Efforts to secure the admission of New Mexico into the Union as a State were begun prior to its creation as a Territory. In 1874–75 both Houses of Congress adopted a bill to provide an enabling act for the admission of the Territory as a State, but some Senate amendments were not voted on in the House, and the bill failed. In 1876 the Senate again adopted its bill, but it was not acted on by the House during that Congress. Nothing further was done till the summer of 1894, when both Houses passed an enabling act. This bill made the usual provision for the formation and ratification of a constitution and the organization of a State government. It provided for the guarantee of perfect toleration of religious beliefs, for the assumption and payment by the State of the debts and liabilities of the Territory, and for the establishment and maintenance of a system of public schools free from sectarian control. The bill also appropriated 64,000 acres of land for the erection of public buildings at the capital; 100,000 acres for the support of an agricultural college; 500,000 acres for permanent water-reservoirs; 46,000 acres for the support of a State university; 100,000 acres for an insane asylum; 200.000 acres for State normal schools; 100,000 for a State school of mines; 100,000 for a deaf and dumb asylum; 100,000 for a State reform school; and 8,600,000 acres for miscellaneous purposes—in all, 9,910,000 acres.

GOVERNORS OF NEW MEXICO.

James S. Calhoun	1851–52	Lewis Wallace	1878–81
William C. Lane	1852–53	Lionel A. Sheldon	1881–85
Solon Borland	1853	Edmund G. Ross	1885–89
David Merriwether	1853–57	L. Bradford Prince	1889–93
Abraham Rencher	1857–61	W. L. Thornton	1893–97
Henry Conolly	1861–65	Miguel A. Otero	1897–
Robert B. Mitchell	1865–67		
W. F. M. Arny (acting)	1867–69		
William A. Pile	1869–71		
Marsh Giddings	1871–76		
Samuel B. Axtell	1876–78		

Revised by ANTONIO JOSEPH.

New Milford: town (founded in 1703); Litchfield co., Conn. (for location of county, see map of Connecticut, ref. 9–D); on the Housatonic river, and the N. Y., N. H. and Hart. Railroad; 16 miles N. of Danbury, 36 miles N. by W. of Bridgeport. It contains five churches, several public and private schools, library (founded 1886), a national bank with capital of $125,000, a savings-bank, a private bank, and a weekly newspaper. It is the center of the tobacco industry of the Housatonic valley, and has two hat-factories, a pottery, and minor industries. Pop. (1880) 3,907; (1890) 3,917; (1900) 4,804.

EDITOR OF "GAZETTE."

Newnan: city; capital of Coweta co., Ga. (for location of county, see map of Georgia, ref. 3–F); on the Atlantic and W. Point and the Cent. of Ga. railways; 39 miles S. of Atlanta. It contains 7 churches, 2 national banks with combined capital of $150,000, Walker High School, College Temple Library (founded 1853), and a weekly newspaper. There are harness, furniture, and cigar factories, marble-works, cottonseed-oil mill, ice-factory, cotton-mills, distilleries, a manufactory of engines, boilers, saw and grist mills, cotton-presses, and several tanneries. It is the center of a large fruit-growing and market-gardening region. Pop. (1880) 2,006; (1890) 2,859; (1900) 3,654.

II. had granted to his brother, the Duke of York, was conquered by the capitulation of New Amsterdam.

Newnham College: an institution at Cambridge, England, formed by the amalgamation of an association for providing lectures for women in Cambridge and an association for providing a hall of residence for women attending the lectures. It was incorporated in 1880. The college stands on a site of about 8½ acres, and contains accommodations for the principal and vice-principals, with resident lecturers, and about 140 students. The main buildings are Clough Hall, Old Hall, and Sidgwick Hall. The library numbers 7,400 volumes. The average number of resident tutors is ten, of students 150. In 1881 the University of Cambridge opened to students of Newnham and Girton Colleges its tripos and previous examinations. There is a system of instruction by correspondence in connection with the college. Instruction is provided for partly by lectures given at Newnham College, and partly by lectures of the university and the colleges of the university that are open to students. A complete course of study involves preparation for a tripos examination for which the usual length of residence is three years. There are a considerable number of scholarships of the annual value of £50. The first principal, Miss A. J. Clough, died in 1892, and was succeeded by Mrs. Henry Sidgwick, the wife of Prof. Sidgwick. Miss Helen Gladstone and Miss Jane Lee are the vice-principals. The college is governed by a council, most of the members of which are connected with Cambridge University. C. H. Thurber.

New Orleans [named in honor of the Duke of Orleans]: city; in Orleans parish, La. (for location, see map of Louisiana, ref. 10–F); on both banks of the Mississippi river, 107 miles from its mouth. It is 960 miles in direct line S. W. of Washington, and 700 miles from St. Louis. From the fact that it was originally built within a great loop of the Mississippi, the city derived its sobriquet of the Crescent City. The present form, due to gradual expansion along the banks of the river, is rather that of the letter S. The city embraces the whole of the parish of Orleans, or about 196 sq. miles; but the settled area hardly exceeds 44 sq. miles. The Mississippi in front of the city has a width in places of 3,000 feet, and a maximum depth of 208 feet; total length of actual harbor, 7 miles on each bank. The jetties at the mouth of the river permit vessels of the highest tonnage to come directly to the city. By a canal in the rear New Orleans has communication with Lake Pontchartrain. The chief railways are the Illinois Central, Southern Pacific, Louisville and Nashville, Texas and Pacific, New Orleans and Northeastern, and the Yazoo and Mississippi Valley. Of street-railways there are about 163 miles.

Plan and General Appearance.—New Orleans was laid out in rectangular form, with ramparts on three sides and a fort at each corner. The plan of the city is now very irregular, as the streets follow the curving lines of the river. The land is low and flat, its greatest elevation being 10 ft. 8 in. above sea-level. It is protected from the waters of the river by a high levee; but during the spring floods these waters occasionally overflow and submerge portions of the city. The drainage is toward the lake, which in times of high wind overflows the settlements in the rear of the city.

The city is divided by Canal Street into two portions, the Creole and the American. In the Creole quarter or *Vieux Carré* the streets are narrow and the houses are welded into compact blocks, except at the lower extremity, or Esplanade Avenue. It is, however, the most interesting portion of the city, for here are the old cathedral, the Cabildo, and many other relics of French and Spanish domination. In the American quarter, besides the business portion, are residences surrounded by stretches of green turf, beds of flowers, and clustering trees, among which are the great magnolia, the palmetto, the palm, the fruit-bearing banana, the fig, and the orange-tree. The climate is tropical. The proximity of the lake and the river renders the atmosphere very moist and equalizes the temperature. The highest average summer temperature is 94° F., and the lowest average in winter is 27° F. The total length of the streets is about 750 miles, of which only about 205¾ miles are paved.

The area of public squares and parks is about 660 acres. Chief among the parks are the City Park and Audubon Park, at the western end of the city, which contains 250 acres and was the site of the Cotton Exposition of 1884–85. There are, besides, numerous well-kept open squares, among them Congo Square, where the slaves once held the voodoo rites, Lafayette Square, which fronts the city-hall, and Jackson Square, the old Place d'Armes, the scene of some of the most important events in Louisiana history.

Buildings.—Among the notable buildings are the U. S. custom-house and post-office, covering a whole square and built of granite; city-hall, of granite, modeled after the Temple of Minerva at Athens; the cathedral on Jackson Square, the Supreme Court buildings (old Cabildo), the mint, the cotton exchange, the archbishop's palace, the Howard Library, and the new buildings of Tulane University. The Howard Memorial Hall is a repository for Confederate relics. The St. Charles Hotel, the most famous hostelry in the South, was destroyed by fire in 1894, but was rebuilt on a larger scale in the following year. The old St. Louis Hotel, in "reconstruction" days the State Capitol, afterward a famous hotel, is not now in use.

As water is usually found at a depth of a few feet, burial of the dead is in most places impossible, and it is customary to place the remains in tombs of brick or marble rising in several tiers above ground.

Churches and Schools.—There are 124 churches for whites and 83 for colored persons. The public-school system is supported partly by a municipal appropriation of $75,000, but chiefly from the income of a fund established in 1850 by John McDonogh, and now amounting to about $1,000,000. There are 55 public schools for whites and 10 for negroes; and there are 145 private schools for whites and 14 for negroes. The public-school enrollment is: Teachers, 752; pupils, 31,521, of whom 6,000 are colored. The total value of the public schools is $1,600,000. There are no mixed schools.

The only university for white people is Tulane University (*q. v.*). There are four universities for colored people: Southern University, a State institution which receives $10,000 a year from the State; Straight University, Congregational, established in 1869 by the American Missionary Association; New Orleans University, opened in 1865 and supported by the Freeman's Aid Society of the Methodist Church; and Leland University, Baptist, incorporated in 1870. Among the colleges for white people are Soule's Business College, the College of the Immaculate Conception (Jesuit), and Ursuline Convent for women (Catholic), founded early in the eighteenth century.

Charitable Institutions.—The most notable charitable institution is the Charity Hospital, built in 1832, which receives from the State $80,000 annually. It contains 850 beds, and handles annually about 7,000 patients. The Touro Infirmary was endowed by a Hebrew philanthropist, Judah Touro, and costs for maintenance about $30,000 annually; it accommodates about 400 patients. There is also a Jewish Home for Widows and Orphans. The institutions supported by the city are the Home for Aged and Infirm, House of Refuge for Boys, and an insane asylum. The charitable institutions maintained by the Catholics are numerous and important. Among them may be mentioned the New Orleans Female Orphan Asylum, St. Vincent's Infant Asylum, St. Elizabeth's Asylum, and the House of the Good Shepherd. The Seventh Street Protestant Orphans' Home is a large institution. The Thomy Lafon Asylum for Boys and the Lafon Home for the Aged are for colored people; they were founded by a colored philanthropist.

Libraries.—The chief public libraries are the State, which contains 39,000 volumes, exclusively on legal subjects; the Howard, 30,000 volumes; and the Fisk Free and Public Library, 28,000 volumes.

Finances.—The city comptroller's report for 1900 gave the following figures: Receipts, $2,427,784.30; expenditures, $2,351,847.88. The bonded debt is $14,132,530, exclusive of a fund of $12,000,000 voted for drainage at an election held in 1899. The valuation of real estate is $103,000,000, of personal property $38,000,000—total, $141,000,000. The city tax-rate is $2.20 per $100; the State tax-rate, $7 per $1,000.

Commerce.—The exports in 1900 were valued at $118,858,764; the imports at $17,490,811. The tonnage of vessels engaged in the foreign export trade entered was 1,627,478 tons; cleared, 1,676,027 tons; in the coastwise trade entered, 518,127 tons; cleared, 511,918; tonnage of foreign vessels in the coastwise trade entered, 56,604 tons; clearances, none. The total exports of cotton in 1900 aggregated 1,667,126 bales, valued at $65,648,390. The exports of breadstuffs were valued at $20,139,504; the exports of tobacco at $35,431,945. The valuation of domestic products received by river, lake, and rail was $162,430,412.47. The amount of freight received by the railroads was 2,568,543 tons, and the amount forwarded 3,270,054.

Manufactures.—Statistics of manufactures are not regularly kept. In 1900 the refineries made 744,392 tons of refined sugar; the rice-mills barreled for market 113,064,268 pounds of rice; 80,000 tons of cottonseed, valued at $1,160,000, were manufactured into oil and cake; and 79,500,000 feet of lumber and staves, valued at $2,779,000, were manufactured. The manufactured tobacco was valued at $31,749,642. There were 6 breweries, 14 shoe-factories, 22 clothing-factories, 20 cotton-presses, and many other large manufacturing concerns.

Drainage and Sewage.—Steps are now being taken to provide the city with modern systems of drainage and sewage, and bonds to the amount of $12,000,000 have been voted to carry out these works. The preliminary work on the drainage system was begun in 1893, but the actual work not till Sept., 1897. The plan comprises a large main-canal in Broad Street, along the lowest level in the city-limits; a system of lateral canals fed by branch canals, and supplemented by surface gutters. The total cost will be $7,933,691. The drainage is pumped into Bayou Bienvenu by five pumping stations, equipped with pumps having a capacity of 250 feet per second and a lift of 10 feet. The preliminary engineering work has been completed for the sewage system, but no actual work has been done. The sewage will be discharged into the Mississippi river. Plans are also being made to supply the city with drinking-water from the Mississippi. This will involve the construction of a filtering plant with a capacity of 40,000,000 gallons per day. At present the city depends upon rain-water caught and preserved in wooden vats or cisterns.

Banking.—In 1900 there were 8 national banks and 5 State banks, having a combined capital of $4,880,200; 3 savings-banks, with capital of $300,000; 2 private banks and a commercial bank. The bank clearances for the twelve months ending June 1, 1900, were $595,157,688.33.

The Mardi-gras Carnival.—A unique feature of New Orleans is the annual celebration of the carnival, which takes place on Shrove Tuesday, or Mardi gras. It originated some twenty years before the civil war, but since then the celebration has been on a grander scale. It compares with the carnivals of Nice, Rome, and other continental cities, and annually attracts to New Orleans thousands of visitors.

History.—The city was founded in 1718 by Sieur de Bienville, second governor of Louisiana under the French domination; was named in honor of the Duke of Orleans, regent of France; and was the capital of Louisiana in 1722–1852 and 1865–80. For many years the city experienced the usual vicissitudes of French colonial settlements. On the transfer of the province to Spain, the city was the scene of an unsuccessful conspiracy to establish a republic. In the last decade of the eighteenth century the invention of Whitney's cotton-gin and the successful granulation of sugar by de Boré gave a vast impetus to the progress of the State and city. In 1801 the production of sugar rose to 5,000,000 lb., and of molasses to 250,000 gal., and the exports of cotton were 34,000 bales. The purchase of the Louisiana territory further stimulated local development.

The early settlers were a motley collection. All classes and conditions were represented, from the French and Spanish officials to the sturdy *coureurs de bois*, or Canadian adventurers. At first some women from the houses of correction in France were sent over as wives for the colonists; but fortunately these were supplemented by the famous *filles à la cassette*, or casket girls, who were of good family and good morals, and who made excellent wives. Soon after Louisiana became a part of the U. S. there was an influx of persons from other parts of the republic seeking their fortunes, as well as a large number of French planters and their slaves from Santo Domingo. The Creoles, or descendants of French and Spanish ancestors, gradually assimilated themselves to U. S. institutions, and fought bravely against the British in the battle of New Orleans.

The battle-field of Chalmette lies 5 miles below the city. When the approach of the British forces was announced, Gen. Andrew Jackson had been busy in New Orleans for three weeks in reviewing and disciplining the militia and other troops, and as he had been informed that there were spies in the city he proclaimed martial law. On Dec. 23, 1814, he marched out of the city and boldly attacked the enemy on the evening of the same day. The British had nearly 5,000 men, while Jackson had only 2,100, though the latter received material assistance from the Carolina, a U. S. gunboat, which anchored opposite the British camp and bombarded it. The action was indecisive, but it retarded the progress of the British and gave Jackson the necessary time to fortify the plain of Chalmette. On Jan. 8, 1815, the British made a final attempt to storm Jackson's breastworks, and were repelled with great slaughter.

The city experienced great losses during the years 1812–15 from the suspension of banks and other financial troubles, but from 1816 to 1840 there was a period of marvelous expansion. The arrival in 1812 of the first steamboat marked the beginning of an immense trade with the Mississippi valley, and large crops of sugar and cotton were raised. The only impediments to growth were the almost annual overflows of the Mississippi and the terrible epidemics of yellow fever. In twenty-seven years fifteen of these epidemics occurred, together with a visitation of the cholera in 1831. In 1834 gas was introduced, and in 1836 a system of water-works. In 1837 New Orleans suffered greatly from the financial panic. Fourteen of its banks suspended in one day; but with a return to more cautious business methods there came a restoration of confidence and more prosperity than before. The cotton exports rose to 1,000,000 bales, and the population was tripled in ten years, causing an enlargement of the corporate limits. In 1841–42 a system of free schools was established; in 1853–55 there were visitations of yellow fever, and of a population of 150,000 nearly 37,000 persons died; in 1860 the city reached the acme of its prosperity, the exports, imports, and domestic products amounting in value to $324,000,000.

In 1862 Louisiana was closely blockaded by a Federal fleet under Admiral Farragut. On Apr. 24 he succeeded in passing the forts that defended the river, and on the following day he anchored in front of the city. In order that the enemy might not profit by the stores laid up in the city, 12,000 bales of cotton had been piled upon the levee and set on fire, and hundreds of barrels of sugar and molasses were added to the burning mass. After a few days of negotiation the city surrendered and was handed over to Gen. B. F. Butler, who had followed Farragut with a large army. After the period of "reconstruction" New Orleans renewed its career of prosperity. Moreover, the manufacturing interests, which before the war were insignificant, now rapidly grew more important.

In 1897 and 1898 yellow fever appeared in the city, but in so mild a form as to deprive the outbreak of all its terrors. The death-rate during these years was, respectively, 24·47 and 24·82. These figures were below the normal, the death-rate for 1896 having been 27·61, and for 1899 26·31 per thousand of the population. The death-rate of the city for 1899, excluding deaths in the Charity Hospital (which receives patients from other parts of Louisiana and from Mississippi and Texas, as well as from the city), was 17·24 per thousand. Pop. (1880), 216,000; (1890) 242,039; (1900) 287,104. JOHN R. FICKLEN and JOHN S. KENDALL.

New Philadelphia: city; capital of Tuscarawas co., O. (for location of county, see map of Ohio, ref. 4–H); on the Tuscarawas river, the Ohio Canal, and the Cleve., Lorain, and Wheel. and the Penn. railways; 24 miles S. by W. of Canton, 98 miles N. of Marietta. It is in a coal, iron-ore, and salt region; has a national bank with capital of $50,000, 3 private banks, and 5 weekly newspapers; and has manufactories of agricultural implements, woolen goods, roofing tile, wire nails, iron pipe, sewer-pipe, brooms, flour, carriages, paper, and machinery. Pop. (1890) 4,456; (1900) 6,213.

New Philippines: The CAROLINE ISLANDS (*q. v.*).

New Pomerania (in Germ. *Neu-Pommern*; native *Birara*), formerly **New Britain**: the largest island of the Bismarck Archipelago. It lies off the northeast coast of New Guinea, from which it is separated by a strait 50 miles wide, extends E. and W., and is about 300 miles long, with 75 miles of greatest breadth; area about 9,000 sq. miles. It is composed of several mountainous masses connected by low land, and the isthmus that connects the body of the island with the northeastern part, called Gazelle Peninsula, is very narrow. The mountains are more or less volcanic, especially at the ends of the island. Several volcanoes are active, and a severe eruption occurred in 1878. The island is very picturesque. The contours of the mountains are attractive, the vegetation is luxuriant, and the foliage rich with a variety of tints. The climate is like that of New Guinea. The southeastern monsoon occurs from May to September, and is accompanied by heavy rains. The dry season is with the northwestern monsoon during the rest of the year, but it is frequently broken by rain. The inhabitants are Melanesian, less attractive than these people generally are. They are

warlike, and are cannibals. They possess considerable manual talent, and carry on some commerce with the neighboring islands. The S. coast is the more densely populated. The population is estimated at 100,000. They were placed under German protection in 1884. M. W. Harrington.

Newport: town; in the county of Monmouth, England; on the Usk; 145 miles W. of London (see map of England, ref. 12–F). It has a very large export trade in coal and iron, over 80 acres of docks, iron-foundries, and manufactures of India-rubber, pottery, etc. In 1839 a Chartist insurrection in which ten persons were killed occurred here. Pop. (1901) 61,474.

Newport: city (settled in 1791); Campbell co., Ky. (for location of county, see map of Kentucky, ref. 1–I); on the Ohio river at the mouth of the Licking river, and on the Louis. and Nash. and the Ches. and Ohio railways; opposite Cincinnati, O., and Covington, Ky., with both of which cities it is connected by railway and foot and wagon bridges. It contains 22 churches, 3 national banks with combined capital of $400,000, gas, electric light, water, sewerage, and street-railway services, public park, Masonic temple, Odd Fellows' library (founded 1868), and a weekly and monthly periodical. The industries include the manufacture of iron and steel, nuts and bolts, watch-cases, stoves, shoes, and piping. The Highland suburbs are very picturesque, and contain the costly residences of many Cincinnati business men. Pop. (1880) 20,433; (1890) 24,918; (1900) 28,301.

Editor of "Journal."

Newport: town (settled in 1763); capital of Sullivan co., N. H. (for location of county, see map of New Hampshire, ref. 8–D); on the Sugar river, and the Boston and Maine Railroad; 40 miles W. by N. of Concord. It contains 5 churches, the Richards Free Library, Antiquarian building, public high and graded schools, and 2 weekly newspapers, and has manufactories of boots and shoes, flannel goods, ladies' underwear, woolen goods, and lumber. It is a summer resort, and 5 miles distant is Austin Corbin's noted Blue Mountain Park. Pop. (1880) 2,612; (1890) 2,623; (1900) 3,126.

Editor of "Argus and Spectator."

Newport: borough (laid out by Paul, John, and Daniel Rider and named Ridersville in 1805; name changed to its present one in 1820; incorporated as a borough in 1840); Perry co., Pa. (for location of county, see map of Pennsylvania, ref. 5–F); on the Juniata river, the Pennsylvania Canal, and the Penn. and the Newport and Sherman Val. railways; 6 miles N.E. of New Bloomfield, the county-seat; 28 miles N. W. of Harrisburg. It is in a grain-growing region; contains 6 churches, 7 public schools, 2 hotels, a national bank with capital of $50,000, a private bank, water-works completed in 1893, and 2 weekly newspapers; and has planing, saw, and grist mills, iron-furnaces, and tanneries. Pop. (1880) 1,399; (1890) 1,417; (1900) 1,734.

Editor of "Ledger."

Newport: city; formerly a capital of the State of Rhode Island, capital of Newport County, and port of entry (for location, see map of Rhode Island, ref. 5–H); on Narragansett Bay, and the Newport and Wickford and the N. Y., N. H. and Hart. railways; 5 miles N. of the Atlantic Ocean, 19 miles S. by W. of Fall River, Mass., 30 miles S. of Providence. It was settled by colonists from Roger Williams's party in 1638 and by Quakers in 1643; was chartered with Providence and Portsmouth under the name of Providence Plantations in 1643; was one of the most important commercial points in the colonies prior to the Revolutionary war, and for some years preceding 1769 had a larger foreign commerce than New York; was captured by the British on Dec. 6, 1776, and occupied till Oct. 25, 1779; and was the headquarters of Rochambeau's French fleet in 1780. It has become one of the most popular places of summer resort in the U. S. Besides its location on a grand and commodious harbor, its bathing facilities, its superb drives and costly summer residences, it has many natural attractions and several objects of large historical interest. The harbor is defended by modern fortifications at Fort Adams, Fort Greble, and Fort Wetherell, the last named on the site of the old Dumplings, where a Revolutionary fort formerly stood. The Hanging Rocks, Spouting Cave, and the chasm, 50 feet deep, locally known as Purgatory, attract many tourists. On Coaster's Harbor island are the U. S. Naval Training Station and Naval War College, and on Goat Island the U. S. Naval Torpedo Station. Newport claims, and the claim is disputed by Providence, to have had the first Baptist church building erected in America (1640). The city also claims to have had the first public school opened in America (1640) and the first synagogue (1762), and to have the oldest newspaper in the U. S., the *Mercury*, established by James Franklin, a nephew of Benjamin, in 1758. Among the notable buildings are the Old Stone Mill, or Round Tower, in Touro Park, said by some antiquaries to have been built by the Norsemen 500 years before the arrival of Columbus, and by others to have been the stone windmill of Gov. Benedict Arnold, mentioned in his will; Trinity church (Protestant Episcopal, erected 1725); First Baptist church (erected 1735); the Redwood Library (erected 1750); State-house (erected 1742); old city-hall (erected 1763); Jewish synagogue which, with its ancient cemetery, is cared for from the income of a special trust fund bequeathed by the late Judah Touro; the Channing Memorial church; the Perry mansion; a new city-hall; the Public Library and the Home for Friendless Children (both founded by Christopher Townsend); and the Industrial School. Touro Park contains a bronze statue of Com. Matthew C. Perry, the gift of Mrs. August Belmont, and a statue of William Ellery Channing; Washington Square, one of Com. Oliver H. Perry; and Equality Park, a Soldiers' and Sailors' Monument. The city has regular steamboat communications with New York and Providence. There are 26 wharves, 16 churches, 10 public-school buildings, the Rogers High School (endowed by William S. Rogers with $100,000), 14 public fountains, 4 libraries (People's, Newport Historical Society, Redwood, and Fort Adams Post) containing over 70,000 volumes, 6 national banks with combined capital of $795,250, 2 State banks with capital of $175,000, 3 savings-banks, electric street-railway, public park (land presented by Levi P. Morton in 1886), and 2 daily and 2 weekly newspapers. In 1900 the assessed valuations were: Real estate, $32,171,300; personal, $7,600,700—total, $39,772,000; and on Jan. 1, 1901, the net bonded debt was $912,000. The city owned property valued at $816,170. Pop. (1880) 15,693; (1890) 19,457; (1895) 21,537; (1900) 22,034.

Editor of "News."

Newport: town (incorporated in 1781, settled in 1793, chartered under the name of Ducasbow in 1802, name changed to present one in 1816); capital of Orleans co., Vt. (for location, see map of Vermont, ref. 2–D); on Lake Memphremagog (*q. v.*), and the Boston and Maine and the Canadian Pac. railways; 44 miles N. by W. of St. Johnsbury. It contains 5 churches, 1 high, 2 graded, and 15 district schools, several manufactories, and a weekly newspaper: is a popular summer resort; and is in an agricultural region. Pop. (1880) town, 2,426, village, 920; (1890) town, 3,047, village, 1730; (1900) town, 3,113, village, 1,874.

Publisher of "Express and Standard."

Newport News: Va.; town, port of entry (for location, see map of Virginia, ref. 7–I); on the James river, Hampton Roads, and the Ches. and Ohio Railway; 14 miles N. of Norfolk, 70 miles S. E. of Richmond. It is in a rich trucking section, has one of the best harbors in the world, and is connected with Hampton and Old Point Comfort by two electric railways. It has an extensive ship-building plant employing 6,000 hands, with dry docks large enough to take in the largest steamships; extensive warehouse piers; two grain elevators with a capacity of 2,850,000 bush.; improved system of water-works, electric-light and gas plants, 5 wood-working mills, ice-factory, a national bank with capital of $100,000, a State bank with capital of $100,000, a private bank, and several guarantee and trust companies, and 3 weekly and 4 daily newspapers. The foreign commerce of the port is carried on principally by the Chesapeake and Ohio Railroad and the United States Shipping Co., making direct connection with England and other European countries, and in grain shipments the port has become the fourth in the U. S. In the calendar year 1900 the exports of domestic merchandise amounted to $35,000,000. Pop. (1890) 4,449; (1901) estimated, 19,500.

John Whitehead.

New Providence: See Bahama Islands.

New Red Sandstone: an important geologic formation of Great Britain. The rocks included under this term belong partly to the Triassic period and partly to the Permian epoch, which is usually regarded as part of the Carboniferous period. For many years the name of the British formation was used to designate a unit of the geologic time scale, and formations in other countries, especially America, received the same name. This usage survives to a great extent in Great Britain, but is obsolescent elsewhere. The

American formation to which the name was most frequently applied is now called NEWARK SYSTEM (*q. v.*). See also OLD RED SANDSTONE. G. K. GILBERT.

New Richmond (RICHMOND JUNCTION Station): village; Clermont co., O. (for location of county, see map of Ohio, ref. 7–C); on the Ohio river, and the Cin., Portsmouth and Va. Railroad; 20 miles E. of Cincinnati. It contains 7 churches, a Roman Catholic and 2 public schools, a national bank with capital of $80,000, and a weekly newspaper, and has woolen, saw, and grist mills, 2 furniture-factories, foundry, and brick and cooperage factories. Pop. (1880) 2,545; (1890) 2,379; (1900) 1,916.

EDITOR OF "INDEPENDENT NEWS."

New Richmond: city (settled in 1855, incorporated as a city in 1885); St. Croix co., Wis. (for location of county, see map of Wisconsin, ref. 4–A); on the Willow river, and the Chi., St. P., Minn. and Omaha and the Wis. Cent. railways; 18 miles N. E. of Hudson, the county-seat, 35 miles N. E. of St. Paul, Minn. It is in an agricultural region, is a milk, cream, and butter center, and the principal industries are lumbering, flour and feed milling, and the shipping of live stock, grain, and farm produce. There are 8 churches, a public and a Roman Catholic parochial school, each graded and with a high-school department, 2 State banks with combined capital of $85,000, electric-light plant and waterworks owned by the city, and 2 weekly newspapers. Pop. (1880) 729; (1890) 1,408; (1900) 1,631.

EDITOR OF "REPUBLICAN."

New Rochelle: village; Westchester co., N. Y. (for location of county, see map of New York, ref. 8–J); on an inlet of Long Island Sound, locally known as New Rochelle harbor, and on the N. Y., N. H. and Hart. Railroad; 20 miles N. E. of the New York city-hall. Its situation and proximity to the metropolis make it the place of permanent residence of many New York business men and a popular summer resort. The village contains several colonial Dutch and English mansions, public-school property valued at over $100,000, a State bank with capital of $30,000, and four weekly newspapers. Pop. (1880) 5,276; (1890) 9,057; (1900) 14,720.

New Siberian Islands: an archipelago N. of Asia and N. E. of the mouth of the Lena delta, so called from the name given to one of them (1806) by a Russian merchant. Being not far distant from the mainland and often connected with it by an ice-bridge, the fauna of these Arctic islands is particularly rich, and includes white bears and foxes, reindeer, and many birds. The islands are also rich in fossil woods and the remains of extinct animals, notably those of the mammoth. In the island of New Siberia is a range of hills, partly composed of carbonized wood, apparently belonging to the Jurassic period. See De Long, *The Voyage of the Jeannette* (2 vols., 1883); Nordenskjöld, *The Voyage of the Vega* (1886). C. C. ADAMS.

New South Shetland Islands: See SOUTH SHETLAND ISLANDS.

New South Wales: the oldest of the seven Australasian colonies of Great Britain. It is the middle colony on the east coast of Australia, with Queensland on the N., South Australia on the W., and Victoria on the S. It lies between lats. 28° and 38° S. and the meridians 141° and 154° E. The western boundary is the meridian of 141° E.; most of the southern is formed by the Murray river, and of the northern by the parallel of 29° S. lat. The area is given officially at 310,700 sq. miles, but planimetric measures make it 308,560. It is a fifth larger than Texas and larger than any state of Europe, Russia only excepted. Three distant and isolated islands—Norfolk, Pitcairn, and Lord Howe—are politically under the supervision of the governor. Their combined area is less than 15 sq. miles.

The name of New South Wales was given to Southeast Australia by Capt. Cook, on his exploratory voyage in 1770, from a fancied resemblance of the coast to that of South Wales. It was afterward applied to the first colony, which took in all Australia E. of the 135th meridian, and was later cut down to its present limits.

Physical Configuration.—The coast is over 700 miles long, with numerous capes, headlands, and bays. It extends N. to Point Danger and S. to Cape Howe. Many of the bays are excellent natural ports. Of these, Port Jackson, about the middle of the coast, has attained the greatest commercial importance, as on it is situated Sydney, the capital. A little farther S. is BOTANY BAY (*q. v.*). Many rivers from the mountains inland empty at the coast, where their mouths give a series of ports capable of improvement by the removal of their sandbars. At the mouth of the Hunter river is Newcastle, the port second in importance.

The surface of the colony falls naturally into three divisions—the coast lands, the table-lands just behind these, and the great interior plains. The coast lands embrace the strip between the coast and the Great Dividing Range of mountains, which runs nearly parallel to the coast, and is from 20 to 120 miles distant from it, farther at the N. than at the S. They are usually flat, fertile, and well adapted to agricultural operations. The eastern versant of the mountains is generally rugged and sometimes precipitous, while the streams that descend it are generally rapid and shallow, and flow through deep and rugged valleys. Of the fourteen rivers on this slope, the longest are the Hawkesbury (330 miles); the Hunter (300 miles); the Shoalhaven (260 miles); and the Clarence (240 miles). Many of these streams form large lagoons at their outlets.

The Great Dividing Mountains include several distinct ranges. At the S. the Australian Alps come in from Victoria. They are the highest mountains in Australia, and the culminating point is Mt. Kosciusko, 7,350 feet high, in the extreme S. of this colony near the headwaters of the Murray river. Though it does not reach the perpetual snow-line by several hundred feet, snow is seldom entirely absent from it. The next range on the N. is that of the Blue Mountains, so called from the tint of the eucalyptus forests which clothe their sides. They are not sharply divided from the Alps, but they are lower and their crest is broader, forming practically a series of table-lands. N. of the Blue Mountains is the Liverpool Range, striking a bold arc from the coast inland to beyond the Darling river. Farther N. is the New England Range, which resumes the direction, parallel to the coast, broken by the Liverpool Range. Inland from the New England Range is a mountain complex, of which the highest known is Ben Lomond (5,070 feet high). The chain is in places 60 or 80 miles wide.

W. of this is the great interior basin of the Darling river. Next the mountains it is well forested and well watered, but with progress westward it becomes smoother, the trees disappear, and the water becomes more scanty. This is the salt-bush country, consisting of red loamy plains with loose soil, with some grass which dries up and disappears in the dry season, and with abundant growth of ill-looking weeds and low brush. This area stretches in the N. into Queensland, and in the W. it is separated from the still more alkaline and arid interior of the continent by broken ranges of low mountains, called the Barrier or Stanley Mountains and the Grey Range. The interior basin is not far above sea-level (300 to 500 feet), but in it are found the great rivers of the continent. The Murrumbidgee (1,350 miles long) and the Lachlan (700 miles) are right-hand affluents of the Murray. The Darling river rises in the northeast angle of the colony, and empties into the Murray near the southwest angle after a course of 1,160 miles. Its right-hand tributaries are in several cases longer than it is itself above their respective mouths, and rise far N. in Queensland. Of the left-hand tributaries which lie in New South Wales the most important are the Macquarie (750 miles long); the Namoi (600 miles); the Bogan (450); and the Gwydir (445). These streams receive very few affluents after leaving the mountains in which they rise, and as they pass through an arid region they are commonly smaller below than above. Sometimes they fail to reach the stream to which they ordinarily contribute. In the N. W. there are many streams which are permanently lost in lagoons or in the sand.

Climate.—The climate is as distinct for the three districts of the coast, mountains, and the interior basin as are the physical features. The coast climate is warm and moist, and is rendered mild and agreeable by an ocean current which passes along it from N. to S., tempering both summer and winter. The mean annual temperature in the coast lands ranges from 60° F. in the S. to 68° in the N., and is somewhat higher a few miles inland than on the immediate coast, on account of the sea-breeze extending but a short distance inland. The summer mean temperatures range from 67° to 76° F., and the winter from 51° to 56°. At Sydney, lat. 33° 51′ S., the mean annual temperature is 63°, that of summer 71°, and that of winter 54·5°. The rainfall is heaviest on the coast, and increases from S. to N. from 36 to 73 inches annually. At the base of the mountains it is 10 or 15 inches less. The rainy season comes in late summer, and the fall is sometimes torrential.

In the mountain district the temperatures are as varied as the elevations. In inhabited altitudes the mean annual temperatures run from 46° around Mt. Kosciusko to 60° in the N. Frost and snow are well known in the S. The mean annual rainfall is more uniform from S. to N. and varies from 25 to 35 inches.

In the interior valley the rainfall varies from 25 inches in the E. to 9 or 10 in the extreme W., and this is likely to fall in heavy rains. The summers are hotter and the winters colder than on the coast, while the mean annual temperature is not very different. The drier air makes the extremes more endurable, and the climate is considered tonic.

In general, the winters throughout the colony are especially mild. Occasionally hot winds from the interior make a great discount on the character of the climate, as also do the "southerly busters," a wind like the Texan northers. On the whole, the climate is healthful and agreeable, and the only serious maladies depending on it are dysenteries and inflammation of the eyes.

Flora and Fauna.—These have the general Australian character and are not sharply divided from those of the adjoining colonies. The flora gives the impression both of novelty and monotony. The director of the Sydney Botanic Gardens has said that no country gives a greater variety and abundance of trees yielding strong, beautiful, and durable timber than New South Wales, and claimed that good timber can be obtained in all parts of the colony, except in some areas of the Monaro, Murrumbidgee, and Murray districts. The banks of the coast rivers, especially, are thickly covered with forest trees. In the W. they are reduced to scrub, except where the ground is subject to overflow. The forests are largely composed of *Myrtaceæ*, characteristic among which are a numerous species of eucalyptus. The members of the Pea family and the composites are especially common, and of the genus *Acacia* the colony has over 100 species. The alpine flora is less different from that of the rest of the world, and a considerable number of its species are the same as those of Europe. The grasses of the interior are especially nutritious for stock, which in cases of drought may find sustenance in the saltworts, composites, umbellifers, and plants of the Geranium family. Five species of palms extend southward into the colony, two of them beyond Sydney.

The native mammals are marsupial, with very few exceptions, and there are many fossil marsupials of enormous size. The domestic animals have all been introduced. A less desirable immigrant was the rabbit, which has multiplied so enormously as to have become a serious pest. Among the birds, many families elsewhere familiar, as the vultures and woodpeckers, are unknown. Among the more characteristic species are the emu, bustard, brush turkey, lyre-bird, honey-sucker, and morepork. Lizards are very numerous, crocodiles unknown, and while some families of well-known poisonous snakes are wanting, their places are taken by others equally dangerous. Insects are especially numerous and varied, though butterflies are represented by relatively few species. Fish are abundant, but the fisheries are little developed. One species of shark receives its name from Port Jackson. Oysters abound, are of good quality, and are for sale throughout the year.

Minerals and Mines.—Gold has been found at many places, especially in the mountain district. It had long been known to exist, but it was not until 1851 that it was found in such paying quantities as to attract general attention. This was in the Ballarat district, now in Victoria, which colony and Queensland now surpass New South Wales in the annual output of gold, but some remarkable finds have been made in the latter colony. About 1881 a nugget was found on the Temora which weighed 116 lb., and in 1851 one was found on the Turon which weighed 106 lb. In 1873 a mass of ore weighing 630 lb. was exhibited, which was estimated to contain £2,000 worth of gold. It was from Hill End. The total value of the gold coined and exported from 1851 to 1899 inclusive is £47,546,013, but the production is at present decreasing. Of silver and silver-lead ore, New South Wales produces more than 90 per cent. of all the silver in the Australasian colonies. The leading mines are at Boorook, in the New England district, near Bathurst, W. of Sydney, and in the Western Barrier Range. The last is a recent discovery and has already proved to be of immense value. In 1899 the output was 692,036 oz. of silver, and 444,627 tons of silver-lead ore. The total value of silver and silver-lead ore exported to the end of 1899 was £27,882,997, and the annual output is increasing. Copper ore was discovered in 1858, and is known to come to the surface in many places. The total output to the end of 1899 has been to the value of £5,019,480. Tin is found in the granitic and basaltic regions in the extreme N., and has been profitably worked since 1872. The output to the end of 1899 was of the value of £6,382,538, but the annual production is now decreasing. The tin has so far been taken from alluvial deposits in existing or ancient stream beds, but this source has now been exhausted and lode-mining undertaken. The stanniferous area probably covers 10,000 sq. miles. Coal was discovered in 1797, but no serious attempt was made to mine it for fifty years. The coal measures extend along the seacoast from lat. 31° 30′ to lat. 35° 30′ S., and are exposed above sea-level at each end. The seams of coal are nearly horizontal and are from 3 to 40 feet in thickness. The total area underlaid by the coal measures is estimated at 24,000 sq. miles. The output of coal is greatest at Newcastle, on the Illawarra coast, and at the western foot of the Blue Mountains. The Illawarra coal is more anthracitic. A sort of cannel coal, called kerosene shale, is mined for use in enriching illuminating gas. In 1847 40,732 tons of coal were raised in the Newcastle region, and this was the total output for the year. This has grown steadily, until in 1899 there were 88 coal mines employing 10,339 men, with an output of 4,597,028 tons of coal. The value of the total production to the end of 1892 was £35,647,004. Iron exists in abundance, and many of the rarer metals are known. The diamond, sapphire, emerald, ruby, opal, and many other precious stones have been found, and building-stones, limestone, fireclay, and clay for brick and pottery are abundant. In 1899 there were 42 smelting furnaces in operation, and 46,159 persons were employed in mining and smelting.

Agriculture.—The industrial life of the colony began in grazing, and pastoral pursuits still continue to form an important element of its wealth. West of a line drawn from lat. 36° S. and lon. 145° E. to lat. 29° S. and lon. 150° E. the land is almost exclusively pastoral, and there are many considerable areas of pastoral land E. of this line. In the pastoral district the climate is so mild that stock require no feeding in winter. The sheep district is to the W. of the line above mentioned. The chief limitations to the development of the flocks are the general aridity and the occasional droughts. Careful breeding for nearly a century has developed an especial race of Australian merino sheep with several good qualities, aside from adaptation to the climate. They are rather more free from disease than other breeds. The land in the pastoral region is largely owned by the state and rented to the graziers. The total number of sheep on Jan. 1, 1900, was 36,213,514. The chief dairy district is on the coast S. of Sydney. Pleuro-pneumonia has become epidemic among the cattle several times and proved very destructive. The total number of horned cattle on Jan. 1, 1900, was 1,967,081. Horses are raised for home use and for the supply of the cavalry in India. Swine are apparently reared only for domestic use.

About 0·5 per cent. of the land is under cultivation, and this is principally in holdings of less than 500 acres. The laws are favorable to *bona-fide* settlers for the acquirement of the title to lands in small holdings. The chief crops are wheat, maize, barley, oats, potatoes, hay, tobacco, sugar, wine, and oranges. Lucerne is much used for hay, and in the Hunter river district six crops are taken annually. Much wheat, oats, and barley is cut for forage. Wheat is grown less than formerly because of the rust, and the production is now insufficient for home needs. The average yield is 13 bush. per acre, while for all Australasia it averages 10, for the U. S. 12, and for Russia 7. The annual consumption of wheat per person in the colony is 6·5 bush., while in the United Kingdom it is 5, and in Russia 2. Maize is cultivated for horse food, especially on the coast N. of Port Stephens; the average yield is 31 bush. per acre. The tobacco-crop has decreased of late years. Sugar can be profitably raised in the extreme N. E., but the production is small. The vine flourishes generally in the coast and mountain districts, and the production of native wines is limited only by the demand. Most of the fruits of the warm and temperate zones are grown, but the orange is the principal fruit product. It does best on the west versant N. of Sydney. The production of 1900 was estimated at 536,640 cases. In 1899–1900 there were 122,224 persons engaged in agriculture. A forest conservation department was created in 1887. There are twenty-one state forests and 1,058 timber reserves, with a combined area of 5,946,355 acres. The

amount of lumber sawn increases slowly from year to year. In 1892 it was nearly 230,000,000 sq. feet.

The need of irrigation has not been very seriously felt because of the sparseness of population and the utilization of the arid area for grazing. A hydrographic survey was recently begun. Irrigation in 1891 was employed only for 23,106 acres, but this is rapidly increasing by private enterprise.

Population.—The aborigines have nearly all disappeared from this colony. The census of 1891 gave their number at 5,097 full blacks and 3,183 half-castes, or 8,280 in all, of whom 4,559 were males. By the same census the total population was 1,132,234, with 20 per cent. more males than females. On Dec. 31, 1892, the population was officially estimated at 1,197,650, an increase of nearly 6 per cent. More than 64 per cent. were born in the colony and nearly 72 per cent. in Australasia. The Chinese formed 1·16 per cent. of the population, and there were very few other aliens. Only 12,478 were dependent on charity. Of the total, 411,710 lived in Sydney, more than one-third of all. The next largest town is Broken Hill, with a population of 23,500, and there are only five other towns with more than 6,000. The average density of population is four per square mile when Sydney is included. Outside of Sydney the density is greatest in the counties to the W. of Sydney, E. of and over the Blue Mountains, next in the coast counties. Over much of the interior basin there is an average of less than one person to the square mile.

In 1899 there were 9,275 marriages, 36,461 births (2,609 illegitimate), and 15,901 deaths. The excess of births over deaths was 20,560, and this excess in the decade ending with 1899 gave 83 per cent. of the increase of population. The average annual death-rate is 14·65 per 1,000, while that of the United Kingdom is 19·07, and of Germany 25·31. From 1888 to 1892, inclusive, the average annual immigration was 65,000, but the number of emigrants was large, averaging 55,000. Assisted immigration became the policy of the colony in 1832, but practically ceased in 1887. The number of assisted immigrants in 1892 was only 179. The influx of Chinese became so embarrassing that in 1881 a poll tax of £10 was placed on each immigrant, and this was made £100 in 1888.

State aid to religion was abolished in 1862. About half of the population are classified as adherents of the Church of England, one-fourth Roman Catholics, one-tenth Presbyterians, and one-tenth Methodists.

Commerce.—The value of the total imports in 1899 was £25,594,315, and of the exports £28,445,466, somewhat less than the average for five years. Wool is the staple export—about half of the total in value—then come tin, copper, tallow, and leather. The chief imports are iron goods, clothing, and cotton and woolen cloths. The trade of the U. S. with Australasia is chiefly with New South Wales and New Zealand. The main exports to the U. S. are specie, coal, and wool, especially the first, so that the trade value is even less than the nominal valuation would indicate. About 10 per cent. of the total exports go to the U. S., and 5 per cent. of the imports are from that country. The tariffs in force in 1890 were less in this colony than in the others, and were on few articles and were specific. In 1891 the tariffs were changed in the direction of higher duties and more of them. The chief revenue from duties is derived from stimulants and narcotics. The total registered shipping consists of 502 sailing vessels and 498 steamers, with a combined capacity of 122,747 tons. About 3,000 foreign vessels annually enter and clear, of which over 90 per cent. are British. About one-third enter Port Jackson and nearly as many the port of Newcastle.

The colony is ill supplied with navigable rivers, and railway transportation is consequently of the highest importance. The construction of railways was begun in 1855, and they are now extended until connection with the neighboring colonies is complete. Intercolonial commerce is, however, hampered by the difference of gauges, that of New South Wales being the English standard of 4 ft. 8½ in., while that of Victoria is 5 ft. 3 in., and the narrow-gauge of 3 ft. 6 in. is often used. From Sydney and Newcastle the railways pass to the W. of the Dividing Mountains and then extend N. and S. One runs N. W. to Bourke, on the Darling. The important mining region in the Barrier Range is reached by a railway from Adelaide, in South Australia. The average cost per mile of railways in the colony is high, being £14,559. This is higher than elsewhere in these colonies, and £3,400 higher than the average in the U. S. The total mileage on June 30, 1900, was 2,771 belonging to the Government and 85 to private persons; also 71 miles of tramway belonging to the Government, built at a cost of £1,924,720. At the end of 1899 there were 13,663 miles of telegraph and telephone lines, with a service of 945 stations, receiving and sending 4,000,000 messages per year; net revenue, £168,758.

The money in circulation in 1892 was: Gold, £9,000,496; notes, £1,439,872; silver, £578,452; other, £139,095. The money coined in 1899 amounted to £3,388,630, and was mostly gold. The total bank assets were £42,194,661, of which 10 per cent. was in coin, and the total liabilities were £33,055,059. The number of depositors in savings-banks was 260,826, with an average deposit of £38 each. During a very severe financial crisis in 1893 eight banks failed, but reopened afterward on a reconstructed basis.

Administration.—The executive is vested in a governor appointed by the British crown, who is commander of the troops, has an annual salary of £7,000, and is assisted by a cabinet of ten ministers. The legislative power is intrusted to a parliament of two houses—the Legislative Council of 73 members (in 1892), appointed by the crown for life, and the Legislative Assembly of 125 members (1893), elected one each from the same number of districts, and receiving £300 per annum. The suffrage is restricted only by sex and residence. (For Federation, see AUSTRALIA.) Education is under state control, and is compulsory between the ages of six and fourteen. It is free for the poor only. In 1899 there were 2,693 public schools (4 of which were high schools), with 233,233 pupils enrolled and 4,884 teachers; cost £737,080; also 1,053 private schools, of which 318 were Roman Catholic. In 1899 the University of Sydney had 519 students and 49 professors and lecturers; the revenue for 1899 was £34,467. There is also a technical college, which with its branches had in 1899 an attendance of 10,256 pupils. A free public library in Sydney has 144,244 volumes.

In 1899 the colony had 58 jails, with 1,984 prisoners (on Dec. 31), and a police force of 2,016 men. During the year 44,722 persons were convicted before magistrates.

The public debt on June 30, 1900, was £65,332,993, with an average rate of interest of 3·63 per cent. The money had been mostly expended in public works, which yield an annual return of 2·93 per cent. of the entire indebtedness. The total revenue for 1899–1900 was £9,973,736, and the expenditure £9,811,402. The entire wealth of the colony at the end of 1898 was estimated at £547,821,500. The military and naval force contains 9,978, mostly militia. The postal department has 1,626 offices, with an income barely covering the expenditure.

History.—Capt. Cook and Sir Joseph Banks landed at Botany Bay Apr. 27, 1770. They made some inspection of the bay, and on Banks's recommendation the home Government finally decided to employ this remote spot as a penal colony. In 1787 Capt. Arthur Phillip was accordingly appointed governor of the new colony of New South Wales, occupying the whole of Australia E. of the meridian of 135° E. and some small islands. He was sent out with about 800 convicts and a small military force. They arrived at Botany Bay Jan. 19, 1788, but as Phillip did not find this bay suitable he removed seven days after to Port Jackson, 6 miles N., and founded the city of Sydney. Thus the colony began with a convict settlement and with the arbitrary government necessary to such a population. Convicts continued to arrive from time to time until 1841. The total number was about 83,000, of whom 43,000 were living when their importation ceased. Of these, 18,000 had become free either by expiration of sentence or by pardon. In the meantime there had been a large immigration of free men and women, and their number was increased by births in the colony. The census of 1841 gave a total population of 114,601, or a ratio of 8 persons without to 3 with convict history, or 9 free persons to every 2 convicts. The history from 1788 to 1841 is that of a penal colony with a rapidly growing ratio of free persons. After 1841 the convict peculiarities slowly, and after 1851 rapidly, disappeared until they were extinguished.

An important element in the history of the colony was the development of the production of wool, still its greatest staple, largely due to the importation of superior breeding animals by Capt. Macarthur.

On the cessation of convict importation the colony suffered from lack of labor, and this want became more urgent during ten years, when, happily, the discovery of gold-fields in 1851, of such a character as to attract worldwide attention, caused an enormous influx of strong and healthy men,

and put an end to the labor famine, while adding materially to the colony's wealth.

When the colony was established, in 1787, the instructions issued to Governor Phillip and the government established by him were thoroughly autocratic. In the course of time, and especially under arbitrary governors, they became intolerable to the free settlers. Agitation resulted in an investigation in 1819 by Bigge of the judicial establishment and the appointment in 1823 of a Legislative Council of five persons appointed by the crown, and the number was afterward increased. In 1824 the liberty of the press was obtained, in 1828 the right of trial by jury, and in 1836 the principle of religious liberty was settled. In 1842 the right of municipal election was first exercised, and in 1843 the Legislative Council was made partly elective. In 1855 the Queen assented to an act conferring a constitution on the colony, and in 1856 came the first ministry under a responsible government. In 1857 Victoria and in 1859 Queensland were separated from the parent colony. Under its present institutions New South Wales has continued to prosper.

References.—The official publications are numerous and useful. Besides the usual blue books and reports may be mentioned: Barton, *History of New South Wales from the Records*, vol. i., 1783–89 (1889). *The Statistician's Report on the Eleventh* (1891) *Census*, first installment (1893), contains a review of all the statistics of the population since the establishment of the colony. Russell has published separately (n. d., but probably 1893) a *Diagram of the Isothermal Lines of New South Wales*, and in his annual *Results of Rain, River*, and *Evaporation Observations made in New South Wales in 1892* (1893) an average rainfall chart of the colony. See also Robinson, *New South Wales, the Oldest and Richest of the Australian Colonies* (1873); Lang, *Historical and Statistical Account of New South Wales* (4th ed. 2 vols., 1874); Reid, *An Essay on New South Wales, the Mother Colony of Australia* (1877); Woods, *Fish and Fisheries of New South Wales* (1882); Liversidge, *Minerals of New South Wales* (1888); and Coghlan, *A Statistical Account of the Seven Colonies of Australasia* (1892).

Newspapers: printed sheets containing news, issued at regular intervals—usually each day or each week—and intended for distribution by sale or gratis. Modern journals convey intelligence of current events, report the transactions of public bodies, officials, etc., and contain also editorial comments on public questions, items of interest in the various fields of human activity, announcements, advertisements, market reports, communications from public and private persons, and in many cases short works of fiction.

The periodical collection and publication of the news of the day began in Europe with the weekly issue of *Das Frankfurter Journal*, by Egenolf Emmel, at Frankfort, Germany, in 1615, 163 years after the discovery of printing from metal types. There had been news-sheets long before; in Europe the earliest were manuscript papers prepared with some regularity, and known in Rome as the *Acta Diurna* and in Venice as the *Gazzetta*. According to tradition, the first printed news-sheet appeared at Nuremberg in 1457, and was called the *Gazette*, but no copy is extant. In 1534 a news-sheet was printed in the same city, of which there was a copy in the Libri collection, with a description in the catalogue. This sheet was entitled the *Neue Zeitung aus Hispanien und Italien*. Ulric Zell, it is believed, printed a news-sheet in Cologne as early as 1499, called the *Chronicle*; and in 1598 another, the *Mercurius Gallo-Belgicus*, was printed there. Some 800 of these occasional news-sheets, all issued before 1610, are preserved in libraries.

The issue of the *Frankfurter Journal* was followed the next year (1616) by that of the *Nieuwe Tijdinghen*, at Antwerp; and in 1622 by the first newspaper in the English language, *The Weekley Newes*, begun by Nathaniel Butter, on May 23 of that year. Butter is mentioned as early as 1611, occasionally printing a news-slip, and in 1621 he published one or two numbers of *The Courant or Weekley Newes from Forain Parts*. He served several of the nobility and gentry as a gatherer of news, which he regularly dispatched in written communications to his patrons in the country. This system of manuscript news-letters in England did not disappear with the establishment of printed newspapers. Those who insisted most on precise and full information continued, especially in the country, to depend more or less upon them until nearly the middle of the eighteenth century. The first daily paper in England, *The Daily Courant*, was issued in 1702, and the first penny paper, *The Orange Postman*, in 1709.

Théophraste Renaudot issued the *Gazette de France*, the first French newspaper, on May 30, 1631. The *Gazette*, with an occasional interruption, has been published from 1631 to the present day, and is one of the oldest papers in the world. Renaudot was a physician and a gossip, and became one of the best-informed men of his day. Like Butter in England, he wrote news-circulars prior to the establishment of the *Gazette*, and, like Butter, he sold his papers in the streets by newsboys and newswomen, who were known as "hawkers" and "Mercury-women." The *Gazette* was under the patronage and control of Richelieu. The first daily paper in France, the *Journal de Paris ou Poste au Soir*, appeared in 1777. The *Journal de la Ville de Paris* was published a century earlier, but only once a week, with the daily occurrences recorded in the style of a diary of events.

The *Post och Inrikes Tidning* was founded in 1644 as the official organ of Sweden. The *Haarlemsche Courant* appeared in 1656. *The St. Petersburg Gazette* was established in 1703, and printed under the authority of Peter the Great, who took an active interest in its management. The first Spanish paper, the *Gaceta de Madrid*, appeared in 1704. There were a *Gazette* and a *Courant* in Amsterdam in 1705. The first paper in India was issued in 1781, and the first in Turkey was printed in Smyrna in 1827 by M. Bleeque, just a century after the introduction of printing in the Ottoman empire. It was called the *Spectator of the East*.

A chronological list of a number of the earliest newspapers of Europe still in existence is appended:

NAMES.	When established.
Frankfort Gazette (first year called Journal)	1615
Gazette de France	1631
Leipzig Gazette	1660
London Gazette	1665
Stamford (Eng.) Mercury	1695
Edinburgh Courant	1705
Rostock Gazette	1710
Newcastle (Eng.) Courant	1711
Leeds (Eng.) Mercury	1718
Berlin Gazette	1722
Berlingske Tidende	1749
Leicester (Eng.) Journal	1752
Dublin Freeman's Journal	1755
Morning Post (London)	1772
The Times (London)	1785
Journal des Débats	1789
Allgemeine Zeitung	1798

All the governments of Europe were early represented by newspaper organs, which are an easy means of communicating orders in council, special edicts, proclamations, and laws to the people. *The London Gazette* was the first of these; it was established in 1665, and is still published. It was originally *The Oxford Gazette*. *Le Moniteur Universel, Journal Officiel de l'Empire Français*, was started in 1789; but Louis Napoleon abandoned the paper in 1869, because it was owned by private individuals, and established another with the simple title of *Journal Officiel de l'Empire Français*. Italy is represented by the *Gazzetta Officiale*; Spain, by the *Gaceta de Madrid*, and Russia by the *Pravitelztaennii Vystaik*. The *Invalide Russe* of St. Petersburg was the organ of the Russian Government for many years. It was established in 1813 to raise a fund for the relief of wounded soldiers. Russia is also represented in Brussels by *Le Nord*, the utterances of which are considered semi-official. Austria is officially heard through the *Gazette* of Vienna.

Comment as an accompaniment of the news, and particularly of the political news, did not begin in England until about 1704, when Swift, Bolingbroke, De Foe, and others began political discussions in various newspapers, which ultimately developed into the "leaders" and "paragraphs" of the present day. The "editorial" as an essential feature of the newspaper did not appear in France until during the Revolution of 1789; in Germany, not till a few years later; and elsewhere in Europe, not until the nineteenth century. Editorial discussion has rarely been long conducted anywhere else with what would be regarded in the U. S. as legitimate and desirable freedom, excepting in Great Britain and her colonies. Great progress in these directions, however, has been made during the latter half of the nineteenth century in France, Italy, parts of Germany, and among the Scandinavian races. In the three countries in which the newspaper development has been greatest, it may be said that in general the most attention has been given in Great Britain to editorial discussion, in France to art, the drama,

light literature, gossip, and *persiflage*, and in the U. S. to news.

The leading English newspapers are those of London, among which the most important are *The Times*, *Daily Telegraph*, *Standard*, *Daily News*, *Morning Post*, and *Daily Chronicle*, all morning dailies; *The Pall Mall Gazette* and *The St. James's Gazette*, afternoon dailies; and *The Observer*, a Sunday newspaper. *The Times* has long been considered the most influential and profitable newspaper in Europe. Its circulation (for some time probably much above 60,000 copies daily) was affected by the growth of the cheap press after the repeal of the stamp-tax in 1855, and by its own adherence to the high price of fivepence for a long time after good eight-page journals were sold in London for a penny. Its circulation is thought to be below 50,000, but it is still justly recognized as the leading journal, and its advertising patronage is enormous. The most widely circulated of the cheap papers is *The Daily Telegraph*, closely followed by *The Standard*, *The Daily Chronicle*, and *The Daily News*; while *The Morning Post*, which was originally a high-priced journal of Tory politics, giving especial attention to social affairs, has, since reducing its price to one penny, made rapid strides. A number of the provincial journals in Great Britain have also large circulations and great influence.

French journalism deals less with news, and in many instances seems less successful in developing great permanent properties. Among the leading Paris journals are *Le Temps*, *La France*, *La Presse*, once conducted by Girardin, *Le Siècle*, *Le Constitutionnel*, to which Saint-Beuve was long a brilliant contributor, the *Débats*, which enjoyed the services of both Girardin and Prévost-Paradol, *La Justice*, the organ of Clémenceau, and *La République Française*, once identified with Gambetta. *Figaro*, a paper devoted chiefly to paragraphs, the drama, Paris gossip, and general flippancy, made the fortune of its founder, Villemessant, and attained a circulation greatly larger than that of any of the papers before mentioned. It now presents also acute political and literary criticism, and it is generally read by the educated classes of all parties. *Le Gaulois* is a younger paper, successfully following in part the same lines. The most widely circulated newspaper in the world is *Le Petit Journal*, which often prints over 1,000,000 copies per day, sold at five centimes. Several newspapers in Germany, although hampered by the restrictions on the press, have attained great prominence, notably the *Vossische Zeitung*, the *Norddeutsche Allgemeine Zeitung*, the *Neue Preussische Zeitung*, the *Volkszeitung*, the *Cologne Gazette*, and the *Hamburgsche Correspondent*. In Russia newspapers are not permitted to discuss political questions, and a rigorous press censorship is maintained. Periodicals entering or leaving the empire are frequently mutilated or defaced in parts by the authorities. The *Journal de St. Pétersbourg*, established in 1824, is a semi-official organ, and the *Novoe Vremya* (New Times), and the *Novosti* (Latest News) are daily papers of large circulation. In Spain freedom of the press has been tolerated only since about 1855. The most influential papers are the *Correspondencia de España* and the *Imparcial*, both in Madrid. Holland has many newspapers of note, the best known being the *Allgemeene Handelsblad* and the *Courant*, of Amsterdam, the *Haarlemsche Courant*, and the *Journal de la Haye*, *De Nederlandsche Stoompost*, and the *Staats-Courant*, of The Hague. The most widely known newspaper of Belgium is the *Indépendance Belge*, which from a news point of view is one of the most important in Europe; next are the *Journal de Bruxelles* and the *Étoile Belge*. In Austria the most influential newspapers are the *Neue Freie Presse* and the *Neue Wiener Tagblatt*. The principal paper of Sweden is the Stockholm *Dagblad*; of Norway, *Den Morgenblad*; of Denmark, the *Aftenposten* of Copenhagen; and of Italy, the *Secolo* of Milan.

The oldest existing official journal is that known to foreigners as the *Peking Gazette*, but among the Chinese as *King Pao*, or Metropolitan Announcements. The exact date of its establishment is not known, but it is mentioned as early as the period K'ai-yuen (713–741). It is issued daily, is printed from movable wooden type, and consists of ten or twelve leaves of thin brown paper ($7\frac{1}{2}$ by $3\frac{3}{4}$ inches), stitched with paper twine in pamphlet form, with yellow paper covers, and contains a brief abstract of the record kept by the imperial household of audiences, presentations, and imperial movements, the names of the officials on palace duty for the day, etc., followed by decrees, rescripts, memorials from the provincial governments and from the censorate, appeal cases, ordinances of appointments, promotions, etc.

The whole management of the *Gazette* is in the hands of sixteen post-officials, military mandarins nominated by and representing as many provinces and regions, who are charged with the transmission of official documents and correspondence to their respective districts. Their scribes attend daily at the chancery of state and copy such documents as the grand council of state (see CHINA) may see fit to give out for publication. As soon as printed, copies are dispatched to the provinces, where extracts are usually published locally for more general circulation, and many persons make a livelihood by furnishing written copies to subscribers.

Modern Chinese newspapers are few in number, and are found chiefly in Hongkong and the treaty-ports. Several of these are owned and conducted by foreigners, and all are the result of foreign influence. The most important are those published at Hongkong (4), Canton (2), and Shanghai (3 or 4). Of these the *Shin Pao* and *Hu Pao*, published at Shanghai, have a large circulation, even in the interior, though postal facilities are practically non-existent. The chief foreign papers are in English, and are published at Shanghai. The most important are *The North China Herald*, *The Celestial Empire*, and *The China Gazette*. Three dailies are issued at Hongkong—the *Press*, the *Mail*, and the *Telegraph*, and several Portuguese papers at Macao.

In Japan, as in China, vernacular journalism dates from the arrival of foreigners in the country. The first real newspaper, the *Nisshin Shinjishi*, was established by a Scotchman, J. R. Black, in 1872. Twenty years later there were 648 newspapers and periodicals in Japanese, all owned and conducted by natives. The most influential are published at Tokio, the capital, and include besides the *Kwampo*, or Official Gazette, the *Shimpo* and *Kokkai*, which are semi-official, the *Shū-sei* and the *Nippo* (conservative), the *Mainichi Shimbun* and the *Yomiuri Shimbun* (liberal), the *Jiyu* and the *Minken* (radical), the *Nichi-nichi Shimbun* (opportunist), and the *Chō-ya Shimbun* and *Kokumin Shimbun* (independent). The press laws are very severe, and suspensions, confiscations, imprisonment, and fines are almost daily occurrences. Indeed, so common is imprisonment that some newspapers maintain a "prison editor," whose duty is simply to go to jail when the paper has been convicted (without trial) of some press offense. The chief foreign papers published at the treaty-ports are in English. The most important are the *Japan Mail* (weekly and daily), the *Gazette* and the *Herald* (dailies with large "mail" editions), and the *Kōbé Herald*. The *Echo du Japon* (in French) is published at Yokohama.

The most remarkable field for newspaper enterprise and newspaper literature has been the U. S.; and, in proportion to population, the development of newspapers has been far greater here than anywhere else. The colonial press first appeared in Boston, Mass., in 1690. On Sept. 25 of that year Benjamin Harris published a sheet with the title of *Publick Occurrences both Foreign and Domestick*. It was the intention of the publisher to issue this paper once a month. Its size was three pages of a folded sheet, leaving one page blank, with two columns to a page, and each page was about 11 by 7 inches. The effort failed, however, in consequence of the opposition of the provincial authorities, who suppressed it after its first issue. The only copy known to be extant is on file in the state paper office in London. A reprint of *The London Gazette* was issued in New York in 1696 which gave the news of an important battle in Europe leading to the Peace of Ryswiek. This was done by William Bradford on the order of Gov. Fletcher, but it was not intended as a regular newspaper. In general, the colonists relied upon a few London papers, received by occasional vessels arriving from England, for news from Europe, and on the gossips at the coffee-houses for local intelligence. Meanwhile, John Campbell, the postmaster of Boston, became a news-gatherer, and furnished the New England governors and a few friends with periodical news-letters or circulars. These led on Apr. 24, 1704, to the publication of *The News-Letter*, which has often been called the first newspaper printed in America. This is Campbell's prospectus:

ADVERTISEMENT.

This News-Letter is to be continued weekly; and all persons who have any Houses, Lands, Tenements, Farms, Ships, Vessels, Goods, Wares or Merchandizes, &c. to be sold or let: or Servants Run-away, or Goods Stole or Lost; may have the same inserted at a Reasonable Rate, from Twelve Pence to Five Shillings and not exceed: Who may agree with John Campbell Post Master of Boston.

All persons in Town or County may have said News-Letter every Week, Yearly, upon reasonable terms, agreeing with John Campbell, Post-master for the same.

The News-Letter, in its early days, was sometimes printed on a single sheet, foolscap size, but oftener on a half sheet, with two columns on each side. It went out of existence when the British troops evacuated Boston in 1776. It enjoyed a monopoly of journalism in America for fifteen years, and yet had a circulation of only 300 copies. In 1719 William Brooker was appointed postmaster of Boston in the place of Campbell, and in consequence of some difficulty about *The News-Letter* and the mails the new postmaster thought it expedient to establish another newspaper. On Dec. 21 of that year he issued *The Boston Gazette*. The appearance of this sheet, added to the loss of office, fired the indignation of Campbell, and thereupon began in America a "war of editors" which has never ceased.

On Dec. 22, 1719, the day after the *Gazette* appeared, the initial paper in Philadelphia, *The American Weekly Mercury*, was issued by Andrew Bradford, a son of the first printer in Pennsylvania. A paper that attracted more attention was *The New England Courant*, established by James Franklin Aug. 7, 1721. Benjamin Franklin began his career as a printer's apprentice on this paper. The *Courant* created a sensation, and its publisher was soon in difficulty. First it had a wordy war with *The News-Letter*. Then James Franklin had a good deal of trouble with the clergy, especially with Cotton and Increase Mather, and finally the journalist and the Government officials had their differences. The communications in the *Courant* produced so much talk and scandal in the quiet town of Boston that its publisher was forbidden to issue his paper except under very arbitrary restrictions, and for attempting to evade these he was thrown into prison. On Feb. 11, 1722, Benjamin Franklin, then only sixteen years of age, was placed in charge as editor and publisher, and he remained for several months in this position. There continued to be the same independent spirit in the management of the paper, and its troubles finally induced James Franklin to abandon its publication. He went to Newport, R. I., where he established the *Gazette* in 1732.

The next paper that appeared in America was *The New York Gazette*, the first in that province. It was published by William Bradford, and the first number was issued on Oct. 23, 1725. In 1727 *The New England Weekly Journal* was published by Samuel Kneeland. *The Maryland Gazette* also appeared in 1727, the first in that colony. It was published till 1736, and revived in 1749. In 1728 Benjamin Franklin made his reappearance as a journalist. Samuel Keimer had started a paper in that year in Philadelphia, which he named *The Universal Instructor in all the Arts and Sciences, and Pennsylvania Gazette*. Franklin had contemplated such an enterprise, and had confided his intention to a fellow-printer, who treacherously informed Keimer of the plan, and the *Instructor* was the result. Franklin, in order to prevent the success of Keimer's journal, immediately began writing "several amusing pieces for Bradford's paper [the *Mercury*], under the title of Busy Body." In less than a year Keimer sold his paper, with its ninety subscribers, to Franklin, who condensed its name to *Pennsylvania Gazette*, and made it a success. On Jan. 8, 1731, *The South Carolina Gazette* was issued, the first in that province. It was printed in Charleston, and lived a year, but was revived in 1734.

The most important newspaper, politically, in early colonial times was started in New York in 1733. On Nov. 5 of that year John Peter Zenger issued the first number of *The New York Weekly Journal*. It was a rival of Bradford's *Gazette* professionally and politically, and Zenger was a fearless journalist. The *Journal* made war on the administration of Gov. Cosby, and in 1734 its editor was arrested for libel on the Government and thrown into prison, and in the hope of crushing the paper the authorities kept him nine months in confinement. In spite of the imprisonment of its editor, the *Journal* continued to appear regularly: and on Aug. 5, 1735, the case was brought before the court for trial. It was the first action for newspaper libel on the American continent. Zenger was acquitted, and the verdict was greeted with the utmost enthusiasm by an immense audience. *The Virginia Gazette*, the first in that province, made its *début* in Williamsburg in 1736; and two newspapers printed in German, the pioneers in any foreign language in the U. S., appeared—one in Germantown, Pa., in 1739, and the other in Philadelphia in 1743.

Most of these colonial papers confined themselves strictly to the merest mention of the news of the day. If any opinions were uttered, they were subservient to the authorities. The Franklins and Zenger were the exceptions, and they originated and practiced that independent spirit which was infused in a new class of papers that appeared subsequent to 1745. This new class was the Revolutionary press. It was still of the colonial stamp, because the country was yet composed of colonies, with governors appointed to rule over them by Great Britain, but the people and the press had become restless, more self-reliant, and more independent of the colonial authorities. The pioneer was *The Independent Advertiser*, issued in Boston on Jan. 4, 1748, under the inspiration of Samuel Adams. One of its contributors was Jonathan Mayhew, who, on the occasion of an election, preached a sermon strongly advocating the republican form of government. David Fowle, the printer of the paper, having issued a pamphlet which severely denounced the Legislature for certain acts, was arrested and imprisoned. On his release he quitted Boston and went to Portsmouth, N. H., where he started *The New Hampshire Gazette* in 1756, and the young patriots of the *Advertiser* had to bide their time. One or two new papers appeared in Boston and New York, and pamphlets were issued by the opponents of the Government in the next year; but the real organ of the Revolutionary party made its appearance on Apr. 7, 1755. It was named *The Boston Gazette and Country Gentleman*, and all the vigorous writers for *The Independent Advertiser* contributed to its columns. The Newport (R. I.) *Mercury* was established on June 12, 1758, by James Franklin, a nephew of Benjamin Franklin. The press on which the elder James Franklin and his brother Benjamin so often worked in Boston remained in the *Mercury* office for 100 years. It was then presented to the Massachusetts Charitable Mechanics' Association. On Feb. 16, 1759, the old *Gazette* of William Bradford was revived, and afterward immortalized by Freneau. On Oct. 29, 1764, *The Connecticut Courant* was issued in Hartford, and is still published there as a weekly.

In opposing the Stamp Act of 1765 the patriotic newspapers had a prodigious influence on the colonists. *The Maryland Gazette*, the Newport *Mercury*, and many other papers printed the resolutions of the Virginia House of Burgesses against it, and several suspended publication in consequence of the act—notably *The Pennsylvania Journal and Weekly Advertiser*. In 1766 a second *Gazette* appeared in Williamsburg, printed by William Rind. The first printed statement of the adoption of the Declaration of Independence on July 4, 1776, was made in the *Gazette* on the 19th of that month, and the document in full appeared in the same paper on the 26th. On May 29, 1767, *The New York Journal, or General Advertiser*, was brought out under the inspiration of George Clinton and Philip Schuyler. It was a revival of Zenger's paper, and was edited by Alexander McDougall. Alexander Hamilton, when only sixteen years of age, was a clever contributor to its columns.

Opposite in political sentiment to these patriot journals was *The Royal Gazetteer*, which was established in New York in 1762 by James Rivington. The leading contributors to the *Gazetteer* were Attorney-General Seabury, Myles Cooper, president of King's (now Columbia) College, the Rev. John Vardill, and the Rev. Samuel Chandler. Major André also wrote for the paper, and his well-known satire, *The Cow Chase*, appeared in the *Gazetteer* on the very day of his capture. It was subsequently called *Rivington's Royal Gazette*, with the royal arms over the office door. It was an ably conducted newspaper. Its office was twice mobbed for its zeal for the crown—once by the Sons of Liberty, and once by a party of Connecticut militia. After enjoying royal favor for many years, Rivington, in 1782, who then saw the "end of things," shaped his course to meet coming events. The title *Royal* was dropped, and the paper was afterward known as *Rivington's New York Gazette and Universal Advertiser*, and the royal arms were removed from over the door of the office. The circulation of the *Gazette* reached, in its best days, the large number of 3,000. Another organ of the crown was started in Boston in 1767. It was *The Chronicle*, and the handsomest journal, typographically, published in the colonies. It exhibited great pretensions to literature. John Mein, one of its publishers, assisted by a pre-Revolutionary wit of Boston named Joseph Green, and a few others, was very severe on the Whigs of those days, but popular sentiment became so inimical to him that he was compelled to stop the publication of *The Chronicle* and leave the country.

The Massachusetts Spy, "calculated on an entire new plan," was the next influentially patriotic paper started in the colonies. Its first number came out in July, 1770, under

the auspices of Isaiah Thomas, the author of the *History of Printing in the United States*. It was a power with the people, and early in 1771 urged a recourse to arms. On the night of Apr. 18, 1775, the material of the *Spy* was conveyed across the Charles river and carried to Worcester, where the paper was ever afterward printed, and where it is now known as *The Worcester Spy*. On May 3, 1775, it first appeared there with the motto in large type: "Americans! Liberty or Death! Join or Die!" The Government, to stem this revolutionary tide after the suspension of *The Chronicle*, resorted to the old *News-Letter*, which was then known as *The Massachusetts Gazette and Weekly News-Letter*.

In the first year of the Revolution eight newspapers were started—four in Philadelphia, where Thomas Paine and Philip Freneau lived and wrote. The first newspaper in New Jersey, the *Gazette*, was issued on Dec. 3, 1777; the first in Mississippi Territory appeared in 1779, a pioneer among the pioneers; and in 1781 the first, *The Gazette or Green Mountain Post Boy*, was published in Vermont. Forty-nine newspapers were established in the colonies from 1745 to 1783, but of all those publications not one appeared daily. While New York was occupied by the British troops four papers were published there, and an arrangement was made in their days of publication by which the public had a newspaper each day. The first daily paper in America was not issued till 1784. It was *The American Daily Advertiser*, and was published in Philadelphia by Claypoole, who was the first to introduce reporting on the continent. Of the 63 newspapers which had been started in America from 1690 to 1783, only 43 were in existence on the conclusion of peace with Great Britain.

When the Constitution went into operation in 1789 there were printed in each week, in the U. S., 76,438 copies of newspapers. Many foreign writers of ability were employed by both the great political parties on the press, and many of the political chiefs wrote for the journals. There were few or no regular editorial articles, but the topics of the day were warmly discussed in communications over all sorts of signatures. Most of the foreign writers were political exiles, and they naturally fell into the ranks of the Democrats and wrote for the papers of that party, strongly against Great Britain and in favor of aiding republican France; and they were very severe on the administrations of Washington and Adams. One of these papers, *The National Gazette*, was established in Philadelphia in Oct., 1791, by Philip Freneau while a clerk under Jefferson in the State Department. Jefferson placed a high estimate on his services as a journalist. The *Gazette* was published till 1793. In 1797 Freneau started *The Time Piece* in New York, which was afterward edited by Matthew L. Davis, and subsequently by John Daly Burk, one of the United Irishmen. Two influential journals were established in 1793: *The New England Palladium* in Boston, and *The Minerva* (afterward and still known as *The Commercial Advertiser*) in New York. Noah Webster, the lexicographer, previously a lawyer in Hartford, was induced to take charge of the latter, and thereby strengthen the Federal party. William L. Stone was subsequently and for many years its editor. It was afterward conducted by Thurlow Weed, and has since had a variety of changes in editors and politics. It is the oldest paper in New York. *The Palladium* was merged with *The Boston Advertiser*. The newspapers that attracted the most attention in the latter part of the eighteenth and the early part of the nineteenth century were *The Aurora* in Philadelphia and *The Evening Post* and *American Citizen* in New York. *The Aurora* was edited by Benjamin Franklin Bache, a grandson of Benjamin Franklin, till 1798, and then passed under the editorial care of William Duane, who had become very much embittered against Great Britain. It was a powerful organ of Jefferson's. *The Evening Post* was started on Nov. 16, 1801, and was strongly Federal in its politics. Alexander Hamilton, John Jay, and their friends established it, and placed William Coleman in the editorial chair, where he remained for nearly thirty years, and was succeeded by William Leggett and William Cullen Bryant. *The American Citizen* was a continuation of *The New York Journal and Argus*. James Cheetham became its editor in 1801, and acted with that portion of the Democratic party of which the Clintons were leaders. The bitterness of these three journals kept up the political excitement in New York to a high pitch and for a long time. Another Democratic paper was issued in New York in 1802 by the friends of Aaron Burr, in opposition to the *Citizen*. It was *The Morning Chronicle*, and edited by Dr. Peter Irving. Washington Irving made his first appearance as a writer in *The Chronicle*, over the signature of "Jonathan Oldstyle." It ceased to exist in 1805.

With the increase of population in the Northwest, the necessity of newspapers became evident, and on Nov. 9, 1793, *The Centinel of the Northwestern Territory* was founded in Cincinnati by William Maxwell, the first newspaper and the first printing-office beyond the Ohio. Nathaniel Willis, an old Boston printer, started *The Scioto Gazette* in Chillicothe in 1796, and in 1799 *The Western Spy and Hamilton Gazette* was issued. Singular as it may seem, some of these newspapers appeared in advance of any in Central or Western New York. *The Otsego Herald*, or *Western Advertiser*, was the first newspaper printed in Central New York. It appeared (18 by 21 inches in size, each of the four printed pages being 9 by 15½ inches) at Cooperstown Apr. 3, 1795, and was continued until 1821. Elihu Phinney was its founder, editor, and the pioneer journalist in that section of the country. William L. Stone, Thurlow Weed, and other distinguished journalists, worked at the case in his office, and J. Fenimore Cooper often "set type" there for amusement, and he described in *The Pioneers* the printing-establishment of the *Herald* in its days of infancy.

The Richmond Enquirer, edited for forty years by Thomas Ritchie, started on May 9, 1804, became a leading and powerful organ of public opinion for half a century. Among other prominent journals that appeared at that time was *The Albany Register*, established in 1803 or 1804, an influential paper, especially under the care of Solomon Southwick, who was its chief editor in 1808. In the overthrow of factions it succumbed to *The Albany Argus*, which was started in 1813, and managed with ability and skill by Edwin Croswell till the defeat of Martin Van Buren in 1840. It was the mouthpiece of the Albany Regency, as the *Enquirer* was of the Richmond Junta. Another paper of note was *The Hudson Balance*, a leading Federal paper in 1804, edited by Harry Croswell. It had to carry on the contest against the Democratic organs with *The Commercial Advertiser* and *The Evening Post* of New York. New party papers continued to make their appearance, and were at that time mostly Democratic. They grew out of the troubles and jealousies of the party-leaders. After the death of Cheetham, the Tammany Hall Democrats set up a paper named *The National Advocate*. Henry Wheaton was its editor for a number of years. It then passed into the hands of Mordecai Manasseh Noah; James Gordon Bennett was also one of its editors. Other influential party papers of that period were *The Portland* (Me.) *Argus*, established in 1803, *The New Hampshire Patriot* in Concord in 1808, *The Hartford* (Conn.) *Times* in 1817, *The Charleston* (S. C.) *Mercury* in 1822, *The Globe* in Washington, and *The Post* in Boston in 1831, the *Nashville* (Tenn.) *Union*, and *The Columbus* (O.) *Statesman*. The newspapers in opposition a large portion of this time, although some of these were originally Democratic, were *The National Intelligencer*, issued in Washington in 1799–1800; *The Providence* (R. I.) *Journal*, established in 1820; *The Boston Courier*, started by Joseph Tinker Buckingham in 1824; *The Richmond* (Va.) *Whig*, in 1826; *The New York Courier and Enquirer*, in 1827; *The Albany Evening Journal*, originally established by Thurlow Weed as an Anti-Masonic organ in 1830; *The Louisville* (Ky.) *Journal*, first issued in 1831, and edited for thirty years by George D. Prentice; *The Boston Atlas*, started by John H. Eastburn and the Webster Whigs in 1832; and *The New York Express*, set up by the Clay Whigs in 1836. These journals represented the National Republican and Whig parties, and made their mark on the pages of political history; but they were not confined wholly to politics. With the progress of the country, and with the discussions of the great questions that came up before the people, they expanded their field of discussion and enlarged their collections of news. Especially in New York, in order to obtain large circulations, efforts were made to acquire the earliest news in advance of one another. More attention was devoted to commercial and foreign intelligence, and they became large advertising mediums. Other papers were established during this long period which were not strictly party papers, but the number was small. One of the most valuable was *Niles's Weekly Register*, which was brought out in Baltimore in 1811, and continued till 1848.

The "organs" at the national capital were an important feature of the party journalism of the period. The first of this class was *The National Intelligencer and Washington Advertiser*. This paper had been removed from Philadel-

phia, where it was known as *The Independent Gazetteer*, on the removal of the seat of government from that city. This was in 1799–1800. The *Intelligencer*, then owned by Samuel Harrison Smith, became the organ of Jefferson. In 1810–12 it passed into the hands of Gales & Seaton, and these journalists introduced the full reports of the debates in Congress. On the advent of Jackson on Mar. 4, 1829, the *Intelligencer* ceased to be the organ of the Government, and became that of the Whig party, and *The United States Telegraph*, edited by Duff Green, was accepted as the organ of Jackson's administration; but a rupture between President Jackson and Vice-President Calhoun caused the establishment (in 1831) of *The Globe*, with Francis P. Blair and Amos Kendall as editors, and this journal became the organ of the Democratic party, continuing till the advent of Harrison in 1841, when the *Intelligencer* resumed its old position. The early death of Harrison, throwing the Whig party into confusion, led John Tyler to select *The Madisonian*, started in 1841, to be his organ. On the election of James K. Polk in 1844 *The Globe* did not return to power with its party, but a new paper, called the *Union*, was established, with Thomas Ritchie as editor, and that journal became the official organ. On the election of Gen. Taylor in 1848 a new paper was started for his organ, as the *Intelligencer* favored the Webster wing of the Whig party. The new paper, *The Republic*, was edited by Alexander Bullitt and John O. Sargeant. The *National Era* served the Free-Soil party in the national capital from 1847, and, besides other powerful contributions to the growing anti-slavery excitement, first gave *Uncle Tom's Cabin*, by Mrs. Stowe, to the world. When Franklin Pierce came into power in 1852–53, *The Union* resumed its position with the Government, but with Gen. Robert Armstrong as editor and Caleb Cushing and A. O. P. Nicholson as contributors, and continued, with John Appleton (previously editor of *The Portland Argus*) as conductor, through the administration of James Buchanan. *The Union* was the last of the official organs at the national capital.

The Rev. John Andrews established in Chillicothe, O., the first religious newspaper in the U. S. It was entitled *The Recorder*, and the initial number was issued in 1814. Nathaniel Willis thought and talked of such an enterprise in Portland, Me., in 1808, but did not receive sufficient encouragement to carry out his plans till 1816. On Jan. 3 of that year he issued the first number of *The Boston Recorder*. *The American Farmer* was the first of the agricultural press. It was published in Baltimore by John S. Skinner, and the first number appeared on Apr. 2, 1818. *The Ploughboy*, managed by Solomon Southwick, followed in 1821, and was published in Albany. *The New England Farmer* next appeared in Aug., 1822. As far back as 1795 *The Boston Prices Current and Marine Intelligencer* was published, but in a few years it became a political newspaper; and the first successful commercial paper was *The New Orleans Prices Current*, established in 1822.

Up to 1833 newspapers in the U. S., whether daily or weekly, were distributed almost exclusively by subscription, and at a price which, considering their size and the amount of reading-matter they gave, would now seem high. Their advertisements, however, were cheap, as was natural, considering that the circulations were small. It was only by becoming an annual subscriber that one could obtain a city paper for less than six cents. There were no street sales, no news-stands or news-agencies, and but small sales at the offices. No paper in the country in 1835 circulated over 5,000 copies; very few over half that number. With all the enterprise that James Watson Webb, of *The Courier and Enquirer*, and Hale and Hallock, of *The Journal of Commerce*, of New York, and Richard Houghton, of *The Boston Atlas*, displayed between the years 1830 and 1840 in news-schooners and pony expresses, not one of these journals could boast of a subscription-list of over 5,000 names.

The penny press appeared in New York in 1833. The *Morning Post* was started on the first day of that year. Horatio David Shepard was the editor, and Horace Greeley and Francis V. Storey were the printers. It was first sold for two cents, and then for one cent. In three weeks it was dead. On Sept. 3, 1833, *The Sun* was issued by Benjamin Day, and sold at one cent per copy. At first it depended for its success on local news, and largely on piquant police reports. It gradually gained a large circulation, and espoused the Democratic side in politics. In 1867 it was reorganized, and came for the first time under the direction of a forcible political editor, Charles A. Dana, who had enjoyed large experience on political journals and as Assistant Secretary of War. Under him it became an influential political journal, and also by a careful selection and skillful condensation of news commended itself to many political opponents. For years it sold from 120,000 to 140,000 copies daily, adhering to its four-page size and two-cent price.

Nearly two years after *The Sun* (on May 6, 1835), another small, cheap paper, *The New York Herald*, made its first appearance, edited by James Gordon Bennett, who had also enjoyed large previous experience on other journals. Within twenty years it attained a circulation of 36,000 copies, and has since that time greatly increased, though with varying prices and success. It displayed great enterprise in the collection of news. In the latter years of his life Mr. Bennett gradually yielded the management of the *Herald* to his only son, bearing his name, who on his father's death succeeded to the absolute control. The son made a liberal use of a portion of the large fortune left him in equipping an expedition in search of Livingstone, which, besides discovering the African explorer, made important contributions to geographical science. He also fitted out a generous but unfortunate Arctic exploration enterprise. He gave great attention to yachting, coaching, base-ball, lawn tennis, racing, polo, and other sports, and continued the policy of his father in making the most energetic and far-reaching collection of all manner of news likely to interest a miscellaneous public his first object.

On Apr. 10, 1841, Horace Greeley, who had already attained distinction as the most forcible political editor then in the Whig ranks, issued the first number of *The New York Tribune*, which he continued to conduct until his nomination for the presidency in 1872, and of which he remained one of the proprietors until his death. The *Tribune* also was at the outset a penny paper, but it differed from the other cheap journals of that period in giving larger attention to politics, literature, and social discussions. Contributors to its columns set forth and advocated the system of Fourier. It encouraged efforts to establish communistic and educational associations. It gave almost the first serious attention to the Rochester knockings and other alleged manifestations of Spiritualism; it pressed upon workingmen the advantages of co-operation and arbitration, instead of trades-unionism and strikes, as a method for securing their best interests; and it became the most conspicuous champion of the warfare through political agencies upon the system of slavery. It made the first great use of the Atlantic cables for transmitting war correspondence. It translated the famous cipher dispatches relating to alleged illegal attempts by Mr. Tilden's partisans to secure electoral votes for him in the disputed election of 1876. It established and has conducted for many years the pioneer Fresh Air Fund, by which large numbers of poor children from the most destitute portions of the city are taken to country homes for a two weeks' vacation during the stifling heat of summer. This is of especial importance as the type of numerous charitable undertakings by other newspapers. The *Tribune* established, within a few months after its first issue, regular weekly and semi-weekly editions, and its weekly soon became the most widely circulated political journal in the U. S.

The New York Times was established by Henry J. Raymond, who had formerly been on the editorial staff of the *Tribune*, in Sept., 1851. It was designed to fill substantially the same field with the *Tribune*, but in a more conservative and moderate way. It also began as a penny paper, and attained success almost at the outset. Its greatest reputation was achieved after Gov. Raymond's death by its vigorous exposure of the Tweed ring, in which it displayed courage and pertinacity, and from which it derived great profit. During Gov. Raymond's life and for some years afterward it was Republican. It gradually displayed free-trade leanings, in 1884 supported the Democratic presidential ticket, and has since formally declared itself a Democratic journal.

On June 1, 1860, *The New York World* was established by a number of religious gentlemen, for the purpose of having a newspaper in the metropolis without the police reports and the theatrical advertisements and notices that occupied so much space in the other city journals, and with a distinctly evangelical tone. After spending a large sum of money this idea was abandoned, and the *World* passed into Democratic hands. On July 1, 1861, the *World* and *The Courier and Enquirer* were united. It had a long and doubtful struggle, but at last under Joseph Pulitzer attained an unusually large circulation.

The *Herald*, *Tribune*, *Sun*, *Times*, and *World* all became large quarto or eight-page newspapers. As their system of collecting news extended, and the labor and expense bestowed upon its preparation increased, the price of all of them except *The Sun* was raised, first to three, and finally, during the civil war, to four cents. They also one after another began the issue of regular Sunday editions, for which the price was five cents, the *Tribune* being the latest to yield to this innovation. After some fluctuations the *World* fixed the price at two cents, and was followed in this for a time by the *Times* and *Herald*, but these returned later to the *Tribune's* price, three cents. All these papers also advanced again to five cents the price of their Sunday issue, which had now become a magazine in itself, ranging according to the pressure of news and advertisements from twenty to forty-eight pages for each issue. The size of the paper in the week-day issues was also gradually increased. It is rarely that any of these papers has now less than ten pages, while twelve, fourteen, and sixteen pages are more common. This great increase in size and in the quantity of reading-matter furnished has been made practicable by several causes: (1) The enormous reduction in the cost of the paper on which they are printed. In 1872 white news print cost from twelve to thirteen cents a pound; in 1894 it could be bought for two and a quarter cents. (2) The introduction in most of the papers of machinery for type-setting, which can be made to reduce greatly the cost of composition. (3) The introduction of improved printing-machinery, by which the papers are printed, cut, pasted, folded and counted, ready for delivery by a single machine, needing only three operators, at the rate of from 20,000 to 40,000 copies per hour. (4) Great reductions in the cost of telegraphing both on the ocean cables and by the domestic lines, coupled with the system of leasing telegraph lines between important news-points for an individual newspaper or a few associates, and the liberal use of long-distance telephone lines. (5) A vast increase in the number of newspaper readers, thus increasing the profit both on circulation and from the consequent advertising. Seventy columns of news and editorial comment, besides many pages of advertisements, are now often sold for two or three cents. Nearly all news is now received by telegraph, and a large part of it is specially collected for each paper by its own corps of correspondents. The expenses for the collection of city news have also immensely increased since 1860. Where eight or ten reporters formerly served a newspaper it now often has sixty to seventy. Counting "casuals" and "special assignment men," it is common for a New York newspaper of the first class to have 100 or more men serving almost every night in its city department. The editorial department has made a similar advance, while specialists are retained in large numbers for the treatment of literary, artistic, musical, dramatic, and other topics.

The same increase in labor and expense and improvement in the collection of news which have been noted in the New York papers, especially since 1860, may be observed proportionately throughout the press of the country. The great distances in the U. S., the excellent telegraphic service, and the facilities afforded by the United and the Associated Presses stimulate the growth of first-class newspapers in all large cities. Thus Philadelphia, Cincinnati, Chicago, St. Louis, New Orleans, and San Francisco have come to possess strong and enterprising journals, many of them as large as, or larger than, the New York papers, and sometimes conducted on a scale of equal expenditure. In Chicago, the *Tribune*, *Herald*, *News*, *Times*, and *Inter-Ocean* are of this class; in St. Louis, *The Globe-Democrat* and *Republic*; in Cincinnati, *The Commercial-Gazette* and *Enquirer*; in New Orleans, *The Times-Democrat* and *Picayune*; and in San Francisco, the *Chronicle*, *Examiner*, *Bulletin*, and *Call*.

A large number of the more substantial newspapers now erect large buildings of their own wherein they establish their machinery and offices, while they derive a handsome income from the rent of the portions of the building not occupied by themselves. In New York, the *Tribune* was the first to construct a large eleven-story fire-proof building of this class. It has since been followed by the *Times*, *World*, and some others; while the *Herald*, adopting a different idea, has constructed a large but low building in the heart of the up-town amusement and advertising quarter, entirely for its own use. In most of the great cities of the country the leading newspapers now own buildings, often the most conspicuous in the place, accommodating many tenants as well as themselves. Even on the Pacific coast the buildings of *The San Francisco Chronicle*, *Portland Oregonian*, and *Seattle Post-Intelligencer* are of the most approved modern, high, fire-proof class, and among the most prominent in their respective cities.

The period since the civil war has been marked also by the rapid development of local journalism throughout the U. S. Nearly every city of 15,000 inhabitants must have its own daily paper—often, indeed, when not half that size. Nearly every county-seat must have its weekly paper, and in the more populous counties some village in almost every township will also have a weekly issue. An immense system of printing what are called "patent outsides" for such papers has sprung up, under which two pages of news and miscellany are edited and printed at some central office for a great multitude of smaller papers, the half-printed sheets being then forwarded to the several offices, to be filled out, in each, with the local news and editorial comment of its own locality. Another economical device for the small country papers is the use of what is called "plate matter." Late news, correspondence, and miscellany likely to be generally acceptable for such papers is put in type in a central office, say in New York or Chicago, and stereotype plates of it are then made and sold to the country press. Thus a country paper often presents to its few hundred readers four pages of attractive reading matter, of which less than a page has been prepared and put in type in its own office.

The Daily Graphic of New York is believed to have been the first illustrated daily newspaper in the world. It regularly printed engravings, often of considerable merit, on four of its eight pages. Its system, however, proved too expensive, and it led a precarious existence, finally dying in 1888. Meantime many of the larger daily journals gradually adopted the plan of illustrating their news columns with portraits of the leading persons referred to, and this proved so popular that the system was largely extended. Many of the newspapers established art departments in their offices. Here they accumulated enormous collections of photographs of almost every prominent personage in America and Europe, together with engravings of public buildings, and every other species of information likely to be useful in enabling them suddenly to produce pictures in illustration of any news article. Various new methods of reproducing photographs on metal and then transferring them to the stereotype pages were introduced. Skillful artists were also employed to attend important public trials, conventions, sessions of Congress and of the Legislature, etc., and to make spirited sketches of the principal speakers and the surrounding scenes. In this manner a large number of newspapers not only in New York but in the other principal cities of the country are liberally illustrated every day. The system has also been seized upon by the offices furnishing "plate matter" to country papers, and the remotest rural weekly can now accompany its news of the latest nomination for Governor or Congress with a portrait of the candidate, or its mention of the latest noted death, whether of prince, or president, or opera-singer, with a tolerable representation of the features of the deceased. Illustrated weeklies are numerous, and some of them have great circulations, *Harper's Weekly* and *Frank Leslie's* being the most prominent in New York. Comic newspapers were for a long time unsuccessful in the U. S., but since 1880 several have become profitable, *Puck*, *Judge*, and *Life* being those best known in New York. Of class-papers the name is legion; half a dozen are devoted exclusively to the affairs of Wall Street. Every trade has its own organ, and often numerous competing organs. The growth of the religious press has been marked by great steadiness, and many of the journals belonging to the larger denominations are among the most stable and successful newspaper properties in the country.

An estimate of the number of newspapers in the world in 1891 showed a total of 41,000, of which 24,000 were published in Europe. The distribution was approximately as follows: The U. S., 12 500; Germany, 5,500; France, 4,100; Great Britain and Ireland, 4,000; Austria–Hungary, 3,500; Italy, 1,400; Spain, 850; Russia, 800; Switzerland, 450; Belgium, 300; Holland, 300. Of this total 17,500 were published in the English language, 7,500 in the German, 6,800 in the French, 1,800 in the Spanish, and 1,500 in the Italian. In 1893 the *Newspaper Press Directory*, of London, gave the number of newspapers in the United Kingdom as 2,268, and of magazines, including the quarterly reviews, as 1,961—a total of 4,229 periodicals.

The following table, from the *American Newspaper Directory* for 1901, shows the number and frequency of issue of newspapers and periodicals in the U. S. and in Canada:

STATES.	Daily.	Tri-weekly.	Semi-weekly.	Weekly.	Bi-weekly.	Semi-monthly.	Monthly.	Bi-monthly.	Quarterly.	Totals.
Alabama	20	..	4	190	1	6	18	..	..	239

Revised by WHITELAW REID.

New Style: See CALENDAR.

Newt: a name applied to various small, tailed batrachians belonging to the genera *Triton*, *Salamandra*, etc., but particularly applicable to *Triton cristatus* of Europe. The newts have vertically flattened tails, and some have fleshy ridges along the back. They frequent ditches and sluggish water generally, feeding on insects and other animal matter. They are harmless, although they are popularly regarded as venomous. F. A. L.

New Tacoma, Wash.: See TACOMA.

New Testament: See BIBLE, THE.

Newton: city (settled in 1826, made the county-seat in 1831); capital of Jasper co., Ill.; on the Embarras river, and the Peo., Dec. and Evans, and the Ind. and Ill. S. railways; 140 miles E. N. E. of St. Louis and 220 S. of Chicago (see map of Illinois, ref. 8–G). It is in an agricultural, coal, and dairy region; has steam and water power saw, flour, and grist mills, creamery, and canning and egg-case factories; and contains 6 churches, public schools with grammar and high grades, a high-school library, a private bank, and 3 weekly papers. Pop. (1890) 1,428; (1900) 1,630.

Newton: city; capital of Jasper co., Ia. (for location of county, see map of Iowa, ref 5–H); on the Iowa Cent. and the Chi., Rock Is. and Pac. railroads; 35 miles E. of Des Moines. It is in an agricultural, horse-breeding, and stock-raising region; has 2 foundries and machine-shops, 2 canning-factories, flour-mills, and harvesting-machine works; and contains 9 churches, Normal College (built in 1893 at a cost of $25,000), a national bank with capital of $50,000, a savings and 2 private banks, and 4 weekly newspapers. Pop. (1880), 2,607; (1890) 2,564; (1900) 3,682.

Newton: city, capital of Harvey co., Kan. (for location of county, see map of Kansas, ref. 7–G); on the Atch., Top. and S. Fé and the Mo. Pac. railways; 135 miles S. W. of Topeka. It is in a fruit and grain growing region, with valuable coal mines and stone quarries in its vicinity. There are 13 churches, public-school buildings that cost $90,000, Free Library (founded 1885), 2 national banks with combined capital of $1000,000, a State bank with capital of $41,000, and a daily and 4 weekly newspapers. The manufactories include railway machine-shops, iron-foundries, carriage and sugar factories, and brick-works. Pop. (1880) 2,601; (1890) 5,605; (1900) 6,208. EDITOR OF "REPUBLICAN."

Newton: city (settled in 1630, separated from Cambridge and incorporated as a town in 1679, chartered as a city in 1873); Middlesex co., Mass. (for location of county, see map of Massachusetts, ref. 2–H); on the Charles river, and the Boston and Albany Railroad; 7 miles W. of Boston. It contains 13 villages, derives large water-power for manufacturing from the river, and is the place of residence of many people doing business in Boston. The city is noted for the healthfulness and beauty of its location. There are more than 30 churches, 2 academies, the New Theological Institution, Lasell Female Seminary, a lyceum, public library (founded 1869) containing over 35,000 volumes, a national bank with capital of $200,000, a savings-bank, and a monthly and 3 weekly periodicals. The manufactories include rolling, paper, and print-cloth mills, and boot and shoe, hosiery, carriage, cordage, emery-cloth, glue, dye, ink, and soap factories. In the center of the city is a cemetery of about 90 acres. Pop. (1890) 24,379; (1900) 33,587.

Newton: town; capital of Sussex co., N. J. (for location of county, see map of New Jersey, ref. 1–C); on the Del., Lack. and W. Railroad; 25 miles N. N. W. of Morristown, 62 miles N. W. of New York city. It is in an agricultural, copper, and iron region; contains a non-sectarian collegiate institute, the Dennis Library (founded 1873), 2 national banks with combined capital of $300,000, and 2 weekly newspapers; and is principally engaged in mining and in the manufacture of shoes and paper boxes. It is a summer resort. Pop. (1880) 2,513; (1890) 3,003; (1900) 4,376.

Newton, ALFRED: ornithologist; b. at Geneva, Switzerland, of English parents, June 11, 1829. He is a fellow of Magdalene College, Cambridge, England, where he is Professor of Zoölogy and Comparative Anatomy. Prof. Newton has a wide acquaintance with ornithology, and his writings abound in numerous references to its literature, especially to that of an early date. His published papers are numerous; he is the author of the article *Ornithology* in the ninth edition of the *Encyclopædia Britannica*, as well as of the shorter ornithological articles, and—with Dr. Parker—of the article *Birds*. A more recent work, in conjunction with Dr. Gadow, is *A Dictionary of Birds*. F. A. LUCAS.

Newton, Sir CHARLES THOMAS, K. C. B., D. C. L.: archæologist; b. at Bredwardine, Herefordshire, England, in 1816; was educated at Shrewsbury School and Christ Church, Oxford, graduating with honors in 1837. He was assistant curator of antiquities in the British Museum from 1840 until 1852, when he was appointed vice-consul at Mytilene. He explored the islands and coasts of the Ionian Archipelago, making extensive excavations at Budrum (Halicarnassus) on the site of the mausoleum erected by Queen Artemisia, and at Cnidus and Branchidæ. At Constantinople he disinterred the Serpent of Delphi. His splendid collection of coins, inscriptions, sculptures, and vases, acquired by excavation or purchase, he deposited in the British Museum. He was named consul at Rome (1860), was keeper of the Greek and Roman antiquities of the British Museum (1861–85), and was appointed Professor of Archæology at University College, London (1880). In Mar., 1861, he married Ann

Mary (1832–66), daughter of the painter Joseph Severn, the friend of Keats. She was an accomplished artist and made copies of the treasures discovered by her husband. He died at Westgate-on-the-Sea, England, Nov. 28, 1894. E. A. G.

Newton, Sir Isaac: physicist; b. at Woolstrop, Lincolnshire, England, Dec. 25, 1642 (old style); posthumous and only child of Isaac Newton, a farmer of good family. Young Newton was early sent to the village school, and afterward to the free grammar school at Grantham. His mother's only wish was to give him sufficient education to enable him to fulfill with credit the duties of a country squire. She therefore removed him early from school, and intrusted him with some share in the management of his own estate of Woolstrop. The boy's passion for mechanics and science was so strong that he entirely neglected his less congenial duties. He constructed mechanical toys of great delicacy; one sun-dial, made in his boyish days, is still in the house at Woolstrop, and another in the Royal Society rooms. His mother, wisely regarding his passion for study, sent him again to school, and in 1660 he entered Trinity College, Cambridge. The same year Dr. Barrow was appointed Professor of Greek; Newton soon found in him a safe guide and cordial helper, not only in the classics, but also in mathematics. When Newton entered Cambridge the philosophy of Descartes reigned supreme; one of the first books read by the student was undoubtedly Descartes's *Analytical Geometry*. This new application of algebra to geometry had opened up a whole world of new possibilities. Yet, strange to say, Newton scarcely speaks of the Cartesian method, and later, in his *Optics*, fails to do simple justice to Descartes in regard to the theory of the rainbow. Newton had the habit of noting down, as he read, points which admitted of further development. His jottings and the subsequent developments of certain points in Wallis's *Arithmetica Infinitorum* led him to many remarkable discoveries. (See Binomial and Fluxions.) These discoveries with which he enriched mathematical science were made before he had completed his twenty-fourth year. It would seem that he recognized the powerful instrument which lay in his hand for the solution of the many problems in physical science, for he neither published his discoveries nor made them known to his friends. Having secured these treasures, he turned his attention toward natural philosophy. In 1661 he had been made sub-sizar, and in 1664 scholar; in 1665 he took his degree as B. A.; in 1667 became junior fellow and M. A.; in 1668 senior fellow; and in 1669 he succeeded Dr. Barrow as Lucasian Professor of Mathematics. The plague in 1665 drove him to his country-seat at Woolstrop; while there he turned his attention to the subject of *gravity*. Whether the story of the falling apple be true or not, he certainly began to connect the mysterious force which draws bodies toward the center of the earth with that which holds the planets in their orbits. Taking the known velocity of falling bodies, he made a calculation upon the force necessary to deflect the moon from a right line and make it revolve in its orbit round the earth. One of the quantities in this problem is the semi-diameter of the earth, which he took too small by nearly one-sixth, supposing a degree on the earth's surface to be only 60 miles. There was a discrepancy between the results of his calculation and the known facts amounting to about one-sixth, which caused him to reject his theory as incomplete, and the magnificent discovery of *universal gravitation* lay neglected for sixteen years. In 1668 Mercator published his *Logarithmotechnia*. His quadrature of the hyperbola involved some of the first principles of the method long before perfected by Newton. Mercator's discovery was sent by Collins to Barrow, and shown by Barrow to Newton. At once the young mathematician laid before his master his own MSS. Barrow was struck by the riches of the collection, and wrote to Collins of it. The copy made at that time was found among Newton's papers at his death; the MSS. were sent to Collins, and their value at once acknowledged by the first mathematicians of the age; but he still refused to publish. Newton's attention was now directed toward the subject of light. By repeated experiment he showed that light is not homogeneous, but that a ray of white light is the resultant of innumerable rays of light possessing different colors, rates of vibration, and refrangibility. In 1672 he was elected a member of the Royal Society of London. Soon after a communication on light was read before that society, which stirred up a violent controversy. Newton advocated the material or corpuscular theory; Hooke, the undulatory theory of light. Newton brought forward many remarkable experiments and much mathematical knowledge to his support. Hooke had little more than an hypothesis to offer. The undulatory theory has since been accepted as the true one, though its foundation is far deeper and surer than that laid by its earlier advocates. In 1671 Newton completed a reflecting telescope made with his own hands, which is still in the library of the Royal Society. About this time, in investigating the colors of thin plates, he invented his very ingenious hypothesis of "fits of easy reflection and transmission." In 1682 a new measurement of an arc of the meridian came to his knowledge; this gave him the information requisite to make again his calculation relative to gravity. As he approached its completion his agitation became so great that he was forced to intrust it to a friend to finish. The result justified his intense feeling: observation and calculation corroborated each other; the crowning glory of Newton's life, the magnificent theory of universal gravitation was complete. (See Gravitation.) His discovery was given to the world under the title *Philosophiæ Naturalis Principia Mathematica* in 1687. This work treats of unresisted motion, of resisted motion, and from them deduces the order of the physical universe. So new and startling an exposition of truth, and one so at variance with preconceived notions, roused vigorous opposition. It was half a century after the publication of Newton's *Principia* before the French mathematicians fully accepted its teachings. In Great Britain the Newtonian philosophy, in spite of its profundity, was early introduced. St. Andrews College adopted it in 1690, Cambridge in 1699, and Oxford in 1704.

For many years Newton's means had been very limited—so much so at times that it is upon the records of the Royal Society of 1674 that the usual dues were not required of him, on account of his inability to pay them. In 1689 he became M. P. for Cambridge. At the expiration of the year Parliament was dissolved. In 1692 an accident, by which he lost the fruit of twenty years of labor, undermined his health and impaired his intellect for a time. The story of this loss—that it was occasioned by a favorite dog which upset a burning candle among his papers and reduced them to ashes—is credited by Biot and pronounced a fiction by Brewster. In 1695 he was appointed warden of the mint, with a salary of from £500 to £600 per annum, and in 1699 he was promoted to the mastership of the mint, with a salary of from £1,200 to £1,500 per annum. The duties of this office he fulfilled with great ability. For twenty years before his death his niece, Mrs. Conduitt, took charge of his establishment in London. His health became greatly impaired, and in 1725 he went to Kensington to live, and the duties of his office were performed by Mr. Conduitt. On Feb. 28 he presided for the last time at a meeting of the Royal Society; the fatigue produced an accession of his disorder, and he died Mar. 20, 1727, and was buried with great pomp in Westminster Abbey. Two controversies which embittered Newton's life have not been mentioned—the one with Leibnitz in 1676 in regard to the authorship of the binomial theorem and the infinitesimal method, where both were independent discoverers; and another with Flamsteed, the first astronomer-royal, in his later years. The following is a list of his works, with the dates of their publication; (1) *Principia* (1687); (2) *Optics* (1704); (3) *Arithmetica Universalis* (1707); (4) *Analysis per Equationes Numero Terminorum Infinitas* (1711); (5) *Methodus Differentialis;* (6) *De Mundi Systemata* (1728); (7) *The Chronology of Ancient Kingdoms Amended* (1728); (8) *Table of Assays;* (9) *Optical Lectures* (1728); (10) *Observations on the Prophecies of Daniel and the Apocalypse of St. John* (1733); (11) *A Method of Fluxions and Analysis of Infinite Series* (1736); (12) *A Historical Account of Two Notable Corruptions of Scripture* (1754). The principal works of Newton have been collected and reprinted by Dr. Horsley under the title of *Newtoni opera quæ exstant omnia* (5 vols., 1779–85). There is also an English translation of the *Principia* which was reprinted in the U. S., but can now be found only at the antiquarian book-stores. His various communications to the Royal Society are to be found in vols. vii.–xi. of its *Transactions*.

S. B. Herrick.

Newton, John: clergyman and author; b. in London, England, July 24, 1725; was the son of a sea-captain, with whom he made several voyages to the Mediterranean; was pressed into the navy as a seaman in 1744; became a midshipman; exchanged into a vessel engaged in the slave-trade

at Madeira; resided some time near Sierra Leone in the employ of a slave-dealer; returned to England in 1747, and for four years thenceforward commanded a Liverpool slave-ship, feeling, as he subsequently said, no scruples as to the nature of his occupation; obtained the surveyorship of the port of Liverpool (then a small place) in 1755; taught himself Latin, Greek, and Hebrew; was deeply affected by the religious movement directed by Wesley and Whitefield; took orders in the Church of England in 1764; became soon afterward curate of Olney, Buckinghamshire, where he formed a close intimacy with the poet Cowper; published a *Narrative* of his early life and remarkable religious experience, and with Cowper wrote the *Olney Hymns*, many of which have passed into popular use in public worship; became in 1779 rector of St. Mary Woolnoth, London; was a leader of the Calvinistic or evangelical party in the Church of England, and author of numerous religious treatises, which at the time enjoyed great popularity, and were collected as his *Works* (6 vols., 1816). D. in London, Dec. 31, 1807. See his *Life*, by Rev. Richard Cecil (London, 1808).

Newton, Gen. John: soldier and engineer; b. at Norfolk, Va., Aug. 24, 1823; graduated at West Point, and was appointed second lieutenant of engineers July, 1842; with the exception of some three years at West Point as assistant Professor of Engineering and while chief engineer of the Utah expedition of 1858, he was engaged in the construction of fortifications on the Atlantic and Gulf coasts, surveys and improvements of rivers and harbors, until the outbreak of civil war in 1861, when, after serving as chief engineer of the department of Pennsylvania and of the Shenandoah, he was, in Sept., 1861, appointed a brigadier-general of volunteers, and commanded a brigade in the defenses of Washington, at the same time performing the duties of an engineer in the construction of those works, until the spring of 1862. With the Army of the Potomac he led his command in the expedition to West Point, at Gaines's Mill, and at Glendale, Va., at South Mountain and Antietam, Md., and at Fredericksburg, Dec., 1862, where he commanded a division; promoted to be major-general Mar., 1863, he commanded the third division of the Sixth Corps in the storming of Marye Heights May 3, 1863. He served with great distinction at Gettysburg, where, after the death of Reynolds, he succeeded to the command of the First Corps July 2, 1863, which he led during the rest of the battle and commanded until the reorganization of the army Mar., 1864, when he was transferred to the West, where he led a division of the Fourth Corps in all the battles of the campaign which resulted in the capture of Atlanta, Sept., 1864; commanded various districts in Florida from Oct., 1864, to Jan., 1866. He was breveted lieutenant-colonel for bravery at Antietam, colonel at Gettysburg, brigadier-general for Peachtree Creek, and major-general for services in the field during the war. When he resumed duty with his corps, in which he had risen to be lieutenant-colonel, he was charged with important engineering duties—in removing the obstructions at Hell Gate and other points on the East river, the proposed enlargement of the Harlem river, the improvement of the Hudson from Troy to New York and of the channel between New Jersey and Staten Island, of many other rivers and harbors, and served upon numerous boards upon civil and military works. He was promoted to be colonel June 30, 1879, and appointed chief of engineers, with the rank of brigadier-general, Mar. 6, 1884. He was retired from active service in the army in Aug., 1886, at his own request. He was commissioner of public works in New York city Aug., 1886, to Nov., 1888, and became president of the Panama Railroad Company in Apr., 1888. D. in New York, May 1, 1895. Revised by James Mercur.

Newton, Richard Heber, D. D.: clergyman; b. in Philadelphia, Oct. 31, 1840; educated at the University of Pennsylvania and at the Philadelphia Divinity School; was ordained deacon in the Episcopal Church in 1862; became his father's assistant in St. Paul's church, and afterward in the Church of the Epiphany, Philadelphia; accepted the charge of Trinity church, Sharon Springs, New York, in 1863, but returned to Philadelphia, and became the rector of St. Paul's church in that city in 1866. In 1869 he was called to the Memorial (afterward All Souls') church, New York, where he became very popular as a preacher, and has built up a strong parish. A Broad Churchman of advanced views, he incurred the suspicion of heterodoxy on account of his alleged rationalism, but he defended himself with ability and continued in his pastorate. His works are *The Morals of Trade* (1876); *Studies of Jesus* (1880); *Womanhood* (1880); *Right and Wrong Uses of the Bible* (1883); *The Book of the Beginnings* (1884); *Philistinism* (1885); *Social Studies* (1886); *Church and Creed* (1891); and many articles in the leading magazines.

Newton's Rings: See Thin Plates, Colors of.

Newton Theological Institution: an institution for the training of young men for the Baptist ministry; at Newton Center, Mass. It was the first Baptist theological seminary of high grade in America, and was founded in 1825. It has a fine location, 7 miles from Boston, with four buildings; the library has 23,000 volumes; the funds of the institution amount to $400,000. The number of students in 1900 was seventy-four. President, Nathan E. Wood, D. D.

Newtown: town: Fairfield co., Conn. (for location of county, see map of Connecticut, ref. 11–E); on the Housatonic river, and the N. Y., N. H. and Hart. and the N. Y. and N. E. railways; 9 miles E. of Danbury, 19 miles N. by W. of Bridgeport. It has manufactories of flour, cider, lumber, carriages and wagons, combs, and buttons, and contains a public library (founded 1876), a savings-bank, and a weekly newspaper. Pop. (1880) 4,013; (1890) 3,539; (1900) 3,276; borough, 254.

Newtown: borough (founded in 1687, incorporated in 1838, formerly the county-seat); Bucks co., Pa. (for location of county, see map of Pennsylvania, ref. 5–J); on the Phila., Newtown and N. Y. Railroad; 14 miles S. E. of Doylestown, the county-seat. It was laid out by William Penn; contains six churches, a public school with high-school department, a Friends school, a national bank with capital of $100,000, and a weekly newspaper; and has a planing-mill, carriage-factory, iron-foundry, and machine-shops, artesian water, and electric lights. Pop. (1880) 1,001; (1890) 1,213; (1900) 1,463. Editor of "Enterprise."

New Ulm: city (founded in 1854, destroyed in a raid and massacre by the Indians in 1862, nearly destroyed by a cyclone in 1881); capital of Brown co., Minn. (for location of county, see map of Minnesota, ref. 10–D); on the Minnesota river, and the Chi. and N. W. Railway; 34 miles W. N. W. of Mankato, 100 miles S. W. of St. Paul. It contains 5 churches, 4 public and 2 parochial schools, Turner hall and gymnasium, Turnverein Library (founded 1864), St. Alexander's Hospital, a State bank with capital of $50,000, a private bank, and 5 weekly newspapers; and has 4 flour-mills, with daily capacity 2,400 barrels, 3 breweries with annual capacity of 30,000 barrels, foundry, creameries, and vinegar-works. Pop. (1880) 2,471; (1880) 3,741; (1900) 5,403. Editor of "Review."

New Westminster: city (formerly capital of British Columbia); British Columbia, Canada (for location, see map of Canada, ref. 8–D); on the Frazer river, 10 miles from its mouth, and on the Canada Pac. and the Great North. railways: 75 miles N. E. of Victoria, the present provincial capital. It is in an agricultural region, and contains the former provincial government buildings, a lunatic asylum, a penitentiary, the Bank of British Columbia and a branch of the Bank of Montreal, and a daily newspaper with weekly edition. The city has valuable facilities for general commerce, but since it ceased to be the provincial capital its principal industry has been the shipment of fish, lumber, grain, and furs. The climate is mild, the mean annual temperature is 47°, and rain is frequent and abundant. Pop. (1881) 1,500; (1891) 6,641. M. W. H.

New Whatcom: See Whatcom.

New Year's Day: The custom of keeping the first day of the year as a day of festivity is a widely prevalent one, but the day on which the year begins varies much in different countries. In the Roman Catholic Church, since the establishment of the Gregorian year (or new style) it falls upon the festival of the Circumcision, a holiday of obligation, which is also the feast-day of several saints, of whom St. Sylvester is the most widely honored. In the other churches it has no specially religious character.

New York [named from *York*, in England, in honor of the Duke of York]: one of the U. S. of North America (North Atlantic group); an original State of the Union; the first in wealth and population; popularly known as the "Empire State."

Area and Location.—It lies between lat. 40° 29′ 40″ and 45° 0′ 42″ N., and lon. 71° 51′ and 79° 45′ 54′ W. The At-

lantic Ocean bounds the State in part on the S. and E., while Long Island Sound is the boundary N. of the island, which gives the name. The rest of the southern boundary is formed by New Jersey and Pennsylvania, and of the eastern boundary by Connecticut, Massachusetts and Vermont, with Lake Champlain setting off the last-named State. On the W. the State is bounded by a point of New Jersey near the ocean, by Pennsylvania near Lake Erie, by the eastern waters of that lake, by the Niagara river adjoining Canada, and by Lake Ontario. Lake Ontario, the St. Lawrence river, and Canada constitute the northern boundary. The outline of the State roughly resembles that of a shoe, with a pointed heel projecting into the ocean, a stub toe touching Lake Erie, and the ankle terminating on Canada. The area is 47,620 sq. miles, and the extreme measurements are 311⅔ miles from N. to S., and 412 miles from W. to E., including Long Island.

Seal of New York.

Physical Features.—Besides the navigable waters which form so large a part of its boundaries, and the East river, a strait of the sea separating Manhattan Island and Westchester County from Long Island, the State has facilities for navigation in Lakes George, Schroon, and Saranac in the N. E., in Otsego, Oneida, Cazenovia, Onondaga, and Skaneateles in the central region, and in Owasco, Cayuga, Seneca, Canandaigua farther W., and in Chautauqua Lake in the extreme W., while hundreds of smaller lakes are used for pleasure-boats. The Hudson river, near the eastern border, is navigable for 151 miles from the ocean, and is the chief feature in the river system, which is notable from the fact that the waters run to all points of the compass. The Mohawk flows 135 miles from the W. into the Hudson, carrying many branches, such as the East and West Canada creeks from the N. and the Schoharie from the S. Into the Oswego river, which has several affluents, the lakes from Oneida to Canandaigua discharge, and through that river into Lake Ontario, and thus into the St. Lawrence. The Genesee, rising in Pennsylvania, crosses New York, and falls into Lake Ontario. In the southern central region, the Chenango, the Tioga, and the Chemung empty into the Susquehanna, which seeks the ocean through the Chesapeake, while farther E. various streams contribute to the Delaware, finally emptying into Delaware Bay. In the N. E. the Chazy and the Saranac flow into Lake Champlain, while the St. Regis, the Raquette, and the Oswegatchie, with others, are affluents of the St. Lawrence. In the western counties, Cattaraugus creek runs into Lake Erie, while the Alleghany river, entering New York from Pennsylvania, returns to carry its waters into the Ohio, and thus into the Mississippi and the Gulf of Mexico. From this watershed the interior lakes and the larger rivers generally, except the Mohawk, cross the lines of latitude.

The trend of the interior waters of New York is determined mainly by its mountains and its hills. These belong to the Appalachian system. On the E. the Green and Hoosac Mountains wall the Hudson, while on the W. the Helderbergs, the Catskills, and the Shawangunk Mountains shut in that river, and turn the affluents of the Delaware. Several ranges in the northeastern counties, of which the Adirondack is the most prominent, are the highest in the State. Mt. Marcy or Tahawas, in that range, is 5,379 feet high, and Dix peak 4,916 feet. The Chateaugay Range, extending from Lake Champlain to the Mohawk in Herkimer County, is dominated by Mt. Seward, 4,384 feet high. The Mohawk valley furnishes the single pathway from E. to W. between the hills and mountains.

Waters from such hills and mountains make falls which are grand and picturesque, like Niagara, on the river between Lake Erie and Lake Ontario; Trenton, on the West Canada creek; the High Falls of the Genesee, at Portage; the Taghanic and others, near Ithaca; and very many on streams in various counties. Power for industrial uses is developed, as by the Niagara, at Little Falls and Cohoes on the Mohawk, at Fulton and elsewhere on the Oswego, at Rochester on the Genesee, at Waterloo and Seneca Falls on the Seneca, at Watertown on the Black river, in the northeastern region in many places, and at a number of other points.

Islands are abundant. Manhattan Island is occupied by the busy part of New York city. Long Island and Staten Island are the largest of groups in the waters adjacent to the ocean. Lake George is beautified by many islands varying in size. In the St. Lawrence the Thousand Islands are only a part of 1,500 lying between New York and Canada.

The groups in the St. Lawrence and Coney Island, on the southern shore of Long Island, are popular summer resorts. Saratoga, near the upper Hudson, Richfield and Sharon, in the central counties, are noted watering-places, while Chautauqua Lake has given name to a system of educational meetings. An increasing number of points in the Adirondack region attract visitors, and some of them are commended as winter sanitaria for pulmonary patients.

Geology.—This is described by Prof. Grove K. Gilbert, of the U. S. Geological Survey, as follows: The formations of the State represent nearly all parts of geologic time. Beginning with the older, an Archæan area is approximately coincident with the Adirondack Mountains, and a smaller body at the S. is the principal constituent of the Highlands of the Hudson. The rocks are chiefly gneisses and granites, and by their hardness and ability to resist decay have partially escaped the great erosion to which the country has been subjected. Against and about these ancient masses lie Palæozoic strata, constituting four-fifths of the rocky foundation of the State. Along the eastern border the Palæozoic rocks are plicated, crushed, and metamorphosed, so that a belt of schists and slates runs from Lake Champlain to New York city. For a short distance W. of this belt and S. of the Adirondacks the strata are disturbed by folds and faults, but without metamorphism, and they extend thence westward in gently undulating sheets to the limits of the State. The older Palæozoic rocks join the Adirondacks on the N., E., S., and S. W. in regular order. In the central and western parts of the State belts of outcrop trend from E. to W., and the rocks dip southward at an average of 25 feet per mile. In general these rocks have little influence upon the topography, producing only occasional ridges on the general plain; but near their eastern margin are massive sandstones which have resisted the eroding agents, preserving an upland tract known as the Catskill Mountains. The Palæozoic formations represent the Cambrian, Silurian, and Devonian periods. Beginning with the lowest they are as follows: (*Cambrian*) Georgia slate, Potsdam sandstone; (*Silurian*) Calciferous sandrock, Trenton limestone, Utica shale and Hudson slate, Medina group, Clinton group, Niagara group, Salina group, Waterlime group, Helderberg limestone; (*Devonian*) Oriskany sandstone, Corniferous and Onondaga limestones, Hamilton group, Portage group, Chemung group, and Catskill group.

Of periods later than the Palæozoic, the Jura-Trias is represented by the Newark sandstones and shales, which occupy a portion of Rockland County S. of the Highlands; the Cretaceous, by a few outcrops on Long Island; and the Pleistocene, by glacial drift and lacustrine and estuarine clays of wide extent. The ice-sheet of the Pleistocene covered the entire State, and produced many of the details of its topography. By its grinding action it gave smooth forms to all hills composed of soft rocks, and it deepened a number of valleys in the great Devonian shale formations in the central and western parts of the State. Cayuga and Seneca Lakes, and a number of smaller lakes lying approximately parallel to them, occupy some of these deepened valleys. The glacial drift lies in an irregular sheet over most of the surface, being in places so thin as hardly to be noticed, and elsewhere several hundred feet in thickness. The greater number of the wells of the State penetrate only this formation, and it constitutes most of the soils. About the shores of Lake Erie, Lake Ontario, and Lake Champlain, and in the St. Lawrence valley are clay deposits overlying the drift, and there is a similar deposit in the valley of the Hudson. These are sediments from great bodies of standing water which covered certain valleys while the ice was melting away. In the Erie and Ontario basins they are limited by a series of terraces and beach ridges marking the coast-lines of the lakes by which they were deposited. One of these old beaches, running from Lewiston to Sodus, has a height above Lake Ontario of from 125 to 200 feet.

Soil and Productions.—About one-half of the area of the State is adapted to cultivation, and the products include nearly all those of the temperate zone. The estimated value of the farm products is placed by the census of 1890 at $161,593,009, giving New York second rank among the States, surpassed only by that of Illinois by $23,166,004. In the number of farms, New York with 226,223 is exceeded only by Illinois, Missouri, Ohio, and Texas. In production of wool New York ranks seventh among the States. On June 1, 1890, there were 1,440,230 milch cows, a larger number than in any other State except Iowa, which had 58,188 more. New York was by far the first among the States in production of milk, with 663,917,240 gal., as also in butter with 98,241,813 lb., and cheese with 4,324,028 lb. Butter is made in considerable part in creameries receiving milk from a number of farms, while cheese comes mainly from factories. The first rank belongs to the State in buckwheat. Out of 39,171,270 lb. of hops produced in the census year in all the States, 20,063,029 lb. were raised on 36,670 acres in New York. The dairy prospers chiefly in the central counties and on the lower Hudson. Hops are produced in Oneida, Lewis, Madison, Otsego, and Schoharie Counties. Onondaga and Wayne Counties and the Chemung valley cultivate some tobacco, while broom corn is a favorite crop in the lower Mohawk valley. Grain is raised in the western and southwestern counties. Attention is given in Northern New York to peas, beans, and potatoes. On Long Island and in less degree near all the cities market-gardens thrive. In the central and western parts apples, plums, pears, and cherries are abundant in favorable years, and in the S. and W. peaches are raised, while grapes are cultivated along the Hudson and the interior lakes to the W., whence wines of acceptable brands are sent to market. For the calendar year 1900 the principal agricultural products are thus stated:

CROPS.	Acreage.	Yield.	Value.
Corn	538,626	17,236,032 bush.	$8,100,935
Wheat	367,015	6,496,166 "	5,002,048
Oats	1,596,379	44,538,974 "	14,252,472
Rye	211,203	3,189,165 "	1,785,932
Barley	170,542	3,751,924 "	1,913,481
Buckwheat	211,203	3,189,165 "	1,785,932
Tobacco (1896)	3,259	3,389,360 lb.	271,149
Potatoes	339,276	27,484,356 bush.	12,366,610
Hay	4,138,261	3,351,991 tons	47,095,474
Totals	7,575,764	.....	$92,574,033

The farm animals, Jan. 1, 1900, number as follows:

ANIMALS.	Number.	Value.
Horses	590,771	$37,251,355
Mules	3,714	257,903
Milch cows	1,487,416	52,357,043
Oxen and other cattle	572,299	15,707,884
Sheep	846,165	3,448,122
Totals	3,500,365	$109,022,307

The following summaries are from the U. S. census reports of 1880 and 1890:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	241,058	226,223	6·2
Total acres in farms	23,780,754	21,961,562	7·6
Value of farms, including buildings and fences	$1,056,176,741	$968,127,286	8·3

* Decrease.

Flora and Fauna.—The maple has been proposed as the State tree because it is so common. Sugar is made from maple sap in the northern counties and to some extent elsewhere. Ten species of oak are found, while a like number of the pine family is reported. The elm beautifies the landscape in most of the pastoral counties. The hickory, beech, birch, ash, hemlock, spruce, cedar, poplar, willow, whitewood, chestnut, basswood, butternut, sycamore, locust, ailantus, black walnut, yew, and sumac may be enumerated. Of flowering plants 1,550 varieties are noted, and 54 species of ferns.

The State includes portions of three faunal regions, the Canadian, Alleghanian, and Carolinian. The Canadian is restricted to the northern and more elevated parts, mainly to the Adirondacks and Catskills. The Alleghanian includes nearly all the more level parts, while the Carolinian occupies barely the lower Hudson valley and a small area just eastward of Lake Erie. The number of indigenous land mammals is about 55; about 350 kinds of birds, not including stragglers, visit the State during their migrations, or spend the greater part of the year in it. Only a little more than one-third of these rear their young within the State. So far as known not a single species of bird or mammal is peculiar to this State. Many southern forms reach the southern border, extending a short distance up the Hudson. Others from the northward come to the mountains and to the higher districts of the Adirondacks and the Catskills. Most of these range outside of the State in all directions. Settlement and the removal of the forests have extirpated many of the larger mammals, such as the elk, which was known in most parts of the State, and the moose and the caribou, which were formerly found in the Adirondacks. The wolf and the beaver have also been practically exterminated, while the panther, wild cat, and black bear are restricted to the least settled mountainous regions. The larger waterfowl, the eagles, and the larger birds of prey, the herons, and the other wading birds, have become rare, while at least two species formerly common on Long Island, the heath-hen and pied duck, have become extinct. The wild turkey has shared the same fate, while only a few pairs represent the wild pigeons formerly present in hundred thousands.

Climate.—The climate of the State is temperate, with marked changes of heat and cold and variations of moisture. Four stations show the following record:

LOCALITY.	TEMPERATURE.		Annual rainfall.	DAYS.			
	Max.	Min.		Clear.	Fair.	Cloudy.	With rain.
New York	95°	6°	52·30 in.	82	150	132	144
Albany	98	−4	44·89 in.	59	162	144	175
Oswego	93	zero.	40·86 in.	74	97	194	167
Rochester	95	6	43·09 in	56	116	193	208

Divisions.—The State is divided into sixty-one counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	*Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

Middletown	11,977	14,522			

Government.—The Legislature consists (1901) of a Senate of 50 members chosen for three years, and an Assembly of 150 members elected annually. Senators are chosen by districts formed on the basis of population without dividing counties, while Assembly districts are also based on population, save that each county has at least one member, except Fulton and Hamilton. The Governor is elected for two years; he has the power to pardon, may remove certain officers, and has the right of veto extending to separate items of appropriation bills, but the veto may be overridden by two-thirds of the members elected to each house. The Lieutenant-Governor is president of the Senate, and his term of office corresponds with that of the Governor, whose place he fills in case of disability. The secretary of State, comptroller, attorney-general, treasurer, and State engineer and surveyor are elected for two years. The Governor, with the advice and consent of the Senate, appoints the superintendents of public works, of banking, of insurance, and of State prisons. Many commissions and State boards are appointed in the same manner. The court of appeals, consisting of a chief judge and six associate judges, has appellate jurisdiction only in questions of law. The Supreme Court, composed of judges elected for fourteen years in eight districts, has general jurisdiction in both law and equity; and from it the Governor designates, for terms of five years, seven justices to constitute an appellate division for the hearing of appeals from the Supreme Court. The courts of oyer and terminer no longer exist, and the courts of sessions are abolished, except in New York County, the county courts taking the criminal jurisdiction of the courts of sessions. There is a surrogate's court in each county. In the counties supervisors representing towns and wards exercise general powers, partly legislative and partly relative to auditing accounts, control of county buildings, and care of the poor. The cities are governed under special charters from the Legislature varying in their provisions. In the towns, which all elect their own officers, the highways and bridges and immediate local concerns are directed by the town board, while justices of the peace pronounce upon minor civil and criminal cases subject to appeal.

Population and Races.—Since 1820 New York has had the first place among the States in population. Its elements have from an early day been much diversified. In 1890 the foreign born numbered 1,571,050, while in the whole U. S. the number was 9,249,547. Of the native whites in the State there were of foreign parentage 1,837,453. Of the total population, 2,976,893 were males and 3,020,960 females. The colored persons were 72,901, and Indians on the reservations in 1892, 5,064. The foreign born consisted of 498,602 Germans, 483,375 Irish, 144,060 English, 93,193 Canadians, 64,141 Italians, 58,466 Russians, 35,332 Scotch, 33,145 Austrians, 28,430 Swedes, 22,718 Poles, 20,443 French, 15,598 Hungarians, 11,557 Swiss, 9,129 Bohemians, 8,602 Norwegians, 8,366 Dutch, 8,108 Welsh, 6,238 Danes, 3,135 Chinese, and nearly all other countries had representatives.

Industries and Business Interests.—These surpass those of any other State of the Union in variety and magnitude. First in agriculture, its rank in manufactures is also at the head. While the total products of the U. S., according to the census of 1890, were in value $9,370,107,624, those of New York were $1,711,577,671, or $380,054,570 more than those of Pennsylvania, the second in order. The capital invested in New York was $1,130,161,195 in 65,840 establishments reported, employing an average of 850,084 persons, whose wages were $466,846,642, an amount greater by $161,290,413 than in Pennsylvania. Hardly any industry permissible in the temperate zone is unrepresented. The cities made the following exhibit:

CITIES.	Industries.	Establishments.	Capital.	Persons employed.	Wages paid.	Cost of materials.	Miscellaneous expenses.	Value of product.
Albany	123	1,294	$16,441,365	14,670	$7,817,564	$11,362,017	$1,767,707	$24,430,396
Auburn	53	209	10,832,611	6,001	2,472,574	3,519,477	1,309,790	9,064,093
Binghamton	93	702	9,022,851	10,077	4,306,862	7,583,413	826,468	14,932,001

Some of the leading manufactures may be tabulated as follows:

CLASSIFICATION.	Establishments.	Capital.	Persons employed.	Wages paid.	Cost of materials.	Miscellaneous expenses.	Value of product.
Combined textiles	566	$70,918,577	59,544	$21,182,030	$46,086,670	$4,553,355	$82,535,242
Cotton goods	42	13,290,745	8,401	2,563,730	5,554,993	733,663	9,777,295
Woolen goods	339	46,461,914	37,992	13,033,901	30,390,598	2,662,282	53,340,151
Silk goods	185	11,165,918	13,151	5,584,399	10,141,079	1,157,410	19,417,796
Dyeing and finishing	49	4,963,095	2,839	1,481,723	1,449,344	372,710	3,636,051
Clothing	2,357	75,697,050	70,593	37,164,217	56,033,725		118,087,027
Liquors, malt	158	53,090,639	8,961	7,206,778	18,322,817		43,064,193
Foundry and machine-shop products	777	52,619,671	29,370	20,111,787	19,461,282		53,546,060
Boots and shoes	140	8,370,287	9,670	4,250,326	7,545,587		13,911,377
Tobacco	391	6,543,914	6,162	2,389,344	3,296,521		8,396,213

During the fiscal year ending June 30, 1893, the collections of internal revenue were: From the manufacture of

distilled spirits, $4,841,338; tobacco, $5,527,033; fermented liquors, $9,311,661; oleomargarine, $1,656; and penalties, $10,433—total, $19,686,276.

Mineral Resources.—The most important mineral products are clay, cement rock, building-stone, salt, and iron ore. All the clays proper are of Pleistocene age, the most important for economic uses being the lacustrine and estuarine clays of the Erie, Ontario, Champlain, and Hudson valleys, but numerous smaller deposits are locally used for brick-making. Shales of the Salina, Hamilton, and Chemung formations are also ground up for this purpose. As the greater clay deposits are readily exploited and practically inexhaustible, the magnitude of the industries in various districts depends chiefly on the demand of neighboring cities, and the Hudson river industries, supplying New York city, are the most important. The annual output of bricks is estimated at about 1,500,000,000, valued at $8,500,000. Roofing tile, drain tile, etc., are also manufactured. Half the hydraulic cement of the U. S. is produced in New York, the productive formation being the Waterlime group. The yield in 1899 was 5,161,553 barrels, valued at $3,522,079, and the greater part of this was obtained from Ulster County. Erie, Onondaga, and Schoharie Counties furnished smaller amounts. In the production of building-stone New York ranks fourth in the U. S. The limestone quarried in 1899 was valued at $1,545,699; marble, at $338,816; sandstone, at $1,218,053; granite, at $306,711; slate, at $76,675. Limestone is obtained chiefly from the Trenton, Niagara, and the Onondaga formations. These are so widely distributed in the central, western, and northern parts of the State that they afford lime-rock and building-stone for local use at very many points. Along the eastern base of the Adirondacks certain beds of the Trenton limestone are of such texture as to take a high polish, and are extensively quarried and marketed under the name of marble. Crystalline marbles are also found in abundance among the metamorphic rocks in St. Lawrence, Columbia, and Westchester Counties. The Potsdam, Medina, and Catskill sandstones and various thinner beds of the Hamilton and Chemung groups are widely distributed, and, like the limestones, are quarried at many points for local use. Sandstone is also shipped to a distance from various quarries of the Potsdam N. of the Adirondack Mountains and of the Medina in Monroe, Orleans, and Niagara Counties. A special grade of sandstone, known as "bluestone," is obtained from the various layers of the Hamilton, Chemung, and Catskill formations in Albany, Greene, Ulster, and Schoharie Counties, and is carried to New York and other cities, where its principal use is as flagging. Granite is derived from crystalline rocks in Westchester County and in the Highlands, and there is an important quarry on one of the Thousand Islands. Slate, quarried in Washington County, is derived from the Hudson River formation. In the production of salt, New York is exceeded only by Michigan. The yield in 1898 was 6,791,798 barrels, valued at $2,369,323. This was derived directly or indirectly from the Salina group, a part being mined and the rest obtained from brines. The Onondaga district, near Syracuse, was for many years one of the most productive in the country, but the Warsaw district, of Wyoming, Genesee, and Livingston Counties, which had rapidly developed, overtook the older district in 1887, and in 1893 doubled its output. In the production of iron ore the State ranks eighth in the U. S., the output of its mines in 1899 being 443,790 long tons, valued at $1,241,981. Magnetite is obtained in great amount along the eastern flank of the Adirondacks, and in less amount on the northern and western flanks, and in the Highlands. Limonite is associated with Lower Palæozoic rocks along the eastern border of the State. Hematite is obtained from metamorphic rocks in Jefferson County, and also from the Clinton formation running E. and W. across Wayne, Cayuga, Oswego, and Oneida Counties. Siderite is found near the city of Hudson, associated with the Hudson slate.

Commerce.—The commerce of New York is in large part that of the nation, as its chief port serves not only for the State, but also for much of the continent. There are twelve customs districts, reporting as follows:

CUSTOMS DISTRICTS AND PORTS.	EXPORTS. For the year ending June 30.		IMPORTS. For the year ending June 30.	
	1899.	1900.	1899.	1900.
Albany	.....	.....	$120,554	$258,525
Buffalo Creek	$8,010,354	$14,488,028	3,675,047	4,134,917
Cape Vincent	196,151	140,131	202,062	244,339

Sag Harbor	8	2,301	.....	.....	1	399	.....	.....	9	2,700
Totals	5,171	1,385,175	7,124	8,786,166	5,181	1,393,792	6,758	8,358,134	24,234	19,923,267

Wealth.—Of the total wealth of the U. S., placed by the census of 1890 at $65,037,091,197, New York possessed $8,576,701,991. Of the real estate with improvements amounting to $39,544,544,333, the share of New York was $5,817,704,667. Of the machinery of mills and their product on hand, stated at $3,058,593,441, New York held $594,476,039. Of railways and equipments, including street-railways, amounting in the U. S. to $8,685,407,323, those in this State were valued at $534,671,937.

In 1900 the total assessed value of real estate was $5,947,110,126, and of personal property $735,586,303. The tax-rate in 1900 was $1.96 per $1,000, and for the fiscal year beginning Oct. 1, 1901, $1.25, the lowest since 1855.

Banking.—On Sept. 5, 1900, there were 336 national banks, with a combined capital of $97,218,210, surplus and profits of $97,720,013.29, and deposits of $560,820,176.80. The State banks on May 31, 1900, numbered 200, with a combined capital of $28,870,700, surplus and profits of $28,403,064, and deposits of $251,059,315. There were also on June 30, 1900, 15 private banks with combined capital of $495,000, surplus and profits of $246,793, and deposits of $2,365,619; 59 loan and trust companies, with combined capital of $48,250,000, surplus and profits of $89,825,970, and deposits of $640,837,146; and 128 mutual savings-banks with $922,081,596 in savings deposits from 2,036,016 depositors, and a surplus fund of $115,381,633. These interests aggregated 738 banking institutions, with a total capital of $174,833,910, surplus and undivided profits of $331,577,473, and deposits of $2,377,163,853.

Insurance.—The annual report of the State commissioners for 1900 showed 253 fire, marine, life, and casualty companies doing business, with assets of $1,943,004,411, and liabilities, except capital stock, of $1,515,309,737, and capital stock of $105,122,017. These companies reported a surplus of $353,326,119, and risks in force $32,925,249,575. There are 55 fraternal beneficiary societies which show receipts of $33,074,648, and disbursements of about $31,000,000. Fifty-three nonfraternal associations show receipts of $11,382,831, payments for claims $7,956,803, and for expenses $3,398,026. The work of the department is constantly on the increase, and unusual efforts are necessary in order to protect the rights of the policy-holders and members of beneficiary associations.

Means of Communication.—The development of the railways of the State is shown in the following summary as reported on Dec. 31 in the several years: (1850) 1,361 miles; (1860) 2,682; (1870) 3,928; (1880) 5,991; (1890) 7,745·85; (1899) 8,114·98. The report of the board of railway commissioners to the Legislature in Jan., 1894, showed that the gross earnings from operations of roads in the State in the fiscal year ending June 30, 1893, were $234,354,615; gross expenses, $157,128,964; net earnings, $77,225,650. The board also reported 47 street-railways in operation by the overhead trolley system and 3 by the cable system, and elevated railways in operation in the boroughs of Manhattan and Brooklyn.

The canal mileage has been greatly reduced by the abandonment of a number of such waterways as had ceased to be profitable. In 1900 the principal canals wholly in the State were the Erie, extending from Albany to Buffalo, built in 1817–62; the Champlain, from Whitehall to Waterford, built in 1817–37; the Oswego, from Syracuse to Oswego, built in 1825–62; the Cayuga and Seneca, from Montezuma to Cayuga and Seneca lakes, built in 1825; and the Black River, from Rome to Carthage, built in 1836–41. The amount of freight carried by these canals annually is about: Erie, 3,235,726 tons; Champlain, 848,965; Oswego, 92,634; Cayuga and Seneca, 38,761; and the Black River, 115,877—total tonnage, 4,331,963. The principal canal, partly within and partly without the State, was the Delaware and Hudson, extending from Honesdale, Pa., to Rondout, N. Y., built in 1826–28.

Churches.—The census of 1890 gave the following statistics concerning the religious bodies having a membership of 2,000 and upward:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	959	967	1,153,130	$25,769,478
Methodist Episcopal	2,123	2,136	242,492	16,944,350
Presb. Church in the U. S. of A.	784	943	154,083	21,293,992
Baptists, Regular	875	924	129,711	12,938,913
Protestant Episcopal	731	860	127,218	30,707,213

Independent congregations	26	27	4,232	722,400

Schools.—The regents of the University of the State of New York have supervision of education; they are elected by the Legislature on joint ballot. Charters of academies, colleges, and universities, libraries and museums proceed from them. A university convocation is held annually under the auspices of this body, and examinations in various studies are conducted by its authority, while plans for "university extension" are promoted by it. The State library and State museum are under its care. Twenty-two colleges for men, 8 for women, and 6 for both sexes, with 7 law schools, 15 of medicine, 3 of pharmacy, 3 of dentistry, 1 of the eye and ear, 2 veterinary, 11 of theology, 3 of pedagogy, and 9 other professional and technical schools are regarded as members of this university. (See COLLEGES.) The superintendent of public instruction, elected by the Legislature, is the head of the common-school system. Superintendents in cities and commissioners over groups of towns have more immediate oversight. In 1899 there were 11,913 public-school buildings. The sum of $7,579,067 was expended for houses and sites, furniture and repairs.

There were 1,569,653 children of school-age in the State, of whom 1,200,574 attended public schools at least part of the time, and 163,946 private schools. There were 31,768 teachers employed at an average annual salary of $604.78. The value of school property was $81,768,493, and the total expenditure for school purposes $33,421,491.37. There were 104 incorporated academies and 565 high schools with academic departments, with 3,888 teachers and 76,470 pupils. The total property of secondary schools was $28,412,184, and the expenditure by such schools in 1900 was $6,036,374. Institutes to the number of 110 were held during the year for teachers, of whom over 15,000 attended. Normal schools were maintained at Albany, Brockport, Buffalo, Cortland, Fredonia, Geneseo, Jamaica, New Paltz, Oneonta, Oswego, Plattsburg, and Potsdam, with a total of 6,000 pupils, property valued at $1,915,235, and expenditures for the year of $355,535. The American Museum of Natural History in New York furnishes instruction to the normal schools and teachers' institutes, and to teachers of common schools in cities near by, making reports on that branch of its work to the superintendent of public instruction.

Libraries.—In 1892 there were reported 511 libraries of 1,000 volumes and upward each, which contained 4,036,530 bound volumes and 379,544 pamphlets. The libraries were classified as follows: General, 99; school, 226; college, 27; college society, 4; legal, 21; theological, 10; medical, 14; Government, 1; public institution, 19; State, 1; Y. M. C. A., 20; social, 31; scientific, 12; historical, 5; garrison, 3; mercantile, 3; and miscellaneous, 4.

Newspapers and Periodicals.—In 1901 there were 1,936 newspapers and periodicals, of which 185 were daily, 6 tri-weekly, 43 semi-weekly, 1,048 weekly, 8 bi-weekly, 47 semi-monthly, 554 monthly, 15 bi-monthly, and 40 quarterly publications.

Post-offices.—The total number of post-offices on Jan. 1, 1901, was 3,695, of which 357 were presidential (20 first-class, 100 second-class, 237 third-class) and 3,338 fourth-class. There were 2,384 money-order offices, and 423 money-order stations.

Charitable, Reformatory, and Penal Institutions.—The board of charities exercises visitorial powers over State hospitals, county poorhouses, and asylums, and over 241 incorporated and 157 licensed asylums, which in 1893 contained 18,879 inmates. The State asylums have also local boards of managers. The State institutions for the insane are located at Utica, Poughkeepsie, Middletown, Buffalo, Willard, Binghamton, Ogdensburg, and Rochester. The aggregate cost of the buildings was $8,509,271. A State institution for feeble-minded children is maintained at Syracuse, and one for feeble-minded women at Newark. At Rome there is a State custodial asylum. Educational institutions for the blind are located at New York and Batavia, and for the deaf and dumb at New York, Fordham, Malone, Albany, Rochester, and Buffalo. There are reformatories at Elmira, Rochester, Canaan Four Corners, and Randall's Island, and for women at Hudson and Albion. For soldiers and sailors there is a home at Bath. The State paupers committed to the several public institutions in 1893 numbered 1,406. The total expenditures for charitable, correctional, and reformatory purposes in 1893 were for an average of 80,543 beneficiaries $20,407,982; in 1880, for 47,701 beneficiaries, they were $8,482,648. The ratio of beneficiaries to population was in 1880 1 to 107; in 1892, 1 to 85. A superintendent of State prisons has charge of institutions at Auburn, Clinton, and Sing Sing, containing in 1892 an average of 3,753 inmates and in 1900 3,376. The expenditures for the year 1900 were $460,528.02. The earnings of convicts engaged in several industries left a deficiency of $477,266.97. There are separate buildings at Auburn for women convicts, and a hospital at Matteawan for insane criminals.

History.—When in 1664 the English seized the colony of New Netherland, they called it New York, in honor of the Duke of York. The discovery of the coast belongs to Giovanni da Verrazano, a Florentine navigator, who at the close of Apr., 1524, anchored near what is now Sandy Hook, and entered the bay and the "very great river." French adventurers, Raulin Seculart and Jean Alphonse, about 1545 visited the same waters, and perhaps built works on Castleton Island below Albany, of which the ruins, it is claimed, still remain. The English title was at first based on the discovery of the North American coast by John Cabot, June 24, 1497, duly recorded on maps by his son Sebastian, but not otherwise. Jacques Cartier, under commission from Francis I. of France, on a second voyage in 1535 ascended the St. Lawrence to Montreal, and heard stories of the country to the S. and W. Actual entry in force by Europeans into the

territory now New York was first made from the N. by Samuel de Champlain, a favorite of the French king Henry IV., sent out to establish New France. In an expedition against the Iroquois he sailed down the lake that bears his name and attacked a party of Indians at Ticonderoga, Essex County. He was afterward repulsed in an attack on a village near Fenner, Madison County. While Champlain was engaged in conflicts with the Iroquois in the north, the Half Moon, a Dutch vessel commanded by Hendrick Hudson, an Englishman in the service of the Dutch East India Company, seeking a western passage to China, anchored Sept. 3, 1609, in the lower bay, and eight days later "went into the river," now the Hudson. On the 19th the Half Moon anchored at the point where Albany now stands. Dutch merchants commissioned a ship in the summer of 1610 for trade to New Netherland, and in 1612 other vessels arrived for a similar purpose. A few huts were built on the southern point of Manhattan Island, the beginnings of New Amsterdam. Even earlier Hendrik Christiaensen had erected a strong house on the west bank of the Hudson just below Albany and called it Fort Nassau. This became a center of traffic with the Indians, but it was so damaged by a freshet as to be abandoned in 1617. A new trading-house was set up at the mouth of the Tawasentha, near Albany, by a company of Amsterdam merchants; there an alliance was formed by this Dutch company on the one side and the Iroquois and other redmen on the other, and this treaty, renewed in 1645, was maintained during the entire period of the Dutch occupation. The Iroquois were thus arrayed against the French in Canada, and an impress given to the history of the colony. In 1621 the Dutch West India Company succeeded the earlier traders. The first colony came out by the New Netherland under the auspices of this company in 1623, and consisted in large part of Walloons, persons of French blood resident in Holland. Eight men were left on Manhattan Island, and another party made its home on the west shore of Long Island. The ship sailed up the Hudson, and most of the newcomers landed at Fort Orange, set out the year before, and eighteen families started the town which has grown into the city of Albany. Other vessels followed, and in 1625 the population had become 200. The next year the government was made more formal, with Peter Minuit as director-general, assisted by a council of five. The settlers engaged largely in the fur-trade, but tried to cultivate tobacco, and soon raised wheat for export.

During the administration of Kieft as director-general (1638–47) and of Peter Stuyvesant (1647–64) the colony was disturbed by Indian wars, by quarrels with the Dutch West India Company over the finances, and, when war broke out between England and Holland, by the aggressions of the English. Finally, in 1664, Col. Nicolls, the personal representative of the Duke of York, appeared in the bay with an English fleet and forced the Dutch to surrender Manhattan Island. He set up a government and summoned two delegates from each town to consider a code, "the Duke's Laws," which was accepted perforce. The Dutch temporarily reconquered the island in 1673, but this conquest was not known to the states-general when the Treaty of Westminster was signed, providing for the restoration by England and Holland of all lands captured during the war. Oct. 15, 1674, orders reached Colve, the director-general, to give up New Netherland, and so the Dutch rule, in the main prudent and beneficent, ceased to exist over what thenceforth was to be New York.

The transfer of the province from the Dutch took place Nov. 9, 1674. With Maj. Edmund Andros, the new governor of the territories of the Duke of York in America, was associated a council of ten appointed by him. "All persons of what religion soever" were to be treated alike, while special guarantees were accorded to the Dutch inhabitants, and efforts were put forth to hold the Iroquois in friendship by a board of commissioners. In response to urgent appeals the duke consented to an assembly of delegates from the freeholders, which met Oct. 17, 1683, and a Charter of Liberties was enacted, certain duties on imports were voted, and courts were established. Jurisdiction to Lake Ontario and the St. Lawrence was asserted by Gov. Dongan, while, to meet complaints of raids by the Iroquois E. and W. and S., a conference was held in Albany with the redmen at which, with the governor of New York, were present representatives of Massachusetts and Virginia, and July 30, 1684, an important treaty was negotiated. When James II., after whom the colony was named, ascended the throne he repudiated the Charter of Liberties, and objected to the powers claimed "for the people met in general assembly." New York was restive under King James's consolidation of the northern colonies as the Dominion of New England. The settlers took kindly to the accession of William and Mary, but Nicholson, the lieutenant-governor, scouted at it, and when Gov. Andros was placed under arrest in Boston deemed it "most safe to forbear acting without definite instructions." His weakness gave opportunity for a revolt under the leadership of Jacob Leisler, a captain of militia, who organized a government in the absence of Gov. Nicholson, and declared in favor of the new sovereigns, but was afterward convicted and hanged for refusal to recognize the military representative of Gov. Sloughter. See LEISLER, JACOB.

Before the Declaration of Independence forty-four different persons served as the executive head of the province, counting the Dutch directors. With most of the governors the assembly had differences over the revenue, and some of them, notably Fletcher and Cornbury, and later Clarke and the first George Clinton, rest under allegations of corrupt use of public moneys. For the purpose of increasing the production of naval stores 2,584 immigrants were brought from the Palatinate in 1711, most of them settling on the banks of the Hudson. Eleven years later a hundred families from the same country found homes on the Mohawk, and in 1738 eighty-three Scotch families were brought over to defend Lake George. To provide funds for expeditions against Canada paper money was first issued. The settlers reached out for trade with their neighbors N. of the St. Lawrence and the lakes, and to extend it a trading-post was set up at Oswego in 1722. Relations with the Iroquois required frequent attention, the governors were inclined to arbitrary acts, freedom of religion was matter of discussion, efforts were put forth to promote education, while so urgent was the pressure for popular rights that in 1729 the Lords of Trade were notified that "most of the previous and open steps which a dependent province can take to make themselves independent at their pleasure are taken by the assembly of New York." That assembly was, in fact, asserting its control over the finances and struggling for the independence of the courts. Negro slaves had been imported, and belief in a plot by some of them led, in 1741, in New York city, to cruel persecutions and a most unreasoning panic.

The French and Indian war (1755–63) fell with especial severity on New York. With their Indian allies the French struck swiftly as far as the Mohawk, but in a sharp fight at Fort Edward near Lake George were repulsed by Gen. William Johnson. Hostilities raged on the upper Hudson, along the Mohawk westward to Oswego, then again on the shores of Lake Champlain. Disasters were the frequent lot of this province, and a defeat on Lake George in July, 1758, opened the door to Montcalm, but it was closed by the capture of Fort Frontenac in August, and the next year Fort Niagara surrendered to Gen. William Johnson, and the French were driven back from Ticonderoga and Crown Point. New York contributed its full share to the splendid victory on the Plains of Abraham in 1759. In the next few years the colony manifested much discontent with British rule. It led in the union of the colonies Oct. 18, 1764, by clothing a committee of correspondence with power to correspond with its neighbors on the oppressive acts of Parliament and "on the impending dangers which threaten the colonies of being taxed by laws to be passed in Great Britain." In the colonial congress held in New York Oct. 7, 1765, the members of this committee took active part, and petitions for redress of grievances were presented to the king. The Stamp Act provoked violent protests, the patriotic association known as the Sons of Liberty was organized, and at last on Jan. 18, 1770, a collision occurred in New York city resulting in bloodshed. This irregular fighting was the real beginning of the Revolutionary war. Yet this province, more engaged in commerce than any other, for a while abandoned the sacrifice involved in total non-importation and restricted itself to the exclusion of tea. On that line it was positive and bold, and "the Mohawks" were organized in Oct., 1773, for aggressive action; but the vessels expected were kept back by a storm and did not arrive until four months after the historic tea-party in Boston harbor; on their arrival "the Mohawks" repeated in New York the exploit planned for the earlier date.

Its situation and topography joined with political events to cast upon this province the brunt of the war of the Revolution, and an account of the important military events that took place within its boundaries will be found in the article

United States (*q. v.*). From the seizure of Ticonderoga, May 10, 1775, and of Crown Point, immediately afterward, armies marched and countermarched on its soil. Its chief city could not be successfully defended even by Washington, and from the autumn of 1776 until Nov. 25, 1783, was in the hands of the British. In 1777 a constitution was adopted by the colony. The vast western domain which New York claimed by royal grant, by purchase from the redmen, and afterward by the British treaty, it voted Apr. 19, 1780, to transfer to the Union to become the Northwest Territory.

Parties divided on the powers of the confederacy, and afterward on the project of the national Constitution; the ratification of that instrument was in doubt until the convention actually voted, when the majority, 30 to 27, was secured through recommendation of amendments which in due time became part of the nation's fundamental law.

The population of the entire State in 1783 was 233,896, fifth in rank in the Union. Many Tories had emigrated, and the disposition was strong to drive out those who remained, but this prejudice was gradually dissipated. Settlers came in rapidly after the peace. Industries, trade, education, the amenities of life, developed with equal step. The Legislature, which had met in Kingston, Poughkeepsie, and New York successively, in 1790 chose Albany as its home. A brilliant galaxy of political leaders directed affairs these early days—Alexander Hamilton, George Clinton, Philip Schuyler, Aaron Burr, Rufus King, John Jay, the Livingstons, De Witt Clinton. Several of them fostered aspirations for the presidency of the U. S., but internal rivalries repelled the prize. These, however, did not prevent united action in the second war with Great Britain. The embargo act of 1807 struck severely the commerce of the chief city, and stirred up opposition; but when that was repealed, and Great Britain repudiated the project of a treaty to recall the orders in council while the impressment of seamen continued, the war spirit ran high. Great sacrifices were undergone, and in 1812 the tide of conflict rolled heavily upon the State. On its soil preparations were hurried forward for the invasion of Canada, and collisions of arms were frequent on Lake Ontario, the St. Lawrence, and Lake Champlain. Ogdensburg was captured by the British, but they were beaten at Sackett's Harbor, and both sides claimed the victory at Chrysler's Farm. Fort Niagara was taken, and Black Rock and Buffalo burned by the British, who in turn, July 5, 1814, suffered defeat by Gen. Winfield Scott at Chippewa, and July 25 at Lundy's Lane. An invasion by way of the Saranac and Lake Champlain was gallantly repulsed in September of the same year. A levy *en masse* of the militia of Herkimer, Oneida, Lewis, and Jefferson Counties was made for the defense of the northern frontier, while New York exhibited equal activity against expected attack. The treaty of peace was welcomed by the people who had suffered so much from the war. Initial steps had been taken for the construction of waterways, and the question soon entered into party politics, with De Witt Clinton as their leading advocate and Gov. Tompkins obstructing, in part out of rivalry toward Clinton. The canal policy triumphed, and gave vast impetus to population and business, to which also later the railway system contributed in large degree. Out of the patroon system (see Patroons) and the concentration of lands in few hands agrarian riots sprang up in 1839 and 1845, and on a smaller scale in 1866. In the civil war (1861–65) New York bore its full share, in spite of resistance to the draft in the chief city and threats elsewhere. The State was credited by the War Department with 448,850 men sent into the field and 18,197 who paid commutation.

The first constitution of New York was in force forty-four years; that framed in 1821 for twenty-five years; that of 1846 with some amendments down to the adoption of the new constitution of 1894. Proposals for radical changes have often been rejected. A convention was held in 1867 and submitted a revised constitution, which, with the exception of the articles referring to the judiciary, was rejected by the people. Several amendments proposed by the Legislature, and in 1874 by a commission, were adopted by popular vote. A convention met at Albany in 1894 for a general revision. Most of the thirty-four amendments submitted by them were adopted by the people. Among others a secret ballot was provided for; the use of balloting-machines was permitted; local and municipal elections in the six largest cities were separated from State and national elections, the former occurring in odd-numbered years and the latter in even-numbered years; etc.

GOVERNORS OF THE COLONY AND THE STATE.

Directors-General—Dutch.	
Adrian Joris	1623–24
Cornelis Jacobzen May	1624–25
William Verhulst	1625–26
Peter Minuit	1626–33
Wouter van Twiller	1633–38
William Kieft	1638–47
Petrus Stuyvesant	1647–64
Colonial Governors—English.	
Richard Nicolls	1664–68
Francis Lovelace	1668–73
Directors-General—Dutch.	
Cornelis Evertse, Jr.	1673
Anthony Colve	1673–74
Colonial Governors—English.	
Edmond Andros	1674–83
Anthony Brockholles*	1677–83
Thomas Dongan	1683–88
Francis Nicholson (acting)	1688–89
Jacob Leisler	1689–91
Henry Sloughter	1691
Richard Ingoldsby*	1691–92
Benjamin Fletcher	1692–98
Earl of Bellamont	1698–1700
John Nanfan (acting)	1699–1701
William Smith†, Abraham de Peyster†, Peter Schuyler†	1701–02
Lord Cornbury	1702–08
Lord Lovelace	1708–09
Peter Schuyler‡	1709
Richard Ingoldsby (act.)	1709–10
Gerardus Beekman‡	1710
Robert Hunter	1710–19
Peter Schuyler‡	1719–20
William Burnet	1720–28
John Montgomerie	1728–31
Rip van Dam‡	1731–32
William Cosby	1732–36
George Clarke (acting)	1736–43
George Clinton	1743–53
Danvers Osborne	1753–55
James de Lancey (acting)	1755
Charles Hardy	1755–57
James de Lancey (acting)	1757–60
Cadwallader Colden‡	1760–61
Robert Monckton	1761
Cadwallader Colden (act.)	1761–62
Robert Monckton	1762
Cadwallader Colden (act.)	1763–65
Henry Moore	1765–69
Cadwallader Colden (act.)	1769–70
Earl of Dunmore	1770–71
William Tryon	1771–74
Cadwallader Colden	1774–75
Peter van Brugh Livingston	1775
William Tryon	1775–80
James Robertson§	1780–83
Andrew Elliott (acting)§	1783
Governors of the State.	
George Clinton	1777–95
John Jay	1795–1801
George Clinton	1801–04
Morgan Lewis	1804–07
Daniel D. Tompkins	1807–17
John Tayler (acting)	1817
De Witt Clinton	1817–23
Joseph C. Yates	1823–25
De Witt Clinton	1825–28
Nathaniel Pitcher (acting)	1828–29
Martin Van Buren	1829
Enos T. Throop	1829–33
William L. Marcy	1833–39
William H. Seward	1839–43
William C. Bouck	1843–45
Silas Wright	1845–47
John Young	1847–49
Hamilton Fish	1849–51
Washington Hunt	1851–53
Horatio Seymour	1853–55
Myron H. Clark	1855–57
John A. King	1857–59
Edwin D. Morgan	1859–63
Horatio Seymour	1863–65
Reuben E. Fenton	1865–69
John T. Hoffman	1869–73
John Adams Dix	1873–75
Samuel J. Tilden	1875–77
Lucius Robinson	1877–80
Alonzo B. Cornell	1880–83
Grover Cleveland	1883–85
David B. Hill (acting)	1885–86
David B. Hill	1886–92
Roswell P. Flower	1892–95
Levi P. Morton	1895–96
Frank S. Black	1897–99
Theodore Roosevelt	1899–1901
Benjamin B. Odell	1901–

* Commanders-in-chief. † Councilors. ‡ Presidents.
§ During the Revolution; not recognized by the patriots.

Authorities.—Of the early French writers editions have been published in Quebec, notably *Journals of Samuel de Champlain* (6 vols.); *Les Mœurs des Sauvages Américains*, by the Jesuit Father Lafitau; *Rélations des Jesuites*. Consult also Charlevoix's *New France*, translated by J. G. Shea, 6 vols.; *Five Nations*, by Cadwallader Colden; *League of the Iroquois*, by Lewis H. Morgan. J. R. Brodhead's *History* covers the period from 1609 to 1691. The State has published *Documentary History*, 4 vols.; *Documents relating to the Colony*, 11 vols.; *Geology and Natural History*, 24 vols.; *Addresses at Centennial Celebrations*, 2 vols. See also J. D. Hammond's *Political History*, 2 vols.; *Life* of Joseph Brant, of Red Jacket, of Sir William Johnson, by William L. Stone; *New York*, by Ellis H. Roberts, 2 vols., in American Commonwealth Series. Histories of many of the towns, cities, and counties are separately published. Ellis H. Roberts and George J. Hagar.

New York (the *Nieuw Amsterdam* of the original Dutch settlers): the chief city of the U. S. in population, commerce, manufactures, and finance. It lies in (reckoned from its city-hall) lat. 40° 42·7′ N., lon. 74° 00·1′ W. from Greenwich; at the junction of the Hudson, at this point often locally called the North river, and the narrow strait forming the southwest extension of Long Island Sound and known as the East river. The city includes Manhattan Island and some of the adjacent mainland N. of it, Governors, Bedloe, and Ellis islands in the bay at the S. (these three the property of the U. S. Government), and Blackwells, Wards, Randalls, and a few minor islands in the East river or Sound, Staten Island, and that part of Long Island comprised in the former cities of Brooklyn and Long Island city, and the former towns of Newtown, Flushing, and Jamaica, and part of Hempstead. (See Brooklyn, Long Island, and Staten Island.)

Area and Plan.—Manhattan Island is 13½ miles long, and varies in width from a few hundred yards at each end to 2¼ miles at Fourteenth Street, the area being about 22 sq. miles, or 14,080 acres. The mainland portion of the city covers some 12,000 acres, and the small islands 400 acres more. The total land area of the greater city is 317·77 sq.

MAP OF THE CITY OF NEW YORK (GREATER NEW YORK) and Vicinity.

The geographical features of this Map are produced from data furnished by the U. S. Geological Survey. The boundaries and the division of the City into Boroughs are according to the Charter of the City of New York, 1897.

miles; its extreme length is 32 miles, and its greatest width 16 miles. Numerous villages and towns have been absorbed by New York in its growth, the names of some of which are still applied to the corresponding parts of the city. Among these, on Manhattan Island, are Greenwich and Chelsea, on the Hudson river in the lower central portion of the city; Yorkville, on the east side at Eightieth Street, and Harlem, also on the east side, further north; and Bloomingdale, Manhattanville, Carmansville, Fort Washington, or Washington Heights, and Inwood, on the west side, extending in a line along the Hudson river from the central part to the northern end of the island. The surface of the land is generally rolling, and in some places hilly, the highest point on Manhattan Island, at Washington Heights, being 238 feet above tide-level.

The substructure of the island consists of crystalline rocks of the Archæan period, flanked, and in some places deeply covered, with drift deposits of the Glacial era. The outcropping rocks are chiefly gneiss, mica-schist, and hornblende, and are part of a great belt extending from northern New England to North Carolina. Much of the city is built directly upon this foundation. In some quarters, however, the drift is too deep to be excavated, and the buildings rest either upon it or upon massive wooden piles driven into it. S. and E. of the city-hall there is a vast bed of beach sand, upon which some of the largest buildings in the city rest, and these, together with those that rest upon piles, are as stable and probably as secure as those bedded upon solid rock.

Street Plan.—The oldest part of the city, at the southern end of Manhattan Island, is irregular in plan, the streets being at unequal intervals, not always parallel or at right angles, and generally narrow. From Fourteenth Street northward to 155th Street on the west side most of the thoroughfares are laid out with mathematical precision, broad, straight avenues running on parallel lines N. and S., and cross streets at right angles to them running E. and W. N. of 155th Street, and indeed for some distance S. of it along the Hudson river, the streets are somewhat irregular, as are also those in the mainland part of the city, where they follow the lines of country lanes and village roads.

Broadway is the principal thoroughfare of the business region, a wide avenue extending lengthwise through the southern and central part of Manhattan Island. From Bowling Green to Tenth Street the cross streets abut upon it, or cross it, chiefly at right angles and at irregular intervals. At Tenth Street it deflects to the westward, and from that point to Fifty-ninth Street the streets cross it at slightly oblique angles and at uniform intervals. N. of Fifty-ninth Street its extension, formerly known as the Boulevard, pursues a somewhat winding course.

Fifth Avenue is a sort of "median line," dividing the cross streets, from Ninth to 140th into E. and W., the house-numbering of each half beginning at Fifth Avenue and running toward the rivers. Below Fifty-second Street the avenue is largely devoted to business establishments of the highest class, clubs, hotels, etc.; above that point it is one of the most fashionable residence streets of the city. Other choice residence districts are found on Madison, Park, West End, and St. Nicholas Avenues, Riverside Drive, Murray Hill, and Fifty-seventh, Seventy-second, and various other cross streets.

Wall Street and adjacent portions of New, Broad, Nassau, and William Streets are the seat of the financial interests of the city. The wholesale dry-goods trade is chiefly centered on Broadway and the streets immediately W. of it, from Leonard to Houston, while the fashionable retail shopping trade occupies Broadway from Tenth to Forty-second Streets, and portions of Fifth and Sixth Avenues and Fourteenth and Twenty-third Streets.

Parks.—The most important of New York's pleasure-grounds is Central Park, in the very heart of the city. It is bounded by Fifth and Eighth Avenues and Fifty-ninth and 110th Streets, and is more than 2½ miles long and half a mile wide. Its area is 840 acres, and it contains 9 miles of carriage roads, 6 miles of bridle roads, and 30 miles of footpaths. About half the area is devoted to woodland, more than 500,000 trees, shrubs, and vines having been planted, besides a considerable natural growth of timber. The park is entered through a score of gates, and fifty ornamental bridges and arches carry the roads and paths over other roads or over the lakes. Conspicuous among the features of the park are the Belvedere, a castellated observatory on the highest point of ground; the Mall, a broad promenade, lined with six rows of large elms, among which stand many statues of famous men; the Terrace and Bethesda Fountain, fine pieces of stone-work and bronze at the northern end of the Mall; the lakes, six picturesque bodies of water, covering 43¼ acres; the menagerie, a small collection of live animals, birds, etc., in the arsenal building; the reservoirs of the Croton water system, 143 acres in extent; the Metropolitan Museum of Art; and the Obelisk, or Cleopatra's Needle, a monument which was made probably about 1500 B. C., and was given to the city of New York in 1877 by the Khedive of Egypt. Central Park was first planned in 1857; the original landscape design was made by E. L. Viele and then modified by Frederick Law Olmsted and Calvert Vaux, and the architectural designs by Calvert Vaux and J. Wray Mould. It ranks by common consent among the most beautiful pleasure-grounds of the world.

Numerous smaller parks and squares are scattered about the city, such as the Battery, at the southern end of Manhattan Island; Bowling Green, at the lower end of Broadway; City-hall Park, now largely occupied by public buildings; Washington Square, with its imposing Memorial Arch at the foot of Fifth Avenue; and Union Square and Madison Square, around which are clustered many of the great hotels and business houses. Morningside Park is a long, narrow pleasure-ground on the steep eastern face of the high ridge W. of Eighth Avenue, between 110th and 123d Streets, and Riverside Park is a similar strip, twice as long, on the western slope of the same ridge, running down to the Hudson river. In the mainland part of the city are four large pleasure-grounds partially laid out and connected by broad parkways. These are Van Cortlandt Park, 1,069 acres; Crotona Park, 135 acres; Bronx Park, 653 acres; and Pelham Bay Park, 1,700 acres. The total park area of the city, exclusive of parkways, is nearly 5,000 acres. The Botanical Garden (250 acres) and the Zoölogical Garden (261 acres) are in Bronx Park. For the former a fine museum has been erected, and in it Columbia University has deposited the fine herbarium of the late Prof. Torrey, valued at $175,000, and its botanical library. Other valuable collections have been secured, and the grounds are being rapidly improved. In the Zoölogical Garden many dens and a great flying cage are completed, and the collection of animals is constantly growing.

Harbor.—The landlocked harbor of New York comprises the lower bay, the upper bay, the East river, and the southern part of the North or Hudson river, and may be entered from the Atlantic Ocean either from the N. E., by way of Long Island Sound, or from the E. and S. by way of the channels at Sandy Hook. The latter is the more frequented course for ocean-going vessels. The lower bay, which includes also Raritan, Sandy Hook, and Gravesend Bays, affords 88 sq. miles of anchorage. It is entered by two channels near Sandy Hook, over a bar about 18 miles S. of the city, the depth of water on the bar being 32 feet at high tide. In this bay are two small islands of artificial construction, named Swinburne and Hoffman islands, and occupied by the hospitals, etc., of the quarantine station. The northern point of Sandy Hook, called Fort Hancock, is elaborately fortified for harbor defense. From the lower bay entrance is had to the upper bay through a picturesque strait called the Narrows, 8 miles from the city. This strait is scarcely a mile wide; on the eastern shore is Fort Hamilton; on the western, Fort Tompkins—an earthwork with batteries at the top of the bluff, overlooking Fort Wadsworth, which is situated at the water's edge and gives name to the whole garrison. A narrow and winding channel known as Staten Island Sound, Arthur Kill, and Kill von Kull, also connects the two bays, but is used only by vessels of light draught. The upper bay, or harbor proper, has 14 sq. miles of anchorage, and contains Governors island, used as a national military station, Ellis island, where all immigrants are landed, and Bedloe island, crowned with Bartholdi's colossal statue of *Liberty Enlightening the World*, a gift from the French people. The North river averages a mile in width, is deep enough for the largest ships, and affords 16 miles of available water-front, of which more than one-third is occupied with docks and piers. The East river is less than half as wide as the North, but is as deep, and the city has several miles of wharfs on it. The northeastern entrance to the harbor, from Long Island Sound, leads through HELL GATE (*q. v.*) into the East river. At Throgs Neck is Fort Schuyler, an inclosed pentagonal casemated masonry work with exterior batteries, and there

are also extensive fortifications on Willetts Point and Davids Island. The harbor is yearly visited by about 16,000 seagoing craft, under steam or sail. The port of entry, or customs district, of New York, comprises New York, Brooklyn, Jersey City, Hoboken, Long Island City, and the minor adjacent cities and towns on the North river, East river, and New York Bay.

Climate.—The climate of New York, which is materially affected by the proximity of the ocean, is on the whole temperate and salubrious, although at times subject to sudden changes of temperature and other conditions. Thousands of visitors from the West and South spend much of every summer in New York for health and pleasure. The average temperature (Fahrenheit scale) and rainfall, by months, from 1870 to 1894 have been as follows:

MONTHS.	Temperature.	Rainfall.
January	30·5°	3·98 inches.
February	31·5	3·92 "
March	36·7	4·04 "
April	48·0	3·40 "
May	59·2	3·22 "
June	69·0	3·16 "
July	73·6	4·25 "
August	72·3	4·71 "
September	65·2	3·65 "
October	55·2	3·38 "
November	43·5	3·78 "
December	33·9	3·27 "
Average annual rainfall	....	44·76 inches.

Architecture.—In no city is a more bewildering variety of architecture to be observed than in New York. The varying tastes of a hundred years of rapid and startling changes are there to be seen. Many streets are lined with monotonous façades of brownstone high-stoop houses of the fashion of a generation ago. A few show still older rows of brick with marble trimmings and quaint wrought ironwork. Mansard roofs are not uncommon, nor are high, steep, tiled roofs of Dutch and German pattern.

Business buildings are perhaps most varied of all. Granite, marble, brownstone, brick, terra-cotta, iron, and other materials are used. Such streets as Broadway, Wall Street, and lower Fifth Avenue present a constantly changing panorama, with no two buildings alike and scarcely any two even resembling each other. Structures of ten and twelve stories are seen on every hand, while those of fifteen and twenty and even more are rapidly increasing in number. Among the more attractive buildings in the central part of the city may be mentioned Madison Square Garden. This structure contains a theater, a concert-hall, a small assembly-room, together with restaurants and dressing-rooms, and an amphitheater capable of holding 17,000 spectators. The exterior of this building is of an ornate Renaissance style, and is adorned by the highest tower in New York, closely copied from the tower of the Giralda at Seville.

The newer hotels and apartment houses are highly decorative in design, and several of the large clubs have showy edifices. The building of the American Fine Arts Society, in West Fifty-seventh Street, is a reproduction of the house of Francis I. in Paris. Of the churches, Trinity, at the head of Wall Street, is pure English Gothic, as is also Trinity chapel belonging to the same parish. The Church of All Souls, on Fourth Avenue, is a massive building of an Italian Byzantine character, of red brick and cream-colored stone in stripes, and has an elaborate porch. St. Thomas's, on Fifth Avenue at the corner of Fifty-third Street, is of English Gothic. Its high tower is crowned by a lantern somewhat in the character of that at Boston, in Lincolnshire. The Judson Memorial church, fronting on Washington Square, is an interesting Italian design, with a square campanile. On Fifth Avenue there are two synagogues remarkable for their architecture—the Temple Emanu-El at Forty-fourth Street, and the Temple Beth-El at Seventy-sixth Street. St. Patrick's Cathedral (Roman Catholic), at Fifth Avenue and Fiftieth Street, is of the Decorated Gothic style of the thirteenth century. Its twin spires are 330 feet high.

Public Buildings.—The city-hall, standing in a park bounded by Broadway, Park Row, and Centre and Chambers Streets, is a small building of beautiful design, dating from 1803–12. It is built of white marble, excepting the rear wall at the N., which is of brownstone painted white, the builders having supposed the city would not extend N. of it, and that therefore the brownstone wall would seldom be seen. The style of architecture is a late revived Classic. Among the many precious relics preserved there are the chair in which Washington sat at his first inauguration as President and the desk on which he wrote his first message to the Congress.

Directly in front of the city-hall, occupying the southern corner of the park, is the U. S. post-office or Federal Building, a huge and ponderous edifice of gray granite in a mixed revived Classic style, with domes modeled somewhat after those of the Louvre. Its ground plan is an irregular quadrangle, the north side measuring 279 feet, the south 144, and the east and west 262½ feet each, and it is five stories high. It was completed in 1875 at a cost of nearly $7,000,000.

The county court-house stands in the park at the rear of the city-hall. It is of white marble, in Corinthian style, with a wing in Romanesque, measuring 150 by 250 feet. The erection of it was begun in 1861, and it has been occupied since 1867, but never has been fully completed. In its construction and furnishing the city was swindled out of vast sums by the notorious "Tweed ring." The most notable of the more recent buildings is that of the Appellate Division of the Supreme Court of New York in Madison Square. It is built of white marble in an ornate Corinthian style, and is elaborately decorated with statuary; the interior decorations are of great beauty.

The criminal courts building is an imposing edifice of brick, terra-cotta, and granite, in Italian Renaissance style, on the block bounded by Centre, Elm, White, and Franklin Streets, first occupied in 1894. On the next block, to the S., connected with the criminal courts by a bridge over Franklin Street, is the city prison, best known as the Tombs, formerly a low, massive structure of granite in pure Egyptian design, now being replaced and entirely remodeled. At Wall, Nassau, and Pine Streets is the U. S. sub-treasury, modeled after the Parthenon. The U. S. barge office, at the Battery, and the Jefferson Market court-house and prison, at Sixth and Greenwich Avenues, are handsome edifices.

Churches.—Places of worship in 1900 numbered more than 1,260, including 114 Baptist, 49 Congregational, 110 Jewish, 97 Lutheran, 173 Methodist Episcopal, 116 Presbyterian, 182 Protestant Episcopal, 78 Reformed, 225 Roman Catholic, and 124 miscellaneous.

Education.—The system of public education in New York comprises the College of the City of New York, an institution of regular collegiate rank for boys; the Normal College for girls, and a complete system of primary, grammar, high, and evening schools (maintaining nearly 500 separate schools), 1 nautical school (on school-ship St. Mary's), and 48 corporate schools (industrial, reformatory, etc.), under direction of the board of education. There is also a kindergarten system. The attendance of all children between the ages of eight and fourteen years is compulsory, unless they are otherwise under instruction, and 12 truant agents are constantly employed in looking up delinquents. The daily attendance of scholars is about 443,000. There are 11,000 teachers on salaries of from $600 to $3,000 a year, and the yearly cost of the entire department is $18,927,819.

Institutions of higher learning are numerous. Besides the colleges of the public-school system, there are Columbia University, the University of the City of New York, St. John's College at Fordham, the College of St. Francis Xavier on West Sixteenth Street, Barnard College, Union Theological Seminary, the General Theological Seminary of the Protestant Episcopal Church, the College of Dentistry, the College of Pharmacy, the College of Economics, five colleges of medicine, and many others for general or special instruction. Schools of art, law, music, architecture, design, mechanics, business training, and industrial trades abound. The Cooper Institute, founded and endowed by Peter Cooper, gives free instruction in many useful and practical branches of learning, and the Ship-building Academy, similarly established by W. H. Webb, affords thorough tuition in ship-building and general seamanship. In the trade schools, founded by Col. Richard T. Auchmuty, at First Avenue and Sixty-seventh Street, instruction is given in carpentering, bricklaying, painting, blacksmithing, plumbing, and kindred practical vocations. The National Academy of Design, the Society of American Artists, the Art Students' League, and the schools connected with the Metropolitan Museum of Art are among the foremost seats of art study and teaching.

