at the top. The golden-crowned thrush and the black and white creeper have almost always a covered nest, yet both occasionally build without any cover. The house-sparrow usually has an open nest, but also occasionally builds one with an arched covering. In the West Indies, and in tropical countries generally, domed nests are a predominating feature, and are undoubtedly an instinctive provision against the violence of tropical rains. Travelers in South America describe the nest of a common species known locally as the baker-bird, or oven-bird (*Furnarius*), so called because it constructs a nest in the form of a baker's oven. This is placed in the most exposed situations, but at a considerable height. The nest is described as made of tempered clay, and as having a lateral opening twice as high as wide, and in the interior divided into two chambers by a partition beginning at the entrance.

The North American water-ouzel, or dipper (*Cinclus mexicanus*) builds a domed nest of a very peculiar character. It is hemispherical in shape, of uniform contour, and usually built on a rock on the edge of a mountain-stream. Externally, it is composed of green moss in a living state, having within a strong, compactly built apartment arched over and supported by twigs, with a cup-like depression at the bottom composed of fine roots and twigs firmly bound together. These structures are a little less than a foot in diameter and from 6 to 8 inches in height. Both species of cactus-wrens of California and Cape St. Lucas build curious domed nests of great size and purse-like in shape. These are composed of long flexible grasses, and are lined with feathers. Both species of *Cistothorus* build circular domed nests, that of *C. stellaris* ingeniously interwoven, externally of long wiry grasses and finer sedges, lined with soft vegetable down. That of *C. palustris* is a stronger structure, built in higher situations, of coarse sedges firmly interwoven and cemented with mud.

FIG. 14.—Marsh-wren (*Cistothorus palustris*).

Another singular peculiarity, found only in species belonging to a few genera, is the employment of cement-like secretions in the construction of their nests, and these are grouped together as "cementers" in certain systems. In some cases it is difficult to determine whether the birds generate their own cement or make use of adhesive substances that exist in nature. We find the nests of humming-birds and of several other kinds of birds covered over with a coating of lichens and mosses, and thus made to resemble the moss-covered bark of the trees on which they are built, and apparently this covering is made to adhere by means of some adhesive cement; but that this is secreted by the bird itself we do not know. We infer, rather than know, that certain swallows temper the earth of which they construct their nests with their own adhesive secretions. In regard to other cases our knowledge is more positive. The chimney-swallow fastens its simple cradle of twigs against the inner walls of a hollow tree or the inside of the chimney, and glues together, twig by twig, the nest itself, by means of a powerful cement which it secretes from its own throat. The famous edible nests of the little Bornean swift (*Collocalia fuciphaga*), formerly supposed to be made of partly digested seaweed, are now known to be constructed entirely of mucus. These nests, which are placed against the rocky sides of caves, are shaped something like a section of a shallow, thin cup, and when new are white and translucent. They darken and deteriorate with age, nests which have been used bringing a much smaller price than those which are perfectly fresh. For other nests, see BUNTING, DICÆUM, CAPE TITMOUSE, etc.; and for further information, see Rennie, *The Architecture of Birds* (London, 1831); Wood, *Homes without Hands* (London, 1865); Davie, *Nests and Eggs of North American Birds* (Columbus, 1889); Bendire, *Life Histories of North American Birds* (Washington, 1892); Newton, *A Dictionary of Birds* (London, 1893–94).

Revised by F. A. LUCAS.

Netherlands, The (Dutch, *De Nederlanden*. Fr. *Les Pays-Bas*): a kingdom of Western Europe; situated between lats. 50° 45′ and 53° 35′ N. and lons. 3° 24′ and 7° 12′ E.; bounded E. by Germany, S. by Belgium, and W. and N. by the North Sea, which indents the coast with two large inlets, the Zuyder Zee and the Dollart; area, 12,656 sq. miles. The country is also known as *Holland*, but *The Netherlands* is its official designation. It has a number of colonies, which are divided into two groups, the Dutch East Indies and the Dutch West Indies. The former includes Java, Madura, Bali, Lombok, Banca, Billiton, the Moluccas, Timor, Sumatra, Celebes, and parts of Borneo and New Guinea; area, 719,674 sq. miles; pop. 31,614,000. The Dutch West Indies include Dutch Guiana, or Surinam (see GUIANA), and Curaçao; area, 46,463 sq. miles; pop. 120,000. All these colonies are treated separately; see JAVA, MADURA, etc.

Physical Features.—As the name indicates, the Netherlands are low and flat, and form the delta of the rivers Rhine, Maas, and Scheldt; there are no mountains, but the naturally formed sandbanks or dunes on some parts of the seacoast attain a considerable height. The country is intersected by the rivers mentioned and their branches, the Waal, Yssel, Leek, and Vecht. Where these are bordered by cities they are called *gracht*, or *haven*, and serve for internal navigation. Along some parts of the seacoast and along all the rivers there have been constructed for protection against inundation huge dikes, 30 feet high, 70 feet broad at the base, some of Norwegian granite, but the majority of clay or peat, strengthened by timber structures. Among the canals, of which there are 1,907,170 miles, serving partly for drainage, partly for communication, the most important are the NORTH HOLLAND CANAL, the NORTH SEA CANAL (*qq. v.*), and the New Waterway, built 1870–85, connecting Rotterdam with the North Sea. A few lakes are found in the province of North Holland, but HAARLEM LAKE (*q. v.*), formerly the largest of them, was drained in 1839–52.

Geology.—The greater part of the country is of alluvial origin; minerals are nowhere found, except a kind of clay well adapted for tiles, brick, and pottery, and a little coal in the province of Limburg, where the mines belong to the state.

Fauna.—All the animals found in Western Europe are indigenous in the Netherlands; wolves appear sometimes, but only during winter and in the sparsely inhabited districts; foxes are plentiful; rabbits abound in the sandy regions, and often do great damage by burrowing through the dunes. Among domestic animals the cattle rank very high, both as milk producers and for their excellent meat. The horses are big and strong; the Frisian horse, of the Percheron type, is much sought for by breeders, as are also the trotters of the northern provinces.

Climate.—The climate is temperate but variable, and generally far from pleasant. Fevers of a malarial character, colds, and bronchial and pulmonary affections are apt to follow on the sudden changes in winds and temperature. The country is fairly healthful, however, except in districts where the soil is marshy, as in much of the province of Zealand.

Soil.—A careful estimate shows that 34 per cent. of the surface consists of good and 2 per cent. of inferior clay land; 45 per cent. is poor and partially reclaimed sand, and fully 18·5 per cent. is covered with heath or other growths without value. Considering the uses to which the soil has been put,

we find that 27·1 per cent. is arable land, 35·4 pastures, 1·7 gardens and orchards, 6 per cent. occupied by water and roads, 7 per cent. woodland, and 0·7 per cent. covered with buildings, the remainder being unimproved. The uncultivated tracts are becoming less in area through irrigation and the introduction of better fertilizers; but much remains to be done in this direction, especially in the provinces Gelderland and Drenthe.

Divisions.—The country is divided into eleven provinces, as follows, with area in square miles and population, Dec. 31, 1899:

PROVINCES.	Area.	Population.	Capitals.	* Ref.
North Brabant	1,980	553,845	Bois-le-duc	7-F
Gelderland	1,972	566,549	Arnhem	6-G
North Holland	1,070	968,105	Haarlem	5-E
South Holland	1,166	1,114,401	The Hague	6-E
Zealand	690	216,293	Middelburg	8-C
Utrecht	534	251,034	Utrecht	6-F
Friesland	1,280	340,263	Leeuwarden	2-G
Overyssel	1,291	333,337	Zwolle	4-H
Groningen	790	299,604	Groningen	2-I
Drenthe	1,032	148,542	Assen	3-I
Limburg	851	281,951	Maestricht	10-G
Totals	12,656	5,103,924		

* Reference for location, see map of Holland and Belgium, vol. iv.

Principal Towns, with Population in 1899.—Amsterdam (523,557) is the capital; The Hague (205,328) is the seat of the government and the residence of the royal family. The other towns of greatest population and importance are Rotterdam, 319,866; Utrecht, 102,040; Groningen, 66,739; Haarlem, 64,836; Arnhem, 57,248; and Leyden, 53,640 (see the separate articles on these and other Dutch towns).

Population.—The people form in blood and language a branch of the Teutonic race. They are characterized especially by industry, perseverance, cautiousness, frugality, scrupulous cleanliness, and a certain sedateness of manners; they are prosperous and contented, and their wealth is quite equally distributed. On Dec. 31, 1899, the population was 5,103,924 (2,520,380 males and 2,583,544 females). The average density per square mile was 403; it was greatest in the province of South Holland (956) and least in Drenthe (144). In 1889 the population was divided as to religious denomination as follows: 2,728,870 Protestants, 1,604,179 Roman Catholics, 97,274 Hebrews, and 81,092 of other denominations. In the same year the number of foreigners in the Netherlands was 48,884, of whom 28,767 were Germans, 13,697 Belgians, 1,398 French, 1,339 British, and 788 Swiss.

Industries and Productions.—Agriculture flourishes most in Friesland (where the finest cattle are reared), North Holland, and parts of Gelderland and Limburg. Rye, barley, and wheat are the chief cereals produced, but fruit and vegetables form a large item of export, especially to England. Potatoes, tobacco, hemp, flax, and beetroot are also staple products. The raising of flower-bulbs has been carried on for centuries, and is still the leading branch of floriculture in the Netherlands. Haarlem is the center of this industry, and in its vicinity may be seen miles of flower-beds containing all varieties of the tulip, crocus, hyacinth, etc. In 1634 and 1636 the "tulipomania," an insane speculation in rare varieties of the tulip, made its appearance in the Netherlands: in all the large cities regular tulip exchanges were established, where bulbs were dealt in at fabulous prices, and where thousands of persons ruined themselves in their efforts to secure some special specimens. Gardening has reached a high degree of perfection, and even in the cities fine garden plots are often found attached to the residences of the well-to-do.

Of manufactures, the most important are cheese (Edam, Hoorn, and North Holland generally), gin (Schiedam, Rotterdam), chocolate and cocoa (Weesp, Utrecht, Rotterdam), potteries (Delft, Maestricht), linens (Bois-le-duc, Helmond), carpets (Deventer), refined sugar (Amsterdam, Rotterdam), long-stemmed clay pipes (Gouda), beet-sugar, potato-starch (Groningen), and cotton goods (Hengelo, Twenthe).

The fisheries have somewhat declined, but contribute still a large amount to the national wealth; herring, cod, salmon, turbot, and anchovies are taken on the coast, and oysters are found in the waters surrounding and intersecting the province of Zealand. Over 25,000,000 herrings are annually taken in the Zuyder Zee alone, and the total number of oysters produced in 1897 was 40,000.

Commerce.—In the principal seaports (Amsterdam, Rotterdam, Harlingen, and the Helder), a large part of the population follows the sea for a livelihood. The commerce of the country, at one time the most important in the world, has declined considerably, but is still extensive and active. It is principally carried on with the Dutch colonies, Great Britain, the countries on the Baltic, and the U. S. In 1899 the value of imports amounted to 1,916,000,000 florins or guilders and the exports to 1,583,000,000, the imports from the U. S. being worth 297,100,000 florins and the exports to the U. S. 60,700,000 (1 florin = $0.40). In that year 11,803 vessels of 9,467,730 tons, of which 3,267 of 2,354,100 tons were Dutch, entered the Dutch ports, while 11,672 vessels of 9,392,682 tons (Dutch, 3,293 of 2,351,622 tons) cleared. The merchant marine at the end of 1899 included 432 sailing vessels, with 84,606 tonnage, and 192 steamers, of 236,118 tons.

Education.—Four universities, those of Leyden (founded in 1575), Groningen (1614), Utrecht (1636), and Amsterdam (1632), all conferring degrees in law, medicine, philosophy, and letters, are attended by about 3,000 students, and are favorably known abroad. The medium and lower grade of instruction is provided on a very liberal scale, and all the schools are unsectarian. In 1891–92 there were, besides professional and technical institutions, 38 secondary schools, with 4,835 pupils, 4,292 elementary schools (2,976 public, with 458,739 pupils, and 1,316 private, with 200,363 pupils), and 993 infant schools, of which 130 were public, with 23,421 pupils, and 86 private, with 79,187 pupils.

Government.—The government is a constitutional and hereditary monarchy. The reigning dynasty is the House of Orange-Nassau, now extinct in the direct male line. The national legislature consists of two branches, the First and Second Chamber of the States-General. The First Chamber, of fifty deputies, is chosen by the provincial states; the term of office is nine years, about one-third retiring every third year. The Second Chamber, of 100 deputies, is chosen directly by males over thirty years of age, who pay a certain amount in taxes; the term is four years, all retiring together. The executive power vests solely in the sovereign; the legislative, jointly on the sovereign and the legislature; but the First Chamber lacks the right of introducing or amending bills. The presidents of both chambers are appointed by the sovereign from among the members. The cabinet consists of the following departments: (1) Foreign Affairs, (2) Interior, (3) Justice, (4) Marine, (5) Finances, (6) War, (7) Waterways, Commerce, and Industry, (8) Colonies; the ministers are appointed by the sovereign; they may, but usually do not, belong to either of the chambers. The provinces are governed by royal commissaries, appointed by the sovereign; and each province has its provincial legislature (*provinciale staten*), elected by the same electors who have the right to elect the members of the Second Chamber. The government of the cities is vested in a mayor (*Burgemeester*), a board of assessors (*Wethouders*), and a common council (*Gemeenteraad*), the members of the last-named body being elected by a class of electors paying less taxes than the electors for the Second Chamber.

There is a standing army of 75,000 men; the navy consisted in 1900 of 13 modern ships (and 5 under construction), and several older vessels, manned by 8,550 officers and men. In 1900 the public debt amounted to 1,158,735,450 florins; in 1899 the receipts 148,021,758 florins, and expenditures, 150,193,989.

History.—The Netherlands or Low Countries denoted, when first spoken of in history, the whole plain extending from the foot of the Vosges and the Ardennes to the North Sea, and comprised not only the present kingdom of the Netherlands, but also Belgium and the northernmost parts of France. It was inhabited by three distinct though kindred tribes—the FRISIANS (*q. v.*) to the N., the Batavians, of German stock, in the center, and the Belgæ, of Gallic stock, to the S. The Belgæ were subjugated by Cæsar; the Batavians were at first allies of Rome, but after the unsuccessful attempt of Claudius Civilis in 67 A. D. to unite the Batavian communities into an organized empire, they too were conquered by the Romans; the Frisians submitted after repeated defeats and rebellions. In 357 the Batavians are spoken of as forming part of the Roman army in the battle of Strassburg against the Germans, and as displaying great valor; but after this time their name disappears from history. The Belgæ gave way to the Franks; the Saxons pushed onward from the E., and in alliance with the Frisians opposed the encroachments of the Franks. On the establishment of the great Frankish empire under the Carlovingians the whole plain was incorporated and the popula-

tion Christianized; but by the division of the empire of Charlemagne the country was divided, the southern part falling to France, the central to Lothringia, and the northern to Germany, and for centuries the different parts followed the different destinies of the main bodies to which they belonged. Meanwhile, the feudal system got a foothold in the country. Dukedoms, Brabant, Limburg, Luxemburg; countships, Artois, Flanders, Holland; bishoprics, Mechlin, Utrecht, etc., were formed, and the remote position of the country made the feudal lords more independent of the royal or imperial power here than anywhere else. On the other hand, the situation on the ocean and the mouths of three great rivers invited to commerce, and flourishing cities grew up and surrounded themselves with strong fortifications. By a marriage the countship of Flanders became united to Burgundy in 1384, and subsequently the Burgundian dukes succeeded, partly by force, partly by craft, in gaining possession of the whole country, which they governed well. By another marriage the Netherlands, with the other Burgundian dominions, came into the possession of the house of Hapsburg in 1477. By the division of Charles V.'s empire between Austria and Spain the Netherlands fell to Spain, and it was a good consequence of this combination, so fatal in other respects, that the Dutch retained their full share in the new commerce which was opened up by the discovery of America and the establishment of the Spaniards in the East Indies. On the whole, it was not so much the interests of the two countries which clashed as the different character of the people and its ruler. The REFORMATION (*q. v.*) had made a deep impression and spread widely in the Netherlands, and Philip II. determined to root it out. In 1566 war broke out. The salient points of the struggle were the formation at Utrecht (Jan. 23, 1579) of a union between the seven northern provinces, Holland, Zealand, Utrecht, Friesland, Groningen, Overyssel, and Gelderland, and the recognition by Spain of this union by the armistice of twelve years concluded in 1609. (For further details, see the articles on MARGARET OF PARMA, ALVA (DUKE OF), JOHN (DON) OF AUSTRIA, FARNESE, the Spanish governors, and WILLIAM OF NASSAU and MAURICE, COUNT OF NASSAU, the Dutch leaders.) By the Peace of Westphalia (1648) the independence of the republic of the United Provinces was formally acknowledged, while the southern provinces, nearly corresponding to the present kingdom of Belgium, remained with Spain and within the Roman Catholic Church. The prosperity of the young state was prodigious, and in maritime affairs it shared with England the supremacy of the world. It crushed the Spaniards and acquired possessions in America and the East Indies. It checked the Portuguese and several times defeated the English. After the battle of Goodwin Sands (Nov. 29, 1652) its admiral, Van Tromp, paraded a broom at his masthead along the English coast as a token that he had swept the Channel, and in June, 1667, De Ruyter sailed up the Thames and blockaded the port of London. In the Baltic also the Netherlands became perfect masters by the Peace of Copenhagen (1660), which kept the Baltic waters open for Dutch trade; and at the same time that they actually held in their hands the commerce of the world, their achievements in philology, theology, natural philosophy, and art gained the admiration of all Europe. Their resistance to the arrogance of Louis XIV. was their greatest glory. (Details of this contest will be found in the articles on LOUIS XIV., WILLIAM OF NASSAU, TURENNE, etc.) After that period the importance of the republic gradually decreased, not because its activity and prosperity really declined, but simply because it was superseded by England; and when in 1782, led by jealousy and considering the opportunity good on account of the American Revolution, it declared war against England, its maritime power received a blow from which it never recovered. Meanwhile, two parties had developed in the interior politics of the state—one aiming to raise the office of the stadtholder into royalty and make it hereditary in the family of Orange-Nassau, while the other, the so-called "patriots," strove to abolish it altogether and establish a pure republic. When in the winter of 1794–95 the French army, after conquering the Spanish Netherlands, entered the territory of the United Provinces, it was hailed by the patriots; the stadtholder, William V., fled to England, and the Batavian republic was proclaimed May 16, 1795. The country paid dear, however, for its new constitution, which, moreover, was changed several times according to the whims of Napoleon. In 1806 the Netherlands was made a kingdom under Louis Bonaparte (the kingdom of Holland); in 1810 it was incorporated with France. Meanwhile the state of its finances had become nearly desperate. The Congress of Vienna established the kingdom of Holland once more, gave the crown to the house of Orange-Nassau, and joined the former Spanish Netherlands with it. This last measure proved a new source of trouble. The southern provinces were agricultural, Roman Catholic, and French or Flemish speaking. The discrepancy between the two parts of the new state, both in political interests and in national character, was so palpable that when in 1830 the southern provinces rose into rebellion the great powers of Europe immediately consented to the separation, and the kingdom of BELGIUM (*q. v.*) was erected, though not until much blood and more money were squandered by the attempts of the King of Holland at maintaining his government. The revolutionary movement of 1848 finally occasioned some change in a liberal direction in the constitution, under the leadership of J. R. Thorbecke (1798–1872), and since that time further progress has been made in all directions toward a more enlightened policy. The franchise has been considerably extended, existing laws have been amended in a more liberal spirit, and many material improvements (railways, canals, etc.) have been made. In 1872 a conflict arose with the Sultan of Atjih, on the island of Sumatra, who grew uneasy under the Dutch supremacy. This revolt developed into a tedious war, which cost the mother country vast sums of money and many lives. See NETHERLANDS, THE, in the Appendix.

J. R. PLANTEN.

Nets and **Netting**: textures made by threads or cords crossing one another and knotted at the points of intersection so as to keep the shape and size of their open meshes. Fishing-nets are the most common instance of the stouter kinds of net, although these are made of many degrees of fineness, and of many different materials. In the decorative arts and in costume net has been used, in Europe and in the East, for fabrics of colored thread and of elaborate design, and as a ground upon which can be sewn sprigs and flowers cut from lace. It is, however, more commonly used for the making of fringes, edgings, bags, coverings for the hair, and "tidies" or "antimacassars." For these purposes a strong and fine cord is commonly used, often of silk. The net is often of very elaborate pattern, and darning or simple forms of embroidery are used to make it still more decorative.

The term is much used also for open-mesh fabrics, which are not true net, because not knotted where the threads cross. Thus mosquito-net is merely a very coarse and open gauze. In ornamental art, too, the work done by pulling out threads and stitching back others in cambric or lawn, so as to produce *drawn work* or *cut work*, is sometimes called net. RUSSELL STURGIS.

Netsuke: the name given in Japan to the elaborately carved buttons or knobs of metal, wood, or ivory used in attaching the tobacco-pouch or other light article to the belt. Artists formerly vied with each other in the minute pains they took to make these *netsukes* marvels of intricate workmanship. Europeans apply the name to all miniature carvings in ivory of Japanese or Eastern workmanship.

Nettement, ALFRED FRANÇOIS: journalist and historian; b. in Paris, France, July 22, 1805. After completing his education at the Collège Rollin, he began in 1829 to publish *critiques* in the journal *L'Universel*, and for many years he wrote for that and other periodicals. He was an ardent Catholic and legitimist, and throughout the troubled years from 1830 to 1850 he resolutely maintained this position. After the Revolution of 1848 he founded *L'Opinion Publique*, a journal intended to help the restoration of the grandson of Charles X. After the *coup d'état* of Dec. 2, 1851, this was suppressed, and Nettement was thrown into prison. After his release he wrote for a time for the *Revue*

Contemporaine, and after 1858 edited *La Semaine des familles*. During all these years he had been producing also a series of historical works, which, even if they can not be called partisan in tone, reflect very clearly their author's opinions. Among these were *Histoire de la révolution de Juillet 1830* (2 vols., 1833); *Suger et son temps* (1842); *Vie de Marie-Thérèse de France* (1843; 3d ed. 1872); *Henri de France, etc.* (2 vols., 1845); *Études critiques sur les girondins* (1848); *La révolution française* (1848); *Histoire de la littérature française sous la Restauration* (2 vols., 1852); *Histoire de la littérature française sous la royauté de Juillet* (2 vols., 1854; 2d enlarged ed. 1858); *Souvenirs de la Restauration* (1858); *La conquête d'Alger* (1856); *Histoire de la Restauration* (8 vols., 1860–72). Besides these larger works, he wrote numerous pamphlets and several works on the history of the Parisian press, of which the most interesting is *Études critiques sur le feuilleton roman* (2 series, 2d ed. 1845–46). Worthy of mention also is his *Vie de Madame la marquise de la Rochejacquelin* (1858; 2d ed. 1865). D. in Paris, Nov. 15, 1869. A. R. Marsh.

Nettle [O. Eng. *netele* : O. H. Germ. *nezzila* > Mod. Germ. *nessel*]: any one of many plants, mostly covered more or less densely with poisonous stinging hairs. They belong to the family *Urticaceæ*, and mostly to the genus *Urtica*. There are over thirty species, many of which are tropical, some of the latter having severe and even dangerous stinging powers. The stalks of some kinds abound in a strong fiber, which, especially in Asia, has a considerable use in the arts. The common nettle-fiber is employed like hemp in Italy. This species (*Urtica dioica*) is naturalized in the U. S. from Europe. Its young shoots make an excellent potherb, and when older are sometimes put into beer. The most common stinging nettles of the Eastern U. S. are, besides the above, the *U. urens*, also European, *U. chamædryoïdes* and *gracilis*, and *Laportea canadensis*. The false nettle of the U. S. is *Bœhmeria cylindrica*, a stingless herb. The so-called Dead-nettle (*q. v.*) is not a nettle at all. In the East Indies the Neilgherry nettle, *Girardinia palmata*, one of the most actively stinging of the true nettles, yields an excellent fiber, which brings a high price in England.

Revised by Charles E. Bessey.

Nettle-rash, or **Hives** (in Lat. *urticaria*): an inflammatory affection of the skin with effusion, causing elevations of the size of a pea, or larger. These wheals are pale, or pale with a red margin, or red, or pale with a small vesicle in the center. The disease is generally of an acute character; the elevations develop quite suddenly and disappear after hours or days. Frequently they return, and some people do not lose the predisposition for many years. They may return at regular or irregular intervals, every day or two, without necessarily having anything in common with intermittent fever. The cause of this condition is either local or systemic. Among the local causes are contact with nettles, from which it has its name; the influence of insects; a hot bath; the sun; and mechanical and chemical influences of different kinds. In predisposed persons, pressure with the finger, friction, or irritation as by a subcutaneous injection of an indifferent fluid, are sufficient to produce it. Among the systemic causes are substances which irritate the nerves of the blood-vessels or of the digestive or genito-urinary organs; certain articles of food, such as champagne, beer, sausage, strawberries, raspberries, currants, oysters; medicines, such as quinine or cod-liver oil. The recurrence of menstruation, the application of leeches to the womb, etc., are causes which have been observed. At times the condition can be traced to no cause, and then a general irritability of the nervous system must be assumed to produce it. Frequently, therefore, it sets in with a chill or with fever, and it is always accompanied by itching and burning. Treatment, although simple, is not always efficient. Locally the use of glycerin, cold-cream, weak solutions of carbolic acid (1–2 per cent.), salt-water bathing, etc., will relieve the itching. The diet must be regulated; no coffee, spice, beer, and but little meat must be taken. The stomach must be improved by the use of bismuth or hydrochloric acid, according to the indications. Mild purgatives will be beneficial—in very bad cases now and then an emetic. Insects must be looked for, menstruation regulated, etc. A. Jacobi and F. E. Sondern.

Nettleship, Edward: ophthalmologist; b. at Kettering, Northamptonshire, England, Mar. 3, 1845; studied medicine in King's College Hospital, London Hospital, and London Veterinary College; in 1873 was appointed curator of Moorfields Ophthalmic Hospital; in 1877 appointed ophthalmic surgeon to St. Thomas's Hospital. His *Student's Guide to Diseases of the Eye*, published in 1880, has passed through several editions both in England and the U. S. S. T. A.

Nettleship, Henry: classical scholar; b. at Kettering, Northamptonshire, England, May 5, 1839; educated at Cathedral School, Durham, at Charterhouse, and at Corpus Christi College, Oxford, where he graduated in 1861. He was assistant master at Harrow from 1868 to 1873, when he became fellow and tutor of Corpus Christi and classical lecturer at Christ Church. In 1878 he was appointed Corpus Professor of Latin Literature in the University of Oxford. He published and edited a large number of works on classical subjects, among which are a portion of the commentary on the *Æneid* in Conington's *Vergil*; a revised edition of Conington's *Vergil*; *Lectures and Essays on Subjects connected with Latin Literature and Scholarship* (1885); *Contributions to Latin Lexicography* (1889). D. July 10, 1893.

Nettle-tree: a handsome tree (the *Celtis australis*), a native of Europe, belonging to the family *Urticaceæ*, and valued for its wood, much used in turnery. It has several congeners in various parts of the Old and New Worlds, the common species of the U. S. being called Hackberry (*q. v.*). In Australia, etc., there are nettle-trees more properly so called, with very sharply stinging leaves and shoots.

Nettleworts (*Urticaceæ*): a group of dicotyledonous plants commonly regarded as a family composed of several sub-families, although probably more correctly a group of families. The flowers are apetalous, and mostly unisexual, with a single, superior, one-celled, one-ovuled ovary. The species (1,560) are mostly tropical, with a considerable number extending into the temperate zones.

The Elms and their allies constitute the sub-family (or family) *Ulmaceæ*, including a dozen or more genera of trees and shrubs and about 120 species.

The Mulberries and their allies (sub-family or family *Moraceæ*) include nearly 1,000 trees and shrubs and a few herbs. The figs (*Ficus*), mulberries (*Morus*), breadfruit (*Artocarpus*), milk-tree (*Brosimum*), and upas-tree (*Antiaris*) are representative plants of this sub-family. Here are also placed the hemp (*Cannabis*) and the hop (*Humulus*).

The Nettles (sub-family or family *Urticaceæ*) are mostly herbs with stinging hairs. They are represented by *Urtica* (the nettles proper), *Bœhmeria* (ramie), *Laportea* (wood nettles, etc.). Charles E. Bessey.

Neuchâtel, or **Neufchâtel**, nö'shaă'tel' (Germ. **Neuenburg**, noi'*e*n-boorch): canton of Switzerland, bounded by France and the Lake of Neuchâtel. Area, 312 sq. miles. It is traversed by several ranges of the Jura Mountains, separated by longitudinal valleys stretching from the S. W. toward the N. E. The lower parts of these mountains are generally well adapted to the production of wheat, wine, and fruits; the higher afford good pasturage, where many cattle are reared and much cheese is produced; some are covered with forests yielding good timber; but the chief occupation of the inhabitants is nevertheless manufacturing, especially watchmaking, which employs nearly 20,000 persons. The first watch was made here in 1681. Up to 1848 the country formed the principality of Neuchâtel, and belonged to the King of Prussia; in that year it adopted a republican constitution, and in 1857 definitely became a member of the Swiss confederation. Three-fourths of the population, 111,928 in number (in June, 1894), speak French, and four-fifths are Protestants.

Neuchâtel: capital of the canton of Neuchâtel, Switzerland; beautifully situated on the shore of the Lake of Neuchâtel (see map of Switzerland, ref. 4–C). It is well built, and has important manufactures of watches and laces, and a large trade in wine and absinthe. Pop. (1893) 16,772.