The Society Library, founded in 1740 and maintained by the annual dues of its members, is the oldest in the city. It has nearly 100,000 volumes for circulation and reference, and a good reading-room. The Astor Library, on Lafayette Place, opened in 1854, founded by John Jacob Astor, and

liberally enlarged and endowed by other members of his family, has more than 250,000 well-selected volumes. Their use is free, but they can not be taken from the building. The Lenox Library, on Fifth Avenue, facing Central Park, was opened in 1877, and was the gift of James Lenox to the city. Its collections of books, manuscripts, pictures, etc., are extensive and of great value, but partake more of the character of a museum than a practical working library. In 1895 it was decided to consolidate the Astor and Lenox Libraries and the Tilden trust fund into one great public library. Dr. John S. Billings was chosen director of the new institution. The central building is to stand on the site of the old distributing reservoir, extending from Fortieth to Forty-second Streets on Fifth Avenue, and will be 366 feet long and 246 feet wide. The main room will contain shelf room for 1¼ million volumes. Early in 1901 the New York Free Circulating Library was consolidated with this institution. The libraries now (1901) contain 536,381 volumes and 177,646 pamphlets in the reference departments and 155,777 volumes in the circulating department. The Free Circulating Library, at 49 Bond Street, has a number of branches throughout the city, and loans about 500,000 volumes yearly. The Mercantile Library, in Clinton Hall, on Astor Place, founded in 1820, is the chief circulating library. It has about 260,000 volumes, which are loaned out to subscribing members, who pay a small annual fee. It has also a particularly well-stocked reading-room of papers, magazines, etc. The Cooper Institute contains a large free library and reading-room, and the New York Historical Society many literary and artistic treasures. There are about fifty other public libraries, mostly free, including collections of law, medical, and other special works.

The principal museums of New York are the Metropolitan Museum of Art in Central Park and the American Museum of Natural History in Manhattan Square, adjoining Central Park. The former, a private corporation under State and municipal patronage, was founded in 1869. Its collections are free to the public, except on two days of each week, and comprise an array, unrivaled in America, of paintings, statuary, bronzes, glass and metal ware, pottery, Cypriote, Etruscan, Egyptian, and other antiquities, musical instruments, laces, tapestries, etc. The Museum of Natural History was founded at about the same time, on the same plan, and is similarly conducted. It contains magnificent collections of mounted specimens of mammalia, birds, fishes, reptiles, and insects; the Jesup collections of over 500 specimens of American woods and 1,500 of building-stones; the Edwards entomological collection of 350,000 specimens; the Tiffany collection of gems; ethnological and archæological collections; and a fine library.

Publications.—Being the business capital of the U. S., the port receiving the bulk of foreign mails, and the point upon which the land and submarine telegraph systems converge, New York is the chief news center, and its newspaper press therefore has surpassing influence and importance. Among its best-known morning journals are the *Herald*, *Sun*, *Tribune*, *Times*, *World*, *Press*, *Journal*, and *Telegraph*. Among papers in foreign languages are the *Courrier des États-Unis* (French); *Staats Zeitung*, *New Yorker Zeitung*, and *New Yorker Volkszeitung* (German); *Il Progreso Italo-Americano* and *L'Eco d'Italia* (Italian); *Las Novedades* (Spanish); and *Hlas Lidu* and *New Yorske Listy* (Bohemian). Evening papers are *The Evening Post*, *Commercial Advertiser*, *Mail and Express*, *Evening Telegram*, *Daily News*, *Evening Sun*, *Evening World*, and *Evening Journal*. There are other daily papers devoted to commercial, financial, legal, and other special topics.

The weekly press numbers hundreds of journals, in many languages, conspicuous among which are the weekly editions of the great daily papers. *Harper's Weekly*, *Leslie's Weekly*, and *Collier's Weekly* make a feature of illustrations. *Puck*, *Judge*, *Life*, *Truth*, and others are humorous and satirical. *The Outlook*, *Churchman*, *Independent*, *Observer*, *Examiner*, *Evangelist*, *American Hebrew*, *Christian Advocate*, *Freeman's Journal*, and others are representative religious journals of high literary quality. There are also scores of trade, technical, educational, juvenile, fashion, scientific, and other periodicals, including some in Greek, Arabic, Armenian, Hebrew, and Chinese. Among monthly publications, such magazines as *Harper's*, *Scribner's*, *The Century*, and others have a worldwide reputation.

In equal degree New York is the center and chief seat of the book-publishing and general printing trades. The names of Harper, Scribner, Appleton, Putnam, and Randolph have long been household words among readers of English the world over, while many younger firms have risen to almost equal eminence with those older houses. The book-importing trade is also principally conducted in New York, and most of the leading London publishers have branch houses or agents there.

Benevolent Institutions.—The charities of New York are founded and conducted on a scale commensurate with the requirements of its teeming population. The Municipal Department of Charities and Correction, at Third Avenue and Eleventh Street, maintains extensive hospitals, asylums for the insane, almshouses, etc., on Blackwells, Wards, and Randalls islands, besides doing a vast relief work for the general poor. The institutions and societies founded by private beneficence are numbered by hundreds. Each religious society, trade, and profession has one, and there is one for every class of sufferers and unfortunates.

Bellevue Hospital, at the foot of East Twenty-sixth Street, is a large and admirable institution, maintained by the city at a cost of over $100,000 a year. It has connected with it a dispensary for the relief of outdoor poor, a medical college of high rank, a training-school for male nurses founded by D. O. Mills, a similar school for female nurses, and various other important adjuncts. The Charity Hospital is on Blackwells island. The Cancer, Mount Sinai, New York, Presbyterian, St. Luke's, Roosevelt, and Women's hospitals are among the best-known private institutions. Beside these there are perhaps fifty more hospitals and as many dispensaries.

Places of Entertainment.—The size and vast business activities of New York make it the resort of myriads of visitors, for whose entertainment a great number of hotels have been erected. Among the best known of these are the Astor House, Brevoort, Broadway Central, Fifth Avenue, Grand Union, Hoffman House, Holland House, Imperial, Majestic, Manhattan, Marie Antoinette, Murray Hill, Netherland, Park Avenue, Plaza, Savoy, Victoria, and Waldorf-Astoria.

There are more than 40 theaters, opera-houses, and music-halls. The Metropolitan Opera-house, at Broadway and Fortieth Street, ranks among the largest in the world. Leading theaters are the American, the Broadway, the Criterion, Daly's, the Empire, the Garden, the Knickerbocker, the Lyceum, the Republic, Wallack's, etc.

Clubs and club-life form an important feature of New York. There are hundreds of such organizations, including a score or more of the first rank. Among these may be named the Aldine, Authors, Century, Colonial, Democratic, Grolier, Knickerbocker, Lotos, Manhattan, Metropolitan, New York, Republican, St. Nicholas, Union, Union League, University, etc. There are also athletic, yachting, press, jockey, and other clubs devoted to special objects. Some of the great social clubs have 1,500 or more members each, and houses fairly palatial in size and equipment.

Government.—The executive head of the city government is the mayor, who is elected by popular vote for a term of four years, and is removable from office for cause only by the Governor of the State. He appoints the heads of most of the executive departments. During his absence or disability the president of the council is acting mayor, with full powers after ten days. The legislative powers of the city are exercised by the council of 29 members and board of aldermen of 61 members, constituting the municipal council. The county officers elected are county clerk, sheriff, register, etc. For courts, see NEW YORK CITY in the Appendix.

The magnitude of the yearly operations in some of the executive departments is indicated by the following statistics of the old city for 1893: Buildings, 2,275 new structures, valued at $54,859,318. Charities and corrections, expenditures, $2,225,000. Fire, 4,132 fires, expenditures $2,223,000, 76 companies, 85 engines, 1,073 men. Police, 3,654 men, about 90,000 arrests, expenditures $5,300,000. Public works, expenditures $3,000,000. Street-cleaning, about 1,890,000 loads of dirt, garbage, ashes, snow, etc., removed, and 62,650 miles of streets cleaned. In 1900 the health department reported 70,872 deaths, 81,721 births, and 32,330 marriages. The death-rate was 20·57 per 1,000.

Post-office.—New York not only has an enormous mail of its own, but it is the port of entry and departure for the bulk of the country's foreign mails. In the main post-office more than 3,000 men are employed, and there are 32 branch offices. During the year ending June 30, 1900, there were delivered through lock-boxes and by carriers 684,768,464 pieces of ordinary mail matter. The aggregate business of

the money-order department amounted to $135,000,000. The total receipts of the office were $9,869,458.35, and the net revenue nearly $6,000,000.

Markets.—The largest public market is Washington, on the block bounded by Washington, West, Vesey, and Fulton Streets, in which almost every imaginable commodity for food is sold. Fulton Market, at Fulton, Beekman, South, and Front Streets, is a large establishment, and is the chief fish-market of the city. There are a dozen more scattered about the city, all under municipal control.

Water and Light.—The water-supply of New York is drawn chiefly from great reservoirs in the basin of the Croton river, in the upper part of Westchester County, about 40 miles N. of the city. Two underground conduits (see AQUEDUCTS) bring the water to four huge reservoirs in Central Park, with a capacity of nearly 1,250,000,000 gal. Thence it is distributed throughout the city by means of some 400 miles of underground iron pipes. The carrying capacity of the two aqueducts is 400,000,000 gal. a day. The first is 8 feet in diameter, and enters Manhattan Island by way of High Bridge over Harlem river; it was completed in 1842. The second is 12 feet in diameter, and was completed in 1890 at a cost of over $25,000,000.

The streets and buildings of the city have a dual system of lighting—by gas and by electricity. There are about 25,000 street gas-lamps. Electric lights are less numerous, being confined to the principal streets and avenues, and some of the parks.

Finances.—The city debt in 1880 was $142,447,400; in 1890, $148,124,216. On Jan. 1, 1901, the total bonded debt of the greater city was $392,013,499.39; the net bonded debt $279,725,370.38. The assessed valuation of real estate in 1900 was $3,168,547,700; of personal property, $535,556,493; of franchises (law of 1900), $219,679,351. Appropriations for support of the city government, etc., in 1901 were $98,096,413.43, of which more than $90,000,000 was raised by taxation.

Immigration.—The vast majority of aliens coming to the U. S. are landed at New York. From 1855 to 1889 they were received at Castle Garden, at the Battery, under State supervision. Since 1889 they have been under charge of the Federal Government, and are received on Ellis island, in the bay. The following table shows the number of passengers landed from 1881 to 1892 inclusive, and the number of trips made by the ships:

YEAR.	Cabin.	Steerage.	Trips.
1881	51,229	441,604	937
1882	57,947	455,450	1,021
1883	58,596	388,267	972
1884	59,503	320,807	943
1885	55,160	281,170	843
1886	68,742	300,918	906
1887	78,792	371,619	885
1888	86,302	383,595	899
1889	96,686	315,227	891
1890	111,830	371,593	914
1891	105,025	445,290	964
1892	120,991	358,486	957
Totals	950,803	4,374,026	11,132

The total number of aliens arrived during the fiscal year ending June 30, 1900, was 341,712.

Manufactures.—New York was in 1890 the seat of 25,403 manufactories, in about 300 different branches of industry; the direct capital investment in these was $426,118,273; the number of employees of all kinds 354,291, receiving in wages $230,102,167; the cost of materials used $366,422,722, and the value of products $777,222,721. Among the leading industries were the following:

INDUSTRIES.	No. of establishments.	Capital.	Employees.	Value of products.
Boots and shoes	2,796	$4,151,127	9,514	$13,088,672
Clothing	6,303	49,940,324	80,944	138,338,580
Coffee and spice	35	1,274,571	670	17,037,019
Electric apparatus, light and power	58	21,690,647	3,042	5,540,910
Foundries	343	15,036,597	10,381	19,543,794
Gas	6	57,605,812	2,633	12,672,963
Malt liquors	52	28,653,206	3,344	23,926,955
Millinery	389	4,539,206	7,657	12,873,387
Musical instruments	131	8,597,015	5,958	12,828,541
Printing and publishing	1,166	35,469,979	22,311	54,488,179
Silk	146	7,771,030	9,460	13,579,462
Tobacco	1,295	16,392,842	22,096	35,560,025

Commerce.—About 50 per cent. of the total foreign trade of the U. S. passes through the port of New York. The imports at New York for the fiscal year ending June 30, 1900, exclusive of gold and silver coin and bullion, were $537,237,282; and the exports, $518,834,471—total, $1,056,071,753. The total of the U. S. for the same year was $2,244,424,266.

Exchanges.—The chief exchanges are the Stock Exchange, now erecting a fine building on Broad Street; the Consolidated, also dealing in stocks; the Produce, whose great building on Whitehall Street is a conspicuous landmark of the city; the Cotton, the Coffee, the Real Estate, and the Coal and Iron. The Stock Exchange, in 1893, was the scene of these transactions: Government bonds, $1,914,200; State and railway bonds, $355,181,650; shares of stocks, $80,013,902. At the Produce Exchange dealings covered 5,612,250 barrels of flour, 1,052,008,000 bush. of wheat, 177,428,000 bush. of corn, and 80,520,000 bush. of oats.

Banks.—New York contains 44 national banks with a capital of $62,800,000, and 40 State banks with a capital of $5,322,700. Most of the former and some of the latter form a Clearing-house Association, through which a daily exchange of checks and bills and payment of balances are effected. The Clearing-house began operations on Oct. 11, 1853, and in the first forty years of its existence, to Oct. 11, 1893, its exchanges aggregated $1,021,018,593,454, and balances $45,981,837,600—a grand total of $1,067,000,431,054. The figures for the year ending Oct. 1, 1900, were: Exchanges, $51,964,588,572; balances, $2,730,441,810—total, $54,695,030,382.

There are also twenty-six savings-banks with savings deposits (1901) of about $493,000,000.

Insurance.—Both fire and life insurance have their American headquarters in New York, and the buildings erected by some of the companies are among the most notable in the city. Such are the buildings of the Equitable, Manhattan, Mutual Reserve, Home, and New York Life Insurance companies on Broadway, of the Mutual Life on Nassau Street, and of the Metropolitan Life on Madison Square. In 1893 there were invested in New York assets of domestic and foreign fire-insurance companies amounting to about $240,000,000. Even more imposing are the figures reported by the thirty-one life-insurance companies doing business in New York, their assets aggregating in 1893 more than $905,000,000, of which more than half belonged to New York companies.

Travel and Transportation.—Local transportation facilities include five lines of elevated steam-railways, and numerous surface street-railways, on which cars are propelled by horse-power and electricity. A uniform rate of five cents fare prevails. The number of passengers carried in 1900 was 1,074,537,848, of whom about 235,000,000 were on the elevated railways in Manhattan and Brooklyn. The East river bridge connects New York with Brooklyn (for description, see BROOKLYN), and other bridges are under construction. The ferries on the North and East rivers and the bay convey scores of thousands daily from and to the suburbs. Harlem river, which separates Manhattan Island from the mainland, is crossed by a number of bridges, among them the lofty and graceful Washington bridge. (See BRIDGES.) General domestic travel is facilitated by the centering at New York of a dozen important trunk railways and numerous subsidiary lines, several important steamboat lines on Long Island Sound and the Hudson river, and a vast coasting trade between New York and Eastern and Southern ports. Foreign transportation is represented by nearly all the transatlantic steamship lines. Most of the railways have their termini in Jersey City, Hoboken, Brooklyn, and Long Island City, whence passengers and freight are transferred to New York by ferry. Two important lines, with their connections, enter the city directly, and have their termini in the Grand Central station, at Fourth Avenue and Forty-second Street. This is a great structure of brick, iron, and glass, with waiting-rooms, ticket-offices, etc., for each of the railways. The principal train-shed is nearly 700 feet long and 240 feet wide, roofed with a single arched span of iron and glass 110 feet high, and will hold at one time 150 ordinary passenger cars; there is an additional train-shed half as large adjoining this on the E. About 550 trains arrive and depart daily by a four-track railway on Park Avenue, partly underground and partly elevated.

History.—The original Indian name of New York was Manhattan. The first European visitor was Giovanni Verrazani, who entered New York Bay in 1525, but made no landing. The real discoverer and explorer of those regions was Hendriek Hudson, an English mariner employed by a

Dutch trading company. He explored New York Bay and the great river which bears his name in 1609, in his little ship the Half Moon. Two years later Adrian Block visited Manhattan, made a landing, and established a trading station. In 1614 the States-General of Holland chartered the United New Netherland Company to engage in trade at Manhattan, and a fort and trading-house were built on the southern point of the island and called Fort Amsterdam. A permanent village settlement was effected in 1623 under the name of New Amsterdam. The first white male child born on the island was Jean Vigne, in 1614, and the first white girl, Sarah Rapalje, was born in 1625. Peter Minuit, the first important governor of the new colony, arrived in 1626, and thereafter the growth of the place was rapid. In 1652 the place was incorporated as a city under the name of New Amsterdam, and the next year was inclosed at the N. by a wall of earth and timber 2,340 feet long, on the present site of Wall Street. On Mar. 12, 1664, the whole colony was granted by Charles II. of England to his brother, the Duke of York, and in August was forcibly seized by a British fleet. The place was now named New York, in honor of its new owner. In 1673 a Dutch fleet seized it again and renamed it New Orange, but a year later it was restored to the English. An organized government and code of laws were established in 1691, and on Apr. 9 of that year the first colonial assembly met in the city. In 1725 the first newspaper, *The New York Gazette*, was founded; in 1730 a fortnightly stage service to Philadelphia was established; in 1752 the Royal Exchange was opened at the foot of Broad Street; in 1754 King's, now Columbia, College was chartered; and in 1768 the Chamber of Commerce was organized.

The spirit of resistance to British rule made its appearance in New York at an early date. The Stamp Act Congress was organized in 1765; so was the league known as the Sons of Liberty. The Stamp Act was publicly burned, cargoes of taxed tea were thrown overboard, a liberty pole was erected on the common, now the City-hall Park, and vigorous public demonstrations were made against the British garrison. One of the earliest conflicts of the war occurred in John Street between Sons of Liberty and British troops. In the spring of 1776 the bulk of the American army was massed in New York, and on July 8 the Declaration of Independence was publicly proclaimed and read to the troops. On the same day the equestrian statue of George III., on Bowling Green, was pulled down and transformed into bullets for the use of the patriot army. After the battle of Long Island the American troops were gradually withdrawn from Manhattan Island northward, several skirmishes being fought on Harlem Heights. The city then passed into the hands of the British, who held it under rigid military rule until Nov. 25, 1783, when the last of their garrison evacuated the city, and the American troops took possession. A few weeks later Washington took farewell of his officers at Fraunces's Tavern, at the corner of Broad and Pearl Streets.

New York was soon chosen as the capital of the young republic. In Jan., 1785, Congress removed thither from Philadelphia and met in Federal Hall, at the corner of Wall and Nassau Streets, now the site of the U. S. sub-treasury. In the same building Washington was inaugurated as President on Apr. 30, 1789, and there the first Congress under the Constitution held its meetings. New York remained the national capital for five years.

The free-school system of the city was organized in 1805 on a small scale; in the following year steam navigation was first accomplished on the North river by Robert Fulton; in 1807 the steamer Clermont began regular trips to Albany, and in 1818 the first line of Sound steamers was established; transatlantic steam navigation began in 1819 with the Savannah, built at New York. In the war of 1812 New York sent out twenty-six privateers, with 2,239 sailors. The port was then blockaded by the British until the end of the war, but the city was defended against invasion. On Nov. 11, 1826, the first canal-boat arrived from Buffalo by way of the newly finished Erie Canal. In 1832 the city was ravaged by Asiatic cholera, and in Dec., 1835, a fire in the southern part of the city raged for three days, destroying 600 buildings and more than $20,000,000 worth of property. Water was introduced through the Croton aqueduct in 1842. The electric telegraph was invented by Prof. Morse in the University of the City of New York, and a line completed to Philadelphia in 1845. In 1849 occurred the famous Astor Place riots, due to jealousy between the friends of the actors Forrest and Macready. The first American World's Fair was opened in 1853 in the Crystal Palace, on what is now Bryant Park.

At the outbreak of the Southern secession movement, in 1860, the mayor of New York, Fernando Wood, proposed to make it a free city, on the plan of those of mediæval Germany. Such schemes were quickly dismissed when the war began in Apr., 1861, and New York thenceforth supported the national Government with great zeal. The local militia were hurried to the front, the U. S. Sanitary Commission, the U. S. Christian Commission, the Union Defense Committee, and other patriotic bodies were organized, and 116,382 soldiers were sent from the city to the Union army. In the summer of 1863 the disaffected and criminal classes of the city, especially those of foreign origin, formed mobs to oppose the enforcement of the Draft Act. For several days in July large bands of rioters roamed about the city, burning buildings, murdering citizens, and stealing whatever they could lay their hands upon. The office of the *Tribune* newspaper was set on fire, the Colored Orphan Asylum was burned, and Negroes were murdered by scores in various parts of the city, and it was not until the Seventh Regiment hurried back from Washington that order was fully restored. More than 1,000 men were killed and wounded, and about $2,000,000 worth of property destroyed.

In the speculative days of the war, and the years immediately following it, political corruption became rampant in the municipal government. It reached its climax in 1870 and 1871, when the notorious Tweed ring was exposed and overthrown, after having robbed the city of more than $20,000,000. In 1871 serious riots took place between the Orangemen and Ribbonmen, rival factions of the Irish population. In 1869 occurred the famous "Black Friday," arising from an unsuccessful effort to "corner" gold; and in 1873 there was another disastrous panic on Wall Street. May 24, 1883, witnessed the opening of the Brooklyn bridge. The funeral of Gen. Grant occurred on Aug. 8, 1885, with one of the largest and most impressive funeral processions ever seen in the U. S. Work was begun on Grant's tomb and monument in the presence of enormous crowds on Apr. 27, 1891, and exactly a year later the cornerstone of the edifice was laid. The four hundredth anniversary of the discovery of America was celebrated in New York in Oct., 1892, on a magnificent scale, the city being profusely decorated and thronged by hundreds of thousands of visitors. On one day, Oct. 12, the elevated railways carried 1,075,537 and the Brooklyn bridge cars 223,625 passengers. On Apr. 27 and 28, 1893, occurred further demonstrations in honor of the memory of Columbus, including a naval review of U. S., British, French, German, Spanish, Russian, Italian, Dutch, Brazilian, and Argentine ships of war, and a land parade of soldiers and sailors of all those nationalities.

The community of interests of New York, Brooklyn, and other adjacent cities led in 1890 to the promulgation of a plan for uniting them into a single municipality—a so-called "Greater New York." A State commission to consider the expediency of such consolidation, and to formulate plans for effecting it, was formed, and in Nov., 1894, the question was submitted to popular vote and carried, except in Mount Vernon, Westchester, and Flushing. An act of consolidation was signed by the Governor May 11, 1896, to take effect Jan. 1, 1898, and the commission appointed to draft a charter for the new city presented its report to the Legislature Feb. 22, 1897. See NEW YORK, CITY OF, in the Appendix.

Population.—(1790) 33,131; (1800) 60,489; (1890) 1,515,301; (1900) 3,437,202. From 1790 to the present day New York has continuously ranked as the most populous city in the U. S. In 1890, of the inhabitants of New York, 875,358 were native born, and 639,943 foreign born; 23,601 were colored (of African descent); 747,579 were male, and 767,722 female; of male inhabitants of voting age, 177,729 were native and 269,069 foreign born; there were 312,766 families, housed in 81,828 dwellings; of the foreign-born inhabitants, 190,418 came from Ireland, 210,723 from Germany, 35,907 from England, 27,193 from Austria, 12,222 from Hungary, 48,790 from Russia, 39,951 from Italy, 10,535 from France, 8,099 from Bohemia, 6,759 from Poland, and 2,048 from China.

W. F. Johnson. Revised by Whitelaw Reid.

New York System: in geology, a division of the Paleozoic rocks in North America, including representatives of the Cambrian, Silurian, and Devonian periods. In the systematic work of the Geological Survey of New York, the most important single contribution ever made to American stratigraphy, it was found impossible to classify the formations in accordance with the categories which had been established by earlier work in Europe; and the geologists not only gave local names to the individual formations of the State, but grouped them under classific terms which were in part novel. The New York System, which was announced in various reports in 1842 and 1843, comprises all the formations of the State from the Potsdam sandstones below to the Chemung group above, both inclusive. It contains twenty-eight formations, grouped in four divisions, in which the Champlain division, as defined by Hall, extends from the Potsdam to the Oneida, the Ontario from the Medina to the Niagara, the Helderberg from the Onondaga to the Corniferous, and the Erie from the Marcellus to the Chemung. The system thus set forth constituted for many years the standard of reference for American rocks of corresponding age, and was of great utility as affording an independent basis for the taxonomy of American formations. It has largely fallen into disuse, first because the progress of stratigraphic study showed that no natural break determined its upper limit, the Appalachian rock series being continuous to the top of the coal-measures; second, because with the progress of paleontologic study it became possible to classify the formations under the categories afforded by the periods of European chronology, and thus give them a more definite place in the general geologic history of the globe. Consult *Geology of New York*, parts i. to iv., 1842–43, and *Bulletin No. 80, United States Geological Survey*. See also Geology and Paleontology.

G. K. Gilbert.

New York, University of the City of: an institution of learning chartered Apr. 18, 1831, and opened in 1832. Until 1883 the corporation was a council of thirty-two members elected by the subscribers to the endowment, together with five representatives of the city government. In 1883 the charter was changed so as to make the council self-perpetuating, one-fourth the members going out each year unless re-elected. The political element was dropped, as also a clause forbidding to any religious denomination a majority of the council. In 1832–35 a building was erected on Washington Square, E., and was replaced 1894–95 by a larger structure intended partly as a source of income and partly for the accommodation of the School of Law, School of Pedagogy, and the graduate department. In 1892 a tract of 20 acres at 200th Street, on the Harlem river, was purchased, on which new buildings for the undergraduate department have been erected. The faculty of arts and science dates from 1832; until 1886 its instruction was to undergraduates only. The college requires a four years' course for the degree of bachelor of arts or of science. A technical school is also supported, which gives the degree of C. E. to its students one year after they have become bachelors of science. In 1886 the Graduate Seminary was founded, which receives candidates for the degrees of master of arts or science and doctor of philosophy. In 1890 the School of Pedagogy (begun provisionally in 1887) was permanently established, giving degrees of Pd. D. and Pd. M. It is the first University School of Pedagogy in America. There are three professors besides numerous lecturers. The faculty of arts and science has 20 professors and over 400 students. It has included many names eminent in literary and scientific effort, as Henry P. Tappan, S. F. B. Morse, Davies, Loomis, Tayler Lewis, and the Drapers. The faculty of medicine, founded 1841, numbered among its earlier members Drs. Valentine Mott, Bedford, Paine, Post, and Draper. Its buildings, after several removals, are upon Twenty-sixth Street, opposite Bellevue Hospital. This faculty has over 20 professors and more than 30 lecturers and assistants; it enrolls about 550 students. Three full winter courses of eight months each are required for the degree of M. D. The faculty of law, founded 1858, comprises 4 professors and 7 lecturers. The course for LL. B. is completed in two years. In 1891 graduate courses were opened leading to the degree of LL. M. There are about 300 students. The chancellors have been Drs. Matthews, Frelinghuysen, Ferris, Crosby, Hall, and MacCracken. The value of the property of the university approaches $2,000,000 in value.

Henry M. MacCracken.

New Zealand: a British colony, in the South Pacific Ocean, S. E. of Australia. The northwest point, Cape Maria van Diemen, is 1,175 miles from Sugar-loaf Point, on the coast of New South Wales, and West Cape is 850 miles from Tasmania. The colony consists of three islands, lying N. E. and S. W., and many islets, between the parallels 33° and 53° S. and the meridians 166° 30′ and 173° W. Of the three principal islands, or New Zealand proper, North island, or New Ulster, has a length of about 515 miles and a breadth of about 250 miles, with an area estimated at 44,467 sq. miles—about that of Pennsylvania. The South island, or New Munster, officially called Middle island, has a length of about 525 miles and a breadth of 180 miles. Its area is estimated at 58,525 miles. The southernmost island is Stewart island, or New Leinster. It is triangular, about 25 miles by 30, and has an area of 665 sq. miles. Attached to the colony are the Chatham, Auckland, Kermadec, Campbell, Antipodes, and Bounty islands. The last three groups are uninhabited. The Chatham islands lie 300 miles E. of New Zealand, and have an area of 375 sq. miles. The Auckland islands lie 180 miles S. of Stewart island, and have an area of 312 sq. miles. The Kermadec islands lie 660 miles N. N. E. of New Zealand, and have an area of 15 sq. miles. The total area of the colony is estimated at 104,471 sq. miles; it is a little larger than Colorado and a little smaller than Italy. The capital is Wellington (*q. v.*).

Physical Configuration.—New Zealand lies on a great submarine plateau which in the N. E. joins that of Polynesia, N. W. that of New Guinea and Queensland, and to the S. that of the Antarctic seas. Between the islands and Tasmania lie the great depths called the Thomson Abyss. The coasts of the colony are more than 4,000 miles in length. There are many natural ports, especially on the northern ends of North and Middle islands, and on the east coast of Stewart island. The harbor of Auckland is especially commodious, and approaching within a mile of its waters, and only 2 or 3 miles of the city, is the greater harbor of Manukau, entering from the opposite coast. On the southwest coast of Middle island is a series of narrow fiords which are too deep to afford anchorage. A mountain range begins E. of the center of North island and extends S. W. to the southern angle of Middle island. On North island it is relatively low, not exceeding 6,000 feet. On Middle island it hugs the west coast from the middle southward, and culminates in Mt. Cook, 13,349 feet high (first ascended in 1882). This range is called the Southern Alps. Many of its mountains reach the altitude of perpetual snow, and have glaciers extending down their sides to about 1,000 feet above sea-level. The best known is the Tasman glacier on the southwestern slopes of Mt. Cook. The fiords of the extreme S. W. are surrounded by snow-capped mountains, and are very picturesque. Near the center of North island and to the S. E. of it are several volcanic cones of considerable height—Ruapela (9,100 feet), Egmont (8,300 feet), both now extinct, and Tongariro (6,500) occasionally active. In the northern half of North island mountains are less frequent and lower. The plains lie mostly in the southwestern quarter of North island, and Mt. Egmont is surrounded by extensive and fertile plains. Four-fifths of Middle island is mountainous, but the mountains are to a great extent open, grassy, and adapted to pastoral pursuits, while the backbone of the Southern Alps is crossed by many low passes. The bolder western versant is rich in minerals. The plains adapted to agriculture lie in the western part of this island. The rivers are usually rapid, short, closed by bars at their mouths, and not adapted to navigation. There are two lake regions in the islands; the first is on the eastern slopes of Middle island. These lakes are in the mountains, are long, slender, and picturesque, and two of them (Te Anau and Wakatipu) are of considerable size. The other is in North island, and its largest lake is Taupo, the largest in the islands, with an area of 250 sq. miles. It lies in the center of the island, and is drained by the Waikato river, one of the most important in the colony. From Lake Taupo in a northeasterly direction to the Bay of Plenty lies the area to which the name of Lake District is given, remarkable for its geysers, hot and sulphurous springs, and natural terraces. The terraces are marble-white or tinted, smooth, apparently artificial, but formed by deposits from the water. With

the warm blue water they form natural baths of great beauty, the curative properties of which are well established. At Whakarewarewa, near Lake Rotorua, in the county of the same name, and about 25 miles from the head of the Bay of Plenty, there is a group of eight geysers, of which one throws a column to the height of 30 or 35 feet. The geysers are varied with boiling springs, steam jets, and mud volcanoes. The geyser phenomena appear to be in decadence. Since their discovery many of the finest geysers have ceased action, and new ones are more seldom formed.

Climate.—The islands of New Zealand stretch through fourteen degrees of latitude, and possess a great variety of climate. In general the climate is mild, agreeable, and healthful, especially that of North island, but they are subject to occasional sudden changes of temperature and weather. The mean annual temperatures are about those of Virginia and Delaware near the coast, but the summers are as cool as those of New Brunswick and Nova Scotia. The mean difference between the temperature of the hottest and that of the coldest months is only 14°, or about that of Cuba. The North island is decidedly warmer than Middle island, the former being bathed by a warm ocean current from the N., while the south and west shores of the latter receive a cool current from the S. W., and each island shelters the other from its own current. Snow very seldom descends to sea-level on North island, and only occasionally on Middle island. The perpetual snow line is about 7,500 feet above sea-level, and is reached by Ruapela on North island and by many mountains on Middle island. Ice occasionally forms in winter in all parts of New Zealand. The annual rainfall averages 40 to 50 inches on Middle island and 30 to 40 inches on North island, and is heaviest on the west coast. At Hokitika, on the west coast of Middle island, in lat. 42° 41′ S., the average annual rainfall is 102 inches. The prevailing winds are westerly, and gales are frequent.

Geology and Mining.—Volcanic action has played an important part in the geologic history of New Zealand, but has long ceased in Middle island and is visibly diminishing in North island. The surface covered still by volcanic rocks is considerable, and these with the non-fossiliferous crystalline and schistose rocks cover about half of the surface. The series of fossiliferous rocks is quite complete. In the upper part of the Cretaceo-Tertiary occurs a calcareous sandstone called "Damaru" stone, which is ornamental and very valuable as a building-stone, as it is easily worked, but hardens in weathering. Saurian remains of great size have been obtained from the Permian beds of Mt. Potts. Gold was discovered in the islands in 1857, but it was not until 1861 that it attracted general attention, and caused a large influx of miners. Placer-mining is to be found chiefly in Middle island, in the Otago, Westland, and Nelson districts. The easily worked placer-fields are probably now exhausted, but there is still much opportunity for hydraulic mining on a large scale. The principal quartz mines are on the northern end of North island, near Auckland, but several auriferous reefs are worked in the gold-fields of Middle island. In 1899, of the 389,558 oz. raised the entire quantity was exported. The value of the total export of gold from the colony to the end of 1899 was £55,966,498. New Zealand stands second of the seven Australasian colonies in the total amount of gold produced, Victoria standing first. Queensland has, however, passed ahead of New Zealand in the annual production. In 1890 the average production of gold per man employed in mining it was, for this colony, nearly £393 in value, far surpassing that for the other colonies. Most of the mining is done on Government land. In the production of coal this colony stands second among the Australasian colonies. Most of the coal-beds are on the west coast of the Middle island, and the chief mines are at Otago, Greymouth, and Westport. The only important coal-measures of the North island are those of Waikato. The total output of coal in New Zealand in 1900 was 975,234 tons, valued at £487,617, and the annual output is increasing. Lignite exists in large quantities, but is used only locally. Oil shales have been found, but the oil has not proved suitable for illuminating purposes, though good for lubrication. The mineral product of the colony next in importance is kauri gum, and this is peculiar to New Zealand. It is a resinous product of the kauri-tree, but is found in the soil where forests of this tree once existed, or at the base of living trees. It is much used as a base for fine varnishes and for other purposes. In 1900 the production of kauri gum was 11,116 tons, valued at £607,919.

Flora.—New Zealand is remarkably rich in forests: one-third of its surface was covered by them in 1830, but this has been reduced to one-fifth. Some of the larger forests disappeared at the rate of 4 per cent. a year, but before the damage was complete the matter was taken up by the Government, and the principles of forest conservation were put in operation. The New Zealand forests are characterized not only by their extent, but by the relatively large ratio of forest species to the entire flora. The most valuable tree is the kauri, which now grows only on the North island and chiefly in the province of Auckland. It reaches 120 to 160 feet in height, 5 to 12 feet in diameter at the butt, and is unrivaled for spars, for which purpose much is exported. There are a score more of useful species of trees. Three-fourths of the species of the flora are endemic, and the number of species common to Australia and New Zealand is small. The North island has a flora in many respects distinct from the rest of the group, having peculiarities which it shares with the isolated islands lying between it and the groups of Melanesia and Polynesia. Among the valuable plants of the flora is the New Zealand flax or hemp, from which a valuable fiber is obtained. It is a liliaceous plant (*Phormium tenax*), and the leaves, from which the fiber is obtained, are from 3 to 9 feet long and 2 to 3 inches broad. The wild plant is chiefly relied on for the supply. The fiber, though nearly as strong as Manilla hemp, is not suitable for ship's cordage, as it does not well stand exposure to alternate wetting and drying.

The *fauna* of New Zealand has several singular features. There are no indigenous land mammals except two species of small bats. There are no snakes; the few lizards are harmless; one species of frog only, and relatively few species of insects are to be found. Among the birds the most remarkable native species are the wingless and hairy species of apteryx or kiwi, of which there are four kinds, and the gigantic wingless moa. The last has been long extinct, but native tradition represents it as formerly hunted as food. Colonization has introduced many species, as the domesticated animals and birds, game birds, small birds, and rabbits. The last have become a serious pest in many districts.

Agriculture.—New Zealand is the best-adapted of the seven Australasian colonies to agriculture, including the pastoral industries, the climate and soil being both favorable for these pursuits throughout the islands. The average yield of crops per acre is generally higher in this than in the other colonies, but the average value per acre is lower. It is estimated that two-thirds of the land is suitable for cultivation or grazing. Of this about one-fifth is under actual cultivation. About one-half of the land in 1893 was still in the possession of the Government. The rural public lands are either sold on favorable terms or leased. In 1900 there were 62,485 holdings, comprising 34,422,653 acres, of which about one-third was leased, and there were (1896) 83,300 persons engaged in agricultural and pastoral pursuits. The wheat produced is generally more than sufficient for home needs, and the average product is from 20 to 25 bush. per acre. Oats are extensively grown and yield 30 bush. per acre, and barley and hay are important crops. Maize is but little grown, likewise tobacco and the vine. Tasmania and New Zealand are the only ones of these colonies producing potatoes for export.

The number of live stock in New Zealand in Apr., 1900, was: Horses, 261,931; horned cattle, 1,210,439; sheep, 19,348,506; swine, 249,751. In 1890 it shipped 896,914 cwt. of fresh and frozen meats, seven or eight times as much as all the other colonies together. The capital employed in the industry of preparing fresh meats for shipment was for that year £1,464,659—more than in any other manufacturing industry. The colony also takes the lead in dairy products, and in amount exported far surpasses all the other colonies. In the number of swine it is similarly pre-eminent, and exports a considerable quantity of pork to the other colonies.

Population.—The aborigines are of a Polynesian race called Maori, are fine looking, though short and rather squat. In 1878 the number returned was 43,595 and in 1891 43,642, of whom 2,119 were half-castes. There are about 20 per cent. more males than females among them. See MAORIS.

Aside from the Maoris, the total population in 1891 was 628,658, of whom 97 per cent. were British subjects and more than one-half were born in New Zealand. The alien population numbered 14,594, of whom 4,444 were Chinese. In 1896 the total population was 743,214, of whom 39,854 were Maoris. In 1899 there were 5,461 marriages, 18,835

births (of which 829 were illegitimate), and 7,680 deaths, giving a surplus of 11,155 births over deaths. The death-rate was 10·24 per 1,000. In the same year there arrived 18,506 immigrants and 16,619 emigrants departed; in the five years 1895–99 inclusive there were nearly 10,000 more emigrants than immigrants. There is no state aid to religion, except in a few cases of endowments obtained at the time of settlement. Over 40 per cent. of the population are adherents of the Church of England, 23 per cent. Presbyterian, 13 per cent. Roman Catholic, and 10 per cent. Methodist.

The chief towns (with population Apr., 1896) are: Wellington (the capital), 41,758 (with suburbs): Auckland (with suburbs), 57,616; Christchurch (with suburbs), 51,330; Dunedin (with suburbs), 47,280; Invercargill, 9,996; Napier, 9,231; Nelson, 6,659; and Oamaru, 5,225.

Commerce.—On Mar. 31, 1900, there were 2,271 miles of railway open to traffic, of which 167 miles were of private ownership, the remainder public. The telegraph system is entirely in the hands of the Government. On Mar. 31, 1900, the colony had 6,910 miles of line, comprising 19,228 miles of wire. The telephone is also in the hands of the Government, and there are 3,160 miles of wire laid, serving 7,150 subscribers. In 1899 the registered vessels of the colony numbered 522, with a combined tonnage of 129,583: 310 were sailing vessels, 212 steamers, In 1899 609 vessels entered and 604 cleared from the ports of the colony. About two-thirds of these vessels were colonial, less than one-third British. Auckland is the most important port, after which come Wellington, Lyttelton, Dunedin, and Bluff Harbor. Nearly all imports are taxed, and on luxuries, such as spirits, wine, and tobacco, the duty is high. The total imports in 1899 were valued at £8,739,633, and the exports at £11,938,335. The chief imports in order of importance were clothing and cloths; iron and steel goods; sugar, paper, books, and stationery; spirits, wine, and beer; and specie. Among the exports the wool equaled in value nearly all the others put together. Next in order was frozen meat, then gold; grain, pulse, and flour; kauri gum; hides, skins, and leather; and butter and cheese. Two-thirds of the imports and exports are with the United Kingdom, but only 5 or 6 per cent. with the U. S. See NEW ZEALAND in the Appendix.

In 1899 there were 5 banks of issue in the colony, of which 2 were wholly New Zealand institutions. The value of the notes of these banks in circulation was £1,195,562. The average deposits in these banks were £14,433,638, and in the private savings-banks £4,192,233.

Administration.—The executive power is in the hands of the governor, appointed by the crown, with a salary of £5,000. He has the power of proroguing Parliament and vetoing legislation. The Parliament, here called the General Assembly, consists of the Legislative Council and the House of Representatives. The members of the first are appointed. Those in office before Sept. 17, 1891, are life members; those subsequently hold for seven years. They number 44 in 1897, and are paid £150 per annum. The members of the House number 74, including 4 Maoris, are elected for three years, and receive £240 per year. Electors may be male or female, must be twenty-one years of age, and have a freehold estate of £25 value. For Maori representation any adult native may vote in the 4 exclusively Maori districts.

Primary education is in public schools, and is compulsory between the ages of seven and thirteen in districts to be decided on by the education department. The University of New Zealand is solely an examining body granting degrees under a royal charter. With it are 3 affiliated colleges, viz., the Otago University, at Dunedin, the Canterbury College, at Christchurch, and the Auckland University College, with a total of 26 instructors and 766 students.

The total revenue in 1899–1900 was £5,386,989, of which over one-quarter came from the railways and less than one-sixth from direct taxation. The amount of expenditure was £5,140,127, excluding the charges of the sinking fund met by debentures. The total expenditures for public works from 1870 to Mar. 31, 1900, was £32,978,626, including discount and charges for raising loans. The net public debt in 1900 was £46,930,077, making £61 17*s.* 3*d.* per head of population. The debt is slowly increasing. The outstanding loans of local governing bodies amounted to £6,963,254 in 1899.

History.—New Zealand was discovered in 1642 by Tasman, who did not land on it. Cook visited the islands several times from 1769 to 1777, circumnavigated them, explored and surveyed their shores in part, and introduced several domesticated animals and plants. The country was little visited, however, because of the bad reputation of the natives. In 1814 Rev. Samuel Marsden established a mission at the Bay of Islands, on the east coast of North island, 80 miles S. E. of North Cape. He was followed by many others, and within a generation the whole population had become nominal Christians. In 1839 the New Zealand Land Company dispatched a preliminary expedition to treat with the natives for the purchase of land. By the treaty of Waitangi in 1840 many of the native chiefs ceded the sovereignty to Great Britain, and in the same year five shiploads of immigrants arrived. Disturbances with the natives occurred from time to time afterward. The most serious was in 1863–64, when the colonial forces had to be supported by several British regiments and ships of war. Final and complete surrender of the natives occurred in 1875. In 1852 a royal act conferred constitutional government on the colony. The colony was divided into 6, afterward 9, provinces, each with its governing council. In 1875 this was abolished and the present system established. Since 1893 women may vote, but are not eligible as Representatives or in the Legislative Council.

REFERENCES.—The official publications of periodical character are numerous and full. Those of Sir James Hector are especially valuable for the geology and climate. Ney, MICHEL: Duke of Elchingen, Prince of Moskva, marshal and peer of France; b. at Saarlouis, Jan. 10, 1769; entered the French army in 1788; was made a brigadier-general in 1797 after the battle of Neuwied, general of division in 1799, after he had greatly distinguished himself by the capture of Mannheim and in Masséna's campaign, and marshal in 1804. He commanded in the Austrian, Prussian, and Spanish campaigns, and distinguished himself at Elchingen, Jena, Eylau, and Friedland. He was ordered to Spain in 1808, and was successful in maintaining French rule over Galicia, but in 1810, while under the command of Masséna, with whom he constantly quarreled, he met with some reverses in Portugal, especially during the retreat from Torres Vedras. His greatest exploits were the battle of Borodino while the grand army crossed the Moskva, his command of the rear guard during the retreat from Moscow, and his exertions in order to organize a new army. After the abdication of Napoleon he submitted to the Bourbons, and was well received by Louis XVIII. When Napoleon returned from Elba, Ney repaired to Paris, assured the king of his fidelity, and received the command of a corps of 4,000 men, with which he marched against the emperor, purposing to capture him and carry him to Paris; but when he saw the enthusiasm with which Napoleon was received everywhere he yielded to the demands of his soldiers and went over to the side of the emperor. In the Waterloo campaign Ney fought the battle of Quatre Bras against the British on the same day that Napoleon defeated the Prussians at Ligny, and at Waterloo he commanded the center with great bravery. After the second restoration he was captured, arraigned for high treason, and placed first before a court martial, which declared itself incompetent, and then before the Chamber of Peers, which by a large majority condemned him to death. He was shot Dec. 7, 1815, in the garden of the Luxembourg, where a monument now stands in his honor. See *Histoire complète du Procès du Maréchal Ney* (2 vols., 1815); Nouval, *Vie du Maréchal Ney* (1833); and Verronais, *Vie militaire de Michel Ney* (1853).

Nez Percé Indians; See SHAHAPTIAN INDIANS.

Ngornu, or **Angornu**: city of Bornu, Central Sudan; on the southwest shores of Lake Chad; 18 miles S. S. E. of Kuka. The great fluctuations of the level of the lake sometimes cause the flooding of the city, and sometimes leave a broad level plain between it and open water. The place is an important trade center, and its importance and population are periodically increased during the markets, when a large traffic is carried on in cotton, amber, metals, corals, and slaves. It is flimsily built, has been moved back farther from the lake shore than its early situation, and is subject to attacks from the predatory tribes which occupy the

islands of the lake. Its population is variously estimated at from 20,000 to 50,000. MARK W. HARRINGTON.

Niagara [from an Iroquois Indian word meaning thunder of water]: a river of North America, forming the boundary between the State of New York and the province of Ontario, Canada, and connecting Lake Erie with Lake Ontario. It is 33 miles long, and has a total fall of 326 feet. It is navigable in its upper course from its issue from Lake Erie to the beginning of the rapids at Niagara Falls, a distance of 16 miles, during which its fall is less than 20 feet; and in its lower course from Lewiston to Lake Ontario, a distance of about 7 miles, during which its fall is only 2 feet. Along its middle course, which contains the celebrated Niagara Falls and is crossed by two suspension bridges, on the Canadian side is the Welland Canal, through which the navigation interrupted by the rapids and falls of the middle course of the river is carried on. In its upper course it forms many islands, and its average depth is 25 feet. In its lower course, from Lewiston to its mouth in Lake Ontario, its depth varies from 100 to 150 feet.

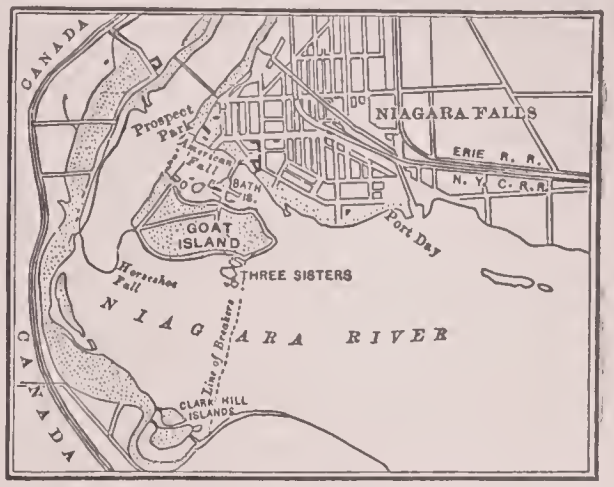
Niagara Falls: cataracts of the Niagara river, discovered by Father Hennepin in 1678, and remarkable for volume of water rather than for height. The general features of the region about the falls looking S. W. are shown in the accompanying cut. Up stream (S.) from the falls the river flows smoothly in a broad channel, little depressed below the general surface of the limestone upland of Western New York. About a mile above the falls the river begins a descent of 50 feet in the upper rapids. At the falls it plunges 160 feet into a narrow gorge about 7 miles long, 200 to 350 feet deep, 800 to 1,500 wide at the top, and generally

Niagara Falls, from the U. S. side.

250 to 500 wide at the water-line. Except for the upper 2 miles, the river pursues a tumultuous course in swift rapids, with a descent of 100 feet, emerging from the gorge at the northern cliffed margin or escarpment of the upland between Lewiston, N. Y., and Queenston, Ontario. The volume of water passing the falls is 280,000 cubic feet per second (U. S. Lake Survey).

The river is divided by Goat island just above the gorge, thus making two falls: the Canadian or Horseshoe fall on the W., the "American" fall on the E. The former has a strongly incurved brink measuring 3,010 feet around the curved crest line, or 1,230 feet across the chord. The face of Goat island, separating the two falls, is 1,310 feet. The American fall, with slight incurvature, measures 1,060 feet from side to side. For 2 miles down the gorge, between the Canadian fall and the lower rapids, the waters flow with relatively smooth surface through a great pool 1,450 feet in greatest width and 189 feet in depth just above the upper suspension bridge, the exceptional depth being attributed to the pounding action of the water beneath the fall. Great blocks or tables of rock sometimes fall from the limestone cliff that incloses the gorge. In 1818 a block fell on the U. S. side; in 1828, 1855, and 1887 blocks fell from the Canadian side, one of these being the formerly well-known Table Rock. In winter-time a great mound of ice forms from the spray beneath the falls, and the walls of the gorge and the trees near the falls are encased in ice.

In order to restore as nearly as possible the natural conditions of the falls, which had been seriously defaced by private owners, and in order to save visitors from annoyance and imposition, which had become extreme, the land on either side of the falls has been converted into public parks. The New York State reservation, containing nearly 107 acres (cost, $1,433,429.50), was opened July 15, 1885; the Queen Victoria Niagara Falls Park on the Canadian side, embracing 154 acres (cost, $436,813.24), was opened May 24,



Niagara Falls reservations.

1888. The gorge is spanned by three bridges, for which see NIAGARA FALLS (the city) and BRIDGES. The finest general views of the falls are to be had from the middle of the upper suspension bridge, and from the high terrace N. of the Horseshoe falls on the Canadian side. An electric railway follows the brink of the gorge from the falls to the escarpment above Queenston. The Cave of the Winds, a hollow behind the falling waters, is entered by many visitors. Engineering enterprise has constructed a tunnel from the bottom of the gorge just below the "American" fall, running back under the city of Niagara Falls for 7,000 feet. See TUNNELS AND TUNNELING.

The geological history of Niagara is of great interest, because of the association of the age of the falls with one of the closing stages of the glacial period. The origin of the limestone upland in which the gorge is cut must be first considered. It consists of relatively resistant strata, 80 to 100 feet thick and dipping gently to the S., of heavy Niagara (Silurian) limestone. The surface of the limestone has been revealed by the gradual stripping off of overlying weaker rocks, and its former northward extension has been much reduced by the erosion of its margin. The retreat of the margin has been accelerated by the undermining of the weaker strata—Niagara, Clinton, and Medina shales and sandstones—beneath it; hence the upland is now terminated by a north-facing bluff or escarpment about 250 feet above the lowland plain that stretches northward from its base, and nearly 40 feet above the present level of Lake Erie.

After the present form of the upland had been essentially produced by the slow weathering of ages, the region was glaciated, the entire surface being buried under a heavy ice-sheet. It is commonly believed that the basin of Lake Erie in weaker rocks S. of the Niagara limestone upland and that of Lake Ontario in weaker rocks N. of the escarpment were in greater part excavated by ice action; but it is difficult to measure the results of this process, and to define how far other processes, such as the warping or obstruction of broad preglacial valleys, may have had to do with forming the basins. Be this as it may, it is known that when the ice-sheet evacuated the region the lakes occupied the basins, much as we now see them; and that wherever the former rivers of the region ran, the post-glacial discharge of Lake Erie took the course of the Niagara river across the plateau and fell over the escarpment on its way to Ontario; thus the cataract was formed at the face of the cliffs. Since then, the strong wearing of the river has caused the recession of the falls at a much more rapid rate than the general retreat of the cliff face under the weak attack of the weather; thus the narrow gorge has been formed, and the falls now stand about 7 miles back from their original position. Their recession continues, and eventually the gorge will be cut back to Lake Erie.

The gorge makes a peculiar bend at the whirlpool, which calls for special explanation. It is believed that at this point the receding falls, which were then working back to the S. W., came upon the drift-filled valley of a small pre-existing stream, which once carried the drainage of a small area of the upland out to the lowland on the N. The further recession of the falls proceeded southward, up the buried valley, from which the drift-filling was rapidly washed out; hence the abrupt angle at the middle of the gorge. The impetus of the river has excavated a basin northwestward from the angle, in line with the old drift-filled valley, but to a greater depth; and here the waters whirl around before escaping into the lower part of the gorge.

The time required for the recession of the falls has been the subject of much study. The falls have been carefully surveyed on four occasions. First in 1842 under James Hall, of the Natural History Survey of New York; in 1875 by the U. S. Lake Survey; in 1886 by R. S. Woodward, of the U. S. Geological Survey; and in 1890 by A. S. Kibbe, of the New York State Engineers. The fall on the U. S. side shows moderate change, its average annual recession in forty-eight years being half a foot. Between 1842 and 1890 the Canadian fall receded 150 to 230 feet along a distance of 900 feet on the western half of its front, and 270 feet at the apex of its curve. This gives an average recession near the middle of from 4 to 6 feet a year; and if this rate had been constant, only about 7,000 years would have been required for the erosion of the gorge.

There is indication, however, that the recession of the falls has not always been at so rapid a rate, and that its age is greater than 7,000 years. The volume of water, the most important factor in determining the rate of retreat, has probably varied greatly, for studies of the shore-lines of the Great Lakes make it clear that their basins have been gently uplifted on the N. since the ice-sheet withdrew, causing changes in their lines of discharge. Before the uplift, it is quite possible, even probable, that Lake Huron drained across the Province of Ontario directly to the lake of that name; in that event, Niagara river must have had but a small fraction of its present volume, and the recession of the falls must have been slow. The great depth of water in the pool below the falls seems to indicate a decided increase in the volume of water about the time that the falls had receded to a point somewhat above the cantilever bridge. The height of the falls has decreased during the retreat, for the limestone cap of the upland descends gently southward, while the rapids below the falls ascend southward; and this loss of height must have had some effect on the rate of recession. It is probable that after the arrival at the drift-filled valley by which the whirlpool is explained there was an increased rate of recession for a time. These and other factors on which the retreat of the falls depends are at present so uncertain that no definite statement can be made as to the time since the river first leaped over the escarpment. The age of the falls is of importance because it gives means of dating a closing stage of the glacial period. It is pretty well ascertained that during the earlier stages of the northward recession of the continental ice-sheet the St. Lawrence valley was obstructed by ice, and the waters of Erie and Ontario were united in a great lake, whose waters ran out to the S. W. by the Wabash river, across Ohio and Indiana to the Ohio river. At a later stage of ice retreat, an outlet was opened eastward down the Mohawk; then the eastern waters fell to a lower level than the edge of the Niagara plateau, separating the two lakes, Ontario occupying the lower basin N. of the escarpment, while Erie lay in the higher basin S. of the escarpment and drained northward over its rim.

An account of the geology of the Niagara gorge is given in the *Natural History of New York*, Geology of the Fourth District, by James Hall (1842); a history of the river, by G. K. Gilbert, is given in the Sixth Annual Report Commiss. New York State reservation at Niagara (1890). An account of the various surveys of the falls with maps and measurements is presented by A. S. Kibbe, in the Seventh Annual Report (1891). A popular account of Niagara is given in *The Niagara Book*, by various authors.

W. M. Davis.

Niagara Falls: city (formed by the consolidation of the villages of Niagara Falls and Suspension Bridge, incorporated in 1892); Niagara co., N. Y. (for location, see map of New York, ref. 4–C); on the Niagara river, and the Erie, the Lehigh Valley, the Mich. Cent., and the N. Y. Cent. and Hudson River railways; 13 miles S. of Lake Ontario, 20 miles N. of Buffalo. The river is here crossed by three remarkable bridges, viz., the upper suspension, built of steel, a foot and carriage bridge, about 300 feet below the falls on the U. S. side, 821 feet span and 260 feet above the water, built to replace one destroyed in the winter of 1889; the cantilever, 910 feet in length, a short distance up stream from the Whirlpool Rapids, built in 1883, the first bridge of its kind constructed in the U. S.; and the railway suspension, 300 feet N. of the cantilever, built of steel, with a carriage-way 28 feet below the track. (See Bridges.) For ages the enormous power of the river was allowed to go to waste, though many projects were conceived to utilize it. The first practical step and triumph of engineering skill was the construction of a hydraulic canal, extending from a point above the falls, through the center of the city to the gorge. From this a 5,000 horse-power was obtained. Since then a great tunnel has been completed at a cost of about $4,000,000, for the purpose of securing a vastly increased water-power for manufacturing purposes. (See Tunnels and Tunneling.) The land and islands surrounding the "American" falls (that is, the falls on the U. S. side) have been appropriated for a State reservation, and the land on the Canadian side of the river now constitutes a similar reservation. From the lands within the New York State reservation the greater part of the scenery for which the locality is famous is visible. (For description of the falls and reservations, see Niagara Falls). The city contains 10 churches, Niagara University (Roman Catholic, organized 1856, chartered 1883), De Veaux College (Protestant Episcopal, chartered 1853), a national bank with capital of $100,000, 3 State banks with combined capital of $200,000, and 2 daily, a semi-weekly, and 2 weekly newspapers. It has numerous hotels and boarding-houses. The industries include the manufacture of paper, pulp, flour, silver-plated ware, paper-coating, and machinery. The assessed valuation of the city in 1893 was $9,704,165, and the total debt in 1894 was $512,000. Pop. of village (1880) 3,320; (1890) 5,502; of city (1900) 19,457.

Editor of "Gazette."

Niagara Falls: another name for Clifton (*q. v.*), a town of Ontario, Canada.

Niagara Group: an American geological formation representing part of the Upper Silurian period; so named by the Geological Survey of New York on account of its typical development along Niagara river. It is exposed throughout the breadth of New York a short distance S. of Lake Ontario, and has a thickness of 300 feet, consisting of shale below and limestone above. At Niagara Falls there are 80 feet of shale overlaid by 85 feet of limestone. In Ohio, Michigan, and other Western States, the shale becomes thin, but the limestone increases to 600 or 800 feet. It occurs also in New Brunswick, Newfoundland, etc., where it is thicker than in New York. The limestone is largely used for building purposes, especially for abutments of bridges, etc. The deposit is marine, and in many places abounds in fossils; some of the earliest land-plants, consisting of the trunks of trees which drifted far from shore, are found in it.

Israel C. Russell.

Niare, Zamouse, or **Bush-cow** [*niare* and *zamouse* are from native names]: a wild ox (*Bubalus pumilus*) found in Western and Western Equatorial Africa. It has no dewlap, has sharp, crooked, and short horns, large and finely fringed ears, and a fierce disposition. It is of a rather small size; it is sometimes trained for the saddle, and may be taught to obey the bit as well as horses; but its pace is only 4 or 5 miles an hour.

F. A. L.

Nias': an island of the Malay Archipelago, a short distance to the W. of Sumatra, near the equator. It is 70 miles long, with an average breadth of 16 miles; is mountainous, and is surrounded with coral reefs, but is fertile, producing rice, sugar, and large quantities of pepper. The inhabitants are estimated at from 200,000 to 250,000. They are closely allied in appearance and language to the Battas, an independent and warlike race in Sumatra. Nias is especially remarkable for the persistency with which the slave-trade has continued there. It is due to intertribal wars. Modigliani's *Un viaggio a Nias* (1890) is an excellent monograph on the island.

Revised by M. W. Harrington.

Nibelungenlied, nee'be-loong-en-leet': the greatest popular epic of the Middle High German period. It was composed by an anonymous poet at the close of the twelfth cen-

tury. The poem is divided into cantos, called adventures, the number of which varies in the different manuscripts. We can further distinguish in the epic two great parts, in the first of which the scene is laid on the Rhine, with Worms as the center, while the chief events of the second part take place on the lower Danube, at the residence of Attila, King of the Huns. The principal hero of the first part is Siegfried, Prince of the Netherlands, who assists Gunther, the King of the Burgundians, in obtaining the hand of Brunhilde, or Brynhild, the powerful Queen of Iceland, and who is rewarded with Kriemhilde, the beautiful sister of Gunther. The envy and jealousy of Brunhilde cause a quarrel between her and Kriemhilde, and finally lead to the murder of Siegfried by Hagen, the faithful vassal of Gunther and deadly enemy of Siegfried. The central figure of the second part is Kriemhilde, who, after the death of Siegfried, thinks of nothing but of avenging herself on the murderers of her husband. For this purpose she marries Attila, and invites Gunther, who had consented to the murder of Siegfried, to visit her with his Burgundians at Attila's residence. Contrary to the advice of Hagen, Gunther and his brothers, Gernot and Gieselher, accept Kriemhilde's invitation. They march to the Danube, and finally arrive at Attila's court, where, after a long and dreadful struggle, all are killed, including Kriemhilde. Only Attila, his friend Dietrich von Bern, and the latter's faithful companion Hildebrand, survive to lament the fearful catastrophe.

The subject-matter of the poem is based upon the German hero-legends which originated in the times of the migration of the tribes, and which formed the favored contents of many single hero-songs previous to their final combination into one great epic. The account in the *Nibelungenlied* of the annihilation of the Burgundians by the Huns has preserved the reminiscence of the historical fact that Attila, in 437, defeated the Burgundians under Gundahari (Gunther), whose capital was Worms. The name of Kriemhilde may also be historical, if the report of Jordanis is correct, according to which (cap. 49) Attila died by the side of a girl named Ildico, which name is the diminutive of Hilde. In Dietrich von Bern we have the famous Theodoric the Great (475–526) of history, who is the most prominent figure in the German hero-legend. Though he reigned long after the death of Attila (453), the legend nevertheless has him appear as a fugitive at Attila's court, thus illustrating the free manner in which the legend treats historical truth.

Concerning Siegfried and his relations to Kriemhilde and Brunhilde there are no historical accounts, unless we accept the views of some recent investigators who see in him the historical Arminius. Owing to the fact that in the *Nibelungenlied* Siegfried and Brunhilde present certain features of character (their extraordinary physical strength, Brunhilde's strange aversion to marriage, etc.) which are seemingly supernatural, a number of scholars hold the view that both are of mythological origin. This opinion derives its main support from the Old Norse version of the Siegfried legend in the *Eddas*, according to which Siegfried and Brunhilde seem to belong to the family of Germanic gods and demigods. Outside of the Norse versions no trace of such divine origin for them has, however, been found in Germanic mythology, and there is, moreover, not the slightest reason offered to explain the strange fact of this old Germanic myth of Siegfried and Brunhilde combining with the historic legend of the Burgundians. All the mythological speculations concerning the divine pre-existence of Siegfried and Brunhilde must therefore be dismissed as more or less clever conjectures. It is far more probable that the Siegfried legend, like the legend of the Burgundians, preserved the reminiscence of the tragic fate of some national hero, who presumably lived before the migration of the tribes, in an age which was accustomed to adorn its heroes with superhuman attributes.

Both legends, that of Siegfried as well as that of the Burgundians, originated among the Franconians, whence they migrated to the North and to other German tribes. We can distinguish two such migrations of the legends to the North, one which probably took place as early as the sixth century and a second one during the thirteenth century, the account of which is embodied in the *Thidreksaga*. Lachmann believed that the *Nibelungenlied* in the form handed down to us was not written by a single poet, but was a conglomeration of old hero-songs. While the existence of such songs must be admitted at least for the beginning of the twelfth century, it is quite obvious that the skillful plan and artistic unity of the poem could not be attained by a mere compiler, but must be ascribed to the conscious work of a single poet. Who this great poet was we do not know, and all the guessing as to his identity and home has proved fruitless.

That the *Nibelungenlied* was a very popular epic can be seen from the number of manuscripts still extant. Among these (ten complete manuscripts and eighteen fragments) the most important are the three which date back to the thirteenth century, and which, since Lachmann, are usually quoted as A, B, C. As to their respective age and authenticity, Lachmann, the editor of MS. A, held that this, the most imperfect of the three, was the original, while Holtzmann, and especially Zarncke, attempted to prove the greater antiquity of MS. C, of which Zarncke made an excellent edition. This difference of opinion was mainly due to opposing views concerning the origin of the poem, and it resulted in a long and bitter fight between the leaders and followers of both schools, known as the famous Nibelungenstreit. The view now held by most scholars is that of Karl Bartsch, who showed in his *Untersuchungen über das Nibelungenlied* that none of the three MSS. represents the original, that the latter is lost, and that MS. B, which was edited by Bartsch, preserved the original more faithfully than the others.

For several centuries the *Nibelungenlied* was entirely forgotten, until Bodmer, in 1757, called attention to it by editing parts of the epic. His efforts created, however, little interest among his contemporaries, Frederick the Great, for instance, treating with contempt all attempts to revive mediæval German literature. A change in the critical estimation and understanding of the poem was brought about by the Romanticists and by the rise of national feeling during the wars with Napoleon I. Then the poem was interpreted and studied at several universities, and in 1815 Zeune published an edition of the epic for the young men who were to carry it with them to the battle-fields. Since then the *Nibelungenlied* has constantly increased in popularity. The greatest philologians of the nineteenth century, like the Grimms, Lachmann, Müllenhoff, Zarncke, Bartsch, and Scherer, devoted themselves to its elucidation, and numerous translations carried the knowledge of it into the widest circles. While in former periods the poem had to suffer from unjust comparisons with Homer, it is now universally considered the greatest national epic of the Germans, in which the wild passions and valorous deeds of a heroic age and the most tender and sacred emotions of the human breast find their artistic expression. For although the characters of the epic appear in the knightly guise of the twelfth century, we can still notice that that the principal heroes really belong to a more primitive period. With marvelous skill the author has depicted his times as well as those of the older heroic age, carefully preserving the epic style despite the lyrical character of the strophe which he employs, and thus creating a work of poetry rich in colors, full of dramatic life and of the deepest ethical sentiments—a picture of the Germanic character and mind in their period of youth.

Bibliography.—The principal editions of the *Nibelungenlied* by Lachmann, Zarncke, and Bartsch have been mentioned above. An excellent list of the most noteworthy literature on the subject is given by Zarncke in the introduction to his edition of the poem. See Hermann Fischer, *Die Forschungen über das Nibelungenlied seit K. Lachmann* (1874); R. von Muth, *Einleitung in das Nibelungenlied* (1877); K. Lachmann, *Ueber die ursprüngliche Gestalt des Ged. von der Nibelungen Noth* (1816); A. Holtzmann, *Untersuchungen über das Nibelungenlied* (1854); F. Zarncke, *Zur Nibelungenfrage* (1854); K. Müllenhoff, *Zur Gesch. der Nibelungen Not* (1855); K. Bartsch, *Untersuchungen über das Nibelungenlied* (1865); W. Willmanns, *Beiträge z. Erkl. u. Gesch. d. Nibelungenlieds* (1877); R. Henning, *Nibelungenstudien* (1883); W. Grimm, *Die deutsche Heldensage* (1889); A. Rassmann, *Die deutsche Heldensage u. ihre Heimath* (1857); R. Heinzel, *Ueber d. Nibelungensage* (1885); W. Müller, *Mythologie d. d. Heldensage* (1886); W. Golther, *Studien zur germ. Sagengeschichte* (1888); Sophus Bugge, *Studien über die Entstehung d. nord. Götter u. Heldensage* (1882); E. Mogk, *Die älteste Wanderung d. d. Heldensage nach d. Norden in Forschungen zur germ. Philologie* (1894); Lichtenberger, *Le poème et la légende des Nibelungen* (1891). The best modern High German version of the *Nibelungenlied* is by K. Simrock (52d ed. 1892).

Julius Goebel.

Nicander of Colophon: Greek didactic poet of the second century B. C. He was the author of a lost epic poem,

Ἑτεροιούμενα, in five books, which suggested Ovid's *Metamorphoses*. We still have a poem, Θηριακά (Remedies against the Bites of Venomous Animals) and Ἀλεξιφάρμακα (Remedies against Poisons), in which the author has sought to enliven the ungrateful theme by digressions and descriptions. There are editions by J. J. G. Schneider (1816) and by O. Schneider (1856). B. L. G.

Nicara'gua: a republic of Central America, between Honduras on the N. W. and Costa Rica on the S., extending from the Caribbean Sea to the Pacific. Area about 40,000 sq. miles. The general outline is nearly an isosceles triangle; one side forms the Caribbean coast, which runs from N. to S. about 300 miles; the Pacific coast trends from S. E. to N. W. and terminates in the Bay of Fonseca, which separates Nicaragua from Salvador. The main mountain axis enters the country from Honduras, passes across it in a southeasterly direction, and terminates at the San Juan river; it is nearly parallel with the Pacific coast and about 90 miles distant from it. Eastward from this range the country falls to low and often swampy lands along the Caribbean coast. Near the Pacific coast, and roughly parallel to it and to the central range, there is an irregular line of volcanic peaks. Nearly all the active and quiescent volcanoes of Nicaragua are in this line, and some of them rise to more than 6,000 feet. Between the volcanoes and the central range is the lake valley, 300 miles long, the most striking natural feature of Nicaragua, and one which has largely determined its history. In it are the two beautiful lakes Managua and Nicaragua, respectively 134 and 110 feet above sea-level in the dry season, and connected by a short river, the Panaloya or Tipitapa; from the southeastern end of Lake Nicaragua the waters are discharged through the San Juan river, 108 miles long, to the Caribbean Sea. Though the outlet is to the Atlantic side, the lake valley is properly on the Pacific slope. The line of volcanic mountains is not continuous; on the contrary, its peaks are scattered, some of them near the coast and some bordering the lakes; indeed, several of them are on islands in Lake Nicaragua. Between these volcanic cones the divide between the lakes and the Pacific is merely a line of low hills, and in some places even these are wanting. Lake Managua is 32 miles long by 16 wide, and deep enough everywhere for the small steamers which ply on it. The Momotombo volcano, on its northern side, is one of the highest peaks in the country (6,255 feet), and the shores everywhere are remarkable for their picturesque beauty. Northwest from the lake the plain of Leon stretches to the Pacific, and is now crossed by a railway. The Tipitapa river, between the two lakes, has little water in the dry season, and is never navigable for large vessels. Lake Nicaragua is 92 miles long by 34 wide, and from 12 to 83 feet deep; its three largest islands, Ometepe, Zapadero, and Solentiname, are simply mountains rising from the water, and the first is a more or less active volcano. At one point the lake is separated from the Pacific by a neck hardly 12 miles wide, and without high hills; here it is proposed to make the Pacific section of an interoceanic ship-canal, on a line 17¼ miles long. See SHIP-CANALS.

The total population of the republic by the census of 1890 was only 360,000; of these, 198,000 were classed as Indians (generally civilized peasantry) and 144,000 as mixed races. Much the greater part of this population is gathered about the lakes and in the space between them and the Pacific. All the northeastern part is very thinly inhabited, mainly by semi-civilized or wild Indians, and portions of it are covered with heavy forests. On the eastern coast is the Mosquito Reserve or MOSQUITIA (*q. v.*), where, as yet, the Nicaraguan Government has only a nominal authority. The eastern and northeastern regions have several good-sized rivers, flowing through fertile valleys; only the low coast lands are unhealthful. The only important industries of Nicaragua are agriculture (especially coffee-growing), grazing, the collection of rubber and dye-woods in the forests, and gold-mining; the annual product of the gold mines (nearly all in the northern districts) does not exceed 23,000 oz. The annual exports now (1894) average in value about $4,000,000, the principal items being coffee, rubber, dye-woods, hides, gold bullion, and fruits (from the Mosquito Coast). Of the total exports, about one-fourth are to the U. S. The imports considerably exceed the exports, about one-fifth coming from the U. S. There are 122 miles of Government railways connecting the lakes with the Pacific coast at Corinto; about 1,600 miles of telegraph lines are also operated by the Government. The common language is Spanish, but some of the Indians still speak their own dialects. The government is a centralized republic; the executive is a president, chosen for four years, and not eligible for re-election for the succeeding term; congress consists of a senate (two senators from each of the twelve departments) and a chamber of deputies (one for every 20,000 inhabitants). All male adult citizens are electors. The Roman Catholic is recognized as the state religion, but other cults are tolerated. The external national debt in 1900 was $1,315,692; the internal debt $3,510,047; total, $4,825,739. The revenue for 1898 was $1,808,331, and the expenses for the same year amounted to $2,175,686. Interest on the debt is regularly paid. The coast of Nicaragua was discovered by Columbus in 1502, and the country was first explored by Gil Gonzalez Davila, who reached the lake region from the Pacific side in 1523; he found a large Indian population. Granada (the original capital) and other towns were founded by Francisco Hernandez de Córdoba in 1524–25. Not long after Nicaragua was made a province of Guatemala, and it continued so until the Central American countries became independent of Spain in 1821. From 1823 to 1839 it was a state of the Central American confederation. During this period, and after it assumed the position of an independent state, there were frequent civil wars, culminating in 1856 in the subjection of the country to the filibuster William Walker, who, however, was expelled in Apr., 1857. With the new constitution of 1858 and the presidency of Tomás Martinez began a period of peace and comparative prosperity, occasionally broken by short wars with some of the other Central American countries. In 1893 there was a civil war, resulting in the election of Gen. José Santos Zelaya. In 1895 Nicaragua united with Honduras and Salvador to form the "Greater Republic of Central America." Since 1857 the capital has been Managua. See NICARAGUA in the Appendix.

Niccolini, GIOVANNI BATTISTA: poet; b. at S Giuliano, near Pisa, Italy, Oct 31, 1782. He studied first at Florence, then philosophy and jurisprudence at Pisa but later turned to classical literature. In Florence he made the acquaintance of the already famous Ugo Foscolo, who conceived a deep affection for him and greatly influenced his literary ideals. Indeed, he is supposed by some to have made him the Lorenzo of the *Ultime lettre di Jacopo Ortis*. Niccolini's first poetical success was a poem (*La Pietà*) on the plague in Leghorn (1804). In 1807 Élise Bonaparte, then Queen of Etruria, made him professor of history and mythology in Florence, where his lectures made a sensation. After the Restoration he was for a time librarian of the grand ducal palace, but the sneers of the courtiers drove him back to his earlier employment. In the meantime he had begun to write plays. His first piece, *Polissena* (1810), was later crowned by the Accademia della Crusca (1818). This was followed by the less important *Medea*, *Edipo*, *Ino e Temisto*, and by versions of the *Seven against Thebes* and *Agamemnon* of Æschylus. In 1815 his first drama, employing modern material and showing an approach to the romantic manner, *Matilda* (in imitation of the *Douglas* of the English John Home), had but moderate success. In *Nabucco* (printed anonymously in London, 1819) he entered upon the drama of political tendencies, slightly veiling under Assyrian names figures of the Napoleonic era (Nabucco = Napoleon; Mitrane = Pius VII.; Arsace = Carnot). Ceasing now for a time to write plays, he took part vigorously in the struggle for literary reform then raging. In 1827, however, he produced a new drama, *Antonio Foscarini*, intended to show a way of reconciliation between romanticism and classicism, but also full of political intentions. A violent controversy at once followed the representation of this. In *Giovanni da Procida* (1830) he uttered his first unmistakable revolutionary cry, a protest against foreign domination in Italy. *Lodovico Sforza detto il Moro* (1833) was unimportant, as was also *Rosmunda d'Inghilterra* (1837); but *Arnaldo da Brescia*, a dramatic poem (secretly printed at Marseilles, 1843), was a political event of the first importance, by reason of the vehemence of its

criticism of the Guelph ideas then dominant in Italy. His later plays, *Filippo Strozzi*, *Beatrice Cenci* (in imitation of Shelley), and *Mario e i Cimbri* (a national lyric drama), are less interesting. Niccolini was critic as well as poet, and we have from him several interesting treatises: *Del sublime e di Michelangiolo* (1825); *Dell' imitazione nell' arte dramatica* (1828); *Sull' romanzo storico* (1837); and, above all, *Discorso sulla tragedia greca* (1844). He died at Florence, Sept. 20, 1861, leaving in manuscript a *Storia della casa di Hohenstaufen*. The first collected edition of his works was in three volumes (Florence, 1831; 4th ed. 1858). This has now been superseded by Prof. Corrado Gargiolli's complete edition in ten volumes (Milan, 1862, *seq.*). See also Vanucci, *Ricordi della vita e delle opere di Giovanni Battista Niccolini* (2 vols., Florence, 1866). A. R. Marsh.

Niccolo da Pisa, nĕĕ-kō-lō-daa-pee'saă: sculptor and architect; b. at the beginning of the thirteenth century. His style, which is unlike that of the artists of his own epoch, is supposed to have been formed on the study of the antique. The Emperor Frederick II., when in Rome in 1221, secured Niccolo's services, and a little later commissioned him to design and erect the fortifications of the castle at Capua and other places. In 1225 Niccolo was called to Bologna to build the convent and church of the Dominicans. In 1231 he was at Padua erecting the Basilica of St. Anthony; he afterward built the Church of S. Maria Gloriosa dei Frari in Venice. Later he made many designs for the Church of San Giovanni at Siena and some buildings and improvements at Pisa, where he was obliged to lay the foundations of his buildings on piles. He built the Church of St. Michael and several palaces in this manner; also the campanile of the Augustinians. He made designs for San Domenico at Viterbo and for San Lorenzo at Naples. He enlarged and embellished the cathedral at Volterra. At Lucca he sculptured several works, among others a *Deposition* (dated 1237) over a door of the cathedral. He erected the monastery and Church of Ss. Trinità at Florence, which Michelangelo admired so much. His statue of a *Virgin and Child* which he made for San Domenico at Bologna was continually imitated by other sculptors, and he was consulted on every important question in architecture and in engineering. In 1260 he built the famous Baptistery at Pisa, in 1267 sculptured the *arca* or shrine of San Domenico in the church of that saint in Bologna, and in 1268 the pulpit for the Siena cathedral. Charles X. of Anjou sent for him to come to Naples to build the abbey of Tagliacozzo. Niccolo was recognized as the greatest sculptor of the age. D. at Siena in 1278. W. J. Stillman.

Niccolo of Arezzo, called also Niccolo Lamberti and Niccolo di Piero: sculptor and architect; b. at Arezzo in 1350. He studied sculpture with Moccio of Siena, whom he soon surpassed. Two statues for the campanile of Sta. Maria dei Fiori proved his skill, but on account of the plague he left Florence in 1383 and went to Arezzo, where he worked at a bas-relief for the Brotherhood of Sta. Maria della Misericordia. The wall of Borgo San Sepolcro having been demolished by an earthquake, Niccolo was sent to repair it. He was driven from Arezzo by civil war and returned to Florence, where he took part in the work at Or San Michele and Sta. Maria dei Fiori, and was chosen one of the seven sculptors to compete for the gates of the Baptistery. Boniface IX. required him to come to Rome after this to repair the Castel St. Angelo. It is supposed that he afterward went to Milan in the service of the Visconti, and that he was the architect called Niccolo Selli of Arezzo who worked for John Galeazzo at the time the Certosa of Pavia was begun. In 1411 the monument of Pope Alexander V. was intrusted to him at Bologna. This fine work still exists at the Certosa. His work is often mistaken for that of Andrea Pisano. D. in Bologna in 1417.
W. J. Stillman.

Nice, nees, or **Nicæ'a** [Gr. Νίκη, liter., victory, or Νίκαια (sc. πόλις, city), city of victory, liter., femin. of νίκαιος, pertaining to victory; cf. Mod. Turk. name, *Isnik* < Gr. εἰς Νίκαιαν, to Nicæa]: an ancient capital of Bithynia; 44 miles S. E. of Byzantium. According to Strabo, it was founded by Antigonus (d. 301 B. C.) and rebuilt by Lysimachus (d. 281 B. C.), who changed its name from Antigonia to Nicæa, in honor of his first wife. It was rectangular, 16 stadia in circuit, and surrounded by massive walls. Two œcumenical councils were held here: the first (325), consisting of 318 bishops, was the first General Council of the Christian Church, and the most important of the series. It condemned Arius, formulated the Nicene Creed, and determined when Easter should be observed. The second (787), reckoned the seventh œcumenical, of 350 bishops, sanctioned the use of pictures in worship. Nice was captured (1078) by the Seljuk Turks and retaken (1097) by the Greeks and crusaders, who brought their ships 7 miles overland. From 1204 to 1261, while Constantinople was in the hands of the Franks and Venetians, it was the capital of the Byzantine empire. Since 1330 it has been held by the Ottomans. In the solitary church (of the eleventh century) still existing is a rude realistic picture of the first council. See Isnik.
E. A. Grosvenor.

Nice (Ital. *Nizza*): capital of the department of Alpes-Maritimes, France; at the foot of the Alps, on both sides of the mouth of the Paglione; 140 miles E. by N. of Marseilles (see map of France, ref. 8–I). It consists of the old town, the new town, and the port, and the three divisions have very different appearances, but they are all connected with each other and surrounded by beautiful promenades, drives, and public gardens, which, together with the exceedingly mild and salubrious climate, yearly attract thousands of foreigners who spend the winter here. It has spinning and weaving factories, and manufactures of artistic pottery, wax, essences, and perfumeries; flowers and fruits are raised on a large scale, and the preservation of the latter forms a prominent industry. Its trade in oil, wine, hemp, and silk is also very important. In 1388 it acknowledged the supremacy of the house of Savoy, and in 1814 became part of the kingdom of Sardinia, but was in 1860 ceded to France. Pop. (1891) 74,250; (1896) 93,760.

Nice, Councils of: See Nice or Nicæa.

Nicene Creed: See Creed.

Niceph'orus: Byzantine historian and Patriarch of Constantinople; commonly regarded as a saint and called the Confessor; was born in 750. Although a layman, he was against his will appointed patriarch by Nicephorus I. in 806, but was persecuted and finally deposed in 815 by the iconoclast Leo V., the Armenian, who banished him to a monastery in the Princes' islands. There he composed many works, deservedly admired for their accuracy, learning, and finished style. Among them are a *Brief History of Constantinople* from 602 to 770, a *Chronology* from Adam to the time of the author, and various treatises on the iconoclastic controversy. D. in 828. Banduri was preparing a comprehensive edition of Nicephorus's works, but died before it was complete. Some were published by Neri (1849) and others by Petra (1852)
E. A. Grosvenor.

Nicephorus: name of three Byzantine emperors. Nicephorus I. (803–811). A soldier, eventually general-in-chief. He rebelled against Constantine VI., by whom he was defeated. His life was spared, but his eyes were put out. In 803 a popular insurrection broke out against the Empress Irene, the sole sovereign, and raised Nicephorus to the throne. He was ambitious and brave, but perfidious. He fought against his two great contemporaries, Charlemagne and Haroun-al-Rashid, was constantly unsuccessful, and obtained peace by paying tribute to each. Making war against Crum, King of the Bulgarians, he invaded Bulgaria; but his whole army was destroyed in the passes of the Balkans, and Nicephorus was captured and put to death (811). His skull, lined with silver, served as a drinking-cup.—Nicephorus II. See Phocas II.—Nicephorus III., Botoniates (1078–81). An intrepid and able general before his accession, on the throne he was indulgent and pusillanimous. His reign was distracted by insurrections, which he was too feeble to suppress. Finally, attacked by the partisans of Alexius Comnenus and desirous of averting civil war, he resigned his crown and became a monk.
E. A. Grosvenor.

Nich'iren [liter., lotus of the sun]: a Japanese priest; b. 1222 A. D.; founder of the Hokke-shiu or Nichiren-shiu, one of the most popular of Buddhist sects. His fanaticism and bitter quarrels with other sects caused him to be banished to Cape Idzu, whence he returned in 1263 A. D. after a two years' exile. A second banishment and a period passed as a hermit in the mountains of Koshiu marked the close of his career. D. in 1282. The incidents of his life figure largely in Japanese art. The chief temples of the sect are at Ikegami, 6 miles S. of Tokio, and its chief book is the *Hokkekiō*, divided into two sections of fourteen chapters each, the first giving Buddha's life up to his thirtieth year, the second the rest of his teachings. These Buddhists recognize a difficult observance for the clergy and an easy one for

the laity. Their central doctrine teaches that every living plant or being may, by successive transmigration, attain to Buddhaship. Man works out his own salvation by observing the law and by prayer, not by relying on Amida Buddha, as some other sects teach. There are two forms of teaching; one symbolic, the other the pure truth. Shaka (that is, Sakya-muni, or the Buddha), whose emblem is the lotus, is worshiped; and the founders, Nichiren and Kishimojin, are held in reverence. J. M. Dixon.

Nichol, John Pringle, LL. D.: astronomer; b. at Brechin, Scotland, Jan. 13, 1804, the son of a bookseller; taught school in early life; studied for the ministry of the Scottish Church, and was licensed to preach, but soon devoted himself to science; became a successful popular lecturer upon astronomy, in which capacity he visited the U. S., and Professor of Practical Astronomy in the University of Glasgow. Among his works were *Views of the Architecture of the Heavens* (1838); *The Stellar Universe* (1848); *The Planetary System, its Order and Physical Structure* (1851); and *Cyclopædia of the Physical Sciences* (1857). D. at Rothesay, Scotland, Sept. 19, 1859.

Nicholas, Saint: Bishop of Myra, in Lycia, Asia Minor; b. at Patara, in Syria. He is the chief patron saint of Russia; patron of numerous seaports; patron saint of children, especially schoolboys, poor maidens, travelers, merchants, and sailors; one of the most popular saints of the Christian Church. On the day of his birth he stood up in his bath with folded hands mutely thanking God that he saw the light. He would nurse only once on Wednesdays and Fridays. He was while a little boy pointed out as a saint. He became a priest and a monk in the monastery of Holy Sion, near Myra, and rose to be abbot; made a pilgrimage to Palestine, and on his return settled in Myra, which was only 3 miles from Patara, where he was chosen bishop. In 325 he attended the Œcumenical Council of Nice, and boxed the ear of Arius because he was so horrified at Arius's blasphemy. He was a miracle-worker upon a stupendous scale. He quelled storms at sea, foretold the future, multiplied loaves of bread, and even raised the dead. He died on Dec. 6, 326, and was buried at Myra, but his relics were removed to Barri, in the kingdom of Naples, in 1087. The most famous story told about him is to the effect that by the clandestine gift of three purses of gold he portioned off three penniless girls whose bankrupt father had contemplated for them a life of shame. It is this story which occasioned the representation of the saint with three golden balls, placed sometimes upon the book he carries, sometimes at his feet, again in his lap. The stories of his deliverance of sailors and shipwrecked persons made him the patron saint of merchants, and as the early merchants were necessarily money-lenders, the three golden balls of their patron saint were adopted by the merchants' guild. So it came to pass ultimately that the golden balls of St. Nicholas became the symbol of the pawnbroker. The care he showed in the protection of children made him their patron, and led to the fiction that he would give them presents on the eve of his festival (Dec. 6). This idea has been transferred to Christmas eve, and in the famous poem of Clement C. Moore, '*Twas the night before Christmas*, the saintly Bishop of Myra appears in any but a dignified way; yet Santa Claus is a corruption of the Dutch name of St. Nicholas, and the Dutch in New Amsterdam celebrated a San Claus holiday.

Samuel Macauley Jackson.

Nicholas: the name of several popes. Nicholas I. (858–868), a Roman by birth, an imperious and energetic character; asserted the papal authority with great success against the metropolitan in his controversy with Hincmar of Reims, and even against the royal and imperial power, compelling Lothaire, King of Lorraine, who was supported by his brother, the Emperor Louis, to abandon his mistress, Walrada, and reinstate his legitimate wife, Theutberga, in her rights as queen. Less successful was his contest with the Patriarch of Constantinople, Photius, who had usurped the see after the deposition of Ignatius by the emperor. Nicholas excommunicated Photius and demanded the reinstatement of Ignatius, but the emperor, Michael III., supported Photius, who in his turn excommunicated Nicholas, arguing that the highest ecclesiastical authority had been transferred from the see of Rome to that of Constantinople by the transference of the imperial residence.—Nicholas II. (1058–61), who was guided throughout his pontificate by the advice of Hildebrand, afterward Gregory VII., held the famous Easter Council in Rome, 1059, which placed the papal election in the hands of the cardinals, and required the assent of the emperor only in the last instance.—Nicholas III. (1277–80) deprived Charles of Anjou of his vicariate of Tuscany, and forced Rudolph of Hapsburg to cede the Romagna and the exarchate of Ravenna.—Nicholas IV. (1288–92) was an unimportant pontiff, remembered chiefly for his abuse of the absolving power in annulling the treaty by which Charles of Anjou had obtained from Alphonso III. of Aragon his release from prison.—Nicholas V. (1447–55), b. at Pisa in 1398, a peaceable and learned man; reorganized and enlarged the Vatican Library and the University of Rome, and gathered in Rome a great number of the most celebrated scholars of the age, among whom were many Greeks who fled to Western Europe on the downfall of the Eastern empire.—In 1328, Louis of Bavaria raised Peter de Corbario as anti-pope to John XXII., under the name of Nicholas V., but he died shortly after in the papal dungeon, and is not counted in the papal succession.

Nicholas I., Nikolai Paulovitch: Czar of Russia (1825–55); b. at St. Petersburg, July 7, 1796; the third son of the Emperor Paul. Before his accession he traveled, visited England, married in 1817 the eldest daughter of Frederick William III. of Prussia, and lived at St. Petersburg in domestic retirement, occupied by military studies. On the death of Alexander I., the elder brother, Constantine, resigned the crown, and thus Nicholas succeeded to the throne. A formidable military conspiracy, which endangered not only his succession but the very existence of the empire, he put down with admirable courage and presence of mind, but also with a relentless severity which approached cruelty. In his reign wars were carried on in Central Asia, the Caucasus, Turkey, Poland, Hungary, and with the Western powers, but he himself possessed slight military skill. He was a good administrator and a vigorous but intolerant ruler. As a diplomat also he had some talent. For several years after 1849 Russia occupied the first place in the political system of Europe, and her plans with respect to Turkey were rapidly maturing when they received a sudden check from Napoleon III. by the alliance between Great Britain, France, and Turkey, and the ensuing Crimean war. The misfortunes of the Russian arms during this war were a great humiliation to him, and are said to have shortened his life. D. Mar. 2, 1855. See Russia (*History*).

Nicholas II.: Czar of Russia; son of Alexander III.; b. May 18, 1868; received a careful education, in which especial attention was paid to the modern languages and scientific studies; entered the army at the age of eighteen; in 1890–91 traveled extensively in the East, visiting Egypt, India, China, and Japan, and he has also visited most of the countries of Western Europe. On the death of his father, Nov. 1, 1894, Nicholas succeeded to the throne, having previously become affianced to the Princess Alix of Hesse-Darmstadt.

Nicholas de Cusa: See Cusanus.

Nicholasville; town; capital of Jessamine co., Ky. (for location, see map of Kentucky, ref. 3–H); on the Queen and Cresc. Route and the Richmond, Nich., Irvine and Beattyville railways; 12 miles S. of Lexington. It is noted for the thoroughbred horses raised and trained there, has several grain elevators, flour-mills, and hemp-factories, and handles a large quantity of tobacco annually. There are a national bank, a State bank, a private bank, and two weekly newspapers. Pop. (1880) 2,303; (1890) 2,157; (1900) 2,393.

Nicholl, Horace Wadham: See the Appendix.

Nichols, Edward Leamington, Ph. D.: physicist; b. in Leamington, England, Sept. 14, 1854; prepared for college at Peekskill Military Academy; graduated at Cornell University 1875; studied in Leipzig, Berlin, and at Göttingen, where (1879) he took the degree of Ph. D.; was appointed Fellow in Physics at Johns Hopkins University in 1879. He became connected with Edison in electrical work at Menlo Park in 1880; was Professor of Physics and Chemistry in Central University, Richmond, Ky., 1881–83; Professor of Physics and Astronomy in the University of Kansas, Lawrence, 1883–87; in 1887 became Professor of Physics in Cornell University, where he has been largely instrumental in developing the course in electrical engineering. Prof. Nichols is a member and vice-president of the American Institute of Electrical Engineers. He is the author of about fifty papers and memoirs, chiefly upon experimental physics, which have appeared in the *Annalen der Physik und Chimie*, *Philosophical Magazine*, *Electrical World*,

American Journal of Science, *Nature*, and the *Transactions* of the several scientific societies; also of a *Laboratory Manual of Physics and Applied Mechanics* (2 vols., New York, 1894), and of a small volume of lectures entitled *The Galvanometer* (New York, 1894). Since 1893 he has been editor of *The Physical Review*, and associate editor of *Johnson's Universal Cyclopædia*, in charge of physics and its applications. C. H. THURBER.

Nichols, JOHN: author; b. at Islington, a suburb of London, England, Feb. 2, 1745; was apprenticed to the eminent printer William Bowyer; became his partner, successor, and biographer, and was a distinguished benefactor to English letters, not only by the enterprise and liberality displayed in several costly undertakings, but by his careful editorship of numerous works and by his own learned writings. Nichols printed in 1778 for private distribution a brochure of fifty-two pages, *Brief Memoirs of Mr. Bowyer*, which was soon expanded into a quarto volume, *Biographical and Literary Anecdotes of William Bowyer, Printer, F. S. A., and of Many of his Learned Friends* (1782); and the latter work became so popular as to be ultimately recast into the valuable series entitled *Literary Anecdotes of the Eighteenth Century* (9 vols. 8vo, 1812–15). and was followed by *Illustrations of Literary History* (8 vols. 8vo, 1817–58), completed by his son, John Bowyer Nichols. From 1778 until his death Mr. Nichols was the editor and publisher of *The Gentleman's Magazine*. Among his elegant volumes upon English local history were *Bibliotheca Topographica Britannica* (52 Nos., 1780–90); *The Progresses, Processions, Festivities, and Pageants of Queen Elizabeth* (4 vols., 1788–1821) and of *King James I.* (4 vols., 1828); and *The History and Antiquities of the Town and County of Leicester* (7 parts, 8 vols., 1795–1815). D. in London, Nov. 26, 1826.—JOHN GOUGH NICHOLS, son of John Bowyer Nichols, continued the publishing business, edited several genealogical journals and was author of works on antiquarian subjects.
Revised by H. A. BEERS.

Nicholson, JAMES: sailor; b. at Chestertown, Md., in 1737; was engaged in the capture of Havana 1762; took command in 1775 of the Defense, a small Maryland vessel, with which he recaptured several prizes from the British; was appointed, June, 1776, to the command of the Virginia (twenty-six guns), and in Jan., 1777, succeeded Commodore Esek Hopkins as commander-in-chief of the Continental navy, and retained that post throughout the war; was engaged with his crew as volunteers in the battle of Trenton; fought a severe but indecisive engagement with the British ship Wyoming June 2, 1780, and was taken prisoner after a gallant resistance with his vessel, the Trumbull (thirty-eight guns), in Aug., 1781, by the British vessels Iris and General Monk. After the war he became commissioner of loans in New York, where he died Sept. 2, 1804.

Nicholson, JOHN: soldier; b. in Dublin, Ireland, Dec. 11, 1821; entered the military service of the East India Company in 1838; engaged in the disastrous campaign in Afghanistan 1840–42; was for some months a prisoner among the Afghans; took part in the Sikh war of 1845; became assistant resident at Lahore; rendered important services in the Sikh war of 1848, after which he became deputy commissioner of the Punjaub, and acquired such influence over the savage tribes of the frontier that he became the object of a kind of hero-worship among a sect which sprang up called the Nekkul-Seynees, which insisted upon paying him the honors of a prophet despite his energetic refusal, carried to the point of inflicting floggings to cure his misguided worshipers of their delusion. With Sir John Lawrence, Nicholson divides the honor of having saved the Punjaub to British allegiance during the great mutiny of 1857; he raised the famous "movable column," with which he destroyed all the rebel forces between Lahore and Delhi, and was assigned the post of honor in the final assault upon Delhi, in which he was mortally wounded Sept. 14, and died Sept. 23, 1857.

Nicias, nis'i-as (in Gr. **Νικίας**): an Athenian statesman and general from the period of the Peloponnesian war. He was very wealthy, the leader of the aristocratic party after the death of Pericles, and the fierce opponent of Cleon; wary, cautious, and superstitious, but prudent and energetic. His military successes—the capture of Minoa in 427, of Melos in 426, of Sphacteria in 425, of Cythera in 424—enabled him after the death of Cleon to negotiate a peace of fifteen years between Athens and Sparta in 421, which received his name. Neither of the parties, however, fulfilled the conditions, and in 415 Alcibiades induced the Athenians to make an expedition against Sicily. Nicias tried to dissuade the people from the undertaking, but in vain. He then accepted the command—first in connection with Alcibiades, afterward alone—and laid siege to Syracuse. Re-enforcements were sent to the city from Sparta. The Athenian fleet was defeated and destroyed, and when Nicias retreated with his troops to the interior, he was soon compelled to surrender, and he himself was put to death (413). Plutarch has written a very interesting sketch of his life and character.
Revised by J. R. S. STERRETT.

Nickel [Germ., from Swed. *nickel*, shortened from *kopparnickel*, copper-nickel, an ore containing the metal]: a metal allied to cobalt and to iron. Although one of the principal ores of nickel was described by Hiarni in 1694 under the name of kupfer-nickel, signifying false copper, it was not until 1754 that Cronstadt announced the discovery of a "semi-metal" which he proposed to give the name nickel. It was reserved for Bergman, in 1779, to show that it was really a new metal.

Properties.—Pure nickel, or the metal obtained by galvanic deposition from a solution as pure as possible, is a silvery-white metal with a strong luster, not tarnishing on exposure to the air. It can be polished so as to be deceptively like polished silver. It is very ductile, hard, and tenacious. A nickel wire will sustain 1½ times the weight required to break an iron wire of the same size. The specific gravity of nickel varies, according to different observers, between 8·27 and 8·93. Its atomic weight is 58·6; its coefficient of linear expansion 0·0000727; its specific heat 0·11; and its electric conductivity 7·374. Its malleability is diminished by an admixture of carbon or manganese. It is attracted by the magnet, and may be rendered magnetic by the same means as iron, its magnetic power compared with that of iron being given as 35 : 55, or as 8 : 9, or as 2 : 3. Repeated ignition destroys its magnetic property, and it loses this power at a lower temperature than iron. Nickel is very difficult of fusion. Adams succeeded in fusing pure nickel in a sealed porcelain crucible lined with pure alumina and bedded in a Hessian crucible at a heat which fused platinum. Crookes and Rohrig put its melting-point at 1,900°–2,100° C. Nickel is soluble in dilute sulphuric and hydrochloric acids, but slowly and with comparative difficulty. Nitric acid attacks and dissolves it readily, as does aqua regia. Strong nitric acid renders it passive. It combines directly with chlorine, bromine, iodine, fluorine, sulphur, phosphorus, and arsenic, forming soluble compounds.

Occurrence.—In the earlier days of nickel-mining the deposits in Saxony, Cornwall, Sweden, Norway, and Hungary furnished arsenide and sulpho-arsenide ores. Practically the ores utilized now on a large scale are the nickel-bearing pyrrhotites, which occur most extensively in the Sudbury district, Canada, and the silicates, among which garnierite is the principal one, mined in New Caledonia. In the U. S. nickel-mining was prosecuted for the longest period at the Gap mine in Pennsylvania, opened for copper in 1744, but worked for nickel since 1863. A small amount of nickel has also been annually produced as a by-product by the Muir la Motte lead mine in Missouri. Mining has also been conducted on a small scale at Lovelock Station, Nev., and at Riddles, Ore. Since 1885, when the production of nickel in the U. S. was 277,904 lb., it has declined, irregularly, until it was only 49,399 lb. in 1893.

At the New Caledonia mines the nickel ore, associated with cobalt ore and with chrome ore, is found at the contact of serpentine and argillaceous schists. Mining began in 1873, but development was hampered by the difficulty in extracting the nickel from the ores. From 1876 to 1890, the Thio district exported 59,448 tons of ore, carrying 8 to 12 per cent. of metal and 228 tons of nickel matte. In 1890 the product was 22,689 metric tons, in 1891 it rose to 60,921 tons, and in 1892 to 83,114 tons, the ore carrying 7 per cent. of metal. From lack of demand only 36,000 tons was exported to France, the balance going to stock, which rose to 80,000 tons. In 1892 France produced, chiefly from New Caledonia ores, 2,741,776 lb. of nickel; Sweden in the same year made 33,000 lb., Norway 275,000 lb., and Germany 1,494,000 lb.

In the Sudbury district, opened since 1887, the ore, a mixture of pure chalcopyrite and nickeliferous pyrrhotite, occurs in irregular lenticular masses in the Huronian rocks in proximity to dikes of diorite. There are indications that in depth the ore becomes more nickeliferous and less cupriferous.

Thus at the Copper Cliff mine the ore carries 4 per cent. of copper and 4·5 per cent. of nickel at a depth of 400 to 500 feet, while at 700 feet the ore runs on an average 0·5 per cent. of copper and 8 to 10 per cent. of nickel. Generally speaking, the ore in the district runs from 1 to 5 per cent. of nickel and from 1 to 4 per cent. of copper. The total product of nickel by the Sudbury mines, as determined by the Ontario Geological Survey, was 3,992,982 lb. It is shipped in the form of a copper-nickel matte, 12,427,986 lb. of this product having been imported into the U. S. in 1893. The statement has been made by good authority that the Sudbury mines can be worked at a profit when nickel sells as low as 25 cents per pound. The district controls the markets of the world. While formerly the metallurgy of nickel was much complicated by the presence of arsenic, cobalt, etc., the treatment of the New Caledonia and Sudbury ores is much simpler. The first process is to obtain by smelting in blast furnaces a matte, which is a mixture of sulphides of nickel, copper, and iron, a preliminary operation being, when sulphur is in excess in the ore, to roast it in heaps or furnaces. The matte is either roasted in reverberatory furnaces, producing an oxide, which is reduced by carbon, or it is blown in a Bessemer converter. The matte is also smelted with alkaline sulphides in excess.

Uses.—For some time the use of nickel was confined to the purposes of coinage and the making of certain alloys. In Jamaica, Belgium, Switzerland, Germany, Servia, Brazil, Mexico, Venezuela, Chili, and the U. S. small coins have been made with an alloy of nickel with zinc and copper, pure nickel being altogether too hard for this use. The U. S. cent, authorized by the act of Feb. 21, 1857, consists of 88 parts of copper and 12 of nickel.

Nickel is largely used in the preparation of German silver or nickel silver. This may be looked upon as a brass to which one-sixth to one-third of nickel has been added. Tradition tells us that this alloy has been in use in China from a remote period; its use in Europe became common about the middle of the nineteenth century. The white copper, or *packfong*, of the Chinese contains 40·4 parts of copper, 31·6 of nickel, 25·4 of zinc, and 2·6 of iron. German silver should be, approximately, 1 part of nickel, 1 of zinc, and 2 of copper. For casting purposes a little lead is sometimes added. A cheaper kind contains 8 parts of copper, 2 of nickel, and 3·5 of zinc. If the amount of nickel fall below 2 parts in 11–12, the silver produced will be little better than brass; 8 parts of copper, 3 of nickel, and 3·5 of zinc make a beautiful alloy closely resembling silver. The preceding, with 4 parts of nickel, makes a very beautiful compound having a faint shade of blue. The Chinese *tutenag* has 8 parts of copper, 3 of nickel, and 6·5 of zinc. This alloy is fusible, hard, and not easily rolled. The color of good German silver is nearly silver white, its fracture small-grained, specific gravity 8·4 to 8·7. It is as ductile as ordinary brass, but harder and capable of being polished. In making it, the three metals should be granulated and well distributed through the crucible, covered with charcoal, and well stirred while in fusion.

The chief use of nickel is for nickel-plating, or the deposition of nickel upon other metals by means of electricity. For many years the fact was well known that a brilliantly white deposit of metallic nickel could be obtained by the electrolysis of a solution of any one of many nickel salts, but the possibility of electro-plating with nickel was not demonstrated until Dr. Isaac Adams, Jr., solved the problem and created, in fact, a new art. He showed the way of supplying a nickel-plating solution regularly and continuously with the metal regularly and continuously withdrawn from it. The use and value of nickel on account of its hardness, beauty, luster, and the polish which it takes were rapidly recognized as soon as nickel-plated ware became common.

The best practical solution for nickel-plating is a solution of the double sulphate of nickel and ammonia. If properly prepared and used, this solution has the property of giving a deposit with a smooth surface which can be polished with little labor, and it gives a very thick deposit before it acquires a rough or matted surface. The solution should be of a salt as pure and neutral as possible, and kept free from substances which would impair its working properties, chief among which are nitric acid, the alkalies, and lime. Nitric acid and caustic alkali are used for cleaning goods about to be plated, and hence, without scrupulous care, a little nitric acid or alkali will find its way into the plating-vat. Nitric acid in very small quantities ruins the vat, the work coming out black and streaked. The presence of potash or soda is at once manifested by a deposit of green oxide or sub-oxide of nickel upon the article being plated. Copper, zinc, and arsenic are also detrimental, and must be excluded or their bad effects neutralized.

While in electro-plating an anode of pure metal is convenient and useful, in working out the problem of nickel-plating Dr. Adams brought to light the curious fact that a plate of pure metallic nickel—used as an anode—does not satisfy the conditions requisite to successful plating. Such a plate does not dissolve regularly in the solution; or, in other words, it does not furnish from itself as much metal as is deposited upon the objects plating. If a plate of nickel combined with carbon—a carbide of nickel—be employed, the metal will be fed into the solution on one side just as fast as it is deposited out on the other, and thus the great desideratum attained—viz., the possibility of continuous and uniform work. Such cast-nickel plates, or anodes, are now successfully made, and form an article of commerce.

Joseph Wharton, of Philadelphia, early began experimenting to determine whether nickel could not be produced in a pure and malleable condition susceptible of being worked in nearly the same manner as iron, and of being applied in the manufacture of various objects requiring strength of material and a material that can not be easily oxidized. One of his earliest experiments was to take the somewhat spongy mass got by reduction of the oxide of nickel, and, after heating it to full redness, work it under a steam-hammer into a bar. In 1873 Mr. Wharton sent to the Vienna Exhibition a sample of nickel in the form of axles and axle-bearings, and at the exhibition in Philadelphia in 1876 he exhibited a remarkable series of objects made of wrought nickel, such as bars, rods, a cube, a horseshoe magnet, and magnetic needles of forged nickel. Dr. Fleitmann, of Iserlohn, Westphalia, Prussia, has improved and cheapened the operation of refining nickel and toughening it, and has reduced the liability to the presence of blowholes in castings by adding to the molten charge in the pot, when ready to pour, a very small quantity of magnesium. Complete malleability of nickel was obtained at Wharton's works in Camden, N. J., before Fleitmann's invention or process, but this last is more rapid and better than the old method. The metal so treated becomes remarkably tough and malleable, and may be rolled into sheets and drawn into wire. Cast plates can be successfully rolled. The cast plates, such as are made for anodes, after reheating, are rolled down to the desired thickness. It is found that it is a great improvement to the nickel anode plates to roll them down; they dissolve with greater uniformity in the bath. Nickel so treated with magnesium has been rolled into sheets as thin as paper. Dr. Fleitmann has also succeeded in welding sheet nickel upon iron and upon steel plates so as to coat them equally on each face with a layer of nickel. The quantity preferred by weight is $\frac{8}{10}$ iron and $\frac{2}{10}$ nickel, $\frac{1}{10}$ of nickel being placed on each surface. To secure union, the iron or steel must be perfectly flat and clean. A pile is made with outer facings of sheet-iron, to protect the nickel from scaling. When the whole is heated to the proper degree, it is passed through the rolls. The two metals become so firmly united that they may be rolled down, two or three together or separately, to the thinness desired.

The unusual properties displayed by meteoric iron, which is invariably associated with nickel, attracted attention to the alloy, but it was not until 1885 that Marbeau's manufacture of nickel steel in the crucible and its addition to ordinary steel brought out the valuable properties of small additions of nickel to steel. James Riley conducted some experiments at the works of the Steel Company of Scotland, with open-hearth steel, and showed that steel containing 4·7 per cent. of nickel had an elastic limit of 28 tons per square inch, and a breaking strain of 40 tons, whereas similar steel without nickel showed only 16 and 30 tons respectively. The elongation and contraction of area of the steel were not materially impaired. In 1890 the Creusot works in France began experiments with nickel steel for armor plate, and in 1891 successful results were obtained with plates of U. S. manufacture. The amount usually alloyed with armor-plate steel by the Bethlehem works is $3\frac{1}{4}$ per cent. of nickel. Some experiments have been made in the direction of using nickel steel for heavy forgings and for common industrial purposes. For the latter, however, the alloy is still too costly. Nickel has declined steadily in price, and it is believed that the figure reached early in 1894 of 40

to 45 cents per pound does not reflect the ultimate capacity for placing it in the market at a low figure.

Revised by C. KIRCHHOFF.

Nickel-plating: See NICKEL.

Nickerson: city (founded in 1878); Reno co., Kan. (for location of county, see map of Kansas, ref. 7–F); on the Atch., Top. and S. Fé and the Mo. Pac. railways; 11 miles N. W. of Hutchinson, 58 miles N. W. of Wichita. It is in an agricultural and stock-raising region; contains a high school, 2 brick schoolhouses, 2 private banks, and a weekly newspaper; and has large stock-yards, roller flour-mill, railway machine-shops, salt-works, and creamery. Pop. (1880) 597; (1890) 1,662; (1900) 1,038. EDITORS OF "ARGOSY."

Nic'obar Islands: a group of twelve inhabited and seven uninhabited islands in the Indian Ocean, 125 miles N. W. of the northern point of Sumatra; area, 635 sq. miles, with 6,900 inhabitants belonging to the Malayan race, with only a low state of civilization. The islands are very fertile, producing cocoanuts, sugar, rice, tobacco, bamboo, and oranges in abundance. All attempts by the Danes to colonize them failed. Since 1869 they have belonged to Great Britain.

Nicode'mus: a member of the Sanhedrim, mentioned thrice in the Gospel of John—iii. 1–21, as coming to Jesus by night; viii. 45, as demanding that Jesus should be heard before being judged; and xix. 38–42, as assisting Joseph of Arimathea in laying out the body of Christ.

Nicol, ERSKINE: genre-painter; b. at Leith, Scotland, July, 1825. He studied in the Trustees' Academy, Edinburgh; settled in London in 1863; associate of the Royal Academy, London; was awarded a second-class medal at the Paris Exposition of 1867. His painting is robust, and his works are popular on account of their subjects, which include life and manners in Great Britain. *Paying the Rent* is in the collection of Mrs. W. H. Vanderbilt, New York; *Paddy's Mark* is in the Corcoran Gallery, Washington.

W. A. C.

Nicolai, CHRISTOPH FRIEDRICH: critic and editor; b. in Berlin, Mar. 18, 1733; was educated in the schools of Berlin, and became in 1749 apprentice in a bookstore at Frankfort-on-the-Oder, where he privately studied classical and English writers, mathematics, history, and philosophy. In 1752 he returned to Berlin and entered the publishing-house of his father. Through the publication of his *Briefe über den gegenwärtigen Zustand der Wissenschaften* (1756), he made the acquaintance of Lessing, and subsequently of Moses Mendelssohn, with whom he associated in publishing the *Bibliothek der schönen Wissenschaften* (1757–58) and the *Briefe die neueste Litteratur betreffend* (1759–65). In 1765 Nicolai founded the *Allgemeine deutsche Bibliothek*, a periodical which he continued until 1792, and by which he exerted a great influence on German literature. He also published a novel, *Leben und Meinungen des Herrn Magisters Sebaldus Nothanker*, a description of a journey through Germany and Switzerland in twelve volumes, and a number of smaller works. While young and under the stimulating influence of Lessing's genius, Nicolai rendered valuable services to German literature, not only as a publisher of influential journals, but also as a critic. He was among the first in Germany to point to Shakspeare's greatness as a dramatist. In his later years he failed to understand the new era in German literature inaugurated by Herder and Goethe. Thus he attempted to ridicule Goethe's *Werther* by a silly parody called *Freuden des jungen Werther* (1775), and in a similar manner he tried to make fun of Herder's enthusiasm for the *Volkslied* by publishing the *Kleyner feyner Almanach* (1778). His antagonists handled him mercilessly and stamped him as the representative of shallow reasoning and barren rationalism. D. in Berlin, Jan. 8, 1811. See von Göcking, *Nicolais Leben und litterarischer Nachlass* (1820); Foss, *Friedrich Nicolai* in *Archiv f. Litteraturgeschichte* (ii. 375).

JULIUS GOEBEL.

Nicolaïeff, or **Nikolaïev**, nĕĕ-kō-laa'yef: town; chief naval station of Southern Russia and great grain emporium; on the Bug, 20 miles from its mouth, and 80 miles N. E. from Odessa (see map of Russia, ref. 10–C). It is strongly defended and advantageously situated. Pop. (1891) 76,578.

E. A. G.

Nicolas, Sir NICHOLAS HARRIS, F. S. A.: historian and antiquarian; b. at East Looe, Cornwall, England, Mar. 10, 1799; became a lieutenant in the British navy in 1815; studied law; was called to the bar 1825; was joint editor of *The Retrospective Review* 1826 and of the *Excerpta Historica* 1831; made a knight of the Hanoverian Guelphic order 1831, chancellor of the Ionian order of St. Michael and St. George 1832, of which he became grand cross 1840. D. at Cape Curé, near Boulogne, France, Aug. 3, 1848. Among his works are *Synopsis of the Peerage of England* (1825); *History of the Battle of Agincourt* (1827); *The Chronology of History* (1835); *History of the Orders of Knighthood of the British Empire* (4 vols., 1841–42); *Dispatches and Letters of Lord Nelson* (7 vols., 1844); *Memoirs of Sir Christopher Hatton* (1847).

Nicolaus (in Gr. Νικόλαος) **of Damascus**: Greek historian, intimate of Herod the Great, and tutor of the children of Antony and Cleopatra; wrote a *Universal History* in 144 books, important fragments of which have been preserved, together with portions of his biography of Augustus. See Müller, *Fragmenta Historicorum Græcorum*, vol. iii., pp. 343–464.

B. L. G.

Nicolay, JOHN GEORGE: historical writer; b. at Essingen, Rhenish Bavaria, Germany, Feb. 26, 1832; was taken to the U. S. by his father in his childhood; was educated in the common schools of Ohio and Illinois; entered the office of *The Pike County Free Press*, Pittsfield, Ill., in 1848, becoming finally editor and proprietor; sold his newspaper and became clerk in the office of the secretary of State of Illinois at Springfield; made the acquaintance of Abraham Lincoln, who chose him as his secretary upon his nomination as President at Chicago; was private secretary of President Lincoln 1861–65; was U. S. consul in Paris, France, 1865–69; edited for a time *The Chicago Republican*; was marshal of the Supreme Court of the U. S. 1872–87. He is the author of *The Outbreak of Rebellion* (New York, 1881), and joint author with John Hay of *Abraham Lincoln: a History* (10 vols., New York, 1891; supp., 2 vols., 1894).

C. H. THURBER.

Nicole, nĕĕ'kōl', PIERRE: moralist and theologian; b. at Chartres, France, Oct. 19, 1625. He studied at Paris at the Collège d'Harcourt and at the Sorbonne, and was a precocious scholar in the classics and theology. He entered Port Royal as a master of classical studies, and soon became the spokesman of its ideas and its efficient but anonymous defender in its contentions with the Jesuits. He was the stanch and life-long friend of Arnauld, and was associated with him in the composition of the famous *Logique* or *Art de penser* of Port Royal, and of many controversial works. He fled with him to the Netherlands from the renewed religious persecutions in 1679, but his more pacific spirit led him to relinquish theological controversy as a condition of returning to Paris (1683). D. Nov. 16, 1695. He furnished Pascal the materials for some of the *Lettres Provinciales*, supervised the first collected edition, and published (1659), under the pseudonym of *William Wendrock*, a Latin translation of them that rivaled the original in popularity. In his eighteen letters under the title *Les Imaginaires et les Visionnaires* (1667) he expressed the austere puritanism of Port Royal in its condemnation of the drama and fiction generally, and excited Racine to a bitter personal reply. His chief title to enduring fame is his thirteen volumes of *Essais de Morale* and *Lettres*, begun in 1671, which assure him a place in the second rank of moralists. They were regarded by his contemporaries as masterpieces of literary style, but now only the *Essai sur le moyen de conserver la paix avec les hommes* is cited. They are judicious in thought and just in expression, but lack depth.

A. G. CANFIELD.

Nicolini, ERNESTO: See the Appendix.

Nicoll, JAMES CRAIG: See the Appendix.

Nicoll, WILLIAM ROBERTSON, LL. D.: a minister of the Free Church of Scotland; b. in Aberdeen, Oct. 10, 1851; educated at Aberdeen University and the Free Church College of Aberdeen; minister at Dufftown 1874–77, at Kelso 1877–86; since 1884 editor of *The Expositor*; since 1886 editor of *The British Weekly*; since 1891 editor of *The Bookman*; projector and editor of *The Expositor's Bible* (to be completed in about 40 vols.); the *Theological Educator*; *The Foreign Biblical Library*; *The Household Library of Exposition*; *The Clerical Library*; *The Sermon Bible*. He is author of *The Incarnate Saviour* (1881); *The Lamb of God* (1886); *James Macdowell*; *Memoir of Prof. Elmslie* (1890); *The Key of the Grave* (1893); and with C. K. Shorter a new *Life of the Brontës* (1895).

Nicome'dia (in Gr. Νικομήδεια): the capital of ancient Bithynia, at the head of the Sinus Astacenus, founded by Nicomedes I. (278–248 B. C.) in 264 B. C., after the destruction of Astacus (a little to the S. E. of it) by Lysimachus. From 292 to 330 A. D. it was the capital of the Eastern Roman empire, and contained many splendid buildings. It has suffered very severely from earthquakes, as in 358 and 362 A. D. Arrian was born, Hannibal died, and Diocletian abdicated here. Constantine died at his Villa Ancyrona, close by. The modern Turkish town of *Ismid* occupies the old site.

Revised by J. R. S. STERRETT.

Nicopolis [= Lat. = Gr. Νικόπολις, liter., city of victory; νίκη, victory + πόλις, city]: name of ten ancient cities, one in Egypt, four in Asia, and five in Europe, each commemorating a victory. The most important are: (1) in Epirus, built by Augustus after the naval battle of Actium (31 B. C.). Long a splendid city, after many vicissitudes it was destroyed by the Bulgarians (1034). Its extensive ruins are 5 miles N. of Prevesa. A heroic battle was fought here (Oct. 3, 1798) by 760 French, Prevesans, and Suliotes against 7,000 soldiers of Ali Pasha of Yanina. See Bellaire's *Les Îles Ioniennes sous la domination française*. (2) A town in Bulgaria on the Danube (Bulg. *Nicopol*), probably ancient *Nicopolis ad Istrum*, founded by Trajan after the second Dacian war (106). Bayezid I. there won a great battle (1396) over the allied French, Hungarians, and Germans. European historians assert that 60,000 Ottomans were slain. Pop. (1888) 5,156.

E. A. GROSVENOR.

Nicosia, nĕe-kō-see'ăă, or **Lefcosia** (anc. *Tremitus*): capital of Cyprus since 1192; surrounded by high walls raised by the Venetians and still intact; famous for its wines and carpets (see map of Europe, ref. 8–H). When captured by the Ottomans (1570) 20,000 persons were massacred. Pop. 12,515.

E. A. G.

Nicosia: town of Sicily; 40 miles N. W. of Catania (see map of Italy, ref. 9–F). It is picturesque and venerable in appearance with its mediæval cathedral and four churches, but its inhabitants are reputed the most illiterate and uncivilized of the island. Pop. 15,460.

E. A. G.

Nicotine, or **Nicotia**: See TOBACCO.

Nictheroy, nĕek-tā-roi': former capital of the state of Rio de Janeiro, Brazil; on the eastern side of the bay, opposite Rio de Janeiro city (see map of South America, ref. 6–G). The business portion, sometimes called Praia Grande, contains few buildings of interest, but the suburbs of Icarahy, São Domingos, São Lourenço, etc., scattered for a long distance along the shores of the bay and among the hills, contain many charming residences and are favorite holiday resorts. Nictheroy was repeatedly bombarded during the naval rebellion of 1893–94. Pop. over 20,000.

H. H. S.

Nicue'sa, DIEGO, de: a Spanish commander; b. at Baeza, Spain, about 1465. He went to Española in 1502, acquired considerable wealth there, and later was agent for the colonists in Spain. For his subsequent history, see the article DARIEN.

Nicum, JOHN, D. D.: Lutheran clergyman; b. in Würtemberg, Jan. 6, 1851; educated at Muhlenberg College, Allentown, Pa., and the Theological Seminary, Philadelphia; became pastor at Frackville, Pa., 1876, Frankford, Philadelphia, 1878, Syracuse, N. Y., 1880, Rochester, N. Y., 1887. His chief works are *History of the New York Ministerium* (1888), and a translation with additions of Wolf's *The Lutherans in America* (1891). He is a member of the American Society of Church History and a contributor to its printed proceedings, as well as to *The Lutheran Church Review*, *The Independent*, and the various Lutheran Church papers. Dr. Nicum has also been active in securing uniform legislative action for the Lutheran churches in the State of New York.

H. E. JACOBS.

Nidāna, nĕe-daa'na [Sanskr., cause, from √*dā*, to bind]: one of the twelve links of the Buddhist chain of cause and effect which Gautama thought out under the Bo-tree during the third watch of the night in which he became Enlightened. He saw that *Ignorance* (in a previous state of existence, of the Four Noble Truths) was the first cause of life with all its misery and sorrow. From this ignorance comes *Conformations*, or the character-forming qualities derived from former births; from conformations come *Consciousness*; from consciousness *Corporeal Form and Name* (that is, individual being); from this come the *Six Organs of Sense*; from these *Contact*; and from contact with the objects of sense comes *Sensation*; from sensation comes *Desire*, or lust, which in turn brings *Attachment*, or clinging to the object of desire (life); from this clinging to life comes *Continuity of Becoming*. This leads to *Birth* in one of the six GATI (*q. v.*), and with birth come *Sickness*, *Disease*, and *Death*. But if Ignorance, the first cause, be removed by the complete extinction of desire, each link will in turn be removed, rebirth will be avoided, sorrow and suffering will come to an end, and Nirvāna will be attained. See Monier-Williams's *Buddhism* (London and New York, 1889); Oldenberg's *Buddha* (trans. by Hoey, London, 1882); Alabaster's *Wheel of the Law* (London, 1871); and the other works mentioned under the article BUDDHISM.

R. LILLEY.

Niebelungen: See NIBELUNGENLIED.

Niebuhr, nee'boor, BARTHOLD GEORG: historian and statesman; b. at Copenhagen, Denmark, Aug. 27, 1776; studied law and philosophy at Kiel and Göttingen; was appointed private secretary to Count Schimmelmann, Danish Minister of Finance, in 1796, and next year secretary to the royal library in Copenhagen; visited England in 1798, and entered the civil service of the Danish Government in 1799; but his enthusiasm for England and hatred to Napoleon made it very unpleasant for him in Copenhagen, and in 1806 he removed to Berlin, where from this year till 1809 he held various offices in the financial department of the Prussian Government. He soon fell out, first with Stein, then with Hardenberg, and finally resigned. Appointed historiographer to the King of Prussia, he delivered in 1810–11 a course of lectures on the history of Rome at the newly established University of Berlin, and in this sphere his brilliant genius and immense learning at once found their proper application. From 1816 to 1822 he resided in Rome as Prussian ambassador to the papal court, though in reality wholly occupied by scientific studies; and in the latter year he removed to Bonn as professor at the university. Here he developed a great literary activity; founded the *Rheinisches Museum* (1827), superintended the new edition of the *Corpus Scriptorum Historiæ Byzantinæ*, and continued his great work, the *Römische Geschichte*. Under the violent impression which the French Revolution of 1830 made on him, he broke down mentally and physically, and died Jan. 2, 1831. His *Römische Geschichte* (3 vols., 1811–32) is, so far as it goes—namely, to the first Punic war—a complete reconstruction of the history of Rome. The entire narrative of the founding of Rome, and the subsequent regal period, all of which had up to Niebuhr's time been accepted as authentic history, he discarded, after a thorough critical analysis, as purely legendary. Some of his hypotheses have been rejected, such as that of the epical source of the early Roman legends; others have been modified, such as that of the origin of the *plebs*; but the fundamental distinction between history and legend, and the methods employed in distinguishing them, inaugurated a new epoch in the study of history, and his wonderful intuition into the correlation between the various elements of which a social organism is composed, as well as the astonishing power of imagination with which from a few scanty remnants he reconstructed the whole organism, will always bear witness to his eminent genius. Other works are: *Kleine historische und philologische Schriften* (2 vols., 1828); *Lectures on Roman History* (3 vols., 1843); *Lectures on Ancient History* (3 vols., 1851); edition of *Fronto* (1816). See Susanna Winkworth, *Life and Letters of B. G. Niebuhr* (3 vols., London, 1852); F. Eyssenhardt, *Barthold Georg Niebuhr* (Gotha, 1886); Bursian, *Gesch. der class. Philol. in Deutschland*, pp. 647–663.

Revised by ALFRED GUDEMAN.

Niebuhr, KARSTEN: traveler; b. at Lüdingworth, in the Hanoverian district of Hadeln, Mar. 17, 1733; studied mathematics at Göttingen; became lieutenant-engineer in the Danish service in 1760, and in the following year was sent as mathematician to an expedition to Arabia, Persia, and the neighboring countries for the purpose of obtaining information bearing on New Testament history and geography. Though all his companions in the expedition perished Niebuhr continued his travels for several years, and on his return to Denmark applied himself to the preparation of a valuable work on Arabia, *Beschreibung von Arabien* (Copenhagen, 1772). He also published *Reisebeschreibung von Arabien und andern umliegenden Ländern* (1774–78) and *Reisen durch Syrien und Palästina* (1837), and edited the papers of Forskal, the naturalist, who died on the journey—*Descriptiones animalium* (1775) and *Flora Ægyptiaco-Arabica* (1776). D. at Meldorf, Holstein, Apr. 26, 1815.

Niel, nēĕ-el′, Adolphe: marshal of France; b. at Muret, Haute-Garonne, France, Oct. 4, 1802; was educated at the École Polytechnique of Paris and the Military Academy of Metz; distinguished himself in the expedition against Constantine 1836, and was made commander of the engineering corps in Algeria; took part in the expedition against Rome in 1849; conducted the siege of Bomarsund in 1854, and planned the operations which led to the fall of Sebastopol; distinguished himself in the Italian campaign of 1859, was made a marshal of France after the battle of Solferino, and Minister of War in 1867. D. in Paris, Aug. 13, 1869.

Niel'lo-work: ornamental work in which plates of metal are engraved with ornamental figures, the lines of which are then filled with a black alloy and the whole burnished. The art is practiced in Russia, and to a certain extent by the silversmiths of Western Europe and the U. S. Some of the earliest and best niellos are Byzantine; the most celebrated are Italian of the Cinque-cento period, and printing from engraved plates is thought to have originated in niello-work of that time. R. S.

Niemcewicz, nyem-tsev′ich, Julian Ursyn: poet; b. at Skoki, Poland, Feb. 16, 1757; received a military education, but left the service in 1788, and entered into Polish politics as a deputy from Lithuania; fought in 1794 at the side of Kościuszko; was carried, together with him, as a prisoner to St. Petersburg, and later accompanied him to the U. S. He returned to Poland in 1807, and played a conspicuous part in politics there till 1830. Shortly after the fall of Warsaw he went to Paris (1833), where he resided till his death, May 21, 1841. In Polish literature he became very celebrated as the author of elegies, e. g. *Dumania w Ursynowie* and *Moje przemiany*, and of the memorable historical songs *Śpiewy hȳstoriczne* (Warsaw, 1816–18–19). He also wrote dramas, *Powrót posla* (The Messenger's Return), *Kazimierz wielki*, *Samolub*, *Dworek na gościńcu*; and romances, *Dwaj Siecichowie* (1815), *Lejba i Siora* (1821), *Jan z Tęczyna* (3 vols., Warsaw, 1825). Two volumes of his *Memoirs* were published at Posen, 1871. Revised by J. J. Král.

Nie'men: river of Prussia and West Russia. It rises a few miles S. of the city of Minsk, becomes navigable at Grodno, and divides at Winge into the Russ and the Gilge, both of which fall into the Kurisches-Haff. It is 500 miles long, and is of considerable commercial consequence.

Niemeyer, August Hermann: See the Appendix.

Niepce, nēĕ-eps′, Joseph Nicéphore: one of the inventors of photography; b. at Châlons-sur-Saône, France, Mar. 7, 1765; entered the army 1792, and saw active service in Italy; was administrator of the district of Nice 1795–1801. In the latter year he returned to Châlons, and devoted himself to researches in chemistry and lithography. In 1813 he conceived the idea of obtaining sun-pictures, and afterward in conjunction with Daguerre (*q. v.*) he invented several of the earlier processes used in Photography (*q. v.*). D. July 5, 1833. —His nephew, Claude Marie François Niepce de Saint-Victor (1805–70), also a soldier, wrote *Traité Pratique* (1856) on photography, and *Recherches Photographiques* (1855).

Nievo, nēĕ-ā′vō, Ippolito: poet and novelist; b. at Padua, Italy, Nov. 30, 1832. He studied philosophy and history at the university in his native place, but while still a student became ardently interested in the revolutionary movements then going on. He joined Garibaldi as a volunteer, and accompanied him as an officer on his Sicilian expedition. On his return, in Mar., 1861, he was lost in the wreck of the steamer Ercole, near the Gulf of Naples. He had published several stories showing great talents: *Il conte pecorajo*, *Angelo di bontà*, and *Le avventure del Barone di Nicastro.* Still more interesting, however, is his posthumous *Confessioni di un ottuagenario* (2 vols., Florence, 1867)—a kind of historical romance, giving a survey of the history of Italy from 1775 down to 1858, and full of episodes drawn with a most skillful hand. His verses have been published under the title *Poesie di Ippolito Nievo* (Florence, 1883).
A. R. Marsh.

Nièvre, nēĕ′evr′: central department of France; situated along the Loire and its two affluents, the Allier and Nièvre, and the Yonne, an affluent of the Seine. Area, 2,632 sq. miles. It is mountainous, and not very fertile. Wine is extensively produced, but wheat is not raised in sufficient quantity for home consumption. Timber and minerals are abundant. Iron, coal, copper, lead, and silver are mined, and there are marble quarries and manufactures of glass and pottery. Pop. (1896) 333,899. Capital, Nevers.

Niger: the third largest river in Africa, in respect of its length and the size of its basin. It drains an area of about 1,150,000 sq. miles. It is formed by the junction of three little rivers, in about 8° 20′ N. lat. and 10° W. lon., and is known to most of the natives in its upper course as the Joliba and in its middle and lower courses as the Quorra. It is 2,500 miles long, and is notable by two facts: (1) Its delta, which begins 100 miles from the sea, is the largest in Africa, the mouths of its outermost branches being 200 miles apart, the whole including 14,000 sq. miles of low alluvial plain covered with forest and jungle. (2) The Niger is the only river in Africa which affords uninterrupted steam navigation between the sea and the heart of the continent. On this route, however, the Niger is followed only as far as the confluence with its greatest tributary, the Benue, on which light-draught steamers journey as far as Yola in Adamawa. Rising among mountains, the Niger flows sluggishly N. to the edge of the Sahara, and then, describing a great bend, it flows S. E. and S. to the Gulf of Guinea, its course running nearly all the way through an undulating plain. The French have navigated the river in light-draught gunboats from Bammaku, on the upper Niger, to the port of Timbuktu. Ascending from the sea, rock obstructions stop navigation at Rabba. The main channel through the center of the delta is known as the Nun river.
C. C. Adams.

Niger Territories: the region in Northwest Africa governed by the Royal Niger Company under a charter granted by Great Britain in 1886. The company, through their agents, made treaties with about 300 native states and tribes, and the region embraces about 500,000 sq. miles, including the Niger delta, but most of it E. of the Niger, and between the Sahara and the Benue river. Their authority over most of this territory is merely nominal, and they have (1894) apparently no influence whatever over the great states of Sokoto and Bornu. The capital is Asaba, above the Niger delta, where public buildings, including a prison and hospitals, have been erected. The head station of the military force is at Lokoja, at the confluence of the Niger and Benue rivers. Trade is making gradual but encouraging progress, amounting annually to nearly £400,000. A council in London governs the territories. The importation of spirituous liquors is prohibited in nineteen-twentieths of the area.
C. C. Adams.

Night-blindness: See Blindness.

Night-hawk: a name applied in North America to birds of the genus *Chordeiles*, belonging to the family *Caprimulgidæ*, or goatsuckers. They are sometimes confounded with the whip-poor-will, from which they may be readily distinguished by their forked tails and absence of bristles about the mouth. The beak is small, gape of mouth wide, wings very long. The plumage is mottled with black, white, gray, and tawny, and there is a conspicuous white patch on the wing. The common species, *Chordeiles virginianus*, is abundant in Eastern North America, and there are two subspecies, one in Florida and one in the Southwest. The Texan night-hawk (*C. texensis*), found also in the Southwest, is smaller and lighter colored. The eggs are laid upon the bare ground, without a nest. The birds are well known by their sharp cry and the loud booming sound produced at twilight by the rapid rush through the air. Night-hawks devour enormous quantities of insects, over 600 having been found in one bird. F. A. Lucas.

Night-heron: a popular name for several species of herons belonging to the genus *Nycticorax*, distinguished from other herons by stouter bills and shorter legs and necks. The most common species is *Nycticorax nycticorax*, which is found in both Europe and North America, although the American bird is accorded the rank of a sub-species, *N. n. nævius.* It is about 2 feet in length, and when adult of a light ashy color, top of head, scapulars, and interscapulars dark glossy green. There are two long, slender white plumes hanging from the head. This bird, locally known as qua or quawk from its cry, breeds in colonies, nesting in high trees in swampy localities. *Nycticorax violaceus* of the Southern U. S. is a rarer and somewhat handsomer bird.
F. A. Lucas.

Nightingale [O. Eng. *nihtegale*; *niht*, night + *galan*, sing]: *Danlias luscinia*, a small and inconspicuous member of the family *Sylviidæ*, famed for its song, which is heard not only at night, but during the day as well. The nightingale is about the size of a bluebird, and is reddish brown above, grayish white below. It is common throughout a

great part of Europe, ranges east into Persia, and occurs in Northern Africa. It also visits England, particularly the eastern and southern counties, where its song may be heard from the middle of April to the middle of June. The Per-

The nightingale (*Daulias luscinia*).

sian nightingale (*Daulias hafizi*) is said to be the bulbul of the poets, but that name is now generally applied to birds of the genus *Pycnonotus*, members of another family, the *Ixidæ*. The nightingale feeds principally upon worms and insect larvæ. The nightingale of the East Indies is the *Kittacincla macrura*, a bird resembling the true nightingale. It sings by night or in a darkened cage, and its song is regarded as equal to that of the true nightingale. F. A. L.

Nightingale, Augustus F.: See the Appendix.

Nightingale, Florence: b. at Florence, Italy, in May, 1823, of wealthy English parents. Prompted by philanthropic instincts, she early turned her attention to the relief of humanity, and studied systems of nursing and hospital management under the Sisters of Charity in Paris and subsequently at the Kaiserswerth institution on the Rhine. During the Crimean war she was sent by the British war department, at the head of a band of select nurses, for the relief of the sufferings of the sick and wounded at Constantinople, and in this position displayed marvelous energy and ability; and the testimonial of £50,000 subscribed for her by a grateful public she devoted to the founding of a training-school for nurses. Her chief writings are *Notes on Hospitals* (1859); *Notes on Nursing* (1860); *On the Sanitary State of the Army in India* (1863); *Notes on Lying-in Institutions* (1871); *Life or Death in India* (1873), etc. Revised by S. T. Armstrong.

Night-jar: See Goatsucker.

Nightmare [*night* + *mare* < O. Eng. *mara*, incubus, bad dream : O. H. Germ. *mara* > Mod. Germ. *mahr*, ghost, nightmare]: a terrific dream (*ephialtes*, *hypnophobia*, *incubus*, *succubus*) in which there appears to be a disagreeable object, as a person, animal, or goblin, present and often upon the breast of the sleeper, accompanied by the inability to cry out, move, or call for help. Some patients have merely a sense of terror, oppression, and inability to call, without any dream. It is often ascribable to heart disease or asthma, more frequently to obstruction in the circulation caused by the pressure of food or flatulency in the alimentary canal, especially when the sleeper lies upon his back and the weight of the overloaded viscera falls upon the aorta. Many of the symptoms of nightmare may occur to nervous and anxious patients in a half-wakeful state just after going to bed. The careful voluntary suspension of the effort to think (a suspension often difficult to accomplish) will usually prevent these attacks, which seem to be due to the performance of the function of thinking at a time when the supply of blood to the brain is deficient. The ancients believed that devils and witches were present during an attack of nightmare. They affirmed that the evil spirits which placed themselves upon the patient were males, called *incubi*, while female spirits and witches, *succubi*, were thought to lie beneath the sleeping sufferer.

Nightshade Family: the *Solanaceæ*, a group of gamopetalous dicotyledons, numbering 1,500 species, mostly natives of the warm climates. They are nearly all herbs or small shrubs, a few only being trees; their flowers are regular, with a superior two-celled ovary, and numerous ovules. The potato (*Solanum tuberosum*), tomato (*Lycopersicum esculentum*), and tobacco (*Nicotiana tabacum*) are members of this family, as are also the species of *Petunia*, *Datura*, *Cestrum*, *Lycium*, etc., many of which are familiar ornamental plants. Charles E. Bessey.

Nigid'ius Fig'ulus, Publius: Latin grammarian; prætor 58 B. C. As a follower of Pompey banished by Cæsar, he died in exile 45 B. C. Next to Varro the most learned man of his time, he treated not only grammar, but also subjects connected with natural science and religion. See A. Swoboda, *P. Nigidii Figuli operum reliquiæ* (Vienna, 1889). M. W.

Nihilism [from Lat. *nihil*, nothing]: a philosophy of universal negation; a nickname given to the tenets of the extreme section of Russian revolutionists and rebels against the czar's authority, who are erroneously supposed to be partisans of universal destruction, without having any positive constructive element in their programme.

Origin of the Name.—The term Nihilism was invented by the great Russian novelist Ivan Turgenev, and appears for the first time in his novel *Fathers and Children*. It is used as a nickname of the hero Bazaroff, who impersonates an intellectual movement which came into existence during the epoch of the emancipation of the serfs (1861), and which since the appearance of Turgenev's novel has actually been known in Russia under the name of Nihilism.

Primitive and genuine Nihilism was a school of philosophical and ethical individualism which flourished in Russia between 1855 and 1865, and is now entirely extinct. It was the first manifestation of the awakening of the feeling of independence in the masses of educated Russians. It had no political aspects, however, and was by its very nature opposed to political action. It proclaimed man's absolute independence of all claims which the family, society, the state, had upon him. It was a vehement and impassioned protest of the individual man against the subjugation which was imposed upon him by ancient traditions in the name of the family and the community. These early Nihilists did not deny everything, for they believed firmly, fanatically, in science and in the power of the individual mind: but they refused to bow to any other authority, and deprecated all that was based upon emotions, fancy, supposed revelation. Something similar took place in Germany in the so-called *Sturm und Drang* period, and for similar reasons. With all its grotesque exaggerations this early Nihilism was a grand and useful movement in a country where the individual had been crushed and downtrodden for generations. The recognition of the rights of women and of children in modern Russia is due to the struggle of the early Nihilists. They paved the way for the modern militant Nihilism, in which the idea of individual independence has received a broad political and social conception; but this social feeling came from quite a different source.

The Origin of the Modern Political Movement.—Political aspirations manifested themselves with the Russian people at a very early date, almost as soon as Western Europe set them a good example. The Napoleonic wars resulting in the invasion of France and the temporary occupation of her provinces by the Russian and German armies brought a considerable section of the best Russian troops into contact with the French, fresh from their great Revolution. The result was a political fermentation among the officers and even soldiers of the imperial guard which, ten years later (Dec. 14, 1825), brought about the famous Decembrist insurrection, which for a moment imperiled the throne of the Emperor Nicholas. This insurrection, which had for its aim the emancipation of the serfs and the establishment of a free constitution in Russia, and which was led and supported by men of the highest position in the country, opened the long struggle for freedom which has been going on in Russia. The revolt was put down, six of its leaders perished on the scaffold, 125 were sent to the Siberian mines, and all sympathizers and accomplices were treated with extreme severity; but the traditions of this first liberal movement could not be extirpated, and in the next generation there arose in Russia a great writer and patriot, Alexander Hertzen (see Hertzen, Alexander), who, having voluntarily expatriated himself in order better to serve the cause of Russian free-

dom, settled in London and there started his famous *Kólokol* (Alarm Bell), a periodical which had an enormous influence in Russia. Moreover, he founded a free printing-office, which did for Russia what the free presses of Switzerland and the Netherlands did for France in the time of Voltaire and Diderot. The leading points of the programme of Hertzen and the democrats of his time were those of the Decembrists, namely, free constitutional government for the country and the emancipation of the serfs. Owing to better knowledge of the agrarian arrangements and of the aspirations of the peasantry, they laid proper stress upon the agrarian question, advocating the emancipation of the serfs with land endowment, and they had the satisfaction of seeing that their plan, although mutilated, was accepted in principle by the Government in 1861.

Transformation of the Individualistic Nihilism into a Political and Social Movement.—With the majority of the educated classes aspirations for liberty found their satisfaction in the individualistic rebellion described above. The years 1860–64 mark the fullest dominion of this school, which found its prophet in Dmitry Pisarev, an essayist and literary critic of the *Russkoi Slovo* (Russian Word), the organ of this individualistic Nihilism; but even at this period there was in the movement an undercurrent making in another direction. It may be called social Nihilism as opposed to the individualistic, and was represented in 1860 by Nicholas Tchernyshevsky, the publicist, journalist, economist, and novelist. He was a socialist and the father of the Russian revolutionary movement. He preached the absolute devotion of the individual to the cause of his country, but he gave the idea of self-sacrifice an individualistic interpretation as the fulfillment of the highest personal happiness for people of a high intellectual and moral development. The theory of moralized egotism and egotistical self-abnegation was developed by Tchernyshevsky with admirable skill, and served as a transition to the doctrine of absolute devotion to the good of the community. As time went on and the disastrous results of the economic shortcomings of the emancipation act of 1861 became more and more apparent, the influence of Tchernyshevsky gained upon that of the genuine Nihilism represented by Pisarev. The generation of 1870 was educated by Tchernyshevsky, but it took from him the kernel of his ethics, dropping as useless his theory of all-pervading individualism. Another writer, Schapov, whose name is little known abroad, must be mentioned here, because his influence in shaping the views of the present revolutionary movement was perhaps even greater than that of Tchernyshevsky. Schapov is the historian of the Russian peasantry. His object has been to bring to light the constructive principles of political and social life, adhered to by the masses of the peasantry as opposed to those which the Muscovite, and afterward the St. Petersburg monarchy, forced upon them. These principles are self-government and local autonomy in administrative and ecclesiastical matters, as opposed to the administrative and ecclesiastic centralization of the state; and in the economic domain communistic ownership of land, meadows, forests, fisheries, and all natural riches, as opposed to the system of private property maintained by the state. Thus he has shown the masses of Russian peasantry to be an excellent plastic material for the building up of a community diametrically opposed to the centralized despotism which has been constituted by temporary historical necessity—namely, the military struggle with alien conquerors.

Nihilism since 1870.—Upon the ground thus prepared foreign influences began to work powerfully after 1870, which is the epoch corresponding to the greatest development of international socialism. At that time, as nowadays, international socialists were divided into two sections, the social democrats and the anarchists. The former advocated the abolition of private property in the instruments of labor and their collective ownership by the workmen; but they wished to preserve the present political organizations, which should be made an instrument with which to rebuild the economic structure of the community. Thus for the social democrats the practical object was to take possession of political power. Peaceful electoral agitation was their chief weapon. The anarchists, headed then by the Russian Michael Bakunin (see BAKUNIN, MICHAEL), advocated the total abolition of the state and the substitution for it of a series of small, absolutely independent, and freely constituted communes. Of these two doctrines, the latter had by far the greater fascination for the Russian socialists of 1870. It seemed the shortest way to universal happiness, and it flattered the national feeling of the Russians. The political backwardness of their country was no longer a drawback, but an advantage. The antiquated autocracy was easier to overthrow than a constitutional monarchy based upon the popular vote. According to Bakunin, the village commune (*mir*) had only to be freed from the oppressive tutorship of the state to become an ideal form of the anarchical organization of society. In fact, Bakunin's anarchy was but a queer mixture of the Prudhonian doctrine with the Slavophilism of Khomiakov or *peasantism* of Schapov. The Russian anarchy of 1870 was a mere dream of universal harmony; but it had for its practical result the complete estrangement of the extreme revolutionary party from the majority of advanced Russians. The autocracy was opposed simply because it was a government, no substantial difference being admitted to exist between Russian autocracy and, for example, the English parliamentary *régime*. Accordingly, nothing was expected and nothing was asked from the educated classes and the liberal opposition, which was in favor of a constitutional government for Russia. The socialists of this epoch based all their hopes upon the peasants. Thousands of young people of both sexes, most of them belonging to the upper classes, went on a crusade among the peasants. They renounced all their privileges and became themselves common manual laborers in the fields, in factories, at the wharves and railways, in all places where common workpeople assembled. The movement failed completely. In 1873–74 some 1,500 propagandists and agitators, or their friends and relatives, were arrested in the thirty-seven provinces of the empire and thrown into prison. Half of them were released after a few months' detention; the rest were kept in solitary confinement for from two to four years, during which seventy-three of them either died or lost their reason. In 1877 a part of them (193) were tried and condemned to various punishments, from simple exile to ten years' penal servitude in the Siberian mines.

A number of other trials of the same nature followed, serving to the Russian socialists as an object lesson, showing the childish inconsistency of their indifference to the forms of political government. Sounder views gained ground very rapidly, but passions spoke first. The wanton cruelty with which political prisoners were treated, the horrors of preliminary detention, the barbarous punishments inflicted for trifling offenses, proved unendurable even to the mild, patient Russians. The spirit of revenge was kindled, giving birth to the first attacks, known by the name of terrorism, upon the Government. The terrorism began with the shot of Vera Zassulitch at Gen. Trepoff, who had ordered the flogging of a political prisoner. On Mar. 31, 1878, she was acquitted by the jury, although she had never denied her act. In 1878 the terrorism was accepted as a system of warfare by the Russian revolutionists, whose organ was a paper called *Zemlia i Volia* (Land and Liberty). This was the first practical struggle with the worst representatives of political despotism, and it gradually led to a very radical change in the theoretical programme. In 1880 the most energetic and numerous section of the Russian revolutionists proclaimed that the aim of their attacks upon the Government was the obtaining of a constitution for Russia. This was the *Narodnaia Volia* party with the "executive committee" at its head, which may be considered the embodiment of Nihilism as understood abroad. A minority made a split, founding a paper called *Tcherny Peredíel*, which kept to the exclusively socialist agitation, repudiating all interference in politics. The paper had but a short life, the police having discovered and sequestrated its printing-office immediately after the publication of its first number, and the party had such a small following that it could not recover from this blow. It was soon dissolved.

The whole of the revolutionary strength rallied under the banner of the *Narodnaia Volia*, which in 1880 thus formulated its programme of political and economic reforms: 1. A permanent representative assembly, having supreme control and direction in all general state affairs. 2. Provincial self-government, secured by the election of all public functionaries. 3. Independence of the village commune as an economic and administrative unit. 4. Complete liberty of conscience, speech, press, meetings, association, and electoral agitation. 5. Manhood suffrage. 6. Substitution of the standing army by a territorial militia. 7. Nationalization of land. 8. A series of measures tending to transfer the possession of factories to workmen.

These points make the programme a socialistic one, but it

is strictly social democratic. It is intended that the remoulding of the country's economic structure shall be carried out exclusively by the future national parliament. For the present the obtaining of such a parliament is the object to which are directed all the efforts of the revolutionary body known to outsiders by the name of Nihilists. The early formless anarchism has disappeared so completely as to leave no trace whatever. In fact, since 1879 there have not been any anarchist manifestoes or pamphlets, or any declaration of anarchist opinion at any of the numberless trials. There were two ways in which the Nihilists tried to carry out their campaign against autocracy. The first, which is widely known, is that of direct attempts against the representatives of autocracy. The second, which is little known, was the organizing of military insurrections similar to that of the Decembrists. These insurrections did not take place; the police succeeded in discovering the plots before they were matured. In the years 1882–84 about 300 military officers of all arms were arrested all over the empire.

In 1888 the minority, which had seceded from the bulk of the party and founded the unsuccessful *Tcherny Perediel*, started in Switzerland a paper, *The Social Democrat*, fully indorsing the programme of the German socialists. Owing to the remarkably rapid growth of this party among German workmen, and the direct and indirect influence of this momentous fact upon Russian workmen, this party has made striking progress among the workmen of all large Russian cities. It has for its immediate object the overthrow of the autocracy, but reckons only upon the power of the proletarians, while the majority of the revolutionary party gives greater prominence to the agrarian question, appealing chiefly to the masses of the peasantry on the one hand and to the liberty-loving, educated classes on the other. Its weapon is organized public opinion, which will force the Government to yield to the legitimate demands of the people, which "include alike the conception of the right of the people to political freedom and the conception of their right to satisfy their material needs on the basis of national production. The party considers the guarantees of these rights to be: 1. Representative government on the basis of universal suffrage. 2. Freedom of religious belief. 3. The independence of courts of justice. 4. Freedom of the press. 5. Freedom of meetings and associations. 6. Inviolability of the individual and his rights as a man." The programme adds the demand for wide provincial and territorial self-government, considering that in view of the variety of tribes and nations composing the empire, "a necessary condition of political freedom is the recognition of the right to political self-determination for all the nationalities entering into its composition."

Niigata, nee′ĕe-gaa′taă: a city and port of Japan; situated on the west coast of the main island, at the mouth of the Shinanogawa; seat of the local government of Echigo (see map of Japan, ref. 5–D). The town is built on a narrow strip of land between the river and the ocean, which is barred from view by high sand hills. Opened to foreign trade in 1869, and nominally a treaty-port and the residence of foreign consuls, Niigata has virtually no foreign trade. The bar at the mouth of the river prevents vessels of foreign build from entering, and the open roadstead is unsafe. During high westerly winds vessels have to seek shelter at the isle of Sado, about 40 miles distant, which, famed for its gold mines, forms part of the prefecture of Niigata. Niigata is a bigoted center of Buddhism. A species of muslin, *chijimi*, made from hemp, is manufactured in the country districts; the apples and watermelons of the province are considered the best in the empire. Pop. 40,778.
J. M. DIXON.

Nijmwegen: See NYMWEGEN.

Nijnii-Novgorod, or **Nijegorod**: government of Central Russia, along the Volga and its affluents, the Oka and the Vetlooga. Area, 19,797 sq. miles. The surface is mostly level; the soil is not very fertile, but excellently cultivated; large quantities of grain, hemp, and flax are raised. In the northern part extensive forests are found, which have given rise to considerable ship-building and manufactures of all kinds of wooden implements. There are also manufactures of Russian leather, soap, iron, and many other articles. Pop. (1897) 1,603,034.

Nijnii-Novgorod: town of Russia; capital of the government of the same name; on the right bank of the Volga, at its confluence with the Oka; 275 miles by rail E. of Moscow (see map of Russia, ref. 6–F). The town is divided into two parts, the principal one being situated on the steep promontory, triangular in shape, and 400 feet high, at the apex of which, on the highest point, stands the Kremlin or citadel, surrounded by a wall 30 feet in height. This portion of the town is mainly made up of three handsomely built streets; the low town consists of one long street along the Volga. The whole town is built of wood, and has few attractions. It is remarkable, however, for a great fair held, from July 15 into September, on a triangular space formed by the junction of the left bank of the Oka with the right bank of the Volga, and so low as to be in other seasons often entirely inundated. (See FAIR.) The ground is laid out for streets, and the Russian Government has established a system of permanent sewerage, extending from river to river. As the time for the fair approaches, a great town springs up, with churches, theaters, hospitals, etc., all built of wood. Hundreds of thousands of people flock here on these occasions, the only means of access from the town being by a bridge of boats across the Oka. The waters are almost completely covered with boats engaged in conveying goods and people, and a large number of people occupy their boats as residences during the fair. The extension of railways and perfection of other means of internal communication does away largely with the motive for fairs of this kind, and this at Nijnii is diminishing in importance. Pop. (1897) 73,033.

Nijnii-Tagilsk: town; in the government of Perm, Russia; in the Ural Mountains; in a district exceedingly rich in iron, copper, lead, and platinum (see map of Russia, ref. 5–I). It contains a mining-school, extensive forges, and manufactures of machinery. Pop. about 40,000.

Nikisch, ARTHUR: See the Appendix.

Nikita, LOUISE: See the Appendix.

Nikko [lit., sun's brightness]: a village of Japan, about 80 miles by rail N. of Tokio, situated at the base of the great range of mountains of which Nantai-san is the chief (see map of Japan, ref. 6–E). Here are situated the finest temples in the empire. Always associated with religious edifices, Nikko became of first importance as a religious resort on the death of IYEYASU (*q. v.*), whose mausoleum was erected on the southern slope of a hill called Hotoke Iwa. About fifty years after the burial of Iyeyasu in 1617, a son of the emperor became abbot of Nikko, and henceforth, till 1868, a prince-abbot was always in residence. A long and magnificent avenue of cryptomerias leads up to Nikko, and its temples are marvels of elegance and beauty. Noteworthy sights are the red-lacquered bridge, crossed only by the emperor, which has been recently renewed, and several fine waterfalls. Nikko, which is a favorite summer resort, is 2,000 feet above sea-level. J. M. DIXON.

Nikolaevsk, nĕ-kō-laa′evsk: fortified town of Eastern Siberia; on the Amur, 23 miles from its mouth (see map of Asia, ref. 2–I). It was founded in 1851, and is an important port. Pop. 2,500.

Nikola I. Petrović-Njegoš, pet′rŏv-ich-ñeg′ŏsh: poet; b. at Cetinje, Montenegro, Oct. 7, 1841; was educated at Trieste and Paris (1856–60); succeeded his uncle Danilo (assassinated Aug. 13, 1860) as reigning Prince of Montenegro; waged successful wars on the Turks in 1862 and again in 1876, considerably enlarging his territory. He gave his country a new code of laws and a sort of constitutional government. He published some of his poems composed in the Servian language in the almanac *Orlić*, over the signature "N." They are lyric songs eulogistic of freedom, and epics modeled after the folk-song. He wrote two historical tragedies, *Vukašin* and *Balkanska carica*. In 1873 he printed a collection of his poems for his private use. Some of his poems have been translated into other Slavonic languages. J. J. KRÁL.

Nikon: Patriarch of Moscow; b. at Nijnii-Novgorod, Russia, 1605; educated in a monastery; rose to be patriarch 1652; introduced Greek music into the Russian Church and revised the Russian liturgy and confession of faith. These reforms excited the violent opposition of the conservatives, some of whom split off, establishing the sect called Raskolniks or Old Believers. By their intrigues he was compelled to retire to a monastery 1658, and in 1666 he was deposed. The new czar canceled this action and restored him to his see, and he was hastening to resume his place when death overtook him Aug. 17, 1681. See Stanley, *History of the Eastern Church*, and W. Palmer, *The Patriarch and the Tsar*, a translation of Nikon's replies to his enemies and a history of his career (6 vols., London, 1871–76). SAMUEL MACAULEY JACKSON.

Nile [from Lat. *Nīlus* = Gr. Νεῖλος, Nile]: probably the longest and most celebrated river in the world, and the most remarkable of the four great streams of Africa. It flows from the equatorial regions along and inside the eastern axis of the continent, and after a course of 4,300 miles (estimated) reaches the Mediterranean in 31° 30′ N. lat. by two principal mouths, forming a delta which begins near Cairo, 100 miles from the sea, and extends 150 miles along the shores. The upper half of the Nile drains vast tropical regions abundantly watered and receives many tributaries; the lower or northern half traverses the rainless portion of the great desert regions, where its valley, bordered by bare rocky bluffs, appears like a band of verdure in the midst of this desolate country.

The basin of the Nile is about 1,500,000 sq. miles, or half the size of the U. S., exclusive of Alaska. For centuries from 200 B. C. the ancient geographers declared that the river rose far S. in great lakes whose position was approximately given by Ptolemy. Their information was discredited by later geographers, and the source of the Nile was the greatest geographical problem until it was solved by several explorers, chief among whom were Speke, the discoverer of Victoria Nyanza, and Baker and Stanley, who revealed Lakes Albert Nyanza and Albert Edward respectively. The ultimate head-waters are not yet definitely determined. The Congo-Nile water parting S. of Victoria Nyanza approaches within 25 to 125 miles of the southern shores of that lake. It is not unlikely that the Kagera affluent of Victoria Nyanza, rising among the mountains near the northeastern shores of Tanganyika Lake (Baumann, 1892), is the most remote source. The main fact is that the Nile proceeds from three lakes lying on high plateaus under the equator—Victoria Nyanza (3,800 feet), Albert Edward (2,850 feet), and Albert Nyanza (2,300 feet). Victoria Nyanza is very remarkable, considering its size, for the small gathering-ground from which it collects its waters. The true Nile issues from the north end of it as a powerful and rapid stream flowing toward the N. W. into Albert Nyanza, where it is joined by the waters received from Albert Edward. Thence it runs with rapid course, and leaves the plateau regions to enter the great plains of the Egyptian Sudan. Here it receives from the W. the waters of a vast network of rivers collected by the Bhar-el-Arab and the Bhar-el-Gazal, and those of the eastern plateaus through the Sobat. After the junction of these rivers, under the name of Bhar-el-Abiad, or White Nile, it follows again a northern course between the tablelands of Kordofan and the plains of Sennaar to Khartum, where the Blue Nile, or Bhar-el-Azrek, brings to it the united waters of the Abyssinian plateau and its snowy mountains. Lower down, about N. lat. 17° 40′, another powerful stream, the Atbara, or Black Nile, pours in the waters of Northern Abyssinia. From this point to the Mediterranean, along its course of nearly 1,500 miles, it receives not a single tributary of importance. Thence making a great bend, it forms a series of rapids, the so-called cataracts of the Nile, the last of which is at Assuan, at its entrance into Egypt.

Like all streams fed by the periodical rains of the tropics, the Nile has its regular season of freshets overflowing its broad valley, transforming Egypt into a widespreading lake from which the cities rise like islands. At Khartum the river begins to rise early in April, but in Egypt generally on June 25. The waters then gradually increase until Sept. 27. At Thebes the flood reaches 40 feet; at Cairo, 27; and at Rosetta, at the mouth of the river, 46 feet. After their retreat the waters leave behind them mud and moisture, in which seeds deposited produce a most luxuriant vegetation and a succession of rich crops. Egypt's proverbial fertility thus entirely depends upon this annual inundation of the Nile, which renews the manure of its soil and provides the necessary moisture in this rainless climate. A rise of only 20 feet at Cairo causes a scarcity; more than 27 feet is unfavorable, and these excessive floods have in recent years caused great destruction of property, including crops. The White Nile contributes very little to the fertility of Egypt, the rich sediment being derived from the Abyssinian tributaries, chiefly the Atbara. At the flood period an enormous volume of the water goes to waste, though it is sorely needed at low water. The necessity of a vast scheme of water-storage is admitted, and engineers (1894) are selecting sites for great reservoirs which may be filled at flood periods and emptied at low water. The Nile is navigable for small vessels for the greater part of its course, but in the White Nile masses of aquatic vegetation, known as the sud, sometimes impede and even imprison vessels.

Revised by C. C. ADAMS.

Niles: city; Berrien co., Mich. (see map of Michigan, ref. 8–H); on the St. Joseph river, and the Cleve., Cin., Chi. and St. L. and the Mich. Cent. railways; 48 miles S. W. of Kalamazoo, 90 miles E. of Chicago. It is in an agricultural region, derives large power for manufacturing from the river, and contains flour and paper mills, iron-foundries, carriage and wagon factories, and other industrial works, two national banks with combined capital of $150,000, a State bank, capital $25,000, and a daily and three weekly newspapers. Pop. (1880) 4,197; (1890) 4,197; (1900) 4,287.

Niles: city; Trumbull co., O. (for location of county, see map of Ohio, ref. 2–J); on the Mahoning river, and the Erie, the Penn., and the Pitts. and W. railways; 5 miles S. E. of Warren, the county-seat, 58 miles E. of Cleveland. It contains 9 churches, public, high, and grammar schools, electric lights, and street-railways, water-works, several manufactories, and a daily and two weekly newspapers. Pop. (1880) 3,879; (1890) 4,289; (1900) 7,468. EDITOR OF "INDEPENDENT."

Nilghau, or **Nylghau** [Hind., liter., blue ox; *nīl*, blue + *gau*, ox, cow; cf. Sanskr. *gāus*: Gr. βοῦς: Lat. *bos*]: a large antelope (*Portax tragocamelus*) found in India, inhabiting the jungles, but apparently preferring the vicinity of cultivated land. The male is of a blue-gray color when full grown, and stands about 4 feet high at the shoulders. The females and young males are tawny red. The horns are 6 or 7 inches long. It is at times very wild, courageous, and resolute, but ordinarily falls an easy victim to the spear or rifle of the hunter. It has never been thoroughly tamed. The flesh is very poor, but the hides have a limited use in the arts. F. A. LUCAS.

Nilsson, CHRISTINE: singer; b. near Wexiö, Southern Sweden, Aug. 3, 1843, of a peasant family. Her father and brother obtained a humble living by playing music at peasant festivities in the neighborhood. Christine attracted the attention of Count Tornërhjelm by her playing and singing in a public market-place, and went by his aid to Halmstad, Stockholm, and Paris, where she finished her musical education by three years' study under Wartel, and made her *début* with eminent success at the Théâtre Lyrique, Oct. 24, 1864, in *La Traviata*. In 1867 she appeared in London in both opera and oratorio, and in 1868 she made a great sensation in Paris by her representation of Ophelia in Ambroise Thomas's *Hamlet*. In that year also she sang in the Crystal Palace, London, at the Handel festival. She first appeared in the U. S. in 1870 in concerts, and in 1871 sang in opera with great success. No singer ever visited the U. S., with the exception of Jenny Lind, who created such an instantaneous furore. She reappeared in London in 1872, and in that year was married in Westminster Abbey to Auguste Rouzeaud, who was connected with a Paris banking-house. He afterward failed in business, and died in an asylum for lunatics in 1882. In 1873 she sang with great success in St. Petersburg. From 1872 to 1877 she sang in London in Italian opera at Drury Lane and at her Majesty's theater, taking the part of Elsa in *Lohengrin* in 1875. She visited her native country in 1876 and again in 1885. In 1883 she made another professional tour in the U. S.; married in Paris Count Casa de Miranda, a Spanish nobleman, Mar. 12, 1887. Soon after she retired from the stage. Her favorite *rôles* are Mignon, Elsa, and Margherita. Her voice possesses remarkable sweetness, brilliancy, and evenness.

B. B. VALLENTINE.

Nilsson, SVEN: naturalist and archæologist; b. Mar. 8, 1787, in Asmundtorfs parish, in Skaane, Sweden, where his

father was a peasant. He was Professor in Natural History in the University of Lund 1832–56, and became widely known as a high authority in zoölogy and palæontology. His most important zoölogical work is his *Skandinaviens Fauna*, in four volumes. A fifth volume of *Illuminated Figures of the Scandinavian Fauna* properly belongs to the set, and the whole constitutes a monumental work. In his later years he devoted himself almost exclusively to Scandinavian antiquities, and by his celebrated work *Skandinaviska Nordens Ur-invånare*, in two magnificent volumes, he became one of the founders of the science of archæology. The first part of this work on the inhabitants of Scandinavia during the stone age was translated into English and published in London by Sir John Lubbock in 1868. The second part treats in a similar manner of the bronze age. Nilsson died Nov. 30, 1887. Rasmus B. Anderson.

Nimeguen: See Nymwegen.

Nîmes, neem (anc. *Nemausus*]: capital of the department of Gard, France; beautifully situated in a valley between hills covered with vineyards and orchards (see map of France, ref. 8–G). It is the see of a bishop, has many excellent educational institutions, and its manufactures of cottons, lace, hosiery, brandy, and especially of silks, are very important. The old portion of the city is poorly built, and is separated by boulevards from the eight modern suburbs, which form the larger part of the town. The architectural monuments which the city contains from the Roman period are of the highest interest. The Maison Carrée is a beautiful Corinthian temple, well preserved, thoroughly restored since 1789, and now used as a museum of paintings and antiquities. Les Arènes is the best preserved amphitheater which exists, containing from thirty-two to thirty-five ranges of seats. In the early Middle Ages it was employed repeatedly as a stronghold; afterward poor people used it as a sort of free tenement-house. Since 1858 it has been completely restored. Pont du Gard, the magnificent aqueduct, is in the vicinity of Nîmes. The citadel, now used as a prison, dates from 1687. The Romans occupied the city in 121 B. C., and during the first emperors it was a magnificent city. Subsequently it suffered much from the Visigoths, Saracens, and Normans, and in the fourteenth century it was nearly deserted. Under Francis I. it rose again, and although it suffered much by the revocation of the Edict of Nantes and during the Revolution, it is very prosperous. Pop. (1891) 71,623; (1896) 74,601.

Nimrod: according to Gen. x. 8–12, a son of Cush and grandson of Ham, "a mighty hunter before the Lord," "a mighty one in the earth," who founded an empire in Shinar or Babylonia and extended his authority northward over the territory of Assyria. This narrative is probably in part an echo of certain ethnic movements. That Assyria was a colony from Babylonia is an assured result of cuneiform study. The name Nimrod, however, has not yet been found in the cuneiform literature. The character is believed by many to be identical with the hero of the great epic, commonly called the Izdubar epic. The Oriental imagination was deeply impressed by the biblical picture of Nimrod, and made of him a tyrant who persecuted Abraham and was guilty of many other acts of cruelty. D. G. Lyon.

Nimrûd, or **Nimroud**: the modern Arabic name of the ruins which represent the ancient Assyrian city Calah (Assyr. *Kalkhu*, Heb. כָּלַח). They lie on the east side of the Tigris, about 20 miles S. E. of Mosul, and about 7 miles above the mouth of the upper Zab. Calah was built by Shalmaneser I. about 1320 B. C., and was after Asshur and Nineveh the third Assyrian capital. After the rise of Calah the three cities flourished contemporaneously, certain of the kings having palaces in more than one of them. When Assur-nazir-pal (884–860) ascended the throne he found Calah in ruins and Assyria in a weak condition. A great warrior, he restored the military power of the nation and rebuilt the city. Here resided likewise his son, Shalmaneser II. (860–824), and his great-grandson, Ramman-nirari III. (811–782). Shalmaneser II. has left inscriptions at Calah, Asshur, Nineveh, Balawat, and other places. Of later kings who adorned Calah may be mentioned Tiglath-pileser III. (745–727), Sargon (722–705), and Esarhaddon (681–668). Sargon's chief architectural work was, however, at his new capital, Dûr-Sharrukin, and that of his sons was at Nineveh. With the accession of the Sargon dynasty therefore the importance of Calah began to decline. The buildings erected here were not only palaces, but also temples and *ziggurats*, or towers, pyramidal in shape. In the last year of the reign of Asshur-nirari (754–745), as we learn from the eponym canon, Calah was the scene of an insurrection. Tiglath-pileser III., the successor of Asshur-nirari, may have made use of this insurrection to seize the throne.

The ruins are about a mile and a half from the Tigris, but formerly the river, which has shifted its course several times, ran along the western and southwestern sides of the city. The inclosure is almost rectangular in shape, not quite a mile and a half from E. to W., and somewhat less than a mile from N. to S. The southern wall, beginning at the southeast angle of the inclosure, runs W. for half a mile, then turns S. and extends another half mile to the old bed of the Tigris. The greatest length from N. to S. is therefore almost as much as that from E. to W. The principal buildings were on an artificial mound or platform in the southwest angle of the inclosure, extending about two-fifths of a mile N. and S. and about one-fourth of a mile E. and W. The Tigris seems to have washed the west and south sides of the mound. George Smith enumerates the buildings as follows: 1. A tower on the northwest corner of the mound, faced with stone to the height of 20 feet, 167 ft. 6 in. each way, built by Shalmaneser II. 2. Temples around the tower built by Assur-nazir-pal. 3. The northwest palace (S. of the tower), about 350 feet square, built by Assur-nazir-pal, repaired by Sargon. 4. The center palace (S. of the northwest palace), built by Shalmaneser II., added to by Ramman-nirari III., dismantled by Tiglath-pileser III., who rebuilt it; destroyed by Esarhaddon. 5. The southwest palace (S. of the center palace), built by Esarhaddon out of materials of the northwest and center palaces. 6. The southeast palace (E. of the southwest palace), built by Shalmaneser II. 7. Temple of Nebo (N. of the southeast palace), built by Ramman-nirari III.

The first excavations at Nimrûd were begun by A. H. Layard in 1845. He was encouraged thereto by Botta's success at Khorsabad. The expenses were borne by Sir Stratford Canning, and the work was successful from the start. Many large and beautiful alabaster bas-reliefs were secured for the British Museum. Those come particularly from the palace of Assur-nazir-pal and are of great value, not only as works of art, but also for the light which they shed on the military methods and the religious beliefs of the times. In the attention paid to the adornment of weapons and furniture, and in the representation of the minute and elaborate embroidery on the dress of the king and his attendants, these sculptures are hardly equaled by any of the work of the two remaining Assyrian centuries. Many of these bas-reliefs were in duplicate, and not a few of the duplicates were sent to the U. S. (See Assyria, under *History*.) Plaster reproductions of the British Museum reliefs may be seen in the Harvard Semitic Museum at Cambridge, in the Metropolitan Museum at New York, and in smaller numbers at other places. Layard's work at Nimrûd occupied parts of several years. Others have also carried on excavations there, notably Hormuzd Rassam and George Smith.

See articles Assyria and Assyrian Explorations and the literature there cited, and for the topography, Felix Jones's *Vestiges of Assyria*, sheet 2. D. G. Lyon.

Nindemann, William F. C.: See the Appendix.

Nine-point Circle: See Circle.

Nineveh (Assyr. *Ninâ* and *Ninua*, Heb. נִינְוֵה, Gr. Νῖνος, Septuagint version, Νινευί): the most celebrated city of the Assyrians. Classical tradition ascribes the founding of the city to Ninus and his wife Semiramis, but this is incorrect. Ninus seems to be a mythical personage. The name Semiramis has with probable correctness been identified with Sammuramat, the name of the wife of Ramman-nirari III. (811–782), but Nineveh had existed for many centuries before the time of Sammuramat. The name of the city resembles the Assyrian word for fish (*nûnu*, Heb. נוּן), and some persons seek a connection between the two. They find corroboration in the complex ideogram (the sign for fish inside the sign for receptacle) by which the city is represented, and also in the story concerning the great fish which swallowed Jonah, the prophet to Nineveh.

The history of the city is intimately connected with that of Assyria. Here was the royal residence during most of the best-known period of Assyrian history. The beginnings of Nineveh antedate our knowledge. A temple to Ishtar, at all periods the favorite deity of the city, existed

there in the nineteenth century B. C. The library of Assurbanipal furnishes a copy of a hymn addressed to Ishtar of Nineveh, the original of which seems to have come from the eighteenth or nineteenth century B. C. In the time of the El-Amarna correspondence (sixteenth century B. C.), the worship of this Ninevite goddess was known in the land of Mitanni, and seems to have been even introduced into Egypt. After this time the temple of Ishtar was restored by many of the kings of Assyria. As Nineveh had overshadowed the older capital Asshur, so it in turn was overshadowed by Calah on the erection of this latter city by Shalmaneser I. (See NIMRÛD.) With the accession of the Sargon dynasty (722–606), however, the loss was more than regained. Sargon himself preferred to build a new city and palace, but his successors Sennacherib, Esarhaddon, and Assurbanipal lavished their time and wealth on the adornment of Nineveh. The extensive conquests of this dynasty, especially in the west, as far as the Mediterranean and Egypt, added greatly to the royal resources. Cedar-trees for the roofs of the buildings were cut down in Lebanon by Manasseh the Judean and neighboring kings, and transported thence to Nineveh. Sennacherib informs us that he tore down the palace of his predecessors, because it was too small and in decay, and that he erected another on a grander scale. This structure must have covered many acres, because it was made large enough, not only for the residence of the king and his attendants, but also for the royal horses and for the storage of booty. In the Bavian inscription he informs us that he enlarged the city, fortified it with lofty walls, irrigated the country around by a system of canals, and surrounded the capital with parks and plantations. Elsewhere he tells us that he built the "Royal Street" 52 cubits wide, leading to the park gate, and published a decree forbidding the abutters, under penalty of death, from laying any part of the foundation of a house within the limits of the street. Esarhaddon, who restored Babylon, which had been destroyed by his father, built a palace at Calah and also one at Nineveh. The last named was considered by its builder superior to any that had gone before. It was likewise surrounded by a park containing rare foreign plants, and its completion was celebrated by a great feast. Assurbanipal lived in the palace built by his grandfather Sennacherib, the restoration of which he records at length and with evident satisfaction. He found it necessary also to strengthen the city walls, which had suffered much from continued heavy rains. The restoration and adornment of the temples of Ishtar and Nebo at Nineveh also engaged his attention. In the palace of Assurbanipal was situated the royal library, that storehouse to which we are so much indebted for our knowledge of Assyrian affairs. Hence, too, have come many of the finest bas-reliefs in alabaster. In the time of the Sargonidæ Nineveh was politically the chief city in the world. West and south, even Asia Minor and Egypt, were subject. Ambassadors came from all known regions bearing tribute; the harem was crowded with princesses from many lands, whose fathers felt honored in being thus allied to the great ruler; the city was thronged with captives and booty, architecture and learning flourished. The prophet Nahum gives an idea of the strength and splendor of the city. A speedy decline followed Assurbanipal. The war with Babylon in the middle of his reign, though successful, was a serious blow to the greatness of Nineveh. His successors were weak, and probably had neither time nor means for extensive building operations. In the sack of the city by the Babylonians and their allies in 606 B. C. the palaces and temples were reduced to ruins, burying in their fall the best products of the Assyrian development.

The tradition of the site of Nineveh has survived until to-day. The ruins lie on the Tigris, E. of Mosul. The river touches the inclosure now only at the northwest and southwest angles. The inclosure has four sides of unequal length. It is about 3 miles long (N. E. to S. W.) while its greatest breadth is a little less than 1½ miles in the northern portion, and its least breadth about three-fifths of a mile at the southern end. The surrounding parks and villages may formerly have been reckoned as part of the city. In Jonah Nineveh is spoken of as a "great city" "of three days' journey." The ruined wall and moat are still distinct. The east side is furthermore defended by several outer lines of embankment. The river Khausar (Assyr. *Khusur*) flows through the city from the E., dividing it into two nearly equal portions, and emptying into the Tigris. Near it is the principal mound, now called Kouyunjik, which is oblong in shape, about 3,000 feet from N. to S., and about half as much from E. to W. across its center. It has as yet been only in part explored. P. E. Botta, French consul at Mosul, was first to make the attempt. His success in digging at Khorsabad, which he believed to be Nineveh, turned his attention from Kouyunjik, and A. H. Layard reaped the great harvest of discovery. Other explorers have been Ross, Hormuzd Rassam, and George Smith. The last named enumerates the buildings in the mound as follows: (1) Three ruined temples, built and restored by many kings in different ages. (2) A palace founded by Shalmaneser I. (B. C. 1320), restored by several subsequent monarchs, destroyed by Sennacherib. (3) A palace founded by Ramman-nirari III. (B. C. 811–782), restored by Sennacherib and Esarhaddon. (4) A palace built by Tiglath-pileser III. (B. C. 745–727). (5) Temple of Nebo and Merodach, restored by Sargon (B. C. 722–705). (6) The southwest palace, built by Sennacherib (B. C. 705–681). (7) The north palace, built by Sennacherib, restored by Assurbanipal (B. C. 668–626).

Nebbi Yunus (the prophet Jonas) is another mound of smaller extent within the inclosure, about three-quarters of a mile S. E. of Kouyunjik. Here also are the ruins of royal buildings, a palace of Sennacherib and one of Esarhaddon; but excavations have been attended with more difficulty than at Kouyunjik, owing to the presence of a Mohammedan cemetery on the mound.

If the Ninevite palaces could be restored as they were in the days of Assurbanipal they would prove to be works of surprising magnificence. Many of the bas-reliefs were so calcined by the fire that they crumbled on exposure to the air. Others have been ruined by the action of the rain, which has carved deep ravines down the sides of the mounds, and still others, during the long centuries, have been dug out by the natives to burn into lime or to use in building houses. Those which reached the British Museum, wonderful as they are, are but a very small portion of what once existed.

The English explorers at Nineveh were more interested in sculptures and inscriptions than they were in architecture. They have accordingly not made such full measurements, drawings, and sketches as the French have done at Khorsabad and at Telloh. The result is that we shall never know the finest Assyrian palaces so well as we do those of less importance.

See Felix Jones's *Vestiges of Assyria*, sheet 1 (Ichnographic Sketch of the Remains of Ancient Nineveh), and ASSYRIA and ASSYRIAN EXPLORATIONS. D. G. LYON.

Ningpo: a foo or departmental city of Cheh-kiang, China, and one of the five ports opened to foreign residence and trade by the treaty made at Nanking in 1842. It is situated at the confluence of the Ts'-ki and the Fŭng-hwa rivers with the Yung, 11½ miles from the sea, and 125 by water from Shanghai; lat. 29° 55′ N., lon. 121° 22′ E. (see map of China, ref. 6-K). Its walls, which are 25 feet high and 22 feet thick at the base, have a circuit of nearly 5 miles, and are pierced by six gates. The streets are clean and well paved and the shops and houses well built. Fire-walls cross the city at distances of 200 to 300 yards. The city, which is an irregular oval in shape, contains many fine buildings, among which are a seven-story pagoda 160 feet high dating from the eighth century, a Mohammedan mosque, a lofty drum-tower near the center of the city, the Temple of the Queen of Heaven, founded near the close of the twelfth century, but rebuilt in 1680 by the Fuh-kien merchants (hence usually known as the "Fuh-kien Temple"), many other Buddhist and Taoist temples, and numerous pai-lows or memorial arches. The foreign settlement is separated from the native city by the Ts'-ki, and occupies the angle between that river and the Yung.

The gold and silver smiths of Ningpo are noted for the delicacy and tastefulness of their work, and Ningpo confectionery is celebrated all over China. The specialty of the place, however, is its elegantly carved and inlaid furniture. Silk-culture is extensively carried on in the surrounding country, and silk-weaving is an important industry. In 1893 498 piculs of silk piece-goods were exported. The development of manufacturing interests in Japan has given a great impetus to cotton-culture, and in 1893 the steam cotton-ginning establishments of Ningpo cleaned over 60,000 piculs of raw cotton. Owing to its proximity to Shanghai the foreign trade with Ningpo is not as great as was anticipated when the port was opened in 1842. According to the returns of the imperial maritime customs, the net volume of trade of the port amounted in 1893 to

15,478,005 taels ($16,251,905 U. S. gold), of which 6,996,717 taels represented foreign imports, 2,192,662 taels native imports, and 6,288,626 taels exports. The chief articles of exports were tea (3,925,551 taels), raw cotton (1,006,116 taels), silk and silk piece-goods, and alum. The imports include opium (5,289 piculs), cottons (639,800 piculs), yarn, sugar (90,237 piculs), tin (581 piculs), vermilion (581 piculs), lead, kerosene oil, and rice (204,854 piculs). The number of vessels entered during the year was 524 (tonnage, 458,646 tons), cleared 530 (tonnage, 459,642). Of the 381 steamers that entered and cleared 162 carried the British flag and 215 the Chinese.

Ningpo has long been an important center of trade. In 1522 the Portuguese settled here by permission and flourished, but their rapacity led to their expulsion in 1542, when 800 of the 1,200 Portuguese residents were massacred, and 25 Portuguese vessels and 42 junks were destroyed. The city was occupied by the British from Oct. 13, 1841, to May 7, 1842, and was captured Dec. 9, 1861, by the Taipings, who, however, were compelled by the foreign fleets then in the river to retire on May 10, 1862. It is an important center of missionary work. Pop. estimated (1893) 255,000.

R. Lilley.

Ninigret: an Indian chieftain of the Narragansett tribe, sachem of Niantic and uncle of Miantonomoh; was neutral during the Pequot war of 1632, but aided the English in that of 1637. Having afterward visited the Dutch at Manhattan and the Western Indians, he was suspected of plotting against the colonists, and war was declared against him by the commissioners of the united colonies 1653, but it was not immediately carried into effect. Meanwhile Ninigret waged war upon the Indians of Long Island, and having refused to obey a summons to Hartford in 1654, Maj. Simon Willard was sent against him, and he was forced to flee. In 1660–62 he sold a large portion of his territory to the colonists, abstained from participation in King Philip's war 1675–76, and died soon afterward.

Niño, neen'yō, Pedro Alonso: navigator; b. at Moguer, Spain, about 1455. He was early connected with Portuguese trading and exploring expeditions to the eastern coast of Africa; was commander of a supply fleet which sailed for Santo Domingo in 1496; and was with Columbus on his third voyage (1498) to Trinidad and the coast of Paria. Returning to Spain immediately after, he associated himself with Cristobal Guerra, a merchant, for a trading expedition to Paria. They left Palos in June, 1499, followed the track which Columbus had taken, coasted Venezuela to Cumaná, and by peaceful trading obtained a large amount of pearls and some gold from the Indians; in Apr., 1500, they returned to Spain. This was, from a financial point of view, the first successful voyage to America. Niño was accused of keeping back a part of the royal perquisites, was arrested, and died before his suit was decided. Herbert H. Smith.

Ninon de l'Enclos: See L'Enclos.

Nio (anc. Ἰος): an island of the Ægean, now, but not anciently, reckoned as one of the Cyclades. It lies N. of Theara and S. W. of Naxos, and is 11 miles long and 5 broad. Area, 20 sq. miles. It is rough, but quite productive, and has a fine harbor and some 4,000 inhabitants.

Ni'obe [= Lat. = Gr. Νιόβη]: daughter of Tantalus, King of Phrygia, and Dione or Taygete; sister of Pelops, and wife of Amphion, King of Thebes, to whom she bore six sons and six daughters (though the number varies). She was on intimate terms with Leto, a wife of Zeus, but boasted arrogantly that she was superior to Leto because she had twelve goodly children, whereas Leto had but two, forgetting that these two were the gods Apollo and Artemis. Enraged at her presumption, Apollo slew her sons and Artemis her daughters. After lying unburied for nine days the children were buried by the gods at Thebes. In pity for the grief of Niobe, the gods changed her into stone and fixed her forever on the side of Mt. Sipylus, E. of Magnesia, on the Hermus. Though turned to stone Niobe still wept, for to this day water oozes from the eyes of the rock-relief, a story which has been noticed by Homer, Sophocles and Ovid. Nowadays the so-called Niobe of Mt. Sipylus is referred to the art of the Hittites, who held sway in Asia Minor before the advent of the Phrygians. The celebrated group of Niobe and her children, in the Uffizi Gallery in Florence, represents the killing of the children by Apollo and Artemis. It was discovered in 1583 on the Esquiline in Rome, and is probably not the group nor a copy of the group mentioned by Pliny as standing in the pediment of the temple of Apollo Sosianus, for the reason that the existing statues can not be grouped in a pediment. Probably this group represents Niobe standing on the summit of a hill, up which the children hasten to her for protection. Remnants of another and more excellent group are preserved in Rome (Museo Chiaramonti). The group mentioned by Pliny was ascribed in antiquity to Scopas or Praxiteles. See any *History of Greek Art* under *Scopas*, or the *Age of Scopas*, but especially see Stark, *Niobe und die Niobiden* (Leipzig, 1863), and his *Nach dem Orient* (1874), p. 243 ff.; Schweisthal, *L'image de Niobé et l'autel de Zeus Hypatos au mont Sipyle* in the *Revue Archéologique* (1887, pp. 213–232); Weber, *Le Sipylos et ses monuments* (Paris, 1880); Humann, *Ein Ausflug in den Sipylos* (Brunswick, 1885); Ramsay, *Sipylos and Cybele* in *Journal of Hellenic Studies*, vol. iii.; Perrot and Chipiez, *History of Art in Phrygia*, etc. (London, 1892), p. 37 ff.; the articles *Niobe* and *Skopas* in Baumeister's *Denkmäler*.

J. R. S. Sterrett.

Niobium: See Columbium.

Niobrara River, or in Fr. **L'Eau qui Court** (i. e. the running water): a tributary of the Missouri. It rises in Laramie co., Wy., and flows 450 miles to the E., through Northern Nebraska, in its lower course separating South Dakota from Nebraska. It is a shallow and very rapid stream. Its upper valley is treeless pasture-land. It next traverses the Great Sandhill region, believed to be almost valueless. It then flows through a rocky region with fertile, well-timbered ravines, and its lower valley has good farming land, with abundant trees.

Niort, nēē'ōr': capital of the department of Deux-Sèvres, France; on the Sèvre-Niortaise; 43 miles N. E. of La Rochelle (see map of France, ref. 6–D). It is a handsome town with beautiful promenades and many elegant buildings. It is a railway junction, and its tanneries, dyeworks, and manufactures of chamois, gloves, and shoes are important. The public gardens are very beautiful. Pop. (1896) 23,674.

Nip'issing: a lake and district of Ontario, Canada. The lake is in lat. 46° 20′ N., about half way between Georgian Bay and the Ottawa river. It is about 40 miles long, 30 wide in its greatest breadth, and of very irregular outline. It receives many streams, of which the most important is the Sturgeon river from the N., and empties by the French river, about 40 miles long, into Georgian Bay. The Canadian Pacific Railway runs along its northern shore. The lake is subject to sudden gales, which make navigation dangerous. Two steamers run on the lake in the summer. The scenery is very picturesque, and a summer hotel has been constructed on one of the numerous islands. Gold has been discovered on the shores near the outlet. The district has a climate as favorable as that of Ottawa, Canada. Good farming lands abound, and the country is being rapidly settled. Mark W. Harrington.

Nipmucs: See Algonquian Indians.

Nipperdey, Karl Ludwig: Latinist; b. in Schwerin, Germany, Sept. 13, 1821; studied under Lachmann and Haupt at Berlin; became privat docent in Leipzig 1850, professor in Jena 1852. D. by suicide Jan. 2, 1875. He edited *Cæsar*, *Cornelius Nepos*, and the *Annals of Tacitus* with German notes, an exegetical masterpiece (9th ed. by G. Andresen, 1892). Cf. R. Schöll, *K. N.* (Jena, 1875), who also published *C. N. Opuscula* (Berlin, 1877). A. G.

Nippon: See Japan.

Nirvāna, nĕĕr-vaa'na [Sanskr. (in Pāli *nibbana*), a blowing out (of the flame of life, or the like), extinguishment, extinction; *nir*, euphonic form of *nis*, out + *vāna*, a blowing, deriv. of √*vā*, blow]: the highest aim and the highest good of the Buddhist saint; the blissful condition of those who by the removal of ignorance and the extinction of desire have arrived at a point where rebirth is no longer necessary and the misery and sorrow incident to life are at an end. (See Nidāna.) This is accomplished by walking in the Noble Eightfold Path. See Buddhism.

The attainment of Nirvāna is not necessarily coincident with death. Gautama became enlightened and attained Nirvāna under the bo-tree. He lived many years thereafter, just as an engine may still run by its momentum after the steam is shut off; but no craving remained and there could be no rebirth, for nothing remained to be reincarnate. At his death he passed away "with that utter passing away in which nothing whatever is left behind."

Men nowadays can not attain Nirvāna. For "enlightenment" all conditions must be favorable. When Gautama was on earth tens of thousands achieved it, and diminishing numbers after his decease; but the opportunity at last passed by, and until another Buddha comes men can hope only to be reborn in a more favorable environment.

Nirvāna, like much else in Buddhism, is an inheritance from the older Indian philosophy, modified by the rejection of pantheism; but a pantheistic influence remains in the Mahāyana schools, and some teachers make Nirvāna mean absorption into the Absolute.

Nirvāna, like many other Buddhist ideas, was too subtle for popular comprehension. The goal was too distant, and now most Buddhists are content to be reborn in one of the heavens, and in the Northern school it has for the most part been supplanted by the doctrine of a Western paradise of sensuous Oriental bliss, where desire is not extinguished but is gratified for numerous æons. See SUKHĀVATI.

See Oldenberg's *Buddha*, translated by Hoey (London, 1884); Alabaster's *Wheel of the Law* (London, 1871); Monier-Williams's *Buddhism* (London and New York, 1889); Max Müller's essay on *Buddhist Nihilism*; Ellinwood's *Oriental Religions and Christianity* (New York, 1892); and the works mentioned under the article BUDDHISM.

GEORGE WILLIAM KNOX.

Nisard, nē̆'zaar', JEAN MARIE NAPOLÉON DÉSIRÉ: literary historian; b. at Châtillon-sur-Seine, France, Mar. 20, 1806. He was liberally educated, taught in the École Normale from 1830 to 1840, was made Professor of Eloquence at the Collège de France in 1843, and director of the École Normale in 1857. He drew attention to himself by criticism noticeable for its lack of sympathy with the romantic movement and the severity of its judgments on its representative writers. The ideal French qualities of mind were to him good sense, clearness, precision, and truth, and these he found in their perfection in the literature of the seventeenth century. From this standpoint his main work, *Histoire de la littérature Française* (4 vols., 1844–61), is written. Its interest centers in its judgments of the main classical writers, the mediæval literature as well as all merely mediocre writers being mainly neglected and the eighteenth and nineteenth centuries being regarded as periods of decay. The same standard of criticism is applied with wider range of subject in his various volumes of essays: *Études d'Histoire et de Littérature* (1859); *Nouvelles Études* (1864); *Mélanges d'Histoire et de Littérature* (1868); *Les quatre grands Historiens Latins* (1874); *Portraits et Études d'Histoire Littéraire* (1875); *Renaissance et Réforme* (1877). He was chosen to the Academy in 1850. D. at San Remo, Italy, Mar. 26, 1888. A. G. CANFIELD.

Nisch, or **Nissa** (anc. *Naissus*): second city of Servia; on the Nissava; 115 miles S. E. of Belgrade (see map of Austria-Hungary, ref. 10–J); always an important military center, now the southern key of Servia. Here the Ottoman armies always mustered before a European war. Pop. (1893) 19,877. E. A. G.

Nishapur': town; in the province of Khorassan, Persia; on the Seka; 53 miles W. of Meshed (see map of Persia and Arabia, ref. 2–J). It is a large city surrounded with walls and ditches, but poorly built and partly in ruins. The surrounding plain, however, situated at an elevation of 4,200 feet, is densely peopled and well cultivated. It has been a city of great importance. The Greeks, who called it Niçaya and Nicæa, believed it to be the birthplace of the god Dionysos. Pop. of the town (1884) 11,000, according to Schindler. Revised by M. W. HARRINGTON.

Ni'si Pri'us [Lat., unless sooner]: a term of English law used (mostly adjectively) to designate a trial of issues of facts in a civil case before a single judge and a jury, the record of the trial, the writ by which the jury is summoned, or the whole system of proceeding at such trials. The phrase is also commonly employed in the U. S. with a similar meaning, though in some States the expression "trial at circuit" is used. (See CIRCUIT.) The rulings and opinions rendered by the judge in trials of this kind are termed *nisi-prius* decisions. *Nisi-prius* trials and decisions are distinguished from those at bar or in banc, that is, those before a full court, either for the trial of issues of fact or for the hearing of appeals upon questions of law from an inferior court. The origin of this peculiar technical phrase is as follows: By the ancient English practice actions of various kinds were tried only in the superior courts sitting at Westminster, and it was therefore necessary for parties and counsel to resort thither from all parts of the realm to attend to the hearing of the causes in which they were interested. In order to remedy this inconvenience, it was provided by Magna Charta that actions of certain kinds should be triable in the county where the cause of action arose, before justices to be sent into each county once a year. Subsequently, this system of local trial was extended to other actions, till it became the uniform practice to try all common-law actions (as distinguished from suits in courts of equity) in the first instance before a judge and jury in the county where the cause of action arose; but the action was still nominally instituted as before, in the superior court, and the jury were summoned by writ to appear there, "unless before" (*nisi prius*) the day appointed the justices came into the proper county to hold a session of court. These important Latin words in the writ then became a convenient designation for the system of trial. These matters are now regulated by the judicature acts, and the *venire* no longer contains the words *nisi prius* or *nisi*, but the words occur in the record and judgment roll. *Nisi-prius* decisions upon questions of law are more commonly reported in England than in the U. S. As they are rendered by a single judge, and often on the spur of the moment, they are not generally deemed to have as high value and authority as decisions rendered by a full court or an appellate court. Their weight and importance of course vary with the ability and reputation of the presiding judge. The most valuable English *nisi-prius* reports are those of Peake, Espinasse, Campbell, Carrington and Payne, and Foster and Finlason. For fuller particulars, see the works of Archbold, Selwyn, Stephens, etc., on *nisi-prius* law, and Henry J. Stephen's *New Commentaries on the Laws of England* (11th ed., London, 1890). Revised by F. STURGES ALLEN.

Nissa, or **Nish**: same as NISCH (*q. v.*).

Nissen, HEINRICH: archæologist and historian; b. in Hadersleben, Germany, Apr. 3, 1839; studied in Kiel and Berlin; was privat docent in Bonn in 1867; professor in Marburg 1869–1876; was called to Göttingen in 1877, to Strassburg in 1878, and to Bonn in 1884. His principal works are *Kritische Untersuchungen über die Quellen der 4. und 5. Decade des Livius* (1863); *Das Templum* (1869); *Pompeianische Studien zur Städtekunde des Alterthums* (1877); *Italische Landeskunde*; *Griechische und Römische Metrologie* (in J. Müller's *Handbuch der class. Alterthumswissenschaft* (1887). ALFRED GUDEMAN.

Nithisdale, or **Nithsdale**, WILLIAM MAXWELL, Earl of: b. in Scotland in 1676; married Lady Winifred Herbert, daughter of the Earl of Powis; took part in the rebellion headed by the Earl of Mar 1715; fell into the hands of the Government at Preston; was committed to the Tower of London, and condemned to death; escaped from the Tower disguised in the clothes of the countess, who had paid him a visit and remained in his stead; took refuge with the Venetian ambassador, and made his way to the Continent. D. at Rome, Mar. 20, 1744. The countess died in 1749.

Nito'cris (*Neit-Âker, Nit-Âqert*): an Egyptian queen; the last ruler of the sixth dynasty, who reigned seven years. Her name has been found in the royal list of the Turin papyrus, but upon no monuments. Our information comes mainly from Herodotus (ii., 100). She is said to have received the throne after the murder of her brother by conspirators, who afterward made her regent. Her brother's death she avenged by drowning those implicated in the plot in a large subterranean chamber into which they were invited to partake of a feast of inauguration. To escape retribution she took her own life. She is also said to have built the third largest pyramid, but she appears rather to have enlarged and faced with granite the pyramid of Mycerinos of the fourth dynasty, in which it is believed that her funeral chamber was located. A story similar to that of Cinderella attaches to her under the name of Rhodopis. Nitocris was also the name of the wife of Psammetichus II., and of his daughter. Herodotus also mentions a Nitocris, Queen of Babylon (i., 185 f.). CHARLES R. GILLETT.

Nitrate of Silver and **Nitrates**: See NITRIC ACID.

Nitre: See SALTPETRE.

Nitric Acid [*nitric* is a deriv. of *niter*]: one of the compounds which nitrogen forms with oxygen and hydrogen. So far as known, nitric acid was first prepared by the Arabian chemist Geber (probably in the ninth century A. D.) by distilling a mixture of niter or saltpeter, cyprian vitriol (sulphate of copper), and alum. He called it *aqua dissolutiva*.

Later it was prepared by other methods and called *aqua fortis*, *spiritus nitri acidus*, and *acidum nitri*. Glauber first showed that the acid can be most easily made by treating saltpeter with sulphuric acid. This led to the name *spiritus nitri fumans Glauberi*. Lavoisier discovered that nitric acid contains oxygen, and later showed that it contains nitrogen. Nitric acid occurs in nature in combination as salts called nitrates. The ammonium, potassium, and sodium salts are very widely distributed over the earth's surface, and in a few places nitrates are found in very large quantities. Small quantities of nitrates occur in the air and in all bodies of natural water. From the soil the nitrates pass into the plants. Nitrates are formed wherever organic substances containing nitrogen, especially refuse animal matter, undergo decomposition in the soil in contact with alkaline bases or their carbonates. This conversion is of great importance in nature, and it has been the subject of much investigation. It was first thought that *nitrification*, as the process is called, was due simply to the action of oxygen, but the work of Schlösing and Müntz, as well as that of Warrington, has shown that it is caused by the action of organized ferments. (See FERMENTATION.) It appears that the nitrifying ferment is present in the soil, and that where the conditions are favorable it acts upon waste nitrogenous matter yielding nitrates. Thus the waste matter is converted into material that is of value for vegetation. Generally the nitrates do not accumulate in the soil, because they are soluble in water. Bodies of water in the neighborhood of places where animal matter is undergoing nitrification always contain nitrates, and their presence is an indication that the water is probably contaminated with sewage.

Nitric acid is made from either potassium nitrate, KNO_3, commonly called *saltpeter*, or sodium nitrate, $NaNO_3$, commonly called *Chili saltpeter* or *cubic niter*, by treating with sulphuric acid. At the same time, in case potassium nitrate is used, either potassium sulphate, K_2SO_4, or acid potassium sulphate, $HKSO_4$ (bisulphate of potash), is formed, or both may be formed according to the proportion of sulphuric acid used. The equations representing the reactions are:

$$KNO_3 + H_2SO_4 = KHSO_4 + HNO_3,$$
$$2KNO_3 + H_2SO_4 = K_2SO_4 + 2HNO_3.$$

In the laboratory the preparation of the acid is carried on in glass vessels so constructed that the acid does not come in contact with anything but glass. On the large scale the composition of the saltpeter by the sulphuric acid takes place in cast-iron retorts, and the acid formed is condensed in earthenware jars. Generally the proportion of saltpeter and sulphuric acid is such that the product left in the retorts is acid potassium sulphate, as this, being easily melted, can be removed from the retorts with less difficulty than the ordinary sulphate, which is hard and requires to be broken up before it can be taken out. It will be seen then that all the nitric acid used is obtained from nitrates found in nature, and these have probably been formed by the action of the nitrifying ferment upon organic matter containing nitrogen.

The acid obtained by the process described is not pure, but always contains water and other compounds of nitrogen which are formed by the action of heat in the acid. In this state it is always more or less colored. The nitrates from which nitric acid is made always contain other substances, especially chlorides, and the acid itself is therefore impure for this reason. On the large scale natural sodium nitrate, or Chili saltpeter, is now used altogether in the preparation of nitric acid, both concentrated and dilute. Pure nitric acid is made from the commercial product by distilling it again. The chlorine, hydrochloric acid, and oxides of nitrogen pass over first, then comes pure acid, and the iodic acid, from the iodate in the saltpeter (see IODINE), and sulphuric acid, and non-volatile impurities remain in the retort. Nitric acid perfectly free from water has probably never been prepared, but Roscoe prepared an acid containing 99·5 to 99·8 per cent. of the compound HNO_3. This concentrated acid is an exceedingly energetic substance. It acts upon organic matter, disintegrating it, and in many cases setting fire to it. It must be handled with the greatest care. In dilute form it also acts readily upon other things producing deep-seated changes. The acid found in the market generally contains about 68 per cent. acid, the rest being principally water. The pure acid boils at 86° C. (186·8° F.), undergoing slight decomposition. It acts upon metals as iron, copper, silver, tin, zinc, etc., yielding in most cases salts called nitrates which are soluble in water. Thus when silver is treated with the acid nitrate of silver, $AgNO_3$, is formed, and this dissolves in the water which accompanies the acid. The metal is therefore said to dissolve in the acid. Whenever nitric acid acts upon a metal a reddish-brown gas is seen. This is nitrogen peroxide, NO_2. Upon organic substances nitric acid acts in different ways. In its most concentrated form it decomposes them. The action in these cases is mainly oxidation. The substances are burned up by the oxygen given up from the acid. When the action does not go to this length nitro-products and ethereal salts of nitric acid may be formed. Thus when the acid acts upon BENZENE (*q. v*) NITROBENZENE (*q. v.*) is formed, thus:

$$\underset{\text{Benzene.}}{C_6H_6} + \underset{\text{Nitric acid.}}{HNO_3} = \underset{\text{Nitrobenzene.}}{C_6H_5.NO_2} + \underset{\text{Water.}}{H_2O}.$$

When it acts upon GLYCERIN (*q. v.*) nitroglycerin (see EXPLOSIVES) is formed, thus:

$$\underset{\text{Glycerin.}}{C_3H_5\begin{cases}OH\\OH\\OH\end{cases}} + 3HNO_3 = \underset{\text{Trinitroglycerin.}}{C_3H_5\begin{cases}O.NO_2\\O.NO_2\\O.NO_2\end{cases}} + 3H_2O.$$

NITROCELLULOSE (*q. v.*) is formed by the action of the acid upon cotton which is nearly pure CELLULOSE (*q. v.*). Nitrocellulose is guncotton. (See PYROXYLIN and EXPLOSIVES.) PICRIC ACID (*q. v.*) is formed by treating CARBOLIC ACID (*q. v.*) with nitric acid. It is trinitrophenol, and is formed as represented in the equation:

$$\underset{\substack{\text{Carbolic acid}\\\text{or phenol.}}}{C_6H_5OH} + 3HNO_3 = \underset{\substack{\text{Picric acid}\\\text{or trinitrophenol.}}}{C_6H_2(NO_2)_3OH} + 3H_2O.$$

Nitric acid is sometimes used in calico-printing to produce a yellow pattern on an indigo ground, in consequence of its power to destroy the color of indigo. "It serves, further, under the name *rouille*, for producing a compound of iron fraudulently used for 'loading' or 'weighting' black silks in the process of dyeing" (*Wagner*).

Nitrates.—These are the SALTS (*q. v.*) of nitric acid. The most common are the potassium and sodium salts, which will be more fully treated under POTASSIUM and SODIUM (*qq. v.*). The calcium salt is made artificially. (See CALCIUM and SALTPETER.) Nitrate of *silver*, or lunar caustic, is of value in the arts, as is nitrate of *lead*; nitrates of *barium* and *strontium* are used in pyrotechny; and nitrate of *bismuth* in medicine. Each of these receives notice under the head of the metal contained in the salt. IRA REMSEN.

Nitrification: See NITRIC ACID.

Nitrite of Amyl: an amber-colored, highly volatile liquid, smelling like ripe bananas, insoluble in water, but soluble in alcohol. It is obtained by the action of nitric acid on amylic alcohol or "fusel oil." Its formula is $C_5A_{11}NO_2$. Amyl nitrite was discovered in 1844, but was not used as a medicine till 1865, when it was brought to notice by Dr. B. W. Richardson, of London. If two or three drops of it be poured on a handkerchief and the vapor inhaled, almost immediately the blood-vessels of the head, face, and neck are felt to throb rapidly and violently; the face becomes crimson and hot, and the head aches from the sensation of fullness. Simultaneously, there is felt an indescribable commotion within the chest, with a feeling of breathlessness and oppression due to a violent and disorderly throbbing of the heart. These effects come on within a few seconds after breathing the fumes of the amyl nitrite, and disappear entirely within a few minutes, unless an overdose be taken. Physiologically, the singular symptoms are largely referable to depression of the vagus nerves and the vasomotor system of nerves, and to paralysis of the unstriped muscular elements in many parts of the body. Hence in spasmodic affections of these parts this substance is used medicinally. In *angina pectoris*, or "breast-pang," and in spasmodic asthma it often relieves with a suddenness and completeness almost magical, if the condition is due to spasm of the arterioles. It is given by inhalation or internally.

Revised by H. A. HARE.

Nitrites: See NITROUS ACIDS.

Nitrobenzene, Nitrobenzol, or **Essence of Mirbane** ($C_6H_5NO_2$): a heavy yellow liquid; discovered in 1834 by Mitscherlich; produced by treating benzene with strong nitric acid. On mixing the two liquids they become warm, assume a brown color, and soon emit red fumes and boil. The color becomes finally orange. On adding water the nitrobenzene separates and settles to the bottom of the vessel. A mixture of sulphuric acid and nitrate of soda is preferred to nitric acid: $C_6H_6 + HNO_3 = C_6H_5NO_2 + H_2O$.

The nitrobenzene is washed with water, a trace of free acid neutralized by a very dilute solution of soda, unchanged benzene distilled off by steam, and the liquid freed from moisture, which makes it turbid, by filtration over dry powdered chloride of sodium (common salt). It has an odor like that of bitter almonds, whence it is often called improperly artificial oil of bitter almonds. It is extensively used as a perfume for soap. Its chief importance is due, however, to the fact that it is converted by reducing agents into aniline: $C_6H_5NO_2 + H_6 = C_6H_7N + 2H_2O$. See ANILINE, ANILINE COLORS, and BENZENE.

Revised by IRA REMSEN.

Nitrocellulose: a general term for the product resulting from the treatment of cellulose, as cotton, wood-fiber, etc., with a mixture of strong nitric and sulphuric acids, whereby one or more atoms of hydrogen are replaced by an equal number of molecules of nitryl (NO_2). Several varieties are known. Hadow (*Chem. Soc. Qu. Jour.*, vii., 201) gives the formulas of three, as follows:

$C_{18}H_{21}(NO_2)_9O_{15}$ or $C_6H_7(NO_2)_3O_5$,
$C_{18}H_{22}(NO_2)_8O_{15}$,
$C_{18}H_{23}(NO_2)_7O_{15}$, Gladstone's cotton xyloïdin.

The first is called trinitrocellulose, and is chiefly used as an explosive. The guncotton for photographers' collodion consists of mixtures of the last two. See COLLODION and PYROXYLINE; also EXPLOSIVES. Revised by IRA REMSEN.

Nitrogelatin: See EXPLOSIVES.

Nitrogen [Lat. *ni'trum*, niter + *-gen*, producing, found in Gr. γεννᾶν, beget, produce, and Lat. *genera're*, beget, produce]: a chemical element, from 79·1 to 79·2 per cent., by volume, of the atmosphere of the earth. It is also found, in small but essential proportion, in the bodies of all animals and plants, and in those constituents of the solid earth which are formed from their remains, such as coal and other apozoic mineral matter. In the earth and waters it occurs also, though in relatively very minute proportion, in the form of nitrates and of ammonia.

Before 1772 air was considered homogeneous and elementary, being convertible by continued respiration wholly into *carbonic acid*, then called "fixed air" and by several other names. At that date, however—which was two years previous to the discovery of oxygen by Priestley—the English chemist Rutherford discovered that after separating from air that had been repeatedly breathed all its carbonic acid, a peculiar irrespirable gas was left. Hence this chemist is recorded as the discoverer of nitrogen. Soon afterward Scheele and Lavoisier discovered that air consists of this gas and oxygen, and that it remains behind after the oxygen is removed.

Preparation.—Nitrogen gas, nearly pure, may be prepared by separating from atmospheric air its other constituents, which are oxygen, carbonic acid, and water. The oxygen, constituting a little over one-fifth of the volume, may be abstracted by passing air over some metals at incandescence. On a small scale, metallic copper in wire or turnings is used, and iron may also be used and is much cheaper, but may give nitrogen contaminated with carbonic oxide. Small remaining traces of oxygen, together with carbonic acid, which is always present, are most certainly removed by passing through a potash or soda lye to which has been added some pyrogallol. If the nitrogen is required to be anhydrous, sulphuric acid or chloride of calcium must also be employed to make it so. These modes of obtaining nitrogen from its most abundant source, the atmosphere, are, however, the most troublesome and expensive modes of all. It is much easier and cheaper to obtain it from a nitrite, nitrite of potassium being generally used. This is mixed in solution with sal ammoniac and boiled, when pure nitrogen gas comes off:

$$NH_4Cl + KNO_2 = KCl + 2H_2O + N_2.$$

Ammonium nitrite, when heated, breaks up entirely into pure nitrogen and water:

$$NH_4NO_2 = N_2 + 2H_2O,$$

but this salt is more expensive.

Nitrogen when pure is a gas, colorless, inodorous, and tasteless, of density = ·97 (air = 1). It is but slightly soluble in water. Chemically, nitrogen has an exceptional inertness toward most other substances; but some metals, as *titanium*, *tungsten*, *boron*, and *carbon*, combine powerfully with it at very high temperatures. By the electric spark it may be made to combine with oxygen directly to form nitric acid, and Bunsen found that when 100 volumes of air were mixed with 226 volumes of the explosive mixture (in the proportion to form water, 2 : 1) of hydrogen and oxygen, and the whole exploded, 11·5 per cent. of the air at once disappeared, combining to form nitrogen acids. During electric storms nitric acid is believed to be formed in the air in small proportion. Nitrogen and carbon may be made to combine directly to form *cyanogen*, by heat in the presence of an alkaline substance. Baryta performs this function best, and it has even been proposed to use this method for the manufacture of ammonia, which is easily obtained from the cyanide of barium.

The nitrogen of the air serves as an essential food for plants. To a considerable extent it is first converted into ammonium salts, particularly the nitrate. These find their way into the soils, and then are converted into substances that can be used by the plants. By the growth of plants nitrogenous compounds are constantly being withdrawn from the soil, but it appears, further, that plants have the power to take up from the air a part of the nitrogen which they need, whether directly or not has not yet been determined.

Nitrogen forms a large number of important compounds, among which may be mentioned AMMONIA, NITRIC ACID, NITROUS OXIDE, etc. These are described under the proper heads. The compound sometimes called hyponitric acid is now more commonly known as nitrogen peroxide. It has the composition NO_2. Revised by IRA REMSEN.

Nitroglycerin: See EXPLOSIVES.

Nitro-hydrochloric Acid (Eng. also *a'qua re'gia*, Fr. *eau régale*, Germ. *königswasser*, *goldscheidewasser*, *salpetersalzsäure*): the product of mixing together strong nitric and hydrochloric acids. The name *aqua regia*, royal water, refers to the power of such mixture to dissolve gold, the "king of metals"—a power which neither of the acids possesses alone. Aqua regia fumes in the air, has a deep-yellow or red color, and evolves free chlorine and a compound, NOCl, known as *nitrosyl chloride*. It was believed at one time that another compound of nitrogen, oxygen, and chlorine, of the composition $NOCl_2$, was also formed, but later investigations make it appear probable that this supposed compound is nitrosyl chloride, containing some free chlorine mixed with it. The energetic action of *aqua regia* is due to the free chlorine and to the chlorine given up by the unstable nitrosyl chloride. It is highly valuable in the arts and in the laboratory in operations with gold and platinum. It is also used in the destruction of organic bodies in the wet way, as when a mineral poison is to be isolated from a stomach or other viscus in toxicological cases, though more powerful agents are sometimes substituted in this case. A somewhat cheaper substitute for the ordinary *aqua regia* may be made by dissolving nitrate of soda in strong hydrochloric acid. Freely diluted with water it forms a valuable tonic in cases of indigestion.

Revised by IRA REMSEN.

Nitroleum: another name for NITROGLYCERIN.

Nitrous Acids and Nitrites: When potassium nitrate, KNO_3, is heated it gives up part of its oxygen, and is converted into *potassium nitrite*, KNO_2, and from this other *nitrites* can be made. These are salts of an acid of the formula HNO_2, which, however, can not be made in the free state. Nitrites are formed in nature in the decomposition of organic matter, and they are often found in well waters. Their presence beyond a certain limit indicates contamination with sewage. IRA REMSEN.

Nitrous Oxide, Nitrogen Monoxide, or **Laughing-gas**: a colorless, transparent, nearly odorless gas, having a sweet taste, and freely soluble in cold water. It is obtained from ammonium nitrate, which by being heated in a retort breaks up into water and nitrogen monoxide. This gas supports combustion nearly as energetically as pure oxygen, but its most important property is its anæsthetic effect on the animal system when breathed instead of ordinary air. Being free from all irritant or offensive properties, it is as readily inhaled as air, but, being incapable of decomposition in the body, it furnishes no oxygen for the needs of the blood. Inhaling the gas thus amounts to temporarily cutting off the usual supply of oxygen through the breath, while not interfering with the respiratory movements or the elimination of carbonic acid. The result is that the individual, without any distress or disagreeable sensation whatever, becomes speedily asphyxiated into complete uncon-

sciousness. In this condition anæsthesia is perfect, and surgical operations can be performed without pain, as by the use of chloroform or ether. On withdrawing the gas and allowing air to be breathed, the blood becomes immediately re-arterialized. The recovery of consciousness is then as swift as its loss, and there are no unpleasant after-effects. When pure and intelligently given, the use of the gas is perfectly safe; but of course if it be continuously breathed too long, the asphyxia will end in death. When breathed diluted with air an exhilarating or intoxicating effect is produced, under the influence of which the experimenter is irresistibly impelled to do all kinds of silly and extravagant acts; hence the old name of "laughing-gas." Nitrogen monoxide can be liquefied and solidified by pressure, and in this state a large supply can be conveniently kept for use in a small iron cylinder. For use in surgery the gas is inhaled through a mouthpiece so made that the expired gases do not mix with the contents of the bag. Revised by H. A. Hare.

Nitzsch, Christian Ludwig: anatomist and ornithologist; b. in Beucha, Germany, Sept. 3, 1782. D. at Halle, Aug. 16, 1837. His knowledge of the anatomy of birds was comprehensive, and he was the first to appreciate the importance of the condition of the carotid artery in the classification of birds. His reputation, however, rests upon the fact that he was the founder of the science of Pterylography (*q. v.*), or the arrangement of the feathers of birds. His first essay was published at Halle, Saxony, in 1833, under the title *Pterylographiæ Avium Pars Prior*, and after his death his papers were edited by Burmeister and the work issued at Halle in 1840 with the title *Pterylographie*. An English translation, by Dr. Sclater, was printed by the Ray Society, London, in 1867. F. A. Lucas.

Nitzsch, Gregor Wilhelm: classical scholar; b. in Wittenberg, Germany, Nov. 22, 1790; was Professor of Ancient Literature in Kiel 1827; was deposed 1852; was called to Leipzig as Professor of Classical Philology; d. July 22, 1861. He is chiefly known as the most learned and persistent advocate of the unity of the Homeric epics, whose nuclei he ascribed to one poetic genius. He wrote *Erklärende Anmerkungen zu Homers Odyssee* (3 vols., 1826–40); *Meletemata de historia Homeri* (2 vols., 1837); *Die Sagenpoesie der Griechen* (1852); *Beiträge zur Geschichte der epischen Poesie der Griechen* (1862). See Lübker, *G. W. Nitzsch in seinem Leben und Wirken* (Jena, 1864). Alfred Gudeman.

Niu-chwang, or **New-chwang**: the town of the province of Shing-king or Southern Manchuria, designated in the treaties made with China in 1858 as a place to be opened to foreign residence and trade. It is a walled village, standing in a purely agricultural region, about 40 miles from the coast of the Gulf of Liao-tung, on a small silted-up branch of the Liao river, in lat. 40° 25′ N. and lon. 122° 40′ E. (see map of China, ref. 3–K). The walls are of mud and much broken down, and the population is small. Being entirely unsuitable for foreign trade, the village of Muh-kow-ying, usually called Yingtse, or "the camp," about 30 miles nearer the coast, was chosen by foreigners as the port of Niu-chwang, and this is the town now designated *Niu-chwang* in diplomatic and consular documents and in customs and trade reports. It was opened to trade in the spring of 1861. It is situated on the left or south bank of the Liao river, about 13 miles from its mouth, where there is a dangerous bar. The foreign settlement lies above the native town (in the other ports it is usually below) and extends along the river bank for over 1,000 yards. The main road leading from the coast to the interior bounds it in the rear. The river here is about half a mile wide, and has a depth at low water of 7 to 9 fathoms.

The native town consists of one long main street running E. and W. parallel to the river, and eight or ten shorter ones at right angles to this thoroughfare. The surrounding country is flat and marshy, only a few feet above the level of the sea, and presents a very dismal appearance. The river is closed by ice for four and a half or five months every year. In winter the temperature is frequently as low as zero; in summer it rises to 80° and 87°. The hottest months are June, July, and August.

The chief industry of the place is the manufacture of bean oil and bean-cake, pulse being a staple agricultural product in Shing-king.

The trade of the port in 1893, according to the imperial maritime customs report, amounted to 17,659,854 haikwan, or custom-house taels ($18,542,846 U. S. gold). Of this, imports of foreign origin amounted to 5,548,403 taels, and of native origin 2,801,027 taels; exports of native produce to foreign ports 2,167,111 taels, and to Chinese ports 7,143,313 taels. The chief foreign imports were cotton and woolen goods, metals, kerosene oil (both U. S. and Russian), and needles, and the chief native imports raw cotton, silk piece-goods, and sugar. The chief exports were beans (4,392,648 taels), bean-cake, used as food for cattle in Northern China and as manure in Southern China (2,327,215 taels), bean oil (345,365 taels), ginseng (741,932 taels), and raw silk (510,008 taels). In the same year 397 vessels, chiefly ocean-going steamers, with a tonnage of 296,654 tons, entered the port and the same number cleared. Of these, 52 per cent. were British, 25 per cent. German, 14 per cent. Chinese, and 6 per cent. Japanese. Pop. (1893) 60,000. R. Lilley.

Nix, or **Nix'ie** (Germ. *nix*): in the popular mythology of the Teutonic races, a water-spirit usually malignant, and often assuming the human form, though able to take any other shape at will. Nixies were resorted to to determine the future, and their good will might be obtained by gifts. From the same etymological root we have "Old Nick" as a name for the devil.

Ni'za, or **Niz'za**, Marcos, de: a Franciscan missionary, discoverer of Arizona; b. at Nice, Italy, about 1495. He went to America in 1531, labored in Guatemala, and in 1534 was with Alvarado in Peru. Later he was in Mexico, and was one of three Franciscans who accompanied Coronado to the N. in 1538. In the next year, under Coronado's instructions, he led an expedition to verify Cabeza de Vaca's reports of rich cities to the N. W. From friendly natives he heard accounts of seven "great cities" (probably the Zuñi pueblos), but after sending a Negro of his party to Cibola, one of them, where he was killed, Niza contented himself with a distant view of the place and returned. He brought to Coronado an exaggerated account of the riches of the seven cities obtained from the reports of the Indians, and probably embellished by his own fancy. The illusion was dispelled by Coronado's expedition in 1540. (See Vasquez de Coronado.) Niza accompanied it, but was sent back in disgrace after the true character of the pueblos had been discovered, and died soon after at Mexico. His report has been repeatedly published. H. H. Smith.

Nizā'mī: Persian poet of the romantic epic; b. in 1141 (A. H. 535), probably at Ganjah in Arran, where most of his days at least were spent. His full name is Abū Mohammed Nizām-ad-Dīn. His father, Yūsof bin Muyid, was a native of Kumm; his mother, as we learn from his writings, was of Kurdish descent. Much of the first part of Nizāmī's life was passed amid the sternness of religious asceticism; illumination came in the form of an outburst of poetic inspiration, when, according to received accounts, he was already approaching his fortieth year, and he gave to the world the *Makhzan-al-asrār* (Treasury of Mysteries), the first of his well-known works. The beautiful romantic epic, *Khosrū and Shīrīn*, a story of love, followed (about 1180). This won court favor for Nizāmī, but he still preferred his life of retirement. His *Dīvān*, or collection of short odes alphabetically arranged, was next completed. The romantic love-story of *Laila and Majnūn* added fresh laurels to his fame. Nizāmī now turned his attention to the heroic subject of Alexander the Great, and produced the *Iskandarnāmah*, treating in the first part the conqueror's victories, and in the second part presenting Alexander in the light of prophet, philosopher, and ethical teacher. The poet's last romance is called *Haft Paikar* (The Seven Portraits), written about A. D. 1197, and purporting to be seven stories narrated by the wives of the Sassanian King Bahrām-Gōr. The above enumerated fivefold group of poems by Nizāmī, omitting the *Dīvān*, is known as the *Khamsah* (Quintuple), or is sometimes called the *Panj Ganj* (Five Treasures). D. at Ganjah in 1203 (A. H. 599). See W. Bacher, *Nizāmī's Leben und Werke* (Leipzig, 1871); S. Robinson, *Persian Poetry for English Readers* (1883); and Rieu, *Catalogue of the Persian MSS. in the British Museum* (vol. ii., p. 563, *seq.*, 1881). There is a lithographed edition of Nizāmī's works (Bombay, 1834 and 1839; Teheran, 1845); lithographed editions also of separate poems have appeared in Europe, Persia, and India; there are partial translations by J. Atkinson, Hindley, von Hammer, and H. Wilberforce Clarke. A. V. Williams Jackson.

Nizam's Dominions: See Haidarabad.

Njord: in Scandinavian mythology, a divinity that presides over the winds, quiets the sea, and is worshiped by sailors and fishermen. He was reared in Vanaheim, but the Vans gave him as a hostage to the Æsas when the war be-

tween them was ended. His wife is Skade, daughter of the giant Thjasse. His dwelling is Noatun, near the sea. He is the opposite of the sea-giant Ægir, who represents the turbulent ocean. See SCANDINAVIAN MYTHOLOGY. R. B. A.

No: the name given to classical dramatic performances in Japan, and usually, but wrongly, associated with dancing. The No has been compared to the old Greek drama from its stateliness, solemnly chanted choruses, quasi-religious element, and from the fact that it is performed in the open air. Scenery is absent, but the robes of the performers are magnificent. The music, though scarcely agreeable to Western ears, has a mysterious grace of its own. These No performances are kept up by the aristocracy, and are a feature of polite Japanese society. Each piece takes about an hour to act, but, in addition to the half-dozen pieces in a complete performance, comic interludes are interspersed, causing the performance to take up the greater part of a day.

No. Lake: See the Appendix.

Noah [from Heb. *Nōach*, Noah, liter., rest]: the patriarch who, on account of his piety, was saved by God from the Deluge, and thus became the second founder of the human race; he was a son of Lamech, and the father of Shem, Ham, and Japheth (Genesis v. 28–ix.). See DELUGE.

Noah, MORDECAI MANUEL: lawyer and editor; b. in Philadelphia, Pa., July 19, 1785; became a lawyer at Charleston, S. C.; engaged actively in politics as a Democrat; went as consul to Riga 1811, to Morocco and Algiers 1813–15; settled in New York, and was connected as editor or proprietor successively with seven newspapers, of which the most important were *The National Advocate* and *The Enquirer* (1826), afterward merged in *The Courier and Enquirer*. Soon after his return from Morocco, Maj. Noah endeavored to form a Jewish colony upon Grand island in the Niagara river, where they were to build a "New Jerusalem" under his administration as "judge in Israel," but few of the Hebrew race responded to the invitation. Noah was elected sheriff of New York, and subsequently appointed surveyor of the port and judge of the court of sessions. He published several successful dramas; a volume of *Travels* (1819); a translation of a spurious *Book of Jasher* (1840); a *Discourse on the Restoration of the Jews* (1845); *Gleanings from a Gathered Harvest* (1845); and other miscellaneous works, chiefly speeches. D. in New York city, Mar. 22, 1851.

Noailles, nō'aal', LOUIS MARIE, Viscount de: soldier; b. in France, Apr. 17, 1756; was second son of the Marshal de Mouchy and a brother-in-law of Lafayette, with whom he served in the American war of independence; was a good tactician; commanded the Soissonnais regiment at the siege of Yorktown, and was one of the commissioners to receive the capitulation of Cornwallis. He bore a patriotic part in the French National Assembly of 1789, proposing, on the night of Aug. 4, that the nobility should voluntarily give up their privileges—a proposition which he maintained with great fervor, and which gave him great influence in the Assembly; received an important command in the army, but resigned in May, 1792, in despair for the cause of liberty, and went to the U. S., while the viscountess, remaining in Paris, became a year later a victim to the Revolutionary tribunal. In 1803 Noailles re-entered the French army, went to St. Domingo, was mortally wounded in an engagement with an English vessel, and died at Havana, Jan. 9, 1804.

No-am'on (Nah. iii. 8, *μερὶς Ἀμμών*), or **No** (Ezek. xxx. 14–16, Jer. xlvi. 25, *Διόσπολις*): the Hebrew name of Thebes in Upper Egypt, the Diospolis Magna of the Greeks. The name corresponds with the Egyptian *Nu-amen*, city of Amon, or *Nu*, "the city" *par excellence*. C. R. G.

Nobility: as a term of rank, a state of social dignity, transmissible by descent and often accompanied by political privilege. In ancient Egypt, as now in India, nobility was inherent in the highest castes, the sacerdotal and the military. In Sparta the nobility originated from conquest; at Athens it resulted from older settlement, the nobles or eupatrids being the descendants of those who at one time had constituted the entire people. In Rome the patricians, who, as at Athens, had originally been the whole people, formed for a long time an exclusive caste, allowing no intermarriage with inferiors, and possessing nearly all the political power; but gradually the plebeians gained equal political rights, and after this those among them who became curule magistrates were not only accounted noble themselves by virtue of their office, but also transmitted dignity to their descendants. Nobility in the old German tribes was of immemorial origin, the earliest records of Teutonic peoples showing clearly the division into noble, simple freeman, and bondman. The origin of the existing nobility of Europe, however, can generally be traced to personal service to the king, who granted certain privileges or immunities either as a reward for past or an inducement to future service. (See FEUDALISM.) Thus in Gaul the lands conquered by the Franks were divided into governments over which various officers were appointed—dukes (from Lat. *dux*, a leader), counts (from *comites*, companions), and marquises (guardians of the frontier "marches"). Both in France and Germany lands and dignities bestowed originally for life became hereditary, and their possessors acquired practical independence of the crown. The result was the feudal anarchy of the Middle Ages. The greater nobles were often able to defy the royal authority, while against their tyranny over their own vassals there was no redress. With the decline of feudalism their power was gradually weakened. Surnames and armorial bearings, adopted in the eleventh and twelfth centuries, and soon becoming general, increased the exclusiveness of the nobles, especially in France and Germany. In the latter country a child could inherit no fief of the empire unless both his parents were of pure blood; and in France, though the son by marriage of a noble father and a mother of ignoble birth might inherit property and receive knighthood, he could enter no order of chivalry. The granting of letters of nobility was a blow to aristocratic exclusiveness. French sovereigns often replenished their treasury by compelling rich subjects to buy letters of nobility, as English kings obliged people to purchase knighthood. The policy of Richelieu, Mazarin, and Louis XIV. was directed to depriving the nobles of their political power, while leaving them their dignities and revenues. Nobility was abolished in France June 19, 1790, and the title of noble became a title to banishment or the guillotine. In 1806 Napoleon founded a new nobility, creating princes, dukes, counts, barons, and chevaliers. The imperial noblesse, generally a reward for services rendered to France, was the only kind acknowledged, and edicts were issued against usurpers of titles. At the Bourbon restoration the old noblesse was again recognized, and that of Napoleon's creation was suffered to remain. In 1848 nobility was abolished by the provisional government, but was again restored by Napoleon III.

The Italian nobility lived generally in strong castles, and were feared by the people, who, when it was possible, excluded them from political power, as in Florence and Genoa, where high birth was a disqualification for government. At present Italian nobles are of two kinds—those of ancient lineage, and others who, having bought estates, take the titles belonging thereto. Titles descend to the eldest son only, but the younger children are called by courtesy *dei principi*, *dei duchi*, etc. Spanish nobility is very ancient: being *hijo d'algo* (son of somebody) implies noble birth and entitles a gentleman to be called *don*, which name, however, is, like *esquire* in the U. S. and Great Britain, very generally given. The estates and titles of the higher nobles or grandees are entailed. Russian nobility was formerly patriarchal, but Peter the Great introduced the European system of titles. In England the Anglo-Saxon nobles sometimes possessed sufficient power to set at naught the will of the sovereign, but from the time of the Conquest, when William the Conqueror made every vassal dependent upon the king, the barons had no such irresponsible power as they gained on the Continent. In Great Britain the term nobility is used in an exclusive sense, being limited to the five temporal ranks of the peerage, duke, marquis, earl, viscount, and baron. Baronet is a title of honor and confers no political privileges. See the articles on these respective titles; Sir J. Lawrence *On the Nobility of the British Gentry*; C. F. Ménestrier, *Les Diverses Espèces de la Noblesse* (Paris, 1683); *Le Blason de la Noblesse* (Paris, 1683); the works of Hallam, Stubbs, May, Guizot, and other historians. Revised by F. M. COLBY.

Noble, JOHN WILLOCK, LL. D.: lawyer; b. at Lancaster, O., Oct. 26, 1831; was educated at Miami University, Ohio, and at Yale College, where he graduated in 1851; was admitted to the bar and settled in St. Louis in 1855, but removed to Keokuk, Ia., in 1856; was city attorney 1859–60; enlisted in the Union army as a private on the outbreak of the civil war; became first lieutenant and adjutant in the Third Iowa Cavalry; became judge-advocate of the Army of

the Southwest and afterward of the department of the Missouri; was promoted to a colonelcy in 1865; breveted brigadier-general of volunteers Mar. 13 same year; served as U. S. district attorney at St. Louis 1867–70, then resumed private practice; became Secretary of the Interior under President Harrison, receiving his commission Mar. 6, 1889.

Noblesville: city; capital of Hamilton co., Ind. (for location of county, see map of Indiana, ref. 6–E); on the White river, and the Chi. and S. E. and the Lake Erie and W. railways; 20 miles N. of Indianapolis. It is in an agricultural and natural-gas region; contains 9 churches, a public high and 3 ward schools, and a daily and 2 weekly newspapers, and has a large strawboard-mill, flour-mill, and carbon-works. Pop. (1880) 2,221; (1890) 3,054; (1900) 4,792.
EDITOR OF "LEDGER."

Nobuna'ga: general and statesman; b. in 1533 of a petty noble family named Ota, in the province of Owari, Japan. He early showed himself an intrepid and capable soldier. Having increased his domains and power, he found himself in collision with the Buddhist priesthood, whose headquarters at Hiyeisan he burned to the ground in 1573. After deposing the last shogun of the Ashikaga house, he became virtual ruler of Japan under the title of Dainagon, and began the work of political reconstruction and concentration, to be perfected later by Hideyoshi and Iyeyasu. Again from 1575–80 he had to struggle against a new coalition of Buddhist monks. In 1582 he fell a victim to treachery. Nobunaga favored the introduction of Christianity, possibly as a counterpoise to Buddhism. J. M. DIXON.

Nocera, nō-chā'răa (anc. *Nuceria Alfaterna*): town in the province of Salerno, Italy; in a district well suited to the raising of sheep and cattle (see map of Italy, ref. 7–F). It is a bishop's see, and has cotton-manufactures. It was destroyed by Carthage for taking part with Rome, flourished again, and was again destroyed by the Normans. Pop. about 12,500.

Noctilion'idæ [Mod. Lat., named from *Noctil'io*, the typical genus, from Lat. *nox*, night; cf. Lat. *vespertil'io*, bat, deriv. of *ves'per*, evening]: a family of insectivorous bats (Cheiroptera) without nasal appendages. The ears are moderate, and provided with a distinct tragus to each; the tail perforates the interfemoral membrane through its upper surface, or, when that is truncated, is produced beyond it; the intermaxillary bones are generally united (sometimes separated); the molars are large and have W-shaped ridges; the incisors are variable ($\frac{2}{1}$, $\frac{1}{1}$, $\frac{2}{2}$, or $\frac{1}{3}$ by 2); the middle finger has two phalanges; the stomach is sacciform and its extremities inclined toward each other. The species are mostly confined to the tropical regions of both hemispheres.
Revised by F. A. LUCAS.

Noctilu'cine [from Lat. *noctilu'ca*, something that shines at night; *nox*, *noc'tis*, night + *luce're*, shine]: a name given by T. L. Phipson to an organic substance supposed to cause the production of light in phosphorescent fish, insects, and decaying matter. At ordinary temperatures it is semi-fluid and whitish in color. It contains nitrogen and water. It dries up readily, yielding amorphous films. Noctilucine is slightly soluble in water and insoluble in alcohol and ether. Sulphuric and nitric acids dissolve it with decomposition. When moist it absorbs oxygen and evolves carbon dioxide. In ozone it is more luminous than when in oxygen, the luminosity apparently being due to oxidation. The spectrum of the light emitted is nearly monochromatic. Noctilucine is secreted in a pure form by the luminous centipede, *Scolopendra electrica*. See *Chem. News*, xxvi., 130, No. 668; *Am. Chem.*, iii., 244; *Comptes Rendus*, lxxv., No. 9; Watt's *Dict.*, 2d supplement, p. 861.

Noctuina: See LEPIDOPTERA.

Nodal Points or **Lines**: See ACOUSTICS.

Noddy: popular name of a species of tern (*Anous stolidus*) whose popular and scientific names relate to the stupid, stolid behavior of the bird, which often alights on ships, and suffers itself to be taken by hand. The noddy is about 16 inches in length, including the long, graduated tail; the adult is sooty brown in color, but has a whitish head. The species is widely distributed over the warmer parts of the globe, and nests in great numbers on mangrove and other bushes. The nest is built of sticks; the eggs are buff with reddish-brown markings, and in some localities are taken in considerable numbers for food. F. A. LUCAS.

Nodes [from Lat. *no'dus*, earlier **gno'dus*, knot: Eng. *knot*]: the points in which the path of any planetary or cometary body intersects the plane of the ecliptic, or any other plane of reference; also the points in which the orbit of any satellite intersects the plane of the orbit of its primary. Nodes are distinguished as *ascending* and *descending*. The ascending node is that through which the body passes from the south to the north side of the plane of reference; the descending, that through which it passes from N. to S. The first is denoted by the sign ☊, the second by the sign ☋. The nodes of most other members of the solar system undergo gradual displacement in the heavens, making, in a period of time longer or shorter, a complete revolution. The period for the moon is short, being but about $18\frac{2}{3}$ years, but for the planets it reaches many thousands of years. The direction of nodal movement is generally retrograde, or from E. to W. Revised by S. NEWCOMB.

Nodier, nō'di-ā', CHARLES: author; b. at Besançon, France, Apr. 29, 1780; studied at Strassburg, and led subsequently an errant and adventurous life, first as an ardent republican, then as a zealous royalist, writing sentimental novels, as *Stella* (1802) and *Le Peintre de Salzbourg* (1803), after the model of *Werther*, and satires against Bonaparte, as *La Napoléone* (1802), and editing *Télégraphe Illyrien* in 1814 under the auspices of Junot and Fouché; became a contributor to the *Journal des Débats* in 1815; librarian to the library of the arsenal of Paris in 1824, member of the Academy in 1834, and died in that city Jan. 26, 1844. He was a very prolific writer, and touched almost every field of literature from lexicography to satire. Some of his works have an interest still: *Dictionnaire des Onomatopées françaises* (1808); *Histoire de Sociétés secrètes de l'Armée* (1815). His chief literary significance, however, lay in his knowledge of the German literature and the services he rendered romanticism by rallying the young romanticists about him. Revised by A. R. MARSH.

Noé, AMEDÉE, de: See CHAM.

Noel, BAPTIST WRIOTHESLEY, M. A.: clergyman; a brother of the first Earl of Gainsborough; b. July 10, 1799, at Leightmont, Scotland; graduated at Cambridge 1826; became one of the queen's chaplains and incumbent of St. John's, Bedford Row, London, but in 1848 left the Established Church and became a Baptist minister in London. He was an eloquent preacher; published a number of volumes of sermons, besides numerous other works, chiefly religious (*Notes of a Tour in Switzerland*, *Essay on Christian Baptism*, 1849; *Letters on the Church of Rome*, 1851; *A Selection of Psalms and Hymns*, 1852, enlarged 1853; *Hymns about Jesus*, mostly original, 1869); and was distinguished for philanthropic labors among the poor of London. D. at Stanmore, Middlesex, England, Jan. 20, 1873.

Noë'tians: name given to the followers of Noëtus, a Patripassian who flourished probably about 200 A. D. (instead of 230, the date formerly given). All we know of him is derived from Hippolytus (d. 236), Epiphanius (d. 403), and Theodoret (d. 457, 8), and they do not quite agree in their statements, Hippolytus and Theodoret saying he was born at Smyrna, and Epiphanius calling him an Ephesian. Perhaps he was born at Smyrna and lived at Ephesus. He was excommunicated for his heresy, which Hippolytus connects with the pantheism of Heraclitus. Through his disciples, Epigonus and Cleomenes, the Roman bishops Zephyrinus (202–218 A. D.) and Callistus (218–223 A. D.) were carried over into the same heresy. See PATRIPASSIANS.

Noko'mis: town (incorporated in 1867); Montgomery co., Ill. (for location of county, see map of Illinois, ref. 7–D); on the Cleve., Cin., Chi. and St. Louis Railway; 16 miles N. E. of Hillsboro, the county-seat, 85 miles N. E. of St. Louis. It is in an agricultural, fruit-growing, and stock-raising region; contains 6 churches, graded public school, a national bank with capital of $50,000, and 3 weekly newspapers; and has a flour-mill and 2 grain elevators. Pop. (1880) 1,062; (1890) 1,305; (1900) 1,371.
EDITORS OF "FREE PRESS-GAZETTE."

No'la: town; in the province of Caserta, Italy; about 14 miles N. E. of Naples (see map of Italy, ref. 6–F). The Castello Cicala and the ex-convent of the Capuchins on a hill above the town give it a picturesque aspect, but the interior has a desolate appearance. Of the sixteen churches, the old Italian Gothic cathedral is the only one of interest. Nola was one of the most ancient and renowned cities of Campania, being of older origin than Rome itself. The

Samnites first conquered the Pelasgian settlers, were in turn driven out by the Romans, but recovered it during the Social wars, and the inhabitants burned it rather than yield to Sulla; Spartacus occupied it afterward. In the time of Vespasian it was called *Augusta Felix*, and this was its most flourishing period. It was strongly walled, had twelve gates, magnificent temples, and two large amphitheaters, between which rose the temple of Augustus, said to have been erected on the site of the house in which that emperor died. Pop. (1881) 7,496.

Nöl'deke, THEODOR: Orientalist; b. at Harburg, Hanover, Mar. 2, 1836; was educated at the gymnasium in Lingen, Hanover, and at the University of Göttingen; was privat docent in Göttingen 1861–64; professor in Kiel 1864–72; has been Professor of Semitic Languages at Strassburg since 1872; is author of *Geschichte des Korans* (1860); *Untersuchungen zur Kritik des alten Testaments* (1869); *Grammatik der neusyrischen Sprache* (1868); *Mandäische Grammatik* (1875); *Syrische Grammatik* (1880); *Geschichte des Perserreiches zur Zeit der Sassaniden* (1879); *Aufsätze zur persischen Geschichte* (1887); *Orientalische Skizzen* (1892); besides a large number of important contributions to journals, etc. He is one of the first authorities in Arabic philology and Oriental history. B. I. W.

Nolet de Brouwere van Steeland, nō'lā-de-brow'ā-rā-văn-stā'lănt, JOANNES CAROLUS HUBERTUS: Flemish poet; b. at Rotterdam, Holland, Jan. 23, 1815. After studying in the University of Louvain he went to Brussels, where he became instructor in the university, and where he has since lived. In 1849 he became a member of the Brussels Academy. For a generation he was the leading literary man of Belgium. His career as a writer began with a brief *Geschiedenis van het Joodsche Votk van de schepping der wereld tot na de verwoesting van Jeruzatem* (The Hague, 1835). His first important poetical work, however, was *Noami* (Louvain, 1840). This was followed by *Ambiorix* (1841); *Dichtluimen* (1842); *Ernst en Boert* (1847); *Zwart op wit* (1853); *Het groote dietsche vaderland* (1857); *Gedichten, etc.* (2 Deel, 1859). In prose he has published the somewhat caustic book *Een Reisje in het Noorde* (1843); *Het Communismus in zijne vroegere en latere vormen*, 1871), etc. In his earlier years he was an ardent admirer of Germany and of German ideas (cf. his *Aen de Germanen*, 1847); but after 1866 he conceived a deep antipathy for Prussia, and strove against German influence upon Belgian literature. This feeling he has most clearly expressed in his academic address, *Du pan-germanisme et de ses influences sur la littérature flamande* (1868). His *Œuvres complètes* (7 vols., 1859–84) contain his *Gedichten* (3 vols., 1859–71), his earlier prose works (2 vols., 1873), his later *Poëzij en Proza* (1877), and *Poëzij en lettercritiek* (1884). A. R. MARSH.

Nolhac, nō'lăk', PIERRE, de: scholar; b. at Ambert, Puy-de-Dôme, France, Dec. 15, 1859. After studying in Paris he passed three years (1882–85) in Rome, as a member of the French school. Returning to Paris he was for a brief time attached to the Bibliothèque Nationale, and was then (1886) appointed Professor in the École des Hautes Études, and associate director of the Museum of Versailles. He has occupied himself chiefly with the beginnings of humanism and of the Renaissance in Italy and France, and has published numerous brilliant studies in this field. Among these are *Le dernier amour de Ronsard* (1832); *Lettres de Joachim du Bellay* (1883); *La bibliothèque d'un humaniste* (1883); *Les collections d'antiquités de Futvio Orsini* (1884); *Le Canzoniere autographe de Pétrarque* (1886); *Fac-similés de l'écriture de Pétrarque et notices sur sa bibliothèque* (1887); *Petites notes sur l'art italien* (1887); *La bibtiothèque de Fulvio Orsini* (1887); *Érasme en Italie* (1888); *Les études grecques de Pétrarque* (1888); *Les correspondants d'Alde Manuce, matériaux nouveaux d'histoire tittéraire, 1483–1514* (1889); *Pétrarque et l'humanisme* (1892); *Études sur la cour de France: La reine Marie-Antoinette* (1892). Besides these de Nolhac has published a volume of verse, *Paysages d'Auvergne* (1888). A. R. MARSH.

Nol'lekens, JOSEPH, R. A.: painter; b. in London, England, Aug. 11, 1737; son of a painter from Antwerp; became a pupil of the sculptor Schumaker; afterward studied at Rome, where he remained ten years; was very successful in executing bas-reliefs, groups of figures, and busts; settled in London 1770; made busts of George III., Fox, Pitt, Warren Hastings, Johnson, Garrick, and the principal celebrities of the time, which were generally considered excellent likenesses; executed numerous commissions for public monuments and statues, as well as mythological groups; married a lady of rank, and accumulated a handsome fortune. D. in London, Apr. 23, 1823.

Nol'le Pros'equi [Lat., to be unwilling to prosecute]: a declaration or undertaking by the plaintiff or prosecuting officer in an action or prosecution at law that he will discontinue further proceedings in the cause against the defendant. It is entered upon the records of the court, and puts an end to the particular proceeding or litigation, in the course of which it is introduced. It was formerly a common practice to enter a *nolte prosequi* both in civil and in criminal cases, but in civil actions other modes of effecting a discontinuance of the proceeding are now more generally adopted. In criminal prosecutions, however, the former practice still remains commonly in force. It usually lies in the discretion of the prosecuting officer to enter a *nol. pros.* (as the phrase is commonly abbreviated), but it is sometimes provided that he must obtain the leave of the court before such a course can be taken. The causes which most frequently induce such action are, that there is an insufficiency of evidence to procure the defendant's conviction, or that the testimony of one of several defendants who have been indicted is desired to be introduced against the others. Such a step might also be taken because, on account of the state of public opinion at a particular time, it was improbable that a jury could be obtained which would be likely to convict the prisoner, or because the trial would be detrimental to the public interests. A *nolle prosequi* may be entered at any stage of the case; but according to the preponderance of authority a *nolte prosequi* entered after the completion of the impaneling of a jury in the case will have the same effect as an acquittal. Otherwise it does not operate as an acquittal, but only as an indefinite suspension of the proceedings, and the prosecution may be again instituted against the defendant when the prosecuting officer deems it desirable. See Bishop's *Criminal Procedure* and Bishop's *Criminal Law*. Revised by F. STURGES ALLEN.

Noma: See CANCRUM ORIS.

Nom'bre de Di'os: a former Spanish settlement on the northern coast of the Isthmus of Panama. Nicuesa's transient settlement of that name was probably on or near the site of the modern Porto Bello; it was abandoned in 1511. In 1519 a new town of Nombre de Dios was founded on the Bay of San Blas, and this became the northern terminus of the route over the isthmus from Panama. During the sixteenth century all the trade of Peru, and much of that from Western Mexico, Guatemala, and the Spice islands, passed through it; it was thus one of the most important ports in America. Owing to its unhealthful location it was only frequented by the merchants on the arrival of the annual fleets from Spain; about sixty of the houses were built of wood, the rest being thatched. The town was attacked by Drake in 1572, and destroyed by him in 1595. It was abandoned in 1597, Porto Bello taking its place. H. H. S.

Nome'idæ [Mod. Lat., named from *No'meus*, the typical genus]: a family of small fishes related to the mackerels. The body is oblong, compressed, and covered with cycloid scales; the lateral line continuous and unarmed; the head compressed; the opercula unarmed; the nostrils double; the mouth with a lateral cleft, upper jaw scarcely protractile; teeth small and conical, on the palate as well as jaws; branchial apertures extensive; branchiostegal rays five or six; dorsal more or less divided, and with the spinous portion shorter than the soft. The skeleton has numerous vertebræ (in *Nomeus* 16 + 26); the stomach very numerous pyloric appendages. The species are all marine, and found in tropical or warm temperate seas.

Nominalism: the doctrine of the NOMINALISTS (*q. v.*).

Nom'inalists [from Lat. *nomen, nominis*, name]: those Schoolmen who held the doctrine that universals (general notions, such as those of man, animal) have no real existences corresponding to them, but are mere names or words (*flatus vocis*). The chief Nominalists were Roscellinus and William of OCCAM (*q. v.*). In modern times their doctrine has been adopted by Thomas Hobbes (but not consistently, inasmuch as he holds the doctrine that the state is a general power, or leviathan, more real than the individual citizen) and John Stuart Mill. Herbert Spencer, though claiming to be a Nominalist, is likewise a Realist when he holds that the persistent force is an ultimate reality producing and annulling the particular forces. Abelard was a Conceptualist or moderate Nominalist, and in this class we are

to place John Locke, Thomas Reid, Dugald Stewart, Dr. Thomas Brown, Sir William Hamilton, and other modern psychologists. See also CONCEPTUALISM, REALISM, and PHILOSOPHY (*History of Philosophy*). WILLIAM T. HARRIS.

Nominating Conventions: in the U. S., meetings of delegates of a political party to nominate candidates for national, State, or local offices. Such nominations were formerly made by the legislative CAUCUS (*q. v.*), which in the case of State elections began to give place to the nominating convention in 1825. In national elections the choice of candidates by the congressional caucus occasioned much complaint, and in 1824 the nominees of the caucus were defeated in the presidential election. From that time there was a steady tendency toward a more popular method of choosing candidates, and in 1831 the first national nominating convention was held by the Anti-Masonic party at Baltimore. Similar conventions were held by the two great national parties in 1832, and since 1840 all candidates for the presidency have been chosen in this way. The conventions meet in the summer immediately preceding the presidential election, which is held in November. They are composed of delegates chosen by the voters of the party, each State being entitled to twice as many delegates as it has persons representing it in Congress. Delegates from the Territories and the District of Columbia are also admitted, though these political divisions have no vote in the presidential election.

Nomina'tion: in politics, an act of designation to office, the ratification of which depends upon another person or body of persons. The President of the U. S. nominates to the Senate the incumbents of high Federal offices, and makes the appointments only after approval. The head of an executive department nominates to the President those whom he desires as his subordinates, and a national, State, county, or town convention of a political party nominates its candidates for office in anticipation of the elections. See NOMINATING CONVENTIONS.

Nomos: one of the territorial divisions of ancient Egypt. See EGYPT, ANCIENT.

Nomsz, JOHANNES: poet; b. at Amsterdam, Holland, in 1738. Little is known of his life, except that it was dissipated and unstable. For a time his name was in everybody's mouth, and he was confidently expected to be one of the greatest stars in the constellation of Dutch poets; but his conduct and the fickleness of his political opinions brought him into discredit, and he died neglected in a hospital at Amsterdam, Aug. 25, 1803. In the course of his life he had tried his hand at almost all kinds of literature, though with best success as a playwright. His first work was a translation of Piron's *Ferdinand Cortez* (1764). He made many other translations during his life, among them Racine's *Athalie*, Corneille's *Le Cid*, Voltaire's *Zaïre*, La Fontaine's *Fables*, part of Tasso's *Gerusalemme Liberata*, etc. He wrote more than fifty dramatic pieces of his own, the best among them being perhaps *Maria van Lalain*, *De Ruiter*, and *Anthonius Hambroek, of de Belegering van Formoza*. He composed two considerable epic poems: *Willem de Eerste, of de Grondlegging der nederlandsche vryheid* (Amsterdam, 1779); and *Maurits van Nassau, Prins van Oranje* (1789). Other poetical work was his *Trionf der Teekenkunst* (1768), and occasional pieces in his *Mengelwerken* (Amsterdam, 1782). In prose he essayed the romance, with mediocre success even in his best work, *Mohammed, of de Hervorming der Arabieren* (1780). In his *Vertelsels* (3 parts, 1781–85) he imitated the *Contes moraux* of Marmontel. Dramatic criticism is the subject of his *Historie van Piet Snot de Toneelspectator*; personal reminiscences of *Myne Uitspanningen* (2 parts, 1789). The literary model of Nomsz was, more than any one else, Voltaire; but it is clear that he never really understood the purposes which the Frenchman cherished in spite of his scoffings. A. R. MARSH.

Non-commissioned Officers: army officers intermediate between the privates and the commissioned officers, such as corporals, sergeants, sergeant-majors, etc. They are not commissioned, but (in the U. S.) receive a warrant; in the British army the latter is the case only with the higher grades. In the U. S., besides those above mentioned, there are ordnance, quartermaster, commissary, and saddler—sergeants, hospital stewards, drum-majors, orderly sergeants, and certain musicians who have the rank of sergeant or corporal. In the British army there are included bombardiers, master gunners, staff clerks, band-masters, etc.

Non-conductors: See ELECTRICITY.

Nonconformists, or **Dissenters**: a name applied to those residents of Great Britain and her colonies who are not connected with the Church of England. There are nearly 300 denominations in Great Britain. The larger and more important may be traced back to the Presbyterians, Brownists (afterward called Independents), Anabaptists, and Roman Catholics of the sixteenth century, or to the Methodists, who arose much later. See the articles on those religious bodies; also FRIENDS.

Nonius, MARCELLUS: a Latin grammarian from Africa, of the beginning of the fourth century, whose work, *Compendiosa doctrina ad filium*, in twenty books, is extremely valuable because of its numerous citations from earlier writers, no longer extant. The compilation in itself is mechanical, and shows little scholarship or judgment. See editions of L. Quicherat (Paris, 1871) and L. Müller (2 vols., Leipzig, 1888). M. WARREN.

Nonjurors: those members of the Church of England who refused to take the oath of allegiance to William and Mary. Sancroft, Archbishop of Canterbury, with several of the bishops and about 400 priests, declined to take it, upon the ground that they were already bound by their oath of allegiance to King James II. In consequence of their refusal they were deprived by act of Parliament in 1691 of their ecclesiastical preferments. The deprived bishops were Sancroft, Turner, Frampton, White, Ken, and Lloyd. Many of the laity, regarding the deprivations as unlawful, adhered to these prelates and formed a religious communion, which they called the faithful remnant of the Church of England. The earlier Nonjurors were not Jacobites. On the contrary, many of them had opposed the violent measures of King James, and most of them were disposed to submit peaceably to the new settlement of the succession. They were willing to live as orderly citizens, but not to bind themselves by new oaths during the life of King James, nor to recognize the claims of Parliament to deprive bishops of their sees. Some of the chief men in the kingdom in influence and learning were among the Nonjurors. The motives of the first Nonjurors appear to have been strictly religious; those of their successors were political. After the death of James II. and of Lloyd and Ken, the last of the deprived bishops, many of them returned to the Established Church, while the rest, looking forward to the possible restoration of the exiled royal family, determined to keep up an episcopal succession. Dissensions, however, arose among them, and they were divided into two communions. Gordon, the last bishop of the original line, died in 1779, and Boothe, the last bishop of the Nonjurors of the Separation, in 1805. Nonjuring congregations continued to exist a little longer; and it is said that a nonjuring clergyman was living as late as 1815. The regular body adhered strictly to the doctrine and discipline of the Church of England, but the separation introduced many changes. A book of *Devotions for Primitive Catholicks*, compiled by Dr. William Deacon, one of their bishops, was used for some time in the congregations of the latter body. It differs widely from the Book of Common Prayer. The Nonjurors, being to a great extent cut off from active life, devoted themselves to literature. The celebrated historian Jeremy Collier was one of their bishops. Leslie, the controversialist, William Law, the able polemic and mystic, and Robert Nelson, the well-known commentator on the feasts and fasts, belonged to their communion. Among the more celebrated of their writings were Deacon's *Devotions*, already mentioned; a treatise on the *Intermediate State*, by Archibald Campbell, a Scottish bishop resident in London; and a learned and elaborate folio called *The Hereditary Right of the Crown of England*. This is believed to have been written by Harbin, a nonjuring clergyman, during the reign of Queen Anne, at a time when the restoration of the Stuarts was thought to be possible. Hilkiah Beaford, however, another nonjuror, assumed the responsibility of it, and was fined and imprisoned for publishing a seditious libel. A history of the Nonjurors was published in 1845 by the Rev. Thomas Lathbury.

Revised by W. S. PERRY.

Nonnus: a Greek epic poet of Panopolis, in Egypt. His date is uncertain, but he is commonly assigned to the fifth century A. D. Originally a heathen, he became a Christian in his old age. The heathen side is represented by the *Dionysiaca* (Διονυσιακά), or *Adventures of Bacchus*, a vast epic in forty-eight books, without plan, without unity, of endless details, of extravagant fancies, a strong contrast to the simplicity and plastic clearness of the old epic. Yet

Nonnus is a genius in his way, and his versification is unequaled for rapidity and smoothness, though fatiguing by reason of its uniform flow. An edition was published by Graefe (1819–26) and one by Köchly (1859). The Christian side of Nonnus is represented by his hexametrical transcription of the Gospel of St. John. See editions by Passow (1834), Marcellus (1861). B. L. GILDERSLEEVE.

Non-residence: See CITIZEN.

Nonsuit, or, more fully, **Judgment of Nonsuit**: in law, a judgment allowing or ordering the plaintiff to discontinue the action which he has instituted. A nonsuit is generally granted on the ground of a default or insufficiency of the evidence offered by the plaintiff, and in case of a nonsuit the plaintiff pays the costs of the action. A nonsuit may generally be taken either at any time before the rendering of the verdict by the jury or a judgment by the court, according to the common-law practice; or, as in some of the U. S., at any time before the case is finally submitted to the jury or the court.

A nonsuit, being merely a default, is no bar to another action on the same ground; and the plaintiff frequently finds it to his advantage to elect to be nonsuited, in order that he may begin his suit over again, or prosecute it at a later time, when his evidence may be more conclusive or other circumstances more favorable. He may submit to a nonsuit by failing to appear for the trial of the case, by absenting himself when the verdict of the jury is about to be rendered, etc. When the judgment for nonsuit is the result of his voluntary act, he can not appeal from the judgment or have it set aside. He may be nonsuited involuntarily on the motion of the defendant when his evidence is insufficient, or for any other cause for which a nonsuit may be ordered. Formerly, in the English practice, a compulsory nonsuit on the ground of the insufficiency of the evidence could not be ordered by the court against the plaintiff, but he might insist that the case should go to the jury; but it was usual for the plaintiff in such a case to submit to a nonsuit, with leave to make a motion to the full court to set the judgment aside. By the judicature acts, however, it has been provided that a nonsuit may be ordered by the judge at or after the hearing or trial upon such terms as to costs, and as to any other action and otherwise as may seem fit; and if the plaintiff does not appear when the action is called for trial the defendant is entitled to a judgment dismissing the action. It was also provided that any judgment of nonsuit, unless the court otherwise directed, should have the effect of a judgment upon the merits, except in case of mistake, surprise, and accident; but this provision has been abrogated.

The former English practice still prevails in the Federal courts of the U. S. and in several of the States, and no nonsuit can be ordered without the consent of the plaintiff; but in other States the plaintiff can be compelled to be nonsuited for insufficiency of evidence. In those States in which a code of civil procedure has been adopted a nonsuit is called a dismissal of the complaint. For a fuller treatment, see the works on practice referred to under the article PRACTICE.

F. STURGES ALLEN.

Noot'ka Dog: a large dog found among the Indians of Vancouver's island, British Columbia, chiefly remarkable for its long woolly hair, which is spun and woven into cloth by the natives.

Nootka Indians: See WAKASHAN INDIANS.

Noph (Ezek. xxx. 16; Isa. xix. 13; Jer. ii. 16), or **Moph** (Hos. ix. 6): the Hebrew name of Memphis, capital of Lower Egypt.

Norbertines: the name of a monastic order, better known as PREMONSTRATENSIANS (*q. v.*).

Nord, nōr: the most northerly department of France; bounded N. E. by Belgium and N. W. by the Straits of Dover. Area, 2,193 sq. miles. The ground is generally low and the surface flat, with the exception of the southeastern part, where some hills and low mountains occur which are rich in coal and iron. The soil is fertile and excellently cultivated, yielding large crops of wheat, hemp, flax, beetroot, tobacco, and fruits. The Aa and the Scheldt, with their numerous tributaries, all navigable, pass through the country, which, moreover, is traversed by several canals. Manufacturing of linen, silk, cotton, and woolen goods, lace, beetroot-sugar, porcelain, chemicals, and iron is extensively carried on; the fisheries, too, are important. The department is strongly fortified, and has many battle-fields. Pop. (1896) 1,811,868.

Nordenskjöld, nōr'den-skyöld, ADOLF ERIK: explorer; b. at Helsingfors, Finland, Nov. 18, 1832; descended from a Swedish family whose members through several generations had distinguished themselves as scientists. He studied geology, mineralogy, and natural history in the university of his native town, and very early received appointment in the mining department; but he could not avoid incurring the suspicion of the Russian Government, and was finally compelled to leave the country. He settled in Sweden, and was appointed superintendent of the mineralogical museum of Stockholm in 1858; accompanied Torell on his Arctic expeditions in 1859 and 1861; led similar expeditions himself in 1864, 1868, and 1872, and made a scientific journey to Greenland in 1870. The results of his researches were published in geographical and mineralogical monographs, and especially in his *Redogörelse for en Expedition till Grönland* (1871). Meanwhile, his attention had been turned to Siberian explorations, and in 1875 he sailed through the Karian Sea to the mouth of the Yenisei, ascended the river in a small boat, and returned home overland. The next year he repeated the voyage, but returned from the Yenisei by sea. His experiences having given him a reasonable hope of accomplishing the northeast passage, he started in July, 1878, in the Vega, supported partly by the Swedish Government and partly by two merchants. Thus the Vega became the first vessel which doubled the northernmost point of the Old World, Cape Tchelyuskin. She wintered in Bering Straits, and reached Japan on Sept. 2, 1879; and the northeast passage was found. On his return home Nordenskjöld was created a baron and loaded with honors. The full report of his voyage was published in Swedish, English, German, and French in 1884.

Nordhausen, nōrt'how-zen: town of Prussia, province of Saxony; at the foot of the Harz Mountains, on the Zorge; 48 miles by rail N. N. W. of Erfurt (see map of Germany, ref. 4–E). It has large distilleries, manufactures of tobacco, chemicals, and leather, and an active trade. It was founded in 874, and was finally annexed to Prussia in 1815. Pop. (1890) 26,847.

Nordhoff, nōrt'hōf, CHARLES: journalist; b. at Erwitte, in Westphalia, Prussia, Aug. 31, 1830. In 1835 his parents emigrated to the U. S.; in 1843 he was apprenticed to a printer in Cincinnati; at the age of fourteen went to sea, and was a sailor for nine years; then worked in newspaper offices. Between 1861 and 1871 he was editorially connected with the New York *Evening Post*, subsequently served as a correspondent of *The New York Tribune*, and became an editor of *The New York Herald*. Among his published works are *Man-of-war Life* (Cincinnati, 1855); *The Merchant Vessel* and *Whaling and Fishing* (Cincinnati, 1855–56); *Cape Cod and Along Shore*, a collection of stories (New York, 1868); *California for Health, Pleasure, and Residence* (New York, 1872); *Northern California, Oregon, and the Sandwich Islands* (New York, 1873); *The Communistic Societies of the United States* (New York, 1874); *Politics for Young Americans* (1875); *The Cotton States in the Spring and Summer of 1875* (1876); *God and the Future Life* (1881); *Peninsular California* (1888). D. July 15, 1901.

Revised by H. A. BEERS.

Noreen, ADOLPH GOTTHARD: philologist; b. at Östra Emtervik, Sweden, Mar. 13, 1854; was educated at the gymnasium of Karlstad in Värmland and at the University of Upsala (1873–77); privat docent at Upsala 1877–87; since 1887 Professor of the Scandinavian Languages at the same university; author of *Äldre Västgötalagen* (1876); *Fryksdalsmålets Gudläre* (1877); *Ordbok öper Fryksdalsmålets* (1878); *Svensk språklära* (i., 1881); *Altisländische und altnorwegische Grammatik* (1884; 2d ed. 1892); *Förläsningar i urgermansk judläre* (1888–90; also in Germ. transl.); *Geschichte der nordischen Sprachen* (in Paul's *Grundriss*, 1889); besides many lesser works, articles in journals, and reviews. He is one of the most active and aggressive of the younger school of comparative philologists, and a leading authority in the field of Scandinavian grammar. B. I. W.

Norelius, E., D. D.: clergyman; one of the pioneers of the Swedish Lutheran Church in the U. S.; b. in Hasseln, Sweden, Oct. 26, 1833; emigrated to the U. S. 1850; studied at Columbus, O. After a pastorate of a year at Lafayette, Ind., he became in 1856 missionary in Minnesota, with Red Wing as his center, and published in 1857 the first Swedish paper in Minnesota. Almost his entire ministerial life has been spent in that State. He has been president of the Augustana synod, and editor of *Augustana*, the organ of that

body. He published in Swedish a history of the Swedish Lutheran churches of the U. S. (1892). H. E. Jacobs.

Norfolk, nōr'fŭk: county of England; bounded N. and N. E. by the North Sea, S. and S. E. by Suffolk, and W. by Cambridge, Lincoln, and the Wash. Area, 2,119 sq. miles. The surface is level or slightly undulating, well tempered, and well watered, the principal rivers being the Ouse, the Yare, the Bure, and the Waveney, which in their course link together the numerous broads of the northeastern district. The soil consists chiefly of a sandy loam. Barley, turnips, and mangold are the chief agricultural products, and cattle and poultry, especially geese and turkeys, are extensively reared for the London market. There are manufactures in Norwich (*q. v.*), and important herring-fisheries connected with Yarmouth and other ports. Pop. (1901) 313,438.

Norfolk: city; Madison co., Neb. (for location of county, see map of Nebraska, ref. 9–F); on the Chi., St. P., Minn. and Om., the Fremont, Elk. and Mo. Val. and the Union Pac. railways; 75 miles S. W. of Sioux City, 130 miles N. W. of Omaha. It is in an agricultural and sugar-beet raising region; has 8 churches, 5 public-school buildings, electric lights, electric street-railway, and a daily and 4 weekly newspapers; and contains the largest beet-sugar factory in the State (established 1891). Pop. (1880) 547; (1890) 3,038; (1900) 3,883. Publisher of "Daily News."

Norfolk: city, port of entry, and U. S. naval station (settled in 1680, bombarded and nearly destroyed by the British in 1776, town organized in 1705 by act of Assembly, chartered as a city in 1845); Norfolk co., Va. (for location, see map of Virginia, ref. 7–I); on the Elizabeth river (an arm of the Chesapeake Bay), the Albemarle and Chesapeake Canal and Dismal Swamp Canal, and 7 important lines of railway; 8 miles from Hampton roads, 17 miles from the Atlantic Ocean, 88 miles S. E. of Richmond. It has an excellent harbor, large, safe, and of sufficient depth to accommodate the largest war vessels, and is in regular steamship communication with various U. S. and European ports, West Indies, and South America. The climate is genial, tempered by the Gulf Stream, which runs nearer the shore off Capes Henry and Hatteras than at any other point on the Atlantic coast. Norfolk and Portsmouth, on the opposite side of the river, constitute the largest naval station in the U. S., and a single U. S. customs district. The foreign trade in 1900 was represented by imports valued at $318,401, and by exports valued at $11,505,729. The city is an important coaling-station, handling 2,350,100 tons annually. The fourth cotton port in the U. S.; has a cotton business of about 1,000,000 bales annually, an annual oyster business valued at $2,500,000, and an annual truck business valued at about $6,000,000, and is the principal peanut-market of the country. There are 30 churches, an academy, a mission college, a college for young ladies, public-school property valued at over $350,000, 3 libraries containing nearly 12,000 volumes, 2 national banks with combined capital of $600,000, 6 State banks with capital of $765,000, board of trade, and cotton exchange, real estate exchange, and other trade and manufacturers' associations. Norfolk has the Holly system of water-works, drawing its supply from several lakes 7 miles distant; thorough sewerage; gas and electric light plants; 4 daily, 5 weekly, and 2 monthly periodicals; and Union stock-yards, business $2,500,000 annually. Four seaside resorts can entertain 8,000 people. Industries: 2 breweries, 6 bottling-works, 2 grain-mills, 2 creosoting plants, 7 peanut-mills, 3 paper-box factories, 3 book-binderies, 9 barrel, box, and crate factories, 5 ice-factories, 8 cotton knitting-mills, 2 cotton-compresses, 10 fertilizer-factories, 4 agricultural-implement works, 3 wagon and carriage works, 6 foundries, machine-shops, and boiler-works, 5 ship-yards, 1 grain elevator, 18 saw and planing mills, 2 furniture-factories, 6 brick plants, 3 electric-supply works, and several minor industries. In 1900 the assessed valuation was $25,924,210, and on Feb. 15, 1901, the net debt was $4,788,147.84: amount in the sinking-fund, $525,000; bonds bear 4 per cent., taken at a premium. Pop. (1880) 21,966; (1890) 34,871; (1900) 46,700.

John Whitehead.

Norfolk, Dukes of (1483), Earls of Arundel (1139), of Surrey (1483), and of Norfolk (1644): a family of the English nobility which enjoys the distinction of hereditary earl-marshal, premier duke, and premier earl of England. The earldom of the East Angles was conferred by Henry I. (1135) upon Hugh Bigod, who lost that title by rebellion against Stephen and Henry II., but was reconciled to the latter monarch and made Earl of Norfolk 1167. His grandson, Roger, was made earl-marshal on the failure of the male line of the Earls of Pembroke 1225, but both titles became extinct on the death of his nephew, of the same name, 1307. After having been held by Thomas of Brotherton, brother of Edward II. (1313–38), and by Thomas Mowbray (1386–1413), both titles were granted by Richard III., June 28, 1483, to John Howard, lord-admiral of England, France, and Aquitaine, a distinguished statesman and military leader, who was killed at the battle of Bosworth Field, Aug. 22, 1485, and attainted shortly afterward.—His son, Thomas Howard, who had been ennobled (as Earl of Surrey) at the same time as his father, whose attainder he also shared, was restored to his original title 1488; distinguished himself in war and diplomacy; was made earl-marshal 1510, and second Duke of Norfolk Feb. 1, 1514, as a reward for having gained the battle of Flodden Field; d. at Framlingham, May 21, 1524.—His son, Thomas Howard, third duke, in many respects the most noted member of the family, b. about 1474, took a very prominent part in public affairs; repeatedly commanded armies of invasion against Scotland; presided over the court which sentenced Queen Anne Boleyn to death, May 19, 1536; suppressed the rebellion known as the "Pilgrimage of Grace" 1537; was thrown into the Tower Dec., 1546, sentenced to death and attainted Jan. 27, 1547, but escaped through the opportune death of Henry VIII. on the following day; had his title restored by Queen Mary; d. Aug. 25, 1554. The cause of his fall might doubtless be traced to the previous misconduct and disgraceful death of his niece, Catharine Howard, third queen of Henry.—His brother, Lord Edward Howard, had been lord high admiral of England, and was killed in an attempt to destroy the French fleet 1513; while his eldest son, Henry Howard, celebrated as a poet under the title of Earl of Surrey, aspired to the hand of the Princess Mary, and was beheaded on Tower Hill, Jan. 19, 1547.—Surrey's son, Thomas Howard, b. about 1536, became fourth duke; intrigued for the hand of Mary, Queen of Scots, and was beheaded at London, June 2, 1572.—His grandson, Thomas Howard, b. 1592, was restored in blood by act of Parliament as Earl of Arundel and of Surrey 1603; was distinguished in the service of Charles I.; was restored to the earldom of Norfolk 1644, and is known to history under the title of Arundel, through the great collection of Grecian marbles made in his name.

Revised by C. K. Adams.

Norfolk Island: an island in the South Pacific, about half way between New Caledonia and New Zealand; lat. 29° S., lon. 168° E.; area, 10 sq. miles; pop. 750; under the supervision of the governor of New South Wales. It is one of the most solitary and inaccessible of the islands of the globe. Originally it was inhabited, and was discovered by Cook in 1774. From 1788 to 1805 and from 1825 to 1842 it was used as a penal colony by New South Wales. In 1856 many of the descendants of the mutineers of the Bounty were transported thither from Pitcairn island. These numbered 149 at the time of the transfer; their descendants now comprise all the inhabitants except those of the Melanesian mission station and school established here. Pop. (1896) 750. The climate is agreeable and healthful, and the soil fertile, but the inhabitants are indolent. M. W. H.

Nor'icum: province of the Roman empire, extending between the Danube and the Save, and bounded E. by Pannonia and W. by Vindelicia and Rhætia. It corresponded approximately to the portion of Austria proper S. of the Danube, together with the provinces of Styria, Carinthia, and Salzburg. It was conquered late in the reign of Augustus. Its principal city was Noreia (the modern Neumarkt in Styria).

Revised by G. L. Hendrickson.

Normal [from Lat. *nor'ma*, carpenter's square, rule; etymol. doubtful, possibly for **nōnma*, ninth, ninth letter, in allusion to the shape of letter L; cf. *germen* < **genmen* (?), *carmen* < **canmen* (?)]: a term used in mathematics. A normal to a plane curve is a straight line in that plane perpendicular to a tangent at the point of contact. The equation of the normal in rectangular co-ordinates is

$$y - y' = -\frac{dx'}{dy'}(x - x'),$$

in which y' and x' are the co-ordinates of the point on the curve. When the length of a normal is spoken of, we generally mean the distance from the point of normalcy to the

point in which the normal cuts the axis of x. In this case the formula for the length is

$$N = y' \sqrt{1 + p'^2},$$

in which y' is the ordinate of the point of contact, and p' the corresponding value of the first differential coefficient of the ordinate. The distance from the point on the curve to the center of the corresponding osculating circle is sometimes taken as the length of the normal, in which case this length is given by the formula

$$N = \frac{(1 + p'^2)^{\frac{3}{2}}}{p''},$$

p' having the same signification as before, and p'' being the corresponding value of the second differential coefficient of the ordinate.

A normal to a curve of double curvature is a straight line lying in the osculating plane and perpendicular to the tangent at its point of contact. In this case the length of the normal is the same as the length of the radius of the osculating circle to the curve at the point of contact. A plane is said to be normal to a curve at any point when it is perpendicular to the tangent at that point. A normal line to a surface is a straight line perpendicular to a tangent plane to the surface at the point of contact. Any plane through a normal line to a surface is a normal plane.

Revised by S. Newcomb.

Normal: city; McLean co., Ill. (for location of county, see map of Illinois, ref. 5–E); on the Chi. and Alton and the Ill. Cent. railways; 2 miles N. of Bloomington, 124 miles S. S. W. of Chicago. It is noted as the seat of the Illinois State Normal University, organized in 1857, which in 1890–91 had 19 instructors and 682 professional and graduate and 145 non-professional students. It is also the seat of the Illinois Soldiers' Orphans' Home, founded in 1869. The Normal University has a library of over 7,000 volumes, and the Orphans' Home one of over 3,000. The city is in a coal region, has extensive nurseries, and contains a national bank, a savings-bank, and 3 periodicals. Pop. (1880) 2,470; (1890) 3,459; (1900) 3,795.

Normal Schools: See Schools.

Norman: village (founded in 1889); capital of Cleveland co., Okl. (for location, see map of Oklahoma, ref. 3–D); near the Canadian river, and on the Atch., Top. and Santa Fé Railroad; 50 miles S. of Guthrie. It is in a corn, grain, and cotton region, and contains the University of Oklahoma, 8 churches, 2 public-school buildings, High Gate Female College (Methodist Episcopal South), 3 State banks, flour and cottonseed-oil mills, and a daily, a monthly, and 3 weekly periodicals. Pop. (1890) 787; (1900) 2,225.

Editor of "State Democrat."

Normandy [Fr. *Normandie*, deriv. of *Normand*, Norman. See Normans]: an old province of France, bordering on the English Channel, and comprising an area of 10,534 sq. miles; now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. The ground is naturally fertile, and the inhabitants are descendants of the old Normans (*q. v.*). When, in 1066, their duke, William II., conquered England, Normandy entered into a close political relation to that country, which continued, generally as a formal union, until, in 1204, Philip Augustus conquered the province and made it a part of France. After the battle of Agincourt, in 1415, the English once more held it, but only till 1449, when Charles VIII. finally united it to France.

Norman French: properly, the French dialect or dialects of Normandy, or the region occupied by the invading Normans or Northmen, which was granted their leader by Charles the Simple early in the tenth century. In English the term is used to designate the Old French brought into England as a result of the Norman conquest, and there having a history somewhat different from that of any form of French in France. At the time of the conquest the French brought into England was not very different from that which is the parent of the modern literary French, but some words of a distinctly different dialect type came in also (cf. *catch* and *chase*, respectively from *cachier* and *chacier* in Old French, the latter of which has become the modern *chasser*, the origin of both being the same). In England certain changes arose; for instance, the diphthong *ie* became close *e*, and, at a later time, *a* before a nasal followed by a consonant appears very often as *au*, whence our frequent spellings with *au* as in *launch*, *aunt*, *avaunt*, *haunt*, etc. The original French diphthong *ei* became to a great extent *oi* in literary French, even in the Old French time, but this change did not take place in Anglo-French. The letter *u* had two distinct values in the early French of England, one like or nearly like that of modern French *u*, the other about like English *u* in *rude* (short or long). Of these two sounds the second was often represented later by *ou*, while in many such words the literary French developed a sound written *eu*; hence in modern English, for example, the common adjective ending *-ous* (= Lat. *-ōsus*), corresponding to modern French *-eux*, as in *generous*, Fr. *généreux*. The Old French *ch*, *j*, and *g* before *e* and *i* still keep in English in old borrowings from French their Old French sounds, as in *chant*, *gist*, *Jew*, *jest*, etc., while in modern literary French they have changed their value. Some words were rather early taken into English from the literary French, and such borrowings have continued up to modern times. In consequence of this and of borrowings directly from Latin and other languages at various times in the history of English, our language shows two or more different forms for many words. Compare *chair* and *chaise* (and even *shay*); *petrify* and *pier*; *peer* and *par* (cf. also *pair*); *cavalier* and *chevalier*, *feeble* and *foible*, etc. A dictionary of the French as used in England is much needed. For the language and its relations to English, see especially Behrens, *Beiträge zur Geschichte der französischen Sprache in England* (in *Französische Studien*, v.), and the same in Paul's *Grundriss der germanischen Philologie*, i., 799–836; also Skeat, *Principles of English Etymology*, 2d series, *The Foreign Element* (1891; this book is reviewed in *Modern Language Notes*, Nov., 1892).

E. S. Sheldon.

Normans [from Fr. *Normand*, from Dan. *Normand*, liter., Northman]: I. *The Northmen.*—Toward the end of the eighth century Western Europe began to be scourged by the inroads of Scandinavian pirates, known to the inhabitants of the British isles as "East-men" and "Danes"—to those of the Continent as "North-men." They were of Teutonic stock, a vigorous, seafaring race, not yet Christianized, peopling the coasts and islands of the Baltic and of the peninsulas of Jutland and Scandinavia. Need and the national thirst for adventure and for strife drove forth swarms of Vikings (i. e. bay-men, frequenters of bays and inlets) from the thickening population down upon the sunnier, richer, weaker south. These scoured the coasts of England, Germany, and France, pressed with their small, sharp, open vessels up the narrowest streams, burned, slew, and plundered, and sailed away laden with booty and with slaves. About the middle of the ninth century these raids began to assume an altogether new character and importance. The consolidation of the three great Scandinavian kingdoms broke the power of the petty kings and independent nobles, and drove many of them forth, with their followers, to seek a freer life in some new home. Northmen threw themselves in larger bands upon England, which the Wessex kings had not yet fairly centralized; upon the Frankish kingdoms, fast falling asunder under the later Carolingian rulers; harried the country, besieged and sacked the cities, wintered at the mouths of the rivers, and by the end of the century had wrested from Alfred half his kingdom, and had begun to plant colonies upon the coasts of France. Northmen ravaged Spain and the shores of the Mediterranean, fell upon Western Italy, penetrated Greece and Asia Minor, and there met others of their countrymen who had pressed down through Russia. In the Russia of that day Scandinavian invaders (Varangians) had become the ruling class, a military aristocracy; and those who made their way still farther south had formed the famous Varangian body-guard of the Byzantine emperors, which maintained its existence and its distinctive character for five centuries. During the latter half of the ninth century, also, Scandinavians, sailing westward, found and settled Iceland, where the old free Germanic community life held for nearly 400 years; whence Greenland was visited and colonized; whence, also, it seems, navigators made their way farther down the North American coast to a "Vinland" where settlements were attempted, and to a still more southerly "Hvitramanaland."

With the establishment, early in the tenth century, of settlements upon the Continent, with the occupation which Scandinavian energy found at home in wars between the three new kingdoms, and with the gradual triumph of Christianity in the north, Europe gained, at last, comparative rest. England's period of misery and humiliation under Ethelred (979–1016), which terminated with the establishment of a Danish dynasty (1017–42), marks the last great outburst of the pent-up heathenism.

II. *Normandy.*—Of all the settlements of the Northmen, one alone was destined to play a really important part in history. By the treaty of Claire-sur-Epte (912) Charles the Simple enfeoffed a viking, Rolf or Rollo, with the lands upon either side of the Seine of which he and his followers were in actual possession. In return the new duke of the Northmen recognized the Carolingian king as his overlord, and received baptism. It seemed highly probable that this latest Teutonic settlement would prove a powerful diversion in favor of the waning authority of the Frankish kings of Laôn against the increasing influence of the French duchy of Paris, which had first risen to importance as a mark against the Northmen, and at whose expense the "Terra Northmannorum" was now created. Duke Rolf, indeed, remained loyal to his Carolingian lord, and, fighting in his cause, won for himself the Bessin; but William "Longsword" (927–943), who added to his domains the Cotentin, was largely French in feeling, and his allegiance to the Carolingians was a wavering one. The third duke, Richard "the Fearless" (943–996), became the "man" of Hugh the Great of Paris, and, later, of his son "Capet," to whose establishment upon the throne he lent decisive aid. It was thus the settlement of these northern pirates, says Freeman, which finally made Gaul French in the modern sense. It was at the same time the alliance with Romanic France which brought the Northmen fully under the influence of French language, law, and custom, which made them *Normans*, the foremost apostles alike of French chivalry and of Latin Christianity. Under Richard "the Good" (996–1026) Norman arms began to be borne beyond the borders of the Norman duchy. Robert of Toesny warred against the infidel in Spain; Rainulf began his career of conquest in Apulia. To the brothers Richard III. (1026–28) and Robert "the Devil" (1028–35) succeeded the "Bastard of Falaise," William the Conqueror. The duchy of Normandy—which before his conquest of England (1066) he had widened by the winning of Maine (1063)—he left at his death (1087) to his first-born Robert, from whom it was wrested (1106) by his brother, Henry I. of England. Thenceforth it was held by the English kings until its seizure by the French crown in 1203.

For the Norman conquest of England and its political consequences, see ENGLAND, HISTORY OF. For the influence which Norman institutions exercised in the development of the English common law, see MUNICIPAL LAW of England.

III. *The Normans in the Sicilies.*—The Sicilies at the beginning of the eleventh century were divided and disputed between Langobards, Greeks, and Saracens. A band of Norman knights, entering Apulia upon a pilgrimage, lent their aid to the Langobards, who were Latin Christians, in an attempt to expel the Greeks. This enterprise miscarried; but the reckless courage and strict discipline of the Normans brought their further assistance into great demand, and won them soon great fame and influence. In 1030 they built the city of Aversa; eight years later their leader Rainulf received from Conrad II. of Germany the title of count. Such beginnings drew from overcrowded Normandy fresh swarms of adventurers, with whose aid the Greek viceroy won from the Moslems (1038) the greater part of the island of Sicily. Swindled in the sharing of the booty, the Normans attacked the Greek possessions in Southern Italy with such success that their leader, William "Iron-arm," son of Tancred d'Hauteville, soon styled himself Count of Apulia; in which title we find his brother and successor, Drogo, confirmed by the German emperor, Henry III. With the third Apulian count, Humphrey, Pope Leo IX. came into strife over Benevento. Defeated and captured in the battle of Civitate (1053), the pontiff was fain to strike a peace upon the condition of Norman vassalage to the holy see. Still another son of Tancred, the famous Robert Guiscard, succeeded his brother Humphrey (1056). "By the grace of God and of St. Peter, Duke of Apulia and Calabria," he spent the first twenty years of his long rule in making good his title over Greek, Langobard, and Norman. Meanwhile his younger brother, Roger, passing with a few hundred knights into Sicily, won a series of brilliant victories, and finally, with Robert's aid, made himself master of the island. In 1081 Robert invaded Greece and defeated the East Roman emperor at Durazzo in Albania. Already Byzantium trembled, when disturbances in Apulia and the repeated summons of the pope, in hot strife with Henry IV. of Germany, drew the Guiscard back to Italy. Bursting into the Campagna with 6,000 horse and 30,000 foot, he pressed back the German emperor, delivered Gregory (besieged in St. Angelo), and sacked Rome (1084). Dying the next year, he left the ducal title to his second son, Roger. His first-born, Bocmund, won great fame in the first crusade and established an independent principality in Antioch. In 1127 the Guiscard line became extinct, and Roger, second Count of Sicily, united the conquests of the house of Tancred, reigning as King of Sicily and Naples; as did also his son and grandson after him, William I. (1154–66) and William II. (1166–89). From the raising of the siege of St. Angelo, through all the conflicts between the papacy and the German empire, the former found in the Sicilies, under the Norman supremacy, its firmest support; but in 1186, through the marriage of Henry VI. of Germany with Constance, aunt and heiress of the childless William II., the succession to the Sicilian throne passed over to the imperial house of Hohenstaufen. Upon William's death (1189) the pope and the Norman nobility set up the illegitimate Tancred; but in 1194, invading the Sicilies with a German army, Henry crushed out all opposition. His son by Constance, Frederick II., afterward united and ruled both realms. Under the Norman kings and the half-Norman Frederick the Sicilies furnished the one example of the time of full religious toleration. Greek and Saracen dwelt together in the enjoyment of civil equality and freedom of faith. The art and the learning of both races found generous encouragement. Sicily and Spain, the points at which the Eastern civilization touched the Western most closely, became the centers from which the culture of the Saracen and the reawakening of scientific study spread throughout Europe. In 1266 Charles of Anjou, in league with the papacy, defeated and slew King Manfred, Frederick's son, and made himself master of the Sicilies. After the overthrow of their supremacy, the Normans, as in France and in England, became blended with the races they had ruled.

MUNROE SMITH.

Norns (Icelandic plural *Nornir*): the goddesses of fate in Scandinavian mythology. There are three—Urd (the Past), Verdande (the Present), and Skuld (the Future). They dwell near Urd's fountain, by one of the roots of the great ash Ygdrasil, where the gods meet in council. They water the branches of Ygdrasil to keep the tree from withering and fading. They weave the web of men's lives, stretching it from the radiant dawn to the glowing sunset. The destiny of the world is in the hands of the norns, and even the gods must submit to their decrees. The three witches in Shakspeare's *Macbeth* have their origin in the Scandinavian norns.

RASMUS B. ANDERSON.

Noroña, nō-rōn'yăă, GASPAR MARÍA DE NAVA ÁLVAREZ, Conde de: poet and soldier; b. at Castellón de la Plana, Spain, May 6, 1760; d. in Madrid in 1815. He became a royal page in 1766; captain of dragoons in 1778. He greatly distinguished himself in the siege of Gibraltar. When peace with Great Britain was declared, he was sent as ambassador to Russia. In 1792 he returned to the army, and became lieutenant-general in command of part of the Spanish army in Galicia. Throughout his career he cultivated letters as a pastime. He wrote a tragedy in verse, *Madama González*; and two comedies in prose, *El Hombre marcial* and *El Cortejo enredador*. He wrote also many lyrics and occasional poems (published under the title *Poesías*, 2 vols., Madrid, 1799), and a dull epic, *Ommiada* (2 vols., Madrid, 1816). He translated into Spanish various poems from the Arabic, Persian, and Turkish (*Poesías asiáticas*, Paris, 1833). The best of his work is to be found in vol. lxiii. of Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 1871).

Norris, WILLIAM EDWARD: novelist; b. in London, 1847, a son of Sir William Norris, chief justice of Ceylon. He was educated at Eton, and admitted to the bar in 1874. Among his novels, which have been likened to Thackeray's, are *Matrimony* (1881); *Thirlby Hall* (1884); *Adrian Vidal* (1885); *The Rogue* (1888); *Marcia* (1890); *Mr. Chaine's Sons* (1891); *His Grace* (1892); *A Deplorable Affair* (1893).

H. A. B.

Norris, WILLIAM FISHER: ophthalmologist; b. June 6, 1839, in Philadelphia, Pa.; was educated at the University of Pennsylvania; is assistant surgeon and brevet captain

U. S. army; surgeon of the Wells Eye Hospital; Professor of Ophthalmology, University of Pennsylvania. He is author of *Medical Ophthalmology* (in Pepper's *System of Medicine*), and, with Charles A. Oliver, of *A Text-book of Diseases of the Eye.* C. H. T.

Norristown: borough (incorporated in 1812, enlarged in 1853); capital of Montgomery co., Pa. (for location of county, see map of Pennsylvania, ref. 6–J); on the Schuylkill river, the Schuylkill Canal, and the Phila. and Reading, the Penn. and the Stoney Creek railways; 16 miles N. W. of Philadelphia. It is in an agricultural and mineral region, and in some parts is 200 feet above the river. The water-supply is from the Schuylkill river, the distribution being from a reservoir at a height of nearly 200 feet above the level of the river. Several bridges across the river connect the borough with that of Bridgeport. The borough is the seat of one of the State hospitals for the insane, having twenty buildings and accommodations for nearly 2,000 patients, and has over 20 churches, public-school property valued at $200,000, 3 national banks with combined capital of $550,000, 4 libraries (the Norristown Library Association, founded 1796; Montgomery County Law, founded 1869; the William McCann High School, founded 1870; and the insane hospital, founded 1880) containing together over 20,000 volumes, and 3 daily, 5 weekly, and 2 other periodicals. The industries include the manufacture of cotton and woolen goods, shirts, hosiery, glass, carpets, brick, flour, and iron furnace and rolling-mill products. Pop. (1880) 13,063; (1890) 19,791; (1900) 22,265. EDITOR OF "HERALD."

Norr'köping: town of Sweden, in lat. 59° N., on the Motala, near the Baltic. The river is here crossed by several substantial bridges, and lined with commodious quays and spacious docks (see map of Norway and Sweden, ref. 12–F). Norrköping ranks as the second manufacturing city in Sweden; it has important ship-building and sugar-refining establishments, a salmon-fishery, and manufactures of paper, tobacco, leather, cotton, linen and woolen goods, and other articles. In 1888 its factories numbered 75. Pop. (1891) 32,826. Revised by R. B. ANDERSON.

Norse Mythology: See SCANDINAVIAN MYTHOLOGY.

North, CHRISTOPHER: See WILSON, JOHN.

North, EDWARD, L. H. D., LL. D.: educator; b. at Berlin, Conn., Mar. 9, 1820; graduated at Hamilton College in 1841; was principal of the Grammar School, Clinton, N. Y., 1841–42; was Dexter Professor of Greek and Latin in Hamilton College 1843–62; has been Professor of Greek Language and Literature in the same institution since 1862. He has been necrologist of the alumni society; editor of the *Triennial*, and of *Alumniana* in the *Hamilton Literary Monthly*; since 1881 a member of the board of trustees; was acting president 1892. C. K. HOYT.

North, FRANCIS: jurist; Baron Guilford, son of the fourth Baron North; b. in England, Oct. 22, 1637; studied at Cambridge and at the Middle Temple; was called to the bar 1661; was retained by the crown in important cases; was knighted and became solicitor-general 1671; appointed attorney-general 1673, chief justice of the common pleas 1675, privy councilor 1679, lord keeper of the great seal 1682; created Baron Guilford Sept., 1683. D. Sept. 5, 1685.—Of his brothers, Sir DUDLEY, b. May 16, 1641, was a wealthy Turkey merchant and M. P., author of *Discourses upon Trade*, etc., which entitles him to a high rank among the political economists of the seventeenth century, and even anticipates the doctrines of Adam Smith and the Manchester school. D. Dec. 31, 1691.—JOHN, b. in London, Sept. 3, 1645, became a fellow of Cambridge, Professor of Greek, master of Trinity College, doctor of divinity, and editor of Plato's *Dialogues*. D. at Cambridge, Apr., 1683.—ROGER, b. about 1650, became attorney-general under James II., was author of biographies of the above three brothers (1740–42) and of several treatises on law, politics, and music. D. Mar. 1, 1734.

North, FREDERIC, Earl of Guilford, best known as Lord NORTH: statesman; b. in England, Apr. 13, 1733; educated at Eton and at Trinity College, Oxford; entered the House of Commons as a Tory at an early age; became a lord of the treasury 1759, and in 1763 moved the expulsion of John Wilkes; supported the American Stamp Act 1765; became joint paymaster of the forces 1766; became Chancellor of the Exchequer and leader of the House of Commons on the death of Charles Townshend 1767; First Lord of the Treasury and Prime Minister 1770; proposed the colonial tea duty 1773, and the Boston Port Bill Mar., 1774; retired from office Mar. 20, 1782; became joint Secretary of State with Fox in the "coalition ministry" 1783; became blind 1787; succeeded to the earldom 1790; died Aug. 5, 1792.

North Adams: town; Berkshire co., Mass. (for location of county, see map of Massachusetts, ref. 2–C); on the Hoosac river, and the Boston and Albany and the Fitchburg railways; at the west terminus of the Hoosac tunnel. (See TUNNELS AND TUNNELING.) It is surrounded by the high and picturesque Berkshire hills, comprises several villages, and has Greylock, the highest mountain in Massachusetts, and Hudson's brook, where there is an interesting natural bridge of soft marble, in its vicinity. The town contains a large number of cotton and woolen mills and shoe-factories, and was one of the first manufacturing places in the Northern and Eastern States to make use of Chinese labor. It has 2 national banks, capital $700,000, 2 savings-banks, a daily and 3 weekly newspapers, and a public library (founded 1884) with over 10,000 volumes. Pop. (1880) 10,191; (1890) 16,074; (1900) 24,200. EDITOR OF "TRANSCRIPT."

North America: See AMERICA.

Northamp'ton, or **Northamptonshire**: an inland county of England; bounded N. by Leicester, Rutland, and Lincoln. E. by Huntingdon, Bedford, and Bucks, S. by Oxford, and W. by Warwick. Area, 984 sq. miles. The surface is finely diversified with richly wooded hills and well-watered valleys, and the soil, consisting mostly of a black mould or a brown loam, is very fertile. Wheat and green crops are largely grown. On the broads many cattle are grazed and dairy farming is carried on. The principal minerals are limestone and ironstone of a good quality. It returns four members to Parliament. Pop. (1901) 248,585.

Northampton: capital of the county of Northampton, England; on the Nene; 50 miles S. E. of Birmingham (see map of England, ref. 10–I). It has a fine town-hall, a free library, a museum, schools of science and art, and thirteen churches, among which is St. Sepulchre's, one of the few remaining round churches in England. In the neighborhood of the town is a fine racecourse at which there are two meetings annually. Its manufactures of hosiery and lace have declined, but those of leather, boots, and shoes are very important: also its breweries, iron-foundries, and flour-mills. The parliamentary borough returns two members to Parliament. Pop. (1901) 87,021.

Northampton: city (settled in 1754); capital of Hampshire co., Mass. (for location of county, see map of Massachusetts, ref. 3–E); on the Connecticut river, and the Boston and Maine, the Conn. River, and the N. Y., N. H. and Hart. railways; 17 miles N. of Springfield, 95 miles W. of Boston. It has an elevated site, affording a fine view of Mt. Holyoke and Mt. Tom, and is connected with Hadley by a bridge across the river. Among its notable institutions are Smith College for young women (non-sectarian, chartered 1871), the Clarke Institution for Deaf Mutes (founded 1867, endowed by John Clarke with $3,000,000), a classical school for girls, the State Lunatic Asylum (established 1858), and a Soldiers' and Sailors' Memorial Hall (cost $75,000). There are 6 libraries (Public, Smith College Reference, Clarke Institution, Burnham Classical School, Hampshire County Law, and Lunatic Asylum) containing over 40,000 volumes; 3 national banks with combined capital of $1,150,000, 2 savings-banks, and a monthly, 2 daily, and 2 weekly periodicals. The industries include the manufacture of baskets, sewing-machines, pocket-books, cotton, woolen, and silk goods, brushes, paper, buttons, and cutlery. The beauty and salubrity of its location have made it a popular summer resort. Pop. (1880) 12,172; (1890) 14,990; (1900) 18,643. EDITOR OF "HERALD."

North Anna, BATTLES OF: See WILDERNESS, BATTLES OF THE.

North Attleboro: town; Bristol co., Mass. (for location of county, see map of Massachusetts, ref. 4–I); on the N. Y., N. H. and Hart. Railroad; 14 miles N. by E. of Providence, 30 miles S. S. W. of Boston. It is noted for its manufactures of jewelry, and contains a public library, national bank with capital of $150,000, savings-bank, and a daily newspaper. Pop. (1890) 6,727; (1900) 7,253.

North Baltimore: village; Wood co., O. (for location of county, see map of Ohio, ref. 2–D); on the Balt. and O. and the Cin., Ham. and Dayton railways; 38 miles E. of Defiance. It is in a natural-gas region, has manufactures

of lumber and staves, and contains a national bank with capital of $60,000, a State bank with capital of $37,500, and two weekly newspapers. Pop. (1880) 701; (1890) 2,857; (1900) 3,561.

North Bay: a town of Ontario, Canada; on the north shore of Lake Nipissing; station on the Northern Pacific Railway; 244 miles N. W. of Ottawa (see map of Ontario, ref. 1–E). It was founded in 1884 and develops rapidly. Population, principally French Canadian, 1,400. M. W. H.

Northbrook, Thomas George Baring, Viscount: statesman; eldest son of the first baron; b. at Stratton Park, near Winchester, England, in 1826; graduated at Oxford 1846; was successively private secretary to Mr. Labouchere at the Board of Trade, to Sir George Grey at the Home Office, to Sir Charles Wood at the India Board and at the Admiralty; entered Parliament in the Liberal interest 1857; was a lord of the admiralty 1857–58; Under Secretary of State for India June, 1859–Jan., 1861, for War from the latter date to June, 1866, and again on the accession of Mr. Gladstone to office Dec., 1868, till Feb., 1872, when he was appointed Viceroy and Governor-General of India, having succeeded to the barony in Sept., 1866. In 1876 he resigned and was created a viscount; in 1880 he was appointed First Lord of the Admiralty in Gladstone's cabinet, but in 1886 opposed the home-rule policy of the Premier.

North Brookfield: town; Worcester co., Mass. (for location, see map of Massachusetts, ref. 3–F); on the North Brookfield branch of the Boston and Albany Railroad; 20 miles W. of Worcester, one of the county-seats. It is in an agricultural and dairying region, is extensively engaged in the manufacture of shoes, and has two libraries (Appleton, founded 1859, and Free Public, founded 1880) containing over 10,000 volumes, a savings-bank, and a weekly newspaper. Pop. (1880) 3,427; (1890) 3,871; (1900) 4,587.

North Cape: See Cape North.

North Carolina [Mod. Lat. (sc. *ter'ra*, land), land of Charles, liter., femin. of *Caroli'nus*, pertaining to Charles, deriv. of *Ca'rolus*, Charles. Named in honor of Charles I.]:

Seal of North Carolina.

one of the U. S. of North America (South Atlantic group); the twelfth of the original thirteen States that ratified the Federal Constitution.

Location and Area.—It lies between 33° 50′ and 36° 33′ N. lat. and 75° 27′ and 84° 20′ W. lon.; is bounded on the N. by Virginia, on the E. and S. E. by the Atlantic Ocean, on the S. by the Atlantic, South Carolina, and part of Georgia, on the W. by Tennessee. Extreme length from E. to W., 503¼ miles; extreme breadth N. to S., 187½ miles; average breadth, 100 miles. Area, 52,250 sq. miles, of which 3,670 are water surface.

Physical Features.—A line drawn from Weldon, on the Roanoke river, to Raleigh, and thence to Columbia, S. C., divides the State into two geologic regions—the eastern or coastal plane region, the formations of which are comparatively recent in age and are composed mainly of sands and clays, with occasional composites of marl and limestone; and the western, the formations of which are of older rocks, mostly granites, gneisses, and crystalline schists, containing two narrow and irregular strips of coal-bearing red sandstone and shale (Triassic or Newark). Along the western border of this eastern region the surface is undulating, and has an elevation varying from 200 to 300 feet above the sea. Eastward, approaching the ocean, the elevation decreases to but a few feet above the sea, and the surface becomes nearly level, in many places marshy, and extensively intersected by the sounds and estuaries of the rivers. The western region, undulating along its eastern border, becomes more hilly westward through the middle and Piedmont counties until the hills become small mountains, and these in turn give place to the Blue Ridge and adjacent mountain chains, which reach their maximum development in the Black Mountains. The eastern region contains large areas of the finest farming lands of the State and valuable forests of pine. The occasional economic mineral products are marls, limestone, and phosphate. In the middle and western counties the mineral products occur on a larger scale. Granite and granitic gneiss suitable for building, monumental, and paving stone are widely distributed. Sandstones—brown, red, and gray—are found in the middle section, and marble—white, pink, and blue—occurs in the western. Slate suitable for roofing has been quarried in two counties; the conglomerates of the Triassic are successfully used as millstones; kaolin occurs in large quantities and of excellent quality. Talc is mined on a considerable scale in the extreme southwest; agalmatolite is found abundantly in Chatham and Moore Counties; baryta occurs extensively, and is mined in Madison County; corundum is extensively mined in Jackson, Macon, and Clay Counties; mica occurs as large crystals associated with quartz and feldspar; and veins of bituminous and anthracite coal in the Triassic formations in Chatham, Moore, Rockingham, and Stokes Counties. Iron ores, copper, silver, and gold are widely distributed through the State. For nearly a century gold-mining has attracted attention, and upward of $22,000,000 worth has been obtained. More than 180 species of minerals have been discovered, including gems such as the diamond, ruby, sapphire, hiddenite, emerald, beryl, amethyst, garnet, and zircon.

North Carolina is well drained, though none of its streams are large. In the mountain plateau are the Hiwassee, Tennessee, Pigeon, French Broad, Nolechucky, and the Watauga, all flowing toward the Mississippi river. The New river flows northward into the Ohio. Eastward of the Blue Ridge, the Broad, Catawba, and Yadkin flow to the Atlantic through South Carolina, the Broad becoming the Wateree and the Catawba the Congaree, the two uniting to form the Santee. The Yadkin, uniting with the Uwharrie, becomes the Pedee. The Dan, the longest river in the State, has part of its course in Virginia. Other rivers rising at some distance from the mountains are the Tar, near its mouth called the Pamlico, the Neuse, the Cape Fear, formed by the Haw and the Deep, the Lumber, changing its name in South Carolina to Little Pedee, and the Waccamaw. All of the rivers E. of the Blue Ridge are navigable 100 or more miles for light craft.

The largest sheets of inland water are Albemarle and Pamlico Sounds. The former is about 50 miles long and of variable width, the maximum being about 15 miles, and Pamlico is about 75 miles long and 15 to 25 miles broad. Between them and the ocean are long, narrow islands of sand, which extend into the ocean, in some places 100 miles, forming dangerous shoals, of which Cape Hatteras, Cape Lookout, and Cape Fear are the most prominent visible points. Lakes are found only in the eastern section. The largest is Mattamuskeet, in Hyde County, 15 miles long and 5 to 7 wide. Waccamaw Lake, in Columbus County, is 8 miles long and about 5 miles broad.

The area occupied by the swamps is nearly 4,000 sq. miles, mostly in the counties bordering on the ocean and the sounds. Some are mere peat-bogs, having a growth of juniper and cypress, while the best have black gums, poplars, ash, and maple. The largest continuous area of swamp is between Albemarle and Pamlico Sounds, nearly 3,000 sq. miles. More than 100 sq. miles of the Great Dismal Swamp is in North Carolina.

The mountain section is a high plateau bounded on the E. by the Blue Ridge and on the W. by the chain known under the names of Iron, Smoky, and Unaka Mountains. Between these are the cross chains, called, beginning at the N., the Black, Craggy, Pisgah and New Found, Balsam, Cowee, Nantehala, Valley River, Cheowah, and Long Ridge Mountains. The average elevation of the Blue Ridge is about 4,000 feet, the highest peaks being the Grandfather and the Pinnacle, nearly 6,000 feet high. The Smoky Mountains have peaks higher than this, as Clingman's Dome (6,660) and Mt. Guyot (6,636 feet). The highest E. of the Rocky Moun-

NORTH CAROLINA

tains are among the Black Mountains, Mt. Mitchell being 6,688 feet high. In all, there are 43 peaks over 6,000 feet high and 82 between 5,000 and 6,000 feet. East of the Blue Ridge are various lower and smaller detached ranges, such as the Sauratun, Brushy, South, Linville, Green River, Tryon, and Hungry Mountains. Belonging to the first named is the picturesque, solitary peak called the Pilot, with the Pinnacle, a sheer mass of rock like a castle.

Flora and Fauna.—North Carolina has an extraordinary variety of flora. Out of 22 oaks indigenous to the U. S. she has 19. She has all the 8 pines, 4 of the 5 sprnces, 6 of the 8 hickories, and all of the 7 magnolias. Some of the best varieties of grapes had their origin here. No country has a more abundant display of rhododendrons, kalmias, honeysuckles, jasmines, ferns, and grasses. In the waters and swamps of the east are turtles and terrapins, including the much-sought diamond-backed variety. Swarms of wild geese, swans, ducks, and the other aquatic fowls attract the sportsman, as does the quail (or partridge) on the uplands. Large catches of mackerel, bluefish, flounder, mullets, etc., are made in the ocean, and of herrings, shad, rock bass, etc., in the sounds and rivers. Immense numbers of menhaden and other fish are caught to be made into fertilizers.

Soil and Productions.—The soil varies considerably in character, being generally a loam which becomes more sandy in the eastern and frequently more clayey in the central and western regions. The great variety of soils and the wide range of climate give rise to a rich and varied forest growth. In the southeastern counties, under the influences of the Gulf Stream, are found the magnolias, palmettos, live-oaks, and other semi-tropical trees, while on the higher mountains of the west are the spruces and firs, characteristic of Canada and New England. The pines (chiefly *Pinus tæda* and *P. palustris*) are the characteristic timber trees of the eastern counties; oaks predominate in the midland and western counties, but in the mountain forests they are interspersed abundantly with chestnut, hemlock, and the tulip-tree. Hickories and other hard-wood trees also abound in the central and western counties, and to a less extent in the east.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms	157,609	178,359	13·2
Total acreage of farms	22,363,558	22,651,896	1·3
Value of farms, with buildings and fences	$135,793,602	$183,977,010	35·5

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	2,482,515	29,790,180 bush.	$16,980,403
Wheat	620,917	5,960,803 "	4,887,858
Oats	263,030	5,046,117 "	2,270,753
Rye	46,212	411,287 "	312,578
Tobacco (1896)	134,567	68,629,170 lb.	5,490,334
Potatoes	17,434	1,063,474 bush.	691,258
Hay	125,305	176,680 tons	1,978,816
Totals	3,689,980	.....	$32,612,000

In 1900 the cotton crop amounted to 503,825 bales.

On Jan. 1, 1900, the farm animals comprised 148,164 horses, value $7,926,938; 112,512 mules, value $7,141,558; 243,298 milch cows, value $4,428,024; 274,843 oxen and other cattle, value $3,383,726; 235,260 sheep, value $379,945; and about 1,500,000 swine, value $6,000,000.

Climate.—The following table shows the mean monthly and annual temperature in degrees Fahrenheit:

MONTHS.	Eastern District.	Central District.	Western District.	State.
January	43·6°	40·7°	38·5°	40·8°
February	46·0	44·2	41·8	44·3
March	49·5	49·2	46·0	48·0
April	57·8	59·8	56·3	57·7
May	67·4	68·2	64·1	66·9
June	75·1	75·7	70·9	74·4
July	78·8	78·7	74·4	77·8
August	77·2	76·0	72·2	75·8
September	72·3	69·8	66·2	70·2
October	62·4	59·2	55·3	59·7
November	52·7	49·1	45·6	49·7
December	45·2	43·2	39·8	42·7
Year	60·7	59·5	55·9	59·0

The following table shows the mean monthly and annual precipitation in inches. It will be noticed that North Carolina belongs to the region of the U. S. characterized by the largest precipitation.

MONTHS.	Eastern District.	Central District.	Western District.	State.
January	4·60	4·30	4·75	4·52
February	3·48	4·25	5·40	4·25
March	4·64	4·21	5·56	4·90
April	4·20	3·75	3·75	3·84
May	4·01	4·00	4·34	4·34
June	4·40	4·00	4·34	4·34
July	5·98	4·66	5·19	5·44
August	6·66	5·33	5·42	6·09
September	5·64	4·30	3·88	4·65
October	4·04	3·47	3·38	3·66
November	3·42	3·53	3·35	3·40
December	4·16	3·73	3·92	4·00
Year	55·23	49·85	53·32	53·29

The average fall of snow is less than 5 inches. The average date of the first killing frost is Oct. 10. Tornadoes with funnel-shaped clouds occur at rare intervals. The storms on the Atlantic coast, especially off Hatteras, are violent and destructive to shipping.

Divisions.—For administrative purposes the State is divided into ninety-seven counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.
Alamance	2-G	18,271	25,665	Graham	2,052

* Reference for location of counties, see map of North Carolina.
† Organized from part of Richmond in 1900.

Principal Cities and Towns, with Population for 1900.—Wilmington, 20,976; Charlotte, 18,091; Asheville, 14,694; Raleigh, 13,643; Winston, 10,008; Greensboro, 10,035; Newbern, 9,090; Concord, 7,910; Durham, 6,679; Elizabeth City, 6,348; Salisbury, 6,277; Goldsboro, 5,877; Washington, 4,842; Fayetteville, 4,670; Gastonia, 4,610; High Point, 4,163; Kinston, 4,106.

Population and Races.—In 1860, 992,622; 1870, 1,071,361; 1880, 1,399,750; 1890, 1,617,947 (native, 1,614,245; foreign, 3,702; males, 799,149; females, 818,798; white, 1,055,382; colored, 562,565, including 561,018 of African descent).

Industries and Business Interests.—The census of 1890 showed that 3,667 manufacturing establishments reported. These had a combined capital of $32,745,995, employed 36,214 persons, paid $7,830,536 for wages and $22,789,187 for materials, and had products valued at $40,375,450. In 1894 there were 146 cotton-mills, with 665,000 spindles and 9,128 looms; 14 woolen-mills; 28 fruit-canning and 14 oyster-canning establishments; 16 fertilizer works; 14 oil-cake factories; 8 hosiery-mills; 16 building-stone quarries; and more than 100 factories manufacturing tobacco in some form. The tobacco industry has made rapid progress, and the towns of Durham, Winston, and Henderson have been created by it. Durham has manufactured in a single year 620,200,000 cigarettes, 4,865,835 lb. of plug and smoking tobacco, 2,263,250 cigars, and 71,500 lb. of snuff, and paid a revenue tax on these manufactures of $616,129; and Winston has paid a revenue tax of over $660,000 on similar manufactures. The manufacture of wagons, carriages, furniture, sash, doors, and blinds, paper, and of miscellaneous iron-work, shows a rapid increase and a large volume. The fisheries industry represents a capital of $506,560, employs over 5,000 persons, 95 vessels, and nearly 2,800 boats.

Finances and Banking.—The total interest-bearing debt of the State in 1900 was $6,287,350; the non-interest-bearing debt, $240,420. The revenue for the year ending Nov. 30, 1900 was $1,618,103.91, the disbursements in the same year were $1,647,824.99.

The assessed valuations in 1898 were: Real estate, $156,800,107.09; personal, $76,967,160; railway, $32,099,931.90—total, $265,867,197.99. Sept. 5, 1900, there were 31 national banks with combined capital of $3,043,500, surplus and profits of $1,434,216.07, and deposits of $7,477,057.97. On June 30 there were 54 State banks, capital $2,217,231, surplus and profits $726,341, and deposits $6,345,312; 25 private banks, capital $274,985, surplus and profits $171,660, and deposits $1,218,328; and 9 stock savings-banks, capital $158,972, surplus and profits $73,509, and $1,717,158 in savings deposits from 8,550 depositors.

Post-offices and Periodicals.—On Jan 1, 1901, there were 3,125 post-offices, of which 59 were presidential (4 first-class, 7 second-class, 48 third-class) and 3,066 fourth-class; 492 were money-order offices. Of newspapers and periodicals there were 27 of daily publication, 14 semi-weekly, 180 weekly, 1 bi-weekly, 7 semi-monthly, and 24 monthly—total, 253.

Means of Communication.—At the close of 1893 there were within the limits of the State 3,577·33 miles of railway, of which the Atlantic Coast Line system had 714·97 miles; the Richmond and Danville Line system, 1,128·69; the Seaboard Air Line system, 661·65; and miscellaneous lines, 1,072·02. The total mileage June 30, 1899, was 3,708·88. The Albemarle and Chesapeake Canal is an important communication between the eastern counties and Norfolk, and the portion in North Carolina is valued at about $100,000.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Baptist, Regular, South	1,480	1,479	153,648	$1,662,405
Baptist, Regular, Colored	1,193	1,198	136,856	717,862
Methodist Episcopal South	1,288	1,230	114,385	1,471,135
African Meth. Episcopal Zion	541	540	111,949	485,711
Presbyterian in the U. S.	282	284	27,477	678,565
Methodist Episcopal	287	282	16,433	195,645
African Methodist Episcopal	61	147	16,156	112,998
Methodist Protestant	199	194	14,351	126,800
Disciples of Christ	186	153	12,437	71,157
Primitive Methodist	317	315	11,914	130,100
Lutheran, United Synod in the South	119	110	11,759	263,690
Protestant Episcopal	178	171	8,186	546,010
Presb. in the U. S. of America	109	105	6,516	89,180

Schools.—In 1899 there were 607,387 children of school age, of whom 390,616 were enrolled in the public schools, and 207,310 in average daily attendance. There were 6,784 schools, and 8,204 teachers—4,127 men and 4,077 women; average monthly salaries, men $25.07, women $22.24. The total value of school property was $10,938,805; the revenue (1897–98), $986,514; and the expenditure, $931,143. There are 12 colleges for women, 106 endowed academies, seminaries, and other private secondary schools, and the following institutions for higher education: University of North Carolina, at Chapel Hill (non-sectarian); Biddle University, at Charlotte (Presbyterian); Davidson College, at Davidson (Presbyterian); Guilford College, at Guilford; North Carolina College, at Mt Pleasant (Evangelical Lutheran); Catawba College, at Newton; Shaw University, at Raleigh (Baptist); Rutherford College, at Rutherford (non-sectarian); Livingstone College, at Salisbury (African Methodist Episcopal Zion); Trinity College, at Trinity College (Methodist Episcopal South); and Wake Forest College, at Wake Forest (Baptist). There are an agricultural and mechanical college for white students and one for colored, five State normal schools for colored teachers, a number of county normal schools for white teachers, graded schools, supported by special taxation, in nearly all the prosperous towns, and a State normal and industrial school for girls at Greensboro.

Charitable, Reformatory, and Penal Institutions.—The various charitable institutions are under the supervision of a State board of public charities. The State maintains hospitals for the Insane at Raleigh and Morganton for whites, and at Goldsboro for colored patients; an institution for the blind at Raleigh; an institution for the deaf and dumb at Morganton; and appropriates $10,000 annually toward the support of the Oxford Orphan Asylum, a Masonic institution. There are also orphan asylums maintained by the Presbyterian, Baptist, and Protestant Episcopal Churches, and by the order of Odd Fellows. The State penitentiary has an extensive farm for the employment of convicts.

Political Organization.—The executive department is composed of the Governor, Lieutenant-Governor, secretary of State, auditor, treasurer, superintendent of public instruction, and attorney-general. The Governor is ineligible for re-election until after an intervening term. He has full pardoning power after conviction; can be removed from office by the House of Representatives beginning an impeachment, but resumes office if acquitted; has no veto power; and does not sign legislative acts. The Senate and the House of Representatives are limited to 50 and 120 members respectively. The judges of the Supreme and Superior courts are elected by the people for eight years; justices of the peace are elected by the General Assembly. The distinction between law and equity practice is abolished. Among the declarations of the constitution are that the State has no right to secede from the Union; that the primary allegiance of citizens is due to the U. S.; that the

State shall not lend its credit except by a vote of the people; that the General Assembly shall provide public schools, the white and colored races to be taught separately, and support the university; that capital punishment shall be inflicted only for murder, arson, burglary, and rape; that the suffrage shall be allowed to males, twenty-one years old or upward, born in the U. S., or naturalized, and residents of the State twelve months and of the county ninety days; and that all voters are eligible to hold office, excepting such as deny the being of Almighty God.

History.—The first charter for a settlement was granted to Sir Walter Raleigh in 1584. He sent a fleet under Amadas and Barlow, who sighted the coast on July 27 of that year. The next year a colony was sent to Roanoke island under Ralph Lane, as governor, but the colonists returned to England in 1586, shortly before Sir Richard Greenville arrived with succor. In 1587 another colony arrived with John White as governor, who shortly went to England for re-enforcements, leaving among the colonists his daughter, wife of Ananias Dare, and her infant, Virginia, the first white child born in America. In 1629 a charter was granted for part of the territory previously known as Virginia, between 31° and 36° 30′ N. lat., under the name of Carolina, to Sir Robert Heath. Nothing having been accomplished under this charter, Charles II. in 1663 conveyed the territory between 36° and 31° N. lat., under the same name, to eight lords proprietors, and in 1665 enlarged the grant to 36° 30′ and 29° N. lat. Palatine powers were granted to the lords proprietors and they inaugurated a government under the "fundamental constitutions," drawn by John Locke. This "grand model" was singularly unsuited to the character and condition of the people, was never fully put into operation, and was after a while abandoned. In 1712 Edward Hyde was commissioned Governor of North Carolina, as distinguished from South Carolina. In 1728 (often erroneously stated as 1729) the shares of seven of the lords proprietors were sold to the crown for £2,500 each, but John, Lord Carteret, afterward Earl Granville, retained his one-eighth part of the soil, surrendering only the jurisdiction. In 1744 his share was laid off to him in severalty, a rectangular area bounded by the Mississippi river and the Atlantic, lat 35° 34′ N., and the Virginia line. Much land was sold by him prior to the Revolutionary war. After the sale to the crown and transfer of jurisdiction the colony increased rapidly in prosperity, gaining much immigration, especially from Virginia, Pennsylvania, north of Ireland, the highlands and lowlands of Scotland, and from the Protestants of Germany, including Moravians. As the governors and other chief officers represented first the lords proprietors and then the crown, collisions with the people sometimes occurred. The first, called the "Culpepper rebellion," in 1678, seems to have arisen from harsh attempts to enforce the navigation laws. The second, called the "Cary rebellion," in 1708–10, apparently had its beginning in the unwillingness of the Quakers to take oaths of office, and degenerated into a party squabble between the aristocracy and the democratic element. In Gov. Johnston's time (1734–52) the counties of old Albemarle refused to submit to an attempt to deprive them of their larger number of representatives, and set at naught the enactment of the Legislature. Afterward they refused to submit to the authority of the superior courts because the crown disallowed the court law passed by the General Assembly. These disputes were settled without bloodshed, but in Gov. Tryon's incumbency a body of men, chiefly in the district allotted to Earl Granville, calling themselves regulators, exasperated at the large fees of officers and the pressure of taxes and quit-rents, combined with the scarcity of currency, rose in arms, broke up a court, and threatened to march on the capital, Newbern. They were easily defeated by Tryon with the militia, May 12, 1771. In 1711 occurred the Tuscarora war, in which the Indians were defeated by aid of a force sent from South Carolina, and the remnant afterward joined the Five Nations in New York, making the Six Nations. North Carolina was forward in resisting the measures of the British Parliament which led to the War of Independence, and in co-operating with the other colonies. The first provincial congress was held on Aug. 25, 1774. The General Assembly of the State has placed on its seal the date of May 20, 1775, as that of the resolutions passed by the people of Mecklenburg demanding independence. On Apr. 12, 1776, the first resolutions authorizing delegates in the Continental Congress to vote for independence were passed by the provincial congress of North Carolina. In July and August following a large force of militia crushed the power of the Cherokee Indians. On Dec. 18, 1776, the first State constitution was adopted. Troops of the State fought gallantly in all the battles of the Revolutionary war from Brandywine to Yorktown. In 1780–81 the people suffered terribly from the invading army, but, in spite of a considerable Tory element, continued steadfast. They assisted in winning the battle of King's Mountain and crippling Cornwallis at Guilford Court-house, and by their persistent hostility forced him to his fate at Yorktown.

North Carolina sent delegates to the Constitutional Convention in 1787, but her convention of 1788 decided to postpone the question of ratification of the Federal Constitution, in order to secure certain amendments. Finding that the most important of these were certain of adoption, ratification was carried by a large majority in 1789. In the same year the General Assembly offered to cede the territory of Tennessee to the U. S., which was accepted in 1790. In 1791 the General Assembly took steps for the location of the seat of government, which had been theretofore migratory. The new capital was called the city of Raleigh. The University of North Carolina was chartered in 1789 and opened in 1795. In 1820 much attention was given to improvement of the river transportation by slackwater navigation, and there was large waste of money on insufficient works. This fever, and the subsequent rise of the railway excitement, led to a heated contest between the eastern and western counties for a change of the constitution under which each county elected a Senator and two members of the lower House. The agitation culminated in a convention held in 1835, which required the division of the State into fifty senatorial districts, each paying one-fiftieth of the public taxes, and, confining the House to 120 members, gave one to each county and divided the remainder among the counties in proportion to the federal population. The public school system had been pressed as early as 1820, but little was done until the distribution of the surplus money of the U. S. in 1837, North Carolina investing her share in bank and railway stock and devoting the stock to the schools. A good system was being developed when the civil war made the fund worthless. What has been done since that war has been effected by taxation.

North Carolina did not at first favor secession from the Union as the best mode of settling the questions relating to slavery and its extension into the territories. When the question of calling a convention of the people for considering these matters was had the vote in Feb., 1861, was adverse by a few hundred majority; but when war broke out she promptly and by a unanimous vote in convention, May 20 following, passed an ordinance of secession, and supported it by large levies of money and of troops, who formed a great part of the army of Gen. Lee in Virginia. In August following Fort Hatteras was captured by the Federal forces. In the spring of 1862 the whole of the country along the sounds from Beaufort to the Virginia line was in their hands. Plymouth was recaptured, with 1,600 prisoners, by the Confederates under Gen. Hoke in Apr., 1864, but recovered by the Federals in October. Wilmington was largely used by the Confederates as a point from and to which their steamers could run despite the blockade. An unsuccessful attempt was made in Dec., 1864, to stop this by capturing Fort Fisher at the mouth of the Cape Fear. Another attack (Jan. 15, 1865) succeeded. Wilmington was soon after captured; Sherman's army marched into Raleigh on Apr. 13, and on the 26th Johnston's army was surrendered. The scheme of reconstruction inaugurated by President Johnson was begun on May 29, 1865, by the appointment of W. W. Holden as provisional governor, who called a convention of the people for which only the white men included in the President's amnesty proclamation were allowed to vote. This convention repudiated the war debt, abolished slavery, and declared the ordinance of secession void. The government, under the "reconstruction laws" of Congress, was inaugurated July 1, 1868. The General Assembly ratified the fourteenth amendment to the U. S. Constitution on the next day, and the fifteenth amendment on Mar. 4, 1869. During the Ku-Klux Klan excitement Gov. Holden declared martial law in Alamance and Caswell Counties, and made many arrests of leading citizens. For his conduct connected with this movement he was impeached and convicted. The present constitution was adopted in 1876, the centennial of the adoption of the first constitution of free North Carolina. Since the civil war, although her losses therein were immense both in men and money, the people of the State have made notable progress.

GOVERNORS OF NORTH CAROLINA.

Under the Lords Proprietors.

S. Census Report of North Carolina; Hawkes, *History of North Carolina*; Wheeler, *History of North Carolina*; Moore, *History of North Carolina*.

KEMP P. BATTLE.

North Carolina, University of: See the Appendix.

North'cote, Sir STAFFORD HENRY, F. R. S.: statesman; b. in London, England, Oct. 27, 1818: educated at Eton and at Baliol College, Oxford, and graduated with honors 1839; was called to the bar at the Inner Temple 1847; was one of the secretaries of the Universal Exhibition of 1851; entered Parliament as a Conservative 1855; took an active part in all questions relating to art and education; was president of the Board of Trade in Lord Derby's third administration 1866; Secretary of State for India Mar., 1867–Dec., 1868; elected governor of the Hudson Bay Company Jan., 1869; was a member of the high joint commission which drew up the Treaty of Washington 1871; became Chancellor of the Exchequer in Disraeli's cabinet 1874; published *Twenty Years of Financial Policy* (1862); became Earl of Iddesleigh (1885). D. in London, Jan. 12, 1887.

North Dakota: one of the U. S. of North America (North Central group); the twenty-sixth admitted to the Union.

Location and Area.—It lies between lat. 46° and 49° N. and lon. 96° 25′ and 104° W. of Greenwich; is bounded on the N. by the Canadian provinces of Assiniboia and Manitoba, on the E. by Minnesota, on the S. by South Dakota, on the W. by Montana; and has an area of 70,795 sq. miles, of which 600 sq. miles are water surface; capital, Bismarck.

Physical Features.—The State is naturally divided into the Red river valley, the James river valley, the Devil's Lake and Turtle Mountain region, the Mouse river section, the coteau or Missouri slope country, and the West North Dakota division. The valley of the Red River of the North is a broad level plain from 50 to 60 miles wide, sufficiently elevated above the river to be free from overflows, and contains the richest of bottom-land mould. The James river valley is one of the most noted artesian-well districts in the world. Immediately N. of Devil's Lake, a veritable inland sea, is the Turtle Mountain and Big Coulee country. The mountains are a range of hills extending over a region 20 by 40 miles, the greater part in the State and the remainder in Manitoba. Bear and St. Paul's buttes are the highest points, and have an elevation of only a few hundred feet. The Mouse river enters the State from Assiniboia in the middle of Ward County, and after a long sweep in ox-bow shape passes out of the State at the northwest corner of Bottineau County into Manitoba. There are valuable deposits of coal along the river, and the territory it incloses is particularly adapted to stock-raising. The valley of this river shows a general depression of from 200 to 300 feet below the level of the surrounding plain. The Rivière de Lacs, a tributary of the Mouse, has a valley 75 miles long, with an abundance of wood and coal in the bluffs. The coteau or Missouri slope country lies W. of the divide between the James and the Missouri rivers, is full of small hills, and has large geological interests. The West North Dakota division lies W. of the Missouri river, is more undulating than the eastern section of the State, has widely separated hills, broad valleys, and conical buttes, is well watered, and has but little snow. Besides the rivers mentioned, good drainage is afforded by the Sheyenne, Goose, Pembina, Maple, Heart, Knife, Cannon Ball, Green, Sweetbriar, Curlew, Little Missouri, and other streams. The rainfall generally is sufficient to mature crops.

Seal of North Dakota.

Geology.—In the valley of the Red river a glacial drift is found beneath lake mud, and cuttings for railways in the territory between the valley proper and bordering lands disclosed lake shore lines with sand and gravel beds. These have been traced around the entire valley, proving it an ancient lake, which has been named Lake Agassiz. Lignite is the principal mineral. The whole of the country W. of the Missouri river and a large part of that E. of it are underlaid with deposits cropping out in veins from 4 to 20 feet in thickness, and in many localities farmers can dig their own supplies from the hillsides. The Turtle Mountain region contains a large variety of building and foundation stones; the Red river valley, salt, limestone, and hydraulic lime; and in other localities are iron, natural gas, and pottery and brick clays.

Soil and Productions.—Almost the entire soil is exceedingly fertile, and some parts are exceptionally so, especially in the Red river valley, which contains the great wheat farms. Much of the surface is underlaid by limestone and glacial drift. The Red river valley is well wooded in parts; the Devil's Lake region contains oak and other timber; the Turtle Mountains have poplar, balm of Gilead, ash, and oak; and along the Missouri river are cottonwoods of large size.

In 1890 North Dakota had 27,611 farms, containing 7,660,333 acres, valued at $75,310,305. The following table is for the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	23,824	381,184 bush.	$160,097
Wheat	2,689,023	13,176,213 "	7,642,204
Oats	611,581	6,299,284 "	2,015,771
Barley	243,761	1,998,840 "	699,594
Potatoes	29,555	1,536,860 "	753,061
Hay	268,834	247,327 tons	1,397,398
Totals	3,866,578		$12,668,125

On Jan. 1, 1900, the farm animals comprised 180,391 horses, value $8,902,389; 6.895 mules, value $465,257; 170,205 milch cows, value $5,629,750; 255,166 oxen and other cattle, value $6,951,242; 374,110 sheep, value $1,183,683; and about 100,000 swine, value $675,000—total head, 986,767; total value, $23,807,321.

Climate.—The winters are cold and rainless and usually break in March. Farming begins early and plowing generally continues till about the middle of November. The dryness of the atmosphere renders the low temperature endurable by man and beast. Summers are warm by day and cool by night, with quite constant breezes. The autumnal weather is the most delightful of the year and frequently extends far into December. The mean annual temperature at the widely separated signal stations is: Bismarck, 39·4°; Fargo, 37°; Pembina, 34·4°; and Fort Buford, 38·7°; and the mean annual rainfall, Bismarck, 20·10 inches; Fargo, 27·17; Pembina, 21·91; and Fort Buford, 13·91.

Divisions.—For administrative purposes the State is divided into 39 counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

* Reference for location of counties, see map of North Dakota.

† Formerly part of Boreman County, Dakota Territory.

‡ This footing includes population of the following counties not existing in 1900, viz.: Bowman (6), Buford (803), Church (74), Dunn (159), Flannery (72), Garfield (33), Hettinger (81), McKenzie (3), Mountraille (122), Renville (99), Sheridan (5), Stevens (16), Wallace (24), Williams (14).

Principal Cities and Towns, with Population for 1900.—Fargo, 9,589; Grand Forks, 7,652; Bismarck, 3,319; Jamestown, 2,853; Valley City, 2,446; Grafton, 2,378; Wahpeton, 2,228; Dickinson, 2,076; Devil's Lake, 1,729; Mandan, 1,658; Minot, 1,277; Larimore, 1,235; Casselton, 1,207; Langdon, 1,188; Hillsboro, 1,172; Park River, 1,088; Cando, 1,061; Lisbon, 1,046.

Population and Races.—(1890) 182,719 (natives, 101,258; foreign, 81,461; males, 101,590; females, 81,129; white, 182,123; colored, 596, comprising 373 persons of African descent, 28 Chinese, 1 Japanese, and 194 civilized Indians).

Industries and Business Interests.—The census reports of 1900 showed that 1,130 manufacturing establishments reported. These had a combined capital of $5,396,490 compared with 382 establishments and $2,894,553 capital in 1890. The value of products increased from $5,028,107 in 1890 to $9,183,114 in 1900—82·6 per cent. The principal manufactures are flour, lumber, butter, leather, cigars, bricks, and woolen goods, and the most important industries are farming and stock-raising. The various grain elevators and warehouses along the lines of the principal railways have a capacity of more than 125,000,000 bush.

Finance and Banking.—In 1900 the assessed valuations of taxable property aggregated $117,789,615, and the State debt was $600,000, of which $200,000 is bonded. On Sept. 5, 1900, there were 27 national banks with combined capital of $1,525,000, surplus and profits of $528,701.79, and deposits of $5,015,981; there were 129 State banks, capital $1,473,650, surplus and profits $558,369, and deposits $5,741,792.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 656 post-offices, of which 37 were presidential (1 first-class, 4 second-class, 32 third-class) and 619 fourth-class, and 244 were money-order offices. Of newspapers and periodicals there were 7 daily publications, 1 semi-weekly, 142 weekly, and 8 monthly—total, 158.

Means of Communication.—The State is crossed from E. to W. by the Northern Pacific and the Great Northern railways, while three other large systems enter it from the S., E., and S. E.—the Minneapolis, St. Paul and Sault Ste. Marie, the Chicago, Milwaukee and St. Paul, and the Chicago and Northwestern. The mileage of these within the State and of several minor local lines on June 30, 1899, aggregated 2,663·85. The construction of the Northern Pacific line through the State was promoted by a Government grant of 10,000,000 acres of land, and aided materially the development of the central part of the State.

Churches.—The constitution guarantees perfect toleration of religious sentiment, declares that no inhabitant of the State shall ever be molested in person or property on account of his or her mode of religious worship, and makes these provisions irrevocable without the consent of the U. S. and the people of the State. The State constitutes a missionary district of the Protestant Episcopal Church with a bishop, and Jamestown is the seat of a bishopric of the Roman Catholic Church. The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	115	115	26,427	$171,550
Lutheran, United Norwegian	162	144	10,283	77,550
Methodist Episcopal	131	132	4,804	139,985
Presb. in the U. S. of America	99	91	3,036	126,425
Lutheran, Norwegian Evangelical	53	52	2,784	22,975
Baptist	54	53	2,298	90,300

Other leading denominations were the Congregational, with 1,616 members; the Lutheran, General Council, 1,582 members; and the Lutheran, Synodical Conference, 1,136.

Schools.—The constitution made it the duty of the Legislature to provide and maintain a system of public schools which should be open to all children of the State and be free from sectarian control. It also provides that this requirement shall be irrevocable without the consent of the U. S. and the people of the State, and that no money raised for the support of the public schools shall be appropriated to or used for the support of any sectarian school. All proceeds of the public lands granted by the U. S. for the support of the common schools, all per centum that may be granted by the U. S. on the sale of public lands, the proceeds of property that shall fall to the State by escheat, the proceeds of all gifts and donations to the State for common schools unless otherwise specified, and all other property otherwise acquired for common schools, are constituted a perpetual trust fund for the support of public schools, and the State is pledged to make good all losses the fund may sustain. The U. S. granted the State for educational purposes 2,000,000 acres of land. Prior to the creation of North and South Dakota the Territory had expended for public education $10,000,000 in five years, and North Dakota entered the Union with 1,362 public schools and with high and graded schools in its principal cities and towns. State institutions include a university and school of mines at Grand Forks, an agricultural college at Fargo, and normal schools at Valley City and Mayville, and the constitution provided for the establishment of a school of forestry to be located in one of four specified counties as the electors might decide, and for a scientific school or other educational or charitable institution at Wahpeton. Denominational colleges are maintained at Fargo and Wahpeton.

Charitable, Reformatory, and Penal Institutions.—These include a school for the deaf at Devil's Lake, State Hospital for the Insane and Home for the Feeble-minded at James-

town. Soldiers' Home at Lisbon, and State penitentiary at Bismarck.

Political Organization.—The constitution provides that every man may freely write, speak, and publish his opinions on all subjects, being responsible for the abuse of that privilege, and in all trials for libel the truth may be given in evidence. Every citizen is free to obtain employment wherever possible, and any person, corporation, or agent thereof maliciously interfering or hindering in any way any citizen from obtaining or enjoying employment already obtained from any other corporation or person is deemed guilty of misdemeanor. Women qualified by age, residence, and citizenship may vote for public-school officers and on all questions pertaining solely to school matters, and are eligible to any school office. All elections are by secret ballot. The executive authority is vested in a Governor, a Lieutenant-Governor, secretary of State, auditor, treasurer, superintendent of public instruction, commissioner of insurance, three commissioners of railways, attorney-general, and a commissioner of agriculture and labor—all elected for terms of two years. The Governor may disapprove of separate items in a bill. The Legislative Assembly holds biennial sessions limited to sixty days, and comprises a Senate, limited to from 30 to 50 members, and a House of Representatives, limited to from 50 to 140 members; Senators elected for four years, Representatives for two. The judicial authority is vested in a Supreme Court of three justices having appellate jurisdiction only, in district and county courts, in courts that may be created in special districts, cities, and towns, and in justices of the peace. The number of Supreme Court justices may be increased to five when the population of the State reaches 600,000.

History.—Capt. Lewis and Capt. Clarke, U. S. A., in their expedition of 1804–06, spent their first winter in camp among the Mandan Indians near the present town of Mandan. Lord Selkirk built a fort at Pembina, on the Red river, in 1810; the first steamer ascended the upper Missouri river in 1830; and John C. Frémont crossed the country from the Missouri river to the James and penetrated as far N. as Devil's Lake in 1839. George Catlin made many sketches of Indian life here in 1841, and Lieut. Warner explored the region for the U. S. Government in 1855. The region was a part of the Louisiana purchase. In 1851 the first land was obtained of the Sioux Indians, and in 1857 the first settlement was made at Sioux Falls, now in South Dakota. The eastern part of the Dakotas was included in the region allotted to Minnesota on its creation as a Territory in 1849. In 1861 the Territory of Dakota was created, extending from lat. 42° 28′ to 49° N., and from Minnesota to the Rocky Mountains. From this tract Idaho, Montana, and Wyoming were set off as Territories. A long agitation for statehood led to a division of the Territory and the creation of the States of North Dakota and South Dakota, both of which were admitted to the Union Nov. 2, 1889.

GOVERNORS OF NORTH DAKOTA.

John Miller	1889–91	Frank A. Briggs	1897–99
Andrew H. Burke	1891–93	F. B. Fancher	1899–1901
Elmer C. D. Shortridge	1893–95	Frank White	1901–
Roger Allin	1895–97		

Revised by W. H. H. Beadle.

North East: borough; Erie co., Pa.; on the Lake Shore and Mich. S. and the Nickel Plate railways; 15 miles N. E. of Erie, the county-seat (see map of Pennsylvania, ref. 1–A). It is in the heart of a rich agricultural region; has a fine park, electric lights, and gravity water-works; a furnace, 2 woodenware and 2 grape-basket factories; a tannery, a winery, tempered-copper works, and a wire-goods factory, and 3 banks. Many stores and residences are lighted and heated with natural gas. The borough has a Roman Catholic college, a graded public school, an opera-house, and 3 newspapers. Pop. (1890) 1,538; (1900) 2,068. Editor of "The Sun."

Norther: a cold, piercing northerly wind occurring in Mexico and Texas, coming on with great suddenness and following warm and moist weather. It usually advances with a bar of stratus cloud, and strikes the observer when this cloud is about 45° above his horizon. There is often a fall of 35° in temperature in two hours, and this fall is said to amount sometimes to 70°. Northers may be either wet or dry, the latter being more frequent. They occur forty or fifty times a year, generally in the months between September and May.

Northers are simply "cold waves" which flow southward instead of eastward, or southeastward, as in the better known types of such waves. They occur in the rear of well-marked "lows" or cyclones, when the cold northern air is drawn bodily into lower latitudes. The cold current of air is shallow, but may be of great horizontal extent. They frequently extend over the Western Gulf, causing very cold weather and dangerous seas, and occasionally they extend to Guatemala, causing frost on the higher lands, and to the Pacific Ocean to the southward. M. W. Harrington.

Northern Crown: See Corona Borealis.

Northern Lights: See Aurora.

Northfield: town; Franklin co., Mass.; on the Connecticut river, at the point where the States of Massachusetts, New Hampshire, and Vermont meet (see map of Massachusetts, ref. 1–E). It is 50 miles N. of Springfield, Mass., and 12 miles S. of Brattleboro, Vt., on the Vermont Central Railroad. It is a beautiful town, the birthplace of Dwight L. Moody, who made it a center of Christian work and influence by founding (1879) a seminary for young women of ability and earnest purpose. The seminary offers general, college preparatory and English courses, has large grounds, nine buildings, and is attended by about 350 students annually. At Gill, 4 miles from Northfield, is Mt. Hermon School, for boys, founded in 1881 by Mr. Moody and friends. There are two Protestant and one Roman Catholic churches, and two hotels. The larger and newer one (the Northfield) is used from October to April as a training-school for Christian workers. There are also a corn-canning factory and a creamery. The business interests are chiefly agricultural. Pop. (1890) 1,869; (1900) 1,966. Evelyn S. Hall.

Northfield: city; Rice co., Minn. (for location, see map of Minnesota, ref. 10–E); on the Chi., Mil. and St. P. and the Minn. and St. L. railways; 37 miles S. of St. Paul. It is in an agricultural region, and contains Carleton College (Congregational, chartered in 1866), St. Olaf College (Lutheran, chartered in 1874), a national bank with capital of $75,000, a State bank with capital of $50,000, and 2 weekly, a bi-weekly, and 2 monthly periodicals. Pop. (1880) 2,296; (1890) 2,659; (1900) 3,210.

Northfield: village; Washington co., Vt. (for location of county, see map of Vermont, ref. 5–C); on the Central Vt. Railroad; 10 miles S. S. W. of Montpelier, 40 miles S. E. of Burlington. It is in a highly productive granite and slate region, is the seat of Maverick University (chartered in 1834), and has a national bank with capital of $100,000, a savings-bank, and a weekly and a monthly periodical. Pop. (1880) 1,313; (1890) 1,222; (1900) 1,508.

North Holland Canal: a waterway extending from Buiksluyt, opposite Amsterdam, to the Helder, a distance of 51 miles. In the sixteenth century Amsterdam was one of the first commercial ports of Europe. The gradual advancement of the art of navigation, together with the increase in draught of vessels, demanded an access more favorable than was afforded by the difficult and shoal channels through the Zuyder Zee. To supply such an access the North Holland Canal was cut. It is 124 feet broad at the surface and 31 feet at the bottom, and is available for vessels drawing 18 feet of water. See also North Sea Canal.

North Platte: city; capital of Lincoln co., Neb. (for location, see map of Nebraska, ref. 10–D); near the confluence of the North and South Platte rivers; on the Union Pacific Railway; 291 miles W. of Omaha. It is in an agricultural and stock-raising region, and contains railway shops, 2 national banks with combined capital of $125,000, and 3 weekly newspapers. Pop. (1880) 363; (1890) 3,055; (1900) 3,640.

North River: See Hudson River.

Northrop, Cyrus, LL. D.: educator; b. at Ridgefield, Conn., Sept. 30, 1834; graduated at Yale College in 1857, and at the Yale Law School in 1859; practiced law at Norwalk, Conn.; was clerk of the State House of Representatives in 1861; of the State Senate in 1862; editor-in-chief of *The New Haven Daily Palladium* 1862–63; Professor of Rhetoric and English Literature in Yale College 1863–84; collector of customs under Presidents Grant and Hayes; president of the University of Minnesota since 1884.

Northrup, Birdsey Grant: See the Appendix.

North Sea, or **German Ocean** (anc. *Ma're Germa'nicum*): a body of water lying between Great Britain and the continent of Europe, having the former and the Orkney and Shetland isles on the W., and Norway, Denmark, Germany, Holland, Belgium, and part of France on the E. and S. Its extreme length from Dover Straits to the most northern of

the Shetland isles, between which and the coast of Norway it merges into the North Atlantic, is about 700 miles; greatest breadth about 420 miles. By the Skager Rack Inlet and its extension, the Kattegat, between the coasts of Denmark and of Norway and Sweden, it communicates with the Baltic Sea. By the Straits of Dover and English Channel (*q. v.*) it has its southern communication with the Atlantic. The depth varies from 66 to 500 feet, the greatest depths being in the northern portions between the north of Scotland and Norway. (See *Johnston's Physical Geography.*) If a line be drawn from the northern point of Denmark to the mouth of the Humber, all S. has 30 fathoms or less, which is said to be the average depth. A line from the same point to Edinburgh will leave S. of it nearly all the 50-fathom depths. Farther N. the depth increases rapidly, and is said to attain 190 fathoms near the Norway coast. The bed of the sea is traversed by several vast shoals, the greatest of which, the Dogger Bank, occupies the center of the sea from lat. 54° 10′ to 57° 24′ N., lon. 1° to 6° 7′ E.; another extends from the Firth of Forth, Scotland, in a northeasterly direction, a distance of 110 miles, while others run from Holstein and Jutland more than 100 miles to the N. W. The great oceanic tidal wave, deflected around the British isles, enters this sea from the N. Pursuing its course southward, it rules the tides as far S. as the Thames and opposite coast, sensibly affects the tides of the Continent through the Channel, but, encountering the tide wave from the English Channel in the southern portions, the tidal phenomena are there the result of the conflict, or rather the union, of the two distinct waves, each exaggerated by a shelving bottom and the contraction between converging shores. At the Orkneys the rise is but 12 feet, at the mouth of the Humber and Thames 18 to 20 feet. The North Sea, notwithstanding the manifest dangers due to its currents, fogs, banks, and contracted area, teems with shipping, and is to the northern nations what the Mediterranean was to the ancients. Its fisheries of cod, mackerel, herring, etc., are important, and contribute in no small degree to the wealth and characteristic development of its marginal population. The island of Heligoland (*q. v.*) is the only one which properly belongs to the North Sea. The numerous islands along the coast of Norway, Denmark, and Holland are rather fragments of a broken coast-line than islands in the sea. One-ninth of the total river discharge of Europe is received by the North Sea from the Humber, Thames, the Rhine and Scheldt, Eider, Elbe, Weser, etc., and from the firths and fiords of the Scotch and Norway coasts. The Zuyder Zee (*q. v.*), which is entered from the North Sea at the Helder, is separated by the chain of sand islands, Texel, Terschelling, etc., which are the existing fragments of the ancient coast-line. The North Sea Canal (*q. v.*) makes Amsterdam virtually a seaport of the North Sea. See *Zur Physik des Meeres*, by Dr. Meyer, from the second annual report of the Kiel commission for investigation of the German seas (Berlin, 1874).

Revised by Mark W. Harrington.

North Sea Canal of Holland (called in Holland **The Amsterdam Canal**): a waterway connecting Amsterdam with the North Sea. Such a canal had been proposed even before making the North Holland Canal (*q. v.*). That work answered the existing exigencies, but was found not equal to those arising from the modern developments of commerce. The bold project of a *direct* water communication with the North Sea was revived in 1854. Nine different "commissions" of engineers and other experts successively studied and reported upon the subject; and it was not until Jan., 1863, that the law authorizing the construction was perfected and the work undertaken. The project involved the shutting off of Lake Y at its eastern end from the Zuyder Zee by a dam one mile in length with locks adequate to the purposes of all the coasting trade of the Zuyder, and of the lighter draught vessels for the North Sea, which still may enter by the Helder. The formation of this dam and the construction of its triple locks, founded by means of a coffer-dam 550 feet in diameter in 18 feet of water on 9,000 piles, are among the most remarkable works of modern hydraulic engineering.

The canal is 23 feet deep and 14½ miles long. In passing through the Y and Wijkermeer Lakes, the depth of which averages about 6 feet, the channel is limited by two embankments 443 feet apart, formed of material mostly dredged from the bottom. There are 38½ miles of these embankments. Through the sand downs of the isthmus separating the Wijkermeer from the North Sea, the channel is formed for about 4 miles by a cut 90 feet wide at the bottom. The great sea-lock called the Ymuiden is situated two-thirds of a mile from the shore-line. It has a double (in length) lock-pond nearly 400 feet long, 60 feet wide, with 25 feet depth on the lock-sills. An artificial harbor was constructed at the sea entrance (for which see Harbors). The canal was opened for traffic on Nov. 1, 1876. The waters of the Y and Wijkermeer are drained into the canal, reclaiming 13,142 acres of arable land. To keep the level of the canal down to 1·6 feet below high water at Amsterdam, and thus permit the adjacent lands to be drained, centrifugal pumps driven by steam-power are placed at the Zuyder Zee locks, pumping from the canal into the Zuyder Zee, and also at eight points along the reclaimed land. At low water natural drainage can be effected through the North Sea through the sea-lock. The works cost about $15,000,000. The traffic on the canal is large and constantly increasing. For further particulars see *Professional Papers* No. 22, Corps of Engineers, U. S. army, by J. G. Barnard, and the work of Croizette Desnoyers; also a full description of the works in *Proc. Inst. C. E.*, vol. lxii., 1880.

Revised by J. J. R. Croes.

North Tonawanda, N. Y.: See Tonawanda.

Northumberland: the northernmost county of England; bounded E. by the North Sea, separated from Scotland by the Tweed and from the county of Durham by the Tyne and Derwent. Area, 2,016 sq. miles. The western part of the county consists of the bare Cheviot Hills and wild moorlands, which, however, afford sustenance to numerous flocks of hardy sheep. Toward the east coast are large fertile valleys with good pasturage and soil fitted for tillage. The principal source of wealth is in the rich mines of lead, copper, and coal, especially the latter, in the Cheviot Hills, and the manufactures which depend upon coal. The number of collieries is about 115. The county returns four members to Parliament. Pop. (1901) 387,728.

Northumberland: borough; Northumberland co., Pa. (for location, see map of Pennsylvania, ref. 4–G); at the junction of the two branches of the Susquehanna river; on the Del., Lack. and W., the Penn., and the Phila. and Reading railways; 2 miles N. of Sunbury, the county-seat, 60 miles N. of Harrisburg. It contains rolling, flour, and saw mills, nail-factories, agricultural-implement works, and other manufactories, and a weekly newspaper. Pop. (1880) 2,293; (1890) 2,744; (1900) 2,748.

Northumberland, Algernon Percy, Fourth Duke of, F. R. S., F. S. A., D. C. L.: second son of the second duke; b. in England, Dec. 15, 1792; educated at Eton; entered the navy in childhood; retired in 1815; was created Baron Prudhoe 1816; spent many years in travel, especially in Egypt and other Eastern countries; collected a magnificent Oriental museum; founded churches, schools, and charitable institutions, and promoted historical, philological, and archæological research; married Lady Eleanor Grosvenor, daughter of the Marquis of Westminister, 1842; succeeded his brother Hugh in the dukedom 1847; restored and decorated upon a splendid scale the ancient seat of the family, Alnwick Castle; was first lord of the Admiralty 1853; made a Knight of the Garter 1858; was president of the Royal Institution. D. at Alnwick Castle, Feb. 12, 1865.

Northumberland, John Dudley, Duke of: statesman; b. in England in 1502; son of Edmund Dudley, the minister of Henry VII.; commanded the English squadron during the war with France 1544–45; was an executor of the king's will 1547; intrigued against the protector Somerset 1549; acquired chief power in the council 1550; was created Duke of Northumberland, lord high steward, and earl marshal 1551; married his fourth son, Lord Guilford Dudley, to Lady Jane Grey, May, 1553; prevailed on Edward to adopt Lady Jane as his successor, June; placed her on the throne July 10, and was executed as a traitor Aug. 22, 1553.

Northum'bria: the largest kingdom of the Saxon Heptarchy, embracing, as its name imports, the region N. of the Humber, and at one time extending to the Forth in Scotland. It was formed into a kingdom by Ida about 547 by the union of Bernicia and Deira. The kingdom was divided at the death of Ida, but reunited under Ethelfrith 593, became the leading British power under Oswald 634–42, and was extinguished by Egbert 827, when the name of England was first applied to the kingdom resulting from the aggregation of the minor states to Wessex and Northumbria. The present county of Northumberland shows a survival of the name of a kingdom many times greater in extent.

Northwestern University: an institution established at Evanston, Ill.; one of the largest universities in the U. S., having nearly 3,000 students and more than 275 professors. It maintains the following degree-conferring departments: A college of liberal arts, a medical school, a woman's medical school, a law school, a school of pharmacy, and a dental school. The Garrett Biblical Institute is the theological department of the university. The charter of the university requires a majority of its board of trustees to be members of the Methodist Episcopal Church, and the university is the largest and richest of the educational institutions in affiliation with that church. The college of liberal arts and the Garrett Biblical Institute are at Evanston, the other professional schools are in the city of Chicago. The campus at Evanston lies along the shore of Lake Michigan, N. of Chicago, and includes 50 acres of ground. The charter of the university prohibits the sale of liquor within 4 miles of the university. Provision is made in the college of liberal arts for graduate and undergraduate work. Its medical school, formerly known as the Chicago Medical College, was the first school of medicine in the U. S. to insist on an examination preliminary to admission, on a graded course of instruction, as well as on a lengthened period of study, and is one of the few medical schools of the country requiring a *bona fide* four years' course. Its law school, formerly known as the Union College of Law, is now one of the most thorough in the U. S. It prescribes fifteen hours of class-room work a week, and requires its law professors, with one or two exceptions, to devote their whole time to the work of the school, withdrawing them from active practice for that purpose. Its school of pharmacy is one of the largest of the kind in the U. S. The university holds property amounting in 1900 to more than $4,000,000, and its ordinary income is $350,000. HENRY WADE ROGERS.

Northwest Passage: a communication by sea between the Atlantic and Pacific Oceans, which was long vainly sought by navigators. See POLAR RESEARCH.

Northwest Provinces, or **Agra**: a great political division of British India, situated around the upper and middle course of the Ganges. It consists of the provinces of Delhi, Merut, Rohilkhand, Agra, Allahabad, and Benares, and comprises an area of 83,286 sq. miles, and with Oudh (1901) 47,696,354 inhabitants. Capital, Allahabad.

Northwest Territories: a portion of the Dominion of Canada, comprising the provisional districts of ALBERTA, ASSINIBOIA, ATHABASCA, and SASKATCHEWAN (*qq. v.*), besides unorganized territory with an area of 906,000 sq. miles. This vast region is bounded S. by the 49th parallel, which divides it from the U. S. and touches the base of the Rocky Mountains at nearly 115° W. lon., thence the boundary runs N. W. along the summit of the Rocky Mountains until it reaches Alaska, and thence due N. to the Arctic Ocean. A marked feature of the region is its division into two plateaus, running generally N. W. and S. E., the more easterly one, with an average altitude of 1,600 feet, being adapted for agriculture, and that toward the W., reaching to the Rocky Mountains, with an average altitude of 3,000 feet, being adapted for grazing. The principal rivers are the Mackenzie, emptying into the Arctic Ocean, the Saskatchewan or Nelson, emptying into Hudson Bay, and the Athabasca, flowing into the lake of the same name. The most important timber is spruce; coal exists in a vast region E. of the Rocky Mountains extending from the frontier, with a width of from 150 to 200 miles, 1,000 miles N.; large coal deposits, as well as lignite and petroleum, exist also elsewhere throughout the territories. Iron, gold, silver, galena, and copper also occur. The product of the fisheries of the Northwest Territories for 1893 amounted to 19,836,000 lb., valued at $793,549. The government of the Northwest Territories is administered by a lieutenant-governor and Legislative Assembly, the seat of government being at Regina. An executive committee, appointed by the Assembly, acts as an advisory body with the lieutenant-governor in the expenditure of territorial funds and money appropriated by the Parliament of Canada. Justice is administered by a stipendiary magistrate, with jurisdiction over all cases, civil and criminal, and by justices of the peace appointed by the lieutenant-governor. For the maintenance of order among the Indians and settlers there is a body of mounted police numbering 1,000. Pop. (1896) about 100,000, including Indians. NEIL MACDONALD.

Northwest Territory: the name formerly applied in the U. S. to the tract of land included between the Mississippi and Ohio rivers and the Great Lakes, comprising the present States of Ohio, Illinois, Indiana, Michigan, and Wisconsin. The original States had ceded it to the national Government, which provided for its administration by the ordinance of 1787. See TERRITORY.

Norton, CHARLES ELIOT: son of Rev. Andrews Norton (1786–1852); b. at Cambridge, Mass., Nov. 16, 1827; graduated at Harvard College 1846; engaged in commerce in Boston; went to India as supercargo 1849; returned home through Europe 1850; wrote *Considerations on some Recent Social Theories* (1853); edited, with Dr. Ezra Abbot, his father's posthumous writings (1855); resided in Europe 1855–57; published *Notes of Travel and Study in Italy* (1860); edited the papers of the Loyal Publication Society 1861–65; was associate editor of *The North American Review* (1864–68); issued a translation of Dante's *Vita Nuova* (1867); lived in Europe 1868–73; published *Historical Studies of Church-building in the Middle Ages* (1880), and a translation of Dante's *Divina Commedia* (3 vols., 1891–92); edited *Correspondence of Carlyle and Emerson* (1883); *Correspondence between Goethe and Carlyle* (1887); *Reminiscences and Letters of Carlyle* (5 vols., 1886–88); *Letters of James Russell Lowell* (2 vols., 1894). He was made Lit. D. by Cambridge University 1884 and LL. D. by Harvard 1887, and was president of the Archæological Institute of America 1879–90. He was Professor of History of Art, Harvard, 1874–97.

Norton, CHARLES LEDYARD: See the Appendix.

Norton, FRANK HENRY: See the Appendix.

Norumbega: the name given by early French explorers to a country, river, and city supposed to be somewhere in the eastern part of the U. S. or Canada, and said to have been discovered by Verrazano in 1524. The site of the city was given on a map published at Antwerp in 1570. In 1604 Champlain ascended the Penobscot, supposing it to be the Norumbega, but after going 22 leagues discovered no indications of a city or of civilization, except a cross in the woods.

According to B. F. De Costa, in his *Norumbega and its English Explorers*, published in Justin Winsor's *Narrative and Critical History*, vol. iii., the name is found in the map of Hieronimus da Verrazano of 1529 as "Aranbega," the initial "N" being omitted, and De Costa says it is there restricted to a definite and apparently unimportant locality. The name, with a variety of spellings (*Norumbegue*, *Norumbergue*, *Anorabegra*, *Anorumbega*, etc.), occurs on many old maps and in the works of various French and English explorers of North America. Norumbega was by some writers thought to embrace all New England, while Lok, in 1582, according to De Costa, seems to have believed that the Penobscot formed its southern boundary. In his *Norumbega and its English Explorers* De Costa expresses himself with great caution in regard to the location of Norumbega, but in his *Lost City of New England* he is of the opinion that if the ruins of the city are ever found they will be found on the Penobscot.

Arthur James Weise, of Troy, N. Y., in his work *The Discovery of America to the Year 1525*, arrives at the conclusion that the name is a contraction of the Old French *L'Anormée Berge* (The Grand Scarp), and claims that the adjective *anormée* and the noun *berge* definitely describe the wall of rocks known as the Palisades on the Hudson river above New York city. Weise has no doubt that by the term Norumbega river the Hudson is meant, and that the country around the Palisades was called by the French explorers *La terre d'anormée berge*, afterward contracted and corrupted into Norumbega and its numerous variations. Weise, in identifying the river called by the French writer "Norombègue" with the present Hudson, lays great stress upon the statement by the same writer that the water of the river was salty to the height of 40 leagues, and shows that the Hudson is brackish beyond the city of Poughkeepsie.

Finally, in 1890, Prof. Eben N. Horsford, of Cambridge, Mass., presented an entirely new theory. In this year appeared his *Discovery of the Ancient City of Norumbega*. In it he claims to have found the precise site of the ancient city, and locates it with absolute confidence on the Charles river in Massachusetts, at its junction with Stony Brook near Waltham. He makes Norumbega identical with the Vinland of the Norsemen (see VINLAND), claiming that Norumbega is an Indian corruption of *Norvegr* (Norway), and that it has borne that name among the aborigines ever since the Norse explorers in the tenth and following centuries made their headquarters there. He takes Norumbega to be the name the explorers did not bestow, but found. So

thoroughly convinced was Prof. Horsford of the correctness of his theory that he built on the site which he identified as Norumbega a tower in commemoration of the Norse discoverers and colonists. Prof. Horsford's discoveries have not received much recognition among scholars. The origin of the name Norumbega and its site are still a matter of doubt. See VINLAND.

In addition to works already cited, see Horsford's *John Cabot's Landfall in 1497 and the Site of Norumbega* and *The Defenses of Norumbega*. RASMUS B. ANDERSON.

Norwalk: town (site purchased from the Indians in 1640, permanently settled in 1651, incorporated as a town in 1653, burned by the Hessians during the Revolutionary war, incorporated as a borough in 1836); Fairfield co., Conn. (for location, see map of Connecticut, ref. 12–D); on Norwalk river, about 2 miles from Long Island Sound, and on the N. Y., N. H. and Hart. Railroad; 42 miles N. E. of New York city, 60 miles S. W. of Hartford. It has an excellent harbor, regular steamboat communication with New York city, large coasting trade, and extensive oyster and flower interests. There are over 16 churches, 4 public halls, 2 public libraries, public park, public high school, institute, school for girls and young ladies, public-school property valued at over $150,000, 3 national banks with combined capital of $540,000, 2 savings-banks, and a daily and 2 weekly newspapers. The principal manufactures are felt, iron, and woolen goods, locks, flour, bolts, screws, fur hats, straw hats, shoes, machinery, and paper. The town contains the cities of Norwalk and of SOUTH NORWALK (*q. v.*). Pop. (1880) 13,956; (1890) 17,747; (1900) 19,932. EDITOR OF "GAZETTE."

Norwalk: city; capital of Huron co., O. (for location of county, see map of Ohio, ref. 2–F); on the Wheeling and Lake E. and the Lake Shore and Mich. S. railways; 56 miles W. S. W. of Cleveland. It is in a farming, dairying, and stock-raising region; has manufactories of organs, sewing and knitting machines, agricultural implements, tobacco, flour, and lumber; and contains 2 national banks with combined capital of $150,000, 2 State banks with capital of $88,000, a public library with over 6,000 volumes, and a daily, a monthly, and 5 weekly periodicals. Pop. (1880) 5,704; (1890) 7,195; (1900) 7,074.

Norway [Old Norse, *Norvegr*, the northern way; Norw. *Norge*]: the western part of the Scandinavian peninsula; situated between 57° 59′ and 71° 11′ N. lat., and 4° 59′ and 31° 11′ E. lon., bordering on Russia and Sweden on the E., and surrounded on all other sides by the sea (see map of Norway and Sweden). Its length from S. W. to N. E. is 1,118 miles, its breadth 264 miles in its widest part. It has a coast-line of 1,700 miles; including the fjords there is a continental coast-line of 10,500 miles. The area is 124,445 sq. miles, three-fourths of which is uninhabitable.

Geology.—The mountains of Norway are of Archæan formation, with superincumbent strata of gneiss, hornblende, and quartz, in many places penetrated by masses of granite and gabbro. Above this foundation are strata of conglomerate and sparagmite, or of Silurian and Devonian formations, containing the oldest fossil remains. The general configuration of the country presents a grand display of ice action, and extensive glaciers are still to be seen. The largest is the Jostedalsbræ, with an area of 350 sq. miles, six times the size of the largest Swiss glacier.

Mountains.—The mountain system practically covers the whole kingdom. It presents no well-defined chains, but has numerous table-lands, among which individual peaks are very irregularly scattered. The Jotun-fjeldene (Giant Mountains) are the highest in Europe N. of the Alps, with Galdhöpiggen (8,528 feet), Glittertind (8,495 feet), and others of but slightly less altitude.

Fjords and Rivers.—The fjords are the most characteristic natural features. Unlike the Scotch firths, they are long and narrow arms of the sea, filling the deep excavations made by glacial ice. The two most famous, both for size and grandeur of scenery, are the Sogne and Hardanger fjords. The thirty larger ones have an average length of 60 miles. The rivers are numerous, but owing to falls and rapids only a few are navigable. Glommen, in the S. E., is the principal one. The lakes, in reality expansions of river-beds, are also numerous.

Islands.—With the exception of two short stretches, the whole coast has a chain of islands, called Skjærgaarden (the island belt). Between this rock rampart and the mainland there is a deep channel which affords shelter from the ocean storms, and makes coast and fjord navigation comparatively safe. Of the 50,000 islands 1,160 are inhabited, 195 being of considerable size. The most important are the Lofoten (Loffoden) islands, within the Arctic Circle.

Climate.—On account of the Gulf Stream the climate is milder than that of any other country in the same latitude. Those parts that are removed from the influence of the sea have a cold winter and hot summer; the coast regions have a mild winter and cool summer. Only the more interior fjords freeze. Barley ripens as far north as 70° N. lat., and potatoes can be raised in the most northerly regions. The mean annual temperature of the southern part of the country and the coast is 44° F. At North Cape it is 35°, but in some parts of the interior it is below 32°, as at Karasjok (Finmark), where it is 26°. The rainfall is greatest on the western coast, where it is 77 inches; on the southwest coast it is 40 inches, in the Lofoten islands 45 inches, while in the most northerly and the southeastern parts it is only 12 inches.

Products.—The soil is not very fertile, except in a few of the valleys. Only about 1,000 sq. miles are under cultivation, but the arable area is much larger. The mineral products are silver, iron, copper, and some gold, nickel and zinc, but none are of much importance. The flora is not rich in species, except in arctic plants, but is quite luxuriant, the profusion of wild flowers being particularly distinguished by their large size and brilliancy of coloring. The principal forests (covering an area of 25,000 sq. miles) are of fir, pine, and birch. Wild fruits are not abundant, although some berries are exported, but the grasses are numerous and afford excellent pasturage. The fauna is varied. The elk, the largest terrestrial animal of Europe, is found in the southern part. The reindeer is the most important wild animal, large herds of which have been semi-domesticated by the Lapps. The bear and fox are numerous. Of marine animals, whales and seals have been abundant, but are rapidly disappearing. The eider duck is the most important bird, and is carefully protected by law. Fish abound along the coast and in nearly all the rivers and lakes. The cod, herring, and mackerel are the most valuable, and are exported in large quantities. Salmon, trout, and lobsters are also plentiful.

Population.—The Norwegians, with the Swedes, Danes, and Icelanders, belong to the Scandinavian branch of the Teutonic race. They are hardy, of great endurance, and usually of large stature. According to the census of 1891 the population was 2,000,917 (965,911 males and 1,035,006 females); of these, 474,129 lived in cities and towns. One and a half per cent. are of Ugro-Finnic race, engaged in herding reindeer and in fishing. Only 2 per cent. are immigrants, mostly Swedes.

Principal Towns.—The six largest cities, with population in 1891, are Christiania, the capital (151,239); Bergen (53,684); Trondhjem (29,162); Stavanger (23,899); Drammen (20,687); and Christiansand (12,813). Hammerfest, the most northerly city in the world (70° 39′), has 2,160 inhabitants.

Divisions.—The chief administrative divisions are the towns of Christiania and Bergen and 18 amts. These are subdivided for local government into over 560 communes. The amts, with area in square miles and population Dec. 3, 1900, according to provisional census results, are as follows:

AMTS.	Sq. miles.	Population.
Christiania (town)	6	225,686
Akershus (or Aggerhuus)	2,055	115,113
Smaalenene (Smalenene)	1,600	136,298
Hedemarken	10,621	125,858
Christians	9,793	115,615
Buskerud	5,790	112,608
Jarlsberg og Larvik (Laurvig)	896	103,772
Bratsberg	5,865	98,788
Nedenes (Nedenas Robygdelaget)	3,609	78,605

Stavanger	3,532	127,192
Söndre Bergenhus (-huus)	6,026	135,337
Bergen (town)	5	72,159
Nordre Bergenhus	7,132	88,454
Romsdal	5,788	135,899
Söndre Trondhjem (Throndhjem)	7,184	135,133
Nordre Trondhjem	8,791	83,948
Nordland	14,517	151,537
Tromsö	10,134	74,296
Finmarken (Finmark)	18,296	32,735
Totals	124,445	2,231,395

Industries.—The principal pursuits are agriculture, fishing, navigation, cattle-raising, dairying, and lumbering. Agriculture is mainly confined to Southern Norway, and is making rapid progress. The principal crops in 1900 were

wheat and rye, 1,159,000 bush.: barley, 3,801,000 bush.; oats, 9,222,000 bush.; potatoes, 22,216,000 bush. Fishing is carried on very extensively, engaging about 130,000 men, the annual proceeds (including the whale and seal fisheries) being about 24,000,000 kroner. The most important fisheries are along the Lofoten islands. Norway's shipping (80 per cent. of which is in the foreign carrying trade) is surpassed in tonnage only by Great Britain, the U. S., and France. In 1900 there were engaged 6,809 vessels, of 1,534,895 tons burden. In recent years there has been great progress in manufacturing, in which the enormous water-power furnished by the numerous streams and waterfalls has begun to be utilized.