Neuchâtel, Lake of: a body of water in Switzerland, 25 miles long and from 3 to 5 miles broad. It sends its waters through the Aar to the Rhine.

Neuendorff, noi'*e*n-dōrf, Adolph: composer and conductor; b. in Hamburg, Germany, June 13, 1843; began the study of music at the age of six years. In 1855 his parents removed to New York, where he continued his musical studies. He became chorus-master of the new German theater in 1857, and soon after violinist in the orchestra of the Stadt theater. In 1859 he made an appearance as a pianist, and then traveled with his father for two years in South America. In 1863 he became conductor of the German theater in Milwau-

kee, but was soon back again in New York. Since then he occupied many positions as conductor, including one year with the Philharmonie Society. He introduced Waehtel and Madame Pappenheim to New York, and conducted a series of Wagner's operas in 1877. He composed several successful operas. D. in New York, Dec. 4, 1897. D. E. H.

Neufchâtel: See NEUCHÂTEL.

Neuilly, nö'yee': town; in the department of Seine, France; 1½ miles from the western extremity of Paris, on the right bank of the river Seine, which is here crossed, on the prolongation of the avenue through the Champs Elysées, by the noble stone bridge built by Perronet. (See BRIDGES.) It was the famous summer residence of Louis Philippe, who occupied the royal château erected in the reign of Louis XV., which was destroyed by the mob Feb. 25, 1848, the right wing alone being saved, which yet forms an object of interest to visitors. The beautiful grounds about Neuilly, once the favorite resort of Parisians, are now laid out in walks skirted by charming villas. Neuilly has a varied manufacturing industry, comprising starch, chemicals, straw goods, porcelain, etc. Pop. (1896) 32,730.

Neumann, noi'măn, KARL FRIEDRICH: Orientalist; b. at Reichmannsdorf, Bavaria, Dec. 22, 1798, of Jewish parents; studied at Heidelberg, Munich, and Göttingen, and was converted to Lutheranism; went in 1827 to Venice to study Armenian in the convent of San Lazaro, thence to Paris and London; made a journey to India and China in 1829–30; brought back a large collection of Chinese and Hindu books, which are now partly in Berlin and partly in Munich; was appointed Professor of Oriental Languages at Munich in 1831, but dismissed in 1852 on account of his liberal views in politics; removed in 1863 to Berlin, and died there Mar. 17, 1870. He was a very prolific writer on various topics. His principal works are *Mémoires sur la Vie et les Ouvrages de David, Philosophe Arménien* (1829); *Lehrsaal des Mittelreichs* (1836); *Geschichte der armenischen Litteratur* (1836); *Asiatische Studien* (1837); *Die Völker des südlichen Russland* (1847); *Ostasiatische Geschichte* (1840–60); *History of Vartan by Elisæus*, and *Chronicle of the Armenian Kingdom in Cilicia, by Vahram* (1830), translated from the Armenian. He also wrote *Geschichte der Vereinigten Staaten von Nordamerika* (3 vols., 1863–66), and *Hoein Schein, or the Discovery of America by Buddhist Monks* (1874). Revised by F. M. COLBY.

Neumayer, noi'mī-er, GEORG B., Ph. D.: magnetician and meteorologist; b. at Kirchheim-Bolander, Pfalz-am-Rhein, Germany, June 21, 1826; was educated in the Polytechnic School, University, and Observatory, at Munich. He was in Australia for many years, where he served as director of the Flagstaff Observatory at Melbourne, and director of the Magnetic Survey of Queensland. On his return he became successively hydrographer of the Admiralty at Berlin and director of the Deutsche Seewarte at Hamburg. He has received the honorable title of *Geheimer Admiralitätsrath*. Among his numerous works, both in German and English, are *Results* at Flagstaff Observatory (1860) and in Victoria (1866–69); his *Discussions* of these observations (1862); *Anleitung zu wissensch. Beobachtungen auf Reisen* (1874; 2d ed. 1888); *Die internationale Polarforschung, Die deutschen Expeditionen und ihre Ergebnisse* (2 vols., 1890–91); *Atlas des Erdmagnetismus* (in Berghaus's *Physikalischer Atlas*, 1891); and (with Prof. Dr. C. Börgen) *Die Beobachtungsergebnisse der deutschen Stationen im Systeme der intern. Polarforschung* (2 vols., 1874–88). MARK W. HARRINGTON.

Neumünster, noi'mün-ster: town; in the duchy of Holstein, Prussia; on the Schwale river; 20 miles by rail S. W. of Kiel (see map of German Empire, ref. 2-E); has large breweries, dye-works, tanneries, and manufactories of woolen and linen fabrics. Pop. (1890) 17,539.

Neu-Pommern, noi'pō'mern: See NEW POMERANIA.

Neuquen, nā-oo-kān': a territory of the Argentine Republic: on the eastern slope of the Andes, S. of the province of Mendoza, between the rivers Limay (a branch of the Negro) and the Colorado. Area officially stated at 42,116 sq. miles, but the limits are not well determined; population about 30,000. In the mountainous western portion there are many fertile valleys; much of the eastern part, except in the river valleys, is arid; and there is an immense bed of shingle, said to be the largest in the world, extending for 600 miles through this territory and Rio Negro: its average thickness is 50 feet. The principal industry, confined to the fertile lands along the rivers, is cattle and sheep raising; the cattle are driven over the mountains to the Chilian markets. Gold, silver, coal, etc., are reported. Until 1879 this region was held by the Ranqueles Indians. Capital, the village of General Achá, with about 2,000 inhabitants. HERBERT H. SMITH.

Neuralgia [Mod. Lat.; Gr. *νεῦρον*, nerve + *ἄλγος*, pain]: pain in a nerve due to functional disturbance either in its central or peripheral extremity. If inflammation be present in the nerve-trunk, NEURITIS (*q. v.*) is a more proper designation. It is, however, often difficult to distinguish between the two conditions, and many authors use the term neuralgia even if inflammation be present, provided pain be the predominant symptom. The disease is rarely met with in children, and is more frequent in women than in men. The causes are debility, exposure to cold, anæmia, reflex irritation, as in facial neuralgia from a decayed tooth, rheumatism, gout, diabetes, malaria, and lead-poisoning. The pain is localized in the distribution of a certain nerve or nerves, and rarely occurs on both sides at once. It is paroxysmal, lasting from a few minutes to many hours, and is deep-seated, sharp, burning or boring, and darting. In the intervals there may be a dull ache. It may recur at regular intervals even when not due to malaria. The skin, especially at certain points on the affected nerve, is extremely sensitive to pressure. Local œdema, sweating, or redness may occur. The hair may become gray in spots, or even fall out. Neuralgias are classified according to the part affected. The following are the principal varieties: Facial (see FACIAL NEURALGIA); intercostal; brachial (involving the arm); crural (involving the front of the thigh); sciatica; coccygodynia (causing intense pain at the end of the spine, made much worse by sitting); erythromelalgia (in which there is great pain in the heel or sole, with hyperæmia or cyanosis). There are also neuralgias of the internal organs, of which gastralgia (neuralgia of the stomach) and nephralgia (neuralgia of the kidney) are examples. In *epileptiform neuralgia* the attack comes on suddenly with extreme severity, lasts only a few seconds, and recurs many times daily. The pain is felt only in the fifth nerve, and may be accompanied by spasm. In the *neuralgia of stumps* the patient, at a greater or less time, usually several months, after amputation of an arm or leg, begins to feel pain, not in the scar, but in the amputated extremity. The apparent position of the removed member is plainly felt, and he often feels the fingers violently flexed or extended. Later the pain appears in the retained part of the member. Sometimes there is violent twitching of the stump. The affection is caused by pressure of the contracting scar upon the ends of the nerves. WILLIAM PEPPER and C. W. BURR.

Neurasthenia: See NERVOUS DISEASES.

Neurilemma: See HISTOLOGY (*Nerves*).

Neurine [from Gr. *νεῦρον*, nerve], or **Cho'line** [from Gr. *χόλος*, gall, bile]: the tri-methyl-oxethyl-ammonium-hydrate, $(CH_3)_3(C_2H_4OH)NOH$. It is obtained from the bile, from the brain, from LECITHIN (*q. v.*), from PROTAGON (*q. v.*), and is prepared synthetically. Lecithin, which occurs in the brain, nerves, yolk of eggs, blood-corpuscles, etc., is now known to be the di-stearyl-glycerin-phosphate of neurine.

Neuri'tis [Gr. *νεῦρον*, nerve + Mod. Lat. suffix *-itis*, denoting a disease of the part to the name of which it is added]: inflammation of a nerve. The nerve is red and swollen. The inflammation may be confined to the fibrous sheath (perineuritis), or invade the deeper connective tissue (interstitial neuritis), or the nerve-fibers may be primarily affected (parenchymatous neuritis). The changes in the last are similar to those in Wallerian degeneration following cutting of a nerve. The medullary substance becomes segmented and divides into globules and granules. The axis cylinders break up, become granular, and finally disappear. The nuclei of the sheath of Schwann increase in number. In the former the internodal nuclei are swollen, those of the sheath of Schwann proliferate, and the nerve-fibers may be completely replaced by fibrous tissue. The following are the chief varieties of neuritis: *Localized neuritis*, due to cold, wounds, and extension of disease from neighboring parts. "Crutch palsy," in which the head of the crutch pressing against the musculo-spiral nerve bruises it and causes palsy in the muscles supplied, is quite common. The hand hangs from the wrist and can not be extended, the forearm is supinated with difficulty, and there is numbness and tingling. In the idiopathic form and in that from wounds there is

great pain, numbness, diminution of the tactile sense, impairment or absolute loss of motion in the muscles, and ultimately wasting. There may be muscular contraction, redness and glossiness of the skin, œdema, and herpes. *Multiple neuritis* may be idiopathic or caused by the poisons of acute infectious diseases, as, for example, diphtheria, typhoid and scarlet fevers, and smallpox; certain poisons, among which are alcohol, lead, and mercury; and, finally, some chronic constitutional diseases, such as cancer, tuberculosis, and diabetes. In the acute form the onset is rapid. Fever, backache, headache, and limb-ache appear first, and are followed by a more or less complete palsy of the legs and arms, and sometimes of the intercostal muscles, so that respiration becomes purely diaphragmatic. There is a characteristic drop of the hands and feet. Sensory disturbances may be slight or severe. There is muscular wasting. The course of the disease varies greatly. The patient may die in a few days or may recover after a prolonged convalescence. In the alcoholic form the onset is apt to be gradual, and there may be neuralgic pains in the arms and legs for months before palsy develops. Fever is rare. The type of the palsy is similar to that already described. There is often delirium, with convulsions and hallucinations of grandeur. Occasionally the mental symptoms are the same as those met with in delirium tremens. The disease is most frequent in women. Steady, quiet drinking is more apt to cause it than occasional drunkenness. *Endemic neuritis* (beriberi) is common in Japan, New Zealand, India, Brazil, and the West Indies. It was formerly prevalent in China. Its cause has not been positively determined, but it is probably infectious. The onset may be sudden or gradual. The symptoms are fever, anæmia, ascending palsy, including sometimes the diaphragm and larynx, muscular wasting, œdema beginning in the legs and becoming general, and anæsthesia to touch but not to pain. Death results from cardiac failure. The mortality-rate varies from 3 to 50 per cent. in different epidemics. In all forms of neuritis there is reaction of degeneration in the muscles.

WILLIAM PEPPER and C. W. BURR.

Neurop'tera [Mod. Lat.; Gr. *νεῦρον*, nerve + *πτερόν*, wing]: a name applied with different limitations by different authors to a group of insects. By some it is used to include the day-flies (Ephemerida), dragon-flies (Odonata), stone-flies (Plecoptera), white ants (Isoptera), book-lice (Corrodentia), scorpion-flies (Panorpata, or Mecoptera), caddis-flies (Trichoptera), and the hellgrammites and ant-lions. By others its use is limited to the last-named forms. With its wider signification it is difficult of definition, but it may be said to include those forms of insects in which the

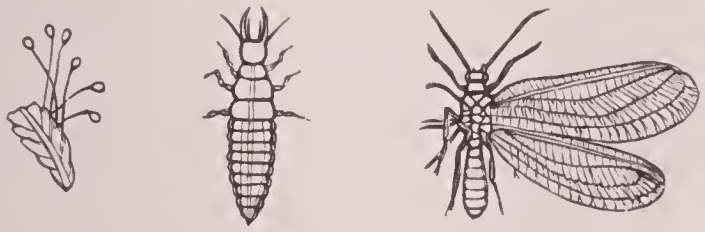

FIG. 1.—Eggs, larva, and adult of *Chrysopaperla*.

mouth-parts, like those of grasshoppers, are fitted for biting and in which the gauzy wings are provided with numerous cross-veins. Such a definition, however, brings together a heterogeneous assemblage of forms, some having a complete, others an imperfect metamorphosis, as well as some in which the mouth-parts are as well adapted for sucking as for biting. (See ENTOMOLOGY.) The Neuroptera proper have a complete metamorphosis, passing through larval and pupal stages before becoming adult; the mouth-parts are fitted for biting, and the wings, four in number, are membranous, and are furnished with numerous veins. The group or order contains but two American families. The first, the *Sialidæ*, contains the hellgrammite flies, *Corydalus*, the aquatic larvæ of which, under the name of "dobsons," are familiar to fishermen. When ready to pupate the larvæ leave the water and make a cavity in the earth, in which the pupa remains inactive for four or five weeks. The other family, *Hemerobidæ*, contains the ant-lions, aphis-lions, and a few other forms. Of these the ant-lions are best known. They dig funnel-shaped pitfalls, at the bottom of which the strong-jawed larva lies buried. Any ant or other insect venturing within the mouth of the funnel tumbles down, and is seized by the larva at the bottom of the pit. The ant-lions spin silken cocoons in which to pass the pupal stage. The aphis-lions (*Chrysopa*) lay their eggs on stalks so as to place them above danger. The larvæ hunt for their prey, which consists of other insects; there is a silken cocoon for the pupal stage. The adults are frequently called golden-eyed flies on account of the color of the eyes in the living insects. Some species emit a most nauseous odor on being disturbed. See ENTOMOLOGY.

FIG. 2.—*Corydalis cornuta*.

J. S. KINGSLEY.

Neuro'sis [from Gr. *νεῦρον*, nerve]: the generic name applied to disorders of the nervous system in which no structural change is discoverable. The number of such affections has materially decreased with improved methods of research. Doubtless some of them are of toxic nature, the disturbed action of the nervous system being due to the altered physiology under the influence of poisons, as we know to be the case in instances of alcoholic or opium poisoning. The long continuance of intoxication or chronic disturbance of the nervous system of a purely functional nature may doubtless lead to organic changes, so that in the end a functional disease may become organic. Among the neuroses are generally considered neuralgia, chorea, epilepsy, paralysis agitans, neurasthenia, and others. The causes which are operative to induce these conditions are considered under the heading NERVOUS DISEASES.

An interesting group are the so-called *occupation neuroses*, such as writer's or scrivener's cramp or palsy, telegrapher's cramp, sempstress's cramp, and the like. In these affections the habitual overuse of certain groups of muscles in finely co-ordinated movements occasionally leads to a condition in which every attempt to perform the accustomed work leads to painful spasm or cramp of the muscles involved. Sometimes there is simply palsy, at other times only pain or cramp: but, as a rule, cramp and pain are associated. In the treatment of neuroses the first indication, as a general thing, is to secure rest of the entire nervous system or of the parts involved. In addition, general tonic treatment is required for the underlying loss of tone, which is the predisposing factor. WILLIAM PEPPER.

In *psychology*, the word neurosis is used to indicate any condition of the central nervous system which is correlative to a particular condition or function in consciousness. Every *neurosis* has its *psychosis*. For example, emotion is a psychosis, which is supposed to involve a certain kind of nervous process or neurosis. The distinction in terms was suggested by Huxley, and has been generally adopted.

J. M. BALDWIN.

Neurot'ics [from Gr. *νεῦρον*, nerve]: in medicine, such drugs as are capable of primarily affecting the functions of intellection, sensibility, or motility. Alcohol, the ethers, chloral, potassium bromide, amyl nitrite, the drugs of the opium type, quinine, strychnine, hemlock, Calabar bean, aconite, digitalis, etc., are neurotics.

Neusiedl, noi'seed'l, **Lake of** (Germ. *Neusiedler See*): a body of water in Hungary; near the northwestern frontier; 23 miles long and 7 miles broad. Its water contains various salts in solution, and has a brackish taste. The lake sometimes dries up entirely, as was the case in 1693, 1738, and 1865; but in 1870 the basin again became filled with water through the Hanság marsh, and the farms and plantations which Archduke Albrecht had laid out under the name of New Mexico were all submerged. Under sudden risings of the water a canal conducts it to the river Rabnitz.

Neustadt, noi'stăt, or **Wie'ner-Neustadt**, *vee'ner-*: town of Lower Austria; at the beginning of the canal of same

name, and on the Vienna and Gratz Railway; 26 miles S. of Vienna (see map of Austria-Hungary, ref. 5–E). It is surrounded by a wall and a deep ditch. In 1834 the town was nearly destroyed by fire. It has since been handsomely rebuilt, and is the seat of a Cistercian abbey and of a military academy founded by Maria Theresa. Its manufactures are important, and include locomotives, machinery, tacks, clocks, leather, etc.; and it has a good trade in horses and agricultural products. Pop. (1890) 24,780.

Neu-Strelitz, noi'strā'lits: capital of the grand duchy of Mecklenburg-Strelitz, Germany; situated between two lakes, 62 miles N. N. W. of Berlin (see map of German Empire, ref. 2–G). It was founded in 1733, is built in the form of an eight-pointed star, and contains a fine palace with a library, a theater, educational and benevolent institutions, and a fine park. Pop. (1890) 9,481.

Neuter Nation: See IROQUOIAN INDIANS.

Neutral Axis: the line in a cross-section of a beam which is neither extended nor compressed when the beam is deflected by a load. This line passes through the center of gravity of the cross-section, provided the elastic limit of the material be not exceeded. See ELASTIC CURVE and FLEXURE. M. M.

Neutrality: the state of peace which a nation observes while some of its friends are at war. Anciently, such a condition can hardly be said to have existed, for wars were general and every state was either the ally or the enemy of every other. In nothing can the progress of society be so clearly seen as in the increasing growth and importance of the neutral status.

Neutrality is not only a privilege to be free, so far as is possible, from the losses and evils of war; it is also a duty to avoid aiding either belligerent, remembering that the other is a friend. The position which a state intends to take in view of a war between its neighbors should be clearly defined. It is accordingly customary to issue a proclamation of neutrality, laying down the rules which are to govern its intercourse with both belligerents alike; the privileges, if any, which they may expect; the obligations which it will itself recognize, and the duties thereby devolving upon its subjects.

Besides such proclamations in view of a particular war, it is also customary for a state to put on its statute-books general laws regulating the actions of its citizens with reference to foreign wars. These are neutrality acts. They are only municipal laws, it is true, yet their violation by the subjects of a state may be ground for damages against it in favor of an injured belligerent, as was proved in the Alabama case. The non-existence or insufficiency of such laws is no excuse for a failure to observe a strict neutrality, but may rather be a cause of complaint. For a full discussion of this subject, the rights and duties of neutral states, and the effects upon neutral trade, the reader is referred to the general article INTERNATIONAL LAW.

The following proclamation of neutrality, issued by the King of Spain at the outbreak of the civil war in the U. S., June 17, 1861, affords an illustration:

"Taking into consideration the relations which exist between Spain and the United States of America, and the desirability that the reciprocal sentiments of good understanding should not be changed by reason of the grave events which have taken place in that republic, I have resolved to maintain the most strict neutrality in the contest begun between the Federal States of the Union and the States confederated at the South; and in order to avoid the damage which might accrue to my subjects and to navigation and commerce from the want of clear provisions to which to adjust their conduct, I do decree the following:

"ART. 1. It is forbidden in all the ports of the monarchy to arm, provide, or equip any privateer vessel, whatever may be the flag she displays.

"ART. 2. It is forbidden in like manner to the owners, masters, or captains of merchant vessels to accept letters of marque, or contribute in any way whatsoever to the armament or equipment of vessels of war or privateers.

"ART. 3. It is forbidden to vessels of war or privateers with their prizes to enter or to remain for more than twenty-four hours in the ports of the monarchy, except in case of stress of weather. Whenever this last shall occur, the authorities will keep watch over the vessel, and oblige her to go out to sea as soon as possible without permitting her to take in any stores except those strictly necessary for the moment, but in no cases arms or supplies for war.

"ART. 4. Articles proceeding from prizes shall not be sold in the ports of the monarchy.

"ART. 5. The transportation under the Spanish flag of all articles of commerce is guaranteed, except when they are directed to blockaded ports. The transportation of effects of war is forbidden, as well as the carrying of papers or communications for belligerents. Transgressors shall be responsible for their acts, and shall have no right to the protection of my Government.

"ART. 6. It is forbidden to all Spaniards to enlist in the belligerent armies or take service on board of vessels of war or privateers.

"ART. 7. My subjects will abstain from every act which, in violation of the laws of the kingdom, can be considered as contrary to neutrality.

"ART. 8. Those who violate the foregoing provisions shall have no right to the protection of my Government, shall suffer the consequences of the measures which the belligerents may dictate, and shall be punished according to the laws of Spain."

This is a fair sample of proclamations of neutrality, yet it is liable to misconstruction. For in point of fact the conveyance of contraband, blockade-running, enlistment in a foreign army, or service on a foreign ship would probably not be punished by the laws of Spain or any other country while neutral. It is simply intended to give warning that such acts are illegal, and that if penalties are incurred at the hands of either belligerent for committing them—e. g. confiscation of contraband goods—no remedy can be furnished by their own Government. On the other hand, certain other acts forbidden by the proclamation, such as arming a privateer or ship of war, would probably be prevented under penalty by the Government. This somewhat curious and illogical distinction between acts apparently of equal criminality rests upon usage, a usage acquiesced in by belligerent as well as neutral, and founded upon the principles that (1) neutral trade shall be as little disturbed as possible in time of war; that (2) anything resembling the fitting out of an armed expedition on neutral ground to operate against a friendly state is not a mere act of trade, but a direct act of war and unneutral, and likely to involve the neutral state in difficulties and make it responsible for damage thereby inflicted. See CONTRABAND and INTERNATIONAL LAW.

T. S. WOOLSEY.

Neuville, nö'veel', ALPHONSE MARIE, de: military painter; b. at St.-Omer, Pas-de-Calais, France, May 31, 1836. He was a pupil of Picot; was awarded medals at the Salons of 1859 and 1861; was made an officer of the Legion of Honor 1881. He began life as a lawyer, but abandoning the law to take up the study of art, he soon achieved a reputation, and with his pictures of episodes of the Franco-German war of 1870 reached the highest rank among modern battle-painters. His compositions are notable for action and vigorous draughtsmanship. One of the best and most important is *The Defense of Le Bourget*, painted in 1879, in the collection of Mrs. W. H. Vanderbilt, New York. D. in Paris, May 20, 1885. WILLIAM A. COFFIN.

Neva: a river of the government of St. Petersburg, Russia. It connects Lake Ladoga with the Gulf of Finland; is 35 miles long; has a curved and sinuous course, with many bars and other obstructions to navigation at its head and mouth, and a series of rapids about midway of its length. It is broad and deep, and the obstructions to navigation have been measurably overcome by engineering works. St. Petersburg occupies the islands of its delta. M. W. H.

Nevada, nĕe-vaa'da: one of the U. S. of North America (Western group); twenty-third in order of admission into the Union; ranked in 1899 eighth in production of gold, sixth in silver, and seventh in aggregate value of both.

Location and Area.—It lies between 35° and 42° N. lat., and 114° and 120° W. lon.; bounded N. by Oregon and Idaho, E. by Utah and Arizona, S. W. and W. by California; extreme length from N. to S., 483 miles; greatest breadth from E. to W., 423 miles; area, 110,700 sq. miles.

Physical Features.—The greater part of Nevada is included in the Great American Basin, which has for its walls the Sierra Nevada on the W. and the Wahsatch Mountains on the E. It is bounded N. and S. by cross-ranges, and has no outlet for its waters. This vast basin is a table-land about 4,000 feet above the sea, and mountains rise from 1,000 to 8,000 feet above its level. About 12,000 sq. miles in the S. E. of the State are outside of this basin, and belong to the Colorado river basin. The Sierra Neva-

da Mountains constitute the west boundary of the State. They throw out one spur, however, the Washoe Mountains, which have a N. E. direction. Most of the mountain chains are parallel to each other, and have a general course from N. to S. The principal chains, beginning at the W., are the Virginia Mountains, W. of Pyramid Lake; the Lake range, between Pyramid and Winnemucca Lakes; the Truckee Mountains, E. of Winnemucca Lake; the Trinity and Antelope Mountains, which form the west boundary of the Lower Humboldt river and Lake valley; the West Humboldt Mountains; and, separated from these by a broad valley, the East Humboldt Mountains; S. of the Humboldts are the Toyabe Mountains, and a parallel range, the Santa Rosa. The Pah-Ute and Coyote Mountains, also outliers of the Toyabe range on the W., extend northward toward the Humboldt river and lake. E. and S. E. of the East Humboldt range are the Edwards Creek Mountains, the New Pass range, the Shoshone and Reese River ranges, the Hot Creek, Reveille, and Smoky ranges, the Diamond, Egan, Ungoweah, and Goshoot Mountains, parallel ranges, with valleys between. In the S. W. is an isolated range, the White Mountains. The Colorado valley has numerous abrupt ranges rising from its plateaus, and three peaks of considerable height—viz., Tem Piute, Pahranegat, and Picohe. The most important ranges of the Colorado region are the Muddy, Vegas, Spring Mountain, and Kingston Mountains. Some of the peaks of the West Humboldt and South Toyabe ranges rise to the height of 10,000 to 12,000 feet. The eastern slope of the Sierra Nevada and the Humboldt, East Humboldt, and Toyabe ranges have a considerable number of streams, which, however, disappear very suddenly from the surface, and reappear as lakes or pools farther on. The principal rivers are the Truckee, which rises in Tahoe Lake and flows N. E. and N. W. into Pyramid Lake; the Humboldt, which is formed by the confluence of several small streams in the N. E. of the State, and after a general southwest course falls into Humboldt Lake; Walker river, in the S. W., which, after a circuitous course, falls into Walker Lake; Carson river, discharging into Carson Lake; Quinn's river, in the N. W.; Reese river, in the central portion of the State; the Rio Virgin, in the S. E.; and the Colorado, which forms for a considerable distance a part of the southeast boundary. The principal lakes are Pyramid, 33 miles long and 14 wide; Walker, nearly as large; Carson, 12 miles in diameter; Humboldt, somewhat smaller; Winnemucca, 18 miles long, 8 wide; and Lake Tahoe, one-third of which is in Nevada, 1,500 feet deep, 6,000 feet above the sea. There are also numerous shallow lakes of large extent in the rainy season, but dry or nearly so in the dry season.

Seal of Nevada.

Mineral Resources.—Gold is not an abundant metal in Nevada, but some of the argentiferous ores contain a large amount of gold in combination. The percentage of gold in these ores varies from 21 to 52 per cent. of the entire metallic product. Silver is, however, the staple mineral product of Nevada. The silver lodes are found in almost every part of the State, some yielding from $65 to $100 to the ton, others ranging from $450 to $2,500 or more to the ton. Of these the mines on the Comstock vein or lode have proved the most valuable. The product of the mines for the year ending Sept. 30, 1891, was 375,708 tons; the gross value, $5,948,563. The yield of the Comstock lode for 1890 was over $4,000,000. The number of men employed on that lode was 1,500. The director of the U. S. mint reported the product of Nevada gold mines in 1899 as valued at $2,219,000, and the Nevada silver mines as producing fine silver with a coining value of $1,090,457. There has been a slight falling off in the output of precious metals in Nevada since 1897, when the gold output was valued at $2,976,400, and the silver at $1,588,881. The other minerals of Nevada are lead, copper in various forms, the production of which decreased from 288,077 lb. in 1883 to 20,000 lb. in 1893, but was revived again in 1898, and in 1899 yielded 556,775 lb.; iron in numerous forms, as magnetic, spathic, specular, common iron pyrites, arsenical and magnetic pyrites, etc.; it is not as yet mined to any extent; antimony, arsenic, possibly quicksilver, manganese, sulphuret of zinc, graphite or plumbago, sulphur (pure), gypsum, rock-salt, nitrate of potassa, carbonate of soda in immense quantities, borax, lignite or brown coal, kaolin, sulphate of magnesia, agates, amethyst, epidote, tourmaline, chalcedony, jasper, carnelian, fluorspar, selenite, granite, and mica, of which 1,500 lb. from a single mine were shipped to Syracuse, N. Y., and Hamburg, Germany, in 1894 to be cut. There are numerous mineral springs and some geysers.

Soil and Productions.—While the State will never be largely agricultural, it possesses a sufficiency of arable lands to supply with the aid of irrigation, and possibly without, the needs of such a population as it is destined to have, and its mountain-slopes and some of its valleys will prove to be among the best grazing-lands of the Pacific region. In 1889 there were 1,167 irrigated farms in the State, covering an area of 224,403 acres. The average value of products per acre from these irrigated lands was $12.92. Only 7 per cent. of the land under irrigation was devoted to the cultivation of cereals, the remainder being given up to forage. Its timber-lands proper, those on which grow the lofty pines of the sierras, are of very moderate extent. A part of the lower portions of the mountain regions and some of the valleys along which the rivers flow are covered with a smaller growth of piñon or nut-pine, cottonwood, birch, willow, dwarf cedar, etc. Of the sixty-five natural families of plants catalogued, many are represented by a large number of genera and species. Lupines, clovers, vetches, and nutritious grasses are the most characteristic plants.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms	1,404	1,277	* 9·0
Total acreage of farms	530,862	1,661,416	† 213·0
Value of farms, including buildings and fences	$5,408,325	$12,339,410	† 128·2

* Decrease. † Increase.

The following table shows the acreage, yield, and value of the principal crops (exclusive of a small quantity of barley) in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Wheat	40,457	991,196 bush.	$693,837
Potatoes	1,753	273,468 "	153,142
Hay	154,330	375,022 tons	2,887,669
Totals	196,540	.....	$3,734,648

On Jan. 1, 1900, the farm animals comprised 42,090 horses, value $690,594; 1,338 mules, value $46,654; 18,250 milch-cows, value $622,325; 219,831 oxen and other cattle, value $5,068,415; 657,773 sheep, value $1,914,120; and about 12,000 swine, value $100,000; total head, 951,282; total value, $8,642,108.

Climate.—This is characterized by great extremes. In winter snow falls upon the summits of the mountains, though there is not much in the valleys. The air is dry, the winds are strong, and, though the sunshine is bright and pleasant at midday, the nights are often intensely cold. In January the mercury falls to from 10° to 16° below zero in the valleys, and much lower in the mountains. Spring comes in about the end of February, though there may be piercing winds and sharp frosts, chilling rain and snow in March, or even in April. Thunder-storms of great severity occur in April and May and into June. When these have passed away, the dry season prevails until October. The temperature rises occasionally to 100° or 105°. It falls every night to between 70° and 80°, and does not average in July and August more than 90° at midday. In the eastern part there are frequent thunder-storms in summer and till Sept. 15, and the heat is longer continued and more oppressive. There is less intense cold, very little snow or frost in winter in Southeastern Nevada, and the culture of cotton and sugar-cane has been attempted there. The climate is remarkably healthful and invigorating.

Divisions.—For administrative purposes the State is divided into fourteen counties, as follows:

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.
Churchill	5-F	703	830	Stillwater	129
Douglas	6-E	1,551	1,534	Genoa	323
Elko	3-I	4,794	5,688	Elko	849
Esmeralda	6-F	2,148	1,972	Hawthorne	436
Enreka	4-H	3,275	1,954	Eureka	785
Humboldt	3-G	3,434	4,463	Winnemucca	1,110
Lander	4-H	2,266	1,534	Austin	702
Lincoln	8-J	2,466	3,284	Pioche	242
Lyon	5-E	1,987	2,268	Dayton	458
Nye	6-H	1,290	1,140	Belmont	242
Ormsby	5-E	4,883	2,893	Carson City	2,100
Storey	5-F	8,806	3,673	Virginia City	2,695
Washoe	4-E	6,437	9,141	Reno	4,500
White Pine	5-J	1,721	1,961	Hamilton	221
Totals		45,761	42,335		

* Reference for location of counties, see map of Nevada.

Principal Cities and Towns, with Population for 1900.—Reno, 4,500; Virginia City, 2,695; Carson City, 2,100; Winnemucca, 1,110.

Population and Races.—1860, 6,857; 1870, 42,491; 1880, 62,266; 1890, 45,761 (native, 31,055; foreign, 14,706; males, 29,214; females, 16,547; white, 39,084; colored, 6,677, of whom 242 were of African descent, 2,833 Chinese, 3 Japanese, and 3,599 civilized Indians); 1900, 42,335.

Industries and Business Interests.—Exclusive of the mining and milling industries, there were reported in 1890 95 manufacturing establishments, which had a combined capital of $1,211,269, employed 620 persons, paid $445,503 for wages and $439,058 for materials, and had products valued at $1,105,063. There were 118 quartz-crushing mills, 13 smelting-furnaces, 10 borax-works, 11 grist-mills, and 11 sawmills.

Finance.—The total debt, exclusive of an irredeemable bond of $380,000, on Jan. 1, 1894, was $201,946; cash in treasury, $190,306; net debt, $11,460. The assessed valuation in 1900 was placed at about $25,000,000, and the State Board advised raising it to $75,000,000. The tax levy averages 3·8 per cent.

Banking.—On Sept. 5, 1900, there were 1 national bank with a capital of $82,000, surplus and profits $8,289.50, and deposits $432,791.48; 4 State banks, capital $370,000, surplus and profits $185,088, deposits $1,474,337; and 1 private bank, capital $25,000, surplus $113, and deposits $24,364.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 189 post-offices, of which 9 were presidential (1 second-class and 8 third-class) and 180 fourth-class, and 53 money-order offices. There were 7 daily, 2 semi-weekly, 20 weekly, and 1 semi-monthly periodicals; total, 30.

Libraries.—In 1892 there were reported 8 public libraries of 1,000 volumes and over, which together contained 40,215 bound volumes and 1,970 pamphlets. They were classified as general, college, public institution, State, social, scientific, Masonic, and not reporting, one each.

Means of Communication.—Nevada had in operation, Jan. 1, 1892, 923 miles of railway, costing $16,570,715, with net earnings of $833,918; in 1899 the mileage in operation was 910·35. The Central Pacific is the principal trunk line, running for 450 miles of its course through the State.

Churches.—The Methodist Episcopal denomination has (1893) 28 churches, 13 ministers, and 895 full members; Protestant Episcopal, 11 churches, 535 members; Roman Catholic, 17 churches, 8 priests, and about 5,000 adherents; Presbyterians, 8 churches, 190 members; Baptists, 3 churches, 52 members; Congregationalists, 1 church, 52 members; Jews, 1 synagogue.

Schools.—In 1900 the number of children of school age (six to eighteen years) was 9,026. In 1898 there were 7,348 enrolled in the public schools, with an average attendance of 4,982; there were 224 schools, and 314 teachers—40 men and 274 women; average monthly salaries: men, $56.11; women, $44.83. The revenue for school purposes was $206,821, the expenditure $203,642, the value of school property $265,011. Nevada has a State university, which had 300 students in 1900.

History.—Nevada is a part of the territory ceded to the U. S. by Mexico by the Treaty of Guadalupe Hidalgo, Feb. 2, 1848. It was at first a part of California Territory, and was subsequently attached to Utah; it was constituted a Territory Mar. 2, 1861, with somewhat smaller boundaries than at present. The constitution was ratified, and Nevada admitted into the Union as a State, Oct. 31, 1864. Additions were made to its territory by congressional enactment in 1866.

GOVERNORS OF NEVADA.

Territorial.		Jewett D. Adams	1883–87
James W. Nye	1861–64	C. C. Stevenson	1887–91
State.		R. K. Colcord	1891–95
Henry G. Blaisdell	1864–71	John E. Jones *	1895–96
Louis R. Bradley	1871–79	Reinhold Sadler	1896–
John H. Kinkead	1879–83		

* D. Apr. 10, 1896.

Revised by C. K. Adams.

Nevada: town (located in 1853); capital of Story co., Ia. (for location of county, see map of Iowa, ref. 4-G); on the Chi. and N. W. Railway; 35 miles N. N. E. of Des Moines. It is in an agricultural and stock-raising region; contains 6 churches, graded schools, a national bank with capital of $50,000, a private bank, and a quarterly and 2 weekly periodicals; and has flour and grist mills, 2 grain elevators, foundry, and machine-shop, planing-mill, 2 tile-works, creamery, and wagon-factory. The State Agricultural College is 9 miles W. of the town. Pop. (1880) 1,541; (1890) 1,662; (1900) 2,472.

Editor of "Story County Watchman."

Nevada: city; capital of Vernon co., Mo. (for location of county, see map of Missouri, ref. 6-E); on the Mo., Kan. and Tex. and the Mo. Pac. railways; 90 miles S. W. of Sedalia. It is the seat of Christian University (Christian), of Cottery College (non-sectarian), and of State Insane Asylum No. 3; has a beautiful lake and park, gas and electric lights, street-railway, artesian well, 2 State banks, with combined capital of $150,000, a national bank with capital of $100,000, a private bank, public-school library, and a monthly, 2 daily, and 4 weekly periodicals; and contains a large zinc-smelter, foundry, ice plant, mills, and other manufactories. Pop. (1880) 1,913; (1890) 7,262; (1900) 7,461.

Editor of "Southwest Mail."

Nevada, Emma Wixom: opera-singer; b. in Nevada City, Cal., in 1861. She was educated in Austin, Tex., and in San Francisco; studied singing in Vienna under Madame Marchesi. She made her *début* at her Majesty's theater, London, in 1880, adopting the name of Nevada. She sang afterward with much success in the chief capitals of Europe. Returning to the U. S., she made her first appearance in New York in 1884 in *La Sonnambula*. Her favorite *rôles* are Lucia, Amina, and Mignon.

Nevada City: city; capital of Nevada co., Cal. (for location, see map of California, ref. 5-D); on Deer creek, and the Nevada County N. G. Railroad; 65 miles N. E. of Sacramento. It is in a mining and a fruit and vine growing region, and has several quartz-mills, a weekly and two daily newspapers, and a State bank with capital of $50,000. Pop. (1880) 4,022; (1890) 2,524; (1900) 3,250.

Névé: See Glaciers.

Nevers, *ne-vār'* (anc. *Noviodunum*, or *Nevirnum*): capital of the department of Nièvre, France; on the Loire, at the influx of the Nièvre, 159 miles by rail S. S. E. of Paris (see map of France, ref. 5-F). The town is old and ill-built, with narrow, crooked streets, but it has beautiful promenades, extensive manufactures of iron and copper ware, chemicals, porcelain, cloth, and linens, and large tanneries, breweries, and cannon-foundries. It has been the see of a bishop since 506; its cathedral, restored in 1879, dates from the thirteenth and fourteenth centuries; and there is a stone bridge of fifteen arches over the Loire. Pop. (1896) 27,108.

Nevin, Alfred, Edwin Henry, Ethelbert, and William Channing: See the Appendix.

Nevin, John Williamson, D. D., LL. D.: theologian; b. in Shippensburg, Franklin co., Pa., Feb. 20, 1803; graduated at Union College, 1821, and at Princeton Theological Seminary, 1826, where he remained as tutor, and wrote his *Biblical Antiquities* (2 vols., Philadelphia, 1828). He was Professor of Hebrew and Biblical Literature in the Presbyterian Theological Seminary at Allegheny City (1829–39), where he edited a weekly literary journal entitled *The Friend* (1833–34); became president of the Mercersburg Theological Seminary 1840, and was president also of Marshall College 1841–53. He published in 1843, at Chambersburg, *The Anxious Bench*, which occasioned much controversy on the subject of revivals; and in 1844 a translation (with an introduction) of Dr. Schaff's inaugural address, *The Principle of Protestantism*, which gave rise to the "Mercersburg theology," of which

Dr. Nevin continued till his death to be the chief exponent. Also *The Mystical Presence* (Philadelphia, 1846), which increased, in its doctrinal aspect, the controversy alluded to; *The History and Genius of the Heidelberg Catechism* (1847), and *Antichrist, or the Spirit of Sect and Schism* (1848). Dr. Nevin edited *The Mercersburg Review* (quarterly, 1849–53); resigned the direction of the Theological Seminary 1851, and the presidency of Marshall College on its removal to Lancaster and consolidation with Franklin College in 1853. He was president of Franklin and Marshall College 1866–76. D. at Caernarvon Place, near Lancaster, Pa., June 7, 1886. See his biography by Theodore Appel (Philadelphia, 1889).

Revised by S. M. Jackson.

Nevis: an island of the British West Indies, in the federated Leeward group. It is 3 miles wide and 4 miles long, and rises by gradual slopes to a height of 3,200 feet. The scenery is beautiful, and the lower slopes of the island, which comprise some 6,000 acres, are fertile and well cultivated. It was discovered by Columbus in 1498, and was settled in 1628 by English emigrants from St. Christopher, with which it forms a presidency, with one legislative council, meeting at St. Kitts. The island was taken by the French in 1706; was restored by the Peace of Utrecht; was taken again by the French in 1782, and restored in the following year. Pop. 11,864. Charlestown (*q. v.*), the capital, is the chief town and has a safe roadstead. Sugar, rum, and molasses are exported.

Nevius, John Livingston, D. D.: missionary and author; b. at Ovid, N. Y., Mar. 4, 1829; educated at Union College and Princeton Theological Seminary; was a missionary of the Presbyterian Board at Ningpo, China, 1853–61, and after 1861 in Shantung. D. at Chefoo, in Shantung, Oct. 19, 1893. He published in English *China and the Chinese* (New York, 1868); *San-Poh; or, North of the Hills* (Philadelphia); *Methods of Mission Work* (1886); and *Demon Possession* (1892); in Chinese, *Guide to Heaven* (1857: in classic Chinese, and in Ningpo dialect); *The Two Lights*; *Errors of Ancestral Worship*; *Guide to Evangelists*; *Systematic Theology* (3 vols., completed); *Explanation of the "True Doctrine"*; *Commentary on the Acts*; *Mark's Gospel with Notes*; *Manual for Inquirers, Evangelists, and Outstations*; *Questions on Matthew's Gospel*, on the *Acts with Commentary*, and on *Romans with Analysis for Bible and Theological Classes*; *Defense of Protestantism against Romanism* (1890); with other writers, *The Westminster Standards*; and *A Mandarin Hymn-book*.—His wife, Helen S. Coan Nevius, b. at Lodi, N. Y., Jan. 8, 1832, wrote a number of books in the Chinese language, including *A Catechism of Christian Doctrine*; and in English, *Our Life in China* (New York, 1857).

Nevome Indians: See Piman Indians.

New Albany: city; capital of Floyd co., Ind. (for location of county, see map of Indiana, ref. 11–F); on the Ohio river, and the Balt. and Ohio S. W., the Louis., N. Alb. and Chi., the Louis., Evans. and St. L., and the Pitts., Cin., Chi. and St. L. railways; 3 miles W. of Louisville, Ky. It derives excellent power for manufacturing from the falls of the Ohio, 2 miles distant, and has a large commerce by rail and water. The census returns of 1890 showed that 299 manufacturing establishments (representing 65 industries) reported. These had a combined capital of $5,352,521; employed 4,508 persons; paid $2,099,091 for wages and $3,471,487 for materials; and had products valued at $6,633,259. The principal industries are the manufacture of iron and steel, cotton, woolen, and hosiery goods, plate glass, and tanned leather. The city has a new belt line of railway, electric street-railways extending through the suburbs, gas and electric light plants, new Masonic temple, Odd Fellows' hall, De Pauw College for young women, public high school for white pupils, Scribner high school for colored youth, 3 libraries (De Pauw College, founded 1846; Township, founded 1851; and Public, founded 1885) containing over 10,000 volumes, 4 national banks with combined capital of $700,000, a State bank with capital of $100,000, and a monthly, 2 daily, and 4 weekly periodicals. The assessed valuation in 1893 was $11,113,060, and the net debt Jan. 1, 1894, $367,989. Pop. (1880) 16,423; (1890) 21,059; (1900) 20,628. Editor of "Ledger."

New Amsterdam: the old name of New York city, adopted on the arrival of Gov. Stuyvesant, in 1647. Previous to that date the village was called Manhattan. On its capitulation, in Sept., 1664, to the English, its name was changed to New York.

Newark: town (founded in 1758); New Castle co., Del. (for location of county, see map of Delaware, ref. 2–H); on the Phil., Wil. and Balt. and the Balt. and Ohio railways; 12 miles S. W. of Wilmington, 37 S. W. of Philadelphia, 58 N. E. of Baltimore. It is in an agricultural region; has several paper-mills and vulcanite-fiber works; and contains the Delaware State College (endowed by the national land grant, and chartered in the year 1870), Academy of Newark (non-sectarian, chartered in the year 1769), Delaware Normal School, 2 libraries (Delaware College and the Delta Phi Society, both founded in 1835) containing over 6,000 volumes, one weekly and a monthly periodical, and a national bank with capital of $50,000. Pop. (1880) 1,148; (1890) 1,191; (1900) 1,213. Editor of "Delaware Ledger."

Newark: city (settled by families from Milford, Branford, and Guilford, Conn., in 1666; chartered as a city in 1836); port of entry; capital of Essex co., N. J. (for location, see map of New Jersey, ref. 2–D); on the Passaic river, the Penn., the Del., Lack. and W., the Erie, the Lehigh Valley, and the Central of N. J. railways, and several lines leased by them; 9 miles west of New York city. It has a river and bay frontage of 10·5 miles, and an area of 18 sq. miles, of which three-fourths are improved and built up. There are 114·44 miles of paved streets, 28·38 miles of steam-railway track, and 90 miles of trolley tracks. The water-supply is obtained from the Pequannock watershed, 21 miles distant, the new system swelling the water debt to $7,777,000. There are brick and pipe sewers, aggregating 179·18 miles in length. The city is laid out regularly; has three public parks—Washington Park, containing a statue of Seth Boyden, the inventor; Military Park, the old training common, containing bronze statues of Gen. Philip Kearny and of Frederick T. Frelinghuysen, formerly U. S. Secretary of State; and Lincoln Park. Since 1895 Essex County has had commissioners laying out a system of parks at a cost of $4,000,000. Three of these are located in Newark—Branch Brook Park, containing 277 acres; East Side Park, 12½ acres; West Side Park, 23 acres. Broad avenues lead in various directions to the county lines, and extend to Elizabeth, the Oranges, Montclair, Caldwell, Rutherford Park, and other points. The city ranks next after New Haven in the number and age of its elm-trees. The river, navigable for some distance above the city, has been greatly improved by the U. S. Government, and, because of its sheltered position, has been a favorite racing-course for the National Association of Amateur Oarsmen and other rowing associations, but of late years the polluted condition of the stream has almost driven oarsmen from its surface. The city is best known for the extent and variety of its manufactures. The census returns of 1890 showed that 2,413 manufacturing establishments (representing 185 industries) reported. These had a combined capital of $53,847,452; employed 43,302 persons; paid $24,568,966 for wages and $38,074,115 for materials; and had products valued at $81,399,137. The following table shows the principal industries:

CLASSIFICATION.	Establishments.	Capital.	Persons employed.
Malt liquors	17	$5,490,473	927
Leather	50	5,052,687	2,303
Jewelry	68	3,853,115	1,905
Foundry and machine-shop products	73	3,601,983	2,225
Hardware	53	2,055,450	1,579
Celluloid and celluloid goods	4	2,028,268	693
Hats and caps	49	1,499,409	2,721
Trunks and valises	14	1,339,050	1,263
Men's clothing, wholesale	93	1,251,287	2,286
Boots and shoes	71	1,190,083	1,765

Next in importance to its manufactories are its financial institutions. In 1900 there were 9 national banks with combined capital of $2,950,000, a State bank with capital of $100,000, 5 savings-banks, a private bank, a trust company with a capital of $1,000,000, 5 insurance companies with combined capital of $1,915,312 and cash assets of $6,535,349, and 2 widely known life companies—the Mutual Benefit and the Prudential of America. Official reports for 1891 showed 272 building and loan associations with 78,700 shareholders and $25,600,000 in assets. The assessed valuations in 1900 were: Real estate, $118,389,585; personal $31,716,875; total, $150,106,460; and the net debt in 1900 was $12,091,640.76. The foreign trade was represented in the fiscal year ending June 30, 1900 by imports of merchandise valued at $295,887 and by exports valued at $1,221,983. In 1900 there were 132

churches, the Roman Catholic, Methodist Episcopal, Presbyterian, Baptist, and Protestant Episcopal predominating in the order given. There were 57,714 children of school age, of whom 38,124 were attending the public schools and 9,138 attending private and parochial schools. The city owned 48 school buildings and hired 4. There were 998 public-school teachers, of whom all but 110 were women. The evening schools had 4,236 pupils. There were also the Newark Academy, an old-established classical institution, St. Benedict's College, St. Mary's and St. Vincent's Academies, and a technical school. Of libraries there were the Free Public (founded 1888), Board of Trade, two business colleges, Essex County Law, St. Benedict's College, Young Men's Catholic Association, New Jersey Historical Society, and the public-school libraries. The charitable and benevolent institutions included the Orphan Asylum, Foster Home, Home for the Friendless, Krueger Home for Aged Men and Women, Faith Home, Home for Incurables, Home for Crippled Children, Day Nursery and Baby Shelter, St. Barnabas, St. Michael's, and the German hospitals, Hospital for Women and Children, Babies' Hospital, Newark City Hospital, and the Charitable Eye and Ear Infirmary. There were 29 social clubs and associations and 8 singing societies. Pop. (1880) 136,508; (1890) 181,830; (1900) 246,070. JOHN L. O'TOOLE.

Newark: village; Wayne co., N. Y. (for location of county, see map of New York, ref. 4–E); on the N. Y. Cent. and H. R., the N. Cent., and the W. Shore railways, and the Erie Canal; 30 miles E. of Rochester. It is in an agricultural region; contains 10 churches, an academy, union school, 2 lower grade schools, water-works, electric lights, the State Custodial Asylum for Feeble-minded Women, union school library (founded 1857), a national bank with capital of $50,000, 2 private banks, and 3 weekly newspapers; and is principally engaged in peppermint-distilling, fruit evaporating and canning, and the manufacture of tinware, vinegar, and flour. Pop. (1880), 2,450; (1890) 3,698; (1900) 4,578. EDITOR OF "GAZETTE."

Newark: city; capital of Licking co., O. (for location of county, see map of Ohio, ref. 5–F); on the Balt. and O. and the Pitts., Cin., Chi. and St. L. railways, and the Ohio and Erie Canal; 33 miles N. E. of Columbus. It is in an agricultural, coal-mining, and natural-gas region; has a large trade in coal, grain, and live stock; and contains 7 public-school buildings, circulating library (founded 1877), 2 national banks with combined capital of $250,000, a savings-bank with capital of $75,000, a private bank, and 3 daily and 4 weekly newspapers. The car-shops of the Balt. and Ohio Railroad are located here, and there are also manufactories of glass, portable engines, stoves, iron-bridge work, paper, wire-cloth, carriages, flour, lumber, and soap. The assessed valuation in 1893 was $5,950,870, and the total debt $335,731. Pop. (1880) 9,600; (1890) 14,270; (1900) 18,157. EDITOR OF "ADVOCATE."

Newark System: in geology, a group of rocks of Mezozoic age, occurring in isolated tracts near the Atlantic coast from Nova Scotia to the Carolinas. Except in Nova Scotia they are sharply separated by unconformity from Archæan and Paleozoic rocks beneath and from Cretaceous and Cenozoic strata above. They are further contrasted by their prevailing red color, and they are distinguished from later formations by high dips. The system has received much attention from geologists, and, being of doubtful age, has been called by many names; its synonomy is larger than that of any other formation or group of the U. S. The largest tract follows the southeastern margin of the Appalachian Mountains from Southern New York across New Jersey, Pennsylvania, and Maryland into Virginia, and smaller areas carry the same trend to North Carolina. A more easterly belt is represented near Richmond, Va., and in Central and Southern North Carolina. A large tract occupies the Connecticut valley in Massachusetts and Connecticut, and other tracts border the Bay of Fundy in Nova Scotia.

The principal rock is shale, chiefly red, but also of dark-slate color. Red sandstones associated with these, though thinner, are of such economic and topographic importance that the system is frequently spoken of as a sandstone. Limestones and conglomerates are of rarer occurrence. The maximum thickness, measured in Pennsylvania, is 27,000 feet. Interbedded with the sedimentary rocks, and also to some extent intruded among them, are traps, and these hard rocks have been left prominent by erosion, constituting the conspicuous hills of the Connecticut valley, the Palisade ridge along the Hudson, and the Watchung Mountains of New Jersey. Remains of plants and fishes have been found in the shales, and many sandstone layers show the tracks of large vertebrates.

The sandstones are quarried for building material and have a wide use under the name of brownstone. The traps constitute one of the best road materials in the country, and are extensively quarried for this purpose, as also for the manufacture of paving-blocks. Coal-seams occur at various places, and were for many years mined near Richmond, Va. See JURA-TRIAS PERIOD, and consult I. C. Russell, *Bulletin No. 85, United States Geological Survey.*

G. K. GILBERT.

Newark-upon-Trent: town; in the county of Nottingham, England: on a navigable branch of the Trent; 120 miles N. by W. of London (see map of England, ref. 8–I). It has an ancient parish church, a grammar school founded in 1529, a free library, a hospital, a town-hall, a corn exchange, and a handsome coffee-palace. It has breweries, iron and brass foundries and other factories, and carries on a large trade in malt, flour, corn, wool, and cattle. Pop. (1891) 14,457.

Newaygo: village; capital of Newaygo co., Mich. (for location of county, see map of Michigan, ref. 6–H): on the Muskegon river, and the Chi. and N. W. Railway; 36 miles N. by W. of Grand Rapids. It has good water-power, and contains two flour-mills, large furniture-factory, saw and shingle mills, and sash-factory, a private bank, and a monthly and two weekly periodicals. Pop. (1880) 1,097; (1890) 1,330; (1900) 1,172. EDITOR OF "REPUBLICAN."

New Bedford: city (set off from Dartmouth 1787, incorporated 1847); one of the capitals of Bristol co., Mass. (for location of county, see map of Massachusetts, ref. 5–I); on the Acushnet river, near its mouth, and the N. Y., N. H. and Hart. Railroad; 56 miles S. of Boston. For more than 100 years it has been the chief seat of the U. S. whale-fishery. From 1755 till about 1854 this industry was at its height and employed 400 whaling-ships, but it has since declined steadily, and in 1900 employed only 22 vessels of all kinds in this pursuit. As this industry declined local capitalists turned their attention to manufacturing, and by 1900 had made New Bedford the second cotton-manufacturing city in the country. In this industry there are 13 establishments and $19,589,000 capital. The cotton-mills had 1,369,380 spindles and 23,351 looms, and a woolen-mill had 4,500 spindles and 63 looms. The census of 1890 showed in all 351 manufacturing establishments (representing 57 industries) with a combined capital of 19,602,583; employing 10,730 persons; paying in wages $4,626,135; and manufacturing products valued at $15,886,288. There are about 50 churches, an excellent system of public schools, a free public library (founded 1852) containing over 70,000 volumes and having an endowment of $64,100, 5 other libraries containing nearly 20,000 volumes, a Friends Academy, St. Luke's and St. Joseph's Hospitals, an orphan asylum, a water-service with over 60 miles of mains, gas and electric light plants, electric street-railway, 3 national banks with combined capital of $2,600,000, 2 savings-banks with deposits of $20,929,041, 2 co-operative banks with deposits of about $500,000, a safe-deposit and trust company with capital of $200,000, and 2 daily and 3 weekly newspapers. The city has regular steamboat communication with Martha's Vineyard, Nantucket, and New York, and has become an important coal-shipping point. The beautiful harbor in Buzzard's Bay is protected by a granite fortification on the extremity of Clark's Point, which is connected with the heart of the city by an avenue 4 miles long. The assessed valuations in 1900 were: Real, $35,762,290; personal, $20,492,665; bank, $1,629,497.50; total, $57,884,452.50; and the net bonded debt on Jan. 1, 1901, was $2,972,159,640. Pop. (1880) 26,845; (1890) 40,733; (1900) 62,442. WILLIAM J. SAYRE.

Newbern: city (settled by the Swiss in 1710); capital of Craven co., N. C. (for location of county, see map of North Carolina, ref. 4–J); at the junction of the Neuse and Trent rivers, and on the Atlantic and N. C. and the Wil., Newb. and Norfolk railways; 90 miles N. E. of Wilmington, 108 miles E. S. E. of Raleigh. It has direct communication with the sea by Ocracoke inlet, and regular connection with Norfolk, Baltimore, and New York by steamship. It is the port of entry for the Pamlico customs district, has a valuable trade in cotton, lumber, naval stores, and fish, and ships early vegetables to Northern markets. The principal local industries are the manufacture of tobacco and lumber

and the distillation of turpentine. There are 15 churches, public library (founded 1886), high school, collegiate institute, a national bank with capital of $100,000, a State bank with capital of $75,000, a citizens' bank with capital of $50,000, a private bank, and a daily and a weekly newspaper. The city was the capital of the province of North Carolina from the organization of the Government till 1793, and was captured by a Union force under Gen. Burnside on Mar. 14, 1862. Pop. (1880) 6,443; (1890) 7,843; (1900) 9,090.

EDITOR OF "JOURNAL."

Newberry: town; capital of Newberry co., S. C. (for location of county, see map of South Carolina, ref. 5–D); on the Columbia and Greenville and the Col., Newb. and Laurens railways; 47 miles N. W. of Columbia. It is the seat of Newberry College (Lutheran, chartered 1856), has graded schools for white and colored pupils, and contains a cotton-factory, cottonseed-oil mill and ginnery, fertilizer-works, door, sash, and blind factory, a national bank with capital of $150,000, a savings-bank with capital of $15,000, and three weekly newspapers. It is a growing cotton-market. Pop. (1880) 2,342; (1890) 3,020; (1900) 4,607.

EDITOR OF "HERALD AND NEWS."