Education.—Compulsory education obtains from the ages of eight to fifteen. Illiteracy does not exceed 2 per cent. In 1896 (the latest date for which there are statistics) there were 5,966 schools with 255,433 pupils in the country districts, and in cities and towns 2,165 schools with 69,466 pupils. There are six seminaries for the education of teachers. Higher education is promoted by high schools, Latin schools, various private and technical schools, and the university at Christiania (founded 1811), with about 50 professors and (1899) 1,350 students. The state religion is Lutheran, but all other creeds are tolerated.

Government.—According to its constitution Norway is a free and independent kingdom, united with Sweden. The two countries have a king and the foreign service in common; in all other respects they are independent of each other, each having its own parliament, ministry, army, etc. The cabinet consists of two ministers of state and not less than seven councilors of state, of which one minister and two councilors are stationed at the Swedish capital in attendance upon the king. Since 1884 the cabinet officers have had seats in parliament. The legislative branch of the Government is vested in a Storthing (parliament), which meets annually, consisting of 112 members, chosen indirectly by a college of electors. Elections to the Storthing occur triennially. Although in reality unicameral, the Storthing elects one-fourth of its number to form an upper house, the Lagthing, the remaining members constituting the Odelsthing. In case both branches fail to agree, a two-thirds vote in joint session is necessary to pass a measure. The king has the right of a suspensive veto, but a bill passed by three successive triennial Storthings becomes law without the royal sanction. The Norwegian constitution is the only one to which the Napoleonic wars gave rise that survived the succeeding reaction. The jury system, in which a majority can convict, but available only in criminal procedure, was introduced in 1890. Direct taxation was introduced in 1893. The state debt (June, 1899) was $53,211,171, mostly due to railway building, begun in 1854. In 1900 there were 1,223 miles of railway, and 8,832 kilometres of telegraph lines. The metric system is used, and the monetary standard is the krone ($.268), divided into 100 öre. The army, with reserves, numbers about 30,000 men and 900 officers; the navy has 51 vessels with about 150 guns.

History.—Norway has been inhabited by the ancestors of its present population since time immemorial. It was long supposed that the aborigines were Lapps, and that Teutonic tribes settled there shortly before the Christian era; but archæologists have shown that the implements representing the stone age were made by the ancestors of the present inhabitants, and that the country has been continuously occupied by the same race ever since. In line with this the contention has been made with considerable force that the Baltic country, especially Denmark and Southern Sweden, was the cradle of the Aryans, or at least that this was the center of Aryan diffusion, and that here the blond, blue-eyed, dolichocephalic Teutonic race was developed. The earliest history of Norway must be studied in its archæological remains. The oldest Runic inscriptions date from between the third and fifth centuries A. D., but they are only of philological importance. The historical period does not begin until the ninth century. The traditions of the centuries preceding are covered over with a mantle of mythology. In 872 the numerous petty kingdoms were united by Harald Fairhair after a long and desperate struggle. At this time viking expeditions were common, and it was through them that the Norsemen became Christians. Harald's son, Haakon the Good, made a fruitless attempt to introduce Christianity, and his efforts were successfully continued by Olaf Tryggveson and Olaf the Saint (1030). From the time of Harald Fairhair until 1319, with the exception of three short intervals, Norway was ruled by kings of the Fairhair line. Many of them were grand figures, and their lives are vividly portrayed in the sagas. The most important of them, after Harald, are: Olaf Tryggveson (995–1000), Olaf the Saint (1014–30), Sverre Sigurdson (1184–1202), and Haakon the Old (1217–63). Of these Sverre was the greatest. He was a soldier-statesman of a high order. Starting out with a handful of untrained men, he gathered an army with which he defeated the reigning king, and in the teeth of the opposition of the Church of Rome and the nobility he built up a democratic kingdom. During Haakon the Old's reign Norway was at the height of her power as a state. Foreign potentates sought Haakon's friendship "in view of his power and experience on the seas," and it is said that in 1256 the pope desired his election as Emperor of Germany. Haakon's successor was his son Magnus, known as the Lawmender. Of the four existing codes of law he compiled one for the whole kingdom that remained in force 400 years. His son Haakon (d. 1319) was the last independent Norwegian king, and with him the Fairhair kings in the male line became extinct. Haakon was succeeded by his grandson, Magnus Smek (the son of Duke Erik of Sweden), and he was King of both Norway and Sweden from 1332 to 1355, when Norway, under Magnus Smek's son, Haakon VI., again became independent, although only nominally. About this time (1349–50) the black death ravaged Norway, reducing the population one-third. Some of the valleys were entirely depopulated. This and the devastating wars of previous periods sapped the strength of the nation, and that proud spirit of independence characteristic of the old Norsemen seemed to have vanished. Haakon VI. married the Danish princess Margaret. Their son Olaf was in 1376 elected King of Denmark, and upon the death of the father, in 1380, he also became King of Norway. Olaf died in 1387, whereupon his mother, Queen Margaret, became ruler of the two countries. In 1397, by the Peace of Calmar, she effected a union with Sweden, thus bringing the whole Scandinavian race under one scepter. Sweden revolted in 1523, but Denmark and Norway remained united until 1814. During the long union with Denmark, Norway's interests were neglected by the Oldenburg kings, who considered the country a province of Denmark; but in the latter part of the eighteenth century the dormant national spirit was awakened. The condition of the Norwegian peasantry, due to their system of land tenure, gave them a feeling of personal independence, but the impulse that aroused the national spirit came from France. The new ideas of the times found expression in highly patriotic, though bombastic, verse, and when the opportunity for regaining their national liberty presented itself the people were prepared. Sweden had demanded Norway as remuneration for participation in the alliance against Napoleon, and after the battle of Leipzig Frederick VI. of Denmark was forced (Treaty of Kiel, Jan., 1814) to cede Norway to Sweden; but the Norwegians refused to be disposed of in this way, declared their independence (Apr. 10, 1814), and on May 17 adopted a free constitution. A Danish prince, Christian Frederick, was elected king. Bernadotte, who had been made Crown Prince of Sweden, invaded Norway to enforce submission, but met with indifferent success. Anxious to have peace before the Council of Vienna convened, Bernadotte offered an armistice, and at the convention of Moss pledged himself to accept the constitution of May 17 in case Norway would unite with Sweden under one king. As the Norwegian king had proved a failure, the proposition was accepted, but on the basis that Norway's equality in the union should be unconditionally recognized. The union was effected Nov. 4, 1814, the conditions of which are specified in an Act of Union (*Rigsakt*). Norway has made great progress industrially and intellectually; but she has had many a struggle with Sweden in defense of her constitutional rights. Especially since 1872 party spirit has run high on questions of national interest, particularly in relation to the consular and diplomatic service. The house of Bernadotte is still the ruling dynasty, the present (1894) representative of which is Oscar II. See NORWAY, HISTORY OF, in the Appendix.

Norwegian Language: strictly the old written language in use in Norway down to the time of the Reformation, and the popular dialects that have succeeded it. The literary language since the Reformation is only Norwegian by virtue of local differentiation; in reality it is Danish, or more correctly Dano-Norwegian. Genetically, Norwegian proper forms with Icelandic the West Norse division of the Scandinavian branch of the Germanic languages. Chronologically, its history falls into two main periods, Old and New. Although minor dialectal differences are distinctly traceable even at the beginning of the Viking age in the eighth century, Old Norwegian first appears beside its offshoot, Old Icelandic, and the East Norse dialects, Old Swedish and Old Danish, as a separate dialect of Old Norse after the introduction of Christianity at the beginning of the eleventh century. Considered principally with reference to Icelandic, which, on account of its literature, is the far more important, Old Norwegian has had three periods of development. Of these the first extended from the year 1000 to 1200, down to which time there is but little difference in the forms of Iceland and Norway. In the second period, from 1200 to 1350, corresponding to the Classical period of Icelandic, the language becomes, however, differentiated in important points. (See ICELANDIC LANGUAGE.) In the third period, 1350 to 1530, or down to the Reformation, there were not only numerous phonetic changes within the language, but, more important still, there was brought to bear upon it, as the result of political conditions, the influence first of Swedish and then of Danish. At the end of the fourteenth century Danish influence became paramount. In the following century Norwegian was rapidly displaced by Danish in its last use in documentary writings, and at the time of the Reformation as a written language it had wholly disappeared. As a spoken language Norwegian still continues to exist in numerous popular dialects. Even in the oldest period a tendency toward dialectal division is noticeable, and doubtless this condition was afterward increased by the loss of the language from literature. A movement, headed by Ivar Aasen in 1848, has been made to rehabilitate popular Norwegian in a normalized form as the national language, but thus far without important result. The material for the history of Norwegian is contained in part in Runic inscriptions, which are, however, with few exceptions, subsequent to the first MSS. The oldest extant MSS. date from the end of the twelfth century. The ancient literature specifically Norwegian is neither large nor important.

The present linguistic condition of Norway owes its origin to the political connection with Denmark which followed the Calmar Union of 1397. Danish after this time not only quickly superseded native Norwegian as a written language, as has already been noticed, but presently became, besides, the official medium and the recognized language of culture, a condition that was still more deeply rooted by the advent of the Reformation by way of Denmark and the Danish translation of the Bible. The supremacy of the Danish language continues to-day with the difference that a Dano-Norwegian form has been developed that shows characteristic differentiations from the Danish of Denmark, both in vocabulary, which has incorporated from the dialects Norwegian words and idioms, and in the phonology of the spoken speech. It is, nevertheless, in all respects fundamentally Danish, and has followed, since the fifteenth century, Danish lines of development.

BIBLIOGRAPHY.—Noreen, *Altisländische und Altnorwegische Grammatik* (Halle, 1884); Sargent, *Grammar of the Dano-Norwegian Language* (Oxford, 1892); Aasen, *Norsk Grammatik* (Christiania, 1864; a grammar of the Norwegian popular dialects written in Danish), and *Norsk Ordbog med dansk Forklaring* (Christiania, 1873; a dictionary of Norwegian forms with Danish definitions. Most Danish dictionaries have appended a list of words specifically Norwegian). An exhaustive scientific treatment of the language by Noreen is contained in Paul's *Grundriss der germanischen Philologie*, vol. i. (Strassburg, 1891).

WILLIAM H. CARPENTER.

Norwegian Literature: the written or printed expression of the thought of the people of Norway. It may with reason be said to have had its origin in the early Runic inscriptions, dating back as far as the sixth century A. D.; but a literature proper did not arise until with the introduction of Christianity (about 1000 A. D.) there came the knowledge of the Latin alphabet and a more suitable writing material than wooden sticks or stone slabs. Norwegian literature in its earliest period is related to that of Iceland (see ICELANDIC LITERATURE), but is of less extent and less importance. Scaldic poetry was cultivated in Norway before the Icelandic scalds obtained a monopoly of praising the Norwegian kings in their "drápas." Eyvind Finnsson (called *Scaldaspillir*, the "spoiler of the scalds," because no other scald could stand comparison with him) has in his *Hákonarmál* given a vivid and poetic expression to his grief at the death of King Haakon the Good. Of the poems of the *Elder Edda* (see ICELANDIC LITERATURE) at least one, and one of the most important of them all, the *Hávamál*, bears intrinsic evidence of having been produced in Norway. The saga-writing, on the other hand, always remained a truly Icelandic art, and the thorough knowledge we possess of Norwegian history in the Middle Ages is due to Icelandic historians; so even when the Norwegian kings wanted their history written to order they applied to Icelanders. Of Norwegian historic writers we may mention Theodoricus Monachus, whose *Historia de Antiquitate Rerum Norvagiensium* was written in Latin about 1175, and the unknown writer of the *Historia Norvegiæ*, written also in Latin about 1180 A. D. Of the historical sagas written in the Old Norse language hardly any can with certainty be attributed to Norwegian authors. The chief exponents of Norwegian prose literature in the Middle Ages, then, are the laws, *Frostapingslög*, *Gulapingslög*, *Bjarkeyjar Réttr*, *Hirskrá*, etc., all published in *Norges Gamle Love* (The Old Laws of Norway, 5 vols., Christiania, 1845–92); furthermore, translations of homilies, saints' lives, and romantic sagas. The *Konungs Skuggsjá*, or *Speculum Regale*, deserves particular attention. The anonymous author of this "King's Mirror" describes himself as a Norwegian, living in the far northern part of the country, Hálogaland. In the form of a dialogue between father and son, the book gives us a description of court customs and court morals as they ought to be. The author makes several interesting digressions on the physical history of Ireland, Iceland, Greenland, on whales, seals, etc. A little piece worth mentioning is the plea of King Sverri against the pope and clergy, who sided against him in the civil war, first edited by Werlauff under the title *Anecdoton Sverreri*, lately by G. Storm, of Christiania, under the title *En Tale mod Biskoperne*.

When Norway through the Calmar Union (1397) became united with Denmark the Norwegian language lost its prestige, and was gradually supplanted among the higher classes and in the cities by the Danish language, while the Norwegian language continued to live on the tongues of the country people. It was this same country people who, when the Norwegian literature fell into decay, harbored a treasure of national traditions embracing the popular ballads and tales which in recent times have been made an object of study, and served to strengthen national sentiments and inspire a national literature.

During the fourteenth and fifteenth centuries, as well as immediately after the Reformation, there was little literary activity in Norway, as was also the case in Denmark. Absalon Pedersön, a chaplain of Bergen, about the middle of the sixteenth century, wrote *Bergens Kapitelsbog* and a *Norges Beskrivelse* (Description of Norway), where he shows himself to be inspired by a high patriotic feeling. Another ecclesiastic, Peder Claussøn Friis (1545–1614), rector of the parish of Undal, besides writing about the natural history, topography, and history of Norway (*Om Diur, Fiske, Fugle og Træer udj Norrige*, *Norriges og omliggende Øers Beskrivelse*, and *Kort Extract af Norriges Krønike*), made a very good translation of Snorri Sturluson's *Lives of the Norwegian Kings* (see ICELANDIC LITERATURE) and of the old Norwegian law. Particularly the former of these two translations served to arouse the national spirit, and thus pave the way for a subsequent national development.

In the eighteenth century Norway contributes to the common "Danish-Norwegian literature" two of its most prominent names, Holberg and Wessel, who were both born in Norway, and spent their childhood and early youth there. Holberg (see HOLBERG, LUDVIG, and DANISH LITERATURE), although he has been called the father of Danish literature, bears in many instances witness of his Norwegian origin, and Johan Herman Wessel (1742–85), whose *Kjærlighed uden Strømper* (Love without Stockings), a travesty of the then usual high-

sounding tragedies in the French manner, is still an attraction on the Danish and Norwegian stage, was one of the founders and the chief figure of Det Norske Selskab, a kind of Norwegian club in Copenhagen, where Norwegian students and literati met and discussed the questions of the day, made verses, and cultivated patriotism. Among the lesser lights of the Selskab may be mentioned Johan Nordal Brun (afterward bishop in Bergen, and author of two patriotic songs that are sung by every Norwegian), Claus Fasting, the two brothers Friman. Edvard Storm, who kept aloof from the society, wrote some fine romances in the Gudbrandsdal dialect, and his *Sinclairs Vise*, celebrating the destruction of the troops of the Scotch Col. Sinclair by Norwegian peasants, is still very popular. Another Norwegian poet of great local prestige was Petter Dass, rector of Alstahang parish, in Northern Norway (d. 1708). His *Nordlands Trompet*, although written in the Danish language, interspersed with many dialect words, is still to be found in every home in that part of the kingdom, and is one of the most widely read books in Norway.

The last century of the union with Denmark had witnessed a gradual development of national spirit in Norway; so when the dissolution of the union with Denmark came in 1814 the Norwegians felt themselves, as a nation, ready to take their fate into their own hands; but the first decenniums after the separation were not particularly well adapted for the development and growth of a national literature. The nation was still too much engaged in building up its political fortunes and restoring its financial and economic resources. Naturally the first products of Norwegian literature after the war were national songs that were direct expressions of joy and pride at the new-born liberty, high sounding and bombastic in phraseology. Among the poets of this period we may mention Simon Olaus Wolff (d. 1859) and Henrik Anker Bjerregaard (d. 1842), both authors of national songs. The last mentioned also wrote a national drama, *Fjeldeventyret*, in which two of the characters are representatives of certain national types. Mauritz Christoffer Hansen (d. 1842) was a novelist of some note; in his earlier rather fantastic productions he was influenced by the German and Danish romanticists, but some of his later novels, describing everyday life, have merit.

A great step in the direction of a national Norwegian literature was made by the poets of the following generation, chief among which stand Henrik Arnold Wergeland (1808–45) and Johan Sebastian Cammermeyer Welhaven (1807–73). Wergeland's father was a Lutheran minister and member of the constitutional convention at Eidsvold in 1814, who was distinguished by his intense Norwegian patriotism and his hatred toward Denmark, to which feeling he gave vent in a book entitled *Danmarks politiske Forbrydelser imod Norge* (Denmark's Political Crimes against Norway). This patriotism was to the full extent inherited by his son Henrik, with whom it took a distinctly practical turn; he was very active in the advancement of the common people, writing popular essays, establishing parish libraries, and editing a newspaper, *For Arbeidsklassen* (For the Working Class), where by means of short stories and treatises he exhorted the common people to thrift, cleanliness, industry, and patriotism, showing himself to be influenced in this work by Benjamin Franklin. Wergeland was also to a certain extent cosmopolitan in his tastes and studies, a pupil of Voltaire and the other eighteenth century philosophers. He was, as a poet, very productive, one of his first works being the unwieldy poem *Skabelsen, Mennesket og Messias* (The Creation, Man, and Messias) in three volumes, afterward rewritten by the author on his deathbed, in one volume, *Mennesket*. Among the most beautiful of his poems are *Jøden* (The Jew), *Jødinden* (The Jewess), poetical pleas for the admission of the Jews into Norway, whence up to that time they were excluded by law; *Den engelske Lods* (The English Pilot); *Norges Storthing*; *Til min Gyldenlak*; *Jan van Huysums Blomstoerstykke*. Some of his stories and poems for children are also excellent. Wergeland's excess of patriotism and his democratic tendencies made him distasteful to the "intelligent" party, which was headed by his great antagonist Welhaven, who in his cycle of poems *Norges Dæmring* (The Dawn of Norway, 1834) treated this excessive Norwegianism with such severe irony that he was considered by many as a traitor to his native country. In opposition to Wergeland he advocated the connection of Norwegian literature and civilization with Danish intellectual life. Welhaven is, in contradistinction to Wergeland, characterized by a great critical ability (even exercised against himself). He has not written much; mostly romances, ballads, and other poems, all of exquisite poetical form and beauty, showing the influence of Goethe and the romanticists. In some of his poems Welhaven gives fine pictures of the natural scenery of Norway, as in *Bergens Stift*, and after Asbjørnsen and Moe had published their popular and fairy tales he took up national subjects in his romances (*Aasgaardsreien*, *Dyre fra Vaa*, *Eivind Boldt*, etc.); so the animosity that a large part of the people had borne against him gradually subsided, and when in 1867 he retired from his chair as professor of literature, Bjørnson, who may be said to be a pupil and successor of Wergeland, wrote one of his most beautiful poems in his honor, while the same Bjørnson in 1881 made the speech at the unveiling of the Henrik Wergeland monument in Christiania. Thus later times have acknowledged that these great antagonists, Wergeland and Welhaven, were equally important and necessary factors in the development of a Norwegian literature. Younger but less gifted contemporaries and partisans of Welhaven were P. A. Munch, the poet and dramatist (see Munch, Peter Andreas), and P. A. Jensen (d. 1867). Also Camilla Collett (b. 1813), a sister of Henriek Wergeland, was more closely allied to Welhaven's school than to her brother. Her chief work, the society novel *Amtmandens Dotre* (1857), where she raises the cry against the social oppression of woman, makes her a pioneer in the movement for the emancipation of woman, and also to a certain extent makes her a forerunner of the society novels of a recent day as represented by Lie and others.

We have seen how Welhaven's national romances were influenced by Asbjørnsen's and Moe's popular fairy tales. These two men were the earliest and most important representatives of the movement, started in the beginning of the forties, to study the national treasures of poetry, music, and language which for centuries had been neglected. As part of this movement must be considered M. B. Landstad's work in collecting and publishing national ballads, a work that was continued by the learned Sophus Bugge; at the same time Aasen (see Aasen, Ivar Andreas) wrote his grammar and dictionary of the Norwegian popular language. Lindemann collected national airs, while Eilert Sundt made the Norwegian gypsies and the condition of the working people the subjects of his particular study. At the same time the historical studies of Rudolph Keyser and P. A. Munch awakened or deepened the interest in the early history of the nation. This is a period of national romanticism: Tidemand and Gude made national scenery and home life a subject of their paintings; Kjerulf and Ole Bull produced a series of national compositions. The chief literary figure is still Welhaven, with P. A. Munch and some lesser lights (like H. H. Schulze, Nicolai Østgaard, Bernhard Herre, and Harald Meltzer) grouped around him.

In the year 1857 Bjørnson's novel (*Synnøve Solbakken*) appeared, opening a new era in Norwegian literature, the period of Bjørnson and Ibsen. Both these authors at first allied themselves with the romantic school of writers. Bjørnson (see Bjørnson, Bjørnstjerne) in his novels treated subjects borrowed from the peasant life, of which he gives a characteristic, even if somewhat idealized, description, while he devoted his earlier dramas to historical subjects, and Ibsen's (see Ibsen, Henrik) earlier productions are all of an historical nature. Since about 1870 both these authors, in their dramas and novels, have turned to reproducing Norwegian city and home life in a realistic manner, and their pictures of Norwegian social life have made them famous the world over. Around these two giants, as it were, of Norwegian literature are grouped other authors also of great talent, such as Jonas Lie, Alexander Kielland, Kristoffer Janson, and Arne Garborg. Janson and Garborg have partly been writing in the common literary language of the country, the Dano-Norwegian language, partly in the so-called *Landsmaal*, in which also Aasmund Olafsson Vinje wrote his poems. Of late years there has grown up in Norway a school of writers whose efforts have been directed toward naturalistic description and the study of individual psychology. These writers do not care about plots, but for minute psychological characterization. The above-mentioned Arne Garborg partly belongs to this school, although he does not participate in its vagaries, such as those indulged in by men like Hans Jæger in his *Kristiania Bohemen* (1885), a book that was confiscated by the police, its author being sentenced to prison. Another author belonging to this school is Knut Hamsun, whose name suddenly gained a cer-

tain notoriety by his book upon the intellectual life of modern America (*Fra det Moderne Amerikas Aandsliv*), and whose novels, *Sult* (Starving), *Mysterier*, *Ny Jord* (New Earth) show a marked resemblance to the style of Dostojevski and other Russians. Gunnar Heiberg has with his dramas (*Kong Midas*, *Balkonen*, *Kunstnere*) also gained a certain fame outside of Scandinavia, and Vilhelm Krag has shown himself to be a poet of considerable force.

Seip, *Norsk og Dansk Literaturhistorie* (Christiania, 1890); Henrik Jæger, *Illustreret Norsk Literaturhistorie* (Christiania, 1892 ff.); J. E. Kraft and Chr. Lange, *Norsk Forfatterlexikon, 1814–56*. A valuable source of information is the yet unfinished work by J. B. Halvorsen, *Norsk Forfatterlexikon, 1814–80* (Christiania, 1881 *ff.*).

P. Groth.

Norwich, nor'rij: capital of the county of Norfolk, England; on the Wensum, immediately above its confluence with the Yare; 114 miles N. N. E. of London (see map of England, ref. 9–L). It is a large, old, and prosperous town, covering the slopes of a hill which rises gradually from the river. It is irregularly built, but full of specimens of early architecture. The cathedral was founded in 1096 by Bishop Herbert de Lozinga. It still retains its original Norman plan to a great extent, but the spire (fourteenth century), 315 feet in height, is mixed Decorated and Perpendicular, while the cloisters (1297–1430) are mainly Decorated in style; and there are remaining two fine arches of the Early English Lady chapel (demolished about 1580). The total length is 407 feet, the length of the nave 204 feet, and the length of the transepts 178 feet. The castle, situated at the highest point of the city, originally extended as far as the fine market-place, but the keep is now the only part remaining. It was long used as a prison, but is now a museum well known for its collection of raptorial birds. The Grammar School, a Decorated building dating from the fourteenth century, was formerly a chapel. St. Andrew's Hall, in which since 1824 the triennial musical festivals have been held, is the nave of the Black Friars' church, rebuilt in the fifteenth century. It is a fine example of Perpendicular work. Among forty-four churches, mostly dating from the fifteenth century, St. Peter Mancroft is perhaps the finest parish church in England. It has an ornamented tower with a peal of twelve bells. There are manufactures of worsted, silk, and cotton fabrics, especially crapes; also of mustard, starch, ornamental ironware, and shoes, while breweries and nursery-gardens in the outskirts of the town give employment to many.

Norwich was the *Caer Gwent* of the Britons, and the *Venta Icenorum* of the Romans. The name *Nord Vic* (North town) probably has reference to the large Roman camp of Caister, 3 miles to the S. It was often plundered by the Danes, and in 1216 it was sacked by the French dauphin Louis. In 1336 several thousand Flemish weavers settled at Norwich, and during the latter part of the sixteenth century there was a large influx of Dutch and Walloon refugees, who did much to foster manufactures. In 1602 nearly half of the inhabitants died of the plague. Norwich has been the seat of a bishopric since 1096, and is a municipal and parliamentary borough, the last returning two members to Parliament. Pop. (1901) 111,728.

Norwich: city (site purchased from the Indians in 1659, settled in 1660, received city charter in 1784, present charter granted in 1871); one of the capitals of New London co., Conn. (for location of county, see map of Connecticut, ref. 10–K); on the Thames river, and the Cent. Vt. and the N. Y. and N. E. railways; 16 miles N. of Long Island Sound, 35 miles S. E. of Hartford. It is in a valley surrounded by hills, has excellent water-power, and is noted for its manufactures. It contains a free academy with a normal training department, an art school, and kindergarten; public-school property valued at nearly $200,000; two libraries (Otis, founded 1848, and Norwich Circulating, founded 1871) containing over 23,000 volumes; 27 churches; 10 public halls; 5 national banks with combined capital of $2,000,000, 3 savings-banks with surplus of over $500,000, and a loan and trust company with capital of $100,000; an art museum; a free public hospital; 5 public squares; and 2 daily, 2 weekly, and 2 monthly periodicals. There are gas and electric light plants, electric street-railway, thorough sewerage system, and improved system of water-works. Prior to 1812 the city had large commercial interests; since then it has developed rapidly as a manufacturing center. Its principal manufactures are cotton, silk, and woolen goods, paper, firearms, wood-working and other machinery, printing-presses, envelope printing-presses, rolling-mill and foundry products, stoves and furnaces, leather-belting, rope, harness, hosiery, nickel goods, files and corks. Pop. (1880) 15,112; (1890) 16,156; (1900) 17,251.

Norwich: village; capital of Chenango co., N. Y. (for location of county, see map of New York, ref. 5–H); on the Chenango river, and the Del., Lack. and W. and the N. Y., Ont. and W. railways; 40 miles N. by E. of Binghamton, 90 miles W. of Albany. It is in an agricultural, dairying, and hop-growing region; contains 2 libraries (Academy and Union School, founded 1850, and the Norwich Circulating, founded 1875), 2 national banks with combined capital of $225,000, and a daily, a semi-weekly, and a weekly newspaper; and has several creameries, blast furnace, foundry, shops of the N. Y., Ont. and W. Railway, brewery, and manufactories of pharmaceutical preparations, silk goods, hammers, chairs, and sash, doors, and blinds. Pop. (1890) 5,212; (1900) 5,766.

Editor of "Chenango Telegraph."

Norwood's Tincture: an alcoholic preparation of American hellebore (*Veratrum viride*), which is supposed to be saturated.

Nosebleed: See Epistaxis.

Nosol'ogy [Gr. *νόσος*, sickness, disease + *λόγος*, discourse, reason]: the doctrine or science of diseases, more especially as regards their classification and nomenclature. The classification of diseases may be based upon theories as to methods of causation, upon the symptoms produced, upon the parts affected, or upon the final results observed. No complete and satisfactory classification of all forms of disease can be made with the present knowledge upon any single one of these plans, for of some diseases we do not know the cause; most symptoms may belong to several different diseases; the same disease may affect very different localities, and the final pathological results are often very obscure unless a *post-mortem* examination has been obtained, and they may even then be doubtful. It is impossible to devise a single nosological scheme of classification which will be well adapted to all the different purposes for which such schemes are needed—that which will best meet the wants of the vital statistician or health officer will not suit the pathological anatomist. A very important part of a nosological scheme is the nomenclature of the individual forms of disease or of lesions which are to be classified. It is essential that different men, in different countries, and at different periods, shall know what is meant by the name of a disease, such as smallpox, pneumonia, diarrhœa, Graves's disease, or amyotrophic lateral sclerosis.

With increase of knowledge, the use of new means of diagnosis and of instruments of precision, and of more minute examination of diseased tissues, comes the recognition of the fact that disorders of function or of structure, formerly classed together under a single name, may differ so greatly as to cause and result as to make it necessary to give them different names. In the eighteenth century the differences between typhus and typhoid fever were unknown, and hence it is impossible to compare the statistics of that period with those of the present day to ascertain the relative prevalence or fatality of these two very distinct diseases. It must be remembered that a disease is not a distinct separate entity, as is commonly supposed, and implied in the way it is mentioned, as, for instance, when cholera is said to enter a house or ravage a town. It is a condition of the body, and for purposes of nomenclature it is usually a group of conditions more or less unusual. Sometimes a name is devised for a group of symptoms, such as locomotor ataxy, sometimes for a pathological lesion, such as spinal sclerosis. A considerable number of different groups of morbid conditions are known by the names of the persons who first discovered them, as, for example, Addison's disease, Bright's disease, and such names for a time serve a good purpose. Jonathan Hutchinson prefers to give the new disease the name of the patient instead of the name of the doctor.

The older attempts at a systematic classification of diseases, including those of Sauvages, the first of which appeared in 1731, of Linnæus in 1763, of Vogel in 1764, of Cullen in 1772, of Pinel in 1813, and of Good in 1817, have long since passed into oblivion, and are now merely historical curiosities. The system devised by Dr. William Farr

for use in the statistical reports of the registrar-general of England has been the basis of most of the systems used by statisticians in Great Britain and America, its most complete development being the nomenclature of diseases issued by the Royal College of Physicians in 1884, as a large octavo volume of over 400 pages. It is proposed by the college to revise this every ten years, and the work of revision is now (1894) in progress.

The schemes of Dr. Farr and other vital statisticians include only those forms of disease which are reported as causes of death, for which between 200 and 400 terms are sufficient, while for the purposes of hospital registration and the needs of pathologists and systematic writers on the diagnosis and treatment of disease a much more extensive list is required. The classification of these into groups is a necessity due to the laws of mental action, since each one who studies and thinks about diseases must think of them in certain relations to each other and to the environment, but the groupings required for different purposes are very different. The nomenclature of the Royal College of Physicians divided all diseases into two great classes, viz., general and local diseases. The general diseases include those which affect the whole body, or which may be distributed in several parts at one time, and these are divided into several groups. Group A includes the diseases dependent on morbid poisons, or the specific febrile diseases, such as smallpox, measles, etc. Group B includes the diseases dependent on external agents other than morbid poisons, such as parasites, chemical poisons, effects of injuries, of climate, of errors of diet, etc. Group C includes the so-called developmental diseases, such as immaturity, malformation, and old age; and Group D includes a number of unclassified affections, such as gout, rheumatism, tubercle, scrofula, leprosy, cretinism, and diabetes. Recent discoveries in pathology and bacteriology make very extensive changes in this classification necessary. The list of parasitic diseases must be greatly extended, and this list can not form a homogeneous group. A nosology which groups together consumption, Asiatic cholera, typhoid fever, diphtheria, erysipelas, pyæmia, boils, glanders, gonorrhœa, pneumonia, and leprosy, all of which are probably due to vegetable micro-organisms, would be of very little use for any purpose except possibly to writers on bacteriology.

For the purposes of medical, sanitary, and vital statistics special forms of nosological classification are required, and in our present want of knowledge certain diseases must remain unclassed. It must be remembered that one of the most important means of advancing knowledge on these subjects is by comparing what is observed now with what was observed in times past, and hence the observations must be published in such a form that comparison is possible. If, for example, we are told that the number of deaths from zymotic diseases in New York in 1875 was 1,000, we can not compare it with the figures at a later period to much purpose, because the so-called zymotic diseases—which are Class I. in Farr's nosology—did not at that time include some diseases which would now be reckoned as belonging to it, as consumption, tetanus, and puerperal peritonitis.

The sanitarian wants a nosology based as far as possible upon causes of disease, yet he does not want all tubercular diseases reported together, but desires that the number of deaths due to consumption shall be stated apart from those due to tubercular meningitis or to tubercular disease of the bones, and he does not want a nosology which includes smallpox, typhoid fever, malarial fevers, and lobar-pneumonia in one group. For many purposes the simple arrangement of the diseases in alphabetical order is preferable to any nosological grouping, yet some grouping is absolutely necessary occasionally to save space. It is best applied to what are called local diseases, yet many of these would more properly be classed as manifestations of affections of the whole system, such as of gout or rheumatism. For most purposes cancer of the liver or of the breast should be classed under cancer, yet at times it must be considered in connection with diseases of the liver.

The majority of the cases of fatal disease are more or less complicated, and belong to several classes. The old idea that diseases can be divided into classes, orders, genera, and species, as is done for plants and animals, is now entirely abandoned, and it is evident that we must have not one nosological system, but several, adapted to different purposes; yet it is also extremely desirable that there should be more uniformity in the schemes used in reports of deaths than now exists.

J. S. Billings.

Nostoc [Fr.; cf. Germ. *nostoch*]: a genus of Algæ growing in fresh water or in damp places on the ground. All the species are composed of threads, consisting of small globular cells, between which are inserted, at intervals, larger cells called *heterocysts*. The threads are intricately wound round one another, and the whole surrounded by a mass of jelly. They reproduce asexually by division of their cells. Of the Nostocs proper there are twenty species in the U. S.

Nostoc threads.

Charles E. Bessey.

Nostrada'mus, whose true name was Michel de Notre-dame: physician and astrologer; b. Dec. 14, 1503, at St.-Rémi, in Provence, of Jewish parents; studied medicine at Avignon and Montpellier, and settled as a physician first at Agen, in the present department of Lot-et-Garonne, and afterward at Salon, near Aix. During the time of the plague, which at this period twice visited Southern France, he rendered great service. His immense fame, however, was built on his capacity as an astrologer. In 1555 he published his *Prophéties*, written in quatrains, and giving in an obscure and enigmatical manner prophecies concerning the coming centuries. Many royal persons—Catherine de' Medici, Henry II., Charles IX., and others—consulted him and loaded him with presents; the last-mentioned even made him his life-physician. In after times also the book found students and admirers; the latest is M. E. Bareste, whose *Nostradamus* appeared at Paris in 1842. In 1781 the book was forbidden by the pope, as it was found to contain a prophecy of the abolition of the papal authority. Nostradamus also published an almanac containing weather prophecies. D. at Salon, July 2, 1566.

Nostrils and their Diseases: The nostrils or nares are divided into the anterior nares, which can be seen by external inspection of the openings of the nose, and the posterior nares, to be seen only by aid of small circular mirrors placed in the back of the throat to reflect light, admitted through the mouth, to the nasal cavities above. The most common of their diseases is *catarrh*.

Nasal catarrh is produced by cold air, by insufflating dust, or by irritants. It is the beginning of many cases of laryngitis and bronchitis, and is an important local condition in a number of the infectious diseases, as in measles and influenza. Simple recent nasal catarrh produces a watery, alkaline serum. When more pronounced the catarrhal flow is less serous, contains mucous corpuscles, is viscid or even tenacious, and is yellowish in color and purulent. Chronic catarrh may result in constriction of the anterior nares, in the development of outgrowths of the mucous membrane, or even polypi. In the posterior nares, by extension to the throat, catarrh may result in permanent or obstinate nasopharyngeal catarrh. Such chronic catarrh may give rise only to habitual coughing and hawking of mucus, but it often impairs the hearing by tumefaction at the aperture of the Eustachian ducts or by extension to the middle ear. Nasal polypus is an attached tumor in the nostrils, originally a small projecting mass of granulations or enlarged glandular tissue. When chronic nasal catarrh has resulted in ulceration and death of the cartilages or bones of the nose, the discharge is often extremely offensive. This disease is known as ozæna. Close examination will discover particles of necrosed matter. Ozæna is more often the result of nasal catarrh in strumous, tubercular, and syphilitic persons. Epistaxis or nose-bleed is the result of local causes, as irritating or picking the nostrils; it is a frequent occurrence in persons having disease of the mitral valve of the heart; it is a symptom peculiar to typhoid fever; it is often due to excessive exercise and to excitement. The catarrhal diseases of the nostrils are treated by topical applications, inhalations, and sprays. Ozæna demands the insufflation or injection of antiseptic washes or the surgical removal of the dead bone. Polypus is removed by cutting or tearing. Nose-bleed is checked by cold applications on the nose, by plugging the nostril with lint, or the introduction of styptics, as tannic acid and persulphate of iron. In extensive bleeding from the nose the nostrils have to be plugged from behind as well as from before.

Revised by William Pepper.

Nota, Alberto, Baron: writer of comedies; b. at Turin, Italy, Nov. 15, 1775. His father had squandered his fortune, and the young man was obliged to toil for a livelihood. He studied law at Turin, and became an advocate at the age of eighteen. After struggling along in his profession for a time, he obtained official employment, and in 1811 he was made substitute for the procurator of the court at Vercelli. Somewhat later he became the secretary and librarian of the Prince of Carignano (later King Charles Albert). He was accused of liberalism, however, and had to give up his post. He removed to Milan, but had to return to Turin and resume his profession. In 1818 he once more entered the royal service, and was made undergeneral-intendant of the department of Nice. Thence he was transferred to Bobbio (1820), San Remo (1823), and finally became general-intendant at Casale (1833) and Coni (1840). D. at Turin, Apr. 18, 1847. During all his life he wrote comedies, the earlier and best of which show that his chief models were Molière and Goldoni. From the former he derived his fondness for general comic types, from the latter his method of depicting character. His defect, however, was a certain remoteness and generality of manner, markedly in contrast with the originality and *vis comica* of the greatest masters of the comic art. His first successful piece was *I Primi passi al mal costume* (acted in Turin, 1808). This was followed by *Il Progettista* (1809); *Il Nuovo Ricco* (1809); *L'Ospite francese* (1810); *I Litiganti* (1811); *Il Filosofo celibe* (1811); *L'Ammalato per immaginazione* (1813); *Il Benefattore e l'Orfana* (1814); *La Donna ambiziosa* (1817); *La Lusinghiera* (1818); *Alessina ossia la costanza rara* (1822); *La Fiera* (1826); *La Novella Sposa* (1826); *Il Torquato Tasso* (1826), etc. After the last date his comic style began to feel the sentimental influences of his time, and suffered greatly. Between 1816 and 1843 there were no less than twelve editions of his works, and many of the pieces were translated into the chief languages of Europe. The best Italian edition is *Commedie di Alberto Nota* (8 vols., Turin, 1842–43). A. R. Marsh.

Not'ables: in France, persons of noble birth or social distinction, from whom the members of the Assembly of the Notables were chosen. This body, which was first convened by the Valois king Charles V., owed its origin to the desire of the monarch to secure a more serviceable instrument of despotic power than the older States-General, which came into frequent collision with the royal will. As its members were dependent upon the crown, with which their interests were often identical, they generally consented to what the king proposed. The last Assembly of the Notables met in Nov., 1788. In the previous year it had accepted in part the reforms proposed by the Government, but now it refused to listen to the demand for the double representation of the Third Estate in the States-General. It opposed all innovations, and was dissolved Dec. 12, 1788.

Notacan'thidæ [Mod. Lat., named from *Notacan'thus*, the typical genus; Gr. νῶτον, back + ἄκανθα, spine, thorn]: a family of fishes of the order *Opisthomi*. The body is elongated (but not eel-like), and the tail tapers strongly backward; it is covered with very small cycloid scales; the lateral line is conspicuous; the head is conic, and the snout more or less produced; the mouth is inferior, the cleft moderate, and the lower jaw quite movable; the teeth are minute and pointed; the branchial apertures are normally extended; there are about eight branchiostegal rays; the dorsal fin is only represented by a number (7–30) of short disconnected spines about the middle of the length; the anal is elongated, and armed with numerous (12–15) spines in front; the caudal small and (typically at least) connected with the anal; the pectorals are well developed, and the ventrals are abdominal and composed of spinous (2–4) and articulated (7–8) rays. Several species are known chiefly from the oceanic abysses. Revised by F. A. Lucas.

Notary Public, or simply (as often called) **Notary**: a public officer existing among all civilized nations, and invested in almost every country in Europe and America with essentially the same functions and privileges accorded to notaries in ancient time—namely, the preparing and attesting of various instruments, the authenticating and certifying of examined copies of documents, the noting and protesting of bills of exchange, the administering of oaths and various other authenticating or solemnifying acts. The manner of appointment of notaries varies in different countries. In England they are appointed by the Archbishop of Canterbury, acting as the Court of Faculties; in Scotland they are admitted by the Lords of Session; in the States of the U. S. they are ordinarily appointed by the Governor. The particular functions and duties and the dignity attached to the office of notary vary in different countries; thus in England (where a notary must have served a clerkship) and many of the countries of Europe notaries are called upon to draw up papers, such as wills, which in the U. S. would be prepared by an attorney and simply acknowledged or sworn to before a notary. In England notaries have always exercised the right of administering oaths, but in the U. S. they can administer oaths only when given the power so to do by statute, which has been done by the U. S. and many of the individual States. In Great Britain and the U. S. a notary may refuse to act if he sees fit, but in some countries, as France, he can not refuse his services.

A notary is a ministerial officer, and is liable to a party injured by the negligent performance of any duty undertaken by him. Statutes also frequently declare his responsibility for misconduct, both civil and criminal. It is clear that in the absence of any statute his conduct is governed by that general rule of law which prescribes that any person who enters upon an undertaking requiring ordinary care and skill is liable to any one injured by this failure to exercise such care and skill. Still a notary is not liable to his employer if he commits an error acting under his employer's direction. Where a bill of exchange is given to an agent for collection, and the agent employs a notary to make protest of it (see Bill of Exchange), and the notary is negligent and thus discharges the drawer and indorsers, there is much divergence of judicial opinion as to the respective liabilities of the agent and notary to the principal—some decisions holding that when the act is strictly notarial (i. e. when the bill is a foreign one) the notary alone is liable to the principal, and that when the bill is an inland bill he is liable only to the agent who employed him; other cases holding that in either case the remedy of the principal is solely against the notary.

A notary can not transfer his official powers or authority to another, and therefore when called upon to perform a strictly notarial act he must in general perform it personally; but where there is a settled commercial usage in a place where a foreign bill is to be protested, that protest may be made by a notary's clerk, a protest so made will be held valid elsewhere, since the protesting of foreign bills is a matter of mercantile usage subject to local customs. In Great Britain and the U. S. courts will generally take judicial notice of the seal of a notary; but the notary's certificate of a certain fact generally has no more legal weight as evidence than the certificate of any other person, except his certificate that a foreign bill was duly protested.

For fuller information, see Brooke's *Office and Practice of a Notary of England* (5th ed. 1890), and the works of Proffatt and Rex on *Notaries*. F. Sturges Allen.

Notation [from Lat. *nota'tio*, deriv. of *notare*, to note]: in mathematics, a conventional method of representing quantities and operations by means of symbols. It explains the meaning of individual symbols, both of operation and of quantity, and shows how to combine them so as to express in the simplest manner every mathematical operation. A simple and comprehensive system of notation is essential to the progress of every science, but in no branch is a complete system more necessary than in mathematics, and in no branch has there been a greater diversity of systems proposed. Our present system is the result of the labors of many men, living in different ages, speaking different languages, and possessing different habits of thought; from these diverse sources a mathematical language has sprung up, defective in many respects, and yet sufficiently simple and copious for most of the purposes of analysis and investigation. Each department of mathematics has its own notation; in this article will only be considered the notation of arithmetic, or the method of writing numbers.

There are at present in general use only two systems of arithmetical notation, the *common* system and the Roman; in addition to these we shall also explain the method of the ancient Greeks.

(1) *The Common System.*—This is sometimes called the *Arabic*, because the figures which it employs were introduced into Europe by the Arabs. The following figures, expressing values regularly increasing by one from nothing to nine, are used in this system: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. These figures, taken separately, are called *digits*. The first one, named *naught*, is also called a *cipher* or *zero*; it stands for no number. The remaining ones are called *significant*

figures. All integral numbers are expressed by writing the proper digits in a line. The digit on the right is said to stand in the *first* place, the one preceding this in the *second* place, the next preceding in the *third* place, and so on. This order of arrangement is called the *scale* of the system. The same digit always indicates the same number of units, but the value of the unit indicated depends on the place it occupies in the scale. If a digit stands in the first place, it expresses simple units or *ones*; if in the second place, it expresses *tens*; if in the third place, it expresses *hundreds*; the value of the unit in any place is always ten times that of the unit in the next lower place. Thus the combination 376 stands for 3 *hundreds*, 7 *tens*, and 6 *ones*, or for the number *three hundred and seventy-six*. If we place a point—which we call the decimal point—on the right of the first place, we may continue the scale downward to any extent; in this case the digit on the right of the point is said to stand in the *first place of decimals*, the next stands in the *second place of decimals*, and so on. The unit of the first place of decimals is *one-tenth*; that of the second place, *one-hundredth*; that of the third place, *one-thousandth*, and so on. Thus the combination ·325 stands for 3 *tens*, 2 *hundredths*, and 5 *thousandths*, or for the number 325-*thousandths*. The scale thus completed is called the decimal scale; it will be noted that this scale is continuous throughout; that is, in proceeding from right to left the unit of each place is ten times that of the preceding place. If we place a cipher in each place, we may write the decimal scale as follows:

Period of billions.	Period of millions.	Period of thousands.	Period of units.		Period of thousandths.	Period of millionths.
etc., etc.						
hundreds of billions,						
tens of billions,						
billions,						
	hundreds of millions,					
	tens of millions,					
	millions,					
		hundreds of thousands,				
		tens of thousands,				
		thousands,				
			hundreds,			
			tens,			
			units,			
				Decimal point.		
					tenths,	
					hundredths,	
					thousandths,	
						ten-thousandths,
						hundred-thousandths,
						millionths,
						etc., etc.
0 0 0 ,	0 0 0 ,	0 0 0 ,	0 0 0	.	0 0 0 ,	0 0 0

For convenience of reading, the scale is separated into periods, each of which embraces three places, and is named as shown above. The denominations above billions are trillions, quadrillions, quintillions, etc., deriving their names from the Latin numerals. If a digit is written in the place of any cipher in the blank scale above given, it will express a corresponding number of units of the name indicated; thus the combination 326,812,435·278,812, expresses the number 326 *millions*, 812 *thousands*, 435 *units*, and 278 *thousandths*, 812 *millionths*. It will be observed that the unit of each place is some power of 10: thus the unit of the first place is 10^0, or 1; that of the second place is 10^1, or 10; that of the third place is 10^2, or 100, and so on. In like manner the unit of the first decimal place is 10^{-1}, or $\frac{1}{10}$; that of the second place of decimals is 10^{-2}, or $\frac{1}{100}$; that of the third place is 10^{-3}, or $\frac{1}{1000}$, and so on. It is from this law of relation that we name the scale a *decimal* scale; for like reason we call this system of indicating numbers the *decimal system*. In the system just explained the units corresponding to the different places are in geometrical progression, the *base* or *radix* of which is 10. Similar scales might be constructed having any other number as a *radix*, but such scales are not in common use.

There is an unfortunate ambiguity in the use of the terms billions, trillions, etc. In the French system, which is generally used in the U. S., each of these denominations is 1,000 times the preceding one; but in the English system it is 1,000,000 times, the billion being a million millions.

(2) *The Roman Method.*—In the Roman method of notation seven capital letters are used. These letters and the values they express are shown below:

Letters, I., V., X., L., C., D., M.
Values, 1, 5, 10, 50, 100, 500, 1000.

Any other number is expressed by a combination of these letters on the general principle that such a combination represents the sum of the values of its constituent letters, these being arranged from left to right in order of value, and the use of the same letter five times or more being avoided by using letters of greater value; but when, in accordance with the above, the same letter would occur four times, it is customary to employ the sub-principle that whenever a letter precedes one of greater value the value of the two is that of their difference instead of their sum. Thus III. denotes 3; VI., 6; LX., 60; XC., 90; XIV., 14; and MDCCLXXVI., 1776. This system is used only for dates, headings of chapters, and the like.

(3) *The Grecian Method.*—In representing numbers the ancient Greeks used either (1) the initial letter of the word denoting the number—e. g. Π (Pente) 5, Δ (Deka) 10, etc.; or (2) they used letters of their alphabet, to which they added the three obsolete characters ϛ′, ϙ′, and ϡ′. Thus the consecutive numbers from 1 to 9 were represented by the characters α′, β′, γ′, δ′, ϵ′, ϛ′, ζ′, η′, and θ′—*simple units*; the tens from 1 ten to 9 tens, or the numbers from 10 to 90, were represented by the characters ι′, κ′, λ′, μ′, ν′, ξ′, ο′, π′, and ϙ′—*tens*; and the hundreds up to nine hundred were represented by the characters ρ′, σ′, τ′, υ′, ϕ′, χ′, ψ′, ω′, and ϡ′—*hundreds*. Thousands were expressed by a subscript dash; thus the number 3,000 was written ,γ. The letter Μ written below any symbol increased its value ten thousand times; these conventional principles enabled them to write any number up to 1,000,000,000. The following examples show how numbers were expressed in this system:

,θ ϡ′ ϙ′ θ′, *nine thousand nine hundred and ninety-nine.*
,δ τ π β′, *four thousand three hundred and eighty-two.*
,γ α′, *three thousand and one.*

Other devices for expressing numbers were conceived by Archimedes, Apollonius, and others, but the entire system was, like that of the Romans, extremely unwieldy and ill fitted to practical computations. Revised by S. Newcomb.

Notation (in music): the mode or system by which musical thoughts are represented in writing, including all the signs, characters, figures, and arbitrary marks necessary to render such thoughts intelligible. The system now in use is mainly a product of the last three or four centuries, and in all civilized nations musical symbols are the same. In ancient times the recording of musical ideas was a subject of perplexity and uncertainty. To convey from one mind to another a clear idea merely of the pitch and the duration of several tones or sounds, though comprising only a very limited series, required of course certain signs or symbols which should possess a fixed meaning. The earliest signs adopted for this purpose seem to have been the letters of the alphabet, which were sometimes placed erect, sometimes inverted, mutilated, commingled, or cast into various fanciful forms, so that by degrees more than 100 of such characters came into use. After this greater simplicity was secured by the use of only a few Roman letters, the lower octave being represented by capitals, the second octave by small letters, and the third by small letters doubled. Besides the letter system another mode of representing musical sounds came into use, the leading feature of which was a single straight line, the various sounds being indicated chiefly by dots, either on the line or more or less distant from it. An illustration of this is given at *a* in the following example, taken from a work by Padre Martini, with its interpretation in black notes at *b* and in modern notes at *c*:

As late as the thirteenth and fourteenth centuries numberless crooked marks, loops, curves, hooks, wavy lines, and other signs, besides the dots, were used with the single straight line, forming a system not easy to be interpreted even by the most skillful of modern musicians. The introduction of several lines with their spaces, and notes of fixed form and duration, was the next important step. The lines were at first only four in number, though we sometimes find the staves belonging to two or three voices (with their proper clefs) so crowded together as to look like one stave of eight or twelve lines. The ancient notes belonging to the four-line stave are described in the article Large (*q. v.*). To indicate the pitch of the notes two clefs were used—

one to mark the place of middle C, and the other that of the F below. These clefs were not permanently fixed, but were placed on such a line as would serve most conveniently to keep the notes within the bounds of the stave and the spaces above and below. The stave now in universal use consists of five lines, and to each stave is prefixed a clef to designate, as from a starting-point, the various degrees of acuteness or gravity of the notes employed. Of these clefs that of F for the bass and that of G for the upper parts are of most frequent use in modern music, the C clef being reserved for certain orchestral parts, and also occasionally used for the tenor and alto in church music. The round-headed form of notes is now exclusively used, the old square breve seldom appearing except in the music of the church. The semibreve is now taken as the standard of unity or the note of longest duration, but the extent of that duration is determined by the will of the composer or performer. The actual speed of a piece of music is indicated by regulative terms or signs at the beginning, or is left to the discretion of the performer; but in all cases the time given to the semibreve determines the time of each minim, crotchet, quaver, etc., because these notes stand to it in the relation of $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, etc. Intervals of silence also, corresponding in duration with the several kinds of notes, are indicated by characters called *rests*. To meet the want of notes bearing other ratios to the semibreve, as $\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{16}$, etc., the simple process of adding a dot to a note was adopted, whereby its duration became one-half longer—a dotted minim, for instance, being $\frac{3}{4}$ of a semibreve, a dotted crotchet $\frac{3}{8}$, etc. The dot is sometimes doubled; in this case the time expressed by the first dot is increased one-half. These dots are equally applicable to the rests. The use of bars was not general till about the middle of the seventeenth century, and to the same period is to be referred the grouping of quavers, semiquavers, etc., by ties or ligatures connecting their stems. Under the head of notation are also comprised the numerous signs of expression, emphasis, loudness and softness, retardation and acceleration of speed, various kinds of ornament, and all the marks belonging to the province of harmony. See Grove's *Dictionary of Music and Musicians*.

Revised by Dudley Buck.

Note [from O. Fr. *note* < Lat. *no'ta*, mark, sign, note; cf. *nos'cere*, *no'tum*, know, recognize]: in music, the character by which a tone is recorded and represented to the eye. (See Notation.) In a less accurate sense, the term "note" is often used for the sound of which it is the representative, as when we say a high note or a low note, meaning a high or low sound. Though not strictly correct, this usage of the word is common even in scientific works and in ordinary converse.

Leading Note.—The leading note is the seventh degree of the major scale, or the semitone next below the octave. In the scale of C the leading note will thus be B; in that of B♭, it will be A, and so in the other keys. In major keys with sharps the last sharp of the signature is always on the leading note. From a certain natural tendency to resolve itself upward into the octave, the major seventh of the scale is said to lead the ear in that direction, or cause it to expect that the next progression will be to the octave, and hence its name of leading note. In minor scales the seventh in its natural form is not properly a leading note, being a minor seventh above the tonic. It is thus a whole tone below the octave, and does not possess any special upward or leading tendency. This defect, however, is removed by the use of an accidental sharp, which brings the seventh into the same relation to the octave as in the major mode, and makes it equally characteristic. The leading note is considered as the most sensitive interval of the scale, because it creates in the mind of the hearer a peculiar longing or desire for an ascent into the octave above, which it already seems almost to touch. Instances of this are given at *a*, *b*, and *c* in Ex. 1, and these may be compared with the true progression as represented in each case by the black dots:

Ex. 1.

Exceptions to this general rule, however, occur in good compositions when special effects are to be produced, or in flowing melodies where the leading note is not prominent *as such*, or when by an upward spring the leading note in its resolution passes over the octave and takes the third or fifth above. Some cases of this kind will be seen in Ex. 2 under the asterisks:

Ex. 2.

The leading note, as third in the chord of the seventh on the dominant, is subject also to the rules relating to the resolution of sevenths; but in this case the rule of the leading note as such, and that affecting it as third in the chord of the seventh, are coincident in requiring that the progression should be one semitone upward—i. e. into the tonic.

Revised by Dudley Buck.

Nothnagel, Hermann, Hofrath: physiologist and neurologist; b. in Alt Lietzegoericke, Brandenburg, Sept. 28, 1841; was educated in Berlin; was privat docent in Berlin and Breslau; became Professor of Medicine in Freiberg (Baden) in 1872, in Jena in 1874, in Vienna in 1882. His principal works are *Topische Diagnostik der Gehirnkrankheiten* (Berlin); *Arzneimittellehre* (seven editions, Berlin); *Beiträge zur Physiologie und Pathologie des Darmes* (in *Zeitschrift für klin. Medicin*); *Bearbeitung einzelner Kapitel der Gehirnkrankheiten* (in Ziemssen's *Pathologie und Therapie*); also a large number of special researches on medical and physiological topics. J. M. Baldwin.

Notice [Fr. *notice*, from Lat. *notitia*, knowledge, acquaintance, a being known, deriv. of *noscere*, *notus*, know]: a legal term used with varying significations. At times it is synonymous with knowledge, as when a court is said to take "judicial notice" of matters of general knowledge. (See Evidence.) Again, it designates the act, means, or instrument by which information is conveyed, e. g. notice to quit (see Landlord and Tenant), notice of dishonor (see Bill of Exchange), notice of acceptance of proposals (see Contract, Assignment, Guaranty), notice in legal proceedings (see Procedure). It is also employed as a technical term to denote information concerning a fact, which "is regarded as equivalent in its legal effect to full knowledge of the fact, and to which the law attributes the same consequences as would be imputed to knowledge." To illustrate: If a person buys and receives property on credit by false representations concerning his financial ability, the vendor upon discovering the fraud may rescind the sale and retake the property from the vendee, or from any purchaser from the vendee having knowledge of the fraud. This right is equally available against a second purchaser, who had notice merely of the fraud and not knowledge.

Actual and Constructive Notice.—While technical notice is divided commonly into actual and constructive, both text writers and judges differ in their definitions of these terms. It is agreed that actual notice is properly applied to authentic information concerning a fact which is directly communicated to the party to be charged by notice. It also applies where a person has the means of knowledge to which he dishonestly shuts his eyes. Beyond this all is debatable ground. It is believed, however, that the weight of authority supports the following views: Notice concerning a fact is to be deemed actual when it consists of information that would put a prudent man upon inquiry, which if followed up would result in acquainting him with the fact, provided that the circumstances authorize the finding, without the aid of any legal presumption, that the fact, or some aspect of it, was brought home to the consciousness of the party. The following is an example: A person who was negotiating for the purchase of certain lands with the one who held the record title was told by their prior owner, who was still in possession, that the latter had a claim on them, and that the former had better let them alone or he would get himself into trouble. He nevertheless concluded the purchase without making any inquiries concerning the nature of the claim. Had he inquired he would have learned that the party in possession was a mortgagor of the prem-

ises. It was held to be a question for the jury whether the purchaser had actual notice of the mortgagor's interest. (*Brinkham* vs. *Jones*, 44 Wis. 498; but see *Lamb* vs. *Pierce*, 113 Mass. 72.) If in the above case the only information acquired by the purchaser concerning the former owner's interest in the land had been that he was still in possession of it, we should have had at most an example of constructive notice. The law casts upon him who purchases property from one not in possession the duty of inquiring as to the possessor's interest, and if he fails to perform that duty it charges him with notice of all the facts that reasonable inquiry would have discovered. The inference of notice, however, in this case is not one of fact, but results from a presumption of law. That presumption may be rebutted. The purchaser may show that he made due inquiry and yet failed to discover any defect in his vendor's title.

In many cases constructive notice is absolute, or, as is often said, the legal presumption that the party chargeable with notice has acquired information concerning the fact in question is conclusive. He will not be allowed to dispute it. This kind of constructive notice is frequently the creature of statute. Under recording acts (see RECORD OF CONVEYANCES) a duly executed and registered deed is absolute notice to subsequent purchasers and incumbrancers not only of its existence, but of all interests in the property thereby conveyed. Constructive notice has a prominent place in the law of negotiable paper. A purchaser of such paper is conclusively taken to have read it, and therefore is never allowed to dispute that he had notice of anything apparent on its face, as, for example, a restrictive indorsement or notarial marks of dishonor for non-acceptance. If he acquires it after maturity he is also charged absolutely with notice of all equities available against his transferrer. So a purchaser of real estate is conclusively deemed to have read every instrument which forms a part of his chain of title and to be notified of every interest therein referred to. This doctrine is necessary to the security of titles.

Whenever notice of a fact is established, whether by direct evidence, by an inference of fact, or by an inference of law, its legal consequences to the one chargeable with it are the same as those that would flow from his knowledge of the fact.

What Constitutes Notice.—This is often determined by statute, as in the case of the recording acts, or by an equally positive rule of unwritten law, as in the case of negotiable paper. Where no such rule exists, it is a question of fact in each case whether the evidence shows (1) that the party to be charged with notice received information of a character that subjected him to the duty to inquire further, and (2) that such further inquiry would have resulted in knowledge of the requisite fact. A mere rumor or a vague report, or a general statement by one having no interest in the subject-matter of the transaction, will not impose on one the duty of inquiry. Such information ordinarily furnishes no clew to the truth. "To set on foot an inquiry into the foundations of mere rumors would in most cases be a vain and impracticable pursuit." If the information, though given by a stranger to the transaction, is definite and apparently credible, and especially if it refers to an authentic source of knowledge, it will impose upon the recipient the duty of further inquiry. Acts may constitute notice. One who fences and cultivates a piece of land thereby gives notice that he claims an interest therein. Visible structures may give notice. The purchaser of a house showing fourteen chimney tops and but twelve flues is notified of an easement in two chimneys on the part of the adjoining house. See Wade on the *Law of Notice*; Pomeroy's *Equity Jurisprudence*, ch. ii., § 5. FRANCIS M. BURDICK.

Notidan'idæ [Mod. Lat., named from *Notidanus*, the typical genus; Gr. *νῶτον*, back + *ἰδανός*, sightly, comely]: a family of selachians of the order *Squali* or sharks, distinguished from all others by the increased number of branchial apertures. In the form of the body they resemble the typical sharks. The skin is shagreen-like; the head depressed, oval, with the snout protuberant; the eye has no nictitant membrane; the nostrils are inferior and distant from the mouth; the mouth has a crescent-like cleft; the teeth are very unlike in the opposite jaws, those in the upper jaw being broad and armed with several cusps, one of which extends beyond the others, but in the lower jaw are six pectinated teeth on each side forward and several smaller posterior ones; the branchial apertures are six or seven in number; small spiracles are persistent on each side of the neck; the dorsal fin is single and inserted far backward behind the ventrals; the anal is well developed and behind the dorsal; the pectorals have an anterior edge straight from the base; the ventrals normal. The family is distinguished, in addition to these peculiarities, by a number of others, and is composed of two genera, *Hexanchus* and *Heptanchus*, represented in most warm seas. T. GILL.

Notion: a concept or general idea. The word is used mainly in logic, and is generally made to include the name given to the class of objects to which a concept or idea has reference. Thus "horse," considered as a "concept" or "idea," is the mental state or inner meaning of the thinker, while "notion" includes the name horse by which this "concept" or "idea" is expressed in reference to the object of thought. J. M. B.

No'to: town of Sicily; 16 miles S. W. of Syracuse (see map of Italy, ref. 10–G). It stands on a hill not far from the sea and commands a charming valley. The old town (Neëtum or Netum), built about 450 B. C. on the ruins of one still more ancient, was utterly destroyed by earthquake in 1693. The modern town was founded in 1703. It carries on trade in grain, wine, oil, and fruits. Pop. 15,925.

No'tochord, or Chorda Dorsalis [*notochord* is from Gr. *νῶτον*, back + *χορδή*, cord; *chor'da dorsa'lis* is Mod. Lat., from Lat. *chor'da*, cord + *dorsa'lis*, pertaining to the back, deriv. of *dor'sum*, back]: a rod of tissue of cartilaginous or softer nature which occurs in Vertebrates, Tunicates, and some other forms between the alimentary tract and the nervous system. In the early stages of the embryo the notochord arises from the dorsal wall of the digestive canal and becomes cut off from it to take its permanent position. In some forms (Amphioxus) it persists throughout life as the sole skeletal structure, and extends from one end of the body to the other. In the ENTEROPNEUSTA (*q. v.*) it occurs only at the anterior end, and in the TUNICATA (*q. v.*) it is developed only in the tail of the larvæ. In the Vertebrates it never quite reaches the anterior end, and in most it usually undergoes more or less complete degeneration. Around it is a sheath of connective tissue, the notochordal sheath, and from thickenings and ossifications in this the bodies of the vertebræ are developed, and with their growth the notochord loses its supportive value and becomes more or less completely obliterated. In adult man the only remnant of it is the so-called "nucleus of the intervertebral disk." To the naturalist, one of the most interesting features connected with the notochord is that it, a skeletal structure, is derived from the alimentary tract, and hence is entodermal in origin. See EMBRYOLOGY. J. S. KINGSLEY.

Notopter'idæ [Mod. Lat., named from *Notop'terus*, the typical genus; Gr. *νῶτον*, back + *πτερόν*, fin]: a family of teleocephalous fishes of the sub-order *Physostomi*, distinguished by many peculiar characters. The family is composed of fresh-water fishes, attaining considerable size, and peculiar to the fresh waters of India and Africa.

Notornis: See the Appendix.

Notoryctes: See the Appendix.

Notothen'idæ [Mod. Lat., named from *Notothe'nia*, the typical genus; from Gr. **νότοθεν*, from the south; *νότος*, south + *-θεν*, from]: a family of teleocephalous fishes, of the sub-order *Acanthopteri*, representing in the southern seas to some extent the codfishes of the northern. The greatest number belong to the typical genus (*Notothenia*), and some of them are abundant on the south coasts of South America and contiguous islands, as well as Kerguelen's Land, Australia, etc.

Notre Dame, University of: See the Appendix.

Nott, ELIPHALET, D. D., LL. D.: educator; b. at Ashford, Conn., June 25, 1773; graduated at Brown University 1795; was licensed to preach in that year and settled at Cherry Valley, N. Y., uniting the duties of pastor of a Presbyterian church with those of principal of an academy; was pastor of a church at Albany 1798–1804, acquiring celebrity as a pulpit orator, especially by a sermon on the death of Alexander Hamilton; was elected president of Union College, Schenectady, N. Y., 1804, and retained that post until his death Jan. 29, 1866. Dr. Nott acquired a considerable fortune by several inventions in stoves and other apparatus for warming buildings, and gave large sums for the endowment of Union College and the foundation of scholarships for poor students. Under his management Union College became one of the strongest literary institutions in the U. S., and 3,700 students were graduated from it during his presi-

dency. Among his publications were *Counsels to Young Men* (1810) and *Lectures on Temperance* (1847).

Not'tingham, or **Nottinghamshire**, or **Notts**: an inland county of England; bounded N. by Yorkshire, E. by Lincolnshire, S. by Leicestershire, and W. by Derbyshire. Area, 824 sq. miles. The eastern part, the vale of the Trent, is level and low; the rest is hilly, partly consisting of moorland, partly covered with remnants of the famous old Forest of Sherwood, the haunt of Robin Hood. In the south are the wolds, consisting of upland moors and pasture lands, broken at intervals by fertile hollows. The principal industry of the inhabitants is the manufacture of lace and of cotton hosiery, and those branches are developed more extensively and to a higher degree of perfection than in any other part of England. Much of the surface is laid out for gardening purposes. Coal, inferior to that of Newcastle, iron ore, marl, and good building-stone are found. Pop. (1901) 274,683.

Nottingham: capital of the county of Notts, England; on the Leen, near its junction with the Trent; 38 miles S. by E. of Sheffield and 126 miles N. N. W. of London (see map of England, ref. 8–I). It was formerly irregularly built, but its appearance has undergone a great change, owing to the widening of the streets and other improvements. On the summit of a rock rising abruptly from the river stands the castle (1674–83), built on the site of a Norman fortress. It was restored in 1878, and is now an art museum. Close by is St. Mary's church, a cruciform structure in the Perpendicular style with a fine tower, and a handsome market-place, 5½ acres in extent, at one end of which is the Exchange, rebuilt in 1814. Among modern erections are the Guildhall (1888) and the University College, with its splendid range of buildings. The latter is chiefly for science teaching, and accommodates in its wings a free library and a natural history museum. The High School (1868) has a large income from endowments. Among modern churches may be mentioned the Roman Catholic Cathedral of St. Barnabas, designed by Pugin, in the Early English style. There is a public park of 150 acres, and a common, called Bulwell Forest, of 135 acres, besides a picturesque arboretum of 17 acres. The Trent is crossed by an iron and granite bridge (1871), and the Trent Bridge cricket-ground is the scene of the home matches of the county, which for many years has been the *berceau* of first-class cricketers.

Nottingham's manufactures of cotton and silk hosiery and of bobbinet and lace are most important; bicycles, baskets, cigars, and needles are also made, and iron and brass works, malting business, and trade in grain and cattle are extensively carried on.

After having been occupied for some time by the Danes, when it constituted one of their five boroughs, it was restored and repeopled by Edward the Elder, who rebuilt the fortress and threw a bridge over the Trent. Parliaments met at Nottingham in 1334, 1337, and 1357. In 1642 Charles I. began the Parliamentary war by setting up his standard here. Nottingham is the seat of a suffragan bishop in the diocese of Lincoln, and a municipal, county, and parliamentary borough, the last returning three members to Parliament. Pop. (1901) 239,753. R. A. Roberts.

Nottingham, Heneage Finch, D. C. L., First Earl of: statesman; son of Sir Heneage Finch, recorder of London; b. in Kent, Dec. 23, 1621; educated at Westminster School and at Christ Church, Oxford; studied law and was called to the bar at the Inner Temple 1645; was a member of the Convention Parliament Apr., 1660; made knight, baronet, and solicitor-general by Charles II. June, 1660; was returned to Parliament for the University of Oxford 1661; became Attorney-General May, 1670; Lord Keeper of the Privy Seal, with the title of Baron Finch of Daventry, Nov., 1673; Lord High Chancellor of England Dec. 19, 1675; presided at the trial of Lord Stafford 1680; was created Earl of Nottingham May 12, 1681, and died in London, Dec. 18, 1682. Famed in his own time for powers of oratory, his portrait was given by Dryden under the character of Amri in his *Absalom and Achitophel*.—His son and successor in the earldom, Daniel Finch, b. about 1647; educated at Christ Church, Oxford; became a privy councilor and First Commissioner of the Admiralty 1679; was one of the commissioners to treat with William, Prince of Orange, 1688; was Secretary of State under William and Mary 1689–93; attended William to the congress at The Hague 1690; was again Secretary of State under Anne 1702–04; became one of the lords justices for the administration of affairs 1714; was Lord President of the Council Sept., 1714–Feb., 1715; wrote an answer to Whiston on the Trinity (1721), for which he was thanked by the University of Oxford; succeeded to the earldom of Winchelsea 1729, and died Jan., 1730.

Noumea: capital of New Caledonia (*q. v.*).

Noun [from O. Fr. *noun*, *nom* > Fr. *nom*: Ital. *nome*, Span. *nombre* < O. Span. *nomme*: Portug. *nome* < Lat. *nō'men*, name]: in grammar, a name or appellation of something, whether it be a substance, creature, quality, action, phenomenon, or any other entity, concerning which name a statement may be made in a sentence. A verb is the name of something as truly as is a noun. The word *talk* is the name of an action. In the sentence, *Talk is cheap*, it is a name concerning which a statement is made; so in the sentence, *It is all for talk*, it is a noun by virtue of its function. In the sentence, *They talk*, a word of like form, if not identically the same word, is also the name of an action, but with different function. The adjective is a name of an attribute; so is a noun. In the sentence, *White is a color*, we call *white* a noun by reason of its function, while in *iron chain*, *stone wall*, names which commonly appear as nouns serve in the *rôle* of adjectives. In the sentence, *There are too many ifs and ands*, the conjunctions *if* and *and* are nouns by virtue of their function. The distinguishing characteristic of a noun therefore is not the fact that it is a name, but its function as furnishing subject-matter for statement in the sentence. From the side of form it is the distinctive mark of the noun as contrasted with the verb that the former has cases, the latter persons. This distinction is developed most finely in the highly inflected languages like Greek and Latin.

Nouns are either concrete, as names for substance, or abstract, as names of attributes, actions, or phenomena. Concrete nouns are either common or proper. A common noun is an appellation which may be shared by all the individuals of a class or applied to the entirety of a material, as *man*, *tree*, or *water*, *wood*. A proper noun is permanently and definitely appropriated to mark an individual person or thing. The name *city* may be applied to any individual of a class, but *Chicago* has been appropriated like a tag or a trade-mark to designate one certain individual. Proper names may generally be traced historically to common names which from persistent connection with individuals have lost their meaning and become purely symbolic instead of representative; thus *Newcastle*, *Neuburg*, *Neuchâtel* were originally common names, *a new castle*, and the name *Smith*, a class name, *smith*. Proper nouns may in their turn become common when extended to a class of individuals sharing the prominent characteristic of the original holder of the name; thus *academy*, *czar* (Cæsar), *palace*, *a Napoleon*, i. e. an autocrat, *a Judas*, i. e. a traitor.

Common nouns may be divided into material nouns, as *water*, *iron*, and class-nouns, and these into individual nouns, as *man*, *house*, and collective nouns, as *people*, *crowd*, *army*. Benj. Ide Wheeler.

Novac'ulite [Lat. *novacula*, razor + suffix *-ite*]: a fine-grained, gritty, homogeneous, siliceous rock, translucent on thin edges and having a conchoidal fracture. It is known to occur at several localities in Europe, in China, and in Georgia and the Carolinas; and it constitutes an important Silurian formation in Arkansas, where it is quarried for the manufacture of whetstones. The variety quarried contains 99·5 per cent. of silica, and is so compact as to absorb but ⅙ per cent. of water. As an abrasive material it is distinguished by its fineness, and its chief use is for giving the final finish to cutting edges. See the annual report of the Geological Survey of Arkansas for 1891. G. K. Gilbert.

Nova (or **New**) **Goa**: See Goa.

Novaković, nov'aăk-ov'ich, Stojan: author; b. at Šabac, Servia, Nov. 1 (o. s.), 1842; was educated at Belgrade, where he became professor in 1865, receiving in 1867 the position of national librarian. He was appointed Minister of Education in 1873, and reappointed in 1874, and again in 1880. During his term of office he reorganized the Servian schools. In 1876 he became Professor of Servian Philology and Literary History at the High School of Belgrade; in 1883 he became a senator; in 1884 Minister of the Interior; in 1886 resigned and was appointed minister to Turkey. His greatest work is a history of Servian literature, *Istorija srpske književnosti* (1867; 2d ed. 1871). In 1869 he published an exhaustive Servian bibliography for the period from 1741-

1867, which he continued in the *Glasnik*. Other noteworthy works of his are *Srpska sintaksa* (3d ed. Belgrade, 1874); *Kosovo*, a collection of folk-songs (3d ed. Belgrade, 1876); *Primjeri*, an historical chrestomathy (1877); *Pripovetka o Aleksandru Velikom* (The Servian Alexandreis, 1878): *Srpska gramatika* (Belgrade, 1879). J. J. Král.

Novalis: pseudonym of Friedrich Leopold, Freiherr von Hardenberg, a poet. He was born at Wiederstädt, a family estate situated in the county of Mansfeld, Saxony, May 2, 1772; studied philosophy at Jena, where he was deeply influenced by Fichte and Schiller, and afterward devoted himself to the study of jurisprudence, chemistry, and mathematics at Leipzig and Wittenberg. The sudden death of his betrothed overwhelmed him with grief, which developed into profound melancholy. During this period he wrote the famous *Hymnen an die Nacht* and the *Geistliche Lieder*, the most perfect of his poetical productions. In 1797 he went to the mining-school of Freiberg for the purpose of studying geology. By coming into renewed contact with life, and by a faithful devotion to his studies, he soon overcame the morbid state of his mind. Shortly after his return from Freiburg he joined in Jena the circle of young writers who gathered around the Schlegels and Tieck, and who are generally known as the founders of the romantic school in Germany. More profoundly than any of the other members he conceived the idea of the unity of poetry, philosophy, and religion, and assigned to poetry the gigantic task of solving the final problems of life. To the principles of romanticism as he understood them he tried to give artistic expression in his unfinished romance, *Heinrich von Ofterdingen*, which he wrote in opposition to Goethe's *Wilhelm Meister*. The air of mysticism surrounding this fragment and the deep philosophical thoughts, frequently assuming the tone of oracles, still fascinate the reader, though as a novel the work must be pronounced an utter failure. It was only in the domain of lyric poetry that the vague emotions of Novalis's deeply agitated soul found their adequate and highly musical expression. D. at Weissenfels, Mar. 25, 1801. His writings were collected and published by L. Tieck and F. Schlegel (2 vols., 1802; 3d vol. 1846): an excellent edition of his poems was made by W. Beyschlag (1869), and an English translation of a selection of his works was published in London in 1891. See also A. Schubart, *Novalis Leben* (1887), and I. Bing, *Friedrich von Hardenberg* (1893).

Julius Goebel.

Novara, nō-vaa′raă: town; in the province of Novara, Italy (see map of Italy, ref. 2-B); about 30 miles W. of Milan, on a rising ground in the midst of the great fertile plain between the Sesia and the Po. The cathedral rivals St. Ambrogio of Milan in antiquity, having been founded A. D. 400. Charitable institutions of all sorts abound, and the provision for general education is liberal. Novara is the largest grain-market in Piedmont, and its manufactures are numerous and extensive. Among these are cotton and linen cloths, starch, candles, sausages, earthenware, hides, etc. Novara is of pre-Roman origin; its inhabitants were noted for their industry in the time of Pliny; and it has played a considerable part in the history of Northern Italy. Early in the twelfth century it was taken and burned by the emperor Henry V. In 1500 Ludovico il Moro was held a prisoner here: in 1513 it was the scene of a battle that ended in the expulsion of the French from Italy; in 1821 the constitutional troops were here defeated by the Austrians; and here again, in 1849, the Austrians triumphed over the Sardinian army. Pop. (1890) 19,577.

Nova Scotia [Lat., New Scotland]: originally Acadia; a province of the Dominion of Canada, consisting of the peninsula of Nova Scotia proper and the island of Cape Breton, which is separated from the mainland by the Gut of Canso. It lies between 43° 25′ and 47° N. lat., and 59° 40′ and 66° 25′ W. lon. Its extreme length is 350 miles, and its breadth varies from 50 to 100. Total area, 20,907 sq. miles. The peninsula is joined to New Brunswick by an isthmus 13 miles wide, across which a ship-railway, joining the waters of the Bay of Fundy and Bay Verte, is (1894) in process of construction. The coast waters of Nova Scotia are the Gulf of St. Lawrence on the N., the Atlantic on the N. E., E., and S., and the Bay of Fundy on the W. (see map of Quebec, New Brunswick, and Nova Scotia).

Physical Features.—The province is intersected by chains of lofty hills, and is indented with deep bays and noble harbors all along its coast. On the southeastern or Atlantic side there are twelve, capable of affording shelter to the largest ships, while every few miles along the shore are smaller harbors, easy of access, forming an admirable shelter for the hundreds of fishing-vessels which ply their calling for the greater part of the year. The shore is studded with small islands. The interior is covered with a network of lakes which find their outlet in numerous small rivers, most of which are navigable for small vessels for from 5 to 12 miles. The chief rivers are the Shubenacadia, Avon, Annapolis, Lahave, Musquodoboit, and St. Mary's. The surface is generally hilly, but the greatest elevation is only 2,100 feet.

Geology.—The more regular geological formations run, for the most part, parallel to the general trend of the Atlantic coast-line. The region forming the southern half of the peninsula of Nova Scotia lies on the Atlantic in the form of a curved wedge, whose apex is formed by Cape Canso, and its base by the narrow triple belt of Silurian, Triassic sedimentary, and Triassic igneous. This area is essentially Cambrian, broken in several districts by the irruption of vast masses of granite, and in many places well covered with drift from the more northerly formations; it is the location of the extensive series of gold-bearing rocks. The Bay of Fundy is warded off from this region by the narrow triple bulwark already mentioned, consisting of, first, a huge wall of massive Triassic trap about 120 miles long, containing very interesting minerals and forming the range called the North Mountains. Next come the narrow Triassic intervals at the foot of this range, drained by the Cornwallis and Annapolis rivers toward Minas basin, and covered by the waters of St. Mary's Bay toward the Atlantic. Lastly, a Silurian strip, with Devonian patches, lying against the parallel range of the South Mountain, coterminous with the Cambrian area.

The northern half of the peninsula and the contiguous island of Cape Breton, to the eastward, are principally occupied by Carboniferous and Permian strata, through which rises, in the W., the chain of the Cobequid Mountains, a mass of ancient igneous rock 100 miles long. This is flanked on the S. with narrow strips of Silurian, Devonian, Carboniferous, Triassic, and the waters of the Minas basin. Through the Carboniferous and Permian in the E. protrude in irregular patches of greater or lesser extent areas of old igneous, Cambrian, Silurian, Devonian, and, in the highlands of Cape Breton, pre-Cambrian rocks also. Within these regions, from the Silurian to the Carboniferous, are found great deposits of iron, limestone, marble, gypsum, coal, freestone, manganese, copper, etc. The coal-fields are extensive and of great value. There are besides vast deposits of bituminous shale rich in petroleum.

Climate.—The climate of Nova Scotia is remarkably temperate, being greatly affected by the ocean currents which surround it. The extremes of temperature are not so great as farther inland. Along the coast the mercury rarely falls to zero, but occasionally it falls 10° below; in summer it rarely reaches 90°. For Nova Scotia the mean temperature of summer is about 61°, of winter about 23°. The average mean annual temperature is about 42°; the average annual percentage of cloud, 60 per cent.; average precipitation of water (rain and snow) per annum, about 45 inches. Wintry weather lasts generally from December to March. The spring is usually backward, but vegetation is very rapid. From May to November the weather is very pleasant and healthful.

Agricultural Products.—The dike lands around the Bay of Fundy are admirably adapted to the production of hay. The interval lands all over the province are rich and productive. The upland is of varying degrees of fertility. Wheat, oats, rye, barley, buckwheat, and Indian corn, together with almost every variety of vegetables, are produced abundantly. Apples, pears, plums, cherries, and all the small fruits of temperate climates are largely cultivated. Away from the sea grapes ripen in the open air. Increased attention is given to the cultivation of fruit, the Government having established a school of horticulture at Wolfville, and considerable quantities are shipped to the English market. In 1891 the farm products included 165,806 bush. of wheat, 227,530 of barley, 1,559,842 of oats, 5,113,612 bush. of potatoes, 63,391 tons of hay, 1,051,592 bush. apples, 9,004,118 lb. of butter, 589,363 lb. of cheese, and 1,072,234 lb. of wool.

The forests of Nova Scotia are very valuable, although they have been greatly injured by fires. They consist chiefly of white and red pine, oak, tamarack, rock maple, hickory, elm, and walnut.

Divisions and Population.—The province (including Cape Breton) is divided into eighteen counties, with population in 1881 and 1891 as follows:

COUNTIES.	* Ref.	Pop. 1881.	Pop. 1891.	COUNTY-TOWNS.	Pop. 1891.
Annapolis	2-A	20,598	19,350	Annapolis	.....

* Reference for location of counties, see map of Province of Quebec, etc.

Principal Towns.—The chief towns are Halifax, the capital (pop. 38,556); Dartmouth (6,249); Truro (5,102); Yarmouth (6,089); Lunenburg (4,044); Spring Hill (4,813); Amherst (3,781); New Glasgow (3,776); Pictou (2,998); North Sydney (2,522); Windsor (2,838); and Liverpool (2,465). The eastern half of the province was settled almost wholly by Scotch, the center and west by English, Scotch, Irish, American loyalists, and a few Canadian French. The county of Lunenburg is almost wholly German. The Micmac Indians number 2,129.

Industries.—In addition to farming the chief industries of the province are fishing, lumbering, and mining. The fishery returns for 1891 show that during that year 14,065 vessels and boats, valued at $1,416,048 and manned by 24,070 men, were engaged in the work. The catch was valued at $7,011,300; comprising cod, $2,464,982; mackerel, $1,399,694; lobster, $1,100,927; herring, $621,722; all others, $1,423,975. The products of the forest included 202,938 cubic feet of white pine timber, 3,082,940 cubic feet of other timber, and 5,195,498 pine and spruce logs. The principal mining industries are coal and gold. In 1893 there were mined 2,229,715 tons of coal, while the production of gold amounted to 18,849 oz.

Prior to the introduction of steel and iron, ship-building was very extensively carried on. A large number of vessels are still built, the number on the returns for 1892 being 2,740, with a tonnage of 425,870. Since 1880 the manufacturing industries have greatly increased. There are two large sugar-refineries and a cotton-factory at Halifax, a cotton-factory at Windsor, and a cotton-duck factory at Yarmouth, smelting-works and rolling-mills at Londonderry, large iron-works at Ferona, steel-works and glass-works at New Glasgow, and numerous smaller establishments, including woolen-mills, tanneries, foundries, shoe-factories, canning-factories, agricultural-implement works, gunpowder and dynamite works. A railway system connected with the great lines of the continent extends throughout the province.

Religion, Education, etc.—According to the census of 1891 there are in the province 122,452 Roman Catholics, 108,520 Presbyterians, 83,122 Baptists, 64,410 members of the Church of England, 54,152 Methodists, 5,882 Lutherans, and 3,112 Congregationalists. The Roman Catholics have two dioceses: the archbishopric of Halifax and the bishopric of Arichat. There is also a bishop of the Church of England, whose diocese extends to Prince Edward Island as well as Nova Scotia. Public schools are supported by a grant from the Government amounting to $222,000, and by direct taxation of the municipalities. In 1893 there were 2,252 schools with 2,319 teachers and over 100,000 pupils. Each of the eighteen counties has an academy. There is a provincial normal school at Truro. There are also six colleges: Dalhousie College and University, at Halifax, which is non-denominational; King's College and University (Episcopal), at Windsor; Acadia College (Baptist), at Wolfville; St. Francis Xavier (Roman Catholic), at Antigonish; St. Ann's (Roman Catholic), in Digby County; and a Presbyterian Theological College, at Halifax. There is an institution for the blind and an institution for the deaf and dumb at Halifax. The province has an admirable system of public charity.

History and Government.—Nova Scotia was visited by the Cabots in 1497. It was first settled in 1604 by the French under de Monts. At that time Nova Scotia, New Brunswick, and a part of Maine were called Acadia. The settlement of Port Royal was attacked by the English colonists of Virginia under Sir Samuel Argall in 1614. They captured the place, and claimed the territory as belonging to England. For many years Acadia was a battle-field for the French and English. In 1621 James I. granted the whole peninsula to Sir William Alexander. It was then for the first time called Nova Scotia. A small Scotch settlement was formed opposite Port Royal, but it did not prosper. After many years of war Nova Scotia was finally ceded to Great Britain by the Treaty of Utrecht in 1713. In 1749 Halifax was settled by Lord Cornwallis. In 1755 the Acadians were expelled from King's and Annapolis Counties. The struggle now went on for the island of Cape Breton. It was ceded to Great Britain by the Treaty of Paris, 1763. Nova Scotia joined the Dominion of Canada in 1867. The Dominion pays an annual subsidy to the province for purposes of the provincial government. The province also enjoys a royalty on coal, gold, and other minerals. The local legislature consists of an upper house of twenty members, and a house of assembly of thirty-eight. The executive is composed of a lieutenant-governor appointed by the governor-general in council, and eight members, three with portfolios and five without.

AUTHORITIES.—See the histories by Haliburton, Murdoch, and Campbell; *Nova Scotia Archives*, compiled by Aikens; Dawson's *Acadian Geology*; and the public documents of Canada and Nova Scotia. JOHN FORREST.

Nova'tian (Lat. *Novatia'nus*): a schismatic Roman bishop of the third century, sometimes called "the first antipope," founder of the rigorous Puritanic sect called Novatians. Perhaps he had been a Stoic philosopher. He was learned and eloquent, but of melancholy temperament; was baptized by sprinkling while on a sick-bed, and not confirmed, but notwithstanding this twofold irregularity soon after became a presbyter. In 251 he was persuaded by Novatus from Carthage to be made bishop in opposition to Cornelius, but was formally excommunicated the same year by the dominant party. He then set out to organize an opposition church, but according to Socrates (*Hist.*, iv., 28) suffered martyrdom in the reign of Valerian (253–260 A. D.). We have a letter of his to Cyprian, in the name of the presbyters and deacons of Rome (*Ep.*, xxxi.). He wrote also *De Cibis Judaicis* (about 250) and *De Trinitate* (about 256), a very valuable treatise. There is an excellent edition of his writings by Edward Welchman (Oxford, 1724), but the best is by John Jackson (London, 1728); those mentioned are translated in the *Ante-Nicene Fathers* (New York, vol. v., pp. 308–311, 611–650). The sect spread E. and W., and continued till after 450 A. D. Revised by S. M. JACKSON.

Novatianism: See NOVATIAN.

Novation [from Lat. *nova'tio*, liter., a making new, deriv. of *nova're*, renew, make new, deriv. of *no'vus*, new; cf. Eng. *new*]: in Roman law, the substitution of a new obligation (see OBLIGATION) for an old one, the old obligation being thereby extinguished. In the new obligation the parties may be the same as in the old, or there may be a new obligee or creditor, or there may be a new obligor or debtor. In the two latter cases (which come under the head of "delegation") novation was resorted to by the Romans because in principle (as at English common law) obligations were not capable of being transferred to new parties.

English Law.—The fact that novation, like other Roman contracts, was independent of "consideration" in the English sense (see CONSIDERATION) makes the Roman rules of novation largely inapplicable in English law. Novation without change of parties does not seem to be recognized at all; novation with change of parties is recognized in but one class of cases. Where, for example, "A owes B £100 and B owes C £100, and the three meet and it is agreed between them that A shall pay C the £100," it is said that "B's debt is extinguished, and C can recover that sum against A." (Bullen, J., in *Tatlock* vs. *Harris*, 3 T. R. 174.) Such a transaction is strictly a double novation, since the new contract between A and C replaces and extinguishes two previous obligations, viz., that of A to B and that of B to C. It comes easily within the English rules of consideration, because C's surrender of his claim against B is a sufficient consideration for his contract with A; B's surrender of his claim against A is a sufficient con-

sideration for the release which he receives from C; and A's release from B's claim is a sufficient consideration for his promise to C.

Both in the Roman and the English law the substitution of a new creditor by novation requires the consent of the debtor, and the new creditor sues on the new obligation—facts which in both systems distinguish novation from the cession of an obligation or assignment of a debt. Both at Roman law and at English common law a method was devised for ceding or assigning a claim without the consent of the debtor, and with the effect of enabling the new creditor (the cessionary or assignee) to sue on the old obligation. In both systems the method devised was the same—the assignee was made *procurator* or attorney of the old creditor, and sued in the old creditor's name. (See MANDATE and POWER OF ATTORNEY.) In modern European law, as in English equity and the modern legislation of Great Britain and the U. S., rights of action on contract are regularly assignable, and the assignee sues in his own name.

Modern Codes.—In most of the European and South American codes, and also in the codes of Louisiana, California, and North and South Dakota, the Roman rules of novation are restated with little change; but the importance of the doctrine is far less than in the older Roman law. In modern European law obligations are regarded as capable of transfer not only on the active side (to a new creditor), but also on the passive (to a new debtor); and although in the latter case the assent of the creditor is necessary, it is not assumed that a new obligation has been contracted between him and the new debtor. Novation between the same parties is regarded as possible, but an agreement to change the form or the substance of an obligation or its modalities (e. g. time or place of payment) is not assumed, in case of doubt, to imply the creation of a new obligation. MUNROE SMITH.

No'va Zem'bla (in Russian, *Novaya Zemlya*, i. e. New Land): two large islands separated by a very narrow strait, forming an enormous crescent in the Arctic Ocean and separating the Sea of Barents from Kara Sea, N. of Northeastern Russia and Northwestern Siberia; belonging to Russia. Area, 34,500 sq. miles. They are uninhabited, but are visited during the summer by whalers and hunters of bears and reindeer. The islands are very desolate, and have been explored by Baron Nordenskjöld.

Revised by M. W. HARRINGTON.

Novel [from O. Fr. *novelle, nouvelle* (> Fr. *nouvelle*) piece of news, liter., femin. of *novel* (whence Eng. *novel*, new, strange) < Lat. *novellus*, dimin. of *novus*, new]: in English, a fictitious prose narrative, which describes real life, past or present, the term romance being applied to narratives of a more or less fantastic character. The distinction is not always closely observed, and no history of the novel can be at all satisfactory without including frequent reference to romance; they are simply two kinds of prose fiction, one the work of realism, the other of idealism.

Early Forms of Fiction.—Fictitious narratives are found in many early and remote literatures. There are Chinese, Japanese, and Egyptian novels, and toward the close of the ancient Greek literature we find prose romances of a somewhat fantastic sort, which were imitated freely at the time of the revival of letters. In Roman literature the *Metamorphoses* or *Golden Ass* of Apuleius is the only survival of a form of story that was extremely common, and the *Satyricon* of Petronius gives us a satirical representation of the corruption of imperial Rome. It was not from these fragments, however, that the modern novel arose, but rather from other sources, one of which was the collections of short tales by unknown authors that appeared in Italy in the fourteenth century. The most important of these was called *Il Novellino*. It contained a number of stories already told a thousand times in prose or verse, familiar in rhymed *fabliaux*, or as historical or biographical anecdotes. They had accumulated from all sources—from the classics, from the East; they were the common property of the world. There were many collections of this sort, but they are all mere inchoate beginnings in comparison with the *Decameron* of Boccaccio (1353), a collection of 100 tales, also gathered from various sources, but told with such charm and grace of style that the book became the model for modern prose. Other Italian novelists followed in Boccaccio's footsteps, and their work spread, in translations, over the rest of Europe. It was the English play, rather than the novel, that was fed from this supply. More important sources of the modern novel are to be found in Spain, a country which acquired power and influence as Italy lost them.

Spanish Romance.—In Spain it is possible to observe many instances of the never-ending conflict between idealism and realism. Nowhere has the division between these two ways of looking at the world been more sharply drawn. The romancers had the additional charm of looking at a world which had many of the qualities of fairyland. The most celebrated of these, the AMADIS OF GAUL (*q. v.*), forms the link that connects the mediæval romance with the modern novel. While it is a fantastic representation of the glory of chivalry it also contains much of the tendency to analytic reflexion which has become the main characteristic of later fiction, and it led directly to a host of imitators, from which the novel was laboriously developed. The origin of the *Amadis* is very obscure; its sources are to be found in Portugal, Spain, France, and England, and to this innate cosmopolitanism it owed perhaps a good part of its success, for it became popular throughout Europe. It was the work of various hands, and was probably first printed early in the sixteenth century. It was a literary representative of the popular taste, and was widely read in its many translations. In Spain it had many followers. In that country many mediæval forms still survived. The long conflict with the Moors had intensified the zeal for the Church as well as a love of warfare, and both these feelings found full expression in the romances which flourished until they were smiled away from out the world by *Don Quixote*. Their only rival in popular favor was the pastoral novel. The first and most important novel of this sort was Montemayor's *Diana*, which appeared about 1559. It owed much of its form to Sannazaro's *Arcadia* (1502), itself inspired by Boccaccio's *Ameto*. The *Diana* was widely translated and imitated. While it would be hard to devise any form of fiction that should be less like life, in time the pastoral secured a hold on reality by the habit which soon became common of describing real persons and incidents under the disguise of shepherds and shepherdesses and their doings. The novel lay hidden beneath those cumbersome trappings.

Spanish Novels.—The realistic novel had, however, a more definite pedigree in that alongside of these unreal works of fiction there grew up in Spain another and very dissimilar form which was destined to have a great vogue. This was the picaresque novel, a story describing real life. The name is derived from the Spanish *pícaro*, or scamp, who is always the hero of these novels. The first to appear was the *Lazarillo de Tormes*, in 1553. It was written by Hurtado de Mendoza, and at once attained great success abroad as well as at home. It was followed by other stories of the same sort by different authors. The most famous of these was *Guzmán de Alfarache*, by Mateo Aleman. While the extravagant romances gave expression to the most serious ideals of the Spaniards, these new picaresque novels indicated a reaction against their cloying impossibility. By the representation of evil deeds, of petty mischief, of ridiculous misadventure on the part of unmoral heroes of low birth, many being reminiscences of the mediæval tales, these novels became not merely formidable rivals, but severe criticisms of the romances which were already hastening to their end. The death-blow was given them, as was said above, by *Don Quixote* (1605–15).

French Romances.—Both the idealistic and the realistic novels made their way all over Europe, but it was in France, then acquiring the importance which Spain was losing, that their influence was greatest. It was the romance that found here a more congenial home than the picaresque novel, for it better suited the artificial society of the seventeenth century. D'Urfé's *Astrée* was the most famous of the pastoral novels, while there was a host of heroic novels of ponderous size and inflated incidents, such as La Calprenède's *Pharamond* (1647), Gomberville's *Polixandre* (1637), and Mlle. de Scudéry's *Clélie* (1660), with which the series closed. The heroic novels deserve to be mentioned with respect for the good they accomplished in expelling the pastoral stories from any possible authority over writers and readers. Their imposing formality, their fantastic artificiality, also served a good purpose in portraying models of decorum and honor for the civilization of a number of readers.

Realistic Novels in France.—While these were the accepted novels of the century, there ran alongside of them a counter-current of realistic fiction, bearing much analogy to the Spanish picaresque novel, from which it sprang. Barclay's *Euphormio* (1603) is the earliest; it was quickly followed by Sorel's *Francion* (1622), the first French novel

of manners. Sorel's *Berger extravagant* was a caricature of the extravagant pastorals. Scarron's *Roman comique* (1652) and Furetière's *Roman bourgeois* (1666) were realistic novels that really expressed not merely a literary but also a political reaction against accepted ideals. The long romances fell by their own weight, but they are always spoken of with respect; the realistic stories are, however, the ones that are read by posterity, and have had the most influence. Mme. de La Fayette's *Princesse de Clèves* (1678), thanks to its brevity as well as to its delicate sentiment, still survives as a study of passion told with rare directness and simplicity. It marked the end of the long romance by showing how unnecessary was the painful accumulation of mere incidents. Le Sage's *Gil Blas* was the successful realistic novel, and its form shows how dependent was this school upon the Spanish picaresque story.

Beginnings of English Fiction.—In England the novel slowly acquired importance. John Lily's *Euphues* (1579–80) was a didactic book in the form of a story. Sidney's *Arcadia* (1590) was the English representative of the pastoral, but the novels that were read for more than a century were for the most part translations of foreign masterpieces. The heroic romances of Spain and the picaresque novels were both extremely popular. These last inspired crude imitations in T. Nash's *Jack Wilton* (1594), and in *The English Rogue* (1665–71). In their time the French heroic romances were also translated and admired, but they had more direct influence on the drama than on fiction.

English Novels.—The most important forerunners of the English novel were Swift's *Gulliver's Travels* (1726)—to speak only of modern times, fantastic voyages had already been written by French satirists—and De Foe's *Robinson Crusoe* (1719), as well as in his other stories now almost wholly overshadowed by that more famous book; but satire is never a lasting inspiration—as Rabelais had shown—and De Foe's masterpiece, though it had many imitators, founded no school. A more fruitful source was the *Spectator*, with its intelligent recognition of the great advance in power of the *bourgeoisie*, and with Addison's untiring efforts to civilize this class. When they had acquired power, the romances became the reading of the ignorant and of children. Just as the flourishing monarchies of Spain and France had produced an aristocratic romance, dealing with great people who were enveloped in a misty splendor, England, now free, began to portray its own social and political ideals in the modern novel. Citizens became the heroes in the place of grandees deposed, and they preferred reading something near their own experience rather than a mere dilution of fairy tales. It was France, however, with its longer literary training, that produced the first novels of this sort, though distinctly under the influence of English ideas; and Marivaux, who had already brought out a sort of French *Spectator* modeled on Addison's, had the honor if not of inspiring yet of preceding Richardson with his *Marianne* (1731–41), a novel bearing much resemblance to *Pamela* (1740). In both novels there is a heroine of humble birth who rises through a series of probable incidents to a position of comfort and security, of perfect respectability, the new ideal. If Marivaux was the first to do this, it was Richardson who won all the credit for it, and it was his greater seriousness that secured it for him. His influence lasted throughout the eighteenth century, and he was, if possible, more warmly admired on the Continent than in England. His *Pamela*, *Clarissa Harlowe* (1748), and *Sir Charles Grandison* (1753) all indicated the importance of the citizen as contrasted with the noble, and the strong moral influences that were then at work to prepare the citizen for his duties. In all his novels Richardson preached virtue, prosily it seems to us, but eloquently it seemed to many of his contemporaries. Fielding, however, agreed with modern readers, and was moved by his weariness of Richardson's inartistic praise of virtue to describing people as he saw them and not as moralists might wish them to be. His *Joseph Andrews* (1740) is almost a caricature of *Pamela*. It is easy to see in it, as elsewhere in Fielding's work, reminiscences of the Spanish picaresque novels; yet what in those books is meager, disjointed, and void of atmosphere, becomes in Fielding's stories a vast and animated picture of life. The influence of Cervantes is more important. Especially is this true of *Tom Jones* (1749), his greatest work. In the novels of Smollett we also distinguish the Spanish influence, as well as that of Le Sage.

In Sterne's *Tristram Shandy* (1759–67) there appeared a new spirit, a combination of humor and pathos, delicate psychological study, and total disregard of incident. Sterne had read many French books and had learned the value of suggestion as a literary instrument, and both this book and his *Sentimental Journey* (1768) express the new cosmopolitanism of the last half of the eighteenth century. It is possible to see the influence of Cervantes in his humor; his sympathy with eccentric persons and with animals is a sign of a growing interest in objects hitherto ignored or derided, and this part of his work foretold, though dimly, the great change that was impending. He was also preparing for it by his iconoclastic denunciation of pedantry. In short, he was a disturbing writer. In Goldsmith's *Vicar of Wakefield* (1766), on the other hand, we find the graceful optimism, the exquisite form, of the best work of the century, and an apparent unconsciousness of the necessity and certainty of change.

Beginning of Modern Romantic Movement.—The change in England had begun with a return, already perceptible in other arts, to an interest in the Middle Ages. Horace Walpole's *Castle of Otranto* (1765) introduced the gloomy cloisters, the knight-at-arms, the wind whistling about battlements, all the paraphernalia of romance. A number of novels followed in the same direction, for instance, Mrs. Radcliff's *Mysteries of Udolpho* (1794).

Rousseau.—In France, meanwhile, Rousseau's *Nouvelle Héloïse* (1761) had opened a larger study of the world. The book was filled with a new love of nature; it dealt with novel social problems, breathing the spirit of democracy; its main characters had an infinite capacity for suffering; it contained most ardent descriptions of the familiar passion of love, and the whole impression made by the story was most noteworthy. We find in it many reminiscences of Richardson's *Clarissa Harlowe*, a strange ancestor for this new movement, and among its descendants is to be counted Goethe's *Werther* (1774). It was on the Continent that its influence was greatest. In England there was a reaction from the revolutionary spirit. In its place we find amusing pictures of life by Miss Burney and tales by Miss Jane Austen, and unimpeachable morality taught by Miss Edgeworth.

Scott.—It was Scott who gave the English novel world-wide importance. He expressed most vividly the patriotic and mediæval revival of his time; he brought back the past and he threw a new light on the present. He vivified history, he taught the love of nature, and delighted generations with his abundant invention. He made over not only the art of novel-writing, but that of writing history. In France we see his influence in Dumas and Victor Hugo, and in Germany the historical novel still survives, though without proving a dangerous rival to Scott's fame. While Scott inspired many followers, the new problems of the nineteenth century called many writers away to their discussion. Dickens studied social abuses and often hid direct practical teaching under a mask of raillery. Thackeray drew pictures of the new polite society, and his acute observations and gentle ridicule were miscalled cynicism. Bulwer combined romanticism and the study of the present with more popularity than success.

George Sand.—In France George Sand employed the novel as a means of asserting the rights of women, just as in England Miss Brontë's *Jane Eyre* touched the subject. Balzac made a profound study, half romantic and half real, of the motley society he saw about him. A complete view of society brought into fiction, notably in the work of George Sand, a new class, the country people, whose virtues she set in sharp contrast with the vices of those who dwelt in cities. Auerbach did the same service for Germany in his *Village Tales*.

American Novelists.—J. F. Cooper in the U. S., inspired by Scott, had drawn romantic pictures of the red Indian. Hawthorne, with far more literary art and a subtler imagination, described New England life in the past and in the present, and also Italy in *The Marble Faun*. All his pages were lit by the last and, in the estimation of many, the most beautiful rays of romanticism, now approaching its end. Mrs. H. B. Stowe's *Uncle Tom's Cabin*, with its vivid drawing of the wrongs of slavery, is perhaps more noteworthy as a campaign document than as a work of art.

Realistic Movement.—Everywhere we find the novel something more than a mere piece of literature. It was continually employed, and not always consciously, to express the writer's emotions and interests, sometimes narrow or special in its aim. Again, as in George Eliot's hand, we find life criticised in its relation to the principles of mo-

rality. It is easy to observe the gradual change in the methods of novel-writing. The great wave of romanticism gradually spent its force after enriching the world with new sympathies and a larger vision. It was succeeded by a tendency toward realism. In England the two had long been combined, as in Scott, without antagonism. Balzac in France alternated between the two, but the movement toward an exacter study of life may be observed in him as well as in his contemporaries. Zola, the most important of living French novelists, has advocated realism with tireless energy, but he has not been able to escape the influences under which he was born, and although he has continually struggled to be a faithful disciple as well as preacher of realism, his work often contradicts his theories. When he is furthest from the literary theory which he detests, he is only too prone to substitute the study of repulsive details for an exact study of life, and it is in the representation of a great picture rather than in the faithful study of incidents that he is greatest. The movement toward realism, which owes much to the scientific advance of the present days, has also been greatly aided by the example of the eminent Russian novelists Turgeneff and Tolstoï. The former aided the movement for the abolition of serfdom by his *Stories of a Sportsman*, which were followed by longer novels written with the utmost art. Tolstoï seemed to abandon all the current theories of composition and to portray life unshaped, but crowded with event as we see it, never modeling itself into a rounded whole. In France Flaubert and de Maupassant rigidly confined themselves to the portrayal of exact truth, and the movement holds sway over the later novelists of the U. S., Italy, Spain, and Scandinavia. That this is but a temporary movement is obvious, for every art that grows changes, and already among the younger writers there is an effort to give greater sway to imagination.

THOMAS SERGEANT PERRY.

Novel'lo, VINCENT: musician; b. in London, England, Sept. 6, 1781; was of Italian descent; became organist of the Portuguese chapel at an early age; was one of the members of the Royal Society of Musicians and a founder of the Philharmonic Society; was a voluminous editor of old musical classics and composer of numerous pieces of considerable merit. D. at Nice, France, Aug. 9, 1861.—His daughter, CLARA ANASTASIA, born in London, June 15, 1818, a distinguished soprano singer and prima donna, married Count Gigliucci, an Italian nobleman, in 1843, and retired from the stage in 1860.—Another daughter is a distinguished Shakspearean scholar. See CLARKE, MARY COWDEN.

November [from Lat. *Novem'ber*, *Novem'bris* (sc. *mensis*, month), originally the ninth month of the Roman year, deriv. of *novem*, nine]: the eleventh month of the year, containing thirty days.

Nov'gorod: government of European Russia, bounded W. by the government of St. Petersburg, and comprising an area of 47,236 sq. miles. The ground is low, the surface mostly undulating, the soil not very rich, and the climate cold. Lakes and navigable rivers are numerous, and connected with each other by canals. Rye, barley, and oats are grown. Large forests and meadows are found, and timber and hay are the chief articles of export. Pop. (1897) 1,392,931.

Novgorod, called also **Novgorod Velikiĭ** (the great): capital of the government of Novgorod, European Russia; on the Volkhov, near its issue from Lake Ilmen; 110 miles by rail S. S. E. of St. Petersburg (see map of Russia, ref. 6–D). It is an old town, and was in the fifteenth century the largest and most important town of Northern Europe. It was in 862 made the capital of the Russian monarchy, founded in that year by Rurik, on the thousandth anniversary of which event a magnificent monument was erected in the city, which otherwise is rather poorly built. It is now entirely dependent for its trade on St. Petersburg and Archangelsk. Pop. (1890) 20,599.

Novikov', NIKOLAĬ IVANOVICH: writer; b. on his father's estate in the government of Moscow, Russia, Apr. 27, 1744. Although he was educated for the army, his literary tastes were so noticeable that the Empress Catherine II. had him transferred to the civil service, from which he retired in 1768. He was one of the earliest of Russian journalists. His first paper was a satirical one called *Trvten* (The Drone, 1769–70). In 1772 he founded *Zhivopisets* (The Painter), which had a great success, and in 1777 he started a monthly review called *Utrennyĭ Svet* (The Morning Light), and continued it for years under various names. He also leased for a decade and gave new life to the *Moscovskyĭa Vedomosti* (Moscow Gazette), previously a mere official sheet of the university. He reproached his fellow countrymen with their mania for everything foreign, and strove in every way to bring the best national things into honor, not only writing *An Attempt at a Dictionary of Russian Writers*, but publishing nineteen volumes of his *Drevnaĭa Rossiskaĭa Vivliofeka* (Old Russian Library), a collection of documents of historical value. He had become a Freemason, and in course of time devoted himself chiefly to philanthropic work, while his ideas showed an increasing tendency toward mysticism. His fame and influence grew apace, so that the Masons were for a time the fashion of the day, but he had numerous enemies, while the empress, who had originally supported him, became more and more suspicious. The French Revolution brought about a sharp reaction against everything that savored of liberalism. Severe measures were taken against the Masons, and Novikov was thrown into prison, from which he was not released until the accession of the Emperor Paul. D. July 31, 1818. See works on him by Longinov (1867), Neselenov (1875), and others. A. C. COOLIDGE.

No'vi Li'gure: town; in the province of Alessandria, Italy; on the northern slopes of the Apennines, at the head of a wide and fruitful plain (see map of Italy, ref. 3–C). It was formerly strongly fortified, having four gates with drawbridges. Novi contains a public library, museum, academies of literature and art, a valuable private picture-gallery, and silk-factories. It is said to have been destroyed by Attila; in 999 it is spoken of as *Corte Nova* or *Castro Novo*, and from that time till 1447, when it gave itself to Genoa, it maintained a semi-independence. This town gave its name to the battle of Aug. 15, 1799, between the French and Russians, in which the French general, Joubert, lost his life. Pop. about 10,000.

Nov'ius: a Latin writer of *fabulæ Atellanæ* of about 100 B. C. Some forty-three titles of his plays are known, and the fragments (117 verses) are given by Ribbeck, *Frag. Comicorum Rom.*, pp. 254–272 (Leipzig, 1873). M. W.

Novorossisk: town of the Black Sea district, Russia; 30 miles S. E. of Anapa (see map of Russia, ref. 10–E). It is the port for Yekaterinodar, and terminus of a railway opened in 1888; also the port for the Stanitza Ilskaia or petroleum district. Coal and ores of metals are found in the neighborhood. Pop. (1880) 2,000; (1890) 10,000. M. W. H.

Novo Tcherkask: town of Russia (founded in 1806); on the Don (see map of Russia, ref. 10–E). It is the capital of the province of the Don Cossacks; is finely built, has a large cathedral, and is the see of an archbishop. Its manufactures are extensive, and it carries on an active trade in cattle, grain, and wine. Pop. (1890) 38,476. E. A. G.

No'vum Or'ganum [Lat., liter., new instrument (or method)]: the name given by Francis Bacon to his great work treating of the proper mode of studying nature in order to extend the dominion of man over the inanimate world. Bacon's great aim was to recall the minds of men from what he deemed the vain and useless speculations of the ancient philosophers to the pursuit of the practical and useful. In order to present the different points of his subject in a manner at once comprehensive and striking, he has given them in the form of aphorisms. In the second aphorism of his first book he tells us that as the naked hand is often unable to perform its proper work without the aid of an instrument, so the human intellect, left to itself, is comparatively inefficient, and needs the help of instruments no less than the hand. To supply this need he composed his great work (published in 1620), comprising the ripe and rich results of a life of study. "In our judgment," says Macaulay, "Bacon's greatest performance is the first book of the *Novum Organum*. All the peculiarities of his extraordinary mind are found there in the highest perfection. Many of the aphorisms, but particularly those in which he gives examples of the influence of the *idola*, show a nicety of observation that has never been surpassed. Every part of the book blazes with wit, but with wit which is employed only to illustrate and decorate truth. No book ever made so great a revolution in the mode of thinking, overthrew so many prejudices, introduced so many new opinions. Yet no book was ever written in a less contentious spirit. . . . What we most admire is the vast capacity of that intellect which without effort takes in at once all the domains of science—all the past, the present, and the future, all the

errors of 2,000 years, all the encouraging signs of the passing times, all the bright hopes of the coming age." *Essay on Lord Bacon*, second part, where will be found many eloquent and admirable passages upon the philosophy of Bacon, though the remarks of the critic on the ancient philosophers, particularly Plato, are to be received with great allowance.

Now'ell, INCREASE: colonist; b. in England about 1590; was chosen as assistant governor of Massachusetts Colony 1629, previous to its actual foundation; emigrated with Winthrop in 1630; was ruling elder of Wilson's church 1630–32; one of the founders of the church in Charlestown 1632; commissioner for military affairs on the occasion of the first Pequot war 1634, and secretary of the colony 1636–49. D. at Boston, Nov. 1, 1655.—His son SAMUEL, b. at Charlestown, Mass., Nov. 12, 1634; graduated at Harvard College 1653; became chaplain in Philip's war, and assistant treasurer 1680–86, and afterward treasurer of Harvard University. He was a stanch supporter of the old charter, and went to England in its behalf in 1688. He did not succeed, however, in accomplishing anything for his purpose, as he died in September, soon after his arrival in London.

Noyes, HENRY DRURY, A. M., M. D.: ophthalmologist; b. in New York city, Mar. 24, 1832; graduated M. D. from the New York College of Physicians and Surgeons in 1855; was elected Professor of Ophthalmology and Otology in Bellevue Hospital Medical College in 1864, a chair he still holds; was attending surgeon to Charity Hospital, New York, 1865–75; has been surgeon to New York Eye and Ear Infirmary since 1869, and is a member of many scientific societies. He is the author of *A Treatise on Diseases of the Eye* (New York, 1881); a *Text-book on Diseases of the Eye* (New York, 1890; 2d ed. 1894), and of numerous monographs published in medical journals. S. T. ARMSTRONG.

Noyes, JOHN HUMPHREY: religious leader; b. at Brattleboro, Vt., Sept. 6, 1811; graduated at Dartmouth College in 1830; studied law, but subsequently studied divinity at Andover and at New Haven, Conn., and was licensed to preach; founded in 1838 a community of Perfectionists near Putney, Vt.; removed in 1847 to Lenox, Madison co., N. Y., where he established the ONEIDA COMMUNITY (*q. v.*). Subsequently he established another branch at Wallingford, Conn. He was the author of various works sustaining his peculiar views. D. at Niagara Falls, N. Y., Apr. 13, 1886.

Nu (or **Nun**): an Egyptian deity, representing the primeval celestial ocean on which Ra, the sun-god, sails and whence he proceeded. He was called "the oldest of the gods," and was regarded as the father of Ra and of the gods in general, being the author of creation and the source of all things. The corresponding female principle was Nu-t or Nun-t (= Nile-water), and together they appear to have signified the male and female personification of the waters of the Nile inundations. C. R. G.

Nubia: a large region in Northeastern Africa, forming a part of the Egyptian possessions, but mostly under Mahdist control since 1882. It has never been a political entity, but it may be roughly described as bounded N. by Egypt, E. by the Red Sea, S. by Abyssinia, Senaar, and Kordofan, and W. by the Libyan Desert and the waste S. of it. Area about 350,000 sq. miles. Lying N. of the region of tropical rains, the country is excessively dry, and not unhealthful; agriculture and stock-raising, the main occupations of the people, are confined to the province of Taka, a few oases, and to a narrow fringe along the Nile. The most arid and desolate part of this region is the Nubian waste, in the northern part of Nubia, which would be impassable were it not for a few oases and wells. These verdant spots, scattered throughout the north, have made a number of important caravan routes practicable, and for centuries a large trade was carried on along these routes, until it was destroyed, for the most part, by the Mahdist revolt. The most productive region is the province of Taka, in the extreme south, which is well watered by streams from the Abyssinian highlands. The people are a mixture of Semitic, Hamitic, and Negro elements, speaking dialects of the Nuba language as well as Arabic, and fanatically Mohammedan in their religious faith; they number probably less than 1,000,000. C. C. ADAMS.

Ñuble, nyoo'blā: an interior province of Chili; between Concepcion and the Argentine frontier; crossed by lat. 37° S. Area, 3,556 sq. miles. It lies partly on the steep slope of the Andes and partly in the plain called the Valley of Chili; the soil of the latter is very fertile, and this is one of the chief wheat-growing provinces. The mountain lands yield excellent timber. Capital and largest city, Chillan. Pop. (1891) estimated, 157,349. HERBERT H. SMITH.

Nubti: a Hyksos King of Egypt, whose reign fell 400 years before the close of the reign of Ramses II., as is shown by a granite stele erected by the latter at Tanis. (See *Records of the Past*, ser. i., vol. v., p. 33 ff.; *Aegyptische Zeitschrift*, 1878, p. 89–106; 1879, p. 138–143; Birch, *Egypt*, p. 76; Wiedemann, *Aegypt. Geschichte*, p. 295.) This tablet was found by Mariette, copied, and reburied. Recent excavators have not succeeded in finding it again. If the Exodus of the Hebrews occurred under Meneptah, the successor of Ramses II., the record of this tablet, taken in connection with the biblical statement that the sojourn of Israel in Egypt lasted 430 years, would show that Joseph lived in the time of one of the early Hyksos kings. This "era of 400 years" is the only example of the kind in Egyptian history, and it appears to have been used in only one other instance, the reign of Bocchoris, the sole king of the twenty-fourth dynasty, who is said by George Syncellus, quoting Manetho, to have lived 990 years after Nubti. CHARLES R. GILLETT.

Nucleobranchia'ta: a name applied by de Blainville to the group of molluscs previously called by Lamarck HETEROPODA (*q. v.*).

Nucle'olus and **Nucleus**: See HISTOLOGY (*The Cell*).

Nucleus (of the earth): See GEOLOGY.

Nudibranchia'ta [Mod. Lat., liter., naked-gilled ones; Lat. *nu'dus*, naked + *bran'chiæ*, from Gr. βράγχια, gills]: a group of Opisthobranchiate molluscs in which the gills, when present, project freely into the water. A shell is always lacking in the adult, on which account these forms are commonly known as naked molluscs. See GASTEROPODA.

Nuevitas: See the Appendix.

Nuevo Leon, nōō-ā'vō-lā-ōn', or **New Leon**: state of Mexico; bounded N. E. and E. by Tamaulipas, S. W. by San Luis Potosí, and W. and N. by Coahuila; separated from the frontier of Texas only by a narrow portion of Tamaulipas. Area, 23,592 sq. miles. It is traversed from N. W. to S. E. by the eastern Sierra Madre; from one-third to one-fourth of the territory S. W. of the Sierra is included in the Mexican plateau, which here has an average elevation of about 6,000 feet; the northern and northeastern portions are in the tierra caliente, low rolling lands or plains falling toward the Rio Grande and varied with a few isolated mountains. The climate of the plateau and the slopes of the Sierra is mild and agreeable; some parts of the lowlands, however, are hot and unhealthful. Rains in good years are abundant, but they are very irregular, and droughts sometimes last for several years; these are especially felt on the plateau, where there is a lack of running water and springs. Much of the population is gathered along the northeastern slope of the Sierra, a well-watered, fertile, and very beautiful district. The principal occupation is agriculture; the most important crops are maize on the higher lands and sugar-cane on the lower ones. The mines are rather unimportant, though rich silver deposits were worked during the colonial period. Nuevo Leon was settled during the last years of the sixteenth century. Pop. (1895) 309,252. HERBERT H. SMITH.

Nuisance [from O. Fr. *noisance*, *nuisance* < Lat. *nocentia*, transgression, guilt, deriv. of *noce're*, hurt, harm]: a rather indefinite legal term which may be said, however, to denote those acts or omissions which unlawfully disturb a person or the public in the enjoyment of property or the exercise of common rights. In the early English law nuisance (*nocumentum*) had in some respects a broader, and in others a narrower, signification than it bears at present. On the one hand, it was confined to annoyances to the enjoyment of a freehold; while now the possessor of any interest in land, and in some cases of movables, may complain of a nuisance. On the other hand, it was applied to any form of such annoyance. Bracton opens his discussion of the topic with this statement: "And it is to be known that of nuisances, one is tortious and hurtful, and another hurtful (*damnosum*) but not tortious (*injuriosum*)." (3 *De Legibus Angliæ*, chs. xliii.–xlvi.) Now the term is limited to harm which is actionable, which produces legal injury as well as damage.

In some instances the same act may be treated by the injured party as a nuisance or as some other kind of tort. One who wrongfully floods his neighbor's land, or erects a building with eaves projecting over the adjoining premises, or allows a tree to grow so near his line that the branches

overhang another's property, thereby commits both a trespass and a nuisance. The same act or omission produces two wrongs. One is the interference with the possession, the other is the incommodity, the discomfort, the annoyance to the possessor. Again, a person who maintains an insecure structure which endangers his neighbor's property commits a nuisance, and is also chargeable with actionable negligence if injury ensues.

An act or omission which would constitute a nuisance at common law may be legalized, and thus cease to be actionable. It is not to be understood, however, that every statute which authorizes a person to do a particular thing or to carry on a particular business will protect him from liability where the thing is so done or the business so carried on as to constitute a common-law nuisance. As a rule it will relieve him from any public prosecution, but it will not bar a private action, unless it shows a clear intent on the part of the legislature to authorize the affair even though a nuisance should result. This is well illustrated by two decisions of the House of Lords. In one (*Metropolitan Asylum District* vs. *Hill*, 6 Appeal Cases 193; cf. *Morton* vs. *Mayor, etc., of New York*, 140 N. Y. 207) it was held that the statute in question empowered the district to build a smallpox hospital only in case this could be done without creating a nuisance. Its hospital turned out to be a nuisance to Hill, and the statute in no way affected his rights. In the other (*London Ry. Co.* vs. *Truman*, 11 Appeal Cases 45) it was held that the company received authority by statute to build its road and maintain a cattle-yard whether a nuisance was created or not. Hence the property-owners who suffered extreme discomfort by reason of the noises and odors of the cattle-yard were without redress. In the U. S. legislative power is limited by constitutional provisions, and a statute undertaking to legalize a nuisance may be unconstitutional as an attempt to authorize the taking of property without compensation. *Baltimore Ry. Co.* vs. *Fifth Baptist Church*, 108 U. S. 317.

Public Nuisance.—An act or omission which endangers the lives, safety, health, property, or comfort of the public, or by which the public are obstructed in the enjoyment of any common right, is a public nuisance. The obstruction of highways, disorderly houses, indecent performances in public, exhibiting or selling obscene articles, selling diseased food, the public exposure of persons having contagious diseases, the pollution of water used by the public, the manufacture, storage, or display of dangerous explosives to the peril of the public, the exercise of offensive trades in thickly settled neighborhoods or adjoining public thoroughfares are examples. There is considerable authority for the statement that a purpresture or encroachment upon public property does not amount to a nuisance unless it subjects the public to some degree of inconvenience. The tendency of modern decisions, however, is to treat every unlegalized purpresture as a nuisance *per se*. Persons responsible for a public nuisance may be proceeded against, at common law and under modern statutes, by indictment for a misdemeanor. Upon conviction the court may subject them to fine and imprisonment, and, if the nuisance still continues, may order its abatement. It may be abated also without indictment in a suit by the proper officer in behalf of the crown or people, but a mob has no right to act for the public in abating it. Nor does abatement extend to the destruction of property which does not of itself constitute the nuisance, but is merely accessory to it. *Brightman* vs. *Inhabitants of Bristol*, 65 Maine 426.

Whether a public nuisance will sustain a private action, either for damages or abatement, depends upon the harm it inflicts upon the individual complaining. If it is a disturbance of all persons alike in the enjoyment of common rights, the injury of any individual is said "to be merged in the common nuisance and injury to all citizens, and the right is to be vindicated and the wrong punished by a public prosecution, and not by a multiplicity of separate actions in favor of private persons." Where the public nuisance, however, produces particular damage to an individual beyond that which he suffers in common with his fellows, he may bring a private action. Accordingly, one whose residence is rendered unfit for comfortable or respectable occupation by an adjoining house of prostitution can maintain an action against those responsible for the nuisance. *Crawford* vs. *Tyrrell*, 128 N. Y. 341.

Private Nuisance.—This "affects only one person or a determinate number of persons, and is the ground of civil proceedings only." It is no defense to an action for a nuisance that it benefits more persons than it harms. A street-railway may improve greatly its passenger service by substituting steam motors for horses; but unless the change is authorized by legislation, and in the U. S. compensation is made to abutting land-owners for the interference with their easements of access, of light, and of air, the benefit conferred on its many patrons will be no answer to a suit by one whose premises are injured and made uncomfortable by the noise, the vibrations, the cinders, the smoke, and the dust resulting from the new appliances. (*Hassner* vs. *Brooklyn City Ry.*, 114 N. Y. 443.) Nor can the defendant relieve himself from liability by showing that he has exercised the utmost care to save the plaintiff from harm. The essence of the wrong we are now considering is the unlawful incommodity to the plaintiff, not the negligence nor the bad motive of the defendant. A man "may not, under color of enjoying his own, set up a nuisance which deprives another of the enjoyment of his property." (See *Hauck* vs. *Tide Water Pipe Line Co.*, 153 Penn. 366.) It is no justification for a nuisance that the defendant has maintained it for many years without complaint; nor that he was careful to establish it in a suitable place, distant from habitations; nor that the plaintiff bought and took possession of his property with knowledge of the nuisance. If it were, a person might prevent the growth of a town, or the proper development of a locality, by establishing a useful but offensive business, such as burning lime, smelting copper, manufacturing gas, or slaughtering animals. Any place where an operation is carried on, so that it does actionable injury to another, is not, in the meaning of the law, a suitable place. *St. Helens Smelting Co.* vs. *Tipping*, 11 House of Lords Cases 642.

However, the place where an alleged nuisance is maintained is often a circumstance of importance in determining whether the plaintiff has sustained actionable injury. A man who chooses to reside in a city must endure the noises and discomforts which are incident to the locality. He has no right to complain if his neighbor blasts rock, or erects an iron building to his temporary annoyance. (*Booth* vs. *Railway*, 140 N. Y. 267.) So a man having an estate under which there are veins of valuable minerals "must take the gift with the consequences and concomitants of the mineral wealth in which he is a participator." Were persons so circumstanced allowed to stand on their extreme rights, the business of the whole country would be seriously hampered.

The courts have found it impossible to define the amount or the exact character of the annoyance or inconvenience which will constitute a nuisance. It is settled, however, that the state of things complained of need not be actually injurious to health. If it seriously interferes with the rational enjoyment or reasonable comfort of the plaintiff's premises it is enough. On the other hand, where damage to property is complained of, it must be "such as can be shown by a plain witness to a plain juryman." It must be substantial and actual, not contingent or remote or sentimental. In a leading English case Lord Justice James illustrated this doctrine in the following manner: "It would have been wrong, as it seems to me, for this court in the reign of Henry VI. to have interfered with the further use of sea-coal in London because it had been ascertained to their satisfaction that by the reign of Queen Victoria both white and red roses would have ceased to bloom in the Temple Gardens. If some picturesque haven opens its arms to invite the commerce of the world, it is not for this court to forbid the embrace, although the fruit of it should be the sights and sounds and smells of a common seaport and ship-building town, which would drive the dryads and their masters from their ancient solitudes." (*Salvin* vs. *North Brancepeth Coal Co.*, Law Reports, 9 Chancery Appeals 705.) When the nuisance is alleged to consist in defendant's use of his property to the inconvenience and discomfort of the plaintiff, the latter must show that the noises, the odors, the sights, or other annoyances complained of rendered his premises uncomfortable to ordinary persons. If one's right to use his property were to depend upon the effect of the use upon a person of peculiar temperament or disposition, or upon one suffering from disease, the standard for measuring it would be so uncertain and fluctuating as to paralyze industrial enterprises. *Rogers* vs. *Elliott*, 146 Mass. 349.

Parties Liable.—The person who creates a nuisance is answerable therefor, and the owner and occupant of land upon which it exists is also liable, as a rule, where he has the legal right and is under a legal duty to keep the premises in proper condition. Where a municipal corporation unlawfully authorizes an individual to commit a nuisance it is

liable for all resulting damages. *Cohen* vs. *Mayor, etc., of New York*, 113 N. Y. 532.

Remedies.—These are abatement, damages, and injunction. The victim of a nuisance may abate it, without instituting a legal proceeding; but where he thus takes the law into his own hands, even in defense of person or property, he acts at his peril. He must be prepared to show that the thing abated was a nuisance, and that he did no unnecessary damage in abating it. (*People* vs. *Board of Health*, 140 N. Y. 1.) In an action for damages the plaintiff may recover nominal, actual, or exemplary damages, according to the facts. (See DAMAGES, MEASURE OF.) "The most efficient and flexible remedy is that of injunction. Under this form the court can prevent that from being done which if done would cause a nuisance; it can command the destruction of buildings or the cessation of works; and its orders may be either absolute or conditional upon the fulfillment by either or both of the parties of such undertakings as appear just in the particular case." See INJUNCTION; also Pollock's *Law of Torts*, and Wood's *Law of Nuisances*.

FRANCIS M. BURDICK.

Nu'kha: a walled town of Asiatic Russia, government of Trans-Caucasia; at the foot of the Caucasian Alps (see map of Russia, ref. 12–G). The inhabitants, consisting mostly of Persians, Tartars, and Armenians, with very few Russians, are engaged in breeding silkworms. The vicinity is one garden of mulberry-trees. Pop. (1892) 25,894.

Nullification [from Lat. *nullifica'tio*, contempt, liter., making void, deriv. of *nullifica're*, despise, liter., make void or as nothing; *nul'lus*, none + *fa'cere*, make. For meaning cf. Eng. *null*]: the act of making null, void, or invalid. The word has acquired a special meaning in the political history of the U. S., as signifying what has been claimed to be the right of one or more of the States in the American Union to declare a law passed by the national Congress unconstitutional, and to refuse to be bound by such an act. This claim, of course, implies the right of each individual State to interpret the Federal Constitution for itself, and thus to impose a check upon the law-making power of the general Government. According to this doctrine, a State which nullified a law of Congress was entitled to all its former privileges, though refusing obedience to the law in question. If, in case of such nullification, the President should attempt to enforce the authority of Congress, the enforcement would be an unconstitutional act, and the State would have the right to retire from the Union.

History of the Doctrine.—Soon after the adoption of the Constitution numerous questions arose involving the relations of the Federal Government to the individual States. During the administration of President John Adams there was so much opposition in some parts of the country to the alien and sedition laws that the people in several of the States boldly took the ground that the U. S. Government had no constitutional right to pass and enforce a law that was manifestly antagonistic to the interests of any individual State. This opinion took the most formal and prominent expression in the Kentucky resolutions of 1798 and the Virginia resolutions of 1799. In the Kentucky resolutions, which were written by Thomas Jefferson, it was held that the Government was a compact between States, and that in this compact the Government "was not made the exclusive or final judge of the extent of the powers delegated to itself, and that, as in all other cases of compact among powers having no common judge, each party has an equal right to judge for itself, as well of infractions, as of the mode and measure of redress." Though the people who adopted these resolutions never went further than the expression of a political opinion, the resolutions are entitled to the distinction of having definitely formulated the doctrine of nullification. At the HARTFORD CONVENTION (*q. v.*) also free expression was given to opinions of a similar nature in regard to the attitude of Congress toward the New England States. The most striking example illustrative of the doctrine was shown by some of the Southern States nearly twenty years later. The occasion was the passage of the tariff law of 1828, and the attitude of Congress toward the Territories in the Northwest. The people of South Carolina deemed the action of Congress oppressive to the Southern States, and accordingly advanced again the theory that the law might be made void by State action. The question was discussed in one of the most memorable debates in the history of Congress by Senator Hayne, of South Carolina, on the one side, and by Daniel Webster, of Massachusetts, on the other. In Webster's celebrated reply to Hayne, delivered Jan. 26, 1830, the views in opposition to the right of nullification were put with such cogency and eloquence that the people of the North, especially of the Whig party, were convinced that the doctrine could not be maintained on any constitutional grounds. The people in the South, however, were by no means convinced. Accordingly, in Nov., 1832, soon after Gen. Jackson's second election to the presidency, a convention was summoned to meet at the capital of South Carolina to consider the question still at issue. The convention drew up and unanimously passed an "ordinance of nullification," which embodied the views on State sovereignty held by Calhoun. (See CALHOUN, JOHN C.) The tariff law just enacted was pronounced "null and void, and no law, nor binding on this State, its officers, or citizens." The ordinance also declared that no appeal to the Supreme Court of the U. S. should be permitted; that any appeal from the decision of a court of the State upholding this ordinance should be treated as contempt; that all officers and jurors were required to obey the ordinance; that all legislative acts to enforce its provisions should be obeyed; and that any measures of force adopted by the general Government for the purpose of levying duties on the foreign commerce of South Carolina would justify the State in regarding itself no longer a member of the Union. Fortunately for the country at the time of this action Gen. Jackson was President. His vast popularity in the South, as well as in the North, gave to his authority great advantages, and he did not hesitate to act with characteristic decision and promptness. He ordered the collector of customs to make use of the revenue cutters and any other vessels that might be available for the purpose of seizing all cargoes liable to pay duties. On the meeting of Congress in Dec., 1832, the President's annual message declared that it was his intention to treat all armed resistance as treason against the U. S. This remarkable paper, written by Edward Livingston, the Secretary of State, not only set forth the constitutional objections to nullification with great power, but it also showed clearly that the Government would be desperately in earnest in the enforcement of its authority. This utterance and the special message addressed to Congress in Jan., 1833, very generally commended themselves to all except the special advocates of nullification. The so-called Clay compromise of 1833 propitiated South Carolina so that the ordinance of nullification was abandoned.

It would not be correct to suppose that the spirit of nullification has been confined to South Carolina, or indeed to the Southern States. In 1820 Ohio passed resolutions approving the Kentucky and Virginia resolutions of 1798–99. Alabama in 1828 entered a formal protest against the validity of the tariff of that year, and in 1831 prohibited the establishment of a U. S. bank in that State. In the same year the Legislature of Maine (Mar. 28) passed a resolution declaring that the U. S. Government in fixing the boundary by treaty with Great Britain between Maine and Canada had exceeded its constitutional powers, and had encroached upon the rights of the State of Maine. The Legislature asserted that the Government of the U. S. had violated the Constitution of the U. S., and "impaired the sovereign rights and powers of the State of Maine," and that "the State of Maine is not bound under the Constitution to submit to the decision which is, or shall be, made under that convention." It further resolved that no decision of any umpire provided by the treaty would have any force "unless the State adopt and sanction the decision." A still more striking case, involving also the question of boundary-line, occurred in Wisconsin. By the Ordinance of 1787 organizing the Northwest Territory the line between Ohio, Indiana, and Illinois, and the territory on the N. was determined as "an east and west line drawn through the southern bend or extreme of Lake Michigan." When the three Southern States, however, were organized their northern line was fixed so as to include a very considerable strip of land N. of the boundary designated by the Ordinance. Michigan at a later period claimed all the territory to which she was originally entitled, and the so-called Toledo war might have become serious had not Congress satisfied the claim by granting to the new State the upper peninsula as a compensation; but the claim of Wisconsin could not be so easily disposed of. According to the line established by the Ordinance, Chicago, Rockford, Galena, and other important towns of Northern Illinois, besides 8,500 sq. miles of the best of farming land, would belong to Wisconsin. From 1838 to 1846 the inhabitants of the territory in dispute

strongly desired to be a part of Wisconsin instead of Illinois, chiefly, no doubt, on account of the State debt of Illinois incurred for internal improvements. The claim of the people rested on the fact that the Ordinance was a compact which could only be annulled "by the consent of all parties," and therefore was superior to the Constitution and the acts of Congress in its binding force. In 1843 an address to Congress was prepared, in which the people declared that if their request was not granted, the people of Wisconsin, "relying on their own resources, and looking to Him who aids the injured for protection, would seek in themselves for that measure of redress which their own right arm can bring them." This belligerent tone, however, was ineffectual. A majority of the people were too indifferent to the subject to venture upon active hostilities, and finally the Supreme Court of the U. S., in *Strader* vs. *Graham* (3 H. 589), declared that the Ordinance of 1787 "was superseded by the adoption of the Constitution of the U. S.," and that the six articles forming the compact of the Ordinance "are not superior and paramount to the Constitution." Thus the claim fell to the ground.

In the same State a conflict of authority grew out of the arrest and detention of a fugitive slave in 1854. The U. S. deputy marshal had seized a fugitive slave by the name of Glover under authority of the Fugitive Slave Law. A local judge issued a writ of *habeas corpus*, but as this was not respected by the U. S. authorities, Glover was rescued by a mob incited and led on by an editor named Booth. Booth was arrested for aiding in the escape of a fugitive slave, and at once made application to A. D. Smith, a justice of the Supreme Court of Wisconsin, for a writ of *habeas corpus*, on the ground that he was detained under an unconstitutional act of Congress. The justice, after prolonged arguments, discharged Booth, holding the Fugitive Slave Law unconstitutional. In the decision it was held that "the State will never consent that a slave-owner, his agent, or an officer of the U. S., armed with process to arrest a fugitive slave from service, is clothed with entire immunity from State authority." Booth was then arrested, convicted, and sentenced by U. S. authority. The State Supreme Court issued a writ of *habeas corpus*; but the action was overruled by the Supreme Court of the U. S., and Booth was remanded to serve out his term. This very interesting instance of conflict of authority will be found fully discussed in 1 Wis. Reports 1–218; 11 Wis. 517; 21 Howard 506–526; and in Hare's *Am. Constitutional Law*, 1202.

The several instances given are enough to show that there was throughout the country a more or less prevalent belief that a State had the supreme constitutional right of ultimate decision in case of an alleged infraction of the Constitution by the Government of the U. S. The attempt of the several Southern States in 1861 to secede was founded upon the assumed right of nullification, and it was not till the close of a terrible war that the question was authoritatively and finally settled.

AUTHORITIES.—Hampden, *The Genuine Book of Nullification* (Charleston, 1831) contains a large list of referenees to cases where the authority of the general Government has been either defied or disputed. The question of constitutional right, however, will be found most satisfactorily treated in the *Debates in Congress*, especially in the *Speeches* of Webster, Calhoun, and Hayne. See also Greeley, *American Conflict*; Stephen, *War between the States*; Lincoln, *Speeches and Messages*; Nieolay and Hay, *Life of Lincoln*; *Histories of the Civil War*, by Davis, Draper, Pollard, and others; also Thwaites, *Boundaries of Wisconsin*; Sanford, *State Sovereignty in Wisconsin*. C. K. ADAMS.

Numan'tia: an ancient city of Spain; the capital of the Celtiberian Arevaci; situated on the Douro, near the present Soria in Old Castile. It became very celebrated on account of the heroic valor with which it defended its independence against the Romans. Of its population, 8,000 men were capable of bearing arms, and with this force it fought successfully against Quintus Fulvius Nobilior in 153 B. C., Quintus Cæcilius Metellus in 143, Quintus Pompeius in 141, Marcus Popilius Lænas in 139, and Cneius Hostilius Mancinus in 137; but in 134 Publius Cornelius Scipio the Younger received the command. With an army of 60,000 men he laid siege to Numantia, and inclosed it completely. His propositions of surrender were rejected, and the siege continued for fifteen months. When Scipio entered the city he found no one to oppose him. Those whom plague and famine and the arrows of the besiegers had spared had fallen upon their own swords. He felt that he himself had been utterly defeated, and in his fury he leveled the vacant houses with the ground.

Nu'ma Pompil'ius: in the mythical history of Rome, the successor of Romulus. His reign, which is said to have lasted from 715 to 672 B. C., was regarded by the Romans as a sort of golden age of peace and prosperity. All the ecclesiastical institutions which formed the basis of the religious ceremonial of the Romans were ascribed to him, and he is also said to have improved the social and political institutions of Rome.

Number [from O. Fr. *nombre* < Lat. *nu'merus*, number]: abstractly considered, the measure of the relation between quantities of the same kind; in this sense it is identical with the term *ratio* or *quotient*. Technically considered, it is a *single* thing, or a *collection* of things of the same kind; it is in this sense that the term is generally employed in mathematics. By an extension of meaning always permissible in the use of mathematical terms, the term *number* is made to include 0, ∞, and also all *surds*; we shall use the term in this extended signification in the following article. For methods of writing numbers, see NOTATION.

Classes of Numbers.—Numbers are divided into classes in many different ways, according to their different properties. The names of some of these classes are given below, with a brief statement of their peculiar properties.

(1) *Odd and Even Numbers.*—The series of integers, 0, 1, 2, 3, 4, etc., called the series of *natural numbers*, is subdivided into two series—the series of *odd numbers*, 1, 3, 5, 7, etc., none of which is exactly divisible by 2, and the series of *even numbers*, 0, 2, 4, 6, etc., each of which is exactly divisible by 2. The following are some of the properties of these two classes of numbers: 1, the sum or the difference of any two even numbers, or of any two odd numbers, is always an even number; 2, the sum of any number of even numbers, or the sum of an even number of odd numbers, is an even number, but the sum of an odd number of odd numbers is an odd number; 3, the product of any number of even numbers is an even number, and the product of any number of odd numbers is an odd number; 4, all the integral powers of even numbers are even numbers, and all the integral powers of odd numbers are odd numbers, and consequently the difference between any power of an odd number and the number itself is an even number.

(2) *Prime and Composite Numbers.*—A *prime* number is one that can not be exactly divided by any other number except 1; all numbers that are not prime are said to be composite—that is, composed of two or more factors; thus 2, 3, 5, 7, etc., are prime numbers; 4, 6, 9, etc., are composite numbers. See PRIME NUMBERS.

(3) *Figurate Numbers.*—Figurate numbers are those which can be derived from the general form

$$\frac{n(n+1)(n+2)\ \ldots\ (n+m)}{1\ .\ 2\ \ .\ 3\ \ \ \ldots\ (m+1)}$$

by making particular suppositions on the arbitrary integers m and n. If we assume m equal to any whole number, and then make $n = 1, 2, 3$, etc., we shall have one series of figurate numbers; by giving to m every value from 0 up, we obtain in succession an infinite number of figurate series. See FIGURATE NUMBERS.

(3) *Polygonal and Pyramidal Numbers.*—These numbers are so named because they express the different numbers of equal spherical balls that can be symmetrically arranged so as to form certain polygonal and pyramidal figures. The polygonal numbers are formed by taking the successive sums of the terms of an arithmetical progression whose first term is 1; if the common difference is 1, we have triangular numbers; if the common difference is 2, we have square numbers; if the common difference is 3, we have pentagonal numbers: and, in general, if the common difference is $m-2$, we have m-gonal numbers. Thus,

{ *Arithmetical series*, 1, 2, 3, 4, 5, 6, 7, etc.;
{ *Triangular numbers*, 1, 3, 6, 10, 15, 21, 28, etc.

{ *Arithmetical series*, 1, 3, 5, 7, 9, 11, etc.;
{ *Square numbers*, 1, 4, 9, 16, 25, 36, etc.

{ *Arithmetical series*, 1, 4, 7, 10, 13, 16, etc.;
{ *Pentagonal numbers*, 1, 5, 12, 22, 35, 51, etc.

Pyramidal numbers are derived from polygonal numbers according to the same law. Thus,

{ *Square numbers*, 1, 4, 9, 16, 25, etc.;
{ *Square pyramidals*, 1, 5, 14, 30, 55, etc.

Here each number of the second line is formed by adding the corresponding number of the first line. The last line of numbers gives the number of equal spherical balls that can be piled in different pyramids having square bases. It is a general principle that any whole number is equal to the sum of 1, 2, or 3 triangular numbers, or to the sum of 1, 2, 3, or 4 square numbers, or to the sum of 1, 2, 3, 4, or 5 pentagonal numbers, etc. Thus the number 23 is equal to 21 + 1 + 1, or to 9 + 9 + 4 + 1, or to 22 + 1, etc.

(4) *Redundant, Defective, and Perfect Numbers.*—If the sum of all the divisors of a number (except itself) is greater than the number, it is said to be *redundant*; thus 12 is a redundant number, because $1 + 2 + 3 + 4 + 6 > 12$. If this sum is less than the number, it is said to be *defective*; thus 10 is a defective number, because $1 + 2 + 5 < 10$. If this sum is just equal to the number, it is said to be *perfect*; thus 6 is a perfect number, because $1 + 2 + 3 = 6$. If $(2^n - 1)$ is a prime number, then is $2^{n-1}(2^n - 1)$ a perfect number; thus $2^7 - 1$, or 127, is prime, and $2^6(2^7 - 1)$, or 8128, is a perfect number.

(5) *Amicable Numbers.*—Two numbers are said to be amicable when each is equal to the sum of all the divisors of the other. Thus 284 and 220 are amicable numbers, as are 17296 and 18416, and also 9363583 and 9437056.

(6) *Bernoulli's Numbers.*—These are the coefficients of the different powers of x in the series obtained by developing the expression $x(e^x - 1)^{-1}$. These numbers are used in the higher branches of applied mathematics, and for this reason they have been computed and tabulated. The general forms of Bernoulli's numbers may be found in the larger French books on the calculus. For a complete discussion of the theory of numbers the reader is referred to Gauss's *Disquisitiones Arithmeticæ*, Dirichlet's *Zahlentheorie*, or to Legendre's *Essai sur la Théorie des Nombres.*

Revised by S. Newcomb.

Numbers, Book of: the fourth book of the Pentateuch, so called because it contains an account of the second census of the Hebrews, made at Sinai in the second month of the second year of the Exodus (ch. i.); it also contains (ch. xxvi.) an account of a third census, thirty-eight years later. Its contents treat largely of the history of the tribes in the journey through the wilderness, and in it are also portions of the Mosaic Law. See Hexateuch and Pentateuch.

Numerals, or **Figures** [*numerals* is from Lat. *numera'lis*, pertaining to numbers, deriv. of *nu'merus*, number]: the characters by means of which numbers are expressed. See Notation.

Numerator: See Fractions.

Numid'ia: that part of the northern coast of Africa which extended between Mauritania in the W. and *Africa Propria*, the ancient territory of Carthage, in the E., corresponding nearly to the modern Algeria. It was inhabited by the same race of people as Mauritania, the Moors, the ancestors of the modern Berbers, and it was divided between many different tribes. By the help of the Romans, as a reward for his support in the wars against Carthage, Massinissa succeeded in uniting the tribes and establishing an empire, several of whose rulers became famous in Roman history, as for instance Jugurtha and Juba. In 46 B. C. Numidia was made a Roman province, and the Romans formed several colonies here, of which Hippo Regius was the most noticeable.

Numid'idæ [Mod. Lat., named from *Nu'mida*, the typical genus, from Lat. *Nu'mida*, a Numidian]: a family of gallinaceous birds typified by the well-known Guinea-fowls (*q. v.*). The general form is familiar to all, and in this respect all the species of the family agree, the body being squat, with the head small and the neck comparatively long, but not as much so as in the turkeys; the head is always more or less wattled and naked; the bill moderate; the nostrils large, oval, and partly covered by a membrane; the tarsi moderately long; the hind-toe a little elevated; the tail depressed or bent downward. The family is sustained, according to Prof. Huxley, by a number of osteological characters. It differs from all others by the absence in its representatives "of any backward process of the second metacarpal, and in the obtuseness and somewhat outward inclination of the costal processes. The acromial process of the scapula is also singularly recurved." In most other respects, however, it agrees essentially with the *Meleagridæ* and *Phasianidæ*, having the same kind of sternum, skull, etc., but slightly modified. The family is peculiar to Africa. The species are chiefly found in the woodlands, and especially along the margins of rivers, and congregate in flocks of 200 and 300 individuals, scattering along in search of food, which consists of insects as well as small grains. The eggs are numerous and are laid in a rude nest, generally concealed in the bush. The dozen or so species are contained in three genera: (1) *Numida*, including the common guinea-fowl (*Numida meleagris*); (2) *Agelastes*, with one species; and (3) *Phasidus*, also with one species. These nearly average in size the domestic species. Revised by F. A. Lucas.

Numismat'ics [from Lat. *numis'ma*, coin (by analogy of *num'mus*, coin), from Gr. *νόμισμα*, something sanctioned by usage, especially a coin, deriv. of *νομίζειν*, own as a custom, deriv. of *νόμος*, custom, law]: the study of coins and, with these, of medals; though properly only of those struck in a die, excluding those east. (See Medal and Medallion.) It has been usual to divide coins for purposes of study (omitting minor details) into three grand classes: (1) *Ancient*, from their earliest existence in the seventh century B. C. to the deposition of Romulus Augustulus (A. D. 476); (2) *Mediæval*, from this period to the beginning of the sixteenth century; (3) *Modern*, from about 1500 to the present time.

The *ancient* coins are classed under (1) Greek, (2) Roman, (3) Græco-Oriental, or Byzantine, under each of which it is customary (following the arbitrary arrangement proposed by Eckhel of Vienna) to take the countries in their order from W. to E., the cities of each country being placed alphabetically. Of the three, the Greek are unquestionably the most important. Heads and full-length representatives of divinities and legendary persons are found on these; sometimes, too, celebrated games—e. g. those of Olympia—are commemorated, as in the chariot-race types of Syracuse; or well-known myths, as that of the Labyrinth, on coins of Cnossus in Crete. Maritime states are often denoted by dolphins and other fish; rivers, like the Achelous, by bulls with human heads. The materials of the coins are gold, silver, bronze, electrum, an alloy (sometimes natural) of silver with gold, or potin or billon, bronze or copper washed with silver. It is supposed that the metal was first formed in roundish lumps and then struck cold, but no ancient die is known to exist in any museum; the materials, however, for coining, the hammer, the anvil, and the tongs, may be seen on a denarius of the Roman family Carisia. Inscriptions on Greek coins are generally in the genitive, on Roman and Oriental in the nominative, the word *νόμισμα* (coin) being in the first case understood. The finest period of Greek art lasts from 460 to 390 B. C., and is nearly coincident with the best period of sculpture; and, as a rule, the colonial coins of Italy and Sicily rival those of Greece proper in beauty, and are even more varied and rich. In one instance, that of Athens, the coins remain to the last rude and ugly, perhaps owing to their great commercial importance, the peoples of the Mediterranean objecting to any change of type. In weight, Greek coins are generally very accurate, but different countries and towns preferred the different standards of the Phœnician, Aginetæ, or Attic talent. Thirteen multiples or submultiples of the Athenian drachma (67·5 troy grains) are known; and of these, 100 went to the *mina*, and 60 minæ to the talent. The two-drachma piece (didrachm) and the four-drachma piece (tetradrachm) are the most usual sizes, the gold generally following the standard of the silver. Bronze coins are usually submultiples of the *obelos*, itself one-sixth of the drachma.

Greek coins are found in Europe in Spain, Gaul, Britain, Italy, Sicily, Thrace, Macedonia, Thessalia, Attica, Bœotia, and the Peloponnesus; and in Asia in Ionia, Phrygia, Lydia, Caria, Cilicia, Phœnicia, and Egypt. In Italy we find magnificent specimens of the colonial coinage at Heraclea, Metapontum, Neapolis, Pandosia, Tarentum, Terina, Thurium, and Rhegium; of very early types at Caulonia, Croton, Pæstum, Populonia, and Sybaris; of the ancient mode of writing, from right to left, on some of the earliest; and of the use of the digamma at Heraclea. The finest coins of Sicily are in like manner colonial, with some resemblance to those of Italy, the earliest ascending in date to B. C. 490 or 480. At Agrigentum the name of the people is written *boustrophedon*—i. e. from right to left and from left to right, as an ox plows. The Syracusan decadrachms represent the largest of ancient Greek coins. Connected with Sicily are some very fine coins bearing Phœnician inscriptions, sometimes attributed to Carthage; indeed, there is no doubt the best specimens were struck for that great city in Sicily at Panormus and other places, and by Greek artists. The beautiful coins of Philistis commemorate a lady not men-

tioned in history, but believed to be the wife of Hiero II., as her name is found carved on a seat in the theater at Syracuse.

In Greece proper we find very early and beautiful specimens of Greek art at Abdera, Œnos, and Thasos, and in various towns of Macedonia and its neighborhood, as Acanthus, Amphipolis, Chalcidice, Lête, and Neapolis. The types in many cases refer to old and well-known myths, as the Gorgon's head at Neapolis. Two remarkable coins exist of Geta, King of the Edoni, both of which were found in the Tigris, and therefore may have been carried back to Persia after the defeat of Xerxes. Of Philip and Alexander the Great coins abound in gold and silver, but are less frequent in bronze, the former being of good art and the latter confirming the extent of his conquests; while those of Lysimachus, King of Thrace, are noteworthy for the portrait they exhibit of Alexander himself, with the symbols of the Young Ammon. Thessaly exhibits some good specimens in the money of Larissa, with some resemblance in fabric to those of Sicily; and Epirus offers the beautiful series from Ambracia, with the noble head of its king, Pyrrhus, treated as the Jupiter of Dodona. The coins of Pyrrhus were probably struck at Tarentum or Syracuse. Athens naturally affords the largest series of Greek coins; some specimens are as early as 500 B. C. Those of the adjacent island of Ægina are very interesting from their antiquity, and from the tradition that Pheidon, King of Argos, first struck coins here in the eighth century B. C. In the Peloponnesus the series of the money of Corinth claims especial attention from its great extent and long-preserved excellence. At Elis we find the digamma on early types of the time of Xerxes, and a magnificent series of the finest period, with the head of Juno and her name, HPA, inscribed on a bandeau over her forehead. With these may be ranged scarcely less noble specimens from Trazene, Arcadia (with the head of Zeus Ætophoros), and Stymphalus—the latter possibly Cretan. Sparta naturally records her famous ruler, Lycurgus, though on a late copper coin. Mantinea and Heræa have good archaic types.

Asia Minor offers us coins partly Greek and partly Græco-Oriental; there is a magnificent head of Mithridates VI. of Pontus; in Mysia we have a unique series of *electrum* coins, called *staters* of Cyzicus, with other splendid trophies of Greek art, in the money of Cyzicus, Phocæa, and Pergamus. The tetradrachms of the last place are called, from their peculiar type, *cistophori*. Ilium in Troas naturally records its local traditions, placing Hector (ΕΚΤΩΡ) on its money, and Æneas carrying Anchises and leading Ascanius. Lydia comes next, with its rude and archaic gold coins, probably, the earliest specimens of Greek numismatic art, though those of Ægina could not have been much later; then comes Ionia, with its great series of Smyrna and Ephesus, and the noble coins of Clazomenæ. Magnesia records its river by the type of a bull butting within the pattern, hence called "Mæander." Early coins of Phocæa exhibit the seal, whence its name; and Chios, Samos, Calymna, and Cos early produced many curious specimens. The coins of Rhodes have an importance of their own, and comprise very fine specimens, with the head of Apollo, probably the same type as was afterward known as the Colossus of Rhodes. On the opposite coast Lycia and Pamphylia afford a remarkable series, the elder ones inscribed in the local character and languages, and Side in the latter province having some especially fine tetradrachms, with the pomegranate fruit (Σιδή) as their type. In Pisidia we have curious locally inscribed coins at Selge, resembling those of Aspendus in Pamphylia. Phrygia offers several coins of interest of the imperial times with local myths, such as that of Deucalion and ΝΩΕ, and Cilicia some remarkable coins inscribed with Phœnician characters and struck by the Persian rulers of that district. These are called "satrap" coins. There are also some interesting types at Tarsus, bearing legends similarly written. These, and the types prevailing along the coast of Syria, at Sidon, Tyre, Aradus, and Byblus, together with the early money of the Bactrian series, might perhaps best be termed Græco-Oriental. The native coins of Carthage and of Judæa must be called Oriental; they do not exhibit anything worthy of remark, except, perhaps, the earliest "shekels" of Judæa, which were probably struck soon after the return of the Jews from Babylon.

Roman numismatics begins about 230 or 240 B. C. with a massive copper coinage, termed technically *æs grave*, having the *as* for its largest size, and the *uncia* (or ounce) for its unit. At first the *as* actually weighed 1 lb., and hence was called *as libralis*, the ounce being its twelfth part; but it was soon and rapidly reduced. The leading types of the Roman *as* are the *Janus bifrons* and the prow of a galley. Other and similar coins were struck in the neighboring towns of Etruria and in Umbria and Apulia. About 170 B. C. gold, silver, and copper coins were issued by various Roman families, who were permitted by the state to strike coins—often, too, beyond the bounds of Italy; and with Julius Cæsar began the imperial series, which lasted till 476 A. D. The main characteristic of Roman art is individuality as opposed to idealism; faithful portraiture, often exceedingly good, as in the cases of Nero, the Antonines, the two Faustinas, etc., with a remarkable permanence of religious types on the reverses. Many historical events are recorded on them, as the crowning of Ptolemy Epiphanes by Lepidus, the introduction of elephants into Rome by Metellus, the construction of the port of Ostia and of the Colosseum by Nero and Vespasian respectively, and the overthrow of Judæa by Titus.

It is probable that all the finest Roman coins were executed by Greek artists, and their chief value for study is the illustration they afford of contemporary sculpture, and the influence they have exercised over mediæval and modern art. After Julius Cæsar the senate reserved to itself the striking of the copper money, which for a long time is always marked with S. C. (*senatûs consultu*). Names for Roman coins are scarce, but we know that the earlier gold and silver coins were termed, respectively, the *aureus* and the *denarius*, the latter of which names was preserved through the Middle Ages as the *denier* of France. Besides the regular coins, the Romans had also what are termed *medallions* (see MEDALLION), and *contorniates*, which were probably tickets of admission to the theaters or games. Christian types, as the *labarum* or standard bearing the cross, are found from Constantine downward, and on one are seen the celebrated words, "*Hoc signo victor eris.*" With the imperial Roman it is usual to class the *imperial Greek* coins, struck in the Greek cities by nearly every emperor, and in some cases, as at Antioch and Alexandria, forming a series unrivaled in number and duration.

The Greek coinage of the Byzantine emperors down to the capture of the city by the Turks in 1453 is generally supposed to begin with Anastasius in A. D. 491. The inscriptions on it are at first in Latin, thence continuously in Greek, its varying orthography showing the gradual change of the language. The Byzantine coinage is mostly in gold, and its chief interest is that it was the principal coinage of Middle and Eastern Europe till the introduction of the florins and ducats of the Italian republics; and, further, because the money of the Vandals in Africa, of the Ostrogoths in Spain and of Nicæa, Thessalonica, and Trebizonde, was framed on Byzantine models.

The early *mediæval* types are a barbaric imitation of the Roman, their art being progressively worse as they were removed farther and farther from Italy, which always retained some traces of her earlier civilization. The earliest mediæval coins are those of the Lombard and Merovingian kings and of the dukes of Benevento, and in Britain the small silver pieces called *sceatas*. In France and in England the *denier* and the *penny-sterling* (i. e. Easterling) were the common and the most important coins. Coins were (except in England, where the right of striking coins was always much restricted) issued by princes and ecclesiastics, as well as by kings, and somewhat later by free cities and corporations. Mediæval coins are not relatively so important to us as the seals of the same epoch, of which many originals and many impressions exist. The coins are nearly always inferior in beauty to those seals, and still more decidedly inferior to the cast medallions of Italy. (See MEDAL and MEDALLION.) It is only in very modern times that the same care and pains have been spent upon die-sinking for coins that are given to the other arts.

Besides the various series above enumerated there exists a vast number of coins struck by different Oriental rulers from the beginning of the empire of the khalifs to the present day. These coins are not very important in the history of art, but very valuable in determining the dates of dynasties; as a rule, with the exception of the Chinese, they are written in the characters of the Mohammedan conquerors, or in some modification of the Devanâgari (or Sanskrit) alphabetic system. Núñez, noon'yāth, RAFAEL: statesman; b. at Cartagena, New Granada, Sept. 28, 1825. He studied in his native city; was elected to congress in 1851, and thereafter took a prominent part in politics; was secretary of the treasury 1855–57 and 1861–62; and edited *El Porvenir* and other journals. From 1863 to 1865 he lived in New York, where he conducted a Spanish newspaper; later he was in Europe until 1874, acting as consul of Colombia at Havre and Liverpool. Returning to his native country, he was the candidate of the liberal party for the presidency in 1875, but was defeated; was governor of the state of Bolivar, senator, and secretary of the treasury for a short time in 1878; and was elected president in 1879. His term of two years (1880–82) was very prosperous. He was again elected for the term beginning Apr., 1884; in 1885 a rebellion was put down, and in 1886 a new constitution was adopted, by which the federal system was abolished, and the presidential term was extended to six years. Under this constitution Dr. Núñez became president in 1886, and again in 1891. D. in Bogota, Sept. 18, 1894. HERBERT H. SMITH.

Núñez de Arce, -dā-aar'thā, GASPAR: dramatist and poet; b. at Valladolid, Spain, Aug. 4, 1834. His studies were pursued at Toledo, and even before they were completed he was given the freedom of the city for a successful drama. Soon after he went to Madrid, where he began to write for various periodicals, and also, both alone and in association with the poet Antonio Hurtado, to produce plays. From his own pen we have the comedies *¿ Quién es el autor ?* (1859); *La Cuenta del Zapatero* (1859); *Como se empeñe un marido* (1860); *Ni tanto ni tan poco* (1865); and the dramas *Deudas de la honra*: *Quien debe, paga*; *Justicia providencial*; and *El Haz de Leña*. The last of these, produced in 1882, and devoted to the story of Don Carlos, is one of the best recent Spanish plays. With Hurtado he wrote *El Laurel de la Zubia* (1865); *Herir en la sombra* (1866); *La Jota aragonesa* (1866); *Una página de oro, ó el Sitio de Cartagena en 1815* (1873). It is, however, quite as much by his poetry as by his plays that Núñez de Arce has obtained his commanding place in Spanish letters. On the whole, he is the best exponent in Spain of the doubts and pessimistic inclinations of the nineteenth century; but at the same time he has often shown remarkable patriotic passion in denouncing the political evils of his country. Through the wretched revolutions of the last half of the century, his voice has again and again been raised against the cruelty and selfishness of self-styled patriots, and more than once his words have echoed throughout Spain. He has given the title *Gritos del Combate* (5th ed. 1885) to the collection of these passionate poems. Besides this volume, he has published several longer poems that have had remarkable popularity: *Última lamentación de Lord Byron* (23d ed. 1884); *Maruja* (9th ed. 1886); *La Pesca* (15th ed. 1886); *La Selva Oscura* (15th ed. 1886); *El Vértigo* (25th ed. 1886); *La Visión de Fray Martín* (15th ed. 1886); *Un Idilio y una Elegía* (18th ed. 1886). In 1860 Núñez de Arce went as correspondent of the Madrid journal *Iberia* to the war between Spain and Morocco; and this is described in his *Recuerdos de la Guerra de África*. He early began to take part in politics, always on the liberal-monarchical side, and in 1865 he was first elected to the Cortes. In 1882 he was Minister of Colonial Affairs. He was elected to the Spanish Academy in 1876. He has published his four chief dramas under the title *Obras dramáticas* (Madrid, 1879); various tales and articles as *Miscelánea literaria* (Barcelona, 1886). A. R. MARSH.

Núñez Vela, -vā'lăă, BLASCO: first Viceroy of Peru; b. at Avila, Spain, about 1490. He held various civil and military offices, and was appointed Viceroy of Peru in 1543, with special directions to enforce the new laws for the abolishment of Indian slavery. He reached Lima in May, 1544. He had already shown his good intentions by refusing the forced services of Indian porters during his journey, and laying an embargo on a cargo of silver, on the ground that it was the product of slave labor; but he lacked discretion to introduce so great a reform against the violent opposition of the colonists. A revolt quickly broke out, headed by Gonzalo Pizarro. Vela made matters worse by imprisoning his predecessor, the governor Vaca de Castro, and in Sept., 1544, he killed the factor, Carbajal, after accusing him of conspiring with Pizarro. He was finally deposed and arrested by the Audiencia, and put on board a ship, to be sent to Spain. The captain of the ship allowed him to land at Tumbez, where he began to organize an army; but Pizarro pursued him, and he fled through Quito to Popayan. Thence, re-enforced by Benalcazar, he returned to Quito, but was defeated and killed by Pizarro at the battle of Añaquito, Jan. 18, 1546. HERBERT H. SMITH.

Nu'nivak: an island in Bering Sea, belonging to the U. S.; in lat. 60° N., lon. 166° W.; off Cape Vancouver and separated from the mainland by Etolin Straits, about 40 miles wide. It is an irregular quadrilateral, about 50 miles long by 30 broad, and contains about 1,200 sq. miles. It is unexplored, but is known to be lightly wooded in sheltered places and to contain many high hills. It is lowest in the northern part, and has no harbors. It is inhabited by Innuits, very degraded and filthy, and noted for the beauty of their ivory carvings and of their skin canoes. Their chief articles of trade are fox-skins, oil, and ivory. M. W. H.

Nun of Kenmare, The: See CUSACK, MARY FRANCES, in the Appendix to Vol. III.

Nur-ed-din Mahmud, or **Malek-al-Adel** (just prince): Sultan of Syria; b. at Damascus in 1117; son of Zenghi, Emir of Bassorah, who had conquered Northern Syria. After Zenghi died (1146), his elder son, Seïf-ed-din, succeeded to the northern half of his dominions, while Nur-ed-din took possession of the rest. In 1147 he defeated Count Joscelin de Courtnay and captured Edessa, the bulwark of the Christian kingdom of Jerusalem. For its recapture Louis VII. of France and Conrad III. of Germany undertook the second crusade. Nur-ed-din defeated Louis, took Antioch, Tripolis, and Damascus (1154), which he made his capital, overthrew Baldwin III., King of Jerusalem, near the Jordan (1155), and gradually mastered nearly all Syria and Palestine. The civil dissensions of the Mussulmans in Egypt led him to interfere in that country, which was subdued and pacified by his generals, the Kurds Schir-Kou and Salah-ed-din. D. at Damascus in 1174. Nur-ed-din was a man of noble character, revered by the Mussulmans and admired by the Christians. His victories were due not only to his diplomacy and military skill, but to his firm persuasion that he was chosen by God as the soldier of Islam. E. A. GROSVENOR.

Nu'remberg (Germ. *Nürnberg*): town of Bavaria; on the Little Pegnitz, here crossed by seven bridges, and on three railway lines; 95 miles N. by W. of Munich (see map of German Empire, ref. 6–E). Of all German cities it is the most interesting and characteristic with respect to its architecture. The houses face the street with their gables, and balconies profusely ornamented with carvings in stone or wood overhang the sidewalks. It is very rich in splendid mediæval monuments which show that its ancient boast of being the commercial, industrial, and literary center of Germany was not vainglorious. Of its many remarkable buildings, the most striking is the Church of St. Sebald, a Gothic structure ornamented with paintings by Albert Dürer, and containing the famous tomb of St. Sebald executed in bronze by Peter Vischer, who, with his five sons, worked on it for nearly thirteen years. The town-hall, the largest building of its kind in Germany, with subterranean dungeons and torture-chambers, the castle, and the Church of St. Lawrence are also interesting edifices. The Albrecht Dürer Platz contains a statue of the great artist, erected in 1840. The principal manufactures of Nuremberg are carvings in wood, bone, and metals, children's toys and dolls, lead-pencils, chemicals and ultramarine, looking-glasses, watches, carriages, and machinery. Its trade is very extensive.

Nuremberg was once the wealthiest and most important of the free imperial cities of Germany. Among the earliest of German cities to accept Protestantism, it gave hearty support to the followers of Luther, and was the seat of important diets during the Reformation. It gave its name to the religious peace of 1532, which granted temporary liberty of worship to Protestants in order to secure united action against the Turkish invaders. Although it suffered greatly during the Thirty Years' war, and gradually declined until in 1806 it lost its independence and was annexed to Bavaria, it is still a great and rich town. Its fortifications, consisting of a double wall and a moat, were demolished during the occupation by the Prussians in 1866, and have been transformed into promenades. Pop. (1900) 261,022, of whom about 25,000 are Roman Catholics.

Nursery: in horticulture, an establishment for the rearing of plants; in the U. S., however, there is a tendency to restrict the term to those areas devoted to the growing of woody plants alone, like trees and shrubs, while the propa-

gation of herbaceous plants is referred to floriculture. The peculiarity of nurseries in the U. S. as distinguished from those of other countries is the enormous quantity of fruit-tree plants which are propagated, a circumstance which arises from the fact that fruit-growing is the chief horticultural pursuit of the republic. In 1890 the nurseries of the U. S. occupied 172,806 acres of land, and represented an invested capital of $52,425,669.51. They employed 45,657 men, 2,279 women, and 14,200 animals. There was a total of 3,386,856,778 plants growing for sale, of which 518,016,612 were fruit-trees and 685,603,396 were grape-vines and small fruits. The greatest number belonging to a single species were 240,570,666 apple-trees, grown upon 20,232¾ acres. Evergreen trees were represented by 822,038,324 plants, and deciduous ornamental and forest trees by 1,297,408,257. The most important nursery region of the U. S., considering both extent and variety of the industry, is Western New York, particularly the counties of Ontario, Monroe, Wayne, and Niagara.

The nursery interest may be divided into two categories with respect to the use and economy of the land—the growing of fruit-trees and plants, and the growing of ornamentals. The market value of fruit stocks is measured by their age and size combined, and it is therefore essential that they be grown upon unworn land in order that the greatest possible growth may be obtained in a given time. It is almost a universal practice to grow only one crop of fruit-trees upon the land. Nursery lands are therefore largely rented for a term of four or five years, after which farm crops are raised upon the soil. A high system of fertilizing would undoubtedly restore the soil to a condition to allow of successful nursery business, but in practice it is found to be cheaper to plant upon land which has never been used for nursery purposes. Ornamental stocks are valued according to their size alone, and these can therefore be satisfactorily grown upon land already used for nursery crops.

Fruit-trees are grown from seeds, and the seedlings are budded or grafted (see GRAFTING) with whatever varieties of the same, or in some cases allied, species the nurseryman may desire. Ordinarily, the growing of seedlings is a separate business from the propagating and growing of named varieties. The seedlings of plums, pears, quinces, and generally of cherries, are mostly grown in France, where labor and seeds are cheap and the climate is adapted to the work. These seedlings are exported to the U. S. at the end of the first season's growth and are planted in nursery rows. The following summer (that is, the second season from the seed) these seedlings are budded to the various named varieties. These buds do not grow until the following spring, at least not in the North; so that when the bud, which is to make the body and top of the tree, begins to grow, the root is two years old. The trees are ready for sale when the bud or top is two or three years old. Apples are now mostly grown upon seedlings raised in the rich soil of the Western States. These seedlings are dug and shipped in the fall of the first year. The purchaser may root-graft these stocks the same winter and plant them in the spring, or he may set them in nursery rows and bud them the following July or August. Peaches are budded in late August or September (in the North) of the first year, and the trees are ready for sale at the close of the following year. That is, peach-trees are sold when the top is one year old and the root two years old. Ornamental trees and shrubs are multiplied in a great variety of ways. Some are budded or grafted, and many are increased directly by seeds, cuttings, or layers. (See CUTTINGS.) Grapes are almost wholly grown from cuttings of the mature wood (see GRAPE), as are also currants and gooseberries. Raspberries and blackberries are multiplied both by means of cuttings of the roots and by suckers which spring from near the base of the plant; but the blackcap raspberries are usually propagated by bending over the growing shoots or canes and allowing the tip to root in the soil, after the manner of a layer. (See LAYERING.) For detailed accounts of nursery practice, consult Barry's *Fruit Garden*, Fuller's *Propagation of Plants*, and Bailey's *Nursery Book*.

L. H. BAILEY.

Nurse-shark: a large shark (*Somniosus microcephalus*) found in Arctic or cold northern waters. It is of a robust form and attains a length of from 12 to 20 feet, but has very small teeth and is sluggish in its motions. This name is also applied to a smaller and more slender shark (*Ginglymostoma cirrata*), occurring in the Caribbean Sea and adjacent waters.

F. A. L.

Nusairieh, Ansyreeh, Ansaries, or **Ansonians**: a Mussulman sect. They inhabit the lower Ansyrean mountain range between Lebanon and Antioch, in Syria, and also are numerous in towns and villages along the coast. They sprang from the Shiïtes, with whose heresies they united many Christian, Jewish, and pagan ideas. Their prophet Nusair taught that God had appeared several times in human form, as in Abraham, Moses, Jesus, Mohammed, and Ali, and will once more manifest himself in El Mahdi or the Messiah. They regard Christ as a prophet, revere the Virgin Mary, observe Christmas, adore the sun and moon, accept the Koran, which they claim was revealed to a Mohammed of their sect and not to the Arabian prophet, maintain the divinity of Ali, who they say was incarnated seven times, practice polygamy, indulge in wine, and believe in the transmigration of souls. In their belief, whoever is apostate or unfaithful to his religion will after death be transformed into a Jew, Mussulman, Christian, or animal. They endeavor to keep their creed secret, and many of their doctrines are unknown. Their neighbors give them a bad reputation, but, though ignorant and superstitious, they are kindly and hospitable.

E. A. GROSVENOR.

Nut: an Egyptian deity, wife of Seb (or Qeb) and mother of Osiris, Isis, Nepthys, and Set-Typhon. She was the personification of the heavens, and is represented as a woman standing like a quadruped upon her hands and feet, while her body symbolized the heavens in which the stars appear. Similarly she is represented by the figure of a cow. Nut is to be distinguished from Nu-t. See NU. C. R. G.

Nutation: See PRECESSION OF THE EQUINOXES.

Nutcracker: a bird of the crow family, so called from the readiness with which it cracks the nuts that form a part of its food. Its scientific name is *Nucifraga caryocatactes*, and it is nearly related to the jays. It is a little over a foot in length; the thick, soft plumage is dark brown, with white or whitish spots on the head and neck; the wings and tail are black, the latter with a white band. The nutcrackers frequent the pine forests of Northern Asia and Europe, feeding on grubs, the seeds of the pine, etc. They associate

The European nutcracker.

in flocks and are active and noisy, except during the breeding season. Although the birds are very common, the eggs were for a long time unknown, owing to the fact that the birds nest early in the spring while the snow is still on the ground, and at this time are shy and quiet. The American nutcracker, better known as Clarke's crow (*Picicorvus columbianus*) is an inhabitant of the pine woods of the western parts of the U. S. It is of a gray color, wings black with a white mark on the secondaries, tail white, except central feathers, which are black.

F. A. LUCAS.

Nutgalls: See GALL INSECTS, GALLOTANNIC ACID, and GALLS.

Nuthatch: any one of a number of small birds belonging to the family *Sittidæ*, and, with a few exceptions, to the genus *Sitta*. They have round, pointed beaks, long wings, short, rather square tails. They are active climbers, and may be seen scrambling about trees, often head downward,

in search of insects and their eggs. They get their popular name from a habit of placing a seed, or small nut, in some convenient crevice, and hacking, or *hatching*, out the contents with blows of the beak. The greater number of species are found in Europe, Asia, and North America, but a few peculiar genera, which may possibly not rightfully belong to the group, are found in New Zealand, Australia, and

The common European nuthatch.

Madagascar. The common European species is *Sitta europea*; the common nuthatch of Eastern North Ameriea is *S. carolinensis*, a bird 6 inches in length, bluish ash above, dull white below; wings blackish, tail, except central two feathers, brown, and nape black. It nests in holes, which it hews out for itself, and lays a number of white eggs speckled with reddish and purplish colors. F. A. Lucas.

Nutmeg: See Myristica.

Nutria Fur: See Coypee.

Nutrition [from Lat. *nutri're*, nourish, whence Eng. *nourish*]: the process by which appropriate material is taken into living organisms and utilized to maintain their existence, promote their development, and facilitate the performance of their functions. This definition covers vegetable as well as animal nutrition. The discussion of the former will be found in the articles on botanical subjects; in this only animal nutrition will be considered. Animal nutrition includes the absorption of gases and of water, and the preparation, appropriation, and assimilation of solid food. The absorption of gases and water takes place, in very simple organisms, through their general surface; in higher organisms the absorption of gases (and perhaps to a very limited extent of water) takes place through lungs or gills by the function of respiration; the absorption of liquids takes place chiefly in the stomach, and of semi-liquids and solids in the intestines. The function of respiration accomplishes an exchange of gases, by which those needed by animal tissues in active life are received into the blood, and those excreted by them are conveyed out of the body. This is as really a part of the process of nutrition as that which consists in appropriating nourishment taken into the stomach, and its details may be found in the article on Respiration.

Briefly stated, nutrition is the result of appropriating food, and food is anything which, when appropriated by the tissues—or, more properly, the cells—of the body, contributes to their life, growth, or functional activity. The simplest forms of animal and vegetable life (amœbæ, bacteria) are nourished by direct absorption of suitable material from the surrounding media, in this respect, as in many others, resembling the individual cells of higher organisms. For the latter, the first step in the process of taking food (after any form of preparation) is called by physiologists "prehension" (laying hold of); the second (applicable to solid or semi-solid food) is usually "mastication" (chewing); the third is usually "deglutition" (swallowing). Some animals, like birds, perform the act of mastication in the stomach (gizzard); others, like fishes, do not masticate at all; others, like cattle, masticate their food after it has been once swallowed and then regurgitated —what is called "rumination." In the highest animal organism, man, the three processes named above are followed by Digestion (*q. v.*), and this by absorption through the walls of the stomach of liquids and the products of gastric digestion, which then enter the blood-vessels and lymph-channels and are conveyed in the blood and lymph to the remotest parts of the body. The undigested food passes into the intestinal canal, where it is further elaborated (for the details of which process see Digestion), the prepared portion being taken up by blood and lymph vessels of the wall of the intestines and conveyed into the circulation, while the residue is carried on and finally expelled by the process of defecation. After nutritive material enters the circulation, it is carried to various parts of the body and comes in contact with individual cells, which then (in health) take up and appropriate to their nourishment what they need. A necessary complement to the process of appropriation is that of exeretion, which consists in the casting off by each cell of effete matter, the product of its own vital activities, which is conveyed by the blood-vessels to the various points of exit from the body—the lungs, the skin, the kidneys, and the bowels.

A correct understanding of the process of nutrition involves, as a fundamental conception, the fact that the most complex being is a community of individual cells, each living by itself, growing, developing, reproducing its like, decaying, and dying in due time, and from the beginning to the end of its existence maintaining its individuality. The life and health of a man depend upon the life, health, and harmonious action of the cells of which his body is composed, and the state of nutrition of a man corresponds to the state of nutrition of his cells. When a man grows fat it is because the cells which make up his adipose (fat) tissue are in a state of high nutrition; when he grows thin, it is because they are under-nourished. When a man grows muscular, it is because his muscle-cells are well nourished; and when these are impoverished, his muscles will be weak and small. All the steps in nutrition previous to the appropriation of food by each cell are but preliminary to that final act in which each cell—like an amœba in a drop of water—takes from its surrounding medium that which is suited to its needs. By means of a process of which nothing is certainly known the material that each cell appropriates undergoes changes which make it like that which already occupies the cell, and fit it to take the place of that which, having served its purpose, is undergoing further changes, and is about to be cast out into the same current which has brought the needed supply of nutrient material. This is the real process of nutrition. Charles W. Dulles.

Nuts: See the Appendix.

Nut'tall, Thomas: botanist and ornithologist; b. in Yorkshire, England, in 1786; was brought up a printer; went to the U. S. in youth; devoted much time to botanical and ornithological studies; traveled in nearly every State of the Union; explored the Great Lakes, the upper courses of the Missouri and Arkansas rivers; crossed to Oregon, the Sandwich islands, and California. He published, among other works, *The Genera of North American Plants* (2 vols., 1818); *A Journal of Travels into the Arkansas Territory* (1821); *A Manual of the Ornithology of the United States and Canada* (1832–34); and *The North American Sylva* (3 vols., 1842–49), being a continuation of F. A. Michaux's work on the same subject. Nuttall was curator and lecturer at the botanic garden of Harvard College at Cambridge 1822–28; returned to England about 1841 on inheriting an estate. D. at St. Helens, Lancashire, Sept. 10, 1859.

Nux Vom'ica [Mod. Lat.; Lat. *nux*, nut + *vo'mere*, vomit]: an important drug consisting of the seeds or beans of a small tree (*Strychnos nux vomica*) of the natural order *Loganiaceæ*, growing in the coast districts of India. The leaves are roundish-oblong, stalked, smooth, and with terminal corymbs. The fruit is a globular berry, about as large as a small orange, with a brittle shell and several seeds lodged in a white gelatinous pulp. The seeds are gray, disk-shaped, a little less than an inch in diameter, and about a sixth of an inch in thickness. They have a very bitter taste and are exceedingly poisonous, both these qualities depending on the presence of the alkaloids strychnine and brucine. Of these, strychnine is the more powerful and important. It is a white powder, almost wholly insoluble in water, odorless, but of an intensely bitter taste. It is highly poisonous, producing in poisonous dose, within half an hour after taking, violent tetanic spasms, the body during the paroxysms being arched backward, with every muscle convulsed and stiff. The mind is unaffected. Death occurs within an hour or two or earlier from a spasmodic prolonged spasm of the muscles of respiration, so that the patient can not breathe. The physiological antidotes are bromides and chloral, and drugs producing motor paralysis, such as Calabar bean, hemlock, tobacco, nitrite of amyl, the anæsthetic ethers, etc., are useful in mitigating the severity of the spasms. Medicinally, strychnine and preparations of nux vomica seeds are used in small repeated doses in cases of nervous debility and paralysis of various kinds, to help in restoring proper functional activity in the affected muscles or organs. Revised by H. A. Hare.

Ny'ack: village; Rockland co., N. Y. (for location of county, see map of New York, ref. 8–J); on the west bank of the Hudson river, and on the Erie, the N. Y., Ont. and W., and the W. Shore railways; 28 miles N. of New York city, with which it has daily steamboat communication, and opposite Tarrytown, with which it is connected by a ferry. It contains Rockland College (non-sectarian, opened in 1874), Nyack Seminary (Protestant Episcopal), Nyack Library Association (founded 1879), public, high, and union schools, several private schools, electric lights, 2 daily and 3 weekly newspapers, a national bank, capital $50,000, a private bank, and manufactories of shoes, pianos, pipe-organs, steam-yachts, boilers, engines, and paper boxes. Pop. (1880) 3,881; (1890) 4,111; (1900) 4.275.

EDITOR OF "JOURNAL."

Nyan'za: a word for lakes in Eastern Equatorial Africa, and especially applied to two great lakes, the *Victoria Nyanza*, or *Ukerewe*, and the *Mwutan*, or *Albert Nyanza*. Nyassa is another form of the same word. See ALBERT NYANZA, NYASSA, and VICTORIA NYANZA.

Nyas'sa: one of the large lakes of inner Africa: about 340 miles long and from 15 to 34 miles wide; 700 feet deep in the south and shallower toward its northern end; area about 14,220 sq. miles. Its waters run to the Zambesi through the Shire river. The shores for the most part are steep, particularly on the west and northeast coasts, and in general the lake gives the impression of a deep cleft in the highland filled with water. Many small rivers flow into the lake on the west coast, but the water receipts of the east coast are small. German and English steamers ply on the lake, whose coasts are divided between those nations. The lake offers (1894) the best route to Central Africa from the Indian Ocean.

C. C. ADAMS.

Nyassaland: See the Appendix.

Nyāya Philosophy: the youngest of the six systems of Brahmanical philosophy (MĪMĀṄSĀ, VEDĀNTA, SĀṄKHYA, YOGA, NYĀYA, and VĀIÇESHIKA, *q. v.*), founded probably some time after the Christian era, and by a man named Gotama, or, as he is often nicknamed, Aksha-pāda, literally, "Having his eyes on his feet." The system bears the Sanskrit name *nyāya*, that is logic, because its importance is chiefly due to its extraordinarily thorough and acute exposition of formal logic, an exposition which has held its own, even until to-day, in India, and which serves as the basis of all philosophical studies, and whose terminology has made its way into the younger treatises of all the other systems. The importance attached to the Nyāya system is evident from the fact that Gotama, in the opening sentence of his manual, the *Nyāya-sūtras*, in enumerating the sixteen fundamental logical conceptions, declares that upon the right understanding of their nature depends the attainment of the supreme welfare, that is, the liberation of the soul from the round of existence. The Nyāya philosophy, however, aims not merely to develop a system of logic, but rather also a complete philosophical system; and is, in this aspect, a continuation and supplement of the Vāiçeshika system, and requires, accordingly, for its proper understanding, some knowledge of the VĀIÇESHIKA (*q. v.*). The metaphysical bases of both systems are the same: both regard the world as a conglomerate of eternal, causeless, and unchangeable atoms; and both agree in their psychology, holding, namely, that the souls are eternal and endless, that they possess certain qualities, and that they can apprehend only by means of the atomistic organ of thought that belongs to them.

The Indic philosophies in general separate strictly two kinds of causes, the material cause (*upādāna-kāraṇa*) and the instrumental cause (*nimitta-kāraṇa*). The material cause of a thing is the matter from which it proceeds and of which it consists. As instrumental cause of a thing is regarded not only the occasion of its coming into being, but also the means by which it is produced. While the material cause of a certain object is always the same, the instrumental causes thereof need by no means be so. Instead of the usual term *upādāna-kāraṇa*, the Nyāya employs—with evident reference to the sixth category of the Vāiçeshika system—the term *samavāyi-kāraṇa*, inherent cause; and assumes, moreover, a third kind of cause—which we should denominate the formal cause—namely, the *a-samavāyi-kāraṇa*, or non-inherent cause. Thus, to use the stock-example, the threads are the inherent cause of the cloth; the connection of the threads, the non-inherent cause; the loom and tools of the weaver, his personal skill, his activity, and the weaver himself are the instrumental causes. Or, again, the cloth is the inherent cause of its qualities, while the qualities of the threads are the non-inherent cause of the qualities of the cloth.

The Nyāya recognizes four sources of true knowledge, to wit: 1, Perception (*pratyaksha*); 2, inference (*anumāna*); 3, analogy (*upamāna*); and 4, trustworthy testimony (*çabda*). Of these, the second palpably outranks the rest. Inference is of three sorts: *a*, From cause to effect (*pūrvavat*), as when from the gathering of the clouds you conclude that it is going to rain; *b*, from effect to cause (*çeshavat*), as when from the swelling of the streams you conclude that it has rained; *c*, from the particular to the general (*sāmānyato dṛshṭa*), answering to our induction, as when, at the sight of a blossoming mango-tree, you infer that the mangos in general are in bloom; or when, from the consideration of the single senses, you arrive at the general idea of the instrument of perception.

The syllogism of the Nyāya has five members, and may be illustrated by the stock-example:

1. Proposition (*pratijñā*): This mountain has fire,
2. Reason (*hetu*): because it has smoke.
3. Example (*drshṭānta*): Whatever smokes has fire, as a kitchen hearth.
4. Application (*upanaya*): This mountain smokes.
5. Conclusion (*nigamana*): Therefore it has fire.

All this, compared with the Aristotelian syllogism, seems needlessly prolix, since 4 and 5 are only repetitions of 2 and 1; but Gotama was not aiming at the utmost brevity, but rather to teach how to present the syllogism in the best and clearest manner to another—that is, the five-membered syllogism is merely the tripartite logical one modified by rhetorical considerations. The conception that underlies the Nyāya syllogism is called invariable concomitance or pervasion (*vyāpti*). Instead of proceeding with one of the "universal affirmatives" of Occidental logic, as "Every smoke presupposes the existence of a fire," the Nyāya proceeds with the invariable concomitance, e. g., of smoke by fire. The observed characteristic (*liñga*), e. g. smoke, is the invariably concomitated (*vyāpya*); the inferable bearer of the characteristic (*liñgin*), e. g. fire, is the invariable concomitant (*vyāpaka*). Although strange in form, this is logically correct. Smoke is invariably accompanied by fire, albeit the converse is not true. The definitions of *vyāpti* and the doctrine of its application are important not only in the Nyāya system, but also in the other philosophic writings of the Hindus.

Such are some of the salient features of the Nyāya. The system goes on to discuss other logical topics, fallacies, and various faults of controversy, often with complicated detail and hair-splitting subtlety. For an outline of these matters, see Garbe's translation of *Aniruddha's Commentary on the Sānkhya-sūtras* (Calcutta, 1892), pages 233–237.

One important point, which concerns both the Vāiçeshika as well as the Nyāya system, still demands our notice. The fundamental works (*sūtras*) of both schools are without any mention of God; and since, moreover, they declare the souls and likewise the substance of the external world to be eternal and uncreated, and since, in agreement with the general Indic view, they hold the fate of the individual to be the product of his good and evil deeds in former existences, there is, accordingly, little room to doubt that the original character of both systems was atheistic. This may be due to the influence of the Sānkhya system. (See SĀNKHYA.) Indeed, the Nyāya and Vāiçeshika doctrines, although presenting many striking contrasts to the Sānkhya, show various peculiarities which seem to rest upon some of the fundamental conceptions of the Sānkhya: such are their pessimistic coloring; their rejection of bliss in heaven as transitory and as leading to new misery; their teaching that even good works are a hindrance to the attainment of salvation; the view that salvation involves the cessation of joy no less than of sorrow—in short, a condition of absolute unconsciousness. Here, too, belongs the fondness for the numerical groupings of the categories and the like.

In later times, both Nyāya and Vāiçeshika go over to theism; but they do not go so far as to hold the personal God to be the creator of matter. Their theology is worked out in the *Kusumāñjali* (written by a Nyāya teacher named Udayanāchārya about 1300 A. D.) and in various works which treat of both systems together. According to these, God is a definite eternal soul, as are all other individual eternal souls: but with this difference, that he is free from the qualities which condition the migration of the other souls (merit, sin, aversion, joy, sorrow), and that he alone possesses the qualities by which he is fitted to govern the universe, to wit, omnipotence and omniscience.

Next to the Vedānta, the Nyāya has produced the greatest number of text-books. Fitzedward Hall's *Index to the bibliography of the Indian philosophical systems* enumerates 202. The *Nyāya-sūtras* were edited with the commentary of Viçvanātha Bhaṭṭāchārya by Nimāi Chandraçiromani (Calcutta, 1828), and with that of Vātsyāyana by Jayanārāyaṇa Tarkapañchānana (*Bibliotheca Indica*, Calcutta, 1865). These *sūtras*, except the last and hardest (the fifth) book, were translated into English, with extracts from Viçvanātha's commentary, by J. R. Ballantyne (Allahabad, 1850–54). *The Kusumāñjali*, with commentary, was edited and translated by E. B. Cowell (*Bibl. Ind.*, Calcutta, 1864). Among the modern works that mingle Nyāya and Vāiçeshika doctrines are especially useful the *Bhāshāparicheda* of Viçvanātha, edited and translated by E. Röer (*Bibl. Ind.*, Calcutta, 1850), and the *Tarkasaṁgraha* of Annabhaṭṭa, edited, translated, and annotated by J. R. Ballantyne, under the title, *Lectures on the Nyāya Philosophy, embracing the text of the T. S.* (Allahabad, 1849; 2d. ed. 1852). Of the last three works various other editions exist.

Among European works on Nyāya-Vāiçeshika, most important are H. T. Colebrooke's treatise in the *Transactions of the Royal Asiastic Society*, i., 92–118, 1824, reprinted with valuable notes by Cowell in Colebrooke's *Miscellaneous Essays*, 2d. ed., i., 280–318 (London, 1873), and three articles by Max Müller, *Beiträge zur Kenntniss der indischen Philosophie*, in volumes vi. and vii. of the *Zeitschrift der deutschen morgenländischen Gesellschaft*.

RICHARD GARBE. Translated by C. R. LANMAN.

Nyblom, nü'blōm, KARL RUPERT, Ph. D.: poet and critic; b. in Sweden, in 1832; graduated at Upsala in 1857; was in 1860 appointed assistant professor in the university, and in 1867 Professor of Æsthetics, Literature, and Art History. In 1879 he was elected a member of the Swedish Academy, which institution had already in 1853 awarded him its prize for the poem *Arion*. Nyblom has been very productive both as æsthetic author and as poet. Among his æsthetic works may be mentioned *Konststudier i Paris* (Art Studies in Paris, 1864), and others collected under the title *Estetiska Studier* (Æsthetic Studies, 1873). As a poet he has published *Dikter* (Poems, 1860); *Bilder från Italien* (Pictures from Italy, by Carlino, 1864; 2d ed. 1883, entitled *Et tår i Södern*); *Nya Dikter* (New Poems, 1865); *Vers och Prosa* (by Carlino, 1870); *Valda Dikter* (Selected Poems, 1876). Besides these original productions he has translated Thomas Moore's *Irish Melodies* (Irländska Melodier, 1858); Shakspeare's *Sonnets*; *American Humorists* (Amerikanska Humorister, 1874). From 1865–68 he edited *Svensk Literaturtidskrift* (Magazine of Swedish Literature).—His wife, a native of Denmark, has shown considerable talent as a novelist. P. GROTH.

Nybom, nü'bōm, JOHAN: poet and publicist; b. in Sweden in 1815; studied at Upsala, but never completed a course. Since 1860 he has resided at Vesterås, at the beginning earning his living as a newspaper writer. His earlier poems are remarkable for their splendor of expression, warmth of feeling, and vivid imagination, but his later efforts have to a large extent fallen below the standard of his earlier work. Among his poems may be noted *Byron i Grekland* (Byron in Greece, 1838); *Sista Natten i Alhambra* (Last Night in the Alhambra); *Dannemora och Österby* (1847). His complete poems (*Samlade Dikter*) appeared 1844–48; 4th ed. 1880. P. GROTH.

Nyctalo'pia: See BLINDNESS.

Nye, EDGAR WILSON: humorist; b. at Shirley, Me., Aug. 25, 1850. He went to Wyoming when a young man, studied law, and was admitted to the bar. He afterward gained reputation as a humorous writer and lecturer under the pseudonym *Bill Nye*, and removed to New York. Among his works are *Bill Nye and the Boomerang* (1881); *The Forty Liars* (1883); *Baled Hay*; *Remarks* (1886). D. Feb. 22, 1896.

Nyerup, nü'e-rōōp, RASMUS: scholar; b. on the island of Fünen, Denmark, in 1759. After passing the philological and theological examinations he entered the Royal Library and began his literary activity, which continued until his death. His chief merit is the interest he aroused in Scandinavian folk literature and archæology. The Museum of Northern Antiquities in Copenhagen is a result of his earnest efforts. His religious and political views were far in advance of his time. D. June 28, 1829. He published *Bidrag til den danske Digtekunsts Historie* (with Rahbek, 6 vols., 1800); *Historisk-statistisk Skildring af Tilstanden i Danmark og Norge i ældre og nyere Tider* (4 vols., 1803–06); *Udvalgte danske Viser fra Middelalderen* (with Abrahamsôn and Rahbek, 5 vols., 1812–14); *Almindelig Morskabslæsning i Danmark og Norge igjennem Aarhundreder* (1816); *Dansknorsk Literaturlexikon* (with J. E. Kraft, 1818); *Peder Laales Ordsprog* (1828), etc. D. K. DODGE.

Nylander, nü'lăăn-der, WILLIAM: lichenologist; b. in Uleaborg, Finland, in 1823. He was Professor of Botany for many years in the University of Helsingfors, and was afterward a resident of Paris. Author of many books and papers on the structure and classification of the lichens, among them *Synopsis Methodica Lichenum* (1858–59); *Lichenes Scandinaviæ* (1861); *Synopsis Lichenum Novæ Caledoniæ* (1868); *Recognitio Monographica Ramalinarum* (1870); *Lichenes Novæ Zelandiæ* (1888); *Lichenes Insularum Guineensium* (1889). CHARLES E. BESSEY.

Nylghau: See NILGHAU.

Nymph: See ENTOMOLOGY.

Nymphs [from Lat. *nym'pha* = Gr. *νύμφη*, nymph]: maiden divinities, inferior in rank to the other gods. They were neither mortal nor immortal, but lived to a great age; they ate ambrosia, and associated with the gods even in Olympus. They enjoyed the sweets of love with Hermes and the Sileni, and from the union sprang high trees which in the end had to die, and with them died also the Nymphs. They were very numerous, inhabiting mountains and valleys (*Oreads*, *Napææ*), springs, rivers, fountains, lakes (*Næads*, *Oceanids*, *Krenææ*, *Limnads*), forests and trees (*Hamadryads*, *Dryads*), groves and grottoes (*Alseids*, etc.), seas (*Nereids*), etc. They were beneficent genii of their dwelling-places, where they hunted, danced, sang, wove, and aided mankind in manifold ways. Goats, lambs, fruit, and oil were offered to them, but no wine. In art they are represented as charming maidens. J. R. S. STERRETT.

Nymphs, Grotto of the: See CAPRI.

Nym'wegen, or **Nijmwegen** (Fr. *Nimègue*: Germ. *Nimwegen*): town of the Netherlands, province of Gelderland; on the Waal; 73 miles by rail E. of Rotterdam (see map of Holland and Belgium, ref. 6–H). It is important on account of its commanding position on the Rhine and Waal, and has extensive manufactures of beer, brandy, eau de cologne, tobacco, and cigars. Treaties of peace were concluded here between Holland and France (Aug. 11, 1678), between Holland and Spain (Sept. 17, 1678), and between France and Germany (Feb. 5, 1679). Pop. (1896) 38,576.

O

: the fifteenth letter of the English alphabet.

Form.—The form is derived through the Latin O from the early Greek and Phœnician **O**, the sixteenth letter of the Phœnician alphabet as adopted by the Greeks.

Name.—The Semitic name *ayin*, meaning "eye," had reference to the shape of the letter, and this name, on account of its meaning, gave the letter its place in the alphabetical series with *pē*, "mouth," *qoph*, "head," *resh*, "head" (side-view), *shin*, tooth, i. e. in a group of letters whose shapes suggested resemblances to the head or its parts. The sound denoted by the Semitic letter was a guttural breathing not existing in the Greek language. The Greeks therefore applied the sign to denote a vowel-sound, as they did also in the case of *aleph* (*a*), *hē* (*e*), and *yōd* (*i*). They used it at first for all the various sounds of *o*: the short, the open-long (later **ω**), and the close-long (later **ου**). The alphabet of Miletus developed early (not later than 800 B. C.) a differentiated form, **Ω**, which was applied to express the long (open) *o*. This symbol was adopted into use at Athens toward the end of the fifth century, and by the middle of the following century in all Greek alphabets. The early Greek (Attic) name for *o* was **οὖ** (cf. **εἶ**, the older name for epsilon, and **ὖ** that for upsilon); the later, post-classical name, *omicron*, **ὂ μικρόν** (little *o*), to distinguish from *omega*, **ὦ μέγα** (big *o*). In Latin the practice of calling the letter by its long sound was revived, and this name, *ō*, has been continued into English.

Sound.—The simple letter *o* is used in English to denote two principal groups of *o*-sounds: (1) The close *o*, vulgarly called "long *o*": (*a*) In stressed monosyllables, before a voiced consonant or finally, this *o* appears as long and is accompanied by a vanish-sound or glide like *u*, i. e. it is a diphthong; thus *node*, *rode*, *old*, *go*, *no*, *so*. The same sound is denoted variously also, e. g. by *ew* in *shew*, *sew*, by *eau* in *beau*, by *ou* in *dough*, *though*, by *ow* in *throw*, *crow*, by *oa* in *moan*. (*b*) In stressed monosyllables before a voiceless consonant the sound is half-long, as in *note*, *ghost*, *post*. (*c*) In words of more than one syllable the vanish-sound nearly or quite disappears, even under the accent, as in *notary*, *October*, *social*. (*d*) In unaccented open syllables the close *o* appears as a short slack ("wide") vowel, as in *obey*, *poetic*.

(2) The open *o*, vulgarly called "short *o*." In phonetics it is the low-back-round vowel. It appears in two forms: (*a*) Slack ("wide"), as in *not*, *pot*, *mob*, *fog*, *odd*, *box*. The vowel in *soft*, *often*, *frost*, *broth*, *strong*, etc., i. e. before *f*, *s*, þ, ŋ, is generally the same with slightly increased quantity. The same sound is denoted by *a* in *wasp*, *swan*, *wad*, *quality*, *yacht*, etc., by *ou* in *hough*, *ow* in *knowledge*. (*b*) Tense ("narrow"), in the position before *r*, as in *corn*, *lord*, *or*, *abhor*. The same sound is denoted by *a* in *all*, *water*, *law*, etc.; by *ou* in *cough*, *trough*. There is also a recent tendency in England to use the sound in *door*, *floor*, *four*, *oar*, *board*, *glory*, etc., where more generally the sound classified above as 1 (*a*) is used.

O stands also for the following *u*-sounds: (1) The high-back-narrow-round of *do*, *prove*, *shoe*, *two*, *who*, *lose*, etc. The same sound is denoted by *oo* in *spoon*, *too*, by *ou* in *youth*, *through*, by *u* in *rude*, *truth*, by *ew* in *Jew*, *crew*, by *ui* in *fruit*, *sluice*. (2) The high-back-wide-round of *wolf*, *woman*, *bosom*. This sound is denoted also by *oo* in *book*, *wood*, by *u* in *bull*, *full*, *push*, by *ou* in *should*, *could*. (3) The unrounded vowel of *son*, *ton*, *dove*, *love*, *month*, *oven*, *mother*, *does*. This sound is denoted also by *u* in *up*, *but*, by *ou* in *tough*, *rough*, *double*, *southern*, *cousin*, *touch*, by *oo* in *blood*, *flood*.

Source.—(1) Of the close *o* as in *no* the chief sources are: (*a*) O. Eng. *ā*: Germ. *ei*, *ē* < Teutonic *ai* < Indo-Europ. *ai*, *oi*; *home* < O. Eng. *hām*: Germ. *heim*: Goth. *haims*, cf. Gr. **κοιμάω**; *goat* < O. Eng. *gāt*: Germ. *geiss*, cf. Lat. *hœdus*; *-one* in *alone*, *only* < O. Eng. *ān*: Germ. *ein*: Goth. *ains*; cf. Gr. **οἴνη**, Lat. *ūnus*; *dough* < O. Eng. *dāg*: Germ. *teig*, cf. Gr. **τοῖχος**; *bone* < O. Eng. *bān*: Germ. *bein*; *oak* < O. Eng. *āc*: Germ. *eiche*; *lode* (*loadstone*) < O. Eng. *lād*, cf. Germ. *leiten*: Goth. *laidjan*; *dole* < O. Eng. *dāl* (*dǣl*): Germ. *theil*: Goth. *dails*; *toe* < O. Eng. *tā*: Germ. *zehe*; *mole* < O. Eng. *māl*: Goth. *mail*; *whole* < O. Eng. *hāl*: Germ. *heil*. (*b*) O. Eng. short *o*, which later suffered lengthening in open syllables and before *ld*, *mb*; as *hole* < *hol*; *stolen* < *stolen*; *knoll* < *cnoll*; *bolt* < *bolt*; *gold* < *gold*; *mould* < *molde*; *foal* < *fola*; *shoal* < *scolu*: *sworn* < *sworen*; *shorn* < *scoren*; *hoard* < *hord*; *board* < *bord*; *over* < *ofer*; *cove* < *cofa*; *clove* < *clofe*; *smoke* < *smocian*; *folk* < *folc*; *throat* < *þrotu*; *float* < *flotian*; *rose* < *rose*; *comb* < *comb*. (*c*) O. Eng. long *ō* preserved (i. e. not changed to *ū*, as in *nōn* > *noon*) before *w*; as *flow* < *flōwan*; *blow* < *blōwan*; *grow* < *grōwan*; *stow* < *stōwian*; *glow* < *glōwian*; *row* < *rōwan*; *low* < *hlōwan*. (*d*) O. Eng. *ea* (*a*) before *l* + *consonant* < Teutonic *a*; as *old* < O. Eng. *eald*: Germ. *alt*, cf. Lat. *alo*; *cold* < O. Eng. *ceald*: Germ. *kalt*: Goth. *kalds*; *hold* < O. Eng. *healdan*: Germ. *halten*: Goth. *haldan*; *bold* < O. Eng. *beald*: Germ. *bald*: Goth. *balþs*.

(2) Of the open *o* the chief sources are: (*a*) M. Eng. short open *o*. This was derived either from O. Eng. *o*, as in *moth* < *moððe*, *lost* < *gelosed*, *broth* < *broð*, *god* < *god*, *horn* < *horn*, *corn* < *corn*, or from O. Eng. *ŏ*, *ō* before nasal < Teutonic *a*, as in *long* < *long*: Germ. *lang*; *song* < *song*: Germ. *sang*; *soft* < *sōfte*: Germ. *sanft*; *brought* < *brōhte*: Goth. *brāhta* (**branhta*); *thought* < *ðōhte*: Goth. *þāhta* (**þanhta*). (*b*) M. Eng. *a* < O. Eng. *a* (*ea*) < Teuton. *a*, as in *salt* < *sealt*: Germ. *salz*, *warm* < *wearm*: Germ. *warm*. (*c*) M. Eng. *au* < O. Eng. *a* + guttural (or *w*) < Teuton. *a*; as in *draw* < *dragan*; *cause* < O. Fr. *cause*; *sauce* < O. Fr. *sauce*. (*d*) M. Eng. *o* < O. Fr. *o*; *cord* < O. Fr. *corde*; *order* < O. Fr. *ordre*.

(3) *O* in its value as *ū* (*oo*) is generally derived from O. Eng. *ō*. This may represent Teutonic *ō*, as in *stool* < O. Eng. *stōl*: Goth. *stōls*; *food* < O. Eng. *fōda*: Goth. *fōdeins*; *mood* < *mōd*: Goth. *mōþs*. Or it may represent Teutonic *an*, as in *goose* < O. Eng. *gōs*: Germ. *gans*; *tooth* < O. Eng. *tōð*: Germ. *zahn*. In certain words *o* (pronounced *ū*) may come from an O. Eng. *ā* preceded by *w*; as *who* < *hwā*, *two* < *twā*, *swoop* < *swāpan*, *swoon* < *swānian*.

(4) *O* in its value as *ŭ* is chiefly derived: (*a*) From M. Eng. *ō*, O. Eng. *ō*, which was shortened in closed syllables after having changed to *ū*; thus in *hoof* < *hōf*, *roof* < *hrōf*, *book* < *bōc*, *good* < *gōd*. Before nasals this O. Eng. *ō* may represent Teutonic *ān*, as in *soon* < *sōna*: O. H. Germ. *sān*; *spoon* < *spōn*: O. H. Germ. *spān*. (*b*) From M. Eng. *u*, after *w* or before *l*, as in *wolf* < M. Eng. *wulf*, O. Eng. *wulf*: Goth. *wulfs*; *wool* < *wulle*; *pull* < *pullian*.

(5) *O* in its value as unrounded *ŭ* is chiefly derived: (*a*) From O. Eng. *u*, as in *son* < O. Eng. *sunne*, *love* < O. Eng. *lufian*; *tongue* < *tunge*; *won* < *gewunnen*; *some* < *sum*. (*b*) From O. Eng. *o* < Teutonic *o*, as in *honey* < O. Eng. *honeg*: Germ. *honig*; *oven* < O. Eng. *ofen*: Germ. *ofen*. (*c*) From O. Eng. *ō*, as in *mother* < *mōder*, *brother* < *brōðor*, *glove* < *glōf*, *flood* < *flōd*, *blood* < *blōd*, *done* < *gedōn*.

Symbolism.—O = oxygen (in chemistry); Ohio; Old, as in O. T., Old Testament, O. Eng., Old English; Ō = 11 (in mediæval Roman notation); O. F. = Odd Fellows; O K = all correct; O. S. = Old Style (calendar previous to 1752).

BENJ. IDE WHEELER.

Oa'hu: one of the Hawaiian islands. (See HAWAII-NEI.) The second in area and the most populous. Honolulu, the capital, is on this island. Pop. (1900) 58,504.

Oak [O. Eng. *ōc*: O. H. Germ. *eih* > Mod. Germ. *eiche*; this name for the tree (*aik-*) is apparently restricted to the Teutonic, and probably replaced an Indo-Europ. name, of which Lat. *quercus*, and Germ. *föhre* are representatives]: any one of a genus (*Quercus*) of trees of the family *Cupuliferæ*, related closely to the chestnuts and beeches, and somewhat distantly to the hazels, hornbeams, alders, and birches, with which they agree in their amentaceous staminate flowers, small perianth, three-celled ovary, and exalbuminous seeds, but from which they are separated by the production of the familiar "acorn" fruit. (Figs. 1, 2, 3.) The ovary contains two ovules in each cell; but after fertilization one of these

grows rapidly at the expense of the rest, so that at maturity there is but one cell, and this usually contains but one seed. The little root of the embryo is directed to the point of the

FIG. 1.—The oak of Europe (*Q. robur*), with flowers and fruit.

acorn. The cup of the acorn is an involucre, which grows up around the fruit after fertilization.

There are about 300 species of oaks, nearly all of which grow naturally in the north temperate zone. They are most abundant in North America, Europe, and Asia. They are absent from Australia, Africa (except the extreme northern portion), South America (except Colombia), and Madagascar. In the U. S. there are about forty-five species, besides half a dozen or more pretty well marked varieties.

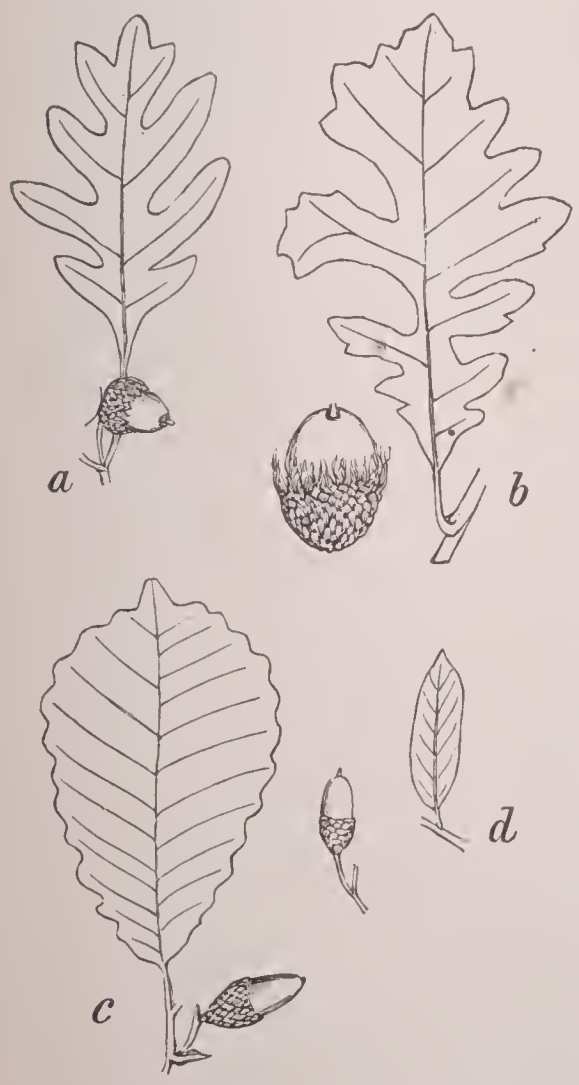

FIG. 2.—*a*, white-oak; *b*, bur-oak; *c*, chestnut-oak; *d*, live-oak (one-fourth natural size).

The white oak (*Q. alba*, Fig. 2, *a*) is one of the most valuable trees of the Eastern U. S. Its tough, hard wood is used in the manufacture of wagons, the frames of railway-cars, heavy machinery, and implements in which great strength is required. It is also much used in making fine furniture, and for the inside woodwork of houses. Bur-oak (*Q. macrocarpa*, Fig. 2, *b*) is notable for its large acorns and fringed cups. It occurs E. of the Rocky Mountains. The chestnut-oak (*Q. prinus*, Fig. 2, *c*) occurs in the northeastern parts of the U. S. Live-oak (*Q. virginiana*, Fig. 2, *d*) occurs from Virginia to Texas and Mexico near the coast. It is evergreen, and attains a height of from 15 to 18 meters (50 to 60 feet). Its wood is very heavy, hard, and tough, and in the days of wooden ships was held in high repute for ship-building. The California live-oak (*Q. agrifolia*, Fig. 3, *a*) is a large spreading,

FIG. 3.—*a*, California live-oak; *b*, red oak; *c*, laurel oak; *d*, cork-oak (one-fourth natural size).

evergreen tree of the coast region of California. The red oak (*Q. rubra*, Fig. 3, *b*) is a fine tree ranging from the great plains eastward. Laurel oak (*Q. imbricaria*, Fig. 3, *c*) is a close-topped tree with pretty foliage. Its range is nearly the same as that of the red oak. The cork-oak (*Q. suber*, Fig. 3, *d*) of the Mediterranean region is of great importance for the commercial cork which it produces.

The oak of England—"British oak"—is *Q. robur* (Fig. 1), a fine tree with foliage resembling that of the white oak. It grows also throughout Europe and Western Asia.

Many oaks attain a great age. Trees from 400 to 500 years old are of common occurrence in the great forests of the U. S. In Europe some trees are supposed to be more than 1,000 years old. CHARLES E. BESSEY.

Oak-apple and **Oak-galls**: See GALL INSECTS and GALLS.

Oak Harbor: village; Ottawa co., O. (for location, see map of Ohio, ref. 2–E); on the Portage river, and the Lake Shore and Mich. S. and the Wheeling and Lake Erie railways; 23 miles E. of Toledo. It is principally engaged in lumber manufacturing, and has a State bank with capital of $25,000, and two weekly newspapers. Pop. (1880) 987; (1890) 1,681; (1900) 1,631.

Oakland: city; capital of Alameda co., Cal. (for location, see map of California, ref. 7–B); on San Francisco Bay, and the Southern Pacific Railroad; opposite and 7 miles E. of San Francisco. An estuary of the bay separates the city from Alameda, and steam-ferries connect the cities of Oakland and San Francisco. Its location on the bay and at the western terminus of the railway system gives the city a large commercial importance. It is in an agricultural and fruit-raising region; is lighted by gas and electricity; has electric street-railways, paid fire department, and efficient police, water, and sewerage services; and contains many costly residences of San Francisco business men. The census of 1890 showed that 103 manufacturing establishments (representing 44 industries) reported. These had a combined capital of $4,015,014, employed 2,944 persons, paid $1,794,317 for wages and $3,246,222 for materials, and had products valued at $5,672,888. The manufactories include flour

and planing mills, marble and iron works, tanneries, smelting and refining works, fruit-preserving works, potteries, a cotton-mill, a large jute-factory, and carriage, windmill, and other factories. In 1890–91 there were 10,183 children enrolled in public schools, and 2,132 in private and parochial schools; 15 public-school buildings, and public-school property valued at $1,002,970. There were 2 colleges, the Pacific Theological Seminary (Congregational), 7 private academies and secondary schools, a private normal and training school, a business college, and 8 libraries of all kinds, containing over 34,000 volumes. In 1894 there were 4 state banks, 2 national banks, a savings-bank, and 4 daily, 10 weekly, and 7 monthly periodicals. Pop. (1880) 34,555; (1890) 48,682; (1900) 66,960. EDITOR OF "ENQUIRER."

Oak-lungs: See LUNGWORT.

Oan'nes: the man-fish god of the Babylonians, resembling Dagon of the Philistines. He is said to have issued from the Persian Gulf, and to have founded the civilization of Lower Chaldæa. As represented by art, a man's head was under that of the fish, and a woman's feet were joined to its tail.

Oases, ō-a'sēez [sing. oasis = Lat. = Gr. *ὄασις*. Cf. Coptic *ouahe*, dwelling-place, oasis, deriv. of *ouih*, dwell]: fertile areas in deserts. Like many geographical terms, oasis originally had only a local application, being the name of certain parts of the SAHARA (*q. v.*). The cause of barrenness of deserts generally being their dryness (see DESERTS), any local supply of moisture may induce fertility amid arid surroundings. Oases are therefore usually found in depressed districts, where a more or less subterranean supply of water is gathered from the occasional rainfall on the surrounding more elevated regions. The Saharan oases, El-Kharga, El-Siwah, etc., are of this kind. Wells are frequently dug in order to increase the supply of water for irrigation; and by using better methods than those of the Arabs the French have improved the condition of various Algerian oases. In Persia and Central Asia many settlements or oases on the margins of the interior deserts are located at points where streams escape from deep valleys in the inclosing barren mountains; here the water may frequently be led over the plain before disappearing in the central arid area, as at Kashgar, Yarkand, and Khotan. In other cases the oasis is near the termination of the stream, where its dwindling waters are easily led about in irrigating canals, as at Merv. Many settlements in the western arid region of the U. S. and in the drier parts of South America are similarly located. Although the term oasis is often used in a figurative or poetical sense to indicate a place of great attractions, the actual oases of deserts can not be so described. Their water-supply is often scanty and impure; they are generally excessively dusty; their products are narrowly limited in variety, and often fall short in quantity. W. M. DAVIS.

Oat, or **Oats** [O. Eng. *ātan*, a name not found outside English, and of doubtful etymology; it displaces a Teutonic word represented by Germ. *hafer* or *haber* < O. H. Germ. *habaro*: Dutch *haver*; cf. *haversack*]: the common name for the seeds and plants of the numerous species of a genus of grasses, *Avena*, generally characterized by having the spikelets in loose panicles, the glumes as long as the florets, the paleæ firm and almost cartilaginous, and the outer one of each floret provided with an awn, which is twisted at the base, but this generally disappears in cultivation. The cultivated oat (*Avena sativa*) is an annual, though the genus contains several perennial species. It is supposed to have developed from *Avena fatua* found growing wild in Europe, where it is considered a weed. It is also wild in California, where it is sometimes cut when green and cured for hay. The oat is decidedly a northern plant and thrives best in a cool, moist soil, reaching the highest state of development in the higher latitudes, and rapidly degenerating when grown in a hot country. Some varieties when threshed part with the hull, and are called hull-less oats; *Avena nuda* is one of these varieties. There is a great difference in the varieties regarding the awn; in some it is entirely wanting, while in others it is long and bent; and as it is hygroscopic, considerable motion is produced when it is changed from a dry to a moist atmosphere. *Avena sterilis* is one of the so-called animated oats.

Oats are produced as one of the chief cereals in nearly all countries where they can be grown; they furnish the most common grain food for horses, and are much used also as food for men. There are more than 150 varieties in the U. S.; in 1900 the acreage was 27,364,795, the product was 809,125,989 bush., and value $208,669,233. The most productive States were: Illinois, 133,642,884 bush.; Iowa, 130,572,138; Wisconsin, 61,971,552; Indiana, 44,866,035; New York, 44,538,974; Kansas, 43,063,943; Pennsylvania, 38,000,872. The oats grown in the Southern States are inferior, and are mostly of the red or dun varieties. In most of the States the legal bushel is 32 lb. Most varieties are cultivated for the grain, although a few are useful for fodder. The oat is a rapid grower, and requires an abundance of available plant-food for perfect development.

The following analyses are the average of many analyses made at experiment stations in the U. S. They are both given in per cent.:

FERTILIZER ANALYSIS.

SUBSTANCE.	Nitrogen.	Phosphoric acid.	Potash.
Grain	1·60	0·77	0·55
Straw	0·65	0·22	1·22

FODDER ANALYSIS.

SUBSTANCE.	Water.	Ash.	Protein.	Crude fiber.	N.-free extract.	Fat.
Grain	11·0	3·0	11·8	9·5	59·7	5·0
Straw	9·2	5·1	4·0	37·0	42·4	2·3

The oat has comparatively few insect enemies, but is subject to about the same fungus diseases as wheat, rust being quite prevalent, particularly if the weather is hot and moist. It is also subject to loose smut in a way similar to wheat, the smut, however, being more destructive to oats than to wheat. Early varieties and early-sowed grain are the least likely to be attacked by fungus diseases. G. C. WATSON.

Oates, TITUS, *alias* AMBROSE: a notorious informer; b. in London, England, about 1620; educated at Merchant Taylors' School and at Cambridge; took orders in the Church of England; officiated in several parishes; became a chaplain in the navy; was dismissed from that post on a charge of disgraceful conduct; professed conversion to Roman Catholicism; became a Jesuit; resided some months in the colleges at Valladolid and St.-Omer; was expelled from both institutions for alleged misconduct; returned to England in 1678, and gave information to the authorities of the existence of a "Popish plot" for the extirpation of Protestantism in England, accusing several of the Roman Catholic nobility and gentry of participation in the pretended conspiracy. The admitted zeal for Roman Catholicism displayed by James, Duke of York, the suspected inclination of King Charles II. to the same faith, and the unexpected corroboration of a part of Oates's testimony by the discovery of some incriminating papers in the possession of one of the accused gave color to the charges, and the murder of Sir Edmondbury Godfrey, the magistrate before whom the testimony was taken, produced conviction in the popular mind. Oates thereupon developed his original testimony into a circumstantial account of the intended burning of London and the shipping in the Thames, a massacre of Protestants, and a landing of a French army in Ireland, adding that the pope had intrusted the government of England to the Jesuits, that the chief officers of state had already been parceled out among the great Roman Catholic lords, that the king was to be assassinated, and that the queen was privy to the plot. The king was incredulous from the first, and refused to countenance the attacks upon his wife; but among the people the excitement was intense, many believing that the Roman Catholics intended to repeat in England the massacre of St. Bartholomew. The houses of Roman Catholics were searched, and extraordinary precautions taken against the supposed danger. Oates was lodged in Whitehall, received a large pension, and had guards assigned him. The accused Roman Catholics were put on trial Nov., 1678; several were convicted and executed; and fresh victims were added from time to time for two years. After the execution of Lord Stafford, Dec., 1680, there was a revulsion of public sentiment; the bad character of Oates was exposed; the Duke of York obtained a verdict of £100,000 against him for defamation (1685), and he was imprisoned as a debtor. On the accession of James II. severer measures were taken; Oates was convicted of perjury, sentenced to stand in the pillory five times a year in as many different towns during his life, to be whipped from Aldgate to Newgate, and thence to Tyburn, and to be imprisoned for life. Public sentiment being now fiercely against him, he was mobbed and nearly killed at the first

pillory, and received 1,700 lashes at the whipping. After the accession of William and Mary, Parliament declared the conviction of Oates illegal. He was pardoned, received a pension of £300 per annum, and survived in obscurity seventeen years longer, dying in London, July 23, 1705. Oates's career is described at some length in Macaulay's *History of England*. See also the accounts in Lingard's and Burnet's works. Revised by F. M. Colby.

Oath [M. Eng. *othe* < O. Eng. *āð* : Germ. *eid* : Icel. *eiðr* : Goth. *aiþs* < Teuton. *aiþa-z* : O. Ir. *oeth*, oath ; akin to Gr. *ὅρκος*, defined as *ὅρκος* by Hesychius ; cf. *ἕρκος*, firm] : in law, a solemn asseveration or promise under sanction of the maker's religion, in the presence of one legally authorized to administer it. If administered without authority, it has no legal effect as an oath (see Perjury), although the transaction may subject the parties to punishment under statutes against unlawful oaths. (Stephen's *Digest of the Criminal Law*, §§ 83–85.) In certain contingencies a person has authority to administer an oath to himself. (*Wilson* vs. *De Coula*, 22 Chancery Division 841.) The object of an oath is so to affect the conscience of the maker as to guaranty his future conduct or present veracity. The means employed in most legal systems is an invocation to a superior power to attest the maker's good faith or veracity, or an imprecation of divine vengeance upon him for false swearing, or both. Primitive oaths contain often no express appeal to a deity. For example, two men grasp an animal, which is chopped in two, as emblematic of what will befall the one who is false to his vow ; or the swearer calls on a fierce beast to punish him if he lies. In other cases, however, the primitive oath-taker calls upon a river, like the Ganges, or upon the sun, or other great natural object which he worships, to destroy him if he swears falsely.

The most important legal oaths in modern times are those required of officials and those required of witnesses. Official oaths are usually promissory, as the following examples will show. The British sovereign upon coronation solemnly promises and swears to govern the people of Great Britain and dominions thereto belonging according to the statutes in Parliament agreed on and the laws and customs of the same; to cause law and justice in mercy to be executed in all his judgments; to maintain the laws of God and the Protestant reformed religion established by law; and to secure unto the bishops and clergy of the nation all such rights and privileges as by law shall appertain unto them. The oath required of the President of the U. S. is that he will faithfully execute the office, and will, to the best of his ability, preserve, protect, and defend the Constitution of the U. S. (Art. 2, § 1, cl. 8.) An English judge takes an oath to "do right to all manner of people, after the laws and usages of this realm, without fear or favor, affection or ill-will"; and similar promises are made by judges in the U. S. upon taking office. A juror's oath is promissory, binding him to try the issue joined in the particular case, and give a true verdict according to the evidence. At times test oaths are required of officers. Of this kind was the oath prescribed by § 1756 of the U. S. Revised Statutes (repealed by ch. 46, Laws of 1884), often called the iron-clad oath, to the effect that the affiant had never voluntarily borne arms against the U. S. since he had been a citizen thereof, nor voluntarily given aid, countenance, counsel, or encouragement to persons engaged in armed hostility thereto. Such official oaths are declaratory. The ordinary witness oath is promissory in form, the witness swearing that the evidence he shall give shall be the truth, the whole truth, and nothing but the truth. An affidavit is in the form of a declaratory oath.

In the absence of express statutory directions the oath is administered in that form which the one taking it considers most binding on his conscience. According to the ordinary common-law form, the affiant holds the New Testament in his bare right hand, assents to the promise to tell the truth addressed to him by the proper officer, and kisses the book. Jews are sworn on the Pentateuch, the closing language of the oath being, "So help you Jehovah"; Mohammedans on the Koran, and Parsees on their sacred books. A part of the ceremony of swearing a Hindu consists in his touching the foot of a Brahmin, or, if a Brahmin is sworn, in his touching another Brahmin's hand. In some parts of India the native takes his oath on water from the Ganges. Chinese oath-takers break a saucer or behead a fowl as an essential part of the ceremony, thereby imprecating punishment upon them for false swearing.

As the religious sanction is an essential element of the oath, it can not properly be taken by an atheist. Under the U. S. Constitution and the constitutions of several States any religious test as a qualification to any office or public trust is forbidden, and officers are allowed to substitute an affirmation for an oath. (See U. S. Constitution, Art. 6, cl. 3, and U. S. R. S., § 1.) In nearly one-half of the U. S. atheists are no longer incompetent as witnesses, but are permitted to give their evidence under the sanction of a solemn affirmation. (Stimson's *American Statute Law*, §§ 45, 46, 47.) Persons having conscientious scruples against taking an oath are generally allowed to affirm. The Oaths Act of 1889 (51 and 52 Vict., c. 46) permits every person who objects to be sworn, either because he has no religious belief or because the taking of an oath is contrary to his religious belief, "to make a solemn affirmation instead of taking the oath, in all places and for all purposes." This legislation was induced largely by the punishment inflicted upon Charles Bradlaugh for sitting and voting in Parliament, in July, 1880, without taking an oath. *Clarke* vs. *Bradlaugh*, 7 Queen's Bench Division 38.

The employment of oaths, even in legal proceedings, has been criticised as irreligious, and also as useless. Pothier declared : "In the exercise of my profession for more than forty years . . . I have not more than twice known a party restrained by the sanctity of the oath from persisting in what he had before asserted." (1 Pothier, *On Evidence*, § 831.) It has been said in reply : "Even the good might be too negligent and the bad would frequently have no concern at all about their words if it were not for the solemnity of this religious act." The tendency of modern legislation is to substitute declarations for unnecessary oaths (see Promissory Oaths Act, 31 and 32 Vict., c. 72), and to treat a solemn affirmation as affording a guaranty of the good faith and veracity of the maker equally trustworthy with that furnished by the oath.

Reference to Oath.—This in Scotch law is the last resource of a party who despairs of any other evidence. It is allowable in civil actions only, and by it the party who refers places the cause on the sole issue of his antagonist's oath. Whatever the antagonist swears to is indisputably true for that cause, though in another proceeding, as a prosecution for perjury, it may be proved to be false. Bell's *Principles of the Law of Scotland*, §§ 2263 to 2269 ; E. B. Tylor's *Ordeals and Oaths*, 34 *Macmillan's Mag.* 1 ; J. E. Tylor *On Oaths* (London, 1835) ; Junkin *On the Oath* (New York, 1845) ; Ford *On Oaths* (London, 1890). F. M. Burdick.

Oaxaca, or **Oajaca**, ō-ăă-haa'kăă : a state of Mexico ; bounded S. by the Pacific and bordering on Guerrero, Puebla, Vera Cruz, and Chiapas; the eastern portion is included in the Isthmus of Tehuantepec. Area, 28,778 sq. miles. With the exception of a narrow coast belt it is mountainous throughout, the principal range being the Sierra Madre del Sur, which crosses it from E. to W., with peaks nearly 12,000 feet in height. Many of the intervening valleys are below 3,000 feet. The soil nearly everywhere is fertile and well watered ; the climate, except in the coast belt, is delightful and very salubrious. Almost the only prominent industry is agriculture ; the principal crops are maize (for home consumption) on the highlands, and sugar, cotton, and indigo in the warm valleys ; coffee-planting has also risen in importance. The cochineal insect is indigenous, but comparatively small quantities are now exported. The mountain forests have abundance of valuable timber. The mineral deposits are said to be extensive and very rich ; but few mining improvements have been introduced, and the present annual yield of gold and silver does not exceed $2,000,000. The state has many interesting antiquities. (See Mexican Antiquities.) Pop. (1893) estimated, 815,460, of whom seven-eighths are civilized Indians, principally Zapotecs and Mixtecs. Herbert H. Smith.

Oaxaca : capital and principal city of the Mexican state of the same name ; situated near the center of the state, in a beautiful valley at the foot of the Sierra Madre del Sur, 3,900 feet above the sea (see map of Mexico, ref. 8–H). The valley was granted in fief to Hernando Cortés (whence his title of Marqués del Valle), and the town was officially founded in 1532. Owing to its isolation it has had little share in the progress of modern Mexico. It is the seat of a bishopric and has a theological seminary, a good public library, cathedral, etc. Pop. (1895) 32,641. H. H. S.

Ob, or **Obi**, o'bĕĕ : a river of Western Siberia. It rises in the Altai Mountains within the Chinese dominions, and

flows in a northern and northwestern direction, with a tortuous course of 2,600 miles, into the Gulf of Obi, an inlet of the Arctic Ocean on the shore of Siberia. It receives many affluents, of which the principal is the Irtish (1,500 miles long), coming in from the left, 200 miles below Tobolsk. It is navigable from Tomsk to its mouth, and forms the commercial highway between China and European Russia. From May 15 to Sept. 15 steamers and lighters ply between Tomsk and Tiumen on the Tobol, near the frontier of Russia.

Revised by M. W. HARRINGTON.

Obadi'ah [from Heb. *'Obadeyāh*, liter., worshiper of Jehovah]: one of the minor Hebrew prophets, of whom nothing is known, except what can be inferred from his book, the briefest book of the Old Testament. This is a monograph on the Day of Jehovah, and especially on the relations of Edom to that day. Punishment has just been inflicted on Edom (verses 1–6) for an offense committed against Jacob (7–14), and the impending day of Jehovah will complete the overthrow of Edom and the triumph of Jacob (15–21). The book has strong affiliations with Joel and with Jer. xlix. 7–22. Different scholars assign it to all places among the prophets, from the earliest to the latest; but the way in which it mentions Judah, Joseph, Ephraim, Samaria, seems to indicate a date before the overthrow of the northern kingdom. Its position among the books of the minor prophets indicates that it belongs to the earlier group of them, and it fits well the historical situation in the reign of Amaziah, King of Judah, 2 Kings xiv. 7–8, 10; 2 Chron. xxv. 11–12, 19. According to this view the similar sentences in Jer. xlix. are quoted from Obadiah.

W. J. BEECHER.

Oban'do, JOSÉ MARIA: general and politician; b. in New Granada about 1797. Nothing is known of his birthplace and parentage; it is said that he was stolen when a child and was adopted by a family of Popayan, whose name he took. In 1822 he joined the republican army, and later he became prominent as a leader of the liberals in the disturbances which ended in the dissolution of the first republic of Colombia. The republic of New Granada having been formed, Obando was vice-president and acting president in the provisional government Nov. 23, 1831, to Mar. 10, 1832. Under Santander he was Secretary of War 1832–37, and in the latter year he was an unsuccessful candidate for the presidency. Marquez was elected and Obando led a revolt against him which lasted until 1841, but he was eventually defeated and banished for several years. Subsequently he was prominent in congress, was president of Cartagena 1850, and was elected president of New Granada for the term beginning in 1853. In 1854, owing to a conflict with congress, he assumed dictatorial powers, and was deposed. In the civil war of 1860 he supported the federalists, commanding a force in Cauca, where he was killed at the battle of Cruz Verde, June 29, 1861. H. H. SMITH.

Obeid', El: the capital of Kordofan, in the Sudan, Africa. It derives its importance primarily from the fact that it lies in a depression of a vast semi-arid plain and its wells never lack water (see map of Africa, ref. 4–F). When the Mahdist revolt occurred (1882), the town had about 100,000 inhabitants. It was a great supply center for Darfur and other parts of the Sudan, and sent large quantities of ostrich feathers and Kordofan gum to the Nile. The houses were mud huts with the exception of the Egyptian Government buildings, which were of sun-dried brick. Insurrections, epidemics, and the ruin of commerce in the Mahdist domain greatly injured the town. C. C. ADAMS.

Ob'elisk [from Lat. *obelis'cus* = Gr. *ὀβελίσκος*, dimin. of *ὀβελός*, spit, pointed pillar]: the name given by the Greeks to the quadrilateral, tapering monolithic monuments erected by the Egyptians in front of their temple pylons as votive offerings to the gods and as memorials of the victorious might conferred by the deities upon the Pharaohs. They are usually composed of Syenite granite, and were cut from the rock with great skill. There is now near Syene, in Upper Egypt, a partially finished obelisk which measures 10½ feet square at the base and 92 feet in length, 72 feet of it being completed. These great masses were finished on three sides before being finally detached from the bedrock by the use of drills and wet wedges. They were made slightly convex, to obviate the concave effect produced by sides that were exactly flat. The usual method of inscription was with a single column of hieroglyphs down the center of each side; three lines to the side ordinarily indicate a later usurpation. They were placed in pairs, for architectural effect, before the great pylons of the temples, and were devoted to the glorification of the Pharaoh in bombastic and landatory phrase. With the exception of a small obelisk found in the necropolis of Memphis by Lepsius, the oldest one known is that now standing at Heliopolis (the city whose hieroglyphic name was written with the sign of the obelisk), erected by Usertasen I., the second king of the twelfth dynasty. Its companion fell in the twelfth century. It is of Syenite granite, 66 feet high, but is now partially buried at the base and has its deeply cut hieroglyphs obliterated on two sides by bees' nests. Till a comparatively recent date its top was covered by a metal sheathing. Cleopatra's Needles was the name given to a pair of obelisks removed from Heliopolis to Alexandria in Roman times, one of which is now on the Thames Embankment in London, and the other in Central Park, New York, the latter having been presented by the Khedive Isma'îl. They were originally erected by Thothmes III. It was one of the great feats of Queen HATASU (*q. v.*) to have completed and erected one of the largest obelisks, 109 feet high, in the short space of seven months. (See Edwards's *Fellahs, Pharaohs, and Explorers*, p. 268 ff.) At Luxor one obelisk is still *in situ* at the E. of the temple pylon; the western and smaller one now stands in the Place de la Concorde at Paris, being 75 feet high, and weighing 212 tons. This pair was erected by the great Ramses. At Karnak, at about the center of the temple as it now exists, stood two obelisks which indicated the entrance to the temple at the time of Thothmes I. Both were erect in 1738, when Pococke visited the place, but one has since been destroyed. The other stands 76 feet high. At Philæ in the portion of the Temple of Isis built by Nectanebo, were two sandstone obelisks, the western one being still *in situ*, while its mate is in England. These monoliths had on their bases Greek inscriptions which gave assistance in the original decipherment of the hieroglyphic character. Two others in granite in the same temple have been destroyed. Moldenke gives a list of 50 obelisks, erect and prostrate or in fragments, 20 of which are in Egypt, 2 in Constantinople, 12 in Rome, 7 in other parts of Italy, 2 in France, 5 in England, 2 in Germany, and 1 in New York. The list, however, includes copies and uninscribed stones. See *Cleopatra's Needle* (in By-paths of Bible Knowledge Series); Gorringe, *Egyptian Obelisks* (1882); Moldenke, *The New York Obelisk* (1891); Maspero, *Egyptian Archæology* (1887); Ebers, *Cicerone durch das alte und neue Aegypten* (1886), etc. CHARLES R. GILLETT.

Ober, FREDERIC ALBION: See the Appendix.

Ober-Ammergau, o'ber-aa'mer-gow: a village of Bavaria, with a population of 1,200; beautifully situated on the Ammer, 46 miles S. W. of Munich; celebrated for the performance of a mystery representing the passion and death of Christ, which takes place here every ten years (see map of German Empire, ref. 7–F). The custom originated in 1634, when the population made a vow to this effect if the village escaped from further invasion of the plague, which prevailed in the vicinity and had begun to ravage their community. The performance requires nearly 600 actors, many of whom are children, chosen among the inhabitants themselves, lasts from 8 A. M. to 5 P. M., with an intermission of an hour and a half, is repeated on Sunday, Monday, and Friday generally, from May to September, and attracts very large audiences, as it is the only place in which mysteries are still performed in true mediæval style. See W. T. Stead's *The Passion Play in 1890* (London, 1890), which gives the text of the play in German and English.

Revised by S. M. JACKSON.

Oberge, EILHARD, von: mediæval German poet who appears in documents from the years 1189–1207 as a vassal of Henry the Lion. With the latter he probably visited England, where he may have learned about the legend of Tristan and Isolde, which he for the first time introduced into German literature by his epic poem *Tristant und Isolde*. Of this poem only a few fragments are extant, from which, however, we may gather that Oberge's account of the legend in many respects differed from the later version of Gottfried von Strassburg. See Franz Lichtenstein, *Eilhard von Oberge* (1878); W. Golther, *Tristan und Isolde* (1887).

JULIUS GOEBEL.

Oberhausen, o-berhow'zen: town; in the Rhine province, Prussia; 5 miles from the east bank of the river Rhine and 20 miles N. of Düsseldorf (see map of German Empire, ref. 4–C). It is a busy railway center; has zinc-smelting works, manufactures of wire rope, glass, porcelain, etc. Extensive

coal-pits are in the vicinity. It is of modern origin, its first houses being built in 1845, and received its municipal charter in 1875. Pop. (1890) 25,249.

Oberlin: village; Lorain co., O. (for location, see map of Ohio, ref. 2–G); on the Lake Shore and Mich. Southern Railway; 35 miles S. S. W. of Cleveland, 105 miles N. N. E. of Columbus. It is the seat of OBERLIN COLLEGE (*q. v.*), and contains a manual-training school, a business college, a school of telegraphy, a national bank, a State bank, and a bi-monthly, a quarterly, and three weekly periodicals. Pop. (1880) 3,242; (1890) 4,376; (1900) 4,082. EDITOR OF "NEWS."

Oberlin, JOHANN FRIEDRICH: philanthropist; b. at Strassburg, Aug. 31, 1740; early showed a remarkable degree of benevolence; was educated at the Strassburg University; was ordained to the Lutheran ministry; became in 1767 pastor of Steinthal or the Ban de la Roche, a wild district in the Vosges Mountains. Here, under his wisely directed care, deep ignorance was succeeded by general intelligence; moral darkness gave place to piety and a remarkable improvement in the industry and thrift of the district, which retained its prosperity, and in 1890 had 6,000 inhabitants. The Ban de la Roehe was visited by many philanthropists, to whom Oberlin's work served as a model. D. at Waldbach, June 1, 1826. See Butler's *Life of Johann Friedrich Oberlin* (London, 1882); and the *Writings* edited by Burkhardt (4 vols., Stuttgart, 1843).

Oberlin College: an institution of learning at Oberlin, O.; founded in 1833 by Rev. John J. Shipherd and Philo P. Stewart. It was chartered Feb. 28, 1834, as Oberlin Collegiate Institute, and retained that name until 1850. The plan was to establish a Christian school for the liberal education of both sexes, encouraging students to assist themselves by manual labor. By 1835 there were theological, college, ladies', and preparatory departments; there was added in 1867 a conservatory of music. The theological seminary has an intimate relation to the Congregational churches of the U. S., but is not authoritatively controlled by them. Its graduates receive the degree of D. B. The seminary building contains accommodations for 100 students, besides the chapel and lecture-rooms. In the college proper there are three courses, the classical, the philosophical, and the scientific, leading respectively to the degrees of A. B., Ph. B., and S. B. The three courses are on an equality as to requirements for admission and graduation. After the freshman year two-thirds of the work is elective. The preparatory school is called the academy. It offers four-year courses leading to the different college courses. The general faculty consists of the president, and 68 professors, permanent instructors, lecturers, and tutors. Of these, 6 professors and 17 instructors are in the conservatory of music. The productive endowment is $912,803. The tuition is $75 per year. The libraries contain 40,000 volumes. The men's gymnasium, the women's gymnasium, and an athletic field furnish opportunities for physical culture. The chemical, botanical, and zoölogical laboratories have separate buildings. There is a valuable museum and herbarium. Asa Mahan was president from 1835 to 1850, Charles G. Finney (1851–1866); James H. Fairchild (1866–1890); William G. Ballantine (1891–96); John H. Barrows, D. D. (1899–). The board of trustees consists of twenty-four members, four of whom are elected annually. The alumni elect one-fourth of the board. Negro students have never been refused admission, and they have constituted from 3 to 5 per cent. of the whole. The total attendance of students, averaging from 1,300 to 1,500 a year, is about equally divided between the two sexes, and about half of all come from outside the State of Ohio. ALBERT A. WRIGHT.

O'bersteiner, HEINRICH, M. D.: alienist; b. in Vienna, Austria, Nov. 13, 1847; studied medicine in the university of that city, graduating in 1870; was appointed director of the insane asylum of Ober-Döbling in 1872, and Extraordinary Professor of Psychiatry at the Vienna University in 1880. His most important work is *Anleitung beim Studium des Baues der nervösen Central-Organe im gesunden und kranken Zustande* (Vienna, 1888). S. T. A.

Obes'ity [from Lat. *obe'sitas*, deriv. of *obe'sus*, fat, plump; liter., having eaten one's fill; *ob* + *e'dere*, eat]: an abnormal deposit of adipose tissue under the integument and around the viscera. The amount of adipose tissue in the organism may be considerably augmented without giving rise to any inconvenience on the part of the individual in the way of encumbering his movements or interfering with the functions of the viscera, etc.; but such a condition would not come within the scope of this article. It is still a condition of health, and the term *obesity* should be applied only to those cases where the deposit of fat is so great as to incommode the patient. Among the predisposing conditions to obesity may be mentioned, first, *hereditary susceptibility*. It is common to meet certain families in which most of the members are corpulent, and sometimes the tendency to become so may be traced through several successive generations. Inactivity and sedentary occupations exert a very material influence over the production of fat, especially when combined with a rich diet. In women the predisposition to corpulence exists in the first years of child-bearing, and again after the "change of life"; in men, between the ages of forty and sixty. The exciting cause is generally found to be malassimilation, due to some derangement of the digestive organs. Fatty food may be directly deposited as such in the tissue, but this is by no means the only source of tissue fat. The albuminoids ingested are converted into two portions, one a fatty, the other a nitrogenous, and thus albuminous food aids largely in the production of adipose tissue. Starches and sugars aid, not so much by conversion into fat as by being readily oxidizable, and therefore preventing destruction of existing fats or fatty elements newly presented. The symptoms of obesity may be enumerated as follows: Diminution of mental and bodily activity, impeded action of the viscera, the organs of respiration, circulation, and digestion. The slightest exertion will bring on panting; the blood is comparatively deficient in quality and quantity, and, as a result, the muscles become weak and flabby. The countenance becomes bloated and sallow, and the patients are liable to suffer from a variety of affections which depend on malassimilation, as gout, rheumatism, etc. Often fatty degeneration of the heart or liver coexists, and we then have the symptoms of these maladies superadded. Harvey has shown in his work on corpulence that the senses of *hearing*, *taste*, *smell*, or *sight* are often absent altogether or blunted to a very annoying extent in corpulent persons. The only methods of treatment that promise good results are the hygienic and dietetic. These methods, which have become famous from the labors of Banting, Oertel, and others, depend for their success upon the regulation of exercise in such manner that the processes of oxidation of food may proceed in normal manner; and regulation of the food, that no excess of fatty elements, and indeed a less quantity than normal, may be presented to the organism. To this end fatty foods are to be reduced almost to nothing, and with them also carbohydrates, whereas the albuminous food, though also reduced, is still given in somewhat liberal measure. The last is necessary that the general systematic tone and functions may be maintained for the purposes of efficient circulation and destruction of fat. Exercise requires definite regulation to suit the needs of each case. Cold bathing, by stimulating the general system and by furnishing a certain amount of exercise, is a useful adjunct. WILLIAM PEPPER.

Obi: a river of Siberia. See OB.

Ob'iter dictum [Lat., liter., said incidentally; *o'biter*, by the way; *dictum*, neut. perf. partic. of *di'cere*, say]: in law, a remark or suggestion made by a judge or a court in disposing of a question which is not necessary to its decision, sometimes termed a *dictum*. Such a suggestion is not regarded as authoritative when the point comes up for positive decision. A *dictum* may, however, have much influence from its reasonableness or from the high reputation of the tribunal from which it emanates. Much law is generated in this manner, one court uttering dicta and another at a later date embodying them into decisions.

Revised by F. M. BURDICK.

Oblates, ob-lāts' [from Lat. *obla'tus* (*offer're*), offered > Span. *oblado*: Fr. *oblat*]: in the Roman Catholic Church, persons associated after the manner of monks or nuns, but without solemn vows. Some oblates are secular priests; others are without orders. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St. Charles Borromeo toward the close of the sixteenth century. He made use of their services chiefly in the wild and inaccessible alpine districts of his diocese. The institute still exists.—The OBLATES OF MARY IMMACULATE are a congregation of regular clerks, founded in 1815 by Bishop Mazenod of Marseilles. They visit the poor and the prisons.—The OBLATE SISTERS OF PROVIDENCE are a sisterhood founded at Baltimore in 1825.

Obligation [from Lat. *obliga're*, oblige, liter., bind before or against; *ob*, against, before + *liga're*, bind]: in Roman and modern law, a legal relation in which one party, the obligee or creditor, has a claim against the other party, the obligor or debtor, who is burdened with a corresponding duty. The duty of the obligor is usually to do something; either to convey property or pay money (*dare*), or to render some service (*facere*). It may be, however, that the obligor is merely to refrain from doing a particular act (*non facere*). In the broadest sense, the claims of the state, of a husband, of a parent, and the corresponding duties of the citizen, the wife, the child, etc., may be regarded as obligations (the so-called obligations *ex re venientes*); but such rights and duties are mere incidents of pre-existing and more general relations, while obligations in the narrower and proper sense are special and independent relations. The term, moreover, is regularly confined to private law; and within this field, to relations of an economic character, when the *dare* or *facere* is of economic value to the obligee. Obligations, accordingly, are treated as a special class of property rights; property (*bona*, *biens*, *Vermögen*) consisting from a legal point of view partly of rights *in rem*, and partly of obligations or rights *in personam*. (See JURISPRUDENCE.) In the case of rights *in rem*, the object over which the right or power is exercised is a thing; in the case of obligations it is sometimes said to be the person of the debtor. The obligation, however, is rather a right against a person than over a person; it does not seize or cover the person of the obligor as rights *in rem* seize and cover things; it is simply a right to demand from the obligor a particular act or course of action. For this reason the Germans define the obligation as a power over the will of the debtor—a definition which is open to the objection that the law regards only his conduct.

In primitive society the remedial rights of the creditor—the means, that is, by which his claim was enforced—were rights over the person in the fullest sense; they could be pushed to the point of making the debtor a slave. In modern society, however, since the general abolition of imprisonment for debt, the ultimate sanction of the obligation is found in the possible seizure and sale of the debtor's property; and some jurists accordingly define the obligation as a right not over the person but over the purse or estate of the obligor.

Rights over things and claims *in personam* have often been brought under a single category by declaring that the obligation is a thing, an "incorporeal thing." Old German, French, and English law go a step further, and assign obligations or claims to the category of movable things. It is obvious that the word "things" in any such classification is used in the sense of property rights; and that when we declare a claim to be a movable, we merely mean that an obligation, when regarded as an asset or portion of an estate, is governed by the rules which govern personal property, and not by the rules which govern real property.

Establishment.—Obligations are called into existence by the law in consequence of various facts, the most important of which are the acts of individuals. Among these acts again the most important are agreements or contracts and wrongful acts or torts (*delicta*). The Roman lawyers, like the English, started with the idea that all obligations were either *ex contractu* or *ex delicto*; and as it became necessary to recognize obligations otherwise created, they treated them as analogous either to contractual or to tortious obligations (*obligationes quasi ex contractu*, *quasi ex delicto*), thus obtaining a classification which, if not wholly scientific, was at least convenient, and which has generally been retained in the modern European codes. One of the chief objections to this classification is that it confuses original and substantive rights created by legal acts with secondary and remedial rights resulting from the infringement of substantive rights—an error which English lawyers avoid by treating torts as a subject wholly distinct from contracts and quasi-contracts. On the other hand, the English habit of treating obligations principally if not exclusively under the head of contracts, and of devoting treatises on contracts mainly to the discussion of obligations, is somewhat confusing, since contract is a method of creating all kinds of private rights, not obligations merely, but also rights *in rem* and family rights. An extreme illustration of the way in which these various functions of contract may be confused is found in the declaration of the courts in the U. S., that to divest a person of title acquired by grant is to impair the obligation of contract.

Parties.—Every obligation has at least two parties, and may have more; there may be a plurality either of obligors or of obligees. In such cases the creditors may be partial creditors and the debtors partial debtors, each of the creditors having a right to demand his share and each debtor being held to pay his share and no more. In the Roman law, and in all the modern European codes except the Prussian, the presumption is that joint obligations are of this character (*nomina ipso jure divisa sunt*). It is possible, however, that each of the creditors may be entitled to demand, or each of the debtors bound to render full performance, and that when one creditor has secured or one debtor has rendered such performance the obligation is extinguished. In such a case the continental jurists call the obligation "solidary" (*obligation solidaire*, *Gesammtschuldverhältniss*). The majority of German writers draw a further distinction between "correal" obligations (Lat. *correi*, joint parties) where there is really but one obligation with a number of joint creditors or joint debtors (e. g. partners, principal and surety), and "merely solidary" obligations, where there is really a plurality of obligations, but when the content or object of all the several obligations is identical. Such a relation exists, as a rule, only between codebtors (e. g. joint tort-feasors). This distinction was unknown to the early codifiers, and is generally rejected in the new codes.

In declaring an obligation "solidary" the law defines the relations between the creditors on the one hand and the debtors on the other, but not the relation between the several creditors or debtors. Whether the single creditor who has obtained performance must divide with the other creditors, and whether the single debtor who has discharged the entire debt has recourse or regress against the other debtors, are distinct and independent questions. Most of the European codes lay down the general rule that such an adjustment shall take place unless it is excluded by the contract of the parties, or by a special rule of law. As between joint wrong-doers regress is denied in nearly all the German codes (including the imperial draft code) if the offense was a willful or malicious one (*delictum dolosum*), but permitted where the common liability was incurred by negligence (*delictum culposum*). The *Code Napoléon* permits regress in both these cases.

Content.—It is essential to the validity of an obligation that the act to be performed by the debtor (Germ. *Leistung*) shall be objectively possible (*impossibilium nulla obligatio*); that it shall be legally and morally permissible (immoral contracts are void *ipso jure*); and that the obligee or creditor shall have some interest in its performance. Whether the interest must be a pecuniary interest, i. e. an interest capable of pecuniary measurement, is disputed; but modern European theory and legislation incline to enforce all obligations where the creditor has even a sentimental interest in securing performance. When the debtor can be compelled to render specific performance, this rule is easy of application; but when such performance can not be secured the measurement of damages presents serious difficulties—difficulties which can be avoided, however, by previous stipulation of a definite penalty (*pœna conventionalis*) for breach of the contract.

Performance (*solutio*, *paiement*, *Erfüllung*).—An obligation need not in principle be fulfilled by the obligor; any person may fulfill it for him unless the creditor has a special interest in securing performance from his debtor, i. e. unless the performance of another is necessarily a different thing from performance by the debtor, which is never true of obligations *dare* and not always of obligations *facere*. That which the debtor is bound to do must be done, unless the creditor agrees to accept something else as an equivalent (*in solutum datio*). If the creditor chooses to take less than is due him, and takes it as full performance, the debt is extinguished, for Roman and modern European law have nothing precisely equivalent to the English doctrine of consideration. In the absence of special provision as to *time* of performance, the debtor may perform as soon as he will and must perform as soon as the creditor demands it. The designation of a time of performance does not, in principle, negative the former rule; the debtor may still anticipate the time unless the creditor has a demonstrable interest in its observance (*dies in dubio pro reo*); nor does the designation of a time necessarily exclude performance after the time has elapsed. The legal importance of a designated time is that non-performance regularly puts the debtor in default without demand or notice from the creditor (*dies interpellat pro homine*). If no *place* of performance is expressly or impliedly indicated, the debtor may perform wherever he finds

the creditor, and must perform (i. e. may be required to perform) in his own place of residence. The latter rule, however, is subject to two important exceptions. If the duty of the obligor is to transfer possession of a specific thing (*res certa*), he can not be required to transport it from the place where it was when the obligation was incurred. If, on the other hand, the obligation is to pay money, European custom and law regularly require payment to the creditor in his place of residence. If a place of fulfillment is expressly or impliedly indicated, the debtor can not free himself by performance elsewhere.

Default (*mora*, *demeure*, *Verzug*).—If the creditor refuses to accept or otherwise prevents performance at the proper place and time, he is in default (*mora creditoris*). The obligation is not extinguished, but the liability of the debtor is minimized. He has a counter-claim for any losses or expenses occasioned by the creditor's default; and if performance becomes impossible without fraud or gross negligence on his part, he is freed. On the other hand, the failure of the debtor to perform at the proper place and time puts him in default, and makes him liable for all resultant damage to the creditor. The latter's claim becomes a claim for performance plus damages for delay. If the creditor can not secure performance at all, his claim changes into a claim for a pecuniary equivalent. He is to be put into as good a position, economically, as if he had secured performance at the proper place and time. This claim is also termed a claim for the recovery of damages.

The rules regarding default are not applicable to the obligations *ex delicto*, for these are not claims for performance, but claims for damages. This was practically recognized by the Roman jurists in their statement that he who has dishonestly appropriated a thing is in default from the outset (*fur semper in mora*).

Damages (*quod interest*, *dommages-intérêts*, *Schadensersatz*) include not only direct loss (*damnum emergens*), but whatever the plaintiff can prove that he would have gained (*lucrum cessans*) if the contractual obligation had been duly performed, or if the tort had not been committed. When the action is based on a willful or malicious wrong (*delictum dolosum*) vindictive damages may be recovered.

Extinction.—Normally, of course, obligations are extinguished by performance. They are not extinguished by tender of performance; but if it is a sum of money or a specific article that is due, and if this be tendered and refused, the debtor may free himself by depositing it in a suitable place (*sequestratio*, *consignation*, *öffentliche Hinterlegung*). Obligations are extinguished when the creditor accepts something in lieu of performance; also by Novation (*q. v.*) and by release (*acceptilatio*, *remise*, *Erlass*). They are extinguished without the consent of the creditor by confusion (e. g. by the fact that the creditor becomes heir to the debtor, or *vice versa*), and by offset with a counter-claim (*compensatio*, *compensation*, *Aufrechnung*). In these last two instances the creditor, if not directly paid, is at least satisfied; he has secured an equivalent. Obligations may be extinguished without satisfaction by the discharge of the bankrupt debtor (see Bankruptcy) by Limitation (*q. v.*), etc. Some obligations, principally *ex delicto*, are extinguished by the death of one of the original parties.

Transfer.—Except in the case of inheritance the Roman law (like the English) was loath to recognize the possibility of transferring obligations to new parties. Ultimately, however, methods of transfer, *inter vivos*, were devised. See Mandate and Novation.

Natural Obligations.—This term was used by the Romans in a double sense: (1) To describe moral obligations to pay or do something without regard to the question whether the law attaches to such obligations a complete sanction, a partial sanction, or no sanction at all. In this sense the legal obligations constitute simply a special class of natural obligations. (2) To describe a moral obligation to which the law attaches some of the effects of a legal obligation, although it does not permit recovery by action. These are the natural obligations in the technical sense; they are imperfect legal obligations.

The recognition accorded to such obligations may vary greatly. Some of them, although not directly actionable, may be enforced as counter-claims; many of them furnish a sufficient basis for novation and for guaranty; most of them have no legal recognition except this, that payment voluntarily made can not be recovered as *indebitum*. Modern codifiers have shown little sympathy for the natural obligation, but they can not wholly escape it. Recovery of payment at least is regularly excluded, and that without any assumption that the payment is to be regarded as a gift or donation.

Cases in which a natural obligation is more or less fully recognized are, e. g., claims outlawed by limitation, claims void by reason of defective form of contract, claims against minors, and (less generally) play-debts. Munroe Smith.

Obligation, Moral: the fact that we recognize an "ought" or right in conduct as binding upon us. In consciousness, moral obligation appears as a sense of direct responsibility to conform to the moral law. We recognize, in Kant's phrase, a "categorical imperative" which is binding upon all men universally. There are three great theories of the origin and meaning of moral obligation: First, the *naturalistic* view, which holds that our sense of duty is the result of custom and experiences of utility; either individual custom, under the pressure of compulsory obedience, or race custom which has become a matter of nervous habit. So Hume, Spencer, Darwin, Bain, Sidgwick. Second, the *intuitive* view, according to which moral obligation is an innate sense of an external law of right, and of our duty to conform to it. (See Intuitionalism.) Among its advocates are Kant, Reid, Hamilton, McCosh, and the theologians generally. Third, the *idealistic* doctrine, that man's sense of obligation arises from the presence in him of the absolute, realizing itself through his mental and moral life, and thus revealing itself more and more as he advances in righteousness, and realizes his true principle of being. So Hegel, Green, Caird, etc. J. M. Baldwin.

Obligation of Contracts: an important topic of constitutional law in the U. S., by reason of § 10 of Article I. of the Federal Constitution, which declares that "no State shall . . . pass any . . . law impairing the obligation of contracts."

This term was not a common one when it was incorporated into the Constitution. It had not been employed in statutes, nor defined by courts. It did not appear in any of the original drafts of the Constitution. Its proposal and adoption excited but little discussion in the constitutional convention. (*Madison Papers*, pp. 1443, 1552, 1581.) It appears to have elicited no comment from any State convention, and the writers of *The Federalist* did not feel called upon to explain or defend it, save in the most general terms. (See Nos. 7 and 44.) It was suggested by the following clause in the ordinance of 1787 for the government of the Northwestern Territory: "No law ought ever to be made in said Territory that shall in any manner whatever interfere with or conflict with private contracts or engagements *bona fide* and without fraud previously formed"; and its unopposed adoption was induced by the state of things, which Madison thus describes in his introduction to the debates on the Constitution: "In the internal administration of the States a violation of contracts had become familiar in the form of depreciated paper made a legal tender, of property substituted for money, of installment laws, and of the occlusions of the courts of justice, although evident that all such interferences affected the rights of other States, relatively creditors, as well as citizens creditors within the State." (*Madison Papers*, p. 712.) Notwithstanding this clause became a part of the Constitution without serious challenge, it has proved a prolific source of litigation to suitors and of perplexity to courts. The questions it has raised are so manifold, and the number of judicial decisions resolving them is so great, that no attempt will be made in this article to do more than to give an outline of the principles which have been declared.

The Extent of the Prohibition.—In terms, the provision applies only to legislation by the States. Hence it is often asserted that the Federal Congress is at liberty to pass laws impairing the obligation of contracts, unless such laws conflict with other parts of the Constitution. (Cf. *Evans* vs. *Eaton*, Peters's Circuit Court Reports 322, and *Hepburn* vs. *Griswold*, 8 Wallace, p. 637.) The better view, however, is that of Chief Justice Chase, that a law of Congress, "not made in pursuance of an express power, which necessarily and in its direct operation impairs the obligation of contracts, is inconsistent with the spirit of the Constitution." *Hepburn* vs. *Griswold*, 8 Wallace, p. 623. Cf. *Legal Tender Cases*, 12 Wallace, pp. 501, 549, and 600; Cooley's *Constitutional Law*, 314.

The law of a State, in order to come within the constitutional prohibition, must be a statute enacted in the ordinary course of legislation, or a constitution established by the

people of a State as their fundamental law. This provision is not aimed at decisions of State courts which refuse to give effect to contracts; nor to the acts of administrative or executive boards or officers; nor to the ordinances of municipal corporations to which the State has not given the force of law; nor to the doings of other corporations or individuals. *New Orleans Water-works* vs. *Louisiana Sugar Co.*, 125 U. S. 18.

A State law which impairs though it does not destroy the obligation of a contract is unconstitutional; but not every statute which affects the value of the contract impairs its obligation. "It is one of the contingencies to which parties look now in making a large class of contracts, that they may be affected in many ways by State and national legislation." (*Hamilton Gas Light Co.* vs. *Hamilton City*, 146 U. S. 258.) Therefore, statutes which prescribe reasonable regulations for the exercise of contract rights are not prohibited. A railway company may be compelled to fence its track, to check the speed of its trains at specified places, or to maintain flagmen at street crossings, even though its charter does not impose any such burdens.

What Contracts are Protected.—The Supreme Court early established the doctrine that the provision applied to executed as well as to executory contracts. In the language of Chief Justice Marshall, "a contract executed as well as one which is executory contains obligations binding on the parties. A grant, in its own nature, amounts to an extinguishment of the right of the grantor, and implies a contract not to reassert that right." (*Fletcher* vs. *Peck*, 6 Cranch 87.) A contract to marry is within the protection of this constitutional provision, but the contract of marriage is not. Marriage is more than a contract; it is a status which can not be dissolved by the will of the parties, but is subject to the regulation and control of the State. It is therefore competent for a State to change its divorce laws at will. It may abolish old causes for divorce from marriage entered into before the enactment of the law, or create new ones without impairing the obligation of contracts. (*Maynard* vs. *Hill*, 125 U. S. 190; *Hunt* vs. *Hunt*, 131 U. S., appendix clxv.) It is often said that the clause in question covers all implied contracts; and a few State decisions support the proposition. (*U. S.* vs. *Williams*, 19 *Pacific Reporter* 288 (Mont.); *Butler* vs. *Rockwell*, 29 *Pacific Reporter* 458 (Colo.).) The later decisions of the U. S. Supreme Court, however, have distinguished contracts implied in fact from those implied in law or QUASI-CONTRACTS (*q. v.*), and have declared that the constitutional prohibition upon the States does not extend to the latter. This prohibition, it is said, "was intended to secure the observance of good faith in the stipulations of parties against any State action. When a transaction is not based upon the assent of the parties it can not be said that any faith is pledged with respect to it; and no case arises for the operation of the prohibition." (*Freeland* vs. *Williams*, 131 U. S. 405; *Morley* vs. *Lake Shore Ry. Co.*, 146 U. S. 162.) Hence a judgment, whether for a tort or upon a contract, is not a contract within this clause of the Constitution.

A statute is not a contract, ordinarily, and may be repealed or amended at the will of the State. It may, however, amount to a contract between the State and other parties, and thus fall within the constitutional prohibition. This was held for the first time in *New Jersey* vs. *Wilson*, 7 Cranch 164, where a statute of New Jersey, which provided for the conveyance to the Delaware Indians of certain lands which should not thereafter be subject to any tax, any law to the contrary notwithstanding, was declared to be a contract, and therefore not repealable by the Legislature after the adoption of the Federal Constitution. A few State courts have held that the power of taxation can not be surrendered by the Legislature, and that a statute undertaking to make such surrender is nugatory and does not give rise to the obligation of a contract. Such decisions have been overruled by the U. S. Supreme Court on the ground that "government was not organized for the purposes of taxation, but taxation may be necessary for the purposes of government. As such, taxation becomes an incident to the exercise of the legitimate functions of government, but nothing more. While a government can not surrender all power of taxation, it may in the exercise of a reasonable discretion surrender part." (*Stone* vs. *Mississippi*, 101 U. S. at p. 820.) In order that a statute be construed as exempting a party from taxation, its terms must be clear and unequivocal; and in order that it amount to a contract, a consideration must be furnished by the recipient of the immunity.

Statutes creating public offices and providing for the compensation of their incumbents are not contracts between the State and the officials. They provide merely for the proper performance of public functions. Hence State officers, in the absence of any provision in the State constitution, and Federal officers, in the absence of a provision of the Federal Constitution, hold their places subject to legislative change of tenure and salary at any moment. (*Butler* vs. *Pennsylvania*, 10 Howard 402.) This rule does not apply to a person who is engaged by the State under a statute to render certain services, not as an officer, but as an employee. *Hall* vs. *Wisconsin*, 103 U. S. 5.

Corporations.—The statutory charter of a public corporation is not a contract between itself and the State, so far at least as public duties and powers are concerned. It is created for the purpose of performing governmental functions, and must be subject always to legislative control and modification. (*East Hartford* vs. *Hartford Bridge Co.*, 10 Howard 533; Dillon *On Municipal Corporations*, 3d ed., §§ 60–79.) If it is organized not to exercise the functions of government, but primarily for the purposes of the corporators, though the public may be benefited indirectly, its charter may and generally does originate a contract obligation between itself and the State which can not be impaired by subsequent legislation. The leading case on this point is *Dartmouth College* vs. *Woodward*, 4 Wheaton 519, decided in 1819, reversing the decision of the superior court of New Hampshire, 1 N. H. 111, rendered in 1817. Two principal questions were involved: (1) Whether an educational college is a public or a private corporation; (2) whether the charter of Dartmouth College contained a contract between the State and the corporation. The court held that an educational corporation is private and not public, unless it is founded and maintained by the State as a part of its governmental machinery. The second question was decided in favor of the college also. Chief Justice Marshall's reasoning is briefly as follows: The objects for which a corporation is created are universally such as the government wishes to promote. They are deemed beneficial to the country; and this benefit constitutes the consideration and, in most cases, the sole consideration of the grant. The charter of Dartmouth was sought and granted for the purpose of perpetuating the application of the bounty of her donors to the specified objects of that bounty. This is plainly a contract, to which the donors, the trustees, and the crown (to whose rights and obligations New Hampshire succeeded) were the original parties. It is a contract made on a valuable consideration. It is a contract on the faith of which real and personal property has been conveyed to the corporation. It is then a contract within the letter of the Constitution.

This was one of the most momentous decisions ever rendered by the Supreme Court. While it has been severely criticised, it has been followed by the Federal tribunals, and with few exceptions by the State courts. Its doctrine, to use Justice Black's vigorous expression, "is sustained not by a current but by a torrent of authorities." (See Shirley's *Dartmouth College Causes*, St. Louis, 1879.) Sir Henry Maine has declared that it is this provision of the Constitution, as construed in the Dartmouth College case, "which has in reality secured full play to the economical forces by which the achievement of cultivating the soil of the North American continent has been performed; it is the bulwark of American individualism against democratic impatience and socialistic fantasy." (*Popular Government*, pp. 247–248.) The decision led to a radical change in State legislation relating to corporate charters. Thereafter the States, as a rule, either by general laws or by special provisions in the charters, reserved the right to amend or to repeal them. See *Greenwood* vs. *Freight Co.*, 105 U. S. 13.

Even where a charter amounts to a contract between the State and the corporation, the courts are unanimous in holding that no collateral agreements restricting State action will be implied. If any such are claimed by the corporation, they must be shown to have been stated expressly in the charter. (*The Charles River Bridge* vs. *The Warren Bridge*, 11 Peters 420; *The Binghamton Bridge Case*, 3 Wallace 51.) Although a State binds itself by an express collateral agreement, it does not thereby lose its right to exercise the power of eminent domain. Nor does the constitutional provision, under discussion, interfere with the fair exercise of the police power by a State. Hence State licenses to carry on particular trades or corporate charters for lotteries may be modified or annulled if, in the opinion of the Legislature, the license or franchise is inconsistent with the public

safety, health, or morals. "The governmental duty of self-protection can not be contracted away, nor can the exercise of rights granted, nor the use of property be withdrawn from the implied liability to governmental regulation, in particulars essential to the preservation of the community from injury." *New York Ry.* vs. *Bristol*, 151 U. S. 556.

State Insolvent Laws.—In the absence of a Federal bankruptcy law the States may provide by statute for the discharge of insolvents from debts contracted after such legislation, without impairing the obligation of contracts. The obligation of a contract is the duty of performing it, which is recognized and enforced by the law applicable thereto. In a State where an insolvent law exists, this obligation is conditional, not absolute; it is an obligation to pay the debt if not discharged therefrom in accordance with law. Such a statute, however, has no extraterritorial force, and does not relieve the debtor from liability to a creditor who is an inhabitant of another State, and does not become a party to the insolvency proceedings. *Ogden* vs. *Saunders*, 12 Wheaton 213.

State Laws Affecting the Remedy.—There has been much judicial confusion upon this topic, because of the frequent failure of the courts to observe the two senses in which the term remedy is used. It is applied to the mode of proceeding by which a legal right is enforced, and also to the law which gives or defines the right. Any State legislation which impairs the right of action upon a contract is prohibited, while that which affects only the procedure in an action is not. This distinction, though often lost sight of by the State courts, has been uniformly observed by the Supreme Court of the U. S. "In modes of proceeding and forms to enforce the contract, the Legislature has control, and may enlarge, limit, or alter them, provided it does not deny a remedy or so embarrass it with conditions or restrictions as seriously to impair the value of the right." (*Penniman's Case*, 103 U. S. 714.) Imprisonment for debt is held to be a relic of ancient barbarism, and a punishment rather than a remedy. Therefore a State law abolishing it even as to existing debts does not impair the obligation of contracts. FRANCIS M. BURDICK.

Obnos: the name given by Manetho to Unas, the ninth and last king of the fifth Egyptian dynasty. His reign, according to the Royal Turin papyrus, lasted thirty years, while Manetho gives him thirty-three years. In Manetho's account a new epoch seems to have begun with his successor, since the years from Menes to Unas are summed up as a complete period. Little is known concerning Obnos-Unas except that he built a pyramid at Saqqarah, which was opened in 1881, and found to contain passageways lined with alabaster, on which were inscribed writings. C. R. G.

O'boe [Ital., from Fr. *hautbois*], or **Hautboy** [from Fr. *hautbois*; *haut*, high + *bois*, wood. Named from its high tone]: a musical wind instrument of an elongated conical form and with a high piercing tone, ranging from C below the treble clef to G, the fourth line above the staff. Apparently it was at first used solely by military bands, but from the time of Bach it has been one of the most important wind instruments in the orchestra. Custom has led the A of this instrument to be considered the standard pitch.

O'Brien, CORNELIUS: See the Appendix.

O'Brien, FITZ JAMES: See the Appendix.

O'Brien, LUCIUS RICHARD: See the Appendix.

O'Brien, WILLIAM, M. P.: political leader; b. at Mallow, Ireland, Oct. 2, 1852; was educated at Cloyne Diocesan College and Queen's College, Cork; entered Parliament in 1883. He is a journalist, and was editor of *United Ireland*. He is leader of the National League; has been four times imprisoned under the Crimes Act of 1887; visited the U. S. twice; is one of the widest known leaders of the Irish party.

O'Brien, WILLIAM SMITH: political leader; b. at Dromeland, County Clare, Ireland, Oct. 17, 1803; son of a baronet of ancient lineage; was educated at Harrow and at Trinity College, Cambridge; entered Parliament for the borough of Ennis 1826. Though he at first supported the Tories, he was afterward returned as an advanced Liberal for the County Limerick, which he represented thirteen years; became the ally of O'Connell and worked earnestly to secure Catholic emancipation, but in the agitation for the repeal of the legislative union between Great Britain and Ireland he favored a resort to forcible measures if necessary, and as the head of the organization known as Young Ireland he ceased to be in accord with O'Connell. He went to Paris Apr., 1848, as a representative of the Irish confederation to solicit aid from the French republic; aided in convoking an Irish national convention (May), which was not allowed to meet; was tried for sedition in the same month, but acquitted; attempted a rising among the peasantry at Mullinahone, in the south of Ireland, July, but was compelled to flee; was captured at Thurles Aug. 5; tried and convicted by a special commission at Clonmel, with T. F. Meagher and MacManus, on a charge of high treason (Oct. 9); sentenced to be hanged; was transported for life to Tasmania, July, 1849; was pardoned 1856; traveled in the U. S. 1859. D. at Bangor, North Wales, June 17, 1864.

Obsequens, JULIUS: a Latin writer, probably of the fourth century, who compiled a record of prodigies (*prodigiorum liber*) happening between the years 249 and 12 B. C., the ultimate source being Livy. No manuscript of this work exists. The *editio princeps* was published by Aldus (Venice, 1508), a revised text by O. Jahn (Leipzig, 1863).

Obsequies: See FUNERAL.

Observan'tine Friars and Nuns [in Lat. name, *Fra'tres strictio'ris observan'tiæ*, liter., brothers of stricter observance]: a monastic order of the Roman Catholic Church. The primitive rule of St. Francis, like that of many other orders of monastics, having been modified by various popes on account of the extreme severity of its discipline, there arose within the order a new party desirous of returning to the austere rule of former days. Certain followers of the severe rule in 1368, under Paoletto di Foligno, were organized as a separate congregation, called Brethren of the Stricter Observance, or Observantines; these are now, as they have long been, far more numerous and influential than the Conventuals, or followers of the mitigated rule. The Capuchins and other congregations follow a still severer rule, and are called Brethren of the Strictest Observance.

Observatory: an establishment for the systematic observation, record, and study of natural phenomena, especially those which pertain to astronomy, meteorology, or magnetism. Establishments for scientific observation date from very ancient times. The celebrated museum of the Ptolemies at Alexandria included astronomy among its objects, and observations of importance to that science as then understood were made there. The Arabs of the Middle Ages also continued the work of the Greek astronomers, and many of their observations and writings have come down to us; but probably none of their establishments formed what we should now call an astronomical observatory.

Coming nearer to our own times, the first observatory celebrated in astronomical history is that of Tycho Brahe, founded in 1576. It was situated on the island of Hveen,

FIG. 1.—Tycho's observatory.

in the Sound, N. of Copenhagen, and was very appropriately named Uranienborg, the city of the heavens. The foundation-stone was laid with great ceremony, and the establishment was fitted with instruments designed by Tycho himself, larger and finer than any previously known. They

were mostly designed to measure arcs from one star to another in the heavens, a method of observation which has since been entirely superseded. Although Tycho's observations suffer, when compared with ours, in value from having been made just before the invention of the telescope, they are renowned for having afforded Kepler the material for establishing his laws of the motions of the planets. See KEPLER and ORBIT.

The century which followed Tycho Brahe was made celebrated by the discovery of the telescope and the foundation of several great observatories. A very natural belief was then current, which is prevalent even at present, that the instruments of an astronomical observatory should be as high as possible above the earth. Thus the observatory of Horrebow is pictured as eight stories high, and an immense building was erected at St. Petersburg as an observatory of the Academy of Sciences. Practically, however, it has been found that the loss is as great as the gain in mounting astronomical instruments at a great elevation above the ground. Although a clearer horizon is obtained, this advantage is slight, and is more than counter-balanced by the exposure to heavy winds, from which astronomical instruments should be thoroughly protected.

The decade 1661–70 is celebrated in the history of science, not only by the organization of the Royal Society of London and of the Academy of Sciences of Paris, but by the erection of the Greenwich and Paris observatories, both of which are still in existence. About that time also was introduced the greatest improvement ever made in the art of determining the apparent positions of the heavenly bodies by observation. The measurement of the angle between two heavenly bodies, as practiced by Tycho Brahe, was made difficult by the diurnal motion of the stars. In consequence of this motion no star would remain at apparent rest relative to the instrument, and it was therefore impossible to point two sights of the latter, or two telescopes, simultaneously at two stars. If pointed correctly on one the other would move away, or rather the instrument would be carried away by the rotation of the earth. To Roemer of Copenhagen, celebrated in connection with the determination of the motion of LIGHT (*q. v.*), occurred the idea of utilizing this very troublesome motion to determine the right ascensions of the heavenly bodies. Let the telescope move only in the meridian, and let the stars in succession pass through its field. Note the time of passage by a good clock regulated to sidereal time, and we have at once the means of determining their relative right ascensions. Thus arose the transit instrument, which is a most useful appliance of an astronomical observatory.

Ever since the time of Tycho men have taken delight in founding munificent establishments of the kind in question; but all that the astronomer really wants besides his office-rooms, library, etc., is something to shelter his instruments from the wind and weather. The more flimsy this shelter is, the better, for a reason not at first sight apparent. One of the first requisites to good astronomical observations is that the instrument and the air around it shall be as nearly as possible of the same temperature as the air outside, no matter how cold the weather may be. If this is not the case, the currents of warm and cold air around the instrument will cause irregular refraction, which will be multiplied as many times as the instrument magnifies, and thus destroy all accurate vision. The heavier and more massive the walls around his instrument, and the more closely it is protected from the outer air, the more difficult it is to fulfill this condition. Sheet-iron is therefore a favorite material for an observing-room, and all defects of construction which have no worse result than admitting cold air are readily forgiven.

From the astronomer's point of view, the most important feature of an observatory is found in the instruments with which it is fitted up. Of these the first in importance are the transit instrument and the EQUATORIAL TELESCOPE (*q. v.*). The former has two distinct uses. One is to determine the time or regulate the astronomical clock and fix its rate, which is necessary because nearly every astronomical observation requires a somewhat accurate statement of the moment at which it was made. The other is to determine the right ascensions of the heavenly bodies. The equatorial telescope is the instrument which most interests the public. It can be readily pointed at any visible object and so moved by clockwork that the object is kept within the field of view. If positions of the heavenly bodies are to be determined, a meridian circle is also a necessity. As this is formed merely by adding circles and other appliances to a transit instrument, the latter is not essential when the observatory possesses a meridian circle. Still it is convenient to have a separate transit instrument, because it can be used for determining the time independently of observations made with a more complex instrument.

Other instruments are of less universal application. The prime vertical transit, being mounted so as to move through the zenith in an east and west circle at right angles to the meridian, is quite limited in application, yet observations of extreme precision have been made with it at Pulkowa and elsewhere. This observatory is also supplied with a vertical circle, an instrument of somewhat peculiar construction for measuring altitudes on or near the meridian. The alt-azimuth is also found at two or three European observatories. It has over the meridian circle the apparent advantage that it can be pointed at any part of the heavens, so that the position of a heavenly body at any moment can be determined; but the very faculty of swinging around on a vertical axis, which such an instrument must always do, interferes with the precision of the observation, and is therefore a serious drawback. If an observer desires to find new comets a COMET-FINDER (*q. v.*) is a very necessary appliance.

The discovery and introduction of the spectroscope and consequent investigations on the constitution, temperature, and other peculiarities of the heavenly bodies, which were before impossible, have added greatly to the outfit of most great observatories. The application of photography to astronomy has resulted in the same way. These new methods of research have not, however, led to such changes in the construction of great instruments as might be supposed. An equatorial telescope is essential to the astronomical use of the spectroscope, which is simply fastened to its eye-end in order that the spectrum of any object in the focus may be examined. If a photograph is to be taken, an equatorially mounted telescope or something equivalent to it is also a necessity; but the ordinary visual telescope is not well adapted to take a photograph because the object-glass is not achromatized for the photographic rays. The telescope must therefore either have a special object-glass made for it, in which the flint glass shall be proportionately less powerful than in the optical telescope, or a so-called "corrector" must be put over the object-glass of the visual telescope so as to correct it for the photographic rays.

Every enlightened nation has one or more observatories of a national character, while several universities, both in America and Europe, possess them as part of their educational establishments. An exhaustive catalogue of the observatories now existing would mount up into the hundreds. We shall only mention those of each country which may be considered as scientifically most important, or which are celebrated for some work done or discovery made in connection with them.

Russia.—The great observatory of Pulkowa, founded by the Emperor Nicholas about the years 1838–40 as a monument of his reign, acquired such celebrity that it was once designated as the astronomical capital of the world. It owes its high reputation to its first director, W. Struve, one of the most renowned practical astronomers of his time, who not only devised superior instruments, but used them with a precision never before reached. Its principal work has been the determination of astronomical constants, especially those of nutation and aberration, and the preparation of more accurate catalogues of the principal fixed stars than were before made. Its work in these lines has set the standard for the world during nearly half a century.

Germany.—The University Observatory of Königsberg, founded early in the nineteenth century, is renowned for the work of Bessel, the greatest practical astronomer of his time. There is also a national observatory at Berlin, but the city has so grown around it that its work is seriously interfered with. At present the most noted national establishment of the kind in Germany is the astro-physical observatory at Potsdam, founded shortly after the Franco-German war as a noble way of expending a portion of the indemnity received from France. As its title implies, it is especially fitted up for spectroscopic and photo-metric studies. Its researches in these departments have given it a position worthy of German science. The researches of Vogel upon the spectrum and motions of the variable star Algol are an example of its activity. The work of making the most accurate possible determination of the magnitude of several thousand of the principal stars in the northern hemisphere is being carried forward to completion as rapidly as possible. The leading universities of Germany are also

supplied with observatories, among which that of Bonn is worthy of special mention as having afforded Argelander and his successors the means of cataloguing and studying the stars of the northern hemisphere. More recent yet is the Strassburg observatory, founded about 1873, and fitted up with the most modern instruments.

France.—Measured by the number of its astronomers and the amount of work done, the observatory of Paris is easily the first of Europe. Its activities cover every branch of astronomy, theoretical and practical. Its directors have been the most celebrated astronomers of France, beginning with the Cassinis, and including more recently such men as Arago and Le Verrier. In popular interest it is, however, outstripped by the observatory of Nice, already mentioned. This fine establishment is situated on the summit of Mont Gros, a hill some 1,200 feet in height, 2 or 3 miles N. E. of

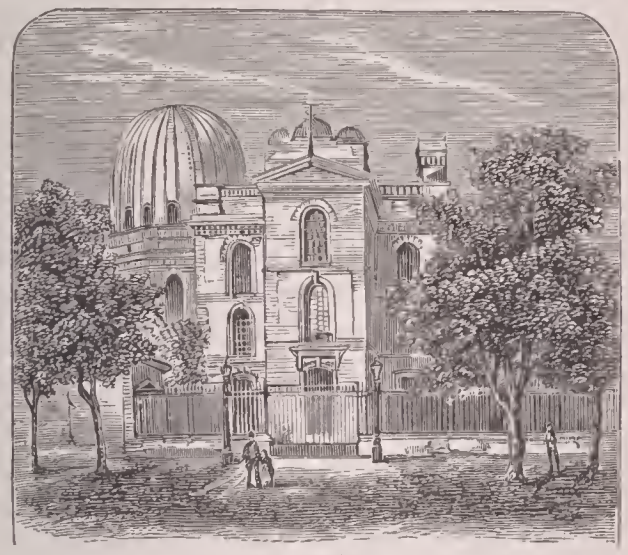

Fig. 2.—Paris observatory.

Nice. It commands a splendid view of the Mediterranean, and among the subjects for which it is noted is the discovery of small planets by photography and the study of the physical aspects of Venus and Mars. There are also observatories at Bordeaux, Lyons, and elsewhere, at which eminent French astronomers are seeking to add to the scientific laurels of their country.

England.—The Royal Observatory at Greenwich overshadows all other British observatories in importance. In the original warrant of Charles II., appointing Flamsteed astronomer-royal, it was prescribed that he should "apply himself with the most exact care and diligence to the rectifying the tables of the motions of the heavens and the places of the fixed stars, in order to find out the much desired longitude at sea for the perfecting the art of navigation." The most remarkable feature in the history of the Greenwich Observatory is the conscientious persistence with which the policy thus comprehensively outlined has been pursued for more than two centuries by a succession of men whose names stand high among those of the astronomers of their times. Without deviating in any way from this policy the scope of the observatory has been extended so as to include photographic and spectroscopic observations. The universities of Edinburgh, Cambridge, Oxford, and Dublin have also noteworthy establishments of the sort. Among Irish observatories the greatest interest, perhaps, centers around that of Lord Rosse, at Birr Castle, Parsonstown, celebrated for the largest telescope ever built.

The United States.—An enumeration of the observatories of this country is not possible. Many have been founded by private munificence, become known for a short time by the work of some astronomer, and finally disappeared from the sight of the scientific world. The old naval observatory at Washington was celebrated in its early years for the work of Sears Cook Walker in investigating the motions of Neptune, and for the part which it took in applying telegraphy to the determination of longitudes, and for the invention of the electro-chronograph. In 1873 it was supplied with a new equatorial telescope of 26 inches aperture, which at the time was the largest of the kind in existence. Four years later it acquired new celebrity by Prof. Hall's discovery of the satellites of Mars. More recently a new and magnificent establishment has been erected on an elevation N. of Georgetown, which in its buildings and outfit fairly rivals any in the world. The Cincinnati Observatory is one of the oldest in the country, having been founded by Prof. O. M. Mitchell. Its work has from time to time been interrupted, but its activity persists until the present day. The Dudley Observatory at Albany, though always suffering from want of the pecuniary support necessary to such an establishment, has in recent times acquired great importance by the work of Prof. Boss, its director and astronomer, in cataloguing a zone of stars. A new structure has recently been erected for it. Princeton College, the University of Virginia, and several other institutions, are also supplied with fine establishments of the sort, of which the work redounds to the credit of the U. S. At Princeton, Prof. Young has devoted himself very largely to spectroscopic work and the study of the sun. Although his telescope is not of the largest size, it was the first one after the Lick telescope with which the fifth satellite of Jupiter was actually seen. The observatory of Georgetown University, D. C., though among the more modest of institutions of the kind, is acquiring celebrity through the application of photography to the registration of transits and zenith distances. The remarkable feature of this work is that a star as it passes across the field of the telescope is made to photograph its image on a plate in the focus of the instrument, not continuously, but at intervals of one or two seconds, thus forming a row of dots on the plate. The same method is being applied to the determination of latitudes with the zenith telescope. The success of this work is due to the ingenuity of the director, Father Hagen, S. J., and his able assistants.

The Harvard Observatory dates from 1843, the great comet of that year being the immediate incentive to its foundation. Under the energetic management of its present director it has grown to be one of the greatest in existence. It was early celebrated for the work of the Bonds, and the discovery of the eighth satellite of Saturn; more recently its principal work has been the photometry of the heavens, the photographing of the constellations, and the study of the spectra of the fixed stars. The Lick Observatory in California is remarkable for the rapidity of its rise. (See Lick.) It was not completed until 1888, but has since risen into great prominence by the activity of its astronomers under the direction of Prof. Holden. The observations of Burnham on double stars, and of Barnard on the planets and satellites, are among its noteworthy contributions to science. The discovery of the fifth satellite of Jupiter, made by Barnard in 1892, is of especial interest. The observatories of Ann Arbor and Hamilton College are noted for the discovery of minor planets made by their former directors, Watson and Peters. In recent times the Madison Observatory has done excellent work with its meridian circle and equatorial telescope.

Magnetic and Meteorological Observatories.—The principal object of a magnetic observatory is to record the changes continually going on in the earth's magnetism. The outfit necessary for this purpose is quite modest, and in consequence such establishments do not fill so great a place in the public eye as astronomical observatories. The most noted in America is that of Toronto, Canada, where continuous observations have been kept up for a considerable period. The Greenwich Observatory has also a magnetic department, where similar records are made and kept.

A meteorological observatory, as its name implies, is devoted especially to records pertaining to the weather, the readings of the barometer, thermometer, etc. In a well-fitted modern meteorological observatory the conditions of the wind and weather are automatically recorded on sheets, so as to preserve a permanent record, available for study and comparison at any future time. S. Newcomb.

Obsid'ian [from Lat. *Obsidia'nus* (corrected reading *Obsia'nus*) *lapsis*, supposed to be obsidian, liter., the stone of *Obsi'dius* (corrected reading *Ob'sius*), name of the man said by Pliny to have found it in Ethiopia; Gr. *ὀψιανός*]: an acid volcanic glass formed by the very rapid cooling of molten material upon or very near the earth's surface. In chemical composition obsidian may correspond either to rhyolite, trachyte, phonolite, or andesite. Its practical identity with these rocks is often shown by a mass of any one of them passing gradually into obsidian at its edge, where the cooling has been most rapid, and the crystallization of individual minerals in this way prevented. Among the acid volcanic glasses obsidian is distinguished by its low percentage of water (generally less than 1 per cent.) and its vitreous luster from *pitchstone*, which contains 4 or 5 per cent. of water and has a resinous luster, though it is otherwise identical with obsidian. Obsidian is usually dark in color

and compact in texture. Frequently it is jet black from included microscopic crystallites of magnetite, and often also of a red color. The particles included in the glass very commonly show by their arrangement the flow movement which took place in the viscous mass before final solidification. If the obsidian has acquired a porous or spongy texture by escaping gases at the time of cooling, it is called *pumice*. If, on the other hand, the cooling was slow enough to allow of the separation of some crystals, the rock becomes an *obsidian porphyry* or *vitrophyre*. The glassy equivalents of the more basic volcanic rocks, like trap or basalt, are called *basalt obsidian* or *tachylite*. Because of the greater tendency of such basic masses to crystallize, their glassy forms are much rarer than the true obsidians and pitchstones.

Obsidian and its allied glasses occur in many volcanic regions. Some of the best-known localities are in the Lipari islands, Iceland, Mexico, Siberia, New Zealand, Peru, and the western parts of the U. S. Obsidian Cliff in the Yellowstone National Park has become well known through the researches of Prof. Joseph P. Iddings.

The perfect conchoidal fracture of obsidian, and the readiness with which it yields very sharp-edged fragments, have made it a favorite material among primitive people for the manufacture of arrow-points, axes, and knives. This was especially the case with the early inhabitants of Mexico, who named their principal source of supply Cerro de las Navajas, the hill of knives. Obsidian has also, both in ancient and modern times, been cut as a gem stone.

Pumice or spongy obsidian is extensively used in the arts for dressing leather or parchment, for polishing, and for toilet purposes. The supply of this is obtained largely from the Lipari islands. G. H. Williams.

Obstetrics, Obstetricy, or **Tocology** [*obstetrics* is from Lat. *obste'trix*, midwife, deriv. of *obsta're*, stand before; *ob*, before, against + *sta're*, stand; *tocology* is from Gr. τόκος, birth + λόγος, discourse, reason]: the branch of medical science embracing the knowledge of the processes accompanying the reproduction of the human species, the assistance to be rendered the mother before, during, and after labor, both natural and irregular, and the care to be taken of the child during the first weeks of its life; also called *midwifery*, particularly in Great Britain. Although nature has adapted woman to bring forth children without any other assistance than that afforded her by her own inherent powers, still, from the very earliest ages, it has been found agreeable and beneficial to a woman in labor to offer her sundry more or less important services in her hour of need, by which present discomforts might in a measure be removed or possible future accidents averted. The earliest records which we find of such assistance show it to have been rendered exclusively by women. Thus the Jews employed women, called *mejelledeth*; the Greeks first made use of old female nurses, who lived in the house and took care of the children. These nurses were called *mæa* (grandmother, nurse), and subsequently, when their practice rose to the dignity of a profession, they were known as *mæeutriæ*. A special tutelary divinity (Ilithyia or Artemis) protected the art. These women appear, however, to have been unlucky in their practice, for at an early period a law was passed in Athens prohibiting women from practicing physic in any of its branches. As early as the time of Hippocrates (about 400 B. C.) we therefore find men (*mæeutai*, *mæeuteres*) called in as assistants in difficult cases; and somewhat later, Herophilus is mentioned as a teacher of obstetrics at Athens. In the writings attributed to Hippocrates is found the first evidence of scientific research into and rational understanding of the phenomena of childbirth. Among the Romans, women (*obstetrices*) likewise assisted in confinements; but the Emperor Augustus is reported to have called the physician Antonius Musa to attend the Empress Livia in a difficult labor, and this precedent has been followed in many countries. At the time of Pliny the royal law (*lex regia*) already provided for the performance of Cæsarean section after the death of women during pregnancy and labor. Celsus and Rufus Ephesus, during the first century of the Christian era, and Galen, Ætius, and Paulus Ægineta in the second, fifth, and seventh centuries, respectively, wrote works on obstetrics. During the Middle Ages medical science remained at a standstill in Europe, but among the Arabs and Persians considerable progress was made in obstetrics, which was practiced by women alone, physicians being called in only as consultants. The writings of Rhazes of Bagdad (A. D. 800), Avicenna of Ispahan (A. D. 900), and Abulcasem (A. D. 1100) became celebrated, and were generally accepted throughout Europe as well as in the East. Up to the sixteenth century very indefinite ideas had existed as to the shape and capacity of the bony canal (pelvis) through which the child has to pass in order to be born; in 1543 Andrew Vesalius gave the first correct description of the normal pelvis, and 200 years later (1754) Levret in France and Smellie in England (1751) completed the description by stating the exact dimensions of the various diameters of the pelvic cavity. The great surgeon Ambroise Paré (1550) was, however, the first actual exponent of modern scientific obstetrics—"the famous restorer and improver of midwifery," as Smellie aptly calls him. He first recommended turning the child by the feet. His successors Guillemeau and especially Mauriceau, worthily developed and improved on the teachings of Paré. That most valuable of obstetrical instruments, the forceps, was invented by an Englishman, Paul Chamberlen, about 1647; it has since been greatly modified and improved. In Germany the first scientific work on obstetrics was published by Eucharius Rösslin in 1513; and in 1690 Justine Siegemund, court midwife at the electoral court of Brandenburg, became celebrated through her book on midwifery. Although numerous careful observations and studies had been made by Smellie and Onld (1742) in England, who described the manner of the entrance of the child's head into the pelvis, by Levret (1747), Solayrés de Renhac (1771), Baudelocque (1781), Madame Lachapelle (1795) in France, and Boër (1791) and Schmitt (1804) in Germany, Naegele the elder (1819) was the first to give a clear, systematic, and tolerably correct explanation of the mechanism of labor; that is, of the manner of passage of the various parts of the child through the pelvic canal. From him dates, in a great degree, the present advanced state of obstetrical science; for on the accurate comprehension of this mechanism depends in a large measure the correct appreciation of the means to be employed in abnormal cases. Among the more important improvements in the art and practice of obstetrics during the nineteenth century are the following: The use of the ear (auscultation) to detect the presence of a living child in the womb; the perfection of the knowledge of the mechanism of labor; the induction of premature labor; the more frequent use of the forceps and the less frequent employment of craniotomy (perforation of the child's head); the substitution of turning and extraction by the feet for forceps and craniotomy in many cases of pelvic deformity; the employment of anæsthetics in natural labor. Obstetrical science and practice have long been taught at all medical universities. Hospitals for the accommodation of women during the lying-in state—so-called lying-in hospitals—have been instituted in many cities of Europe, and in a less degree in the U. S. They are almost invariably connected with medical schools, and afford excellent opportunities for the study of the obstetrical art. The largest lying-in hospital at present is in Vienna, in which about 10,000 women are confined annually; others are at Paris, Berlin, Dublin, etc. Societies devoted solely to the advancement of the department of obstetrics exist in London, Berlin, Edinburgh, Dublin, New York, Philadelphia, Boston, and other cities. Journals containing only articles on obstetrical topics are published in Germany, France, Great Britain, and the U. S. On the European continent, and to a certain degree in Great Britain, women in labor are attended only by midwives, who are taught in special schools to perform the minor duties of an obstetrician, such as to separate the child from the mother by tying and dividing the umbilical cord, removing the afterbirth, and caring for the comfort of the mother and the child. Physicians are called in only in difficult cases. In the U. S., however, and among the better classes of Great Britain, the safer plan is followed of intrusting every confinement, whether natural or abnormal, to the care of an educated physician, who is assisted by a competent nurse, and who, in case of need, may be able to foresee and prevent accidents which the superficial and inferior teaching of a midwife would incapacitate her from perceiving or avoiding.

The study of obstetrics is divided into three chapters: 1. The anatomy of the organs taking part in the process of reproduction in the female; 2, the functions of those organs during reproduction: their physiology; 3, the disorders and diseases affecting these and other organs during the same period: their pathology.

1. *Anatomy.*—In the bony receptacle (pelvis) at the end of the trunk are situated the female generative organs, viz.,

the two ovaries, containing the female germs or ova: between them the womb or uterus, to which they are attached; on either side also the two Fallopian tubes, opening into the uterus; finally, the vagina or passage leading from the mouth of the womb to the external organs. The breasts, although coming into function only after the birth of the child, are generally included in this list.

2. *Physiology.*—The functions of these organs are menstruation, conception, gestation or pregnancy, labor or parturition, and lactation. They are limited to a certain period of life, generally beginning with the twelfth to the fifteenth year and continuing till the forty-fifth or forty-eighth year. The youngest authentic case of parturition on record occurred at the age of nine years, the oldest at fifty-four years. Menstruation and reproduction are generally coincident, although cases are reported in which repeated impregnation took place without menstruation having ever occurred. Conception having taken place, the impregnated ovum passes through one of the Fallopian tubes to the uterus, where it becomes attached and grows and develops (its nourishment being derived from the mother through a convolution of vessels called the afterbirth or placenta, from which a cord of vessels, the umbilical cord, runs to the abdomen of the child), until at the end of a period varying from 275 to 280 days it is ready to be expelled by the contractions of the powerful muscular fibers of the womb (labor-pains). In occasional rare cases the term of pregnancy may be prolonged to 300 or 306 days; but most statements of this kind by women are not reliable and usually depend on errors of reckoning. The signs of pregnancy are manifold. The chief symptoms are: Cessation of the menses, nausea, particularly in the morning, enlargement of the abdomen and the breasts, discoloration of the space around the nipple; later, the movement of the child (or fœtus) and the pulsations of the child's heart, audible only to a practiced ear applied to the abdomen. A physical examination of the abdomen and genital organs will at all times reveal the state of affairs; still, only in exceptional cases is it possible to decide upon the existence of pregnancy before the beginning of the third month. Enlargement of the abdomen from dropsy, ovarian and other tumors, may simulate pregnancy. The part of the child presenting itself at the mouth of the womb during pregnancy or labor is called the presentation. During pregnancy the child frequently changes its position; during labor, however, the part originally presenting generally remains. The most frequent position of the child in the womb is the longitudinal, corresponding with the long axis of the mother, and by far the most common presentation is that of the head (96 in 100), generally the crown or vertex, seldom the face (1 in 200); much less frequent is the presentation of the other extremity of the child, the breech or feet (3 in 100). A transverse presentation, when the long axis of the child crosses the long axis of the mother, is met with about once in 200 labors, and always requires artificial rectification. Labor or parturition is the act of delivery of the fœtus and its appendages (the placenta and the membranes inclosing the child) through the natural passages. It may be divided into three stages: 1. From the first pains till the complete dilatation of the mouth of the womb; 2, the birth of the child; 3, the expulsion of the afterbirth and membranes. *First stage.*—At the end of pregnancy labor is ushered in by so-called premonitory pains, resulting from the beginning contractions of the womb and lasting an indefinite time, several hours or days. A mucous, slightly bloody, discharge accompanies these pains, which gradually become more severe; the mouth of the womb becomes fully dilated, and the bag of waters (in which the child floats) is protruded. *Second stage.*—The bag ruptures, the waters are discharged, the pains become still more severe, the presenting part of the child passes through the pelvic canal, always adapting its longest diameter to the longest one of the pelvic cavity, and is expelled through the external orifice, being rapidly followed by the remainder of the child's body. The *third stage* comprises the delivery of the placenta and membranes, which generally takes place within thirty minutes. The average duration of labor in first confinements is twelve hours, although eighteen to twenty-four hours would not be considered abnormal; women who have had children are generally delivered more rapidly, within six or eight hours. After labor the lying-in state begins, during which the function of lactation is inaugurated, and the womb gradually returns to its natural size and configuration before conception, which latter event ordinarily takes place within six weeks. The child, having been separated from its connection with the mother by the ligation and division of the umbilical cord, is washed, dressed, and applied to the breast as soon as the mother has recovered from her exertions. By an early application of the child the febrile excitement known as "milk fever," ordinarily occurring on the third or fourth day, with the flow of milk into the breasts, is in a great measure avoided. The period which a woman after labor is confined to her bed varies in different countries; while in civilized communities seven to ten days is considered the proper time, in the East and among savage races the mother resumes her daily avocations immediately after delivery, and among the lower classes in Europe and the U. S. puerperal women very frequently leave their beds on the third or fourth day without evil consequences.

3. *Pathology.*—Pregnancy does not always last the stated time of 280 days, but often is interrupted at an earlier period, either by causes depending on diseases of the mother or of the fœtus and its appendages, or by accident or intention. Such interruptions may occur at any time, and during the first six months are called abortion or miscarriage, during the last three premature delivery. A fœtus born before the twenty-eighth week is ordinarily not viable, although several instances have occurred in which children born as early as the twenty-sixth week were by extraordinary care raised to maturity. The danger to the life of the mother from abortion may at times be great, either from uncontrollable loss of blood or from inflammation of the uterus or bowels (peritonitis). This is particularly liable to be the case when the abortion has been forcibly induced, as by sudden shock or with a criminal purpose. Tardieu relates thirty-four cases of criminal abortion, in which the death of the mother resulted in twenty-two. The danger is greatest during the third, fourth, and fifth months; during the first two months the impregnated ovum often escapes almost unperceived. A common cause of abortion is disease of the placenta. The physiological discomforts of pregnancy, such as nausea, neuralgic pains, constipation, may occasionally become so aggravated as to be actual sources of danger, and the pregnant woman is liable to dropsy, hæmorrhoids, congestion of the kidneys, and numerous other complaints. Occasionally the impregnated ovum does not pass into the uterus, but becomes attached in the Fallopian tube or drops into the abdominal cavity and develops there. This condition is called extrauterine pregnancy (tubal or abdominal), and generally ends fatally about the third or fourth month by rupture of the tube or peritonitis. In rare cases the child has been retained until term and removed by operation alive or dead, or it has died and been discharged piecemeal through the bowel, vagina, etc. The removal of the pregnant tube with the ovum intact by abdominal section has been successfully performed by Tait, of Birmingham, England, Veit, of Berlin, Mundé, and others during the early months of pregnancy; and numerous cases are reported where after rupture the abdomen has been opened, the bleeding tube ligated and removed, and the woman recovered.

Labor is either natural or preternatural—natural when nothing occurs to mar the progress of the unaided birth of the child and appendages, preternatural when the assistance of art, either manual or instrumental, is required. The causes of preternatural labor may lie either in the mother or the child. *The mother.*—Deformities of the pelvis or of the soft genital organs, rupture of the uterus, vagina, or the external parts (perineum), flooding (either during labor, when the placenta is situated over the mouth of the womb and is detached during dilatation of that orifice —placenta prævia—or after labor from the open vessels of the normal placental attachment), convulsions, inversion of the uterus. *The child.*—Too large size, monstrosity, abnormal presentation, transverse or oblique (requiring manual or instrumental interference), compression and protrusion of the umbilical cord (dangerous to the life of the child, but not to the mother, and not impeding delivery), too firm attachment of the placenta. The operations which may become necessary during pregnancy or labor are: The induction of abortion, when the preservation of the life of the mother renders it imperatively necessary that the pregnancy be interrupted, and of premature delivery, when the birth of a fully developed child at term is impossible on account of pelvic deformity; Cæsarean section, the removal of the child and appendages through an incision in the

abdomen and uterus, in cases where the pelvic deformity is so aggravated as to preclude the natural or instrumental delivery of even a mutilated child by the natural passages; the extraction of the child with the forceps; version or turning, and manual extraction by the feet, when it is desired to change the position of the child and accomplish rapid delivery; craniotomy, the perforation of the head and removal of the brain of the living or dead child to enable the passage of the diminished head through the contracted pelvis, thus sacrificing the child for the sake of the mother, etc. Of recent years the operation of Cæsarean section has been more successful both for mother and child, owing to increased experience in abdominal operations and careful antiseptic rules. A modification of the old operation was introduced by Prof. Porro, of Italy, and consists in removing the uterus and ovaries after extracting the child. It can hardly be said to have supplanted the original method. Of the dangers which assail the woman after delivery the most frequent are sore nipples and inflammation of the breasts and childbed or puerperal fever. The general mortality during parturition has decreased in consequence of the improvement in the study and practice of obstetrical science. According to a compilation by Winckel (*Path. and Therap. of the Puerperal State*, 1869) from more than a million labors, it averaged about 6 in 1,000 cases in private practice and 30 in 1,000 cases in lying-in hospitals, the large mortality in the latter institutions being mainly due to the epidemics of puerperal fever breaking out in them from time to time, the disease being rendered particularly virulent by the generally poor physical condition of the patients and the necessary crowding to which they were more or less subjected. The mortality from puerperal fever (which is now recognized to be simply blood-poisoning or septicæmia, the poison usually having been introduced from without, often in some mysterious manner) has so much decreased through the careful observance of the antiseptic rules now practiced in all surgical manipulations that even in maternity hospitals, where formerly the death-rate was the largest, the average percentage of deaths from this cause is less than 1 per cent. PAUL F. MUNDÉ.

Ocala: city (founded in 1851); capital of Marion co., Fla. (for location, see map of Florida, ref. 4–I); on the Fla. Cent. and Peninsular, the Fla. Southern, and the Savannah, Fla. and W. railways; midway between Jacksonville and Tampa. It is the center of the orange belt of the peninsula; contains 5 churches for white people and 6 for colored, 2 public-school buildings, industrial school, several private schools, 2 national banks, a State bank, and a daily and 4 weekly periodicals; and is principally engaged in orange and vegetable growing and phosphate-mining. Pop. (1880) 803; (1890) 2,904; (1900) 3,380.

EDITOR OF "BANNER."

Ocaña, ō-kaan'yăă: a town of the department of Santander, Colombia; 235 miles N. N. W. of Bogotá; 3,820 feet above the sea (see map of South America, ref. 1–C). It is the center of the trade between Lake Maracaibo and Venezuela on the E. and the Magdalena valley on the W.; the surrounding district is one of the finest agricultural regions of Colombia. Ocaña was founded in 1572. It was formerly the capital of Santander. H. H. S.

Oc'cam, or **Ock'ham**, WILLIAM OF: a Scholastic philosopher; b. at Occam, in the county of Surrey, England; d. in Munich, Bavaria, in 1347, at an advanced age. He was educated first at Oxford, and, after he became a Franciscan, in 1319, at Paris under the famous Duns Scotus. He rejected the realism of his master, and became the most eminent of Nominalists. Throughout his life, consistent with the strictest tenets of his order, he strenuously contested the pretensions of the pope to political power and secular possessions, first taking the side of Philip the Fair against Boniface VIII., and subsequently opposing John XXII., by whom he was summoned to trial before an ecclesiastical court at Avignon, whence he took refuge in 1328 with the Emperor Louis of Bavaria, just then in the midst of his struggle with the pope. He promised his pen in support of that monarch in return for his own protection (*Tu me defendas gladio, ego te defendam calamo*). Toward the close of his life he became desirous of making his peace with the pope, but he never signed the recantation demanded by him. No other scholar since the days of Abelard had applied himself so zealously to logic. His skill in handling logical weapons, his acuteness in making distinctions, his fertility in inventing reasons, gave him the name of *Doctor invincibilis*. His careful discrimination between the logical, real, and grammatical significance of terms enabled him to silence his opponents. The hypostatic entities of the Schoolmen before him were disposed of by his doctrine of the subjective nature of thought. His favorite principle was, "Entia non sunt multiplicanda præter necessitatem." In his *Centilogium Theologicum* the greater part of his hundred demonstrations attempt to prove that theological dogmas, such as the existence, unity, or infinity of God, the Trinity, creation, incarnation, transubstantiation, etc., involve contradiction of logical principles, are irreconcilable with reason, and to be accepted only by faith. This doctrine struck a fatal blow at Scholasticism. That form of philosophy had arisen solely out of the necessity which was felt of proving the rationality of the dogma. It had been seen that agnosticism would not only undermine rational theology, but also the faith in the dogmas themselves, because it would come to be held that they are inconceivable, and hence were words to which our minds attach no meaning; but in the triumph of Nominalism this older and more correct view was for a time eclipsed. If the objects of faith could not be proved by philosophy, nor even reconciled with reason, Scholasticism had no task to fulfill except the negative one of destroying what illusions it had already created. Its decline was rapid. The chief works of Occam are (*a*) *Tractatus Logices*, (*b*) *Quodlibeta Septem*, (*c*) *Super quatuor libros Sententiarum*, (*d*) *Expositio Aurea super totam Artem Veterum*. Besides these there were commentaries and polemics. WILLIAM T. HARRIS.

Occasional Causes, Doctrine of: a doctrine invented by the Cartesians to explain the action of mind and matter upon each other. Their theory was that God, the First Cause, on the *occasion* of certain volitions within the mind, produces certain actions or motions of the body; since, said they, the soul, a thinking substance, can not act upon matter, which is pure extension. This doctrine was first fully set forth by Geulinex, and it made necessary extensive and ingenious treatises on the part of Leibnitz, Malebranche, and other philosophers of that epoch to explain away the difficulties involved. Revised by W. T. HARRIS.

Occipital Bone: See OSTEOLOGY.

Oc'com, or **Occum**, SAMSON: an Indian preacher of the Mohegan tribe; b. at Mohegan, near Norwich, Conn., about 1723; was educated at the Rev. Ebenezer Wheelock's Indian school at Lebanon; in 1766 accompanied Rev. Nathaniel Whitaker, D. D., who was sent on a mission to Scotland, England, and Wales to raise funds for the establishment of schools for the education and Christianization of the North American Indians. Being the first preacher of these aboriginal tribes who had visited Great Britain, he created a sensation, and drew large audiences everywhere. He officiated in George Whitefield's chapel in Tottenham Court Road, London, and greatly contributed to the success of Dr. Whitaker's mission. The projected school subsequently became Dartmouth College, New Hampshire. After his return he continued in the ministry, preaching chiefly to the Indians. In 1786 he removed with a colony of Indians to what is now Oneida co., N. Y.; subsequently he lived among the Stockbridge Indians. D. at New Stockbridge, N. Y., July 14, 1792. He wrote an account of the Montauk Indians, published by the Massachusetts Historical Society (1st series, x., 106), and wrote the hymn, *Awaked by Sinai's Awful Sound*.

Occultation [from Lat. *occulta'tio*, a hiding, deriv. of *occulta're*, intensive of *occu'lere*, hide; *ob-*, intensive + *cela're*, hide]: in astronomy, the hiding of one heavenly body behind another. The most common cases of this phenomenon are the occultation of stars by the moon, several of which can usually be seen every month with the aid of a small telescope. Indeed, by closely scrutinizing the moon, when it is three or four days old, it will be found that scarcely an hour passes without some star being hidden behind the dark edge of her disk. Two important astronomical conclusions have been drawn from such occultations. One is that the apparent diameters of even the brightest stars do not exceed a small fraction of a second. This is shown by the fact that, when occulted by the dark limb of the moon, they retain their full brilliancy until the limb actually covers them, and then disappear completely with absolute suddenness, no matter how oblique may be the motion. There is never a visible fading away of the light, which would be the case if the star were of sensible magnitude, because then it would only be gradually covered by the moon.

Another conclusion is that the moon has no atmosphere, or at least none dense enough to exert any refraction upon the rays of light. Did such an atmosphere exist, the star, when near occultation, would be seen through it, and its light would suffer a certain amount of refraction. When a bright star is occulted it sometimes appears to be entirely projected upon the moon's limb before it disappears, as if the moon itself were transparent. This, however, is purely an effect of irradiation, which makes the moon's bright limb appear larger than it really is.

Observations of occultations are useful both for the determination of longitudes and for fixing the position of the moon. The best determination yet made of longitudes in Australia was made by Prof. Auwers from a great number of occultations of the moon observed in that region. The work of determination is, however, more laborious than that of a determination by the telegraph.

Stars are occasionally occulted by the planets. This occurrence is a comparative rarity, owing to the small size of the planets and the disappearance of the star at the approach of the brilliant body of the planet itself. S. Newcomb.

Occupancy: See Property.

Occupation [from Lat. *occupa'tio*, a seizing, deriv. of *occupa're*, seize, take possession of, occupy]: in Roman law, the act of taking possession. The possession thus acquired, if the law allowed, could end in full ownership. Thus, *occupaticius ager*, in one of the old Latin grammarians, denotes land deserted by its own cultivator and occupied or taken possession of by another. The principal objects which could by Roman law be thus taken possession of were—(1) wild animals, which in their free state were held to be without an owner, and wherever taken belonged to the *captor*. If, after being taken, they recovered their freedom, they again became without an owner and could belong to a new *captor*. (2) Things abandoned by an owner with the intention of giving up his ownership and without intending to transfer his right to another. (3) Treasure-trove belonged by Roman law to the finder in certain cases only, as where it had been hid in an unusual way and so long that the owner was not to be discovered. Where it was found by a man on his own ground or on ground without an owner, it belonged wholly to him. Where it was found on the ground of another, it went half to the finder, half to the proprietor of the soil; to the state if the land was public. (4) In war the foe was looked on as without rights, and thus his property was without an owner and capable of acquisition. Things taken from a public enemy during war, however, went first to the state, which could give rights over them to others, as to the captors.

Occupation as a Means of Acquiring Territory.—Discovery, exploration, and settlement resulting in beneficial use, found a valid claim to territory hitherto unoccupied. The third of these is the essential point. By beneficial use is meant any commercial use of the resources of the new country, by fishing or fur-trading stations as well as by cultivating the soil. The rights of a civilized discoverer are held to be paramount to those of prior savages, but the ownership of the latter should be extinguished by purchase. Where settlements of different nationality are made on the same coast, the territory is equitably divided between them. The extent of country which occupation in its early stage may found claim to is vast but indefinite, including generally the drainage areas of the rivers explored. The history of the U. S. claim to Oregon and of the formation and colonization of the Congo Free State may be read in illustration.

Military Occupation.—In the *Instructions for the Government of Armies of the United States in the Field*, issued in 1863, sec. i., it is declared that "a place, district, or country occupied by an enemy stands in consequence of the occupation under the martial law of the invading or occupying army." "Martial law is the immediate and direct effect and consequence of occupation or conquest," whether a proclamation to that effect has been made or not. It "consists in the suspension by the occupying military authority of the criminal and civil law, and of the domestic administration and government in the occupied place or territory, and in the substitution of military rule and force for the same, as well as in the dictation of general laws, as far as military necessity requires this suspension, substitution, or dictation. The commander of the forces may proclaim that the administration of all civil and penal law shall continue, either wholly or in part as in times of peace, unless otherwise ordered by the military authority." In 1874 at Brussels was held a conference of delegates of European powers to work over a code of the rules to be observed in civilized warfare. Their project, as modified by discussion, speaks as follows of military authority within the territory of an enemy: "A territory is considered to be occupied when it is found in point of fact placed under the authority of a hostile army. Occupation extends only to the territory where such authority is established and is in a position to be exercised.

"The legal authority being suspended and passing into the hands of the occupant, he will take all possible steps to reestablish and secure order and public business.

"With this in view he will maintain the laws in force in time of peace unchanged, except in case of necessity."

This code has never received governmental sanction; it simply represents the opinion of the delegates. There are two questions which interest us in this question of occupation: The first is, what is occupied territory? the second, what legal changes does occupation work? See Brussels Conference.

Without going into these questions at length, it is enough to say that occupation, being a result of military force, must depend upon the continuance of such force. This, however, does not imply that the presence of the invading army must be constant in a given district. It *does* require that the military power of the dispossessed sovereign shall be inoperative in it.

As to the second query, it is to be remarked that occupation is not completed conquest. Such change of sovereignty as is implied in conquests results only from a subsequent treaty of cession or from prescriptive possession. The original sovereign retains his rights, but temporarily they are suspended. Meanwhile the will of the occupant prescribes the laws of the occupied territory as a matter of military necessity and in recognition of a state of fact. Such necessity should be the limit of his exercise of this right. He should, and probably will, keep in force the former laws, so far as relates to local order and government. He will not exact any form of military service from the inhabitants. The taxes imposed upon them, except when in the nature of penalties, should be expended for their benefit. On the other hand, all unorganized opposition to the occupant is unlawful and in its graver forms criminal. What proceedings within the occupied district on the part of discontented inhabitants should be punished with severity it is not easy to define by general rules. Thus much, however, may be said—that guerrilla warfare by parties who have no uniform, or who put on and take off a uniform at pleasure, and are without any connection with the national army, is, and on account of the atrocity and insidiousness with which such warfare is apt to be carried on ought to be, punished with severity. Revised by T. S. Woolsey.

Ocean [from Lat. *oce'anus* = Gr. *ὠκεανός*, the river surrounding the habitable world; old preverb *ō-* + partic. of root *kei* (*κεῖμαι*), lie; cf. Skr *āçáyāna-*, lying around]: the vast body of salt water, occupying the greater depressions of the earth's surface. The ocean is sometimes spoken of as the hydrosphere, between the solid geosphere and the gaseous atmosphere. Its area is 150,000,000 sq. miles, or three-quarters of the earth's surface. Its average depth is about 2 miles (according to Krümmel, open oceans, 2,000 fathoms; all salt water, 1,800 fathoms); its volume is 300,000,000 cubic miles, or $\frac{1}{843}$ of the earth's volume; its mass is 13×10^{17} tons, or $\frac{1}{4540}$ of the earth's mass.

A marked characteristic of the ocean is its continuity, and the fact that the land areas which rise above it are mostly gathered into large continental masses, lying for the greater part in one hemisphere, instead of being scattered through the ocean in small islands. The hemisphere which has Southern England for its pole includes nearly all of the land, while the hemisphere having New Zealand for its pole includes the greater oceans. The oceans of the land hemisphere are the Atlantic with its Arctic gulf, the Indian, and a part of the Northern Pacific; the lands in the water hemisphere are Australia and the islands thereabouts, a part of South America and the Antarctic lands. The South Pacific and Antarctic Oceans may therefore be regarded as the great ocean area of the world, from which the North Pacific, the Indian, and the Atlantic-Arctic waters extend in the form of great arms, the first broad and blunt, the last long and relatively narrow.

Viewed from the standpoint of the earth's history, the ocean is that part of its mass which remains liquid at exist-

ing temperatures, but which was probably vapor or gases during the earth's early youth, when the earth was a glowing mass, and which will be frozen solid in the earth's old age. In the economy of the earth, the ocean is the great reservoir from which nearly all the circulating waters are derived by evaporation. Its vapors are carried by the winds, condensed to fall as rain or snow on the ocean again or on the lands; returning from the lands as rivers, bearing land waste in suspension or solution. The waves of the ocean beat on the shores of the lands and consume them. Thus the ocean gains contributions of all kinds of materials afforded by the lands, the coarser parts being deposited near shore, the finer suspended particles being strewn farther off shore, but seldom more than 200 or 300 miles away, while the dissolved parts remain in solution until abstracted by organic or physical process. The currents of the ocean are of extreme importance in determining the distribution of temperatures; the tides sweep the shores and bays. The level surface of the ocean is the standard of reference in all measures of the earth's form, and of the altitude of the lands.

Classification of the Ocean Areas.—The parts of the ocean are divided, first, according to depth; second, according to form. Soundings are now made with great accuracy even in depths of over a mile. Fine steel wire is used instead of rope, and the sinker is automatically detached on touching the bottom. Thermometers may be attached to the wire at various points, with automatic devices for registering the temperature at the greatest depth to which they descend. Samples of the bottom and of water from various depths are brought up. When dredging is attempted wire rope is used to haul the dredge. Soundings have shown that the great oceanic areas are all over 1,000 fathoms in depth, while the waters close around the continents are often less than 100 fathoms in depth for a considerable distance off shore. This shallow belt really belongs to the continent, although at present overflowed by the sea; it is called the continental shelf; nearly all the littoral islands are borne upon it (see ISLANDS), and it receives nearly all the waste from the adjacent lands. It is well developed along the Atlantic coast of the U. S., being over 500 miles wide in the N. E., where Newfoundland rises from it, and narrowing southwestward, but it is almost wanting along the Pacific coast. The shelf encroaches on the Gulf of Mexico, the deep basin of the Gulf being only about half the water area. Shelves occur along the northeast and southeast coasts of South America, but not on the western coast. A broad shelf extends from Europe across the North Sea and beyond Great Britain. Two extensive platforms of this kind stretch S. E. from Asia and N. from Australia, bearing many islands.

The deep oceans really constitute a single water body, with arms running between the lands; but we shall later see good reason for subdividing them according to their surface circulation. Partly set aside from the great ocean are the mediterraneans: the classic Mediterranean, the greatest example of the kind, the Caribbean Sea, the Gulf of Mexico, the Red, Celebes, Sulu, China, and other marginal Asiatic seas of less size. These are all of 1,000 or 2,000 fathoms depth, or more; but they communicate with the great ocean only by relatively narrow, or at least shallow, passages. It is noticeable that the ordinary geographical terminology of the oceanic areas gives no clew to their physical features. *Ocean* should never be applied to the waters on the continental shelf, as in the German Ocean. *Gulf* should be reserved for deep re-entrants, such as the Gulf of Guinea, and not applied to shallow bays, such as the Persian Gulf or the Gulf of St. Lawrence. *Sea* might advisedly be applied to mediterraneans, like the Caribbean or the Chinese Sea, and not to shallow waters, like the Yellow Sea or the North Sea, or to open gulfs, like the Arabian Sea. *Bay* should be reserved for shallow re-entrants, like Delaware Bay, Chesapeake Bay, and not given to deep gulfs, such as the Bay of Biscay or of Bengal. The ordinary use of these terms is in hopeless confusion.

The greatest depths thus far discovered are in the Pacific, N. E. of Japan, 4,655 fathoms, and in the Atlantic, N. of Porto Rico, 4,561 fathoms. The great oceanic depression sinks much deeper beneath the sea-level than the mean height of the land rises above it. The reason for this is primarily the great volume of the ocean, but various secondary causes should be considered: the strength of sunshine giving active evaporation, rapid atmospheric circulation, and plentiful rainfall; the chemical activity of the atmosphere in weathering rocks into soil; the relatively slow rate of continental and mountain upheaval—all these combine to permit the forces of degradation to reduce the greater parts of the lands nearly to sea-level. Only here and there on the earth, and only now and then in geological time, are great land elevations possible. Viewed in this way, it can be hardly accidental that the largest and driest continent has the highest mountains and plateaus.

The greater part of the deep ocean floor is smooth and monotonous, without the variety of relief that characterizes the lands. Excepting within a few hundred miles of the shore, it receives no significant share of mechanical land waste. Excepting volcanic cones, and excepting occasional inequalities near continents, not characteristic of the open oceans, the ocean floor is a gently undulating plain of calcareous or argillaceous mud or "ooze," the argillaceous ooze preponderating at depths greater than 2,500 fathoms. The ooze is derived for the most part from the disintegration of the skeletons of minute forms of life (chiefly Foraminifera which live near the ocean surface), with a small share of volcanic dust. The broad and gentle undulations of the bottom by which the shallower "swells" descend to the deeper "abysses" do not serve to break its monotony. All is cold and dark, without changes of days, weather, or seasons.

Composition of Ocean Water.—In 100 parts of ocean water, 3·5 parts are dissolved salts, whose composition as determined by Dittmar for the *Challenger Report* is:

Chloride of sodium	77·758	Sulphate of potassium	2·465
Chloride of magnesium	10·878	Bromide of magnesium	0·217
Sulphate of magnesium	4·737	Carbonate of calcium	0·345
Sulphate of calcium	3·600		

Besides these substances, many others exist in minute proportions, as bromine, iodine, fluorine, phosphorus, silicon, boron, gold, silver, lead, copper, zinc, cobalt, nickel, iron, manganese, aluminium, barium, strontium, etc. (*Forchhammer*).

It is noticeable that those minerals which are easily soluble make a considerable part of sea salt, even though relatively rare in the earth's crust, while the more common and less soluble rocks are faintly represented in the sea; yet two of the latter, silica and limestone, although occurring in very small proportion, are used as the framework of most marine animals. Atmospheric gases also occur in sea water: near the surface the proportion of oxygen to nitrogen is about one to three, but in deep water the oxygen is greatly diminished. Carbonic acid, believed to be loosely combined with certain of the salts, exists in much greater proportion than in the atmosphere, its source presumably being in volcanic vents, whence it must issue as a liquid under the great pressure of the deep ocean.

The salinity of the surface waters varies by small but significant amounts. The average density is 1·026, but it rises to 1·027 in the dry trade-wind belts of the open ocean, where evaporation is in excess of rainfall, and to over 1·028 in inclosed seas, like the Mediterranean and the Red Seas. A lower measure (1·026) is found around the equator under the moist air and heavy rains of the doldrums, where it is occasionally possible to gather water that is almost fresh at the surface after a heavy downpour; and also especially among islands, where the movement of the waters is retarded and the rainfall is increased, as about Java and Sumatra, where the density is 1·025. The sea surface is also slightly fresher in high latitudes, where evaporation is deficient, and in long arms of the sea (but not in trade-wind latitudes), as the Black Sea (1·021 to 1·014), the Baltic (1·023 to 1·004), and the Gulf of St. Lawrence. Large springs sometimes rise through the salt water near the shore, bringing water almost fresh to the surface.

The density of the ocean at the bottom is hardly greater than at the top, so little is water compressible, in spite of vast pressures exerted upon it, the ocean being unlike the atmosphere in this respect. According to Tait, an ocean 2 miles deep loses about 76 feet of depth by compression; the depression of the actual ocean surface in this manner being about 116 feet, thus laying bare about 2,000,000 sq. miles of coastal lowlands that would be submerged if the ocean should now assume a uniform density,

Although the water on the open ocean is remarkably transparent, it is believed that sunlight is practically extinguished at a depth of a few hundred fathoms. Under a clear sky mid-ocean water has a strong blue color, but under heavy clouds it becomes gray or leaden, and when streaked with foam under a heavy storm the water seems almost black. On "soundings" near shore the color generally becomes greenish; near large rivers it may be tinged

with yellow, even out of sight of land. Patches of red or whitish color are sometimes caused by swarms of minute animals or plants.

The mean temperature of the ocean surface varies with latitude and with the movement of its currents. The contrast of equatorial and polar temperatures is less in the ocean surface waters than in the air over the lands, being from about 85° to 30° in the first and from 90° to 10° or 0° in the second. This is because of the equalizing tendency of ocean currents. The annual variation of temperature is relatively small over all parts of the ocean surface, not only on account of the currents, but also because the temperature of the water is changed with great difficulty, by reason of its various physical properties. It warms slowly because of its reflecting power, by which much sunshine is thrown back; its transparence, by which much sunshine is allowed to penetrate beneath the surface and little is absorbed to warm the surface layer; its volatility, by which much sunshine is expended in warmer latitudes in supplying latent heat for evaporation; its mobility, by which the surface layer is frequently mixed with less warmed or cooled water from beneath; its currents, by which water now warmed is replaced by cooler water. Conversely, these physical properties all retard its cooling. It is on account of this conservatism with respect to temperature that the climate of the great south temperate oceanic zone is so inhospitable—not excessively cold in winter, not warm in summer, but always of a penetrating chill. The islands of South Georgia, no farther from the equator than Middle England, have snow in midsummer, with glaciers descending to the sea-level; this contrast not being due to any exceptional conditions in the southern islands, the climate of whose latitude they fairly represent, but to the exceptionally favorable condition of England, which lies to leeward of a large drift of warm and well-tempered ocean waters. The conservatism of the ocean as to temperatures affects the winds that blow over it, and these in turn affect the climate of leeward coasts; hence the milder climate of Western Europe, where the winds prevailingly blow from the ocean, in contrast to the severe climate of Eastern North America, where the winds prevailingly blow from the lands. See CLIMATOLOGY.

Salt water has its maximum density at its freezing-point, 28°, being in this respect strongly contrasted with fresh water, which is densest at 39°. The coldest waters of the ocean therefore accumulate at the bottom, but in freezing salt water expands and its ice floats. As the ice-crystals form, the salt is partially excluded from them. The floe-ice of polar seas is thus formed. When drifted by winds or currents two floes may collide, thus forming pack-ice. Unless melted by drifting into warmer latitudes, the ice may become heavier and heavier in successive winters; thus the paleocrystic ice-sheets or old heavy ice-floes of Arctic explorers are explained. Icebergs are shed into the sea from glaciers; they may float into sub-temperate latitudes; they sometimes carry bowlders and gravel, which are dropped to the sea-floor as the iceberg melts.

The distribution of temperature in the deeper oceans is dependent on their supply of cold polar water which creeps along the bottom toward the equator. In the polar oceans the variation of temperature with depth is slight, the whole mass being within a few degrees of its freezing-point; in the equatorial oceans the decrease is rapid until a temperature of 40° or 38° is reached at a depth of about 400 fathoms, then there is a slow cooling to a temperature of 34°; or 32° at the bottom. The mediterranean seas, inclosed by comparatively shallow barriers, can not receive a supply of deep cold waters; hence their bottom temperature is dependent either on their own coldest surface waters in winter or on the temperature of the open ocean water at the depth of their deepest inlet. Thus the Mediterranean, with a maximum depth of 2,170 fathoms, has a uniform temperature of 55° at all depths beneath 260 fathoms, this being the temperature to which the whole sea is reduced in winter. The Caribbean Sea and the Gulf of Mexico, with depths of 3,428 and 2,118 fathoms, have bottom temperatures of 39°. As this is much lower than the mean temperature of the surface in winter, the depth of the deepest inlet from the Atlantic, 710 fathoms, was predicted from the previously known depth at which 39° occurred in the adjacent open ocean. The Sulu Sea, inclosed by the Philippine islands, is remarkable in having great depth, 2,550 fathoms, yet its bottom temperature is 50·5°; hence its deepest inlet is thought to be about 200 fathoms. Before considering the cause of the movement of the cold polar waters toward the equator, other movements of the ocean must be examined.

Waves are produced by the winds blowing over the ocean surface. While the wave-form moves forward in the direction of the wind, the water particles describe orbital paths, moving forward at the crest, backward in the trough, falling and rising between. When little waves ride on the surface of larger ones, they are more exposed to the wind on the larger crests than in the troughs; hence while on the crests they are blown forward, and thus increase the orbital velocity of the particles in the larger wave, and in turn increase the movement of the larger wave. It is in great part for this reason that a film of oil, that spreads spontaneously over the water and prevents the formation of little waves, prevents also the increase in size and the combing or breaking of the larger waves; and hence in rough weather is of great service in decreasing the violence of wave-motion near a laboring vessel.

Strong gales and hurricanes produce waves of great size, but none of greater height than 30 or 40 feet have been carefully measured. When a great size is attained the progressive velocity of the wave may be as much as 60 or 80 miles an hour; the wave-length, or distance from crest to crest, a quarter to half a mile; hence such waves succeed one another in periods of fifteen or twenty seconds. While their velocity of progression is exceeded by the stronger blasts of wind in the gales that cause them, it is frequently the case that they outstrip the average gale, although in such cases the forward orbital velocity of the water particles in the wave-crest is much less than that of the wind. Once excited in a storm-area, the waves swing outward on all sides, diminishing their height, but preserving their length, velocity, and period, and gradually falling to a broad heaving of the surface, known as a swell. The winter storms of temperate latitudes thus cause a long, low swell across the doldrums of the equator, even into the hemisphere opposite to that of their source. When the swell runs ashore on a gently shoaling coast, its height increases, the length and velocity of the successive waves decrease; but their period remains unchanged; close to the shore they roll over and fall, and are hence called breakers or surf; they dash violently upon the beach, rushing forward in a sheet of foam, and returning under the next wave to form the dreaded undertow. When a strong wind blows on a steep coast over deep water, another effect is produced; here the waves attain great size, but instead of dashing against the shore they dance up and down in front of it. The stronger the wind, the deeper the on-shore water must be to manifest this motion.

Long flat waves are produced by earthquake shocks or volcanic explosions under or near the sea. The waves overwhelm the coasts near their source, causing great destruction. In the Strait of Sunda, after the explosion of the volcano Krakatoa, Aug. 26, 1883, the sea rose over 100 feet on the neighboring coasts, drowning over 30,000 persons. Waves thus excited swing far and wide across the ocean, like waves from storms, imperceptible in the open sea, but increasing considerably when running on a shoaling coast. Their velocity of progression is very great; the waves from the earthquake at Simoda, Japan, Dec. 23, 1854, were registered in San Francisco in twelve and a half hours; the waves from the earthquake at Arica, Peru, Aug. 13, 1868, were registered at Sydney, Australia, in twenty-three hours.

Storm-waves or destructive overflows of the sea are caused on low coast lands when violent on-shore winds conspire with a rising tide. The densely populated delta of the Ganges has repeatedly suffered in this manner; in the cyclone wave of Nov., 1876, it is reported that over 100,000 persons were drowned. Similar storm-waves occurred on the Louisiana coast in Oct., 1893, and on the low Carolina coast in August of the same year.

Ocean currents are of several kinds. The great surface currents are caused by the winds; the deep movement from the polar seas is due chiefly to difference of density resulting from difference of temperature; the opposed surface and bottom currents in certain straits are caused by difference of density; active alternating currents in estuaries and sounds are caused by the TIDES (*q. v.*).

Wind-made currents are caused by the brushing forward of water in wave-crests, whereby a general forward movement is communicated, first to the surface stratum, then to deeper layers. Where the winds are steady, as in the trade-wind belts, the currents are regular; where the winds

are frequently interrupted by stormy shifts, as in the temperate zones, the surface currents vary more or less with the winds, but the general drift of the sub-surface waters follows the prevailing direction of the wind. Where the winds vary periodically, as in the monsoon region of the Indian Ocean, the currents vary also, their time of change being a little later than that of the winds. The general winds of the world have an eddy-like circulation around each of the five chief oceans; but the ocean currents are much better hemmed in than the winds, and their circulatory movement gives good physical warrant for the division of the great continuous ocean into the parts generally recognized—the North and South Pacific, the North and South Atlantic, the Indian and the Antarctic Oceans. The great eddies of the northern oceans turn slowly from left to right; of the southern oceans from right to left, except that the Antarctic has a drift from left to right, or west to east, around the pole, which it shares with the three adjoining oceans. The Arctic should be regarded as hardly more than a great gulf at the end of the long Atlantic. The currents of the ocean eddies may be called drifts where they are broad and slow-moving, and streams where they are concentrated to narrow courses and rapid flow near coasts or through straits.

The circulation of the North Pacific is relatively simple and regular; its strongest movement is on the W., where the equatorial member of the eddy turns sharply from its westward course and flows N. E. past Japan, forming the Japanese current, or Kuro-siwo; there is a moderate backset or reversed eddy in the Alaskan bay, a small amount of leakage from the Arctic through Bering Strait, and some cold waters flowing southwestward past Kamchatka. The South Pacific eddy is less regular; it bears a vast volume of cooled water northward along the west coast of South America, forming the Humboldt or Peruvian current, and thus producing near the Galapagos islands the lowest temperatures in the equatorial ocean; but it loses distinctness among the many islands on its western side, it gives off branches through the Australasian archipelago to the Indian Ocean, and it is confluent on the S. with the great Antarctic eddy. The South Indian Ocean has a normal right to left eddy, but on the N. it is complicated by the alternating monsoon currents of the Bay of Bengal and the Arabian Sea. Very little if any water passes from the Indian Ocean around the Cape of Good Hope to the Atlantic. The South Atlantic eddy is confluent with the Antarctic on the S., and separated from Patagonia by a wedging current of cold water; but it is very peculiar in giving forth a great branching current across the equator, to join with the North Atlantic eddy off the coast of Guiana. The North Atlantic eddy receives the branch current just mentioned; it is complicated on the W. by the branches outside of the Antilles, as well as through the Caribbean and Gulf of Mexico. The strong stream issuing from the Gulf between Florida and Cuba, known as the Gulf Stream, is the most famous current of the world, running 80 or 90 miles a day in its narrowest part. As the North Atlantic is the only ocean communicating with Arctic waters, all their circulation is dependent on the great branch of the North Atlantic drift which splits off W. of France, passes northeastward along the coast of Norway, and, after making the round of the Arctic, returns on either side of Greenland to form the Labrador current, which wedges its way southward along the eastern coast of the U. S.

Within each oceanic eddy the more quiet waters about the center contain a greater or less amount of floating seaweed or *sargasso*, as it is called by the Portuguese, hence the name Sargasso Sea. Between the paired eddies of the North and South Pacific and Atlantic there are countercurrents of somewhat variable strength, somewhat N. of the equator, running from W. to E.; they are presumably caused chiefly by the southwest winds that occur here, particularly in the northern summer season. The latter are the extension of the southeast trade into the northern hemisphere, where it turns to a southwest wind. It is by a similar extension of the southeast trade of the Indian Ocean into the northern hemisphere, where it forms the southwest monsoon of the northern summer, that the currents there are reversed from the course that they maintain under the northeast monsoon of winter.

The very slow movement of the deep cold polar water toward the equator, proved by the distribution of temperatures already described, has by many geographers been referred to the reflux of an excess of surface waters, brushed by the winds toward the poles; but this excess is not proved. Moreover, the branch current that crosses the equator from the South to the North Atlantic should, if the winds were the only cause of the bottom movements, produce a north-to-south movement of the deep waters beneath the Atlantic equator; but the distribution of bottom temperatures there indicates that the deep movement under the equator in the Atlantic is chiefly from S. to N.; hence some other cause than surface winds must be inferred for the bottom movement. This cause is found in the greater density of the cold polar waters; the fact of greater density being doubted by no one, but its sufficiency to cause movement being often questioned. It appears, however, from calculation, that the effective equatorward force here applied is not much less than the force by which the tides are swung back and forth twice a day, as has been shown by Ferrel; and as the equatorward force acts perpetually, it should be regarded as the chief cause of the bottom movement.

Salinity currents are found well exhibited at the Strait of Gibraltar, where the less saline surface current is inward and the denser undercurrent outward; similarly in the Bosphorus, between the dense Mediterranean and the fresher Black Sea; at the strait of Bab-el-Mandeb; and at the entrance to the Baltic. The undercurrent in these various straits always moves from the denser to the less dense water body.

The distribution of life in the ocean has been much studied by the exploring expeditions of the nineteenth century. This life is extremely abundant and varied in the littoral waters of the torrid zone, and exists in remarkable variety even in much colder latitudes, both the vegetable and animal forms of the polar seas being much more numerous than those of Arctic lands. Besides those forms found along the shores in relatively shallow water, there are others which inhabit the open sea near the surface, hence called pelagic forms; and others again which inhabit the bottom of the deepest oceans, in spite of the intense pressure of the overlying water, of the monotony of the surrounding physical conditions, and of the absence of sunlight. From the fact that certain abysmal forms possess eyes and are marked by varied colors, it is inferred that light from some other source, such as phosphorescent animals, may cause a faint illumination there. The intermediate depths of the ocean have been imperfectly explored, but if they possess any characteristic fauna it is a very sparse one. The pelagic fauna of the surface is remarkable chiefly for the excessive abundance of minute, almost transparent, forms, chiefly of the lower orders of life. It is from the minute calcareous and siliceous skeletons of these animals that the ooze of the bottom is chiefly supplied. Although the plants and animals of the land are thought to have been evolved from more primitive forms that inhabited the seas, where the earliest forms of life presumably existed, yet the larger marine mammals, such as whales, walruses, etc., are believed to have been developed from land mammals.

Ocean Grove: town; Monmouth co., N. J. (for location, see map of New Jersey, ref. 4–E); on the Atlantic Ocean, and the Cent. of N. J. and the Penn. railways; 1 mile from Asbury Park, 6 miles S. of Long Branch. It is a popular summer resort, and is widely known as the seat of the Ocean Grove Camp Meeting Association of the Methodist Episcopal Church. This association was organized in 1869 under the presidency of the Rev. E. H. Stokes, D. D., who still (1894) retains its direction. The first preaching-stand was erected in 1874, the congregation using seats of pine planks laid on trestles and without backs. The first permanent building, a frame structure covered with green pine boughs, was erected in 1875; an auditorium, seating 5,000 people and costing $10,000, was built in 1880; and a second auditorium, the largest audience-room for evangelistic services in the U. S., comfortably seating 10,000 persons and costing $75,000, was dedicated Aug. 9–12, 1894. The town has numerous hotels, boarding-houses, and summer cottages, and two weekly newspapers. Pop. (1890) 2,754; (1900) 4,251.

Ocea'nia, or **Oceanica**: a term of no precise application, used by various geographical writers to denote lands in

greater or less areas of the Pacific Ocean, some including only Polynesia, Melanesia, and Micronesia, and others adding Australasia and the East Indian Archipelago. Many leading geographers and map-makers do not now employ the term at all on account (1) of the confusion above noted; (2) because it has been made to include both oceanic and continental islands, though its use should be confined to oceanic islands; and (3) because it has been used to exclude a large part of the oceanic area to whose lands it would be in strictness equally applicable, as the Atlantic islands. C. C. Adams.

Ocellus [Lat., a little eye]: a name given to the smaller organs of vision, especially in the Arthropoda. In these the ocelli are small, simple organs, each with its own lens and retinal layer, and are contrasted with the larger compound organs of vision so typical of the group. See Entomology.

O'celot [from Mex. *ocelotl*]: one of the handsomest of the cat family found in America, the *Felis pardalis* of the naturalists. It is found from Southeast Texas to Patagonia, and formerly ranged to Louisiana. The color varies from tawny yellow to reddish gray, marked with numerous black spots, and dark stripes and blotches edged with black. There is

The ocelot.

almost always one of these stripes along the region of the shoulders, and there are two black stripes on each cheek. The under parts are whitish. The ocelot is extremely variable in its markings, and it is still an open question as to whether or not several distinct species have been combined under one name. The total length varies from 3 to 4 feet, the tail being 11 to 15 inches long. F. A. Lucas.

Ocher, o'ker [from Fr. *ocre* < Lat. *och'ra* = Gr. *ὤχρα*, yellow ocher, deriv. of *ὠχρός*, pale, pale yellow]: any one of certain pigments made of clays colored by hydrated peroxide of iron in variable proportions, varying in shade from pale yellow to deep orange. The term is also more broadly applied to any clay richly colored by peroxide of iron. Ruddle, or red chalk, is a variety of ocher consisting of decomposed *hematite*. In mineralogy, earth varieties of *hematite* or iron peroxide, if bright tinted, are known as red ocher, while argillaceous and decomposing *limonites*, or hydrated peroxides, give rise to brown ocher. Moreover, the term is used in that science, in combination, to express the earthy, pulverulent, decomposing oxides of other elements.

Ochino, *ō*-kee'n*ō*, Bernardino: preacher; b. at Siena, in the Papal States, 1487; joined the strictest branch of the Franciscan order, and afterward the still stricter order of the Capuchins, and acquired a great reputation as a preacher. Paul III. chose him for confessor, and other honors were heaped upon him. He was chosen in 1538 by the Capuchins to be their general; but in Naples he became acquainted with the Spanish mystic Juan Valdez, with Peter Martyr, and others, and from that time began to preach on justification by faith, on the futility of indulgences, etc. Suspicions arose with respect to his orthodoxy; and when, in 1542, he published in Venice his *Dialogi VII. Sacri.*, he was summoned to Rome to explain and retract. Fully aware of the danger, he fled to Geneva, where he published six volumes of Italian sermons (*Prediche*, 1542–44), of which twenty-five were translated into English (1548). From Geneva he went to Augsburg, and thence to Strassburg, London, Zurich, Cracow, etc., in each place preaching to the Italians, publishing a number of books, but leading a somewhat erratic life. D. at Schlackau, Moravia, 1565. In the first works he published after his flight from Italy he advocated Calvinistic views, but in the later Socinianism becomes more and more apparent, especially in his catechism, published at Basel (1561). See his *Life*, by Benrath (Leipzig, 1875; trans. into English, New York, 1877). Revised by S. M. Jackson.

Ochoa y Ronna, Eugenio, de: poet, critic, and scholar; b. at Lezo, Guipuzcoa, Spain, Apr. 19, 1815; d. Feb. 29, 1872. After studying at the College of San Mateo, and then in that of Santo Tomás at Madrid, he went in 1829 to Paris to study in the École des Arts et Métiers. He also essayed painting, but trouble with his eyes obliged him to abandon this. In 1834 he returned to Madrid, and began to write for the *Gaceta de Madrid*, which the famous Alberto Lista was then directing. The revolution of La Granja, however, forced him to return to Paris, where he occupied himself with editing works of the Spanish classic writers for the extensive *Colección de los mejores autores españoles* planned by Bandry, as well as with other literary undertakings. He brought out the first modern editions of the works of the Marquis of Santillana, *Hernán Pérez de Pulgar*, etc. In 1844 he returned to Madrid and became under-librarian in the National Library. In 1847 he was made director of the state printing establishment; and soon after chief of bureau in the ministry of Public Instruction. In 1844 he was elected a member of the Spanish Academy, and a little later of the Academy of History. Besides his work as editor, he made many translations from the English and French, among others of Hume's *History of England*; Napoleon III.'s *Jules César*; Scott's *Monastery* and *St. Ronan's Well*; Vergil's *Eclogues* (1879). He prepared for Rivadeneyra's *Biblioteca de Autores Españoles* an *Epistolario español* (vols. xiii. and xlii.). By commission of Louis Philippe he compiled an exhaustive catalogue of the Spanish manuscripts in the libraries of Paris (1844). Worthy of mention also are his play, *Incertidumbre y Amor* (1836); *París, Londres, y Madrid* (1861); *Miscelánea de Literatura, Viajes y Novelas* (1867). His poetical and critical contributions to periodicals were very numerous. A. R. Marsh.

Ock'ley, Simon: Orientalist; b. at Exeter, England, in 1678; studied at Queen's College, Cambridge, distinguishing himself by his attainments in the Oriental languages; took orders in the Church of England; became vicar of Swavesey, near Cambridge, 1705; published a Latin *Introduction to the Oriental Languages* (1706); a *History of the Jews* (1707), translated from the Italian of Rabbi Leon of Modena, with an original *Supplement concerning the Caraites and Samaritans*, and several translations from Oriental manuscripts; became Professor of Arabic at Cambridge 1711; published *The History of the Saracens* (2 vols., 1708–18). D. at Swavesey, Aug. 9, 1720.

Ocmul'gee River: a stream which rises in the central part of Georgia by several head-streams, flows in a generally S. S. E. course, and above Colquitt joins the Oconee to form the Altamaha river. Small steamboats ascend to Macon. Its lower course is through sandy pine woods; its upper, through a granite region, where there are many rapids. It is 300 miles long.

O'Con'nell, Daniel: patriot; b. at Carhen, County Kerry, Ireland, Aug. 6, 1775; the son of a gentleman of small estate, but of ancient family; was educated at St. Omer and Douay, and in 1794 began to study law at Lincoln's Inn; in 1798 was called to the bar; rose at once to distinction as a barrister, and very soon became prominent in Irish politics, addressing himself to the work of the emancipation of the Roman Catholics and of Ireland. In 1815 he was challenged by Alderman d'Esterre of Dublin, whom he mortally wounded; and a duel with Mr. Peel was soon after prevented by the police. In 1823 he founded the Catholic Association, which exerted a powerful influence in favor of the repeal of legislation unfavorable to Ireland, but the Government brought in a bill to suppress it, and it dissolved itself in 1825. In 1828 he was chosen to Parliament from County Clare, but was excluded by the Test oath; in 1829, however, the Roman Catholic emancipation took place, and O'Connell entered the House of Commons. His life-work was one of agitation, both among the people and in the House of Commons, for the repeal of the Union. In 1842 he began to hold monster meetings in Ireland, and in 1843 he was arrested on a charge of conspiracy and sedition, convicted, and heavily fined; but the Lords reversed the judgment Sept. 7, 1844. In the meanwhile the Young Ireland party,

falling under the control of more impetuous spirits, began to discredit the moral force policy of O'Connell and advocate more violent measures than he approved. In 1845 his influence was fast declining, and in 1846 his support of the Whig ministry tended to make him even more unpopular with the Irish party. In 1847, enfeebled by overwork and by anxiety for Ireland, where the famine had broken out, he started on a pilgrimage to Rome, but died at Genoa, May 15, 1847. He is buried at Glasnevin, Dublin. See *Life and Speeches of Daniel O'Connell*, by his son, John O'Connell (London, 1846); Cusack, *The Liberator, his Life and Times* (London, 1872); Justin McCarthy, *History of Our Own Times* (1879–80). Revised by F. M. COLBY.

O'Connor, RODERICK, popularly called RORY: the last independent King of Ireland; b. in Connaught in 1116; succeeded to the throne of Connaught on the death of his father, Turlogh O'Connor, 1156; disputed the supremacy for several years with the O'Neals and the O'Briens; assumed the title of King of Ireland 1166; assembled a parliament of lords and clergy at Athboy 1167; aided in the expulsion of Dermot, King of Leinster, 1168; defeated the English invaders under Strongbow in several engagements, but subsequently came to terms with them and reinstated Dermot in his kingdom; afterward carried on war with the English with varying success, until in 1175, after an interview with Henry II. of England, he acknowledged that monarch as lord paramount of Ireland, retaining for himself his ancestral kingdom of Connaught. His sons having revolted against him, Roderick retired in 1186 to a monastery, where he died in 1198.

O'Connor, THOMAS POWER, M. P.: journalist and politician; b. at Athlone, 1848; educated at Queen's College, Galway, and graduated at the Queen's University; became a journalist; entered Parliament 1880; became one of the most prominent leaders of the Parnellite party and of the Land League; lectured in the U. S. 1881; was elected president of the Irish National League of Great Britain 1883; was elected to the House of Commons for the Scotland division of Liverpool, for which he still (1894) sits, 1885; is the author of *Lord Beaconsfield, a Biography* (1876); *The Parnell Movement* (1885), and other works; editor of the *Cabinet of Irish Literature*; started *The Star* newspaper (1887), which he sold 1890, and started *The Sun*, 1893.
C. H. THURBER.

Oconomowoc: city; Waukesha co., Wis. (for location, see map of Wisconsin, ref. 7–E); on Oconomowoc creek and Lake Labelle, and the Chi., Mil. and St. P. Railway; 31 miles W. of Milwaukee. It is in an agricultural region, is surrounded by numerous beautiful lakes, has excellent drives, valuable mineral springs, and commodious hotels, and as a summer resort has been called the Saratoga of the West. Pop. (1880) 2,174; (1890) 2,729; (1900) 2,880.

O'Conor, CHARLES, LL. D.: jurist; b. in New York city, Jan. 22, 1804; son of Thomas O'Conor, who emigrated from Ireland to the U. S. for political reasons in 1801, and devoted himself largely to journalism and the writing of pamphlets on Irish and Roman Catholic questions. Charles O'Conor was admitted to the bar in 1824, and by his untiring industry and native talent became the recognized leader of the legal profession in New York. He first gained repute in *nisi prius* cases before juries, but the case which first gave him an established reputation was that of the fugitive slave Jack (1835). The most celebrated of his cases were the Lispenard will case (1843), the Forrest divorce case (begun in 1850 and finally disposed of in 1868), and the Parrish will case (1862). He deprecated the civil war, and, believing that its aim was inconsistent with the original principles of the confederation under the Constitution, he sympathized with the Southern States, and became senior counsel for Jefferson Davis when he was indicted for treason. He never held public office except that of district attorney for a few months during the administration of President Pierce and that of a member of the constitutional convention in 1864. In 1868 he was nominated for the presidency by the extreme Democrats, and received about 22,000 votes. He was noted for his integrity and simplicity of character. D. at his residence on the island of Nantucket, May 12, 1884. F. STURGES ALLEN.

Oconto: city; capital of Oconto co., Wis. (for location, see map of Wisconsin, ref. 4–F); on Green Bay, at the mouth of the Oconto river, and on the Chi. and N. W. and the Chi., Mil. and St. P. railways; 30 miles N. by E. of Green Bay. It is in a lumbering region, and contains a public park, a national bank (capital $60,000), flour and planing mills, iron-foundries, wagon-factories, and three weekly newspapers. Pop. (1880) 4,171; (1890) 5,219; (1900) 5,646.

Octahedron [from Gr. *ὀκτάεδρον*, liter., an eight-sided thing, neut. of *ὀκτάεδρος*, having eight sides or bases; *ὀκτώ*, eight + *ἕδρα*, seat, base]: a solid bounded by eight triangular planes. If regular, its faces are equilateral. It has twelve edges and six solid angles, each formed by four equal plane angles. Its solid contents are equal to the cube of one of its edges multiplied by ·4714045.

Octane: C_8H_{18}, the eighth of the marsh-gas series of hydrocarbons. It occurs naturally in American petroleum, and can be obtained from that portion of the oil that boils between 115° and 130°. It may be produced by the dry distillation of the lime-soap of menhaden oil, by passing the vapor of the thirteenth of the same series, tridecane, $C_{13}H_{28}$, through a red-hot tube, and also from octyl iodide, phthalic acid, indigo blue, acenaphthene, etc. By long-continued fractional distillation it may be separated into two hydrocarbons, having different boiling-points, but the same composition. IRA REMSEN.

Octa'via: sister to Augustus, Emperor of Rome. She was first married to C. Marcellus, and after his death to Mark Antony. She was a woman of remarkable beauty and great accomplishments, and her life reveals a conspicuous nobility of character. Her son, M. Marcellus, was adopted by Augustus, and it was expected that he would be his successor, but he died prematurely in 23 B. C. In 32 B. C. Octavia was divorced by Antony, but she continued to devote herself to his children, and even educated his children by Cleopatra. She died heart-broken in her fifty-fourth year in 11 B. C. Augustus pronounced the funeral oration.
Revised by G. L. H.

Octo'ber [from Lat. *Octo'ber*, originally the eighth month of the Roman year, deriv. of *oc'to*, eight]: the tenth month in the Julian and Gregorian years.

Octocoral'lia [Mod. Lat., from Gr. *ὀκτώ*, eight + *κοράλλιον*, coral]: a group of animals belonging to the SCYPHOMEDUSÆ (*q. v.*), order *Anthozoa*. They are marine polyps, the parts of which are arranged in eights. Thus there are eight feathered tentacles surrounding the mouth, while the central cavity of the body is partly divided into chambers by eight radiating partitions, which extend from the mouth region to the opposite end of the body. With very few exceptions the individuals or polyps form large assemblages or colonies, varying considerably in shape. The hard skeletal portions are of two kinds. The first, spicules of varying shape, occur in the flesh, and are the product of the middle body layer or mesoglœa. They are always present, and in dried specimens they form the bulk of the "bark" which covers the axial portion. This latter is not always present. When it occurs it is horny in character, and is frequently hardened, as in the precious coral, by the deposition of salts of lime. It arises from the outer layer or ectoderm of the body. The group, which is also known as Alcyonaria, contains about 700 species, the principal ones being arranged in four families. In the *Pennatulidæ*, or "sea-pens," there is a "root" (Fig. 1) which is buried in the mud or sand, while from the exposed portion the separate polyps, variously arranged, project. In some (e. g. *Pennatula*) the polyps occur on lateral outgrowths, so that the resemblance to a quill is strongly marked. In the *Gorgonidæ*, including the sea-fans and sea-whips, the colony is firmly fastened to some solid support, has a horny or calcareous axis, which like the colony itself may consist of simple whip-like branches, or stronger irregularly branching parts as in the red or precious coral of the Mediterranean, or lastly as in the sea-fans, of a broad flat network of interlacing branches. In the "organ-pipe corals" (*Tubiporidæ*) each polyp sits in a tubular calcareous sheath, the tubes of a colony being

FIG. 1.—*Kophoblemnon.*

united at regular intervals by horizontal platforms. In the *Alcyonidæ* (Fig. 2) or cork polyps, the sessile colonies lack any solid axis, and the polyps are inserted in tubes in a usually leathery basis. See Dana, *Zoöphytes of the United States Exploring Expedition* (1848); Kölliker, *Pennatulids of the Challenger Voyage* (1880); Wilson, *Embryology of Renilla*; and numerous papers by Verrill, Koren and Danielssen, Milne Edwards, and the older authors. J. S. KINGSLEY.

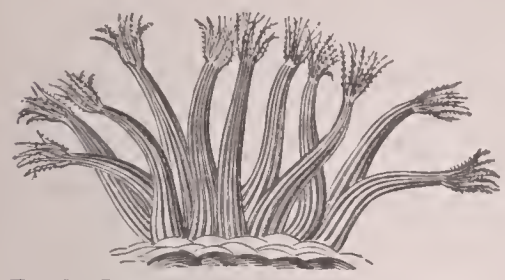

FIG. 2.—Part of a colony of *Anthelia lineata* (natural size).

Octop'oda [Mod. Lat., plur. of *Octo'pus*: Gr. ὀκτώ, eight + πούς, ποδός, foot]: a sub-order of Cephalopods or cuttlefishes, in which but eight arms (feet) are developed around the mouth; the body is sac-like, and no true shell is developed. In reproduction the peculiar HECTOCOTYLE (*q. v.*) is introduced. About fifteen genera and 100 species are known. *Octopus*, the principal genus, contains several large species, one of which, weighing in large specimens 60 lb., occurs in the Mediterranean, while an Alaskan species has a "radial spread of nearly 28 feet." The genus *Argonauta* contains the "paper-nautilus" or "paper-sailor," in which the female secretes a calcareous egg-case, which is the "shell" so familiar in cabinets. This is not a true shell, but is formed by one pair of arms of the female which are expanded and modified for the purpose. The stories about this form floating about on the surface of the ocean and raising its arms as sails to catch the breeze are now known to have no foundation in fact. J. S. KINGSLEY.

Octopus: See MOLLUSCA and OCTOPODA.

Odd Fellows, Independent Order of: a secret benevolent and benefit association which had its origin in London, England, about 1745. The earliest societies or lodges of Odd Fellows are described as assemblages mainly for social purposes, having an initiation ceremony, a collection being made to aid needy members. About the year 1800 the lodges in London and Liverpool were known as the London Order. In 1809 a member of a London lodge removed to Manchester and introduced the order into that city, where it was so favorably received that several lodges were speedily organized, and in 1814 the lodges in Manchester and vicinity were consolidated under the title of The Independent Order of Odd Fellows of the Manchester Unity. A grand lodge, composed of those who had filled the chair of noble grand (the presiding officer) a regular term in a subordinate lodge, was organized and assumed supervision of the subordinates. The London associations and other lodges throughout the kingdom refused to acknowledge the authority of the Manchester organization, and several other "Unities" sprang into existence. The Manchester adherents attained greater prosperity than any of their rivals, and the increase of lodges in Great Britain determined the Manchester authorities to organize an annual movable committee to take the place of the local grand lodge, the first meeting of which was held at Hanley, Staffordshire, May 19 and 20, 1823, and was attended by ninety-eight deputies, representing the several subordinate lodges. The early laws were crude and imperfect, and the receipts were inadequate to meet the authorized disbursements. The annual movable committee eventually established a system of rates based on the experience acquired, which enabled the subordinates to meet the relief requirements and accumulate an ample reserve fund.

The Manchester Unity, the most important body of Odd Fellows in Europe, has organized lodges in the United Kingdom, France, Turkey, Africa, North and South America, East and West Indies, and Australasia. There are many minor orders. In 1893 the Manchester Unity had 4,551 lodges, 722,725 adult and 90,057 juvenile members.

United States.—Societies or lodges of Odd Fellows were organized in New York and other cities of the U. S. as early as 1806, but had a brief existence. On Apr. 26, 1819, Thomas Wildey and four others, who had been members of Odd Fellows' lodges in England, organized a lodge in Baltimore, Md., calling it Washington Lodge No. 1. A member of a lodge at Preston, England, visited this self-instituted body in the latter part of the year 1819, and on his return to his home procured from the Duke of York Lodge of the Manchester Unity, located at Preston, a document dated Feb. 1, 1820, clothing the Baltimore organization with the powers of a grand as well as of a subordinate lodge under the title of "No. 1, Washington Lodge, the Grand Lodge of Maryland and of the United States of America." This action of a subordinate was confirmed by the grand committee of the Manchester Unity. On Feb. 22, 1821, Washington Lodge surrendered the English charter to a "body of past grands," and "the Grand Lodge of Maryland and the United States" was organized, the members of Washington Lodge receiving a subordinate charter from the new grand lodge. In 1823 the self-instituted lodges in Philadelphia, New York, and Boston were induced to recognize the Maryland organization, and that body immediately forwarded charters to the subordinates, as well as grand lodge charters for Pennsylvania, New York, and Massachusetts. On Apr. 15, 1824, it was deemed advisable to separate the powers of the national from the State organization, and the project was consummated Feb. 22, 1825, when the first meeting of the Grand Lodge of the U. S. was held. On Sept. 17, 1878, the name of the supreme body was changed to The Grand Lodge of the Independent Order of Odd Fellows, and on Sept. 18, 1879, the present title, The Sovereign Grand Lodge of the Independent Order of Odd Fellows, was adopted.

In 1826 Thomas Wildey, the presiding officer of the Grand Lodge of the U. S., known as the "grand sire," visited England and obtained from the grand committee of the Manchester Unity an independent charter, granting to the Grand Lodge of the U. S. authority "to conduct the business of Odd Fellowship without the interference of any other country, so long as the same is administered according to the principles and purity of Odd Fellowship." Intimate relations between the two grand bodies continued for several years, but in 1842, after fruitless efforts on the part of the heads of the order in Great Britain and the U. S. to reconcile, by correspondence, vital differences in the work which had arisen, James L. Ridgely, grand corresponding and recording secretary, and Isaac D. Williamson, grand chaplain of the Grand Lodge of the U. S., were commissioned as special deputies to the Manchester Unity to adjust the matters in dispute. The commissioners attended the meeting of the annual movable committee at Wigan, May 16, 1842, and after a conference continued through several days found that their efforts for harmonious co-operation were futile. The commissioners presented an elaborate report of their proceedings to the Grand Lodge of the U. S. in Sept., 1842, and that body adopted a series of resolutions on the subject. The hostilities of the Manchester Unity threatened in 1842, and consummated in 1843 by their attempt to institute lodges in the U. S., resulted in an entire severance of the existing relations.

The Objects of the Order.—The objects of Odd Fellowship are "to visit the sick, relieve the distressed, bury the dead, and educate the orphan." It seeks "to improve and elevate the character of man, imbue him with proper conceptions of his capabilities for good, enlighten his mind, enlarge the sphere of his affections, and lead him to a cultivation of the true fraternal relation designed by the great Author of his being." The motto "Friendship, Love, and Truth" was known and used in connection with the order in 1775. The organization for attaining these objects has two branches, closely connected, yet distinct—lodges and encampments.

In 1851 the ladies' degree, or degree of Rebekah, was adopted. Then only Scarlet degree members and their wives were eligible to membership; now the following are eligible to membership in a Rebekah lodge: All persons who have received the degree of Rebekah; all Odd Fellows in good standing and their wives; all unmarried white women who have attained the age of eighteen years, who believe in a Supreme, Intelligent Creator and Ruler of the Universe, and who are of good moral character. The female membership of this degree Dec. 31, 1893, was 108,732.

In 1882 a degree for Uniformed Patriarchs was adopted, and this was revised and became what is now termed "The degree of Patriarchs Militant," a military side of the encampment branch of the order. To be eligible one must be a Royal Purple degree member, in good standing in his lodge and encampment. The unit of the military organization is a "canton," which consists of at least fifteen members, called "chevaliers." The cantons are organized into battalions, regiments, brigades, and divisions. The grand sire is *ex officio* the head and commander-in-chief of the Patriarchs Militant, and his instructions are issued

through the adjutant-general and department commanders of the several jurisdictions. The grand secretary of the Sovereign Grand Lodge is adjutant-general.

Qualification for Membership.—To become a member of a lodge under the jurisdiction of the Sovereign Grand Lodge, the applicant must be a free white male of good moral character, who has arrived at the age of twenty-one years, and who believes in a Supreme Being, the Creator and Preserver of the Universe. No one but a member who has attained the third (previous to 1880, the fifth) or Scarlet degree in a lodge is eligible to membership in an encampment, and can remain a member of the encampment only so long as he continues in good standing in his lodge. This latter requirement is subject to the following exceptions: When he takes a withdrawal card from his lodge or is suspended by it for non-payment of dues, his standing in his encampment is not affected for a year thereafter, or if his lodge becomes extinct and he is aged and infirm he may still retain his membership in his encampment.

Charters for Subordinate and Grand Bodies.—Five or more members of the third or Scarlet degree holding withdrawal cards granted by legal lodges may apply for a charter for a lodge to the grand lodge of the State or Territory in which it is proposed to locate. Five or more members having the third or Royal Purple degree, and holding legal withdrawal cards, may petition the grand encampment of the State or Territory in which it is proposed to locate for a subordinate encampment. Application for a lodge in a State or Territory in which no grand lodge has been organized must be made to the Sovereign Grand Lodge, and the same rule applies to a petition for an encampment. On the petition of ten or more lodges the Sovereign Grand Lodge will issue a warrant for a grand lodge of the State, Territory, or province in which the petitioning lodges are located, or for a grand encampment on a like application by five or more subordinate encampments.