Newberry, JOHN STRONG, M. D., LL. D.: geologist and naturalist; b. at Windsor, Conn., Dec. 22, 1822; graduated at Western Reserve College in 1846, and at Cleveland Medical College in 1848. In 1851 he established himself as a physician in Cleveland, but, finding no time for scientific studies, in 1855 he accepted an appointment as surgeon and geologist of the expedition under Lieut. R. S. Williamson, U. S. army, for the exploration of the territory lying between San Francisco and the Columbia river. In 1857–58 he was attached, in the same capacity, to the expedition under Lieut. J. C. Ives, U. S. army, which made the first exploration of the Colorado river. In 1859 he accompanied Capt. J. N. Macomb, U. S. engineers, in the exploration of the country bordering the upper Colorado and San Juan rivers. During the civil war he was a member of the U. S. Sanitary Commission, and to him was delegated the organization and direction of all its operations in the valley of the Mississippi. In 1866 he was appointed Professor of Geology in the School of Mines, Columbia College, New York, a position he retained until his death, which occurred at New Haven, Conn., Dec. 7, 1892. In 1869 the Geological Survey of Ohio was organized, and he was placed at its head. Under his direction the work was vigorously prosecuted, and an important series of reports were published. Dr. Newberry was honored with membership in most of the learned societies of the U. S. and in many of Europe; was one of the original corporators of the National Academy of Sciences; was president of the American Association for the Advancement of Science (1867), of the New York Academy of Sciences (1867–91), of the Torrey Botanical Club (1880–90), and of the International Congress of Geologists (1891), and received the Murchison medal of the Geological Society of London (1888). His publications have been chiefly in the department of geology and palæontology, but also include papers on botany and zoölogy. The most important are a report *On the Geology, Botany, and Zoölogy of Northern California and Oregon*; *The Geology of the Colorado Expedition* (1860); *Geology of the San Juan Expedition* (1875); *Reports of the Geological Survey of Ohio*; *Our Later Extinct Floras* (1869); *Catalogue of the Plants of Ohio* (1860); *Fossil Plants collected on the Northwestern Boundary Commission* (1863); *The Rock Oils of Ohio* (1859); *Circles of Depositions in American Sedimentary Rocks* (1873); *Iron Resources of the United States* (1874); *The Structure and Relations of Dinichthys* (1875); *Fossil Fishes and Fossil Plants of the Triassic Rocks of New Jersey and the Connecticut Valley* (1888); *Palæozoic Fishes of North America* (1889). Revised by G. K. GILBERT.

Newboldt, JOHN HENRY: See the Appendix.

New Braunfels: city (founded by Prince Braunfels in 1845); capital of Comal co., Tex. (for location of county, see map of Texas, ref. 5–H); at the intersection of the Comal and Guadalupe rivers, and on the International and Gt. N. Railroad; 30 miles N. E. of San Antonio, 50 miles S. by W. of Austin. It is in an agricultural and stock-raising region, has excellent water-power, and contains 3 churches, public school, 2 denominational schools, hospital, waterworks, electric lights, 2 cotton-gins, 2 roller-mills, several carriage and machine shops, cottonseed-oil mill, a national bank with capital of $50,000, and 2 weekly newspapers. Pop. (1880) 1,938; (1890) 1,608; (1900) 2,097.

New Brighton: village (now part of the borough of Richmond, New York city); Richmond co., N. Y. (for location of county, see map of New York, ref. 8–A); on the north shore of Staten Island, and on the Staten Island Rapid Transit Railroad; 6 miles S. W. of Manhattan, with which it is connected by ferry. It comprises several villages, which command a view of the upper bay of New York and the Narrows, and the Sailors' Snug Harbor, for aged mariners, a richly endowed estate with extensive buildings, and an institution for destitute children of seamen. The village contains 10 churches, 3 libraries (Brighton Heights Seminary, Sailors' Snug Harbor, and Trinity English and Classical School) containing nearly 10,000 volumes, 2 large hotels, a national bank with capital of $100,000, the S. R. Smith Infirmary (a small but thoroughly equipped hospital), 2 weekly newspapers, and many costly residences of New York business men. There are two dyeing and printing works, several large plaster-mills, the largest cotton-storage warehouses on New York harbor, wall-paper and silk printing-factories, and public water-works and an electric-lighting system supplying New Brighton, West New Brighton, and Tompkinsville. Pop. (1880) 12,679; (1890) 16,423.

EDITOR OF "STATEN ISLANDER."

New Brighton: borough; Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4–A); on the Beaver river, and the Pitts., Ft. W. and Chi., the Erie and Pitts., and the Pitts. and Lake Erie railways; 29 miles N. N. W. of Pittsburg. It is in a coal and clay region, contains 8 churches, 4 public-school buildings, library (Y. M. C. A., founded 1852), 2 national banks with combined capital of $150,000, a private bank, and a daily and a weekly newspaper, and has 4 potteries, 2 flour-mills, 2 planing-mills, novelty iron-works, bath-tub works, flint-glass factory, sewer-pipe works, horse-nail works, gas-engine works, and soap-factory. Pop. (1880) 3,653; (1890) 5,616; (1900) 6,820.

EDITOR OF "NEWS."

New Britain: a name given by Dampier to the group of islands now called BISMARCK ARCHIPELAGO (*q. v.*), and especially to the largest island of this group, now under German protection and called NEU-POMMERN or NEW POMERANIA (*q. v.*).

New Britain: city (first settlement made about 1650; became a town in 1850; chartered as a city in 1870); Hartford co., Conn. (for location of county, see map of Connecticut, ref. 9–G); on the N. Y. and N. E. and the N. Y., N. H. and Hart. railways; 9 miles S. W. of Hartford. It contains 12 churches, a Roman Catholic cathedral, State armory, State Normal School, high school, public-school property valued at over $260,000, 2 libraries (Normal School, founded 1851, and Institute, founded 1853) containing over 16,000 volumes, public park of 74 acres, gas, water, and electric-light plants, 2 national banks with combined capital of $410,000, a savings-bank with deposits of over $2,530,000, and 2 daily and 3 weekly newspapers. The industries include the manufacture of iron and brass goods, artistic bronze house-trimmings, builders' hardware, cutlery, hosiery, joiners' tools, and brick. The assessed valuation of the city in 1892 was $8,154,059, and the net debt on Jan. 1, 1894, was $459,816. Pop. (1880) township, 13,979; city, 11,800; (1890) township and city coextensive, 19,007; (1900) 28,202.

EDITOR OF "HERALD."

New Brunswick: a province of the Dominion of Canada, formerly a part of Nova Scotia; bounded N. by the Province of Quebec and the Bay of Chaleurs, E. by the Gulf of St. Lawrence, Northumberland Strait, and the Bay of Fundy, and W. by the State of Maine. It lies between 44° 30′ and 48° 5′ N. lat., and 63° 47′ and 69° 5′ W. lon. Area, 28,100 sq. miles (for location, see map of provinces of Quebec and New Brunswick).

Physical Features.—The physical features of New Brunswick are a reflection of its geological history. All the geological deposits of greater age than the Carboniferous form a *massif* or "complex," diversified in places by ridges of intrusive granite. Of the granites, there are two principal bands which form the axes of two ranges of hills, the one in the northern portion of the province, the other near its southern coast. In most places the rocks of the *massif* are altered by heat and pressure, and contain in places ores of various metals. Between the two ranges of granite hills a large triangular area of the *massif* is covered by sandstones and shales of Carboniferous age, which are unaltered, and therefore comparatively soft and friable, and contain beds of coal and other mineral deposits of economical importance.

The Carboniferous deposits form an undulating plain whose eastern margin borders the Gulf of St. Lawrence, and on the other two sides is limited by the slopes of the two hill ranges mentioned above.

North of the northern granite range the *massif* forms a plateau of calcareous slates which is crossed by the upper branches of the St. John river, and extends down the valley of the Restigouche to Chaleurs Bay. The plateau and the plain nearly meet on the middle courses of the St. John river, where the Palfrey Mountains on the one side and the Nepisiguit Hills on the other sink down to the level of the plain. Similarly in its lower courses the St. John river breaks through the southern range of hills, its valley dividing the Nerepis Hills from the Quaco Hills. In the Quaco Hills the rocks consist largely of ancient, consolidated volcanic deposits, and the granitic core appears at the surface in only a few places.

The highest hills are in the main granitic belts. Bald Mountain, in the Nerepis Hills, is 1,400 feet high, and the Sagamore Mountain, in the Nepisiguit Hills, is 2,240 feet high. The largest lake in the province is Grand Lake, in the hollow of the carboniferous plain, and is 30 miles long; but the lower reaches of the St. John river, among the Southern Hills, present several lake-like expansions of considerable size, as Washademoak Lake and Belleisle and Kennebecasis Bays.

The chief rivers are the St. John, over 440 miles long, the Miramichi, the Restigouche, and the Nepisiguit, the first discharging its waters into the Bay of Fundy, the other three emptying into the Gulf of St. Lawrence. The St. Croix and the Petitcodiac are also rivers of some importance entering the Bay of Fundy. The St. John river is unique, for one of so considerable size, in being contracted at its mouth to 400 feet, and having there a tidal rapid with alternate flow out and in twice a day.

The principal indentations of the eastern coast of New Brunswick are Chaleur, Miramichi, and Verte Bays. The province is divided from Prince Edward Island on this coast by the Strait of Northumberland, and from Nova Scotia by the Bay of Fundy. This bay has two indentations of its northern shore, Passamaquoddy at one end, and Chignecto Bay at the other. The bays of both shores of the province afford excellent fishing-grounds.

Mineral Products.—Coal has been found at many points in New Brunswick, but occurs only in thin seams; the most important is that at Grand Lake, which has been worked for many years. A valuable deposit of albertite (melanasphalt) was formerly worked at Hillsboro, in Albert County, but the vein is exhausted. It occurs in an extensive deposit of pyroschist, of which at present no use is made. Quarries of excellent freestone are worked in Albert, Westmoreland, Northumberland, and Gloucester Counties, and the product sent to the upper provinces of Canada, and more largely to the U. S. Good roofing-slates are found in the northern part of Charlotte County and elsewhere. Lime is calcined at St. John, where there are large deposits of limestone; the product is used for domestic purposes and for exportation to the U. S. Manganese mines have been opened, and are still operated in Albert and King's Counties. Extensive deposits of nickeliferous pyrites have been found in Charlotte County, but are not yet worked with profit. Plumbago, copper, antimony, bismuth, and lead occur; gold has been found in small quantities, and iron ore of several kinds is known to occur in considerable quantities, but is not mined.

Climate.—The climate of New Brunswick has some unusual contrasts. The western part of the central plain has a high summer temperature, and the mercury sometimes rises to 95° and 100° in the shade; here the native flora or wild plants include many species found in Eastern Ontario and Western Massachusetts; the genial temperature is due to the southern range of hills, which exclude the moist, chilly winds of the Gulf of Maine. On the other hand, many of the plants of Labrador are found growing on the islands and points of the southern shore that jut out into the Bay of Fundy, which are thus bathed in the cool air and fogs of the Atlantic Ocean. As a result the vegetation of this shore has a more arctic (or alpine) aspect than that of the highest hills of the interior. Statistics show that the hottest months of the year are those in which fogs are most prevalent along the coast. In 1889 the maximum temperature at St. John in February was 42°, minimum −11°; maximum in June 86·7°, minimum 45°; mean temperature for year, 43°; average annual rainfall, 26·4 inches. At Fredericton, 80 miles inland, the maximum temperature in February was 42·9°, minimum −33°; maximum in May 91·7°, minimum 32°; mean temperature for year, 43·9°; average annual rainfall, 25·8 inches.

Soil.—Considerable tracts in New Brunswick are of a hilly and broken character, and so not suitable for agricultural purposes; but the moisture of the climate encourages the growth of trees, and such tracts afford excellent timberland. Other parts consist of good farming land. The best soils are found in connection with calcareous slates of Silurian age, as in Carleton, Victoria, Restigouche, and Queen's counties; or with the red sandstones of Carboniferous age, as in the valleys of King's, Albert, and Westmoreland; or on the flood plains of the great rivers, as the St. John, Miramichi, and Restigouche. Very fertile diked lands occur around the shores near the head of the Bay of Fundy. The total acres occupied in 1891 were 4,471,250; under crop, 1,018,704; in pasture, 479,607; gardens and orchards, 11,479; woodland and forest, 2,961,460. A great impetus has been given to dairying and cheese-making, both federal and provincial governments aiding the farmers in these directions. The chief agricultural products are wheat, buckwheat, oats, rye, hay, potatoes, and other root-crops.

Geographical Divisions and Population.—The province is divided into sixteen counties, as follows:

COUNTIES.	* Ref.	Pop. 1881.	Pop. 1891.	COUNTY-TOWNS.
Albert	5-I	12,329	10,971	Hopewell Cape.
Carleton	5-G	23,365	22,529	Woodstock.
Charlotte	6-G	26,087	23,752	St. Andrews.
Gloucester	3-H	21,614	24,897	Bathurst.
Kent	4-I	22,618	23,845	Richibucto.
King's	5-H	25,617	23,087	Hampton.
Madawaska	3-F	.....	.....	Edmundston.
Northumberland	4-H	25,109	25,713	Newcastle.
Queen's	5-H	14,017	12,152	Gagetown.
Restigouche	3-G	7,058	8,308	Dalhousie.
St. John (city)	6-H	26,127	24,184	
St. John (county)	6-H	26,839	25,390	St. John.
Sunbury	5-H	6,651	5,762	Oromocto.
Victoria	4-G	15,686	18,217	Grand Falls.
Westmoreland	5-I	37,719	41,477	Dorchester.
York	5-G	30,397	30,979	Fredericton.
Totals	.....	321,233	321,263	

* Reference for location of counties, see map of provinces of Quebec and New Brunswick.

Madawaska and Victoria are separate counties for provincial and municipal purposes, but constitute one county under the name of Victoria for Dominion purposes, and hence the census returns appear only under the latter. The population in 1824 was 74,176; in 1840, 156,662; in 1861, 252,047. In 1881 the origins of the people were: English, 93,387; French, 56,635; Irish, 101,284; Scotch, 49,829; German, 6,310; Dutch, 4,373. Of the Irish, fully one-half were north of Ireland Protestants. In 1891 more than three-fourths of the population were of native parentage. The chief centers of population are the city of St. John, pop. 39,179, including Portland, annexed in 1889 (in census return in above table Portland is included in St. John county); Fredericton, pop. 6,500; Moncton, 8,762; Chatham, 5,644; Newcastle, 4,000; Sussex, 3,200; Woodstock, 3,288; St. Stephen, 2,680; Bathurst, 4,800; Richibucto, 3,986; St. Andrews, 1,778; Marysville, 1,400.

Means of Communication.—There are in operation fully 1,350 miles of railway, intersecting the province in all directions, and bringing all parts into easy communication, connecting it with Nova Scotia and Quebec on the E. and N. and with the U. S. on the W. Chief among the lines of railway are the Intercolonial Railway, running from St. John to Moncton and connecting the latter city with Halifax on the E. and Quebec on the N., having within the province a length of 345 miles; the Canadian Pacific Railway, extending from St. John to Vanceboro, Fredericton, Woodstock, and Edmundston, and connecting with the railway systems of Canada and the U. S., with over 400 miles of rails in the province; the Canada Eastern Railway, running from Fredericton to Chatham through the interior of the province, 127 miles; the Shore Line Railway, 82 miles long, extending from St. John to St. Stephen; the Central Railway, 75 miles long; the Kent Northern, 34 miles; the Salisbury and Harvey and Albert Southern, 69 miles; the Caraquet Railway, 68 miles; the Elgin and Havelock, and other shorter lines.

During the summer steamers ply on the river St. John, where is to be seen some of the finest natural scenery in the world. A line of steamers also runs between St. John and

Boston, from St. John to Digby and Annapolis in Nova Scotia, and from Shediac to Prince Edward Island. Regular passenger and freight steamships also run from St. John to Great Britain and to the West Indies. A very large amount of money has already been expended in the construction of a ship-railway across the Isthmus of Chignecto between New Brunswick and Nova Scotia, a distance of 17 miles. It will connect the waters of the Gulf of St. Lawrence and the Bay of Fundy, and when completed will be able to transport the largest ship.

Industries and Business Interests.—Ship-building and lumbering, outside of agriculture, were the staple industries for years. Lumbering still occupies a prominent position, but ship-building, owing to the use of iron and steel in the construction of ships, has very considerably declined. The number of vessels on the registry for 1893 was 1,010; the total tonnage, 156,086. The industrial establishments in 1881 were 3,117, with 19,922 persons employed; in 1891 there were 5,419; capital invested, $16,608,755; number of employees, 26,609; wages paid, $5,936,021; cost of raw material, $12,443,043; value of products, $23,685,636. The value of machinery and tools employed in 1891 was $5,478,924; number of steam-engines in use, not including those used in mines, agriculture, and shipping, 507, with 23,626 horse-power. There are five cotton-mills, a sugar-refinery, two rolling-mills, nail-mills, a pulp-mill, several foundries, together with many factories and other industrial establishments. The total value of exports for the year 1893 (exclusive of trade with the other provinces of Canada) was $7,253,611, of which $3,069,027 went to Great Britain and $3,735,074 to the U. S. For the same year the total value of imports was $5,763,884, of which $1,976,225 came from Great Britain and $2,933,763 from the U. S. The chief articles of export were minerals, value $80,417; fish, $756,437; forest products, $5,539,676; animals and their products, $210,539; agricultural products, $174,968; manufactures, $464,940; miscellaneous, $26,634.

In 1893 there were engaged in the fisheries 226 vessels; tonnage, 3,382; value, $83,795; men employed on vessels, 827. Also 5,978 boats; value, $202,282; men employed on boats, 10,478; fathoms of gill-nets and seines in use, 528,817; value of nets, seines, lobster plant, etc., $1,489,035. The total value of the fisheries for 1893 was $3,746,121.

Political Organization.—The Government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada, whose term of office is five years, or until his successor thereafter is appointed; an executive council, consisting of an attorney-general, solicitor-general, provincial secretary, chief commissioner of board of works, surveyor-general, and two or three others. All members of the executive council must be members of the legislative assembly. The legislative assembly is composed of forty-one members and elected for four years, unless sooner dissolved by the Lieutenant-Governor. The legislative council, or upper house, was abolished in 1892. The franchise is so broad that it nearly approaches manhood suffrage. Any male person twenty-one years of age, being a British subject, under no disability, owning real estate of the value of $100, or real and personal together of the value of $400, or having an annual income of $400, or being a priest or other Christian minister in charge of a congregation, or a licensed teacher or professor in any school or college, or a resident for twelve months prior to the election in any electoral district, may have his name put on the voters' list.

The judiciary of the province is composed of a chief justice and five associate justices of the Supreme Court; six county court judges, having jurisdiction in actions of contract to the extent of $400 and of torts to $200, with criminal jurisdiction the same as the Supreme Court, except in capital offenses. Parish court commissioners and justices of the peace have limited jurisdiction in their localities for the collection of debts and in preliminary examinations.

The total annual revenue is about $650,000, of which $483,569 is received as a subsidy from the Dominion. The balance is derived from crown lands, fishing rights, fees of offices, and certain sources of direct taxation. This revenue is expended by the executive Government in paying interest on the public debt, toward the support of public schools, roads, bridges, agriculture, charitable institutions, and other public services. The net debt, incurred chiefly in aid of railway construction within the province, on Dec. 31, 1893, was $2,183,563.

Churches and Schools.—In 1891 there were 974 church edifices, as follows: Roman Catholic, 153; Church of England, 156; Baptist, 322; Methodist, 208; Presbyterian, 108; others, 19. The Roman Catholics numbered 115,961; Baptists, 79,649; members of the Church of England, 43,095; Presbyterians, 40,639; Methodists, 35,504; all others, 6,415.

The public-schools system is free and non-sectarian, under the control of the provincial Government, and liberally supported from the public funds. The property of the different localities is also assessed to support the schools. During the first term of 1893 there were 1,614 schools, taught by 1,693 teachers; attendance of pupils, 60,154, or 1 in 5·34 of the population. There may be a grammar school in each county and a superior school in every parish. In 1893 there were 14 grammar and 50 superior schools. The attendance given above includes these schools. The payment of provincial funds for the year ended June 30, 1893, was $148,832.27. The total expenditure during the year for grammar, superior, and common schools (not including district assessments for school buildings, apparatus, fuel, etc.) was $421,383.60, or an average cost per pupil of $6.06.

The province also maintains at Fredericton a normal school for training teachers; attendance, 1892–93, 264. Three institutions possess university powers and confer degrees in the different arts and faculties—the University of New Brunswick (coeducational) at Fredericton, supported by the province; attendance in 1893, 81; the University of Mt. Allison (coeducational), Sackville, controlled by the Methodists; attendance, 1892–93, 152; Mt. Allison was the first university in Canada to confer full university privileges and degrees upon women; St. Joseph's College, Memramcook, under the control of the Roman Catholics, and especially patronized by the French Acadians. The Methodists also maintain a Ladies' College and Boys' Academy at Sackville; the Baptists, a seminary for both sexes at St. Martins; and the Roman Catholics, convent schools at St. John and other parts of the province.

Charitable Institutions, etc.—Several of these are at St. John, including the provincial asylum for lunatics, hitherto maintained by the province, but now in part by the counties, and under control of the Government; the General Public Hospital, open to all and supported by the province, by the municipality of St. John, by fees from paying patients, and from income from invested funds; the Protestant and Roman Catholic orphan asylums; the Wiggins Male Orphan Asylum for the benefit of sons of deceased mariners; the Reformatory for Boys, where the inmates are educated and taught a trade; and the Home for Aged Women. The Victoria Hospital at Fredericton is supported in the same manner as the General Public Hospital. The Lazaretto, at Tracadie, Gloucester County, for the care of those smitten with leprosy, is supported by the Dominion Government, and the Roman Catholic Sisters of the Hôtel Dieu take charge of the patients. There were about twenty-five patients in 1893. The penitentiary for the maritime provinces, at Dorchester, is supported by the Dominion for the incarceration of convicts.

History, etc.—The province was formerly a part of Nova Scotia, and known as Sunbury County. A colony of about 800 persons in 1761 from New England settled at Maugerville on the St. John river. The largest immigration took place when the United Empire Loyalists, mostly from Massachusetts, arrived in the province May 18 and Oct. 4, 1783. They founded the city of St. John. Their descendants are scattered throughout the province, and are found in all walks of life. By royal letters patent, dated Aug. 16, 1784, King George the Third made it a separate province, and appointed Thomas Carleton, a brother of Sir Guy Carleton, captain-general and governor-in-chief. Fredericton is the capital, where are fine legislative buildings. The first legislature met at St. John Jan. 3, 1786. The province became a part of the Dominion of Canada July 1, 1867, and is represented in the Senate of Canada by ten members, appointed for life, and in the House of Commons by sixteen members, elected for five years.

AUTHORITIES.—For detailed information as to the history and growth of the province, consult Munro's *History of New Brunswick*; Johnson's *Agricultural Report*; Cooney's *History of New Brunswick*; Hannay's *History of Acadia*; Gray's *History of Confederation*; Fenety's *Political Notes*; Lawrence's *Foot-Prints*; the annual parliamentary reports; and the decennial census returns. ALFRED A. STOCKTON.

New Brunswick: city (settled under the name of Prigmore's Swamp in 1681, received its present name in 1714, granted a royal charter in 1730, incorporated as a town in

1736, and as a city on Sept. 1, 1784); capital of Middlesex co., N. J. (for location of county, see map of New Jersey, ref. 4–D); at the head of navigation on the Raritan river, at the eastern terminus of the Delaware and Raritan Canal, and on the Penn. Railroad; 26 miles N. E. of Trenton, 33 miles S. W. of New York city. It is the seat of Rutgers College (Reformed, chartered 1766), of a theological seminary of the Reformed Church (chartered 1784), and of the State Mechanical and Agricultural College (endowed with the national land grant and now a part of Rutgers College). There are 2 private classical schools for boys, a grammar school connected with the college, a young ladies' seminary, a model farm and observatory belonging to the college, 2 national banks with combined capital of $350,000, a savings-bank with assets of $1,654,472, a public library, and 3 daily and 6 weekly newspapers. The industries include the manufacture of wall-paper, rubber goods, printing-presses, boots and shoes, lamps and bronze-work, porous plasters, machinery, hosiery, and buttons. The assessed valuation in 1893 was $10,200,000, and the net debt on Apr. 1, 1894, was $1,256,276. Pop. (1880) 17,166; (1890) 18,603; (1900) 20,006.
EDITOR OF "HOME NEWS."

Newburg: city (settled by the whites in 1709; known as the Palatine Parish of Quassaic till 1752, when it received its present name; chartered as a city in 1865); one of the capitals of Orange co., N. Y. (for location of county, see map of New York, ref. 7–I); on the Hudson river, and the Erie and the West Shore railways (the N. Y. C. and H. R., the N. Y. and N. E., and the Newburg, Dutchess and Conn. railways on the opposite side of the river); 60 miles N. of New York city. It is in an agricultural region, has an elevated site, and possesses much historical interest. The old Hasbrouck House was occupied by George Washington during a part of the Revolutionary war, and his proclamation disbanding the American army was promulgated there. The building contains many relics of Revolutionary days, and with the grounds is carefully preserved. Near the building is a stone monument, erected by the Federal and State governments to commemorate the successful close of the war. The city has regular steamboat connection with New York and the principal cities on the Hudson, and contains 25 churches, graded public and parochial schools, Free Library (founded 1852), Y. M. C. A. Library (founded 1881), Second Judicial District Law Library (founded 1880), Home for the Friendless, St. Luke's Home, Home for Children, an academy, hospital, electric street-railways, 3 national banks with combined capital of $1,000,000, a savings-bank with surplus of nearly $1,100,000, and 4 daily, a monthly, 2 semi-weekly, and 2 weekly newspapers. There is a large trade in coal and dairy products. The principal industries are ship-building and the manufacture of agricultural implements, oilcloth, cotton and woolen goods, carpets, paper, shoes, and carriages. Pop. (1880) 18,049; (1890) 23,087; (1900) 24,943.
EDITOR OF "JOURNAL."

Newburyport: city (settled about 1635, was separated from the town of Newbury in 1764, chartered as a city in 1851): seaport; one of the capitals of Essex co., Mass. (for location, see map of Massachusetts, ref. 1–I); on the Merrimack river, and the Boston and Maine Railroad; 3 miles W. of the Atlantic Ocean, 36 miles N. E. of Boston. It contains the Putnam Free School, Anna Jaques Hospital, Y. M. C. A. Memorial Building, Old Ladies' Home, high, training, and graded public schools, Marine Museum, public library (founded 1854) containing nearly 30,000 volumes, electric street-railways, 4 national banks with combined capital of 670,000, 2 savings-banks with aggregate deposits of about $6,500,000, and 2 daily and 2 weekly newspapers. The industries include ship-building and the manufacture of cotton goods, boots and shoes, fiberloid, carriages, silverware, hats, pumps, steam-engines, and combs. The assessed valuation in 1893 was $9,705,528, and the net debt on Jan. 1, 1894, was $388,790. Pop. (1880) 13,538; (1890) 13,947; (1900) 14,478.
EDITOR OF "HERALD."

New Caledonia: an island in the South Pacific, about 800 miles E. of Queensland, and half way between New Guinea and New Zealand. It was discovered by Cook in 1774 and annexed by France in 1853. It is 250 miles long, with a greatest breadth of 30 miles, and extends N. W. and S. E. Along its axis run a series of mountain masses, of which the culminating points reach 5,600 feet. At some distance from the west coast is a coral reef which protects the shores from the force of the waves, and gives a sort of interior navigation with smooth water. The soil is fertile, the climate excellent, and the plants of the tropics and temperate zone can be raised. There are many nickel mines, some of which yield ore containing 7 to 10 per cent. of pure nickel. Gold was formerly worked, iron ore is abundant, and valuable deposits of copper, mercury, tin, and platinum are known to exist. The chief port and capital is Noumea, an excellent port on the west coast near the south end; pop. 4,600. With its dependencies, including the Loyalty islands, 60 miles E., New Caledonia forms a convict colony with an area of 7,654 sq. miles, and a population (1890) of 62,752. The native population numbered 70,000 at the time of annexation, but they are rapidly decreasing, and now number less than 25,000. They are called Kanakas. The remaining population is chiefly white and half of its number consists of convicts, either under punishment or liberated. The Isle of Pines, at the southern extremity, was assigned to Communists deported after the overthrow of the Paris Commune.
MARK W. HARRINGTON.

New Canaan: town (incorporated in 1801); Fairfield co., Conn. (for location of county, see map of Connecticut, ref. 12–D); on the N. Y., N. H. and Hart. Railroad; 5 miles N. W. of Norwalk, 8 miles N. by E. of Stamford. It is delightfully situated among hills ranging from 300 to 500 feet above tide-water, has fine drives into the country and to the beaches on Long Island Sound, and contains many summer homes of New York physicians and business men, boot, shoe, and clothing factories, a national bank with capital of $100,000, a savings-bank, a library and reading-room, and a weekly newspaper. Pop. (1880) 2,673; (1890) 2,701; (1900) 2,968; borough (1900) 1,304.
EDITOR OF "MESSENGER."

New Castile: See CASTILE, NEW.

Newcas'tle: a port of entry; capital of Northumberland County, New Brunswick; on the left bank of the Miramichi, 30 miles from its mouth (see map of Quebec, ref. 4–H). The river is to this point navigable for large ships. Its ship-building, lumber-trade, and fisheries are important. Salmon, herring, bass, mackerel, oysters, and lobsters are largely exported. Pop. 4,000.

Newcastle: a town of New South Wales; 80 miles N. N. E. of Sydney; at the mouth of the Hunter river, terminus of a railway running to the counties N. W. and N. (see map of Australia, ref. 6–J). This is the center of the principal coal industry of Australia. The coal is sent largely to China. There is also a large commerce in cereals. The town is unattractive, and is given a sable color by the large amount of coal handled. The tonnage of the port is very large. Pop. (1891) 12,913.
M. W. H.

New Castle: city (formerly the county-seat); New Castle co., Del. (for location of county, see map of Delaware, ref. 2–H); on the Delaware river at the head of Delaware Bay, and on the Phil., Wil. and Balto. Railroad; 5 miles S. of Wilmington, the county-seat, 36 miles S. W. of Philadelphia. It has an excellent harbor with navigation open almost the entire year, is in an agricultural region, and has manufactories of cotton and woolen goods, carpets, rolling-mill products, piping, and agricultural implements. There are a library (founded 1812), a branch of the Farmers' Bank of Delaware (State), and a daily newspaper. Pop. (1880) 3,700; (1890) 4,010; (1900) 3,380.