Powers of Subordinates.—A subordinate lodge is invested with the power to initiate and confer the initiatory and the three degrees on persons regularly proposed and elected residing within the district assigned to it. An encampment confers in like manner three degrees. Lodges and encampments have the power to regulate the fees for initiation, degrees, and weekly dues, and may determine the amounts to be paid for weekly benefits to sick or disabled members, funeral benefits, etc., but such amounts must not be less than the minimum prescribed by the grand body having jurisdiction.

The Sovereign Grand Lodge.—A grand lodge or grand encampment is composed of the past presiding officers of its subordinates, and the representatives of the several grand bodies constitute the Sovereign Grand Lodge. Each grand body is entitled to one representative if the membership in its jurisdiction is less than 1,000; if 1,000 or more, then to two.

Statistics.—The statistics from 1830 (previous to which they are incomplete) to Dec. 31, 1893, are as follows: Initiations, 1,947,711; members relieved, 1,809,045; widowed families relieved, 209,902; members buried, 176,320; receipts, $168,056,287.65; paid for sick and funeral benefits and the care of widows and orphans, $64,376,265.92. In 1900 the total membership of the 55 grand lodges in the U. S. and Canada was 862,723; the total membership of the order was 890,965, female members not included. The American organization is not in affiliation with the English order, the Manchester Unity of Odd Fellows, membership 900,668. The encampment branch numbers 129,564 members; Rebekah lodges, sisters 200,849, brothers 125,297; Chevaliers of the Patriarchs Militant, 15,274. Total relief paid during the year ending Dec. 31, 1899, $3,695,488.32; members relieved, 116,367; widowed families relieved, 6,212; paid for relief of members, $2,826,246.92; for widowed families, $141,646.10; for education of orphans, $50,540.55; burying the dead, $677,054.75.

The Sovereign Grand Lodge has organized grand lodges in every State and Territory of the U. S., the provinces of Canada, and independent grand lodges in the German empire, Denmark, Switzerland, and Australasia. Subordinate lodges have been organized in France, Holland, Sweden, Mexico, Cuba, Chili, Peru, Japan, and the Sandwich islands. Grand and subordinate encampments have been instituted in nearly every locality where lodges are established. Twenty-seven monthly, seven semi-monthly, and fourteen weekly periodicals are published—forty-one in the U. S., and one each in England, Germany, Denmark, Switzerland, Canada, Japan, and Australasia.

THEODORE A. ROSS.

Ode [via Fr. and Lat. from Gr. ᾠδή, song, ode, earlier ἀοιδή, deriv. of ἀείδειν, later ᾄδειν, sing]: in the modern use, a lyric piece of more dignified character than the song, and usually one in which profound feelings are expressed. The ancients originally included under this name all kinds of lyric verse. Pindar, Alcæus, Anacreon, Sappho, Simonides, and others among the Greeks, and Horace, Catullus, and others among the Romans, were writers of odes.

Revised by M. W. HUMPHREYS.

O'denheimer, WILLIAM HENRY, D. D., LL. D.: bishop; b. in Philadelphia, Pa., Aug. 11, 1817; graduated at the University of Pennsylvania 1835; took orders in the Protestant Episcopal Church 1838; became rector of St. Peter's, Philadelphia, 1840, and Bishop of New Jersey, Oct. 13, 1859. Author of *Jerusalem and Vicinity* (1855); *Origin and Compilation of the Prayer-book*; *The True Catholic no Romanist* (1842); *Thoughts on Immersion* (1843); *The Young Churchman Catechized*, i., ii. (1844); *The Devout Churchman's Companion*; *Private Prayer-book* (1851); *Bishop White's Opinions*; *Ringleburgius on Study*; with Rev. F. M. Bird prepared a collection of poems on the Holy Spirit; sermons, addresses, charges, etc. D. at Burlington, N. J., Aug. 14, 1879.

Revised by W. S. PERRY.

O'dense: town of Denmark; capital of the island of Fünen (see map of Norway and Sweden, ref. 14–C). It is an old and prosperous city, with good educational institutions and an active trade. It has a castle and a Gothic cathedral built 1086–1301, and is the seat of a Protestant bishopric. Several large sugar-refineries and iron-foundries are in operation. Pop. (1890) 30,277.

O'denwald, ō'den-văalt: a mountain region of Germany, occupying the southern part of Hesse-Darmstadt, and extending for a distance of about 45 miles from the Neckar, which to the S. separates it from the Black Forest, to the Main, which to the N. separates it from the Spessart Mountains. Its western declivities toward the plain of the Rhine are abrupt, but to the N. it slopes down through several terraces, and to the S. E. it gradually disappears in the level plains. Its highest peaks rise to about 2,000 feet. The mountains are covered with pine, oak, and beech, and the valleys with orchards and vineyards.

O'der: a river of Germany. It rises in Moravia at an elevation of 1,950 feet above the sea, enters Prussian Silesia, where it becomes navigable at Ratibor, traverses the provinces of Brandenburg and Pomerania, and, after a course of 550 miles, empties through the Stettiner Haff into the Baltic. Its navigation is difficult, and along its lower course expensive embankments are required to protect the surrounding country against inundation.

Odes'sa: fortified town and seaport of South Russia; in the government of Kherson; 46° 29′ N. lat. and 30° 41′ E. lon.; on a bay of the Black Sea, midway between the mouths of the Dnieper and Dniester (see map of Russia, ref. 13–C). When ceded by the Ottomans at the Treaty of Yassy (1791), its site was occupied by a miserable Tartar village called Hadji Bey. It is now in population and commerce the fourth city in Russia—surpassed only by St. Petersburg, Moscow, and Warsaw—and the most important port on the Black Sea, communicating by regular steamship lines with the chief ports of Europe. Founded in 1794 by Catherine II., it rapidly increased under its sagacious governor, the Duc de Richelieu (1803–15). In consequence of an insult to the British colors it was bombarded (Apr. 22, 1854) by the allied Anglo-French fleet, when the buildings nearest the water were destroyed. Alexander I. in 1817 declared it a free port for thirty years. The bay of Odessa is exposed to violent east winds, has a soft bottom, and is shallow in many places; hence the spacious modern double harbor, capable of accommodating 350 vessels, is largely artificial, and protected by long moles; it is frozen up part of the year. The summers are hot, with little rainfalls—the clouds of white dust are almost intolerable—and the winters are long and severe. The city stands on a plateau or succession of cliffs nearly 200 feet high, with a narrow belt of shore, occupied by barracks, bathing establishments, and shipping houses. Along the edge of the plateau runs an elegant boulevard, planted with trees and lined with palatial residences. Communication with the beach is afforded by a magnificent flight of stone steps. The city is well built and has broad, straight streets. In the environs are villas and orchards, beyond which stretches a barren steppe. It has many benevolent institutions, and is a great educational

center; has a university (formerly Richelieu Lyceum) with rich museum, observatory, and library. It is the headquarters of the Eighth Army-corps. The Bishop of Kherson and the governor of the province reside here. There are numerous breweries and manufactories, as of cordage, sailcloth, soap, and candles, but Odessa is specially important as the southern outlet for grain, which constitutes the greater part of the entire exports, valued (1891) at $62,391,100. The imports, principally raw cotton (1891), were valued at $15,747,730. Pop. (1897) 404,651, the majority Russians, but there are many Jews, Greeks, Armenians, Italians, Germans, Roumanians, and Tartars; also a considerable number of British residents. E. A. Grosvenor.

Odic Force [Germ.; cf. Gr. *ὁδός*, way, passage]: a term originally applied by Reichenbach to a peculiar iridescence which some people could see about the arms of a magnet. It was afterward the name for a mysterious force supposed to be transmitted from a hypnotist. (See Hypnotism.) It has received the synonym *psychic force* from Crookes, who performed several startling experiments with Home, the spiritualist, Sergeant Coxe, and others, which he asserted were due to its action.

Odin: in Scandinavian mythology, the father of gods and men. As such he is styled Alfather. He has a great number of names, one of which is Valfather—that is, "the father of the slain," since those who fall in battle go to his great hall, called Valhal—that is, "the hall of the slain." War is called Odin's amusement. The sword is called Odin's fire. He is one of the wisest of gods. He is described as a tall, long-bearded, one-eyed old man. In the dawn of time he pawned one eye for a drink of Mimer's fountain of wisdom beneath Ygdrasil. From his high seat Hlidskjalf he looks out upon all the world and sees all that is going on. On his eight-footed horse Sleipner he rides through the air and upon the waters, clad in his blue cloak and golden helmet, and wielding his spear Gungner. He needs no food. He lives on mead; the food set before him he gives to his two wolves, Gere and Freke. Two ravens, Hugin (thought) and Munin (memory), sit upon his shoulders and tell him all that they see and hear. At dawn he sends them out to gather news and they return to him in the evening. His servant is Hermod, the swift messenger. He possesses the gold ring Draupner, from which eight other rings of the same weight as the original drop every ninth night. Both the spear Gungner and the ring Draupner were made for him by the dwarfs. Odin invented the runes, the old Scandinavian alphabet. From the giant Suttung he secures, after a desperate struggle, the skaldic mead, which the giant kept concealed in a mountain cavern. Hence poetry is called Odin's drink, or the drink of the asas. Odin is found in all Teutonic countries, and by the name Vâta he can be traced back to India. The Anglo-Saxons and Old High Germans called him Wodan. In the Scandinavian tongues the *w* is dropped, hence Old Norse Óðinn. The Latin writers usually replace this divinity with the Roman Mercury, hence *dies Mercurii*, the fourth day in the week, became in Old Norse Óðins-dagr, in Dan. Onsday, in Anglo-Saxon Wodansdäg, in English Wednesday, etc. Odin was the progenitor of kings, and the greatest families, the Ynglings in Sweden, the Skjoldungs in Denmark, and the Hallygians in Norway, traced their pedigrees back to him. See Scandinavian Mythology and bibliography under the same. Rasmus B. Anderson.

Odoa'cer: King of Italy from 476 to 493 A. D.; descended from some one of the Germanic tribes along the Danube. At about the age of thirty he entered the service of the West Roman empire, and held a high position in the imperial guard when (in 475) Orestes, commander-in-chief of the army, deposed the emperor, Julius Nepos, and placed his own son, Romulus Augustulus, on the throne. The army, consisting of barbarian mercenaries, now demanded of Orestes that one-third of the soil of Italy should be given up to them for permanent settlement; and when Orestes refused, the soldiers chose Odoacer for their leader, and a war broke out which ended with the defeat and death of Orestes and the abdication and banishment of Romulus (Aug., 476). This date is assumed as marking the fall of the Western empire, for Odoacer did not assume the title of emperor, but that of King of Italy. He was acknowledged by Zeno, the Byzantine emperor, took up his residence at Ravenna, and governed with energy and moderation. For several years Italy enjoyed peace. The laws and institutions were maintained, the Church was respected, and several campaigns in Dalmatia and Noricum were successfully carried through. Meanwhile Theodoric, the King of the Ostrogoths, crossed the Alps, instigated and perhaps supported by Zeno, and in three great battles Odoacer was defeated, and finally shut up in Ravenna. Here he held out for more than two years, but capitulated on the condition that he and Theodoric should rule as joint kings. The agreement was confirmed by a solemn oath, but a few days afterward Theodoric put Odoacer to death, Mar. 5, 493. See Pallmann, *Geschichte der Völkerwanderung*.

Revised by G. L. Hendrickson.

Odobæ'nidæ: a family of mammals belonging to the order *Pinnipedia*, containing the walruses and related to the families *Phocidæ*, or true seals, and *Otariidæ*, or eared seals. The form is peculiar, but resembles that of the *Phocidæ* more than that of the *Otariidæ*; the hinder legs are flexible forward; no external ears are developed; the skull is oblong and truncated in front; the dentition is very peculiar, the canine teeth of the upper jaw being enormously developed and specialized as tusks, while those of the lower jaw are atrophied; the incisors, except the external of the upper jaw, are early lost; the molar teeth are $\frac{4}{4}$, but the posterior are generally cast in the adult; the anterior limbs are about as large as the posterior; in the anterior feet the toes decrease in a curved line, and are destitute of claws; in the posterior feet the five digits scarcely increase toward the inner, and all are provided with claws; the skin is very thick. The family is represented by the walruses or morses (see Walrus), which are found only in the high northern seas.

Revised by F. A. Lucas.

Odom'eter, or, more correctly, **Hodom'eter** [Gr. *ὁδός*, way, journey + *μέτρον*, measure]: an instrument by means of which the distance traveled by a carriage or other vehicle, or even a person walking, is registered. In the case of a carriage it is usually a train of wheelwork attached to the axle and one of the wheels of the carriage. It registers the number of revolutions of the wheel by moving an index on a dial. A similar instrument, called a cyclometer, can be attached to a bicycle or a tricycle. The name pedometer is usually given to an instrument for measuring walking distances. The mechanism depends upon the relative movement of a comparatively heavy suspended body accompanying each step. Thus the number of steps is measured, and the user must find the distance he walks in a given number of steps before he can interpret the reading of the instrument as applied to his own case.

Odona'ta [Mod. Lat., from Gr. *ὀδούς*, *ὀδόντος*, a tooth, in allusion to the long teeth on the labium]: that order of insects which includes the dragon-flies. (See Entomology.) These are insects which pass through an incomplete metamorphosis, which have strong biting jaws, and which have four membranous net-veined wings, the hinder pair about equaling the others in size. The dragon-flies lay their eggs in the water, and from these hatch out active, rapacious larvæ, remarkable for the peculiar apparatus (mask) which they have for seizing their food. The lower lip (labium), when not in use, is folded beneath the mouth, but on the approach of some other insect it can be extended some distance beyond the head, so that the sharp jaws which it bears can grasp the prey. With growth there are repeated moults, and gradually the wings appear as small outgrowths on the back. At last the larva or nymph climbs some reed, the skin splits down the back, and from the opening the adult dragon-fly appears. The adults prey upon insects and are of especial value in destroying mosquitoes. The numerous superstitions connected with these forms are without foundation. For American species, see Hagen, *Proceedings of the Boston Society of Natural History*, xviii. (1875).

J. S. Kingsley.

O'Don'nell, Leopold, Marshal, Duke of Tetuan, Count of Lucena: soldier; b. Jan. 12, 1809, at Santa Cruz in Teneriffe; entered the Spanish army; became a colonel, and for his services against the Carlists at Lucena (1839) was made a grandee and lieutenant-general. In 1840 he sided with the queen-mother and went to France, where he intrigued against his former ally, Espartero. In 1843, after the latter's fall, O'Donnell was made captain-general of Cuba, where he became moderately wealthy. In 1854 he became Espartero's war minister; succeeded him as prime minister in 1856, and was several times afterward a member of the cabinet. In 1859–60 he commanded in Morocco; captured Tetuan Feb. 6, 1860; retired from public life in July, 1866. D. at Bayonne, Nov. 5, 1867.

O'Donojú, ō-don-ō-hoo', Juan: last Spanish viceroy of New Spain (Mexico); b. about 1755. He attained the rank of lieutenant-general in the army, and had held high civil positions in the Peninsula when, in 1821, he was appointed captain-general and acting viceroy of New Spain. On his arrival at Vera Cruz he found that the revolution, led by Iturbide, had acquired such strength that his own authority was practically nullified. O'Donojú himself held liberal opinions, and under the circumstances he was convinced that the only sensible course was to treat with the insurgents. On Aug. 23 he met Iturbide at Córdoba and signed a treaty by which Mexico was recognized as an independent empire, and it was agreed to invite one of the Spanish Bourbon princes to reign over it; Mexico city was surrendered to the revolutionists. Pending advices from Spain, O'Donojú was elected one of the provisional regents. He died in Mexico, Oct. 8, 1821, before he could learn of the scornful nullification of his treaty by the Spanish Cortes. H. H. S.

Odontoglos'sæ [Mod. Lat.; Gr. *ὀδούς, ὀδόντος*, tooth + *γλῶσσα*, tongue]: a term applied by Nitzsch to an order of birds comprising the flamingoes only, on account of the tooth-like projections bordering the tongue. It is the equivalent of the *Amphimorphæ* of Huxley. F. A. L.

Odon'tophore: the rasping tongue of cephalopod and gasteropod Mollusca (*q. v.*).

Odontor'nithes [Mod. Lat.; Gr. *ὀδούς, ὀδόντος*, tooth + *ὄρνις* (plur. *ὄρνιθες*), bird]: a name applied by Prof. Marsh to a sub-class of birds containing all those provided with teeth. These are all fossil forms, as Ichthyornis and Hesperornis (*q. v.*), which so far have been found in the Jurassic and Cretaceous strata. F. A. L.

O'Dwyer, Joseph, M. D., LL. D.: pædiatrist; b. in Summit co., O., Oct. 12, 1841; graduated M. D. from College of Physicians and Surgeons, New York, in 1866; devoted himself to diseases of children, and invented the method of treating croup and diphtheria by intubation; received degree of LL. D. from St. John's College, Fordham. S. T. A.

Odyniec, od-in'yets, Antoni Edward: author; b. at Giejstuny, Poland; was educated by Basilian priests at Boruny; studied literature at the University of Wilna; published two volumes of his poems, *Poezye* (Wilna, 1825–26). At Warsaw, where he resided in 1826–29, he published two volumes of the almanac *Melitele* (1829, 1830; 3d vol. Leipzig, 1836), which contained contributions from the foremost poets of the romantic school, and a drama in verse, *Izora* (1829). In 1829, with his intimate friend Mickiewicz, he traveled in other parts of Europe; alone he visited Paris and London; in 1831–37 lived at Dresden. During his stay in foreign lands he wrote excellent translations from Byron, Moore, Walter Scott, and others (Leipzig, 1838–43, Wilna, and Warsaw, 1874, in 4 vols.). At the same time he was a regular contributor to a number of journals. In 1837 he returned to Lithuania, and for two years was editor-in-chief of a universal encyclopædia, *Encyklopedya powszechna* (Wilna and Warsaw). At Wilna he was for twenty years political editor of the *Kuryer Wileński*. His collected poems appeared at Wilna, in 1859, as *Poezye Ant. Edw. Odyńca* (3d ed. Warsaw, 1874). His dramas, *Felicita* (Wilna, 1849, Poznań, 1858), *Barbara Radziwiłówna* (Wilna, 1858), and *Jerzy Lubomirski* (Wilna, 1861), are more lyrical than dramatic. In 1865 he removed to Warsaw where, in the *Kronika Rodzinna*, he published a series of masterly letters, *Listy z podróży* (Letters of Travel; separate ed. Warsaw, 1875–78), descriptive of his travels with Mickiewicz, which mark him as the greatest Polish letter-writer. D. at Warsaw, Jan. 15, 1885. J. J. Král.

Odys'seus (in Gr. *Ὀδυσσεύς*, in Lat. *Ulixes*): King of Ithaea, son of Laertes and Anticlea, a daughter of Autolycus. The name means *the hater*, and was interpreted in various ways (cf. *Od.* 19, 400–412, and 1, 62 ff.). He won as his wife Penelope, the daughter of Icarius of Sparta, in return for suggesting to Tyndareus the oath taken by the suitors of Helen (*q. v.*). When his son Telemachus was a babe, Odysseus was prevailed upon by a ruse of Palamedes and Nestor to join the expedition against Troy, whither he sailed with twelve ships. At Troy he was distinguished for bravery, pertinacity, eloquence, and cunning. He therefore took part in expeditions that required a spy's cool and skillful work. The arms of Achilles were awarded to him after that hero's death, a fact which drove Ajax mad. At the close of the Trojan war he was driven by the ill-will of Poseidon to various parts of the world. The story of his return is told by Homer in the *Odyssey*. Finally, after ten years' wanderings and twenty years' absence from home, he reached Ithaea in safety, and with the help of his son Telemachus and a few faithful servants he slew the suitors of Penelope. In works of art he is usually recognized by his conical sailor's cap. See the article *Odysseus* in Baumeister's *Denkmäler*. J. R. S. Sterrett.

Œcolampa'dius, Johannes, whose true name was Hans Hussgen: theologian; b. at Weinsberg, Suabia, in 1482; studied first jurisprudence at Bologna, then theology at Heidelberg, subsequently Greek under Reuchlin at Stuttgart, where he also learned Hebrew from a baptized Spanish Jew, and received an appointment as preacher in 1516 at Basel, where he assisted Erasmus in his edition of the Greek New Testament. Luther's writings made a very deep impression on him. In 1518 he became preacher in the principal church of Augsburg; from 1520 to 1522 was an inmate of the convent of Altenmünster, near Augsburg. In 1522 he returned to Basel as preacher and Professor in Theology, and after the disputations at Baden (1526) and Bern (1528) he succeeded in introducing the Reformation in Basel and Ulm. In the controversy between Luther and Zwingli concerning the Lord's Supper he gradually adopted the views of Zwingli, which he maintained in his *De genuina verborum Domini, "Hoc est corpus meum," Expositione* (1525), and in his disputation with Luther at Marburg in 1529. His gentleness of character procured for him the name of the "Swiss Melanchthon." D. at Basel, Nov. 24, 1531. Besides the above-mentioned dissertation he wrote *De ritu paschali*; *Epistola canonicorum indoctorum ad Eccium*, and several commentaries and introductions to the books of the Old Testament. There are biographies of him by Hess (Zurich, 1791), Herzog (Basel, 1843, 2 vols.), and Hagenbach (Elberfeld, 1859). Revised by S. M. Jackson.

Œcumenical Councils: See Councils, Œcumenical.

Œde'ma [Mod. Lat., from Gr. *οἴδημα*, swelling, tumor, deriv. of *οἰδεῖν*, swell]: in pathology, a condition in which a tissue or organ is puffed or swollen with fluid exuded from the blood. It is most frequent in the loose tissues under the skin, and here constitutes the condition called "dropsy." When widespread throughout the organism, the name anasarca is applied. Œdema may be caused by obstruction to the circulation, causing distension of the veins and capillaries; it may be due to a watery condition of the blood, or to changes in the blood-vessels. Where stasis of the blood in the veins is at fault a cyanotic hue of the skin is noted, while in cases due to watery blood or diseases of the blood-vessels the skin may be wholly normal in appearance.

Œdema of the glottis is a condition in which the epiglottis and tissues of the larynx are inflamed and œdematous. It occasions great obstruction to breathing, and, unless relieved promptly, will cause death by suffocation.

Œdema of the lungs is often the immediate cause of death in heart disease, Bright's disease, and other chronic affections. William Pepper.

Oe'denburg (Hung. *Soprony*): town of Western Hungary; near the Lake of Neusiedl; 37 miles S. E. of Vienna, with which it communicates by railway (see map of Austria-Hungary, ref. 5–F). It is a prosperous and handsomely built town, with a large trade in wheat, wine, and cattle, and manufactures of sugar and soap. Its old fortifications have been demolished, with the exception of a huge watch-tower, the highest in Hungary; remains of the Roman time are also found. Pop. (1890) 29,543.

Œd'ipus [= Lat. = Gr. *Οἰδίπους*]: in Grecian mythology, a son of Laius, King of Thebes, and Jocasta, who was exposed by his father on account of an ill-boding oracle, but was saved by a shepherd and brought to Corinth. Misunderstanding another oracle, he left Corinth and went to Thebes. On the way he slew his father unawares and at Thebes married his mother. She bore him two sons, Eteocles and Polynices, and two daughters, Antigone and Ismene; but the hidden horrors of his life were subsequently revealed to him. Jocasta hanged herself; between Eteocles and Polynices there was a deathly hatred, and they slew each other; Œdipus put out his own eyes and wandered blind, guided by Antigone, from Thebes to Colonus in Attica, where he died in the grove of the Eumenides. The legends of Œdipus, of which the two baneful oracles and his meeting with the Sphinx, whose enigma he unriddled, form the mystical but singularly suggestive center, were often treated by the Attic tragedians, and there still exist

two tragedies on this subject by Sophocles, *King Œdipus* and *Œdipus at Colonus*. See the article *Oidipus* in Baumeister's *Denkmäler*. J. R. S. STERRETT.

Œhlenschläger, ö'len-shlā-ger, ADAM GOTTLOB: poet; b. in Frederiksberg, a suburb of Copenhagen, Denmark, Nov. 14, 1779. His parents, who were of German extraction, were in moderate circumstances, and until his twelfth year the future poet received no regular instruction. At that time he attracted the attention of Edvard Storm, by whom he was placed in school, where he remained four years. On his leaving school it was at first determined that he should become a tradesman, then he began to prepare for the university, and finally appeared on the stage with but slight success. In 1800, with the assistance of the brothers Oersted, he entered the university as a student of law, but his natural love for poetry made his professional studies distasteful to him. In 1802, after a sixteen hours' conversation with the Norwegian critic Steffens, who had returned from Germany filled with the ideas of the new romantic school, he came to a full realization of what poetry was for him. In the symbolical poem *Guldhornene*, the motive of which was taken from the theft of the Old Norse gold horns from the museum in Copenhagen, he made the declaration of his poetic faith. His legal studies were relinquished and a collection of poems in his early style, already in the printer's hands, was destroyed and other poems written hastily in their place, among these *Sanct Hansaften-Spil*. This new poetic departure roused much opposition among the members of the old school, and stamped Œhlenschläger as the undisputed leader of romanticism in Denmark. In 1805 he received a Government stipend and spent the succeeding four years in travel. Six months were spent in Halle with Steffens, three in Weimar in intimate companionship with Goethe, and a year and a half in Paris, where he was little influenced by the life about him. In Switzerland he visited Madame de Staël, at whose home he met many of the leading writers of the day. Soon after his return to Copenhagen he was appointed Professor of Æsthetics at the university, a position for which he was not specially fitted. During this period Œhlenschläger's popularity was enormous, one of his warmest admirers being Baggesen, but on the latter's return to Copenhagen in 1813 the relations of the two poets became strained. Œhlenschläger was painfully lacking in self-criticism, and this induced him to publish many works that were wholly unworthy of his genius. Baggesen's unfavorable criticisms of these angered their author and his friends. Twelve of the latter, among them Paul Möller and Hauch, formed themselves into a bodyguard called *Tylvten*, and challenged Baggesen in Latin to defend his position. To this Grundtvig and others replied, and the controversy continued until 1819, to be renewed later by Johan L. Heiberg. The criticism of the latter is of real value, distinguishing clearly the faults and virtues of Œhlenschläger, his wonderful richness of vocabulary, his lack of dramatic instinct, the epic-lyric character of his works, and their genuine nationality. It was this latter quality that induced Tegnér in the summer of 1829 to crown Œhlenschläger in the Cathedral of Lund as the northern king of singers. His position in Danish literature is best shown by the fact that his statue shares with Holberg's the place of honor before the National theater. Among his works may be mentioned *Poetiske Skrifter* (2 vols., 1805); *Hakon Jarl* (1807); *Baldur hiin gode* (1807); *Palnatoke* (1809); *Axel og Valborg* (1810); *Correggio* (1811); *Hagbarth og Signe* (1815); *Nordens Guder* (1819); *Dronning Margreta* (1833); *Dina* (1842). D. Jan. 20, 1850. See *Œhlenschlägers poetiske Skrifter, udg. af. F. L. Liebenberg* (32 vols., Copenhagen, 1857–62); *Erindringer* (4 vols., Copenhagen, 1850–51). D. K. DODGE.

Oehler, GUSTAV FRIEDRICH, von, D. D.: theologian; b. at Ebingen, Würtemberg, June 10, 1812; educated at Tübingen, where he became Professor of Old Testament Theology 1852, and where he died Feb. 19, 1872. He was orthodox, conservative, yet progressive. His fame rests upon his *Old Testament Theology*, a posthumous work, made up from his lectures by his son (2 vols., Tübingen, 1873–74; 2d ed. 1882; English trans., 2 vols., Edinburgh, 1874–75; revised by Prof. G. E. Day, New York, 1883). It is the leading book in this department, though many prefer the more modern, H. Schultz (1892). His *Lehrbuch der Symbolik*, edited by Johann Delitzsch, appeared in Tübingen 1876 (2d ed., by T. Hermann, Stuttgart, 1891). See his *Life*, by Josef Knapp (Tübingen, 1876). S. M. JACKSON.

Œnan'thic Ether [*œnanthic* is from Gr. *οἰνάνθη*, the first shoot of the vine, vine blossom; *οἴνη*, the vine + *ἄνθη*, bloom]: a name given by Liebig and Pelouze to a substance existing in all wines, giving them their characteristic odor. It remains behind as an oily liquid when large quantities of wine are distilled; obtained in larger quantities by distilling winelees after mixing with half their bulk of water. It consists essentially of capric, caprylic, and a very little butyric acids, partly free, mostly in the form of ethereal salts of isoamyl and ethyl alcohols. A solid substance called œnanthic ether is manufactured in Bavaria and used for flavoring inferior wines. Revised by IRA REMSEN.

Œnop'ides (in Gr. *Οἰνοπίδης*): a Grecian astronomer and philosopher of Chios, who is commonly supposed to have been a contemporary of Anaxagoras; is named among the Greeks who visited Egypt and became acquainted with the learning of the Egyptians; is said to have claimed the discovery of the obliquity of the ecliptic; invented a cycle for bringing into agreement the solar and lunar year, which invention he inscribed on a brazen tablet and set up at Olympia. He proposed also a theory of the rise and fall of the waters of the Nile, and an explanation of the Milky Way as the original pathway of the sun.
Revised by J. R. S. STERRETT.

Œnothera: See PRIMROSE.

Oersted, ör'sted, ANDERS SANDOE: the greatest of Danish jurists; b. in Rudkjöbing, Denmark, Dec. 21, 1778; brother of Hans Christian Oersted. In 1810 he became a judge of the Supreme Court, a position which he held only three years. He occupied various positions in the king's cabinet and in the Diet, and in 1853 he became Prime Minister of Denmark. Oersted's chief fame rests on his services to Danish jurisprudence, which in its present condition may be regarded as the result of his labors. He was a man of remarkable industry, learning, and clear insight, and all these he brought to bear on a thorough revision of the system of jurisprudence. Among his most important works are *Haandbog over den danske og norske Lovkyndighed*, a manual of Danish and Norwegian jurisprudence (6 vols., 1822–33), and *Eunomia* (4 vols., 1815–22). His last work was *The History of my Life and Times* (Af mit Livs og min Tids Historie, 4 vols., 1851–57). His contributions to the periodical literature of his time are very numerous. D. May 1, 1860.
RASMUS B. ANDERSON.

Oersted, HANS CHRISTIAN: physicist; b. at Rudkjöbing, in the Danish island of Langeland, Aug. 14, 1777. His father was an apothecary, and in the shop he made his first studies and experiments. In 1794 he entered the University of Copenhagen. In 1799 he took the degree of doctor of philosophy, after presenting a thesis entitled *Architectonics of Natural Metaphysics*. After traveling from 1801 to 1803 in Holland, Germany, and France, he was appointed Extraordinary Professor in Natural Philosophy at the University of Copenhagen in 1806, and his lectures soon attracted attention on account of their popular form and their enthusiasm. To awaken the interest of his countrymen for the study of nature was the aim of his life, and he succeeded in establishing a polytechnic school in Copenhagen, of which he was director from 1829, and in introducing natural science as an element of instruction in the Latin schools. During a scientific journey in Germany in 1812 and 1813 he wrote an essay on the identity of chemical and electrical forces, in which he for the first time shadowed forth his ideas of the unity of electricity and magnetism which he had entertained since 1800, but his great discovery on this point was not made until 1819, and was communicated to the world in a little pamphlet in 1820, *Experimenta circa efficaciam conflictus electrici in acum magneticam*. The discovery was immediately accepted, and honors were showered on the discoverer. His other writings comprise a large number of minor essays, most of which were translated into German, and two larger works, *Naturlärens mechaniske Deel* (Manual of Mechanical Physics) and *Aanden i Naturen*, which has been translated into English by Miss Horner under the title *The Soul in Nature*. The Danes are very proud of Oersted's name. There are two monuments in his honor in Copenhagen, and Oersted Park is named for him. D. in Copenhagen, Mar. 9, 1851.

Oertel, JOHANNES ADAM: See the Appendix.

Oertel, ör'tel, MAX JOSEPH, M. D.: physician; b. at Dillingen, Bavaria, Mar. 20, 1835; studied medicine in the University of Munich, graduating M. D. in 1863; was assistant

at Pfeuffer's clinic for four years, subsequently studying laryngology with Czermak. He paid special attention to diseases of the heart and lungs, and invented a system of graduated exercise in hill-climbing for the treatment of certain respiratory and circulatory disturbances. In 1876 he was made professor extraordinary in the Munich university. He contributed several monographs to von Ziemssen's *Cyclopædia of Practice and of Therapeutics*. Other important works are *Ueber Terrain-Curorte* (Leipzig, 1886); *Die Pathogenese der epidemischen Diphtherie* (Leipzig, 1887). D. in Munich, July 19, 1897. S. T. ARMSTRONG.

Oe'sel: an island in the Baltic, belonging to the government of Livonia, Russia. Area, 1,000 sq. miles. Pop. 53,120. Wheat, rye, oats, and barley are raised, cattle, sheep, and horses are reared, and considerable fishing is carried on. It was governed by the Teutonic Knights for a long period; passed into the possession of Denmark in 1559; was ceded to Sweden in 1645, and finally ceded to Russia in 1721. The population is principally Esthonian.

Œsoph'agus [Lat. = Gr. *οἰσοφάγος*; *οἰσο-* etym. obscure, commonly but probably erroneously connected with *οἴσω*, the fut. of *φέρειν*, bear + *φαγεῖν*, to eat]: the gullet, that part of the alimentary canal that leads from the pharynx to the stomach. In the adult man it is 9 inches long, extending in a nearly vertical line from the fifth cervical vertebra through the posterior mediastinum and through the œsophageal foramen of the diaphragm, ending in the cardiac orifice of the stomach. It has an outer or muscular coat, containing an outer layer of longitudinal muscle-fibers, and another of similar annular fibers, the upper fibers being chiefly striped and partly voluntary in the upper parts, but entirely involuntary and non-striated in the lower portion. The middle or cellular coat abounds in glands which open by long ducts. The innermost or mucous coat is lined by scaly epithelium. In caliber the œsophagus is the smallest part of the alimentary tube. In the lower animals the œsophagus has several modifications, the most remarkable of which is that singular dilatation which is called the *crop*, and which is observable in gallinaceous and vulturine birds, etc. Most articulate and many molluscous organisms have also a so-called œsophagus. See HISTOLOGY (*The Digestive Organs*).

Ofan'to: a river of Southern Italy, called by the ancients *Aufidus*. It rises 6 miles E. of Monte Marano, enters the Adriatic 4 miles N. W. of Barletta, after a course of 75 miles. The battle of Cannæ was fought on its right bank near its mouth.

Of'fa: King of Mercia; reigned in the latter half of the eighth century; greatly extended the boundaries of his kingdom, but is especially famous as the builder of the so-called Offa's dike, which for several centuries was the boundary between England and Wales. He established an undisputed suzerainty over the Heptarchy; murdered Ethelbert, King of East Anglia, and took possession of his kingdom 792; founded the abbey of St. Albans; drew up a code of laws. D. in 796.

Offenbach, *ō'fen-bäk'h*: town; in the grand duchy of Hesse-Darmstadt, Germany; on the Main; 5 miles S. E. of Frankfort (see map of German Empire, ref. 5–D). It has extensive manufactures of carriages, musical instruments, jewelry, carpets, hosiery, paper, tobacco, and pipes. Pop. (1890) 35,064.

Offenbach, JACQUES: composer; b. at Cologne, Germany, June 21, 1819, of Jewish parentage; studied from 1835 to 1837 at the Conservatory of Paris; played afterward the violoncello in the orchestra of the Théâtre Comique; became in 1847 leader of the orchestra of the Théâtre Français; established in 1855 the Bouffes-Parisiens, and composed a great number of burlesque operas and scenes, of which *La Fille de Madame Angot*, *Barbe bleue*, *Orphée aux Enfers*, *La Belle Hélène*, and *La Grande Duchesse* were the most applauded. D. in Paris, Oct. 4, 1880.

Office Found: See INQUEST OF OFFICE.

Offices and Officers [from Lat. *offi'cium*, performance, service, duty, official duty; *opus* or *ops*, work, toil + *facere*, do; cf. *officī'na*, workshop. Derivation from *ob* + *facere* is unlikely, as *officere* has the sense of to hinder]: in general, a public office is understood to be a right or a duty conferred or imposed by law on one or more persons to act in the execution and application of the law; while officers are those persons upon whom an office has been conferred or imposed. It is necessary to distinguish carefully between office and employment. For as the government may enter into both public legal and private legal relations, it may have both officers and employees. The term officer is a term of the public law; the term employee is a term of the private law. It has been said that the former "embraces the idea of tenure, duration, emolument, and duties." (*United States* vs. *Hartwell*, 6 Wallace 385.) An office finds its sources and its limitations in some provision of public law; an employment is based upon a contract. An office not being a contract, it is held that it may be terminated at any time, and that the salary, if any, attached to it may be diminished during its term without violating the provisions of the Federal Constitution, preventing a State from impairing the obligation of a contract. (*Butler* vs. *Pennsylvania*, 10 Howard 402.) Where, however, a salary has been attached to an office, it is held that if the salary has been earned it becomes a claim against the Government in the nature of a contract which may be enforced by suit against the Government where the Government may be sued, and may not be diminished in amount even by a State Legislature. (*Fisk* vs. *Police Jury*, 116 United States 131.) This fact that an office finds its sources and limitations in the public rather than the private law has a great influence over all contests which may arise relative to the duties and to the rights of officials, the courts holding very strictly to the rule that the provisions of the private law are not to be applied to this public legal relation. *Fitzsimmons* vs. *Brooklyn*, 102 New York 536; *Andrews* vs. *Portland*, 79 Maine 484.

Offices differ in the way in which they are organized. Thus an authority may consist of one person or more than one person. The first method is known as the single-headed system; the second is usually called the board system. Each of these methods of organizing offices has its advantages. The single-headed system is generally chosen for all offices whose duties require energy, rapidity of action, and a well-defined responsibility; the board system for all branches in which carefulness of deliberation and impartiality of decision are necessary. The former method of organizing offices is therefore usually chosen for all executive and administrative offices; the latter for judicial offices.

Officers, like offices, may be variously classified. In many states there is an important distinction between professional and honorary offices. The first are those who devote their entire time to the discharge of their duties; the latter are those who merely employ a part of their time in the discharge of public functions, relying on some other occupation as the means of their livelihood, and generally having short terms and receiving no or a very small salary. A system of administration relying mainly upon these honorary officers is called a self-government system, while a system relying upon professional officers is known as a bureaucratic system. In the U. S. the rule is that the administrative organization is based upon the self-government system, while upon the continent of Europe the organization is usually bureaucratic. At the same time, in certain branches of administration in the U. S., e. g. in the municipal administration, the bureaucratic system is being adopted on account of its greater efficiency, and, notwithstanding the fact that salaries are paid, its greater economy. It has, however, the disadvantage of preventing the people as a whole from accustoming themselves to the discharge of public duties and of fostering the development of an official class which has the monopoly of government.

The official relation is usually formed in either one of two ways, by election by the people or by appointment by some governmental authority. Originally the method of filling offices in the U. S. was by an executive appointment, the only exception being found in the case of the purely local, such as the town offices; but as a result of the partisan use of the power of appointment, and as a result of the increasingly democratic character of the people throughout the States, the method of election grew more popular, and most of the important offices are filled by popular election. In the Federal Government, which was formed before this democratic spirit had so fully developed, the Constitution provides that most of the offices shall be filled by appointment. The tendency, however, in the U. S. would seem to be toward the adoption of the appointive system. This tendency is particularly marked in the cities where the application of the principle of popular election of all important officers had led to a diffusion of responsibility and to inefficient administration. Originally in the English and U. S. system of administration acceptance of office was regarded as oblig-

atory, and we find cases in the early English reports where those persons who have refused to accept office have been indicted, and also where they have been forced by the courts to assume the burdens of the office; the duty to serve as officer of the Government being regarded just as obligatory as the present duty to serve upon the jury. In the course of the nineteenth century, however, this obligation to serve as officer has been in many cases abolished, and to fill the various Government offices reliance is placed upon the well-known desire of most persons to serve in official capacities.

The law generally provides certain qualifications for office; the power to hold office being regarded not as a right belonging to every individual, but as a privilege which is granted only to those who are qualified to perform official duties. These qualifications differ somewhat in the case of elective and appointive offices, being more stringent in the case of the latter than in the case of the former. For elective offices the qualifications consist usually in the possession of citizenship or the right to vote, the attainment of a certain age, and the possession of good character; to the majority of offices men only are eligible. In the case of purely local offices residence in the locality in which the duties of the office are to be performed, or some equivalent therefor, is generally required, while in some cases the possession of real property or the payment of a certain amount of taxes is required. In the case of appointive offices, in addition to these requirements, the law often provides quite stringent requirements, which are to insure the possession by the incumbent of the office of the necessary intellectual qualifications. The possession of these intellectual qualifications is to be shown in either one of two ways. In the case of offices, the performance of whose duties requires the possession of technical knowledge, it is usually provided that no one is qualified who has not received a thorough course of training to be evidenced by the possession of some diploma or certificate. Such is the case generally for judges and the law officers of the Government, who must be admitted to the bar and must have practiced for a certain time. Such is also the case for the engineering service of the Government, where the incumbent must be a qualified engineer or surveyor. In the case of the great majority of appointive offices where the duties are largely of a clerical nature, the civil service reform movement has resulted in the adoption of less stringent but, at the same time, of rather important educational and intellectual qualifications, usually to be shown by examinations. These are either competitive in character or ordinary pass examinations, where it is merely required of the candidate who presents himself for appointment that he must have passed the examination at a certain standard. For a further consideration of this matter, see CIVIL SERVICE AND CIVIL SERVICE REFORM.

All officers have by law certain rights upon which they may insist, and also certain duties which they may be compelled to perform. Among the rights possessed by officers may be mentioned the right to exercise the functions of the office. Any one who has been properly appointed or elected may, by appeal to the courts, force the granting to him of the office which he has been chosen to fill. In the second place the criminal law offers a special protection to all officers who come in contact with the people, as bearers of a direct command of a competent authority to do or not to do some particular thing. In such a case they may use force to execute their orders, and any resistance offered to them is made a crime. Where the law specifically provides that officers shall receive a salary, they have also the right to such compensation, which may be enforced by an action in the courts, but inasmuch as the official relation is a relation of public and not of private law, the claim for salary can not be based upon the fact that services of an official character have been rendered, but is to be found solely in the fact that the law has stated that a compensation shall be attached to a given office. As has been said, the compensation is governed entirely by the rules of the public law. Thus the fact that a person does not discharge the duties of the office has no effect upon his right to obtain salary; he will not lose the right to the salary from the fact that by sickness he has been unable to perform his duties, so long as he has not been actually removed. (*O'Leary* vs. *Board of Education*, 93 New York 1.) The salary of officers is enforced by suit against the Government where suit is allowed, or by application to the proper court for a *mandamus* to force the accounting officers to grant the salary. In some cases in addition to the salary there is a civil pension attached to the office, though this is not common in the U. S. outside of the judicial service and the police and fire services of the various municipalities.

Among the duties imposed upon officers may be mentioned the requirement to take the oath of office before beginning to perform its functions, the giving of an official bond, and in general the faithful performance of the detailed duties assigned to the office by the statutes providing for it. The performance of the duties of the office is insured by a threefold responsibility. In the first place, if anybody is injured by the negligence of an officer in the performance of his duties, in many cases he may recover damages from such officer. In the second place, the law often punishes as a crime the non-performance of official duties. In the third place, the violation of duties where the administrative system is at all centralized, and where the superior administrative officers have a strong disciplinary power, will result in an administrative responsibility. Thus in many cases the superior officers have the power to impose fines and to suspend and even to remove delinquent officers. In the U. S. Federal Government the disciplinary power is very strong, but in the States very generally, the system being so extremely decentralized, we find very few examples of this disciplinary power. The only possible exception to this statement is to be found in the cities where, as a result of recent development, the disciplinary power of the mayor over the rest of the city officers has been very largely increased.

The official relation is terminated in various ways. In the first place the law often provides a fixed term for an office. In this case the expiration of the term renders the officer incapable to perform his duties except where it is provided, as it often is, that he shall hold over until his successor enters the office. Further, in order to prevent an official interregnum, the courts often hold that an officer will be regarded as an officer *de facto* after the expiration of his term, and that his acts may not be questioned collaterally in the courts in an action to which such officer is not a party. The term of office is usually fixed in the U. S. at from two to four years. The attempt has been made, however, to do away with this fixed term for all offices whose duties are not of the highest importance, in the hope that the tenure will become one practically during good behavior. (See on this point the article on CIVIL SERVICE AND CIVIL SERVICE REFORM.) As a general thing also the official relation may be terminated by the resignation of the officer. This is absolutely true except in the cases where the office is obligatory, and the statutes provide that an officer shall hold over until his successor shall enter upon the performance of his duties. In such a case resignation by the officer will have no effect upon his duty to continue the performance of official duties. (*Badger* vs. *United States*, 93 United States 599.) Again, loss of qualifications generally entails loss of office. Thus the attainment of a certain age, which in the U. S. often vacates the office, sometimes renders one holding an office unqualified to perform its duties. In these cases, however, of loss of qualifications it is usually provided that the loss of qualifications must be determined by the courts, and all persons dealing with officers are not required to find out whether they have become disqualified, inasmuch as the principle applicable to *de facto* officers will be applied in these cases of loss of qualifications. The official relation may also be terminated by removal. Where the office is filled by election it is usually held by the courts that unless the statute so specifically provides the officer may not be removed, but that where an officer is appointed and there is no provision made by the law as to his term, he may be removed by the appointing officer, the power of removal being held to be incident to the power of appointment. (See *Ex parte Hennen*, 12 Peters 230, 239.) In a great many cases, however, the power of removal of an appointing officer is limited to the case where cause presents itself. In such a case the removal may be reviewed by the courts, it being held by the courts that what is cause is a question of law over which they have jurisdiction. (See *People* vs. *Fire Commissioners*, 73 New York 437.) In these cases of removal for cause the courts also insist that the individual removed shall be given an opportunity to be heard in his defense; and the proceedings for the removal take on somewhat the character of a regular trial. (*Dullam* vs. *Willson*, 53 Michigan 392.) Finally the official relation may be terminated by the action of the Legislature, which has the power, as a result of the fact that the official relation is a relation of public law and is not in the nature of a contract, to ter-

minate the official relation by abolishing the office, by shortening the term, by declaring the office to be vacant, or by transferring the duties of one office to another, or finally also by means of impeachment. *State* vs. *Douglas*, 26 Wisconsin 428, and *Augusta* vs. *Sweeny*, 44 Georgia 463.

FRANK J. GOODNOW.

Offset: in surveying, a short distance measured at right angles to a straight line in order to locate the position of a point. The method of determining the position of an irregular line by means of offsets is to run a straight course in the general direction of the line, and at suitable points of this course to measure offsets to the line in question; then, knowing the distance of each offset from the origin of the course, the length of each offset, and its direction, whether to the right or left, the corresponding points of the irregular line may be plotted. The method of offsets is particularly valuable in filling in the outlines of a topographical survey, and especially in tracing the courses of roads, streams, and coast-lines.

Ofterdingen, ŏf'ter-ding-*en*, HEINRICH, von: the name of a supposed minnesinger who is mentioned in the Middle High German poem *Saengerkrieg auf der Wartburg*, but of whom we have no further reliable accounts. Despite the latter fact he became the favorite hero of the romantic school (Novalis), and was at one time even supposed to be the author of the *Nibelungenlied*. J. G.

Ogam: See IRISH LANGUAGE AND LITERATURE.

Ogar'ev, NIKOLAĬ PLATENOVICH: author; b. on his father's estate in the government of Pensa, Russia, in 1818; d. 1877. During a trip to the Caucasus in 1838 he made the acquaintance of the banished poet Prince Odoevskiĭ, with whom he became intimate and to whom he addressed some of his earliest verses. His first poems to be printed appeared in the *Otechest vennyĭa Zapis ki* (Annals of the Country) in 1840, and for a number of years after this he continued to contribute to various journals. In 1848 Ogarev settled in London, where he took an important part in editing *Kolokol* (the Alarm Bell) and other revolutionary publications of Hertzen, his friend from college days. A third edition of his poetical works appeared in 1863. A. C. COOLIDGE.

Ogden: city; capital of Weber co., Ut. (for location, see map of Utah, ref. 3–L); at the confluence of the Ogden and Weber rivers, the mouth of Ogden cañon, and the foot-hills of the Wasatch Mountains; on the Union Pac., the Central Pac., and the Rio Grande West. railways; 37 miles N. of Salt Lake City. It derives excellent power for industrial purposes from the rivers, has an abundant supply of water from mountain springs and good natural drainage, and is in an agricultural, fruit-growing, iron, salt, lime, building-stone, and coal region. The main and branch railway connections give it importance as a commercial receiving and shipping point. It contains Ogden Academy (Congregational), a military academy, 12 public schools, public-school property valued at $250,000, various manufactories, 3 national banks, a State bank, an incorporated bank, a loan and trust company, and a semi-weekly, a monthly, and 3 daily periodicals. Pop. (1880) 6,069; (1890) 14,889; (1900) 16,313. EDITOR OF "STANDARD."

Ogdensburg: city (known as the "Maple City," founded in 1749, incorporated in 1868) and port of entry; St. Lawrence co., N. Y. (for location, see map of New York, ref. 1–H); at the confluence of the St. Lawrence and the Oswegatchie rivers; on the Central Vt. and the Rome, Watertown and Ogdensburg railways; opposite Prescott, Canada, with which it is connected by steam-ferry; 175 miles N. N. W. of Albany. It is well built, has handsome maple-shaded streets, and obtains power from the river, which serves many manufactories. The city is the headquarters of a line of screw steamers plying between Chicago and intermediate lake ports, and annually handles a large amount of grain and lumber, besides general lake and river freight. There are a U. S. Government building, a Roman Catholic cathedral, several public parks, public-school property valued at $100,000, large grain elevators and warehouses, 2 libraries containing together about 15,000 volumes, a national bank, a State bank, and 2 daily and 4 weekly newspapers. Pop. (1880) 10,341; (1890) 11,662; (1900) 12,633.

EDITOR OF "JOURNAL."

Oge, ō'zhā', JACQUES VINCENT: one of the forerunners of Haitian independence; b. at Dondon about 1755. He was a light mulatto of a wealthy family; was educated in Paris, and served in the army of one of the German electors. When the French Revolution broke out he was chosen deputy for Haiti to the Constituent Assembly, where he was a prominent member of the Amis des Noirs society. In 1790 he organized a secret expedition in the U. S. with the object of freeing the slaves of Haiti; landed at Cape Français, Oct. 23, with 250 men, and at first gained some partial successes; but he was soon after defeated, and gave himself up on condition that his life should be spared. Notwithstanding this he was broken on the wheel at Cape Français Feb. 26, 1791. His death excited the colored population to fury and led to the massacre of the whites soon after. H. H. S.

Ogham, Ogam: See IRISH LANGUAGE AND LITERATURE.

Ogilvie, CLINTON: See the Appendix.

Oglesby, RICHARD JAMES: soldier; b. in Oldham co., Ky., July 25, 1824; left an orphan at the age of eight years, he removed to Decatur, Ill., in 1836; learned the carpenter's trade, which with farming occupied his time until 1844, meanwhile studying law, and in 1845 was licensed and began practice at Sullivan. In 1846 he returned to Decatur, and was commissioned first lieutenant in the Fourth Illinois Regiment (Col. E. D. Baker's), with which he participated at Vera Cruz and Cerro Gordo. Resuming his practice at Decatur in 1847, he pursued a course of study at the Louisville Law School, graduating in 1848; in 1849 he journeyed overland to California and engaged in mining until 1851, when he again resumed his residence and practice at Decatur. In 1858 he was defeated for Congress, but was elected to the State Senate in 1860, which seat he resigned, and accepted the colonelcy of the Eighth Illinois Volunteers: commanded a brigade at capture of Forts Henry and Donelson; was made brigadier-general Mar. 21, 1862, remaining in command of brigade until the battle of Corinth, where he was severely wounded and disabled until Apr., 1863, when he returned to duty, having meanwhile (Nov., 1862) been promoted to be major-general, and was assigned to the Sixteenth Corps. Resigned May, 1864, and in November of that year was elected Governor of Illinois (1865–69); re-elected in 1872, but chosen U. S. Senator Jan., 1873, and served through the term ending 1879; was Governor of Illinois 1885–89. D. in Elkhart, Ind., Apr. 24, 1899.

Oglethorpe, JAMES EDWARD: founder of the State of Georgia; b. in London, Dec. 21, 1698; entered the army about 1712; studied at Oxford for a short time; served under Prince Eugene and Marlborough 1715–18; entered Parliament in 1722 for Haslemere; obtained a charter in 1732 and a grant for the founding of Georgia and the colonization of poor debtors in that province: founded Savannah 1733; received the Protestant emigrants of Salzburg 1734, and soon after revisited England, but returned to Savannah with John and Charles Wesley in 1735. In 1738 he took a regiment of troops thither, and after war was declared between Great Britain and Spain he commanded the Georgia and South Carolina forces in an invasion of Florida. He made an unsuccessful attack on St. Augustine 1741, and in 1742 repelled by stratagem the attack of the Spaniards upon Georgia; returned finally to England 1743; served against the Pretender 1745, and was court-martialed for misconduct 1746, but acquitted. In 1765 he retired as a general upon half pay. D. at Cranham Hall, Essex, Jan. 30, 1785. See biographies by Harris (Boston, 1841), Wright (London, 1867), and Bruce (New York, 1890).

Ogowe: one of the largest rivers of Western Africa; rises between 2° and 3° S. lat., near 14° E. lon., and after a general N. W. course for about 300 miles turns S. W. near the equator, then W., and enters the Atlantic through many streams, forming a large delta extending nearly 50 miles along the coast a little S. of the equator. Many attempts to explore the Ogowe were defeated by the natives, but Savorgnan de Brazza (beginning in 1876) revealed its entire course, which is considerably impeded by cataracts. In its upper reaches the Ogowe traverses wide savannas, but lower down runs mostly through dense forests. There are many large islands in the lower part, where the river is very wide and shallow. A large part is navigable in high water by light-draught vessels; many European trading-posts are on its banks; the native population is numerous; and the river is the most important natural factor in the work of developing the French Congo territory. C. C. A.

O'Grady, STANDISH: See the Appendix.

Og'yges (in Gr. Ὠγύγης and Ὤγυγος); in Greek mythology, the first King of Thebes, whose oldest gate was called, after him, the Ogygian. During his time the waters of Lake

Copais rose above its banks and inundated the whole valley of Bœotia. An Ogygian deluge is also spoken of in Attica, and Ogyges himself is sometimes represented as a Bœotian autochthon, sometimes as an Egyptian king, and was brought into manifold connections with the earliest legendary history of Greece. Revised by J. R. S. STERRETT.

O'Hara, THEODORE: soldier and poet; b. at Danville, Ky., Feb. 11, 1820. He served in the army during the Mexican war, and afterward practiced law at Washington, D. C. On the outbreak of the civil war he took part with the South and became a colonel in the Confederate army. D. near Guerryton, Ala., June 6, 1867. He is remembered chiefly by his very popular poem *The Bivouac of the Dead*, written to commemorate the Kentuckians killed at Buena Vista during the war with Mexico. H. A. B.

O'Higgins: an interior province of Chili, S. of Santiago, from which it was separated in 1883. Area, 2,524 sq. miles. The eastern portion is included in the Andes; the western part is in the "valley of Chili" and is very fertile, producing wheat, wine, fruits, etc. Near Rancagua, the capital, there are celebrated hot springs. Pop. (1891) 92,892.

O'Higgins (Span. pron. ō-ee'gĕens), AMBROSIO: administrator; b. in County Meath, Ireland, about 1730. His real name was Ambrose Higgins, and he was of a poor and respectable family. His uncle, a priest in Cadiz, Spain, took charge of his education, eventually gave him a small outfit of goods, and sent him to trade in South America. He landed at Buenos Ayres and made his way over the Andes to Chili, where for many years he was a trader and peddler in a small way. Eventually he obtained a commission in the army, distinguished himself in the Araucanian wars, rapidly rose in rank, and in 1788 was made captain-general of Chili; before this time he had changed his name to O'Higgins, as a more aristocratic form. His rule was very successful; he was created Marquis of Osorno, and in 1796 was nominated Viceroy of Peru, a position which he retained until his death at Lima, Mar. 18, 1801. H. H. SMITH.

O'Higgins, BERNARDO: soldier; illegitimate son of Ambrosio O'Higgins; b. at Chillan, Chili, Aug. 20, 1776. He was educated in England, where he associated with Miranda and other prominent Spanish-American republicans; returned to Chili in 1802, joined the revolutionists in 1810, and soon attained prominence as a military leader. On the deposition of Carrera from the command of the army (1813) O'Higgins was chosen to fill his place. The violent opposition of Carrera and his faction divided the country into two hostile camps; civil war was impending, when the arrival of a Spanish army from Peru forced the rivals to combine their forces against the common foe. Relying on the aid promised by Carrera, O'Higgins encountered Osorio at Rancagua; Carrera—intentionally, as was charged—did not re-enforce him, and he was disastrously defeated Oct. 2, 1814. Chili was deserted to the Spaniards, and the patriot leaders fled over the Andes. O'Higgins joined the army of San Martin at Mendoza, and in the patriot invasion of Chili (1817) was his principal lieutenant; his charge decided the victory of Chacabuco Feb. 12, 1817, and the consequent occupation of Santiago. San Martin declined the office of supreme director of Chili, and on Feb. 15 it was given to O'Higgins with dictatorial powers. O'Higgins governed for nearly six years, during which the last Spaniards were driven from Chili, and the country was rapidly developed; his steady support of San Martin did much to secure the overthrow of the Spaniards in Peru. His efforts to form a popular representative government were less successful; the opposition of the aristocratic party and of the old adherents of Carrera at length led to a revolution, and O'Higgins was forced to resign Jan. 28, 1823. He went to Peru, and died at Lima, Oct. 24, 1842. HERBERT H. SMITH.

Ohio: one of the U. S. of North America (North Central group); the fourth State admitted into the Union; popularly known as the "Buckeye State."

Location and Area.—It lies between lat. 38° 27′ and 41° 57′ N., and lon. 80° 34′ and 84° 49′ W.; is bounded N. by Michigan and Lake Erie, E. by Pennsylvania and West Virginia, S. by West Virginia and Kentucky, and W. by Indiana; greatest length from E. to W. about 215 miles, greatest breadth from N. to S. about 210 miles; area, 41,060 sq. miles, of which 300 sq. miles are water surface.

Physical Features.—The surface consists of an undulating plain, from 450 to 1,550 feet above the sea-level. The highest point is near Bellefontaine, in Logan County, which has an altitude of 1,550 feet. The highest extended portions are in the central part, while the watershed separating the St. Lawrence system from the Mississippi valley system runs from N. E. to S. W. across the State, attaining an average height of from 1,100 to 1,300 feet. This dividing range enters the State in Ashtabula County but a few miles from Lake Erie, and crosses irregularly to the central western border, passing thence S. W. into Indiana. The northern side of this watershed is naturally smaller and the rivers are shorter, though the descent from the high central tableland is more gentle than in the southern slope. In the northwestern part the lands were originally swampy. There are a few small lakes in some of the western counties. The rivers in the northern or St. Lawrence system emptying into Lake Erie are the Maumee, Sandusky, Huron, Vermilion, Black, Rocky, Cuyahoga, Chagrin, Grand, Ashtabula, and Conneaut. In the southern system as tributaries of the Ohio are the Mahoning, the Walhonding, and Tuscarawas, which unite to form the Muskingum, the Scioto, Little Miami, and Great Miami. Of these only the Maumee is navigable, and that for only about 20 miles from Lake Erie.

Seal of Ohio.

Geology.—The entire geological series of Ohio consists of stratified rocks of Palæozoic time, having an aggregate thickness, if the average of the different strata be reckoned, of about 3,500 feet. The important geological feature is the Cincinnati axis or anticlinal. The main fold extends N. W. from Southwestern Ohio into Indiana, and thence an offshoot extends N. E. across Ohio to the islands of Lake Erie. From this Cincinnati axis the strata dip gently on the two sides in a W. and S. E. direction. The Trenton limestone underlies Northern and Western Ohio at a depth of from 1,000 to 2,000 feet, whence it has been traced to the extreme southwestern part, where it shows an outcrop. The Utica black shale, which overlies this in the N. W., shows an outcrop nowhere in the State. The Hudson River group underlies the entire State, and covers in the outcrop about 4,000 sq. miles in the S. W. It consists of alternate layers of limestone and shale. The Medina shales (red or yellow non-fossiliferous shales) and the Clinton limestone occur as outcrops only in the southern and southwestern part. The Clinton limestone yields small quantities of petroleum, at a few points is the source of gas, and occasionally contains hematite ore, but not in workable quantities. The Niagara group, shales and limestones, occupies about 3,000 sq. miles in its outcrop in the W. and S. The Lower Helderberg limestone occupies a large area, though it is covered for the most part by drift deposits. The outcrop of the Devonian limestone (Upper Helderberg or Corniferous) is found in a narrow strip running from the center of the State to the N. and including the islands in Lake Erie, also in a similar belt through the northwestern counties. The Ohio shale overlies the preceding in Central Ohio, and in its outcrop stretches in a belt from 10 to 20 miles across the center of the State. The natural gas and the petroleum of Northeastern Ohio come from these shales. Passing from the Devonian system, the Subcarboniferous system brings in the Waverly group of shales and sandstones, which show a broad belt across the State, immediately E. of the Devonian shale outcrop, and forms the western rim of the coal-basin which occupies all of the eastern and southeastern parts. Of the five strata making up the Waverly group the most important is the Berea grit, which is a source of fine building-stone and of grindstone grit, and where it dips beneath the surface is the repository of invaluable supplies of petroleum, gas, and salt water. The Carboniferous system, including the Conglomerate series and the coal-measures, form the surface of about one-quarter of the State, extending from the Waverly group to and beyond the southeastern boundary. The Conglomerates and the lower coal-measures con-

tain thirteen distinct seams of bituminous coal, while in the upper coal-measures there are ten seams, less valuable than those in the lower measures. The different seams vary widely in character, but embrace all varieties of bituminous, steam, coking, gas, and cannel coal. The seams range in thickness from a few inches to 13 feet. The lower measures furnish the greater portion of the coal mined in the State. The amount of coal in this district is estimated by Prof. Orton at 20,000,000,000 tons, or, at the ordinary rate of consumption, sufficient to supply the demand for 1,000 years. These seams in all the coal-measures occur in interstratification with shales, limestone, fire-clays, and iron ore. The glacial drift covers about two-thirds of the State with sand, gravel, and clay to the depth of from 25 to 300 feet.

Mineral Productions.—The mineral resources of Ohio are such as to give her a prominent place among the States. While the variety of her mineral products is not large, they represent a vast amount of capital, and the volume and value of the productions are annually increasing in nearly every line. She ranked fifth among the States in value of mineral productions for the census year 1889–90, which is given as $26,653,439. In the production of iron ore there has been a marked falling off, the output in 1886 being 344,484 tons; in 1889, 252,409 tons; and in 1899, 53,221 tons. In 1859 the first well was drilled in the U. S. for petroleum. Ohio had a fairly conspicuous part in the great economic movements resulting from this beginning, and has made several unique contributions to the subject. The oil-field of Mecca, Trumbull County, is one of these. It yields a heavy lubricating oil of great excellence from wells only 30 to 50 feet deep, the oil being drawn by buckets as in ordinary water-wells. The Macksburg oil-field of Noble and Washington Counties was the first in the State to attain large proportions. Better than its oil production is the knowledge that it has yielded of the laws of petroleum accumulation. In its best year, 1885–86, it yielded fully 750,000 barrels. In 1873 the inflammable gas that always accompanies oil was first turned to account in a large way. An iron-mill in Pittsburg was supplied with gaseous fuel brought in by a pipe line from a well 10 or 12 miles distant. This led to the drilling of deep test-wells in almost every county in Ohio, and one of these wells, drilled in Findlay in Nov., 1884, led to the most surprising discovery ever made in the economic geology of the State, namely, that the Trenton limestone of Lower Silurian age is, under certain conditions, a prolific source of gas and oil. The surface rocks of Northwestern Ohio, which are Upper Silurian limestones, hold at a depth of 1,000 to 1,500 feet reservoirs of oil that yield not less than 5,000 barrels to the acre, and volumes of gas, under a pressure of 400 to 600 lb. to the square inch, flowing out at a rate of 10,000,000, 20,000,000, or 30,000,000 cubic feet a day. The Trenton limestone also furnishes by far the largest portion of the illuminating oils of the U. S. The natural gas of Ohio is used to a large extent in manufacturing, especially glass-making; also for domestic fuel, both in and out of the State. (See NATURAL GAS.) The gas used in Columbus, Newark, and Lancaster is derived from the Clinton formation of Upper Silurian age, and the fact that this stratum is petroliferous is another contribution of Ohio to the knowledge of this class of products. Of crude petroleum the annual output has increased over three hundredfold since 1880. The nature and amount of the mineral productions of Ohio for the year 1899, as reported by the U. S. Geological Survey, together with her rank in each, are shown in the following table:

MINERAL PRODUCTS.	Amount.	Rank.
Petroleum, barrels	21,142,108	1
Natural gas, consumers' receipts	$1,866,271	4
Coal (bituminous) tons	16,500,270	4
Sandstone, value	$1,775,642	1
Limestone, value	$1,793,604	4
Portland cement, barrels	480,982	4

In 1899 the production of coke was 83,878 tons, valued at $255,129. The fire-clays constitute a resource which is already the basis of a large industry that seems destined to become one of the foremost in the State. Ninety-eight per cent. of all the grindstones produced in the U. S. are from Ohio. The State ranks second in number of stone quarries of all kinds and in value of their products.

Soil and Productions.—In the southeastern portion the soils are formed directly from the underlying and outcropping rocks, while in the rest of the State, above the line of the terminal moraine, the soil is of foreign origin, being derived from the clay and gravel of the drift, a mixture of the various formations lying in the path of the glacial ice. These drift-soils fall into three classes—the limestone soils in the western part of the State, the clay of the uplands, and the swamp lands, especially of the northwest. Of these the first two are the best, and are excellently adapted to agriculture. The uplands are especially suited to the cultivation of wheat, and every cereal product which the latitude permits is raised in the State. In the northeastern part dairy products constitute the great staple. Of the soils outside the drift-covered area, the limestone in the extreme eastern and southeastern counties are among the best in the State. Many of the soils are well adapted for fruits and berries, which are raised in great abundance. The grape is largely cultivated.

The native trees embrace eighty-eight known varieties, the most common of which are the oaks, hickories, maples, elms, the ash, poplar, and beech. Fourteen varieties of oaks are found, including the white (the most common tree in the State), red, black, yellow, burr, swamp Spanish, and swamp white; four varieties of maple; six of hickory; three of elm; white, red, green, blue, and black ash; papaw; basswood; buckeye; yellow and honey locust; catalpa; butternut; black walnut; three varieties of birch—cherry, yellow, and red; chestnut; beech; five varieties of poplar, including the quaking ash, cottonwood, and balsam poplar; five varieties of pine; hemlock; and tamarack. The flora of the State embraces a wide variety and large number of species, but none peculiar to Ohio.

Agriculture has always been the leading occupation, though the value of the land has decreased in common with that of immediately neighboring States. This fact, due in great measure to the opening of the trans-Mississippi lands, is beginning to produce its effects in changing the character of Ohio agriculture. While the cereal products still continue far in the lead, fruit and truck farming are receiving increasing attention. Ohio is the foremost State in the number of sheep and the amount of wool produced, while dairy farming, especially in the Western Reserve, constitutes one of the most flourishing and extensive occupations.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms	247,189	251,430	*1·7
Total acreage of farms	24,529,226	23,352,408	†4·8
Value of farms, with buildings and fences	$1,127,497,353	$1,050,031,828	†6·9

* Increase. † Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	2,888,924	106,890,188 bush.	$36,342,664
Wheat	1,420,646	8,523,876 "	6,051,952
Oats	1,061,593	40,340,534 "	10,488,539
Rye	30,905	513,023 "	282,163
Barley	23,058	622,566 "	267,703
Buckwheat	9,227	147,632 "	85,627
Tobacco (1896)	32,012	23,688,880 lb.	1,066,000
Potatoes	165,284	12,561,584 bush.	5,024,634
Hay	1,559,242	1,652,797 tons	18,263,407
Totals	7,190,891	.....	$77,872,689

On Jan. 1, 1900, the farm animals comprised 640,429 horses, value $35,222,931; 16,883 mules, value $979,911; 780,939 milch cows, value $25,224,330; 674,619 oxen and other cattle, value $20,702,044; 1,389,073 sheep, value $4,972,882; and about 1,500,000 swine, value $15,000,000—total head, 4,001,943; total value, $102,102,098.

Climate.—The location of the State subjects it to the climatic conditions of both the lake region and the Ohio-Mississippi valley, and hence to a wide range in temperature and rainfall. Not only is the annual range great, but the changes are often sharp and sudden, especially in the central part. The summers are extremely warm in the southern part, the thermometer not infrequently reaching 100°. In the central section the heat is rarely so intense, while in the north it is materially tempered by the presence of the large body of water on the boundary. The winters are quite variable, seldom rigorous in any part of the State, but occasionally severe in the northern part, where the snowfalls are also often heavy. In general, the climate is healthful, and has proved itself conducive to vigorous animal and vegeta-

ble growth. The following table presents the important facts as to temperature and rainfall, and is based on the observations of the Ohio Weather and Crop Service, extending over a period of years:

MONTHS.	TEMPERATURE.			PRECIPITATION.		
	Mean.	Max.	Min.	Mean.	Max.	Min.
January	26·0°	76°	−34°	3·13 in.	8·33 in.	0·64 in.
February	31·3	80	−18	3·97	10·38	0·42
March	35·3	87	−17	2·85	9·58	0·33

Divisions.—For administrative purposes the State is divided into eighty-eight counties, as follows:

COUNTIES AND COUNTY-SEATS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-SEATS.	Pop. 1900.
Adams	8-D	26,093	26,328	West Union	1,033
Allen	3-D	40,644	47,976	Lima	21,723
Ashland	3-G	22,223	21,184	Ashland	4,087
Ashtabula	1-J	43,655	51,448	Jefferson	4,087
Athens	7-G	35,194	38,730	Athens	3,066
Auglaize	4-D	28,100	31,192	Wapakoneta	2,915
Belmont	5-I	57,413	60,875	St. Clairsville	1,210
Brown	8-D	29,899	28,237	Georgetown	1,529
Butler	6-C	48,597	56,870	Hamilton	23,914
Carroll	4-I	17,566	16,811	Carrollton	1,271
Champaign	5-D	26,980	26,642	Urbana	6,808
Clark	5-D	52,277	58,939	Springfield	38,253
Clermont	7-C	33,553	31,610	Batavia	1,029

* Reference for location of counties, see map of Ohio.

Principal Cities and Villages, with Population for 1900.—Cleveland, 381.768; Cincinnati, 325,902; Toledo, 131,822; Columbus, 125,560; Dayton, 85,333; Youngstown, 44,885; Akron, 42,728; Springfield, 38,253; Canton, 30,667; Hamilton, 23,914; Zanesville, 23,538; Lima, 21,723; Sandusky, 19,664; Newark, 18,157; Portsmouth, 17,870; Mansfield, 17,640; Findlay, 17,630; East Liverpool, 16,485; Lorain, 16,028; Steubenville, 14,349; Marietta, 13,348; Chillicothe, 12,976; Ashtabula, 12,949; Piqua, 12,172; Massillon, 11,944; Ironton, 11,868; Marion, 11,862; Tiffin, 10,989.

Population and Races.—1860, 2,339,511; 1870, 2.665,260; 1880, 3,198,062; 1890, 3,672,316 (native, 3,213,023; foreign, 459,293; males, 1,855,736; females, 1,816,580; white, 3,584,-805; colored, 87,511, comprising 87,113 persons of African descent, 183 Chinese, 22 Japanese, and 193 civilized Indians); 1900, 4,157,545.

Industries and Business Interests.—Ohio is among the foremost States in variety and amount of industrial products. In 1890 it ranked third in the number of manufacturing establishments; fifth in amount of capital invested, value of product, and wages paid; and fourth in number of persons employed. The total number of establishments was 28,673, employing 331,548 persons. The capital invested was $402,793,019; wages paid, $158,768,883; cost of material used, $341,016,464; and value of products, $641,-688,064. The following table includes the chief industries in 1890:

INDUSTRIES.	Capital.	Persons employed.	Value of product.
Agricultural implements	$29,399,930	8,326	$14,333,258
Boots and shoes, factory product	3,176,318	5,991	8,489,728
Brick and tile	6,212,838	9,301	5,813,437
Carriages and wagons	13,952,571	10,504	18,777,866
Clothing, men's, factory product	13,106,296	16,357	20,604,134
Clothing, women's, factory product	2,056,455	2,636	4,352,098
Coffee and spice, roasting, etc	1,417,728	608	7,806,763
Flouring and grist mill products	13,472,455	4,296	39,468,409
Foundry and machine-shop products	32,589,798	26,628	43,617,072
Furniture	7,255,804	6,408	8,780,689
Glass	4,094,677	6,651	5,649,182
Iron and steel	31,865,847	21,373	57,134,110
Iron and steel, nails and spikes	3,723,812	2,654	7,929,912
Leather	4,380,015	1,569	6,701,670
Liquors, distilled	2,109,879	484	12,033,884
Liquors, malt	21,491,924	3,494	15,899,629
Lumber, planing-mill products	7,908,742	5,938	12,910,538
Paints	3,906,580	824	4,528,764
Paper	7,581,536	3,042	7,209,750
Petroleum-refining	15,871,138	2,281	16,343,493
Printing and publishing	11,442,602	10,791	17,015,401
Saddlery and harness	2,694,665	3,208	6,340,355
Ship-building	2,950,811	2,822	3,804,838
Slaughtering and meat-packing	3,582,540	1,633	17,012,198
Tobacco (chewing, snuff, etc.)	2,105,848	1,940	5,991,177
Tobacco (cigars and cigarettes)	2,729,275	6,575	7,024,748

Finance.—The assessed valuation of property in 1900 was: Real estate in cities and villages, $674,525,676; real estate not in cities and villages, $599,678,045; personal property, $559,849,507—total, $1,834,053,228.

The receipts during the fiscal year ending Nov. 15, 1900, were $8,031,817.72, and the expenditures $7,712,567.32. The funded State debt, Nov. 15, 1900, was $701,665, all of which is to be paid by July 1, 1903. The aggregate local debt is $96,193,513.94, of which $77,606,261.40 are municipal debts, and $10,521,247.58 debts of counties.

Banking.—On Sept. 5, 1900, there were 276 national banks with combined capital of $46,515,760, surplus and undivided

profits of $20,074,842.98, and deposits of $157,917,698.20; on June 30, 71 private banks, capital $1,509,220; surplus and profits $485,114, and deposits $10,019,076; and on April 2, 164 State banks, capital $14,223,600, surplus and profits $4,861,798, and deposits $85,157,634, and 4 mutual savings-banks with surplus and profits of $2,539,901 and $39,738,121 in savings deposits from 86,181 depositors.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 3,362 post-offices, of which 235 were presidential (12 first-class, 64 second-class, 159 third-class) and 3,127 fourth-class, with 1,562 money-order offices, and 77 money-order stations. Of newspapers and periodicals there were 168 daily, 5 tri-weekly, 40 semi-weekly, 793 weekly, 6 bi-weekly, 14 semi-monthly, 178 monthly, 4 bi-monthly, and 10 quarterly publications; total, 1,218.

Means of Communication.—In Jan., 1894, there were in the State 8,634·18 miles of railway, owned by 88 corporations and operated under 54 systems. In 1900 the mileage was 8,691. The Baltimore and Ohio system operated the lines of 12 distinct corporations within the State, and the Pennsylvania Company 10 lines. The State is crossed by five of the great east and west trunk lines, viz.: the Pennsylvania, the Baltimore and Ohio, the Lake Shore and Michigan Southern, the New York, Lake Erie and Western, and the New York, Chicago and St. Louis. The Cleveland, Cincinnati, Chicago and St. Louis, the Columbus, Hocking Valley and Toledo, the Cincinnati, Hamilton and Dayton, the Columbus, Sandusky and Hocking, the Norfolk and Western, and others traverse the State from N. to S., and afford with many smaller lines thorough facilities for the distribution of Ohio's products and especially those of the coal districts. The earnings were, in 1900, $86,049,117.88, and the Ohio dividends aggregated $6,367,746.04.

There are four canals, built, owned, and operated by the State, having an aggregate length of 697 miles, distributed as follows: Ohio Canal (from Lake Erie at Cleveland to the Ohio river at Portsmouth), including feeders, 334 miles; Miami and Erie Canal (from the Ohio river at Cincinnati to Lake Erie at Toledo), including branches, 282 miles; Hocking Canal (branch of the Ohio Canal), 56 miles; Walhonding Canal 25 miles. The total cost of construction was $14,340,572.99; the total expenditures for superintendence and repairs to Nov. 15, 1892, were $10,068,747.12; total receipts, $15,878,875. For many years the earnings were largely in excess of the expenses, and the canals added many times their cost to the value of commodities produced, in lessening the cost of transportation to the markets, but for several years they have been operated at a loss.

Churches.—The Roman Catholic Church has an archdiocese, Cincinnati, and two dioceses, Cleveland and Columbus; and the Protestant Episcopal Church divides the State into the dioceses of Ohio and Southern Ohio. The census of 1890 gave the following statistics of the religious bodies having a membership in the State of 5,000 and upward:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	586	591	336,114	$7,395,640
Methodist Episcopal	2,340	2,335	240,650	8,749,970
Presb. in the U. S. of America	618	647	82,444	5,754,350
Baptist, Regular	616	632	57,685	2,543,888
Disciples of Christ	475	475	54,425	1,462,250
United Brethren in Christ	745	725	47,678	1,198,870
Reformed Church in the U. S	294	288	35,846	1,128,275
Congregational	247	260	32,281	2,044,525
German Evan. Synod of N. A	107	107	31,617	836,200
Lutheran, Joint Syn. of Ohio, etc.	191	201	31,261	839,272
Christian	273	265	25,952	392,500
Methodist Protestant	234	233	18,931	441,000
Lutheran, General Synod	189	185	18,437	1,039,950
Protestant Episcopal	166	191	17,454	2,069,787
Lutheran, General Council	118	114	15,915	483,100
Lutheran, Synodical Conference	54	55	15,440	409,975
United Presbyterian	136	140	14,710	697,550
Evangelical Association	216	216	14,673	491,975
German Evan. Protest. of N. A.	22	23	11,793	438,800
Friends, Orthodox	95	97	10,884	202,250
African Methodist Episcopal	111	114	10,025	318,250
Brethren, or Dunkards, Conservative	95	133	8,490	153,365
Baptist, Free-will	128	127	6,982	149,350
Jews, Reformed	17	17	6,576	636,225
United Brethren in Christ, Old Constitution	250	254	5,822	237,940

Schools.—Ohio was the recipient of the first gift of land from Congress for the support of public education, and also received the first grants of land from Congress for the establishment of a college or seminary of learning, through which grants the idea of a State university became firmly fixed in the public mind as an essential part of the educational system of every Western State. When the State was admitted into the Union the control and disposal of these lands passed to it, with the single restriction that whatever the manner of that disposal might be only the income should be used for the purposes specified. The State at first leased the lands for long periods, but after 1827 the policy of selling was adopted. The proceeds, borrowed by the State, have been constituted a permanent irreducible debt on which the State pays 6 per cent. interest. Nearly all of the original grant of 704,488 acres has been sold, producing a fund the income of which is $203,696.56. The unsold lands are leased. In addition to this income there is levied annually a tax of 1 mill on the dollar of all taxable property for the maintenance of a State common school fund, which is distributed annually to each county in proportion to school enumeration. Since 1821 the townships and school districts have had authority to levy taxes for the further support of schools. Finally, fines for many petty offenses are by law payable to the townships for school purposes. Since 1889 a compulsory education law has been in force. In 1899 there were 1,209,735 children of school age, of whom 828,500 were enrolled in the public schools, with an average daily attendance of 613,337. There were 13,077 schools and 25,712 teachers—10,556 male and 15,156 women; average monthly salaries, men $50, women $40. Value of school property, $41,446,838; revenue for school purposes, $13,112,824; expenditure, $12,671,798; expenditure per pupil, based on average daily attendance, $20.66.

The land given by Congress in 1787 for a seminary of learning in the Northwest Territory passed in 1803 to the Ohio University at Athens. Miami University at Oxford became in like manner the beneficiary of a similar grant in the Symmes purchase of lands in the Miami valley. Like the Ohio University, its trustees are nominated by the Governor, and both institutions receive small annual appropriations from the State treasury. The Ohio State University at Columbus was established by the State to receive the Congressional land grant of 1862. In 1901 it had 106 professors and 1,450 students. The value of land, buildings, and apparatus was $2,500,000, and the total endowment $553,893.62. In 1891 a permanent annual levy of one-twentieth of a mill on the taxable property of the State was granted to this university. In the number of colleges Ohio outranks any other State. Among them are several well-known denominational institutions. In 1890–91 there were 37 colleges, with 727 professors and instructors, and 12,030 students in all departments. Among the best established of these colleges are Adelbert, Kenyon, Marietta, Oberlin, Ohio Wesleyan, Cincinnati, and Wooster. There are several medical colleges, 3 law schools, and numerous commercial colleges in the State.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Ohio had 193 libraries, containing 1,320,099 bound volumes and 171,977 pamphlets. The libraries were classified as follows: General, 39; school, 37; college, 47; college society, 12; law, 5; theological, 9; medical, 7; public institution, 7; State, 1; Y. M. C. A., 4; social, 12; scientific, 5; historical, 3; I. O. O. F., 2; mercantile, 1; historical and scientific, 1; historical and theological, 1.

Charitable, Reformatory, and Penal Institutions.—The care of the insane, deaf and dumb, and blind is enjoined upon the State by the constitution, and systematic provision has been made for these and other dependent classes, as well as for the delinquent classes. The general organization of these institutions is the same. The affairs of each are managed and officers and employees selected by a separate board of trustees. These boards usually consist of five members appointed by the Governor and so arranged that the term of one member expires each year. There are five State hospitals for the insane, and the erection of a sixth one, near Massillon, was provided for in 1893. Those in operation are at Athens, Cleveland, Columbus, Dayton, and Toledo. The State also in part supports the Longview Asylum at Carthage. An asylum for epileptics, on the cottage plan, near Gallipolis, was authorized in 1890. For the training of other defective classes there are institutions for feeble-minded youth, the deaf and dumb, and the blind—all at Columbus. The State has also provided homes for the permanent or protracted residence of certain classes of its citizens as follows: Working Home for the Blind, at Iberia; Soldiers' and Sailors' Orphans' Home, at Xenia; and Soldiers' and Sailors' Home, at Sandusky. The State re-

formatory institutions consist of a boys' industrial school, at Lancaster, and a girls' industrial home, at Delaware. A State reformatory at Mansfield has been authorized, which will occupy an intermediate position between the industrial homes and the State penitentiary at Columbus. In addition there are children's homes in forty of the counties, and an infirmary in every county. A State board of charities and correction, consisting of six members appointed by the Governor, is charged with the duty of investigating the whole system of public charities and correctional institutions, and of examining into the condition and management of prisons, jails, infirmaries, public hospitals, and asylums. In 1899 the expenditure of public money for charitable, reformatory, and penal purposes was $3,477,208.38.

Political Organization.—The government of Ohio, while conforming to the general type of State governments, presents a few peculiarities. The legislative power is vested in a General Assembly of two branches, chosen biennially and meeting in even-numbered years; but since 1854 there has always been an adjourned session in the intermediate year. The normal number of Senators is 35, of Representatives 100, but by a peculiar system of apportionment the whole number is generally a little larger or a little smaller (as, in 1901, Senators 29, Representatives 110). The apportionment is made decennially by the Governor, auditor, and secretary of State. The concurrence of a majority of all members of each house is necessary to the enactment of a law, but the approval of the Governor is not necessary. The executive department is vested in the Governor and the usual State officers. All elected State officers are chosen for two years, except the auditor, chosen for four years, and the school commissioner and members of the board of public works, whose terms are three years. These officers are divided into two groups, elections for which occur in alternate years, thus necessitating State elections each year. The Governor is commander-in-chief of the military forces, grants reprieves and pardons, and exercises such appointing power as may be conferred on him by law. He does not possess the veto power, and as his relation to the appointive offices is dependent on the Legislature, his power in the government is less than that of the Governor of most States. The judicial system embraces a Supreme Court, circuit courts, and courts of common pleas. The Supreme Court consists of six judges chosen, one each year, for terms (since 1892) of six years. The State is divided into eight circuits with three judges in each, chosen, one every two years, for terms of six years. The judges in each circuit sit as a single court. There are ten common pleas districts, nine of which have three subdivisions each, with one judge in each subdivision, and more if the Legislature so provides. The common pleas judges are elected for five years. The elective franchise is limited to sane male citizens of the U. S. over twenty-one years of age who have resided in the State one year, in the county thirty days, and in the precinct twenty days. Those who have been convicted of infamous crimes are excluded from voting or holding office. The local government is a mixture of the county system of the South and the township system of New England. The greater share of local powers is exercised by the county. The county commissioners construct and care for the public works and buildings of the county, and have the power to levy taxes for these purposes. They may create new and change the boundaries of old townships. All other county officers report to them annually. Their term of office is three years. The county treasurer receives all taxes within the county—State, county, and local (township, city, village, or district).

History.—The territory embraced within Ohio was discovered and explorations were begun by the French under La Salle about 1670. The French possession of the territory till the middle of the eighteenth century was undisturbed, though by charters of James I. and Charles II. Virginia and Connecticut were granted jurisdiction over the region. About 1748 and 1749, when the English began to establish trading-posts and to plan for the settlement of the Ohio region, disputes arose with the French resulting in war. In 1763 the Treaty of Paris established the English possession. No attempts at settlement beyond temporary trading-posts were made before the war of independence. During that period several battles were fought with the Indians on this territory, and disputes arose between the States as to the ownership of the western lands. Massachusetts, Connecticut, New York, and Virginia laid claim to the northwestern region, while the other States regarded the land as the joint possession of the thirteen. Maryland's refusal to accede to the Articles of Confederation unless the individual States gave up their claims brought about a cession to Congress of the title to the lands in question, save that Connecticut reserved a tract (popularly known as the Western Reserve) along Lake Erie, W. of Pennsylvania, containing 3,666,291 acres, and Virginia reserved a similar tract, to pay her land bounties, between the Miami, Scioto, and Ohio rivers, containing 3,709,848 acres. In 1785 provisions were made by Congress for the survey and sale of western lands, and in 1787 the famous ordinance for the government of the territory N. W. of the Ohio, forbidding slavery in the entire region, was passed. In the same year the Ohio Company, an association formed in Boston, purchased a large tract on the Muskingum, and in Apr., 1788, the first settlement was made at Marietta, by a colony from Massachusetts. In July of the same year the territorial government was formally organized. In December a settlement was made in Cincinnati. During the next four years the settlers were disturbed by Indian raids, but in 1794 Gen. Anthony Wayne won a victory over the Indians on the Maumee, and the treaty of Greenville in 1795 secured peace for the territory. Settlements followed rapidly, and in 1799 the second stage of territorial life was entered upon, when a legislature was elected which met at Cincinnati. Ohio was admitted to the Union as a State on Feb. 19, 1803. The constitution was revised by a convention in 1850–51, and the revision was so complete as practically to make a new constitution. It was ratified in June and went into effect in September of the same year. Another revision was made in 1873, but the constitution was rejected in 1874. Chillicothe was the State capital in 1800–10 and 1812–16, Zanesville in 1810–12, and Columbus has been the capital since 1816. During the war of 1812 the State suffered from British and Indian raids, and during the civil war it was twice invaded by Confederate troops. The history of Ohio has been in the main that of a peaceful industrial development.

GEORGE W. KNIGHT.

Ohio River: the largest of the affluents of the Mississippi in respect to its discharge of water, which averages 158,000 cubic feet per second, that of the Missouri being but 120,000 feet. The Ohio originates at Pittsburg, Pa., in the confluence of the Allegheny and Monongahela rivers. Its length below Pittsburg is 975 miles; total length to its ultimate source, 1,265 miles. A straight line from Pittsburg to Cairo, Ill., at its mouth, measures 615 miles. Its drainage area is 202,400 sq. miles, according to Ellet, or 214,000, according to Humphreys. Its elevation at Cairo is 322 feet; at Pittsburg, 1,021 feet. Its mean fall is ·72 of a foot to the mile. Its mean rate of flow is about 3 miles an hour. Its mean rise in flood is some 30 feet above extreme low water; occasionally, as in July, 1884, the rise exceeds 60 feet. Above Cincinnati it is in many places fordable at

low water for six or eight weeks; but during the rest of the year it is navigable throughout its length for flat-bottomed steamboats. It has two classes of islands: one kind is fertile, and the other mere sandbanks, called "tow-heads" by boatmen. With its numerous tributaries (some of them navigable the year through), it has fully 5,000 miles of high-water navigation. It has no important rapids, except at Louisville, Ky., where it falls 22½ feet in 2 miles. It was discovered in 1669 by the French under La Salle, and called by them La Belle Rivière (the beautiful river).

Revised by Reuben G. Thwaites.

Ohio State University: an institution of learning at Columbus, O., where it owns and occupies 337 acres of land within the city. It is founded on the congressional land grant for education made in 1862, and was opened in 1873. Its land is worth at least $1,250,000; it has eight buildings for instruction worth $330,000; other buildings worth $45,000; a laboratory equipment worth $75,000; agricultural and horticultural equipment worth $15,000; museums worth $50,000; and a library of 30,000 volumes. Its cash endowment is $553,065. Annual income (1899): Interest on endowment, $33,065; proceeds of State tax, $176,058; congressional appropriation, $24,000; fees and rents, $44,450—total, $277,573. It offers courses of study for degrees in arts, three in philosophy (the Latin, the modern language, and the English), science, agriculture, horticulture and forestry, civil, mining, mechanical, and electrical engineering, pharmacy, and veterinary medicine; also a two-year course in agriculture and one in mining. Military instruction and training are given by an officer of the U. S. army. A law department was opened in 1891, and a school of industrial arts and manual training in Sept., 1893. The university has (1894) 67 professors, associates, and assistants, and 800 students. W. H. Scott.

Ohio University: a coeducational institution at Athens, O., projected in 1787 in the purchase made from the Government of the U. S. by the Ohio Company. By a contract between these two parties two townships of land were set apart and placed under the care of the Legislature of the State. The university was organized under an act of the Legislature passed in 1804. Instruction began to be given as early as 1809, and the first graduate was the well-known Thomas Ewing, whose diploma bore date 1815. The regular faculty was organized in 1822, and the first president was elected in that year. Owing to adverse legislation the original endowment fund was very much reduced, and the income is consequently small. For several years the Legislature has supplemented the income of the institution by an annual appropriation varying from $5,000 to $20,000. The trustees are appointed by the Governor of the State, who is an *ex officio* member of the board. Charles W. Super, Ph. D., LL. D., became president in 1883. The present (1900) faculty consists of 10 professors, 5 associate professors, and 6 instructors. The number of students in 1900 exceeded 400, of whom 110 were in the collegiate department. The institution is non-sectarian. Charles W. Super.

Ohio Wesleyan University: a coeducational institution at Delaware, Ohio; organized under the auspices of the Methodist Episcopal Church in 1844. The grounds embrace University Campus, Monnett Campus, Barnes Hill, and Merrick Park. Upon University Campus is a famous sulphur spring and an arboretum consisting of over 600 varieties of trees and shrubs. There are eight buildings, including University Hall, erected at a cost of $175,000. The total value of grounds and buildings is estimated at $525,000. The endowment is $744,000, of which $255,000 still pays annuities to donors. The presidents have been Edwin Thompson, D. D., LL. D., Frederick Merrick, D. D., L. D. McCabe, D. D., LL. D., Charles H. Payne, D. D., LL. D., and since 1889 James W. Bashford, D. D., Ph. D. The university embraces graduate, collegiate, preparatory, musical, art, and commercial departments. The number of students enrolled in 1900 was 1,319. These came from thirty States and Territories and ten foreign countries. About 33 per cent. of its graduates have entered the ministry, and a large number have become missionaries. J. W. Bashford.

Ohl, ōl, Jeremiah F., Mus. Doc.: clergyman, b. in Northampton co., Pa., June 26, 1850. Studied in Muhlenberg College, Allentown, Pa., and Theological Seminary, Philadelphia; was pastor at Quakertown, Pa., 1874–93; director of Deaconess Institute, Milwaukee, Wis., and Professor of Liturgies and Church Music in Lutheran Theological Seminary, Chicago, Ill., since 1893. He has published *School and Parish Hymnal* (Philadelphia, 1892), besides numerous musical contributions in sheet and pamphlet forms.

H. E. Jacobs.

Öhlenschläger, Adam Gottlob: See Œhlenschläger.

Ohm: the unit of resistance in Electricity (*q. v.*). The *practical ohm*, which was till lately in use, is a resistance equal to that of a certain standard coil of wire made of German silver. It was constructed by a committee of the British Association for the Advancement of Science in 1863. The *legal* or *congress ohm*, adopted by the International Electrical Congress in Paris in 1884, is defined as the resistance, at a temperature of 0° C., of a column of pure mercury, 106 cm. in length and 1 sq. mm. in cross-section. These are close approximations to a certain theoretical ohm which is 10^9 C. G. S. units of resistance. R. A. Roberts.

Ohm, ōm, Georg Simon: physicist; b. at Erlangen, Bavaria, Mar. 16, 1787; studied in his native city, and was appointed Professor in Physics in 1817 at the Jesuit College of Cologne, director of the Polytechnic School in Nuremberg in 1833, and professor in 1849 at Munich, where he died July 7, 1874. He discovered the so-called Ohm's law (see Electricity) set forth in his *Galvanische Kette, mathematisch bearbeitet* (Berlin, 1827), which was translated into English in Taylor's *Scientific Memoirs* (vol. xi., London, 1841), and was rewarded with the Copley medal by the Royal Society of London. Besides his principal work, *Beiträge zur Molecularphysik* (Nuremberg, 1849), he wrote, among others, *Bestimmung des Gesetzes, nach welchem die Metalle die Contact-Elektricität leiten* (1826).

Ohm's Law: See Electricity.

Oidium: an old name for the first stage (conidial) of the powdery grape-mildew. See Mildew.

Oil-cake: the residue which is left, after the expression of fixed oils from crushed or ground seed of any kind. It is used both as food and as a direct fertilizer. The cake is frequently pulverized before using, and is then called *oil-meal*. Linseed-oil cake is valuable for fattening cattle. It is largely exported from the U. S. to Great Britain. *Cotton-seed meal* is used for feeding cattle, and is a valuable manure. Rape-cake and colza-cake are fed to sheep or applied directly to the land. Bean-cake is similarly used by the Chinese.

Oil City: city (incorporated as a borough in 1862 and as a city in 1870); Venango co., Pa. (for location, see map of Pennsylvania, ref. 3–B); at the junction of the Allegheny river and Oil creek; on the Allegheny Valley, the Erie, the Lake Shore and Mich. South., and the West. N. Y. and Pa. railways; 8 miles E. N. E. of Franklin, the county-seat, 18 miles S. of Titusville. It is in the center of the great petroleum-oil district, and in its early days was wholly dependent on that industry. It contains several large oil-refineries, pipe-works, iron-foundries, engine and boiler works, and other manufactories; and has street-railways, electric lights, city hospital, public library, an oil exchange, public-school property valued at over $100,000, a national bank, a State bank, 3 private banks, and a semi-weekly, a weekly, and 2 daily periodicals. From Clark's Summit, near the city, a splendid view of the region is had. Pop. (1880) 7,315; (1890) 10,932; (1900) 13,264. Editor of "Derrick."

Oil-cloth: See Carpets.

Oil-engine: See Gas-engine.

Oil Islands: See Chagos Archipelago.

Oil of Tar: See Tar.

Oil of Turpentine: See Turpentine.

Oil Rivers: chiefly branches of the Niger. They form the Niger delta, though some of them have sources independent of that river. From them comes most of the palm oil exported from West Africa. They form a wonderful network of more or less navigable rivers and creeks extending from the eastern boundary of the British colony of Lagos to the northern frontier of the German Cameroons. The land along the lower part of these rivers is marshy and covered with mangrove, but at some distance above tidewater the marshy banks become firm dry land and the mangrove is gradually supplanted by the screw pine and other vegetation. The rivers are under the administration of a British imperial commissioner, and the chief port is Akasa at the mouth of the main Niger. The climate of this delta region is less unhealthful for Europeans than in the other West African possessions of Great Britain.

C. C. Adams.

Oils [plur. of *oil*, from O. Fr. *oile*, *uile* > Fr. *huile* < Lat. *oleum*, from Gr. ἔλαιον, olive oil, oil, deriv. of ἐλαία, olive-tree]: liquid fats (see FATS and FOOD) existing ready formed in nature. They are mostly fluid at ordinary temperatures, unctuous to the touch, stain paper with a permanent greasy spot, are insoluble in water, little soluble in alcohol (castor oil excepted), completely dissolved by ether, often, but not always, tasteless and odorless, and form soaps with alkaline bases, setting free glycerin. In short, the oils are glycerides, and fall under the general designation of fat-oils, including certain pasty sorts, like palm oil, cocoa oil, and other butter-like vegetal fats. The fat vegetal oils are all fixed, while the essential oils are all volatile. The volatility of some of the fatty acids forms no exception to this statement. The essential or volatile oils mostly exist ready formed in plants, from which they are obtained by distillation. They are distinguished from the fat-oils not more by their volatility and odor than by their action with alkaline bases, not being capable of saponification. The volatile oils are therefore separately considered (III.), while the fixed fat-oils are conveniently grouped with reference to their origin, as I. Vegetable Oils and II. Animal Oils.

I. VEGETABLE OILS.—In plants the fat-oils exist chiefly in the seeds, sometimes in the flesh or pulp about the seeds, as in the olive, dogberry, etc., and much more rarely in the roots, as in the earth-almond (*Cyperus esculentus*), which contains 26 per cent. of oil disseminated in minute globules in the cellular tissue. In the oil-producing seeds the oil is often associated with albuminous matters, gum and mucilage; as in linseed, for example. When such seeds are bruised or ground and diffused in water, these albuminous bodies suspend the oil, entangled in a milky *emulsion* of a glairy and mucilaginous consistency. Linseed is a prominent example of this sort of seeds. The vegetal oils are usually divided into two groups: (1) *The drying oils*, like linseed oil, which on exposure to air absorb oxygen and dry to a resinoid surface or varnish; and (2) *the fatty* or *non-drying oils*, of which olive oil is an example. The latter class become rancid on exposure to air, but as a rule such oils do not dry up, although many of them thicken.

Purification of Oils.—The crude oils come from the press more or less changed by the heat employed, and contaminated by albumen, resinous and coloring matter, which must be removed to fit the oils for nice purposes. The treatment originally proposed by Thénard in 1801 is still in general use—mixing the oil with 2 or 3 per cent. of concentrated sulphuric acid in a lead-lined vat, and stirring it until it assumes a greenish tint. After twenty-four hours' repose about 2 per cent. of its volume of water, of about 170° F., is added, and the whole agitated vigorously until the liquid appears milky, when the mixture is transferred for rest to large reservoirs at a constant temperature of about 80° F. After some days' rest the clear oil is decanted and filtered either through cotton, carded wool, or flannel, sometimes through river sand and branches of trees free of leaves. The saturation of the acid is accomplished after Dubrunfaut by chalk without the use of so much water. The oil-cake itself is sometimes employed in a state of dry powder, to avoid filtration, 50 kilog. of the powdered cake being capable of clarifying 200 hectoliters of oil in successive portions of about 6 hectoliters each. Oils like cottonseed and palm oil are treated in England by a mixture of nitric acid and potassium chlorate, which rapidly oxidizes the coloring-matters. About 1 to 2 per cent. of this mixture suffices, and an excess of chlorate is to be avoided as well as of nitric acid, which with alkalies gives a strong red color to the oil. Many other methods of purification have been proposed for oils, of which we mention only that of *air-treatment* with acid by Michaud, who proposed in 1869 to blow air through the oil, while the acid is permitted to fall in, in numerous small streams. The oil charged with air forms with the feculence a mixture of less density, which gathers as a bulky scum on the surface, which is skimmed off, while the operation is repeated until this scum ceases to appear. The oil is then treated by a current of steam until it is warmed to 212°, and with a diminishing quantity of steam it is in half or three-quarters of an hour ready to separate from the water and filter.

Physical Properties.—All the oils are lighter than water, but their densities vary greatly with temperature; e. g. olive oil at 12° C. has sp. gr. ·919; at 26°, ·911; and at 94°, ·862. The congealing-points of the oils vary also greatly, being for olive oil 2° (C.); colza, — 6·25°; groundnut, — 7°; almonds, — 10°; grape, — 16°; poppy and castor, — 18°; linseed, — 27·6°; pine, — 30°. The oils vary equally in electric conductivity, that of olive oil being 677 times less than the others. This peculiarity was made the basis of Rousseau's *diagometer*, an instrument designed to detect adulteration in olive oil by the varying intensity of an electrical current moving a magnetic needle.

Chemical Properties.—The effects of air upon the vegetable oils have already been given. In general, the non-drying, both vegetable and animal, become rancid by exposure to air, while the drying oils become gummy or resinous. This effect is quickened or intensified by boiling them with oxide of lead, peroxide of manganese, and borate or acetate of manganese—an operation attended with the production of a high color. For colorless varnishes drying oils are treated in the cold by oleate of lead prepared by acting on oleic acid by litharge. The same result is obtained by the use of protoxide of manganese, precipitated by an alkali from a protosalt of manganese, rapidly washed, and incorporated with the oil. On driving into the mixture a finely divided current of air the manganese is peroxidized in the midst of the oil, giving after washing with oil a colorless and very drying oil. The action of acids and alkalies upon oils is considered under OLEIC ACID and SOAP. See also CASTOR OIL, LINSEED OIL, OLIVE, etc.

II. ANIMAL OILS.—The animal oils and fats have a constitution closely identical with the non-drying vegetal oils. They are in general ethereal salts of glycerin and the fatty acids, so rich in oleic acid as to remain fluid at ordinary temperatures. The animal oils have, as a class, a characteristic and very persistent odor, referable to their origin, which in some of the fish oils is peculiarly offensive. This animal odor adheres with great obstinacy to the soaps made from even the sweetest animal oils. The liquid animal oils are largely derived from marine animals. *Sperm oil* occurs in the cavity of the head of the sperm whale (*Physeter macrocephalus*), mixed with spermaceti, from which it is separated by crystallization and pressing in the cold. It is saponified with difficulty by potash, yielding the same fatty acids as spermaceti fat. It is esteemed the most valuable of animal oils, and brings the highest price. *Whale* or *train oil* is obtained from the blubber of the right whale (*Balæna misticetus*), from the blackfish, and from other species of whales. Its sp. gr. varies from ·919 to ·929. Dolphin oil and porpoise oil contain a peculiar fat called delphinine, phocenine, or dolphin fat. It is a neutral, very mobile oil, of sp. gr. 0·948–0·954, of a faint, peculiar, somewhat ethereal odor, like that of valeric acid. Seal oil, shark oil, sea-calf oil are fat-oils obtained from the blubber of these animals, and have characteristics in common with whale oil. The menhaden of the Atlantic coast are extensively taken for their oil and the *fish-guano* produced from the compressed fish after boiling to separate the oil.

Cod-liver Oil. See COD-LIVER OIL.

III. ESSENTIAL OR VOLATILE OILS.—The essential oils of plants consist chiefly of mixtures of hydrocarbons with acid of oxygenized bodies of the same class. They are mostly isomeric or polymeric with oil of turpentine, represented by $C_{10}H_{16}$. Turpentine oil is the product of various species of *Coniferæ*, and is obtained from wounds or incisions in the bark, from which it exudes in combination with the resin and other vegetable juices, and is separated from them by distillation. While all the volatile oils thus obtained from coniferous plants are alike in general properties, as of odor, solvent power, etc., they really differ much in density, and more especially in optical properties, some revolving the polarized beam to the right (dextro-rotatory), while others revolve it to the left (lævo-rotatory), and in unlike degrees. Most kinds of turpentine oils are mixtures of two or more isomeric or polymeric hydrocarbons, differing in physical and sometimes in chemical properties. The oxidized constituents of the essential oils are sometimes the direct products of the oxidation of the hydrocarbon itself, in which case they are usually viscid resins; while in other cases the two classes appear distinct. The hydrocarbons from essential oils may be arranged in three polymeric groups, having the formulas, respectively, $C_{10}H_{16}$, $C_{15}H_{24}$, $C_{20}H_{32}$. The first group comprises the greater number of these bodies—turpentine, orange, caraway, nutmeg, anise, thyme, etc.; the second, those from cloves, rosewood, cubebs, calamus, etc.; while the last group has only one representative, colophene. These groups are distinguished by the vapor-densities of the bodies belonging to them—viz., the first group requires a theoretical vapor-density of 4·71, while actual experiment on oil of turpentine, pepper, juniper, lemon, orange, etc.,

gives closely approximate results. For calamus and patchouli oils Gladstone got densities of 6·80 and 7·2, respectively, while theory requires for the formula $C_{15}H_{24} = 7·06$ sp. gr.

The volatile oils generally absorb oxygen rapidly, rarefying and gaining color in the process, and sometimes forming crystals of camphor-like bodies. Oil of turpentine in four months absorbs twenty times its volume of oxygen, and in forty-three months 128 volumes; it thus acquires the properties of ozone, and its bleaching power is seen on the cork used to stop the bottle containing it. Chlorine, bromine, iodine, and hydrochloric acid gas are all absorbed by turpentine and other oils of that group, which are thus changed generally into resins, balsams, or camphors. The oils of lemon, orange, etc., by exposure seem spontaneously to lose their delicate perfume and change to the odor of turpentine. The volatile oils are generally obtained by distilling the parts of plants in which they exist, as the leaves, bark, roots, and even wood, either alone or more usually with water, the vapor of which carries over mechanically the oils of a higher boiling-point. These usually emit at 212° a vapor of considerable tension, which gives the characteristic odor of the plant, and is condensed with the steam, separating in the receiver into a milky or turbid layer, usually, but not always, lighter than the water. Many oils of delicate perfume, like oil of lemons, orange, etc., exist in cells in the skin of the fruit and leaves in a state sufficiently abundant to permit their separation by mechanical pressure, while heat would impair their delicacy. The *essences* are only the watery solutions of essential oils, and are often prepared in domestic economy, as rose-water, essence of pennyroyal, mint, etc., by distillation or by addition of the oils to a sufficient quantity of water to hold them in emulsion or hydration, forming the so-called *distilled waters* of the apothecary.

Some of the volatile oils contain acids, aldehydes, etc., the study of which has shed important light on organic chemistry—e. g. oil of winter-green (*Gaultheria procumbens*) and meadow-sweet (*Spiræa ulmaria*) furnishing salicylate of methyl and salicylic aldehyde. Bitter almonds furnish benzoic aldehyde, and aldehydes of analogous constitution are obtained from the essential oils of cumin (*Cicuta virosa*), oil of cinnamon and cassia, etc. Sulphur exists in certain oils, as of garlic and mustard. The number of the volatile oils of vegetable origin is very large. Gmelin in his *Handbook* describes over 170. There are large areas of the earth where plants with a terebinthine or balsamic odor abound almost exclusively, as in portions of Nevada and California. The properties of the plants referred to remain, for the most part, to be investigated.

The odors of volatile oils are by no means all agreeable. Many are pungent, irritating, and even repulsive; their taste is usually aromatic, often burning. Alcohol and ether are their proper solvents. Many volatile oils are the result of decomposition of other compounds by heat, fermentation, and the action of acids; such are eupione, creosote, fusel oil, oil of wine, etc.; while others which exist ready formed in plants, like those of *Spiræa ulmaria* and *Gaultheria procumbens*, may be formed artificially. There are volatile oils of animal origin, as in ants, castoreum, skunk, etc.

The adulteration of volatile oils is often practiced with fixed oils, when it may be detected by a permanent greasy stain left on paper after evaporation and warming; by distilling off the volatile oil, leaving the fixed oil behind; or by dissolving the volatile oil in three or four volumes of 80 per cent. alcohol, when the greater part of the fixed oil remains behind. Alcohol is also a frequent adulterant, and may, when the quantity is large, be detected by dilution of the adulterated oil with water, when it becomes very turbid. Oil of turpentine is often used to adulterate the costly oils of the same series, as of orange, lemon, neroli, etc. It may often be detected by the smell, or after setting fire to it and then blowing it out.

The odor of volatile oils is closely connected with their oxidation. Oil of turpentine, lemon, clove, and the like, when distilled in carbonic acid or nitrogen, and over lime, are nearly odorless. Air restores the odor. Moisture seems essential also to the development of the odor of volatile oils. All odorous flowers are more fragrant when moistened with dew, and in dry climates roses and other fragrant blooms are scentless after the dry season sets in and dew no longer falls. Violets dried over calcium chloride under a bell lose all odor, but regain it completely when moistened again with water; and paper moistened with a volatile odor and then perfectly dried ceases to emit odor until it is again moistened with a little water. Rose-leaves and other fragrant petals yield a much stronger water if distilled from a bath acidulated with sulphuric acid—a fact noticed by Albertus Magnus. It is a curious fact that many distilled waters when kept in well-closed bottles become slimy, lose their proper odor, and acquire an offensive smell; whereas if kept in loosely covered vessels they remain unchanged, or even recover their proper odor when exposed, after change, to air again. Gmelin suggests that this is due to albuminous and mucous matters carried over in the distillation, which, when they putrefy, rob the volatile oil of a portion of its oxygen, depriving it of its proper odor. See *Neues Handwörterbuch der Chemie*, *Oele* and *Oele Ätherische*.

Revised by Ira Remsen.

Oinomania: See Delirium Tremens.

Oise, wäz: river of France. It rises in the Ardennes, Belgium, and joins the Seine after a course of 158 miles, half of which is navigable.

Oise: department of France, along the Seine and the Oise. Area, 2,261 sq. miles. The surface is flat, and the soil rich and very well cultivated. The wine is of inferior quality, but large crops of wheat are raised, and enormous quantities of fruit and vegetables are sent to the Paris markets. Iron manufactures are carried on, besides various industries on a small scale. Pop. (1896) 404,511. Capital, Beauvais.

Ojeda, or **Hojeda**, ō-hā′dä, Alonso, de: cavalier and adventurer; b. at Cuenca, Spain, about 1468. He was noted for his daring athletic feats and harebrained enterprises. In 1493 he joined Columbus for the second expedition to the New World, and during the two years following he led several military expeditions and explorations in the interior of Española. His most audacious feat was the capture of the Indian chief Caonabó from the midst of his tribe. Ojeda was again in Spain when accounts arrived of the third voyage of Columbus and the discovery of the coast of Paria, and through the influence of Bishop Fonseca he was permitted to fit out a trading and exploring voyage to the same region. With him were associated Amerigo Vespucci and Juan de la Cosa, probably as pilots. Leaving Cadiz May 20, 1499, with four ships, they followed nearly in Columbus's course, reached the coast of Guiana, passed between Trinidad and the mainland, and followed the continent westward, trading with the Indians for gold and pearls. At Lake Maracaibo, their farthest point, they found Indian villages built on piles in the water, whence they called the place Venezuela; and this name passed in time to the surrounding country. Returning they touched at Española, and reached Spain in June, 1500. In 1502 Ojeda explored the same coast to Cape Vela. Soon after he was imprisoned in Española, and again by his debtors in Spain; but his influence in court circles procured his release, and in 1505 he made a third voyage to South America, exploring on this occasion as far west as the Gulf of Darien. In 1508 he obtained a royal grant to colonize and govern the region called Nueva Andalucía, corresponding to the northern coast of Colombia from Cape Vela to the Gulf of Darien. Nicuesa received a similar grant of the Darien region. The two governors fitted out expeditions at Santo Domingo, and Ojeda sailed in Nov., 1509, with 400 men. At Cartagena Bay he landed with part of his force to capture Indians for slaves. The Indians, after their first surprise, gathered in great numbers, attacked the Spaniards, and killed all except Ojeda and one other, who escaped by concealing themselves in the swamps; they were rescued, when nearly dead, by a party sent from the ships. Ojeda then sailed to the eastern side of the Gulf of Darien, where he founded the colony of San Sebastian; but his reckless treatment of the Indians provoked their hostility, and the Spaniards were forced to keep within the fortifications, where they suffered terribly from hunger. Ojeda himself was severely wounded by a poisoned arrow. He at length left the colony in charge of Francisco Pizarro, and sailed away to seek re-enforcements; but, after being shipwrecked on Cuba, he finally reached Santo Domingo, with fortunes completely broken. Unable to secure aid for his colony, he died at Santo Domingo in complete poverty about 1514. For the subsequent history of the colony, see Darien.

gable at the city of Orel, and joins the Volga at Nijnii-Novgorod, after a course of 837 miles. As it runs through some of the most fertile and densely peopled regions of Russia, it is of great importance as a commercial highway.

Okaw River: See KASKASKIA.

Okayama, ō-kaă-yaa′maă: a town and prefecture in the province of Bizen, Central Japan; situated on the northern shore of the inland sea, and connected by rail with Hiogo and the East (see map of Japan, ref. 6–B). It is an important mission-station. Pop. of the town, 32,989. J. M. D.

Okecho′bee, Lake: the largest lake in the Southern U. S. It lies in Southern Florida; is 40 miles long, has an area of about 1,250 sq. miles, and is only 12 feet in maximum depth. It contains but few fishes. It receives several streams, of which Kissimmee river is the most important. A large part of the lake is grown up with grass and weeds. Its waters are discharged through the Everglades mainly by the Caloosa river. Nearly all the shores of the lake are impenetrable, swampy jungle, and the lake itself is nearly inaccessible. It contains a few low islands. It has been partially drained.

Okefeno′kee Swamp: one of the largest swamps of the U. S.; covers an area of about 500,000 acres, in Charlton, Ware, and Clinch cos., Ga., and Baker co., Fla. It is about 40 miles N. and S. by 30 E. and W. The eastern part is mostly an open lake dotted with small floating islands. The lake portion is 12 miles in width. This swamp has forests of heavy timber, and is the abode of countless rattlesnakes, moccasins, and alligators, besides many species of game-birds.

O′ken (originally *Ockenfuss*), LORENZ: naturalist; b. at Bohlsbach, Baden, Aug. 1, 1779; studied medicine and natural science at Würzburg and Göttingen, and was appointed Professor of Medicine at Jena in 1807 and of Natural Science in 1812. In 1816 he began the publication of *Isis*, a periodical of a miscellaneous character, though chiefly devoted to natural history and philosophy. Some political criticisms which it contained gave the Government an opportunity of interfering, and in 1819 Oken resigned his office and lived as a private teacher till 1828, when he received a professorship at Munich. In 1832 he removed to a similar position in Zürich, where he died Aug. 11, 1851. His principal works are *Lehrbuch der Naturphilosophie* (1808–11; Eng. trans. by Dr. Tulk, London, 1847); *Lehrbuch der Naturgeschichte* (1813–27); *Die Zeugung* (1805); *Ueber die Bedeutung der Schädelknochen* (1806), etc. As a pupil of Schelling, the general character of Oken's works has not been acceptable to naturalists, speculation having been cultivated too much at the expense of observation, and his hypotheses now exist chiefly as a warning against "transcendental" excesses. Even the hypothesis of the vertebral composition of the skull, which he developed, after but independently of Goethe, has now little acceptance.

Okhotsk′ Province of Siberia: See MARITIME PROVINCE.

Okhotsk, Sea of: a large inlet of the Pacific Ocean on the eastern shore of Asia, between the island of Saghalin, Siberia, Kamchatka, and the Kurile islands. Its northern part is frozen from November to April.

Oklaho′ma: one of the Territories of the U. S. of North America (South Central group); organized May 2, 1890; capital, Guthrie.

Location and Area.—It lies between 34° and 37° N. lat. and 96° and 103° W. lon.; is bounded N. by Kansas and Colorado, E. by Indian Territory, S. by Indian Territory and Texas, W. by Texas and New Mexico. Area, 39,030 sq. miles, of which 200 sq. miles are water surface.

Physical Features.—The greater part of Oklahoma is an upland prairie, rising gradually toward the N. and W. The Wichita Mountains in the S. are the principal elevations. The Cimarron and Canadian rivers, important tributaries of the Arkansas, with a general course from N. W. to S. E., water the northern and central portions, while the Red river forms a part of the southern boundary, and its two forks, with numerous smaller feeders drain the southwestern portion.

Soil and Productions.—The soil in general is similar to that on the same meridians in Texas and Kansas, and is adapted to the cultivation of almost every kind of plant. Wheat has averaged 20 bush. to the acre throughout Oklahoma, with maximum production in places of 62 bush., and corn and oats have averaged 40 bush. to the acre. Cotton yields an average of 500 lb. to the acre. Horticulture thrives in every section, the more hilly portions being especially adapted to apples and grapes. The woodlands contain walnut, oak, hickory, pecan, and other trees common to the latitude. The following table shows the acreage, yield, and value of the principal crops for the year 1900:

CROPS.	Acreage.	Yield.	Value.
Corn	544,002	14,144,052 bush.	$3,677,454
Wheat	981,967	18,657,373 "	9,888,408
Cotton	208,553	66,555 bales	2,512,584
Totals	1,734,522	.....	$16,078,446

The farm animals on Jan. 1, 1900, comprised 50,326 horses, value $1,213,970; 9,584 mules, value $350,107; 40,715 milch cows, value $1,298,808; 283,256 oxen and other cattle, value $7,182,529; 33,094 sheep, value $83,380; and about 50,000 swine, value $250,000; total head, 466,975; total value, $10,378,794. The minerals so far as known comprise gold, silver, coal, iron, salt, gypsum, asphaltum, petroleum, building-stones, and flagging-stones.

Climate.—The climate of Oklahoma is so equable that the staple products of both North and South can be cultivated with profit. The average annual temperature is 58·4°. The mean annual rainfall is about 35 inches.

Divisions.—For administrative purposes Oklahoma is divided into twenty-three counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1890.	Pop. 1900.	COUNTY-TOWNS.	Pop. 1900.

† Organized from Indian lands since 1890.
‡ Claimed by Texas; awarded to Oklahoma by U. S. Supreme Court, Mar. 16, 1896.

Principal Cities and Towns, with Population for 1900.—Oklahoma, 10,037; Guthrie, 10,006; Shawnee, 3,462; Enid, 3,444; El Reno, 3,383; Perry, 3,351; Ponca, 2,528; Stillwater, 2,431; Kingfisher, 2,301; Blackwell, 2,283; Norman, 2,225; Newkirk, 1,754; Alva, 1,499.

Population and Races.—1890, 61,834 (native, 59,094; foreign, 2,740; males, 34,733; females, 27,101; white, 58,826; colored, 3,008, including 2,973 persons of African descent, 25 Chinese, and 10 civilized Indians).

Industries and Business Interests.—Though Oklahoma was organized as a Territory on May 2, 1890, the census returns show that on June 1 following 72 manufacturing establishments reported. These had a combined capital of $95,519, employed 195 persons, paid $71,918 for wages and $56,518 for materials, and had products valued at $180,445.

Finance.—In 1900 the assessed valuations aggregated $49,338,691. The bonded debt was $48,000, and the general warranty indebtedness $379,054.18.

Banking.—On Sept. 5, 1900, there were 24 national banks, with combined capital of $865,100, surplus and undivided profits of $151,761.08, and deposits of $2,956,208.23; Dec. 31 there were 79 Territorial banks, capital stock $744,588.66, surplus and profits $483,970.73, and deposits $3,918,622.12. There are six building and loan associations.

Post-offices and Periodicals.—On Jan. 1, 1901, there were 619 post-offices, of which 27 were presidential (6 second-class, 21 third-class) and 592 fourth-class, with 192 money-order offices. There were 152 newspapers and periodicals: 13 daily, 126 weekly, 1 semi-monthly, and 12 monthly.

Means of Communication.—The Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, the St. Louis and San Francisco railways, and the Choctaw Coal and Railway Company, operate lines within the Territory. The total mileage June 30, 1899, was 710·94.

Churches.—In 1893 the Roman Catholic Church had 25 organizations, with a reported membership of 10,000; the Methodist Episcopal Church North, 165 organizations, 2,136 members; the Baptists, 25 organizations, 800 members; the Presbyterian Church, 24 organizations, 750 members; the Congregationalists, 24 organizations, 616 members; and the Protestant Episcopal Church, 6 organizations, 166 members. There were 50 organizations of the Young People's Society of Christian Endeavor, with 1,000 members.

Schools.—In 1899 there were 114,736 children of school-age, of whom 85,635 were enrolled in the public schools, with an average daily attendance of 54,600. There were 1,982 schools and 2,182 teachers—914 men, and 1,268 women; average monthly salaries, men $31.93; women $26.20. The value of school property was $700,000; revenue, $617,592; and expenditure $596,492. Besides direct taxes the school districts receive the proceeds of fines in criminal cases, and also moneys arising from the rental of lands set apart for educational purposes. The Legislature has established a university at Norman, a normal school at Edmond, and an agricultural and mechanical college at Stillwater.

History.—Oklahoma (beautiful land) is a part of the Louisiana purchase of 1803, and of the tract set apart for Indian tribes by act of Congress June 30, 1834. Patents granted to the "five civilized tribes" covered materially all the lands in Indian Territory. By a treaty in 1866 the western half of the Creek territory, containing 3,402,450 acres, was ceded to the U. S. for settlement of other civilized Indians and freedmen, the Government to pay 30 cents an acre. The Seminoles at the same time ceded their tract of over 2,000,000 acres at 15 cents an acre, purchasing 200,000 acres of the Creek cession. Remnants of seven tribes were located by the Government on the ceded lands, but a large portion remained unoccupied. In 1879 schemes were projected by speculators for taking possession of these unoccupied lands. Parties of settlers entered the Territory with the intention of obtaining homes. President Hayes issued proclamations forbidding such movements, and ordering the ejectment of all intruders. Many of the invaders were arrested and expelled from the Territory, but new expeditions were started. Colonization companies were formed, and lands guaranteed to members. This state of things continued till 1887. Legislation then began to be discussed in Congress looking toward the formation of a new Territory in the coveted region. The first bill for territorial organization passed the House, but was lost in the Senate. Meanwhile the Creeks and Seminoles were induced to enter into an agreement for the complete cession and release of their lands provisionally ceded in 1866. The Government paid for these cessions $4,193,799, receiving an aggregate of 5,439,865 acres. President Harrison's proclamation opened the unoccupied portion to settlement Apr. 22, 1889. A military force equal to a regiment of cavalry and more than a regiment of infantry was employed to keep out intruders until noon of the designated day, and to preserve order among the throngs of expectant settlers. Two land-offices were opened and a U. S. court established. More than 50,000 persons entered the Territory on the first day. During the afternoon of that day a bank was opened at Guthrie with a capital of $50,000. Four months later the town of Guthrie had four daily newspapers, water-works, street-car and electric-light companies, and six banks. For the first year the settlers had no organized government, but early in 1890 a law was passed by Congress and signed by the President creating Oklahoma Territory. The Territory was made to include the lands ceded by the Creeks and Seminoles, together with the Public Land Strip, or No-Man's Land. The Cherokee Strip was to be added to the Territory whenever the Indian title should be extinguished, without further legislation. The district known as Greer County was claimed by Texas, and provision was made for the judicial determination of the title. Further cessions were made by the Sac and Fox, Pottawatomie, Shawnee, Cheyenne, and Arapahoe Indians, and as a result nearly 300,000 acres of land formerly held by these Indians was opened to white settlers during 1891. In Sept., 1893, the Government having perfected its title to the Cherokee Strip by treaty and purchase, this entire tract, consisting of some 6,000,000 acres of land, was opened to settlement by the President's proclamation. The scenes at the first settlement of Oklahoma, in 1889, were repeated. It was estimated that 90,000 people struggled to possess themselves of a title to the soil. Much suffering resulted from lack of water and provisions. The incorporation of the Strip makes the southern boundary of Kansas the northern boundary of the Territory.

GOVERNORS OF OKLAHOMA.

George W. Steele	1890-92	Cassius M. Barnes	1897–
Abraham J. Seay	1892-93		
William C. Renfrow	1893-97		

Revised by WILLIAM C. RENFROW.

Oklahoma City: city (settled Apr. 22, 1889); capital of Oklahoma co., Okl. (for location, see map of Oklahoma, ref. 3–D); on the North Canadian river, and the Atch., Top. and Santa Fé Railroad; 25 miles S. of Guthrie. The river has a fall of 27 feet in 4 miles, and the power thus obtained has been brought into the city for manufacturing purposes by means of a canal. The city is the largest cotton-market in Oklahoma; contains flour-mills, cotton-gins, brick-yards, packing-houses, and several hotels; and has a large trade in agricultural products and lumber. There are 3 national banks and 2 daily and 4 weekly newspapers. Pop. (1890) 4,151; (1900) 10,037. EDITOR OF "GAZETTE."

Okra: See GUMBO.

Ok'ubo, TOSHIMICHI: statesman; b. in the province of Satsuma, Japan, about 1830 A. D. Trained under the able lord of Satsuma, who died in 1858, he early directed all his energies to the overthrow of the Tokugawa shogunate or *bakufu*, whose most determined enemies were found in the Satsuma clan, and Okubo became their leading spirit. Their ideal was the restoration of the imperial power as it existed before 1200 A. D., and this change was effected in 1868 by means of Western appliances. From 1870–78 Okubo was the most powerful minister in the imperial cabinet. He went on a special mission to China in 1874, and successfully settled the Formosan difficulty. Later, Saigo Takamori separated from him and raised a revolt in Satsuma; but the suppression of this rebellion in 1877 left Okubo's policy triumphant. On May 14, 1878, when on his way to the palace in Akasaka, Tokio, he was murdered by six bravoes belonging to the party of the deceased Saigo. A handsome monument has been erected on the spot. Okubo was a prominent member of the Iwakura embassy which visited Washington in 1872. J. M. DIXON.

Ok'uma, SHIGENOBU: statesman and financier; b. in the province of Kiushiu, Hizen, Japan, in 1837. He studied Dutch at Nagasaki, and also English; after the restoration entered the Foreign Office, and became a councilor of state in 1870, with charge of the Finance Department. For the next twelve years he directed the finances of Japan, but the depreciation of the fiat currency and other circumstances led to his removal. In 1882 was organized the Kaishinto, or constitutional-liberal party, of which he is the acknowledged leader; it seeks the overthrow of clan rule, and the subordination of cabinets to the parliament. In Oct., 1889, Okuma, who had returned to office as Minister for Foreign Affairs, was attacked by an assassin, and had his leg blown off by a dynamite bomb. Okuma's liberal schemes for a revision of the existing treaties fell through, and he resigned office in Nov., 1891. He founded a college in Tokio—the Semmon-Gakko—largely devoted to the study of political economy. J. M. DIXON.

O'laf, SAINT: the patron saint of Norway; b. about 995; King of Norway 1015–28; a son of Harald Gränske, a grandson of Harald the Fair-haired; commanded a Viking fleet when twelve years old, and was one of the most famous and most dreaded sea-kings of the North before he was nineteen. In 1014 he returned from a pillaging jaunt along the coasts of France and Spain, and installed himself in his patrimony, the throne of Norway. He now set about introducing Christianity among his countrymen, but his measures were so severe and violent that the Norwegians rose in rebellion against him, and when, in 1028, Knud (Canute) the Great, King of Denmark and England, who laid claim to Norway, landed with an army near Throndhjem, then called Nidaros, Olaf was compelled to flee to Russia. Two years afterward

he returned with aid from Russia and Sweden, and gave battle at Stiklestad, near Throndhjem, July 29, 1030, but his army was routed, and he himself slain and buried on the spot. Subsequently, when Norway became thoroughly Christianized, his body was taken to the cathedral of Throndhjem and enshrined behind the high altar. Great miracles were reported; crowds of pilgrims journeyed to his shrine; legends and folk-lore gathered around his name; and in the following century he was solemnly canonized and declared the patron saint of the country. On Aug. 21, 1847, King Oscar I. instituted the order of St. Olaf. See NORWAY.

Revised by R. B. ANDERSON.

Olaf Trygvason: King of Norway 995–1000; b. in 964; great-grandson of Harald Haarfager, and a son of Trygve (Old Norse, *Tryggvi*), who was viceroy in Southeastern Norway, and who was assassinated by Gudröd, son of Erik Bloodaxe. The widow of Trygve and her son fled through Sweden to Russia. The stories of his experiences in Russia and of his Viking expeditions in Baltic and British waters are so full of miracles and romance that it is difficult to sift the wheat from the chaff. Meanwhile it is certain that the young man became celebrated as the greatest hero and athlete of his time. He plundered in England with the Danish king Svend, but made peace with King Ethelred in 994, accepted the Christian faith, and was baptized, King Ethelred himself being his god-father. Olaf promised never again to attack England, and the following summer (995) he returned to Norway. He arrived there in the most opportune moment, the ruler, Hakon Jarl, having just been driven from his throne and murdered by this thrall. Olaf found no trouble in getting possession of the crown. He devoted all his time and strength to the introduction of Christianity, but his methods were too severe and the cause made but little progress. He founded Nidaros (now Throndhjem), and made it the capital of the kingdom. He also sent Christian missionaries to the Orkneys, Faeroes, Iceland, and to Greenland. Leif Erikson, who discovered Vinland (see VINLAND), was the missionary he sent to Greenland. Finally he organized an expedition against the Wends (in Pomerania) to secure some possessions belonging to his queen, Thyra, a sister of Svend Forkbeard of Denmark. At the same time an alliance was formed against him by the Danish king Svend, the Swedish king Olaf, and the banished Norwegian Jarl Erik Hakonson. The allied forces attacked Olaf near Svolder (an island near Rügen in the Baltic), and after one of the fiercest naval engagements known in old Norse history he fell Sept. 9 in the year 1000. Olaf Trygvason is the most conspicuous figure in old Norse history, and he is the subject of many a song and story. See NORWAY.

RASMUS B. ANDERSON.

Olathe: city; capital of Johnson co., Kan. (for location, see map of Kansas, ref. 5–K); on the Missouri river, and the Atch., Top. and Santa Fé and the Kans. City, Ft. Scott and Memphis Railways; 22 miles S. W. of Kansas City, Mo. It is in an agricultural region; contains an academy, the Kansas Institution for the Education of the Deaf and Dumb, a commercial college, 2 libraries, a national bank, State bank, and private bank, and 5 weekly newspapers; and has flour-mills, canning-factory, and a number of wood-working establishments. Pop. (1880) 2,285; (1890) 3,294; (1900) 3,451.

EDITOR OF "HERALD."

Ol'bers, HEINRICH WILHELM MATHIAS: astronomer; b. at Arbergen, near Bremen, Oct. 11, 1758; studied medicine at Göttingen, and practiced as a physician at Bremen, where he died Mar. 2, 1840. His leisure hours he gave to the study of astronomy, especially comets. He invented a new method of calculating the orbits of comets from three observations, which proved easier and more accurate than the old one; and his calculations and observations of comets, collected and published in the *Astronomisches Jahrbuch* in 1782–1829 and 1833, enjoy a great reputation. Of the planets between Mars and Jupiter, which were eagerly sought after by the astronomers in the beginning of the nineteenth century, he discovered two—Pallas, Mar. 28, 1802, and Vesta, Mar. 29, 1807.

Old Age, Diseases of: The natural history of the bodies of animals, in common with that of all living beings, includes the following stages: First, the embryonic stage; second, that of infancy; third, that of adolescence; fourth, that of adult life or maturity; fifth, that of old age (senescence) or decline, which is terminated at death. Each of these stages is marked by physiological conditions differing in the main from those of other stages. In man, it is well known that the physiological activity of infancy and adolescence is in marked contrast to the physiological deliberateness (we may say) of adult life and the physiological inactivity of old age. Likewise there are certain diseases that are very common in early life, but practically unknown in old age; so also in old age certain disorders are more likely to occur than at other times of life. Conditions which predispose to these diseases are, in general, the physical inability to perform movements and exercises which in earlier life are not only easy but usually pleasant; the inactivity of the muscles of the internal organs, such as the intestines or the bladder; and the rigidity of the blood-vessels, which opposes an obstacle to the motion of the blood propelled by a heart which does its work less actively than formerly; and the increasing fragility of these blood-vessels. In addition to this, every tissue in the body of an old person differs from similar tissues in the young just as surely as an old leaf differs from a newly developed one. This difference can be seen to a certain extent in the microscope, but beyond this, changes which elude sight and chemical analysis mark the old tissues, and are clearly evinced by the functional inactivity of these tissues. They are the occasion of accidents and diseases to which the old are more liable than the young. Among the diseases of old age we can not properly class those changes in the hair and the scalp which make one gray and the other bald, nor perhaps that common alteration of the skin known technically as vitiligo (leucoma), which consists in the disappearance of the pigment matter from beneath the cuticle in certain places, so that there are patches lighter in color than the general hue of the skin; but there is a special tendency in the old to the formation of small collections in the skin, due to the stopping up of the sebaceous follicles and the suppression, to a certain extent, of the function of perspiration; and they are often sufferers from erysipelas and carbuncles.

In the eyes, the development of far-sightedness (presbyopia) can not be considered a disease, but the formation of cataracts (opacities of the crystalline lens) can.

In the ears, the dull hearing is physiological, and the disposition to the accumulation of wax (cerumen) in the external auditory canal comes in the same category.

In the muscular system, the changes of old age consist in weakening of the muscle fibers and disappearance of the fat which normally surrounds them, resulting in leanness, which is a familiar feature of advanced age. In what may be called early old age there is sometimes a development of abnormal quantities of fat beneath the skin and among the muscles, but if persons with this development live long they almost invariably lose their fat and present the normal picture of senility. The muscular system of old persons is not more subject to disease than that of adults.

The bones of the old undergo an alteration of the proportions of their animal matter (organized matter) compared to their mineral ingredients (unorganized matter). The former is reduced in relative quantity, the latter is increased. As a consequence, the bones are more brittle and more liable to fracture. An example of fracture caused by trifling violence is seen in that of the neck of the thigh-bone (femur). This part of the bone may be broken by a wrench occasioned by tripping upon a carpet, or even by the weight of the body alone—what is known as "spontaneous" fracture. Connected with these changes in the bones there is often stiffness in the joints, due partly to alteration in the membrane covering the ends of the bones which make up the joint, partly to diminished secretion of the lubricating fluid (synovia) of the joint, and partly to the weakness of the muscles.

More serious troubles than those of the parts already mentioned occur in the internal organs of old persons. The circulatory apparatus undergoes changes, which—if not in themselves pathological—predispose to accident and disease. The tissues composing the walls of the heart and blood-vessels, as age advances, lose their elasticity and contractile force by the substitution of fat for muscle-cells, and eventually the deposit of calcareous salts. Fatty degeneration of the heart, with the deposit of various salts immediately under the thin lining membrane (endothelium) of the heart and arteries, weakens the heart, and may be followed by dilatations of its walls or of the walls of the arteries, resulting in the latter case in aneurisms. Further, fragments of such deposits on the valves of the heart and of the aorta may become detached and be carried forward in the circulation (embolism) until they lodge in some vessel too small to permit their further progress, and by blocking it up cut off the circulation of a certain area in the brain or lungs or

some other portion of the body (infarct). When fatty or calcareous degeneration occurs in the nutrient arteries of the heart (coronary arteries) the result may be what is known as angina pectoris, or some other form of disease, which in time is surely fatal. When an embolus lodges in the brain and becomes an infarct, the result is disturbance of that part of the brain; and this may go so far as to cause paralysis of the portion of the body over which it presides. In the lungs an infarct is likely to cause pneumonia. In the kidney an infarct causes also destruction of a certain portion of its working tissue. An infarct occurring in a toe is a common cause of what is called senile gangrene. The changes in the circulatory apparatus of old persons sometimes leads to unusual distension of the blood-vessels (plethora) or to dropsy caused by the leakage of their contents through their impaired walls.

The respiratory apparatus of old persons is especially liable to injury and disease. This is seen in the development of asthma, which may be considered here, although it is often regarded as a disease belonging to the nervous system and only showing its effects in the lungs. A very common cause of asthma is the development of emphysema, which is a dilatation of the air-cells (alveoli) that, like the leaves on a tree, are found at the ends of the minutest ramifications of the bronchial tubes. The lining membrane of the bronchial tubes is especially prone to disease in old persons, who suffer often and severely with bronchitis, and in whom this disease is almost as dangerous as it is in little children, whose bronchial tubes are so small that they are easily blocked up by an excess of their normal secretion. In advancing age there is a tendency to the development of consumption (phthisis), which finds its largest number of victims before the age of thirty years, and then diminishes in frequency until about the age of fifty years, when persons with weak lungs pass through a second period of danger.

The disorders of the digestive apparatus in old persons are to a certain extent connected with the loss of their teeth and the imperfect activity of their salivary glands. Partly on this account and partly because of the growing old of the mucous membrane of the stomach, indigestion is very frequently found in the old. The liver, which is part of the digestive apparatus and a most important organ in producing regular evacuations of the bowels, undergoes senile changes which sometimes result in jaundice, and frequently in constipation or in actual obstruction of the bowels, the former impairing the health and the latter being very dangerous to life. These changes sometimes lead to dropsy, because they constrict the large (portal) vein which brings back to the heart the blood from the abdominal viscera.

After middle life and in old age the kidneys often undergo changes, consisting in alterations of their structure caused by gout (gouty kidney), which are like those of the form of kidney disease called Bright's disease. In old age albumin or sugar may be excreted by the kidney to such an extent as to constitute a true albuminuria, or a diabetes mellitus. In some cases dropsy may occur. The old, like the very young, are liable to the discharge of small concretions from the kidney—what is called gravel. Such concretions, remaining in the kidney of the old, may cause the formation of stones (calculi), and these in turn may give rise to an inflammation accompanied by the formation of matter (pus), constituting what is known as pyelitis. In the old, and especially in men, the urinary bladder is frequently the seat of disease. Owing to the weakness of the muscles in its wall, there is often in the old an inability to properly evacuate this organ, leading sometimes to accumulation of its contents (technically called "retention"), which may result in partial paralysis of the organ and dribbling away of its contents, which deceives the sufferer into the notion that the organ must surely be empty. This involuntary evacuation sometimes depends upon a weakness in the circular muscular fibers at the neck of the bladder, and is then called "incontinence." In old men the prostate gland, which is situated close to the neck of the bladder, sometimes grows to such a size as to furnish a mechanical obstacle to the proper evacuation of the bladder. In such cases, and in others in which the bladder is not properly emptied, there often develops an inflammation of the bladder (cystitis), which may occasion very serious difficulty and even death. This inflammation is sometimes propagated along the tubes which lead from the kidneys to the bladder (ureters), and sets up what has been mentioned above as pyelitis.

The brain and nervous system in the old are peculiarly liable to functional and organic disorders. Vertigo is only a manifestation of a defect in the circulation within the brain. Stoppage of the circulation by an infarct may cause a passing disturbance or a paralysis which leads to death. The breaking of a blood-vessel in the brain, with the pouring out of blood into the general tissue of the brain, constitutes what is called apoplexy. There is also another form of apoplexy called serous, in which there is an internal dropsy caused by the passing of the watery parts of the blood through the thinned walls of the blood-vessels. In the old, palsy with its tremblings is frequently seen, and changes which elude detection by the microscope give rise to what is called senile dementia.

The constitutional diseases to which the old are especially liable are gout and rheumatism. To mention the many disturbances which may depend upon these diseases would require much more space than can here be given to the subject, and those who wish information on these points may consult articles under these titles.

Protection against the diseases of old age is best secured by attention to the general principles of health. The old should be well housed, well clothed, with especial care to protect their extremities; they should rest, and avoid strains of body or mind as far as possible. Moderate exercise is healthful; but it should be remembered that rest, and not activity, is the normal state of the old. In eating and drinking, the old should exercise temperance, as suggested by nature. The comparative inactivity of the body in old age is accompanied by a comparatively limited demand for food, and this should be taken at rather longer intervals than is common in the more active stages of life. Speaking from the physiological standpoint, the use of spirits should be regulated by the custom of each individual. Those unused to wine have no need for it when older; those accustomed to it may usually continue its use in moderation.

CHARLES W. DULLES.

Old'castle, Sir JOHN, Baron Cobham, popularly known as "the good Lord Cobham": religious reformer; b. in England about the middle of the fourteenth century; fought with credit in the French wars; obtained by marriage the title of baron; was an early convert to the doctrines of Wycliffe; took part with John of Gaunt, Duke of Lancaster, in his efforts to promote ecclesiastical reform, presenting a remonstrance on the subject in Parliament, entitled *Twelve Conclusions addressed to the Parliament of England*; wrote a number of discourses and satirical verses: declared the pope to be Antichrist; consequently was accused of heresy, and thrown into the Tower in the first year of Henry V. (1413); escaped to Scotland, and thence into Wales; was falsely accused of raising an army of 20,000 Lollards to overthrow the king; thereupon was outlawed by Parliament and a price set on his head. He was captured in Wales, was hung in chains alive upon a gallows, and burned to death by a slow fire at St. Giles's Fields, London, Dec. 25, 1417. See his *Life*, by Gilpin (1808).

Old Catholics: a body of seceders from the Roman Catholic Church. The movement dates from a protest against the papal infallibility decree of the Vatican Council in 1870 as being contrary to history and conscience. Dr. DÖLLINGER (*q. v.*), who had done more than any one else to incite to rebellion against the Vatican decrees, in an open letter to the Archbishop of Munich (formerly his pupil), declared (Mar. 28, 1871) that "as a Christian, as a theologian, as an historian, and as a citizen, he could not accept the Vatican decrees"; whereupon he was excommunicated Apr. 17, 1871, as being guilty of "the crime of open and formal heresy." His colleague, Prof. Friedrich, incurred the same fate. The latter became an Old Catholic, but Döllinger did not follow. The movement spread with considerable rapidity in Germany and Switzerland. It professed to retain the whole Catholic system, with the exception only of the Vatican decrees, which were regarded as dangerous innovations. It never identified itself with Protestantism in any form; but it is regarded by the Roman Catholic Church as neo-Protestant, since it denies her authority, rejects her specific doctrines, and affiliates with many religious bodies considered by her outside the pale of the true faith. It was formally organized in 1873 by the election of Prof. Joseph Hubert Reinkens as bishop. He was consecrated by the Jansenist bishop Heykamp at Rotterdam Aug. 11, 1873, and recognized in this new dignity by the Prussian Government. He resides at Bonn on the Rhine. The Old Catholics, or "Christian Catholics," of Switzerland elected Edward Herzog, formerly a priest at Olten, their bishop. He was consecrated by Bishop

Reinkens at Rheinfelden, Sept. 18, 1876, and resides at Berne. In 1880 he visited the U. S. as a guest of the General Convention of the Protestant Episcopal Church then in session at New York. The Old Catholics are most in sympathy with the Episcopal Church of England and the U. S., but still retain the mass and most of the doctrines and ceremonies of the Roman Church. The question of clerical celibacy nearly created a split among them. They have a theological faculty at Bonn, and one at Bern. The movement never extended beyond Germany and Switzerland, but Père Hyacinthe, the eloquent ex-preacher of Notre Dame, who has a small congregation of admiring followers in Paris, has recently declared himself an Old Catholic. The Old Catholics of Germany and Switzerland held a second international congress at Lucerne Sept. 13–15, 1892, at which they resolved to publish an international theological quarterly review, to be edited by Prof. Michaud, of Berne. The Old Catholic congregation in Bonn is the most flourishing, though not very large, and celebrated in 1892 its twentieth anniversary, at which Bishop Reinkens and Prof. von Schulte delivered addresses. The movement seems to have almost spent itself. For the Old Catholic side, see Joh. Friedr. von Schulte, *Der Altkatholicismus, Geschichte seiner Entwickelung*, etc. (Giessen, 1887); Fr. Nippold, *Neueste Kirchengeschichte* (Berlin, 4th ed. 1892); *Proceedings* of the Second International Old Catholic Congress (Lucerne, 1893); *Revue internationale de théologie*, edited by E. Michaud. For a *résumé* of the Roman Catholic view of this schism, see Hergenroether, *Kirchengeschichte* (vol. iii., pp. 979–984).

PHILIP SCHAFF.

Oldenburg, ōl'den-boorch: grand duchy of North Germany. It consists of three distinct parts, viz.: Oldenburg proper, bordering N. on the German Ocean and surrounded on the other sides by Hanover; the principality of Lubeck, wholly inclosed by Holstein, the Baltic, and territory of the free city of Lubeck; and the principality of Birkenfeld, situated in Rhenish Prussia. Total area, 2,479 sq. miles. Pop. (1900) 398,499. Oldenburg proper is low and flat; large dikes have been erected along the shores of the ocean and the rivers Weser and Jahde. The soil is partly marshy, partly sandy, in some places covered with extensive forests, in others with heath. Agriculture and cattle-breeding are the chief occupations; of manufactures there are none. Oldenburg was established as an independent state, ruled by a count, at the end of the eleventh century. The family that established its power then has ruled ever since, giving, moreover, new dynasties to Russia, Denmark, and Sweden. In 1773 Oldenburg was made a duchy, and in 1815 a grand duchy. A constitution was given to the grand duchy Feb. 18, 1849, which, revised by a decree of Nov. 22, 1852, granted liberty of the press, trial by jury, and equality of all citizens in political and social matters. The legislative power is exercised by a *Landtag* or diet; the executive, by a responsible ministry under the grand duke.

Oldenburg: city of Germany; capital of the grand duchy of Oldenburg. It has several good educational institutions, museums, and scientific collections; a public library with 100,000 volumes, a fine ducal palace with beautiful gardens; two large and much-frequented cattle and horse fairs; and an active trade on the river Hunte, here navigable for small vessels. Pop. (1890) 21,646.

Old English: See ENGLISH LANGUAGE and ENGLISH LITERATURE.

Old'ham: town; in the county of Lancashire, England; on the Medlock; 6 miles from Manchester (see map of England, ref. 7–G). In 1760 it consisted of only sixty houses, but the discovery of rich coal mines in its immediate vicinity occasioned the establishment of large cotton-factories, and soon it became one of the leading manufacturing towns of England. It has nearly 300 cotton-mills with over 12,000,000 spindles, which consume one-fifth of the total imports of cotton into England. Its other manufactures include velvets, silks, hats, cords, etc., besides great weaving-machine works. The parliamentary borough, which is larger than the municipal, returns two members. Pop. (1891) 131,463; (1901) 137,238.

Oldha'mia [Mod. Lat., named from Dr. Oldham, late director of the Geological Survey of India]: a peculiar organism having a branching, plant-like form, thought by some to be a polyzoon, by others a vegetable; found in the Cambrian rocks of Ireland, and interesting as one of the first-known forms of life.

Old Light: See NEW LIGHT.

Old Man's Beard: See FRINGE-TREE.

Old Persian: See PERSIAN LANGUAGE.

Old Prussian Language: an extinct variety of the Lithuanian language. It was the language of the early inhabitants of the territory between the Deime, the Alle, and the Weichsel. Only the scantiest means of information concerning it have been handed down to us. This is attributable to the fact that the German orders, which in the thirteenth century had subdued the Prussians, after the bloody struggle forbade the use of the language, which was in consequence after the introduction of the Reformation into Prussia already so far repressed that even the kindly encouragement of Duke Albrecht, the first secular ruler of the province, could not avail to prevent its speedy extinction. From the period prior to the secularization of Prussia there is preserved but one record of the language, namely, the so-called *Elbing Vocabulary*, a manuscript dating from about 1400, which was, however, copied from an original belonging to the thirteenth century. This vocabulary contains 803 Prussian words with a German translation, and appears to have been prepared for the use of officials of the orders who acted as judges. The other sources of the Old Prussian are, with the exception of certain lesser materials and various names of places and persons, two translations differing in dialect of Luther's lesser catechism (Königsberg, 1545), and a translation of Luther's *Enchiridion* (Königsberg, 1561). These versions are unfortunately so imperfect and the orthography of the *Elbing Vocabulary* is so bad that all these texts yield little more than a caricature of the Old Prussian language, which was entirely extinct by the end of the seventeenth century. For the study of the Old Prussian we are limited almost exclusively to the works of G. H. F. Nesselman: *Die Sprache der alten Preussen an ihren Ueberresten erläutert* (Berlin, 1845); *Ein deutsch-preussisches Vocabularium* (Königsberg, 1868); *Thesaurus linguæ prussicæ* (Berlin, 1873). These fail, however, to satisfy scientific needs. See LETTIC RACE.

A. BEZZENBERGER.

Old Red Sandstone: an important geologic formation of Devonian age occurring in Scotland and Wales. The name was formerly applied also to one of the units of geologic chronology, but in that sense has been replaced by Devonian. This change accords with the general tendency in geologic nomenclature to avoid giving a chronologic meaning to petrographic terms, which can be actually descriptive only in restricted districts. The formation in Scotland has an estimated thickness of 6,000 to 20,000 feet, including shales, conglomerates, and volcanic tuffs, as well as the characteristic red sandstones. It is believed to have been laid down in inland lakes or seas, and is distinguished by its remarkable fish remains, which constitute a principal theme of Hugh Miller's classic works, *The Old Red Sandstone* and *Footprints of the Creator*. See DEVONIAN PERIOD, and Archibald Geikie's paper on *The Old Red Sandstone of Europe* in the *Transactions* of the Royal Society of Edinburgh, vol. xxviii. (1879).

G. K. GILBERT.

Old-School Baptists: See ANTI-MISSION BAPTISTS.

Old Style: See CALENDAR.

Old Testament: See BIBLE.

Old Wife, or **Old Squaw**: a common name for the long-tailed duck (*Harelda glacialis*), an abundant and prettily marked species of the northern hemisphere generally, though most common along the coast. The breeding plumage is varied with black, white, and brown, and the two central tail-feathers of the male reach a length of 8 or 9 inches. For the fish of this name, see WRASSE.

F. A. L.

Oleacin'idæ [Mod. Lat., from *Oleacina*, the name of one of the genera]: a family of terrestrial gasteropod molluscs of the order *Pulmonata*. The shell is spiral, and in most oblong and with a narrow aperture, but in some is depressed and heliciform, with a wide aperture. The family includes numerous species.

Olean: city (chartered 1893); Cattaraugus co., N. Y. (for location, see map of New York, ref. 6–C); at the junction of the Allegheny river and Olean creek; on the Erie, the West. N. Y. and Pa., and the Cent. N. Y. and West. railways; 69 miles E. S. E. of Buffalo. It is on the border of the largest hemlock lumber belt in the U. S., is close to the Pennsylvania oil-fields, and is the center of large lumber and tanning interests. It is also the eastern terminus of the Ohio pipe-line and the western terminus of a pipe-line

from the Pennsylvania oil-fields to the Atlantic seaboard, and contains one of the largest refineries of the Standard Oil Company, with immense storage tanks. There are 11 churches, 7 public-school buildings, public library, a commercial college, St. Mary's parochial school, 2 banks, 2 daily, a semi-weekly, 2 weekly, and 3 monthly periodicals, and a State armory. The city is lighted by electricity, and has natural gas for fuel and lighting, electric street-railway, 3 flour-mills, 4 foundries and machine-shops, railway-shops, 2 planing-mills, marble, glass, barrel, and lubricating works, and other industries. Pop. (1880) 3,036; (1890) 7,358; (1900) 9,462. JAMES H. MCKEE.

Olean'der [Fr. *oléandre* : Ital. *oleandro* : Span. *eloendro*, under influence of *oleum* from Lat. **lorandrum*, itself a corruption, under influence of *laurus*, *lorus*, of *rhododendron* = Gr. *ῥοδόδενδρον*; *ῥόδον*, rose + *δένδρον*, tree]: an evergreen shrub (*Nerium oleander*) of the family *Apocynaceæ*, a native of warm parts of the Old World, and now extensively cultivated. In colder regions it thrives as an ornamental shrub, but requires protection from frost. Its flowers are usually of a rich-pale red, but are sometimes white. *N. odorum*, the fragrant oleander, a native of India, is a more tender species, with sweet-scented flowers. The wood and all parts have a poisonous action resembling that of digitalis, best treated by a judicious use of stimulants.
Revised by L. H. BAILEY.

Olearos: See ANTIPAROS.

Oleas'ter [Lat., wild olive-tree, deriv. of *o'lea*, olive-tree]: a small tree (*Elæagnus angustifolia*) of the family *Elæagnaceæ*, a native of warm regions in the Old World; is planted as an ornamental tree for its silvery foliage. Its flowers are exceedingly fragrant. Several other species of *Elæagnus* are cultivated for ornament, and one, the goumi of the Japanese (*E. longipes*), is now somewhat grown for the acid berries. L. H. B.

Ole Bull: See BULL, OLE BORNEMANN.

Olefiant Gas: See ETHYLENE.

O'lefines [deriv. of *olefiant*; Lat. *o'leum*, oil + *-ficare*, make, produce]: hydrocarbons of the general formula C_nH_{2n}, homologous with ethylene, C_2H_4, so called from their property of forming oily compounds with chlorine, like Dutch liquid, $C_2H_4Cl_2$. They are found among the products of destructive distillation, and may be formed by the exposure of paraffins to high temperatures under pressure; thus:

Butane. Ethyl hydride. Ethylene.
$$C_4H_{10} = C_2H_6 + C_2H_4.$$

See ETHYLENE, HYDROCARBONS, and TAR.

O'leic Acid [*oleic* is from Lat. *o'leum*, oil]: an acid (formula $C_{18}H_{34}O_2$), discovered in 1811 by Chevreul; the most important of the group of fatty acids of the general formula $C_nH_{2n-2}O_2$, set free by the saponification of olein, the fluid component of most oils and natural fats. It is obtained by treating olive oil, almond oil, or animal oils, by a caustic alkali, preferably by potash, decomposing the resulting soap by tartaric acid, and heating the fatty acid, after first washing it with water in the water-bath with half its weight of oxide of lead in fine powder for some hours. The oleate of lead, separated by ether and filtration from the stearate, is decomposed by dilute hydrochloric acid, and the ethereal solution of oleic acid is then separated from the acid-water, washed, and the ether distilled from it. Oleic acid is soluble in alcohol, and crystallizes from it on cooling in brilliant crystals which melt at 57° F. to a clear colorless oil. At 39° F. this fluid acid solidifies to a hard white crystalline mass, which expands as it cools. Oleic acid distills over unchanged in a vacuum, and is even soluble in strong sulphuric acid at ordinary temperatures without decomposition. It is without smell or taste when pure, and is insoluble in water. Alcohol and ether dissolve it in all proportions, and in solutions it reacts neutral. By air it is slowly oxidized at ordinary temperatures, but it rapidly absorbs oxygen when melted, becoming rancid both to smell and taste, and then develops a strong acid reaction. It dissolves the solid fats, and is itself dissolved by sodium chloride (as in bile), forming a soap with an acid reaction.

Very large quantities of crude and high-colored oleic acid are produced in the lime saponification of lard and tallow by Chevreul's method in the manufacture of stearin candles. The insoluble lime-soap formed in this process is decomposed by dilute sulphuric acid, and the cake of fatty acids which forms on the surface of the cooled mother-liquor holds the oleic acid entangled in the stearic and margaric acids, from which it is in great part freed by filtration at 32° in the hydraulic press. This impure oleic acid, which is found in commerce under the name of *red oil*, yields pure oleic acid after separation from its lead-salt, after a second saponification with an alkali, and is salted out with sodium chloride mixed with sodium carbonate, by which means only can it be freed from the associated coloring-matters. At 66° F. the specific gravity of oleic acid is 0·898. Nitrous acid converts oleic acid into elaidic acid, an isomeric form of oleic acid, without forming a second decomposition product. Nitric acid acts on oleic acid with violence, evolving volatile acids of the general formula $C_nH_{2n}O_2$—namely, acetic, butyric, propionic, caproic, etc.—and mixed acids of the general formula $C_nH_{2n-4}O_2$, such as suberic, pimelic, adipic, etc.; the number and proportion of these depending on the activity and duration of the reaction. With the metals oleic acid forms neutral oleates $M'(C_{18}H_{33}O_2)$ or $M''(C_{18}H_{33}O_2)_2$, according to the equivalence of the metal. The neutral oleates of the alkali metals are soluble in water, and are not completely thrown down from solution, as are the stearates and palmitates, by the addition of another soluble salt. The acid oleates are liquid and insoluble in water. Absolute alcohol and ether dissolve the oleates in the cold, by which reaction they are distinguished and separable from the stearates and palmitates.
Revised by IRA REMSEN.

O'lein, or **Ela'in** [from Gr. *ἔλαιον*, oil]: that portion of oil or fat which remains liquid at ordinary temperatures; the oily principle of solid fats. It is of variable composition, but in all cases it consists of oleic acid, or of some acid homologous with the oleic, combined in various definite proportions with glycerin. Drying oils and volatile oils do not contain olein. The olein of commerce is chiefly a crude oleic acid prepared from palm oil in the British candle-factories. "Lard oil" is a similar product derived from lard in the U. S. Both are now chiefly used for oiling machinery. See OLEIC ACID.

Oleomargarine [Lat. *o'leum*, oil + margarine]: See BUTTER, ARTIFICIAL; CHEESE, and MARGARINE.

Oler'iculture: that branch of horticulture which treats of the art and science of growing kitchen-garden vegetables. It is synonymous with the term vegetable-gardening. The strawberry is referred to olericulture in Europe, but in the U. S. to pomology; the melon to pomology in England, but in the U. S. to olericulture. *Truck-gardening*, or *trucking*, is a term applied to that style of vegetable-gardening which grows vegetables upon a somewhat large scale for strictly commercial purposes, in distinction from *farm-gardening* or *kitchen-gardening*, in which plants are grown for home use. *Market-gardening* is identical with *truck-gardening*, although the eleventh census of the U. S. separated them, using the latter term to designate the industry when "carried on in favored localities at a distance from market, water and rail transportation being necessary," while market-gardening is "conducted near local markets, the grower of vegetables using his own vehicle for transporting his products direct to either the retailer or consumer."

The truck-gardening interests of the U. S., as reported by the eleventh census, employed 534,440 acres of land in 1890. The most important trucking districts are the New England, the New York and Philadelphia, the peninsular, comprising the Delaware and Chesapeake peninsula, the Norfolk, the Southern Illinois, and the South Atlantic. The most notable single trucking center is Norfolk, Va., where light warm soil, the proximity of the Gulf Stream, and excellent water and rail transportation combine to afford the best natural conditions and economical market facilities. The truck-gardening interests of the U. S. have been greatly modified and extended by the introduction of simple and efficient forcing-houses. (See GREENHOUSE.) Tomatoes, cucumbers, radishes, lettuce, and other crops are now grown with as much profit in winter as in summer. The largest acreage devoted to a single crop in the census year was 114,381 acres in watermelons; there were 77,094 acres in cabbages, 56,162 in pease, and 37,970 in asparagus. See Vilmorin-Andrieux's *Vegetable Garden* (English edition); Henderson's *Gardening for Profit*; Burr's *Field and Garden Vegetables of America*; Greiner's *How to Make the Garden Pay*. L. H. BAILEY.

Olfactometer: See RECORDING APPARATUS, PSYCHOLOGICAL, in the Appendix.

Olga, SAINT: a patron saint of Russia, who in 903 became the wife of the Grand Duke Igor I. of Kieff. He was murdered 945, and Olga became regent in the name of their

son Sviatoslaff. She punished the murderers cruelly and made a vigorous ruler. When Sviatoslaff ended his minority (955) and ascended the throne, she retired to Constantinople, embraced Christianity and was baptized under the name of Helena. She returned to Russia, labored earnestly, but with indifferent success, to introduce Christianity—her son never accepted it—and died at Kieff in 969, aged about eighty years. Her day in the Russian calendar is July 11. See Castremont, *Histoire de l'introduction du Christianisme sur le continent Russe, et la vie de Sainte Olga* (Paris, 1879).

Revised by S. M. Jackson.

Olib'anum [=Late Lat., from Arab. *al*, the + *lubān* (whence Gr. λίβανος), frankincense]: a gum resin which exudes from the tree *Boswellia serrata*, which grows in Africa and India. It occurs in oblong or rounded laminæ, opaque, of yellow or reddish color, dull and waxy on the fracture. It melts with difficulty and imperfectly when heated, and burns with a bright flame. It has a balsamic, resinous smell and an acrid bitter taste. Triturated with water, it forms a milky, imperfect solution. Alcohol dissolves nearly three-fourths of it. Braconnot (*Ann. Chim. Phys.* (2), lviii., 60) found 100 parts of it to yield 8 of volatile oil, 56 of resin, 30·8 of gum, and 5·2 of a glutinous body insoluble in water and alcohol, with some mineral matter. It is used for fumigation and in the preparation of plasters It has been burned from antiquity in religious ceremonies. See Boswellia, Frankincense, and *U. S. Disp.*; *Jahresb.*, 1858, 482; *Ann. Chem. u. Pharm.*, xxxv., 306; *Zeit. f. Chem.* (2), vii., 201.

Olifant River, or **Elephant River**: See Limpopo River.

Ol'igarchy [from Gr. ὀλιγαρχία; ὀλίγος, few + ἄρχειν, rule]: a form of government in which the supreme power is vested in a small class of persons. It differs from aristocracy in the extent of the governing class, which in an aristocracy usually embraces the entire body of the nobles, while in an oligarchy a certain political clique or coterie has the controlling influence. Oligarchies have been among the most unjust and oppressive of governments, and for the most part have been short-lived.

Oligocene Period [*oligocene* is from Gr. ὀλίγος, small + καινός, new]: a division of geologic time succeeding the Eocene period and preceding the Neocene. In the classification of Cenozoic or Tertiary time by Lyell three divisions were recognized: Eocene (older), Miocene, and Pliocene. Subsequently it was found advantageous in classifying certain European formations to substitute two divisions for the Eocene, the name Eocene being retained for the older and Oligocene, proposed by Beyrich, being applied to the younger. In the nomenclature adopted by the U. S. Geological Survey for the geologic atlas of the U. S. the earlier use of Eocene is restored. See Eocene Period. G. K. G.

Oligochætæ [Mod. Lat., from Gr. ὀλίγος, few + χαίτη, bristle]: an order of Annelid worms, of which the earthworms may be taken as types. In all the elongate cylindrical body is without distinct head, without any distinct appendages, but with a few bristles on each segment, the remnants of the fleshy feet (parapodia) with many bristles occurring in other Annelids. These worms are hermaphrodite, and the young develop without a metamorphosis. Two divisions are usually recognized. The first is the *Terricolæ*, or Earthworms (*q. v.*), which live in moist earth; the second, the *Limicolæ*, live in the ooze at the bottom of the water, but few occurring in the sea, the great majority being inhabitants of fresh water. Of the *Limicolæ* there are many genera, which are grouped in five families. Little is known of the American forms. The genera of *Terricolæ* are numerous. The student should consult Wilson's papers on the embryology (*Journal of Morphology*, i. and iii.) and the numerous papers on the anatomy and species, by Beddard and Benham, in the *Quarterly Journal of Microscopical Science* since 1885. J. S. Kingsley.

Olin'da: a town of the state of Pernambuco, Brazil; on a low promontory of the coast, about 9 miles N. of the city of Pernambuco, with which it is united by railway (see map of South America, ref. 4–H). It was the first settlement in Northern Brazil, having been founded in 1535; was long the capital of Pernambuco, and having been taken by the Dutch, was the capital of their colony in Brazil from 1630 to 1654. Until about 1710 it was the most important commercial city of the coast N. of Bahia. Recife, or Pernambuco, which had been a fishing village, gradually supplanted it as a trading center, and eventually became the political capital; but Olinda remained the see of the bishop. It is now the residence of many wealthy Pernambucans, and is a favorite resort for bathing, etc. Its quaint old buildings, erected by the Portuguese and Dutch, are very interesting. Pop. (1891) about 9,000. Herbert H. Smith.

Oliphant, Carolina: See Nairne.

Oliphant, Laurence: traveler, author, and mystic; b. in England in 1829, son of Sir Anthony Oliphant, subsequently chief justice of Ceylon; went to Ceylon in his youth; visited Nepaul in 1850; journeyed through Southern Russia and the Crimea, and in 1853 published *The Russian Shores of the Black Sea*; became private secretary to Lord Elgin, Governor-General of Canada; subsequently was superintendent of Indian affairs in Canada; published *The Trans-Caucasian Provinces the Proper Field of Operations for a Christian Army* (1855); accompanied the army of Omar Pasha to the region in question; wrote *The Trans-Caucasian Campaign of Omar Pasha* (1856); accompanied Lord Elgin as private secretary on his mission to China in 1857; wrote *A Narrative of the Earl of Elgin's Mission to China and Japan* (1860); was *chargé d'affaires* in Japan 1861; sat in Parliament for the Stirling burghs 1861–68; joined with his mother the semi-religious community established by Thomas L. Harris at Portland, Chautauqua co., N. Y.; became correspondent of *The Times* in Paris in 1870, and manager of the American interests of the Direct Cable Company; about 1875 settled at Haifa, Palestine, having interested himself in the project for colonizing Palestine with the Jews. D. at Twickenham, England, Dec. 23, 1888. Among his works were *The Land of Gilead* (1880); *Episodes in a Life of Adventure* (1887); *Scientific Religion* (1888); and the novels *Piccadilly* (1870); *Altiora Peto* (1883); and *Masollam* (1886). See *Life* by Mrs. M. O. W. Oliphant (1891).

Oliphant, Margaret O. Wilson: novelist; b. at Wallyford, near Musselburgh, Scotland, in 1828; published more than seventy books, including a large number of successful novels and other works of fiction, consisting chiefly of delineations of Scottish and English life and character, most of which have been republished in the U. S. Among them are *Passages in the Life of Mrs. Margaret Maitland* (1849); *Adam Graeme of Mossgray* (1852); *The Chronicles of Carlingford* (1863); *Salem Chapel*; *The Perpetual Curate* (1864); *The Minister's Wife* (1869); *A Rose in June* (1874); *Within the Precincts* (1879); *A Little Pilgrim: in the Unseen* (1882); *A Country Gentleman* (1887); *Sons and Daughters* (1890); *The Cuckoo in the Nest* (1893). She wrote biographies of Edward Irving (1862), St. Francis of Assisi (1871), Count Montalembert (1872), Principal Tulloch (1888), Thomas Chalmers (1893), and others; *Historical Sketches of the Reign of George II.* (2 vols., 1869); *Royal Edinburgh* (1890); *The Literary History of England from 1790 to 1825* (1882); *The Victorian Age of English Literature* (1893). D. in Wimbledon, England, June 25, 1897.

Oliphant, Thomas Laurence Kington: biographer and philologist; b. near Bristol, England, Aug. 16, 1831; educated at Eton and Oxford; studied law at the Inner Temple; is author of *Life of the Emperor Frederick the Second* (1862); *Jacobite Lairds of Gask* (1870); *Sources of Standard English* (1873); *Life of the Duc de Luynes* (1875); *Old and Middle English* (1878; 2d ed. 1893); *New English* (1886).

Olivares, ō-lĕē-vaa'rās, Gasparo de Guzman, Count of: prime minister of Philip IV. of Spain; b. in Rome, Jan. 6, 1587, his father being at that time the Spanish ambassador at the papal court; studied at Salamanca; became influential in court circles as the trusted friend of the heir-apparent, who, on succeeding to the throne in 1621, made him Duke of San Lucar de Barrameda, and intrusted the administration to his direction. Under his ministry Spain was involved in wars with Portugal, France, and the Netherlands; the people were impoverished by the heavy taxes; revolts broke out in Catalonia and Andalusia, and Portugal secured her independence. The failure of his policy caused his dismissal from court, and having afterward published a work that gave offense to people in authority, he was banished to Toro, where he died July 22, 1645.

Olive [viâ O. Fr., from Lat. *oli"va*, *o'lea*, from Gr. ἐλαία, olive-tree]: a tree of the genus *Olea* (*Olea europæa*). The olive-tree has been grown from the most ancient times, both in Europe and Asia Minor; both fruit and oil form important products of the Mediterranean region, where the bland "sweet" oil replaces butter and other animal fats for table and culinary use; while all over the world it is used for

salads as well as for medicinal purposes, in preference to all others. The pickled fruit also is in its home an article of food in common use, while elsewhere esteemed a table delicacy. The tree is a slow grower, but attains great size and age; some groves have an historic celebrity, and are preserved with scrupulous care. The wood is close-grained, hard, of a yellowish tint, and is much esteemed for carving and fine work generally. The small-fruited wild olive (oleaster) is of value only as a grafting stock for the improved varieties, of which over thirty are cultivated in Southern France alone, and many others in Spain and Italy, the three countries that chiefly supply the commercial demand. The olive has been extensively propagated in California, where the "mission olive" was early introduced by the Franciscan missionaries; and that State produces both excellent oil and pickled fruit. Attempts to introduce it into the Southern U. S. have not been successful, on account of the occasional severe changes and low temperatures occurring there. According to Humboldt, for the success of the olive the mean temperature of the coldest month should not fall below 41·5° F. or 5° C. Some varieties are much hardier than others, bear considerable frost, and require less heat to mature the fruit.

The tree is propagated either from twig cuttings, from sprouts of truncheons of old wood set in moist ground, or from gnarled woody buds (*novoli*) that form mostly near the base of the trunk. It begins to bear from the seventh to the ninth year, according to climate and varieties, some trees yielding crops alternate years, others annually. The crop increases up to the thirtieth year, when single trees, it is said, sometimes yield as much as 300 lb. of oil; but ordinarily 10 to 15 lb. per tree is accepted as a fair crop, corresponding to about 70 to 100 lb. of the fruit. While the tree is not very exacting as to soil, is not exhaustive, and is often seen doing well on stony slopes, it responds gratefully to fertile soil and liberal fertilization; the pomace from the oil-press is frequently the only return it receives for years, and the fact that the oil takes nothing from the soil accounts in part for the persistence of its production in the oldest countries. The color of the fruit when fully ripe (in November and December) is purple or purplish black; its shape varies from almost round to long-oval; the oil is contained (to the extent of 15 to 25 per cent. of the whole fruit) in the watery flesh, together with a bitter astringent principle, which renders the natural fruit uneatable, but belongs only to the juice, and can readily be extracted by weak lye. The hard pit varies much in size; the little oil contained in its kernel deteriorates that of the flesh, and is excluded from the best qualities when practicable. The best varieties for oil are not well suited for pickling; the pickling olives should be large, firm-fleshed, and have a small pit, like the "queen olive" of Spain.

For *oil-making* the fruit is not allowed to get fully ripe, as the oil would then be thick and rank-tasting; for the best quality the flesh must still be firm, the color golden to purplish only, and the fruit must be worked quickly after gathering. It is usually pulped in an edge-wheel crushing-mill of stone; but as this crushes the pits, improved tinned-iron mills in which this can be avoided are now being introduced. The highest quality, "virgin" oil, is that which flows from the crushed mass without pressing; its quantity is usually quite small, and it is not ordinarily found in commerce. The next best, the first quality of commerce, is obtained by pressing the cold pulp in round flat baskets or bags, made of such perfectly inodorous, strong materials as palm-leaves, esparto grass, bamboo, or (in California) canvas cloth; the oil being extremely liable to absorb any odors with which it may come in contact, the utmost cleanliness and exclusion of all damaged fruit must be carefully observed. After the first pressing, the pomace or press-cake is broken up, reground, and thinned with cold water; there follows a second pressing which yields a commoner quality of oil, used by the poorer classes of the population. A third, and occasionally a fourth pressing with *hot* water yields a still inferior oil, used for burning, lubrication, and soap-making.

The liquids flowing from the press are murky-looking emulsions of the watery juice with minute droplets of oil. They are usually allowed to settle in appropriate tanks, an operation which according to circumstances may require from a few weeks to several months, and during which the air is excluded as much as possible to avoid rancidity. The oil floating on top is dipped or drawn off, and if not perfectly limpid is filtered, so as to remove completely any of the acrid juice that would render it unpalatable. Of late a more rapid process of separation, by means of a water-current in a settling-tank, has been introduced with great advantage.

The *pickled olive* is an important article of commerce, and in the olive-growing countries also an important part of the daily food. For home use the fruit is allowed to grow much riper than when intended for export, and is then more palatable and digestible, but more difficult to keep. In either case the acridity may be extracted slowly by water alone, frequently changed and then replaced by brine, together with laurel-leaves, coriander, fennel, etc., and sometimes vinegar, according to taste; but for export the fruit, when barely turning color and still quite hard, is steeped in caustic lye of varying strength (4 to 6 oz. to a gallon of water) for eight to ten or more hours, until the pit is readily detached from the flesh. The lye is then replaced by cold water, renewed daily, until the acridity is removed, and then by brine, which may or may not be flavored as above. Sometimes the fruit is also pitted, stuffed with capers, and preserved in fine oil.

The olive oil industry has suffered greatly from the adulteration (chiefly carried out at Marseilles) with cheaper oils, especially that of the peanut (*Arachis hypogæa*) and of cottonseed. The latter addition, if not too heavy, is difficult of detection by the taste, though easily shown by chemical reagents. E. W. Hilgard.

Olive Family, or **Olea'ceæ** [*Oleaceæ* is Mod. Lat., named from *O'lea*, the typical genus, from Lat. *o'lea*, from Gr. ἐλαία, olive-tree]: a family of dicotyledonous trees and shrubs, including about 300 species, mostly natives of warm, temperate, and tropical climates, the ash alone having a higher northern range. The leading character of the family is that of having regular gamopetalous or sometimes polypetalous flowers, with the parts of the calyx and corolla four and hypogynous, while the stamens are only two, and the ovary two-celled; but some are apetalous. The olive-tree is far the most important representative of the family, and next to it the ash-trees with their excellent tough timber, one species also yielding manna. Among the small trees or shrubs cultivated for ornament are lilacs, privet, fringe-tree, Forsythia, and jasmine.

Oliver, George, D. D.: clergyman and author; b. at Papplewick, England, Nov. 5, 1782; graduated at Cambridge 1803; took orders in the Church of England; became head master of King Edward's grammar school at Great Grimsby 1809; vicar of Scopwick 1831; incumbent of Wolverhampton 1834, and rector of South Hykeham, Lincolnshire, 1847; filled high posts in the Masonic order, and wrote several works upon Masonry which met with wide acceptance. Among them are *Historic Landmarks of Freemasonry*, *The History of Initiation*, *Antiquities of Freemasonry*, and *Institutions of Masonic Jurisprudence*. D. Mar. 3, 1867.

Oliver, Grace Atkinson: See the Appendix.

Oliver, Peter, LL. D.: chief justice of Massachusetts; b. at Boston, Mass., Mar. 26, 1713; graduated at Harvard College 1730; held several offices in Plymouth County, and was appointed a justice of the Supreme Court Sept., 1756; became chief justice 1771; was impeached by the House of Representatives 1774 for refusing to subscribe an engagement to receive no pay or emolument except from the Assembly; accompanied the British troops on their retirement from Boston 1776; subsisted some years in England on a grant from the crown. D. at Birmingham, Oct. 13, 1791. He was author of various political writings and of some poems.

Olives, Mount of, or **Mount Olivet**, now **Jebel et-Tûr** (mount of the rock): an eminence on the E. of Jerusalem, from which it is separated by the narrow valley of Jehoshaphat. It rises 2,693 feet above the level of the sea, and 100 feet above the most elevated part of Jerusalem. It forms the middle summit of a ridge of hills which to the N. expands into a large elevated table-land, but which here contracts and terminates in a row of three hills. The southernmost of these hills is now called the "Mountain of Offense," because Solomon there instituted the pagan worship for his concubines. The northern hill was the place where Titus encamped when he besieged Jerusalem. The middle summit is the proper Mount of Olives. At its foot, near the bridge over the brook of Kedron, lies the garden of Gethsemane. Its swelling sides are streaked with patches of bare rock between the olive groves, which are planted in terraces. The Church of the Ascension, built upon its

top by Helena, which was seen by Sir John Mandeville in 1327, has disappeared, and in its place is a small octagonal chapel within a paved court connected with a mosque. In the Old Testament, Mt. Olivet is first mentioned in connection with the flight of David from Absalom (2 Sam. xv. 30); next as the scene of the worship of Chemosh and Moloch, set up by Solomon (1 Kings xi. 7), but destroyed by Josiah (2 Kings xxiii. 13); and finally as the place from which, by the order of Ezra, the people got the branches for the feast of tabernacles (Neh. viii. 15). In the New Testament the allusions are more numerous. "It is very prominent," Schaff says (*Through Bible Lands*, n. e., p. 272), "in the closing scenes of our Saviour's ministry. In Bethany, on the eastern slope of Olivet, he had his most intimate friends, Lazarus, Martha, and Mary, and performed his last and greatest miracle (Luke x. 38–42; John xi.); from Mt. Olivet he made his triumphal entry into Jerusalem (Luke xix. 29–38); here he spent the nights intervening between the entry and his passion, and returned every morning to teach in the temple (Luke xxi. 37); descending from this mountain, he wept over the ungrateful city and foretold her fearful doom (Luke xxi. 41–44); to it he repaired on the night of his betrayal (John xviii. 1); from it he ascended to heaven to take possession of his throne (Luke xxiv. 50; Acts i. 12)." See also Tobler, *Siloahquelle und d. Oelberg* (St. Gall, 1852). Revised by S. M. Jackson.

Olivet College: an institution of learning at Olivet, Mich.; founded in 1844. While not sectarian, it is more closely related to the Congregational denomination than to others. Its nine buildings, well placed in a charming spot, are well built and finely equipped. The musical department and the department of science are exceptionally well equipped. The yearly attendance is about 300. The value of the college property and endowment is about $300,000.
Willard G. Sperry.

Oliv'idæ [Mod. Lat., named from *Oli'va*, the typical genus, from Lat. *oli'va*, olive (see Olive), named from its olive shape]: a family of Gasteropod molluscs, with elongate oval shells, the outer surface polished and frequently brightly colored. The spire is short, the mouth elongate, its inner lip obliquely plaited. The species of Olives are numerous (over 100), and are arranged among several genera. Their beauty makes them great favorites with collectors.

Olivier, ō'lĕv'vi-ā', Juste Daniel: poet; b. at Eysins, canton of Vaud, Switzerland, Oct. 18, 1807. He showed an early inclination to letters, and at eighteen won a prize in the poetical competition at Lausanne. In 1830 he published his first volume of poems, *Poèmes suisses*; this was followed by *L'Avenir* (1831); *L'Évocation* (1833); and *Les Deux Voix* (1835). About 1842 he became involved in political difficulties, left his professorship in Lausanne, and went to Paris, where he lived most of the rest of his life. D. in Geneva, Jan. 7, 1876. Later poetical works are *Les Chansons lointaines* (1847); *Dernières Chansons*; *Théâtre de société, fantaisies dramatiques* (1870). He also wrote a number of works in prose: *Le Canton de Vaud* (2 vols., 1837–41); *Études d'histoire nationale* (1842); *Mouvement intellectuel de la Suisse* (1845). A. G. Canfield.

Ol'ivine: See Chrysolite.

Ollier, ō'li-ā', Louis Xavier Édouard Léopold, M. D.: surgeon; b. in Lyons, France, in 1825; graduated M. D. at the School of Medicine, Paris, in 1857; settled in Lyons; appointed surgeon to the Hôtel Dieu and professor in the surgical clinic; paid special attention to the surgical pathology of bones and joints, and his researches on these subjects are highly esteemed by the medical profession. His principal works are *Traité expérimental et clinique de la régénération des os et de la production artificielle du tissu osseux* (Paris, 1867); *Traité des résections* (Paris, 1885–89).
S. T. Armstrong.

Ollivier', Émile: statesman; b. at Marseilles, France, July 2, 1825; studied law, and began to practice as an advocate at Paris in 1847. In 1848 he was sent as commissary-general to Marseilles to pacify the city, and shortly after he was appointed prefect, but in 1849 returned to his business in Paris. In 1857 he was elected a member of the Legislative Assembly, and made himself conspicuous by his courageous and eloquent opposition to the government of Napoleon III. Gradually, however, the emperor succeeded in winning him over to his side, and he was generally considered a political renegade, when on Jan. 2, 1870, he became Napoleon's prime minister. He was president of the cabinet when the war was declared against Prussia, but he retired Aug. 9, after the first reverses of the French arms. He was elected to the Academy Apr. 7, 1870. He was a candidate for election to the Chamber in 1876, in 1877, and in 1885, but was defeated on each occasion. He has published, among other works, *Démocratie et Liberté* (1867); *Le 19 Janvier* (1869); *Principes et Conduite* (1875); *L'Église et l'État au Concile du Vatican* (2 vols., 1879); *M. Thiers à l'Académie et dans l'Histoire* (1880); *Nouveau manuel de droit ecclésiastique français* (1885); and *1789 et 1889* (1890).
Revised by F. M. Colby.

Olmedo, José Joaquín, de: poet; b. in Guayaquil, Ecuador, May 20, 1780; d. there Feb. 19, 1847. Educated at Quito and Lima, he received the degree of doctor from the university of the latter city in 1805. He taught law for a time in the university, then began practice as an advocate in Guayaquil. In 1810 he went to Spain as a deputy to the famous Cortes of Cadiz, remaining in the mother-country until 1814. Returning to America, he was a member of the so-called Junta de Gobierno of Guayaquil (1820), and of the Constitutional Assembly of Peru (1823). He was one of the Peruvian deputation to seek military aid of Bolívar; and was sent by the latter as minister plenipotentiary to London, where he became a warm friend of Andrés Bello. Returning home in 1828 he was a member of the constitutional convention of Riobamba, which finally separated Ecuador from Colombia (1830). Elected successively vice-president of Ecuador and governor of the department of Guayas, he presided over the national convention of Ambato in 1835. In 1845 he headed the successful revolution against Gen. Flores, and directed the provisional government; but was defeated in his candidature for the presidency. It is, however, as a poet that he will be longest remembered, having in spite of the small amount of his production an indisputable claim to a foremost place in Spanish-American letters. His poetic manner is that of Quintana, too rhetorical for the taste of the present; and the title often given him, the South-American Pindar, indicates both his excellences and his defects. Few poets, nevertheless, are more widely read by Spanish-Americans. There is no good complete edition of his works. The most important are to be found in the *América Poética* of Gutierrez (Valparaiso, 1846). These should be supplemented by the *Poesías inéditas de Olmedo*, edited by D. Manuel Corpancho in 1861. See also Herrera, *Apuntes biográficos de D. J. J. Olmedo* (Quito, 1887).
A. R. Marsh.