Newcastle: town; capital of Henry co., Ind. (for location, see map of Indiana, ref. 6–F); on the Blue river, and the Ft. Wayne, Cin. and Louisv., the Cleve., Cin., Chi. and St. L., and the Pitts., Cin., Chi. and St. L. railways; 15 miles S. of Muncie, 42 miles E. by N. of Indianapolis. It is in an agricultural region, has important manufactures, and contains a national bank with capital of $100,000, a State bank with capital of $130,000, and three weekly newspapers. Pop. (1880) 2,299; (1890) 2,697; (1900) 3,406.

New Castle: city; capital of Lawrence co., Pa. (for location of county, see map of Pennsylvania, ref. 4–A); at the confluence of the Shenango and the Neshannock rivers, which here form the Beaver river, and on the Erie, the Penn., the Pitts. and Lake Erie, the Pitts. and W., and the W. N. Y. and Penn. railways; 52 miles N. by W. of Pittsburg. It is in a bituminous coal, limestone, fire-clay, iron-ore, and sandstone region, and has numerous blast furnaces and mills, 3 machine-shops, wire-rod mill, steel-billet mill, large wire-nail mill, tin-plate mill, asphalt-block works, stove-works, 2 glass-factories, grist and planing mills, several foundries, and a paper-mill. There are three national banks with combined capital of $500,000, 20 churches, 16 schools, 2 colleges, a library (Y. M. C. A., founded 1886),

and a monthly, 2 daily, and 4 weekly periodicals. Pop. (1880) 8,418; (1890) 11,600; (1900) 28,339.

EDITOR OF "COURANT."

Newcastle, DUKE OF : See CAVENDISH, WILLIAM.

Newcastle, THOMAS PELHAM HOLLES, Duke of: Prime Minister of Great Britain; b. in 1693, the son of the first Lord Pelham, to whose peerage and estates he succeeded in 1712. He had previously inherited the large estates of his uncle, and was one of the wealthiest land-owners in England. All the weight of his influence was thrown on the Whig side, and his services to the house of Hanover won him the gratitude of the king. He was made Earl of Clare in 1714, Duke of Newcastle in 1715, and in 1724 became Secretary of State in Walpole's ministry. His abilities are represented as of a mean order, but he held this office for thirty years, and when he laid it down he became Prime Minister, succeeding his brother, Henry Pelham, in that office in 1754. He resigned in 1756, but was recalled in the following year to form the ministry rendered brilliant by the genius of Pitt. Newcastle, who was merely the nominal head, resigned in 1762, and after this, with the exception of a few months in 1765, when he was Lord Privy Seal, he held no official position. D. in Aug., 1768. F. M. COLBY.

Newcastle-upon-Tyne: city (with the constitution of a county); in the county of Northumberland, England; on the left bank of the Tyne, 8 miles from its mouth; 275 miles from London and 117 from Edinburgh (see map of England, ref. 3–H). The city is built for the most part on steep hills and gently rising ground. It presents a striking appearance, owing to the contrasts of antiquated and modern buildings. Among the former are several towers belonging to the old walls, the keep and chapel of the old castle, and the Black Gate. The Church of St. Nicholas (1359–1435), now the cathedral, was built upon the site of an earlier structure, destroyed by fire in 1216, of which a few remains still exist. St. John's church, built in the reign of Henry I., contains much original Norman work, with other later additions. St. Andrew's church, dating from the twelfth century, is built in the Transition style. The central part of Newcastle owes its stately buildings chiefly to Richard Grainger (1798–1861). Grey Street (named from Earl Grey) and Grainger Street are the finest thoroughfares in the city. The town-hall, built in 1863, stands near the cathedral, and close by are the corn-market and the corporation offices. Other notable buildings are the Guild-hall, the Exchange, the Moot Hall for the meetings of assizes, and the Central News room and art-gallery. The Museum of the Natural History Society (1884) contains a collection of British birds and a unique series of Bewick's wood-cuts. The Public Library contains nearly 70,000 volumes, and the library of the Literary and Philosophical Society has 40,000 volumes. Two important colleges—the College of Science (1871) and the College of Medicine (1851)—are affiliated to the University of Durham. There is also the Rutherford College (1878). There are several public parks, including the Town Moor, an extensive common 987 acres in extent, the Leazes ornamental park, Brandling Park, besides Armstrong Park and Jesmond Dene, for which Newcastle is indebted to Lord Armstrong. The Tyne is crossed by three bridges which connect Newcastle with GATESHEAD (*q. v.*), which is virtually a part of Newcastle. The High Level Bridge, built by Robert Stephenson (1846–49), is a quarter of a mile long. It contains a carriage-way 90 feet above high water, by which the precipitous streets on both sides of the river are avoided, and a railway at a height of 118 feet above high water. The Swing Bridge, finished in 1876, which is 281 feet in length, is worked by hydraulic machinery. It was erected on the site of a Roman and two later bridges.

The port of Newcastle is the fourth in importance in the United Kingdom; London, Liverpool, and Cardiff coming first. The total tonnage (excluding that coastwise) entered and cleared in 1892 was 4,205,580. The Tyne is navigable for large vessels as far as Elswick, a township on the western outskirts of Newcastle, where the engineering and ordnance works of Sir W. G. Armstrong, Mitchell & Co. are situated. These occupy an area of 125 acres and present a frontage of about a mile to the river. The principal article of trade is coal. The output of the coal-fields of Durham and Northumberland, of which Newcastle is the center, was in 1892 33,362,861 tons; and in the same year 4,117,450 tons of coal and coke, exclusive of that used by steamers engaged in the foreign trade, were exported, mainly to Hamburg, the Baltic, and the Mediterranean. In 1891 the total number of persons employed in the coal business, including those washing and coking coal, was 123,404, of whom three-fourths were working underground. In ship-building the Tyne comes next to the Clyde. In 1892 92 steamships (not including war vessels), with a gross tonnage of 176,743, were launched at the Tyne ports, which include North and South Shields. The principal manufactures are locomotive and marine engines, heavy ordnance, lead and its compounds, chemical manures, earthenware, fire-brick, alkali, cement, and glass of various kinds. One of the alkali-works turns out the largest quantity of caustic soda of any works in the world. In 1891 over 40,000 tons of various goods and 180,000 tons of coal and coke were exported to the U. S.

In the times of the Romans there was a stationary camp at the bridge called *Pons Ælii*. Later, on account of its fortified position giving protection to the monks of the neighboring monasteries, the town was called Monkchester. Robert of Courthose, son of William the Conqueror, built a castle here which was called Newcastle and became the nucleus of the modern town. In the reign of Edward I. it was surrounded by walls, and afterward on four different occasions defeated the attempts of the Scots to effect its capture. In 1640, having declared in favor of the king, it was taken by the Scotch Covenanters under Leslie, who held it for a year. In 1644 it was taken again after a siege of ten months.

Newcastle is the seat of a bishopric founded in 1882. Since 1835 the city has been governed by a corporation composed of a mayor, 16 aldermen, and 48 town councilors. It returns 2 members to Parliament. Pop. (1891) 186,300; (1901) 214,881. R. A. ROBERTS.

Newchwang: See NIUCHWANG.

Newcomb, SIMON: astronomer and mathematician; b. at Wallace, Nova Scotia, Mar. 12, 1835; removed to the U. S. in boyhood; taught school in Maryland for several years; in 1857 was employed as a computer on *The Nautical Almanac*. In the following year he first gave special attention to theoretical astronomy; was appointed in 1861 Professor of Mathematics in the navy, and stationed at the Naval Observatory, for which he supervised the construction and erection of the great telescope; was secretary of the commission created by Congress in 1871 for the observation of the transit of Venus, Dec. 9, 1874, and took part in organizing the expeditions sent to remote quarters of the earth upon that occasion. He was superintendent of *The Nautical Almanac*, published by the Navy Department, 1877–99. The Royal Astronomical Society of England in 1874 awarded to him its gold medal for his tables of Uranus and Neptune. From 1884 until 1893 he acted as Professor of Mathematics and Astronomy in Johns Hopkins University. In 1878 he received the Huyghens medal of the Dutch Society of Sciences, and in 1890 the Copley medal of the Royal Society of London. Besides numerous astronomical investigations, he has written a number of mathematical textbooks and several works on economic subjects, and was one of the associate editors of the revised edition of *The Universal Cyclopædia*.

Newcomen, THOMAS; the inventor of the modern form of the steam-engine; b. in Devonshire, England, about the middle of the seventeenth century; practiced the trade of a blacksmith; became interested in the applications of steam, and in 1705 patented a fire-engine.

The engines of the Marquis of Worcester and of Savery and of all their predecessors in this field were more or less reproductions of the old steam-fountain of Hero (B. C. 120); but Newcomen made an entirely new departure and constructed in 1705 the first real steam-engine, consisting of a train of mechanism in which the steam-motor was at the one end, and the pump to which its work was applied was at the other, the intermediate parts being the simplest possible and giving direct connection between the driving and the driven parts. In the earlier engines the same vessel had usually served as boiler, engine, and pump, and performed each of its several offices with inefficiency. Newcomen, following Savery, built a steam-boiler of which the only function was to make and supply the steam required; he made a working cylinder of which the sole purpose was the transformation of the heat of the steam into useful work by a thermodynamic operation. He then transferred the power thus generated to a pump, by means of which it was applied to the useful work of raising water from the depths of a mine. The net result was the accomplishment

of this work with an economy greatly exceeding that attained by the best machines of his predecessors. The new engine also demanded but an insignificant steam-pressure, and thus was much safer where working at considerable depths than was the Savery engine, which, under similar conditions, employed a comparatively high pressure. Its greater safety and immense economy soon drove the latter entirely out of the market.

The principal defect of the Newcomen engine was the combining of the functions of working cylinder and condenser in the same vessel, and it was the invention of an improvement upon the Newcomen engine, the separate condenser, that gave James Watt his opportunity and his fame. The modern condensing pumping engine, however, is a Newcomen engine rather than a Watt engine, and Newcomen, rather than Watt, is "the inventor of the steam-engine." R. H. THURSTON.

New Cumberland: town; capital of Hancock co., W. Va. (for location, see map of West Virginia, ref. 2-H); on the Ohio river, and the Pitts., Cin., Chi. and St. Louis Railway; 9 miles N. of Steubenville, O., 30 miles W. of Pittsburg, Pa. It has manufactories of fire-brick, terra-cotta work, sewer-pipe, and foundry and machine shop products, a private bank, and two weekly newspapers. Pop. (1880) 1,218; (1890) 2,305; (1900) 2,198.

New Decatur: town; Morgan co., Ala. (for location, see map of Alabama, ref. 1-C); on the Tennessee river, and the Louisville and Nashville Railroad; 87 miles N. of Birmingham. It is in an agricultural, lumbering, and wool-growing region, and has a weekly newspaper. Pop. (1880) not in census; (1890) 3,565; (1900) 4,437.

Newell, SAMUEL: missionary; b. at Durham, Me., July 24, 1784; graduated at Harvard in 1807; studied theology at Andover Seminary; was one of the signers of the memorandum (dated June 27, 1810) from students of that institution which led to the formation of the American Board of Commissioners for Foreign missions; was ordained as a foreign missionary at Salem with four associates Feb. 5, 1812; sailed for Calcutta with Judson; in the same month was ordered to retire by the British authorities of Bengal; went to the Isle of France, thence to Ceylon, and settled at Bombay in 1817, where he wrote, with his companion missionary, Gordon Hall, a work entitled *The Conversion of the World, or the Claims of Six Hundred Millions* (Andover, 1818), which had an extensive circulation. He also prepared a memoir of his first wife, Harriet (Atwood) Newell, who died at the Isle of France, Nov. 30, 1812, at the age of nineteen years—a work which had a wide popularity, and was translated into several languages. D. at Bombay, Mar. 30, 1821.

New England: collectively, the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. The territory comprised in these States was originally called North Virginia, when granted in 1606 by James I., to the Plymouth Company for colonization, but received its present name from Capt. John Smith, who explored it in 1614, and made a map of the coast. The first white settlers were chiefly natives of England. In 1900 the population of New England was 5,591,952. See the articles on the individual States.

Newfoundland: an island and British colony in North America, lying across the entrance of the Gulf of St. Lawrence. It is situated between the parallels of 46° 36′ 50″ and 51° 39′ N. lat., and between the meridians of 52° 37′ and 59° 24′ 50″ W. lon. Its greatest length from Cape Ray (the southwestern extremity of the island) to Cape Norman (the farthest northern land) is 317 miles, and the greatest breadth from Cape Spear (the most easterly point) to Cape Anguille (the most westerly) is 316 miles. The total area is 42,200 sq. miles. Its coast is 1,000 miles round, measuring from headland to headland; but so deeply indented are its shores with bays that if these were circumnavigated the operation would more than double that extent of coast-line. It is that part of the continent of North America which lies nearest to Europe, the distance between the most eastern part of Newfoundland and Valentia, in Ireland, being 1,640 miles. By the two great bays of Trinity and Placentia it is almost severed into two portions, the southern being the peninsula of Avalon, on which ST. JOHN'S (*q. v.*), the capital, is situated, and which is united to the northern by a narrow isthmus, in one place only 3 miles in width. The Avalon peninsula is further divided by the bays of St. Mary and Conception; and, having thus an extensive frontage on the Atlantic and numerous harbors, and being in proximity to the best fishing-grounds, it is the most thickly populated portion of the island. On all sides the great arms of the Atlantic penetrate far into the land, some of the bays being 90 miles in length. Within a degree of the eastern coast is the Great Bank of Newfoundland—the greatest submarine island of the globe, 600 miles in length and 200 in breadth—the chief breeding-ground of the cod. The whole Atlantic coast of Labrador, 1,100 miles in extent, with its valuable fisheries, is also attached to Newfoundland and under the jurisdiction of the colony.

Climate.—The fogs generated on the Banks by the confluence of the Arctic current and the Gulf Stream are felt only on the southern and southeastern shores of the island when southerly winds prevail. The climate is variable, but taken as a whole is more temperate and more favorable to health than that of the neighboring continent. In winter the thermometer seldom sinks more than a few degrees below zero, and that for but a few hours. The summer range of the thermometer is from 70° to 80°, and it is seldom that 84° is reached. The average mean temperature is 41°–42°; the average rainfall is 58·30 inches. Tornadoes are unknown, and thunder-storms very rare.

Geology.—All the great ancient rock systems between the Lower Laurentian and the coal measures are more or less represented at one part or another of the island. The Laurentian system has an immense spread, constituting the principal mountain ranges and coming to the surface through the more recent deposits or brought up by great dislocations. Three-fourths of the peninsula of Avalon are Huronian (equivalent to the Cambrian of English geologists). Lower Silurian rocks have a large development, and in these the metallic ores occur. The Carboniferous series occupy a large area in the neighborhood of St. George's Bay and Grand Lake.

Mountains.—The coasts present, for the most part, a forbidding aspect. Dark cliffs, miles on miles of rocky walls from 200 to 300 feet in height, bold promontories and headlands, greet the voyager at almost all parts of the island; but when the bays are entered scenes of rare beauty are frequently met with. On passing from the rugged coast-line to the interior a hilly country presents itself, with eminences of no great elevation. The center of the island, which is but imperfectly known, consists of an elevated, undulating plateau traversed here and there by ranges of low hills, the surface being diversified by valleys, woods, and lakes. Much of the interior is a savanna country, the soil being a fine black peat-mould. All the great hill ranges take a northeasterly and southwesterly direction. The principal of these is the Long Range, which extends along the western side of the island for nearly its entire length, having peaks more than 2,000 feet in height. Parallel to this is the Anguille Range. The Middle Range stretches across the country from Fortune Bay to Notre Dame Bay. Avalon district is traversed by several ranges of hills. In addition, there are isolated and sharply peaked summits having the local name of "tolts."

Bays, Rivers, and Lakes.—The largest bay is Placentia, 55 miles wide at the entrance and 90 miles in length, containing numerous islands. Fortune Bay is 25 miles wide and 70 in length. At its mouth are the islands of St. Pierre and Miquelon, ceded by treaty to France as a shelter for its fishermen. Bay St. George, on the western coast, is 40 miles wide, with a good harbor at its head. Notre Dame Bay, on the northeastern coast, is 50 miles wide at its mouth, and with its numerous arms penetrates more than 80 miles inland. Bonavista Bay presents some of the finest scenery in the island. Trinity Bay runs 70 miles inland. The harbor on which the town of Trinity stands is one of the finest in the world. On the south side of the bay is Heart's Content, where the Atlantic cables are landed. Conception Bay is the most populous and commercially important.

The three largest rivers are the Exploits, the Humber, and the Gander. The Exploits rises in the southwestern angle of the island, flows in a northeasterly direction, and falls into the Bay of Exploits after a course of more than 200 miles. It drains an area of nearly 4,000 sq. miles. The Humber drains an area of 2,000 sq. miles and falls into the Bay of Islands. The Gander falls into Gander Bay, and drains an area of 2,500 sq. miles.

Lakes and ponds cover nearly a third of the entire surface, and in many districts they form a very beautiful feature in the landscape. The largest is Grand Lake, 56 miles

in length, with an area of 192 sq. miles, inclosing an island 22 miles long and 5 miles in breadth. Red Indian Lake is 37 miles long, with an area of 64 sq. miles. Gander Lake is 33 miles in length.

Fauna and Flora.—The reindeer, black bear, wolf, beaver, and several species of fox are among the indigenous wild animals. The species of birds, most of which are migratory, number about 300. The forests are chiefly found in the valleys of the large rivers and along the banks of their tributaries. The principal varieties of the forest timbers are white pine, white and black spruce, tamarack, fir, yellow and white birch. In the Gander, Exploits, Humber, and Gambo valleys there are considerable areas of pine-forests. There are many kinds of berry-bearing plants.

Minerals.—The first copper mine—that of Tilt Cove—was opened in 1864, on the shore of Notre Dame Bay. Another still more productive mine was opened in 1875 at Betts Cove, in the same district, and in 1878 a third, at Little Bay, which has eclipsed both its predecessors. A rich deposit of lead ore has been discovered at Port-a-Port, and lead and silver deposits on the shores of Placentia Bay. Gold has been found in small quantities. Gypsum in immense quantities is found on the western coast, also marble of various shades of color. There is a coal-field in St. George's Bay 25 miles wide by 10 miles in length. It is still unworked. The total value of copper ores exported up to 1898 was $10,500,000, and of all ores (1888–98) $7,829,148.

Agriculture.—While there are districts irreclaimably barren, especially near the southern and southeastern shores, there are many fertile belts which if cultivated would sustain a very large population in comfort. In the region around St. George's Bay there are 730 sq. miles suitable for settlement. Bay of Islands, including the Deer Lake and Grand Lake country, contains 600 sq. miles, the valley of the Gander 1,700 sq. miles, and the Exploits valley 1,620 sq. miles available for settlement. In addition, there are less extensive tracts of fertile land in other localities fit for agricultural purposes, and also extensive areas admirably suited for cattle and sheep raising, forming an area of 2,000,000 acres. Thus there are known to be close on 5,000,000 acres fit for agricultural and grazing purposes. Of this, 64,494 acres are improved land, and 20,524 acres are in pasture.

Fisheries.—The fisheries constitute the great staple industry. The most important is the cod-fishery, which is prosecuted around the shores of the island, along the coast of Labrador, and to a limited extent on the Banks. The average annual value of this fishery is about $6,000,000. It is prosecuted from June 1 till the middle of October. The codfish when salted and dried are exported to Brazil, the West Indies, Spain, Portugal, Italy, and Britain. (See FISHERY RELATIONS OF THE UNITED STATES.) The seal-fishery is next in value. It is carried on in powerful steamers and stout sailing vessels from Mar. 1 till the middle of April. The young seals are taken on the ice-fields brought down by the Arctic current, where they are suckled by the mothers till three or four weeks old, when they are in the best condition. In 1900 the catch was 203,850; average value, $2.92 per seal. The chief seats of the herring-fishery are Labrador, Bonne Bay, Bay of Islands, St. George's Bay, and Fortune Bay. The salmon and lobster fisheries are also important.

Population.—The seats of population are all situated on the various bays and harbors, there being no settlement at any distance from the seacoast. The earliest record of the resident population is that of 1654, which gives the number as 1,750; in 1763 it was 7,000; in 1804, 20,380; in 1857, 124,288; in 1884, 197,589; and in 1891, 202,145. Of these, 53,502 were engaged in catching and curing fish, the number of able-bodied fishermen being about 30,000. The population is distributed about the shores of the island as follows: South coast, from Cape Ray to Cape Race, 34,752; east and northeast coast, from Cape Race to Cape St. John, 150,389; from Cape Ray to Cape St. John, 12,773; Labrador (Atlantic coast), 4,211. According to the census of 1891, there were 72,342 Roman Catholics, 68,075 members of the Church of England, 52,672 Methodists, 2,092 members of the Salvation Army, and 1,447 Presbyterians.

Education.—The system of education is the separate or denominational one. The legislature each year appropriates from the general revenue a certain amount for educational purposes; in 1892 the sum was $144,450. This is divided among the religious denominations in proportion to their respective numbers. There are three superintendents of schools—one representing the Church of England, one the Roman Catholic Church, and one the Methodist Church. The number of elementary schools is 543. There are three colleges—Church of England, Roman Catholic, and Methodist—one Presbyterian Academy, and two grammar schools. In the elementary schools there are 31,422 pupils: in the colleges, academy, and grammar schools, 969. The total number of pupils is 1 in 6·14 of the entire population.

Government.—This consists of a governor, who is appointed by the crown of England; a legislative council or upper chamber, composed of 15 members nominated by the governor in council and holding office for life; and a house of assembly of 36 members, elected every four years by the votes of the people, each male twenty-one years of age having a vote. The executive council consists of 7 members chosen by the party commanding a majority in the legislature. They are responsible to the house of assembly. The island is divided into 17 electoral districts.

Revenue and Commerce.—The revenue is mainly derived from duties on imports. The revenue for the year 1899 amounted to $1,702,453. The public debt at the close of the year 1899 was $17,571,754. The value of exports for the year 1900 was $8,627,576; the value of imports was $7,497,147. The great import trade is with Great Britain, the U.S., and Canada. The registered shipping of Newfoundland at the close of 1899 was: vessels, 2,478; tonnage, 107,168.

Railways.—The first railway was opened for traffic in 1884, from St. John's to Harbour Grace, 83½ miles, with a branch to Placentia, 27 miles in length, built in 1888. In 1893 the Legislature decided on an extension of this line, and entered into a contract for building a line to Port-au-Basque, on the southwestern extremity of the island, viâ the Exploits valley, Bay of Islands, and St. George's Bay, 500 miles in length, to be completed in 1896. In 1899 638 miles of road were in operation in the island.

History.—Newfoundland was discovered in 1497 by John Cabot, although five hundred years before, according to Icelandic sagas, it was visited by Lief, son of Eric the Red. The value of its fisheries was soon afterward made known, and fishermen from Normandy, Brittany, and the Basque Provinces were attracted to its encompassing seas. It was not till 1583 that formal possession of the island was taken by Sir Humphrey Gilbert, in the name of Queen Elizabeth. Various attempts at planting a colony were made, the most important being by Sir George Calvert, afterward Lord Baltimore, who in 1623 obtained a patent entitling him to the lordship of the whole southern peninsula. He built a house at Ferryland and introduced settlers, but was so harassed by the French that he abandoned the place and settled in Maryland, where he founded the city of Baltimore. Meantime English fishermen in increasing numbers carried on the valuable cod-fisheries on the Banks and along the shores. The fish taken were dried on shore, and when winter approached the fishermen embarked for England, taking with them the products of their labors. Laws were enacted prohibiting fishermen from remaining behind at the close of the fishing season, forbidding settlement, or even the erection of a house without a special license. For more than a century this policy was persevered in, greatly retarding the prosperity of the country and inflicting cruelties and hardships on the settlers who resisted the tyranny of the merchant adventurers; but the laws prohibiting settlement and land-grants were at length repealed, a governor was appointed in 1728, and a new order of things began, but it was not until the beginning of the nineteenth century that the last restrictions were removed.

The French long disputed with Great Britain for the possession of Newfoundland, but the contest was ended in 1713 by the Treaty of Utrecht, which ceded the island to England, but secured to the French the right of fishing and curing fish on the northern coast from Pointe Riche to Cape Bonavista; the limits were afterward (1783) changed to Cape Ray and Cape St. John. This concession to the French has led to continual disputes and bitter animosities, and, though they have no territorial rights, that portion of the coast on which they have fishing privileges is but scantily settled and is far behind the rest of the island.

In 1832 representative government was bestowed on Newfoundland by the British Parliament. Household suffrage was established and the people acquired the power of making their own laws, and expending their own revenue. In 1854 the present form of government was established. In 1846 the prosperity of the colony met a severe check by a terrible fire which destroyed three-fourths of St. John's, the

capital, leaving 12,000 people homeless. Another in 1892 destroyed more than half the city; the estimated loss was $20,000,000. In 1858 the first transatlantic submarine cable was laid, connecting Newfoundland with the Old World. Previously the island had been connected by cable with the American continent. In 1873 direct steam communication with Great Britain and the U. S. was established, which gave an important impulse to trade. In 1887 the ballot system was introduced in the election of members of the legislative assembly; and in 1889 manhood suffrage was adopted. See NEWFOUNDLAND in the Appendix. M. HARVEY.

Newfoundland Dog: See DOGS.

Newgate: a prison in London; at the west end of Newgate Street, opposite the Old Bailey. It is mentioned as a prison in 1207. It was at the new gate of the city. In the fifteenth century Sir Richard Whittington in his will left funds to rebuild it. In 1666 it was again rebuilt after the great fire. The present edifice was erected in 1780, but was greatly damaged by a fire in the No-popery riots of that year. In 1808 Mrs. Fry began her labors for the improvement of the horrible condition which had for centuries characterized the place. Debtors ceased to be sent there in 1815, and the institution gradually became, in many respects, a model one of its kind. Since 1877 Newgate has been practically disused, except during sessions or when the gallows are required.

New Glasgow: town; Pictou co., Nova Scotia; on the Nova Scotia Railway; 9 miles S. E. of Pictou; on East river (see map of Quebec, ref. 2–C). It has ship-yards, foundries, tanneries, and other manufactories, several important coal mines, and a weekly newspaper. Pop. (1891) 3,776.

New Granada: See COLOMBIA.

New Guinea: the largest known island except Greenland. It lies just N. of Australia, between the equator and 11° S. lat., and has an estimated area of 312,000 sq. miles. If the bottom of the shallow channel between New Guinea and Australia were elevated about 300 feet the island would form a part of the southern continent. On the other sides of New Guinea, however, the insular mass is clearly defined by the rapid slope of the sea-bottom to oceanic depths. Most of the north and southeast coasts are high and mountainous, long ranges paralleling the shores usually at some distance inland, the culminating point of the island, as far as is known, being Mt. Owen Stanley (about 13,200 feet) in the southeast prolongation of the island. The Charles Louis Mountains, which abut on the southwest coast, form the only important range whose main axis is directed from the sea toward the central regions. The island is surrounded by many large and small islands, naturally a part of the mainland and doubtless joined with it in an earlier geological age. There are also many verdant coral islands. The coasts are indented by deep bays, few of them, however, affording first-rate harbors. Unlike most of the adjacent portions of Australia, the island has an abundant rainfall and a luxurious flora. Its drainage system is fairly well developed, though much of the land in the non-mountainous regions adjacent to the coasts is of a swampy character. The largest rivers are the Fly and the Kaiserin Augusta, both of which take their rise in the central regions, the Fly following a tortuous course southward to the Gulf of Papua, and the Kaiserin Augusta taking a course almost due E. through the German possessions. Most of the rivers are densely wooded along their banks, but where the bush is penetrated for a few miles an open, undulating country is reached, covered with grass and scattered forest trees.

The flora of the western half of the island differs considerably from that of the remainder, being nearly akin to the flora of the myriad islands farther W., while the vegetation of the rest of the island unmistakably shows the influence of Australia. There are also many species peculiar to New Guinea. For instance, fifty palms are named as found only on this island. In its fauna, however, New Guinea far more strongly resembles Australia than the lands nearer Asia. Only two mammals and about fifty birds are known to be peculiar to New Guinea, but some of these are very remarkable, as, for instance, the several varieties of the birds of paradise. The inhabitants are chiefly Papuan, though among some of the tribes a Malayan admixture is apparent, and other natives, particularly in the S. E., resemble and are evidently related to the Polynesians. The island is sparsely settled, which may be due to the almost incessant warfare between the tribes that was common everywhere before the whites obtained a firm foothold on the coasts. The population probably does not exceed 700,000.

The entire island has been divided by treaty among three European powers. About one-half the total area, comprising all of the island W. of the 141st meridian, is Dutch territory, and for governmental purposes has been attached to the residency of Ternate, Molucca islands. The Dutch have done very little to develop this large domain, which is estimated to contain 200,000 inhabitants.

British New Guinea (founded 1888, area 90,000 sq. miles, estimated pop. 300,000) comprises the southern part of East New Guinea and the neighboring islands. British missionaries have labored there with encouraging results, and have laid the foundations of law and order. The cost of the administration is guaranteed by New South Wales, Victoria, and Queensland, and the administrator is appointed by the British Government. The chief settlement is Port Moresby on the Gulf of Papua; the white population is about 250, and there are eight stations along the coast to which mails are carried by an Australian line of steamers. The country has a fair amount of resources, including gold, and some of the land is suited for sugar and other tropical cultures.

Kaiser Wilhelm's Land (German protectorate since 1884, area 72,000 sq. miles, estimated pop. 110,000) includes all of the northern part of Southeast New Guinea. The German New Guinea Company, to whom the administration is intrusted, have planted a number of stations, opened plantations with success, and are exporting tobacco to Europe. Horses and cattle flourish in some districts and the protectorate has much fine timber and other natural riches. See NEW GUINEA in the Appendix. See d'Albertis, *New Guinea* (London, 1880); Chalmers and Gill, *Work and Adventure in New Guinea* (London, 1885); Romilly, *From my Verandah in New Guinea* (London, 1889). C. C. ADAMS.

Newhall, CHARLES STEDMAN: See the Appendix.

New Hampshire [named from *Hampshire* in England]: one of the U. S. of North America (North Atlantic group); the ninth of the thirteen original States that ratified the Federal Constitution.

Location and Area.—It lies between 42° 40′ and 45° 18′ 23″ N. lat., and 70° 37′ and 72° 37′ W. lon.; in general shape it is that of a right-angled triangle, with its apex toward the N. and the right angle at the S. E.; extreme length, 178 miles; extreme width, 100 miles; bounded on the N. by the Province of Quebec, on the E. by Maine and the Atlantic Ocean, on the S. S. E. and S. by Massachusetts, and on the W. by Vermont; area, 9,336 sq. miles (5,975,040 acres). The relative position of New Hampshire in the Union in 1890 was third in manufacture of cotton, sixth in manufacture of wool, twenty-fourth in assessed valuation, and thirty-third each in population and agricultural products.

Seal of New Hampshire.

Physical Features.—The Appalachian range of mountains enters the State from Maine and, crossing diagonally, forms first an elevated mountain tract, known as the White Mountain region, exceeding 2,000 feet in height, and then passes southwesterly in a range of lesser hills along the western side of the State. Coos County, N. of the White Mountains, has an average elevation of over 1,500 feet above the sea, while the S. E. part of the State, between the highlands and the coast, has an average elevation of less than 500 feet. The White Mountain district, comprising about 1,400 sq. miles, and divided by the valleys of the Saco and Lower Ammonoosuc rivers and the famous "Notch" into two ranges, known locally as the White and Franconia ranges, is one of great beauty, and is fitly called the Switzerland of America. Its highest peak is Mt. Washington (6,286 feet), the highest land near the coast N. of Mt. Mitchell in North Carolina; but there are twenty-eight other peaks

above 4,000 feet. The picturesque scenery of the State, together with its healthful climate, has made it attractive as a summer resort. New Hampshire has only 18 miles of seacoast, and Portsmouth is the only good harbor. Of the Isles of Shoals, a group of eight rocky islands lying 8 or 9 miles off the coast, three belong to New Hampshire. There are five principal drainage basins. The entire western portion, about 3,060 sq. miles, is drained by the Connecticut river, which, rising in the extreme N. of New Hampshire, forms for the entire distance the natural boundary between it and Vermont. Its chief tributaries in New Hampshire are the Upper and Lower Ammonoosuc in the mountain region, the Mascoma and Sugar rivers (the latter the outlet of Sunapee Lake) in the central part, and the Ashuelot river in the S. The N. E. portion, 775 sq. miles, is drained by the Androscoggin river, which rises in Lake Umbagog. The eastern mountain district, 850 sq. miles, discharges its waters through the Saco river. The S. E. basin, 825 sq. miles, is that of the Piscataqua, which with its tributary, the Salmon Falls river, forms for a considerable distance the boundary with Maine. The Cocheco river also flows into the Piscataqua, which forms the harbor of Portsmouth, and is the only navigable river in the State. The central and southern parts, about 3,825 sq. miles, are drained by the Merrimack, which is formed by the junction of the Pemigewasset, that, rising in the mountains, receives the waters of Squam and New Found Lakes, and the Winnipiseogee, which is the outlet of the lake of the same name. Its principal tributaries are the Contoocook, Sowhegan, Suncook, and Nashua rivers. The Merrimack is thickly set with manufacturing cities, and is said to turn more spindles than any other stream in the world. The State is noted for the number and beauty of its lakes and ponds, the water area being about 300 sq. miles. The largest lake is Winnipiseogee (i. e. The smile of the Great Spirit), in Belknap and Carroll Counties. It is 19 miles long and 8·25 miles wide. Its outline is very irregular, and it contains 264 islands. The other principal sheets of water are Umbagog, 18 sq. miles (partly in Maine); Squam, 15·6; Sunapee, 11·2; New Found, 8; Ossipee, 7; and Great Bay, 6·8.

Geology and Mineralogy.—New Hampshire was one of the earlier portions of the American continent to appear above the primal ocean. Nearly all its formations belong to the Eozoic age, and few parts of the country exhibit in

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	32,181	29,151	9·4
Total acreage of farms	3,721,173	3,459,018	7·0
Total value of farms	$75,834,389	$66,162,600	12·8

* Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	25,264	934,768 bush.	$523,470
Wheat	496	8,085 "	7,438
Oats	30,526	995,148 "	378,156
Rye	887	15,168 "	12,438
Barley	4,528	102,786 "	68,867
Potatoes	17,916	1,809,516 "	959,043
Hay	596,076	518,586 tons	8,038,083
Totals	675,693	.....	$9,987,495

On Jan. 1, 1900, the farm animals comprised 55,578 horses, value, $3,217,455; 135,457 milch cows, value $4,429,444; 79,221 oxen and other cattle, value $2,025,477; and 79,072 sheep, value $252,239; total head, 349,326; total value, $9,924,615.

Climate.—The climate is cold but healthful, the winters being severe and the summers mild and agreeable. The mean annual temperature for the part N. of the White Mountains and on the W. as far S. as Hanover is 41°, that of the southern part is 45°; the mean winter and summer temperatures for the two parts respectively are 17° and 65°, and 23° and 66·5°. The monthly average temperatures at the following places show the local variations:

PLACE.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Average.	Period.
Concord	20·975°	24·35°	31·35°	44·47°	57·37°	65·47°	70·40°	68·22°	60·77°	50·1°	37·5°	26·05°	46·42°	20 years.
Hanover	16·5	18·6	26·4	41·0	55·8	65·2	69·1	66·2	57·7	45·6	33·2	21·0	43·0	20 "

moraines and the scarification of the rocks better proofs of the ice age. The general movement of the glaciers during that period was to the S. E. The terraces of the next period are very marked along the Connecticut and Merrimack rivers. Ores of gold, silver, copper, zinc, lead, tin, arsenic, iron, bismuth, manganese, and molybdenum are found in the State, but in quantities so small or so difficult of extraction that at present none is mined. Other minerals are quartz and feldspar for glass, plumbago, precious stones, ochers, whetstones, and soapstone. Beryl is very abundant, and the largest known crystals have been found at Grafton and Acworth, one having weighed 2,900 lb. Mica occurs in fine sheets at Grafton and Alstead. Four-fifths of the entire product of the U. S. comes from New Hampshire. There are also found fine brick-clays, slate, limestone and colored porphyries, and granite.

Flora and Fauna.—About 50 per cent. of the State is covered with forests, but the large forest areas are restricted to the White Mountain district and to Coos County. The principal trees are the chestnut, hornbeam, locust, elm, butternut, white ash, hickory, white oak, poplar in the S., and the beech, sugar-maple, white and yellow birches, red oak, pine, spruce, larch, and fir in the N. The birds include those ordinarily found in New England and several Canadian species. In the northern forests are deer, fox, bear, raccoon, mink, marten, and smaller game. The streams, once full of trout, have been greatly depleted, and the State Fish Commission is attempting to restock the waters with trout and salmon.

Soil and Productions.—The soil is not fertile. It is light and sandy in the southern part, but portions of the Connecticut valley and of Coos County are well adapted to farming. The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

The average precipitation in inches, including melted snow, is shown by the following table:

PLACE.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Average.	Period.

Totals	.....	376,530	411,588		

* Reference for location of counties, see map of New Hampshire.

Principal Cities and Towns, with Population for 1900.—Manchester, 56,987; Nashua, 23,898; Concord, 19,632; Dover, 13,207; Portsmouth, 10,637; Keene, 9,165; Berlin, 8,886; Rochester, 8,466; Laconia, 8,042; Somersworth, 7,023; Claremont, 6,498; Franklin, 5,846; Exeter, 4,922.

Population and Races.—The population in 1860 was 326,073; in 1870, 318,300; in 1880, 346,991; and in 1890, 376,530 (natives 304,190; foreign, 72,340; males, 186,566; females, 189,964; whites, 375,840; colored, 690); 1900, 411,588.

Industries and Business Interests.—The principal industry is manufacturing. It is estimated that there are 2,000 water-powers in the State, many of them of great value. There is considerable manufacture of paper and of boots and shoes, but that of cotton and woolen goods forms the chief industry. The lumber and sawmill industry is also large. The census returns of 1890 showed that 3,229 manufacturing establishments reported, having a combined capital of $79,375,160, employing 63,361 persons, paying $24,248,054 for wages and $47,754,152 for materials, and having products valued at $85,770,549. The cotton industry had 27 plants and $26,801,933 capital, employed 19,533 persons, paid $6,429,084 in wages, consumed 107,319,124 lb. of raw material, and had products valued at $21,958,002; the woolen industry had 89 plants and $14,721,786 capital, employed 9,400 persons, paid $3,341,695 for wages, consumed 22,152,190 lb. of raw material, and had products valued at $14,445,172; and the lumber and sawmill industry had 831 plants and $11,883,447 capital, employed 8,932 persons, paid $2,519,609 for wages and $4,883,591 for materials, and had products valued at $10,907,438. In 1899 New Hampshire held fifth rank in the production of granite, the output having a value of $802,636.

Finance.—Official reports for the year ending May 31, 1900, showed balance on hand, $341,586.88; receipts, $1,285,684.10; disbursements, $1,170,743.66; balance, $456,527.32. The assessed valuation of taxable property is about $300,000,000. On June 1, 1899, the net indebtedness was $1,335,068.05, and on June 1, 1900, it was $1,118,798.94. Reduction of the debt during the year $216,269.11.

Banking and Insurance.—The first bank in the State was established at Portsmouth in 1792, and the first savings-bank in 1823. On Sept. 5, 1900, there were 55 national banks with combined capital of $5,498,300, surplus and profits of $2,236,559.23, and deposits of $12,284,777.96. On June 30, 1900, 9 State banks with combined capital of $560,000, surplus and profits of $104,710 and deposits of $989,536; and 58 mutual savings-banks with surplus and profits of $4,220,592, and $53,896,711 in savings deposits from 136,544 depositors. The insurance business was represented in 1893 by 38 local and 45 foreign fire-insurance companies, which wrote risks amounting to $84,222,246, received premiums of $1,026,593, and paid losses of $595,665; 21 life and 11 fidelity and casualty companies, which wrote risks of $16,594,075, received premiums of $762,189, and paid losses of $432,524; and 21 fraternal beneficiary associations, which had 621,000 members, received $17,294,443 for assessments, and paid $7,474,901 for all liabilities.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 566 post-offices, of which 48 were presidential (2 first-class, 11 second-class, and 35 third-class), and 518 fourth-class, 318 money-order offices and 12 money-order stations. There were 14 daily, 3 semi-weekly, 282 weekly, 1 bi-weekly, 3 semi-monthly, 35 monthly, 1 bi-monthly, and 1 quarterly publications; total, 98.

Libraries.—In 1892 there were reported 31 public libraries of 1,000 volumes and over, which contained 150,668 bound volumes and 13,197 pamphlets. They were classified as follows: General, 6; school, 8; college, 5; college society, 1; law, 1; public institution, 2; State, 1; Y. M. C. A., 1; social, 3; historical, 1; and not reported, 2.

Means of Communication.—The first railway in the State was chartered in 1835. The mileage has increased as follows: (1850) 467; (1860) 661; (1870) 736; (1880) 1,015; (1890) 1,142; (1899) 1,223·23, not including a narrow-gauge railway of 13 miles, and lumber roads used only in winter. The railway up Mt. Washington is noticeable as a triumph of engineering. It makes an ascent of 3,625 feet in 2¾ miles, with a maximum grade of 1,980 feet to the mile, and an extreme curve of 497 feet radius. With a few slight exceptions, all the railways of the State are embraced in five systems, the Boston and Maine, the Concord and Montreal, the Fitchburg, the Maine Central, and the Grand Trunk.

Churches.—The U. S. census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	68	67	39,920	$205,600
Congregational	188	228	19,712	1,405,050
Methodist Episcopal	134	132	12,354	614,350
Baptist	85	100	8,768	585,050
Free-will Baptist	94	93	8,004	379,000
Unitarian	26	28	3,252	357,200
Protestant Episcopal	44	55	2,911	541,400
Advent Christian	43	43	1,978	36,500
Christian	23	24	1,522	62,950
Universalist	33	34	1,204	203,025

There are also communities of Shakers at Enfield and Canterbury, numbering 100 and 150 respectively.

Schools.—In 1892 there were 37 academies in the State, having 180 teachers, 2,630 pupils, and buildings valued at $955,000, and 51 high schools, with 125 teachers and 3,180 pupils. In 1885 the district system was abolished and the town system established. This has resulted in a considerable increase in the length of the school year, which in 1899 was 135·3 days. In the school year 1898–99 there were 1,902 public schools with 2,970 teachers—256 men and 2,714 women; average monthly salary of men, $69.75; of women, $40.59. According to the school census there were 69,783 children of school age, of whom 65,193 were enrolled and 47,773 in average daily attendance. The value of school property was $3,658,143; revenue for school purposes, $999,556; expenditure, $1,051,265. Expenditure per pupil, based on average daily attendance, $22.02. Each town is required by law to raise for school purposes $350 for every $1 of its apportionment of the State tax. The only normal school was established at Plymouth in 1870; in 1900 it had 13 teachers and 347 pupils. It is supported by the State. Its course of study covers two years. There are two colleges in the State—Dartmouth College (*q. v.*) and the New Hampshire College of Agriculture and the Mechanic Arts. The latter was established in connection with Dartmouth College in 1866, and was removed to Durham by act of Legislature in 1893, when it had a faculty of 21 members and 120 students.

Charitable, Reformatory, and Penal Institutions.—The New Hampshire Asylum for the Insane was established at Concord in 1838. It is supported by the income of considerable invested funds and by what is paid by individuals and towns for the support of patients. A training-school for nurses is established in connection with it. There is also an asylum for the insane in each county. The State board of health is also a commission of lunacy, and "all persons committed to custody as insane persons shall be wards of the State, and subject to State supervision." The New Hampshire Orphans' Home at Franklin, established in 1871, is supported by voluntary contributions. The Industrial School, established at Manchester in 1851, is a "house of reformation for juvenile offenders" of both sexes. Boys are instructed in farm and garden work, or are taught some trade; girls are instructed in housework, and are taught to make both men's and women's clothing. The State prison was established at Concord in 1812.

Government.—Manhood suffrage prevails, restricted only in the case of paupers, of persons voluntarily excused from taxation, and of unnaturalized aliens. The Governor, 5 councilors, and the Legislature, consisting (1901) of 24 Senators and 397 Representatives, are elected biennially in November and enter upon office on the first Wednesday of the next ensuing January. A majority is necessary for an election. From 1734 to 1792 the chief magistrate was called President; after that date the title was Governor. The first biennial election was in 1878. In 1889 the beginning of official terms was changed from June to January. The judiciary system of 1874 provided for a superior court, composed of a chief justice and two associate justices, and a circuit court similarly constituted; but in 1876 these were combined into a Supreme Court with a chief justice and six associate justices, having legal and equitable jurisdiction.

History.—The first European who visited New Hampshire was Martin Pring, who entered the Piscataqua in June, 1603; and the first map of the coast was made by Capt. John Smith in 1614. The territory was included in the grant made in 1620 to the Plymouth Company, and was further included in that made by the company in 1622 to Sir Ferdinando Gorges and Capt. John Mason of all the

land between the Merrimack and Kennebec rivers and a line 60 miles inland. The name given in the charter to the tract was "Maine," but it was also called "Laconia." The first settlement was made in 1623 at Little Harbor (Rye) and at Dover. Strawberry Bank (Portsmouth) was settled in 1631, Exeter in 1638, and Hampton in 1639. In Nov., 1629, Mason and Gorges divided their grant, Mason taking that part W. of the Piscataqua river, to which he gave the name of New Hampshire, from the county of Hampshire, where he lived. The efforts of Mason and his heirs to enforce their proprietary rights led to litigation that was not wholly quieted till 1787. His opponents based their claims upon a deed said to have been obtained by one Wheelwright from four Indian chiefs in May, 1629. In 1641 the province voluntarily united with Massachusetts. In 1677 a royal order fixed the northern boundary of Massachusetts at 3 miles N. of the Merrimack, and in 1679 a royal commission established a government in New Hampshire. The king appointed the governor and council, and the people elected the assembly. This plan was interrupted by the appointment in 1685 of Joseph Dudley as Governor of New England, but in 1692 the separate provincial government of New Hampshire was established, which continued till the Revolution. Owing to its frontier position, New Hampshire suffered terribly from the Indians in the French and Indian wars. It furnished 500 men for the siege of Louisburg in 1745, 500 for the attack upon Crown Point in 1755, and 2,600 for the succeeding operations of the war. The boundaries of the province were fixed by royal determination, much the same as now, the S. and E. in 1740, and the W. in 1764. The province grew rapidly in population after the quieting of the Indians, so that it had 80,000 inhabitants at the outbreak of the Revolution. In that struggle it took an active part, and one of the first assaults on royal authority was the capture of the fort at New Castle in Dec., 1774. Two regiments from New Hampshire were in the battle of Bunker Hill. New Hampshire and Vermont troops, under the command of Gen. Stark, who bore a commission from New Hampshire, gained the decisive victory of Bennington. For the whole war New Hampshire furnished 12,497 men. A State constitution was adopted in 1784, and on June 21, 1788, the Federal Constitution was adopted by a small majority. As New Hampshire was the ninth State to adopt this Constitution, the Union was thus secured. The State constitution was thoroughly revised in 1792, slightly modified in 1852, and again revised in 1877. Once in seven years by special vote is taken "the sense of the people as to the revision of the constitution and calling a convention for that purpose." In the war of 1812 New Hampshire furnished more than 2,000 men, and in the civil war she furnished 18 regiments of infantry, 1 of cavalry, 1 light and 1 heavy battery, and 3 companies of sharpshooters—in all, 32,750 men, or about 10 per cent. of the population. Portsmouth was the capital of the province. From 1775 to 1805 the Legislature met at different places, but since then Concord has been the capital.

GOVERNORS OF NEW HAMPSHIRE.

Josiah Bartlett	1792–94	William Haile	1857–59
John Taylor Gilman	1794–1805	Ichabod Goodwin	1859–61
John Langdon	1805–09	Nathaniel S. Berry	1861–63
Jeremiah Smith	1809–10	Joseph A. Gilmore	1863–65
John Langdon	1810–12	Frederic Smyth	1865–67
William Plumer	1812–13	Walter Harriman	1867–69

JOHN KING LORD.

New Harmony: town (settled by the Harmonists under George Rapp in 1815, transferred to Robert Owen for an experiment in socialism in 1824, and seat of a "school of industry" founded subsequently by William Maclure); Posey co., Ind. (for location of county, see map of Indiana, ref. 11–A); on the Wabash river, and the Peoria, Dec. and Evansville Railway; 15 miles N. of Mt. Vernon, the county-seat, 26 miles N. W. of Evansville. It contains 4 churches, graded public school, public library in a new building costing $14,000 and containing 7,000 volumes, an art-gallery, and a museum; a private bank, 2 weekly newspapers, and saw, planing, and flour mills. Pop. (1880) 1,095; (1890) 1,197; (1900) 1,341.

EDITOR OF "REGISTER."

New Hartford: town (settled in 1733, incorporated in 1738): Litchfield co., Conn. (for location of county, see map of Connecticut, ref. 7–F); on the Farmington river, and the N. Y., N. H. and Hart., the Phila. and Read., and the N. Y. and N. E. railways; 29 miles N. W. of Hartford. It contains 7 churches, 9 public schools, a Roman Catholic parochial school, and 2 weekly newspapers, and has 4 cotton-mills, a plane, rule, and level factory, several saw-mills, brush, broom, and turning shops, and a hosiery-factory. Other industries are general farming and tobacco-growing. Pop. of township (1880) 3,302; (1890) 3,160; (1900) 3,424.

EDITOR OF "TRIBUNE."

New Haven: city; capital of New Haven co., Conn. (for location, see map of Connecticut, ref. 11–F); on the New York, New Haven, and Hartford Railroad, and four of its leased lines; 36 miles W. S. W. of Hartford, and 74 miles E. N. E. of New York city. It is the largest city in the State; is situated on a sandy plain at the head of New Haven Bay, and between West and Quinnipiack rivers, 4 miles from Long Island Sound.

Early residents laid out a large square which was divided by six streets running nearly N. and S., and six streets running nearly E. and W. As this method of construction ignored the shape of the harbor and the relation of New Haven to other cities and towns, it was rejected. Roads, running from this original square to neighboring cities and towns, were straightened and converted into avenues, and cross streets were laid out at various angles to them. The city has 140 miles of street carefully laid out and graded. Of this number 34 miles are paved with Telford and macadam pavements, and 4½ miles with Belgian and granite blocks. These streets are drained by 80 miles of sewers, constructed on the combined system. The park area, improved and unimproved, is 819·44 acres. At the center of the city is a square, known as The Green, which contains many elms of great size and beauty. This square is intersected by Temple Street, noted for a perfect arch of old and stately elms. To the N. E. and W. of the city are two mountain parks known, respectively, as East and West Rock parks. Several carriage roads, 20 feet in width, and many foot-paths wind their way to the top of East Rock, 360 feet in height, and crowned by a Soldiers' and Sailors' monument; and one carriageway and several foot-paths lead to the top of West Rock, which is 420 feet in height. The grade of these roads averages about 3 and never exceed 4 feet in 100. Four parks have been laid out at the harbor's edge.

The town of New Haven contains 68 churches, divided denominationally as follows: Congregational, 17; Methodist Episcopal, 14; Protestant Episcopal, 12; Roman Catholic, 9; Baptist, 7; Lutheran, 4; Jewish, 4; Presbyterian, 1; and Universalist, 1. New Haven has an excellent system of free public schools. The number of schoolhouses occupied and owned by the district is 32, with a seating capacity of 13,433. The number of pupils registered in 1893 was 15,453, and the average daily attendance was 10,830. The annual cost of maintaining the schools is estimated at $312,900. Hopkins Grammar School, established 1660, prepares boys for Yale. The Yale Campus, two blocks W. of the city center, is a rectangle containing two city blocks. A series of buildings, fronting in, forms an inclosed court. Two of these buildings—Vanderbilt and Osborn Halls—are the chief architectural attractions of the city. To the N. of the campus a second large quadrangle of university buildings is (1894) being constructed. The Sheffield Scientific School and the departments of law and medicine are a little removed from the campus. See YALE UNIVERSITY.

Taxable property at a little more than one-half its actual value was assessed in 1893 at $54,814,715. Church, school, and university property exempt from taxation was esti-

mated at $6,000,000. The ordinary receipts of city, town, and school district in 1893 were $1,441,035.52, and the ordinary expenses $1,396,087.02. The indebtedness, bonded and floating, of these three corporations in 1893 was $2,696,929.09. There are 13 banks, viz., 7 national, 3 State, and 3 savings-banks, and 1 building and loan association. The national and State banks form the New Haven Clearing-house. The principal business is the distribution of goods to surrounding towns and cities, and the manufacture of carriages, rifles, clocks, hardware, and corsets. The census returns of 1890 showed that 1,042 manufacturing establishments (representing 128 industries) reported. These had a combined capital of $16,826,635, employed 17,654 persons, paid $9,876,270 for wages and $13,259,097 for materials, and had products valued at $28,574,038.

Late in the autumn of 1637 Theophilus Eaton, a London merchant, and a few associates settled on one of the bays of Long Island Sound. He was joined the next spring by Rev. Mr. Davenport and a small company, who named the place New Haven. The same place had previously been named by Block, the Dutch discoverer, Roodenberg—red hills—because of the appearance of East and West Rocks. These settlers acknowledged allegiance to neither king nor government. They accepted the Scriptures as containing the only proper rule for the government of both Church and state. Under this theocracy they lived in simplicity and independence, until a liberal charter, procured by Connecticut from Charles II. in 1662, included them within its jurisdiction. By this charter, to which New Haven after much ill feeling submitted, New Haven and Hartford were made joint capitals of Connecticut. In 1873, by an amendment to the constitution, Hartford was made the sole seat of government. New Haven is now governed by three corporations—the City of New Haven, the Town of New Haven, and the New Haven School District. The town possesses the most territory and includes all of both city and school district. The school district includes all of the city, but not all of the town. Each of these corporations possesses complete autonomy, and is supreme within its own jurisdiction. The city is governed under a special charter adopted in 1881. A mayor is the nominal head of the executive division. The departments of public works, fire, and police are managed by boards of commissioners called non-partisan, but in reality bi-partisan. The legislative division consists of a court of common council, which is divided into two boards, the board of aldermen and the board of councilmen. There are 24 aldermen, two from each ward, of whom one in each ward is elected annually, and 36 councilmen, all of whom are elected annually. The administrative duties of the town are performed by a board of 7 selectmen, elected by the people. The legislature of the town is its adult male citizens acting in a properly called town meeting. The administrative duties of the school district are in the hands of a board of education, consisting of 9 members. Adult citizens of the district meet, lay a school-tax, and vote supplies. Pop. (1880) city and town reported as coextensive, 62,882; (1890) city, 81,298; town, 86,045; (1900) 108,027.

FRANK S. BISHOP.

New Heb'rides: an archipelago of Polynesia consisting of a chain of islands extending from lat. 13° S. and lon. 166° E. to lat. 20° S., lon. 170° E., a distance of over 500 miles. They are under the protection of a mixed French and British commission. The total area is about 5,100 sq. miles. There are a dozen larger islands and innumerable smaller ones. The largest is Espiritu Santo (75 miles by 40) toward the northern end of the group, discovered by Quiros in 1606. S. E. of it is Malikolo (56 miles by 20), with a fine harbor. Banks islands are in the northern part of the group. The islands are volcanic and nearly free from coral reefs. The soil is generally rich and deep. The rainfall is heavy; the principal rainy season extends from December to March. The temperature does not fall below 58° F., and seldom rises above 90°. The islands are densely wooded and the breadfruit, sago-palm, banana, sugar-cane, yam, taro, arrowroot, orange, and pineapple flourish. Mammals and birds are scarce. Whaling is extensively carried on in the neighboring seas, and one of the important products is bêche-de-mer. Imhaus estimates the population at from 75,000 to 80,000, among them 150 whites—missionaries and traders. The missions here have been successful; on the southern island (Aneiteum) the entire population is said to be Christian, and this influence predominates over the southern end of the group. The natives are Polynesian and Papuan. They are usually neat and clean, strong and often willing to work, but generally inhospitable and cruel. They vary much in the different islands. See Imhaus, *Les Nouvelles Hébrides* (1890), and Paton, *John G. Paton, Missionary in the New Hebrides: an Autobiography* (1891).

MARK W. HARRINGTON.

New Holland: See AUSTRALIA.

New Iberia: town; capital of Iberia parish, La. (for location of parish, see map of Louisiana, ref. 10–D); on the bayou Teche, and the S. Pac. Railroad; 125 miles W. of New Orleans. It is in a sugar, rice, cotton, and lumber region, and is principally engaged in the manufacture of cypress lumber. Minor industries are the manufacture of cotton-seed oil, brick, sash, doors, and blinds, soap, and mineral waters. There are 2 national banks with combined capital of $100,000, high school, 2 public schools, convent, Howe Institute, seminary, 8 churches, 2 public halls, park and race-track, electric lights, iron bridge across the Teche, and a daily and a weekly newspaper. Pop. (1880) 2,709; (1890) 3,447; (1900) 6,815.

EDITOR OF "ENTERPRISE."

New Ireland: a large island of the Bismarck Archipelago, now called NEW MECKLENBURG (*q. v.*).

New Jersey [named from the island of *Jersey* in the English Channel]: one of the U. S. of North America (North Atlantic group); the third of the original thirteen States that ratified the Federal Constitution; capital, Trenton.

Seal of New Jersey.

Location and Area.—It is situated between Delaware river and bay and the Atlantic Ocean and Hudson river, and between 38° 55′ 50·42″ and 41° 21′ 19″ N. lat., and 73° 53′ 51·25″ and 75° 33′ 2·74″ W. lon.; bounded on the N. by New York, on the E. by the Hudson river, Staten Island Sound, Raritan Bay, and the Atlantic, on the S. by Delaware Bay, and on the W. by the Delaware river, which separates it from Delaware and Pennsylvania; extreme length, 167⅜ miles (according to the State topographical survey); greatest breadth, 59 miles; least breadth, 32 miles; area, 8,224·44 sq. miles (5,263,641·60 acres), of which 7,514·40 sq. miles are land surface.