Olmsted, Denison, LL. D.: scientist; b. at East Hartford, Conn., June 18, 1791; graduated at Yale 1813; was a college tutor 1815–17; became in 1817 professor of chemistry, mineralogy, and geology, and executed what is believed to have been the first State geological survey in the U. S. (report published 1824–25); became in 1825 Professor of Mathematics in Yale College, and in 1836 Professor of Astronomy and Natural Philosophy; published in 1831, 1832, and 1842 text-books on natural philosophy, several works on astronomy for schools, and a number of biographical memoirs; made important observations on hail, on meteors, the aurora borealis, etc.; his conclusions regarding the latter phenomenon are in vol. viii. of the *Smithsonian Contributions*. D. at New Haven, Conn., May 13, 1859.

Olmsted, Frederick Law, M. A.: landscape architect; b. in Hartford, Conn., Apr. 26, 1822; studied civil engineering, and later pursued scientific studies at Yale College. He was then for two years a working student of agriculture, and afterward seven years a farmer and horticulturist upon his own land. In 1853 and 1854 he made a study of the economical conditions of the slave States, traveling a distance of more than 4,000 miles on horseback. In the spring of 1857 he was appointed superintendent of the preparatory work of the projected Central Park of New York. In 1858, in association with Calvert Vaux, he devised a plan for this park, which was selected as the most satisfactory of thirty-three plans submitted in competition. After the adoption of the plan the designers were employed to carry it out. At the outbreak of the civil war in 1861 he was appointed by President Lincoln a member of the National Sanitary Commission, and organized and managed its executive business. He spent the period 1863–65 on the Pacific slope, serving as chairman of the California State commission, taking the custody of the Yosemite and Mariposa reservations, ceded to the State by Congress as public parks. From 1865 to 1872 he engaged in New York in the general practice of landscape architecture; in 1872 served for a time as presi-

dent and treasurer of the park commission of New York; in 1876 moved to Boston. He has been employed upon upward of eighty public recreation-grounds, among the more important of which are the public parks of New York, Brooklyn, Boston, Bridgeport, Trenton, Montreal, Buffalo, Chicago, Milwaukee, Louisville, and Kansas City. He is the designer of the grounds of the Capitol at Washington; also of the general scheme for the restoration and preservation of the natural scenery of Niagara Falls, and, in association with Mr. Vaux, of the plan now being carried out by the State of New York for this purpose. Mr. Olmsted is the author of the following works: *Walks and Talks of an American Farmer in England*, first published in 1852; it has been several times reprinted; *A Journey in the Seaboard Slave States* (1856); *A Journey in Texas* (1857); *A Journey in the Back Country* (1861). Translations of *A Journey in Texas* have been published in Paris and Leipzig.

Ol'mütz: town; in the province of Moravia, Austria; on the March; 129 miles N. N. E. of Vienna (see map of Austria-Hungary, ref. 3–F). It is strongly fortified, and was the place of imprisonment of La Fayette. It is the see of an archbishop. It has a well-attended university, two military academies, a polytechnic school, manufactures of linens, cloths, and porcelain, and a large trade in grain and cattle. Pop. (1890) 19,761.

Olney: city; capital of Richmond co., Ill. (for location, see map of Illinois, ref. 9–G); on the Balt. and Ohio S. W., and the Peoria, Dec. and Evans. railways; 31 miles W. of Vincennes, 117 miles E. of St. Louis, Mo. It is an important shipping point and trade center, is engaged in manufacturing, and has a public library (founded in 1886), a national bank with capital of $50,000, a private bank, and four weekly newspapers. Pop. (1880) 3,512; (1890) 3,831; (1900) 4,260.

Olney, JESSE, A. M.: educator; b. at Union, Tolland co., Conn., Oct. 12, 1798; taught at Whitesborough and Binghamton, N. Y., and for twelve years in the Hartford Grammar School, where he introduced the method, now generally adopted, of separating geography from astronomy, and beginning the former study by familiarizing the pupil with the description and surroundings of his own town, county, and State, advancing thence to national and foreign geography. He published a number of school books that had an enormous circulation, including a *Geography and Atlas* (1828) and *The National Preceptor* (1831). He served ten terms in the Connecticut Legislature, where he was an active worker in behalf of educational interests, and was elected State comptroller of public accounts in 1867. D. at Stratford, Conn., July 30, 1872.

Olney, RICHARD: lawyer; b. in Oxford, Mass., Sept. 15, 1835; was graduated at Brown University in 1856, and at Harvard Law School in 1859. He afterward received the degree of LL. D. from these institutions. He practiced law in Boston, serving in the Massachusetts legislature in 1874 till appointed Attorney-General of the U. S. by President Cleveland. He served from March 6, 1893, till June 8, 1895, and as Secretary of State from that time till March 4, 1897. He has since practiced law in Boston.

Olonetz': government of European Russia, S. W. of the government of Archangel; around the Lake of Onega. Area, 57,439 sq. miles. The ground is low, flat, and marshy, containing many large lakes, and covered with immense forests. Pop. (1897) 366,647. Capital, Petrozavodsk.

Olozaga, ō-lō'thaă-gaă, SALUSTIANO: statesman; b. at Logroño, Spain, in 1803; educated for the bar; elected to the Cortes 1833; reporter of the constitutional commission 1837, when he insisted on the retention of the senate; proposed and carried laws providing for electoral reform, the suppression of monasteries, the abolition of ecclesiastical tithes, and a general amnesty. He was president of the Cortes Mar., 1869, and Apr., 1871. D. at Enghien, France, Sept. 26, 1873.

Olshausen, ōls'how-zen, HERMANN: Bible commentator; b. at Oldeslohe, Holstein, Aug. 21, 1796; studied theology at Kiel and Berlin, and was appointed professor in 1827 at Königsberg and in 1834 at Erlangen, where he died Sept. 4, 1839. His *Biblischer Commentar über sämmtliche Schriften des neuen Testaments* appeared at Königsberg, 1830, *sqq.*, and was finished by his friends after his death; translated into English for Clark's Foreign Theological Library, and a revised edition of it (by A. C. Kendrick, D. D.) published in New York (6 vols.) in 1856–58. He defended the allegorical and typical methods, while not neglecting the grammatical and historical. Revised by S. M. JACKSON.

Olsson, ōl'sŭn, OLOF, D. D.: theologian; b. in Vermland, Sweden, Mar. 31, 1841; educated at Upsala and Leipzig, ordained 1863; emigrated to the U. S. 1869. His first pastorate was in MacPherson co., Kan., during which he was a member of the Legislature of the State; became Professor of Theology in Augustana Seminary, Rock Island, Ill., 1876–88; pastor Woodhull, Ill., 1889. He became president of Augustana College and Seminary in 1891. D. May 12, 1900.

Olszewski, KAROL: See the Appendix.

Olym'pia (in Gr. 'Ολυμπία): a plain in Elis, Peloponnesus, on the banks of the Alpheus, where the Olympian games were held, containing the Altis or sacred grove, which was said to have been inclosed by Hercules, and which contained the temple of the Olympian Zeus, with his statue by Phidias, and many other public buildings. Connected with the Altis were the stadium and the hippodrome. (See OLYMPIAN GAMES.) At the time of the Elder Pliny (23–79 A. D.) about 3,000 statues were standing; now the space is occupied with grain-fields, with a few scattered ruins. See Flasch's article *Olympia* in Baumeister's *Denkmäler* for the history of Olympia and the results of excavations made on the site by the German Government. See also the official work *Ausgrabungen von Olympia* (Berlin, 1875–81), and Bœtticher, *Olympia, das Fest und seine Stätte* (Berlin, 1883). J. R. S. STERRETT.

Olympia: city (settled in 1847, incorporated in 1859); capital of the State of Washington and of Thurston County (for location, see map of Washington, ref. 5–C); on Des Chutes river, Budd's inlet (the southern extremity of Puget Sound), and the Northern Pacific and the Port Townsend Southern railways; 36 miles S. W. of Tacoma, 121 miles N. of Portland, Ore. It is in a timber, coal, iron, sandstone, and copper region; is laid out with broad and regular streets; has direct steamship communication with the principal points on the sound and the Pacific coast; and contains water, sewerage, electric-light, and street-railway services. A bridge 520 feet long connects it with Tumwater, on the opposite side of the river, and another, 2,030 feet long, connects it with the west shore of the inlet. The city derives exceptional power for manufacturing from the river, which has three falls with a total descent of 85 feet in a distance of 1,500 feet, and was improved by the construction of a dam in 1890. Its principal manufactures are connected with the lumber industry, and include the only plant in the country for making water-pipe from yellow fir. There are 7 churches, 2 academies, State library with over 20,000 volumes, a public library, hospital, several secret society halls, 2 national banks with combined capital of $200,000, a State bank with capital of $60,000, and a daily and 3 weekly newspapers. The assessed valuation in 1893 was $3,437,096, and the total debt on Feb. 1, 1901, was $109,237. Pop. (1880) 1,232; (1890) 4,698; (1900) 4,961; (1901) estimated, 6,000.
J. O. SCOBEY.

Olym'piad [from Lat. *Olym'pias* = Gr. 'Ολυμπιάς, 'Ολυμπιάδος, Olympiad, deriv. of τὰ 'Ολύμπια, the Olympian games]: the period of four years between any two successive celebrations of the Olympian games. The Olympiad was early adopted as an era for the recording of the dates of events. The Olympiads were designated by numbers, the first being reckoned from the victory of Coræbus in the foot-race, B. C. 776; or, again, they took the name of the principal victor in the next previous Olympian games. Events are recorded as having happened in such and such an Olympiad, or in such a year of a certain Olympiad. To reduce Olympiads to dates according to our reckoning substract 1 from the number of the Olympiad, multiply by 4, add the number *in* the Olympiad minus 1, and then subtract from 776. When the date is after Christ proceed as before, but add the full number of the Olympiad and subtract therefrom 776. The 293d Olympiad, which was the last (Ol. 293·2), ended in 394 A. D. See GRECIAN GAMES.
Revised by J. R. S. STERRETT.

Olympian Games: the greatest national Greek festival. It was held quadrennially in honor of Zeus, in Olympia in Elis, Greece, and lasted five days, beginning just after the summer solstice. It is chiefly famous for its athletic contests and chariot-races. From the remotest antiquity Olympia was consecrated to religious rites, and there for centuries the Greeks lavished their wealth and their marvelous artistic skill in the erection of temples and shrines. They brought

thither, also, once in four years, the best they had in the way of physical development, and gradually contests of strength, endurance, and skill became the most prominent feature of the festivals. At the eastern end of the plain a level course, the stadium, was laid out in yielding sand, 600 Olympian feet (about 625 feet) in length, and for many years the contests were foot-races in a straight line along the stadium. Only free-born Greeks of unblemished reputation, who had trained during a prescribed period in a Greek gymnasium, were permitted to enter. Lots were drawn for position, and at the feet of the statue of Zeus each contestant swore a solemn oath to race fairly. The prize was a wreath of olive branches cut with a golden knife by a lad whose parents were still living from the sacred wild olive-tree in Olympia. The wreaths were placed on a table at the feet of the statue of Zeus in the temple. The victor, his head encircled with a fillet of wool, was crowned with the wreath and a palm-branch was placed in his hand. The name of the victor, of his father, and of his birthplace was proclaimed by a herald. To win the olive wreath was considered the highest possible honor. The victor could erect a monument in the sacred grove, and in some instances he was permitted to erect a statue of himself. Beginning with the fifteenth Olympiad, in addition to the original stadium race, a double race was run—that is, the course to the end of the stadium and back to the starting-place. Some Olympiads later there was a long-distance race twelve times around the stadium. In the eighteenth Olympiad the pentathlon was added. This was a combination contest consisting of running, jumping, disk-throwing, spear-throwing, and wrestling. Five Olympiads later boxing was added, and in the twenty-fifth chariot-races and the pankration, or combined wrestling and boxing match. The contests were originally confined to men, but gradually boys were admitted to the lighter ones, and at the 145th they were admitted to the severest of all, the pankration. By a truce established in the ninth century B. C., under the protection of Sparta, all competitors and spectators of Greek descent could attend the festivals unmolested even in time of war. Pilgrims from all the Greek cities and from the most distant colonies thronged to the games. Here poets and orators found appreciative audiences, sculptors found patrons, tradesmen sold their wares. The importance of the festivals diminished after the Peloponnesian war, although they were continued long after the Roman conquest. See the article GRECIAN GAMES.

See Curtius, *Olympia*; Boetticher, *Olympia, Das Fest und seine Stätte*; Laloux and Monceaux, *Restauration d'Olympie.* B. B. HOLMES.

Olym'pus [= Lat. = Gr. Ὄλυμπος], Mod. **Elymbo**: a lofty range of mountains which separated Thessaly from Macedonia. Their sides are clad with beautiful forests, but the tops are covered with snow for nine months of the year. The highest peak rises 9,754 feet, and on its broad, cloud-veiled summit stood, according to the oldest myths of Greece, the palace of Zeus and the other gods. Later, the abode of the gods was moved by a more refined sentiment to the celestial spheres, but Mt. Olympus still retained its charm for the imagination. See Heuzey, *Le Mont Olympe et l'Acarnanie* (Paris, 1860); Barth, *Reise durch das Innere der Europäischen Türkei*; Tozer, *The Highlands of Turkey* (London, 1869), ii. Revised by J. R. S. STERRETT.

Olyn'thus (in Gr. Ὄλυνθος), now *Aio Mamas*: an ancient city of Macedon; on the Toronaic Gulf; was at different periods dependent on Athens or Sparta, acquired great wealth from its excellent commercial position, but was taken in 347 by Philip of Macedon, who sold the inhabitants as slaves and destroyed its buildings. See Vömel, *De Olynthi situ* (Frankfort, 1829). J. R. S. S.

Omaha: city (laid out in 1854, incorporated in 1859); capital of Douglas co., Neb.; on the Missouri river, and the Burlington Route, the Chi., Rock Is. and Pac., the Chi., St. P., M. and Om., the Fremont, Elk. and Mo. Valley, the Mo. Pac., the Chi., Mil. and St. P., the Chicago and Northwestern, the Omaha and St. L., and the Union Pac., and Illinois Central railways; opposite Council Bluffs, Ia.; 476 miles N. by W. of St. Louis, 490 miles W. of Chicago (for location, see map of Nebraska, ref. 10–H). The city is built on a plateau about 80 feet above the river, is laid out with wide streets, of which more than 85 miles are paved, is lighted with gas and electricity, and has improved water and sewerage plants and electric street-railways. The river is here crossed by three bridges—one of steel, built by the Union Pacific Railroad Company, 66 feet above low water, cost $1,500,000; one of iron, connecting the city with Council Bluffs, for wagon and street-railway use: and one of steel, for steam-railway use, with the longest drawbridge in the world, between East Omaha and Council Bluffs, built by the East Omaha Land Company, cost $1.000,000. The city has laid out six magnificent parks, containing upward of 500 acres and connected by boulevards, at a total cost of more than $1,000,000. The city contains 106 churches, viz.; Presbyterian, 16; Methodist Episcopal, 14; Congregational, 9; Roman Catholic, 12; Baptist, 12; Protestant Episcopal, 11; Christian, 3; Unitarian and Latter-day Saints, 1 each; Evangelical, 5; Hebrew, 4; Lutheran, 13; Christian Science, 1; Universalist, 1; Adventist, 1; Greek, 1; Free Methodist, 1. The school census of Omaha for 1901 was 30,765. There are 45 buildings used for public-school purposes, and public-school property valued at over $2,000,000. The institutions for higher education include Creighton College (Roman Catholic), two medical colleges, Brownell Hall (Protestant Episcopal), Academy of the Sacred Heart (Roman Catholic), and St. Catharine's Academy (Roman Catholic). There are six libraries containing more than 67,000 volumes—the City Free Library, with upward of 57,000 volumes, occupies a beautiful building. The State Institute for the Deaf and Dumb is located in the city. In 1901 the city had 8 national banks with combined capital of $3,650,000, 2 savings-banks, and 3 daily, 28 weekly, 3 semi-monthly, and 11 monthly periodicals. Omaha, by reason of its railway and river connections, is the distributing center of a large area of country. It has a wholesale business of over $70,000,000 per annum, and it pays the Federal Government in internal revenue taxes over $3,500,000 annually. The machine, car-building, and repair-shops of the Union Pacific Railroad are here, and the city has extensive smelting and refining works, packing-houses, breweries, and boiler-works. The Board of Trade returns of 1900 showed that 175 manufacturing establishments reported. These had a combined capital of $30,000,000, employed 12,000 persons, paid $5,400,000 for wages and $84,000,000 for materials, and had products valued at $120,000,000. Omaha is the headquarters of the U. S. army Department of the Missouri. Pop. (1900) 102,555.—SOUTH OMAHA: city (founded in 1885); Douglas co., Neb.; adjoining Omaha on the south. It is the third largest meat-packing city in the U. S., and has extensive stock-yards and five large packing and rendering plants. The city contains 15 churches, 13 public-school buildings, public-school property valued at over $400,000, 3 national banks with combined capital of $640,000, 2 State savings-banks with capital of $50,000, several hotels, a handsome exchange building, a public park, and 4 daily newspapers. Pop. (1890) 8,062; (1900) 16,000.

Revised by IRVING F. BAXTER.

Omahas: See SIOUAN INDIANS.

Oman: a territory comprising the southeast portion of the Arabian peninsula. It has a coast-line of about 1,500 miles along the Persian Gulf, the Gulf of Oman, and the Arabian Sea. It contains eight badly defined districts or states, of which Muscat is the most important. The inhabitants, though professedly Mussulmans, are less intolerant than those of Western Arabia, and preserve ideas and customs derived from their original fire-worship. It was formerly a part of a powerful and extensive Arabic state or imamat, which consisted of Arabic, Persian, and African territories, but which in 1854, at the death of the Imam Said Seid, was divided between his two sons, one receiving the African territories, and the other the Asiatic territory, with Muscat for its capital. Oman now consists of a low, hot, but, if well watered, very fertile coast-land, producing cotton, sugar, rice, maize, watermelons, and bananas. Behind this coast-land rises a mountainous region consisting of bare and naked ranges inclosing beautiful and fertile valleys, where the coffee-tree grows, and figs, almonds, grapes, oranges, lemons, walnuts, and apples. On the inner slope of these mountains lies a row of oases, mostly inhabited by Bedouins, and behind the oases stretch the Arabian deserts. The area is 82,000 sq. miles and the population estimated at 1,500,000, but the authority of the sultan does not extend far outside his capital, Muscat. The state is practically under British protection. Revised by M. W. HARRINGTON.

Ö'man, VIKTOR EMANUEL, Ph. D.: poet, philologist, and publicist; b. in Sweden in 1833; studied at Lund and graduated at Jena in 1859. He has been chiefly engaged in newspaper work as contributor to and editor of the journals *Al-*

lehanda för Folket and *Nerikes Allehanda*, both published in Örebro, Sweden. His original literary productions are two small volumes of poems, *Lyriska blad* (1857 and 1868) and the poetic tale *Riddar Herbert och Jungfru Hilde* (1866). Öman has shown himself a fine translator in his reproduction in Swedish of Milton's *Paradise Lost* and Euripides's *Medea*, besides some of the masterpieces of Russian, Polish, Magyar, and Hindu poetry. In the philological field he has produced a *Lärobok i engelska språket* (Manual of the English Language, 1867) and *Svensk-engelsk Handordbok* (Swedish-English Dictionary, 1872; 2d ed. 1881), which have now been made antiquated by more recent and complete works. P. Groth.

O'mar, Abu Hafsah Ibn ul Khattab: the second Caliph of the Mussulmans; b. about 581. At first a bitter opponent of the Prophet, he was suddenly converted to Islam (617), and was ever afterward its zealous apostle. In 634 he was elected to succeed Abubekir. Considering the title of caliph, "successor," too exalted to be borne by one who did not come immediately after Mohammed, he assumed the title Emir ul Muniminn, "Commander of the Believers," which had been solemnly decreed him and which the caliphs have borne ever since. In 635 he adopted the Hejira (*q. v.*) as the beginning of the Mussulman era. Wholly devoted to the interests of his faith, by his great administrative and military talents he was the real founder of the vast Arabian empire. In 637 Syria and Palestine were conquered, and the mosque of Omar built at Jerusalem on the site of Solomon's temple. Egypt was subdued 639–641 and Persia in 642. In 640 the union of the Arabian tribes was completed, they for the first time being brought together in one religion under one chief. Omar was exceedingly simple in his habits, economical, and shrewd, a fanatic, yet tolerant of others, and generally fair and impartial. Nevertheless, an act of injustice provoked the resentment of a Persian slave, by whom he was stabbed to death (644). He was buried near the Prophet. E. A. Grosvenor.

Omar Khayyām: Persian poet; renowned as mathematician, astronomer, and philosopher. His full name is given as Ghiās uddīn Abul Fath Omar bin Ibrahīm al-Khayyām; the epithet Khayyām (tent-maker) is presumably due to his father's calling, or to his own occupation before he was in position to devote himself to literary and scientific work. Omar Khayyām was a native of Naishāpūr in Khorassan, and he flourished in the latter part of the eleventh and beginning of the twelfth century. According to tradition, his death took place in the year A. D. 1123 (A. H. 517), but there is ground for believing that it may possibly have occurred some twenty years earlier, as his collegiate friend and companion in years, the celebrated Vizir Nizām ul Mulk of Tūs, is stated to have been born A. D. 1017 (A. H. 408). An interesting story is preserved regarding Omar's first steps in the attainment of fortune, but there is not space for it here. A generous annuity provided for him through the favor of his friend at court, the Vizir Nizām ul Mulk, gave him the means and requisite leisure for pursuing his mathematical and astronomical researches; his work in Arabic on algebra, *Aljebr u al Mukabileh*, enjoyed the reputation of being a standard for several centuries. Merit raised him to an appointment as astronomer royal to the Sultan Malikshāh A. D. 1074, and under this monarch's patronage Omar Khayyām was instrumental in instituting a reform of the Persian calendar and introducing the new reckoning of the Jalālian era, the so-called *Tarīkh i Jalāli* or *Malikshāhi* from the reigning sultan, Jallāluddīn Malikshāh. It dates from Mar. 15, 1074 (10th Ramazān, 471 A. H.).

Greater even than his scientific fame is the renown which his philosophic poetry in the Lucretian or Voltairean vein won for him. It is by his *Rubā'yāt*, or *Quatrains*, that he is most generally known. Some 500 of these rhyming four-line stanzas are attributed to his pen; they breathe a spirit of free-thinking and often enough approach atheism and scoffing; at times the tone is mystical, and again metaphysical and pessimistic; sometimes the verses pulse with a warm rhapsodical beat and a thoroughly human touch; always they are characterized by a vigorous and poetic imagination. Many of the *rubā'is* which pass under Omar Khayyām's name are doubtless not really his, but there is difficulty in deciding, as there is no single uniform recension that can be adopted as exclusive authority, and the numerous manuscripts differ considerably in the number of quatrains they contain. At Naishāpūr the tomb of Omar is shown to travelers; it rests beneath the shadow of blossoming fruit-trees, and the spirit of the astronomer-poet's own prophecy is therefore fulfilled, that his grave should be situated where the wind should shower roses upon it.

Bibliography.—An edition and translation of Omar Khayyām's mathematical work, based on the Leyden and Paris copies, was brought out by Woepcke, *L'algébre d'Omar Alkhayyāmi* (Paris, 1851). For the poet's life and works, consult Rieu, *Catalogue of Persian Manuscripts in the British Museum*, ii., p. 546, and Garcin de Tassy, *Note sur les Rubā'iyāt de Omer Khaiyām* (Paris, 1857). Editions of the quatrains have appeared at Lucknow, Calcutta, Paris, and London. Among English translations is the well-known rendering into English verse by E. Fitzgerald (London, 1859, 1872, 1879; Boston, 1887), and one by E. H. Whinfield which gives also the Persian text (Trübner, London, 1883; 2d ed. translation 1893); there is likewise a prose-rendering by J. H. McCarthy (Nutt, London, 1889). A French version accompanying the Persian text was published by Nicolas (Paris, 1867). Translations of the *Rubā'yāt* have been made in a number of other modern languages, which bears witness to the popularity of Omar's writings also in later times and among foreign peoples.

A. V. Williams Jackson.

Omar Pasha: soldier; b. at Plaski, in Croatia, in 1806; son of an Austrian officer. He studied at the military school of Thurm and served in an Austrian frontier regiment, but in 1833 for some unknown reason escaped to Bosnia, embraced Islam, and changed his name, Michael Lattas, to Omar. Soon he became tutor to the sons of Husseïn Pasha. Going to Constantinople he was appointed a teacher in the military school, married a wealthy Ottoman lady, and was appointed writing-master to Abd-ul Medjid, the heir-apparent. On his pupil's accession he was rapidly promoted. He was sent as military governor to the Lebanon, was made a pasha, and assisted in suppressing rebellions in Bosnia and Kurdistan. During the dual occupation of the Danubian provinces (now Roumania) by Russia and the Ottoman empire, he commanded the Ottoman troops, whom he raised to a high degree of efficiency. In the Crimean war, as commander on the Danube, he several times defeated the Russians and forced them to raise the siege of Silistria. His attempt to relieve Kars was a failure. After the war he was governor of Bagdad, but, having been accused of maladministration, he was removed and banished to Kharput in 1859. He was restored and sent to Bosnia in 1861 and to Crete in 1867 to put down rebellions. For a time he was Minister of War (1869), and a member of the imperial Council till his death, Apr. 18, 1871. He was the ablest Ottoman general in the nineteenth century. E. A. Grosvenor.

Ombay', or **Allor**: an island of the Malay Archipelago, Solor group, N. of Timor; in lat. 8° 5′ to 8° 28′ S. and lon. 123° 43′ to 125° 15′ E. It is 65 miles long, 12 miles broad, high, volcanic, and inhabited by savage tribes of a mixed Negro and Malay origin. At Allor the Dutch have a settlement and carry on some trade in wax, edible birds'-nests, and pepper. Pop. estimated at 194,000.

Omdurman: See the Appendix.

Omen [from Lat. *o'men*, sign, omen < Old Lat. *osmen*; possibly connected with *augeo*, *auxilium*, *auctor*, in the sense of "authorization"; or possibly with *auscultare*, *auris*, in sense of "something heard"]: among the ancient Romans, a sign by which the gods were believed to indicate their favor or opposition to any proposed public or private action. The omens were publicly observed by the magistrates, assisted by haruspices and augurs, the former observing signs of the first, the latter of secondary importance. In the time of Cicero, and even before it, the whole matter of taking omens, of divining, soothsaying, and the like, had fallen into disrepute among the intelligent, but with the vulgar these arts were still of importance up to the time of the later empire.

Omentum [Mod. Lat. = Lat., adipose membrane, spec. the caul]: the membranous reflections of the peritoneum extending between certain abdominal organs and distinguished as the *great omentum*, a quadruple fold protecting the small intestine; the *gastro-hepatic omentum*, a double fold extending from the liver to the stomach; and the *gastro-splenic*, a double fold extending from the great pouch of the stomach to the spleen.

Omish: See Mennonites.

Ommyiades, ō-mī'yădz, or **Ommiades**: the first hereditary dynasty of caliphs, so named from their ancestor Om-

meyah, a remote kinsman of Mohammed. Moaviah, son of the Koreish chieftain, Abu Sophian, and former secretary of the Prophet, governor of Syria since 640, opposed in arms the succession of Ali (655). The latter being murdered (661), Moaviah, already master of Arabia, Egypt, and Syria, succeeded to the throne despite the opposition of the family of Ali. He made Damascus the capital of the Mussulman empire, rendered the succession hereditary though hitherto elective, and was followed by thirteen princes of his family. Under Moaviah I., Samarkand, Tunis, and Tripoli were subdued, and Kairouan, the "metropolis of African Mussulmanism," founded, but his troops were defeated in a seven years' siege of Constantinople (672–79). His son and successor, Yezid I., reigned three years, caring for little except dissipation. Moaviah II. and Mervan I. were both poisoned soon after accession. Abd-ul Malek I. conquered Irak and Persia from the partisans of the dead Ali, crushed all internal opposition, and captured Carthage (704). The reign of Walid I. (705–715) was in every way the most brilliant of the Ommyiade rule. His general Hassan subdued the Moors and accomplished their enthusiastic conversion to Islam, and Tarik defeated the Visigoths, and with Mousa subdued the entire Peninsula of Spain as far as the Bay of Biscay. Meanwhile in the East Tartary was subjugated and the Mussulman arms carried victoriously to India. The next two caliphs were Suleïman I., a zealous and incapable prince, and Omar II., famous for his ascetic virtues. Under the latter France was invaded (719) and Constantinople again besieged in vain (717–719). Yezid II. was succeeded by Hashem I., whose general, Abderrahman, captured Nîmes in France (730), but was utterly defeated at the decisive battle of Tours by Charles Martel (732). Walid II. was feeble and contemptible. Yezid III., Ibrahim I., and Mervan II., altogether reigned six years; Mervan II. was deposed (750) by Abul Abbas the Bloody, founder of the Abasside dynasty. The surviving Ommyiades were all butchered save two, one of whom, Abderrahman I., founded the Ommyiade caliphate of Cordova in Spain (755), where his family reigned till 1031. The universal caliphate of the Ommyiades had lasted eighty-nine years. Notwithstanding the general intellectual and military brilliancy of their reign, it was disastrous for Islam. They represented the worldly and ambitious element, in opposition to the simple faith and practices of earlier days, and by the civil wars they fomented or occasioned, and even by their foreign conquests, rendered dismemberment of the Mussulman empire inevitable. E. A. Grosvenor.

Omnibus: See Carriages.

Omniscience [Lat. *om'nis*, all + *sci're*, know]: an attribute of God, in consequence of which he knows of all that has been, all that is, and all that shall be. In its last phase, as Foreknowledge (*q. v.*), it has occasioned several very subtle theological distinctions.

Omsk: capital of the government of Omsk, Siberia; at the confluence of the Om and the Irtisch (see map of Asia, ref. 3–E). It contains military schools, hospitals, manufactories, and mining works, and is the residence of the governor-general. Its fortress, constructed in 1766, is the strongest in Western Siberia. Pop. (1897) 37,470, exclusive of the garrison, which numbers 6,000. E. A. G.

On (Egypt. *An*; Gr. *Heliopolis*): the name applied by the Hebrews (Gen. xli. 45, 50; xlvi. 20) to the famous city of the sun, Heliopolis (*q. v.*), which was also known by them as Beth-Shemesh, House of the Sun (Jer. xliii. 13), of which Heliopolis is simply a translation. The same Hebrew letters that spell On when differently vocalized give *Aven* (Ezek. xxx. 17), which thus becomes, erroneously, a second Hebrew name of Heliopolis. C. R. G.

Oña, ōn'yăă, Pedro, de: poet; b. at Los Confines, on the Biobio river, Chili, about 1565. He studied at the University of San Marcos in Lima, and passed most of his life in that city, where he was *fiscal* of the audience. His best known work is the epic *Arauco domado* (1st ed., Lima, 1596). It relates to the Araucanian wars, and is an evident imitation of Ercilla's *Araucana*; though inferior to the latter in poetical merit, it has considerable historical value. Oña also published *Temblor de Lima* (1609); *Ignacio de Cantabria* (1639), etc. D. at Lima about 1640. H. H. S.

On'ager: a species of wild ass (*Equus onager*, or *E. hemippus*) inhabiting the plains of Central Asia. It is reddish in summer, gray in winter, with a streak of black along the center of the back, crossed by a second bar over the shoulders.

Oñate, ōn-yaa'tā, Juan, de: settler of New Mexico; b. at Guadalajara, Mexico, about 1555. He was a man of wealth and position, son of the founder of Guadalajara, and married to a granddaughter of the conqueror Cortés. His proposition to conquer and colonize the region N. of the Rio Grande was first accepted by the Viceroy Velasco in 1595; but delays ensued because Velasco's successor, Monterey, refused to give him full powers as governor. The objections were finally overcome, and Oñate left Zacatecas Jan. 20, 1598, with 130 soldiers, a large force of Indians, 83 wagons, and 7,000 cattle. On Apr. 20 the expedition reached the Rio Grande, probably at El Paso del Norte. Oñate crossed, and after some exploration founded San Juan, the first capital of New Mexico, in August. During the first year there were several conflicts with the Pueblo and other Indians, who were finally defeated; subsequently the colony prospered greatly. In 1599 and again in 1604 Oñate explored portions of Arizona, following the Gila river to the sea in the latter year. There is evidence that he ceased to be governor about 1608, but the date of his death is unknown. Some accounts say that he led an expedition eastward in 1611. Herbert H. Smith.

Onawa: town; capital of Monona co., Ia. (for location, see map of Iowa, ref. 4–D); on the Sionx City and Pac., the Chi. and N. W., and the Green Bay, Winona and St. P. railways; 37 miles S. by E. of Sioux City. It is in an agricultural and stock-raising region, and has a public library (1867), a State bank with capital of $50,000, and three weekly newspapers. Pop. (1880) 882; (1890) 1,358; (1900) 1,933.

Onchidium, ŏn-kid'i-ŭm [Mod. Lat., incorrectly formed from Gr. *ὄγκος*, angle]: a genus of slug-like pulmonate molluses, noticeable chiefly from the fact that one of its Indian species has the whole dorsal surface covered with eyes formed on the vertebrate type. This species lives on the shore between tide-marks, and the eyes are supposed to enable it to escape the fishes which feed upon it.

Oncken, Johann Gerhard: missionary; b. at Varel, Oldenburg, Germany, about 1800; was in early life a domestic servant; lived for a time in England, where he became a member of an Independent church; opened a bookstore at Hamburg as agent of the Edinburgh Bible Society and the Lower Saxony Tract Society; organized a Baptist church, of which he became pastor 1834; was appointed a missionary of the American Baptist Convention 1835; visited many parts of Germany, Austria, Switzerland, and Denmark, preaching, baptizing, distributing the Scriptures, and founding churches; was several times imprisoned; edited religious journals in English and German; visited the U. S. in 1852 and in 1865. D. in Zurich, Jan. 2, 1884.

Ondricek, Franz: See the Appendix.

One'ga: a large lake in the government of Olonetz in Western Russia. Next to Lake Ladoga, it is the largest lake of Europe, covering an area of 4,830 sq. miles. It is connected with the Volga and the Dwina by canals, and communicates with Lake Ladoga by the Sweer. It abounds in fish. Onega is also the name of a river of Northern Russia not connected with the lake, but occupying the basin next E.; also of a town near the mouth of this river, and of the great bay of the White Sea into which this river empties. Revised by M. W. Harrington.

Oneida, ō-nī'da: village; Madison co., N. Y. (for location, see map of New York, ref. 4–G); on the N. Y. Cent. and Hudson River and the N. Y., Ont. and W. railways; 26 miles E. of Syracuse. It is in an agricultural and hop-growing region, and contains a union school, 2 national banks with combined capital of $165,000, a State bank with capital of $50,000, a savings-bank, a private bank, several large manufactories, and 2 semi-weekly and 2 weekly periodicals. Pop. (1890) 6,083; (1900) 6,364.

Oneida Community: a society of religious communists, consisting of about 300 members, formerly established on Oneida creek, Madison co., N. Y. At the time of its dissolution in 1881 it owned a fine estate of 650 acres, also a commodious mansion, and several mills and manufactories. A smaller branch society was located at Wallingford, Conn.

History.—The founder of this Community (see Noyes, John Humphrey) and the circle of believers he had gathered around him at Putney, Vt., devoted themselves at first exclusively to the development and publication of their religious views, and had no thought of becoming a community; but their intimacy of relationship and unity of faith

gradually led them to adopt the communistic manner of life. In 1846 they began the experiment of complex marriage, but this step gave such offense to their neighbors that the little Community was compelled to disband. In the following spring, however, in response to the invitation of another community, which had recently been started under the influence of the Putney school, the members of the latter were once more united on the banks of the Oneida creek. Here they were allowed to carry out their communistic views for nearly thirty years with comparative freedom from molestation. During the first seven or eight years of its existence poverty and apostacy several times brought the Community to the verge of failure; but by 1855 the members had become disciplined by hardship and labor, and a number of lucrative business enterprises had been started, the most important of which were the manufacture of game-traps and the packing of fruits and vegetables. As the project of maintaining an expensive publishing branch at Brooklyn, N. Y., had in the meantime, after three years' trial, been abandoned, the Community soon found itself settled upon a firm financial basis. During the next twenty years the Oneida Community formed a conspicuous feature in the social life of the U. S., and its prosperity, both domestic and financial, was unquestioned. Education was always one of the leading objects of the Community, and an opportunity for intellectual culture was afforded every member. The paper which for more than forty years was published as the organ of the society was a constant channel for thought and literary effort. Soon after 1873 the troubles began which led to its dissolution. The men and women who were admitted to membership after the prosperity of the Community had been assured were by no means so whole-hearted in their devotion to the cause of Christian communism as were those who had joined in the face of poverty and disgrace. Furthermore, some of the leaders among the young people had already begun to lose their faith in the religious principles which lay at the foundation of the Community polity, and consequently Noyes was, to a large extent, deprived of their support in the series of trials upon which the Community was about to enter. In the spring of 1879 the clergy of New York State convened at Syracuse for the purpose of initiating judicial and legislative proceedings against the Oneida Community, and in August of that year Noyes, who had withdrawn to Canada in consequence of threatened arrest, perceiving that it would be inexpedient to hold out further against the public sentiment of the State, wrote a letter to the Community proposing that the obnoxious social features of the institution be abandoned. This proposition was acceded to with scarcely a dissenting voice, and was carried out in good faith. The entire dissolution of the Community soon followed. On Jan. 1, 1881, the property was divided, and the members were incorporated under the laws of New York State as a joint-stock company, in which capacity they have since carried on the business of the old Community. The peace and equity which prevailed in the division of the Community estate may be largely ascribed to the influence of Noyes.

Religion.—In 1834, when the religious movement which culminated in the Oneida Community was started at New Haven, Noyes and his followers were called Perfectionists, in consequence of their belief that salvation from sin was attainable in this life; but soon other varieties of Perfectionists sprung up, whose doctrines and tendencies differed widely from those of the New Haven brethren, and the name ceased to be distinctive. The principal theological doctrine of Noyes and of the Oneida communists was that the second coming of Christ is already past, having taken place about the year 70 A. D. in connection with the destruction of Jerusalem by the Romans; and from this they argued that the primitive Church is now alive and accessible, and that it is able, by virtue of its own victory over sin and death, to accord the same victory to every true seeker after righteousness. They looked forward to a third coming of Christ at the end of the "times of the Gentiles," and expected that the final and general judgment of the world would then take place. In regard to the Godhead Noyes maintained that it consisted of two beings, the Father and the Son, whose relation to each other was analogous to that of man and woman. He taught that the devil had existed and sinned from eternity, and that God is in no way responsible for evil. In his doctrines concerning baptism, regeneration, and the functions of law and grace, Noyes was a close follower of St. Paul. In fact, his entire theological system was based largely on St. Paul's writings.

Social Organization.—All property in the Oneida Community was held in common, and the education and subsistence afforded to the members was considered a just equivalent for their labor. Hence no accounts were kept between the members, except such as might be kept between the members of any ordinary family. For government and discipline the Oneida communists relied chiefly upon the power of their religion, but for the better application of that power they devised a system of public censorship called by them "mutual criticism," which was found to work admirably as a substitute for the laws and penalties of ordinary society.

The social organization embraced also a scheme of "pantagamy," or complex marriage, which has often been wrongly confused with the practices of "free-lovers" and other licentious persons. In every essential particular wherein marriage morality differs from prostitution, viz., in respect to sacredness and permanence of union, care and provision for women and children, and the exclusion of irresponsible connections, the Oneida Community stood on the side of marriage. The mortality among the children born under this system between the years 1869 and 1878 was less than one-third that of the corresponding mortality in the U. S.

Bibliography.—J. H. Noyes's *History of American Socialisms* (1870); Nordhoff, *Communistic Societies of the United States* (1875); Hepworth Dixon, *New America* (1867); *The Berean*, by J. H. Noyes (1847); also the following pamphlets by J. H. Noyes: *The Bible Argument*, *Salvation from Sin*, *Mutual Criticism*, *Male Continence*, and *Scientific Propagation*. Also an article by Dr. Van de Warker in *The American Gynæcological Journal*, Aug., 1884.

G. W. Noyes.

Oneida Lake: a body of water in Oneida, Oswego, Madison, and Onondaga cos., N. Y.; 20 miles long and 6 miles wide. Its surface is 369 feet above the sea. It abounds in fish. It formerly, with its outlet, Oneida river, was the channel of an important navigation, but it is superseded by railways. The river is a deep, sluggish, tortuous stream, 18 miles long, with low banks. It falls into Oswego river.

Oneidas: See Iroquoian Indians.

Oneon'ta: village (settled in 1786, first schoolhouse built in 1790, first mill started in 1795, first church built in 1816); Otsego co., N. Y. (for location, see map of New York, ref. 5–H); on the Susquehanna river, and the Del. and Hudson Railroad; 60 miles N. E. of Binghamton, 82 miles W. by S. of Albany. It is the seat of a State normal school (burned and rebuilt at a cost of $175,000 in 1894); has 7 churches, a State armory, a public library with over 4,000 volumes, 2 national banks, and a daily, a monthly, and 3 weekly newspapers, and contains the repair, car, and machine-shops of the Del. and Hudson Railroad, 3 planing-mills, 2 foundries, 2 grain elevators, knitting-mill, and sash and door, piano, cigar, and shirt factories. Pop. (1880) 3,002; (1890) 6,272; (1900) 7,147.

Editor of "Herald."

Onesan'der [= Lat. = Gr. Ὀνήσανδρος]: a Platonic philosopher under Nero; the author of a Στρατηγικὸς λόγος, dedicated to Quintus Veranius, consul in 49 A. D., which treats of the duties of a commander, and the style of which is based on that of Xenophon. The work was first published in a Latin translation, often reprinted; the first edition of the Greek text was by N. Rigaltius (Paris, 1599); best editions by Schwebel (Nuremberg, 1762, fol.) and A. Köchly (Leipzig, 1860). B. L. G.

Onion [from Fr. *ognon*, *oignon* < Lat. *u'nio*, *unio'nis*, a single large pearl, an onion, liter., unity, oneness (whence Eng. *union*), deriv. of *u'nus*, one]: a cultivated biennial herb and its bulbous foot, the latter composed of leaf-elements in a thickened condition; the *Allium cepa*, a plant of the order *Liliaceæ*, cultivated in Egypt and Asia from immemorial time, and thence introduced into nearly all civilized countries. The onion differs from the garlic especially in having the elements of its bulb disposed in concentric layers and not in separate cloves. Among the marked types are the potato onion, grown from off-set bulbs growing near the root, and the top onion, produced from similar bulbs growing at the top of the flower-stalk. Ordinary onions are raised in the first season from seed, or in the second year from the small *sets* or incompletely grown bulbs of the previous year's crop. The onion has an aromatic sulphur oil containing allyl. The bulb is highly nutritious. The crop requires a fertile soil, and clean culture, and as it is very

hardy it should be sown early. In medicine it is a stimulating expectorant, valued in domestic practice, especially in diseases of children. Revised by L. H. Bailey.

Onomas'ticon: See Dictionary.

Onomatopœ'ia [Gr. *ὀνοματοποιία*, the creating of a name; *ὄνομα*, name + *ποιεῖν*, make]: the formation or modification of a word in imitation of a sound. The simplest and clearest cases of onomatopœia are contained in words which are direct names of sounds, as *boo-hoo*, *ding-dong*, *bang*, *bow-wow*, *moo*, *coo*, *baa*. Individual cases in which such words come to serve as verbs and nouns are undeniable; as *buzz*, *chuck*, *chuckle*, *hiss*, but they are so likely to become then conventional, and therefore to submit to the regular phonetic laws of the language, that it is necessary carefully to distinguish between words that are actively onomatopœtic and such as are only historically so. For instance, the verb *cackle* was doubtless in its origin imitative, but comparison with M. Eng. *cakelen* and Low Germ. *kākeln* shows that it can not be wholly the result of recent imitative action. It is often impossible to determine whether such correspondences may not be due to independent imitative action in the separate languages; thus *boom*, *bum*, *bumble-bee*, *hum*, *humble-bee*; cf. Germ. *bummen*, *hummen*, *summen* (also M. H. Germ.), *hummel* (O. H. Germ. *humbal*), "humble-bee," M. Eng. *humbelbee*, Dutch *hommelen*, etc. Words of this sort are generally so near their imitative source as to be continually subject to renewal. Such readaptation of historical material is distinctly an act of language-creation, and may well serve to illustrate the original processes in the generation of language; cf. differentiations like *crack*: *crash*, *clack*: *clash*, *smack*: *smash*. The historical name of the *cuckoo*, O. Eng. *gēac* > M. Eng. *geke* (cf. dial. *gowk*) : Germ. *gauch* < M. H. Germ. *gouch* : O. N. *gaukr*, has yielded in English to the more expressive *cuckoo*, older *cuccu*, which probably represents the Fr. *cucu*, *coucou*, and in Germ. *kuckuck*, a loan-word from Dutch *cuccūc*. Probably the French and perhaps the Dutch form is imitative, but in the light of forms in other languages, e. g. Gr. *κόκκυξ*, Lat. *cucu'lus*, it is practically impossible to tell where borrowing leaves off and where direct imitation of sound begins. The material collected in the writings of Hensleigh Wedgwood, e. g. in the introduction to his *Dictionary of English Etymology* (3d ed. 1878), is confused and uncritical; the best introduction to the subject will be found in Paul, *Principles of the History of Language* (2d ed. 1886), chap. ix.

Benj. Ide Wheeler.

Ononda'ga Indians: See Iroquoian Indians.

Onondaga Lake: a body of water in Onondaga co., N. Y. It is 5 miles long, 1 mile wide, and has a maximum depth of 65 feet, but its southern part is very shallow. Its waters are stagnant, and their level is 361 feet above tide. They flow into Seneca river. The lake has a natural puddling of marl, which keeps the brine of the Onondaga limestone from its waters. The lake was probably formed by the dissolving out of salt rock, and the subsequent falling in of the roof of the cavern thus formed.

Onosander: same as Onesander (*q. v.*).

Ontario (formerly Upper Canada): the wealthiest and most populous province of the Canadian Dominion. It received its present name in 1867, when it joined Quebec (formerly Lower Canada) and the two chief Maritime Provinces, New Brunswick and Nova Scotia, in the political union of the British North American provinces. It embraces an area of 222,000 sq. miles (2,350 water surface), extending from E. to W. fully 1,200 miles, i. e. between the meridians 74° and 95° W. of Greenwich, and N. and S. nearly 700 miles, or approximately from 42° to 53° N. lat. The older and more settled portions of the province, which date from 1791, are those which lie immediately N. of Lakes Erie and Ontario. As the country was opened up and the western waterways were utilized for commerce, settlement gradually took possession of undefined areas in a northwesterly direction. This territorial expansion was facilitated by the acquisition in 1868 of the vast area which for two centuries had owned the sway of the Hudson Bay Company. The northern and western limits of Ontario were without precise determination until 1878, when arbitrators, at the instance of the Dominion, in agreement with the provincial governments, made an award, which after a time was accepted by all parties interested, and settled the precise boundaries of the province. These are, on the E. and N. E., the Ottawa river, the Province of Quebec, and a line separating Ontario from the Northeast Territory, running N. to Hudson Bay from Lake Temiscaming, close to the meridian 79° W.; on the N. and N. W., Hudson Bay, the waterways of the Albany river, Lake Joseph, and Lac Seul, and the English river to a point of intersection with the meridian line drawn from the northwest angle of the Lake of the Woods, on the U. S. boundary; on the S. W. and S., Rainy and Pigeon rivers, Lakes Superior, Huron, St. Clair, Erie, and Ontario, with their connecting waterways (the St. Mary, St. Clair, Detroit, and Niagara rivers), and the St. Lawrence.

Physical Features.—The physical conformation of the older organized sections of the province has little to distinguish it. Nowhere do the elevations exceed 1,000 feet. The Niagara escarpment extends from the Blue Mountains, on Nottawasaga Bay, to the Niagara river, and there is a slight elevation trending S. E. from the Georgian Bay to the St. Lawrence, thence into the State of New York. N. of this hydrographical basin of the St. Lawrence the aspect of the province is bolder and more rugged. Here the Laurentian Hills, trending northwestward, cross the province, though reduced now to a hummocky plateau, locally termed the Height of Land. This ancient ridge parts the waterways N. into Hudson Bay, E. into the Ottawa, and W. into Lakes Nepigon and Superior. Among the many interior lakes besides Nepigon, which is situate N. of Lake Superior, are Lakes Nipissing, Muskoka, and Simcoe, all E. of Georgian Bay.

Geology.—Geologically, Ontario partakes of the characteristics which belong to the area extending from the Atlantic coast to Lake Superior. It is composed almost entirely of rocks belonging to the Archæan and Palæozoic divisions. Throughout the later geological ages these rocks have remained exempt from important disturbance, but have been subjected to prolonged processes of denudation, so that the more resistent rocks form the higher points. E. of Kingston and Ottawa the surface is based on horizontal beds of Silurian rocks, generally limestones, and S. of a line drawn from Kingston to the northern part of Georgian Bay it is based on rocks of the Palæologic age, but the series include strata as high as those of the Devonian period. The mineral-bearing area, which extends from Georgian Bay to Lake Winnipeg and northward, consists of Laurentian gneissic and granitic rocks, within which are many areas of plutonic and volcanic rocks, and of metamorphic slate of Huronian age. Overlying these occur the sedimentary and volcanic rocks of the Animike, Nepigon, and Keewanian group, whose nearly horizontal stratification contrasts sharply with the almost vertical older rocks upon which and against which they rest. In the upper Ottawa valley the lower and middle divisions of the Laurentides are overlaid unconformably by continuous and perfectly conformable series of sedimentary strata of the Cambro-Silurian system. Some of the clays abound in nodules holding remains of the seal, fishes, insects, shells, and plants. The great Huronian belt runs across the country from S. W. to N. E., and includes crystalline schists, breccias, conglomerates, argillites, and syenites, traversed by diabase dikes remarkable for their length.

Climate.—The summers are warm and the winters cold; but the cold is extreme only in the uninhabited northern portion, while even there the rigor is moderated by the snowfall and the absence of blizzards. In the populous parts of the province the cold is pleasant and bracing, while the snow is of much service to the lumberman as well as to the farmer. Of the length of the winters there is much popular misconception outside the province. Sometimes there is a late spring, but the average winter in the Ontario peninsula is not more than three months long. At Toronto the "close" season for navigation is usually from Dec. 15 to Mar. 15. The following table indicates the extremes of the provincial climate in widely separate sections:

PLACES.	Latitude.	Longitude.	Elevation above the sea.	MEAN TEMPERATURE.	
				Summer.	Winter.
Goderich (Lake Huron)	43·45	81·43	728	65·3	23·7
Port Arthur (head of Lake Superior)	48·27	89·12	611	58·0	9·0
Ottawa (Ottawa river)	45·26	75·42	236	65·3	15·4
Toronto (Lake Ontario)	43·39	79·23	350	64·1	24·6

Note.—The summer temperatures are taken from the months of July, August, and September, and those of the winter from January, February, and March.

The precipitation (rain and snow) for the year 1892 in three of the above places was as follows: Port Arthur, rain 16·06, snow 26·8 inches—total, 18·74; Ottawa, rain 23·10, snow 106·0—total, 33·70 inches; Toronto, rain 25·28, snow 42·2—total, 29·50 inches.

Soil and Products.—Over 100,000 sq. miles is still in forest, though in the older districts the woodland is chiefly young or second-growth timber—spruce, maple, and pine. Of the 23,000,000 acres of occupied and assessed land, about one-half is cleared, over 8,000,000 acres are woodland, and nearly 3,000,000 acres are marshes. Of the cleared land, 8,000,000 acres are under crop, 2,500,000 acres are in pasture, and nearly 200,000 acres are devoted to orchards and gardens. The soil and the climate admit of the cultivation of nearly all the useful food grains and roots, and of many marketable fruits. The assets of the farmers of Ontario in 1899 were given in the annual report of the Bureau of Statistics as follow: Land, $563,271,777; buildings, $213,440,281; live stock, $115,806,455; implements, $54,995,857. The total was $847,513,360. The following is the value of crops produced on the farms of Ontario in 1899: Hay and clover, $27,010,003; oats, $24,901,670; fall wheat, $9,631,365; peas, $8,675,673; potatoes, $6,538,144; barley, $5,858,202; turnips, $5,807,839; spring wheat, $4,682,476; husking corn, $4,291,300; silage or fodder corn, $3,395,510; mangolds, $1,671,871; rye, $1,142,423; buckwheat, $2,501; beans, $703,090; carrots, $459,254; total, $104,771,321.

The fruit crop for all but the hardier fruits is somewhat precarious, except in the Niagara district, where the peach is grown to fair perfection. Apples are usually a fine and profitable crop throughout the older parts of the province, as are cherries and plums, while strawberries, grapes, and small fruits are raised in great abundance in the Lake Erie and Lake Ontario counties. The forests and woodlands have contributed considerably to the exports of the province, besides affording material for some of its important industries. Now they are chiefly valuable to the crown for the revenue derived from timber dues and the rents accruing from leases to lumbermen. Where the timber limits are sold outright, the revenues will in future years shrink in value.

Mineral Resources.—The mineral wealth of Ontario is large, though economic conditions have hitherto not been favorable to its development. The chief exports of mineral ore have been to the U. S., and the duties imposed by that country have largely handicapped the industry. The area richest in minerals is that stretching from Sudbury district, in the neighborhood of Lake Nipissing, W. to Port Arthur, at the head of Lake Superior, and on to the Lake of the Woods. Within this region are gold, silver, copper, nickel, iron, galena, plumbago, and zinc ore, mica, and apatite, besides large deposits of granite, marble, and freestone. W. of Port Arthur is an argentiferous region of great richness. Many of the central and eastern counties also are rich in most of the metals named, and also in phosphates and other mineral fertilizers. In the western peninsula are salt, petroleum, gypsum, and materials for building, including large deposits of clays for terra-cotta and pressed brick. Mineral products of the province for 1899, exclusive of the yield from the precious metals, was about $6,000,000, one-third of which was expended for labor. Of this amount $2,700,000 represents the value of the building-stone mined during the year, including rubble, lime, cement, pottery, brick, and tile. A like amount represents the value of salt, petroleum, and natural gas. The gold production in nine months of 1899 was 20,210 oz.; silver, 98,000 oz.; nickel, 4,608,000 lb.; copper, 4,642,000 lb.; pig iron, 48,216 tons. The rush to incorporate mining companies in 1897, which resulted in 140 with a capital of $101,531,000, was not maintained in 1898. The total number in the latter year was 49 with a capital of $30,762,998. The revenue derived by the Government from sales and rentals was $109,140 for the year ending June 30, 1899. The number of men employed in 1898 was 7,495; the wages paid were $2,464,239.

Live Stock.—Ontario has paid special attention to the breeding of carriage and saddle horses, and care for the sanitary condition of cattle has enabled shippers to command good prices in Great Britain, as well as to save themselves the annoyance of embargoes. The total value of the live stock in the province in 1899 was estimated at $120,000,000, while sales within the year amounted to $38,457,018, divided as follows: Cattle, $17,303,426; hogs, $14,157,394; horses, $3,204,006; sheep, $2,629,201; poultry, $1,162,991. The wool trade increases steadily, the total clip for 1892 amounting to over 5,500,000 lb., the average weight per fleece in the Lake Ontario counties reaching 6·22 lb. The cheese and butter industries show a like advance. Bee-culture is also a growing industry, and honey has become a considerable source of revenue.

Population (including races and religion).—The population of Ontario in 1891 was 2,114,321, or more than half that of the Dominion W. of the Maritime Provinces. Of this number 1,708,702 are native born, 329,037 are British subjects (chiefly English, Scotch, and Irish), while 23,440 were born in Germany, and 42,702 in the U. S. The increase in population since 1881 has been slight, the province having lost heavily by emigration to the U. S. and the Canadian Northwest. Classified by religions, there were 647,518 Methodists, 452,712 Presbyterians, 385,999 members of the Church of England, 358,300 Roman Catholics, 96,969 Baptists, 45,029 Lutherans, 16,879 Congregationalists, and 10,320 members of the Salvation Army.

Divisions.—Ontario is for municipal purposes divided into 42 counties and 6 provisional districts. The former are comprised within the older organized sections of the province; the latter (Muskoka, Parry Sound, Nipissing, Algoma, Thunder Bay, and Rainy River) extend northwestward from the northern provisional counties to the prairie Province of Manitoba. Ninety-two electoral divisions return each a member in the Provincial Legislature, which consists of but one Chamber.

† Provisional districts with county organizations.
‡ Cornwall, in Stormont Co., is the county-town for the three counties of Dundas, Glengarry, and Stormont.

Cities.—The population of the 12 cities in 1891 was as follows: Toronto, 181,220; Hamilton, 48,980; Ottawa, 44,154; London, 31,977; Kingston, 19,264; Brantford, 12,753; Guelph, 10,539; St. Thomas, 10,366; Windsor, 10,322; Belleville, 9,914; Stratford, 9,501; St. Catharines, 9,170.

Government.—The administration of provincial affairs is

intrusted to an executive and a legislative assembly, which together form the parliament of the province, with a lieutenant-governor, who is advised by a cabinet, composed of eight members. Toronto is the seat of the Provincial Government. The Executive Council comprises the Attorney-General (Premier), Commissioner of Crown Lands, Commissioner of Public Works, Minister of Education, Minister of Agriculture, Treasurer, Secretary, and Registrar, and another cabinet officer without portfolio. The Legislature has by law a duration of four years, unless sooner dissolved by the lieutenant-governor. It is governed by the constitutional principles which guide the Federal Government and parliament at Ottawa, and has exclusive jurisdiction in questions relating to property and civil rights, education, municipal government, and all other matters of local concern. Matters of a general character are under the jurisdiction of the Dominion authority and parliament, in the latter of which Ontario is represented by 24 members in the Senate, appointed by the crown, and by 92 members in the Commons, elected by the people. The higher legal machinery of the province is grouped under the Supreme Court of Judicature for Ontario. This court is divided into two branches—the court of appeal and the high court of justice. The latter is again subdivided into the three divisions—queen's bench, chancery, and common pleas courts. The judges are appointed by the Dominion Government. Toronto is the seat of the higher courts.

Education.—In 1891, of the adult population of the province only 3·83 per cent. were unable to read and 5·20 per cent. were unable to write. Though separate schools continue to be recognized and aided by the province, the educational system is in the main unsectarian, and the public schools are free to all. The chief source of the school maintenance is local taxation, aided by Government grants from the public chest. In 1898 the province expended over $4,000,000 upon public schools alone. These were 5,932 in number, with an enrollment of 478,394 and an average attendance of 273,451. In charge of these schools there were 9,209 teachers (6,466 female and 2,743 male), the average salary being $297 for the former and $421 for the latter. Of Roman Catholic (separate) schools, there were in 1898 345, with 41,667 pupils and 700 teachers. Besides the public schools, the province maintains 130 high schools, of which 35 are collegiate institutes, employing in both 571 highly qualified teachers, with a registered enrollment of 23,301 pupils and an average attendance of 14,066. There are also 69 teachers' institutes, 2 well-appointed normal schools (one in Toronto and one in Ottawa), besides a number of city and county model schools, a school of pedagogy, a provincial agricultural college and experimental farm, and a school of practical science. In addition to all these the province gives aid to a number of industrial schools and eleemosynary institutions, and maintains schools for the blind and the deaf and dumb. It also gives legislative aid to mechanics' institutes, free public libraries, and art schools. The entire school system is under the administration of a department of the Provincial Government, at the head of which is the Minister of Education. School boards, under the supervision of the provincial department, are intrusted with the local administration.

At the head of the educational system of the province stands the national institution, Toronto University and College. This institution has dual functions, viz.: (1) An examining and degree-conferring body, governed under the crown by a board of trustees, senate, and convocation; and (2) a teaching body, directed by a university council, composed of the president and professorial staff. Since 1850 it has been undenominational and has attracted toward it, under the University Federation Act, a number of theological colleges, schools of medicine, of science, of music, agriculture, dental surgery, and pharmacy, which take advantage of its comprehensive art course, laboratory work, etc. The affiliating denominational colleges are Victoria University (Methodist), Knox College (Presbyterian), St. Michael's College (Roman Catholic), Wycliffe College, and Huron College (Episcopalian).

The other colleges of the province are Queen's University, Kingston (Presbyterian); McMaster University, Toronto (Baptist); Trinity University, Toronto (Episcopalian); Woodstock College (Baptist), Alma College, St. Thomas; Albert College, Belleville; and Upper Canada College, Toronto. The last named, an old historic, residential school for boys, was founded by Sir John Colborne in 1829 upon the model of the great public schools of England.

Railways and Canals.—The province has been liberal in its subventions for the construction and equipment of local railways. The total railway mileage of Canada in operation in 1899 was 17,358 miles, about half of which run through Ontario. The characteristics of the vast inland navigation of Canada have necessitated canals over many of its waterways. The Dominion Government has undertaken the construction of a new canal on the St. Mary river, to give access to Canadian traffic in its passage in and out of Lake Superior. The existing canals of the St. Lawrence system, which lie almost wholly within the province, are over 70 miles in length; the total height directly overcome by locks is 533 feet. The available depth, with the exception of that in the Welland Canal, is (1894) limited to 9 feet. The Murray Canal connects the Bay of Quinté and Lake Ontario. The Rideau Canal, which connects the Ottawa river with Lake Ontario, was undertaken at an early period for military purposes. The U. S. has reciprocal privileges over the Canadian canal system, and utilizes it largely as against the privilege Canada enjoys in the railway bonding system over U. S. territory.

Finance.—Ontario, unlike the other provinces of the Dominion, has no debt, if we except subventions to local railways to the extent of about $1,500,000, which has a period of forty years for its redemption. What debt she had, as a partner with Quebec in the old Province of Canada, was assumed by the Dominion at confederation. Under the arrangement by which the province entered the union, Ontario receives an annual subsidy from the Federal Government of $1,196,873, and had in 1900 a surplus of assets over liabilities presently payable of $1,957,873. The indebtedness of the municipalities amounted in 1890 to nearly $50,000,000, with assets slightly in advance of this sum.

Commerce and Business Interests.—So far as can be known, the trade of the province for the year 1893 was as follows: Exports, $33,850,873; imports, $48,243,756; duty paid on the latter, $8,661,581. (These figures can be only approximately correct, since much of the provincial export and import trade passes through the ports of Montreal, Quebec, and Halifax, and no separate record is kept of it.) The two chief customers of the province are the U. S. and Great Britain. There are 76 loan, building, and investment companies, with a subscribed capital of over $80,000,000, doing business in Ontario. Of the 39 banks making returns to the Federal Government on Jan. 1, 1893, 10 had their headquarters in Ontario. At that date the total liabilities of the 39 banks amounted to $217,195,975, and the total assets to $302,696,715. The crisis in banking and commercial circles in the U. S. in 1893 was little felt in Ontario, owing to the conservative efforts put forth by Canadian banking and monetary men to strengthen their financial resources and act cautiously with regard to credits. Ontario has a large export and domestic trade in manufactures of all kinds, including agricultural implements, machinery, edged tools, musical instruments, sewing-machines, besides woolen goods, tweeds, cottons, undressed furs, leather goods, woodenware manufactures, etc.

History.—Canada, even long after the conquest, had but a mere fringe of settlement along the St. Lawrence and the Bay of Fundy. Adventurous spirits, however, had probed the waterways to the far West and the region that, after the passing of the Constitutional Act of 1791, was to become a new colony of the crown, as yet an almost unbroken wilderness. The close of the Revolutionary war brought bands of Loyalists into the country, and these located themselves partly in Acadia in the E., and partly along the upper St. Lawrence and about the mouth of the Niagara river in the W. To give the western-settling Loyalists a country and a home, the British Government divided Canada into two provinces, Western or Upper Canada being set off from the old French province on the St. Lawrence, the Ottawa river forming a rough dividing-line. Gen. Simcoe, an old Revolutionary campaigner, was sent out as lieutenant-governor, and established his seat of Upper Canada government for a time at Niagara, where the first parliament of the province met, and afterward at York, which subsequently resumed its old Indian name of Toronto. Toronto was founded in 1793, and has since, with an occasional brief interruption, been the provincial capital. The war of 1812 bore hardly upon the fortunes of the province, and it was also hindered by its long battle against the paternalism of the mother-country, or rather against the tyranny of a bureaucratic colonial executive, which stood in the way of progress and the attainment of responsible government. The union of

the two Canadas, which occurred in 1841, proved unfortunate, for to the strife of political factions was added a war of races which made legislation impossible and brought about political deadlock. The solvent was confederation, which took place in 1867, and made Upper Canada (now Ontario) a self-governed province of the Dominion. Territorial expansion brought advancement, not only political and economical, but intellectual and social as well.

G. MERCER ADAM.

Ontario, Lake: the easternmost and smallest of the Great Lakes drained by the St. Lawrence. Its area, as determined from the maps of the U. S. Lake Survey, is 7,104 sq. miles; another estimate from the same data gave an area of 7,240 sq. miles. The hydrographic basin, including the lake surface, has an area of 30,790 sq. miles. The mean elevation of the surface of the lake is 247 feet above sea-level, and 326 feet lower than the surface of Lake Erie. The maximum depth is 738 feet. The lake is 190 miles long and 55 miles wide. Its discharge is estimated at 300,000 cubic feet per second. As is the case with all large lakes, it is subject to fluctuation of level, due to annual variation in rainfall and evaporation, to secular climatic changes which are irregular both in amount and in time, to changes in the direction and force of the wind, and to variations in atmospheric pressure. The amount of these various oscillations have not been studied in Lake Ontario, but are believed to have a mean range of 5 or 6 feet, with the exception of local changes due to strong winds, which may be 10 or 15 feet. Lake Ontario is connected with Lake Erie by the Welland Canal and with Montreal by the St. Lawrence, which can be descended by steamers, the return being accomplished by means of a series of canals. The lake seldom freezes except near the shore, and is the highway of an extensive commerce. For a sketch of the later geological history of the Great Lakes, see ST. LAWRENCE RIVER. I. C. RUSSELL.

Ontog'eny [from Gr. *ὤν, ὄντος*, being + root *γεν-*, produce]: a term introduced by Haeckel, and now in general use, for the development of the individual, as opposed to phylogeny or the development of the race. See MORPHOLOGY and EVOLUTION.

Ontol'ogy [Gr. *τὰ ὄντα*, the things that exist (neut. plur. of *ὤν, ὄντος*, pres. partic. of *εἶναι*, be) + *λόγος*, reason, discourse]: the science of being in general or of the essence of things. It is sometimes identified with metaphysics, but usually is made one of its divisions, and co-ordinate with rational psychology, cosmology, and theology, according to the nomenclature of Wolf, who established this fourfold division of metaphysics. The Aristotelians and the Scholastics treated under physics the problems of rational cosmology, and under metaphysics those of ontology. Aristotle called the latter (metaphysics) *πρώτη φιλοσοφία*, and included under it also theology. His *De Anima*, or at least the portions of the third book that treat of reason (*νοῦς*), may be regarded as the first work (and as still the best, according to some) on rational psychology, but psychology was generally classed among the natural sciences by his followers. Logic, however, as treating of the mere forms of thought, should belong under rational psychology, and be contrasted with ontology, which treats of real being and of the essence of things: (*a*) *of being*, as quality, quantity, infinite and finite, etc.; (*b*) *of essence*, as identity and difference, form and matter, ground and sequence, noumenon and phenomenon, cause and effect, substance and attribute, possibility and necessity, and similar relations. The general problem of ontology is to find the highest principle, or that which is true in and for itself—the Absolute. Inasmuch as psychology, with the problem of certitude, has come to the front rank in modern philosophy, it has happened that the latest systems of ontology, notably those of Germany since Kant, have striven to unite ontology with psychology, and thus create an ontological logic which should give the *a priori* laws and conditions of thought and being. Kant's work was negative in this respect, and denied the possibility of knowing things in themselves, hence of all ontology; it confined all *a priori* knowledge to the forms of the mind, and made all objects of knowledge subjective and phenomenal; but since he included among these subjective forms of the mind such universal, logical conditions of existence as time and space, quality, quantity, relation, and mode—these categories being the *a priori* conditions of existence *for us*—it was possible to construct a science of ontology within the subjective or psychological province. In fact, no room was left for the possibility of objective being outside of mind. Hence arose the systems of Schelling and Hegel and their followers, whose ontology is based on psychology. See PHILOSOPHY, HISTORY OF. WILLIAM T. HARRIS.

Onychoph'ora [Mod. Lat., from Gr. *ὄνυξ, ὄνυχος*, claw + *φορός*, bearing]: a group of animals, containing the single genus *Peripatus*, of very doubtful position. First described as a mollusc, it was later transferred to the worms, and upon the discovery by Moseley (1875) of the existence of tracheæ it was elevated to a class—*Protracheata*—and regarded as the ancestor of all true insects. The genus *Peripatus* occurs in South and Central America, in the West Indies, at the Cape of Good Hope, and in Australia and New Zealand, a distribution which indicates great antiquity. The animal, which has a length of an inch or two, has a worm- or caterpillar-like body, with distinct head and a varying number of pairs of fleshy feet, each terminated with a double claw. On the head are a pair of eyes, a pair of antennæ, and a pair of horny jaws. The greatest interest pertains to its internal structure. The nervous system consists of two widely separated cords connected by the brain in front and a supra-intestinal loop behind and numerous cross bands in the body. The alimentary canal is straight; respiration is effected by numerous bunches of tubular air-tubes (tracheæ) scattered over the surface. Instead of the excretory tubes (*vasa Malpighii*) of ordinary insects, excretory products are removed by means of segmentally arranged nephridia like those of Annelids. The animals live in decaying wood, and for protection secrete an enormous amount of slime from a pair of slime glands opening on either side of the mouth. The young are born alive, but the different forms present great differences in their development. As will be seen, in some features the *Onychophora* resemble the true insects (Hexapods), while in others they present features not found elsewhere outside of the group of Annelids. For a general account of anatomy, development, and classification, see Sedgwick, *Quarterly Journal Micros. Science* (1885–88). J. S. KINGSLEY.

Onychoteu'thidæ [Mod. Lat., named from *Onychoteuthis*, the typical genus; Gr. *ὄνυξ, ὄνυχος*, claw + *τευθίς*, cuttlefish, squid]: a family of cuttlefishes (Cephalopods), embracing some of the squid, in which the eye has a sinus above and the water bathes the lens. On the New England coast, N. of Cape Cod, one member of the family, *Ommastrephes illicebrosa*, is the most abundant squid, and is caught in large quantities as bait for codfish.

Onyx, ō'nix [= Lat. = Gr., a veined gem, liter., fingernail]: a variety of chalcedonic quartz, composed of parallel layers of chalcedony of some shade of brown, green, red, or other color alternating with layers of white. When the red is a rich brownish-red chalcedony (*sard*) and the white bands pure and translucent, the variety is known as *sardonyx*; when quartz and gray chalcedony are in combination, *chalcedonyx*; when the ground is black and the bands are very thin and grayish white, *onicolo*. The varieties of onyx were highly prized by the ancients for the manufacture of cameos, one of which, said to be the largest known, measuring 11 inches by 9, is preserved in the Museo Borbonico at Naples: other great cameos are at Vienna, in the British Museum, and in the Bibliothèque Nationale, Paris. Onyx is now much used in jewelry, but nearly all modern onyx is the result of artificial staining or dyeing. *Mexican onyx*, so called, is like aragonite, being essentially a carbonate of calcium containing small quantities of iron and manganese, to the distribution of which are due the beautiful variegated colors for which the stone is so much admired. Its hardness is 3, its specific gravity 2·9. It is formed on the floors of caves, being the result of a deposition of calcareous waters, either cold or hot, between the successive layers of which the iron and manganese is deposited. It was used by the ancient Mexicans, who carved it into masks, idols, and a variety of objects, but was first brought to general notice at the Centennial Exposition at Philadelphia in 1876, where a magnificent series of specimens was shown by the Mexican commission.

On account of the softness of the material it can be readily carved with a knife, and at Puebla and other places in Mexico is extensively worked into trays, crucifixes, inkstands, fruit, fish, and other natural objects, many of the latter being copied with remarkable skill in the representation both of form and color. The so-called *mosaic agate* is, properly speaking, a ruined aragonite, the original material having been broken up into irregular pieces and recemented by a secondary deposition of Mexican onyx. See AGATE and CHALCEDONY. Revised by G. F. KUNZ.

O'ölite [Gr. *ᾠόν*, egg + *λίθος*, stone, modified by confusion with ending *-ite*]: See LIMESTONE.

O'öphore: See FERNWORTS.

Oosterzee, ōs'ter-zā, JAN JACOB, van: theologian; b. at Rotterdam, Holland, Apr. 17, 1817; studied theology at Utrecht, and after holding prominent pastorates he became professor there in 1862. D. while on a visit at Wiesbaden, July 29, 1882. He led the evangelical party in Holland. Of his numerous writings several have been translated into English, among which are *The Image of Christ as represented in Scripture* (3 vols., 1855–61; London, 1874); *Theology of the New Testament* (1867; London, 1870); *Christian Dogmatics* (1870–72; London, 1874); *Year of Salvation* (1874); *Moses* (1876); *Practical Theology* (1878). Revised by S. M. JACKSON.

Opah: See KINGFISH.

Opal [from Fr. *opale* < Lat. *o'palus*, from Gr. *ὀπάλλιος*, opal]: a gem consisting of natural silica and containing some water, sometimes up to 11 per cent. It is never crystallized, but always amorphous, with a marked conchoidal fracture. Several varieties are recognized, of which *precious* or *noble opal* is the most highly prized. Its value arises from its remarkable and exquisite play of colors. The general aspect is whitish or milky, and the opalescence consists of countless gleams of many-colored light or "fire." A more transparent variety, with broader reflections of color—red, yellow, blue, green, or violet—is more brilliant, though less highly valued as a gem, and is known as *fire-opal* or *girasol*. Black opals are almost invariably the result of an artificial staining of a poor white opal. The name *lechosos* is given to those showing much green light, and *zeasite* to those that have much red. The noble and the fire opal are the only kinds used in jewelry. Other varieties of various colors, but lacking the opalescence, are *common opal* (translucent), *semi-opal* (nearly opaque), and *wood-opal* or *opalized wood*, which is formed by the replacement of wood by silica in solution, and sometimes occurs in considerable amount in the form of fossil tree-trunks, etc., like agatized and jasperized wood. Opal occurs in igneous rocks—amygdaloidal, trachytic, and porphyritic—and the wood-opals, etc., in regions of hot siliceous springs derived from volcanic rocks. The finest noble opal has been mined for a long time in trachyte near Dubnik, Hungary, and of late abundantly in a jaspery ironstone on the Barcoo river in Queensland, Australia, and near Wilcannia, New South Wales; also in amygdaloid near Colfax, almost on the State line of Washington and Idaho. Mexico and Honduras yield very fine fire-opal in trachytic rock, also the Queensland locality above named, and Oregon. See HYALITE. GEORGE F. KUNZ.

Opeli'ka: city; capital of Lee co., Ala. (for location, see map of Alabama, ref. 5–E); on the Cent. of Ga. and the West. of Ala. railways; 28 miles N. W. of Columbus, 66 miles E. N. E. of Montgomery. It is in a grain and cotton-growing region, annually handles large quantities of cotton, dry goods, and groceries, has several large cotton-warehouses, flour-mills, and other industrial establishments, and contains a national bank with capital of $75,000, a State bank with capital of $100,000, and a daily and a weekly newspaper. Pop. (1880) 3,245; (1890) 3,703: (1900) 4,245.

Opelousas: town; capital of St. Landry parish, La. (for location, see map of Louisiana, ref. 10–D); on the S. Pacific Railroad; 45 miles W. by N. of Baton Rouge. It is in a cotton, rice, corn, and stock raising region, and contains the Academy of the Immaculate Conception (Roman Catholic), a State bank with capital of $50,000, and three weekly newspapers. Pop. (1880) 1,676; (1890) 1,572: (1900) 2,951.

Opera [=Ital., liter., work, composition < Lat. *o'pera*, neut. plur. of *opus*, work]: a drama which is sung with accompaniment of instrumental music. Dramas occasionally interspersed with songs to familiar airs are called vaudevilles; dramas occasionally accompanied by instrumental music are called melodramas. On its dramatic side the form of the opera does not differ widely from that of the spoken drama. Inasmuch, however, as it is to be sung, the text of an opera, the *libretto*, must be of much smaller extent than that of an ordinary drama.

It is on its musical side that the opera presents its most clearly marked peculiarities of form. There are, or at least were until the time of Wagner, several sharply distinguished forms which serve to make up the vocal part of the composition. The chief of these are the recitative, aria, duet, trio, and chorus. The recitative is the least elaborated musical form of the opera, and is designed for the more rapid prose passages of the dialogue, as opposed to the finished lyrical parts. It is not, strictly speaking, melody at all, but the voice moves through a few notes only, including frequent chromatic intervals, and having little unity of key or tonality. Moreover, there is no clear division of time, such as is secured by the division into bars, but the series of notes proceeds with abruptly changing movement, divided merely by a few strongly accentuated resting-points. The aria is a theme for a solo voice, being a complete melodic subject, and having divisions of strophe, verse, etc. Duets and trios (*duetti*, *terzetti*) are combinations of two or three voices in a complete melodic subject. In addition to these there are the ensemble pieces, in which all the principal actors and singers (commonly from four to six in number) unite in some harmonized strain. The finale is an example of an ensemble movement. Lastly, there is the full mass of harmonized voices as given in the chorus. In this the several parts are each rendered by a number of voices, supplied by a band of subsidiary actors specially set apart for this purpose. The instrumental part of operatic music requires a large orchestra to render it adequately.

The opera is pre-eminently a modern art, being developed, as might be expected, later than the simple forms of modern music itself. It grew up in Italy at the beginning of the seventeenth century, during the period of the Renaissance, and when polyphonic music had pretty well exhausted its resources, and a basis had been laid by Palestrina for our present system of harmony. It was in Florence, about the year 1600, that the first opera appeared. Certain patrons of art set themselves in the spirit of the Renaissance to rediscover the vocal music of the Greek drama, and by the help of certain singers and composers, among whom were Caccini and Peri, they invented recitative as the nearest representative of Greek dramatic intonation. This first opera, the earliest known example of which is a piece entitled *Eurydice*, composed by Peri, consisted of recitative, or, as the Italians called it, *aria parlante*, choruses, a few duets and trios, together with instrumental prelude and interludes. This early recitative has more of equal-time division than our present mode. For fifty years this opera remained the luxury of nobles, being performed only before courts during special festivities; after that it gradually became a popular entertainment. The instrumental part of the opera was greatly improved by Monteverde, who added the overture (*toccata*). Later in the century the melody of the aria was enriched by two composers named Cavalli and Cesti. It was indeed in connection with the opera that our modern style of melody developed itself. Before the invention of this new form of art music had consisted almost exclusively of skillful combinations of distinct themes in intricate contrapuntal arrangements, with little regard to harmony and no thought of a single ruling melody. The opera, by stimulating solo-singing and by reviving a taste for the beauties of popular melody, supplied the necessary incentive for the elaboration of sweet-sounding and finished melodic themes. In the following (the seventeenth) century A. Scarlatti clearly marked off the aria from the recitative, and gave it the triple division which it retained for nearly a century. The later Italian operas—namely, the works of Piccini, Paesiello, and Cimarosa—do not display any great change of style. In the works of Verdi, however, covering as they do a period of many years, we find a marvelous progress and development. (See VERDI.) Later, a young composer named Pietro Mascagni attracted the attention of the world as the representative of young Italy, plainly showing the influence of Wagner. His first great success was with the one-act opera *Cavalleria Rusticana* (Rustic Chivalry, 1890).

In France the earliest operas, those of Lulli (end of the seventeenth century) and of Rameau (beginning of the eighteenth century) were little more than imitations of the Italian style. The basis of French opera was laid by Gluck (1773–87), who set himself to rectify the evils of the existing Italian opera by confining the exercises of the vocal art

within due limits, and by bringing into greater prominence the dramatic character of opera. He shortened the aria-form, expunged the numerous bravura passages with which it was laden, and reduced the number of airs in the opera by elevating the recitative to a higher rank, rendering it richer in a musical aspect and more impressive dramatically. Gluck also greatly improved the quality of the operatic chorus, making it a more conspicuous element of the opera, and added to the instrumental part, seeking to bring it into closer unity with the dramatic subject. The French classic opera ("grand opera") after Gluck scarcely fulfills the expectations raised by such an admirable foundation; but it must be admitted that the French school has always been faithful to the teaching of Gluck in seeking to do justice to the dramatic claims of opera. The French recitative is characterized by great energy and freedom of movement, and admirably adapted to dramatic effect. Among those composers who have written solely or mainly for the French stage are Méhul, Cherubini, Spontini, Meyerbeer, Rossini, Gounod, and Thomas. Perhaps, however, it is in the lighter style of opera that the French have excelled. The early vaudeville, which is the forerunner of the opéra bouffe, was light, graceful, and piquant. Rousseau's *Le devin de Village* is a good example of this genre. The first composer of the opéra comique, strictly so called, was A. F. Boieldieu. Other writers of this lighter style of French opera are Hérold, Halévy, Auber, Adam, and Offenbach. The modern French opera composers, Massenet, Saint-Saens, Bizet, etc., are really to be classified with the modern German school, so far as the harmonic treatment of their various works is concerned, and also their modes of orchestration.

In Germany, until the rise of Wagner, the opera was marked by less of national originality than in France. Keiser did little more than carry out Italian traditions, and Mozart was the first great opera-writer in Germany. He united Italian sweetness of melody with German richness and depth of harmony, and his operatic music, as pure music, has never been equaled. Passing by Beethoven's *Fidelio*, we find that the German opera after Mozart sank for a while to a low ebb. The one worthy attempt to raise its character came from the romanticists—namely, Spohr, Weber, and Marschner—who sought to give a national tone to German opera by taking half-legendary subjects from early German history. To Weber especially will remain the glory of having first founded a distinct German operatic style. Wagner is the successor of Weber in more than one sense. See WAGNER, WILHELM RICHARD. Revised by DUDLEY BUCK.

Operti, GIUSEPPE: See the Appendix.

Ophid'ia: an order of reptiles containing the serpents, characterized by the large number of vertebræ, numerous ribs, and absence of sternum. Fore limbs are never present, but in a few species the hind legs are present as mere rudiments. See SERPENTS.

Ophidi'idæ [Mod. Lat., named from *Ophi'dium*, the typical genus, from Gr. *ὀφίδιον*, dimin. of *ὄφις*, serpent]: a family of teleocephalous fishes belonging to the sub-order *Acanthopteri*, and distinguishable from all others by a peculiar modification and position of the ventral fins. The body is more or less elongated, almost eel-shaped, with the tail long, the scales small and partly imbedded, the head moderate, the teeth small, mostly villiform, the dorsal and anal fins low, united with the caudal, without spiny rays; ventral fins inserted at the chin, having each the form of a bifid filament. The species are mostly small in size, and several occur in deep water. Revised by D. S. JORDAN.

Ophiocephal'idæ [Mod. Lat., named from *Ophioce'phalus*, the typical genus; Gr. *ὄφις*, serpent + *κεφαλή*, head]: a family of teleocephalous fishes of the sub-order *Acanthopteri*, distinguished by a peculiar union of characters. The body is elongated and anteriorly subcylindrical; the scales of moderate size; the lateral line with an abrupt curve; the head depressed, oval above, and covered with shield-like scales, the general appearance being that of a mullet; dorsal and anal fins long, and without spines; caudal round, separated from the dorsal and anal; ventrals thoracic (and composed of one simple but partly articulated and five branched rays) or absent. The skeleton has numerous (fifty-two to sixty-one) vertebræ; the caudals are provided with ribs, the abdominal cavity being continued to below the caudal portion; four gills are developed, but no pseudobranchiæ; a cavity accessory to the gill-cavity is developed, in which water is retained, but no super-branchial organ is present; pyloric appendages may be either present (two in number) or absent. The family is composed of fresh-water fishes peculiar to Southern and Southeastern Asia. Above thirty species are known. The peculiar accessory gill-cavity contains a supply of water, which serves to keep moist the gills of the fish for a long time after being taken out of water. The species are therefore well adapted to withstand prolonged deprivation from that element.

Revised by D. S. JORDAN.

O'phir [cf. Sanskr. *Abhīra*, name of a people anciently found on the lower Indus]: the name (in Gen. x. 29) of the eleventh of the thirteen sons of Joktan, all of whom appear to have settled in Arabia; also the name of a place or region famous in the commercial history of the Hebrews, from which, or perhaps only by way of which, came gold, almug-wood, and precious stones (1 Kings x. 11). The voyage thither and back, or perhaps the voyage which only took Ophir in its way, required three years (1 Kings x. 22). Ophir can hardly have been a general name for remote southern countries, nor can it have been any such far-off place as Peru, but should be looked for either in Africa (Bruce, Robertson, Petermann), or in India (Vitringa, Reland, Ritter, Ewald), or, more probably, in Arabia (Michaelis, Niebuhr, Forster, Knobel, Kalisch). See A. Soetbeer, *Das Goldland Ofir* (Berlin, 1880). Revised by S. M. JACKSON.

Ophites, ō'fīts [from Gr. *ὄφις*, serpent], or **Serpent-worshipers**: a sect of Gnostics who joined the worship of the serpent to the general characteristics of the faith and practice of other Gnostics. They honored the serpent because he tempted Eve to eat of the forbidden fruit—an act which they believed to be highly advantageous to the human race. They kissed the serpent and fed it with the Eucharistic bread; but others rejected Christianity, and honored Cain, Judas Iscariot, and other wicked personages. It has been supposed that the sect was of Jewish origin, but the sharp antithesis which they set between Judaism and Christianity, and the copious element they evidently had drawn from Greek philosophy, seem to indicate a pagan origin. Their speculations have a certain resemblance to the mythologies of Babylon (the seven-headed serpent) and Persia.

Ophitic Structure: See DIABASE.

Ophiuroi'dea [Gr. *ὄφις*, snake + *οὐρά*, tail + suff. *-oid*, like]: a class of ECHINODERMATA (*q. v.*), embracing those forms popularly known as "brittle stars" or "serpent stars." The Ophiurans differ from the other starfishes (Asteroidea), among other features, in having a well-marked central disk from which radiate the long and nearly cylindrical arms. These latter are flexible, and are far more rapidly moved than are those of the true starfishes. In the true serpent stars (Ophiuræ) they are simple, but in the "basket fishes" (Euryalæ) they are branched many times, so that when incurled the whole animal quite closely simulates a shallow basket. Less conspicuous but equally important differences are the total absence of a vent and the inclusion of the ambulacral plates on the inside of the arms, the small tube feet projecting upon the sides. The Ophiurans are all marine, and live creeping about among the "roots" of the seaweeds, etc. A few bring forth living young, but most species lay eggs, and the young when hatched bear not the slightest resemblance to the adults. These young, known as *plutei*, at first swim freely, but later they become quiescent, and undergo a metamorphosis which results in the assumption of the adult form. See for the species Lyman, *Ophiuridæ and Astrophytidæ* (Cambridge, 1864); for development, Apostolides, *Archives de Zoologie Expérimentale*, x. (1882).

J. S. KINGSLEY.

Ophthal'mia [Mod. Lat. = Lat. = Gr. *ὀφθαλμία*, deriv. of *ὀφθαλμός*, eye]: a term which should be restricted to inflammations of the conjunctiva—i. e. the membrane lining the eyelids and covering the exposed surface of the eyeball. It is synonymous with conjunctivitis, and is divided into *simple* or *catarrhal*, *purulent*, *membranous*, *phlyctenular*, and *granular ophthalmia*.

Catarrhal ophthalmia (catarrhal or muco-purulent conjunctivitis) is the mildest form of inflammation of the conjunctiva. It may be caused by over-use of the eyes, by the contact of irritating substances, by riding in the wind, and by "catching cold," or it may be associated with certain diseases, as nasal catarrh, bronchitis, typhoid fever, rheumatism, and especially measles and scarlet fever. The symptoms are inability to use the eyes, a feeling of a foreign body in the eye, and the development of a secretion, at first mucous and afterward muco-purulent, which gums the eyelids

together. The eyeballs look very red, and upon everting the eyelids their lining membrane is found to be still more reddened, and to have a somewhat velvety appearance. Usually there is not much dread of light. This affection does not imperil the eyesight if properly treated. The disease is commonest in warm and changeable weather, and, if the secretion is free, is markedly contagious. Some of the special varieties of it are distinctly epidemic; one, often occurring in the spring and fall, should be known as epidemic conjunctival catarrh, but is vulgarly called "pink eye." Mild cases of catarrhal ophthalmia should be treated by removing the cause, washing the eyelids and eyes frequently with soap and water, and keeping the discharge cleaned away with some mild collyrium; an excellent one is a solution of common table salt in the proportion of a teaspoonful to the pint. Boracic acid and borax are much used for the same purpose. In the severe types very decided treatment may be necessary, especially the application of strong astringents like nitrate of silver.

Purulent ophthalmia is a very dangerous disease. It is customary to describe it under two forms, as it occurs in the new-born, *ophthalmia neonatorum*, and in adults, *gonorrhœal ophthalmia*. The ophthalmia of new-born infants generally begins about the third day after birth, at first as a simple conjunctivitis, but rapidly develops into a violent inflammation, characterized by the free secretion of thick pus, which is exceedingly contagious, swelling of the conjunctiva, and great pressure upon the blood-vessels supplying nutrition to the cornea, which often becomes ulcerated, causing permanent loss of sight. An inflammation of this kind is due to contagion occurring either during the birth or immediately after it. The active principle of this contagion is a micro-organism which was originally discovered by Neisser, and is called the *gonococcus* of Neisser. When a similar inflammation occurs in adults it is also due to contagion carried to the eye by soiled fingers which have been in contact with a discharge in which these micro-organisms exist. In infants generally both eyes are affected; in adults usually the right eye, although the left very often also becomes involved. Only the most vigorous and active treatment will save such eyes from destruction. This consists, in brief, of iced compresses, frequent irrigation of the inflamed eye with a mild antiseptic fluid, at the proper time painting the swollen conjunctiva with nitrate of silver solution, and of the use of atropine and eserine to combat the corneal involvement. Not a moment's delay should take place in turning over cases of this kind to the hands of a competent physician, because eyesight may most rapidly be destroyed. *Prophylactic measures* should be exercised immediately after the birth of the child. The chief method is the one known as Crédé's method, which consists in careful cleansing of the eye immediately after birth, and dropping into it a 2-per-cent. solution of nitrate of silver. This should never be omitted if there is the least suspicion of contagion, and in large institutions should be adopted as the routine practice. It has been the means of saving thousands of eyes.

Membranous ophthalmia is a violent inflammation of the conjunctiva, in which a false membrane forms upon its surface. It is most often seen in connection with diphtheria, and is almost sure to mar the sight of the eye. Very active treatment of the character already described is necessary, except that nitrate of silver is not so efficacious as in other cases.

Phlyctenular ophthalmia is an inflammation of the conjunctiva which is characterized by great dread of light, and, in addition to the ordinary symptoms of conjunctivitis, the formation of minute blisters, or pimples, which scatter themselves over the conjunctiva, or are arranged around the margin of the cornea. It generally occurs in scrofulous children, and is often seen in connection with measles. It is brought about by errors of diet, and in a great majority of cases is associated with disease of the nose—for example, catarrh. In addition to mild antiseptic eye-lotions, and occasionally atropine, constitutional measures should be adopted, especially the use of iron, arsenic, and cod-liver oil. It is a troublesome affection, and often relapses, and as the little pimples break down and form ulcers, they leave scars on the cornea which disturb the visual acuity.

Granular ophthalmia. See GRANULAR LIDS.

The occurrence of catarrhal, purulent, or granular ophthalmia in a school, reformatory, or other public institution, among children or adults, is often due to ignorance or carelessness on the part of the attendants, and should be subjected to rigid inquiry and the evil corrected. Many scores of children contract eye diseases, which ultimately result in hopeless blindness, in the schools and reformatories of large cities. Over-crowding and insufficient provisions for isolating initial cases are mainly to be blamed for this result.

G. E. DE SCHWEINITZ.

Ophthalmol'ogy [from Gr. *ὀφθαλμός*, eye + *λόγος*, discourse, reason]: the science of the eye, including its anatomy, functions, diseases, and treatment. See EYE, OPHTHALMIA, OPHTHALMOSCOPE, etc.

Ophthal'moscope [Gr. *ὀφθαλμός*, eye + *σκοπεῖν*, view, observe]: an instrument for examining the interior of the eye; invented by Heinrich Helmholtz, Professor of Physics in the University of Königsberg in 1851. The discovery of the principles upon which this invention was based was the result of close observation, careful experiment, and mathematical calculation. "Its origin," says Zander (*The Ophthalmoscope*, 1864), "may be traced to successive endeavors to solve two problems—the first being why the eyes of men and animals sometimes shine with a reddish luster; and the second, why the interior of an eye more usually appears dark." Owing to the fact that the portion of light passing into the eye, which is reflected from its inner surface, is so reflected that it emerges in the same direction, ordinarily no illumination from the bottom of the eye is visible, and consequently no image is seen. Helmholtz employed an instrument, consisting of three pieces of plane glass, from which the reflection was made at an angle of 56°, set in a frame and open behind, where the observer placed his eye. Ruete, in 1852, used a mirror with a hole in the center of it, and a convex glass to obtain an aërial image. An important modification was made by a mechanician named Rekoss, who adjusted to it what is called the Rekoss disk. The latest improvements have consisted principally in modifications of this disk, and in adding to the number of lenses it originally contained.

Description of the Instrument.—The ophthalmoscope, in its simplest form, consists of a small circular mirror with a central perforation. Liebreich's instrument is a concave mirror of 8 inches focal length, with a central perforation about a line in diameter, mounted on a handle about 6 inches long. If we place back of this mirror a Rekoss disk, its margin set with numerous convex and concave lenses of suitable focal lengths, and so made to revolve that each of these lenses may be readily brought opposite to the central hole in the mirror, we have an ophthalmoscope of the most approved pattern. Among the most useful patterns of the instrument, now ordinarily used and sometimes called "refraction ophthalmoscopes," the one constructed by Loring is the most serviceable.

Uses.—In examining the eye with the ophthalmoscope, the interior of the organ is illuminated by reflecting through the pupil, by means of the ophthalmoscopic mirror, the rays from a strong light placed a little behind and to one side of the patient's head, in such a position that the light falls upon his temple, but not upon the eye. If the observer thus illuminates the eye, resting the rim of the ophthalmoscope against his brow and looking through the hole in its center, the pupil of the illuminated eye will appear red. This is the reddish reflex from the bottom of the eye. Let the observer now approach to within an inch, or less, of the eye he is examining, keeping the red reflex in view, and (there being no error of refraction or exercise of accommodation in either the observed or the observing eye) he will distinctly see a small portion of the fundus under an enlargement of some fifteen diameters. This is called the *direct* method, and the image seen is called the *virtual* erect or upright image. If the observer places his eye at a distance of 12 or 15 inches from the observed eye, and, having obtained the red reflex, interposes a 2-inch double convex lens at a little less than its focal distance from the eye, he will see a much larger portion of the fundus than by the method already described, but much less magnified, the enlargement being only about four diameters. This is called the *indirect* method, and the image seen is the *real*, inverted, aërial image. By these methods we may examine the crystalline lens, the vitreous humor, the optic nerve, the retina, and the choroid, and any deviation from a condition of health may be readily detected. The optical condition of an eye may also be determined by means of the ophthalmoscope, independently of the statements of the patient. This is of great advantage in examining the eyes of young children, as well as eyes that are partially or totally blind. In examining the interior of the eye for the causes of impairment

of vision, we frequently find appearances which lead to the detection of grave diseases of other important structures, as, for instance, the kidneys, heart, blood, brain, and spinal cord. Anomalies of refraction are also frequently discovered by means of the ophthalmoscope which would otherwise remain undetected, and by a suitable combination of spherical and cylindrical glasses good sight is restored.

Much light may be thrown by the ophthalmoscope upon the diagnosis of cases of tumor of the brain and of inflammatory changes at the base of the brain; but many of the statements of those who profess to solve questions of insanity by the use of the ophthalmoscope, as a method of ascertaining the vascular condition of the brain, are entirely destitute of scientific basis. Ophthalmoscopic examination finds its greatest field of usefulness, independently of purely ocular affections, in the study of diseases of the nervous system, but is important in many general diseases as a diagnostic agent. See *The Ophthalmoscope* (by Zander), already quoted. Revised by G. E. de Schweinitz.

O'pie, John: painter; b. at St. Agnes, near Truro, England, in May, 1761; gave proofs of artistic talent in childhood which attracted the attention of Dr. Wolcott, of Truro ("Peter Pindar"), by whom he was taken to London; acquired fame by his skill in portraiture; received from the leading members of the nobility more commissions than he could execute; devoted himself successfully to severe study to correct the defects of his earlier style of painting, which were now sufficiently obvious; produced several admired historical pictures; became Professor of Painting at the Royal Academy 1806, and began a series of lectures Mar., 1807, but died in London before completing the first course, Apr. 9, 1807. Four *Lectures* were published, with a memoir by his widow, in 1809. His best-known pictures are the *Murder of David Rizzio* and his own portrait in the Dulwich Gallery, but other historical pictures are known by the engravings in Boydell's *Shakspeare*. Besides his lectures, he published a *Life of Reynolds* and a letter on *The Cultivation of the Fine Arts in England*.—His second wife, Amelia Alderson Opie, whom he married in 1798 (b. at Norwich, Nov. 12, 1769), acquired a great reputation by her delineations of English home-life in a series of novels: joined the Society of Friends after she became a widow. D. at Norwich, Dec. 2, 1853. Revised by Russell Sturgis.

Opisthobranchia'ta [Mod. Lat., from Gr. ὄπισθεν, behind + βράγχια, gills]: an order of molluses in which the gills, when present, are behind the heart. See Gasteropoda.

Opisthoc'omi [Mod. Lat., named from *Opistho'comus*, the typical genus, from Gr. ὀπισθόκομος, wearing the hair long behind, in allusion to the flaring crest]: an order of birds containing but a single family, *Opisthocomidæ*, represented by a single species, the anomalous Hoactzin (*Opisthocomus cristatus*. (See Hoactzin.) The skull resembles that of gallinaceous birds, especially in the imperfect development of the maxillo-palatines. The sternum is much cut away in front; the furcula ankyloses with the manubrium below, and with the coracoids above. There is an enormous, muscular crop, divided by a partial constriction. The bird has affinities with the pigeons and *Gallinæ*, and in some points approaches the plantain-eaters, *Musophagidæ*. The order corresponds to Huxley's *Heteromorphæ*. F. A. L.

Opistho'mi [Mod. Lat.; Gr. ὄπισθεν, behind + ὦμος, shoulder]: an order of fishes of the sub-class of teleosts, distinguished by the separation of the shoulder-girdle or scapular arch from the head, and its consequent posterior position, whence the name. The skull has its several bones developed in nearly the same manner as the ordinary spiny-rayed fishes; the supraoccipital projects forward between the parietals; the jaws are normally developed, the maxillary arch being bounded above by the premaxillary, and at the sides by the supramaxillary bones; a distinct symplectic bone exists; the branchial apparatus is complete, the superior branchihyal and pharyngeal bones ossified, four superior pharyngeals, three basal branchihyals, and a pair of inferior pharyngeals being developed; the scapular arch is entirely dissevered from the connection exemplified in most fishes, and (in some cases at least) is connected with the anterior vertebræ; the mesocoracoid is absent; no interclavicles are developed; the ventral fins either abdominal (the pubic bones being far removed from the scapular arch) or wanting. The order is represented by two families, *Mastacembelidæ* and *Notacanthidæ*. It is not certain, however, that these two families are closely related, or even that they belong to the same order. Revised by D. S. Jordan.

Opitz, Martin: poet; b. at Bunzlau, Silesia, Dec. 23, 1597; studied at Frankfort-on-the-Oder and Heidelberg, but at the outbreak of the Thirty Years' war went to Holland, and thence to Denmark. In 1621 he returned to Silesia and lived in various positions as teacher, pirvate secretary, diplomatic agent, and historiographer at the courts of several influential princes; was knighted by the Emperor Ferdinand in 1628, and died of the plague at Dantzic, Aug. 20, 1639. Though mediocre as a poet he marks an important epoch in the history of German literature, and for more than a century he was called the "father of German poetry." This great influence on the literature of Germany he attained chiefly by his theoretical and critical writings, of which his *Aristarchus sive de contemptu Linguæ Teutonicæ* (1617) and his *Buch von der deutschen Poeterey* (1624) are the most important. The rules he laid down in the latter book concerning the proper use of the language of poetry, and especially concerning the metrical system, practically guided the development of modern German poetry up to the classical period. The highly developed metrical art of the thirteenth century having degenerated in the course of time, Opitz's discovery that accentuation and not quantity constituted the essential feature of German verse-structure was all the more important. He had a high conception of the poet's vocation, the final aim of which appeared to him in the attainment of fame and immortality, and for more than a century his ideal of the poet inspired his followers and admirers. The head of the so-called first Silesian school of poets, he fought for the honor and purity of German language and literature as a true patriot in the midst of the devastation wrought by the Thirty Years' war, and by pointing to the ancients as the greatest literary models he inaugurated that epoch in German literature which culminated in the classic era of the eighteenth century. See K. Weinhold, *Martin Opitz von Boberfeld* (1862); Palm, *Beiträge zur Gesch. der d. Literatur des 16 und 17 Jahrhunderts* (1877); Borinski, *Die Poetik der Renaissance* (1886); Witkowski, *Aristarchus und Buch v. d. d. Poeterey* (1888); W. Scherer, *Kleine Schriften*, ii., 375; K. Burdach, in *Forschungen zur deutschen Philologie* (1894).

Julius Goebel.

Opium [= Lat. from Gr. ὄπιον, poppy-juice, dimin. of ὀπός, juice, sap]: a concrete juice obtained from the unripe capsules of the poppy (*Papaver somniferum*). Opium has been known as a drug from a remote period, distinct accounts of its collection as a branch of industry in Asia Minor being found in the writings of Dioscorides, about the year 77 B. C. From the countries bordering on the Mediterranean the use of opium was carried East through Asia, probably by the Arabians. Though the poppy is naturalized as a garden flower in Europe and America, yet opium is produced as an article of commerce only in India, Persia, Egypt, and Asia Minor. It is obtained by making a shallow horizontal incision in the unripe poppy-head a few days after the fall of the petals. This is done in the afternoon, and the milky juice that oozes from the cuts is scraped off next morning and made into lumps of varying size, ranging in weight from an ounce to several pounds. Good Turkey opium is a hard, tenacious solid of compact texture and a reddish-brown or fawn color. It has a strong, peculiar odor and a rather bitter, somewhat acrid, taste. Its medicinal virtues reside in certain alkaloids, of which *morphine* is the most important, as it occurs in greatest quantity and most perfectly represents the properties of the crude drug. This alkaloid was discovered by Sertürner, an apothecary in Hanover, in 1816. It exists in opium combined with a peculiar acid called *meconic*, and in good Turkey opium is found in the proportion of from 12 to 15 per cent. Pure morphine exists in small, colorless, shining crystals, inodorous, but of a bitter taste. It is almost wholly insoluble in water, but its salts are readily soluble, and hence are used in medicine in preference to the pure alkaloid. The acetate, sulphate, and hydrochlorate are officinal in the *United States Pharmacopœia*. The other alkaloids of opium known to affect the human system are *codeine*, *narceine*, *narcotine*, and *papaverine*, but twelve besides these have been obtained from the drug, although they seem to be only chemical and physiological curiosities. *Thebaine*, for instance, produces in the lower animals violent tetanic convulsions, and *cryptopine* wild delirium with *dilated* pupils. Besides these sixteen alkaloids, a neutral principle, *meconine* or *opianyl*, and pectine, albumen, mucilage, sugar, and wax are all constituents of opium.

The effects of opium upon the animal system are as complex as the composition of the drug. In general its influence falls upon the nervous system, the symptoms being all functional nerve-disturbances, and these prove by their peculiar character that, in kind, the opium influence is a conjoint irritation and paralysis. The resultant clinical effect varies in different parts of the nervous system, and also is modified by circumstances of dose, individual idiosynerasy, temperament, habit, etc. The symptoms produced by opium under ordinary circumstances are as follows: With a small dose there is experienced relief from any feelings of discomfort that may be present at the time of taking. In the Asiatic, physical fatigue, mental exhaustion or distress, small pains and aches, hunger, etc., all tend to disappear, leaving a feeling of general comfort, calm, and peace; but this frequently is not seen in the European, who often experiences from the first the secondary symptoms, which are some little tendency to loss of appetite, coated tongue, slight headache, and constipation. With larger quantities the feeling of relief from discomfort is speedily succeeded by the characteristic feature of opium narcosis—namely, a conscious intellectual dullness, accompanied by a drowsiness, which upon every opportunity casts the subject into a state of unconsciousness analogous to ordinary sleep in very many respects, but differing from it in certain others. When thus affected the perceptive cerebral centers are blunted, and a pre-existing severe pain will not be so acutely felt. After a number of hours the patient awakes to a feeling of general misery, with disordered stomach, dry coated tongue, headache, and constipated bowels. Indeed, under the opium influence all the natural secretions, save that of the skin, tend to diminish. As a result of idiosyncrasy, many persons of very "nervous" temperament, instead of experiencing the ordinary effects, are thrown by opium into a state of morbid wakefulness with excessive agitation, their minds being filled with horrible imaginings; so great is the distress experienced that persons thus affected will endure almost any pain rather than seek relief from opium. Others, of highly imaginative temperament, like the Orientals, pass into a beatific state of mind, with pleasing fancies and visions of delicious and gorgeous imagery, as so graphically described by De Quincey; but with Europeans or Americans these tempting effects are rarely produced, simple progressive stupefaction being the whole expression of the cerebral influence of the drug. Still others, especially children, manifest a strong convulsive tendency which may even culminate in severe general convulsions, with tetanic rigidity of the whole body. In some of the lower animals, as in frogs, tetanus is the normal expression of the opium influence, because the effect on the spinal cord is stimulant and the spinal cord of the frog dominates his brain, whereas the reverse holds true in man. Intolerable itching of the whole skin, vomiting, syncope, are other abnormal effects of opium occurring in certain individuals. The influence of bodily state and habit upon the effects of the drug is astonishing. In severe pain, in the prostration from great loss of blood, and other morbid states, the relation between dose and effect changes so that quantities fatal in health may produce no more than a mild influence. Precisely the same result follows the habitual taking of opium, and confirmed opium-eaters often take in a day enough to kill ten or twenty ordinary persons. Of the alkaloids, the effects of morphine differ only in minor points from those of crude opium, and those of narceine and codeine also conform to the same general type. Narcotine causes many of the disagreeable after-effects of opium-taking.

Large doses of opium or morphine may be fatal, though many circumstances conspire to make the effects exceedingly uncertain, such as vomiting or non-absorption of the whole quantity taken. Enormous draughts of opiates, administered with deadly intent, are therefore often recovered from; generally 4 grains of opium or their equivalent are reckoned as a dangerous quantity, and 5 grains have killed. The salts of morphine are estimated as four times more powerful than the same quantity of opium. The prominent symptoms of opium-poisoning are deep coma, with flushed or pale and ghastly face, contracted pupils, slow, stertorous breathing, and slow, full pulse. Death occurs from stoppage of breathing through paralysis of the respiratory center in the medulla oblongata. The treatment, after evacuation of the poison left in the stomach through emetics or the stomach-pump, is especially directed toward keeping up the breathing. The patient is aroused by any means, however rough, such as the cold douche, forced walking, shouting at the patient, and beating him with whips. If he can swallow, hot black coffee is given freely. If in spite of all means he sinks into coma and respiration begins to fail, artificial breathing and hypodermic injections of strychnine (a powerful excitant of respiration) are cautiously employed. No case should be given up till actual death.

In India, besides its use as a mere luxury, the drug is much employed in non-narcotic doses simply to sustain the strength in lieu of food and sleep during hard physical work. As to its value or otherwise in this respect there has been much discussion and difference of opinion, and the Indian Government in 1893 appointed a commission to inquire into the matter. In China opium is consumed to an enormous extent by all classes, the mode of taking it being to smoke an aqueous extract in a peculiarly formed pipe. Opium-smoking began in China in the latter half of the seventeenth century, and, in spite of all the Government's efforts to prevent it, rapidly spread till it may now be called a national practice. China thus consumes nine-tenths of all the opium exported from India, besides a considerable quantity from Asia Minor, and the whole of that produced within her own dominions. In medicine opium and morphine fulfill a variety of purposes, some of which could hardly be divined from the effects of the drug on the healthy system. These may be summarized as the support of life, and invigoration and maintenance of the heart's action in circumstances of great prostration and where ordinary food can not be digested; the cure or relief of pain, spasm, and general nervous irritability; the induction of sleep; repression of excessive secretion, as in diarrhœa; and curative influence of an unknown character in certain inflammatory diseases. In the fulfillment of most of these indications the induction of the physiological narcotic effects of opium is both unnecessary and harmful. The pharmaceutical preparations of opium are very numerous: the two most familiar are *laudanum*, a simple tincture of opium, of which 13 minims (about 25 drops) is the equivalent of a grain of opium; and *paregoric*, a camphorated tincture, compounded of opium, camphor, benzoic acid, oil of anise, honey, and dilute alcohol. Half a fluid ounce of this tincture represents very nearly a grain of opium. The salts of morphine are also very largely used, and their administration in solution by hypodermic injection has in certain circumstances advantages over opiates given by the mouth.

Revised by H. A. Hare.

Opobalsamum: See Mecca Balsam.

Opodel'doc [cf. Gr. *ὀπός*, juice, sap]: the common name of the "camphorated soap liniment" of the *United States Pharmacopœia* of 1850. It is compounded of common soap, camphor, oil of rosemary, oil of origanum, and alcohol. When cold it has the consistence of a soft ointment. It is essentially the same as the "soap liniment" of the present *Pharmacopœia*, and may be used as an anodyne and gentle rubefacient application in sprains, bruises, etc.

Opop'anax [= Lat. = Gr. *ὀποπάναξ*; *ὀπός*, juice, sap + *πάναξ*, a kind of plant (cf. *πανακής*, all-healing)]: the inspissated juice of the *Pastinaca opoponax*, a plant closely resembling the common parsnip. It is a fetid gum resin, resembling assafœtida in its powers, but much feebler. It has a very limited use in medicine. The best comes from the Levant.

Opor'to: city of Portugal; capital of the province of Minho; situated on both sides of the Douro, 3 miles from its mouth; 174 miles N. by E. by rail from Lisbon (see map of Spain and Portugal, ref. 14–A). Entrance into the Douro is difficult on account of a shifting sandbank in its mouth, and the river is subject to extraordinary and dangerous freshets, but at Oporto it forms an excellent harbor, lined with elegant quays and crossed by many beautiful bridges. Oporto is one of the most picturesque cities in the world, built on a steep acclivity, which it climbs through terraces covered with strikingly colored houses. Some of the streets are narrow, crooked, dirty, and so steep that no carriage can pass through them, but others are broad, airy, clean, and lined with magnificent houses. Among the buildings the cathedral, the Gothic Church of Cedofeita (originally founded in 559), the bishop's palace, and the Hospital of St. Anthony are most noticeable. Oporto possesses a polytechnic academy, a medical school, two picture-galleries, and a library with 200,000 volumes and 9,400 MSS. There are manufactures of gold and silver ware, glass, pottery, leather, linen, woolen, silk, and cotton fabrics, and tanning, brewing, distilling, cork-cutting, and sugar-refining are

carried on; but Oporto derives its chief importance from its commerce. It is the center of trade for a large part of Portugal. The annual value of its imports amounts to about $9,000,000, and that of its exports to over $17,000,000. Its trade is chiefly with England and Brazil, and the principal article of exportation is wine, the so-called port wine, red and white, of which by far the largest and best portion is exported to Great Britain. Pop. (1878) 105,838.

Opossum (Amer. Ind. name): any animal of the family *Didelphidæ*, a group of marsupial mammals peculiar to America. The most familiar species is the common or Virginia opossum, *Didelphys virginiana*. It has a pointed head, wide gape, many sharp teeth, a rough tongue, large and naked ears, small eyes, a long, tapering, flexible, and prehensile tail, and its toes are armed with sharp, strong, and curved claws. It has a well-developed pouch, and is about the size of a large cat, but its shape is low and squat; it is of a grayish-white color; the face, near the snout, is pure white, and the ears are black. It is mostly nocturnal and arboreal in its habits, and feeds on insects, eggs, small birds, and fruits. It sometimes destroys poultry. It is much hunted for food and for its skin, and shows much dexterity in escaping by creeping away in the grass. It has a remarkable habit of feigning death when captured, hence the proverbial expression "playing 'possum," and bites severely when defending itself. It is slow in its movements, and often suspends itself from the branch of a tree by its tail. It is very prolific, producing from six to fifteen at a birth, which, as soon as born, are put by the mother into her pouch, where they remain attached to the nipple until they are able to move about. In winter, if the climate is cold, the opossum becomes sluggish, but not torpid like the marmot. There are numerous South American species, some of them with no pouch. Revised by F. A. Lucas.

Opossum.

Op'peln: town of Prussia, in the province of Silesia; on the Oder; 51 miles S. E. of Breslau (see map of German Empire, ref. 5–I). It has some manufactures of linen, leather, pottery, and tiles, and an important trade in timber and cattle. Oppeln was formerly the residence of the Dukes of Silesia, whose castle stands on an island in the Oder. Pop. (1890) 19,206.

Oppenheim, Hermann, M. D.: physician and author; b. at Warburg, Westphalia, Prussia, Jan. 1, 1858; educated at Göttingen, Bonn, and Berlin; was head physician and temporary director of the Neue Klinik der Charité in Berlin 1883–91. Among his published works are numerous contributions to the *Archiv für Psychiatrie* (from 1885 on); *Beiträge zur Pathologie der multiplen Neuritis und Alcohollähmung* (*Zeitschrift für Klinische Medicin*, 1886); *Die traumatischen Neurosen* (1889; 2d ed. 1892); *Zur Kenntniss der syphilitischen Erkrankungen des centralen Nervensystems* (Berlin, 1890). S. T. Armstrong.

Op'pert, Jules: Orientalist; b. July 9, 1825, at Hamburg, of Jewish parentage; studied first law at Heidelberg, then Oriental languages at Bonn and Berlin, where in 1847 he published *Das Lautsystem des Altpersischen*; was appointed Professor in German at the lyceum of Laval in 1848, and at that of Rheims in 1850; accompanied the scientific expedition to Mesopotamia, sent out in 1851 by the French Government, and was appointed Professor in Sanskrit at the schools of the national library in 1857, and 1874 Professor of Assyriology in the Collège de France. In 1881 he was elected member of the Académie des Inscriptions. His principal works are *Les Inscriptions des Achéménides* (1852); *L'Expédition scientifique de France en Mésopotamie* (1859–64); *Grande Inscription du Palais de Khorsabad* (1863); *Éléments de la grammaire assyrienne* (1860; 2d ed. 1868); *Rapports de l'Égypte et de l'Assyrie* (1868); *Documents juridiques de la Chaldée* (1875); *Le peuple et la langue des Mèdes* (1879); *La chronologie de la Genèse* (1879); *L'ambre jaune chez les Assyriens* (1880); *Etudes sumériennes* (1881). Revised by Benj. Ide Wheeler.

Oppia'nus (Gr. Ὀππιανός): poet; b. at Anazarbus, in Cilicia; flourished under Marcus Aurelius, and composed a didactic poem on fishing, Ἁλιευτικά, in five books. The versification is smooth, the style ornate. Another poem on hunting (Κυνηγετικά) was long ascribed to this Oppianus, but the style is dry and the versification halting, and it is generally believed to be the production of a later poet of the same name. The works of Oppianus have been edited by J. G. Schneider (Leipzig, 1813) and F. S. Lehrs (Paris, 1846). B. L. G.

Op'pius, Gaius: an intimate friend of Julius Cæsar, who intrusted to him and Balbus the management of affairs while he was absent in Spain. He was the author of lives of Cæsar, Cassius, Scipio Africanus the elder, which are only known to us through citations. The *Bellum Alexandrinum* has also been attributed to him, and by Niebuhr the *Bellum Africanum*, a view now abandoned. M. W.

Oppolzer, Theodor, von: astronomer; b. at Prague, Austria, Oct. 26, 1841; d. Dec. 26, 1886. He took an active part in geodetic measurements, but is best known as the author of a great work in two volumes entitled *Bahnbestimmung der Planeten und Cometen* (1870–80). It is the standard work of the nineteenth century on theoretical astronomy. Of more popular interest is his *Canon der Finsternisse*, published by the Vienna Academy of Sciences in 1887, and containing tables of all total and annular eclipses of the sun visible in the northern hemisphere from 1200 B. C. to A. D. 2160, with charts showing the path of the shadow or annulus for each eclipse. S. Newcomb.

Optatia'nus, Publilius Optatianus Porfyrius or Porphyrius: a Latin poet of the fourth century, perhaps of African birth, who, while in exile about the year 325, addressed a panegyric to the Emperor Constantine, by which he secured his recall. The collection is prefaced by a letter of the emperor to the author and the author's reply. The poems, twenty-eight in number, while prosodically not very faulty, show a great decline in taste, and are chiefly remarkable for their artificiality, including acrostics, telestichs, hexameter-squares (with as many verses as there are letters in each verse), and other whimsical forms. They have been edited by L. Mueller (Leipzig, 1877). M. Warren.

Optative Mood: See Syntax.

APPENDIX.

Mechanicsburg: borough (incorporated in 1826); Cumberland co., Pa. (for location of county, see map of Pennsylvania, ref. 6–F): on the Cumberland Val. Railroad; 8 miles W. of Harrisburg. It is in an agricultural and mining region; has a variety of manufactories; and contains the Irving Female College (Lutheran, chartered in 1856), graded schools, library, 2 national banks with combined capital of $150,000, and a monthly and 4 weekly newspapers. Pop. (1880) 3,018; (1890) 3,691; (1900) 3,841.

Mechanicsville: a village of Virginia, about 7 miles N. E. of Richmond, which gives its name to a battle fought near by between the Confederate and Federal forces June 26, 1862, also known as the battle of Beaver Dam Creek (see map of Virginia, ref. 6–H). On the authority of Gen. Longstreet, Swinton places the loss of the Confederates between 3,000 and 4,000. The Federal loss was less than 400. See Gaines's Mill, Battle of.

Mechanicville: village; Saratoga co., N. Y. (for location of county, see map of New York, ref. 4–J); on the Hudson river, the Champlain Canal, and the Del. and Hudson and the Fitchburg railways; 18 miles S. of Saratoga, 20 miles N. of Albany. It has good water-power, manufactories of linen thread and of other articles, a national bank with capital of $50,000, and 2 weekly newspapers. Pop. (1880) 1,265; (1890) 2,679; (1900) 4,695.

Mechlin, mek'lin (Germ. *Mecheln*, Fr. *Malines*): city of Belgium; in the province of Antwerp, on the Dyle; 14 miles S. S. E. of the city of Antwerp (see map of Holland and Belgium, ref. 9–E). It is the see of the archbishop primate of Belgium, and has an ecclesiastical seminary and several other educational institutions. Its cathedral is a magnificent edifice, erected in the twelfth century, and adorned with paintings by Rubens and Vandyke. Mechlin has manufactures of linen, woolens, needles, lace, and beer. In the fourteenth century it was one of the manufacturing centers of Europe. Pop. (1891) 51,558.

Meeker, Joseph Rusling: artist; b. in Newark, N. J., Apr. 21, 1827; studied art at the National Academy of Design; has worked chiefly in St. Louis, Mo., and has devoted himself to Southern scenery, especially Louisiana landscapes. His paintings include *The Indian Chief*; *The Acadians in the Atchafalaya*; *The Vale of Cashmere*; *The Lotos-Eaters*; *Louisiana Bayou*; and *The Noonday Rest* (from Longfellow's *Evangeline*).

Meeks, Eugene: artist; b. in New York city in 1843; studied art at home and abroad, his professional life having been passed chiefly in Florence, Italy; is an associate of the Florence Academy. His more notable pictures include *Little Nell and her Grandfather*; *Bridal Chamber in Palazzo Manzi-Lucca*; *A Gondola Party*; and *Halt at the Golden Lion*.

Meilhac, mā'lăăk', Henri: dramatist; b. in Paris, Feb. 25, 1831; educated at the Lycée Louis-le-Grand; employed as a humorous illustrator and writer for the periodical press 1852–55; began his career as a dramatist in 1855, at first with little success, but becoming one of the most skillful and prolific of French playwrights. He wrote many of the operettas of which Offenbach composed the music, including *La Belle Hélène*, *La Vie Parisienne*, *La Grande Duchesse*, *La Périchole*, and *Les Brigands*. Nearly all of his work was done in collaboration, mainly with Ludovic Halévy (*q. v.*). Some of his most successful unaided productions were *Ma Cousine*, *Décoré*, and *Petite Marquise*. He also wrote for the *Revue de Paris*. He received the decoration of the Legion of Honor in 1869, and was promoted to be an officer in 1884. He was admitted to the French Academy in 1888. D. in Paris, July 6, 1897.

Melba, Nellie (*Mitchell*): singer; b. in Melbourne, Australia (from which she takes her stage name), May 19, 1865, of wealthy parents. After studying at home, she went to Paris and studied under Madame Marchesi. She made her first appearance in Brussels in Oct., 1887; appeared in London, May, 1888; Paris, May, 1889; St. Petersburg, May, 1890; Nice and Palermo, 1892; Milan, Mar., 1893; Stockholm, Oct., 1893; Copenhagen, Oct., 1893; New York, Dec., 1893. At all of these places she achieved great success. In her early youth she married William Armstrong, but soon separated from him. He died subsequently. Since her first appearance in New York, she has been re-engaged each season. Her voice is a brilliant bravura soprano. D. E. H.

Memorandum of Association: a document subscribed by seven or more persons for the purpose of forming a corporation or joint-stock company under the Companies Act of Great Britain, setting forth the particulars, such as the name of the company, place of its registered office, object of its formation, the liability assumed by the parties, amount of capital, etc. It corresponds to the *certificate of incorporation* of companies organized under the statutes of the several States in the U. S. See Corporations and Joint-stock Companies, and the authorities there referred to.

F. Sturges Allen.

Mental Hygiene: As the term indicates, mental hygiene has to do primarily with the conditions that favor the normal functioning of the various mental processes. But since psychology assumes that every psychic process has its correlative in a physical process—or, in technical language, that there is no psychosis without a corresponding neurosis—and since even popular opinion looks upon the mind as in some way dependent upon the brain, mental hygiene has come to include the hygiene of the nervous system, and especially cerebral hygiene. Moreover, as the body is a federated union of tissues, and the nervous tissues not only control the condition of the other tissues, but, in turn, are affected by it, cerebral hygiene presupposes somatic hygiene. The subject has received special attention from physicians and psychologists in modern times. The development of the science of psychiatry has produced a vast amount of technical literature more or less bearing upon the subject, and many physicians have given sensible advice in popular writings. For example, among the older writers may be mentioned Feuchtersleben, whose *Diätetik der Seele* passed through some fifty editions, and among more recent writers Mitchell, whose little book on *Wear and Tear* is well known.

Our definite knowledge of the physiological changes that accompany mental activity was slight before the investigations of the Italian physiologist Mosso. By the perfection of the plethysmograph, an instrument for testing the volume of circulation of the blood, and by his investigations, clinical and experimental, he made a great advance in methods of studying the subject. Without noting exceptions or going into details, he found that every psychic process, such as sensation, emotion, and intellectual activity—as in performing an arithmetical operation—is accompanied by an increase in the blood-supply to the brain and a decreased flow to the periphery. Emotion especially is accompanied by increase in the cerebral blood-supply. This result of ordinary experiments with the plethysmograph and the like was corroborated by testing the intracranial circulation directly in the case of patients where the skull had been opened by disease. Investigations of the temperature of the brain both in men and animals were made. Here, too, the temperature of the brain was taken directly and compared with that of the body. In the case of a young girl with a hole in her skull, a clinical thermometer could be inserted within the dura mater. From careful tests, both while the

patient was asleep and while awake, it appears that excitement is accompanied by a marked increase in the cerebral temperature, and that ordinary mental activity is accompanied by a slight increase, although liberation of heat in the latter case is largely due to processes of nutrition and disaggregation. Extended investigations of muscular and nervous fatigue led also to the theory that certain toxic products are formed during the functional activity of the nerve-cells, and that these pass into the blood and poison the tissues generally.

A number of other investigators have since studied this subject. The most thorough and extended work, besides that of Mosso, has been done by Binet and his students in the laboratory of the University of Paris. Binet has studied by special apparatus, using the plethysmograph, the sphygmograph, and the like, the rapidity of the heart-beat, the rhythm of the heart, the capillary circulation, the blood-pressure, temperature of the body, respiration, muscular power, and nutritive changes during intellectual work. From the result of these investigations it appears that under the influence of mental work greater or less modifications in the most important physiological functions of the organism occur. A certain number of these modifications are produced by very short mental work; others are observed only after prolonged and intense activity. In all cases it appears that no intellectual work can be accomplished without an effect on the organism. The duration and intensity of this effect vary according to the amount of mental work and according to the physiological functions studied. After a short period of work, the heart-beat is accelerated; if the work continues long enough, the heart-beat is retarded. In the same manner, the form of the pulse becomes sometimes accentuated during a short piece of work, and when the work continues many minutes the dicrotism is weakened. Circulation in the hand is similarly affected. At the beginning of the work a vaso-constriction is noticed, and after some minutes a vaso-dilatation. For the respiratory function the same phenomenon is produced. At first there is an acceleration of the respiratory movements, and after some minutes a retardation. Finally, the muscular power seems also to be increased after a short piece of mental work, and, on the contrary, to diminish after mental activity of an hour. It seems, then, that for a certain number of physiological functions short mental work produces certain modifications and prolonged mental work produces opposite modifications.

It is probable that mental activity is accompanied by definite physical changes in the individual nerve-cells of the brain involved. Although the nerve-fibers seem capable of functioning for an indefinite period, as shown by Bowditch and others, and the effect of work upon them is not yet apparent, the nerve-cells undergo remarkable changes during continued activity. After electrical stimulation of ganglion-cells in frogs and cats, Dr. Hodge found a remarkable shrinking of the nerve-cells, particularly of the nuclei. But the cell recovers after a sufficient period of rest. After rather severe work for five hours the nucleus has shrunk to about half its normal size. By complete rest for six hours the cell recovers about half what it lost; but at least twenty-four hours of rest is necessary for complete recovery. The same conditions of fatigue can be reached in less time by increasing the stimulus. In further experiments Dr. Hodge extended his observations to other animals, and studied the effects of ordinary diurnal fatigue, as shown in the brain as well as in the cord and spinal ganglia. A remarkable difference was found between the condition of the cells in the morning and their condition at night. For example, in the brain-cells of honey-bees taken at night the nuclei had shrunken about a third. We must suppose that something similar occurs in man. Functional activity exhausts the nerve-cells, and they recover slowly.

Thus in the present state of scientific investigation it appears that during intellectual activity the blood-supply to the brain is increased; at least during excitement an increased liberation of heat occurs; the substance of the nerve-cells is actually used up, and probably certain toxic products are formed. A rough analogy exists between the conditions of work in the muscles and in the nerves. According to Lagrange the conditions are the same for the brain that thinks and the muscle that contracts. In the long run, the amount of work one's nervous system can do depends not alone upon its initial character, but upon the efficiency of the rest of the body (1) in furnishing the material for those processes of anabolism that must continually go on in the nervous substance to supply the waste involved in its functional activity, and (2) in carrying away the poisonous products that result from that activity.

These results put the problems of mental hygiene on a definite basis. Once clearly seen that every intellectual process is accompanied by organic changes, and hence by expenditure of energy, the problem of hygiene becomes an economic one of adjusting expenditure to income. The nervous system is a mechanism for the storage and distribution of energy. But its power of storing energy is limited. Hence at any moment only a limited amount of energy is available. If more goes to one form of activity, less can be expended in another. Moreover, when any one phase of consciousness predominates, the other forms of consciousness are likely to be weakened. For example, during intense emotion intellectual activity is at a minimum, and during intense intellectual activity extreme emotion is impossible. It is evident that the essential thing is the maintenance of the proper balance between the storage and the expenditure of energy. How may it be known when this balance is disturbed, when the expenditure exceeds the income? To a normal person the sensation of fatigue is the sign. In the case of muscular work the warning is so strong that there is little danger of over-exertion. In case of nervous work the warning is not so easily recognized. It should be stated, however, that the first essential to mental health is work. The unused muscle atrophies. The same is true of the nerves. But in muscular activity both nerve and muscle are involved, so that one can not use the muscles without also exercising and developing the nerve-centers. Fatigue is the natural result of the expenditure of energy, and entirely normal. Over-fatigue, permanent fatigue, is pathological.

The symptoms of fatigue noted by different writers are legion. The most characteristic are perhaps the following: Restlessness; lack of the power of co-ordination, whether of the vocal organs, making one stumble in speech, or of the other muscles of the body, causing uncertainty in the use of the limbs; twitching movements and the like; also decreased sensibility, especially of sight and hearing, and various vaso-motor phenomena, such as flushing, unusual color of the ears, and so on; and on the mental side irritability, loss of memory for common things, loss of curiosity and of the power of attention, and disturbance of sleep.

Something more than mere observation, however, is necessary, and in recent years special investigations have been made by physicians, psychologists, and teachers using different methods studying fatigue in individuals and in groups. The chief general problems are three: First, to obtain a series of tests of the functional ability of an individual—that is, his psycho-physic characteristics as regards rapidity in mental work, ability to improve by practice, susceptibility to fatigue, etc.; second, to find a standard test of the condition of the nervous system, so that a physician may determine when an individual is suffering from over-pressure; and, third, to determine the most favorable rhythm of periods of work and rest to enable one to do the maximum amount of intellectual work within the limits of health.

It is very difficult to get good tests of the condition of the central nervous system. But although, to use Mosso's figure, the human body is like a laboratory where one meets "No admittance" at every door and corner, still methods of studying nervous fatigue already devised promise to give a more satisfactory answer to the problems of mental hygiene than has hitherto been possible. Two classes of methods have been used: First, those that test the physical concomitants of mental activity or the physical effects of mental fatigue; second, those that test the quantitative and qualitative variations in the mental work done in different periods under definite conditions. Of the first class of methods two have been most used. First, the method of the ergograph, which consists in testing the cerebral fatigue by testing the muscular power in a group of muscles before and after a period of mental work. The ergograph, devised by Mosso, is a simple apparatus in which the arm is placed in a horizontal position and a weight lifted by contracting one of the fingers. The amount of contraction is registered by a pen that writes a curve on a revolving drum, and the amount of work done by the muscle is easily estimated from this curve. It is customary to contract the muscle in a certain rhythm, say every two seconds, marked by the strokes of a metronome, and to continue the work to the point of exhaustion—i. e. until voluntary contraction of the finger is no longer possible. The unit of measure is usually

the kilogrammeter—the power required to raise a weight of one kilogramme one meter. The amount of work done indicates the condition of the neuro-muscular mechanism, and the curve on the drum registering this is called the fatigue-curve. Using this method, Mosso and his assistants have made interesting tests of the effects of mental work. Dr. Maggiora tested his muscular power with the ergograph after a lecture. The work accomplished by his middle finger before exhaustion was only 5·055 kilogrammeters, while at the same hour of the preceding day the work done amounted to 7·161 kilogrammeters; that is, as a result of the intellectual exertion the work done by the finger was diminished 2 kilogrammeters. Again, he made a number of tests of his muscular strength before and after conducting examinations. The normal curve of work, as shown by tests before the examination, represented 6·087 kilogrammeters. After the first examination the amount of work done was only 2·745 kilogrammeters. The examinations continued for several days. On the last day Dr. Maggiora again wrote his fatigue-curve with the following result: Before the examination the work done was 5·694 kilogrammeters; after the examination it was only 1·086 kilogrammeters.

The second method of this class consists in testing the cerebral fatigue by testing the sensibility. Dr. Griesbach has tested cerebral fatigue by testing the discriminating dermal sensibility. If two compass-points are brought in contact with the skin, they must be separated a certain distance to be perceived as two. The distance at which the compass-points must be separated on any part of the body in order to be distinguished gauges the discriminative dermal sensibility for that locality. Griesbach's experiments indicate that the greater the fatigue the less the dermal sensibility; that is, the farther apart the compass-points must be placed to be perceived as two. Extended investigations have been made upon school-children, testing fatigue by this method. The results found by Griesbach have been corroborated by investigations made by Vannod and others; but more recent investigations have cast doubt upon the reliability of this method, and Kraepelin and others say that now they put no confidence in it.

The quantitative and qualitative variations in mental work done under the influence of fatigue are tested by a great variety of methods. Among those which have been commonly employed are the following: Writing from dictation; the performance of simple arithmetical operations; writing from memory numbers heard once; the filling of gaps in mutilated sentences; mental operations similar to those in ordinary school work, such as performing simple problems in algebra, the inflection of Greek verbs, and the like. Kraepelin's method of testing the mental ability and the condition of fatigue is the most elaborate and scientific of all the varieties of this class. He has at least made a definite beginning in investigation of the functional ability of the psycho-physical mechanism. He aims at nothing less than definite data in regard to the personal characteristics of the individual, and the care with which he has worked out his method and made corrections for the various sources of error commend his work as of prime importance. His method is, briefly, as follows: The subject is given a note-book containing simple sums for addition, in which he adds without intermission, sometimes for several hours at a time. At a signal sounded every five minutes, the subject draws a line behind the number last added; by this means after the experiment it is very easy to determine how many numbers were added by the individual each five minutes. It is relatively easy to obtain results by this method, but difficult to interpret them. Recent experiments indicate that at least four important factors modify the results: practice, excitement or a warming-up process, voluntary effort, and fatigue. The first three tend to increase the amount of work done; the fourth factor, fatigue, decreases the amount of work. In interpreting results it is difficult to determine how much influence each of these factors has; but by making corrections for the effect of the first three the influence of fatigue can be determined approximately.

The chief significance of these studies of fatigue is perhaps in the way of developing methods, and yet a few practical inferences are justified by the results already obtained. In the main they agree with every-day experience, but the studies of nervous fatigue have made emphatic, definite, and tangible what were before the platitudes of observation. It appears from these investigations that fatigue is a general condition of the physical organism, that it is not local except in relative degree, and, moreover, that it is the normal concomitant of activity. It increases inevitably when one is awake. Nutrition, drugs, change, and rest all modify its course, but apart from such influences it increases continually during the period of waking life. It has been shown that to do the maximum amount of work involving nervous activity intervals of rest must alternate with periods of work. The length of rest required depends upon the length of the preceding period of work, the intensity of the activity, and the efficiency with which the other bodily tissues work in carrying away the toxic products formed and in bringing up nutritive material. The most striking result is the range of individual variation demonstrated. All investigators by different methods have found evidence of this. Kraepelin finds two distinct classes—those who do their best work in the morning and fall off in ability to work during the day, and another class who do their best work at night—and of course many individuals who fall between these two distinct classes. Kemsies also, in studies among school-children, finds most striking individual differences in susceptibility to fatigue: some whose ability to work falls off from the very first, others who improve, others who attain their maximum ability at some definite hour in the day. The susceptibility to fatigue is a fundamental characteristic of the individual. Mosso likens these individual differences to the different ways in which different people are affected by drugs, such as ether and chloroform. It has been shown also that one may be in a condition of permanent fatigue without knowing it; and, further, that physical activity, while important for health, is not a rest from mental work, but that any violent exercise decidedly increases the mental strain. Perhaps the most important result has been to show the absolute importance of a suitable alternation of periods of work and rest in mental activity.

Closely connected with the problem of rhythm of work and rest is that of the relation of excitement to nervous health. This is a most critical question. Of course the word excitement may be so defined that it applies merely to what is injurious to health, and some milder term—extreme interest, extreme enthusiasm, or the like—may be used for the emotional states that are not injurious; but it is more in harmony with current usage, and sufficiently accurate for the present purpose, to use the word excitement as a more general term. Using the word in this wider sense, it can not be said that a person in health should avoid excitement. The man who avoids all exciting stimuli is likely to become like the invalid who by avoiding the air is always in danger of taking cold. He becomes weakened so that small stimuli excite. He merely reduces his emotional level, but he can not avoid excitement. On the other hand, Nature protects and hardens the man who does not fear excitement. A certain amount of mental stimulation is necessary. Excitement of moderate degree, the "warming up" noticed in experimentation, is for the nerves what vigorous exercise is for the muscles. We crave excitement. The race has developed through excitement of every kind. We can not avoid it. The nervous system loses tone without it. Many men must have at least the mild stimulation of some fad or the like to offset the monotony of their routine life. So far as hygiene is concerned, of course, if one can find help from a general platitude, the rule is moderate but not extreme excitement. More concretely, the points to be emphasized are as follows: In case of children special care should be taken to avoid premature excitement of every kind. All forms of artificial excitement—by means of opium, alcohol, and the like—should be avoided both by children and by adults. Again, the degree of excitement desirable and healthful depends upon the individual store of energy. The only general rule is that when excitement interferes with sleep and nutrition the danger-signal has appeared. But while we can not avoid excitement, relaxation is of prime importance for the hygiene of the nerves. It indicates strength rather than weakness, and a habit of periodic relaxation is a great safeguard against nervous breakdown. A matter of special importance seems to be the maintenance of the proper rhythm between excitement and relaxation. A breaking of this rhythm seems to be a positive injury to health. Popular opinion at least could furnish a long list of illustrations, from the general belief that running for a train is more dangerous if one misses it to the general consensus of physicians that disappointment in a love-affair is a common cause of nervous prostration. In other words, there should be the normal reaction to excitement. And in general artificial interference

with the normal reaction to emotion of any kind is likely to be injurious to health. This, however, is only one side of the matter. It by no means follows that one should give way to passion or let emotion run riot. Another aspect requires the consideration of self-control.

The hygienic importance of self-control is obvious enough upon a little reflection. Self-control is the great safeguard against nervous disorder. In most cases of neurasthenia it is probably safe to say that lack of self-control was not merely the result, but one of the causes of the disorder. One who has self-control does not worry, does not waste his strength by passion, does not fritter away his energy by attention to the unessential. Self-control might almost be defined as a well-established habit of conserving nervous energy. How far one can be trained to self-control directly is a difficult problem. But there is great possibility of developing self-control indirectly. We inhibit impulse and passion in one direction by turning attention to vital interests in some other subject. Every interest is potentially a means of self-control. The number and intensity of our interests gauge in large degree our power of self-control. Hence the development of manifold and enthusiastic interests in literature, art, science, athletics, and the like is important not only morally, but of great advantage also to health, as furnishing frequently the only adequate means for controlling injurious tendencies and passions. The normal method of inhibiting emotion is by turning attention to some vital interest foreign to the occasion of our emotion.

Another essential for mental hygiene is freedom from worry. Taken in its broadest sense this includes a great deal. The extreme form of worry is chronic fear; and in all forms worry is related to fear. The injury to health from the latter is too obvious for special comment; but even the milder form may be almost equally injurious, and it is this that demands special discussion. Any analysis of the mental process of worry must be arbitrary, but some aspects of it may be distinguished. Worry, besides its emotional coloring that relates it to fear, has two essential characteristics: (1) confusion, or the interference of mental associations; (2) automatic repetition of the mental processes that cause the confusion or the fear. The confusion, or interference of association, is of all degrees from the mere hesitancy of the normal man between two alternatives to the pathological cases known as *folie de doute*, the insanity of doubt. The extreme form throws light on the more common, milder forms. In a typical case an alternative always presents itself, and the patient is always distracted by doubt. It is largely this confusion of association which causes the fatigue when one has to do unfamiliar work and puzzles over alternate methods of action. The habit of weighing arguments pro and con, of balancing on the knife-edge of judicial indecision as regards the details of action, is an extremely fatiguing habit, which in the normal individual is the counterpart of the insanity of doubt. In fact, there is no hard-and-fast line between the two. The second characteristic is automatic repetition. Whether we worry about a friend, our own health or reputation, our business, the task we have to perform on the morrow, or whether it be the racking of our brains with a problem or a puzzle, or the mere interference of association from the insistence of a distracting train of thought or a doggerel rhyme, the process repeats itself over and over. The image of the friend in distress, of our own chagrin or loss, of the unwelcome task, the distracting idea, or the feeling of running against the same unsolvable difficulty, occur again and again, and, like repetition of anything else, must perforce cause fatigue, even apart from the accompanying unpleasant feelings. Of course, it is as true that ill health causes worry as that worry causes ill health; but, whichever be primarily cause and which effect, much may done by mental regimen. It is specially important in the education of the young that the methods should be such as to avoid confusion of association, and children should be trained to clear-cut speaking and acting and the forming of definite decisions. Those who show a special tendency to balance arguments and shiver before decisions should have special training in decisive action.

Apart from an active life, the most important preventive of worry is a settled philosophy of life. It may be in the form of stoicism, of Christian self-surrender, of pantheistic mysticism in its various forms, of Titanic resistance to evil fate, or of a mere agnostic faith that the universe is sound at the core. But something of the kind is essential, and the degree of one's surrender to this philosophy of life is the measure of one's freedom from worry. The more truly religious this philosophy the better, because the religious instinct is one of the deepest things in human nature, and the deeper and more vital the philosophy the more it will make the thought and activity straightforward and decisive. In another way this philosophy of life is seen to be essential. The tale of the occasions of worry would be a long one; but in general the great cause of worry is the great gap between our ideals and our practice. We enter upon our tasks with ideals adjusted to ideal conditions. We soon find that conditions are not ideal, our friends are not ideal, our own performance is not ideal. All this is a constant source of worry. We can not change the conditions. Honor forbids us to lower our ideals. Here religious faith and a settled philosophy of life are helpful.

The common-sense verdict of experience and the results of scientific investigation agree in showing the importance of the obvious principles of mental hygiene—the necessity of activity, of sleep, of a proper alternation of periods of work and of rest, the folly of working beyond one's normal period, the danger of artificial stimuli in place of rest and sleep, the advantage of regularity, permanent interests, ideals, decision, faith, and a clear conscience. The prevalence of nervous diseases and insanity emphasizes the importance of mental hygiene; but its value is not merely as a preventive of such disorders. Regard for its teachings is essential to happiness and efficiency in work, and it is an important factor in the prevention and cure of other diseases. Recent investigations especially emphasize the great importance of mental suggestion in the cure of disease. A great number of undoubted cases of cure by Christian science, by faith-healing, by quack physicians of various kinds, and especially by hypnotic suggestion, as well as the experience of medical practitioners, show that medicine can not ignore the psychology of therapeutics, and demonstrate in most convincing manner what Kant in the last century called the power of the mind in controlling disease. All these investigations indicate that a perfect mental hygiene would be one of the greatest safeguards against physical disease.

WILLIAM H. BURNHAM.

Meredith, EDMUND ALLEN: statesman; b. in Ardtrea, County Tyrone, Ireland, Oct. 7, 1817; graduated at Trinity College, Dublin, in 1837. He was admitted to the Canadian bar in 1844. He was appointed Professor of Mathematics in McGill University in 1846, and resigned the following year to become Assistant Provincial Secretary of Upper Canada. In 1867 he was appointed Under Secretary of State for the Provinces, and in 1873 First Deputy Minister of the Interior. Among his essays and papers are *An Essay on the Oregon Question*; *Influence of Recent Gold Discoveries on Prices*; *Talfourd's Tragedy of Ion*; *Essay on Friendless and Neglected Children*; *Compulsory Education in Crime*; *Emendations in Shakespeare*; *National Language and National Manners*; *Work of Recent Prison Congresses*; *Miss Dix, Philanthropist and Asylum Reformer.*

Meredith, WILLIAM RALPH, LL. D.: jurist; b. in Middlesex, Ontario, Mar. 31, 1840; educated at the local grammar school and at Toronto University, where he received the degree of LL. D. in 1872; was called to the bar in 1861,

and was made queen's counsel in 1875 and 1880; in 1888 became an honorary member of the law faculty of Toronto University; in 1889 was made corporation counsel of Toronto, to which place he had removed; was elected to the Legislature in 1872, in which year and subsequent years he was identified with legislative measures exempting workmen's wages, creating statutory mechanics' liens, granting workingmen compensation for injuries, etc.; in 1878 was leader of the Opposition; in 1882 opposed the Government on educational and ecclesiastical matters; in 1894 was made chief justice of the common pleas division of the high court of justice of Ontario; in 1895 was elected to the senate of the University of Toronto; in 1896 was appointed a member of the committee for the revision of the provincial statutes. F. STURGES ALLEN.

Meriwether, LEE: statistician; b. in Columbus, Miss., Dec. 25, 1862; was educated in the public schools of Memphis, Tenn.; with an elder brother, founded the *Free Trader*; at the age of nineteen made a walking tour in Europe to study the condition of workingmen and the effect of protective tariffs; was commissioned by the U. S. Labor Bureau to report on the condition of European labor, the report being published in 1886, after the completion of which work he was retained in the service of the Government to collect statistics relative to labor in the U. S. He is the author of *A Tramp Trip: How to See Europe on Fifty Cents a Day* (1887).

Merriam, HENRY CLAY: soldier; b. in Houlton, Me., Nov. 13, 1837; graduated at Waterville College; was commissioned captain in the Twentieth Maine Infantry in 1862, appointed captain in the Eightieth U. S. (colored) Infantry in 1863, lieutenant-colonel of the Eighty-fifth (colored) Infantry in 1864, and was transferred to the Seventy-third (colored) Infantry the same year; was mustered out of service in 1865, commissioned major of the Thirty-eighth Infantry in 1866, transferred to the Twenty-fourth Infantry in 1869, became lieutenant-colonel of the Second Infantry in 1876, and colonel of that regiment in 1885; was promoted to brigadier-general in 1897, and advanced to major-general at the beginning of the war with Spain. He is the inventor of the "Merriam pack."

Merrill, FREDERICK JAMES HAMILTON, Ph. D.: geologist; b. in New York city, Apr. 30, 1861; graduated at the School of Mines, Columbia University, in 1885; served as an assistant on the Geological Survey of New Jersey 1885–87, and was fellow in geology at Columbia 1886–90, receiving in June, 1890, the degree of Ph. D. Dr. Merrill was made assistant State geologist of New York in Oct., 1890, and soon afterward received the appointment of assistant director of the New York State Museum, in connection with which work he was, during 1892 and 1893, director of the scientific exhibit of the State of New York at the World's Columbian Exposition. In 1894 he was made full director of the New York State Museum, and in 1898 became State geologist. Dr. Merrill is a fellow of the Geological Society of America, of the New York Academy of Science, and of the American Association for the Advancement of Science, as well as a member of various other scientific and historical societies. He has contributed scientific articles, mostly on geology, to the *Proceedings* of the societies of which he is a member, and to the *American Journal of Science* and the *Popular Science Monthly*, in addition to which he is the author of the following bulletins of the New York State Museum: *Salt and Gypsum Industries in New York* (Albany, 1893); *Mineral Resources of New York* (1896); *Road Materials and Road Building in New York* (1897); *Guide to the Study of the Geological Collections of the New York State Museum* (1898); and of a *Report on the Scientific Exhibit of the State of New York at the World's Columbian Exposition* (1894). MARCUS BENJAMIN.

Merrill, GEORGE EDMANDS, A. M., D. D.: minister and educator; b. in Charlestown (now Boston), Mass., Dec. 19, 1846; prepared for college in the Cambridge (Mass.) high school; A. B., Harvard, 1869; A. M., Harvard, 1872; graduated at Newton Theological Seminary, 1872; D. D., Colby University, 1896; pastor of Baptist churches in Springfield, Mass., 1872–77; Salem, Mass., 1877–85; Colorado Springs, Col., 1885–87; Newton, Mass., 1890–99; became president of Colgate University, Hamilton, N. Y., in 1899; author of *The Story of the Manuscripts* (1881); *Crusaders and Captives* (1890); *The Reasonable Christ* (1893); *The Parchments of the Faith* (1894).

Merrill, STEPHEN MASON, D. D., LL. D.: M. E. bishop; b. in Jefferson co., Ohio, Sept. 16, 1825; joined the Ohio Conference of the M. E. Church in 1864 as an itinerant; became editor of the *Western Christian Advocate* in 1868; was consecrated bishop in 1872; received the degree of D. D. from Wesleyan University in 1868, and LL. D. from Northwestern University in 1886. His works embrace *Christian Baptism* (1876); *The New Testament Idea of Hell* (1878); *The Second Coming of Christ* (1879); *Aspects of Christian Experience* (1882); *Digest of Methodist Law* (1885); and *Outlines of Thought on Probation* (1886).

Merritt, ANNA (*Lea*): artist; b. in Philadelphia, Pa., Sept. 13, 1844; studied art in Dresden and London; received diploma and medal at the Philadelphia Centennial Exhibition in 1876; published a memorial of her husband after his death, entitled *Henry Merritt's Art Criticism and Romance, with Recollections and Twenty-three Etchings* (1879), to furnish a portrait for which she studied etching, afterward adopting it as a profession. Other etchings of hers are two portraits of Mary Wollstonecraft; *View on the Thames*; a portrait of Sir Gilbert Scott; and Ellen Terry as Ophelia. Among her exhibited paintings are *A Scene on the Grand Canal, Venice*; *Eve Overcome by Remorse*; *The Pied Piper of Hamelin*; *St. Cecilia*; *A Bacchante*; *A Girl with Doves*; and *Camilla*.

Messiter, ARTHUR HENRY: organist; b. in Frome, England, in 1834; studied and practiced his profession in England till he was twenty-four years old, and then went to New York, sang tenor in Trinity Church choir, and in June, 1866, succeeded Dr. Henry Stephen Cutler as organist and choirmaster. He retained this position until May 1, 1897, when he was retired on a pension. D. E. HERVEY.

Metargon: a gaseous element obtained from the atmosphere by Prof. William Ramsay and Dr. Morris W. Travers, of London, England. In the liquefaction of large volumes of argon, using liquid air as the cooling agent, it was found that a white solid appeared on the sides of the bulb and in the liquid. The gas obtained by this method, after the liquid had boiled away, gave a spectrum which was entirely different from that of argon, though resembling it in general character. With low dispersion it gave a banded spectrum, but with a grating single equidistant bright lines appeared with the intermediate spaces filled with dim lines. The density of the gas was found to be almost identical with that of argon, being 19·87, and it is monatomic. As the gas had a different spectrum from argon and behaved somewhat differently at low temperatures, Prof. Ramsay concluded that it was elementary, and gave it the name of metargon. It holds the same relation toward argon that nickel does to cobalt, having approximately the same atomic weight, but different properties. According to Sir William Crookes, the atomic weight of this element would be about 40. See NEON. MARCUS BENJAMIN.

Method in Education: Method comprehends everything that pertains to the system employed in the presentation of subjects of instruction to pupils. *General method* considers the fundamental principles upon which all instruction should be based; *special method* develops the application of these principles to the several subjects constituting the programme of studies. General method takes account of the mental operations by which knowledge is received and assimilated, and proposes to present to the mind new materials for knowledge in accordance with the mind's mode of operation, so that the process of acquisition may be facilitated. General and special method together embrace what is sometimes included under the science and art of teaching, or the philosophy of teaching. It is within comparatively recent times that method has been scientifically worked out and become entitled to respect as a matter of serious study. Properly included in general method are a considerable number of special forms of more or less general application, such as the *Socratic method*, which is essentially the art of giving instruction by questions, and consists in asking the question in such a way as to arouse the intelligence of the listener and prompt him to an appreciation of the truth without its being stated to him dogmatically. It takes its name from the first great exponent of this method, Socrates, and may properly be classified as the method of questions. As questioning forms a part of all instruction, the principles of the Socratic method are interwoven with all phases of the art of teaching. Another method is the *heuristic method*, or the method of discovery. This method aims to have the pupil retrace the steps gone over in the original discovery of the truth to

be imparted. The teacher places the materials before the students and suggests the method of procedure, leaving them to discover the principles independently. It affords a welcome variation from the purely dogmatic method, in which the teacher continually imparts instruction, filling the pupil's mind without calling for original effort on his part. The recapitulation theory, or reverberatory theory of biology, which assumes that each individual reproduces *in petto* the experience of the philogenetic series, supports the heuristic method of instruction according to which each mind should repeat the psychogenetic order. The obvious criticism is that the range of learning is too large, and the heuristic method can be developed to a limited extent only. The *monitorial method* (or the *mutual method*), developed by ANDREW BELL and JOSEPH LANCASTER (*qq. v.*), was purely a device of school management, and not in any proper sense a method of instruction. The *inductive method*, of which much has been written, takes its origin from the philosophy of Bacon, though it was clearly recognized by Aristotle. Since Bacon's day it has been the method of scientific investigation, but only recently has it become prominent as a method of school instruction. In scientific teaching it has become widely used through the introduction of laboratories, in which the pupils observe facts and perform experiments. As applied to language work, it reverses the process of giving a rule and illustrating it by example, and gives first a number of examples, from which the pupil sees the general truth. The *object method*, which has been referred to Pestalozzi, has often been interpreted to mean simply the exhibition of objects for the pupil to look at, and has frequently degenerated into a mere waste of time. Rightly conceived, it is a most valuable means of instruction, in that it enables the mind to avail itself of the senses of touch and sight as well as of hearing, and thus produces a more vivid and lasting impression. The *natural method* is generally applied to the teaching of modern languages, and is opposed to the so-called grammar method. It rests on two principles: First, that the necessary interest for the successful prosecution of language work can most easily be aroused by the actual spoken use of the foreign tongue; second, that a boy or a man can best learn a new language in the same manner in which an infant acquires its native speech. The first principle is sound, but the second fallacious. In practice the method consists in a very large use of conversation. In the hands of skillful native teachers good results are often obtained. Other particular methods are the *deductive method*; the *method of disputation*, so generally used in the universities of the Middle Ages, when books were lacking and disputes furnished the only exercises for the students; and the *historical method*, which is applicable to a considerable number of subjects. This by no means exhausts the list. In most and perhaps in all of these methods there are valuable features, but the safest standpoint is that which, while knowing them all, does not adhere strictly to any one. It is unquestionably true that there should be as many methods as there are teachers. The best teacher will be the one who, knowing all the methods, is an eclectic, using some of all and all of none, and varying the method to suit varying conditions and different classes of students.

The history of method has not yet been fully written. Comenius was the first of the modern writers on the subject; his *Magna Didactica*, written early in the seventeenth century, one of the world's great educational classics, is the first great work on method from a philosophical basis, though previous to this Ascham and Ratich had given attention to new methods of teaching. Pestalozzi contributed largely to its development. Among the German schoolmen and philosophers, Froebel, Herbart, and Ziller have made important contributions. The invention of printing entirely revolutionized methods of teaching. Previous to that books had been very scarce and practically inaccessible for school use. Printing made it possible to place a copy of the text studied in the hands of every pupil and so entirely do away with the old methods of dictation. In Europe, however, much less use is made of text-books, even to-day, than in America. Indeed, perhaps the greatest American contribution to method is the development of scientific text-books. The lecture method, so called, still prevails almost exclusively in European universities, and to a considerable extent in the universities of the U. S., though by no means so prominent in the U. S. as abroad; but the lecture method is not considered widely available in instruction below university grade. Innumerable books on the subject of method, under various titles, have been written, among which may be mentioned Laurie's *Institutes of Education*; Tompkins's *Philosophy of Teaching*; McMurry's *General Method* (and also *Special Methods* in several subjects); Landon's *Art of Teaching and Class Management*; White's *Elements of Pedagogy*; Page's *Theory and Practice of Teaching*; Rein's *Outlines of Pedagogics*; and the works of Comenius, Pestalozzi, Herbart, and Froebel, a considerable part of which may be found in English translations. Cajori's *History of Physics* and *History of Mathematics* are also of interest. Kehr, *Geschichte der Methodik*, in five volumes (Gotha, 1891), is the most valuable single work on the history of method, but it is confined to Germany. C. H. THURBER.

Mettam, CHARLES: architect; b. in Dublin, Ireland, in May, 1819; educated as an architect and civil engineer in his native city, practiced there and in England until 1848, and afterward in New York city. In 1854 he proposed an elevated railroad structure in New York. In 1861 he was employed under Gen. Delafield on the construction of fortifications in New York harbor. He patented many articles used in buildings, including the rolling iron shutter. He designed the funeral car that bore the remains of President Lincoln in New York. D. in Bayonne, N. J., Dec. 5, 1897.

Mexico: The census of 1895 showed a population of 12,619,959, a density of 16·4 to the square mile. About 19 per cent. is of European descent, 43 native Indian, and 38 mixed European and Indian. The state is spending large sums to improve the harbors on the Gulf coast. Vera Cruz, an open roadstead, is gradually being made a good port. The depth of water on the bar at Tampico was only 8 or 9 feet in 1893, but in 1899 steamships drawing 24 feet enter the port. The drainage works by which the waters of the Valley of Mexico are carried outside the wall of mountains that hemmed them in were completed in 1897. The works cost $20,000,000, were twelve years in building, and include a tunnel 6 miles long through the range, while the canal in the valley is 43 miles long. The surplus waters which sometimes flooded the city of Mexico and the sewage of the city are thus carried outside the valley. The works are expected greatly to improve the sanitary condition of the city and reduce its heavy death-rate. Mexico is supplying about one-third of the silver production of the world; but ever since 1886, when the price of silver began to fall, the Government has encouraged gold-mining by facilitating the exploration and working of the placers, and granting special franchises and concessions. Under this stimulus, production increased from $1,269,907 in 1892–93 to $7,584,182 in 1897–98. Cattle-raising is increasing, and in two years Mexico has sent about 400,000 small cattle to the U. S. at about $16 a head (silver) to take the place of better stock sent to Europe. The total imports were $61,304,914 (gold), of which the U. S. supplied $31,020,136, Great Britain $10,479,512, France $6,754,015, Germany $6,678,393, and Spain $2,918,323. The total exports were $73,527,616 (gold), of which $57,888,243 went to the U. S., or 79 per cent. of the total exports, as against 77 per cent. in 1896–97. C. C. ADAMS.

Military Insignia: badges and other devices used as distinguishing marks of military rank and service. These are necessarily so numerous in the various armies and navies of the world that it is not feasible to describe all in this article. Distinctions of military rank are universally marked by the use of badges, such as shoulder-straps and epaulettes, with different devices, usually highly ornamental for officers of the highest rank. Details can be given here for the U. S. services only.

As early as 1775 general officers and their aides were distinguished by "ribbands" of various colors worn between the coat and the waistcoat, field and company officers by cockades, sergeants by a stripe or epaulette of red cloth on the right shoulder, corporals by a stripe of green. A general order dated June 18, 1780, under authority of an act of Congress, made the first announcement of insignia of rank, as follows: Major-generals were to wear two epaulettes with two stars on each, and a black-and-white feather in the hat; brigadiers, epaulettes with one star, and a white feather; field officers, two epaulettes; captains, one epaulette on the right shoulder; lieutenants, one epaulette on the left shoulder. The aides of the general commanding in chief were distinguished by a green-and-white feather in the hat, other aides by a green feather, inspectors by a blue feather. All officers, both commissioned and non-commissioned, were required to wear a cockade. Service stripes first appeared in 1782, when it was ordered that each non-commissioned

officer and private who had served four years in any Continental regiment might wear one stripe of white tape on the left sleeve of his regimental coat, and for eight years' service two stripes. Changes were often made up to the time of the civil war, since which time the distinctions have remained substantially what they now are.

THE ARMY.—The arms and corps of the army are distinguished first by badges (insignia proper), and by facings. The insignia for officers' undress coats are as follows: The letters "U. S.," in Gothic design, of suitable height (one inch), each followed by a period, embroidered in gold or made of gold or gilt metal (except for the corps of engineers, which are embroidered in silver or made of silver), are worn on each side of the collar, an inch from its edge and midway of its height, with distinctive insignia of suitable height, embroidered or made of metal, worn on each side of the collar about five-eighths of an inch from the letters "U. S.," as follows: Adjutant-general's department, a shield of gold or gilt metal, or embroidered in gold; inspector-general's department, a gold or gilt sword and fasces crossed and wreathed; judge-advocate-general's department, sword and pen crossed and wreathed, embroidered in gold, or of gold or gilt metal; quartermaster's department, sword and key crossed on a wheel surmounted by a spread eagle, of gold or gilt metal, platinum and enamel; subsistence department, a silver crescent half an inch between cusps, placed near the golden letters "U. S.," cusps to the rear; pay department, a diamond three-quarters by one inch, embroidered in gold, or of gold or gilt metal, placed with shorter diagonal vertical; medical department, a modification of the cross of the Knights of St. John, three-quarters of an inch over all, embroidered in gold or made of gold or gilt metal in exact imitation of gold embroidery, the center plain, and the cross without border; corps of engineers, a silver-turreted castle; ordnance department, shell and flame, of gold or gilt metal, or embroidered in gold; signal corps, two crossed signal-flags and a burning torch, of gold or gilt metal, or embroidered in gold; record and pension office, a silver trefoil, within and partly upon a gold wreath, embroidered or in metal; cavalry, two crossed sabers, an inch high, with the number of the regiment above the intersection, of gold or gilt metal, or embroidered in gold; artillery, two crossed cannon, an inch high, with the number of the regiment at the intersection, of gold or gilt metal, or embroidered in gold; infantry, two crossed rifles, an inch high, with the number of the regiment above the intersection, of gold or gilt metal, or embroidered in gold.

The cap badge for all officers is the coat of arms of the U. S., embroidered in gold, and is placed in front so that the top of the badge is slightly below the top of the cap.

Epaulettes.—The epaulettes of the general of the army are of gold with solid crescent; device, two silver embroidered stars, with five rays each, 1½ inches in diameter, and the arms of the U. S. embroidered in gold placed between them. Those of a lieutenant-general are of gold, with solid crescent; device, three silver embroidered stars of five rays each, respectively 1½, 1¼, and 1⅛ inches in diameter; the largest placed in the center of the crescent; the others placed longitudinally on the strap and equidistant, ranging in order of size from the crescent. Those of a major-general are the same as for the lieutenant-general, omitting the smallest star, and the smaller of the two remaining stars placed in the center of the strap. Those of a brigadier-general are the same as for a lieutenant-general, omitting all stars but the largest. The adjutant-general, inspector-general, and chief of the record and pension office wear an aiguillette, with the right epaulette.

Arrangement of Buttons.—The general wears two rows of twelve buttons each, placed by fours; lieutenant-general, two rows of ten each, the upper and lower groups by threes, the middle by fours; major-general, two rows of nine each, placed by threes; brigadier-general, two rows of eight, placed by twos; field officers, two rows of nine, equidistant; company officers, two rows of seven, equidistant.

Sword-belts.—General officers wear sword-belts of red Russia leather, with three stripes of gold embroidery; all field officers, of black enameled leather, with one broad stripe of gold lace; staff officers below the grade of major, of black enameled leather, with four stripes of gold lace interwoven with black silk; company officers of the line, of black enameled leather, with four stripes of gold lace, interwoven with silk of the color of the facings of the arm of the service.

Insignia of Corps on Epaulettes.—The chiefs of the various staff corps and staff departments have upon their epaulettes the insignia of their respective corps or departments, substantially as already described for the undress coat.

Shoulder-knots.—Officers of the adjutant-general's department wear shoulder-knots of gold cord, a quarter of an inch in diameter, Russian pattern, on dark-blue cloth ground; insignia of rank embroidered on the cloth ground of the pad; a solid shield of silver on the center of the pad (except for a colonel and assistant adjutant-general, who wears it on the bullion of the knot midway between the upper fastening and the pad); an aiguillette of gold wire cord; the cord for the breast-plaits is a quarter of an inch in diameter, and that for the arm-plaits three-sixteenths of an inch, and they are worn on the right shoulder-knot, the loop crossed on top of the right arm above the elbow, and the cords fastened, before buttoning, to the top and second buttons on the right side of the coat. The aiguillette, instead of being permanently attached to the shoulder-knot, may be made separate, so as to be attached to the coat under the knot, by means of a strap or tongue passing through the lower fastenings of the knot.

Officers of the inspector-general's department wear knots like those of the adjutant-general's department, but with solid gold or gilt sword and fasces crossed and wreathed in place of the silver shield.

Officers of the judge-advocate-general's department wear the same knot as that of the adjutant-general's department, without the aiguillette and shield, but with sword and pen crossed and wreathed, embroidered in silver on the cloth ground of the pad (except for a colonel and assistant judge-advocate-general, who wears the device made of solid silver on the knot midway between the upper fastening and the pad).

In the quartermaster's department colonels wear the same knot as the officers of the adjutant-general's department, without the aiguillette and shield, but with a sword and key, crossed on a wheel, surmounted by a spread eagle looking to the front, made of gold or gilt metal, platinum, and enamel, and placed midway between the fastening and the pad. Officers below the rank of colonel wear a similar device placed on the center of the pad.

In the subsistence department colonels wear the same knot as the officers of the adjutant-general's department, without the aiguillette and shield, but with a silver crescent, an inch between cusps, placed on the strap over the first crossing of the embroidery above the pad, cusps to the rear. Officers below the rank of colonel wear a silver crescent similar to that of the colonel, to be placed centrally on the pad, cusps to the rear, the extremities of the cusps to be equidistant from a median line drawn through the center of the fastening and the center of the pad.

In the medical department colonels wear the same knot as officers of the adjutant-general's department, without the aiguillette and shield, but with a modification of the cross of the Knights of St. John, made of solid silver in imitation of embroidery, three-quarters of an inch over all, the center plain and the cross without border, placed on the crossing of the cords below the upper fastening, one axis of the cross to coincide with the axis of the strap. Officers below the rank of colonel wear a cross an inch over all, embroidered in dead-gold bullion, or made of gold or gilt metal in exact imitation of gold embroidery, the center plain and the cross without border, placed on the center of the pad; the axes of the cross coincide with the axes of the pad.

In the pay department colonels wear the same knot as officers of the adjutant-general's department, without the aiguillette and shield, but with a diamond embroidered in silver or made of silver metal in exact imitation of silver embroidery, diagonal, in size three-quarters of an inch by an inch, placed on the strap over the first crossing of the embroidery above the pad, the shorter line parallel to the line of the shoulders. Officers below the rank of colonel wear a diamond of the pattern above described, placed on the center of the pad, the shorter diagonal parallel to the line of the shoulder.

The knot of officers of the engineer corps is the same as that of the adjutant-general's department, without the aiguillette and shield, but with a silver-turreted castle. That of the ordnance department is the same as in the adjutant-general's department, without the aiguillette and shield, but with a shell and flame in silver embroidery. That of the signal corps is the same as in the adjutant-

general's department, without the aiguillette and shield, but with two crossed signal-flags and a burning torch, in gold and silver embroidery. That of the record and pension office is a silver trefoil within and partly upon a gold wreath embroidered or in metal. Aides-de-camp to major-generals and brigadier-generals, and regimental adjutants, wear the shoulder-knots of their corps or regiment, with aiguillette attached. Officers of cavalry, artillery, and infantry wear knots of the same pattern as for the staff corps, but on cloth of the same color as the facings of their arm, with the number of the regiment embroidered in silver and insignia of rank on the cloth ground of the pad.

Insignia of Rank on Shoulder-knots.—Colonel, a silver-embroidered eagle at the center of the pad; lieutenant-colonel, two silver-embroidered leaves, one at each end of the pad; major, two gold-embroidered leaves, one at each end of the pad; captain, two silver-embroidered bars at each end of the pad; first lieutenant, one silver-embroidered bar at each end of the pad; second lieutenant, plain; additional second lieutenant, same as the second lieutenant. The foregoing insignia are the same as prescribed for the shoulder-strap.

Shoulder-straps.—The general of the army wears shoulder-straps of dark-blue cloth, 1⅝ inches wide by 4 inches long, bordered with an embroidery of gold a quarter of an inch wide, two silver-embroidered stars of five rays each and gold-embroidered arms of the U. S. between them. Lieutenant-general, of dark-blue cloth, 1⅝ inches wide by 4 inches long, bordered with an embroidery of gold a quarter of an inch wide; three silver-embroidered stars of five rays each, one star on the center of the strap and one at each end, equidistant between the center and the outer edge of the strap, the center star the largest. Major-general, the same as for a lieutenant-general, except that there are two stars instead of three; the center of each star is an inch from the outer edge of the gold embroidery on the ends of the strap, both stars of the same size. Brigadier-general, the same as for a major-general, except that there is one star instead of two at the center of the strap. The cloth of the straps for the general staff and staff corps is dark blue; infantry, white; artillery, scarlet; cavalry, yellow. Colonel, the same as for a brigadier-general, omitting the star, with a silver-embroidered spread eagle on the center of the strap, 2 inches between the tips of the wings, having in the right talon an olive branch and in the left a bundle of arrows; an escutcheon on the breast, as represented in the arms of the U. S. Lieutenant-colonel, the same as for a colonel, omitting the eagle, with a silver-embroidered leaf at each end, each leaf extending seven-eighths of an inch from the end of the strap. Major, the same as for a lieutenant-colonel, with a gold-embroidered leaf at each end, each leaf extending seven-eighths of an inch from the end of the strap. Captain, the same as for a major, omitting the leaves; at each end two silver-embroidered bars of the same width as the border, placed parallel to the ends of the strap; the distance between them and the border equal to the width of the border. First lieutenant, the same as for a captain; at each end one silver-embroidered bar of the same width as the border, placed parallel to the ends of the strap, at a distance from the border equal to its width. Second lieutenant, the same as for a first lieutenant, omitting the bars. Additional second lieutenant, the same as for a second lieutenant. Chaplain, of dark-blue cloth of the usual size and pattern, with a plain Latin cross in the center.

Insignia of Rank on Overcoat Sleeves.—General officers wear a knot of flat black mohair soutache braid, not exceeding an eighth of an inch in width, and composed of five braids, double knot: colonels, five braids, single knot; lieutenant-colonels, four braids, single knot; majors, three braids, single knot; captains, two braids, single knot; first lieutenants, one braid, single knot; second lieutenants, without braid; chaplains, without braid.

Facings.—The facings of the various arms are as follows: General officers, officers of the staff corps and departments, dark sky-blue (Khaki uniform only); infantry, white (except of the Khaki uniform, sky-blue); cavalry, yellow; artillery, scarlet; engineer troops, scarlet piped with white; ordnance troops, crimson piped with white; post quartermaster-sergeants, buff piped with white; commissary sergeants, gray piped with white; sergeants of the signal corps, black piped with white; hospital corps, emerald green.

Cadets of the U. S. Military Academy.—The facings of the cadet uniform are black. Rank is indicated by gold-lace chevrons on the full dress, and by black cloth chevrons on the undress coat, as follows: Captain, a chevron of four bars; lieutenant, a chevron of three bars, the adjutant having in addition an arc, and the quartermaster a tie; sergeant-major, a chevron of two bars with an arc; quartermaster-sergeant, a chevron of two bars with a tie; first sergeant, a chevron of two bars with a diamond; color-sergeant, a chevron of two bars with a star; sergeant, a chevron of two bars; corporal, a chevron of two bars, worn below the elbow. The forage-cap and dress-hat badges are the coat of arms of the U. S., with the letters "U. S. M. A." in a scroll connecting the tips of the eagle's wings.

Chevrons, Stripes, etc., of Non-commissioned Officers and Privates.—The rank of non-commissioned officers is marked on the blouse and overcoat by chevrons of cloth, and on the uniform dress coat, except for the hospital corps, by chevrons of gold lace. Chevrons are worn points down; those on the uniform dress coat and blouse are above the elbow; those on the overcoat, below the elbow, with the point half an inch above the cuff. The cloth chevrons are of the same color as the facings of the uniform dress coat, except those worn by the hospital corps, which are of emerald green. Those for the overcoat of infantry are of dark-blue cloth. The engineers' and signal corps' chevrons are piped with white cloth. The bars of the chevrons are half an inch wide, separated by silk stitching; white for hospital stewards, acting hospital stewards, engineers, signal corps, and for overcoats for infantry; black for all others; the upper and lower edges are finished or bound with a similar stitching. The arms of the chevron-bars are 6 to 7 inches long, being the arcs of a circle of about 25 inches radius, and meeting at an angle of about 96 degrees; distance between extreme outer ends about 9 inches.

Rank is indicated as follows: Sergeant-major, three bars and an arc of three bars. Quartermaster-sergeant, three bars and a tie of three bars. Saddler sergeant, three bars and a saddler's round knife, handle upward. The knife is of the following dimensions: Handle 1¾ inches long, three-quarters of an inch wide near top, five-eighths of an inch near the blade; blade 1⅛ inches deep in center; from point to point of the blade, 3¼ inches; center of edge, 1¼ inches above the inner angle of the chevron. Chief trumpeter, three bars and an arc of one bar, with a bugle, of pattern worn on caps, in the center. Principal musician, three bars and a bugle. Ordnance sergeant, three bars and a star. Post quartermaster-sergeant, three bars and a crossed key and pen. Commissary sergeant, three bars and a crescent (points to the front) 1¼ inches above the inner angle of the chevron. Hospital steward, three bars and an arc of one bar, of emerald-green cloth, inclosing a red cross. Acting hospital steward, the same as for a hospital steward, omitting the arc. Private of the hospital corps, and all persons neutralized by the terms of the Geneva Convention, a brassard of white cloth, 16 inches long and 3 inches wide, with a cross of red cloth, 2 inches long and 2 inches wide, in the center, worn on the left arm, above the elbow. Sergeant of the first class of the signal corps, three bars and an arc of one bar, inclosing a device, consisting of crossed signal-flags, red and white, and a burning torch in yellow. Sergeant of the signal corps, the same as for a sergeant of the first class, omitting the arc. First sergeant, three bars and a lozenge. Sergeant, three bars. Regimental and battalion color-sergeant, three bars and a sphere, 1¼ inches in diameter. Corporal, two bars. Lance-corporal, one bar. Farrier, a horse-shoe of cloth, 4½ inches long and 3¾ inches wide, worn toe uppermost. Pioneer, two crossed hatchets, of cloth, same color and material as the facings of the uniform dress coat, sewed on each sleeve above the elbow, in the place indicated for a chevron (those of a corporal to be just above and resting on the chevron), the head of the hatchet upward, its edge outward, of the following dimensions: handle, 4½ inches long, a quarter to a third of an inch wide; hatchet, 2 inches long, 1 inch wide at the edge. First-class gunner, an elongated cannon-projectile 1½ inches long and three-fourths of an inch wide, point up, of scarlet cloth neatly piped and stitched on the outside of the right sleeve of the dress coat, blouse, and overcoat half-way between the point of the shoulder and the elbow, below the chevron in the case of a non-commissioned officer. Company litter-bearer, a brassard of red cloth worn on the left arm above the elbow.

Gold-lace Chevrons.—Gold-lace chevrons are of the same dimensions as cloth chevrons, stitched on cloth of the same color as the facings of the uniform dress coat. Those for engineers have a stitching of white silk on each edge of the gold lace. Those for the signal corps have the crossed signal-

flags and torches of the same color and dimensions as those for the cloth chevrons, and embroidered in silk and bullion in high relief.

Service Chevrons.—All enlisted men who have served faithfully for one term of enlistment, for either three or five years, wear as a mark of distinction, on both sleeves of the uniform dress coat, below the elbow, a diagonal half-chevron of gold lace, half an inch wide, stitched on a piece of dark-blue cloth of the color of the uniform dress coat, and extending from seam to seam, the front end nearest the cuff, and half an inch above the point of the cuff. Those of the enlisted men of the hospital corps, however, consist of a single stripe of emerald-green facing-cloth, half an inch wide and 12 inches long, stitched on the outer edges with white chevron silk, and worn on both sleeves of the blouse below the elbow.

To indicate service in war, a diagonal half-chevron of gold lace, half an inch wide, with piping on each side an eighth of an inch wide, is worn on each sleeve of the uniform dress coat, of cloth of the same color as the facings of the arm of service in which the soldier earned the right to wear it; those for engineers have in addition a stitching of white silk on each side of the gold lace. Those for the enlisted men of the hospital corps are worn on both sleeves of the blouse, and consist of a single stripe of emerald-green facing-cloth, half an inch wide and 12 inches long, piped on the outer edges with orange facing-cloth an eighth of an inch wide, indicating war service in the hospital corps only. War service in other arms is indicated by pipings of the color worn by the arm in which such service was rendered, except in the engineer corps, in which case the outer edges of the scarlet pipings have a row of white silk stitching.

All soldiers who have served during the war of the rebellion, who were honorably discharged; all who served in the Indian campaigns enumerated in general orders from the headquarters of the army; and all who have served or may serve in the army of the U. S. in war, or in such Indian campaigns approaching the magnitude of war as may from time to time be so designated by the Secretary of War, are entitled to wear the "service-in-war" chevron. The chevrons to indicate service and service in war, if more than one, will be worn one above the other in the order in which they were earned, with a quarter of an inch between them. But one chevron will be used for each enlistment, the "service-in-war" chevron being worn in place of the "service" chevron for each enlistment in which the right to wear it was earned. A lance-corporal wears, in addition to the uniform of a private, a chevron having one bar of lace or braid; holding a renewed appointment, he is entitled to wear the uniform of a corporal, except that the chevron shall have but one bar of lace or braid.

Corps Badges.—By direction of the Secretary of War, Nov. 19, 1898, it was decided that the corps badges prescribed in General Orders No. 99, July 15, 1898, adjutant-general's office, are a part of the uniform of the army and serve as marks of identification the same as the symbols of the various arms of the service and the different staff corps. These badges are as follows: Cavalry corps, a winged horse-foot; artillery corps, crossed conical projectiles, with round shot above the center; First Corps, a circle over the letter "I," of special design; Second Corps, a four-leaf clover; Third Corps, a three-tooth clutch; Fourth Corps, a caltrop; Fifth Corps, a five-bastion fort; Sixth Corps, a six-spoke hub; Seventh Corps, a seven-pointed star; Eighth Corps, two circles overlapping each other, one-third radius, resembling the figure 8; Ninth Corps, a buzz-saw with nine teeth; Tenth Corps, two triangles, point to point, resembling the letter X; Eleventh Corps, badge of Tenth Corps, with horizontal bar through the center, representing "XI"; Twelfth Corps, a square with clover-leaf at each corner, thereby showing twelve small circles; Thirteenth Corps, a palm-leaf with thirteen spikes; Fourteenth Corps, a square, with half-circles on each side; Fifteenth Corps, a bugle; Sixteenth Corps, a spear-head; Seventeenth Corps, a battle-axe; Eighteenth Corps, an arch.

The divisions of the corps are represented by the color of the symbol, as follows: First Division, red; Second Division, white; Third Division, blue.

These corps symbols are habitually worn in the form of a small badge on the front of the hat or in the center of the crown of the forage-cap by enlisted men, and on the left breast by officers, and are of felt of the color designating the division to which the wearer belongs; the badge being 1½ inches high, or occupying a space 1½ inches square. Officers and enlisted men belonging to a corps and not attached to a division wear the corps symbol of the size above described in red, bordered in white one-sixteenth of an inch and edged in blue one-thirty-second of an inch. If preferred, officers and enlisted men are authorized to wear the proper badge made of gold or yellow metal enameled in the proper colors. The members of the provost guard when on duty may wear on the left breast, as a badge of authority, the corps symbol, 3 inches high, or occupying a space 3 inches square, made of tin or white metal. A modification of the general order establishing corps badges provides that these as worn by officers and men shall be from 1¼ to 1½ inches in size, and that officers may wear them on the hat or cap.

The Navy.—The various branches of the navy are distinguished from one another by suitable devices, while grades are indicated generally by the disposition of gold lace on the collar, cocked hats and forage-caps, and especially by grade devices proper and sleeve ornaments.

Corps Devices.—The line of the navy is distinguished by the foul anchor. The other devices used are: For the medical corps, a spread oak-leaf embroidered in dead gold, with an acorn embroidered on it in silver; for the pay corps, a silver oak-sprig; for the construction corps, a gold sprig of two live-oak leaves and an acorn; for professors, one silver oak-leaf and an acorn; for civil engineers, the letters C. E. in silver.

Insignia of Grade.—The grade is indicated in a general way on the collar of the special full-dress coat by a strip of navy-gold wire or thread lace, of two vellums, around the top and down the front, 1¾ inches wide for flag-officers, 1½ inches for captains and commanders, 1 inch for lieutenant-commanders, lieutenants, and lieutenants junior grade, and one-half inch for ensigns. The same general distinction is brought out on the cocked hat, as follows: For the admiral, a strip of 2-inch gold lace, laid on flat, around the outer rims of the fans, passing under the peaks; for rear-admirals, a strip of 1½ inches of gold lace, laid on flat, around the outer rims of the fans, passing under the peaks; for all other officers, a strip of black silk lace 2½ inches wide, binding the rims of the fans, and showing 1¼ inches on each side and under the peaks.

The visor of the forage-cap is embroidered as follows: Admiral and rear-admiral, embroidered all around with oak-leaves; staff officers of corresponding relative rank, a gold band, half an inch wide, embroidered all around the edge; captain and commander, embroidered along the front edge with oak-leaves; staff officer of corresponding relative rank, a gold band, half an inch wide, embroidered along the front edge. The cap device for all officers, except chaplains, chief boatswains, chief gunners, chief carpenters, chief sailmakers, mates, and clerks, is a silver shield, emblazoned paleways, of thirteen pieces, with a chief strewn with stars surmounted by a silver spread eagle, the whole being placed on two crossed foul anchors embroidered in gold; for chief boatswains, chief gunners, chief carpenters, chief sailmakers, warrant officers, mates, and pay clerks, two gold foul anchors crossed.

Distinctions of grade also appear in the belt ordered to be worn on special occasions, as follows: For rear-admirals, the belt is of dark navy-blue cloth, with gold-embroidered stripe a quarter of an inch wide on each edge, and one of the same width in the center. The slings are of dark navy-blue cloth, with three gold-embroidered stripes an eighth of an inch wide, arranged as on the belt. For captains and commanders, the belt is of dark navy-blue silk webbing, with 7 sixteenth-inch gold-lace stripes. For lieutenant-commanders and lieutenants, the belt is of dark navy-blue silk webbing, with 5 sixteenth-inch gold-lace stripes. For lieutenants junior grade and ensigns, the belt is of dark navy-blue silk webbing, with 3 sixteenth-inch gold lace stripes.