Physical Features.—A straight line drawn from Jersey City to Trenton divides the State into two strongly contrasted parts; the northern, undulating, hilly, and in places mountainous; the southern, through most of its extent almost a plain. Three mountain ranges traverse the northern part, two of which—the Blue Mountain or Blue Ridge, called also Kittatinny and known in New York as Shawangunk, and the Highland Range—belong to the Appalachian chain. The third is a part of the low range which may be traced from Massachusetts into New Jersey through Southeastern New York. The Blue Ridge, composed of quartzose conglomerate, with softer slate, crosses the Delaware river at the Water Gap, where its summit is 1,479 feet above the sea, and runs N. E. for 40 miles in an almost unbroken ridge to the New York State line, near which, at High Point, it rises to an elevation of about 1,800 feet. The Kittatinny valley lies between the Blue Ridge on the N. W. and the Highland Range on the S. E., and is noted for its rural beauty and agricultural wealth. The Highland Range occupies a belt 22 miles wide on the New York State line and 10 miles wide on the Delaware, and is composed of numerous disconnected ridges, among which are Hamburgh Mountain, reaching a height at Rutherford's Hill of 1,488 feet; Wawayanda Mountain, height 1,450 feet; Musconetcong, Schooley's, and Green Pond Mountains. The third range consists of ridges of trap rock, which diversify the red sandstone belt, a strip of an average width of 20 miles crossing the State from N. E. to S. W., the south boundary of which coincides closely with a straight line drawn from Jersey City to Trenton. The chief of these ridges are the First, a part of which is better known as Orange Mountain, 534 feet high

at Garret Rock, near Paterson; the Second, the less continuous Third Mountain, Rocky Hill, Ten-mile Run Mountain, Long Hill, Sourland Mountain, Goat Hill, Round Mountain, Pickle Mountain, 767 feet high; and the Palisades, which wall in the Hudson on the W. from the New York State line nearly to Jersey City. In the southern part there are a few rounded hills, but no rocky eminences. The Navesink Highlands, S. of Sandy Hook, which are a seamark in approaching New York harbor, reach a height of about 400 feet. Southern New Jersey is a gently undulating plain, from 150 to 190 feet in elevation in the center, and sloping gradually to the Atlantic on the E. and the Delaware river or bay on the W. The prevailing surface is sandy. A cretaceous formation of great value, containing marls, useful in agriculture, and plastic clay and kaolin, extensively employed in the manufacture of brick, pipe, tile, porcelain, and pottery, is found in a belt bounded on the N. W. by a line drawn from Raritan Bay on the N. E. to the head of Delaware Bay on the S. W. Sand available for making glass exists throughout the southern part of the State. In the same region the cedar swamps form a curious and important deposit of timber, which is exhumed in good condition from beds in which it has lain for hundreds of years.

The Hudson river bounds the State on the E. for 28 or 30 miles. It receives from New Jersey only the Wallkill river, which reaches it at Rondout, N. Y. The smallness of the drainage into the Hudson is due to the barrier interposed by the Palisades. Newark Bay receives the Passaic and Hackensack rivers, with their tributaries. The Ramapo, Wanaque, and Pequannock rivers, whose union forms the Pompton river, and the Rockaway river, all affluents of the Passaic, yield, at a minimum elevation of 200 feet above the sea, 314,000,000 gal. of water daily, which is available for the supply of the cities of Northern New Jersey. Raritan Bay receives the Raritan river, with its north and south branches. The Elizabeth and Rahway rivers flow into Staten Island Sound. The Navesink, Shrewsbury, Shark, Manasquan, Metedeconk, Tom's, Little Egg Harbor or Mullicas, and Great Egg Harbor rivers and Cedar creek flow into the Atlantic or into bays communicating directly with the sea. Delaware Bay receives the Delaware river, with its fifteen tributaries and four affluents of these, and in the extreme S. of the State Cohansey creek and Maurice river, as well as a number of smaller streams. The tidal bays along the coast, sometimes called harbors or sounds, form a line of internal water communication from the Metedeconk river to Cape May for vessels of light draught, and abound in game, fish, and shellfish. The principal ones are Barnegat Bay, Little Egg Harbor, Great Bay, Absecom Bay, and Great Egg Harbor. In the northern part of the State are many mountain lakes and ponds, remarkable for purity of water and quite generally stocked with black bass. Greenwood Lake, partly in New York, is from a third to half a mile wide, and 7 or 8 miles long. It is drained by the Wanaque. Lake Hopatcong, the largest body of fresh water in the State, is 914 feet above mean tide, 5½ miles long, and from a third to 1¾ miles in width, and is drained by the Musconetcong. Budd's Lake, on the top of Schooley's Mountain, is nearly circular, with a circumference of about 3½ miles, and is the source of the south branch of the Raritan. Green Pond, in Morris County, 1,044 feet above the sea, is 3 miles long and a quarter to half a mile wide. These lakes and ponds are favorite places of summer resort. The Delaware river receives the drainage of 2,344·80 sq. miles; Delaware Bay of 1,060·10 sq. miles; the Atlantic Ocean, directly or through tidal sounds, of 3,857·60 sq. miles; the Hudson river of 251·90 sq. miles.

Geology.—Hardly any coal is found in New Jersey, but in other directions its mineral and geological wealth is great and remarkably diversified. In 1891 it was the ninth State in amount of product of iron ore. There were thirty-two mines, which produced 525,612 long tons of ore, of which 517,922 tons were magnetite. Official reports for 1899 give the total production (all magnetite) as 256,185 long tons. The great decrease is due to the difficulty of mining and the necessity of roasting or concentrating the ores. New Jersey supplies 3·07 per cent. of the country's total output of iron ore. Manganiferous zinc ores of excellent quality are found at Franklin, Sussex co., and supply a large part of the zinc oxide and metallic zinc used in the U. S. In 1899 there was a production of granite valued at $779,822, sandstone valued at $147,768, limestone valued at $153,025, slate valued at $1,600; total value, $1,082,215. A small quantity of minerals used as paints were also produced. Among building materials are a very fine gneiss, white and blue limestones, roofing and writing slates, and flag and paving stones. The trap ridges supply the best of road material in such abundance and at so low a cost that the northern part of the State is now covered with a network of admirable highways. Graphite or plumbago has been mined with profit. Large quantities of porcelain and pottery clays of excellent quality are found; infusorial earth, used for polishing and in the preparation of giant powder, is obtained in Morris County; and moulding sand of good quality and sand for making the brick for reverberatory furnaces abounds in Burlington and Morris Counties. Sulphate of baryta, manganese, molybdenum, iron pyrites, used largely for producing sulphuric acid, and green sand for chemical purposes and glass-making, are among the other mineral products. The sum of $8,000 has been appropriated annually for many years for the geological survey of the State.

Soil and Productions.—The soil is a sandy loam, easily tilled, and lighter in the southern than in the middle and northern parts of the State. Clay marls, pure marls, shell marls, lime, and the peat and marsh-mud of the tide-washed region are advantageously used to enrich the land. The forest area covers about one-third of the State. The prevalent timber of the southern part is pine, with some cedar in the swamps; the forest of the northern part consists chiefly of oak, hickory, chestnut, hornbeam, tulip-tree, basswood, elm, ash, pine, sassafras, and wild cherry. The magnolia glauca is found in the swamps. Wild grapes, cranberries, whortleberries, blackberries, and raspberries are abundant. The flora of the State is large. The rattlesnake and copperhead are the only poisonous reptiles.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	34,307	30,828	10·1
Total acreage of farms	2,929,773	2,662,009	9·1
Total value of farms	$190,875,833	$159,262,840	16·6

* Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	257,364	8,493,012 bush.	$3,821,855
Wheat	122,753	2,344,582 "	1,734,991
Oats	95,003	2,812,089 "	871,748
Rye	64,717	1,029,000 "	565,950
Buckwheat	10,005	160,080 "	91,447
Potatoes	48,435	3,342,015 "	2,005,209
Hay	396,113	499,102 tons	8,010,587
Totals	994,390	.....	$17,101,787

On Jan. 1, 1900, the farm animals comprised 79,972 horses, value $5,828,258; 7,196 mules, value $679,883; 223,261 milch cows, value $8,729,505; 39,896 oxen and other cattle, value $1,224,982; 42,722 sheep, value $185,584; and about 175,000 swine, value $2,000,000; total head, 568,047; total value, $18,648,212. Much attention is paid to seed-farms and nurseries, especially in districts within easy reach of the markets of New York and Philadelphia. In 1890 the area in seed-farms was 6,272 acres, and the value of seed-farm implements and buildings more than $2,000,000. In the same year there were 145 nurseries, with an area of 5,465 acres, representing an investment of about $2,000,000. The fruit crop is large, notably in peaches, apples, and grapes.

Climate.—The following table exhibits the mean temperature (in degrees F.) and rainfall (in inches) by months, from observations taken through a series of years at different points:

MONTHS.	Temperature.	Precipitation.	MONTHS.	Temperature.	Precipitation.
January	25·7°	2·38	July	74·8°	3·89
February	32·4	3·89	August	72·0	5·64
March	37·7	3·77	September	66·0	4·08
April	50·2	2·91	October	53·3	3·73
May	59·6	5·99	November	44·4	3·02
June	69·8	4·46	December	30·8	3·64
Average for the year				51·4	47·40

Early fruits ripen from ten days to two weeks earlier in the southern counties than in the northern, although the mean temperature of the spring months is only three or four degrees higher.

Divisions.—For administrative purposes the State is divided into twenty-one counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	*Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.
Atlantic	7-C	28,836	46,402	May's Landing	.....
Bergen	2-E	47,226	78,441	Hackensack	9,443
Burlington†	5-D	58,528	58,241	Mt. Holly	.....
Camden	6-C	87,687	107,643	Camden	75,935

* Reference for location of counties, see map of New Jersey.
† Part of Burlington annexed to Ocean since 1890.

Principal Cities and Towns, with Population for 1900.—Newark, 246,070; Jersey City, 206,433; Paterson, 105,171; Camden, 75,935; Trenton, 73,307; Hoboken, 59,364; Elizabeth, 52,130; Bayonne, 32,722; Atlantic City, 27,838; Passaic, 27,777; Orange, 24,141; West Hoboken, 23,091; East Orange, 21,506; New Brunswick, 20,006; Perth Amboy, 17,699; Plainfield, 15,369; Union, 15,187; Montclair, 13,962; Bridgeton, 13,913; Morristown, 11,267; Kearney, 10,896; Harrison, 10,596; Millville, 10,583; Phillipsburg, 10,052.

Population and Races.—The population in 1850 was 489,555; 1860, 672,035; 1870, 906,096; 1880, 1,131,116; 1890, 1,444,933 (native, 1,115,958; foreign, 328,975; males, 720,819; females, 724,114; white, 1,396,581; colored, 48,352, of whom 47,638 were persons of African descent, 608 Chinese, 22 Japanese, and 84 civilized Indians).

Industries and Business Interests.—The manufacturing interest is of extraordinary volume and variety. In 1890 New Jersey, compared with other States, ranked fifth in combined textile products, first in silk fabrics, seventh in woolen, and eleventh in cotton. The value of silk fabrics manufactured in 1890 was $25,405,982, against $12,851,045 in 1880, and was nearly one-half greater than that of any other State. The value of woolen fabrics from 55 establishments was $9,984,640, against $6,829,074 in 1880. Seventeen establishments produced cotton fabrics worth $5,902,615. The value of the whole textile product from 199 establishments was $46,647,626, against $28,499,579 in 1880. Eighteen furnaces made 145,040 tons of pig iron in 1890, of which 41,479 tons were Bessemer, and 8 establishments made 17,999 short tons of steel. Six establishments made 185,510 tons of cast-iron pipe and fittings, value $5,032,571, more than one-third of the product of the U. S. The census reports of 1890 showed that 9,221 manufacturing establishments reported. These had a combined capital of $249,890,428, employed 186,901 persons, paid $96,509,703 for wages and $188,960,704 for materials, and had products valued at $353,179,917. See HOBOKEN, NEWARK, PATERSON, and TRENTON.

Finance.—No State tax upon individuals has been imposed for many years, except one for school purposes, apportioned among local taxing districts at the rate of $5 for each child between the ages of five and eighteen years, as shown by a school census taken annually. The amount thus collected by the State is reapportioned equitably, and paid over to the local school authorities. This is additional to the amount raised by local taxation for school purposes. Official reports of the State finances for the year ending Oct. 31, 1900, showed balance from previous year, $1,253,153.13; receipts, $3,623,796; disbursements, $2,871,726.97; balance, $2,005,222.16. The State debt on Jan. 1, 1900, was $119,000, payable in installments, the last of which will fall due in Jan., 1902. The State school fund, resulting largely from the sale of riparian lands, amounted on Oct. 31, 1893, to $3,693,621.22, from the income of which an appropriation of $100,000 is required to be made annually for the support of public schools. The assessed valuation of real and personal property in 1899 was $864,516,527.

Banking.—On Sept. 5, 1900, there were 115 national banks, with combined capital of $15,068,355, surplus and profits of $14,613,653.91, and deposits of $73,461,509.25; on June 30 there were 20 State banks, capital $1,703,750, surplus and profits $1,345,279, and deposits $8,144,031; 30 loan and trust companies, capital $5,560,800, surplus and profits $5,307,890, and deposits $40,045,780; and 26 mutual savings-banks, surplus fund $5,380,703, with $57,886,922 in savings deposits from 202,682 depositors.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 921 post-offices, of which 118 were presidential (12 first-class, 43 second-class, 63 third-class) and 803 fourth-class. There were 613 money-order offices and 78 money-order stations. There were 374 newspapers and periodicals: 48 daily, 3 semi-weekly, 282 weekly, 1 bi-weekly, 3 semi-monthly, 35 monthly, 1 bi-monthly, and 1 quarterly publications.

Libraries.—In 1892 there were reported 96 public libraries of 1,000 volumes and over, which contained 655,127 bound volumes and 112,434 pamphlets. The libraries were classified as follows: General, 28; school, 27; college, 7; college society, 3; law, 3; theology, 4; public institution, 4; State, 1; Y. M. C. A., 4; social, 9; scientific, 3; historical, 1; I. O. O. F., 1; and mercantile, 1. The library of the New Jersey Historical Society at Newark contains about 14,000 volumes and 20,000 pamphlets; the State library at Trenton, about 41,000 volumes, two-thirds of which are on law.

Means of Communication.—The railway development of the State has been as follows: (1850) 206 miles; (1860) 560; (1870) 1,125; (1880) 1,684; (1890) 2,099; (1892) main track, 2,162, second track, 708, third and fourth tracks, 178, sidings, 1,206—total, 4,254. The principal main lines are the Penn., the Central of N. J., the Phila. and Reading, the N. Y., Lake Erie and W., the Del., Lack. and W., the N. Y., Susquehanna and W., the West Shore, and the Lehigh Valley. The valuation of all railway and canal property in 1900 was $223,384,249, and the taxes were: State, $1,116,921.24; local, $417,090.69—total, $1,534,011.93. The Morris and Essex Canal, built about 1830, connects Jersey City and Phillipsburg, and was formerly a general commercial route, but for many years has been used as a coal route by the Lehigh Valley Railroad, its lessee. It is about 106 miles long. The Delaware and Raritan Canal, connecting New Brunswick and Trenton, about 43 miles long, built in 1831–34, affords direct communication between New York and Philadelphia by means of the Raritan and Delaware rivers. The street-railways, chiefly electric, aggregate over 300 miles.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	219	218	222,274	$6,050,682
Methodist Episcopal	579	584	82,955	5,009,075
Presb. in the U. S. of America	300	423	58,759	6,699,100
Baptist	224	268	38,757	2,957,628
Protestant Episcopal	184	236	30,103	3,815,850
Reformed Church in America	124	155	24,057	2,091,029
Lutheran, General Council	30	27	7,940	339,500
African Methodist Episcopal	54	69	5,851	159,850
Congregational	33	38	4,912	655,300
Methodist Protestant	39	39	3,459	181,950
Friends	43	47	3,261	267,700
African Methodist Episcopal Zion	25	25	2,954	107,700
Jews, Orthodox	19	19	2,521	44,300
Lutheran, General Synod	16	16	2,415	126,100

Schools.—The general supervision of public schools is intrusted to a State superintendent of public instruction, appointed by the Governor for a term of three years, and to one superintendent for each county, appointed by the State board of education. The school census enumeration, May 30, 1898, was: males, 236,293; females, 230,421—total, 466,714. In 1897–98 there were 304,680 children enrolled in the public schools, with an average daily attendance of 200,278. There were 1,850 schools and 6,276 teachers—834 men and 5,442 women. The average monthly salaries were, men $85.82, women $49.72. The value of school property was $14,601,840; the revenue for school purposes, $5,757,679; the total expenditure, $5,723,424. The State Normal School at Trenton, opened in 1855, has a three years' course. The New Jersey College of Agriculture, at New Brunswick, is the scientific school of Rutgers College, with a four years' course. It has a farm of 100 acres and 130 free scholarships, receives State aid to the amount of about $7,000 annually, and had, in 1892–93, 171 students. The principal higher educational institutions are the College of New Jersey, at Princeton, founded in 1746,

Rutgers College, at New Brunswick, chartered as Queen's College (1766); Burlington College (1846) and St. Mary's Hall (1837), at Burlington (Protestant Episcopal); Seton Hall College, at South Orange (Roman Catholic, 1856); Stevens Institute of Technology, at Hoboken; Theological Seminary (Presbyterian), at Princeton; Drew Theological Seminary (Methodist), at Madison; German Theological School (Presbyterian), at Bloomfield; Lawrenceville School; Peddie Institute, Hightstown; Centenary Collegiate Institute, at Hackettstown (Methodist Episcopal); Newark Academy (1792); Blair Presbyterial Academy, at Blairstown; St. Elizabeth's Academy, for girls (Roman Catholic), near Morristown; and the Pennington Seminary, for both sexes, at Pennington.

Charitable, Reformatory, and Penal Institutions.—These comprise the State prison, at Trenton, built in 1836 and since much enlarged; the State Reform School for Boys, at Jamesburg, opened in 1867, with a farm of 490 acres; the State Industrial School for Girls, near Trenton, with a farm of 79 acres; a Hospital for the Insane, at Trenton, built in 1844; a Hospital for the Insane, at Morris Plains, opened in 1876 at a cost of $2,250,000; the Institution for Feeble-minded Women, at Vineland, opened in 1888; the Training-school for Feeble-minded Children at Vineland, opened in 1888; the School for Deaf Mutes, near Trenton; and the Soldiers' Home at Kearney, near Newark. There are public county asylums for lunatics in Burlington, Camden, Cumberland, Essex, Gloucester, Hudson, Passaic, and Salem Counties.

Political Organization.—The Governor is elected for a term of three years, and can not hold the office for two consecutive terms. He appoints most of the members of the judiciary, and many heads of departments and executive officers. The Legislature consisted in 1894 of a Senate of twenty-one members, and a General Assembly of sixty members. Each county elects one Senator for a term of three years, one-third of the body being elected each year. The Legislature meets annually, with no limit of session. The right of suffrage is enjoyed by every male citizen of the U. S., of the age of twenty-one years, who shall have been a resident of the State one year, and of the county in which he claims his vote five months next before the election, excepting idiots, insane paupers, and convicts not pardoned or restored by law to the right of suffrage. A modification of the Australian ballot system is in operation.

History.—The earliest white settlers of New Jersey were the Dutch, who between 1614 and 1621 founded the colony of New Netherlands on the territory between the Hudson and Delaware rivers. In 1664 this region passed to the English, and the Duke of York, who held a grant from the king, made it over to John, Lord Berkeley, and Sir George Carteret. The province was named in honor of Carteret, who had distinguished himself while governor of the island of Jersey. The proprietors established a government, republican in its character, which continued until 1676, when the province was divided into East Jersey and West Jersey by a line drawn from Little Egg Harbor to a point on the Delaware in lat. 41° 40′ N. The two divisions remained distinct until 1702, when the proprietors surrendered their powers of government to the crown, reserving their exclusive right to dispose of the soil. Thereafter, until the Revolution, New Jersey was a royal province. From 1703 to 1738 the provinces of New York and New Jersey had the same governors. There were no Indian troubles, and the course of provincial history after 1702 was prosperous and uneventful. On July 2, 1776, two days before the Declaration of Independence, the provincial congress adopted a constitution for an independent State, which was ratified on July 18, 1776, and under this the State was governed until 1844. New Jersey was fighting-ground during most of the Revolution. The important battles of Trenton, Princeton, and Monmouth, with other minor engagements, were fought within her borders. Washington was in winter quarters at Morristown (*q. v.*) in 1777, and in 1779–80 and 1780–81. William Paterson, of New Jersey, was eminently influential in the convention that framed the Federal Constitution, which was ratified by the State on Dec. 18, 1787. In this wise and patriotic act New Jersey was anticipated only by Delaware and Pennsylvania. It is worthy of notice that the State constitution of 1776 allowed universal suffrage, both male and female, white and colored, subject to a property qualification of £50. Women continued to vote until 1807. A new constitution was adopted in 1844, and amended in 1875.

New Jersey furnished 88,305 men to the army during the civil war. The naval and marine enlistments numbered 4,853. The entire expense to the State for organizing, equipping, subsisting, supplying, and transporting her troops was $2,894,384.99.

GOVERNORS OF NEW JERSEY.

William Livingston	1776–90	Rodman M. Price	1854–57
William Paterson	1790–93	William A. Newell	1857–60
Richard Howell	1793–1801	Charles S. Olden	1860–63
Joseph Bloomfield	1801–02	Joel Parker	1863–66
John Lambert (acting)	1802–03	Marcus L. Ward	1866–69
Joseph Bloomfield	1803–12	Theodore F. Randolph	1869–72
Aaron Ogden	1812–13	Joel Parker	1872–75
William S. Pennington	1813–15	Joseph D. Bedle	1875–78
Mahlon Dickerson	1815–17	George B. McClellan	1878–81
Isaac H. Williamson	1817–29	George C. Ludlow	1881–84
Garret D. Wall (declined)	1829	Leon Abbett	1884–87
Peter D. Vroom	1829–32	Robert S. Green	1887–90
Samuel L. Southard	1832–33	Leon Abbett	1890–93
Elias P. Seeley	1833	George T. Werts	1893–96
Peter D. Vroom	1833–36	John W. Griggs	1896–98
Philemon Dickerson	1836–37	Foster M. Voorhees	1898–
William Pennington	1837–43		
Daniel Haines	1843–45		
Charles C. Stratton	1845–48		
Daniel Haines	1848–51		
George F. Fort	1851–54

Frederic Adams.

New Jersey, College of: an institution of learning (whose corporate name was changed in 1896 to *Princeton University*) founded under the auspices of the Presbyterian Synod of New York, which then included New Jersey. Chartered by New Jersey in 1746, it was opened in Elizabethtown in May, 1747, received a more liberal charter in 1748, was removed to Newark, and finally to Princeton in 1757, where a large building was erected named Nassau Hall, in memory of William III. of the house of Nassau. It was occupied as a barracks and a hospital both by the colonial and the British troops in the Revolution. Gen. Washington drove the British from its walls Jan. 3, 1777. The Continental Congress met in it in 1783, and the members of Congress and Gen. Washington attended the commencement in that year. Gen. Washington presented fifty guineas to the trustees to repair the damages of war, which were appropriated for a portrait of Washington by the elder Peale. Dr. Witherspoon and two of the alumni, Richard Stockton and Benjamin Rush, were signers of the Declaration of Independence. Rev. Jonathan Dickinson was the first president from May to Oct., 1747. Rev. Dr. James McCosh was president from 1868 to June, 1888. Active and energetic, his reputation greatly advanced the interests of the college. The faculty was enlarged, the number of students increased, new studies introduced, nine large buildings erected, and the funds greatly augmented. Among its benefactors have been N. Norris Halstead, who erected the observatory, John C. Green, and Henry G. Marquand. Mr. Green gave $750,000 to found a school of science, erect a library, Dickinson Hall, and for other objects. The trustees of his estate erected Witherspoon Hall and Edwards Hall and Chemical Hall, enlarged the school of science, and endowed a number of professorships. These donations have amounted to $2,500,000. In 1882 Mr. Marquand erected a handsome chapel, costing $125,000, and other friends placed in the observatory one of the largest telescopes ever constructed. William Libbey, Sr., who founded the museum of geology and archæology at a cost of $100,000, also presented to the college the University Hotel, which cost more than $250,000.

The college year is divided into two terms; most of the studies are elective in the junior and senior years. There are many prizes and fellowships, the recipients of the latter being required to pursue a prescribed course of study for one year after graduation. The John C. Green School of Science is now in operation. There are (1899–1900) 81 professors and instructors, and 1,099 students. The post-graduate courses are increasing. In 1900 they had 132 students. President Francis L. Patton, D. D., LL. D., was inaugurated June 20, 1888. Since that time the faculty has been enlarged, the num-

ber of students increased by more than 300, and more than $2,000,000 has been given to the college, chiefly in the form of large and beautiful buildings. The college and society libraries contain more than 200,000 volumes. The number of graduates is (1900) nearly 9,000, among whom have been some of the most distinguished men in Church and state, the most eminent being James Madison, fourth President of the U. S. Within the last twenty years $4,000,000 have been contributed by friends to the college. The buildings are mostly of stone, and occupy the campus, which runs parallel with the main street of the town. The grounds are shaded with fine trees. Nassau Hall, East and West Colleges, the American Whig and Cliosophic halls form a fine quadrangle, within which are planted two Revolutionary cannon. The other buildings lie E. and S.W. of this quadrangle. The geological and archæological museum in Nassau Hall and the museum of natural history in the School of Science are rapidly growing in importance. See Maclean, *History of the College of New Jersey* (2 vols., Philadelphia, 1877). HENRY C. CAMERON.

New Jersey Tea: a small shrub (*Ceanothus americanus*) belonging to the Buckthorn family (*Rhamnaceæ*), whose leaves were used as a substitute for tea during the American Revolution. The other species of the genus *Ceanothus* are abundant in Western and Southwestern U. S. See CEANOTHUS. CHARLES E. BESSEY.

New Jerusalem, Church of the: the name taken by a body of Christian worshipers who accept as true the doctrines taught in the theological writings of Emanuel Swedenborg. (See SWEDENBORG, EMANUEL.) In 1787, fifteen years after Swedenborg's death, the first organization for worship on the basis of those doctrines was formed in London, and consisted of sixteen persons. Two years later a general conference was held, also in London, of believers in the new faith. From that time to the present similar meetings have been held annually in England, with the exception of a few years; and in 1821 a legal body was formed under the title, The General Conference of the Ministers and other Members of the New Church, signified by the New Jerusalem in the Apocalypse or Revelation of John.

This church has flourished principally in England, the U. S., and Canada, though a few scattered societies are to be found on the continent of Europe. The beginnings in the U. S. were but little later than those in England, the first regular society, with a minister at its head, having been formed in Baltimore, Md., in the year 1792. In 1817 the body now known as The General Convention of the New Jerusalem in the United States of America was organized at a meeting held in Philadelphia. From that time till 1893 it has held seventy-three annual sessions. This body was incorporated in the year 1861, under the laws of the State of Illinois, and includes the larger part of those in the U. S. and Canada who openly accept the doctrines of the New Church. It consists of eleven "associations" and other local organizations, comprising in the aggregate 107 societies, or worshiping assemblies, with 95 ministers and 6,461 members. If the isolated and scattered believers be added to the foregoing, the total would probably be, in round numbers, 10,000. Besides the above, not a few who retain their connection with other Christian bodies are known to favor the teachings of Swedenborg.

The term New Church, or Church of the New Jerusalem, is used by those who adopt it not only because Swedenborg himself uses it, but because his writings seem to them to contain a complete new system of Christian doctrine. Without setting aside anything that is true in the old Christianity, the new system claims to be a deeper unfolding of the Scriptures and of God's nature and purposes as revealed therein. Swedenborg was no organizer of religious institutions, but confined himself to a statement of the principles on which others, at their discretion, may establish them. These all center in three general or essential ones, which relate respectively (1) to God, (2) to Divine revelation or the Scriptures, and (3) to heavenly life and happiness. These three subjects may properly be considered in their order.

Concerning God.—1. God is one in essence and in person, and can never be thought of otherwise without grievous error. 2. Not only did he create all other beings in the beginning, but by the unceasing communication of his life he continually preserves them; so that preservation is perpetual creation. 3. He is, in his essence, perfect love and wisdom. Love is his inmost nature, and wisdom is the means whereby love gives itself expression and carries out its purposes. His love is absolute goodness, his wisdom absolute truth. 4. His Divine Providence is the active operation and oversight of infinite love and wisdom in the government of men. They live because he loves them, and the ruling purpose of his providence is their spiritual and eternal welfare; but true happiness can be realized only in the exercise of freedom. Man is therefore created a free agent. This freedom renders possible a reciprocal relationship between him and God on the basis of mutual love; but it also involves possibilities of an opposite character. Accordingly, the origin of evil is due to man's abuse of his freedom. 5. God can not be known or apprehended by finite men except so far as he is revealed in a manner accommodated to their limited powers of thought and sight. The theophanies, or divine appearances, recorded in the Old Testament were produced by his filling an angel with his presence, and being thus seen as a man. 6. More marked than any of these manifestations was that which found expression in the birth of Jesus Christ, which event, according to the New Church theology, was simply the way in which the one God Jehovah came into nearer and more definite relations with his human family. He clothed himself with their nature so that outwardly he was a man like themselves, but inwardly "the everlasting Father." His nature had at first its own distinct life and consciousness. Being derived, in part, from a finite human mother, it inherited her imperfections, with tendencies to evil and liabilities to temptation. By means of temptations successfully resisted he overcame evil and hell, and thus brought redemption to men. In this process, which was gradually effected, his human nature was wonderfully transformed. Its evil and limiting conditions were put away, and there came down into the place of them the perfect goodness and wisdom of the Father. In other words, his human was glorified, or made divine. He became to eternity "Emmanuel, God with us." The Lord Jesus Christ, as thus embodying in himself all of deity, is the one true object of Christian worship. 7. There is a Trinity in God, though not a Trinity of persons, but a threefold or trinal order of being, such as finds expression in the one person of our Lord Jesus Christ. Man is made "in the image, after the likeness," of God; and in him is a trinity of soul, body, and proceeding life or operation. In God likewise is the inmost and inscrutable Divinity, or the Father; the Divine Human or the Son, bringing the Father forth to view; and the Divine proceeding life or energy, pictured by the Lord's breathing on his disciples. These are the constituent parts or elements of one Divine person, each being essential to a full conception of him.