Sleeve Ornaments (special full-dress, frock, blue service, and evening dress coat).—The admiral wears two strips of 2-inch gold lace, with one 1-inch strip between, set a quarter of an inch apart; rear-admirals, one strip of 2-inch gold lace, 1½ inches from the edge of the sleeve, with one strip of half-inch gold lace a quarter of an inch above it; captains, four strips of half-inch gold lace, set a quarter of an inch apart; commanders, three strips of half-inch gold lace, set a quarter of an inch apart; lieutenant-commanders, two strips of half-inch gold lace, with one strip of quarter-inch gold lace between, a quarter of an inch apart; lieutenants, two strips of half-inch gold lace, a quarter of an inch apart; lieutenants junior grade, one strip of half-inch gold lace, with one strip of quarter-inch gold lace a quarter of an inch

above it; ensigns, one strip of half-inch gold lace; chief boatswains, chief gunners, chief carpenters, chief sailmakers, one strip of half-inch gold lace, woven with dark-blue silk thread at intervals of 2 inches—the width of the blue silk weaving is half an inch; naval cadets who have completed the four years' course at the Naval Academy, one strip of quarter-inch gold lace. In the case of officers below the grade of rear-admiral, the lower edge of the sleeve lace is 2 inches from the edge of the sleeve.

All staff officers, except chaplains, wear the same lace on the cuff as is prescribed for line officers with whom they have rank, with bands of colored cloth around the sleeve, between strips of gold lace, as follows: Medical officers, dark-maroon velvet; pay officers, white cloth; naval constructors, dark-violet cloth; professors of mathematics, olive-green cloth; civil engineers, light-blue velvet. Staff officers entitled to but one strip of lace on the sleeve wear the colored cloth so as to show one-fourth of an inch above and below the strip. The sleeve ornaments for chaplains are of lustrous black braid, and correspond in width and disposition with those of line officers of the same relative rank. Line officers (including chief boatswains, chief gunners, mates, boatswains, gunners, and warrant machinists) wear a star of five rays, embroidered in gold, an inch in diameter, on the outer side of each sleeve and midway between the seams, with one of the rays pointing directly downward, and the point one-fourth of an inch from the upper edge of the upper strip of lace. Mates, boatswains, gunners, and warrant machinists wear the star 4 inches from the edge of the sleeve. On the overcoat the grade-mark on the sleeve is of lustrous black braid of double thickness, showing the same width and disposition as that of gold lace worn on the other coats. Cadet officers at the Naval Academy have their rank indicated by sleeve-marks, commissioned grades wearing stripes around the cuff, petty officers badges on the upper arm.

Epaulettes and Shoulder-knots.—All officers, except chaplains, chief boatswains, chief gunners, chief carpenters, chief sailmakers, naval cadets, warrant officers, mates, and clerks, wear two gold bullion epaulettes of the following dimensions: The admiral and rear-admirals, a strap $2\frac{3}{4}$ inches wide and 6 inches long; frog, $4\frac{3}{8}$ inches wide; crescent, eleven-sixteenths of an inch in the broadest part; bullion, $3\frac{1}{2}$ inches long and five-eighths of an inch in diameter. Captains and commanders, a strap $2\frac{3}{4}$ inches wide and 6 inches long; frog, $4\frac{3}{8}$ inches wide; crescent, eleven-sixteenths of an inch in the broadest part; bullion, 3 inches long and half an inch in diameter. Lieutenant-commanders, lieutenants, and ensigns, a strap $2\frac{1}{2}$ inches wide and 6 inches long; frog, $4\frac{3}{8}$ inches wide; crescent, nine-sixteenths of an inch in broadest part; bullion, 3 inches long and three-eighths of an inch in diameter. Naval cadets who have completed the four years' course at the Naval Academy, gold-embroidered shoulder-knots in lieu of epaulettes. All staff officers wear the same epaulettes as are prescribed for line officers with whom they have relative rank, with the substitution of the proper corps devices.

Shoulder-straps.—The admiral's shoulder-straps are $4\frac{7}{8}$ inches long and $1\frac{5}{8}$ inches wide, including the border, which is a quarter of an inch wide, embroidered in dead gold. The center is of dark navy-blue cloth, upon which are embroidered the corps and rank devices as below. For all other officers, except chaplains, chief boatswains, chief gunners, chief carpenters, chief sailmakers, warrant officers, mates, clerks, and naval cadets, the shoulder-straps are $4\frac{1}{2}$ inches long and $1\frac{1}{2}$ inches wide, including the border, which is a quarter of an inch wide, embroidered in dead gold. The center is of dark navy-blue cloth, upon which are embroidered the corps and rank devices as below.

Embroidered Devices for Frogs of Epaulettes and for Shoulder-straps and Knots.—For the admiral, four silver stars of five rays each, placed equidistant from each other in the middle of the strap or frog of the epaulette, with a gold foul anchor, $1\frac{1}{8}$ inches long, under each of the two outer stars. For rear-admirals, two similar stars, one near each end of the frog, with a silver foul anchor seven-eighths of an inch long in the center. For captains, a silver spread eagle in the center, with a silver foul anchor at each end. For commanders, a silver oak-leaf at each end, with a silver foul anchor in the center. For lieutenant-commanders, a gold oak-leaf at each end, with a silver foul anchor in the center. For lieutenants, two silver bars at each end, with a silver foul anchor in the center. For lieutenants junior grade, one silver bar at each end, with a silver foul anchor in the center. For ensigns, a silver foul anchor in the center. For naval cadets who have completed the four years' course at the Naval Academy, a gold foul anchor in the center of the pad of the shoulder-knot.

Staff officers wear on the frog of the epaulette and on the shoulder-strap the same rank devices as are prescribed for line officers with whom they have relative rank, substituting the proper corps device for the foul anchor. The devices for frogs of epaulettes are the same in dimensions as those on the collar of the service coat.

Shoulder-marks.—For all officers except chaplains, chief boatswains, chief gunners, chief carpenters, chief sailmakers, warrant officers, mates, and clerks, the shoulder-marks are of blue cloth, worked over one thickness of haircloth or other similar stiffening material, $5\frac{1}{4}$ inches long on the side, $2\frac{1}{4}$ inches wide, with a symmetrical triangular peak at the top, extending an inch beyond the parallel sides; at the center of this peak is a small navy button. For the admiral and rear-admirals the top is covered with 2-inch gold lace, showing a margin of one-eighth of an inch of cloth, and has worked over the gold lace the same device as on the shoulder-straps. For captains, commanders, lieutenant-commanders, lieutenants, lieutenants junior grade, ensigns, and naval cadets, strips of gold lace running across the shoulder-mark the same as on the cuff of the special full-dress coat are worn, including the star for line officers of the above grades, and the colored cloth for staff officers of corresponding rank.

Embroidered Collar Devices (for frock-coats of chief boatswains, chief gunners, chief carpenters, chief sailmakers, and warrant officers).—Chief boatswains, two foul anchors, crossed, embroidered in silver; boatswains, two foul anchors, crossed, embroidered in gold; chief gunners, a flaming spherical shell, embroidered in silver; gunners, a flaming spherical shell, embroidered in gold; chief carpenters, a chevron point down, embroidered in silver; carpenters, a chevron point down, embroidered in gold; chief sailmakers, a diamond, embroidered in silver; machinists, four gold oak-leaves; sailmakers, a diamond embroidered in gold; pharmacists, a Geneva cross, embroidered in gold; mates, after twenty years' service as such, a binocular glass, with the axes at right angles to the edge of the collar, eyepieces up, embroidered in silver; under twenty years' service as such, a binocular glass, placed as above, embroidered in gold; pay clerks, the corps device of the pay corps, embroidered in gold.

Embroidered Collar Devices for Service Coats.—Collar devices for the service coat are embroidered in high relief on dark navy-blue cloth. They are an inch in height, with other dimensions proportionate, and are placed vertically or horizontally with reference to the upper edge of the collar. The rank device commences three-quarters of an inch from the front edge of the collar. The corps device is placed three-quarters of an inch in rear of the rear edge of the rank device. For flag officers the stars are placed $1\frac{1}{4}$ inches between centers, with one point up, the center line of the upper point being at right angles to the upper edge of the collar. Where two bars are worn the distance between them is the width of a bar. The bar is always placed at right angles to the upper edge of the collar. The anchor is placed with the shank parallel to the upper edge of the collar, and the crown to the front. Devices representing a leaf or a sprig of leaves are placed with the axes parallel to the upper edge of the collar, stem to the front, and acorn, if any, on the upper side.

Devices are as follows: For the admiral, four silver stars with a gold foul anchor under each of the outer stars; for the rear-admirals, two silver stars and a silver foul anchor; for captains, a silver spread eagle and a silver foul anchor; for commanders, a silver oak-leaf and a silver foul anchor; for lieutenant-commanders, a gold oak-leaf and a silver foul anchor; for lieutenants, two silver bars and a silver foul anchor; for lieutenants junior grade, one silver bar and a silver foul anchor; for ensigns, a silver foul anchor; for naval cadets who have completed the four years' course at the Naval Academy, a gold foul anchor.

Staff officers wear the same rank devices as are prescribed for line officers with whom they have rank, substituting the proper corps devices for the anchor. Chief boatswains, chief gunners, chief carpenters, chief sailmakers, warrant officers, mates, and pay clerks wear the same devices on the collar of their service coat as are prescribed for the frock coat.

Rating Badges.—All petty officers wear on the outer garment a rating badge, consisting of a spread eagle above a class chevron. Petty officers of the starboard watch wear the badge on the right arm, and those of the port watch on

the left arm, half-way between the shoulder and the elbow. The chevrons are made of stripes of scarlet cloth, three-eighths of an inch wide, separated one-quarter of an inch, and sewed flat without padding. The badge covers a field 3¼ inches broad. Chief petty officers wear three stripes with an arch of one stripe forming the arc of a circle between the ends of the upper stripe of chevron, the outside radius of the circle being 1⅞ inches; the specialty mark is in the center of the field under the arch, and entirely included in a circle an inch in diameter; the eagle rests on the center of the top of the arch. Petty officers, first class, wear three stripes in the chevron; second class, two stripes; and third class, one stripe; the specialty mark is in the center of the field in the angle of the upper stripe, and the eagle 1½ inches above the angle and just above the specialty mark. For permanent petty officers holding three consecutive good-conduct badges, the chevrons are made of gold lace instead of scarlet cloth. On blue clothing the eagle and specialty marks are worked in white, and on white clothing in blue.

The specialty marks are as follows: Gun-captain, a foul anchor placed perpendicularly; master-at-arms, a five-point star; boatswain, mate, coxswain, a pair of crossed anchors; quartermaster, a steering-wheel; gunner's mate, a pair of crossed guns; seaman gunner, a shell and flame; chief yeoman, a pair of crossed keys; hospital steward and hospital apprentice (first class), Geneva cross; yeoman (first, second, or third class), a pair of crossed pens (quill); printer and schoolmaster, an open book; bandsman, a lyre; electrician, a globe; machinist and boiler-maker, a three-bladed propeller; water-tender, coppersmith, oiler, carpenter, mate, plumber, and painter, a pair of crossed hatchets; blacksmith, a pair of crossed hammers; sailmaker's mate, a cringle.

Marks.—Every enlisted man who has qualified as a seaman gunner wears the specialty mark so placed that the top comes an inch below the point of the chevron, or, if not a petty officer, in place of the rating badge. Hospital apprentices wear a Geneva cross of red cloth, the cross-bars 2 inches long and two-thirds of an inch wide, in place of the rating badge. An apprentice mark 2 inches long, worked in white on blue clothes and in blue on white clothes, is worn by all enlisted persons who belong to or have passed through the ratings of apprentice in the navy. On the overshirt and jumper it is worn on the breast, 2 inches below the neck-opening. On all coats, except overcoats, it is worn on the outside of the same sleeve as the rating badge, half-way between the elbow and wrist.

The watch mark is worn by all enlisted men, except petty officers, officers' messmen, and bandsmen. It consists of a strip of braid three-eighths of an inch wide, white on blue shirts and blue on white shirts, placed on the shoulder-seam of the sleeve and extending entirely around the arm. For first and second class firemen and coal-passers, the braid is red on both blue and white shirts, and of the same width and disposition as above. The men of the starboard watch wear the mark on the right, those of the port watch on the left sleeve.

Continuous-service marks, of scarlet cloth, 8 inches long, the side edges being turned under until they meet on the under side, to show a width of three-eighths of an inch, are worn on the left sleeve diagonally across the outside of the forearm at an angle of 45 degrees, one for each complete re-enlistment for three years under continuous service, a quarter of an inch apart.

Marine Corps.—The insignia of rank of the Marine Corps of the U. S. navy are essentially the same as those worn in the army. CORNELIS DE W. WILLCOX.

Millard, HARRISON: singer and composer; b. in Boston, Mass., Nov. 27, 1829. When twenty years old he went to Italy and studied there for three years under famous masters. Made a successful appearance in opera in Europe and returned to Boston in 1858. The next year he went to New York, and in that year composed his famous song *Viva l'America*. In 1861 he enlisted in the Seventy-first Regiment, and later received a commission as first lieutenant in the Nineteenth U. S. regulars. He served in the army until 1864, when he resigned, having been severely wounded in battle. He was appointed to a position in the New York custom-house, which he retained for twenty-one years. He composed many songs which attained a very wide popularity, also much church music, and two operas, *Uncle Tom's Cabin* and *Deborah*. D. in New York, Sept. 10, 1895. His daughter Marie is a soprano singer of merit. D. E. H.

Miller, CHARLES HENRY: artist; b. in New York city, Mar. 20, 1842; was educated at Mount Washington Collegiate Institute; graduated in medicine at the New York Homœopathic Institute in 1864; studied art, and became an exhibitor at the National Academy in 1860; traveled in Europe, stopping for study in Munich; became a member of the National Academy in 1875; was president of the New York Art Club in 1879, and of the American committee at the Munich International Exposition in 1883. His pictures include *The Challenge Accepted*; *A Long Island Homestead*; *High Bridge from Harlem Lane*; *A Bouquet of Oaks*; *A Suburban Wayside*; *Cornfield at Queen Lawn*; and *Oaks at Creedmore*. Under the pseudonym of Carl de Muldor, he is the author of *The Philosophy of Art in America* (1885).

Miller, JOSEPH NELSON: naval officer; b. in Ohio, Nov. 22, 1836. He entered the Naval Academy in 1851, became passed midshipman in 1856, master in 1858, lieutenant in 1860, lieutenant-commander in 1862, commander in 1870, and captain in 1881. As commander of the ironclad Passaic he took part in the bombardment of Forts Sumter and McAllister in 1863. As executive officer of the Monadnock he participated in the attacks on Fort Fisher, and was specially reported for bravery in these fights. He was advanced to commodore in 1894, made rear-admiral in 1897, and retired in 1898.

Miller, LEWIS: b. in Greentown, O., in 1829; after learning the trade of the machinist, he established a manufactory in Canton, where he improved, after his own ideas, the mower and reaper; afterward established plants in Akron and Mansfield, manufacturing agricultural implements of all kinds. He did much philanthropic work, and was deeply interested in the perfection of the Sunday-school. In 1874 he evolved the idea of the Chautauqua Assembly, and his plans, after having been examined by Bishop Vincent, of the Methodist Church, and other clergymen, were placed in operation. He was made president of the organization, and remained in that office until his death, at which time he was also president of the board of trustees of Mount Union College, at Alliance, O. D. Feb. 17, 1899.

Mills, ALBERT LEOPOLD: soldier; b. in New York city, May 7, 1854; graduated at the Military Academy in 1879, and was commissioned second lieutenant in the First Cavalry; after service on the frontier, was promoted first lieutenant; took part in the campaign against the Sioux in 1891 and in other Indian wars, for four years being adjutant of his regiment; did duty at the cavalry and infantry school at Fort Leavenworth, in the department of tactics and strategy, and at the outbreak of the Spanish-American war was commissioned captain and assistant adjutant-general, afterward becoming chief of staff in General Young's brigade, taking part with the Rough Riders in the battle of La Guasima, and winning distinction for gallantry and ability; was severely wounded at the battle of San Juan. He was appointed superintendent of the U. S. Military Academy with the rank and pay of colonel.

Mind and Body: The question of the relation of mind to body has been discussed as long as any other question in philosophy. The history of the problem is the history of philosophy. We may confine ourselves, therefore, to a statement of the alternative theories which are held to-day, each claiming to represent more adequately than the others the data and conclusions of modern thought. At the same time we should be careful to distinguish the scientific or dualistic point of view from the more philosophical or monistic point of view; for it is finally to this distinction that the current discussions of the subject reduce themselves.

Taking up the scientific point of view, we find the following theories in the field: (1) *The so-called "epi-phenomenon" theory.* Those who hold this view are for the most part workers in positive science, who are convinced that the universe is subject with no exception to the law of the conservation and correlation of energy. They maintain that the brain, being a part of the material universe, must be subject to this law; that the energies which it may manifest are derived from the material processes of nutrition, anabolism, etc., and that therefore no process can take place in the brain which does not have its exact antecedents—its causes—in material changes. If this be the case, we are told, mind can have no influence in brain-processes—can in no way direct or release energy, and, in fact, can have no place whatever in the causal series which brain and nerve action exhibit. The mind is in no sense a cause. It is an

"epi-phenomenon"—an index, merely, of the material processes—a spark thrown off by the machinery; and in the mental processes and functions we are to recognize only a singular and what is usually called "subjective" way of discovering that the brain-processes are taking place in this center or that, in this form or that, etc.

This theory—or class of theories—was earlier called the "automaton," or "conscious automaton," theory. It took its name from the position and arguments of Descartes—who, however, did not apply them strictly to man—that the brain is a machine, an automatic-working thing which can not be interfered with by the mind.

It is evident, of course, that if one go on to ask for a philosophy built up on this theory he is driven to some form of materialism; for the recognition of the material causes as efficient, at the same time that the mind is denied all efficiency, makes it necessary to hold that there is only one form of ultimate reality—matter or motion, or both, in whatever form this hypothesis be made. There are many, however, who do not wish to draw this conclusion, although still holding to the universal application of the law of conservation of energies in the brain. Some also refuse to go into metaphysics, claiming that it is better to take an agnostic position, and so adopt the theory to be mentioned next.

(2) *The "double-aspect" theory.* According to this way of stating the question the problem itself vanishes. We are told that the initial distinction between body and mind, considered as being two distinct substances capable of acting and reacting upon each other, is mistaken. On the contrary, body and mind are always together; we never know them apart; they are equally entitled to recognition, and the only reasonable procedure is that which takes them as constituting a single group of changes which must be considered as a whole. Looked at from the point of view of the body; the emphasis falls on the brain-changes, and the law of conservation is a statement which is necessary to bring these changes into relation to the others going on in nature. But looked at from the point of view of the mind—that is, within consciousness—we have the processes called mental with certain laws of their own, matched and accompanied by those of the brain. These are two *aspects*, therefore, of a single reality. We can not take both points of view at once, and in consequence we reach the artificial abstraction of mind as a separate thing set over against body, which is considered as another and different thing.

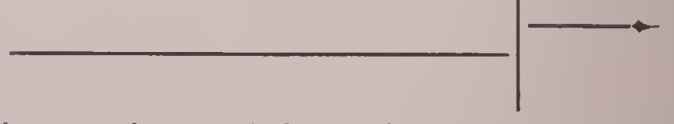
(3) *The "cause and effect" theory*—the theory according to which mind and body are two separate efficient causes which in some way work mutual effects, each in the phenomenal series represented by the other. This is the so-called "common-sense view" which holds that in willing to move the arm, for instance, the mind works changes in the brain and so brings about the modifications necessary to the actual performance of the movements designed.

(4) *The theory of "psycho-physical parallelism."* This theory declares that science is not capable of dealing with the question; that science should simply state the facts which are clearly established and hand the question of the ultimate relation of mind and body to the same department which deals with the constitution of mind and body—i. e. to philosophy. Yet, recognizing the facts established by science, it holds to certain things which may be stated in brief order, leaving their clearer exposition to the following section. *A.* The law of conservation of energy holds for all physiological processes, including those of the brain. *B.* The processes of mind are subject to great laws which require independent statement in the science of psychology, and which can not be stated adequately under the categories of physical cause and effect. *C.* These two forms of phenomena, with their laws, are associated in what is called a parallel way; that is, they are uniformly associated, and one is never found in experience dissociated from the other.

With this exposition of the principal hypotheses now current some lines may be devoted to stating the point of view of the present writer. It is often held that the "automaton theory"—the view which considers the brain-processes as the sufficient statement of the grounds of all voluntary movement—is the outcome of the denial of causal energy to consciousness; in other words, that there is no alternative to what is called the epi-phenomenon theory of consciousness except a theory holding that the law of conservation of physical energy is violated in voluntary movement.

Now this reduction of the possible views to two is unnecessary, and, indeed, impossible. In speaking of the antecedents of a voluntary movement we have to consider the entire group of phenomenal events which are always there when voluntary movement takes place; and among the phenomena really there the conscious state called volition is really there. To say that the same movement could take place without this state of consciousness is to say that a lesser group of phenomenal antecedents occurs in some cases and a larger group in other cases of the same event. Why not go to the other extreme, and say that the brain is not necessary to voluntary movement, since volition could bring about the movement without using the nervous processes to do it with? In his posthumous book on *Matter and Monism*, the late Mr. Romanes brings out this inadequacy of the automaton view, using the figure of an electro-magnet, which attracts iron-filings only when it is magnetized by the current of electricity. Whatever the electricity be, the magnet is a magnet only when it attracts iron-filings; to say that it might do as much without the electricity would be to deny that it is a magnet; and the proof is found in the fact simply that it does not attract iron-filings when the current is not there. So the brain is not a brain when consciousness is not there; it could not produce voluntary movement—simply because, as a matter of fact, it does not. So consciousness does not, on the other hand, produce movement without a brain. The whole difficulty seems to lie in an illegitimate use of the word "causation." Such a conception as physical causation can not be applied beyond the sphere of things in which it has become the explaining principle—i. e. in the objective, external world of things. The moment we ask questions concerning a group of phenomena which include more than these things, that moment we are liable to some new statement of the law of change in the group as a whole. Such a statement is the *third alternative* in this case; and it is the problem of the metaphysics of experience to find the category, or the most general principles of experience as a whole, both objective and subjective. The writer is far from thinking that the automaton or epi-phenomenon man can argue his case with much force in this higher court of appeal.

The other extreme is represented by those writers who think that the revision of the law of causation can be made in the sphere of objective phenomenal action represented by the brain; and so claim that there is a violation of the principle of conservation of energy in a voluntary movement, an actual efficiency of some kind in consciousness itself for producing physical effects. This is as illegitimate as the other view. It seems to deny the results of all objective empirical science and so to sweep away the statements of law on one side, on which the higher interpretation of the group of phenomena as a whole must be based. And it does it in favor of an equally empirical statement of law on the other side. It is not easy to see how any result for the more complex system of events can be reached if we deny the only principles which we have in the partial groups. To do so is to attempt to interpret the objective in terms of the subjective factor in the entire group; and we reach by so doing a result which is just as partial as that which the epi-phenomenon man reaches by his mechanical explanation. Lotze made the same mistake long ago, but his hesitations on the subject showed that he appreciated the difficulty. The claim of these writers that the mechanical view of causation can not be used as an adequate explaining principle of the whole personality of man seems good; but for reasons of much the same kind it seems equally true that as long as we are talking of events of the external kind, i. e. of brain processes, we can not deny what we know of these events as such.



The general state of the problem may be shown by the accompanying diagram, which will at any rate serve the modest purpose of indicating the alternatives. The line above, of the two parallels, may represent the statements on the psychological side which, on the theory of parallelism, mental science has a right to make; the lower of the parallels, the corresponding series of statements made by physics and natural science, includes the chemistry and physiology of the brain. Where they stop an upright line may be drawn to indicate the setting of the problem of interpretation in which both the other series of statements claim to be true;

and the further line to the right then gives the phenomena and statements of them which we have to deal with when we come to consider man as a whole. Now the point is that we can neither deny either of the parallel lines in dealing with the phenomena of the single line to the right, nor can we take either of them as a sufficient statement of the further problem which the line to the right proposes. To take the line representing the mechanical principles of nature and extend it alone beyond the upright is to throw out of nature the whole series of phenomena which belong in the upper parallel line and are not capable of statement in mechanical terms. And to extend the upper line alone beyond the upright is to allow that mechanical principles break down in their own sphere.

As to the interpretation of the single line to the right, it may always remain the problem that it now is. The best we can do is to get points of view regarding it; and the main progress of philosophy seems to be in getting an adequate sense of the conditions of the problem itself. From the more humble side of psychology, the growth of consciousness itself may teach us how the problem comes to be set in the form of seemingly irreconcilable antinomies. The person grows both in body and mind, and this growth has to have two sides, the side facing toward the direction from which, the "retrospective reference," and the side facing the direction toward which, the "prospective reference" of growth and the consciousness of growth. The positive sciences have by their very nature to face backward, to look retrospectively, to be "descriptive," as the term is used by Prof. Royce—these give the lower of our parallel lines. The moral sciences, so called, on the other hand, deal with judgments, appreciations, organizations, expectations, and so represent the other, the "prospective" mental attitude and its corresponding aspects of reality. This gives character largely to the upper one of our parallel lines. But to get a construction of the further line, the one to the right, is to ask for both these view-points at once—to stand at both ends of the line—at a point where description takes the place of prophecy and where reality has nothing further to add to thought. The writer believes that the best evidence looking to the attainment of this double point of view is found just in the fact that we are able to compass both of these functions in a measure at once; and that in our own *self-consciousness* we have an inkling of what that ultimate point of view is like. It is the very essence of such a contention in philosophy that it is a comprehension of both aspects of phenomenal reality, and not the violation or denial of either of them. J. Mark Baldwin.

Minor, Robert Crannell: artist; b. in New York city, Apr. 30, 1840; studied art in Belgium, France, and Italy; was president of the Société artistique et littéraire of Antwerp in 1874; returned to the U. S. and opened a studio in New York city, where he has since resided. His paintings include *Evening Dawn*; *The Studio of Corot*; *Under the Oaks*; *The World of Kent*; *The Cradle of the Hudson*; *The Close of Day*; and *A Mountain Path*.

Minor, Virginia Louisa: reformer; b. in Goochland co., Va., Mar. 27, 1824; received academic education in Charlottesville, Va.; removed to St. Louis, Mo., in 1846; originated the woman-suffrage movement in Missouri in 1866; organized the Woman Suffrage Association in 1867; was the first woman in the U. S. to claim suffrage as a right, taking the question before the courts, finally to the U. S. Supreme Court.

Minto, Gilbert John, Earl of: b. in London, England, in 1845; graduated at Trinity College, Cambridge, and entered the Scotch Guards in 1867. He was assistant military secretary with the Turkish army on the Danube in 1877, served in the Afghan campaign in 1879, and was appointed captain of mounted infantry in the Egyptian campaign in 1882. He was military secretary to Lord Lansdowne in Canada from 1883 to 1886, and was appointed Governor-General of Canada in 1898.

Mizon, mēē′zōṅ′, Lieut. L.: African explorer and officer in the French army; b. in 1853. He explored a wholly unknown region of the Northwest Congo basin in 1890–92, and the treaties he made with numerous native chiefs were eventually a part of the bases for the extension of the French Congo to the N. E. as far as Lake Chad. He followed to its mouth the Sanga river, which he showed to be about 1,000 miles long and the fourth largest tributary of the Congo. France, later, planted a line of stations along the Sanga. The work of Mizon, with that of other explorers farther E., proved that the water-parting between the Congo and the Niger basins was farther N. than it was supposed to be situated. He died on Mayotte island, near Madagascar, Mar. 22, 1899, as he was on his way to take the governorship of the Obock and Somali coast protectorate. C. C. A.

Modesty and Bashfulness: Under the general heading of *modesty reactions* several phases of development have been distinguished in the individual. Bashfulness in childhood grows into coyness and social timidity, the former indicating the oncoming of sexual maturity. Modesty proper is a matter of later origin, involving the sense of self and more or less reflection on personal relationships. The form of modesty known as *shame* indicates both physical situations, as seen in matters of physical indelicacy, and moral situations, seen in so-called moral shame. The manifestations of this class of phenomena in the child may be set out in some detail (following the writer's works on *Mental Development in the Child and the Race* and *Social and Ethical Interpretations*).

The general character of a child's bashfulness need not be enlarged upon. Its form of expression is also familiar. It begins to appear generally in the first year, showing itself as an inhibiting influence upon the child's normal activities. Its most evident signs are nervous fingerings of dress, objects, hands, etc., turning away of head and body, bowing of head and hiding of face, awkward movements of trunk and legs, and in extreme cases reddening of the face, puckering of lips and eye-muscles, and finally weeping and crying. An important difference, however, is observable in these exhibitions according as the child is accompanied by a familiar person or not. When the mother or nurse is present, the signs all seem to be useful in securing concealment from the eye of strangers—behind dress or apron or figure of the familiar person. In the absence, however, of such a refuge the child sinks often into a state of general passivity or inhibition of movement, akin to the sort of paralysis usually associated with great fear. This analogy seems to give a real indication of the race origin of bashfulness, which is probably a differentiation of fear—i. e. of persons, in view of personal qualities possessed by the one who fears; the concealing tendency also showing the parallel development of intimate personal relationships of protection, support, etc.

Observations of bashfulness serve to throw the illustrations of it into certain periods or epochs. The child is earliest seized with what may be called "primary" or "organic" bashfulness akin to the organic stages in the well-recognized instinctive emotions, such as fear, anger, sympathy, etc. This exhibition occurs in the first year and marks the attitudes of the infant toward strangers. It is not so much inhibitory of action in this first stage; it rather takes on the positive signs of fear: protestation, shrinking, crying, and so forth. It falls easily under the type of reaction known as "sensori-motor suggestion," being very largely provided for in the nervous equipment of the child at this age.

The duration of this stage depends largely upon the child's social environment. The passage from the attitude of instinctive antipathy toward outsiders, and that of affection equally instinctive toward the members of the household, over into a more reasonable sense of the difference between proved friends and unproved strangers—this passage depends directly upon the growth of the sense of general social relationships established by experience, which are largely got through imitation, and its clarifying influence upon the sense of self in the child. One of the most important elements in the child's progress in this way from its "organic" social life is the degree and variety of its intercourse with other children, and indeed also with other adults than those of its own home. Children carried to summer hotels every year, or brought into the drawing-room to see the mother's callers, soon lose all "fear of strangers" and become quite frankly approachable, even showing great liking for society at the tender age of a year and a half or so. On the other hand, children kept in extreme isolation from strangers, young or old, may show extraordinary paralysis of all motor functions, of a markedly organic kind, steadily for two or three years later on in their development.

The rapidity with which a child gets over its organic bashfulness varies also remarkably with the attitudes of older children whom he sees. Nothing else cures a child of this physical shyness so quickly as the example of an older

child. This is one of the marked offices of imitation also, to shorten the stages of social growth.

There is next a period of strong social tendency in the child, of toleration of strangers and liking for persons, in great contrast to the attitudes of organic distrust just mentioned. There seems to be a reaction against the instinct of social self-preservation characteristic of the earlier stage. It is due in all likelihood to the actual experience of the child in receiving kind treatment from strangers—kinder in the way of indiscriminate indulgence than the more orderly treatment which it gets from its own parents. Everybody comes, through experience, to be trusted on first acquaintance, just as in the earlier years everybody is considered, by mistrust, an agent of possible harm.

That this new phase of social attitude is learned from experience is seen in the absence of this confidence, on the part of the child, toward animals. The fear, purely, of the organic stage persists in the child's thoughts of animals which are new to him, and only becomes more confirmed as he fails to get the same reasons for "modifying his opinion" that teach him to tolerate persons more and more comfortably.

Finally, we may note the return of bashfulness in the child's second and third years. This time it is bashfulness in the proper sense of the term—rid largely of fear, and rid also of its compelling organic force and methods of expression. The bashful three-year-old smiles in the midst of his hesitation, draws near to the object of his curiosity, is evidently overwhelmed with the sense of his own presence rather than that of his new acquaintance, and indulges in actions calculated to keep notice drawn to himself. All this makes so marked a contrast to the exhibition of the organic period that it constitutes a most important resource for the study of the evolution of the social sense.

In this last case we have before us, in short, a phenomenon of rather complex self-consciousness—a thing of *ideal* value—and its suggestion-complexes, as they body themselves forth in the child's reactions, reveal his extraordinary progress in the understanding of himself and the world. He now begins to show the germ of *modesty* and of all the emotions akin to and contrary to it.

The several aspects of the child's personal environment appeal to him in a progressive way. It seems fair to think that persons are at first to him only a peculiar part of his projected, presented, objective world of things. He has "personal projects" before he has any sense of himself as a spiritual being or as the subject of his own mental processes. The getting of objects seems to be part of the business for which his nervous equipment more or less adequately provides, and among these objects the persons who move around him are characterized by very important marks.

The observation of "organic" bashfulness tends, when viewed in connection with this earlier point, to confirm this view of the way the child begins to apprehend persons; and at the same time enables us to see a little further. For, strange as it may appear, we are here confronted with an element of organic equipment especially fitted to receive and respond to these peculiar objects—persons, "personal projects." The child strikes instinctively an extraordinary series of attitudes when persons appear among his objects: attitudes which other objects, *qua* objects, do not excite. These attitudes extend somewhat to animals, and that makes it all the more striking. For animals are persons to a child of that age: they act upon him through his animal parts, through physical pains, pleasures, fears, etc., and that is all that persons can do to an infant a year old. We have to say, therefore, that the child is born to be a member of society in the same sense that he is born with eyes and ears to see and hear the movements and sounds of the world, and with touch to feel the things in space; and all views of the man as a total creature, a creation, must recognize him not as a single soul shut up in a single body, but as a soul partly in his own body, partly in the bodies of others—a service for which he pays in kind, since we see in his body preparation for the reception of the soul-life, the suggestions of mind and spirit, of those others.

Again, the second phase of the child's actions in the presence of persons—the freer, more ready reception of strangers and intercourse with them seen usually during the second year—also has its meaning. The child begins to find out more about persons, and so to gain associations which give him the beginning of certain expectations regarding them; self-formed expectations, that is, no longer dependent merely upon the stirrings of instinct and inherited impulse. He learns that pleasure comes almost always from persons, as does the alleviation of pain. This is a mortal blow at organic bashfulness, as every father and mother knows. A lump of sugar will very soon release the inhibitions of the shy year-old. Then he learns something of the characteristics of persons, the irregularity of personal action, the presence of the "personal equation" of mood and feeling in those nearest to him. This leads him to seek out somewhat individual methods of pleasing these near persons and of securing their smile and approbation, or of escaping the reproofs which his shyness brings; and these he substitutes for the blinder attempt to hide himself, which nature taught him.

And he also learns our habits, the regularities of character in adults, and so finds that nobody will hurt him, after all. It is amusing how soon a two or three year old child "sizes up" a stranger, and meets him half-way with conduct more or less appropriately attuned to the indications of character shown in the face and acts of the newcomer.

So, with all this, the instinctive or "organic" bashfulness gets rapidly rubbed away. But it is now clear that the means of this freedom from it are all social. A child's growth away from the instinct of social fear to the apprehension of social truth, and all his actions midway in this progress, come only from varied and persistent experience of people and appeals to living examples. How can character be apprehended if characters are absent? And how can character-schemes be grown into if the regularity of the child's life is of so narrow a scope that all the threads of his social relationship run the same way, and no tangles and confusions arise to bring out his own strenuous action and his rebellions against his native reflex ways of behavior?

The oncoming of true modesty, finally—the bashfulness which shows the simpler form of reflection upon self and the actions of self—represents the child's direct application of what he knows of persons to his own inner life. It is what has been called the "subjective" stage in his sense of personality.

But, as we soon find, this grows only apace with the contrary movement by which he assigns his own enriched mental experience back to his teacher, and seeks his further judgment upon it. The child when he knows himself able to draw a figure, for example, does not know this alone or completely. He has also the sense of the social "copy" or example from which the lesson was learned, and further and with it, he knows that his performance is again subject to revision in light of the approval or disapproval of teacher or friend. The performances of the self can not in any case be freed from the sense of possible inspection by others, and the child shrinks from this inspection. This is a constant feature of his progress. Suffice it to say that in this higher *rapport*, which involves the sense of self-agency in relation to the agency of other people like self—here in the real reflective relation of self to others—comes the third and crowning stage of the class of phenomena known by the word bashfulness. My children do their imperfect tasks for me because they know me to understand and be indulgent: the elder, H., even assumes the patron, and says of the younger, E., "She is so little, you know." But in the presence of the stranger whose opinion is not known beforehand, they are bashful with the sense of new standards perhaps firmly insisted upon. This is the inhibiting suggestion of bashfulness, of modesty, and clearly also of certain ethical emotion.

The whole situation becomes an extraordinary point of vantage for the development view of the origin of the social and personal sense. We have in it direct evidence of the growth of the social instinct by accretions from experiences of social conditions—or from the adding up of variations all fitted to survive socially—and direct evidence, further, of the lines of progress which these experiences and variations have marked out. For the infant is an embryo person, a social unit in the process of forming; and he is, in these early stages, plainly recapitulating the items in the social history of the race.

This social evolution presents a phase of general development in which the theory that the individual goes through stages which repeat the race-stages of his species ought to find illustrations of more than common value. For the social life is a late attainment, whether considered anthropologically or racially, and the child waits to begin the series of "laps in the social race" until he meets us, his observers, face to face. The embryology of society is open to study in the nursery.

Several important hints at the history of societies, both animal and human, are afforded by the phenomena of bash-

fulness as now described. Organic bashfulness would seem to represent the instinctive fear shown by the higher animals, coupled with the natural family and gregarious instincts which they have. This shades up into the more fearless and more confiding attitudes of certain passably peaceable creatures, which take kindly to domestication, and depend more upon animal organizations and natural defenses, such as those afforded by geographical distribution, coloration, habits of life, etc., for their protection. For the social protections are, after all, more effective for the defense of racial life and propagation than the special instinctive armament of individuals. Then, only in man, of course, do we find the stage of reflective thought on self and the social relations of self, which is seen germinating in the child in the third year or later.

The parallel seems also to be worth something to the anthropologist when he comes to inquire into the history of the human species. Admitting with Westermarck that man as a species is monogamous and tends to family life, we should find in his earliest history the period of organic bashfulness; and its instinctive presence in the very young child lends further support, perhaps, to Westermarck's view. The later tribal and nomadic conditions possibly tended to release the cords of an instinct so purely defensive, and to bring in the freer range of peaceful pursuits represented by the second stage of the child's history; while again the stage of development of the distinctly industrial, artistic, and commercial life of man, with its social ways of solving all problems of public welfare, corresponds to the more reflective attainments of the three-year-old. For there can be no doubt that recent writers are correct in finding that the most refined egoism is a reflex from the most generalized socialism; a thesis which social psychology takes now from the analyses of Bourget and the insights of Tarde and the historians of society, but one which it seems itself quite able to make good by its own methods of inquiry.

J. Mark Baldwin.

Mohammedan Schools: The learning of the Arabs before Mohammed was limited to a single subject, poetry, in which they had attained high rank. Their astronomy was nothing but astrology; their knowledge of medicine could not be called scientific; their history was simply genealogy and a few historical dates handed down by oral tradition. The new religion opened an entirely new field and gave the first incentive to scholarly effort. The knowledge of the Koran and of the traditions handed down from the personal followers of the Prophet became for all later time the foundation of learned investigation among the Arabs. The first efforts of scholarship were directed at fixing and securing the correct text and the proper reading of the Koran. The system of schools and of teaching among the Mohammedan people has an important place in their history. The whole system falls into two parts—elementary and higher education. Order, as represented by courses of study and curriculum, is completely lacking in both parts. The schools grew up quite voluntarily; the motive was purely a religious one. Elementary schools were provided for in the earliest times of Islam, not only in Arabia, but also in the provinces. The benefits of instruction were not limited to the rich, and even girls attended some of the schools. The discipline was marked by severity. There was some consciousness of pedagogical principles, since there was strife between scholars over the question whether anything can be educated into a man which is not in him by nature, or whether education is merely a development of the gifts bestowed at birth—one of the controversial questions of all educational history. The famous Sadi puts this phrase into the mouth of the king, at the very beginning of his *Rose Garden*. "One who is not a man does not become a man through education." Elementary instruction was imparted in the schools that were connected with the mosques. This instruction embraced reading, the elements of grammar, memorizing poems, and religion, taught by means of committing the Koran to memory. As pictorial art was discountenanced by Islam, the artistic impulse was gratified by many forms of calligraphy, so that writing became a form of art instruction. While the growing interest in grammatical study checked the despotism of religious influence in the elementary schools, this despotism had free play in the field of higher education, which at first concerned itself solely with the study of the Koran, which kept souls healthy, and of medicine, which kept bodies healthy. Philology gradually found its way into the higher schools, while the speculative and mathematical disciplines followed in its train, but religion jealously guarded its supremacy. Yet religion contributed much to the development of higher instruction. In the first place, it opened the mosques for teaching, thus supplying ready-made an outfit of university buildings. A natural consequence of using the mosques for places of instruction was that the instruction should be free to all comers, and this it virtually was. For the Mohammedan the mosque does not possess that high quality of sanctity that the church has for the Christian. He honors it, indeed, but is not anxious as to its use, provided some pious purpose can be joined with that use. So it came to pass that under the same roof the pious said his prayers and the philologian expounded some poet or other.

There was almost no barrier whatever between the great public and the teacher. If the lecture took place, as was often the case, in the mosque itself, the listeners simply formed a narrow circle about the teacher, and every respectable person could join the circle, provided only that the teacher was willing, as he always was, except occasionally when polemic discussion waxed too hot. An important element in the higher education of Islam was the custom of making pilgrimages. These pilgrimages were stimulated both by religious and philological zeal. From a religious motive many men went to Mecca from the most distant lands, and, passing through cities that had famous schools, naturally tarried to hear the great teachers. Men who were enthusiastic for Islam and also scientifically inclined undertook wonderful journeys to all parts of the world where there could be any possible fund of tradition in regard to the sayings and doings of Mohammed. But the language of Middle Arabia, in which the Koran was written, became the classical tongue of Islam, so that believers of other countries undertook pilgrimages to master the peculiarities of the Bedouin tongue. The desire of many to go among the children of the Arabian desert was so strong that the attacks of the Bedouins, who killed the travelers or took them prisoners, seemed to be a stroke of good fortune. This movement certainly contributed much to the wandering impulses of Mohammedan students and teachers, which is one of the most notable facts in the educational system of Islam. No literary newspaper was needed to spread new views, for the travelers carried with them both evil and good reports into far-distant lands.

The meeting of strange scholars, often from distant countries, produced a lust for disputation which sometimes led even to the shedding of blood, and is exactly parallel with the same development in the earliest universities of the Middle Ages. Great stress was laid upon the memory, not because of the lack of books, but on account of the free and open nature of the instruction. The fame of the scholar consisted in what he knew by heart; one *savant* boasted that he had seventy thousand extracts as though in a sack. There was practically complete freedom of teaching. Every Mussalman of respectable reputation could set up as a teacher without special difficulty. A certain limitation to this freedom was found in the fact that no one could use the book of an author in public instruction unless he had the author's written permission; after the author's death this permission must be had from the heirs. Such a testimonial from an author naturally became a testimony of capacity, and therefore a sort of license to teach. After the establishment of the formal high school, or *madrasas*, the teacher still enjoyed great freedom in the choice of the subject and in method. There were no definite terms; the teacher could prolong the course as long as the book held out. There was much dictation, and the lectures were often tedious. The professors were in the habit of testing the knowledge of the students by questions. The same teacher might, and frequently did, lecture on a great variety of subjects. So far as salary was concerned, teachers were generally left to provide for their own support as best they could or would. They had recourse not only to state employment of various kinds, but also and particularly to poetry. The ruler whose praise was sung might even pay his poet's debts. The scholar with a princely patron whom he served as permanent poet laureate was very lucky. Those masters who took boarders were most certain of a permanent income. From the fifteenth century the activity of the Mohammedan schools gradually declined and the numerous attendance fell off. The modern school system varies with the different countries in which the Mohammedan religion prevails. Statistics are difficult to obtain and not reliable. In 1887 there were in Turkey

nearly 7,000 schools and more than 7,000 teachers. There is no compulsory system, and the teachers depend upon fees for support. The well-to-do in the chief villages engage private tutors for their own children and those of their dependents. The chief subject of education is still the reading of the Koran. Of higher schools, there are some 15 Government colleges, with about 2,500 pupils, and 21 national schools in the chief towns, with about the same number of pupils. A considerable number of pupils are educated in foreign countries at the expense of the Government. See articles on TURKEY, ARABIA, and other Mohammedan countries. C. H. THURBER.

Monium: an elementary substance obtained by Sir William Crookes, of London, England, in the separation of the constituents of the rare earth yttria by skillful methods of fractionation. Using an especially designed form of spectroscope to test the relative amounts of the substances present in the fraction, Sir William Crookes isolated this substance, which gave a characteristic series of lines at the extreme end of the ultra-violet spectrum. Unlike the gases discovered by Prof. William Ramsay, it readily forms compounds with other elements, and the discoverer says that the atomic weight will be very close to 118. He named it *monium* from the Greek word for "alone."

MARCUS BENJAMIN.

Monmouth, Battle of: Sir Henry Clinton, the later British commander at Philadelphia in the Revolutionary war, evacuated that city in the night of June 17–18. He marched across New Jersey intending to gain New York, and was pursued by Washington, who moved on a parallel line. Serving under Washington were Wayne, Stirling, Greene, Hamilton, and Charles Lee. To the latter, an overrated officer, known afterward to have been a traitor, the attack was intrusted. It was a time of great heat and heavy rains. On the morning of June 28 the British left Freehold or Monmouth, and they were soon threatened by the Americans. Though favorably situated, the latter by Lee's order began an inexplicable retreat. Clinton and Cornwallis pursued the fugitives, who were soon met and rallied by Washington himself. The commanding general severely upbraided Lee, reformed the lines, and repelled the British. The Americans expected to renew the battle in the morning. Many on both sides died from sunstroke. In casualties the British loss was over 400; the American loss is variously stated (229 or 362). The British retreated during the night, and secured an unhindered line of march to New York. Gen. Lee was suspended for twelve months on the grounds of disobedience, disrespect, and misbehavior. Later he wrote an impertinent letter to Congress and was dismissed from the service. EDMUND K. ALDEN.

Monmouth, JAMES SCOTT, Duke of: illegitimate son of Charles II. of England and Lucy Walters; b. in Rotterdam, Apr. 9, 1649. He was brought to England after his father's restoration to the throne, was created Duke of Monmouth, and in 1663 was married to the Countess of Buccleugh. He assumed the name of Scott as the family designation of the Buccleugh family, and was made Duke of Buccleugh. He received notice and honors at court and saw service in the army. Gradually he acquired prestige as a Protestant leader, and was closely associated with Shaftesbury. In 1679 Monmouth was intrusted with the command in Scotland against the insurgents, whom he routed at Bothwell Bridge. It was now the exciting era of the exclusion question. Monmouth was for a while disgraced, deprived of command, and was obliged to leave the country. He soon returned, and became a center for exclusion endeavors. An attempt was made to prove that he was the legitimate heir to the throne, and his cause was improved by his "progress" in the west of England, and by his personal popularity. He was partially compromised in the plots against the Duke of York, was pardoned, and again retired to the Continent.

On the accession of James II. in 1685, concerted risings were planned in Monmouth's favor. The "Protestant Duke" himself sailed from Holland with a few vessels and followers, and landed at Lyme Regis June 11. He issued a declaration claiming the crown, which the Government answered by a bill of attainder. Some thousands of militia and countrymen from the south and west joined his side; at Taunton he assumed the royal style, and he entered Bridgewater. James's forces were collecting under Churchill and Feversham. A night surprise on the royalists failed, and the insurgents were totally defeated at Sedgemoor July 6. Monmouth fled from the field and was taken two days later in the New Forest. He displayed an abject want of moral courage, and in spite of entreaties he was condemned and executed in London July 15. The suppression of the rebellion was further signalized by bloody reprisals under Justice Jeffreys. The episode of the rebellion enters into the novels *Lorna Doone* and *Micah Clarke*.

EDMUND K. ALDEN.

Monroe, WILL S.: educator; b. in Union township, Luzerne co., Pa., Mar. 22, 1863; educated in the public schools of Luzerne County; A. B., Leland Stanford Junior University, 1894; studied in the Universities of Jena, Paris, and Leipzig; teacher and principal in public schools, Luzerne co., Pa., 1887–89; superintendent of schools, Nanticoke, Pa., 1889–92; superintendent of schools, Pasadena, Cal.; Professor of Psychology and Pedagogy, State Normal School, Westfield, Mass., since 1896. He is author of *Educational Labors of Henry Barnard* (1893); *Comenius's School of Infancy* (translated and edited, 1896); *Bibliography of Education* (1897); *Entwickelung der sozialen Vorstellungen des Kindes* (Berlin, 1899); and of numerous contributions to American and foreign educational journals.

C. H. THURBER.

Monte Nuovo: an extinct volcano in the Phlegræan Fields, on the northwest shore of the Gulf of Naples, directly W. of Naples. Its history is unusual in that its active life lasted only a few days, and its beginnings and growth, and in fact the whole story of its building, were duly recorded by eye-witnesses. The site of the volcano prior to 1538 formed a part of Lucrine Lake, which itself occupied the crater of an ancient volcano. One side of it had been worn away, admitting the sea, and the galleys of the Roman fleet formerly used the crater as a harbor. On Sept. 29, 1538, the bottom of the crater harbor and of the surrounding sea was slightly elevated, exposing a strip of sea-floor 600 feet wide. This strip was suddenly rent with cracks from which steam escaped, and then, says one of the records, "smoke, fire, stones, and mud composed of ashes poured forth with a noise like the loudest thunder. The stones were shot up into the air about as high as a crossbow can carry, and they fell sometimes on the edge and sometimes into the mouth of the vent." The eruption ceased on the third day, was renewed on the fourth and the seventh, and the ejection of "smoke" or steam was observed for several weeks, since which time no signs of activity have appeared. On the seventh day several persons were killed by falling stones or mephitic vapors. Monte Nuovo is 440 feet above the sea, formed of scoria and volcanic mud without lava, with rather steep slopes covered with coarse herbage. Its outlines have been very little changed in the three and a half centuries of its existence. C. C. ADAMS.

Moore, CLARA (*Jessup*): author; b. in Philadelphia, Pa., Feb. 16, 1824; was educated in New Haven, Conn.; during the civil war, established the woman's Pennsylvania branch of the U. S. sanitary commission, the special relief committee for hospital work, and was instrumental in founding the Union temporary home for children in Philadelphia; removed to London, England, about 1879, after the death of her husband, and legally changed her surname to Bloomfield-Moore. Her publications include *The Diamond Cross* (1857); *Mabel's Mission*, poems and stories (1875); *On Dangerous Ground*, translated into French and Swedish (1876); *Sensible Etiquette* (1878); *Slander and Gossip* (1882); and *The Warden's Tale and other Poems, New and Old* (1883). Under the pen-name of *Mrs. Clara Moreton*, some of her early stories won prizes.

Moore, HARRY HUMPHREY: artist; b. in New York city, July 2, 1844; after studying art at home and in California, went to Dresden in 1865, subsequently working under Gérôme in Paris; visited Spain, where he became the pupil of Fortuny; spent several years in the study of Moorish life in Morocco; worked in Rome under Fortuny 1873–75; returned to the U. S.; lived in Japan 1880–81, and then settled in Paris; was made chevalier of the Order of Charles III. by the Queen Regent of Spain. His paintings, which chiefly represent Spanish, Moorish, and Japanese scenes, include *Almeh*, a Moorish dancer; *The Blind Guitar-player*; *A Moorish Bazaar*; *A Bulgarian*; *A Moorish Merchant*; *A Morning Call in Japan*; *The Daimio*; and *A Garden-Party at the Alhambra*.

Moore, JOHN BASSETT: lawyer; b. in Smyrna, Del., Dec. 3, 1860; received private education, and graduated at the University of Virginia in 1880, after which he studied law;

was admitted to the bar in 1883; served in the U. S. Department of State as clerk 1885–86; was third Assistant Secretary of State 1886–91; secretary on the part of the U. S. in the Samoan conference in 1887, and in the fisheries conference 1887–88; was first Assistant Secretary of State in 1898; acted as secretary and counsel to the U. S. peace commission at Paris in 1898; Professor of International Law and Diplomacy in Columbia University since 1891. He is the author of *Report on Extraterritorial Crime* (1887); *Report on Extradition* (1890); *A Treatise on Extradition and Interstate Rendition* (1891); *Asylum in Legations and Consulates and in Vessels* (1892); *Kossuth: a Sketch of a Revolutionist* (1895); *History and Digest of International Arbitrations* (1898); and is one of the editors of the *Journal du Droit International Privé.*

Moore, Willis Luther, LL. D.: meteorologist; b. near Binghamton, N. Y., Jan. 18, 1856; educated at public schools and at the Government military school at Fort Myer, near Washington, D. C., and subsequently studied scientific branches for five years under private tutors. In 1876 he entered the U. S. Signal Corps, and ten years later was promoted to the grade of observer-sergeant for his invention of new mechanical appliances. During the five years that followed he was engaged as a meteorological clerk in preparing daily synoptic charts for use of the official forecasters, and in that way became thoroughly familiar with the study of weather forecasting. On the organization of the weather service on a civil basis in 1891, he became local forecast official in charge of the meteorological office in Milwaukee, Wis., and in 1894 became professor in the U. S. Weather Bureau. He was assigned to duty in Chicago in 1894 as forecast official for the upper lakes and fifteen of the Western States, and in July, 1895, was appointed chief of the U. S. Weather Bureau. He received the degree of LL. D. from the University of Nebraska in 1897. He is a fellow of the American Association for the Advancement of Science, as well as a member of various other scientific associations. He has delivered many public addresses and lectures and has contributed articles to various reviews and magazines.

Marcus Benjamin.

Morgan, Sir George Osborne; lawyer and member of Parliament; b. in Conway, Carnarvonshire, Wales, May 8, 1826; educated at Baliol College, Oxford; called to the bar in 1853; made queen's counsel and bencher of Lincoln's Inn in 1869, and treasurer of that Inn in 1890; represented the County of Denbigh in Parliament 1868–85; returned from East Denbighshire in 1886 and 1892. He was appointed judge advocate-general and privy councilor in 1880, and Under-Secretary of State for the Colonies in 1886, and was made a baronet in 1892. He carried through Parliament the act abolishing corporal punishment in the army, besides many other beneficial measures, especially that securing married women's property ownership. He acted as chairman of various committees of Parliament, including that on land titles and transfer in 1887–88, and that on law and trade bills in 1888–93. He wrote political pamphlets on *Land Reform in England*, *Disestablishment in Wales*, etc., and a standard work on chancery practice. D. in London, Aug. 25, 1897.

Morgan, James Appleton: author; b. in Portland, Me., Oct. 2, 1850; graduated at Racine College, Wisconsin, and at the law school of Columbia College, New York, in 1869; began the practice of law in New York in 1871, but devoted most of his time to literature. In 1877 he formulated a theory as to the authorship of Shakespeare's plays, which was published in *Appleton's Journal.* His suggestion was that the plays as printed in 1623 presented a growth founded on plays originally produced by Shakespeare, with additions and alterations by actors and stage censors. In 1885 he founded the Shakespeare Society of New York. His Shakespearean work includes an edition of the plays and poems; *The Shakespearean Myth, or William Shakespeare and Circumstantial Evidence* (Cincinnati, 1881); *Some Shakespearean Commentators* (1882); *Venus and Adonis, a Study in the Warwickshire Dialect* (New York, 1885); *Shakespeare in Fact and in Criticism* (1887); and *Digesta Shakespeareana*, a topical classification of publications about Shakespeare's writings (1887). He has published also *Macaronic Poetry* (1872); *Note to De Colyar on Guaranty and Suretyship* (1874); *The Law of Literature* (2 vols., 1875); *Notes to Best's Principles of Evidence* (2 vols., 1876); and *Notes to Addison on the Law of Contract* (3 vols., 1876).

Morgan, John Pierpont: banker and financier; b. in Hartford, Conn., Apr. 17, 1837; son of Junius Spencer Morgan, a banker and partner of George Peabody, the philanthropist; educated at Boston high school and University of Göttingen; returned to the U. S. and entered the banking business in 1857; in 1864 founded the copartnership of Dabney, Morgan & Co.; in 1871 became a member of the firm of Drexel, Morgan & Co., which was changed in 1895 to J. P. Morgan & Co. He has been connected with most of the large financial railroad operations in the U. S. for nearly thirty years, and has reorganized or has been influential in promoting the financial credit of the New York City and Northern Railroad 1895; Chesapeake and Ohio Railroad 1888; Southern Railway 1891; and of the Erie system, the Reading system, and others. He is a director in the New York Central, New York, New Haven and Hartford, Baltimore and Ohio, Southern Railway, and others; and is largely interested in the General Electrical Company. He is prominent among dog, horse, and flower fanciers, and in yachting circles, and has been the donor of many rich gifts to scientific and charitable institutions.

F. Sturges Allen.

Morgan, Lewis Henry, LL. D.: anthropologist; b. in Aurora, N. Y., Nov. 21, 1818; graduated at Union College in 1840; studied law, and practiced in Rochester, N. Y., 1844–64; member of Assembly in 1861; State Senator 1868–69. In 1844, because of his connection with a secret society called the Grand Order of the Iroquois, he visited the Indians of New York State, was adopted by a tribe of Senecas, and began a study of their social organization and government. In 1847 he began to publish in the *American Review* a series of *Letters on the Iroquois*, and in 1851 his first book, *The League of the Iroquois*, appeared, giving a thorough and scientific account of the home life and organization of the Six Nations. In 1858, being then in Marquette, Mich., he learned that the Ojibwas' government and customs were similar to those of the Iroquois, and this led to further investigation. Information obtained through personal research and correspondence, covering the systems of kinship of more than four-fifths of the world, was published by the Smithsonian Institution in 1869, entitled *Systems of Consanguinity and Affinity of the Human Family*, and from the same material a treatise on *Ancient Society* was made (New York, 1877). He wrote also *The American Beaver and his Works* (Philadelphia, 1868) and *Houses and House Life of the American Aborigines* (Washington, 1881). He received the degree of LL. D. from Union College in 1873, was elected a member of the National Academy of Sciences in 1875, and was a member of other scientific societies. In 1879 he was president of the American Association for the Advancement of Science. D. in Rochester, N. Y., Dec. 17, 1881.

Morine, Alfred Bishop: lawyer and journalist; b. in Port Medway, Nova Scotia, Mar. 31, 1857; educated at the local schools and at Dalhousie University, Halifax, and was called to the bar in 1894; became correspondent at Ottawa for the *Halifax Herald* and *St. Johns Sun*; subsequently editor of the *New Era*, Halifax, and *The Spectator* of Annapolis; removed to Newfoundland, and became editor of the *St. Johns Mercury* (1883–85) and of the *Herald* (1889–91); was elected to the Legislature in Buenavista in 1886 and retained his seat until 1889; in 1890 was chosen one of the people's delegates to England in connection with the French treaties question, and in 1891 also. He is a supporter of a union of the Canadian provinces, and incidentally of protection and union with Great Britain.

F. Sturges Allen.

Morley, Edward Williams, M. D., Ph. D., LL. D.: chemist; b. in Newark, N. J., Jan. 29, 1838; graduated at Williams College in 1860, and then turned his attention to teaching, devoting himself chiefly to chemistry, which soon became a specialty with him. In 1869 he was called to the chair of Chemistry in the Western Reserve University, which institution, then in Hudson, O., has since removed to Cleveland, and under the name of Adelbert College now forms part of the Western Reserve University. This chair, together with a similar one in the Cleveland Medical College, he has since continued to fill. Prof. Morley has devoted his attention very largely to a consideration of the redetermination of the atomic weight of oxygen. This investigation, extending over a decade, was brought to a successful completion in 1885, when he definitely showed that the atomic weight of that element by three methods was 15·879,

with a possible error in the fourth decimal place. The results of this magnificent investigation were published in the *Smithsonian Contributions to Knowledge* in 1896, under the title *On the Densities of Oxygen and Hydrogen and on the Ratio of their Atomic Weights*. He has also been associated with Prof. Albert A. Michelson, of the University of Chicago, and with Prof. William A. Rogers, of Colby University, in investigations of a chemical-physical nature that have gained for him a high reputation. For the prosecution of his work on the determination of the atomic weight of oxygen he gathered a library of chemical periodicals which is unique in the U. S. He was president of the American Association for the Advancement of Science in 1895, was elected president of the American Chemical Society for 1899, and since 1897 has been a member of the National Academy of Sciences. His publications have appeared in chemical journals both in the U. S. and abroad, and in the *Proceedings* of the various societies of which he is a member. MARCUS BENJAMIN.

Morphy, PAUL CHARLES: chess-player; b. in New Orleans, La., June 22, 1837; exhibited from childhood surprising skill in chess, and at the age of twelve had defeated the best players of his native city; graduated at St. Joseph's College; studied law, and was admitted to the bar in 1857; at the chess congress in New York in 1857 was the victor, thereby becoming the champion player of the U. S.; in 1858 visited Europe; gained a victory over Löwenthal and others in London; defeated the best French and German players, and gave exhibitions of his ability to play eight games simultaneously without seeing the chess-boards. Later he suddenly abandoned chess-playing, and conceived such an abhorrence therefor that it almost drove him into a frenzy to hear the subject mentioned. D. July 10, 1884.

Morton, OLIVER PERRY: statesman; b. in Saulsbury, Wayne co., Ind., Aug. 4, 1823; studied for two years at Miami University; afterward studied law and was admitted to the bar in 1847, and began practice in Centreville, Ind. He was elected circuit judge in 1852, but was deprived of the office under the new State constitution of the next year, when he studied for a year in Cincinnati before resuming practice. He had been a Democrat, but in 1854 was active in forming the Republican party, and was its candidate for Governor, but was defeated. In 1860 he was elected Lieutenant-Governor, and in Jan., 1861, became Governor through the election of Gov. Henry S. Lane to the U. S. Senate. When President Lincoln called for volunteers Indiana's quota was raised at once, and Gov. Morton became famous through his energetic measures toward placing troops in the field and providing for their care and sustenance, as one of the "war Governors." He was opposed by a Democratic Legislature in 1863, and would have been deprived by it of his military control had not the withdrawal of Republican members left the Legislature without a quorum. Gov. Morton borrowed money for government expenses, and appointed a bureau of finance to control its disbursement, and this course was at first condemned, but afterward so thoroughly approved that he was again elected Governor in 1864. He was elected to the U. S. Senate in 1867, and again in 1873. He served on the committees on foreign relations, agriculture, military affairs, elections, and land claims, and was active in the impeachment proceedings against President Johnson. In the Republican convention of 1876 he received 124 votes on the first ballot for a Presidential candidate. He was a member of the electoral commission in 1877. After having a paralytic stroke in 1865 he was obliged always to use crutches. D. in Indianapolis, Ind., Nov. 1, 1877. See *Life and Public Services of Oliver Perry Morton* (Indianapolis, 1876).

Morton, WILLIAM THOMAS GREEN: dentist; b. in Charlton, Mass., Aug. 19, 1819; d. in New York city, July 15, 1868. He studied dentistry in Baltimore in 1840, and in 1841 he returned to Boston. While practicing his profession he attended medical lectures, and studied chemistry in the laboratory of Dr. CHARLES T. JACKSON (*q. v.*), and there became acquainted with the anæsthetic properties of sulphuric ether. After experimenting on himself, he successfully administered it to a dental patient Sept. 30, 1846. The new anæsthetic was first used publicly by Dr. John C. Warren in an operation at the Massachusetts General Hospital, Oct. 16, 1846. Morton's claim to the discovery was hotly contested, notably by Dr. Jackson and Horace Wells. The French Academy, after an investigation, of the Montyon prize awarded 2,500 francs to Dr. Jackson for the discovery, and 2,500 to Dr. Morton for its application to surgical operations. A monument commemorating the discovery was presented to the city of Boston by Thomas Lee in 1868.

Mosby, JOHN SINGLETON: soldier; b. in Powhatan co., Va., Dec. 6, 1833; entered the University of Virginia; before completing his course was fined and sentenced to imprisonment for wounding another student by shooting, but was afterward pardoned and his fine remitted; studied law during his imprisonment; was admitted to the bar soon after his release, and practiced in Bristol, Washington co., Va. At the opening of the war in 1861 he enlisted as a private in the Confederate cavalry, and served under Gen. Joseph E. Johnston in Shenandoah valley, and at Manassas. In Feb., 1862, he was made adjutant of his regiment, but was reduced to the ranks after two months. Serving as a scout on June 14, 1862, he guided Gen. James E. B. Stuart's brigade in a raid against Gen. McClellan on the Chickahominy. In Jan., 1863, he recruited a force of irregular cavalry in Northern Virginia, which he employed in cutting off communication and destroying supply-trains. When not engaged in a raid his men were dispersed and concealed, with orders for assemblage at a set time and place. At Chantilly, Mar. 16, 1863, he defeated a cavalry force much larger than his own. At Dranesville, Apr. 1, 1863, he defeated a force sent especially to capture him. His force was scattered at Warrenton Junction, but was reorganized, and cut its way through Gen. Hooker's lines. In May, 1864, Mosby's operations compelled Gen. Grant to detail a special force of cavalry to protect his communications. Mosby was commissioned captain in March, 1863, major two weeks later, and colonel some time afterward. On Apr. 21, 1865, his regiment was disbanded, and he returned to the practice of law in Warrenton. In 1872 he supported Gen. Grant as a candidate for the presidency, and gave as a reason therefor his opinion that Southern support of the Republican party was the best means for attaining tranquillity and home rule. It is said that a letter written by him to the New York *Herald* in 1876 contained the first use of the phrase "the solid South." He was consul at Hongkong for six years just preceding President Cleveland's first administration, and afterward practiced law in San Francisco, Cal. In Dec., 1886, in Boston, he delivered a lecture on Stuart's cavalry, which was repeated in other places, and published in a book entitled *War Reminiscences* (Boston, 1887). See *Partisan Life with Mosby*, by John Scott (New York, 1867), and *Mosby and his Men*, by J. Marshall Crawford (1867).

Mosler, HENRY: artist; b. in New York city, June 6, 1841; went with his family to Cincinnati in 1851, and to Nashville in 1854; having evinced a talent by engraving on blocks with crude tools, was instructed in drawing by his father, and afterward in painting in oil by George Kerr, an amateur; returned to Cincinnati in 1855, and worked there a year as draughtsman for the *Omnibus*, a comic weekly; was a pupil of James H. Beard 1859–61; followed the Western army as art correspondent for *Harper's Weekly* 1862–63; was appointed on Gen. William Nelson's staff; painted portraits of various generals; studied in Düsseldorf and Paris 1863–65, spent the next eight years in the U. S., obtaining national reputation through his painting *The Lost Cause*, and studied under Piloty in Munich 1874–76, during this time winning a medal at the Royal Academy; since 1877 has resided in Paris. His picture *Le retour*, exhibited at the Paris Salon of 1879, was bought by the French Government for the Musée du Luxembourg. In 1885 he received for his *Last Sacrament* one of the four cash prizes at the exhibition of the American Art Association. Among his best-known works are *Early Cares* and *Quadroon Girl* (1878); *The Return* and *Les femmes et les sécrets* (1879); *Purchase of the Wedding Gown* and *Spinning Girl* (1880); *Night After the Battle* and *Return of the Fisherwomen* (1881); *Discussing the Marriage Contract* (1882); *Wedding Morning* and *Rainy Day* (1883); *Last Sacrament* and *Village Clockmaker* (1884); *Approaching Storm* (1885); and *Visit of the Marquise* (1886–87).

Most Favored Nation Clause: in the law of commercial treaties, a treaty clause which binds each of the treaty-making powers to give to all the contracting parties all the privileges which it then gives, or afterward may give, to that nation which receives from it the most favorable terms in respect to those matters. An example of such stipulation is the treaty or agreement on the subject of trade-marks made between the U. S. and Great Britain in 1878, which

provides that "The citizens of each of the contracting powers shall have, in the dominions and possessions of the other, the same rights as belong to native subjects and citizens, or as are now granted or may hereafter be granted to the subjects and citizens of the most favored nation, in everything relating to trade-marks and trade labels." If strictly observed such a clause would often result in compelling a power to grant to another power concessions actually or supposedly inimical to its own interests, without an equivalent concession or recompense from the other; but this difficulty has been avoided by construing the doctrine to mean that such a clause applies only to gratuitous concessions, and does not entitle the nation claiming under it to the privileges given to some other nation in return for corresponding privileges unless the party claiming under it offers a fair consideration for them. See Wharton's *International Law Digest.*

F. STURGES ALLEN.

Moszkowski, MORITZ: pianist and composer; b. in Breslau, Germany, Aug. 23, 1854, and studied in Dresden and in Berlin, where he settled permanently. He has composed a large number of pieces for the piano, many of them very brilliant, also *Johanna d'Arc*, a symphony; several works for violin and violoncello with orchestra; a violin concerto, suite for orchestra, and other orchestral works, and an opera, *Boabdil.*

D. E. HERVEY.

Motor Carriages: Motor carriages are not a new creation. The first work in this line of which we have any well-authenticated record was by a Frenchman, Cugnot, in 1770. He constructed an operative though crude steam-carriage for heavy-draught service, and this machine is still preserved in the Conservatoire des Arts Métiers, Paris. These experiments, which were carried on under the auspices of the Government, do not appear to have been prosecuted with much energy, and a few years later the French Revolution effectually checked all progress in the new art. In England the subject was attacked with great ingenuity, skill, and energy, and for a long time the steam road-carriage was regarded as offering a better solution of the question of rapid transit than the steam-railway. An operative steam-carriage was constructed in Halifax, England, by Robert Fourness in 1788, and Nathan Reed, of Massachusetts, constructed and operated a steam-carriage in the same year. In 1803 Jean Richard Trevithick built a steam-carriage and ran it on the highway in and about London.

From 1820 to 1840 was a very busy period with inventors of motor carriages. The most successful of these were Walter Hancock and Goldsworth Gurney. Hancock constructed ten steam-carriages during this period. They were mostly of the double-body coach type, and were the most efficient and practical self-propelled vehicles of his time. Several of these were run regularly from London over certain routes, and remained in service some time.

Gurney built a series of carriages propelled by steam, and operated them regularly, carrying passengers between Gloucester and Cheltenham for four months. In 1834 the Steam-Carriage Company of Scotland was formed, and it operated a line of steam-coaches for the conveyance of passengers between Glasgow and Paisley, which plied hourly for several months with regularity. The distance is 7 miles, and the trip was made in thirty-four minutes, a speed of 17 miles an hour being obtained in the open country.

About 1834 a very strong prejudice was aroused in England against the new form of road locomotion. This was largely instigated by the railroad companies, rapidly growing in power, who foresaw serious competition in the steam-carriage, and it found a ready welcome with the ignorant rustic class, always opposed to new inventions, and with the general public, which had been recently alarmed by several serious motor-carriage accidents. The result was the passage of a parliamentary act imposing such onerous conditions upon the operation of road carriages as practically to prohibit their utilization. This was a serious setback to progress in England, and it remained without repeal or modification until 1896.

Experiments up to the present time have been conducted with steam as a motive power, and have resulted in the development of practical types of heavy steam vans, trucks, omnibuses, and other vehicles for heavy work and low speed, and these have been commonly used in France, and to a limited extent in England, since 1850.

Although the principle of the gas-engine was understood as early as 1794, when a patent on this form of motor was granted to Robert Street in England, and from this time engaged the attention of such men as Wright, Barnett, and Lenoir, not until the subsequent improvements by Dr. Otto, of Germany, in 1867, did steam have any competitor as a motive power; but the ability to construct a practical and reliable explosion engine, and the feasibility of substituting hydrocarbon oils for gas and carrying a very condensed fuel, such as naphtha, seemed at once to solve the question of an automatic vehicle motor.

Among the first to appreciate this fact and to set about constructing a practical vehicle was Gottlieb Daimler, of the Otto Gas-Engine Works in Cologne, Germany. Contemporaneous with Daimler large numbers of experimenters appeared in France, England, and the U. S., and at present (1899), while it can not be said that the gasoline carriage has reached the state of perfection necessary to warrant its general use, its future seems to promise a wide field.

The first public demonstration of what was being done was a contest of "automobile vehicles" held in Paris in the summer of 1894. This event marks an epoch in the history of trackless transportation. It was instituted by *Le Petit Journal* of Paris, and consisted of a trial of speed from Paris to Rouen and back. The vehicles registered for participation numbered 102. Of these, 15 appeared at the start on the day of the race, 2 being steam-vehicles and 13 propelled in various ways, by the exploding of gasoline or naphtha. The winner was a vehicle propelled by a Daimler gasoline motor, which covered the 75 miles of the course in 5 hours and 40 minutes.

In June, 1895, a race from Paris to Bordeaux and return, a distance of 705 miles, was arranged, for which 28 vehicles appeared at the start. Twelve vehicles reached Bordeaux, and nine made the complete trip. The time of the winner was 48 hours and 48 minutes, and again a vehicle propelled by a Daimler gasoline explosion motor finished ahead. Of the nine vehicles completing the course but one was run by steam, and that was a very heavy and cumbersome affair. In these contests vehicles propelled by electric storage batteries appeared, but in every case had failed to make any important showing in a field now recognized not to have been theirs.

In Nov., 1895, in Chicago, the *Times-Herald* of that city inaugurated a contest for motocycles, as they were called. This was to consist of a trial of speed and practicability between Chicago and Milwaukee, 100 miles. On Nov. 2, the day set for the contest, but 2 vehicles were prepared to start, and it was postponed until Nov. 28. On this date 15 vehicles appeared. Of these, 7 were propelled by gasoline, 1 by steam, and 7 by electricity. On the day of the start Chicago was covered with a deep fall of snow, and the route had been changed to Evanston and return, 54 miles. At the final start only 6 vehicles were prepared to compete, 4 gasoline and 2 electric, and of these but 2 finished, both gasoline. The winner was an American motor vehicle, constructed by Charles Duryea, of Springfield, Mass. The other finisher was A. Mueller, in a German vehicle built by Benz, of Mannheim, Germany. Duryea's time for the 54 miles was 10 hours and 23 minutes.

This contest, though of little intrinsic worth, was the beginning of the horseless-vehicle epoch in the U. S., and was largely instrumental in attracting the attention of inventors and capitalists to this new art, which has since grown to large proportions, and is fairly started on a career of economic usefulness. From this time, contests and races of all descriptions have followed one another with great frequency, the principal of which have been the London *Engineer* contest of 1896, to celebrate the modification of the odious English road laws; a race from Paris to Marseilles and return; a trial of heavy vehicles in Liverpool in the summer of 1898; and a contest of passenger-carrying cabs in Paris in 1898, on the results of which was based the decision to transform the entire Paris cab service from horse-drawn vehicles to electric automobiles. London and New York have large and well-equipped electric-cab stations, and the utility of the electric carriage for this branch of service has passed all expectations and greatly stimulated the interest of producers of electricity.

General Construction.—The construction of motor vehicles has been very much aided and simplified by the results of the development of the bicycle with its improved tires, and especially is this the case with the lighter forms of road-carriages where it has been possible to combine speed, strength, and comfort through the use of ball-bearings, bicycle construction, and pneumatic tires. Motor-carriage construction of course exhibits great differences of

detail, besides variations necessary through the difference in the conditions of service imposed.

For vehicles of light construction, intended for high speeds, steel rims and tangential steel-wire spokes are employed in the better class, and the wheels are usually fitted with large pneumatic tires made with a very thick outer shell. For the heavier class of vehicles wooden wheels are found preferable, and for hard roads the solid-rubber tire is used by the majority of makers. Nearly all builders concur in the advisability of using ball-bearings on the lighter vehicles. For the heavier variety ball, plain, and roller bearings are all used.

One feature employed by nearly all carriage-builders is a balance or compensating gear. The driving-gears then are not keyed to the same axle, but are connected through this compensating gear, which is so constructed as to admit of the wheels revolving at different rates of speed when turning corners, thereby avoiding the injurious slipping of the outer wheel which would occur were the wheels rigidly connected. The same result is sometimes attained in electric carriages without mechanical means, but through the use of two independent driving motors, one attached to each wheel, electrically connected in such a way as to give the proper increment to the outer wheel in turning; or, again, through the use of a peculiarly constructed motor, the field of which, capable of rotation, is geared to one driving-wheel through an internal gear, while the armature is geared through an external gear to the other driving-wheel. This object is accomplished in a great variety of ways, but the purpose is the same in each case as that of the device used on the tricycles of fifteen years ago.

Steering is sometimes done through the ordinary king-bolt method, but oftener and with better results by individually pivoting each front wheel at the end of the axle and causing them to turn through the proper angles by a system of links connected to the hand-steering lever. As can be readily seen, the latter leaves various opportunities for improving the faults of steering at high speeds, which do not exist in the former.

Speed-control is closely associated with the character of the motive power. In the case of the steam-carriage variations of speed are obtained by some form of link motion, as is done with the ordinary locomotive. In the case of the gasoline-engine the speed can not be varied beyond certain comparatively narrow limits which have proved acceptable to the users, and it becomes necessary to use two or more separate trains of gears, and different speeds are obtained through the medium of a gear-shifting device which transmits the power of the engine through any of the gearing-trains desired. The electric carriage lends itself most readily to the matter of speed-control, and mere changes in the battery connections, sufficient to alter the voltage applied at the motor, is all that is needed to get gradations of speed.

Brakes of all descriptions are employed on motor carriages, and this is, as may be seen, a question of vital importance. Some form of band brake operated by a foot-lever is usual and most satisfactory; but tire-brakes, consisting of a broad shoe pressed against the periphery of the tire, are in common use, especially on European carriages. The builders of electric vehicles often fit them with some form of electric brake, the usual principle of operation being the retardation or magnetic drag effected by running a motor as a dynamo through the momentum of the carriage. The employment of current generated in this way for recuperating the batteries is limited to hills of more than ordinary inclination, such as grades of 10 per cent. or more.

Speed.—The speed of an automobile can be made almost anything that the condition of the road and the intrepidity of the driver will permit. In France the maximum speed of automobiles is not limited by the character of the road surface, and for special purposes great speeds are obtained; but in current literature the speed of the French carriages has been greatly overstated, and this fact has been carried into the reports of French societies interested in the art. Few French carriages have speeds exceeding 20 miles an hour, and in the autumn of 1898 the best obtainable evidence indicated that but three automobiles in France had a maximum speed on the level of more than 25 miles an hour. Of these three but one had a speed of more than 30 miles an hour, and this one was reported to have gone from Paris to Amsterdam at an average speed of 25 miles an hour, and was driven by Baron De Knyff, who, with Charron and Bollée, holds the front rank among the automobile drivers. Such speeds as these are out of the question over any but the very best roads. In cities this fact, combined with police regulations, places at 12 miles an hour the maximum speed to be provided by the builder.

Steam-Carriages.—The application of steam to automobiles presents no novelty in principle, for exactly the same character of engine is required as on the ordinary locomotive, though of course lighter and less powerful. The real obstacle in the way of a successful steam-vehicle lies in the care and attention necessary to bestow upon the boiler and its accessories. Simple as is the steam-carriage in most particulars, its operation under the best conditions requires the full attention of a trained mechanic. Steam transportation has been reasonably successful only where conditions of operation and current wages of operators have not prohibited the employment of two operators, or where the speed has been reduced to such an extremely low mark as to require the supervision of but one man. The most successful system of steam carriage propulsion is probably that devised by M. Serpollet, a Frenchman. This has been applied with success to heavy omnibuses, vans, road-tractors, and tramways, but, by reason of the great weight of boiler required, is not applicable to the lighter class of road-vehicles. His invention, in brief, consists of a peculiar form of boiler which he calls an instantaneous steam-generator. It is a water-tube boiler, the tubes being made of steel pipes with very thick walls and flattened out so as to leave a small slit called the capillary space. These tubes are exposed to a very hot flame, and, containing as much highly heated metal as they do, are not cooled by the small amount of water passing through the interior slit, but instantly vaporize it, and the interior walls maintain their temperature by conduction of heat from the exterior. It is claimed that this boiler can be run for a long time without injury with no water whatever in the tubes, and in fact it is by regulating the amount of water fed to the boiler that Serpollet obtains his variations of speed. Since the boiler is without capacity—that is, all the steam generated immediately passes into the engine—the moment the water ceases flowing the engine stops. The greater number of steam-carriages use some form of tubular boiler, which is non-explosive, and apply the heat through a gasoline burner, this being the most convenient fuel obtainable. Among the steam-vehicles in commercial use may be mentioned a line of goods-vans, built by the Liquid Fuel Engineering Company of London, and operated between London and Birmingham.

Petroleum or Gasoline Carriages.—To this class belong all those vehicles employing engines or motors actuated by the explosion of hydrocarbon vapors. The Otto principle of explosion engine is used almost exclusively. It consists of a cylinder and piston which act alternately as pump and motor—that is, there is one effective or working stroke only in two revolutions of the crank-shaft. At the first forward stroke a mixture of air and gas is sucked in; on the return stroke this is compressed; on the second forward stroke this mixture is ignited in one of several possible ways, and an explosion results, driving the piston forward and storing up the resulting surplus energy in a fly-wheel large enough to do the work required of the engine between the separate working strokes. On the second return stroke the exhaust or burned gas is expelled. The application of explosive engines to carriages was never successful until the principle of the compressed charge was applied. Explosion engines used on motor carriages almost universally employ the vapor of common gasoline to form the explosive mixture. This is obtainable anywhere, and is a cheap and condensed form of fuel. With few exceptions, the gasoline is vaporized and intimately mixed with air before entering the explosion-chamber. The device for vaporizing the oil is known as the carburetter, and in its simplest form consists of a tank containing a certain amount of gasoline through which air is drawn by the suction of the piston, becoming saturated in its passage with the vapor of the volatile oil. This vapor, however, must be mingled with a certain amount of air before a truly explosive mixture is reached, and this is accomplished through some form of regulating valve which permits the control of the richness of the mixture. A form of aspirating carburetter, in which the gasoline is sucked up in a fine needle-like jet and sprayed in the midst of an inrushing current of air, is the one in most common use.

The extremely high temperature accompanying the explosions and the frequency with which these take place——several hundred a minute—results in greatly overheating the cylinder-walls, and necessitates the use of some cooling device, usually a water-jacket, and a small pump to maintain the circulation of the water around the cylinder and through a coil of pipe exposed to the air, where it dissipates the heat acquired from the cylinder. On the smaller engines this complication is often dispensed with, and the cooling effect of the air coming in contact with a large number of radiating vanes, which form a part of the cylinder and explosion-chamber, relied upon to keep the engine at a moderate temperature. This method of cooling will be observed on all the small motocycles, voiturettes, etc., where simplicity is essential. Currents of air forced by fans have also been employed.

The ignition of the explosive mixture may be effected by an electric spark or by the hot-tube method. In the spark method an induction coil is employed to force a spark at the proper instant between two conducting points or electrodes in the explosion-chamber, surrounded by the mixture of gas and air. This of course necessitates carrying a source of electrical energy, which is usually in the form of two small cells of dry battery. In the hot-tube method of ignition the chamber is fitted with a small platinum tube projecting outward therefrom and kept at a high temperature by a gasoline burner placed beneath. The vapor filling the chamber and the interior of the tube comes in contact with its heated sides, which, however, are not at a temperature high enough to ignite it under the conditions of pressure obtaining. As the piston returns, the gas is compressed, and at the point of greatest compression—that is, at the end of the stroke—the temperature of the tube is sufficient to explode the mixture. This apparently crude device has been used with great success on many carriages. The French racing carriages are almost all provided with hot tubes. As will be seen from a consideration of the events taking place in the cylinder of a gas-engine, this motor can not be self-starting like a steam-engine, but some mechanical means of previously compressing the gas before an explosion can take place must be used. This is ordinarily effected by turning the engine over once or twice through the medium of a hand-wheel placed conveniently near the driver, which is thrown out of gear when the engine starts.

The advantages of the gasoline-engine consist in the cheap, compact, common, and well-known character of the fuel. At a price of ten cents a gallon for gasoline a well-built carriage with two passengers should be run at an expense of less than half a cent a mile. The main disadvantages are the disagreeable odor, which has been greatly exaggerated in current literature, noise of the exhaust-gases, and vibrations and shocks of the engine which seem inseparable from this form of motor, and its rather uncertain action due to its sensitiveness to changes of temperature, mixture, and the exhaustive wear upon the operating parts which the high working temperature necessitates. Devices have been employed which almost entirely overcome the disagreeable odor and the noise of exhaust, while shocks and vibrations are to a large extent questions of workmanship. The prevailing and important defects of the gasoline-engine, which have resulted to the advantage and the spread of the electric carriage in its own peculiar though limited field, are the numerous functions which must be performed as a result of the sensitiveness to changes of atmospheric conditions just referred to, and to the fact that the motor requires in operation the same general attention which would be demanded by any engine.

Electricity as a Motive Power.—The electric carriage makes use of electricity stored in the form of chemical energy in accumulators or storage batteries. A storage battery consists of a positive plate containing lead peroxide and a negative plate of porous lead immersed in an electrolyte of dilute sulphuric acid. This combination forms a type of battery that can be discharged in the same way as the ordinary primary cell, and acts on exactly the same principle, and when discharged either fully or partly the battery can be connected to a source of electrical energy and the chemical compounds on the plates, resulting from the passage of the discharge-current, transformed into their original constituency by forcing an electric current between the plates in a reverse direction. If this reverse current is continued sufficiently long, all the active material of the battery becomes reconverted to its original chemical form, and the battery is said to be charged, for it is now again able to yield current to the extent of its full capacity, and this process of charge and discharge may be carried on indefinitely. It is evident that although electricity is put into the cell and later withdrawn, it is really a storage of chemical energy that is effected, which on discharge is manifested as electricity.

Although the principle of the lead storage battery has been well known since 1860, it is only since 1890 that its increasing fields of usefulness and extended application to the industrial arts have demanded due attention to improvements and refinements in its manufacture. Still more recently the peculiar conditions of road-vehicle service have demanded a form of lead storage battery which should possess with other essentials lightness and durability, but already storage batteries are available which conform sufficiently to the requirements to make the electric vehicle both serviceable and commercially practical. The immense superiority of control and the simplicity of the motive power in electric vehicles have, in fact, a strong tendency to extend this field beyond its most advantageous limits and to produce a willingness to accept relatively low standards of performance in storage batteries.

The relatively poor character of American roads has greatly retarded, and up to the present time almost prevented, the introduction of types of automobiles whose principal recommendation lies in unlimited radius of action, and it is not surprising that the world must still look to France as a leader in the production of vehicles propelled by gasoline, if not also in the degree of their development; while in England possibly the extreme conservatism may account for the fact that such development as has been made in that country in the new art has been along the lines of the steam-carriage.

A special form of motor on electric vehicles reduces all noise to a minimum. The controller-handle, placed conveniently at the left of the operator, gives three speeds through the medium of a very simple controller. The steering-handle, placed at the right of the driver, and a foot-lever operating a powerful and quick-acting band brake, complete the apparatus necessary for a thorough control of the carriage. For the average person but a few hours' trial is necessary to give skill and familiarity in all phases of the operation. A mileage of 30 is the normal amount for these vehicles, although much more than this has often been obtained. For a two-passenger carriage at the prices ordinarily prevailing in American cities, the cost per mile is one cent or slightly more. This type of carriage is rapidly coming into vogue.

The advantages of the electric carriage are cleanliness, flexibility, ease and completeness of control, simplicity, freedom from noise, odor, and vibration, and, compared with the horse, economy of operation (within the limits of reasonable deterioration). Its disadvantages are the weight of the battery and its limited mileage.

Mott, Lucretia (*Coffin*): reformer; b. in Nantucket, Mass., Jan. 3, 1793; daughter of Capt. Thomas Coffin, a descendant of one of the original purchasers of the island of Nantucket; went with her parents to Boston, Mass., in 1804; was educated in a school taught by James Mott (1788–1868), a member of the Society of Friends and a prominent anti-slavery worker, to whom she was married in 1811; became a teacher in Philadelphia in 1817, and entered the ministry of the Society of Friends in 1818; was a Hicksite after the division of the society in 1827. Mrs. Mott was one of the most prominent participators in the movement against slavery. She was one of the founders of the American Anti-slavery Society in Philadelphia in 1833, and thereafter participated in the organizing of various female anti-slavery societies. In 1840 she went to London as a delegate of the American Anti-slavery Society to the world's anti-slavery convention, but women were excluded as members. This action of the convention led to the woman's-rights movement, in which Mrs. Mott was a leader, she being one of the four women who called a convention in Seneca Falls, N. Y., in 1848, and afterward devoting much of her effort to the procurement of a better legal and political status for women. For some years she was president of the Pennsylvania Peace Society. As a preacher she made various journeys through New England, New York, Pennsylvania, Maryland, Virginia, Ohio, and Indiana. D. near Philadelphia, Pa., Nov. 11, 1880. See her

Life, with that of her husband, edited by her granddaughter, Anna Davis Hallowell (Boston, 1884).

Moulton, Richard Green, Ph. D.: educator; b. in Preston, England, May 5, 1849; studied at New Kingswood School, Bath, and Clevedon College, Northampton; B. A., University of London, 1869; B. A., University of Cambridge, 1874, and M. A. 1877; Ph. D., University of Pennsylvania, 1891; extension lecturer to the University of Cambridge 1874–90; extension lecturer to American Association for Extension of University Teaching 1890–91; extension lecturer to London (England) Society for Extension of University Teaching 1891–92; Professor of Literature in English, University of Chicago, since 1892. He is author of *Shakespeare as a Dramatic Artist*; *The Ancient Classical Drama*; *The Literary Study of the Bible*; *The Modern Reader's Bible* (21 vols.). C. H. Thurber.

Mountain, George Jehoshaphat, D. D., D. C. L.: Anglican bishop; b. in Norwich, England, July 27, 1789; son of Bishop Jacob Mountain; educated at Trinity College, Cambridge; took orders 1812 and 1813; held rectorships in Fredericton and Quebec, of which in 1821 he became archdeacon: was Bishop of Montreal 1836–50; Bishop of Quebec 1850–62; author of *Songs of the Wilderness* (1846); *Journal of a Northwest Mission* (1853); founded in 1844 the Bishop's College, Lennoxville. D. near Quebec, Jan. 6, 1863.

Mountain, Jacob, D. D.: Anglican bishop; b. at Thwaite Hall, Norfolk, England, 1750; was educated at Cambridge, and received valuable church preferments. In 1793 he was appointed Bishop of Quebec, and was the first Anglican prelate in Canada. He was distinguished for the faithfulness with which he performed the severe duties of his ecclesiastical position, as well as the important *ex-officio* civil functions which then attached to his office. D. June 16, 1825.

Mount Vernon Ladies' Association of the Union: the oldest patriotic association of women now in existence in the U. S., founded in 1854 by Miss Ann Pamela Cunningham, of South Carolina. Its object was to teach the people of the U. S. to remember Washington and his great achievement, and its immediate purpose was the raising of funds to purchase the Mount Vernon estate, including the mansion and Washington's tomb. In 1674 a tract of 5,000 acres on the west bank of the Potomac river, 15 miles S. of the present city of Washington, was granted to John Washington and Nicholas Spencer by Lord Culpepper. Of this estate one-half was inherited by Lawrence Washington, who in 1743 built his residence there and named the property Mount Vernon in honor of the British admiral under whom he had served. On his death, in 1752, the estate passed to his half-brother, George Washington, who then made it his home, and who bequeathed it to his nephew, Bushrod Washington, who became its owner on the death of Martha Washington in 1802. From Bushrod it passed to his nephew, John Augustine Washington, and then to John Augustine Washington, Jr., who, unable to keep his inheritance in a proper state of repair, endeavored, in accordance with the wishes of the family, to effect its permanent preservation by selling it to the national Government. This plan failed, as did also an attempt to dispose of it to the Commonwealth of Virginia. It was in consequence of these failures that Miss Cunningham organized the Ladies' Association and appointed vice-regents representative of the States of the Union to aid in the work. An appeal was then made to the country for the desired amount of money. The first contribution came from the Laurens district in South Carolina, and it was soon followed by donations from every section of the country. The greatest interest, however, was created by the celebrated oration on Washington by Edward Everett, who prepared it and delivered it seventy times for the benefit of the Mount Vernon fund, thus giving to its treasury more than $40,000. Masonic lodges and other organizations came forward with liberal contributions, until in Mar., 1858, the association was able to purchase from Mr. John A. Washington, Jr., and his heirs 200 acres of the Mount Vernon estate, including the tomb, the mansion, attendant buildings, the wharf, etc., paying therefor $200,000 and interest. The Legislature of Virginia granted the association a proper charter, giving it permission to charge a suitable fee, "not exceeding twenty-five cents," to all visitors, for the care and maintenance of the property. On coming into possession of the estate ruin and decay were found on every side, but repairs were immediately instituted and a steamboat service established for the conveyance of visitors from Washington to Mount Vernon. Notwithstanding these necessary expenses, the association announced in Nov., 1859, that the last obligation had been canceled and the home of Washington was the property of the nation. In order to maintain Mount Vernon in a satisfactory condition, an endowment fund of $140,000 was started, but the civil war prevented its completion, and after the war it was found that the money collected had been absorbed in the care of the estate and necessary repairs. Beginning with 1866, the annual meetings in May of the regents at Mount Vernon were resumed, and strong efforts were made to furnish the mansion with household furniture and belongings of Washington. For this purpose the several rooms were assigned to the special care of certain States, whose regents undertook their restoration; thus the main hall is cared for by Alabama, the music-room by Ohio, the banquet-hall by New York, the west parlor by Illinois, and the remaining rooms were suitably allotted. By this method the furnishing of the interior of the mansion has been accomplished, and as typical of the articles procured may be mentioned the sword worn by Washington at Braddock's defeat, the harpsichord and music-stool given by Washington to Nellie Custis on her marriage, and the rug woven by order of Louis XVI. and sent by him as a present to Washington. In 1887 a tract of 35 acres adjoining Mount Vernon was presented to the association by Jay Gould, so that at present the entire property includes 237 acres. The endowment fund is being restored, and when its interest becomes equal to the expenses the entrance-fee to the grounds will be discontinued.

Muir, John: naturalist; b. in Dunbar, Scotland, Apr. 21, 1838. He came with his parents to the U. S. in 1850 and settled near the Fox river in Wisconsin. He was graduated from the scientific department of the University of Wisconsin in 1864. He set out on a botanizing tour, wandering through the Southern States, Cuba, and California, settling in the latter place in 1868. In 1876 he joined a party connected with the geodetic survey of the great Basin; and in 1879 he made a tour of exploration in Alaska, where he discovered the great glacier now named after him. He was one of the first to make known the beauties of the Yosemite. He has published *The Mountains of California* (1894) and many magazine articles.

Muir, Mackenzie Montague: English lawyer and law writer; b. Sept. 29, 1847, and received his education at Charterhouse and Brasenose College and at Hertford College, Oxford University, and was a fellow of Hertford College 1874–88; was called to the bar in 1873, in which year he was appointed secretary to Lord Chief Justice Coleridge, which position he retained till 1877; was made recorder of Deal in 1892, and recorder of Sandwich and bencher of the Middle Temple in 1894. He is the author of several standard legal works, including editions of Mackenzie on *Bills of Lading*; of Chalmers and Mackenzie on the *Judicature Acts*; of Mackenzie and Lushington on the *Laws of Registration*; and of Mackenzie and Hough on the *Bankruptcy Acts*. F. Sturges Allen.

Müller, Georg Friedrich (commonly called George Müller): philanthropist; b. in Kroppenstädt, Prussia, not far from Magdeburg, Sept. 27, 1805. His youth was anything but exemplary. He did not hesitate to lie and to steal. He deliberately deceived his father and other beneficiaries, forged documents to effect a temporary purpose, and was at times drunken and unchaste. In 1825, while leading this evil life, he entered the University of Halle as a divinity student, for he expected to be a pastor. Later in that year he was converted, and determined to be a missionary. But his father's opposition prevented his going to the foreign field, and on Mar. 19, 1829, he became a six months' probationary missionary student of the London Society for Promoting Christianity among the Jews. But, chafing under the necessary restrictions the society put upon its probationers, he resigned in Jan., 1830, allied himself to the Plymouth Brethren, and a little later became minister of Ebenezer chapel, belonging to that denomination, in Teignmouth, a few miles south of Exeter. Convinced that believers were the only proper subjects for baptism, and that immersion was the only true scriptural mode of baptism, he was immersed early in that year, but he never was anything else than a Plymouth Brother. On Oct. 7, 1830, he married Miss Mary Groves, sister of Anthony Norris Groves, one of the founders of the Plymouth Brethren and

the benefactor of John Kitto. His wife was six years his senior. Her first child and her fourth were stillborn, date of birth Aug. 9, 1831, and June 13, 1838, respectively; her second child was Lydia, born Sept. 17, 1832, married Nov. 16, 1871, to a widower, James Wright, the present director of the institution which Mr. Müller founded, and died Dec., 1889; her third child was Elijah, born Mar. 19, 1834, died June 26, 1835. At the time of his sister's marriage, Mr. Groves was living as a volunteer missionary in Bagdad. His renunciation of home and country and devotion of his own and his wife's money to the Christianization of the world made a profound impression on George Müller, and led him to give up the salary of £55 which his church had agreed to pay him, abolish pew-rents, and depend solely upon the voluntary gifts of his congregation and others. He believed that God would on request supply all his wants if he had faith. Upon this principle he lived all the rest of his life, and though often in great straits, and face to face with absolute pennilessness, he calmly waited upon God to supply his wants, and they always were supplied. In the first full year of thus living on faith (1831) his income from the money placed in the chapel-box, and from presents in money, provisions, and clothing given by members and others, was £150, or nearly thrice what he would have received in the way of salary. At Teignmouth he made the acquaintance of the eminent Plymouth Brother Henry Craik, and they began, in 1832, joint ministerial labor in Bristol, and so continued until the death of Mr. Craik, in 1866.

On Feb. 20, 1834, Mr. Müller records in his diary his plan to establish "on scriptural principles an institution for the spread of the Gospel at home and abroad." On Mar. 5, 1834, a public meeting was called to inaugurate the Scriptural Knowledge Institution for Home and Abroad. Its objects were (1) to assist day, Sunday, and adult schools, provided they gave instruction by "godly persons" and upon "scriptural principles," to establish such schools and to put poor children in them; (2) to circulate the Holy Scriptures; (3) to aid missionary efforts. Its principles were never to solicit money from unconverted persons and never to go into debt.

In April, 1835, Mr. Müller revisited the famous A. H. Franeke's orphan house in Halle, where in his student days he had himself lodged. He was so much impressed with what he saw there that on his return to Bristol he determined to do something himself for orphans, and at the same time give public demonstration of the practical results of faith, for he intended to make no direct appeals. On Dec. 9, 1835, he called a public meeting and broached his plan. The money at once began to come in, and he rented a house to accommodate thirty girls. He had, however, forgotten to ask God for orphans to shelter, and the first day none were offered. This omission was at once supplied, and by 1837 he had three houses full. In 1843 he opened another. In June, 1849, he moved the orphanage to a house especially constructed at Ashley Down, just outside of the city, and on Nov. 12, 1857, he opened another there; on Mar. 12, 1862, another; the fourth on Nov. 5, 1868; the fifth and latest on Jan. 6, 1870. The money requisite for these large and costly buildings, as well as that for the maintenance of the work, has been raised without direct appeals, though the circulation of Mr. Müller's autobiography and of the reports of the work gives the orphanage wide publicity. Oftentimes there has not been money in hand to provide the next meal, but never has it failed to come in sufficient amount. These orphanages are branches of the Scriptural Knowledge Institution.

On Feb. 6, 1870, his first wife died. He preached her funeral sermon. On Nov. 30, 1870, he married Miss Susannah Grace Sangar, then in the fifty-seventh year of her age. With this wife he was able to carry out a long-cherished scheme —to preach the Gospel outside of Bristol and in foreign lands. He made his first missionary tour in 1875, but only through England; but in subsequent years, down to May, 1892, he and his wife were well-nigh continuously traveling, and they visited parts of the world as widely separated as India and Australia and the contiguous lands, Canada, and the U. S. In all he made seventeen tours, covered 200,000 miles by land and sea, and addressed more than 3,000,000 persons. The expenses of these tours were paid by voluntary gifts, coming, as he believed, in answer to prayer. While his orphanage was perpetually on his heart, he never spoke about it unless specially requested.

On Jan. 13, 1895, Mr. Müller's second wife died, and he conducted the whole funeral service for her. He did not marry again. In the last report (1896–97) he made on the work of the institution he showed that it was flourishing. From the beginning, 121,683 pupils had been in its schools; 281,652 Bibles, 1,448,662 Testaments, 21,343 psalters, and 222,196 other portions of the Holy Scriptures had been distributed; missionary operations had been carried on in many lands; 111,489,067 scriptural books, pamphlets, and tracts had been circulated; and 9,844 orphans had been cared for. "The total amount of money received, by prayer and faith, for the various objects of the institution," including the orphanage, had been £1,424,646 6*s.* 9½*d.*

Mr. Müller had frequent attacks of illness all his life, but retained to the end great recuperative powers. His death was caused by syncope, on Mar. 10, 1898, at Ashley Down, he being an inmate of one of the orphanage houses, Bristol.

His autobiography, *A Narrative of Some of the Lord's Dealings with George Müller, written by himself* (London, 1837–85, 4 parts, numerous reprints and several translations), tells the marvelous story of his success in raising money by prayer and faith and in carrying on expensive undertakings; his *Preaching Tours and Missionary Labors* (1883) recounts some of his journeys. See his biography by Arthur T. Pierson (New York, 1899). S. M. J.

Mulock, William, Q. C.: statesman; b. in Bond Head, Ontario, Jan. 19, 1843; graduated at the University of Toronto in 1863, and was admitted to the bar in 1868. He took his degree of M. A. in 1871, and received an honorary degree of LL. D. in 1894. He has held a seat in the House of Commons since 1882, and in 1890 was made a Q. C. He became Postmaster-General July 13, 1896, and while holding the office established a uniform rate of postage from Canada to all parts of the empire.

Mundy, Johnson Marchant: sculptor; b. near New Brunswick, N. J., May 13, 1832. In his boyhood, which was mainly spent at Geneva, N. Y., he manifested artistic tendency, and early received his first instruction in the art of drawing. Having been in the employment of an ornamental marble-cutter in New York city, in 1854 he entered the studio of Henry K. Brown, in Brooklyn, his first successful work in marble being a bust of Benjamin Hale. During his twenty years' residence in Rochester—where he settled in 1863 and opened the first school in that city for drawing and modeling—he produced many busts, statuettes, and medallions, among his more notable statuettes being *The Reaper*, *The Pilgrim*, and *Columbia*. His sight having always been defective, in his fifty-second year his left eye became entirely blind, and the right eye was seriously and progressively affected. Removing to the home of his sister, in Tarrytown, N. Y., he there, depending solely upon the sense of touch, modeled the statue for the soldiers' monument in that village, and produced his famous statue of Washington Irving. D. in Tarrytown, Aug. 16, 1897.

Municipal Assessments: By this term is commonly understood those impositions or burdens placed upon lands or property for benefit coming immediately and especially from local improvements, such as the establishment of a park, the grading of a street or thoroughfare, etc. In the U. S. such assessments are nearly always made by the local municipalities, which are authorized to make them by the laws of the State, and hence the subject is here treated; but there is nothing in the nature of them that prevents their being made by the central Government, when it is vested with power to do so. As here used, the term assessment is a special and specific application of its general use to signify the determination of the value of a man's property for purposes of taxation, or the value, or share of taxes, so determined. Although such assessments are in the nature of taxes, as here treated they are distinguished from taxes, as that term is generally understood; and this distinction has been constantly recognized in Great Britain in the acts of Parliament, which have distinguished between *taxes* for the benefit of the entire kingdom and *assessments* imposed for the improvement of local districts. In the U. S. the distinction is also recognized so that generally constitutional provisions requiring that "taxation shall be equal and uniform throughout the State," even when made applicable to municipal taxation, are held not to preclude by their intrinsic force such local assessments, and statutes exempting property from taxation are uniformly held not to exempt the property from such assessments; thus, a statute exempting a homestead, or the real estate of churches or charitable institutions, from taxation, does not make the property free from assessments

for local-improvement benefits, such as widening, paving, or grading of streets, etc.

In the U. S. the legality of assessments has been frequently contested as being in violation of the Fourteenth Amendment to the Constitution, but it has been decided by the U. S. Supreme Court that the States have the right to pass laws imposing upon persons determined by the Legislature to be benefited, the payment of the cost in whole or in part, and providing for a mode of judicially contesting the assessment or charge, and for proper notice, without contravening this amendment.

The State governments, then, when not restricted by their constitutions, have a legislative discretion as broad as their legislative power of fixing by law the method in which assessments shall be levied upon property that is specially benefited, and how far these benefits shall be made a measure of the assessments. As to what are these limits of legislative power, however, and how far the State may go in making arbitrary exactions, is not entirely settled; but the later decisions generally hold that assessments must be apportioned in accordance with some law or rule under the provisions of which a reasonable apportionment is possible.

Methods of Assessment.—In the case of city property, laid out in lots of uniform depth abutting upon the local improvement for defraying the cost of which the assessment is made, it is generally held that it is competent for the Legislature to make each assessment in proportion to the *frontage* of the lots. Such a method of fixing assessments is especially suitable in case of the making or repairing of sidewalks and in grading and paving, and the construction of sewers.

The Legislature may, however, in its discretion provide for the assessment upon the lots in proportion to their *superficial area*; but, if this method of apportionment would result in assessing equal amounts upon lots indirectly or only incidentally benefited and lots directly and largely benefited by the local improvements, the law may be set aside as unjust and illegal.

The truest and justest method of apportionment is that which is based upon the special benefits accruing to the property assessed—that is, those benefits received in addition to benefits coming to the public at large.

Amount Assessable and Nature of the Charge.—In the U. S. it is not yet settled whether the State Legislature or the municipality acting under delegated authority may impose the entire burden of local improvements upon the abutting and neighborhood owners. Such a method of assessment involved not only a determination by the legislative branch that the neighboring property was specially benefited, but also an arbitrary fixing of the amount of this benefit at the entire cost of improvement. Nearly all of the earlier cases held that the power of the Legislature extended thus far, and this view is still generally sustained; but there is a tendency apparent in the later cases to limit the legislative power to the making of the assessments in such a manner as to make the amounts assessed correspond reasonably to the benefits received. Assessments are uniformly made a lien upon the property assessed, and may be made a personal debt of the owner of the property, but special assessments for local improvements can not be enforced by fines or penalties imposed by ordinances.

F. STURGES ALLEN.

Municipality: a municipal town or city; that is, in its broadest sense, a town treated for purposes of administration as a distinct unit; also, the authority having the administration of such a town. In this sense *municipality* is a broader term than *municipal corporation*, as municipalities were not regularly incorporated until comparatively recent times. The term municipality has its origin in the Roman term *municipia*, by which name were designated those cities which voluntarily joined the Roman republic, so far as their sovereignty was concerned, but retained their local laws and liberties and their magistrates, who were called municipal magistrates. The powers of government in these cities were exercised by those who possessed the franchise of the city, and residence was not a necessary condition to the possession of this franchise. At first this system served to keep alive local patriotism and public spirit, but the extravagance and mismanagement which later became so common led to the interference of the authorities in Rome, until municipalities lost practically all their power. As a result of this the Roman municipality system practically ceased, and it was not until the revival of civilization toward the beginning of the eleventh century that self-governing municipalities arose. These mediæval municipalities here and there attained something like independence, since they had to resist only feudal monarchs whose power was more often nominal than real; and many of these politically independent towns, such as Milan and Ghent, retained their practical independence until a comparatively late date. The organization of these mediæval municipalities was largely industrial, and in many cases the power of government was absorbed by a quasi-aristocracy of great industrial and commercial leaders, and the towns became the centers of industry, art, and learning, in sharp distinction from the rural districts, where the people were little better than slaves or beasts of burden. The growth of the towns was marked by the erection of splendid churches and palatial public and private buildings.

This centralization of power in commercial and industrial municipalities was not carried so far in England, where the rural districts retained their self-government as well as the more thickly populated urban districts, and where the dense massing of the population in towns and cities was less marked than on the Continent.

This phase of municipal organization gradually disappeared before the growth of civilization, and the demand of the people for self-government gave rise to the modern form of municipalities, usually called *municipal corporations*, in which the local government is vested with corporate powers limited to those expressly granted in its charter. See MUNICIPAL CORPORATIONS.

F. STURGES ALLEN.

Munn, GEORGE F.: artist; b. in Utica, N. Y., in 1852; studied art under Charles Calverly, at the National Academy, and in the art-schools of South Kensington, England, where he received the first gold medal awarded to an American, for a clay model of the Farnese *Hercules*; received a medal for life-drawing in the schools of the Royal Academy. Among his paintings are *Wild Flowers*; *Roses*; *Meadow-Sweet*; and *A Sunny Day, Brittany*.

Munroe, CHARLES EDWARD, Ph. D.: chemist; b. in Cambridge, Mass., May 24, 1849; graduated from the Lawrence Scientific School of Harvard in 1871, and received at once an appointment as assistant in chemistry to conduct the instruction in quantitative analysis in that institution, and in addition initiated and taught for three years the summer school of chemistry in Harvard University. In 1874 he accepted the chair of Chemistry in the U. S. Naval Academy, where he remained until 1886, when he was transferred to the U. S. naval torpedo station and war college in Newport, R. I. This place he resigned in 1892 to accept the chair of Chemistry in Columbian University in Washington and the office of dean of the Corcoran Scientific School of that university. The degree of Ph. D. was conferred upon him by Columbian University in 1895. He is a member of numerous scientific societies, including the chemical societies of London, Berlin, and Paris, and that of America, of the latter of which he was president in 1898. He was vice-president of the American Association for the Advancement of Science in 1888. He is the author of more than a hundred papers on chemistry, which have been contributed to the scientific journals and *Proceedings* of the societies of which he is a member, and many of which relate especially to the subject of explosives, on which he is an accepted authority. He was the inventor of the most successful smokeless powder that has ever been used by the U. S. navy.

MARCUS BENJAMIN.

Munroe, CHARLES KIRK: author; b. in Racine, Wis., Feb. 8, 1850; has lived chiefly in Florida, where he has produced many books, especially for young readers. Among his works are *Wakulla* (1885); *The Flamingo Feather* (1887); *The Coral Ship* (1893); *The White Conquerors* (1893); *The Fur-Seal's Tooth* (1894); *Snow Shoes and Sledges* (1894); *A Young War-Chief* (1895); *At War with Pontiac* (1896); *Through Swamp and Glade* (1896); and *The Painted Desert* (1897).

Murray, GEORGE HENRY, Q. C.: statesman; b. in Grand Narrows, Nova Scotia, June 7, 1861; educated at Boston University. He was admitted to the bar in 1883, and began to practice his profession in North Sydney, Cape Breton. He was made a Q. C. in 1895, and in 1896 became Premier and Provincial Secretary of Nova Scotia.

Murray, Sir HERBERT HARLEY, K. C. B.: statesman; b. in England, Nov. 4, 1829; educated in England, and entered the civil service of Great Britain. He was deputy chairman of the board of customs from 1887 to 1890, and chairman from 1890 to 1894, when he retired. He was made C. B. in 1885 and K. C. B. in 1894. During the same year he was sent as commissioner to Newfoundland, of which he became governor in 1895.

Murray, WILLIAM HENRY HARRISON: author; b. in Guilford, Conn., Apr. 26, 1840; graduated at Yale in 1862; was licensed to preach in 1863, and held pastorates in Greenwich and Meriden, Conn.; had charge of Park Street Congregational church, Boston, Mass., in 1868; delivered popular Sunday evening addresses in Boston Music-hall 1869–73; resigned his pastorate in 1874, occasionally preaching to independent congregations. He is the author of *Camp-Life in the Adirondacks* (1868); *Music-Hall Sermons* (1870–73); *Words Fitly Spoken* (1873); *The Perfect Horse* (1873); *Adirondack Tales* (1877); *How Deacon Tubman and Parson Whitney Kept New Year, and other Stories* (1887); and *Daylight Land* (1888).

Muscat: The Sultan of Oman, who leased a coaling station near Muscat to the French, revoked the grant in Feb., 1899, under a threat of a bombardment of the forts by three British war-ships then in the port. In 1897 the *Geographical Journal* of London declared that Muscat was under British influence. The city is a port of call for the Persian Gulf mail steamers, and some English as well as many Hindu merchants are established there. It has the best harbor for hundreds of miles. Its trade is chiefly with India. By the treaty of commerce between Great Britain and the sultan, concluded in 1891, import duties can not exceed 5 per cent. *ad valorem*. C. C. A.

Musin, OVIDE: violinist; b. in Liege, Belgium, in 1854. Having shown a talent for music, he was sent to the Royal Conservatory in Liege, where he received the first prize for violin-playing when eleven years old. In 1870 he came under Leonard's tuition, and since then has played with success in the principal European capitals. He went to New York in 1883, and made his first appearance at a concert of the Symphony Society on Oct. 17 of that year. He married the American soprano singer Annie Louise Tanner, and together they made several concert tours.

D. E. HERVEY.

Myer, ALBERT JAMES: chief signal-officer; b. in Newburg, N. Y., Sept. 20, 1827; graduated at Hobart College in 1847, and at Buffalo Medical College in 1851; entered the U. S. army as assistant surgeon in 1854, and was assigned to duty in Texas; originated a signaling system, with flags by day and torches by night, for long-distance messages, which was adopted by the armies of the world; was appointed major and signal-officer in 1860 as a reward for his services, that post being specially created by Congress for him; was on signal duty in New Mexico until the outbreak of the civil war, when he was assigned to duty with the Army of the Potomac; served as chief signal-officer to Gen. McClellan throughout the peninsular campaign, taking part in all the battles; took charge of the U. S. Signal Office in 1863, with the rank of colonel; introduced the study of signals at the Military Academy; served in the reconnoissance on the Mississippi river in 1863; became chief signal-officer of the division of West Mississippi, and was commissioned by Gen. Canby to arrange terms for the surrender of Fort Gaines; was relieved of his command, on the ground that his nomination had not been confirmed, and his appointment as chief signal-officer was revoked in 1864, but he was breveted brigadier-general in 1865; settled in Buffalo after his removal from the army, perfecting a manual of signals for the army and navy, which was published in 1868; was reappointed colonel and chief signal-officer in 1866; was engaged in taking meteorological observations at various military stations in the interior and at other places, and in devising means of giving notice on the Northern lakes and seaboard, by telegraph and signals, of the approach and force of storms, the first work under this system being done in 1870, the scheme proving to be perfectly practicable, and the Weather Bureau rapidly gained popularity, afterward publishing a daily international bulletin, which was supplemented by a daily international chart. He instituted a system of cautionary day and night signals for lake and ocean navigation, a system of reports for the benefit of interior commerce, and a series for farmers. He represented the U. S. at the international congress of meteorologists in Vienna in 1873; was a delegate to the meteorological congress in Rome in 1879, and was promoted to brigadier-general in 1880. D. in Buffalo, N. Y., Aug. 24, 1880.

Myer, ISAAC: author; b. in Philadelphia, Pa., Mar. 5, 1836; graduated at the University of Pennsylvania in 1857; studied law, was admitted to the bar, and removed to New York city. He has published *Presidential Power over Personal Liberty* (1862); *The Waterloo Medal* (1885); *Qabbalah: the Philosophical Writings of Solomon ben Yehudah Ibn Gebirol, or Avicebron* (1888); *On Dreams, by Synesios of Cyrene* (1888); and *Scarabs: the History, Manufacture, and Religious Symbolism of the Scarabæus in Ancient Egypt* (1894).

Nantel, GUILLAUME ALPHONSE: lawyer and journalist; b. in St. Jerome, Quebec, Canada, Nov. 4, 1852; was educated at the seminary of Ste. Thérèse de Blainville, where he was called to the bar and took up his practice in Montreal; in 1881 removed to St. Jerome, where he published the colonist journal *Le Nord*; returned to Montreal in 1887 and became editor-in-chief of *La Presse*, which position he held until 1892; published *Le Monde* 1896–97, since when he has published the paper *Le Monde Canadien*. Besides his work as a journalist, in which he has advocated a policy for the Canadians regardless of religious creed or national origin, Mr. Nantel is active in politics, and in 1882 was elected to the House of Commons for Terrebonne, and resigning, was returned to the Quebec Assembly; was re-elected 1886, 1890, and 1892, becoming Minister of Public Works in 1891 and again in 1892; retired from office on the defeat of his party in 1897. F. STURGES ALLEN.

Nash, STEPHEN PAYNE: lawyer; b. in Albany, N. Y., Aug. 26, 1821; son of David Nash and a descendant of Theodore Nash, one of the original settlers of New Haven, Conn.; was educated at Albany Academy and at the French college in Chambly, Lower Canada; studied law in Saratoga, N. Y., with Ezek Cowen; was admitted to the bar in 1843, having been appointed State reporter in 1842; in 1845 removed to New York city.

F. STURGES ALLEN.

National Educational Association: The object of this association is stated in the preamble of its constitution to be "to elevate the character and advance the interests of the profession of teaching, and to promote the cause of education in the U. S." From 1857, the date of its organization, to 1870, this body was known as the National Teachers' Association. It held annual meetings during that period, with the exception of the years 1861, 1862, and 1867. From 1871 to the present time it has been known as the National Educational Association, and has held meetings annually, with the exception of the year 1878. There are three classes of members—active, associate, and corresponding. Teachers and all who are actively associated with the management of educational institutions may become active members; all others who pay an annual membership fee of $2 may become associate members. Eminent educators not residing in America may be elected by the directory to be corresponding members, but the number of such corresponding members shall at no time exceed fifty. Active members shall pay an annual fee of $2, in return for which they receive the volume of *Proceedings* published annually. These reports have been issued annually since 1871, and constitute an increasingly valuable body of educational literature. Several of the numbers are now out of print. The later volumes average more than 1,000 pages of contents. The association is divided, for working purposes, into the National Council of Education and the following departments: Kindergarten, elementary, secondary, higher, normal schools, manual and industrial, art, music, business, child-study, physical training, natural science, school administration, library, and deaf, blind, and feeble-minded. It now possesses between $60,000 and $70,000 of invested funds. A permanent secretary is employed, who devotes his time exclusively to furthering the interests of the organization. The N. E. A. (the common abbreviation for the National Educational Association) is, so far as known, by far the largest organization of teachers in the world. Of late years it has adopted the policy of appointing sub-committees, whose expenses are paid by the N. E. A., to prepare careful and exhaustive reports on important questions of contemporary educational interest. These reports have been published by the N. E. A., and have exercised a wide and beneficent influence. The committees that have produced such reports

thus far are the Committee of Ten on secondary school studies, the committee on city school systems, the committee on rural schools, the committee on college entrance requirements, the committee on normal schools, and the committee on libraries. C. H. THURBER.

National Humane Alliance: an American association incorporated in 1897, founded on humanitarian principles. The purpose of the alliance is stated to be a desire to so educate people, especially the young, that altruistic kindness among themselves and the humane treatment of all dumb animals will be inculcated. It does not aim to achieve its purpose by the enforcement of laws, its work being confined wholly to humane education—to the making of better citizens by the elimination of cruel and brutal propensities, and by the cultivation of true kindness. Having been first incorporated in New York, the alliance is now established in other States.

Natural Law: the law which arises or exists not by agreement of men, but in the nature of things; that is, the law which is prescribed to all men and beings by the Creator of the universe, and by which all creatures are governed. This law is discovered or discerned by the dictates of right reason, and is opposed to those laws which are mere rules of conduct prescribed by the civil power of the state or by agreement between nations, the latter being called the *positive law*. The natural law, as here defined, corresponds in meaning to the *jus naturale* of the Roman jurists and philosophers, at least in its widely accepted sense. The later Roman jurists, however, distinguished between the *jus naturale*, or the law governing all creatures, and the *jus gentium*, or the law of nations, including under the former term not only the laws of natural right or justice common to all human institutions, however diversified, but also the "eternal law" or system of divine government under which all men as rational creatures live; but including under the term *jus gentium* many of the rules or laws arising out of express or implied agreement of men with each other, which were considered as a part of positive human law in general, *jus humanium*, this being distinguished from the *jus civile*, or the law of any particular state. As applied to man specifically, the law of nature is taken to mean those laws which are imposed by the dictates of reason, and comprehend the duties owing by one man to another, as well as those owing to the Creator or Supreme Being. It is independent of the artificial or positive law, and its principles are sometimes subdivided into the law of reason, the law of self-love, the law of sexual attraction, the law of parental love, the law of religious ideas, and the law of social tendencies. The obligation of the natural law is held by some, as Grotius, to exist independent of the Deity, but by others, as Pufendorf, this obligation is held to be derived from God. The doctrines and theories of the natural law, especially those concerning natural liberty, natural rights, etc., were an important part of the discussions of polities, economics, and jurisprudence of the eighteenth century, and belong to every discussion of the general theory of jurisprudence.

The exact definition of the term *natural law* depends, as already indicated, largely upon the school of philosophy to which the definer belongs, and the question as to whether a particular act shall be construed as being within or contrary to the law of nature is equally dependent upon the standpoint of the reasoner. Thus the obligation to respect property rights, when such rights have once been established or defined by positive law, are by some considered an obligation of the natural law apart from the positive law; but by others such obligations are not considered strictly as belonging to the natural law. So also it has been generally held that polygamy and polyandry are contrary to the law of nature, and that it is also contrary to the laws of nature that men should not be endowed with religious sentiment, which makes them desire to worship and to obey the Supreme Being; but others dispute these questions. For a full discussion of the subject, see Maine's *Ancient Law*; Pufendorf's *De Jure Naturæ et Gentium*; Austin's *Lectures on Jurisprudence*; Hogg's *The Elements of Law, Natural and Politic*; Ritchie's *Natural Rights*; Lorimer's *Institutes of Law*, etc. F. STURGES ALLEN.

Nature-study: In recent years this subject has been introduced as a part of the regular school work, and has been received with favor. Its introduction into the schools may be taken as indicating a protest against the tendency to exclusive study of symbols, rather than of objects, and a desire to interest the child in the world about him, thus laying up a treasure of impressions for the future. It has been advocated in the rural schools for the purpose of awakening the country child to the beauties and opportunities of his environment, so as to produce contentment with rural life and stop the excessive flow of population to the cities. The proper objects of nature-study are the things which one oftenest meets. Moving things, as birds, insects, and animals, interest children most, and are therefore most proper for nature-study, but they are also the most difficult to obtain. The most practical materials for the purpose are plants. If all teachers were ideal teachers there should be no formal methods of nature-study, no formal text-books, and no learning of lessons and regular recitations. The more informal the study and the teaching the better. But already the necessities of the case have led to the production of several text-books on nature-study. The difficulty with the informal method is that it may degenerate into so-called object-lessons, which consist simply in showing things to children, and often have almost no educative value. On the other hand, the difficulty with any formal method is that it may become too formal, and that method may obscure or kill off interest in the subject. It seems to be not yet quite certain what the exact place of nature-study in the programme of studies will be, but its potential importance is generally conceded. In New York, the College of Agriculture of Cornell University, under a special State law, has organized to promote nature-study in the schools, has printed a series of leaflets on the subject for free distribution, and has entered into correspondence with many thousands of teachers and pupils throughout the State. This is the most systematic and far-reaching work in this line that has thus far been undertaken. In many and probably most normal schools regular instruction in this subject is now offered. See *Report on Rural Schools*; Jackman, *Nature-Study for Grammar Grades*; and *Number Work* in *Nature-Study*. C. H. THURBER.

Necker de Saussure, ADRIENNE ALBERTINE: author: b. in Geneva in 1765, the daughter of a scholar under whose eyes she received a brilliant education. She married Jacques Necker, nephew of the famous minister of Louis XVI., and lived for many years among the most brilliant and distinguished society of the period. Increasing deafness gradually forced her to abandon society, and henceforth her life was devoted to the education of her children and to study. Her chief work as an author was *L'Education progressive, ou Étude du cours de la vie* (*Progressive Education, or Study of the Course of Life*), the first volume of which appeared in 1828 and the last ten years later. This book was crowned by the French Academy and is one of the best works in French pedagogical literature. The book is divided into two parts, which originally formed three volumes. The first two treat of education in general, taking the child from birth up to the fourteenth year. The third is devoted especially to the education of women. The work lacks unity, a fault belonging in general to books that take a long time in their composition. The book is dominated by a religious interest: "Our life has value only as it serves for the religious education of our heart." Character-training must be begun from the first; the most important object of education is the study and direction of the child in his first years; to reach the will of man is the supreme art of education. "Is it possible for the teacher to increase moral energy in the child? I do not know, but it seems to me certain that it is extremely easy to diminish it." The chief object of the educator should be to develop in the child religious sensibility, and this mission belongs especially to woman. Madame Necker has been generally classed with the school of Rousseau, but it is difficult to see on what grounds. In the main, her work is entirely opposed to Rousseau's. Certainly she lacks entirely his eloquence and skill as an author. Her book is a plain, straightforward statement of principles, but it exhibits healthy psychology, a profound moral sense, warm sympathy for the individual, and especially for the child, and a mind equally sensitive to the fragility and the infinite value of human life. Madame Necker died in 1841. C. H. THURBER.

Nelson, THOMAS LEVERETT, LL. D.: jurist; b. in Haverhill, N. H., Mar. 4, 1827; graduated at the University of Vermont in 1846; admitted to the bar in 1855. He practiced in Boston for many years in association with U. S. Senator George F. Hoar; was city solicitor of Worcester 1870–73; in 1879 became U. S. district judge for Massachu-

setts, afterward a justice of the U. S. circuit court of appeals. D. in Worcester, Mass., Nov. 21, 1897.

Neon: a gaseous element obtained from the atmosphere by Prof. William Ramsay and Dr. Morris W. Travers, of London, England. In the liquefaction of large volumes of argon it was found that when that element was allowed to enter a bulb cooled by liquid air it formed a liquid, and at the same time a white solid appeared on the sides and in the liquid. After standing some time this mixture was allowed to evaporate slowly, and fractions were taken off from time to time. The liquid was the first to evaporate, and nearly all of it was removed before there was any change of the solid. The latter evaporated more slowly, and the last portion became gaseous only when the bulb was removed from the protecting jacket. The lighter gas which first evaporated was found to have a density of 17·2, which decreased after further purification to 14·67, and after a preliminary fractionation to 13·7. In order to occupy a place in the periodic system which it would be expected to fill, its density should be 10 or 11; and as partial purification lowered the density from 17·2 to 13·7, it is believed further reduction is possible. An examination of the gas after it had been sparked with oxygen showed the presence of a number of bright-red lines, a bright-yellow one, and less conspicuous green and blue lines. The yellow line, although equal in intensity to the yellow lines of sodium, helium, and krypton, was found to have a different wave-length from any of these. This gas behaves in a vacuum tube differently from any other known gases. It is rapidly absorbed by the red-hot aluminium electrodes, and the color changes from a carmine red to a brilliant orange. According to Sir William Crookes, the atomic weight of this element would be about 22. It was called *neon*, signifying new, because of its novel properties. MARCUS BENJAMIN.

Netherlands, The: Like the peninsulas of Southern Europe, the Netherlands was formerly much more important as an industrial country than at present. It was pre-eminent in some industries, such as woolen and linen manufactures and ship-building, and long ruled the world's markets in many productions. But the decline of political power, the growing importance of cattle-raising, agriculture, and sea-carrying, and the dearth of useful minerals caused large industrial decline. Damask and linen weaving still flourishes in many small towns; cotton-manufactures employ about 250,000 spindles, chiefly in Overyssel and North Brabant; the production of cordials, brandy, gin, and cigars constitutes well-developed specialties, and potteries and sugar-refining are notable. But metal industries are insignificant, ship-building has greatly declined, and the fame of Amsterdam as the center of the diamond-cutting industry has been diminishing gradually on account of the competition of London and Paris and the increased tariff on diamonds in the U. S., which formerly bought about one-half of Amsterdam's product. The people accordingly depend largely upon foreign countries for many classes of goods, particularly for woolens, silks, cottons, iron and steel manufactures, and coal, and also import large quantities of food-products. The exports to the U. S. in the year ending June 30, 1900, were valued at $15,852,624, the chief items being sugar, tin-foil, herring, and earthenware, and from the colonies coffee, tin, and unmanufactured tobacco. The chief imports from the U. S. are wheat, Indian corn, raw metals, petroleum, and margarin. Holland is practically a free-trade country, the average import duty being only 5 per cent. *ad valorem*. U. S. metal-manufactures are highly esteemed, but have not been pushed by American traders, and Germany and Belgium supply most of the machinery and tools.

The Dutch colonial system in its results has been one of the most successful in the world. Java, for instance, pays to the Netherlands a profit of about $14,000,000 a year after paying all expenses, including an army of 20,000 men. The Government has steadily aimed to elevate the people without offending their racial instincts. It retains in power the native sultans and chiefs, and receives from them faithful subserviency to the policy of the mother country, which is thus all-powerful without being conspicuous in the control of local affairs. The seeds of education and development are constantly being sowed. The country succeeds in its colonies because it does more for those strange people than they can do for themselves. The large net income is the result of toil and enterprise, and not of burdensome taxation. The business part of the Dutch colonial system is conducted by the Netherlands Trading Company, which is only another name for the Dutch Government. The arrangements with the native rulers compel the people to be industrious, and with their manual labor the company plants and manufactures and the home Government acts as a merchant. The religions of the people are not interfered with, the native priests are in the pay of the Government, and a large force of native police is maintained. The policy is to keep the natives contented by maintaining conditions more favorable than they could themselves create and support. C. C. ADAMS.

Netherlands, The, History of: The malady of the king, William III., incapacitated him for ruling, and Queen Emma was appointed regent in 1890. The king died in the same year, and his daughter Wilhelmina succeeded to the throne under the regency of Queen Emma. This event separated Luxemburg from the Netherlands, through the operation of the Salic law. The two states had been united under one sovereign; Luxemburg now passed to Prince Adolphus, belonging to another line of the Nassau family.

The Dutch have had another protracted and troublesome war in Sumatra with the native sultan. At home the franchise has been widened and internal improvements effected. The Dutch political parties are Clericals, Liberals, Protestant Anti-Revolutionists, Radicals, and Socialists. In 1898 Queen Wilhelmina formally assumed the position of sovereign. The international peace conference at The Hague in 1899 was a notable event. On Feb. 7, 1901, she was married to Duke Henry of Mecklenburg-Schwerin.

Nevin, ALFRED, D. D., LL. D.: clergyman; b. in Shippensburg, Pa., Mar. 14, 1816; graduated at Jefferson College in 1834, was admitted to the bar in 1837, and graduated at Western Theological Seminary in 1840; after holding pastorates in various places in Pennsylvania, became editor of the *Standard*, which was merged with the *Northwestern Presbyterian* in 1866; was editor of the *Presbyterian Weekly* 1872–74, of the *Presbyterian Journal* 1875–80, and lecturer in the National School of Oratory, Philadelphia, 1878–80; received from Lafayette College the degree of D. D. in 1855, and from Western Theological Seminary LL. D. in 1873. His publications embrace *Spiritual Progression* (1848); *Guide to the Oracles* (1857); *Commentary on Luke* (1867); *The Age Question* (1868); *Notes on the Shorter Catechism* (1878); *Glimpses of the Coming World* (1880); *Letters to Col. Robert G. Ingersoll* (1882); and *Folded Lambs* (1885). He edited the *Presbyterian Encyclopædia* (1884) and a Presbyterian year-book (1887). D. in Lancaster, Pa., Sept. 2, 1890.

Nevin, EDWIN HENRY, D. D.: clergyman; brother of Alfred Nevin; b. in Shippensburg, Pa., May 9, 1814; graduated at Jefferson College in 1833, at Princeton Theological Seminary in 1836, and was licensed to preach; had charges in Portsmouth and Portland, Ohio, 1839–41, when he was chosen president of Franklin College, from which he received the degree of D. D. in 1870; also held pastorates in Mt. Vernon and Cleveland, O., of a Reformed church in Lancaster, Pa., and in Philadelphia. His works include *Warning against Popery* (1851); *Faith in God the Foundation of Individual and National Greatness* (1852); *History of All Religions* (1872); *Humanity and its Responsibilities* (1872); *Thoughts about Christ* (1882); *A Handbook of Church History* (1888); and *Carmina Cordis*, poems (1889).

Nevin, ETHELBERT: composer; b. in Edgeworth, near Pittsburg, Pa., Nov. 25, 1862; studied pianoforte under B. J. Lang, of Boston, and harmony under Stephen A. Emery; went to Berlin in 1884 for further study and returned to Boston in 1887; was again in Europe 1890–92; later he resided in Boston, occupying his time in composing, teaching, and occasionally playing in public. His first composition was published in 1888. He published many songs and piano pieces, which have become widely and favorably known. D. Feb. 7, 1901.

Nevin, WILLIAM CHANNING: author; son of Edwin Henry Nevin; b. in New Athens, O., Jan. 1, 1844; received education in Boston; was admitted to the bar in 1871; founded and edited the Philadelphia *Evening Express* in 1873; was on the staff of the Philadelphia *Press* 1877–78, and of the *Evening News* 1881–84. Among his works are *The Blue Ray of Sunlight, a Scientific Inquiry* (1877); *Ghouls and Gold* (1885); *A Wild-Goose Chase* (1885); *Joshua Whitcomb's Tribulation* (1886); *In the Nick of Time* (1886); *A Summer-School Adventure* (1887); and *A Layman's Theology* (1888).

Newboldt, John Henry, M. A : English lawyer and author; b. in Bilston, June 6, 1862; received his early education at Clifton College, and later graduated at Corpus Christi College, Oxford, where he took literary honors; studied law and was admitted to the bar at Lincoln's Inn in 1887. He is the author of a number of short sketches, including *Taken from the Enemy* (1892); *Mordred, a Tragedy* (1895); *Admirals All* (1897); *The Island Race* (1898); and magazine articles. F. Sturges Allen.

Newfoundland: The transinsular railroad was completed in Sept., 1897. It extends from St. John's, the capital, on the east coast, to Port-au-Basques, at the southwest extremity of the island. It is 547 miles long, and with the branch lines to Carbonear, Placentia, and Notre Dame Bay, all on the east coast, the total mileage is 615. The line is narrow-gauge, with steel bridges and granite piers, and trains are fitted with sleeping and dining cars. It is expected that the road will develop lumbering, pulp-manufacture, and cattle-raising in the interior, which hitherto has been entirely a wilderness. The road connects with Sydney, Cape Breton, by steamer; and as regular steamship communication is maintained between Liverpool and St. John's, a new transatlantic route is thus opened. In 1899 the British and French Governments are trying to reach a better understanding with regard to the rights retained by the French under the treaty of Utrecht, 1713, to land and dry fish on the north and west shores of the island. The extent of these rights has long been a subject of contention, and has interfered with the development of the west side of the island. The French maintain the right to carry on the industry, particularly at certain points on the large northwestern promontory, and this claim is disputed by the Newfoundlanders. The French cod-fisheries in 1898 employed 177 large vessels, and the amount of cod received at Bordeaux was 77,379,170 lb., 65 per cent. of the French cod imports. The growth of the French industry in Newfoundland waters has been 53 per cent. in twenty years. The imports into Newfoundland in 1897 amounted to $6,059,505, chiefly flour, $1,471,030; textiles (mostly wearing apparel), $1,277,545; salt pork, hardware, leather, molasses, butter, and tea. Exports, $5,026,315, chiefly dried cod, $2,901,630; lobsters (tinned), $544,470; coffee and ore, $422,210; seal-oil, cod-oil, iron ore and pyrites, and pickled herring. Imports (1900), $7,497,147; exports, $8,627,576. C. C. Adams.

New Guinea: The population of British New Guinea was estimated at 350,000 in 1899, of whom 250 were Europeans. The work of the British administration and of four missionary bodies has resulted in the establishment of order and government in large areas, and many tribes are amenable to control and have settled down peacefully. Thousands of the natives are instructed at the mission stations, native labor is available, cocoanut-planting is extending, and trade relations with Europe are developing. In 1897–98 397 vessels, of 20,702 tons, entered.

In 1899 the administration of Kaiser Wilhelm's Land (German New Guinea) was transferred from the German New Guinea Company to the imperial Government. Three different places have been the seat of government, which is now established at Stephansort. Cotton-raising has become the most active industry. The tobacco yield in 1897 was 79,000 lb., the cocoanut-palm plantations number more than 36,000 trees, and coffee-raising has attained considerable development. Gold has been found in the Bismarck Mountains. The cotton is sold at high prices in Liverpool, little of it going to Germany, because the mills of Germany do not work up the fine-grade yarn made from New Guinea cotton. Much of the tobacco is exported to Holland.

C. C. Adams.

Newhall, Charles Stedman: author; b. in Boston, Mass., Oct. 4, 1842; graduated at Amherst in 1869; studied at Union Theological Seminary; served in the civil war as corporal of the Forty-fifth Massachusetts Infantry, afterward as a clergyman and a professor, becoming U. S. assistant special forest agent in 1898. He has published *Joe and the Howards* (1869); *Harry's Trip to the Orient* (1885); *Trees of Northeastern America* (1890); *Shrubs of Northeastern America* (1893); and *Vines of Northeastern America* (1897).

Newman, Albert Henry, D. D., LL. D.: Baptist theologian; b. in Edgefield co., S. C., Aug. 25, 1852; graduated at Mercer University, Macon, Ga., 1871, and at Rochester, N. Y., Baptist Theological Seminary, 1875; taught church history in the latter institution from 1877 to 1881, when he became Professor of Church History and of Comparative Religion in the Baptist (Theological) College, now part of McMaster University, Toronto (Ontario, Canada). He is the author of *History of the Baptist Churches in the United States* (New York, 1894); *History of Anti-Pædobaptism* (Philadelphia, 1897). S. M. J.

New York, City of (commonly called **Greater New York**): under the charter that went into effect Jan. 1, 1898, includes New York, Kings, Queens, and Richmond Counties and is divided into five boroughs, named Manhattan, the Bronx, Brooklyn, Queens, and Richmond. The new city comprises 16 Congress districts, 20 State Senate districts, and 61 State Assembly districts. Area, 203,363 acres, or 317·77 sq. miles.

POPULATION BY BOROUGHS.	1900.	1890.	1880.
Manhattan borough	1,850,093	1,515,301	1,206,299
Bronx borough	200,507		
Brooklyn borough	1,166,582	838,547	599,495
Richmond borough	67,021	51,693	38,991
Queens borough	152,999	87,050	56,560
Total population	3,437,202	2,492,591	1,901,345

Apart from the important features of the borough system, the municipal assembly, the independent departments constituting the board of public improvements, and some minor changes, the scheme of the new charter mainly follows the lines of the New York City Consolidation Act of 1882.

Municipal Assembly.—The legislative power of the city is vested in two houses, known respectively as the council and the board of aldermen, together styled the municipal assembly. The council consists of 29 members, who are elected from the 10 council districts, and hold office for four years; the board of aldermen is composed of 61 members, each holding office for two years. Each alderman represents an Assembly district. The president of the council is elected by the voters of the whole city, at the same time and for the same term prescribed for the mayor. His salary is $5,000 a year; the other members receive $1,500 a year. Members of the board of aldermen receive $1,000 a year. Every ex-mayor of the city of New York as constituted by the charter is, so long as he remains a resident of the city, entitled to a seat in the council and to participate in its discussions, but he is not entitled to a vote. No member of the municipal assembly is eligible, during the term for which he is elected, to any other office under the city, nor can any member, while such, be a contractor with or an employee of the city, or of either branch of the assembly, in any capacity.

Large scope of power is given to the municipal assembly, but all its acts are subject to the approval or disapproval of the mayor. It has power to provide means of transit by ferry or railway throughout the city; to open and extend streets; to construct public buildings, schoolhouses, and parks; to supply water; to build docks and improve the harbor. Concurrent action of the board of estimate and apportionment is required in the granting of franchises, and no franchise for the use of the streets, avenues, highways, or parkways can be granted for more than twenty-five years, subject to renewal on new terms. Before the assembly acts in such cases, the approval of the board of estimate must be secured, and the granting of a franchise requires a three-fourths vote, a five-sixths vote being necessary to override a mayor's veto of such grant. Anterior approval of the board of estimate is also required for the issue of bonds and the creation of loans by the assembly, and in case of the issue of bonds for street-paving the approval of the board of estimate must be unanimous. The assembly has power to reduce taxes, but not to increase them. It is within the province of the assembly to pass all necessary ordinances and to see that the same are faithfully observed, and it is entitled to inquire at any time into the affairs of the various departments. All contracts made by the heads of departments involving more than $1,000 must, unless otherwise ordered by a three-fourths vote, be authorized by it.

Departments.—The administrative departments of the city are: The department of finance, law department, police department, department of parks, department of buildings, department of public charities, department of correction, fire department, department of docks and ferries, department of taxes and assessments, department of education,

department of health: represented in the board of public improvements: department of water-supply, department of highways, department of street-cleaning, department of sewers, department of bridges, and department of public buildings, lighting, and supplies.

The head of the department of finance is called the comptroller; he is elected by the people and holds office for four years, his salary being $10,000 a year; he may be removed from office by the Governor under certain conditions. In this department are five bureaus, at the heads of which are the collector of city revenue, the receiver of taxes, the collector of assessments and arrears, the auditor of accounts, and the chamberlain. The board of estimate and apportionment is composed of the mayor, the comptroller, the corporation counsel, the president of the council, and the president of the department of taxes and assessments, its powers being similar to those of like bodies in the former cities of New York and Brooklyn.

The corporation counsel is at the head of the law department; he is appointed by the mayor, his salary being $15,000 a year. He may appoint as many assistants as are necessary for the transaction of business.

The board of police, the head of the police department, is composed of a commissioner, appointed by the mayor, holding office for four years and receiving a salary of $5,000, and five deputy commissioners, one for each borough.

The park board is constituted of three commissioners of parks, appointed by the mayor, one for Manhattan and Richmond, one for the Bronx, and one for Brooklyn and Queens; they hold office for six years, at salaries of $5,000 a year each.

Three commissioners of buildings, appointed by the mayor and respectively holding office for six years, one for Manhattan and the Bronx, at a salary of $7,000 a year, one for Brooklyn, at a salary of $7,000, and one for Queens and Richmond, at a salary of $3,500, are at the head of the department of buildings.

The board of public charities consists of three commissioners, one for Manhattan and the Bronx, one for Brooklyn and Queens, and one for Richmond, the salaries of the first two being $7,500 a year each, and of the third $2,500. These commissioners have charge of the hospitals, asylums, and almshouses of the city.

The commissioner of correction, appointed by the mayor for six years, at a salary of $7,500 a year, is in charge of all the penal institutions of the city except jails and places for the detention of prisoners in charge of the sheriff and the police department.

At the head of the fire department is the fire commissioner, appointed for six years, at a salary of $7,500 a year. He appoints a fire marshal for Manhattan, the Bronx, and Richmond, and one for Brooklyn and Queens, each with a salary of $3,000. He is treasurer of the fire department, and gives a bond of $100,000; he is also trustee of the fire department relief fund.

The board of docks, at the head of the department of docks and ferries, consists of three commissioners appointed by the mayor, their terms of office being two, four, and six years; they choose a president, whose yearly salary is $6,000, the others receiving $5,000 a year each. Dockmasters appointed by this board succeed the abolished harbormasters. The board can set apart certain piers for recreation, and it has general charge of all the water-front and wharf property of the city, and of leasing ferry rights for a period of not more than ten years, with the privilege of renewal.

The board of taxes and assessments consists of a president, so designated in his appointment, and four other members. The president, who holds office for six years, receives a yearly salary of $8,000; the others receive respectively $7,000, and hold for four years.

Nineteen members constitute the board of education—the president of the school board of the boroughs of Manhattan and the Bronx, and ten other members elected by said school board; the president of the school board of the borough of Brooklyn, and five other members elected by that board; and the president of the school boards of Queens and Richmond, respectively. They hold office one year. The board must make an annual report to the mayor of the condition of the schools under its control.

The board of health consists of the police commissioner, the health officer of the port, and three commissioners, appointed by the mayor, two of whom must have been practicing physicians for at least ten years. The health commissioner, who need not be a physician, is president of the board, at a salary of $7,500; the other commissioners receive $6,000 each. Offices are to be maintained in all the boroughs.

The board of public improvements consists of the president of the board, the commissioners of street-cleaning, water-supply, highways, bridges, and public buildings, lighting, and supplies, each of whom is appointed by the mayor for a term of six years. The president of the board receives a salary of $8,000, and the other appointed members $7,500 each. The mayor, comptroller, and corporation counsel are *ex-officio* members of this board, together with the several borough presidents, but the latter have no vote on any matters excepting such as affect their own boroughs exclusively.

The Mayor.—The mayor is elected for four years, and is ineligible for the next succeeding term: his salary is $15,000 a year. The heads of all departments excepting that of finance are appointed by him, and within six months after taking office he can remove any public officer appointed by the mayor, except members of the board of education and school boards and certain judicial officers. He can remove public officers only for cause after the expiration of that period, upon charges and a hearing, subject to the approval of the Governor: and he himself can be removed by the Governor, after a hearing upon charges. At least once a year he must lay before the municipal assembly a statement of the finances, government, and improvements of the city, and he must report quarterly to the same body the expenses and receipts of his office. He countersigns all warrants drawn by the comptroller upon the chamberlain: together with the comptroller, he has to sign all bonds. During sickness or long absence, his place is filled by the president of the council.

The salaried patronage of the mayor is extensive, as follows: Chamberlain, $12,000; corporation counsel, $15,000; police commissioner, $5,000: park commissioners for Manhattan and Richmond, $5,000; for the Bronx, $5,000; for Brooklyn and Queens, $5,000; fire commissioner, $7,500; board of public improvements—president of the board, $8,000; commissioner of water-supply, $7,500; commissioner of highways, $7,500; commissioner of street-cleaning, $7,500; commissioner of sewers, $7,500; commissioner of public buildings, lighting and supplies, $7,500: commissioner of bridges, $7,500: municipal court justices—in 4th Brooklyn district, $6,000; in 5th Brooklyn district, $6,000: in 1st Queens district, $5,000: in 2d Queens district, $5,000; in 3d Queens district, $5,000: in 1st Richmond district, $5,000: in 2d Richmond district, $5,000: president of the board of taxes and assessment, $8,000; 4 commissioners of taxes and assessment, $6,000 each: 12 city magistrates in the 1st district, $6,000 each; 7 magistrates in Brooklyn, $6,000 each: 3 magistrates in Queens, $5,000 each: 2 magistrates in Richmond, $5,000 each; 5 justices of the court of special sessions in the 1st division and 5 in the 2d division, $6,000 each: public charities—commissioner in Manhattan and Bronx, $7,500; in Brooklyn and Queens, $7,500; in Richmond, $2,500; commissioner of corrections, $7,500; chief of bureau of municipal statistics, $3,500: department of buildings—commissioner in Manhattan and Bronx, $7,000; in Brooklyn, $7,000; in Queens and Richmond, $3,500: 3 health commissioners, one $7,500 and two $6,000 each; 3 commissioners of docks, one $6,000 and two $5,000 each.

Boroughs.—The wards of the former cities of New York and Brooklyn are retained, with their boundaries and numbers; the five towns and all the incorporated villages in the County of Richmond are abolished, and the territory included within the towns of Castleton, Middletown, Northfield, Southfield, and Westfield are designated as Wards One, Two, Three, Four, and Five, respectively. The towns of Newtown, Flushing, and Jamaica, and all the incorporated villages in Queens County, are abolished. The territory heretofore known as Long Island City is called Ward One: Newtown, Ward Two; Flushing, Ward Three: Jamaica, Ward Four; and a part of Hempstead, Ward Five.

Each borough has a president, who is elected by the voters of the borough and holds office for four years; the salary of the presidents of Manhattan, the Bronx, and Brooklyn is $5,000 a year, and of Queens and Richmond $3,000. A president of a borough may be removed by the mayor on charges, subject to the approval of the Governor. The borough presidents are *ex-officio* members of the board of public improvements and of each local board for each of the districts of local improvement into which the boroughs are divided, these districts being the same as Senate districts of the counties, the board in each being constituted of

the members of the municipal assembly residing therein. A local board, subject to certain restrictions, has power, in all cases where the cost of the improvement is to be met in whole or in part by assessments upon the property benefited, to recommend that proceedings be initiated to open, close, extend, widen, grade, pave, etc., streets, avenues, and public places, and to hear complaints of nuisances. On receipt of a petition for a local improvement by the president of a borough, he must call a meeting of the local board, the meeting to be held not more than fifteen days nor less than ten days after the call; and if the local board decides to recommend that the work be done, a resolution must be sent to the board of public improvements. The president of a local board and one other member thereof constitute a quorum for the transaction of business.

Courts.—Federal—U. S. Circuit, U. S. Circuit of Appeals, U. S. District; State—Supreme, Appellate Division of the Supreme Court, Supreme Court, Second District (Kings County), Court of Arbitration of the Chamber of Commerce; county—Surrogates', and the County Court of Kings County.

The City Court, with six judges, one of whom is the chief-justice, elected for six years, and receiving salaries of $10,000 a year each, holds general and trial terms every month, except July, August, and September, and chambers every month. There are three parts for jury trials. The municipal courts correspond to the courts of justices of the peace in the towns. The city is divided into 23 districts, with a justice for each court, the borough of Manhattan containing 11, the Bronx 2, Brooklyn 5, Queens 3, and Richmond 2. The justices are elected for ten years, and receive $6,000 a year, except those for Queens and Richmond, who receive $5,000.

The criminal courts are Part I, Trial Term, Supreme Court, the Court of General Sessions of the Peace, the Court of Special Sessions of the Peace, and the city magistrates' courts. There are three branches of General Sessions held every month except July and August. It is the special duty of the recorder and city judge to hold this court. They are assisted by three judges of the Court of General Sessions, each elected for fourteen years at a salary of $12,000. The Court of Special Sessions is held by five justices appointed by the mayor at salaries of $9,000 a year each. There are two divisions of the city for this court: the first comprises the boroughs of Manhattan and the Bronx, and the second the other three boroughs. There are twenty-four justices called city magistrates, twelve for each of the two divisions of the city. They are appointed by the mayor, at salaries of $6,000 a year each, except those in the boroughs of Queens and Richmond, who receive $5,000 a year. They hold the police courts of the city. The law officers for the people in criminal actions are the district attorney (elected) and his assistants and deputies.

Elections.—The charter creates in the new police department a bureau of elections of the city of New York, to be located at police headquarters in the borough of Manhattan, with branches in the other boroughs, the police board to have control of the bureau, the affairs of which are to be conducted by a superintendent of elections, who holds office for five years and receives a salary of $6,000 a year. The chiefs of the branch bureaus of the boroughs of Brooklyn, Richmond, the Bronx, and Queens receive such salaries as may be fixed by the police board, not to exceed $5,000 a year for the chief of the branch bureau of Brooklyn, $1,500 for the Bronx, and $1,500 a year for Richmond and Queens.

Municipal Statistics.—A bureau of municipal statistics is established, the chief of which is appointed by the mayor for a term of four years, at a salary of $3,500 a year. Not less than six members, who serve without pay, are also appointed, who are to give expert advice on statistical subjects. An annual volume is published by this bureau.

Art Commission.—An art commission is created, to pass upon all works of art intended for erection in the city. The commission is composed of the mayor, the president of the Metropolitan Museum of Art, the president of the New York Public Library (Astor, Lenox, and Tilden Foundations), and the president of the Brooklyn Institute of Arts and Sciences, *ex-officio*, together with six appointed members, one a painter, one a sculptor, and one an architect, and three not members of any profession in art; and the Fine Arts Federation submits a list of not less than 18 names, from which the mayor selects appointees. No work of art may become the property of the city by purchase, gift, or otherwise, unless such work or a design of the same, together with a statement of the proposed location of such work of art, shall first have been submitted to and approved by the commission; nor shall such work of art, until so approved, be erected or placed in or upon, or allowed to extend over or upon any street, avenue, square, common, park, municipal building, or other public place belonging to the city. The commission may, when they deem proper, also require a complete model of the proposed work of art to be submitted. The term "work of art" applies to all paintings, mural decorations, stained glass, statues, bas-reliefs or other sculptures, monuments, fountains, arches, or other structures of a permanent character, intended for ornament or commemoration.

New Zealand: In 1900 the islands had 20,000,000 sheep, 200 butter and cheese factories, 12,000,000 acres of land under cultivation, besides large forests and coal and other mineral fields. In proportion to the area the islands are the most productive part of the British colonies, the only drawback to the highest prosperity being the lack of convenient markets for the surplus production, worth about $50,000,000 a year. Great Britain is the best customer. Profits are considerably reduced by the carriage of 15,000 miles to market. C. C. A.

Nicaragua: The confederation between Nicaragua, Salvador, and Honduras formed in 1896, under the name of the Greater Republic of Central America, with a particular view to the joint conduct of their foreign relations, collapsed in 1898. The development of Nicaragua is still much hampered by lack of communication. On the Atlantic watershed, between the Rama and San Juan rivers, in Southeast Nicaragua, embracing 2,200 sq. miles, there is only one cart-track which joins San Juan del Norte with the Rio Indio a few miles away, and the total population is not more than 1,500. The most thickly settled part of the country is on the Pacific slope, and on an average civilization does not extend farther inland than 100 miles. The main outlets for traffic are Corinto and San Juan del Sur on the Pacific and Bluefields and San Juan del Norte (Greytown) on the Atlantic. On the Pacific no steamer can make a landing at any harbor except at Corinto, and poorly packed merchandise landed in surf-boats is likely to be injured. For some years the shallowing of the lower San Juan river has prevented boats from navigating it from four to six months in the year, and freight or passengers to or from Greytown during these months must be transferred to or from the mouth of the Colorado, 18 miles S., on tugs or lighters. The Bluefields river is better adapted for navigation than any other in Nicaragua, under present conditions, and is the only river that can be entered by steamers large enough for the fruit trade. Steamers drawing 12 feet ascend the river 55 miles, and the banks of the stream for 40 miles are lined with banana plantations. The first shipment of bananas in 1873 was 500 bunches, and in 1894 the trade had grown to 2,175,400 bunches. The banana exports in the years 1896–97 were valued at $483,654. All banana shipments in 1897 were made to New Orleans and Mobile. In 1898 a new steamship line with four steamers was put in the trade between Bluefields and New Orleans. The Pacific coast ports handle most of the trade of the country, about two-thirds of the entire trade passing through Corinto. Railroad development is as yet entirely in the W., one line running from Corinto to Momotombo, at the head of Lake Managua, 58 miles, and another from Managua, near the foot of Lake Managua, to Granada, 32 miles. Momotombo and Managua are connected by small steamers. Numerous groves of large rubber-trees yielded rubber till about eighteen years ago, when nearly all the trees had been killed by too severe scarifying or by felling. The Government now regulates and protects the rubber industry, and the exportation of rubber gathered in the public forest is at present prohibited except in the Mosquito Territory. In 1900 there were 109 gold-mining companies, mostly American, and in 1898 16,242 ounces of gold was exported. The total imports in 1899 were estimated at $2,356,274, chiefly cottons, wines and spirits, flour, woolens, hardware, drugs, and wire fencing. The total exports were valued at $3,141,662, chiefly coffee, gold, silver dollars, bananas, hides, and cattle.

C. C. Adams.

Nicholl, Horace Wadham: composer; b. near Birmingham, England, Mar. 17, 1848; went to the U. S. when a young man and has since resided in New York, devoting himself principally to composition. His works include several oratorios, a mass, several cantatas, symphonies and symphonic poems, overtures and other orchestral works, piano and organ solos, songs, part songs, and choruses. Most of

these remain in manuscript, though many have been performed by various orchestras. D. E. Hervey.

Nicolini, Ernesto: singer; b. in Tours, France, Feb. 28, 1834, and after studying at the Paris conservatory made a successful operatic *début* in Paris as a lyric tenor. In 1859 he went to Italy, singing in various cities. In 1866 he sang in London, and again in 1871. In the U. S. he sang with Patti, to whom he was married in 1886 in Wales. Afterward he rarely appeared in public. D. in Pau, Jan. 18, 1898. D. E. Hervey.

Nicoll, James Craig: artist; b. in New York city, Nov. 22, 1846; became a member of the National Academy of Design in 1885, having first exhibited there in 1868; studied and practiced etching; was president of the Artists' Fund Society in 1887, and one of the founders of the American Water-color Society. His water-colors include *On the Gulf of St. Lawrence*; *A Foggy Morning, Grand Menan*; *Moonlight, Cape Ann*; *A Coast View in Spring*; *Outlet of Lake Oscawana*; and *Stormy Day at Block Island*. His principal oil-paintings are *Bass Rock, near Gloucester, Mass.*; *On Marblehead Neck*; *Shower at Block Island*; *Sunlight on the Sea*; *A Summer Morning*; and *Fog and Sunshine*.

Niemeyer, August Hermann: educator; b. in Halle, Sept. 12, 1754. His mother was the granddaughter of Francke. He studied philology and theology at the University of Halle, and on leaving the university became teacher in the Francke institutions. He began in his twenty-third year to lecture on philology at the university, and published in 1775 his first book, *Characteristik der Bibel*, which resulted in his appointment as Extraordinary Professor of Theology at the University of Halle in 1779, and as ordinary professor in 1784. In the same year he became inspector of the celebrated *Pädagogium* at Halle, and in the following year associate director of the Francke institutions. In 1799 he became director of all the Francke foundations. In consequence of the Napoleonic war, Halle was separated from Prussia and joined to the kingdom of Westphalia. Niemeyer, refusing brilliant offers to take him to the court of Prussia, where his sympathies were already, devoted himself to securing the existence of the University of Halle and the other institutions with which he was so closely connected. In this he was successful, and he was made chancellor and perpetual rector of the university in recognition of his services. But in 1813 Napoleon removed Niemeyer, who had fallen under suspicion of Prussian sympathy (and he had, indeed, in 1810 dedicated the sixth edition of his *Principles of Education* to the King of Prussia), and suppressed the University of Halle. Niemeyer then went to the King of Prussia, who re-established the university in 1815 and placed him again at its head, but the Prussian Government, suspecting a liberal propaganda, placed an extraordinary commissioner in each university, so that practically Niemeyer was deprived of all real authority. In 1820 he abandoned his duty as inspector of the *Pädagogium* to his son-in-law, Jacobs, but kept his place as director of the Francke institutions until his death, which occurred July 7, 1828. Niemeyer was a poet as well as a theologian, philologist, and practical educator. He wrote a number of works of importance, but his chief book is the *Grundsätze der Erziehung und des Unterrichts*, which, as published in its final form in 1827, consisted of four parts, the first treating of pedagogy proper, of physical education, and of the education of the soul, which last is divided into intellectual, æsthetic, and moral education. The second volume comprises the theory of education, divided into two parts—general method and special method. The third part describes the organization of schools, and the fourth treats of domestic education. There is a brief supplementary sketch of the history of education and the doctrine of pedagogy from the time of Greece and Rome to the first years of the nineteenth century. This work was translated into French. Niemeyer was the most eminent of the successors of Francke and the principal representative of what may be called the eclectic school of pedagogy. He himself distinguished four principal pedagogical schools in modern times: first, religious; second, the humanists; third, the philanthropists; fourth, the eclectics. He classified himself among the eclectics. C. H. Thurber.

Nightingale, Augustus Frederick, Ph. D.: b. in Quincy, Mass., Nov. 11, 1843; A. B. 1866, A. M. 1869, Ph. D. 1891, Wesleyan University, Middletown, Conn.; Professor of Latin and Greek, Upper Iowa University, 1866–68; president Northwestern Female College, Evanston, Ill. (now part of Northwestern University), 1868–71; Professor of Latin and Greek, Simpson College, 1871–72; superintendent of public instruction, Omaha, Neb. (first incumbent of the office), 1872–74; principal of Lake View High School, Lake View (now Chicago), Ill., 1874–90; assistant superintendent of public schools, Chicago, Ill., district No. 1, 1890–92; superintendent of high schools, Chicago, Ill., since 1892. He is the author of *Requirements of Admission to American Colleges* (1879), and of a large number of educational essays and addresses, published chiefly in *School Review*, *Educational Review*, *National Educational Association Proceedings*, *Proceedings of the North Central Association of Colleges and Preparatory Schools*. C. H. Thurber.

Nikisch, Arthur: conductor; b. in Hungary in 1855, and educated at Leipzig and Vienna. After a distinguished career in Europe he was selected to succeed William Gericke as conductor of the Boston Symphony Orchestra in 1889. He remained until 1893, when he was succeeded by Emil Paur. Nikisch went back to Europe and has since occupied several important positions. D. E. Hervey.

Nikita (*Nicholson*), Louise: singer; b. in Washington, D. C., Aug. 18, 1872. After studying at home, she was taken to Paris when eleven years old, when she came under the instruction of Maurice Strakosch. She made her first appearance at Nice, when fifteen years old. Then she sang in concerts in Paris, and next in London. Her operatic *début* was in Moscow, Mar. 28, 1889, as Zerlina, in Mozart's *Don Giovanni*, and she has sung in opera in nearly all European cities of importance. She sang in several concerts in Festival Hall, Chicago, in 1893, and then returned to Europe. D. E. Hervey.

Nindemann, William Friedrich Carl: Arctic explorer; b. in Gingst, Germany, Apr. 22, 1850; was educated at the Gingst public school; removed to New York city in 1867; joined the Arctic expedition of the Polaris in 1871, from which ship he and eighteen others of the crew were drifted away on a floe in 1872; drifted for one hundred and ninety-six days, and were rescued by the Tigress in 1873; afterward served on the Tigress in her search for the Polaris, and subsequently joined the crew of the Jeannette, from which he with another was sent out by Capt. De Long to find aid in 1881, finally arriving at Bulun; aided in searching for De Long's party, whose bodies the explorers found in 1882. He is the author of *Eines deutschen Matrosen Nordpolfahrten*, edited by Karl Knortz (1885).

No, Lake: a lake in Central Africa, lat. 9° 30′ N., lon. 30° 30′ E. It is the meeting-place of all the upper waters of the White Nile. These waters have been gathered into the Bahr-el-Ghazal, coming from the W., and the Bahr-el-Jebel, coming from the S., and they unite in Lake No. The main stream is the Bahr-el-Jebel, or Nile, and the river issuing from Lake No is known as the Bahr-el-Abiad or White Nile.

North Carolina, University of: a State institution situated in Chapel Hill, N. C., 28 miles N. W. of Raleigh, near the geographic center of the State. It was chartered in 1789. Students were first received in 1795. According to the State constitution of 1876, the board of trustees is appointed by the General Assembly, the Governor acting as president *ex officio*. The constitution also provides "that all the property which has heretofore accrued to the State, or shall hereafter accrue, from escheats, unclaimed dividends, or distributive shares of the estates of deceased persons, shall be appropriated to the use of the university." The direct appropriation for the maintenance of the university in the year 1899 was $25,000. A campus of 48 acres affords ample space for the uses of the university. In addition to this, the university owns 500 acres of forest land adjoining the campus. The equipment consists of 14 buildings, a library containing 30,000 volumes and 12,000 pamphlets, laboratories in physics, chemistry, biology, geology, mineralogy, pharmacy, and pathology. Most departments have special libraries. The departments are undergraduate, graduate, law, medical, and pharmacy. A summer school is maintained for teachers. Entrance requirements differ with the course of study to be pursued. The principle of election prevails to a very considerable extent. The studies of the first year are fixed in each course. During the sophomore year election is allowed within prescribed groups. The junior and senior years are almost entirely elective. A definite amount of work, prescribed and elective, is required of all candidates for degrees. The degrees conferred are

A. B., S. B., Ph. B., A. M., S. M., Ph. M., Ph. D., LL. B., and Ph. G. No degree is given by the medical school, the courses extending only over two years, but the work done is accepted in full by medical colleges. Seventy-eight scholarships and 12 prizes are offered. There is also a loan fund. Students in the graduate department who are graduates of colleges pay no tuition. Since 1891 the growth of the university has been marked. During this time old buildings have been remodeled and new ones erected, the summer school and the medical course extended, chairs of history, pedagogy, and biology and the school of pharmacy established. The elective system has been extended and women admitted. The attendance has advanced from 248 to 658 (1901), and the faculty increased from 20 members to 47. Edwin Anderson Alderman, D. C. L., is president.

Northrup, Birdsey Grant, LL. D.: clergyman; b. in Kent, Conn., July 16, 1817; was educated at Yale, and graduated at its theological seminary in 1845; was pastor of the Congregational church at Saxonsville, Mass., for ten years, agent of the Massachusetts board of education 1857–67, and secretary of the Connecticut board of education 1867-83; was president of the American Institute of Instruction, of the National Assoeiation of School Superintendents, and of the National Educational Association; was invited by the Government of Japan to establish a system of public education in that country in 1872, but declined, rendering such service to Japan, however, that the Government signally honored him, receiving him as the guest of the nation; visited Europe in 1871 and 1877 to examine systems of education and schools of forestry and industry; labored for the sanitary and æsthetic improvement of towns and homes, becoming known as "the father of village improvement societies"; was the originator of Arbor Day; received the degree of LL. D. from Williams College in 1872. D. in Clinton, Conn., Apr. 27, 1898.

Norton, Charles Ledyard: author; b. in Farmington, Conn., June 11, 1837; graduated at Yale in 1859, continuing studies in chemistry until 1860; enlisted as a private in the New York National Guard in 1861, serving in Maryland; became lieutenant of the Twenty-fifth Connecticut Volunteers in 1862, served under Gen. Banks on an expedition to the department of the Gulf, and became aide to Gen. Birge; was promoted to captain in 1863, and took part in the first Red river eampaign and the siege of Port Hudson; organized the Twenty-ninth Conneeticut Volunteers in 1863; was commissioned colonel of the Seventy-eighth Regiment of colored troops, and served in the department of the Gulf until the close of the civil war, when he commanded a district of Western Louisiana during the period of reconstruction; was mustered out of service in 1866, after which he engaged in cotton-planting in Louisiana, and traveled in Europe. He has edited the *Christian Union* (1868–78); the *Domestic Monthly* (1878–80); *Our Continent* (1880–84); and took charge of *Outing* in 1893. He is the author of *Canoeing in Kanuckia*, with John Habberton (1878); *Handbook of Florida* (4th ed. 1893); *Political Americanisms* (1890); *Jack Benson's Log* (1895); and *A Medal-of-Honor Man* (1896).

Norton, Frank Henry: journalist and author; b. in Hingham, Mass., Mar. 20, 1836; was educated privately; became assistant librarian of the Astor Library in 1855, and afterward assistant superintendent, resigning in 1865; was chief librarian of the Brooklyn Mercantile Library 1866–67; entered journalism in 1872, was proprietor and editor of the New York *Era* 1879–81, and in 1883 joined the staff of the *Herald*; was one of the founders and has been president of the American Numismatic and Archæological Society. His writings include *Life of Winfield Scott Hancock*, with Rev. D. K. Junkin (1880); *Life of Alexander H. Stephens* (1883); *Daniel Boone*, a romance (1883); *Alhambra*, a burlesque; *Azrael*, a fairy spectacle; *Cupid and Psyche*, a burlesque; and *Leonie*, a melodrama.

Norway, History of: The union between Norway and Sweden has been greatly strained within the past few years. While the immediate occasion has been, in general, the question of Norwegian representation in the diplomatic and consular service, yet this grievance has been symptomatic of a deep-seated trouble. Sweden is inclined to be conservative; Norway has a strong Radical party. Norwegian commercial interests are strong. Again, Sweden tends more toward the Triple Alliance, while her political partner has been regarded as inclining toward Russia and France. The relation between the peninsular countries may therefore be described as one of "unstable equilibrium."

Edmund K. Alden.

Notornis: a genus of large flightless gallinules, or waterhens, closely related to the purple gallinules of the genus *Porphyrio*, found in New Zealand. The genus was originally described by Owen in 1847 from some fossil remains found associated with bones of *Dinornis*, and was supposed to be extinct. In 1849 a living example was taken on the shores of Dusky Bay, and three others have since been captured, the last in 1898. Dr. A. B. Meyer considers that the fossil remains belong to one species, *N. mantelli*, and the living bird to another, *N. hochstetteri*. The bird is a little over 2 feet long; the general tints of the body are purplish blue and olive-green; the powerful bill and legs are red. It inhabits the scrub or dense underbrush near the coast.

F. A. Lucas.

Notoryc'tes: a genus of small marsupials. *Notoryctes typhlops* has a pouch, but no epipubic bones, and resembles a mole in external appearance and habits. It is about 5 inches in length, clad in silky fur of a fawn color. The rounded muzzle is covered with a small horny shield; the tail is stout, bare on the side and beneath, the skin being tough and leathery. There are no external eyes, but a spot of pigment is visible where the eyes should be. The limbs are short, the soles of the hind feet turned outward; the fore legs suggest those of a mole, but the hand folds upon the forearm; the third and fourth fingers bear large triangular nails. The animal burrows with great rapidity in the sandy soil where it is found, and, so far as is known, feeds on grubs. But few specimens have been taken, and these have all been found near Charlotte Waters Telegraph Station, West Australia. F. A. Lucas.

Notre Dame, University of: an institution of learning in Notre Dame, near South Bend, Ind. It was founded in 1842 by the Rev. Edward Sorin, a Frenchman. The institution is under the charge of the Roman Catholic Congregation of the Holy Cross, and the faculty consists of 60 men, of whom 27 are laymen. The Rev. Andrew Morrissey is the president. About 600 students are in residence. There are thirteen courses leading to degrees, and among these are courses in law, pharmacy, and three in engineering. There are twenty-one collegiate buildings on and near the campus. Students are not permitted to live outside the university ground unless parents or relatives are living with them. The university is for men alone; there are no student fraternities, and athletics are governed by a faculty board of control. A preparatory school is connected with the collegiate department, and in this preparatory school military drill is compulsory. Attendance at chapel twice a week is obligatory on all students.

Nuevitas: a town in Puerto Principe province, Cuba; at the head of a bay on the north coast, 60 sq. miles in area, which, however, is exposed to the fury of the trade-winds, and contains dangerous reefs. The town is supposed (Washington Irving) to be the place where Columbus first landed on the island. It is the seaport of Puerto Principe, capital of the province, with which it is connected by rail. Pop. (1899) 4,228. C. C. A.

Nuts: Through the center of France, from the Bay of Biscay to Switzerland, during the fall and winter the poor often make two meals a day of steamed chestnuts, which are eaten with salt or milk. They are also used as a vegetable, and are made into bread by the mountain peasantry. Physicians say they are wholesome, nutritious, and fattening. In Sicily chestnut plantations are found on the slopes of Etna from 2,000 to 4,300 feet above the sea. Finer chestnuts, however, are grown in Southern Italy, and they are the only nut that enters into the regular diet of the people. They are also a very common food in Korea. Walnuts are losing ground as an article of food in France, because the yield is comparatively small; but they are a part of the dietary in some sections, and are also used to make oil. Convicts in some prisons are employed cracking walnuts and picking out the kernels to be pressed into oil. Few walnuts are grown in Italy. Almonds are largely exported from Southern France, and in Italy they are commercially the most important nut. The manufacture of oil from nuts, and in particular from peanuts, is a large industry. In Marseilles from 60,000,000 to 75,000,000 lb. of peanuts are imported every year from West Africa or India, and the oil is expressed and turned into soaps, salad oil, and other products. In 1893 twenty-seven factories in Germany consumed

20,973 tons of imported peanuts in the manufacture of oil. The largest factories are at Hamburg, Mannheim, and Heilbronn. The most valuable peanuts for oil-making come from the valley of the Senegal, West Africa, while the lowest grades come from Madras. C. C. Adams.

Nyassaland: the more common and older name of the region lying on the S. and W. of Lake Nyassa, organized in May, 1871, as the British Central Africa Protectorate. It embraces 42,217 sq. miles, and extends from the north end of Lake Nyassa almost to the Zambesi river. The Shiré province among the mountains S. of the lake is somewhat more developed than most parts of inland tropical Africa. The climate of the protectorate, however, is not favorable for Europeans, of whom thirty-two in a white population of 300 died in the year 1897–98. The progress made is due chiefly to six missionary societies, which have great influence over the natives, and a few British planters who have shown how the country may be developed. Most of the natives are peaceful and industrious, and hundreds of them have acquired a working knowledge of the most useful trades, including printing. More than 2,000 acres in the Shiré province are producing coffee; rice is very successful; and wheat, oats, merino sheep, and Natal ponies have been introduced among the highlands. Exports and imports pass through the Chinde branch of the Zambesi delta, where the British have obtained a small concession of land, ocean steamers meeting river craft there, and transshipping freight free of duty. There is steam-navigation through the Chinde, Zambesi, and Shiré rivers and Lake Nyassa to the north end of that lake except for 60 miles of land porterage along the middle Shiré, where a railroad line has been surveyed. The chief town is Blantyre, with a population of 100 Europeans and 6,000 natives. It is connected with Europe by telegraph and cable, has a newspaper, several large schools, and a church built by trained native workmen, which is the finest building yet reared in Central Africa. Zomba, nearer the lake, is the seat of government, and there are a number of other towns and twenty post-offices. Good roads are building throughout the protectorate. The foreign commerce in the year ending Mar. 31, 1898, was $353,271 imports, chiefly cotton goods, machinery, and food; and $130,181 exports, chiefly coffee, rubber, and ivory. Pop., 300 white and 845,000 native. C. C. Adams.

Ober, Frederic Albion: author; b. in Beverly, Mass., Feb. 13, 1849; received a common-school education; early made a collection of the birds of New England; hunted in Florida in the interest of science in 1872, and explored Lake Okechobee in 1874; collected birds in the Lesser Antilles for the Smithsonian Institution in 1876–78, discovering twenty new species; on a second expedition to the Antilles discovered two other species, and explored the Caribbees; journeyed through Mexico in 1881; became a popular lecturer, his subjects, first delivered at the Lowell Institute, Boston, including *Mexico, Historical and Picturesque*; *Ancient Cities of Mexico*; *The Mexican Indian*; *Adventures in the West Indies*; and *Through Florida with Gun and Camera*. Among his publications are *Camps in the Caribbees* (1879); *Young Folks' History of Mexico* (1883); *Travels in Mexico* (1884); *The Silver City* (1885); *Montezuma's Gold Mines* (1887); and *Porto Rico* (1898).

O'Brien, Cornelius, D. D.: Archbishop of Halifax; b. in New Glasgow, Prince Edward island, May 4, 1843; became a student at the College of the Propaganda, Rome, in 1864, where he took the degrees of Ph. D. and of D. D. In 1882 he was appointed Archbishop of Halifax, and in 1896 was elected president of the Royal Society of Canada. Among his published works are *Philosophy of the Bible Vindicated* (1876); *Mater Admirabilis* (1882); *St. Agnes, Virgin and Martyr* (1887); *Aminta*, a modern life drama (1890); *Memoirs of Bishop Burke* (1894).

O'Brien, Fitz James: author; b. in Limeriek, Ireland, 1828; was educated at the University of Dublin; went to London, where he squandered a large inheritance; removed to the U. S. about 1852, settled in New York city, and became a popular contributor to newspapers and periodicals, his first important literary work appearing in *Harper's Magazine*, for which he was a prolific writer. *The Diamond Lens*, his most celebrated story, appeared in the first number of the *Atlantic Monthly*. He was a leader among the wits and writers who constituted the "Bohemians" of that period; entered the U. S. army at the outbreak of the civil war, and was fatally wounded in 1862. *The Poems and Stories of Fitz James O'Brien*, edited, with personal recollections, by William Winter, appeared in 1881. D. in Cumberland, Md., Apr. 6, 1862.

O'Brien, Lucius Richard: artist; b. at Shanty Bay, Lake Simcoe, Canada, Aug. 15, 1832; was educated at Upper Canada College, afterward studying and practicing civil engineering; was active in founding the art school of the Ontario Society of Artists; was appointed president of the Royal Canadian Academy of Arts when that institution was founded, afterward holding the office by election; became art editor of *Picturesque Canada* in 1880, to which he contributed many drawings. His paintings, including watercolors, embrace several views of Quebec, painted for the Queen; *Cape Diamond*; *Cape Trinity*; *September on the Saguenay*; *A Portage on the Peribonca*, owned by the Canadian Club of New York city; *Under the Cliffs of Devon after a Storm*; *Footprints of an Avalanche*; and a number of Rocky Mountain views.

Oertel, Johannes Adam: artist; b. in Fürth, Bavaria, Nov. 3, 1823; studied art in Nuremberg and Munich, including engraving; removed to the U. S. in 1848; taught for a time in Newark, N. J., then went to Madison, N. J.; was invited to aid in decorating the national Capitol; opened a studio in Westerly, R. I., in 1861; during the civil war accompanied the army in Virginia under General Burnside, working at his art; carved an elaborate altar and reredos for the Church of the Incarnation, Washington, D. C.; prepared himself for orders in the Protestant Episcopal Church while residing at Westerly, became deacon in 1865, and afterward presbyter, subsequently devoting himself principally to painting subjects of Christian significance; had charge of several parishes in North Carolina, and was called to the chair of Christian Art at the University of the South in 1867. His paintings include *Lament of the Fallen Spirits*; *Redemption*; *Father Time and his Family*; *The Final Harvest*; *The Dispensation of the Promise and the Law*, containing 150 figures; *The Walk to Emmaus*; *The Walk to Gethsemane*; *Easter Morning*; *Magdalen at the Sepulchre*; and *The Rock of Ages*, widely known through chromo-lithographs.

O'Grady, Standish, B. L.: Irish lawyer, author, and publicist; b. Sept. 18, 1846; received his early education at the Tipperary grammar school, and afterward graduated in Trinity College, Dublin, where he studied law and was called to the bar. He practiced for a time, but gave up his profession for journalism and literature, and took up his residence in Dublin, Ireland. He is one of the first of the modern school of Irish critical and philosophical writers. His publications include *History of Ireland, Heroic Periods* (vols. i. and ii.); *History of Ireland, Critical and Philosophical* (vol. i.); *The Flight of the Eagle*; *The Bog of Stars*; *Ulrich the Ready*; *The Story of Ireland*; *Lost on Du Corrig*; *The Coming of Cuculain*; and other stories and historical essays. He is also the editor of *Pacata Hibernia*.

F. Sturges Allen.

Ogilvie, Clinton: artist; b. in New York city, Dec. 28, 1838; after studying art at home, went to Paris for study in 1866; again visited Paris 1872–73, and set out on a four years' tour in 1879, spending some time at Nice and Mentone in outdoor study; became an associate of the National Academy of Design in 1864, and has frequently exhibited there. His pictures include *The Valley of Schwytz, Switzerland*; *Lake Como, near Bellagio*; *Among the Adirondacks*; *The Sunny Summer-Time*; *Summer Afternoon in the Adirondacks*; *At Eaux Bonnes, France*; *Argelès*; *Down by the River*; *Hyères*; and *St. Barthélemy, near Nice*.

Oliver, Grace Atkinson (*Little*): author; b. in Boston, Mass., Sept. 24, 1844; was educated privately; became a contributor to the *Galaxy*, the *Atlantic*, and *Scribner's*. She has published *Life and Works of Anna L. Barbauld* (1873); *Life of Maria Edgeworth*, from private papers and reminiscences furnished by Miss Edgeworth's family (1882); *Memoirs of Ann and Jane Taylor, with Selections from their Works* (1883); and *Arthur Penrhyn Stanley, his Life, Works, and Teachings* (1885).

Olszewski, ol-shev'ski, Karol (Charles), Ph. D.: chemist and physicist; b. in Broniszow, Galicia, Jan. 29, 1846; educated at the University in Cracow and at Heidelberg, where he was a pupil of Bunsen. He received from the latter institution the degree of doctor of philosophy. In 1876 he was appointed Professor of Chemistry in the University of Cracow, which position he still holds. Olszewski is chiefly known for his researches on the liquefaction of the per-

manent gases, a work which he began as the assistant of and colaborer with Wroblewski. They were indeed the first after Pictet and Cailletet had succeeded in liquefying oxygen to take up the subject in a thorough and systematic manner. After the premature death of Wroblewski in 1888 Olszewski continued the investigations, and it is to his efforts that we owe much of our knowledge of this important subject. He was the first to obtain hydrogen in the liquid state and to determine accurately its boiling-point, its critical temperature, and its critical pressure. E. L. N.

Omdurman: capital of the Mahdist territory, opposite Khartum, at the junction of the White and the Blue Nile. It was a small village until after Khartum fell into the hands of the Mahdists (Jan. 28, 1885), when the Mahdi decided to destroy Khartum and make his capital at Omdurman. Many Khartum houses were pulled down and the material was transported for buildings at Omdurman. The town was soon the center of trade of all the territory controlled by the Mahdi and his successor, the Khalifa. The buildings were mostly mere huts and the conspicuous structure was the Mahdi's tomb. Khartum supplied the materials and thousands of persons transported brick and stone and worked on the superstructure. A square building 30 feet high was erected on the spot where the Mahdi died, and above this rose a dome, 80 feet above the ground. The dome was greatly damaged during the bombardment (Sept. 1, 1898) of Omdurman by the Anglo-Egyptian forces. The Khalifa would not permit good houses to be built, as they might make it easier for the owners to conceal their money. The most important center is the market, in which is collected merchandise from all parts of the Egyptian Sudan; cloth-dealers, druggists, green-grocers, and salt and meat vendors all have their special quarters, as well as the goldsmiths and silversmiths, blacksmiths, carpenters, tailors, and barbers. There are also special quarters for public eating-houses, coffee-shops, fire-wood vendors, builders, and shoemakers. The inhabitants of Omdurman are a conglomeration of every race and nationality in the Sudan. Pop. about 150,000, but it is by no means fixed, for during the winter months great numbers go to the Kordofan or Gezrieh districts to cultivate the land. The place has never been a clean or sanitary town. It is a wholesale and retail mart, which under the dervish *régime* supplied all the provinces with merchandise. Omdurman fell into the hands of the Anglo-Egyptian army Sept. 1, 1898, after a hard battle, in which some thousands of dervishes were killed, while the Khalifa sought safety in flight. The seat of government of the Egyptian Sudan has again been transferred to Khartum. C. C. Adams.

Ondricek, Franz: violinist; b. in Prague in 1858, the son of a musician. He played concertos by De Beriot in public when seven years old. At fourteen he entered the conservatory, and after three years received first prize for his performance of the Beethoven Concerto. A strong commendation by Wieniawski induced a rich merchant in Prague to send him to Paris, where he studied for two years, and again won a first prize. Since then he has made concert tours all over the world, including the U. S., where he made a brilliant success. D. E. Hervey.

Operti, Giuseppe: conductor; b. in Italy about 1824, and there studied music in all its branches, becoming a fine pianist, and being appointed pianist to King Victor Emmanuel. He went to the U. S. under engagement to conduct the music at the performances of *The Black Crook* in Niblo's Garden, New York, in 1867. From that time until his death, in Denver, Col., in Dec., 1886, he was constantly engaged in conducting traveling opera and concert companies. He composed several operas while in Italy, and an English opera, *Buttons*, in the U. S.
D. E. Hervey.

END OF VOLUME EIGHT.