The Scriptures.—According to Swedenborg, the Bible, or Sacred Scripture, is the veritable Word of God, uttered by him through writers whose minds he used as his instruments. It is divine not only from the fact that God gave it, but also because it partakes of his nature and quality. The truth which it contains is infinite. The natural or literal sense of Scripture is its least and lowest part. Within that sense are higher senses or degrees of meaning, which are distinct from and yet make one with the letter. In other words, the Scriptures are written by what Swedenborg terms correspondences. That is to say, every object, place or person that is mentioned in them represents something that pertains to the mental or spiritual life of man. By the interpretation of these representatives or correspondences a connected spiritual sense is obtained entirely different from the sense of the letter, and serving to show that the Scriptures, though outwardly clothed in thoughts and language borrowed from natural men, are internally and essentially the living truth of God. The law of correspondence is not arbitrary, but coincides with the law of creation itself; for every natural object exists from a spiritual cause, and is the visible form and embodiment of some particular phase of spiritual life, to which it is said to correspond. Of the relation between the natural and spiritual worlds more will be said below. By means of correspondence the Word is in its literal sense brought down to all possible conditions of human character, so that it may reach every man where he stands, and help him to ascend to a higher state of life. Many correspondences are obvious, and constantly occur in common language. Heat, for instance, corresponds to love, light to wisdom, and water to cleansing truth. Most of Swedenborg's theological writings are devoted to an exposition of the spiritual sense of Scripture by applying thereto the doctrine of correspondence. Of our common Bible, the books of Ruth, Chronicles, Ezra, Nehemiah, Esther, Job, Proverbs, Ecclesiastes, and the Song of Solomon, in the Old Testament, and the Acts and Epistles in the New, have no

continuous spiritual sense, and were not written under the same full inspiration as the remaining books, which contain that sense. The first chapters of Genesis have only spiritual truth, the historical truth beginning with the life of Abraham. The remainder of the Word, with few exceptions, deals with actual history, yet holds the deeper meaning within.

Heavenly Life and Happiness.—All of Swedenborg's teachings are affected by the definite instruction which he gives respecting the other world. He shows that the latter is not far off in space, but an inner realm of being, always present, and bearing the same relation to the world of nature that a man's spirit bears to his body. Indeed, the spirits of all men are living, though unconsciously, in the spiritual world, and when their natural bodies die they wake to a clear perception of its realities. The spiritual body, of which Paul speaks, is an essential part of the human organism. The spiritual world is real and substantial, though intangible to natural senses. It is full of visible persons and objects like those on earth, as appears from the fact that they were seen by the prophets and others when the eyes of their spirits were opened. Such opening is possible to all men, but is seldom permitted, and then only for some special purpose. Swedenborg affirms that it was his own frequent experience, in order that he might understand the things which it was his office to teach; but he warns his readers against the dangers of intercourse with spirits, except when it comes unsought, and so by Divine permission.

Heaven is in its essence a state of the mind, and the same is true of hell. The one is a state which is ruled by love of the Lord and the neighbor; the other, a state in which love of self and the world is supreme. So far as man cherishes heavenly affections he is brought into harmonious relations with heaven, and is actually making heaven his home. In like manner, so far as he cherishes selfish and worldly loves, or—what is the same—indulges his evil tendencies, he brings himself under the influence of infernal spirits, and becomes identified with them. After death he finds a permanent abode in the other world, according to the choice which he has made here. No one is condemned to hell, but each one who goes there condemns himself. The pure atmosphere of unselfish love which rules in heaven is but torment to those who are confirmed in evil, and they turn away from it to a more congenial life and companionship. JAMES REED.

New Kensington: borough (founded in 1891); Westmoreland co., Pa. (for location of county, see map of Pennsylvania, ref. 5–B); on the Allegheny river, and the Allegheny Valley Railway; 18 miles N. E. of Pittsburg. It contains 4 churches, 2 school buildings, a bank, a weekly newspaper, and several glass-works, foundry and machine shop, and reduction, cold-rolled steel, stone, and white-lead works. Pop. (1900) 4,665.
EDITOR OF "DISPATCH."

New Lebanon: town; Columbia co., N. Y. (for location of county, see map of New York, ref. 6–J); on the Lebanon Springs Railroad; 24 miles S. E. of Albany. It contains the villages of Lebanon Springs, a summer resort noted for its thermal springs, New Lebanon Center, West Lebanon, New Britain, and Tilden's, and the Shaker community of Mt. Lebanon; is in an agricultural region; and contains a seminary for girls, several hotels, churches, public schools, and manufactories of thermometers, glass, machinery, flour, lumber, pharmaceutical preparations, brooms, and vinegar. Pop. (1880) 2,245; (1890) 1,765; (1900) 1,556.

New Leon: See NUEVO LEON.

New Lexington: village; capital of Perry co., O. (for location of county, see map of Ohio, ref. 6-G); on the Ohio Cent. and the Cin. and Musk. Valley railways; 21 miles S. W. of Zanesville, 53 miles S. of Columbus. It is surrounded by hills containing valuable deposits of coal, and has a court-house, completed in 1887 at a cost of $150,000, town-hall which cost $12,000, public-school building which cost $20,000, St. Aloysius Female Academy, a private bank, and two weekly newspapers. The industries are coal-mining and manufacturing. Pop. (1880) 1,357; (1890) 1,470; (1900) 1,701. EDITOR OF "HERALD."

New Light and **Old Light**: terms used for the two parties in the Associate Synods of Scotland, about 1800, and used later for the two parties in the Reformed Presbyterian Church in the U. S. See PRESBYTERIAN CHURCH.

New Lisbon (now **Lisbon**): village; capital of Columbiana co., O.; on the Beaver river, and the Erie and the Pitts., Marion and Chi. Railway; 35 miles E. of Canton, 56 miles W. N. W. of Pittsburg, Pa. (see map of Ohio, ref. 4–J). It is in an agricultural, coal, iron, and wool-growing region, and has manufactories of fire-brick, sewer-pipe, and woolen goods, a national bank with capital of $50,000, a private bank, and four weekly newspapers. Pop. (1880) 2,028;(1890) 2,278.

New London: city (founded in 1646, name changed from Naumeag in 1658, plundered and burned by the British in 1781, chartered as a city in 1784); port of entry; one of the capitals of New London co., Conn. (for location, see map of Connecticut, ref. 11–K); on the Thames river, here crossed by a noted bridge (see BRIDGES), 3 miles above its entrance into Long Island Sound, and on the Cent. Vt., the N. Y. and N. E., and the N. Y., N. H. and Hart. railways; 40 miles S. E. of Hartford, 50 miles E. of New Haven. The site rises from the river to a series of hills back of the city and commands an attractive stretch of scenery. The harbor is considered the best on the Sound, is 3 miles wide and 30 feet deep, thoroughly protected against storms and floating ice, defended at its entrance by Fort Trumbull, and was once the base of large commercial operations. New London has daily steamboat communication with New York, is much frequented in summer by tourists, and contains many summer residences of people doing business elsewhere. There are 12 churches, the Bulkeley High School for boys, the Williams Memorial Institute for girls, the Haven Public Library building, the New London County Historical Society (with valuable library), 3 national banks with combined capital of $550,000, 2 savings-banks with surplus of nearly $400,000, a State-bank with capital of $300,000, and a weekly and 3 daily periodicals. The city has ample water, sewerage, gas, and electric light plants, and contains 4 shipyards, extensive silk-mills, iron-foundries, woolen-mill, cotton-gin factory, large sawmill, printing-press manufactory, and many minor industries. The river here is a favorite racing-course for college rowing-clubs. Above the city and on the opposite side of the river the U. S. Government has established a naval station. Among the attractions is Fort Griswold, an earthwork with a small battery, the scene of a massacre on Sept. 6, 1781, which is commemorated by a shaft 127 feet high. Pop. (1880) 10,537; (1890) 13,757; (1900) 17,548. EDITOR OF "TELEGRAPH."

New London: city; Waupaca co., Wis. (for location of county, see map of Wisconsin, ref. 5–E); at the confluence of the Wolf and the Embarras rivers, and on the Chi. and N. W. and the Green Bay, Win. and St. P. railways; 21 miles W. N. W. of Appleton, 39 miles W. S. W. of Green Bay. It is in an agricultural and lumber region; has planing, saw, and flour mills, breweries, and screen door and window, furniture, excelsior, and embossed-wood factories; and contains a private bank, weekly newspaper, and water pronounced the purest in the State. Pop. (1890) 2,050; (1900) 2,742. EDITOR OF "TRIBUNE."

Newman, ALBERT HENRY: See the Appendix.

Newman, EDWARD, F. L. S.: entomologist; b. at Hampstead, England, May 13, 1801; began in childhood to study natural history, especially entomology; established and edited *The Entomological Magazine* 1833, *The Entomologist* 1840, *The Zoölogist* 1843, and *The Phytologist* 1844; became in 1840 a publisher, and issued, besides many popular works by other writers, his own *History of British Ferns* (1840); *Dictionary of British Birds* (1866); *Illustrated Natural History of British Moths* (1869); *Illustrated Natural History of British Butterflies* (1871); and several minor treatises. He gave almost exclusive attention for several years to insects injurious to vegetation. D. June 12, 1876.

Newman, FRANCIS WILLIAM, LL. D.; author; b. in London, June 27, 1805; educated at Ealing and at Worcester College, Oxford, and graduated with double first-class honors 1826; was fellow of Baliol 1826–30, when he resigned on account of theological objections to subscribing the Thirty-nine Articles; traveled extensively in the East, acquiring a familiar knowledge of Arabic and of Oriental literature, but gradually becoming widely alienated from Anglican theology; was classical tutor in Bristol College from 1834–40, Professor of Classics at Manchester New College, London, 1840–46, and Professor of the Latin Language and Literature at University College, London, 1846–63; after that time devoted himself exclusively to literature. Similar in mental characteristics to his brother, he diverged from the Church of England in precisely the opposite direc-

tion, though the title of his first book betrays the same longing for ecclesiastical unity which led Dr. John H. Newman to the Church of Rome. He is the author of *Catholic Union: Essays toward a Church of the Future and the Organization of Philanthropy* (1844); a scholarly *History of the Hebrew Monarchy* (1847); *The Soul, its Sorrows and Aspirations* (1849; n. e. 1882); a remarkable autobiography entitled *Phases of Faith, or Passages from the History of my Creed* (1850; n. e. 1881); *The Odes of Horace translated into Unrhymed English Meters* (1853); *The Iliad of Homer translated into Unrhymed English Meters* (1856); *Theism, Doctrinal and Practical* (1858; n. e. as *Hebrew Theism*, 1874); an English-Arabic *Dictionary* in Roman type (2 vols., 1871); *Early History of Cardinal Newman* (1891); besides treatises on many other subjects, including mathematics, social science, politics, elocution, philology, and general literature, which exhibit great scholarship and wonderful versatility. D. in Weston-super-Marc, Somerset, Oct. 4, 1897.

Revised by S. M. Jackson.

Newman, John Henry, D. D.: religious leader; b. in London, Feb. 21, 1801; educated at Ealing and at Trinity College, Oxford; graduated B. A. 1820; was chosen a fellow of Oriel 1823; took Anglican orders 1824; was vice-principal of St. Albans Hall 1825–26; tutor of Oriel 1826; opposed Catholic emancipation 1829; was one of the university preachers 1830; joined with Hurrell Froude in forming a conservative Anglo-Catholic party within the Church of England; visited Rome and Sicily 1832–33; took part with Keble and Pusey in originating the Oxford Movement; was a leader in the propaganda of High Church doctrines by means of the celebrated *Tracts for the Times*; rapidly developed his tendencies toward Roman Catholicism; was in 1828–43 incumbent of St. Mary's, Oxford, and chaplain of Littlemore, and acquired great fame as a preacher and writer; founded at Littlemore in 1842 a community of ascetics. In 1845 he joined the Roman Catholic priesthood, and in 1849 established a branch of the brotherhood of St. Philip Neri at Edgbaston, where he took up his residence. He delivered lectures on *Anglican Difficulties* in 1850, and on *Catholicism in England* in 1851. The latter, in which he depicted the popular prejudices against Roman Catholics with great powers of irony and satire, gave rise to an action for libel by Dr. Giovanni Giacinto Achilli. The verdict went against Newman, and he was condemned to pay £100, after a famous trial which cost him upward of £10,000, for which he was reimbursed by his friends. He wrote a number of the *Tracts for the Times* (1833–41), including the famous *Tract No. 90*; *Parochial Sermons* (6 vols., London, 1834–42); *Essay on Development of Christian Doctrine* (1845); *Arians of the Fourth Century* (1833); *Theory of Religious Belief* (1844); *Loss and Gain* (1848); *Callista, a Sketch of the Third Century* (1855); *Apologia pro Vita Mea* (1864), afterward recast as *A History of my Religious Opinions* (1865); *An Essay in Aid of a Grammar of Assent* (1870); *A History of Arianism* (1875); many sermons, lectures, essays, poems, and other works, including a reply to Gladstone's pamphlet on *The Vatican Decrees* (1875) and *A Letter addressed to His Grace the Duke of Norfolk*. He was made a cardinal May 12, 1879. D. at Edgbaston, Birmingham, Aug. 11, 1890. See his *Letters*, written while in the Church of England (2 vols., 1891), and E. A. Abbott, *Anglican Career of Cardinal Newman* (2 vols., 1892).

Revised by S. M. Jackson.

Newman, John Philip, D. D., LL. D.: bishop; b. in New York city, Sept. 1, 1826; educated at Cazenovia Seminary; became a minister of the Methodist Episcopal Church: was for several years pastor of the Metropolitan Methodist Episcopal Church, Washington, D. C., and chaplain of the U. S. Senate 1869–74; was pastor Madison Avenue Congregational Church, New York, 1882–84. In 1886 he again became pastor of the Metropolitan Methodist Episcopal Church. He was elected bishop May 24, 1888, and settled in Omaha, Neb. He was a member of the Society of Biblical Archæology, and author of *From Dan to Beersheba*; *The Thrones and Palaces of Babylon and Nineveh* (1875); *Christianity Triumphant* (1884); *America for Americans* (1887); *The Supremacy of Law* (1890). D. in Saratoga, N. Y., July 5, 1899.

Newmarket: town of England; partly in the county of Cambridge, partly in that of Suffolk; 69 miles N. N. E. of London (see map of England, ref. 10–K). It is the seat of the most famous race-course in England, and in 1891 had 6,213 inhabitants, most of whom are jockeys, grooms, trainers, and stablemen.

Newmarket: post-village of York County, Ontario, Canada; on the Northern Railway; 34 miles N. of Toronto (see map of Ontario, ref. 4–D). It has two weekly newspapers, important manufactures, and trade. Pop. of sub-district (1891) 2,143.

New Market: town; Rockingham co., N. H. (for location of county, see map of New Hampshire, ref. 10–G); on the Lamprey river, and the Boston and Maine Railroad; 14 miles W. of Portsmouth, 38 miles E. of Concord. It contains a national bank with capital of $80,000, a town library (founded 1872), and a daily and two monthly periodicals, and is principally engaged in the manufacture of cotton goods. Pop. (1880) 2,368; (1890) 2,742; (1900) 2,892.

Editor of "Advertiser."

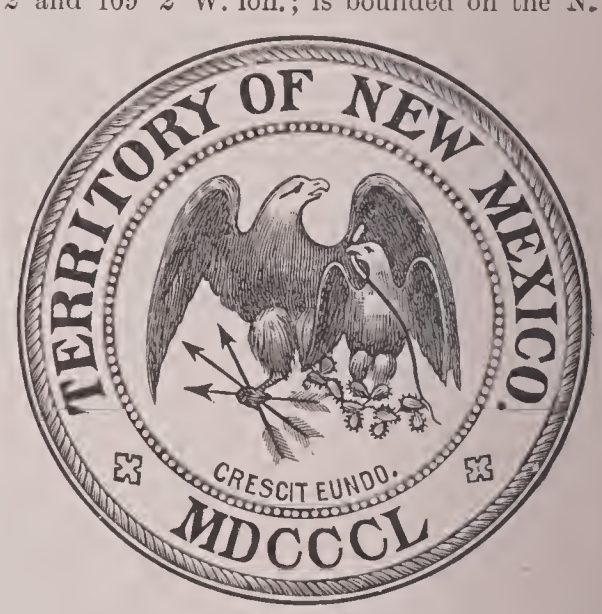
Newmarket Road, Battle of: See Fraziers Farm, Battle of.

New Mecklenburg, or **New Ireland** (native *Tambara*): an island of the Bismarck Archipelago, N. E. of New Guinea. It is the second largest island of the group, and is separated from the largest (New Pomerania) by a strait so narrow that it was long undiscovered, and was later half choked by a volcanic eruption near it. It is about 200 miles long by 20 or 30 broad, lies N. W. and S. E., and contains about 4,000 sq. miles. It is generally mountainous, higher at the western end. It is but little known, and attempts to colonize have been unsuccessful. In climate and population it is similar to New Pomerania (*q. v.*). It is under German protection.

M. W. Harrington.

New Mexico: one of the Territories of the U. S. of North America (Western group); organized Sept. 9, 1850; capital, Santa Fé.

Location and Area.—It lies between 31° 20′ and 37° N. lat., and 103° 2′ and 109° 2′ W. lon.; is bounded on the N. by Colorado, on the E. by Indian Territory and Texas, on the S. by Texas and Mexico, on the W. by Arizona; length from N. to S., 345 miles on the east side, 380 miles on the west side; breadth from E. to W., 330 miles on the north line, 352 miles on the south; area, 122,580 sq. miles (78,451,200 acres).



Seal of New Mexico.

Physical Features.—New Mexico forms a part of the lofty table-land which is the foundation of the Rocky Mountain ranges, as well as those of the Sierra Madre. This table-land gradually slopes southward to the Llano Estacado, or Staked Plain, and to El Paso. The Llano Estacado is a broad, almost level, treeless, and waterless plain, extending over three or four degrees of longitude and nearly as many of latitude, which is apparently barren, but is capable, if irrigated, of yielding large crops. From the elevated table-land there rise hundreds of summits of the Rocky Mountains, and W. of the Rio Grande the peaks of the Sierra Madre lift themselves from 3,000 to 10,000 feet above the *mesa* or plateau. The mountain chains E. of the Rio Grande valley are known locally as the Guadalupe, Sacramento, and Organ Mountains, and still farther E. the Sierras Blanca, Hueca, Capitana, etc., which form the western boundary of the valley of the Rio Pecos. W. of the Rio Grande the Sierra Madre is divided into numerous chains and some isolated peaks. The principal of these mountain chains are the Sierra San Mateo, the Zuñi Mountains, the Sierra del Datil, and the Sierra Mimbres. Still farther W. the San Juan Mountains enter New Mexico from Colorado, and the heavy masses of the Mogollon Mountains and the Pinaleno, Peloncito, and Chiricahua Mountains from Arizona. The principal river of New Mexico is the Rio Grande, which has a general direction from N. to S., but is not navigable in any part of its course through New Mexico. It re-

W.P. Speller sculp

ceives from the W. two tributaries, the Rio Chama and the Rio Puerco, and from the E. several smaller streams. The Rio Pecos, a large affluent of the Rio Grande, drains the southeastern and eastern portion, and the Canadian river and two or three of its branches the northeastern. The western portion is drained by the large tributaries of the Colorado river and their affluents, and particularly by the San Juan, Little Colorado, and Gila, each of which has three or four considerable tributaries.

Soil and Productions.—The mountain ranges are partially covered (where they are not basaltic) with pine, cedar, spruce, and other evergreens. The foot-hills have extensive tracts of piñon or nut-pine and a smaller cedar, and in the river-bottoms are belts of cottonwood, sycamore, and other deciduous trees. In the southern part there are numerous groves of oak and walnut; in the Llano Estacado the mesquite grows to a varying height of from 5 to 20 feet. In the southern and southwestern portions the tree-cactus is a marked feature in the landscape. There are many indigenous grasses, the most widely spread and valuable of all being the nutritious *mesquite* or *grama* grass, which grows during the rainy season of July and August, ripens in the autumn, and dries on its stalk, furnishing to cattle, in its stalks and rich seeds, a valuable and natural hay of which they are exceedingly fond. The arable soils, under the influence of irrigation, yield fair crops. The U. S. census of 1890 showed a total of 3,085 farms under irrigation in New Mexico, not including those of Pueblo Indians. The irrigated area actually in crop amounted to 91,745 acres. The average value of products per acre was $12.80, and the average annual cost of water $1.54 per acre. The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in New Mexico:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms	5,053	4,458	*11·8
Total acreage of farms	631,131	787,882	†24·8
Total value of farms	$5,514,399	$8,140,800	†47·6

* Decrease. † Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	25,216	554,752 bush.	$355,041
Wheat	183,207	3,847,347 "	2,616,196
Oats	7,641	229,994 "	110,397
Barley	1,076	31,204 "	19,346
Potatoes	976	18,544 "	21,140
Hay	37,544	77,341 tons	765,676
Totals	255,660		$3,887,796

On Jan. 1, 1900, the farm animals comprised 83,184 horses, value $1,680,945; 3,298 mules, value $112,323; 19,510 milch cows, value $618,467; 659,849 oxen and other cattle, value $12,301,571; 3,973,439 sheep, value $8,022,362; and about 28,000 swine, value $200,000; total head, 4,767,280—total value, $22,935,668.

Minerals.—Gold and silver are abundant. The oldest mining districts are the Old and New Placers, Pinos Altos, Cimarron, Arroyo Hondo, Manzano, and Moreno, and tracts in the Organ Mountains, the Sierras Blanca, Carriza, Jicarilla, and the Mogollon and Magdalena Mountains. The director of the U. S. mint estimated the value of the product of gold from New Mexico mines in 1899 at $584,100, and of silver at $650,731. The output of both silver and gold has decreased greatly since about 1890. Copper is found in very rich ores in several parts. The product in 1899 was 3,935,441 lb. Galena mines in the Organ Mountains yield 80 per cent. of pure lead, besides about $50 worth of silver to the ton. The lead output in 1899 was 4,856 short tons. Iron and salt are abundant. Anthracite coal is found in the Placer Mountains on the east border of the Rio Grande valley, 30 or 40 miles S. S. W. of Santa Fé, and bituminous in nearly every county. The production in 1899 by counties was, Bernalillo, 493,310 short tons; Colfax, 368,373 tons; Lincoln, 12,737 tons; and Rio Arriba, San Juan, Santa Fé, and Socorro, 176,294 tons; total, 1,050,714 tons. Gypsum is found in several counties, and a remarkably large and pure deposit exists on the San Augustin Plains in Donna Ana County, near an extinct volcano and a salt lake. Adjoining this deposit is an extensive one of carbonate and sulphate of soda, in the bed of an ancient river or lake. Valencia, Mora, and Taos Counties also contain carbonate of soda. Valuable deposits of fine clay have been found near Socorro and near Santa Fé, and there is a bed of superior kaolin in the suburbs of Santa Fé. Large beds of alum have been discovered, and some of them worked, on the Gila river. New Mexico is rich also in precious stones, and the production is steadily increasing. The most valuable are emeralds, turquoise, euclase, sapphires, garnets, milk and fire opals, peridots, and agates. The petrified woods are largely used by jewelers for inlaid work. There are numerous mineral springs in New Mexico, and the hot springs, about 5 miles from Las Vegas, and at Ojo Caliente, in Taos County, have a very high reputation. The temperature varies from 80° to 140° F.

Climate.—The climate, though varied, is dry. In the N. the range of the thermometer is between 10° and 75° F. In the S. the temperature is very mild, the thermometer rarely indicating as low a temperature as 32°. The rainy season in the southern part is in July and August. The amount of annual rainfall is 15·80 inches. The prevalent winds are E. S. E., S. W., W., and N. The climate has justly a high reputation for healthfulness.

Divisions.—For administrative purposes New Mexico is divided into nineteen counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

* Reference for location of counties, see map of New Mexico.
† Formed since 1890 census.

Principal Cities and Towns, with Population for 1900.—Albuquerque, 6,238; Santa Fé, 5,603; Las Vegas, 3,552; Raton, 3,540; Gallup, 2,946; Silver City, 2,735; Roswell, 2,006; Alamogordo, 1,524; Socorro, 1,512.

Population and Races.—1860, 93,516; 1870, 91,874; 1880, 119,565; 1890, 153,593 (native, 142,334; foreign, 11,259; males, 83,055; females, 70,538; white, 142,719; colored, 10,874, comprising 1,956 persons of African descent, 361 Chinese, 3 Japanese, and 8,554 civilized Indians).

Industries and Business Interests.—The principal industries are silver, gold, and coal mining, stock-raising, and agriculture. Manufacturing is in its infancy. The census of 1890 showed that 127 manufacturing establishments reported. These had a combined capital of $965,938, employed 944 persons, paid $532,727 for wages and $691,420 for materials, and had products valued at $1,516,195.

Finance.—In 1900 the assessed valuation of taxable property was $38,452,181.30. The rate of taxation in 1897 was 10·80 per cent. against 7·75 per cent. in 1896. From Nov., 1896, to June, 1899, the revenues were $287,046.96; the expenditures for the same period were $347,315.15. The Territorial debt June 30, 1899, was $1,243,400; the total indebtedness of the counties, $2,997,665. On June 30, 1900, the total indebtedness, including county debt, was $4,178,123.09. There were also old militia warrants outstanding aggregating $650,000, a portion of which was believed to be fraudulent, and none of which is officially included in the statements of public indebtedness.

Banking.—On Sept. 5, 1900, there were 9 national banks, with a combined capital of $710,000, surplus and profits of $245,227.42, and deposits of $3,558,210.52; and on June 30, 6 State banks, combined capital $344,650; surplus and profits, $84,437; and deposits, $1,688,996.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 324 post-offices, of which 13 were presidential (3 second-

class, 10 third-class), 311 fourth-class, and 117 money-order offices. The newspapers and periodicals comprised 4 daily, 1 semi-weekly, 45 weekly, and 3 monthly; total, 53.

Libraries.—In 1892 there were reported 5 public libraries of 1,000 volumes and over, which contained 11,154 bound volumes and 3,230 pamphlets. The libraries were classified as follows; College, 3; law, 1; and garrison, 1.

Means of Communication.—The total railway mileage of New Mexico on June 30, 1899, was 1,706·12. In 1893 the Legislature passed an act exempting from taxation for six years after completion any new railway lines or extensions of existing ones begun and partially opened for traffic within three years.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	317	347	100,576	$296,755
Methodist Episcopal	32	22	1,750	71,200
Presb. in the U. S. of America	39	39	1,275	45,675
Methodist Episcopal South	25	25	548	32,600
Church of Jesus Christ of Latter-day Saints	5	5	442	1,432
Baptist	15	5	355	22,000
Congregational	4	4	175	17,800

Schools.—In 1891 the Legislature passed an act establishing a common-school system under direction of a board of education, consisting of the Governor, the superintendent of public instruction, and the presidents of the university, of the Agricultural College, and of St. Michael's College. According to the official report of Dec. 31, 1900, there were 52,652 children of school age, of whom 27,173 were enrolled in the public schools, and 15,832 were in average daily attendance. There were 506 schools, and 706 teachers whose average monthly pay is $39.19, many of whom taught both in English and Spanish; but English is required to be taught by law, and is taught in every public school in New Mexico. The total receipts for public-school purposes are about $200,000 annually. The institutions for advanced instruction are the University of New Mexico, at Albuquerque; Agricultural College, at Las Cruces; School of Mines, at Socorro; and the New Mexico Military Institute, at Roswell. Under the supervision and control of the Roman Catholic Church are public schools in Albuquerque, San Miguel, and Los Alamos; parochial and select schools in Albuquerque, San Miguel, Santa Fé, Mesilla, Los Alamos, and Las Vegas; St. Vincent's Academy, in Albuquerque; an academy in Silver City; Academy of Our Lady of Light, in Santa Fé; St. Joseph's Convent, in Fernandez de Taos; Annunciation Convent, in Mora; Academy of the Immaculate Conception, in Las Vegas; Academy of the Visitation, in Las Cruces; Convent of Our Lady of the Sacred Heart, in Bernalillo; Convent of Our Lady of Mount Carmel, in Socorro; and St. Michael's College, in Santa Fé; and a number of schools for Indian children.

Charitable, Penal, and Reformatory Institutions.—An orphan asylum, a hospital, and a sanitarium are maintained in Santa Fé under the direction of Roman Catholic Sisters of Charity. Silver City has a hospital conducted by the Sisters of Mercy. The New Mexico penitentiary and a public deaf and dumb asylum are maintained in Santa Fé.

History.—At the time of the discovery of the American continent New Mexico had a large and industrious population, either Aztec or Toltec, who had their walled towns, their stone dwellings several stories in height, their manufactures of cotton and wool, their rude but effective weapons of war, and who cultivated and irrigated the soil and gathered therefrom large crops. They were idolaters. The Spanish adventurers Alvar Nuñez, Marco de Niza, and Coronado penetrated to this region in 1537, 1539, and 1540. In 1581–82 the country was explored by Spanish adventurers, from whose account it was named New Mexico. Between 1595 and 1599 Juan de Oñate was sent thither by the Viceroy of Mexico to establish forts, colonies, and missions, and to take possession of the whole country in the name of the King of Spain. Oñate was successful, but in 1680 the Indians rose and drove the Spaniards out of the country. In 1698 the Spaniards regained a portion of their former power. In 1822 the inhabitants of New Mexico united with those of Mexico in throwing off the yoke of Spain, and thenceforward, until 1846, they were governed in the same way with the other states of Mexico. In 1846 Gen. Stephen Kearny, with a small U. S. force, captured Santa Fé, and soon after conquered the whole Territory and raised the U. S. flag there. In 1848 the region was ceded to the U. S. by the treaty of Guadalupe Hidalgo. By the treaty of Dec. 30, 1853, what was known as the Gadsden purchase was added to the Territorial area, which then comprised the whole of Arizona and a portion of what is now Colorado. Arizona was set off from it in 1863 and the portion of Colorado in 1865. During the early part of the civil war New Mexico was the scene of a protracted and bloody strife. In 1859 the Legislature passed a law recognizing the existence of slavery in the Territory, but this was repealed in 1861, and with it was abolished the system of peonage—a modified slavery which had existed for two and a half centuries.
